Note that some of the written comments offer suggestions or express preferences related to the Project and do not address environmental issues or the adequacy of the DSEIR. All comment letters will be forwarded to the Board of Supervisors (Board) for consideration via this FSEIR. In conformance with Section 15088(a) of the California

Environmental Quality Act (CEQA) Guidelines, written responses were prepared addressing comments on environmental issues raised in comments on the DSEIR.

MASTER RESPONSES

This section presents "master responses" addressing similar or recurring topics in the comments received on the DSEIR. Through master responses, the County can address the common topics in a comprehensive manner and without duplication in the individual responses. Some of the thematic comments submitted on the DSEIR pertain to issues that are not considered significant impacts on the environment under CEQA, as will be discussed in Master Responses 1 and 2. Such issues include non-CEQA issues and social and economic impacts. The intent of the master responses is to avoid repetition within this document and improve readability by giving a single, comprehensive response to these comments. Responses to the individual comments that raise these recurring topics refer the reader to the master responses in this section.

MASTER RESPONSE 1: NON-CEQA ISSUES

MASTER COMMENT 1

Select comments submitted on the DSEIR raise non-CEQA issues. These comments are not directly related to the adequacy of the environmental document and include commenter's opinion on the approval or denial of the Project, the inclusion of certain candidate rezone sites, and other comments pertaining to the "merits" of the Project.

MASTER RESPONSE 1

The CEQA Guidelines frame the scope and focus of review and the extent, nature, and scope of responses by a lead agency to comments on a DSEIR. This FSEIR addresses specific comments pertaining to environmental impact analyses contained within the DSEIR and acknowledges comments not related to environmental impacts and analysis. As indicated in Master Comment 1, some of the comments received pertain to a commenter's opinion on the approval or denial of the Project, the inclusion of specific candidate rezone sites, and other comments on the overall merits of the Project. This master response provides background and a response to these types of comments.

CEQA Guidelines Section 15204 shapes the focus of review for a draft environmental impact report (EIR) as follows:

(a) In reviewing draft EIRs, persons and public agencies should focus on the sufficiency of the document in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the project might be avoided or mitigated. Comments are most helpful when they suggest additional specific alternatives or mitigation measures that would provide better ways to avoid or mitigate the significant environmental effects. At the same time, reviewers should be aware that the adequacy of an EIR is determined in terms of what is reasonably feasible, in light of factors such as the magnitude of the

project at issue, the severity of its likely environmental impacts, and the geographic scope of the project. CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors. When responding to comments, lead agencies need only respond to significant environmental issues and do not need to provide all information requested by reviewers, as long as a good faith effort at full disclosure is made in the EIR.

(c) Reviewers should explain the basis for their comments, and should submit data or references offering facts, reasonable assumptions based on facts, or expert opinion supported by facts in support of the comments. Pursuant to Section 15064, an effect shall not be considered significant in the absence of substantial evidence.

CEQA Guidelines Section 15204(e) also states that the above focus of review should "not be used to restrict the ability of reviewers to comment on the general adequacy of a document or of the lead agency to reject comments not focused as recommended by this section."

The environmental review process involves an objective assessment of the potential environmental consequences if a proposed project is carried out, rather than offering opinions on whether a project should be approved or denied. The County serves as the governing body responsible for land use decisions, with Planning and Environmental Review acting as the primary entity providing information and recommendations on land development to the Planning Commission and Board. Decision-makers (in this case, the Planning Commission as a recommending body and final decision by the Board) take into account various factors beyond those covered in the CEQA document, such as community support, economic impacts like taxes, jobs, and other non-environmental considerations, when deciding whether to approve or reject a project.

Comments either in favor or against a project do not necessarily address environmental impacts. Consequently, such comments are duly noted and forwarded to the decision-makers for their deliberations on project approval or denial. According to the CEQA Guidelines, individuals and public agencies reviewing draft EIRs should concentrate on assessing whether the document adequately identifies and analyzes potential environmental impacts, as well as proposing ways to avoid or mitigate significant effects of a project. Lead agencies are required to respond only to significant environmental concerns when addressing comments. The County acknowledges that public comments were submitted on the DSEIR that fall outside the scope of CEQA, and therefore, do not necessitate a specific response from the County. Nonetheless, all comments have been included in this FSEIR for documentation and review and will be considered by the decision-makers.

MASTER RESPONSE 2: SOCIAL AND ECONOMIC IMPACTS

MASTER COMMENT 2

Some comments submitted on the DSEIR suggest that the Project could lead to social or economic impacts, specifically mentioning concerns about its potential effects on the quality of life.

MASTER RESPONSE 2

The scope of an EIR is strictly defined by a lead agency's assessment of potential significant environmental impacts of a project, which are limited to physical conditions rather than social or economic factors (Public Resources Code [PRC] Section 21060.5; CEQA Guidelines Section 15360). Social or economic impacts that are not directly related to physical changes to the environment are explicitly excluded from the EIR (CEQA Guidelines Sections 15064[e], 15131[a], 15358[b], and 15382). Therefore, social or economic impacts that do not result from physical changes to the environment do not constitute substantial evidence of a significant environmental effect (PRC Section 21080[e][2]; CEQA Guidelines Section 15064[f][6]).

Some comment letters received express opposition to the Project due to concerns about its potential impact on the community's character or residents' perceived quality of life. However, under CEQA, the primary focus remains on maintaining a high-quality environment that is healthful and pleasing to the senses and intellect of people, while also accommodating the State's economic and social needs (PRC Sections 21000-21001).

The County's EIR process has been conducted in accordance with CEQA statutes and guidelines which acknowledge that environmental considerations sometimes need to be balanced with economic and social needs. CEQA permits lead agencies to approve projects despite significant environmental effects if feasible alternatives or mitigation measures are not available or practical (PRC Section 21002).

Therefore, comments regarding potential social or economic effects of the Project that are not linked to physical changes in the environment are duly noted. These comments will be provided to the decision-makers for consideration during their deliberations on whether to approve or deny the Project. As per CEQA Guidelines, such comments do not require further analysis or response in this FSEIR, as they fall outside its defined scope focused on physical environmental impacts.

RESPONSES TO COMMENTS

The seven comment letters received by the County during the public comment period for the DSEIR are included in Appendix RTC-1. Each bracketed comment is presented and followed by a numbered response to each comment. The responses amplify or clarify information provided in the DSEIR and/or refer the reader to the appropriate place in this FSEIR where the requested information can be found. Comments that are not directly related to environmental issues (e.g., opinions on the merits of the Project that are unrelated to its environmental impacts) are noted for the record. Where revisions to the DSEIR text are required in response to the comments, such revisions are noted in the response to the comment. All new text is shown as **bold and underlined** and deleted text is shown as ~~struck through~~.

The changes to the analysis contained in the DSEIR represent only minor clarifications/amplifications and do not constitute significant new information. In accordance with CEQA Guidelines Section 15088.5, recirculation of the DSEIR is not required. Each letter has been considered by the County and addressed, according to CEQA Guidelines Section 15088, prior to certification of this FSEIR.

LETTER 1

BRECA (May 19, 2024).

COMMENT 1-1

I have attached the comments of the Butterfield-Riviera East Community Association (BRECA) on the Draft Subsequent Environmental Impact Report for the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project.

Please acknowledge receipt of this email.

Also, if there is way for us to get on a list for people to be notified of activities on this document and the general RHNA process, please add our name to that list.

RESPONSE 1-1

This comment is noted for the record. The County has acknowledged receipt of the email and added BRECA to the list of interested parties to be notified of activities on the SEIR and Project in general.

COMMENT 1-2

These are the comments of the Butterfield-Riviera East Community Association (BRECA) concerning the Draft Subsequent Environmental Impact Report for the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (DSEIR).

The Butterfield-Riviera East Community Association (BRECA) is a membership based community organization. Our goals are to promote citizen involvement and enhance the community. The boundaries of our association are the American River on the north, Folsom Blvd. on the south, the Mayhew Drain on the west, and Paseo Rio Way (both sides of the street) on the east.

As explained in the Executive Summary and Chapters 1 and 2, the main purpose of the RHNA Rezone Project is to increase the number of dwelling units (du) in unincorporated Sacramento County zoned to lower income households so as to meet the recently revised RHNA numbers plus an additional margin. Lower income dwellings are defined as being zoned at a density of 30 du/acre or greater. A secondary purpose is to increase the zoning of moderate income dwellings.

One of the parcels included as a candidate in the Sacramento County Rezone Project lies within the boundaries of our Association: It has Assessor Parcel Number (APN) 075-0020-015-0000, and is identified as site 15 in Appendix PD-1 to the DSEIR. Another parcel, with APN 075-0440-024-0000, identified as site 16 in Appendix PD-1, lies immediately to the east of our Association boundaries. BRECA has been heavily involved for at least two decades in various planning efforts concerning the first site. The first site is along Folsom Blvd., immediately opposite the Butterfield Light Rail Station, and is approximately 14.7 acres in total. It consists mostly of fallow field, with a single house and some outbuildings surrounded by trees.

Response 1-2

This comment provides introductory statements, a summary of BRECA's community organization, a summary of the main purposes of the Project, and an overview of the two candidate rezone sites (Sites 15 and 16) that are located in or immediately adjacent to BRECA's boundaries. The comment does not address the adequacy of the DSEIR.

Comment 1-3

We first want to bring to your attention that candidate site 15 (as identified in Appendix PD-1) should not be included in the "lower income" category of the Rezone Project at all because it is too big. California Government Code Section 65583.2(c)(2) reads in part:

> *"(B) A site larger than 10 acres shall not be deemed adequate to accommodate lower income housing need unless the locality can demonstrate that sites of equivalent size were successfully developed during the prior planning period for an equivalent number of lower income housing units projected for the site or unless the locality provides other evidence to the department that the site can be developed as lower income housing…."*

As noted above, the candidate site 15 (as identified in Appendix PD-1) is actually about 14.7 acres. Current zoning for the site dates from the Riverstone Square proposal approved by the Board of Supervisors in 2007, and includes about 2.3 acres of dedicated park land zoned RD-0, leaving 12.4 acres developable at RD-20. Appendix PD-1 indicates that the acreage rezoned is 11.45 acres (net). Whether the text of California Government Code cited above refers to gross or net acres, the site is clearly larger than allowed by the cited Code for lower income housing.

The DSEIR makes no mention of this. Nor does it cite any examples of "…sites of equivalent size (that) were successfully developed during the prior planning period for an equivalent number of lower income housing units…." It seems likely to us that there are none. Are there any sites that fulfill this criteria?

Consequently, as the main purpose of the Rezone Project is to zone areas with higher density to increase the RHNA numbers, and candidate site 15 (as identified in Appendix PD-1) cannot be used to increase those numbers, site 15 should not be included as lower income density (i.e. over 30 dwelling units [du] per acre) zoning. We point out that the proposed rezone has many more additional lower income units (973, DSEIR p. 2-3) than are required to meet the RHNA requirements. Hence removing Site 15 would not result in failure to achieve the main goal of the Rezone project. Is County Planning willing to modify the proposed project to remove candidate site 15 from the higher density category? If not, why not?

Response 1-3

This is not a comment on the adequacy of the environmental document. Rather, this comment is related to the merits of the Project – see Master Response 1.

As mentioned by the commenter, the parcel (APN 075-0020-015-0000) where candidate rezone Site 15 is located, consists of approximately 14.7 acres and includes two existing zoning designations on the parcel – the Multiple Family Residential 20 (RD-20) and Recreation (O) zones. The O-zoned portion of the parcel is approximately 3.2 acres (not 2.3 acres), which leaves a balance of approximately 11.5 acres of existing RD-20 zoned land. The 11.5-acre RD-20 portion of the parcel is Site 15 in the Project, which was previously proposed to be rezoned to Multiple Family Residential 40 (RD-40) and not change the zoning of 3.2 acres of O-zoned land. Since publication of the DSEIR, and partially in response to comments received on Site 15, Site 15's acreage and proposed zoning was modified from 11.45 acres at RD-40 to 5.73 acres at RD-30. The 3.2 acre park site with O-zoning is relocated to the northern third of the parcel and the remainder of the site will retain existing RD-20 zoning. See Chapter 2, "Project Description", for additional information.

Although Site 15's rezone acreage has decreased to below 10 acres, the following response related to Site 15's inclusion in the Project is noted for the record. Site 15 is identified in the *Sacramento County Housing Element of 2021-2029* (Housing Element) as a potential candidate rezone site, which was reviewed by State of California Department of Housing and Community Development (HCD) for consistency with State housing element law and required site selection criteria. The second portion of the cited Government Code (Section 65583.2(c)(2)(B)) allows for jurisdictions to justify inclusion of large sites based on factors other than just a comparison of developments from the previous housing cycle. Based on the previously proposed RD-40 zoning alone, the site could have been developed with as many as 458 units; however, given the Government Code cited it was reasonable to assume that the site would have been developed with a mix of income ranges (i.e. some of the development would be for market rate units and some would be reserved for lower income individuals). The County provided this as justification, per Government Code, for keeping the larger site (Site 15) on the inventory. This was intended to provide flexibility for a future developer. Finally, it should be noted that the rezone does not ensure that there will be affordable units built on the site just that it is "available" for development.

With modification of the site's acreage and zoning, from 11.45 acres at RD-40 to 5.73 acres at RD-30, Site 15 is now below the 10 acre threshold identified in the Government Code cited; therefore, Site 15 is consistent with State housing element law and required site selection criteria and no additional justification related to the size of the site is required.

As noted in Master Response 1, the DSEIR does not evaluate the merits of the Project and it is not appropriate for the DSEIR to make recommendations for removal or additions of candidate rezone sites.

COMMENT 1-4

The second point that we would like to make is that the DSEIR appears to us to omit an entire subcategory of adverse environmental impact. In Chapter 4, Aesthetics, there is a subcategory for "Impact AES-1: Degrade Existing Visual Character or Quality of Public Views." However, there is no category for degrading of "private views," even when said

views would be experienced by a large number of people. In particular, we point out that the "private views" of residents who live adjacent to candidate sites number 15 and 16 (as described in Appendix PD-1) would be greatly degraded by the zoning proposed in the Rezone proposal.

Regarding site 15, it is bordered on the North by single family detached houses, most of which are single story, with a few two story. On the west it is bordered by duplexes, which are all single story. As these residents look out from their back yards, as noted above, they currently see an open field with a single one story house and some outbuildings (site 15). If the Rezone proposal were to take effect, and development occur at the proposed density of 40 du/acre, this view would change to, most likely, one or more large apartment or condominium buildings averaging about four (4) stories in height. This would of course tremendously degrade their "private" view.

Site 16 (as described in Appendix PD-1) likewise has single family homes, one and two story, to the north. These would be adversely affected by the proposed 40 du/acre zoning of this site.

We are of course aware that the current zoning for site 15 (as described in Appendix PD-1) is for 20 du/acre for most of the site. The final plan of this, in the Riverstone Square proposal, was for a combination of small detached single family homes to the north and west, and row houses to the south and east. Those would have been two (2) or three (3) stories high. We view this as marginally compatible with surrounding construction. If this zoning was used for apartments or condominiums, it would most likely be two (2) stories on average. So a change to 40 du/acre would be a significant change.

We add, as cited in the DSEIR (p. 4-16 and 4-17), the following land use policies from the Sacramento County General Plan:

> *"LU-18. Encourage development that compliments the aesthetic style and character of existing development nearby to help build a cohesive identity for the area."*
>
> *"LU-102. Ensure that the structural design, aesthetics and site layout of new developments is compatible and interconnected with existing development."*

It is strikingly obvious that the proposed rezone of candidate sites 15 and 16 (as described in Appendix PD-1) to 40 du/acre, are inconsistent with the above land use policies. If developed per the proposed zoning it would constitute a significant adverse effect on the environment of the neighbors.

We also add that it appears that there may be many of the sites in the Rezone proposal that would have the same situation as sites 15 and 16 (as described in Appendix PD-1).

The failure to disclose this effect renders the DSEIR inadequate under the California Environmental Quality Act (CEQA).

RESPONSE 1-4

Under CEQA, the question is whether a project will affect the environment of persons in general, not whether a project will affect particular persons (*Association for Protection etc. Values v. City of Ukiah* [1991] 2 Cal.App.4th 720, 734). For this CEQA analysis, as with *Mira Mar Mobile Community v. City of Oceanside* ([2004] 119 Cal.App.4th 477), the DSEIR has properly drawn a distinction between public and private views, determining that only impairment of the former would constitute a significant impact under CEQA. Further, CEQA Guidelines Appendix G thresholds state that a proposed project would have a significant impact related to aesthetics if: "in nonurbanized areas, [it would] substantially degrade the existing visual character or quality of public views of the site and its surroundings (public views are those that are experienced from publicly accessible vantage point)". Since the Project is located within urbanized areas, CEQA Guidelines Appendix G thresholds state that a proposed project would have a significant impact related to aesthetics if: "the project [would] conflict with applicable zoning and other regulations governing scenic quality." As stated on DSEIR page 4-21, the Project would not conflict with scenic quality zoning and in the instance that future development does conflict with zoning or design standards, discretionary entitlements subject to approval by the appropriate hearing body would be required. Any such discretionary entitlements would be subject to additional CEQA review. Although an analysis of degradation of public views is not required per CEQA for the Project because candidate rezone sites are located in urbanized areas, the County acknowledges the importance of visual character and quality. Therefore, the DSEIR provides an analysis of potential degradation of public views for informational purposes. Finally, although the County acknowledges the commenter's concerns, neither State nor local law protects private views from private lands, and the rights of one private landowner cannot prevail over the rights of another private landowner except in accordance with uniformly applied standards and policies as expressed in the County's General Plan and zoning ordinances (*Mira Mar Mobile Community v. City of Oceanside*, ibid.). A disclaimer to Impact AES-1 has been added to clarify that this analysis is included for informational purposes only.

This comment further asserts that the rezone of Sites 15 and 16 will result in substantial adverse impacts to the surrounding neighbors and inconsistencies with the *Sacramento County General Plan of 2005-2030* (General Plan) Land Use Element policies LU-18 and LU-102 (quoted within Chapter 4, "Aesthetics," of the DSEIR) due to the potential for substantial changes in allowable height and story limits of future development consistent with the proposed zoning. As correctly noted by the commenter, the Project proposes to rezone Sites 15 and 16 from RD-20/O and RD-20(PC) to RD-30/O and RD-40(PC), respectively; however, because both sites are surrounded by single-family/low density residential zoning, allowable height and story limits will not change for either site without additional entitlements. Pursuant to Table 5.8.B of the Sacramento County Zoning Code (Zoning Code), the maximum height and stories for a multifamily residential project in the RD-20, RD-30 or RD-40 zones is 40 feet and 3 stories when adjacent to low density residential zoning district. Thus, under existing and proposed zoning, the height of future development on Sites 15 and 16 would not change (i.e., height limit would remain 40 feet). See Appendix AES-1 and Zoning Code Table 5.8.B for further information.

Therefore, the Project will have no impact on Sites 15 and 16 related to height and story limits over what could be developed on the site under existing conditions.

Comment 1-5

On a side note, we point out that there is an inconsistency between the site designations in Appendix PD-1 and Appendix AES-1. APN 075-0020-015-0000, is identified as site number 15 in Appendix PD-1 to the DSEIR. However, in Appendix AES-1, it is identified as site number 37. APN 075-0440-024-0000, is identified as site 16 in Appendix PD-1, but as site number 34 in Appendix AES-1. It appears that most or all of the site numbers in Appendix PD-1 are inconsistent with those in Appendix AES-1. This likely confuses many people. Inasmuch as much of the text of the main document refers to site numbers without clarification of which Appendix this should refer to, this needs to be fixed in the final environmental document. This is also why our comments above refer repeatedly to Appendix PD-1 as the source of the site number.

Response 1-5

Thank you for your comment. Appendix AES-1 was inadvertently sorted in alphabetical order by existing zoning and the candidate rezone site numbers were not correctly integrated. As mentioned by the commenter, the APN and all other information was correct regarding existing and proposed zoning and height permissions. Appendix AES-1 has been updated to correct this discrepancy.

Comment 1-6

On another note, we also want to comment on traffic impacts. We see that, according to DSEIR Chapter 10, Transportation, traffic congestion and Level Of Service have been deemed to be not significant effects under CEQA. None-the-less, we are concerned about the impact of the large number of vehicles that would be added to our streets by the proposed high density zoning. We are particularly concerned about the combined impact of sites 15 and 16 (as described in Appendix PD-1) on the intersection of Folsom Blvd. and Bradshaw Road. This intersection is already projected to be a Level of Service F in the future. More traffic will only make things worse. Although we do not expect the DSEIR to address this question, we do intend to bring it to the attention of the Board of Supervisors.

Response 1-6

This comment is related to additional traffic associated with increased density allowed under proposed zoning for Sites 15 and 16. Specifically the commenter notes concern related to the increased traffic from these sites at the intersection of Folsom Boulevard and Bradshaw Road, which currently operates at an unacceptable Level of Service (LOS).

As correctly noted by the commenter, LOS is no longer a metric used to determine transportation impacts under CEQA. Thus, in the case of traffic operations, specifically intersection and roadway LOS, such an analysis is not required pursuant to CEQA Guidelines Section 15064.3(a) since congestion and intersection operations no longer constitute a transportation impact under CEQA. However, Sacramento County

Department of Transportation (SACDOT) staff will separately review congestion and intersection operations for future developments in a Local Transportation Analysis (LTA) (for Site 15) or a Focused Access and Circulation Study (FACS) (for Site 16).

Relatedly, SACDOT provided the following conditions of approval for Sites 15 and 16 related to subsequent LTA and FACS requirements:

Site 15

- PRIOR TO APPROVAL OF IMPROVEMENT PLANS: The applicant shall submit for review and approval a Local Transportation Analysis stamped and signed by a California-Licensed Civil Engineer or Traffic Engineer that analyzes and adheres to the scope provided by the Department of Transportation's Trip Generation Letter in accordance with the County of Sacramento Transportation Analysis Guidelines and identifies transportation related impacts and mitigations.
- PRIOR TO ISSUANCE OF A CERTIFICATE OF OCCUPANCY: The applicant shall comply with all mitigation measures, recommended improvements, recommended access/circulation changes, and conditions of approval as a result of the Local Transportation Analysis.
- AS AN ADVISORY: Upon review of the project's site plan, the Department of Transportation may request a Local Transportation Analysis (LTA) for the project to assess its impact on onsite and offsite roadway facilities and will be conditioned to perform the LTA prior to the approval of improvement plans and pay a review fee of $2,000 to the Department of Transportation.

Site 16

- PRIOR TO APPROVAL OF IMPROVEMENT PLANS: The applicant shall submit for review and approval a Focused Access and Circulation Study stamped and signed by a California-Licensed Civil Engineer or Traffic Engineer that analyzes and adheres to the scope provided by the Department of Transportation's Trip Generation Letter in accordance with the County of Sacramento Transportation Analysis Guidelines and identifies transportation related impacts and mitigations.
- PRIOR TO ISSUANCE OF A CERTIFICATE OF OCCUPANCY: The applicant shall comply with all mitigation measures, recommended improvements, recommended access/circulation changes, and conditions of approval as a result of the Focused Access and Circulation Study.
- AS AN ADVISORY: Upon review of the project's site plan, the Department of Transportation may request a Focused Access and Circulation Study (FACS) to review site access, fronting roadways, and/or onsite circulation. A FACS focuses on driveway locations, traffic control, traffic calming, and median/turn restrictions, rather than off-site impacts. The review fee for a FACS, if required, is $2,000 and must be completed prior to the approval of improvement plans.

When future development on candidate rezone sites submit for subsequent phases such as improvement or grading plans, the project applicant will provide details regarding the project's location, access points, size, density, traffic patterns, mode splits, and other relevant features that are not currently known. These site-specific project characteristics are essential for conducting a comprehensive analysis of the project's transportation impacts (that are not covered under CEQA).

The site-specific transportation study will encompass an evaluation of traffic operations including congestion, safety considerations, on-site circulation, and connections for multi-modal transportation modes. This detailed assessment will be crucial in understanding and addressing the full spectrum of transportation effects associated with the proposed projects.

LETTER 2

Caltrans, District 3 (April 9, 2024).

COMMENT 2-1

Thank you for including California Department of Transportation in the review process for PLNP2020-00042 Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project. We wanted to reach out and let you know we have no comments at this time.

Please provide our office with copies of any further actions regarding this proposal. We would appreciate the opportunity to review and comment on any changes related to this development.

Should you have questions please contact me, Local Development Review and System Planning Coordinator, by phone (530) 821-8261 or via email at D3.local.development@dot.ca.gov.

RESPONSE 2-1

This comment is noted for the record. The County will continue to notify Caltrans of further actions or changes related to the Project.

LETTER 3

CRPD (May 20, 2024).

COMMENT 3-1

Cordova Recreation and Park District (CRPD or 'District') is responding to a 'Notice of Availability' from Sacramento County regarding a subsequent environmental report for the Sacramento County Regional Housing Needs Allocation Rezone Project. The County previously circulated a 'Notice of Preparation' (NOP) with a public review period of December 22, 2023 to January 22, 2024. A scoping meeting for public agencies was also held on January 4, 2024. CRPD inadvertently missed the opportunity to provide early comments regarding the environmental aspects of the rezone project.

The current environmental report refers to earlier EIR's that were prepared for special planning areas within the County. All these areas, (including Fair Oaks Boulevard, North Watt Avenue and Old Florin Town SPA), are located outside the District.

RESPONSE 3-1

This comment provides introductory statements and is noted for the record. The comment does not address the adequacy of the DSEIR.

COMMENT 3-2

The County's rezone project includes 79 properties with an overall area of 235 acres. Most of the parcels are zoned for residential development, but by increasing the allowed density the County can provide the opportunity for the development of an additional 4,081 units in the lower income category. After this increase of high-density zoning the County will meet the State's requirements for residential zoning.

Two of the sites targeted for rezone are located within CRPD. Both sites are in the west end of the District with access from Folsom Boulevard (Site #15 and Site #16). The combined area of these properties is 13.9 acres.

RESPONSE 3-2

This comment provides an overview of the Project and identifies that two candidate rezone sites are located within CRPD's service area (Sites 15 and 16). The comment does not address the adequacy of the DSEIR.

COMMENT 3-3

*While the subsequent environmental report is addressing 'Public Services and Recreation', no new or more significant effects have been identified. As in earlier EIR's, the report states that the Quimby Act and **General Plan Policy PF-123** covers potential impacts of the rezone on Parks and Recreation Facilities. No additional mitigation has therefore been required.*

*In the report Park and Recreation Facilities have been included with **Table ES-1:** Summary of Resource Topics Excluded from Detailed Analysis on page ES-65 and ES-*

*66. **Impact PSR-5: Require Construction of Parks and Recreation Facilities** states increase for demand for parks and recreation facilities would be required by the Quimby Act and General Plan Policy PF-123. Park Districts in the three special plannjng [sic] areas (Carmichael, North Highlands and Southgate) have been addressed individually under **Impact PSR- 5.***

RESPONSE 3-3

This comment provides an overview of the DSEIR's analysis of park and recreation facilities. To clarify, impacts to Parks and Recreation facilities is not listed in Table ES-1, which as mentioned is a summary of topics excluded from additional detailed analysis because they were covered in the original environmental document sufficiently. Instead, Impact PSR-5 is listed in Table ES-2, which is the executive summary of topics covered in the SEIR. This comment does not address the adequacy of the DSEIR.

COMMENT 3-4

Rezone sites #15 and #16 are both located along Folsom Boulevard, close to the west boundary of Rancho Cordova. This part of the CRPD is generally considered to be underserved by Quimby parkland.

***Site #15** is proposed to be rezoned from 20 units/acre (RD-20) to 40-units/acre (RD-40). The 11.45-acre property includes a 3-acre portion zoned for parks and open space (O) in the center. While **Appendix PD-1** lists the proposed zoning as RD-40/0, the three-acre park portion has been included with both the existing and proposed density calculation. As a result, the project seems to exclude the -acres [sic] of parkland and by default rezones the 3-acres of parkland to high density housing. Because this zoning change would eliminate land that in the future could be developed as a public park, CRPD recommends that the 3-acre parkland should be excluded from rezoning and density calculations.*

***Site #16** is also proposed to be rezoned from 20 units/acre (RD-20) to 40 units/acre (RD-40). The size of this parcel is 2.45-acres.*

RESPONSE 3-4

See Response 1-3 for Letter 1. The Project does not propose a rezone of the O-zoned portion of Site 15. Rather, as further detailed in Response 1-3 for Letter 1, the 3.2 acre O-zoned portion of the site is retained and shifted to the northern third of the parcel. This was contemplated and modified since the publication of the DSEIR in consultation with interested parties including the property owner and CRPD.

COMMENT 3-5

***Impact PSR-5** describes why the rezone will not impact the demand for park and recreation facilities (see **Table ES-1** on page ES-65 and 66). Both the General Plan and the Quimby Act are mentioned as evidence that future multi-family developments within the Carmichael, North Highlands and Southgate Park Districts will have a sufficient amount of parkland. While the DSEIR report is focused on three special planning areas*

within the County (Fair Oaks Boulevard, North Watt Avenue and Old Florin Town SPA), CRPD recommends that all the eleven park districts that are subject to the rezone project should be mentioned in impact assessment PSR-5.

Response 3-5

The subject DSEIR is a subsequent environmental document to the General Plan EIR along with three distinct area plans (North Watt Corridor Plan, Old Florin Town SPA, and Fair Oaks Boulevard Corridor Plan). While the analysis in the DSEIR for the three area plans pertains to the specific geography of the applicable plan, the General Plan covers the entire unincorporated County. Therefore, the DSEIR provides a full analysis of the Project on all 11 park districts within the unincorporated County that contain candidate rezone sites. The environmental setting for all 11 park districts is discussed on DSEIR page 9-11 through 9-14 and impacts to parks and recreation facilities for all 11 recreation and park districts is contained in *Impact PSR-5, Sacramento County General Plan, Proposed Project Impact Evaluation* beginning on page 9-43 of the DSEIR. Discussion related to CRPD is included in both the environmental setting and in Impact PSR-5, which pertains to impacts on parks and recreation facilities.

Furthermore, since publication of the DSEIR and in response to comments received from CRPD, County staff has met with CRPD to discuss the Project and inclusion of appropriate conditions of approval for Sites 15 and 16 related to park and recreation services and facilities. As a result of discussions, CRPD has identified conditions of approval for Sites 15 and 16 and staff has worked closely with CRPD to ensure no adverse impacts to CRPD. Chapter 9, “Public Services and Recreation”, has been updated to detail the results of collaboration.

For the record, the citation stating page ES-65 through ES-66 of the Executive Summary are a part of Table ES-1 is incorrect. Pages ES-65 through ES-66 are within Table ES-2 of the Executive Summary.

Comment 3-6

*A detailed analysis of Impact PSR-5 is found on pages 9-43 to 9-48. There appears to by [sic] a typo on page 9-43 under **Proposed Project Impact Evaluation,** third bullet should reference "CRPD" (for Cordova Recreation and Park District) instead of COPD.*

Response 3-6

This comment is not a comment on the adequacy of the DSEIR; however, the DSEIR has been updated globally to correct the acronym (CRPD) in reference to the Cordova Recreation and Park District.

Comment 3-7

For unknown reasons, CRPD was not aware of the earlier environmental review process. However, the District has noted that Southgate Park and Recreation District responded to the County's Notice of Preparation (NOP) as covered in the DSEIR on page 9-44. Similarly to Southgate, CRPD has standard conditions that apply to the County portion of

the District. These standard conditions have been provided in the past to Sacramento County as part of the review and comment on new development proposals. As a part of these conditions, CRPD requires that developments consent to be included in a CRPD financing district for the purposes of funding costs to repair, maintain, and replace facilities in perpetuity. When development applications are submitted for the rezoned sites, the District will work with the County to incorporate park conditions with the project approval.

Response 3-7

Thank you for your comment. While this is not a comment on the adequacy of the environmental document, it is noted for the record. Further, as subsequently discussed in meetings between CRPD and PER on June 13, 2024, PER welcomes conditions of approval from CRPD. Since the June 13th meeting, PER staff has worked with CRPD to identify and include conditions of approval to ensure appropriate park development, funding, and maintenance commiserate with the potential increased level of future development on Sites 15 and 16. This comment and the addition of CRPD conditions of approval do not change the disposition of environmental impacts disclosed or the adequacy of the environmental document associated with recreation and park facilities. Chapter 9, “Public Services and Recreation,” Impact PSR-5, has been supplemented to note the conditions of approval received and added for Sites 15 and 16 from the CRPD. Additionally, the Board Letter for the Project contains further details on the conditions of approval added.

Comment 3-8

The California Environmental Quality Act (CEQA) does not require that economic aspects of a project are analyzed. However, Public Services and Recreation (that is a subject of CEQA review) are directly affected by funding. Regarding parks, this means that the amount of parkland in addition to the quality of park improvements and park maintenance depends on the available funding. Generally, park fees have not increased at the same rate as costs for park construction and park maintenance.

While the DSEIR refers to the 'Quimby Act' as evidence that the State and local requirements for parks will be met, it does not consider that High-Density Infill Development in Sacramento County qualifies for an exemption from Quimby Parkland Requirements (see ***Goal 2 in the Housing Element*** *portion of the General Plan and section 6.5.4.D of the County Zoning Code). The District also does not know, when the County would consider an 'Alternative Calculation Method' outlined in* ***Chapter 22.40.045*** *to determine parkland requirements potentially reducing the current standards within the District from 4.87-acres/1,000 residents. In order to manage some of the unknown aspects of the rezone project, CRPD recommends that the County should not permit waivers from Quimby Parkland Requirements.*

Some new multi-family developments will fall under a "by right" approval process that allows approval without compliance with the requirements of Chapter 22.40. Therefore, the report should also identify Sacramento County ***Chapter 9.70 Local Parks and Recreation Dedication and Fees*** *as a mechanism to provide mitigation for the impact of increased population for projects that are not subject to Chapter 22.40.*

Response 3-8

The commenter incorrectly indicates that “high-density” infill development qualifies for an exemption from Quimby Parkland requirements and erroneously references the General Plan Housing Element Goal 2 and Zoning Code Section 6.5.4.D. Future development that meets the definitions and requirements of the Quimby Act are not exempt from payment of in lieu fees, parkland dedication, or a combination of both as referenced in County Code Title 22, Chapter 22.40. It should be noted that the program cited, namely the Affordable Housing Incentive Program, does provide incentives, concessions, and waivers (collectively referred to as “waivers,” herein) for certain projects that meet specific criteria; however, most waivers are related to objective development standards of the Zoning Code and do not give the County or the developer the ability to waive Quimby Act requirements.

Regarding when the County would consider an “Alternative Calculation Method” for Quimby parkland dedications requirements, County Code Section 22.40.045 (B) indicates that an alternative method could be considered only if the local public agency providing parks services makes an application “to the Board of Supervisors for a determination of the standard for existing neighborhood and community park acreage.”

As mentioned by the commenter, future development on candidate rezone sites that is consistent with applicable Zoning Code development and design standards would be “by right”. When candidate rezone sites are the subject of a tentative subdivision map, Quimby requirements are conditions of the map process. Without a subdivision map or condition of approval requiring Quimby Act compliance, the commenter is correct that the County does have another mechanism in County Code regarding local parks and recreation dedication and fees. County Code Title 9, Chapter 9.70, is another mechanism to mitigate park impacts of developments. Chapter 9, “Public Services and Recreation,” of the DSEIR has been updated to include this mechanism for local park districts. Furthermore, as mentioned in the General Plan Public Facilities Element, it is acknowledged that Quimby requirements and other funding/dedication mechanisms located in County Code are only one component of the comprehensive park needs of any local park district. The General Plan states that other financing and funding mechanisms may need to be utilized to ensure that the park needs of new development are met. The General Plan further states that “other” financing mechanisms may include, but are not limited to, “development impact fees, local assessment districts, community facilities districts, grants, donations, and cooperative agreements between local government agencies.”

Comment 3-9

Exclude the 3-acre open space zone within site #15 from the RHNA Rezone Project.

Response 3-9

See Response 1-3 for Letter 1. The Project does not propose a rezone of the O-zoned portion of Site 15.

COMMENT 3-10

Expand PSR-5 impact assessment to include all the Park Districts that are affected by the rezone project.

RESPONSE 3-10

See Response 3-5 for Letter 3.

COMMENT 3-11

Do not exempt Affordable Housing Projects within Sacramento County from Quimby Parkland requirements.

RESPONSE 3-11

See Response 3-8 for Letter 3.

COMMENT 3-12

Correct typo on page 9-43 under ***Proposed Project Impact Evaluation;*** *third bullet to "CRPD" (for Cordova Recreation and Park District) instead of COPD.*

RESPONSE 3-12

See Response 3-6 for Letter 3.

COMMENT 3-13

Sacramento County Code Chapter 9.70 should be mentioned as a mechanism to provide park and recreation mitigation for projects that are not subject to Chapter 22.40.

RESPONSE 3-13

See Response 3-8 for Letter 3.

LETTER 4

DCJE (May 17, 2024).

COMMENT 4-1

On behalf of the Dry Creek Joint Elementary School District, please find the attached letter pertaining to the "Notice of Availability of a Draft Subsequent Environmental Impact Report For The Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project." If you have any questions, feel free to contact me.

RESPONSE 4-1

This comment provides introductory statements and is noted for the record. The comment does not address the adequacy of the DSEIR.

COMMENT 4-2

On behalf of the Dry Creek Joint Elementary School District ("District"), we provide this letter to submit comments regarding the Draft Subsequent Environmental Impact Report ("DEIR") for the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project ("Project") proposed by Sacramento County ("County"). According to the DEIR, The Project consists of rezoning sites totaling approximately 235 acres across unincorporated Sacramento County to provide additional lower income (i.e., extremely low income, very low income, and low income) and moderate-income category housing opportunities. As per the DEIR, the County aims to it provides [sic] additional capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law.

RESPONSE 4-2

This comment also provides introductory statements and is noted for the record. The comment does not address the adequacy of the DSEIR.

COMMENT 4-3

As a threshold issue, the District is sparsely mentioned in the DEIR. There is no significant analysis of the District or the linkages between housing development, their impact on the District, and the need for infrastructure to support the community's students. As a general note, the District requests additional discussion of these topics be included in the DEIR.

RESPONSE 4-3

Chapter 9, “Public Services and Recreation,” of the DSEIR provides an appropriate analysis of the Project on all seven school districts within the unincorporated County that contain candidate rezone sites. The environmental setting for all seven school districts is discussed on DSEIR page 9-6 through 9-9 and impacts to school facilities for all seven school districts is contained in *Impact PSR-3, Sacramento County General Plan, Proposed Project Impact Evaluation* beginning on page 9-34 of the DSEIR. Discussion associated with the DCJE is included in both the environmental setting and in Impact PSR-3, which pertains to impacts to school facilities.

As discussed in DSEIR Chapter 1, “Introduction,” while the Project would increase the development capacity on candidate rezone sites, there is no development proposed at this time. Furthermore, there is no certainty on timing of development or to what degree and intensity the surrounding County will develop other than what the existing General Plan designation and zoning can provide. The CEQA Guidelines provide: “the degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR” (CEQA Guidelines, Section 15146). This section specifically notes that, “an EIR on a project such as the adoption or amendment of a comprehensive zoning ordinance…should focus on the secondary effects that can be expected to follow from the adoption or amendment of a comprehensive zoning ordinance, but the EIR need not be as detailed as an EIR on the specific construction projects that might follow” (CEQA Guidelines, Section 15146[b]).

As described in CEQA scoping meetings for the Project and in the DSEIR topical chapters, analysis conservatively assumes full buildout of the candidate rezone sites and mitigation and conditions of approval are applied broadly to ensure impacts are reduced or entirely mitigated. DCJE was provided notice of both Notice of Preparations (NOP) that were released for the Project and were invited to attend scoping meetings. DCJE did not comment on the NOP or attend scoping meetings. However, the DSEIR still includes analysis of impacts of the Project on all impacted school districts. In fact, sources available were reviewed and cited regarding DCJE including the school district website and the DCJE School Facilities Master Plan.

Comment 4-4

Furthermore, the Housing Accountability Act prohibits local planning agencies from denying a residential project (or approving it at a reduced density) if the project complies with all applicable objective standards. (Gov. Code § 65589.50).) The County cannot impose any condition on such a project if the condition makes the project infeasible, financially or physically. These objective standards are set out in the general plan and zoning documents approved by local planning agencies. As such, once the Project is approved, the District will no longer have an avenue to ensure that the impact of high-density residential units on schools is adequately identified, analyzed, addressed, and mitigated.

Response 4-4

As pointed out in the comment, if the Project is approved, future development may be “by-right” subject to non-discretionary design review and compliance with County standards and any adopted conditions of approval. However, some future development may deviate from use regulations and/or development standards thereby requiring a discretionary entitlement that would be subject to additional environmental review, along with local-agency review and placement of conditions of approval. Since it is possible that most future development on candidate rezone sites will be by-right paired with the fact that the County does intend to use the streamlining/tiering provisions of CEQA, PER has made multiple attempts to solicit feedback from local agencies that may be impacted by the Project. During scoping meetings and follow-up coordination meetings, PER has

worked closely with various agencies and districts to ensure each of the candidate rezone sites are conditioned appropriately to mitigate any adverse impacts.

As subsequently discussed in a meeting between DCJE and PER on May 30, 2024, PER welcomes comments and conditions of approval from DCJE. Furthermore, since the May 30th meeting, PER staff has worked with DCJE to add conditions of approval to ensure appropriate school facilities commiserate with the potential increased level of future development on the three sites located within DCJE boundaries (Sites 1, 2, and 3). Chapter 9, “Public Services and Recreation,” Impact PSR-3, has been supplemented to note the conditions of approval received and added for Sites 1 through 3 from the DCJE.

This comment along with the addition of DCJE conditions of approval does not change the disposition of environmental impacts disclosed or the adequacy of the environmental document associated with school facilities. Staff’s Board Letter contains further details on the conditions of approval added for DCJE sites.

Comment 4-5

Therefore, through this letter, the District wishes to emphasize that this Project has the potential to have a profound negative effect on the District's students, their families, and residents. Overall, the DEIR fails to present any information needed to assess the Project's environmental impacts on the District.

With the foregoing in mind, the District requests the County revise the DEIR to address the serious deficiencies identified in this letter, develop appropriate mitigation measures for impacts that are identified as significant, and then recirculate the revised DEIR as required by CEQA. (CEQA Guidelines § 15088.5.) The District is hopeful that collaboration with the County, as outlined in this letter, will yield meaningful solutions that alleviate the impacts caused by the Project. The District is prepared to provide information as necessary to assist the County in addressing each of the District's concerns regarding the proposed Project.

Response 4-5

The comment states the Project would have a “profound negative effect on the District’s students, their families, and residents.” The comment letter does not provide sufficient detail to arrive at this conclusion and does not include specific examples of how the Project would negatively impact the DCJE’s ability to continue to serve their service population. As noted above, the County and DCJE have collaborated since the publication of the DSEIR and believe that the conditions of approval added by DCJE do yield meaningful solutions; however, the County disagrees that the DSEIR should be recirculated because the conditions of approval added do not change the disposition of impacts already included in the DSEIR.

Comment 4-6

The DEIR does not meet its purpose as an informational document because it fails to provide an adequate description of the environmental setting related to schools.

One of CEQA's basic purposes is to inform government decision-makers and the public about the potential significant environmental effects of proposed projects and to disclose to the public the reasons for approval of a project that may have significant environmental effects. (CEQA Guidelines § 15002(a)(l) and (a)(4).) In line with this goal, the preparer of an EIR must make a genuine effort to obtain and disseminate information necessary to the understanding of the impacts of project implementation. (See, CEQA Guidelines § 15151; Sierra Club v. State Board of Forestry (1994) 7 Cal.4th 1215, 1236.)

An EIR must describe existing environmental conditions in the vicinity of the proposed project from a local and regional perspective, which is referred to as the "environmental setting." (CEQA Guidelines § 15125.) This description of existing environmental conditions serves as the "baseline" for measuring the qualitative and quantitative changes to the environment that will result from the project and for determining whether those environmental effects are significant. (Id.; see also, CEQA Guidelines § 15126.2(a); Neighbors for Smart Rail v. Exposition Metro Line Constr. Auth. (2013) 57 C4th 439, 447.)

District facilities are critical part to the Project location's environment and should be considered throughout the DEIR impact categories. The DEIR identifies that three (3) of the rezone sites are within the District's boundaries and that these 3 sites will generate a total of Two Hundred and Thirty-Five (235) students that will need to be housed on District campuses. (DEIR, 9-35.) However, the DEIR fails to identify the impacted school sites, the available capacity at those schools, whether the students generated by development will need transportation, and related impacts. District facilities are at or nearing their capacity and so it is likely that these students may not be housed at their nearest campus or new facilities will be needed to house these students. The District is inadequately equipped to house these excess students. The DEIR fails as an informational document as it does not daylight these issues to the public or decision makers to adequately evaluate the impact of the Project.

Furthermore, it is common practice for cities and counties to rely on program-level environmental documents to excuse further analysis at the project-level. (See Citizens for Responsible Equitable Environmental Development v. City of San Diego Redevelopment Agency (2005) 134 Cal.App.4th 598, 608.) Applied to this instance, the County would be able to approve further project-specific entitlements without informing the public regarding the impact of such specific projects on school facilities. Therefore, the County must do the work of identifying and analyzing these impacts in this DEIR to ensure that the document complies with the basic principles of CEQA.

The DEIR purports to describe the Project's environmental setting in each of the environmental impact categories that are analyzed in the DEIR. However, in doing so, the DEIR barely mentions the District school throughout the entire document. The DEIR fails to present any information needed to assess the Project's environmental impacts on the District. For instance, the DEIR fails to address the current and projected future enrollment at District campuses that will be affected by the Project; the District's educational program objectives; a description of how the District currently uses its facilities; and the current vehicular and pedestrian paths of travel used by District staff, students and their families to get to and from school. Without consideration of these

factors, it is impossible for the lead agency and public to assess whether the Project has any impacts on the District's students, families, and staff, and whether those impacts are significant.

Response 4-6

As described in Response 4-3 for Letter 4, the DSEIR provides an appropriate analysis of the Project in Chapter 9, “Public Services and Recreation,” related to all seven school districts within the unincorporated County that contain candidate rezone sites. This includes an environmental setting for all seven school districts (DSEIR page 9-6 through 9-9) that builds upon the environmental setting of the General Plan EIR. Discussion and analysis associated with the DCJE is included in both the environmental setting and in Impact PSR-3, which pertains to impacts to school facilities. Finally, staff reviewed and provided information regarding DCJE taken directly from the school district website and the DCJE School Facilities Master Plan; therefore, it is unclear how the DSEIR fails to provide an adequate environmental setting related to schools.

While the Project does not include any site-specific development plans, designs, or proposals currently, the reasonably foreseeable consequence of the Project is future development of the candidate rezone sites. The DSEIR goes as far as calculating a worst case, site-by-site, population estimate that was used together with the student generation factor posted by DCJE to provide a conservative estimate of increases in student population due to the Project.

The DSEIR concludes that the increase in the student population would result in an increased demand for schools and that development would be subject to payment of applicable school impact fees to fund necessary facility improvements. Future development associated with the Project would require financing plans or participation in existing plans that include funding mechanisms for schools. Financial impacts to school districts for facilities are mitigated under Government Code Sections 65995(h) and 65996(b). Government Code Section 65995(h) states that the payment or satisfaction of a fee, charge, or other requirement levied or imposed pursuant to Section 17620 of the Education Code is deemed to be full and complete mitigation of the impacts for the planning, use, development, or the provisions of adequate school facilities. Government Code Section 65996(b) finds that these provisions provide full and complete school facilities mitigation.

Therefore, the Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental services and/or facilities, the construction of which would cause significant environmental impacts in order to maintain performance objectives for maintenance of schools.

Comment 4-7

The DEIR fails to identify and analyze all impacts on school facilities.

The DEIR does not address student generation within the context of the overall growth within the County and its impact on enrollment and potential overcrowding of school sites.

The District requests the County consider the cumulative impacts of the Project alongside other new developments within the County, related to student generation, the facilities needed to accommodate such growth, and all the impacts on the District, direct and indirect, resulting from the Project.

CEQA Guidelines, Appendix G, states that a project may have public services impacts on schools if the project would "result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives" for the provision of school services.

There is a myriad of ways in which large residential and commercial development projects can impact a school district's need for new or physically altered facilities in order to maintain performance objectives. The DEIR does not and should analyze all potential impacts under this standard, including but not limited to: (1) whether the influx of students would require "physically altered" school facilities unrelated to the accommodation of additional enrollment; (2) whether other impacts of the proposed Project, such as increased traffic, noise, or air pollutants in the neighborhood, could impact the District's need for new or physically altered school facilities; and (3) whether other impacts of the proposed Project could otherwise interfere with the District's ability to accomplish its own performance objectives. Consideration of the above-listed categories information is essential to properly making these determinations.

Lead agencies, and the DEIR, often cite to SB 50 (specifically, Government Code sections 65995(h) and 65996(a)), for the proposition that the payment of school impact fees (commonly referred to as "developer fees") excuses them from their obligations to analyze and mitigate impacts posed on school districts by development. In addition, the relevant text in the DEIR is a misstatement of the law related to developer fees and CEQA. While SB 50 does declare that the payment of the developer fees authorized by Education Code section 17620 constitutes "full and complete mitigation of the impacts of any legislative or adjudicative act on the provision of adequate school facilities," (Gov. Code § 65995(h)), SB 50 does not excuse lead agencies from analyzing such impacts on school facilities in the first place. Further, California courts have since acknowledged that developer fees do not constitute full and complete mitigation for school-related impacts other than school overcrowding. (Chawanakee Unified Sch. Dist. v. Cty. of Madera (2011) 196 Cal.App.4th 1016.) Thus, the payment of fees does not constitute full mitigation for all impacts caused by development related to traffic, noise, biological, pedestrian safety, and all other types of impacts related to the District and its educational program. The District expects the County to analyze and mitigate all such impacts for this Project.

From a practical standpoint, the amount of developer fees received by school districts typically falls woefully short of alleviating the impacts caused by development. This is due largely to the fact that: (1) statutory developer fee amounts fail to acknowledge the differences in costs of school construction from one district to another; (2) the developer fee amounts fail to contemplate the special facilities needs of those districts experiencing rapid growth, such as the need for portables; and (3) the adjustment formula for developer

fees is based on a "construction cost index" and does not include indexing related to the increases in land costs, resulting in the actual costs of facilities (i.e., land and improvements) increasing at a greater rate than the adjustment.

The inadequacy of developer fees as a source of funding for school facilities has forced school districts to rely increasingly on other sources of funding, primarily including local bond funds and State bond funds administered under the School Facilities Program ("SFP"). However, these sources of funds can be equally unreliable. Local bond funds are also difficult to generate, as local bonds are subject to district bonding capacity limitations and voter approval. Either way, the funding formula was never intended to require the State and local taxpayers to shoulder a disproportionate portion of the cost of school facilities.

In addition to the fact that current school sites do not have sufficient space to accommodate additional students, an inadequate infrastructure -which might include cafeterias, restroom facilities, sewerage, electrical capacity, and the like -may also preclude any additional growth. Placing too great a strain on the infrastructure is itself a physical impact to be addressed in an EIR.

Thus, the payment of fees does not constitute full mitigation for all impacts caused by development related to traffic, noise, biological, pedestrian safety, and all other types of impacts related to the District and its educational program. The District expects the County to analyze and mitigate all such impacts for this Project.

Response 4-7

See Response 4-6 for Letter 4 above.

Impacts to the non-school environment (i.e., traffic, air quality, noise generated from construction activities, public infrastructure, public services, etc.), including cumulative impacts, are analyzed in the DSEIR. Cumulative impacts for each resource topic is discussed within individual resource topic chapter (i.e., Chapter 4, “Aesthetics,” through Chapter 13, “Wildfire”). Projects are required to adhere to mitigation measures to reduce the severity of impacts. The comment letter does not explain how the DSEIR’s analysis with regards to the non-school environment is inadequate. The DCJE sets developer impact fees, not the County. Lastly, the adequacy of school impact fees is not an issue to be addressed under CEQA.

Comment 4-8

The DEIR fails to identify and analyze all impacts on housing.

The DEIR should estimate the amount of development fees to be generated by development in accordance with implementation of the Project and should describe the phasing of residential and development over time from inception to build-out of the Project.

The timing of development will also determine when new students are expected to be generated, and therefore is an important consideration particularly when considering the

cumulative impact of a project in conjunction with other approved or pending development. High-density residential units, such as multi-family housing, have a proportionally larger impact on the District when compared to single family homes. This is because multi-family units generate a similar number of students to single family units but over a smaller square footage. Therefore, the developer fees collected on such multi-family housing do not accurately reflect the burden placed on the District to ensure adequate facilities are ready to house the students generated by development. Therefore, significant multi-family residential development often leads to a scenario where the developer fees imposed on such development does not track with the need for facilities to house students generated by such development.

While the foregoing funding considerations raise fiscal issues, they translate directly into physical and environmental impacts, in that inadequate funding for new school construction results in overcrowding of existing facilities. Furthermore, fiscal and social considerations are relevant to an EIR, particularly when they either contribute to or result from physical impacts. (Pub. Resources Code § 21001(g); 14 Cal. Code Regs. §§ 15021(b), 15131(a)-(c), 15142 & 15382.)

RESPONSE 4-8

Chapters 1, "Introduction," and 2, "Project Description" of the DSEIR clearly explains that while the Project would increase the development capacity on candidate rezone sites, there is no development proposed at this time. Furthermore, there is no certainty on timing of development or to what degree and intensity the surrounding County will develop other than what the existing General Plan designation and zoning can provide. See also Response 4-6 for Letter 4.

COMMENT 4-9

The County Must Consider All Traffic and Related Impacts, Including Impacts on Traffic on Student Safety, Caused by the Project.

The DEIR was required to address potential effects related to traffic, including noise, air quality, and any other issues affecting schools. (Pub. Resources Code, §§ 21000, et seq.; Cal. Code Regs., tit. 14, §§ 15000, et seq.; Chawanakee Unified School District v. County of Madera, et al., (2011) 196 Cal.App.4th 1016.) Additionally, specifically related to traffic, the DEIR was required to analyze safety issues related to traffic impacts, such as reduced pedestrian safety, particularly as to students walking or bicycling to and from District schools; potentially reduced response times for emergency services and first responders traveling to these schools; and increased potential for accidents due to gridlock during school drop-off and pick up hours. Though the DEIR generally analyzes the traffic impacts anticipated by the Project, its analysis is inadequate, particularly in relation to schools. Traffic issues are a particular concern for school districts in that increased traffic volume may interfere with established school bus routes, require new and additional routes, and may increase safety concerns for students walking or riding bicycles or other modes of transportation to and from school.

Any environmental analysis related to the Project must address potential effects related to traffic, noise, air quality, and other issues affecting schools. (Pub. Resources Code, §§ 2100, et seq.; Cal. Code Regs., tit. 14 §§ 15000, et seq.; Chawanakee Unified School District v. County of Madera, et al., (2011) 196 Cal.App.4th 1016.)

Specifically related to traffic, there must be an analysis of safety issues, such as reduced pedestrian safety; potentially reduced response times for emergency services and first responders traveling to these schools; and increased potential for accidents due to gridlock during school drop-off and pick-up hours. (See, Journal of Planning Education and Research, "Planning for Safe Schools: Impacts of School Siting and Surrounding Environments on Traffic Safety," November 2015, Chia-Yuan Yu and Xuemei Zhu, pg. 8 [Study of traffic accidents near Austin, Texas schools found that "[a higher percentage of commercial uses was associated with more motorist and pedestrian crashes" around schools].)

The State Office of Planning and Research has developed new CEQA Guidelines that sets forth new criteria for the assessment of traffic impacts and now encourages the use of metrics such as vehicle miles traveled ("VMT"), rather than level-of-service ("LOS"), to analyze project impacts on traffic. (14 Cal. Code Regs. §15064.3.) However, local agencies may still consider impacts on traffic congestion at intersections where appropriate and must do so where, as here, such traffic congestion will cause significant impacts on air quality, noise, and safety issues caused by traffic. (Pub. Res. Code § 21099(b)(3).)

To the extent the Project may implement construction that impedes circulation in the County, and clog the access roads to, from, and around the District campuses, such items should be addressed in the EIR. (See, 5 Cal. Code Regs. § 1401O(k), which requires that school facilities be easily accessible from arterial roads.)

In addition to increased risks of vehicular accidents, the traffic and parking impacts posed by the Project may impact the safety and convenience of students who walk or bike to school. Title 5 of the California Code of Regulations requires that school sites be located within a proposed attendance area that encourages student walking and avoids extensive bussing. (5 Cal. Code Regs. § 10410(1).) As per the District Board Policy 5142.2, the District is committed to reducing vehicle emissions by encouraging students to walk or bicycle to school or to use district or public transportation. It is important that these traffic impacts are not only assessed through a VMT analysis, but also through a LOS analysis, as traffic congestion that may result from the Project may cause significant issues related to safety, noise, and air quality.

The requirement to analyze student safety issues is rooted in both the California Constitution and CEQA. Article I, section 28(c), of the California Constitution states that all students and staff of primary, elementary, junior high, and senior high schools have the inalienable right to attend campuses that are "safe, secure, and peaceful." CEQA is rooted in the premise that "the maintenance of a quality environment for the people of this state now and in the future is a matter of statewide concern." (Pub. Res. Code § 21000(a).) Naturally, safety is crucial in the maintenance of a quality environment. "The

capacity of the environment is limited, and it is the intent of the Legislature that the government of the state take immediate steps to identify any critical thresholds for the health and safety of the people of the state and take all coordinated actions necessary to prevent such thresholds being reached." (Pub. Res. Code § 21000(d).) The Legislature has made clear in declarations accompanying CEQA's enactment that public health and safety are of great importance in the statutory scheme. (Pub. Res. Code §§ 21000 (b), (c), (d), (g); 21001(b), (d) (emphasizing the need to provide for the public's welfare, health, safety, enjoyment, and living environment.) (California Building Industry Assn. v. Bay Area Air Quality Management Dist. (2015) 62 Cal.4th 369, 386.)

The District notes that no mention is made in the DEIR regarding travel-to-school analysis, including school bus routes, or walking/riding paths or routes. The District requests these school-related transportation, traffic, and safety impacts be analyzed and addressed, including those resulting from traffic and transportation impacts from the Project as a whole, and those school impacts relating to both (1) Project resident students' travel to and from yet-to-be identified school sites, and (2) congestion and related impacts on campus pick-up and -drop off procedures in light of increased traffic on major and arterial roads outside the Project. As mentioned, the District's campuses are currently nearing capacity and no single campus is projected to be able to support the Project's full population. As a result, students residing in the Project will likely need to travel from the Project to interim or new alternative school sites, which necessitates analysis of contingency bus and home to school travel routes to same. Furthermore, as per the District's BP/AR 3541 students are only eligible for bussing if they live more than 2 miles from their designated campus. Due to the location of the rezoned areas, and their nature as high-density residential, it is more than likely that the developments in the re- zoned areas will generate a proportionally large number of students that will not be eligible for bussing and, therefore will have to walk to school on a road that will be significantly busier due to the traffic generated by development.

The DEIR is inadequate in its discussion of the significant and inevitable traffic and transportation impacts, particularly as related to the Project's construction. The construction of, and traffic generated by, the Project will severely exacerbate the existing inadequacies in the County's roadways/sidewalks and the safety issues posed thereby. These impacts will severely inhibit the District's ability to operate its educational programs. However, none of these issues were properly analyzed in the DEIR.

The foregoing categories of information are critical for determining the extent of both physical and fiscal impacts on the District caused by increased population growth.

Response 4-9

Impacts related to transportation hazards and emergency access were programmatically (see DSEIR page 10-22 for methodology utilized to address transportation hazards and emergency access impacts) analyzed in Chapter 10, “Transportation,” Impact TRAN-3: Hazardous Design Feature Impacts (page 10-38 through 10-41) and Impact TRAN-4: Emergency Access Impacts (page 10-41 through 10-44). As discussed therein, Chapter 10, “Transportation,” evaluates whether the Project would directly or indirectly, substantially increase hazards due to a geometric design feature (e.g., sharp curves or

dangerous intersections) or incompatible uses (e.g., farm equipment); or result in inadequate emergency access. However, as discussed throughout the DSEIR, specific details about how the candidate rezone sites would be developed are unknown and a site-specific analysis of transportation hazards and emergency access cannot be evaluated at this time.

Analysis contained within Impact TRAN-3 states that future development on candidate rezone sites would be subject to, and designed in accordance with, the County's 2018 Improvement Standards (or the most recent design standards available at the time of development). The Improvement Standards contain objective, industry-proven, and safe standards that apply to transportation and circulation facilities across the entire County. These standards address potential design hazards including sight distance, driveway placement, signage and striping. As part of County Department of Transportation (SACDOT) and County Engineering Site Improvement and Permit Section (SIPS) review of the Project, conditions identifying the required driveway upgrades, distance between driveways, and other applicable design standards from the Improvement Standards addressing potential hazards were identified for each candidate rezone site. Compliance with the Improvement Standards is not only a condition of approval for candidate rezone sites but will also be reviewed and approved by SACDOT and/or SIPS during subsequent improvement/grading plan review. Thus, compliance with the Improvement Standards would not result in hazardous transportation design features that may result in conflicts with pedestrians and bicyclists. Furthermore, foreseeable residential development on the candidate rezone sites would not introduce incompatible uses, such as farm equipment or heavy-duty truck traffic, to area roadways during operations.

Impact TRAN-4 also provides a programmatic analysis of emergency access impacts associated with the Project. As stated in Chapter 10, "Transportation," (DSEIR page 10-42), future development is required to comply with the California Fire Code of Regulations which will ensure adequate emergency access. Additionally, Sacramento Metropolitan Fire District (SMFD) and Pacific Fruitridge Fire Protection District (PFFD) have provided conditions of approval specifically pertaining to fire and emergency medical services and proper emergency vehicle access. Impacts related to response times and facilities for fire and emergency medical services is addressed in Chapter 9, "Public Services and Recreation," Impact PSR-1. The analysis for Impact PSR-1 discloses that SMFD did indicate that station response zones are already impacted by excessive call volume; however, future development is required to comply with conditions of SMFD/PFFD and pay all applicable fire protection impact fees. With compliance with conditions and the payment of impact fees, future development would not impede onsite fire protection and emergency response and would not result in new substantial adverse physical impacts associated with the provision of new or physically altered fire and emergency services and/or facilities, in order to maintain acceptable service ratios, response times, or performance objectives than would occur with implementation of the General Plan.

See Response 1-6 for Letter 1 for discussion regarding SACDOT's subsequent review of congestion and intersection operations for future development projects (in a LTA or FACS). As noted in Response 1-6 for Letter 1, this review is required by SACDOT's Transportation Analysis Guidelines (TAG) and is separate and distinct from the

environmental impacts identified in CEQA and the DSEIR. SACDOT's review of future projects that require a LTA or FACS will, among other things, include a review of safety considerations. Sites 1 through 3 have all been conditioned by SACDOT to provide a LTA.

In addition, as discussed in Response 4-4 and 4-5 for Letter 4 the County and DCJE have collaborated since the publication of the DSEIR and believe that the conditions of approval added in response to DCJE comments yield meaningful solutions in this area. Additionally, the *Sacramento County Active Transportation Plan* (ATP) identifies high injury collisions nearby schools including those within DCJE. Sidewalks and other improvements are included in the ATP due to community input and review of existing conditions and accident reports. Further, to ensure future developers are coordinating with DCJE on safe routes to school (SRTS), the following condition of approval has been added to Sites 1 through 3:

> PRIOR TO THE ISSUANCE OF BUILDING PERMITS: The developer shall coordinate with Dry Creek Joint Elementary School District to identify safe routes to school for the student population of a subsequent development and travel to said school.

By implementing the aforementioned standards, studies, programs, and conditions of approval, the County aims to ensure that all development within the County does not exacerbate safety hazards for vehicular, pedestrian, or other forms of multi-modal transportation.

Comment 4-10

The County Must Consider Social Impacts Caused by the Project.

The Final EIR should identify how school facilities are currently utilized as civic centers, and are projected to serve in that capacity in the future, and assess the impacts of the Project on that use and identify how the District's grounds are currently utilized for recreation (parks) and open space, and are projected to serve in that capacity in the future, and assess the impacts of the Project on that use. These two requests are made in light of school districts' roles in providing recreational space and civic centers to the community. As overcrowding increases at school sites, the community's ability to utilize school facilities becomes limited, which has both physical and social impacts on the community. For example, the addition of relocatable classrooms to house new students may reduce available playing field or recreational space. Similarly, moving schools to multi-track class schedules, or having to set aside additional space for new alternative education students, may interfere with the community's ability to gain access to school facilities for civic use.

Response 4-10

See Master Response 2.

COMMENT 4-11

The District is prepared to provide any information necessary to assist the County in preparation of the final EIR and in addressing each of the issues set forth above. The District is committed to working with the County and any developers to ensure that the District's needs are met and that development located in the area of the proposed Project as well as all of the residents of the community can receive adequate and appropriate educational facilities.

Importantly, the District's comments and suggestions provided herein should be read as primarily focused on those impacts that go beyond the Project's direct impact on the need for school facilities to house the Project's students. While the direct impact may be statutorily mitigated, it should still be analyzed and discussed. And, importantly, the direct impact is not the only school-related impact foreseeably caused by the Project. Other environmental impacts which have an effect on school services, including those related to traffic and transportation, including travel to school routes and bus stops and routes, noise and air quality, pedestrian and alternative travel safety and convenience, infrastructure impacts, and all other types of impacts related to school services and school-related community concerns, all of which are important to the District's mission. Therefore, the District respectfully requests that the final EIR, include a discussion, analysis, and mitigation of all such impacts.

RESPONSE 4-11

This comment is a closing summary of the letter, which the above responses have addressed.

LETTER 5

SacSewer (May 15, 2024).

COMMENT 5-1

The Sacramento Area Sewer District (SacSewer) has reviewed the subject document and has the following comments.

The Sacramento County Housing Element of 2021-2029 identifies a shortfall of 2,884 units for the lower-income category in the County. There are insufficient appropriately zoned sites to accommodate the County's Regional Housing Needs Allocation (RHNA) obligation for the lower-income category. As such, Planning and Environmental Review (PER) is undertaking a rezone of ±235 acres within the unincorporated County to provide additional lower-income and moderate-income category housing opportunities. The Project does not propose to construct new residential or other development on the ±235 acres proposed to be rezoned; instead, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. The planning horizon year for the Project is 2029.

RESPONSE 5-1

This comment provides introductory statements and is noted for the record. The comment does not address the adequacy of the DSEIR.

COMMENT 5-2

Note: Effective January 1, 2024, the Sacramento Regional County Sanitation District and the Sacramento Area Sewer District merged into one district called the Sacramento Area Sewer District, or SacSewer for short.

SacSewer provides local sewer service to the proposed project site via its collection system and conveys sewage from the collection system to the EchoWater Resource Recovery Facility for treatment, resource recovery, and disposal.

SacSewer is not a land-use authority and plans and designs its sewer systems using information from land-use authorities. SacSewer bases the projects identified within its planning documents on growth projections provided by these land-use authorities.

RESPONSE 5-2

This comment provides introductory statements regarding SacSewer. Please note, the DSEIR correctly refers to the District as the "Sacramento Area Sewer District" or "SacSewer" in applicable topical chapters. This comment does not address the adequacy of the DSEIR.

COMMENT 5-3

To receive sewer service, the project proponent must complete Sewer Master Plans that include connection points and phasing information to assess the existing capacity of the

collection systems to determine if the current facilities can convey the additional flows generated by the Project.

In March 2021, the SacSewer Board of Directors approved the most current SacSewer planning document, the 2020 System Capacity Plan Update (SCP). In February 2013, the SacSewer Board of Directors adopted the Interceptor Sequencing Study (ISS). The SCP and ISS are on the SacSewer website at System Capacity Plans - Sacramento Area Sewer District (sacsewer.com).

The increased densities proposed by the Project were not included in the most current SCP and ISS planning documents. Portions of the Project area may exceed the design capacity of the existing collection system and may require projects to upsize the existing collection system to handle the increased flows proposed by the Project.

Customers receiving service from SacSewer are responsible for rates and fees outlined within the latest SacSewer ordinance. Fees for connecting to the sewer system recover the capital investment of sewer and treatment facilities that serve new customers. SacSewer does not guarantee sewer service or system capacity to the property until the property obtains proper permits to connect to the system and pays all facility impact (capacity) fees. The SacSewer ordinances are on the SacSewer website at Ordinances - Sacramento Area Sewer District (sacsewer.com).

Response 5-3

The above comments are advisory statements regarding how future developments under the Project will connect to public sewer service. SacSewer staff provided the same letter on the revised NOP circulated in December 2023 for the Project and staff at PER and SacSewer coordinated to provide detailed information to this end within the DSEIR and the planning staff report package. This comment is noted and because it does not comment on the adequacy of the environmental document, no further response is required.

LETTER 6

SMAQMD (May 15, 2024).

COMMENT 6-1

Thank you for allowing the opportunity for the Sacramento Metro Air Quality Management District to comment on the Draft SEIR for RHNA Rezone Project. We have reviewed the project and have no comments.

RESPONSE 6-1

This comment is noted for the record. After review, the commenter notes that SMAQMD has no comments on the adequacy of the DSEIR.

LETTER 7

Johnny Vega (May 19, 2024).

COMMENT 7-1

My name is Johnny Vega, 31-year resident of Arden Arcade. My home is a Single-Family Home. My neighborhood is a Single Family Neighborhood. It would be nice to keep the neighborhood this way. Unfortunately, there are forces at work to dismantle this style and way of life. A life I have invested in throughout my adult years of diligent, thoughtful effort. Sadly, I do not have the years available to start over. My life, my quality of life, and my way of living are in jeopardy. And each of you have the power to challenge these negative change agents to protect the citizens in your districts.

I live here because:

- *These neighborhoods are organized as single-family homes.*
- *The green spaces - so carefully planned and maintained - provide safe outdoor activities.*
- *These neighborhoods are quiet and safe.*
- *These neighborhoods are wonderful and safe places to raise families.*
- *My neighbors are my friends, and we depend on each other as needs arise.*
- *My neighbors work together to keep our homes/sanctuaries clean, safe, and quiet.*

RESPONSE 7-1

This comment provides introductory statements, background regarding the commenter's neighborhood context, and personal reasons the commenter lives in their community. The comment does not address the adequacy of the DSEIR.

COMMENT 7-2

This rezoning plan, I believe, is the beginning of the end of my single-family home neighbor and other single-family home neighbors through the far reaches of this rezoning plan that allows for the development of high-density multi-family rental units built, including low-income units. I am not against the idea of building affordable housing, it is the way these affordable housing units are designed with little to no regard for the character and feel of the existing single-family home neighborhoods.

To maximize the number of occupancies, three-story structures are being built in traditional one-story single-family neighborhoods. Yes, there is an occasional two-story home, but by far, our old established neighborhoods are single-story. And this way of organizing people has given form to our neighborhoods that are desired, sought out, and sustained and has made our neighborhoods integral to our quality of life.

What these in-fill projects lack that is essential to maintaining the character and feel of our neighborhoods is "ownership." It is the most essential characteristic of ownership that is the foundation of our community. Without "skin-in-the-game" what motivates someone to maintain their property. Without "skin-the-game" what motivates someone to be basically a "good-neighbor."

If the intent is to provide affordable housing, then do exactly that, i.e. build single-family homes and provide access to their affordability. Building these "High-Density, Low-Income" apartments only enriches the lives of the developers at the expense of our beautiful neighborhoods. And do not be mistaken, there is a real – tangible- cost to our neighborhoods that will not be compensated. All to provide some untested relief to the "housing crisis" in California.

We know that State Agencies throughout California have spent $24 Billion on this problem of housing the "unhoused." No oversight. No audit. No fiduciary mechanism in place to ensure this "housing" relief money made an improvement to California's unhoused. Imagine how many single-family home mortgages could have been made affordable from the $24 Billion that has essentially been misappropriated.

Considering costs and expenses, think about the "multiplier effect." I live in an area that is zoned RD-4. In my neighborhood of approximately 16 acres, I share a space with 64 single-family homes. Assume that each home accommodates 2.5 residents for a total of 160 neighbors that require county services for health - both physical and mental, education, utilities, peace officers, transportation, etc., each service requiring commensurate funding. Now imagine adding that same amount of people to a restricted area of 2 acres. Now you've increased county services by a factor of eight in this restricted area. As property owners, we pay for those services through our taxes. Does the developer pay in perpetuity for these "cost-of-living adjusted" services? If this effort is about housing relief, then someone must pay to keep the "lights-on." Again, "Ownership" is the foundation of a neighborhood. Rentals do not have "skin-in-the-game" and we know from experience that social services are unfortunately the low-hanging fruit when it comes to budget cuts.

My neighbors and I are now in a battle to save our "Quality of Life" because of the results of planning efforts like this: PLPN [sic] 2023-00089 and PLPN 2023-00087 if approved will build High-Density, Low-Income Multi-Family apartments that we believe will forever change the quality, and character of our neighborhood in a not-so-good-of-a-way.

I implore the board to consider the long-term effects of these Zoning changes. What it means for both the existing traditional Single-Family-Home neighborhoods and communities and to the proposed new residents forced to live in a restricted area without the benefit of "ownership" and possibly reduce county services.

Please, Please, Please consider the "Quality of Life " your decision will have on real peoples lives on both sides of the issue and reconsider a better solution to our communities facing the "unhoused" in a meaningful and sustainable way for everyone.

RESPONSE 7-2

See Master Responses 1 and 2.

This comment does not specifically identify which candidate rezone sites are of concern. Additionally, it should be noted that the Project is a rezone and other amendments to land use designations in the General Plan, Community Plans and applicable distinct area plans and does not constitute a development application. At this time, it is uncertain, and the Project does not require future development on candidate rezone sites to be rented or owned nor does it ensure a specific income level of the future residents. Finally, for the record, the referenced private entitlement application control numbers (PLNP2023-00089 and PLNP2023-00087) are not a part of the Project.

This page intentionally left blank.

APPENDIX INTRO-1: NOTICES OF PREPARATION AND SCOPING COMMENTS

Todd Smith, Planning Director
Planning and Environmental Review

Troy Givans, Director
Department of Community Development

DEPARTMENT OF COMMUNITY DEVELOPMENT
Planning and Environmental Review Division
NOTICE OF PREPARATION

June 12, 2023

TO: ALL INTERESTED PARTIES

SUBJECT: NOTICE OF PREPARATION OF A DRAFT Subsequent ENVIRONMENTAL IMPACT REPORT FOR the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (PLNP2020-00042)

Sacramento County (County) will be the Lead Agency under the California Environmental Quality Act (CEQA) for preparation of a Subsequent Environmental Impact Report (SEIR), consistent with Section 15162 of the State CEQA Guidelines, for a project known as the SACRAMENTO COUNTY REGIONAL HOUSING NEEDS ALLOCATION (RHNA) REZONE PROJECT (Project). This Notice of Preparation has been sent to responsible and trustee agencies and involved federal agencies pursuant to Section 15082 of the State CEQA Guidelines. Agencies should comment on the scope and content of the environmental information that is germane to the agencies' statutory responsibilities in connection with the proposed project. Due to the time limits mandated by State law, your response must be sent at the earliest possible date, but not later than 31 days after receipt of this notice. Late comments received prior to 5:00 PM Thursday July 13, 2023, will be considered.

The project description, location, and the probable environmental effects are contained in the attached materials and may also be viewed online at:
https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx

Please send your Agency's response to this Notice to:

Leanne Mueller, Senior Planner
Department of Community Development
Planning and Environmental Review Division
827 7th Street, Room 220, Sacramento, CA 95814
or via e-mail at: CEQA@saccounty.net

Your response should include the name of a contact person in your agency.

Two scoping meetings will be conducted in associated with this project; one will be tailored for the general public and one will be tailored for other agencies.

- The public meeting will take place at 6 PM on June 27, 2023; the zoom link is here: https://saccounty-net.zoomgov.com/j/1607749221?pwd=OURXb0NiT2lKN2Z4YW5IaHdmZVkvUT09
- The agency meeting will take place at 10 AM on June 27, 2023; the zoom link is here: https://saccounty-net.zoomgov.com/j/1616308719?pwd=SWN3a1IwT3NibWc1YUF6eGU3TXo1UT09

PROJECT TITLE

SACRAMENTO COUNTY REGIONAL HOUSING NEEDS ALLOCATION (RHNA) REZONE PROJECT

CONTROL NUMBER

PLNP2020-00042

PROJECT BACKGROUND

California Government Code Sections 65583 and 65583.2 require cities and counties to provide a parcel-specific inventory of appropriately zoned, available and suitable sites to provide housing opportunities for all income levels. The Regional Housing Needs Allocation (RHNA) for the County's 2021-2029 Housing Element includes 21,272 units, of which 7,158 units are lower-income extremely low income, very low income, and low income housing units (referred to collectively as lower-income units). While the County's 2021-2029 Housing Element demonstrates that the County has sufficient residential capacity to accommodate its RHNA for moderate and above moderate income housing units, there is a current shortfall of 142 acres to accommodate 2,884 lower-income units.

PROJECT DESCRIPTION AND LOCATION

To meet the RHNA for the County's 2021-2029 Housing Element, the County is required to rezone sufficient sites at 30 dwelling units per acre or greater for 2,884 lower income units for those with incomes ranging from $0 to $69,050 annually. To meet the RHNA requirements and provide a buffer to accommodate for the "no net loss" provisions of State law for residential units, the County would rezone 165 acres (142 acres and approximately a 15 percent buffer) for lower income units. In addition, the project includes parcels that would be rezoned to provide for moderate inventory opportunity sites. Fourteen parcels totaling 20.88-acres are proposed for rezoning to either the RD-10 or RD-15 designation to provide 211 units.

Plate 1 shows proposed rezone sites.

The Zoning Code would also be amended to ensure compliance with the provisions of Government Code Section 65583.2, in particular, for by-right development and default densities for lower income units by adding language to Chapter 2 (Zoning Districts), Chapter 3 (Use Regulations), and Chapter 5 (Development Standards). These amendments will ensure the Zoning Code allows developments in which 20 percent or more of the units are deed-restricted affordable to lower income households are allowed by-right on vacant sites, even if development exceeds 150 units, and default densities of <u>at least</u> 30 dwelling units per acre for lower income units are in place. Proposed changes to the County's Zoning Code are shown in Table 1 and Table 2.

Proposed changes to *Table 2.4 Table of Residential Zoning Districts of the Zoning Code*, as shown in Table 1, would remove the maximum permitted density for multiple family residential development. Program A1 of the 2021-2029 Housing Element provides a minimum density of 20 units per acre and a maximum density of at least 30 units per acre. Removal of the maximum density allows for additional housing density in accordance with State law, while still meeting the minimum requirements.

Table 1. Proposed Revisions to Table 2.4 Table of Residential Zoning Districts

Zoning District	Zoning District Abbreviation	Permitted Development
Multiple Family Residential 20	RD-20	Same as RD-15 except allowing a ~~maximum~~ density of 20 dwelling units.
Multiple Family Residential 25	RD-25	Same as RD-15 except allowing a ~~maximum~~ density of 25 dwelling units.
Multiple Family Residential 30	RD-30	Same as RD-15 except allowing a ~~maximum~~ density of 30 dwelling units.
Multiple Family Residential 40	RD-40	Same as RD-15 except allowing a ~~maximum~~ density of 40 dwelling units.

Note: For Densities and provisions to exceed densities refer to Section 5.2.3

Proposed revisions to Zoning Code *Table 5.8.A Lot Standards-Multifamily Residential*, shown in Table 2, include addition of a footnote to refer to Section 3.5.1 of the County's Zoning Code for the most recent information regarding additional development allowances for lower-income multifamily development, such as, provision for by-right development and density bonus provisions.

Additionally, Section 3.5.1.F of the Zoning Code would be updated to clarify the maximum densities listed in Section 3.5.1 B-E (Residential Use Standards) of the Zoning Code may be increased pursuant to Section 5.2.3. (Density Bonuses and Intensity Increases) further clarifying required densities and densities for lower-income projects. Proposed changes are shown below:

Table 2. Proposed Revisions to Table 5.8.A for Multifamily Residential Lot Standards

Standard	RD-10	RD-15	RD-20	RD-25	RD-30	RD-40	All other Zones where Permitted
Allowed Density [1]							
Maximum Density (dwelling units/net acre)[1]	10	15	20	25	30	40	[2]

[1] New lots created with Parcel Maps shall use the density calculation methodology of Section 7.1.13
[2] See Section 3.5.1.B through 3.5.1.J for allowed densities for residential product types in all other zones, where allowed

3.5.1.F Density Increases

The maximum densities listed in 3.5.1 B-E may be increased pursuant to Section 5.2.3 (Density Bonuses and Intensity Increases)

Parcels located in Special Planning Areas (SPA) and other comprehensive planning efforts are also identified as candidate rezone sites. Some SPAs or planning effort provide a maximum density or specific density ranges that are not consistent with the Zoning Code Update or

rezone effort. The following SPAs would include proposed rezone sites: Fair Oaks Fair Oaks Boulevard Corridor Plan Main Street District:

- Old Florin Town
- Downtown Rio Linda SPA
- North Watt SPA
- Greenback Lane SPA
- North Highland Town Center
- Folsom Boulevard SPA
- Victory Avenue SPA
- Stockton Boulevard SPA

Amendments to ensure consistency with the proposed Zoning Code amendments and State requirements for density (30 units per acre) allowing sites in SPAs to be classified as available affordable housing sites are proposed.

The project would require amendments to the County's General Plan to ensure consistency between the General Plan land use designations and Zoning Districts. Parcels with proposed land use amendments are shown in Plate 1. The project would include the following General Plan amendments:

1. Amend the General Plan designation of 46 parcels totaling 207 acres from Low Density Residential to Medium Density Residential for consistency with the proposed RD-30 Zoning District.
2. Amend the General Plan designation of five parcels totaling 34.4 acres from Low Density Residential to High Density Residential for consistency with proposed RD-40 Zoning District.
3. Amend the General Plan designation of five parcels totaling 21.87 acres from Low Density Residential to High Density Residential for consistency with proposed RD-40 Zoning District.
4. Amend the General Plan designation of two parcels totaling 11 acres from Medium Density Residential to High Density Residential for consistency with proposed RD-40 Zoning District.
5. Amend the General Plan designation of ten parcels totaling 16.59 acres from Low Density Residential to Medium Density Residential for consistency with the proposed RD-15 Zoning District.
6. Amend the General Plan designation of one parcel totaling 2.9 –acres from Intensive Industrial to Medium Density Residential for consistency with the proposed RD-30 Zoning District.
7. Amend the General Plan designation of one parcel totaling 5.28 –acres from Intensive Industrial to High Density Residential for consistency with the proposed RD-40 Zoning District.
8. Further an additional three parcels totaling 12.38 acres will have their current General Plan designations changed from Agricultural –Residential (AG-Res) to Medium Density Residential (MDR).
9. Land Use Element Program LU-5 will be amended to read: All residential projects involving three or more units, shall not have an average overall density of less than

75% of the zoned maximums or, if subject to a density range, less than the minimum listed density. The appropriate hearing body may approve a lesser density if they can make a finding that, unless physical or environmental constraints make achieving the minimum required densities impractical.

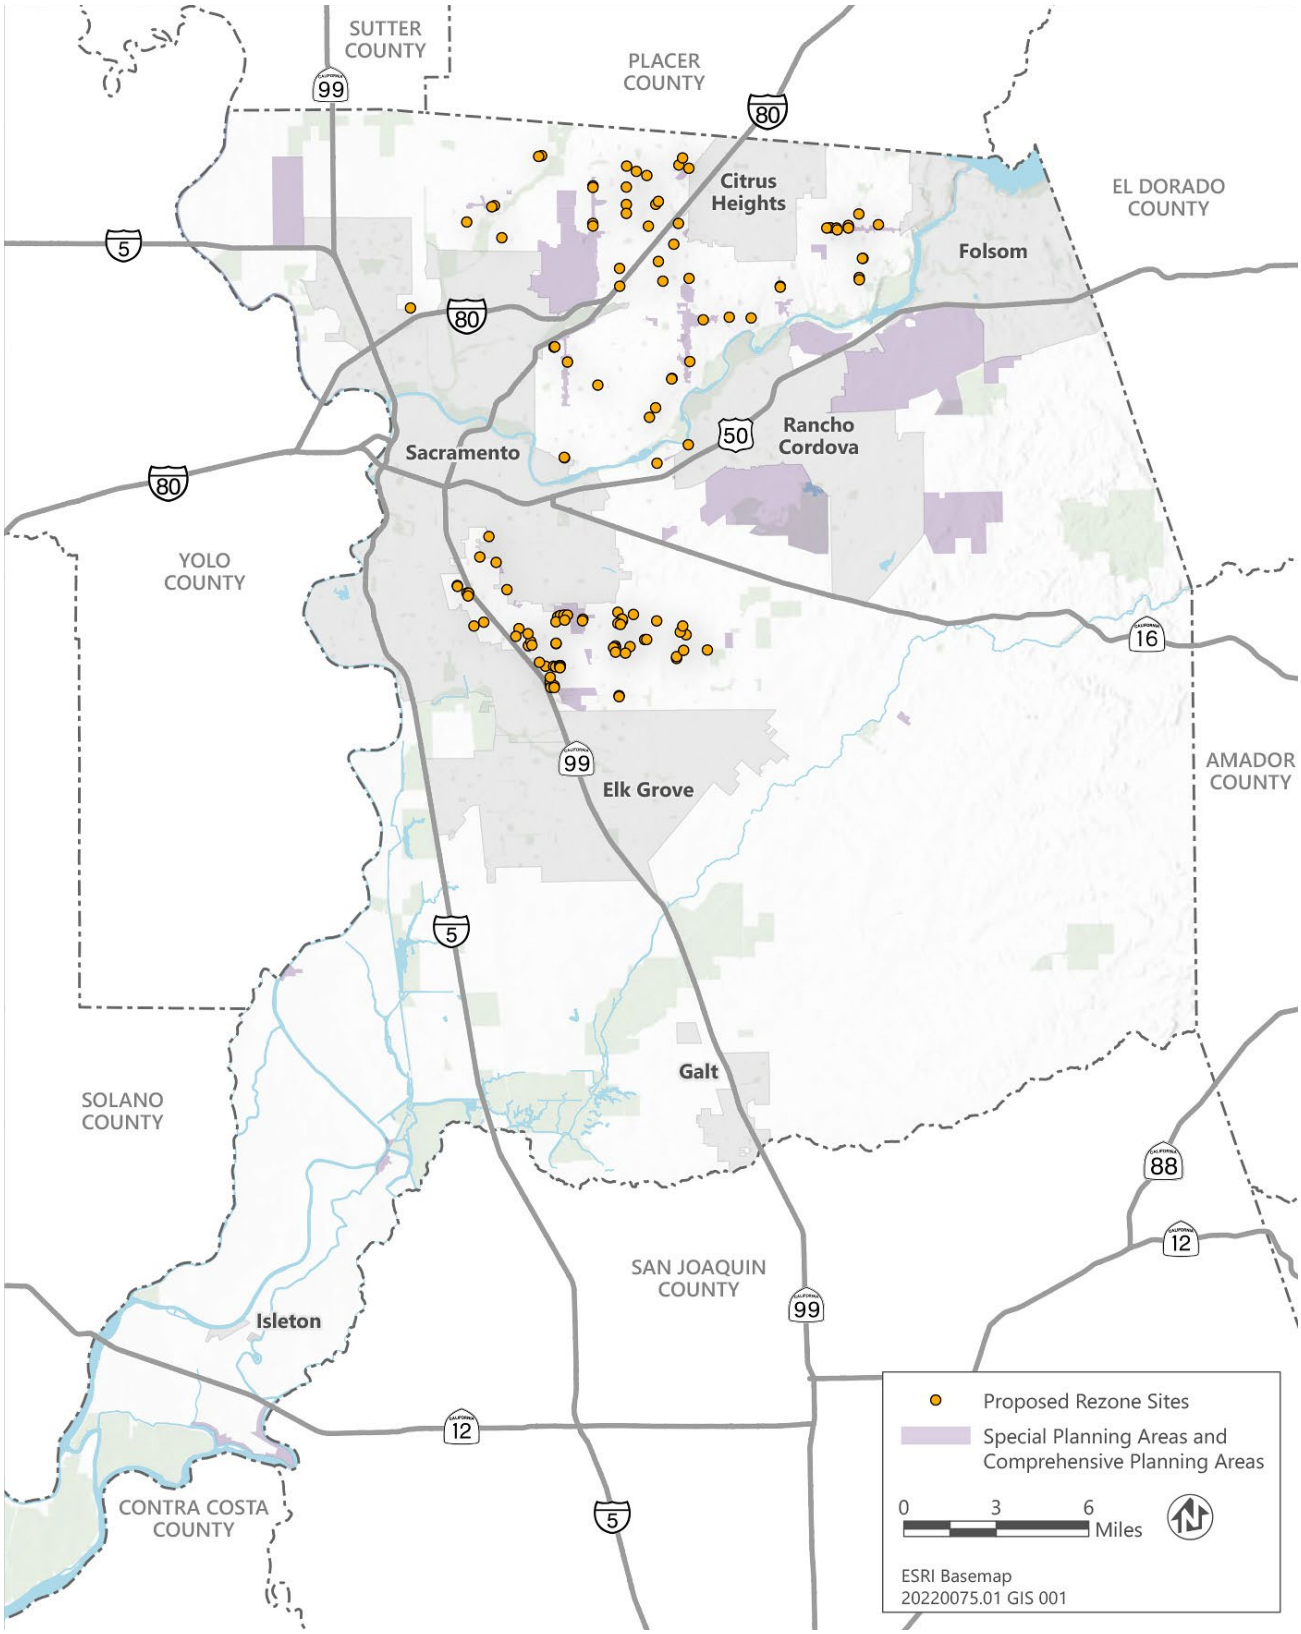
PROJECT OBJECTIVES:

The primary objectives for the project are outlined below:

1. Compliance with California Government Code Sections 65583 and 6553.2.
2. Implement Housing Action Plan Program A1 to increase the vacant land inventory and facilitate development.
3. Provide zoning and land use designations for at least 3,300 lower-income housing units to meet the RHNA and a buffer to accommodate the "no net loss" provision requirements.
4. Provide zoning and land use designations for moderate income housing units.

ENVIRONMENTAL/LAND USE SETTING:

The project covers all of Sacramento County, which lies within the Central Valley of California. The County includes 14 community areas within the unincorporated County and seven incorporated cities. Most of the communities are located in the urbanized core in the western, northwestern, and northern portions of the County. The southwestern, eastern, and southern portions of the County include more agricultural and rural residential development. The County includes SPAs and comprehensive planning areas for established areas to allow use, regulations, and standards that would not be allowed under the countywide regulations. The proposed revisions to land use designations and site zoning are located throughout the County and within several established SPAs and comprehensive planning areas. Plate 1 shows the County limits, SPA and comprehensive planning areas boundaries, and parcels proposed for land use and zoning changes.



PROBABLE ENVIRONMENTAL EFFECTS/SEIR FOCUS:

The analysis in the SEIR will describe conditions as compared to the General Plan EIR, describe the legal and regulatory framework relevant to the project, describe standards of significance to be used in the analysis, and describe analysis methodologies. The SEIR will evaluate whether implementing the project would potentially result in one or more new or more severe significant environmental effects compared to the impacts identified in the General Plan EIR. The following issue areas will be addressed in the SEIR: transportation, air quality, climate change, energy, land use, noise and vibration, tribal cultural resources, population and housing, public services/recreation, utilities, and wildfire. Because the project involves changes to existing General Plan designations and zoning for sites that are currently designated and zoned for development, original General Plan EIR sections that evaluated the potential for ground disturbance to result in physical adverse effects to natural resources would not alter the EIR's evaluation of impacts associated with ground disturbance. The County anticipates that the project would not alter the analysis and conclusions of the General Plan EIR on the following environmental issue areas: agriculture and forestry resources, aesthetics, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, mineral resources, and. These issue areas will be discussed in a "Effects Adequately Addressed in the General Plan EIR" section.

INTENDED USES OF THE SEIR:

The Sacramento County Planning Commission and the Board of Supervisors will use the information contained in the SEIR to evaluate the project and render a decision to approve or deny the requested land use and zoning changes.

COMMENTS TO REQUEST FOR REVIEW FOR THE NOTICE OF PREPARATION FOR THE DRAFT ENVIRONMENTAL IMPACT REPORT, SACRAMENTO COUNTY REGIONAL HOUSING NEEDS ALLOCATION (RHNA) REZONE PROJECT, SCH#2023060304, SACRAMENTO COUNTY

Pursuant to the State Clearinghouse's 9 June 2023 request, the Central Valley Regional Water Quality Control Board (Central Valley Water Board) has reviewed the *Request for Review for the Notice of Preparation for the Draft Environmental Impact Report* for the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project, located in Sacramento County.

Our agency is delegated with the responsibility of protecting the quality of surface and groundwaters of the state; therefore, our comments will address concerns surrounding those issues.

I. Regulatory Setting

Basin Plan

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38.

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically as required, using Basin Plan amendments. Once the Central Valley Water Board has

adopted a Basin Plan amendment in noticed public hearings, it must be approved by the State Water Resources Control Board (State Water Board), Office of Administrative Law (OAL) and in some cases, the United States Environmental Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues. For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website:
http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/

Antidegradation Considerations

All wastewater discharges must comply with the Antidegradation Policy (State Water Board Resolution 68-16) and the Antidegradation Implementation Policy contained in the Basin Plan. The Antidegradation Implementation Policy is available on page 74 at:
https://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/sacsjr_201805.pdf

In part it states:

Any discharge of waste to high quality waters must apply best practicable treatment or control not only to prevent a condition of pollution or nuisance from occurring, but also to maintain the highest water quality possible consistent with the maximum benefit to the people of the State.

This information must be presented as an analysis of the impacts and potential impacts of the discharge on water quality, as measured by background concentrations and applicable water quality objectives.

The antidegradation analysis is a mandatory element in the National Pollutant Discharge Elimination System and land discharge Waste Discharge Requirements (WDRs) permitting processes. The environmental review document should evaluate potential impacts to both surface and groundwater quality.

II. Permitting Requirements

Construction Storm Water General Permit

Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit), Construction General Permit Order No. 2009-0009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). For more information on the Construction General Permit, visit the

State Water Resources Control Board website at:
http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

Phase I and II Municipal Separate Storm Sewer System (MS4) Permits[1]

The Phase I and II MS4 permits require the Permittees reduce pollutants and runoff flows from new development and redevelopment using Best Management Practices (BMPs) to the maximum extent practicable (MEP). MS4 Permittees have their own development standards, also known as Low Impact Development (LID)/post-construction standards that include a hydromodification component. The MS4 permits also require specific design concepts for LID/post-construction BMPs in the early stages of a project during the entitlement and CEQA process and the development plan review process.

For more information on which Phase I MS4 Permit this project applies to, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/municipal_permits/

For more information on the Phase II MS4 permit and who it applies to, visit the State Water Resources Control Board at:
http://www.waterboards.ca.gov/water_issues/programs/stormwater/phase_ii_municipal.shtml

Clean Water Act Section 404 Permit

If the project will involve the discharge of dredged or fill material in navigable waters or wetlands, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACE). If a Section 404 permit is required by the USACE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water drainage realignment, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements. If you have any questions regarding the Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACE at (916) 557-5250.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACE permit (e.g., Non-Reporting Nationwide Permit, Nationwide Permit, Letter of Permission, Individual Permit, Regional General Permit, Programmatic General Permit), or any other federal permit (e.g., Section 10 of the Rivers and Harbors Act or Section 9 from the United States Coast Guard), is required for this project due to the disturbance of waters of the United States (such as streams and

[1] Municipal Permits = The Phase I Municipal Separate Storm Water System (MS4) Permit covers medium sized Municipalities (serving between 100,000 and 250,000 people) and large sized municipalities (serving over 250,000 people). The Phase II MS4 provides coverage for small municipalities, including non-traditional Small MS4s, which include military bases, public campuses, prisons and hospitals.

wetlands), then a Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. There are no waivers for 401 Water Quality Certifications. For more information on the Water Quality Certification, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/

Waste Discharge Requirements – Discharges to Waters of the State

If USACE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the proposed project area, the proposed project may require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation. For more information on the Waste Discharges to Surface Water NPDES Program and WDR processes, visit the Central Valley Water Board website at:https://www.waterboards.ca.gov/centralvalley/water_issues/waste_to_surface_water/

Projects involving excavation or fill activities impacting less than 0.2 acre or 400 linear feet of non-jurisdictional waters of the state and projects involving dredging activities impacting less than 50 cubic yards of non-jurisdictional waters of the state may be eligible for coverage under the State Water Resources Control Board Water Quality Order No. 2004-0004-DWQ (General Order 2004-0004). For more information on the General Order 2004-0004, visit the State Water Resources Control Board website at: https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2004/wqo/wqo2004-0004.pdf

Dewatering Permit

If the proposed project includes construction or groundwater dewatering to be discharged to land, the proponent may apply for coverage under State Water Board General Water Quality Order (Low Threat General Order) 2003-0003 or the Central Valley Water Board's Waiver of Report of Waste Discharge and Waste Discharge Requirements (Low Threat Waiver) R5-2018-0085. Small temporary construction dewatering projects are projects that discharge groundwater to land from excavation activities or dewatering of underground utility vaults. Dischargers seeking coverage under the General Order or Waiver must file a Notice of Intent with the Central Valley Water Board prior to beginning discharge.

For more information regarding the Low Threat General Order and the application process, visit the Central Valley Water Board website at: http://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2003/wqo/wqo2003-0003.pdf

For more information regarding the Low Threat Waiver and the application process, visit the Central Valley Water Board website at:

https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/waivers/r5-2018-0085.pdf

Limited Threat General NPDES Permit

If the proposed project includes construction dewatering and it is necessary to discharge the groundwater to waters of the United States, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. Dewatering discharges are typically considered a low or limited threat to water quality and may be covered under the General Order for *Limited Threat Discharges to Surface Water* (Limited Threat General Order). A complete Notice of Intent must be submitted to the Central Valley Water Board to obtain coverage under the Limited Threat General Order. For more information regarding the Limited Threat General Order and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2016-0076-01.pdf

NPDES Permit

If the proposed project discharges waste that could affect the quality of surface waters of the State, other than into a community sewer system, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. A complete Report of Waste Discharge must be submitted with the Central Valley Water Board to obtain a NPDES Permit. For more information regarding the NPDES Permit and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/help/permit/

If you have questions regarding these comments, please contact me at (916) 464-4684 or Peter.Minkel2@waterboards.ca.gov.

Re: 2023060304, Sacramento County Regional Housing Needs Allocation (RNHA) Rezone Project (PLNP2020-00042), Sacramento County

Dear Ms. Mueller:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

RECEIVED
JUN 15 2023
County of Sacramento
Department of Community Development
Planning and Environmental Review Division

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

- **a.** A brief description of the project.
- **b.** The lead agency contact information.
- **c.** Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
- **d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

- **a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

- **a.** Alternatives to the project.
- **b.** Recommended mitigation measures.
- **c.** Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

- **a.** Type of environmental review necessary.
- **b.** Significance of the tribal cultural resources.
- **c.** Significance of the project's impacts on tribal cultural resources.
- **d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

- **a.** Whether the proposed project has a significant impact on an identified tribal cultural resource.
- **b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (https://ohp.parks.ca.gov/?page_id=30331) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
    b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
   a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
   b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
   a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
   b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
   c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Pricilla.Torres-Fuentes@nahc.ca.gov

Sincerely,

Pricilla Torres-Fuentes

PLANNING AND ENVIRONMENTAL REVIEW DIVISION
NOTICE OF PREPARATION

DECEMBER 22, 2023

TO: **ALL INTERESTED PARTIES**

SUBJECT: **REVISED NOTICE OF PREPARATION OF A DRAFT SUBSEQUENT ENVIRONMENTAL IMPACT REPORT FOR THE SACRAMENTO COUNTY REGIONAL HOUSING NEEDS ALLOCATION (RHNA) REZONE PROJECT (SCH# 2023060304; COUNTY CONTROL NO. PLNP2020-00042)**

Sacramento County (County) will be the Lead Agency under the California Environmental Quality Act (CEQA) for preparation of a Subsequent Environmental Impact Report (SEIR), consistent with Section 15162 of the State CEQA Guidelines, for a project known as the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Project). The SEIR will address new information or changes not included in the previously certified environmental documents for which candidate rezone sites are located in. This Notice of Preparation (NOP) has been sent to responsible and trustee agencies and involved federal agencies pursuant to Section 15082 of the CEQA Guidelines. Agencies should comment on the scope and content of the environmental information that is germane to the agencies' statutory responsibilities in connection with the proposed project. Due to the time limits mandated by State law, your response must be sent at the earliest possible date, but not later than 30 days after receipt of this notice (by January 22, 2024).

An NOP for the Project was issued on June 12, 2023. Given Project refinements, specifically the adjustment in acreages proposed for rezone as described in detail below, there is a need to reissue the NOP. As such, this NOP supersedes the prior NOP released on June 12, 2023.

The Project description, location, and the probable environmental effects are contained in the attached materials and may also be viewed online at:

https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx

Please send your agency's response to this notice to:

Jessie Shen, Senior Planner
Department of Community Development
Planning and Environmental Review Division
827 7th Street, Room 225, Sacramento, CA 95814
or via e-mail at: CEQA@saccounty.net

Your response should include the name of a contact person in your agency.

A scoping meeting tailored to agencies for the Project will be held on Thursday, January 4, 2024 from 10:00 AM to 12:00 PM (noon) virtually via Zoom at:

https://saccounty-net.zoomgov.com/j/1615249340?pwd=K3pLbE1LOFV0dTRsM0c0c2tGbUZTQT09

Agencies with specific questions about the Project should contact Jessie Shen, Senior Planner, at 916.875.3711 or shenj@saccounty.gov for further information.

PROJECT TITLE: **SACRAMENTO COUNTY REGIONAL HOUSING NEEDS ALLOCATION (RHNA) REZONE PROJECT**

CONTROL NUMBER: **PLNP2020-00042**

PROJECT BACKGROUND:

California Government Code Sections 65583 and 65583.2 require cities and counties to provide a parcel-specific inventory of appropriately-zoned, available, and suitable sites to provide opportunities for housing at all income levels. The RHNA identified in the *Sacramento County Housing Element of 2021-2029* (Housing Element) for unincorporated Sacramento County is 21,272 new housing units. Table 1 identifies the RHNA allocation of the new housing units and projected supply by income category (i.e., income category the units are required to be affordable for).

Table 1. 2021-2029 Regional Housing Needs Allocation and Projected Supply for Unincorporated Sacramento County by Income Category

Income Category (Income Level)	RHNA	Projected Supply[1]	Oversupply / Shortfall
Lower Income ($0 - $69,050)[2]	7,158 units	4,274 units	-2,884 units
Moderate Income ($69,051 - $103,550)	4,186 units	7,658 units	+3,472 units
Above Moderate Income ($103,550+)	9,928 units	12,121 units	+2,189 units
Total	*21,272 units*	*23,653 units*	

Notes: [1] Projected supply includes accessory dwelling units (ADUs).

[2] The lower income category includes Extremely Low Income ($0 - $25,900), Very Low Income ($25,901 - $43,150), and Low Income ($43,151 - $69,050) levels.

Source: Sacramento County Housing Element of 2021-2029.

As summarized in Table 1, the Housing Element demonstrates that the County has sufficient residential capacity to accommodate its RHNA for moderate and above moderate income category units, but has a shortfall of sites to accommodate the lower income category units. The County has appropriately-zoned sites to accommodate 4,274 lower income category units, compared to a RHNA of 7,158 lower income category units. Therefore, there is a shortfall of 2,884 lower income category units. Program A1 of the Housing Element identifies the Countywide Rezone Program (Project) as the means to accomplish accommodating the shortfall of lower income category units.

PROJECT DESCRIPTION AND LOCATION:

As described in Program A1 of the Housing Element, to meet the shortfall identified for the lower income category (2,884 units), the County is required to rezone sufficient sites to allow multifamily residential uses by-right, at 30 dwelling units per acre or greater. The County intends to rezone additional sites beyond those needed to meet the RHNA obligation for the lower income category in order to provide a buffer of lower-income sites in the event those sites are lost from the inventory (i.e., lower-income sites

are developed units for moderate or above moderate income categories). Additionally, the County also intends to rezone sites to increase the buffer for the moderate income category.

The Project entails the rezone of 83 candidate rezone sites, totaling ±248.33 acres, resulting in a potential development capacity (realistic capacity) of ±4,081 lower income category units and ±156 moderate income category units. The addition of ±4,081 lower income category units exceeds the County's unmet RHNA of 2,884 lower income category units by 1,197 units. Plate NOP-1 shows the locations of the candidate rezone sites.

Table 2 provides a summary of the total acreage and net increase in residential units resulting from the Project by community planning area. The net increase in residential units is the difference between a candidate rezone site's existing zoning designation maximum density permitted and the proposed zoning designation maximum density permitted. For example, a 1-acre site currently zoned RD-20 (maximum density of 20 units per acre) with a proposed zoning of RD-30 (maximum density of 30 units per acre) nets 10 additional units with the Project.

Table 2. Summary of Rezone Acreage and Associated Net Increase in Units by Community Planning Area

Community Planning Area	Rezone Acreage		Net Increase in Units[1]	
	Lower Income	Moderate Income	Lower Income	Moderate Income
Antelope	35.43	0.00	701	0
Arden Arcade	1.98	0.00	20	0
Carmichael/Old Foothill Farms	10.10	6.52	209	68
Cordova	13.90	0.00	278	0
Fair Oaks	2.89	0.00	51	0
North Highlands	41.55	0.97	531	0[2]
Orangevale	5.71	2.22	144	19
Rio Linda/Elverta	18.77	0.00	321	0
South Sacramento	91.97	11.51	1,747	115
Vineyard	4.81	0.00	141	0
Subtotal	*227.11*	*21.22*	*4,143*	*202*
Total	*±248.33 acres*		*±4,345 units*	

Notes: [1] The net increase in units is the difference between a candidate rezone site's existing zoning designation maximum density permitted and the proposed zoning designation maximum density permitted.

[2] There is no net increase in units as the maximum density (from existing to proposed zoning) is unchanged; however, minimum density with the proposed zoning would increase compared to existing zoning.

As shown in Table 2, a total of ±248.33 acres within 10 community planning areas would be rezoned with ±227.11 acres accommodating the lower income category and ±21.22 acres accommodating the moderate income category. The Project would result in a net increase of 4,345 units, of which ±4,143 units are lower income and ±202 units are moderate income.

The Project does not propose to construct new residential or other development on the ±248.33 acres proposed to be rezoned; rather, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. Of the total ±248.33 acres proposed to be rezoned, ±161.90 acres (65 percent) currently allows for (either by-right or with a discretionary entitlement) multifamily residential development. The Project would increase residential density on these sites and does not change the development footprint. The horizon year for the Project is 2029.

Analysis of the Project tiers from the *Sacramento County General Plan of 2005-2030* (General Plan) and three distinct area plans (Fair Oaks Boulevard Corridor Plan, North Watt Avenue Corridor Plan, and Old Florin Town SPA). Table 3 summarizes the Project's resultant net increase in residential units for each plan.

Table 3. Summary of Project's Net Increase in Residential Units By Land Use Plan

Land Use Plan	Project's Net Increase in Residential Units
General Plan	±3,829 units
Fair Oaks Boulevard Corridor Plan	±12 units
North Watt Avenue Corridor Plan	±230 units
Old Florin Town SPA	±274 units
Total	*±4,345 units*

In addition to the required Community Plan Amendment and corresponding Rezone for the Project, the Project would require amendments to the County's General Plan to ensure consistency between the General Plan land use designations and proposed zoning districts. Of the total ±248.33 acres proposed to be rezoned with the Project, ±115.23 acres would be amended to the Medium Density Residential (MDR) land use designation and ±71.72 acres would be amended to the High Density Residential (HDR) land use designation. The remaining ±61.38 acres would not require a General Plan land use designation amendment.

Additionally, the Sacramento County Zoning Code (Zoning Code) would be amended to ensure compliance with State housing law. Distinct area plans (i.e., special planning areas [SPAs], Corridor Plan areas, and neighborhood preservation areas [NPAs]), which are an extension of the Zoning Code, that contain candidate rezone sites would also be amended to ensure consistency with State requirements for density and classifying sites within these distinct area plans as available affordable housing sites.

PROJECT OBJECTIVES:

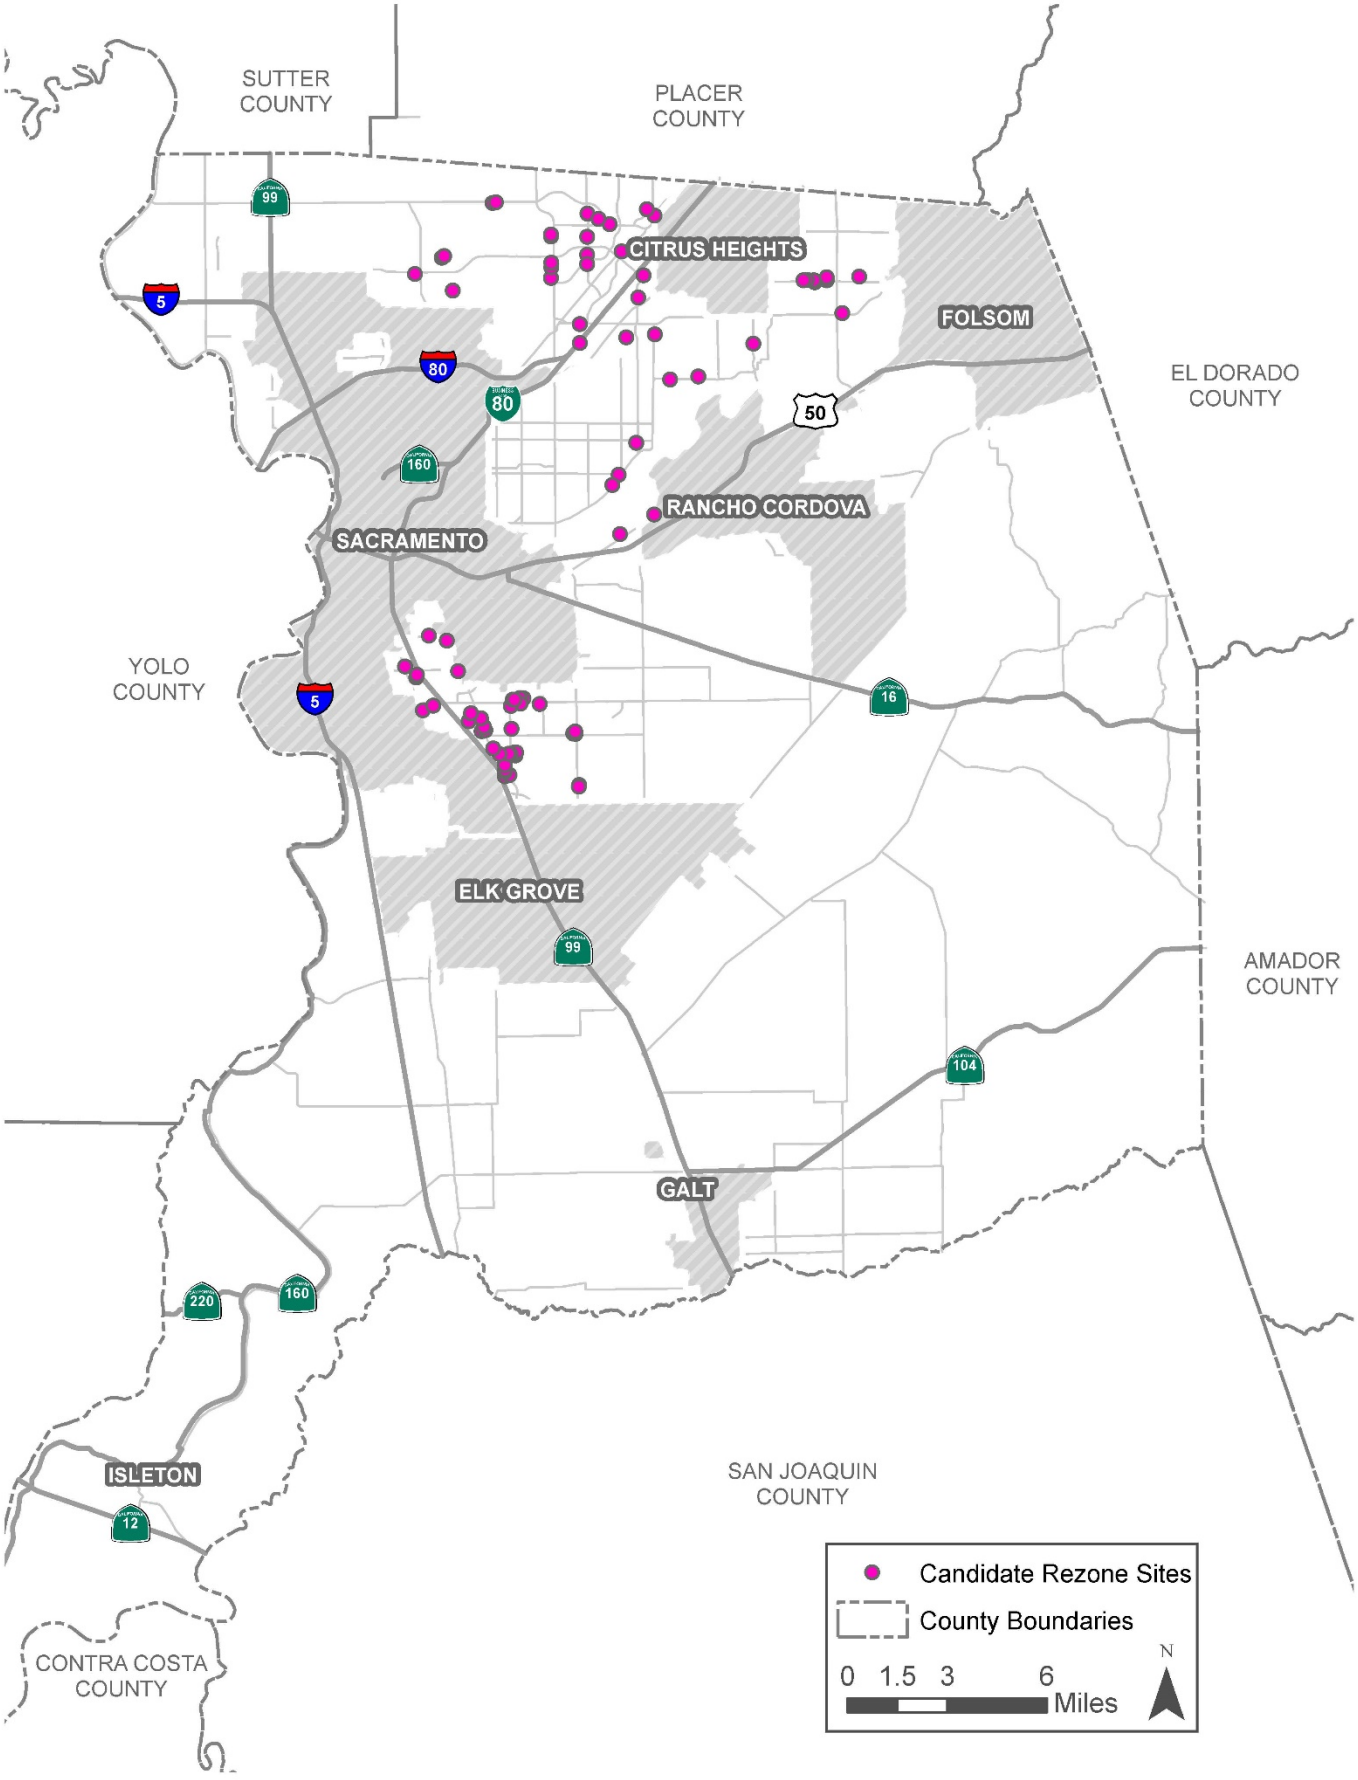
The purpose of the Project is to address the housing needs of the County and to meet the requirements of State law. The objectives of the Project are to:

- Comply with California Government Code Sections 65583 and 65583.2;
- Implement Program A1 to increase the vacant land inventory and facilitate development;
- Provide zoning and land use designations for at least 3,300 lower-income housing units to meet the RHNA and a buffer to accommodate the "no net loss" provision requirements; and
- Provide zoning and land use designations for moderate income housing units.

ENVIRONMENTAL/LAND USE SETTING:

The Project is located in Sacramento County, which lies within the Central Valley of California. The County includes 7 incorporated cities, and the remaining unincorporated portions of the County is divided into 14 community planning areas. Most of these community planning areas are in the urbanized core in the western, northwestern or northern portion of the County, where the majority of the candidate rezone sites are proposed (Plate NOP-1). The southwestern, eastern and southern portions of the County are more agricultural and rural residential. Many portions of the developed County are within the historic floodplains of the three major rivers (Sacramento, American, and Cosumnes Rivers) and are protected by a system of levees.

PROBABLE ENVIRONMENTAL EFFECTS/SEIR FOCUS:



The analysis in the SEIR will describe conditions as compared to the *Sacramento County General Plan Update Final Environmental Impact Report* (General Plan FEIR), *Fair Oaks Boulevard Corridor Plan and Roadway Project Final Environmental Impact Report* (Fair Oaks Boulevard Corridor Plan FEIR), *North Watt Avenue Corridor Plan Final Environmental Impact Report* (North Watt Avenue Corridor Plan FEIR), and *Old Florin Town Special Planning Area Final Environmental Impact Report* (Old Florin Town SPA FEIR) (collectively referred to as prior FEIRs), describe the legal and regulatory framework relevant to the Project, describe standards of significance to be used in the analysis, and describe analysis methodologies. The SEIR will evaluate whether implementing the Project would potentially result in one or more new or more severe significant environmental effects compared to the impacts identified in the prior FEIRs. The following issue areas will be addressed in the SEIR: transportation, air quality, climate change, energy, land use, aesthetics, noise and vibration, tribal cultural resources, population and housing, public services/recreation, utilities, and wildfire.

Because the Project involves changes to existing General Plan designations and zoning for sites that are currently designated and zoned for development, the prior FEIRs sections that evaluated the potential for ground disturbance to result in physical adverse effects to natural resources would not alter the prior FEIR's evaluation of impacts associated with ground disturbance. The County anticipates that the Project would not alter the analysis and conclusions of the prior FEIRs on the following environmental issue areas: agriculture and forestry resources, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, and mineral resources. These issue areas will be discussed in an "Effects Adequately Addressed in the Prior FEIRs" section.

INTENDED USES OF THE SEIR:

The Sacramento County Planning Commission and the Board of Supervisors will use the information contained in the SEIR to evaluate the Project and render a decision to approve or deny the requested land use and zoning changes.

COUNTY OF SACRAMENTO
DEPARTMENT OF COMMUNITY DEVELOPMENT
PLANNING AND ENVIRONMENTAL REVIEW DIVISION
AGENCY SCOPING MEETING

DECEMBER 22, 2023

TO: **ALL INTERESTED PARTIES**

SUBJECT: **AGENCY SCOPING MEETING FOR THE DRAFT SUBSEQUENT ENVIRONMENTAL IMPACT REPORT FOR THE SACRAMENTO COUNTY REGIONAL HOUSING NEEDS ALLOCATION (RHNA) REZONE PROJECT (SCH# 2023060304; COUNTY CONTROL NO. PLNP2020-00042)**

Sacramento County (County) will be the Lead Agency under the California Environmental Quality Act (CEQA) for preparation of a Subsequent Environmental Impact Report (SEIR), consistent with Section 15162 of the State CEQA Guidelines, for a project known as the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Project). The SEIR will address new information or changes not included in the previously certified environmental documents for which candidate rezone sites are located in.

The Project description, location, and the probable environmental effects are contained in the attached materials and may also be viewed online at:

https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx

The Notice of Preparation (NOP) was sent to responsible and trustee agencies and involved federal agencies, pursuant to Section 15082 of the CEQA Guidelines, on December 22, 2023. The 30-day public comment period ends on January 22, 2024. Written comments can be submitted via mail (Attn: Jessie Shen, Senior Planner; Department of Community Development, Planning and Environmental Review Division; 827 7th Street, Room 225, Sacramento, CA 95814), electronic mail (CEQA@saccounty.net), or oral comment during the scoping meeting (information follows). Agencies should comment on the scope and content of the environmental information that is germane to the agencies' statutory responsibilities in connection with the proposed project.

A scoping meeting tailored to agencies for the Project will be held on Thursday, January 4, 2024 from 10:00 AM to 12:00 PM (noon) virtually via Zoom. Interested parties can join the meeting at:

https://saccounty-net.zoomgov.com/j/1615249340?pwd=K3pLbE1LOFV0dTRsM0c0c2tGbUZTQT09

Agencies with specific questions about the Project should contact Jessie Shen, Senior Planner, at 916.875.3711 or shenj@saccounty.gov for further information.

APPENDIX INTRO-2: SOUTH SACRAMENTO HABITAT CONSERVATION PLAN PROJECT SPECIFIC AVOIDANCE AND MINIMIZATION MEASURES

Project Name:

SSHCP Project Specific Avoidance and Minimization Measures

Based upon review of the SSHCP Permit Application, the Project must be constructed in compliance with the Avoidance and Minimization Measures (AMMs) listed below. The applicant will be responsible for reporting compliance with AMMs as applicable. Please submit all required reporting documents to SSHCP@saccounty.net and reference the project Control Number in the correspondence.

Instructions: For each Condition and AMM outlined below, indicate how the Project has or will comply with each provision in the 'Project Compliance' box. If a condition is not applicable to your project, indicate such in the 'Project Compliance' box.

Condition 1. Avoid and Minimize Urban Development Impacts to Watershed Hydrology and Water Quality	
Avoidance and Minimization Measure	**Project Compliance**
LID-1 (Stormwater Quality): When the size of a project exceeds the thresholds established by the State Water Resources Control Board (SWRCB) (see the most recent Stormwater Quality Design Manual for the Sacramento and South Placer Regions, or future SWRCB-approved design manuals applicable to the Plan Area), incorporate stormwater management into site design to satisfy the requirements outlined in the most recent Stormwater Quality Design Manual for the Sacramento and South Placer Regions. Stormwater management may include groundwater recharge (LID-2) and natural site features (LID-3).	
LID-2 (Groundwater Recharge): When siting SSHCP Preserves containing Riparian, Open Water, or Freshwater Marsh SSHCP land cover types, the Implementing Entity will prioritize locations that are suitable for groundwater recharge.	
LID-3 (Natural Site Features): Incorporate preservation of a site's natural aquatic features (such as creeks and streams) into project design to retain natural hydrologic patterns and to retain habitat that might be used by Covered Species.	
Condition 2. Avoid and Minimize Urban Development Direct and Indirect Impacts to Existing Preserves and SSHCP Preserves AMMs associated with Condition 2 must be applied to all UDA Covered Activities that border an existing Preserve or planned SSHCP Preserve1.	
Avoidance and Minimization Measure	**Project Compliance**
EDGE-1 (Compatible Land Uses): To the maximum extent practicable, development project Covered Activities will locate compatible land uses (e.g., designated open space such as parks and ball fields, detention basins, and other land uses with less-intensive human activity) in areas immediately adjacent to existing or planned Preserve boundaries. The compatible land use will provide additional buffering of Preserves from potential indirect effects of adjacent urban development. The soil surfaces in a compatible land use area may be re-contoured provided that the soil restrictive layer remains undamaged and most of the soil profile above the restrictive layer remains intact. The Land Use Authority will determine when it is not practicable to locate a compatible land use adjacent to existing or planned Preserve boundaries.	

[1] Additional AMMs specific to the Cordova Hills Master Plan are described in the December 8, 2016 "on-ramp" Biological Opinion (Corps File Number SPK-2004-00116), as discussed in Section 5.2.1.2 and in Appendix K.

Project Name:

SSHCP Project Specific Avoidance and Minimization Measures

EDGE-2 (Single-Loaded Streets): To the maximum extent practicable, the design of Urban Development Covered Activities will locate single-loaded streets adjacent to existing or planned Preserve. The Land Use Authority will determine when single-loaded streets are not practicable.	
EDGE-3 (Preserve Setbacks): Urban Development Covered Activities constructed adjacent to existing or planned Preserves must establish a minimum 50-foot-wide setback outward from the boundary of any existing Preserve or planned SSHCP Preserve. This minimum 50-foot-wide setback will function as a transition between Urban Development and the Preserve, and must be managed to maintain the natural community of vegetation present in the adjacent Preserve. As much of the setback as possible should remain in the same natural habitat as the Preserve. However, as discussed in Section 5.2.5, Covered Activities in Preserve Setbacks in the UDA, where an existing or planned Preserve is adjacent to an existing roadway (e.g., collectors, arterials, thoroughfares), the 50-foot Preserve Setback will not be required, and any bicycle or pedestrian trail will be established in the road right-of-way. In addition, where a planned roadway crosses an existing or planned Preserve, no Preserve Setback will be required, and any bicycle or pedestrian trail will be established in the road right-of-way. **EDGE-3a (Setback Recreational Trails)**: Trails are best suited outside of the setback; however, certain types of recreational trails or facilities (e.g., benches, trash receptacles, shade structures, fencing) that can be constructed with minimum ground disturbance and in compliance with EDGE-7 may be allowed within a Preserve Setback, as specified in Section 5.2.5, Covered Activities in Preserve Setbacks in the UDA. Preserve Setback design must locate trails on the side nearest development, away from the Preserve boundary. Trails may be permeable or semi-permeable hiking trails or paved community trials. The maximum trail width will be 16 feet total, including 2-foot-wide shoulders. Post and cable fencing, split rail, or other open fencing will be installed adjacent to recreation trails to keep pedestrians on the trail. **EDGE-3b (Setback Firebreaks)**: If approved by the local authorities, the Preserve Setback trail may also be used as a firebreak. In instances where a trail cannot act as a firebreak, the firebreak will be located between the trail and the Preserve boundary (see Section 5.2.7). Firebreaks allowed inside the setbacks must be created by methods that will not disturb the soil's restrictive layer, such as mowing, minor scraping of surface vegetation, or shallow tilling, to comply with EDGE-7. Firebreak width within Preserve Setbacks is the minimum width needed to comply with applicable local codes. **EDGE-3c (Setback Shade Trees and Landscaping)**: To prevent potential impacts from irrigation water or from accumulation of leaf litter onto the grasslands or vernal pools of a Preserve, planting of shade trees or landscaping vegetation will be limited to the area of the Preserve Setback located between the recreation trail and the adjacent urban development (i.e., away from Preserves). Only drought-tolerant plant species will be planted. The planting pallet used for Preserve Setback landscaping will not include invasive plant species listed in the California Invasive Plant Council's (Cal-IPC) California Invasive Plant Inventory Database or listed in the Cal-IPC California Invasive Plant Watch List (see http://www.cal-ipc.org/paf/). Any shade trees planted along Preserve Setback trails will be native species that are found in California grasslands and that can survive in the Vernal Pool–Grassland border without long-term irrigation or fertilization (e.g., valley oak, black oak, blue oak, oracle oak). In general, no more than 30% of any 1,000-foot-long segment of a Preserve Setback trail will have canopy cover from tree plantings (to be consistent with maximum tree densities naturally found within native California grasslands and savanna).	

Project Name:

SSHCP Project Specific Avoidance and Minimization Measures

Drip irrigation will be allowed for a maximum of 5 years to establish shade trees or landscape vegetation between the recreation trail and adjacent urban development. The Implementing Entity has the discretion to allow irrigation to continue past 5 years if extenuating circumstances necessitate it (e.g., during a drought) and the continuance of irrigation will not affect the Preserve. Any irrigation systems located within Preserve Setbacks will be inspected quarterly to determine if such systems are affecting soils or vegetation not part of the intended plantings. Irrigation system repairs will be completed immediately if it is determined that the irrigation system is affecting vegetation or soil moisture not part of the intended tree planting. If, during annual monitoring of the adjacent Preserve (see Chapter 8), adverse indirect effects (e.g., leaf litter accumulation, irrigation runoff, plant encroachment) of the Preserve Setback's planted vegetation are detected, then the SSHCP Implementing Entity, the Preserve Manager, and the entity responsible for the Preserve Setback will identify appropriate adaptive management of the Preserve Setback tree or landscape plantings in accordance with the Preserve Setback Easement (see Section 5.2.5 and Chapter 9).	
EDGE-4 (Locate Stormwater Control Outside Preserves): Roads, sidewalks, and other impermeable surfaces of Urban Development Covered Activities adjacent to existing or planned Preserves will slope away from Preserves and Preserve Setbacks or intercept drainage with swales or curbs and gutters to preclude drainage from entering Preserves and Preserve Setbacks. Stormwater flows must be directed away from Preserves and Preserve Setbacks and directed into stormwater control facilities inside the development (outside Preserves and Preserve Setbacks)2 (see EDGE-6 for exception to EDGE-4 in certain SSHCP Linkage Preserves).	
EDGE-5 (Stormwater Control in Preserve Setbacks): If trails are established in any Preserve Setback in compliance with EDGE-3, the trail must be sloped away from the Preserve, and rainwater leaving the trail surface must flow into an adjacent low-velocity bio-retention swale or cell to keep rainwater runoff and trail contaminants from entering the Preserve. Low-velocity bio-retention swales or cells are typically small linear features placed on one or both sides of a trail. As required by EDGE-3, trails and their adjacent bio-retention swales or cells must be located on the side of the Preserve Setback nearest development.	
EDGE-6 (Detention Basins in Linkage Preserves): Because planned SSHCP Linkage Preserves L1, L2, L4, L7, L8, L9, and L10 (see Section 7.5) surround natural creeks or streams that must receive stormwater from planned adjacent Urban Development Covered Activities, a limited number of stormwater detention basins will be allowed on those Linkage Preserves. Detention basins within Linkage Preserves (see Section 5.2.7) will be designed and constructed with fill material to build up the perimeter of the detention basin so as not to impact the soil restrictive layer (duripan or hardpan) and function of the soil perched aquifer. Detention basins within Linkage Preserves will capture stormwater flows and runoff, and will discharge water to the stream/creek or percolate collected water to the soil perched aquifer. Detention basin structures that collect stormwater entering the basin or convey stormwater leaving the basin must be designed to avoid and minimize effects to Covered Species habitat in the Linkage Preserve.	
EDGE-7 (Hardpan/Duripan Protection): To protect the soil perched aquifer and the micro-watersheds supporting existing vernal pool hydrology, activities that have the potential to cut into, disrupt, or remove the soil's restrictive layer (hardpan or duripan) will not occur within Preserves or Preserve Setbacks.	

[2] Detention basins are allowed in some Linkage Preserves consistent with the requirements of EDGE-6. At the time of SSHCP preparation, seven Linkage Preserves with drainages are planned SSHCP Preserves: L1, L2, L4, L7, L8, L9, and L10 (see Section 5.2.7 and Section 7.5). Also see project-specific measures in Section 5.5.1.

SSHCP Project Specific Avoidance and Minimization Measures

However, in certain circumstances, the Covered Activities defined in Section 5.2.6, Covered Activities in Stream Setbacks in the UDA, and Section 5.2.8, Covered Activities in the Laguna Creek Wildlife Corridor of the Preserve System, may result in punctures[3] or other minor disruptions of the soil hardpan or duripan if approved by the Implementing Entity and the Technical Advisory Committee according to the process described in Chapter 9 of the SSHCP. If a Covered Activity on a Preserve or Preserve Setback results in a puncture or other disruption to the soil hardpan or duripan, the puncture will be sealed using bentonite clay or other material that maintains the functionality of the soil's restrictive layer and associated perched aquifer.	
EDGE-8 (Outdoor Lighting): All outdoor lighting in Urban Development Covered Activity projects will be designed to minimize light pollution into existing and planned Preserves, except where a Land Use Authority Permittee determines lighting is necessary for public safety or security. Minimization measures may include light fixture placement (e.g., as low to the ground as possible), lamp designs (e.g., shielding, low glare, or no lighting), directing light away from Preserves, or other means to avoid or minimize light pollution. The Third-Party Project Proponent will use the best information available at the time of project design to minimize effects of light pollution on target SSHCP Covered Species (e.g., western spadefoot (*Spea hammondii*), Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), and Ricksecker's water scavenger beetle (*Hydrochara ricksecker*i)).	
EDGE-9 (Livestock Access to Preserves): Urban Development Covered Activity projects that include on-site Preserves will include in their design an adequate number of access points and facilities for delivery and pick up of grazing animals (livestock), such that these activities will not significantly alter the Preserve's habitat and are consistent with the protection of livestock and protection of adjacent public property, and include adequate public safety measures.	
EDGE-10 (Prevent Invasive Species Spread): Completed Covered Activities (including roads) will be maintained in a manner that avoids the spread of invasive species into Preserve and Open Space areas. Such maintenance measures will include the following: • To prevent the transport of non-native invasive species onto Preserves, before bringing any equipment onto an SSHCP Preserve or Preserve Setback, equipment must be cleaned of mud, dirt, and plant material. Cleaning will occur in the infested area or another appropriate location as approved by a Plan Permittee. • Mowing rotation will start in un-infested areas and move to infested areas. • Invasive plant prevention techniques will be incorporated into maintenance plans. • The SSHCP Implementing Entity will survey road shoulders, ditches, and rights-of-way that border SSHCP Preserves for invasive weeds or other exotic plant species. Where roadside weed infestations have reached a critical control point, the Implementing Entity or Land Use Authority Permittee will apply the appropriate manual, mechanical, or chemical treatment.	
Condition 3. Implement Construction Best Management Practices Condition 3 applies to all Covered Activities	
Avoidance and Minimization Measure	**Project Compliance**
BMP-1 (Construction Fencing): Orange construction fencing will be installed to ensure that ground disturbance does not extend beyond the allowed construction footprint (i.e., the limit of project	

[3] Punctures may include small holes that penetrate the soil hardpan or duripan such as might occur when digging or drilling holes for the installation of fence posts, sign posts, or trees.

SSHCP Project Specific Avoidance and Minimization Measures

construction plus equipment staging areas and access roads). Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will mark the outer boundary of any Preserve Setback or Stream Setback adjacent to or within the project site with orange construction fencing prior to ground disturbance. This fencing will remain in place until project completion, as identified by the Plan Permittee.	
BMP-2 (Erosion Control): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will install temporary control measures for sediment, stormwater, and pollutant runoff as required by the Plan Permittee to protect water quality and species habitat. Silt fencing or other appropriate sediment control device(s) will be installed downslope of any Covered Activity that disturbs soils. Fiber rolls and seed mixtures used for erosion control will be certified as free of viable noxious weed seed. As discussed in Section 5.4.2, Covered Species Take Avoidance and Minimization Measures, erosion controls installed in or adjacent to Plan Area modeled habitat for giant gartersnake (*Thamnophis gigas*), western pond turtle (*Actinemys marmorata*), California tiger salamander (California tiger salamander), or western spadefoot (see Chapter 3) must be of appropriate design and materials that will not entrap the species (e.g., not contain mesh netting). Regular monitoring and maintenance of the project's erosion control measures will be conducted until project completion to ensure effective operation of erosion control measures.	
BMP-3 (Equipment Storage and Fueling): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will ensure that equipment storage and staging will occur in the development footprint only (not sited in any existing on-site Preserve, planned on-site Preserve, Preserve Setback, Stream Setback, or aquatic land cover type). Fuel storage and equipment fueling will occur away from waterways, stream channels, stream banks, and other environmentally sensitive areas within the development footprint. However, certain equipment storage and fueling activities can be allowed on Preserves within habitat re-establishment/establishment sites (refer to Section 5.2.7) if no location outside of the site is available. If a Covered Activity results in a spill of fuel, hydraulic fluid, lubricants, or other petroleum products, the spill will be absorbed and waste disposed of in a manner to prevent pollutants from entering a waterway, Preserve, Preserve Setback, or Stream Setback.	
BMP-4 (Erodible Materials): Plan Permittees and Third-Party Project Proponents implementing Covered Activities must not deposit erodible materials into waterways. Vegetation clippings, brush, loose soils, or other debris material will not be stockpiled within stream channels or on adjacent banks. Erodible material must be disposed of such that it cannot enter a waterway, Preserve, Preserve Setback, Stream Setback, or aquatic land cover type. If water and sludge must be pumped from a subdrain or other structure, the material will be conveyed to a temporary settling basin to prevent sediment from entering a waterway.	
BMP-5 (Dust Control): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will water active construction sites regularly, if warranted, to avoid or minimize impacts from construction dust on adjacent vegetation and wildlife habitats. No surface water will be used from aquatic land covers; water will be obtained from a municipal source or existing groundwater well.	
BMP-6 (Construction Lighting): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will direct all temporary construction lighting (e.g., lighting	

used for security or nighttime equipment maintenance) away from adjacent natural habitats, and particularly Riparian and Wetland habitats and wildlife movement areas.	
BMP-7 (Biological Monitor): If a Covered Activity includes ground disturbance within Covered Species modeled habitat, an approved biologist will be on site during the period of ground disturbance, and may need to be on site during other construction activities depending on the Covered Species affected. After ground-disturbing project activities are complete, the approved biologist will train an individual to act as the on-site construction monitor for the remainder of construction, with the concurrence of the Permitting Agencies. The on-site monitor will attend the training described in BMP-8. The approved biologist and the on-site monitor will have oversight over implementation of Avoidance and Minimization Measures, and will have the authority to stop activities if any of the requirements associated with those measures are not met. If the monitor requests that work be stopped, the Wildlife Agencies will be notified within one working day by email. The approved biologist and/or on-site monitor will record all observations of listed species on California Natural Diversity Database field sheets and submit them to the California Department of Fish and Wildlife. The approved biologist or on-site monitor will be the contact source for any employee or contractor who might inadvertently kill or injure a Covered Species or who finds a dead, injured or entrapped individual. The approved biologist and on-site monitor's names and telephone numbers will be provided to the Wildlife Agencies prior to the initiation of ground-disturbing activities. Refer to species-specific measures for details on requirements for biological monitors.	
BMP-8 (Training of Construction Staff): A mandatory Worker Environmental Awareness Program will be conducted by an approved biologist for all construction workers, including contractors, prior to the commencement of construction activities. The training will include how to identify Covered Species that might enter the construction site, relevant life history information and habitats, SSHCP and statutory requirements and the consequences of non-compliance, the boundaries of the construction area and permitted disturbance zones, litter control training (SPECIES-2), and appropriate protocols if a Covered Species is encountered. Supporting materials containing training information will be prepared and distributed by the approved biologist. When necessary, training and supporting materials will also be provided in Spanish. Upon completion of training, construction personnel will sign a form stating that they attended the training and understand all of the Avoidance and Minimization Measures. Written documentation of the training must be submitted to the Implementing Entity within 30 days of completion of the training, and the Implementing Entity will provide this information to the Wildlife Agencies.	
BMP-9 (Soil Compaction): After construction is complete, all temporarily disturbed areas will be restored similar to pre-project conditions, including impacts relating to soil compaction, water infiltration capacity, and soil hydrologic characteristics.	
BMP-10 (Revegetation): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will revegetate any cut-and-fill slopes with native or existing non-invasive, non-native plants (e.g., non-native grasses) suitable for the altered soil conditions and in compliance with EDGE-2 and EDGE-8, if applicable.	
BMP-11 (Speed Limit): Project-related vehicles will observe the posted speed limits on paved roads and a 10-mile-per-hour speed limit on unpaved roads and during travel in project areas. Construction crews will be given weekly tailgate instruction to travel only on designated and marked existing, cross-country, and project-only roads.	

Project Name:

SSHCP Project Specific Avoidance and Minimization Measures

Condition 4. Avoid and Minimize Impacts that May Result from Implementation of Covered Transportation Projects Note: This Condition only applies to projects that include road improvements.	
Avoidance and Minimization Measure	**Project Compliance**
ROAD-1 (Road Project Location): Road projects will be located in the least environmentally sensitive area to avoid, to the maximum extent practicable, impacts on Covered Species, Covered Species habitat, and waters of the United States. Road project alignments will follow existing roads, road easements, and rights-of-way, or be sited in disturbed areas to minimize habitat loss and additional habitat fragmentation.	
ROAD-2 (Wildlife Crossing Structures): Road projects that are Urban Development Covered Activities (see Section 5.2.1) (including the Capital Southeast Connector, see Section 5.2.1.1) or are Rural Transportation Covered Activities (see Section 5.2.3) will include an adequate number of wildlife crossing structures, as depicted in Figure 5-10. An adequate number of wildlife crossing structures within the Urban Development Area (UDA) and outside the UDA will provide for continued dispersal and movement of native wildlife throughout the SSHCP Plan Area, as required by the SSHCP Biological Goals and Objectives (see Chapter 7). The Plan defines "wildlife crossing structure" as a physical structure specifically designed or retrofitted to facilitate undercrossing for target wildlife species. The Plan further classifies wildlife crossings as hydrologic crossings and dry crossings. Hydrologic crossings are built where there is an existing stream, creek, or intermittent drainage to maintain existing hydrologic connectivity within the Plan Area. As described below, hydrologic crossings require specialized features to be built into the crossing structure, such as elevated platforms to allow wildlife to pass under a crossing structure when it is inundated with water. Dry wildlife crossings are built where there is no hydrologic feature but where a crossing is needed to provide for overland connectivity. SSHCP wildlife crossing structures may include structures such as bridges, arches, or box and pipe culverts. Plan Permittees expect that future wildlife movement and dispersal within the UDA will occur almost entirely within the boundaries of the future interconnected SSHCP Preserve System (see Section 7.5). Therefore, wildlife crossings are needed wherever a roadway crosses (bisects) the conceptual SSHCP Preserve System (see Figure 5-10). Wildlife crossing structures inside the UDA will be sized to accommodate movement of a highly mobile native indicator species (i.e., coyote (Canis latrans)). By designing UDA wildlife crossing structures to meet the movement and dispersal requirements of coyote, the Plan Permittees anticipate that the crossing structure will also accommodate most native wildlife species that currently occupy the UDA (see Chapter 3). The Plan Permittees expect that most of the Plan Area outside of the UDA will remain as Open Space over the 50-year Permit Term (see Chapter 4). Therefore, the Plan Permittees expect that the Rural Transportation Project Covered Activities proposed outside the UDA will have a relatively small effect on the movement and dispersal of larger or more mobile native wildlife species, including coyote. Consequently, the Plan Permittees anticipate that the design of Rural Transportation Project Covered Activities outside the UDA will need to include wildlife crossing structures primarily where the Rural Transportation Project Covered Activities occur within California tiger salamander modeled habitat (see CTS-3 and also Chapter 3, Figure 3-16). The design and location of wildlife crossing structures both inside the UDA and outside the UDA will be determined by collaboration between the Third-Party Project Proponent, the Land Use Authority, and the Implementing Entity. Crossing design will use the best available scientific and	

commercial information for the target species. The design of crossing structures will be based on demonstrated effectiveness of design for the target species when such information is available, or will be designed with a high level of certainty of success based on studies of similar taxa in similar environmental settings. The proposed wildlife crossing structures designs will be reviewed and approved by the Implementing Entity prior to final design.

The Implementing Entity will develop a Wildlife Crossing Maintenance Manual to be provided to the entity responsible for maintaining the wildlife crossing. The Wildlife Crossing Maintenance Manual will identify vegetation management, clearing of obstructions, and other techniques to maintain the desired movement and hydrologic connectivity, and to avoid effects to adjacent Preserves.

All SSHCP wildlife crossing structures in the UDA will include the following design elements:

- Open-bottom bridges or arches where the roadway crosses a river or stream. Where an open-bottom bridge or arch is used, the span of the crossing will be at least 1.2 times the bankfull width of the stream and span the banks to allow for dry wildlife passage along each side of the stream and to avoid or minimize piers or footings within the stream. (Bankfull width refers to the width of a stream channel at the point where over-bank flow begins during a flood event.)
- Any wildlife crossing structure that also maintains hydrologic connectivity will be designed to maintain pre-construction water capacity, depth, and velocity. The crossing structure will not restrict or impede normal flows or flood flows, unless a primary purpose of the structure is to manage such flow(s). Wildlife crossing structures must be designed to provide a dry passage (e.g., a platform ledge) higher than flows for a 10-year storm event to allow wildlife to pass through an inundated crossing structure.
- Wildlife crossing structures in the UDA will be designed and sized to accommodate movement of at least medium-sized mammals (e.g., coyote). The opening must be at least 3 feet high and the crossing structure must have a minimum openness ratio of at least 0.4.
- Vegetation leading up to the entrance of a crossing structure and the substrate leading into and within the crossing structure will be natural and appropriate to provide for continuity of habitat, attract the target animal species for which the crossing is designed, and facilitate use of the crossing structure.
- A wildlife crossing under six-lane roads or larger will be designed to provide ambient light and temperature in the longer crossing structures (e.g., either by providing a larger opening or a grate at the top of the structure to improve the attractiveness of the crossing to certain Covered Species and wildlife that may hesitate to cross through dark, confined structures or one with a temperature gradient (Jackson and Griffin 2000)). If a road is less than six lanes in width, these designs will be optional.
- Lighting will not be placed at or near the entrance of a wildlife crossing structure to maintain natural ambient light conditions at night and to increase chances of wildlife use. However, a Land Use Authority Permittees may allow lighting if necessary for human health or safety.

Outside the UDA, wildlife crossing structures may be required for California tiger salamander (refer to CTS-1), and could also be required for other native species. For example, for all rural transportation Covered Activity projects located in giant gartersnake modeled aquatic habitat, certain design features must be implemented to improve opportunities for giant gartersnake passage and dispersal. In addition, rural transportation Covered Activity projects in PPU-6 that are not within giant gartersnake modeled aquatic habitat, but are located between areas of mapped giant gartersnake modeled habitat (e.g. some Bruceville Road improvements) will also be required to implement such project design features. Appropriate project design features shall be incorporated when the rural transportation project includes the replacement or the modification of

an existing drainage feature, and/or the project crosses a stream, creek, ditch, or other drainage. The South Sacramento Conservation Agency and the appropriate Land Use Authority Permittee shall collaborate with the proponents of each rural transportation Covered Activity to determine the need for, the design, and appropriate locations of snake passage structures. Acceptable giant gartersnake passage structures and design features for rural transportation Covered Activities shall be determined by the South Sacramento Conservation Agency in collaboration with the USFWS, CDFW, and TAC species experts, using the best available scientific and commercial information. The SSHCP Wildlife Crossing Maintenance Manual shall identify techniques for the maintenance and the management of structures and aquatic habitat that provide passage opportunities for the giant gartersnake. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
ROAD-3 (Roadside Pesticide Use): If pesticide use is necessary along roadsides, the appropriate SSHCP Permittee will ensure that the pesticide application strictly complies with the pesticide label and all other applicable federal, state, and local authorities pertaining to the use, safety, storage, disposal, and reporting of the pesticide. Where roadside weed infestations have reached a critical control point, the Implementing Entity or a Land Use Authority Permittee will apply the appropriate manual, mechanical, or chemical treatment. In addition, the Implementing Entity or appropriate Land Use Authority Permittee will post signs along road shoulders adjacent to sensitive areas that are within the SSHCP Preserve System (e.g., California tiger salamander breeding ponds, endemic plant populations, vertebrates that rely on insects for part of their diet). The signs will identify pesticide use restrictions or other roadside maintenance restrictions.	
Condition 5. Avoid and Minimize Impacts that Result from Public Use of Low-Impact Nature Trails in Preserves AMMs associated with Condition 5 must be applied to all UDA Covered Activities that border or contain an existing Preserve or planned SSHCP Preserve	
Avoidance and Minimization Measure	**Project Compliance**
NATURE TRAIL-1 (Nature Trail Plan): A nature trail plan must be prepared for each Preserve where a trail is allowed by the Preserve Management Plan. Nature trails will be unpaved trails that vary in width depending on terrain and existing constraints, but will never exceed 4 feet in width. Where a trail crosses a swale, wooden walkways elevated to a height no greater than 2 feet will be installed. Trail improvements may include mowing vegetation to create or maintain a trail, minor grading to remove trip hazards, and signs providing directional and educational information. Public access to land acquired for preservation will be prohibited until a trail plan can be prepared by the Implementing Entity and approved by the Permitting Agencies. A trail plan will include the following: • Maps identifying areas that contain sensitive habitats or species occurrences. • Maps that show the location and footprint of proposed trails. • Methods used to control public access. • Trail and use monitoring methods, schedules, and responsibilities. • Trail operation and maintenance guidelines and responsibilities. • Clear triggers for use restrictions or closure based on sensitive biological indicators (e.g., seasonal closures of some trails on the basis of activity periods of Covered Species or sensitive species).	

SSHCP Project Specific Avoidance and Minimization Measures

NATURE TRAIL-2 (Nature Trail Protection of Duripan): Nature trails will be sited and constructed so as not to interfere with existing soil duripan and the perched aquifer that support the existing hydrologic regime of the Vernal Pool–Grassland, and will not interfere with existing pool hydrology. Trails within Preserves will not be paved.	
NATURE TRAIL-3 (Nature Trail Location): Nature trails will be located away from sensitive natural resources (e.g., vernal pools, riparian habitat, woodland habitat, Covered Species occurrences, raptor nesting sites, tricolored blackbird (*Agelaius tricolor*) colony sites). The Wildlife Agencies will determine the distance necessary to avoid impacts to sensitive natural resources.	
NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design): Biological studies will be conducted within the area being considered for nature trail construction prior to project design. The studies will include land cover type mapping and focused species surveys and/or wetland delineations. The biological studies will include assessments of potential effects of trail construction on Preserve System resources, and recommendations for avoidance and minimization that may be incorporated into project siting, design, construction, and operation.	
NATURE TRAIL-5 (Monitoring of Nature Trail Impacts): Impacts that could result from use of a nature trail within a Preserve will be monitored according to the Preserve Management Plan (Chapter 8) to ensure that uses do not conflict with the individual Preserve Management Plan. If use of a trail is found to conflict with the individual Preserve Management Plan, use of that trail will be discontinued until adjustments in the use can be made to reduce or eliminate conflicts. The Implementing Entity will make decisions about discontinuing or modifying use of a trail in consultation with the Preserve Manager or other applicable Preserve management agency or organization.	
Condition 6. Avoid and Minimize Impacts When Re-Establishing or Establishing Wetlands	
Avoidance and Minimization Measure	**Project Compliance**
RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool): Re-establish or establish Vernal Pool Wetland according to the following guidelines: • Re-establishment will always take priority over establishment of vernal pools. Establishment will be permitted only after it has been determined that sites with the potential to re-establish vernal pools no longer exist in the Plan Area or cannot be acquired through a willing seller/buyer agreement. • When possible, re-established or established sites will be located adjacent to an existing Preserve(s) to maximize connectivity and Preserve area. • Re-establishment or establishment will not result in direct or indirect adverse impacts to the hydrologic regime of existing vernal pools. Vernal pool re-establishment or establishment actions will not remove more than 10% of any existing vernal pool watershed, as defined by the SSHCP LIDAR analysis (see Section 3.3 and Conservation Action VPI1.2 in Table 7.1). • Vernal pool re-establishment will attempt to restore the historical density and range of vernal pool sizes to the maximum extent feasible using historical aerial photography of the site, if available. Where aerial photography of the site's historical conditions is not available, vernal pool re-establishment will include a range of pool sizes (area and depth) to accommodate the different habitat needs and life history characteristics of the vernal pool invertebrate Covered Species.	

SSHCP Project Specific Avoidance and Minimization Measures

• Established vernal pools must be located on sites with vernal pool soils, defined as any Plan Area soil type where vernal pools currently exist. • Established vernal pool sites will include a range of pool sizes to accommodate the different habitat needs and life history characteristics of the three vernal pool invertebrate Covered Species. • The total density of vernal pools will not exceed 10% of the suitable soil areas in any vernal pool re-establishment and/or establishment site, unless it can be shown that the suitable areas of that site historically supported greater densities. • Re-establishment or establishment may include inoculation when it is likely that no seed or cyst bank of vernal pool species remains at a site. Vernal Pool inocula will come from nearby vernal pools that are on the same geologic formation and soil type. Each SSHCP vernal pool re-establishment/establishment project is required to achieve the SSHCP Performance Standards for Vernal Pool Re-Establishment or Establishment, (which will be developed by the South Sacramento Conservation Agency within 18 months of Permit issuance). **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
RE-ESTABLISHMENT/ESTABLISHMENT-3 (Re-Establishment/Establishment of Freshwater Marsh or Open Water Near Airports): During review of proposed re-establishment/establishment projects for freshwater marsh or open water on SSHCP Preserves, the Implementing Entity shall consider the potential for the location of the re-establishment/establishment projects to increase the risk of wildlife strikes or generation of ground fog at airports. If a re-establishment/ establishment project would result in (1) a net increase in open water or freshwater marsh acreage over baseline conditions4 within 5 miles of Mather Field, Sacramento Executive Airport, or Franklin Field; or (2) replacement of open water/freshwater marsh habitat that is located 2 or more miles from Mather Field or Sacramento Executive Airport with open water/freshwater marsh habitat that is located less than 2 miles from those airports, a qualified biologist shall prepare a concise letter report. The letter report shall summarize the biologist's findings regarding (1) the species likely to use the re-established/established habitat, (2) a rough order of magnitude estimate on the peak number of birds that might use the re-established/established habitat, and (3) potential movement patterns for birds using the re-established/established habitat and whether they might cross through the airport safety zones (e.g., to reach foraging habitat or another wildlife attractant). The letter report will also provide recommendations to the Implementing Entity on how they could reduce any of the identified wildlife hazards if there are any feasible means to do so that would not conflict with the biological goals and measurable objectives of the Conservation Plan. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
Condition 7. Avoid and Minimize Impacts to Streams and Creeks AMMs associated with Condition 7 must be applied to all Covered Activities where a stream or creek is located within a project footprint.	
Avoidance and Minimization Measure	**Project Compliance**

[4] For purposes of establishing SSHCP land cover baseline conditions (including the baseline conditions of the Freshwater Marsh and Open Water land covers), baseline acreages will be calculated using the final SSHCP Land Cover Baseline Map (see discussions in Sections 3.3.1 and Section 10.4.2.3)..

Project Name:

SSHCP Project Specific Avoidance and Minimization Measures

STREAM-1 (Laguna Creek Wildlife Corridor): A 150-foot setback measured from the top of the bank on both sides of the stream will be applied to Laguna Creek within the Urban Development Area (minimum 300-foot corridor width). If trails are located within the Laguna Creek Wildlife Corridor, the nearest edge of the trail will be located at least 80 feet from the top of the bank.

Stream Setback Minimum Requirements in the Urban Development Area

Stream	Minimum Setback (from the Top of Bank Measured in Aerial Perspective) on Both Sides of the Stream
Elder Creek	100 feet
Frye Creek	100 feet or as depicted as part of the NewBridge development project hardline Preserve (see Appendix K)
Gerber Creek	100 feet
Morrison Creek	100 feet
Central Paseo	100 feet or as depicted as part of the Cordova Hills development project hardline Preserve (Appendix K)
Sun Creek	100 feet or as depicted as part of the Sun Creek development project hardline Preserve (see Appendix K)

STREAM-2 (UDA Stream Setbacks): A 100-foot setback measured from the top of the bank on both sides of the stream channel will be applied to all streams listed in Table 5-2 (see also Figure 2-4). If a stream reach supports woody riparian vegetation, the setback will be equal to the riparian edge plus 25 feet or will be the setback defined above, whichever is greater. If trails are located within the Stream Setback, the nearest edge of the trail will be located at least 50 feet from the top of the bank.

STREAM-3 (Minor Tributaries to UDA Streams): A 25-foot setback measured from the top of the bank on both sides of the stream channel will be applied to all avoided first and second order tributaries to the streams listed in Table 5-2 and Laguna Creek. Refer to Objective W6 in Chapter 7 (Table 7-1) regarding avoided first and second order tributaries. Trails are not permitted within headwater ephemeral Stream Setbacks.

STREAM-4 (Minimize Effects from Temporary Channel Re-Routing): When an Urban Development Covered Activity temporarily re-routes a stream, creek, or drainage, the re-routing will be completed in a manner that minimizes impacts to beneficial uses and habitat. The following measures will be employed to minimize disturbances that will adversely impact water quality:

- No equipment will be operated in areas of flowing or standing water.
- Construction materials and heavy equipment must be stored outside of the active flow of any waters.
- When work within waters is necessary, the entire stream flow will be diverted around the work area.
- In the event of rain, the disturbed in-water work area will be temporarily stabilized before water body flow exceeds the capacity of the diversion structure. The disturbed water body will be stabilized so that the disturbed areas will not come in contact with the flow.
- Once construction is complete, all project-introduced material (e.g., pipes, gravel, cofferdam, sandbags) must be removed, leaving the water as it was before construction. Excess materials will be disposed of at an appropriate disposal site.

SSHCP Project Specific Avoidance and Minimization Measures

• All work areas will be effectively isolated from stream flows using suitable control measures before commencement of any in-water work. The diverted stream flow will not be contaminated by construction activities. Structures for isolating the in-water work area and/or diverting the stream flow (e.g., cofferdam, geo-textile silt curtain) will not be removed until all disturbed areas are cleaned and stabilized. • Any flow diversion used during construction will be designed in a manner to prevent pollution and minimize siltation, and will provide flows to downstream reaches. Flows will be maintained to support existing aquatic life, riparian wetlands, and habitat that may be located upstream and downstream from any temporary diversion. • All surface waters, including ponded waters, will be diverted away from areas undergoing grading, construction, excavation, vegetation removal, and/or any other activity that may result in a discharge to waters. • All temporary dewatering methods will be designed to have the minimum necessary impacts to waters to isolate the immediate work area. All dewatering methods will be installed such that natural flow is maintained upstream and downstream of the diversion area. Any temporary dams and diversions will be installed such that the diversion does not cause sedimentation, siltation, or erosion upstream or downstream of the diversion area. All dewatering methods will be removed immediately upon completion of diversion activities. • A method of containment must be used below any bridge, boardwalk, and/or temporary crossing to prevent debris from falling into the waters through the entire duration of a project. • If temporary surface water diversions and/or dewatering are anticipated, the Third-Party Project Proponent will develop and maintain on site a surface water diversion and/or dewatering plan. The plan(s) must be developed prior to initiation of any water diversions and will include the proposed method and duration of diversion activities. The plan(s) must be made available to Central Valley Water Board staff upon request. • When work in a flowing stream is unavoidable and any dam or other artificial obstruction is being constructed, maintained, or placed in operation, sufficient water will be allowed at all times to pass downstream to maintain beneficial uses of waters below the dam. Construction, dewatering, and removal of temporary cofferdams will not violate the turbidity, settle-able matter, pH, temperature, or dissolved oxygen requirements of any Water Quality Control Plan. • Any temporary dam or other artificial obstruction will only be built from clean materials such as sandbags, gravel bags, water dams, or clean/washed gravel that will cause little or no siltation. Stream flow will be temporarily diverted using gravity flow through temporary culverts or pipes, or pumped around the work site with the use of hoses.	
STREAM-5 (Design for Stream Channel Re-Routing, Widening, or Deepening): When an Urban Development Covered Activity alters a stream, creek, or drainage by re-routing, widening, or deepening a channel, the project design will include the following: • The main channel of a re-routed channel will be free to migrate laterally over its active and terrace floodplain. • Channel geometry (plan, profile, and cross-section) of the site will be appropriate for the watershed location and physical/hydrologic condition. • Local, native materials will be used as fill material to the extent practicable. • Bioengineering techniques will be used for construction and maintenance of bank stabilization. Bioengineered bank stabilization structures will use vegetation in combination with bank reshaping; biodegradeable geotextile materials; and, in some cases, a minimal amount of rock or wood to the extent practicable to dissipate erosive energy. Third-Party Project Proponents will consult a professional engineer when considering using bioengineering techniques.	

• All re-routed, widened, or deepened streams are required to establish Stream Setbacks with minimum widths required under STREAM-1, STREAM-2, or STREAM-3. All re-routed, widened, or deepened streams must re-establish/ establish and maintain native Woody Riparian land cover and/or native Grassland Riparian land cover in the entire Stream Setback.	
Condition 8. Avoid and Minimize Impacts to Covered Species from Utility and Utility Maintenance Covered Activities Note: AMMs associated with Condition 8 must be applied to all Covered Activities associated with construction and maintenance of infrastructure projects.	
Avoidance and Minimization Measure	**Project Compliance**
UTILITY-1 (Avian Collision Avoidance): Installation of new, or relocation of existing, utility poles, lines, and cell towers located within the Preserve System or within 1,000 feet of a Preserve boundary will be coordinated with the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife. The applicant or relevant utility/service provider will install utility poles, lines, and cell towers in conformance with Avian Powerline Interaction Committee (APLIC) standards for collision-reducing techniques, as outlined in Reducing Avian Collisions with Power Lines: State of the Art in 2012 (APLIC 2012), or any superseding document issued by the APLIC.	
UTILITY-2 (Utility Maintenance on Preserves): Utility maintenance inside SSHCP Preserves and SSHCP Preserve Setbacks containing vernal pools will occur only when vernal pools have been dry for 30 days, except in emergency situations related to human health and safety.	
UTILITY-3 (Trenchless Construction Methods): Where a pipeline or conduit crosses an existing or planned Preserve or will be located between adjacent Preserves (e.g., under a roadway that has a Preserve on both sides), trenchless construction methods will be used to minimize impacts to the existing soil profile (including impacts to a hardpan or duripan) to maintain the perched aquifer in Vernal Pool Grassland land cover type.	
UTILITY-4 (Siting of Entry and Exit Location): The entry and exit locations for the trenchless construction method (see Utility-3) will be sited to avoid impacts to vernal pools and Riparian Woodland, and to avoid direct take of SSHCP Covered Species.	
Condition 9. Avoid and Minimize Impacts That Might Result From Removing or Breaching Levees to Establish or Re-establish Riparian Habitat	
Avoidance and Minimization Measure	**Project Compliance**
LEVEE-1 (Preparation of Hydrologic Analysis): Prior to approving a draft Preserve Management Plan that includes (1) modifying or breaching an existing levee, or (2) would place a potential impedance to high-water event flood-flows on the water side of an existing levee (including new riparian vegetation plantings or other new Preserve facilities), a hydrologic analysis will be conducted. The Preserve activity will only be implemented if the hydrologic analysis concludes that the activity will not result in a substantial increase in flood stage elevations or flood risk on lands outside the Preserve.	
Condition 10. Avoid and Minimize Impacts That Might Result From Potential Residual Contamination of Preserves and Related Exposure of People to Such Hazardous Materials	

Project Name:

SSHCP Project Specific Avoidance and Minimization Measures

Avoidance and Minimization Measure	Project Compliance
HAZARDOUS MATERIALS-1 (Preparation of Phase I Environmental Site Assessment): Prior to the acquisition of a preserve site or implementation of a stream or riparian restoration project, a Phase I Environmental Site Assessment shall be conducted in general accordance with the American Society for Testing and Materials Standard Practice E1527-05. The purpose of this Environmental Site Assessment is to identify, to the extent feasible pursuant to the American Society for Testing and Materials Standard, recognized environmental conditions in connection with the potential site. The term "recognized environmental condition" means the presence or likely presence of hazardous substances or petroleum products on the property under conditions that may indicate an existing release, a past release, or a material threat of release of these substances to the property. If the Phase 1 Environmental Site Assessment indicates the presence of a recognized environmental condition, the Implementing Entity shall consider the following options. • Determine that the acquisition/project can proceed on the basis that the Habitat Plan goals and objectives can be met on the site even with the presence of a recognized environmental condition. • Conduct a Phase II Environmental Site Assessment, including soil and groundwater testing, to further study the potential for contamination to limit the Implementing Entity's management activities. • If the results of the Phase I (or Phase II) Environmental Site Assessment indicate that the Habitat Plan goals and objectives cannot be met on the site, the Implementing Entity should not acquire the site.	
HAZARDOUS MATERIALS-2 (Contingency Plan): As part of each Preserve Management Plan or site restoration plan, a Contingency Plan shall be prepared to address the actions that would be taken during construction in the event that unexpected contaminated soil or groundwater is discovered. The Contingency Plan shall include health and safety considerations, handling and disposal of wastes, reporting requirements, and emergency procedures. The Contingency Plan shall include a requirement that if evidence of contaminated materials is encountered during construction, construction would cease immediately and applicable requirements of the Comprehensive Environmental Release Compensation and Liability Act and the California Code of Regulations Title 22 regarding the disposal of waste would be implemented.	
Covered Species Take Avoidance and Minimization Measures Note: These AMMs apply to all Projects that contain modeled species habitat.	
Avoidance and Minimization Measure	**Project Compliance**
SPECIES-1 (Litter Removal Program): A litter control program will be instituted for the entire project site. All workers will ensure that their food scraps, paper wrappers, food containers, cans, bottles, and other trash are deposited in covered or closed trash containers. All garbage will be removed from the project site at the end of each work day, and construction personnel will not feed or otherwise attract wildlife to the area where construction activities are taking place.	
SPECIES-2 (No Pets in Construction Areas): To avoid harm and harassment of native species, workers and visitors will not bring pets onto a project site.	
SPECIES-3 (Take Report): If accidental injury or death of any Covered Species occurs, workers will immediately inform the approved biologist or on-site monitor and site supervisor. The approved	

biologist or on-site monitor will phone the appropriate contact person at the Implementing Entity. The Implementing Entity will immediately contact the Wildlife Agencies by telephone. A memorandum will be provided to the Implementing Entity and Wildlife Agencies within 1 working day of the incident. The report will provide the date and location of the incident, number of individuals taken, the circumstances resulting in the take, and any corrective measures taken to prevent additional take.	
SPECIES-4 (Post-Construction Compliance Report): A post-construction compliance report will be submitted to the SSHCP Implementing Entity within 30 calendar days of completion of construction activities or within 30 calendar days of any break in construction activity that lasts more than 30 days. The report will detail the construction start and completion dates, any information about meeting or failing to meet species take Avoidance and Minimization Measures (AMM), effectiveness of each AMM that was applied at the project site, and any known project effects to Covered Species.	
PLANT-1 (Rare Plant Surveys): If a Covered Activity project site contains modeled habitat for Ahart's dwarf rush (Juncus leiospermus var. ahartii), Bogg's Lake hedge-hyssop (Gratiola heterosepala), dwarf downingia (Downingia pusilla), Legenere (Legenere limosa), pincushion navarretia (Navarretia myersii), or Sanford's arrowhead (Sagittaria sanfordii), the Covered Activity project site will be surveyed for the rare plant by an approved biologist and following the California Department of Fish and Wildlife (CDFW) Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities dated March 20, 2018or the most recent CDFW rare plant survey protocols. An approved biologist will conduct the field surveys and will identify and map plant species occurrences according to the protocols. See Chapter 10 for the process to submit survey information to the Plan Permittee and the Permitting Agencies. The appropriate timing of surveys and use of reference populations is applicable to all covered rare plant species, as described in the 2018 CDFW survey protocol referenced above. For Bogg's Lake hedge-hyssop which is an annual plant with seed banks that may not germinate every year , the project proponent may be required to survey a project site for more than one year to substantiate negative findings if the previous year was either extremely dry or extremely wet (which may be found in the Department of Water Resources Water Supply Index Bulletin (http://cdec.water.ca.gov/reportapp/javareports?name=WSI). However, if local reference populations of the species are detectable at the time of survey and none of the species are observed on a project site, a negative finding will be made. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
PLANT-2 (Rare Plant Protection): If a rare plant listed in AMM PLANT-1 is detected within an area proposed to be disturbed by a Covered Activity or is detected within 250 feet of the area proposed to be disturbed by a Covered Activity, the Implementing Entity will assure one unprotected occurrence of the species is protected within a SSHCP Preserve before any ground disturbance occurs a the project site.	
ORCUTT-1 (Orcutt Grass Surveys): If a Covered Activity project site is located within or adjacent to (within 1 mile of) the Mather Core Recovery Area and contains the Vernal Pool land cover type, the project site will be surveyed for Sacramento and slender Orcutt grass by an approved biologist following California Department of Fish and Wildlife (CDFW) Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities dated March 20, 2018 or most recent CDFW guidelines to determine if Sacramento and/or slender Orcutt grass is	

present. An approved biologist will conduct the field investigation to identify and map occurrences. See Chapter 10 for the process to conduct and submit survey information. **This AMM has been revised to reflect USFWS and/or CDFW permit conditions**	
ORCUTT-2 (Orcutt Grass Protection): Where known or new Sacramento or slender Orcutt grass occurrences are found, they will be protected within an SSHCP Preserve that is at least 50 acres. The occurrence will be located interior to the Preserve at a distance of no less than 300 feet from the edge of the Preserve boundary. If a Third-Party Project Proponent encounters a previously undiscovered occurrence of Sacramento or slender Orcutt grass on a Covered Activity project site, the Third-Party Project Proponent will contact the Implementing Entity or Land Use Authority Permittee with authority over the project, who will coordinate with the Wildlife Agencies for written concurrence of avoidance to ensure that the project does not cause take of the species.	
Valley Elderberry Longhorn Beetle	
Avoidance and Minimization Measure	**Project Compliance**
VELB-1 (Valley Elderberry Longhorn Beetle Avoidance): If a Covered Activity is planned within modeled habitat for valley elderberry longhorn beetle, project proponents will conduct a survey for presence of elderberry shrubs within 100 feet of the project area. If elderberry shrubs are found, protocol level surveys will be conducted. Direct impacts (within 20 feet of construction, shall be avoided as much as possible. Indirect impacts (shrubs between 20-100 feet of construction) shall also be avoided as much as possible. Any direct loss of elderberry shrubs shall be compensated for according to *USFWS Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (USFWS 1999b). **This AMM has been revised to reflect USFWS and/or CDFW permit conditions**	
California Tiger Salamander	
Avoidance and Minimization Measure	**Project Compliance**
CTS-1 (California Tiger Salamander Daily Construction Schedule): Ground-disturbing Covered Activities within California tiger salamander modeled habitat (Figure 3-16) will occur outside the breeding and dispersal season (occur after July 31 and before October 15), to the maximum extent practicable. If Covered Activities must be implemented in modeled habitat (Figure 3-16) during the breeding and dispersal season (after October 15 and before July 31), construction activities will not start until 30 minutes after sunrise and must be complete 30 minutes prior to sunset.	
CTS-2 (California Tiger Salamander Exclusion Fencing): If a Covered Activity must be implemented in modeled habitat (Figure 3-16) during the breeding and dispersal season (after October 15 and before July 31), exclusion fencing will be installed around the project footprint before October 15. Temporary high-visibility construction fencing will be installed along the edge of work areas, and exclusion fencing will be installed immediately outside of the temporary high-visibility construction fencing to exclude California tiger salamanders from entering the construction area or becoming entangled in the construction fencing. Exclusion fencing will be at least 1 foot tall and be buried at least 6 inches below the ground to prevent salamanders from going under the fencing. Fencing will remain in place until all construction activities within the construction area are complete. No project activities will occur outside the delineated project footprint. An approved biologist must inspect the exclusion fencing and project site every morning before 7:00 a.m. for integrity and for any entrapped California tiger salamanders. If a California tiger salamander is encountered, refer to	

CTS-5, below. (However, the Implementing Entity may, with approval of the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW), determine that it is appropriate for a Covered Activity project to not implement CTS-2 for certain long and linear roadway Covered Activity projects if it appears that the exclusion fencing will likely trap individuals or cause more take of California tiger salamander than it would prevent.)	
CTS-3 (California Tiger Salamander Monitoring): If Covered Activities must be implemented in modeled habitat (Figure 3-16), an approved biologist experienced with California tiger salamander identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place, and will inspect the project site for California tiger salamander every morning before 7:00 a.m., or prior to construction activities. As required by BMP-8 (Training of Construction Staff), the approved biologist will also train construction personnel on the required California tiger salamander avoidance procedures, exclusion fencing, and correct protocols in the event that a California tiger salamander enters an active construction zone. If a California tiger salamander is encountered, refer to CTS-5, below.	
CTS-4 (Avoid California Tiger Salamander Entrapment): If Covered Activities must be implemented in modeled habitat, all excavated steep-walled holes or trenches more than 6 inches deep will be provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes or trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within California tiger salamander modeled habitat will be inspected for California tiger salamanders by the approved biologist prior to being moved. If a California tiger salamander is encountered, refer to CTS-5, below.	
CTS-5 (California Tiger Salamander Encounter Protocol): If a California tiger salamander is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately (California Department of Fish and Wildlife (CDFW) and U.S. Fish and Wildlife Service (USFWS)). Construction activities will be suspended in a 100-foot radius of the animal until the animal is relocated (as described in the Relocation Plan, AMM CTS-8) by an approved biologist with appropriate handling permits from the Wildlife Agencies. Prior to relocation, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the salamander, within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to USFWS and CDFW immediately. Any worker who inadvertently injures or kills a California tiger salamander or who finds dead, injured, or entrapped California tiger salamander(s) must immediately report the incident to the approved biologist. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
CTS-6 (Erosion Control Materials in California Tiger Salamander Habitat): If erosion control (BMP-2) is implemented within California tiger salamander modeled habitat (Figure 3-16), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that salamanders are not trapped (no monofilament). Coconut coir matting and fiber rolls with burlap are examples of acceptable erosion control materials. This limitation will be communicated to the contractor through use of special provisions included in the bid solicitation package.	

SSHCP Project Specific Avoidance and Minimization Measures

CTS-7 (Rodent Control): CTS-7 only applies to projects that are within California tiger salamander modeled habitat (Figure 3-16) and on Covered Activities. Rodent control will be allowed only in developed portions of a Covered Activity project site. Where rodent control is allowed, the method of rodent control will comply with the methods of rodent control discussed in the 4(d) Rule published in the U.S. Fish and Wildlife Service's (2004) final listing rule for tiger salamander. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
The following California tiger salamander AMMs are conditions of the CDFW Incidental Take Permit and are in addition to the previous AMMs. For example, relocation may not occur without notification and discussion with USFWS, as described in CTS-5 above.	
CTS-8 (California Tiger Salamander Relocation Plan): Project proponents shall prepare a California tiger salamander Relocation Plan (Relocation Plan) for Covered Activities occurring in California tiger salamander modeled habitat. The Relocation Plan shall include the name(s) of the approved biologists(s) who will relocate California tiger salamander; pre-construction habitat assessment methodology; measures to minimize temporary impacts to California tiger salamander habitat outside the permanent impact area; capture, handling, and relocation methods; a map and description of the relocation area(s) for captured California tiger salamander, including relative location, quality of habitat, non-native species or the potential for California tiger salamander-barred tiger salamander hybrids to be present, identified upland burrows determined to be suitable for California tiger salamander placement, distance to aquatic habitat, and potential barriers for movement; written permission from the landowner to use their land as a relocation site; and identification of a wildlife rehabilitation center or veterinary facility that routinely evaluates or treats amphibians. Project proponents shall submit the Relocation Plan to the Land Use Authority Permittee or Implementing Entity, who will send it CDFW for written approval at least 15 days prior to the beginning of any Covered Activities, including preconstruction surveys. If California tiger salamander is found within a construction site or 200 feet beyond the construction site (200-foot boundary), Project personnel shall notify the approved biologist(s) immediately. If California tiger salamander is encountered within a construction site, is directly threatened by Covered Activities, and is unable to move to a safe area on its own, the approved biologist(s) shall relocate California tiger salamander to a safe area in accordance with the Relocation Plan. Otherwise, California tiger salamander may only be captured and handled by the Approved Biologist(s). The Permittees or Authorized Party shall notify CDFW within 24 hours of each time California tiger salamander is relocated. Notification to CDFW shall be via telephone or email, followed by a written incident report. Notification shall include the date, time, location, and circumstances of the incident. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
CTS-9. (California Tiger Salamander Pre-Construction Surveys). The approved biologist(s) shall complete a visual survey in each of the construction sites located within suitable upland habitat and within a 200-foot boundary, including access roads. The approved biologist(s) shall pay particular attention to suitable California tiger salamander habitat features and search beneath woody debris. If California tiger salamander is found within the construction site, access roads, or the 200-foot boundary, the approved biologist(s) shall delay installation of the exclusion barrier until the approved biologist(s) relocate(s) the California tiger salamander out of the Project Area and 200-foot boundary in accordance with AMM CTS-8. The approved biologist(s) shall visually inspect all potential burrow within suitable upland habitat in the construction site, access roads, and 200-foot boundary, prior to installing exclusionary fencing.	

Project Name:

SSHCP Project Specific Avoidance and Minimization Measures

This AMM has been revised to reflect USFWS and/or CDFW permit conditions	
Western Spadefoot	
Avoidance and Minimization Measure	**Project Compliance**
WS-1 (Western Spadefoot Work Window): Ground-disturbing Covered Activities within western spadefoot modeled habitat (Figure 3-17) will occur outside the breeding and dispersal season (after May 15 and before October 15), to the maximum extent practicable.	
WS-2 (Western Spadefoot Exclusion Fencing): If Covered Activities must be implemented in modeled habitat (Figure 3-17) after October 15 and before May 15, exclusion fencing will be installed around the project footprint before October 15, and the project site must be monitored by an approved biologist following rain events. Temporary high-visibility construction fencing will be installed along the edge of work areas, and silt fencing will be installed immediately behind the temporary high-visibility construction fencing to exclude western spadefoot from entering the construction area. Fencing will remain in place until all construction activities within the construction area are completed. No project activities will occur outside the delineated project footprint. If a western spadefoot is encountered, refer to WS-6, below.	
WS-3 (Western Spadefoot Monitoring): If Covered Activities must be implemented in modeled habitat (Figure 3-17) in the breeding and dispersal season (after October 15 and before May 15), an approved biologist experienced with western spadefoot identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place, and will inspect the project site daily for western spadefoot prior to construction activities. The approved biologist will also train construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a western spadefoot enters an active construction zone (i.e., outside the buffer zone). If a western spadefoot is encountered, refer to WS-6, below.	
WS-4 (Avoid Western Spadefoot Entrapment): If a Covered Activity occurs in western spadefoot modeled habitat (Figure 3-17), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within western spadefoot modeled habitat will be inspected for western spadefoot by the approved biologist prior to being moved. If a western spadefoot is encountered, refer to WS-6, below.	
WS-5 (Erosion Control Materials in Western Spadefoot Habitat): If erosion control (BMP-2) is implemented within western spadefoot modeled habitat (Figure 3-17), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that western spadefoots are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.	
WS-6 (Western Spadefoot Encounter Protocol): If Covered Activities must be implemented in modeled habitat (Figure 3-17) during the breeding and dispersal season (after October 15 and before May 15), and a western spadefoot is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be	

suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the western spadefoot within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife immediately. Any worker who inadvertently injures or kills a western spadefoot or who finds dead, injured, or entrapped western spadefoot(s) must immediately report the incident to the approved biologist.	
Giant Garter Snake	
Avoidance and Minimization Measure	**Project Compliance**
GGS-1 (Giant Gartersnake Surveys): If the SSHCP giant gartersnake modeled habitat maps (Figure 3-18) show that modeled habitat for giant gartersnake is present within a Covered Activity's project footprint or within 300 feet of a project footprint, then an approved biologist will conduct a field investigation to delineate giant gartersnake aquatic habitat within the project footprint and adjacent areas within 300 feet of the project footprint. In addition to the SSHCP land cover types shown in Figure 3-18, giant gartersnake aquatic habitat includes, but is not limited to, low-gradient streams and creeks, open water, freshwater marsh, agricultural ditches, and rice fields. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential sites and provide these maps to the Local Land Use Permittees and the Implementing Entity. Locations of delineated giant gartersnake habitat must also be noted on plans that are submitted to a Local Land Use Permittee. The applicant will use this information to finalize project design. Covered Activities may occur throughout the year as long as giant gartersnake habitat is identified and fully avoided. Otherwise, Covered Activities must comply with GGS-2 through GGS-8, below. See Chapter 10 for the process to conduct and submit survey information.	
GGS-2 (Giant Gartersnake Work Window): Covered Activities that do not fully avoid giant gartersnake modeled habitat (Figure 3-18) will be conducted during the snake's active season. Construction and ground-disturbing activities will be initiated after May 1 and will end prior to September 15. If it appears that these activities may go beyond September 15, the Third-Party Project Proponent or Plan Permittee will contact the Land Use Authority Permittee and the Implementing Entity as soon as possible, but not later than September 1. The Land Use Authority Permittee and the Implementing Entity will discuss with the Wildlife Agencies additional measures necessary to minimize take. The additional measures would vary depending on where the work is occurring. For example, if the work outside the giant gartersnake active season is a continuation of work within a dewatered channel or within a disturbed area where no more than two days have passed without ground-disturbing activities, burrows are no longer expected to be occupied by giant gartersnake, therefore no additional measures may be necessary. However, if ground disturbing work will occur outside the giant gartersnake active season in an area that was not previously disturised in the active season, or there has been no ground disturbance for more than two days, an approved biologist may be necessary on-site during earth moving activities, to monitor for giant gartersnake presence. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
GGS-3 (Giant Gartersnake Monitoring): If a Covered Activity is occurring in giant gartersnake modeled habitat (Figure 3-18), an approved biologist experienced with giant gartersnake	

identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place in aquatic habitat or within 300 feet of aquatic habitat, and will inspect the project site daily for giant gartersnake prior to construction activities. If a giant gartersnake is encountered, refer to GGS-7. The approved biologist will also train construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a giant gartersnake enters an active construction zone (i.e., outside the buffer zone).	
GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion): If construction activities will occur in giant gartersnake aquatic habitat, aquatic habitat will be dewatered and then remain dry and absent of aquatic prey (e.g., fish and tadpoles) for 15 days prior to initiation of construction activities. If complete dewatering is not possible, the Implementing Entity will be contacted to determine what additional measures may be necessary to minimize effects to giant gartersnake. After aquatic habitat has been dewatered 15 days prior to construction activities, exclusion fencing will be installed extending a minimum of 300 feet into adjacent uplands to isolate both the aquatic and adjacent upland habitat. Exclusionary fencing will be erected 36 inches above ground and buried at least 6 inches below the ground to prevent snakes from attempting to move under the fence into the construction area. In addition, high-visibility fencing will be erected to identify the construction limits and to protect adjacent habitat from encroachment of personnel and equipment. Giant gartersnake habitat outside construction fencing will be avoided by all construction personnel. The fencing and the work area will be inspected by the approved biologist to ensure that the fencing is intact and that no snakes have entered the work area before the start of each work day. The fencing will be maintained by the contractor until completion of the project. If giant gartersnake is encountered, refer to GGS-7, below.	
GGS-5 (Avoid Giant Gartersnake Entrapment): If a Covered Activity occurs in giant gartersnake modeled habitat (Figure 3-18), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps at an angle of no more than 30 degrees constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within giant gartersnake modeled habitat will be inspected for giant gartersnake by the approved biologist prior to being moved. If a giant gartersnake is encountered, refer to GGS-7. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
GGS-6 (Erosion Control Materials in Giant Gartersnake Habitat): If erosion control (BMP-2) is implemented within giant gartersnake modeled habitat (Figure 3-18), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure snakes are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.	
GGS-7 (Giant Gartersnake Encounter Protocol): If a giant gartersnake is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a	

report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the giant gartersnake within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service and CDFW immediately. Any worker who inadvertently injures or kills a giant gartersnake or who finds one dead, injured, or entrapped must immediately report the incident to the approved biologist. Any giant gartersnake observed during Covered Activities will be allowed to move away from danger on its own or be moved by the approved biologist with CDFW and USFWS approval to handle the snake and in accordance with the CDFW-approved Giant Gartersnake Relocation Plan detailed in AMM GGS-9. **This AMM has been revised to reflect USFWS and/or CDFW permit conditions**	
GGS-8 (Giant Gartersnake Post-Construction Restoration): After completion of ground-disturbing Covered Activities, the applicant will remove any temporary fill and construction debris and will restore temporarily disturbed areas to pre-project conditions. Restoration work includes such activities as re-vegetating the banks and active channels with an appropriate native seed mix. Appropriate methods and plant species used to re-vegetate such areas will be determined on a site-specific basis in consultation with the Implementing Entity. Restoration work may include replanting emergent aquatic vegetation. Refer to the U.S. Fish and Wildlife Service's (USFWS) Guidelines for the Restoration and/or Replacement of Giant Gartersnake Habitat (USFWS 1997), or the most current USFWS guidelines at the time of the activity. A photo documentation report showing pre- and post-project conditions will be submitted to the Implementing Entity 1 month after implementation of the restoration. **This AMM has been revised to reflect USFWS and/or CDFW permit conditions**	
GGS-9 (Giant Gartersnake Relocation Plan): Project proponents shall prepare a Giant Gartersnake Relocation Plan (Relocation Plan) for Covered Activities occurring in giant gartersnake modeled habitat. Project proponents shall submit the Relocation Plan to the Land Use Authority Permittee or Implementing Entity, who will send it CDFW for written approval at least 30 days prior to the beginning of any Covered Activities. The Relocation Plan shall include, at a minimum, the proposed giant gartersnake capture and handling technique; a quantification of the amount, relative location, and quality of suitable habitat (aquatic and upland) within proposed relocation site(s) including invasive and non-native species present, available upland burrows for aestivation and high-water refugia, suitable prey items, and potential barriers for movement; written permission from the landowner to use their land as a relocation site; and identification of a wildlife rehabilitation center or veterinary facility that routinely evaluates or treats snakes and is permitted to handle giant gartersnake. **This AMM has been revised to reflect USFWS and/or CDFW permit conditions**	
GGS-10 (Giant Gartersnake Pre-construction Surveys): If Covered Activities will occur within 200 feet of modeled giant gartersnake aquatic habitat, the approved biologist(s) shall conduct one pre-construction survey within 24 hours prior to beginning ground disturbing activities. The approved biologist(s) shall investigate all small mammal burrows within suitable upland habitat. The Project Area will be resurveyed whenever there is a lapse in construction activity of two weeks or more. **This AMM has been revised to reflect USFWS and/or CDFW permit conditions**	
Western Pond Turtle	

Project Name:

SSHCP Project Specific Avoidance and Minimization Measures

Avoidance and Minimization Measure	Project Compliance
WPT-1 (Western Pond Turtle Surveys): If the SSHCP western pond turtle modeled habitat maps (Figure 3-19) show that modeled habitat for western pond turtle is present within a Covered Activity's project footprint or within 300 feet of a project footprint, then an approved biologist will conduct a field investigation to delineate western pond turtle aquatic habitat within the project footprint and within 300 feet of the project footprint. In addition to the SSHCP land cover types shown in Figure 3-19, western pond turtle aquatic habitat includes, but is not limited to, low-gradient streams and creeks, open water, freshwater marsh, and rice fields. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential sites and provide those maps to the Local Land Use Permittees and the Implementing Entity. Locations of delineated western pond turtle habitat must also be noted on plans that are submitted to a Local Land Use Permittee. The applicant will use this information to finalize project design. Covered Activities may occur throughout the year as long as western pond turtle habitat is identified and fully avoided. Otherwise, Covered Activities must comply with WPT-2 through WPT-9. See Chapter 10 for the process to conduct and submit survey information.	
WPT-2 (Western Pond Turtle Work Window): Maintenance and improvements to existing structures may occur throughout the year as long as western pond turtle habitat is identified and avoided, and movement of equipment is confined to existing roads. Otherwise, construction and ground-disturbing Covered Activities must be conducted outside of western pond turtle's active season. Covered Activities will be initiated after May 1 and will commence prior to September 15. If it appears that these activities may go beyond September 15, the appropriate Plan Permittee will contact the Land Use Authority Permittee and the Implementing Entity as soon as possible, but not later than September 1, to determine if additional measures are necessary to minimize take. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
WPT-3 (Western Pond Turtle Monitoring): If a Covered Activity is occurring in western pond turtle modeled habitat (Figure 3-19), an approved biologist experienced with western pond turtle identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while Covered Activities are taking place in aquatic habitat or within 300 feet of aquatic habitat, and will inspect the project site daily for western pond turtle prior to these activities. The approved biologist will also train construction or maintenance personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a western pond turtle enters an active construction or maintenance zone (i.e., outside the buffer zone). **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion): If Covered Activities will occur in western pond turtle aquatic habitat, aquatic habitat for the turtle will be dewatered and then remain dry and absent of aquatic prey (e.g., crustaceans and other aquatic invertebrates) for 15 days prior to the initiation of construction activities. If complete dewatering is not possible, the Implementing Entity will be contacted to determine what additional measures may be necessary to minimize effects to western pond turtle. After aquatic habitat has been dewatered 15 days prior to Covered Activities, exclusion fencing will be installed extending a minimum of 300 feet into adjacent uplands to isolate both the aquatic and adjacent upland habitat. Exclusionary fencing will be erected 36 inches above ground and buried at least 6 inches below the ground to prevent turtles from attempting to burrow or move under the fence into the work area. In addition, high-visibility	

fencing will be erected to identify work area limits and to protect adjacent habitat from encroachment of personnel and equipment. Western pond turtle habitat outside exclusionary fencing will be avoided by all construction or maintenance personnel. The fencing and work area will be inspected by the approved biologist to ensure that the fencing is intact and that no turtles have entered the work area before the start of each work day. Fencing will be maintained by the contractor or maintenance entity until completion of the project. If, after exclusion fencing and dewatering, western pond turtles are found within the project footprint or within 300 feet of the project footprint, the Third-Party Project Proponent will discuss the next best steps with the Implementing Entity and Wildlife Agencies. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
WPT-5 (Avoid Western Pond Turtle Entrapment): If a Covered Activity occurs within western pond turtle modeled habitat (Figure 3-19), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within western pond turtle modeled habitat will be inspected for western pond turtle by the approved biologist prior to being moved.	
WPT-6 (Erosion Control Materials in Western Pond Turtle Habitat): If erosion control (BMP-2) is implemented within western pond turtle modeled habitat (Figure 3-19), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that turtles are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.	
WPT-7 (Western Pond Turtle Modeled Habitat Speed Limit): Covered Activity construction and maintenance vehicles will observe a 20-mile-per-hour speed limit within western pond turtle modeled upland habitat (Figure 3-19).	
WPT-8 (Western Pond Turtle Encounter Protocol): If a western pond turtle is encountered during Covered Activities, the approved biologist will notify the Wildlife Agencies immediately. Covered Activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the turtle, within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service immediately. Any worker who inadvertently injures or kills a western pond turtle or who finds one dead, injured, or entrapped must immediately report the incident to the approved biologist. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
WPT-9 (Western Pond Turtle Post-Construction Restoration): After completion of Covered Activities, the applicant will remove any temporary fill and construction debris and will restore temporarily disturbed areas to pre-project conditions. Restoration work includes such activities as re-vegetating the banks and active channels with a seed mix similar to pre-project conditions. Appropriate methods and plant species used to re-vegetate such areas will be determined on a site-	

specific basis in consultation with the Implementing Entity. Restoration work may include replanting emergent aquatic vegetation and placing appropriate artificial or natural basking areas in waterways and wetlands. A photo documentation report showing pre- and post-project conditions will be submitted to the Implementing Entity 1 month after implementation of the restoration. **This AMM has been revised to reflect USFWS and/or CDFW permit conditions**	
Tricolored Blackbird	
Avoidance and Minimization Measure	**Project Compliance**
TCB-1 (Tricolored Blackbird Surveys): If modeled habitat for tricolored blackbird (Figure 3-26) is present within a Covered Activity's project footprint or within 500 feet of a project footprint, or if Covered Activity impacts include the Mixed Riparian Scrub land cover type, regardless of whether it is included in the modeled habitat map, then an approved biologist will conduct a field investigation to determine if existing or potential nesting or foraging sites are present within the project footprint and adjacent areas within 500 feet of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Within the Plan Area, potential tricolor blackbird nest sites are often associated with freshwater marsh and seasonal wetlands, or in thickets of willow, blackberry, wild rose, thistle, and other thorny vegetation. Tricolored blackbirds are also known to nest in crops associated with dairy farms. Foraging habitat is associated with annual grasslands, wet and dry vernal pools and other seasonal wetlands, agricultural fields (such as large tracts of alfalfa and pastures with continuous haying schedules and recently tilled fields), cattle feedlots, and dairies. The Third-Party Project Proponent will map all existing or potential nesting or foraging sites and provide these maps to the Land Use Authority Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Land Use Authority Permittee. See Chapter 10 for the process to conduct and submit survey information. **This AMM has been revised to reflect USFWS and/or CDFW permit conditions**	
TCB-2 (Tricolored Blackbird Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present within a project footprint or within 500 feet of a project footprint if existing or potential nest sites were found during design surveys and construction activities will occur during the breeding season (March 1 through September 15). An approved biologist will conduct pre-construction surveys within 30 days and again within 3 days of ground-disturbing activities, and within the proposed project footprint and 500 feet of the proposed project footprint to determine the presence of nesting tricolored blackbird. The surveys should be separated by at least three weeks. Pre-construction surveys will be conducted during the breeding season (March 1 through September 15). Surveys conducted in February (to meet pre-construction survey requirements for work starting in March) must be conducted within 14 days and 3 days in advance of ground-disturbing activities. If a nest is present, then TCB-3 and TCB-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and the Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies. . **This AMM has been revised to reflect USFWS and/or CDFW permit conditions**	
TCB-3 (Tricolored Blackbird Nest Buffer): If active nests are found within the project footprint or within 500 feet of any project-related Covered Activity, the Third-Party Project Proponent will establish a 500-foot temporary buffer around the active nest until the young have fledged.	

SSHCP Project Specific Avoidance and Minimization Measures

TCB-4 (Tricolored Blackbird Nest Buffer Monitoring): If nesting tricolored blackbirds are present within the project footprint or within 500 feet of any project-related Covered Activity, then an approved biologist experienced with tricolored blackbird behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place near the disturbance buffer. Work within the nest disturbance buffer will not be permitted. If the approved biologist determines that tricolored blackbirds are exhibiting agitated behavior, construction will cease until the buffer size is increased to a distance necessary to result in no harm or harassment to the nesting tricolored blackbirds. If the biologist determines that the colonies are at risk, a meeting with the Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will be held to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a tricolored blackbird flies into an active construction zone (i.e., outside the buffer zone).	
TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves): On SSHCP Agricultural Preserves, pesticides (including herbicides) will not be applied from January 1 through July 15.	
Swainson's Hawk	
Avoidance and Minimization Measure	**Project Compliance**
SWHA-1 (Swainson's Hawk Surveys): If modeled habitat for Swainson's hawk (Figure 3-25) is present within a Covered Activity's project footprint or within 0.25 mile of a project footprint, then an approved biologist will conduct a survey to determine if existing or potential nesting sites are present within the project footprint and adjacent areas within 0.25 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Nest sites are often associated with Riparian land cover, but also include lone trees in fields, trees along roadways, and trees around structures. Nest trees may include, but are not limited to, Fremont's cottonwood (*Populus fremontii*), oaks (*Quercus* spp.), willows (*Salix* spp.), walnuts (*Juglans* spp.), eucalyptus (*Eucalyptus* spp.), pines (*Pinus* spp.), and Deodar cedar (*Cedrus deodara*). The Third-Party Project Proponent will map all existing and potential nesting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.	
SWHA-2 (Swainson's Hawk Pre-Construction Surveys): If existing or potential nest sites were found during surveys (SWHA-1), and construction activities will occur during the breeding season (March 1 through September 15), pre-construction surveys will be required to determine if active nests are present within a project footprint or within 0.25 mile of a project footprint. An approved biologist will conduct pre-construction surveys within 30 days and again within 3 days of ground-disturbing activities to determine presence of nesting Swainson's hawk. Pre-construction surveys will be conducted during the breeding season (March 1 through September 15). If a nest is present, then SWHA-3 and SWHA-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	

SWHA-3 (Swainson's Hawk Nest Buffer): If active nests are found within the project footprint or within 0.25 mile of any project-related Covered Activity, the Third-Party Project Proponent will establish a 0.25 mile disturbance buffer around the active nest until the young have fledged, with concurrence from the Wildlife Agencies.	
SWHA-4 (Swainson's Hawk Nest Buffer Monitoring): If nesting Swainson's hawks are present within the project footprint or within 0.25 mile of any project-related Covered Activity, then an approved biologist experienced with Swainson's hawk behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place within the buffer. Work within the temporary nest disturbance buffer can occur with the written permission of the Implementing Entity and Wildlife Agencies. If nesting Swainson's hawks begin to exhibit agitated behavior, such as defensive flights at intruders, getting up from a brooding position, or flying off the nest, the approved biologist will have the authority to shut down construction activities. If agitated behavior is exhibited, the biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a Swainson's hawk flies into an active construction zone (i.e., outside the buffer zone).	
SWHA-5 (Swainson's Hawk Nest Tree Avoidance): Project proponents shall avoid removal of Swainson's hawk nest trees active within the last 5 years, to the maximum extent practicable. Removal of occupied nest trees shall be timed outside of the Swainson's hawk nesting season, which would limit removal to October 1 through February 1, and shall not remove any occupied nest trees until the last young have fledged, as verified by the approved biologist. The Implementing Entity shall provide the number of Swainsons' hawk nest trees removed each year, along with nest locations, in each Annual Report submitted to CDFW. **This AMM has been revised to reflect USFWS and/or CDFW permit conditions**	
Greater Sandhill Crane	
Avoidance and Minimization Measure	**Project Compliance**
GSC-1 (Greater Sandhill Crane Surveys): If modeled habitat for greater sandhill crane (Figure 3-22) is present within a Covered Activity's project footprint or within 0.5 mile of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential roosting sites are present within the project footprint and adjacent areas within 0.5 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Roosting sites within the Plan Area are often associated with flooded fields, seasonal wetlands, and freshwater marsh. The Third-Party Project Proponent will map all existing or potential roosting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Roosting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.	
GSC-2 (Greater Sandhill Crane Pre-Construction Surveys): Pre-construction surveys will be required to determine if active roosting sites are present within a project footprint or within 0.5 mile of a project footprint if existing or potential roosting sites were found during initial surveys and construction activities will occur when wintering flocks are present within the Plan Area (September 1 through March 15). An approved biologist will conduct pre-construction surveys within 15 days of	

ground-disturbing activities, and within 0.5 mile of a project footprint, to determine presence of roosting greater sandhill cranes. Pre-construction surveys will be conducted September 1 through March 15, when wintering flocks are present within the Plan Area. If birds are present, then GSC-3, GSC-4, and GSC-5 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.	
GSC-3 (Greater Sandhill Crane Roosting Buffer): If active roosting sites are found within the project footprint or within 0.5 mile of any project-related Covered Activity, the Third-Party Project Proponent will establish a 0.5 mile temporary roosting disturbance buffer around each roosting site until the cranes have left. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
GSC-4 (Greater Sandhill Crane Visual Barrier): Greater sandhill cranes have low tolerance for human disturbance, and such disturbance has caused cranes to abandon foraging and roosting sites. Repeat disturbance affects their ability to feed and store energy needed for survival. If project-related activities occur within 0.5 mile of a known roosting site as identified by surveys conducted during implementation of GSC-1 or GSC-2, a visual barrier will be constructed.	
GSC-5 (Greater Sandhill Crane Roosting Buffer Monitoring): If roosting sites are found within the project footprint or within 0.50 mile of any project-related Covered Activity, an approved biologist experienced with greater sandhill crane behavior will be retained by the Third-Party Project Proponent to monitor the roosting site throughout the roosting season and to determine when the birds have left. The approved biologist will be on site daily while construction-related activities are taking place within the disturbance buffer. Work within the temporary disturbance buffer can only occur with the written permission of the Implementing Entity and Wildlife Agencies. If greater sandhill cranes are abandoning their roosting and/or forage sites, the approved biologist will have the authority to shut down construction activities. If roost abandonment occurs, the approved biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid harm and harassment of individuals. The approved biologist will also train construction personnel on the avoidance procedures, buffer zones, and protocols in the event that greater sandhill cranes move into an active construction zone (i.e., outside the buffer zone).	
Western Burrowing Owl	
Avoidance and Minimization Measure	**Project Compliance**
WBO-1 (Western Burrowing Owl Surveys): Surveys within modeled habitat are required for both the breeding and non-breeding season. If the project site falls within modeled habitat, an approved biologist will survey the project site and map all burrows, noting any burrows that may be occupied. Occupied burrows are often (but not always) indicated by tracks, feathers, egg shell fragments, pellets, prey remains, and/or excrement. Surveying and mapping will be conducted by the approved biologist while walking transects throughout the entire project site plus all accessible areas within a 250-foot radius from the project site. The centerline of these transects will be no more than 50 feet apart and will vary in width to account for changes in terrain and vegetation that can preclude complete visual coverage of the area. For example, in hilly terrain with patches of tall grass, transects will be closer together, and in open areas with little vegetation, they can be 50 feet apart. This methodology is consistent with current survey protocols for this species (California Burrowing Owl Consortium 1993). Adjacent parcels under different land ownership will be surveyed only if	

access is granted or if the parcels are visible from authorized areas. If suitable habitat is identified during the initial survey, and if the project does not fully avoid the habitat, pre-construction surveys will be required. Burrowing owl habitat is fully avoided if project-related activities do not impinge on a 250-foot buffer established by the approved biologist around suitable burrows. See Chapter 10 for the process to conduct and submit survey information.	
WBO-2 (Western Burrowing Owl Pre-Construction Surveys): Prior to any Covered Activity ground disturbance, an approved biologist will conduct pre-construction surveys in all areas that were identified as suitable habitat during the initial surveys. The purpose of the pre-construction surveys is to document the presence or absence of burrowing owls on the project site, particularly in areas within 250 feet of construction activities. To maximize the likelihood of detecting owls, the pre-construction survey will last a minimum of 3 hours. The survey will begin 1 hour before sunrise and continue until 2 hours after sunrise (3 hours total), or begin 2 hours before sunset and continue until 1 hour after sunset. Additional time may be required for large project sites. A minimum of two pre-construction surveys will be conducted (if owls are detected on the first survey, a second survey is not needed). All owls observed will be counted and their location will be mapped. Surveys will conclude no more than 2 calendar days prior to construction. Therefore, the Third-Party Project Proponent must begin surveys no more than 4 days prior to construction (2 days of surveying plus up to 2 days between surveys and construction). To avoid last-minute changes in schedule or contracting that may occur if burrowing owls are found, the Third-Party Project Proponent may also conduct a preliminary survey up to 15 days before construction. This preliminary survey may count as the first of the two required surveys as long as the second survey concludes no more than 2 calendar days in advance of construction.	
WBO-3 (Burrowing Owl Avoidance): If western burrowing owl or evidence of western burrowing owl is observed on the project site or within 250 feet of the project site during pre-construction surveys, then the following will occur: ***During Breeding Season***: If the approved biologist finds evidence of western burrowing owls within a project site during the breeding season (February 1 through August 31), all project-related activities will avoid nest sites during the remainder of the breeding season or while the nest remains occupied by adults or young (nest occupation includes individuals or family groups foraging on or near the site following fledging). Avoidance is establishment of a minimum 250-foot buffer zone around nests. Construction and other project-related activities may occur outside of the 250-foot buffer zone. Construction and other project-related activities may be allowed inside of the 250-foot non-disturbance buffer during the breeding season if the nest is not disturbed, and the Third-Party Project Proponent develops an avoidance, minimization, and monitoring plan that is approved by the Implementing Entity and Wildlife Agencies prior to project construction based on the following criteria: • The Implementing Entity and Wildlife Agencies approve of the avoidance and minimization plan provided by the project applicant. • An approved biologist monitors the owls for at least 3 days prior to construction to determine baseline nesting and foraging behavior (i.e., behavior without construction). • The same approved biologist monitors the owls during construction and finds no change in owl nesting and foraging behavior in response to construction activities. If there is any change in owl nesting and foraging behavior as a result of construction activities, the approved biologist will have authority to shut down activities within the 250-foot buffer.	

Construction cannot resume within the 250-foot buffer until any owls present are no longer affected by nearby construction activities, and with written concurrence from the Wildlife Agencies. If monitoring by the approved biologist indicates that the nest is abandoned prior to the end of nesting season and the burrow is no longer in use, the non-disturbance buffer zone may be removed if approved by the Wildlife Agencies. The approved biologist will excavate the burrow in accordance with the latest California Department of Fish and Wildlife guidelines for burrowing owl to prevent reoccupation after receiving approval from the Wildlife Agencies. The Implementing Entity and Wildlife Agencies will respond to a request from the Third-Party Project Proponent to review the proposed construction monitoring plan within 21 days. During Non-Breeding Season: During the non-breeding season (September 1 through January 31), the approved biologist will establish a minimum 250-foot non-disturbance buffer around occupied burrows. Construction activities outside of this 250-foot buffer will be allowed. Construction activities within the non-disturbance buffer will be allowed if the following criteria are met to prevent owls from abandoning over-wintering sites: • An approved biologist monitors the owls for at least 3 days prior to construction to determine baseline foraging behavior (i.e., behavior without construction). • The same approved biologist monitors the owls during construction and finds no change in owl foraging behavior in response to construction activities. • If there is any change in owl foraging behavior as a result of construction activities, the approved biologist will have authority to shut down activities within the 250-foot buffer. • If the owls are gone for at least 1 week, the Third-Party Project Proponent may request approval from the Implementing Entity and Wildlife Agencies that an approved biologist excavate usable burrows and install one-way exclusionary devices to prevent owls from re-occupying the site. After all usable burrows are excavated, the buffer zone will be removed and construction may continue. Monitoring must continue as described above for the non-breeding season as long as the burrow remains active.	
WBO-4 (Burrowing Owl Construction Monitoring): During construction of Covered Activities, 250-foot construction buffer zones will be established and maintained around any occupied burrow. An approved biologist will monitor the site to ensure that buffers are enforced and owls are not disturbed. The approved biologist will also train construction personnel on avoidance procedures, buffer zones, and protocols in the event that a burrowing owl flies into an active construction zone.	
WBO-5 (Burrowing Owl Passive Relocation): Passive relocation is not allowed without the express written approval of the Wildlife Agencies. Passive owl relocation may be allowed on a case-by-case basis on project sites during the non-breeding season (September 1 through January 31) with the written approval of the Wildlife Agencies if the other measures described in this condition preclude work from continuing. Passive relocation must be done in accordance with the latest California Department of Fish and Wildlife guidelines for burrowing owl. Passive relocation will only be proposed if the burrow needing to be removed or with the potential to collapse from construction activities is the result of a Covered Activity. If passive relocation is approved by the Wildlife Agencies, an approved biologist can passively exclude birds from their burrows during the non-breeding season by installing one-way doors in burrow entrances. These doors will be in place for	

48 hours to ensure that owls have left the burrow, and then the biologist will excavate the burrow to prevent reoccupation. Burrows will be excavated using hand tools only. During excavation, an escape route will be maintained at all times. This may include inserting an artificial structure into the burrow to avoid having materials collapse into the burrow and trap owls inside. Other methods of passive relocation, based on best available science, may be approved by the Wildlife Agencies over the 50-year Permit Term.	
WBO-6 (Burrowing Owl Timing of Maintenance Activities): All activities adjacent to existing or planned Preserves, Preserve Setbacks, or Stream Setback areas will be seasonally timed, when safety permits, to avoid or minimize adverse effects on occupied burrows.	
WBO-7 (Rodent Control): Rodent control will be allowed only in developed portions of a Covered Activity project site within western burrowing owl modeled habitat. Where rodent control is allowed, the method of rodent control will comply with the methods of rodent control discussed in the 4(d) Rule published in the U.S. Fish and Wildlife Service's (2004) final listing rule for tiger salamander.	
Covered Raptor Species To avoid direct and indirect effects of Covered Activities on covered raptor species, the following AMMs will be implemented. This measure applies to Cooper's hawk (*Accipiter cooperii*), loggerhead shrike (*Lanius ludovicianus*), northern harrier (*Circus cyaneus*), and white-tailed kite (*Elanus leucurus*). The following AMMs do not apply to ferruginous hawk (*Buteo regalis*), as they do not nest in the Plan Area. The following AMMs also do not apply to Swainson's hawk or burrowing owl, as specific AMMs have been developed for these covered raptor species.	
Avoidance and Minimization Measure	**Project Compliance**
RAPTOR-1 (Raptor Surveys): If modeled habitat for a covered raptor species (Figures 3-20, 3-23, 3-24, or 3-28) is present within a Covered Activity's project footprint or within 0.25 mile of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential nesting sites are present within the project footprint and adjacent areas within 0.25 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential nesting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.	
RAPTOR-2 (Raptor Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present with a project footprint or within 0.25 mile of a project footprint if existing or potential nest sites are found during initial surveys and construction activities will occur during the raptor breeding season. An approved biologist will conduct pre-construction surveys within 30 days and 3 days of ground-disturbing activities within the proposed project footprint and within 0.25 mile of the proposed project footprint to determine presence of nesting covered raptor species. Pre-construction surveys will be conducted during the raptor breeding season. If a nest is present, then RAPTOR-3 and RAPTOR-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.	
RAPTOR-3 (Raptor Nest/Roost Buffer): If active nests are found within the project footprint or within 0.25 mile of any project-related Covered Activity, the Third-Party Project Proponent will	

establish a 0.25 mile temporary nest disturbance buffer around the active nest until the young have fledged.	
RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring): If project-related Covered Activities within the temporary nest disturbance buffer are determined to be necessary during the nesting season, then an approved biologist experienced with raptor behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place within the disturbance buffer. Work within the temporary nest disturbance buffer can occur with the written permission of the Implementing Entity and Wildlife Agencies. If nesting raptors begin to exhibit agitated behavior, such as defensive flights at intruders, getting up from a brooding position, or flying off the nest, the approved biologist/monitor will have the authority to shut down construction activities. If agitated behavior is exhibited, the biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a covered raptor species flies into an active construction zone (i.e., outside the buffer zone).	
Western Red Bat	
Avoidance and Minimization Measure	**Project Compliance**
BAT-1 (Maternity Roost Surveys): If modeled habitat (Figure 3-30) for western red bat is present within 300 feet of a Covered Activity's project footprint, and a Covered Activity is proposed between May 1 and August 31 (when pre-flight/nursing young may be present), then an approved biologist will conduct a field investigation of the project footprint and adjacent areas within 300 feet of the project footprint to determine if a potential maternity roost is present, and to identify and map potential maternity roost sites. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. If potential maternity roost sites are found, the Third-Party Project Proponent will note their locations on project designs and will design the project to avoid all areas within a 300-foot buffer around the potential maternity roost sites. As discussed in AMM BAT-3, maternity roost habitat is fully avoided if project-related activities do not impinge on a 300-foot buffer established by the approved biologist around an existing or potential maternity roost site. See Chapter 10 for the process for Covered Activity projects to conduct and submit project survey information. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
BAT-2 (Maternity Roost Pre-Construction Surveys): If the Third-Party Project Proponent elects not to avoid potential maternity roost sites within the project footprint plus a 300-foot buffer during May through August, additional western red bat surveys are required. Prior to any ground disturbance related to Covered Activities or staging of equipment in the project footprint, an approved biologist will conduct a pre-construction survey within 3 days of ground-disturbing activities (within the project footprint and 300 feet of the project footprint) to determine the presence of maternity roost sites. Pre-construction surveys will be conducted during the roosting season when pre-flight/nursing young may be present (May 1 through August 31). If a maternity roost is present, then AMM BAT-3 shall be implemented. The approved biologist will inform the Land Use Authority Permittee and SSHCP Implementing Entity (the South Sacramento Conservation	

Agency) of all roost sites and species locations, and they in turn will notify the Wildlife Agencies (USFWS and CDFW), and provide all survey information to the Wildlife Agencies. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
BAT-3 (Maternity Roost Buffer): If active maternity roost sites are found within the project footprint or within 300 feet of the project footprint between May 1 and August 31, the Third-Party Project Proponent will establish a 300-foot temporary disturbance buffer around the active maternity roost site until bats have vacated the roost and the Wildlife Agencies concur that the roost is vacant. Very few western red bats are expected to be present in the Action Area in the winter months (November 1 through March 31). However, if active winter hibernaculum sites are found within the project footprint or within 300 feet of the project footprint between November 1 and March 31, the Third-Party Project Proponent will establish the same 300-foot temporary disturbance buffer around the active winter hibernaculum site until bats have vacated the hibernaculum and the Wildlife Agencies concur that the hibernaculum is vacant.. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**	
BAT-4 (Bat Eviction Methods for Non-Maternity and Non-Hibernaculum Roosts): An approved biologist will determine if non-maternity and non-hibernaculum day and night roosts are present on the project site. If direct impacts to non-maternity and non-hibernaculum day and night roosts cannot be avoided, the Third-Party Project Proponent will prepare a bat eviction plan, and inform the Land Use Authority Permittee and the SSHCP Implementing Entity (the South Sacramento Conservation Agency). They in turn shall inform the Wildlife Agencies, and provide the bat eviction plan for review. If necessary, the approved biologist may be allowed to remove the bats using safe-eviction methods acceptable to the Wildlife Agencies. **<u>This AMM has been revised to reflect USFWS and/or CDFW permit conditions</u>**

APPENDIX AES-1: CANDIDATE REZONE SITES HEIGHT PERMISSIONS TABLE

APPENDIX AES-1: HEIGHT PERMISSIONS TABLE

The below table provides a comprehensive list of height permissions for the candidate rezone sites, comparing the existing and proposed maximum height permitted by-right. **Please note, there was a sorting error when the table was compiled into the DSEIR that resulted in incorrect site numbers. The below table shows the correct site numbers in bold underline and the incorrect site numbers are struck out. A clean version of the table immediately follows for ease of reading.**

Site Number	APN	Current Zoning Designation	Current Permitted Height (Feet)	Proposed Zoning Designation	Proposed Permitted Height (Feet)

6. Climate Risk Detailed Report
6.1. Climate Risk Summary
Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	19.3	annual days of extreme heat
Extreme Pr	5.7	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different a

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity S	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity S	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures
7. Health and Equity Details
7.1. CalEnviroScreen 4.0 Scores
The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	19.3	annual days of extreme heat
Extreme Pr	5.7	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell.

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGl

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	40

6. Climate Risk Detailed Report
6.1. Climate Risk Summary
Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	19.3	annual days of extreme heat
Extreme Pr	5.7	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 mete
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average condi

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity S	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	40
AQ-PM	35.1

6. Climate Risk Detailed Report
6.1. Climate Risk Summary
Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	19.3	annual days of extreme heat
Extreme Pr	5.7	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 m
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (Ca

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity S	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract

6. Climate Risk Detailed Report
6.1. Climate Risk Summary
Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	19.3	annual days of extreme heat
Extreme Pr	5.7	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 met
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanE

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity S	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	40
AQ-PM	35.1
AQ-DPM	76.8

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	24.1	annual days of extreme heat
Extreme Pr	6.45	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0.69	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (h

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive Capaci	Vulnerability Score
Temperatu	2	0	0	N/A

Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive Capaci	Vulnerability Score
Temperatu	2	1	1	3
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract

1. Basic Project Information
1.1. Basic Project Information

Data Field	Value
Project Nar	Sac Rezone North Watt (rezoned)
Constructic	6/7/2025
Lead Agency	
Land Use S	Project/site
Analysis Le	County
Windspeec	3.5
Precipitatic	39.2
Location	38.66735756395545, -121.38321539651498
County	Sacramento
City	Unincorporated
Air District	Sacramento Metropolitan AQMD
Air Basin	Sacramento Valley
TAZ	657
EDFZ	13
Electric Uti	Sacramento Municipal Utility District
Gas Utility	Pacific Gas & Electric
App Versio	2022.1.1.21

1.2. Land Use Types

Land Use S	Size	Unit	Lot Acreage	Building Ar	Landscape	Special Lan	Population	Description
Apartment	735	Dwelling U	21.3	705600	185653		2058	

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title

2. Emissions Summary
2.1. Construction Emissions Compared Against Thresholds

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	21.8	annual days of extreme heat
Extreme Pr	6.35	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell.

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGE

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive Ca	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive Ca	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	58.2

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	19.3	annual days of extreme heat
Extreme Pr	5.7	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the gric

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (I

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive Capaci	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive Capaci	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	48.6
AQ-PM	23.7
AQ-DPM	22.3

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	19.3	annual days of extreme heat
Extreme Pr	5.7	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid ce

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (Had

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A

Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack l	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack l	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	42.6
AQ-PM	34
AQ-DPM	24.2
Drinking W	87.7
Lead Risk H	46.5
Pesticides	0

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroSc	80
Healthy Pla	13
Project Loc	Yes
Project Loc	Yes
Project Loc	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

Measure Ti	Co-Benefits Achieved

7.5. Evaluation Scorecard

Category	Number of	Total Point	Max Possit	Weighted Score

7.6. Health & Equity Custom Measures

Measure Ti	Sponsor

8. User Changes to Default Data

Screen	Justification
Land Use	20 percent of total before rezone
Constructic	1/5 of total project

ll. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
GEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	19.3	annual days of extreme heat
Extreme Pr	5.7	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid ce

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (Had

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A

Wildfire	1	0	0 N/A
Flooding	0	0	0 N/A
Drought	0	0	0 N/A
Snowpack l N/A	N/A	N/A	N/A
Air Quality	0	0	0 N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R N/A	N/A	N/A	N/A	
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack l N/A	N/A	N/A	N/A	
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	42.6

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	19.3	annual days of extreme heat
Extreme Pr	5.7	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid ce

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (Had

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A

Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack l	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack l	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	42.6

Project Loc	Yes
Project Loc	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

Measure Ti	Co-Benefits Achieved

7.5. Evaluation Scorecard

Category	Number of	Total Point	Max Possit	Weighted Score

7.6. Health & Equity Custom Measures

Measure Ti	Sponsor

8. User Changes to Default Data

Screen	Justification
Land Use	fifth of total project
Constructic	1/5 of total project
Screen	Justification
Land Use	25 percent of total before rezone
Constructic	1/5 of total project

ll. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
GEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	19.3	annual days of extreme heat
Extreme Pr	5.7	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid ce

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (Had

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A

Wildfire	1	0	0 N/A
Flooding	0	0	0 N/A
Drought	0	0	0 N/A
Snowpack l N/A	N/A	N/A	N/A
Air Quality	0	0	0 N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack l	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	42.6

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	19.3	annual days of extreme heat
Extreme Pr	5.7	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid ce

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (Had

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A

Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators

6. Climate Risk Detailed Report
6.1. Climate Risk Summary
Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.
Climate Ha Result for F Unit
Temperatu 24.1 annual days of extreme heat
Extreme Pr 6.45 annual days with precipitation above 20 mm
Sea Level Rise meters of inundation depth
Wildfire 0.69 annual hectares burned
Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 m
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (Ca

6.2. Initial Climate Risk Scores
Climate Ha Exposure S Sensitivity S Adaptive C Vulnerability Score
Temperatu 2 0 0 N/A
Extreme Pr 2 0 0 N/A
Sea Level R N/A N/A N/A N/A
Wildfire 1 0 0 N/A
Flooding 0 0 0 N/A
Drought 0 0 0 N/A
Snowpack N/A N/A N/A N/A
Air Quality 0 0 0 N/A
The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores
Climate Ha Exposure S Sensitivity S Adaptive C Vulnerability Score
Temperatu 2 1 1 3
Extreme Pr 2 1 1 3
Sea Level R N/A N/A N/A N/A
Wildfire 1 1 1 2
Flooding 1 1 1 2
Drought 1 1 1 2
Snowpack N/A N/A N/A N/A
Air Quality 1 1 1 2
The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6. Climate Risk Detailed Report
6.1. Climate Risk Summary
Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	21.8	annual days of extreme heat
Extreme Pr	6.35	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 m
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (Ca

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures
7. Health and Equity Details
7.1. CalEnviroScreen 4.0 Scores
The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for Pro	Unit
Temperatu	19.3	annual days of extreme heat
Extreme Pr	5.7	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 me

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (Can

6.2. Initial Climate Risk Scores

Climate Ha	Exposure Sco	Sensitivity S	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack	N/A	N/A	N/A	N/A

Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure Scc	Sensitivity !	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	48.6

Unemployr	62.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroSc	70
Healthy Pla	29
Project Loc	Yes
Project Loc	Yes
Project Loc	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

Measure Ti	Co-Benefits Achieved

7.5. Evaluation Scorecard

Category	Number of A	Total Point	Max Possib	Weighted Score

7.6. Health & Equity Custom Measures

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	20.7	annual days of extreme heat
Extreme Pr	6	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 m

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (Ca

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity :	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity :	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack	N/A	N/A	N/A	
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	53.7

6. Climate Risk Detailed Report
6.1. Climate Risk Summary
Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.
Climate Ha Result for F Unit
Temperatu 19.3 annual days of extreme heat
Extreme Pr 5.7 annual days with precipitation above 20 mm
Sea Level Rise meters of inundation depth
Wildfire 0 annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators

6. Climate Risk Detailed Report
6.1. Climate Risk Summary
Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.
Climate Ha Result for F Unit
Temperatu 18.8 annual days of extreme heat
Extreme Pr 6.2 annual days with precipitation above 20 mm
Sea Level Rise meters of inundation depth
Wildfire 0 annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure. The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure. The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators

6. Climate Risk Detailed Report
6.1. Climate Risk Summary
Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	24.1	annual days of extreme heat
Extreme Pr	6.45	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0.69	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	2	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	2	1	1	3
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	21.8	annual days of extreme heat
Extreme Pr	6.35	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score

Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	58.2

6. Climate Risk Detailed Report
6.1. Climate Risk Summary
Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	19.3	annual days of extreme heat
Extreme Pr	5.7	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Ha	Exposure Sc	Sensitivity S	Adaptive Ca	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure Sc	Sensitivity S	Adaptive Ca	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures
7. Health and Equity Details
7.1. CalEnviroScreen 4.0 Scores
The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract

Project Loc	Yes
Project Loc	Yes
Project Loc	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

Measure Ti	Co-Benefits Achieved

7.5. Evaluation Scorecard

Category	Number of	Total Point:	Max Possib	Weighted Score

7.6. Health & Equity Custom Measures

Measure Ti	Sponsor

8. User Changes to Default Data

Screen	Justification
Constructic	No demo
Land Use	landscape area = 20% of total lot acreage

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	18.8	annual days of extreme heat
Extreme Pr	6.2	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity !	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity !	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	48.5
AQ-PM	37.5

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroSc	49
Healthy Pla	77
Project Loc	No
Project Loc	No
Project Loc	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

Measure Ti	Co-Benefits Achieved

7.5. Evaluation Scorecard

Category	Number of Total Point Max Possib	Weighted Score

7.6. Health & Equity Custom Measures

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	24.1	annual days of extreme heat
Extreme Pr	6.45	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0.69	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity S	Adaptive C	Vulnerability Score
Temperatu	2	0	0	N/A
Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack I	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity S	Adaptive C	Vulnerability Score
Temperatu	2	1	1	3
Extreme Pr	2	1	1	3

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for F	Unit
Temperatu	21.8	annual days of extreme heat
Extreme Pr	6.35	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	0	annual hectares burned

Temperat

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	0	0	N/A

Extreme Pr	2	0	0	N/A
Sea Level R	N/A	N/A	N/A	N/A

Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity	Adaptive C	Vulnerability Score
Temperatu	1	1	1	2
Extreme Pr	2	1	1	3
Sea Level R	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	
AQ-Ozone	58.2
AQ-PM	37.4
AQ-DPM	27.5

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	2,282,256	760,752	0.00	0.00	—

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (Building Square Footage)	Acres Paved (acres)
Demolition	0.00	0.00	0.00	7,404	—
Site Preparation	—	—	10.5	0.00	—
Grading	—	—	60.0	0.00	—
Paving	0.00	0.00	0.00	0.00	—

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Apartments Mid Rise	—	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2025	0.00	375	0.01	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	40.0
AQ-PM	35.1
AQ-DPM	76.8
Drinking Water	78.5
Lead Risk Housing	72.2
Pesticides	0.00
Toxic Releases	22.2
Traffic	82.0
Effect Indicators	—
CleanUp Sites	51.3
Groundwater	82.5
Haz Waste Facilities/Generators	10.2
Impaired Water Bodies	43.8

Solid Waste	0.00
Sensitive Population	—
Asthma	89.8
Cardio-vascular	78.3
Low Birth Weights	53.5
Socioeconomic Factor Indicators	—
Education	87.3
Housing	99.3
Linguistic	93.9
Poverty	87.8
Unemployment	81.7

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	15.01347363
Employed	17.64403952
Median HI	2.065956628
Education	—
Bachelor's or higher	23.94456564
High school enrollment	100
Preschool enrollment	52.58565379
Transportation	—
Auto Access	6.351854228
Active commuting	46.04131913
Social	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	86.0
Healthy Places Index Score for Project Location (b)	14.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	40.0
AQ-PM	35.1
AQ-DPM	76.8
Drinking Water	78.5
Lead Risk Housing	72.2
Pesticides	0.00
Toxic Releases	22.2
Traffic	82.0
Effect Indicators	—
CleanUp Sites	51.3

2016 Voting	10.1

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	86.0
Healthy Places Index Score for Project Location (b)	14.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	1/5th of project in 2025
Construction: Construction Phases	1/5th of project

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	2,282,256	760,752	0.00	0.00	—

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (Building Square Footage)	Acres Paved (acres)
Demolition	0.00	0.00	0.00	7,404	—
Site Preparation	—	—	10.5	0.00	—
Grading	—	—	57.0	0.00	—
Paving	0.00	0.00	0.00	0.00	—

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Apartments Mid Rise	—	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2027	0.00	375	0.01	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	40.0
AQ-PM	35.1
AQ-DPM	76.8
Drinking Water	78.5
Lead Risk Housing	72.2
Pesticides	0.00
Toxic Releases	22.2
Traffic	82.0
Effect Indicators	—
CleanUp Sites	51.3
Groundwater	82.5
Haz Waste Facilities/Generators	10.2
Impaired Water Bodies	43.8

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	86.0
Healthy Places Index Score for Project Location (b)	14.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	40.0
AQ-PM	35.1
AQ-DPM	76.8
Drinking Water	78.5
Lead Risk Housing	72.2
Pesticides	0.00
Toxic Releases	22.2
Traffic	82.0
Effect Indicators	—
CleanUp Sites	51.3
Groundwater	82.5
Haz Waste Facilities/Generators	10.2
Impaired Water Bodies	43.8

Solid Waste	0.00
Sensitive Population	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	86.0
Healthy Places Index Score for Project Location (b)	14.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	1/5th of project in 2025

Paving	0.00	0.00	0.00	0.00	—

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Apartments Mid Rise	—	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2029	0.00	375	0.01	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	40.0
AQ-PM	35.1
AQ-DPM	76.8
Drinking Water	78.5
Lead Risk Housing	72.2
Pesticides	0.00
Toxic Releases	22.2
Traffic	82.0
Effect Indicators	—
CleanUp Sites	51.3
Groundwater	82.5
Haz Waste Facilities/Generators	10.2
Impaired Water Bodies	43.8

Solid Waste	0.00
Sensitive Population	—
Asthma	89.8
Cardio-vascular	78.3
Low Birth Weights	53.5
Socioeconomic Factor Indicators	—
Education	87.3
Housing	99.3
Linguistic	93.9
Poverty	87.8
Unemployment	81.7

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	15.01347363
Employed	17.64403952
Median HI	2.065956628
Education	—
Bachelor's or higher	23.94456564
High school enrollment	100
Preschool enrollment	52.58565379
Transportation	—
Auto Access	6.351854228
Active commuting	46.04131913
Social	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	86.0
Healthy Places Index Score for Project Location (b)	14.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	71,928	23,976	0.00	0.00	—

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Site Preparation	—	—	0.94	0.00	—
Grading	—	—	2.00	0.00	—
Paving	0.00	0.00	0.00	0.00	—

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Apartments Mid Rise	—	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2025	0.00	375	0.01	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	24.1	annual days of extreme heat
Extreme Precipitation	6.45	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.69	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A

Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	59.7
AQ-PM	39.5
AQ-DPM	50.3
Drinking Water	47.8
Lead Risk Housing	54.5
Pesticides	0.00
Toxic Releases	20.9
Traffic	21.4
Effect Indicators	—
CleanUp Sites	18.7

Groundwater	78.3
Haz Waste Facilities/Generators	59.8

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Apartments Mid Rise	—	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2025	0.00	375	0.01	< 0.005
2026	0.00	375	0.01	< 0.005

2027	0.00	375	0.01	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	21.8	annual days of extreme heat
Extreme Precipitation	6.35	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth

Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2

Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	58.2
AQ-PM	37.4
AQ-DPM	27.5
Drinking Water	61.1
Lead Risk Housing	92.2
Pesticides	7.24
Toxic Releases	21.8
Traffic	47.0

Effect Indicators	—
CleanUp Sites	80.9
Groundwater	99.2
Haz Waste Facilities/Generators	61.6
Impaired Water Bodies	0.00

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Apartments Mid Rise	—	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2027	0.00	375	0.01	< 0.005
2028	0.00	375	0.01	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A

Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	48.6
AQ-PM	23.7
AQ-DPM	22.3
Drinking Water	78.8
Lead Risk Housing	41.2
Pesticides	73.8
Toxic Releases	30.3
Traffic	28.5
Effect Indicators	—
CleanUp Sites	86.5

Groundwater	88.9
Haz Waste Facilities/Generators	99.8
Impaired Water Bodies	51.2
Solid Waste	99.9
Sensitive Population	—
Asthma	50.2
Cardio-vascular	53.9
Low Birth Weights	36.4
Socioeconomic Factor Indicators	—
Education	47.5
Housing	61.9
Linguistic	43.9
Poverty	58.5
Unemployment	62.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	36.84075452
Employed	20.45425382
Median HI	23.26446811
Education	—

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	18.8	annual days of extreme heat
Extreme Precipitation	6.20	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	48.5
AQ-PM	37.5
AQ-DPM	65.4
Drinking Water	56.6
Lead Risk Housing	38.1
Pesticides	29.5
Toxic Releases	41.1
Traffic	78.6
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	28.3
Haz Waste Facilities/Generators	40.9
Impaired Water Bodies	51.2
Solid Waste	73.0

Sensitive Population	—
Asthma	87.9
Cardio-vascular	72.0
Low Birth Weights	9.08
Socioeconomic Factor Indicators	—
Education	20.9
Housing	22.7
Linguistic	21.4
Poverty	43.5
Unemployment	40.6

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	65.76414731
Employed	89.43924034
Median HI	66.04645194
Education	—
Bachelor's or higher	71.14076736
High school enrollment	100
Preschool enrollment	54.90825099
Transportation	—
Auto Access	28.53843193
Active commuting	72.93725138
Social	—
2-parent households	56.35827024

Voting	87.62992429
Neighborhood	—
Alcohol availability	60.41319133
Park access	81.35506224
Retail density	56.73039908
Supermarket access	55.37020403
Tree canopy	89.60605672
Housing	—
Homeownership	69.85756448
Housing habitability	79.08379315
Low-inc homeowner severe housing cost burden	69.62658796
Low-inc renter severe housing cost burden	61.37559348
Uncrowded housing	59.34813294
Health Outcomes	—
Insured adults	68.56152958
Arthritis	8.6
Asthma ER Admissions	25.7
High Blood Pressure	9.1
Cancer (excluding skin)	7.2
Asthma	46.1
Coronary Heart Disease	12.2
Chronic Obstructive Pulmonary Disease	31.1
Diagnosed Diabetes	50.0
Life Expectancy at Birth	28.4
Cognitively Disabled	72.6
Physically Disabled	62.2
Heart Attack ER Admissions	23.7

Mental Health Not Good	69.9
Chronic Kidney Disease	27.1
Obesity	53.5
Pedestrian Injuries	75.4
Physical Health Not Good	59.3

2016 Voting	77.1

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	49.0
Healthy Places Index Score for Project Location (b)	77.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	24.1	annual days of extreme heat
Extreme Precipitation	6.45	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.69	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	59.7
AQ-PM	39.5
AQ-DPM	50.3
Drinking Water	47.8
Lead Risk Housing	54.5
Pesticides	0.00
Toxic Releases	20.9
Traffic	21.4
Effect Indicators	—
CleanUp Sites	18.7
Groundwater	78.3
Haz Waste Facilities/Generators	59.8
Impaired Water Bodies	77.3
Solid Waste	0.00

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	21.8	annual days of extreme heat
Extreme Precipitation	6.35	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	58.2
AQ-PM	37.4
AQ-DPM	27.5
Drinking Water	61.1
Lead Risk Housing	92.2
Pesticides	7.24
Toxic Releases	21.8
Traffic	47.0
Effect Indicators	—
CleanUp Sites	80.9
Groundwater	99.2
Haz Waste Facilities/Generators	61.6
Impaired Water Bodies	0.00
Solid Waste	52.9

Sensitive Population	—
Asthma	93.4
Cardio-vascular	69.2
Low Birth Weights	79.4
Socioeconomic Factor Indicators	—
Education	62.9
Housing	73.4
Linguistic	39.2
Poverty	91.6
Unemployment	65.6

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	10.16296677
Employed	6.274862056
Median HI	6.672654947
Education	—
Bachelor's or higher	19.73566021
High school enrollment	12.79353266
Preschool enrollment	42.65366354
Transportation	—
Auto Access	24.89413576

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	83.0
Healthy Places Index Score for Project Location (b)	13.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	48.6
AQ-PM	23.7
AQ-DPM	22.3
Drinking Water	78.8
Lead Risk Housing	41.2
Pesticides	73.8
Toxic Releases	30.3
Traffic	28.5
Effect Indicators	—
CleanUp Sites	86.5
Groundwater	88.9
Haz Waste Facilities/Generators	99.8
Impaired Water Bodies	51.2
Solid Waste	99.9

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	42.6
AQ-PM	34.0
AQ-DPM	24.2
Drinking Water	87.7
Lead Risk Housing	46.5
Pesticides	0.00
Toxic Releases	22.0
Traffic	61.2
Effect Indicators	—
CleanUp Sites	40.8
Groundwater	55.3
Haz Waste Facilities/Generators	30.2
Impaired Water Bodies	43.8
Solid Waste	39.0

Sensitive Population	—
Asthma	91.3
Cardio-vascular	90.3
Low Birth Weights	79.8
Socioeconomic Factor Indicators	—
Education	75.7
Housing	77.6
Linguistic	77.4
Poverty	89.5
Unemployment	95.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	9.072244322
Employed	15.56525087
Median HI	12.4085718
Education	—
Bachelor's or higher	17.50288721
High school enrollment	14.67984088
Preschool enrollment	74.27178237
Transportation	—
Auto Access	16.95110997
Active commuting	49.83959964
Social	—

2016 Voting	14.1

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	80.0
Healthy Places Index Score for Project Location (b)	13.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Apartments Low Rise	—	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2026	0.00	375	0.01	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	42.6
AQ-PM	34.0
AQ-DPM	24.2
Drinking Water	87.7
Lead Risk Housing	46.5
Pesticides	0.00
Toxic Releases	22.0
Traffic	61.2
Effect Indicators	—
CleanUp Sites	40.8
Groundwater	55.3
Haz Waste Facilities/Generators	30.2
Impaired Water Bodies	43.8
Solid Waste	39.0

Sensitive Population	—

2016 Voting	14.1

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	80.0
Healthy Places Index Score for Project Location (b)	13.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	one fifth of total project

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	42.6
AQ-PM	34.0
AQ-DPM	24.2
Drinking Water	87.7
Lead Risk Housing	46.5
Pesticides	0.00
Toxic Releases	22.0
Traffic	61.2
Effect Indicators	—
CleanUp Sites	40.8
Groundwater	55.3
Haz Waste Facilities/Generators	30.2
Impaired Water Bodies	43.8
Solid Waste	39.0

Sensitive Population	—
Asthma	91.3
Cardio-vascular	90.3
Low Birth Weights	79.8
Socioeconomic Factor Indicators	—
Education	75.7
Housing	77.6
Linguistic	77.4
Poverty	89.5
Unemployment	95.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	9.072244322
Employed	15.56525087
Median HI	12.4085718
Education	—
Bachelor's or higher	17.50288721
High school enrollment	14.67984088
Preschool enrollment	74.27178237
Transportation	—
Auto Access	16.95110997
Active commuting	49.83959964
Social	—
2-parent households	10.38111125

Voting	30.89952521
Neighborhood	—
Alcohol availability	49.8652637
Park access	57.48748877
Retail density	47.01655332
Supermarket access	29.53933017
Tree canopy	84.60156551
Housing	—
Homeownership	30.16809958
Housing habitability	28.23046324
Low-inc homeowner severe housing cost burden	26.71628384
Low-inc renter severe housing cost burden	30.95085333
Uncrowded housing	20.03079687
Health Outcomes	—
Insured adults	19.91530861
Arthritis	12.5
Asthma ER Admissions	10.3
High Blood Pressure	6.0
Cancer (excluding skin)	49.7
Asthma	8.7
Coronary Heart Disease	15.5
Chronic Obstructive Pulmonary Disease	5.0
Diagnosed Diabetes	10.1
Life Expectancy at Birth	9.0
Cognitively Disabled	18.3
Physically Disabled	43.7
Heart Attack ER Admissions	11.0

Mental Health Not Good	15.9
Chronic Kidney Disease	10.6
Obesity	23.4
Pedestrian Injuries	55.0

2016 Voting	14.1

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	80.0
Healthy Places Index Score for Project Location (b)	13.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	fifth of total project
Construction: Construction Phases	1/5 of total project

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	989,537	329,846	0.00	0.00	—

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Site Preparation	—	—	10.5	0.00	—
Grading	—	—	60.0	0.00	—
Paving	0.00	0.00	0.00	0.00	—

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Apartments Low Rise	—	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2028	0.00	375	0.01	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	42.6
AQ-PM	34.0
AQ-DPM	24.2
Drinking Water	87.7
Lead Risk Housing	46.5
Pesticides	0.00
Toxic Releases	22.0
Traffic	61.2
Effect Indicators	—
CleanUp Sites	40.8
Groundwater	55.3
Haz Waste Facilities/Generators	30.2
Impaired Water Bodies	43.8
Solid Waste	39.0

Sensitive Population	—
Asthma	91.3
Cardio-vascular	90.3
Low Birth Weights	79.8
Socioeconomic Factor Indicators	—
Education	75.7
Housing	77.6
Linguistic	77.4
Poverty	89.5
Unemployment	95.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	9.072244322
Employed	15.56525087
Median HI	12.4085718
Education	—
Bachelor's or higher	17.50288721
High school enrollment	14.67984088
Preschool enrollment	74.27178237
Transportation	—
Auto Access	16.95110997
Active commuting	49.83959964
Social	—
2-parent households	10.38111125

2016 Voting	14.1

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	80.0
Healthy Places Index Score for Project Location (b)	13.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	fifth of total project
Construction: Construction Phases	1/5 of total project

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	42.6
AQ-PM	34.0
AQ-DPM	24.2
Drinking Water	87.7
Lead Risk Housing	46.5
Pesticides	0.00
Toxic Releases	22.0
Traffic	61.2
Effect Indicators	—
CleanUp Sites	40.8
Groundwater	55.3
Haz Waste Facilities/Generators	30.2
Impaired Water Bodies	43.8
Solid Waste	39.0

Sensitive Population	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	80.0
Healthy Places Index Score for Project Location (b)	13.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	fifth of total project before rezone
Construction: Construction Phases	1/5 of total project

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Sac Rezone Fair Oaks (before)
Construction Start Date	1/1/2025
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	3.50
Precipitation (days)	39.2
Location	38.637469230516956, -121.32836613666706
County	Sacramento
City	Unincorporated
Air District	Sacramento Metropolitan AQMD
Air Basin	Sacramento Valley
TAZ	619
EDFZ	13
Electric Utility	Sacramento Municipal Utility District
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.21

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Apartments Low Rise	25.0	Dwelling Unit	1.25	26,500	10,890	—	70.0	—

AQ-1-793

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	24.1	annual days of extreme heat
Extreme Precipitation	6.45	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.69	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A

Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	59.7
AQ-PM	39.5
AQ-DPM	50.3
Drinking Water	47.8
Lead Risk Housing	54.5
Pesticides	0.00
Toxic Releases	20.9
Traffic	21.4
Effect Indicators	—
CleanUp Sites	18.7

Groundwater	78.3
Haz Waste Facilities/Generators	59.8
Impaired Water Bodies	77.3

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	21.8	annual days of extreme heat
Extreme Precipitation	6.35	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth

Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2

Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	58.2
AQ-PM	37.4
AQ-DPM	27.5
Drinking Water	61.1
Lead Risk Housing	92.2
Pesticides	7.24
Toxic Releases	21.8
Traffic	47.0

Effect Indicators	—
CleanUp Sites	80.9
Groundwater	99.2
Haz Waste Facilities/Generators	61.6
Impaired Water Bodies	0.00
Solid Waste	52.9
Sensitive Population	—
Asthma	93.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	83.0
Healthy Places Index Score for Project Location (b)	13.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	20% of total lot acreage is landscaped as in GP
Construction: Construction Phases	modemo

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A

Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	48.6
AQ-PM	23.7
AQ-DPM	22.3
Drinking Water	78.8
Lead Risk Housing	41.2
Pesticides	73.8
Toxic Releases	30.3
Traffic	28.5
Effect Indicators	—
CleanUp Sites	86.5

Groundwater	88.9
Haz Waste Facilities/Generators	99.8
Impaired Water Bodies	51.2
Solid Waste	99.9
Sensitive Population	—
Asthma	50.2
Cardio-vascular	53.9
Low Birth Weights	36.4
Socioeconomic Factor Indicators	—
Education	47.5
Housing	61.9
Linguistic	43.9
Poverty	58.5
Unemployment	62.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	36.84075452
Employed	20.45425382
Median HI	23.26446811
Education	—
Bachelor's or higher	39.34300013

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	70.0
Healthy Places Index Score for Project Location (b)	29.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	South Florin

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	18.8	annual days of extreme heat
Extreme Precipitation	6.20	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	48.5
AQ-PM	37.5
AQ-DPM	65.4
Drinking Water	56.6
Lead Risk Housing	38.1
Pesticides	29.5
Toxic Releases	41.1
Traffic	78.6
Effect Indicators	—
CleanUp Sites	0.00

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	49.0
Healthy Places Index Score for Project Location (b)	77.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Sac Rezone Fair Oaks operations (before)
Operational Year	2030
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	3.50
Precipitation (days)	39.2
Location	38.637469230516956, -121.32836613666706
County	Sacramento
City	Unincorporated
Air District	Sacramento Metropolitan AQMD
Air Basin	Sacramento Valley
TAZ	619
EDFZ	13
Electric Utility	Sacramento Municipal Utility District
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.21

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Apartments Low Rise	25.0	Dwelling Unit	1.25	26,500	10,890	—	70.0	—

AQ-1-927

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Energy	E-15	Require All-Electric Development

2. Emissions Summary

2.4. Operations Emissions Compared Against Thresholds

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	24.1	annual days of extreme heat
Extreme Precipitation	6.45	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.69	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	59.7
AQ-PM	39.5
AQ-DPM	50.3
Drinking Water	47.8
Lead Risk Housing	54.5
Pesticides	0.00
Toxic Releases	20.9
Traffic	21.4
Effect Indicators	—
CleanUp Sites	18.7
Groundwater	78.3
Haz Waste Facilities/Generators	59.8
Impaired Water Bodies	77.3

Solid Waste	0.00
Sensitive Population	—
Asthma	88.7

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	47.0
Healthy Places Index Score for Project Location (b)	30.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	21.8	annual days of extreme heat
Extreme Precipitation	6.35	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	58.2
AQ-PM	37.4
AQ-DPM	27.5
Drinking Water	61.1
Lead Risk Housing	92.2
Pesticides	7.24
Toxic Releases	21.8
Traffic	47.0
Effect Indicators	—
CleanUp Sites	80.9
Groundwater	99.2
Haz Waste Facilities/Generators	61.6
Impaired Water Bodies	0.00

Solid Waste	52.9

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	83.0
Healthy Places Index Score for Project Location (b)	13.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	20% of total lot acreage is landscaped as in GP

Sac Rezone Old Florin operations (before) Detailed Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.4. Operations Emissions Compared Against Thresholds

2.5. Operations Emissions by Sector, Unmitigated

2.6. Operations Emissions by Sector, Mitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.1.2. Mitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.2. Electricity Emissions By Land Use - Mitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.2.4. Natural Gas Emissions By Land Use - Mitigated

4.3. Area Emissions by Source

4.3.1. Unmitigated

4.3.2. Mitigated

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

4.4.2. Mitigated

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

4.5.2. Mitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.6.2. Mitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.7.2. Mitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.8.2. Mitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.9.2. Mitigated

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

4.10.4. Soil Carbon Accumulation By Vegetation Type - Mitigated

4.10.5. Above and Belowground Carbon Accumulation by Land Use Type - Mitigated

4.10.6. Avoided and Sequestered Emissions by Species - Mitigated

5. Activity Data

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.9.2. Mitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.1.2. Mitigated

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.10.4. Landscape Equipment - Mitigated

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.11.2. Mitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.12.2. Mitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.13.2. Mitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

5.14.2. Mitigated

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

5.15.2. Mitigated

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

5.16.2. Process Boilers

5.17. User Defined

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

5.18.2.2. Mitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Sac Rezone Old Florin operations (before)
Operational Year	2030
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	3.00
Precipitation (days)	37.8
Location	38.49656099729435, -121.39733654991514
County	Sacramento
City	Unincorporated
Air District	Sacramento Metropolitan AQMD
Air Basin	Sacramento Valley
TAZ	774
EDFZ	13
Electric Utility	Sacramento Municipal Utility District
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.21

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Apartments Low Rise	503	Dwelling Unit	25.2	533,180	219,717	—	1,408	—

AQ-1-1013

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Energy	E-15	Require All-Electric Development

2. Emissions Summary

2.4. Operations Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.3	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	48.6
AQ-PM	23.7
AQ-DPM	22.3
Drinking Water	78.8
Lead Risk Housing	41.2
Pesticides	73.8
Toxic Releases	30.3
Traffic	28.5
Effect Indicators	—
CleanUp Sites	86.5
Groundwater	88.9
Haz Waste Facilities/Generators	99.8
Impaired Water Bodies	51.2

Solid Waste	99.9
Sensitive Population	—
Asthma	50.2
Cardio-vascular	53.9
Low Birth Weights	36.4
Socioeconomic Factor Indicators	—
Education	47.5
Housing	61.9
Linguistic	43.9
Poverty	58.5
Unemployment	62.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	36.84075452
Employed	20.45425382
Median HI	23.26446811
Education	—

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	20.7	annual days of extreme heat
Extreme Precipitation	6.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	2	1	1	3
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	53.7
AQ-PM	37.6
AQ-DPM	57.1
Drinking Water	55.8
Lead Risk Housing	32.5
Pesticides	0.00
Toxic Releases	24.2
Traffic	76.4
Effect Indicators	—
CleanUp Sites	58.2
Groundwater	35.0
Haz Waste Facilities/Generators	19.2
Impaired Water Bodies	51.2
Solid Waste	0.00

Sensitive Population	—
Asthma	71.2
Cardio-vascular	80.6
Low Birth Weights	0.74
Socioeconomic Factor Indicators	—
Education	16.2
Housing	21.1
Linguistic	17.3
Poverty	56.4
Unemployment	76.1

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	54.45912999
Employed	22.03259335
Median HI	48.69754908
Education	—
Bachelor's or higher	69.9987168
High school enrollment	100

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	42.0
Healthy Places Index Score for Project Location (b)	63.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	units and acreage from excel sheet; 439680/5=87936
Construction: Construction Phases	no demo
Construction: Architectural Coatings	Sac metro rule 301: Flat coating limit = 50 g/L, nonflat coating = 100 g/L, roof coating = 50 g/L, driveway sealers = 50 g/L
Operations: Architectural Coatings	Sac metro rule 301, VOC limits: flat coating = 50 g/L, nonflat coating = 100 g/L, driveway sealer = 100 g/L

APPENDIX NOI-1: NOISE MODELING OUTPUTS

Attenuation Calculations for Stationary Noise Sources

KEY: Orange cells are for input.
Grey cells are intermediate calculations performed by the model.
Green cells are data to present in a written analysis (output).

STEP 1: Identify the noise source and enter the reference noise level (dBA and distance).

STEP 2: Select the ground type (hard or soft), and enter the source and receiver heights.

STEP 3: Select the distance to the receiver.

Noise Source/ID	Reference Noise Level			Attenuation Characteristics				Attenuated Noise Level at Receptor		
	noise level (dBA)	@	distance (ft)	Ground Type (soft/hard)	Source Height (ft)	Receiver Height (ft)	Ground Factor	noise level (dBA)	@	distance (ft)
HVAC Leq - 60 dB Threshold	70.0	@	3	hard	6	5	0.00	59.5	@	10
HVAC Leq - 55 dB Threshold	70.0	@	3	hard	6	5	0.00	54.9	@	17

Notes:

Estimates of attenuated noise levels do not account for reductions from intervening barriers, including walls, trees, vegetation, or structures of any type.

Computation of the attenuated noise level is based on the equation presented on pg. 176 and 177 of FTA 2018.

Computation of the ground factor is based on the equation presentd in Table 4-26 on pg. 86 of FTA 2018, where the distance of the reference noise leve can be adjusted and the usage factor is not applied (i.e., the usage factor is equal to 1).

Notes: Data provided by DKS Associates

Distance Propagation Calculations for Stationary Sources of Ground Vibration

KEY: Orange cells are for input.

Grey cells are intermediate calculations performed by the model.

Green cells are data to present in a written analysis (output).

STEP 1: Determine units in which to perform calculation.

— If vibration decibels (VdB), then use Table A and proceed to Steps 2A and 3A.

— If peak particle velocity (PPV), then use Table B and proceed to Steps 2B and 3B.

STEP 2A: Identify the vibration source and enter the reference vibration level (VdB) and distance.

STEP 3A: Select the distance to the receiver.

Table A. Propagation of vibration decibels (VdB) with distance

Noise Source/ID	Reference Noise Level			Attenuated Noise Level at Receptor		
	vibration level (VdB)	@	distance (ft)	vibration level (VdB)	@	distance (ft)
Impact pile driver	112	@	25	71.9	@	541
Vibratory Roller	94	@	25	71.9	@	136
Large bulldozer	87.0	@	25	71.8	@	80

The Lv metric (VdB) is used to assess the likelihood for vibration to result in human annoyance.

STEP 2B: Identify the vibration source and enter the reference peak particle velocity (PPV) and distance.

STEP 3B: Select the distance to the receiver.

Table B. Propagation of peak particle velocity (PPV) with distance

Noise Source/ID	Reference Noise Level			Attenuated Noise Level at Receptor		
	vibration level (PPV)	@	distance (ft)	vibration level (PPV)	@	distance (ft)
Impact pile driver	1.518	@	25	0.199	@	97
Vibratory Roller	0.210	@	25	0.198	@	26
Large bulldozer	0.089	@	25	0.191	@	15

The PPV metric (in/sec) is used for assessing the likelihood for the potential of structural damage.

Notes:

Computation of propagated vibration levels is based on the equations presented on pg. 185 of FTA 2018. Estimates of attenuated vibration levels do not account for reductions from intervening underground barriers or other underground structures of any type, or changes in soil type.

APPENDIX TRAN-1: PROJECT SPECIFIC VEHICLE MILES TRAVELED ANALYSIS MEMO

MEMORANDUM

DATE: February 23, 2024

TO: Kari Zajac | Ascent Environmental

FROM: Dave Tokarski | DKS Associates

SUBJECT: Sacramento County Residential Rezones – VMT Analysis Project # P23063-000

INTRODUCTION

Ascent Environmental has contracted with DKS Associates to prepare a Vehicle Miles Traveled (VMT) analysis for the proposed rezoning of parcels throughout unincorporated Sacramento County from their current General Plan zoning to residential zoning. The list of parcels includes approximately 80 parcels representing nearly 235 total acres. Each parcel listed includes data including property address (if available), assessor parcel number (APN), CPAC community, current General Plan land use designation and zoning, proposed zoning designation, minimum proposed residential density, maximum proposed residential density, existing use (or vacancy), ownership (public or private), and proposed residential capacity by income level (lower income, moderate income, and above moderate income), and total proposed residential capacity. In addition to a spreadsheet containing the list of proposed parcels, County staff provided the project team with a GIS geodatabase locating each of the sites within the county.

PROPOSED REZONES

Table 1 shows the number of parcels identified for rezones and the number of parcels identified per Community Plan Area, as well as the unincorporated County as a whole. The table shows that a majority of the proposed units are located in the South Sacramento (41%), North Highlands (18%), and Antelope (14%) areas. All other areas combined total approximately 27% of the total potential increase in residential capacity.

Figure 1 shows the location (and site number) of each of the rezone parcels along with the extents of unincorporated communities.

TABLE 1: REZONE PARCELS BY COMMUNITY PLAN AREA

UNINCORPORATED COMMUNITY	NUMBER OF PARCELS	TOTAL ACRES	TOTAL CAPACITY (DU)	PERCENT OF TOTAL CAPACITY
ANTELOPE	4	29.63	1,037	14%
ARDEN ARCADE	1	1.98	59	1%
CARMICHAEL/OLD FOOTHILL FARMS	10	16.62	387	5%
FAIR OAKS	2	2.89	85	1%
NATOMAS	0	0.00	-	0%
NORTH HIGHLANDS	10	42.52	1,359	18%
ORANGEVALE	7	7.93	218	3%
CORDOVA	2	13.90	556	7%
RIO LINDA/ELVERTA	6	18.77	561	8%
SOUTH SACRAMENTO	35	96.47	3,014	41%
VINEYARD	2	4.81	143	2%
TOTAL REZONE SITES	79	235.52	7,419	100%

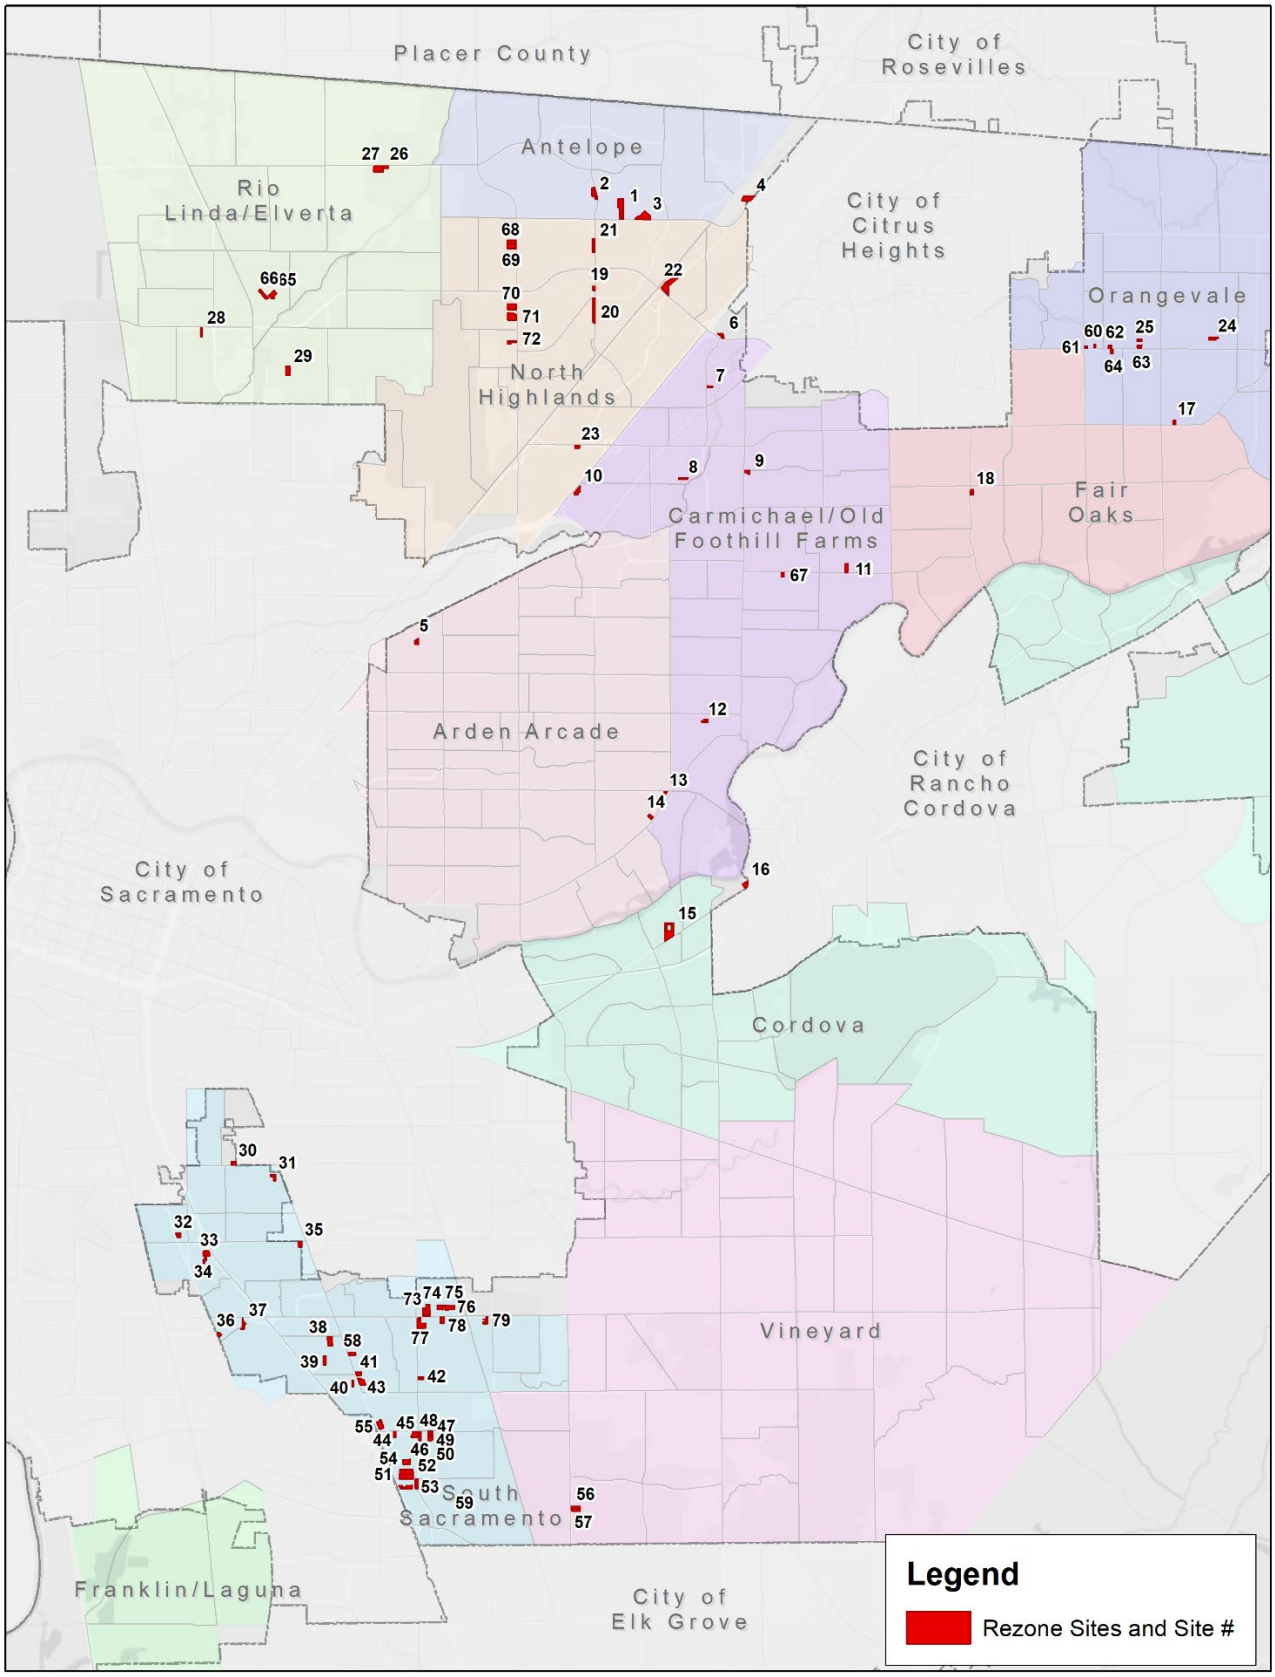

FIGURE 1: LOCATION OF REZONE PARCELS

VMT MODELING

In order to analyze the impacts of the rezones on VMT, the potential rezone parcels needed to be modified in the regional travel demand model used for VMT analysis by Sacramento County. SACOG (the Sacramento Area Council of Governments) maintains a regional activity-based model (ABM) called SACSIM19, which is used by local jurisdictions, including Sacramento County, for regional transportation impact analysis. SACOG currently maintains a base year (2016) scenario, as well as a number of future year (2027, 2035, and 2040) scenarios. Additionally, Sacramento County has had its consultants develop a "Super-Cumulative" scenario for use in major impact studies in the unincorporated County, including major development projects along Jackson Highway in the southeast portion of the County and in the Natomas area. Based on discussions with County staff, this analysis relies on this "Super-Cumulative" model for cumulative conditions.

The model uses "pseudo" parcels as its main land use input. Each "pseudo" parcel consists of a set of XY coordinates to represent the approximate center of the actual land use area, as well as other data including traffic analysis zone (TAZ), number of households, number of enrolled students at schools (primary, high school, and university), number of employees (education, food/beverage, government, industrial, medical, office, retail, service, other, and total), and other fields not directly involved in land use modifications. In addition to the parcels file, the land use inputs include a "households" file (with details for each household linked to a parent parcel) and a "persons" file (with details for each person linked to a parent household). These files are all interdependent, so changing land use includes making changes to all three of them.

In order to apply the proposed rezones at a parcel level, it was necessary to associate each parcel (polygon) identified for rezoning to an appropriate pseudo parcel (XY point) in the model. This was achieved using GIS (geographic information systems) spatial joining processes. Once the appropriate SACSIM19 parcel was identified in both the base year (2016) and super-cumulative models, then land use assumed in the model was identified in order to determine how best to apply the rezone dwelling units. In some cases, there was no model pseudo-parcel match for the identified polygon parcel. These locations had to be added to the model input.

Based on review of all rezone parcels and both the 2016 (for existing plus project) and super-cumulative (cumulative plus project) models, a number of cases were identified that each would require assumptions to be made regarding the relationship between the assumed dwelling unit capacity assumed with the rezones and the data already contained in the models. These cases and assumptions made for allocating the rezone dwelling units in the model are listed below.

- Existing Plus Project
    - For sites where there are 1 or 2 dwelling units in the model, assume those dwelling units will be replaced by the County's assumed rezone units
    - For sites where there are higher dwelling units in base year SACSIM model than County's rezone units, keep the units already in the model
    - For sites where base year model has fewer dwelling units than County Rezone units, replace with County Rezone units
    - For sites where there is a small amount of employment, zero out the employment
    - For sites where there is a large amount of employment, review case by case

- Cumulative Plus Project
    - For sites where there are 1 or 2 dwelling units in the model, assume those dwelling units will be replaced by the County's assumed rezone units
    - For sites where there are higher dwelling units in cumulative SACSIM model than County's rezone units, keep the units already in the model
    - For sites where there is a small amount of employment, zero out the employment
    - For sites where there is a large amount of employment, review case by case

Based on these assumptions, less than the total 7,419 total dwelling units were added to each model, as some of the rezone units were already included in each of the model land use inputs. Once the land use changes were applied to subject parcels, households, and persons in the model, the model was rerun for both Existing Plus Rezones and Super-Cumulative Plus Rezones scenarios. As with previous VMT studies prepared for Sacramento County, VMT per Capita and VMT per Employee were calculated for each TAZ and the region as a whole, as was VMT by speed bin data for the region as a whole.

VMT RESULTS

Table 2 shows the changes in regionwide VMT associated with the proposed rezones. The table summarizes both total region wide network VMT and VMT per Capita for both Existing (2016) and Super Cumulative conditions without and with the rezones, as well as the difference between the two. The table shows that region wide network VMT increases by approximately 1.2% under Existing Plus Project conditions and by approximately 0.2% under Super-Cumulative Plus Project conditions. It should be noted that network VMT reported in this table are rounded to the nearest 100. A more detailed version of this data (unrounded and divided into 5 mile per hour "speed bins") is shown in **Table 3**.

Sacramento County, in accordance with OPR (Office of Planning and Research) guidance[1] has identified an 85% threshold for residential VMT for projects within Unincorporated Sacramento County. In other words, any project whose VMT per Capita (calculated using an accepted methodology, such as using the travel demand model as done in this analysis) exceeds 85% of the regional average represents a significant impact in regard to VMT.

[1] *Technical Advisory on Evaluating Transportation Impacts in CEQA*, California OPR, December 2018

Table 4 shows the changes in VMT per Capita summarized by unincorporated community with implementation of the rezones. The table shows that under base year no project conditions, five of the ten communities have VMT per Capita 85% or less of the regional average. Of these five, four communities see a decrease in VMT per Capita with the addition of the rezones, while one (Vineyard) sees an increase the VMT per Capita that is already beyond the threshold for a VMT impact. None of the decreases result in VMT per Capita decreasing to below the 85% threshold. Under future ("Super-Cumulative") conditions, one of the ten communities (Rio Linda/ Elverta) is projected to have VMT per Capita beyond the 85% threshold without the rezones. This community sees an increase in VMT per Capita with the addition of the rezones. One additional community (Orangevale) is projected to have VMT per Capita at exactly the 85% threshold, while the addition of the rezones increases VMT per Capita in this community beyond the threshold.

TABLE 4:VMT PER CAPITA (ALL UNINCORPORATED TAZS) BY COMMUNITY PLAN AREA1

	# of TAZs		VMT/Capita (Sacramento County CPACs)			
			2016		Super-Cumulative

Regionwide VMT per Capita			**20.20**			
85% of Regional			17.17			

Note: **Bold** numbers represent VMT per Capita greater than 17.17 (85% of base year regionwide average)
TAZ = Traffic Analysis Zone

[1] The results presented in this table are inclusive of three candidate rezone sites (in the South Sacramento community) that are no longer part of the project.

Table 5 shows the changes in VMT per Capita summarized by each of the four EIR's that have been certified by Sacramento County in previous years, including the North Watt Corridor Plan, The Old Florin Town SPA, the Fair Oaks Boulevard Corridor Plan, and the remaining area of the Sacramento County General Plan. The table shows that the rezone sites in each of the areas above covered by a previous EIR have VMT per Capita less than the 85% threshold and although the North Watt Corridor sites show a slight increase in VMT per Capita under Super-Cumulative conditions, none of the sites show VMT per Capita increases that would put them above the threshold.

TABLE 5: VMT PER CAPITA FOR REZONE SITES WITHIN PREVIOUS EIRS

Sacramento County CPAC	Number Of Sites	Number Of DU	VMT/Capita (Sacramento County CPACs)			
			2016		Super-Cumulative

85% of Regional			17.17			

Note: **Bold** numbers represent VMT per Capita greater than 17.17 (85% of base year regionwide average)
TAZ = Traffic Analysis Zone

Table 6 summarizes the number of rezone dwelling units that meet the 85% threshold (non-impact) or exceed the 85% threshold (impact). The table show that of the 7,419 total proposed units, 1,282 (or 17.3%) of the units exceed the threshold under base year conditions, while 1,119 (or 15.1%) of the units exceed the threshold under Super-Cumulative conditions.

TABLE 6:DWELLING UNITS IMPACTS BY COMMUNITY PLAN AREA

Sacramento County CPAC	Number Of Sites	Number of DU	Dwelling Unit Impacts by CPAC			
			2016 Rezone		Super-Cumulative Rezone	
			Non-Impact	Impact	Non-Impact	Impact
Antelope	4	1,037	687	350	826	211
Arden Arcade	1	59	59	-	59	-
Carmichael/Old Foothill Farms	10	387	305	82	387	-
Cordova	2	556	556	-	556	-

South Sacramento	35	3,014	3,014	-	3,014	-
Vineyard	2	143	-	143	-	143
Total	79	7,419	6,137	1,282	6,300	1,119
Percent of Units >85% of Regional Average				17.3%		15.1%

Note: DU = Dwelling Unit

Impact = VMT per Capita greater than 17.17 (85% of base year regionwide average)

Table 7 shows the VMT per Capita (and resultant percentage of regional average) for each of the 79 sites identified for rezone dwelling units. This table allows the County to review each site individually to determine if that site meets or exceeds the 85% threshold. Any locations that are shown in **bold** and **shaded** exceed the 85% threshold and represent a significant impact in terms of VMT. Those that are not bold or shaded meet the threshold and therefore do not represent a significant impact in terms of VMT.

In addition to the results for each site, the table also shows that the weighted average VMT per Capita for all rezone households (based on number of units per site) falls within the 85% threshold for both base year (75%) and future year (73%) conditions.

Subject: Request for Ability to Serve the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-00042)

Dear Justin Chen,

Planning and Environmental Review (PER) is currently preparing the environmental analysis associated with the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Project). The Project's revised Notice of Preparation (NOP) was released on December 22, 2023, and may be viewed online at: https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx.

The Sacramento County Housing Element of 2021-2029 identifies a shortfall of 2,884 units for the lower-income category (includes the low, very low, and extremely low income categories; incomes ranging from $0 to $69,050 annually) in the County. Simply, there is insufficient appropriately-zoned sites to accommodate the County's RHNA obligation for the lower-income category. As such, PER is undertaking a rezone of ±248.33 acres comprising 83 candidate rezone sites within the unincorporated County to provide additional lower-income (to fulfill the RHNA obligation and increase the buffer) and moderate income (to increase the buffer) category housing opportunities. The Project does not propose to construct new residential or other development on the ±248.33 acres proposed to be rezoned; rather, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. The planning horizon year for the Project is 2029.

Attachment 1 lists the 3 candidate rezone sites (Sites 12, 13 and 71) within Carmichael Water District's service area that are proposed to be rezoned with the Project. Information regarding site acreage, existing and proposed zoning designations, and net increase in units are also provided. The net increase in residential units is calculated as the difference between an existing zoning designation's maximum density and the proposed zoning designation's maximum density. For example, a 1-acre site currently zoned RD-20 (maximum density of 20 units per acre) with a proposed zoning of RD-30 (maximum density of 30 units per acre) nets 10 additional units with the Project. Attachment 2 depicts the locations of these candidate rezone sites within Carmichael Water District's service area, as well as individual site maps. In total, the Project is anticipated

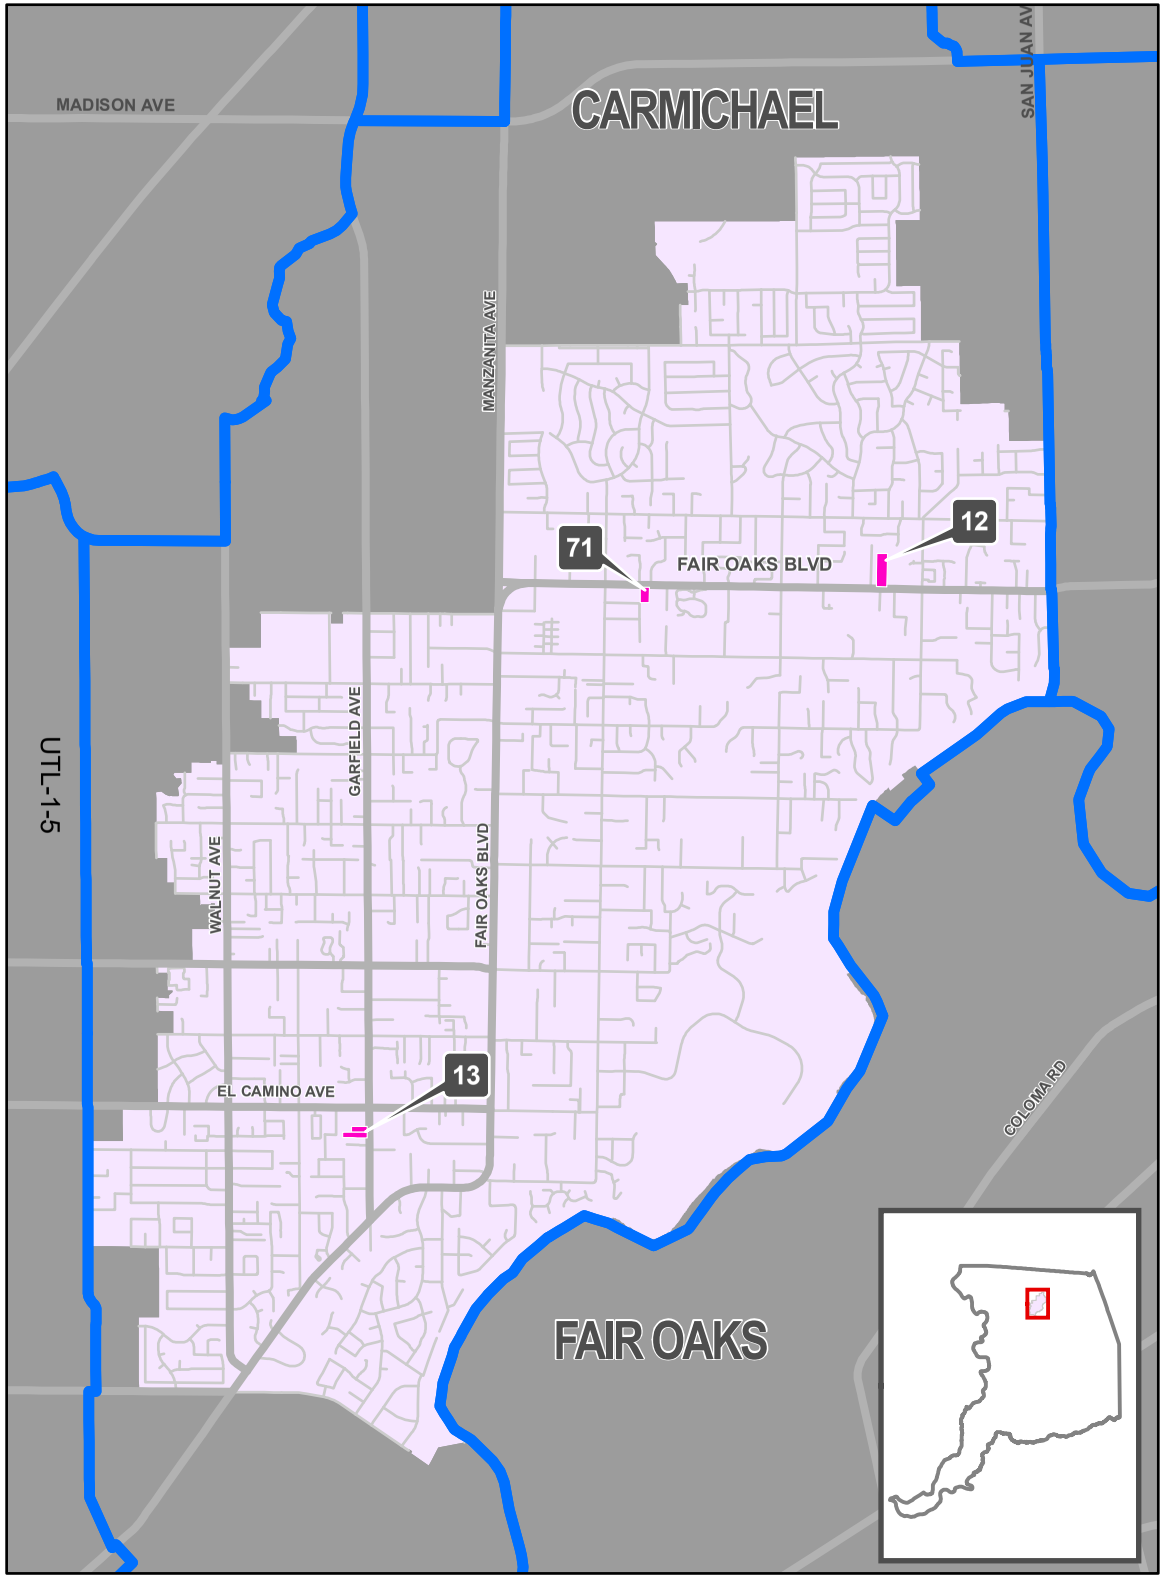
to result in a net increase of 142 lower-income units within Carmichael Water District's service area.

It is noted that Section 4.6 of the Carmichael Water District's 2020 Urban Water Management Plan provides a projection of water use for lower income households. Pursuant to California Water Code §10910 through 10915, PER requests the following information:

1. Whether the projected water demand associated with the Project was include as part of the most recently adopted urban water management plan; and
2. If the Project's water demand was not included as part of the most recently adopted urban water management plan, does Carmichael Water District have adequate capacities to serve the Project?

Additionally, PER requests any comments (including conditions of approval or advisories) Carmichael Water District may have for the Project. If you have any questions or would like to set up a meeting to further discuss the Project, please contact me at shenj@saccounty.gov or 916.875.3711.

Sincerely,



Jessie Shen
Senior Planner

RE: Request for Ability to Serve the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-0042)

Dear Jessie Shen,

We have received your inquiry requesting information regarding the 3 candidate rezone sites (Sites 12, 13, and 71) within Carmichael Water District's service area.

Please see the response to the request for information:

1. Whether the projected water demand associated with the Project was included as part of the most recently adopted urban water management plan; and

   According to Carmichael Water District's 2020 Urban Water Management Plan (2020 UWMP), the anticipated net increase of 142 lower-income units fall within the forecasted future water use 2020 – 2030 (Section 4.4.3), thus, within the timeline of Sacramento County Housing Element of 2021 – 2029 project.

   Annual demand of water for multi-family residential is 0.14 acre-feet/dwelling unit and the proposed net increase of 142 units will result in annual water demand of 19.88 acre-feet. Carmichael Water District anticipates ~30 acre-feet of estimated low-income water use by 2030 (Section 4.6). Carmichael Water District is capable of meeting the water demands in its service area in normal, single dry, and five consecutive dry years from 2020 – 2045 as long as the guidelines disclosed in the portfolio is strategically implemented (2020 UWMP, Section 5.4).

   Carmichael Water District concludes that the district holds adequate capacity to serve the Project and has considered this level of increased demand within the specified timeframe.

2. If the Project's water demand was not included as part of the most recently adopted water management plan, does Carmichael Water District have adequate capacities to serve the project?

   N/A.

We do not have any further comments at this time. However, if you have any questions or require additional information, please contact the office at (916) 483-2452 or send our department an email at engineering@carmichaelwd.org.

Sincerely,

Gregory R. Norris

Sacramento, CA 95822
mcarrey@cityofsacramento.org

Subject: Request for Ability to Serve the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-00042)

Dear Michelle Carrey,

Planning and Environmental Review (PER) is currently preparing the environmental analysis associated with the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Project). The Project's revised Notice of Preparation (NOP) was released on December 22, 2023, and may be viewed online at: https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx.

The Sacramento County Housing Element of 2021-2029 identifies a shortfall of 2,884 units for the lower-income category (includes the low, very low, and extremely low income categories; incomes ranging from $0 to $69,050 annually) in the County. Simply, there is insufficient appropriately-zoned sites to accommodate the County's RHNA obligation for the lower-income category. As such, PER is undertaking a rezone of ±248.33 acres comprising 83 candidate rezone sites within the unincorporated County to provide additional lower-income (to fulfill the RHNA obligation and increase the buffer) and moderate income (to increase the buffer) category housing opportunities. The Project does not propose to construct new residential or other development on the ±248.33 acres proposed to be rezoned; rather, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. The planning horizon year for the Project is 2029.

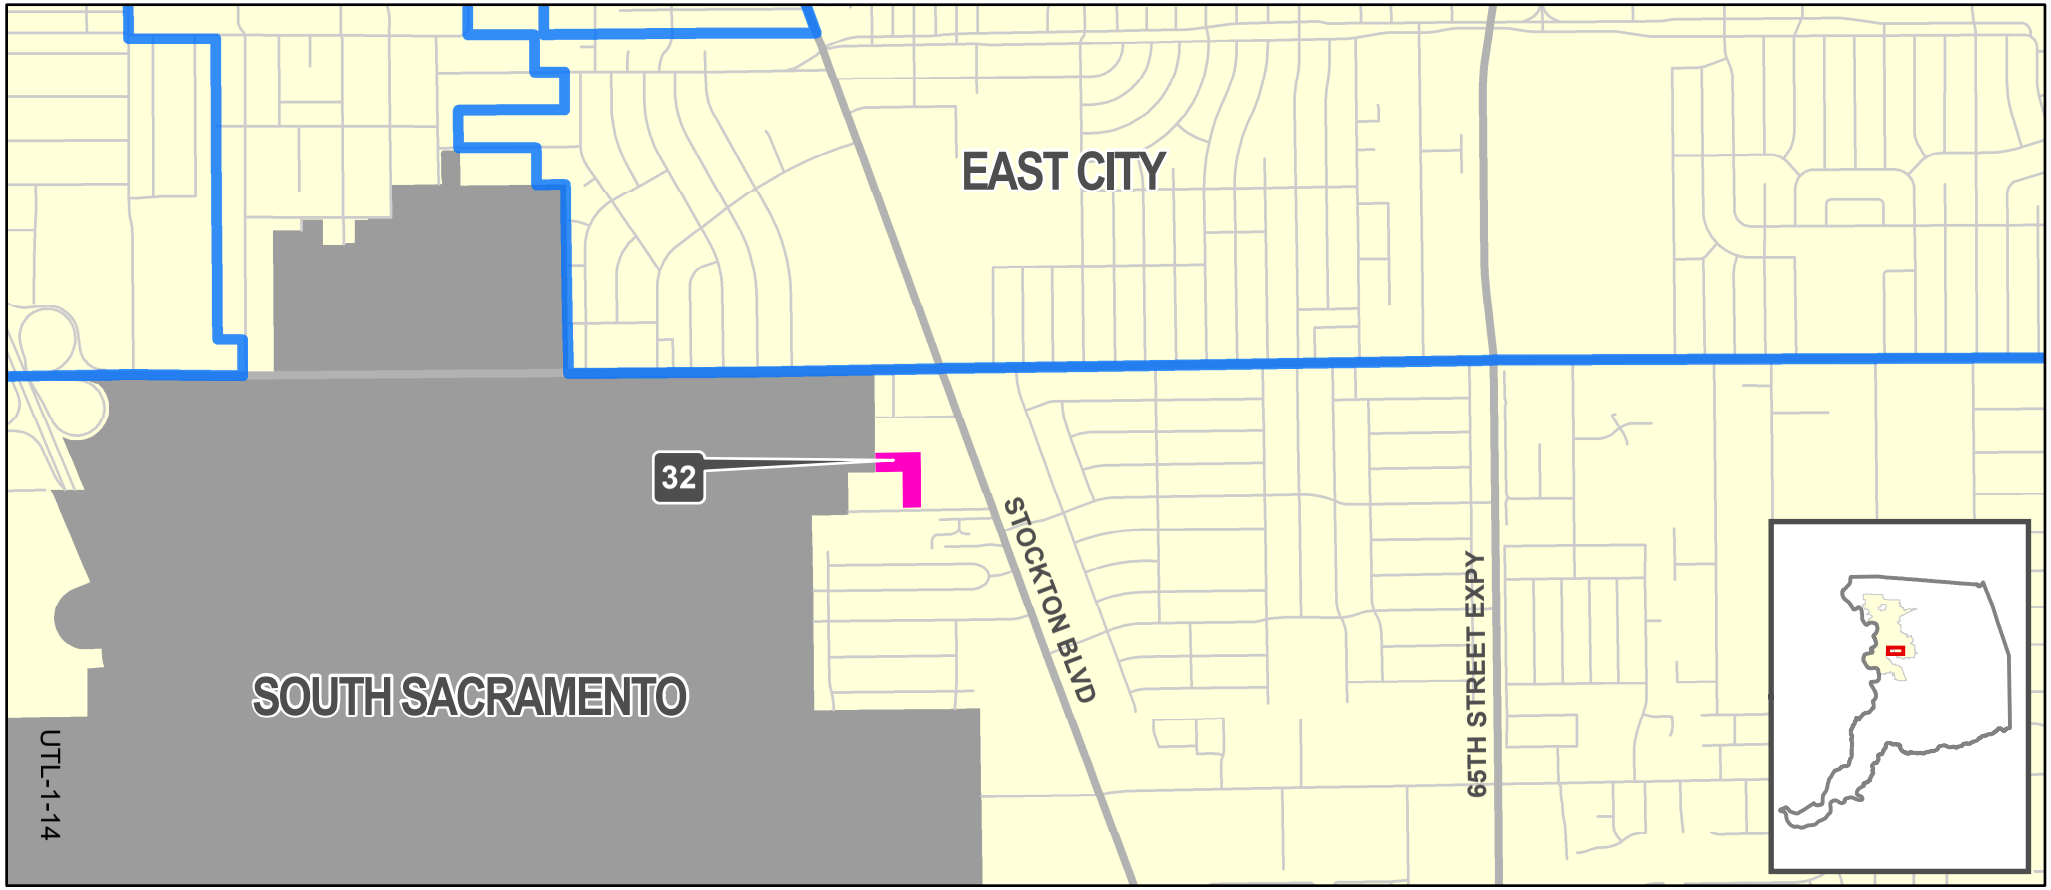
Attachment 1 lists the 1 candidate rezone site (Site 32) within the City of Sacramento's water service area that is proposed to be rezoned with the Project. Information regarding site acreage, existing and proposed zoning designations, and net increase in units are also provided. The net increase in residential units is calculated as the difference between an existing zoning designation's maximum density and the proposed zoning designation's maximum density. For example, a 1-acre site currently zoned RD-20 (maximum density of 20 units per acre) with a proposed zoning of RD-30 (maximum density of 30 units per acre) nets 10 additional units with a rezone. Attachment 2 depicts the location of this candidate rezone site within the City of Sacramento's water service area, as well as an individual site map. In total, the Project is anticipated to result in a net increase of 43 lower-income units within the City of Sacramento's water service area.

It is noted that Section 4.6 of the City of Sacramento's 2020 Urban Water Management Plan provides a projection of water use for lower income households. Pursuant to California Water Code §10910 through 10915, PER requests the following information:

1. Whether the projected water demand associated with the Project was include as part of the most recently adopted urban water management plan; and
2. If the Project's water demand was not included as part of the most recently adopted urban water management plan, does the City of Sacramento have adequate capacities to serve the Project?

Additionally, PER requests any comments (including conditions of approval or advisories) the City of Sacramento may have for the Project. If you have any questions or would like to set up a meeting to further discuss the Project, please contact me at shenj@saccounty.gov or 916.875.3711.

Sincerely,



Jessie Shen

City of Sacramento
SB 610/SB 221 Water Supply Assessment and Certification Form

This form may be used to complete water supply assessments for projects located in an area covered by the City's most recent Urban Water Management Plan.

Note: Please do not use this form if the projected water demand for your project area was not included in the City's latest Urban Water Management Plan. To review the City's Urban Water Management Plan, please visit: https://www.cityofsacramento.org/Utilities/Reports

Project: PLNP2020-00042 Sacramento County RHNA Rezone Project

Date: 3/5/2024

Project Applicant (Name of Company): Sacramento County Planning and Environmental Review

Applicant Contact (Name of Individual): Nathan Serafin

Phone Number: 916-874-7708

E-mail: serafinn@saccounty.gov

Address: 827 7th Street, Room 225, Sacramento, CA 95814

Project Applicant to fill in the following:

1. Does the project include:

Type of Development	Yes	No
A proposed residential development of 500 or more dwelling units	☐	✓
A shopping Center employing more than 1,000 persons or having more than 500,000 square feet?	☐	✓
A Commercial Office building employing more than 1,000 persons or having more than 250,000 square feet?	☐	✓
A proposed hotel or motel, or both, having more than 500 rooms	☐	✓
A proposed industrial, manufacturing, or processing plant or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area	☐	✓
A mixed use project that includes one or more of the projects specified above	☐	✓
A project that would demand an amount of water equivalent to, or greater than, the water required by a 500 dwelling unit project	☐	✓

If the answer is no to all of the above, a water supply assessment is not required for the project.

2. Is the projected water demand for the project location included in the City's 2020 Urban Water Management Plan, adopted June 29, 2021?

Yes: ☑ No: ☐

If the answer is no, you cannot use this form. Please refer to the requirements of SB 610 for preparing a water supply assessment.

3. Please fill in the project demands below:

Type of Development	Land Use Category	Demand Factor		Proposed Development			Current Zoning		
		Residential Water Use Factor, afy/dwelling unit	Non-Residential Water Use Factor, afy/employee	Number Dwelling Units	Number Employees	Total Demand	Number Dwelling Units	Number Employees	Total Demand
Residential - Low	Rural Residential (RR)	.61	.09						
	Suburban Neighborhood Low Density (SNLD)								
	Traditional Neighborhood Low Density (TLDR)								
Residential - Medium	Suburban Neighborhood Medium Density (SMDR)	.39	.09						
	Urban Neighborhood Low Density (ULDR)

Park	Parks and Recreation (PRK)	.37	.17						
Open Space	Open Space (OS)	0	0						
Other									
Other									
Other									
Total Demand (AFY)									5.16

4. Required Elements of Water Supply Assessment (Water Code § 10910)

A. Water supply entitlements, water rights or water service contracts (Water Code § 10910(d)):

The City's water supply entitlements, water rights and water service contract are identified and discussed in the Urban Water Management Plan, Chapters 3, 6, and 7.

All infrastructure necessary to deliver a water supply to the project is in place, excepting any distribution facilities required to be constructed and financed by the project applicant: Yes: [✓] No: [ ]

B. Identification of other sources of water supply if no water has been received under City's existing entitlements, water rights or water service contracts (Water Code § 10910(e)):

Not applicable.

C. Information and analysis pertaining to groundwater supply (Water Code § 10910(f)):

Addressed by Urban Water Management Plan, Chapters 3, 6, and 7.

Verification of Water Supply
(for residential development of more than 500 dwelling units)

Based on the City's most recent Urban Water Management Plan, are there sufficient water supplies for the project during normal, single dry and multiple dry years over a 20 year period?

Yes: [✓] No: [ ]

Fair Oaks, CA 95628
tgray@fowd.com

Subject: Request for Ability to Serve the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-00042)

Dear Tom Gray,

Planning and Environmental Review (PER) is currently preparing the environmental analysis associated with the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Project). The Project's revised Notice of Preparation (NOP) was released on December 22, 2023, and may be viewed online at: https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx.

The Sacramento County Housing Element of 2021-2029 identifies a shortfall of 2,884 units for the lower-income category (includes the low, very low, and extremely low income categories; incomes ranging from $0 to $69,050 annually) in the County. Simply, there is insufficient appropriately-zoned sites to accommodate the County's RHNA obligation for the lower-income category. As such, PER is undertaking a rezone of ±248.33 acres comprising 83 candidate rezone sites within the unincorporated County to provide additional lower-income (to fulfill the RHNA obligation and increase the buffer) and moderate income (to increase the buffer) category housing opportunities. The Project does not propose to construct new residential or other development on the ±248.33 acres proposed to be rezoned; rather, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. The planning horizon year for the Project is 2029.

Attachment 1 lists the 2 candidate rezone sites (Sites 18 and 19) within Fair Oaks Water District's service area that are proposed to be rezoned with the Project. Information regarding site acreage, existing and proposed zoning designations, and net increase in units are also provided. The net increase in residential units is calculated as the difference between an existing zoning designation's maximum density and the proposed zoning designation's maximum density. For example, a 1-acre site currently zoned RD-20 (maximum density of 20 units per acre) with a proposed zoning of RD-30 (maximum density of 30 units per acre) nets 10 additional units with a rezone. Attachment 2 depicts the locations of these candidate rezone sites within Fair Oaks Water District's service area, as well as individual site maps. In total, the Project is anticipated to result in a net increase of 51 lower-income units within Fair Oaks Water District's service area.

It is noted that Section 4-6 of the Fair Oaks Water District's 2020 Urban Water Management Plan provides a projection of water use for lower income households. Pursuant to California Water Code §10910 through 10915, PER requests the following information:

1. Whether the projected water demand associated with the Project was include as part of the most recently adopted urban water management plan; and
2. If the Project's water demand was not included as part of the most recently adopted urban water management plan, does Fair Oaks Water District have adequate capacities to serve the Project?

Additionally, PER requests any comments (including conditions of approval or advisories) Fair Oaks Water District may have for the Project. If you have any questions or would like to set up a meeting to further discuss the Project, please contact me at shenj@saccounty.gov or 916.875.3711.

Nathan,

The Fair Oaks Water District (FOWD) can serve all parcels within our existing service area, including those parcels within the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-00042). Specific conditions for approval for each parcel will be determined upon the County Planning application distribution for comments and conditions and with a service application to the FOWD.

Please contact me with any questions.

Regards,

County of Sacramento

December 29, 2023

Edmond Leggette, General Manager
Florin County Water District
PO Box 292055
Sacramento, CA 95829
fcwd@sbcglobal.net

Subject: Request for Ability to Serve the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-00042)

Dear Edmond Leggette,

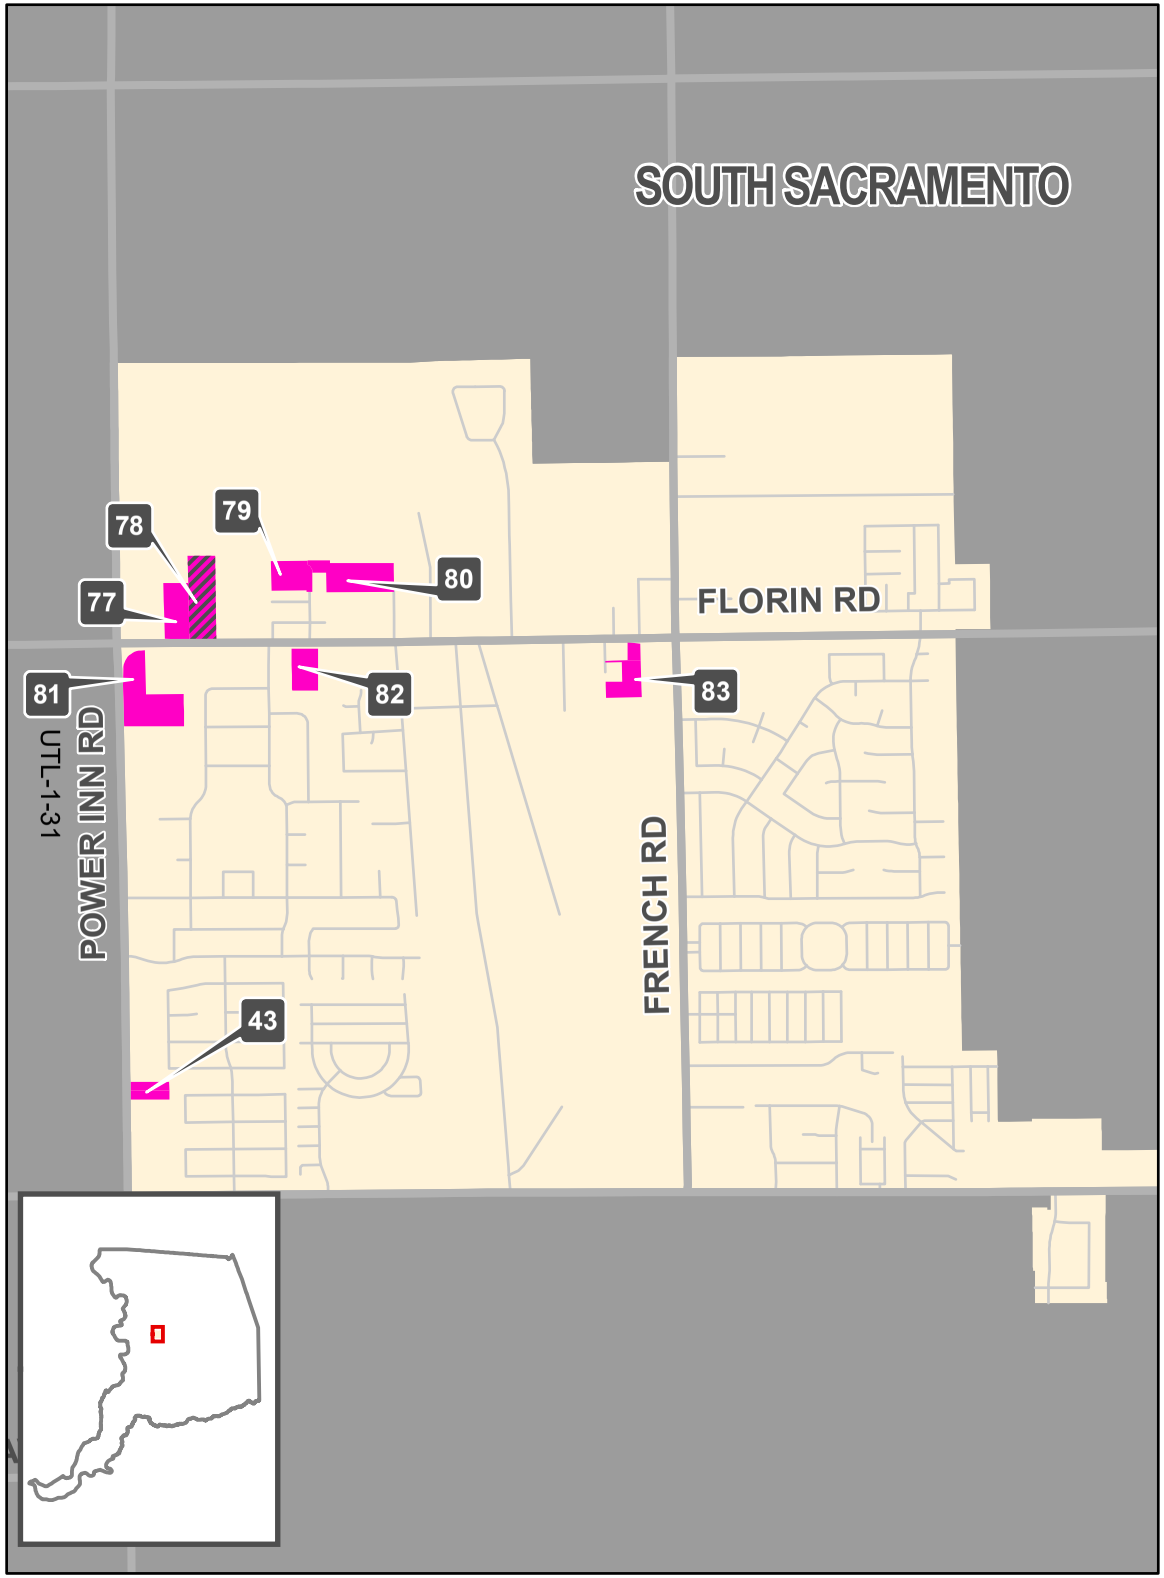
Planning and Environmental Review (PER) is currently preparing the environmental analysis associated with the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Project). The Project's revised Notice of Preparation (NOP) was released on December 22, 2023, and may be viewed online at: https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx.

The Sacramento County Housing Element of 2021-2029 identifies a shortfall of 2,884 units for the lower-income category (includes the low, very low, and extremely low income categories; incomes ranging from $0 to $69,050 annually) in the County. Simply, there is insufficient appropriately-zoned sites to accommodate the County's RHNA obligation for the lower-income category. As such, PER is undertaking a rezone of ±248.33 acres comprising 83 candidate rezone sites within the unincorporated County to provide additional lower-income (to fulfill the RHNA obligation and increase the buffer) and moderate income (to increase the buffer) category housing opportunities. The Project does not propose to construct new residential or other development on the ±248.33 acres proposed to be rezoned; rather, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. The planning horizon year for the Project is 2029.

Attachment 1 lists the 8 candidate rezone sites (Sites 43, 77-83) within Florin County Water District's service area that are proposed to be rezoned with the Project. Information regarding site acreage, existing and proposed zoning designations, and net increase in units are also provided. The net increase in residential units is calculated as the difference between an existing zoning designation's maximum density and the proposed zoning designation's maximum density. For example, a 1-acre site currently zoned RD-20 (maximum density of 20 units per acre) with a proposed zoning of RD-30 (maximum density of 30 units per acre) nets 10 additional units with a rezone. Attachment 2 depicts the locations of these candidate sites within Florin County Water District's service area, as well as individual site maps. In total, the Project is anticipated to result in a net increase of 288 lower-income units within Florin County Water District's service area.

PER requests information pertaining to whether Florin County Water District has adequate capacities to serve the Project. It is noted that Florin County Water District does not meet the criteria that necessitates the preparation of an urban water management plan. Additionally, PER requests any comments (including conditions of approval or advisories) Florin County Water District may have for the Project. If you have any questions or would like to set up a meeting to further discuss the Project, please contact me at shenj@saccounty.gov or 916.875.3711.

Sincerely,



Jessie Shen
Senior Planner

Orangevale, CA 95662
jduran@orangevalewater.com

Subject: Request for Ability to Serve the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-00042)

Dear Joe Duran,

Planning and Environmental Review (PER) is currently preparing the environmental analysis associated with the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Project). The Project's revised Notice of Preparation (NOP) was released on December 22, 2023, and may be viewed online at: https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx.

The Sacramento County Housing Element of 2021-2029 identifies a shortfall of 2,884 units for the lower-income category (includes the low, very low, and extremely low income categories; incomes ranging from $0 to $69,050 annually) in the County. Simply, there is insufficient appropriately-zoned sites to accommodate the County's RHNA obligation for the lower-income category. As such, PER is undertaking a rezone of ±248.33 acres comprising 83 candidate rezone sites within the unincorporated County to provide additional lower-income (to fulfill the RHNA obligation and increase the buffer) and moderate income (to increase the buffer) category housing opportunities. The Project does not propose to construct new residential or other development on the ±248.33 acres proposed to be rezoned; rather, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. The planning horizon year for the Project is 2029.

Attachment 1 lists the 7 candidate rezone sites (Site 25-26 and 64-68) within Orange Vale Water Company's (OVWC's) service area that are proposed to be rezoned with the Project. Information regarding site acreage, existing and proposed zoning designations, and net increase in units are also provided. The net increase in residential units is calculated as the difference between an existing zoning designation's maximum density and the proposed zoning designation's maximum density. For example, a 1-acre site currently zoned RD-20 (maximum density of 20 units per acre) with a proposed zoning of RD-30 (maximum density of 30 units per acre) nets 10 additional units with a rezone. Attachment 2 depicts the locations of these candidate rezone sites within OVWC's service area, as well as individual site maps. In total, the Project is anticipated to result in a net

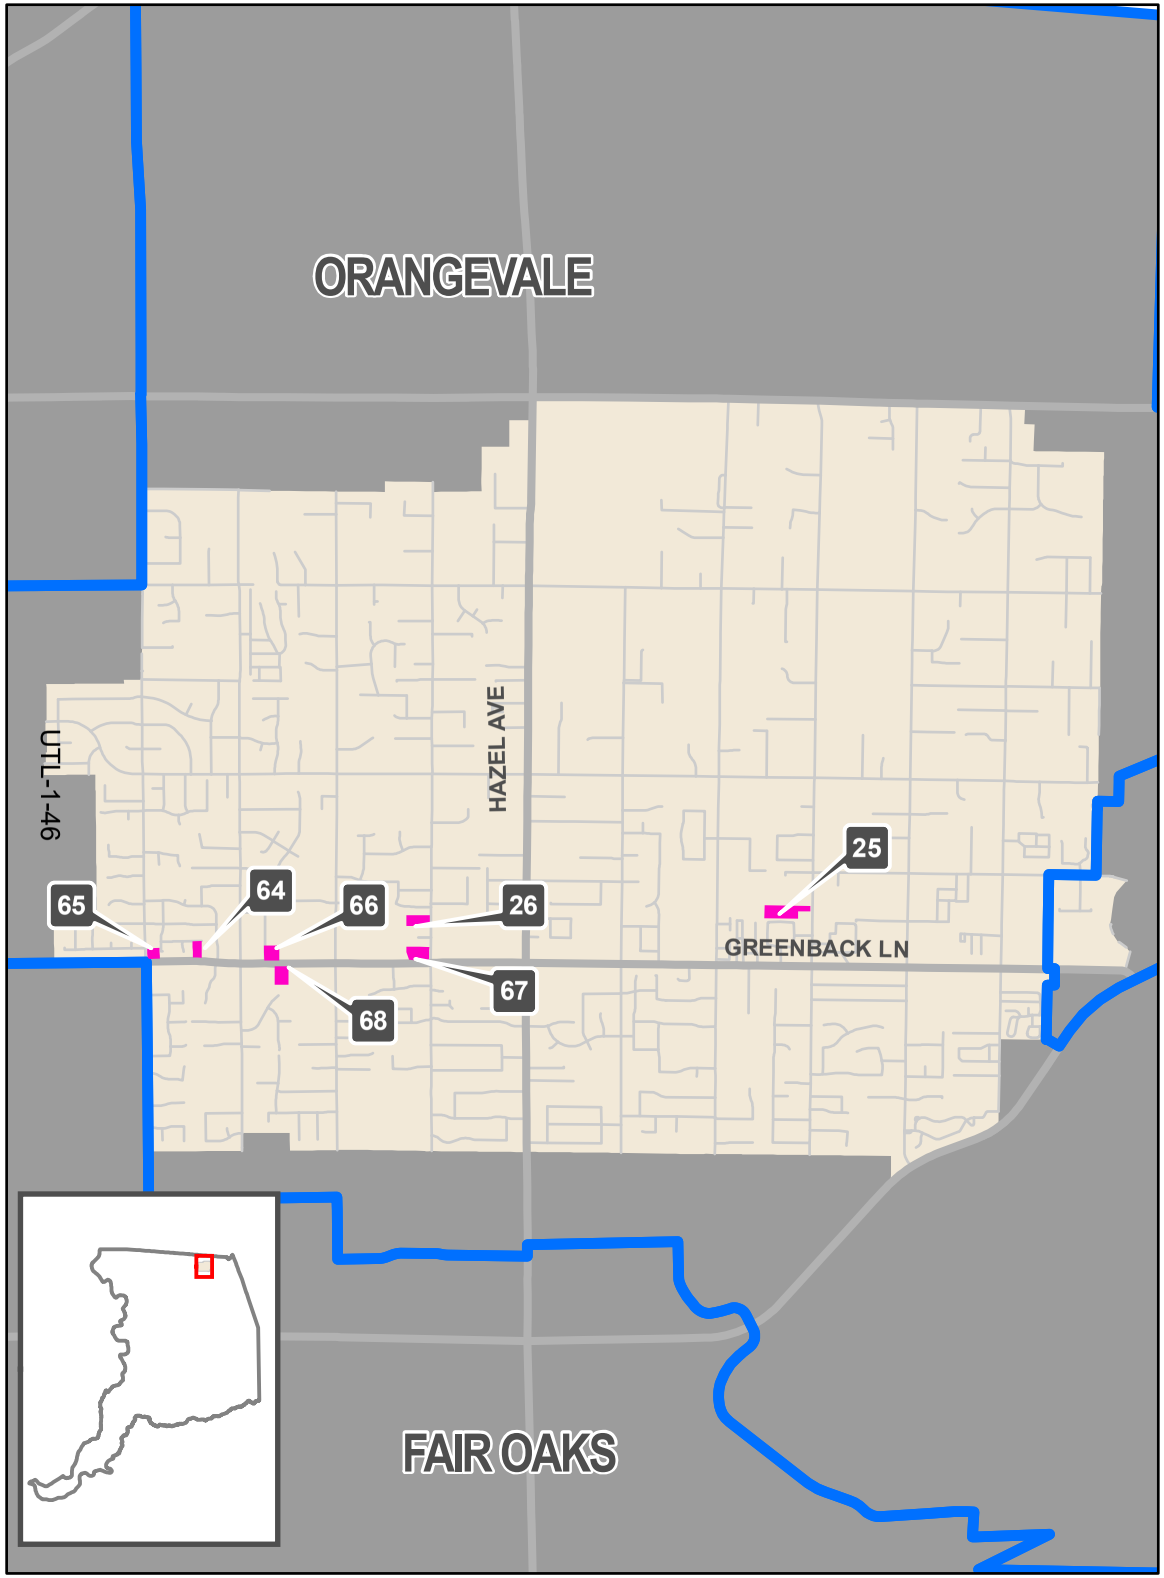
increase of 163 units (144 lower-income units and 19 moderate-income units) within OVWC's service area.

It is noted that Section 4.6 of the OVWC's 2020 Urban Water Management Plan provides a projection of water use for lower income households. Pursuant to California Water Code §10910 through 10915, PER requests the following information:

1. Whether the projected water demand associated with the Project was include as part of the most recently adopted urban water management plan; and
2. If the Project's water demand was not included as part of the most recently adopted urban water management plan, does OVWC have adequate capacities to serve the Project?

Additionally, PER requests any comments (including conditions of approval or advisories) OVWC may have for the Project. If you have any questions or would like to set up a meeting to further discuss the Project, please contact me at shenj@saccounty.gov or 916.875.3711.

Sincerely,



Jessie Shen
Senior Planner

Good morning Jessie,

I received your request for water availability to serve Sac County's RHNA project. I am not aware if this project was in our Urban Management plan, but I doubt it. We have plenty of capacity to cover all these projects. Our demands have gone down over past years due to metering and conservation efforts.

You may reach out to me directly if you have any other questions. Joe Duran is no longer with the company.

Sincerely,

Mark DuBose

Rio Linda, CA 95673
GM@rlecwd.com

Subject: Request for Ability to Serve the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-00042)

Dear Tim Shaw,

Planning and Environmental Review (PER) is currently preparing the environmental analysis associated with the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Project). The Project's revised Notice of Preparation (NOP) was released on December 22, 2023, and may be viewed online at: https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx.

The Sacramento County Housing Element of 2021-2029 identifies a shortfall of 2,884 units for the lower-income category (includes the low, very low, and extremely low income categories; incomes ranging from $0 to $69,050 annually) in the County. Simply, there is insufficient appropriately-zoned sites to accommodate the County's RHNA obligation for the lower-income category. As such, PER is undertaking a rezone of ±248.33 acres comprising 83 candidate rezone sites within the unincorporated County to provide additional lower-income (to fulfill the RHNA obligation and increase the buffer) and moderate income (to increase the buffer) category housing opportunities. The Project does not propose to construct new residential or other development on the ±248.33 acres proposed to be rezoned; rather, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. The planning horizon year for the Project is 2029.

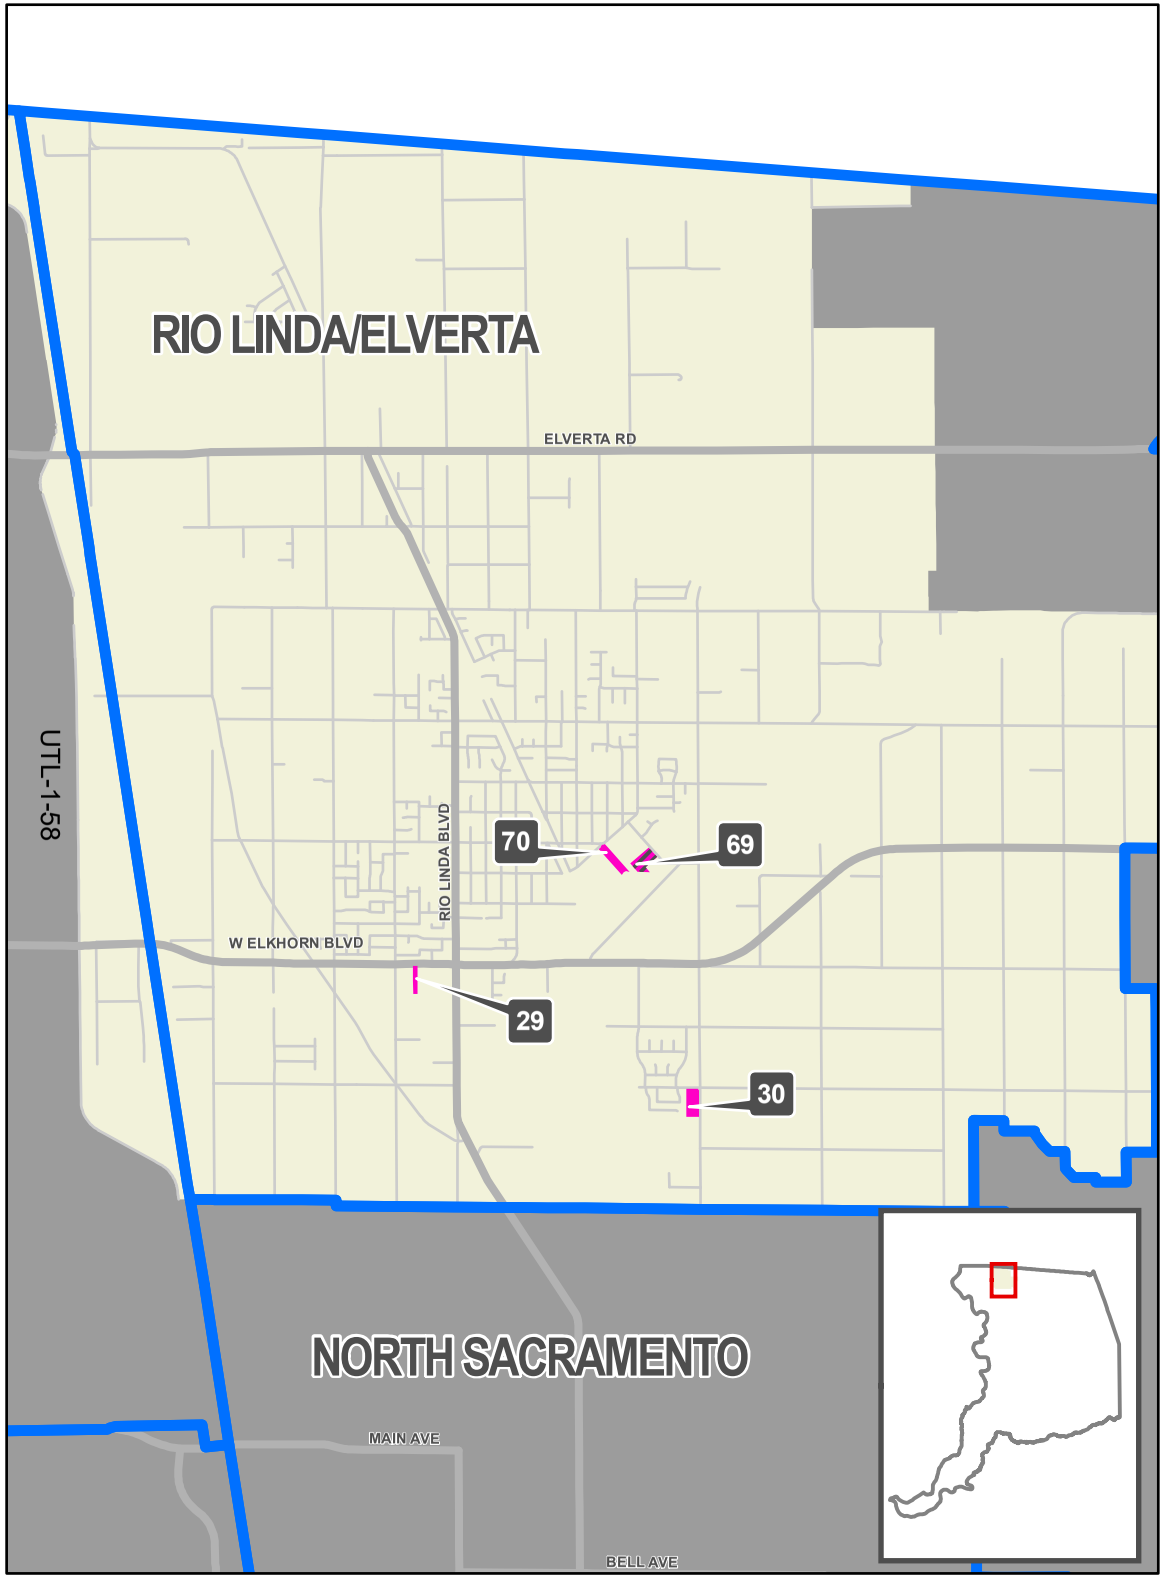
Attachment 1 lists the 4 candidate rezone sites (Sites 29-30 and 69-70) within Rio Linda/Elverta Community Water District's (RLECWD's) service area that are proposed to be rezoned with the Project. Information regarding site acreage, existing and proposed zoning designations, and net increase in units are also provided. The net increase in residential units is calculated as the difference between an existing zoning designation's maximum density and the proposed zoning designation's maximum density. For example, a 1-acre site currently zoned RD-20 (maximum density of 20 units per acre) with a proposed zoning of RD-30 (maximum density of 30 units per acre) nets 10 additional units with a rezone. Attachment 2 depicts the locations of these candidate sites within RLECWD's service area, as well as individual site maps. In total, the Project is anticipated to result in a net increase of 118 lower-income units within RLECWD's service area.

It is noted that Section 4.2.4 of the RLECWD's 2020 Urban Water Management Plan provides a projection of water use for lower income households. Pursuant to California Water Code §10910 through 10915, PER requests the following information:

1. Whether the projected water demand associated with the Project was include as part of the most recently adopted urban water management plan; and
2. If the Project's water demand was not included as part of the most recently adopted urban water management plan, does RLECWD have adequate capacities to serve the Project?

Additionally, PER requests any comments (including conditions of approval or advisories) RLECWD may have for the Project. If you have any questions or would like to set up a meeting to further discuss the Project, please contact me at shenj@saccounty.gov or 916.875.3711.

Sincerely,



Jessie Shen

Nathan and Jesse:

Firstly, thank you for your patience. My response has been delayed due to unscheduled, concerted demands associated with ongoing litigation. The litigation has been in process for eight years, and is now ratcheting up significantly. We are a small agency with limited resource to maintain more than a few spinning plates at the same time.

Secondly, I must apologize that your direct questions do not have correspondingly direct responses. Sometimes the world is not as conveniently black and white as we would like it to be. I have read and understand (I think) your request and the citations therein. In response, I provide the following information:

The attached Section 4.2.4 of the District's UWMP does provide projections. However, section 4.2.4 also stipulates the limitations to planning described in section 4.2.1 (relevant section also attached). Section 4.2.1 explains the severely protracted delay in long-planned residential development coming to fruition. At the center of this protracted delay is a Sacramento County planning document titled "Rio Linda Elverta Community Plan", which includes a restriction (PF-8) on continued use of groundwater. Simply put, the 1998 document stipulates "No net increase in groundwater pumping". Extending that premise, the document prescribes alternative water supplies, e.g. surface water, are needed to enable development.

In 2018, the District was in robust, recurring discussions with Elverta Specific Plan representatives to explore means of complying with the groundwater use restrictions delineated in the Rio Linda Elverta Community Plan. Consistently the Elverta Specific Plan developers were funding the District's participation in a project aimed at procuring surface water facilities. Unfortunately, the developers suddenly ceased financial support for the River Arc project citing "fiscal fatigue". Dialog with the developers acutely evaporated in 2018.

The Water Code sections you've cited in your request include, generally, that the District needs to describe its actions to procure sufficient supplies if such sufficiency does not yet exist. The District has adopted (in 2016) a capacity fee structure to include the projected, substantial costs for surface water facilities. However, those funds in that magnitude will NOT materialize unless and until a substantial number of residential units are constructed with each unit paying a drinking water capacity fee. Any units built on groundwater, with the promise of

future construction of surface water facilities, exposes the potential that home building can stop before sufficient funding is acquired.

In my considerable experience, the above described conundrum is typically assuaged via developers encumbering their land with a community facilities district (Mello-Roos). Such municipal funding methods mitigate the potential for broken promises. Unfortunately, the District inquired with the developers regarding the feasibility of Mello-Roos funding and their response was that their project does NOT have the bonding capacity for drinking water facilities. Expounding, they have so much infrastructure needs requiring bonds that there isn't enough room for water infrastructure funding. To illustrate, the developers conveyed, "if the County does not provide relief on transportation costs, we won't need any water".

Please contact me with any needed clarifications.

Good afternoon,

I'm following up on my previous email regarding our request for an Ability to Serve the Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-00042).

I'll be available if you have any questions or issues. Thank you!

Dear Tim Shaw,

Please find attached Sacramento County PER's Request for Ability to Serve the Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-00042).

Full details are included in the attached PDF, which include the request letter and a description of sites within your service area. Please reach out if you have any questions or issues accessing the document.

Best,

Nathan Serafin, Planning Associate

4.2.1.2 *Planned Development Within the Service Area*

The District considered all anticipated growth within the District as a part of its demand projections. In order to verify that the selected growth assumptions appropriately include new developments, known planned developments were inventoried. The Elverta Specific Plan (ESP), which falls under the land use authority of Sacramento County, is currently the only known planned development within the District.[2] The ESP is a proposed 1,756-acre development located in the northeastern portion of the District's service area, consisting of residential, agricultural residential, commercial, office/professional, parks, and school land uses (Figure 3-3). In 2016, the District prepared a Water Supply Assessment (WSA) to support the development planning process. At that time, the demand associated with the project was estimated to be 944 AFY by 2017 and 4,303 AFY at full buildout by 2037 (Affinity Engineering and J. Crowley Group, 2016). However, construction of the ESP has not yet begun, and Sacramento County is in the process of updating the ESP. Since the updated land use plans for the ESP are not currently known, the demands associated with the ESP cannot be estimated at this time, and thus are not included in the District's projected water demands (Table 4-7). However, it is noted, that given the scale of the ESP, it is anticipated that the District will be required to prepare a revised WSA for the updated ESP, which will evaluate the availability of supply to meet all demands for the District, inclusive of the ESP and other anticipated growth. Additionally, it is noted that the District has the right to update its UWMP at any point, including outside of the 5-year regulatory-required update cycle, and that depending on the timing of the revised ESP, the District may opt to update or provide an amendment to the 2020 UWMP.

The annual growth rate of 0.38 percent, used as the basis for the growth in District demands, is anticipated to conservatively account for all anticipated growth within the District, outside of the ESP.

4.2.1.3 *Water Demand Factors*

Water use rates are influenced by a variety of factors, including weather, economic recession, and state and local regulations, among other drivers. Given this, selecting a "representative" baseline is important for developing the land-use based water demand factors to estimate baseline water use by existing customers, which can then be extrapolated and applied to future growth within the District.

Table 4-2 provides current and historical potable water demand and Table 4-1 provides historical water use by sector within the District. It is noted that the most recent water demand, for 2020 and 2021 was consistent with the pre-drought conditions of 2011-2013. However, in addition to climate and weather influences, customer water demands over the recent historical period are also influenced by water rates. In 2016, the District adopted a new water rate structure, that eliminated tiered rates and removed the rate-based incentive for customers to conserve water. In 2022, the District again adopted a

4.2.4 Water Use for Lower Income Households

☑ *CWC § 10631.1*

(a) The water use projections required by Section 10631 shall include projected water use for single-family and multifamily residential housing needed for lower income households, as defined in Section 50079.5 of the Health and Safety Code, as identified in the housing element of any city, county, or city and county in the service area of the supplier.

(b) It is the intent of the Legislature that the identification of projected water use for single-family and multifamily residential housing for lower income households will assist a supplier in complying with the requirements under Section 65589.7 of the Government Code to grant a priority for the provision of service to housing units affordable to lower income households.

The water demands presented in Section 4.1.2 include projected future water use by lower income households. Per Health and Safety Code 50079.5, a lower income household is defined as a household with lower than 80 percent of the District's median income.

The water demand for lower income households was based on the number of needed extremely-low, very-low, and low-income units for 2021-2029 housing cycle identified in Sacramento County for the Sacramento Area Council of Governments' (SACOG) 2020 Regional Housing Needs Plan (RHNP). As presented in the Sacramento County Housing Element of 2021-2029, the RHNP identified a need for 2,233 extremely-low income, 2,233 very-low income, and 2,692 low-income units by 2029, or approximately 33 percent of households out of the total planned 21,272 units for unincorporated Sacramento County (Sacramento County, 2022). Since the District falls within the unincorporated Sacramento County area it is therefore assumed that approximately 33 percent of SFR and MFR residential water demands within the District's service area will be associated with lower income households.

The projected water demand for lower income households within the District's service area is presented in Table 4-9 for five-year increments between 2020 and 2040, which is estimated as 33 percent of the projected water demands of the associated sectors presented in Table 4-6. The total water demand for lower income households in 2045 is estimated to be 811 AFY.

Table 4-9 Projected Potable Water Demand for Lower-Income Households

Sector	2025	2030	2035	2040	2045
Single Family	725	746	766	783	798
Multi-Family	12	12	12	13	13
TOTAL	737	758	778	796	811

NOTES:
(a) Volumes are in units of AF.
(b) Per the District's 2021-2029 housing cycle identified in Sacramento County for the Sacramento Area Council of Governments' (SACOG) 2020 Regional Housing Needs Plan (RHNP), 33 percent of housing units served lower income households. It is assumed that approximately 33 percent of the future residential water demand will be associated with lower income households.

schmitzk@saccounty.gov

Subject: Request for Ability to Serve the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-00042)

Dear Kerry Schmitz,

Planning and Environmental Review (PER) is currently preparing the environmental analysis associated with the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Project). The Project's revised Notice of Preparation (NOP) was released on December 22, 2023, and may be viewed online at: https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx.

The Sacramento County Housing Element of 2021-2029 identifies a shortfall of 2,884 units for the lower-income category (includes the low, very low, and extremely low income categories; incomes ranging from $0 to $69,050 annually) in the County. Simply, there is insufficient appropriately-zoned sites to accommodate the County's RHNA obligation for the lower-income category. As such, PER is undertaking a rezone of ±248.33 acres comprising 83 candidate rezone sites within the unincorporated County to provide additional lower-income (to fulfill the RHNA obligation and increase the buffer) and moderate income (to increase the buffer) category housing opportunities. The Project does not propose to construct new residential or other development on the ±248.33 acres proposed to be rezoned; rather, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. The planning horizon year for the Project is 2029.

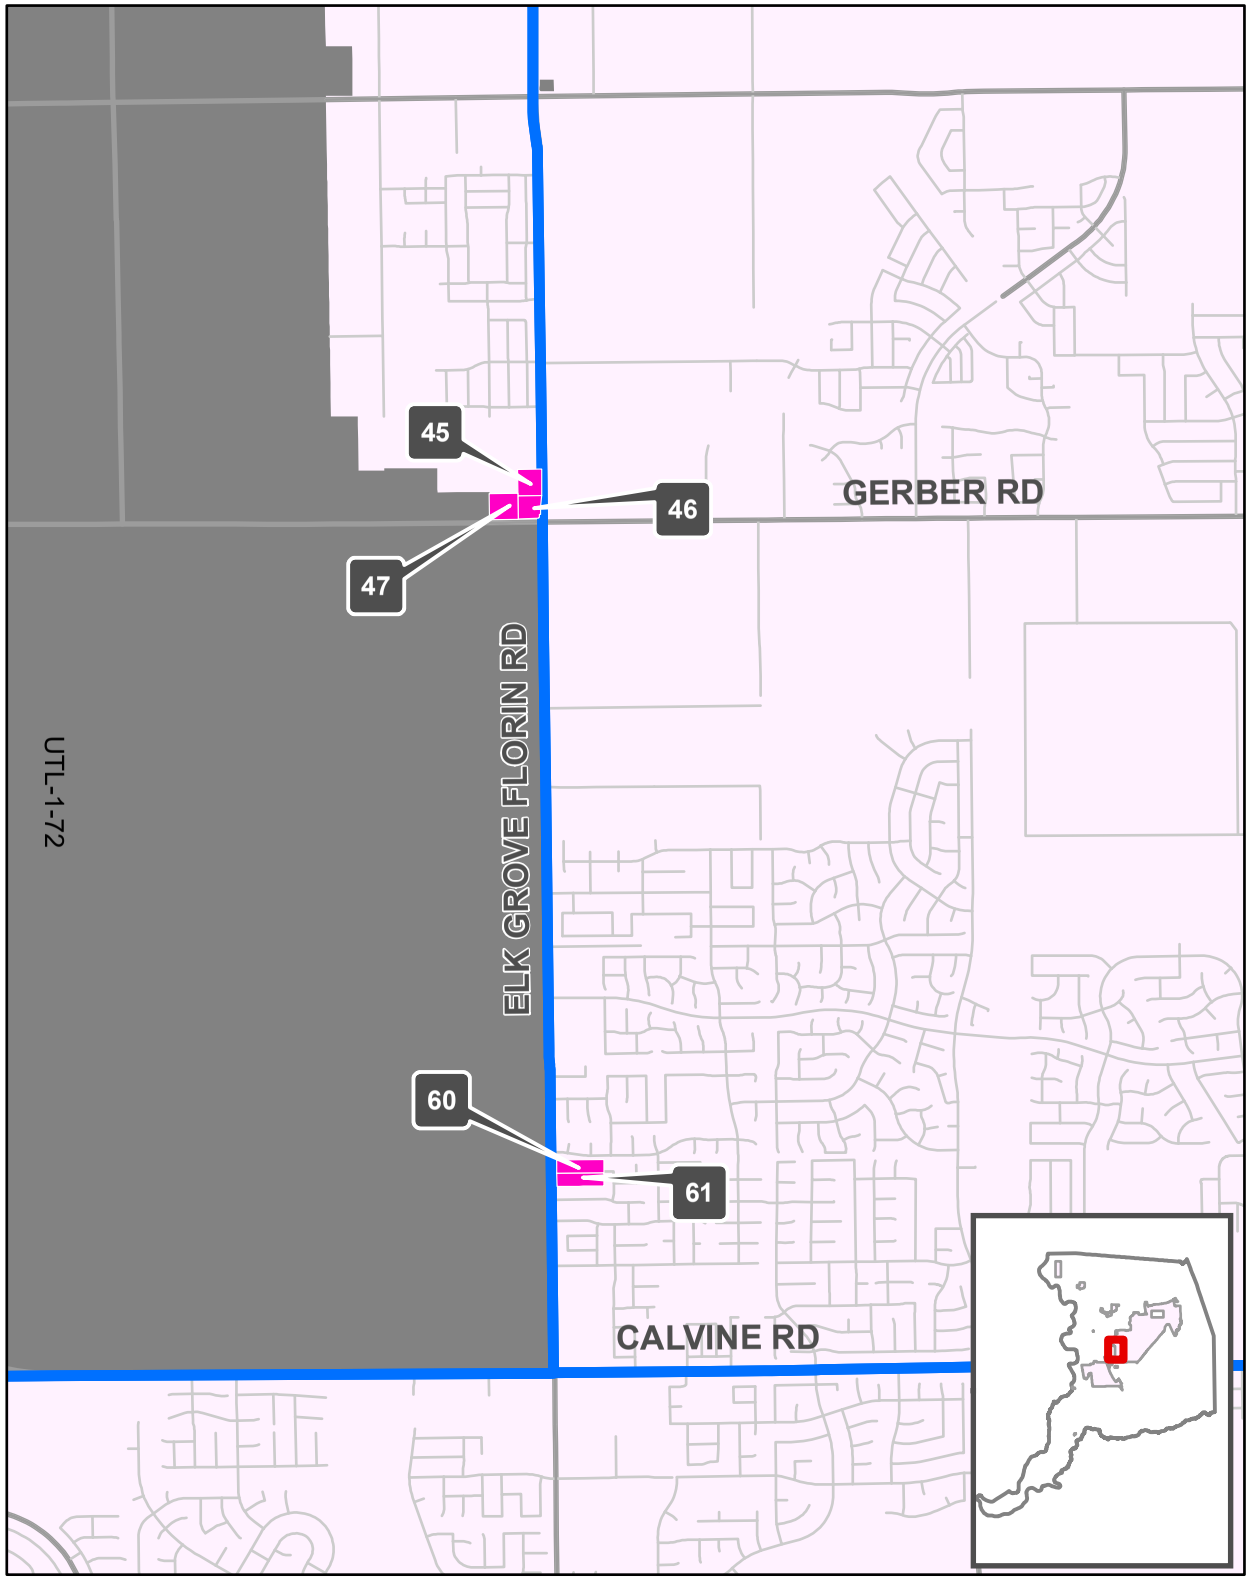
Attachment 1 lists the 5 candidate rezone sites (Sites 45-47 and 60-61) within Sacramento County Water Agency's (SCWA's) service area that are proposed to be rezoned with the Project. Information regarding site acreage, existing and proposed zoning designations, and net increase in units are also provided. The net increase in residential units is calculated as the difference between an existing zoning designation's maximum density and the proposed zoning designation's maximum density. For example, a 1-acre site currently zoned RD-20 (maximum density of 20 units per acre) with a proposed zoning of RD-30 (maximum density of 30 units per acre) nets 10 additional units with a rezone. Attachment 2 depicts the locations of these candidate rezone sites within SCWA's service area, as well as individual site maps. In total, the Project is anticipated to result in a net increase of 347 lower-income units within SCWA's service area.

It is noted that Section 4.6 of the SCWA's 2020 Urban Water Management Plan provides a projection of water use for lower income households. Pursuant to California Water Code §10910 through 10915, PER requests the following information:

1. Whether the projected water demand associated with the Project was include as part of the most recently adopted urban water management plan; and
2. If the Project's water demand was not included as part of the most recently adopted urban water management plan, does SCWA have adequate capacities to serve the Project?

Additionally, PER requests any comments (including conditions of approval or advisories) Sacramento County Water Agency may have for the Project. If you have any questions or would like to set up a meeting to further discuss the Project, please contact me at shenj@saccounty.gov or 916.875.3711.

Sincerely,



Jessie Shen
Senior Planner

Attachments:	FW ATTENTION Request for Ability To Serve the PLNP2020-00042 - Sacramento County RHNA Rezone Project.msg image001.png image002.png

Jessie,

The attached email still stands. With three of the five parcels removed the following is still true:

“The 2020 UWMP predicts an increase in the number of connections (and therefore water used) and does not tie that increase to any specific project much less any specific APN. The UWMP also predicts an increase in overall demands due to growth that is lower than what the WSIP predicts. Long story short, the 2020 UWMP predicted an increase in connections that is below what has occurred and predicts a new level of demand that is lower than what our WSIP predicts. So, the increase in DUs associated with this change in zoning, while not explicitly studied in any planning document, would fit within the growth analyzed in the 2020 UWMP and SCWA will have adequate water supplies to serve the project. “

Please continue to work with Bob Steeg on condition language.

Thank you,

Mike Grinstead
Sacramento County Water Agency

Subject: RE: Regional Housing Need Allocation (RHNA) Countywide Rezone Scoping Meeting and Request for Conditions of Approval

Hi Mike,

Apologies for the delay in circling back on the email below - since we last connected in mid-January, we dropped 3 sites from this current rezone package. This means there are now only 2 sites resulting in a net increase of 141 lower-income multifamily units within SCWA’s service boundaries for the

current rezone package. These two sites are:

1. APN 121-0120-001 / 8207 Elk Grove Florin Road, 2.42 acres, existing UR zoning, proposed RD-30 zoning, net increase of 71 units
2. APN 121-0120-002 / 8225 Elk Grove Florin Road, 2.39 acres, existing UR zoning, proposed RD-30 zoning, net increase of 70 units

Based on SCWA's 2020 UWMP, on page 4-20, the multifamily residential demand factor is 0.17 af/du = 0.15 af/du for indoor + 0.02 sf/du for outdoor. The increase in water demand for 141 multifamily units would be 23.97 afy = 141 du * 0.17 af/du. Note this is the type of analysis we need to include in the EIR. Based on previous correspondence, SWCA indicated adequate water supplies to serve the project when it consisted of 5 rezone sites. Can you please confirm this is still the case now that there are only 2 rezone sites?

Hi Bob – apologies in the delay in connecting with you re: SCWA conditions for these sites. In a nutshell, our project is proposing to rezone the 2 sites listed above to create additional capacity for lower-income category units (to meet our Regional Housing Needs Assessment obligations). The project does not propose any actual development on these sites and you will see plans for actual development when a developer comes in for non-discretionary design review.

At this point, if SCWA would like to include conditions on the rezone, your standard conditions look pretty good as a starting point. Attached are SCWA conditions – I mined three entitlement projects (PLNP2021-00149, Gerber Creek Unit 2; PLNP2019-00020, Spring Gardens; and PLNP2022-00144, Chandon 13) and revised slightly for our Rezone Project (note future development on rezone sites will not likely include maps and if future maps were proposed, these would be subject to a future discretionary entitlement SWCA would review and condition). Please let me know if you'd like these conditions added for SCWA's two parcels, and if you have any edits - thank you!

Yes. You can also work Bob Steeg (ccd along with his supervisor) to craft the language. Bob has been conditioning projects for decades and is a real resource. He has a long list of standard conditions to choose from as well as the ability to suggest new ones.

He would benefit from the parcel list. Would start with SCWA parcels and then move on to the rest. We will need to thing about two points of connection to the water system, upsizing any existing pipes, following standards, etc.

Thanks,

Mike

Thank you, Kerry!

Mike – since you've already provided a response to our letter, we're all good on any needs from SCWA at this time. Do you have any thoughts on conditions SCWA would like to put on the candidate rezone properties? My supervisor and I were considering drafting some standard conditions for water districts (i.e., obtain will-serve letters prior to improvement plan approval) to review and consider if they'd like added to the rezone sites within their jurisdiction. Is that something you'd be interested in taking a look at? Let me know and I can share when drafted, thanks!

Hello Water Resources,

I wanted to reach out to see if we could schedule a virtual meeting with Water Resources staff the week of 1.23 or 1.29 to discuss the Project, primarily to answer any questions you may have in crafting conditions of approval/advisories for the Project. Apologies for the long list persons on this email – I haven't been as involved in PRC initial/condition review for a while, so am not familiar with who from Water Resources generally staffs these meetings.

If you are able to identify the Water Resources staff that would be involved in reviewing/conditioning this Project and can provide a few days/times of availability the week of 1.23 or 1.29, I can get the meeting scheduled – thank you so much!

Subject: RE: Regional Housing Need Allocation (RHNA) Countywide Rezone Scoping Meeting and Request for Conditions of Approval

Hello,

Thank you to the agencies/departments that attended the Project's scoping meeting last Thursday, 1.4.24. For those who were unable to attend, a recording of the scoping meeting is available for on the Project's website (highlighted in yellow below).

As mentioned at the scoping meeting, we will be distributing Project materials (list of the 83 candidate rezone sites in a spreadsheet and maps) for your agency/department's review/use in

formulating conditions of approval and advisories for the Project. These materials will be provided in a subsequent email. If your agency/department has issues accessing/downloading, or would like us to tailor information specific to your needs, please reach out to Nathan (serafinn@saccounty.gov).

I will be reaching out to each agency/department to schedule 1-on-1 meetings so we keep the ball rolling on formulating conditions of approval and advisories for the Project (due Friday, March 1, 2024). Thanks all!

Subject: Regional Housing Need Allocation (RHNA) Countywide Rezone Scoping Meeting and Request for Conditions of Approval

Importance: High

Hello,

Planning and Environmental Review (PER) is currently processing the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project to address the County's shortfall of lower income category units. A Notice of Preparation of an environmental document for the Project was originally issued in June 2023; however, given Project refinements, specifically the decrease in acreages proposed for rezone, there is a need to reissue the NOP. The revised NOP is available for review at the link below.

As currently proposed, PER is undertaking a rezone of ±248.33 acres comprising of 83 candidate rezone sites within the unincorporated County to provide additional lower-income (to fulfill the RHNA obligation and increase the buffer) and moderate income (to increase the buffer) category housing opportunities. The Project itself would not construct any housing units, but would allow for additional housing units to be constructed.

During the 30-day NOP comment period, PER will hold one scoping meeting tailored to agencies for the Project on Thursday, January 4, 2024 from 10:00 AM to 12:00 PM (noon) virtually via Zoom (https://saccounty-net.zoomgov.com/j/1615249340?pwd=K3pLbE1LOFV0dTRsM0c0c2tGbUZTQT09). PER encourages your agency's/department's attendance at the meeting to further understand the Project to be able to provide conditions of approval and advisories tailored to the Project on your agency's/department's behalf.

Pertinent Project information, including the NOP and scoping meeting information, may be viewed online at: https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx.

Agencies/departments with specific questions about the Project should contact Jessie Shen, Senior Planner, at 916.875.3711 or shenj@saccounty.gov.

Subject:	FW: ATTENTION: Request for Ability To Serve the PLNP2020-00042 - Sacramento County RHNA Rezone Project
Date:	Friday, January 12, 2024 11:36:00 AM
Attachments:	PLNP2020-00042_Ability to Serve Letter_SCWA.pdf image001.png Copy of UWMP Demands_Land Use Changes.xlsx
Importance:	High

Nathan,

Given that the changes PER is seeking to make with the rezoning are new, they are not contemplated explicitly in any SCWA planning document. The attached spreadsheet shows that the difference in demands between what is proposed in the letter and what was planned for show an increase in use for the specific APN acreage than what had been projected, although this is based upon an internal planning document called the Water System Infrastructure Plan (WSIP.)

The 2020 UWMP predicts an increase in the number of connections (and therefore water used) and does not tie that increase to any specific project much less any specific APN. The UWMP also predicts an increase in overall demands due to growth that is lower than what the WSIP predicts. Long story short, the 2020 UWMP predicted an increase in connections that is below what has occurred and predicts a new level of demand that is lower than what our WSIP predicts. So, the increase in DUs associated with this change in zoning, while not explicitly studied in any planning document, would fit within the growth analyzed in the 2020 UWMP and SCWA will have adequate water supplies to serve the project.

SCWA will need to include the updated demands in a build out model to determine if any changes to infrastructure (i.e. if pipes need to be bigger in the location of the projects.) We do not at this point know if there will be some changes to pipe diameters associated with the project. This will be accomplished over the next two years as the update to the Master Plan is completed. That update is slated to begin mid-2024.

Sacramento, CA 95838
audie.foster@amwater.com

Subject: Request for a Water Supply Assessment for the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-00042)

Dear Audie Foster,

Planning and Environmental Review (PER) is currently preparing the environmental analysis associated with the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Project). The Project's revised Notice of Preparation (NOP) was released on December 22, 2023, and may be viewed online at: https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx.

The Sacramento County Housing Element of 2021-2029 identifies a shortfall of 2,884 units for the lower-income category (includes the low, very low, and extremely low income categories; incomes ranging from $0 to $69,050 annually) in the County. Simply, there is insufficient appropriately-zoned sites to accommodate the County's RHNA obligation for the lower-income category. As such, PER is undertaking a rezone of ±248.33 acres comprising 83 candidate rezone sites within the unincorporated County to provide additional lower-income (to fulfill the RHNA obligation and increase the buffer) and moderate income (to increase the buffer) category housing opportunities. The Project does not propose to construct new residential or other development on the ±248.33 acres proposed to be rezoned; rather, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. The planning horizon year for the Project is 2029.

Attachment 1 lists the 33 candidate rezone sites (Sites 5, 8, 16-17, 23, 27-28, 31, 33-42, 44, 48-59, and 62-23) within California American Water's service area that are proposed to be rezoned with the Project. Information regarding site acreage, existing and proposed zoning designations, and net increase in units are also provided. The net increase in residential units is calculated as the difference between an existing zoning designation's maximum density and the proposed zoning designation's maximum density. For example, a 1-acre site currently zoned RD-20 (maximum density of 20 units per acre) with a proposed zoning of RD-30 (maximum density of 30 units per acre) nets 10 additional units with a rezone. Attachment 2 depicts the locations of these candidate rezone sites within California American Water's service area, as well as individual site maps. In total, the Project is anticipated to result in a net increase of 2,105 units (1,990 lower-income units and 115 moderate-income units) within California American Water's service area.

It is noted that Section 4.5 2 of California American Water's 2020 Urban Water Management Plan for the Sacramento Mian District provides a projection of water use for lower income households. Pursuant to California Water Code §10910 through 10915, PER requests the following information:

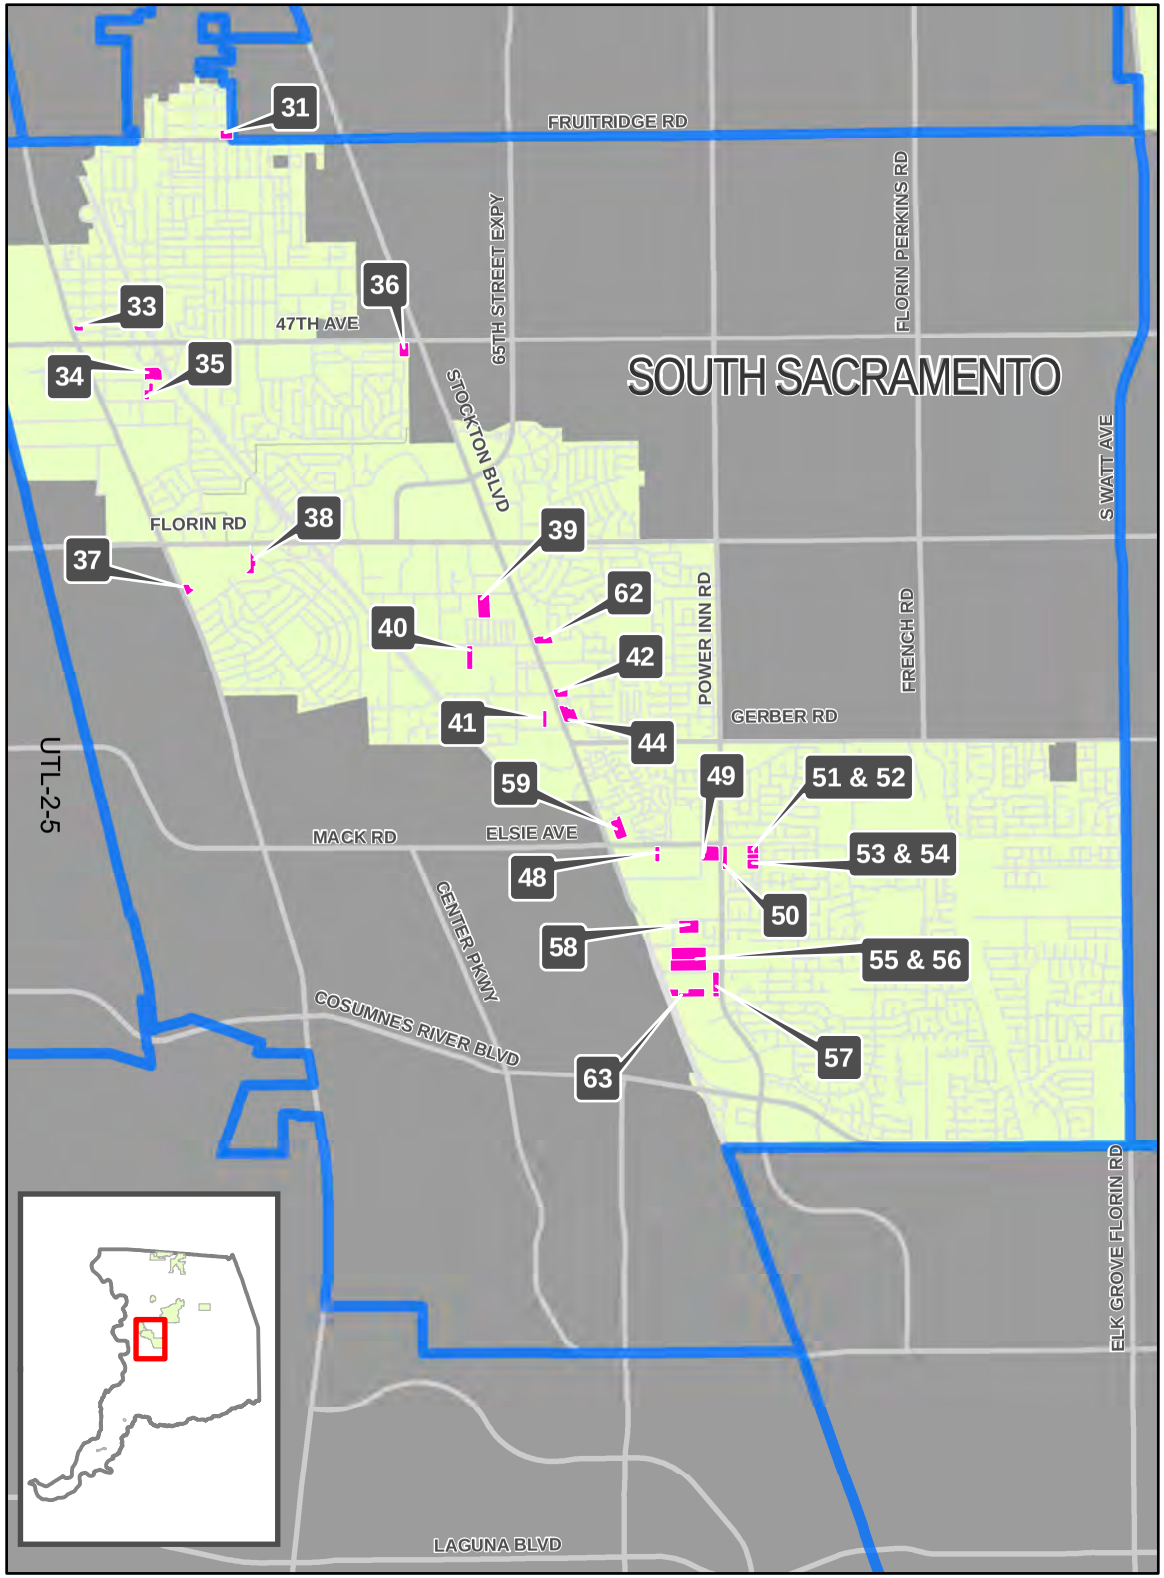
1. Whether the projected water demand associated with the Project was include as part of the most recently adopted urban water management plan; and

2. If the Project's water demand was not included as part of the most recently adopted urban water management plan, since the Project would result in a net increase of more than 500 dwelling units within California American Water's service area, please provide a water supply assessment (WSA) for the Project.

California Water Code §10910(c) identifies that the WSA shall include a discussion regarding whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with a proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

Additionally, PER requests any comments (including conditions of approval or advisories) California American Water may have for the Project. If you have any questions or would like to set up a meeting to further discuss the Project, please contact me at shenj@saccounty.gov or 916.875.3711.

Sincerely,



Jessie Shen
Senior Planner

California American Water

Water Supply Assessment for
Sacramento County Regional Housing Needs Allocation Rezone Project

March 2024

I. Introduction

On December 29, 2023, the County of Sacramento submitted a letter to California American Water requesting a Water Supply Assessment (WSA) for the Sacramento County (County) Regional Housing Needs Allocation (RHNA) Rezone Project (Project). This WSA was prepared pursuant to the **California Water Code [Section 10910]**. California American Water's 2020 Urban Water Management Plan for the Sacramento Main Districts (2020 UWMP) did not include water demands for the Project; therefore, this assessment addresses the ability of California American Water to serve water to this Project.

II. Project Overview

The County has identified a shortfall of 2,884 housing units in the lower-income categories and therefore cannot accommodate the County's RHNA obligation for lower- and moderate- income housing. The Project provides capacity for future development of housing to meet the County's remaining unmet RHNA needs of 2,884 lower-income category units for the planning year of 2029. The County identified 33 rezone sites within California American Water's service areas. These service areas include Antelope, Fruitridge Vista, Lincoln Oaks, Parkway, and Suburban-Rosemont. Within these service areas, there will be a net increase of 2,105 units including 1,990 lower-income units and 115 moderate-income units. The number of additional units and associated demands in million gallons (MG) are shown in **Table 1**.

Table 1: Additional Units and Demand

Service Area	Additional Units	Additional Demand (MG)
Antelope	203	10.8
Fruitridge Vista	89	23.8
Lincoln Oaks	290	6.2
Parkway	1,236	58.7
Suburban-Rosemont	278	3.4

III. Water Demands [Section 10910(c)]

California American Water's 2020 UWMP for the Sacramento Main District did not include the proposed demands for the Project. There have been no significant changes or updates to demand projections for California American Water's Antelope, Fruitridge Vista, Lincoln Oaks, or Parkway service areas since the 2020 UWMP. Within the Suburban-Rosemont service area there, a WSA was completed earlier this year for the West Jackson Highway (WJH) Project, which is anticipated to add 996 million gallons (MG) of water demand. Historical demands from the past five years are presented in **Table 2**.

Table 2: Historical Demands (MG)

Service Area	2019	2020	2021	2022	2023
Antelope	1,349	1,452	1,442	1,367	1,190
Fruitridge Vista	1,026	964	990	979	928
Lincoln Oaks	1,732	1,849	1,753	1,656	1,591
Parkway	2,482	2,655	2,478	2,373	2,277
Suburban-Rosemont	2,629	2,872	2,622	2,699	2,543

Future demands were estimated by applying historical growth rates and include the demands for the WJH Project in Suburban-Rosemont as well as the projected demands for this Project. For the purpose of this WSA, the Project is projected to be in service by 2030. Projected demands are shown in **Table 3**.

Table 3: Projected Demands (MG)

Service Area	2025	2030	2035	2040	2045
Antelope	1,421	1,469	1,507	1,547	1,565
Fruitridge Vista	998	1,097	1,158	1,218	1,224
Lincoln Oaks	1,830	1,878	1,921	1,966	1,981
Parkway	2,526	2,595	2,606	2,660	2,723
Suburban-Rosemont	2,727	3,027	3,325	3,623	3,923

IV. Water Supply [Section 10910(d)]

A. Identification of Water Supply Entitlements [Section 10910(d)(1)]

California American Water's service areas are served primarily by groundwater wells. The wells in the Fruitridge Vista, Parkway, and Suburban-Rosemont service areas draw water from the South American Subbasin (SASb). The wells in the Antelope and Lincoln Oaks service areas draw water from the North American Subbasin (NASb). These basins are not adjudicated, therefore rights to the groundwater are based on the water rights of the property owner. As is the case with most municipal water providers, California American Water delivers water to parcels that it does not own. This is considered an appropriative use of groundwater. There is no permitting required for the use of groundwater in this case; however, the use of groundwater is limited to what is used by the overlying property owners.

California American Water has an agreement with the City of Sacramento to purchase water. In 2010, CAW revised an existing wholesale supply agreement with the City to receive a maximum of 3.46 million gallons per day (MGD) of non-firm supply during off-peak periods (October 15th through May 14th), plus an additional 2.3 MGD of firm capacity, for a total of 5.76 MGD. Because the non-firm capacity of 3.46 MGD can only be used during seven months of the year, the total yearly amount available is calculated to be 1,576 MG. However, in a dry year or multiple dry years, it is assumed that only the firm supply would be available. Additionally, this agreement includes three of California American Water's service areas, Arden, Parkway, and Suburban-Rosemont, so it is assumed that this firm supply would be available to each of these service areas proportional to their respective demands. For the Suburban-Rosemont service area, this equates to 403 MG, and for the Parkway service area, this equates to 378 MG. California American Water has an additional agreement with the City of Sacramento to purchase water for the Fruitridge Vista service area in the amount of 3.24 MGD. The is considered a guaranteed supply source, so it is assumed to be available in normal and dry years.

California American Water has a take or pay agreement with Sacramento Suburban Water District (SSWD) to purchase up to 652 MG per year of water for its Antelope and Lincoln Oaks service areas. This is not a guaranteed supply source, so it is considered unavailable in dry years.

Total firm supply availability is summarized in **Table 4** for a normal year, a dry year, and multiple dry years. Firm well supply is calculated as the total well supply with the largest well out of service.

Table 4: Supply by Year Type

Year Type	Source	Capacity (MG)				
		Antelope	Fruitridge Vista	Lincoln Oaks	Parkway	Suburban-Rosemont
Normal Years	Groundwater Wells	6,776	3,637	7,827	7,446	9,279
	Purchased Water	652	1,183	652	1,576	1,576
	Total	7,428	4,820	8,479	9,022	10,855
Single Dry Year	Groundwater Wells	6,776	3,637	7,827	7,446	9,279
	Purchased Water	0	1,183	0	378	403
	Total	6,776	4,820	7,827	7,824	9,682
Multiple Dry Years	Groundwater Wells	6,776	3,637	7,827	7,446	9,279
	Purchased Water	0	1,183	0	378	403
	Total	6,776	4,820	7,827	7,824	9,682

B. Demonstration of Water Supply [Section 10910(d)(2)]

Section 10910(d)(2)(A), contracts or proof of entitlements: The agreements between California American Water and the City of Sacramento and SSWD for purchased water are documented in the 2020 UWMPs for California American Water, City of Sacramento, and SSWD, which can be found on the Department of Water Resources website at wuedata.water.ca.gov.

California American Water has appropriative rights to the groundwater extracted from groundwater wells.

Section 10910(d)(2)(B), capital outlay program: California American Water's Capital Improvement Program (CIP) must be approved by the California Public Utilities Commission (CPUC). The current approved CIP from the 2019 General Rate Case (GRC) can be found on the CPUC website at cpuc.ca.gov, Decision D.21-11-018, Appendix B, Attachment C-4. California American Water is currently awaiting a CPUC decision for its latest GRC filed in 2022, which contains an updated CIP.

Section 10910(d)(2)(C), permits for construction of infrastructure: The Project will connect to existing California American Water infrastructure. Although no off-site infrastructure is anticipated to be needed, Project owners would be responsible for providing any infrastructure needed to convey water to the Project, including obtaining any permits for construction.

Section 10910(d)(2)(D), regulatory approvals: The Project is located within California American Water's existing service area, therefore no regulatory approvals are required in order to convey water to the Project.

V. Supply and Demand Assessment [Section 10910(c)(3)]

California American Water has sufficient supply to meet projected demands in normal, dry, and multiple dry years through 2045, as shown in **Tables 5.1 through 5.5**. However, it should be noted that the groundwater wells are aging, and as they age, they tend to lose production capacity and are at risk of failure. California American Water has a well replacement plan in place that prioritizes replacement of wells that are at high risk of failure, whether it be due to age or other factors. This analysis assumes that

these wells are replaced when needed to replace diminished capacity or avoid failure and that replacement wells are of similar production capacity.

Table 5.1: Supply and Demand (MG) – Antelope

Year Type	Source	2025	2030	2035	2040	2045
Normal Years	Supply	7,428	7,428	7,428	7,428	7,428

VI. Groundwater Withdrawals [Section 10910(f)]

Section 10910(f)(1), groundwater information in the UWMP: California American Water's 2020 UWMP identified the SASb as the source of groundwater for its Fruitridge Vista, Parkway, and Suburban-Rosemont service areas. These service areas have a combined well production capacity of approximately 43,700 gallons per minute (gpm) from 55 groundwater wells, which equates to approximately 22,600 MG per year. The firm capacity of these wells, or the capacity with the largest well out of service, is approximately 39,500 gpm, or 20,400 MG. These well capacities were updated from the 2020 UWMP with more recent well pump efficiency tests.

California American Water's 2020 UWMP identified the NASb as the source of groundwater for its Antelope and Lincoln Oaks service areas. These service areas have a combined well production capacity of approximately 30,600 gallons per minute (gpm) from 41 groundwater wells, which equates to approximately 16,100 MG per year. The firm capacity of these wells is approximately 27,800 gpm, or 14,600 MG. These well capacities were updated from the 2020 UWMP with more recent well pump efficiency tests.

Section 10910(f)(2)(A), description of groundwater basin: The SASb is a high priority subbasin surrounded by the American, Cosumnes, Mokelumne, and Sacramento Rivers to the north, south and west, and the foothills of the Sierra Nevada to the east. The SASb is comprised of two aquifers; the upper and lower aquifers are described as follows in the Sacramento Central Groundwater Authority Alternative Submittal:

"The upper fresh-water aquifer is wedge-shaped along the eastern side of the basin (dipping and thickening westward) but is relatively flat-lying on the western side. The thickness can vary up to approximately 300 feet, but is typically 200 feet, and the bottom can extend to an elevation of approximately 200 feet below mean sea level. The upper aquifer is generally correlative to the Laguna Formation and other similar/younger sediments.

The lower fresh-water aquifer is similar in shape to the upper aquifer, but considerably larger. The wedge portion of the lower aquifer, on the eastern side of the basin, rests on bedrock (relatively impermeable) and can extend to depths between 800 and 1,200 feet below mean sea level. Within the center and western portions of the basin, the base of the lower aquifer extends to depths between 1,200 and 2,000 feet below mean sea level, to the top of the unusable water. This unusable water may occur at depths of 800 feet below mean sea level beneath the Delta area of the South American Subbasin. The lower aquifer is generally correlative to the Mehrten Formation and pre-Mehrten sediments.

The Laguna and Mehrten Formations were deposited during the Pliocene and Miocene Epochs, respectively, (Gutierrez, 2011) of the Tertiary or Neogene Period (2.6 to 23.0 million years ago) in a fluvial environment (DWR, 1974). These formations are comprised of interbedded layers of gravel, sand, silt, and clay with numerous channel deposits within the South American Subbasin. The deposits are wedge-shaped and dip gently and thicken in a westerly direction. The Laguna Formation is derived from granitic and metamorphic rocks while the Mehrten Formation is derived from andesitic rock. The Mehrten Formation also includes dense, hard layers of tuff-breccia."

"The cones-of-depressions…were developed during the middle of the last century as groundwater was pumped extensively for agricultural land uses, and were known to not be in a state of equilibrium (i.e., groundwater levels still falling) in the mid 1980's. The majority of the subbasin's recharge occurs from the percolation of rainfall and irrigation water and from the rivers that bound three sides of the subbasin, including the Delta."

The NASb is a high priority basin that covers approximately 342,000 acres in Sutter, Placer, and Sacramento Counties bounded by the American, Bear, Feather, and Sacrmento Rivers. Different portions of the subbasin are managed by different agencies. California American Water's service areas are managed by the Sacramento Groundwater Authority (SGA), which manages the groundwater resources in the area north of the America River within Sacramento County. The following is a description of the NASb from the 2021 Groundwater Sustainability Plan (GSP):

"The NASb is in the Sacramento Valley and is filled largely with sediments derived from the adjacent Sierra Nevada foothills, which contain fresh water. In general, these fresh-water bearing sediments beneath the NASb are thinnest to the east and thicken up to 2,000 feet to the west. The sediments consist of alternating layers of clays, silts, sand and gravel. The sand and gravels layers into which wells are constructed are referred to as aquifers. These sand and gravel layers were deposited by meandering rivers and creeks, so they are not continuous across the entire Subbasin. Although the sediments are not present as continuous layers, they are interconnected. This was demonstrated by observing that groundwater levels in the

various sand and gravel layers have similar levels and trends. Based on this information, the NASb is interpreted as having one principal aquifer.

Groundwater is recharged from throughout the surface of the Subbasin and from groundwater inflow from adjacent subbasins. No geologic sediments are impermeable, so some recharge occurs in all areas that are not covered by impermeable surfaces (such as asphalt or concrete). This is particularly important in agricultural areas where, even though there are low permeability soils, there are more than one hundred thousand acres of land that have applied or ponded water throughout the growing season, which results in large volumes of recharge to the Subbasin."

"Groundwater levels in the western portion of the Subbasin are generally stable through time dating back to early in the 20th century. Groundwater levels in the central part of the Subbasin showed long-term declines in the north-central portion until the mid-1960s and in the southcentral portion until the mid-1990s, when conjunctive use programs arrested these declines and allowed groundwater levels to begin to recover. Groundwater levels in the eastern portion of the subbasin have been generally stable since the 1970s, but they do show declines during dry periods with recovery during wet periods.

The groundwater contours show a pumping depression in the center of the Subbasin that is currently about 30 feet below mean sea level. Groundwater flows radially toward this depression, from the fringes of the Subbasin toward the center. The depression has been stabilized, with groundwater levels generally declining during dry periods and recovering during wet periods.

Limited land subsidence due to groundwater pumping was documented up to the early 1990s, but there were no documented impacts associated with the subsidence. Since then, the subsidence has been negligible."

Section 10910(f)(2)(C), GSP: California enacted the Sustainable Groundwater Management Act in 2014 and this requires that the state's high and medium priority groundwater basins develop a GSP to balance pumping and recharge to the basin. To accomplish this, six Groundwater Sustainability Agencies (GSAs) were formed to develop one GSP for the SASb. The GSP was finalized in 2022 and can be found on the SASb website at sasbgroundwater.org. The key finding of the GSP is that the basin will be sustainable over the next twenty years as long as planned recycled water, recharge, and other projects are implemented. The SGA completed a Groundwater Sustainability Plan for NASb in 2021 and can be found on the SGA website as sgah2o.org. The key finding of this GSP is that while there is currently a surplus of water, there is a potential future deficit of 3,500 AFY, which can be offset through a conjunctive use project.

Section 10910(f)(3), description and analysis of the amount of groundwater pumped: Actual groundwater withdrawals for the past five years are shown in **Table 6**.

Table 6: Historical Groundwater Withdrawals (MG)

Service Area	2019	2020	2021	2022	2023

Total	4,650	5,011	5,440	5,716	5,318

VII. Conclusion of Sufficiency

In conclusion, California American Water has sufficient supply for future demands, including the Sacramento County RHNA Rezone Project, through 2045. This includes normal years, dry years, and multiple dry years.

APPENDIX UTIL-3: SACRAMENTO SUBURBAN WATER DISTRICT CORRESPONDENCE AND WATER SUPPLY ASSESSMENT

THESE CORRESPONDENCES INCLUDED FOUR ADDITIONAL SITES THAT ARE LONGER INCLUDED IN THE PROJECT. ADDITIONALLY, NUMBERING OF THE CANDIDATE REZONE SITES HAVE BEEN MODIFIED SINCE THE OCCURRENCE OF THESE CORRESPONDENCES.

Subject: Request for a Water Supply Assessment for the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-00042)

Dear Dan York,

Planning and Environmental Review (PER) is currently preparing the environmental analysis associated with the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Project). The Project's revised Notice of Preparation (NOP) was released on December 22, 2023, and may be viewed online at: https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx.

The Sacramento County Housing Element of 2021-2029 identifies a shortfall of 2,884 units for the lower-income category (includes the low, very low, and extremely low income categories; incomes ranging from $0 to $69,050 annually) in the County. Simply, there is insufficient appropriately-zoned sites to accommodate the County's RHNA obligation for the lower-income category. As such, PER is undertaking a rezone of ±248.33 acres comprising 83 candidate rezone sites within the unincorporated County to provide additional lower-income (to fulfill the RHNA obligation and increase the buffer) and moderate income (to increase the buffer) category housing opportunities. The Project does not propose to construct new residential or other development on the ±248.33 acres proposed to be rezoned; rather, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. The planning horizon year for the Project is 2029.

Attachment 1 lists the 21 candidate rezone sites (Sites 1-4, 6-7, 9-11, 14-15, 20-24, and 72-76) within Sacramento Suburban Water District's (SSWD's) service area that are proposed to be rezoned with the Project. Information regarding site acreage, existing and proposed zoning designations, and net increase in units are also provided. The net increase in residential units is calculated as the difference between an existing zoning designation's maximum density and the proposed zoning designation's maximum density. For example, a 1-acre site currently zoned RD-20 (maximum density of 20 units per acre) with a proposed zoning of RD-30 (maximum density of 30 units per acre) nets 10 additional units the Project. Attachment 2 depicts the locations of these sites within SSWD's service area, as well as individual site maps. In total, the Project is

anticipated to result in a net increase of 1,088 units (1,020 lower-income units and 68 moderate-income units) within SSWD's service area.

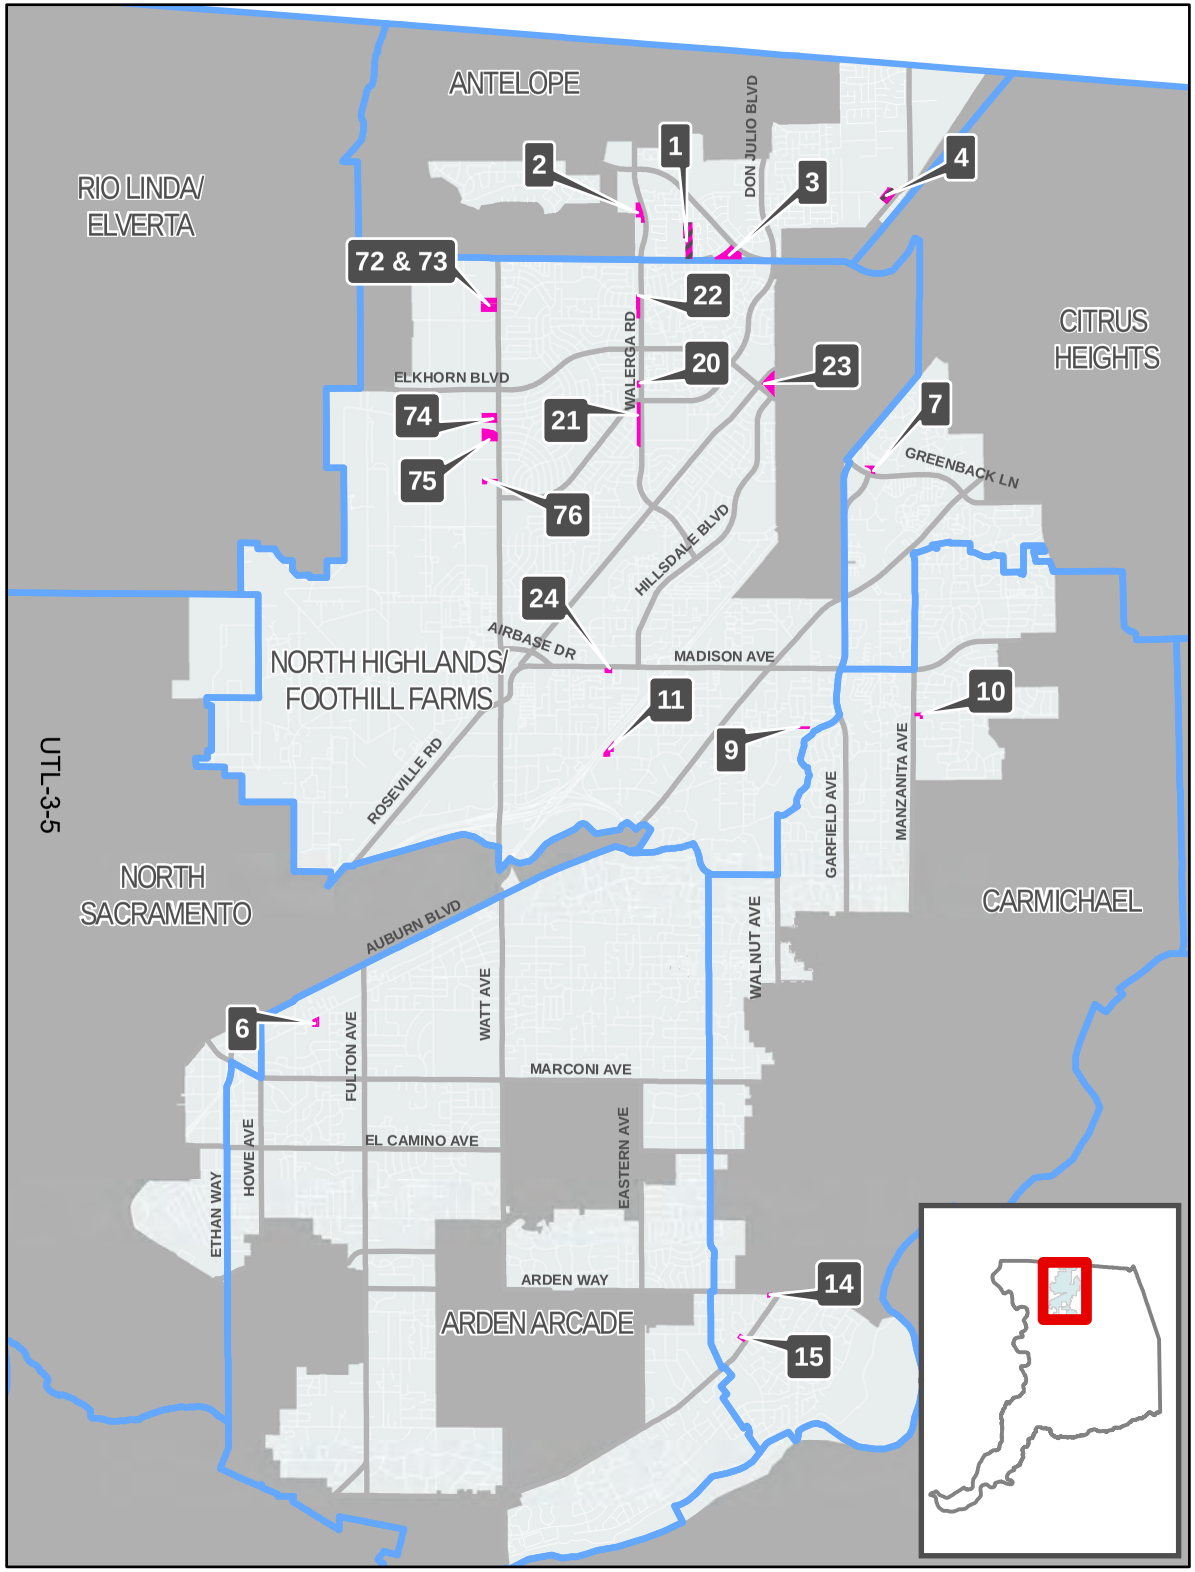
It is noted that Section 4.7 of SSWD's 2020 Urban Water Management Plan provides a projection of water use for lower income households. Pursuant to California Water Code §10910 through 10915, PER requests the following information:

1. Whether the projected water demand associated with the Project was include as part of the most recently adopted urban water management plan; and
2. If the Project's water demand was not included as part of the most recently adopted urban water management plan, since the Project would result in a net increase of more than 500 dwelling units within SSWD's service area, please provide a water supply assessment (WSA) for the Project.

California Water Code §10910(c) identifies that the WSA shall include a discussion regarding whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with a proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

Additionally, PER requests any comments (including conditions of approval or advisories) SSWD may have for the Project. If you have any questions or would like to set up a meeting to further discuss the Project, please contact me at shenj@saccounty.gov or 916.875.3711.

Sincerely,



Jessie Shen
Senior Planner

Executive Summary

This Water Supply Assessment (WSA) was prepared on behalf of Sacramento Suburban Water District (SSWD) for the portion of the Sacramento County Regional Housing Needs Allocation (RHNA) rezone project that would be served by and is located in SSWD's service area (Project) in accordance with Senate Bill (SB) 610 (now codified as California Water Code sections 10910 and 10911) and SB 221. SB 610 and SB 221 require land use planning entities that are evaluating certain large development projects to verify that sufficient water supplies are projected to exist to supply the Project. A WSA is a document required to be prepared for use in Sacramento County's environmental review of the Project under the California Environmental Quality Act (CEQA).

The Project addressed in this WSA is a rezoning of a total of 74.55 acres on 20 sites to a range of higher density residential land uses within the SSWD service area.

As described in SSWD's 2020 Urban Water Management Plan (Brown and Caldwell, 2021), SSWD uses mainly groundwater that is supplemented with surface water when it is available. Surface water is obtained under contracts with Placer County Water Agency, the United States Bureau of Reclamation, San Juan Water District, and the City of Sacramento. Groundwater has historically been the primary source of water for SSWD and is the primary source of supply in dry years.

The Project is estimated to increase SSWD's projected 2045 water demand by 0.8 percent from 38,536 acre-feet per year (ac-ft/yr) to 38,835 ac-ft/yr. SSWD's projected 2045 available annual water supply is 93,064 ac-ft/yr (48,000 ac-ft/yr in a dry year), which is 139 percent and 24 percent above the projected 2045 total demand of 38,835 ac-ft/yr for the total service area including the Project in a normal and dry year, respectively. Therefore, SSWD's projected available annual water supplies are sufficient to serve the demands of SSWD's existing water service area including the increased demands due to the Project.

This WSA does not verify the adequacy of the existing and planned future groundwater well pumping capacity and the distribution system's hydraulic capacity to serve the Project.

Section 1

Introduction

This section describes the purpose of this water supply assessment (WSA), the WSA requirements, the portion of the Sacramento County Regional Housing Needs Allocation (RHNA) rezone project that is served by and located in SSWD's service area (Project), and limitations of the WSA.

1.1 Purpose

This WSA has been prepared for the purpose of documenting the availability of water supplies to serve the Sacramento Suburban Water District (SSWD) and the Project.

SSWD intends to supply water to the existing water system's service area including the demands due to the Project through buildout. Water supplies that are excess to the amount needed to supply the buildout of the existing water system's service area are available to supply additional demands due to the Project.

This WSA documents the projected buildout demand of SSWD's water system's service area that includes the estimated Project demand. The SSWD demands including the Project are compared to SSWD's projected water supplies to verify that sufficient water supplies are projected to exist to supply the Project.

1.2 WSA Requirements

Senate Bills (SB) 610 (now codified as California Water Code sections 10910 and 10911) and 221 require that WSAs be included in environmental documentation for certain projects and an affirmative written verification of sufficient water supply be included in the WSA for approval of certain development. Applicable developments are those that would have a water demand that would be equivalent to or greater than the amount of water used by a 500 dwelling unit (DU) project or would increase the number of service connections by at least 10 percent. The WSA is performed in conjunction with a project's land-use approval process and must include an evaluation of the sufficiency of the water supplies available to the water supplier to meet existing and anticipated future demands including the demand associated with the Project. The evaluation must cover a twenty-year period and address the following water year types: a) normal; b) single dry; and c) multiple dry.

The WSA must identify any existing water supply entitlements, water rights, or water service contracts held by the water supplier or relevant to the identified water supply for the Project. If the public water supplier relies on groundwater supplies, the WSA must describe the groundwater basins from which the Project will be supplied. For each basin that has not been adjudicated, the assessment should indicate whether the California Department of Water Resources (DWR) has identified the basin as being critically overdrafted.

1.3 Description of Project

The Project addressed in this WSA is the SSWD portion of the greater Sacramento County RHNA rezone project. The Project is a rezoning of a total of 74.55 acres on 20 sites from a mixture of residential and non-residential land use zoning to a range of higher density residential land use with the SSWD service area. Table 1-1 summarizes those Project site locations, current and proposed land use zoning, and increase in DUs due to the proposed zoning changes.

Table 1-1. Land Use and Demographics for the Project

Site No.	Assessor Parcel Number (APN)	Address/Siting Description	Redeveloped acreage [a], acre	Land Use Zoning		Project Dwelling Units

72	215-0062-057-0000	6233 Watt Avenue	2.13	SPA (North Watt- RMU-1)	RD-40	32	85
Total			**74.55**	--	--	**1,030**	**2,314**

a. Redeveloped acreage is equal to lot size, except as noted.

b. Site No. 1: Lot size is 16.64 acres, but only 10.0 acres are being re-developed in this Project.

c. Net increase in dwelling units is difference between dwelling units for Project land use zoning minus current land use zoning.

d. Site No. 22: The SSWD service area parcel (222-0024-001-000) area is 6.02 acres. Parcel 222-0024-041-0000 is within the California American Water Company service area, so it is excluded from the WSA.

1.4 WSA Limitations

A WSA is a document required to be prepared for use in Sacramento County's environmental review of the Project under the California Environmental Quality Act (CEQA). This WSA does not verify the adequacy of the existing and planned future groundwater well pumping capacity and the distribution system's hydraulic capacity to serve the Project.

Section 2

Water Demands

This section describes the projected water demand for the existing SSWD water service area and the Project. SSWD's historical and projected water use is described in Section 4 of the SSWD 2020 Urban Water Management Plan (UWMP) (Brown and Caldwell, 2021).

2.1 Multi-Family Unit Water Demand Factors

Multi-family unit water demand factors (UWDF) were established for each of the Project's proposed land use zoning categories for RD-10 to RD-40 (i.e., the revised land uses proposed by Sacramento County for the Project). SSWD's Water System Master Plan (WSMP) (Brown and Caldwell, 2017) identifies multi-family UWDFs. The majority (99 percent) of the buildout multi-family land use area within the SSWD service area as documented in the WSMP is within the low density category, which is defined as 7 to 15 DUs per acre.

The approach to estimate the multi-family UWDFs consisted of the following steps:

1. Usage Factors
    a. Use the 1.6 people per multi-family DU (WSMP)
    b. Use 209 gallons per day per multi-family DU (UWMP)
    c. Use 131 gallons per capita per day demand for buildout for the multi-family low density land use category, with an average density of 11 DUs per acre (WSMP).
2. Outdoor Usage
    a. Estimate the outdoor water use for the multi-family low density land use category using: a) the evapotranspiration and effective precipitation values for the Project area; and b) an estimate of the landscape area.
3. Indoor Usage
    a. Calculate the indoor water use per capita and per DU by subtracting the outdoor demand in step 2 from the total demand in step 1.
    b. Indoor water usage is assumed to be 105 gpd/person.
4. UWDFs
    a. For each land use zone, apply the respective DUs per acre to the indoor UWDF from step 3; and then
    b. add the estimated outdoor water use from step 2.

Table 2-1 presents the estimated UWDFs for each of the multi-family land use zones.

Table 2-1. Multi-Family Unit Water Demand Factors Estimate						
Item	Units	Multi-Family Land Use Zoning				
		SSWD existing multi-family land use	RD-15	RD-20	RD-30	RD-40
Dwelling units (DU)	DU/acre	11	15	20	30	40
Population [a]	people/acre	17.6	24	32	48	64
Indoor water use [b]	gpd/acre	1,848	2,520	3,360	5,040	6,720
	ac-ft/yr/acre	2.1	2.8	3.8	5.6	7.5
Landscape area [c]	Landscaped acre/acre	0.15	0.15	0.15	0.15	0.15
Outdoor water use [d]	ac-ft/yr/acre	0.51	0.51	0.51	0.51	0.51
	gpd/acre	453	453	453	453	453
UWDF						
Total water usage	ac-ft/yr/acre	2.6	3.3	4.3	6.2	8.0
	gpd/acre	2,301	2,973	3,813	5,493	7,173
Demand per DU	gpd/DU	209	198	191	183	179
Per capita demand	GPCD	131	124	119	114	112

a. *Based on 1.6 people per DU (WSMP) (Brown and Caldwell, 2017)*
b. *Based on assumed indoor usage of 105 gpd/person*
c. *Based on assumed 15% irrigated landscape per acre*
d. *Based on a net evapotranspiration (ETo) of 58 in/year, with a 70% ETo factor. The net ETo is from SSWD's Urban Water Use Objective (UWUO) Report to DWR (DWR, 2024)*

2.2 Projected Water Demand

This section presents the projected water demands for the SSWD water service area (pre-Project) and the Project, both individually and combined, through 2045.

2.2.1 Projected Water Demands for the Water Service Area (pre-Project)

The projected water demands for the current land use zoning in the water service area were estimated in Section 4 of the SSWD 2020 UWMP. Table 2-2 presents the projected water demands for the current land use zoning as projected in the 2020 UWMP, minus the water demand previously estimated for the current land use zoning of the Project parcels. Water demand projections for 2025 through 2045 assume a normal water year type.

Table 2-2. Projected Water Demands with Current Land Use Zoning (pre-Project), ac-ft/yr					
Area	2025	2030	2035	2040	2045
Total Service Area (pre-Project) [a]	38,184	38,617	38,611	38,574	38,536
Project Parcels (current land use zoning) [b]	- 174	- 174	- 174	- 174	- 174
Total Service Area Minus Project Parcels	**38,010**	**38,443**	**38,437**	**38,400**	**38,362**

a. *2020 UWMP Table 4-5*
b. *Calculated based on SSWD Water System Master Plan UWDFs (WSMP Table 3-14) combined with the Project parcel acreage and current land use zoning*

2.2.2 Projected Water Demands for the Project

The projected water demands for the Project are based on the UWDFs in Table 2-1 and the Project land use and dwelling units summarized in Table 1-1. The Project is estimated to be constructed after 2025 with Project completion by 2029. The projected demand for the Project is 473 ac-ft/yr as shown in Table 2-3. A portion of this demand (174 ac-ft/yr) is already accounted for in the 2020 UWMP (see Table 2-2). The net increase in demand as a result of the Project is 299 ac-ft/yr (473 ac-ft/yr – 174 ac-ft/yr = 299 ac-ft/yr).

Table 2-3. Project Water Demands

a. *See Table 2-2.*
b. *See Table 2-3. The Project is estimated to be constructed after 2025 with Project completion by 2029.*

Section 3

Water Supply to Demand Comparison

This section provides a comparison of SSWD's normal and dry water year supplies and water demands. SSWD's water demands are described in Section 2. SSWD's total water supplies for normal and dry years through 2045 shown in this section are from SSWD's 2020 UWMP.

3.1 Water Supplies

As described in SSWD's 2020 UWMP, SSWD uses mainly groundwater that is supplemented with surface water when it is available that is obtained under contracts with Placer County Water Agency, the United States Bureau of Reclamation, San Juan Water District, and the City of Sacramento. Groundwater has historically been the primary source of water for SSWD and is the primary source of supply in dry years. The groundwater use in SSWD has significantly declined since 1998 due to the availability of surface water as an alternative supply.

3.2 Normal Year Water Supply and Demand Comparison

Table 3-1 compares SSWD's projected normal year water demands to the supplies in five-year intervals through 2045. The water demands represent the SSWD's total projected water demands for the existing water service area plus the Project. The supply minus demand row indicates that in all years there is a surplus of projected supply.

Table 3-1. Normal Year Water Supply and Demand Comparison, ac-ft/yr

Year	2025	2030	2035	2040	2045
Total supply [a]	93,064	93,064	93,064	93,064	93,064
Total demand [b]	38,010	38,916	38,910	38,873	38,835
Supply minus demand, surplus/(deficit)	55,054	54,148	54,154	54,191	54,229

a. *See SSWD 2020 UWMP Table 7-4.*

b. *See Table 2-4.*

3.3 Single Dry Year Water Supply and Demand Comparison

Table 3-2 provides a projected water supply and demand comparison for single dry years through the year 2045. Purchased surface water supplies from Placer County Water Agency, United States Bureau of Reclamation, and the City of Sacramento are reduced to zero and groundwater is the primary source of supply in dry years with some dry year supply from San Juan Water District and from City of Sacramento exchange (groundwater substitution transfer). As can be seen in Table 3-2, SSWD has the supplies to meet single dry year demands of the existing service area and the Project.

Table 3-2. Single Dry Year Water Supply and Demand Comparison, ac-ft/yr					
	2025	2030	2035	2040	2045
Total supply [a]	48,000	48,000	48,000	48,000	48,000
Total demand [b]	38,010	38,916	38,910	38,873	38,835
Supply minus demand, surplus/(deficit)	9,990	9,084	9,090	9,127	9,165

a. See SSWD 2020 UWMP Table 7-5.

b. See Table 2-4.

3.4 Multiple Dry Years Water Supply and Demand Comparison

Table 3-3 provides a projected water supply and demand comparison for multiple dry years through the year 2045. Purchased surface water supplies from Placer County Water Agency, United States Bureau of Reclamation, and the City of Sacramento are reduced to zero and groundwater is the primary source of supply in dry years with some dry year supply from San Juan Water District and from City of Sacramento exchange (groundwater substitution transfer). As can be seen in Table 3-3, SSWD has the supplies to meet multiple dry year demands of the existing service area and the Project.

Table 3-3. Multiple Dry Years Water Supply and Demand Comparison, ac-ft/yr						
		2025	2030	2035	2040	2045
First year	Supply [a]	48,000	48,000	48,000	48,000	48,000
	Demand [b]	38,010	38,916	38,910	38,873	38,835
	Supply minus demand, surplus/(deficit)	9,990	9,084	9,090	9,127	9,165
Second year	Supply [a]	48,000	48,000	48,000	48,000	48,000
	Demand [b]	38,010	38,916	38,910	38,873	38,835
	Supply minus demand, surplus/(deficit)	9,990	9,084	9,090	9,127	9,165
Third year	Supply [a]	48,000	48,000	48,000	48,000	48,000
	Demand [b]	38,010	38,916	38,910	38,873	38,835
	Supply minus demand, surplus/(deficit)	9,990	9,084	9,090	9,127	9,165
Fourth year	Supply [a]	48,000	48,000	48,000	48,000	48,000
	Demand [b]	38,010	38,916	38,910	38,873	38,835
	Supply minus demand, surplus/(deficit)	9,990	9,084	9,090	9,127	9,165
Fifth year	Supply [a]	48,000	48,000	48,000	48,000	48,000
	Demand [b]	38,010	38,916	38,910	38,873	38,835
	Supply minus demand, surplus/(deficit)	9,990	9,084	9,090	9,127	9,165

a. *See SSWD 2020 UWMP Table 7-6.*

b. *See Table 2-4.*

Section 4

Conclusion

In accordance with the requirements of California Water Code sections 10910 through 10915, this WSA verifies that sufficient water supplies are available to serve the Project as well as the other projected demands within SSWD's service area. SSWD's projected water supplies are sufficient under non-drought (normal year) and drought (single and multiple dry years) conditions.

Subject: Request for Ability to Serve the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Control No. PLNP2020-00042)

Dear Mike Huot,

Planning and Environmental Review (PER) is currently preparing the environmental analysis associated with the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (Project). The Project's revised Notice of Preparation (NOP) was released on December 22, 2023, and may be viewed online at: https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/Countywide-Rezone-Program.aspx.

The Sacramento County Housing Element of 2021-2029 identifies a shortfall of 2,884 units for the lower-income category (includes the low, very low, and extremely low income categories; incomes ranging from $0 to $69,050 annually) in the County. Simply, there is insufficient appropriately-zoned sites to accommodate the County's RHNA obligation for the lower-income category. As such, PER is undertaking a rezone of ±248.33 acres comprising 83 candidate rezone sites within the unincorporated County to provide additional lower-income (to fulfill the RHNA obligation and increase the buffer) and moderate income (to increase the buffer) category housing opportunities. The Project does not propose to construct new residential or other development on the ±248.33 acres proposed to be rezoned; rather, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. The planning horizon year for the Project is 2029.

All 83 candidate rezone sites are located within the Sacramento Area Sewer District's and the Sacramento Regional County Sanitation District's (collectively known as SacSewer) service area. Attachment 1 provides a list of the candidate rezone sites (Sites 1-83) and information regarding site acreage, existing and proposed zoning designations, and net increase in units. The net increase in residential units is calculated as the difference between an existing zoning designation's maximum density and the proposed zoning designation's maximum density. For example, a 1-acre site currently zoned RD-20 (maximum density of 20 units per acre) with a proposed zoning of RD-30 (maximum density of 30 units per acre) nets 10 additional units with a rezone. Attachment 2 depicts the locations of these candidate rezone sites within the SacSewer service

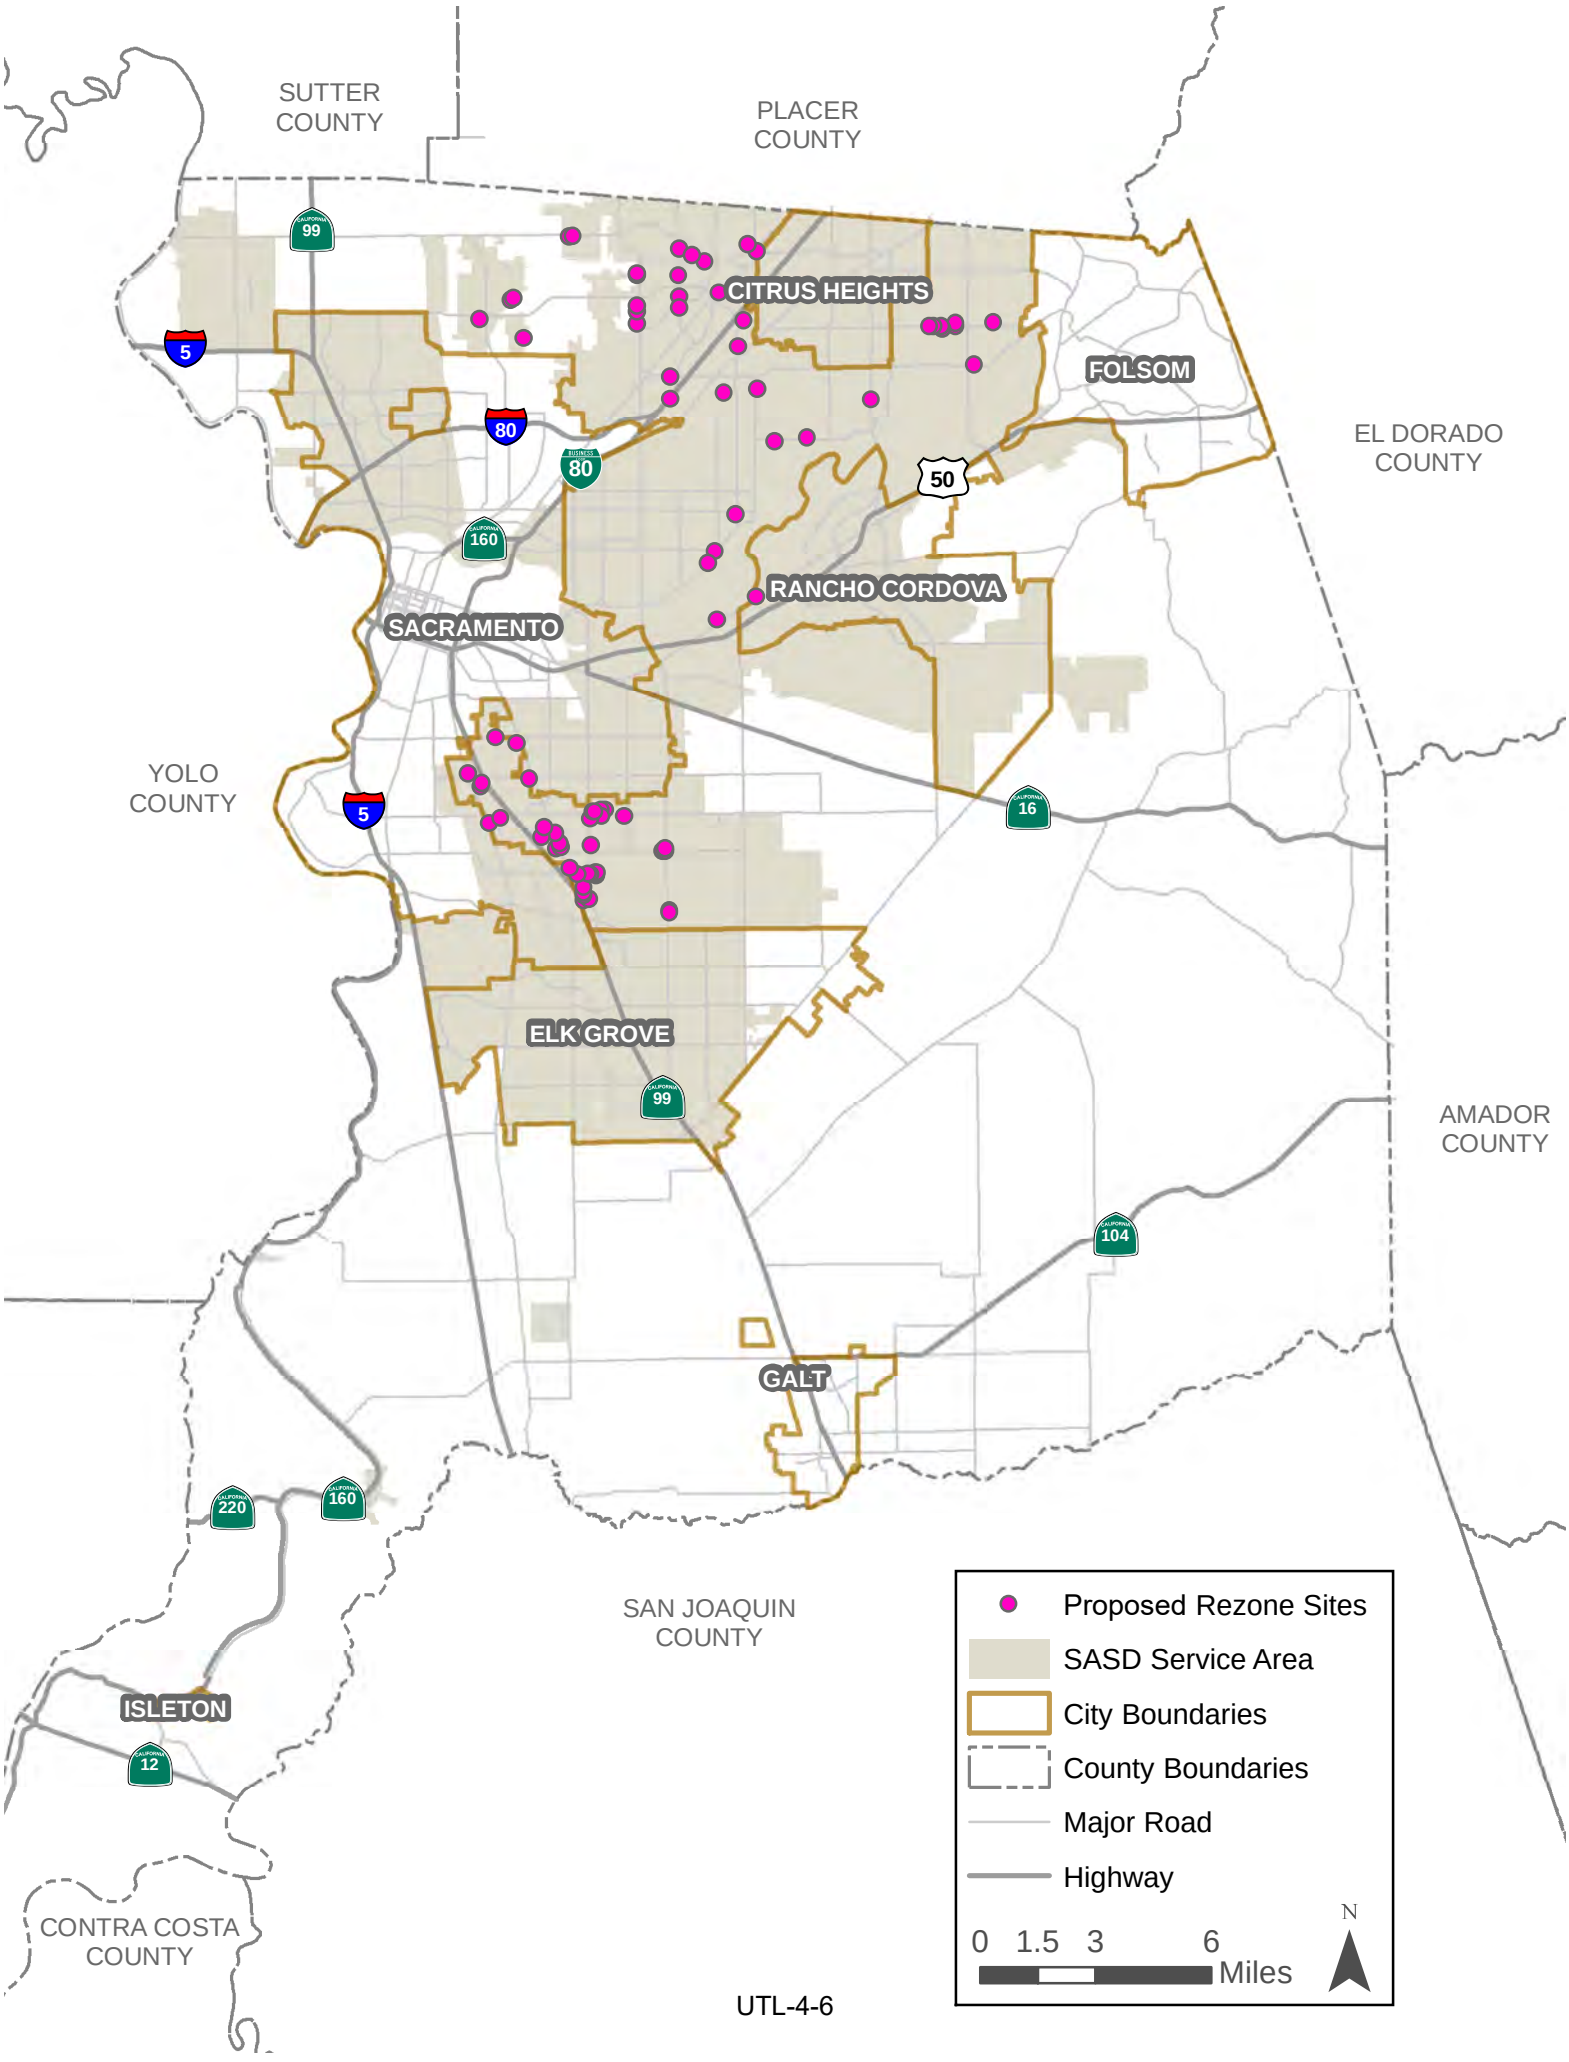
area. In total, the Project is anticipated to result in a net increase of 4,345 units (4,143 lower-income units and 202 moderate-income units) within the SacSewer service area.

It is noted that SacSewer exempts certain types of developments that include deed restricted affordable units from various impact fees. At this time, no development is proposed with the Project; thus, PER is specifically concerned with overall system-wide supply and infrastructure capacity. Pursuant to California *Government Code Section 65583.2(b)(5*), projects implementing our approved Housing Element, including this Project, require the County to describe existing or planned sewer supply, including the availability and access to distribution facilities. Parcels included in the affordable inventory must have sufficient sewer supply available and accessible to support housing development or be included in an existing general plan program or other mandatory program or plan, including a program or plan of a public or private entity providing sewer service, to secure sufficient sewer supply to support housing development. Therefore, PER requests the following information:

1. Whether the projected sewer demand associated with the Project was included as part of an adopted sewer management plan, or similar; and
2. If the Project's sewer demand was not included as part of the most recently adopted sewer management plan, does SacSewer have adequate capacities to serve the Project?

Additionally, PER requests any comments (including conditions of approval or advisories) SacSewer may have for the Project. If you have any questions or would like to set up a meeting to further discuss the Project, please contact me at shenj@saccounty.gov or 916.875.3711.

Sincerely,



Jessie Shen
Senior Planner

Ms. Jessie Shen
County of Sacramento – Community Development Department
827 Seventh Street, Room 225
Sacramento, CA 95814

Subject: **REVISED NOTICE OF PREPARATION OF A DRAFT SUBSEQUENT ENVIRONMENTAL IMPACT REPORT FOR THE SACRAMENTO COUNTY REGIONAL HOUSING NEEDS ALLOCATION (RHNA) REZONE PROJECT (SCH# 2023060304; COUNTY CONTROL NO. PLNP2020-00042)**
APN: **N/A**
File No: **PLNP2020-00042 (SCH# 2023060304)**

Dear Ms. Shen,

The Sacramento Area Sewer District (SacSewer) has reviewed the subject document and has the following comments.

The Sacramento County Housing Element of 2021-2029 identifies a shortfall of 2,884 units for the lower-income category in the County. There are insufficient appropriately zoned sites to accommodate the County's Regional Housing Needs Allocation (RHNA) obligation for the lower-income category. As such, Planning and Environmental Review (PER) is undertaking a rezone of ±248.33 acres comprising 83 candidate rezone sites within the unincorporated County to provide additional lower-income and moderate-income category housing opportunities. The Project does not propose to construct new residential or other development on the ±248.33 acres proposed to be rezoned; instead, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. The planning horizon year for the Project is 2029.

Note: Effective January 1, 2024, the Sacramento Regional County Sanitation District and the Sacramento Area Sewer District merged into one district called the Sacramento Area Sewer District, or SacSewer for short.

SacSewer provides local sewer service to the proposed project site via its collection system and conveys sewage from the collection system to the EchoWater Resource Recovery Facility for treatment, resource recovery, and disposal.

SacSewer is not a land-use authority and plans and designs its sewer systems using information from land-use authorities. SacSewer bases the projects identified within its planning documents on growth projections provided by these land-use authorities.

Board of Directors
Representing:
County of Sacramento | City of Citrus Heights
City of Elk Grove | City of Folsom
City of Rancho Cordova | City of Sacramento
City of West Sacramento | County of Yolo

Christoph Dobson
General Manager/District Engineer
Rosemary Clark
Director of Collection System Operations
Glenn Bielefelt
Director of EchoWater Operations
Mike Huot
Director of Policy & Planning
Matthew Doyle
Director of Internal Services
Masiku Tepa Banda
Director of Finance
Nicole Coleman
Director of Communications

To receive sewer service, the project proponent must complete Sewer Master Plans that include connection points and phasing information to assess the existing capacity of the collection systems to determine if the current facilities can convey the additional flows generated by the Project.

In March 2021, the SacSewer Board of Directors approved the most current SacSewer planning document, the 2020 System Capacity Plan Update (SCP). In February 2013, the SacSewer Board of Directors adopted the Interceptor Sequencing Study (ISS). The SCP and ISS are on the SacSewer website at System Capacity Plans - Sacramento Area Sewer District (sacsewer.com).

The increased densities proposed by the Project were not included in the most current SCP and ISS planning documents. Portions of the Project area may exceed the design capacity of the existing collection system and may require projects to upsize the existing collection system to handle the increased flows proposed by the Project.

Customers receiving service from SacSewer are responsible for rates and fees outlined within the latest SacSewer ordinance. Fees for connecting to the sewer system recover the capital investment of sewer and treatment facilities that serve new customers. SacSewer does not guarantee sewer service or system capacity to the property until the property obtains proper permits to connect to the system and pays all facility impact (capacity) fees. The SacSewer ordinances are on the SacSewer website at Ordinances - Sacramento Area Sewer District (sacsewer.com).

If you have any questions regarding these comments, please call me at (916) 876-6104.

Sincerely,

Robb Armstrong

Jessie Shen:

I have attached the comments of the Butterfield-Riviera East Community Association (BRECA) on the Draft Subsequent Environmental Impact Report for the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project.

Please acknowledge receipt of this email.

Also, if there is way for us to get on a list for people to be notified of activities on this document and the general RHNA process, please add our name to that list.

Thank you.

Re: Comments on the Draft Subsequent Environmental Impact Report for the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project

Jessie Shen:

These are the comments of the Butterfield-Riviera East Community Association (BRECA) concerning the Draft Subsequent Environmental Impact Report for the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project (DSEIR).

The Butterfield-Riviera East Community Association (BRECA) is a membership based community organization. Our goals are to promote citizen involvement and enhance the community. The boundaries of our association are the American River on the north, Folsom Blvd. on the south, the Mayhew Drain on the west, and Paseo Rio Way (both sides of the street) on the east.

As explained in the Executive Summary and Chapters 1 and 2, the main purpose of the RHNA Rezone Project is to increase the number of dwelling units (du) in unincorporated Sacramento County zoned to lower income households so as to meet the recently revised RHNA numbers plus an additional margin. Lower income dwellings are defined as being zoned at a density of 30 du/acre or greater. A secondary purpose is to increase the zoning of moderate income dwellings.

One of the parcels included as a candidate in the Sacramento County Rezone Project lies within the boundaries of our Association: It has Assessor Parcel Number (APN) 075-0020-015-0000, and is identified as site 15 in Appendix PD-1 to the DSEIR. Another parcel, with APN 075-0440-024-0000, identified as site 16 in Appendix PD-

1-2

1, lies immediately to the east of our Association boundaries. BRECA has been heavily involved for at least two decades in various planning efforts concerning the first site. The first site is along Folsom Blvd., immediately opposite the Butterfield Light Rail Station, and is approximately 14.7 acres in total. It consists mostly of fallow field, with a single house and some outbuildings surrounded by trees.

1-2, cont

We first want to bring to your attention that candidate site 15 (as identified in Appendix PD-1) should not be included in the "lower income" category of the Rezone Project at all because it is too big. California Government Code Section 65583.2(c)(2) reads in part:

> "(B) A site larger than 10 acres shall not be deemed adequate to accommodate lower income housing need unless the locality can demonstrate that sites of equivalent size were successfully developed during the prior planning period for an equivalent number of lower income housing units projected for the site or unless the locality provides other evidence to the department that the site can be developed as lower income housing…."

As noted above, the candidate site 15 (as identified in Appendix PD-1) is actually about 14.7 acres. Current zoning for the site dates from the Riverstone Square proposal approved by the Board of Supervisors in 2007, and includes about 2.3 acres of dedicated park land zoned RD-0, leaving 12.4 acres developable at RD-20. Appendix PD-1 indicates that the acreage rezoned is 11.45 acres (net). Whether the text of California Government Code cited above refers to gross or net acres, the site is clearly larger than allowed by the cited Code for lower income housing.

1-3

The DSEIR makes no mention of this. Nor does it cite any examples of "…sites of equivalent size (that) were successfully developed during the prior planning period for an equivalent number of lower income housing units…." It seems likely to us that there are none. Are there any sites that fulfill this criteria?

Consequently, as the main purpose of the Rezone Project is to zone areas with higher density to increase the RHNA numbers, and candidate site 15 (as identified in Appendix PD-1) cannot be used to increase those numbers, site 15 should not be included as lower income density (i.e. over 30 dwelling units [du] per acre) zoning. We point out that the proposed rezone has many more additional lower income units (973, DSEIR p. 2-3) than are required to meet the RHNA requirements. Hence removing Site 15 would not result in failure to achieve the main goal of the Rezone project. Is County Planning willing to modify the proposed project to remove candidate site 15 from the higher density category? If not, why not?

The second point that we would like to make is that the DSEIR appears to us to omit an entire subcategory of adverse environmental impact. In Chapter 4, Aesthetics, there is a subcategory for "Impact AES-1: Degrade Existing Visual Character or Quality of Public Views." However, there is no category for degrading of "private views," even when said views would be experienced by a large number of people. In particular, we point out that the "private views" of residents who live adjacent to

1-4

candidate sites number 15 and 16 (as described in Appendix PD-1) would be greatly degraded by the zoning proposed in the Rezone proposal.

Regarding site 15, it is bordered on the North by single family detached houses, most of which are single story, with a few two story. On the west it is bordered by duplexes, which are all single story. As these residents look out from their back yards, as noted above, they currently see an open field with a single one story house and some outbuildings (site 15). If the Rezone proposal were to take effect, and development occur at the proposed density of 40 du/acre, this view would change to, most likely, one or more large apartment or condominium buildings averaging about four (4) stories in height. This would of course tremendously degrade their "private" view.

Site 16 (as described in Appendix PD-1) likewise has single family homes, one and two story, to the north. These would be adversely affected by the proposed 40 du/acre zoning of this site.

We are of course aware that the current zoning for site 15 (as described in Appendix PD-1) is for 20 du/acre for most of the site. The final plan of this, in the Riverstone Square proposal, was for a combination of small detached single family homes to the north and west, and row houses to the south and east. Those would have been two (2) or three (3) stories high. We view this as marginally compatible with surrounding construction. If this zoning was used for apartments or condominiums, it would most likely be two (2) stories on average. So a change to 40 du/acre would be a significant change.

1-4, cont

We add, as cited in the DSEIR (p. 4-16 and 4-17), the following land use policies from the Sacramento County General Plan:

> "LU-18. Encourage development that compliments the aesthetic style and character of existing development nearby to help build a cohesive identity for the area."
>
> "LU-102. Ensure that the structural design, aesthetics and site layout of new developments is compatible and interconnected with existing development."

It is strikingly obvious that the proposed rezone of candidate sites 15 and 16 (as described in Appendix PD-1) to 40 du/acre, are inconsistent with the above land use policies. If developed per the proposed zoning it would constitute a significant adverse effect on the environment of the neighbors.

We also add that it appears that there may be many of the sites in the Rezone proposal that would have the same situation as sites 15 and 16 (as described in Appendix PD-1).

The failure to disclose this effect renders the DSEIR inadequate under the California Environmental Quality Act (CEQA).

On a side note, we point out that there is an inconsistency between the site designations in Appendix PD-1 and Appendix AES-1. APN 075-0020-015-0000, is identified as site number 15 in Appendix PD-1 to the DSEIR. However, in Appendix AES-1, it is identified as site number 37. APN 075-0440-024-0000, is identified as site 16 in Appendix PD-1, but as site number 34 in Appendix AES-1. It appears that most or all of the site numbers in Appendix PD-1 are inconsistent with those in Appendix AES-1. This likely confuses many people. Inasmuch as much of the text of the main document refers to site numbers without clarification of which Appendix this should refer to, this needs to be fixed in the final environmental document. This is also why our comments above refer repeatedly to Appendix PD-1 as the source of the site number.

1-5

On another note, we also want to comment on traffic impacts. We see that, according to DSEIR Chapter 10, Transportation, traffic congestion and Level Of Service have been deemed to be not significant effects under CEQA. None-the-less, we are concerned about the impact of the large number of vehicles that would be added to our streets by the proposed high density zoning. We are particularly concerned about the combined impact of sites 15 and 16 (as described in Appendix PD-1) on the intersection of Folsom Blvd. and Bradshaw Road. This intersection is already projected to be a Level of Service F in the future. More traffic will only make things worse. Although we do not expect the DSEIR to address this question, we do intend to bring it to the attention of the Board of Supervisors.

1-6

We look forward to your response to these comments.

You may contact us at jmorgan1@ix.netcom.com.

Thank you for your attention to these matters.

Hello,

Thank you for including California Department of Transportation in the review process for PLNP2020-00042 Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project. We wanted to reach out and let you know we have no comments at this time.

Please provide our office with copies of any further actions regarding this proposal. We would appreciate the opportunity to review and comment on any changes related to this development.

Should you have questions please contact me, Local Development Review and System Planning Coordinator, by phone (530) 821-8261 or via email at D3.local.development@dot.ca.gov.

Thank you!

Regarding: Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project
(County Control Number PLNP2020-00042)
Draft Subsequent Environmental Impact Report, dated April 2024
(State Clearinghouse Number 2023060304)
Notice of Availability (NOA)

Public Review Period: April 5, 2024 to May 20, 2024

Reviewed by: Cordova Recreation and Park District
Laura Taylor, CRPD Park Planning and Development Manager
Lisbet Gullone, CRPD Contract Planner

Cordova Recreation and Park District (CRPD or 'District') is responding to a 'Notice of Availability' from Sacramento County regarding a subsequent environmental report for the Sacramento County Regional Housing Needs Allocation Rezone Project. The County previously circulated a 'Notice of Preparation' (NOP) with a public review period of December 22, 2023 to January 22, 2024. A scoping meeting for public agencies was also held on January 4, 2024. CRPD inadvertently missed the opportunity to provide early comments regarding the environmental aspects of the rezone project.

3-1

The current environmental report refers to earlier EIR's that were prepared for special planning areas within the County. All these areas, (including Fair Oaks Boulevard, North Watt Avenue and Old Florin Town SPA), are located outside the District.

PROPOSED REZONE

The County's rezone project includes 79 properties with an overall area of 235 acres. Most of the parcels are zoned for residential development, but by increasing the allowed density the County can provide the opportunity for the development of an additional 4,081 units in the lower income category. After this increase of high-density zoning the County will meet the State's requirements for residential zoning. 3-2

Two of the sites targeted for rezone are located within CRPD. Both sites are in the west end of the District with access from Folsom Boulevard (Site #15 and Site #16). The combined area of these properties is 13.9 acres.

SUMMARY OF ENVIRONMENTAL REPORT

While the subsequent environmental report is addressing 'Public Services and Recreation', no new or more significant effects have been identified. As in earlier EIR's, the report states that the Quimby Act and **General Plan Policy PF-123** covers potential impacts of the rezone on Parks and Recreation Facilities. No additional mitigation has therefore been required.

In the report Park and Recreation Facilities have been included with **Table ES-1**: *Summary of Resource Topics Excluded from Detailed Analysis* on page ES-65 and ES-66. **Impact PSR-5: Require Construction of Parks and Recreation Facilities** states increase for demand for parks and recreation facilities would be required by the Quimby Act and General Plan Policy PF-123. Park Districts in the three special planning areas (Carmichael, North Highlands and Southgate) have been addressed individually under **Impact PSR-5**. 3-3

REZONE SITES WITHIN THE DISTRICT

Rezone sites #15 and #16 are both located along Folsom Boulevard, close to the west boundary of Rancho Cordova. This part of the CRPD is generally considered to be underserved by Quimby parkland.

Site #15 is proposed to be rezoned from 20 units/acre (RD-20) to 40-units/acre (RD-40). The 11.45-acre property includes a 3-acre portion zoned for parks and open space (O) in the center. While **Appendix PD-1** lists the proposed zoning as RD-40/O, the three-acre park portion has been included with both the existing and proposed density calculation. As a result, the project seems to exclude the 3-acres of parkland and by default rezones the 3-acres of parkland to high density housing. Because this zoning change would eliminate land that in the future could be developed as a public park, CRPD recommends that the 3-acre parkland should be excluded from rezoning and density calculations. 3-4

Site #16 is also proposed to be rezoned from 20 units/acre (RD-20) to 40 units/acre (RD-40). The size of this parcel is 2.45-acres.

DSEIR REPORT

Impact PSR-5 describes why the rezone will not impact the demand for park and recreation facilities (see **Table ES-1** on page ES-65 and 66). Both the General Plan and the Quimby Act are mentioned as evidence that future multi-family developments within the Carmichael, North Highlands and Southgate Park Districts will have a sufficient amount of parkland. While the DSEIR report is focused on three special 3-5

planning areas within the County (Fair Oaks Boulevard, North Watt Avenue and Old Florin Town SPA), CRPD recommends that all the eleven park districts that are subject to the rezone project should be mentioned in impact assessment PSR-5.

3-5, cont

A detailed analysis of Impact PSR-5 is found on pages 9-43 to 9-48. There appears to by a typo on page 9-43 under **Proposed Project Impact Evaluation**, third bullet should reference "CRPD" (for Cordova Recreation and Park District) instead of COPD.

3-6

For unknown reasons, CRPD was not aware of the earlier environmental review process. However, the District has noted that Southgate Park and Recreation District responded to the County's Notice of Preparation (NOP) as covered in the DSEIR on page 9-44. Similarly to Southgate, CRPD has standard conditions that apply to the County portion of the District. These standard conditions have been provided in the past to Sacramento County as part of the review and comment on new development proposals. As a part of these conditions, CRPD requires that developments consent to be included in a CRPD financing district for the purposes of funding costs to repair, maintain, and replace facilities in perpetuity. When development applications are submitted for the rezoned sites, the District will work with the County to incorporate park conditions with the project approval.

3-7

ADDITIONAL DSTRICT COMMENTS

The California Environmental Quality Act (CEQA) does not require that economic aspects of a project are analyzed. However, *Public Services and Recreation* (that is a subject of CEQA review) are directly affected by funding. Regarding parks, this means that the amount of parkland in addition to the quality of park improvements and park maintenance depends on the available funding. Generally, park fees have not increased at the same rate as costs for park construction and park maintenance.

While the DSEIR refers to the 'Quimby Act' as evidence that the State and local requirements for parks will be met, it does not consider that High-Density Infill Development in Sacramento County qualifies for an exemption from Quimby Parkland Requirements (see **Goal 2 in the Housing Element** portion of the General Plan and section 6.5.4.D of the County Zoning Code). The District also does not know, when the County would consider an 'Alternative Calculation Method' outlined in **Chapter 22.40.045** to determine parkland requirements potentially reducing the current standards within the District from 4.87-acres/1,000 residents. In order to manage some of the unknown aspects of the rezone project, CRPD recommends that the County should not permit waivers from Quimby Parkland Requirements.

3-8

Some new multi-family developments will fall under a "by right" approval process that allows approval without compliance with the requirements of Chapter 22.40. Therefore, the report should also identify Sacramento County **Chapter 9.70 Local Parks and Recreation Dedication and Fees** as a mechanism to provide mitigation for the impact of increased population for projects that are not subject to Chapter 22.40.

SUMMARY OF CHANGES AND ADDITIONS REQUESTED BY CRPD

1. Exclude the 3-acre open space zone within site #15 from the RHNA Rezone Project.

3-9

2. Expand PSR-5 impact assessment to include all the Park Districts that are affected by the rezone project. 3-10
3. Do not exempt Affordable Housing Projects within Sacramento County from Quimby Parkland requirements. 3-11
4. Correct typo on page 9-43 under **Proposed Project Impact Evaluation** , third bullet to "CRPD" (for Cordova Recreation and Park District) instead of COPD. 3-12
5. Sacramento County Code Chapter 9.70 should be mentioned as a mechanism to provide park and recreation mitigation for projects that are not subject to Chapter 22.40. 3-13

Please contact the District if you have any questions or comments regarding this letter.

Re: Response of Dry Creek Joint Elementary School District to "Notice Of Availability Of A Draft Subsequent Environmental Impact Report For The Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project"

Dear Ms. Shen:

On behalf of the Dry Creek Joint Elementary School District ("District"), we provide this letter to submit comments regarding the Draft Subsequent Environmental Impact Report ("DEIR") for the Sacramento County Regional Housing Needs Allocation (RHNA) Rezone Project ("Project") proposed by Sacramento County ("County"). According to the DEIR, The Project consists of rezoning sites totaling approximately 235 acres across unincorporated Sacramento County to provide additional lower income (i.e., extremely low income, very low income, and low income) and moderate-income category housing opportunities. As per the DEIR, the County aims to it provides additional capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. **4-2**

As a threshold issue, the District is sparsely mentioned in the DEIR. There is no significant analysis of the District or the linkages between housing development, their impact on the District, and the need for infrastructure to support the community's students. As a general note, the District requests additional discussion of these topics be included in the DEIR. **4-3**

Furthermore, the Housing Accountability Act prohibits local planning agencies from denying a residential project (or approving it at a reduced density) if the project complies with all applicable objective standards. (Gov. Code § 65589.5(j).) The County cannot impose any condition on such a project if the condition makes the project infeasible, financially or physically. These objective standards are set out in the general plan and zoning documents approved by local planning agencies. As such, once the Project is approved, the District will no longer have an avenue to ensure that the impact of high-density residential units on schools is adequately identified, analyzed, addressed, and mitigated. **4-4**

Therefore, through this letter, the District wishes to emphasize that this Project has the potential to have a profound negative effect on the District's students, their families, and residents. Overall, the DEIR fails to present any information needed to assess the Project's environmental impacts on the District.

With the foregoing in mind, the District requests the County revise the DEIR to address the serious deficiencies identified in this letter, develop appropriate mitigation measures for impacts that are identified as significant, and then recirculate the revised DEIR as required by CEQA. (CEQA Guidelines § 15088.5.) The District is hopeful that collaboration with the County, as outlined in this letter, will yield meaningful solutions that alleviate the impacts caused by the Project. The District is prepared to provide information as necessary to assist the County in addressing each of the District's concerns regarding the proposed Project. 4-5

I. The DEIR does not meet its purpose as an informational document because it fails to provide an adequate description of the environmental setting related to schools.

One of CEQA's basic purposes is to inform government decision-makers and the public about the potential significant environmental effects of proposed projects and to disclose to the public the reasons for approval of a project that may have significant environmental effects. (CEQA Guidelines § 15002(a)(1) and (a)(4).) In line with this goal, the preparer of an EIR must make a genuine effort to obtain and disseminate information necessary to the understanding of the impacts of project implementation. (See, CEQA Guidelines § 15151; *Sierra Club v. State Board of Forestry* (1994) 7 Cal.4th 1215, 1236.)

An EIR must describe existing environmental conditions in the vicinity of the proposed project from a local and regional perspective, which is referred to as the "environmental setting." (CEQA Guidelines § 15125.) This description of existing environmental conditions serves as the "baseline" for measuring the qualitative and quantitative changes to the environment that will result from the project and for determining whether those environmental effects are significant. (*Id.*; see also, CEQA Guidelines § 15126.2(a); *Neighbors for Smart Rail v. Exposition Metro Line Constr. Auth.* (2013) 57 C4th 439, 447.) 4-6

District facilities are critical part to the Project location's environment and should be considered throughout the DEIR impact categories. The DEIR identifies that three (3) of the rezone sites are within the District's boundaries and that these 3 sites will generate a total of Two Hundred and Thirty-Five (235) students that will need to be housed on District campuses. (DEIR, 9-35.) However, the DEIR fails to identify the impacted school sites, the available capacity at those schools, whether the students generated by development will need transportation, and related impacts. District facilities are at or nearing their capacity and so it is likely that these students may not be housed at their nearest campus or new facilities will be needed to house these students. The District is inadequately equipped to house these excess students. The DEIR fails as an informational document as it does not daylight these issues to the public or decision makers to adequately evaluate the impact of the Project.

Furthermore, it is common practice for cities and counties to rely on program-level environmental documents to excuse further analysis at the project-level. (See *Citizens for Responsible Equitable*

Environmental Development v. City of San Diego Redevelopment Agency (2005) 134 Cal.App.4th 598, 608.) Applied to this instance, the County would be able to approve further project-specific entitlements without informing the public regarding the impact of such specific projects on school facilities. Therefore, the County must do the work of identifying and analyzing these impacts in this DEIR to ensure that the document complies with the basic principles of CEQA.

The DEIR purports to describe the Project's environmental setting in each of the environmental impact categories that are analyzed in the DEIR. However, in doing so, the DEIR barely mentions the District school throughout the entire document. The DEIR fails to present any information needed to assess the Project's environmental impacts on the District. For instance, the DEIR fails to address the current and projected future enrollment at District campuses that will be affected by the Project; the District's educational program objectives; a description of how the District currently uses its facilities; and the current vehicular and pedestrian paths of travel used by District staff, students and their families to get to and from school. Without consideration of these factors, it is impossible for the lead agency and public to assess whether the Project has any impacts on the District's students, families, and staff, and whether those impacts are significant.

4-6, cont

II. The DEIR fails to identify and analyze all impacts on school facilities.

The DEIR does not address student generation within the context of the overall growth within the County and its impact on enrollment and potential overcrowding of school sites. The District requests the County consider the cumulative impacts of the Project alongside other new developments within the County, related to student generation, the facilities needed to accommodate such growth, and all the impacts on the District, direct and indirect, resulting from the Project.

CEQA Guidelines, Appendix G, states that a project may have public services impacts on schools if the project would "result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives" for the provision of school services.

4-7

There is a myriad of ways in which large residential and commercial development projects can impact a school district's need for new or physically altered facilities in order to maintain performance objectives. The DEIR does not and should analyze all potential impacts under this standard, including but not limited to: (1) whether the influx of students would require "physically altered" school facilities unrelated to the accommodation of additional enrollment; (2) whether other impacts of the proposed Project, such as increased traffic, noise, or air pollutants in the neighborhood, could impact the District's need for new or physically altered school facilities; and (3) whether other impacts of the proposed Project could otherwise interfere with the District's ability to accomplish its own performance objectives. Consideration of the above-listed categories information is essential to properly making these determinations.

Lead agencies, and the DEIR, often cite to SB 50 (specifically, Government Code sections 65995(h) and 65996(a)), for the proposition that the payment of school impact fees (commonly

referred to as "developer fees") excuses them from their obligations to analyze and mitigate impacts posed on school districts by development. In addition, the relevant text in the DEIR is a misstatement of the law related to developer fees and CEQA. While SB 50 does declare that the payment of the developer fees authorized by Education Code section 17620 constitutes "full and complete mitigation of the impacts of any legislative or adjudicative act on the provision of adequate school facilities," (Gov. Code § 65995(h)), SB 50 does not excuse lead agencies from analyzing such impacts on school facilities in the first place. Further, California courts have since acknowledged that developer fees do not constitute full and complete mitigation for school-related impacts other than school overcrowding. (*Chawanakee Unified Sch. Dist. v. Cty. of Madera* (2011) 196 Cal.App.4th 1016.) Thus, the payment of fees does not constitute full mitigation for all impacts caused by development related to traffic, noise, biological, pedestrian safety, and all other types of impacts related to the District and its educational program. The District expects the County to analyze and mitigate all such impacts for this Project.

From a practical standpoint, the amount of developer fees received by school districts typically falls woefully short of alleviating the impacts caused by development. This is due largely to the fact that: (1) statutory developer fee amounts fail to acknowledge the differences in costs of school construction from one district to another; (2) the developer fee amounts fail to contemplate the special facilities needs of those districts experiencing rapid growth, such as the need for portables; and (3) the adjustment formula for developer fees is based on a "construction cost index" and does not include indexing related to the increases in land costs, resulting in the actual costs of facilities (i.e., land and improvements) increasing at a greater rate than the adjustment.

4-7, cont

The inadequacy of developer fees as a source of funding for school facilities has forced school districts to rely increasingly on other sources of funding, primarily including local bond funds and State bond funds administered under the School Facilities Program ("SFP"). However, these sources of funds can be equally unreliable. Local bond funds are also difficult to generate, as local bonds are subject to district bonding capacity limitations and voter approval. Either way, the funding formula was never intended to require the State and local taxpayers to shoulder a disproportionate portion of the cost of school facilities.

In addition to the fact that current school sites do not have sufficient space to accommodate additional students, an inadequate infrastructure – which might include cafeterias, restroom facilities, sewerage, electrical capacity, and the like – may also preclude any additional growth. Placing too great a strain on the infrastructure is itself a physical impact to be addressed in an EIR.

Thus, the payment of fees does not constitute full mitigation for all impacts caused by development related to traffic, noise, biological, pedestrian safety, and all other types of impacts related to the District and its educational program. The District expects the County to analyze and mitigate all such impacts for this Project.

III. The DEIR fails to identify and analyze all impacts on housing.

The DEIR should estimate the amount of development fees to be generated by development in accordance with implementation of the Project and should describe the phasing of residential and development over time from inception to build-out of the Project.

4-8

The timing of development will also determine when new students are expected to be generated, and therefore is an important consideration particularly when considering the cumulative impact of a project in conjunction with other approved or pending development. High-density residential units, such as multi-family housing, have a proportionally larger impact on the District when compared to single family homes. This is because multi-family units generate a similar number of students to single family units but over a smaller square footage. Therefore, the developer fees collected on such multi-family housing do not accurately reflect the burden placed on the District to ensure adequate facilities are ready to house the students generated by development. Therefore, significant multi-family residential development often leads to a scenario where the developer fees imposed on such development does not track with the need for facilities to house students generated by such development.

4-8, cont

While the foregoing funding considerations raise fiscal issues, they translate directly into physical and environmental impacts, in that inadequate funding for new school construction results in overcrowding of existing facilities. Furthermore, fiscal and social considerations are relevant to an EIR, particularly when they either contribute to or result from physical impacts. (Pub. Resources Code § 21001(g); 14 Cal. Code Regs. §§ 15021(b), 15131(a)-(c), 15142 & 15382.)

IV. The County Must Consider All Traffic and Related Impacts, Including Impacts on Traffic on Student Safety, Caused by the Project.

The DEIR was required to address potential effects related to traffic, including noise, air quality, and any other issues affecting schools. (Pub. Resources Code, §§ 21000, et seq.; Cal. Code Regs., tit. 14, §§ 15000, et seq.; *Chawanakee Unified School District v. County of Madera, et al.*, (2011) 196 Cal.App.4th 1016.) Additionally, specifically related to traffic, the DEIR was required to analyze safety issues related to traffic impacts, such as reduced pedestrian safety, particularly as to students walking or bicycling to and from District schools; potentially reduced response times for emergency services and first responders traveling to these schools; and increased potential for accidents due to gridlock during school drop-off and pick up hours. Though the DEIR generally analyzes the traffic impacts anticipated by the Project, its analysis is inadequate, particularly in relation to schools. Traffic issues are a particular concern for school districts in that increased traffic volume may interfere with established school bus routes, require new and additional routes, and may increase safety concerns for students walking or riding bicycles or other modes of transportation to and from school.

4-9

Any environmental analysis related to the Project must address potential effects related to traffic, noise, air quality, and other issues affecting schools. (Pub. Resources Code, §§ 2100, et seq.; Cal. Code Regs., tit. 14 §§ 15000, et seq.; *Chawanakee Unified School District v. County of Madera, et al.*, (2011) 196 Cal.App.4th 1016.) Specifically related to traffic, there must be an analysis of safety issues, such as reduced pedestrian safety; potentially reduced response times for emergency services and first responders traveling to these schools; and increased potential for accidents due to gridlock during school drop-off and pick-up hours. (See, Journal of Planning Education and Research, "Planning for Safe Schools: Impacts of School Siting and Surrounding Environments on Traffic Safety," November 2015, Chia-Yuan Yu and Xuemei Zhu, pg. 8 [Study of traffic accidents

near Austin, Texas schools found that "[a higher percentage of commercial uses was associated with more motorist and pedestrian crashes" around schools].)

The State Office of Planning and Research has developed new CEQA Guidelines that sets forth new criteria for the assessment of traffic impacts and now encourages the use of metrics such as vehicle miles traveled ("VMT"), rather than level-of-service ("LOS"), to analyze project impacts on traffic. (14 Cal. Code Regs. §15064.3.) However, local agencies may still consider impacts on traffic congestion at intersections where appropriate and must do so where, as here, such traffic congestion will cause significant impacts on air quality, noise, and safety issues caused by traffic. (Pub. Res. Code § 21099(b)(3).)

To the extent the Project may implement construction that impedes circulation in the County, and clog the access roads to, from, and around the District campuses, such items should be addressed in the EIR. (See, 5 Cal. Code Regs. § 14010(k), which requires that school facilities be easily accessible from arterial roads.)

In addition to increased risks of vehicular accidents, the traffic and parking impacts posed by the Project may impact the safety and convenience of students who walk or bike to school. Title 5 of the California Code of Regulations requires that school sites be located within a proposed attendance area that encourages student walking and avoids extensive bussing. (5 Cal. Code Regs. § 10410(1).) As per the District Board Policy 5142.2, the District is committed to reducing vehicle emissions by encouraging students to walk or bicycle to school or to use district or public transportation. It is important that these traffic impacts are not only assessed through a VMT analysis, but also through a LOS analysis, as traffic congestion that may result from the Project may cause significant issues related to safety, noise, and air quality.

4-9, cont

The requirement to analyze student safety issues is rooted in both the California Constitution and CEQA. Article I, section 28(c), of the California Constitution states that all students and staff of primary, elementary, junior high, and senior high schools have the inalienable right to attend campuses that are "safe, secure, and peaceful." CEQA is rooted in the premise that "the maintenance of a quality environment for the people of this state now and in the future is a matter of statewide concern." (Pub. Res. Code § 21000(a).) Naturally, safety is crucial in the maintenance of a quality environment. "The capacity of the environment is limited, and it is the intent of the Legislature that the government of the state take immediate steps to identify any critical thresholds for the health and safety of the people of the state and take all coordinated actions necessary to prevent such thresholds being reached." (Pub. Res. Code § 21000(d).) The Legislature has made clear in declarations accompanying CEQA's enactment that public health and safety are of great importance in the statutory scheme. (Pub. Res. Code §§ 21000 (b), (c), (d), (g); 21001(b), (d) (emphasizing the need to provide for the public's welfare, health, safety, enjoyment, and living environment.) (*California Building Industry Assn. v. Bay Area Air Quality Management Dist.* (2015) 62 Cal.4th 369, 386.)

The District notes that no mention is made in the DEIR regarding travel-to-school analysis, including school bus routes, or walking/riding paths or routes. The District requests these school-related transportation, traffic, and safety impacts be analyzed and addressed, including those resulting from traffic and transportation impacts from the Project as a whole, and those

school impacts relating to both (1) Project resident students' travel to and from yet-to-be identified school sites, and (2) congestion and related impacts on campus pick-up and -drop off procedures in light of increased traffic on major and arterial roads outside the Project. As mentioned, the District's campuses are currently nearing capacity and no single campus is projected to be able to support the Project's full population. As a result, students residing in the Project will likely need to travel from the Project to interim or new alternative school sites, which necessitates analysis of contingency bus and home to school travel routes to same. Furthermore, as per the District's BP/AR 3541 students are only eligible for bussing if they live more than 2 miles from their designated campus. Due to the location of the rezoned areas, and their nature as high-density residential, it is more than likely that the developments in the re-zoned areas will generate a proportionally large number of students that will not be eligible for bussing and, therefore will have to walk to school on a road that will be significantly busier due to the traffic generated by development.

4-9, cont

The DEIR is inadequate in its discussion of the significant and inevitable traffic and transportation impacts, particularly as related to the Project's construction. The construction of, and traffic generated by, the Project will severely exacerbate the existing inadequacies in the County's roadways/sidewalks and the safety issues posed thereby. These impacts will severely inhibit the District's ability to operate its educational programs. However, none of these issues were properly analyzed in the DEIR.

The foregoing categories of information are critical for determining the extent of both physical and fiscal impacts on the District caused by increased population growth.

V. The County Must Consider Social Impacts Caused by the Project.

The Final EIR should identify how school facilities are currently utilized as civic centers, and are projected to serve in that capacity in the future, and assess the impacts of the Project on that use and identify how the District's grounds are currently utilized for recreation (parks) and open space, and are projected to serve in that capacity in the future, and assess the impacts of the Project on that use. These two requests are made in light of school districts' roles in providing recreational space and civic centers to the community. As overcrowding increases at school sites, the community's ability to utilize school facilities becomes limited, which has both physical and social impacts on the community. For example, the addition of relocatable classrooms to house new students may reduce available playing field or recreational space. Similarly, moving schools to multi-track class schedules, or having to set aside additional space for new alternative education students, may interfere with the community's ability to gain access to school facilities for civic use.

4-10

VI. Conclusion

The District is prepared to provide any information necessary to assist the County in preparation of the final EIR and in addressing each of the issues set forth above. The District is committed to working with the County and any developers to ensure that the District's needs are met and that development located in the area of the proposed Project as well as all of the residents of the community can receive adequate and appropriate educational facilities.

4-11

Importantly, the District's comments and suggestions provided herein should be read as primarily focused on those impacts that go beyond the Project's direct impact on the need for school facilities to house the Project's students. While the direct impact may be statutorily mitigated, it should still be analyzed and discussed. And, importantly, the direct impact is not the only school-related impact foreseeably caused by the Project. Other environmental impacts which have an effect on school services, including those related to traffic and transportation, including travel to school routes and bus stops and routes, noise and air quality, pedestrian and alternative travel safety and convenience, infrastructure impacts, and all other types of impacts related to school services and school-related community concerns, all of which are important to the District's mission. Therefore, the District respectfully requests that the final EIR, include a discussion, analysis, and mitigation of all such impacts.

4-11, cont

Please feel free to contact me directly if we can be of any assistance. Thank you.

Sincerely,

Dr. Brad Tooker, Superintendent

Ms. Jessie Shen
County of Sacramento – Community Development Department
827 Seventh Street, Room 225
Sacramento, CA 95814

Subject: **REVISED NOTICE OF AVAILABILITY OF A DRAFT SUBSEQUENT ENVIRONMENTAL IMPACT REPORT FOR THE SACRAMENTO COUNTY REGIONAL HOUSING NEEDS ALLOCATION (RHNA) REZONE PROJECT (SCH# 2023060304; COUNTY CONTROL NO. PLNP2020-00042)**
APN: **N/A**
File No: **PLNP2020-00042 (SCH# 2023060304)**

Dear Ms. Shen,

The Sacramento Area Sewer District (SacSewer) has reviewed the subject document and has the following comments.

The Sacramento County Housing Element of 2021-2029 identifies a shortfall of 2,884 units for the lower-income category in the County. There are insufficient appropriately zoned sites to accommodate the County's Regional Housing Needs Allocation (RHNA) obligation for the lower-income category. As such, Planning and Environmental Review (PER) is undertaking a rezone of ±235 acres within the unincorporated County to provide additional lower-income and moderate-income category housing opportunities. The Project does not propose to construct new residential or other development on the ±235 acres proposed to be rezoned; instead, it provides capacity for future development of housing units to meet the County's remaining unmet RHNA of 2,884 lower income category units, consistent with State law. The planning horizon year for the Project is 2029. 5-1

Note: Effective January 1, 2024, the Sacramento Regional County Sanitation District and the Sacramento Area Sewer District merged into one district called the Sacramento Area Sewer District, or SacSewer for short.

SacSewer provides local sewer service to the proposed project site via its collection system and conveys sewage from the collection system to the EchoWater Resource Recovery Facility for treatment, resource recovery, and disposal. 5-2

SacSewer is not a land-use authority and plans and designs its sewer systems using information from land-use authorities. SacSewer bases the projects identified within its planning documents on growth projections provided by these land-use authorities.

Board of Directors
Representing:
County of Sacramento | City of Citrus Heights
City of Elk Grove | City of Folsom
City of Rancho Cordova | City of Sacramento
City of West Sacramento | County of Yolo

Christoph Dobson
General Manager/District Engineer
Rosemary Clark
Director of Collection System Operations
Glenn Bielefelt
Director of EchoWater Operations
Mike Huot
Director of Policy & Planning
Matthew Doyle
Director of Internal Services
Masiku Tepa Banda
Director of Finance
Nicole Coleman
Director of Communications

To receive sewer service, the project proponent must complete Sewer Master Plans that include connection points and phasing information to assess the existing capacity of the collection systems to determine if the current facilities can convey the additional flows generated by the Project.

In March 2021, the SacSewer Board of Directors approved the most current SacSewer planning document, the 2020 System Capacity Plan Update (SCP). In February 2013, the SacSewer Board of Directors adopted the Interceptor Sequencing Study (ISS). The SCP and ISS are on the SacSewer website at System Capacity Plans - Sacramento Area Sewer District (sacsewer.com).

The increased densities proposed by the Project were not included in the most current SCP and ISS planning documents. Portions of the Project area may exceed the design capacity of the existing collection system and may require projects to upsize the existing collection system to handle the increased flows proposed by the Project.

5-3

Customers receiving service from SacSewer are responsible for rates and fees outlined within the latest SacSewer ordinance. Fees for connecting to the sewer system recover the capital investment of sewer and treatment facilities that serve new customers. SacSewer does not guarantee sewer service or system capacity to the property until the property obtains proper permits to connect to the system and pays all facility impact (capacity) fees. The SacSewer ordinances are on the SacSewer website at Ordinances - Sacramento Area Sewer District (sacsewer.com).

If you have any questions regarding these comments, please call me at (916) 876-6104.

Sincerely,

Robb Armstrong

AGENDA
COUNTY PLANNING COMMISSION
COUNTY OF SACRAMENTO
700 H STREET SUITE 1450
SACRAMENTO, CA 95814
MONDAY MAY 20, 2024 5:30 PM

AGENDA Item:
PLNP2020-00042 (Countywide/Shen) GENERAL PLAN AMENDMENT, COMMUNITY PLAN AMENDMENT, REZONE AND ZONING ORDINANCE AMENDMENT (Board Of Supervisors - Final Approval) Supervisorial District(s): All

My name is Johnny Vega, 31-year resident of Arden Arcade. My home is a Single-Family Home. My neighborhood is a Single Family Neighborhood. It would be nice to keep the neighborhood this way. Unfortunately, there are forces at work to dismantle this style and way of life. A life I have invested in throughout my adult years of diligent, thoughtful effort. Sadly, I do not have the years available to start over. My life, my quality of life, and my way of living are in jeopardy. And each of you have the power to challenge these negative change agents to protect the citizens in your districts.

I live here because:

- These neighborhoods are organized as single-family homes.
- The green spaces - so carefully planned and maintained - provide safe outdoor activities.
- These neighborhoods are quiet and safe.
- These neighborhoods are wonderful and safe places to raise families.
- My neighbors are my friends, and we depend on each other as needs arise.
- My neighbors work together to keep our homes/sanctuaries clean, safe, and quiet.

7-1

This rezoning plan, I believe, is the beginning of the end of my single-family home neighbor and other single-family home neighbors through the far reaches of this rezoning plan that allows for the development of high-density multi-family rental units built, including low-income units. I am not against the idea of building affordable housing, it is the way these affordable housing units are designed with little to no regard for the character and feel of the existing single-family home neighborhoods.

7-2

To maximize the number of occupancies, three-story structures are being built in traditional one-story single-family neighborhoods. Yes, there is an occasional two-story home, but by far, our old established neighborhoods are single-story. And this way of organizing people has given form to our neighborhoods that are desired, sought out, and sustained and has made our neighborhoods integral to our quality of life.

What these in-fill projects lack that is essential to maintaining the character and feel of our neighborhoods is “ownership.” It is the most essential characteristic of ownership that is the foundation of our community. Without “skin-in-the-game” what motivates someone to maintain their property. Without “skin-the-game” what motivates someone to be basically a “good-neighbor.”

If the intent is to provide affordable housing, then do exactly that, i.e. build single-family homes and provide access to their affordability. Building these “High-Density, Low-Income” apartments only enriches the lives of the developers at the expense of our beautiful neighborhoods. And do not be mistaken, there is a real – tangible- cost to our neighborhoods that will not be compensated. All to provide some untested relief to the “housing crisis” in California.

We know that State Agencies throughout California have spent $24 Billion on this problem of housing the “unhoused.” No oversight. No audit. No fiduciary mechanism in place to ensure this “housing” relief money made an improvement to California’s unhoused. Imagine how many single-family home mortgages could have been made affordable from the $24 Billion that has essentially been misappropriated.

Considering costs and expenses, think about the “multiplier effect.” I live in an area that is zoned RD-4. In my neighborhood of approximately 16 acres, I share a space with 64 single-family homes. Assume that each home accommodates 2.5 residents for a total of 160 neighbors that require county services for health - both physical and mental, education, utilities, peace officers, transportation, etc., each service requiring commensurate funding. Now imagine adding that same amount of people to a restricted area of 2 acres. Now you’ve increased county services by a factor of eight in this restricted area. As property owners, we pay for those services through our taxes. Does the developer pay in perpetuity for these "cost-of-living adjusted" services? If this effort is about housing relief, then someone must pay to keep the “lights-on.” Again, “Ownership” is the foundation of a neighborhood. Rentals do not have “skin-in-the-game” and we know from experience that social services are unfortunately the low-hanging fruit when it comes to budget cuts.

7-2, cont

My neighbors and I are now in a battle to save our “Quality of Life” because of the results of planning efforts like this: PLPN 2023-00089 and PLPN 2023-00087 if approved will build High-Density, Low-Income Multi-Family apartments that we believe will forever change the quality, and character of our neighborhood in a not-so-good-of-a-way.

I implore the board to consider the long-term effects of these Zoning changes. What it means for both the existing traditional Single-Family-Home neighborhoods and communities and to the proposed new residents forced to live in a restricted area without the benefit of “ownership” and possibly reduce county services.

Please, Please, Please consider the “Quality of Life '' your decision will have on real peoples lives on both sides of the issue and reconsider a better solution to our communities facing the “unhoused” in a meaningful and sustainable way for everyone.

I wish I had more time to write a better letter, but I only recently learned of this meeting.

Johnny Vega
