[illegible] Operational Provision – Permitted Equipment and Activities

The District's permitting process [illegible] ensures that [illegible] new or modified sources of air contaminants are properly controlled such that emissions are reduced or mitigated to below the District's thresholds of significance. District [illegible] Rules and [illegible] Regulation [illegible] require that [illegible] and modified [illegible] sources of air contaminants [illegible] obtain an Authority to Construct [illegible] and Permit to Operate [illegible] before [illegible] operation. [illegible] Permits to Operate [illegible] are valid for [illegible] and must be renewed [illegible] to ensure [illegible] continued compliance with [illegible] applicable rules and regulations. [illegible] Permits to Operate may contain [illegible] conditions [illegible] to limit emissions [illegible] below [illegible] thresholds [illegible] and to ensure [illegible] compliance with [illegible] applicable rules and regulations. [illegible] Permits to Operate [illegible] are issued [illegible] after [illegible] the District [illegible] has verified [illegible] that [illegible] the equipment [illegible] is constructed [illegible] and operated [illegible] according to the [illegible] specifications [illegible] submitted [illegible] with the [illegible] Authority to Construct application. [illegible] Permits to Operate [illegible] may be [illegible] revoked [illegible] if the [illegible] District determines [illegible] that [illegible] the equipment [illegible] is not being [illegible] operated [illegible] in compliance [illegible] with [illegible] applicable rules [illegible] and regulations.

[illegible] Authority to Construct [illegible] and Permit to Operate [illegible] for [illegible] permitted [illegible] equipment [illegible] and activities [illegible] are considered [illegible] a project [illegible] under [illegible] the California Environmental Quality Act (CEQA) [illegible] and [illegible] the District [illegible] is the [illegible] lead agency. [illegible] The District's environmental document (Negative Declaration, Mitigated Negative Declaration, [illegible] Environmental Impact Report) [illegible] must [illegible] address [illegible] the [illegible] impacts [illegible] from [illegible] the [illegible] construction [illegible] and [illegible] operation [illegible] of [illegible] the [illegible] permitted [illegible] equipment [illegible] and activities. [illegible] Mitigation measures [illegible] must be [illegible] identified [illegible] for [illegible] any [illegible] significant [illegible] impacts [illegible] and [illegible] must be [illegible] implemented [illegible] as a [illegible] condition [illegible] of [illegible] approval [illegible] for [illegible] the [illegible] Authority to Construct [illegible] and Permit to Operate.

[illegible] Operational Provision – Non-permitted Equipment and Activities

[illegible] Sources Exempt [illegible]

[illegible] Equipment [illegible] and [illegible] activities [illegible] that [illegible] emit [illegible] air [illegible] contaminants [illegible] but [illegible] are [illegible] exempt [illegible] from [illegible] District [illegible] permit [illegible] requirements because they fall below the District's emission thresholds for requiring permits is [illegible] required [illegible] to [illegible] comply [illegible] with [illegible] applicable [illegible] rules [illegible] and [illegible] regulations [illegible] and [illegible] may be [illegible] subject [illegible] to [illegible] inspection [illegible] by [illegible] District [illegible] staff.

Mobile Sources

[illegible] Many [illegible] of the [illegible] construction [illegible] equipment [illegible] and [illegible] vehicles [illegible] that [illegible] will be [illegible] used [illegible] during [illegible] the [illegible] construction [illegible] phase [illegible] of [illegible] the [illegible] project [illegible] are [illegible] mobile [illegible] sources [illegible] that [illegible] are [illegible] not [illegible] subject [illegible] to [illegible] District [illegible] permit [illegible] requirements. [illegible] Mobile [illegible] sources [illegible] are [illegible] regulated [illegible] by [illegible] the [illegible] California [illegible] Air [illegible] Resources [illegible] Board [illegible] (CARB) [illegible] and [illegible] the [illegible] United [illegible] States [illegible] Environmental [illegible] Protection [illegible] Agency [illegible] (EPA). [illegible] Mobile [illegible] sources [illegible] are [illegible] required [illegible] to [illegible] comply [illegible] with [illegible] applicable [illegible] CARB [illegible] and [illegible] EPA [illegible] regulations [illegible] and [illegible] may [illegible] be [illegible] subject [illegible] to [illegible] inspection [illegible] by [illegible] CARB [illegible] staff.

1. California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM10, PM2.5, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or

exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24 hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m3 is equal to or less than one. For PM2.5, the 24 hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.

3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

4. Any equivalent measurement method which can be shown to the satisfaction of the ARB to give equivalent results at or near the level of the air quality standard may be used.

5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

6. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

7. Reference method as described by the U.S. EPA. An “equivalent method” of measurement may be used but must have a “consistent relationship to the reference method” and must be approved by the U.S. EPA.

8. To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national standards are in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national standards to the California standards the units can be converted from ppb to ppm. In this case, the national standards of 53 ppb and 100 ppb are identical to 0.053 ppm and 0.100 ppm, respectively.

9. On June 2, 2010, a new 1-hour SO2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

10. The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

11. The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 µg/m3 as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

12. In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

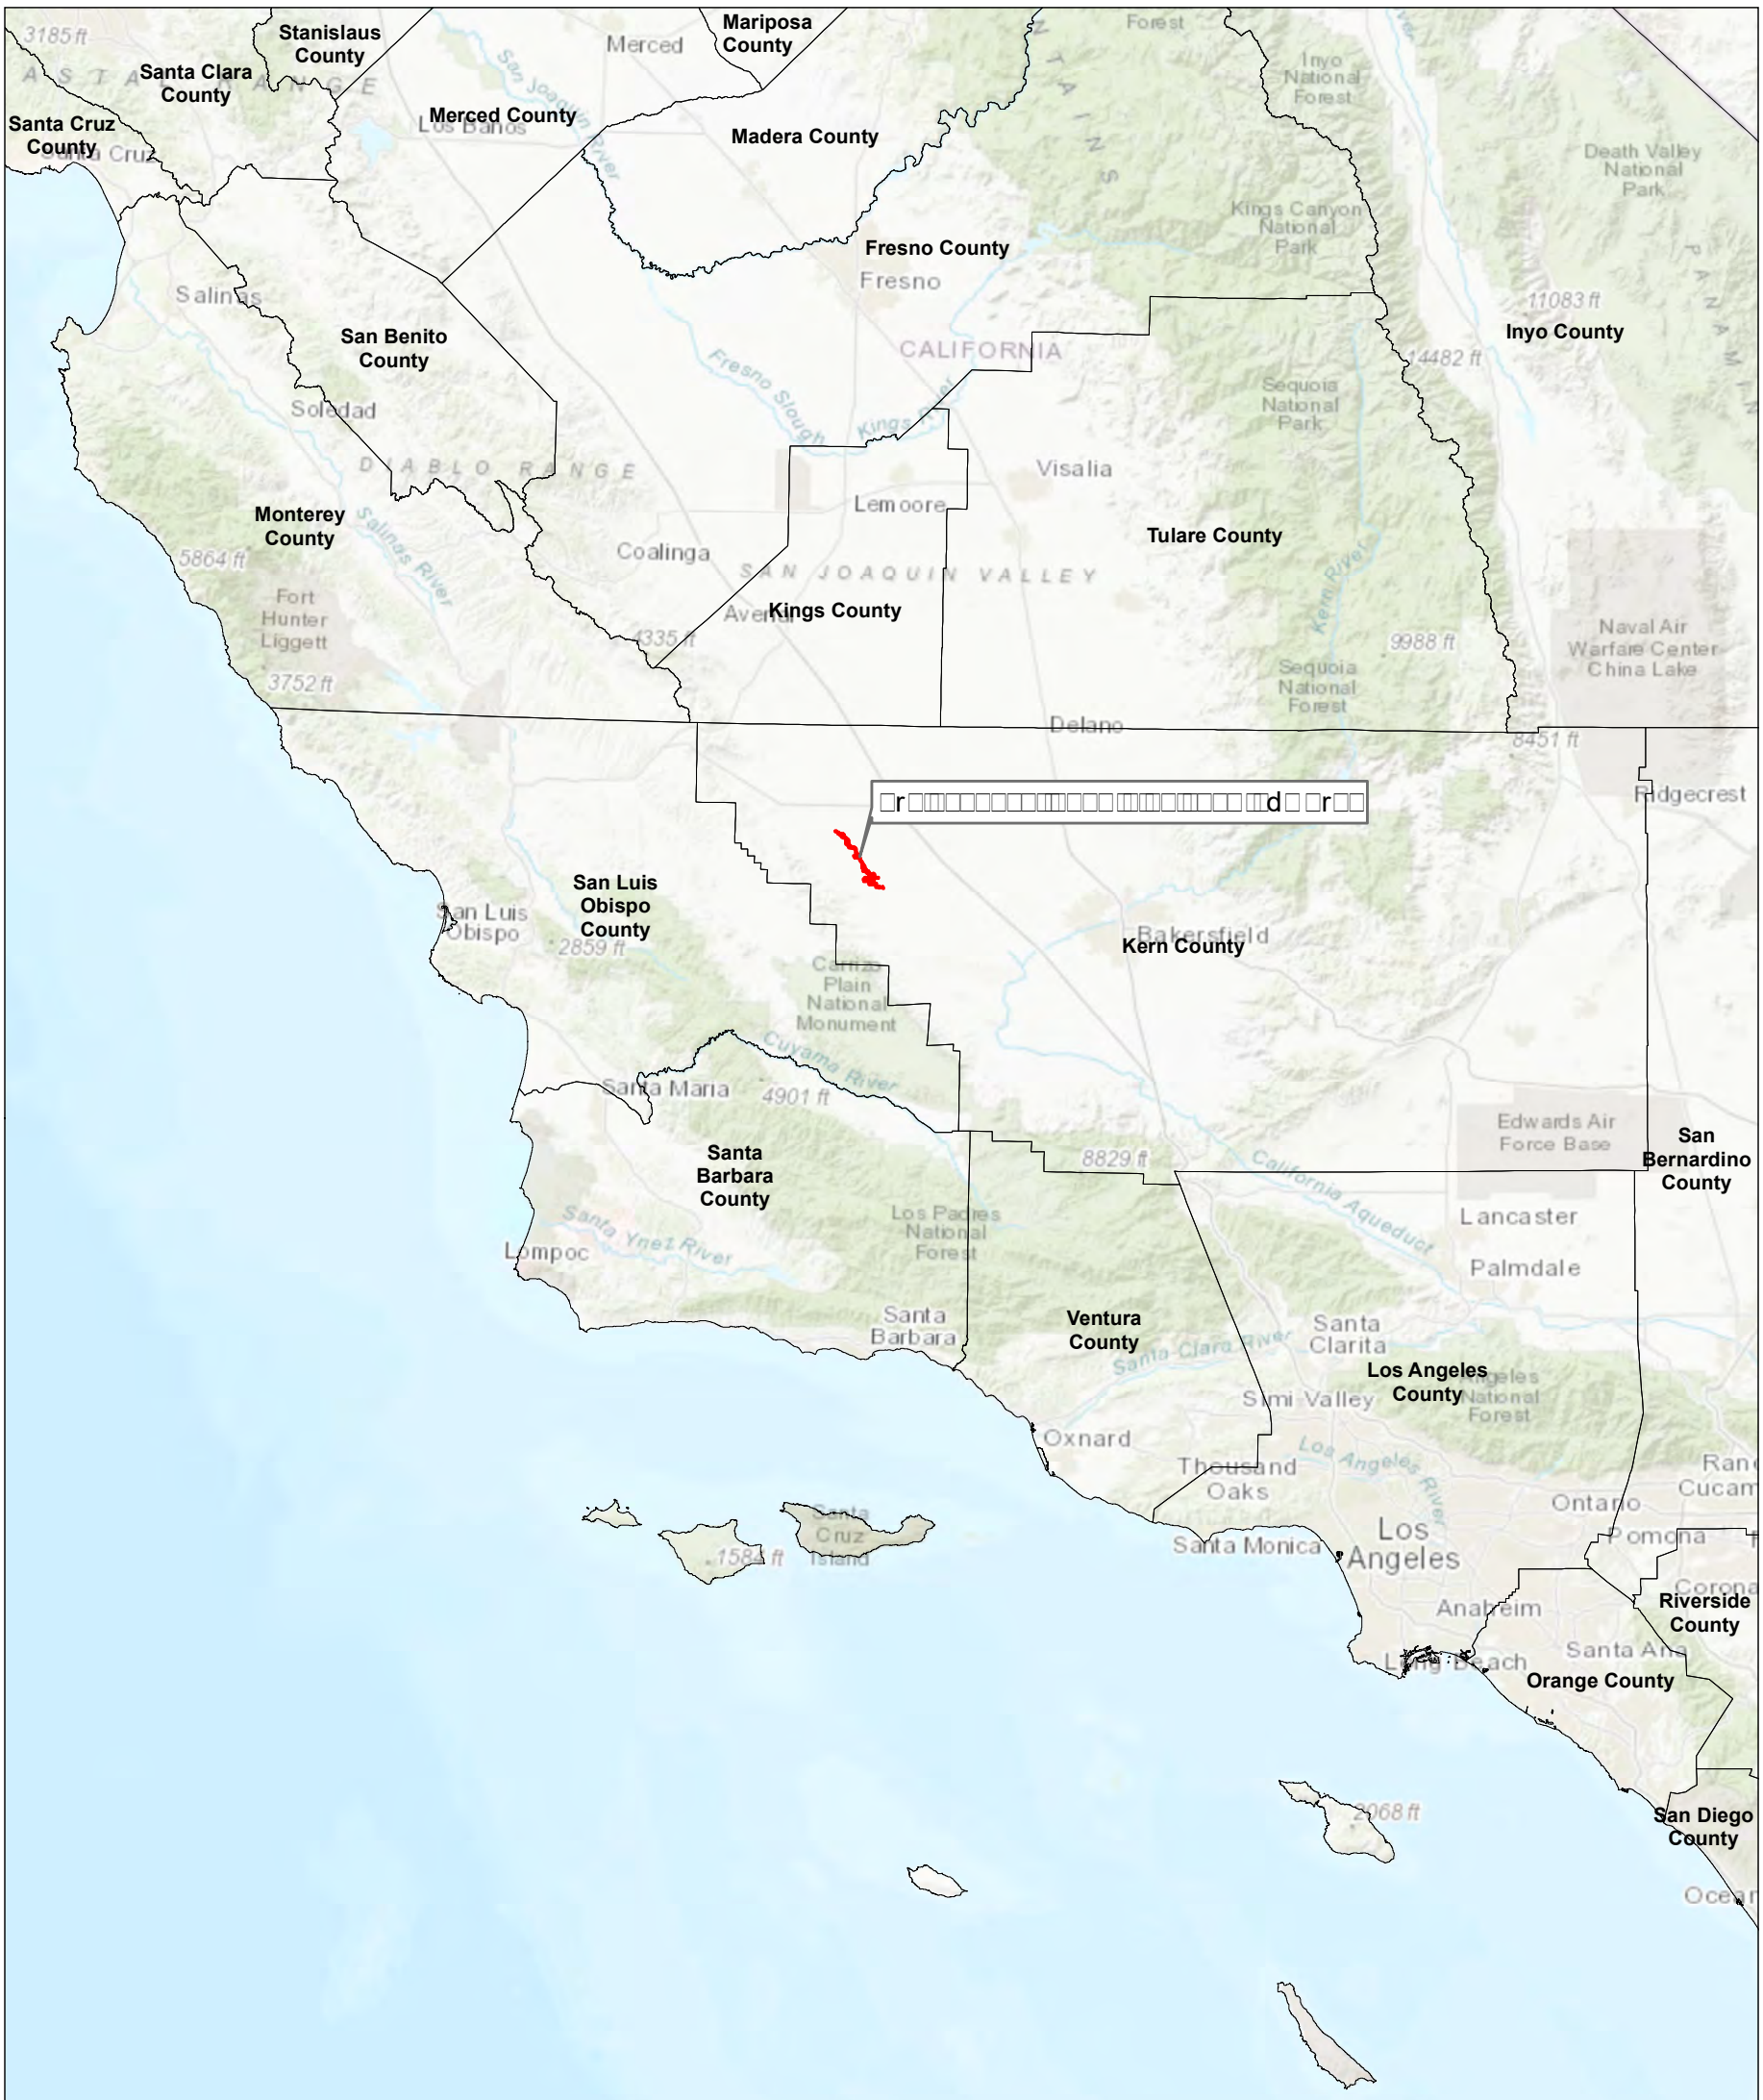
1.0 INTRODUCTION

Aera Energy LLC (Aera Energy) is proposing to construct and implement the CarbonFrontier Project (Project), which includes carbon capture and sequestration (CCS) in the South and North Belridge oil fields south of Blackwells Corner and west of State Route (SR) 33 in Kern County, California (Figure 1). The proposed Project is designed to capture carbon dioxide (CO_2) from existing produced gas streams and emissions from existing stationary oil field infrastructure sources within Aera Energy's South Belridge Oil Field, and transport the CO_2 through a system of pipelines to the North Belridge Oil Field for injection into dedicated Class VI injection wells for geologic sequestration. It is anticipated that the proposed Project would capture and sequester up to 2 million metric tons (MM Mt) of CO_2 per year beginning in 2027 and will contribute to the goal of California for carbon neutrality by 2045 (Executive Order B-55-18) by reducing industrial CO_2 emissions.

Aera Energy has submitted an application to the Kern County Planning and Natural Resources Department to request approval of a Zone Change and Conditional Use Permit (CUP) for the construction and operation of the Project. Implementation of the Project would also require permits from the United States Environmental Protection Agency (USEPA) for nine injection wells in compliance with the Underground Injection Control (UIC) program Class VI geologic sequestration regulations. The proposed CO_2 related facilities, pipelines, Class VI injection wells and associated CO_2 monitoring wells would be located within the CUP boundary (Figure 2).



1.1 PURPOSE OF THE REPORT

This Biological Resources Technical Report (BRTR) is intended to document the biological resources that are associated with the Project. The goal of this report is to document the current baseline environmental conditions for biological resources that occur within the Biological Study Area (BSA) to support future California Environmental Quality Act (CEQA) documentation for the Project. This BRTR will provide an emphasis on special-status plant and wildlife species, wildlife corridors, and special-status/sensitive natural communities, and in addition, evaluate the potential for these species to occur within the BSA.

1.2 BIOLOGICAL STUDY AREA (BSA)

The BSA includes all areas that could be directly and indirectly affected by the Project. The BSA for the Project totals approximately 3,252 acres, and is shown in Figure 3. The BSA includes the Project footprint, the proposed construction areas, all areas of temporary and permanent impacts, and the areas within a 500-foot buffer extending outward from the Project construction area and facilities, including on either side of the pipeline alignment and around all Project related infrastructure. The 500-foot buffer was chosen to include potential direct and indirect Project impacts on plant and wildlife species from construction activity.

□□□

2.0 PROJECT DESCRIPTION

2.1 PROJECT PURPOSE

The purpose of the Project is to substantially reduce Aera Energy's CO_2 emissions from the existing South Belridge Oil Field. The proposed Project is expected to capture and sequester significant amounts of CO_2 over the life of the Project, and contribute to California's goal of carbon neutrality by 2045 (Executive Order B-55-18).

Aera Energy's Project Objectives are as follows:

- Construct and operate facilities and infrastructure to capture, transport, inject, and permanently sequester up to 37.5 million MM Mt of CO_2 in a safe, secure, and economically feasible manner for storage, not enhanced hydrocarbon recovery;
- Minimize new disturbance by siting and designing Project facilities and infrastructure within the existing developed oil field footprint;
- Reduce the carbon intensity of Aera Energy's produced oil and gas by capturing CO_2 from produced gas (pre-combustion) and stationary sources (post-combustion);
- Generate environmental, social, and economic benefits for Kern County and the State of California by implementing low carbon technologies, developing CCS infrastructure, and providing living-wage jobs in the region; and
- Contribute to California's goal to achieve carbon neutrality by 2045 (Executive Order B-55-18) by integrating carbon capture in existing operations as well as ending oil and gas production from select reservoirs and repurposing them for the permanent storage of CO_2.

2.2 PROJECT LOCATION

The Project is located within the Central Valley portion of western Kern County in Aera Energy's Belridge oil fields (see Figures 1 and 2). Aera Energy is the primary operator of both oil fields. The South Belridge and North Belridge oil fields are contiguous and located approximately seven miles southwest of the community of Lost Hills and just west of SR 33 (see Figure 2). The main entrance to the South Belridge Oil Field is located at the private Oasis Road along Seventh Standard Road west of SR-33.

The BSA is contained within the following Sections of the South and North Belridge oil fields: Sections 26, 27, 28, 34, 35, and 36 of Township 27 South, Range 20 East; Sections 1, 2, and 12 of Township 28 South, Range 20 East; Sections 6, 7, 17, 18, 19, 20, 27, 28, 29, 32, and 33 of Township 28 South Range 21 East, and Section 2, 3, and 4 of Township 29 South, Range 21 East, Mount Diablo Base and Meridian, County of Kern, State of California, in the U.S. Geological Survey (USGS) Blackwells Corner, Carneros Rocks, and Belridge 7.5-minute topographic; approximately 7 miles southwest of the community of Lost Hills, Kern County, California.

The proposed CO_2 capture facilities would be located within the developed portion of the South Belridge Oil Field, which comprises a total of about 16,218 acres, while the proposed CO_2 sequestration field would be located in the North Belridge Oil Field, which is about 5,801 acres total. The Sequestration Field

refers to an underground geologic formation, situated at a depth of approximately 8,500 feet, where the CO_2 would be stored. The proposed CO_2 capture facilities would be spread out through the South Belridge Oil Field. The proposed CO_2 sequestration field (approximately 2,636 acres) in the North Belridge Oil Field is made up of privately owned parcels predominately developed with oil and gas production and accessory facilities and infrastructure. Together, the two Belridge oil fields cover an area of approximately 22,019 acres, approximately 13 miles long and up to 3 miles wide. The Project footprint, which includes areas of temporary and permanent impacts, and locations of all Project facilities, is approximately 308 acres.

2.2.1 Environmental Setting

CO_2 capture and compression equipment would be constructed adjacent to four existing facilities within the South Belridge Oil Field. The proposed CO_2 sequestration field is contained within approximately 2,636 acres of land within the North Belridge Oil Field. The proposed Project location is not designated by the California Department of Conservation (DOC) as Prime Farmland, Farmland of Statewide Importance, or Unique Farmland. However, the proposed Project footprint has two parcels (Assessor's Parcel Number [APN]: 068-220-26 and 085-210-42) subject to Farmland Security Zone (FSZ) contracts and three parcels subject to Williamson Act Land Use Contracts; one parcel (APN: 068-210-13) designated as non-prime; one (1) parcel (APN: 068-200-33) designated as mixed; and one parcel (APN: 085-220-37) designated as prime.

The BSA is not located within a Kern County-designated mineral recovery zone (excluding oil and gas); however, the South and North Belridge oil fields are designated by the Kern County General Plan for Mineral and Petroleum exploration and extraction.

The nearest residences closest to the BSA include one residence located east of SR-33 adjacent to the North Belridge Oil Field (this property has been purchased by Aera Energy), a small housing tract on Lost Hills Road, north of Lerdo Highway and roughly three miles east of the BSA, and the community of Lost Hills located approximately seven miles northeast of the BSA.

2.3 PROJECT OVERVIEW

Aera Energy proposes to construct and operate a carbon capture and sequestration project, with the CO_2 capture facilities located within the South Belridge Oil Field, and transport the CO_2 by pipeline to the North Belridge Oil Field for permanent sequestration via CO_2 injection wells into a designated underground sequestration zone, known as the 64 Zone, at depths of approximately 8,500 feet below ground surface.

New processing facilities and field systems would be constructed to implement the Project. Processing facilities would include: 1) carbon capture facilities constructed adjacent to existing oil field equipment within the South Belridge Oil Field; 2) pipelines to transport the CO_2 stream to the North Belridge Oil Field, and 3) dedicated injection wells within North Belridge to inject CO_2 into the dedicated CO_2 sequestration zone. Existing oil wells that penetrate the dedicated CO_2 sequestration zone would be permanently plugged and abandoned (including the removal of surface wellheads) in accordance with applicable laws and regulations or repurposed for injection or monitoring activities.

Field systems would include: 1) additional pipelines to convey produced gas, water, and steam within South Belridge; and 2) electrical power distribution and supervisory control and data acquisition networks and control rooms. The Project would also include maintenance of existing access roads. Monitoring systems would be constructed, including re-purposing of existing wells, to monitor the CO_2 injection operations in accordance with state and federal requirements. Details of the new processing facilities, infrastructure, and field systems is outlined further in the following sections.

Aera Energy would operate the field under a well-established and proven management system that incorporates many processes, plans and programs to ensure public and worker health and safety, environmental protection, regulatory compliance, and community involvement. These programs include Spill Prevention, Incident Response, Site Safety, Site Security, Pollution Prevention, Species Protection, Environmental Compliance, Environmental Training, Safety Training, and Community Involvement.

2.3.1 Project Permits and Approvals

Aera Energy has submitted a land use application package to the Kern County Planning and Natural Resources Department (Kern County) to request approval of a Zone Classification Change and CUP and would obtain any other required approvals for the construction and operation of a CCS Project in the South and North Belridge oil fields. The proposed Project would require approvals for additions and improvements to the existing oil field facilities (gas separation, compression, and pumping equipment), new CO_2 pipelines located primarily aboveground utilizing existing pipeline corridors, UIC Class VI geologic sequestration injection wells, CO_2 monitoring wells, and an underground carbon sequestration field for the storage of CO_2 in accordance with appropriate financial assurance mechanisms that ensure permanence in compliance with applicable regulatory standards. Implementation of the Project would also require permits from the USEPA for up to nine Class VI injection wells in compliance with the UIC program Class VI geologic sequestration regulations, including five re-purposed wells and four new injection wells.

2.4 PROPOSED PROJECT COMPONENTS

The following sections provide additional details and discussion regarding each of the Project components. Project plans include construction of four CO_2 capture facilities, construction of pipelines to convey CO_2 from the capture facilities to the proposed sequestration field, and construction or re-purposing of nine injection wells within the North Belridge Oil Field. The proposed Project also includes construction of monitoring wells, new field systems, and utility connections and delivery lines. Each of the components are described in the following subsections and are depicted on Figure 3.

The proposed Project includes the following components:

- CO_2 Capture and Processing Facilities - one pre-combustion capture facility and three post-combustion capture facilities (Figure 4).

- Pipelines – an approximately 10-mile main CO_2 pipeline, CO_2 distribution lines to each injection well, and produced gas, water and steam pipelines. The majority of the new pipelines would be installed on pipe supports between two to four feet above the ground. Pipe supports are typically spaced 15 to 30 feet apart depending on the size and the weight of the pipeline. New pipelines may be installed on existing pipe supports or on new pipe supports.

- Subsurface Wells – Development/Conversion and operation of up to nine CO_2 injection wells, including four new injection wells and five existing re-purposed wells, and up to nine monitoring wells. As part of the proposed Project, up to 55 existing oil wells would be plugged and abandoned within the North Belridge Oil Field in accordance with state and federal requirements to prevent leakage of CO_2 from the sequestration zone. Up to 40 additional wells, previously abandoned within the North Belridge Oil Field, would be re-abandoned to meet current state and federal plugging requirements. Additionally, 21 existing wells that are adjacent to Steam Generator Setting (SGS) 2868 and SGS 2972 would need to be plugged and abandoned prior to construction of the CO_2 capture facilities at these two locations.

- Access Roads – Maintenance and repair of existing field access roads.

- Water Systems – Construction of water treatment facilities at each of the CO_2 capture facilities.

- Electrical Transmission – Construction of approximately 6,840 feet of 115 kilovolt (kV) overhead transmission lines from the existing Aera Energy -owned electrical supply grid to two new electrical substations located adjacent to the CO_2 capture facilities.

- Networks – Electrical power distribution, and supervisory control and data acquisition (SCADA) networks.

2.4.1 CO_2 Capture and Processing Facilities

Proposed CO_2 capture facilities include facilities and processes needed for the separation, dehydration, compression, and cooling of CO_2 from both pre-combustion (Pre-C) produced gas stream and from post-combustion (Post-C) flue gas. Pre-C and Post-C components are outlined below.

2.4.1.1 Pre-Combustion Components

Del Sur to Gas Plant (GP) 32 Pipeline. An existing 16-inch diameter Wet Gas pipeline operating at approximately 150 pounds per square inch in gauge (psig). It is known as the Del Sur line to GP 32 and would be utilized to supply produced gas to GP 32. The Tulare Associated gas stream would need to go through the Del Sul Compressor Station to increase pressure before being transported to GP 32. A new 200-foot long “jumper” line would be constructed to feed Tulare gas from a 10-inch diameter pipeline (operating at less than 25 psig) into the Del Sur Compressor Station. The compressors would then connect the Tulare gas into the Del Sur line which currently transports Diatomite gas, at an increased pressure of over 125 psig. The existing pipeline is made of carbon steel with a corrosion-resistant internal coating, is situated aboveground on pipe supports, and crosses Seventh Standard Road. One existing

idle compressor at the Del Sur Compressor Station would be put back in service to accommodate the Tulare gas. The Del Sur compressors would also be upgraded with new materials/trim for corrosion resistance.

Tulare CVR to GP 32 Pipeline. Alternatively, gas produced from existing wells in the Tulare Formation would be transported by installing a new 12-inch to 16-inch diameter 3.5-mile pipeline extending from the SOX 2-3 facility east of SR 33 to the existing SOX 3-2 facility, terminating at the GP32 location. The proposed pipeline would be installed primarily aboveground on pipe supports. The pipeline would cross SR 33 and Seventh Standard Road using horizontal boring techniques.

The compressed, mixed stream from Del Sur would be further integrated with the balance of the Diatomite Produced Gas from the other Compressor Stations at sulfur oxide (SOX) 32. At SOX 32, total sulfur content would be reduced. After the sulfur is reduced, the treated gas is passed from the SOX 32 facility to the carbon processing facility within GP 32. The de-sulfurized stream would be then cooled and chilled to reduce water content and condense heavy hydrocarbons (C_{3+}).

Pre-C Facility. In the pre-C CO_2 capture and processing facility, the produced gas would be cooled, then passed through an absorber column where an absorbent chemically reacts with and binds about 90% of the CO_2. The rich absorbent carrying CO_2 is piped to the regenerator column, where through the application of heat, the CO_2 would be released and captured in relatively pure concentration. The CO_2 would then be compressed, dehydrated, removed of oxygen, and piped to the sequestration storage site. Following CO_2 release, the lean absorbent would be recycled back to the absorber column. The remaining natural gas would then be transferred to the steam generation facilities for use as fuel. Refer to Figure 5 for the proposed Pre-C Facilities Site Plan.

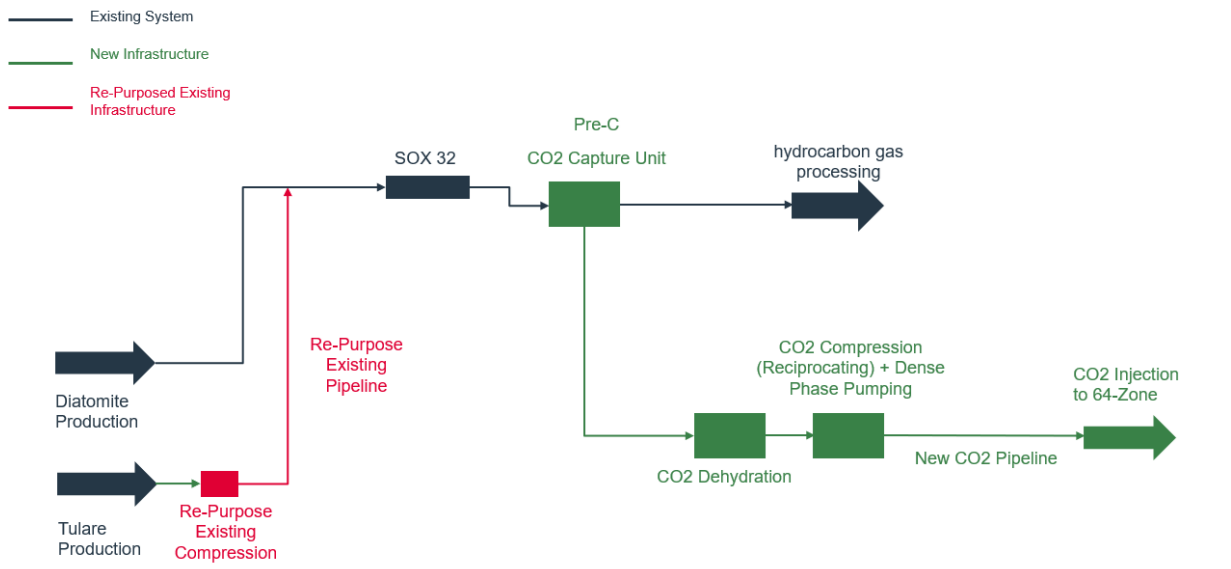

Figure 5. Use of Existing Infrastructure for Pre-C CO_2 Removal

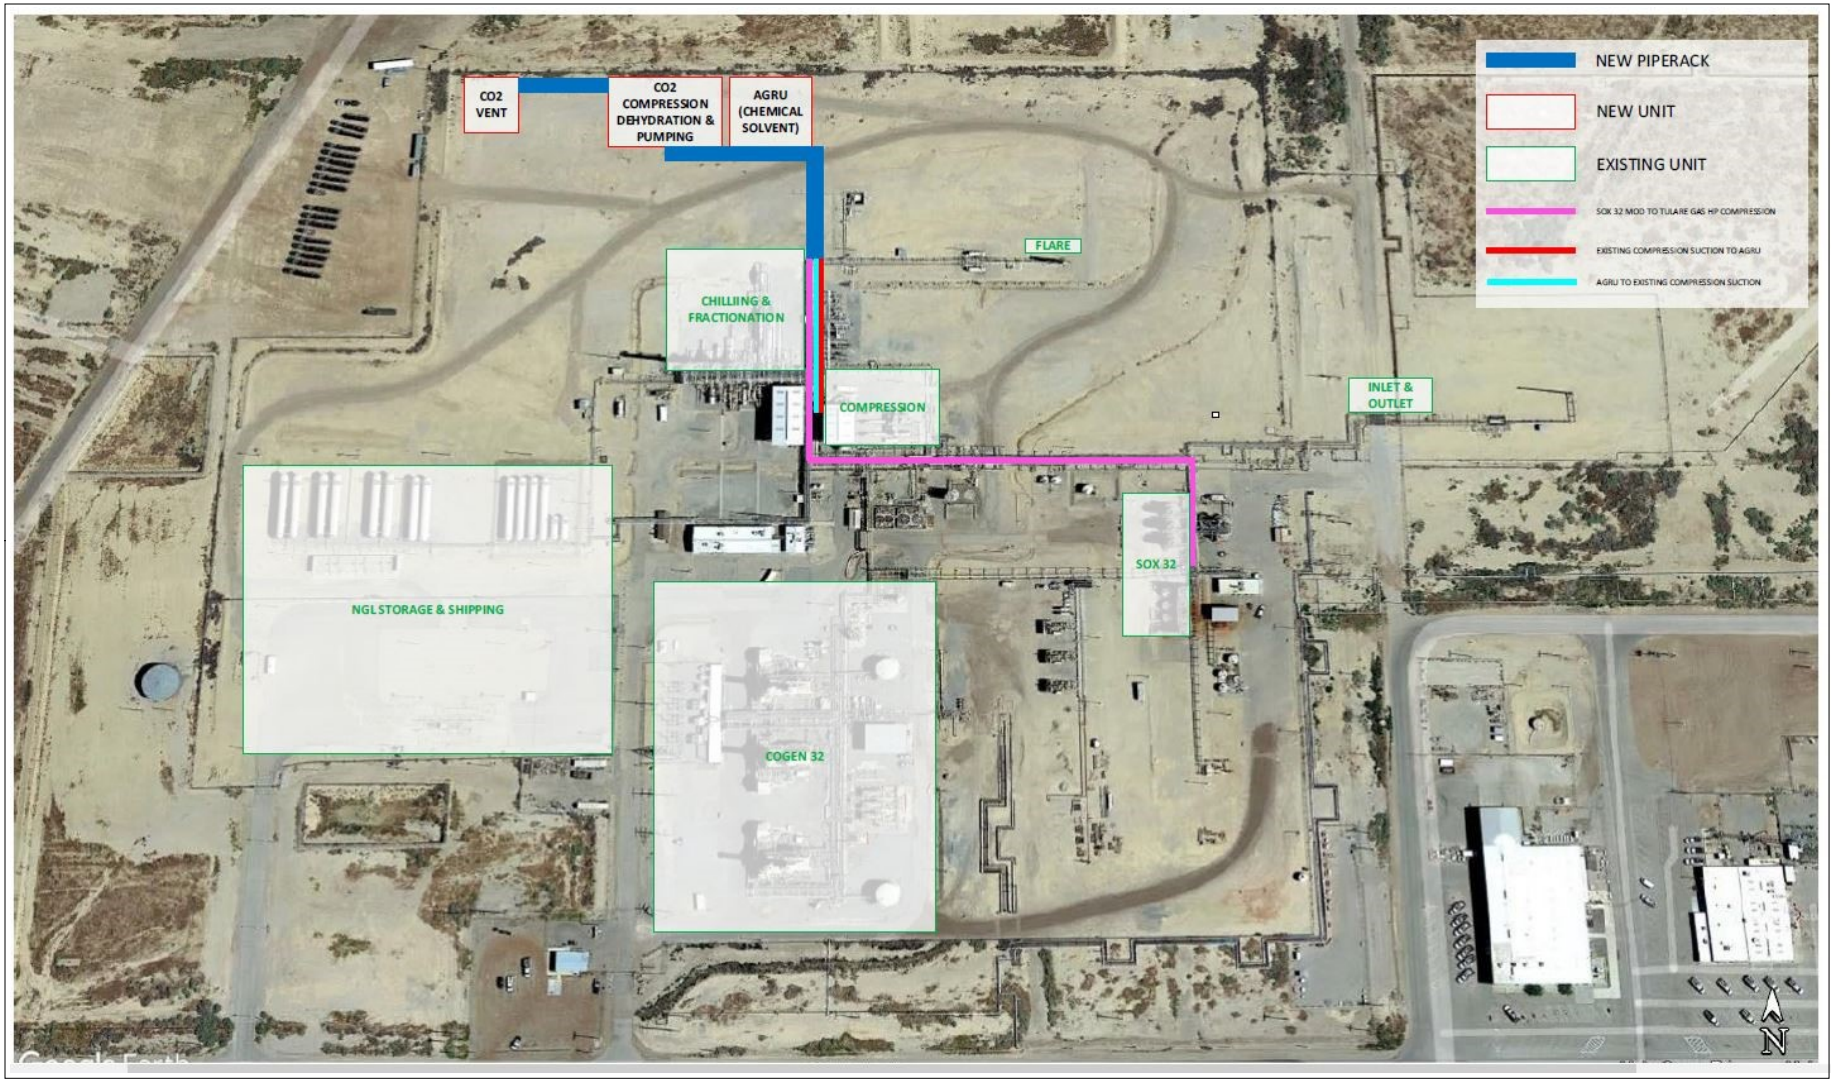
The Pre-C process would use the existing facility infrastructure of GP 32. The figure above also indicates what is part of the existing system and what would be new. Figure 6 below shows the CO_2 processing facility, denoting existing infrastructure and proposed infrastructure.



2.4.1.2 Post-Combustion Capture Facilities

Proposed CO_2 capture and processing facilities includes the separation, dehydration, compression, and cooling of CO_2 from flue gas emissions from existing stationary sources within South Belridge. A Post-C capture facility would be constructed at each of the three existing facilities: Cogeneration Facility (COGEN 32), SGS 2972, and SGS 2868. The flue gas emissions from each Post-C source would be ducted to its own CO_2 capture and processing facility.

In each of the three CO_2 capture and processing facilities, the flue gas would be cooled, then passed through an absorber column where an absorbent chemically reacts with and binds about 90% of the CO_2. The remaining flue gas (primarily oxygen, nitrogen, and the remaining uncaptured CO_2), would be vented to the atmosphere.

The rich absorbent carrying CO_2 is piped to the regenerator column, where through the application of heat, the CO_2 would be released and captured in relatively pure concentration. The CO_2 would then be compressed, dehydrated, removed of oxygen, and piped to the sequestration storage site. Following CO_2 release, the lean absorbent would be recycled back to the absorber column. The Post-C process would use the existing facility infrastructure of COGEN 32 at GP 32, SGS 2972, and SGS 2868. Figures 7, 8, and 9 below show the Post-C site plans including the proposed CO_2 processing facility (blue outline), proposed power line routes (yellow line), proposed CO_2 pipelines routes (black line), potential substation locations (purple outline), proposed steam line routes (green line), proposed water line routes (light blue line), proposed demolition sites (red shading), and existing infrastructure.

2.4.2 CO_2 Pipelines

Main Pipeline. A new 10-mile, 6- to 12-inch pipeline would be constructed primarily aboveground on pipe supports to deliver CO_2 from the capture facilities to the proposed injection wells. The above-ground pipeline sections would be constructed on metal pipeline supports. Each support would have a concrete foundation approximately 6- to 12-feet deep. The pipe would rest on the pipe supports, which would be spaced at approximately 20-foot intervals along the pipeline length. The pipeline would be primarily installed aboveground, except where the pipeline would cross main access roads within the oil field properties. The pipelines would be installed below ground at the main access road crossings. Where pipelines are placed below ground at internal access road crossings, the proposed pipelines would be installed using conventional trenching techniques. The new pipeline would use existing pipeline routes to the maximum extent feasible to minimize ground disturbance and impacts in the BSA.

Booster Pump Station. A new booster pump station may be constructed adjacent to the existing Compressor Station 49, at each of the post-combustion recovery sites, or at Gas Conditioning Facility 32.

Distribution Pipelines. Distribution pipelines approximately 4 to 8 inches in diameter would extend from the main pipeline to the proposed injection wells. The distribution pipelines would be primarily aboveground on pipe supports, except where the pipelines cross main access roads within the oil field. The pipelines would be installed below ground at the main access road crossings.

The above-ground pipeline sections would be constructed on metal pipeline supports. Each support would have a concrete foundation approximately 6- to 12-feet deep. The pipe would rest on the pipe supports, which would be spaced at approximately 20-foot intervals along the pipeline length. Where pipelines are placed below ground at internal access road crossings, the proposed pipelines would be installed using conventional trenching techniques. Where the pipelines cross public roads, the pipelines would be installed using jack-and-bore techniques.

2.4.3 Subsurface Wells

Two types of wells are associated with the proposed Project: CO_2 injection wells and monitoring wells. Each well type is described below. Non-active wells that would be plugged and abandoned as part of the Project are also discussed below.

Injection Wells. A total of nine injection wells would be utilized for the proposed Project, including four new injection wells and five existing wells that would be re-purposed for CO_2 injection, in compliance with USEPA UIC regulations. Injection Well Design documents were submitted to USEPA, which included the well specific construction details, procedures, design criteria, current and planned wellbore schematics, and well surveys for all planned Class VI CO_2 injection and monitoring wells.

Monitoring Wells. Five existing wells are proposed to monitor the CO_2 injection operations and ensure that the CO_2 injection remains within the 64 Zone reservoir. Monitoring wells neither produce nor inject fluids. Up to an additional three monitoring wells, locations to be determined, may be proposed, pending

further evaluation. Monitoring wells would be used to monitor temperature, pressure, fluid levels, acoustic signals, and for the collection of fluid and gas samples.

Corrective Action Wells. A total of 172 unique deep wellbores in the area of interest of North Belridge were identified from an exhaustive search of Aera Energy's drilling records, Aera Energy's internal database, and CalGEM's WellSTAR database. Of the 117 permanently abandoned wells, up to 40 would need to be re-abandoned. Up to 55 operational wells would need to be abandoned. Aera Energy would complete the well abandonments/re-abandonments using existing well abandonment crews as part of its baseline annual well abandonment program.

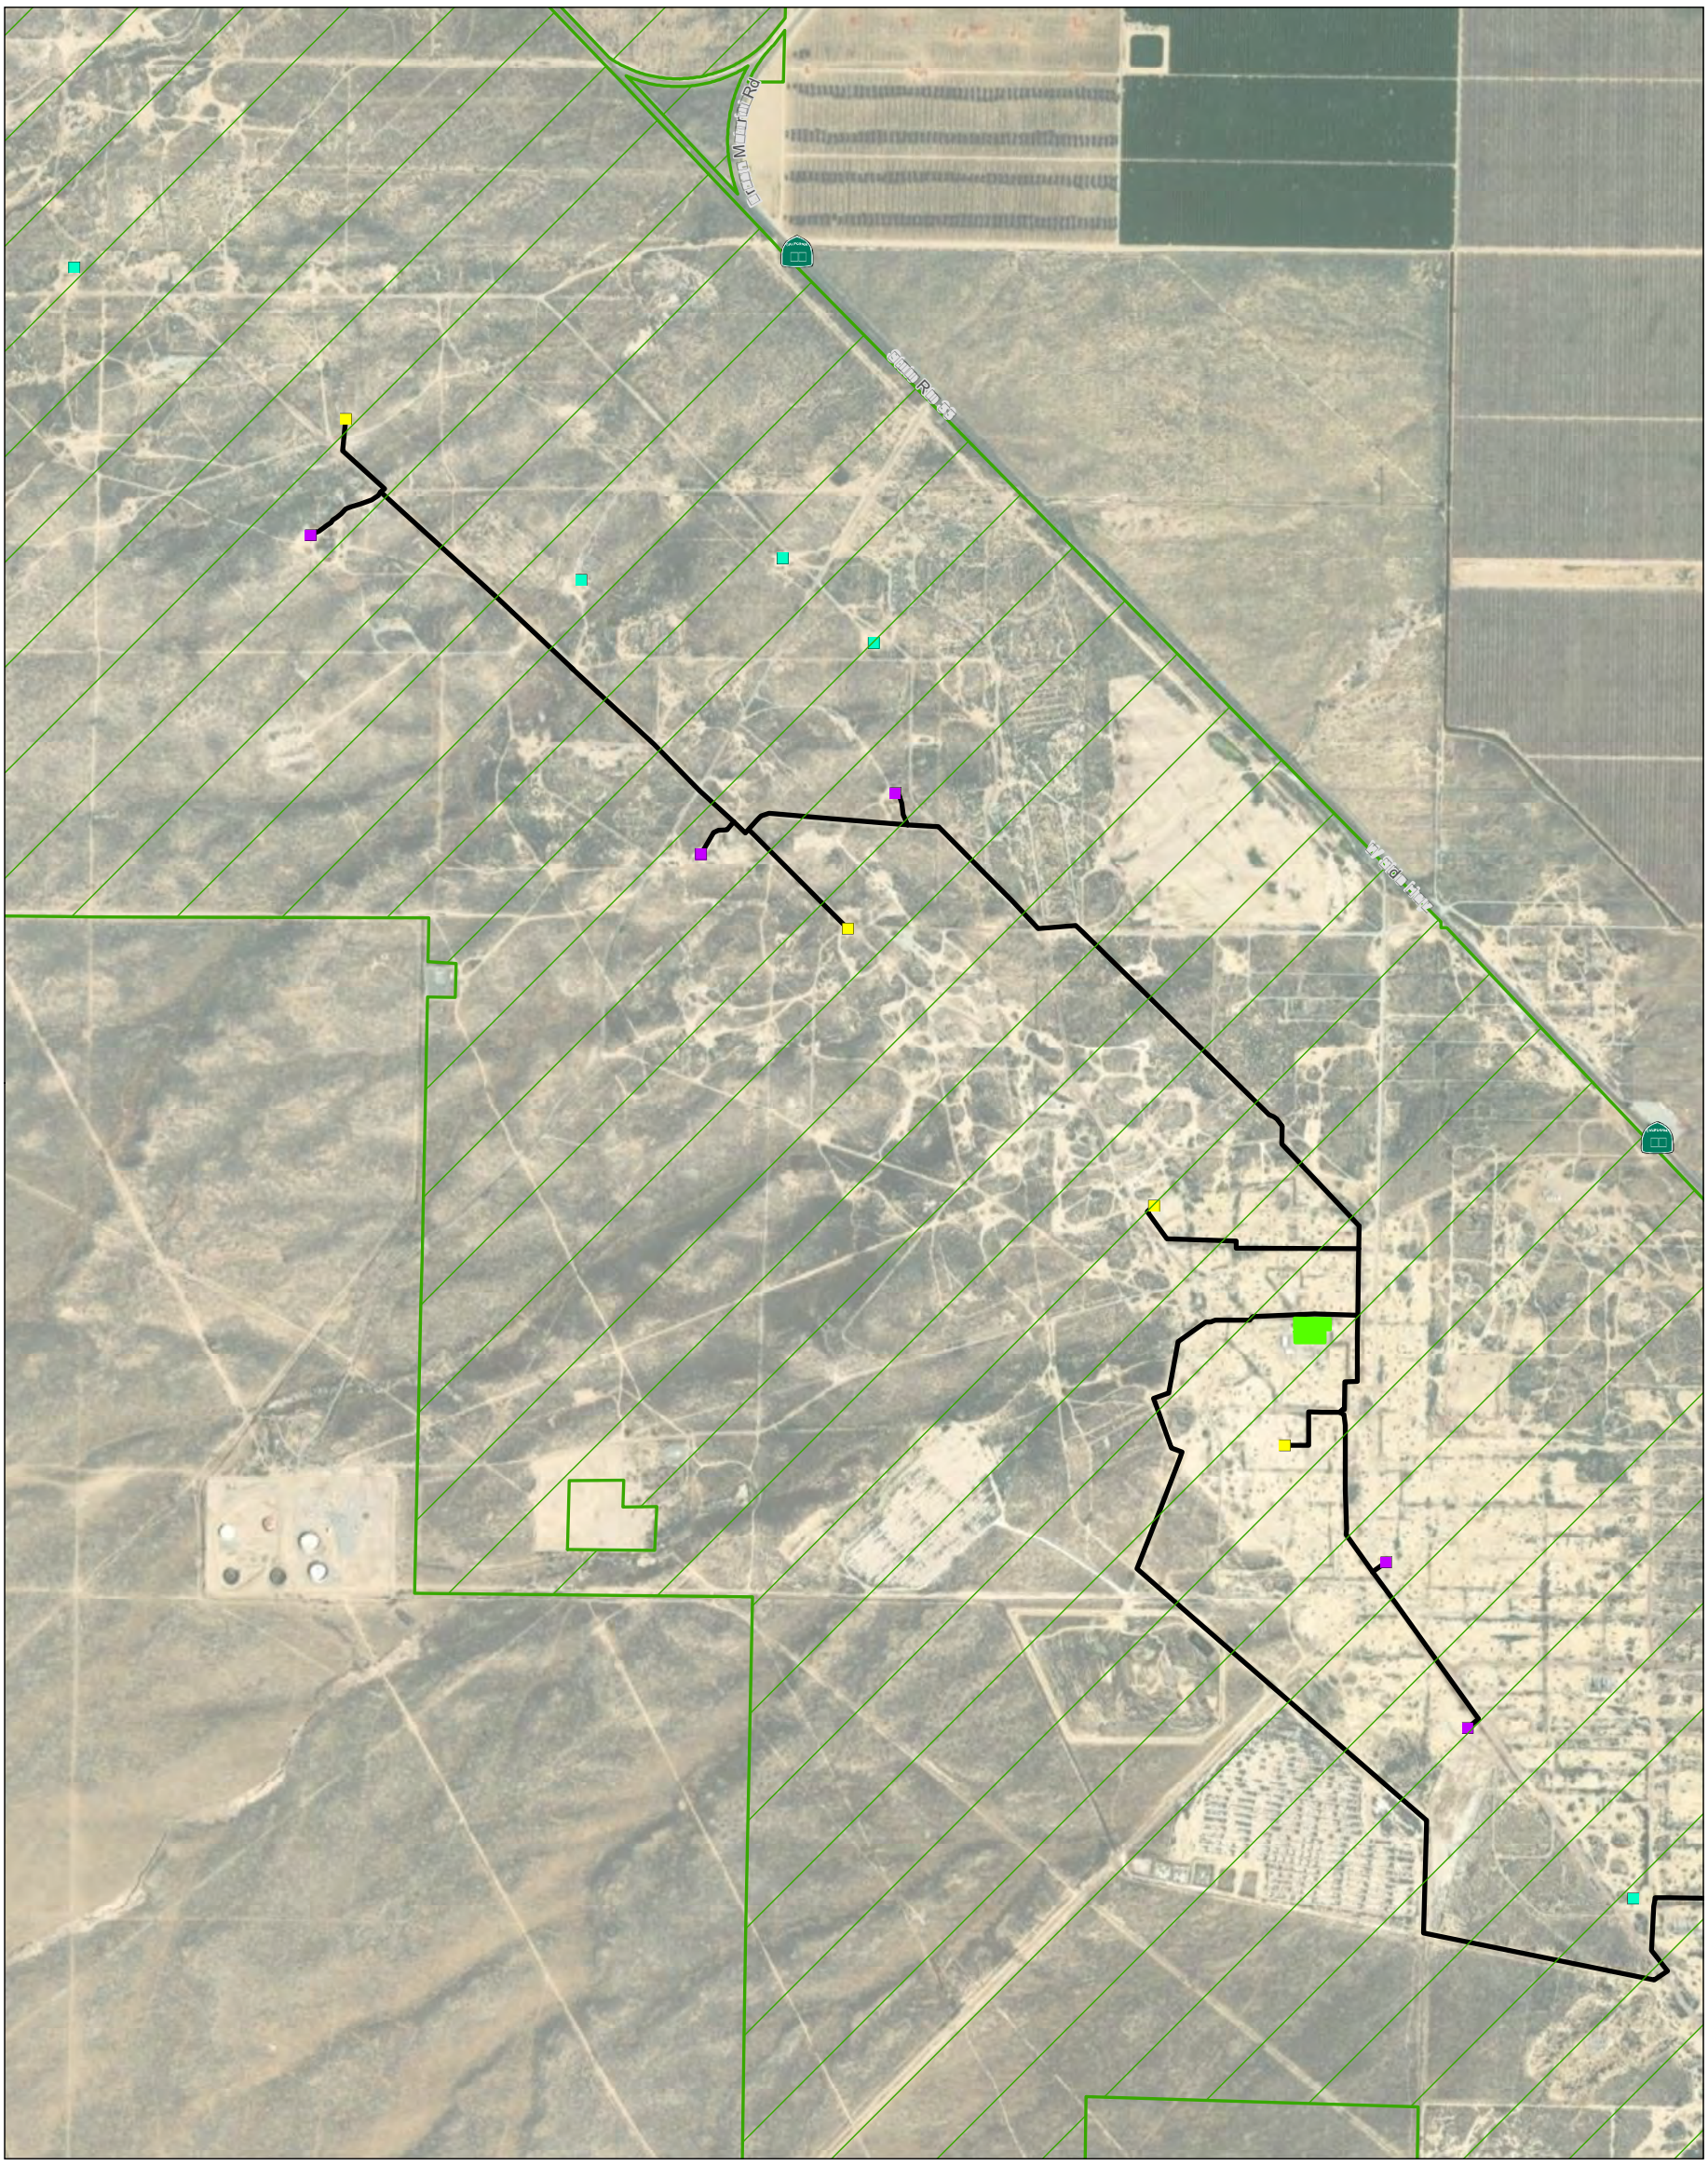

Table 1 below presents the listing of proposed injection and monitoring wells in the North Belridge Oil Field. Refer to Figure 10 for the proposed injection and monitoring well locations in the BSA.

Table 1. Injection and Monitoring Wells

Title

Proposed Injection and Monitoring Well Locations

Notes

1.
2.
3.

In addition to the construction and conversion of wells, 21 wells within the SGS 2868 and SGS 2972 areas would be plugged and abandoned. For the locations of GP 32, SGS 2972, SGS 2868, Compressor Station 49, and other Project infrastructure within the BSA, refer to Figure 11.

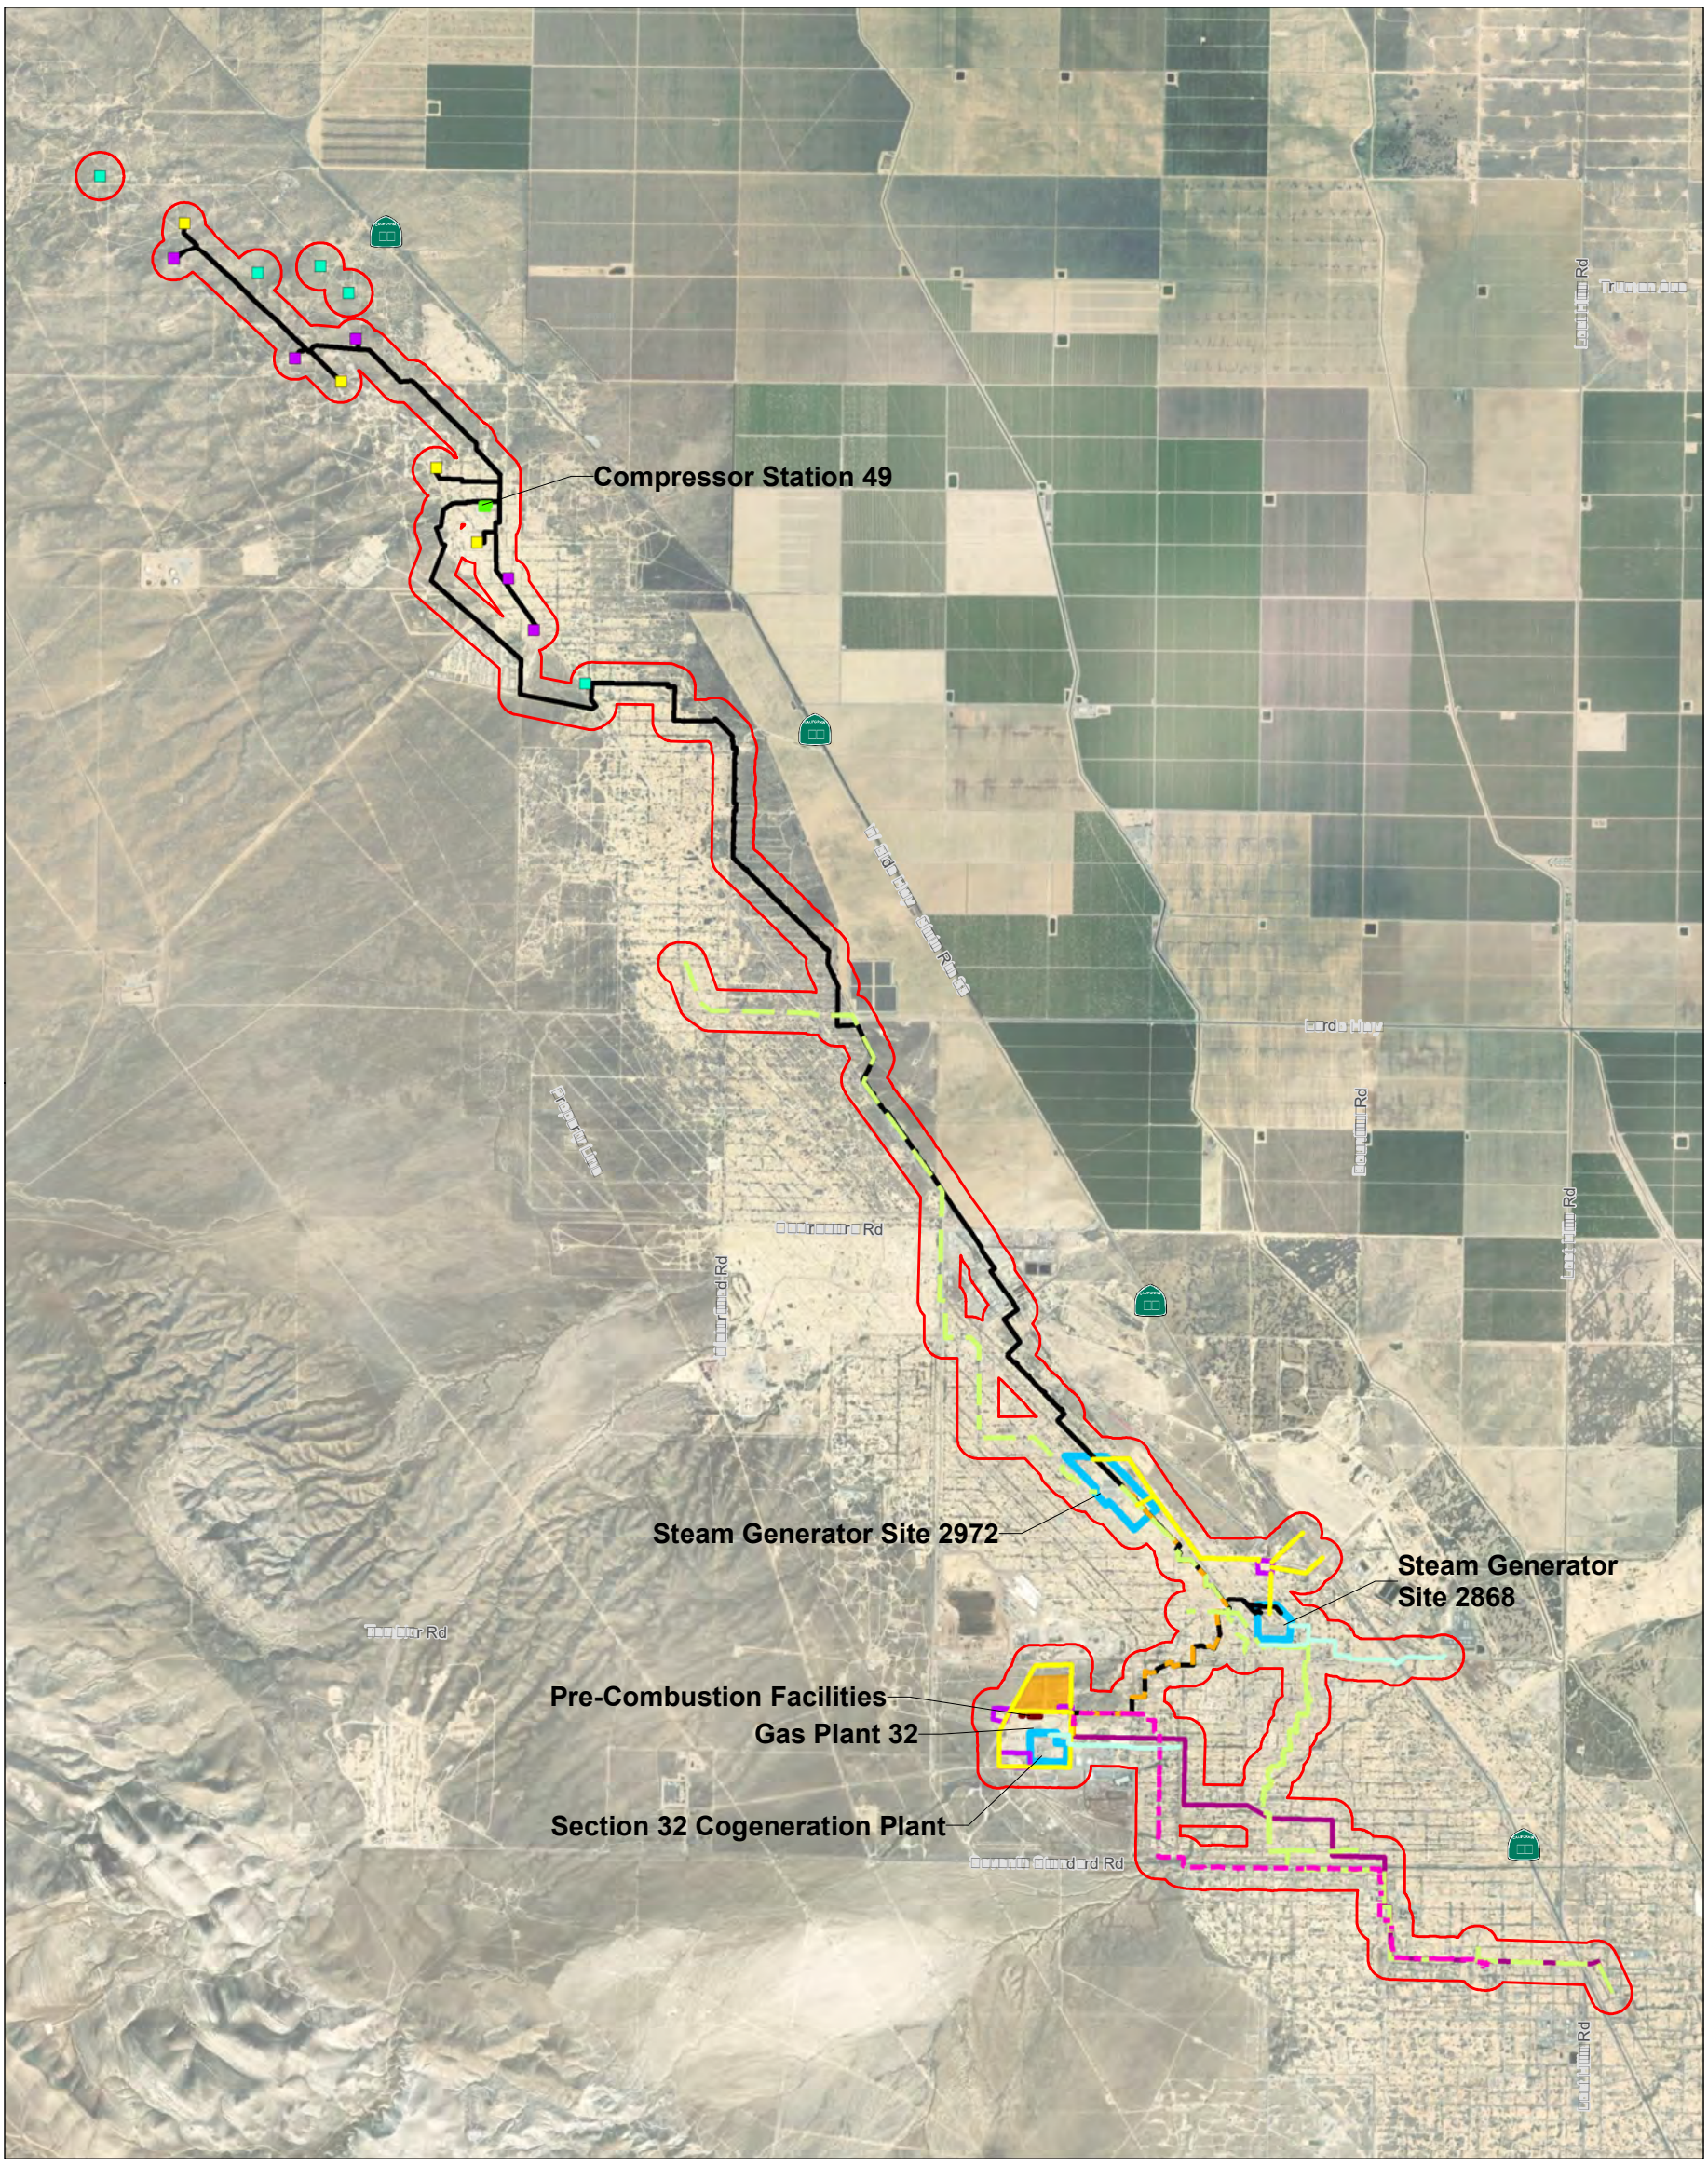
2.4.4 Field Systems

The proposed Project would include the installation of a system of onsite intra-field gathering and distribution lines for various co-located services, including steam distribution within South Belridge, water treatment facilities, source water gathering, produced gas distribution, softened water transfer, separated produced gas distribution, and installation of communication networks. Where pipelines are placed below ground at internal access road crossings, the proposed pipelines would be installed using conventional trenching techniques. Where the pipelines cross public roads, the pipelines would be installed using a combination of trenching and jack-and-bore techniques.

The field gathering and distribution system has been designed to monitor CO_2 injection operations and locate pipeline corridors on raised pipe supports to minimize external corrosion. Construction sequencing and timing for field systems would be concurrent with other additions and improvements to the existing oil field facilities.

One of the Project objectives is to reduce the carbon intensity of Aera Energy's produced oil and gas. Steam pipelines would be installed to distribute steam from the SGS 2972 and SGS 2868 sites to areas of the field where steam is currently generated without CO_2 capture. These new steam lines would allow Aera Energy to prioritize generating and supplying steam from the SGS 2972 and SGS 2868 sites with CO_2 capture. The steam lines would be constructed of pipeline in sizes ranging from 6- to 14- inches in diameter. The additional pipelines would be routed along access roads on raised pipe supports to minimize external corrosion. Where pipelines are placed below ground at internal access road crossings, the proposed pipelines would be installed using conventional trenching techniques. A total of approximately nine miles of new steam pipelines would be installed as part of the proposed Project.

2.4.5 Support Infrastructure



2.4.5.1 Buildings

The Project would utilize existing buildings, as well as new control rooms at the SGS 2972 and SGS 2868 capture facilities. During construction, and as needed during Project operational periods, temporary modular buildings may be used to provide any required offices space, meeting space, and storage space.

2.4.5.2 Domestic Water and Septic Systems

Existing available domestic water and septic systems are available at existing buildings. New domestic water from Aera Energy's existing groundwater wells located in the Buena Vista Water Storage District would be supplied to the two new control rooms. New septic systems or holding tanks would be installed at the new control rooms.

Compressor Station 49
Steam Generator Site 2972
Steam Generator Site 2868
Pre-Combustion Facilities
Gas Plant 32
Section 32 Cogeneration Plant

□□□

2.4.5.3 Emergency Systems

Aera Energy has developed an Emergency and Remedial Response Plan (ERRP) specifically tailored to the proposed CO_2 operations for the Project. The ERRP describes actions that Aera Energy would take to address movement of the injection fluid or formation fluid in a manner that may endanger an underground source of drinking water (USDW) during the construction, operation, or post-injection site care periods for the proposed Project. The Plan is intended to meet the requirements of 40 Code of Federal Regulations (CFR) 146.94 Emergency and Remedial Response.

In some cases, particularly where life threatening safety is involved, Aera Energy would immediately cease injection. However, in some circumstances, Aera Energy would, in consultation with the UIC Program Director, determine whether gradual cessation of injection would be appropriate.

Control systems would be installed on individual injection and monitoring wells to monitor system performance and subsurface conditions. In the event of an emergency, Aera Energy operators would remotely activate closure of an emergency shutdown valve on the flowline from that well or for the entire pipeline system. The emergency shutdown valve protects the distribution system and other downstream pressure piping from overpressure. In the event of a system shutdown, the CO_2 may be vented to the atmosphere to protect against damage to facilities, pipelines, and wells.

2.4.5.4 Water Systems

The proposed Project would require, on average, up to approximately 1,223 acre feet per year (afy) (26,000 barrels [bbls] of water per day [BPD]) for use in the CO_2 capture facilities for approximately 20 years of operation. The proposed Project would primarily use produced water from the South Belridge Oil Field. Fresh water would be minimally used as potable water to control rooms, fire/emergency supply as needed, facility housekeeping, and only used in the process if sufficient water is allocated under Aera Energy's water rights. Water treatment facilities would be installed at the CO_2 capture facilities to treat produced water.

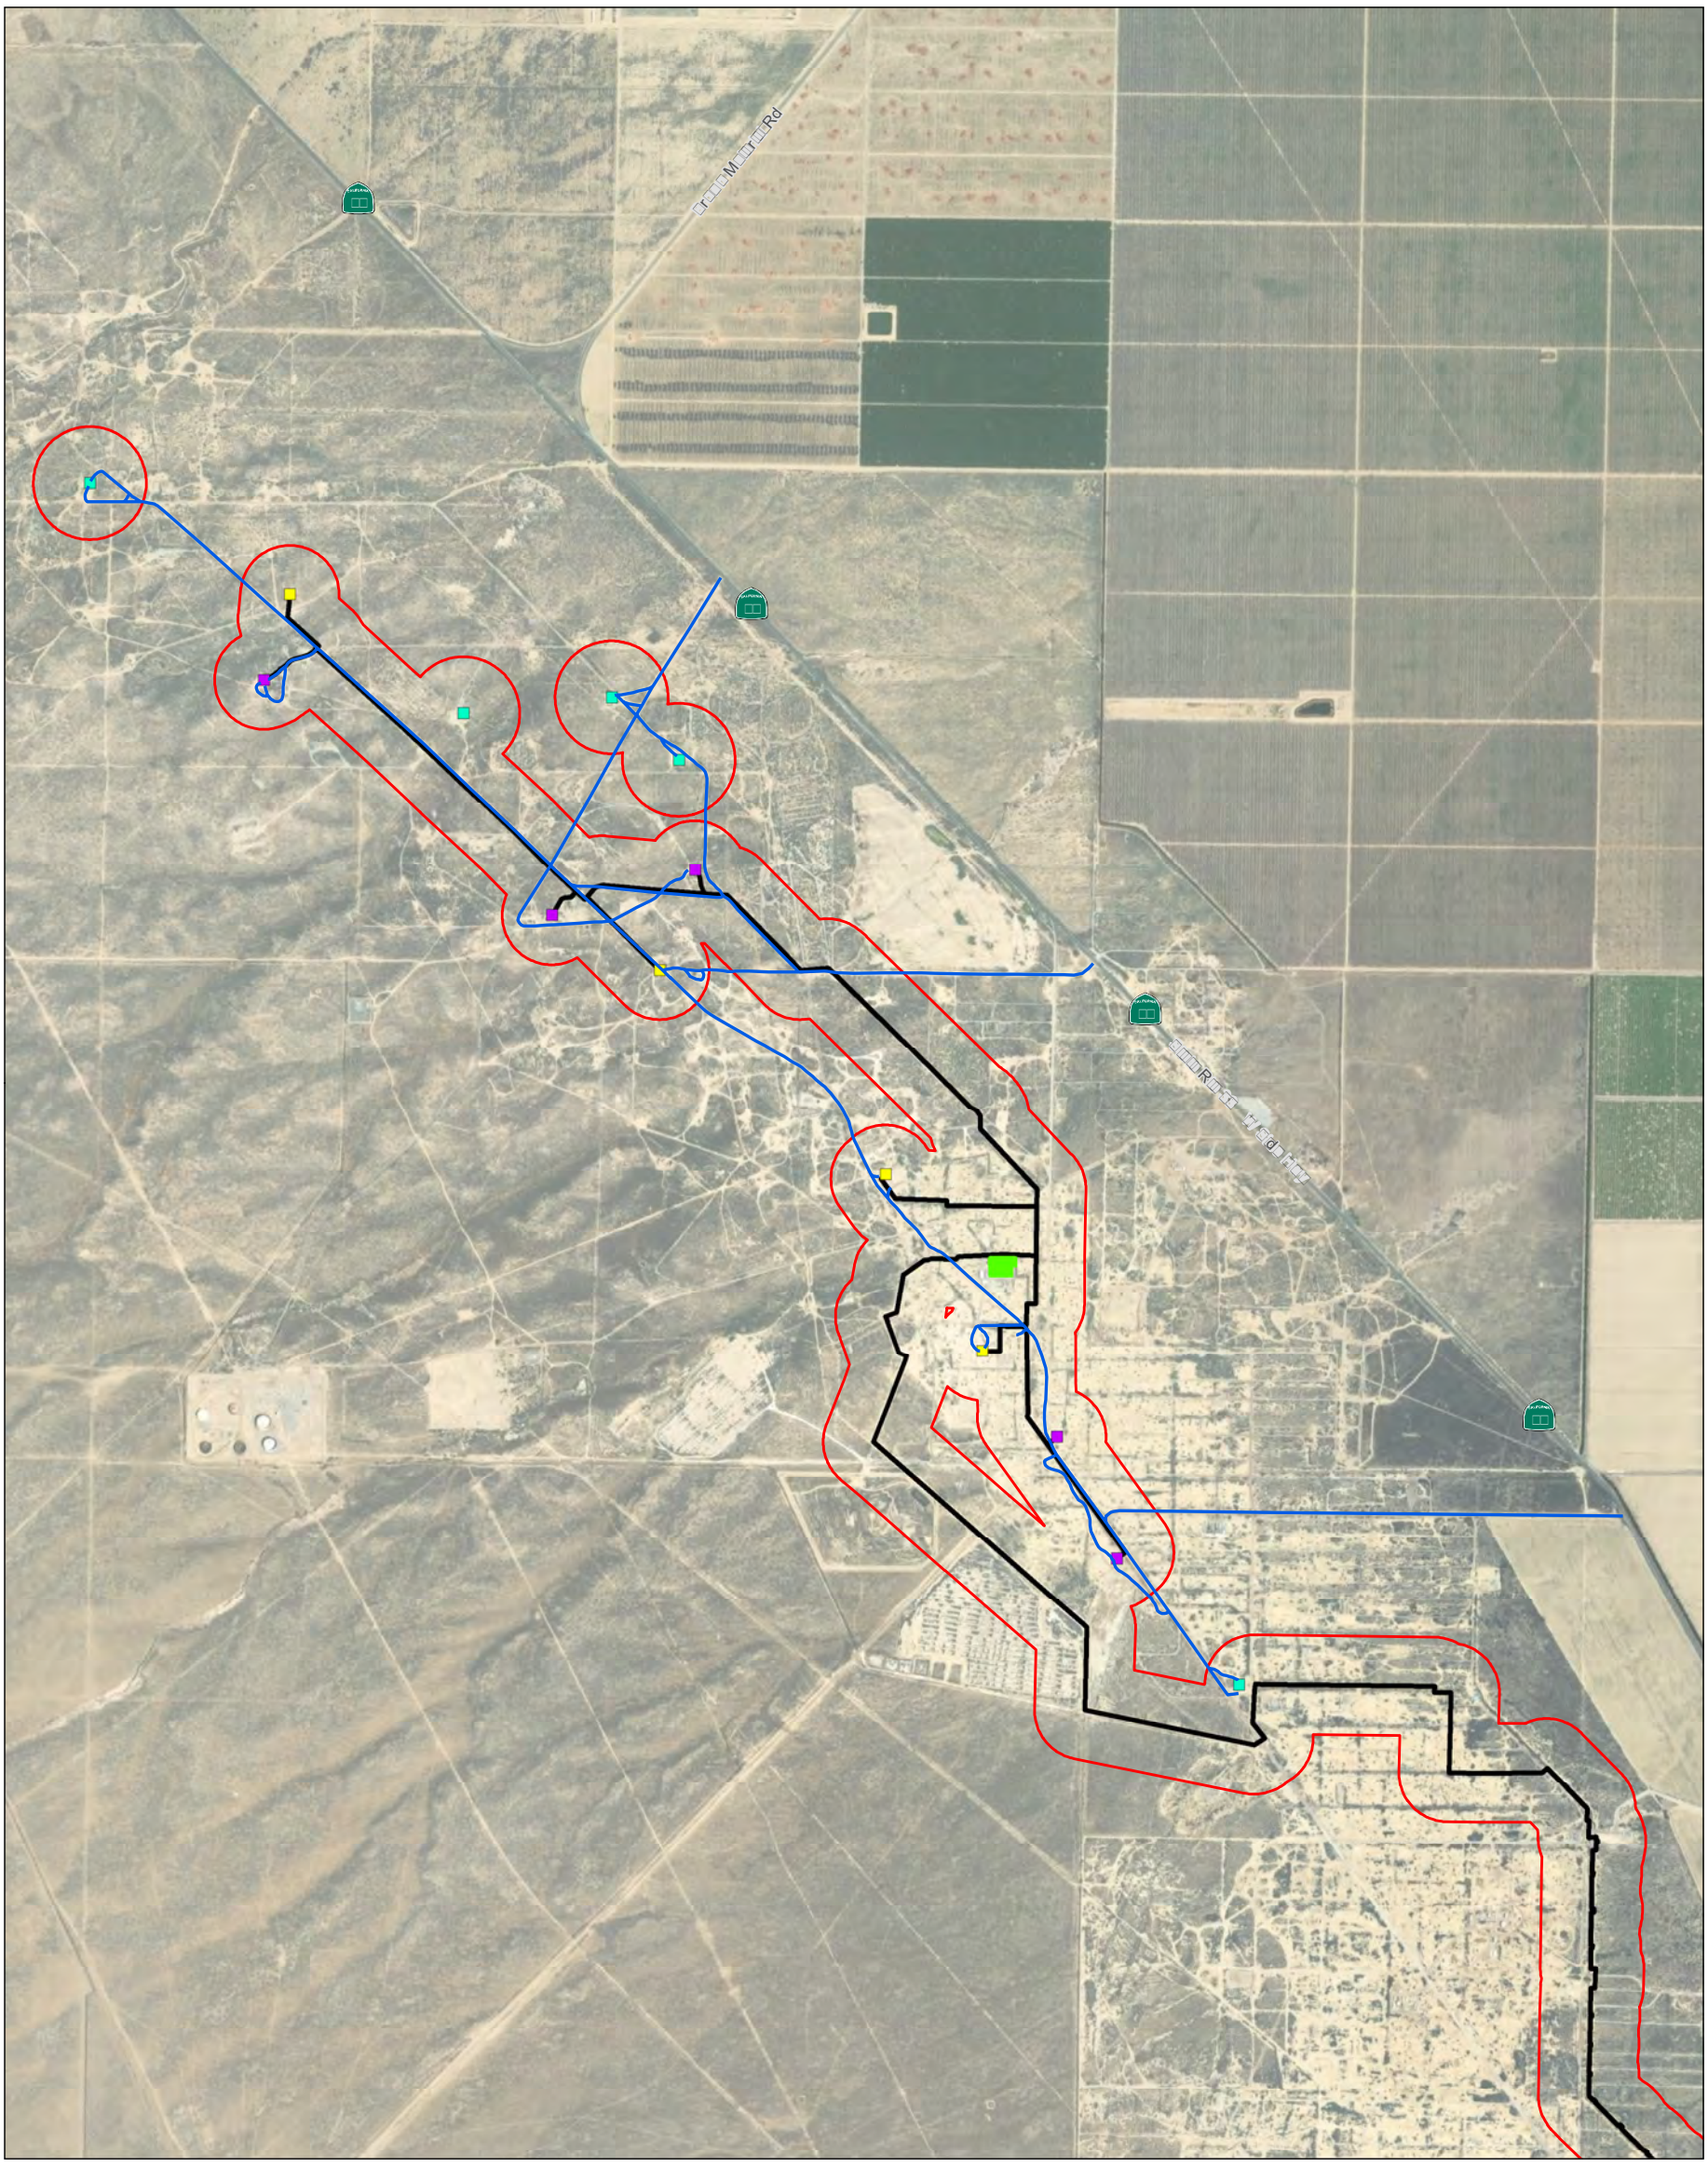
2.4.5.5 Access Roads

CO_2 capture facilities would be constructed immediately adjacent to the existing COGEN 32 and GP 32 facilities in the South Belridge Oil Field. The CO_2 facilities would be accessible by Main Camp Road, either from Oasis Road off Seventh Standard Road or directly from Seventh Standard Road.

Access roads within the South Belridge Oil Field would be improved (Figure 12) to allow for safe and efficient delivery of equipment to the carbon capture facility sites during the construction period and for ongoing maintenance and operating activities after start-up. Existing access roads within the North Belridge would be utilized to provide access for pipeline and well construction. The road would be repaired as needed to allow for safe and efficient access.

2.4.6 Utilities and Communications

2.4.6.1 Electrical Transmission Power Line Interconnection



The existing facilities in the BSA are currently being served from Pacific Gas and Electric's (PG&E's) distribution system via existing substations. Power supplied by COGEN 32 is backed up by standby electrical service interconnection from PG&E. The Project would require transmission-level service interconnection as load demand increases. The expected maximum electric load of the Project is approximately 49 megawatts, via Aera Energy -owned equipment, to power all facility processing, pumps, maintenance, monitoring, control, and communication systems. Therefore, the proposed Project would include the construction of an Aera Energy -owned 115 kV transmission power line interconnection as well as two Aera Energy -owned 115 kV/12 kV substations. Additional improvements to off-site PG&E substations may also be necessary; however, those potential improvements have not been specified at this time.

Aera Energy's project includes two transmission lines to serve the CO_2 capture facilities; 1) an approximate 0.46-mile overhead transmission power line interconnect from Aera Energy's existing 115 kV power line along SR-33 to a new onsite Aera Energy-owned 115/12 kV substation; and 2) an approximate 0.8-mile overhead transmission power line interconnect from Aera Energy's existing 115 kV power line along Hill Road within the South Belridge Oil Field to a new on-site Aera Energy-owned 1225/12 kV substation adjacent to GP 32. The 115 kV power line would be constructed, operated, and maintained by Aera Energy. Pending final design of the electrical transmission line, improvements and modifications may also be required at the existing PG&E-owned substations within the South Belridge Oil Field. Work at existing PG&E-owned substations is expected to occur within the existing substation properties.

Interconnection of the proposed Aera Energy -owned 115/12 kV substations to the existing electric transmission grid would require construction of new 115 kV power line tap from the 115 kV power lines. Although design is preliminary, the Project would be supported by up to approximately 17 wooden poles spaced every 400 feet. The wooden poles would be embedded approximately six feet deep.

The substation would consist of incoming metering and switching equipment, transformers, and protective equipment to monitor and provide protection for the various circuits providing power to the new equipment. The incoming 115 kV power line would come into the Aera Energy -owned substations via overhead aluminum conductors terminating on an A-frame structure. Following the A-frame is the high voltage circuit breakers that protect the facility from over and under voltage conditions, as well as fault conditions (abnormal electric current) that may develop along the system.

M□□□□Rd
Rd

□□□□

2.4.6.2 Electrical Distribution

Electrical power would be supplied from Aera Energy's 115 kV distribution system and would include new distribution lines to two new 115kv/12kV electrical substations. From the substations, new 12kV distribution lines would supply power to power distribution centers adjacent to each of the CO_2 capture facilities. The power distribution centers would include disconnects, breakers, transformers, and motor control centers. Electrical power from the motor control centers would be connected to the motor and lighting loads within the CO_2 capture facilities.

Electrical power to the field loads would run on a 12 kV primary/480-volt secondary overhead power distribution system. Pole or pad-mounted transformers would be located at the booster station and other ancillary facilities. Additionally, electrical power drops would be provided to each injection and monitoring well using nearby 12kV overhead electrical service.

2.4.6.3 SCADA Networks

A SCADA network is a control system comprising of computers, networked data communications and a graphical user interface for high-level supervision of processes. The Project would utilize a SCADA network for normal operation of CO_2 processing, pipeline, and injection equipment. Some individual equipment may also include programmable logic controllers. The distributed control system and programmable logic controllers would control equipment and processes and provide data on process conditions and performance. When applicable, distributed control system and programmable logic controller communication would utilize fiber optic networks.

Process control and monitoring stations would be in each of the CO_2 capture facilities. The monitoring and control stations would be configured to provide data and status information to assist operators to quickly identify and resolve issues. Field measurement and control equipment would be configured to be monitored and operated both locally and from the central processing facility control building. In the event of a serious out-of-normal-range condition, the distributed control system and local equipment programmable logic controllers would be programmed to safely shutdown equipment and processes.

2.4.6.4 Injection Monitoring Systems

Each monitoring well would be equipped with downhole monitoring equipment which would include pressure and temperature gauges and, on select wells, may also include fiber optic distributed temperature sensors (DTS) and/or distributed acoustic sensors (DAS). Pressure and temperature gauge lines would be strapped to the outside of the tubing for data transmission to surface for data collection and monitoring. In addition to logs, downhole samplers can be run through the tubing to recover fluid samples from the reservoir. The internal diameter of the tubing planned for injection wells is sized for the planned injection rate.

2.5 CONSTRUCTION PROCEDURES

This section describes the construction of the Project components discussed above in Section 2.4 (Proposed Project Components). The Project is proposed to be implemented in phases to maximize efficiency and help moderate construction activity levels. Most of the processing facility construction would occur over a three year time period, expected to start in 2025 after the applicable permits are issued.

CO_2 capture facility and infrastructure construction would occur for approximately three years, starting with the Pre-C facility construction at GP 32. Sequential construction would occur for construction of the Post-C facilities located at COGEN 32 and the two steam generator settings. Injection well pad construction, drilling and plugging and abandonment activities, and pipeline construction activities would begin concurrently with the start of facility construction. Installation of CO_2 distribution pipelines, installation of intra-field electrical distribution, water treatment facilities and pipelines, and well hookups would occur throughout the three year period.

2.5.1 Grading and Site Disturbance

The Project would require minor grading of the proposed CO2 capture facilities, totaling approximately 40 acres, most of which is previously disturbed area. The Project would maximize the use of existing roads, well pads, and cleared areas wherever possible. Proposed cut and fill volumes are approximately 203,000 cubic yards total. Each well pad would be approximately 145 feet by 280 feet in area. Each well pad would be cleared of vegetation and leveled to prepare it for well drilling. Any excess spoils would be transported to a designated fill location within the Project footprint for re-use as fill material or moved off-site to an appropriate soils disposal or reuse facility.

Additional ground disturbance would occur for construction of the utilities component of the Project including water pipelines and overhead power lines. The estimated disturbance from the Project pipelines would be minimized as most would be located aboveground, placed on existing and new pipe supports and along existing pipeline corridors. The estimated ground disturbance for the 115 kV and 12 kV power line would be approximately 2.1 acres. Refer to Table 2 below for a summary of the proposed Project's Site Disturbance Area. Note that some disturbance areas overlap. Refer to Table 5 for specific habitat impact area calculations.

Table 2. Site Disturbance Area

Project Component	Temporary Disturbance Area (acres)	Permanent Disturbance Area (acres)	Grading Volume (cubic yards)[a]
Pre-C Capture Facility (GP 32)	2	2	7,000
Post-C Facility at SGS 2868	12	9.6	39,000
Post-C Facility at SGS 2972	16	14	52,000

Project Component	Temporary Disturbance Area (acres)	Permanent Disturbance Area (acres)	Grading Volume (cubic yards)[a]
Post-C Facility at COGEN 32	9.7	9.7	32,000
Booster Pump Station	0.5	0.5	1,600
Injection Well Pads (9 total)	8.5	8.5	27,500
Monitoring Wells (9 total)	8.5	8.5	27,500
CO_2 Pipelines (15.8 mi.)	95.8	9.6[b]	NA
Gas Lines (5.1 mi.)	22.5	2.3[b]	NA
Water Lines (4.2 mi.)	21.4	2.1[b]	NA
Steam Lines (7 mi.)	42.5	4.3[b]	NA
Electrical Lines (1.3 mi.)	2.1	1	NA
Electrical Substations (2)	5	5	16,200
Staging Area	25	25	NA
TOTALS:	272[c]	102[c]	203,000

Notes:

[a] Assumes two feet of over-excavation and re-compaction.

[b] Assumes 5-foot wide permanent disturbance for above-ground piping.

[C] Some disturbance areas over-lap. Refer to Table 4 for Impact Area calculations.

NA – Not applicable

Some pipelines are co-located.

2.5.2 CO2 Capture and Processing Facilities

2.5.2.1 Removal and Demolition of Existing Facilities

The proposed CO_2 capture facility areas currently contain piping and other idle equipment that would be removed, and wells that would be permanently abandoned, prior to construction of the proposed facilities. There is some debris from former operations, such as broken concrete, in scattered locations throughout the Project footprint. Debris would be reused or recycled to the extent feasible. Five shipping pumps, two water tanks, two electrical transformers, a water heater, an electrical panel, and one moisture separator

would be removed or demolished on the land north of GP 32; all equipment is out of service. Demolition of various oil production facilities (old pipeline) and equipment (a production header) would occur on approximately nine acres of land around SGS 2868. Miscellaneous rubble piles would also be cleared. Demolition of various oil production facilities (including old foundations and pipeline) and equipment would occur around SGS 2972.

The proposed CO_2 capture facility areas also contain abandoned structures that would be demolished prior to construction of the proposed facilities. Demolition of a sulfur treatment facility, maintenance shed, old equipment yard, and a building would occur on approximately 1.5 acres of land at GP 32. The to-be-demolished building holds a former Control Room, Lab, Conference Room, and associated offices. The old equipment yard currently stores three gas compressors and five cylindrical gas tanks, which would be relocated prior to demolition. One storage building would be demolished on the land northeast of GP 32.

2.5.2.2 Processing Facilities Construction

Grading for the CO_2 capturing facilities would occur over an approximate 3-year construction period and would require approximately 40 total acres of disturbance on areas with pre-existing disturbance. The following outlines construction procedures associated with grading and installation of the processing facilities:

- **Environmental Survey**. Pre-activity biological surveys would be completed prior to initiating work.
- **Staging.** Material and equipment would be gathered on-site;
- **Inspection.** Material and equipment would be inspected for quality assurance. Construction equipment would be verified to meet applicable environmental regulations. Equipment operators and field workers would be verified to possess the proper qualifications;
- **Civil.** Soil would be graded and excavated. Concrete equipment foundations, pipe supports, pads and containment would be poured;
- **Equipment.** Major vessels and equipment would be set on foundations;
- **Supports.** Pipe supports would be installed;
- **Plant Piping.** Piping, valves, and instrumentation would be installed between equipment and vessels. Welds would be radiographed and connections strength tested;
- **Electrical.** Electrical panels, conduit, and power wiring would be installed;
- **Instrumentation.** Instrumentation signal wiring and tubing would be installed. Terminations would be made at the instrumentation and connections would be tested;
- **Corrosion Control.** Piping and non-galvanized structural steel would either be insulated or primed and painted. Buried steel piping would be coated or wrapped with protective coatings. Cathodic protection would be used in certain areas to protect buried steel piping from external corrosion. Insulating kits would be used to protect buried steel piping from external corrosion. Insulating kits would be used to isolate above-ground from buried piping;
- **Start-Up Preparation.** All valves and instrumentation would be put in normal operating positions/modes for start-up. All safety devices would be checked for proper operation;
- **Personnel Training.** Operators, mechanics, and instrument mechanics would be trained to operate and maintain the facilities;
- **Start-Up.** Plant would be started and tested for proper operation. Any problems or issues would be resolved; and

- **Operation.** Normal operation would commence.

2.5.2.3 Removal and Demolition of Existing Facilities

The proposed CO_2 capture facility areas currently contain piping and other idle equipment that would be removed, and wells that would be permanently abandoned, prior to construction of the proposed facilities. There is some debris from former operations, such as broken concrete, in scattered locations throughout the Project footprint. Debris would be reused or recycled to the extent feasible. Five shipping pumps, two water tanks, two electrical transformers, a water heater, an electrical panel, and one moisture separator would be removed or demolished on the land north of GP 32; all equipment is out of service. Demolition of various oil production facilities (old pipeline) and equipment (a production header) would occur on approximately nine acres of land around SGS 2868. Miscellaneous rubble piles would also be cleared. Demolition of various oil production facilities (including old foundations and pipeline) and equipment would occur around SGS 2972.

The proposed CO_2 capture facility areas also contain abandoned structures that would be demolished prior to construction of the proposed facilities. Demolition of a sulfur treatment facility, maintenance shed, old equipment yard, and a building would occur on approximately 1.5 acres of land at GP 32. The to-be-demolished building holds a former Control Room, Lab, Conference Room, and associated offices. The old equipment yard currently stores three gas compressors and five cylindrical gas tanks, which would be relocated prior to demolition. One storage building would be demolished on the land northeast of GP 32.

2.5.2.4 Proposed Grading and Site Development

The Project would require minor grading of the proposed CO_2 capture facilities, totaling approximately 40 acres, most of which are previously disturbed areas. The Project would maximize the use of existing roads, well pads, and cleared areas wherever possible. Proposed cut and fill volumes are approximately 203,000 cubic yards total. Well pads would be approximately 145 feet by 280 feet in area. Each well pad would be cleared of vegetation and leveled to prepare it for well drilling. Excess spoils would be transported to a designated fill location within the Project footprint for re-use as fill material or moved off-site to an appropriate soils disposal or reuse facility.

Additional ground disturbance would occur for construction of the utilities component of the Project including water pipelines and overhead power lines. The estimated disturbance from the Project pipelines would be minimized as most would be located aboveground, placed on existing new pipe supports and along existing pipeline corridors. The estimated ground disturbance for the 115 kV and 12 kV power line would be approximately 2.1 acres.

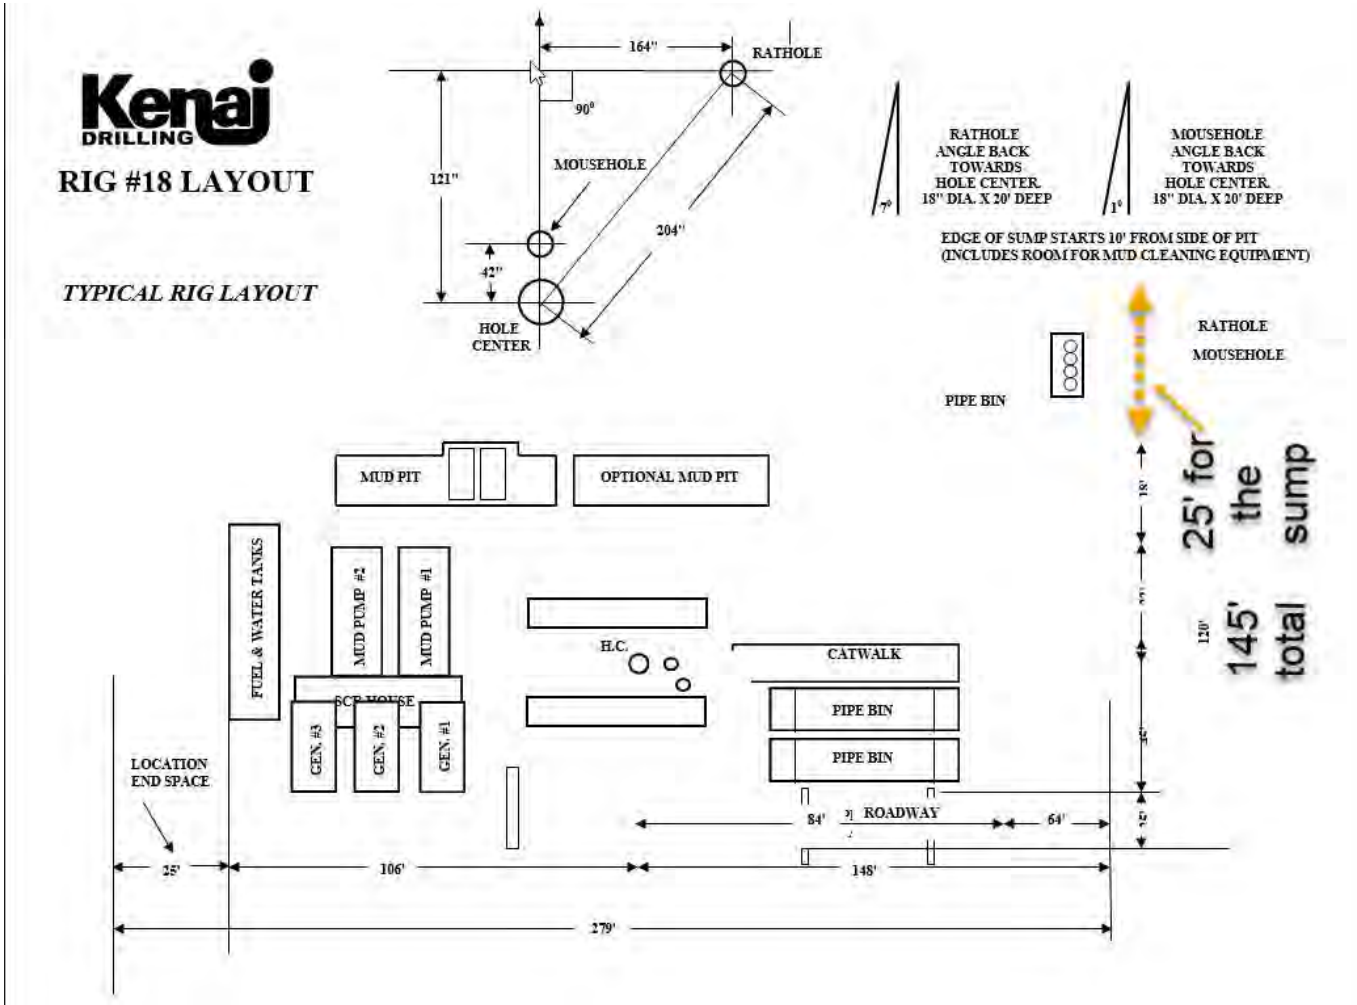
2.5.3 Well Construction, Drilling, Completion, and Decommissioning

The proposed Project includes re-purposing five existing oil wells and drilling four new wells to use for CO_2 injection activities. Additionally, five existing wells would be converted to monitoring wells to monitor the CO_2 plume.

2.5.3.1 Well Pads and Roadways

Well locations have been carefully selected to minimize disturbance by reusing existing well pads, where feasible, and to allow for the permanent CO_2 sequestration within the dedicated zone. Well pads have been designed to minimize the amount of surface disturbance while meeting the technical constraints of drilling and operating the wells. Areas within the designated well pad area would be cleared of all vegetation and other deleterious material utilizing heavy equipment. The proposed wells would be constructed on existing well pads; however, these pads may need to be cleared of encroaching vegetation or enlarged to meet Project requirements. Earthwork would be completed utilizing conventional equipment (e.g., dozers, loaders, scrapers, motor graders, excavators, sheep's foot compactors, smooth drum rollers, water trucks. etc.).

2.5.3.2 Injection Well Drilling and Completion



Pad Area and Drilling Rig

Well pad construction would minimize additional ground disturbance through use of existing pads and disturbed areas to the extent feasible. Approximately 8.4 acres would be permanently used and maintained for the injection well pads during the life of the Project. The selected monitoring wells are all existing wells. Minor well pad maintenance may be conducted at each monitoring well location.

Drilling rigs would operate 24 hours per day while drilling, and depending on the type of well, would operate consecutively for up to 14 days at each location. The specific rig has not been determined at this time, but the rig would be the equivalent to Kenai #18 (see Figure 13).

Additional drilling equipment for either rig would include: fluid handling equipment, waste storage containers, four generators, mud handling system, blow out prevention equipment, spill prevention equipment, hydrogen sulfide (H_2S) detection equipment, three mud pumps, cuttings bin, catwalk, trailer (also referred to as "doghouse") and others. Note, the equipment listed is for a typical drilling operation, the exact equipment list and layout may vary depending on the specific well to be drilled.

Construction Methodology

The proposed drilling and production operations would be performed in accordance with USEPA UIC Class VI well regulations. The installation and drilling of injection wells is a multi-step process. After a well drilling location is determined, a conductor pipe with diverter valves is installed. These valves would allow any fluid that flows into the wellbore during drilling to be diverted and controlled. The drilling rig and supporting drilling equipment is then set up on location and the drilling process begins. This is called the "spud" of a well.

To progressively deepen the wellbore, a downward force must be exerted on the drill bit. This downward force is provided by the drill pipe that is attached to the drill bit. As the bit continues to drill downward, more pipe is attached on top thereby increasing the weight on the bit. The drill bit rotates as it moves down the wellbore. The rotating action is produced by a rotary table, top drive, or motor; depending on which drilling rig type is being utilized.

Rock cuttings are generated as the drill bit spins on the rock formation it is drilling through. These cuttings must be removed from the wellbore by drilling fluids (drilling mud). The drilling fluids are pumped through the drill pipe, out of the openings in the drill bit and then back up between the space between the drill pipe and the hole (this is referred to as the annulus). The mud handling equipment at the surface separates the cuttings from the mud, and recycles the mud to be used again. In addition to circulating the drill cuttings, drilling mud provides lubrication and cooling to the drilling bit and well control by changes to the drilling mud weight.

Once the wellbore is drilled to a specified depth, the drill pipe is pulled out of the hole and casing is installed. The well casing is a pipe that is permanently installed in the wellbore to stabilize the hole, prevent entry of wellbore fluids, and help to prevent the exit of drilling muds out of the wellbore. Once the casing has been run to the specified program depth, it is then cemented in place. Cement is pumped down the inside of the casing string and circulated up the annulus. For this Project, casing and cementing specifications would follow the requirements of the USEPA's UIC Class VI well regulations (40 CFR 1467.81 et seq.).

A smaller drill bit is then placed into the wellbore and the well is drilled deeper. This process continues with subsequently smaller drill bits and smaller casing strings being installed until the completion depth is reached. Once the wellbore is drilled to a specified depth, the drill pipe is pulled out of the hole and casing is installed. Casing is a steel pipe that is permanently inserted into the wellbore to create a barrier to prevent fluid transmission. Once the casing has been run to the specified depth, it is then cemented in place, effectively sealing the outside of the casing to the wellbore. The casing also serves as the foundation for the blowout preventer.

A total of three casing strings would be installed on Project wells.

Next, the injection liner piping (long string casing), consisting of materials compatible with exposure to the injected fluid, would be drilling through the injection zone. The injection liner would be inserted into the well and cemented in place. The injection well would be completed by perforating the authorized injection

zones. Completion equipment consisting of a packer, monitoring equipment, and tubing would be installed.

Well Drilling Fluids and Cuttings Disposition

The drilling process would use a water-based drilling mud composition the primary components of which are gel and water. The drilling fluids and cuttings would either be reused onsite (i.e., cuttings may be used onsite for fill and road base material) or solidified and then transported to an approved facility for recycling or disposal.

Hydrogen Sulfide Monitoring

H_2S gas is known to occur in the 64 Zone and overlying formations. The Aera Energy "Hydrogen Sulfide Policy" would be followed throughout the drilling operations, which addresses monitoring equipment requirements, personnel responsibilities, first aid, and evacuation procedures. Continuous ambient air monitoring for both hydrogen sulfide and flammable gases would be in effect for the entire drilling process.

Blowout Prevention Equipment

Blowout prevention systems are safety systems that are used in the drilling of an oil and gas well. These systems prevent the uncontrolled release of reservoir fluids and shut off flow to prevent spills and material releases. Blowout prevention equipment would be used during drilling and removed once the well has been completed and secured. Blowout prevention equipment would conform to the California Department of Oil, Gas, and Geothermal Resources (DOGGR) (now CalGEM) publication M07 "Blowout Prevention Equipment in California, Equipment Selection and Testing" 2006 Edition (DOGGR 2006).

Lighting System

The drilling operation would provide sufficient lighting to ensure safe working conditions. Vapor proof lighting and wiring would meet the California Division of Occupational Safety and Health specifications. The top of the derrick would have a red beacon to address potential aviation hazards. Rig lighting would be aimed towards the Project footprint, and away from the night sky and neighboring properties.

Well Re-Purposing

Within existing wells to be converted to CO_2 injection wells, the completion equipment would be removed, and the well would be cleaned out to the required depth for injecting into the 64 Zone Sandstone sequestration zones. Casing inspection and annulus evaluation logs would be completed to confirm that the annulus seal through the confining layer is sufficient to prevent movement of fluids behind the existing long string casing. A new inner casing would be installed and cemented to the surface.

The injection well would be completed by perforating the authorized injection zones. Completion equipment consisting of a packer, monitoring equipment, and tubing would be installed.

2.5.3.3 Monitoring Well Modifications

The construction procedures for repurposing of existing wells to monitoring wells are similar to repurposing wells for injection. The differences include perforation intervals in the appropriate zones to be monitored, and smaller outside diameter tubing would be used if the tubing inside diameter is large enough to allow running wireline logging tools and downhole sampler equipment that are planned to meet periodic monitoring requirements as required by USEPA requirements.

2.5.3.4 Well Stimulation

Aera Energy believes that the injection zone (64 Zone Sandstones) would require stimulation in all Project injection and monitoring wells, including wells either repurposed to or newly drilled for Class VI service. The stimulation program would be necessary because depleted reservoir pressure in the sequestration zone would cause fluid losses during drilling and completion operations, and cement losses during primary cementing of injection liners. Stimulation to remove this initial near-wellbore damage would occur after well construction is finished but prior to the start of CO_2 injection.

Well stimulation may also be necessary on specific injectors after the start of CO_2 injection if low initial injectivity is encountered or if reductions in ongoing injectivity are observed.

The method used for all stimulation work would be matrix acidizing. Aera Energy would ensure that no new fractures develop during stimulation by limiting pump pressures to a maximum of 80% of the sequestration zone fracture gradient, measured or calculated during Pre-Operational Testing. Additionally, Aera Energy would ensure that no loss of containment occurs by maintaining at least 20 feet of separation between the base of the primary confining zone and the top wellbore opening to the injection zone below.

All chemical additives used in the stimulations would be tested and confirmed compatible with the injection and confining zones.

2.5.3.5 Downhole Monitoring Equipment

Injection and monitoring wells would be equipped with downhole devices and equipment to evaluate external mechanical integrity of the wells and monitor growth of the CO_2 plume. The wells would be designed to allow the use of these testing and monitoring devices and workover tools as required by USEPA regulation. Downhole monitoring equipment would include pressure and temperature gauges and, on select wells, may also include fiber optic DTS and/or DAS. Pressure and temperature gauge lines would be strapped to the outside of the tubing for data transmission to surface for data collection and monitoring. The DTS and/or DAS line would be cemented in the annulus between the inner (injection) casing and the outer casing. The annuli would be sized to allow for data lines and clamps to be installed for downhole monitoring devices lines.

The internal diameter of the tubing planned for observation monitoring wells would be sized to allow running wireline logs such as pulsed neutron, saturation, pressure, and noise. In addition to logs,

downhole samplers can be run through the tubing to recover fluid samples from the reservoir. The internal diameter of the tubing planned for injection wells is sized for the planned injection rate.

2.5.4 Well Decommissioning

Existing wells that require decommissioning (plugging and permanent abandonment) as part of the construction of the proposed Project would follow the decommissioning procedures listed below:

- Remove surface equipment (such as flowlines, sensor equipment, non-well control valves, and miscellaneous debris) from location.
- Move in subsurface equipment.
- Perform pre-cementing operations, kill the well, conduct pre-abandonment tests if required by regulations, and remove rods, tubing, pump, and other equipment.
- Clean out wellbore to total depth, or at least 25 feet within the perforation.
- Complete cementing operations, including the following. Set the bottom hole plug across perforations as specified in California laws or CalGEM regulations. Tag cement to confirm hardness per CalGEM regulations. Bring cement up to next marker. Perforate and isolate any un-cemented annuli if they exist at required zone tops through a variety of methods. If un-cemented annuli do exist, timeline for well abandonment would be extended. Tag cement at each relevant marker. Steps described previously would be repeated until cement is at surface.
- Top off cement with surface crew, if necessary.
- Cut-off well head 5 feet below grade.
- Weld metal plate with ending 5 digits of American Petroleum Institute (API) number on top of cemented well head.
- Restore location to original grade.

2.5.5 CO_2 Pipeline Construction

The Project would require the installation of a new approximately 10 mile, 6-inch to 12-inch diameter CO_2 pipeline that would connect the CO_2 capture facilities to the injection wells. The pipeline would be built primarily aboveground within Aera Energy's existing operating properties. The CO_2 pipeline would be in place prior to the first CO_2 injection.

Excess spoils generated during the course of the pipeline construction project would be transported to a designated fill location within the Project footprint for re-use as fill material as part of the Project or would be disposed at a permitted disposal site.

2.5.5.1 Access and Staging Areas for Pipeline Construction

The CO_2 pipeline component of the Project would be accessed from existing oil field access roads. No new roads would be constructed as part of this component of the Project and no existing roads would require additional grading or improvements for the pipeline construction activities. Existing disturbed areas would be utilized for pipeline construction staging areas.

2.5.5.2 Pipeline Construction Methodology

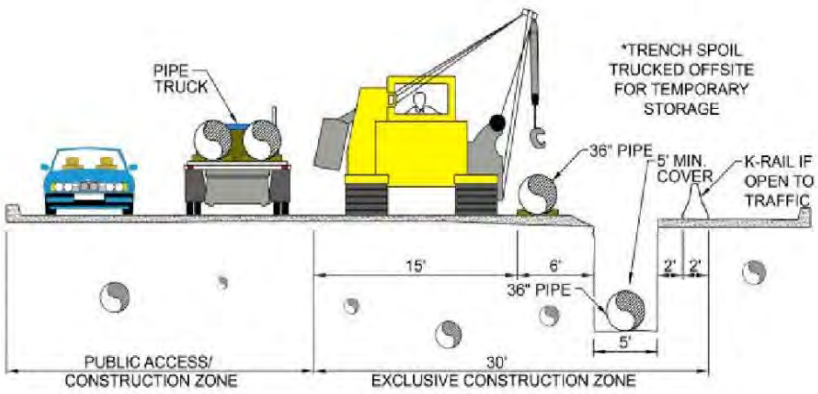
Construction and installation of the CO_2 pipeline would be construction primarily aboveground, resting either on existing pipe supports or new supports. At designated internal road crossings, the pipeline would be installed by conventional trenching (Figure 14, Typical Pipeline Construction). At public road crossings, the pipelines would be installed using jack and bore construction techniques. Refer to Figure 15 – Typical Jack and Bore Work Area. At ephemeral creek and drainage channel crossings, the pipelines would be span over the channel, with pipe supports placed outside of the active channel on either side.

The sequence of construction activities for the CO_2 pipeline component of the Project is summarized below. Construction of the CO_2 pipeline is scheduled to take approximately 6 months.

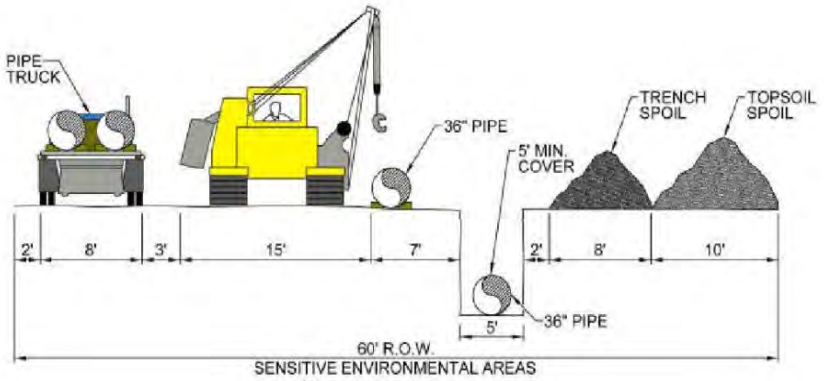
- **Mobilization and Staging:** Prior to construction, the contractor would mobilize the site and establish staging areas for materials and equipment storage. Construction equipment would be staged along the route and would progress with the pipe installation.

- **Surveying, Staking and Flagging:** The centerline would be marked at line-of-site intervals, at points of intersection (including offset stakes marking the edges of the construction right-of-way [ROW]), and at all known underground facilities. In addition, any environmentally sensitive areas (i.e., biological, cultural, and/or hydrological resources) would be clearly marked.

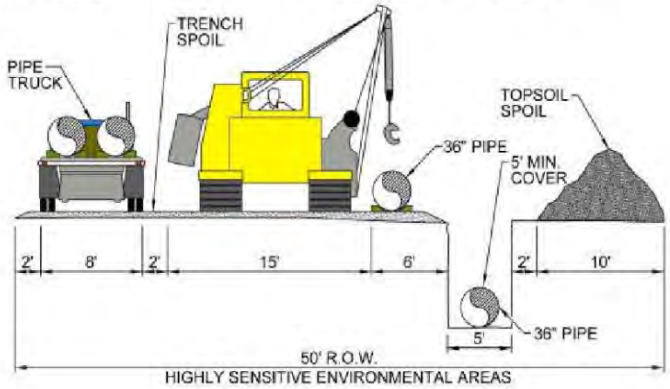
- **Clearing and Grading:** The majority of the temporary construction easement occurs along the previously disturbed pipeline corridors. Where necessary, existing vegetation would be cleared and the ground surface within the construction ROW would be graded and smooth to provide safe and efficient operation of construction equipment.

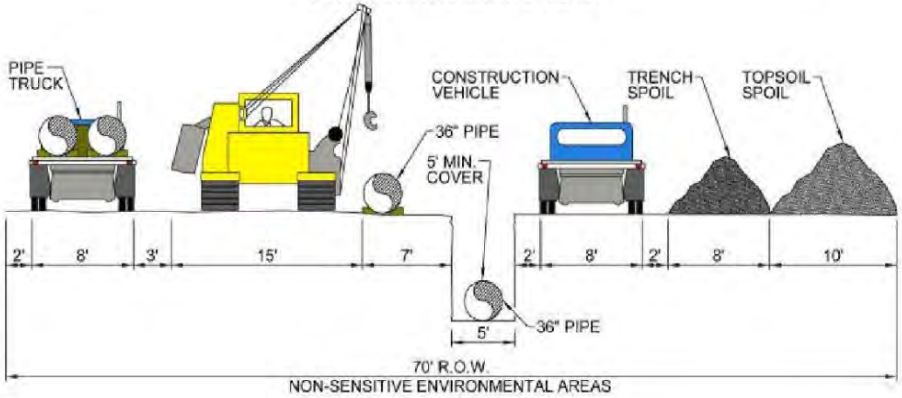


- **Hauling and Stringing:** The pipe would be hauled by truck to one of the staging areas where it would be offloaded by cranes and loaded onto stringing trucks to be delivered to the construction ROW.



- **Pipe Supports:** Pipe supports would be constructed at approximately 20-foot to 30-foot intervals along the pipeline, as needed. A truck-mounted drill would be used to auger a 24-inch to 36-inch diameter hole approximately 6-8 feet deep. The pre-fabricated steel pipe support would be set into the hole and the hole would then be filled with concrete.





- **Trenching:** The typical trench would be approximately five feet deep and between two and five feet wide. Excavated soils may be preserved and used as backfill materials at the site of origin. Spoil piles would be placed along the trench in areas where a temporary construction easement is available. Materials deemed unsuitable for backfill would be disposed of offsite and/or transported to Aera Energy's Belridge road-mix facility for re-use in accordance with all applicable regulations.

- **Jack-and-Bore:** Jack-and-bore tunneling would be utilized at road crossings, where required. This methodology is used for horizontal pipeline construction and entails the excavation of pits on either side of the crossing and use of a boring machine with a cutting 'head', auger, and casing. The auger and casing are pushed behind the 'head' as it cuts through the ground. The auger caries the debris back to the pit as the head cuts. Jack-and-bore horizontal tunneling is anticipated to take approximately 10 days to complete at each location. Additional locations may be added based on circumstances that are unknown at this time, such as utility conflicts or requirements imposed by the County or Caltrans. Typical horizontal bores are 10 feet deep and require entry pits of approximately 15 feet by 40 feet and receiving pits of approximately 10 feet by 15 feet. In any location where Jack and Bore is used, there is only one entry pit and one exit pit (Figure 15, Typical Jack and Bore Work Area).

- **Pipe Placement, Welding, and Coating:** New pipeline segments would be inspected to locate and repair any faults or voids in the pipeline coating prior to being lowered into the trench. In areas where the pipe is joined within the ditch, "bell holes" would be dug at each pipe joint to facilitate access for welding and joint coating application. These welds would typically be made in the ditch, with the pipe at its final elevation and alignment. Welding and Coating would apply to all areas throughout the Project.

- **Weld Inspection:** All welds would be inspected in accordance with state and federal welding requirements. When inspected radiographically all radiographs would be recorded and interpreted for acceptability in accordance with API 1104. All rejected welds would be repaired or replaced as necessary and re-radiographed. The inspection reports would be kept for the life of the pipeline.

- **Line Lowering, Backfill, and Compaction:** For conventional open trench segments, the welded pipe segments or individual pipe lengths would be lifted and lowered into the trench by side boom tractors. The native material excavated from the pipeline trench would either be reused as backfill, transported to Aera Energy's Belridge road-mix facility, or would be hauled and disposed offsite to at an approved landfill facility. Required backfill material would be compacted with compaction rollers and/or hydraulic tampers and undergo compaction testing to ensure that all trench locations are compacted in accordance with standard engineering practices and permit requirements. All trenches would either be fenced, backfilled, or covered with steel plates at the end of each workday.

- **Aboveground Equipment Installation:** The majority of aboveground equipment would be pre-fabricated at a staging area and then transported to the respective locations for final assembly and tie-in to the pipeline facilities. Valve and meter set assembly locations would be either paved or graveled. After installation, all above-grade piping and equipment would be painted and the valve would be enclosed by a chain-link fence.

- **Creek Crossings.** At creek crossings, the pipelines will be installed on pipe supports located outside of the bed and bank of the creek channel, and will be supported sufficiently so that they

span the creek. Construction activities will be conducted from outside of the creek channels where possible to avoid impacts to the channels.

- **Hydrostatic Testing:** In accordance with applicable codes and regulations, the entire pipeline would undergo hydrostatic testing prior to operation by pumping water into the test sections, pressurized to design-test pressure, and maintained that pressure for a minimum amount of time to identify defects in construction. Water to be used for hydrotest would be from local water systems. Discharged water would be stored into baker tanks to be held for testing. After results of the samples are analyzed, the water may be used for dust control or used for additional testing on other pipeline segments. The Stormwater Pollution Prevention Plan (SWPPP) Plan prepared by Aera Energy would also include Best Management Practices (BMPs) in case the hydrotest is not successful initially.

- **Pigging:** Pipeline pigs are devices that are inserted into and travel throughout the length of a pipeline driven by a product flow to perform functions, such as cleaning or dewatering and provide information on the condition of the line, as well as the extent and location of any problems. After the pipeline has been hydrostatically tested and dewatered, the contractor would run several utility pigs of various types to remove as much water as possible and any remaining small debris from within the pipeline.

- **Cleanup and Restoration:** All construction material and debris would be removed and disposed of at appropriate landfills or recycled. Clean up and restoration would be ongoing throughout the Project and when an active site is completed, the area shall be restored to surface grade. In upland areas, the ROW would be regraded to its approximate pre-construction contour and stabilized or restored to pre-construction conditions, in compliance with all relevant permits. All staging areas and temporary extra workspaces would be recontoured to pre-construction conditions and would be stabilized or restored in accordance with all relevant permits. All paving repairs would be made in accordance with the current County requirements. As a final step, the route within unpaved portions of the roadway shoulder or private ROW would be marked with approximately five-foot-high pipeline markers placed in accordance with PHMSA standards.

- **Operations and Maintenance:** Maintenance of pipeline and auxiliary facilities would continue to be performed as required by state and federal requirements.

2.5.6 Field Systems Construction

The proposed Project would include the installation of a system of onsite gathering and distribution lines for various co-located services, including produced gas lines, steam distribution, source water gathering, and softened water transfer.

2.5.6.1 Intra-Field Pipelines

The field gathering and distribution system would be designed to locate pipeline corridors primarily along existing pipeline corridors on raised pipe supports to minimize external corrosion. The sequence of

general construction procedures associated with the installation of intra-field pipelines would be similar to the CO_2 pipeline construction described above and would follow the process listed below:

- Mobilization and Staging
- Surveying, Staking and Flagging
- Clearing and Grading
- Hauling and Stringing
- Pipe Placement, Welding, Inspection, and Coating
- Pipeline Installation and Testing

2.5.6.2 Intra-Field Electrical Distribution

The intra-field electrical distribution system would be constructed concurrently with injection well drilling/re-purposing and CO_2 capture facility construction. Once poles are erected, the conductor would be strung from conductor pull and tension sites at the end of the power line interconnection alignment moving from one pole to the next. Each conductor would be pulled into place at a pre-calculated sag and then tension-clamped to the end of each insulator. The sheaves and vibration dampers and accessories would be removed once installation is complete.

2.5.7 Electrical Transmission Interconnection Power Line Construction

Aera Energy would construct, operate, and maintain approximately 1.26-miles of new, 115-kV transmission line to the Aera Energy-owned substations located in the BSA. The estimated permanent disturbance of the 115 kV electrical interconnection would be 2 acres with 4 acres of temporary disturbance. To support the major construction efforts, electrical connections are anticipated be in place prior to significant field activities.

2.5.7.1 Access and Staging Areas for Electrical Transmission Interconnection

Primary access to the power line interconnection sites would be using existing access roads. Construction of the power line interconnection would be completed by the designated contractor. The new wood poles would require approximately six to eight feet of embedment. Construction would involve temporary ground disturbance around each new power pole location (approximately a 50-foot radius) as well as temporary ground disturbance associated with access to each pole location (approximately a 15-foot-wide access route). All new poles and access thereto would be located within existing oil field production areas or along a dirt road. Pole work areas would likely be located approximately every 400 feet for 115kV lines, and 200 feet for 12kV lines. Where final design allows, power pole work areas would overlap. Final design would determine final power pole locations. Temporary staging and lay down areas may also be needed for the construction of the interconnection facilities but would primarily use existing disturbed/developed areas.

2.5.7.2 Construction Methodology for Electrical Transmission Interconnection

Substations. Two new substations would be constructed near the proposed CO_2 capture facilities. Each substation would require approximately 1 acre.

Power Line Removal/Construction. The new 115 kV power lines would be supported by up to approximately 17 wooden poles.

Pole installation would consist of the following basic steps:

- Deliver new pole at pole site;
- Auger new hole using line truck attachment or hand dig if the line truck cannot access the site;
- Backfill around the pole;
- Install bottom section by line truck, crane;
- Install top section by line truck, crane; and
- Install switches where necessary. There may be several SCADA-operable or other switches at the point of interconnection and elsewhere.

Once poles are erected, conductor would be strung from conductor pull and tension sites at the end of the power line interconnection alignment. The average distance is 4,000 feet between pull and tension sites. Each conductor would be pulled into place at a pre-calculated sag and then tension-clamped to the end of each insulator. The sheaves and vibration dampers and accessories would be removed once installation is complete. Transmission Power Line construction and substation improvements are anticipated to take approximately 6 months.

2.5.8 Construction Personnel and Traffic

Equipment and personnel requirements would vary throughout the course of any given year and across the life of the Project depending on the construction activities underway. However, it is estimated that the peak construction workforce would be approximately 300 people.

Drilling rigs would operate 24 hours per day while drilling, and the proposed injection wells are expected to take approximately 14 days to complete. Drilling crews consist of six to seven contractors who would typically be on-site for 12-hour shifts, one starting at noon and the other starting at midnight.

At full build-out, the operational aspects of the Project would require a total of eight to ten personnel. During the years of peak Project operation, the Project is anticipated to generate approximately 12 average daily vehicle trips per day. Of these, two are bulk material and waste deliveries, and 10 are employee vehicle trips. Worker parking on-site would be on Project property, using designated areas such as staging areas.

2.5.9 Construction Timing

Construction of the proposed Project is anticipated to require up to three years to complete. Initial activities are expected to start in 2025 and would include the following tasks: mobilization, demolition, well abandonments, surface facility construction, pipeline construction, and well drilling. Activities in 2026 and 2027 would include well abandonments, facility construction, and pipeline construction.

2.5.10 Equipment and Personnel Requirements

Table 3 – Equipment and Personnel - Peak Estimates provides an annualized summary of anticipated equipment and personnel requirements during construction for each of the major Project components (processing facilities, field infrastructure, and utilities). Equipment and personnel requirements vary throughout the course of any given year and across the life of the Project; therefore, peak year counts and timing are provided.

Table 3. Equipment and Personnel - Peak Estimates

Activity	Peak Monthly Count	
	Personnel	Equipment
On-Site Roads	8	8
Facilities Pad Grading	15	15
Well Pad Grading	14	14
Well Drilling (Injection and Monitoring)	17	17
CO_2 Capture Facilities	96	92
Compressor Station Construction	28	20
CO_2 Main Pipeline	29	29
Distribution Pipelines	23	23
Gas Lines	20	20
Steam Lines	20	20
Water Lines	20	20
Electrical Transmission Line	12	12
Intra-Field Electrical Distribution	12	12

Activity	Peak Monthly Count	
	Personnel	Equipment
On-site Electrical Substations	18	18
Demolition	12	12

2.6 OPERATION AND MAINTENANCE

All facilities and equipment would be operated, maintained, and inspected in accordance with the applicable USEPA requirements. These regulations specify the types and frequencies of safety inspections and maintenance to be performed. Records documenting compliance with these requirements would be maintained on site and would be periodically reviewed by Aera Energy personnel to ensure compliance. In addition, safety and compliance inspections and audits of the facilities are performed on a regular basis by USEPA and other regulatory personnel.

2.6.1 Project Operations and Schedule

The proposed Project construction phase would take approximately three years. The capture of CO_2, and injection and monitoring for the Project would commence as soon as construction for the Project is completed. Project injection and monitoring wells, processing facilities, pipelines, transportation infrastructure, and maintenance involved with the Project operations is anticipated to operate for a period of approximately 20 years. The operational life of the Project would depend on the actual volume of CO_2 supplied and therefore may vary. Following the completion of CO_2 injection operations, there would be a roughly 15-year period of post-injection subsurface monitoring, plugging of injection wells, and post-closure site care. Surface monitoring in the BSA may extend for a period of up to 100 years, or as needed, to detect any CO_2 leaks, in compliance with federal and state requirements.

Aera Energy would employ direct and indirect methods to track the extent of the CO_2 plume and the presence or absence of elevated pressure during the operation period to meet USEPA requirements. Annual fluid sampling and pulsed neutron logging would be conducted at each of the monitoring wells. Pulsed neutron logs performed every three years at injection well sites would provide additional confirmation of CO_2 plume and pressure front extent. Periodic seismic surveys would also be conducted using vibroseis trucks travelling along existing roadways within the North Belridge Oil Field. The frequency of the use of vibroseis trucks would depend on the monitoring program developed in conjunction with USEPA.

3.0 METHODOLOGIES

3.1 LITERATURE REVIEW

A literature search focused on the BSA was conducted prior to field surveys in March, May, and June 2022. In addition, a query of the California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDB) was conducted on September 30, 2022, and again in October 2022 and July 2023 using Geographic Information System (GIS) tools to spatially search the area encompassing the Project site and a 10-mile buffer (CNDDB October 2022). The query was conducted for the Blackwells Corner, Carneros Rocks, and Belridge USGS 7.5-Minute Series Quadrangles where the proposed Project is primarily located and the 11 surrounding quads that include: Antelope Plain, Belridge, Emigrant Hill, Las Yeguas Ranch, Lokern, Lost Hills, Lost Hills NW, McKittrick Summit, Reward, Shale Point, and West Elk Hills. Maps of special-status plant and wildlife occurrences listed in the CNDDB are shown in Appendix A, Figures A-1 and A-2.

Additional data regarding the potential for occurrence of special-status species and policies relating to these special- status species and other natural resources were gathered from the following sources:

- State and Federally Listed Endangered and Threatened Animals of California (CDFW, 2022b); Special Animals List (CDFW, 2022c);
- State and Federally Listed Endangered, Threatened, and Rare Plants of California (CDFW, 2022d);
- Inventory of Rare and Endangered Vascular Plants of California (CNPS, 2022);
- California Sensitive Natural Communities (CDFW, 2022e); and Consortium of California Herbaria (CCH, 2022).

3.2 BIOLOGICAL SURVEYS AND HABITAT ASSESSMENTS

3.2.1 Reconnaissance Wildlife and Plant Surveys

Stantec biologists conducted a habitat assessment and biological resource surveys to document the existing biological resources within the BSA over eight days, including March 15-17, May 9-12, and June 2, 2022. The reconnaissance-level surveys were performed within all habitat and terrain types present within the BSA. The primary goals of the habitat assessment and biological surveys were to identify habitat types within the BSA, assess habitats in terms of their suitability of supporting special-status wildlife or plant species, and to document the presence or absence of any special-status species and other biological resources.

Surveys were conducted throughout the BSA by experienced field biologists, with surveys being performed on foot where accessible based on terrain and vegetative cover, and by vehicle in highly developed areas with little or no vegetation. Biologists conducted the foot surveys by walking meandering transects within the Project site and within a 500-foot buffer where accessible, at an average pace of approximately 2 miles per hour (mph) (3.2 kilometers per hour [km/hr]). Biologists ensured that all habitats and topographic

conditions were encompassed during the surveys. During the surveys biologists would walk while visually scanning for wildlife, and listening for wildlife songs, calls, and other signs. Surveying was halted periodically to listen for wildlife and to identify, record, enumerate, or photograph any detected species or habitat features. Species that were present were identified and recorded through direct visual observation, sound, or their sign (e.g., scat, tracks, etc.). Species identifications conform to the most up-to-date field guides and technical literature.

Plant species and vegetation communities within the BSA were identified to the maximum extent possible during the reconnaissance surveys. The 2022 surveys were not focused on floristic surveys and were performed outside of the known flowering period for the detection of special-status species; therefore, some special-status plant species may not have been identified.

To the extent possible, surveys were conducted during the season and time of day that migratory birds were expected to be present, resident bird species were nesting and fledging, small mammals were active and detectable visually or by sign, and above-ground amphibian and reptile movement would generally be detectable. However, it should be noted that some wildlife species and/or individuals may have been difficult to detect due to their elusive nature, cryptic morphology, or nocturnal behavior. Surveys were conducted during daylight hours when temperatures were such that reptiles and other wildlife would be active.

Surveys to map potential San Joaquin kit fox (SJKF) (*Vulpes macrotis mutica*) dens were conducted by Stantec during reconnaissance surveys in March, May, and June 2022. Surveys were conducted within the proposed Project footprint and included an approximate 500-foot-buffer on either side of the pipeline where potential habitat was present and accessible. Potential dens were identified per the USFWS *Standardized Recommendations for Protection of the Endangered San Joaquin Kit Fox Prior to or During Ground Disturbance* (USFWS 2011), and mapped using GPS. The presence of SJKF signs (e.g., tracks, claw marks, scat, prey remains, and configuration of den and ramp) were also used to distinguish potential dens. Additional surveys to confirm the use of any identified potential dens are planned to be performed prior to construction.

3.2.2 Floristic Botanical Surveys

Floristic botanical surveys were conducted during daylight hours in February 22 and 23, March, 7, 8, and 9, and May 2, 3, 4, 5, 11, and 12, 2023, by Stantec biologists Ashleigh Townsend, Saoirse Kirby, Catherine Yoo, Lauren Harrison, Cassandra Cortez, Megan Wong, Julia Thompson, Ethan Martin, and Jared Pratt. The primary goals of the floristic reconnaissance survey were to identify and assess the suitability of habitat for special status plant species and to document an inventory of plant species within the BSA. The BSA was surveyed by the biologists on foot walking meandering transects throughout the Project site. Plants were identified based on professional knowledge and experience and/or by using keys, descriptions, and illustrations in the Jepson Manual: Higher Plants of California, 2nd Edition (Baldwin et al. 2012) and the Jepson Flora Project (The Jepson Herbarium 2023). Notes on plants observed were recorded, and photographs of plants and representative plant community landscapes were taken.

Surveys were conducted in accordance with current agency protocols, including the CDFW *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities*

(CDFW 2018), the U.S. Fish and Wildlife Service (USFWS) Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plants (USFWS 2000), and the CNPS Botanical Survey Guidelines (CNPS 2001).

3.2.3 Protocol Blunt-nosed Leopard Lizard Surveys

Protocol blunt-nosed leopard lizard (BNLL) (*Gambelia sila*) surveys were conducted during the adult BNLL survey season in May, June, and July 15 2023 by MESA Biological, LLC, based upon the *Approved Survey Methodology for the Blunt-nosed Leopard Lizard* (CDFW 2019). Surveys followed approved CDFW Protocol Survey Methodology guidelines regarding number and timing of surveys, time of day, temperature, weather conditions, survey crew spacing, and level of surveyor experience. The survey crew was comprised of a combination of Level I and Level II surveyors in ratios no more than three Level I to every one Level II. A Level I surveyor is defined by CDFW as a surveyor who has demonstrated the ability to distinguish BNLL from other common lizards found in the southwestern San Joaquin Valley. In addition to meeting the qualifications of a Level I surveyor, a Level II surveyor is defined as a surveyor who has participated in at least 50 BNLL surveys and has made at least one confirmed field observation of a BNLL.

The results of the adult season BNLL surveys conducted in 2023 are included the MESA Biological report presented in Appendix B.

3.2.4 Vegetation and Habitat Assessment

The primary purpose of the habitat assessment surveys was to evaluate and document the various existing conditions within the BSA and map the vegetation communities present. Habitat assessment surveys and vegetation mapping characterizes the plant communities within the BSA and determines presence or absence of sensitive plant communities and habitats, including wetland, aquatic, and riparian habitats.

Stantec biologists conducted the habitat assessment surveys to document the existing biological resources within the BSA over eight days in 2022, including March 15-17, May 9-12, and June 2, 2022. Stantec biologists walked meandering transects parallel to the proposed Project alignment throughout the BSA. Special attention was paid to areas that contained potentially suitable habitat for special-status species. Binoculars were also used to scan the landscape and aid in detection and identification of birds and other wildlife.

The results of the field mapping were incorporated into vegetation maps using geographic information systems (GIS). The total area of each plant community in acres was calculated using GIS.

The mapping and description of plant communities in the BSA were classified based on the alliance classification system described in *Preliminary Descriptions of the Terrestrial Natural Communities of California* (Holland 1986) and described in the second edition of *A Manual of California Vegetation* (Sawyer et al. 2009). Scientific names and common names are according to the second edition of *The Jepson Manual* (Baldwin et al., 2012).

Incidental wildlife species observed or expected to use the BSA were recorded by sight, calls, tracks, scat, and other signs. In addition to species observed, expected wildlife use of the BSA was determined by known habitat preferences of local species and knowledge of their relative distributions in the region.

Photo documentation of habitats within the BSA is included in Appendix C.

4.0 REGULATORY FRAMEWORK

4.1 FEDERAL REGULATIONS

4.1.1 Federal Endangered Species Act

The Federal Endangered Species Act (ESA) includes provisions that protect federally listed threatened and endangered species and their habitats from unlawful take, requiring that federal actions do not jeopardize the continued existence of a listed species or result in the destruction or adverse modification of designated critical habitat. Under the ESA, "take" is defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." The ESA regulations define harm as "an act which actually kills or injures fish or wildlife." Harm is further defined to include significant habitat modification or degradation that actually kills or injures fish or wildlife by significantly impairing essential behavioral patterns, including breeding, spawning, rearing, migrating, feeding, or sheltering" (50 CFR § 17.3).

Activities that may result in "take" of listed species, and have a federal permit or funding nexus, are typically regulated by the USFWS and National Marine Fisheries Service (NMFS) through Section 7(a)(2) of the ESA. Activities that do not have a federal permit or funding nexus are regulated through Section 10(a)(1)(B) of the ESA and required a federal Incidental Take Permit (ITP) and Habitat Conservation Plan (HCP).

Critical habitat is defined in Section 3(5)(A) of the ESA as "(i) the specific areas within the geographical area occupied by the species on which are found those physical or biological features (I) essential to the conservation of the species, and (II) which may require special management considerations or protection; and (ii) specific areas outside the geographical area occupied by the species upon a determination by the Secretary of Commerce or the Secretary of the Interior (Secretary) that such areas are essential for the conservation of the species."

The effects analyses for designated critical habitat must consider the role of the critical habitat in both the continued survival and the eventual recovery (i.e., the conservation) of the species in question, consistent with the Ninth Circuit juridical opinion, Gifford Pinchot Task Force v. USFWS. The USFWS produced an updated list of candidate species December 6, 2007 (72 FR 69034). Candidate species are not afforded any legal protection under ESA; however, candidate species typically receive special attention from Federal and State agencies during the environmental review process.

4.1.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) of 1918 (16 U.S.C. 703-711) makes it unlawful to possess, buy, sell, purchase, barter, or "take" any migratory bird listed in Title 50 of the Code of Federal Regulations Part 10. "Take" is defined as possession or destruction of migratory birds, their nests or eggs. Disturbances that cause nest abandonment and/or loss of reproductive effort or the loss of habitats upon which these birds depend may be a violation of the MBTA. The MBTA prohibits killing, possessing, or trading in migratory

birds except in accordance with regulations prescribed by the USFWS. This act encompasses whole birds, parts of birds, and bird nests and eggs.

4.1.3 Bald and Golden Eagle Protection Act of 1940 (16 USC 668)

The Bald Eagle Protection Act of 1940 (16 U.S.C. 668, enacted by 54 Stat. 250) protects bald and golden eagles by prohibiting the taking, possession, and commerce of such birds and establishes civil penalties for violation of this Act. Take of bald and golden eagles is defined as follows: “disturb means to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available, (1) injury to an eagle, (2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior’’ (72 FR 31132; 50 CFR 22.3).

The USFWS is the primary federal agency authority charged with the management of golden eagles in the United States. A permit for take of golden eagles, including take from disturbance such as loss of foraging habitat, may be required if this Project affects such resources. On November 10, 2009, the USFWS implemented new rules (74 FR 46835) governing the “take” of golden and bald eagles. The new rules were released under the existing Bald and Golden Eagle Act which has been the primary regulation protection unlisted eagle populations since 1940. All activities that may disturb or incidentally take an eagle or its nest as a result of an otherwise legal activity must be permitted by the USFWS under this act. The definition of disturb (72 FR 31132) includes interfering with normal breeding, feeding, or sheltering behavior to the degree that it causes or is likely to cause decreased productivity or nest abandonment. If a permit is required, due to the current uncertainty on the status of golden eagle populations in the western United States, it is expected permits would only be issued for safety emergencies or if conservation measures implemented in accordance with a permit would result in a reduction of ongoing take or a net take of zero.

4.1.4 Clean Water Act and Rivers and Harbors Act

Areas meeting the regulatory definition of “Waters of the U.S.” (Jurisdictional Waters) are subject to the jurisdiction of the United States Army Corps of Engineers (USACE) under provisions of Section 404 of the Clean Water Act (CWA) (1972) and Section 10 of the Rivers and Harbors Act (1899). These waters may include all waters used, or potentially used, for interstate commerce, including all waters subject to the ebb and flow of the tide, all interstate waters, all other waters (intrastate lakes, rivers, streams, mudflats, sandflats, playa lakes, natural ponds, etc.), all impoundments of waters otherwise defined as “Waters of the U.S.,” tributaries of waters otherwise defined as “Waters of the U.S.,” the territorial seas, and wetlands (termed Special Aquatic Sites) adjacent to “Waters of the U.S.” (33 CFR, Part 328, Section 328.3). Wetlands on non-agricultural lands are identified using the Army Corps of Engineers Wetlands Delineation Manual (Environmental Laboratory, 1987). The Project site falls within the South Pacific Division of the USACE and is under the jurisdiction of the Los Angeles District.

On January 18, 2023, the federal agencies published the final "Revised Definition of 'Waters of the United States” rule (2023 Rule) in the Federal Register, which became effective on March 20, 2023 (USACE and USEPA 2023). The 2023 Rule generally returns to the pre-2015 definition.

The 2023 Rule defines waters of the United States to include:

1. Traditional navigable waters, the territorial seas, and interstate waters;
2. Impoundments of other jurisdictional waters of the United States, except for those that qualify under category 5, below;
3. Tributaries to either of the above waters and tributaries that meet the "relatively permanent" standard or the "significant nexus" standard, (collectively, "jurisdictional tributaries");
4. Wetlands adjacent to traditional waters, wetlands adjacent and with a continuous surface connection to relatively permanent tributaries and impoundments, and wetlands adjacent to other jurisdictional tributaries when those wetlands meet the "significant nexus" standard; and
5. Intrastate lakes and ponds, streams, or wetlands that are not identified in categories 1–4 above that meet either the "relatively permanent" standard or the "significant nexus" standard.

The scope of category 4 (wetlands) was recently limited by the United States Supreme Court in *Sackett v. Environmental Protection Agency, et al.*, Case No. 21-454 (*Sackett*). In *Sackett*, the court held that wetlands are jurisdictional only when they are "as a practical matter indistinguishable from waters of the United States," with a "continuous surface connection" with a water of the United States "making it difficult to determine where the 'water' ends, and the 'wetland' begins."

Construction activities within jurisdictional waters are regulated by the USACE. The placement of fill into such waters must comply with permit requirements of the USACE. As a part of the permit process, the USACE works directly with the USFWS and NMFS to assess potential Project impacts on biological resources.

Section 401 of the CWA ensures that federally permitted activities comply with the federal CWA and state water quality laws. Under CWA Section 401, an applicant for a federal permit or license for any activity which may result in a discharge to federal waters must obtain Water Quality Certification (WQC) that the proposed activity will comply with state water quality standards. In California, CWA Section 401 is implemented either by the State Water Resources Control Board (SWRCB) or the applicable Regional Water Quality Control Board (RWQCB), with most WQCs issued in connection with USACE CWA Section 404 permits for dredge and fill discharges. The SWRCB or RWQCB issues a WQC via the CWA Section 401 process verifying that a proposed Project complies with water quality standards and other conditions of California law. CWA Section 401 certification typically precedes USACE CWA Section 404 permit issuance.

4.1.5 National Environmental Policy Act

The Project would require federal actions including the issuance of Class VI UIC permits from the EPA. However, the Project is Categorically Excluded from further review under the National Environmental Policy Act (NEPA); the Safe Drinking Water Act UIC program is exempt from performing an Environmental Impact Statement (EIS) under section 101(2)(C) and an alternatives analysis under section 101(2)(E) of NEPA under a functional equivalence analysis. Although the Project is exempt from NEPA, in their purview the EPA has determined the Project is an undertaking subject to Section 106 of the National Historic

Preservation Act (NHPA) of 1966, as amended and its implementing regulations (36 CFR 800), pursuant to subpart 800.3(a)).

4.2 STATE REGULATIONS

4.2.1 California Environmental Quality Act

CEQA establishes State policy to prevent significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures. CEQA applies to discretionary actions directly undertaken, financed, or permitted by local or State lead agencies when those actions are found to have or are likely to have direct or indirect environmental impacts. Regulations for implementation are found in the State CEQA Guidelines published by the Resources Agency. These guidelines establish an overall process for the environmental evaluation of projects.

4.2.2 California Endangered Species Act

Provisions of the California Endangered Species Act (CESA) protect State-listed Threatened and Endangered species. The CDFW regulates activities that may result in "take" of individuals ("take" means "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill") listed under CESA. Habitat degradation or modification is not expressly included in the definition of "take" under the California Fish and Game Code. The CDFW may authorize take under the CESA via an ITP through California Fish and Game Code Section 2081(b). CDFW also maintains lists for Candidate-Endangered Species and Candidate-Threatened Species. California Candidate Species are afforded the same level of protection as listed species. Additionally, the California Fish and Game Code contains lists of vertebrate species designated as "fully protected" (California Fish & Game Code §§ 3511 [birds], 4700 [mammals], 5050 [reptiles and amphibians], 5515 [fish]). Such species may not be taken or possessed without an approved Natural Communities Conservation Plan.

In addition to Federal and State-listed species, the CDFW also has produced a list of California Species of Special Concern (SSCs) to serve as a "watch list." Species on this list are of limited distribution or the extent of their habitats has been reduced substantially, such that threat to their populations may be imminent. These SSCs may receive special attention during environmental review, but they do not have statutory protection.

4.2.3 Native Plant Protection Act (Fish & Game Code 1900-1913)

California's Native Plant Protection Act (NPPA) requires all State agencies to utilize their authority to carry out programs to conserve endangered and rare native plants. Provisions of NPPA prohibit the taking of listed plants from the wild and require notification of the CDFW at least 10 days in advance of any change in land use. This allows CDFW to salvage listed plant species that would otherwise be destroyed. The Applicant is required to conduct botanical inventories and consult with CDFW during project planning to comply with the provisions of this act and sections of CEQA that apply to rare or endangered plants.

4.2.4 California Fish and Game Code Section 1602

Section 1602 of the California Fish and Game Code requires an entity to notify CDFW before commencing an activity that will:

- Substantially divert or obstruct the natural flow, or substantially change or use any material from the bed, channel or bank of any river, stream, or lake; or
- Deposit or dispose of debris, waste or other material where it may pass into any river, stream, or lake.

If any of these activities may substantially alter its bed, channel, or bank, or adversely affect existing fish and wildlife resources, a Lake and Streambed Alteration Agreement is required. A Lake and Streambed Alteration Agreement lists the CDFW conditions of approval relative to a proposed project and serves as an agreement between an applicant and the CDFW for the performance of activities subject to Section 1602. For the purposes of this Report, potential CDFW jurisdiction is interpreted as extending from the streambed/thalweg to the outer edge of adjacent riparian vegetation (for both natural and anthropogenic drainage features) and for this BSA, is roughly equivalent to "waters of the State" as defined by the RWQCB.

4.2.5 Section 3503 & 3503.5 of the Fish and Game Code

Birds of prey are protected under the California Fish and Game Code. Sections 3503 and 3503.5 states it is "unlawful to take, possess, or destroy any birds of prey (in the order Falconiformes or Strigiformes) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this Code or any regulation adopted pursuant thereto." Construction disturbance during the breeding season could result in the incidental loss of fertile eggs or nestlings or otherwise lead to nest abandonment. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered "take" by the CDFW. Under Sections 3503 and 3503.5 of the California Fish and Game Code, activities that would result in the taking, possessing, or destroying of any birds-of-prey, taking or possessing of any migratory nongame bird as designated in the MBTA, or the taking, possessing, or needlessly destroying of the nest or eggs of any raptors or non-game birds protected by the MBTA, or the taking of any non-game bird pursuant to Fish and Game Code Section 3800 are prohibited.

4.2.6 Porter-Cologne Water Quality Control Act

The SWRCB and RWQCBs regulate the discharge of waste to waters of the State. All projects proposing to discharge waste that could affect waters of the State must file a waste discharge report with the appropriate regional board. The board responds to the report by issuing Waste Discharge Requirements or a waiver for that project discharge. Both of the terms "discharge of waste" and "waters of the State" are broadly defined such that discharges of waste include fill, any material resulting from human activity, or any other "discharge." Isolated waters/wetlands within California, which are no longer considered "waters of the United States" as defined by Section 404 of the CWA and limited by the *Sackett* decision, are addressed under the Porter-Cologne Act.

4.3 OTHER APPLICABLE REGULATIONS, PLANS, AND STANDARDS

4.3.1 California Native Plant Society Rare Plant Program

The mission of the California Native Plant Society (CNPS) Rare Plant Program is to develop current, accurate information on the distribution, ecology, and conservation status of California's rare and endangered plants, and to use this information to promote science-based plant conservation in California. Once a species has been identified as being of potential conservation concern, it is put through an extensive review process. Once a species has gone through the review process, information on all aspects of the species (e.g., listing status, habitat, distribution, threats, etc.) are entered into the online CNPS Inventory and given a California Rare Plant Rank (CRPR). In 2011, the CNPS officially changed the name "CNPS List" to "CRPR." The Program currently recognizes more than 1,600 plant taxa (species, subspecies and varieties) as rare or endangered in California.

Vascular plants listed as rare or endangered by the CNPS, but which might not have a designated status under State endangered species legislation, are defined by the following CRPR:

- CRPR 1A - Plants considered by the CNPS to be extinct in California
- CRPR 1B - Plants rare, threatened, or endangered in California and elsewhere
- CRPR 2 - Plants rare, threatened, or endangered in California, but more numerous elsewhere
- CRPR 3 - Plants about which we need more information – a review list
- CRPR 4 - Plants of limited distribution – a watch list

In addition to the CRPR designations above, the CNPS adds a Threat Rank as an extension added onto the CRPR and designates the level of endangerment by a 1 to 3 ranking, with 1 being the most endangered and 3 being the least endangered and are described as follows:

- 0.3 – Seriously threatened in California (high degree/immediacy of threat)
- 0.2 – Fairly threatened in California (moderate degree/immediacy of threat)
- 0.3 – Not very threatened in California (low degree/immediacy of threats or no current threats known.

5.0 EXISTING CONDITIONS

5.1 SETTING

The Project is located within the South and North Belridge oil fields south of Blackwells Corner and west of State Route 33 in Kern County, California. It is situated in Sections 21, 22, 26, 27, 28, 34, 35, and 36 of Township 27 South, Range 20 East, Sections 1, 2, and 12 of Township 28 South, Range 20 East, Sections 7, 17, 18, 20, 27, 28, 29, 32, 33, and 34 of Township 28 South, Range 21 East, and Sections 2 and 3 of Township 29 South, Range 21 East MDB&M, in the U.S. Geological Survey (USGS) Blackwells Corner, Carneros Rocks and Belridge 7.5-minute topographic quadrangles. The BSA covers the proposed project surface facilities, pipelines, and proposed injection and monitoring wells that spans approximately 13 miles and varies in width from approximately 1,000 to 1,500 feet wide. Elevation ranges from 550 to 675 feet above sea level. Surrounding land use consists of a mix of existing oil and gas development for the purposes of mineral extraction within undeveloped valley saltbush scrub habitat, and includes agricultural and grazing land.

Observations documented during the site assessment are described in Sections 4.2.1, 4.2.2, and 4.3. Additionally, evidence of use of the BSA by special-status species was documented in the field and is shown in Appendix A, Figure A-3. A photolog was also generated showing general site conditions throughout the Project site and is included in Appendix C.

5.2 VEGETATION COMMUNITIES AND LAND COVERS

As defined in the Manual of California Vegetation, 2nd Edition (MCVII), a vegetation alliance is “a category of vegetation classification which describes repeating patterns of plants across a landscape. Each alliance is defined by plant species composition and reflects the effects of local climate, soil, water, disturbance and other environmental factors” (Sawyer et al. 2009). Generally, Stantec’s mapping and description of plant communities follows the classification system described in MCVII. The MCVII is generally limited to communities that are native or naturalized within California.

Biological resources observed within the BSA during the field survey were comprised primarily of common plant species and vegetation community characteristic of the southern San Joaquin Valley. The extent and condition of vegetation communities within the BSA varied depending on the level of existing development and ongoing mineral extraction activities. Within the BSA, Stantec biologists mapped two plant communities defined by Sawyer et al. (2009) and one landcover type. These are described further in Section 5.2.1 below and depicted in Appendix A, Figure A-4. Acreages for each plant community and land cover type are provided in Table 4, below.

5.2.1 Vegetation Communities and Land Cover Types

ATRIPLEX POLYCARPA SHRUBLAND ALLIANCE (ALLSCALE SCRUB)

Allscale (*Atriplex polycarpa*) Scrub occurs primarily in the northern half of the BSA, where it has formed relatively open stands and/or is interspersed with annual grasslands described below. Patches of Allscale

Scrub also occur in southern half of the BSA but are degraded by their vicinity to intensive oil field operations. Allscale Scrub is characterized by an open to continuous canopy with a variable herbaceous layer near the ground which includes seasonal annuals and non-native grasses. Within the BSA this alliance consists primarily of allscale saltbush (*Atriplex polycarpa*) with a varied herbaceous layer that consists of *Bromus* sp. Commonly known as salt-scrub or saltbush scrub communities, these common arid-land upland communities are found in flat or hilly areas of the southern San Joaquin Valley and are typically characterized by alkaline soils and open canopy with interspersed shrubs with varying densities dependent on slope, aspect, and moisture levels. Approximately 870.28 acres of this land cover type occur within the BSA (Appendix A, Figure A-4).

RED BROME/MEDITERRANEAN GRASS GRASSLANDS HERBACEOUS SEMI-NATURAL ALLIANCE (RED BROME OR MEDITERRANEAN GRASS GRASSLANDS)

Non-native annual grasslands primarily occur toward the central section of the BSA, with an extensive stand located east of Pole Line Road. This vegetation community is also often interspersed with Allscale Scrub. Red Brome or Mediterranean Grass Grasslands consist primarily of non-native grasses from the Mediterranean region such as red brome (*Bromus madritensis* ssp. r*ubens*) and Mediterranean grass (*Schismus barbatus*). Red brome or Mediterranean Grass Grasslands are typically found in disturbed and non-disturbed habitats along roadsides, railroads, and cultivated fields. This vegetation community is highly invasive and widely distributed in the western U.S. and provides a source of fuel for wildfires. Approximately 225.49 acres of this land cover type occur within the BSA (Appendix A, Figure A-4).

DISTURBED/DEVELOPED

This classification was used to map portions of the Project site that are developed; primarily existing roadways and development as related to oil and gas operations for mineral extraction. Where vegetated, these areas are generally composed of sparse occurrences of non-native and ruderal vegetation both within and in the margins of the mapped areas. Approximately 2,179.20 acres of this land cover type occur within the BSA (Appendix A, Figure A-4).

Table 4. Vegetation Communities and Land Cover Types Occurring within the BSA and Estimated Permanent and Temporary Impacts

Vegetation Community/Land Cover Type	Acreage Within BSA	Acreage of Permanent Project Impacts[1]	Acreage of Temporary Project Impacts[2]
Disturbed/Developed	2,179.20	86.63	170.73
Allscale Shrubland	870.28	1.57	43.09
Red Brome or Mediterranean Grass Grasslands	225.49	0.86	4.74
Total	**3,274.97**	**89.06**	**218.56**

[1] Potential sources of permanent project impacts include clearing and grubbing and construction of the carbon capture facility structure, pipeline supports (assuming the pipelines and distribution piping will be above ground and elevated), and injection and monitoring wellheads. Permanently impacted areas would result in permanent structures with no revegetation/restoration.

[2] Potential sources of temporary project impacts include use of heavy equipment and worker foot-traffic along the construction corridor, access and staging, temporarily graded and grubbed areas, and future maintenance activities. Temporarily impacted areas would be revegetated/restored.

5.2.2 Common Plant Species Observed

Plants observed during the 2022 reconnaissance-level surveys and 2023 spring-time floristic surveys, were recorded. The survey resulted in the documentation of 78 species of native and non-native plants within the BSA, a list of which is provided in Table 5 below. Species scientific and common names correspond to those described in the second edition of *The Jepson Manual* (Baldwin et al., 2012).

Table 5. Plant Species Observed within the BSA

Scientific Name	Common Name
Aizoaceae	
*Mesembryanthemum nodiflorum**	slender iceplant
Amaranthaceae	
Atriplex polycarpa	cattle spinach
*Bassia scoparia**	kochia
*Chenopodium album**	common lambs quarters
Asteraceae	
Ambrosia acanthicarpa	annual bur-sage
Baccharis pilularis	coyote brush
*Centaurea melitensis**	tocalote
Centromadia sp.	tarweed
Deinandra pallida	Kern tarweed
Ericameria nauseosa	rubber rabbitbrush
Gutierrezia californica	California matchweed
Helianthus annuus	annual sunflower
Heterotheca grandiflora	telegraph weed
Isocoma acradenia var. *bracteosa*	alkali goldenbush
*Lactuca serriola**	prickly lettuce
Lasthenia californica	California goldfields
Layia glandulosa	white layia
Madia elegans	common madia
Malacothrix coulteri	snake's-head
Matricaria discoidea	pineapple weed
*Senecio vulgaris**	common groundsel
Sonchus asper ssp. *asper**	prickly sow thistle
Stephanomeria pauciflora	wire-lettuce
Boraginaceae	
Amsinckia menziesii	small-flowered fiddleneck
Amsinckia sp.	fiddleneck
Amsinckia tessellata	desert fiddleneck
Pectocarya linearis	sagebrush combseed

Scientific Name	Common Name
Phacelia ciliata	Great Valley phacelia
Plagiobothrys canescens	valley popcornflower
Brassicaceae	
*Brassica nigra**	black mustard
*Brassica tournefortii**	Saharan mustard
Descurainia pinnata	tansy mustard
*Hirschfeldia incana**	summer mustard
Lepidium nitidum	peppergrass
*Sisymbrium irio**	London rocket
*Sisymbrium orientale**	oriental mustard
Tropidocarpum gracile	slender tropidocarpum
Bryaceae	
Bryum argenteum	silvery bryum
Caryophyllaceae	
*Herniaria hirsuta**	hairy rupturewort
Spergularia sp.	sand spurry
Chenopodiaceae	
Atriplex polycarpa	allscale saltbush
*Salsola tragus**	russian thistle
Suaeda nigra	bush seepweed
Crassulaceae	
Crassula connata	pygmy-weed
Cucurbitaceae	
Cucurbita palmata	coyote melon
Euphorbiaceae	
Croton setiger	doveweed
Euphorbia ocellata	Contura Creek spurge
Euphorbia polycarpa	ribseed sandmat
Fabaceae	
Acmispon wrangeleanus	Chilean trefoil
Astragalus lentiginosus	freckled milk vetch
*Medicago polymorpha**	California burclover
Geraniaceae	
*Erodium cicutarium**	redstem filaree
*Erodium moschatum**	whitestem filaree
Lamiaceae	
*Marrubium vulgare**	white horehound

Scientific Name	Common Name
Malvaceae	
Eremalche parryi	Parry's mallow – only one flowering plant with bisexual (non-pistillate) flowers was observed; characteristics tend to be consistent with the much more common *E. parryi* ssp. *parryi* rather than *E. parryi* ssp. *kernensis*
*Malva parviflora**	cheeseweed
Onagraceae	
Camissonia contorta	plains evening primrose
Orobanchaceae	
Castilleja attenuata	narrow leaved owl's clover
Plantaginaceae	
Plantago erecta	California plantain
Plantago ovata	Desert plantain
Poaceae	
*Avena fatua**	wild oats
*Bromus diandrus**	ripgut grass
*Bromus hordeaceus**	soft-chess grass
Bromus madritensis ssp. *rubens**	red brome
Distichlis spicata	salt grass
Festuca microstachys	small fescue
Hordeum murinum ssp. *leporinum**	hare barley
Melica imperfecta	California melic
*Phalaris aquatica**	bulbous canarygrass
*Phalaris caroliniana**	Carolina canarygrass
*Polypogon monspeliensis**	annual beard grass
*Schismus barbatus**	Mediterranean grass
Polemoniaceae	
Gilia minor	little gilia
Polygonaceae	
Eriogonum angulosum	angle stem buckwheat
Pottiaceae	
Tortula muralis	wall-screw moss
Solanaceae	
Datura wrightii	Jimson weed
Tamaricaceae	
Tamarix sp.*	tamarisk
Themidaceae	
Dipterostemon capitatus ssp. *capitatus*	blue dicks

*Denotes non-native species

5.3 COMMON WILDLIFE

5.3.1 Invertebrates and Gastropods

A focused survey for insects was not conducted within the BSA during the 2022 survey effort. Conditions in the BSA provide a suite of microhabitat variations for a wide variety of terrestrial insects and other invertebrates. As in all ecological systems, invertebrates in the BSA play a crucial role in a number of biological processes. They serve as the primary or secondary food source for a variety of birds, reptiles, and mammals; they provide important pollination vectors for numerous plant species; they act as efficient components in controlling pest populations; and they support the naturally occurring maintenance of an area by consuming detritus and contributing to necessary soil nutrients. Some of the orders identified in the BSA included beetles (*Coleoptera* spp.), flies (*Diptera* spp.), grasshoppers (*Orthoptera* spp.), moths and butterflies (*Lepidoptera* spp.), wasps, bees, and ants (*Hymenoptera* spp.), and dragonflies and damselflies (*Odonata* spp.).

5.3.2 Fish

Although ephemeral drainages within the BSA are capable of conveying seasonal flows during rain events, no water was present within the BSA at the time of the 2022 survey effort. Furthermore, there are no known species of fish that occur within the BSA.

5.3.3 Amphibians

Amphibians typically require a source of standing or flowing water for an extended period (2 to 3 months) to complete their life cycle. However, some terrestrial species can survive in drier areas by remaining in moist environments or by burrowing into the soil. Downed logs, bark, and other woody material in various stages of decay (often referred to as coarse woody debris), resources which are largely absent from the BSA, can provide shelter and feeding sites for a variety of wildlife, including amphibians and reptiles. These species are highly cryptic and often difficult to detect. Amphibians all require aquatic habitat for all or part of their life cycle, which may only be present within the BSA for a short period time during and immediately after substantial rain events. Therefore, amphibians are not expected to occur within the BSA.

5.3.4 Reptiles

The number and type of reptile species that may occur at a given site is related to a number of biotic and abiotic features. These include the diversity of plant communities, substrate, soil type, climate, and presence of refugia such as rock piles, boulders, and native debris.

Weather conditions were favorable for the detection of reptiles during the 2022 surveys. Optimal conditions for reptile surveys are clear weather with temperatures between 77°F and 95°F. During the site visit, the weather was clear, with temperatures ranging between 50°F and 75°F. Although temperatures were not optimal for the detection of reptiles during the site visit, reptiles were still active and observed. Three common species were observed in the BSA at the time of the reconnaissance survey: the common side blotched lizard (*Uta stansburiana*), the western whiptail (*Aspidoscelis tigris*), and the northern pacific rattlesnake (*Crotalus oreganus*).

Many reptile species, even if present, are difficult to detect because they are cryptic and their life history characteristics (e.g., foraging, thermoregulatory behavior, fossorial nature, camouflage etc.) limit their ability to be observed during most surveys. Furthermore, many species are only active within relatively narrow thermal limits, avoiding both cold and hot conditions, and most species take refuge in microhabitats that are not directly visible to the casual observer, such as rodent burrows, in crevices, under rocks and boards, and in dense vegetation where they are protected from unsuitable environmental conditions and predators. In some cases, they are only observed when flushed from their refugia. Suitable habitat conditions for certain special-status reptiles occurs within the BSA, including the San Joaquin coachwhip (*Masticophis flagellum ruddocki*) and BNLL; both of these species were observed in the BSA during the 2023 protocol BNLL surveys.

5.3.5 Birds

Birds were identified by sight and sound and were frequently observed throughout the BSA. The most common bird species observed were common ravens (*Corvus corax*) and California quail (*Callipepla californica)*. Active common raven and mourning dove (*Zenaida macroura*) nests were observed in the BSA during reconnaissance surveys. Loggerhead shrike (*Lanius ludovicianus*), a California SSC, was observed perching on power lines and flying in the BSA during reconnaissance and protocol BNLL surveys. Swainson's hawk (*Buteo swainsoni*) is a state threatened species that was incidentally observed flying overhead during protocol BNLL surveys. California horned lark (*Eremophila alpestris actia*), prairie falcon (*Falco mexicanus*), yellow warbler (*Setophaga petechia*) are special-status bird species that were observed during protocol BNLL surveys. It is likely that many other birds use the BSA at different periods, either as wintering habitat, seasonal breeding, or as occasional migrants.

5.3.6 Mammals

Generally, the distribution of mammals on a given site is associated with the presence of factors such as access to perennial water, topographical and structural components (e.g., rock piles, vegetation) that provide cover and support a prey base, and the presence of suitable soils for fossorial mammals (e.g., sandy areas). Small mammal burrows were observed to be generally sparse within the BSA. Signs of mammal species (tracks, scat, etc.) were detected, and a number of common mammals are expected to occur within the BSA given the habitat conditions and species that are known to occur in the region. Several San Joaquin antelope squirrels (SJASs) (*Ammospermophilus nelsoni*) were observed during the 2022 reconnaissance surveys and 2023 protocol BNLL surveys. One individual kangaroo rat (*Dipodomys* sp.) was observed; however, the species was not identified. Other mammals observed include common species including the desert cottontail (*Sylvilagus audubonii*) and black-tailed jackrabbit (*Lepus californicus*). Common mammals may also include the Botta's pocket gopher (*Thomomys bottae).*

Additionally, several earthen and artificial cover sites were located within the BSA that meet the definition as a potential den for SJKF as described in the USFWS *Standardized Recommendations for Protection of the Endangered San Joaquin Kit Fox Prior to or During Ground Disturbance* (2011). While no SJKF were observed in the BSA, and none of the potential dens observed showed any obvious sign of recent SJKF activity, SJKF are known to inhabit active oil fields in the western Kern County area and monitoring of the potential dens would be required to determine current occupation status. Several potential American badgers dens were also observed and mapped.

Wildlife observed during the 2022 reconnaissance surveys and 2023 protocol BNLL surveys are included in Table 6.

Table 6. Wildlife Species Observed within the BSA

Scientific Name	Common Name	Notes
Birds		
Artemisiospiza belli	Bell's sparrow	
Bubo virginianus	great horned owl	
Buteo jamaicensis	red-tailed hawk	
Buteo swainsoni	Swainson's hawk	State Threatened Species; incidental observation reported in third party 2023 BNLL Survey
Callipepla californica	California quail	
Cathartes aura	turkey vulture	
Charadrius vociferus	killdeer	
Chordeiles acutipennis	lesser nighthawk	
Columba livia	rock dove	
Corvus brachyrhychos	American crow	*Corvus brachyrhychos*
Corvus corax	common raven	
Eremophila alpestris actia	horned lark	CDFW Watch List Species
Euphagus cyanocephalus	Brewer's blackbird	
Falco mexicanus	prairie falcon	CDFW Watch List Species
Geococcyx californianus	greater roadrunner	
Haemorhous mexicanus	house finch	
Icterus cucullatus	hooded oriole	
Lanius ludovicianus	loggerhead shrike	California Species of Special Concern
Mimus polyglottos	northern mockingbird	
Passer domesticus	house sparrow	
Passerculus sandwichensis	savannah sparrow	
Sayornis nigricans	black phoebe	
Sayornis saya	say's phoebe	
Setophaga petechia	yellow warbler	California Species of Special Concern
Sturnella neglecta	western meadowlark	
Sturnus vulgaris	European starling	
Thryomanes bewickii	Bewick's wren	
Tyrannus verticalis	western kingbird	
Tyto alba	barn owl	
Zenaida macroura	mourning dove	
Zonotrichia leucophrys	white-crowned sparrow	
Mammals		

Scientific Name	Common Name	Notes
Ammospermophilus nelsoni	San Joaquin antelope squirrel	State Threatened Species
Canis latrans	coyote	
Dipodomys sp.	kangaroo rat	
Lepus californicus	black-tailed jackrabbit	
Sylvilagus audubonii	desert cottontail	
Reptiles		
Aspidoscelis tigris	western whiptail	
Crotalus oreganus	northern Pacific rattlesnake	
Gambelia sila	blunt-nosed leopard lizard	Federal Endangered, State Endangered, CDFW Fully Protected
Masticophis flagellum ruddocki	San Joaquin coachwhip	California Species of Special Concern
Pituophis catenifer	gopher snake	
Uta stansburiana	common side-blotched lizard	

5.4 JURISDICTIONAL WATERS/WETLANDS

5.4.1 Potential Jurisdictional Features

The USACE Regulatory Program regulates activities pursuant to Section 404 of the federal Clean Water Act (CWA); the CDFW regulates activities under California Fish and Game Code Sections 1600-1607; and the RWQCB regulates activities under Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act.

Potential jurisdictional aquatic features observed in the BSA include sections of Chico Martinez Creek, remnants of ephemeral streams, and various drainage ditches; these features may also be regulated as jurisdictional features by CDFW (Appendix A, Figure A-5.0-5.11). Potentially jurisdictional features are described in more detail in the attached Jurisdictional Delineation Report (see Appendix D).

5.4.2 Preliminary Jurisdictional Determination

Table 7 quantifies the potential jurisdictional waters (in acres, square feet, and linear feet) for the delineated resources within the BSA and includes footnotes summarizing the key characteristics of potential jurisdictional waters for each agency/regulatory jurisdiction based on Stantec's understanding of current regulatory guidance.

Table 7. Preliminary Jurisdictional Waters Totals in the BSA

Potential Jurisdictional Waters[1]	Acres	Square Feet	Linear Feet
U.S. Army Corps of Engineers			
N/A[2]	N/A	N/A	N/A
Total Potential USACE Jurisdiction	**N/A**	**N/A**	**N/A**

Potential Jurisdictional Waters[1]	Acres	Square Feet	Linear Feet
Regional Water Quality Control Board			
Waters of the State (Drainage Ditch between Main Camp Rd and Gas Plant 32)	0.189	8,229	411
Waters of the State (Drainage Ditch along west side of Pole Line Road and north of Tulare Road)	0.155	6,741	602
Waters of the State (Streambed of Remnant Ephemeral Stream south of Contractors Road)	1.008	43,907	1,711
Waters of the State (Streambed of Remnant Sections of Zemorra Creek south of Main Camp Road)	1.195	52,030	1,446
Chico Martinez Creek (Streambed)	6.920	301,413	6,247
Total Potential RWQCB Jurisdiction	**9.467**	**412,320**	**10,417**
California Department of Fish and Wildlife			
Drainage Ditch between Main Camp Rd and Gas Plant 32	0.189	8,229	411
Drainage Ditch along west side of Pole Line Road and north of Tulare Road	0.155	6,741	602
Streambed of Remnant Ephemeral Stream south of Contractors Road	1.008	43,907	1,711
Streambed of Remnant Sections of Zemorra Creek south of Main Camp Road	1.195	52,030.16	1,446
Streambed of Chico Martinez Creek	6.920	301,413	6,247
Total Potential CDFW Jurisdiction	**9.467**	**412,320**	**10,417**

[1] Areas of potential jurisdiction are subject to final verification and approval by the regulatory agencies (i.e., USACE, RWQCB, and CDFW).

[2] No potential federal Waters of the U.S. were delineated with the BSA due to lack of an ordinary high water mark (OHWM) and/or no evident connectivity to any other federal Waters of the U.S. recognized as a traditional navigable water.

Based upon the initial impact assumptions there would be 40,508 square feet or 0.930 acre of temporary impacts on potentially jurisdictional aquatic features within the BSA (Appendix A, Figure A-5.0). There would be no permanent impacts to potentially jurisdictional aquatic features because pipelines would be installed on pipe supports that span the creek crossings.

5.5 SOILS

Prior to conducting the field reconnaissance, historic soils data from the Natural Resources Conservation Service (NRCS) was used to determine potential soil types that may occur within the BSA, including where hydric soils may have historically occurred (Appendix A, Figure A-6). Characteristics of soils present on the site are summarized in Table 8.

Table 8. Historic Soils Occurring within the BSA

Map Unit Symbol	Map Unit Name	Description	Hydric	Acreage in BSA
174	Kimberlina fine sandy loam, 0-2% slopes	The Kimberlina series consists of very deep, well drained soils on flood plains and recent alluvial fans. These soils formed in mixed alluvium derived dominantly from igneous and/or sedimentary rock sources.	No	1,302.67
175	Kimberlina fine sandy loam, 2-5% slopes	The Kimberlina series consists of very deep, well drained soils on flood plains and recent alluvial fans. These soils formed in mixed alluvium derived dominantly from igneous and/or sedimentary rock sources.	No	232.04
176	Kimberlina fine sandy loam, 5-9% slopes	The Kimberlina series consists of very deep, well drained soils on flood plains and recent alluvial fans. These soils formed in mixed alluvium derived dominantly from igneous and/or sedimentary rock sources.	No	7.90
196	Milham sandy loam, 0 to 2 percent slopes Major Land Resource Area 17	The Milham series consists of very deep, well drained soils on alluvial fans, plains, low terraces, and fan remnants. These soils formed in mixed calcareous alluvium weathered from granitic and sedimentary rock.	No	547.25
197	Milham sandy loam, 2 to 5 percent slopes	The Milham series consists of very deep, well drained soils on alluvial fans, plains, low terraces, and fan remnants. These soils formed in mixed calcareous alluvium weathered from granitic and sedimentary rock.	No	394.53
211	Panoche clay loam, 0 to 2 percent slopes	The Panoche series consists of very deep, well drained soils on alluvial fans and flood plains. These soils formed in loamy calcareous alluvium from sedimentary rock.	No	445.81
212	Panoche clay loam, 2 to 5 percent slopes	The Panoche series consists of very deep, well drained soils on alluvial fans and flood plains. These soils formed in loamy calcareous alluvium from sedimentary rock.	No	344.78
Total				**3,274.97**

6.0 SPECIAL-STATUS BIOLOGICAL RESOURCES

The background information presented above, combined with field observations taken during the survey, was used to generate a list of special-status natural communities and special-status plant and animal taxa that either occur or may have the potential to occur within the BSA and/or adjacent habitats. For the purposes of this report, special-status taxa are defined as plants or animals that:

- Have been designated as either rare, threatened, or endangered by CDFW or the USFWS, and are protected under either the California or Federal ESAs;
- Are candidate species being considered or proposed for listing under these same acts;
- Are recognized as SSCs by the CDFW;
- Are ranked as CRPR 1, 2, 3 or 4 plant species;
- Are Fully Protected by California Fish and Game Code, Sections 3511, 4700, 5050, or 5515; or
- Are of expressed concern to resource/regulatory agencies, or local jurisdictions

6.1 SPECIAL-STATUS NATURAL COMMUNITIES

Special-status natural communities are defined by CDFW (2009) as, "...communities that are of limited distribution statewide or within a county or region and are often vulnerable to environmental effects of projects." All vegetation within the state is ranked with an "S" rank, however only those that are of special concern (S1-S3 rank) are generally evaluated under CEQA. Allscale Scrub/Shrubland is located sporadically throughout the BSA and is most common in the northern half of the BSA; this habitat type is utilized by a variety of special-status species, but it only has a state rarity rank of S4, and is not considered sensitive (CDFW 2022e).

6.2 DESIGNATED CRITICAL HABITAT

Literature review conducted prior to conducting field surveys determined that no critical habitat occurs within the BSA (USFWS 2022b). The nearest designated critical habitat units include: 1) a critical habitat unit for Buena Vista Lake ornate shrew (*Sorex ornatus relictus*) located approximately 13.8 miles east of the BSA; 2) a critical habitat unit for vernal pool fairy shrimp (*Branchinecta lynchi)* located approximately 13.8 miles southwest of the BSA; and, 3) a critical habitat unit for California tiger salamander (*Ambystoma californiense*) located approximately 18.1 miles northwest of the BSA. The BSA is also located outside of the known respective ranges of these species.

6.3 SPECIAL-STATUS PLANTS

Table 9 presents a list of special-status plants, including federally- and state-listed species and CRPR 1-4 species that are known to occur in the region surrounding the BSA (within 10 miles). A records search of the CNDDB, the CNPS Online Inventory, and the Consortium of California Herbaria (CCH) was performed for special-status plant taxa and non-protocol plant surveys within the BSA; a map of CNDDB occurrences for special-status plants within a 10-mile radius of the BSA is included in Appendix A, Figure A-1). Additionally, spring-time floristic surveys were completed by Stantec biologists in February, March, and

April 2023. Each of the taxa identified in the record searches was assessed for their potential to occur within the BSA based on the following criteria:

- **Present**: Taxa were observed within the BSA during recent botanical surveys or population has been acknowledged by CDFW, USFWS, or local experts.
- **High**: Both a documented recent record (within 10 years) exists of the taxa within the BSA or immediate vicinity (approximately 5 miles) and the environmental conditions (including soil type) associated with taxa presence occur within the BSA.
- **Moderate**: Both a documented recent record (within 10 years) exists of the taxa within the BSA or the immediate vicinity (approximately 5 miles) and the environmental conditions associated with taxa presence are marginal and/or limited within the BSA; the BSA is located within the known current distribution of the taxa and the environmental conditions (including soil type) associated with taxa presence occur within the BSA.
- **Low**: A historical record (over 10 years) exists of the taxa within the BSA or general vicinity (approximately 10 miles) and the environmental conditions (including soil type) associated with taxa presence are marginal and/or limited within the BSA.
- **Not Likely to Occur:** The environmental conditions associated with taxa presence do not occur within the BSA.

In regard to special-status plants, a single plant keyed to *Eremalche parryi* was observed west of Pole Line Road during botanical surveys in 2023 (Figure 22; Appendix C, Photo 27). The identification and potential regulatory status of this specimen is complicated by the somewhat controversial taxonomy of the Kern mallow and Parry's mallow. The debate centers around the gender, size, and color of flowers to be included in each taxon (Cypher 2002). Certain populations in the Kern/Parry's mallow complex exhibit a condition known as gynodioecy, meaning that some of the plants have only bisexual flowers and other plants in the same population have only pistillate flowers. Bisexual flowers have both male and female parts; these flowers also are known as perfect or hermaphroditic. Pistillate flowers have only female parts; these flowers also are known as male-sterile. Pistillate flowers have shorter petals than bisexual flowers in the same population. Experts agree that Kern mallow is gynodioecious. However, any gynodioecious population in the complex keys to *Eremalche parryi* ssp. in Baldwin et al. (2012), including those that species experts consider to be Parry's mallow (Cypher 2002). Other populations in the Kern/Parry's mallow complex consist only of plants with bisexual flowers; these populations key to *Eremalche parryi* ssp. *parryi* (Baldwin et al. 2012) and are indisputably Parry's mallow. Parry's mallow is generally accepted to have larger flower parts than Kern mallow; Kern mallow flowers may be either white or pale lavender, regardless of gender; Parry's mallow flowers tend to be mauve, purple, or rose-pink (Cypher 2002).

Regarding the single plant observed within the BSA, based on the subject photo and measurements (Appendix C, Photo 27), the single fully budding flower observed appeared to be purple, with petal length in excess of 8.5 mm (closer to 15 mm), calyx length in excess of 8 mm, and abruptly acuminate sepal tips – all characteristics that are more diagnostic of *E. parryi* ssp. *parryi* rather than *E. parryi* ssp. *kernensis*, per the characters/keys included in Baldwin et al. (2012) and Cypher (2002). In addition, the specimen had a bi-sexual (non-pistillate) flower. Considering this information, the specimen cannot be conclusively identified as *E. parryi* ssp. *kernensis* and is most likely the much more common *E. parryi* or *E. parryi* ssp. *parryi*. The potential for occurrence of Kern mallow within the BSA is assessed to be low.

Table 9. Known and Potential Occurrences of Special-status Plant Taxa within the BSA

Species	Status	Habitat and Distribution	Blooming Period	Potential to Occur
Allium howellii var. *howellii* Howell's onion	**4.3**	Found in valley and foothill grassland in clay or serpentinite soils between 160 and 7,220 feet (50 – 2,220 meters) in elevation	Mar-Apr	**Not Likely to Occur:** The nearest occurrence is currently unknown. Suitable habitat/soil for this species does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Amsinckia furcata forked fiddleneck	**4.2**	Found in cismontane woodland, and valley and foothill grasslands between 160 and 3,280 feet (50–1,000 meters) elevation	Feb-May	**Low:** The nearest occurrence is currently unknown. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Androsace elongata ssp. *acuta* California androsace	**4.2**	Found in chaparral, cismontane woodland, coastal scrub, meadows and seeps, pinyon and juniper woodland, and valley and foothill grasslands, between 490 and 4,280 feet (150–1,305 meters) in elevation.	Mar-Jun	**Not Likely to Occur:** The nearest occurrence is currently unknown. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Antirrhinum ovatum oval-leaved snapdragon	**4.2**	Found in chaparral, cismontane woodland, pinyon and juniper woodland, and valley and foothill grasslands in clay or gypsum and often alkaline soils between 655 and 3,280 feet (200–1,000 meters) in elevation.	May-Nov	**Not Likely to Occur:** The nearest occurrence is approximately 3.5 miles southwest of the BSA; however, this occurrence was recorded in 1962. Suitable habitat/soil for this species does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Astragalus hornii var. *hornii* Horn's milk-vetch	**1B.1**	Found in meadows, seeps and playas on lake margins in alkaline soils between 195 and 2,790 feet (60 – 850 meters) in elevation.	May-Oct	**Not Likely to Occur:** The nearest occurrence is currently unknown. Suitable habitat for this species does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Astragalus macrodon Salinas milk-vetch	**4.3**	Found in chaparral, cismontane woodlands, valley and foothill grasslands on sandstone, shale and serpentine soils, between 820 and 3,115 feet (250–950 meters) in elevation.	Apr-Jul	**Not Likely to Occur:** The nearest occurrence is currently unknown. Suitable habitat/soil for this species does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Atriplex cordulata var. *cordulata* heartscale	**1B.2**	Found in chenopod scrub, meadows and seeps, and valley and foothill grasslands in sandy, saline or alkaline soils below 1,835 feet (560 meters) in elevation.	Apr-Oct	**Low:** The nearest occurrence is approximately 9.9 miles east of the BSA. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Atriplex cordulata var. *erecticaulis* Earlimart orache	**1B.2**	Found in valley and foothill grasslands, between 130 and 330 feet (40 – 100 meters) in elevation.	Aug-Sep (Nov)	**Not Likely to Occur:** The nearest occurrence is currently unknown. Annual grassland habitat exists within the BSA, but the elevation of the BSA is above the known elevational range for the species. Not observed in the BSA during appropriately timed floristic botanical surveys.

Species	Status	Habitat and Distribution	Blooming Period	Potential to Occur
Atriplex coronata var. *coronata* crownscale	**4.2**	Found in valley and foothill grasslands, playas, and vernal pools in alkaline soils between 455 and 1,640 feet (139 – 500 meters) in elevation.	Mar-Oct	**Low:** The nearest occurrence is currently unknown. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Atriplex coronata var. *vallicola* Lost Hills crownscale	**1B.2**	Found in chenopod scrub, valley and foothill grasslands, and vernal pools in alkaline soils between 160 and 2,085 feet (50 – 635 meters) in elevation.	Apr-Sep	**Low:** The nearest recorded occurrences is approximately 4.1 miles east of the BSA from 1989, and the most recent occurrence is 8 miles east of the BSA from 2013. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Atriplex flavida Carrizo Plain crownscale	**1B.3**	Found in chenopod scrub, valley and foothill grassland, and vernal pools in alkaline soils between 1,920 feet and 1,985 feet (585 – 605 meters) in elevation.	Mar-Jul	**Low:** The nearest occurrence is currently unknown. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Canbya candida white pygmy-poppy	**4.2**	Found in Joshua tree woodland, Mojavean desert scrub, and pinyon and juniper woodland in granitic, gravelly, and sandy soils between 1,970 and 4,790 feet (600 – 1,460 meters) in elevation.	Mar-Jun	**Not Likely to Occur:** The nearest occurrence is currently unknown. Suitable habitat for this species does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Caulanthus californicus California jewelflower	**FE, SE, 1B.1**	Found in chenopod scrub, pinyon and juniper woodlands, and valley and foothill grasslands in sandy soils between 200 and 3,280 feet (61 – 1,000 meters) in elevation.	Feb-May	**Low:** The nearest recorded occurrence is approximately 1.2 miles east of the BSA from 1937; however, the most recent occurrence was recorded in 2008 and was 7.6 miles from the BSA. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Caulanthus lemmonii Lemmon's jewelflower	**1B.2**	Found pinyon and juniper woodlands, and valley and foothill grasslands between 260 and 5,185 feet (80 – 1,580 meters) in elevation.	Feb-May	**Low:** The nearest recorded occurrence is approximately 8.2 miles southwest of the BSA from 2017. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Cirsium crassicaule slough thistle	**1B.1**	Found in chenopod scrub, marshes and swamps, and riparian scrub between 10 and 330 feet (3 – 100 meters) in elevation.	May-Aug	**Not Likely to Occur:** The nearest recorded occurrence is approximately 9.2 miles east of the BSA from 1954; however, the most recent occurrence was recorded in 1982, 9.8 miles northeast of the BSA. Annual grassland habitat exists within the BSA, but the elevation of the BSA is above the known elevational range for the species. Not observed in the BSA during appropriately timed floristic botanical surveys.

Species	Status	Habitat and Distribution	Blooming Period	Potential to Occur
Clarkia xantiana ssp. *parviflora* Kern Canyon clarkia	**4.2**	Found in chaparral, cismontane woodland, Great Basin scrub, and valley and foothill grassland in roadside, rocky, and sandy soils and on slopes between 2,295 and 11,875 feet (700 – 3,620 meters) in elevation.	May-Jun	**Not Likely to Occur:** The nearest occurrence is currently unknown. Annual grassland habitat exists within the BSA, but the elevation of the BSA is below the known elevational range for the species. Not observed in the BSA during appropriately timed floristic botanical surveys.
Delphinium recurvatum recurved larkspur	**1B.2**	Found in chenopod scrub, cismontane woodland, and valley and foothill grasslands in alkaline soils between 5 and 2,590 feet (3 – 750 meters) in elevation.	Mar-Jun	**Low:** The nearest recorded occurrence is approximately 3.6 miles east of the BSA from 2011. Suitable habitat for this species does exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Eremalche parryi ssp. *kernensis* Kern mallow	**FE, 1B.2**	Found in in chenopod scrub, pinyon and juniper woodlands, and valley and foothill grasslands in dry, open sandy to clay soils between 225 and 4,230 feet (70 – 1,290 meters) in elevation.	(Jan, Feb) Mar-May	**Low:** A single flowering *Eremalche parryi* plant was observed during botanical surveys completed in Spring 2023 west of Pole Line Road. The specimen had bisexual (non-pistillate) flowers, and Kern mallow is acknowledged to have populations that have pistillate flowers. The flower characteristics tend to be more consistent with the much more common *E. parry*i ssp. *parryi* rather than *E. parryi* ssp. *kernensis*.
Eriastrum hooveri Hoover's eriastrum	**4.2**	Found in chenopod scrub, pinyon and juniper woodlands, and valley and foothill grasslands, sometimes in gravelly soils between 160 and 3,000 feet (50–915 meters) in elevation.	(Feb) Mar-Jul	**Moderate:** The nearest recorded occurrence is within the BSA from 1986. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Eriogonum gossypinum cottony buckwheat	**4.2**	Found in chenopod scrub, and valley and foothill grasslands between 325 and 1,805 feet (100–550 meters) in elevation.	Mar-Sep	**Low:** The nearest occurrence is currently unknown. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Eriogonum nudum var. *indictum* protruding buckwheat	**4.2**	Found in chaparral, chenopod scrub, and cismontane woodland in clay and serpentine soils between 490 and 4,800 feet (150 – 1,463 meters) in elevation.	(Apr) May-Oct (Dec)	**Not Likely to Occur:** The nearest occurrence is currently unknown. Suitable habitat/soil for this species does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Eriogonum temblorense Temblor buckwheat	**1B.2**	Found in valley and foothill grasslands in clay or sandstone soils between 990 and 3,280 feet (300 – 1,000 meters) in elevation.	(Apr) May-Sep	**Not Likely to Occur:** The nearest recorded occurrence is approximately 3.7 miles west of the BSA from 1971; however, the most recent occurrence was recorded in 2011 9 miles southeast of the BSA. Suitable habitat/soil for this species does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.

Species	Status	Habitat and Distribution	Blooming Period	Potential to Occur
Eschscholzia hypecoides San Benito poppy	**4.3**	Found in chaparral, cismontane woodland, and valley and foothill grassland in clay and serpentine soils between 655 and 4,920 feet (200 – 1500 meters) in elevation.	Mar-Jun	**Not Likely to Occur:** The nearest occurrence is currently unknown. Suitable habitat/soil for this species does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Eschscholzia lemmonii ssp. *kernensis* Tejon poppy	**1B.1**	Found in chenopod scrub, and valley and foothill grasslands between 520 and 3,280 feet (160 – 1000 meters) in elevation.	(Feb) Mar-May	**Low:** The nearest occurrence 9.6 miles southeast of the BSA from 2001. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Eschscholzia rhombipetala diamond-petaled California poppy	**1B.1**	Found in valley and foothill grasslands in alkaline or clay soils between 0 and 3,200 feet (0 – 975 meters) in elevation.	Mar-Apr	**Low:** The nearest recorded occurrence is approximately 9.9 miles southwest of the BSA; however, this occurrence was recorded in 1986. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Fritillaria agrestis stinkbells	**4.2**	Found in chaparral, cismontane woodland, pinyon and juniper woodland, and valley and foothill grasslands in clay soils, and sometimes in serpentine soils, between 30 and 5,100 feet (10–1,555 meters) in elevation.	Mar-Jun	**Not Likely to Occur:** The nearest occurrence is currently unknown. Suitable habitat/soil for this species does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Lasthenia chrysantha alkali-sink goldfields	**1B.1**	Found in vernal pools in alkaline soils between 0 and 655 feet (0 – 200 meters) in elevation.	Feb-Apr	**Not Likely to Occur:** The nearest recorded occurrence is approximately 8.6 miles northeast of the BSA; however, this occurrence does not have a recorded date. Suitable habitat does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Lasthenia ferrisiae Ferris' goldfields	**4.2**	Found in vernal pools in alkaline and clay soils between 65 and 2,295 feet (20 – 700 meters) in elevation.	Feb-May	**Not Likely to Occur:** The nearest occurrence is currently unknown. Suitable habitat for this species does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Lasthenia glabrata ssp. *coulteri* Coulter's goldfields	**1B.1**	Found in coastal salt marshes and swamps, playas, and vernal pools below 4,005 feet (1,220 meters) in elevation.	Feb-Jun	**Not Likely to Occur:** The nearest recorded occurrence is approximately 4.9 miles east of the BSA in 2010. Suitable habitat for this species does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.

Species	Status	Habitat and Distribution	Blooming Period	Potential to Occur
Layia heterotricha pale-yellow layia	**1B.1**	Found in cismontane woodland, coastal scrub, pinyon and juniper woodlands, and valley and foothill grasslands in alkaline or clay soils between 980 and 5,595 feet (300 – 1,705 meters) in elevation.	Mar-Jun	**Low:** The nearest recorded occurrence is approximately 5.9 miles west of the BSA from 1954; however, the most recent occurrence was recorded in 1955 8.6 miles southwest of the BSA. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Layia munzii Munz's tidy-tips	**1B.2**	Found in chenopod scrub, and valley and foothill grasslands in alkaline clay soils between 490 and 2,295 feet (150 – 700 meters) in elevation.	Mar-Apr	**Not Likely to Occur:** The nearest recorded occurrence is approximately 7.5 miles north of the BSA in 1954; however, the most recent occurrence was recorded in 1988 7.9 miles northeast of the BSA. Suitable habitat/soil for this species does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Madia radiata showy golden madia	**1B.1**	Found in cismontane woodland and valley and foothill grasslands between 80 and 3985 feet (25 – 1215 meters) in elevation.	Mar-May	**Low:** The nearest recorded occurrence is approximately 4.3 miles east of the BSA from 1992; however, the most recent occurrence was recorded in 2008, 5.7 miles east of the BSA. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Monolopia congdonii San Joaquin woollythreads	**FE, 1B.2**	Found in chenopod scrub, and valley and foothill grasslands, in sandy soils between 195 and 2,625 feet (60 – 800 meters) in elevation.	Feb-May	**Low:** The nearest recorded occurrence is approximately 0.84 miles west of the BSA from 2008. However, the most recent occurrence was from 2019, 8.2 miles northeast of the BSA. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Puccinellia simplex California alkali grass	**1B.2**	Found in chenopod scrub, meadows and seeps, valley and foothill grassland, and vernal pools in sinks, alkaline soils, flats, lake margins, and mesic vernal pools between 5 and 3,050 feet (2 – 930 meters) in elevation.	Mar-May	**Low:** The nearest recorded occurrence is approximately 7.6 miles east of the BSA from 1983. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Stylocline citroleum oil neststraw	**1B.1**	Found in chenopod scrub, coastal scrub, and valley and foothill grasslands in clay soils between 160 and 1,310 feet (50 – 400 meters) in elevation.	Mar-Apr	**Not Likely to Occur:** The nearest occurrence is 8.3 miles southeast of the BSA from 2011. Suitable habitat/soil for this species does not exist within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.
Trichostema ovatum San Joaquin bluecurls	**4.2**	Found in chenopod scrub and valley and foothill grassland between 215 and 1,050 feet (65 – 320 meters) in elevation.	(Apr-Jun) Jul-Oct	**Low:** The nearest occurrence is currently unknown. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.

Species	Status	Habitat and Distribution	Blooming Period	Potential to Occur
Tropidocarpum californicum King's gold	**1B.1**	Found in chenopod scrub between 210 and 590 feet (65 - 180 meters) in elevation.	Feb-Mar	**Low:** The nearest occurrence is currently unknown. Suitable habitat for this species exists within the BSA. Not observed in the BSA during appropriately timed floristic botanical surveys.

* Months appearing in parenthesis listed under blooming periods above indicates and additional but uncommon blooming period for that specific species.

Status Codes

Federal Designation

FE Federally Endangered

FT Federally Threatened

State Designation

SE State Endangered

SR State Rare

California Rare Plant Rank (CRPR) Designation

1B Plants rare, threatened, or endangered in California and elsewhere.

2B Plants presumed extinct in California but more common elsewhere.

4 Plants of limited distribution – a watch list

.1 Seriously threatened in California (high degree/immediacy of threat).

.2 Fairly threatened in California (moderate degree/immediacy of threat).

.3 Not very threatened in California (low degree/immediacy of threats or no current threats known).

6.4 SPECIAL-STATUS WILDLIFE

Special-status taxa include those listed as threatened or endangered under the federal or California ESAs, taxa proposed for such listing, SSCs, and other taxa that have been identified by the USFWS, CDFW, or local jurisdictions as unique or rare and which have the potential to occur within the BSA.

The CNDDB was queried for occurrences of special-status wildlife taxa within a 10-mile radius around the BSA; a map of CNDDB occurrences for special-status wildlife within a 10-mile radius of the BSA is included in Appendix A, Figure A-2). The specific habitat requirements and the locations of known records of occurrence of each special-status wildlife species were the principal criteria used for inclusion in the list of taxa potentially occurring within the BSA. Other wildlife species added for consideration include loggerhead shrike, which is an SSC that was observed in the BSA during reconnaissance surveys, California horned lark, which is a CDFW Watch List species observed during protocol BNLL surveys, and Buena Vista Lake ornate shrew, which is a federal endangered species requested for consideration in a CDFW comment letter on the Project CEQA Notice of Preparation (NOP) (CDFW 2023a). Table 10 summarizes the special-status wildlife taxa known to occur (within 10 miles), and their potential for occurrence in the BSA. Each of the taxa identified in the database reviews/searches were assessed for its potential to occur within the BSA based on the following criteria:

Present: Taxa (or sign) were observed in the BSA or in the same watershed (aquatic taxa only) during the most recent surveys, or a population has been acknowledged by CDFW, USFWS, or local experts.

High: Habitat (including soils) for the taxa occurs on site and a known occurrence occurs within the BSA or adjacent areas (within 5 miles of the BSA) within the past 20 years; however, these taxa were not detected during the most recent surveys.

Moderate: Habitat (including soils) for the taxa occurs on site and a known regional record occurs within the database search, but not within 5 miles of the BSA or within the past 20 years; or a known occurrence occurs within 5 miles of the BSA and within the past 20 years and marginal or limited amounts of habitat occurs on site; or the taxa's range includes the geographic area and suitable habitat exists.

Low: Limited habitat for the taxa occurs on site and no known occurrences were found within the database search and the taxa's range includes the geographic area.

Not Likely to Occur: The environmental conditions associated with taxa presence do not occur within the BSA

Table 10. Known and Potential Occurrences of Special-Status Wildlife within the BSA

Species	Status	Habitat Requirements	Potential to Occur
AMPHIBIANS			
Spea hammondii western spadefoot	**SSC**	Occurs in Central valley grasslands and adjacent foothills, although some populations can be found in pine-oak woodlands of the valley foothills. Require shallow, temporary pools or steams during the breeding season. Resides in burrows most of the year.	**Low:** The nearest recorded occurrence is approximately 6 miles northeast of the BSA. Suitable upland habitat for this species is present in the BSA but there is no likely suitable breeding habitat. Not observed during reconnaissance surveys.
BIRDS			
Agelaius tricolor tricolored blackbird	**ST, SSC, BCC**	Occurs throughout the San Joaquin valley. Utilizes irrigated crops for foraging and typically nests in marshes wetlands with cattails, bulrushes, and willows as well as triticale fields.	**Not Likely to Occur (Nesting) / Moderate (Transient):** The nearest recorded occurrence is approximately 0.45 miles west of the BSA; however, the most recent occurrence was recorded over 20 years ago in 1997. This species could potentially forage in the BSA but there is no suitable nesting habitat. Not observed during reconnaissance surveys.
Athene cunicularia burrowing owl	**SSC**	Occurs in dry open grasslands, prairies, and low foothills. Highly tolerant of human activity and development including road shoulders, drainage sumps and under portable buildings.	**High (Nesting) / High (Transient):** The nearest recorded occurrence is approximately 3.89 miles northwest of the BSA. Suitable nesting and foraging habitat for this species is present in the BSA. Not observed during reconnaissance surveys.
Buteo swainsoni Swainson's hawk	**ST, BCC**	Occurs in grasslands with scattered trees, juniper-sage flats, riparian areas, savannahs, and agricultural or ranch lands with groves or lines of trees. Requires adjacent suitable foraging areas such as grasslands, or alfalfa or grain fields supporting rodent populations.	**Present (Transient):** The nearest recorded occurrence is approximately 5.17 miles northeast of the BSA. While this species could potentially forage in the BSA, there are limited potential nesting trees within a 0.5-mile radius of the BSA, and no nesting trees actually within the BSA. A single Swainson's hawk was incidentally observed flying overhead during protocol BNLL Surveys.
Charadrius montanus mountain plover	**SSC**	Occurs in grasslands, cultivated fields, and foothill valleys.	**Moderate (Nesting) / Moderate (Transient):** The nearest recorded occurrence is approximately 4.7 miles northwest of the BSA; however, the most recent occurrence was recorded over 20 years ago in 1994. Suitable nesting and foraging habitat for this species is present in the BSA. Not observed during reconnaissance surveys.
Charadrius alexandrinus nivosus western snowy plover	**FT, SSC**	Occurs year round in the San Joaquin Valley, where they breed on barren sparsely vegetated flats and along shores of alkaline and saline lakes, agricultural wastewater ponds, and salt evaporation ponds.	**Not Likely to Occur (Nesting) / Low (Transient):** The nearest recorded occurrence is 10 miles northeast of the BSA from 1978. This species could potentially forage in the BSA with low likelihood but there is no suitable nesting habitat. Not observed during reconnaissance surveys.

Species	Status	Habitat Requirements	Potential to Occur
Eremophila aplestris actia	**WL**	Occurs oastal regions, chiefly from Sonoma County to San Diego County and allso main part of San Joaquin Valley and east to foothills. Prefers hort-grass prairie, "bald" hills, mountain meadows, open coastal plains, fallow grain fields, alkali flats.	**High (Nesting) / Present (Transient):** There are no recorded occurrences within ten miles of the BSA. California horned larks were observed in the BSA during protocol BNLL surveys. Suitable nesting and foraging habitat for this species is present in the BSA.
Falco mexicanus prairie falcon	**WL**	Occurs in grasslands, savannahs, rangeland, some agricultural fields, and desert scrub. The known range is from southeastern deserts through Central Valley along the inner Coast Ranges and Sierra Nevada.	**Not Likely to Occur (Nesting) / Present (Transient):** The nearest recorded occurrence is within the BSA; this species was incidentally observed flying overhead during 2023 BNLL surveys. This species could potentially forage in the BSA but there is no suitable nesting habitat.
Gymnogyps californianus California condor	**FE**	Forages over large expanses of land including but not limited to, grasslands, foothills, coastal mountain ranges. Nests on cliff faces, large trees or manmade structures.	**Not Likely to Occur (Nesting) / Low (Transient):** There are no recorded occurrences within ten miles of the BSA. This species could potentially forage in the BSA but there is no suitable nesting habitat. Not observed during reconnaissance surveys.
Lanius ludovicianus loggerhead shrike	**SSC**	Occurs in broken woodlands, savannah, pinyon-juniper, Joshua tree, and riparian woodlands, desert oases, scrub and washes. Prefers open country for hunting, with perches for scanning, and fairly dense shrubs and brush for nesting.	**High (Nesting) / Present (Transient):** There are no recorded occurrences within ten miles of the BSA. Loggerhead shrikes were observed in the BSA during reconnaissance and protocol BNLL surveys. Suitable nesting and foraging habitat for this species is present in the BSA.
Toxostoma lecontei Le Conte's thrasher	**SSC**	Occurs in dry, sparsely vegetated deserts, grasslands, and foothills. Populations in California are known to occur in Fresno, Kern and Kings counties.	**High (Nesting) / High (Transient):** Le Conte's thrasher individuals have been recorded within the BSA; however, the occurrence was from 1948. Suitable nesting and foraging habitat for this species is present in the BSA. Not observed during reconnaissance surveys.
FISH			
Hypomesus transpacificus Delta smelt	**FT, ST**	Small fish, endemic to California that only occurs in the San Francisco Estuary. The Delta Smelt life cycle follows the four seasons—spring spawning in fresh water, summer migration/rearing in the low salinity zone, fall maturation in the low salinity zone, and winter upstream migration shortly before spawning.	**Not Likely to Occur:** The BSA is outside of the range of the species and there is no suitable aquatic habitat in the BSA. No occurrences recorded within 10 miles of the BSA. Not observed during reconnaissance surveys.
INVERTEBRATES			
Branchinecta longiantenna longhorn fairy shrimp	**FE**	Occurs in clear, freshwater vernal pools, claypan pools, or freshwater depressions in sandstone in the Central Valley and around Soda Lake in San Luis Obispo County. There are only five known locations where this species occurs.	**Not Likely to Occur:** The nearest recorded occurrence is approximately 9.2 miles west of the BSA. No vernal pools occur within the BSA so it is unlikely that this species could occur. Not observed during reconnaissance surveys.

Species	Status	Habitat Requirements	Potential to Occur
Branchinecta lynchi vernal pool fairy shrimp	**FT**	The species lives in a variety of vernal pool habitats and is currently found throughout California's Central Valley, the central coast, southern California, and southern Oregon.	**Not Likely to Occur:** No occurrences were recorded within 10 miles of the BSA. No vernal pools occur within the BSA so it is unlikely that this species could occur. Not observed during reconnaissance surveys.
Bombus crotchii Crotch bumble bee	**SCE**	Occurs from coastal California east to the Sierra-Cascade crest and south into Mexico. Food plant genera include *Antirrhinum*, *Phacelia*, *Clarkia*, *Dendromecon*, *Eschscholzia*, and *Eriogonum*.	**Moderate:** Suitable habitat is present because *Phacelia and Eriogonum* potential food plants occur within the BSA. The nearest recorded occurrence is approximately 6.7 miles southwest of the BSA from 1980; however, the most recent occurrence is from 1998, 7.5 miles southwest of the BSA. Not observed during reconnaissance surveys.
Danaus plexippus Monarch butterfly	**FC**	Winter roost sites extend along the coast from northern Mendocino to Baja California, Mexico. Roosts located in wind-protected tree groves (eucalyptus, Monterey pine, cypress), with nectar and water sources nearby. Food plant genus *Asclepias*.	**Not Likely to Occur:** No suitable habitat for food or roosting occurs within the BSA. Not observed during reconnaissance surveys.
Protodufourea zavortinki Zavortink's protodufourea bee	**SSC**	Known host plants including members of *Phacelia* and *Emmenanthe*	**Low:** Suitable habitat is present because *Phacelia* potential host plants occur within the BSA. The nearest recorded occurrence is approximately 8 miles southwest of the BSA from 1970; however, the most recent occurrence is from 1993, 8.9 miles *southeast* of the BSA. Not observed during reconnaissance surveys.
MAMMALS			
Ammospermophilus nelsoni San Joaquin antelope squirrel	**ST**	Occurs in open grasslands but prefers areas that lightly vegetated. Found in saltbush scrub lands mainly in the San Joaquin Valley.	**Present:** Suitable habitat for this species is present in the BSA. SJAS individuals were observed within the BSA during the 2022 reconnaissance surveys and 2023 protocol BNLL surveys, with all observations occurring north of Lerdo Highway and most observations concentrated toward the northern end of the BSA. SJAS was also observed in grasslands north of GP32 during 2022 protocol BNLL surveys conducted for a separate project (South Valley Biological Consulting 2022).
Antrozous pallidus pallid bat	**SSC**	Occurs in a wide variety of habitats including grasslands, shrublands, woodlands, and forests. Roosts in open, dry habitats with rocky areas including caves, crevices, trees, buildings, and mines.	**Not Likely to Occur (Roosting) / Moderate (Transient):** The nearest recorded occurrence is approximately 6 miles west of the BSA; however, this occurrence was recorded well over 20 years ago in 1948. Suitable roosting habitat for this species is not present in the BSA. Not observed during reconnaissance surveys.

Species	Status	Habitat Requirements	Potential to Occur
Dipodomys ingens giant kangaroo rat	**FE, SE**	Inhabits annual grasslands on the western side of the San Joaquin Valley, with marginal habitat in alkali scrub. Needs level terrain and sandy loam soils for burrowing.	**Low to Moderate:** The nearest recorded occurrence of giant kangaroo rat (GKR) is approximately 1 mile southeast of the BSA from 2016 at Aera Energy's Block 12 property. Relatively dense annual grasslands and saltbush scrub in the BSA may support marginal habitat for the species. Not observed during reconnaissance surveys. Small mammal trapping is proposed to determine presence/absence.
Dipodomys nitratoides brevinasus short-nosed kangaroo rat	**SSC**	Occurs in lightly vegetated grasslands in the Central San Joaquin Valley of California, primarily in areas with sandy soils conducive to burrowing. Found exclusively west of the California Aqueduct.	**Moderate:** The nearest recorded occurrence is approximately 4 miles east of the BSA from 2007. Suitable habitat for this species is present in the BSA. Not observed during reconnaissance surveys.
Dipodomys nitratoides nitratoides Tipton kangaroo rat	**FE, SE**	Occurs in lightly vegetated grasslands in the Central San Joaquin Valley of California, primarily in areas with sandy soils conducive to burrowing. Found exclusively east of the California Aqueduct.	**Not Likely to Occur:** The nearest recorded occurrence is approximately 3.5 miles east of the BSA. BSA is outside the known range of the species that occurs east of the California Aqueduct. Not observed during reconnaissance surveys.
Eumops perotis californicus western mastiff bat	**SSC**	Occurs in open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, grasslands, and chaparral. Roosts in crevices in cliff faces, high buildings, trees, and tunnels.	**Not Likely to Occur (Roosting) / Moderate (Transient):** The nearest recorded occurrence is approximately 2.6 miles east of the BSA; however, this occurrence was recorded well over 20 years ago in 1953. Suitable habitat for this species is not present in the BSA. Not observed during reconnaissance surveys.
Lasiurus cinereus hoary bat	**SSC**	May be found at any location in California, although distribution patchy in southeastern deserts. This common, solitary species winters along the coast and in southern California, breeding inland and north of the winter range. During migration, may be found at locations far from the normal range, such as the Channel Islands (Brown 1980) and the Farallon Islands (Tenaza 1966). Habitats suitable for bearing young include all woodlands and forests with medium to large-size trees and dense foliage	**Not Likely to Occur:** The nearest occurrence is 5.9 miles west of the BSA from 1947. Suitable habitat is not found within the BSA. Not observed during reconnaissance surveys.
Onychomys torridus tularensis Tulare grasshopper mouse	**SSC**	Occurs in grasslands in the Central San Joaquin Valley of California, primarily in areas with sandy soils conducive to burrowing.	**Moderate:** The nearest recorded occurrence is approximately 5.49 miles east of the BSA. Suitable habitat for this species is present in the BSA. Not observed during reconnaissance surveys.

Species	Status	Habitat Requirements	Potential to Occur
Perognathus inornatus San Joaquin pocket mouse	**SSC**	Occurs in lightly vegetated grasslands in the Central San Joaquin Valley of California, primarily in areas with sandy soils conducive to burrowing.	**Moderate:** The nearest recorded occurrence is approximately 0.7 mile south of the BSA and the most recent occurrence is from 2003, 4.5 miles southeast of the BSA. Suitable habitat for this species is present in the BSA. Not observed during reconnaissance surveys.
Sorex ornatus relictus Buena Vista Lake ornate shrew	**FE, SSC**	Occurs in marshlands and riparian areas in the Tulare Basin. Prefers moist soil. Uses stumps, logs, and litter for cover.	**Not Likely to Occur:** No occurrences were recorded within 10 miles of the BSA. No suitable marshland or riparian habitat occurs within the BSA so it is unlikely that this species could occur. Not observed during reconnaissance surveys.
Taxidea taxus American badger	**SSC**	Uncommon, permanent resident found throughout most of the state, except in the northern North Coast area. Most abundant in drier open states of most shrub, forest and herbaceous habitats, with friable soils.	**Moderate:** The nearest recorded occurrence is approximately 7.7 miles southeast from 1990. Suitable habitat exists in the BSA, and a few potential badger dens were observed in the BSA. No badgers were observed during reconnaissance surveys.
Vulpes macrotis mutica San Joaquin kit fox	**FE, ST**	Occurs in drier open stages of most shrub, forest, and herbaceous habitats. Needs a sufficient food supply, friable soils, and open, uncultivated ground. Highly tolerant of human activity and will opportunistically utilize man-made structures for cover and denning sites. Preys on burrowing rodents and discarded food-trash.	**Present:** There are two occurrences from over 20 years ago. There are multiple occurrences within 10 miles of the BSA, including a 2007 occurrence located 2.9 miles southeast of the BSA. Suitable habitat for this species is present in the BSA. Several potential SJKF dens were observed during reconnaissance surveys in 2022 and protocol BNLL surveys in 2023. No SJKF were observed during reconnaissance surveys, but the species is assumed to occur within the BSA.
REPTILES			
Anniella pulchra northern California legless lizard	**SSC**	Occurs in coastal dunes, valley-foothill, chaparral, and coastal scrub. This is a secretive species that prefers sandy or loose organic soils.	**Low:** The nearest recorded occurrence is approximately 7.8 miles southwest of the BSA from 2015. Suitable habitat for this species is present in the BSA. Not observed during reconnaissance surveys.
Anniella alexanderae Temblor legless lizard	**SCE**	Endemic to the alkali desert scrub and annual grasslands of the southwestern San Joaquin Valley, east of the Temblor mountains at 168-466m (551-1,529 ft.) elevation.	**Low:** The nearest recorded occurrence is 8.8 miles southeast of the BSA from 2017. Suitable habitat for this species is present in the BSA. Not observed during reconnaissance surveys.
Arizona elegans occidentalis California glossy snake	**SSC**	Occurs in arid scrub, rocky washes, grasslands, and chaparral. Appear to prefer microhabitats of open areas with soil loose enough for easy burrowing.	**Moderate:** The nearest recorded occurrences are approximately 5.5 and 8.5 miles southeast of the BSA from 1932 and 2015. Suitable habitat for this species is present in the BSA. Not observed during reconnaissance surveys.

Species	Status	Habitat Requirements	Potential to Occur
Emys marmorata western pond turtle	**SSC**	Occurs near permanent ponds, lakes, streams, irrigation ditches, or permanent pools along intermittent streams west of the Sierra-Cascade crest, except along the Mojave River.	**Not Likely to Occur:** The nearest recorded occurrence is approximately 4.9 and 8.9 miles east of the BSA. Suitable habitat for this species is not present in the BSA. Not observed during reconnaissance surveys.
Gambelia sila blunt-nosed leopard lizard	**FE, SE, FP**	Occurs mainly in the Carrizo Plain, Cuyama, Panoche and the San Joaquin Valleys. Typically inhabits grasslands, saltbush scrub and alkali sink scrub. Uses animal burrows for shelter.	**Present:** The nearest CNDDB occurrences are approximately 0.1 mile north and 7.2 miles southeast of the BSA from 1987 and 2020 respectively. Suitable habitat for this species is present in the BSA. Two BNLLs were observed in BNLL protocol survey Segment 4 and two BNLLs were observed in Segment 3 during the 2023 adult season protocol surveys; one adult male BNLL and one sub-adult (sex unknown) BNLL were observed in Segment 3 during the 2023 hatchling/sub-adult season protocol surveys (Appendix B; Mesa Biological 2023).
Masticophis flagellum ruddocki San Joaquin coachwhip	**SSC**	Occurs in grasslands with an understory of saltbush scrub and alkali sink scrub in areas with an abundance of small mammal burrows.	**Present:** The nearest recorded occurrences are approximately 3.1 miles southeast and 7 miles northeast of the BSA. Suitable habitat for this species is present in the BSA. A San Joaquin coachwhip was observed in the BSA during protocol BNLL surveys.
Phrynosoma blainvilli coast horned lizard	**SSC**	Occurs in valley, foothill hardwood, conifer and riparian habitats, as well as in pine-cypress, juniper and annual grassland habitats. Occurs in the Sierra Nevada foothills from Butte Co. to Kern Co. and throughout the central and southern California coast.	**Moderate:** The nearest recorded occurrence is 9.3 miles northeast of the BSA from 2008. Suitable habitat for this species is present in the BSA. Not observed during reconnaissance surveys.

6.5 WILDLIFE CORRIDORS AND SPECIAL LINKAGES

Wildlife corridors and linkages facilitate regional animal movement and are generally centered in or around waterways, riparian corridors, flood control channels, contiguous habitat, and upland habitat. Drainages generally serve as movement corridors because wildlife can move easily through these areas, and fresh water is available. Corridors also offer wildlife unobstructed terrain for foraging and for dispersal of young individuals.

As the movements of wildlife species are more intensively studied using radio-tracking devices, there is mounting evidence that some wildlife species do not necessarily restrict their movements to some obvious landscape element, such as a riparian corridor. For example, radio-tracking and tagging studies of Coast Range newts, California red-legged frogs, southwestern pond turtles, and two-striped garter snakes found that long-distance dispersal involved radial or perpendicular movements away from a water source with little regard to the orientation of the assumed riparian "movement corridor" (Hunt, 1993; Rathbun et al., 1992; Bulger et al., 2002; Trentham, 2002; Ramirez, 2002, 2003a, 2003b). Likewise, carnivores do not necessarily use riparian corridors as movement corridors, frequently moving overland in a straight line between two points when traversing large distances (Newmark, 1995; Beier, 1993, 1995; Noss, et al., 1996; Noss et al., no date). In general, the following corridor functions can be utilized when evaluating impacts to wildlife movement corridors:

- Movement corridors are physical connections that allow wildlife to move between patches of suitable habitat. Simberloff et al. (1992) and Beier and Loe (1992) correctly state that, for most species, we do not know what corridor traits (length, width, adjacent land use, etc.) are required for a corridor to be useful. But, as Beier and Loe (1992) also note, the critical features of a movement corridor may not be its physical traits but rather how well a particular piece of land fulfills several functions, including allowing dispersal, plant propagation, genetic interchange, and recolonization following local extirpation.
- Dispersal corridors are relatively narrow, linear landscape features embedded in a dissimilar matrix that links two or more areas of suitable habitat that would otherwise be fragmented and isolated from one another by rugged terrain, changes in vegetation, or human-altered environments. Corridors of habitat are essential to the local and regional population dynamics of a species because they provide physical links for genetic exchange and allow animals to access alternative territories as dictated by fluctuating population densities.
- Habitat linkages are broader connections between two or more habitat areas. This term is commonly used as a synonym for a wildlife corridor (Meffe and Carroll, 1997). Habitat linkages may themselves serve as source areas for food, water, and cover, particularly for small- and medium-size animals.
- Travel routes are usually landscape features, such as ridgelines, drainages, canyons, or riparian corridors within larger natural habitat areas that are used frequently by animals to facilitate movement and provide access to water, food, cover, den sites, or other necessary resources. A travel route is generally preferred by a species because it provides the least amount of topographic resistance in moving from one area to another yet still provides adequate food, water, or cover (Meffe and Carroll, 1997).

- Wildlife crossings are small, narrow areas of limited extent that allow wildlife to bypass an obstacle or barrier. Crossings typically are manmade and include culverts, underpasses, drainage pipes, bridges, and tunnels to provide access past roads, highways, pipelines, or other physical obstacles. Wildlife crossings often represent choke points" along a movement corridor because useable habitat is physically constricted at the crossing by human-induced changes to the surrounding areas (Meffe and Carroll, 1997).

6.5.1 Wildlife Movement in the Project Site

Wildlife likely use both the natural and developed portions of the BSA on a regular basis during normal foraging, migration, nesting, and denning activities. There are no known, widespread, wildlife corridor studies that include the BSA. The CDFW maintains GIS data for "Missing Linkages" (i.e., wildlife corridors) derived from the California Essential Habitat Connectivity Project, which is the best available information on important areas needed for maintaining connectivity between large blocks of land for wildlife corridor purposes (CDFW 2023b). Essential Connectivity Areas are intended to be a broad scale representation of areas that provide essential connectivity. The BSA does not fall within an Essential Connectivity Area; the nearest Essential Connectivity Area is the Temblor Range approximately 5 to 10 miles west of the Belridge Oil Fields (CDFW 2023).

7.0 IMPACT ASSESSMENT FOR SPECIAL-STATUS SPECIES AND SENSITIVE HABITATS

Construction of the proposed Project could impact various special-status wildlife species and their habitat. The construction of the CCS facility, pipelines and supports, injection and monitoring wells, and associated infrastructure would require clearing/grubbing, grading, excavation, and other land disturbance impacts. Potential sources of temporary project impacts include use of heavy equipment and worker foot-traffic along the construction corridor, access and staging, temporarily graded and grubbed areas, and future maintenance activities.

7.1 DIRECT EFFECTS

Construction activities would most likely be most adverse to ground dwelling or fossorial animals (i.e., animals that live in nests, dens, burrows, or substrate below ground). Animals such as foraging and nesting Crotch bumble bee, reptiles, small mammals, burrowing owl, SJAS, and American badger have the potential to be injured or killed while above ground or while occupying dens/burrows from heavy equipment used during construction activities, including during new pipeline construction, well drilling, utility line construction, trenching, excavation of foundations for Project features, construction of utility line towers, and construction of other Project facilities. Impacts could include crushing of individuals and crushing or collapse of burrows by construction vehicles and during construction work. Such animals could also fall into excavated areas (e.g., pipeline trenching, bore pits) and become trapped, which could result in mortality or injury. Additionally, if left unimpeded, individuals that could move through the work areas and across access roads could be at risk of injury or mortality from foot and vehicle traffic. Direct effects on wildlife, including injury or mortality, may could also result from regrading dirt roads with heavy equipment, and maintaining paved roads with paving equipment if wildlife were to enter construction areas or be near where this work is being carried out.

Construction activities could also directly impact ground nesting birds or birds that nest in shrubs. Clearing/grubbing could directly impact active bird nests if these activities are conducted during the nesting season, resulting in potential damage or destruction to nests, eggs, and/or young.

Direct effects on special-status wildlife could also result from increased equipment and human presence, including construction related disturbance and ground vibration during excavation, trenching, pipeline installation, and related activities. Construction noise, disturbance, and ground vibration could cause collapse of burrows and may deter wildlife from inhabiting or foraging in areas near construction activities. Therefore, foraging and other above-ground behaviors could be disrupted, and exposure to predators and competition with other animals for resources could result from displacement behavior as wildlife migrate to other areas without construction disturbance.

Direct effects on special-status wildlife could result from the loss of suitable habitat in the BSA. With the large size of the BSA and expected scarcity of special-status species in the BSA, it is not possible to quantify direct impacts on special-status species. Because most of the areas where Project construction would occur are already impacted and developed with oil and gas extraction infrastructure, the potential

for direct impacts on special-status species, including from loss of burrows and other suitable habitat in the BSA, is expected to be low. Additionally, direct impacts from construction are expected to be mainly temporary, and would cease after construction within affected areas has been completed. Due to the relatively small size and primarily temporary nature of impacts expected on suitable habitat in the BSA, the Project is not anticipated to substantially reduce the overall availability of habitat for special-status wildlife species.

No direct effect/impacts on special-status plants are anticipated because no special-status plants were confirmed to occur within the BSA as a result of appropriately timed floristic botanical surveys.

7.2 INDIRECT EFFECTS

Project construction activities would temporarily reduce vegetation in areas where vegetation trimming or removal is needed, and may temporarily increase airborne dust that may settle on vegetation surrounding construction areas within the BSA. The dust from construction activity may temporarily degrade the overall quality of the local vegetation communities in the BSA. Additionally, heavy equipment working in the BSA may disrupt or compact soils in localized areas and make some habitat less suitable for digging burrows by mammals for a period of time. Certain biotic crusts and other developed soil profiles may be affected by construction activities and would potentially reduce soil viability for special status plants and animals. These indirect effects may diminish the suitability of habitat near construction areas for special-status wildlife for a period of time following construction while vegetation regenerates, rainstorms remove dust from vegetation, and burrows are re-established. Noise disturbance could also have the potential to alter the foraging and/or dispersal/migration behaviors of species such as SJAS and nesting behaviors of various bird species. However, these indirect impacts would be temporary and localized, and are not expected to translate into adverse effects on special-status wildlife because most locations within the Project site and beyond would not be subjected to these indirect effects.

7.3 CUMULATIVE EFFECTS

Potential cumulative effects must be considered in context of the intensive oilfield operations that have been ongoing in the region for decades. The BSA consists mostly of existing disturbed oil and gas infrastructure interspersed with impacted Allscale Scrub shrubland, and Red Brome or Mediterranean Grass grasslands within roughly the southern half of the Project site, with more natural stands of Allscale Scrub and grasslands within roughly the northern half of the BSA. Although the size of the Project footprint is relatively large, the estimated permanent and temporary impacts are small. Potential impacts to special-status species would be mitigated with a suite of comprehensive measures, and impacts to habitats and jurisdictional waters would also be offset with restoration and/or compensatory mitigation. As a result, no substantial cumulative effects are anticipated.

8.0 AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES

8.1 AVOIDANCE AND MINIMIZATION MEASURES

The avoidance and minimization measures below pertain to Project activities in the BSA. Through the Project design features and application of the general and species-specific avoidance and minimization measures outlined below, Aera Energy will avoid and minimize potential impacts on federally listed species and minimize loss and degradation of federally listed species habitat in the BSA to the greatest extent practicable. Agency-approved biologist(s) will also be identified prior to start of construction, and will be responsible for monitoring Project activities to ensure compliance with avoidance and minimization measures; agency-approved biologists may require approvals from USFWS, CDFW, and/or Kern County. The agency-approved biologist(s) will have the authority to immediately stop any activity not complying with avoidance and minimization measures or other conditions prescribed by future Project permits (e.g., USFWS Biological Opinion [BO], State ITP). The agency-approved biologist(s) will be knowledgeable and experienced in the biology and natural history of the covered federally listed species and experienced with implementing the measures required in the BO. At least 30 days prior to the start of ground-disturbing activities, Aera Energy will submit biologist qualifications to the applicable agencies for approval. Qualifications will include the necessary experience and/or permits for handling of special-status species (if authorized), excavating burrows or dens, and monitoring construction activities.

8.1.1 Best Management Practices

The BMPs below have been incorporated into the implementation of Project activities to avoid and minimize effects on special-status species and their habitat in the BSA. These BMPs will be implemented at all times.

BMP-1: Aera Energy will initiate a trash abatement program before starting Project activities and will continue the program for the duration of the Project. Aera Energy will ensure that trash and food items are contained in animal-proof containers and removed at least once a week to avoid attracting opportunistic predators such as ravens, coyotes, and feral dogs.

BMP-2: Upon completion of Project activities at each work area, Aera Energy will remove from and properly dispose of all temporary fill and construction refuse.

BMP-3: Aera Energy will implement dust control measures during Project activities to facilitate visibility for monitoring of special-status by the agency-approved biologist. Aera Energy will keep the amount of water used to the minimum amount needed and will not allow water to form puddles.

BMP-4: Aera Energy will prohibit use of erosion control materials potentially harmful to special-status species, such as monofilament netting or similar material, in potential special-status species habitat.

BMP-5: Before starting construction activities, Aera Energy will clearly delineate the boundaries of the construction area with fencing, stakes, or flags and will restrict all Project activities to within these areas. Aera Energy will maintain all fencing, stakes, and flags until the completion of construction activities in that area.

BMP-6: Aera Energy will immediately stop and arrange for repair and cleanup of any fuel or hazardous waste leaks or spills at the time of occurrence, or as soon as it is safe to do so. Aera Energy will ensure the proper storage and handling of hazardous materials during Project activities and properly contain and dispose of any unused or leftover hazardous products off site.

BMP-7: Aera Energy will keep oil out of trenches and other excavations. In the event that oil, produced water, or drilling mud containing oil are accidentally conveyed to an excavated area, Aera Energy will implement measures to preclude BNLL, GKR, and SJKF access to the excavated area until oil and oil residues have been removed and no longer pose exposure risk to wildlife. Measures will include installation of temporary netting or covering to preclude species access.

BMP-8: Aera Energy will ensure that any application of herbicide is done by a licensed applicator in accordance with label specifications and all applicable federal, state, local laws and regulations.

BMP-9: Aera Energy will prohibit the use of rodenticides in the BSA.

BMP-10: Aera Energy will ensure that all equipment fueling and equipment maintenance occur at least 100 feet from special-status species dens, burrows, or precincts. Sufficient spill containment and cleanup equipment will be present at all fueling locations.

BMP-11: In temporary disturbance areas, Aera Energy will conserve, stock-pile, and re-spread topsoil.

BMP-12: If the proposed Project could impact jurisdictional waters, construction activities in jurisdictional waters would occur only during dry conditions.

8.1.2 General Avoidance and Minimization Measures

The avoidance and minimization measures below will be implemented whenever Project activities occur.

GEN-1: An agency-approved biologist will be onsite during all ground-disturbing Project activities that may result in take of special-status species or adverse impacts to their habitat.

GEN-2: Aera Energy will clearly delineate work exclusion zones for habitat of special-status species that will be avoided during Project activities within the BSA. Aera Energy will maintain all signs, stakes, flags, and/or rope or cord, and fencing until the completion of Project activities in each area.

GEN-3: Project-related personnel will access the BSA using existing routes and will not cross natural areas outside of or in route to the BSA. Aera Energy will restrict Project -related vehicle traffic to established roads, staging, and parking areas. Aera Energy will ensure that vehicle speeds do not exceed 15 mph to avoid special-status species on or traversing roads. Aera Energy will flag all dirt access roads in the field and vehicle operation will be limited to these designated ingress and egress routes.

GEN-4: Aera Energy will conduct an education program for all persons employed or otherwise working in the BSA before performing any work that includes information about the biology and general behavior of special-status species, and the need and requirement to properly implement the BMPs and avoidance and minimization measures.

GEN-5: Aera Energy will confine all ground- or vegetation-disturbing construction activities to daylight hours (sunrise to sunset). Well drilling activities will occur 24-hours per day.

GEN-6: Aera Energy will not allow vehicles to park within 50 feet of known special-status species dens, burrows, or precincts.

GEN-7: Workers will inspect for wildlife under vehicles and equipment every time the vehicles and equipment are moved. If wildlife is present, the worker will wait for the wildlife to move unimpeded to a safe location or for the agency-approved biologist to determine if the animal may be safely moved.

GEN-8: The agency-approved biologist will inspect all open holes and trenches within the Project footprint at the beginning, middle, and end of each day for trapped wildlife. Aera Energy will provide escape ramps at all excavated, steep-walled holes or trenches and the agency-approved biologist will oversee the covering of all of the excavations at the close of each working day.

GEN-9: All pipes, hoses, conduits, culverts, or similar materials stockpiled or installed in the Project footprint will be capped or otherwise enclosed at the ends to prevent entry by special-status species and other wildlife. The agency-approved biologist will inspect all such materials for special-status wildlife before they are moved, buried or capped.

GEN-10: Workers will inform the agency-approved biologist if a special-status species is seen within or near the Project footprint. All work in the vicinity of a special-status species will cease until the animal is moved by the agency-approved biologist or it moves from the area of its own accord.

GEN-11: The agency-approved biologist will perform pre-construction surveys for presence of special-status species no more than 14 days prior to construction activities in order to delineate work exclusion zones and mark small-mammal burrows within 50 feet of the ground disturbance area.

GEN-12: Prior to construction within the ground disturbance area, Aera Energy will hand-remove large shrubs identified by the agency-approved biologist to encourage special-status species to move out of the area. Aera Energy will also install temporary exclusion fencing around the ground disturbance areas to exclude special-status species from the construction site. The temporary exclusion fencing would be installed in a sequential manner that corresponds to the progression of construction activities. For example, temporary exclusion fencing will not be installed simultaneously at all work locations and will be removed immediately upon completion of Project construction activities at each work area to minimize habitat fragmentation caused by fencing. Aera Energy will submit a fencing plan to the applicable agencies for approval prior to new construction occurring as part of the Project that will specify the type of temporary fence to be used, installation procedure, specific area fenced, and fencing maintenance procedures. If an animal is found trapped inside the temporary fencing, all work will cease and the agency-approved biologist will open the fence to allow the animal leave the fenced area on its own accord.

GEN-13: The agency-approved biologist will accompany the exclusion fence construction crew to ensure that special-status species are not killed or injured during fence installation. The temporary exclusion fencing will be installed to avoid special-status species burrows when feasible and supported sufficiently to maintain its integrity under all conditions such as wind and heavy rain for the duration of the construction activities in that work area. The agency-approved biologist will check the temporary exclusion fence at least once weekly to identify necessary maintenance or repairs.

GEN-14: After completion of live trapping described below under Species-Specific Avoidance Measures, any burrows that could be used by BNLL, GKR, SJAS, or SJKF present within the fenced ground disturbance area or burrows that are likely to be connected to burrows within the fenced area, as determined by the agency-approved biologist, will be fully excavated by hand by the agency-approved biologist or by an individual under the direct supervision of the agency-approved biologist. The agency-approved biologist will determine if burrows outside of the fenced area are likely to be connected to burrows within the fenced area, based on several factors, including:

- Proximity of burrows outside the fencing to those within fencing;
- Burrow size and orientation; and
- Soil hardness/compaction (indicator of the depth of the burrows).

The agency-approved biologist may also use a scope to help make this determination.

GEN-15: If a BNLL, GKR, SJAS, or SJAS is injured as a result of Project-related activities during construction, operations and maintenance, or well plugging and abandonment, the agency-approved biologist will immediately take it to a USFWS- and/or CDFW-approved wildlife rehabilitation or veterinary facility, and USFWS and/or CDFW will be notified immediately.

GEN-16: To the greatest extent feasible, vehicles left overnight will not be located within 50 feet of small mammal burrows.

GEN-17: Aera Energy will limit nighttime activity to essential personnel only, including emergency response or security personnel, to ensure that vehicle traffic necessary during nighttime hours will minimize effects on GKR and SJAS.

GEN-18: Aera Energy will minimize new disturbance and habitat fragmentation by consolidating infrastructure and confining all Project-related parking, storage, laydown, and temporary equipment storage areas to previously disturbed areas to the greatest extent practicable.

GEN-19: Prior to construction, Aera Energy shall coordinate with USFWS and USEPA to obtain a federal BO for federally listed species that could be affected by the Project.

GEN-20: Prior to construction, Aera Energy shall coordinate with CDFW to obtain a State ITP or CESA consistency determination for state listed species that could be affected by the Project.

8.1.3 Species-Specific Avoidance and Minimization Measures

The following avoidance and minimization measures are proposed for special-status species that have either been observed within the BSA, assessed as having the potential to occur within the BSA, or are otherwise assessed as having the potential to be impacted by the proposed Project.

8.1.3.1 Crotch Bumble Bee (CBB)

CBB-1: If Crotch bumble bee becomes state listed or remains a candidate species under the California ESA, at least one year prior to construction a qualified biologist shall conduct a survey within the Project footprint and a 100-foot buffer zone following the CDFW *Survey Considerations for California Endangered Species Act (CESA) Candidate Bumble Bee Species* (CDFW 2023). The Crotch bumble bee survey effort shall include at minimum:

- A detailed habitat assessment;
- A survey proposal submitted to and approved by CDFW;
- Appropriately-timed foraging and nesting bumble bee surveys;
- Per the CDFW guidance (2023c), Aera Energy shall notify CDFW for further coordination as required to avoid or mitigate impacts and to determine if a State ITP will be required.

CBB-2: At minimum, a 50-foot avoidance buffer shall be maintained surrounding foraging Crotch bumble bees and active Crotch bumble bee nests unless CDFW agrees to a reduced buffer.

8.1.3.2 Burrowing Owl (BUOW)

BUOW-1: At least one year prior to construction, a qualified biologist shall conduct a protocol survey within the Project footprint and a 150-meter (approximately 500 ft.) buffer zone following the California Burrowing Owl Consortium *Burrowing Owl Survey Protocol and Mitigation Guideline*s (Burrowing Owl Consortium 1993). The burrowing owl protocol survey effort shall include:

- Phase I: Habitat Assessment;
- Phase II: Burrow Survey;
- Phase III: Burrowing Owl Surveys, Census, and Mapping; and
- Phase IV: Resource Summary and Written Report

BUOW-2: Prior to construction and no more than 14 days prior to ground-disturbing activities, a qualified biologist shall conduct preconstruction surveys of all areas with suitable habitat that will be permanently or temporarily impacted, plus a 200-meter buffer in areas subject to legal access, to locate active breeding or wintering burrowing owl burrows. The survey methodology shall be consistent with the take avoidance survey methods outlined in the CDFW *Staff Report on Burrowing Owl Mitigation* (CDFW 2012). Because burrowing owl may re-colonize a site after only a few days, time lapses between Project

activities may trigger subsequent surveys, including, but not limited to, a final survey conducted within 24 hours prior to ground disturbance to identify any additional burrowing owl or burrows necessitating avoidance, minimization, or mitigation measures. The need for additional surveys will be at the final discretion of the qualified biologist. If burrowing owl absence is reverified, Project activities can proceed providing acceptance by CDFW of the survey results.

If burrowing owl are detected on-site during preconstruction surveys or during construction, no ground-disturbing activities within a minimum 200-meter avoidance buffer shall occur around occupied burrows during the breeding season (February 1 to August 31), unless authorized by CDFW. During the non-breeding season (September 1 to January 31), no ground-disturbing activities within a minimum 50-meter avoidance buffer shall occur around occupied burrows, unless authorized by CDFW.

If burrow avoidance is infeasible during the non-breeding season or during the breeding season where resident owls have not yet begun egg laying or incubation, or where the juveniles are foraging independently and capable of independent survival, the applicant shall coordinate with CDFW to develop a Burrowing Owl Exclusion and Mitigation Plan. The Burrowing Owl Exclusion and Mitigation Plan strategy may include, but is not limited to, the following:

- Passive exclusion of BUOW from burrows within the Project site using one-way doors.
- Excavation of potential BUOW burrows that are confirmed to be empty of BUOW adults and/or young.
- Creation of artificial BUOW burrows to offset the loss of known occupied BUOW burrows.
- Acquisition of BUOW conservation lands and/or bank credits.

8.1.3.3 Swainson's Hawk (SWHA)

SWHA-1: At least one year prior to construction, a qualified biologist shall conduct a protocol survey within the Project footprint and a 0.5 mile buffer zone following the Swainson's Hawk Advisory Committee *Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley* (Swainson's Hawk Advisory Committee 2000). The Swainson's hawk protocol survey effort shall include:

- Phase I: Pre-breeding Season Nest Surveys (recommended optional); Schedule: one all day survey conducted from January to March;
- Phase II: Nesting Territory and Courtship Surveys; Schedule: three surveys conducted from sunrise to 10:00AM and/or 16:00PM to sunset; surveys conducted from March 20 to April 5;
- Phase III: Nesting Activity Surveys; Schedule: three surveys conducted from sunrise to noon and/or 16:30PM to sunset; surveys conducted from April 5 to April 20;
- Phase IV: Egg-laying and Incubation Monitoring (monitoring known nest sites only, if required); Schedule: monitoring conducted as needed per biologist discretion from April 21 to June 10.

- Phase V: Fledging and Post-fledging Monitoring (if required); Schedule: three monitoring days conducted from sunrise to noon and/or 16:00PM to sunset; monitoring conducted from June 10 to July 30.

SWHA-2: If active Swainson's hawk nest(s) are identified during protocol surveys, Aera Energy shall coordinate with CDFW to develop appropriate avoidance buffers and to determine if a State ITP for Swainson's hawk is required.

SWHA-3: At minimum, a 500-foot avoidance buffer shall be maintained surrounding active Swainson's hawk nests unless CDFW agrees to a reduced buffer.

8.1.3.4 California Horned Lark, Loggerhead Shrike, LeConte's Thrasher, and Other Nesting Birds (NB)

The following avoidance and minimization measures will be implemented to protect special-status bird species that have been observed in the BSA as well as the numerous bird species protected under the MBTA and California Fish and Game Code.

NB-1: If feasible, clearing and grubbing shall be scheduled to occur in the fall and winter (between September 16 and January 31), outside of the typical nesting season. If any construction activities are proposed to occur during the typical nesting season (February 1 to September 15), a nesting bird survey in areas of suitable nesting habitat as determined by a qualified biologist shall be conducted no more than 14 days prior to construction to determine presence/absence of nesting birds. A Nesting Bird Survey Report documenting the results of nesting bird surveys shall be submitted to the involved regulatory agencies for review/approval prior to construction.

NB-2: If an active bird nest is observed during preconstruction surveys or during construction, at a minimum, a 500-foot avoidance buffer surrounding the nest shall implemented for nesting raptors and a 250-foot avoidance buffer shall be implemented for other nesting bird species. Nest avoidance buffers may be reduced if monitoring determines nesting birds are acclimated to construction disturbance and under the discretion of a qualified biologist.

NB-3: Nests, eggs, or young of birds covered by the MBTA, California Fish and Game Code, or any other regulatory laws shall not be moved or disturbed until a qualified biologist has determined that the nest has become inactive or young have fledged and become independent of the nest,

8.1.3.5 Blunt-nosed Leopard lizard (BNLL)

Aera Energy proposes to utilize the measures below to avoid and minimize impacts on BNLL during Project activities. The proposal to use these measures shall be submitted to CDFW for review/approval prior to construction. USFWS/CDFW will be notified if the avoidance and minimization measures vary from what is described in this BRTR.

BNLL-1: Protocol-level surveys will be conducted by agency-approved Project biologist(s) in suitable habitat within the Project footprint one year prior to the start of construction following the CDFW *Approved Survey Methodology for the Blunt-Nosed Leopard Lizard* (CDFW 2019).

BNLL-2: The agency-approved biologist will conduct visual preconstruction surveys within the Project footprint in areas of potential BNLL habitat no more than 30 days prior to ground disturbing activities associated with each construction phase. The USFWS-approved biologist will conduct daily surveys prior to construction activities to ensure BNLLs are not within the Project footprint. Reports for each survey will be submitted to USFWS/CDFW within 30 days of completion.

BNLL-3. During the BNLL active season (April 15 through October 15), in areas where BNLL or BNLL signs are present, the following measures will be implemented:

a. Following the preconstruction survey for BNLL within the Project footprint, if active burrows or egg clutch sites are identified within the Project footprint, the USFWS-approved biologist will establish, maintain, and monitor 50-foot buffers around active burrows and egg clutch sites. The 50-foot buffers will be established around the active burrow and clutch sites in a manner that allows for a connection between the burrow site and the suitable natural habitat adjacent to the footprint so that BNLL may leave the Project footprint after the young have hatched. Project activities within the 50-foot buffers, including vegetation clearing and grubbing (as described below), will be prohibited until the eggs have hatched and BNLL have been allowed to leave the Project footprint, as determined by the USFWS-approved biologist.

b. Following the preconstruction survey for BNLL within the Project footprint, if no active burrows or egg clutch sites are identified within the Project footprint, the USFWS-approved biologist will supervise vegetation clearing and grubbing activities with hand tools. Cleared vegetation will be cut to 4 inches above the ground level, and all trimmings will be removed from the Project footprint. A follow-up preconstruction survey will be conducted in the vegetation-free work area to look for BNLL or their sign. Any BNLL observed during the follow-up survey will be allowed to leave the work site on their own accord. Immediately after the follow-up preconstruction survey of the vegetation-free work area, the Project footprint will be delineated with high-visibility fencing and "a non-gaping, nonclimbing barrier using a rigid and non-climbable material" wildlife exclusion fence. The vegetation-free work area within the wildlife exclusion fence will be maintained and monitored daily by the USFWS-approved biologist or USFWS-approved biological monitor.

c. The Contractor will conduct ground-disturbing activities when air temperatures are between 75- and 95°F. The temperature range corresponds to the period when this species is active and can avoid danger.

BNLL-4: During the non-active season (October 16 through April 14), suitable BNLL burrows identified during protocol-level and preconstruction surveys will be avoided by the Contractor. A 50-foot no-work buffer will be established around burrows to prevent impacts until the active season, when BNLL will be able to leave the vegetation-free work area on their own accord. The no-work buffer will be established by routing the high-visibility fencing and wildlife exclusion fence around the suitable burrow sites in a manner that allows for a connection between the burrow site and the suitable natural habitat adjacent to the footprint so that BNLL can leave the Project footprint during the active season. If construction activities are required during this period, the appropriate measures will be established through consultation with the USFWS and CDFW.

BNLL-5: If BNLL are observed at any time during protocol-level surveys, preconstruction surveys, or the construction period, USFWS and CDFW will be contacted. Appropriate measures to avoid take of the species will be established through consultation with the USFWS and CDFW.

BNLL-6: Non-disturbance exclusion zones will be established along the Project footprint in potentially suitable areas (alkali desert scrub, annual grassland, barren, valley foothill riparian); fencing will be composed of a combination of both high-visibility fencing and wildlife exclusion fencing.

BNLL-7: Non-disturbance exclusion zones will be maintained and monitored by the USFWS-approved biological monitor(s) to avoid the possibility for take of BNLL, their burrows/nests, or the species' habitat outside of the Project footprint.

To clarify terminology in the above measures, it is acknowledged that “active burrows” and “egg clutch sites” are difficult to identify. Thus, burrows will be considered potentially “active” or potentially “egg clutch sites” when a BNLL has been observed on-site. If no BNLL are observed, all burrows will be considered inactive. To clarify the timing of after “the eggs have hatched,” active burrows will be considered active until after the juvenile season (August 15–September 30; CDFW 2019) is over.

In addition to the above measures for BNLL, the following additional general measures will be followed during construction activities occurring within the BNLL protocol survey Segments 3 and 4 (see Appendix B) where BNLL have been observed during protocol surveys:

* Measures to be implemented prior to and during initial clear and grub.

** Measures to be implemented until potentially suitable areas for BNLL are cleared of burrows and vegetation.

*** Measures to be implemented at all times.

BNLL-8: In addition to an environmental training program, site specific BNLL training will be provided to construction personnel prior to and during clear/grub activities. Training will not be required post clear/grub. Construction personnel will be provided a BNLL site-specific avoidance measures handout for reference; the BNLL handout will be available to crews in the field during tailgate meetings.

BNLL-9: During periods that are optimal for BNLL activity (approximately April 15 through October 15), an additional USFWS-approved BNLL biologist/monitor will be present full time during all ground disturbing activities and mobilizations per work area.**

a. The qualified biologists will conduct visual surveys for BNLL and check the work area(s) and access route(s) to determine presence or absence of BNLL.**

b. If the USFWS-approved biologist determines that further investigation is required to rule out potentially active burrows, a scope may be used to examine burrows for egg clutches.

BNLL-10: If BNLL are observed within the exclusionary fencing during construction, a 250 foot avoidance buffer will be erected on the north and south side of the buffer while the eastern and/or western edges of the fencing will be dis-assembled and lain on the ground to allow the BNLL to leave on its own volition.

Once the BNLL is observed leaving the work area the fencing will be installed back to its previous condition and the 250-foot buffer removed. If the BNLL does not leave the work area of its own volition within 24 hours, USFWS/CDFW will be consulted for further guidance.***

BNLL-11: Offsite locations where BNLL have been observed or are likely to occur will be clearly marked, when possible, to prevent workers from driving off the road and to prevent inadvertent destruction of burrows.***

BNLL-12: A speed limit of 5 mph will be posted and observed within work areas in BNLL protocol survey Segments 3 and 4 (refer to Appendix B) until approved otherwise by the USFWS-approved biologist.**

BNLL-13: Construction and Project related vehicles will be escorted by a USFWS-approved biologist/monitor, within predetermined ingress/egress routes.**

BNLL-14: A USFWS-approved biologist will survey areas of suitable habitat 24 hours prior to ground disturbance in order to determine if any significant changes have occurred since last surveyed.*

BNLL-15: Prior to ground disturbing activities (burrow excavations and/or construction activities), enhanced surveys, in addition to protocol surveys, will take place for 5 days in areas that contain open land cover (such as dirt roads and barren open spots) where BNLL had not been previously detected but are adjacent to recent observations. These surveys will be conducted in addition to protocol surveys. Enhanced surveys will consist of two surveyors walking adjacent transects to provide 100 percent visual coverage within each segment. Enhanced surveys will take place under the optimal temperature described by CDFW (2019) and will be completed by September 30 of the relevant year. Additionally, should the USFWS-approved biologist assess any burrow or area of potentially housing BNLL, the biologist may surveil the area continuously for additional time each day to ensure no BNLL are present.

8.1.3.6 Temblor Legless Lizard (TLL)

TLL-1: If Temblor legless lizard becomes state listed or remains a candidate species under the California ESA, at least one year prior to construction a qualified biologist shall conduct a survey within the Project footprint. The Temblor legless lizard survey effort shall include at minimum:

- A detailed habitat assessment;
- A survey proposal submitted to and approved by CDFW;
- Aera Energy shall notify CDFW for further coordination to avoid or mitigate impacts and to determine if a State ITP will be required for Temblor legless lizard.

TLL-2: At minimum, a 30-foot avoidance buffer shall be maintained surrounding unearthed Temblor legless lizards unless CDFW agrees to a reduced buffer.

8.1.3.7 Northern California Legless Lizard, California Glossy Snake, San Joaquin Coachwhip, Coast Horned Lizard, and Other Reptiles (OR)

OR-1: After installation of exclusion fencing, a qualified biologist shall conduct visual preconstruction surveys within the Project footprint in areas of suitable habitat no more than 30 days prior to ground disturbing activities. If any northern California legless lizard, California gloss snake, San Joaquin coachwhip, coast horned lizard, or other reptiles are observed within exclusion fencing, they will be relocated to suitable habitat outside of the exclusion fencing by a qualified biologist.

OR-2: At minimum, a 50-foot avoidance buffer shall be maintained surrounding northern California legless lizard, California gloss snake, San Joaquin coachwhip, coast horned lizard, or other special-status reptile species unless CDFW agrees to a reduced buffer.

8.1.3.8 Giant Kangaroo Rat (GKR)

Aera Energy will utilize the measures below to avoid and minimize impacts on GKR during Project activities. USFWS/CDFW will be notified if the avoidance and minimization measures, including GKR trapping and relocation, vary from what is described in this BRTR. USFWS/CDFW will approve any measures not described herein prior to implementation.

GKR-1: A qualified biologist with required federal and state permits will conduct small mammal trapping in suitable habitat within the BSA to determine presence/absence of GKR. Trapping efforts shall follow the USFWS *Survey Protocol for Determining Presence of San Joaquin Kangaroo Rats* (USFWS 2013). A survey proposal shall be submitted for review and approval by USFWS/CDFW. Survey results shall be submitted to USFWS/CDFW to determine if a federal BO and state ITP will be required for GKR.

GKR-2: No more than 14 days prior to construction, the USFWS-approved biologist will conduct surveys to identify all potential burrows used by GKR within the disturbance areas and within 50 feet of areas where ground disturbance will occur.

GKR-3: The agency-approved biologist will establish a buffer of at least 50 feet around potential GKR burrows to avoid impacts on burrows. The buffer area will be delineated prior to construction activities and marked with brightly colored markers that will be visible to workers as well as signs, stakes, flags, and/or rope or cord.

GKR-4: Aera Energy will leave undisturbed any GKR food stores (e.g., haystacks, seed caches, or other stockpiled forage). If avoidance is not feasible, the USFWS-approved biologist will implement measures to keep the food stores intact, including temporarily relocating the food stores and covering seeds with plywood to allow temporary vehicle or on-foot access.

GKR-5: GKR burrows within the fenced disturbance area will be live trapped prior to surface disturbance or vegetation grubbing activities within that specific temporary exclusion fencing area and relocated (see **GKR-7**). Aera Energy's live-trapping and relocation procedures will adhere to a relocation plan for GKR and SJAS approved by USFWS/CDFW prior to ground disturbance occurring. Aera Energy would target fall (September-November) or early spring (March-April) if kangaroo rats do not show signs of being reproductively active or tending young (lactating) for trapping and relocation to maximize the potential for

relocation success (Tennant et al. 2013). The trapping period will continue for at least 5 consecutive trap nights, within each project segment. If presence is determined within a specific project segment area, then trapping within the segment will cease. Traps will be set at dusk and checked and closed at dawn. Traps may be checked more often if weather conditions (i.e., abnormally high or low nighttime temperatures, inclement weather, etc.) warrant, as determined by the USFWS-approved biologist. If predicted nighttime temperatures drop below 50°F, then traps may be checked more frequently, and synthetic batting or additional insulating material may be placed in traps to reduce the effects of colder temperatures on trapped animals. Trapping will cease if captured animals are found to be lethargic or otherwise exhibiting signs of a decrease in body temperature. If a lactating female is captured, it will be released until it is no longer lactating. Trapped animals will be held temporarily in large plastic buckets with a layer of sandy soil and sections of cardboard tube in a sheltered and secure location prior to their release. GKRs will be released within 48 hours of their capture, unless it is determined by the USFWS-approved biologist that holding them for a longer period will increase the potential for relocation success. No animals will be held for more than 7 days. Following completion of trapping, the area will be searched for evidence of continued presence of GKRs. If evidence indicates a GKR remains within the enclosure but is avoiding the traps, then that animal will be removed by carefully excavating the occupied precinct with hand tools (see **GKR-7**).

GKR-6: After completion of live trapping, burrows would be fully excavated by hand per **GEN-14**. Any GKRs encountered will be allowed to escape out of harm's way into adjacent habitat (if present) or, at the discretion of the USFWS-approved biologist, will be collected and relocated (see **GKR-7**).

GKR-7: Trapped or collected GKRs will be relocated within the BSA at least 50 feet from ground disturbance areas. Aera Energy's live-trapping and relocation procedures will adhere to a relocation plan for GKR approved by USFWS/CDFW prior to ground disturbance occurring. The USFWS-approved biologist will conduct reconnaissance surveys of a potential release site to determine suitability. Preference will be given to unoccupied or low-occupancy release locations with ample burrows that consist of alluvial and loamy soils, soils with a sandy or gravelly texture, or fine-grained soils with sparsely distributed shrubs that also provide ample refugia. Sites with suitable habitat and lacking burrows can also be suitable if artificial burrows are used (as described below). The USFWS-approved biologist will evaluate suitability, based on habitat characteristics, burrow density, signs of GKR presence (scat, clippings, auditory cues, etc.), small mammal trapping, and the size of the relocation site. Aera Energy would use soft-release methods. Artificial burrows and temporary enclosure fencing will be used to reduce risk of predation or mortality resulting from disoriented animals fleeing the release site.

Artificial burrow designs will be based on best available science currently accepted by USFWS/CDFW. Generally, artificial burrows will be constructed using cardboard or similar material tubes (approximately 3 to 4 inches wide, and 48 to 60 inches in length) that are sloped from opposite directions to a central chamber set approximately 12 to 18 inches below the ground. Artificial burrows will be constructed in similar arrangement as the native burrows from which the GKRs were relocated. Enclosures would also be based on best available science currently accepted by USFWS/CDFW. Generally, enclosures will be constructed with 48-inch-tall wire mesh fencing or similar material supported by metal fence posts, with mesh openings small enough to prevent GKRs from prematurely leaving the release site or becoming entangled. The enclosure will be circular, with a 12- to 15-foot diameter around the artificial burrow. The

bottom 8 inches of the fence material will be buried below ground level to deter predators and GKRs from excavating passages under the fence. The top of the enclosure will be covered with polyvinyl chloride (PVC) hardware, cloth, or similar material to deter avian predators from landing inside the enclosure. Enclosure fencing will be in place for 7 days after the relocation, and supplemental food (a seed mix consisting of 75 percent white proso millet and 25 percent oat) will be provided for 7 days. Only the USFWS-approved biologist is authorized to capture, handle, and relocate GKRs.

GKR-8: Any sick or injured GKR encountered will be collected by the USFWS-approved biologist and taken to a wildlife rehabilitation center of veterinary facility for injured animals.

8.1.3.9 Short-nosed Kangaroo Rat, Tulare Grasshopper Mouse, San Joaquin Pocket Mouse, and Other Small Mammals (SM)

The following avoidance and minimization measures will be implemented to protect special-status small mammal species that have potential to occur in the BSA.

SM-1: Presence/absence of short-nosed kangaroo rat, Tulare grasshopper mouse, San Joaquin pocket mouse, and other small mammals shall be documented during GKR trapping proposed in **GKR-1**.

SM-2: If live-trapping and/or excavation of burrows is authorized by USFWS/CDFW for the purpose of relocation of GKR, any short-nosed kangaroo rat, Tulare grasshopper mouse, San Joaquin pocket mouse, and other small mammals discovered during implementation of **GKR-5**, **GKR-6**, and **GKR-7** will be likewise relocated.

SM-3: During construction, any short-nosed kangaroo rat, Tulare grasshopper mouse, San Joaquin pocket mouse, or other small mammals incidentally unearthed during construction activities or entrapped in work areas by exclusion fencing shall either be:

- Captured and relocated outside of the exclusion fencing by a qualified biologist; or
- Released through a temporary opening in the exclusion fencing, with the exclusion fencing to be repaired to restore fence integrity immediately after release of the animal(s).

8.1.3.10 San Joaquin Antelope Squirrel (SJAS)

Aera Energy will utilize the measures below to avoid and minimize impacts on SJASs during Project activities. CDFW will be notified if the avoidance and minimization measures, including SJAS trapping and relocation, vary from what is described in this application. CDFW will approve any measures not described herein prior to implementation.

SJAS-1: No more than 14 days prior to construction, the CDFW-approved biologist will conduct surveys to identify all potential burrows used by SJAS within the disturbance areas and within 50 feet of areas where ground disturbance will occur.

SJAS-2: The CDFW-approved biologist will establish a buffer of at least 50 feet around potential SJAS burrows to avoid impacts on burrows. The buffer area will be delineated prior to construction activities and

marked with brightly colored markers that will be visible to workers as well as signs, stakes, flags, and/or rope or cord.

SJAS-3: Any potential SJAS burrows detected by the CDFW-approved biologist within the temporary exclusion fencing installed after preconstruction surveys (see **GEN-12**) that cannot be avoided will be live trapped prior to surface disturbance or vegetation grubbing activities within that specific temporary exclusion fencing area and relocated (see **SJAS-5**). Aera Energy's live-trapping and relocation procedures will adhere to a relocation plan for GKR and SJAS approved by CDFW prior to ground disturbance occurring. The CDFW-approved biologist and biological monitor, or a supervised trapping crew, will conduct live trapping over at least five consecutive days. If possible, trapping and the relocation of SJAS will avoid the breeding/mating season (January to May) in order to avoid disrupting family units. Ideally, this will take place during late summer and early fall. However, if trapping/relocation activities cannot be delayed until after the breeding season and a lactating female is captured, it will be released until it is no longer lactating.

SJAS-4: After completion of live trapping, burrows would be fully excavated by hand per **GEN-14**. Any SJAS encountered during the excavation will be allowed to escape to adjacent natural habitat (if present) or, at the discretion of the CDFW-approved biologist, collected and relocated (see **SJAS-5**).

SJAS-5: Trapped or collected SJASs would be relocated to an area of suitable habitat in the BSA, at least 50 feet from any disturbance areas. Aera Energy's live-trapping and relocation procedures will adhere to a relocation plan for GKR and SJAS approved by CDFW prior to ground disturbance occurring. The CDFW-approved biologist will conduct reconnaissance surveys of a potential release site to determine suitability. Preference will be given to unoccupied or low-occupancy release locations with ample burrows that consist of alluvial and loamy soils, soils with a sandy or gravelly texture, or fine-grained soils with sparsely distributed shrubs that also provide ample refugia. Sites with suitable habitat and lacking burrows can also be suitable, if artificial burrows are used (as described below). The CDFW-approved biologist will evaluate suitability, based on habitat characteristics, burrow density, signs of SJAS presence (scat and auditory cues), and the size of the relocation site. The CDFW-approved biologist may also complete camera surveys or small-mammal trapping if visual signs are not adequate for judging the level of site occupancy. If the CDFW-approved biologist determines that there does not appear to be a sufficient number of natural existing burrows that could be used by the relocated SJAS at the release site (a minimum of one burrow per individual released will be the target), artificial burrows will be constructed. SJAS will be hard released.

Artificial burrows would consist of two cardboard tubes (e.g., cardboard mailing or storage tubes), minimum of 3 inches in diameter, that slope from opposite directions to a central chamber situated 15 to 20 inches below the ground surface. The central chamber would consist of corrugated cardboard or other biodegradable material that would form the walls of an approximately 2-foot-square excavation. The walls of the chamber would be secured with plywood to prevent the chamber from being crushed when backfilling the trench. The chamber would be provisioned with a food cache of seeds (~ 5 pounds, a mix of 75 percent proso white millet and 25 percent oat groats, or similar mixture), along with a few sheets of paper towels. Artificial burrows would be spaced a minimum of 60 feet apart to account for the typical home range of SJAS. However, in order to preserve the configurations of neighbors, the spatial

relationship of neighbor groups from the capture site will be maintained at the release site, to the extent possible, by replicating the spatial relationship of burrows from the capture site at the release site to the extent feasible.

SJAS-6: Only the CDFW-approved biologist is authorized to capture, handle, and relocate SJAS. Each captured SJAS will be placed into a separate container, such as a 5-gallon bucket or other similar container, filled with at least 6 inches of sand and fitted with a lid. The lid shall be made of wire screen, or other similar material; air holes may be drilled into a solid lid. In order to minimize the amount of time individuals are held within the containers, the captured individuals will be taken to the preidentified release site immediately following each day of the 5-day trapping effort.

SJAS-7: Any sick or injured SJAS encountered will be collected by the CDFW-approved biologist and taken to a rehabilitation center or veterinary facility for injured animals.

8.1.3.11 San Joaquin Kit Fox (SJKF)

The following measures will be deployed during Project activities to avoid or minimize adverse effects on SJKF as well as avoid injury or mortality.

SJKF-1: If a potential SJKF den is discovered or a SJKF is found in an "atypical" den (e.g., a pipe or culvert), Aera Energy will establish a minimum 50-foot buffer around the den. If a "known" den (one that shows evidence of current use or was used in the past) is discovered, Aera Energy will establish a minimum buffer of at least 100 feet around the den. If a "natal" den (den in which SJKF young are reared, typically with two or more openings) is discovered, a buffer of at least 200 feet will be established around the den. Natal dens with pups present will have a buffer of at least 500 feet. If these buffers cannot be completely avoided, the USFWS-approved biologist will notify USFWS/CDFW.

SJKF-2: Potential and known dens that cannot be avoided by the minimum buffer distances described above may be destroyed only after the USFWS-approved biologist has determined that SJKF is not currently present after 4 consecutive nights of monitoring. Dens must be destroyed immediately after the fourth night of monitoring if no activity is documented. Den destruction would include the following measures:

- Dens would be carefully hand excavated under the direct supervision of the USFWS-approved biologist. The den would then be filled with dirt and compacted to prevent reentry and use of the den during the construction period. If a SJKF is discovered during excavation, the excavation will cease immediately, and monitoring of the den, as described above, will be resumed. Completing the excavation and the destruction of the den will resume when, in the judgment of the USFWS-approved biologist, it can be verified that the SJKF has left the partially destroyed den.

- Natal dens will not be excavated until 1) the pups and adults have vacated the den and 2) concurrence to proceed with the excavation has been received from USFWS/CDFW. If a SJKF does not vacate a den within a reasonable timeframe, USFWS and CDFW will be consulted to obtain written guidance (via email) prior to proceeding with the den destruction.

SJKF-3: Potential dens lacking signs of occupancy that are at least 50 feet from work or disturbance areas will remain intact and will not be altered or blocked from use.

SJKF-4: Aera Energy will replace each known and natal SJKF den that cannot be avoided and will be destroyed by Project activities as follows:

- Aera Energy will install one artificial SJKF den for each known den and three artificial dens for each natal den to be collapsed due to unavoidable disturbance. Aera Energy will install artificial dens within 300 feet of the collapsed den, or as close as deemed safe from oil and gas operations, prior to excavation of the known or natal den. Artificial natal dens will be multi-chambered and have multiple entrances. If more than 10 suitable SJKF dens are located within a 300-foot radius of the collapsed den, Aera Energy will locate the replacement dens within 400 feet of the collapsed den. The artificial den(s) will be completed before excavation of known and natal SJKF dens can occur to compensate for the loss of important shelter for protection, reproduction, and escape from predators.
    - The following criteria will be considered when selecting an artificial SJKF den location within the BSA:
        - Artificial dens should be as close as possible to the destroyed or disturbed SJKF den,
        - The location should have a high likelihood of SJKF visitation,
        - Den entrances should be oriented to avoid flooding and direct sun exposure, and
        - The den complex should have a reduced likelihood of future disturbance, including development, regular maintenance, and human tampering.
    - Construction of dens will follow the guidance available in best available science, including that provided in the USFWS *Standardized Recommendations for Protection of the San Joaquin Fox Prior to or During Ground Disturbance* (USFWS 2011) and *Urban Roads and the Endangered San Joaquin Kit Fox* (Bjurlin et al. 2005), as well as the related descriptions and discussion provided in Harrison et al. (2011) and Cypher et al. (2012). Generally, artificial dens will meet the following specifications:
        - Subterranean dens will consist of at least two entrance tunnels measuring approximately 3.3 feet in length and roughly 8 inches in diameter, and will be oriented to avoid flooding.
        - Material will be PVC, high-density polyethylene pipe or similar material.
        - Subterranean chambers will be at least 20 inches in diameter and 15 inches tall, and the floor of the chamber will be at least 3.3 feet below ground to provide

thermal insulation. Additionally, subterranean chambers will be box-or dome-shaped, with an earthen floor to allow foxes to enlarge the den over time.

- Dens will be constructed to exclude larger predators such as red foxes, bobcats, and coyotes.
- Natal dens will be constructed to include multiple entrances with multiple chambers.

8.1.3.12 American Badger

AB-1: No less than 14 days and no more than 30 days prior to any construction activities, a preconstruction survey shall be conducted by a qualified biologist for American badger. The status of all potential American badger dens shall be determined and mapped.

AB-2: At minimum, a 50-foot avoidance buffer shall be maintained surrounding active American badger dens unless CDFW agrees to a reduced buffer.

8.1.4 Mitigation Compliance

It is estimated the proposed Project would result in the following impacts to habitats and jurisdictional waters:

- Allscale Shrubland: 1.61 acres permanent impacts; 43.06 acres temporary impacts;
- Red Brome or Mediterranean Grass Grasslands: 0.86 acre permanent impacts; 4.74 acres temporary impacts; and
- RWQCB Waters of the State/CDFW Jurisdictional Areas: 0.012 acre permanent impacts; up to 1.144 acre temporary impacts.

The following compensatory mitigation measures will be implemented to offset impacts to habitats and jurisdictional waters:

MIT-1: Post-construction, Aera Energy shall restore temporarily impacted Allscale Shrubland and Red Brome or Mediterranean Grass Grasslands. A qualified habitat restoration specialist shall prepare a Habitat Mitigation and Monitoring Plan (HMMP) that outlines the following at minimum:

- Mitigation work plan, including species palette, planting and irrigation schedule, hydroseeding, and erosion control;
- Maintenance plan/schedule;
- Success criteria;
- Monitoring methods;

- Monitoring and reporting schedule; and
- Provisions for long-term and adaptive management.

MIT-2: For permanent impacts to Allscale Scrubland and Red Brome or Mediterranean Grass Grasslands habitat, Aera Energy shall either:

- Purchase conservation bank credits at a minimum 2:1 replacement ratio; or
- Obtain suitable mitigation lands to preserve Allscale Scrub shrubland habitat at a minimum 2:1 replacement ratio:
    - All land that is protected for the purpose of mitigation will be placed under a permanent conservation easement and managed in perpetuity;
    - Mitigation lands shall be monitored, with a monitoring and reporting schedule to be negotiated with the involved regulatory agencies (e.g., CDFW).

MIT-3: Prior to construction, Aera Energy shall coordinate with SWRCB/RWQCB and CDFW and obtain a Waste Discharge Requirement permit and/or Lake and Streambed Alteration Agreement if required.

MIT-4: Post-construction, Aera Energy shall restore temporarily impacted jurisdictional waters to pre-construction grades and conditions, including bed grooming and smoothing, bank restoration, and/or temporary erosion and sedimentation controls, where necessary. Restoration of temporary impacts shall follow any provisions included in the Waste Discharge Requirement permit and/or Lake and Streambed Alteration Agreement, if applicable.

MIT-5: For permanent impacts to confirmed jurisdictional waters, Aera Energy shall either:

- Purchase mitigation bank credits at a minimum 2:1 replacement ratio; or
- Post-construction, conduct enhancement of jurisdictional features in which permanent impacts occur; enhancement of jurisdictional waters shall be monitored, with a monitoring and reporting schedule to be negotiated with the involved regulatory agencies (e.g., SWRCB/RWQCB, CDFW).

Appendix B 2023 BLUNT-NOSED LEOPARD LIZARD SURVEYS, BELRIDGE OIL FIELDS, KERN COUNTY, CALIFORNIA

PROTOCOL-LEVEL BLUNT-NOSED LEOPARD LIZARD SURVEY REPORT

AERA ENERGY LLC - CARBON FRONTIER

Prepared by: MESA Biological LLC

Prepared for: Nina Casterline – Environmental Advisor - Aera Energy LLC

Date: October 12, 2023

SECTION 1.0 - PROPERTY DETAILS AND LOCATION

1.1 Project Details

Client:	Aera Energy LLC	**Project Name:**	CarbonFrontier
Project Contact 1:	Nina Casterline	**Project Contact 2:**	Beau Gentry

Brief Project Description:

Aera has applied to the Kern County Planning and Natural Resources Department to request approval of a Zone Change and Conditional Use Permit (CUP) and will obtain any other required approvals for the construction and operation for the proposed Project in the South and North Belridge oil fields. The proposed Project would capture carbon dioxide (CO_2) from existing produced-gas streams (pre-combustion) and emissions from existing stationary sources (post-combustion) and transport the CO_2 by pipeline from South Belridge to the North Belridge Oil Field for permanent sequestration via CO_2 injection wells into a designated underground sequestration zone, known as the 64 Zone, at depths of approximately 8,500 feet below ground surface. It is anticipated that the proposed Project would capture approximately 30 million metric tons of CO_2 throughout its estimated 20-year lifetime.

The proposed Project includes re-purposing five existing oil wells and drilling four new wells for CO_2 injection. A new 6- to 12-inch pipeline would be constructed to deliver CO_2 from the capture facilities to the proposed injection wells. The pipelines would be primarily installed aboveground, except where the pipeline would cross main access roads (below ground) within the oil field properties. Distribution piping, each approximately 4- to 8-inches in size, would extend from the main pipeline to the proposed injection wells. The distribution pipelines would also be primarily aboveground on pipe supports, except where the pipelines cross main access roads (below ground) within the oil field.

1.3 Description of Survey Focus Areas

Total Acres Segment 1:	Total Acres Segment 2:	Total Acres Segment 3:	Total Acres Segment 4:
92.905 acres	89.386 acres	108.088 acres	135.894 acres

Total Acres Surveyed: 426.273 acres

Description of Focus Areas:

After receiving project data and preliminary survey focus areas from Aera Energy LLC (Aera), MESA Biological LLC (MESA) prepared a scope of work to conduct protocol level blunt-nosed leopard lizard surveys covering approximately 7.15 linear miles of pipeline. This included 8 well locations that will each require a drilling pad of approximately 280ft x 145ft. After evaluating Aera's project data and the requirements of the California Department of Fish and Wildlife (CDFW) survey protocol, MESA determined the proposed scope and preliminary survey coverage areas were too large to adequately cover while still meeting the requirement of survey protocol. MESA's analysis determined that the project could meet the requirements of protocol if broken into 4 relatively equal segments. It is important to note, there were areas that were inaccessible due to fences, surface expressions/ground fissures, and an asbestos contaminated disposal site. Prior to initiating surveys, Aera concluded that it was unsafe to conduct the survey within the vicinity of these surface expressions and disposal site. A small portion of the project area was not included as it was an active agricultural field.

SECTION 2.0 - METHODOLOGIES AND DATA COLLECTION

2.1 Survey Methodologies

Description of Methodologies:

On April 25th, 2023, Aera provided MESA with a KMZ file that represented the proposed survey coverage area that included pre-determined segments of the project that were considered to contain habitat suitable for the blunt nosed leopard lizard. A visual assessment of shrub density and measurements of vegetation densities were recorded at various points throughout the four survey focus areas to help determine appropriate transect spacings. CDFW protocol states "BNLL are often difficult to detect, particularly in areas where shrubs are fairly numerous (>30% cover) and/or the herbaceous vegetation is dense and tall (>30 cm). In such conditions, no greater than 10-meter-wide transects should be walked at a slow pace. In areas with few shrubs and shorter herbaceous vegetation (<10 cm), transects as wide as 20 meters are acceptable". Throughout the survey focus areas, only a few random clusters of vegetation in each segment contained shrub cover that exceeded 30% cover. Most of the segments contained a sporadic and sparse cover of *Atriplex* that did not exceed the 30% threshold. Vegetation height was also estimated at several points throughout the segments and although there were a few small patchy areas containing pockets of *Amsinkia* sp. and other herbaceous vegetation that exceeded 10 cm, most of the focus areas did not exceed this threshold. A sizeable amount of previously disturbed land comprised of roadways, well pads and other oil production infrastructure also occurred throughout the project areas. After analyzing these factors, MESA concluded that 20 meter transects would satisfy the protocol requirements for visual coverage and would provide the researcher with suitable opportunity to detect presence of blunt-nosed leopard lizards.

Prior to initiating surveys, MESA estimated that a total of 4 surveyors would be necessary to adequately cover each of the 4 segments using 20 meters transect spacing. However, after the first few surveys, it was determined that the number of surveyors could be reduced to 3 surveyors. The first few survey days provided an opportunity for biologists to evaluate coverage suitability determining that the roadways that were centered in each segment still afforded 3 surveyors opportunity to achieved 100% visual survey coverage. For the remainder of the surveys, MESA utilized 3 to 4 surveyors to conduct each day of surveys. Using the pre-determined survey focus area boundaries, 20 meter transect lines were created electronically in ESRI's ArcGIS and uploaded to ESRI's FieldMaps. Transects uploaded to FieldMaps were electronically referenced by each surveyor during surveys to support consistently accurate coverages. Prior to conducted each survey, a crew lead was assigned to each crew. This crew lead was a level II surveyor and was responsible for all safety related requirements and data collection described in Section 2.2. Surveys were conducted in a north/south direction where feasible; however, portions of all segments required alternate survey directions.

The survey was completed in accordance with all protocol requirements listed in the 2019 California Department of Fish and Wildlife's Approved Survey Methodology for the Blunt-Nosed Leopard Lizard.

2.2 Data Collection Procedures

The crew lead for each survey day was responsible for recording all start/end times, temperatures and weather conditions using ESRI's Survey123. The crew lead was also tasked with recording common lizard counts and all incidentally observed wildlife species gathered by the crew at the end of each transect. During the survey, tracks of all surveyors were recorded using FieldMaps and overlayed onto an aerial image to help ensure adequate coverage within the survey boundary. FieldMaps was also used to record the location of all incidental special-status species observed. All incidentally observed dens potentially suitable for San Joaquin kit fox were recorded along with active or inactive stick nests. At the end of each survey day, the crew lead would utilize the raw data collected in Survey123 and compile a formal data form using the MESA formatted document. All compiled data forms are provided in **Attachment B – MESA Biological LLC Data Forms**. Upon completion of the final survey day, MESA mapped all occurrences of BNLL and other incidentally observed sensitive resources to prepare **Attachment A – Survey Focus Areas and Special-Status Species Observations Maps**.

2.3 Survey Dates Protocol Survey Requirements

All survey dates and other requirements of the protocol survey have been summarized in **Attachment C – Protocol Blunt-Nosed Leopard Lizard Summary Results Table**. One summary table for each of the 4 survey segments has been provided.

2.4 List of Surveyor Levels

A list of all surveyor's names and levels can be found in Attachment C - Protocol Blunt-Nosed Leopard Lizard Survey Results Summary Table.

SECTION 3.0 HABITAT IDENTIFIED

3.1 Habitat Communities Present in Survey Focus Areas

All four of the survey segments contain largely undisturbed lands primarily consisting of Saltbush Scrub or as referred to in A Manual of California Vegetation (Sawyer, J.O., T. Keeler-Wolf, and J. M. Evens. 2009), *Atriplex polycarpa* shrubland alliance (Allscale Scrub). Mixed within this community are areas that contain current and historical oil producing infrastructure. This infrastructure largely consists of oil pumping units, pipelines, header or manifold facilities, tank settings, electrical power poles and electrical substation facilities. Surrounding a large majority of the oil production equipment are lands used to access these facilities. Roadways, well pads and maintenance corridors containing hard compacted soils that are void of vegetation occur in and around this oil production infrastructure.

3.2 General Habitat Characteristics, Land Uses and Survey Limitations

The vegetation community that best describes each of the four segments can be described as Allscale scrub. This community contains a mixture of weedy or ruderal type vegetation. Much of the weedy vegetation is associated with oil producing infrastructure that occurs at varying levels throughout the four segments.

Segment 1: contains more disturbed lands from oil production than the other 3 segments. Almost the entirety of this survey focus area parallels an existing pipeline corridor. The Segment 1 transects have been centered on the existing corridor and Allscale scrub is the dominant vegetation community. Much of this scrub habitat is mixed with pockets of weedy or ruderal plants that have taken over areas that have been previously disturbed by oil production. A significant amount of the weedy vegetation occurs along road edges or perimeters of well pads and other infrastructure (see **Photograph 1**) In this segment, two areas were omitted from transect survey coverage. One small area near the southern end of the segment was not included as it was an agricultural field (see **Photograph 2**). Another section near the north end of the segment was not covered by transect surveys as there where several areas that contained surface expressions or ground fissures that posed a safety risk (see **Photograph 3**). Segment 1 boundary and the omitted areas are shown in **Attachment A – Figure 1.1**.

Segment 2: comparable to Segment 1, transects have been centered primarily on an existing pipeline corridor. Some of Segment 2 occurs within a land farm that was historically used to dispose of drill cuttings. This land farm has been left dormant for a long enough to allow for regeneration of Allscale scrub (see **Photograph 4**). Two portions of Segment 2 were inaccessible. One area located at the south end of the segment was surrounded by a barbed wire fence, no access points to enter this area could be found nearby (see **Photograph 5**). Another area near the mid-point of the segment was inaccessible as there was a chain link fence that prohibited access (see **Photograph 6**). The topography in the southern end of this segment is relatively flat. The Segment 2 boundary and the omitted fenced off areas are shown in **Attachment A – Figure 1.2**.

Segment 3: occurs within relatively unimpacted Allscale scrub. Although some oil production infrastructure exists, a higher density occurs to the south in Segments 1 and 2. The topography contains more rolling undulations than Segment 1 and 2. The location of Segment 3 can be seen in **Attachment A – Figure 1.3**. Much of this segment also parallels an existing pipeline corridor with dirt access road.

Segment 4: occurs within relatively unimpacted Allscale scrub. Much of the oil producing infrastructure occurs to the south of Segment 4. Of all segments, Segment 4 contains more hilly terrain that other southern segments. The topography can be best described as very gentle rolling hills or undulations. The location of Segment 4 can be seen in **Attachment A – Figure 1.4**.

SECTION 4.0 - SITE PHOTOGRAPHS

4.1 Photographic Site Conditions

	
Photograph 1 – Segment 1: was taken facing south overlooking the pipe corridor that currently runs parallel with the proposed CO_2 pipeline route. Photo illustrates Allscale scrub mixed with weedy plants in an area that accommodates some existing oil producing infrastructure.	**Photograph 2 – Segment 1:** was taken facing north on the east side of the proposed CO_2 pipeline corridor. The photograph illustrates the agricultural field that was excluded from the survey.
	
Photograph 3 – Segment 1: shows the road closure barriers used by Aera to restrict access to the northern portion of Segment 1. Several surface expressions or ground fissures were identified in this area and were deemed a safety hazard.	**Photograph 4 – Segment 2:** was taken near the mid-point of Segment 2 facing south. Photograph shows the existing corridor that will accommodate the proposed CO_2 pipeline. Also, the old drill cutting land farm occurs to the west (right side of the corridor) now contains a relatively dense cover of *Atriplex* sp.
	
Photograph 5 – Segment 2: illustrates a barbed wire fence that surrounds a small area within Segment 2 that was excluded from the survey area.	**Photograph 6 – Segment 2:** illustrates a chain link fence that surrounds a lined pit within the Segment 2 survey area. This area contained asbestos and was inaccessible.

	
Photograph 7 – Segment 3: was taken near the mid-point of Segment 3 facing north overlooking the existing corridor that will accommodate the proposed CO_2 pipeline. Corridor is surrounded by relatively intact Allscale scrub.	**Photograph 8 – Segment 4:** was taken facing north overlooking the proposed CO_2 pipeline corridor in Segment 4
	
Photograph 9: Photograph shows the sub-adult blunt-nosed leopard lizard found in Segment 3.	**Photograph 10:** Photograph shows one of the adult blunt-nosed leopard lizards observed during protocol surveys.

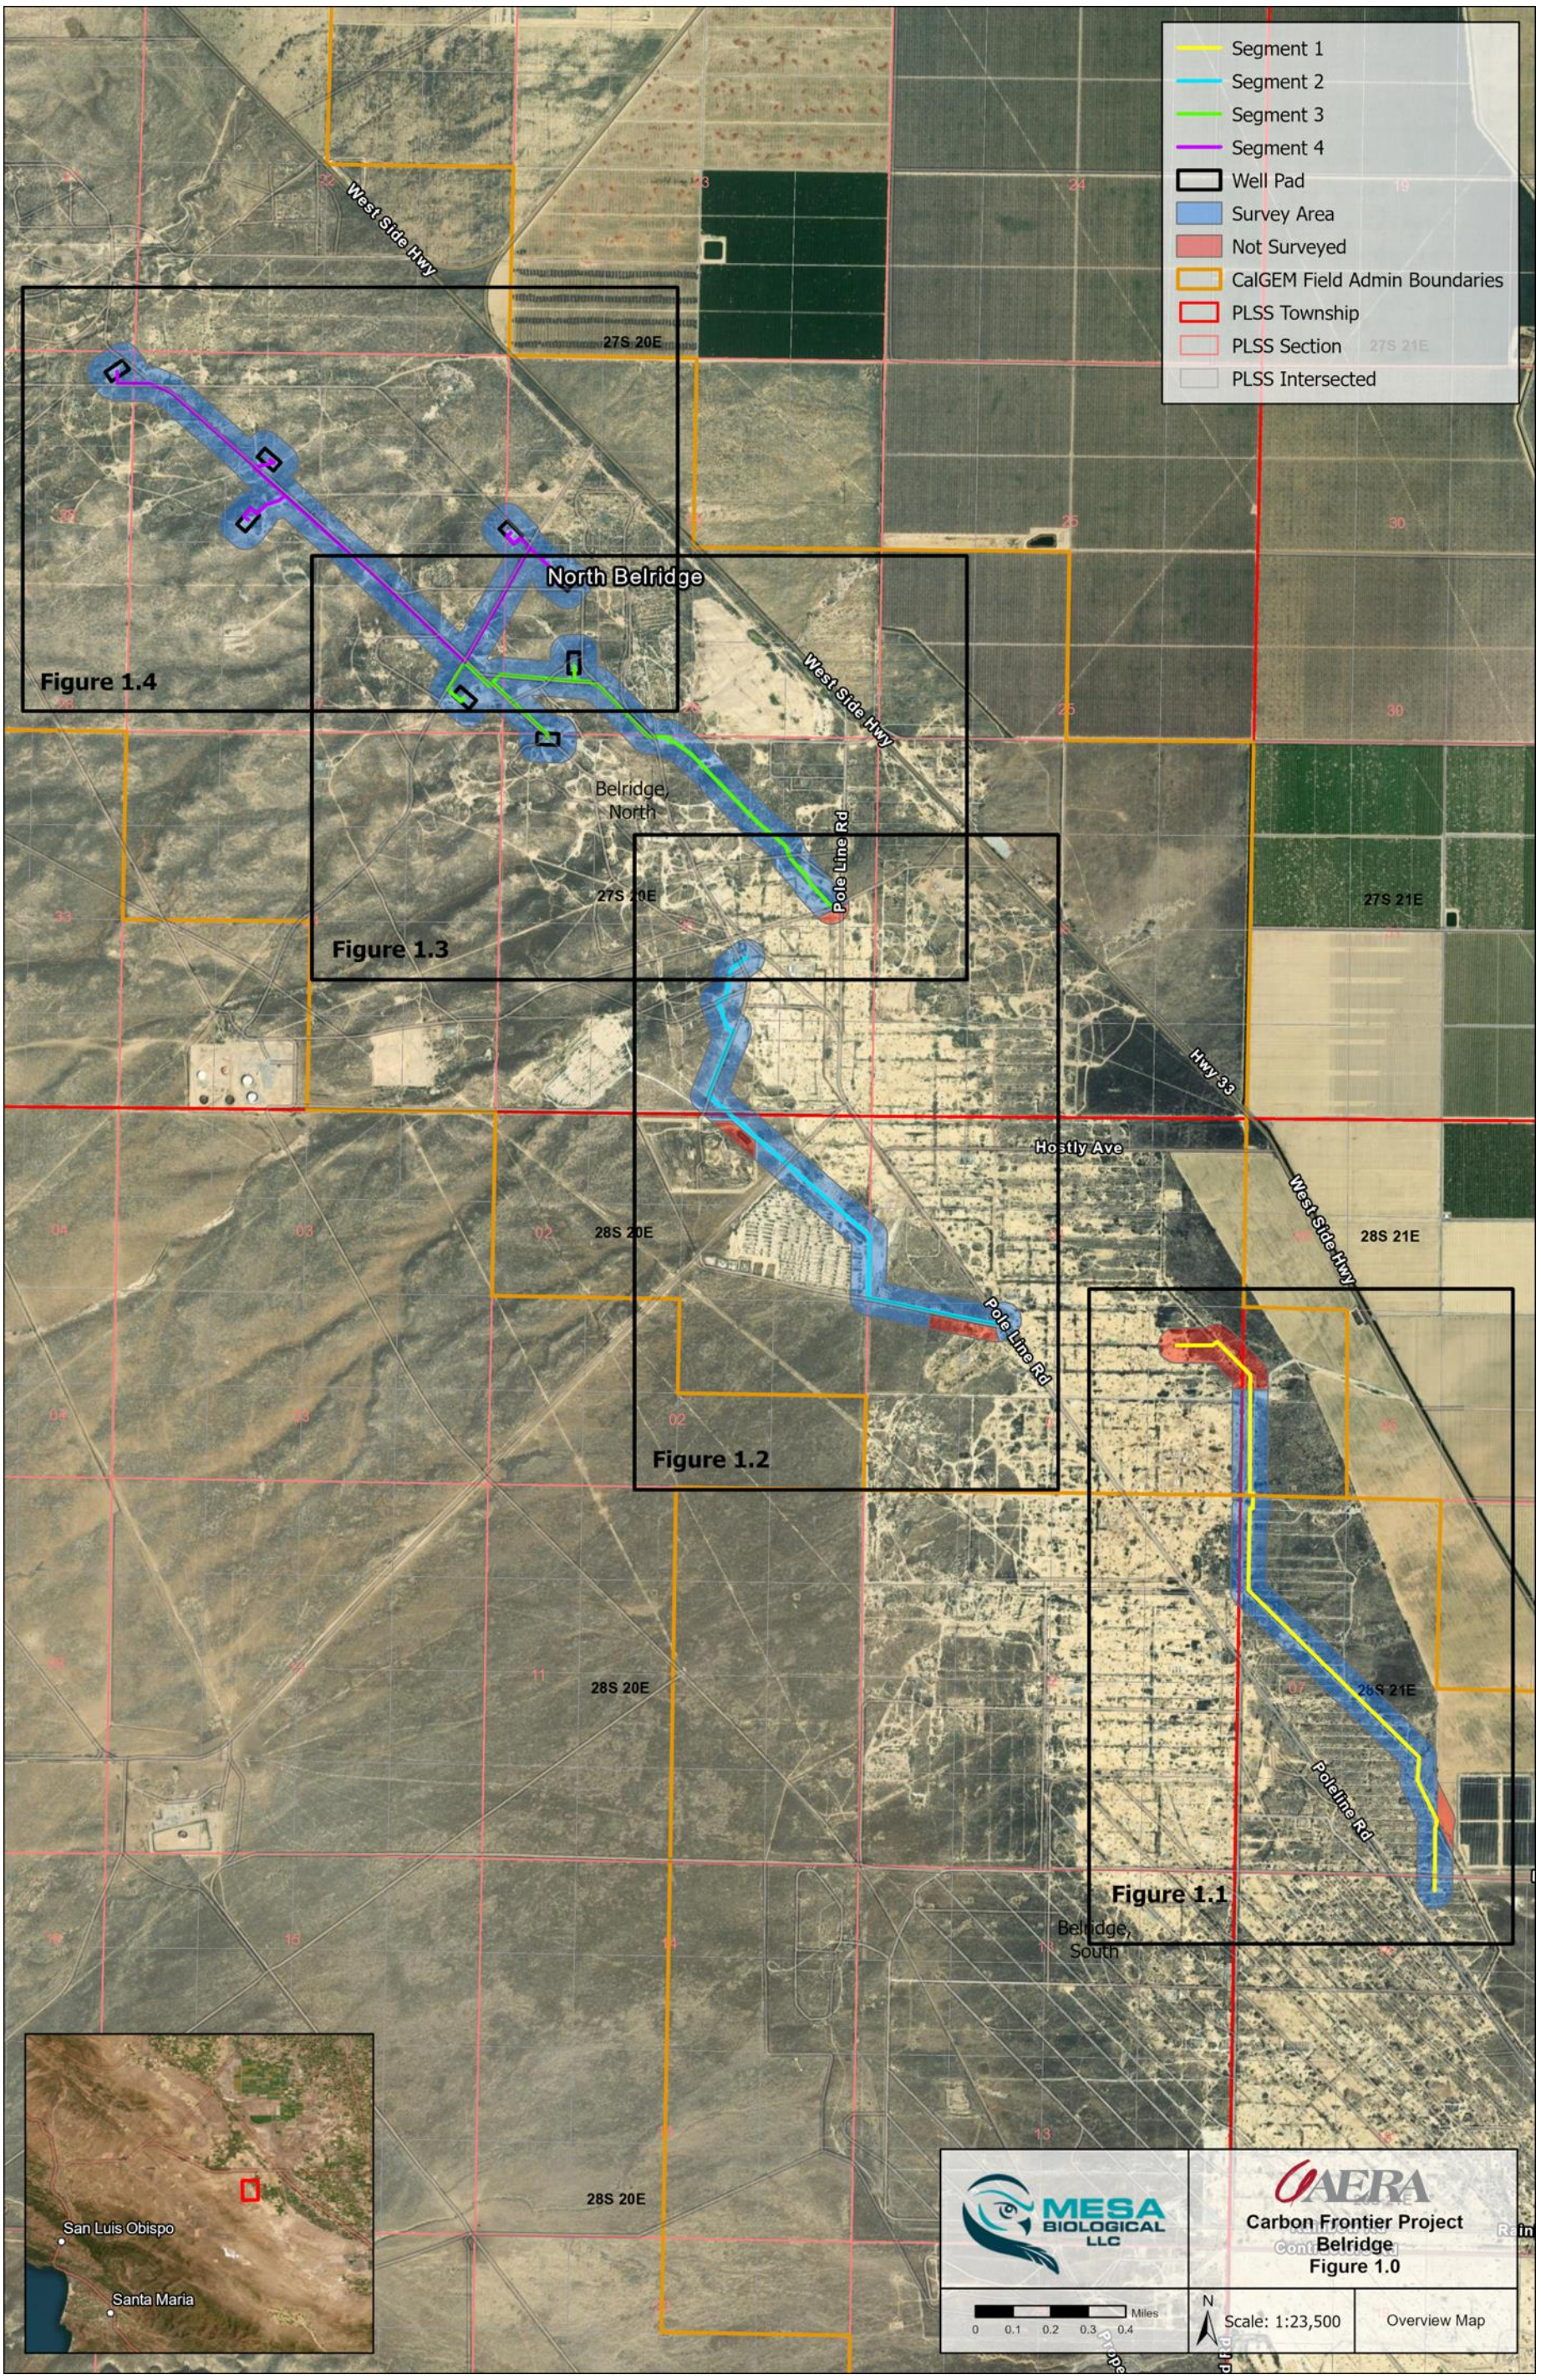
SECTION 5.0 - SPECIAL-STATUS AND COMMON SPECIES IDENTIFIED

5.1 Blunt-Nosed Leopard Lizard Observations

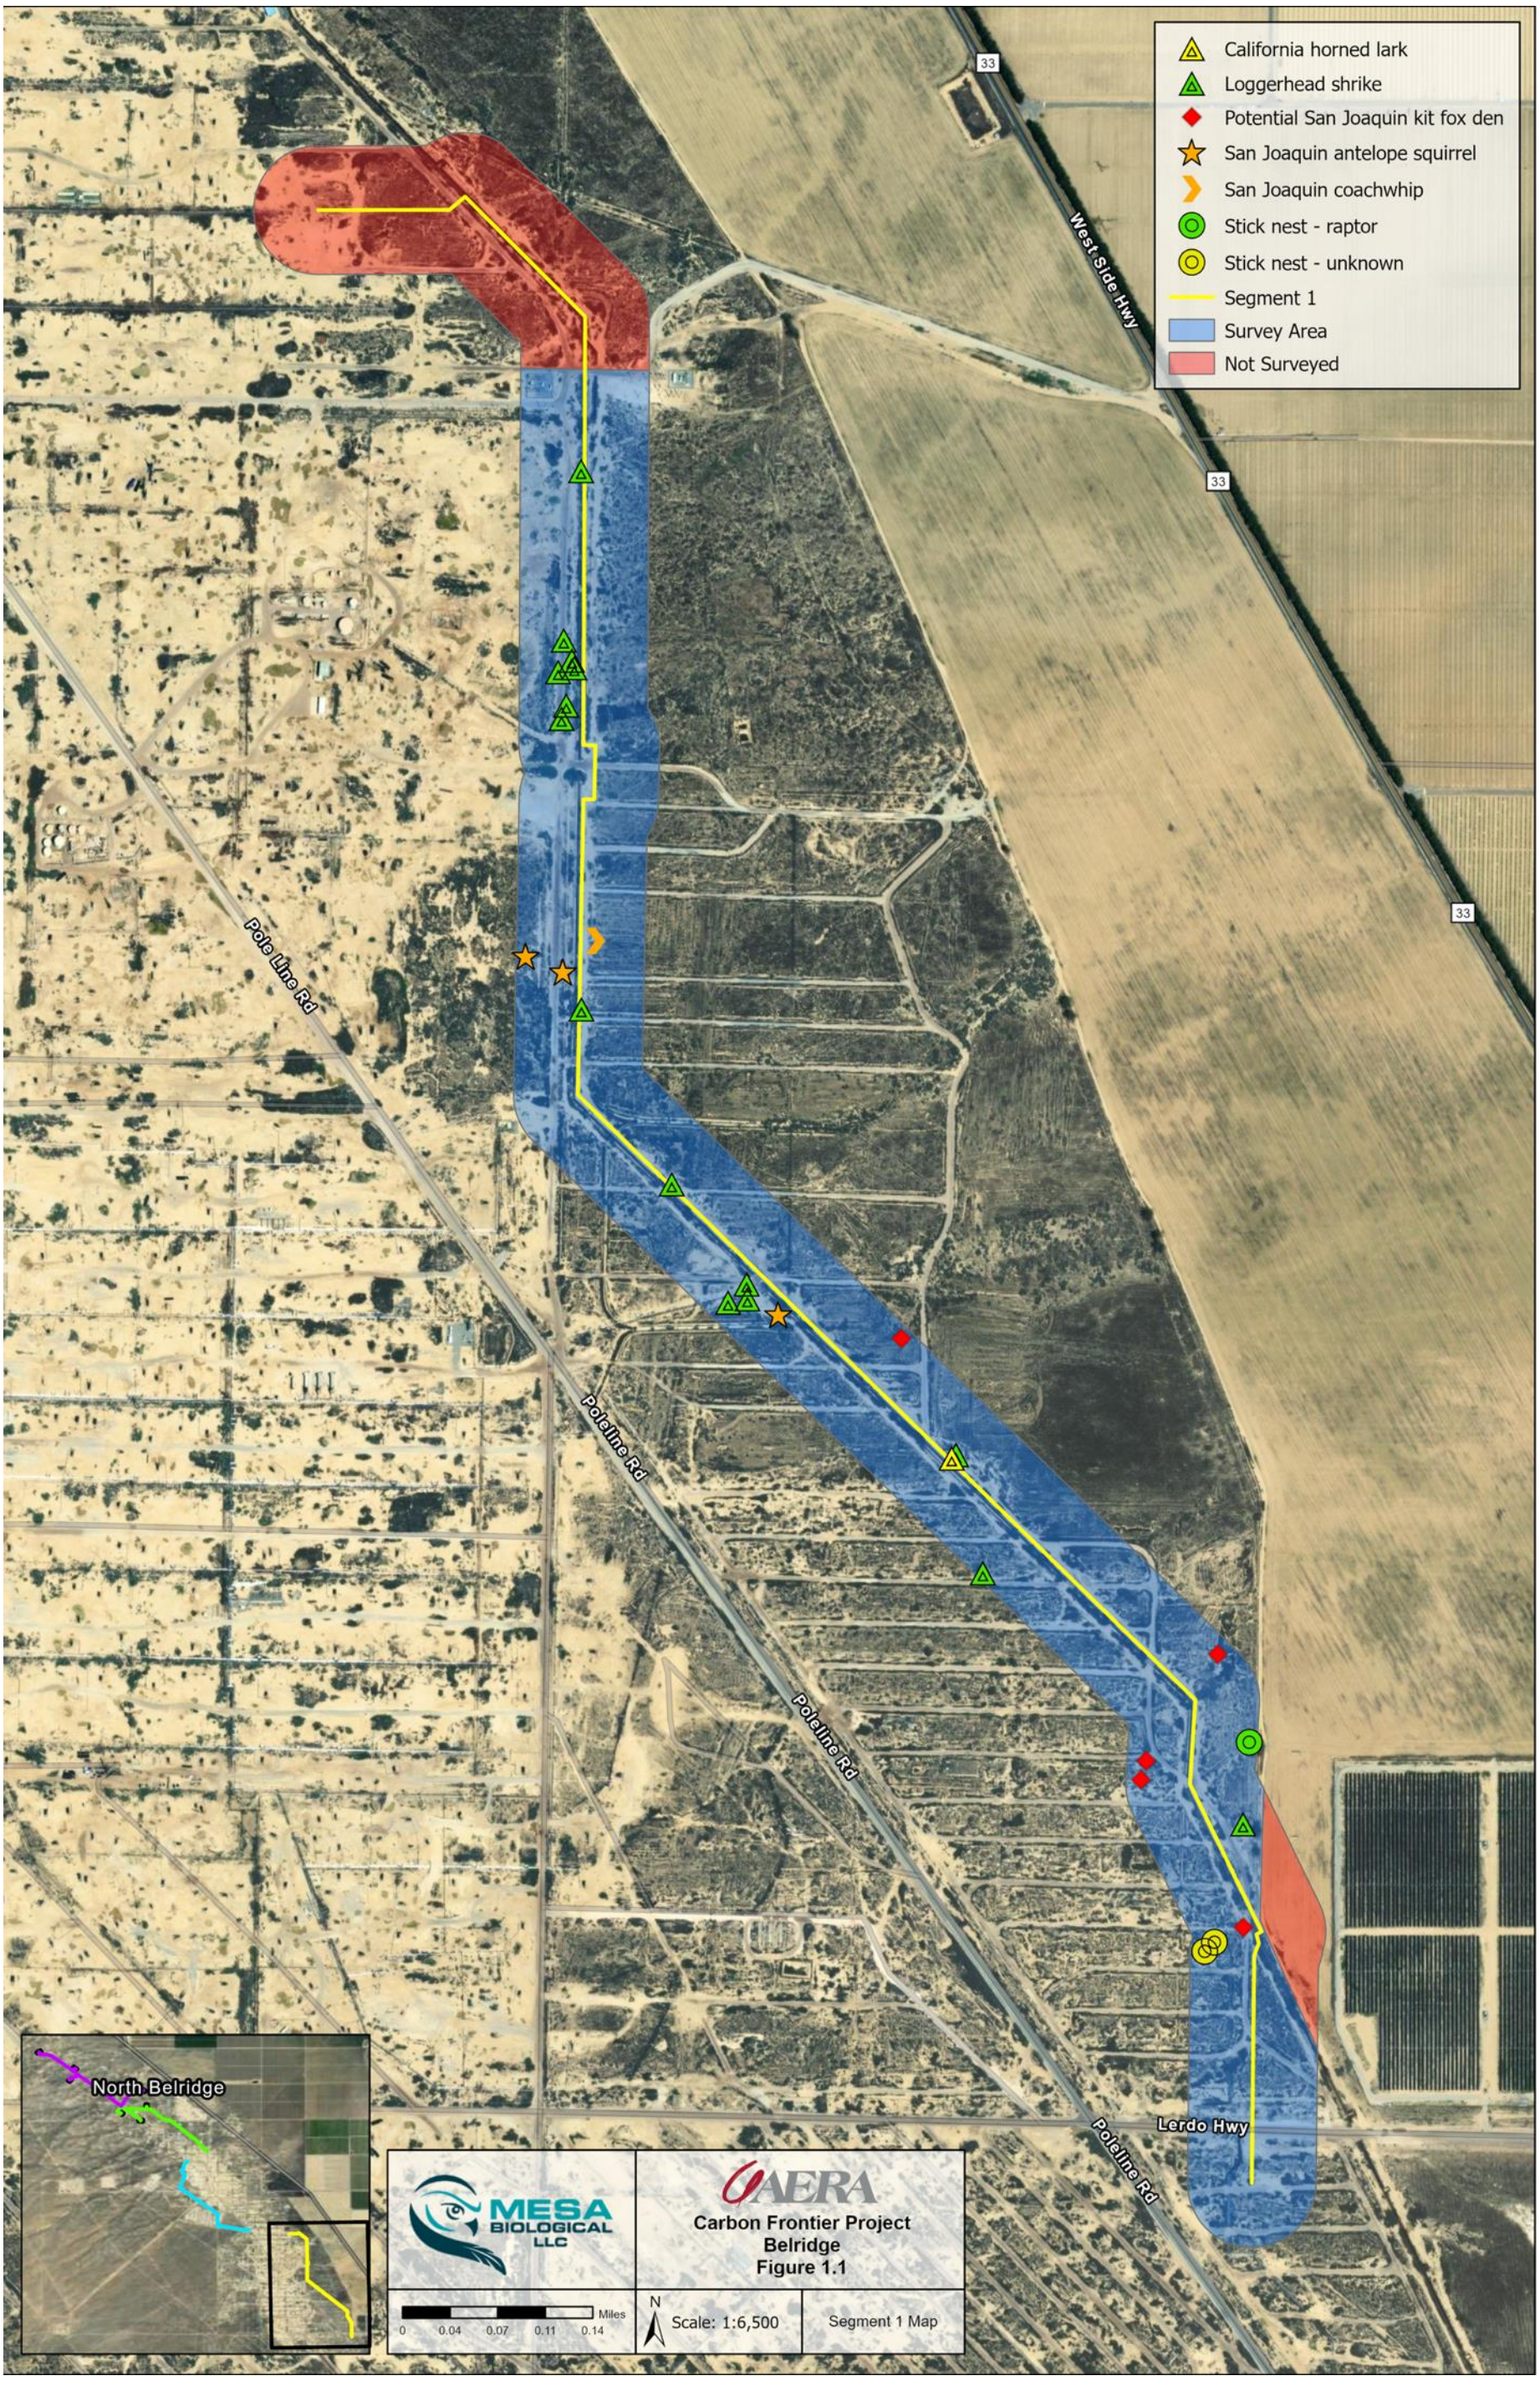
Date (month/day/year)	Location Description (Segment Number)	Sex (male/female)	Life Stage (adult/sub-adult/hatchling)	Coordinates (Decimal degrees)
06/09/23	Segment 4	female	adult	35.546400°, -119.799638°
06/15/23	Segment 3	unknown	adult	35.543039°, -119.795407°
06/30/23	Segment 3	unknown	adult	35.541822°, -119.793807°
06/30/23	Segment 3	unknown	adult	35.541867°, -119.793773°
09/20/23	Segment 3	male	adult	35.543394°, -119.795956°
09/20/23	Segment 3	unknown	sub-adult	35.542878°, -119.795594°

5.2 Other Incidentally Observed Special-Status Species

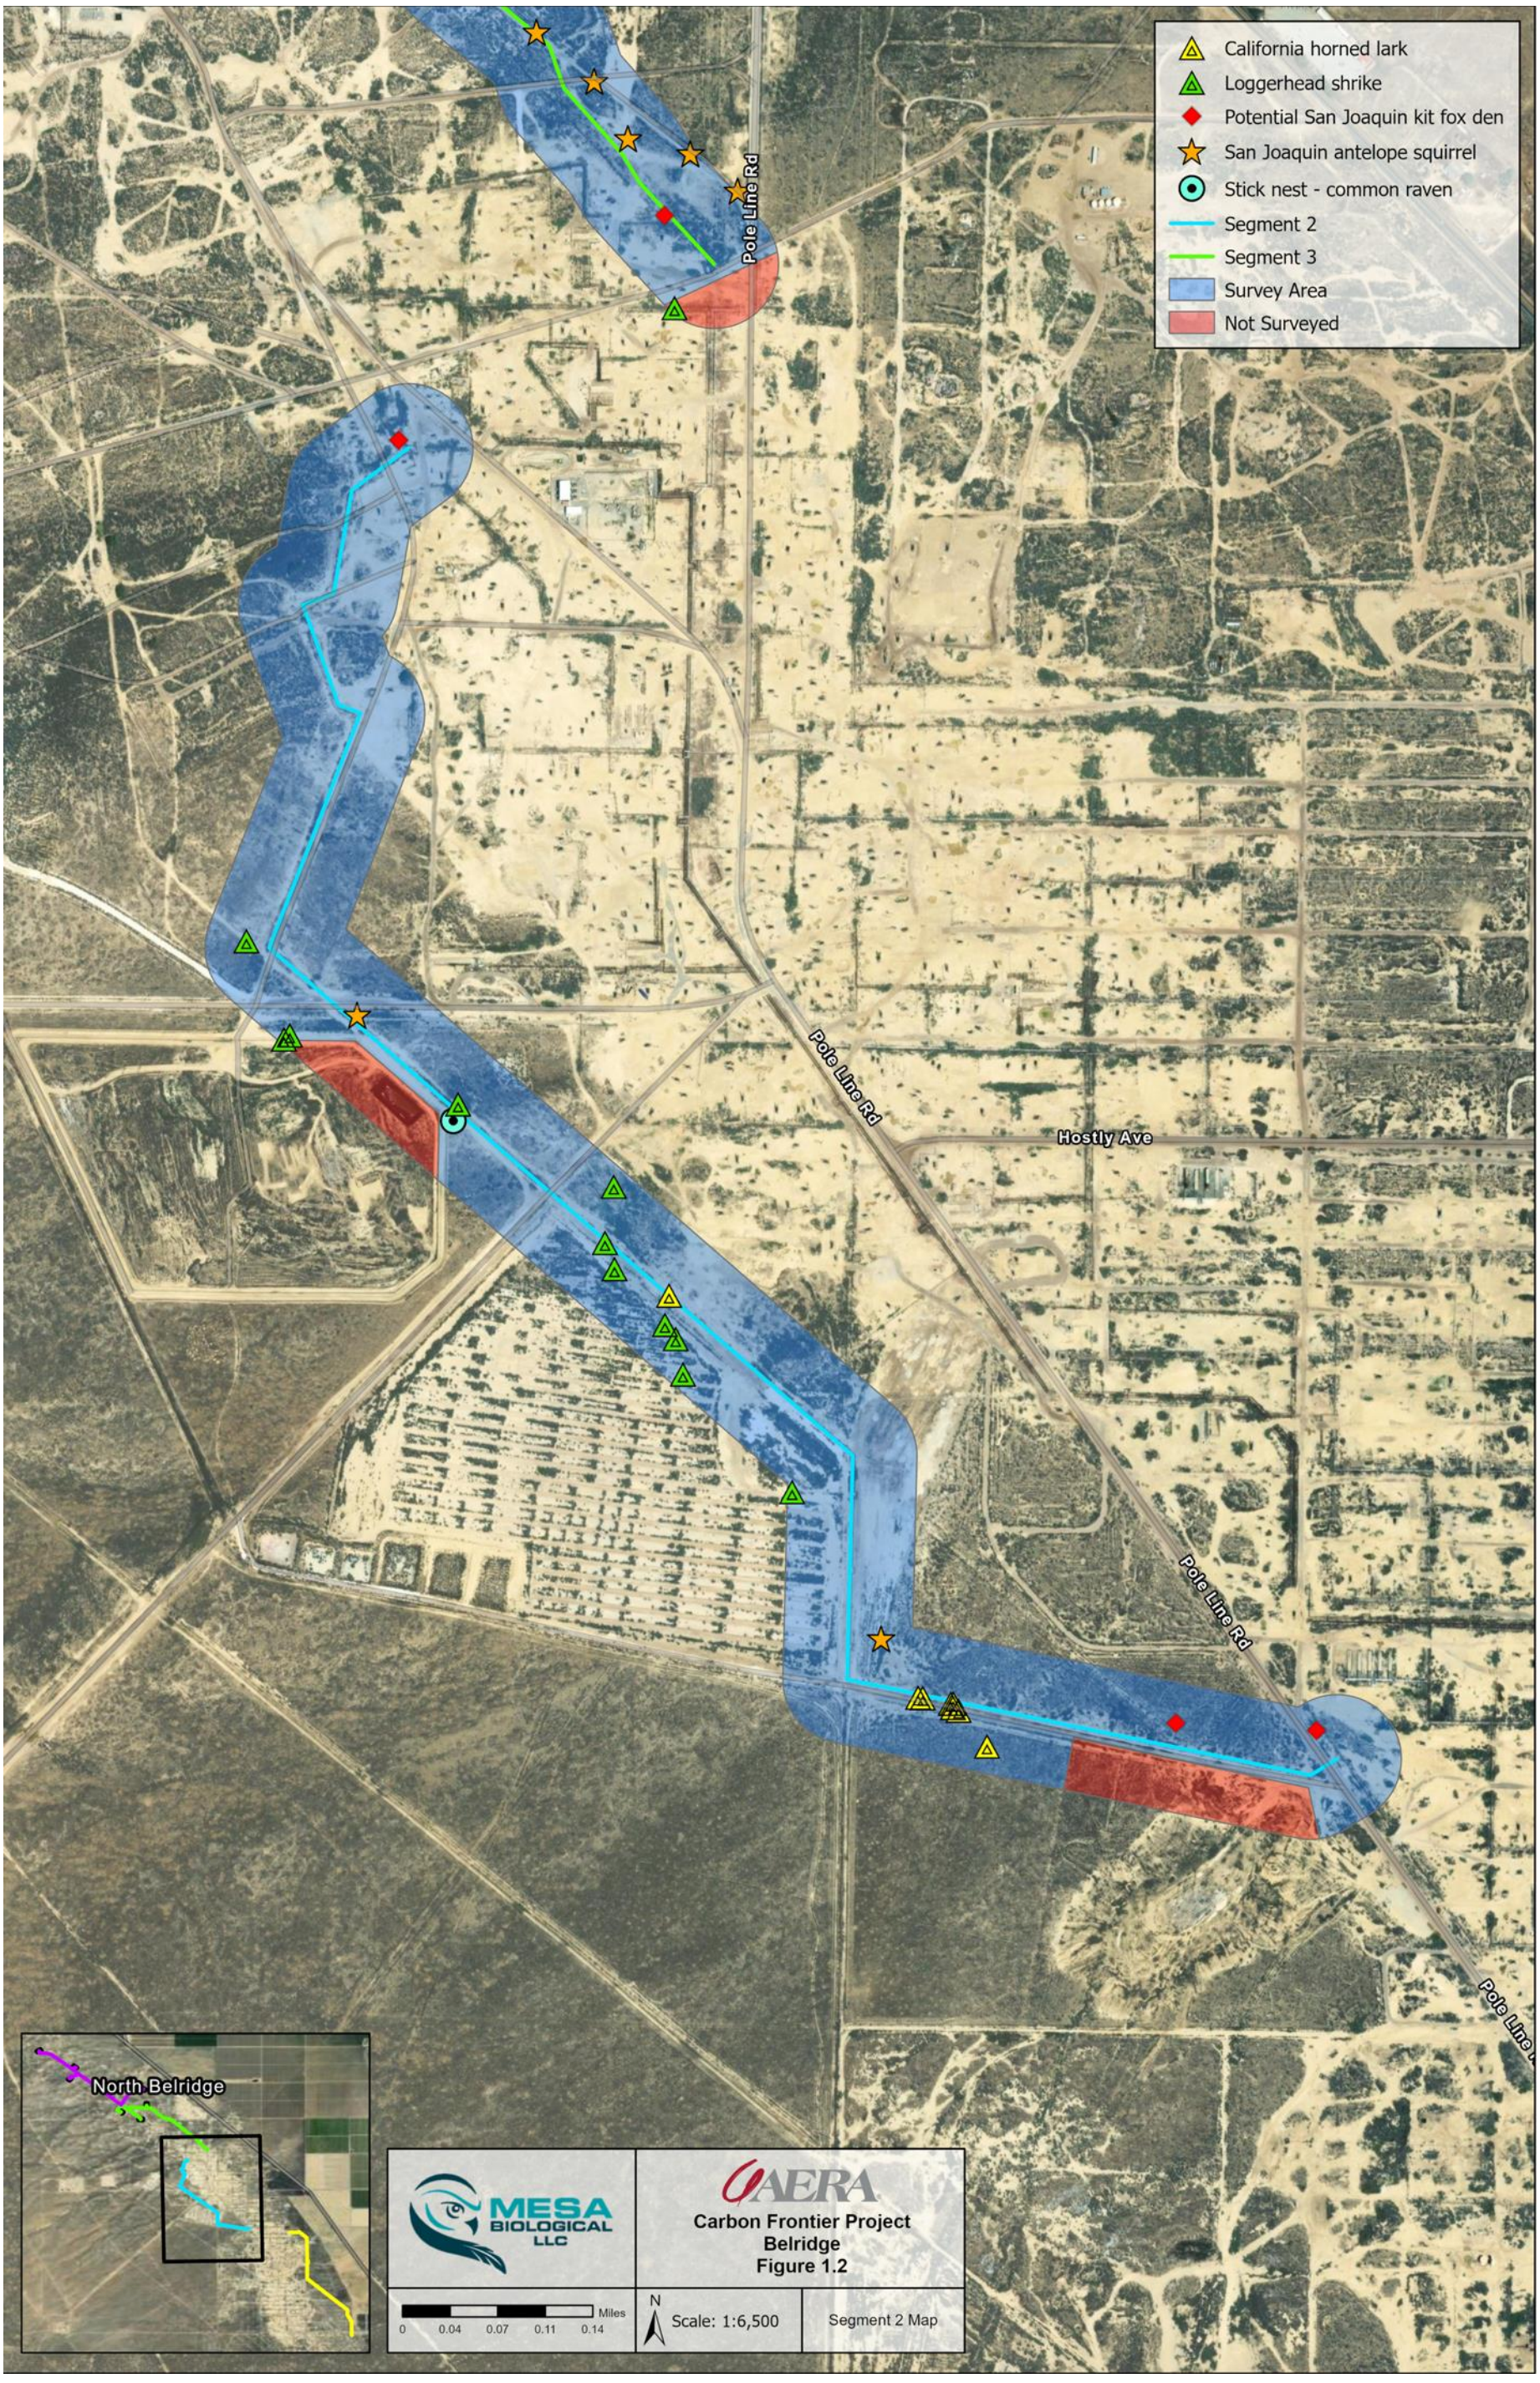
Common Name	*Scientific Name*	Status:
San Joaquin antelope squirrel	(*Ammospermophilus nelsoni*)	California Threatened
Loggerhead shrike	(*Lanius ludovinicanus*)	California Species of Special Concern
California horned lark	(*Eremophila alpestris actia*)	California Watch List
San Joaquin coachwhip	(*Masticophis flagellum ruddocki*)	California Species of Special Concern
San Joaquin kit fox (scat)	(*Vulpes macrotis mutica*)	USFWS Endangered; California Threatened
Prairie falcon	(*Falco mexicanus*)	California Watch List



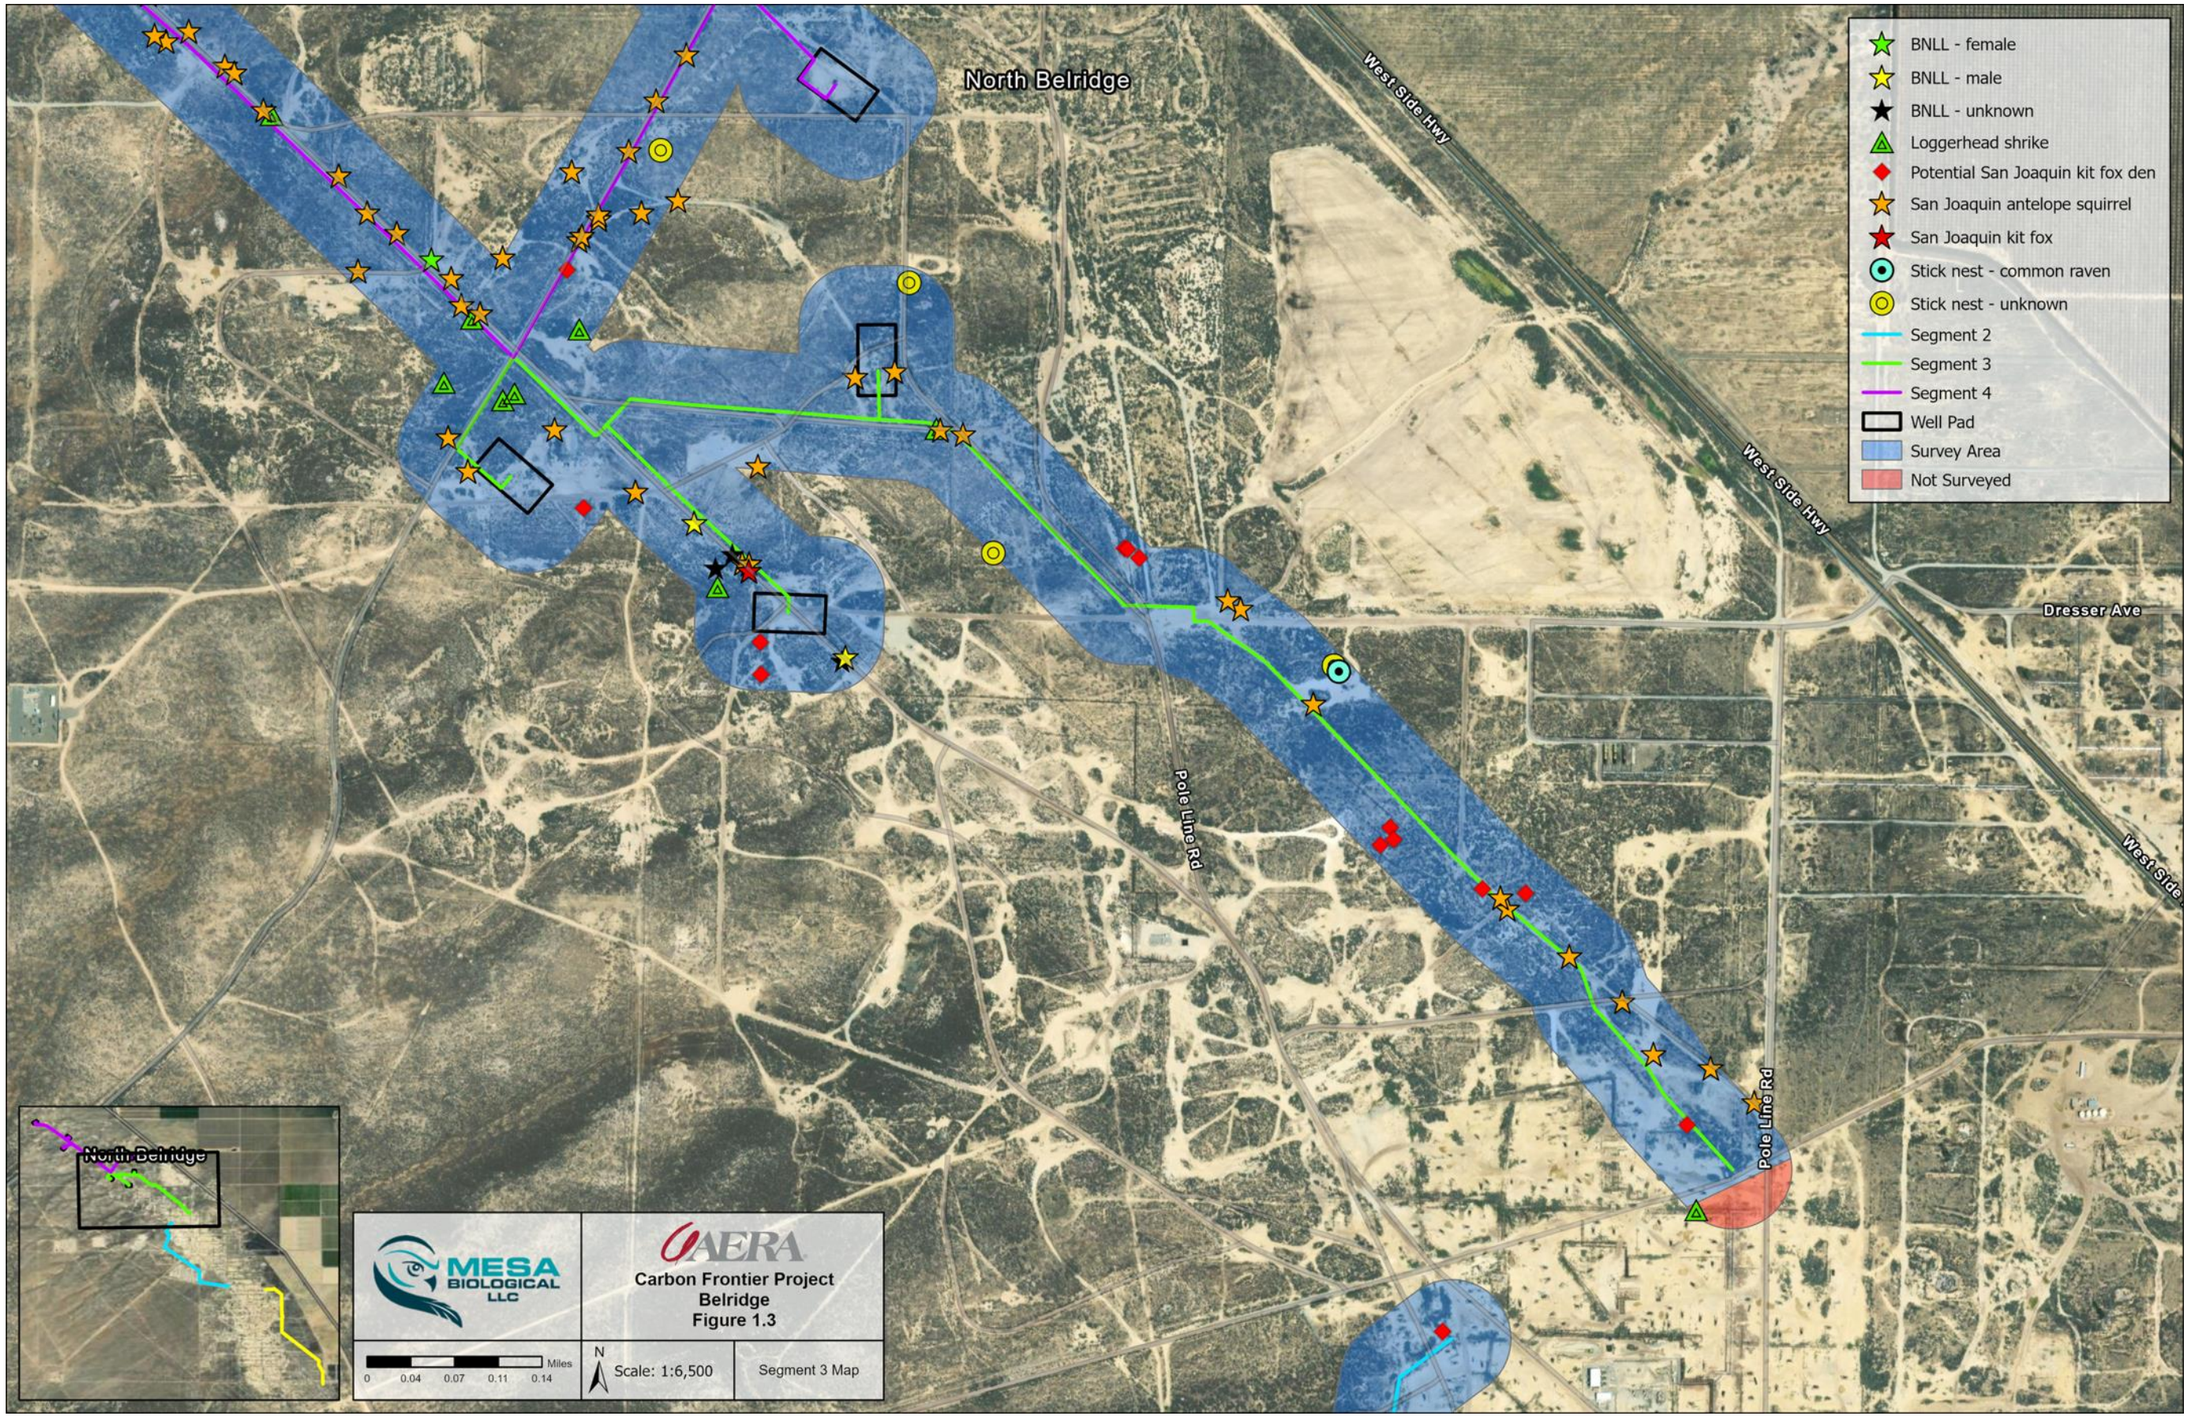
Swainson's hawk	(*Buteo swainsoni*)	California Threatened



Additional Comments:
Several stick nests were incidentally observed during the survey. The location of each nest is shown in **Attachment A – Figures 1.1 to 1.4**. Scat indicative of San Joaquin kit fox was observed on the proposed Segment 3 CO_2 pipeline corridor. No CNDDB RareFind Field Form was submitted for this observation of kit fox sign. The location can be found in **Attachment A – Figure 1.3**. According to the 2011 United States Fish and Wildlife Service (USFWS) Standardized Recommendations for the Protection of the San Joaquin Kit Fox Prior to or During Ground Disturbance multiple dens that would be considered "potential dens" were incidentally found and recorded during the survey. One prairie falcon and one Swainson's hawk was observed soaring overhead. No CNDDB RareFind Field Form submittals were uploaded to the database as these two species did not appear to have an affiliation with the project site.



6.0 List of Common Species Observed During Surveys



Common Name:	Scientific Name:
northern mockingbird	*Mimus polyglottos*
lesser nighthawk	*Chordeiles acutipennis*
common raven	*Corvus corax*
mourning dove	*Zenaida macroura*
Brewer's blackbird	*Euphagus cyanocephalus*
desert cottontail	*Sylvilagus audubonii*
red-tailed hawk	*Buteo jamaicensis*
western meadowlark	*Sturnella neglecta*
western kingbird	*Tyrannus verticalis*
California quail	*Callipepla californica*
hooded oriole	*Icerus cucullatus*
black-tailed jackrabbit	*Lepus californicus*
great horned owl	*Bubo virginianus*
barn owl	*Tyto alba*
gopher snake	*Pituophis catenifer*
European starling	*Sturnus vulgaris*
killdeer	*Charadrius vociferus*
kangaroo rat	*Dipodomys sp.*
greater roadrunner	*Geococcyx californianus*
yellow warbler	*Setophaga petechia*
black phoebe	*Sayornis nigricans*
Savannah sparrow	*Passerculus sandwichensis*
western pacific rattlesnake	*Crotalus oreganus*
American crow	*Corvus brachyrhynchos*

Segment 2 – Aera Energy LLC Carbon Frontier - Survey Day 1

Survey Information

Survey Date:	Client:	Location:	Project:
May 22, 2023	Aera Energy LLC	North Belridge, Kern County, CA	Carbon Frontier Segment 2

Surveyors

Name:	Surveyor Qualifications:
Karla Lopez	Level II
Rory Miller	Level II
Dorothy Tran	Level II
Rodney Aguirre	Level II

Start/End Times and Recorded Weather Conditions

Start Time:	9:10am	**End Time:**	11:18am
Start Temperature (°F):	80.1°F	**End Temperature (°F):**	90.2°F
Start Cloud Cover:	5%	**End Cloud Cover:**	5%
Wind Speed:	1.8mph	**Wind Speed:**	2.2mph
Weather Summary:	Sunny skies		

Recorded Blunt-Nosed Leopard Lizard Observations and Location

Sex: (male/female)	Life Stage: (adult/sub-adult/hatchling)	Coordinates: (Latitude/Longitude)	Notes:
0	N/A	N/A	No BNLL identified

Other Lizard Species Observations

Side-Blotched Lizard (*Uta stansburiana*):	36
California Whiptail Lizard (*Aspidoscelis tigris munda*):	21
Blainsville Horned Lizard (*Phrynosoma blainvillii*):	0

Other Special-Status Species Observed

Common Name:	Scientific Name:	Status:
California horned lark	*Eremophila alpestris actia*	WL
WL: California Watch List		

Incidental Common Species Observations:

Common Name:	Scientific Name:	Common Name:	Scientific Name:
European starling	*Sturnus vulgaris*	house finch	*Haemorhous mexicanus*
lesser nighthawk	*Chordeiles acutipennis*	western meadowlark	*Sturnella neglecta*
common raven	*Corvus corax*	western kingbird	*Tyrannus verticalis*
mourning dove	*Zenaida macroura*	California quail	*Callipepla californica*
black-tailed jackrabbit	*Lepus californicus*	Bell's sparrow	*Artemisiospiza belli*
desert cottontail	*Sylvilagus audubonii*

California Department of Fish and Wildlife Protocol Survey Requirements:
1) Four consecutive survey days occurred from July 10th through July 13th.
2) No more than eight days occurred within a 30-day period.
3) No more than five survey days occurred within any seven day period.

Scientific name: *Gambelia sila*

Common name: blunt-nosed leopard lizard

Date of field work (mm-dd-yyyy): 09-29-2023

Comment about field work date(s): Began May 15th 2023 ending Sept 29th 2023

OBSERVER INFORMATION

Observer: Paul D. Rosebush

Affiliation: MESA Biological LLC on behalf of Aera Energy LLC

Address: 8847 Hickory Hills Ave , Bakersfield, CA 93312

Email: paul@mesabio.com

Phone: (661) 203-2409

Other observers: Jeffrank Solorzano, Dorothy Tran, Rory Miller

DETERMINATION

Keyed in:

Compared w/ specimen at:

Compared w/ image in:

By another person: Paul Rosebush, Jeffrank Solorzano, Rory Miller, Dorothy Tran

Other:

Identification explanation: A total of six individuals were observed by 4 surveyors during transects surveys. Surveyors were able to photograph 4 of 6 individuals.

Identification confidence: Very confident

Species found: Yes **If not found, why not?**

Level of survey effort: Protocol level blunt-nosed leopard lizard walking transect surveys.

Total number of individuals: 6

Collection? No **Collection number:**

Museum/Herbarium:

ANIMAL INFORMATION

How was the detection made? Seen

Number detected in each age class:

adults	juveniles	larvae	egg mass	unknown
5	1			

Age class comment: 5 adult individuals and 1 juvenile observed

Site use description: Very low density of oil field infrastructure. Some evidence of historical sheep grazing.

What was the observed behavior? All six individuals were observed along the edges of a dirt access road. Normal foraging behavior was noted.

Describe any evidence of reproduction: One of the six individuals was a hatchling. One female was observed with distinct breeding colors.

SITE INFORMATION

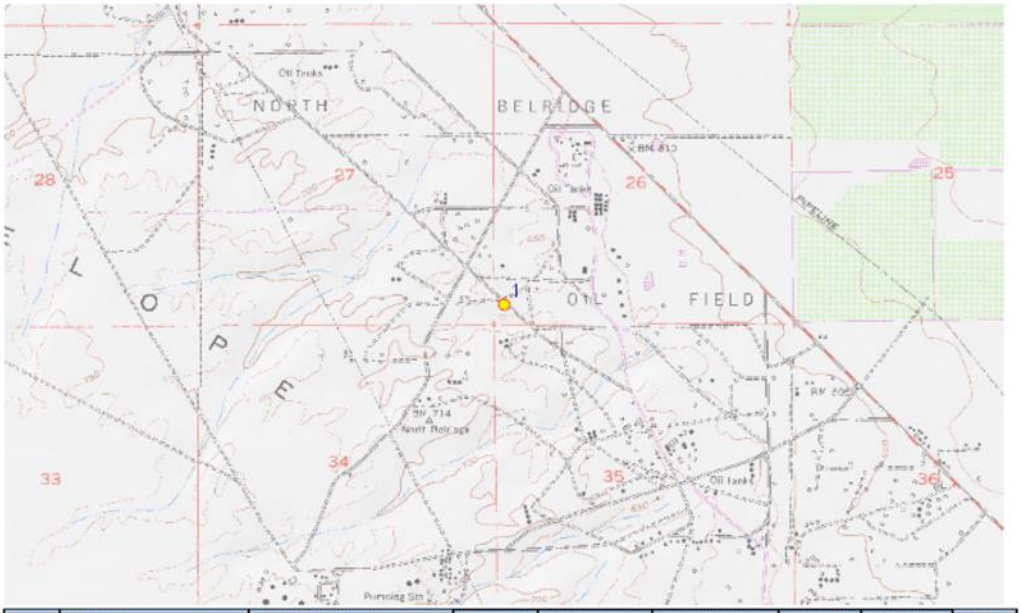
Habitat description: Generalized habitat is Allscale scrub surrounding light oil field infrastructure.

Slope: Less than 5% slope.

Aspect:

Land owner/manager: Property is owned by an oil production company.

Site condition + population viability: Good



Immediate & surrounding land use: Primary use is oil extraction, some evidence of sheep grazing was noted. Lands to the east of the existing oil field are comprised of active agriculture. Lands to the west of the existing oil field are comprised of grazed grasslands.

Visible disturbances: Evidence of light oil infrastructure in the form of oil wells, access roads, pipelines and electrical infrastructure. Some evidence of historical sheep grazing was identified.

Threats: Oil production.

General comments:

DETERMINATION

Keyed in:

Compared w/ specimen at:

Compared w/ image in:

By another person:

Other: Physical identification of approx. 8 California horned larks made during protocol level BNLL surveys.

Identification explanation: ~8 positive observations of California horned lark

Identification confidence: Very confident

Species found: Yes **If not found, why not?**

Level of survey effort: Incidental observations of California horned larks made during protocol level survey for blunt-nosed leopard lizard.

Total number of individuals: ~8

Collection? No **Collection number:**

Museum/Herbarium:

ANIMAL INFORMATION

How was the detection made? Seen

Number detected in each age class:

adults	juveniles	larvae	egg mass	unknown
8				

Age class comment:

Bird site use:

☐ Nesting ☐ Rookery ☐ Nesting colony ☐ Burrow site ☐ Lek

☐ Non-breeding (over-wintering) ☐ Communal roost ☑ Other

Site use description: possible nesting habitat. No nests or nesting behaviors displayed.

What was the observed behavior? routine foraging

Describe any evidence of reproduction: None

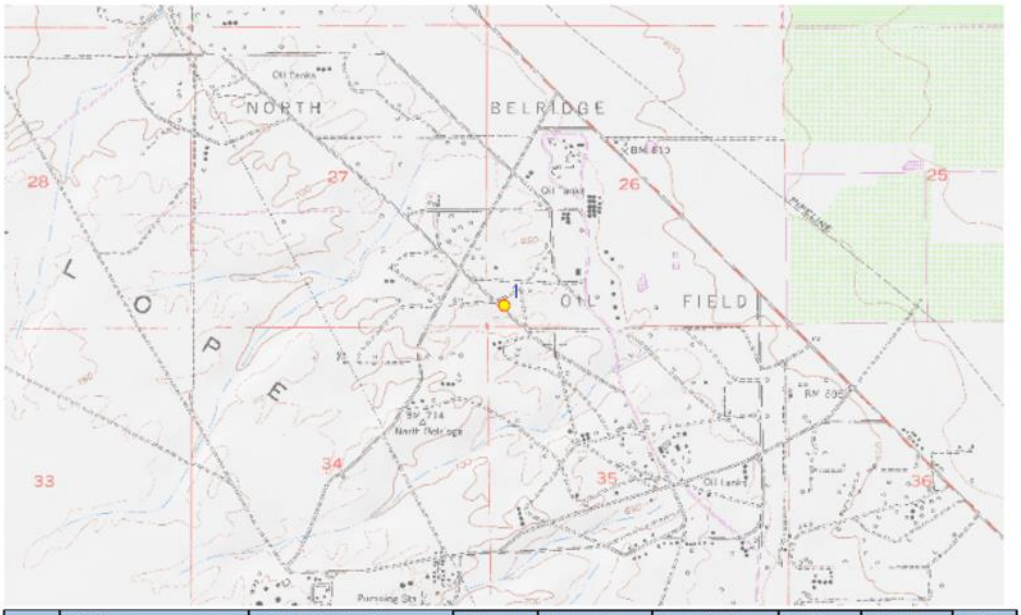
SITE INFORMATION

Habitat description: Generalized habitat: Allscale scrub mixed with pockets of oil producing infrastructure.

Slope: less than 5% Land owner/manager: Oil production company

Aspect:

Site condition + population viability: Good



Immediate & surrounding land use: Immediate land use is oil production surrounded by active agriculture to the east and open grazed grasslands to the north and west. High density oil infrastructure occurs to the south.

Visible disturbances: Some disturbances from oil production have occurred

Threats: Oil production

General comments:

Site Location:	**Belridge Oil Fields, Kern County, California**	

Photograph ID: 23 **Photo Location:** South Belridge Oil Field 35.47°W; 119.74°N **Direction:** Southeast **Survey Date:** 5/26/2023 **Comments:** View of existing Aera oil facilities, pipelines, and disturbed habitat along proposed steam pipeline route in southern portion of Action Area.	
Photograph ID: 24 **Photo Location:** South Belridge Oil Field 35.47°W; 119.74°N **Direction:** West **Survey Date:** 5/26/2023 **Comments:** View of existing Aera oil facilities, pipelines, and disturbed habitat facing proposed steam pipeline route in southern portion of Action Area. Note level of disturbance to southern portion of Action Area.	

Client:	**Aera Energy LLC**	**Project: Carbon Frontier Project**
Site Location:	**Belridge Oil Fields, Kern County, California**	

Photograph ID: 25 **Photo Location:** South Belridge Oil Field 35.47°W; 119.73°N **Direction:** West **Survey Date:** 5/26/2023 **Comments:** View of existing Aera oil facilities, pipelines, and disturbed habitat along proposed steam pipeline route in southern portion of Action Area. Note level of disturbance to southern portion of Action Area.	
Photograph ID: 26 **Photo Location:** South Belridge Oil Field 35.44°W; 119.72°N **Direction:** Northeast **Survey Date:** 6/13/2023 **Comments:** View of Chico Martinez Creek in southern portion of Action Area with Aera oil facilities in the background.	

Client:	**Aera Energy LLC**	**Project: Carbon Frontier Project**
Site Location:	**Belridge Oil Fields, Kern County, California**	

Photograph ID: 27 **Photo Location:** North Belridge Oil Field 35.53°W; 119.78°N **Direction:** Toward ground **Survey Date:** 3/7/2023 **Comments:** *Eremalche parryi* individual observed during floristic botanical survey. Only one flowering plant with bisexual (non-pistillate) flowers was observed; characteristics tend to be consistent with the much more common *E. parryi* ssp. *parryi* rather than Kern mallow (*E. parryi* ssp. *kernensis*).	
Photograph ID: 28 **Photo Location:** South Belridge Oil Field 35.49°W; 119.75°N **Direction:** Southeast **Survey Date:** 6/7/2023 **Comments:** View of annual grassland habitat east of Pole Line Road in area that had multiple potential kit fox dens.	

Client:	**Aera Energy LLC**	**Project: Carbon Frontier Project**
Site Location:	**Belridge Oil Fields, Kern County, California**	

Photograph ID: 29 **Photo Location:** South Belridge Oil Field 35.45°W; 119.69°N **Direction:** Toward ground **Survey Date:** 7/20/2022 **Comments:** Uncapped pipe within the BSA that could serve as a potential atypical kit fox den.	
Photograph ID: 30 **Photo Location:** South Belridge Oil Field 35.46°W; 119.71°N **Direction:** Southeast **Survey Date:** 7/20/2022 **Comments:** Potential kit fox den observed and mapped east of Pole Line Road.

Appendix B□ WETLAND DETERMINATION DATA FORMS AND ORDINARY HIGH-WATER MARK DATASHEETS

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Aera Belridge ERS City/County: Belridge oil field, western Kern County Sampling Date: 06/01/22

Applicant/Owner: Aera State: CA Sampling Point: SP1

Investigator(s): G. Hoetker, J. Byrd Section, Township, Range: S32, T29S, R21E

Landform (hillslope, terrace, etc.): excavated drainage ditch Local relief (concave, convex, none): Concave Slope (%): 1%

Subregion (LRR): LRR C Lat: 35.447616 Long: -119.734113° Datum: NAD83

Soil Map Unit Name: 174 – Kimberlina fine sandy loam, 0-2% slopes NWI classification: Riverine

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✓ No ____ (If no, explain in Remarks.)

Are Vegetation Y, Soil Y, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No ____

Are Vegetation —, Soil —, or Hydrology — naturally problematic? N (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ____	No ✓	**Is the Sampled Area within a Wetland?** Yes ____ No ✓
Hydric Soil Present?	Yes ____	No ✓	
Wetland Hydrology Present?	Yes ____	No ✓	

Remarks: No wetland indicators; excavated drainage ditch; no OHWM; potential waters of the state

VEGETATION – Use scientific names of plants.

FACW species ____	x 2 = ____
FAC species ____	x 3 = ____
FACU species ____	x 4 = ____
UPL species ____	x 5 = ____
Column Totals: ____ (A)	____ (B)

Prevalence Index = B/A = ____

Hydrophytic Vegetation Indicators:

___ Dominance Test is >50%

___ Prevalence Index is ≤3.0[1]

___ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)

___ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes ____ No ✓

Remarks: No dominant hydrophytic vegetation.

SOIL

Sampling Point: SP1

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	%	Redox Features Color (moist)	%	Type[1]	Loc[2]	Texture	Remarks
0-5"	10YR 4/4	100%	—	—	—	—	sand	
5-16"	10YR 4/3	100%	—	—	—	—	loamy sand	

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ Stratified Layers (A5) (**LRR C**)
- ___ 1 cm Muck (A9) (**LRR D**)
- ___ Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)
- ___ Sandy Mucky Mineral (S1)
- ___ Sandy Gleyed Matrix (S4)
- ___ Sandy Redox (S5)
- ___ Stripped Matrix (S6)
- ___ Loamy Mucky Mineral (F1)
- ___ Loamy Gleyed Matrix (F2)
- ___ Depleted Matrix (F3)
- ___ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: —

Depth (inches): —

Hydric Soil Present? Yes ___ No ✓

Remarks:

Sandy soil top layer; loamy sand bottom layer — no hydric soil indicators

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ___ No ✓ Depth (inches): ___

Water Table Present? Yes ___ No ✓ Depth (inches): ___

Saturation Present? (includes capillary fringe) Yes ___ No ✓ Depth (inches): ___

Wetland Hydrology Present? Yes ___ No ✓

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

No hydrology indicators

FACU species ____	x 4 = ____
UPL species ____	x 5 = ____
Column Totals: ____ (A)	____ (B)

Prevalence Index = B/A = ____

Hydrophytic Vegetation Indicators:

___ Dominance Test is >50%

___ Prevalence Index is ≤3.0[1]

___ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)

___ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes ____ No ✓

Remarks: No dominant hydrophytic vegetation present.

SOIL

Sampling Point: SP18

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	%	Redox Features Color (moist)	%	Type[1]	Loc[2]	Texture	Remarks
0-16"	10YR 5/6	100%					loam	

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ Stratified Layers (A5) (**LRR C**)
- ___ 1 cm Muck (A9) (**LRR D**)
- ___ Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)
- ___ Sandy Mucky Mineral (S1)
- ___ Sandy Gleyed Matrix (S4)
- ___ Sandy Redox (S5)
- ___ Stripped Matrix (S6)
- ___ Loamy Mucky Mineral (F1)
- ___ Loamy Gleyed Matrix (F2)
- ___ Depleted Matrix (F3)
- ___ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: ~~_____~~

Depth (inches): ~~_____~~

Hydric Soil Present? Yes _____ No ✓

Remarks:

No hydric soil indicators.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes _____ No ✓ Depth (inches): _____

Water Table Present? Yes _____ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No ✓ Depth (inches): _____

Wetland Hydrology Present? Yes _____ No ✓

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

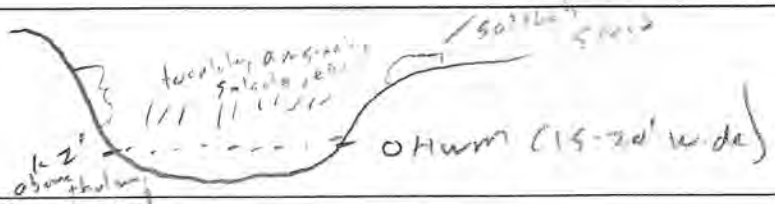
No wetland hydrology indicators.

Area

Project: CCS (N 45 Baldridge) **Date:** 07/19/22 **Time:** 11:30
Project Number: 185805372 **Town:** W. Kern Co. **State:** CA
Stream: Chico Martinez Creek **Photo begin file#** **Photo end file#**
Investigator(s): G. Hecker, E Martin, J. Pratt, C Coates

Y ☑ / N ☐ Do normal circumstances exist on the site?



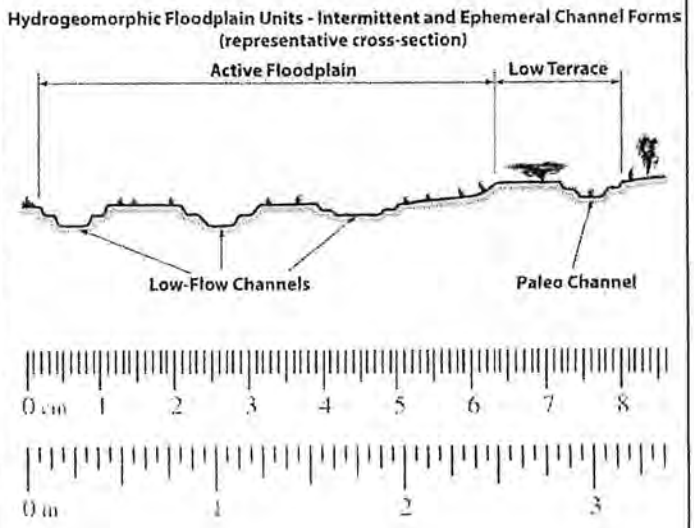
Y ☐ / N ☑ Is the site significantly disturbed?

Location Details: Chico Martinez Creek

Projection: 35.445175°, **Datum:** NAD 83
Coordinates: -119.715113°

Notes: 0.4-mile section of Chico Martinez Creek

Brief site description:



Checklist of resources (if available):

- ☑ Aerial photography
  Dates:
- ☑ Topographic maps
  Scale:
- ☐ Geologic maps
- ☐ Vegetation maps
- ☑ Soils maps
- ☐ Rainfall/precipitation maps
- ☑ Existing delineation(s) for site
- ☑ Global positioning system (GPS)
- ☐ Other studies
- ☐ Stream gage data
  Gage number:
  Period of record:
- ☐ Clinometer / level
- ☐ History of recent effective discharges
- ☐ Results of flood frequency analysis
- ☐ Most recent shift-adjusted rating
- ☐ Gage heights for 2-, 5-, 10-, and 25-year events and the most recent event exceeding a 5-year event

The dominant Wentworth size class that imparts a characteristic texture to each zone of a channel cross-section is recorded in the average sediment texture field under the characteristics section for the zone of interest.

Inches (in)	Millimeters (mm)	Wentworth size class	
10.08	256	Boulder	
2.56	64	Cobble	Gravel
0.157	4	Pebble	
		Granule	
0.079	2.00	Very coarse sand	
0.039	1.00	Coarse sand	
0.020	0.50	Medium sand	Sand
1/2 0.0098	0.25	Fine sand	
1/4 0.005	0.125	Very fine sand	
1/8 0.0025	0.0625	Coarse silt	
1/16 0.0012	0.031	Medium silt	
1/32 0.00061	0.0156	Fine silt	Silt
1/64 0.00031	0.0078	Very fine silt	
1/128 0.00015	0.0039	Clay	Mud

☑ **Walk the channel and floodplain within the study area to get an impression of the vegetation and geomorphology present at the site. Record any potential anthropogenic influences on the channel system in "Notes" above.**

☐ **Locate the low-flow channel (lowest part of the channel). Record observations.**

Characteristics of the low-flow channel: thin layer of cobble & gravel on surface, loamy sand below

Average sediment texture: _____

Total veg cover: 41 % Tree: ____ % Shrub: 25 % Herb: 16 %

Community successional stage:

☐ NA ☑ Mid (herbaceous, shrubs, saplings)

☐ Early (herbaceous & seedlings) ☐ Late (herbaceous, shrubs, mature trees)

Dominant species present: Atriplex polycarpa, Salsola tragus, Centaurea melitensis

Other: ☐ _____

☐ _____

☐ _____

☐ _____

☑ **Walk away from the low-flow channel along cross-section. Record characteristics of the low-flow/active floodplain boundary.**

Characteristics used to delineate the low-flow/active floodplain boundary:

☑ Change in total veg cover ☐ Tree ☐ Shrub ☐ Herb

☐ Change in overall vegetation maturity

☐ Change in dominant species present

☐ Other ☐ Presence of bed and bank

☐ Drift and/or debris

☐ Other: _____

☐ Other: _____

☑ **Continue walking the channel cross-section. Record observations below.**

Characteristics of the active floodplain:

Average sediment texture: same as above

Total veg cover: 41 % Tree: ____ % Shrub: 25 % Herb: 16 %

Community successional stage:

☐ NA ☑ Mid (herbaceous, shrubs, saplings)

☐ Early (herbaceous & seedlings) ☐ Late (herbaceous, shrubs, mature trees)

Dominant species present: Same as above

Other: ☐ _____

☐ _____

☐ _____

☐ _____

☑ **Continue walking the channel cross-section. Record indicators of the active floodplain/low terrace boundary.**

Characteristics used to delineate the active floodplain/ low terrace boundary:

- ☐ Change in average sediment texture
- ☐ Change in total veg cover ☐ Tree ☐ Shrub ☐ Herb
- ☐ Change in overall vegetation maturity
- ☐ Change in dominant species present
- ☐ Other
  - ☐ Presence of bed and bank
  - ☐ Drift and/or debris
  - ☐ Other: _____
  - ☐ Other: _____

☑ **Walk the active floodplain/low terrace boundary both upstream and downstream of the cross-section to verify that the indicators used to identify the transition are consistently associated the transition in both directions.**

Consistency of indicators used to delineate the active floodplain/low terrace boundary:

- Y ☑ N ☐ Change in average sediment texture
- Y ☑ N ☐ Change in total veg cover ☐ Tree ☐ Shrub ☐ Herb
- Y ☑ N ☐ Change in overall vegetation maturity
- Y ☑ N ☐ Change in dominant species present
- Y ☑ N ☐ Other:
  - Y ☑ N ☐ Presence of bed and bank
  - Y ☐ N ☐ Drift and/or debris
  - Y ☐ N ☐ Other: _____
  - Y ☐ N ☐ Other: _____

☐ **If the characteristics used to delineate the active floodplain/low terrace boundary were NOT consistently associated with the transition in both the upstream and downstream directions, repeat all steps above.**

☐ **Continue walking the channel cross-section. Record characteristics of the low terrace.**

Characteristics of the low terrace:

Average sediment texture: minimal gravel, loamy sand

Total veg cover: 25 % Tree: ____ % Shrub: ____ % Herb: 5 %

Community successional stage:

- ☐ NA
- ☑ Early (herbaceous & seedlings)
- ☐ Mid (herbaceous, shrubs, saplings)
- ☐ Late (herbaceous, shrubs, mature trees)

Dominant species present: Salsola tragus, Centaurea maculosa

Other:

- ☐ _____
- ☐ _____
- ☐ _____
- ☐ _____

☑ **If characteristics used to delineate the active floodplain/low terrace boundary were deemed reliable, acquire boundary.**

Active floodplain/low terrace boundary acquired via:

- ☐ Mapping on aerial photograph
- ☑ GPS
- ☐ Digitized on computer
- ☐ Other: _____

Aera CarbonFrontier Project

Aquatic Resources Delineation Report

July 13, 2023

Prepared for:

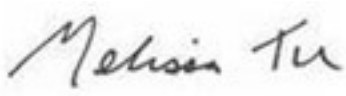
Aera Energy LLC
10000 Ming Avenue
Bakersfield, CA 93311-1302

Prepared by:

Stantec Consulting Services Inc.
5500 Ming Avenue, Suite 410
Bakersfield, CA 93309

Sign-off Sheet

The conclusions in the Report titled Aquatic Resources Delineation Report for the CarbonFrontier Project are Stantec's professional opinion, as of the time of the Report, and concerning the scope described in the Report. The opinions in the document are based on conditions and information existing at the time the scope of work was conducted and do not take into account any subsequent changes. The Report relates solely to the specific project for which Stantec was retained and the stated purpose for which the Report was prepared. The Report is not to be used or relied on for any variation or extension of the project, or for any other project or purpose, and any unauthorized use or reliance is at the recipient's own risk.



Stantec has assumed all information received from Aera Energy LLC (the "Client") and third parties in the preparation of the Report to be correct. While Stantec has exercised a customary level of judgment or due diligence in the use of such information, Stantec assumes no responsibility for the consequences of any error or omission contained therein.

This Report is intended solely for use by the Client in accordance with Stantec's contract with the Client. While the Report may be provided to applicable authorities having jurisdiction and others for whom the Client is responsible, Stantec does not warrant the services to any third party. The Report may not be relied upon by any other party without the express written consent of Stantec, which may be withheld at Stantec's discretion.

Executive Summary

On behalf of Aera Energy LLC (Aera), Stantec Consulting Services Inc. (Stantec) conducted a delineation of potential federal wetlands and waters of the United States (WOTUS), and waters of the State of California (waters of the State) for an approximately 3,252-acre Study Area for the CarbonFrontier Project located within the South and North Belridge oil fields in western Kern County, California (Appendix A, Figure 1). The Study Area is defined as the proposed Aera CarbonFrontier Project surface features footprint plus a 500-foot radius buffer.

The delineation was conducted within the Study Area on June 1, July 18, July 20, and September 13, 2022; and May 26 and June 13, 2023 in accordance with the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory 1987), the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (U.S. Army Corps of Engineers [USACE] 2008), *A Field Guide to the Identification of Ordinary High Water Mark (OHWM) in the Arid West Region of the United States* (Lichvar and McColley 2008), and the *Implementation Guidance for the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* (State Water Resources Control Board [SWRCB] 2020). Data documenting presence/absence of vegetation, soils, and hydrology wetland parameters at the sample points within the Study Area during the delineation were collected on Arid West Region Wetland Determination Data Forms (Arid West – Version 2.0) (Appendix B). Where applicable, the OHWMs of aquatic features were delineated per Lichvar and McColley (2008), with data documented on OHWM datasheets (Appendix B). Photographs of the Study Area are included in Appendix C.

The purpose of this delineation of aquatic resources is to document and describe (if present): federal wetlands and WOTUS, waters of the State, and/or California Department of Fish and Wildlife (CDFW) streams in accordance with reporting standards for the USACE, the Central Valley Regional Water Quality Control Board (RWQCB). No potential federal wetlands or WOTUS were delineated or otherwise found to occur within the Study Area. Potential waters of the State features were delineated in the Study Area, including sections of Chico Martinez Creek, remnants of ephemeral streams, and various drainage ditches; these features may also be regulated as jurisdictional features by CDFW.

Stantec advises all interested parties to treat the determinations and supporting information contained herein as preliminary. Verification of jurisdictional boundaries are formally determined through permitting consultation with resource agencies.

1.0 INTRODUCTION

This Aquatic Resources Delineation Report (Report) prepared by Stantec Consulting Services Inc. (Stantec) is intended to document and assess potential jurisdiction of the aquatic resources within the Aera Energy LLC (Aera) South and North Belridge oil fields in support of the proposed Aera CarbonFrontier Project in western Kern County, California (Appendix A, Figure 1). Aquatic resource surveys were conducted for the Aera CarbonFrontier Project by Stantec Senior Biologist Geoff Hoetker with assistance from Logan Elms, Jasmin Byrd, Jared Pratt, Ethan Martin, and Cassandra Cortez, on June 1, July 18, July 20, and September 13, 2022; and May 26 and June 13, 2023. This Report summarizes the methods and results of the survey, as well as an assessment of potential jurisdictional aquatic resources within the Study Area. This Report may support future Project permitting for resources that may fall within the following jurisdictions:

- The U.S. Army Corps of Engineers (USACE), pursuant to Clean Water Act (CWA) Section 404;
- The Central Valley Regional Water Quality Control Board (RWQCB), pursuant to the State of California (State) Porter-Cologne Water Quality Control Act (California Water Code, Chapter 2, § 13050) and/or CWA Section 401; and/or
- The California Department of Fish and Wildlife (CDFW), pursuant to section 1602 of the California Fish and Game Code (CFGC).

Stantec advises all parties to treat the information contained herein as preliminary until the USACE, RWQCB, and/or CDFW provide verification of jurisdictional assessments.

1.1 PURPOSE OF THE REPORT

This delineation of aquatic resources has been prepared to evaluate the potential aquatic resources that may occur within the Study Area for the proposed Aera CarbonFrontier Project, which is defined as the proposed Aera CarbonFrontier Project footprint plus a 500-foot radius buffer. This Report is being prepared to support any new infrastructure or Aera CarbonFrontier Project activities and associated permitting that may be required in the Study Area.

1.2 STUDY AREA

The Study Area is located within the North and South Belridge oil fields, in an unincorporated area of western Kern County, approximately 14 miles west of the town of Buttonwillow, seven miles southwest of the town Lost Hills, and eleven miles north of the town of McKittrick, California. From the south, the Study Area spans an area in the vicinity of the intersection of Lost Hills Road and State Route (SR-) 33 (also known as the West Side Highway), northwestward through Seventh Standard Road, northward through the South Belridge Oil Field variously paralleling or oriented east of Pole Line Road through Lerdo Highway, then continuing along the vicinity of Pole Line Road to the North Belridge Oil Field (Appendix A. Figure 1).

The Study Area is approximately 13 miles long and is approximately 1,000 feet (0.19 mile) wide. The approximate centroid of the Study Area is located at the following coordinates: 35.501525°, -119.751895° (North American Datum

of 1983 [NAD 83]. The Study Area encompasses approximately 3,252 acres mainly within the Belridge and Blackwells Corner (1988) 7.5-minute U.S. Geological Survey (USGS) quadrangles, with small portions of the Study Area falling within the Lost Hills and Carneros Rocks USGS quadrangles.

To access the Study Area from Interstate 5, take the Buttonwillow SR-58 / McKittrick Highway exit and travel west on SR-58 for approximately eight miles; turn right onto Lokern Road and travel west approximately 7 miles; turn right on SR-33 and travel northwest approximately 2 miles to arrive at the southern end of the Study Area.

1.3 PROJECT DESCRIPTION

Aera has submitted an application to the Kern County Planning and Natural Resources Department to request approval of a Zoning Change and Conditional Use Permit (CUP) and will obtain any other required approvals, for the construction and operation of a carbon capture and sequestration (CCS) project in the South and North Belridge oil fields. The proposed Aera CarbonFrontier Project would require approvals for construction and operation of the proposed facilities (gas separation, compression, and pumping equipment), new carbon dioxide (CO_2) pipelines located primarily aboveground utilizing existing pipeline corridors, Underground Injection Control (UIC) Class VI geologic sequestration injection wells, CO_2 monitoring wells, and an underground carbon sequestration field for the storage of CO_2 in accordance with appropriate financial assurance mechanisms that ensure permanence in compliance with applicable regulatory standards.

The proposed Aera CarbonFrontier Project would capture CO_2 from existing produced gas streams (pre-combustion) and emissions from existing stationary sources (post-combustion) within the South Belridge Oil Field and transport the CO_2 through pipelines to the North Belridge Oil Field for injection at dedicated Class VI injection wells. The proposed underground CO_2 sequestration field, approximately 2,636 acres in size, would be located within the North Belridge Oil Field with surface and mineral rights held by Aera and other private owners. Oil and gas production activities would cease within the underground geologic formation where CO_2 would be stored, prior to commencement of the Project.

It is anticipated that the proposed Aera CarbonFrontier Project would capture and sequester up to 1.6 million metric tons (MMt) of CO_2 per year beginning in 2027 and will contribute to the goal of California for carbon neutrality by 2045 (Executive Order B-55-18) by reducing CO_2 emissions.

Implementation of the Aera CarbonFrontier Project would require permits from the United States (U.S.) Environmental Protection Agency (USEPA) for up to nine Class VI injection wells in compliance with the UIC program Class VI geologic sequestration regulations. The proposed CO_2 related facilities, pipelines, Class VI injection wells and associated CO_2 monitoring wells will be located within the CUP boundary. The proposed Aera CarbonFrontier Project would utilize up to 1,223 acre-feet per year (afy) (26,000 barrels of water per day) , sourced primarily from treated water associated with production and supplemented with existing freshwater entitlements, if available.

.

2.0 ENVIRONMENTAL SETTING

2.1 LAND USES

The Belridge oil fields were discovered in the early 1900s, as oil naturally surfaced due to pressure in the geologic reservoir, with the first well drilled along the Chico Martinez Creek in April 1911 (Allan and Lalicata 2012). Since then, the Belridge oil fields developed into North and South Belridge oil fields. The Study Area lies along the South and North Belridge oil fields on the Antelope Plain, an alluvial piedmont consisting of coalescing alluvial fans from the Temblor Range to the west. The region slopes to the east towards the San Joaquin Valley. The Study Area is heavily disturbed with oil wells and well pads, oil and gas infrastructure, gas and steam pipelines, and multiple unnamed dirt or graveled access roads along with a few paved roads.

2.2 TOPOGRAPHY AND ELEVATION

The topography of the Study Areas is relatively flat, interrupted only by oil and gas infrastructure, and slopes gradually from west to east towards the San Joaquin Valley. The Study Area ranges from 675 feet above mean sea level (amsl) on the western edge down to 550 feet amsl on the eastern edge.

2.3 CLIMATE

Climate in the Study Area is based on historical weather data collected at Buttonwillow, California (Western Regional Climate Center 2022). The station is located approximately 15 miles east of the Study Area:

- **Type:** The climate of the area is characterized as Mediterranean with moderate winters and hot, dry summers.
- **Precipitation:** Precipitation in the Study Area primarily occurs as rain. The average annual rainfall is approximately 5.64 inches.
- **Air Temperature:** Air temperatures in the Study Area ranges between an average January temperature range of 46 degrees Fahrenheit (ºF) and an average July temperature of 82 ºF. The annual average temperature is approximately 63 ºF.
- **Growing Season:** The growing season (i.e., the longest continuous period of a non-freezing air temperature of 32ºF or higher) in the Study Area is approximately 321 days and occurs between approximately January 20 and December 6 (Weather Spark 2022).

2.4 HYDROLOGY AND GEOMORPHOLOGY

The Study Area is within Hydrologic Unit Code (HUC)-8 18030012 - Tulare-Buena Vista Lakes. This area is also mainly within the Lower Kern River Flood Canal HUC-10 Watershed 1803001216, with a section of the southern portion of the Study Area within the Upper Kern River Flood Canal HUC-10 Watershed 1803001212. The Study Area also includes the following HUC-12 Watersheds from north to south: unnamed-180300121502, Town of Lost Hills-180300121504, unnamed-180300121603, Kern River Flood Canal-Kern River Channel-180300121604, Kern River Flood Canal-180300121602, Chico Martinez Creek-180300121206, and Kern River Flood Canal-180300121207 (Appendix A, Figure 2).

The Study Area is located within the San Joaquin Valley groundwater basin, and in the Kern County groundwater subbasin. This groundwater subbasin extends from the Greenhorn Mountains to the east to the Temblor Range to the west. It shares its southeastern boundary with the White Wolf groundwater subbasin and its northern boundary with both the Tulare Lake and Tule Groundwater subbasin. Streamflow through the vicinity of the Study Area is generally directed from the Temblor Range to the west toward the Central Valley to the east.

Chico Martinez Creek, an ephemeral stream toward the southern end of the Study Area, is the most prominent remaining regional stream draining from the southwest to the northeast through the South Belridge Oil Field toward the Central Valley. The source of historic Chico Martinez Creek is located on the eastern slope of the Temblor Range (35.4188542, -119.8623563 WGS84) and it generally flows east where it terminates approximately 0.55 mile southwest of Lost Hills Highway Kern County, California (35.4610736, -119.6990172 WGS84). While the terminus of historic Chico Martinez Creek is located west of Lost Hills Highway based on historical data (USGS and National Wetlands Inventory [NWI]); a review of available aerial imagery (dating back to 1994) indicates it flows further east to approximately 1.10 miles east of Lost Hills Highway where it terminates at a north-south traversing agricultural canal/aqueduct. The Study Area includes three sections of historic Chico Martinez Creek:

1) Section of Chico Martinez Creek located approximately 0.45 mile south of the Aera Oasis Building (i.e., the main Aera office building at the South Belridge Oil Field), then continuing toward the northeast before reaching Seventh Standard Road.

2) Section of Chico Martinez Creek located approximately 0.45 mile southeast of the Aera Oasis Building and beginning approximately 700 feet north of Seventh Standard Road, then continuing toward the northeast; and

3) Section of Chico Martinez Creek beginning just south of the intersection of SR-33 and Treeline Road/Roustabout Road, crossing under SR-33, then continuing to the northeast.

Considered as a whole, sections of Chico Martinez Creek still appear to be channelized but these sections are interspersed with areas with no defined channel bed and bank. The system has been altered and segmented due to oil field development, the presence of SR-33 and other roads, and agricultural activities (to the east).

According to the U.S. Fish and Wildlife Service (USFWS) NWI (USFWS 2022) (Appendix A, Figure 3), the USGS National Hydrography Dataset (NHD) (USGS 2022) (Appendix A, Figure 4), USGS 7.5-minute topographic maps, and an analysis of historical aerial imagery, additional hydrologic features that have historically occurred within the Study Area include the following:

1) Two unnamed streams toward the northern end of the Study Area; no evidence of these features remains in the Study Area. There is channelization for these features visible on aerial imagery southwest of the Study Area;
2) Two unnamed streams northwest of Compressor Station 49; one stream formerly traversed through an area located 0.55 mile northwest of Compressor Station 49, and the other stream formerly traversed through an area located 1.45 miles northwest of Compressor Station 49. No evidence of these features remains in the Study Area; there is channelization for these features visible on aerial imagery approximately 1.2 miles west of the Study Area;

3) A short section of an unnamed stream west of Compressor Station 49; no evidence of this feature remains in the Study Area. There is channelization for this feature visible on aerial imagery approximately 0.3 mile west of the Study Area;
4) An unnamed ephemeral stream just south of Contractors Road; remnants of this feature remain within the Study Area, but this feature has been highly altered due to oil production activities. Channelization and remnants of canals along this feature are visible on aerial imagery west of the Study Area;
5) Zemorra Creek, toward the extreme southwestern corner of the Study Area south of Main Camp Road; this is a tributary that drains to the southeast toward Chico Martinez Creek. A small remnant of this feature currently exists in the Study Area; additional channelization for this feature is visible on aerial imagery west of the Study Area;
6) An unnamed stream toward the extreme southern end of the Study Area, approximately 0.45 mile south of Chico Martinez Creek; no evidence of this feature currently exists in the Study Area; there is channelization for this feature visible on aerial imagery approximately 0.8 mile southwest of the Study Area;
7) Various small historic artificially flooded marshes and/or ponds (some with nearby canals) formerly located throughout the Study Area; an accumulation of these features occurred north and west of the 2868 Steam Plant, and in the vicinity of the Section 20 Dehydration Facility and areas to the south (the 2868 Steam Plant and Section 20 Dehydration Facility are both located along Pole Line Road). No current evidence of these features was observed. Based on historical aerial imagery, they were removed prior to 2013, with most of these features likely removed many years ago; and,
8) Various ponds used by Aera for wastewater treatment/disposal and/or detention, retention, infiltration, or treatment of stormwater runoff; these features are assumed to be exempt from qualifying as waters of the State of California (waters of the State) per the wetland definitions provided in Section 3.d. in the *State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* (State Water Resources Control Board [SWRCB] 2019) and were not delineated.

The aforementioned unnamed streams likely were channelized from runoff from the Temblor Ranges and may have flowed unhindered at a point in their history. However, sections of these streams within the Study Area have been virtually eliminated as a result of historical fill, grading, and development of oil well and pipeline infrastructure and access roads (as described in Chapter 5.2).

The South and North Belridge oil fields, located near the western margin of the San Joaquin Basin, occupy a region of extensive sedimentary rocks of varying porosity and permeability, containing anticlinal folds and large pools of petroleum, much of which has been previously extracted in the early and middle 20th century. The age range of the pools and their corresponding geologic formations is from Pliocene-Miocene (23 to 2.58 million years ago) for the uppermost members, down to Oligocene (33.9 to 23 million years ago), and then down to Eocene (56 to 33.9 million years ago) oceanic sands at a depth of over 8,500 feet. The San Andreas Fault, the boundary of the Pacific and North American plates, borders the San Joaquin Basin on the west, approximately 10 miles from the oil fields, on the other side of the Temblor Range.

2.5 SOILS

According to the U.S. Department of Agriculture (USDA) Natural Resource Conservation Service (NRCS), four soil map units occur in the Study Area. The soils are described in the *Soil Survey of Kern County, California* (USDA NRCS 2022a). The map units are summarized in Table 1 and shown in Appendix A, Figure 5.

Table 1: Historic Soil Map Units within the Study Area.

Map Unit Symbol	Map Unit Name	Description	Hydric	Acreage in Study Area
174	Kimberlina fine sandy loam, 0-2% slopes	The Kimberlina series consists of very deep, well drained soils on flood plains and recent alluvial fans. These soils formed in mixed alluvium derived dominantly from igneous and/or sedimentary rock sources.	No	1,295.40
175	Kimberlina fine sandy loam, 2-5% slopes	The Kimberlina series consists of very deep, well drained soils on flood plains and recent alluvial fans. These soils formed in mixed alluvium derived dominantly from igneous and/or sedimentary rock sources.	No	232.05
176	Kimberlina fine sandy loam, 5-9% slopes	The Kimberlina series consists of very deep, well drained soils on flood plains and recent alluvial fans. These soils formed in mixed alluvium derived dominantly from igneous and/or sedimentary rock sources.	No	7.87
196	Milham sandy loam, 0 to 2 percent slopes Major Land Resource Area 17	The Milham series consists of very deep, well drained soils on alluvial fans, plains, low terraces, and fan remnants. These soils formed in mixed calcareous alluvium weathered from granitic and sedimentary rock.	No	559.60
197	Milham sandy loam, 2 to 5 percent slopes	The Milham series consists of very deep, well drained soils on alluvial fans, plains, low terraces, and fan remnants. These soils formed in mixed calcareous alluvium weathered from granitic and sedimentary rock.	No	383.16
211	Panoche clay loam, 0 to 2 percent slopes	The Panoche series consists of very deep, well drained soils on alluvial fans and flood plains. These soils formed in loamy calcareous alluvium from sedimentary rock.	No	442.39
212	Panoche clay loam, 2 to 5 percent slopes	The Panoche series consists of very deep, well drained soils on alluvial fans and flood plains. These soils formed in loamy calcareous alluvium from sedimentary rock.	No	344.96
Total				**3,251.96**

2.6 VEGETATION COMMUNITIES AND LAND COVER TYPES

Vegetation types in the Study Area were classified based on the vegetation alliance classification system described in *A Manual of California Vegetation, 2nd Edition* (Sawyer et al. 2009). Two dominant vegetation communities and one land cover type occurs in the Study Area and are described below.

2.6.1 Vegetation Communities

***Atriplex polycarpa* Shrubland Alliance (Allscale scrub)**

Allscale scrub occurs primarily in the southern half of the Study Area, where it has formed relatively open stands in the and/or is interspersed with annual grasslands, described below. Allscale (*Atriplex polycarpa)* scrub is characterized by an open to continuous canopy with a variable herbaceous layer including seasonal annuals and non-native grasses. The alliance is typically found in washes, playa lake beds and shores, dissected alluvial fans, rolling hills, terraces and edges or large low gradient washes. Soils may be carbonate rich, alkaline, sandy, or sandy clay loams (Sawyer et al. 2009).

Typically, allscale is dominant in the shrub canopy with white bursage (*Ambrosia dumosa*), cheesebush (*Ambrosia salsola*), fourwing saltbush (*Atriplex canescens*), red brome (*Bromus madritensis* ssp*. rubens*), small, seeded spurge (*Euphorbia polycarpa*), creosote bush (*Larrea tridentata*), and bladderpod (*Peritoma arborea*). Patches of the allscale scrub, dominated by allscale shrubs with non-native grasses, primarily bromes (*Bromus* spp.) and weeds including Russian thistle (*Salsola tragus*) and Maltese star thistle (*Centaurea melitensis*), occur along the historic ephemeral drainage.

***Bromus rubens* - *Schismus* (*arabicus, barbatus*) Herbaceous Semi-Natural Alliance (Red brome or Mediterranean grass grasslands)**

Annual grasslands are scattered throughout the Study Area, with an extensive stand located east of Pole Line Road. This alliance of non-native annual grasses is dominated by red brome and/or schismus (*Schismus arabicus* and/or *S. barbatus*). The alliance is highly adaptable and can be found in all topography settings and soil textures. Most of the grasslands in the Study Area had been subjected to grazing and/or mowing, making it difficult to find flowering heads of grasses for identification, but red brome and ripgut brome (*Bromus diandrus*) were confirmed in some areas. Other representative native and non-native forbs observed in grasslands on site included fiddleneck (*Amsinckia menziesii*), cheeseweed (*Malva parviflora*), red filaree (*Erodium cicutarium*), and occasional Russian thistle. Non-native annual grasslands occur primarily in the southern half of the Study Area.

2.6.2 Land Cover Types

Disturbed/Developed

Most of the Study Area is significantly disturbed by oil and gas infrastructure, modification, and activities including wells, well pads, pipelines, and access roads. In addition, historical drainages onsite have been altered through grading/and or fill with earthen berms and hummocks.

3.0 REGULATORY BACKGROUND

3.1 CLEAN WATER ACT SECTION 404

Section 404 of the CWA regulates the discharge of dredged material, placement of fill material, or certain types of excavation within federal waters of the United States (WOTUS) and authorizes the Secretary of the Army, through the Chief of Engineers, to issue permits for such actions. Permits can be issued for individual projects (individual permits) or for general categories of projects (nationwide permits). WOTUS are defined by the CWA as "rivers, creeks, streams, and lakes extending to their headwaters and any associated wetlands." Wetlands are defined by the CWA as "areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support a prevalence of vegetation typically adapted for life in saturated soil conditions." The USACE has adopted several revisions to their regulations in order to more clearly define WOTUS. Until the beginning of 2001, WOTUS included, among other things, isolated wetlands and lakes, intermittent streams, prairie potholes, and other waters that are not part of a tributary system to interstate waters or to navigable WOTUS. The protection of federal jurisdictional WOTUS has been historically contentious and subject to numerous legal decisions since 2001.

In 1986, the federal agencies (USACE and USEPA) implemented historic regulations (the 1986 Regulations) that defined WOTUS to mean traditional navigable waters, the territorial seas, interstate waters, and intrastate waters whose use or degradation could affect interstate or foreign commerce, as well as tributaries (streams that flow into larger streams or other bodies of water) of and wetlands adjacent to any of those waters.

The jurisdictional extent of USACE regulation changed with the 2001 *Solid Waste Agency of Northern Cook County* (*SWANCC*) *v. U.S. Army Corps of Engineers* ruling. The U.S. Supreme Court held that the USACE could not apply Section 404 of the CWA to extend their jurisdiction over an isolated quarry pit. The Court ruled that the CWA does not extend Federal regulatory jurisdiction over non-navigable, isolated, intra-state waters. However, the Court made it clear that non-navigable wetlands adjacent to navigable waters are still subject to USACE jurisdiction.

In 2006, the U.S. Supreme Court issued its seminal decision in the consolidated cases *Rapanos v. United States* and *Carabell v. United States* (collectively referred to as *Rapanos v. United States* (*Rapanos*). Justice Scalia narrowly interpreted the statutory term "waters of the United States" in a four-Justice plurality opinion, holding that CWA jurisdiction extended over only "relatively permanent, standing or continuously flowing bodies of water" that are connected to traditional navigable waters, plus wetlands with a "continuous surface connection" to such relatively permanent water bodies. Justice Kennedy wrote separately, concurring with the Court's judgment with respect to the facts of the case, but interpreted "waters of the United States" to include wetlands that possess a "significant nexus" to waters that are or were navigable in fact or that could reasonably be so made.

The Court's split decision and lack of a commanding majority opinion in *Rapanos* created confusion among the federal agencies and public. On December 2, 2008, the federal agencies released a regulatory guidance document, Clean Water Act Jurisdiction Following the U.S. Supreme Court's Decision in *Rapanos v. United States* & *Carabell v. United States* (USACE and USEPA 2008), addressing common questions about federal jurisdiction over WOTUS and clarifying the two jurisdictional standards from *Rapanos*. In the 2008 *Rapanos Guidance*, the federal agencies concluded that federal jurisdiction existed over certain waterbodies that meet the "relatively permanent" standard from

Justice Scalia's plurality opinion or Justice Kennedy's "significant nexus" standard, the latter of which would be determined by a fact-specific analysis.

Federal jurisdictional WOTUS protected under the CWA were defined in a 2015 Final Rule by USACE and USEPA; however, the Sixth Circuit U.S. Court of Appeals issued an order staying the new Clean Water Rule nationwide, pending a determination by the court on jurisdiction to review the rule. The 2015 Clean Water Rule was stayed, and the prior regulations published in 1986, along with some changes in 2008 as a result of the Rapanos U.S. Supreme Court decision, remained in effect.

On February 28, 2017, the Trump Administration issued Executive Order 13778, *"Restoring the Rule of Law, Federalism, and Economic Growth by Reviewing the 'Waters of the United States' Rule."* The executive order directed the USACE and USEPA to review the 2015 Rule for consistency with the policy outlined in Section 1 of the order and to issue a proposed rule rescinding or revising the 2015 Rule as appropriate and consistent with law. On September 12, 2019, the USACE and USEPA repealed the 2015 Rule and restored the previous regulatory regime as it existed prior to finalization of the 2015 Rule. This final rule, *"Definition of 'Waters of the United States'—Recodification of Pre-Existing Rules"* was published in the Federal Register on October 22, 2019.

On April 21, 2020, the USEPA and USACE published the Navigable Waters Protection Rule (NWPR) to define WOTUS. The agencies streamlined the definition to include four simple categories of jurisdictional waters, provided clear exclusions for many water features that traditionally have not been regulated, and defined terms in the regulatory text that had never been defined before. Congress, in the CWA, explicitly directed the agencies to protect "navigable waters." The NWPR regulated these waters and the core tributary systems that provide perennial or intermittent flow and excluded ephemeral waters. The final NWPR fulfilling Executive Order 13788 became effective on June 22, 2020; however, on August 30, 2021, the U.S. District Court for the District of Arizona vacated the NWPR finding "fundamental, substantive flaws that cannot be cured without revising or replacing the NWPR's definition."

On June 9, 2021, the USACE and USEPA under the Biden Administration announced their intent to revise the definition of WOTUS to protect more waterways, beginning a new rulemaking process that restores protections put in place before 2015.

On January 18, 2023, the federal agencies published the final "Revised Definition of 'Waters of the United States'" rule (2023 Rule) in the Federal Register, which became effective on March 20, 2023 (USACE and USEPA 2023). The 2023 Rule generally returns to the pre-2015 definition. The implications of the final 2023 WOTUS rule are such that many ephemeral waters not considered protected under the former 2020 NWPR would now be protected.

The 2023 Rule defines WOTUS to include:

1. Traditional navigable waters, the territorial seas, and interstate waters;
2. Impoundments of other jurisdictional WOTUS, except for those that qualify under category 5, below;
3. Tributaries to either of the above waters and tributaries that meet the "relatively permanent" standard or the "significant nexus" standard, (collectively, "jurisdictional tributaries");

4. Wetlands adjacent to traditional waters, wetlands adjacent and with a continuous surface connection to relatively permanent tributaries and impoundments, and wetlands adjacent to other jurisdictional tributaries when those wetlands meet the "significant nexus" standard; and

5. Intrastate lakes and ponds, streams, or wetlands that are not identified in categories 1–4 above that meet either the "relatively permanent" standard or the "significant nexus" standard.

On March 19, 2023, the U.S. District Court for the Southern District of Texas enjoined the 2023 Rule in Texas and Idaho pending its consideration of those states' legal challenges to the rule. On April 12, 2023, the U.S. District Court for the District of North Dakota similarly issued a preliminary injunction preventing the application of the 2023 Rule in 24 states: Alabama, Alaska, Arkansas, Florida, Georgia, Indiana, Iowa, Kansas, Louisiana, Mississippi, Missouri, Montana, Nebraska, New Hampshire, North Dakota, Ohio, Oklahoma, South Carolina, South Dakota, Tennessee, Utah, Virginia, West Virginia, and Wyoming. The federal agencies announced that, pending resolution of the litigation, they will apply the pre-2015 regulatory regime in the 26 states subject to injunctions and the 2023 Rule in the remaining 24 states, including California.

Most recently, on May 25, 2023, the U.S. Supreme Court issued its ruling in *Sackett v. Environmental Protection Agency (Sackett)*, which established a more stringent test to determine whether the CWA applies to certain categories of wetland. The Sackett family had backfilled a lot near Priest Lake in Idaho, and in agreeing that the Sacketts' lot is a wetland, the U.S. Court of Appeals for the 9th Circuit applied the test outlined by Justice Kennedy in Rapanos: whether there is a "significant nexus" between the wetlands and waters that are covered by the CWA, and whether the wetlands "significantly affect" the quality of those waters. With *Sackett*, the U.S. Supreme Court unanimously reversed the 9th Circuit's ruling, where in a majority opinion, lower courts were directed to apply a more stringent test in *Rapanos*, in which the CWA applies to a particular wetland only if it blends or flows into a neighboring water that is a channel for interstate commerce (SCOTUSblog 2023). While the Court decided that it is clear that some "adjacent" wetlands will also qualify under the CWA as "waters of the United States," wetlands that are entirely separate from traditional bodies of water will not qualify. The CWA will apply to wetlands that are "as a practical matter indistinguishable from waters of the United States" because they have a "continuous surface connection" with a larger body of water, "making it difficult to determine where the 'water' ends and the 'wetland' begins."

The result of the *Sackett* ruling is that certain adjacent wetlands formerly protected under the CWA will no longer be federally protected. The USACE and USEPA have acknowledged the Sackett ruling and indicated they will interpret the phrase "waters of the United States" consistent with the U.S. Supreme Court's decision in *Sackett*; the agencies will continue to review the decision to determine next steps (USACE 2023a), but no official guidance had been released at the time of the preparation of this Report.

3.2 CLEAN WATER ACT SECTION 401 AND PORTER-COLOGNE WATER QUALITY CONTROL ACT

Section 401 of the CWA ensures that federally permitted activities comply with the federal CWA and state water quality laws. Section 401 is implemented by California's RWQCB, triggered by the Section 404 permitting process. RWQCB issues a Water Quality Certification (WQC) via the Section 401 process that a proposed project complies with water quality standards and other conditions of California law. Evaluating the effects of a proposed project on both water quality and quantity (runoff) falls under the jurisdiction of the RWQCB. This certification typically precedes

USACE permit issuance. Any activities that would require a USACE Section 404 permit would also likely require a Section 401 WQC or a waiver from RWQCB.

In addition, the Porter-Cologne Water Quality Control Act (Porter-Cologne Act) serves as the primary water quality law in California and addresses two primary functions: water quality control planning and waste discharge regulation. The various RWQCBs are charged with protecting all waters of California, defined as "any surface water or groundwater, including saline waters, within the boundaries of the State." This encompasses all waters of the State, including those not under federal jurisdiction. The Porter-Cologne Act defines "waters of the State" very broadly, with no physical descriptors, and no interstate commerce limitation. In regulating discharges of dredged or fill material; therefore, the RWQCB jurisdiction is more broad than federal jurisdiction. The discharge of dredged or fill material may constitute a discharge of waste that could affect the quality of waters of the State. Under the Porter-Cologne Act, discharges of dredged or fill material to Waters of the State not subject to CWA Section 404 (i.e., non-USACE jurisdictional) are regulated by the RWQCB under the Porter-Cologne Act Article 4 Individual or General Waste Discharge Requirements (WDR). The WDR permit requirements ensure that the permitted activities comply with state water quality standards over the term of the action and are consistent with the requirements of the California Environmental Quality Act, the California Endangered Species Act, and the Porter-Cologne Act. Procedures for complying with WDR regulations, including submittal of an application with a project description and impact assessment, are similar to CWA Section 401 procedures.

In 2019, the SWRCB adopted the SWRCB *State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* for inclusion in the forthcoming Water Quality Control Plan for Inland Surface Waters and Enclosed Bays and Estuaries and Ocean Waters of California (SWRCB 2019).

The Water Boards (i.e., SWRCB and RWQCB) define an area as wetland as follows:

"An area is wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation."

Applicants must file an application with the California Water Boards (defined as the SWRCB and nine RWQCBs) for any activity that could result in the discharge of dredged or fill material to waters of the State in accordance with Title 23 California Code of Regulations Section 3855.

The SWRCB Procedures became effective on May 28, 2020, and this current guidance has been considered during the preparation of this Report. For the purposes of this Report, RWQCB jurisdiction (i.e., waters of the State) has been interpreted conservatively by Stantec as including most natural streambeds, areas extending from the streambed/thalweg to the outer edge of adjacent riparian vegetation, certain isolated wetlands or waters that may not be under USACE jurisdiction, and most artificial ditches and ponds that are not used for wastewater treatment/disposal; detention, retention, infiltration, or treatment of stormwater runoff subject to a stormwater permitting program; or agricultural crop irrigation or stock watering.

3.3 CALIFORNIA FISH AND GAME CODE SECTION 1602

Section 1602 of the CFGC requires a proponent proposing a project that may affect a river, stream, or lake to notify the CDFW before beginning the project. If activities will result in the diversion or obstruction of the natural flow of a stream, or substantially alter its bed, channel, or bank, or adversely affect existing fish and wildlife resources, a Lake and Streambed Alteration Agreement is required. A Lake and Streambed Alteration Agreement lists the CDFW conditions of approval relative to a proposed project and serves as an agreement between an applicant and the CDFW for the performance of activities subject to Section 1602. For the purposes of this Report, CDFW jurisdiction is interpreted as extending from the streambed/thalweg to the outer edge of adjacent riparian vegetation (for both natural and anthropogenic drainage features) and for this Study Area, is roughly equivalent to “waters of the State” as defined by the RWQCB.

4.0 METHODS

The aquatic resource assessment is broken down into three steps: a desktop review, a field assessment, and a jurisdictional assessment. Methods for each step are described below.

4.1 DESKTOP REVIEW

Prior to conducting fieldwork, the following resources were reviewed:

- USFWS NWI Wetland Mapper (USFWS 2022);
- Google Earth color aerial imagery dating back to 1994;
- USGS 7.5-minute topographic maps dating back to 1988;
- USGS National Hydrography Dataset (USGS 2022);
- USDA NRCS soils maps (USDA 2022a); and
- Local and state hydric soil lists (USDA NRCS 2022b)

These resources were used to identify potential aquatic features based on changes in vegetation, topographic changes, and/or visible drainage patterns. Prior to the field assessment, potential features were digitized into a working field map that was then used as a reference during the assessment.

4.2 FIELD ASSESSMENT

The delineation was conducted within the Study Area (Appendix A, Figure 6-1) in accordance with the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory 1987), the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (USACE 2008), *A Field Guide to the Identification of Ordinary High Water Mark (OHWM) in the Arid West Region of the United States* (Lichvar and McColley 2008), and the *Implementation Guidance for the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* (SWRCB 2020).

An assessment and delineation of potentially jurisdictional waters was conducted within the Study Area by Stantec Senior Biologist Geoff Hoetker with assistance from Logan Elms, Jasmin Byrd, Jared Pratt, Ethan Martin, and Cassandra Cortez, on June 1, July 18, July 20, and September 13, 2022; and May 26 and June 13, 2023. Transects were walked throughout the Study Area, supplemented by driving within the Study Area where feasible. During the field assessment, hydrologic features observed were mapped over recent aerial photograph base maps using the ESRI® Collector for ArcGIS app on an Apple® iPad® coupled with an EOS Arrow 100 sub-meter external Global Positioning System (GPS) unit. Mapping was further refined in the office using ArcGIS (version 10.8.1) with aerial photograph base maps with sub-meter accuracy, and the total jurisdictional area for each regulatory jurisdiction was calculated.

Based on available historical mapping of aquatic features, combined with observations of surface conditions, 18 sample points/soil test pits were originally excavated within the Study Area (Appendix A, Figures 6-1 to 6-12). Each feature had at minimum paired sample points, with one point positioned within the aquatic feature and another point positioned in nearby uplands. Three pairs of sample points (six sample points total) were positioned along Chico Martinez Creek, which is a major drainage through the Belridge South Oil Field. A total of 18 sample points was

determined to be sufficient based on the relative homogeneity of conditions along the aquatic features and in adjacent uplands. Two of the sample points, SP13 and SP14, occurred in a former Study Area boundary but this general area has been removed from consideration as a project component in the current Study Area; therefore, no results for these sample points are presented in this Report other than their mention as a matter of continuity.

If feasible, soil test pits were excavated to a depth of approximately 16 inches (or to a restrictive layer if present) and evaluated for potential hydric soil indicators. Hydrophytic vegetation and wetland hydrology indicators were also evaluated in the vicinity of these sampling locations. Percent cover estimates for vegetation were conducted by visually estimating absolute percent cover for each plant species within a sample plot. Generally, sample plot sizes included a 10-foot radius for saplings and shrubs, and a 5-foot radius for herbs; there were no trees or woody vines present, therefore evaluations of these vegetative strata were not applicable. Plant species were identified to the lowest possible taxonomic level per *The Jepson Manual: Higher Plants of California* (Baldwin et al. 2012).

Positive indicators for each of the following three parameters are required for a wetland to meet the USACE criteria for jurisdictional wetland determination (Environmental Laboratory 1987). The three parameters are defined as follows:

- **Hydrophytic vegetation** is defined as macrophytic vegetation that is adapted to, and occurs in, areas where soils are frequently or permanently saturated of sufficient duration to exert a controlling influence on the plant species present. Plant species adjacent to the sample points were identified and included following the "50/20 rule," meaning that plant species in each vegetation stratum (i.e., tree, sapling/shrub, herb, and woody vine) were included in order of abundance until at least 50% of the total vegetation cover was accounted for, plus any other species that, by itself, accounts for at least 20% of the total. Plants are assigned a Wetland Indicator Status (WIS) based on their frequency of occurrence in wetland habitats following the most recent 2020 National Wetland Plant List (NWPL) (USACE 2020) and using the Indicator Ratings Definitions (Lichvar et al. 2012) as follows:
    - OBL (Obligate Wetland Plants): Almost always occur under natural conditions in wetlands. With few exceptions, these plants (herbaceous or woody) are found in standing water or seasonally saturated soils (14 or more consecutive days) near the surface;
    - FACW (Facultative Wetland Plants): Usually occur in wetlands but may occur in non-wetlands. These plants predominately occur with hydric soils, often in geomorphic settings where water saturates the soils or floods the soil surface at least seasonally;
    - FAC (Facultative Plants): Occur in wetlands and non-wetlands. These plants can grow in hydric, mesic, or xeric habitats. The occurrence of these plants in different habitats represents responses to a variety of environmental variables other than just hydrology, such as shade tolerance, soil pH, and elevation, and they have a wide tolerance of soil moisture conditions;
    - FACU (Facultative Upland Plants): Usually occur in non-wetlands but may occur in wetlands. These plants predominately occur on drier or more mesic sites in geomorphic settings, where water rarely saturates the soils or floods the soil surface seasonally; and,

- UPL (Upland Plants): Almost never occur under natural conditions in wetlands. These plants occupy mesic to xeric non-wetland habitats. They almost never occur in standing water or saturated soils. Typical growth forms include herbaceous, shrubs, woody vines, and trees.

The hydrophytic vegetation parameter is met when at least one of the following tests is fulfilled:

- The prevalent vegetation (more than 50% of the dominant plant species) is typically adapted to areas having wetland hydrology and hydric soil conditions and rated OBL, FACW, or FAC.
- The prevalence index, which is a value determined by accounting for the relative cover and WIS and ranges from 1 (only OBL species present) to 5 (only UPL species present), is less than or equal to 3.
- Vegetation has morphological adaptations to growing in inundated or saturated conditions.

In this Report, the abbreviations for the WIS categories have been inserted after the initial use of Latin/scientific names for identified dominant plants to reflect the hydrophytic indicator status as most recently presented by USACE (2020). Plants not listed by USACE (2020) have no hydrophytic indicator status (NI) and are treated as UPL.

- **Hydric Soils** are defined as soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part (USDA Soil Conservation Service 1994; USDA NRCS 2018). Hydric soils are identified based on observable properties that result from prolonged saturated-anaerobic conditions. To assess whether hydric soil was present at each sample point, soil attributes (including color [hue, value, and chroma], redoximorphic features [color patterns in a soil formed by oxidation/reduction of iron and/or manganese that are caused by loss/depletion], or gain/concentration of pigment compared to the matrix color, mottling, texture, grain size, structure, streaking, etc.) were recorded on the delineation forms. Soil colors were assessed using the Munsell Soil Color Book (Munsell 2009).
- **Wetland hydrology** refers to inundation and/or saturation of the soil by flooding or a shallow water table for a prolonged period during the growing season, such that the character of the soil and vegetation are substantially different from areas that do not experience inundation/saturation in this manner. The identification of wetland hydrology follows the guidelines of Environmental Laboratory (1987) and USACE (2008). Visual evidence among the positive indicators of wetland hydrology includes surface water, high water table, or soil saturation; geomorphic features associated with inundation (e.g., channels, shorelines); and water marks, sediment deposits, or drift deposits.

Preliminary jurisdictional delineation maps are included in Appendix A, Figures 6-1 to 6-12. Data documenting presence/absence of vegetation, soils, and hydrology wetland parameters at the sample points within the Study Area during the delineation were collected on Arid West Region Wetland Determination Data Forms (Arid West – Version 2.0) (Appendix B). Where applicable, the OHWMs of aquatic features were delineated per Lichvar and McColley (2008), with data documented on OHWM datasheets (Appendix B). Photographs of the Study Area are included in Appendix C.

4.3 JURISDICTIONAL ASSESSMENT

Regarding the types of federal WOTUS regulated by the USACE, Stantec maintains the current approach based on our understanding of current policy and guidance:

1. The term “wetlands” includes WOTUS in the instances where all three wetland parameters (i.e., hydrophytic vegetation, hydric soil, and wetland hydrology) are present and the aquatic feature is non-isolated.

2. The term “other waters” typically encompasses drainages and other features bound by a definable OHWM with connectivity to jurisdictional waters and includes WOTUS lacking one or more of the three wetland parameters.

Potential jurisdictional boundaries for waters of the State under RWQCB jurisdiction were delineated per the SWRCB *Implementation Guidance for the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* (SWRCB 2020). Under the SWRCB *Procedures*, the California Water Boards rely on delineations approved by USACE within the boundaries of WOTUS. Where federal jurisdiction does not extend to state waters, the proposed procedures direct applicants to use the methods described by Environmental Laboratory (1987) and USACE (2008). For the purposes of this delineation, waters of the State extend from the channel bed to the top of a bank or outer edge of riparian canopy (whichever is greater) and also include adjacent wetlands, non-federal isolated waters (if present), swales, and anthropogenic features such drainage ditches that are not considered to be jurisdictional federal WOTUS.

For the purposes of this delineation, CDFW jurisdiction has been conservatively considered to extend from the channel bed to the top of an adjacent bank or outer edge of adjacent riparian canopy (whichever is greater) and also may include smaller swales and certain anthropogenic drainage features such as drainage ditches not considered to be jurisdictional federal WOTUS.

5.0 RESULTS AND DISCUSSION

The following presents a description of the vegetation, soils, and hydrologic conditions in the Study Area, followed by the results of the preliminary determination of federal and state jurisdictional features. The information is based on the review of existing data and the field delineation conducted in June, July, and September 2022; and May and June 2023. Copies of data forms used during the delineation are included in Appendix B.

5.1 POTENTIAL JURISDICTIONAL FEATURES

Potential jurisdictional aquatic features observed in the Study Area include two excavated drainage ditches, remnant sections of two ephemeral streams, and Chico Martinez Creek. These features are described below, with photos in Appendix C.

5.1.1 Drainage Ditches

Two excavated drainage ditches were identified and delineated within the Study Area. An excavated trapezoidal drainage ditch was delineated within the southwestern section of Study Area north of Main Camp Road between the road and Gas Plant 32 (Appendix A, Figure 6-12). The ditch was excavated at some time in the past presumably to route runoff around the southern side of Gas Plant 32. The ditch is approximately 411 feet long, 20 feet wide, and skirts the southern boundary fence of Gas Plant 32; there is a 20-inch diameter culvert opening at the eastern end of the ditch under the fence line, but the other end of the culvert could not be located. In the vicinity of sample point 1 (SP1), excavated toward the centerline of the ditch, the vegetation was dominated by Russian thistle (*Salsola tragus*) (UPL) in the herb stratum; there were no tree, shrub, or woody vine strata present. The presence of this species did not support a dominance of hydrophytic vegetation. The substrate at SP1 included dark yellowish brown (10YR 4/4) sand at a depth of 0 to 5 inches of the soil profile and brown (10YR 4/3) loamy sand at a depth of 5 to 16 inches of the soil profile; no hydric soil indicators were observed. No surface water, high water table, saturation, or any other primary or secondary wetland hydrology indicators were observed. The ditch was completely dry at the time of the delineation. No evidence of an OHWM was observed along the ditch. In adjacent uplands, SP2 was excavated in an area that supported no hydrophytic vegetation, hydric soil, or wetland hydrology indicators.

The other excavated drainage ditch was delineated along the west side of Pole Line Road north of Tulare Road. The entire ditch is approximately 0.40-mile-long and 12-feet wide, but because of the shape and orientation of the Study Area, only two short sections of the ditch occur within the Study Area – a 330-foot section oriented southeast to northwest along the west edge of Pole Line Road (Appendix A, Figure 6-5), and a 271-foot section that spurs off from the southwest to the northeast located approximately 0.29 mile northwest of the other section (Appendix A, Figure 6-4). The function of the ditch is to accept runoff from Pole Line Road. In the vicinity of SP11, excavated toward the centerline of the ditch, the vegetation was dominated by allscale saltbush (*Atriplex polycarpa*) (FACU) in the shrub stratum and red brome (*Bromus madritensis* ssp. *rubens*) (NI) in the herb stratum; there were no tree or woody vine strata present. The substrate at SP11 included a 2-inch layer of soil-like material on the surface that was flaky and hydrophobic (i.e., repelled water); this was assumed to be a non-natural material and may have been some sort of soil additive or other substance. Below this layer was dark yellowish brown (10YR 4/4) loamy sand at a depth of 2 to 10 inches of the soil profile, where a restrictive layer was met; no hydric soil indicators were observed. No surface water, high water table, saturation, or any other primary or secondary wetland hydrology indicators were observed.

The ditch was completely dry at the time of the delineation. No evidence of an OHWM was observed along the ditch. In adjacent uplands, SP12 was excavated in an area that supported no hydrophytic vegetation, hydric soil, or wetland hydrology indicators.

An area with a third drainage located south of Roustabout Road and west of Lost Hills Road, where SP13 and SP14 were excavated in the vicinity, occurred in a former Study Area boundary but this general area has been removed from consideration as a project component in the current Study Area; no results for these sample points are presented in this Report.

5.1.2 Remnants of Ephemeral Streams

Sections of two remnants of ephemeral streams were identified and delineated within the Study Area. A remnant of an unnamed ephemeral stream was delineated south of Contractors Road (Appendix A, Figures 6-2 and 6-3). According to NWI and NHD mapping data (USFWS 2022, USGS 2022), this drainage formerly originated approximately 3.5 miles west of the Study Area in the Bacon Hills (foothills in the Temblor Range), proceeded west to east through the Study Area, and then continued approximately 0.4 mile along what is now the south side of Contractors Road before emptying to an area that is now occupied by orchards. Within and outside the Study Area, this drainage has been subjected to extensive historical disturbance from fill and grading and rarely conveys water. Based on Google Earth historical aerial imagery, this feature was altered west of Pole Line Road at some time between August 2006 and March 2007, where only segments of small dry ponds connected by culverts remain. Approximately 1,130-linear-feet of remnant sections of the stream were delineated within the Study Area west of Pole Line Road, where the stream then enters through a 36-inch diameter culvert that has become three-quarters buried with sediment then proceeds 90 feet east to a fence line. The drainage segments range from approximately 12 feet to 50 feet wide; the segments closest to Pole Line Road have the streambed and banks densely overgrown with weeds, and those furthest west of Pole Line Road are mostly devoid of vegetation. From the fence line east of Pole Line Road, the drainage continues to the east but could not be accessed because of the fence line. This remaining 580-foot section of the drainage on the other side of the fence has been delineated based on the apparent alignment of the drainage as evident on current aerial imagery.

In the vicinity of SP3, excavated toward the centerline of a stream remnant east of Pole Line Road, the vegetation was dominated by coyote brush (*Baccharis pilularis*) (NI) in the sapling/shrub stratum; and short-pod mustard (NI), tocalote (*Centaurea melitensis*) (NI), and salt grass (*Distichlis spicata*) (FAC) in the herb stratum; there were no tree or woody vine strata present. Collectively, these species did not support a dominance of hydrophytic vegetation. The substrate at SP3 included dark yellowish brown (10YR 4/4) loamy sand at a depth of 0 to 16 inches of the soil profile with no noticeable changes in composition throughout the profile; no hydric soil indicators were observed. No surface water, high water table, saturation, or any other primary or secondary wetland hydrology indicators were observed.

In the vicinity of SP15, excavated toward the centerline of a stream remnant west of Pole Line Road, there was no vegetation present and no dominance of hydrophytic vegetation. The substrate at SP15 included dark yellowish brown (10YR 4/4) sandy loam at a depth of 0 to 6 inches of the soil profile with no noticeable changes in composition throughout the profile; the soil became impenetrable at a depth of 6 inches; no hydric soil indicators were observed. No surface water, high water table, saturation, or any other primary or secondary wetland hydrology indicators were observed. The drainage was completely dry at the time of the delineation. No evidence of an OHWM was observed at this feature. It is likely that the remnant of this stream rarely conveys water, and only during heavy rain events. In

adjacent uplands, SP4 and SP16 were excavated in areas that supported no hydrophytic vegetation, hydric soil, or wetland hydrology indicators.

Approximately 1,146-linear-feet of remnant sections of Zemorra Creek were delineated toward the extreme southwestern corner of the Study Area in the vicinity of Main Camp Road (Appendix A, Figures 6-11 and 6-12); this is a tributary that drains to the southeast toward Chico Martinez Creek. According to NWI and NHD mapping data (USFWS 2022, USGS 2022), this drainage originates approximately 4.3 miles west of the Study Area in the Bacon Hills (foothills in the Temblor Range). The drainage at some point before 2005 experienced historical alteration leading through what is now the Study Area, where the drainage proceeds to the southeast under a dirt access road (presumably at one point through what is now likely a buried culvert) before continuing to the southeast toward Chico Martinez Creek.

In the vicinity of SP9, excavated toward the centerline of a remnant of Zemorra Creek, the vegetation was dominated by allscale saltbush (*Atriplex polycarpa*) (FACU) in the shrub stratum, and red brome (*Bromus madritensis* ssp. *rubens*) (NI) and tocalote (NI) in the herb stratum; there were no tree or woody vine strata present. The substrate at SP9 included brown (10YR 4/3) loam at a depth of 0 to 8 inches of the soil profile, where a restrictive layer was met; no hydric soil indicators were observed. No surface water, high water table, saturation, or any other primary or secondary wetland hydrology indicators were observed. The drainage was completely dry at the time of the delineation. No evidence of an OHWM was observed along the drainage. In adjacent uplands, SP10 was excavated in an area that supported no hydrophytic vegetation, hydric soil, or wetland hydrology indicators.

5.1.3 Chico Martinez Creek

As previously discussed in Section 2.4, three segments of Chico Martinez Creek traverse the Study Area (Figures 6-6 to 6-11. The first segment of Chico Martinez delineated is an approximately 0.08-mile section south of the Aera Oasis Building and south of Seventh Standard Road. In the vicinity of SP17, excavated toward the centerline of the stream, the vegetation was dominated by allscale saltbush (FACU) in the shrub stratum, and Jimson weed (*Datura wrightii*) (UPL) and turkey mullein (*Croton setiger*) (NL) in the herb stratum; there were no tree or woody vine strata present. Collectively, these species did not support a dominance of hydrophytic vegetation. The substrate at SP17 included yellowish brown (10YR 5/6) sand at a depth of 0 to 16 inches of the soil profile with no noticeable changes in composition throughout the profile; no hydric soil indicators were observed. No surface water, high water table, saturation, or any other primary or secondary wetland hydrology indicators were observed. The drainage was completely dry at the time of the delineation. No evidence of an OHWM was observed along this segment of Chico Martinez Creek. In adjacent uplands, SP18 was excavated in an area that supported no hydrophytic vegetation, hydric soil, or wetland hydrology indicators.

The second segment of Chico Martinez delineated is an approximately 0.83-mile section roughly southeast of the Aera Oasis Building and north of Seventh Standard Road. In the vicinity of SP5, excavated toward the centerline of the stream in a position where an OHWM was visible, the vegetation was dominated by allscale saltbush (FACU) in the sapling/shrub stratum and Russian thistle (UPL) in the herb stratum; there were no tree or woody vine strata present. Collectively, these species did not support a dominance of hydrophytic vegetation. The substrate at SP5 included a 0.25-inch layer of small gravels on the surface, with dark yellowish brown (10YR 4/6) loamy sand at a depth of 0.25 to 16 inches of the soil profile with no noticeable changes in soil composition throughout the profile; no hydric soil indicators were observed. No surface water, high water table, saturation, or any other primary or

secondary wetland hydrology indicators were observed. This section of the creek was completely dry at the time of the delineation. In adjacent uplands, SP-6 was excavated in an area that supported no hydrophytic vegetation, hydric soil, or wetland hydrology indicators.

The third segment of Chico Martinez delineated is an approximately 0.27-mile section in the vicinity of SR-33 toward the intersection of Treeline Road/Roustabout Road. The sample points for this segment, SP7 and SP8, were excavated in a section of Chico Martinez Creek just to the northeast that appeared in a former Study Area boundary but no longer occurs in the current Study Area boundary (Figure 6-6); the conditions along this entire extent of Chico Martinez were assessed to be similar enough to support the use of these points as surrogates for the segment of Chico Martinez Creek that remains in this vicinity of the current Study Area. In the vicinity of SP7, excavated toward the centerline of the stream in a position where an OHWM was visible, the vegetation was dominated by allscale saltbush (FACU) in the sapling/shrub stratum and Russian thistle (UPL) in the herb stratum; there were no tree, herb, or woody vine strata present. The presence of this species did not support a dominance of hydrophytic vegetation. The substrate at SP7 included a 0.25-inch layer of small gravels on the surface, with dark yellowish brown (10YR 4/4) loamy sand at a depth of 0.25 to 16 inches of the soil profile with no noticeable changes in composition throughout the profile; no hydric soil indicators were observed; no hydric soil indicators were observed. No surface water, high water table, saturation, or any other primary or secondary wetland hydrology indicators were observed. This section of the creek was completely dry at the time of the delineation. In adjacent uplands, SP-8 was excavated in an area that supported no hydrophytic vegetation, hydric soil, or wetland hydrology indicators.

It must be noted that at two sampling locations at two separate segments of Chico Martinez Creek (i.e., SP5 and SP7), the bounds of the OHWM were determined with supporting information included on OHWM datasheets (Appendix B); however, it should also be noted that Chico Martinez Creek was observed to feature discontinuous OHWMs (including stream stretches with and without OHWMs) consistent with “discontinuous ephemeral channels” per Lichvar and McColley (2008). This section of Chico Martinez Creek appears capable of conveying water, but likely only during and immediately after substantial rain events. As a result, the OHWM datasheets are included for informational purposes, but no OHWM has been mapped due to the substantial discontinuity of this feature along Chico Martinez Creek.

5.2 NEGATIVE DATA

Prior to field surveys, other potential aquatic features within the Study Area, such as the various small historic artificially flooded marshes, ponds and canals described in Section 2.4, were targeted based on available resources such as aerial imagery and historical NWI and NHD data. Upon examining these areas, no evidence of any of these features was observed. The substrate and vegetation in these areas where these features may have historically occurred were indistinguishable from adjacent uplands. These areas had likely been graded and filled by past activities; the areas revealed no continuity of concavity or channelization that would be suggestive of any stream flow. It appears likely that historical development associated with the grading and construction of oil wells, pipelines, access roads, and associated infrastructure has permanently altered the hydrology of the landscape in these areas, and where water may have once flowed or collected in these areas, perhaps only ephemerally or as a result of anthropogenic activities, it evidently no longer does.

5.3 PRELIMINARY JURISDICTIONAL DETERMINATION

Appendix A, Figures 6-1 to 6-12 include delineation maps for the potential jurisdictional features within the Study Area; the delineation maps have been prepared consistent with the *Updated Map and Drawing Standards for the South Pacific Division Regulatory Program* (USACE 2016). Table 2 presents the 14 sample points selected within the Study Area; a summary of vegetation, soil, and hydrology wetland parameters present/absent based on observed indicators recorded on USACE Arid West Region data sheets (Appendix B); and a characterization of the potential federal and state jurisdictional features occurring within the vicinity of the sample points.

Table 2. Preliminary Jurisdictional Determination Summary

Sample Point / Soil Pit	Hydrophytic Vegetation	Hydric Soil	Wetland Hydrology	Potential Jurisdiction[1]		
				Federal / USACE	State / RWQCB	CDFW Jurisdictional Areas
SP1	N	N	N	N/A	Waters of the State (Drainage Ditch)	Drainage Ditch

[1] Areas of potential jurisdiction are subject to final verification and approval by the regulatory agencies (i.e., USACE, RWQCB, and CDFW).

[2]. This area occurred in a former Study Area boundary, but this general area has been removed from consideration as a project component in the current Study Area, no results for these sample points are presented in this Report.

Table 3 quantifies the potential jurisdictional waters (in acres, square feet, and linear feet) for the delineated resources within the Study Area and includes footnotes summarizing the key characteristics of potential jurisdictional waters for each agency/regulatory jurisdiction based on Stantec's understanding of current regulatory guidance.

Table 3. Preliminary Jurisdictional Waters Totals in the Study Area

Potential Jurisdictional Waters[1]	Acres	Square Feet	Linear Feet
U.S. Army Corps of Engineers			
N/A[2]	N/A	N/A	N/A
Total Potential USACE Jurisdiction	**N/A**	**N/A**	**N/A**
Regional Water Quality Control Board			
Waters of the State (Drainage Ditch between Main Camp Rd and Gas Plant 32)	0.189	8,229	411
Waters of the State (Drainage Ditch along west side of Pole Line Road and north of Tulare Road)	0.155	6,741	602
Waters of the State (Streambed of Remnant Ephemeral Stream south of Contractors Road)	1.008	43,907	1,711
Waters of the State (Streambed of Remnant Sections of Zemorra Creek south of Main Camp Road)	1.195	52,030	1,446
Chico Martinez Creek (Streambed)	6.920	301,413	6,247
Total Potential RWQCB Jurisdiction	**9.467**	**412,320**	**10,417**
California Department of Fish and Wildlife			
Drainage Ditch between Main Camp Rd and Gas Plant 32	0.189	8,229	411
Drainage Ditch along west side of Pole Line Road and north of Tulare Road	0.155	6,741	602
Streambed of Remnant Ephemeral Stream south of Contractors Road	1.008	43,907	1,711
Streambed of Remnant Sections of Zemorra Creek south of Main Camp Road	1.195	52,030.16	1,446
Streambed of Chico Martinez Creek	6.920	301,413	6,247
Total Potential CDFW Jurisdiction	**9.467**	**412,320**	**10,417**

[1] Areas of potential jurisdiction are subject to final verification and approval by the regulatory agencies (i.e., USACE, RWQCB, and CDFW).

[2] No potential federal WOTUS were delineated with the Study Area due to lack of an OHWM and/or no evident connectivity to any other federal WOTUS recognized as a traditional navigable water.

6.0 SUMMARY AND CONCLUSIONS

6.1 FEDERAL WETLANDS/OTHER WATERS

The jurisdictional delineation did not identify any potential jurisdictional federal WOTUS within the Study Area. Based on the current definition of WOTUS and Stantec's professional opinion, because the potentially jurisdictional aquatic features within the Study Area either lack an OHWM and/or otherwise have no evident connectivity to any other federal WOTUS recognized as a traditional navigable water, these features likely do not qualify as potential WOTUS. No three-parameter wetlands meeting federal standards were delineated within the Study Area. The recent *Sackett* decision (USACE 2023) should have no influence on the status of WOTUS within the Study Area because there are no adjacent wetlands (or any other wetlands) within the Study Area.

A previous delineation of Chico Martinez Creek (Stantec 2021) asserted that Chico Martinez Creek was not a potential federal jurisdictional WOTUS, based on the USEPA and USACE 2020 NWPR (Code of Federal Regulations 33 Part 328) because as an ephemeral drainage, it was not considered jurisdictional and had no connectivity to a traditional navigable water (Stantec 2021).

There are no regional USACE Approved Jurisdictional Determinations (AJDs) reported within the vicinity of the South and North Belridge oil fields (USACE 2023b). The nearest known federally jurisdictional water is the California Aqueduct. Under 40 Code of Federal Regulations 230.3(3), the USACE considers the California Aqueduct "Waters of the United States" (Caltrans 2022) as defined below from the regulations:

> "All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce including any such waters:
>
> a. Which are or could be used by interstate or foreign travelers for recreational or other purposes; or
>
> b. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
>
> c. Which are used or could be used for industrial purposes by industries in interstate commerce.

None of the aquatic features delineated in this Report have connectivity with the California Aqueduct. Chico Martinez Creek, the most significant regional drainage, reaches its terminus 1.80 miles west of the California Aqueduct.

6.2 WATERS OF THE STATE

The jurisdictional delineation identified potential jurisdictional waters of the State within the Study Area. Based on the current guidance for determining Waters of the State and Stantec's professional opinion, these include a total of 9.467 acres that may potentially fall under the jurisdiction of RWQCB. While the *State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* provide exemptions for ditches used for agricultural purposes (SWRCB 2019), there does not appear to be an exemption currently provided for ditches in other settings.

6.3 CDFW JURISDICTIONAL AREAS

The jurisdictional delineation identified potential CDFW jurisdictional areas within the Study Area. Based on Stantec's professional opinion, these include 9.467 acres that may potentially fall under the jurisdiction of CDFW. This total is identical to the RWQCB total because there is no additional riparian habitat acreage associated with any of the identified potential jurisdictional features.

6.4 CONCLUSION

Based on Stantec's preliminary assessment, the Study Area may include potentially jurisdictional waters. If the proposed Aera CarbonFrontier Project cannot completely avoid the potential jurisdictional waters delineated within the Study Area, Aera will likely need to procure regulatory permits from the RWQCB and/or CDFW. These may include WDRs from the Central Valley RWQCB for impacts to potential Waters of the State, and a CDFW Section 1602 Lake and Streambed Alteration Agreement.

The conclusions presented above represent Stantec's professional opinion based on our knowledge and experience with the applicable regulatory agencies, including their technical guidance documents and manuals. However, the USACE, RWQCB, and CDFW have final authority in determining the status and presence of jurisdictional wetlands/waters and the extent of their boundaries.

Appendix B WETLAND DETERMINATION DATA FORMS AND ORDINARY HIGH-WATER MARK DATASHEETS

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Aera Belridge ERS City/County: Belridge oil field, western Kern County Sampling Date: 06/01/22

Applicant/Owner: Aera State: CA Sampling Point: SP1

Investigator(s): G. Hoetker, J. Byrd Section, Township, Range: S32, T29S, R21E

Landform (hillslope, terrace, etc.): excavated drainage ditch Local relief (concave, convex, none): Concave Slope (%): 1%

Subregion (LRR): LRR C Lat: 35.447616 Long: -119.734113° Datum: NAD83

Soil Map Unit Name: 174 – Kimberlina fine sandy loam, 0-2% slopes NWI classification: Riverine

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✓ No ____ (If no, explain in Remarks.)

Are Vegetation Y, Soil Y, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No ____

Are Vegetation —, Soil —, or Hydrology — naturally problematic? N (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ____	No ✓	**Is the Sampled Area within a Wetland?** Yes ____ No ✓
Hydric Soil Present?	Yes ____	No ✓	
Wetland Hydrology Present?	Yes ____	No ✓	

Remarks: No wetland indicators; excavated drainage ditch; no OHWM; potential waters of the state

VEGETATION – Use scientific names of plants.

Tree Stratum (Plot size: —)	Absolute % Cover	Dominant Species?	Indicator Status

Dominance Test worksheet:

Number of Dominant Species That Are OBL, FACW, or FAC: 0 (A)

Total Number of Dominant Species Across All Strata: 1 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 0 (A/B)

Prevalence Index worksheet:

Total % Cover of:	Multiply by:
OBL species ____	x 1 = ____
FACW species ____	x 2 = ____
FAC species ____	x 3 = ____
FACU species ____	x 4 = ____
UPL species ____	x 5 = ____
Column Totals: ____ (A)	____ (B)

Prevalence Index = B/A = ____

Hydrophytic Vegetation Indicators:

___ Dominance Test is >50%

___ Prevalence Index is ≤3.0[1]

___ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)

___ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes ____ No ✓

Remarks: No dominant hydrophytic vegetation.

SOIL

Sampling Point: SP1

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	%	Redox Features Color (moist)	%	Type[1]	Loc[2]	Texture	Remarks
0-5"	10YR 4/4	100%	—	—	—	—	sand

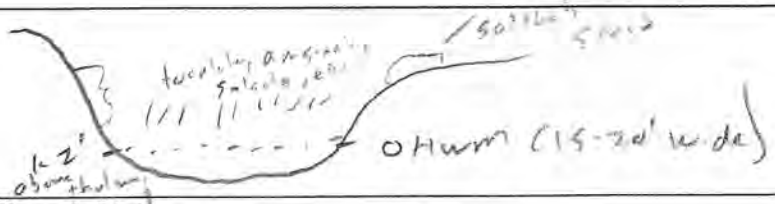
Y ☑ / N ☐ Do normal circumstances exist on the site?



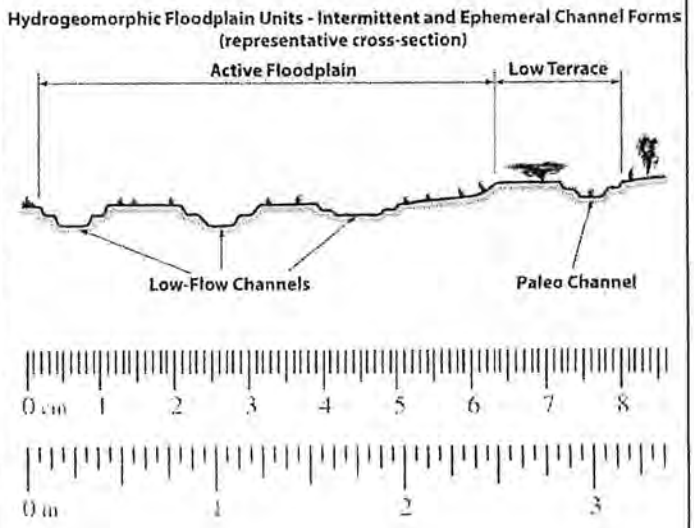
Y ☐ / N ☑ Is the site significantly disturbed?

Location Details: Chico Martinez Creek

Projection: 35.445175°, **Datum:** NAD 83
Coordinates: -119.715113°

Notes: 0.4-mile section of Chico Martinez Creek

Brief site description:



Checklist of resources (if available):

- ☑ Aerial photography
  Dates:
- ☑ Topographic maps
  Scale:
- ☐ Geologic maps
- ☐ Vegetation maps
- ☑ Soils maps
- ☐ Rainfall/precipitation maps
- ☑ Existing delineation(s) for site
- ☑ Global positioning system (GPS)
- ☐ Other studies
- ☐ Stream gage data
  Gage number:
  Period of record:
- ☐ Clinometer / level
- ☐ History of recent effective discharges
- ☐ Results of flood frequency analysis
- ☐ Most recent shift-adjusted rating
- ☐ Gage heights for 2-, 5-, 10-, and 25-year events and the most recent event exceeding a 5-year event

The dominant Wentworth size class that imparts a characteristic texture to each zone of a channel cross-section is recorded in the average sediment texture field under the characteristics section for the zone of interest.

Inches (in)	Millimeters (mm)	Wentworth size class	
10.08	256	Boulder	
2.56	64	Cobble	Gravel
0.157	4	Pebble	
		Granule	
0.079	2.00	Very coarse sand	
0.039	1.00	Coarse sand	
0.020	0.50	Medium sand	Sand
1/2 0.0098	0.25	Fine sand	
1/4 0.005	0.125	Very fine sand	
1/8 0.0025	0.0625	Coarse silt	
1/16 0.0012	0.031	Medium silt	
1/32 0.00061	0.0156	Fine silt	Silt
1/64 0.00031	0.0078	Very fine silt	
1/128 0.00015	0.0039	Clay	Mud

☑ **Walk the channel and floodplain within the study area to get an impression of the vegetation and geomorphology present at the site. Record any potential anthropogenic influences on the channel system in "Notes" above.**

☐ **Locate the low-flow channel (lowest part of the channel). Record observations.**

Characteristics of the low-flow channel: thin layer of cobble & gravel on surface, loamy sand below

Average sediment texture: _____

Total veg cover: 41 % Tree: ____ % Shrub: 25 % Herb: 16 %

Community successional stage:

☐ NA ☑ Mid (herbaceous, shrubs, saplings)

☐ Early (herbaceous & seedlings) ☐ Late (herbaceous, shrubs, mature trees)

Dominant species present: Atriplex polycarpa, Salsola tragus, Centaurea melitensis

Other: ☐ _____

☐ _____

☐ _____

☐ _____

☑ **Walk away from the low-flow channel along cross-section. Record characteristics of the low-flow/active floodplain boundary.**

Characteristics used to delineate the low-flow/active floodplain boundary:

☑ Change in total veg cover ☐ Tree ☐ Shrub ☐ Herb

☐ Change in overall vegetation maturity

☐ Change in dominant species present

☐ Other ☐ Presence of bed and bank

☐ Drift and/or debris

☐ Other: _____

☐ Other: _____

☑ **Continue walking the channel cross-section. Record observations below.**

Characteristics of the active floodplain:

Average sediment texture: same as above

Total veg cover: 41 % Tree: ____ % Shrub: 25 % Herb: 16 %

Community successional stage:

☐ NA ☑ Mid (herbaceous, shrubs, saplings)

☐ Early (herbaceous & seedlings) ☐ Late (herbaceous, shrubs, mature trees)

Dominant species present: Same as above

Other: ☐ _____

☐ _____

☐ _____

☐ _____

☑ **Continue walking the channel cross-section. Record indicators of the active floodplain/low terrace boundary.**

Characteristics used to delineate the active floodplain/ low terrace boundary:

- ☐ Change in average sediment texture
- ☐ Change in total veg cover ☐ Tree ☐ Shrub ☐ Herb
- ☐ Change in overall vegetation maturity
- ☐ Change in dominant species present
- ☐ Other
  - ☐ Presence of bed and bank
  - ☐ Drift and/or debris
  - ☐ Other: _____
  - ☐ Other: _____

☑ **Walk the active floodplain/low terrace boundary both upstream and downstream of the cross-section to verify that the indicators used to identify the transition are consistently associated the transition in both directions.**

Consistency of indicators used to delineate the active floodplain/low terrace boundary:

- Y ☑ N ☐ Change in average sediment texture
- Y ☑ N ☐ Change in total veg cover ☐ Tree ☐ Shrub ☐ Herb
- Y ☑ N ☐ Change in overall vegetation maturity
- Y ☑ N ☐ Change in dominant species present
- Y ☑ N ☐ Other:
  - Y ☑ N ☐ Presence of bed and bank
  - Y ☐ N ☐ Drift and/or debris
  - Y ☐ N ☐ Other: _____
  - Y ☐ N ☐ Other: _____

☐ **If the characteristics used to delineate the active floodplain/low terrace boundary were NOT consistently associated with the transition in both the upstream and downstream directions, repeat all steps above.**

☐ **Continue walking the channel cross-section. Record characteristics of the low terrace.**

Characteristics of the low terrace:

Average sediment texture: minimal gravel, loamy sand

Total veg cover: 25 % Tree: ____ % Shrub: ____ % Herb: 5 %

Community successional stage:

- ☐ NA
- ☑ Early (herbaceous & seedlings)
- ☐ Mid (herbaceous, shrubs, saplings)
- ☐ Late (herbaceous, shrubs, mature trees)

Dominant species present: Salsola tragus, Centaurea maculosa

Other:

- ☐ _____
- ☐ _____
- ☐ _____
- ☐ _____

☑ **If characteristics used to delineate the active floodplain/low terrace boundary were deemed reliable, acquire boundary.**

Active floodplain/low terrace boundary acquired via:

- ☐ Mapping on aerial photograph
- ☑ GPS
- ☐ Digitized on computer
- ☐ Other: _____

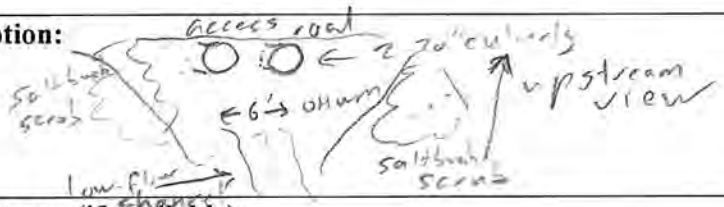
Y ☑ / N ☐ Do normal circumstances exist on the site?



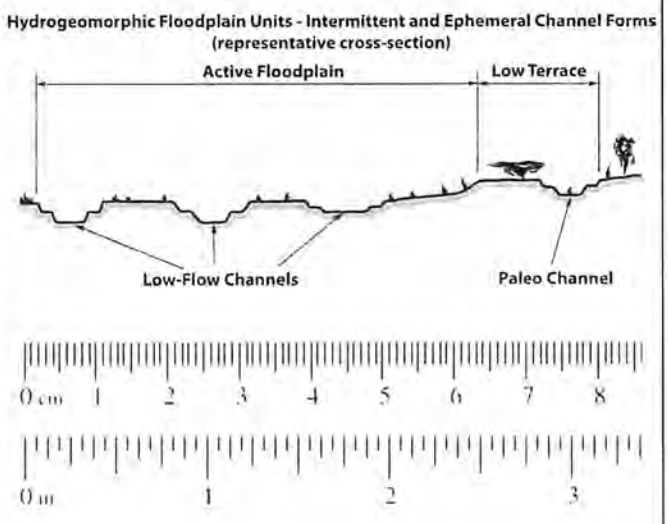
Y ☑ / N ☐ Is the site significantly disturbed?

Location Details: Chico Martinez Creek

Projection: 35.460661° **Datum:** NAD 83
Coordinates: 119.698066°

Notes: Small section of Chico Martinez Creek east of Hwy 33.

Brief site description:



Checklist of resources (if available):

- ☑ Aerial photography
  Dates:
- ☑ Topographic maps
  Scale:
- ☐ Geologic maps
- ☐ Vegetation maps
- ☑ Soils maps
- ☐ Rainfall/precipitation maps
- ☐ Existing delineation(s) for site
- ☑ Global positioning system (GPS)
- ☐ Other studies

- ☐ Stream gage data
  Gage number:
  Period of record:
- ☐ Clinometer / level
- ☐ History of recent effective discharges
- ☐ Results of flood frequency analysis
- ☐ Most recent shift-adjusted rating
- ☐ Gage heights for 2-, 5-, 10-, and 25-year events and the most recent event exceeding a 5-year event

The dominant Wentworth size class that imparts a characteristic texture to each zone of a channel cross-section is recorded in the average sediment texture field under the characteristics section for the zone of interest.

Millimeters (mm)	Inches (in)	Wentworth size class	
10.08	256	Boulder	
2.56	64	Cobble	Gravel
0.157	4	Pebble	
0.079	2.00	Granule	
0.039	1.00	Very coarse sand	
0.020	0.50	Coarse sand	
0.0098 (1/2)	0.25	Medium sand	Sand
0.005 (1/4)	0.125	Fine sand	
0.0025 (1/8)	0.0625	Very fine sand	
0.0012 (1/16)	0.031	Coarse silt	
0.00061 (1/32)	0.0156	Medium silt	Silt
0.00031 (1/64)	0.0078	Fine silt	
0.00015 (1/128)	0.0039	Very fine silt	
		Clay	Mud

☑ **Walk the channel and floodplain within the study area to get an impression of the vegetation and geomorphology present at the site. Record any potential anthropogenic influences on the channel system in "Notes" above.**

☑ **Locate the low-flow channel (lowest part of the channel). Record observations.**

Characteristics of the low-flow channel:

Average sediment texture: loamy sand

Total veg cover: ____ % Tree: ____ % Shrub: 35 % Herb: ____ %

Community successional stage:

☐ NA ☑ Mid (herbaceous, shrubs, saplings)

☐ Early (herbaceous & seedlings) ☐ Late (herbaceous, shrubs, mature trees)

Dominant species present: Atriplex polycarpa

Other: ☐ ☐ ☐ ☐

☑ **Walk away from the low-flow channel along cross-section. Record characteristics of the low-flow/active floodplain boundary.**

Characteristics used to delineate the low-flow/active floodplain boundary: same as above

☐ Change in total veg cover ☐ Tree ☐ Shrub ☐ Herb

☐ Change in overall vegetation maturity

☐ Change in dominant species present

☐ Other ☐ Presence of bed and bank

☐ Drift and/or debris

☐ Other: ____

☐ Other: ____

☑ **Continue walking the channel cross-section. Record observations below.**

Characteristics of the low-flow channel:

Average sediment texture: loamy sand

Total veg cover: ____ % Tree: ____ % Shrub: 35 % Herb: ____ %

Community successional stage:

☐ NA ☑ Mid (herbaceous, shrubs, saplings)

☐ Early (herbaceous & seedlings) ☐ Late (herbaceous, shrubs, mature trees)

Dominant species present: Atriplex polycarpa

Other: ☐ ☐ ☐ ☐

☑ **Continue walking the channel cross-section. Record indicators of the active floodplain/low terrace boundary.**

Characteristics used to delineate the active floodplain/ low terrace boundary:

- ☐ Change in average sediment texture
- ☑ Change in total veg cover ☐ Tree ☑ Shrub ☐ Herb
- ☐ Change in overall vegetation maturity
- ☐ Change in dominant species present
- ☐ Other ☐ Presence of bed and bank
  - ☐ Drift and/or debris
  - ☐ Other: _____
  - ☐ Other: _____

☑ **Walk the active floodplain/low terrace boundary both upstream and downstream of the cross-section to verify that the indicators used to identify the transition are consistently associated the transition in both directions.**

Consistency of indicators used to delineate the active floodplain/low terrace boundary:

- Y ☐ N ☐ Change in average sediment texture
- Y ☑ N ☐ Change in total veg cover ☐ Tree ☑ Shrub 65% ☐ Herb
- Y ☐ N ☐ Change in overall vegetation maturity
- Y ☐ N ☐ Change in dominant species present
- Y ☐ N ☐ Other: Y ☑ N ☐ Presence of bed and bank
  - Y ☐ N ☐ Drift and/or debris
  - Y ☐ N ☐ Other: _____
  - Y ☐ N ☐ Other: _____

☐ **If the characteristics used to delineate the active floodplain/low terrace boundary were NOT consistently associated with the transition in both the upstream and downstream directions, repeat all steps above.**

☑ **Continue walking the channel cross-section. Record characteristics of the low terrace.**

Characteristics of the low terrace:

Average sediment texture: loamy sand

Total veg cover: ____ % Tree: ____ % Shrub: 65 % Herb: ____ %

Community successional stage:

- ☐ NA
- ☑ Mid (herbaceous, shrubs, saplings)
- ☐ Early (herbaceous & seedlings)
- ☐ Late (herbaceous, shrubs, mature trees)

Dominant species present: Atriplex polycarpa

Other:

- ☐ _____
- ☐ _____
- ☐ _____
- ☐ _____

☐ **If characteristics used to delineate the active floodplain/low terrace boundary were deemed reliable, acquire boundary.**

Active floodplain/low terrace boundary acquired via:

- ☐ Mapping on aerial photograph
- ☐ GPS
- ☐ Digitized on computer
- ☐ Other: _____

AERA CARBONFRONTIER PROJECT

Cultural Resources Survey Report

July 19, 2023

Prepared for:
Aera Energy, LLC
10000 Ming Avenue
Bakersfield, California 93311

Prepared by:
Mitch Evans
Santos Ceniceros-Rodríguez
Fiadh Kelly
Stantec Consulting Services, Inc.
2646 Santa Maria Way, Suite 107
Santa Maria, California 93455

Project Number:
185805372

This document may contain sensitive archaeological information. Not for public distribution.

The conclusions in the Report titled *Aera CarbonFrontier Project – Cultural Resources Survey Report* are Stantec's professional opinion, as of the time of the Report, and concerning the scope described in the Report. The opinions in the document are based on conditions and information existing at the time the scope of work was conducted and do not take into account any subsequent changes. The Report relates solely to the specific project for which Stantec was retained and the stated purpose for which the Report was prepared. The Report is not to be used or relied on for any variation or extension of the project, or for any other project or purpose, and any unauthorized use or reliance is at the recipient's own risk.

Stantec has assumed all information received from Aera Energy, LLC (the "Client"), and third parties in the preparation of the Report to be correct. While Stantec has exercised a customary level of judgment or due diligence in the use of such information, Stantec assumes no responsibility for the consequences of any error or omission contained therein.

This Report is intended solely for use by the Client in accordance with Stantec's contract with the Client. While the Report may be provided to applicable authorities having jurisdiction and others for whom the Client is responsible, Stantec does not warrant the services to any third party. The report may not be relied upon by any other party without the express written consent of Stantec, which may be withheld at Stantec's discretion.

1 MANAGEMENT SUMMARY

Between May 2022 and June 2023, Stantec Consulting Services, Inc. (Stantec) conducted a Phase I cultural resources investigation on behalf of Aera Energy LLC (Aera), of approximately 1,544 acres of land in Belridge oil fields (North and South), Kern County (the "Project"). The Project would require federal actions including the issuance of Class VI Underground Injection Control (UIC) permits from the United States (U.S.) Environmental Protection Agency (USEPA). However, the Project is Categorically Excluded from further review under the National Environmental Policy Act (NEPA); the Safe Drinking Water Act UIC program is exempt from performing an Environmental Impact Statement (EIS) under section 101(2)(C) and an alternatives analysis under section 101(2)(E) of NEPA under a functional equivalence analysis[1]. Although the Project is exempt from NEPA, in their purview, the USEPA has determined the Project is an undertaking subject to Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended and its implementing regulations (36 Code of Federal Regulations [CFR] 800), pursuant to subpart 800.3(a)).

The Project is additionally subject to compliance with the California Environmental Quality Act (CEQA) requirements regarding its impacts on cultural resources. CEQA (Public Resources Code [PRC] Sections 21000 etc.) requires that, before approving most discretionary projects, the lead agency must identify and examine any significant adverse environmental effects that may result from activities associated with such projects (PRC Sections 21083.2 and 21084.1). CEQA explicitly requires that the study examine whether the project may result in a significant adverse change to "historical resources" and "unique archaeological resources." Kern County is the CEQA Lead Agency for the Project.

Under these requirements, a cultural resources inventory was conducted to address NHPA and CEQA requirements to determine impacts of the proposed Project on any cultural resources eligible for nomination to the California Register of Historical Resources (CRHR) (PRC 5024.1; 14 CCR 4850 *et seq.*) and/or to the National Register of Historic Places (NRHP) (40 CFR 1508.27(b)(8)). The purpose of this study is to evaluate resources for CRHR and NRHP eligibility, and to assess the proposed Project's potential impacts on historical resources, archaeological resources, and historic properties.

The study consisted of an archival records search of the entire Area of Potential Effect (APE) and the surrounding Study Area (1-mile radius around the APE) and an intensive pedestrian survey of the entire APE, including the route of the new pipeline (north and south) and injection area. The records search was

[1] United States Court of Appeals, Eighth Circuit. 1991. Western Nebraska Resources Council v. US EPA, 943 F.2d 867, 871–72 (8th Cir. 1991) and EPA Associate General Counsel Opinion (August 20, 1979). No, 90-2158, United States Court of Appeals, Eighth Circuit. 943 F.2d 867 (8th Cir. 1991). Decided September 3, 1991.

conducted at the Southern San Joaquin Valley Information Center (SSJVIC) of the California Historical Resources Information System (CHRIS) at California State University, Bakersfield (CSUB). The records search revealed that nine previous studies have been conducted within the APE and an additional 17 have been conducted within the surrounding Study Area. No resources had previously been recorded within the APE, however, one prehistoric isolate and two historic sites have been previously recorded within the surrounding Study Area.

The pedestrian survey included 15-20-meter parallel transects of Project footprint, which includes the proposed carbon capture and sequestration (CCS) Project and its ancillary facilities and equipment, including new CO_2 pipelines, injection wells, CO_2 monitoring wells, and an underground carbon sequestration field/zone (the geologic formation where CO_2 would be stored at a depth of approximately 8,500 feet below ground surface). The planned CO_2 pipeline will be located on Aera Energy property. Access/egress for the Project will be along existing paved and dirt roads extending throughout the property primarily via Main Camp Road (northeast-southwest trending) and Pole Line Road (northwest-southeast trending). Portions of the proposed pipeline will extend across areas of open land with no existing access/egress. The Project may include repair/improvements of existing access roads to ensure safe and efficient delivery of equipment to the carbon capture facility sites during the construction period and for ongoing operation and maintenance activities.

As a result of the Phase I archaeological investigation,107 cultural resources were identified within the study area. These resources consisted of 105 historic-period archaeological and architectural resources, 25 isolated discoveries, one multicomponent site, and one prehistoric site. Of these, five sites were identified as potentially significant under either NRHP or CRHR eligible. Stantec recommends avoidance of cultural resources that appear NRHP/CRHR eligible.

2 PROJECT DESCRIPTION

Aera has submitted an application to the Kern County Planning and Natural Resources Department to request approval of a Zoning Change and Conditional Use Permit (CUP) and any other required approvals, if any, for the construction and operation of a CCS project in the South and North Belridge oil fields. The proposed Project would require approvals for additions and improvements to the existing oil field facilities (gas separation, compression, and pumping equipment), new carbon dioxide (CO_2) pipelines located primarily aboveground utilizing existing pipeline corridors, UIC Class VI geologic sequestration injection wells, CO_2 monitoring wells, and an underground carbon sequestration field for the storage of CO_2 in accordance with appropriate financial assurance mechanisms that ensure permanence in compliance with applicable regulatory standards.

The proposed Project would capture CO_2 from existing produced gas streams (pre-combustion) and emissions from existing stationary sources (post-combustion) within the South Belridge Oil Field and transport the CO_2 through pipelines to the North Belridge Oil Field for injection at dedicated Class VI injection wells. The proposed underground CO_2 sequestration field, approximately 2,636 acres in size, would be located within the North Belridge Oil Field with surface and mineral rights held by Aera and

other private owners. Oil and gas production activities would cease within the Underground geologic formation here CO_2 would be stored, prior to commencement of the proposed Project.

It is anticipated that the proposed Project would capture and sequester up to 1.6 million metric tons (MMt) of CO_2 per year beginning in 2027 and will contribute to the goal of California for carbon net-neutrality by 2045 (Executive Order B-55-18) by reducing industrial CO_2 emissions.

Implementation of the Project would require permits from the USEPA for up to nine Class VI injection wells in compliance with the UIC program Class VI geologic sequestration regulations. The proposed CO_2 related facilities, pipelines, Class VI injection wells and associated CO_2 monitoring wells will be located within the CUP boundary. The proposed Project would utilize, on average, up to 1,223 acre-feet per year (afy) (26,000 barrels of water per day) for use in the CO_2 capture facilities for up to 20 years of operation. primarily sourced from existing Belridge oil field produced water. Fresh water would be sourced from existing State Water Project entitlements with the Belridge Water Storage District and from existing Aera-owned groundwater wells located in the Buena Vista Water Storage District

3 PROJECT LOCATION

The Project is located within the North and South Belridge oil fields in an unincorporated area of western Kern County, approximately 14 miles west of Buttonwillow, six miles south of Lost Hills, and eleven miles north of McKittrick, California (Figure 1 – Appendix A). The APE is on lands owned and operated by Aera Energy. From the south, the APE spans an area in the vicinity of the intersection of Lost Hills Road and State Route (SR) 33 (also known as the West Side Highway), northwestward through Seventh Standard Road, northward through the South Belridge Oil Field variously paralleling or oriented east of Pole Line Road through Lerdo Highway, then continuing along the vicinity of Pole Line Road to the North Belridge Oil Field.

The APE Survey Area is approximately 13 miles long, approximately 250 feet wide, and encompasses approximately 1,167 acres primarily within the Belridge and Blackwells Corner (1988) 7.5-minute U.S. Geological Survey (USGS) topographic quadrangles, with smaller portions within the Lost Hills and Carneros Rocks USGS topographic quadrangles (Figure 2 – Appendix A). To access the APE from Interstate 5, take the Buttonwillow SR-58 / McKittrick Highway exit and travel west on SR-58 for approximately eight miles; turn right onto Lokern Road and travel west approximately 7.3 miles; turn right on SR-33 and travel northwest approximately 2.5 miles to arrive at the southern end of the APE.

4 REGULATORY FRAMEWORK

This study was conducted to meet CEQA requirements regarding cultural resources on lands proposed for development. CEQA (PRC Sections 21000 etc.) requires that, before approving most discretionary projects, the lead agency must identify and examine any significant adverse environmental effects that may result from activities associated with such projects (PRC Sections 21083.2 and 21084.1). CEQA explicitly requires that the initial study examine whether the project may have a significant effect on “historical resources” and “unique archaeological resources.” Under these requirements, a cultural

resources inventory was conducted to determine impacts of the proposed project on cultural resources potentially eligible for nomination to the CRHR.

4.1 California Environmental Quality Act

CEQA (California PRC Section 21000 et seq.) (1970) established that historical and archaeological resources are afforded consideration and protection by the CEQA (14 CCR Section 21083.2, 14 CCR Section 15064). CEQA Guidelines define significant cultural resources under three regulatory designations: historical resources, tribal cultural resources, and unique archaeological resources. These designations permit for a fair amount of overlap.

A historical resource is a “resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the CRHR”; or “a resource listed in a local register of historical resources or identified as significant in a historical resource survey meeting the requirements of Section 5024.1(g) of the PRC”; or “any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California, provided the agency’s determination is supported by substantial evidence in light of the whole record” (14 CCR Section 15064.5[a][3]). Historical resources automatically listed in the CRHR include California cultural resources listed in or formally determined eligible for the NRHP and California Registered Historical Landmarks from No. 770 onward (PRC 5024.1[d]). Locally listed resources are entitled to a presumption of significance unless a preponderance of evidence in the record indicates otherwise.

Tribal cultural resources (TCRs) are similar to the traditional cultural property designation within the NHPA guidance. These can be sites, features, places, cultural landscapes, and sacred places or objects that have cultural value or significance to a Tribe. To qualify as a TCR, it must either be 1) listed on or eligible for listing on the California Register or a local historic register or, 2) or is a resource that the lead agency, at its discretion and supported by substantial evidence, determines should be treated as a TCR (PRC Section 21074). TCRs can include “non-unique archaeological resources” (see “unique archaeological resource” below) that, rather than being important for “scientific” value as a resource, can also be significant because of the sacred and/or cultural tribal value of the resource. Tribal representatives are considered experts appropriate for providing substantial evidence regarding the locations, types, and significance of TCRs within their traditionally and cultural affiliated geographic area (PRC Section 21080.3.1(a)).

Under CEQA, a resource is generally considered historically significant if it meets the criteria for listing in the CRHR. A resource must meet at least one of the following criteria (PRC 5024.1; 14 CCR Section 15064.5[a][3]):

> Is associated with events that have made a significant contribution to the broad patterns of California’s history and cultural heritage. Title 14, CCR Section 4852(b)(1) adds, “is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States.”

Is associated with the lives of persons important in our past. Title 14, CCR Section 4852(b)(2) adds, "is associated with the lives of persons important to local, California, or national history."

Embodies the distinctive characteristics of a type, period, region, or method of construction; or represents the work of an important creative individual; or possesses high artistic values. Title 14, CCR 4852(b)(3) allows a resource to be CRHR eligible if it represents the work of a master.

Has yielded, or may be likely to yield, information important in prehistory or history. Title 14, CCR 4852(b)(4) specifies that importance in prehistory or history can be defined at the scale of "the local area, California, or the nation."

Historical resources must also possess integrity of location, design, setting, materials, workmanship, feeling, and association (14 CCR 4852[c]).

An archaeological artifact, object, or site can meet CEQA's definition of a unique archaeological resource even if it does not qualify as a historical resource (PRC 21083.2[g]; 14 CCR 15064.5[c][3]). An archaeological artifact, object, or site is considered a unique archaeological resource if "it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria (PRC 21083.2[g]):

Contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information.

Has a special and particular quality such as being the oldest of its type or the best available example of its type.

Is directly associated with a scientifically recognized important prehistoric or historic event or person."

4.2 Criteria for Substantial Adverse Change to Historical Resources

As quoted below, the CEQA statute (California PRC Section 21000 et seq.) defines how to determine if actions will, or have, created adverse effects to historical resources.

"A project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. For purposes of this section, an historical resource is a resource listed in, or determined to be eligible for listing in, the California Register of Historical Resources. Historical resources included in a local register of historical resources, as defined in subdivision (k) of Section 5020.1 or deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1, are presumed to be historically or culturally significant for purposes of this section, unless the preponderance of the evidence demonstrates that the resource is not historically or culturally significant. The fact that a resource is not listed in, or determined to be eligible for listing in, the California Register of Historical Resources, not included in a local register of historical resources, or not deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1 shall not preclude a lead agency from determining whether the

resource may be an historical resource for purposes of this section" (California PRC Section 21084.1).

4.3 Public Resources Code 5097.98

This section discusses the procedures that need to be followed upon the discovery of Native American human remains. The NAHC, upon notification of the discovery of human remains is required to contact the County Coroner pursuant to subdivision (c) of Section 7050.5 of the Health and Safety Code and shall immediately notify those persons it believes to be the most likely descendants.

4.4 Health and Safety Code 7050.5

This code establishes that any person, who knowingly mutilates, disinters, wantonly disturbs, or willfully removes any human remains in or from any location without authority of law is guilty of a misdemeanor. It further defines procedures for the discovery and treatment of Native American human remains.

4.5 National Historic Preservation Act

The Project is considered an undertaking subject to compliance with Section 106 of the NHPA of 1966, as amended, and its implementing regulations (36 CFR 800). The issuance of Class VI UIC permits is a federal action subject to historic resources consultation in accordance with Section 106, including the identification, evaluation, and NHPA Section 106 consultation process with the State Historic Preservation Office (SHPO) within California Department of Parks and Recreation (DPR). The purpose of the archaeological study was to identify and document any cultural resources within the APE, to evaluate such resources for NRHP eligibility, and to assess future project effects on historic properties. The APE was designed to consider both direct and indirect effects on cultural resources from the undertaking. An APE is defined as "the geographic area or areas within which an undertaking may directly or indirectly cause changes in the character or use of historic properties, if any properties exist" (36 CFR 800.16(d)). The APE for direct effects for this undertaking is confined to the Project footprint, which includes the proposed CCS Project and its ancillary facilities and equipment (new CO_2 pipelines, injection wells, CO_2 monitoring wells, and an underground carbon sequestration field). It is expected that any potential adverse impacts from the Project will be contained within this direct APE.

The NHPA provides a regulatory framework to ensure that significant cultural resources are recognized and protected during federal projects and programs through the Section 106 (36 CFR 800) compliance process. For compliance with the NHPA, cultural resource significance is evaluated in terms of eligibility for listing in the NRHP. Properties eligible for the NRHP are considered historic properties. Section 106 of the NHPA requires that federal agencies consider the potential effects of undertakings on historic properties. The purpose of this cultural resources study is to identify and document cultural resources within the APE, to evaluate those resources for NRHP eligibility, and to assess Project effects on historic properties.

4.6 National Register of Historic Places Eligibility Criteria

The criteria for determining eligibility for listing in the NRHP is defined in 36 CFR 60.4. Agencies evaluate potential historic properties discovered in the Identification phase in consultation with the SHPO to determine if the resources are eligible for inclusion in the NRHP. Cultural resources generally more than 50 years old may be considered eligible for listing and they must meet one or more of the following criteria:

- Criterion A: Be associated with events that have made a significant contribution to the broad patterns of America's history
- Criterion B: Be associated with the lives of persons significant to our past
- Criterion C: Embody the distinctive characteristics of a type, period, or method of construction, or represents the work of a master, or possesses high artistic value, or represents a significant and distinguishable entity whose components may lack individual distinction
- Criterion D: They must have yielded or may be likely to yield information important in prehistory or history

In addition to meeting at least one of the above-listed criteria, a determination of eligibility for the NRHP must consider the resource's integrity. A property's integrity is grounded in an understanding of the property's physical characteristics and how those characteristics relate to its significance. The NRHP defines seven aspects of integrity: location, design, setting, materials, workmanship, feeling, and association. An archaeological site, building, structure, district, or object that meets one of the NRHP significance criteria and has enough integrity to convey that historical significance is considered eligible for listing in the NRHP and is a historic property under Section 106 of the NHPA. A full explanation of the procedures for evaluating historic resources can be found in publications issued by the National Park Service, including National Register Bulletin 15, How to Apply the National Register Criteria for Evaluation (NPS 1990).

4.7 Criteria for Adverse Effects

The NHPA (36 CFR Section 800.5) defines how to determine if actions will, or have, created adverse effects to historic resources.

An adverse effect is found when an undertaking may directly or indirectly alter any of the characteristics of a historic property that qualify the property for inclusion in the NRHP in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association.

Consideration shall be given to all qualifying characteristics of a historic property, including those that may have been identified subsequent to the original evaluation of the property's eligibility for the NRHP. Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance or be cumulative.

Adverse effects on historic properties include but are not limited to the following:

i. Physical destruction of or damage to all or part of the property;

ii. Alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation, and provision of handicapped access, that is not consistent with the Secretary's standards for the treatment of historic properties (36 CFR part 68) and applicable guidelines;

iii. Removal of the property from its historic location;

iv. Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance;

v. Introduction of visual, atmospheric or audible elements that diminish the integrity of the property's significant historic features;

vi. Neglect of a property which causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to an Indian tribe or Native Hawaiian organization; and

vii. Transfer, lease, or sale of property out of Federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance.

4.8 Native American Graves Protection and Repatriation Act

The Native American Graves Protection and Repatriation Act (NAGPRA) (25 United States Code [USC] Section 3001) and its implementing regulations (43 CFR Part 10) presents a systematic process for determining the rights of lineal descendants and Indian tribes to certain Native American human remains, funerary objects, sacred objects, or objects of cultural patrimony with which they are affiliated.

NAGPRA defines the following terms:

> (1) "burial site" means any natural or prepared physical location, whether originally below, on, or above the surface of the earth, into which as a part of the death rite or ceremony of a culture, individual human remains are deposited.
>
> (2) "cultural affiliation" means that there is a relationship of shared group identity which can be reasonably traced historically or prehistorically between a present day Indian tribe or Native Hawaiian organization and an identifiable earlier group.
>
> (3) "cultural items" means human remains and-
>
> (A) "associated funerary objects" which shall mean objects that, as a part of the death rite or ceremony of a culture, are reasonably believed to have been placed with individual human remains either at the time of death or later, and both the human remains and associated funerary objects are presently in the possession or control of a Federal agency or museum, except that

other items exclusively made for burial purposes or to contain human remains shall be considered as associated funerary objects.

(B) “unassociated funerary objects” which shall mean objects that, as a part of the death rite or ceremony of a culture, are reasonably believed to have been placed with individual human remains either at the time of death or later, where the remains are not in the possession or control of the Federal agency or museum and the objects can be identified by a preponderance of the evidence as related to specific individuals or families or to known human remains or, by a preponderance of the evidence, as having been removed from a specific burial site of an individual culturally affiliated with a particular Indian tribe,

(C) "sacred objects" which shall mean specific ceremonial objects which are needed by traditional Native American religious leaders for the practice of traditional Native American religions by their present day adherents, and

(D) "cultural patrimony" which shall mean an object having ongoing historical, traditional, or cultural importance central to the Native American group or culture itself, rather than property owned by an individual Native American, and which, therefore, cannot be alienated, appropriated, or conveyed by any individual regardless of whether or not the individual is a member of the Indian tribe or Native Hawaiian organization and such object shall have been considered inalienable by such Native American group at the time the object was separated from such group.

5 ENVIRONMENTAL BACKGROUND

The APE is within the western San Joaquin Valley (SJV), which accounts for the southern half of the Central Valley of the Great Valley Geomorphic Province. The Great Valley Geomorphic Province is an alluvial plain about 50 miles wide and 400 miles long in the central part of California. The southwestern margin of the valley is renowned for its oil fields trapped within anticlinal uplifts. The SJV is surrounded by three mountain ranges: the Sierra Nevada on the east, the Temblor Range on the west, and the Tehachapi Range on the south. The Belridge oil fields were discovered in the early 1900s, as oil naturally surfaced due to pressure in the geologic reservoir. The first well was drilled along Chico Martinez Creek in April 1911 (Allan and Lalicata 2012). Since then, the Belridge Oil Fields were developed into North and South Belridge oil fields. The APE is heavily disturbed with oil wells and well pads, oil and gas infrastructure, gas and steam pipelines, and multiple unnamed dirt or graveled access roads and a few paved roads.

5.1 Natural Setting

The APE lies along the South and North Belridge oil fields on the Antelope Plain, an alluvial piedmont consisting of coalescing alluvial fans from the Temblor Range to the west. The region slopes to the east towards the SJV. The topography of the APE is relatively flat, interrupted only by oil and gas infrastructure, and consists of grades between 0 and 9 percent slope and elevations range from

approximately 675 feet above mean sea level (amsl) on the western edge down to 550 feet amsl on the eastern edge of the APE.

The APE is within the SJV groundwater basin and the Kern County groundwater subbasin. This groundwater subbasin extends from the Greenhorn Mountains in the east to the Temblor Range in the west. Streamflow through the vicinity of the APE is generally directed from the Temblor Range in the west toward the Central Valley in the east. Chico Martinez Creek, an ephemeral stream at the southern end of the APE, is the most prominent regional stream draining southwest/northeast through the South Belridge Oil Field toward the Central Valley. Sections of Chico Martinez Creek within the APE appear to be channelized but are interspersed with no defined channel bed and bank. Chico Martinez Creek has been altered and segmented due to oil field development and road construction.

Soil types mapped across the APE are composed predominantly of Kimberlina fine sandy loam, with minor amounts of Milham sandy loam and Panoche clay loam. The Kimberlina series consists of very deep, well-drained soils on flood plains and recent alluvial fans. These soils formed in mixed alluvium derived mostly from igneous and/or sedimentary rock sources. The Milham series consists of very deep, well-drained soils on alluvial fans, plains, low terraces, and fan remnants. These soils formed in mixed calcareous alluvium weathered from granitic and sedimentary rock. The Panoche series consists of very deep, well-drained soils on alluvial fans and flood plains. These soils formed in loamy calcareous alluvium from sedimentary rock (USDA NRCS 2022).

The climate of the area is characterized as Mediterranean with moderate winters and hot, dry summers. Precipitation primarily occurs as rain with an average annual rainfall of approximately 5.64 inches. Air temperatures range between an average January temperature of 45.8 degrees Fahrenheit (ºF) and an average July temperature of 81.9 ºF. The annual average temperature is approximately 63.4 ºF. Climate is based on historical weather data collected at Buttonwillow, California (Western Regional Climate Center 2022), located approximately 15 miles east of the APE.

5.2 Vegetation and Wildlife

The primary vegetation within the APE is classified as *Atriplex polycarpa* Shrubland Alliance (Allscale scrub) and native and non-native grasslands. Allscale scrub occurs primarily in the southern half of the Study Area. Allscale (*Atriplex polycarpa)* scrub is characterized by an open to continuous canopy with a variable herbaceous layer including seasonal annuals and non-native grasses. The alliance is typically found in washes, playa lake beds and shores, dissected alluvial fans, rolling hills, terraces and edges or large low gradient washes. Soils may be carbonate rich, alkaline, sandy, or sandy clay loams (Sawyer et al. 2009).

Typically, allscale is dominant in the shrub canopy with annual bursage (*Ambrosia acanthicarpa*), fourwing saltbush (*Atriplex canescens*), red brome (*Bromus madritensis* ssp. *rubens*), small, seeded spurge (*Euphorbia polycarpa*), and coyote brush (*Baccharis pilularis*). Patches of the allscale scrub, dominated by allscale shrubs with non-native grasses, primarily bromes (*Bromus* spp.) and weeds including Russian thistle (*Salsola tragus*), occur along a historic ephemeral drainage within the APE.

Common animals in the area include numerous bird species, the black-tailed jackrabbit (*Lepus californicus*), desert cottontail rabbit (*Sylvilagus audubonii*), kangaroo rat (*Dipodomys sp.*), coyote (*Canis latrans),* San Joaquin antelope squirrel (*Ammospermophilus nelson),* side-blotched lizards (*Uta stansburiana*), Northern Pacific Rattlesnake (*Crotalus oreganus)* and California whiptail lizards (Aspidoscelis tigris munda).

6 CULTURAL BACKGROUND

6.1 Ethnography and Archaeology

The North and South Belridge oil fields and the surrounding areas are within the ethnographic territory of the Southern Valley Yokuts. The Southern Valley Yokuts have been the subject of considerable study by numerous researchers (e.g., Gifford and Schneck 1926; Kroeber 1925; and Wallace 1978a). The Southern Valley Yokuts' homeland was centered near water sources including the Tulare, Buena Vista, and Kern Lakes and connecting sloughs and rivers. Prior to the emergence of modern agricultural practices in the region, the SJV was a landscape dominated by networks of interconnecting watercourses, lakes, and sloughs at historic contact (e.g., Sutton 1997:3). The Southern Valley Yokuts, primarily the Wowol, Tachi, and Chunut tribes, occupied the Tulare Lake Basin (Cook 1955). Tulare Lake, part of the larger Tulare Lake Basin, was a large freshwater lake formed by the consolidation of alluvial fan dams generated by the Kings River to the east and Los Gatos Creek to the west (Atwater et al. 1986). People inhabited the Tulare Lake region from at least 13,000 calibrated years before present (CYBP) to after historic contact (Sutton 2019:293). At its maximum, the lake covered some 100 square miles and boasted a diverse biotic community that supported a large population of various Yokut tribes (Preston 1981). Buena Vista Lake, which was the second largest lake in the Tulare Lake Basin, was fed by the waters of the Kern River and was connected with Kern and Tulare Lakes via sloughs. During the mid-20th century, Buena Vista Lake dried up after its tributary rivers were impounded by the construction of Isabella Dam for agricultural and municipal water uses.

Natural and anthropogenic factors have heavily impacted the integrity of archaeological sites in the Central Valley. Fluctuations in temperature since the Pleistocene created different periods of increased precipitation and flooding which morphed the Valley's terrain. These floods either washed away artifacts from the earliest periods or deeply deposited them under alluvial soils (Aviña 1999:9; Rosenthal et al. 2007:150). Agricultural development, levee construction, and river erosion during historic times have also contributed to the destruction of surface sites (Rosenthal et al. 2007:149). Artifacts have also been taken by private collectors through time, making interpretation more difficult since this precludes analysis by anthropologists and the provenience which provides context is likely lost (Sutton 2019:293). Our interpretations of the early peopling of the Central Valley are also impacted by biases in data introduced by poor sampling strategies in the past. Early archaeological work in the Central Valley focused primarily on the recovery of artifacts and burials while ignoring dietary remains and technological features (Rosenthal et al. 2007:150). Burials and artifacts alone cannot present an accurate picture of past events.

Continuing work has refined our understanding of the Central Valley's archaeological record (Rosenthal et al. 2007:149; Sutton 2019; Jones and Perry 2012). The Southern part of the Central Valley has fewer

recorded sites than the rest of the Valley north of the King's River which is the traditional historic divide between Northern and Southern Yokut territories (Rosenthal et al. 2007:148). Because of this, data from the rest of the Valley is necessary to have a wholistic understanding of the cultural patterns of the southern section of the valley. The chronology used in this report will be organized using Fredrickson's (1973, 1974) California adaptation of Willey and Phillips' (1958) classification scheme as modified by Rosenthal et al. (2007). This classification scheme will be applied because it is comprehensive enough to provide a chronological framework for the cultural patterns that appear throughout the Valley and, because it incorporates newer radiocarbon dates (Groza 2002; LaJeunesse and Pryor 1996; Meyer and Rosenthal 1997) adjusted with modern calibration curves.

6.2 Prehistory

6.2.1 Paleo-Indian (11,550 to 8550 cal B.C.)

During the terminal Pleistocene, western California's climate was more seasonal than today, with cooler temperatures, greater effective precipitation, and a longer rainy season (West 2000:19-20). At the onset of the Holocene, temperatures in western California increased as precipitation decreased gradually (Adam and West 1983; West 2000). By 10,100 CYBP, Tulare Lake was stable and shallow reaching depths ranging from 64m to 58m (Sutton 2019:289-290). The earliest accepted evidence of human occupation of the Central Valley are basally thinned and fluted projectile points (Rosenthal et al. 2007:151). These points are dated in other parts of North America to at least 12,900 CYBP (Sutton 2019:276). In the SJV, these points have only been found in Tracy Lake, the Woolfsen mound (CA-MER-215), and the Tulare Lake Basin (Heizer 1938; Moratto 1984; Peak and Weber 1978; Rosenthal et al. 2007:151). It is assumed that these first peoples were generally nomadic with their subsistence being based on large game hunting and fishing. There is no direct evidence from western California that these early people hunted Pleistocene megafauna, but it is highly likely (Erlandson et al. 2007; Jones and Perry 2012; Rosenthal and Meyer 2004; Sutton 2019). Stemmed points are also found in association with fluted points. It is currently theorized that stemmed points may be coeval with Clovis fluted technologies or older (Erlandson 2012:28-30; Sutton 2019).

6.2.2 Lower Archaic (8550 to 5550 cal B.C.)

In the Central Valley, the Lower Archaic is mostly represented by isolated finds (Rosenthal et al. 2007:151). These finds include stemmed points, chipped stone crescents, flaked stone artifacts, and concave base points (Fenega 1992; Wallace 1991). The only Central Valley archaeological site definitively dated to the Lower Archaic was found on the past shoreline of Buena Vista Lake (KER-116). Radiocarbon dates from freshwater mussels at KER-116 ranged from 7175 and 6450 cal. B.C. (Fredrickson and Grossman: 1977; Hartzell 1992). Lithics recovered at KER-116 include three chipped stone crescents, a stemmed projectile point fragment, a carved stone atlatl spur, and a few small-flaked-stone implements (Rosenthal et al. 2007:151). A faunal assemblage recovered from KER-116 shows that freshwater fish and mussels, waterfowl, and artiodactyls were consumed (Hartzell 1992). While milling tools are largely absent from Valley floor assemblages, including KER-116, Lower Archaic sites in the

adjoining Sierra Nevada and Coast Range foothills contain abundant milling equipment and other indications of reliance on plant foods (Meyer and Rosenthal 1997; Rosenthal et al. 2007:152). How Valley and Foothill adaptations during the Lower Archaic relate to each other is unclear (Rosenthal et al. 2007:152). The establishment of cultural interaction spheres is also seen in Lower Archaic Valley deposits. A variety of stemmed points styles are found in Lower Archaic deposits of Tulare basin that resemble styles from throughout California and from the Great Basin. Marine shell beads from California are also found in archaeological deposits in the Great Basin that are coeval to the Lower Archaic. Obsidian from the Eastern Sierra mountains is found in Lower Archaic Great Basin deposits. (Rosenthal et al. 2007:152).

6.2.3 Middle Archaic (5550 to 550 cal B.C.)

During the Middle Archaic, California's climate became warmer and dryer causing the decline and desiccation of Tulare Lake and the decline of other western lakes as well (Benson et al. 2002; Davis 1999; White et al. 2002). Sea levels also began to rise at this time causing the Central Valley to become a wetland environment (Atwater and Belknap 1980; Goman and Wells 2000). The archaeological record shows more diversified subsistence-settlement patterns during this time. Some sites show evidence of an increasing emphasis on seed processing while others show placement of emphasis on hunting, fowling, and fishing (Rosenthal et al. 2007:153). Artifacts from this period include Haliotis shell ornaments in varied geometric shapes, Olivella and Haliotis beads, distinctive spindle-shaped charmstones, cobble mortars, chisel-ended pestles, heavy projectile points, and mortars and pestles. A tradition of extended westerly oriented burials known as the Windmiller Pattern appears throughout the SJV (Fredrickson 1973, 1974; Moratto 1984). Bones were extensively utilized for tools, such as for awls, fish spear tips, saws, and pressure flakers which were used in the manufacture of flaked-stone implements such as projectile points. Sites also show increasing residential stability along river corridors of the Sacramento and San Joaquin Valleys (Rosenthal et al. 2007:153)

6.2.4 Upper Archaic (550 cal B.C. to cal A.D. 1100)

In the Upper Archaic, there was an abrupt turn to cooler, wetter, and more stable climate and the refilling of lakes that had desiccated in the middle Holocene (Rosenthal et al. 2007:155). The archaeological record for the Upper Archaic is better preserved and understood compared to preceding periods. There is evidence for the existence of different cultural groups in the Central Valley at this time. Large mounded villages associated with Berkley pattern assemblages appear in the lower Sacramento Valley (Rosenthal et al. 2007:156). Berkley pattern village sites have extensive debris and features that reflect long-term residential occupation (Bouey 1995:348-349). The Windmiller cultural pattern is still seen in archaeological assemblages from this time (Bennyhoff 1994b,c). Little is known about the cultures that occupied the Southern SJV during the Upper Archaic (Siefkin 1999:56-57). Southern SJV Upper Archaic village sites that have been excavated also show signs of long-term occupation and exploitation of aquatic and terrestrial environments for food (Hartzell 1992: 304-305). New types of bone tools and other implements made of bone such as wands, tubes, and ornaments appear in the archaeological record. Groups throughout the valley varied in what they harvested. Foods that were consumed by different

groups included acorns, salmon, shellfish, rabbits and deer. In the SJV, People were still using obsidian sourced from the east side of the Sierra Nevada and, some southern SJV sites used obsidian from the North Coast Ranges (Rosenthal et al. 2007:157).

6.2.5 Emergent Occupation (cal A.D. 1100 to Historic)

The Climate in the Central Valley at this time was relatively unchanged from that of the Late Holocene, but flooding and drought events did occur. The archaeological record of the Emergent Occupation is the most substantial and comprehensive compared to earlier periods and shows the most diversity (Bennyhoff 1977). After 1,000 A.D., many archaic traditions and tools disappeared throughout the central valley and new cultural traditions similar to those seen by European-Americans at contact emerge (Rosenthal et al. 2007:157). Between about A.D. 1000 and 1300, the bow and arrow is introduced to the Central Valley and replaces the atlatl (Bennyhoff 1994a). Villages are structured around rivers, tributaries, and deltas (Rosenthal et al. 2007:158). Two broad phases occur at this time: the Lower and Upper Emergent.

Artifacts associated with the Lower Emergent phase include banjo-type *Haliotis* (abalone) ornaments, bird bone whistles, soapstone pipes, and rectangular *Olivella* sequin beads (Rosenthal et al.2007:158). During the Lower Emergent, the Stockton serrated point is developed in the delta area (Dougherty 1990). Panoche side-notched points and cottonwood points are found in Lower Emergent Occupation deposits in SJV (Hartzell 1992:173; Moratto 2002; Olsen and Payen 1983; Pritchard 1970; Siefken 1999:152-154) Gunther-barbed points are introduced in the northern Sacramento Valley During the Lower Emergent (Basgall and Hildebrandt 1989:123; Jaffke 1997). Artifacts associated with the Upper Emergent, include corner-notched and desert series arrow points, *Olivella* lipped and clam disk beads and bead drills, magnesite cylinders, hopper mortars, and village sites with pits resembling known ethnographic settlements (Beardsley 1954:77-79; Bennyhoff, in Elsasser 1978:44; Fredrickson 1984; Moratto 1984: 213; Pritchard:1970, 1983). Mammal, fish, and bird bone are found in Upper Emergent period middens from many sites. More mortars and pestles appear throughout the valley after 1,000 A.D. with small seeds, acorn, pine nuts, manzanita becoming more economically important in the northern Central Valley (Miksicek 1999; Wohlgemuth 2004).

6.3 Historic Period

European contact with the Yokuts initiated in 1772, when a detachment of Spanish soldiers under the command of Pedro Fages ventured through the Tejon Pass into the SJV. The only other significant 18th century Spanish contact with the Southern Valley Yokuts was a visit by friar Francisco Garcés in 1776. No significant European contact with the Southern Valley Yokuts occurs again until the beginning of the 19th century when Spaniards more actively entered and proselytized the area. While Spanish colonization and missionization heavily altered the traditional socio-cultural practices of the Yokuts, the Spanish never successfully took over the southern valley. During the time when California was part of Mexico (1822-1846), the most significant Mexican influence was a severe malaria outbreak in 1833 that killed approximately 75 percent of the Native population (Wallace 1978a:459-460). With the annexation of

California by the United States, the discovery of gold in Sutter's Mill, and the incorporation of California as a State by the U.S. Government, the SJV was overrun with settlers who occupied native lands.

At contact, the native populations of the central valley were numerous, and their socio-cultural practices were rich and complex. Archaeological assemblages dating to between cal A.D. 1000 to 1769 such as arrow points, increased variation in burials, pottery, shaped mortars and pestles, changes in arrow point styles, and *Olivella* bead blanks all indicate that people in the area were engaged in a rich and expansive interaction sphere. Many of these objects and associated practices were still largely in use at European contact (Rosenthal et al. 2007:157). It is estimated that 100,000 Native people lived in the central valley between A.D. 1772 and 1821 (Cook 1955, 1976, 1978; Moratto 1984:171).

The Spanish presence in the region played a part in the dispersal of native populations from the foothills and depopulation of entire villages (Cook 1955:55-56). The indigenous population in the region was severely reduced by European diseases introduced by the Spanish. The precipitous decline of Indigenous population and disruption of traditional lifeways by the Spanish Mission system left the surviving Natives despondent and unresistant making the process of dispossession by Euro-Americans relatively easy as the settlers, sometimes forcibly, removed Indian families and communities (Wallace 1978b:469). The few surviving Southern Valley Yokuts were sent to the Tejon reservation established at the base of the Tehachapi Mountains, or to the Fresno reservation near Madera. These reservations failed to prosper, and in 1859, the Native Americans who remained on them were moved to the Tule River reservation.

Historic period effects on the landscape began with ranching and mineral extraction during the mid-1850s; gold mining was an important local enterprise as well as stock-raising and farming and to a lesser extent. By 1850, approximately 300,000 people immigrated to California from around the world in search of gold. People that moved into the SJV paid little mind to the oil seeps they saw along the Old Road when they entered the valley until the early 1860's. The first oil refinery was erected in Titusville, Pennsylvania in 1861 after it was discovered that bitumen from the seeps could be refined into kerosene.

By 1865, oil was exploited throughout Southern California. One of the most significant oil discoveries in California occurred in Kern County in the lower SJV. The Kern County oil fields cover a large swath of land beginning at the base of the Tehachapi Mountains and running north through the lower SJV toward the community of Taft (Caltrans 2013). The resulting oil discoveries in Kern County drew thousands of skilled and unskilled workers into the southern SJV and almost immediately created boomtowns, such as McKittrick, Taft, Arbuckle, Fellows, and Reward (Caltrans 2013). The railroad lines that traveled from the SJV oil fields to various refineries in the state were essential in the growth and success of the oil fields. From 1903 to 1906, California became the top oil producing state. Oil discoveries in the kern region ended with WWII but the area remains a major source of oil to the present day.

6.3.1 Belridge Oil Field

Belridge oil field is 13 miles long by three miles wide. The property is sectioned into North, Middle, and South Belridge for land holding reasons. It overlies three large petroleum reservoirs: the Tulare pool, the Diatomite pool, and the Sub-Monterey pool. The field lies above the crest of a large, elongated anticline. Continuous vertical oil columns ranging up to 1,300 ft are trapped along the crest of the anticline (Allan et

al. 2010). Natural faults created by extension of the growing anticline and movement of the San Andreas fault allow hydrocarbons to leak from source beds to overlying soils (Allan et al. 2010:5).

The Tulare pool is twelve miles long by three miles wide and covers 10,500 acres. The Tulare pool is relatively shallow running 400 to 1,000 ft beneath the overlying alluvium deposited over the last circa 12,000 years. The Tulare pool is used as a source of heavy (11-15° API) oil. The soils of the Tulare pool are highly porous and permeable. The Tulare reservoir rests directly on top of the Diatomite reservoirs. The Tulare reservoir was the focus of field development and production until technological advances shifted the focus to the deeper Diatomite rocks.

The Diatomite pool is fifteen miles long by three-quarters of a mile wide and covers 8,000 acres. It runs 800 to 2,000 ft in depth. The Diatomite pool is used as a source of light (23-39° API) oil. The reservoir rock of the diatomite pool is composed of the silica left behind by the diatoms that were deposited through time. The Belridge diatomite has a high matrix porosity (50-70%) in its upper levels, is highly compressible (100-300 x 10^{-6} psi^{-1}) and has a very low matrix permeability (0.1-3.0md) (Rahman et al. 2011). Because of the low matrix permeability of the diatomite, the pools were commercially unproductive until 1977 when the hydraulic fracture method could be applied successfully to retrieve the oil.

The Sub-Monterey pools are four miles long by one mile wide. They span from 6-9,400 ft in depth and have a productive size of 1,600 acres. Gas and light oil are extracted from the Sub-Monterey pools. Natural fractures caused by tectonic movement allows the oil trapped in the Sub-Monterey pool to rise to the surface and seep into the other pools. The following section will present a history of Belridge oil field and wells that were dug to access these petroleum deposits from 1911 to the present. This history presented here borrows heavily from Allan and Lallicata's *The Belridge Giant Oil Field - 100 Years of History and a Look to a Bright Future* (2012).

Belridge Oil Field was founded by five families when the Tulare & Diatomite pools were tapped into with the excavation of Well #101 in 1911. Well #101, located in South Belridge, allowed Belridge Oil Co. to begin producing heavy oil. The Tulare and Diatomite pools were accessed again in 1912 in North Belridge. During the 1920's, approximately 100 wells were drilled in South Belridge and thirty wells in North Belridge. By the late-1920s, steel derricks and diesel engines replaced wooden derricks powered by steam because of the increased safety, efficiency, and ability to handle longer casing strings (Allan and Lalicata 2012).

In the 1930's, the Sub-Monterey pools were discovered and developed in North Belridge and production was further expanded with the addition of 170 more wells. The deeper Temblor Sand sub-Monterey reservoirs were discovered at 6,000 to 8,000 ft (1800-2450 m) in North Belridge and became important petroleum resources for World War II. In 1932, the Discovery well for 64 Zone, well 64-27N, was drilled into the sub-Monterey formations. In June 1934, General Petroleum drilled Berry 1-30 to TD at 11,377 ft (3468 m), the deepest well in world at the time. The well utilized mud log and driller's log only because electric logs were not in use in California at the time.

From 1930-1948 a total of 148 wells (8 dry holes) were drilled in the sub-Monterey pools. From 1936-1984, 540 billion cubic feet of gas (BCFG) were injected for gas storage and pressure maintenance. the

sub-Monterey pools reached peak production of 135 MMCFG/day and 13,950 barrels of oil (BO)/day in 1938 (Allan and Lalicata 2012). The discovery well for Y Sand; well 47-27N, was excavated into the sub-Monterey formations in 1941. During the 1950's an unknown number of wells were drilled. From 1956-59, the In-situ combustion pilot method is employed by in Belridge field. In 1963, the use of Cyclic steaming begins. The In-situ combustion project was carried out by Mobil from 1963-1968. 1966 was the discovery year for Carneros Sand sub-Monterey formations.

The first successful hydraulicly fractured well was drilled into the Belridge Diatomite in 1977 making these deposits lucrative. In 1979, the shareholders of Belridge Oil Co. approved the merger of their company with Shell Oil Co. In 1986, the use of water injection began to mitigate subsidence (sinking of soils due to the subterranean voids created by oil extraction). In the same year, production peaked at 172,700 BO/day and 114.4 million cubic feet of gas (MMCFG)/day. From 1987-2007, the Aquifer Lift project was carried out and completed on east flank to reduce aquifer inflow.

The first horizontal wells were drilled in South Belridge in 1993; forty-six wells were drilled by Shell and twenty were drilled by Mobil. The nature of the deposits created too many complications to be profitable so attention was switched to the diatomite reserves. In 1995, four horizontal wells were drilled into the diatomite pools and completed by Shell. In 1996, Mobil drilled a horizontal well in the southeast nose of the field. Aera Energy LLC was formed in 1997 from Shell and Mobil assets. At this time, the horizontal well drilling started by Mobil was expanded upon the formation of Aera Energy LLC. The first four wells were technically successful but economic failures. In 2001, the Program for recompletions and add-pays began. In 2002, Production peaks at 76,100 BO/day, 52.9 MMCFG/day. By 2011, the field had 46 active wells. In September of 2022, ExxonMobil and Shell sold Aera Energy to IKAV (Jacobs 2022).

6.4 Current Land Use

The APE is within existing developed oil and gas fields in the North and South Belridge oil fields, in an unincorporated area of western Kern County. The North and South Belridge oil fields are active and have been operating to some extent since 1911. Surface ownership of the land is privately held by Aera Energy. Much of the land is highly developed by Aera Energy's oil extraction efforts and continues to be developed further. The cumulative development includes the drilling of new wells, the construction of derricks, pumpjacks, steam boilers and injection systems, systems to support these, including the Belridge Water Softening Plant, and constructing basic amenities and offices (such as the Oasis office) for the operation of these infrastructures. This is largely in support of the Aera Energy wells on the 64 Zone lease (Formerly Shell's Oceanic lease), the Belridge I-III leases, and the Diatomite Thermal Recovery lease, the latter especially containing many Enhanced Oil Recovery wells and injection platforms. Furthermore, there is a planned recycling facility with construction underway within the APE.

The surrounding land use of the APE consists of densely developed privately owned oil and gas fields, primarily those owned by Chevron, Aera Energy, and multiple smaller oil companies such as E & B Natural Resources Management Co and Belridge Energy Resources, Inc. who share in the use of the land to operate wells on leases such as the Hopkins lease, the Weber lease, and the Mission lease.

Multiple corporations, such as RHC and Wesco Distribution, use the land to store and assemble derrick parts, oil tankers, construction equipment, and modular offices.

Land uses not directly related to the oil extraction within the APE include maintenance of the power transmission lines on Pole Line Road by Pacific Gas and Electric Company, and the conservation and development of water resources for the region by the Belridge Water Storage District, as well as the maintenance of public roads such as Highway 33, by Caltrans. Outside the APE the land is developed largely for grazing cattle and agriculture, although the land is also home to the (currently abandoned) Belridge Elementary School in the former town of Belridge.

7 METHODOLOGY

The cultural resource study completed for the Project consisted of a records search conducted by the Southern San Joaquin Valley Information Center (SSJVIC) of the California Historical Resources Information System (CHRIS) at CSUB, an intensive pedestrian survey of the entire approximately 1,167-acre APE, as well as a Sacred Lands File Search (SLFS) with the Native American Heritage Commission (NAHC) in West Sacramento. The methodology used during the current study is provided below.

7.1 Records Search

On April 4 and August 15, 2022, CHRIS archival records searches were conducted by the SSJVIC on behalf of Stantec. The search entailed a review of all previously documented prehistoric and historic-period cultural resources, including archaeological sites, features, and isolated finds located within the Study Area (Figure 4 - Confidential), as well as a review of all known cultural resource survey reports, excavation reports, and regional overviews. The purpose of the records search was to determine the number of cultural resource studies and known archaeological resources in the APE, and the 1-mile radius Study Area. Additionally, as part of the records search the following sources were reviewed:

- Google Earth imagery;
- Historical Aerial imagery; and,
- USGS topographic quadrangle maps:
    - Lost Hills, CA (1914; 1914 ed., 1928 ed., 1938 ed., 1947 ed.) 1:125,000;
    - Belridge, CA (1943; 1953; 1957 ed.) 1:31,680;
    - Blackwell, Ca (1943) 1:31,680;
    - Bakersfield (1948) 1:250,000;
    - Carneros Rocks, Ca (1959; 1961 ed.) 1:24,000;
    - McKittrick, Ca (1912; 19112 ed., 1920 ed., 1934 ed., 1943 ed.) 1:125,000; and,
    - Simmler, Ca (1943) 1: 62:500.

Literature from the West Kern Oil Museum's library was also reviewed to provide historical context.

The record searches identified nine reports of the APE (Aviña 1999; BioSystems Analysis, Inc. 1989; Brunzell 2011; 2013b; Fredrickson 1985; Palm-Leach et al. 2010; Schiffman and Monday 1982; Snethkamp 1991; Unknown 1987), and 17 reports within the Study Area (Table 1; Figure 3 – Appendix

A). The records searches revealed that no resources are previously recorded in the APE, and three resources have been previously recorded in the Study Area (Table 2).

There have been no previously documented resources within the APE. However, there are three cultural resources documented within the Study Area, as described below (Table 2).

P-15-019637 is a projectile point made from crypto crystalline silicate. The resource was originally recorded in 2015 (Azpitarte 2015). The projectile point features middle stage flaking and displays breakage on both the proximal and distal ends (Azpitarte 2015) and appears to be a Vandenberg Contracting Stem within the larger Coastal Contracting Stem Cluster (Justice 2002: 242).

P-15-02116 consists of the remains of a historic period brick boiler pad/firebox associated with steam energy production and/or the heating of crude oil. The resource was originally recorded in 1985 and was noted as consisting of a few red fired/glazed bricks within fire affected soil and approximately 12 purple bottle glass fragments (Lewy and Uli 1985).

P-15-02117 consists of a large distribution of well fractured red glazed fire bricks and yellow kiln bricks in five separate concentrations, a few purple and blue bottle glass fragments, oxidated soils, and abandoned wells associated with the remains of a large, fired boiler plant and steam operated drilling site. The resource was originally recorded in 1985 (Howard and Uli 1985).

The records search did not identify any cultural resources that are listed or eligible for listing on local, State, or federal registers within the Study Area.

Table 2. Cultural Resources Previously Recorded Within the Study Area

Primary No.	Trinomial	Type	Age	Location	Description
P-15-019637	-	Isolate	Prehistoric	Within Study Area	AP16. Isolate: Crypto Crystalline Silicate Projectile Point
P-15-02116	CA-KER-002116	Site	Historic	Within Study Area	AH02. Foundations/structure pads); AH04. Privies/dumps/ trash scatters
P-15-02117	CA-KER-002117	Site	Historic	Within Study Area	AH02. Foundations/structure pads; AH04.Privies/dumps/ trash scatters

Review of aerial imagery and topographic maps indicate that the APE was predominantly undeveloped land until 1937. By 1942, moderate amounts of petroleum extraction-related development (roads, tanks, and oil derricks) as well as significant development (buildings, residential complex, ponds, and greater concentrations of oil derricks) are visible in surrounding areas. By 1953, the South Belridge Lease Camp expanded to include a school, swimming pool, landing strip, water tanks, and oil tanks. By 1984, the formerly undeveloped land to the northeast of the APE was cultivated for agricultural use and all residential buildings appear to have been demolished. Development and expansion are seen to have largely continued through 1979. No significant changes in the configuration of the APE and surrounding land are evident following 1979, however, pipelines tracing the proposed path of the CCS alignment are visible in photography from 2005.

7.2 Native American Notification/Sacred Lands File Search

On August 19, 2022, Stantec, on behalf of Aera, contacted the NAHC and requested a SLFS for the Study Area. The NAHC acknowledged via email to have received the request on August 23, 2022, and indicated a response is pending.

7.3 Field Methods

A pedestrian survey of the entire approximately 1,167-acre APE (including a 150-foot buffer on either side of the alignment) was conducted. Given the history of the area, Stantec archaeologists anticipated points of historical interest, such as wells, irrigation canal ditches, retaining ponds, old roadways, refuse scatters, historic oil wells and drills (derricks), isolated historic artifacts such as bottles and bricks, and lithic scatters and various isolated artifacts. Stantec archaeologists Mitch Evans, Jeremiah Camp, Joseph Cusack, Fiadh Kelly, Santos Ceniceros-Rodríguez, Santos, and Saeed Sawaed completed the survey. The initial survey was completed in 2022, on May 2 through 5, May 9 through 12, October 3 through 6, and October 25 through 28, 2022. Additional field surveys were completed during February 13-24 and May 5 and 19, 2023.

The survey was conducted by walking parallel transects along the proposed Project corridor, spaced approximately 15 to 20 meters apart. Stantec examined surface and subsurface exposures such as rodent burrows and cut banks for physical manifestations of prehistoric and historic cultural constituents. Surface visibility was good to excellent throughout the APE. Documentation included field notes, photographs, and sub-meter GPS data collection. The crew followed guidelines and standards specific to survey and recordation within oil fields (BLM, 2016). Cultural resources were recorded on DPR 523 forms (Appendix B – confidential). Two regions in the southeastern extent of the APE measuring 2.8km^2 and 2.7km^2 were surveyed via vehicle due to site-specific conditions (high density of oil pumpjacks/derricks in active operation, restricted access to the DTR area, and powered equipment in active operation).

The extent of the survey coverage was recorded with Environmental Systems Research Institute (ESRI) Field Maps for ArcGIS and an *Arrow Lite* GPS receiver with submeter horizontal accuracy utilizing Universal Transverse Mercator (UTM), North American Datum of 1983 (NAD 83), Zone 11, meters, as the spatial reference. Photographs were taken with Apple iPhones and/or iPads to document resources and the environment within the APE and surrounding areas. The extent of the survey coverage is shown on the Belridge, Blackwells Corner, Lost Hills, and Carneros Rocks 7.5-minute USGS topographic quadrangles (see Figure 2).

8 SURVEY RESULTS

Ground visibility in the APE during survey was good and ranged from 80 to 95 percent. In total, the survey team observed 107 cultural resources within the APE (Appendix B). One hundred-one (101) of the resources are historic period, 80 sites and 21 isolate historic resources. Three of the 107 inventoried resources are prehistoric. One prehistoric site consists of a shell midden, a stone sphere, and chipped stone tools (282103-BN-1A). One multi-component site (272028-BC-1A) was also identified. This site has

several prehistoric sandstone discoidal artifacts consistent with Milling Stone Horizon sites dating to 9000BP (Sutton 1978), and the historic component consists of an assemblage of metal pipelines, valves, various concrete debris, and fencing with braided cord associated with oil well #2-28, as well as anchor hooks and concrete footings used for hoisting and securing a tower derrick. Seventeen resources are historic wells or sites containing historic wells on multiple historic leases (Belridge, Mannel Minor, J.D. Martin (Texaco), & Shell Oceanic). The wells' years of drilling range from 1907 to 1965 (Table 3).

Table 3. Historic Wells Located Within Study Area

Field ID	Type	Location	Description	Township, Range	Section
272026-BC-2A	Site	In survey area	AH10 (Machinery), AH2 (Foundations). Well cellar and wellhead. Well #15. Drilled 1917.	T27S, R20E	26
272027-BC-24A	Site	In survey area	AH4 (Trash/debris scatter). Bricks and amethyst glass. Plugged historic well #21. On 1931 lease but drilled 1942.	T27S, R20E	27
272027-BC-25A	Site	In survey area	AH4 (Trash/debris scatter). Bricks and debris. Plugged well #19. Drilled 1918.	T27S, R20E	27
272027-BC-26A	Site	In survey area	AH2 (Foundations), AH10 (Machinery). Well pad/foundation and wellhead. Well #16. On 1931 lease but drilled 1941.	T27S, R20E	27
272021-BC-1A	Site	In survey area	AH2 (Foundations), AH4 (Debris Scatter). Various wooden structures and oilfield debris. Well #2	T27S, R20E	21
272021-BC-2A	Site	In survey area	Well #22	T27S, R20E	21

9 NRHP/CRHR ELIGIBILITY RECOMMENDATIONS

Preliminary NRHP/CRHR eligibility recommendations for cultural resources identified in the APE are included in this section. Of the 107 cultural resources identified, three sites are historically significant discovery wells, of which two meet the criteria (Criterion A/1) for listing on the NRHP/CRHP due to the significance of the discovery of oil for the region and the greater implications for the California and United States. These discovery oil wells sparked the development and expansion of wells within the pool basin areas (Allan 2012). The prehistoric component of resources 282103-BN-1A and 272028-BC-1A contain evidence for considerable antiquity and have the potential to yield information important in prehistory of the region and the greater California. The cultural constituents at these two prehistoric sites have the potential to yield information on chronology, technology, exchange, and subsistence and settlement patterns within the San Joaquin Valley region, and therefore, these sites are recommended eligible under Criterion D/4. The 102 remaining resources were inventoried, evaluated, based on recommendations provided by the BLM but do not appear NRHP/CRHR eligible. These historic oil industry resources were inventoried as individual resources, although additional study may indicate these resources are contributing elements to a larger historic district.

Five (5) of the cultural resources identified in the APE appear to be eligible for listing in the NRHP/CRHR and are listed below (Table 4).

Table 4. Eligibility Recommendations

Period	ID#	T/S/R	Section	Lat/Long	UTM	NRHP/CRHR Eligibility Justification
Historic – Oil well and potential associated structure (demolished)	272021-BC-1A	T27S, R20E	21	35.559275, -119.816603	244707.79 mE / 3938718.30 mN	Criterion A/1. Site represents oil extraction infrastructure for the 1930s. Well #2 of the Tidewater Associated Oil Company, associated with the expansion of oil extraction in response to adjacent discovery well (272022-BC-1A).
Historic – Oil well and encampment	272022-BC-1A	T27S, R20E	22	35.559641, -119.813536	244987 mE/ 3938751 mN	Criterion A, D/1, 4. Belridge-A #1 discovery well, oil workers camp debris
Historic – A domestic water line and a	272027-BC-2A	T27S, R20E	27	35.544500, -119.798917	246264.64 mE / 3937033.28 mN	Criterion A/1. Historic site discovery well. It's well #64-27, 1800s land grant, 1930s well operation.

Period	ID#	T/S/R	Section	Lat/Long	UTM	NRHP/CRHR Eligibility Justification
discovery well						
Multi-component – Historic well and prehistoric groundstone and lithic scatter	272028-BC-1A	T27S, R20E	28	35.556522, -119.817214	244643.66 mE / 3938414.44 mN	Criterion D/4. The site contains unique constituents consistent with Milling Stone Horizon. The site has the potential to yield information important in prehistory. Additional investigation at the site would be needed to confirm the presence of potential Milling Stone horizon components.
Prehistoric – Lithic scatter and shell midden scatter	282103-BN-1A	T29S, R21E	3	35.439419, -119.703656	254583.00 mE / 3925133.67 mN	Criterion D/4. The resource artifacts are consistent with rare and presumed temporally and geographically diagnostic artifacts in Southern California. Additional testing and analysis needed to confirm recommendation.

10 MANAGEMENT RECOMMENDATIONS

10.1 Introduction

As part of the current cultural resource inventory, 1,167 acres of land within the Belridge oil fields (North and South) were inventoried to determine whether significant cultural resources would be affected by the proposed Project (see Figure 2). A total of 107 cultural resources were identified during the survey. Stantec is of the opinion that 5 of the 107 cultural resources in the APE may be eligible for inclusion in the NRHP/CRHR (see Table 3, Table 4, and Appendix B). None of the other resources identified within the APE are recommended eligible for listing in the NRHP/CRHR. Portions of the APE have a moderate sensitivity for intact subsurface cultural resources, and human remains may be unearthed when working in proximity of prehistoric resources.

If historic properties in the APE cannot be avoided by the Project, it is recommended that a Historic Property Treatment Plan (HPTP) be developed and implemented for the Project. A Memorandum of Agreement should be prepared to implement the HPTP, with, at a minimum, the Environmental Protection Agency and the State Historic Preservation Officer as signatory parties, and Kern County as a concurring

party (see 36 CFR §800.16). The HPTP, at a minimum, should address: 1) NRHP eligible resources, 2) cultural resource monitoring, 3) exclusionary fencing to protect historic properties, 4) accidental discovery procedures, 5) the treatment of human remains, and 6) Native American involvement.

Recommendations for the treatment of cultural resources and human remains are presented below.

10.2 NRHP/CRHR Eligible Resources

The Project may result in physical disturbance of historic properties. If these resources cannot be avoided by the proposed Project, the lead agency will consult the State Historic Preservation Officer at the California Office of Historic Preservation to address the adverse effects of the proposed Project. The results of this consultation may result in the need for further study.

272021-BC-1A

Site Description

272021-BC-1A is a historic oil extraction and distribution infrastructure site from Aera Well #2 date to the 1930's. The site consists of four features: a series of abandoned, partially buried pipelines of unknown length (Feature 1), an idle oil well (Feature 2), two wrecked wooden structures (Features 3 & 4) and plugged Aera Well #2 with well pad (Feature 5). The site contains one artifact, a historic tin can with church-key opening (Artifact 1). The site is associated with oil production in the Belridge fields certainly as far back as the 1950s according to aerial photography, the use of wooden structures on the site suggests a possible older date for the site; remaining constituents, however, date to the 1950s.

NRHP/CRHR Eligibility Evaluation

It is Stantec's opinion that 272021-BC-1A is eligible for listing in the NRHP under Criterion A and listing in the CRHR under Criterion 1 as the site is associated with events that have made a significant contribution to the broad patterns of local or regional history of California and the United States. As discussed above, the discovery of the Sub-Monterey Pools in the 1930's established new zones of oil extraction in North Belridge, wells expanded within the production limits of the Sub-Monterey Pool and became important petroleum resources for WWII (Allan 2012). Feature 1 is Well #2 of the Tidewater Associated Oil Company, associated with the expansion of oil extraction in response to adjacent discovery well (272022-BC-1A) for the Sub-Monterey Pool production zone 64.

The cultural materials at 272021-BC-1A can be analyzed to address such historic archaeology research domains as oil worker camp activities, chronology, technology, and distribution of oil extraction, distribution, and refinery machinery and equipment. Site chronology has been addressed in this text, although diagnostic remains can tighten the period of utilization at the site. The period of significance for 272021-BC-1A has been established from the 1930's-1950's. The clear impact oil development has had on the surrounding area and economy underscores the importance of 272021-BC-1A to the region and the history of oil exploration in California.

Integrity

272021-BC-1A appears to possess substantial integrity by satisfying multiple aspects or qualities of this historic resource. The site moderately retains its integrity of location as the oil well derrick superstructure has been demolished and well capped, the subsurface components of the well are present and exist in the same location as when first drilled. In addition, a second idle well is present within the site maintaining land use patterns within the site location. None of these changes and during the production life of an oil well has adversely affected the site's overall setting and feeling. The superstructure of the well has been demolished potentially affecting the assessment of design and materials, although during the historic use of the well it was and maintains to be routine procedure to maintain and upgrade producing wells and cap underperforming, unprofitable wells, therefore, design and remains consistent with the region. The historic constituent features combined and deposited that remain are intact and have maintained configuration from the historic use of the area. The overall environment and feel have remained consistent with development being consistent with the historic land use of oil extraction and distribution. The site possesses integrity of association, the existing well is a discovery well for the sub-Monterey formations, a catalyst for further expansion of oil extraction infrastructure from the 1930's and 1950's.

272022-BC-1A

Site Description

The site consists of a cement foundation (Feature 1), a red brick stain (Feature 2), cement and brick rubble debris concentration (Feature 4), historic refuse scatter (feature 5), sump (Feature 6), and water storage reservoir (Feature 7), an indirect heating boiler (Feature 8), and multiple pipelines (Features 9, 10, & 11). Two wells occupy the site, a discovery well labeled as Belridge-A #1 to the north and one well to the south. The site exhibits evidence of substantial diagnostic surface artifacts as well as evidence for subsurface features. The oil well was abandoned in the 1930s and has been exploited under multiple leases since then.

NRHP/CRHR Eligibility Evaluation

It is Stantec's opinion that 272022-BC-1A. is eligible for listing in the NRHP under Criterion A and listing in the CRHR under Criterion 1 as the site is associated with events that have made a significant contribution to the broad patterns of local or regional history of California and the United States. The site is recommended eligible under Criterion D and 4 as the site may be likely to yield information important to history. Belridge-A#1, on the Richfield Oil Co of California lease (1944), has been identified as a discovery well for the Sub-Monterey Formation reservoirs. Stantec's intensive survey identified surface and subsurface constituents consisting of historic structure foundations and a historic debris field containing diagnostic constituents.

The cultural materials at 272022-BC-1A can be analyzed to address such historic archaeology research domains as oil worker camp lifestyle, chronology, technology, and distribution of oil extraction, distribution, and refinery machinery and equipment. Site chronology has been addressed in this text via various records and maps, although diagnostic artifacts can calibrate the period of utilization at the site.

The clear impact oil development has had on the surrounding area and economy underscores the importance of 272021-BC-1A to the region and the history of oil exploration in California.

Integrity

272022-BC-1A appears to possess good overall integrity, despite disturbances that include the obvious disassembling of the oil derrick and demolition of associated structure(s). Undisturbed portions of the site, including the areas of demolition debris and refuse deposition, can provide direct chronostratigraphic data necessary to identify periods of occupation and associated assemblages. The site retains integrity of location as the refuse deposit feature does not appear to have been altered, the materials of the demolished structure are present in the location of deposition. The site's overall setting and feel has not been compromised and is likely consistent with the time of occupation, although expanded. Overall, these features retain integrity of workmanship. Integrity of design and materials is minimal to moderate as the oil well derrick has been removed and possible oil workers camp/structure have been demolished.

272027-BC-2A

Site Description

272027-BC-2A is a historic discovery well (64-27N) site. The well drilled in 1932 and the discovery well for 64 Zone in sub-Monterey formation. Between 1936-1984 540 BCFG injected for gas storage and pressure maintenance. In 1938 the well performance peaked with production of the well reaching 135 MMCFG/day and 13,950 BO/day. The site consists of a concrete well foundation and oil derrick labelled "64-27". The well is specifically a prospect well whose details were made confidential during its peak production and drilling periods and has continued producing significant amounts of oil; the site therefore is one of the few remaining of its kind representing significant events in the history of oil exploration in California.

NRHP/CRHR Eligibility Evaluation

It is Stantec's recommendation that 272027-BC-2A. is eligible for listing in the NRHP under Criterion A and listing in the CRHR under Criterion 1. Stantec's intensive survey of the site identified surface and subsurface (well and foundations) cultural constituents consisting of historic oil extraction and distribution infrastructure. The cultural materials identified at 272027-BC-2A have been identified by *BLM Oil Fields Site Documentation, Survey Standards and Reporting Bakersfield Field Office* to warrant inventory. Aera has identified the discovery wells and associated oil pool zones as significant markers in the property's historic utilization and expansion (Allan 2012). Stantec does not anticipate this eligibility will preclude the use of the well for injection.

Integrity

272027-BC-2A appears to possess substantial integrity by satisfying multiple aspects or qualities of this historic resource. The site clearly retains its integrity of location as the oil well derrick superstructure remains, although portions have been retrofitted to updated components, the subsurface components of the well are present and exist in the same location as when first drilled. Minor domestic development in

the form of a water line has occurred, although this may lend to the utilization of the area by oil workers while working the well; none of this has adversely affected the site's overall setting and feeling. The superstructure of the well has been retrofitted potentially affecting the assessment of design and materials, although during the historic use of the well it was and maintains to be routine procedure to maintain and upgrade producing wells, therefore design and remains consistent with the region. The historic constituent features combined and deposited that remain are intact and have maintained configuration from the historic use of the area. The overall environment and feel have remained consistent with development being consistent with the historic land use of oil extraction and distribution. The site possesses integrity of association, the existing well is a discovery well for the sub-Monterey formations, a catalyst for further expansion of oil extraction infrastructure through the 1930's.

272028-BC-1A

Site Description

272028-BC-1A is a multi-component site surrounding Aera Energy Well #2-28, which is an idle well. The site is approximately 423 ft north-to-south and 335 ft east-to-west. The site consists of ten features and fourteen artifacts. The prehistoric artifacts include sandstone disks, some lithic flakes, a hammer stone, and ochre that has been worked. Prehistoric features include a sparse ochre scatter (Feature 11) and a scatter of a complete stone disk and multiple stone disk fragments (Feature 10) exhibiting various production methodologies and sizes. These artifacts may be affiliated with the Milling Stone Horizon, which dates to 9000BP (Sutton 1978) and has been identified in numerous instances in coastal southern California, potentially lending further evidence for the Middle Holocene Western Nexus. The historic-period component of this resource includes glass and metal parts, while historic features include a debris pile (Feature 1), a steel pipe fence post connected by braided cord (Feature 4), concrete footings (Features 2 & 3), anchor hooks (Features 5 & 6), and pipelines (Features 7 & 8), a valve (Feature 9).

NRHP/CRHR Eligibility Evaluation

It is Stantec's opinion that 272028-BC-1A. is eligible for listing in the NRHP under Criterion D and listing in the CRHR under Criterion 4 as the site may be likely to yield information important in prehistory. Stantec's intensive survey identified surface cultural constituents consisting of groundstone, chipped stone flakes, and historic oil extraction and distribution infrastructure. The cultural materials identified as 272028-BC-1A can be analyzed to address such basic prehistoric archaeology research domains as chronology, technology, and exchange, and subsistence and settlement patterns within the San Joaquin Valley, southern California. Site chronology can be addressed through radiocarbon dating of the marine shell present at the site. Lithic technology can be addressed through analysis of lithic reduction, use wear, and material sourcing. Chemical sourcing (X-Ray fluorescence) can be used to analyze trade patterns of toolstone. The site contains constituents consistent with Milling Stone Horizon. Analysis of archaeological assemblages may add to the greater dataset for this period. Comparative analysis with other discoidal artifacts throughout southern California may provide insight into the purpose of this rare artifact type. Additional investigation at the site would be needed to confirm the presence of potential Milling Stone horizon components.

Integrity

272028-BC-1A appears to possess good overall integrity from both the prehistoric and historic components, despite minor surface disturbances in the form of surface grading. The surface grading likely exposed the numerous prehistoric stone discoidal fragments scatter throughout portions of the site. Spoils piles are still present on site possibly containing cultural constituents. Other disturbances to the prehistoric component are due to the establishment of the historic oil well, associated oil distribution infrastructure, and construction of the dirt access roads. The well structure is no longer present and the well abandoned, although a majority of the historic constituents, piping, foundations, rigging, are present and undisturbed. Portions of the disturbed area north of the well foundation has exposed several chipped stone flakes of varying material types. Based on the moderate impacts to the prehistoric component and minimal impacts to the historic component, the site has good integrity. Overall, with the exception of the oil derrick superstructure, these constituents retain integrity of materials, design, setting, feeling, and workmanship.

282103-BN-1A

Site Description

282103-BN-1A is a prehistoric lithic, groundstone and shell midden deposit containing one feature and five artifacts. Artifact 1 is a sandstone sphere measuring 6.53 cm in diameter. Artifact 2 is a piece of Pismo clam shell, Artifact 3 is a sandstone chopping tool, Artifact 4 is a rhyolite flake, and Artifact 5 is a CCS flake. *Mitylus* sp. was also observed. Feature 1 is a large combined sparse shell midden and sparse lithic scatter. Collection of Artifact 1 is recommended by the recorders of this resource due to proximity to operating facilities.

NRHP/CRHR Eligibility Evaluation:

It is Stantec's recommendation that 282103-BN-1A is eligible for listing in the NRHP under Criterion D and listing in the CRHR under Criterion 4 as the site may be likely to yield information important in prehistory. Stantec's intensive survey identified surface cultural constituents consisting of groundstone, chipped stone flakes, and marine shell. The cultural materials identified as 282103-BN-1A can be analyzed to address such basic prehistoric archaeology research domains as chronology, technology, and exchange, and subsistence and settlement patterns within the San Joaquin Valley, southern California, and the Great Basin. Site chronology can be addressed through radiocarbon dating of the marine shell present at the site. Lithic technology can be addressed through analysis of lithic reduction, use wear, and material sourcing. Chemical sourcing (X-Ray fluorescence) can be used to analyze trade patterns of toolstone. Analysis of archaeological assemblages may clarify the questions concerning the Middle Holocene Western Nexus. The fine-grained sandstone sphere (Artifact 1) is of an artifact type that has been associated with the Middle Holocene Western Nexus, an interaction sphere linking coastal southern California and the northwestern Great Basin some 5,000 years ago (Sutton & Koerper 2009). Further analysis is recommended for the marine shell present at the site.

Integrity

282103-BN-1A appears to possess good overall integrity, despite disturbances that include a surface scrape and spoils berm on the northern extent of the resource. Although disturbed, the surface artifacts and midden would indicate a potential for further subsurface deposits to be intact. The shell constituents can provide chronostratigraphic data necessary to identify periods of occupation and associated assemblages. The Site is bounded on all four sides by paved roads and oil pipeline infrastructure runs through the western extent; however, the site integrity has sustained minor impacts by a relatively inconsequential surface scrape, and the soils remain onsite. Overall, the site appears to retain good integrity.

10.3 Cultural Resource Monitoring

10.3.1 Historical Resources

Twelve historic-period and multi-component period resources were identified within the APE that are eligible for listing in the NRHP/CRHR. Cultural resource monitoring is recommended for Project activities conducted in the vicinity of these resources.

10.3.2 Prehistoric Resources

Newly identified prehistoric archaeological sites 282103-BN-1A and multi-component archaeological site 272028-BC-1A are within the APE. The two resources both exhibit unique artifacts consistent with other lower archaic prehistoric archaeological sites and both may contain a subsurface component. Due to this study's eligibility recommendations for these two prehistoric resources, monitoring is recommended for Project activities conducted in the vicinity of these resources.

10.3.3 Exclusionary Fencing

Exclusionary fencing should be placed at 282103-BN-1A, 272028-BC-1A, and 272022-BC-1A. The fencing should be placed in coordination with a qualified archaeologist. Because 272022-BC and 282103-BN-1A are in proximity to the proposed Project components, it is recommended that these resources be avoided, and the scope of Project activities in these areas be reconsidered.

10.4 Accidental Discoveries

10.4.1 Archaeological Deposits

The methods and techniques used by Stantec are considered sufficient for the identification of cultural resources visible at the ground surface. However, there is always a possibility that buried archaeological deposits could be found during construction and earth disturbing activities. As a result, prior to the initiation of any additional ground-disturbing activities, field personnel should be alerted to the possibility of buried prehistoric or historic cultural deposits.

In the event that field personnel encounter buried cultural materials, work in the immediate vicinity of the find should cease and a qualified archaeologist contacted to evaluate the finds and make recommendations. The archaeologist shall have the authority to stop or divert construction excavation as necessary. All such deposits should be avoided by project activities until the archaeologist has evaluated the situation and provided direction for further procedures. Upon completion of the evaluation, a report should be prepared documenting the methods and results, as well as recommendations. The report should be submitted to the project proponent, EPA, Kern County, and the SSJVIC. If the qualified archaeologist finds that any cultural resources are present meet eligibility requirements for listing on the NRHP/CRHR, plans for the treatment, evaluation, and mitigation of the impacts to the find will need to be developed.

10.4.2 Human Remains

In the event that human remains, or unassociated funerary objects or grave goods are encountered, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the coroner will notify the Native American Heritage Commission (NAHC) within 24 hours of the identification. The NAHC will determine a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site and provide recommendations for the proper treatment of the remains and associated grave goods. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

In addition to the County Coroner, qualified archaeologist(s) shall be contacted immediately to comply with applicable laws and regulations (e.g., the Native American Graves Protection and Repatriation Act as outlined at 43 CFR 10) and Archaeological Resources Protection Act 43 CFR 7).

10.5 Native American Consultation and Monitoring

Native American consultation should be implemented during Project construction. Native American monitoring should occur during ground disturbing activities at known prehistoric resources.

Re: Belridge Carbon Capture and Sequestration Project, Kern County

Dear Mr. Evans:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Cameron.vela@nahc.ca.gov.

Sincerely,

Cameron Vela

1.0 INTRODUCTION

Stantec Consulting Services Inc. (Stantec) has prepared this Desktop Geohazards and Geotechnical Assessment on behalf of Aera Energy LLC (Aera) for the CarbonFrontier Project (Project), located in the South and North Belridge oil fields in western Kern County, California (Project Site). The Project Vicinity Location is shown in Figure 1. The Study Area includes the proposed Project components within the North and South Belridge oil fields.

1.1 PROJECT DESCRIPTION

Aera has submitted an application to the Kern County Planning and Natural Resources Department to request approval of a Zone Change and Conditional Use Permit (CUP) and will obtain any other required approvals for the construction and operation for the proposed Project in the South and North Belridge oil fields.

The proposed Project would capture carbon dioxide (CO_2) from existing produced-gas streams (pre-combustion) and emissions from existing stationary sources (post-combustion) and transport the CO_2 from South Belridge through a pipeline to the North Belridge Oil Field for injection via nine dedicated Underground Injection Control (UIC) Class VI injection wells. It is anticipated that the proposed Project would capture approximately 30 million metric tons of CO_2 throughout its estimated 20-year lifetime[1].

The Project site is primarily contained within the South and North Belridge oil fields, in the Central Valley portion of western Kern County. The South Belridge and North Belridge oil fields are contiguous and cover an area of approximately thirteen miles long and three miles wide. The proposed CO_2 capture facilities are located within the developed portion of the South Belridge Oil Field and include the separation, dehydration, compression, and cooling of CO_2 from both pre-combustion (Pre-C) and produced gas streams from post-combustion (Post-C) flue gas. The proposed CO_2 sequestration field is located within the North Belridge Oil Field, which is predominately developed with oil and gas production.

Gas produced from the Tulare and Diatomite formations via existing oil wells within South and North Belridge would be mixed and conditioned using existing and modified process equipment. Mixing of the Diatomite and Tulare gas streams would start at the Del Sur Field Compressors. Using the existing (modified) compressors, the mixed stream would be transported, via an existing gas pipeline to a pre-combustion CO_2 capture facility to be located near Gas Plant 32. The carbon capture facility will include three steel towers of varying height (not exceeding 120 feet), and between 2 to 12 feet in diameter. The gas stream would first be treated to remove sulfur at existing sulferox (SOX) plants. The de-sulfurized stream would then be cooled to reduce water content and condense heavy hydrocarbons. Then, CO_2 would be removed from the hydrocarbon gas streams using a physical solvent or a traditional amine

[1] Note, the operational life of the proposed Project will be controlled by the sequestration reservoir's storage capacity (currently undergoing review) and volume of CO_2 captured per year which will fluctuate.

In each of the three post-combustion CO_2 capture facilities within Co-generation Plant 32 (at Gas Plant 32) and Steam Generator Stations (SGS) 2868 and 2972, the flue gas would be cooled, then passed through an absorber column where an absorbent will chemically react with and bind about 90% of the CO_2. The remaining flue gas (primarily oxygen, nitrogen, and the remaining uncaptured CO_2), would be vented to atmosphere. The rich absorbent carrying CO_2 is piped to the regenerator column, where through the application of heat, the CO_2 would be released and captured in relatively pure concentration. The CO_2 would be then compressed, dehydrated, stripped of oxygen, and piped to the sequestration site. Oil and gas production activities within the proposed sequestration zone, known as the 64 zone, would cease as a result of the implementation of the proposed Project.

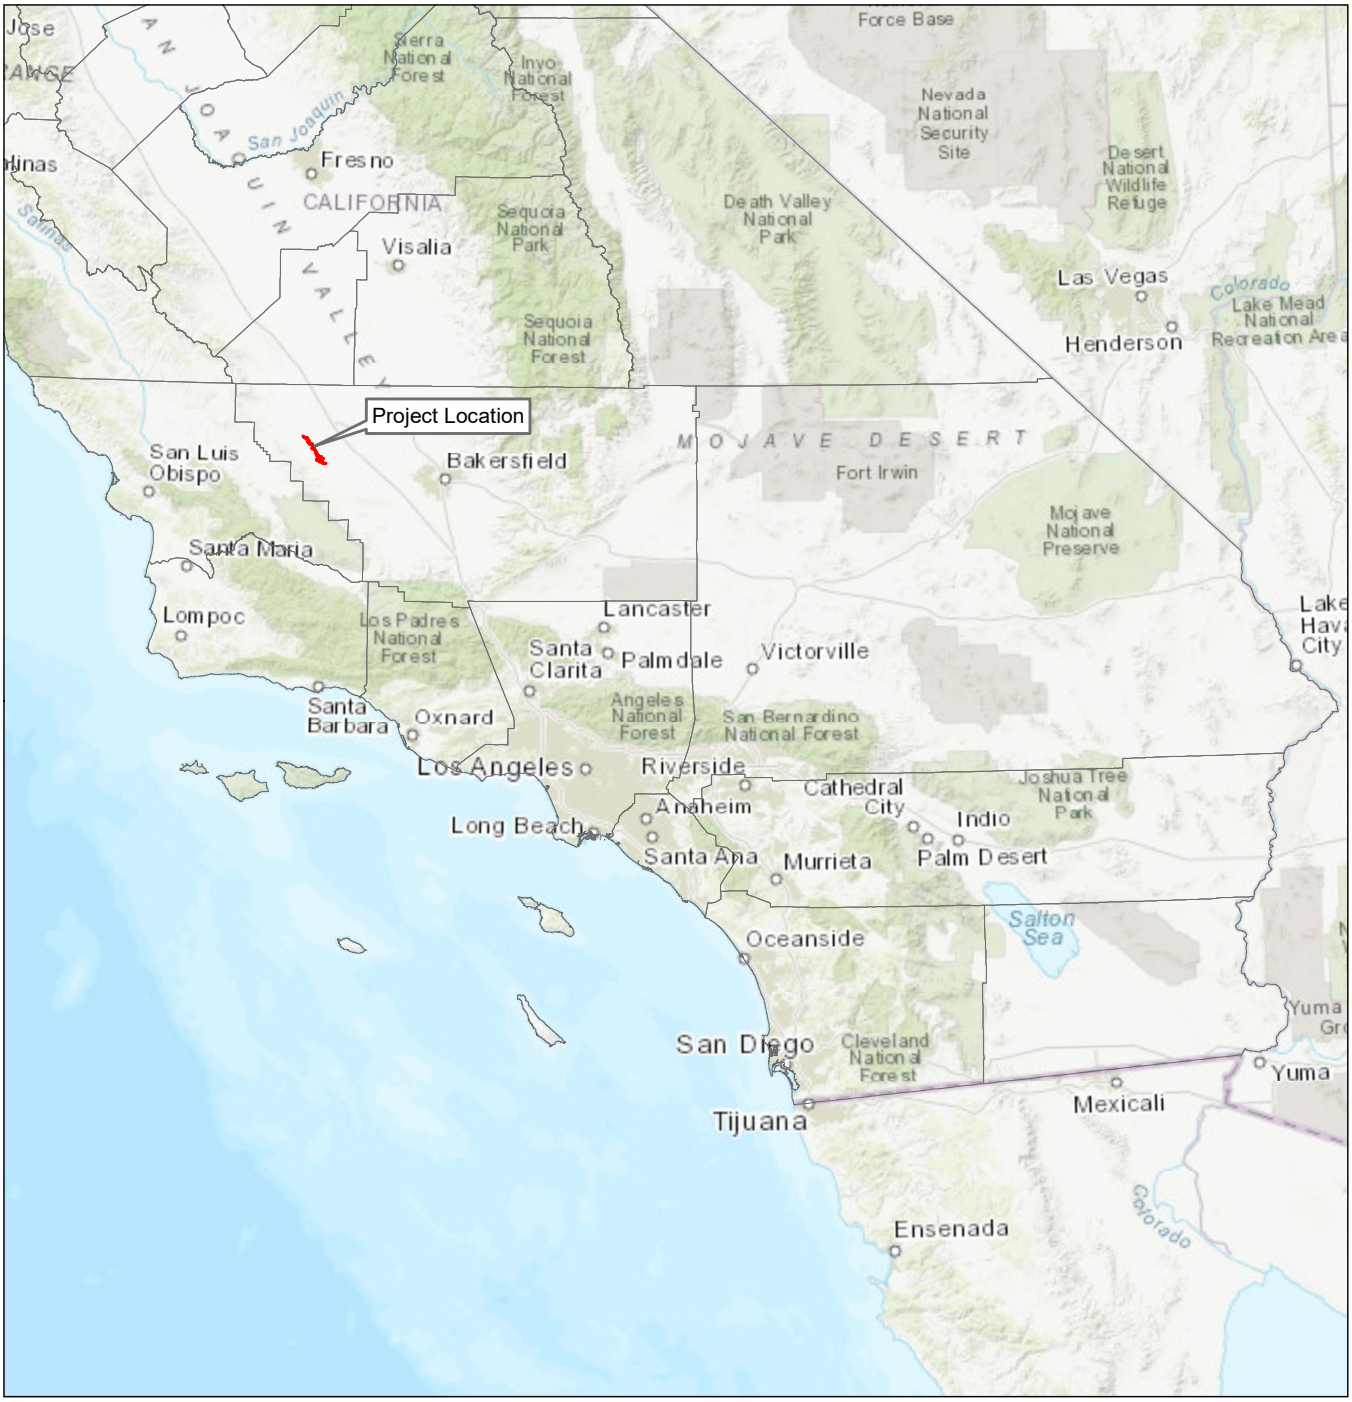
A new approximately 10-mile, 6- to 12-inch pipeline would be constructed to deliver CO_2 from the capture facilities to the proposed injection wells. The pipeline would be primarily installed aboveground, except where the pipeline would cross main access roads (below ground) within the oil field properties. Distribution piping, each approximately 4- to 8-inches in size, would extend from the main pipeline to the proposed injection wells. The distribution pipelines would also be primarily aboveground on pipe supports, except where the pipelines cross main access roads (below ground) within the oil field.

The proposed Project includes re-purposing five existing oil wells and drilling four new wells for CO_2 injection. Additionally, four existing wells would be converted to monitoring wells to monitor the CO_2 plume. Up to four additional monitoring wells may also be constructed, either as repurposed oil wells and/or new wells. The proposed Project would also require plugging and abandonment of up to 40 existing oil wells within the North Belridge Oil Field in accordance with state and federal requirements to prevent leakage of CO_2 from the sequestration zone. Additionally, up to 40 wells previously abandoned within the North Belridge Oil Field would be re-abandoned to meet current state and federal plugging requirements. Finally, 13 wells that are adjacent to SGS 2868 and SGS 2972 will need to be abandoned prior to construction of the CO_2 capture facilities at these two locations.

Refer to Figures 2a through 2h for the location of the Study Area.

1.2 PURPOSE AND SCOPE OF WORK

1.2.1 Purpose



The purpose of this Desktop Geohazards and Geotechnical Assessment is to evaluate relevant publicly available information and data provided by Aera for the Project Site and provide an overview of geologic conditions which represent potential geotechnical hazards associated with the proposed Project. This report has been prepared in general accordance with accepted geotechnical engineering principles and in general conformance with the approved scope of services.

1.2.2 Scope of Work

Stantec performed a desktop-level evaluation of the geologic and soil hazards that may affect future development of the Project Site. The Scope of Work for this Desktop Geohazards and Geotechnical Assessment included:

- Review of relevant published geologic information consisting of the following: U.S. Geological Survey published maps and reports, State of California-issued geologic and hazard maps, and County of Kern Safety Element;
- Review and summarize regional and local geology and identify potential geotechnical and geologic hazards;
- Research and identify relevant geologic hazards, such as fault rupture, seismic shaking or spreading, liquefaction, landslide, subsidence, erosion, slope stability, shallow groundwater, and collapsible soils, based on readily available information; and
- Production of this Desktop Geohazards and Geotechnical Assessment with associated maps in support of the Environmental Impact Report (EIR) prepared by the County.

2.0 RESULTS

The following sections detail the findings of this Desktop Geohazards and Geotechnical Assessment.

2.1 REGIONAL GEOLOGY

The Project Site is located in the San Joaquin Valley, within the southern half of the Great Valley Geomorphic Province of California. The Great Valley is characterized by a broad alluvial plain extending over 400 miles through Central California and reaching up to 50 miles wide. The San Joaquin Valley is approximately 200 miles long and up to 70 miles wide. The northern portion of the San Joaquin Valley is drained by the San Joaquin River, which flows from east-central California to the San Francisco Bay before reaching the Pacific Ocean. The southern portion of the San Joaquin Valley drains into two terminal lake beds, Tulare Lake and Buena Vista Lake. Geologically, the San Joaquin Valley structural trough is characterized by marine and continental sedimentary deposits reaching thicknesses of up to 32,000 feet.

The surficial geology of the Project Site consists of Quaternary-age alluvial deposits ranging from gravel to sand, silt, and clay units. The Tulare Formation underlies the Quaternary alluvium and consists of weakly indurated gravel, pebble, sand, and clay. Clay units vary in permeability (Aera Energy & Geosyntec Consultants, 2022). The Tulare Formation is underlain by the San Joaquin formation, the Etchegoin formation, and the Monterey Shale. The San Joaquin formation is characterized as a Pliocene aged sandstone, silty sand, and siltstone containing mostly marine fossils. The Etchegoin formation is a marine sandstone. The Monterey Shale is a marine biogenic deposit characterized by clayey to siliceous shales with varying degrees of bedding, weathering, and lithification (Dibblee & Minch, 2006). The geologic map of the Project Site is provided in Figures 3a through 3i.

Structurally, the Project Site is located along the western margin of the San Joaquin fold belt. The fold belt is characterized by fault-bend and fault-propagated folds associated with complex faulting in the area and resulting in a series of anticlines and synclines along the southern and western boundaries of the San Joaquin Valley (Namson & Davis, 1988).

The U.S. Geological Survey (USGS) has mapped Quaternary active faults within 35-miles of the Project Site. The nearest Quaternary active faults mapped by the USGS are the San Andreas fault zone, a right-lateral fault zone located approximately 10 miles west of the Project Site and the Poso Creek fault, approximately 25 miles east of the Project Site. Other named and unnamed Quaternary active faults have also been mapped within a 35-mile radius of the Project Site (USGS, 2023).

2.2 REGIONAL GROUNDWATER

The Project Site is located within the Central Valley Groundwater Basin, San Joaquin Basin, and Kern County subbasin (CDWR, 2023; CDWR, 2020). Broadly speaking, groundwater flow is to the east and toward the main valley floor. Potentiometric surface analysis for the alluvial deposits indicates the groundwater flow in the North Belridge Oil Field area is to the north-northeast, and in the South Belridge Oil Field area groundwater flows to the east-northeast (Aera Energy & Geosyntec Consultants, 2022).

The California Department of Water Resources (CDWR) and USGS periodically monitor groundwater levels in water wells surrounding the Project Site. The groundwater level at an observation well (Site Code 355137N1195985W0001) located approximately 8.9 miles east of the Project Site is reported as 34.3 ft below ground surface (bgs) on October 17, 2022. The groundwater level at an observation well (Site Code 354021N1195011W001), located approximately 9 miles southeast of the Project Site is reported as 124.2 ft bgs on October 12, 2022 (CDWR, 2023).

The Belridge multiple-well monitoring site (Belridge Water Storage District, BWSD) is located approximately 1.3 miles east and downgradient from the northeast corner of the South Belridge Oil Field. Table 1 provides the most recent depth to water data from this group of groundwater monitoring wells (USGS, 2023).

Table 1. Summary of groundwater monitoring well data for the Belridge multiple-well monitoring site (USGS, 2023).

Well No.	USGS Site ID	Location (lat/long)	Well Depth (ft)	Depth to Water (ft bgs)	Date Collected
BWSD #5	353049119434105 028S021E08A005M	35°30'49.07", 119°43'41.96"	280	156.04	1/18/2023
BWSD #4	353049119434104 028S021E08A004M	35°30'49.07", 119°43'41.96"	530	178.96	1/18/2023
BWSD #3	353049119434103 028S021E08A003M	35°30'49.07", 119°43'41.96"	890	518.08	1/18/2023
BWSD #2	353049119434102 028S021E08A002M	35°30'49.07", 119°43'41.96"	1190	519.01	1/18/2023
BWSD #1	353049119434101 028S021E08A001M	35°30'49.07", 119°43'41.96"	1515	681.65	1/18/2023

The approximate surface elevation of the Project Site is 546 feet above mean sea level (amsl). Based on the above groundwater level data, the estimated depth to groundwater at the Project Site is 150 to 500 ft bgs.

2.3 REGIONAL SEISMICITY

2.3.1 Fault Rupture Hazard

The USGS has mapped Quaternary active faults within 35-miles of the Project Site. The nearest Quaternary active fault mapped by the USGS is the San Andreas fault zone, a right-lateral fault zone, located approximately 10 miles west of the Project Site. The Poso Creek fault is located approximately 25 miles east of the Project Site. Other named and unnamed Quaternary active faults have also been mapped within a 35-mile radius of the Project Site (USGS, 2023),though none occur at the Project Site. Although the possibility of a new fault forming cannot be entirely precluded, the regular occurrence of low magnitude seismic events on the existing active [illegible] [illegible] [illegible]

- A relative shallow groundwater table (within approximately 50 feet below ground surface) or completely saturated soil conditions that would allow positive pore pressure generation.

The Project Site is not within any currently mapped Liquefaction Zones established by the California Geological Survey (CGS) as the area has not been evaluated for liquefaction or landslide hazards (CGS, 2019). Additionally, the Project Site is outside of Earthquake Zones of Required Investigation, as mapped by CGS (CGS, 2022).

Based on the near surface soil conditions, anticipated subsurface soil conditions, depth to groundwater, and proximity to seismically active faults, it is Stantec's opinion that the potential for seismically induced settlement, including liquefaction, is low to moderate at the Project Site (less than 50% probability within the next 100-years).

2.3.4 Lateral Spreading

Lateral spreading typically occurs as a form of horizontal displacement of relatively flat-lying alluvial material toward an open or "free" face such as an open body of water, channel, or excavation. This movement is generally due to failure along a weak plane and is often associated with liquefaction. As cracks develop within the weakened material, blocks of soil displace laterally toward the open face. Cracking and lateral movement may gradually propagate away from the face as blocks continue to break free.

The Project Site has a low to moderate liquefaction potential as discussed above and is located at least one-half to one mile from a free face (abrupt changes in surface topography). Given the relatively flat topography of the Project Site, soil conditions, depth to groundwater, depth to bedrock, and the low potential for liquefaction in the area, the potential for lateral spreading is considered low.

2.4 LOCAL FAULTS AND FRACTURES

Twelve subsurface faults with measurable vertical offset were interpreted from a three-dimensional (3D) seismic survey of the Project Site and correlated with well log data. These fault interpretations were incorporated into a static 3D geologic model to support the project's UIC Class VI application (Aera Energy, 2022b). Four of the identified faults form the boundaries of the Area of Review (AoR) in which the CO_2 plume will be contained, an additional □□□ are contained within the AoR bounding faults□□□d □□ □ □r□ □□□□□d □□□□d□ □□□□□ □□R. None of the faults identified offset Quaternary strata or have ground surface expressions and were consequently interpreted to be inactive.

Each fault transects the injection zone. Furthermore, fault stability analysis indicates that these faults are stable and not susceptible to movement (Aera Energy, 2022b).

2.5 SUBSIDENCE

Land subsidence is a gradual settling or sudden sinking of the Earth's surface due to several factors. Underground mining operations can lead to surface subsidence as subsurface material settles where fluids and/or material have been removed from below. Soil types also play a role in land subsidence since some types of soil expand when wet and contract when dry.

In California's San Joaquin Valley, the primary cause of land subsidence is groundwater pumping in unconsolidated aquifers (CDWR, 2020). Surface subsidence due to groundwater withdrawal is well documented within the San Joaquin Valley Groundwater Basin and Kern County Subbasin (CDWR, 2020; USGS, 2022b). Approximately 900 square miles within the San Joaquin River Hydrologic Region have subsided, with subsidence reaching up to 2.25 feet in some areas (CDWR, 2020).

Surface subsidence due to oil extraction has been documented at the Project Site. Subsidence at the Project Site has been attributed to withdrawal of oil and gas from diatomaceous reservoirs at depths of approximately 1,000 to 2,000 feet below ground level. Monitoring data from radar satellite synthetic aperture radar (RADARSAT SAR) surveys collected every 24-days from February through December, 2001, were used to determine subsidence within the Project Area. The maximum ground surface vertical displacement detected during this time occurred from June 25 to July 19 (30 millimeter [mm]), and from August 12 to September 5 (60 mm).

Additional SAR data from the European ERS-1 and ERS-2 satellites were used to derive subsidence estimates for the period 1992 to 2000. During this time, the maximum subsidence detected within the North Belridge Oil Field area was 1,850 mm, or an average of 15 mm per day over a 24-day period (Youden, et al., 2002). Aera began using interferometric synthetic aperture radar (InSAR) data in 1999 to monitor subsidence rates on an approximately monthly basis. As a result of these data, measures were employed to balance fluid withdrawal and injection in these reservoirs to mitigate subsidence rates. InSAR data indicate that in 2021, vertical movement of the surface ranged from -10 cm to +10 cm, suggesting that only minor amounts of subsidence and inflation have occurred within the monitored area (Aera, 2022a).

Although unconsolidated alluvial soils are present over portions of the Project Site, these soils are largely unsaturated and are not used as a source of groundwater. Therefore, the risk of subsidence in these soils is low. Subsidence has been historically documented at the Project Site and attributed to oil and gas withdrawal from diatomaceous reservoirs within the Monterey Formation at depths of 1,000 to 2,000 feet. Monitoring data indicate that subsidence mitigation efforts have been successful and little-to-no subsidence occurs today. For this reason, the risk of subsidence at the Project Site due to oil and gas extraction is considered moderate. Lastly, the proposed Project will be exclusively used for CO_2 sequestration and no fluids, aside from small-volume samples for monitoring, will be withdrawn from the sequestration zone, eliminating the possibility for subsidence caused by the Project.

2.6 SITE CONDITIONS

2.6.1 Expansive Soil Potential

Soil volume changes can occur when expansive soils undergo alternating cycles of wetting (swelling) and drying (shrinking). Soils mapped on the Project Site are primarily alluvial and include Kimberlina fine sandy loam with 0 to 9 percent slopes, Milham sandy loam with 0 to 5 percent slopes, and Panoche clay loam with 0 to 5 percent slopes. These soils are not considered hydric soils (NRCS, 2023).

The design level geotechnical investigation will determine the expansive potential of the underlying soil at the Project Site and any mitigation measures required.

2.6.2 Corrosive Soil Potential

Sand in direct contact with concrete typically has a lower corrosion potential than clay soils in direct contact with concrete. Corrosive soils can typically be mitigated with corrosion resistant concrete. Natural Resources Conservation Service (NRCS) mapped soils on the Project Site have the following risks of corrosion:

Table 2. Corrosive potential of soils mapped on the Project Site (NRCS, 2023).

Soil Type	Potential Corrosion of Concrete	Potential Corrosion of Steel
Kimberlina fine sandy loam, 0 to 2 percent slopes MLRA 17	Moderate	Moderate
Kimberlina sandy loam, 2 to 9 percent slopes	Moderate	High
Milham sandy loam, 0 to 2 percent slopes MLRA 17	Moderate	Moderate
Milham sandy loam, 2 to 5 percent slopes	Moderate	High
Panoche clay loam, 0 to 5 percent slopes	Low	Moderate

The design level geotechnical investigation will determine the corrosion potential of the underlying soil at the Project Site and any mitigation measures required.

2.6.3 Near-surface Obstructions or Restrictive Soil Layers

If surface organics are identified, they will be removed prior to grading the Project Site. The approximate depth of subsurface organic material and soils will be characterized in the design level geotechnical investigation. Near-surface obstructions or restrictive soil layers will be assessed by the design-level geotechnical investigation.

2.6.4 Frost Depth

California Extreme Frost Line Penetration at the Project Site is an average of 5 inches per the US Department of Commerce (Department of Commerce, 2023). Proposed minimum foundation depths will be required below the frost depth and will be included in the design-level geotechnical investigation report.

2.6.5 Slopes

The Project Site is relatively flat, with a topographic gradient less than 5 percent. Permanent slopes steeper than 5:1 (horizontal to vertical) or higher than 5 feet are not anticipated to be constructed or built upon for the Project. Due to the existing topography and the proposed grading, landslides are not considered a potential hazard for the Project Site. The stability of slopes, if any, should be verified when design-grading information becomes available.

2.6.6 Erosion

The predominantly fine-grained soils underlying the Project Site are potentially susceptible to erosion or the loss of topsoil due to surface water flows and wind-driven movement. The on-site soils have a very low to medium runoff potential (the potential for water to runoff into drainage channels vs. infiltrate directly into the soil. The erosion potential for each on-site soil was also determined using the K-Factor. The soil-erodibility factor (K) represents: (1) the susceptibility of soil or surface material to erosion, (2) the transportability of the sediment, and (3) the amount and rate of runoff given a particular rainfall input, as measured under a standard condition. Fine-textured soils that are high in clay have low K values (about 0.05 to 0.15) because the particles are resistant to detachment. Coarse-textured soils, such as sandy soils, also have low K values (about 0.05 to 0.2) because of high infiltration resulting in low runoff, although these particles are easily detached. Medium-textured soils, such as a silt loam, have moderate K values (about 0.25 to 0.45) because they are moderately susceptible to particle detachment and they produce runoff at moderate rates. Soils having a high silt content are especially susceptible to erosion and have high K values, which can exceed 0.45 and can be as large as 0.65. Silt-size particles are easily detached and tend to crust, producing high runoff rates and large runoff volumes (Caltrans, 2023). Refer to Table 3 below.

Table 3. Erosive Potential for Soils Mapped on the Project Site (NRCS, 2023).

Soil Type	Runoff Class	Erosion Potential (K-Factor)
Kimberlina fine sandy loam, 0 to 2 percent slopes MLRA 17	Very Low	0.32
Kimberlina sandy loam, 2 to 9 percent slopes	Low	0.43
Milham sandy loam, 0 to 2 percent slopes MLRA 17	Low	0.43
Milham sandy loam, 2 to 5 percent slopes	Medium	0.43
Panoche clay loam, 0 to 5 percent slopes	Low	0.43

The erosion potential for soils increased when the soils are disturbed, the existing vegetation removed, and the soil is exposed to wind and rain drop impact. Additionally, steeper slopes will tend to erode faster if not protected with erosion and sediment control best management practices (BMPs). Mitigation of soil erosion may include selective grading, establishment of anchoring vegetation, design of runoff control features such as drainage ditches, and construction of erosion control features such as pavements and surface mats. These mitigation options will be addressed in the design-level evaluations for the Project.

2.6.7 Landforms that Could Develop Sinkholes or Other Hazards

Sinkholes and karst topography (limestone formations susceptible to formation of underground caverns) are known to exist in California (USGS, 2000). However, the Project Site is covered by Quaternary alluvial material and underlain by loosely-consolidated bedrock of the Tulare Formation. Therefore, the potential for sinkhole development at the Project Site is considered relatively low. Existing landforms are not consistent with landforms that could develop into sinkholes or other geologic hazards but should be addressed in the design level geotechnical investigation when site specific conditions are understood.

2.7 REVIEW OF AERIAL PHOTOGRAPHS

Historical aerial imagery from 1937, 1942, 1956, 1974, 1976, 1984, 1994, 2005, 2009, 2012, and 2016 reveal that the Project Site and adjacent properties were developed for oil and production since prior to 1937 (EDR, 2022).

3.0 CONCLUSIONS

Based on the currently planned development, it is Stantec's opinion that the Project Site has a low likelihood of surface fault rupture due to the distance from active faults. The Project Site may be subject to strong ground shaking due to seismic events. The anticipated depth to groundwater ranges from 150 feet bgs to 500 feet bgs at the Site. Based on the near surface soil conditions, anticipated subsurface soil conditions, and the low to moderate PGA, it is Stantec's opinion that the potential for liquefaction-related ground failure, including liquefaction, is low to moderate. The potential for lateral spreading is low, and the likelihood of surface subsidence is moderate on the Project Site.

Although expansive soils have not specifically been identified on the Project Site, the design-level geotechnical investigation will establish the types and depths of soils at the Project Site and recommend corrosion mitigation and minimum foundation depths to mitigate against the potential effects of frost.

The design-level geotechnical investigation will further assess the depth to groundwater below the Project Site, if needed. Due to the relatively flat topography of the Project Site, landslides are not considered a potential hazard. The development of sinkholes is unlikely but will be further assessed during the design level geotechnical investigation.

4.0 LIMITATIONS AND ASSUMPTIONS

Analyses performed at the desktop level rely on available, pre-existing data. The intent of the desktop approach is to provide practical results that guide our client as an exploratory, cost-saving measure before field work is considered and conducted. No field investigation was performed as part of this Assessment. Limitations and assumptions relevant to this Assessment include, but are not limited to, the following:

- The data analyzed herein is correct and adequate for this analysis.
- Data provided by the Client, including reports and maps, are correct and up to date.
- The activity state (e.g., active, inactive) of faults identified in this Assessment is not addressed herein.
- Slope stability within the Study Area or surroundings is not addressed herein.

Version History

File Name	Version	Date	Description of Change
Attachment E – Aera CCS Testing and Monitoring Plan.pdf	1	January 19, 2023	Original document
Attachment E – CarbonFrontier Testing and Monitoring Plan V2 04182024	2	April 18, 2024	Revisions made based on additional monitoring well and design of seismicity monitoring network

This Testing and Monitoring Plan (TMP) describes how Aera Energy LLC (Aera) will monitor the CarbonFrontier site pursuant to Title 40 of the Code of Federal Regulations (CFR) 146.90. In addition, the TMP will be used to confirm that that the wells are operating as planned, the carbon dioxide (CO_2) plume and pressure front are moving as predicted, and that there is no endangerment to Underground Sources of Drinking Water (USDWs). Monitoring data will also be used to validate and update the geological and reservoir models used to predict the CO_2 plume extent and to support Area of Review (AoR) reevaluations and non-endangerment demonstrations.

Aera will review and submit any amendments to the TMP no less than every 5 years in order to incorporate monitoring data, operational data, and AoR reevaluations, in accordance with 40 CFR

146.90(j). Results of the testing and monitoring activities described below may trigger action according to the Emergency and Remedial Response Plan (ERRP, **Attachment I**).

2. OVERALL STRATEGY AND APPROACH FOR TESTING AND MONITORING

The CarbonFrontier TMP and the monitoring, verification, and accounting (MVA) program detailed in the Quality Assurance and Surveillance Plan (QASP) will be used to demonstrate safe underground storage of injected CO_2 and USDW non-endangerment.

An AoR delineation model was constructed using a comprehensive data set as further described in **Section 2** of the Application Narrative and **Attachment B**. The proposed injection site is characterized by a porous and permeable injection zone, the 64 Zone Sandstones, overlain by a laterally continuous and impermeable confining layer, the Santos Shale Member, both of which are folded to form a broad anticline. The Santos Shale Member has an average true vertical thickness of approximately 200 feet (ft) and extends far beyond the AoR. The confining zone fractures are very limited and do not affect the macroscopic sealing capacity of the layer. Faults exist but available data suggests that these faults do not transmit fluids or pressure. Log and core analysis data display a difference of at least two orders magnitude in permeability between the 64 Zone Sandstones and the Upper Santos and Lower Santos shales. Overall, the site data indicate that the fluids will be confined to the 64 Zone Sandstones.

The Alluvium and Tulare formation (Fm) are potential USDWs over a portion of the area within the AoR that is outside the aquifer exemption boundary (for the Tulare Fm), and/or where groundwater with total dissolved solids (TDS) concentrations less than 10,000 milligrams per liter (mg/L) may exist (for the Alluvium and outside of the Tulare Fm exempt area). The injection zone is separated from these potential USDWs by numerous confining layers at depth. The injection zone is on average 7,250 ft true vertical depth (TVD) below the Tulare Fm across the North Belridge oil field anticline; whereas, the Alluvium, where present, is separated from the injection zone by a vertical distance of approximately 8,000 ft. The potential risks of CO_2 injection on groundwater quality in the potential USDWs are minimal due to: the limited aerial extent of the potential USDWs; numerous confining units (at the base of the Alluvium, within the Tulare Fm, and in deeper formations); the structural geometry of the North Belridge oil field anticline and injection zone; and the vertical distance separating the potential USDWs from the injection zone.

The injection wells will have continuous monitoring through pressure and temperature gauges. Pressure and temperature monitoring will enable immediate detection of deviations outside the operational limits. The injectate will be analyzed for fluid composition to verify geochemical composition and potential reaction with reservoir constituents. Each injection well will be tested annually for external mechanical integrity and undergo a pressure fall-off test every five years.

Subsurface monitoring will consist of CO_2 plume and pressure front monitoring, groundwater monitoring, and seismicity monitoring. Monitoring wells 1-28N, 39-26N, and 27-1N will be used to monitor the CO_2 plume through direct and indirect methods, including fluid sampling of the injection zone, pulsed neutron logging, and distributed temperature sensing (DTS). The pressure front will be monitored directly at wells 1-28N, 39-26N, and 27-1N. Monitoring wells 1-28N and

25-26N will be monitored for potential changes in fluid geochemistry above the injection zone in the Agua Sandstone, which is the first permeable interval above the injection zone, directly overlying the primary confining layer. These wells will also be analyzed by pulsed neutron logging in the Agua Sandstone for potential CO_2 leakage. Monitoring well 35X-27N will be used for fluid sampling and pressure monitoring in the Lower Carneros Sandstone, which overlies the secondary confining layer.

A microseismic monitoring network, in conjunction with the California Integrated Seismic Network, will be used to monitor for microseismic events at or above magnitude 1.0. Estimates of earthquake shaking potential prepared by the California Geological Survey (CGS) and United States Geological Survey (USGS) indicate that the AoR is located in an area of moderate seismic risk; however, while there are active faults within the region that have the potential to produce significant sharking, none are expected to induce subsurface ruptures within the AoR. All of the faults that are present within the AOI are interpreted to be inactive. The ERRP (**Attachment I**) provides details on the appropriate response actions.

This TMP and the **QASP** details the continuous pressure and temperature monitoring of the injection and monitoring wells in addition to periodic well logging, mechanical integrity testing, and subsurface fluid and CO_2 stream analysis used to demonstrate safe operation and storage of the injected CO_2. This TMP and **QASP** will provide early detection of operational or well integrity issues and demonstrate USDW non-endangerment. A summary of the testing and monitoring strategies to be conducted is given in **Table 1**.

2.1 Quality Assurance Procedures

A **QASP** for the testing and monitoring activities, required pursuant to 146.90(k), is provided as **Appendix A** to this TMP.

2.2 Reporting Procedures

Aera will report the results of testing and monitoring activities to the U.S. Environmental Protection Agency (EPA) in compliance with the requirements under 40 CFR 146.91.

Table 1: Summary of Testing and Monitoring Activities

Activity	Location(s)	Method	Pre-Injection Frequency	Injection Frequency	PISC Frequency	Analytical Technique	Lab/Custody	Purpose
CO_2 stream analysis	After compression and processing and before injection wellheads	Direct sampling	Once	Quarterly	N/A	Chemical analysis	California certified lab	Monitor injectate
Injection rate and volume	Before wellhead	Flow meter	N/A	Continuous	N/A	Direct measurement	N/A	Monitor injectate rate and volume
Injection temperature/ pressure	Before wellhead	Temperature/ pressure gauge	N/A	Continuous	N/A	Direct measurement	N/A	Monitor injectate temperature, pressure, and well integrity
Annular pressure	Wellhead	Pressure gauge	N/A	Continuous	None	Direct measurement	N/A	Monitor annular pressure and well integrity
Downhole pressure/ temperature	Injection wells	Downhole gauge and DTS	Continuous	Continuous	None	Direct measurement	N/A	Monitor reservoir pressure/injection temperature/well integrity
	Monitoring wells	Downhole gauge and DTS	Continuous	Continuous	Quarterly	Direct measurement	N/A	Monitor reservoir pressure/injection temperature/well integrity
Internal mechanical integrity	Injection wells and Monitoring wells	Annulus pressure test via annulus pressure gauge	Once	Every five years	None	Direct measurement	N/A	Monitor internal mechanical integrity of wellbore
External mechanical integrity	Injection wells	Temperature log/DTS, acoustic log, or oxygen activation log	Once	Annual	Once, prior to plugging	Physical analysis	N/A	Monitor external mechanical integrity
	Monitoring wells	Temperature log/DTS, acoustic log, or oxygen activation log	Once	As needed	As needed	Physical analysis	N/A	Monitor external mechanical integrity
	Injection wells	Ultrasonic casing/ cement log	Once	As needed	None	Physical analysis	N/A	Monitor well integrity
Corrosion monitoring	After compression	Coupon	Once	Quarterly	None	Physical analysis	N/A	Monitor well integrity
Pressure fall-off testing	Injection wells	Pressure gauge	Once	Every 5 years	None	Direct Measurement	N/A	Monitor well and reservoir integrity

Activity	Location(s)	Method	Pre-Injection Frequency	Injection Frequency	PISC Frequency	Analytical Technique	Lab/Custody	Purpose
Geochemistry monitoring	Monitoring wells: Agua Sandstone (I-28N, 25-26N); Lower Carneros Sandstone (35X-27N)	Fluid sampling	Once	Annually	Every two years	Chemical analysis	California certified lab	Monitor for CO_2 leakage
CO_2 plume tracking	Monitoring wells: 64 Zone (I-28N, 39-26N, 27-1N)	Fluid sampling	Once	Annually	Every two years	Direct Measurement	California certified lab	Directly monitor CO_2 plume migration
	Monitoring wells: 64 Zone (I-28N, 39-26N, 27-1N)	Pulsed neutron wireline log	Once	Annually	Every two years	Indirect measurement	N/A	Indirectly monitor CO_2 plume migration
	Monitoring wells: Agua Sandstone (I-28N, 25-26N)	Pulsed neutron wireline log	Once	Annually	Every two years	Indirect measurement	N/A	Monitor for CO_2 leakage
Pressure front tracking	Monitoring wells: 64 zone (I-28N, 39-26N, 27-1N); Agua Sandstone (I-28N, 25-26N); Lower Carneros Sandstone (35X-27N)	Pressure gauge	Continuously	Continuously	Continuously	Direct Measurement	N/A	Monitor pressure front migration
Seismic activity monitoring	AoR and within 1 mile radius of injection wells	Borehole DAS (38-35N) and public surface seismic stations	Continuous	Continuous	None	Indirect measurement	N/A	Monitor natural and induced seismic activity of 1.0 for reservoir, well, facility, and pipeline integrity
	Within 1 mile radius of injection wells	California Integrated Seismic Network	Continuous	Continuous	Continuous	Indirect measurement	N/A	Monitor seismic activity of magnitude 2.7 or greater for reservoir, well, facility, and pipeline integrity

3D: three dimensional
DAS: distributed acoustic sensing
DTS: distributed temperature sensing
N/A: not applicable
PISC: post-injection site care

3. CARBON DIOXIDE STREAM ANALYSIS [40 CFR 146.90(A)]

Aera will analyze the CO_2 stream during the operation period to yield data representative of its chemical and physical characteristics and meet the requirements of 40 CFR 146.90(a).

3.1 Sampling Location and Frequency

Sampling will take place quarterly each year starting from 3 months, 6 months, 9 months, and 12 months after the date of commencement/injection. The collected samples will be analyzed by an analytical laboratory.

Prior to the commencement of injection, Aera will conduct a pre-injection analysis of the CO_2 injection stream with samples collected from monitoring points upstream of CO_2 injection wellheads. Aera will submit these data to EPA as part of the permit application requirements [146.82(a)(7)(iv)].

The proposed CO_2 stream will be sourced from a mixture of Aera's planned CO_2 capture facilities, located in the adjacent South Belridge oil field, and from third-party suppliers, received by pipeline or truck. These streams will be tested and reported to EPA according to the requirements of 40 CFR 146.82(a)(7)(iv). The proposed CO_2 streams are discussed in more detail in **Sections 1 and 7** of the Application Narrative.

3.2 Analytical Parameters

Aera will analyze the CO_2 stream for the constituents identified in **Table 2** using the methods listed.

Table 2: Summary of Analytical Parameters for CO_2 Stream

Parameter	Analytical Method(s)
Carbon dioxide (CO_2)	ASTM D1945-14 (2019). Gas Chromatography (GC) with thermal conductivity detector (TCD)
Moisture (water vapor, H_2O)	ISBT 3.0. Electrometric moisture analyzer
Oxygen (O_2), Nitrogen (N_2)	ASTM D1945-14 (2019). GC/TCD
Argon (Ar)	ISBT 4.0. GC with discharge ionization detector (DID) for Ar
Hydrogen (H_2)	ASTM D1945-14 (2019). GC/TCD
Carbon monoxide (CO)	ISBT 5.0. GC with pulsed discharge ionization detector (PDID)
Oxides of nitrogen (NO_x)	ISBT 7.0. Colorimetric tubes, able to detect NO and NO_2
Ammonia (NH_3)	ISBT 6.0. Ammonia-specific colorimetric detector tube
Total hydrocarbons (THC)	ISBT 10.0. GC with flame ionization detector (FID)
Methane (CH_4)	ASTM D1945-14 (2019). GC/TCD
Aromatic hydrocarbons	ISBT 12.0. GC with photoionization detector (PID)
Total sulfur (TS)	ISBT 13.0. GC with sulfur chemiluminescent detector (SCD) Apply ISBT 14.0 if SO_2 level is expected to exceed 1 ppm
Sulfur dioxide	ISBT 14.0. GC/SCD
Hydrogen sulfide (H_2S)	ASTM D1945-14 (2019). GC/TCD
Ethanol (C_2H_6O)	EPA Method 8260B. GC with mass spectroscopy (MS)
^{13}C isotope	USGS Techniques and Methods 5-D4. GC with dual-inlet isotope ratio mass spectrometry (GC-IRMS)

3.3 Sampling Methods

Samples will be collected and prepared based on recommendations of the analytical methods included in **Table 2**.

Sample containers will be labeled with durable labels and indelible markings. A unique sample identification number, sample description, sampling date, location, personnel, and their signatures will be recorded on each sample container. Please refer to **Section 2.3** of the **QASP**. for further details.

3.4 Laboratory to be Used / Chain of Custody and Analysis Procedures

Samples will be analyzed by California-certified laboratories using standard method-specific procedures. Selected laboratories, methods, and detection limits are listed in the **QASP**, along with the required chain of custody procedures.

Chain of custody information will include sampling date, sample description, type of sample, sampler name, location of sampling, methods for analysis, preservatives in the sample container, requested turnaround time for sample results, and the names and signatures of the people relinquishing and receiving the sample(s). A separate laboratory will be contracted to perform the carbon ^{13} isotope analysis. Details of the sample chain of custody and the analysis procedures are included in the **QASP** document.

4. CONTINUOUS RECORDING OF OPERATIONAL PARAMETERS [40 CFR 146.88(E)(1), 146.89(B) AND 146.90(B)]

Aera will install and use continuous recording devices to monitor injection pressure, rate, and volume; the pressure on the annulus between the tubing and the long string casing; the annulus fluid volume added; and the temperature of the CO_2 stream, as required by 40 CFR 146.88(e)(1), 146.89(b), and 146.90(b).

Safety valves and system equipment will be installed and operated following American Petroleum Institute Recommended Practice 14B. Biannual testing of surface and subsurface safety valves will be conducted to document their ability to hold pressure. Aera has standard operating procedures to function-test surface safety valves in existing facilities. The surface safety valves, also known as emergency shutdown valves, will be calibrated every 6 months to document their ability to hold pressure. Aera will conduct a function test of the master valve and associated wellhead pipeline isolation valves by fully opening and closing the valves on an annual basis. In addition, Aera will demonstrate valves can hold pressure by conducting an annual leak test using pressure gauges installed on either side of the valves.

Aera will use its existing supervisory control and data acquisition (SCADA) system to monitor equipment, rapidly identify issues that require repairs, and automatically initiate shut-in by a fail-safe actuated gate valve if a critical parameter is exceeded. In addition, Aera's Integrated Operating Control Center (IOCC) is staffed continuously by trained operators to monitor alarms and wells. If there is a triggered alarm, the IOCC will be able to shut-in injection immediately. An operator can then be dispatched to the well site to troubleshoot the alarm and perform needed repairs. If Aera finds a surface or subsurface safety valve inoperable, injection will be shut-in and repairs will be made within 90 days. If an extension of 90 days is needed, a request for approval will be sent to the Underground Injection Control (UIC) Program Director.

In compliance with 40 CFR 146.89(b), Aera will begin continuous monitoring of operational parameters by conducting an initial annulus pressure test on each injection and monitoring well to establish internal mechanical integrity prior to the start of CO_2 injection. Although exact procedures for specific wells will vary based on conditions and equipment at the location and below surface, in general, Aera will use the procedure below for conducting each annulus pressure test:

- Notify the UIC Program Director in writing 30 days in advance of the annulus pressure test, in compliance with 40 CFR 146.91(d)(3).
- Fill the tubing/casing annulus to surface with corrosion inhibited packer fluid.
- Rig up the pump truck and connect to the tubing/casing annulus at surface.
- Increase pressure on the tubing/casing annulus to the injection maximum allowable surface injection pressure and mechanically isolate the annulus.
- Hold pressure for 30 minutes. Capture test data on a pressure recording chart and in a data file with a reading at least once/minute.

- Less than a 3% drop or 3% build in pressure from the initial pressure shall constitute a successful annulus pressure test.
- Bleed off pressure, shut in the tubing/casing annulus. Rig down the pump truck.
- If the test is successful, report the results to the UIC Program Director within 30 days, as per 40 CFR 146.91(b)(1).
- If the test is unsuccessful, report the results to the UIC Program Director within 24 hours, as per 40 CFR 146.91(c)(4) and commence an investigation to evaluate the cause of the test failure.
    - In the event that a loss of mechanical integrity is discovered, as per 40 CFR 146.88(f), Aera will:
        - Cease injection.
        - Take the steps reasonably necessary to determine whether there may have been a release of the injected CO_2 stream or formation fluids into any unauthorized zone.
        - Notify the UIC Program Director within 24 hours.
        - Restore and demonstrate mechanical integrity to the satisfaction of the UIC Program Director prior to resuming injection.

4.1 Monitoring Location and Frequency

Following the initial annulus pressure test, as required under 40 CFR 146.88(e)(1), 146.89(b), and 146.90(b), Aera will continuously monitor and record operational parameters at each injection well including surface and downhole injection pressure, injection rate and volume, surface and downhole temperature, surface and downhole pressure on the annulus between the tubing and long string casing, and the annulus fluid volume as detailed in **Table 3**.

Table 3: Sampling Devices, Locations, and Frequencies for Continuous Monitoring

Test Description	Device(s)	Location	Minimum Sampling Frequency[a]	Min. Recording Frequency[b]
Injection Pressure	Direct Measurement by Pressure Gauge	Surface and downhole	Continuous	Continuous [c]
Injection Rate	Flowmeter	Surface	Continuous	Continuous [c]
Injection Volume	Calculated	Surface	Continuous	Continuous [c]
Annulus Pressure	Direct Measurement by Pressure Gauge	Surface and Above Packer	Continuous	Continuous [c]
Annulus Fluid Volume	Direct Measurement of Fluid Added	Surface	As Required [d]	As Required [d]
CO_2 Stream Temperature	Temperature Gauge	Surface	Continuous	Continuous [c]
Temperature	DTS	Surface and Downhole	Continuous	Continuous [c]
Acoustic	DAS	Surface and Downhole	Continuous	Continuous [c]

Notes:
[a] Sampling frequency refers to how often the monitoring device obtains data from the well for a particular parameter. For example, a recording device might sample a pressure transducer monitoring injection pressure once every 2 seconds and save this value in memory.
[b] Recording frequency refers to how often the sampled information gets recorded to digital format (such as a computer hard drive). For example, the data from the injection pressure transducer might be recorded to a hard drive once every minute.
[c] This can be the average of the sampled readings over the period, or maximum or minimum, as appropriate.
[d] Fluid volume added or removed to maintain annular pressure will be recorded on the date performed and submitted to the regulatory authority.

4.2 Monitoring Details

Calibration standards, precision, and tolerances for the instruments in **Table 3** will meet or exceed accepted industry standards. Formulas used for calculation of parameters and conversion factors will be provided by the equipment supplier and will comply with accepted industry standards for the specific equipment and be appropriately adjusted for the CO_2 stream and composition parameters.

Data collected from the activities detailed in **Table 3** will be stored in Aera's surveillance system starting prior to the beginning of CO_2 injection so that baseline values, averages, and trends can be established for the parameters at each well. After the start of CO_2 injection, trends will be continuously monitored on each well and compared to prior trends so that changes can be quickly recognized. Total injection rates and volumes into injection wells will be analyzed relative to total CO_2 supplied for injection from surface facilities.

Well by well data trends that are steady and predictable, and in accordance with both CO_2 volumes supplied for injection and expected reservoir pressure increases from injection, will suggest the presence of satisfactory mechanical integrity. Rapid changes in parameters such as annulus

pressure, fluid added to the annulus, and injection rate, or unexpected trends in these data, may provide cause for an investigation of mechanical integrity.

In the event that a loss of mechanical integrity is discovered, as per 40 CFR 146.88(f), Aera will:

1. Cease injection.
2. Take the steps reasonably necessary to determine whether there may have been a release of the injected CO_2 stream or formation fluids into any unauthorized zone.
3. Notify the UIC Program Director within 24 hours.
4. Restore and demonstrate mechanical integrity to the satisfaction of the UIC Program Director prior to resuming injection.

5. CORROSION MONITORING

In compliance with 40 CFR 146.90(c), Aera will monitor well materials during the injection operation period for loss of mass, thickness, cracking, pitting, and other signs of corrosion to ensure that the well components meet the minimum standards for material strength and performance. Aera will use the corrosion coupon method, as per 40 CFR 146.90(c)(1) and collect and evaluate samples according to the description below.

5.1 Monitoring Location and Frequency

Coupon samples will be attached to individual holders and inserted into a corrosion monitoring flow-through loop that is connected to the main CO_2 transport pipeline. Aera will place the loop in a location downstream of the process compression/dehydration/pumping equipment and upstream of wellheads. A parallel stream of high-pressure CO_2 will be routed from the main CO_2 transport pipeline through this corrosion monitoring loop and then back into a lower pressure point upstream in the system. The corrosion monitoring loop will operate when injection is active. No other equipment will act on the CO_2 past this point; therefore, this location will provide representative exposure of the coupon samples to the CO_2 composition, temperature, and pressure that will be incurred at wellheads and below surface. The holders and location of the system will be included in the pipeline design and will allow for continual injection during sample removal.

Aera will conduct initial baseline evaluations of corrosion coupon samples upon authorization to inject, and then quarterly following the start of injection, as per 40 CFR 146.90(c). An additional evaluation of coupons will occur within 30 days after any stop in injection, followed by a return to the quarterly monitoring schedule. If the CO_2 injection rate changes significantly, Aera will adjust the monitoring frequency to demonstrate sufficient characterization of well construction materials.

5.2 Sample Description

Corrosion coupon samples will consist of the same materials used in injection well construction that are expected to be in contact with the CO_2 stream. The materials are listed in **Table 4** below. Each coupon will be weighed, measured, and photographed prior to initial exposure.

Table 4: List of Equipment Coupons with Materials of Construction

Equipment Coupon	Material of Construction
Long-String Casing (6000ft – 8000 ft)	Modified 13Cr110
Liner (7700ft – 8500ft)	Modified 13Cr95
Injection Tubing	Modified 13Cr80
Wellhead	Flow wetted surfaces are expected to consist of F6NM in CO_2 Injection wells and F22 with Alloy 625 Clad in monitoring wells.
Packer	Alloy 718 or equivalent for packers and EPDM Elastomers

5.3 Monitoring Details

The coupons will be handled and assessed for corrosion using the ASTM International (ASTM) G1-03 1999 standard for preparing, cleaning, and evaluating corrosion test specimens. The coupons will be photographed, visually inspected with a minimum of 10× power, dimensionally measured (to within 0.0001 in.) and weighed (to within 0.0001 gm). An ongoing record of the appearance, dimension, and weight, of each respective coupon sample will be maintained showing changes from previous evaluations. Rates and trends of corrosion will be determined for each respective sample, and changes in rates and trends will be noted. As warranted based on observed coupon corrosion rates, Aera may conduct additional downhole tests in wells, only as needed, for comparison and to demonstrate continual mechanical integrity.

5.3.1 Additional Downhole Corrosion Tests

An initial casing inspection log will be run prior to commencing injection operations as per 40 CFR 146.87(a)(4)(iv) and will provide baseline casing wall thickness measurements to which future logs will be compared. Subsequent casing inspection logs will be run as warranted based on observed coupon corrosion rates and trends or as required by the UIC Program Director, as per CFR 146.89(d) and 146.90(e). Aera will provide written notification to the UIC Program Director at least 30 days of prior to running these logs, as per 40 CFR 146.87(f). Casing inspection log measurement showing a wall thickness reduction greater than 20 percent from the initial log will be evaluated and may warrant corrective action.

6. ABOVE CONFINING ZONE MONITORING

Aera will monitor groundwater quality for potential geochemical changes above the confining zone during the operation period to meet the requirements of 40 CFR 146.90(d).

Aera will conduct pressure, temperature, and pulsed neutron logging along with fluid composition monitoring in the sandstone units directly overlying the primary confining unit and the secondary confining unit. This testing will allow for early detection of potential leakage from the injection zone. The monitoring wells will be located on Aera property.

The two sandstone units in which monitoring will be conducted are as follows:

- Agua Sandstone, approximately 7,500 to 7,800 ft TVD: permeable zone immediately above the primary confining layer (Lower Santos Shale)

- Lower Carneros Sandstone, approximately 6,550 to 7,150 ft TVD: permeable zone directly above the secondary confining layer (Upper Santos Shale)

A generalized stratigraphic column for the North Belridge oil field is depicted in **Figure 1**.

6.1 Monitoring Location and Frequency

Table 5 shows the planned monitoring methods, locations, and frequencies for groundwater quality and geochemical monitoring above the confining zone. The locations of the project monitoring wells are shown in **Figure 2**. These wells are located to allow for early detection of potential leakage from the injection zone into the permeable Agua or Lower Carneros Sandstones, which directly overlie the primary and secondary confining layers, respectively.

Pulsed neutron logging will be used to understand the porosity of different sections of the monitoring zone and to monitor for the presence of fluids and potential CO_2 leakage. The saturation will be used to quantify the amount of CO_2 leaking through the primary confining layer, with the location used to identify a potential pathway of the leakage and what corrective actions may be necessary.

Pressure and temperature will be monitored continuously to identify indicators of potential leakage from the injection zone to the monitoring zone. An increase in pressure and decrease of temperature in the monitoring zone may indicate leakage of CO_2 or other displaced gases and/or reservoir fluids from the injection zone into the Agua or Lower Carneros Sandstones. Because pressures in the monitoring zone are expected to be generally stable, variations from baseline identified through fluid sampling and analysis may provide an additional indicator of potential leakage of CO_2 or displacement of reservoir fluids into the monitoring zones.

Fluid will be analyzed for geochemical properties (CO_2 concentrations, pH, and metal ions) to detect potential leakage from the injection zone as evidenced by increases in CO_2 or metals concentrations due to increased acidity during injection. While changes are not anticipated, as the project progresses and the CO_2 plume migrates within the AoR, data will be analyzed to evaluate if additional monitoring is warranted.

Baseline monitoring will be conducted prior to injection to establish conditions against which to compare future monitoring data. A numerical database will be used to establish statistical bounds of each analytical parameter for comparison of the baseline to injection period data. Significant abnormalities or changes will be used to evaluate sequestration efficacy and if additional sampling events may be warranted. Abnormalities suggestive of leakage could include increased TDS, change in cation and/or anion signature(s), increase in CO_2 concentrations, pH changes, or changes in dissolved metal concentrations.

Table 5: Monitoring of Fluid Composition and Geochemical Changes Above the Confining Zone

Target Formation	Monitoring Activity	Monitoring Location(s)	Spatial Coverage	Frequency[1,2]
Agua Sandstone (approximately 7,500-7,800 ft TVD)	Fluid sampling	Monitoring wells 1-28N and 25-26N	Northern half of injection area	Baseline: Once prior to first injection. During injection: annually
	Temperature and Pressure Monitoring	Monitoring wells 1-28N and 25-26N	Vertical distribution within well casings (based upon geophysical data indicating most transmissive interval within the perforation)	Continuous
	Pulsed neutron logging	Monitoring wells 1-28N and 25-26N	Along wellbore	Baseline: Once prior to first injection During injection: annually
Lower Carneros Sandstone (approximately 6,550–7,150 ft MD)	Pressure	Monitoring well 35X-27N	Above injection zone	Continuous
	Fluid sampling	Monitoring well 35X-27N	Above injection zone	Baseline: Once prior to first injection During injection: annually

Notes:
1. Annual sampling will occur up to 45 days before the anniversary date of authorization of injection each year.
2. Logging will take place up to 45 days before the anniversary date of authorization of injection each year.

MD: measured depth

6.2 Analytical Parameters

Table 6 identifies the parameters to be monitored and the analytical methods. Fluid sampling is planned to include an extensive set of chemical parameters to establish aqueous geochemical data. Parameters will include selected constituents that:

- Have primary and secondary EPA drinking water maximum contaminant levels;
- Are the most responsive to interaction with CO_2 or brine;
- Are needed for quality control; and
- May be needed for geochemical modeling.

If new information or updates to the geochemical modeling based on pre-operational testing identifies additional subsurface geochemical processes (e.g., potential changes in subsurface properties or potential contaminant mobilization), the list of subsurface fluid analytical parameters may be updated.

Table 6: Summary of Analytical and Field Parameters for Fluid Sampling

Parameters	Analytical Methods
Cations/metals (aluminum, barium, calcium, manganese, sodium, potassium, iron, arsenic, magnesium, silica, cadmium, chromium, copper, lead, selenium, titanium, zinc)	EPA Method 200.7/200.8 or similar
Anions (chloride, sulfate, sulfide, bromide, fluoride, nitrate)	EPA Method 300.0/300.1 or similar; SM 4500 for sulfide
Dissolved gases - CO_2 - CH_4 - O_2 - H_2S (field)	 RSK-175M RSK-175M SM 4500 OG or RSK-175M Field
Total dissolved solids	EPA Method 160.1/SM 2540 C
Alkalinity	SM 2320 B/EPA Method 310.1
Field measurements: - pH - Specific conductance - Temperature	 EPA Method 150.1/SM4500-H+B EPA Method 120.1 Thermocouple
Hardness	SM 2340C
Turbidity	SM 2130B
Specific gravity	SM2710F
Water density	SM2710F
Dissolved inorganic carbon isotopes ($\delta^{13}C$)	Mass spectrometry

6.3 Sampling Methods

Sampling will be performed in accordance with the **QASP**. Samples will be handled and shipped to the selected analytical laboratory under standard chain-of-custody procedures, detailed in the **QASP** and in the following section.

6.4 Laboratory to be Used/Chain of Custody Procedures

Samples will be analyzed by California-certified laboratories using standard method-specific procedures. Selected laboratories, methods, and detection limits are listed in the **QASP**, along with required chain of custody procedures.

Chain of custody information will include sampling date, sample description, type of sample, sampler name, location of sampling, methods for analysis, preservatives in the sample container, requested turnaround time for sample results, and the names and signatures of the people relinquishing and receiving the sample(s).

6.5 Surface Air and/or Soil Gas Monitoring

Pursuant to 40 CFR 146.90 (h)(1) through (3), surface air monitoring and/or soil gas monitoring may be required by the EPA for Class VI wells based on potential endangerment to USDWs within the AoR. There is little potential for USDW endangerment within the AoR for numerous reasons (**Section 2.7** of the Application Narrative) which include an aquifer exemption for portions of the North Belridge oil field [EPA, 2019], groundwater TDS concentrations exceeding the 10,000 mg/L threshold to be considered a USDW in parts of the Alluvium [Wood Environmental and Infrastructure Solutions, Inc., 2021], and where there is groundwater within the Alluvium with

TDS potentially less than 10,000 mg/L, there are multiple confining layers and low risk for communication with the injection zone. In the portions of the AoR where there is no aquifer exemption and TDS concentrations in groundwater are unknown, if groundwater occurs within the Tulare Fm and/or Alluvium, it is considered a potential USDW; however, the potential for endangerment caused by CO_2 injection is still low due to the anticlinal geometry, presence of multiple confining units, and the limited extent of these potential USDWs.

If the results of planned pre-operational testing identify significant uncertainties about the geologic setting, EPA may mandate surface air and/or soil gas monitoring be conducted under 40 CFR 146.90; if this occurs, Aera will comply with these requirements. Class VI injection wells are also subject to Subpart RR of the EPA Greenhouse Gas (GHG) Reporting Program. This rule requires facilities to develop and implement an MRV plan that is site specific and details the maximum monitoring area (MMA), active monitoring area (AMA), potential leakage pathways, strategies for detecting and quantifying leakage, and general information on CO_2 received for injection. Aera will comply with these requirements by developing and implementing an EPA-approved MRV plan.

7. EXTERNAL MECHANICAL INTEGRITY TESTING

Aera will conduct at least one of the tests presented in **Table 7** periodically during the injection phase to demonstrate external mechanical integrity as required at 146.89(c) and 146.90.

7.1 Testing Location and Frequency

To demonstrate the external mechanical integrity of the CO_2 injection wells, Aera will conduct at least one of the tests presented in **Table 7** annually during the injection phase, as required in 146.89(c) and 146.90(e). External mechanical integrity tests will be also performed on monitoring wells if irregularities are observed in continuous measurements of the surface tubing and annulus pressure or during routine logging, testing, and sampling programs.

Table 7: Annual External Mechanical Integrity Tests (MITs)

Test Description	Location
Temperature	Conventional wireline well log or DTS
Acoustic	Conventional wireline noise log
Oxygen Activation	Conventional wireline well log

7.2 Testing Details

Aera will run at least one of the tests in **Table 7** every year, within 45 days of the respective anniversary date of the start of injection on each CO_2 injection well, and as warranted on monitoring wells.

DTS allows for continuous temperature profiles over the installed depth rather than measurements at fixed points. DTS fiber optic cable will be cemented in the annulus and will be utilized from the surface to top of the confining layer in the injection wells to continuously provide accurate temperatures profiles of the injection stream. The continuous temperature data can be analyzed to

provide information about the specific depths that the CO_2 enters the formation. Abnormal temperature profiles may indicate mechanical integrity concerns or unexpected leakage of CO_2. DTS will be installed in monitoring wells, 1-28N, 39-26N, 25-26N and 27-1N.

The following general procedure will be followed for logging:

- Notify the UIC Program Director of the logging schedule at least 30 days prior to logging, per 40 CFR 146.87(f).
- Move in and rig up wireline logging unit. Assemble the temperature, oxygen activation, or noise logging tools.
- Rig up wireline pressure control equipment and test for leaks.
- Run in the hole with tools to plug back total depth and log to surface per industry-cased hole logging standards.
- Recover tools and rig down.
- Interpret log results.
- As required in 40 CFR 146.88(f), if there is an indication of a loss of mechanical integrity:
    - Cease injection;
    - Take the steps reasonably necessary to determine whether there may have been a release of the injected CO_2 stream or formation fluids into any unauthorized zone;
    - Notify the UIC Program Director within 24 hours;
    - Restore and demonstrate mechanical integrity to the satisfaction of the UIC Program Director prior to resuming; and
    - Notify the UIC Program Director when injection can be expected to resume.
- If mechanical integrity is confirmed, prepare and submit a report on the interpreted logging results to the UIC Program Director within 30 days, as required in 40 CFR 146.91(b).

8. PRESSURE FALL-OFF TESTING

Aera will perform pressure fall-off tests during the injection phase as described below to meet the requirements of 40 CFR 146.90(f).

8.1 Testing Location and Frequency

A pressure fall-off test will be conducted on each operational Class VI injection well, at least once every 5 years throughout the injection phase of the project. Results of pressure fall-off tests will be submitted to UIC Program Director electronically within 30 days of the test [40 CFR 146.91(e) and 146.91(b)(3)].

Aera will conduct pressure fall-off testing according to the procedure below.

8.2 Testing Details

A pressure fall-off test is composed of a period of injection followed by a period of shut-in. Aera will hold and record a constant injection rate while maintaining as stable operating conditions as practically possible prior to the test shut-in period. The injection will then be shut in instantaneously at the wellhead or as near the wellhead as feasible. One or more pressure gauges will record the pressure either downhole, at or near the wellhead or both downhole and at the wellhead. Each gauge will be of type that meets or exceeds American Society of Mechanical Engineers B 40.1 Class 1A (1% accuracy across full range). The surface pressure gauge will cover the 0 to 3,000-psi range while the downhole gauge will cover the 0 to 8,000 psi range. Exact gauges specifications will be included in each test report.

Overall, measures will be taken to acquire test data of sufficient quality, over sufficient time periods, to enable clear interpretation of the test results and an evaluation of the near-wellbore formation properties.

9. CARBON DIOXIDE PLUME AND PRESSURE FRONT TRACKING

Aera will employ direct and indirect methods to track the extent of the CO_2 plume and the presence or absence of elevated pressure during the operation period to meet the requirements of 40 CFR 146.90(g). As shown below, the plan and schedule are designed to monitor the free-phase CO_2 plume location, thickness, and saturation; track the pressure development within the AoR over time; validate computational modeling results; and demonstrate the operations are not leading to elevated CO_2 or brine leakage or seismic risks.

Annual fluid sampling, pulsed neutron logging, and continuous measurements of injection zone temperature and pressure within four monitoring wells will provide a robust mechanism for tracking the extent of the CO_2 plume and the presence or absence of elevated pressures.

Monitoring well locations were selected based on simulated plume and pressure front migration and are in locations to validate the simulation results with the monitoring plan outlined below. **Figures 3 and 4** show the predicted evolution of the CO_2 plume and pressure front, respectively, during and following injection.

9.1 Plume Monitoring Location and Frequency

Table 8 presents the methods that Aera will use to monitor the position of the CO_2 plume, including the activities, locations, and frequencies Aera will employ. The parameters to be analyzed as part of fluid sampling in the injection zone and associated analytical methods are the same as for above confining zone monitoring and are presented in **Table 6**.

Quality assurance procedures for these methods are presented in **Section 1.4** of the **QASP**.

Table 8: CO_2 Plume Monitoring Activities

Target Formation	Monitoring Activity	Monitoring Location(s)	Spatial Coverage	Frequency
Direct Plume Monitoring				
64 Zone	Fluid sampling	1-28N	1 Point Location: ~8,029 - 8,358 ft MD	Annual
64 Zone	Fluid sampling	39-26N	1 Point Location: ~7,975 - 8,243 ft MD	Annual
64 Zone	Fluid sampling	27-1N	1 Point Location: ~8,001 - 8,302 ft MD	Annual
Indirect Plume Monitoring				
64 Zone	Pulsed neutron logging	1-28N	Survey log: ~7,505 - 8,450 ft MD	Quarterly until plume identified, then annual
64 Zone	Pulsed neutron logging	39-26N	Survey log: ~7,667–8,300 ft MD	Quarterly until plume identified, then annual
64 Zone	Pulsed neutron logging	27-1N	Survey log: ~7,594 - 8,278 ft MD	Quarterly until plume identified, then annual
64 Zone	DTS	1-28N	Entire Wellbore	Continuous
64 Zone	DTS	39-26N	Entire Wellbore	Continuous
64 Zone	DTS	27-1N	Entire Wellbore	Continuous

9.2 Plume Monitoring Details

9.2.1 Direct Methods

Fluid Sampling

The primary method for direct plume monitoring will be fluid sampling from the injection zone to detect changes from baseline values, indicative of the CO2 plume's presence. Samples will be collected annually, up to 45 days before the anniversary date of authorization of injection each year. The parameters to be analyzed as part of the fluid sampling in the target injection zone and the analytical methods are presented in Table 6.

9.2.2 Indirect Methods

Distributed Temperature Sensing

Distributed temperature sensing allows for continuous temperature profiles over the installed depth rather than measurements at fixed points The continuous temperature data can be analyzed to provide information about the specific depths that the CO_2 enters the formation. Abnormal temperature profiles may indicate mechanical integrity concerns or unexpected leakage of CO_2. DTS will be installed in the 64 Zone monitoring wells, 1-28N, 39-26N, and 27-1N, to identify temperature changes that may indicate the CO_2 plume's arrival at that location. DTS will also be installed in the Agua sandstone monitoring well 26-25N to evaluate temperature changes above the injection zone.

Pulsed Neutron Logging

The CO_2 plume location will be tracked using pulsed neutron logging that will provide high-resolution vertical data around the wellbore of each monitoring well. The saturation of CO_2 in the target formation will be estimated by measuring the die-away time of a short neutron pulse. The die-away time is a function of the porosity and the fluid types in the rock. Pulsed neutron log accuracy and calibration are discussed in the **QASP** (**Section 1.4.7**)

An initial pulsed neutron log will be performed before the CO_2 plume reaches the monitoring well and will serve as a baseline that future measurements will be compared against. Increases in CO_2 saturation relative to baseline may indicate that the plume has reached the monitoring well. These data will be used in reevaluations of the AoR (**Attachment B**).

9.3 Pressure-Front Monitoring Location and Frequency

9.3.1 Distributed Pressure Sensing

Aera will deploy pressure gauges in each monitoring well to continuously monitor reservoir pressure and detect the position of the pressure front. **Table 9** presents the methods that Aera will use to monitor the position of the pressure front, including the activities, locations, and their frequencies.

Quality assurance procedures for these methods are presented in **Section 1.4.7** of the **QASP**.

Table 9: Pressure Front Monitoring Activities

Target Formation	Monitoring Activity	Monitoring Location(s)	Spatial Coverage	Frequency
Direct Pressure-Front Monitoring				
64 Zone	DTS/Pressure Gauge	1-28N	Distributed measurement to ~8,450 ft MD	Continuous
64 Zone	DTS/Pressure Gauge	39-26N	Distributed measurement to ~8,243 ft MD	Continuous
64 Zone	DTS/Pressure Gauge	27-1N	Distributed measurement to ~8,278 ft MD	Continuous

9.4 Seismicity Monitoring

A microseismic monitoring network will be utilized to detect microseismic events at or above magnitude 1.0 in real time. Events with an event magnitude of at least 1.0 will be detectable across the entirety of the AoR from surface to at least 2,000 ft below the injection zone and at least 1 mile radius of the injection wells. Future technologies may be added to the seismic monitoring network pending evaluation and the approval of the UIC Program Director. Additionally, the California Integrated Seismic Network will be monitored continuously for indication of an earthquake of magnitude 2.7 or greater occurring within a radius of one mile of injection operations from commencement of injection activity to its completion. Aera will respond to seismic events with an epicenter in the AoR in accordance with the Seismic Response System for seismic events >M1.0 established in the Emergency and Remedial Response Plan (**Attachment I).** A summary of the seismic monitoring locations and frequencies is given in **Table 10**.

9.4.1 Network Design

A continuously recording distributed acoustic sensing (DAS) fiber optic cable will be deployed from approximately surface–8,000 ft within a plugged and abandoned well, 38-35N, located in the capproximate center of the AoR. DAS is a system using fiber optic cables to provide distributed strain sensing along the length of the cable. The combined downhole DAS in addition to public seismic monitoring stations will be capable of accurately detecting a magnitude event of at least 1.0 (or higher) within, and surrounding, the AoR.

9.4.2 Network Operation

After design, the microseismic network will be installed and tested. After testing is completed, the network will be operational to monitor for microseismic events in real time through the injection phase and into the post-injection period. Monitoring will begin at least one month prior to injection to establish the microseismic baseline.

Table 10: Summary of Passive Seismic Monitoring System

Target Formation	Monitoring Activity	Monitoring Location(s)	Spatial Coverage	Frequency
AoR	Seismic events over magnitude 1.0	Borehole DAS (38-35N) and public surface seismic stations	Within 1-mile radius of injection wells	Continuous
AoR	Seismic events over magnitude 2.7	California Integrated Seismic Network	Within 1-mile radius of injection wells	Continuous

CO_2 Saturation (%)

Notes:

The CO_2 plume is shown as a percent value of CO_2 saturation in the pore space, which is the sum of all phases (free-phase, dissolved phase in water, dissolved phase in oil, and residual) for all cells in the model at the respective time. The saturations are shown in map view by presenting the maximum value for all depths of the Area of Review. The Area of Review Boundary is defined as the maximum extent of the CO_2 plume and the pressure front.

TITLE AND APPROVAL SHEET

This Quality Assurance and Surveillance Plan (QASP) is approved for use and implementation at CarbonFrontier. The signatures below denote the approval of this document and intent to abide by the procedures outlined within it.

Name Title	Date
Name Title	Date
Name Title	Date

DISTRIBUTION LIST

The following project participants will receive the completed Quality Assurance and Surveillance Plan (QASP) and all future updates for the duration of the project.

1. PROJECT MANAGEMENT

1.1 Project/Task Organization

1.1.1 Key Individuals and Responsibilities

The project, led by Aera Energy LLC (Aera), includes participation from several subcontractors. The testing and monitoring activities responsibilities will be shared between Aera and their designated subcontractors and the program will be broken in six subcategories:

1. Subsurface Fluid Sampling
2. Well Logging
3. Mechanical Integrity Testing (MIT)
4. Pressure/Temperature Monitoring
5. Carbon Dioxide (CO_2) Stream Analysis
6. Geophysical Monitoring

1.1.2 Independence from Project QA Manager and Data Gathering

The majority of the physical samples collected and data gathered as part of the monitoring, verification, and accounting (MVA) program will be analyzed, processed, or witnessed by third parties independent and outside of the project management structure.

1.1.3 QA Project Plan Responsibility

Aera will be responsible for maintaining and distributing the official, approved Quality Assurance and Surveillance Plan (QASP). Aera will periodically review this QASP and consult with U.S. Environmental Protection Agency (EPA) if/when changes to the plan are warranted.

1.2 Problem Definition/Background

1.2.1 Reasoning

The Aera CarbonFrontier Carbon Capture and Sequestration (CCS) Project's MVA program has operational monitoring, verification, and environmental monitoring components. Operational monitoring is used to ensure safety with the procedures associated with fluid injection, determine the response of the injection zone, and the movement of the CO_2 plume. Aera will use its existing Supervisory Control and Data Acquisition (SCADA) system to monitor injection. Key monitoring parameters include the pressure of injection well tubing and annulus, injection zone geochemistry, above confining zone geochemistry, and seismicity. Other monitoring parameters include injection rate, total mass and volume injected, injection well temperature profile, and pressure front tracking.

The verification component will provide information to evaluate if leakage of CO_2 through the confining zone is occurring. This includes pulsed neutron logging, subsurface fluid monitoring, and pressure and temperature monitoring.

The environmental monitoring components will determine if the injectate were potentially released into the shallow subsurface. This monitoring includes pulsed neutron logging, subsurface fluid monitoring, and seismicity monitoring.

The primary goal of the CarbonFrontier MVA program is to demonstrate that project activities are protective of human health and the environment. To help achieve this goal, this QASP was developed to establish the quality standards of the testing and monitoring program to meet the requirements of the EPA's Underground Injection Control (UIC) Program for Class VI wells.

1.2.2 Reasons for Initiating the Project

The goal of the CarbonFrontier CCS Project is to inject and retain CO_2 for permanent geologic sequestration. In order to demonstrate that this can be done safely, a rigorous MVA plan is proposed to demonstrate that the injected CO_2 is retained within the intended storage reservoir.

1.2.3 Regulatory Information, Applicable Criteria, Action Limits

The Class VI Rule requires owners or operators of Class VI wells to perform several types of activities during the lifetime of the project in order to demonstrate that the injection wells maintain their mechanical integrity, that fluid migration and the extent of pressure elevation are within the limits described in the permit application, and that underground sources of drinking water (USDWs) are not endangered. These monitoring activities include mechanical integrity tests (MITs), injection well testing during operation, monitoring of subsurface fluid quality, and tracking of the CO_2 plume and associated pressure front. This document details both the measurements that will be taken as well as the steps to demonstrate that the quality of the data is such that the data can be used with confidence in making decisions during the life of the project.

1.3 Project/Task Description

1.3.1 Summary of Work to be Performed

Table 1 describes the testing and monitoring activities, reasoning, responsible parties, locations, methods, techniques, and purpose. **Tables 2** and **3** summarize the instrumentation and geophysical surveys, respectively.

The Testing and Monitoring Plan (**Attachment E**) contains the schedule for the activities listed in the tables mentioned above.

Table 1: Summary of Testing and Monitoring

Activity	Location(s)	Method	Pre-Injection Frequency	Injection Frequency	PISC Frequency	Analytical Technique	Lab/Custody	Purpose
CO_2 stream analysis	After compression and processing and before injection wellheads	Direct sampling	Once	Quarterly	N/A	Chemical analysis	California certified lab	Monitor injectate
Injection rate and volume	Before wellhead	Flow meter	N/A	Continuous	N/A	Direct measurement	N/A	Monitor injectate rate and volume
Injection temperature/ pressure	Before wellhead	Temperature/ pressure gauge	N/A	Continuous	N/A	Direct measurement	N/A	Monitor injectate temperature, pressure, and well integrity
Annular pressure	Wellhead	Pressure gauge	N/A	Continuous	None	Direct measurement	N/A	Monitor annular pressure and well integrity
Downhole pressure/ temperature	Injection wells	Downhole gauge and DTS	Continuous	Continuous	None	Direct measurement	N/A	Monitor reservoir pressure/injection temperature/well integrity
	Monitoring wells	Downhole gauge and DTS	Continuous	Continuous	Quarterly	Direct measurement	N/A	Monitor reservoir pressure/injection temperature/well integrity
Internal mechanical integrity	Injection wells and Monitoring wells	Annulus pressure test via annulus pressure gauge	Once	Every five years	None	Direct measurement	N/A	Monitor internal mechanical integrity of wellbore
External mechanical integrity	Injection wells	Temperature log/DTS, acoustic log, or oxygen activation log	Once	Annual	Once, prior to plugging	Physical analysis	N/A	Monitor external mechanical integrity
	Monitoring wells	Temperature log/DTS, acoustic log, or oxygen activation log	Once	As needed	As needed	Physical analysis	N/A	Monitor external mechanical integrity
	Injection wells	Ultrasonic casing/ cement log	Once	As needed	None	Physical analysis	N/A	Monitor well integrity
Corrosion monitoring	After compression	Coupon	Once	Quarterly	None	Physical analysis	N/A	Monitor well integrity
Pressure fall-off testing	Injection wells	Pressure gauge	Once	Every 5 years	None	Direct Measurement	N/A	Monitor well and reservoir integrity

Activity	Location(s)	Method	Pre-Injection Frequency	Injection Frequency	PISC Frequency	Analytical Technique	Lab/Custody	Purpose
Geochemistry monitoring	Monitoring wells: Agua Sandstone (I-28N, 25-26N); Lower Carneros Sandstone (35X-27N)	Fluid sampling	Once	Annually	Every two years	Chemical analysis	California certified lab	Monitor for CO_2 leakage
CO_2 plume tracking	Monitoring wells: 64 Zone (I-28N, 39-26N, 27-1N)	Fluid sampling	Once	Annually	Every two years	Direct Measurement	California certified lab	Directly monitor CO_2 plume migration
	Monitoring wells: 64 Zone (I-28N, 39-26N, 27-1N)	Pulsed neutron wireline log	Once	Annually	Every two years	Indirect measurement	N/A	Indirectly monitor CO_2 plume migration
	Monitoring wells: Agua Sandstone (I-28N, 25-26N)	Pulsed neutron wireline log	Once	Annually	Every two years	Indirect measurement	N/A	Monitor for CO_2 leakage
Pressure front tracking	Monitoring wells: 64 zone (I-28N, 39-26N, 27-1N); Agua Sandstone (I-28N, 25-26N); Lower Carneros Sandstone (35X-27N)	Pressure gauge	Continuously	Continuously	Continuously	Direct Measurement	N/A	Monitor pressure front migration
Seismic activity monitoring	AoR and within 1 mile radius of injection wells	Borehole DAS (38-35N)	Continuous	Continuous	None	Indirect measurement	N/A	Monitor natural and induced seismic activity of 1.0 for reservoir, well, facility, and pipeline integrity
	Within 1 mile radius of injection wells	California Integrated Seismic Network	Continuous	Continuous	Continuous	Indirect measurement	N/A	Monitor seismic activity of magnitude 2.7 or greater for reservoir, well, facility, and pipeline integrity

3D: three dimensional
DAS: distributed acoustic sensing
DTS: distributed temperature sensing
N/A: not applicable
PISC: post-injection site care

Table 2: Instrumentation Summary

Monitoring Location	Instrument Type	Monitoring Target (Formation or Other)	Data Collection Location(s)	Purpose
CO_2 facility	Pressure/temperature gauge	CO_2 stream	Plant, after compression	Monitor operation, equipment, and permit parameters
	Flowmeter	CO_2 stream	Plant, after compression	Monitor operation, equipment, and permit parameters
Monitoring wells	Pressure gauge	AOR	Wellbore (all wells)	Pressure front tracking and dissipation zone pressure monitoring
	Pulsed neutron logging tool		Logged interval total depth (TD) to surface casing	Well integrity and CO_2 plume migration
	DTS fiber optic		Wellbore (1-28N, 39-26N, 27-1N)	Well integrity and CO_2 plume migration
	DAS fiber optic		Wellbore (38-35N)	Downhole seismic activity monitoring
Injection wells	Pressure/temperature gauge	Injectate	Wellhead	Monitor operation, equipment, and permit parameters
	Pressure/temperature gauge	64 Zone	1 point location, below injection packer	Monitor operation, equipment, and permit parameters
	Pressure gauge	Injection well annular pressure	Wellhead	Monitor operation, equipment, and permit parameters, integrity of casing, tubing and packer
	Fluid level acoustic sensor	Injection well annular fluid level	Wellhead	Monitor equipment, integrity of casing, tubing and packer
	DTS fiber optic	AoR	Wellbore	Monitor the operation, equipment, and permit parameters; well integrity

AoR: area of review
DAS: distributed acoustic sensing
DTS: distributed temperature sensing

Table 3: Geophysical Surveys Summary

Monitoring Activity	Tool or Survey Description	Monitoring Location	Monitoring Target (Formation or Other)	Purpose
Well logs	Triple Combo	New injection wells	Surface to TD	Reservoir and fluid properties, correlations
	Pulsed neutron	monitoring wells	Injection zone, primary confining layer, and first permeable layer above primary confining layer	Well integrity and CO_2 plume saturation
	Cement bond log/ultrasonic casing cement inspection log	Injection wells	All casing strings	Well integrity

TD: total depth

1.3.2 Geographic Locations

The planned location of injection and monitoring wells are provided in **Table 4** and are shown in **Figure 1.**

1.3.3 Resource and Time Constraints

No resource or time constraints have been identified during the pre-construction phase.

1.4 Quality Objectives and Criteria

1.4.1 Performance/Measurement Criteria

The overall objective of quality assurance for monitoring is to develop and implement procedures to provide results that meet the site characterization and non-endangerment requirements set for the Class VI permit.

Table 5 summarizes parameters for analytical and field monitoring of subsurface fluid quality. Subsurface fluid monitoring will be conducted during the pre-injection, injection, and post-injection phases of the project. Monitoring wells will be used to gather water-quality samples and pressure data. **Tables 6** and **7** summarize the analytical parameters for CO_2 stream monitoring and corrosion coupon assessment. The list of analytes may be reassessed periodically and adjusted to

include or exclude compounds based on their effectiveness to the overall monitoring program goals. **Table 8** summarizes the specifications for field gauges.

Table 9 summarizes the typical outcome of testing and monitoring results, including activity levels of each parameter, project action limits, detection limits, and anticipated readings. This will serve as a reference for data review, validation, and taking corrective actions.

Key testing and monitoring areas include:

- Subsurface fluid sampling
    - Aqueous chemical concentrations
- Well logging
    - Pulsed neutron logging
- Corrosion monitoring
- Mechanical integrity testing (MIT)
    - Pressure, temperature and acoustic logging
    - Pulsed neutron logging
    - Cement and casing evaluation logging
- Pressure/temperature monitoring
    - Pressure/temperature from in-situ gauges
    - Pressure/temperature from surface gauges
    - Temperature from distributed temperature sensing
- CO_2 stream analysis
    - Carbon dioxide (CO_2, volume per volume [v/v])
    - Moisture (H_2O, parts per million [ppm] v/v)
    - Oxygen (O_2, ppm v/v)
    - Nitrogen (N_2, ppm v/v)
    - Argon (Ar, ppm v/v)
    - Hydrogen (H_2, ppm v/v)
    - Carbon monoxide (CO, ppm v/v)
    - Nitrogen oxides (NOx, ppm v/v)
    - Ammonia (NH_3, ppm v/v)
    - Total hydrocarbons (THC, ppm v/v as CH_4)
    - Methane (CH_4, ppm v/v)

  - aromatic hydrocarbons (ppm v/v)
  - Total sulfur (TS, ppm v/v)
  - Sulfur dioxide (SO_2, ppm v/v)
  - Hydrogen sulfide (H_2S, ppm v/v)
  - Isotope δ13C (per mil, ‰)
  - Ethanol (ppm v/v)
- Seismicity monitoring
  - Distributed acoustic sensing (DAS) fiber optic

Table 5: Summary of Analytical and Field Parameters for Fluid Sampling

Parameters	Analytical Methods[1]	Detection Limit/Range[2]	Typical Precisions (Laboratory Control Limit) [2]	Typical Quality Control (QC) Requirements
Cations/metals (aluminum, barium, manganese, arsenic, cadmium, chromium, copper, lead, selenium, titanium, zinc)	EPA Method 200.7/200.8 or similar by inductively coupled plasma optical emission spectroscopy (ICP-OES) or mass spectroscopy (ICP-MS)	0.01 to 2 mg/L (analyte, dilution, and matrix dependent; scanning or selective ion monitoring mode dependent)	85-115%	Daily calibration; blanks, duplicates, QC check std, and matrix spikes at 10% or greater frequency
Cations/metals (calcium, sodium, potassium, iron, magnesium, silica)				Daily calibration; blanks, duplicates, QC check std, and matrix spikes at 10% or greater frequency
Anions (chloride, sulfate, sulfide, bromide, fluoride, nitrate)	EPA Method 300.0/300.1 or similar by ion chromatography; SM 4500 for sulfide by colorimetry	0.1 to 1 mg/L for 300.0/300.1; 0.05 mg/L for SM 4500 (sulfide) (analyte, dilution, and matrix dependent)	90-110%; 70-130% for sulfide	Daily calibration; blanks, duplicates, QC check std, and matrix spikes at 10% or greater frequency
Dissolved CO_2	Coulometric titration or RSK-175M by gas chromatography/flame ionization detector (GC/FID)	5 µg/L	80-120%	Daily calibration; blanks, duplicates, QC check std, and matrix spikes at 10% or greater frequency
Dissolved CH_4	RSK-175M by GC/FID	1 µg/L	80-120%	Daily calibration; blanks, duplicates, QC check std, and matrix spikes at 10% or greater frequency
Dissolved O_2	SM 4500 OG by Membrane Electrode Method or RSK-175M by GC/FID	0.01 mg/L	80-120%	Daily calibration; blanks, duplicates, QC check std, and matrix spikes at 10% or greater frequency
Dissolved H_2S (field)	Field Test Kit	Dependent on selected field test kit	Dependent on selected field test kit	Dependent on selected field test kit
Total dissolved solids	EPA Method 160.1/SM 2540 C by gravimetry	1 mg/L	84-108 %	Balance calibration, duplicate analysis, QC check std
Alkalinity	SM 2320 B/EPA Method 310.1 by titration	5 mg/L	80-120%	Daily calibration of pH, blanks, duplicates, QC check std

Parameters	Analytical Methods[1]	Detection Limit/Range[2]	Typical Precisions (Laboratory Control Limit) [2]	Typical Quality Control (QC) Requirements
pH (field)	EPA Method 150.1/SM4500-H+B electrometrically	Dependent on field meter selected	Dependent on field meter selected	User calibration per manufacturer recommendation, QC check std
Specific conductance (field)	EPA Method 120.1 by conductivity meter	Dependent on field meter selected	Dependent on field meter selected	User calibration per manufacturer recommendation, QC check std
Temperature (field)	Thermocouple	Dependent on field meter selected	Dependent on field meter selected	Factory calibration
Hardness	SM 2340C by titration	7.05 mg/L	Dependent on selected laboratory	Daily calibration; blanks, duplicates, QC check std, and matrix spikes at 10% or greater frequency
Turbidity	SM 2130B by nephelometry	0.05 NTU	90-110%	Daily calibration; blanks, duplicates, QC check std, and matrix spikes at 10% or greater frequency
Specific gravity	SM 2710F by calculation	0.05	Dependent on selected laboratory	Daily calibration; blanks, duplicates, QC check std, and matrix spikes at 10% or greater frequency
Water density	SM 2710F by calculation	0.05g/cc	Dependent on selected laboratory	Daily calibration; blanks, duplicates, QC check std, and matrix spikes at 10% or greater frequency
Dissolved inorganic carbon isotopes ($\delta^{13}C$)	Mass spectrometry	Dependent on selected laboratory	Dependent on selected laboratory	Dependent on selected laboratory

Note 1: An equivalent method may be employed with the prior approval of the UIC Program Director.
Note 2: Detection limits and precision (laboratory control limits) are typical for these analytical methods and were provided by Eurofins Environment Testing.
µg/L: microgram per liter
g/cc: gram per cubic centimeter
mg/L: milligrams per liter
NTU: Nephelometric turbidity unit

Table 6: Summary of Analytical Parameters for CO_2 Stream

Parameters	Analytical Methods[(1)]	Detection Limit/Range	Typical Precisions	QC Requirements[(2)]
Carbon dioxide (CO_2)	ASTM D1945-14 (2019). Gas Chromatography (GC) with thermal conductivity detector (TCD).	0.01-20 mol.%	0.01-0.10% repeatability and 0.02-0.15% duplicability between 0-20 mol.%	Routine calibrations per ASTM standards; blanks, duplicates, QC check standards by the contracted laboratory
Moisture (H_2O)	ISBT 3.0. electrometric moisture analyzer.	0-100 ppm. v/v	5-10% @ 10 ppm v/v	Routine calibrations per ISBT standards; blanks, duplicates, QC check standards by the contracted laboratory
Oxygen (O_2)	ASTM D1945-14 (2019). GC/TCD.	0.01-20 mol.%	0.01-0.10% repeatability and 0.02-0.15% reproducibility between 0-20 mol.%	Routine calibrations per ASTM standards; blanks, duplicates, QC check standards by the contracted laboratory
Nitrogen (N_2)	ASTM D1945-14 (2019). GC/TCD.	0.01-100 mol.%	0.01-0.10% repeatability and 0.02-0.15% reproducibility between 0 – 100 mol.%	Routine calibrations per ISBT standards; blanks, duplicates, QC check standards by the contracted laboratory
Argon (Ar)	ISBT 4.0. GC with discharge ionization detector (DID).	0-100 ppm. v/v	5-10% @ 30 ppm v/v	Routine calibrations per ISBT standards; blanks, duplicates, QC check standards by the contracted laboratory
Hydrogen (H_2)	ASTM D1945-14 (2019). GC/TCD.	0.01-10 mol.%.	0.01-0.08% repeatability and 0.02-0.12% reproducibility between 0 – 10 mol.%	Routine calibrations per ASTM standards; blanks, duplicates, QC check standards by the contracted laboratory
Carbon monoxide (CO)	ISBT 5.0. GC with pulsed discharge ionization detector (PDID).	0-50 ppm. v/v	5-10% @ 10 ppm v/v	Routine calibrations per ISBT standards; blanks, duplicates, QC check standards by the contracted laboratory
Nitrogen oxides (NO_x)	ISBT 7.0. colorimetric tubes to detect NO and NO_2.	0.2-10 ppm. v/v	5-30% of full scale	Routine calibrations per ISBT standards; blanks, duplicates, QC check standards by the contracted laboratory
Ammonia (NH_3)	ISBT 6.0. ammonia-specific colorimetric detector tube.	0.5-5 ppm. v/v	5-30% of full scale	Routine calibrations per ISBT standards; blanks, duplicates, QC check standards by the contracted laboratory
Total hydrocarbons (THCs)	ISBT 10.0. GC with flame ionization detector (FID).	0-100 ppm. v/v	1-2% @ 20 ppm v/v	Routine calibrations per ISBT standards; blanks, duplicates, QC check standards by the contracted laboratory
Methane (CH_4)	ASTM D1945-14 (2019). GC/TCD.	0-100 mol.%	0.01-0.10% repeatability and 0.02-0.15% reproducibility between 0 – 100 mol.%	Routine calibrations per ISBT standards; blanks, duplicates, QC check standards by the contracted laboratory

Parameters	Analytical Methods[(1)]	Detection Limit/Range	Typical Precisions	QC Requirements[(2)]
Aromatic hydrocarbons	ISBT 12.0. GC with photoionization detector (PID). 0-5 ppm	0-0.20 ppm	5-10% @ 0.020 ppm v/v	Routine calibrations per ISBT standards; blanks, duplicates, QC check std, and matrix spikes at 10% or greater frequency
Total sulfur	ISBT 13.0. GC with sulfur chemiluminescent detector (SCD).	0-5 ppm. v/v	5-10% @ 0.10 ppm	Routine calibrations per ISBT standards; blanks, duplicates, QC check standards by the contracted laboratory
Sulfur dioxide (SO_2)	ISBT 14.0. GC/SCD.	0-5 ppm. v/v.	5-10% @ 0.10 ppm v/v	Routine calibrations per ISBT standards; blanks, duplicates, QC check standards by the contracted laboratory
Hydrogen sulfide (H_2S)	ASTM D1945-14 (2019), GC/TCD.	0.3 - 30 mol.%	0.04-0.10% repeatability and 0.07-0.15% reproducibility between 0.3 – 30 mol.%	Routine calibrations per ASTM standards; blanks, duplicates, QC check standards by the contracted laboratory
Ethanol EtOH	EPA Method 8260B. GC with mass spectroscopy (MS).	25-500 ppb, v/v	10-13% between 25-500 ppb v/v	Routine calibrations per EPA recommendations; blanks, duplicates, QC check standards by the contracted laboratory
^{13}C isotope	USGS techniques and methods 5-D4. GC with dual-inlet isotope ratio mass spectrometry (GC-IRMS)	–50 to 3 ‰	±0.1 ‰	Quality assurance information to be provided by the contracted laboratory

Note 1: An equivalent method may be employed with the prior approval of the UIC Program Director.
Note 2: Key elements for quality assurance (QA) include: employing knowledgeable and responsible personnel to perform sample analysis, documentation, and reporting, establishing a QA team with experienced and dedicated reviewers to review results, and appropriate maintenance and calibration of equipment involved.

Table 7: Summary of Analytical Parameters for Corrosion Coupons

Parameters	Analytical Methods[(1)]	Detection Limit/Range	Typical Precisions	QC Requirements
Mass	NACE RP0775-2005	0.005 mg	+/- 2%	Annual calibration of scale
Thickness	NACE RP0775-2005	0.001 mm	+/- 0.005 mm	Factory calibration

Note 1: An equivalent method may be employed with the prior approval of the UIC Program Director.
mm: millimeter

Table 8: Summary of Measurement Parameters for Field Gauges

Parameters	Methods	Detection Limit/Range	Typical Precisions	QC Requirements
Booster pump discharge pressure	ANSI Z540-1-1994	+/- 0.001 psi / 0-3000 psi	+/- 0.01 psi	Annual calibration of scale
Injection tubing temperature	ANSI Z540-1-1994	+/- 0.001 °F / 0-500 °F	+/- 0.01 °F	Annual calibration of scale
Annulus pressure	ANSI Z540-1-1994	+/- 0.001 psi / 0-3000 psi	+/- 0.01 psi	Annual calibration of scale
Injection tubing pressure	ANSI Z540-1-1994	+/- 0.001 psi / 0-3000 psi	+/- 0.01 psi	Annual calibration of scale
Wellhead pressure	ANSI Z540-1-1994	+/- 0.001 psi / 0-3000 psi	+/- 0.01 psi	Annual calibration of scale
Downhole temperature	ANSI Z540-1-1994	+/- 0.001 °F / 0-500 °F	+/- 0.01 °F	Annual calibration of scale
Injection mass flow rate	Unknown	Dependent on selected meter	Depended on selected meter	Based on manufacturer specifications

psi: pounds per square inch

Table 9: Actionable Testing and Monitoring Outputs

Activity or Parameter	Project Action Limit	Anticipated Reading
Seismic Activity	Action taken based on magnitude and felt report or local observation as per Seismic Response System established in Emergency and Remedial Response Plan (**Attachment I**)	No seismic event greater than M2.5 within 1 mile of injection wells
Mechanical integrity (pulsed neutron log)	Action taken when pulsed neutron measurements indicate CO_2 outside of expected range / zone	No measurement change from baseline caused by CO_2 in annular space, above injection zone, or in formation above confining zone
Surface pressure / temperature	Action taken when pressures and temperatures are well outside of modeled / expected range	Pressures/temperatures within proposed operational ranges
Downhole pressure / temperature	Action taken when pressures and temperatures are well outside of modeled / expected range	Pressures/temperatures within proposed operational ranges
Subsurface fluid quality	Action taken when changes in fluid constituent concentrations indicate movement of CO_2 or brines into or above the confining zone	No statistically significant difference between observed and baseline geochemical parameter patterns in Agua Sandstone or Lower Carneros Sandstone formation
Above confining zone pressure	Action taken when pressures are well outside of modeled / expected range	Pressures within proposed operational range
Injection well annular volume	Action taken when annular volume is well outside of modeled / expected range	No expected annular volume change not related to temperature

1.4.2 Precision

Assessment of analytical precision can be made through the use of field generated duplicate samples as well as laboratory generated duplicate samples.

1.4.3 Accuracy and Bias

Data accuracy and bias will be assessed by analyzing standards of known concentrations and measuring its actual recovery in analysis versus the expected recovery. Laboratory assessment of analytical accuracy and bias will be the responsibility of the individual laboratories per their standard operating procedures (SOPs) and analytical methodologies and will be evaluated through the use of laboratory control samples, matrix spikes, and surrogates (where applicable). Assessment of bias in the field can be ascertained through collection of field blanks. Field blanks will be collected no less than one per sampling event to screen for sample bottle contamination. For direct pressure or logging measurements, there is no potential for bias with the instruments used to collect data.

1.4.4 Representativeness

Data representativeness expresses the degree to which data accurately and precisely represents a characteristic of a population, parameter variations at a sampling point, a process condition, or an environmental condition. The sampling network has been designed to provide data representative of site conditions. For analytical results of individual subsurface fluid samples, representativeness will be estimated by ion and mass balances. Ion balances with ±10% error or less will be considered valid. Mass balance assessment will be used in cases where the ion balance is greater than ±10% to help determine the source of error. For a sample and its duplicate, if the relative percent difference is greater than 10%, the sample may be considered non-representative.

1.4.5 Completeness

Data completeness is a measure of the amount of valid data obtained from a measurement system compared to the amount that was expected to be obtained under normal conditions. It is anticipated that data completeness of 90% for liquid sampling will be acceptable to meet monitoring goals. For direct pressure and temperature measurements, it is expected that data will be recorded no less than 90% of the time.

1.4.6 Comparability

Data comparability expresses the confidence with which one data set can be compared to another. The data sets to be generated by this project will be comparable to future data sets because of the use of standard sample collection and analytical methods and the level of QA/QC effort. If historical subsurface fluid data become available from other sources, their applicability to the project and level of quality will be assessed prior to use with data gathered on this project. Direct pressure, temperature, and logging measurements will be directly comparable to previously obtained data.

1.4.7 Method Sensitivity

Tables 10 through **15** provide additional details on gauge specifications and sensitivities. Values may change depending on vendor, service provider, and specific item chosen at time of operation.

Table 10: Pressure and Temperature – Downhole Gauge Specifications.

Parameter	Value
Calibrated working pressure range	Atmospheric to 10,000 psi
Initial pressure accuracy	<+/- 2 psi over full scale
Pressure resolution	0.005 psi at 1-s sample rate
Pressure drift stability	<+/- 1 psi per year over full scale
Calibrated working temperature range	77–266 °F
Initial temperature accuracy	<+/- 0.9°F per +/-0.27 °F
Temperature resolution	0.009 °F at 1-s sample rate
Temperature drift stability	<+/- 0.1 °F per year at 302 °F
Max temperature	302 °F

Table 11: Representative Logging Tool Specifications

Parameter	Pulsed Neutron	Cement Bond Log	Ultrasonic casing / cement inspection
Logging speed	Up to 3,600 ft/hr	Up to 3,600 ft/hr	400 to 4,500 ft/hr
Vertical resolution	15 in	3 ft	0.6 to 6.0 in
Investigation	Formation fluid saturation, annular space, mechanical integrity	Cement bond (cement-casing, cement-formation)	Casing and cement (cement-casing, cement-formation and annular coverage)
Temperature rating	350 °F	350 °F	350 °F
Pressure rating	15,000 psi	20,000 psi	20,000 psi

Table 12: Pressure Field Gauge—Injection Tubing Pressure

Parameter	Value
Calibrated working pressure range	0 to 3,000 psi
Initial pressure accuracy	< 0.04375 %
Pressure resolution	0.001 psi
Pressure drift stability	To be determined after first year

Table 13: Pressure Field Gauge—Annulus Pressure

Parameter	Value
Calibrated working pressure range	0 to 3000 psi
Initial pressure accuracy	< 0.04375 %
Pressure resolution	0.001 psi
Pressure drift stability	To be determined after first year

Table 14: Temperature Field Gauge—Injection Tubing Temperature

Parameter	Value
Calibrated working temperature range	0 to 500 °F
Initial temperature accuracy	< 0.0055 %
Temperature resolution	0.001 °F
Temperature drift stability	To be determined after first year

Table 15: Mass Flow Rate Field Gauge—CO_2 Mass Flow Rate

Parameter	Value
Calibrated working flow rate range	50,522 to 303,133 lb/hr
Initial mass flow rate accuracy	< 0.18 %
Mass flow rate resolution	0.0001 lb/hr
Mass flow rate drift stability	To be determined after first year

lb/hr: pounds per hour

1.5 Special Training/Certifications

1.5.1 Specialized Training and Certifications

The geophysical survey equipment and wireline logging tools will be operated by trained, qualified, and certified personnel, according to the service company that provides the equipment. The subsequent data will be processed and analyzed according to industry standards. No specialized certifications are required for personnel conducting subsurface fluid sampling, but field sampling will be conducted by personnel trained to understand and follow the project specific sampling procedures. Upon request, Aera will provide the agency with the laboratory SOPs developed for the specific parameter using the appropriate standard method. Each laboratory technician conducting the analysis on the samples will be trained on the SOP developed for each standard method. Aera will include the technician's training certification with the annual report.

1.5.2 Training Provider and Responsibility

Training for personnel will be provided by the operator or by the subcontractor responsible for the data collection activity.

1.6 Documentation and Records

1.6.1 Report Format and Package Information

Aera will submit an annual report containing the required project data, including testing and monitoring information as specified by the Class VI permit. Data will be provided in electronic or other formats as required by the UIC Program Director.

1.6.2 Other Project Documents, Records, and Electronic Files

Other documents, records, and electronic files such as well logs, test results, or other data will be provided as required by the UIC Program Director.

1.6.3 Data Storage and Duration

Aera or a designated contractor will maintain the required project data as specified in the Class VI permit.

1.6.4 QASP Distribution Responsibility

The Aera Plant Manager will be responsible for ensuring that those included on the distribution list will receive the most current copy of the approved QASP.

2. DATA GENERATION AND ACQUISITION

2.1 Sampling Process Design

Discussion in this section is focused on subsurface fluid sampling and does not address monitoring methods that do not gather physical samples (e.g., logging, seismic monitoring, and pressure/temperature monitoring). During the pre-injection and injection phases, subsurface fluid sampling is planned to include an extensive set of chemical parameters to establish aqueous geochemical baseline data. Parameters will include selected constituents that: (1) have primary and secondary EPA drinking water maximum contaminant levels, (2) are the most responsive to interaction with CO_2 or brine, (3) are needed for quality control, and (4) may be needed for geochemical modeling. The full set of parameters is presented in **Table 5**. After a sufficient baseline is established, monitoring scope may shift to a subset of indicator parameters that are (1) the most responsive to interaction with CO_2 or brine and (2) are needed for quality control.

Implementation of a reduced set of parameters would be done in consultation with the EPA. Isotopic analyses will be performed on baseline samples to the degree that the information helps verify a condition or establish an understanding of non-project related variations. For non-baseline samples, isotopic analyses may be reduced in the monitoring wells if a review of the historical project results or other data determines that further sampling for isotopes is not needed. During a period where a reduced set of analytes is used, if statistically significant trends are observed that are the result of unintended CO_2 or brine migration, then the analytical list would be expanded to the full set of monitoring parameters. The fluid samples will be analyzed using a laboratory meeting the requirements under the EPA National Environmental Laboratory Accreditation Program (NELAP). The other samples will be analyzed by the operator or a third-party laboratory.

Dissolved CO_2 will be analyzed by methods consistent with Test Method B of ASTM D 513-11 or equivalent. Isotopic analysis will be conducted using established methods.

2.1.1 Design Strategy

2.1.1.1 CO_2 Stream Monitoring Strategy

The primary purpose of analyzing the CO_2 stream is to evaluate the potential interactions of CO_2 and/or other constituents of the injectate with formation solids and fluids. This analysis can also identify (or rule out) potential interactions with well materials. Establishing the chemical composition of the injectate also supports the determination of whether the injectate meets the qualifications of hazardous waste under the Resource Conservation and Recovery Act (RCRA), 42 U.S.C. 6901 et seq. (1976), and/or the Comprehensive Environmental Response, Compensation, and Liability Act, (CERCLA) 42 U.S.C. 9601 et seq. (1980). Additionally, monitoring the chemical and physical characteristics of the CO_2 (e.g., isotopic signature, other constituents) may help distinguish the injectate from the native fluids and gases if unintended leakage from the storage reservoir occurred. Injectate monitoring is required at a sufficient frequency to detect changes to any physical and chemical properties that may result in a deviation from the permitted specifications.

Calibration of transmitters used to monitor pressures, temperatures, and flow rates of CO_2 into the injection well shall be conducted annually. Reports will contain test equipment used to calibrate the transmitters, including test equipment manufacturers, model and serial numbers, calibration dates, and expiration dates.

2.1.1.2 Corrosion Monitoring Strategy

Corrosion coupon analyses will be conducted quarterly to aid in demonstrating the mechanical integrity of the equipment in contact with the CO_2. Coupons shall be sent quarterly to a qualified company for analysis and an analysis conducted in accordance with NACE Standard RP-0775 (or similar) to determine and document corrosion wear rates based on mass loss.

2.1.1.3 Above Confining Zone Monitoring Strategy

Aera will monitor subsurface fluid composition for potential geochemical changes above the confining zone during the operation period to meet the requirements of 40 CFR 146.90(d).

Monitoring will be conducted in the following zones:

- Agua Sandstone, approximately 7,500 to 7,800 ft true vertical depth (TVD): zone immediately above the primary confining layer (Lower Santos Shale)
- Lower Carneros Sandstone, approximately 6,550 to 7,150 ft TVD: zone directly above the secondary confining layer (Upper Santos Shale)

The monitoring wells 1-28N and 25-26N will be used for fluid sampling of the groundwater in the Agua Sandstone at prescribed frequencies in **Attachment E**. Monitoring well 35X-27N will be used for fluid sampling of the groundwater in the Lower Carneros Sandstone. These wells are selected to allow for early detection of potential leakage from the injection zone into the permeable

Agua or Lower Carneros Sandstones, which directly overlie the primary and secondary confining layers, respectively.

Samples will be analyzed for constituents listed in **Table 5** to document baseline fluid chemistry and to detect changes in fluid chemistry that could result from the movement of brine or CO_2 from the storage interval through the seal formation.

2.1.1.4 Injection Zone Fluid Monitoring Strategy

The primary method for direct plume monitoring will be fluid sampling from the injection zone to detect changes from baseline values, indicative of the CO_2 plume's presence. Monitoring wells 1-28N, 39-26N, and 27-1N will be used for fluid sampling of the reservoir fluid in the injection zone. The parameters to be analyzed and the analytical methods are presented in **Table 5**.

2.1.2 Type and Number of Samples/Test Runs

Subsurface fluid sampling plans are detailed in **Attachment E** and summarized in **Tables 16** and **17**. CO_2 stream analysis plans are also detailed in **Attachment E**.

2.1.3 Site/Sampling Locations

Table 16 shows the planned monitoring methods and locations for subsurface fluid composition and geochemical monitoring above the confining zone. **Table 17** shows the planned monitoring methods and locations for subsurface fluid composition and geochemical monitoring in the injection zone. The locations of the monitoring wells are shown in **Figure 1**. Wells are located based on the AoR modeling to allow for tracking of the CO_2 plume and pressure front and early warning of leakage from the injection zone into the Agua Sandstone or Lower Carneros sandstone.

CO_2 stream sampling will occur after the pre-combustion and post-combustion sources have compressed and comingled so that the sample will be representative of the composition of the injectate.

Table 16: Monitoring of Fluid Composition and Geochemical Changes Above the Confining Zone

Target Formation	Monitoring Activity	Monitoring Location(s)	Spatial Coverage
Agua Sandstone (approximately 7,500-7,800 ft TVD)	Fluid sampling	Monitoring wells 1-28N and 25-26N	Northern half of injection area
	Temperature and Pressure Monitoring	Monitoring wells 1-28N and 25-26N	Vertical distribution within well casings (based upon geophysical data indicating most transmissive interval within the perforation)
	Pulsed neutron logging	Monitoring wells 1-28N and 25-26N	Along wellbore
Lower Carneros Sandstone	Pressure	Monitoring well 35X-27N	Above injection zone

Target Formation	Monitoring Activity	Monitoring Location(s)	Spatial Coverage
(approximately 6,550–7,150 ft MD)	Fluid sampling	Monitoring well 35X-27N	Above injection zone

Table 17: Monitoring of Fluid Composition and Geochemical Changes in the Injection Zone

Target Formation	Monitoring Activity	Monitoring Location(s)	Spatial Coverage
64 Zone	Fluid sampling	1-28N	1 Point Location: ~8,029 - 8,358 ft MD
		39-26N	1 Point Location: ~7,975 - 8,243 ft MD
		27-1N	1 Point Location: ~8,001 - 8,302 ft MD
	Pulsed neutron logging	1-28N	Survey log: ~7,505 - 8,450 ft MD
		39-26N	Survey log: ~7,667–8,300 ft MD
		27-1N	Survey log: ~7,594 - 8,278 ft MD
	DTS	1-28N, 39-26N, and 27-1N	Entire Wellbore

2.1.4 Sampling Site Contingency

The proposed monitoring wells are located on property owned by Aera and access permissions have already been granted. No problems with site accessibility are anticipated. If inclement weather makes site access difficult, sampling schedules will be reviewed, and alternative dates may be selected that would still meet permit-related conditions.

No problems of site inaccessibility are anticipated for CO_2 stream sampling. If inclement weather makes site access difficult, sampling schedules will be reviewed, and alternative dates may be selected that would still meet permit related conditions.

2.1.5 Activity Schedule

The subsurface fluid sampling activities are summarized in **Table 5** with schedules in **Tables 16** and **17**. The CO_2 stream sampling activities are summarized in **Table 6**. CO_2 stream sampling will be conducted quarterly.

2.1.6 Critical/Informational Data

During both sampling and analytical efforts, detailed field and laboratory documentation will be taken. Documentation will be recorded in field and laboratory forms and notebooks. Critical information will include time and date of activity, person/s performing activity, location of activity (well or field sampling location), method (instrument or lab analysis), field or laboratory

instrument calibration data, and field parameter values. For laboratory analyses, the laboratory will provide a report containing critical data generated during the analysis and provide to end users in digital and printed formats. Noncritical field data may include appearance and odor of the sample, problems with well or sampling equipment, and weather conditions.

2.1.7 Sources of Variability

Potential sources of variability related to monitoring activities include (1) natural variation in fluid quality, formation pressure and temperature and seismic activity; (2) variation in fluid quality, formation pressure and temperature, and seismic activity due to project operations; (3) changes in recharge due to rainfall, drought, and snowfall; (4) changes in instrument calibration during sampling or analytical activity; (5) different staff collecting or analyzing samples; (6) differences in environmental conditions during field sampling activities; (7) changes in analytical data quality during life of project; and (8) data entry errors related to maintaining project database.

Activities to eliminate, reduce, or reconcile variability related to monitoring activities include (1) collecting long-term baseline data to observe and document natural variation in monitoring parameters, (2) evaluating data in timely manner after collection to observe anomalies in data that can be addressed, be resampled or reanalyzed, (3) conducting statistical analysis of monitoring data to determine whether variability in a data set is the result of project activities or natural variation, (4) maintaining weather-related data using on-site weather monitoring data or data collected near project site (such as from local airports), (5) checking instrument calibration before, during and after sampling or sample analysis, (6) thoroughly training staff, (7) conducting laboratory quality assurance checks using third party reference materials, and/or blind and/or replicate sample checks, and (8) developing a systematic review process of data that can include sample-specific data quality checks (i.e., cation/anion balance for aqueous samples).

2.2 Sampling Methods

2.2.1 Sampling SOPs

2.2.1.1 Analytical Parameters

Table 5 identifies the parameters to be monitored and the analytical methods Aera will use for subsurface fluid sampling. If new information or updates to the geochemical modeling based on pre-operational testing raises additional concerns about subsurface geochemical processes (e.g., potential changes in subsurface properties or potential contaminant mobilization), the list of analytical parameters may need to be updated to ensure that the applicable parameters are included.

Subsurface fluid sampling data will be compared to baseline data to identify changing conditions in the subsurface, including fluid leakage. Abnormalities suggestive of leakage could include increased total dissolved solids (TDS), change in cation and/or anion signature(s), increase in CO_2 concentrations, pH changes, or changes in dissolved metal concentrations that indicate leaching of the geological formation.

Table 6 identifies the parameters to be monitored and the analytical methods Aera will use for CO_2 stream sampling. Revisions to the methods may be made in consultation with the UIC Program Director.

2.2.1.2 Sampling Methods

Fluid sampling will likely be performed using a U-tube sampling system to collect large volume samples recovered at the surface at reservoir pressure using a positive gas displacement pump driven with nitrogen gas. A downhole check valve allows fluid to flow into a loop of stainless-steel tubing, after which fluid is driven to the surface with compressed ultra-pure nitrogen gas. The sample is then collected at formation pressure at a volume of up to 100 liters. This sampling method prevents off-gassing and isolates the sample from ambient air. Samples will be depressurized for collection and submitted for laboratory analysis according to standard shallow groundwater analysis methods, described below, with temperature and pressure corrections calculated. Pressurized samples may become degassed, with gas analyzed, pending development of a project-specific SOP, as no EPA standard analytical methods are known for deep subsurface fluid. If U-tube sampling is determined to be infeasible in the monitoring well (which can occur if fines or precipitates accumulate in the system, for example), alternate sampling methods will be evaluated.

Depending on the developed laboratory project-specific SOP for analysis of pressurized samples, Aera will follow traditional groundwater sampling SOPs as needed. Samples requiring filtration will be filtered through 0.45-micrometer flow-through filter cartridges as appropriate and consistent with ASTM D6564-00. Before sample collection, filters will be purged with a minimum of 100 mL of well water (or more if required by the filter manufacturer). For field parameters, additional efforts will be made to minimize exposure time to the atmosphere during filtration, collection, and analysis.

Sample holding times will be consistent with those described in EPA (1974), American Public Health Association (APHA [2005]), Wood (1976), and ASTM Method D6517-00 (2005). After collection, samples will be placed in ice chests in the field and maintained thereafter at $\leq$6 °C, but not frozen, until analysis. The samples will be maintained at their preservation temperature and hand-delivered or shipped via overnight carrier to the designated laboratory within 24 hours. The sample bottles will have waterproof labels with information denoting project, sampling date and time, sampling location, sample identification number, sample type (fresh water or brine), analyte, volume, filtration used (if any), and preservative used (if any).

2.2.2 In-situ Monitoring

In-situ monitoring of subsurface fluid chemistry parameters is not currently planned.

2.2.3 Continuous Monitoring

Pressure data will be collected from monitoring wells on a continuous basis (e.g., hourly to daily) using dedicated pressure transducers with data loggers to characterize pressure trends.

2.2.4 Sample Homogenization, Composition, Filtration

Described above in **Section 2.2.1**.

2.2.5 Sample Containers and Volumes

For subsurface fluid samples, new sample bottles will be used. Sample bottles and bags for analytes will be used as received (ready for use) from the vendor or contract analytical laboratory for the analyte of interest. A summary of sample containers is presented in **Table 18**.

For CO_2 stream monitoring, samples will be collected in a clean sample container rated for the appropriate collection pressure (i.e., mini cylinders or polybags). Details are summarized in **Table 19**.

2.2.6 Sample Preservation

For subsurface fluid samples, the preservation methods in **Table 18** will be used. No preservation is required or used for CO_2 stream, and additional details of sampling requirements are shown in **Table 19**.

Corrosion coupon sampling only requires that the coupons be physically separated (e.g., sleeves, baggies) during transportation to prevent physical abrasion.

2.2.7 Cleaning/Decontamination of Sampling Equipment

Pumps and related equipment and materials necessary for subsurface fluid sampling will be selected based on site needs and cleaned and decontaminated according to standard guidelines.

The field glassware (pipets, beakers, filter holders, etc.) will be cleaned with tap water to remove any loose dirt, washed in a dilute nitric acid solution, and rinsed three times with deionized water before use.

CO_2 stream sampling containers will be either disposed of or decontaminated by the analytical laboratory.

2.2.8 Support Facilities

For subsurface fluid sampling, the following are required: air compressor, vacuum pump, generator, multi-electrode water quality sonde, analytical meters (pH, specific conductance, etc.). Field activities are usually completed in field vehicles and portable laboratory trailers located on site.

Sampling tubing, connectors and valves required to sample the CO_2 stream will be supplied by the analytical lab providing the sampling containers. Sampling will occur within the CO_2 compression unit.

Field gauges will be removed from injection and monitoring wells utilizing existing standard industry tools and equipment. Deployment and retrieval of verification well gauges will be done using procedures and equipment recommended by the vendor, subcontractor, or per standard industry practice.

2.2.9 Corrective Action, Personnel, and Documentation

Field staff will be responsible for properly testing equipment and performing corrective actions on broken or malfunctioning field equipment. If corrective action cannot be taken in the field, then

equipment will be returned to the manufacturer for repair or replacement. Significant corrective actions affecting analytical results will be documented in field notes.

2.3 Sample Handling and Custody

Logging, geophysical monitoring, and pressure/temperature monitoring does not apply to this section and is omitted.

Sample holding times will be consistent with those described in EPA (1974), APHA (2005), Wood (1976), and ASTM Method D6517-00 (2005). After collection, samples will be placed in ice chests in the field and maintained thereafter at $\leq$6 °C but not frozen until analysis. The samples will be maintained at their preservation temperature and hand-delivered or shipped via overnight carrier to the designated laboratory within 24 hours. Analysis of the samples will be completed within the holding time listed in **Tables 18** and **19**. As appropriate, alternative sample containers and preservation techniques approved by the UIC Program Director will be used to meet analytical requirements.

CO_2 stream sampling occurs under high pressure. Impurities in CO_2 may be improperly measured due to partitioning coefficient of CO_2 when in sampling system. It is a significant factor for consistently obtaining accurate analytical results. The point in the system where vaporization occurs must be well managed to prevent impurity partitioning and avoid over or under-reporting of impurities. ISBT 2.0 standard recommends that the vaporization devices including the pressure regulators remain heated during sample collection and analysis. Precautions should be taken to prevent icing at the vaporization point. Samples should be analyzed as soon as practically possible after collection to minimize potential sample adulteration.

2.3.1 Maximum Hold Time/Time Before Retrieval

See **Tables 18** and **19** for maximum sample holding time for subsurface fluid samples and CO_2 stream samples.

2.3.2 Sample Transportation

See description at the beginning of this section.

2.3.3 Sampling Documentation

Field notes will be collected for the subsurface fluid samples collected. These forms will be retained and archived as reference. The sample documentation is the responsibility of sampling personnel.

An analysis authorization form will be provided with each CO_2 stream sample provided for analysis.

2.3.4 Sample Identification

The sample bottles will have waterproof labels with information denoting project, sampling date and time, sampling location, sample identification number, sample type (fresh water or brine), analyte, volume, filtration used (if any), and preservative used (if any).

Table 18: Summary of Anticipated Sample Containers, Preservation Treatments, and Holding Times for Subsurface Fluid Samples

Target Parameters	Volume/Container Material	Preservation Technique	Sample Holding Time
Cations/metals (aluminum, barium, calcium, manganese, sodium, potassium, iron, arsenic, magnesium, silica, cadmium, chromium, copper, lead, selenium, titanium, zinc)	250 ml/HDPE	Filtered, nitric acid, 4 °C	180 days
Anions (chloride, sulfate, sulfide, bromide, fluoride, nitrate)	125 ml/ HDPE	4 °C	28 days (48 hours for nitrate)
Dissolved gases CO_2 CH_4 O_2	 2 X 40-mL VOA vials 2 X 40-mL VOA vials 500 mL amber glass	 4 °C, no headspace HCl, 4 °C, no headspace 4 °C, no headspace	 7 days 14 days 15 minutes
TDS	1-liter HDPE	4 °C	7 days
Alkalinity	250 ml/HDPE	4 °C	14 days
Hardness	250 ml/HDPE	Nitric acid	180 days
Turbidity	125 ml/ HDPE	4 °C	48 hours
Specific gravity	250 ml/HDPE	4 °C	28 days
Water density	250 ml/HDPE	4 °C	28 days
Dissolved inorganic carbon isotopes ($\delta^{13}C$)	Dependent on selected analytical laboratory		

Table 19: Summary of Sample Containers, Preservation Treatments, and Holding Times for CO_2 Stream Analysis

Sample	Volume/Container Material	Preservation Technique	Sample Holding time (max)
CO_2 stream	(2) 2L MLB Polybags (1) 75 cc Mini Cylinder	Sample Storage Cabinets	5 days

2.3.5 Sample Chain-of-Custody

For fluid samples, chain-of-custody will be documented using a standardized form. Copies of the form will be provided to the person/lab receiving the samples as well as the person/lab transferring the samples. These forms will be retained and archived to allow simplified tracking of sample status. The chain-of -custody form and record keeping is the responsibility of sampling personnel.

For CO_2 stream analysis, an analysis authorization will accompany the sample to the laboratory at which point a chain-of-custody accompanies the sample through their processes.

2.4 Analytical Methods

Logging, geophysical monitoring, and pressure/temperature monitoring does not apply to this section and is omitted.

2.4.1 Analytical SOPs

Analytical SOPs are referenced in the laboratory methods provided in **Tables 5 and 6**. Other laboratory specific SOPs utilized by the laboratory will be determined after a contract laboratory has been selected. Upon request, Aera will provide the agency with the laboratory SOPs developed for the specific parameter using the appropriate standard method. Each laboratory technician conducting the analysis on the samples will be trained on the SOP developed for each standard method. Aera will include each technician's training certification with the annual report.

2.4.2 Equipment/Instrumentation Needed

Equipment and instrumentation are specified in **Tables 5 and 6** for the individual analytical methods.

2.4.3 Method Performance Criteria

Tables 5 through **7** list the analytes specific to each method along with the associated performance criteria, including reporting limits, method detection limits, and accuracy and precision limits. Nonstandard method performance criteria are not anticipated for this project.

2.4.4 Analytical Failure

Each laboratory conducting the analyses in **Tables 5** through **7** will be responsible for appropriately addressing analytical failure according to their individual SOPs.

2.4.5 Sample Disposal

Each laboratory conducting the analyses in **Tables 5** through **7** will be responsible for appropriate sample disposal according to their individual SOPs.

2.4.6 Laboratory Turnaround

Laboratory turnaround will vary by laboratory, but generally turnaround of verified analytical results within one month will be suitable for project needs.

2.4.7 Method Validation for Nonstandard Methods

Nonstandard methods are not anticipated for this project. If nonstandard methods are needed or proposed in the future, the EPA will be consulted on additional appropriate actions to be taken.

2.5 Quality Control

Geophysical monitoring and pressure/temperature monitoring does not apply to this section and is omitted. For log quality control, please refer to specific vendors at time of logging, following industry standard practices.

2.5.1 Field Quality Control Samples

2.5.1.1 Blanks

For subsurface fluid sampling, a field blank will be collected and analyzed for the inorganic analytes in **Table 5** at a frequency of 10% or greater. Field blank samples consist of laboratory supplied, reagent-free water that are collected in the field. Field blanks will be exposed to the same field and transport conditions as the subsurface fluid samples. Field blanks will be used to detect contamination resulting from the collection process. Trip blanks will be included with each set of samples being transported to analytical laboratories to detect contamination resulting from the transportation process.

2.5.1.2 Duplicates

For each subsurface fluid sampling event, a duplicate subsurface fluid sample will be collected from a well from a rotating schedule at 10% or greater frequency. Duplicate samples will be collected from the same source immediately after the original sample in different sample containers and processed as the other samples. Duplicate samples will be used to assess sample heterogeneity and analytical precision.

2.5.2 Exceeding Control Limits

If the sample analytical results exceed control limits (i.e., ion balances > ±10%), further examination of the analytical results will be done by evaluating the ratio of the measured TDS to the calculated TDS (i.e., mass balance) per the American Public Health Association (APHA) method. The method indicates which ion analyses should be considered suspect based on the mass balance ratio. Suspect ion analyses will then be reviewed in the context of historical data and interlaboratory results, if available. Suspect ion analyses will then be brought to the attention of the analytical laboratory for confirmation and/or reanalysis. The ion balance will be recalculated, and if the error is still not resolved, suspect data will be identified during data validation and may be given less importance in data interpretations.

2.5.3 Calculating Applicable QC Statistics

2.5.3.1 Charge Balance

The analytical results will be evaluated to determine correctness of analyses based on anion-cation charge balance calculation. Because the potable waters are electrically neutral, the chemical analyses should yield equally negative and positive ionic activity. The anion-cation charge balance will be calculated using the formula:

$$\%\ difference = 100 \text{ x } \frac{\sum cations - \sum anions}{\sum cations + \sum anions},$$

where the sums of the ions are represented in milliequivalents (meq) per liter and the criteria for acceptable charge balance is ±10%.

2.5.3.2 Mass Balance

The ratio of the measured TDS to the calculated TDS will be calculated in instances where the charge balance acceptance criteria are exceeded using the formula:

$$1.0 < \frac{measured\ TDS}{calculated\ TDS} < 1.2,$$

where the anticipated values are between 1.0 and 1.2.

2.5.3.3 Outliers

Identification of statistical outliers is essential prior to the statistical evaluation of fluid chemistry. This project will use the EPA's Unified Guidance (March 2009) as a basis for selection of recommended statistical methods to identify outliers in subsurface fluid chemistry data sets as appropriate. These techniques include probability plots, box plots, Dixon's test, and Rosner's test. The EPA-1989 outlier test may also be used as another screening tool to identify potential outliers.

2.6 Instrument/Equipment Testing, Inspection, and Maintenance

Logging tool equipment will be maintained as per wireline industry best practices and standards.

For subsurface fluid sampling, field equipment will be maintained, factory serviced, and factory calibrated per manufacturer's recommendations. Spare parts that may be needed during sampling will be included in supplies on-hand during field sampling.

For the laboratory equipment, testing, inspection, and maintenance will be the responsibility of the analytical laboratory per standard practice, method-specific protocol, or NELAP requirement.

2.7 Instrument/Equipment Calibration and Frequency

2.7.1 Calibration and Frequency of Calibration

Pressure/temperature gauge calibration information is located in **Tables 10** through **15**. Logging tool calibration will be performed at the discretion of the service company providing the equipment, following standard industry practices. Calibration frequency will be determined by standard industry practices.

For subsurface fluid sampling and CO_2 stream sampling, calibration requirements are specific to each method and given in **Tables 5** and **6**, respectively.

2.7.2 Calibration Methodology

Logging tool calibration methodology will follow standard industry practices.

For subsurface fluid sampling and CO_2 stream sampling, calibration methodology is given in **Tables 5** and **6**, respectively.

2.7.3 Calibration Resolution and Documentation

Logging tool calibration resolution and documentation will follow standard industry practices.

For subsurface fluid sampling and CO_2 stream sampling, calibration resolution and documentation requirements are specific to each method and given in **Tables 5** and **6**, respectively.

2.8 Inspection/Acceptance for Supplies and Consumables

2.8.1 Supplies, Consumables, and Responsibilities

Supplies and consumables for field and laboratory operations will be procured, inspected, and accepted as required from vendors approved by Aera or the respective subcontractor responsible

for the data collection activity. Acquisition of supplies and consumables related to fluid analyses will be the responsibility of the laboratory per established standard methodology or operating procedures.

2.9 Non-Direct Measurements

Aera will employ direct and indirect methods to track the extent of the CO_2 plume and the presence or absence of elevated pressure. Non-direct methods include pulsed neutron logging, DTS, and seismicity monitoring by DAS.

2.9.1 Pulsed Neutron Logging

The CO_2 plume location will be tracked using pulsed neutron logging that will provide high-resolution vertical data around the wellbore of the Agua Sandstone (I-28N, 25-26N) and 64 Zone (1-28N, 39-26N, and 27-1N) monitoring wells. The saturation of CO_2 in the target formation will be estimated by measuring the die-away time of a short neutron pulse. The die-away time is a function of the porosity and the fluid types in the rock. The exact precision and accuracy of the data will depend on the selected tool and the logging environment of each well, but representative pulsed neutron logging tool specifications are given in **Table 21**.

An initial pulsed neutron log will be created before the CO_2 plume reaches the monitoring well and will serve as a baseline that future measurements will be compared against. Increases in CO_2 saturation relative to baseline will indicate when and where the plume has reached the monitoring well. These data will also be used in reevaluations of the AoR.

2.9.2 Distributed Temperature Sensing

DTS allows for continuous temperature profiles over the installed depth rather than measurements at fixed points. The continuous temperature data can be analyzed to provide information about the specific depths that the CO_2 enters the formation. Abnormal temperature profiles may indicate mechanical integrity concerns or unexpected leakage of CO_2. DTS fiber optic cable will be installed in the 64 Zone monitoring wells, 1-28N, 39-26N, and 27-1N, to identify temperature changes that may indicate the CO_2 plume's arrival at that location. DTS fiber optic will also be installed in the Agua sandstone monitoring well 26-25N to evaluate temperature fluctuation above the injection zone.

2.9.3 Seismicity Monitoring

A microseismic monitoring network will be utilized to detect microseismic events at or above magnitude 1.0 in real time. Events with an event magnitude of at least 1.0 will be detectable across the entirety of the AoR from surface to at least 2,000 ft below the injection zone and at least 1 mile radius of the injection wells. Future technologies may be added to the seismic monitoring network pending evaluation and the approval of the UIC Program Director. Additionally, the California Integrated Seismic Network will be monitored continuously for indication of an earthquake of magnitude 2.7 or greater occurring within a radius of one mile of injection operations from commencement of injection activity to its completion. Aera will respond to seismic events with an epicenter in the AoR in accordance with the Seismic Response System for seismic events >M1.0

established in the Emergency and Remedial Response Plan (**Attachment I).** A summary of the seismic monitoring locations and frequencies is given in **Table 20**.

2.9.3.1 Network Design

A continuously recording DAS fiber optic array will be deployed from approximately surface–8,000 ft within a plugged and abandoned well, 38-35N, located in the approximate center of the AoR. DAS is a system using fiber optic cables to provide distributed strain sensing along the length of the cable. The combined downhole DAS in addition to public seismic monitoring stations will be capable of accurately detecting a magnitude event of at least 1.0 (or higher) within, and surrounding, the AoR.

2.9.3.2 Network Operation

After design, the microseismic network will be installed and tested. After testing is completed, the network will be operational to monitor for microseismic events in real time through the injection phase and into the post-injection period. Monitoring will begin at least 1 month prior to injection to establish the microseismic baseline.

Automatic event detection shall include 24-hour/day seismic event tracking and detection, with event location processing completed within 24–48 hours for larger events. Responses to events of a range of low to high magnitudes will be set up according to a traffic light system, with descriptions provided in the Emergency and Remedial Response Plan (**Attachment I**). Maintenance of seismometer, datalogger and communications equipment shall be conducted periodically according to the manufacturer's specifications. Processed data of recorded events will be catalogued and summarized monthly. Monitoring and maintenance will be conducted by trained personnel.

Table 20: Summary of Passive Seismic Monitoring System

Target Formation	Monitoring Activity	Monitoring Location(s)	Spatial Coverage	Frequency
AoR	Seismic events over magnitude 1.0	Borehole DAS (38-35N) and public surface seismic stations	Within 1-mile radius of injection wells	Continuous
AoR	Seismic events over magnitude 2.7	California Integrated Seismic Network	Within 1-mile radius of injection wells	Continuous

2.10 Data Management

2.10.1 Data Management Scheme

Aera or a designated contractor will maintain the required project data as provided elsewhere in the permit. Data will be backed up on tape or held on secure servers.

2.10.2 Recordkeeping and Tracking Practices

The records of gathered data will be securely held and properly labeled for auditing purposes.

2.10.3 Data Handling Equipment/Procedures

The equipment used to store data will be properly maintained and operated according to proper industry techniques. Aera's supervisory control and data acquisition (SCADA) and vendor data acquisition systems will interface with one another, and all subsequent data will be held on a secure server.

2.10.4 Responsibility

The primary project managers will be responsible for ensuring proper data management is maintained.

2.10.5 Data Archival and Retrieval

The data will be held by Aera. These data will be maintained and stored for auditing purposes as described in **Section 2.10.1**.

2.10.6 Hardware and Software Configurations

Aera and vendor hardware and software configurations will be appropriately interfaced.

2.10.7 Checklists and Forms

Checklists and forms will be procured and generated as necessary.

3. ASSESSMENT AND OVERSIGHT

3.1 Assessments and Response Actions

3.1.1 Activities to be Conducted

Subsurface fluid data will be collected at the frequency outlined in **Table 1**. After completion of sample analysis, results will be reviewed for QC criteria as noted in **Section 2.5**. If the data quality fails to meet criteria set in **Section 2.5.**, samples will be reanalyzed, if still within holding time criteria. If outside of holding time criteria, additional samples may be collected, or sample results may be excluded from data evaluations and interpretations. Evaluation for data consistency will be performed according to procedures described in the EPA 2009 Unified Guidance (EPA, 2009).

3.1.2 Responsibility for Conducting Assessments

Organizations gathering data will be responsible for conducting internal assessments. Stop-work orders will be handled internally within individual organizations.

3.1.3 Assessment Reporting

The assessment information will be reported to the individual organizations' project manager outlined in **Section 1.1**.

3.1.4 Corrective Action

The corrective action affecting only an individual organization's data collection responsibility will be addressed, verified, and documented by the individual project managers and communicated to the other project managers as necessary. Corrective actions affecting multiple organizations will be addressed by the members of the project leadership and communicated to other members on the distribution list for the QASP. Assessments may require integration of information from multiple monitoring sources across organizations (operational, in-zone monitoring, above-zone monitoring) to determine whether correction actions are required and/or the most cost-efficient and effective action to implement. Aera will coordinate multiorganization assessments and corrective actions as warranted.

3.2 Reports to Management

3.2.1 QA Status Reports

QA status reports are not expected to be required. If any testing or monitoring techniques are changed, the QASP will be reviewed and updated as appropriate in consultation with EPA. Revised QASPs will be distributed by Aera to the full distribution list at the beginning of this document.

4. DATA VALIDATION AND USABILITY

4.1 Data Review, Verification, and Validation

4.1.1 Criteria for Accepting, Rejecting, or Qualifying Data

Subsurface fluid data validation will include the review of the concentration units, sample holding times, and the review of duplicate, blank, and other appropriate QA/QC results. The results will be entered into a database or spreadsheet with periodic data review and analysis. Aera will retain copies of the laboratory analytical test results and/or reports. Analytical results will be reported on a frequency based on the approved Class VI permit conditions. In the periodic reports, data will be presented in graphical and tabular formats as appropriate to characterize general subsurface fluid quality and identify intrawell variability with time. After sufficient data have been collected, additional methods, such as those described in the EPA 2009 Unified Guidance (EPA, 2009), will be used to evaluate intrawell variations for subsurface fluid constituents, to evaluate if significant changes have occurred that could be the result of CO_2 or brine seepage beyond the storage reservoir.

4.2 Verification and Validation Methods

4.2.1 Data Verification and Validation Processes

See **Sections 2.5** and **4.1.1**. Appropriate statistical software will be used to determine data consistency.

4.2.2 Data Verification and Validation Responsibility

Aera or its designated subcontractor will verify and validate subsurface fluid sampling data.

4.2.3 Issue Resolution Process and Responsibility

Aera or its designated representative will oversee the subsurface fluid data handling, management, and assessment process. Staff involved in these processes will consult with Aera or its designated representative to determine actions required to resolve issues.

4.2.4 Checklist, Forms, and Calculations

Checklists and forms will be developed specifically to meet Class VI permit requirements.

4.3 Reconciliation with User Requirements

4.3.1 Evaluation of Data Uncertainty

Statistical software will be used to determine subsurface fluid data consistency using methods consistent with EPA 2009 Unified Guidance (EPA, 2009).

4.3.2 Data Limitations Reporting

The organization-level project managers will be responsible for ensuring that data developed by their respective organizations is presented with the appropriate data-use limitations.

Project No.: 185805372

Sign-off Sheet and Signatures of Environmental Professionals

This document entitled *Aera CarbonFrontier Project), Phase I Environmental Site Assessment* was prepared by Stantec Consulting Services Inc. ("Stantec") for the account of Aera Energy LLC (the "Client"). The conclusions in the Report are Stantec's professional opinion, as of the time of the Report, and concerning the scope described in the Report. The opinions in the document are based on conditions and information existing at the time the scope of work was conducted and do not take into account any subsequent changes. The Report relates solely to the specific project for which Stantec was retained and the stated purpose for which the Report was prepared. The Report is not to be used or relied on for any variation or extension of the project, or for any other project or purpose, and any unauthorized use or reliance is at the recipient's own risk.

Stantec has assumed all information received from the "Client" and third parties in the preparation of the Report to be correct. While Stantec has exercised a customary level of judgment or due diligence in the use of such information, Stantec assumes no responsibility for the consequences of any error or omission contained therein.

This Report is intended solely for use by the Client in accordance with Stantec's contract with the Client. While the Report may be provided to applicable authorities having jurisdiction and others for whom the Client is responsible, Stantec does not warrant the services to any third party. The report may not be relied upon by any other party without the express written consent of Stantec, which may be withheld at Stantec's discretion.

1.0 EXECUTIVE SUMMARY

Stantec Consulting Services Inc. (Stantec) has completed a Phase I Environmental Site Assessment (ESA) report of the property located within the North and South Belridge oil fields, located from an area to the west of the intersection of State Route (SR) 33 and Brown Material Road, southeast to the approximate location of the intersection of SR-33 and Lost Hills Road (the "Subject Property"), on behalf of Aera Energy LLC (Aera) (the "Client"). The work was performed according to Stantec's proposal and terms and conditions dated August 9, 2022, and accepted by the Client on August 30, 2022. Aera Energy LLC (Aera) (the "User") has been designated as the User of this report. The intended use of this Phase I ESA is to identify potential risks associated with the proposed construction of a carbon dioxide transfer pipeline, to be used in a carbon capture and sequestration system.

The Phase I ESA was conducted in conformance with the requirements of ASTM International (ASTM) Designation E1527-21 and E1527-13, and All Appropriate Inquiry (AAI) as defined by the United States Environmental Protection Agency (EPA) in Title 40 of the Code of Federal Regulations (CFR), Part 312 (40 CFR 312), except as may have been modified by the scope of work, and terms and conditions, requested by the Client. Any exceptions to, or deletions from, the ASTM or AAI practice are described in Section 2.3.

The Subject Property is located within the North and South Belridge Oil Fields, in an unincorporated area of western Kern County, approximately 14 miles west of the town of Buttonwillow, seven miles southwest of the town Lost Hills, and eleven miles north of the town of McKittrick, California. From the south, the Subject Property spans an area in the vicinity of the intersection of Lost Hills Road and SR-33 (also known as the West Side Highway), northwestward through Seventh Standard Road, northward through the South Belridge Oil Field variously paralleling or oriented east of Pole Line Road through Lerdo Highway, then continuing along the vicinity of Pole Line Road to the North Belridge Oil Field. A Subject Property Location Map is provided as Figure 1. A Subject Property Vicinity Overview Map is provided as Figure 2 and Subject Property Vicinity Maps illustrating the main features of the Subject Property and vicinity are provided as Figures 3A through 3F. Subject Property Vicinity Maps Photographs taken during the site reconnaissance visit are provided in Appendix A.

We have performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E1527-21 of the "Subject Property", an approximately 13-mile long corridor that encompasses all Project features and a one-eighth mile buffer, centered on 35.501525°, 119.751895° (World Geodetic System of 1984 [WGS 84]). Any exceptions to, or deletions from, this practice are described in Section 2.3 of this report. This assessment has revealed the following recognized environmental conditions (RECs), Controlled RECs (CRECs), and/or significant data gaps in connection with the Subject Property:

- The current and historical use of the Subject Property and surrounding land for petroleum hydrocarbon extraction activities, from 1911 to the present, is considered a REC.
- Regulatory records indicate that an area of land to the west of the Subject Property, but likely incorporating the Subject Property, was used as a Class III solid waste landfill until 2007. The

area of fill is listed as over 27 acres, to a depth of 10 feet below ground surface (bgs), and it is considered likely that portions of the Subject Property occur within this area of fill. In addition, historical aerial photography indicate worker residences were demolished in the 1970s and 1980s. Houses constructed prior to this period often contained asbestos-containing materials (ACM) and lead-based paint (LBP) within the building materials. The potential for ACM and LBP to be contained within various areas of fill at the Subject Property, as well as the potential for the fill to be uncompacted and/or uncontrolled, is considered a REC.

- Kern County Environmental Health Services records indicated that a historical waste disposal site is located in the South Belridge Oil Field east of the Oasis office building. Refer to Figure 3 for the approximate location of the waste disposal site. No additional information was available for this REC.
- A total of 41 wastewater pits used for disposal of 'produced water' or for other uses are currently or were historically located within 0.5 miles of the Subject Property. Of these, the majority are either closed former percolation ponds, secondary containment basins, emergency overflow basins, or process basins. Based on the distance, direction, and regulatory status, these sites are not anticipated to represent an environmental concern to the Subject Property.

The preceding summary is intended for informational purposes only. Reading of the full body of this report is recommended.

2.0 INTRODUCTION

The objective of this Phase I Environmental Site Assessment (ESA) was to perform All Appropriate Inquiry (AAI) into the past ownership and uses of the Subject Property consistent with good commercial or customary practice as outlined by ASTM International (ASTM) in "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process", Designation E1527-21 and E1527-13. "All Appropriate Inquiry" is the process for evaluating a property's environmental conditions for the purpose of qualifying for landowner liability protections under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) following final rule of Part 312 of Title 40, Code of Federal Regulations (40 CFR Part 312). The purpose of this Phase I ESA was to identify, to the extent feasible, adverse environmental conditions including recognized environmental conditions ("RECs") of the Subject Property. While the AAI Rule still references the ASTM E1527-13 standard until fully adopted by the EPA, this report incorporates procedures as prescribed in ASTM E1527-21, which is the current published ASTM standard for Phase I ESAs.

The ASTM E1527-21 standard indicates that the goal of the Phase I ESA is to identify RECs, as well as historical recognized environmental conditions (HRECs) and controlled recognized environmental conditions (CRECs) that may exist at a property. The term "recognized environmental conditions" is defined as:

1) the presence of hazardous substances or petroleum products in, on, or at the Subject Property due to a release to the environment;

2) the likely presence of hazardous substances or petroleum products in, on, or at the Subject Property due to a release or likely release to the environment; or

3) the presence of hazardous substances or petroleum products in, on, or at the Subject Property under conditions that pose a material threat of a future release to the environment.

ASTM defines a "HREC" as a previous release of hazardous substances or petroleum products affecting the Subject Property that has been addressed to the satisfaction of the applicable regulatory authority and meets current unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (e.g., activity and use limitations or other property use limitations). A HREC is not considered a REC.

ASTM defines a "CREC" as a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (e.g., as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), but with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (e.g., property use restrictions, activity and use limitations, institutional controls, or engineering controls).

As defined by ASTM, RECs can include hazardous substances or petroleum products present under conditions in compliance with laws if that presence represents a material threat of future release. The release of hazardous substances or petroleum products is, however, not a REC if that presence is a *de minimis* condition. *De minimis* conditions are minor releases that generally do not present a material risk to human health and would not likely be subject to enforcement action if brought to the attention of governmental agencies. ASTM also considers the potential for a business environmental risk (BER), defined as a risk which can have a material environmental or environmentally driven impact on the business associated with the current or planned use of the Subject Property, not necessarily limited to those environmental issues required to be investigated by the ASTM standard. Consideration of BERs may involve addressing one or more ASTM non-scope considerations.

This Phase I ESA was conducted in accordance with our proposal to Aera Energy LLC (Aera) dated August 9, 2022, and Client's authorization on August 30, 2022. The scope of work conducted during this Phase I ESA consisted of a visual reconnaissance of the Subject Property, interviews with key individuals, and review of reasonably ascertainable documents. The scope of work did not include an assessment for environmental regulatory compliance of any facility ever operated at the Subject Property (past or present), or sampling and analyzing of environmental media. Stantec was not contracted to perform an independent evaluation of the purchase or lease price of the Subject Property and its relationship to current fair market value. The conclusions presented in this Phase I ESA report are professional opinions based on data described herein. The opinions are subject to the limitations described in Section 2.3.

ASTM E1527-21 notes that the availability of record information varies from source to source. The User or Environmental Professional (EP) is not obligated to identify, obtain, or review every possible source that might exist with respect to a property. Instead, ASTM identifies record information that is reasonably ascertainable from standard sources. "Reasonably ascertainable" means:

1. Information that is publicly available;
2. Information that is obtainable from its source within reasonable time and cost constraints; and
3. Information that is practicably reviewable.

2.1 SUBJECT PROPERTY DESCRIPTION

The Subject Property is located within the North and South Belridge oil fields, in an unincorporated area of western Kern County, approximately 14 miles west of the town of Buttonwillow, seven miles southwest of the town of Lost Hills, and eleven miles north of the town of McKittrick, California. From the south, the Subject Property spans an area in the vicinity of the intersection of Lost Hills Road and State Route (SR) 33 (also known as the West Side Highway), northwestward through Seventh Standard Road, northward through the South Belridge Oil Field variously paralleling or oriented east of Pole Line Road through Lerdo Highway, then continuing along the vicinity of Pole Line Road to the North Belridge Oil Field. A Subject Property Location Map is illustrated on Figure 1. A Subject Property Vicinity Overview Map is provided as Figure 2 and Subject Property Vicinity Maps illustrating the main features of the Subject

Property and vicinity is provided as Figures 3A through 3F. Photographs taken during the site reconnaissance visit are provided in Appendix A.

The Subject Property is approximately 11.7 miles long and is approximately 1,000 feet (0.19 mile) wide. The approximate centroid of the Subject Property is located at the following coordinates: 35.501525°, -119.751895° (WGS 84). The Subject Property is within the Subject Property and encompasses approximately 3,252 acres mainly within the Belridge and Blackwells Corner (1988) 7.5-minute U.S. Geological Survey (USGS) quadrangles, with small portions of the Subject Property falling within the Lost Hills and Carneros Rocks USGS quadrangles.

To access the Subject Property from Interstate 5, take the Buttonwillow SR-58 / McKittrick Highway exit and travel west on SR-58 for approximately eight miles; turn right onto Lokern Road and travel west approximately 7.3 miles; turn right on SR-33 and travel northwest approximately 2.5 miles to arrive at the southern end of the Subject Property.

Aera has submitted an application to the Kern County Planning and Natural Resources Department to request approval of a Zone Change and Conditional Use Permit (CUP) (deemed complete on September 26, 2022) and any other required approvals, if any, for the construction and operation of a carbon capture and sequestration (CCS) project in the South and North Belridge oil fields. The proposed Project would require approvals for additions and improvements to the existing oil field facilities (gas separation, compression, and pumping equipment), new carbon dioxide (CO_2) pipelines located primarily aboveground utilizing existing pipeline corridors, Underground Injection Control (UIC) Class VI geologic sequestration injection wells, CO_2 monitoring wells, and an underground carbon sequestration field for the storage of CO_2 in accordance with appropriate financial assurance mechanisms that ensure permanence in compliance with applicable regulatory standards.

The proposed Project would capture CO_2 from existing produced gas streams (pre-combustion) and emissions from existing stationary sources (post-combustion) within the South Belridge Oil Field and transport the CO_2 through pipelines to the North Belridge Oil Field for injection at dedicated Class VI injection wells. The proposed underground CO_2 sequestration field, approximately 2,636 acres in size, would be located within the North Belridge Oil Field with surface and mineral rights held by Aera and other private owners. Oil and gas production activities within the proposed sequestration zone within the North Belridge Oil Field, known as the 64 zone, would cease as a result of the implementation of the proposed Project.

It is anticipated that the proposed Project would capture and sequester up to 1.6 million metric tonnes (MMt) of CO_2 per year beginning in 2026 and will contribute to the goal of California for carbon neutrality by 2045 (Executive Order B-55-18) by reducing industrial CO_2 emissions.

Implementation of the Project would require permits from the EPA for up to nine Class VI injection wells in compliance with the UIC program Class VI geologic sequestration regulations. The proposed CO_2 related facilities, pipelines, Class VI injection wells and associated CO_2 monitoring wells will be located within the CUP boundary. The proposed Project would not exceed 1,223 afy (26,000 barrels or 1.09 million gallons

per day) and Aera would need to acquire and/or develop additional sources of water to support the Project during the operational phase.

The Belridge oil fields were discovered in the early 1900s, as oil naturally surfaced due to pressure in the geologic reservoir, with the first well spudded along the Chico Martinez Creek in April 1911 (Allan and Lalicata 2012). Since then, the Belridge oil fields developed into North and South Belridge oil fields. The Subject Property lies along the North and South Belridge oil fields on the Antelope Plain, an alluvial piedmont consisting of coalescing alluvial fans from the Temblor Range to the west. The region slopes to the east towards the San Joaquin Valley. The Subject Property is heavily disturbed with oil wells and well pads, oil and gas infrastructure, gas and steam pipelines, and multiple unnamed dirt or graveled access roads along with a few paved roads.

2.2 SPECIAL TERMS, CONDITIONS, AND ADDITIONAL ASSUMPTIONS

The exceptionally large size of the Subject Property introduced limitations to Stantec's site reconnaissance visit conducted on October 13, 2022; chiefly, access to all building interiors and some portions of the Subject Property and adjacent land was not granted due to time and security clearance constraints. This is considered a data gap but is not considered to significantly affect the EP's ability to identify RECs at the Subject Property and is unlikely to affect the overall conclusions of this report.

2.3 EXCEPTIONS AND LIMITING CONDITIONS

This report documents work that was performed in accordance with generally accepted professional standards at the time and location in which the services were provided and given the schedule and budget constraints established by the client. No other representations, warranties, or guarantees are made concerning the accuracy or completeness of the data or conclusions contained within this report, including no assurance that this work has uncovered all potential and actual liabilities and conditions associated with the Subject Property.

This report provides an evaluation of selected environmental conditions associated with the Subject Property that was assessed at the time the work was conducted and is based on information obtained by and/or provided to Stantec at that time. There are no assurances regarding the accuracy and completeness of this information received from others.

Conclusions made within this report consist of Stantec's professional opinion as of the time of the writing of this report and are based solely on the scope of work described in the report, the limited data available, and the results of the work. They are not a certification of the Subject Property's environmental condition.

The client did not provide or contract Stantec to provide recorded title records or search results for environmental liens or activity and use limitations encumbering the property or in connection with the Subject Property. Stantec did not obtain historical records that document the property history in 5-year intervals, and this resulted in data gaps. Although this represents data gaps, these data gaps are not

considered to impact the EPs ability to identify RECs unless stated as such. Based on the information obtained during the course of this ESA and general knowledge of development at and near the Subject Property, the absence of this information did not affect the ability of the EPs to identify RECs, HRECs, CRECs, or *de minimis* conditions.

This report has been prepared for the exclusive use of the client identified herein and any use of or reliance on this report by any third party is prohibited, except as may be consented to in writing by Stantec or as required by law. The provision of any such consent is at Stantec's sole and unfettered discretion and will only be authorized pursuant to the conditions of Stantec's standard form reliance letter. Stantec assumes no responsibility for losses, damages, liabilities, or claims, howsoever arising, from third party use of this report.

Project Specific limiting conditions are provided in Section 2.2.

The conclusions are based on the conditions encountered at the Subject Property by Stantec at the time the work was conducted.

As the purpose of this report is to identify Subject Property conditions which may pose an environmental risk; the identification of non-environmental risks to structures or people on the Subject Property is beyond the scope of this assessment.

The findings, observations, and conclusions expressed by Stantec in this report are not an opinion concerning the compliance of any past or present owner or operator of the Subject Property which is the subject of this report with any Federal, state, provincial or local law or regulation.

This report presents professional opinions and findings of a scientific and technical nature. It does not and shall not be construed to offer a legal opinion or representations as to the requirements of, nor compliance with, environmental laws, rules, regulations, or policies of Federal, state, provincial or local governmental agencies. It is recommended that issues raised by the report should be reviewed for the client by its legal counsel.

Stantec specifically disclaims any responsibility to update the conclusions in this report if new or different information later becomes available or if the conditions or activities on the property subsequently change.

2.4 PERSONNEL QUALIFICATIONS

This Phase I ESA was conducted by, or under the supervision of, an individual that meets the ASTM definition of an EP. The credentials of the EP and other key Stantec personnel involved in conducting this Phase I ESA are provided in Appendix B.

3.0 USER-PROVIDED INFORMATION

ASTM E1527-13 and ASTM E1527-21 describe responsibilities of the User to complete certain tasks in connection with the performance of "All Appropriate Inquiries" into the Subject Property. The ASTM standard requires that the EP request information from the User on the results of those tasks because that information can assist in the identification of RECs, CRECs, HRECs, or *de minimis* conditions in connection with the Subject Property. Towards that end, Stantec requested that the User provide the following documents and information:

Description of Information	Provided (Yes / No)	Description and/or Key Findings
User Questionnaire and/or Interview	Y	Historical oil field operations identified.
Environmental Liens or Activity and Use Limitations (AUL)	Y	Chain of title information reviewed identified use limitations at closed landfill area.
Previous Environmental Permits or Reports Provided by User	Y	If none, the user reportedly does not possess any of these documents.
Purpose of the Phase I ESA	Y	The intended use of the Phase I is to identify potential areas of concern that may affect the construction of the proposed CCS project.

The User provided information is included in Appendix C.

4.0 RECORDS REVIEW

The objective of consulting historical sources of information is to develop the history of the Subject Property and surrounding area and evaluate if past uses may have resulted in RECs. Physical setting records are evaluated to determine if the physical setting may have contributed to adverse environmental conditions in connection with the Subject Property. During the review of historical records, Stantec attempted to identify uses of the Subject Property from the present to the first developed use of the Subject Property. Stantec's research included the reasonably ascertainable and useful records described in this section.

4.1 PHYSICAL SETTING

A summary of the physical setting of the Subject Property is provided in the table below with additional details in the following subsections:

Topography:	Relatively flat with an overall gradual slope from west to east towards the San Joaquin Valley, in keeping with the surrounding topography.
Soil/Bedrock Data:	The Subject Property is underlain by alluvium and the Tulare formation, an unconsolidated formation of silts, sands, and gravel. The Tulare formation overlies the Etchegoin formation, which consists of sandstone and mudstone sedimentary marine deposits.
Estimated Depth to Groundwater/ Estimated Direction of Gradient:	Shallow groundwater may occur beneath the North Belridge Oil Field in the form of perched water. Within the central portion of the South Belridge Oil Field, groundwater is typically co-mingled with oil. Within the eastern flank of the South Belridge Oil Field, groundwater generally flows to the east. Depth to groundwater within the main portion of the oil field is typically greater than 150 feet below ground surface.
NOTE: Site-specific groundwater flow direction and depth can only be determined by conducting site-specific testing, which Stantec has not conducted.	

4.1.1 Subject Property Topography and Surface Water Flow

The topography of the Subject Property is relatively flat, interrupted only by oil and gas construction, and slopes gradually from west to east towards the San Joaquin Valley. The Subject Property ranges from 675 feet above mean sea level (amsl) on the western edge down to 550 feet amsl on the eastern edge.

4.1.2 Regional and Subject Property Geology

According to the U.S. Department of Agriculture (USDA) Natural Resource Conservation Service (NRCS), four soil map units occur in the Subject Property. The soils are described in the *Soil Survey of Kern County, California* (USDA NRCS 2022a). The map units are summarized in Table 1 and shown in Appendix A, Figure A-1.

Table 1: Historic Soil Map Units within the Subject Property.

Map Unit Symbol	Map Unit Name	Description	Hydric	Acreage in Subject Property
174	Kimberlina fine sandy loam, 0-2% slopes	The Kimberlina series consists of very deep, well drained soils on flood plains and recent alluvial fans. These soils formed in mixed alluvium derived dominantly from igneous and/or sedimentary rock sources.	No	1,295.40
175	Kimberlina fine sandy loam, 2-5% slopes	The Kimberlina series consists of very deep, well drained soils on flood plains and recent alluvial fans. These soils formed in mixed alluvium derived dominantly from igneous and/or sedimentary rock sources.	No	232.05
176	Kimberlina fine sandy loam, 5-9% slopes	The Kimberlina series consists of very deep, well drained soils on flood plains and recent alluvial fans. These soils formed in mixed alluvium derived dominantly from igneous and/or sedimentary rock sources.	No	7.87
196	Milham sandy loam, 0 to 2 percent slopes Major Land Resource Area 17	The Milham series consists of very deep, well drained soils on alluvial fans, plains, low terraces, and fan remnants. These soils formed in mixed calcareous alluvium weathered from granitic and sedimentary rock.	No	546.13
197	Milham sandy loam, 2 to 5 percent slopes	The Milham series consists of very deep, well drained soils on alluvial fans, plains, low terraces, and fan remnants. These soils formed in mixed calcareous alluvium weathered from granitic and sedimentary rock.	No	383.16
211	Panoche clay loam, 0 to 2 percent slopes	The Panoche series consists of very deep, well drained soils on alluvial fans and flood plains. These soils formed in loamy calcareous alluvium from sedimentary rock.	No	442.39
212	Panoche clay loam, 2 to 5 percent slopes	The Panoche series consists of very deep, well drained soils on alluvial fans and flood plains. These soils formed in loamy calcareous alluvium from sedimentary rock.	No	344.96
Total				**3,251.96**

The Subject Property is located in the Great Valley Geomorphic Province, within the southwestern portion of the San Joaquin Valley. The southwestern margin of the valley is renowned for its oil fields trapped within anticlinal uplifts (CGS, 2002). Soil types mapped across the Subject Property, as reported by the EDR Area Corridor Report, predominantly comprise the Kimberlina fine sandy loam, with minor amounts of Milham sandy loam and Panoche clay loam. The California Geological Survey maps bedrock beneath the Subject Property as comprising Pleistocene to Holocene (Recent) alluvium, lake, playa, and terrace deposits, often unconsolidated or semi-consolidated.

4.1.3 Regional and Subject Property Hydrogeology

The Subject Property is within Hydrologic Unit Code (HUC)-8 18030012 - Tulare-Buena Vista Lakes. This area is also mainly within the Lower Kern River Flood Canal HUC-10 Watershed 1803001216, with a section of the southern portion of the Subject Property within the Upper Kern River Flood Canal HUC-10 Watershed 1803001212. The Subject Property also includes the following HUC-12 Watersheds from north to south: unnamed-180300121502, Town of Lost Hills-180300121504, unnamed-180300121603, Kern River Flood Canal-Kern River Channel-180300121604, Kern River Flood Canal-180300121602, Chico Martinez Creek-180300121206, and Kern River Flood Canal-180300121207.

The southwestern San Joaquin Basin regional groundwater flow direction is generally to the east towards the San Joaquin Valley [Burton et al., 2012; Kern County Planning and Natural Resources Department, 2020a]. Within the Subject Property, however, the local hydraulic gradient is typically affected by local geologic structures, such as the anticlines and synclines that typify the western San Joaquin fold belt [Harding, 1976; Aera, 2014; Kern County Planning and Natural Resources Department, 2020b].

The EPA, under the Safe Drinking Water Act, requires protection of underground sources of drinking water (USDW) that have total dissolved solids (TDS) concentrations less than 10,000 milligrams per liter (mg/L). If the TDS concentration is greater than 10,000 mg/L, the formation can be considered a non-USDW. Oil-bearing formations include a mixture of typically poor-quality to saline groundwater and hydrocarbons [Kern County Planning and Natural Resources Department, 2020a]. Within the North Belridge Oil Field, groundwater is typically intermingled with oil.

The UIC program administered by the EPA granted California Department of Conservation Division of Oil, Gas and Geothermal Resources (CalGEM, formerly DOGGR) primacy to administer the UIC program in 1982, the oil and gas producing aquifers identified in 1973 and 1974 California Oil and Gas Fields Volumes I, II, and III submitted in accordance with Section 1425 (a) of the Safe Drinking Water Act dated April 20, 1981 were exempt as a USDW (EPA, 1982). In the North Belridge Oil Field, this includes the Tulare Formation, Etchegoin Formation, Monterey Formation, Temblor Formation, and Tumey Formation; whereas in the South Belridge Oil Field, this includes the Tulare Formation, Etchegoin Formation, and Monterey Formation.

In accordance with the EPA groundwater exemption criteria specified in Title 40, CFR, Part 146.4, Aera Energy, LLC and Greka Oil & Gas, Inc. submitted an Underground Injection Control Aquifer Exemption Application for the Tulare Formation, North Belridge Oil Field (Revision 1) [Aera and Greka, 2018] and Aera Energy, LLC, Belridge Energy Resources, California Resources Corporation, E&B Natural Resource

Management, Freeport-McMoran Oil & Gas, Linn Operating Inc., Vaquero Energy Inc., and West American Energy submitted an Underground Injection Control Aquifer Exemption Application for the Tulare Formation, South Belridge Oil Field [Aera et al., 2018], to DOGGR and the California State Water Resources Control Board (SWRCB) on November 7, 2018 and July 26, 2018, respectively, to expand the existing USDW exempt areas. These documents were intended to demonstrate the groundwater within the Tulare Formation met the following EPA exemption criteria specified in Title 40, CFR, Part 146.4:

- It does not currently serve as a source of drinking water; and
- It cannot now and will not in the future serve as a source of drinking water because:
    - It is mineral-, hydrocarbon-, or geothermal-energy producing, or can be demonstrated by a permit applicant as part of a permit application for a Class II or Class III operation to contain minerals or hydrocarbons that considering their quantity and location are expected to be commercially producible, or
- TDS content of the groundwater is more than 3,000 mg/L and less than 10,000 mg/L and is not reasonably expected to supply a public water system or to have any other beneficial uses.

The applications were approved by the EPA June 7, 2019 [EPA, 2019] and March 13, 2020 [EPA, 2020], respectively.

Within the eastern and southern-most portion of the Subject Property, including the northern portion of the South Belridge Oil Field, groundwater within the Alluvium occurs as a perched zone atop the unconformity at the base of the Alluvium and/or upper clay layer within the Tulare Fm. In this area, alluvial groundwater consists of produced water from former produced water percolation ponds (see Figure 2.7-1 for former disposal pond locations) [Aera, 2017; Aera Energy, LLC, and Greka Oil & Gas, Inc. (Aera and Greka), 2018; USEPA, 2019; Wood Environmental & Infrastructure Solutions, Inc. (Wood), 2021].

This produced groundwater transitions into native groundwater to the east and northeast, with a mixed zone occurring between these two groundwater types [Aera, 2017; Wood, 2021, 2022]. Native alluvial groundwater occurs to the east of the North Belridge Oil Field as wells as within and to the east of the South Belridge Oil Field, where the western extent of native alluvial groundwater is controlled by the North and South Belridge oil fields anticline structures [Wood, 2019, 2021, 2022] (Figure 2.7-4). There is no native alluvial groundwater within the southern portion of the North Belridge Oil Field (Figure 2.7-5) [Aera, 2014, 2017; SWRCB, 2014; Wood, 2022].

Publicly available groundwater elevation data and groundwater quality data from monitoring wells within portions of the Alluvium were compiled from the North and South Belridge oil fields [Breitburn Operating LP. (Breitburn), 2018a; Wood, 2021, 2022; Groundwater and Environmental Services, Inc. (GES), 2022]. The potentiometric surface map for the Alluvium indicates groundwater flow in the North Belridge Oil Field area to the north-northeast, and in the South Belridge Oil Field area to the east-northeast. There are no groundwater elevation data for the Alluvium in the northern half of the Subject Property, likely because the Alluvium is less than 150 ft thick and the depth to groundwater, where available, is mostly greater

than 150 ft. Therefore, the Alluvium in the northern portion of the Subject Property is believed to be dry due to the structural elevation.

4.1.4 Surface Hydrology

Chico Martinez Creek, an ephemeral stream toward the southern end of the Subject Property, is the most prominent remaining regional stream draining from the southwest to the northeast through the South Belridge Oil Field toward the Central Valley. The source of historic Chico Martinez Creek is located on the eastern slope of the Temblor Range (35.4188542, -119.8623563 WGS84) and it generally flows east where it terminates approximately 0.55 mile southwest of Lost Hills Highway Kern County, California (35.4610736, -119.6990172 WGS84). While the terminus of historic Chico Martinez Creek is located west of Lost Hills Highway based on historical data (USGS and National Wetlands Inventory [NWI]); a review of available aerial imagery (dating back to 1994) indicates it flows further east to approximately 1.10 miles east of Lost Hills Highway where it terminates at a north-south traversing agricultural canal/aqueduct. The Subject Property includes two sections of historical Chico Martinez Creek:

1) Section of Chico Martinez Creek located approximately 0.45 mile southeast of the Aera Oasis Building (i.e., the main Aera office building at Belridge) and beginning approximately 700 feet north of Seventh Standard Road, then continuing for approximately 0.40 mile toward the northeast; and

2) Section of Chico Martinez Creek beginning just south of the intersection of SR-33 and Treeline Road/Roustabout Road, crossing under SR-33, then continuing to the northeast for approximately 0.65 mile.

Considered as a whole, sections of Chico Martinez Creek still appear to be channelized but these sections are interspersed with areas with no defined channel bed and bank. The system has been altered and segmented due to oil field development.

4.2 FEDERAL, STATE AND TRIBAL ENVIRONMENTAL RECORDS

A regulatory agency database search report was obtained from Environmental Database Resources, Inc., a third-party environmental database search firm. A complete copy of the database search report, including the date the report was prepared, the date the information was last updated, and the definition of databases searched, is provided in Appendix D.

Stantec evaluated the information listed within the database relative to potential impact to the Subject Property, assessing the potential for impacts based in part on the physical setting. As part of this process, inferences have been made regarding the likely groundwater flow direction at or near the Subject Property. As described in 4.1.3, shallow groundwater flows to the east. Observations about the Subject Property and adjoining properties made during the Subject Property reconnaissance are provided in more detail in Section 5.

4.2.1 Listings for Subject Property

The Subject Property was identified in the environmental database report in the following databases with the associated entries listed below:

Local Lists of Hazardous Waste/Contaminated Sites: CERS HAZ WASTE

- Phillips 66 – 17251 Pole Line Road. This entity is listed as a hazardous waste generator, though additional information regarding the specific waste(s) produced is not listed.

Records of Emergency Release Reports: CHMIRS (California Hazardous Material Incident Report System)

- Phillips 66 Pipeline – 17251 Pole Line Road. This entry is associated with California Office of Emergency Services (OES) Incident Number 4-6216. The incident occurred on November 30, 2004, and comprised a release of approximately 50 BBLS of crude oil due to a portable tank overfill. The release was reportedly contained to a bermed containment area.

Other Databases

The Subject Property was also positively identified in the following databases, though the positive identification does not necessarily constitute an elevated risk of impact.

- Facility Index System
    - Phillips 66 – “Middle”, associated with an address of 17251 Pole Line Road and registry identification number 110065253969.
- Certified Unified Program Agency (CUPA)
    - Phillips 66 – Middle, associated an address of 17251 Pole Line Road, listed within Kern County CUPA database. The entry is dated May 6, 2022.
- Emissions Inventory Data
    - Unocal California PI, associated with an address of 17251 Pole Line Road and a facility ID of 1520
    - Phillips 66 Pipeline, associated with an address of 17251 Pole Line Road and a facility ID of 1520
- UIC – There are 119 UIC sites listed associated with the Subject Area, all of which are associated with Aera Energy LLC.

4.2.2 Listings for Adjoining and Nearby Sites with Potential to Impact Subject Property

Stantec assessed data presented in the environmental agency database search report to evaluate the potential for conditions on adjoining and nearby sites to pose a REC, CREC, or HREC for the Subject Property. The evaluation included an opinion of the potential for contamination by hazardous substances or petroleum products to migrate to the Subject Property from an adjoining or nearby site, including by vapor migration or encroachment (i.e., potential for a vapor encroachment condition [VEC]).

Based on this evaluation, the following individual facilities were identified as the most likely potential sources of impact to the Subject Property. The basis for why each of the following listed databases creates a REC for the Subject Property is also provided.

Listed Facility Name/Address	Database Listing(s)	Distance/Direction from Subject Property
Multiple wastewater pits located across the North and South Belridge oilfield	EDR Wastewater Pits	18 pits <1/8 mile (660 feet) from the Subject Property 8 pits between 1/8 mile and 1/4 mile (1,320 feet) from the Subject Property 15 pits located between 1/4 mile and 1/2 mile (2,640 feet) from the Subject Property (a total of 41 pits).
Subject Property. The listed pits are a combination of closed percolation ponds, secondary containment basis, process basins, discharge ponds, and emergency overflow basins. Refer to Appendix C for a listing of each pit identified, its purpose, and status.		
Closed North Belridge Landfill 1 mile NE Belridge Oil Co	SWF/LF, FINANCIAL ASSURANCE, CERS	590 feet west of the Subject Property.
The landfill is listed as a 210,000 cubic yard capacity Class III landfill that ceased operation in 2007, and was operated by Aera Energy LLC. The dimensions are listed as 10 feet deep and with an area of 28.7 acres. The landfill was closed under Cal Recycle Permit SWIS/WDID/Global ID Number 15-AA-0067. The site was capped and has been maintained/inspected by WSP and Aera. The potential for uncontrolled fill and solid waste disposal over such a large area in close proximity to the Subject Property is considered a REC.		
South Belridge Disposal Site	Kern County Environmental Health Services landfill database	Within Subject Property along existing Del Sur to GP 32 pipeline. No excavation is currently proposed.
The landfill was legacy owned by Shell Oil Co. The dimensions are listed with an area of 15 acres and an unknown depth. The potential for uncontrolled fill and solid waste disposal over an area within the buffer for a pipeline in the Subject Property is considered a REC.		

The remaining listings in the database search report, including listings of Orphan Sites, provided in Appendix D do not constitute a potential REC for the Subject Property.

4.3 LOCAL/REGIONAL ENVIRONMENTAL RECORDS

Stantec checked the following sources to obtain information pertaining to Subject Property use and/or indications of RECs in connection with the Subject Property:

4.3.1 Local Health Department

Agency Name, Contact Information, Date	Finding
Kern County Environmental Health Services Contacted via website form October 7, 2022	The Kern County Environmental Health Services (KCEHS) department has provided information in response to a Public Records Act request. The information provided by KCEHS has been incorporated into this report.

4.3.2 Fire Department

Agency Name, Contact Information, Date	Finding
Kern County Fire Department Contacted via website form October 11, 2022	The Kern County Fire Department (KCFD) responded to Stantec's initial request for information pertaining to parcels that comprise the Subject Property on October 14, 2022. The KCFD identified records pertaining to the following addresses: • 19651 Highway 33 – An Occupancy Detail Report identifying Aera Energy as the current tenant. • 19091 Highway 33 – A Fire Protection System Permit (ref. 2012-FPS-047) registered to Aera Energy. The system is described as an Ansul I-101 system installed within a spray booth. • 18271 Highway 33 – A Fire Alarm Permit (ref. 2006-FA-022) registered to Exxon Mobile in 2006, Linn Energy in 2015 (2015-FA-052). • 16435 Highway 33 – Occupancy Detail Reports for Shell Pipeline Co-Carneras. The inspection records (spanning from 2011 to 2019) indicate an automated pump station is present at this address.

4.3.3 Local Building and/or Planning Department Records

Agency Name, Contact Information, Date	Findings
Kern County Planning and Natural Resources Department planning@kerncounty.com October 7, 2022	The Kern County Planning and Natural Resources Department did not respond to Stantec's request for information within the timescales of this report. While this is

Agency Name, Contact Information, Date	Findings
	considered a data gap, it is not considered to significantly affect the EP's conclusions.

4.3.4 Local/Regional Pollution Control Agency Department Records

Agency Name, Contact Information, Date	Findings
San Joaquin Valley Air Pollution Control District sjvapcd@valleyair.org October 11, 2022	In a response dated October 13, 2022, the San Joaquin Valley Air Pollution Control District (SJVAPCD) indicated that the District holds records responsive to Stantec's information request (identified by request number C-2022-10-50); however, due to the volume of records requested from the SJVAPCD, an extension to the response deadline was requested. The SJVAPCD indicated that records would be released to Stantec as and when they were identified. Stantec will collate, interpret, and relay any subsequent pertinent findings to the Client as these responses are received.
California Department of Toxic Substances Control: Chatsworth Office 9211 Oakdale Avenue Chatsworth, CA 91311 October 10, 2022	In a response dated October 13, 2022, the California Department of Toxic Substances Control (DTSC) acknowledged Stantec's request for information regarding parcels identified as comprising the Subject Property. The DTSC Chatsworth office did not identify records pertaining to those parcels, but instead referred Stantec to the online Envirostor database maintained by the DTSC. The Envirostor database does not show any cases at the Subject Property surrounding facility, within a one-mile radius of the Subject Property. The nearest case is associated with Clean Harbors Buttonwillow LLC, located at 2500 West Lokern Road approximately 4.1 miles southeast of the Subject Area.

4.3.5 Local/Regional Water Quality Agency Records

Agency Name, Contact Information, Date	Findings
State Water Resources Control Board GeoTracker Database Accessed October 10, 2022	The State Water Resources Control Board (SWRCB) maintains its records within the online GeoTracker database. Stantec reviewed the database and did not identify any cases located within the Subject Property. The nearest case is located approximately 50 feet west of the Subject Property (see Figure 3 in Section F) and is associated with a Leaking Underground Storage Tank (LUST) case that was granted case closure in 1991. The media of concern is listed as soil impacted by gasoline.

Agency Name, Contact Information, Date	Findings
	There are no other cases within a one-mile radius of the Subject Property.

4.3.6 Federal/State/Local Natural Resource Records

Agency Name, Contact Information, Date	Findings
California Department of Conservation Geologic Energy Management Division Well Finder Online Application Accessed October 11, 2022	Stantec reviewed the Well Finder application maintained by CalGEM. The Subject Property is located within the North Belridge and South Belridge oil fields and is surrounded by thousands of plugged wells and hundreds of active, idle, and canceled wells. The density of oil wells along the Subject Area is greatest in the South Belridge Oil Field. The path of the Subject Property skirts to the north of the majority of the wells in the North Belridge Oil Field.

4.4 HISTORICAL RECORDS REVIEW

4.4.1 Land Title Records/Deeds

Land title records, deeds, environmental liens, and activity and use limitation documentation was not provided by the User, and public records were not searched by Stantec.

4.4.2 Aerial Photographs

Stantec reviewed historical aerial photographs provided by Environmental Data Resources, Inc. (EDR). The general type of activity on a property and land use changes can often be discerned from the type and layout of structures visible in the photographs. However, specific elements of a facility's operation usually cannot be discerned from aerial photographs alone. The following table summarizes Stantec's observations of the reviewed historical aerial photographs. Copies of the historical aerial photographs are included in Appendix E.

Year	Scale	Observations of Subject Property and Adjoining/Nearby Properties
1937, 1942	1"=1,000'	On the earliest reviewed mapping from 1937, the Subject Property is predominantly comprising undeveloped land. Moderate amounts of petroleum extraction-related development (roads, tanks, oil derricks) are visible in Sections A and F, and significant development (buildings, ponds, greater concentrations of oil derricks) is visible in Sections B and E. The southeastern portion of Section E appears to be developed with a residential complex for site workers, complete with houses with gardens, soft landscaping, and suspected school or communal building.

Year	Scale	Observations of Subject Property and Adjoining/Nearby Properties
1956	1”=1,000’	Significant development is evident in Section A by 1956, including the construction of roads, parking lots, tanks, and oil well platforms. An airstrip was constructed to the southeast of Section D. Additional derricks have been constructed in the southern and western portions of Section F. Section F –Tank battery constructed adjacent to the southeast by 1994
1974, 1976	1”=1,000’	Percolation ponds are evident approximately 550 feet northeast of the Subject Property in Section B, with addition and expansion of the ponds evident through later years to until 1984. Additional smaller percolation ponds are visible throughout Section D, with further additions in 1976 and 1984. The formerly undeveloped land to the northeast of the Subject Property has been cultivated for agricultural use. Some of the residential dwellings in the southeastern portion of Section E appear to have been demolished by 1976, and all remaining units are fully removed by 1984.
1984	1”=1,000’	Proliferation of oil extraction platforms is visible in the southwest of Section C by 1984. Percolation ponds are visible in the surrounding area, with the closest located approximately 350 feet west of the Subject Property. Tank farms have been constructed to the northeast and southwest of the Subject Property in Section D by 1984. A facility or complex has been constructed in the formerly-undeveloped southwestern portion of Section E, with several buildings, tanks, and associated roads and parking lots visible.
1994	1”=1,000’	A battery of tanks has been constructed adjacent to the southeast of the Subject Property in Section F.
2005	1”=1,000’	Pipelines tracing the proposed path of the Subject Property are visible in photography from 2005.
2009, 2012	1”=1,000’	The percolation ponds to the northeast of Section B have been drained by 2009.

Name of aerial photograph source: EDR Aerial Photo Decade Package.

The use of the Subject Property and surrounding lands for hydrocarbon extraction use and the inherent risks of surface spills and observed percolation of impacted process water into the subsurface is considered a REC.

The demolition of residential structures in the vicinity of the Subject Property is considered an item of note, given the potential for asbestos containing materials to be present within the former building fabrics which may now be present in surface soils, assuming the demolition materials were not thoroughly removed from the Subject Property.

4.4.3 City Directories

Stantec retained a third party to research available city directories for the Subject Property and adjoining and nearby properties, in approximately five-year intervals. Copies of the city directory listings are included in Appendix E.

The City Directory report did not identify any addresses listed to Ducon Road or Pole Line Road, located within and adjacent to the Subject Property.

Name of city directories and source: EDR City Directory Image Report.

Given the absence of entries, no RECs were noted during the review of the City Directories.

4.4.4 Historical Fire Insurance Maps

Fire insurance maps were developed for use by insurance companies to depict facilities, properties, and their uses for many locations throughout the United States. These maps provide information on the history of prior land use and are useful in assessing whether there may be potential environmental contamination on or near the Subject Property. These maps, which have been periodically updated since the late 19th century, often provide valuable insight into historical Subject Property and adjoining and nearby property uses.

Stantec requested fire insurance maps from EDR; however, no coverage exists for the Subject Property. The Sanborn® Map Search Report indicating “no coverage” is presented in Appendix E.

4.4.5 Historical Topographic Maps

Stantec reviewed historical USGS Topographic Maps of multiple quadrangles to help identify past Subject Property and adjoining and nearby property usage and areas of potential environmental concern. Copies of the historical maps are provided in Appendix E. The topographic map quadrangles and scales are listed below:

Scale	Quadrangle	Year
30-minute, 1:125,000	McKittrick Lost Hills	1912 1914
15-minute, 1:50,000	McKittrick	1979
7.5-minute, 1:31,680	Belridge Blackwell	1943 1943
7.5-minute, 1:24,000	Belridge Blackwells Corner	1947 1947
7.5-minute, 1:24,000	West of Goose Lake Lost Hills Blackwells Corner Belridge Carneros Rocks	1950 1953, 1973, 2012, 2015, 2018 1953, 1973, 1982, 2012, 2015, 2018 1953, 1973, 2012, 2015, 2018 1959, 1973, 1982, 2012, 2015, 2018

The following table summarizes the maps reviewed and our observations.

Year	Scale	Observations of Subject Property and Adjoining/Nearby Properties
1912, 1914	1:125,000	On the earliest reviewed map editions from 1912 and 1914, the Subject Property comprises undeveloped land. The central portion of the Subject Property is crossed by two creeks flowing from the southwest to the northeast.
1943, 1947	1:31,680, 1:25,000	By 1943, the Subject Property and surrounding land has been partially developed with multiple tracks and minor roads providing access to the oil field with associated pump stations. Highway 33 has been constructed to the east of the Subject Property. Numerous oil exploration structures (derricks and/or pumpjacks) are visible in cluster around the South Belridge Lease Camp in the southern portion of the Subject Property. The area remains largely unchanged by 1947.
1950, 1953, 1959, 1973, 1979, 1982, 2012, 2015, 2018	1:24,000	By 1953, the South Belridge Lease Camp has expanded with labeled features including a school, swimming pool, landing strip, water tanks, and oil tanks. Additional oil derricks and/or pumpjacks are mapped throughout the oilfield to the northwest and south/southeast. Additional access roads have been constructed in a uniform distribution across the oilfield, providing access to the oil wells. At least six batteries of oil tanks are mapped in the northern portion of the Subject Property. Further expansion to the oilfield extraction activities is evidence to the southwest of the South Belridge Lease Camp by 1979. No significant changes in the configuration of the Subject Property and surrounding land are evident from subsequent map editions through to the most recent mapping from 2018.

Name of maps and source: EDR Historical Topo Map Report.

The historical use of the Subject Property and surrounding land for hydrocarbon extraction activities is considered a REC to the entire Subject Property.

4.4.6 Other Historical Sources

No other historical sources were researched.

5.0 SITE RECONNAISSANCE

A visit to the Subject Property and its vicinity was conducted by Ms. Emily Medler on October 13, 2022. Ms. Medler was accompanied by Mr. Jared Pratt, of Stantec, as an Aera-designated Person-In-Charge (PIC). Ms. Medler and Mr. Pratt were not accompanied by other Aera personnel during the Subject Property visit. Figure 2 provides information about the Subject Property and adjoining sites and the location of potential areas of environmental concern. Photographs collected during the site reconnaissance are included in Appendix A.

5.1 SITE RECONNAISSANCE METHODOLOGY

The site reconnaissance focused on observation of current conditions and observable indications of past uses and conditions of the Subject Property that may indicate the presence of RECs. The reconnaissance of the Property was conducted on foot and Stantec utilized the following methodology to observe the Property:

- Traverse the outer Subject Property boundary
- Traverse transects across the Subject Property
- Traverse the periphery of all structures on the Subject Property

Weather conditions during the visit to the Subject Property were clear and sunny. There were no weather-related Subject Property access restrictions encountered during the reconnaissance visit. The reconnaissance of the Property was conducted by way of accessible oil roads and adjacent highways. All buildings and interior areas were not accessible due to security clearances.

5.2 GENERAL DESCRIPTION

Subject Property and Area Description:	The Subject Property is located within the North and South Belridge oil fields. The Subject Property is active oil production and processing facilities in Kern County, CA.
Subject Property Operations:	The Subject Property is used for oil and gas production, including heavy oil production from the Tulare formation and light oil production from the Diatomite formation. Crude oil is sold on the Property and is transported to markets in California for processing into gasoline and other fuels.
Structures, Roads, Other Improvements:	The Subject Property is approximately 13 miles long. There are abundant structures, roads, and other petroleum industry infrastructure located on the Subject Property, including but are not limited to: separators, well heads, pumping stations, transportation lines, pipelines, and steam generators.
Subject Property Size:	Approximately 3,252 acres
Estimated % of Subject Property Covered by	~35-50%

Buildings and/or Pavement:	
Observed Current Subject Property Use/Operations:	Oil Production and Processing
Observed Evidence of Past Subject Property Use(s):	The Belridge Oil Field has consistently been used as an oil field since 1911.The Subject Property remained undeveloped until 1943 (See 4.4.5 Historical Topographic Maps) and has since been consistently used for oil production.
Sewage Disposal Method (and age):	Could not be determined
Potable Water Source:	Belridge Water Storage District
Electric and Natural Gas Utilities:	Pacific Gas & Electric

5.3 HAZARDOUS SUBSTANCES AND PETROLEUM PRODUCTS

The following table summarizes Stantec's observations during the Subject Property reconnaissance.

Observations	Description/Location
Hazardous Substances and Petroleum Products as Defined by CERCLA 42 U.S.C. § 9601(14) with identified uses:	None observed.
Drums/Totes/Intermediate Bulk Containers (≥ 5 gallons):	None observed.
Strong, Pungent, or Noxious Odors:	Yes, throughout the Subject Property hydrocarbon odors were noted, associated with active petroleum production activities.
Pools of Liquid:	Five large separation ponds were observed in the southeast portion of Section D along Pole Line Road. Specific contents could not be determined but appeared to be a slurry mix of produced water, and oil.
Unidentified Substance Containers:	None observed.
Polychlorinated biphenyl (PCB)-Containing Equipment:	None observed.
Other Observed Evidence of Hazardous Substances or Petroleum Products:	None observed.

5.4 INTERIOR OBSERVATIONS

Due to security clearance and safety reasons, Stantec was not able to observe interior spaces of buildings and structures within the Subject Property.

5.5 EXTERIOR OBSERVATIONS

Stantec made the following observations during the site reconnaissance of exterior areas of the Subject Property and/or identified the following information during the interview or records review portions of the assessment:

Observations	Description
On-site Pits, Ponds, or Lagoons:	Due to the size and active production of the Subject Property, not all pits, ponds, or lagoons were not able to be documented. The following was observed during the site reconnaissance: • Four separation ponds were observed in the southeast portion of Section D along Pole Line Road. • 0.08-square mile area of decommissioned percolation ponds in the central portion of Section B.
Stained Soil or Pavement:	Limited staining was observed on the ground surface around active oil wells within the Subject Property.
Stressed Vegetation:	No stressed vegetation was observed in the Subject Property.
Waste Streams and Waste Collection Areas:	No waste collection areas were observed on or adjacent to the Subject Property.
Solid Waste Disposal:	No solid waste disposal areas were observed.
Potential Areas of Fill Placement:	In the southeast corner of Section B, a sink hole area was observed within the Subject Property. This area was fenced off and was only able to be observed from Pole Line Road. Additionally minor stockpiling was observed in the southern corner of Section B associated with some pipeline maintenance crews.
Wastewater:	No wastewater discharge was observed during the site reconnaissance.
Stormwater:	Due to the predominantly unpaved nature of the Subject Property, stormwater generally infiltrates the surface of the Subject Property or flows down-gradient. In paved portions of the Subject Property, stormwater flows into surface drains and is allowed to discharge onto unpaved portions of the facility.
Wells:	Oil wells were observed throughout the entirety of the Subject Property. Stantec observed a representative number of oil wells to determine likely existing conditions at the typical well pads within the Subject Property
Septic Systems:	Existing Aera office facilities are served by active septic systems
Other Exterior Observations:	None

5.6 UNDERGROUND STORAGE TANKS/STRUCTURES

Existing USTs:	An abundance of above ground infrastructure was observed during the site reconnaissance that have the potential to lead to underground storage tanks (USTs). In Section D, an active fuel station owned by Schwebel Petroleum Co. was observed that would indicate the presence of USTs. USTs at the fueling station are in compliance and operating with active Kern County Environmental Health (KCEHS) permits. Given the size and active production of the Subject Property, there is potential that several USTs are present within the Subject Property.
Former USTs:	Given the size, active production, and historical use of the Subject Property, there is potential that several former USTs are present within the Subject Property.
Other Underground Structures:	An abundance of underground structures was observed during the site reconnaissance. Due to the size, active production of the Subject Property, and the constraints of this report, all underground structures were not able to be observed and documented. Refer to the Photo Log included in Appendix A for examples of aboveground infrastructure that would indicate the presence of underground structures.

5.7 ABOVEGROUND STORAGE TANKS

Existing ASTs:	Several large crude oil and water Aboveground Storage Tanks (ASTs) were observed during the site reconnaissance. The ASTs observed were not accessible due to fencing and security clearances. No evidence of leaks or surface staining were observed around the ASTs. Refer to the Photo Log included in Appendix A for some ASTs that were observed during the site reconnaissance.
Former ASTs:	Several ASTs were observed during the site reconnaissance, many of which are likely former ASTs. Due to the size, active production of the Subject Property, and the constraints of this report, all aboveground structures were not able to be observed and documented. Refer to the Photo Log included in Appendix A for some former ASTs that were observed during the site reconnaissance.

5.8 ADJOINING PROPERTIES

5.8.1 Current Uses of Adjoining Properties

As viewed from the Subject Property and/or from public rights-of-way, Stantec made the following observations about use and activities on adjoining sites:

NORTH	Petroleum extraction and pipeline stations.
EAST	Used for petroleum extraction purposes.
SOUTH	Used for petroleum extraction purposes.
WEST	Petroleum extraction and grazing land.

5.8.2 Observed Evidence of Past Uses of Adjoining Properties

Observations of adjoining sites providing indications of past use and activities, if any, are described below.

NORTH	Due to the former and abandoned infrastructure that is present, this site appears to have been used for oil production use.
EAST	Due to the former and abandoned infrastructure that is present, this site appears to have been used for oil production use.
SOUTH	Due to the former and abandoned infrastructure that is present, this site appears to have been used for oil production use.
WEST	Due to the former and abandoned infrastructure that is present, this site appears to have been used for oil production use.

5.8.3 Pits, Ponds, or Lagoons on Adjoining Properties

As viewed from the Subject Property and/or from public rights-of-way, Stantec made the following observations about the presence of pits, ponds, and lagoons on adjoining sites:

NORTH	None observed.
EAST	None observed during the site reconnaissance. Historical aerials indicate the presence of separation or percolation ponds.
SOUTH	None observed.
WEST	A sinkhole/area of subsidence was observed in the along the southwestern portion of Section B.

5.9 OBSERVED PHYSICAL SETTING

Topography of the Subject Property and Surrounding Area:	The Subject Property is relatively flat with gentle slope from west to east.

6.0 INTERVIEWS

The results of various interviews with property owner representatives have been incorporated into the report findings.

7.0 EVALUATION

This section provides a summary overview of or Findings, Opinions, and Conclusions.

7.1 FINDINGS AND OPINIONS

Information gathered from interviews, reviews of existing data, and an inspection was evaluated to determine if RECs are present in connection with the Subject Property. Based on this information, Stantec made the following findings and developed the following opinions.

- The Subject Property comprises multiple parcels of land currently and historically used by the petroleum hydrocarbon extraction industry. Sources of potential impacted on and within close proximity to the Subject Property have included oil derricks and pumpjacks, pipelines, ASTs, and percolation ponds. Records indicate a LUST case and recorded release of oil have occurred on or within close proximity to the Subject Property. Multiple wastewater pits have been observed in proximity to the Subject Property during a site reconnaissance visit and historical aerial photography. CalGEM records show hundreds of active, plugged, and abandoned wells are present within the vicinity of the length of the Subject Property.

  The Subject Property and adjacent land has been in use for petroleum hydrocarbon extraction activities from 1911 to the present day. Multiple current and historical information sources indicate releases of petroleum hydrocarbons have occurred on or close to the Subject Property. Based on the long history of petroleum production activities at the Subject Property, there is a potential for additional areas of petroleum hydrocarbon containing soil to exist in the vicinity of proposed project features.

- Regulatory records indicate an area to the west of the Subject Property comprised a Class III landfill. The entry is listed 590 feet west of the Subject Property but is recorded as up to 28.7 acres in area, filled to a depth of approximately 10 feet. Given the dimensions, Stantec believes the oil field facility was designated as a landfill to allow historical operators to fill and dispose of soil and/or waste on-site. In addition, historical aerial photography shows a worker housing area in the southern portion of the Subject Property was demolished in the 1970s and 1980s. Buildings constructed prior to this time were likely constructed with materials including ACM and LBP.

  Relatively uncontrolled solid-waste disposal practices of mixed fill type, which may include demolition material, ACM, and LBP, if present beneath the Subject Property, would require special handling and disposal, and represents a potential BER. Additional safety measures for construction workers may also be required, if the fill is to be disturbed during construction phase activities. Heterogeneous or uncompacted fill also presents a settlement risk, should structures of significant weight be proposed across areas of fill.

- An environmental records search was performed and identified sites within their respective ASTM E1527-21 search radii of the Subject Property that may represent RECs, CRECs, HRECs, or *de minimis* conditions.
- A total of 41 wastewater pits are located within 0.5 miles of the Subject Property, with 18 located within 0.125 miles (660 feet) of the Subject Property. Of these, the majority are either closed former percolation ponds, secondary containment basins, emergency overflow basins, or process basins.

Based on the distance, direction, and regulatory status, these sites are not anticipated to represent an environmental concern to the Subject Property.

Based on one or more of the following reasons: distance from the Subject Property, position of sites with respect to assumed groundwater flow direction, the type of native soils, and regulatory status, none of the other sites identified in the environmental records search report are expected to impact soil or groundwater quality at the Subject Property. The environmental records search identified no additional RECs, CRECs, HRECs or *de minimis* conditions at or near the Subject Property.

7.2 DATA GAPS

The federal AAI final rule [40 CFR 312.10(a)], ASTM E1527-13, and ASTM E1527-21 identify a "data gap" as the lack or inability to obtain information required by the standards and practices of the rule despite good faith efforts by the EP or the User.

Any data gaps resulting from the Phase I ESA described in this report are listed and discussed below.

Gap	Discussion
Deletions or Exceptions from Scope of Work Referenced in Section 1.4:	None.
Weather-Related Restrictions to Site Reconnaissance:	None
Facility Access Restrictions to Site Reconnaissance:	The interiors of all the buildings and structures present onsite were not able to be observed due to restrictions and security clearance. These restrictions are not considered to significantly limit the EP's ability to recognize RECs at the Subject Property and are not considered to affect the overall conclusions of this Report.
Other Site Reconnaissance Restrictions:	Due to the size of the Subject Property and the time restrictions of this report, every surface and area within the Subject Property was not able to be observed. This restriction is not considered to significantly limit the EP's ability to recognize RECs at the Subject Property and is not considered to affect the overall conclusions of this Report.
Data Gaps from Environmental Records Review:	Responses were not received from multiple regulatory agencies contacted as part of the information request process. While these absent responses are considered to represent data gaps, they are not considered to significantly limit the EP's ability to recognize RECs at the Subject Property and are not considered to affect the overall conclusions of this Report.
Data Gaps from Historical Records Review:	Historical aerial photographs and topographic maps were not able to be obtained in 5-year intervals. This is considered a data gap but given the relatively small changes noted between map and photograph editions, it is not considered to significantly limit the EP's ability to recognize RECs at the Subject Property and is not considered to affect the overall conclusions of this Report.

Gap	Discussion
Data Gaps from Interviews:	None
Other Data Gaps:	None.

7.3 CONCLUSIONS

We have performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E1527-21 of the Subject Property, an approximately 11.7-mile long area centered on 35.501525°, -119.751895° (WGS 84). Any exceptions to, or deletions from, this practice are described in Section 2.3 of this report. This assessment has revealed the following evidence of RECs in connection with the Subject Property:

- The current and historical use of the Subject Property and surrounding land, from 1911 to present, for petroleum hydrocarbon extraction activities is considered a REC.
- Regulatory records indicate an area of land to the west of the Subject Property, but likely incorporating the Subject Property, was used as a Class III landfill until 2007. The area of fill is listed as over 27 acres, to a depth of 10 feet bgs, and it is considered likely that portions of the Subject Property are incorporated within this area of fill. In addition, historical aerial photography indicate worker residences were demolished in the 1970s and 1980s. Houses constructed prior to this period often contained ACM and LBP within the building fabric. The potential for ACM and LBP to be contained within various areas of fill at the Subject Property, as well as the potential for the fill to be uncompacted and/or uncontrolled, is considered a REC.
- Kern County Environmental Health Services records indicated that a historical waste disposal site is located in the South Belridge Oil Field east of the Oasis office building. Refer to Figure 3 for the approximate location of the waste disposal site. No additional information was available for this REC.
- A total of 41 wastewater pits are currently or were historically located within 0.5 miles of the Subject Property. Of these, the majority are either closed former percolation ponds, secondary containment basins, emergency overflow basins, or process basins. Based on the distance, direction, and regulatory status, these sites are not anticipated to represent an environmental concern to the proposed project.

7.4 RECOMMENDATIONS

Stantec recommends the following additional activities to further characterize the soil conditions at the Subject Property and to assist in planning for construction of the proposed Project:

- Complete Phase II ESA activities within selected areas of potential environmental concern within the Subject Property that may be affected by the proposed Project, such as historical

drilling/production sump locations, and the closed Class III solid waste landfill, and a suspect waste disposalarea.

- Develop a Soil Management Plan for implementation during Project construction activities to properly manage affected soils/wastes that are encountered during ground disturbing activities.

8.0 NON-SCOPE CONSIDERATIONS

The following ASTM E1527-21 Non-Scope Considerations were performed as part of this Phase I ESA:

- Lead-Based Paint
- Asbestos-Containing Materials
- PCBs in Caulk

8.1 LEAD-BASED PAINT

Concern for LBP is primarily related to residential structures. The EPA's Final Rule on Disclosure of Lead-Based Paint in Housing (40 CFR Part 745) defines LBP as paint or other surface coatings that contain lead equal to or in excess of 1.0 milligram per square centimeter or 0.5 percent by weight.

The risk of lead toxicity in LBP varies based upon the condition of the paint and the year of its application. The U.S. Department of Housing and Urban Development (HUD) has identified the following risk factors:

- The age of the structure as follows: maximum risk is from paint applied before 1950.
- There is severe risk from paint applied before 1960.
- There is moderate risk from deteriorated paint applied before 1970.
- There is slight risk from the paint that is intact but applied before 1977.
- The condition of the painted surfaces.
- The presence of children and certain types of households in the building.
- Previously reported cases of lead poisoning in the building or area.

Construction Date	Residential (Yes/No)	Observed Condition of Painted Surfaces
Variable	No	Painted surfaces observed on-site were of various states of condition, with peeling, cracking, and flaking paint observed on painted exterior surfaces of ASTs, pipelines, and stairways.

8.2 ASBESTOS

Asbestos can be found in many applications, including sprayed-on or blanket-type insulation, pipe wraps, mastics, floor and ceiling tiles, wallboard, mortar, roofing materials, and a variety of other materials commonly used in construction. The greatest asbestos-related human health risks are associated with friable asbestos, which is ACM that can be reduced to powder by hand pressure. Friable asbestos can

become airborne and inhaled, which has been associated with specific types of respiratory disease. The manufacturing and use of asbestos in most building products was curtailed during the late 1970s. Presumed ACMs in the form of flange gasket material, AST gaskets, and pipe insulation were observed throughout the Subject Property.

Stantec makes no warranty as to the possible existence or absence of inaccessible materials or to their evaluation with respect to asbestos content. Samples of suspect ACM should be collected for laboratory analysis of asbestos prior to any renovation or building demolition to be compliant with, EPA National Emission Standard for Hazardous Air Pollutants (NESHAP) regulations.

8.3 PCBS IN CAULK

PCBs belong to a broad family of man-made organic chemicals known as chlorinated hydrocarbons. The commercial production of PCBs started in the late 1920s until their manufacture was banned in 1979 because of the possible carcinogenic risk to human health and to the environment. PCBs have a range of toxicity and vary in consistency from thin, light-colored liquids to yellow or black waxy solids. Due to their non-flammability, chemical stability, high boiling point, and electrical insulating properties, PCBs were used in hundreds of industrial and commercial applications including electrical, heat transfer, and hydraulic equipment; as plasticizers in paints, plastics, and rubber products; in pigments, dyes, and carbonless copy paper; and many other industrial applications. The PCBs used in these products were chemical mixtures made up of a variety of individual chlorinated biphenyl components, known as congeners. Most commercial PCB mixtures are known in the United States by their industrial trade names. The most common trade name is Aroclor.

Prior to the 1979 ban, PCBs entered the environment during their manufacture and use in the United States. Although no longer commercially produced in the United States, PCBs may be present in products and materials such as caulk produced before the 1979 PCB ban. Today PCBs associated with building demolition or renovation projects can still be released into the environment from illegal or improper dumping of PCB wastes; disposal of PCB-containing consumer products into municipal or other landfills not designed to handle hazardous waste and through improper containment during removal.

Further assessment of PCBs in caulk appears to be warranted based upon the date of construction of on-site facilities.

PROJECT EXPERIENCE

SOIL AND GROUNDWATER REMEDIATION SYSTEMS

Former Ultramar #77 | Yorba Linda, California, United States | Geologic Staff

For more than 20 years, Stantec has provided support to the ongoing remediation project comprising the monitoring and decommission of remedial wells and groundwater monitoring wells surrounding a former hydrocarbon release site. Responsibilities have included oversight of drilling contractors to destroy on-site and off-site wells, co-ordination with subcontractors, and liaison with regulatory agencies and the general public. Dates involved: 01/2020-06/2020

Azusa Landfill Soil Disposal | Azusa, California, United States | Geologic Staff

Stantec was approached to assist with the delineation of and removal of non-conforming soils that had been mistakenly sent to a landfill with an inappropriate classification for the waste. An investigation was prepared to locate and define the extent of the non-conforming soils, comprising soil sampling and in-situ analysis with an x-ray fluorescence tool. Responsibilities included on-site sampling and record-keeping, sample preparation, and reporting. Role: Geologic Staff | Dates involved: 03/2020-04/2020

Willett Tank Farm | Ventura, California, United States | Geologic Staff

Stantec is providing ongoing support to a land developing Client interested in the purchase of a former crude oil storage facility comprising four former above-ground storage tanks with ancillary infrastructure. A Phase I identified contamination beneath the site, potentially extending to a nearby stream. Thomas coordinated subcontractors to delineate and assess vertical and lateral extents of hydrocarbon-impacted soils beneath the former crude oil storage facility. Responsibilities included collection of soil and soil vapor samples, scheduling of laboratory analysis, real-time adjustments to proposed sampling locations based on field observations, and preparation of draft figures indicating the volume of impacted soils requiring remediation and/or removal. Role: Geologic Staff | Dates involved: 06/2020

Former NASA Industrial Plant | Downey, California, United States | Geologic Staff

Stantec assisted in the potential acquisition of a property located on a former NASA rocket and materials testing facility. Thomas supported Phase I ESA to identify potential sources of contamination located on the property and to assess the potential for known off-site contamination to impact the subsurface media at the property. In order to meet the deadlines of an escrow period, he also assisted in scoping, preparing for, and undertaking a limited Phase II ESA. Soil vapor probes were installed to assess the presence and extent of solvent plumes in soil vapor. Soil and groundwater samples were also taken to assess the potential source of the observed vapor phase plumes beneath the property. Further analysis of the data led to the identification of two discrete plumes at the property. One derived from an off-site source and the second was identified to be associated with a localized source located on the property.

Based on the findings of the Phase II ESA, recommendations of the likely mitigation measures were made based on the identified soil vapor contamination. In addition, the investigation identified that should the acquisition proceed, the Client could be required to accept partial responsibility for potential future litigation or remediation of the regional soil vapor phase contamination plume.

BROWNFIELD REMEDIATION AND REDEVELOPMENT

Centre 27 Business Park * | Birstall, England, United Kingdom | Geo-Environmental Consultant

Provided support in the redevelopment of a business park suffering from subsidence attributed to either the compression of a historical landfill known to lie beneath the site, or due to collapsing former coal workings known to encroach upon the site, or a combination of the two. An intrusive investigation was undertaken to assess the extents of the former landfill and assess the extent and condition of historical coal workings beneath the site, as well as undertake a ground gas assessment and structural assessment to inform redevelopment design. Site works comprised drilling and rock coring. Responsibilities included co-ordination with subcontractors, soil and rock logging, and soil sampling, report writing, preliminary founding pile design Role: Geo-Environmental Consultant | Dates involved: 05/2018

Former INEOS Plastic Works* | Helsby, Cheshire, United Kingdom | Geo-Environmental Consultant

Provided oversight of a brownfield remediation project to support the redevelopment of a former plastics factory to a site suitable for residential use. The site, highly impacted with chemicals from its former use, required the oversight of a qualified environmental consultant to ensure remediation was undertaken in line with regulatory guidelines. Responsibilities included oversight of excavation and sump-pump removal of free product, soil, groundwater and surface water sampling, analysis of chemical testing results, preparation and refinement of Conceptual Site Models and Material Reuse Models, and liaison with the UK Environment Agency. Role: Geo-Environmental Consultant | Dates involved: 03/2018-01/2019

VAPOR INTRUSION / METHANE SITE ASSESSMENT & MITIGATION-RELATED PROJECTS

Western Avenue | Los Angeles, California, United States | Geologic Staff

Scoped and managed a soil vapor investigation along the proposed route of a water trunk line in central Los Angeles. The five-mile stretch of proposed pipeline passed through methane zones mapped by the Los Angeles Department of Building and Safety. In order to assess potential health and safety risks to construction workers during construction of the pipeline, Thomas coordinated and led a six-week field investigation involving the drilling, installation, and sampling of soil vapor probes.

Playa Vista | Los Angeles, California, United States | Geologic Staff

Assisted in the assessment and mitigation of vapor intrusion conditions (to include methane) identified at a commercial office building that was being remodeled into a medical office building. The scope of services provided included the completion of vapor intrusion investigations to evaluate the presence of volatile organic compounds and methane within the subsurface of the building. The results of the methane testing were used to establish the methane design basis in accordance with LADBS site testing standards and city ordinance for methane mitigation systems. Stantec assisted the general contractor on behalf of the client to provide additional architectural design considerations and implementation of the mitigation systems as a retrofit of the existing building. Air monitoring was provided during the installation of the sub-slab passive methane mitigation piping system based on the detection of up to 100% methane beneath the building slab during the assessment phase of the project.

Thomas provided additional air monitoring during the remodel to confirm that the installed methane mitigation measures were performing adequately in limiting the intrusion of methane and VOCs into the building. In addition, water quality testing was completed by Stantec to evaluate the existing water supply quality and enable decisions to be made on equipment that may be needed to meet the client's healthcare standards and existing state and federal water quality standards for occupancy by its personnel and visitors for use as a medical office building.

EMPLOYMENT HISTORY

Delta-Simons Environmental Consultants

Geo-Environmental Consultant
2016 - 2020 · 3 years

Preparation of Phase I Environmental Site Assessments, Phase II Site Investigations, Remediation Statements and Remediation Verification Reports. Experienced in scoping and overseeing drilling and excavation programs, scheduling and interpreting chemical analysis of soil and groundwater samples, and collecting and interpreting geotechnical data.

** denotes projects completed with other firms*

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527-21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

CERS: CERS

A review of the CERS list, as provided by EDR, and dated 04/18/2022 has revealed that there are 2 CERS sites within the requested target property.

Site	Address	Map ID / Focus Map(s)	Page
PHILLIPS 66 - MIDDLE	***17251 POLE LINE RD***	***J41 / 8***	***84***
PHILLIPS 66 PIPELINE	***17251 POLE LINE RD***	***J42 / 8***	***88***

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Page Numbers and Map Identifcations refer to the EDR Area/Corridor Report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of state and tribal landfills and solid waste disposal facilities

SWF/LF: Solid Waste Information System

A review of the SWF/LF list, as provided by EDR, has revealed that there is 1 SWF/LF site within approximately 0.5 miles of the requested target property.

PHILLIPS 66 - MIDDLEWATER PUMP STA (Continued) **S121788390**

Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: The facility is using the following tank: 1.) 158 gallon tank colored single wall steel cubical shaped non-Underwriter's Laboratory (UL) listed tank sitting over a single wall steel containment tub. Tank is used to supply diesel to the station's fire water pump. These tanks will be referred to the Kern County Fire Prevention Unit for compliance followup. Please contact Captain Tom Ellison or Engineer Anthony Romero at (661) 391-7080 for more information.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

LOS ANGELES CO LF METHANE: Methane Producing Landfills
This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.
Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.
Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.
Daycare Centers: Licensed Facilities
Source: Department of Social Services

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Stantec were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

End of Report

San Joaquin Valley
Air Pollution Control District

**FACI□IT□ □□□□

11. The operator shall submit reports of any required monitoring at least every six months unless a different frequency is required by an applicable requirement. All instances of deviations from permit requirements must be clearly identified in such reports. [District Rule 2520, 9.5.1] Federally Enforceable Through Title V Permit

12. Deviations from permit conditions must be promptly reported, including deviations attributable to upset conditions, as defined in the permit. For the purpose of this condition, promptly means as soon as reasonably possible, but no later than 10 days after detection. The report shall include the probable cause of such deviations, and any corrective actions or preventive measures taken. All required reports must be certified by a responsible official consistent with section 10.0 of District Rule 2520 (6/21/01). [District Rules 2520, 9.5.2 and 1100, 7.0] Federally Enforceable Through Title V Permit

13. If for any reason a permit requirement or condition is being challenged for its constitutionality or validity by a court of competent jurisdiction, the outcome of such challenge shall not affect or invalidate the remainder of the conditions or requirements in that permit. [District Rule 2520, 9.7] Federally Enforceable Through Title V Permit

14. It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of the permit. [District Rule 2520, 9.8.2] Federally Enforceable Through Title V Permit

15. The permit may be modified, revoked, reopened and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition. [District Rule 2520, 9.8.3] Federally Enforceable Through Title V Permit

16. The permit does not convey any property rights of any sort, or any exclusive privilege. [District Rule 2520, 9.8.4] Federally Enforceable Through Title V Permit

17. The Permittee shall furnish to the District, within a reasonable time, any information that the District may request in writing to determine whether cause exists for modifying, revoking and reissuing, or terminating the permit or to determine compliance with the permit. Upon request, the permittee shall also furnish to the District copies of records required to be kept by the permit or, for information claimed to be confidential, the permittee may furnish such records directly to EPA along with a claim of confidentiality. [District Rule 2520, 9.8.5] Federally Enforceable Through Title V Permit

18. The permittee shall pay annual permit fees and other applicable fees as prescribed in Regulation III of the District Rules and Regulations. [District Rule 2520, 9.9] Federally Enforceable Through Title V Permit

19. Upon presentation of appropriate credentials, a permittee shall allow an authorized representative of the District to enter the permittee's premises where a permitted source is located or emissions related activity is conducted, or where records must be kept under condition of the permit. [District Rule 2520, 9.13.2.1] Federally Enforceable Through Title V Permit

20. Upon presentation of appropriate credentials, a permittee shall allow an authorized representative of the District to have access to and copy, at reasonable times, any records that must be kept under the conditions of the permit. [District Rule 2520, 9.13.2.2] Federally Enforceable Through Title V Permit

21. Upon presentation of appropriate credentials, a permittee shall allow an authorized representative of the District to inspect at reasonable times any facilities, equipment, practices, or operations regulated or required under the permit. [District Rule 2520, 9.13.2.3] Federally Enforceable Through Title V Permit

22. Upon presentation of appropriate credentials, a permittee shall allow an authorized representative of the District to sample or monitor, at reasonable times, substances or parameters for the purpose of assuring compliance with the permit or applicable requirements. [District Rule 2520, 9.13.2.4] Federally Enforceable Through Title V Permit

23. No air contaminants shall be discharged into the atmosphere for a period or periods aggregating more than 3 minutes in any one hour which is as dark or darker than Ringelmann #1 or equivalent to 20% opacity and greater, unless specifically exempted by District Rule 4101 (02/17/05). If the equipment or operation is subject to a more stringent visible emission standard as prescribed in a permit condition, the more stringent visible emission limit shall supersede this condition. [District Rule 4101, and County Rules 401 (in all eight counties in the San Joaquin Valley)] Federally Enforceable Through Title V Permit

24. No person shall manufacture, blend, repackage, supply, sell, solicit or apply any architectural coating with a VOC content in excess of the corresponding limit specified in Table of Standards 1 effective until 12/30/10 or Table of Standards 2 effective on and after 1/1/11 of District Rule 4601 (12/17/09) for use or sale within the District. [District Rule 4601, 5.1] Federally Enforceable Through Title V Permit

25. All VOC-containing materials subject to Rule 4601 (12/17/09) shall be stored in closed containers when not in use. [District Rule 4601, 5.4] Federally Enforceable Through Title V Permit

26. The permittee shall comply with all the Labeling and Test Methods requirements outlined in Rule 4601 sections 6.1 and 6.3 (12/17/09). [District Rule 4601, 6.1 and 6.3] Federally Enforceable Through Title V Permit

27. With each report or document submitted under a permit requirement or a request for information by the District or EPA, the permittee shall include a certification of truth, accuracy, and completeness by a responsible official. [District Rule 2520, 9.13.1 and 10.0] Federally Enforceable Through Title V Permit

28. If the permittee performs maintenance on, or services, repairs, or disposes of appliances, the permittee shall comply with the standards for Recycling and Emissions Reduction pursuant to 40 CFR Part 82, Subpart F. [40 CFR 82 Subpart F] Federally Enforceable Through Title V Permit

29. If the permittee performs service on motor vehicles when this service involves the ozone-depleting refrigerant in the motor vehicle air conditioner (MVAC), the permittee shall comply with the standards for Servicing of Motor Vehicle Air Conditioners pursuant to all the applicable requirements as specified in 40 CFR Part 82, Subpart B. [40 CFR Part 82, Subpart B] Federally Enforceable Through Title V Permit

30. Disturbances of soil related to any construction, demolition, excavation, extraction, or other earthmoving activities shall comply with the requirements for fugitive dust control in District Rule 8021 unless specifically exempted under Section 4.0 of Rule 8021 (8/19/2004) or Rule 8011 (8/19/2004). [District Rules 8011 and 8021] Federally Enforceable Through Title V Permit

31. Outdoor handling, storage and transport of any bulk material which emits dust shall comply with the requirements of District Rule 8031, unless specifically exempted under Section 4.0 of Rule 8031 (8/19/2004) or Rule 8011 (8/19/2004). [District Rules 8011 and 8031] Federally Enforceable Through Title V Permit

32. An owner/operator shall prevent or cleanup any carryout or trackout in accordance with the requirements of District Rule 8041 Section 5.0, unless specifically exempted under Section 4.0 of Rule 8041 (8/19/2004) or Rule 8011 (8/19/2004). [District Rules 8011 and 8041] Federally Enforceable Through Title V Permit

33. Whenever open areas are disturbed, or vehicles are used in open areas, the facility shall comply with the requirements of Section 5.0 of District Rule 8051, unless specifically exempted under Section 4.0 of Rule 8051 (8/19/2004) or Rule 8011 (8/19/2004). [District Rules 8011 and 8051] Federally Enforceable Through Title V Permit

34. Any paved road or unpaved road shall comply with the requirements of District Rule 8061 unless specifically exempted under Section 4.0 of Rule 8061 (8/19/2004) or Rule 8011 (8/19/2004). [District Rules 8011 and 8061] Federally Enforceable Through Title V Permit

35. Any unpaved vehicle/equipment area that anticipates more than 50 Average annual daily Trips (AADT) shall comply with the requirements of Section 5.1.1 of District Rule 8071. Any unpaved vehicle/equipment area that anticipates more than 150 vehicle trips per day (VDT) shall comply with the requirements of Section 5.1.2 of District Rule 8071. On each day that 25 or more VDT with 3 or more axles will occur on an unpaved vehicle/equipment traffic area, the owner/operator shall comply with the requirements of Section 5.1.3 of District Rule 8071. On each day when a special event will result in 1,000 or more vehicles that will travel/park on an unpaved area, the owner/operator shall comply with the requirements of Section 5.1.4 of District Rule 8071. All sources shall comply with the requirements of Section 5.0 of District Rule 8071 unless specifically exempted under Section 4.0 of Rule 8071 (9/16/2004) or Rule 8011 (8/19/2004). [District Rules 8011 and 8071] Federally Enforceable Through Title V Permit

36. Any owner or operator of a demolition or renovation activity, as defined in 40 CFR 61.141, shall comply with the applicable inspection, notification, removal, and disposal procedures for asbestos containing materials as specified in 40 CFR 61.145 (Standard for Demolition and Renovation). [40 CFR 61 Subpart M] Federally Enforceable Through Title V Permit

37. The permittee shall submit certifications of compliance with the terms and standards contained in Title V permits, including emission limits, standards and work practices, to the District and the EPA annually (or more frequently as specified in an applicable requirement or as specified by the District). The certification shall include the identification of each permit term or condition, the compliance status, whether compliance was continuous or intermittent, the methods used for determining the compliance status, and any other facts required by the District to determine the compliance status of the source. [District Rule 2520, 9.16] Federally Enforceable Through Title V Permit

38. The permittee shall submit an application for Title V permit renewal to the District at least six months, but not greater than 18 months, prior to the permit expiration date. [District Rule 2520, 5.2] Federally Enforceable Through Title V Permit

39. When a term is not defined in a Title V permit condition, the definition in the rule cited as the origin and authority for the condition in a Title V permits shall apply. [District Rule 2520, 9.1.1] Federally Enforceable Through Title V Permit

40. Compliance with permit conditions in the Title V permit shall be deemed in compliance with the following outdated SIP requirements: Rule 401 (Madera, Fresno, Kern, Kings, San Joaquin, Stanislaus, Tulare and Merced), Rule 110 (Fresno, Stanislaus, San Joaquin), Rule 109 (Merced), Rule 113 (Madera), Rule 111 (Kern, Tulare, Kings), and Rule 202 (Fresno, Kern, Tulare, Kings, Madera, Stanislaus, Merced, San Joaquin). A permit shield is granted from these requirements. [District Rule 2520, 13.2] Federally Enforceable Through Title V Permit

41. Compliance with permit conditions in the Title V permit shall be deemed in compliance with the following applicable requirements: SJVUAPCD Rules 1100, sections 6.1 and 7.0 (12/17/92); 2010, sections 3.0 and 4.0 (12/17/92); 2031 (12/17/92); 2040 (12/17/92); 2070, section 7.0 (12/17/92); 2080 (12/17/92); 4101 (2/17/05); 4601 (12/17/09); 8021 (8/19/2004); 8031 (8/19/2004); 8041 (8/19/2004); 8051 (8/19/2004); 8061 (8/19/2004); and 8071 (9/16/2004). A permit shield is granted from these requirements. [District Rule 2520, 13.2] Federally Enforceable Through Title V Permit

42. On December 31, 2012 the initial Title V permit was issued. The reporting periods for the Report of Required Monitoring and the Compliance Certification Report begin January 1 of every year, unless alternative dates are approved by the District Compliance Division. These reports are due within 30 days after the end of the reporting period. [District Rule 2520] Federally Enforceable Through Title V Permit

1. No modification to this unit shall be performed without an Authority to Construct for such modification(s), except for changes specified in conditions below. [District Rule 2010] Federally Enforceable Through Title V Permit
2. The fuel supply line shall be physically disconnected from this unit. [District Rules 4306 and 4320] Federally Enforceable Through Title V Permit
3. This equipment shall not be operated for any reason until an Authority to Construct permit is issued approving all necessary retrofits required to comply with the applicable requirements of District Rule 4306 and all other applicable District regulations. [District Rule 4306 and 4320] Federally Enforceable Through Title V Permit
4. Unit shall be maintained and operated in accordance with the manufacturer's specifications and recommendations. [District Rule 4305] Federally Enforceable Through Title V Permit
5. Heater shall be fueled only on natural gas or LPG. [District Rule 4305] Federally Enforceable Through Title V Permit
6. Total heat input to this unit shall be less than 30 billion Btu per calendar year. [District Rule 4305] Federally Enforceable Through Title V Permit
7. Unit shall be tuned within 30 days of startup and at least once each calendar year in which it operates thereafter, by a qualified technician in accordance with Rule 4304. [District Rules 2201, 4304, and 4305] Federally Enforceable Through Title V Permit
8. Unit shall be equipped with a non-resettable fuel flow meter. A master meter which serves more than one unit may be used, provided either: (1) the total heat input to all of the units is less than 30 billion Btu/yr, or (2) the permittee monitors the operation of each unit to determine the amount of fuel consumed by each unit. [District Rule 4305] Federally Enforceable Through Title V Permit
9. Permittee shall maintain accurate records of monthly and annual fuel usage, and of dates tuning is performed for a period of five years and shall make such records readily available for District inspection upon request. [District Rule 4305] Federally Enforceable Through Title V Permit
10. Particulate matter emissions shall not exceed either of the following limits: 0.1 grain/dscf at operating conditions or 0.1 grain/dscf calculated to 12% CO2, nor 10 lb/hr. [District Rules 4201 and 4301] Federally Enforceable Through Title V Permit
11. Sulfur compound emissions shall not exceed 0.2% by volume, 2000 ppmv, on a dry basis averaged over 15 consecutive minutes. [District Rule 4801] Federally Enforceable Through Title V Permit

1. The true vapor pressure of liquid stored shall not exceed 11.0 psia. [District Rule 2201] Federally Enforceable Through Title V Permit
2. Total throughput of organic liquid with TVP greater than 5.9 psia and less than or equal to 11.0 psia shall not exceed either of the following limits: 190,000 bbl/day or 85,000 bbl/day on a monthly average basis. [District Rule 2201] Federally Enforceable Through Title V Permit
3. Total throughput of organic liquid with TVP less than or equal to 5.9 psia shall not exceed either of the following limits: 360,000 bbl/day or 180,000 bbl/day on a monthly average basis. [District Rule 2201] Federally Enforceable Through Title V Permit
4. Combined total throughput of permits S-77-9, '-11, and '-14 shall not exceed either of the following limits: 550,000 bbl/day or 265,000 bbl/day on a monthly average basis. [District Rule 2201] Federally Enforceable Through Title V Permit
5. VOC emission rate from permits S-77-9, '-11, and '-14 shall not exceed 227.1 lb/day. [District Rule 2201] Federally Enforceable Through Title V Permit
6. VOC emission rate from permits S-77-9, '-11, and '-14 shall not exceed 41,913 lb/yr. [District Rule 2201] Federally Enforceable Through Title V Permit
7. VOC emission rate shall not exceed 152.8 lb/day. [District Rule 2201] Federally Enforceable Through Title V Permit
8. Tank shall be equipped with operational temperature indicator. [District Rule 2201] Federally Enforceable Through Title V Permit
9. Permittee shall maintain a record of the liquid stored, the period of storage, and the maximum true vapor pressure of that liquid during the respective storage period. [District Rule 2201] Federally Enforceable Through Title V Permit
10. Permittee shall maintain records of maximum daily throughput and monthly average daily throughput. [District Rule 2201] Federally Enforceable Through Title V Permit
11. When storing organic liquids with true vapor pressure less than 0.5 psia, the requirements of Sections 5.3, 5.5 and 6.1 of District Rule 4623 (Amended May 19, 2005) shall not apply to this unit. This exemption applies to all conditions in this permit referencing Rule 4623 Sections 5.3, 5.5 or 6.1 only. [District Rule 4623] Federally Enforceable Through Title V Permit
12. Before switching to the storage of organic liquids with true vapor pressure greater than or equal to 0.5 psia, all covers, seals, and lids shall be inspected by the facility operator to ensure compliance with the provisions of this permit. This includes all conditions containing District Rule 4623 reference. [District Rule 2520] Federally Enforceable Through Title V Permit

13. The internal floating roof shall rest or float on the liquid surface (but not necessarily in complete contact with it) inside a storage vessel that has a fixed roof. The internal roof shall be floating on the liquid surface except during initial fill and when the storage vessel is completely emptied or subsequently emptied and refilled. When the roof is resting on the leg supports, the process of filling, emptying, or refilling shall be continuous and shall be accomplished as rapidly as possible. Whenever the permittee intends to land the roof on it's legs, the permittee shall notify the APCO in writing at least five days prior to performing the work. [District Rule 4623] Federally Enforceable Through Title V Permit
14. Gaps between the tank shell and the primary seal shall not exceed 2 1/2 inches. [District Rule 4623] Federally Enforceable Through Title V Permit
15. The cumulative length of all primary seal gaps greater than 1 1/2 inches shall not exceed 10% of the circumference of the tank. [District Rule 4623] Federally Enforceable Through Title V Permit
16. The cumulative length of all primary seal gaps greater than 1/8 inch shall not exceed 30% of the circumference of the tank. [District Rule 4623] Federally Enforceable Through Title V Permit
17. No continuous gap in the primary seal greater than 1/8 inch wide shall exceed 10% of the tank circumference. [District Rule 4623] Federally Enforceable Through Title V Permit
18. No gap between the tank shell and the secondary seal shall exceed 1/2 inch. [District Rule 4623] Federally Enforceable Through Title V Permit
19. The cumulative length of all gaps between the tank shell and the secondary seal, greater than 1/8 inch shall not exceed 5% of the tank circumference. [District Rule 4623] Federally Enforceable Through Title V Permit
20. The metallic shoe-type seal shall be installed so that one end of the shoe extends into the stored liquid and the other end extends a minimum vertical distance of 18 inches above the stored liquid surface. [District Rule 4623] Federally Enforceable Through Title V Permit
21. The geometry of the metallic-shoe type seal shall be such that the maximum gap between the shoe and the tank shell shall be no greater than 5 inches for a length of at least 18 inches in the vertical plane above the liquid. [District Rule 4623] Federally Enforceable Through Title V Permit
22. There shall be no holes, tears, or openings in the secondary seal or in the primary seal envelope that surrounds the annular vapor space enclosed by the roof edge, seal fabric, and secondary seal. [District Rule 4623] Federally Enforceable Through Title V Permit
23. The secondary seal shall allow easy insertion of probes up to 2 1/2 inches in width in order to measure gaps in the primary seal. [District Rule 4623] Federally Enforceable Through Title V Permit
24. The secondary seal shall extend from the roof to the tank shell and shall not be attached to the primary seal. [District Rule 4623] Federally Enforceable Through Title V Permit
25. All openings in the roof used for sampling and gauging, except pressure-vacuum valves which shall be set to within 10% of the maximum allowable working pressure of the roof, shall provide a projection below the liquid surface to prevent belching of liquid and to prevent entrained or formed organic vapor from escaping from the liquid contents of the tank and shall be equipped with a cover, seal or lid that shall be in a closed position at all times, with no visible gaps and be gas tight, except when the device or appurtenance is in use. [District Rule 4623] Federally Enforceable Through Title V Permit
26. A gas-tight condition is defined as a condition without a gas leak. A gas leak is defined as a reading in excess of 10,000 ppmv, above background, as measured by a portable hydrocarbon detection instrument in accordance with the procedures specified in EPA Test Method 21. A reading in excess of 10,000 ppmv above background is a violation of this permit and Rule 4623 and shall be reported as a deviation. [District Rule 4623] Federally Enforceable Through Title V Permit

27. A leak-free condition is defined as a condition without a gas leak or a liquid leak. A liquid leak is defined as the dripping of organic liquid at a rate of more than 3 drops per minute. A gas leak is defined as a reading in excess of 10,000 ppmv, above background, as measured by a portable hydrocarbon detection instrument in accordance with the procedures specified in EPA Test Method 21. A liquid leak or reading in excess of 10,000 ppmv above background is a violation of this permit and Rule 4623 and shall be reported as a deviation. [District Rule 4623] Federally Enforceable Through Title V Permit

28. Each opening in a non-contact internal floating roof, except for automatic bleeder vents (vacuum breaker vents) and rim space vents, shall provide a projection below the liquid surface. [District Rule 4623] Federally Enforceable Through Title V Permit

29. Each opening in the internal floating roof except for leg sleeves, automatic bleeder vents, rim space vents, column wells, ladder wells, sample wells, and stub drains is to be equipped with a cover or lid which is to be maintained in a closed position at all times (i.e., no visible gap) except when the device is in actual use. The cover or lid shall be equipped with a gasket. Covers on each access hatch and automatic gauge float well shall be bolted except when they are in use. [District Rule 4623] Federally Enforceable Through Title V Permit

30. Automatic bleeder vents shall be equipped with a gasket and shall be closed at all times when the roof is floating except when the roof is being floated off or is being landed on the roof leg supports. [District Rule 4623] Federally Enforceable Through Title V Permit

31. Rim vents shall be equipped with a gasket and are to be set to open only when the internal floating roof is not floating or at the manufacturer's recommended setting. [District Rule 4623] Federally Enforceable Through Title V Permit

32. Each penetration of the internal floating roof for the purpose of sampling shall be a sample well. The well shall have a slit fabric cover that covers at least 90% of the opening. The fabric cover must be impermeable. [District Rule 4623] Federally Enforceable Through Title V Permit

33. Each penetration of the internal floating roof that allows for passage of a column supporting the fixed roof shall have a flexible fabric sleeve seal or a gasketed sliding cover. The fabric sleeve must be impermeable. [District Rule 4623] Federally Enforceable Through Title V Permit

34. The permittee shall visually inspect the internal floating roof, and its appurtenant parts, fittings, etc. and measure the gaps of the primary seal and/or secondary seal prior to filling the tank for newly constructed, repair, or rebuilt internal floating roof tanks. If holes, tears, or openings in the primary seal, the secondary seal, the seal fabric or defects in the internal floating roof or its appurtenant parts, components, fittings, etc., are found, they shall be repaired prior to filling the tank. [District Rule 4623] Federally Enforceable Through Title V Permit

35. The permittee shall visually inspect, through the manholes, roof hatches, or other openings on the fixed roof, the internal floating roof and its appurtenant parts, fittings, etc., and the primary seal and/or secondary seal at least once every 12 months after the tank is initially filled with an organic liquid. There should be no visible organic liquid on the roof, tank walls, or anywhere. Other than the gap criteria specified by this rule, no holes, tears, or other openings are allowed that would permit the escape of vapors. Any defects found are violations of this rule. [District Rule 4623] Federally Enforceable Through Title V Permit

36. The permittee shall conduct actual gap measurements of the primary seal and/or secondary seal at least once every 60 months. [District Rule 4623] Federally Enforceable Through Title V Permit

37. Permittee shall submit the reports of the floating roof tank inspections to the APCO within five calendar days after the completion of the inspection only for those tanks that failed to meet the applicable requirements of Rule 4623, Sections 5.2 through 5.5. The inspection report for tanks that that have been determined to be in compliance with the requirements of Sections 5.2 through 5.5 need not be submitted to the APCO, but the inspection report shall be kept on-site and made available upon request by the APCO. The inspection report shall contain all necessary information to demonstrate compliance with the provisions of Rule 4623. [District Rule 4623] Federally Enforceable Through Title V Permit

38. Permittee shall maintain the records of the internal floating roof landing activities that are performed pursuant to Rule 4623, Sections 5.3.1.3 and 5.4.3. The records shall include information on the true vapor pressure (TVP), API gravity, storage temperature, type of organic liquid stored in the tank, the purpose of landing the roof on its legs, the date of roof landing, duration the roof was on its legs, the level or height at which the tank roof was set to land on its legs, and the lowest liquid level in the tank. [District Rule 4623] Federally Enforceable Through Title V Permit

39. The tank pressure-vacuum (PV) relief valve shall be set to within 10% of the maximum allowable working pressure of the tank. The PV relief valve shall be permanently labeled with the operating pressure settings. The PV relief valve shall be properly installed and maintained in good operating order in accordance with the manufacturer's instructions, and shall remain in leak-free condition except when the operating pressure exceeds the valve's set pressure. [District Rule 4623] Federally Enforceable Through Title V Permit

40. Permittee shall notify District at least 7 days prior to the date when unobstructed primary and secondary seal/gap testing will occur. [District Rule 1070]

41. All records required to be maintained by this permit shall be maintained for a period of at least five years and shall be made readily available for District inspection upon request. [District Rule 4623] Federally Enforceable Through Title V Permit

42. This unit was constructed prior to 1973 and has not been modified (as defined in 40 CFR 60.14) or reconstructed (as defined in 40 CFR 60.15) since 1973. Therefore, the requirements of 40 CFR 60 are not applicable to this unit. A permit shield is granted from these requirements. [District Rule 2520] Federally Enforceable Through Title V Permit

43. Permittee shall conduct true vapor pressure (TVP) testing of the organic liquid stored in this tank at least once every 24 months and/or whenever there is a change in the source or type of organic liquid stored in the tank. The TVP of any organic liquid shall be determined by measuring the Reid Vapor Pressure (RVP) using ASTM D 323 (Test Method for Vapor Pressure for Petroleum Products), and converting the RVP to TVP at the tank's maximum organic liquid storage temperature. The conversion of RVP to TVP shall be done in accordance with the procedures in appendix B of District Rule 4623. Records of TVP testing shall be maintained. [District Rules 2520 and 4623] Federally Enforceable Through Title V Permit

1. This tank shall only store liquid with a true vapor pressure (TVP) of 5.9 psia or less under all storage conditions. [District Rules 2201and 4623 and 40 CFR 60.110b(a), 112b(a)] Federally Enforceable Through Title V Permit
2. Total throughput of organic liquid with TVP less than or equal to 5.9 psia shall not exceed either of the following limits: 360,000 bbl/day or 180,000 bbl/day on a monthly average basis. [District Rule 2201] Federally Enforceable Through Title V Permit
3. Combined total throughput of permits S-77-9, '-11, and '-14 shall not exceed either of the following limits: 550,000 bbl/day or 265,000 bbl/day on a monthly average basis. [District Rule 2201] Federally Enforceable Through Title V Permit
4. VOC emission rate from permits S-77-9, '-11, and '-14 shall not exceed 227.1 lb/day. [District Rule 2201] Federally Enforceable Through Title V Permit
5. VOC emission rate from permits S-77-9, '-11, and '-14 shall not exceed 41,913 lb/yr. [District Rule 2201] Federally Enforceable Through Title V Permit
6. VOC emission rate shall not exceed 119.4 lb/day. [District Rule 2201] Federally Enforceable Through Title V Permit
7. Permittee shall maintain a record of the liquid stored, the period of storage, and the maximum true vapor pressure of that liquid during the respective storage period. [District Rule 2201 and 40 CFR 60.116b(c)] Federally Enforceable Through Title V Permit
8. Permittee shall maintain records of maximum daily throughput and monthly average daily throughput. [District Rule 2201] Federally Enforceable Through Title V Permit
9. When storing organic liquids with true vapor pressure less than 0.5 psia, the requirements of Sections 5.3, 5.5 and 6.1 of District Rule 4623 (Amended May 19, 2005) shall not apply to this unit. This exemption applies to all conditions in this permit referencing Rule 4623 Sections 5.3, 5.5 or 6.1 only. [District Rule 4623] Federally Enforceable Through Title V Permit
10. When storing organic liquids with true vapor pressure less than 0.75 psia, the requirements of 40 CFR 60 Subpart Kb shall not apply to this unit. This exemption applies to all conditions in this permit referencing 40 CFR 60 Subpart Kb only. [40 CFR 60.112b(a)] Federally Enforceable Through Title V Permit
11. Before switching to the storage of organic liquids with true vapor pressure greater than or equal to 0.5 psia, all covers, seals, and lids shall be inspected by the facility operator to ensure compliance with the provisions of this permit. This includes all conditions containing District Rule 4623 reference. [District Rule 2520] Federally Enforceable Through Title V Permit

12. Before switching to the storage of organic liquids with true vapor pressure greater than or equal to 0.75 psia, all covers, seals, and lids shall be inspected by the facility operator to ensure compliance with the provisions of this permit. This includes all conditions containing District Rule 4623 or 40 CFR 60 Subpart Kb reference. [District Rule 2520] Federally Enforceable Through Title V Permit

13. This tank shall be equipped with a closure device between the tank shell and roof edge consisting of two seals mounted one above the other; the one below shall be referred to as the primary seal, and the one above shall be referred as the secondary seal. [District Rules 2201 and 4623 and 40 CFR 60.112b(a)(2)(i)] Federally Enforceable Through Title V Permit

14. The external floating roof shall float on the surface of the stored liquid at all times (i.e., off the roof leg supports) except during the initial fill until the roof is lifted off the leg supports and when the tank is completely emptied and subsequently refilled. When the roof is resting on the leg supports, the process of filling, emptying, or refilling shall be continuous and shall be accomplished as rapidly as possible. Whenever the permittee intends to land the roof on its legs, the permittee shall notify the APCO in writing at least five calendar days prior to performing the work. The tank must be in compliance with this rule before it may land on its legs. [District Rule 4623 and 40 CFR 60.112b(a)(2)(iii)] Federally Enforceable Through Title V Permit

15. Gaps between the tank shell and the primary seal shall not exceed 1 1/2 inches. [District Rule 4623 and 40 CFR 60.113b(b)(4)(i)] Federally Enforceable Through Title V Permit

16. The cumulative length of all gaps between the tank shell and the primary seal greater than 1/2 inch shall not exceed 10% of the circumference of the tank. [District Rule 4623 and 40 CFR 60.113b(b)(4)(i)] Federally Enforceable Through Title V Permit

17. The cumulative length of all primary seal gaps greater than 1/8 inch shall not exceed 30% of the circumference of the tank. [District Rule 4623 and 40 CFR 60.113b(b)(4)(i)] Federally Enforceable Through Title V Permit

18. No continuous gap in the primary seal greater than 1/8 inch wide shall exceed 10% of the tank circumference. [District Rule 4623 and 40 CFR 60.113b(b)(4)(i)] Federally Enforceable Through Title V Permit

19. No gap between the tank shell and the secondary seal shall exceed 1/2 inch. [District Rule 4623 and 40 CFR 60.113b(b)(4)(ii)(B)] Federally Enforceable Through Title V Permit

20. The cumulative length of all gaps between the tank shell and the secondary seal, greater than 1/8 inch shall not exceed 5% of the tank circumference. [District Rule 4623 and 40 CFR 60.113b(b)(4)(ii)(B)] Federally Enforceable Through Title V Permit

21. The metallic shoe-type seal shall be installed so that one end of the shoe extends into the stored liquid and the other end extends a minimum vertical distance of 24 inches above the stored liquid surface. [District Rule 4623 and 40 CFR 60.113b(b)(4)(i)(A)] Federally Enforceable Through Title V Permit

22. The geometry of the metallic-shoe type seal shall be such that the maximum gap between the shoe and the tank shell shall be no greater than 3 inches for a length of at least 18 inches in the vertical plane above the liquid. [District Rule 4623] Federally Enforceable Through Title V Permit

23. There shall be no holes, tears, or openings in the secondary seal or in the primary seal envelope that surrounds the annular vapor space enclosed by the roof edge, seal fabric, and secondary seal. Except for gaps meeting permit requirements, the primary seal shall completely cover the annular space between the edge of the floating roof and tank wall. [District Rule 4623 and 40 CFR 60.112b(a)(2)(i)(A), 40 CFR 60.113b(b)(4)(i)(B) and 60.113b(b)(4)(ii)(C)] Federally Enforceable Through Title V Permit

24. The secondary seal shall allow easy insertion of probes of up to 1 1/2 inches in width in order to measure gaps in the primary seal. [District Rule 4623] Federally Enforceable Through Title V Permit

25. The secondary seal shall extend from the roof to the tank shell and shall not be attached to the primary seal. Except for gaps meeting permit requirements, the secondary seal shall completely cover the annular space between the external floating roof and the wall of the storage vessel in a continuous fashion. [District Rule 4623 and 40 CFR 60.112b(a)(2)(i)(B) and 40 CFR 60.113b(b)(4)(ii)(A)] Federally Enforceable Through Title V Permit

□□□□□□□□ □□□ □□ □□□ □□□□□ □□□ □□□□□□□ □ □□M□□□ □ □□□

□□□□□□□□□ □□□□ □□ □□□□ □□□□□M □□D□□□□

26. All openings in the roof used for sampling and gauging, except pressure-vacuum valves which shall be set to within 10% of the maximum allowable working pressure of the roof, shall provide a projection below the liquid surface to prevent belching of liquid and to prevent entrained or formed organic vapor from escaping from the liquid contents of the tank and shall be equipped with a cover, seal or lid that shall be in a closed position at all times, with no visible gaps and be gas tight, except when the device or appurtenance is in use. [District Rule 4623] Federally Enforceable Through Title V Permit

27. A gas-tight condition is defined as a condition without a gas leak. A gas leak is defined as a reading in excess of 10,000 ppmv, above background, as measured by a portable hydrocarbon detection instrument in accordance with the procedures specified in EPA Test Method 21. A reading in excess of 10,000 ppmv above background is a violation of this permit and Rule 4623 and shall be reported as a deviation. [District Rule 4623] Federally Enforceable Through Title V Permit

28. Except for automatic bleeder vents, rim vents, and pressure relief vents, each opening in a non-contact external floating roof shall provide a projection below the liquid surface. [District Rule 4623 and 40 CFR 60.112b(a)(2)(ii)] Federally Enforceable Through Title V Permit

29. Except for automatic bleeder vents and rim vents, roof drains, and leg sleeves, each opening in the roof shall be equipped with a gasketed cover, seal, or lid that shall be maintained in a closed position at all times (i.e., no visible gap) except when in actual use. [District Rule 4623 and 40 CFR 60.112b(a)(2)(ii)] Federally Enforceable Through Title V Permit

30. Automatic bleeder vents shall be equipped with a gasket and shall be closed at all times when the roof is floating except when the roof is being floated off or is being landed on the roof leg supports. [District Rule 4623 and 40 CFR 60.112b(a)(2)(ii)] Federally Enforceable Through Title V Permit

31. Rim vents shall be equipped with a gasket and shall be set to open when the roof is being floated off the roof leg supports or at the manufacturer's recommended setting. [District Rule 4623 and 40 CFR 60.112b(a)(2)(ii)] Federally Enforceable Through Title V Permit

32. Each emergency roof drain shall be provided with a slotted membrane fabric cover that covers at least 90 percent of the area of the opening. The fabric cover must be impermeable if the liquid is drained into the contents of the tanks. [District Rule 4623 and 40 CFR 60.112b(a)(2)(ii)] Federally Enforceable Through Title V Permit

33. External floating roof legs shall be equipped with vapor socks or vapor barriers in order to maintain a gas-tight condition so as to prevent VOC emissions from escaping through the roof leg opening. [District Rule 4623] Federally Enforceable Through Title V Permit

34. All wells and similar fixed projections through the floating roof shall provide a projection below the liquid surface. [District Rule 4623] Federally Enforceable Through Title V Permit

35. The solid guidepole well shall be equipped with a pole wiper and a gasketed cover, seal or lid which shall be in a closed position at all times (i.e., no visible gap) except when the well is in use. [District Rule 4623] Federally Enforceable Through Title V Permit

36. The gap between the pole wiper and the solid guidepole shall be added to the gaps measured to determine compliance with the secondary seal requirement, and in no case shall exceed 1/2 inch. [District Rule 4623] Federally Enforceable Through Title V Permit

37. The slotted guidepole well on a external floating roof shall be equipped with the following: a sliding cover, a well gasket, a pole sleeve, a pole wiper, and an internal float and float wiper designed to minimize the gap between the float and the well, and provided the gap shall not exceed 1/8 inch; or shall be equipped with a well gasket, a zero gap pole wiper seal and a pole sleeve that projects below the liquid surface. [District Rule 4623] Federally Enforceable Through Title V Permit

38. The gap between the pole wiper and the slotted guidepole shall be added to the gaps measured to determine compliance with the secondary seal requirement, and in no case shall exceed 1/8 inch. [District Rule 4623] Federally Enforceable Through Title V Permit

39. The permittee of external floating roof tanks shall make the primary seal envelope available for unobstructed inspection by the APCO on an annual basis at locations selected along its circumference at random by the APCO. In the case of riveted tanks with toroid-type seals, a minimum of eight locations shall be made available; in all other cases, a minimum of four locations shall be made available. If the APCO suspects a violation may exist the APCO may require such further unobstructed inspection of the primary seal as may be necessary to determine the seal condition for its entire circumference. [District Rule 4623] Federally Enforceable Through Title V Permit

40. Measurements of gaps between the tank wall and the primary and secondary seal shall be performed during the hydrostatic testing of the vessel or within 60 days of the initial fill with a volatile organic liquid. [40 CFR 60.113b(b)(1)(i)] Federally Enforceable Through Title V Permit

41. If any source ceases to store volatile organic liquid for a period of 1 year or more, subsequent introduction of volatile organic liquid into the vessel shall be considered an initial fill. [40 CFR 60.113b(b)(1)(iii)] Federally Enforceable Through Title V Permit

42. The permittee shall inspect all floating roof tanks at least once every 12 months to determine compliance with the requirements of this rule. The actual gap measurements of the floating roof primary and secondary seals shall be recorded. Permittee shall measure seal gaps, at one or more floating roof levels when the roof is floating off the roof leg supports, around the entire circumference of the tank in each place where a 0.32-cm diameter uniform probe passes freely (without forcing or binding against seal) between the seal and the wall of the storage vessel and measure the circumferential distance of each such location. The inspection results shall be submitted to the APCO as specified in Section 6.3.5. [County Rule 107 (40 CFR 60.113b(b)(1)(i) & (ii); and 40 CFR 60.113b(b)(2)(i) & (ii)] Federally Enforceable Through Title V Permit

43. The permittee shall inspect the primary and secondary seals for compliance with the requirements of this rule every time a tank is emptied or degassed. Actual gap measurements shall be performed when the liquid level is static but not more than 48 hours after the tank roof is re-floated. If the external floating roof has defects, the primary seal has holes, tears, or other openings in the seal or the seal fabric, or the secondary seal has holes, tears, or other openings in the seal or the seal fabric, the owner or operator shall repair the items as necessary before filling or refilling the storage vessel. The owner or operator shall notify the APCO in writing at least 30 days prior to the filling or refilling of each storage vessel to afford the APCO the opportunity to inspect the storage vessel prior to refilling. [District Rule 4623 and 40 CFR 60.113b(b)(6)] Federally Enforceable Through Title V Permit

44. Permittee shall submit the reports of the floating roof tank inspections to the APCO within five calendar days after the completion of the inspection only for those tanks that failed to meet the applicable requirements of Rule 4623, Sections 5.2 through 5.5. The inspection report for tanks that that have been determined to be in compliance with the requirements of Sections 5.2 through 5.5 need not be submitted to the APCO, but the inspection report shall be kept on-site and made available upon request by the APCO. The inspection report shall contain all necessary information to demonstrate compliance with the provisions of Rule 4623. [District Rule 4623 and 40 CFR 60.115b(b)] Federally Enforceable Through Title V Permit

45. Permittee shall maintain the records of the external floating roof landing activities that are performed pursuant to Rule 4623, Sections 5.3.1.3 and 5.4.3. The records shall include information on the true vapor pressure (TVP), API gravity, storage temperature, type of organic liquid stored in the tank, the purpose of landing the roof on its legs, the date of roof landing, duration the roof was on its legs, the level or height at which the tank roof was set to land on its legs, and the lowest liquid level in the tank. [District Rule 4623] Federally Enforceable Through Title V Permit

46. All records required to be maintained by this permit shall be maintained for a period of at least five years and shall be made readily available for District inspection upon request. [District Rule 4623 and 40 CFR 60.116b(a)] Federally Enforceable Through Title V Permit

47. Permittee shall notify District at least 30 days prior to the date when unobstructed primary and secondary seal/gap measurements will occur to afford the APCO the opportunity to have an observer present. [40 CFR 60.113b(b)(5)] Federally Enforceable Through Title V Permit

□□□□□□□□ □□□ □□ □□□ □□□□□ □□□ □□□□□□□ □ □□M□□□ □ □□□
□□□□□□□□□□ □□R□□R□□ □□M□ □□□□□□□ □□□□□□5 □□□ □□ □□ □□□□□□ □ □□□□□□□□ □□□□□□
□□□□□□□□□ □□□□ □□ □□□□ □□□□□M □□D□□□

48. Permittee shall make necessary repairs or empty the storage vessel within 45 days of identification in any inspection for seals not meeting the requirements listed in 40 CFR 60.113b(b)(4)(i) and (ii). If necessary repairs cannot be made within 45 days and if the vessel cannot be emptied within 45 days, a 30-day extension may be requested from the APCO. Such an extension request must include a demonstration of unavailability of alternate storage capacity and a specification of a schedule that will assure that the control equipment will be repaired or the vessel will be emptied as soon as possible. [40 CFR 60.113b(b)(4)] Federally Enforceable Through Title V Permit

49. The owner or operator of each storage vessel shall keep readily accessible records showing the dimension of the storage vessel and an analysis showing the capacity of the storage vessel. Such records shall be retained for the life of the source. [40 CFR 60.116b(b)] Federally Enforceable Through Title V Permit

50. Permittee shall maintain records of daily throughput. [District Rule 2520] Federally Enforceable Through Title V Permit

51. Permittee shall conduct true vapor pressure (TVP) testing of the organic liquid stored in this tank at least once every 24 months and/or whenever there is a change in the source or type of organic liquid stored in the tank. The TVP of any organic liquid shall be determined by measuring the Reid Vapor Pressure (RVP) using ASTM D 323 (Test Method for Vapor Pressure for Petroleum Products), and converting the RVP to TVP at the tank's maximum organic liquid storage temperature. The conversion of RVP to TVP shall be done in accordance with the procedures in appendix B of District Rule 4623. Records of TVP testing shall be maintained. [District Rule 2520 and 4623] Federally Enforceable Through Title V Permit

52. Compliance with permit conditions in the Title V permit shall be deemed compliance with District Rule 4623 (amended may 19, 2005) and 40CFR60 Subpart Kb. A permit shield is granted form this requirement. [District Rule 2520] Federally Enforceable Through Title V Permit

San Joaquin Valley
Air Pollution Control District

PERMIT TO OPERATE **FACILITY ADDRESS:**

LOCATION: **MODIFICATION:**

EQUIPMENT DESCRIPTION:

PERMIT UNIT REQUIREMENTS

1. This engine shall be equipped with either a positive crankcase ventilation (PCV) system that recirculates crankcase emissions into the air intake system for combustion, or a crankcase emissions control device of at least 90% control efficiency. [District Rule 2201] Federally Enforceable Through Title V Permit
2. The engine shall be equipped with a turbocharger and with an aftercooler or intercooler. [District Rule 2201] Federally Enforceable Through Title V Permit
3. Particulate matter emissions shall not exceed 0.1 grains/dscf in concentration. [District Rule 4201] Federally Enforceable Through Title V Permit
4. No air contaminant shall be discharged into the atmosphere for a period or periods aggregating more than three minutes in any one hour which is as dark as, or darker than, Ringelmann 1 or 20% opacity. [District Rule 4101] Federally Enforceable Through Title V Permit
5. This engine shall be operated only for testing and maintenance of the engine, required regulatory purposes, and during emergency situations. For testing purposes, the engine shall only be operated the number of hours necessary to comply with the testing requirements of the National Fire Protection Association (NFPA) 25 - "Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems". Total hours of operation for all maintenance, testing, and required regulatory purposes shall not exceed 100 hours per calendar year. [District Rule 4702 and 17 CCR 93115 and 40 CFR 63 Subpart ZZZZ] Federally Enforceable Through Title V Permit
6. The permittee shall maintain monthly records of emergency and non-emergency operation. Records shall include the number of hours of emergency operation, the date and number of hours of all testing and maintenance operations, and the purpose of the operation (for example: load testing, weekly testing, rolling blackout, general area power outage, etc.). For units with automated testing systems, the operator may, as an alternative to keeping records of actual operation for testing purposes, maintain a readily accessible written record of the automated testing schedule. [District Rule 4702 and 17 CCR 93115] Federally Enforceable Through Title V Permit
7. An emergency situation is an unscheduled electrical power outage caused by sudden and reasonably unforeseen natural disasters or sudden and reasonably unforeseen events beyond the control of the permittee. [District Rule 4702] Federally Enforceable Through Title V Permit
8. The permittee shall maintain monthly records of the type of fuel purchased, the amount of fuel purchased, date when the fuel was purchased, signature of the permittee who received the fuel, and signature of the fuel supplier indicating that the fuel was delivered. [Rule 2520 and 17 CCR 93115] Federally Enforceable Through Title V Permit
9. If this engine is located on the grounds of a K-12 school, or if this engine is located within 500 feet of the property boundary of a K-12 school, the engine shall not be operated for non-emergency purposes, including maintenance and testing, between 7:30 a.m. and 3:30 p.m. on days when school is in session. [Rule 2520 and 17 CCR 93115] Federally Enforceable Through Title V Permit

10. If this engine is located on the grounds of a K-12 school, the engine shall not be operated for non-emergency purposes, including maintenance and testing, whenever there is a school sponsored activity. [Rule 2520 and 17 CCR 93115] Federally Enforceable Through Title V Permit

11. Compliance with permit conditions in the Title V permit shall be deemed compliance with the following applicable requirements of SJVUAPCD Rule 4201 (Amended December 17, 1992) and Kern County Rule 407. A permit shield is granted from these requirements. [District Rule 2520] Federally Enforceable Through Title V Permit

12. All records shall be maintained and retained on-site for a minimum of five (5) years, and shall be made available for District inspection upon request. [District Rule 4702 and 17 CCR 93115] Federally Enforceable Through Title V Permit

13. This engine shall be equipped with an operational non-resettable elapsed time meter or other APCO approved alternative. [District Rule 4702 and 17 CCR 93115, and 40 CFR 63 Subpart ZZZZ] Federally Enforceable Through Title V Permit

14. This engine shall be operated and maintained in proper operating condition as recommended by the engine manufacturer or emissions control system supplier. [District Rule 4702 and 40 CFR 63 Subpart ZZZZ] Federally Enforceable Through Title V Permit

15. Only CARB certified diesel fuel containing not more than 0.0015% sulfur by weight is to be used. [District Rules 2201 and 4702 and 17 CCR 93115] Federally Enforceable Through Title V Permit

16. During periods of operation for maintenance, testing, and required regulatory purposes, the permittee shall monitor the operational characteristics of the engine as recommended by the manufacturer or emission control system supplier (for example: check engine fluid levels, battery, cables and connections; change engine oil and filters; replace engine coolant; and/or other operational characteristics as recommended by the manufacturer or supplier). [District Rule 4702 and 40 CFR 63 Subpart ZZZZ] Federally Enforceable Through Title V Permit

17. This engine shall not be used to produce power for the electrical distribution system, as part of a voluntary utility demand reduction program, or for an interruptible power contract. [District Rule 4702 and 40 CFR 63, Subpart ZZZZ] Federally Enforceable Through Title V Permit

18. The permittee shall maintain monthly records of emergency and non-emergency operation. Records shall include the number of hours of emergency operation, the date and number of hours of all testing and maintenance operations, the purpose of the operation (for example: load testing, weekly testing, rolling blackout, general area power outage, etc.) and records of operational characteristics monitoring. For units with automated testing systems, the operator may, as an alternative to keeping records of actual operation for testing purposes, maintain a readily accessible written record of the automated testing schedule. [District Rule 4702 and 17 CCR 93115 and 40 CFR 63, Subpart ZZZZ] Federally Enforceable Through Title V Permit

19. All records shall be maintained and retained on-site for a period of at least 5 years and shall be made available for District inspection upon request. [District Rules 1070, 4702, 2520 and 17 CCR 93115, and 40 CFR 63 Subpart ZZZZ] Federally Enforceable Through Title V Permit

20. The engine shall be in full compliance with 40 CFR Part 63, Subpart ZZZZ (National Emission Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines). [40 CFR 63, Subpart ZZZZ] Federally Enforceable Through Title V Permit

21. The permittee must minimize the engine's time spent at idle during startup and minimize the engine's startup time to a period needed for appropriate and safe loading of the engine, not to exceed 30 minutes. [40 CFR 63, Subpart ZZZZ] Federally Enforceable Through Title V Permit

22. The engine's oil and filter shall be changed every 500 hours of operation or every 12 months, whichever comes first. [40 CFR 63, Subpart ZZZZ] Federally Enforceable Through Title V Permit

23. The engine's air filter shall be inspected every 1,000 hours of operation or every 12 months, whichever comes first, and replaced as necessary. [40 CFR 63, Subpart ZZZZ] Federally Enforceable Through Title V Permit

24. The engine's hoses and belts shall be inspected every 500 hours of operation or every 12 months, whichever comes first, and replaced as necessary. [40 CFR 63, Subpart ZZZZ] Federally Enforceable Through Title V Permit

25. The permittee shall maintain records of performance tests and performance evaluations as required in §63.10(b)(2)(viii) and records of required maintenance performed on the air pollution control and monitoring equipment. [40 CFR 63, Subpart ZZZZ] Federally Enforceable Through Title V Permit

26. The permittee shall maintain records of the occurrence and duration of each malfunction of operation (i.e., process equipment) or the air pollution control and monitoring equipment. The permittee shall also maintain records of action taken during periods of malfunction to minimize emissions in accordance with §63.6605(b), including corrective actions to restore malfunctioning process and air pollution control and monitoring equipment to its normal or usual manner of operation. [40 CFR 63, Subpart ZZZZ] Federally Enforceable Through Title V Permit

San Joaquin Valley
Air Pollution Control District

PERMIT UNIT REQUIREMENTS FOR: **EFFECTIVE DATE:**

ATTACHMENTS: **PERMIT UNIT REQUIREMENTS:**

PERMIT UNIT REQUIREMENTS

THE FOLLOWING TERMS AND CONDITIONS HAVE BEEN ESTABLISHED BY THE DISTRICT TO ENSURE COMPLIANCE WITH DISTRICT, STATE AND FEDERAL RULES AND REGULATIONS. FAILURE TO COMPLY WITH ANY OF THESE TERMS AND CONDITIONS MAY RESULT IN ENFORCEMENT ACTION.

PERMIT UNIT REQUIREMENTS

1. The true vapor pressure of liquid stored shall not exceed 11.0 psia. [District Rule 2201] Federally Enforceable Through Title V Permit
2. Total throughput of organic liquid with TVP greater than 5.9 psia and less than or equal to 11.0 psia shall not exceed either of the following limits: 190,000 bbl/day or 85,000 bbl/day on a monthly average basis. [District Rule 2201] Federally Enforceable Through Title V Permit
3. Total throughput of organic liquid with TVP less than or equal to 5.9 psia shall not exceed either of the following limits: 360,000 bbl/day or 180,000 bbl/day on a monthly average basis. [District Rule 2201] Federally Enforceable Through Title V Permit
4. Combined total throughput of permits S-77-9, '-11, and '-14 shall not exceed either of the following limits: 550,000 bbl/day or 265,000 bbl/day on a monthly average basis. [District Rule 2201] Federally Enforceable Through Title V Permit
5. VOC emission rate from permits S-77-9, '-11, and '-14 shall not exceed 227.1 lb/day. [District Rule 2201] Federally Enforceable Through Title V Permit
6. VOC emission rate from permits S-77-9, '-11, and '-14 shall not exceed 41,913 lb/yr. [District Rule 2201] Federally Enforceable Through Title V Permit
7. VOC emission rate shall not exceed 129.9 lb/day. [District Rule 2201] Federally Enforceable Through Title V Permit
8. Permittee shall maintain a record of the liquid stored, the period of storage, and the maximum true vapor pressure of that liquid during the respective storage period. [District Rule 2201 and 40 CFR 60.116b(c)] Federally Enforceable Through Title V Permit
9. Permittee shall maintain records of maximum daily throughput and monthly average daily throughput. [District Rule 2201] Federally Enforceable Through Title V Permit
10. When storing organic liquids with true vapor pressure less than 0.5 psia, the requirements of Sections 5.3, 5.5 and 6.1 of District Rule 4623 (Amended May 19, 2005) shall not apply to this unit. This exemption applies to all conditions in this permit referencing Rule 4623 Sections 5.3, 5.5 or 6.1 only. [District Rule 4623] Federally Enforceable Through Title V Permit
11. When storing organic liquids with true vapor pressure less than 0.75 psia, the requirements of 40 CFR 60 Subpart Kb shall not apply to this unit. This exemption applies to all conditions in this permit referencing 40 CFR 60 Subpart Kb only. [40 CFR 60.112b(a)] Federally Enforceable Through Title V Permit

12. Before switching to the storage of organic liquids with true vapor pressure greater than or equal to 0.5 psia, all covers, seals, and lids shall be inspected by the facility operator to ensure compliance with the provisions of this permit. This includes all conditions containing District Rule 4623 reference. [District Rule 2520] Federally Enforceable Through Title V Permit

13. Before switching to the storage of organic liquids with true vapor pressure greater than or equal to 0.75 psia, all covers, seals, and lids shall be inspected by the facility operator to ensure compliance with the provisions of this permit. This includes all conditions containing District Rule 4623 or 40 CFR 60 Subpart Kb reference. [District Rule 2520] Federally Enforceable Through Title V Permit

14. This tank shall be equipped with a closure device between the tank shell and roof edge consisting of two seals mounted one above the other; the one below shall be referred to as the primary seal, and the one above shall be referred as the secondary seal. [District Rules 2201 and 4623 and 40 CFR 60.112b(a)(2)(i)] Federally Enforceable Through Title V Permit

15. The external floating roof shall float on the surface of the stored liquid at all times (i.e., off the roof leg supports) except during the initial fill until the roof is lifted off the leg supports and when the tank is completely emptied and subsequently refilled. When the roof is resting on the leg supports, the process of filling, emptying, or refilling shall be continuous and shall be accomplished as rapidly as possible. Whenever the permittee intends to land the roof on its legs, the permittee shall notify the APCO in writing at least five calendar days prior to performing the work. The tank must be in compliance with this rule before it may land on its legs. [District Rule 4623 and 40 CFR 60.112b(a)(2)(iii)] Federally Enforceable Through Title V Permit

16. Gaps between the tank shell and the primary seal shall not exceed 1 1/2 inches. [District Rule 4623 and 40 CFR 60.113b(b)(4)(i)] Federally Enforceable Through Title V Permit

17. The cumulative length of all gaps between the tank shell and the primary seal greater than 1/2 inch shall not exceed 10% of the circumference of the tank. [District Rule 4623 and 40 CFR 60.113b(b)(4)(i)] Federally Enforceable Through Title V Permit

18. The cumulative length of all primary seal gaps greater than 1/8 inch shall not exceed 30% of the circumference of the tank. [District Rule 4623 and 40 CFR 60.113b(b)(4)(i)] Federally Enforceable Through Title V Permit

19. No continuous gap in the primary seal greater than 1/8 inch wide shall exceed 10% of the tank circumference. [District Rule 4623 and 40 CFR 60.113b(b)(4)(i)] Federally Enforceable Through Title V Permit

20. No gap between the tank shell and the secondary seal shall exceed 1/2 inch. [District Rule 4623 and 40 CFR 60.113b(b)(4)(ii)(B)] Federally Enforceable Through Title V Permit

21. The cumulative length of all gaps between the tank shell and the secondary seal, greater than 1/8 inch shall not exceed 5% of the tank circumference. [District Rule 4623 and 40 CFR 60.113b(b)(4)(ii)(B)] Federally Enforceable Through Title V Permit

22. The metallic shoe-type seal shall be installed so that one end of the shoe extends into the stored liquid and the other end extends a minimum vertical distance of 24 inches above the stored liquid surface. [District Rule 4623 and 40 CFR 60.113b(b)(4)(i)(A)] Federally Enforceable Through Title V Permit

23. The geometry of the metallic-shoe type seal shall be such that the maximum gap between the shoe and the tank shell shall be no greater than 3 inches for a length of at least 18 inches in the vertical plane above the liquid. [District Rule 4623] Federally Enforceable Through Title V Permit

24. There shall be no holes, tears, or openings in the secondary seal or in the primary seal envelope that surrounds the annular vapor space enclosed by the roof edge, seal fabric, and secondary seal. Except for gaps meeting permit requirements, the primary seal shall completely cover the annular space between the edge of the floating roof and tank wall. [District Rule 4623 and 40 CFR 60.112b(a)(2)(i)(A), 40 CFR 60.113b(b)(4)(i)(B) and 60.113b(b)(4)(ii)(C)] Federally Enforceable Through Title V Permit

25. The secondary seal shall allow easy insertion of probes of up to 1 1/2 inches in width in order to measure gaps in the primary seal. [District Rule 4623] Federally Enforceable Through Title V Permit

□□□□□□□□ □□□ □□ □□□ □□□□□□ □□□ □□□□□□□□ □□M□□□ □ □□□

26. The secondary seal shall extend from the roof to the tank shell and shall not be attached to the primary seal. Except for gaps meeting permit requirements, the secondary seal shall completely cover the annular space between the external floating roof and the wall of the storage vessel in a continuous fashion. [District Rule 4623 and 40 CFR 60.112b(a)(2)(i)(B) and 40 CFR 60.113b(b)(4)(ii)(A)] Federally Enforceable Through Title V Permit

27. All openings in the roof used for sampling and gauging, except pressure-vacuum valves which shall be set to within 10% of the maximum allowable working pressure of the roof, shall provide a projection below the liquid surface to prevent belching of liquid and to prevent entrained or formed organic vapor from escaping from the liquid contents of the tank and shall be equipped with a cover, seal or lid that shall be in a closed position at all times, with no visible gaps and be gas tight, except when the device or appurtenance is in use. [District Rule 4623] Federally Enforceable Through Title V Permit

28. A gas-tight condition is defined as a condition without a gas leak. A gas leak is defined as a reading in excess of 10,000 ppmv, above background, as measured by a portable hydrocarbon detection instrument in accordance with the procedures specified in EPA Test Method 21. A reading in excess of 10,000 ppmv above background is a violation of this permit and Rule 4623 and shall be reported as a deviation. [District Rule 4623] Federally Enforceable Through Title V Permit

29. Except for automatic bleeder vents, rim vents, and pressure relief vents, each opening in a non-contact external floating roof shall provide a projection below the liquid surface. [District Rule 4623 and 40 CFR 60.112b(a)(2)(ii)] Federally Enforceable Through Title V Permit

30. Except for automatic bleeder vents and rim vents, roof drains, and leg sleeves, each opening in the roof shall be equipped with a gasketed cover, seal, or lid that shall be maintained in a closed position at all times (i.e., no visible gap) except when in actual use. [District Rule 4623 and 40 CFR 60.112b(a)(2)(ii)] Federally Enforceable Through Title V Permit

31. Automatic bleeder vents shall be equipped with a gasket and shall be closed at all times when the roof is floating except when the roof is being floated off or is being landed on the roof leg supports. [District Rule 4623 and 40 CFR 60.112b(a)(2)(ii)] Federally Enforceable Through Title V Permit

32. Rim vents shall be equipped with a gasket and shall be set to open when the roof is being floated off the roof leg supports or at the manufacturer's recommended setting. [District Rule 4623 and 40 CFR 60.112b(a)(2)(ii)] Federally Enforceable Through Title V Permit

33. Each emergency roof drain shall be provided with a slotted membrane fabric cover that covers at least 90 percent of the area of the opening. The fabric cover must be impermeable if the liquid is drained into the contents of the tanks. [District Rule 4623 and 40 CFR 60.112b(a)(2)(ii)] Federally Enforceable Through Title V Permit

34. External floating roof legs shall be equipped with vapor socks or vapor barriers in order to maintain a gas-tight condition so as to prevent VOC emissions from escaping through the roof leg opening. [District Rule 4623] Federally Enforceable Through Title V Permit

35. All wells and similar fixed projections through the floating roof shall provide a projection below the liquid surface. [District Rule 4623] Federally Enforceable Through Title V Permit

36. The solid guidepole well shall be equipped with a pole wiper and a gasketed cover, seal or lid which shall be in a closed position at all times (i.e., no visible gap) except when the well is in use. [District Rule 4623] Federally Enforceable Through Title V Permit

37. The gap between the pole wiper and the solid guidepole shall be added to the gaps measured to determine compliance with the secondary seal requirement, and in no case shall exceed 1/2 inch. [District Rule 4623] Federally Enforceable Through Title V Permit

38. The slotted guidepole well on a external floating roof shall be equipped with the following: a sliding cover, a well gasket, a pole sleeve, a pole wiper, and an internal float and float wiper designed to minimize the gap between the float and the well, and provided the gap shall not exceed 1/8 inch; or shall be equipped with a well gasket, a zero gap pole wiper seal and a pole sleeve that projects below the liquid surface. [District Rule 4623] Federally Enforceable Through Title V Permit

□□□□□□□□□ □□□□ □□ □□□□ □□□□□M □□D□□□

39. The gap between the pole wiper and the slotted guidepole shall be added to the gaps measured to determine compliance with the secondary seal requirement, and in no case shall exceed 1/8 inch. [District Rule 4623] Federally Enforceable Through Title V Permit

40. The permittee of external floating roof tanks shall make the primary seal envelope available for unobstructed inspection by the APCO on an annual basis at locations selected along its circumference at random by the APCO. In the case of riveted tanks with toroid-type seals, a minimum of eight locations shall be made available; in all other cases, a minimum of four locations shall be made available. If the APCO suspects a violation may exist the APCO may require such further unobstructed inspection of the primary seal as may be necessary to determine the seal condition for its entire circumference. [District Rule 4623] Federally Enforceable Through Title V Permit

41. Measurements of gaps between the tank wall and the primary and secondary seal shall be performed during the hydrostatic testing of the vessel or within 60 days of the initial fill with a volatile organic liquid. [40 CFR 60.113b(b)(1)(i)] Federally Enforceable Through Title V Permit

42. If any source ceases to store volatile organic liquid for a period of 1 year or more, subsequent introduction of volatile organic liquid into the vessel shall be considered an initial fill. [40 CFR 60.113b(b)(1)(iii)] Federally Enforceable Through Title V Permit

43. The permittee shall inspect all floating roof tanks at least once every 12 months to determine compliance with the requirements of this rule. The actual gap measurements of the floating roof primary and secondary seals shall be recorded. Permittee shall measure seal gaps, at one or more floating roof levels when the roof is floating off the roof leg supports, around the entire circumference of the tank in each place where a 0.32-cm diameter uniform probe passes freely (without forcing or binding against seal) between the seal and the wall of the storage vessel and measure the circumferential distance of each such location. The inspection results shall be submitted to the APCO as specified in Section 6.3.5. [County Rule 107 (40 CFR 60.113b(b)(1)(i) & (ii); and 40 CFR 60.113b(b)(2)(i) & (ii)] Federally Enforceable Through Title V Permit

44. The permittee shall inspect the primary and secondary seals for compliance with the requirements of this rule every time a tank is emptied or degassed. Actual gap measurements shall be performed when the liquid level is static but not more than 48 hours after the tank roof is re-floated. If the external floating roof has defects, the primary seal has holes, tears, or other openings in the seal or the seal fabric, or the secondary seal has holes, tears, or other openings in the seal or the seal fabric, the owner or operator shall repair the items as necessary before filling or refilling the storage vessel. The owner or operator shall notify the APCO in writing at least 30 days prior to the filling or refilling of each storage vessel to afford the APCO the opportunity to inspect the storage vessel prior to refilling. [District Rule 4623 and 40 CFR 60.113b(b)(6)] Federally Enforceable Through Title V Permit

45. Permittee shall submit the reports of the floating roof tank inspections to the APCO within five calendar days after the completion of the inspection only for those tanks that failed to meet the applicable requirements of Rule 4623, Sections 5.2 through 5.5. The inspection report for tanks that that have been determined to be in compliance with the requirements of Sections 5.2 through 5.5 need not be submitted to the APCO, but the inspection report shall be kept on-site and made available upon request by the APCO. The inspection report shall contain all necessary information to demonstrate compliance with the provisions of Rule 4623. [District Rule 4623 and 40 CFR 60.115b(b)] Federally Enforceable Through Title V Permit

46. Permittee shall maintain the records of the external floating roof landing activities that are performed pursuant to Rule 4623, Sections 5.3.1.3 and 5.4.3. The records shall include information on the true vapor pressure (TVP), API gravity, storage temperature, type of organic liquid stored in the tank, the purpose of landing the roof on its legs, the date of roof landing, duration the roof was on its legs, the level or height at which the tank roof was set to land on its legs, and the lowest liquid level in the tank. [District Rule 4623] Federally Enforceable Through Title V Permit

47. All records required to be maintained by this permit shall be maintained for a period of at least five years and shall be made readily available for District inspection upon request. [District Rule 4623 and 40 CFR 60.116b(a)] Federally Enforceable Through Title V Permit

48. Permittee shall notify District at least 30 days prior to the date when unobstructed primary and secondary seal/gap measurements will occur to afford the APCO the opportunity to have an observer present. [40 CFR 60.113b(b)(5)] Federally Enforceable Through Title V Permit

49. Permittee shall make necessary repairs or empty the storage vessel within 45 days of identification in any inspection for seals not meeting the requirements listed in 40 CFR 60.113b(b)(4)(i) and (ii). If necessary repairs cannot be made within 45 days and if the vessel cannot be emptied within 45 days, a 30-day extension may be requested from the APCO. Such an extension request must include a demonstration of unavailability of alternate storage capacity and a specification of a schedule that will assure that the control equipment will be repaired or the vessel will be emptied as soon as possible. [40 CFR 60.113b(b)(4)] Federally Enforceable Through Title V Permit

50. The owner or operator of each storage vessel shall keep readily accessible records showing the dimension of the storage vessel and an analysis showing the capacity of the storage vessel. Such records shall be retained for the life of the source. [40 CFR 60.116b(b)] Federally Enforceable Through Title V Permit

51. Permittee shall maintain records of daily throughput. [District Rule 2520] Federally Enforceable Through Title V Permit

52. Permittee shall conduct true vapor pressure (TVP) testing of the organic liquid stored in this tank at least once every 24 months and/or whenever there is a change in the source or type of organic liquid stored in the tank. The TVP of any organic liquid shall be determined by measuring the Reid Vapor Pressure (RVP) using ASTM D 323 (Test Method for Vapor Pressure for Petroleum Products), and converting the RVP to TVP at the tank's maximum organic liquid storage temperature. The conversion of RVP to TVP shall be done in accordance with the procedures in appendix B of District Rule 4623. Records of TVP testing shall be maintained. [District Rule 2520] Federally Enforceable Through Title V Permit

53. Compliance with permit conditions in the Title V permit shall be deemed compliance with District Rule 4623 (amended may 19, 2005) and 40CFR60 Subpart Kb. A permit shield is granted form this requirement. [District Rule 2520] Federally Enforceable Through Title V Permit

San Joaquin Valley
Air Pollution Control District

RMIT IT **IRATIO DAT**

I M T D CRI TIO
R M D 5 D R D M R D R

RMIT IT R IR M T

1. No air contaminant shall be released into the atmosphere which causes a public nuisance. [District Rule 4102]
2. No air contaminant shall be discharged into the atmosphere for a period or periods aggregating more than three minutes in any one hour which is as dark as, or darker than, Ringelmann 1 or 20% opacity. [District Rule 4101]
3. Particulate matter emissions shall not exceed 0.1 grains/dscf in concentration. [District Rule 4201]
4. This engine shall be equipped with either a positive crankcase ventilation (PCV) system that recirculates crankcase emissions into the air intake system for combustion, or a crankcase emissions control device of at least 90% control efficiency. [District Rule 2201]
5. The exhaust stack shall vent vertically upward. The vertical exhaust flow shall not be impeded by a rain cap (flapper ok), roof overhang, or any other obstruction. [District Rule 4102]
6. This engine shall be equipped with a non-resettable hour meter with a minimum display capability of 9,999 hours, unless the District determines that a non-resettable hour meter with a different minimum display capability is appropriate in consideration of the historical use of the engine and the owner or operator's compliance history. [District Rule 4702 and 17 CCR 93115]
7. Only CARB certified diesel fuel containing not more than 0.0015% sulfur by weight is to be used. [District Rules 2201 and 4801, and 17 CCR 93115]
8. Emissions from this IC engine shall not exceed 6.713 g-NOx/bhp-hr. [District Rule 2201 and 17 CCR 93115]
9. Emissions from this IC engine shall not exceed 0.369 g-PM10/bhp-hr based on USEPA certification using ISO 8178 test procedure. [District Rules 2201 and 4102, and 17 CCR 93115]
10. This engine shall be operated and maintained in proper operating condition as recommended by the engine manufacturer or emissions control system supplier. [District Rule 4702]
11. During periods of operation for maintenance, testing, and required regulatory purposes, the permittee shall monitor the operational characteristics of the engine as recommended by the manufacturer or emission control system supplier (for example: check engine fluid levels, battery, cables and connections; change engine oil and filters; replace engine coolant; and/or other operational characteristics as recommended by the manufacturer or supplier). [District Rule 4702]
12. An emergency situation is an unscheduled electrical power outage caused by sudden and reasonably unforeseen natural disasters or sudden and reasonably unforeseen events beyond the control of the permittee. [District Rule 4702 and 17 CCR 93115]
13. This engine shall not be used to produce power for the electrical distribution system, as part of a voluntary utility demand reduction program, or for an interruptible power contract. [District Rule 4702 and 17 CCR 93115]

14. This engine shall be operated only for testing and maintenance of the engine, required regulatory purposes, and during emergency situations. Operation of the engine for maintenance, testing, and required regulatory purposes shall not exceed 30 hours per calendar year. [District Rule 4702 and 17 CCR 93115]

15. The permittee shall maintain monthly records of emergency and non-emergency operation. Records shall include the number of hours of emergency operation, the date and number of hours of all testing and maintenance operations, the purpose of the operation (for example: load testing, weekly testing, rolling blackout, general area power outage, etc.) and records of operational characteristics monitoring. For units with automated testing systems, the operator may, as an alternative to keeping records of actual operation for testing purposes, maintain a readily accessible written record of the automated testing schedule. [District Rule 4702 and 17 CCR 93115]

16. The permittee shall maintain monthly records of the type of fuel purchased. [District Rule 4702 and 17 CCR 93115]

17. If this engine is located on the grounds of a K-12 school, or if this engine is located within 500 feet of the property boundary of a K-12 school, the engine shall not be operated for non-emergency purposes, including maintenance and testing, between 7:30 a.m. and 3:30 p.m. on days when school is in session. [17 CCR 93115]

18. If this engine is located on the grounds of a K-12 school, the engine shall not be operated for non-emergency purposes, including maintenance and testing, whenever there is a school sponsored activity. [17 CCR 93115]

19. All records shall be maintained and retained on-site for a minimum of five (5) years, and shall be made available for District inspection upon request. [District Rule 4702 and 17 CCR 93115]

Dear Mr. Stanley:

On October 10, 2022, the Department of Toxic Substances Control (DTSC) received your email of the same date requesting records under the Public Records Act. After a thorough review of our files, no site records were found pertaining to the sites/facilities referenced above.

Many of our records are available on EnviroStor, an online database that provides non-confidential, public access to DTSC's data management system. It tracks our cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities and sites with known or suspected contamination issues. EnviroStor is available 24/7, 365 days a year. The data reflects the latest updates as they are entered in the system. Access it from your computer or smartphone, the local library – anywhere Internet access is

available. Just go to www.envirostor.dtsc.ca.gov. You will find a step-by-step tour of EnviroStor under the "How to Use EnviroStor" menu on the website.

If you have any questions or would like further information regarding your request, please contact me at 747-249-1019 or via email at ChatsworthFileRoom@dtsc.ca.gov.

Sincerely,
Roya Riahi Nejad

To: EH
Subject: New submission from Environmental Health: Information Request

CAUTION: This email originated from outside of the organization. Do not click links, open attachments, or provide information unless you recognize the sender and know the content is safe.

Describe the records you are requesting in as much detail (business name, address, type of record desired, etc.) as possible:

Stantec is completing a Phase I Environmental Site Assessment of multiple parcels located in western Kern County. Our client is proposing to construct a pipeline that will span (approximately) from North Belridge, southwards to Missouri Triangle; an approximate distance of 12 miles. The purpose is to evaluate the parcels from when they were undeveloped, what the parcels were historically used for, and their current use. We then identify potential risks associated with those activities and provide recommendations to our client.

The regulations put forth by the Environmental Protection Agency require us to follow All Appropriate Inquiry practices (Title 40 of the Code of Federal Regulations, Part 312), which involves requesting information held by regulatory bodies that pertain to environmental matters at our subject property. As such, Stantec kindly requests that you review the attached spreadsheet which contains a list of parcels identified by Assessor Parcel Number that the proposed pipeline will pass through, with street addresses included where present.

Once reviewed, we would be grateful if you could let us know of any records associated with the parcels which may be of environmental importance to our assessment, including but not limited to:
• Records of above/underground storage tanks (past and present);
• Records of spills/releases of hazardous materials
• Records of the storage of hazardous materials and/or inspections that have been completed
• Records of past site assessments, such as Phase I ESA reports or Phase II soil/groundwater/soil vapor sampling reports
• Records of public nuisances due to site activities (noise, odors, illegal or unpermitted processes)
• Records of current or past planning/building permits, particularly for commercial or industrial uses.

We understand that you may not hold records sorted by APN, so below is a list of parcels for which we have identified formal street addresses:

20576 SEVENTH STANDARD RD MC KITTRICK
20322 SEVENTH STANDARD RD MC KITTRICK
20310 SEVENTH STANDARD RD MC KITTRICK
20118 LERDO HY LOST HILLS

HAZARDOUS WASTE GENERATOR

EPA ID NUMBER: CAL 000 237 885

VIOLATIONS

YES	NO/NA	VIOL. #	GENERATOR REQUIREMENTS
☐	☒	GR01	Generator has an EPA Identification number to treat, store, dispose, transport, or transfer hazardous waste [Title 22, CCR 66262.12].
☐	☒	GR02	The facility has made an appropriate waste determination for hazardous based on own knowledge or analysis or other [Title 22, CCR 66262.11]
☐	☒	GR03	Facility Personnel demonstrate awareness of proper(legal) hazardous-waste handling procedures. [Title 22, CCR, 66262.34(d)(2)].
☐	☒	GA01	Hazardous waste has not accumulated for more than 90/180/270 days(depending upon volume/circumstances) without the facility having a hazardous waste storage permit [Title 22,CCR, 66262.34(a).]
☐	☒	GA02	Empty containers or inner liners greater than 5 gallons have dates when emptied and are managed properly within one year of date emptied [Title 22, CCR, 66261.7(f)].
☐	☒	GA03	Universal waste is not accumulated at facility for more than one year [Title 22, CCR, 66273.15(a);66273.35(a)].
☐	☒	GA04	The facility disposes used oil filters within 180 days of generation (or one year if less than 1 ton are accumulated) [Title 22, CCR, 66266.130(c)(4)].
☐	☒	GA05	The facility disposes lead-acid batteries within 180 days of generation (or one year if less than 1 ton are accumulated) [Title 22, CCR, 66268.81(a)(6)]
☐	☒	GC01	Hazardous waste storage containers are in good condition [Title 22, CCR, 66262.34(a)(1)(A)].
☐	☒	GC02	Containers holding hazardous waste are closed/sealed except when adding/removing waste [Title 22, CCR, 66262.34(a)(1)(A)].]
☐	☒	GC03	The facility documents weekly inspections of hazardous waste storage area/containers [Title 22, CCR, 66265.15(d) and 66262.34(a)(1)(A)].
☐	☒	GC04	The facility documents daily inspections of tanks where hazardous waste is stored [Title 22, CCR 66262.34(a)(1)(A)].
☐	☒	GC05	The facility has adequate secondary containment for hazardous waste tank systems [Title 22, CCR 66262.34(a)(1)(A)].
☐	☒	GC06	Containers utilizing satellite accumulation rules are at or near the point of generation [Title 22, CCR 66262.34(e)(1)(A)].
☐	☒	GC07	Satellite wastes are managed according to the regulations (complete labeling, accumulation times, 55-gallon or 1 quart volume limits, etc.). [Title 22, CCR, 66262.34(e)].
☐	☒	GR04	Manifests or LDRs are properly completed and/or retained by generator for 3 years [Title 22, CCR 66262.23(a)(1); 66263.42;66263.24;66262.34(a)(4)].
☐	☒	GR05	The facility filed an exception report to DTSC after not receiving the signed TSDF copy of a manifest within 35 days [Title 22, CCR, 66262.42].
☐	☒	GR06	The facility has copies of bills of lading or receipts for removal of hazardous wastes [HSC 25160.2-Consolidated manifests/ 66266.81(a)(6)(B)-lead acid batteries/66266.130- oil filters]. The facility shall maintain copies of receipts for at least three years.
☐	☒	GR07	The facility submitted a hazardous waste recycling report [HSC 25143.10]
☐	☒	GT01	The facility is conducting on-site treatment of hazardous waste with a tiered permit [HSC 25189.5(d)]
☐	☒	GT02	Authorized, licensed, and certified hazardous waste haulers are used to transport hazardous waste to appropriate facilities [H&S Code Chapter 6.5 Section 25163].
☐	☒	GT03	Hazardous wastes are sent to authorized disposal facilities [HSC 25189.5].
☐	☒	GT04	Hazardous waste is not disposed to ground, water, or air [HSC 25189.5].

INSPECTOR: WAQAR RUSTAM **DATE:** 09/14/2009

VIOLATIONS

YES	NO/NA	VIOL. #	GENERATOR REQUIREMENTS
☐	☒	GL01	Containers of hazardous waste are properly labeled (includes appropriate accumulation date, the words "HAZARDOUS WASTE," the waste composition/physical state, the hazardous properties, and name/address of generator) [Title 22, CCR, 66262.34(f)].
☐	☒	GL02	Containers of excluded recyclable materials are properly labeled [HSC 25143.9(a)].
☐	☒	GL03	Containers of universal waste are properly labeled. [Title 22, CCR, 66273.14 for SQH or 66273.34 for LQH].
☐	☒	GL04	Containers of drained used oil filters are labeled with the words "DRAINED USED OIL FILTERS" [Title 22, CCR, 66266.130(c)(3)].
☐	☒	GL05	Accumulation dates are marked on spent lead-acid batteries [22CCR 66266.81]
☐	☒	GL06	Tanks/containers of used oil destined for recycling are clearly marked with the words "USED OIL" [HSC 25143.9(a)].
☐	☒	GL07	Empty contaminated containers are clearly marked with the date they were emptied [Title 22, CCR, 66261.7(f)].

SUMMARY OF OBSERVATIONS/VIOLATIONS

☐ **No violations of underground storage tank, hazardous materials, or hazardous waste laws/regulations were discovered. KERN CUPA greatly appreciates your efforts to comply with all the laws and regulations**

☒ **Violations were observed/discovered as listed below. All violations must be corrected by implementing the corrective action listed by each violation. If you disagree with any of the violations or corrective actions required, please inform the CUPA in writing.**

ALL VIOLATIONS MUST BE CORRECTED WITHIN 30 DAYS OR AS SPECIFIED. CUPA must be informed in writing with a certification that compliance has been achieved. A false statement that compliance has been achieved is a violation of the law and punishable by a fine of not less than $2,000 or more than $25,000 for each violation. Your facility may be reinspected any time during normal business hours. If a second reinspection becomes necessary due to non compliance, a reinspection charge of $85.00 per hour may be charged to the facility.

You may request a meeting with the Program Manager to discuss the inspection findings and/or the proposed corrective actions. The issuance of this Summary of Violations does not preclude the CUPA from taking administrative, civil, or criminal action.

FACILITY NAME: RSC EQUIPMENTAL RENTAL 684 **ADDRESS:** 19091 HIGHWAY 33 MCKITTRICK, CA 93251 **FA ID:** FA0004246 **FILE ID:** 000314

VIOLATIONS

VIOL. NO	VIOL. TYPE	CORRECTIVE ACTION REQUIRED
BP03	MINOR VIOLATION	Hazardous materials can become discarded material and potentially hazardous waste if stored in improperly labeled containers or in deteriorated containers. Improperly labeled containers are to be properly labeled within ten days. Hazardous materials in deteriorated or leaking containers are to be placed in overpack containers or appropriate non-deteriorated containers within 96 hours. Otherwise the materials may be considered a waste. **PLEASE LABEL ALL THE CONTAINERS CONTAINING HAZARDOUS MATERIALS.**

	H348	Failure to provide initial and annual safety training to all employees and/or failure to document and maintain training records for 3 years	HSC 6.95 25505(a)(4)
	H338	Failure to report a release or threatened release of a hazardous material to the CUPA and to California Office of Emergency Services	HSC 6.95 25510(a)
	H761	Failure to have the HMBP readily available to personnel of the business/facility	HSC 6.95 25505(c)

Inspector: Lana Elfstrom **Inspection Date:** 01/17/2019

CONDITIONAL EXEMPTIONS FROM REPORTING REQUIREMENTS

Agricultural handlers are conditionally exempt from electronically submitting Emergency Response and Employee Training Plans in CERS if the following requirements are met:

- Owner/Operator annually submits the Facility Information and Hazardous Materials Inventory electronically into CERS
- Each location/building, where hazardous materials (i.e. pesticides, petroleum products, fertilizers, etc.) are stored, is posted with warning signs that meet the following requirements:
  - Shall be conspicuous and visible from any direction of probable approach
  - Shall be of such size that it is readable from 25 feet and shall be labeled as follows:

> DANGER HAZARDOUS MATERIAL STORAGE AREA
> (the hazardous materials stored within shall be noted by category
> [i.e. pesticides, petroleum products, fertilizers, etc.])
> ALL UNAUTHORIZED PERSONS-KEEP OUT - IN AN EMERGENCY, CONTACT:
> (list the name and phone number of an emergency contact person(s))

  - Shall be repeated in an appropriate language other than English when persons who do not understand the English language may enter the posted location/building
- Owner/Operator provides training for all new employees and annual training, including refresher courses, for all employees in safety

Exempt Facility Violations

V	Viol #	Summary	Code
	H760	Failure to submit Emergency Response/Contingency Plan in CERS when not meeting agricultural handler exemption requirements	HSC 6.95 25507.1, 25508(a)(1); 19 CCR 4 2670, 2671
	H758	Failure to submit Employee Training Plan in CERS when not meeting agricultural handler exemption requirements	HSC 6.95 25507.1, 25508(a)(1); 19 CCR 4 2670, 2671
	H759	Failure to establish and submit a HMBP in CERS when not meeting remote unstaffed facility exemption requirements	HSC 6.95 25505, 25506, 25507.2, 25508(a)(1)

SUMMARY OF OBSERVATIONS/VIOLATIONS

☒ **No violations of hazardous materials business plan laws/regulations were discovered. Kern County UPA greatly appreciates your efforts to comply with all the laws and regulations applicable to your facility.**

☐ **Violations were observed/discovered as listed below. ALL VIOLATIONS MUST BE CORRECTED WITHIN 30 DAYS OR AS SPECIFIED. UPA must be informed in writing with a certification that compliance has been achieved. A false statement that compliance has been achieved is a violation of the law and punishable by a fine of not less than $2,000 or more than $25,000 for each violation. Your facility may be reinspected any time during normal business hours. If a second reinspection becomes necessary due to non compliance, a reinspection charge of $115.00 per hour may be charged to the facility.**

You may request a meeting with the Program Manager to discuss the inspection findings and/or the proposed corrective actions. The issuance of this Summary of Violations does not preclude the CUPA from taking administrative, civil, or criminal action.

Inspection Type: ☒ Routine ☐ Reinspection	**Reinspection required:** ☐ Yes ☒ No	
Inspection Element: BUS PLAN LARGE LOW RISK 1 UNIT		

File/CERS Review Violations

V	Viol #	Summary	Code
	H335	Failure to adequately submit a complete HMBP into the California Environmental Reporting System (CERS)	HSC 6.95 25505, 25508(a)(1)
	F001	Failure to pay the HMBP annual permit fees	KCOC 8.04.030
	H344	Failure to complete and submit the Business Activities page and/or Business Owner/Operator Identification page in CERS	HSC 6.95 25508(a)(1); 19 CCR 4 2729.2(a)(1);
	H342	Failure to complete and submit Hazardous Materials Inventory information for all hazardous materials at or above reportable quantities in CERS	HSC 6.95 25505(a)(1), 25506, 25508(a)(1)
	H341	Failure to annually review and electronically certify that the HMBP is complete and accurate on or before the annual due date	HSC 6.95 25508(c), 25508.2
	H346	Failure to complete and submit Site Map with all required content in CERS	HSC 6.95 25505(a)(2), 25508(a)(1)
	H347	Failure to submit an adequate Emergency Response/Contingency plan in CERS	HSC 6.95 25505(a)(3), 25508(a)(1)
	H353	Failure to submit an adequate Employee Training Plan in CERS	HSC 6.95 25505(a)(4), 25508(a)(1)
	H340	Failure to notify property owner in writing that a HMBP is required	HSC 6.95 25505.1
	H336	Failure to provide property owner a copy of the HMBP upon request	HSC 6.95 25505.1

Onsite Inspection Violations

V	Viol #	Summary	Code
	H334	Failure to adequately establish and implement a HMBP	HSC 6.95 25507
	H345	Failure to revise HMBP in CERS within 30 days upon a change of information, inventory, address, ownership, or operation.	HSC 6.95 25508.1(a)-(f)
	H348	Failure to provide initial and annual safety training to all employees and/or failure to document and maintain training records for 3 years	HSC 6.95 25505(a)(4)
	H338	Failure to report a release or threatened release of a hazardous material to the CUPA and to California Office of Emergency Services	HSC 6.95 25510(a)
	H761	Failure to have the HMBP readily available to personnel of the business/facility	HSC 6.95 25505(c)

Inspector: Lana Elfstrom **Inspection Date:** 01/17/2019

CONDITIONAL EXEMPTIONS FROM REPORTING REQUIREMENTS

Agricultural handlers are conditionally exempt from electronically submitting Emergency Response and Employee Training Plans in CERS if the following requirements are met:

- Owner/Operator annually submits the Facility Information and Hazardous Materials Inventory electronically into CERS
- Each location/building, where hazardous materials (i.e. pesticides, petroleum products, fertilizers, etc.) are stored, is posted with warning signs that meet the following requirements:
  - Shall be conspicuous and visible from any direction of probable approach
  - Shall be of such size that it is readable from 25 feet and shall be labeled as follows:

> DANGER HAZARDOUS MATERIAL STORAGE AREA
> (the hazardous materials stored within shall be noted by category
> [i.e. pesticides, petroleum products, fertilizers, etc.])
> ALL UNAUTHORIZED PERSONS-KEEP OUT - IN AN EMERGENCY, CONTACT:
> (list the name and phone number of an emergency contact person(s))

  - Shall be repeated in an appropriate language other than English when persons who do not understand the English language may enter the posted location/building
- Owner/Operator provides training for all new employees and annual training, including refresher courses, for all employees in safety

	H299	Failure to post emergency information	22 CCR 12 66262.34(d)(2); 40 CFR 262.34(d)(5)(ii)
	H303	Failure to maintain facility to prevent fire, explosion, and/or release	22 CCR 12 66262.34(d)(2); 40 CFR 1 262.34(d)(4), 265.31
	H306	Failure to have all required emergency equipment	22 CCR 12 66262.34(d)(2); 40 CFR 1 262.34(d)(4), 265.32
	H305	Failure to maintain all required emergency equipment	22 CCR 12 66262.34(d)(2); 40 CFR 1 262.34(d)(4), 265.33
	H308	Failure to maintain adequate aisle space	22 CCR 12 66262.34(d)(2); 40 CFR 1 262.34(d)(4), 265.35
	H798	Failure to complete Uniform Hazardous Waste Manifest exception report when required	HSC 6.5 25123.3(h); 22 CCR 12 66262.42 (a),(c),(d)

Large Quantity Generator - Violations

V	VIOL #	Summary	Code
	H245	Failure to conduct annual employee training and maintain documentation until facility closure	22 CCR 12 66262.34(a)(4); 22 CCR 15 66265.16
	H237	Failure to prepare and implement a contingency plan	22 CCR 12 66262.34(a)(4); 22 CCR 15 66265.51
	H240	Failure to include all required information in the contingency plan	22 CCR 12 66262.34(a)(4); 22 CCR 15 66265.52

Large Quantity Generator - Violations (continued)

V	VIOL #	Summary	Code
	H238	Failure to maintain a copy of the contingency plan on site and/or submit a copy to all responding agencies	22 CCR 12, 66262.34(a)(4); 22 CCR 15 66265.53
	H258	Failure to dispose of hazardous waste within 90 days of accumulation start	HSC 6.5 25123.3(b)(1), 25201; 22 CCR 12 66262.34(a)
	H268	Failure to accumulate hazardous waste in containers that are in good condition	22 CCR 12 66262.34(a)(1); 22 CCR 15 66265.171
	H270	Failure to store hazardous waste in containers made of or lined with a material compatible with the hazardous waste to be stored	22 CCR 12 66262.34(a)(1); 22 CCR 15 66265.172
	H272	Failure to keep hazardous waste tank/container closed	22 CCR 12 66262.34(a)(1); 22 CCR 15 66265.173
	H274	Failure to conduct weekly hazardous waste storage area inspections	22 CCR 12 66262.34(a)(1); 22 CCR 15 66265.174
	H289	Failure to conduct daily inspections of hazardous waste tank systems	22 CCR 12 66262.34(a)(1); 22 CCR 15 66265.195(a), 66265.195(c)
	H309	Failure to maintain adequate aisle space	22 CCR 12 66262.34(a)(4); 22 CCR 15 66265.35
	H275	Failure to locate reactive and ignitable waste at least 15 meters (50 feet) from the facility's property line	22 CCR 12 66262.34(a)(1); 22 CCR 15 66265.176
	H279	Failure to separate incompatible waste during storage	22 CCR 12 66262.34(a)(1); 22 CCR 15 66265.17(b), 66265.177
	H304	Failure to maintain facility to prevent fire, explosion, and/or release	22 CCR 12 66262.34(a)(4); 22 CCR 15 66265.31
	H291	Failure to meet secondary containment requirements for hazardous waste tank systems or components	22 CCR 12 66262.34(a)(1); 22 CCR 15 66265.193
	H294	Failure to immediately remove from service a tank system which is unfit for use and/or comply with applicable requirements	22 CCR 15 66265.196
	H292	Failure to meet tank system closure requirements	22 CCR 15 66265.111, 66265.114, 66265.197
	H286	Failure to obtain and/or maintain a new hazardous waste tank assessment by a professional engineer	22 CCR 12 66262.34(a)(1); 22 CCR 15 66265.192(a)
	H800	Failure to complete an assessment or reassessment of a hazardous waste tank as required	22 CCR 15 66265.192(h)
	H312	Failure to conduct hazardous waste tank system cathodic protection system inspections as required	22 CCR 12 66262.34(a)(1); 22 CCR 15 66265.195(b), 66265.195(c)
	H815	Failure to comply with air emmisions requirements for hazardous waste in containers	22 CCR 12 66262.34(a)(1); 22 CCR 15 66265.178
	H816	Failure to comply with air emmisions requirements for hazardous waste in tanks	22 CCR 12 66262.34(a)(1); 22 CCR 15 66265.202
	H307	Failure to have all required emergency equipment	22 CCR 12 66262.34(a)(4); 22 CCR 15 66265.32
	H301	Failure to inspect and/or maintain all safety/emergency equipment as required	22 CCR 12 66262.34(a)(4); 22 CCR 15 66265.33
	H244	Failure to complete Uniform Hazardous Waste Manifest exception report when required	22 CCR 12 66262.42(a),(b),(d)
	H799	Failure to complete certification of waste minimization on all manifests	22 CCR 12 66262.27(a)
	H257	Failure to adequately complete, and maintain for review, all requirements of the source reduction evaluation review and plan (SB-14)	HSC 6.5 25244.19, 25244.21; 22 CCR 31 67100.5
	H254	Failure to properly prepare a source reduction evaluation review and plan every four years	HSC 6.5 25244.19; 22 CCR 31 67100.7, 67100.8
	H255	Failure to prepare a summary progress report and submitted it to DTSC every four years	22 CCR 31 67100.9

Universal Waste Generator - Violations

V	VIOL #	Summary	Code
	H318	Failure to comply with all universal waste training requirements	22 CCR 23 66273.36
	H321	Faillure to meet universal waste labeling requirements	22 CCR 23 66273.34
	H330	Universal waste accumulation exceeded the 1 year limit	22 CCR 23 66273.35
	H329	Failure to disposal of universal waste at an appropriate destination facility	22 CCR 23 66273.31(a)
	H320	Failure to properly prepare and/or retain shipping papers for all universal waste shipped	22 CCR 23 66273.38; 49 CFR 1 172.201(e)
	H325	Failure to handle waste aerosol cans to prevent fire, explosion, and/or release	HSC 6.5 25201.16(e)
	H328	Failure to meet accumulation standards for aerosol cans	HSC 6.5 25201.16(f)
	H326	Failure to properly clean up and/or contain spills of electronic devices, CRTs and/or CRT glass	22 CCR 23 66273.33.5

Waste Lead Acid Battery Generator - Violations

V	VIOL #	Summary	Code
	H290	Failure to meet requirements for handling, storing, and/or transporting lead acid batteries	22 CCR 16 66266.81(a)(1)
	H293	Failure to properly manage, store, and/or label damaged lead acid batteries	22 CCR 16 66266.81(b)
	H250	Failure to maintain documentation for disposal of lead acid batteries for 3 years	22 CCR 16 66266.81(a)(4)(B)
	H261	Failure to meet all requirements when accepting spent lead acid batteries	22 CCR 16 66266.81(a)(3)

SUMMARY OF OBSERVATIONS/VIOLATIONS

☒ **No violations of hazardous waste laws/regulations were discovered. KERN CUPA greatly appreciates your efforts to comply with all the laws and regulations applicable to your facility.**

☐ **Violations were observed/discovered as listed below. All violations must be corrected by implementing the corrective action listed by each violation. If you disagree with any of the violations or corrective actions required, please inform the CUPA in writing.**

ALL VIOLATIONS MUST BE CORRECTED WITHIN 30 DAYS OR AS SPECIFIED. CUPA must be informed in writing with a certification that compliance has been achieved. A false statement that compliance has been achieved is a violation of the law and punishable by a fine of not less than $2,000 or more than $25,000 for each violation. Your facility may be reinspected any time during normal business hours. If a second reinspection becomes necessary due to non compliance, a reinspection charge of $115.00 per hour may be charged to the facility.

You may request a meeting with the Program Manager to discuss the inspection findings and/or the proposed corrective actions. The issuance of this Summary of Violations does not preclude the CUPA from taking administrative, civil, or criminal action.

	H236	Failure to obtain/maintain an active/correct EPA ID number	22 CCR 12 66262.12
	H251	Improper hazardous waste determination	22 CCR 12 66262.11
	H248	Failure to comply with all consolidated manifest procedures	22 CCR 12 66262.40(a); HSC 6.5 25160.2
	H239	Failure to properly complete the Uniform Hazardous Waste Manifest	22 CCR 12 66262.23(a)
	H243	Failure to properly prepare manifests for transportation	22 CCR 12 66262.20
	H246	Failure of owner/operator to send generator manifest copies to DTSC within 30 days	22 CCR 12 66262.23(a)(4)
	H241	Failure to maintain signed copies of manifests for 3 years	22 CCR 12 66262.40(a)
	H297	Hazardous waste not transported by registered hauler	22 CCR 13 66263.41; HSC 6.5 25163(a)
	H260	Improper labeling of hazardous waste containers/portable tanks	22 CCR 12 66262.34(f)
	H810	Failure mark stationary tanks with "Hazardous Waste" and/or accumulation start date	22 CCR 12 66262.34(f)

Inspector: Lana Elfstrom **Inspection Date:** 01/17/2019

General Violations - All Generators (continued)

V	VIOL #	Summary	Code
	H298	Disposal of hazardous waste at an unauthorized location	HSC 6.5 25189.5(a), 25201(a)
	H302	Failure to manage recyclable materials according to requirements	HSC 6.5 25143.2, 25143.9
	H296	Failure to properly manage used oil and fuel filters	22 CCR 16 66266.130; HSC 6.5 25250.22
	H812	Failure to properly manage empty containers > 5 gallons	22 CCR 11 66261.7
	H811	Failure to follow all requirements for hazardous waste satellite accumulation	22 CCR 12 66262.34(e)
	H808	Failure to properly manage soiled/contaminated rages before being sent for laundering	HSC 6.5 25144.6(b)

Small Quantity Generator - Violations

V	VIOL #	Summary	Code
	H242	Failure to conduct employee training on waste handling and emergency procedures	22 CCR 12 66262.34(d)(2); 40 CFR 262.34(d)(5)(iii)
	H256	Hazardous waste accumulation time limit exceeded	HSC 6.5 25123.3(h)(1); 22 CCR 12 66262.34(d)
	H259	Acutely/extremely hazardous waste accumulation time limit exceeded	HSC 6.5 25123.3(c), 25123.3(h)(1)(C); 22 CCR 12 66262.34(b)(1)
	H267	Failure to accumulate hazardous waste in containers that are in good condition	22 CCR 12 66262.34(d)(2); 40 CFR 1 262.34(d)(1), 262.34(d)(2), 265.171
	H269	Failure to store hazardous waste in containers made of or lined with a material compatible with the hazardous waste to be stored	22 CCR 12 66262.34(d)(2); 40 CFR 1 262.34(d)(2), 265.172
	H271	Failure to keep hazardous waste tank/container closed	22 CCR 12 66262.34(d)(2); 40 CFR 1 262.34(d)(2), 265.173
	H276	Failure to separate incompatible waste during storage	22 CCR 12 66262.34(d)(2); 40 CFR 1 262.34(d)(2), 265.17(b), 265.177
	H273	Failure to conduct weekly hazardous waste storage area inspections	22 CCR 12 66262.34(d)(2); 40 CFR 1 262.34(d)(2), 265.174
	H281	Failure to conduct daily inspections of hazardous waste tank systems	22 CCR 12 66262.34(d)(2); 40 CFR 1 262.34(d)(3), 265.201(c)(1), 265.201(c)(2), 265.201(c)(3)
	H299	Failure to post emergency information	22 CCR 12 66262.34(d)(2); 40 CFR 262.34(d)(5)(ii)
