1 Introduction

1.1 Project Overview

The proposed Marcos Specific Plan Project (project) includes a request for approval of a Specific Plan, General Plan Amendment, Rezone, Site Development Plan, Multi-Family Site Development Plan, Conditional Use Permit, Tentative Subdivision Map, and a Tentative Parcel Map for a residential mixed-use development project within the 12.06-acre Specific Plan Area. The General Plan Amendment and Rezone would change the General Plan designation and Zoning from Commercial (C) to Specific Plan Area (SPA). The Marcos Specific Plan (Appendix A) has been prepared with the intent to provide a comprehensive plan to ensure the efficient development of a multi-land use development. The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the General Plan.

The project site is located at the northwest corner of Grand Avenue and Linda Vista Drive in the City of San Marcos (City) (Assessor's Parcel Numbers 219-152-42, 219-152-44, 219-152-45, 219-152-51, 219-152-61, 219-152-70, 219-152-74, 219-152-75, 219-152-76, 219-152-77, 219-152-78, and 219-152-79). Please refer to Figure 1, Project Location, and Figure 2, Project Site. The existing project site has been previously disturbed and developed. Previous structures on-site have been demolished, and the site currently is vacant with remaining paved areas, billboards, and the bridge crossing over Las Posas Creek. Channel improvement work associated with the segment of Las Posas Creek that runs through the project site, and the associated bridge over the channel, was previously permitted by the City, and the channel is currently subject to restoration maintenance activities following channel improvements within the permitted conservation easement area. The project site is located in an urban area of the City surrounded by commercial and industrial uses to the north, east, and west, as well as undeveloped land to the south. The project site is located just south of State Route (SR) 78.

The project consists of construction of 102 multifamily residential units on 5.03 acres of the project site, and construction of 7,658 square feet (sf) of office space, 49,266 sf of specialty retail space and 7 live-work units on 6.05 acres of the project site (Figure 3, Illustrative Site Plan; Figure 4, Conceptual Site Plan). Residential units would be contained within 15 townhome buildings, and units would be a mix of six different unit types, ranging in size from two to three bedrooms. Additionally, the residential area would include a pool building, pool and spa area, barbeque area, picnic area, and play area for residents. The residential buildings would be located on the northwestern portion of the site, and commercial uses would be placed along the southern and eastern project boundaries. Access to the residential area would be provided via Grand Avenue at a northern driveway, and access to the commercial area would be via Grand Avenue at a southern driveway and two driveways along Linda Vista Drive. The project would provide 204 garage parking spaces for residences, 34 residential guest parking spaces, and 278 commercial parking spaces. The project would install 1 level electric vehicle (EV) charger in each garage and 2 EV chargers in the guest parking area, totaling in 106 EV charging stations. Additionally, the commercial component of the project would include 6,200 sf of solar.

The project would also include circulation improvements, such as construction of a landscape buffer and a Class I bike path with a separate pedestrian path adjacent to it at its project frontage along the segments of Linda Vista Drive and Grand Avenue, installation of stop signs, and reconstruction of curb ramps located along project driveways, including detectable surface warning tactiles (yellow truncated domes).

1.2 California Environmental Quality Act Compliance

The City is the lead California Environmental Quality Act (CEQA) agency responsible for the review and approval of the proposed project. Based on the findings of the initial study (IS), the City has made the determination that a mitigated negative declaration (MND) is the appropriate environmental document to be prepared in compliance with CEQA (California Public Resources Code, Section 21000 et seq.). As stated in CEQA Section 21064.5, an MND may be prepared for a project subject to CEQA when an IS has identified no potentially significant effects on the environment.

This draft IS/MND has been prepared by the City as lead agency and is in conformance with Section 15070(a) of the CEQA Guidelines (14 CCR 15000 et seq.). The purpose of the MND and the IS Checklist is to determine any potentially significant impacts associated with the proposed project and to incorporate mitigation measures into the project design, as necessary, to reduce or eliminate the significant or potentially significant effects of the project.

1.3 Public Review Process

In accordance with CEQA, a good faith effort has been made during the preparation of this IS/MND to contact affected agencies, organizations, and persons who may have an interest in this project.

In reviewing the IS/MND, affected public agencies and the interested public should focus on the sufficiency of the document in identifying and analyzing the project's possible impacts on the environment. The Draft IS/MND and related documents are available for review on City's website (https://www.san-marcos.net/departments/development-services/planning/environmental-review-sustainability/environmental-documents).

Comments on the IS/MND may be made in writing before the end of the public review period. Following the close of the public comment period, the City will consider this IS/MND and comments thereto in determining whether to approve the proposed project.

Written comments on the IS/MND should be sent to the following address by August 14, 2023.

City of San Marcos
Planning Division
1 Civic Center Drive
San Marcos, California 92069
Contact: Chris Garcia
Email: cgarcia@san-marcos.net

1.4 Initial Study Checklist

Dudek, under the City's guidance, prepared the project's Environmental Checklist (i.e., IS) per CEQA Guidelines Sections 15063–15065. The CEQA Guidelines include a suggested checklist to indicate whether a project would have an adverse impact on the environment. The checklist is found in Section 2 of this document. Following the Environmental Checklist, Sections 2.1 through 2.21 include an explanation and discussion of each significance determination made in the checklist for the project.

For this IS/MND, the following four possible responses to each individual environmental issue area are included in the checklist:

1. Potentially Significant Impact
2. Less-than-Significant Impact with Mitigation Incorporated
3. Less-than-Significant Impact
4. No Impact

The checklist and accompanying explanation of checklist responses provide the information and analysis necessary to assess relative environmental impacts of the project. In doing so, the City will determine the extent of additional environmental review, if any, for the project.

INTENTIONALLY LEFT BLANK

2 Initial Study Checklist

1. **Project title:**

   Marcos Specific Plan Project

2. **Lead agency name and address:**

   City of San Marcos
   Development Services Department, Planning Division
   1 Civic Center Drive
   San Marcos, California 92069

3. **Contact person and phone number:**

   Chris Garcia, Senior Planner
   760.744.1050, ext. 3237

4. **Project location:**

   The project site is located at the northwest corner of Grand Avenue and Linda Vista Drive in the City (Assessor's Parcel Numbers 219-152-42, 219-152-44, 219-152-45, 219-152-51, 219-152-61, 219-152-70, 219-152-74, 219-152-75, 219-152-76, 219-152-77, 219-152-78, 219-152-79). Please refer to Figures 1 and 2.

5. **Project sponsor's name and address:**

   AOA San Marcos LLC
   709 Randolph Avenue
   Costa Mesa, California 92629

6. **General plan designation:**

   The existing General Plan land use designation for the project site is Commercial (C). The project proposes a General Plan Amendment to change the existing General Plan designation to Specific Plan Area (SPA).

7. **Zoning:**

   The existing zoning for the project site is Commercial (C). The project proposes a Rezone to change the existing zoning to Specific Plan Area (SPA).

8. **Description of project. (Describe the whole action involved, including but not limited to later phases of the project, and any secondary, support, or off-site features necessary for its implementation. Attach additional sheets if necessary):**

   The proposed Marcos Specific Plan Area consists of 12.06 acres, which is separated into three distinct Planning Areas divided by the Las Posas Creek Planning Area, which is a 0.98-acre city-owned parcel within a Conservation Easement included in the Specific Plan Area. The East-End Planning Area (6.05 acres) and

the West-End Planning Area (5.03 acres) make up the other two Planning Areas within the Specific Plan Area, and make up a combined 11.07 acres of proposed development area. The 6.05-acre East-End Planning Area is located on the east portion of the Specific Plan Area and is considered an innovative arts-focused commercial, live-work, makerspace, and retail development area. This portion of the project would include 7 live-work units, 7,658 sf of office space, and 49,266 sf of specialty retail space.

The West-End Planning Area is approximately 5.03 acres and is located on the west portion of the Specific Plan Area and would include a multifamily land use of approximately 20.3 dwelling units per acre. This portion of the Planning Area includes 102 multifamily dwelling units in 15 separate buildings ranging in composition from 4 units per building to 10 units per building. Floor plans within each building would consist of stacked flat, townhomes and carriage-style unit plans. All floor plans would have two-car direct access garages with 24 units providing tandem parking to maximize the site. A total of 34 guest parking spaces would be distributed throughout the site for the convenience of the residents. As part of this portion of the Planning Area, there would be approximately 80,767-sf of common open space area including recreational amenities such as a pool, BBQ area, walking path adjacent to Las Posas Creek, and other amenities spread throughout the Planning Area. Individual units would have the benefit of private open space ranging from 95-sf to 255-sf with a total of 14,899-sf of private open space provided throughout the West-End Planning Area dwelling units. Buildings would be oriented to increase open space with paseos serving as interior courtyards as well as facing Las Posas Creek to take advantage of the vegetation along the creek (Figures 3 and 4).

The project proposes contemporary and modern architectural and landscape styles to reflect the urban setting. The Planning Areas would be designed to engage users and residents via an interconnected series of landscaped spaces and walkways within each respective Planning Area. In conformance with the City's Water Efficient Landscape Ordinance, a variety of trees, shrubs, plants, and land covers would be planted in the landscaped areas proposed throughout the project site. Refer to Figures 5a and 5b for the conceptual landscaping plans. A bridge currently spans the restored creek, which would link the proposed retail, commercial, and residential Planning Areas as well as provide pedestrian and emergency vehicle access. There is no development proposed within the creek, which would remain protected by a conservation easement.

Access to the residential area would be provided via Grand Avenue at a northern driveway, and access to the commercial area would be via Grand Avenue at a southern driveway and two driveways along Linda Vista Drive. The project would provide 204 garage parking spaces for residences, 34 residential guest parking spaces, and 278 commercial parking spaces. The project would also install 1 level EV charger in each garage, and 2 EV chargers in the guest parking area, totaling in 106 EV charging stations. The project would also include circulation improvements, such as construction of a landscape buffer and a Class I bike path with a separate pedestrian path adjacent to it at its project frontage along the segments of Linda Vista Drive and Grand Avenue, installation of stop signs, and reconstruction of curb ramps located along project driveways, including detectable surface warning tactiles (yellow truncated domes).

The proposed project includes a request for approval of a Specific Plan, General Plan Amendment, Rezone, Site Development Plan, Multi-Family Site Development Plan, Conditional Use Permit, Tentative Subdivision Map, and a Tentative Parcel Map. The General Plan Amendment and Rezone would change the General Plan designation and Zoning from Commercial (C) to Specific Plan Area (SPA). The Marcos Specific Plan (Appendix A) has been prepared with the intent to provide a comprehensive plan to ensure the efficient

development of a multi-land use development. The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the General Plan.

9. Surrounding land uses and setting: Briefly describe the project's surroundings:

The existing project site has been previously disturbed, developed, and demolished, and is currently vacant with remaining paved pad areas and billboards. The project site is located in an urban area of the City surrounded by developed areas, including commercial and industrial uses to the north, east, and west, as well as undeveloped land to the south.

10. Other public agencies whose approval is required (e.g., permits, financing approval, or participation agreement):

Permits were previously obtained for the creek restoration, channel widening and associated site improvements back in 2010/2011, including Section 401 Water Quality Certification from the Regional Water Quality Control Board (RWQCB), an Operation of Law Letter for a Section 1602 Lake and Streambed Alteration Agreement from the California Department of Fish and Wildlife (CDFW), and a stacked Nationwide Permit 14, 27, and 33 from the U.S. Army Corps of Engineers (USACE). The project would also include Department of Environmental Health and Quality (DEHQ) review, which is further detailed in Section 2.9, Hazards and Hazardous Materials. The project would not include any development within the creek area/conservation easement, and no additional agency permits are anticipated for the proposed project.

11. Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1? If so, is there a plan for consultation that includes, for example, the determination of significance of impacts to tribal cultural resources, procedures regarding confidentiality, etc.?

Yes, in compliance with Assembly Bill (AB) 52 and Senate Bill (SB) 18, the City, as lead agency, is responsible for conducting government to government consultation with pertinent tribal entities. Additional details are provided in Section 2.18, Tribal Cultural Resources.

Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact," as indicated by the checklist on the following pages.

☐ Aesthetics	☐ Agriculture and Forestry Resources	☐ Air Quality
☒ Biological Resources	☒ Cultural Resources	☐ Energy
☒ Geology and Soils	☐ Greenhouse Gas Emissions	☒ Hazards and Hazardous Materials
☐ Hydrology and Water Quality	☐ Land Use and Planning	☐ Mineral Resources
☐ Noise	☐ Population and Housing	☐ Public Services
☐ Recreation	☒ Transportation	☒ Tribal Cultural Resources
☐ Utilities and Service Systems	☐ Wildfire	☐ Mandatory Findings of Significance

Determination (To be completed by the Lead Agency)

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier ENVIRONMENTAL IMPACT REPORT or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier ENVIRONMENTAL IMPACT REPORT or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Signature Date

Evaluation of Environmental Impacts

1. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project would not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
2. All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
3. Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an Environmental Impact Report (EIR) is required.
4. "Less Than Significant Impact With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level.
5. Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:
    a. Earlier Analysis Used. Identify and state where they are available for review.
    b. Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
    c. Mitigation Measures. For effects that are "Less Than Significant With Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.
6. Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.
7. Supporting Information Sources: A source list should be attached, and other sources used, or individuals contacted should be cited in the discussion.
8. This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
9. The explanation of each issue should identify:
    a. the significance criteria or Threshold, if any, used to evaluate each question; and
    b. the mitigation measure identified, if any, to reduce the impact to less than significance

2.1 Aesthetics

		Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
I.	**AESTHETICS** – Except as provided in Public Resources Code Section 21099, would the project**:**				
a)	Have a substantial adverse effect on a scenic vista?	☐	☐	☒	☐
b)	Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☒	☐
c)	In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☐	☐	☒	☐
d)	Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☒	☐

a) Would the project have a substantial adverse effect on a scenic vista?

Less-than-Significant Impact. A scenic vista is typically defined as a public view of highly valued visual and scenic resources such as the ocean and distant mountain ranges, particularly from public vantage points. As discussed in the General Plan environmental impact report(EIR), hillside and ridgeline areas visible throughout the City, as viewed from the SR-78 corridor and other locations such as parks and scenic roads, are considered valuable. The nearest officially designated state scenic highway is SR-78. SR-78 is a designated state scenic highway from the west boundary of the Anza-Borrego Desert State Park to the east boundary of the State Park. SR-78 is located approximately 0.03 miles north of the project site; however, the portion designated as a state scenic highway begins approximately 41 miles east of the project site. The project site is located approximately 25 miles west of the closest portion of SR-78 identified as an eligible state scenic highway. The City's General Plan does not identify any designated scenic vistas; however, the General Plan more generally aims to protect the City's scenic resources such as the San Marcos, Merriam, and Double Peak Mountains, creek corridors, mature trees, rock outcroppings, and ocean views. The project site and surrounding valley terrain are encompassed by mountains to the west and south that provide opportunities for elevated vantage points offering long and broad views, which may include views of the project site. However, due to the relatively flat terrain of the project site and surrounding area, and the project site's location on a currently developed site in an urbanized area, development of the proposed project is not expected to impede views of existing scenic vistas, nor is the project site considered a scenic vista. Therefore, impacts associated with scenic vistas would be less than significant.

b) Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Less-than-Significant Impact. Scenic highways and routes are a unique component of the circulation system, as they traverse areas of unusual scenic or aesthetic value. The nearest eligible state scenic highway is Interstate (I) 5. I-5 is located approximately 8 miles west of the project site and is not visible due to distance. SR-78 is located approximately 100 feet north of the project site. However, the section of SR-78 proximate to the project site is not identified as a Scenic Highway per the California Department of Transportation (Caltrans) State Scenic Highways Program. Additionally, a portion of SR-78 is also identified as an eligible state scenic highway; however, this eligible segment begins approximately 25 miles east of the project site in Santa Ysabel.

Although the project site is not located within a viewshed of a state scenic highway, the City has designated SR-78 as a view corridor to surrounding ridgelines (City of San Marcos 2012a). The project site is visible from SR-78; however, even with development of the proposed project, views of the surrounding hillsides and ridgelines are not expected to be substantially obstructed from SR-78 due to the flat nature of the site and similar surrounding development. Therefore, impacts associated with state scenic highways would be less than significant.

c) In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Less-than-Significant Impact. Section 21071 of the California Public Resources Code (i.e., CEQA) defines an "urbanized area" as "(a) an incorporated city that meets either of the following criteria: (1) Has a population of at least 100,000 persons, or (2) Has a population of less than 100,000 persons if the population of that city and not more than two contiguous incorporated cities combined equals at least 100,000 persons." Therefore, the City is located within an urbanized area as defined by CEQA.

To ensure that both current and future development within the City is designed and constructed to conform to existing visual character and quality of the surrounding built environment, the City's Municipal Code includes design standards, specific to each Zoning District, related to building height, parking, landscaping requirements, and other visual considerations. The purpose is to regulate and restrict the uses of buildings and structures, and to encourage the most appropriate use of land. The project would be subject to design review by the City and would be required to meet the City's conditions of approval, which will ensure that proposed structures and landscaping would be consistent with the City's General Plan and Municipal Code. Therefore, implementation of the proposed project consistent with the development standards in the City's Municipal Code, as required by the City's conditions of approval and as reviewed as part of the plan check process, would not substantially degrade the existing visual character or quality of the site or its surroundings or result in significant visual impacts.

Additionally, development of the project would be consistent with surrounding development and would not degrade the existing visual character of the project site and its surroundings. The visual character of the site would be altered by the proposed project, as it would change the existing demolished and vacant site into a mixed-use residential development. While the proposed project would change the existing visual character on the site, it is not characterized as substantial degradation since few public vantage points of the project site exist

and the site is surrounded by adjacent development, including commercial and industrial uses to the north, east, and west, as well as undeveloped land to the south in a highly urbanized area of the City. Although the proposed mixed-use residential uses would differ in land use designation and visual character in comparison to the previous commercial development on-site, the proposed mixed-use residential development would conform to the existing urbanized character of the surrounding area and would not substantially change the views from any public viewpoint. With City approval of the proposed land use and zoning change from Commercial (C) to Specific Plan Area (SPA), the proposed project would be required to comply with design standards of the approved Specific Plan for the project site. With approval of the proposed Specific Plan for the project site, impacts would be less than significant.

d) Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Less-than-Significant Impact. Lighting in the project vicinity is associated with roadway lighting and lighting associated with the existing commercial and industrial uses that surround the project site. Development of the proposed project would result in new sources of light from the residential units, commercial uses, landscaping lighting, security lighting, and internal circulation and pedestrian lighting. Although more light sources are anticipated from the proposed project in comparison to existing conditions, the increase in lighting is not expected to be substantial, seeing as the site was previously developed with commercial uses and is surrounded by lighting associated with adjacent development and roadways. Additionally, all lighting associated with the project would be required to comply with the City's Municipal Code Section 20.300.080, Light and Glare Standards. Although the proposed project would result in new sources of light in the area, the project site is in an urbanized area and is surrounded by existing development with existing sources of day and nighttime lighting. The use of energy-efficient, architecturally appropriate fixtures created to alleviate glare, conflict, and light pollution would be incorporated to minimize and restrict nighttime light pollution and light trespass on adjacent properties in compliance with the City's Municipal Code and the proposed Marcos Specific Plan design and development standards.

Implementation of the proposed project could potentially include sources of glare from architectural finishes or amenities on-site. The project developer would be required by the City's Municipal Code Section 20.300.080, Light and Glare Standards, to minimize use of reflective building materials and finishes, as well as reflective lighting structures and metallic surfaces to the extent feasible to impede any potential-generated glare. The project would not propose any features that would be characterized as creating a substantial new source of glare that would adversely affect daytime or nighttime views in the area. Therefore, impacts associated with light and glare would be less than significant.

2.2 Agriculture and Forestry Resources

		Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
II.	**AGRICULTURE AND FORESTRY RESOURCES** – In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:				
a)	Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b)	Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒
c)	Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?	☐	☐	☐	☒
d)	Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e)	Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

a) ***Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?***

No Impact. The project site is designated as Urban and Built-Up Land by the California Department of Conservation Farmland Mapping and Monitoring Program (CDC 2016). As a result, the proposed project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural uses.

No Prime Farmland, Unique Farmland, nor Farmland of Statewide Importance exist within the immediate vicinity of the project site. The proposed project would not result in substantial changes that could result in the conversion of farmland to non-agricultural use. The proposed project site is surrounded entirely by developed land, with the exception of one vacant lot adjacent to the southeastern portion of the site. This vacant lot is designated as "Urban and Built-Up Land" by the CDC FMMP. Surrounding development adjacent to the project site include industrial, mixed-use, and commercial uses. Given the extent of development surrounding the proposed project site, and considering the site was previously developed, the proposed project would not result in the conversion of any existing farmland, and no impact would occur.

b) ***Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?***

No Impact. The project site is not zoned for agricultural use or designated as land under the Williamson Act, nor is the project site zoned for forest land or timberland production (CDC 2016). As stated in response to Threshold a) above, the project site has been previously disturbed and developed. Therefore, implementation of the proposed project would not result in the loss or conversion of forest land. No impact would occur regarding conflicts with existing zoning for agricultural use or forest land.

c) ***Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?***

No Impact. Please see response to Threshold 2.2(a) and 2.2(b) above.

d) ***Would the project result in the loss of forest land or conversion of forest land to non-forest use?***

No Impact. Please see response to Threshold 2.2(a) and 2.2(b) above.

e) ***Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?***

No Impact. Please see response to Threshold 2.2(a) and 2.2(b) above.

2.3 Air Quality

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
III. AIR QUALITY – Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☒	☐

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	☐	☐	☒	☐
c) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☒	☐
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☐	☐	☒	☐

An Air Quality and Greenhouse Gas Technical Report was prepared for the proposed project in December 2022 and is included as Appendix B to this IS/MND. Findings from Appendix B are summarized throughout this analysis.

a) Would the project conflict with or obstruct implementation of the applicable air quality plan?

Less-than-Significant Impact. The San Diego Air Pollution Control District (SDAPCD) is responsible for developing and implementing the clean air plans for attainment and maintenance of the ambient air quality standards in the basin—specifically, the State Implementation Plan (SIP) and Regional Air Quality Strategy (RAQS).[1] San Diego Association of Governments (SANDAG) is responsible for developing forecasts and data that are used by SDAPCD in preparing the SIP and RAQS. In November 2020, SDAPCD adopted the Air Quality Management Plan for attaining the federal 8-hour 75 parts per billion and 70 parts per billion ozone (O_3) standards (2020 Attainment Plan), which is the air basin's input to the SIP and required to demonstrate how SDACPD proposes to attain the federal O_3 standards. The plan anticipates attainment of the 2008 and 2015 National Ambient Air Quality Standards (NAAQS) standards by 2026 and 2032, respectively. The 2020 Attainment Plan includes planning requirements for attaining the O_3 NAAQS including on-road motor vehicle emissions budgets for transportation conformity, a vehicle miles traveled (VMT) offset demonstration, Reasonably Available Control Measures, Reasonable Further Progress, an Attainment Demonstration, and contingency measures in the event of a failure to meet a milestone or to attain by the predicted attainment date (SDAPCD 2020). The SIP and RAQS rely on information from California Air Resources Board (CARB) and SANDAG, including mobile and area source emissions as well as information regarding projected growth in the County of San Diego (County) as a whole and the cities in the County, to project future emissions and determine the strategies necessary for the reduction of emissions through regulatory controls. CARB mobile source emission projections and SANDAG growth projections are based on population, vehicle trends, and land use plans developed by the County and the cities in the County as part of the development of their General Plans.

[1] For this discussion, the relevant federal air quality plan is 2020 Plan for Attaining the National Ambient Air Quality Standards for Ozone in San Diego County (SDAPCD 2020). The RAQS is the applicable plan for purposes of State air quality planning. Both plans reflect growth projections in the basin.

While SDAPCD and the City do not provide guidance regarding the analysis of impacts associated with air quality plan conformance, the County's Guidelines for Determining Significance and Report and Format and Content Requirements – Air Quality does discuss conformance with the RAQS (County of San Diego 2007). The guidance indicates that, if the project, in conjunction with other projects, contributes to growth projections that would not exceed SANDAG's growth projections for the City, the project would not be in conflict with the RAQS (County of San Diego 2007). If a project includes development that is greater than that anticipated in the local plan and SANDAG's growth projections, the project might conflict with the SIP and RAQS and may contribute to a potentially significant cumulative impact on air quality.

The project site is designated as Commercial (C) in the City's General Plan and is zoned Commercial (C). The project proposes to redesignate the site to Specific Plan Area (SPA) and create a mixed-use development. The project would add a total of 102 townhomes and 7 live/work units along with specialty retail/commercial/office uses. The City's Commercial designation and zoning allows for a several permitted uses. A mixture of commercial retail and office was selected to reflect potential development on the project site. Based on the City's development code, the Commercial designation would allow for greater development intensity based on generation of more vehicle trips and VMT as shown in Table 9 (Development Intensity Comparison) of the Air Quality and Greenhouse Gas Technical Report (Appendix B to this EIR). As such, the project would result in less criteria air pollutant emissions, and thus less intensive uses, than development allowed under the existing Commercial designation.

SANDAG produces a Regional Growth Forecast, which is important for developing regional plans and strategies mandated by federal and state governments such as the Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS), the Program EIR for the RTP/SCS, the Air Quality Management Plan, the Federal Transportation Improvement Program, and the Regional Housing Needs Assessment. The most recent RTP/SCS was adopted in December 2021 with a planning horizon of 2016 through 2050. The growth forecasts are appended to the RTP/SCS. Appendix F of the 2021 Regional Plan describes the trends in population, housing, and employment. The San Diego region is expected to grow by nearly 437,000 people and the growth in population will add about 440,000 jobs and more than 280,000 housing units (SANDAG 2021).

The forecast process includes two main phases. The first phase of the forecast is produced using California Department of Finance population projections and rates developed by SANDAG based on historic economic and demographic trends. The size and makeup of the working age population in the region and high labor force participation is used to project future job growth. The projected higher values in working age population, coupled with older residents staying in the labor force longer results in more jobs in the region by the end of the forecast period. Housing units and households in the region were forecasted based on rates developed from historical data as well as assumptions of housing unit development and household formation in the future. The second phase of the forecast allocates the forecasted growth down to the jurisdictions and smaller geographical areas. The subregional forecast distributes growth based on a variety of factors, including available capacity for housing and accessibility to jobs and transportation. SANDAG works with the region's 18 cities, the County, and other agencies that manage land use to understand local land use plans, such as general plans, community plans, and specific plans, as well as constraints to development and already permitted projects to develop the subregional projections for housing and employment. Table 10 in Appendix B shows the population, housing units, and employment projections for the City and the San Diego region for the 2021 Regional Plan.

As shown in Table 10 of Appendix B, the project is expected to add 329 residents in 109 dwelling units and 115 employment opportunities. The added residents would represent approximately 1.2% of the anticipated population growth, 1% of the housing growth, and 0.6% of the employment growth over the RTP/SCS planning horizon. Based on the above information, the increase in population and employment would be well within the growth projections.

Per CEQA Guideline Section 15206(b), the project would not be considered regionally significant because it would not have the potential to substantially affect housing, employment, or population projections within the San Diego region, which are the basis of the RAQS projections. As such, the project would not conflict with or obstruct implementation of the RAQS. Furthermore, the project would not result in substantial construction or operational emissions that would conflict with the local Air Quality plan, which is discussed further in Section 2.3(b). Therefore, implementation of the project would not conflict with the RAQS or SIP and proposed development would be consistent with the growth in the region, resulting in less-than-significant impacts.

b) Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Less-than-Significant Impact. Past, present, and future development projects may contribute to the San Diego Air Basin (SDAB) adverse air quality impacts on a cumulative basis. By its nature, air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development, and SDAPCD develops and implements plans for future attainment of ambient air quality standards. Based on these considerations, project-level Thresholds of significance for criteria pollutants are used in the determination of whether a project's individual emissions would have a cumulatively considerable contribution on air quality. If a project's emissions would exceed the applied significance Thresholds, it would have a cumulatively considerable contribution. Conversely, projects that do not exceed the project-specific Thresholds are generally not considered to be cumulatively significant.

Construction and operation of the project would result in emissions of criteria air pollutants, which may result in a cumulatively considerable net increase in emissions of criteria air pollutants for which the SDAB is designated as nonattainment under the NAAQS or the California Ambient Air Quality Standards (CAAQS). The SDAB has been designated as a federal nonattainment area for O_3 and a state nonattainment area for O_3, particulate matter less than or equal to 10 microns in diameter (PM_{10}), and particulate matter less than or equal to 2.5 microns in diameter ($PM_{2.5}$). The following discussion quantitatively evaluates potential short-term construction and long-term operational impacts that would result from implementation of the project.

Proposed construction activities would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and volatile organic compound (VOC) off-gassing from architectural coatings and asphalt pavement application) and off-site sources (i.e., on-road haul trucks, delivery trucks, and worker vehicle trips). Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and for dust, the prevailing weather conditions. Therefore, such emissions levels can only be estimated, with a corresponding uncertainty in precise ambient air quality impacts.

Criteria air pollutant emissions associated with construction activity were quantified using the California Emissions Estimator Model (CalEEMod). Construction emissions were calculated for the estimated worst-case day over the construction period associated with each phase and reported as the maximum daily

emissions estimated during each year of construction (2024–2025). Construction schedule assumptions, including phase type, duration, and sequencing, were based on information provided by the applicant or CalEEMod defaults and are intended to represent a reasonable scenario based on the best information available. Oxides of nitrogen (NO_x) and carbon monoxide (CO) emissions would primarily result from the use of construction equipment and motor vehicles.

Fugitive dust (PM_{10} and $PM_{2.5}$) emissions would primarily result from grading and site preparation activities. The project would be required to comply with SDAPCD Rule 55, Fugitive Dust Control. This rule requires that the project take steps to restrict visible emissions of fugitive dust beyond the property line. Compliance with Rule 55 would limit fugitive dust (PM_{10} and $PM_{2.5}$) generated during grading and construction activities. To account for dust control measures in the calculations, it was assumed that the project would ensure that active sites be watered at least two times daily. The application of architectural coatings, such as exterior application/interior paint and other finishes would produce VOC emissions. The contractor would be required to comply with the requirements of SDAPCD's Rule 67.7, Cutback and Emulsified Asphalt, which would limit VOC emissions from asphalt off-gassing.

Table 11 in Appendix B presents the estimated maximum daily construction emissions generated during construction of the project. As shown in Table 11 of Appendix B, maximum daily construction emissions would not exceed the significance Thresholds for VOC, NO_x, CO, sulfur oxide (SO_x), PM_{10}, or $PM_{2.5}$ during construction; and short-term construction air quality impacts would be less than significant.

Operation of the project would generate VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$ emissions from mobile sources, including vehicular traffic generated by residents, employees, customers, and visitors; energy sources from natural gas usage; area sources, including the use of landscaping equipment, consumer products, natural gas hearths, and from architectural coatings. Pollutant emissions associated with long-term operations were quantified using CalEEMod using a combination of project-specific information and CalEEMod default values.

Table 12 in Appendix B presents the maximum area, energy, and mobile source emissions associated with project operation (year 2026) in summer. Table 13 in Appendix B presents the maximum area, energy, and mobile source emissions associated with project operation (year 2026) in winter. As shown in Tables 12 and 13 of Appendix B, maximum daily operational emissions from the project would not exceed the significance Thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$; long-term air quality impacts would be less than significant.

As discussed in Appendix B, the SDAB has been designated as a federal nonattainment area for O_3 and a state nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. The nonattainment status is the result of cumulative emissions from various sources of air pollutants and their precursors within the SDAB, including motor vehicles, off-road equipment, and commercial and industrial facilities. Construction and operation of the project would generate VOC and NO_x emissions (which are precursors to O_3) and emissions of PM_{10} and $PM_{2.5}$. However, as indicated in Tables 11, 12, and 13 of Appendix B, project-generated construction and operational emissions would not exceed the emission-based significance Thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$.

Cumulative localized impacts would potentially occur if a construction project were to occur concurrently with another off-site project. Construction schedules for potential future projects near the project area are currently unknown; therefore, potential construction impacts associated with two or more simultaneous projects would be considered speculative. However, future projects would be subject to CEQA and would require air quality analysis and, where necessary, mitigation if the project would exceed applied Thresholds. Criteria air pollutant

emissions associated with construction activity of future projects would be reduced through implementation of control measures required by SDAPCD. For example, cumulative PM_{10} and $PM_{2.5}$ emissions would be reduced because all future projects would be subject to SDAPCD Rule 55 (Fugitive Dust), which sets forth general and specific requirements for all construction sites in the SDAB. In addition, cumulative VOC emissions would be subject to SDAPCD Rule 67.0.1 (Architectural Coatings).

Based on the project-generated construction and operational emissions of CO, SO_x, VOC, NO_x, PM_{10}, and $PM_{2.5}$, the project would not result in a cumulatively considerable increase in emissions of nonattainment pollutants. Therefore, the project's cumulative air quality impact would be less than significant.

c) Would the project expose sensitive receptors to substantial pollutant concentrations?

Less-than-Significant Impact. Notably, in the California Building Industry Association v. Bay Area Air Quality Management District case decided in 2015, the California Supreme Court held that CEQA does not generally require lead agencies to consider how existing environmental conditions might impact a project's occupants, except where the project would significantly exacerbate an existing environmental condition. Accordingly, the significance criteria above related to exposure of sensitive receptors to substantial pollutant concentrations is relevant only to the extent that the project exacerbates existing air quality conditions.

Air quality varies as a direct function of the quantity of pollutants emitted into the atmosphere, the size and topography of the air basin, and the prevailing meteorological conditions. Air quality problems arise when the rate of pollutant emissions exceeds the rate of dispersion. Reduced visibility, eye irritation, and adverse health impacts on those persons termed "sensitive receptors" are the most serious hazards of existing air quality conditions in the area. Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution, as identified by CARB, include children, older adults, athletes, and people with cardiovascular and chronic respiratory diseases; however, for the purposes of this analysis, residents are also considered sensitive receptors. As such, sensitive receptors include residences, schools, playgrounds, childcare centers, athletic facilities, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes. The nearest existing sensitive receptors are the Little People Preschool and Daycare located 707 feet south of the project's southern boundary. Other sensitive receptors include Mission Sports Park located 1,760 feet northeast of the project's northeastern boundary, multifamily residential uses located 2,020 feet southeast of the project's southern boundary and Bradley Park located 3,400 feet west of the project's western boundary.

Mobile source impacts occur on two scales of motion. Regionally, project-related travel would add to regional trip generation and increase the VMT within the local airshed and the SDAB. Locally, project generated traffic would be added to the roadway system near the project site. If such traffic occurs during periods of poor atmospheric ventilation, is composed of many vehicles "cold-started" and operating at pollution-inefficient speeds and is operating on roadways already crowded with non-project traffic, there is a potential for the formation of microscale CO hotspots in the area immediately around points of congested traffic. Because of continued improvement in vehicular emissions at a rate faster than the rate of vehicle growth and/or congestion, the potential for CO hotspots in the SDAB is steadily decreasing.

CO transport is extremely limited, and CO disperses rapidly with distance from the source. Under certain extreme meteorological conditions, however, CO concentrations near a congested roadway or intersection may reach unhealthy levels, affecting sensitive receptors such as residents, school children, hospital patients,

and the elderly. Typically, high CO concentrations are associated with urban roadways or intersections operating at an unacceptable level of service (LOS). Projects contributing to adverse traffic impacts may result in the formation of CO hotspots.

To verify that the project would not cause or contribute to a violation of the CO standards, a screening evaluation of the potential for CO hotspots was conducted using the County screening threshold of 3,000 peak trips (County of San Diego 2007). Based on the Transportation Impact Analysis prepared for the project (Appendix H), there would be approximately 126 trips during the AM peak-hour and 189 trips during the PM peak-hour, which would be minimal in comparison to the screening Threshold of 3,000 peak trips. Therefore, the project would not result in a CO hotspot and would result in a less-than-significant impact.

As determined in Section 2.3(b) of this report, project construction and operation would not exceed significance Thresholds for VOC, NO_x, CO, SO_x, $PM_{10,}$ or $PM_{2.5}$. VOCs and NO_x are precursors to O_3, for which the SDAB is designated as nonattainment with respect to the NAAQS and CAAQS. The health effects associated with O_3 are generally associated with reduced lung function. The contribution of VOCs and NO_x to regional ambient O_3 concentrations is the result of complex photochemistry. The increases in O_3 concentrations in the SDAB due to O_3 precursor emissions tend to be found downwind from the source location to allow time for the photochemical reactions to occur. However, the potential for exacerbating excessive O_3 concentrations would also depend on the time of year that the VOC emissions would occur because exceedances of the O_3 CAAQS/NAAQS tend to occur between April and October when solar radiation is highest. The holistic effect of a single project's emissions of O_3 precursors is speculative due to the lack of reliable and meaningful quantitative methods to assess this impact. The project would not exceed the significance Thresholds for VOC or NO_x; therefore, implementation of the project would contribute minimally to regional O_3 concentrations and the associated health effects.

In addition to O_3, NO_x emissions contribute to potential exceedances of the NAAQS and CAAQS for nitrogen dioxide (NO_2) (since NO_2 is a constituent of NO_x). Health effects that result from NO_2 and NO_x include respiratory irritation, which could be experienced by nearby receptors during the periods of heaviest use of off-road construction equipment. However, project construction would be relatively short term, and off-road construction equipment would be operating at various portions of the site and would not be concentrated in one portion of the site at any one time. In addition, as shown in Table 4 of Appendix B, CARB air quality monitoring shows existing NO_2 concentrations in the area are well below the NAAQS and CAAQS standards. Because project generated NO_x emissions would not exceed the significance Threshold, the project would not result in potential health effects associated with NO_2 and NO_x.

CO tends to be a localized impact associated with congested intersections. The associated potential for CO hotspots were discussed previously and were determined to be a less-than-significant impact. Furthermore, as shown in Table 4 of Appendix B, CARB air quality monitoring shows the existing CO concentrations in the area are well below the NAAQS and CAAQS standards. Thus, the project's CO emissions would not contribute to significant health effects associated with this pollutant.

Construction and operation of the project would also not exceed Thresholds for PM_{10} or $PM_{2.5}$ and would not contribute to exceedances of the NAAQS and CAAQS for particulate matter or would obstruct the SDAB from coming into attainment for these pollutants. Additionally, the project would implement dust control strategies and be required to comply with SDAPCD Rule 55, Fugitive Dust Control, which limits the amount of fugitive dust generated during construction. Due to the minimal contribution of particulate matter during construction and operation, the project is not anticipated to result in health effects associated with PM_{10} or $PM_{2.5}$.

In summary, the project would not result in any potentially significant contribution to local or regional concentrations of nonattainment pollutants and would not result in a significant contribution to the adverse health impacts associated with those pollutants. Impacts would be less than significant. Furthermore, there are numerous scientific and technological complexities associated with correlating criteria air pollutant emissions from an individual project to specific health effects or potential additional nonattainment days, and there are currently no modeling tools that could provide reliable and meaningful additional information regarding health effects from criteria air pollutants generated by individual projects.

In addition to impacts from criteria pollutants, project impacts may include emissions of pollutants identified by the state and federal government as toxic air contaminants (TACs) or hazardous air pollutants. State law has established the framework for California's TAC identification and control program, which is generally more stringent than the federal program and aimed at TACs that are a problem in California. The state has formally identified more than 200 substances as TACs, including the federal hazardous air pollutants, and is adopting appropriate control measures for sources of these TACs. The greatest potential for TAC emissions during construction would be diesel particulate emissions from heavy equipment operations and heavy-duty trucks and the associated health impacts to sensitive receptors. The following measures are required by state law to reduce diesel particulate matter emissions:

- Fleet owners of mobile construction equipment are subject to the CARB Regulation for In-use Off-road Diesel Vehicles (13 CCR 2449), the purpose of which is to reduce diesel particulate matter and criteria pollutant emissions from in-use (existing) off-road diesel-fueled vehicles.
- All commercial diesel vehicles are subject to Title 13, Section 2485 of the California Code of Regulations, limiting engine idling time. Idling of heavy-duty diesel construction equipment and trucks during loading and unloading shall be limited to 5 minutes; electric auxiliary power units should be used whenever possible.

Health effects from carcinogenic air toxics are usually described in terms of cancer risk. SDAPCD recommends an incremental cancer risk Threshold of 10 in a million (SDAPCD 2015). "Incremental cancer risk" is the net increased likelihood that a person continuously exposed to concentrations of TACs resulting from a project over a 9-, 30-, and 70-year exposure period will contract cancer based on the use of standard Office of Environmental Health Hazard Assessment risk-assessment methodology (OEHHA 2015).

As outlined in Appendix B, maximum daily PM_{10} or $PM_{2.5}$ emissions generated by construction equipment operation and haul-truck trips during construction, which is based on exhaust and fugitive dust generated by equipment operation and vehicle travel, would be well below the significance Thresholds. Moreover, total construction of the project would last approximately 15 months, after which project-construction TAC emissions would cease. Thus, the duration of the proposed construction activities would only constitute a small percentage of the total 30-year residential exposure period recommended by the Office of Environmental Health Hazard Assessment. Concentrations of mobile-source diesel particulate matter emissions are typically reduced by 70% at a distance of approximately 500 feet (CARB 2005). The nearest existing sensitive receptors are multifamily residential uses located 2,020 feet southeast of the project site. Therefore, construction would take place substantially farther than 500 feet from the nearest sensitive receptors. Due to the temporary nature of construction activities and the dispersive properties of diesel particulate matter, the nearest residential receptors would not be impacted regarding construction health risks. Regarding long-term TAC emissions, the project would result in a minimal increase in daily truck traffic on the roadway network and would not require stationary sources (such as diesel emergency generators).

Therefore, the exposure of project-related TAC emission impacts to proximate sensitive receptors would be less than significant.

The project itself would create sensitive receptors in the form of the new residences. The CARB identified sources of air pollution that are of primary concern to the siting of new sensitive receptors. Those sources include freeways, high traffic roadways, distribution centers, large stationary sources, etc. (CARB 2005). As a mixed-use development, the project would not be a source of TACs. The project is located near SR-78, which is a source of air pollution; however, the project would not exacerbate the surrounding existing conditions. As such, an evaluation of the environment's impact on the project is not required pursuant to CEQA. It should be noted that the Title 24 standards recognizing that indoor air pollution primarily from PM concentrations is a concern for development in California and have required the use of minimum efficiency reporting value (MERV) 13 filters. The American Society of Heating, Refrigerating, and Air-Conditioning Engineers reported that MERV 13 filters remove 90% of particles ranging from 1 to 3 microns, and less than 75% for particles ranging from 0.3 to 1 microns (ASHRAE 2019). The use of MERV 13 filters is a recognized best practice to reduce exposure to local air pollution (BAAQMD 2016).

In conclusion, the proposed project would not expose sensitive receptors to substantial pollutant concentrations, and impacts are determined to be less than significant.

d) Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Less-than-Significant Impact. Construction and operation of the project would result in various emissions; however, criteria air pollutants, fugitive dust, and TACs are addressed under Sections 2.3(b) and 2.3(c) above. As such, this impact analysis is focused on the potential for an odor impact to occur. The occurrence and severity of potential odor impacts depends on numerous factors. The nature, frequency, and intensity of the source; the wind speeds and direction; and the sensitivity of receiving location each contribute to the intensity of the impact. Although offensive odors seldom cause physical harm, they can be annoying and cause distress among the public and generate citizen complaints.

Odors would be generated from vehicles and/or equipment exhaust emissions during construction of the project. Odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment, architectural coatings, and asphalt pavement application. Such odors would disperse rapidly from the project site and generally occur at magnitudes that would not affect substantial numbers of people. Therefore, impacts associated with odors during construction would be considered less than significant.

Land uses and industrial operations associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The project does not propose and would not engage in any of these activities or other potential activities that would generate operational odors. The project entails residential and commercial uses and would not create any new sources of substantial odors during operation. Therefore, impacts related to odors are determined to be less than significant.

2.4 Biological Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
IV. BIOLOGICAL RESOURCES – Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☐	☒	☐	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☐	☒	☐	☐
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☒	☐	☐
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☒	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☒	☐
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☒	☐	☐

A Biological Resources Memorandum was prepared for the proposed project in December 2022 and revised in March 2023 and is included as Appendix C to this IS/MND. Findings from Appendix C are summarized throughout this analysis. For the purpose of the analysis herein, the biological study area (study area) covers the approximately 11.07-acre project site, plus an additional 0.99-acre portion of Linda Vista Drive. The 12.06-acre study area boundary was determined using the boundaries of all involved parcels for the proposed project.

a) Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Less-than-Significant Impact with Mitigation Incorporated. Until buildings and infrastructure were demolished and removed from the study area in recent years, the majority of the study area was developed with the exception of biological resources associated with the Las Posas Creek. All structures were removed from the study area by 2018; however, large areas of pavement remain. Furthermore, prior to channel improvement and restoration work, when the site was almost entirely developed, the channel bisecting the study area was narrow and supported a much lower level of biodiversity than it supports currently (Appendix C). Outside of the channel area, the study area is a mosaic of urban/developed and disturbed habitat which supports limited vegetation. The study area, in general, is relatively flat with little topographic variation aside from the channel. The majority of sensitive vegetation communities mapped within the study area are encompassed within the Conservation Area, or immediately adjacent to it in areas that would not be directly impacted as a result of the proposed project. The Conservation Area is to remain under the City's jurisdiction and is subject maintenance and monitoring per the terms of the associated Long Term Management Plan (Dudek 2018). As stated in the Long Term Management Plan, USACE, RWQCB, and CDFW have jurisdiction over the wetlands associated with the channel area, and the necessary permits were obtained for the channel improvement project impacts.

Special-Status Plants

Six vegetation communities/land covers were identified in the biological study area including disturbed habitat (3.26 acres); disturbed wetland (0.03 acres); urban/developed (7.98 acres); coastal and valley freshwater marsh (0.33 acres); herbaceous wetland/southern willow scrub (0.42 acres); and disturbed southern riparian woodland (0.04 acres). These vegetation communities/land covers are outlined in Table 1 of Appendix C.

A total of 60 species of native or naturalized plants, 30 native (50%) and 30 non-native (50%), were recorded in the study area during the site visit. The majority of native plant cover occurs within the Conservation Area within and surrounding the channel. However, some native species occur scattered throughout the disturbed and developed areas, occupying a low cover overall in those areas.

Two plant species with a California Rare Plant Rank (CRPR) were observed during the survey: San Diego sagewort (CRPR 4.2), and San Diego marsh-elder (*Iva hayesiana*; CRPR 2B.2). Plant species with a CRPR of 4 (i.e., San Diego sagewort) are considered limited distribution or watchlist species and less sensitive/rare than plant species with a CRPR of 1 through 3 (CNPS 2022). San Diego sagewort currently has a tentative global ranking of G3, which corresponds to a moderate extinction risk "due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors" (Appendix C).

These plant species are located primarily within in the existing Conservation Area associated with the channel, and were planted as part of the channel restoration work. No special-status plant species were observed during a previous biological reconnaissance survey of the channel area conducted by Dudek in December of 2008, prior to channel restoration work in the area. San Diego marsh elder is located within the Conservation Area adjacent to the channel. While the majority of San Diego sagewort present in the study area is located within the existing Conservation Area, some San Diego sagewort is located outside of

the Conservation Area, immediately to the southwest of the existing bridge near a storm drain, and within the small biofiltration basin to the east of the bridge on the northern side of the channel.

Based on historic aerials and geotechnical investigations, the study area was graded and developed between 1964 and 1987 to its current configuration, and was previously almost entirely developed with pavement, buildings, and roads with the exception of the channel. Fill soil material is located over older alluvium throughout the proposed project area to a depth of 4 feet below surface. Undocumented fill was likely deposited throughout the entire project area as described in the geotechnical report (Geotek 2021). Due to the disturbed, previously developed context of the study area supporting little to no appropriate habitat and suitable substrate, no special-status plant species other than those which were planted during channel restoration are expected to occur within the study area, and thus focused rare plant surveys are not necessary. Additionally, the study area does not support vernal pools and therefore is not expected to support special-status plant species associated with vernal pools.

In summary, special-status plants observed in the study area during the site visit with a CRPR of 1 or 2 (San Diego marsh elder) are located entirely within the Conservation Area and would not be impacted by the proposed project. Plant species with a CRPR of 4 (i.e., San Diego sagewort) are considered limited distribution or watchlist species and less sensitive/rare than plant species with a CRPR of 1 through 3 (Appendix C). Some San Diego sagewort, a species which was not observed in the study area in 2008 but was planted during restoration activities (Dudek 2009, 2011), is located adjacent to, but outside of, the Conservation Area near a storm drain and within a small biofiltration basin and may be impacted by the proposed project. Since the Conservation Area would not be impacted, the proposed project would not result in direct impacts to plant species with a CRPR of 1 or 2, and therefore direct impacts to special-status plants would be less than significant.

Due to the disturbed, previously developed context of the study area outside of the channel area supporting little to no appropriate habitat and suitable substrate, no special-status plant species other than those which were planted during channel restoration are expected to occur within the study area. Potential short-term indirect impacts to special-status plants associated with dust and erosion, and potential short- and long-term indirect impacts associated with increased human presence, and would be less than significant with implementation of mitigation measure **MM-BIO-1**. All proposed mitigation measures are outlined at the end of this section.

Special-Status Wildlife

A total of 12 wildlife species were observed during the site visit, including 10 bird species, one mammal (California ground squirrel [*Otospermophilus beecheyi*]), and one reptile (western fence lizard [*Sceloporus occidentalis*]). All wildlife species observed in the study area are relatively common, widely distributed, and adapted to living in close proximity to urban development.

While focused wildlife surveys were not conducted, no special-status wildlife species were observed during the 2022 reconnaissance survey. Due to the disturbed, previously developed context of the study area, which is situated in a highly urbanized area, and the relatively limited extent of native habitat present, there is a low potential for special-status wildlife species to occur in the study area, especially outside of the Conservation Area which will not be impacted as a result of the proposed project. Outside of the Conservation Area, the study area has limited potential to support nesting birds during the avian breeding season due to the disturbed nature of the majority of the area, lack of substantial vegetative cover, and

surrounding development. Nesting in the study area would likely be limited to small, common bird species which are tolerant of disturbance from adjacent development and traffic. Vegetation within and adjacent to the channel provides denser cover for wildlife and primarily has the potential to support nesting of common, small riparian bird species such as common yellowthroat (*Geothlypis trichas*), while disturbed and urban/developed open areas could support common species such as mourning dove (*Zenaida macroura*) which sometimes nest on the ground. Mature willows (*Salix* sp.) located in the disturbed southern riparian woodland and tall eucalyptus trees (*Eucalyptus* sp.) located mostly adjacent to the western side of the study area have the potential to support nesting of common bird species in addition to raptors that are adapted to urban environments, such as Cooper's hawk (*Accipiter cooperii*).

Some scattered small mammal burrows, California ground squirrel and/or rabbit burrows are present in the study area where pavement isn't present. Due to the highly disturbed condition of the study area and the fact that a large amount of the area is paved and was historically almost entirely developed, the level of habitat suitability for special-status wildlife species such as burrowing owl (*Athene cunicularia*) is low, and there is a low potential for the study area to support special-status small mammals. No burrowing owl sign was observed within the study area during the survey.

The study area is not expected to support special-status listed riparian birds such as least Bell's vireo (*Vireo bellii pusillus*) or southwestern willow flycatcher (*Empidonax traillii extimus*) because the riparian areas on site are too small and isolated to support these species. The area of the channel east of the bridge is not expected to support special-status riparian birds since it is comprised mostly of cattails in the channel with scattered small willows. West of the existing bridge, there is a denser cover of riparian vegetation including willows in the channel area, but the potential for the habitat to support least Bell's vireo is still low due to the urbanized status of the surrounding area and the relatively narrow and limited amount of mature native habitat present in the study area. Southwestern willow flycatcher occurrences are increasingly rare in southern California and would be expected in wider and more extensive riparian habitat than is present in and adjacent to the study area. Additionally, the study area does not support vernal pools and therefore is not expected to support special-status wildlife species associated with vernal pools, such as listed large branchiopods.

According to the California Natural Diversity Database, two special-status wildlife occurrences with 1 mile accuracy overlap the study area: American badger (*Taxidea taxus*) from an unknown year and Townsend's big-eared bat from 1930 (*Corynorhinus townsendii*) (Appendix C). The study area does not contain suitable roosting or foraging habitat for Townsend's big-eared bat, and American badger is not expected to occur due to the disturbed and urbanized context of the study area. No designated or proposed critical habitat for special-status wildlife species occurs in the study area (Appendix C).

The highly disturbed condition of the majority of the study area, with limited vegetative cover and surrounded by development, is not suitable habitat for most special-status wildlife. However, the project area and adjacent vegetation have the potential to support nesting birds which are tolerant of disturbance during the avian breeding season. If clearing, grubbing, or other ground disturbance occurs during the nesting bird season, any impacts to active nests or the young of nesting bird species would be significant.

Indirect impacts to protected nesting birds that have the potential to occur within or adjacent to the study area could result from construction activities. Potential temporary indirect impacts to nesting birds could occur as a result of excessive noise and increased human activity in close proximity to an active nest. Long-term indirect impacts could result from intense lighting adjacent to the Conservation Area, which could limit

suitability of the native habitat for nesting birds, increased human activity in the vicinity of the Conservation Area, and an increase in the number of domestic pets (i.e., cats, which may hunt and kill native wildlife if allowed to roam outdoors, or off-leash dogs, which can also harm or kill wildlife). Impacts to nesting birds shall be mitigated to less than significant through nesting bird surveys and establishment of appropriate nest buffers, as described in **MM-BIO-2**, and lighting, increased human activity, and domestic pet impacts would be less than significant with implementation of **MM-BIO-1**.

In summary, indirect impacts to special-status plants and wildlife would be less than significant with mitigation incorporated.

b) Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Less-than-Significant Impact with Mitigation Incorporated. The impact limits of the proposed project are shown in Figure 3 of Appendix C, over the vegetation mapping. As shown, the limits of work overlap approximately 11.01 acres of non-sensitive land covers which do not require mitigation for direct impacts. Direct impacts to sensitive vegetation communities would be completely avoided, and impacts would be limited to urban/developed and disturbed habitat land covers. While the primary focus of the biological survey was on areas outside of the channel and a formal jurisdictional delineation was not conducted as a part of the survey effort, vegetation communities observed in and adjacent to the channel area were mapped. Vegetation communities, including those classified as potential wetlands, were mapped within the study area and may be regulated by local, state, and federal agencies. These include disturbed wetland, coastal and valley freshwater marsh, herbaceous wetland/southern willow scrub, and disturbed southern riparian woodland. Communities below the ordinary high water mark (OHWM) within the channel are likely regulated USACE, pursuant to Section 404 of the federal Clean Water Act; CDFW, pursuant to Section 1602 of the California Fish and Game Code; and the RWQCB, pursuant to Section 401 of the federal Clean Water Act. Communities located outside of the OHWM but adjacent to the channel, such as disturbed southern riparian woodland, may be regulated as riparian habitat by CDFW. Communities located above the OHWM up to the top of the channel bank may be regulated by both CDFW and RWQCB.

The proposed project would not impact the Conservation Area, and permanent fencing is to be installed around the Conservation Area. As a part of the channel improvement project, native transitional species were planted along the widened channel slopes to serve as a native habitat buffer to the drainage channel.

Short-term indirect impacts associated with dust and erosion, and short- and long-term indirect impacts associated with increased human presence could occur as a result of project implementation. Such impacts could negatively affect viability of sensitive native vegetation adjacent to the project footprint through decreasing photosynthetic ability and degradation due to unauthorized access. Indirect impacts resulting from project implementation would be less than significant with implementation of **MM-BIO-1** outlined below. In summary, impacts would be less than significant with mitigation incorporated.

c) Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Less-than-Significant Impact with Mitigation Incorporated. As described in response to Threshold 2.4-b), vegetation communities, including those classified as potential wetlands, were mapped within the study area and may be regulated by local, state, and federal agencies. These include disturbed wetland, coastal and valley freshwater marsh, herbaceous wetland/southern willow scrub, and disturbed southern riparian woodland. Communities below the OHWM within the channel are likely regulated by USACE, pursuant to Section 404 of the federal Clean Water Act; CDFW, pursuant to Section 1602 of the California Fish and Game Code; and RWQCB, pursuant to Section 401 of the federal Clean Water Act. Communities located outside of the OHWM but adjacent to the channel, such as disturbed southern riparian woodland, may be regulated as riparian habitat by CDFW. Communities located above the OHWM up to the top of the channel bank may be regulated by both CDFW and RWQCB.

A property located immediately south of Linda Vista Drive across from the study area is a managed vernal pool mitigation site known to contain vernal pools and sensitive species which are associated with vernal pool habitats. However, the study area has been graded and almost entirely developed with the exception of the channel, and extensively disturbed in the past, and no vernal pools were observed within the study area during the site visit. Although the survey was conducted outside of the usual wet season, no evidence of vernal pools or depressions that could support ponding were observed. Additionally, as determined during the geotechnical study, fill soil material is located over older alluvium throughout the proposed project area to a depth of 4 feet below surface, and undocumented fill was likely deposited throughout the entire project area (Geotek 2021). The study area does not support vernal pools and therefore no impacts to vernal pools would occur as a result of the proposed project.

Waters of the U.S., including wetlands, are considered sensitive and thus are regulated by local, state, and federal agencies. The proposed project would not result in direct impacts to potential jurisdictional resources which are located within the Conservation Area, and thus no permits for impacts to jurisdictional resources are required. As a part of the channel improvement project, native transitional species were planted along the widened channel slopes to serve as a native habitat buffer to the drainage channel to further protect riparian and wetland habitats beyond the permanent fencing which shall be installed around the Conservation Area. Potential short- and long-term indirect impacts to potential jurisdictional resources located adjacent to the impact area, such as off-site transport of sediment and pollutants, would be avoided through implementation of measure **MM-BIO-1**, and would be less than significant with mitigation incorporated.

d) Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Less-than-Significant Impact. The study area includes an approximately 770-foot-long (0.15-mile) segment of Las Posas Creek (encompassed within the Conservation Area). The Las Posas Creek is a north to southwest–trending urbanized channel originating in the foothills of San Marcos and flowing south through an urban corridor of the city before reaching its confluence with San Marcos Creek, approximately 1 mile downstream of the study area. The ability for this reach to provide a dispersal corridor for terrestrial wildlife and avifauna is restricted by road crossings, culverts, fences, buildings and other manmade structures that restrict wildlife use, fragment habitat, and impede movement. Terrestrial movement upstream is limited by

culverts under Grand Avenue, which forms the northern boundary of the study area, and SR-78 beyond Grand Avenue, and the entire study area is fenced with chain link fencing. Terrestrial movement downstream is limited by culverts under Via Vera Cruz, approximately 550 feet west of the study area.

A formal wildlife movement study has not been conducted; however, with wetland and riparian vegetation, stream bed, and perennial water supply, the Conservation Area likely facilitates limited wildlife movement. Because the channel at this location is earthen bottomed, vegetated, and supports perennial stream flow (due to urban runoff), it provides cover and aquatic resources for wildlife species in the area, and likely permits limited wildlife movement from Grand Avenue west to Via Vera Cruz, where the channel becomes contained within a closed channel conveyance system. Therefore, the study area likely provides resources primarily to birds. Other common urban wildlife such as coyote (*Canis latrans*), common raccoon (*Procyon lotor*), or striped skunk (*Mephitis mephitis*) may also occasionally use the study area for foraging, but due to fencing as well as the culverts and roads surrounding and fragmenting available habitat, the study area likely does not facilitate substantial movement opportunities for terrestrial wildlife. This area has not been designated as a regional wildlife corridor in the City's draft Subarea Plan to the Multiple Habitat Conservation Program (MHCP), and given the fragmented nature of Las Posas Creek, this area likely does not function as a regional wildlife corridor due to the constrained urban context of the study area and the fragmented nature of the channel. For these reasons, impacts to wildlife corridors are determined to be less than significant.

e) Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Less-than-Significant Impact. Section 14.12.200 of the City's Municipal Code provides that where a permit is required for excavation, fill, or obstruction for installation or repair of utilities under any public street, sidewalk, trail, or public place, such construction should be located away from trees. The project would not require the removal of trees within the public right-of-way. As described above, the project site has been heavily disturbed and previously developed with commercial uses. The Conservation Area contains native habitat which has already been greatly enhanced through the recent restoration efforts, and sensitive habitat within the study area as well as any sensitive wildlife it supports would be protected through the measures of the proposed project, consistent with Goal COS-1 of the General Plan (City of San Marcos 2021). The proposed project would also be consistent with Policy 2.6 of Goal COS-2 of the General Plan, as project implementation would not be expected to result in the removal of healthy, mature trees (City of San Marcos 2021). Implementation of the project would introduce a landscape plan and more vegetation and trees than what currently exists in the study area, which would accomplish more than the 1:1 tree replacement rate required in the case that any trees within the study area are removed and are considered to be mature at the time clearing occurs for the proposed project. As such, the project would comply with the City's Municipal Code and impacts would be less than significant.

f) Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Less-than-Significant Impact with Mitigation Incorporated. The North County MHCP is a long-term regional conservation plan established to protect sensitive species and habitats in northern San Diego County. The MHCP is divided into seven Subarea Plans—one for each jurisdiction within the MHCP—that are permitted and implemented separately from one another. The City of Carlsbad is the only city under the MHCP that has an approved and permitted Subarea Plan. The City of San Marcos Subarea Habitat

Conservation Plan/Natural Community Conservation Plan (San Marcos Subarea Plan) (City of San Marcos 2001) has not been finalized or implemented, and the City is no longer an active participant in the Natural Community Conservation Plan program or the subregional MHCP conservation planning effort. However, it is the City's policy to comply with the conservation policies identified in the draft San Marcos Subarea Plan, including an assessment of a designated Biological Core and Linkage Area or MHCP Focused Planning Area in the context of a proposed project and the preservation of sensitive biological resources. The study area is not within a designated Biological Core and Linkage Area or a MHCP Focused Planning Area.

As described above, the impact limits of the proposed project are shown in Figure 3 of Appendix C. As shown, the limits of work overlap approximately 11.01 acres of non-sensitive land covers which do not require mitigation for direct impacts. Direct impacts to sensitive vegetation communities shall be completely avoided, and impacts will be limited to urban/developed and disturbed habitat land covers. Based on the results of the Biological Resources Letter Report, with implementation of proposed mitigation measures **MM-BIO-1** and **MM-BIO-2**, the proposed project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other applicable plan related to biological resources. Therefore, impacts would be less than significant with mitigation incorporated.

Mitigation Measures

MM-BIO-1 Sensitive Vegetation and Resources Protection. Indirect impacts to sensitive riparian and wetland vegetation communities, sensitive habitat, and jurisdictional aquatic resources located within the existing Conservation Area, which will remain under the City's jurisdiction, shall be avoided through implementation of the following measures.

a. All proposed lighting systems associated with proposed future development shall comply with City standards for shielded low sodium, low wattage lighting designed to cut glare and light scatter and to direct light away from the Conservation Area.
b. Signage shall be installed by the project applicant or its designee along the development/open space interface and/or should be provided at existing buildings where determined appropriate by the City for the purpose of identifying sensitive habitats and educating visitors and residents of sensitive habitats and/or restoration efforts. Signage shall include information regarding the importance of not allowing pets to roam outdoors and off-leash, both for the safety of pets and to protect native wildlife.
c. The Conservation Area shall be strategically fenced to ensure habitat protection and to minimize conflicts with adjacent neighborhoods. All necessary fencing shall be designed to allow for wildlife passage but deter human use of the Conservation Area. The Conservation Area shall be fenced using permanent chain-link fencing.
d. The limits of work shall be clearly defined and marked in the field and reviewed by a qualified biologist for consistency against the approved grading plan prior to initiation of project construction.
e. All site preparation and construction activities shall incorporate standard erosional best management practices (BMPs) including, but not limited to, straw bales, gravel bags, sand bags, the periodic watering of bare areas, and the direction of construction area drainage to existing storm drain facilities.

f. All equipment maintenance, staging areas, and dispensing of fuel, oil, or other toxicants shall occur in designated upland areas at least 50 feet from the Conservation Area.

g. Install silt fencing and other silt containment devices where necessary to prevent off-site transport of sediment and pollutants. Install oil and grease traps at any storm drain inlets which are adjacent to or within work areas.

h. Any post-construction BMPs shall be described in a Stormwater Management Plan to illustrate how runoff from proposed developments will be treated prior to its discharge into the drainage.

MM-BIO-2 Nesting Bird Surveys. Construction-related ground-disturbing activities (e.g., clearing/grubbing, grading, and other intensive activities) that occur during the breeding season (February 15 through August 31 for most species, and from January 15 through August 31 for raptors,) shall require a one-time biological survey for nesting bird species to be conducted by a qualified biologist within the limits of work within 72 hours prior to construction. This survey is necessary to ensure avoidance of impacts to nesting raptors and/or birds protected by the federal Migratory Bird Treaty Act and California Fish and Game Code, Sections 3503 and 3513. If any active nests are detected, the area shall be flagged and mapped on the construction plans or a biological resources figure, and the information provided to the construction supervisor and any personnel working near the nest buffer. Active nests shall have "no work zone" buffers established around them (e.g., 250 feet for passerines to 500 feet for raptors) by the project biologist in the field with brightly colored flagging tape, conspicuous fencing, or other appropriate barriers or signage. The project biologist shall serve as a construction monitor during those periods when construction activities occur near active nest areas to avoid inadvertent impacts to these nests. The project biologist may adjust the 250-foot or 500-foot setback at his or her discretion depending on the species and the location of the nest (e.g., if the nest is well protected in an area buffered by dense vegetation). However, if needed, additional qualified monitor(s) shall be provided in order to monitor active nest(s) or other project activities in order to ensure all of the project biologist's duties are completed. Once the nest is no longer occupied for the season as determined by the project biologist, construction may proceed in the setback areas.

If construction activities, particularly clearing/grubbing, grading, and other intensive activities, stop for more than 3 days, an additional nesting bird survey shall be conducted within the proposed impact area.

2.5 Cultural Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
V. CULTURAL RESOURCES – Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?	☐	☐	☒	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?	☐	☒	☐	☐
c) Disturb any human remains, including those interred outside of formal cemeteries?	☐	☒	☐	☐

The following analysis is based, in part, on the Cultural Resources Phase I Inventory Report prepared by Dudek in December 2022, included as Appendix D.

a) Would the project cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?

Less-than-Significant Impact. As defined by the CEQA Guidelines (14 CCR 15000 et seq.), a "historical resource" is considered to be a resource that is listed in or eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR), has been identified as significant in a historical resource survey, or is listed on a local register of historical resources. Under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California Public Resources Code, Section 21084.1; 14 CCR 15064.5[b]). If a site is listed or eligible for listing in the CRHR, or included in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of California Public Resources Code, Section 5024.1[q]), it is a historical resource and is presumed to be historically or culturally significant for the purposes of CEQA (California Public Resources Code, Section 21084.1; 14 CCR 15064.5[a]).

A California Historical Resources Information Systems records search of the project site and a 1-mile radius buffer was conducted by Dudek at the South Coastal Information Center (SCIC) on October 19 and November 2, 2022. The records search results indicate that 77 previous cultural resources studies have been conducted within 1 mile of the project area. Of the 77 previous studies, four studies intersect the project area and are listed in Table 1 of Appendix D. These studies consist of one archaeological report for the City of San Marcos General Plan Amendment, a cultural resources monitoring report, a draft EIR, and an archaeological records search and literature review. A review of the four reports indicates that approximately 10% of the project area has been previously studied.

Report SD-18207, Cultural Resources Monitoring Report for the Los Posas and Grand Avenue Capital Improvement Project, City of San Marcos, San Diego County, California (Clark and Duran 2019), details

Rincon Consultants' discovery and treatment of CA-SDI-22954. Rincon Consultants submitted an incident report to USACE, which described the resource and recommended it ineligible for listing on the NRHP due to a lack of integrity. USACE concurred with Rincon Consultants' recommendation and determined the site is not eligible. The State Historic Preservation Officer concurred with USACE's recommendation that the site not be included in the NRHP.

The SCIC records search identified one cultural resource (CA-SDI-22954), a historic-age trash scatter, within the project area. The records search also identified 47 cultural resources within the 1-mile search radius buffer outside of the project area. Of the total 47 resources identified in the 1-mile buffer, 30 are prehistoric sites, nine are historic sites, four are prehistoric isolates, three are multicomponent sites, and one resource lacks sufficient information to discern the age (Table 2 in Appendix D). No historic addresses are located within the project area; however, three are located within the 1-mile search radius.

CA-SDI-22954 consists of a historic-age trash scatter that was originally identified during cultural monitoring for the Los Posas Creek and Grand Avenue Capital Improvement Project in San Marcos in 2019 by Rincon Consultants. CA-SDI-22954 was recorded in the northern-central component of the current project area, just south of Grand Avenue along the eastern bank of Los Posas Creek. It measures approximately 50 feet long (N/S) by 10 feet wide (E/W). The site consisted of approximately 60–70 artifacts, including bottle glass fragments (clear, brown, opaque, and blue), metal fragments, and a select few transfer print ceramics. Rincon Consultants' preliminary analysis of the makers' marks on several bottle bases suggested the artifacts likely dated to the 1920s and 1930s. Modern debris, such as a cassette tape and a few plastic bottles, were found intermixed with the historic trash scatter and suggested site disturbance. Rincon Consultants concluded that the site was probably an opportunistic dumping event. Rincon Consultants was also unable to associate the artifacts with a particular event or person. Due to the site's lack of integrity and disturbed nature, as well as the inability to directly associate the trash scatter with a particular event or person, the Rincon Consultants also recommended the site did not meet the eligibility requirements for listing on the NRHP under any criteria.

Dudek conducted an online review of historic aerial photographs of the project area and general vicinity, to help determine the possible development and land use of the project area in the past. Thirty-six historic aerial photographs of the project area were available at various years from 1938 to 2020 (NETR 2022). The historic aerial photograph from 1938 reveals the project area had a road intersecting the northwestern component of the project area. It also appears that Grand Avenue is at the northern end of the project boundary, and it was possibly paved. There also appears to be Las Posas Creek in the northern and central components of the project area. No structures or land modifications (other than the roads) are identifiable in the image. The 1947 and 1953 aerials do not reveal any changes to the project area. The 1964 aerial photo reveals approximately five small buildings, possibly residential buildings, adjacent to Grand Avenue at the northwest and northern sections of the project area. The photograph also shows two small buildings, again possibly residential buildings, near the southern section of the project area, and the development of what appears to be present day Linda Vista Drive. The 1967 aerial photograph does not reveal significant changes. The 1978 aerial photograph shows more development in the center and northwestern sections of the project area, as evidenced by a few more structures. The 1980 aerial photograph displays more distinct building development in the eastern section of the project area. The 1980 aerial photograph also displays the possible demolition (or renovation/expansion) of at least two or three structures that began being visible in the 1964 aerial photograph, near the northern and southern aspects of the project area. The 1981 through 1986 aerial photographs do not depict significant changes within the project area. The

1987 aerial photograph possibly exhibits more building development in the central aspect of the project area. The aerial photographs from 1988 through 1994 do not appear to reveal substantial changes within the project area. The 1995 aerial photograph reveals slightly more building development within the project area. The 1996 through 2010 historic aerial photographs do not indicate substantial changes to the project area. The 2012 aerial photograph reveals structural demolition. The buildings that were demolished were near or at the northern, northwest, central, and eastern aspects of the project area, which appear to be vacant pads in the 2012 aerial photograph. The buildings that were demolished generally begin appearing at the 1978 aerial photograph and continue increasing in number as the years progress, thus pointing to the likely destruction of modern structures by around 2012. The 2012 aerial photograph also displays the apparent demolition of the remaining structures from the 1964 photograph. The 2014 to 2020 aerial photographs do not appear to display significant changes to the project area. The most recent 2020 aerial photograph does not display any structures within the project area.

Historic topographic (topo) maps of the project area also were reviewed. There are 18 topo maps available from various years from 1893 to 2018. The 1893 through 1965 topo maps do not show significant development within the project area. The 1970 and 1979 topo maps reveal three structures within the project area, and the structures generally resemble residential houses. The structures' locations on the 1970 and 1979 topographic maps appear to match the historical aerial photograph from 1964. The 1983 topographic map shows approximately ten new structures inside the project area, which vary in size and generally correspond to the 1978 aerial photographs. The 2000 to 2018 topographic maps do not show substantial new development. The most recent topographic map from 2018 does not display any structures within the project area.

Additionally, as discussed above, due to the site's lack of integrity and disturbed nature, as well as the inability to directly associate the trash scatter with a particular event or person, Rincon also recommended the site (CA-SDI-22954) did not meet the eligibility requirements for listing on the NRHP under any criteria. For the reasons stated above and detailed in Appendix D, the project would result in less-than-significant impacts to historical resources.

b) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?

Less-than-Significant Impact with Mitigation Incorporated. The intensive pedestrian survey was conducted by a Dudek archaeologist on October 28, 2022, using standard archaeological procedures and techniques that meet the Secretary of Interior's standards and guidelines for cultural resources inventory. Jessica Alexander, a Luiseño monitor with Saving Sacred Sites, was also present during the entire pedestrian survey. The intensive level survey methods consisted of a walking 10 meter-wide transects across the project area. The ground surface was examined for prehistoric artifacts (e.g., flaked stone tools, tool-making debris, stone milling tools, ceramics, fire-affected rock), soil discoloration that might indicate the presence of a cultural midden, soil depressions, features indicative of the current or former presence of structures or buildings (e.g., standing exterior walls, post holes, foundations), and historic-age artifacts (e.g., metal, glass, ceramics, building materials). Ground disturbances such as burrows, cut banks, and drainages were also visually inspected for exposed subsurface materials.

The project area is significantly disturbed. Disturbances include several push piles, billboards, wood debris, drainage culverts, gravel piles, and restoration along Las Posas Creek. The western component of the project area shows evidence of being graded as evidenced by an elevated earthen berm adjacent to the

bridge. The project area is generally flat with little to no topographic variation. Asphalt covers most of the eastern and southern portions of the project area. The western half of the project area is a vacant field. Las Posas Creek transects the project area from the north to the southwest corner near the southwest corner of the project area. There is a modern-looking bridge that spans over the creek as well. Visibility within the entire project area was excellent (80%–100 %) in areas with no dense vegetation present. The only exception is near Las Posas Creek, which was low visibility (0%–20%). The primary vegetation noted included tumbleweeds, low-lying dry grasses, and cat tails near Las Posas Creek.

Dudek revisited the location where CA-SDI-22954 was previously recorded and did not relocate the site. No artifacts or features were identified within the site boundary during the current survey. Modern culvert slope contouring were present near the mapped location of CA-SDI-22954, which is likely associated with restoration work along the banks of Los Posas Creek. It appears that CA-SDI-22954, which was originally observed during a monitoring program, was destroyed as a result of the restoration work associated with Los Posas Creek for the Los Posas Creek and Grand Avenue Capital Improvement. No cultural artifacts or features were observed during the pedestrian survey.

Dudek's archaeological resources inventory of the project indicates that there is moderate sensitivity for identifying intact subsurface archaeological deposits during project implementation. The SCIC records search identified one cultural resource, CA-SDI-22954, a historic-age trash scatter, within the project area. CA-SDI-22954 was previously evaluated and determined to not be eligible for listing on the NRHP; however, it was not evaluated under CEQA or CRHR. The current pedestrian survey did not relocate CA-SDI-22954 or any other cultural resources within the project area. Dudek determined that CA-SDI-22954 was destroyed by the restoration work associated with Los Posas Creek. Since CA-SDI-22954 was destroyed, it is not a historical resource as defined under CEQA. No further studies or mitigation is necessary for CA-SDI-22954. In addition, the records search identified 47 cultural resources within 1 mile of the project area. The presence of cultural resources located within the vicinity of project area indicates that the surrounding area has been utilized extensively prehistorically and historically.

Based on historic aerials and Geotech investigations, the project area was graded and developed between 1964 and 1987 to its current configuration. Fill soil material is located over older alluvium throughout the project area to a depth of 4 feet below surface. No intact prehistoric or historic-age resources will be present within the fill sediment; however, because a previous resource was present within the project area (CA-SDI-22954) and other cultural resources located within the 1-mile search buffer, there is a potential to encounter cultural resources within the older alluvium sediments below the fill. Dudek recommends cultural resources monitoring, consisting of a qualified archaeological monitor and Luiseno Native American monitor, during all initial ground disturbing activities within the older alluvium sediments (below the fill). Monitoring can be reduced or terminated if no discoveries are made or if documentation is provided which demonstrates that ground-disturbing activities will be occurring in sediments with no potential for cultural resources. Archaeological monitoring is not recommended for ground disturbing activities in the fill as there is no potential for intact cultural resources within that stratum.

In the event that unanticipated archaeological resources are encountered during project implementation, impacts to these resources would be potentially significant. With the implementation of the City's standard cultural mitigation measures **MM-CUL-1** through **MM-CUL-4**, potentially significant impacts to unknown archaeological resources would be reduced to less than significant. Therefore, impacts would be less than significant with mitigation incorporated. Mitigation measures are outlined below.

c) Would the project disturb any human remains, including those interred outside of formal cemeteries?

Less-than-Significant Impact with Mitigation Incorporated. No prehistoric or historic burials were identified within the proposed project site as a result of the California Historical Resources Information Systems records search, Native American Heritage Commission (NAHC) Sacred Lands File search, or pedestrian survey. In the event that human remains are inadvertently encountered during construction activities, such resources would be treated in accordance with state and local regulations that provide requirements with regard to the accidental discovery of human remains, including California Health and Safety Code Section 7050.5, California Public Resources Code Section 5097.98, and the California Code of Regulations Section 15064.5(e). In accordance with these regulations, if human remains are found, the County Coroner must be immediately notified of the discovery. No further excavation or disturbance of the project site or any nearby area reasonably suspected to overlie adjacent remains can occur until the County Coroner has determined, within two working days of notification of the discovery, if the remains are potentially human in origin. If the County Coroner determines that the remains are, or are believed to be, Native American, he or she is required to notify the NAHC within 24 hours. The NAHC must immediately notify those persons it believes to be the most likely descendant from the deceased Native American. The most likely descendant must then complete their inspection within 48 hours of being granted access to the site. The most likely descendant would then determine, in consultation with the City, the disposition of the human remains. Compliance with these regulations and implementation of MM-CUL-4 outlined below would ensure that impacts related to human remains as a result of the proposed project would be less than significant with mitigation incorporated.

Mitigation Measures

MM-CUL-1 Pre-Excavation Agreement. Prior to the issuance of a Grading Permit, or ground disturbing activities, the Applicant/Owner shall enter into a Tribal Cultural Resources Treatment and Repatriation Agreement (Pre-Excavation Agreement) with a Traditionally and Culturally Affiliated Native American Tribe (TCA Tribe), identified in consultation with the City. The purpose of the Pre-Excavation Agreement shall be to formalize protocols and procedures between the Applicant/Owner and the TCA Tribe for the protection, treatment, and repatriation of Native American human remains, funerary objects, cultural and/or religious landscapes, ceremonial items, traditional gathering areas, and other tribal cultural resources. Such resources may be located within and/or discovered during ground disturbing and/or construction activities for the proposed project, including any additional culturally appropriate archaeological studies, excavations, geotechnical investigations, grading, preparation for wet and dry infrastructure, and other ground disturbing activities. Any project-specific Monitoring Plans and/or excavation plans prepared by the project archaeologist shall include the TCA Tribe requirements for protocols and protection of tribal cultural resources that were agreed to during the tribal consultation.

The landowner shall relinquish ownership of all non-burial related tribal cultural resources collected during construction monitoring and from any previous archaeological studies or excavations on the project site to the TCA Tribe for proper treatment and disposition per the Pre-Excavation Agreement, unless ordered to do otherwise by responsible agency or court of competent jurisdiction. The requirement and timing of such release of ownership, and the recipient thereof, shall be reflected in the Pre-Excavation Agreement. If the TCA

Tribe does not accept the return of the cultural resources, then the cultural resources will be subject to curation.

MM-CUL-2 Construction Monitoring. Prior to the issuance of a Grading Permit or ground disturbing activities, the Applicant/Owner or Grading Contractor shall provide written documentation (either as signed letters, contracts, or emails) to the City's Planning Division stating that a Qualified Archaeologist and Traditionally and Culturally Affiliated Native American monitor (TCA Native American monitor) have been retained at the Applicant/Owner or Grading Contractor's expense to implement the construction monitoring program, as described in the Pre-Excavation Agreement.

The Qualified Archaeologist and TCA Native American monitor shall be invited to attend all applicable pre-construction meetings with the General Contractor and/or associated subcontractors to present the construction monitoring program. The Qualified Archaeologist and TCA Native American monitor shall be present on site during grubbing, grading, trenching, and/or other ground disturbing activities that occur in areas of native soil or other permeable natural surfaces that have the potential to unearth any evidence of potential archaeological resources or tribal cultural resources. In areas of artificial paving, the Qualified Archaeologist and TCA Native American monitor shall be present on site during grubbing, grading, trenching, and/or other ground disturbing activities that have the potential to disturb more than six inches below the original pre-project ground surface to identify any evidence of potential archaeological or tribal cultural resources. No monitoring of fill material, existing or imported, will be required if the General Contractor or developer can provide documentation to the satisfaction of the City that all fill materials being utilized at the site are either: 1) from existing commercial (previously permitted) sources of materials; or 2) are from private or other non-commercial sources that have been determined to be absent of tribal cultural resources by the Qualified Archaeologist and TCA Native American monitor.

The Qualified Archaeologist and TCA Native American monitor shall maintain ongoing collaborative coordination with one another during all ground disturbing activities. The requirement for the construction monitoring program shall be noted on all applicable construction documents, including demolition plans, grading plans, etc. The Applicant/ Owner or Grading Contractor shall provide written notice to the Planning Division and the TCA Tribe, preferably through e-mail, of the start and end of all ground disturbing activities.

Prior to the release of any grading bonds, or prior to the issuance of any project Certificate of Occupancy, an archaeological monitoring report, which describes the results, analysis, and conclusions of the construction monitoring shall be submitted by the Qualified Archaeologist, along with any TCA Native American monitor's notes and comments received by the Qualified Archaeologist, to the Planning Division Manager for approval. Once approved, a final copy of the archaeological monitoring report shall be retained in a confidential City project file and may be released, as a formal condition of Assembly Bill (AB) 52 consultation, to San Luis Rey Band of Mission Indians, Rincon Band of Luiseño Indians, San Pasqual Band of Mission Indians or any parties involved in the project specific monitoring or consultation process. A final copy of the report, with all confidential site

records and appendices, will also be submitted to the South Coastal Information Center after approval by the City.

MM-CUL-3 Unanticipated Discovery Procedures. Both the Qualified Archaeologist and the TCA Native American monitor may temporarily halt or divert ground disturbing activities if potential archaeological resources or tribal cultural resources are discovered during construction activities. Ground disturbing activities shall be temporarily directed away from the area of discovery for a reasonable amount of time to allow a determination of the resource's potential significance. Isolates and clearly non-significant archaeological resources (as determined by the Qualified Archaeologist, in consultation with the TCA Native American monitor) will be minimally documented in the field. All unearthed archaeological resources or tribal cultural resources will be collected, temporarily stored in a secure location (or as otherwise agreed upon by the Qualified Archaeologist and the TCA Tribe), and repatriated according to the terms of the Pre-Excavation Agreement, unless ordered to do otherwise by responsible agency or court of competent jurisdiction.

If a determination is made that the archaeological resources or tribal cultural resources are considered potentially significant by the Qualified Archaeologist, the TCA Tribe, and the TCA Native American monitor, then the City and the TCA Tribe shall determine, in consultation with the Applicant/Owner and the Qualified Archaeologist, the culturally appropriate treatment of those resources.

If the Qualified Archaeologist, the TCA Tribe, and the TCA Native American monitor cannot agree on the significance or mitigation for such resources, these issues will be presented to the Planning Division Manager for decision. The Planning Division Manager shall make a determination based upon the provisions of CEQA and California Public Resources Code Section 21083.2(b) with respect to archaeological resources and California Public Resources Section 21704 and 21084.3 with respect to tribal cultural resources, and shall take into account the religious beliefs, cultural beliefs, customs, and practices of the TCA Tribe.

All sacred sites, significant tribal cultural resources, and/or unique archaeological resources encountered within the project area shall be avoided and preserved as the preferred mitigation. If avoidance of the resource is determined to be infeasible by the City as the Lead Agency, then the City shall require additional culturally appropriate mitigation to address the negative impact to the resource, such as, but not limited to, the funding of an ethnographic study and/or a data recovery plan, as determined by the City in consultation with the Qualified Archaeologist and the TCA Tribe. The TCA Tribe shall be notified and consulted regarding the determination and implementation of culturally appropriate mitigation and the drafting and finalization of any ethnographic study and/or data recovery plan, and/or other culturally appropriate mitigation. Any archaeological isolates or other cultural materials that cannot be avoided or preserved in place as the preferred mitigation shall be temporarily stored in a secure location on site (or as otherwise agreed upon by the Qualified Archaeologist and TCA Tribe), and repatriated according to the terms of the Pre-Excavation Agreement, unless ordered to do otherwise by responsible agency or court of competent jurisdiction. The removal of any artifacts from the project site will be inventoried with oversight by the TCA Native American monitor.

If a data recovery plan is authorized as indicated above and the TCA Tribe does not object, then an adequate artifact sample to address research avenues previously identified for sites in the area will be collected using professional archaeological collection methods. If the Qualified Archaeologist collects such resources, the TCA Native American monitor must be present during any testing or cataloging of those resources. Moreover, if the Qualified Archaeologist does not collect the cultural resources that are unearthed during the ground disturbing activities, the TCA Native American monitor may, at their discretion, collect said resources for later reburial or storage at a local curation facility, as described in the Pre-Excavation Agreement.

In the event that curation of archaeological resources or tribal cultural resources is required by a superseding regulatory agency, curation shall be conducted by an approved local facility within San Diego County and the curation shall be guided by California State Historical Resources Commission's Guidelines for the Curation of Archaeological Collections. The City shall provide the Applicant/Owner final curation language and guidance on the project grading plans prior to issuance of the grading permit, if applicable, during project construction. The Applicant/Owner shall be responsible for all repatriation and curation costs and provide to the City written documentation from the TCA Tribe or the curation facility, whichever is most applicable, that the repatriation and/or curation have been completed.

MM-CUL-4 Human Remains. As specified by California Health and Safety Code Section 7050.5, if human remains, or remains that are potentially human, are found on the project site during ground disturbing activities or during archaeological work, the person responsible for the excavation, or his or her authorized representative, shall immediately notify the San Diego County Medical Examiner's Office by telephone. No further excavation or disturbance of the discovery or any nearby area reasonably suspected to overlie adjacent remains (as determined by the Qualified Archaeologist and/or the TCA Native American monitor) shall occur until the Medical Examiner has made the necessary findings as to origin and disposition pursuant to Public Resources Code 5097.98.

If such a discovery occurs, a temporary construction exclusion zone shall be established surrounding the area of the discovery so that the area would be protected (as determined by the Qualified Archaeologist and/or the TCA Native American monitor), and consultation and treatment could occur as prescribed by law. As further defined by State law, the Medical Examiner will determine within two working days of being notified if the remains are subject to his or her authority. If the Medical Examiner recognizes the remains to be Native American, and not under his or her jurisdiction, then he or she shall contact the Native American Heritage Commission by telephone within 24 hours. The Native American Heritage Commission will make a determination as to the Most Likely Descendent, who shall be afforded 48 hours from the time access is granted to the discovery site to make recommendations regarding culturally appropriate treatment.

If suspected Native American remains are discovered, the remains shall be kept in situ (in place) until after the Medical Examiner makes its determination and notifications, and until after the Most Likely Descendent is identified, at which time the archaeological examination of the remains shall only occur on site in the presence of the Most Likely

Descendent. The specific locations of Native American burials and reburials will be proprietary and not disclosed to the general public. According to California Health and Safety Code, six or more human burials at one location constitute a cemetery (Section 8100), and disturbance of Native American cemeteries is a felony (Section 7052). In the event that the Applicant/Owner and the Most Likely Descendant are in disagreement regarding the disposition of the remains, State law will apply, and the mediation process will occur with the NAHC. In the event that mediation is not successful, the landowner shall rebury the remains at a location free from future disturbance (see Public Resources Code Section 5097.98(e) and 5097.94(k)).

2.6 Energy

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
VI. Energy – Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☐	☐	☒	☐
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	☐	☐	☒	☐

a) Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Less-than-Significant Impact. The project would result in an increase in energy consumption during construction and operation, which are addressed separately below.

Construction Emissions

Electricity Usage

Temporary electric power for as-necessary lighting and electronic equipment, such as computers inside temporary construction trailers, would be provided by SDG&E. The electricity used for such activities would be temporary, would be substantially less than that required for project operation and would therefore have a negligible contribution to the project's overall energy consumption.

Natural Gas Usage

Natural gas is not expected to be required during project construction. Fuels used for construction would primarily consist of diesel and gasoline, which are discussed under the subsection "Petroleum Usage," below. Any minor amounts of natural gas that may be consumed because of project construction would be temporary and negligible, and would not have an adverse effect; therefore, impacts would be less than significant.

Petroleum Usage

Petroleum would be consumed throughout construction of the project. Fuel consumed by construction equipment would be the primary energy resource expended over the course of construction, and VMT associated with the transportation of construction materials and construction worker commutes would also result in petroleum consumption. Heavy-duty construction equipment associated with construction activities and haul trucks involved in relocating dirt around the project site are assumed to use diesel fuel. Construction workers would travel to and from the project site throughout the duration of construction (approximately 15 months). It is assumed that construction workers would travel to and from the project site in gasoline-powered vehicles.

Heavy-duty construction equipment of several types would be used during project construction. CalEEMod was used to estimate construction equipment usage; results are included in Appendix B. The estimated diesel fuel usage from construction equipment, haul trucks, and vendor trucks is estimated at 47,643 gallons of diesel fuel. The total fuel usage associated with worker vehicles is estimated at 10,959 gallons of gasoline. Project construction would represent a "single-event" petroleum demand and would not require on-going or permanent commitment of petroleum resources for this purpose. Therefore, the impacts would be less than significant.

Operational Emissions

Electricity Usage

The operational phase would require electricity for multiple purposes, including building heating and cooling, lighting, and electronics. CalEEMod was used to estimate project emissions from electricity uses (see Appendix B). Default electricity generation rates in CalEEMod were used based on the proposed land use and climate zone. Note that the project would include installing solar photovoltaic (PV) systems sized to generate about 5,200 kilowatt-hours (kWh) per residential unit for 530,400 kWh per year.

Title 24 of the California Code of Regulations serves to enhance and regulate California building standards. The most recent amendments to Title 24, Part 6, referred to as the 2019 standards, became effective on January 1, 2020. According to CalEEMod estimates, the proposed project would consume 694,894 kWh per year during operation. The project would include solar PV systems pursuant to the City's Climate Action Plan (CAP) that generates a minimum of 2 kilowatts per sf of gross floor area. The project would generate a minimum of 283,164 kWh per year (NREL 2023). For context, in 2021, California used approximately 281 billion kWh of electricity (CEC 2022a). Locally, in 2021, total electricity demand in San Diego County was approximately 19 billion kWh (CEC 2022a).

The project proposes residential and commercial uses reflecting contemporary energy efficient/ energy conserving designs and operational programs. Uses proposed by the project are not inherently energy intensive, and the project electricity demands in total would be comparable to other projects of similar scale and configuration. Additionally, the project would be required to comply with the applicable Title 24 standards which would further ensure that the project energy demands would not be inefficient, wasteful, or otherwise unnecessary and impacts would be less than significant.

Natural Gas Usage

The operation would require natural gas for various purposes, including water heating and natural gas appliances. Natural gas consumption associated with operation is based on the CalEEMod outputs presented in Appendix B, CalEEMod default values for natural gas usage were assumed for the project; however, based on the City's policies in the CAP, the site may be conditioned to be all-electric. This analysis provides a conservative estimate of natural gas usage.

As explained above, Title 24 of the California Code of Regulations serves to enhance and regulate California's building standards and 2019 standards are the current standards. According to CalEEMod estimates, the proposed project would consume 2,699,982 kilo-British thermal units (kBtu) per year. For context, in 2021, California consumed approximately 1,191 trillion kBtus of natural gas (CEC 2022b). Locally, in 2021, residential and non-residential uses in San Diego County consumed about 52 trillion kBtu of natural gas (CEC 2022b). As supported by the preceding discussions, project natural gas consumption would not be considered inefficient, wasteful, or otherwise unnecessary and impacts would be less than significant.

Petroleum Usage

During operations, most of the project's fuel consumption would involve the use of motor vehicles traveling to and from the project site by residents, customers, and employees.

Petroleum fuel consumption associated with motor vehicles traveling to and from the project site is a function of the VMT due to project operation. As shown in Appendix B, the annual VMT attributable to the proposed project were estimated based on project-specific trip generation information and CalEEMod default values for the proposed land use. Like the construction worker and truck trips, fuel consumption from residents, customers, and employees is estimated by converting the total CO_2 emissions from operation of the project to gallons using the conversion factors for CO_2 to gallons of gasoline or diesel. Based on the annual fleet mix provided in CalEEMod, approximately 96% of the fleet are assumed to run on gasoline, while the remaining 4% are assumed to run on diesel. In the first year of assumed operations (2026), the proposed project would consume approximately 137,440 gallons of gasoline, and 4,630 gallons of diesel from vehicle travel.

Trip generation and VMT generated by the project are consistent with other mixed uses of similar scale and configuration. That is, the project does not propose uses or operations that would inherently result in excessive and wasteful vehicle trips and VMT, nor associated excess and wasteful vehicle energy consumption.

Enhanced fuel economies realized pursuant to federal and state regulatory actions, and related transition of vehicles to alternative energy sources (e.g., electricity, natural gas, biofuels, hydrogen cells) would decrease future gasoline fuel demands per VMT. The project would implement sidewalks, facilitating and encouraging pedestrian access. In compliance with CALGreen, the project would promote the use of bicycles as an alternative means of transportation by providing short-term and/or long-term bicycle parking accommodations. Facilitating pedestrian and bicycle access for employees would reduce VMT and associated energy consumption. As supported by the preceding discussions, project transportation energy consumption would not be considered inefficient, wasteful, or otherwise unnecessary and impacts would be less than significant.

Renewable Energy Potential

As part of the project's design process, the project applicant considered how the project could potentially increase its reliance on renewable energy sources to meet the project's energy demand. Renewable energy sources that were considered for their potential to be used to power the project, consistent with the California Energy Commission's definition of eligible renewables, include biomass, geothermal, solar, wind, and small hydroelectric facilities.

Given the project's location in an urban area and the nature of the project, there are considerable site constraints, including limited land availability, incompatibility with on-site and surrounding land uses for large scale power generation facilities, unknown interconnection feasibility, compatibility with utility provider systems, and no known water or geothermal resources to harness, that would eliminate the potential for biomass, geothermal, and hydroelectric renewable energy to be installed on site.

Regarding wind power, due to the urban nature of the site and surrounding land uses, wind turbines are not feasible as it represents an incompatible use. Specifically, a general rule of thumb is to install a wind turbine on a tower with the bottom of the rotor blades at least 30 feet above anything within a 500-foot horizontal radius and to be sited upwind of buildings and trees (APA 2011; NREL 2015), which the project site cannot accommodate.

Regarding solar power, the project would install solar PV systems consistent with the CAP requirements on the 102 townhomes. Each system would be sized to generate about 5,200 kWh per residential unit for a total of 530,400 kWh per year. While the project does not propose battery storage at this time, the project does not preclude installation of battery storage in the future if determined to be a feasible and compatible land use of the site.

The City's CAP includes measure E-2, which requires solar PV installation for non-residential projects. Given the programmatic nature of a specific plan, some of the commercial building layouts, design, and end uses, may still be refined, as such the feasibility of solar PV on the commercial portion is still being determined. The final determination of feasibility will be made consistent with the City's CAP.

In summary, the project includes the on-site renewable energy source (i.e., solar) that was determined to be feasible for the site and does not include the on-site renewable energy sources that were determined to be infeasible.

As explained above, the project would use renewable energy on site as determined to be feasible and would not result in wasteful, inefficient, or unnecessary consumption of energy resources, including electricity, natural gas, or petroleum during project construction or operation. Impacts would be less than significant.

b) Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Less-than-Significant Impact. The project would be subject to and would comply with, at a minimum, the California Building Energy Efficiency Standards (24 CCR, Part 6). Part 6 of Title 24 establishes energy efficiency standards for residential and non-residential buildings constructed in California to reduce energy demand and consumption. The proposed project would also be subject to Part 11 of Title 24, also known as the CALGreen building standards. These were adopted into the City's building design criteria. Furthermore, the project would be consistent with the City's CAP Consistency Checklist measures, such as

through its implementation of EV charging stations and PV panels, which would further reduce operational energy use. The proposed project would be built and operated in accordance with all existing, applicable regulations at the time of construction. For these reasons stated, the proposed project would result in a less-than-significant impact associated with the potential to conflict with energy standards and regulations.

2.7 Geology and Soils

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
VII. GEOLOGY AND SOILS – Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☒	☐
ii) Strong seismic ground shaking?	☐	☐	☒	☐
iii) Seismic-related ground failure, including liquefaction?	☐	☐	☒	☐
iv) Landslides?	☐	☐	☐	☒
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☐	☐	☐	☒
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	☐	☐	☒	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	☐	☐	☐	☒
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☒	☐	☐

The following analysis is based, in part, on the Geotechnical Evaluation prepared by GeoTek in June 2021, which is included as Appendix E to this EIR.

a) Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

ii) Strong seismic ground shaking?

Less-than-Significant Impact. The project site is located in tectonically active southern California. However, no active or potentially active fault is known to exist at the project site, nor is the site situated within an Alquist-Priolo Earthquake Fault Zone. The nearest fault, the Newport-Ingelwood Rose Canyon Fault is located approximately 11.6 miles west of the site (Appendix E). Based on the lack of active or potentially active faults underlying the project area, the potential for surface rupture is low and the project site would not be subject to a greater seismic risk than other locations within the region. Additionally, per the Alquist-Priolo Earthquake Fault Zoning Act, because the project site is not located in an Alquist Priolo Fault Zone, the proposed project would not place any prohibited uses (e.g., uses containing structures with a capacity of 300 people or more; uses with the potential to severely damage the environment or cause major loss of life; or specific civic uses including police and fire stations, schools, hospitals, rest homes, nursing homes, and emergency communication facilities) within an Alquist–Priolo Fault Zone. Thus, the potential for loss, injury, or death involving rupture of a known earthquake fault is considered low.

The proposed project would be designed in accordance with applicable CBC criteria, including those specific to resistance to seismic shaking. Furthermore, the proposed project would be constructed in accordance with other applicable regulations, current seismic design specifications of the Structural Engineers Association of California, and applicable requirements of the California Occupational Safety and Health Administration. These required seismic design considerations are used to minimize structural damage in the event of ground shaking. As such, for the reasons described above, the proposed project's impacts associated with rupture of a known earthquake fault and strong seismic ground shaking would be less than significant.

iii) Seismic-related ground failure, including liquefaction?

Less-than-Significant Impact. Liquefaction typically occurs when a site is subjected to strong seismic shaking, on-site soils are cohesionless, groundwater is encountered within 50 feet of the surface, and soil relative densities are less than approximately 70%. During a Geotechnical evaluation of the site, groundwater was encountered at a depth ranging from 16.5 to 17 feet below the existing ground surface; however, liquefaction and seismic settlement potential on the site are considered negligible due to the presence of shallow bedrock and the cohesive nature of the on-site older alluvium. Therefore, project impacts associated with liquefaction would be less than significant.

iv) Landslides?

No Impact. The project site is flat and primarily consists of paved areas. The project site is identified in the City's Safety Element as having "Zero Susceptibility" to landslides (Figure 6-1 of the General Plan) (City of

San Marcos 2012b). Additionally, the Geotechnical Evaluation determined that the potential for landslides to occur on-site is negligible. Therefore, the project site is not considered susceptible to landslides and no impacts would occur.

b) Would the project result in substantial soil erosion or the loss of topsoil?

Less-than-Significant Impact. The project site is flat and primarily consists of paved areas. During re-development, the proposed project would be required to comply with the City's Grading Ordinance, which contains design standards and performance requirements that must be met to avoid or reduce, to an acceptable level, excessive erosion. Furthermore, in accordance with Municipal Code requirements, the proposed project would implement all recommendations pertaining to soil erosion or loss of topsoil as contained within the Geotechnical Evaluation prepared for the project (Appendix E). As such, impacts related to soil erosion and the loss of topsoil would be less than significant.

c) Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

No Impact. As described above, the project site is flat, currently consisting of existing development and paved parking. The Geotechnical Evaluation determined that the potential for landslides, liquefaction, or slope instabilities to occur is negligible (Appendix E). The proposed project would be required to comply with the recommendations of the Geotechnical Evaluation prepared for the project regarding earthwork activities. Therefore, no impacts would occur.

d) Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Less-than-Significant Impact. The Geotechnical Evaluation determined that the potential for on-site soil expansion ranges from "low" to "very high." The proposed project, however, would be required to comply with the recommendations established in the Geotechnical Evaluation regarding earthwork activities (Appendix E). As such, impacts related to expansive soils would be less than significant.

e) Would the project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

No Impact. The proposed project would not include septic tanks or alternative wastewater disposal systems. As described in Section 2.19, Utilities and Service Systems, the proposed project would construct private on-site sewer lines which would connect to existing City infrastructure. Therefore, no impacts would occur.

f) Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Less-than-Significant Impact with Mitigation Incorporated. A significant impact may occur if grading or excavation activities would disturb paleontological resources within the project site. The project site has been previously graded and consists of disturbed, paved land. Previous on-site development activities affected the entirety of the project site, and as such, it follows that any paleontological resources that may have once been located on the project site could have been previously disturbed. However, the possibility

of a paleontological discovery cannot be discounted. Accordingly, destruction of paleontological resources or unique geologic features during site-disturbing activities associated with construction of the proposed project is considered a potential significant impact. Therefore, mitigation measure **MM-GEO-1** is provided and would be implemented to ensure potential impacts during construction activities to paleontological resources or unique geologic features are reduced to a less-than-significant level.

Mitigation Measures

MM-GEO-1 In the event that paleontological resources (fossil remains) are exposed during construction activities for the proposed project, all construction work occurring within 50 feet of the find shall immediately stop until a qualified paleontologist, as defined by the Society of Vertebrate Paleontology's 2010 guidelines, can assess the nature and importance of the find. Depending on the significance of the find, the paleontologist may record the find and allow work to continue or recommend salvage and recovery of the resource. All recommendations will be made in accordance with the Society of Vertebrate Paleontology's 2010 guidelines and shall be subject to review and approval by the City of San Marcos. Work in the area of the find may only resume upon approval of a qualified paleontologist.

2.8 Greenhouse Gas Emissions

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
VIII. GREENHOUSE GAS EMISSIONS – Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☒	☐
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☒	☐

The section herein is based on findings from the Air Quality and Greenhouse Gas Technical Report prepared for the proposed project, included as Appendix B to this IS/MND.

a) Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

b) Would the project generate conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Less-than-Significant Impact.

Construction Emissions

Construction of the project would result in greenhouse gas (GHG) emissions, which are primarily associated with the use of off-road construction equipment, haul trucks, on-road vendor trucks, and worker vehicles.

Construction of the project is anticipated to commence in February 2024 and would last approximately 15 months, ending in May 2025. On-site sources of GHG emissions include off-road equipment and off-site sources including vendor trucks and worker vehicles. Table 16 in Appendix B presents construction emissions for the project in 2024 through 2025 from on-site and off-site emission sources. As shown in Table 16 of Appendix B, the estimated total GHG emissions during construction of the project would be approximately 583 MT CO2e over the construction period. Estimated project-generated construction emissions amortized over 30 years would be approximately 19 MT CO2e per year. As with project-generated construction criteria air pollutant emissions, GHG emissions generated during construction of the project would be short-term in nature, lasting only for the duration of the construction period, and would not represent a long-term source of GHG emissions.

Operational Emissions

Operation of the project would generate GHG emissions through vehicle trips by residents, employees, customers, and visitors to and from the project site; landscape maintenance equipment operation; energy use (natural gas and generation of electricity consumed by the project); solid waste disposal; and generation of electricity associated with water supply, treatment, and distribution and wastewater treatment. The estimated operational project-generated GHG emissions are shown in Table 17 of Appendix B. As shown in Table 17 of Appendix B, estimated annual project-generated GHG emissions would be approximately 1,641 MT CO_2e per year as a result of project operation; with amortized construction emissions of approximately 19 MT CO_2e per year, total project emissions would be approximately 1,660 MT CO_2e per year.

City of San Marcos' Climate Action Plan Consistency

This section evaluates the project's impacts to GHG in accordance with the City's 2020 CAP Consistency Checklist. A completed CAP Checklist is included as Appendix B. New discretionary development projects subject to CEQA review that are below the applicable screening size listed in the CAP Checklist would emit less than 500 MT CO_2e annually and would not contribute considerably to cumulative climate change impacts, and therefore, would be considered consistent with the CAP and associated emissions projections. As shown in Table 17 of Appendix B, GHG emissions would exceed 500 MT CO_2e, therefore a CAP consistency review is required.

For projects that are subject to CAP consistency review, the next step in determining consistency is to assess the project's consistency with the growth projections used in development of the CAP. This section allows the City to determine a project's consistency with the land use assumptions used in the CAP. As outlined in detail in Section 4.5 of Appendix B, the project was shown to implement all applicable checklist items within the City's CAP. Therefore, the project would be consistent with the City's CAP, and impacts to GHG emissions would be less than significant.

Consistency with Senate Bill 32, Assembly Bill 1279, and Executive Order S-3-05

Executive Order (EO) S-3-05 identified the following goals: GHG emissions should be reduced to 2000 levels by 2010, to 1990 levels by 2020, and to 80% below 1990 levels by 2050. SB 32 establishes a statewide GHG emissions reduction target whereby CARB, in adopting rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emissions reductions, shall ensure that statewide GHG emissions are reduced to at least 40% below 1990 levels by December 31, 2030. AB 1279 establishes a policy of the state to achieve net zero GHG emissions no later than 2045 and for statewide anthropogenic GHG emissions to be reduced to at least 85% below 1990 levels by 2045.

CARB is responsible for preparing a "Scoping Plan" for achieving the maximum technologically feasible and cost-effective GHG emission reductions required by regulatory action and to update the plan at least once every 5 years. The Scoping Plan recommends strategies for implementation at the statewide level to meet the goals of AB 32, SB 32, and the EOs and establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions. Each Scoping Plan builds upon the successful framework established by the initial Scoping Plan and subsequent updates, while also identifying new, technologically feasible, and cost-effective strategies to ensure that California meets increasingly stringent GHG reduction targets in a way that promotes and rewards innovation, continues to foster economic growth, and delivers improvements to the environment and public health, including in disadvantaged communities. The Scoping Plan updates have continued to express optimism in meeting future year targets of 2050 and 2030, as evaluated in the 2014 and 2017 Scoping Plans (respectively), and most recently, the 2045 goal addressed in the 2022 Scoping Plan under EO B-55-18, which AB 1279 codified and expanded on.

While there are no established protocols or Thresholds of significance for that future year analysis, CARB forecasted in the 2014 Scoping Plan that compliance with the current Scoping Plan would put the state on a trajectory of meeting the long-term 2050 GHG goals, although the specific path to compliance was unknown at the time (CARB 2014). The 2017 Scoping Plan outlined a strategy to achieve the 2030 GHG reduction target. The proposed scenario in the 2022 Scoping Plan lays out a path not just to carbon neutrality by 2045, but also to the 2030 GHG emissions reduction target (CARB 2022). The modeling indicates that, if the plan described in the proposed scenario is fully implemented, and done so on schedule, the state is on track to reduce its emissions to 260 MMT CO_2e by 2030 (CARB 2022).

The City's CAP outlines the measures for the City to achieve its share of state GHG reductions. The City's GHG reduction targets are consistent with the CARB's recommendations for community-wide targets. As discussed in the CAP, by meeting the 2030 target, the City will meet the 2030 state goal identified in SB 32 and maintain a trajectory to meet its proportional share of the 2050 target identified in EO S-3-05. Regarding, AB 1279, it is important to note that the state's carbon neutrality goal does not preclude any individual project from emitting GHG emissions. AB 1279 codifies EO B-55-18; however, its enactment was linked to the concurrent enactment of SB 905, which requires CARB to create a Carbon Capture, Removal, Utilization, and Storage Program that, fundamentally, will sequester carbon emitted by other projects. Therefore, the state's carbon neutrality goal does not preclude all individual projects from emitting GHG emissions.

As discussed above, the project would be consistent with the CAP and, therefore, would be consistent with state GHG reduction goals and progress towards achieving carbon neutrality.

Consistency with SANDAG Regional Transportation Plan/Sustainable Communities Strategy

At the regional level, the SANDAG's RTP/SCS has been adopted for the purpose of reducing GHG emissions attributable to passenger vehicles in the San Diego region. In October 2015, SANDAG adopted its Regional Plan, which was subsequently updated in 2021. The RTP/SCS is not directly applicable to the project because the underlying purpose of the RTP/SCS is to provide direction and guidance on future regional growth (i.e., the location of new residential and nonresidential land uses) and transportation patterns throughout the City and greater San Diego County, as stipulated under SB 375. CARB has recognized that the approved RTP/SCS is consistent with SB 375. The SANDAG Regional Plan is generally consistent with the local government plans. Since the project is within the scope of development that was anticipated in the General Plan (see Section 2.3[a]), it would not result in growth that would conflict with the Regional Plan.

Based on the preceding considerations, the project would not conflict with an applicable plan adopted for the purpose of reducing GHG emissions or generate GHG emissions that would have a significant impact on the environment; therefore, the project's impacts on GHG emissions would be less than significant.

2.9 Hazards and Hazardous Materials

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
IX. HAZARDS AND HAZARDOUS MATERIALS – Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☒	☐	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☒	☐
d) Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☒	☐

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☒	☐
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	☐	☐	☒	☐

The following analysis is based, in part, on the Phase I Environmental Site Assessment prepared for the project by Dudek in December 2022, which is included as Appendix F to this EIR.

a) Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Short-Term Construction Impacts

Less-than-Significant Impact. Potentially hazardous materials would likely be handled on the project site as part of project construction. These materials would include gasoline, diesel fuel, lubricants, and other petroleum-based products required to operate and maintain construction equipment. Handling of these potentially hazardous materials would be temporary and would coincide with the short-term construction phase of the project.

Although these materials would likely be stored on the project site, storage would be required to comply with the guidelines set forth by each product's manufacturer and with all applicable federal, state, and local regulations pertaining to the storage of hazardous materials. Consistent with federal, state, and local requirements, the transport of hazardous materials to and from the project site would be conducted by a licensed contractor. Any handling, transport, use, or disposal of hazardous materials would comply with all relevant federal, state, and local agencies and regulations, including the U.S. Environmental Protection Agency, the California Department of Toxic Substances Control, the California Occupational Safety and Health Administration, Caltrans, the Resource Conservation and Recovery Act, the SCAQMD, and the County Fire Department Hazardous Materials Division. Therefore, short-term construction impacts related to the transport, use, or disposal of hazardous materials would be less than significant.

Long-Term Operational Impacts

Less-than-Significant Impact. As a residential mixed-use land use, potentially hazardous materials associated with operation of the project would include those materials typically associated with cleaning and maintenance activities. Although these materials would vary, they would generally include household cleaning products, solvents, paints, fertilizers, and herbicides and pesticides. Many of these materials are considered household hazardous wastes, common wastes, and universal wastes by the U.S. Environmental Protection Agency, which considers these types of wastes common to businesses and households and to pose a lower risk to people and the environment than other hazardous wastes when properly handled, transported, used, and disposed of (EPA 2022). Federal, state, and local regulations typically allow these types of wastes to be handled and disposed of under less-stringent standards than other hazardous wastes, and many of these wastes do not need to be managed as hazardous waste.

In addition, any potentially hazardous material handled on the project site would be limited in quantity and concentration, consistent with other similar residential uses located in the City, and any handling, transport, use, and disposal of such material would comply with applicable federal, state, and local agencies and regulations. In addition, as mandated by the Occupational Safety and Health Administration, all hazardous materials stored on the project site would be accompanied by a Materials Safety Data Sheet, which would inform on-site personnel and residents of the necessary remediation procedures in the case of accidental release (OSHA 2012). Therefore, long-term operational impacts associated with the use, transport, and disposal of hazardous materials would be less than significant.

b) Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Less-than-Significant Impact with Mitigation Incorporated. In December 2022, a Phase I ESA (Appendix F) was prepared by Dudek in accordance with American Society of Testing and Materials Standards and Standards and Practices for All Appropriate Inquiries. The Phase I ESA covered the entirety of the project site.

Historical uses of the project site included commercial and industrial uses. The site was partially developed with several commercial/industrial buildings by 1964. Las Posas Creek, which transects the project site, was improved by 1970, and several more industrial buildings were constructed, including the concrete and metal industrial buildings on the northwest corner of the project site. By the mid-1980s, the project site was mostly developed or paved with the exception of a small area east of the creek in the center of the project site. Businesses included construction and hardware suppliers, auto repair shops, a car dealership, and concrete and metal manufacturers. By 2011, most of the buildings were removed with the exception of the construction company building in the southern portion of the project site, which was demolished in 2013. The creek was widened and improved with a bridge constructed across it in 2019.

Based on the results of the research, available data, and a site survey, the Phase I ESA (Appendix F) did not identify any recognized environmental conditions, but the Phase I ESA did identify historical recognized environmental conditions, controlled recognized environmental conditions, and a vapor encroachment condition. To ensure this contamination does not threaten the health of future occupants of the project site, implementation of mitigation measure **MM-HAZ-1** shall be required. MM-HAZ-1 would require the preparation of a soil management plan (SMP) prior to construction of the project site. Implementation of

MM-HAZ-1 would ensure that previous contamination would not result in adverse health and safety impacts to construction workers, future residents and visitors of the site, nor off-site land uses.

Furthermore, 1023 and 1031 Grand Avenue were neighboring businesses formerly on the western portion of the project site that conducted metal fabrication, auto repair, and manufacturing. Site features of concern included a former septic tank, former septic leach field, former parts washers, a wastewater trench drain, and former burial and forming pits. Site assessment, remediation, and monitoring for fuel-related chemicals (petroleum hydrocarbons) and VOCs were conducted between 2006 and 2011. Soil and groundwater data indicated that the primary contaminant of concern was petroleum hydrocarbons. A mitigation plan, based on the proposed commercial use of the site, was approved by the County of San Diego DEHQ in 2012. Mitigation activities included excavation and off-site disposal of contaminated soils and further evaluation of the trench drain, as well as soil excavation, soil stockpile sampling, groundwater sampling, backfilling areas with clean fill, analysis of vapor risk, and dewatering and off-site disposal of extracted groundwater. The 2012 Closure Report by GeoEnviro Services, Inc. indicates that mitigation goals (established for the proposed commercial use of the site) were met. According to the data in the 2012 report, there are a couple locations where soil was just above the residential regulatory screening level for diesel. Case closure was granted by DEHQ in July 2012 following the completion of the site mitigation plan. The closure is based on commercial use of the site. DEHQ stated in the closure letter (DEHQ 2012) that "changes to this land use may require reassessment…to determine if the revised land use could result in a risk to public health." If this portion of the project site is to be developed for residential use, concurrence would need to be obtained from DEHQ given the condition in their closure letter. DEHQ could require sampling in certain locations or they may be satisfied with the implementation of the SMP described in MM-HAZ-1. The project applicant would be required to comply with all DEHQ requirements prior to project construction.

With implementation of MM-HAZ-1, and required compliance with all applicable regulations, impacts would be considered less than significant with mitigation incorporated.

c) Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Less-than-Significant Impact. Land uses and activities typically associated with hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste include manufacturing, research, and industrial uses. The project would not include any such uses or activities. During construction of the project, MM-HAZ-1, as discussed above, would ensure impacts due to contaminated soils on site would be mitigated to a less-than-significant level.

The nearest school to the project site is the Little People Preschool and Daycare located 707 feet south of the project's southern boundary. Although the project would be located within 0.25 miles of a school, the project would not emit hazardous emissions or include handling of hazardous or acutely hazardous materials, substances, or wastes. Therefore, impacts associated with the emitting or handling or hazardous materials within 0.25 miles of a school would be less than significant.

d) Would the project be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Less-than-Significant Impact. The following hazardous waste site lists, including the California Department of Toxic Substances Control's EnviroStor database, the State Water Resources Control Board's GeoTracker site, the Cortese list, or other lists compiled pursuant to Section 65962.5 of the Government Code, were reviewed, and the project appeared on one of these lists (CalEPA 2022; DTSC 2022; SWRCB 2022). Two former leaking underground storage tank (LUST) cases were identified on the project site on the State Water Resources Control Board's GeoTracker site (SWRCB 2022). The former LUST case on the eastern end of the project site was granted regulatory closure in 1988, and the former LUST case on the southern end of the project site was granted regulatory closure in 2017.

Cases are considered closed when the appropriate regulatory agency has determined that no further action is required for further land use because actions were taken to adequately remediate the release, or because the release was minor, presents no environmental risk, and no remedial action is necessary. Though closed, they remain on the Cortese List for informational purposes.

Furthermore, as described in response to Threshold b) above, 1023 and 1031 Grand Avenue were neighboring businesses formerly on the western portion of the project site that conducted metal fabrication, auto repair, and manufacturing. Site features of concern included a former septic tank, former septic leach field, former parts washers, a wastewater trench drain, and former burial and forming pits. Site assessment, remediation, and monitoring for fuel-related chemicals (petroleum hydrocarbons) and VOCs was conducted between 2006 and 2011. Soil and groundwater data indicated that the primary contaminant of concern was petroleum hydrocarbons. A mitigation plan, based on the proposed commercial use of the site, was approved by the County of San Diego DEHQ in 2012. Mitigation activities included excavation and off-site disposal of contaminated soils and further evaluation of the trench drain, as well as soil excavation, soil stockpile sampling, groundwater sampling, backfilling areas with clean fill, analysis of vapor risk, and dewatering and off-site disposal of extracted groundwater. The 2012 Closure Report by GeoEnviro Services, Inc. indicates that mitigation goals (established for the proposed commercial use of the site) were met. According to the data in the 2012 report, there are a couple locations where soil was just above the residential regulatory screening level for diesel. Case closure was granted by DEHQ in July 2012 following the completion of the site mitigation plan. The closure is based on commercial use of the site. DEHQ stated in the closure letter (DEHQ 2012) that "changes to this land use may require reassessment…to determine if the revised land use could result in a risk to public health." If this portion of the project site is to be developed for residential use, concurrence would need to be obtained from DEHQ given the condition in their closure letter. DEQH could require sampling in certain locations or they may be satisfied with the implementation of the SMP, as required by **MM-HAZ-1**. The project applicant would be required to comply with all DEQH requirements prior to project construction.

For the reasons outlined above, impacts associated with hazardous materials sites would be less than significant.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

Less-than-Significant Impact. The closest airport to the project site is the McClellan-Palomar Airport, which is located approximately 5 miles west of the project site. The project site is not located within any of the McClellan-Palomar Airport Influence Areas Safety Zones. The majority of the City, including the project site, is within McClellan-Palomar Airport Influence Area Review Area 2 (San Diego County Regional Airport Authority 2011). Review Area 2 is within the airspace protection and/or overflight notification areas. There are limits on the heights of structures in areas of high terrain, which would not apply to the project (City of San Marcos 2012b). Therefore, this impact would be less than significant.

f) Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Less-than-Significant Impact. According to the General Plan Safety Element, the San Marcos Emergency Operations Plan governs the operations of the City during a disaster. This plan addresses response to moderate evacuation scenarios, including the identification of evacuation points and general routes (City of San Marcos 2012b).

The proposed project would be required to abide by the standards set forth in the San Marcos Emergency Operations Plan. Implementation of the proposed project is not expected to impact any roadway or staging areas that are identified in any emergency planning documents and would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. As required under the California Fire Code, the proposed project would be required to present development plans which afford fire and emergency responders suitable fire access roads dimensions and surfaces (Chapter 5, Section 503.1 through Section 503.4 of the California Fire Code), an adequate number of emergency rated entrances to the community (Appendix D, Section D106 of the California Fire Code), and entryway gate access for first responders (Chapter 5 of the California Fire Code, Section 503.6). The proposed point of entry will be reviewed by the San Marcos Fire Department (SMFD) and would be required to meet the qualifications for emergency access to and from the project site. Therefore, it is determined that impacts related to emergency response or emergency evacuation as a result of the proposed project would be less than significant.

g) Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

Less-than-Significant Impact. The project site is not located in any fire hazard severity zones (CAL FIRE 2022), nor is the project site located near any local responsibility areas or state responsibility areas. The project site is a previously developed vacant lot that is relatively flat and shows signs of previous disturbance. The proposed project would be required to comply with all applicable state and local fire codes, including compliance with the California Fire Code and SMFD, which require a design that affords fire and emergency responders suitable fire access roads dimensions and surfaces (Chapter 5, Sections 503.1 through Section 503.4 of the California Fire Code).

For the reasons stated above, and considering the project site is located in an urbanized area surrounded on all sides by existing development, implementation of the proposed project would not expose people or structures to risk of loss, injury, or death involving wildfires, and impacts would be less than significant.

Mitigation Measures

MM-HAZ-1 Soil Management Plan. Prior to commencement of construction or excavation activities, a Soil Management Plan (SMP) shall be prepared for use during earthmoving activities to address potential residual impacts in soil from prior releases on the project site, as well as potential unknown impacts that could be encountered (e.g., USTs). Known areas of concern include very limited areas of diesel in soil at 1010 Linda Vista Drive and 1023/1031 Grand Avenue. There was also a former tank at 961 Grand Avenue; soil beneath the tank was reportedly clean, however, the location could be noted in the SMP in an abundance of caution. Details regarding the former impacts are discussed in the December 2022 Phase I ESA prepared by Dudek and other pertinent publicly available cleanup reports. The SMP shall identify these known areas of concern and include training procedures for identification of contamination, if present. The SMP shall describe procedures for assessment, characterization, management, and disposal of hazardous constituents, materials, and wastes, in accordance with all applicable state and local regulations. Contaminated soils shall be managed and disposed of in accordance with local and state regulations. The SMP shall include health and safety measures, which may include but are not limited to periodic work breathing zone monitoring and monitoring for volatile organic compounds using a handheld organic vapor analyzer in the event impacted soils are encountered during excavation activities.

2.10 Hydrology and Water Quality

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
X. HYDROLOGY AND WATER QUALITY – Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	☐	☐	☒	☐
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☐	☐	☒	☐
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
i) result in substantial erosion or siltation on- or off-site;	☐	☐	☒	☐
ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;	☐	☐	☒	☐
iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	☐	☐	☒	☐
iv) impede or redirect flood flows?	☐	☐	☒	☐
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	☐	☐	☐	☒
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☐	☐	☒	☐

The following analysis is based, in part, on the Preliminary Drainage Study and Storm Water Quality Management Plans (SWQMPs) prepared for the project by Fuscoe Engineering LLC in March 2023, and on the Water and Sewer Study prepared by the Vallecitos Water District (VWD) in May 2023, which are included as Appendices I, J, K, and L, respectively, to this EIR.

a) Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Less-than-Significant Impact. Construction activities associated with the proposed project could result in potential impacts to water quality. In addition to sediment erosion from ground-disturbing activities on the project site, fuels, oils, lubricants, and other hazardous substances used during construction could be released and potentially impact water quality.

The proposed project would be required to comply with the NPDES State Water Resources Control Board Construction General Permit Order No. 2009-0009-DWQ for stormwater discharges and general construction activities, and would incorporate standard construction best management practices (BMPs), such as regular cleaning or sweeping of construction areas and impervious areas, and various erosion and sediment control BMPs, such as filtration media screens, fiber rolls, and de-siltation basins. In compliance with the Construction General Permit, a Stormwater Pollution Prevention Plan will be prepared for the project that would specify erosion and sediment control BMPs that would be implemented during construction to minimize impacts to water quality. Furthermore, project implementation of permanent structural, source control, and site design BMPs would effectively treat post-construction stormwater runoff

prior to discharge from the site in compliance with the requirements of the City's BMP Design Manual and the project's SWQMPs. As outlined in the "West" and "East" SWQMPs (Appendices J and K), the existing site consists of development areas that were previously commercial pads but the buildings have been demolished. The channel that runs through the site was recently improved by the City. The development area had a new storm drain added to collect runoff from the pads and discharge into the improved channel. A bridge was constructed to link to the "West" and "East" sites.

In existing conditions, there are some subtle flow paths where the site drains to the storm drain outlets that were constructed as part of the channel improvements at nodes 200 and 400. The westerly third of the "West" site leads to a local depression near node 10 before spilling out onto the adjacent property to the west. The proposed development areas will be re-graded to ensure that the runoff is routed to the channel. The site has a system of concrete swales and storm drains to collect runoff and convey it to water quality basins and/or underground detention structures for hydromodification storage before being discharged to the channel at nodes 200, 400, and 1,000.

The site has less defined flow paths on the "East" side. It appears that some of the site drains to the newly constructed storm drain at nodes 300, 700, and 900 while other parts may sheet flow over the side of the channel at nodes 600 and 800. The easternmost third of the proposed commercial site is very flat due to the concrete foundations that were left behind. While the flow paths are less definitive, it appears as though it generally flows out through the sheet flow onto Linda Vista Drive. There are storm drain inlets further south down Linda Vista Drive that discharge into the same channel that bisects the project, so any runoff that leaves the project site ultimately ends up in the same channel. The proposed development areas would be re-graded to ensure that the runoff is routed to the channel. Runoff would no longer be allowed to spill out onto the adjacent property to the south or out onto Linda Vista Drive. The proposed residential uses on the "West" site have a system of concrete swales and storm drains to collect runoff and convey it to water quality basins and/or underground detention structures for hydromodification storage being discharged to the channel at nodes 200, 400, and 1,000. The proposed commercial uses on the "East" site have a similar pattern, except that there would be no underground detention, and a storm drain system that outlets to the channel at nodes 300, 700, and 900 would be implemented.

The storm drain system for the proposed project has been designed for the 100-year storm event. Through the use of on-site detention systems, the site has been designed so that the channel would see no increase in flow for the proposed condition. The proposed project would benefit the adjacent properties by eliminating potential vector control issues with localized ponding and re-routing flows that currently lead off-site or add to runoff in the street. In the proposed condition, those off-site runoffs would be captured, treated, for water quality, and safely released to the channel.

The proposed biofiltration features on-site would be subject to regular inspection and maintenance. The property owner is required, pursuant to the City's Municipal Code Section 14.15 and the BMP Design Manual, to enter into a stormwater management and discharge control maintenance agreement for the installation and maintenance of permanent BMPs prior to issuance of permits. Implementation of the proposed project is not anticipated to violate any water quality standards or waste discharge requirements, nor degrade surface or ground water quality. Therefore, impacts associated with water quality, stormwater drainage, and stormwater runoff would be less than significant.

b) Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Less-than-Significant Impact. As outlined in the Geotechnical Evaluation completed for the project, groundwater was encountered at borings 16.5 and 17 feet below grade (Appendix E). The use of dewatering techniques may be necessary if excavations below the groundwater elevation occur. As described in response to Section 2.10(a), the project would treat storm water runoff through the use of biofiltration basins. All storm water would be adequately treated by the biofiltration basins prior to being discharged to natural/undisturbed areas that could allow the runoff to infiltrate into the ground and eventually reach groundwater. As the project would use biofiltration and BMPs that would effectively treat stormwater runoff, it is not expected that project implementation would have a potentially significant adverse impact on groundwater quality or cause or contribute to an exceedance of applicable groundwater receiving water quality objectives or degradation of beneficial uses. Additionally, in current conditions, the project site is almost entirely developed with impervious surfaces and would remain so following project implementation such that there would not a substantial net increase in impervious surfaces that would reduce groundwater recharge on the site.

A well may be drilled for the East-End Planning Area and West-End Planning Area to provide water for landscape irrigation. Wells shall be subject to approval by the County of San Diego Department of Environmental Health. If utilized, wells and well equipment shall be properly screened using landscaping and/or a fence or structure. The irrigation water usage is estimated at 1 million gallons per year. The San Marcos Area Groundwater Basin is defined by DWR as a very low priority for groundwater overdraft pursuant to the 2014 Sustainable Groundwater Management Act (San Diego County Water Authority 2023). As such, there is currently no sustainable groundwater management plan applicable to the project site. Therefore, the project would not conflict with a sustainable groundwater management plan. Although the project is considering well use for irrigation purposes; it is more likely to utilize irrigation water from VWD.

The project would receive potable water from VWD, who in turn, receives its water from the Metropolitan Water District of Southern California (MWD). MWD obtains water from local sources as well as the Colorado River, via the Colorado River Aqueduct, and the Sacramento-San Joaquin Delta, via the State Water Project (MWD 2021). Implementation of the proposed project would not substantially decrease groundwater basins through increasing water demand on-site or impede sustainable groundwater management of any groundwater basin. Therefore, impacts would be less than significant.

c) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i) Result in substantial erosion or siltation on- or off-site?

Less-than-Significant Impact. Under the existing conditions, the project site has been previously disturbed and is currently developed with paved areas and billboards. The project would involve grading activities that would bring the project site to a flat grade and the construction of new paved surfaces, residential buildings, commercial buildings and landscape areas. The project would also include a new engineered stormwater drainage system that would feature structural, water quality BMPs such as retention facilities to treat and manage stormwater flows.

As outlined in the SWQMPs prepared for the project (Appendices J and K), the receiving channel has been restored and is an actively managed conservation area, which would help with minimizing the potential for soil erosion. Additionally, the project would also include design features to reduce the potential for erosion. The finish grade of the facility would be less than or equal to 2%, as flatter surfaces reduce erosion and channelization within the facility. It is recommended to have the ponding area side slopes be 3H:1V or shallower. The logic behind this is that gentle side slopes are safer, less prone to erosion, establishes vegetation quickly, and is easier to maintain. The inflow velocities are going to be limited to 3 ft/s or less or energy dissipation methods are going to be used for concentrated inflows. Reducing these high inflow velocities will lower the amount of erosion, scouring, and channeling. Curb inlets are going to be at least 12 inches wide, have a 4- to 6-inch drop and an apron and energy dissipation as needed. The energy dissipation would help reduce the potential erosion. If erosion due to concentrated stormwater runoff flow occurs, eroded areas would be repaired, re-seeded, or re-planted. Corrective measures would have to be made such as adding erosion control blankets, adding stones at flow-entry points, or minor grading to restore proper drainage according to the original plan. If the issue is not corrected by restoring the BMPs to the original plan and grade, the City engineer would be contacted prior to any additional repairs or reconstruction. There would be an inspection after every 0.5-inch or larger storm event, but if erosion due to storm water is observed, the inspection frequency would be changed to after every 0.1-inch or larger storm event.

While the project's future drainage conditions would be designed to mimic the existing on-site drainage conditions to the maximum extent practicable, construction activities would inevitably result in changes to the internal drainage patterns of the site. However, the project's future storm drain system will be designed to conform with applicable federal, state, and local requirements related to drainage, hydrology, and water quality. In addition, the project's structural water quality BMPs would be designed such that any potential sediments collected on site would be captured in retention facilities so that they would not be conveyed to downstream waters and result in siltation. As such, alteration of the on-site drainage pattern would be conducted in a manner consistent with all applicable standards related to the collection and treatment of stormwater, such that it would not result in substantial erosion or siltation on or off site. Therefore, impacts associated with altering the existing drainage pattern of the project site and erosion or siltation would be less than significant.

ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite?

Less-than-Significant Impact. As discussed above, the project would inevitably result in changes to the internal drainage patterns of the project site. However, the project's future storm drain system would be designed to conform with applicable federal, state, and local requirements related to drainage, hydrology, and water quality. As such, alteration of the on-site drainage pattern would be conducted in a manner consistent with all applicable standards related to the collection and treatment of stormwater.

As outlined in the "west" and "east" SWQMPs (Appendices J and K), the development area had a new storm drain added to collect runoff from the pads and discharge into the improved channel. Runoff would be collected in gutters, cross gutters, and shallow storm drains, which would direct the runoff to the biofiltration BMPs. The biofiltration BMPs have been sized for both pollutant control and hydromodification mitigation. The landscaped parkway and street trees will provide retention and pollutant removal of runoff from the sidewalk and bike bath in accordance with Green Street guidance.

As outlined in the preliminary drainage study (Appendix I), the storm drain system for the proposed project's residential and commercial development areas has been designed for the 100-year storm event. Using on-site detention systems, the site has been designed so that the channel would see no increase in flow for the proposed condition. The proposed project would benefit the adjacent properties by eliminating potential vector control issues with localized ponding and re-routing flows that currently lead off-site or add to runoff in the street. In the proposed condition, those off-site runoffs will be captured, treated for water quality, and safety released to the channel.

In addition, according to the Flood Insurance Rate Maps No. 06073C0789H and No. 06073C0793G for the project area, the project site is located within Zone X, which is defined by the Federal Emergency Management Agency as an area located outside of the 100-year and 500-year flood plains (FEMA 2012). Therefore, impacts associated with altering the existing drainage pattern of the project site and flooding would be less than significant.

iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Less-than-Significant Impact. As previously addressed, the project would inevitably alter the drainage patters of the project site; however, the project would include a new engineered stormwater drainage system that would be designed to conform with applicable federal, state, and local requirements related to drainage, hydrology, and water quality. As described above, through the use of on-site detention systems, the site has been designed so that the channel would see no increase in flow for the proposed condition. The proposed project would benefit the adjacent properties by eliminating potential vector control issues with localized ponding and re-routing flows that currently lead off-site or add to runoff in the street. In the proposed condition, those off-site runoffs would be captured, treated, for water quality, and safely released to the channel._Alteration of the on-site drainage pattern would be conducted in a manner consistent with all applicable standards related to the collection and treatment of stormwater. Therefore, impacts associated with altering the existing drainage pattern of the project site and stormwater would be less than significant.

iv) Impede or redirect flood flows?

Less-than-Significant Impact. The project site is located in Zone X, an area of minimal flood hazard per the Federal Emergency Management Agency FIRM panels No. 06073C0789H and No. 06073C0793G effective May 16, 2012. Zone X is defined as an area located outside of the 100-year and 500-year flood plains (FEMA 2012). In addition, as previously discussed, although internal drainage patterns would be somewhat altered as a result of project development, the project would maintain adequate stormwater conveyance as to not result in an increase of surface runoff that would result in flooding on- or off-site associated with the 100-year, 24-hour storm event. As outlined in the "west" and "east" SWQMPs (Appendices J and K), overflow is designed to safely convey to a downstream storm drain system or discharge point size overflow structure to pass 100-year peak flow for on-line infiltration basins and water quality peak flow for off-line basins. This design was put into place because planning for overflow lessons the risk of property damage due to flooding. Therefore, impacts associated with impeding or redirecting flood flows would be less than significant.

d) In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation?

No Impact. The project site is approximately 8 miles inland from the Pacific Ocean and would not be subject to inundation by tsunami. The project site is not located within a 100-year flood hazard area, and is not located in flood hazard, tsunami, or seiche zones. Given that the project site is not located near a large standing body of water, inundation by seiche (or standing wave) is considered negligible. The project site is generally flat with no steep slopes and does not contain slopes subject to mudflows; and therefore, no impacts related to inundation would occur.

e) Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Less-than-Significant Impact. The Carlsbad Management Area Water Quality Improvement Plan (WQIP) update was accepted in December 2021 for the Carlsbad Watershed Management Area Responsible Agencies, which include the Cities of Carlsbad, Encinitas, Escondido, Oceanside, San Marcos, Solana Beach, and Vista, and the County of San Diego. The purpose of the Carlsbad WQIP is to guide the Responsible Agencies' Jurisdictional Runoff Management Plans towards improving water quality in Municipal Separate Storm Sewer System discharges (or storm water discharges) and receiving water bodies. Responsible Agencies' Jurisdictional Runoff Management Plans contain the strategies, standards and protocols by which each Responsible Agency will implement their individual program in response to the priorities and goals established in the WQIP (Carlsbad Watershed Management Area Responsible Agencies 2021). The City of San Marcos Jurisdictional Runoff Management Plan update was approved in January 2017. The project would be required to comply with the City's Jurisdictional Runoff Management Plan construction and land use guidelines.

The proposed project is located within the San Marcos Hydrologic Area, which is the second largest within the Carlsbad Watershed Management Area. The Carlsbad Management Area Water WQIP outlines areas of priority water quality conditions and highest priority water quality conditions. As such, the proposed project would not conflict with or obstruct implementation of the Carlsbad Management Area Water WQIP or any other water quality plan. Further, the site is not located within a sustainable groundwater management plan area. Therefore, impacts are determined to be less than significant.

2.11 Land Use and Planning

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XI. LAND USE AND PLANNING – Would the project:				
a) Physically divide an established community?	☐	☐	☒	☐

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☒	

a) Would the project physically divide an established community?

Less-than-Significant Impact. The proposed project would result in the construction of 102 multifamily residential units, 7 live-work units, 7,658 sf of office space, 49,266 sf of retail space, and associated recreational and parking improvements on 11.07 acres of the project site. Residential units would be contained within 15 townhome buildings, and the units would be a mix of six different types, ranging in size from two to three bedrooms. The residential buildings would be located on the northwestern portion of the project site, and commercial uses would be places along the southern and eastern project boundaries. Access to the residential area would be provided via Grand Avenue at a northern driveway, and access to the commercial area would be via Grand Avenue at a southern driveway and two driveways along Linda Vista Drive. The project would provide 204 garage parking spaces for residences, 34 residential gust parking spaces, and 278 commercial parking spaces.

The project proposes a General Plan Amendment and Rezone to change the General Plan designation and Zoning from Commercial (C) to Specific Plan Area (SPA) to allow for the proposed multifamily dwelling units, commercial space, associated amenities, and private open space. The Specific Plan has been prepared with the intent to provide a comprehensive plan to ensure the efficient development of a multi-land use development. Although development of the proposed residential land uses would be inconsistent with the existing land use and zoning designation, the project site is located in an urban part of the City within close proximity to a range of existing infrastructure and development including commercial uses, parks, single and multifamily residential, and schools/educational facilities. The proposed project would not incorporate new roads or require removal of roads that currently provide access to the area. Furthermore, because the project site is surrounded by existing roadways, no separation or disruption of surrounding uses would occur as a result of the project's implementation. As such, the incorporation of the proposed project would not divide an established community, and impacts would be less than significant.

b) Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Less-than-Significant Impact. The project proposes a General Plan Amendment and Rezone to change the General Plan designation and Zoning from Commercial (C) to Specific Plan Area (SPA) to allow for the proposed multifamily dwelling units, commercial space, associated amenities, and private open space. The General Plan Amendment and Rezone would change the General Plan designation and Zoning from Commercial (C) to Specific Plan Area (SPA). The Specific Plan has been prepared with the intent to provide a comprehensive plan to ensure the efficient development of a multi-land use development. The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of

the policies and goals of the General Plan. The Site Development Plan will configure the site for multifamily dwelling units, commercial space, street configuration, infrastructure, recreational open space, and private open space. The Tentative Subdivision Map presents specific lot configurations for the site. A Conditional Use Permit would be required for proposed uses associated with the commercial portion of the project.

Upon City approval of the GPA/Rezone to Specific Plan Area, the proposed project would be required to comply with the allowable multifamily residential and commercial uses and development standards outlined in the Specific Plan prepared for the project site. Although the proposed project would amend the land use designation, the concurrent process of amending the General Plan designation does not necessarily equate to consistency with the document. The proposed project would not result in a significant environmental impact due to a conflict with the City's General Plan Land Use Element goals, and project implementation would not impede the City's ability to achieve these goals. A General Plan Consistency Analysis was prepared for the project and is included as Appendix B to the Marcos Specific Plan (Appendix A to this IS/MND).

The project would not result in a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect, as further discussed below.

2050 Regional Transportation Plan/Sustainable Communities Strategy

SANDAG's 2050 RTP/SCS outlines projects for rail and bus services, highways, local streets, bicycling, and walking, movement of goods, as well as systems and demand management. The 2050 RTP/SCS presents a transportation system designed to maximize transit enhancements, integrate biking and walking elements, and promote programs to reduce demand and increase efficiency. As described in Section 2.17, Transportation, the proposed project would provide for residential land uses in an infill area, taking advantage of the site's location near transit, retail, employment, schools, parks, and other uses. The proposed project would be consistent with programs, plans, ordinances and policies addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.

Although the proposed project would not be consistent with the existing zoning and land use designations, the proposed project would generate fewer GHG emissions at buildout than potential development permitted under the existing land use designations. Thus, the proposed project would not increase land use intensities as provided in the RTP/SCS and would therefore not result in environmental impacts due to inconsistency with this plan.

Multiple Habitat Conservation Program

The North County MHCP is a long-term regional conservation plan established to protect sensitive species and habitats in northern San Diego County. The MHCP is divided into seven Subarea Plans—one for each jurisdiction within the MHCP—that are permitted and implemented separately from one another. The City of Carlsbad is the only city under the MHCP that has an approved and permitted Subarea Plan. The City of San Marcos Subarea Habitat Conservation Plan/Natural Community Conservation Plan (San Marcos Subarea Plan) (City of San Marcos 2001) has not been finalized or implemented, and the City is no longer an active participant in the Natural Community Conservation Plan program or the subregional MHCP conservation planning effort. However, it is the City's policy to comply with the conservation policies identified in the draft San Marcos Subarea Plan, including an assessment of a designated Biological Core

and Linkage Area or MHCP Focused Planning Area in the context of a proposed project and the preservation of sensitive biological resources.

As described above in Section 2.4, Biological Resources, proposed project implementation would result in potentially significant impacts to biological resources. However, compliance with existing regulations and implementation of mitigation measures MM BIO-1 and MM BIO-2 outlined in Section 2.4 would ensure that the proposed project would not conflict with the MHCP or draft San Marcos Subarea Plan, or other applicable regulations related to biological resources. Implementation of proposed mitigation, and City review of development plans for the project site would ensure impacts to biological resources would be less than significant. Furthermore, the proposed project would be consistent with the Conservation and Open Space Element goals of the City's General Plan, as shown in the General Plan Consistency Analysis prepared for the project which is included as Appendix B to the Marcos Specific Plan (Appendix A to this IS/MND).

San Marcos Municipal Code Zoning Ordinance Title 20

As described above, a Rezone would be required to re-designate the project site from Commercial to Specific Plan Area. Approval of the proposed GPA/Rezone would allow for development of the project site with the proposed residential land uses and associated amenities and improvements. Upon City approval of the GPA/Rezone to Specific Plan Area, the proposed project would be required to comply with the allowable uses and development standards outlined in the Specific Plan prepared for the project site (Appendix A). Although the proposed project would amend the land use designation and zoning to Specific Plan Area, the concurrent process of amending the zoning designation does not necessarily equate to consistency with the Zoning Ordinance. However, with the exception of the request for a General Plan Amendment and Rezone for the project site, the proposed project would be consistent with the remaining goals that guide development within the City. Therefore, the proposed rezoning of the site would be consistent with the City's Zoning Ordinance.

Based on the considerations outlined above, the proposed project would not conflict with an applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Therefore, project impacts related to land use and planning are determined to be less than significant.

2.12 Mineral Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XII. MINERAL RESOURCES – Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☒

a) Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

No Impact. According to the City's General Plan – Conservation and Open Space Element, the City has land classified in all four Mineral Resource Zones (MRZ) (City of San Marcos 2012a). The different MRZs are defined as follows:

> **MRZ-1:** Areas where adequate information indicates that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence.
>
> **MRZ-2:** Areas where adequate information indicates that significant mineral deposits are present or where it is judged that a high likelihood for their presence exists.
>
> **MRZ-3:** Areas containing mineral deposits the significance of which cannot be evaluated from available data.
>
> **MRZ-4:** Areas where available information is inadequate for assignment to any other MRZ zone.

California does not require that local governments protect land designated as MRZ-1, MRZ-3, or MRZ-4. However, the City is responsible for recognizing lands designated as MRZ-2 and protecting these areas from premature development incompatible with mining. City lands designated as MRZ-2 include small portions between Double Peak, Mt. Whitney, and Franks Peak; and small portions in the northern Sphere of Influence within Twin Oaks Valley Neighborhood (City of San Marcos 2012a). These locations do not overlap with the proposed project site; therefore, no loss of known mineral resources would occur.

Furthermore, the project site is not designated as a locally important mineral resource recovery site on any local general plan, specific plan, or other land use plan (City of San Marcos 2012a). Thus, due to the location and nature of the proposed project, there would be no impact to mineral resources.

b) Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

No Impact. Please see response to Threshold 2.12(a) above.

2.13 Noise

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XIII. NOISE – Would the project result in:				
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☐	☒	☐

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
b) Generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☒	☐
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☒	☐

The following analysis is based, in part, on the Noise Technical Report prepared for the project by Dudek in December 2022, which is included as Appendix G to this EIR.

In light of these above significance criteria, this analysis uses the following standards to evaluate potential noise and vibration impacts.

- Construction noise – the City has adopted the County's construction noise threshold of not exceeding 75 A-weighted decibels (dBA) for an 8-hour period, between 7:00 a.m. and 7:00 p.m., when measured at any occupied property where the noise is being received.
- Off-site project-attributed transportation noise – For purposes for this analysis, a direct roadway noise impact would be considered significant if increases in roadway traffic noise levels attributed to the proposed project were greater than 3 dBA community noise equivalent level (CNEL) at an existing noise-sensitive land use.
- Off-site project-attributed stationary noise – For purposes for this analysis, a noise impact would be considered significant if noise from on-site project sound sources, including typical operation of heating, ventilation, and air conditioning (HVAC), other electro-mechanical systems, as well as outdoor events, exceeded 65 dBA hourly energy equivalent level (L_{eq}) at the property line from 7:00 a.m. to 10:00 p.m., and 55 dBA hourly L_{eq} from 10:00 p.m. to 7:00 a.m.
- Construction vibration – Guidance from Caltrans indicates that a vibration velocity level of 0.2 inches per second (ips) peak particle velocity (PPV) received at a structure would be considered annoying by occupants within (Caltrans 2020). As for the receiving structure itself, aforementioned Caltrans guidance from Section 2 recommends that a vibration level of 0.3 ips PPV would represent the threshold for building damage k.

a) Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Less-than-Significant Impact.

Short-Term Construction Noise

Construction noise and vibration are temporary phenomena, varying from hour to hour and day to day, depending on the equipment in use, the operations performed, and the distance between the source and receptor. Equipment that would be in use during construction would include, in part, graders, scrapers, backhoes, rubber-tired dozers, loaders, cranes, forklifts, cement mixers, pavers, rollers, and air compressors. The typical maximum noise levels for various pieces of construction equipment at a distance of 50 feet are presented in Table 3 of Appendix G. Usually, construction equipment operates in alternating cycles of full power and low power, which the Federal Highway Administration Roadway Construction Noise Model User's Guide (FHWA 2006) characterizes as "acoustical usage factor" and thereby produces energy-average noise levels over time (L_{eq}) that are less than the listed maximum noise level. The average sound level of construction activity also depends on the amount of time that the equipment actually operates on site.

Using the provided construction information, prediction results are summarized in Table 4 of Appendix G, at the nearest noise-sensitive receptor for two calculation scenarios as follows:

- Usage of the shortest activity-to-receptor distance for the loudest equipment type and quantity associated with the studied construction phase, with less noisy equipment types at successive distance increments of 50 feet; and
- An "acoustic centroid" approach, akin to the Federal Transit Administration (FTA) general assessment technique for estimating construction noise, whereby all listed equipment for a construction phase is represented by a common location at the geographic center of the studied construction zone or area.

The first of these methods is considered a conservative approach to assess what might be characterized as a peak exposure level, applicable to not more than approximately 10%–15% of the total construction period and when the studied construction activity is taking place with loudest equipment along the property boundary closest to these nearest off-site receivers. The second approach utilizes the acoustic centroid technique to represent a time-averaged location for the phase equipment and activity, thereby yielding average noise levels to represent overall noise exposure as experienced for adjacent receivers over the duration of each construction phase.

A Microsoft Excel–based noise prediction model emulating and using reference data from the Federal Highway Administration Roadway Construction Noise Model (FHWA 2008) was used to estimate construction noise levels. (Although the Roadway Construction Noise Model was funded and promulgated by the Federal Highway Administration, it is often used for non-roadway projects, because the same types of construction equipment used for roadway projects are often used for other types of construction.) Input variables for the predictive modeling consist of the equipment type and number of each, the aforementioned acoustical usage factor, the expected duration (in hours) of on-site activity, and the distance from the receiver. Conservatively, no topographical or structural shielding was assumed in the modeling.

As presented in Table 4 of Appendix G, the estimated construction noise exposure levels for each of the five expected sequential phases are not predicted to exceed 75 dBA L_{eq} over an 8-hour period at the nearest noise sensitive receptors to the north of the project site under both of the calculation methods described above. ,Thus, temporary construction-related noise impacts would be considered less than significant.

Long-Term Operational Noise

Off-Site Roadway Traffic Noise

The proposed project would result in the creation of additional vehicle trips on local roadways (i.e., Linda Vista Drive, Grand Avenue, and Via Vera Cruz), which could result in increased traffic noise levels at adjacent noise-sensitive land uses. The project is expected to generate a net total of 2,241 daily trips to the roadway system (Appendix H). As shown in Table 3.1 of the project's Transportation Impact Study (Appendix H), during the PM peak-hour, approximately 189 vehicles are estimated to enter or exit the project site. Utilizing this information, an emulator based on the Federal Highway Administration's Highway Traffic Noise Prediction Model RD-77-108 was used to estimate potential noise impacts at adjacent noise-sensitive uses. Information used in the model included posted traffic speeds, truck mix percentage, and average daily traffic (ADT) volumes (expressed as vehicles per hour) for the existing, near-term year 2024 with and without project, and horizon year 2050 with and without project conditions. ADT volumes for I-78 were obtained separately via the SANDAG Transportation Forecast Information Center for the existing (2016), near-term (2025), and horizon (2050) years. Existing (2022) and Near-Term (2024) ADT volumes for I-78 were derived by determining the yearly percentage increase or decrease in traffic using the information available from the Transportation Forecast Information Center. Consistent with Caltrans guidance (Caltrans 2013), this analysis assumes 80% of the ADT occurs during daytime hours (7:00 a.m. to 7:00 p.m.), 5% during the evening (7:00 p.m. to 10:00 p.m.), and 15% during the nighttime (10:00 p.m. to 7:00 a.m.). Appendix G contains the input data and results of the traffic noise modeling effort. In summary, the project would have to roughly double the traffic volumes on nearby studied roadway segments in order to increase traffic by 3 dBA, which would be considered a barely perceptible increase (Caltrans 2013).

Traffic noise levels were modeled at the same geographic positions as the measured locations ST2 and ST3 as shown in Appendix G. The traffic noise level for ST1 was predicted at the northwestern boundary of the project site to be representative of the future residences located behind a proposed 6-foot noise wall. The traffic noise model results are summarized in Table 5 of Appendix G, and represented by CNEL values. Table 5 of Appendix G shows that at all three listed representative receivers, the addition of proposed project traffic to the local roadway network would result in a CNEL increase of less than or equal 1 dB, which is below the discernible level of change for the average healthy human ear. Thus, a less-than-significant impact is expected for proposed project-related off-site traffic noise increases affecting existing residences in the vicinity.

On-Site Roadway Traffic Noise

As of January 2019, the study of future project residential exposures to off-site transportation noise sources is not considered for noise impact assessment at the California state level. Hence, for informational purposes and as shown in Table 5 of Appendix G, predicted future (2024 and 2050) "with project" noise levels exceed the City's "conditionally acceptable" multifamily/mixed-use land use compatibility standard threshold of 75 dBA CNEL at the receiver representing the multifamily residences located adjacent to Grand Avenue. The proposed 6-foot noise wall on the northeastern side of the property, situated between the project buildings and the parallel major roadway represented by Grand Avenue and CA-78 traffic, is predicted to provide an insertion loss of approximately three to four dBA for first-floor exterior areas.

Second floor balconies (as shown in Exhibit D of Appendix G) facing Grand Avenue and CA-78 are also predicted to exceed 75 dBA CNEL but would not be benefited by the additional three to four dBA of insertion

loss from the 6-foot noise wall. If these balconies are not merely an architectural or decorative feature and are intended to be used as private outdoor spaces with the potential to be occupied by residents or their guests, then those balconies would need to be acoustically upgraded to reduce outdoor noise exposure for seated occupants.

An approach that Dudek has recommended on previous residential projects is to provide this identified noise reduction need by way of the addition of a solid and sufficiently massive material layer to the planned square-tubed metal railings on the balcony usable area perimeter. As depicted in Exhibit E of Appendix G, showing detail from a previously studied project (and thus used merely for illustration purposes), proposed installation of a 6-millimeter (0.236-inch) sheet of plexiglass (acrylic) on the interior-facing side of the balcony railing structure would be expected to yield an effective sound transmission class rating of at least 15. Although the material itself has a sound transmission class rating of 29, the approximate 1-inch-wide air gap between the bottom edge of the plexiglass panel and the balcony floor results in lower expected sound transmission class performance. In other words, the area of the gap as a fraction of the barrier material surface area causes the reduction in sound transmission loss performance. Other material options and designs are possible, subject to non-acoustical considerations such as desired barrier opacity, balcony deck drainage, etc., provided that the designed installation has barrier material having adequate mass and solidity, an approximate deck to top-edge height of 42 inches (3.5 feet), and with minimized airgaps such as the sample appearing in Exhibit E of Appendix G.

Exhibit F of Appendix G illustrates examples of similar sound-blocking balcony barriers to help reduce incoming traffic noise and increase occupant privacy at pre-existing Vista Flores Apartments and Barham Villas Apartments that overlook and are within comparable horizontal distances to the CA-78 highway as anticipated project facades appearing in Exhibit D of Appendix G.

On these bases, implementation of PDF-NOI-1 and PDF-NOI-2 below would help reduce traffic noise exposure levels. However, predicted traffic noise exposure levels may still exceed the City's land use compatibility standard of 65 dBA CNEL at the Private Usable Open Spaces for these Category B receptors per Table 7-4 (as shown in Exhibit B of Appendix G). As permitted by note 5 in Table 7-4 (as shown in Exhibit B of Appendix G), the project's group Usable Open Spaces (pool, playground, etc.) that are shielded by multiple project building rows would be predicted to have traffic noise exposure levels less than 65 dBA CNEL and would therefore be compatible with the City's land use compatibility standard. This is supported by language in note 5 from Table 7-4 (as shown in Exhibit B of Appendix G) as follows: "When the noise limit for Private Usable Open Space cannot be met, then a Group Usable Open Space that meets the exterior noise level standard shall be provided."

PDF-NOI-1 Where project exterior on-site noise levels due to off-site surface transportation noise sources are predicted to exceed 65 dBA CNEL at useable open space areas, the project shall install noise-reducing features external to or upon the useable open space areas (or within, as practical and appropriate) in the form of sound walls, fencing, landscape berms, or similarly performing barriers to occlude incoming roadway traffic noise.

PDF-NOI-2 Residential unit patios or balconies with roadway-facing building facades predicted to be exposed to external noise levels in excess of 65 A-weighted decibels community noise equivalent level shall feature railings or other partial-height barriers comprising sufficiently solid and dense materials (e.g., acrylic, glass, wood that exhibits a sound transmission class rating of at least 20) and of a 42-inch minimum height (from floor or deck of the

balcony surface) that occludes direct sound path from the noise-producing roadway of concern and a seated patio or balcony occupant.

Stationary Project Operations Noise

The completion of various buildings on the project site will add a variety of noise-producing mechanical equipment that include those presented and discussed in the following paragraphs. In addition to noise-producing mechanical equipment on the roofs of the project buildings, the site contains several proposed outdoor spaces on the east side of the site where events are expected to take place. Most of these noise-producing equipment or sound sources would be considered stationary, or limited in mobility to a defined area.

The aggregate noise emission from these outdoor-exposed sound sources has been predicted with the Datakustik CadnaA sound propagation program. CadnaA is a commercially available software program for the calculation, presentation, assessment, and prediction of environmental noise based on algorithms and reference data per International Organization of Standardization Standard 9613-2, "Attenuation of Sound During Propagation Outdoors, Part 2: General Method of Calculation" (ISO 1996). The following assumptions and parameters are included in this CadnaA-supported stationary noise source assessment:

- Ground effect acoustical absorption coefficient equal to 0.5, which intends to represent an average or blending of ground covers that are characterized largely by hard reflective pavements and existing building surfaces across the project site and the surroundings;
- Reflection order of 1, which allows for a single reflection of sound paths on encountered structural surfaces such as the modeled building masses;
- Off-site residential structures and the commercial buildings have not been rendered in the model;
- Calm meteorological conditions (i.e., no wind) with 68 degrees Fahrenheit and 50% relative humidity; and
- All of the modeled noise sources are operating concurrently and continuously for a minimum period of 1 hour.

As analyzed in Appendix G, aggregate noise emission from continuously operating outdoor-exposed rooftop HVAC units is expected to range between 20 to 36 dBA hourly L_{eq}, which is below the City's exterior noise Threshold of 60 dBA L_{eq} for commercial land uses and below the proposed Specific Plan Threshold of 65 dBA L_{eq} at the site boundary. Additionally, aggregate project noise emission from the combination of this anticipated building HVAC noise and a "large" in-progress outdoor event attended by 100 people at the planned event area is expected to range between 25 to 60 dBA hourly L_{eq}, which is below the Specific Plan Threshold of 65 dBA L_{eq} at the site boundary. Given that such a large attended outdoor event is predicted to be compliant, one can reasonably assume that an HVAC-plus-event noise emission associated with "small" outdoor events that may occur locally around distinct project buildings would, on the basis of smaller event attendance having less acoustical contribution due to average speech levels, also be compliant with this Specific Plan standard.

Therefore, noise impacts associated with stationary operations related to rooftop HVAC equipment would be less than significant.

b) Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Less-than-Significant Impact. Construction activities may expose persons to excessive groundborne vibration or groundborne noise, causing a potentially significant impact. Caltrans has collected groundborne vibration information related to construction activities (Caltrans 2020). Information from Caltrans indicates that continuous vibrations with a PPV of approximately 0.2 ips is considered annoying. For context, heavier pieces of construction equipment, such as a bulldozer that may be expected on the project site, have peak particle velocities of approximately 0.089 ips PPV or less at a reference distance of 25 feet (FTA 2018).

Groundborne vibration attenuates rapidly, even over short distances. The attenuation of groundborne vibration as it propagates from source to receptor through intervening soils and rock strata can be estimated with expressions found in Federal Transit Administration and Caltrans guidance. As outlined in Section 5 of Appendix G, PPV_{rcvr} is the predicted vibration velocity at the receiver position, PPV_{ref} is the reference value at 25 feet from the vibration source (the bulldozer), and D is the actual horizontal distance to the receiver. Therefore, at this predicted PPV, the impact of vibration-induced annoyance to occupants of nearby commercial buildings would be less than significant.

Construction vibration, at sufficiently high levels, can also present a building damage risk. However, anticipated construction vibration associated with the proposed project would yield levels of 0.16 ips PPV, which does not surpass the guidance limit of 0.3 ips PPV for preventing damage to older residential structures (Caltrans 2020). Because the predicted vibration level at 30 feet is less than this guidance limit, the risk of vibration damage to nearby structures is considered less than significant.

Once operational, the proposed project would not be expected to feature major producers of groundborne vibration. Anticipated mechanical systems like heating, ventilation, and air-conditioning units are designed and manufactured to feature rotating (fans, motors) and reciprocating (compressors) components that are well-balanced with isolated vibration within or external to the equipment casings. On this basis, potential vibration impacts due to proposed project operation would be less than significant.

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Less-than-Significant Impact. There are no private airstrips within the vicinity of the project site. The closest airport to the project site is the McClellan Palomar Airport, approximately 5 miles west of the site. According to the McClellan-Palomar Airport Land Use Compatibility Plan (SDCRAA 2011) the project site is not located within a noise exposure contour and would therefore not expose people residing or working in the project area to excessive noise levels. Impacts from aviation overflight noise exposure would be less than significant.

2.14 Population and Housing

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XIV. POPULATION AND HOUSING – Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

a) Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Less-than-Significant Impact. As previously described, the proposed project would consist of the construction of 102 multifamily residential units, 7 live-work units, 7,658 sf of office space, 49,266 sf of specialty retail space, and associated open space and parking improvements on an 11.07-acre project site. Residential units would be contained within 15 townhome buildings, and units would be a mix of six different unit types, ranging in size from two to three bedrooms. The project proposes a General Plan Amendment and Rezone to change the General Plan designation and Zoning from Commercial (C) to Specific Plan Area (SPA) to allow for its residential, commercial, and open space components.

As of 2022, the City has a persons per household ratio of 3.01 (DOF 2022). As such, the project's 109 residential dwelling units (inclusive of the 7 live-work units) would generate approximately 328[2] residents. Although not all residents of the project would be new to the City, residential development at the project site would be considered unplanned growth, as a residential land use at the project site is not accounted for in the City's Zoning or General Plan land use designation.

Development of the project, however, is unlikely to directly induce substantial population growth in the area. This is because the area surrounding the project site is already developed. Additionally, because the proposed project site is currently developed and includes existing access roads and utility service, no indirect impacts associated with the extension or construction of roads or expansion of public utilities are expected to occur as a result of the proposed project.

The City is forecasted to grow from 98,915 persons in 2020 to 109,095 persons in 2035, resulting in a population increase of 10,180 (SANDAG 2013). Additionally, SANDAG allocated 3,116 housing units to the

[2] 3.01 x 109 = 328.09

San Marcos area for the 2021-2029 Housing Element Cycle (City of San Marcos 2021). Therefore, the population growth associated with the project is well within the City's anticipated population growth. The implementation of the project would help to accommodate the City's expected population growth and help meet its housing needs goal.

The proposed project would be subject to compliance with the City's General Plan Housing Element goals and policies, compliance with housing-related ordinances in the City's Municipal Code, and would be subject to applicable development fees, as outlined below.

The City's Growth Management Ordinance (Chapter 20.315 of the Municipal Code) was adopted to implement the General Plan and to manage the projected growth of residential, industrial, and commercial development. The ordinance requires that all new development bear the cost of providing the public facilities and services needed to effectively serve the new development. The Growth Management Ordinance does not limit density of development or cap the number of residential building permits that can be issued within the planning period. To the contrary, the ordinance will ensure that public facilities and services are, or will be, provided to serve future residential development anticipated by the Regional Housing Needs Assessment.

The City's Inclusionary Housing Ordinance, established in May 2000, requires housing developers of one or more units to contribute to housing for extremely low, very low-, low-, and moderate-income households as defined by the U.S. Department of Housing and Urban Development. Developers of for-sale single family projects and rental projects of six or fewer units may pay an in-lieu fee in accordance with Section 20.310.050 of the Municipal Code. In-lieu fees are deposited into an interest-accruing account to provide housing opportunities for target households. The City has the discretion to accept an irrevocable dedication of land or other non-monetary contribution that is not less in value than the otherwise required in-lieu fee if the non-monetary alternative furthers the goals and policies of the Housing Element.

The City charges fees to process plans submitted for residential projects and to finance the provision of important services that are needed to accommodate housing and population growth. Fees and exactions are used to finance public facilities, roadways, water and sewer infrastructure, schools, and other community services. Nearly all of these fees are assessed through a pro rata share system, based on the magnitude of the project's impact or the extent of the benefit that will be derived. The City's fees have not been found to act as a constraint to the development of housing in San Marcos. For new residential projects, developers in San Marcos may be required to pay one or more of the following fees depending on the location, type, and size of the project: Planning, Building and Environmental Fees; City Impact Fees; and Regional Impact Fees (City of San Marcos 2013).

In summary, implementation of the project would change the site's land use designation and zoning from Commercial to Specific Plan Area in a manner that would accommodate development of 109 residential units, 7,658 sf of office space, 49,266 sf of specialty retail space, and associated open space and parking improvements. The project is anticipated to generate approximately 328 residents, which is well within the City's projected population growth. Additionally, while residential uses are not currently accounted for under the City's existing zoning and general plan land use designation, the addition of 109 residential units would help the City to reach its goal of 3,116 new residential units by 2029. Furthermore, the project would not induce substantial population growth in the vicinity of the project site because the area is developed with existing roads and utilities. Therefore, no indirect impacts associated with the extension or construction of roads or other infrastructure is expected to occur as a result of the project. City requirements for funding

and pre-planning for implementation of housing projects would also ensure that proposed project growth is adequately planned for prior to development. As such, for the reasons described above, the project's impacts associated with substantial unplanned population growth would be less than significant.

b) ***Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?***

No Impact. Given that no residential uses are located on the project site, the project would not displace existing housing, nor would it impede future residential development potential. The project site is currently vacant and does not contain any business or residential uses. Therefore, no impacts associated with the displacement of people or housing would occur.

2.15 Public Services

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XV. PUBLIC SERVICES – Would the project:				
a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:				
Fire protection?	☐	☐	☒	☐
Police protection?	☐	☐	☒	☐
Schools?	☐	☐	☒	☐
Parks?	☐	☐	☒	☐
Other public facilities?	☐	☐	☒	☐

a) ***Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:***

Fire protection?

Less-than-Significant Impact. Fire and Emergency Medical Services in the City are provided by SMFD. SMFD Station 1, located at 180 West Mission Road (approximately 1.25 miles east of the project site), would which provide primary response to the project site, and SMFD Station 2, located at 1250 South Rancho Santa Fe Road (approximately 2.15 miles southwest of the project site) would provide additional support as necessary.

The project would result in the development of 109 multifamily residential units, 7,658 sf of office space, and 49,266 sf of retail space. As outlined in Section 2.14, Population and Housing, the project's residential component is expected to house approximately 328 residents. Under existing conditions, the project site is

currently primarily vacant and is developed with paved areas and billboards. As such, the proposed project would increase the demand for SMFD resources when compared to existing conditions, as the project would result in an increase in calls for fire and emergency medical calls on the project site.

As previously discussed, however, the project would not result in substantial unplanned population growth. As such, the project is not anticipated to result the need for new facilities or physically altered facilities related to fire protection services. Furthermore, pursuant to Section 17.44.030 of the City's Municipal Code, the project's developer would be required to pay the City's Development Services Fees, which would be used to fund City services, including SMFD. This would offset the costs of increased personnel or equipment that could be required to maintain acceptable service ratios, response times, and other performance objectives under project conditions. Furthermore, the project would be designed and constructed in accordance with all appliable provisions of the state and local fire code. As such, for the reasons described above, the project's impacts on fire protection services would be less than significant.

Police protection?

Less-than-Significant Impact. The City contracts with the San Diego County Sheriff's Department for law enforcement services (City of San Marcos 2022a). The San Diego County Sheriff's San Marcos Station is located at 182 Santa Place, approximately 2.1 miles east of the project site.

The project would result in the development of 109 multifamily residential units, 7,658 sf of office space, and 49,266 sf of retail space. As outlined in Section 2.14, the project's residential component is expected to house approximately 328 residents. Under existing conditions, the project site is currently vacant and is developed with paved areas and billboards. As such, the proposed project would increase the demand for police services when compared to existing conditions, as the project would result in an increase in police calls to the project site.

Implementation of the proposed project would be expected to increase the frequency of emergency and non-emergency calls to the Sherriff's Department. However, over 100 deputies, volunteers, and professional staff serve the residents of the City (SDCSD 2022). Law enforcement services include general patrol, criminal investigation, crime prevention, juvenile services, narcotics and gang investigations, communications and dispatch, and various management support services. Unlike fire services, which respond solely to emergencies, law enforcement services consist of patrolling large areas 24 hours a day, 365 days a year. Police units are continuously mobile, and service calls are responded to by the nearest available mobile unit. At the San Marcos Station, patrol deputies are assigned to a geographical "beat" area, allowing deputies to become familiar with citizens and problems within their "beats" (City of San Marcos 2012b).

As previously discussed, the proposed project would not result in substantial unplanned population growth. As such, the project is not anticipated to result the need for new facilities or physically altered facilities related to police protection services. Furthermore, pursuant to Section 17.44.030 of the City's Municipal Code, the project's developer would be required to pay the City's Development Services Fees, which would be used to fund City services, including the Sheriff's Department. This would offset the costs of increased personnel or equipment that may be required to maintain acceptable service ratios, response times, and other performance objectives under project conditions. As such, service ratios and response times are anticipated to remain adequate with implementation of the proposed project, and the proposed project is not expected to affect police protection such that new or physically altered governmental facilities are

needed. Therefore, for the reasons outlined above, the project's impacts on police protection services would be less than significant.

Schools?

Less-than-Significant Impact. Public education throughout the City is provided by the San Marcos Unified School District (SMUSD). The project site is in the service area of La Mirada Academy (approximately 0.85 miles west of the project site) which serves grades K-8, and San Marcos High School (approximately 1.15 miles southwest of the project site) which serves grades 9-12. According to the City's General Plan Land Use and Community Design Element, the City's generation rates for SMUSD students per household are as follows: elementary school students (grades K–5): 0.2297 per household, middle school students (grades 6–8): 0.0993 per household, and high school students (grades 9–12): 0.1234 per household (City of San Marcos 2012c). As such, the project's 109 residential units would result in the generation of approximately 25 elementary school students, 11 middle school students, and 13 high school students. These contributions to the existing district's enrollment would be nominal and would not result in the need for new or physically altered school facilities.

The project's developer would also be required to contribute development fees to SMUSD pursuant to California Education Code Section 17620 et seq. and Government Code Sections 65995(h) and 65996(b), as well as the City's Municipal Code Section 17.52.050. The current school fee for residential development required by SMUSD is $4.79 per sf for residential development and $0.78 per sf for commercial development; however, this fee is subject to change between the drafting of this document and the issuance of a building permit (SMUSD 2022). Furthermore, consistent with General Plan Policy LU-11.2, the project's developer would be required to provide a "will serve" letter substantiating that the develop has paid the required school fees prior to the issuance of a building permit. These fees would offset the costs of increased personnel or equipment that SMUSD to continue to provide an adequate level of service under project conditions. Therefore, for the reasons described above, the project's impacts associated with public school services would be less than significant.

Parks?

Less-than-Significant Impact. As previously described, the proposed project would result in the addition of approximately 328 residents in the City. This increase in residents would increase demands for neighborhood and regional parks and other recreational facilities. The addition of 328 residents, however, would be a nominal contribution to the City. Therefore, the proposed project is not anticipated to result in the need for new or physical altered park facilities. Additionally, the project's developer would be required to pay a Park and Recreational Development Construction Unit Fee, pursuant to Section 17.36.030 of the City's Municipal Code. These fees would be used for public park improvements, to ensure the City is able to provide an adequate level of parks and recreational services under project conditions. The proposed project would also include a number of on-site recreational amenities to help offset the project's contribution to the demand for public parks and recreational facilities. Therefore, the project's impacts on park facilities would be less than significant. For further discussion on the project's impacts on the City's recreational services, refer to Section 2.16, Recreation, below.

Other public facilities?

Less-than-Significant Impact. Other public facilities provided within the City include library services. Library services within the City are provided by the San Diego County Library system. The San Marcos Branch, located at 2 Civic Center Drive, is located approximately 1.4 miles east of the project site. The project's addition of 328 residents would increase the demand for library services in the City. This increase, however, would be nominal and would not result in the need for new or physically altered library facilities. Additionally, as described in the Section 9.08.020 of the City's Municipal Code, library services are considered a component of the City's parks and recreation services. Therefore, a portion of the development fees that would be paid pursuant to Section 17.36.030 of the City's Municipal Code, would be dedicated toward the improvement of existing library services. As such, the proposed project's impacts on library services would be less than significant.

2.16 Recreation

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XVI. RECREATION				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☒	☐
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☒	☐

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Less-than-Significant Impact. The City provides nearly 290 acres of existing parkland including 24 community parks, 13 neighborhood parks, and 3 recreation centers. The City also provides a 70-mile trail network for hiking, biking, running, and equestrian use (City of San Marcos 2022b). The parks nearest to the project site is Mission Sports Park, located approximately 0.35 miles northeast of the project site.

As described in Section 2.14, the project is expected to result in the generation of approximately 328 residents in the City. While this would result in an increase in the demand for recreational facilities, this increase, however, would be nominal and would not result in the need for new or physically altered park or recreational facilities.

The proposed project would include approximately 80,767-sf of common open space area including recreational amenities such as a pool, BBQ area, walking path adjacent to Las Posas Creek, and other

amenities spread throughout the Planning Area. Individual units would have the benefit of private open space ranging from 95-sf to 255-sf with a total of 14,899-sf of private open space provided throughout the West-End Planning Area dwelling units. These on-site amenities would help to offset a portion of the project's demand for off-site parks and recreational facilities. Additionally, as stated it Section 2.15, Public Services, the project's developer would be required to pay a Park and Recreational Development Construction Unit Fee, pursuant to Section 17.36.030 of the City's Municipal Code. These fees would be used for public park improvements, to ensure the City is able to provide an adequate level of parks and recreational services under project conditions. Therefore, for the reasons described above, the project's impacts on existing neighborhood and regional parks would be less than significant.

*b) **Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?***

Less-than-Significant Impact. The project site is vacant with no existing recreational facilities on or near the project site. As mentioned above, the proposed project would include approximately 80,767-sf of common open space area including recreational amenities such as a pool, BBQ area, walking path adjacent to Las Posas Creek, and other amenities spread throughout the Planning Area. These on-site amenities would be within the project site and included in the project's design. Any potential environmental impacts related to the construction and operation of these on-site recreational amenities are analyzed in this IS/MND as part of the impact assessment conducted for the entirety of the project. No adverse physical impacts beyond those already disclosed in this document would occur as a result of implementation of the project's on-site recreational facilities. Therefore, impacts associated with the construction or expansion of recreational facilities would be less than significant.

2.17 Transportation

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XVII. TRANSPORTATION – Would the project:				
a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?	☐	☐	☒	☐
b) Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?	☐	☒	☐	☐
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☒	☐
d) Result in inadequate emergency access?	☐	☐	☒	☐

The section is based on the Local Transportation Analysis (LTA) and the Vehicle Miles Traveled (VMT) Analysis Technical Memorandum, prepared by CR Associates in March 2023. These reports are included as Appendix H-1

and H-2, respectively. The traffic study area included signalized and unsignalized intersections along and adjacent to the project site, site access driveways, and any classified (non-residential) roadway segments that are linked to the intersections that are being studied. A complete list of intersections and roadway segments are provided in Appendix H-1.

The transportation impact analysis prepared for the proposed project is consistent with the objectives and requirements of the City of San Marcos's General Plan Mobility Element and applicable provisions of CEQA, including disclosure of project impacts in both existing and cumulative horizon years.

a) Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Less-than-Significant Impact. The project site is located at the southeast corner of Grand Avenue and Linda Vista Drive with Grand Avenue to the north and Linda Vista Drive to the east and south. Adjacent land uses include commercial and industrial uses to the north, east, south, and west of the project site. The closest freeway is SR-78 located approximately 100 feet northeast of the project site.

Access to the project from the regional transportation network will be provided via SR-78, Grand Avenue, Linda Vista Drive, Via Vera Cruz, South Las Posas Road, and West San Marcos Boulevard. These facilities will either provide a direct connection to the project, via a project driveway, or will provide a critical link between the project and the regional transportation network.

Project site access would be provided via the following new project driveways:

- Project Driveway #1 would be along the south side of Grand Avenue approximately 900 feet northwest of Linda Vista Drive. This driveway would be a new side-street stop-controlled intersection with Grand Avenue as the uncontrolled approach and the project driveway as the stop-controlled approach. This driveway would serve as the main entry point for residents.
- Project Driveway #2 would be located along the south side of Grand Avenue approximately 300 feet northwest of Linda Vista Drive. This driveway would be a new side-street stop-controlled intersection with Grand Avenue as the uncontrolled approach and the project driveway as the stop-controlled approach. This driveway would serve as one of three entry points for the retail and office components of the project.
- Project Driveway #3 would be located along the north side of Linda Vista Drive approximately 700 feet southwest of Grand Avenue. This driveway would be a new side-street stop-controlled intersection with Linda Vista Drive as the uncontrolled approach and the project driveway as the stop-controlled approach. This driveway would serve as one of three entry points for the retail and office components of the project.
- Project Driveway #4 would be located along the north side of Linda Vista Drive approximately 250 feet southwest of Grand Avenue. This driveway will be a new side-street stop-controlled intersection with Linda Vista Drive as the uncontrolled approach and the project driveway as the stop-controlled approach. This driveway will serve as one of three entry points for the retail and office components of the project.

As discussed above, an LTA (see Appendix H-1) has been prepared for the project consistent with City requirements to evaluate the effects of the project on the circulation network, and improvements have

been recommended that would increase performance of unacceptable roadways/intersections to acceptable or pre-project conditions.

The proposed project is consistent with SANDAG's San Diego Forward: The Regional Plan policies and strategies to manage congestion, as it would develop in an infill area, and the project would incorporate safe access to/from the project site and surrounding roadways. The proposed project would also not preclude the development of any specific improvement projects identified in the Regional Plan to reduce regional congestion.

The project site is within 0.5 miles of the transit lines serviced by North County Transit District described below:

- Bus Route 347 – This bus route is serviced along West Mission Road and North Las Posas Road within the project study area. This bus route connects the Palomar College Transit Center to the CSU San Marcos SPRINTER Station. Operations starts at 5:31 a.m. and ends at 7:21 p.m. between Monday and Friday with 30-minute intervals. On Saturdays, operations start at 7:22 a.m. and ends at 7:08 p.m. with 60-minute intervals. This route does not operate on Sundays.
- Bus Route 445 – This bus route is serviced along West Mission Road and North Las Posas Road within the project study area. This bus route connects the Palomar College Transit Center to the Carlsbad Poinsettia Station (COASTER Connection). Between Monday and Friday, operations start at 6:34 a.m. and ends at 10:19 a.m. with 30-minute intervals for the morning period. Similarly, between Monday and Friday, operates start at 3:36 p.m. and ends at 7:19 p.m. with 30-minutes intervals for the afternoon period. This route does not operate on Saturdays or Sundays.
- SPRINTER – This light rail line runs between Oceanside Transit Center and Escondido Transit Center (eastbound and westbound direction). The nearest stop to the project site is the Palomar College Transit Center. Operation starts at 4:17 a.m. and ends at 9:10 p.m. between Monday and Sunday with 30-minute intervals.

Based on the preliminary review of the project site plan, the project would not conflict with existing or planned transit, bicycle, or pedestrian facilities and would not result in any impacts to transit facilities.

Under existing conditions, there are no Class II bicycle facilities along project frontage. However, per the City of San Marcos General Plan, there are planned Class II bicycle facilities along the segments of Grand Avenue and Linda Vista Drive fronting the project. The project would construct a landscape buffer and a Class IV bike path with a separate pedestrian path adjacent to it at its project frontage along the segments of Linda Vista Drive and Grand Avenue.

The proposed Class IV bike path along Grand Avenue would transition the current on-street bike facilities on Grand Avenue to a physically separated bike lane within the multi-purpose trail component for the Specific Plan Area. These improvements would facilitate a safer bicycle lane along the project's frontage and help facilitate a safer and more connected bicycle network city-wide. The Class IV bike lane planned for Linda Vista Drive is consistent with the General Plan Mobility Element's call for at least a Class II bike lane. The Class IV bike lane would separate bicyclists from vehicles with a physical barrier incorporated in the planned multi-purpose trail along the frontage and transitioning back to the on-street bike lane south of the project. Therefore, the project would not conflict with existing or planned bicycle facilities.

Public sidewalks are proposed along the segments of Grand Avenue and Linda Vista Drive fronting the project. Sidewalks are also proposed throughout the internal roadways providing direct access to dwelling units, office and commercial buildings, and other on-site amenities.

Additionally, the project would reconstruct curb ramps located along project driveways, including detectable surface warning tactiles (yellow truncated domes). Implementation of the recommendation above should enhance the walkability and safety of the overall pedestrian environment, and reduce potential impacts to pedestrian facilities.

The project would not be inconsistent with any program, plan, or policy related to the above-mentioned goals nor would it preclude the City from implementing adopted transportation-related programs, plans, or policies. Additionally, since SB 743 went into effect, analysis of traffic congestion based on the level of service (LOS) metric is not part of the CEQA impact assessment. However, the City requires separate LOS-based traffic analysis to demonstrate that the traffic added by the project would maintain mobility performance goals outlined in the City's General Plan. As such, the LOS-based traffic study was submitted to the City under separate cover for review and approval (Appendix H-1).

The project would not conflict with any plans or policies regarding existing or proposed bicycle or pedestrian facilities in the study area and would be consistent with the City's General Plan Mobility Element, included in the General Plan Consistency Analysis within Appendix A. As discussed above, the project would not conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities, and impacts would be less than significant.

b) Would the project conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?

Less-than-Significant Impact with Mitigation Incorporated. On September 27, 2013, SB 743 was signed into law, which creates a process to change the way that transportation impacts are analyzed under CEQA. SB 743 required the Governor's Office of Planning and Research to amend the CEQA Guidelines to provide an alternative to LOS for evaluating transportation impacts. Under the new transportation guidelines, LOS, or vehicle delay, will no longer be considered an environmental impact under CEQA. The Governor's Office of Planning and Research recommended VMT as the most appropriate measure of project transportation impacts for land use projects and land use plans. The updates to the CEQA Guidelines required under SB 743 were approved on December 28, 2018.

The Updated CEQA Guidelines state that "generally, vehicle miles traveled (VMT) is the most appropriate measure of transportation impacts" and define VMT as "the amount and distance of automobile travel attributable to a project." It should be noted that "automobile" refers to on-road passenger vehicles, specifically cars and light trucks. Heavy-duty truck VMT could be included for modeling convenience and ease of calculation (for example, where models or data provide combined auto and heavy truck VMT). Other relevant considerations may include the effects of the project on transit and non-motorized travel.

On November 16, 2020, the City adopted its Transportation Impact Analysis Guidelines (TIAG). The following sections describe the analysis methods outlined in the City's TIAG to describe how transportation related impacts are analyzed and identified in relation to VMT. Additionally, per the City TIAG, analysis methods are described to evaluate the traffic effect as a result of the proposed project in relation to LOS.

The City's TIAG provide screening criteria to screen out VMT based on project size, location, provision of affordable housing, and transit availability. The City uses screening Thresholds to quickly identify when a project should be expected to cause a less-than-significant impact without conducting a detailed VMT study. Relevant screening criteria for the proposed project is described below:

- Small Projects – Projects that generate fewer than 110 daily vehicle trips can be presumed to cause a less-than-significant transportation impact and would not require a detailed VMT analysis. Trips should be calculated using SANDAG trip generation rates (or other sources if an applicable SANDAG rate is not available).
- Map-Based Screening for Residential a–d Office Projects - Residential and office projects located in areas that generate VMT below adopted City Threshold can be presumed to have a less-than-significant transportation impact. This determination must be made by SANDAG's online residential and employment VMT maps for existing year or model baselines year VMT (whichever is available at the time analysis is being conducted), which show census tracts in the city where the VMT is below the regional average.
- Local-Serving Retail and Public Facilities – Retail projects that are 50,000 sf gross floor area or less can be presumed to have a less-than-significant transportation impact and would not require a detailed VMT analysis. Retail can include shopping centers as well as standalone uses such as commercial shops, gas stations, and restaurants. This screening criteria applies to the entirety of a retail project; it would not be applied to multiple tenants at a retail site separately. For a mixed-use project, this screening criteria should be applied to the retail/commercial component separately to determine if that portion of the project screens out of a detailed VMT analysis.

Since the project would be composed of a mix of land uses, each component was evaluated independently per land use type. The screening criteria evaluation for each component is detailed below.

- Residential Component – Per Section 2.1.2.5 of the City's TIAG, the project is located in an efficient VMT/capita area. Therefore, the residential component of the project is deemed to have a less-than-significant impact and no further VMT analysis is required.
- Office Component – Per Section 2.1.2.5 of the City's TIAG, the project's office component is not located in an efficient VMT/employee area. Therefore, the office component of the project would not be screened out from completing detailed VMT analysis.
- Retail Component – Per Section 2.1.2.3 of the City's TIAG, the project consists of less than 50,000 sf of retail and considered "local-serving retail." Therefore, the retail component of the project is to have a less-than-significant impact and no further VMT analysis is required.

The project's VMT per employee was obtained from the SANDAG VMT screening map. Per the City's TIAG, an employee project is determined to have a significant impact if the project generates VMT per employee greater than 85% of the regional average. The regional average VMT per employee was determined using the SANDAG Series 14 ABM2+/2021 RP Year 2016 Base Year model. As outlined in Appendix H-2, the project (office component) is anticipated to generate a VMT per employee of 16.80 miles, which exceeds the significance Threshold of 16.07 miles. Therefore, the project would have a significant VMT impact and mitigation measures are required to reduce VMT per employee.

The project's (office component) VMT per employee is not anticipated to fall under the significant Threshold as the project site is located in an area primarily composed of industrial and commercial land uses where

employees travel longer-than-average distances for work compared to the region. As noted above, the project would have a significant VMT impact for the office component and mitigation measures are required to reduce the VMT per employee. The project's total VMT per employee is 16.80 miles. To mitigate the project's VMT to less-than-significant levels, mitigation measures would need to reduce the total VMT per employee by 4.4% from 16.80 miles to 16.07 miles.

To reduce the average VMT per employee, the project would implement **MM-TRA-1**, a Transportation Demand Management Program. A Transportation Demand Management Program would facilitate increased opportunities for walking and bicycling, as well as provide the resources, means, and incentives for ridesharing and carpooling. The California Air Pollution Control Officers Association Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity was taken into consideration initially; however, the SANDAG Mobility Management Guidebook/VMT Reduction Tool was determined more appropriate as it identifies several measures that specifically target employee VMT.

MM-TRA-1 would satisfy the "1A-Voluntary Employer Commute Program-5.4% employee VMT reduction with 100% employee eligibility" SANDAG VMT Reduction tool measure. Table 2.17-1, Project VMT Mitigation, summarizes the project's trip reductions and mitigation results.

Table 2.17-1. Project VMT Mitigation

VMT/Employee	Threshold	Mitigation Measures (% Reduction)	VMT/ Employee Reduction	Net VMT/ Employee	Mitigated?
16.80	16.07	SANDAG 1A (-5.4%)	-5.4%	15.89	Yes

Source: Appendix H-2.

Based on the VMT reduction results, implementation of MM-TRA-1 is anticipated to reduce the VMT per employee generated by 5.4%. Thus, with the implementation of MM-TRA-1, the project is anticipated to generate 15.89% VMT per employee, which does not exceed the 16.07 Threshold. Therefore, since the MM-TRA-1 would reduce the VMT per employee to less-than-significant levels, the impact is mitigated, and the project is considered to have a less-than-significant impact with mitigation incorporated.

c) Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less-than-Significant Impact. The proposed project would be developed within the vacant and highly disturbed, previously developed property, with the addition of roadway modifications, sidewalk improvements, and driveways. The project site is located in an area surrounded by development, off Grand Avenue and Linda Vista Drive. As described within Section 2.17(a), the project would be served by four driveways.

As outlined in Appendix H-1, the project would not impede traffic at the driveways or adjacent roadway system. The LTA recommends that that the project driveways are constructed in accordance with City standards, and that stop signs are installed at project driveways (Appendix H-1).

All final project plans and the LTA prepared for the project (included as Appendix H-1) are subject to review and approval by the City and the San Marcos Fire Department. Proposed circulation improvements per the LTA would be designed in accordance with the City's roadway design standards to ensure proper safety

requirements are met (Appendix H-1). These proposed circulation improvements are part of the proposed project's design. All uses on-site, including vehicle, pedestrian and bicycle circulation would be typical of such a development, and no incompatible uses, or equipment are proposed. Further, the proposed project is a mixed-use development with residential and commercial uses and would not result in land uses that would be incompatible with the existing land uses surrounding the project site. Therefore, impacts regarding increases in hazards due to geometric design features or incompatible uses would be less than significant.

d) Would the project result in inadequate emergency access?

Less-than-Significant Impact. As described in response to Threshold c), the project would be served by two driveways located on Grand Avenue and two driveways located on Linda Vista Drive. All driveways would provide for full turning movements. According to the General Plan Safety Element, the San Marcos Emergency Operations Plan governs the operations of the City during a disaster. This plan addresses response to moderate evacuation scenarios, including the identification of evacuation points and general routes (City of San Marcos 2012b). The project would be required to abide by standards as set forth in the San Marcos Emergency Operations Plan. Implementation of the project would not impact any roadway or staging areas that are identified in any emergency planning documents and would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

Furthermore, the California Fire Code, along with the San Marcos Fire Department, administers the rules and regulations on fire access design. Final site plans will be required to show fire and emergency responders suitable fire access roads dimensions and surfaces (Chapter 5, Section 503.1 through Section 503.4 of the California Fire Code), an adequate number of emergency rated entrances to the community (Appendix D, Section D106 of the California Fire Code. All final project plans and the Traffic Impact Analysis prepared for the project are subject to review and approval by the City and the San Marcos Fire Department. Proposed circulation improvements would be designed in accordance with the City's roadway design standards to ensure proper safety requirements are met (Appendix H-1). Therefore, for the reasons outlined above, it is determined that impacts related to emergency access would be less than significant.

Mitigation Measures

MM-TRA-1 Transportation Demand Management (TDM) Program. To reduce the average VMT per employee, the property manager of the office component of the project shall provide transit information to the tenants as well as offers for transit passes or subsidizes transit fares. Rideshare and micro mobility parking shall be provided on site, as well as bicycle racks. Tenants within the office areas will be encouraged to implement telecommuting, flexible work schedules, and/or compressed work weeks. Additionally, a preferential parking permit program shall be implemented.

2.18 Tribal Cultural Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XVIII. TRIBAL CULTURAL RESOURCES				
Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or	☐	☐	☒	☐
b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1? In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	☐	☒	☐	☐

The evaluation of potential impacts to Tribal Cultural Resources (TCRs) is based on the findings resulting from tribal consultation conducted by the City, as the lead agency, as well as the findings of the Cultural Resources Phase I Inventory Report conducted by Dudek in December 2022 (Appendix D).

Senate Bill 18

California SB 18, which took effect on March 1, 2005, requires local (city and county) governments to consult with California Native American tribes identified by the NAHC for the purpose of protecting, and/or mitigating impacts to cultural places in creating or amending general plans and specific plans (Government Code Section 65352.3).

The project is subject to compliance with SB 18 (Government Code Section 65352.3), requires local governments to invite California Native American tribal representatives to participate in consultation about proposed General Plan and Specific Plan adoptions or amendments. The City is considering an amendment to the General Plan and Specific Plan for the parcels within the project site and as such, initiated SB 18 consultation. All NAHC-listed California Native American Tribal representatives that have requested project notification pursuant to SB 18 were sent letters by the City on May 18, 2022, via mail. The notification letters contained a project description, request for consultation, and contact information for the appropriate lead agency representative.

Assembly Bill 52

AB 52 of 2014 amended California Public Resources Code Section 5097.94 and added California Public Resources Code Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3. AB 52 established that TCRs must be considered under CEQA and also provided for additional Native American consultation requirements for the lead agency. California Public Resources Code Section 21074 describes a TCR as a site, feature, place, cultural landscape, sacred place, or object that is considered of cultural value to a California Native American Tribe. A TCR is either:

- On the CRHR or a local historic register;
- Eligible for the CRHR or a local historic register; or
- A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of California Public Resources Code Section 5024.1.

AB 52 formalizes the lead agency–tribal consultation process, requiring the lead agency to initiate the opportunity for tribal consultation with California Native American groups that are traditionally and culturally affiliated with the project area, including tribes that may not be federally recognized. Lead agencies are required to begin consultation prior to the release of a negative declaration, MND, or EIR by contacting those tribal groups who have previously provided formal written request for notification of projects under the agency's jurisdiction.

Section 1 (a)(9) of AB 52 establishes that "a substantial adverse change to a tribal cultural resource has a significant effect on the environment." Effects on TCRs should be considered under CEQA. Section 6 of AB 52 adds Section 21080.3.2 to the California Public Resources Code, which states that parties may propose mitigation measures "capable of avoiding or substantially lessening potential significant impacts to a tribal cultural resource or alternatives that would avoid significant impacts to a tribal cultural resource." Further, if a California Native American tribe requests consultation regarding project alternatives, mitigation measures, or significant effects to TCRs, the consultation shall include those topics (California Public Resources Code, Section 21080.3.2[a]). Finally, the environmental document, for which the tribal consultation is focused, and the mitigation monitoring and reporting program (where applicable), developed in consideration of information provided by tribes during the formal consultation process, shall include any mitigation measures that are adopted (California Public Resources Code, Section 21082.3[a]).

The project is subject to compliance with AB 52 (California Public Resources Code, Section 21074), which requires consideration of impacts to TCRs as part of the CEQA process, and that the lead agency notify California Native American Tribal representatives (that have requested notification) who are traditionally or culturally affiliated with the geographic area of the proposed project. All NAHC-listed California Native American Tribal representatives that have requested project notification pursuant to AB 52 were sent letters by the City on May 3, 2022, via mail. The notification letters contained a project description, outline of AB 52 timing, an invitation to consult, a project site plan, and contact information for the appropriate lead agency representative.

Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

a) ***Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)?***

Less-than-Significant Impact. As described under Section 2.5, Cultural Resources, a SCIC records search and NAHC Sacred Lands File search were conducted for the project site. The SCIC and NAHC Sacred Lands File results identified one cultural resource within the project area, which consists of a historic-age trash scatter. As discussed in Section 2.5, this resource did not meet the eligibility requirements for listing on the NRHP under any criteria. Moreover, an additional 47 cultural resources were identified within the 1-mile buffer. A NAHC Sacred Lands File search was requested on October 10, 2022. The results were received on November 30, 2022, and the results were negative. Therefore, the project would not adversely affect TCRs that are listed or eligible for listing in the state or local register. Impacts would be less than significant.

b) ***A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1? In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.***

Less-than-Significant Impact with Mitigation Incorporated. The project is subject to compliance with AB 52 and SB 18 (California Public Resources Code, Section 21074), which requires consideration of impacts to TCRs as part of the CEQA process and requires lead agencies to provide notification of proposed projects to California Native American Tribal representatives that have requested such notifications. Outreach letters to all Native American group representatives included on the NAHC contact list were mailed out on May 3, 2022 as part of preparation of the Cultural Resources report to be completed for the project. To date, two (2) Tribes have requested consultation, including Rincon Band of Luiseño Indians on May 20, 2022; and San Luis Rey Band of Mission Indians on June 6, 2022. The City conducted the consultation meeting with representatives of the San Luis Rey Band of Mission Indians on June 1, 2023, and consultation with the San Luis Rey Band of Mission Indians was concluded on January 12, 2023. The City conducted the consultation meeting with representatives of the Rincon Band of Luiseño Indians on February 21, 2023, with consultation concluding on February 21, 2023. Both the San Luis Rey Band of Mission Indians and Rincon Band of Luiseño Indians concluded formal consultation with the understanding that the project would implement the City's standard tribal cultural resource mitigation measures. The project would implement these mitigation measures as outlined under MM-CUL-1 through MM-CUL-4 in Section 2.5 above. Consultation is pending completion with the San Pasqual Band of Mission Indians at this time, and the City requested a close-out letter from the San Pasqual Band of Mission Indians on May 15, 2023.

Implementation of **MM-CUL-1** through **MM-CUL-4**, as discussed in Section 2.5, would reduce the potential for impacts to TCRs to occur, should any resources be located within the site's subsurface. Therefore, impacts would be less than significant with mitigation incorporated.

2.19 Utilities and Service Systems

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XIX. UTILITIES AND SERVICE SYSTEMS – Would the project:				
a) Require or result in the relocation or construction of new or expanded water, waste water treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☐	☐	☒	☐
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?	☐	☐	☒	☐
c) Result in a determination by the waste water treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☒	☐
d) Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☐	☐	☒	☐
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☒	☐

The following analysis is based, in part, on the Preliminary Drainage Study and SWQMPs prepared for the project by Fuscoe Engineering LLC in March 2023, and on the Water and Sewer Study prepared by VWD in May 2023, which are included as Appendix I, J, K, and L, respectively, to this EIR.

a) ***Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?***

Less-than-Significant Impact. The project would not require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunication facilities for the reasons discussed in the following subsections.

Water Facilities

The project involves the construction of a 102-unit multifamily residential community, office space, and commercial space, which would increase demand for water supply on the project site. Water service would be provided by VWD, and there are existing water lines within Grand Avenue and Linda Vista Drive. The project site is within VWD's 855 Pressure Zone. The commercial portion of the project site would make two fire water connections, one in Grand Avenue and one in Linda Vista Drive. One domestic water line would connect at Grand Avenue. Water connections on the residential portion of site would be made to existing VWD water service lines underneath Grand Avenue. According to the VWD 2020 Urban Water Management Plan (UWMP), the anticipated demand for water supply within VWD's service area is anticipated to be greater than the demand for water in the future, which indicates that VWD has available capacity to serve the proposed project (see Section 2.19[b]). The project's nominal contribution to the total water demand could be served by existing water facilities serving the project area without requiring new or expanded facilities. Additionally, a Water and Sewer Study prepared for the project (Appendix L) concluded that although the project would increase the projected average water demand by approximately 28,967 gallons a day, the water storage capacity is available to serve the project's increased storage requirements. Therefore, impacts associated with the construction or expansion of water facilities would be less than significant.

Wastewater Treatment Facilities

Wastewater collection would be provided by VWD, and there are existing sewer lines within Grand Avenue and Linda Vista Drive. Existing 8-inch and 15-inch wastewater lines are located adjacent to the project site, which connect to larger pipelines in Las Posas Road (Appendix L). The commercial portion of the project site would gravity drain via proposed 8-inch sewer lines connecting to an existing public sewer main in Linda Vista Drive. A separate 8-inch grease wastewater line would be constructed in anticipation of the inclusion of restaurant uses within the commercial portion of the site and would gravity drain to an internal sewer line connection before continuing to the public sewer connection in Linda Vista Drive. Grease traps would be strategically located along the 8-inch grease wastewater line to capture grease from restaurants. Restaurants may be required to install additional grease traps during the tenant improvement process per City of San Marcos Building Code requirements. The residential portion of the project site would gravity drain via a proposed 8-inch sewer line to a public sewer connection on site. An existing 8-inch wastewater line located on the western property line will be abandoned and instead would gravity flow underneath proposed driveways to a connection on the adjacent property to the existing sewer line. A new 20-foot easement would be granted to VWD for the rerouted sewer line while VWD would maintain the rights to the existing 20-foot sewer easement through the site.

The VWD currently has a wastewater system that has a total liquids treatment capacity of 12.45 million gallons per day (MGD), and has an estimated maximum daily flow of approximately 9.54 MGD (City of San Marcos 2012c). VWD's award-winning Meadowlark Water Reclamation Facility (MRF) is capable of recycling up to 74% of the wastewater generated in VWD's service area. Built in 1961, MRF is located within the southwestern portion of VWD's service area in Carlsbad. The MRF treats wastewater to meet the stringent standards of California Title 22 and Waste Discharge Permit R9-2007-0018 issued by RWQCB Region 9.

Wastewater generated by the proposed project would be treated by the MRF. MRF has a capacity of 5 MGD, with a wet weather treatment capacity of 8 MGD, and treats wastewater at 0.25 MGD. It is expected that the MRF would be able to adequately treat wastewater flows from the proposed project, and therefore new

wastewater treatment facilities would not be needed. Additionally, a Water and Sewer Study prepared for the project (Appendix L) concluded that although the project would increase the projected wastewater generation by 21,097 gallons per day, there is capacity currently available to serve the proposed project.

Thus, the project would not require or result in the relocation or construction of new wastewater treatment facilities that would cause significant environmental effects. Therefore, impacts would be less than significant.

Stormwater Drainage Facilities

As described in Section 2.10, Hydrology and Water Quality, and as outlined in the "West" and "East" SWQMPs (Appendices J and K), the existing site consists of development areas that were previously commercial pads but have since been demolished. The channel was recently improved by the City, and the development area had new storm drains added to collect runoff from the pads and discharge into the improved channel. A bridge was constructed to link to the "West" and "East" sites.

In existing conditions, there are some subtle flow paths where the site drains to the storm drain outlets that were constructed as part of the channel improvements at nodes 200 and 400. The westerly third of the "West" site leads to a local depression near node 10 before spilling out onto the adjacent property to the west. The proposed development areas will be re-graded to ensure that the runoff is routed to the channel. The site has a system of concrete swales and storm drains to collect runoff and convey it to water quality basins and/or underground detention structures for hydromodification storage before being discharged to the channel at nodes 200, 400, and 1000.

The site has less defined flow paths on the "East" side. It appears that some of the site drains to the newly constructed storm drain at nodes 300, 700, and 900 while other parts may sheet flow over the side of the channel at nodes 600 and 800. The easternmost third of the proposed commercial site is very flat due to the concrete foundations that were left behind. While the flow paths are less definitive, it appears as though it generally flows out through the sheet flow onto Linda Vista Drive. There are storm drain inlets further south down Linda Vista Drive that discharge into the same channel that bisects the project, so any runoff that leaves the project site ultimately ends up in the same channel. The proposed development areas would be re-graded to ensure that the runoff is routed to the channel. Runoff would no longer be allowed to spill out onto the adjacent property to the south or out onto Linda Vista Drive. The proposed residential uses on the "West" site have a system of concrete swales and storm drains to collect runoff and convey it to water quality basins and/or underground detention structures for hydromodification storage being discharged to the channel at nodes 200, 400, and 1000. The proposed commercial uses on the "East" site have a similar pattern, except that there would be no underground detention, and a storm drain system that outlets to the channel at nodes 300, 700, and 900 would be implemented.

The storm drain system for the proposed project has been designed for the 100-year storm event. Through the use of on-site detention systems, the site has been designed so that the channel would see no increase in flow for the proposed condition. The proposed project would benefit the adjacent properties by eliminating potential vector control issues with localized ponding and re-routing flows that currently lead off-site or add to runoff in the street. In the proposed condition, those off-site runoffs would be captured, treated, for water quality, and safely released to the channel.

The proposed development areas will be re-graded to ensure that the runoff is routed to the channel. Runoff would no longer be allowed to spill out onto the adjacent property to the south or out onto Linda Vista Drive. The residential site has a system of concrete swales and storm drains to collect runoff and convey it to water quality basins and/or underground detention structures for hydromodification storage before being discharged to the channel at nodes 200, 400, and 1000. The commercial site has a similar system, except that there will be no underground detention. That side of the project will have a storm drain system that outlets to the channel at nodes 300, 700, 900. Proposed public improvements around the site would be treated by green street elements including trees.

All storm water runoff would be conveyed through on-site private storm water quality facilities and storm drain system. Although new stormwater drainage facilities would be constructed, these improvements are part of the project analyzed herein, and as such, any potential environmental impacts related to these components of the project are already accounted for in this IS/MND as part of the impact assessment conducted for the entirety of the project. No adverse physical effects beyond those already disclosed in this IS/MND would occur as a result of implementation of the project's stormwater drainage system improvements. Therefore, impacts associated with stormwater drainage facilities would be less than significant.

Electric Power Facilities

Electric power service would be provided to the project site by San Diego Gas and Electric. Any proposed above-ground transformers and electrical facilities that solely service the project site would be placed on-site and not within the City's right-of-way. If feasible, and at the discretion and concurrence from SDG&E, all existing aboveground utility poles along the project frontage on Grand Ave. would be undergrounded.

At full built-out, the project's operational phase would require electricity for building operations (appliances, lighting, etc.). In addition, the project would be required to comply with the 2016 Title 24 standards or the most recent standards at the time of building permit issuance. The energy-using fixtures within the project would likely be newer technologies, using less electrical power. Therefore, impacts associated with electrical power facilities would be less than significant.

Natural Gas Facilities

Natural gas would be provided by San Diego Gas and Electric. The project would comply with 2016 Title 24 building energy efficiency standards, reducing energy used in the state. Based on compliance with Title 24, the project would generate a need for natural gas that is consistent with multifamily homes, commercial and office uses. Therefore, impacts associated with natural gas facilities would be less than significant.

Telecommunications Facilities

The City is served by multiple telephone service providers. Since the project site is in an urbanized area and is nearby other residential uses, there are existing telecommunication facilities that would be able to serve the project site, including Cox Communications and AT&T. Once the project is completed, the residents of the project would be able to connect to existing telecommunication services without the need for expansion or construction of new facilities. Therefore, impacts associated with telecommunications facilities would be less than significant.

b) Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Less-than-Significant Impact. The project site would receive its water supply from the VWD. According to the City's General Plan, the VWD receives its water from MWD, which imports water from the Colorado River and Northern California (City of San Marcos 2012c).

MWD was formed in 1928 to develop, store, and distribute supplemental water to southern California for domestic and municipal purposes. MWD consists of 26 member agencies and has a service area covering six counties, 5,200 square miles, and approximately 19 million people. MWD obtains water from local sources as well as the Colorado River, via the Colorado River Aqueduct, and the Sacramento-San Joaquin Delta, via the State Water Project. MWD's UWMP documents the availability of these supplies to meet future demands. With a projected annual water demand of 4,925,000 acre-feet per year for 2025, the MWD UWMP concludes that, with implementation of required conservation measures, MWD has supply capabilities sufficient to meet expected demands through 2045 under normal, single dry, and multiple dry water years (MWD 2021).

In general, water demand tends to increase in dry years, primarily due to increased water activities such as landscape irrigation. Thus, to assess the reliability of their water supply service, every urban water supplier is required to assess its water service under normal, dry, and multiple-dry water years. Although the project site was not accounted for as a residential land use in the MWD's UWMP, the water demand generated by the project is expected to present an insignificant increase in water demand relative to the annual water demand projected by the MWD's UWMP.

Further, the project site would be developed in compliance with the California Green Building Code, which implements water efficiency standards for appliances and fixtures. Compliance with the California Green Building Code would further reduce project water usage in combination with VWD and MWD's ongoing water conservation practices. VWD requires a development-specific evaluation of water use to determine its ability to service any development and capacity fees to be paid. A "Water Availability" letter will be required for processing the proposed project (VWD 2021). Compliance with these regulations and conservation measures will ensure sufficient water supplies are available to service the proposed project. Impacts to water services would be less than significant.

c) Would the project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Less-than-Significant Impact. A significant impact would occur if the wastewater treatment provider indicates that a project would increase wastewater generation to such a degree that the capacity of the facilities currently serving the project site would be exceeded. As described in Section 2.19(a), wastewater generated at the project site would be treated at the MRF. MRF has a capacity of 5 MGD, with a wet weather treatment capacity of 8 MGD, and treats wastewater at 0.25 MGD. It is expected that the MRF would be able to adequately treat wastewater flows from the project, even with the additional wastewater flow that was not accounted for in the Land Outfall's capacity studied in the 2018 Master Plan (Appendix L). Therefore, impacts associated with wastewater treatment capacity would be less than significant.

d) Would the project generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Less-than-Significant Impact. A significant impact may occur if a project were to increase solid waste generation to such a degree that existing and projected landfill capacities would be insufficient to accommodate the additional solid waste.

Solid waste disposal in the City is provided by a private franchise hauler, EDCO Waste and Recycling (EDCO), a private waste collection and recycling company that handles all residential, commercial, and industrial collections within the City (City of San Marcos 2012c). Waste collected by EDCO is hauled to the Escondido Resource Recovery Transfer Station. Waste is then transported to the Sycamore Sanitary Landfill in Santee, while recyclable materials are processed at the Escondido Resource Recovery Transfer Station (City of San Marcos 2012c). The project site would be serviced by EDCO.

The Escondido Resource Recovery Transfer Station has a permitted daily maximum capacity of 3,223 tons. Solid waste is consolidated here and trucked to a landfill for disposal. The Sycamore Sanitary Landfill has a daily permitted throughput of 5,000 tons/day of solid waste, a remaining capacity of approximately 113,972,637 cubic yards, and an anticipated closure date of 2042 (CalRecycle 2022).

The project would result in the development of 109 multifamily residential units, 7,658 sf of office space, and 49,266 sf of retail space. Project construction would involve some generation of waste during demolition; however, in accordance with AB 939, the construction contractor would ensure that source reduction techniques and recycling measures are incorporated into project construction. Once operational, the project would result in waste typically associated with multifamily residences, commercial uses, and office space uses. According to the California Department of Resources Recycling and Recovery, multifamily residences generate approximately four pounds per dwelling unit per day, commercial uses generate approximately 10.53 pounds per employee per day, and office space uses generate approximately 1.24 pounds per employee per day (CalRecycle 2019).

Considering the project site was previously developed with commercial uses, and considering existing capacity of landfills in the project vicinity, the proposed project is expected to be adequately served by the El Sobrante and Badlands Landfill. In addition, the project would implement recycling and waste diversion programs consistent with City requirements. Solid waste generated by the project would not generate waste in excess of state or local standards. Therefore, impacts associated with landfill capacity would be less than significant.

e) Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Less-than-Significant Impact. The proposed project would be required to comply with all federal, state, and local statues and regulations related to solid waste, diversion of waste, and recycling. All solid waste facilities, including landfills, require solid waste facility permits to operate. In San Diego County, California Public Resources Code (Sections 44001–44018) and California Code of Regulations Title 27, Division 2, Subdivision 1, Chapter 4 (Section 21440 et seq.) authorizes the County Department of Environmental Health, Local Enforcement Agency to issue solid waste facility permits. Sycamore Sanitary Landfill is a permitted facility and EDCO is a licensed hauler. For these reasons, and the reasons stated above under Section 2.19(d), impacts related to solid waste as a result of project implementation would be less than significant.

2.20 Wildfire

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XX. WILDFIRE – If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☒	☐
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☒	☐
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☒	☐

a) Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?

Less-than-Significant Impact. The project site is not located within or adjacent to a state responsibility area or local responsibility area Very High Fire Hazard Severity Zone (CAL FIRE 2009). The project site is located within an urbanized and developed area of the City. Although the project site is on undeveloped land, this wildland is not in an area subject to high fire risk. The nearest VHRHSZ is a local responsibility area located approximately 0.7 miles southwest of the proposed project site (CAL FIRE 2009). As discussed in Section 2.9, Hazards and Hazardous Materials, the proposed project would be required to comply with all applicable state and local fire codes, including compliance with the California Fire Code and the San Marcos Fire Department, which require a design that affords fire and emergency responders suitable fire access roads dimensions and surfaces (Chapter 5, Section 503.1 through Section 503.4 of the California Fire Code). The proposed project would not substantially impair an adopted emergency response plan or emergency evacuation plan and, therefore, impacts are determined to be less than significant.

b) Due to slope, prevailing winds, and other factors, would the project exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

Less-than-Significant Impact. The proposed project site is located in a developed area of the City and is not located within or adjacent to a fire hazard severity zone. Although the project site includes native vegetation that could experience a relatively small-scale wildfire risk, the proposed project land uses would not exacerbate that risk. The preliminary site plans and emergency access for the proposed project will be reviewed by City Fire and would be in compliance with the Fire Code. It has been determined that the proposed project would not exacerbate wildfire risks, exposing occupants to pollutants and, therefore, impacts would be less than significant.

c) Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

Less-than-Significant Impact. While the proposed project would require the installation of water sources and other underground utilities to connect to the City's existing infrastructure (refer to Section 2.19), these would not exacerbate fire risks, as the proposed project is not located within or adjacent to a fire hazard severity zone and these improvements would be constructed within an existing right-of-way or within the project site boundary. The project does not propose any new overhead utility lines nor construction of roads to serve the project site. The proposed project would not require the installation or maintenance of such infrastructure which would exacerbate fire risk, and therefore, impacts are determined to be less than significant.

d) Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

Less-than-Significant Impact. The project is not located in a Very High Fire Hazard Severity Zone and risk of wildfire is considered low within the project site due the relative size of the habitat area and location. The Geotechnical Evaluation (Appendix E) also does not note any significant landslide risks based on the soil types. The project would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes. Therefore, impacts are determined to be less than significant.

2.21 Mandatory Findings of Significance

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XXI. MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?	☐	☒	☐	☐
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)	☐	☒	☐	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☐	☒	☐	☐

a) ***Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?***

Less-than-Significant Impact with Mitigation Incorporated. As described throughout this IS/MND, with the incorporation of the identified mitigation measures for biological, paleontological, and cultural resources, the project would not degrade the quality of the environment; would not substantially reduce the habitats of fish or wildlife species; would not cause a fish or wildlife population to drop below self-sustaining levels; would not threaten to eliminate a plant or animal; and would not eliminate important examples of major periods of California history or prehistory. Therefore, impacts would be less than significant with mitigation incorporated.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)

Less-than-Significant Impact with Mitigation Incorporated. When evaluating cumulative impacts, it is important to remain consistent with Section 15064(h) of the CEQA Guidelines, which states that an EIR must be prepared if the cumulative impact may be significant and the project's incremental effect, though individually limited, is cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.

Alternatively, a lead agency may determine that a project's incremental contribution to a significant cumulative effect is not cumulatively considerable through mitigation measures set forth in an IS/MND or if the project will comply with the requirements in a previously approved plan or mitigation program that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area in which the project is located.

The proposed project would potentially result in project related impacts to biological resources, cultural resources, geology and soils, hazards and hazardous materials, and transportation resources that could be potentially significant without the incorporation of mitigation. Thus, when coupled with potential impacts related to the implementation of other related projects throughout the broader project area, the project would potentially result in cumulative-level impacts if these significant impacts are left unmitigated.

Cumulative projects in the project site area that were considered in the project analysis include the 10 cumulative projects outlined in Section 6.1 of the LTA prepared for the project (Appendix H-1). These cumulative projects include, Pacific Commercial; San Marcos Highlands; El Dorado II Specific Plan; Villa Serena; Mariposa (Phase 1); Murai Subdivision; Pacifica San Marcos; Karl Strauss Brewery; Gran Vista Multi-Family; and Hughes Circuits projects.

With the incorporation of mitigation identified throughout this IS/MND, the project's impacts to biological resources, cultural resources, geology and soils, hazards and hazardous materials, and transportation resources would be reduced to less-than-significant levels and would not considerably contribute to cumulative impacts in the greater project region. In addition, these other related projects would presumably be bound by their applicable lead agency to (1) comply with all applicable federal, state, and local regulatory requirements; and (2) incorporate all feasible mitigation measures, consistent with CEQA, to further ensure that their potentially cumulative impacts would be reduced to less-than-significant levels.

Although cumulative impacts are always possible, the proposed project, by incorporating all mitigation measures outlined herein, would reduce its contribution to any such cumulative impacts to less than cumulatively considerable; therefore, the project would result in individually limited, but not cumulatively considerable, less-than-significant impacts with mitigation incorporated.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Less-than-Significant Impact with Mitigation Incorporated. As evaluated throughout this IS/MND, with incorporation of mitigation identified herein, all environmental impacts associated with the project would be reduced to less-than-significant levels. Thus, the project would not directly or indirectly cause substantial adverse effects on human beings. Impacts would be less than significant with mitigation incorporated.

Chapter 1: Specific Plan Summary

1 Specific Plan Summary

The Marcos Specific Plan hereafter also noted as "Specific Plan" or "Plan," has been written with the intent to provide regulations for the development of an attractive, multiple land use, urban, commercial-residential community at the intersection of Grand Avenue and Linda Vista Drive in the City of San Marcos, California. The following chapters will explain the vision for this community and the proposed development standards, design guidelines, utilities, infrastructure, and public services necessary to implement that vision and support future development.

1.1 Specific Plan Summary Description

The Marcos Specific Plan provides the City of San Marcos a comprehensive planning tool to help guide the orderly development of a new multi-land use development. Located just south of State Route 78 at the corner of Grand Avenue and Linda Vista Drive, the 12.06-acre Specific Plan Area is conveniently situated in central San Marcos and close to multiple freeway access points. The site is central to educational, retail, office, and industrial uses, making it an ideal location for infill development. The Specific Plan envisions a high quality, urban living environment that provides strong pedestrian connectivity to surrounding uses supported by modern artist-inspired commercial, live-work, makerspace, retail development hub and high-quality multi-family residential including recreational open space amenities to their residents. The Specific Plan is separated into three distinct planning areas divided by the Las Posas Creek Planning Area, which is a 0.98-acre city-owned parcel included in the Specific Plan Area. The East-End Planning Area is approximately 6.05-acres and is located on the east portion of the Specific Plan and is considered an innovative arts-focused commercial, live-work, makerspace, and retail development. Site design for the East-End Planning Area provides an atmosphere which blends creative commercial spaces, live-work concepts, and landscaped open spaces into unique shopping experiences for visitors and creative spaces for commercial, live-work, makerspace, retail, restaurant, and artistic-oriented studio and maker spaces for artisans and craftspeople. The West-End Planning Area is approximately 5.03-acres and is located on the west portion of the Specific Plan area and would include a multi-family land use of approximately 20.3 dwelling units per acre. The West-End Planning Area includes 102 multi-family dwelling units in 15 separate buildings ranging in composition from 4 units per building to 10 units per building. Floor plans within each building will consist of stacked flat, townhomes and carriage-style unit plans. All floor plans will have two-car direct access garages with 24 units providing tandem parking to maximize the site. A total of 34 guest parking spaces will be distributed throughout the site for the convenience of the residents. As part of the West-End site plan layout, there will be approximately 80,767 SF of common open space including recreational amenities such as a pool, BBQ area, walking path adjacent to Las Posas Creek, and other amenities spread throughout the planning area. Individual units will have the benefit of private open space ranging from 95 sf to 255 SF with a total of 14,899 SF of private open space provided throughout the West-End Planning Area dwelling units. Buildings will be oriented to increase open space with paseos serving as interior courtyards as well as facing Las Posas Creek to take advantage of the vegetation along the creek. The Marcos Specific Plan will meld contemporary and modern architectural and landscape styles to reflect the urban setting. The Planning Areas will be designed to engage users and residents via an interconnected series of landscaped spaces and walkways within each respective Planning Area. An existing bridge spanning the restored meandering creek is nestled between the Planning Areas and creates a natural pedestrian and emergency vehicle connectivity between the residential land use and the commercial, retail, and makerspace land uses facilitating easy access to shops and restaurants for

residents of the West-End Planning Area. The result is an attractive, conveniently located, safe, and efficient urban development which contributes to the enhancement of the quality of life within the City of San Marcos.

1.2 Specific Plan Preparation Statement

The preparation of this Specific Plan began with a comprehensive site analysis. Issues such as total usable lot area, land uses, densities and floor area ratio, infrastructure, architecture, open space, and others were included in the analysis. Based on those evaluations, this Specific Plan was developed to encompass comprehensive rules which allow development to be realized. Elements including land uses and design standards, circulation and infrastructure, financing methods, and implementation were compiled to guide development within the Plan area.

This page intentionally left blank

Chapter 2: Introduction

2 Specific Plan Introduction

The Marcos Specific Plan has been created to assist readers seeking to develop uses within the boundaries of the Specific Plan area and provides the framework for project design and development by providing rules, regulations, and guidance prior to embarking on project design. The chapters included within this document outline the following: Site history and regulatory compliance with State and local rules and regulations, land uses anticipated within the Plan area, design rules and regulations which should be relied upon when developing building plans, circulation infrastructure for bicycles, pedestrians, public transit, and vehicles, infrastructure required to service the plan area, the scale of site work required to provide buildable areas within the Plan area, public facilities required to service the Specific Plan area, fees and maintenance responsibilities required for regular site and public infrastructure installation and upkeep, and implementation strategies for future development. When adhering to the chapters mentioned above the developer and city can expect to facilitate the orderly design, development and implementation of projects within the Specific Plan area.

2.1 Specific Plan Purpose and Scope

The Marcos Specific Plan is a comprehensive plan designed to ensure the efficient development of a new mixed-use community. The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the General Plan. As a policy document, the Specific Plan embodies the broad policy directives of the General Plan and applies those policies and goals to the establishment of specific objectives for the planning area. As a regulatory document, the Specific Plan provides direction for the assignment of land uses, development intensities, development regulation, architectural and landscape design guidelines, grading, infrastructure design and capacity standards, development phasing, and financing, which must be met to successfully implement the proposed development. The planning and review process established by the specific plan emphasizes the direct and comprehensive correlation between land use, transportation, public services, and infrastructure necessary to support the efficient development of the planning area. When implemented, these elements of the Specific Plan will form a cohesive and rational development that complements and enhances the unique characteristics of this area of the city. All subsequent development shall be consistent with the policies and regulations contained herein.

2.2 Specific Plan Objectives

Specific Plans provide a tool for comprehensive and creative planning strategies that respond to the unique conditions of the site while implementing the goals and policies of the General Plan. The following objectives have been crafted to guide development that is consistent with the City of San Marcos General Plan:

1. Integrate medium high-density housing opportunities and commercial uses close to major transit, education facilities, and trails to optimize land use with transit use and active modes of transportation, reduce reliance on automobiles, and potentially reduce greenhouse gas emissions.
2. To the extent possible given site constraints, maximize the opportunity to provide medium high-density housing for the city of San Marcos in the 20.1-.30.0 dwelling unit density range which is comparable to other medium high-density housing developments in the City of San Marcos.

3. Develop high-quality attainable housing which helps to meet the housing needs of the City of San Marcos and the region.
4. Develop commercial mixed-use gathering space oriented toward creative arts, culinary arts, and business.
5. Create a highly connected and efficient circulation system of pathways supported by pedestrian friendly architecture and landscaping to promote walkability and connect people to surrounding transit and places.
6. Design a vehicular circulation system that adequately accommodates traffic and minimizes traffic impacts in and around the planning area.
7. Establish development standards and design guidelines that ensure distinctive architecture, landscaping and recreational amenities that complements and enhances the existing surrounding neighborhood while providing a desirable living environment for residents within the planning area.
8. Institute a program for the long-term maintenance of the community to ensure all facilities are adequately maintained to City standards.
9. Finance or contribute a fair share of funding to all community services and infrastructure needed to support development proposed by the Specific Plan to promote economic stability.

2.3 Contents of the Specific Plan

Per California Government Code §65451, a specific plan shall contain the following written and graphic information:

- The Specific Plan shall include a statement of the relationship of the specific plan to the General Plan.
- The distribution, location, and extent of the uses of land, including open space, within the area covered by the plan.
- Standards and criteria by which development will proceed, and standards for the conservation, development, and utilization of natural resources, where applicable.
- The proposed distribution, location, and extent and intensity of major components of public and private transportation, sewage, water, drainage, solid waste disposal, energy, and other essential facilities proposed to be located within the area covered by the plan and needed to support the land uses described in the plan.
- A program of implementation measures including regulations, programs, public works projects, and financing measures necessary to conduct all of the above.

To comply with these requirements, the Marcos Specific Plan includes the following information:

- An introduction that includes the planning objectives for the Specific Plan which encompasses the goals of, and is consistent with, the General Plan regarding land use, circulation, resource management, community design, as well as public services and utilities (Chapter 1 and 2).
- Written descriptions and graphic illustrations of proposed land uses within the planning area, including clearly identified specific development patterns and design standards (Chapter 3).

- Written descriptions and graphic depictions of architectural, landscape, and open space designs (Chapter 4).
- Written descriptions and graphic illustrations of proposed vehicular, pedestrian circulation systems for the planning area and the connections to adjacent public and private circulation networks (Chapter 5).
- A grading, utility, and infrastructure plan that includes the location and extent of utility services necessary to serve the planning area (Chapter 6).
- A public services and facility plan that identifies the specific agencies and extent of public services and facilities necessary to serve the planning area (Chapter 7).
- A public facility financing and phasing plan that provides the general outline for the financing mechanisms proposed and the phasing of public improvements to the planning area (Chapter 8).
- An implementation and amendment program that provides the mechanisms available for project review procedures and regulations for specific development within the planning area and any future amendments to the Specific Plan (Chapter 9).

2.4 Specific Plan Authority

California Government Code §65450 in conjunction with the City of San Marcos Zoning Ordinance Chapter 20.535, authorizes the City's legislative body to prepare and adopt Specific Plans. The Specific Plan will become the vehicle for the systematic implementation of the City's General Plan with a defined area covered under the governing authority of the General Plan. This Specific Plan is a regulatory document intended to establish the development and performance standards for all future uses within the Specific Plan planning area. All subsequent development plans, tentative parcel and/or tract map(s) and/or similar entitlements for projects within the planning area shall be consistent with the regulations set forth in the Specific Plan and with other applicable City of San Marcos regulations. Where the Specific Plan is silent, the San Marcos Municipal Code shall govern. As such, this Specific Plan shall be adopted by Ordinance by the City of San Marcos City Council.

2.5 Planning Area Description

The Marcos Specific Plan area is generally located in central San Marcos within the Business/Industrial District. The Plan area was previously developed and currently stands vacant and disturbed area with Las Posas Creek generally splitting the parcels from northeast to southwest. The area surrounding the Specific Plan area is generally developed as commercial and light industrial uses.

2.5.1 Regional and local Setting

The Marcos Specific Plan planning area encompasses approximately 12.06 gross acres. As illustrated in **Figure 1, Regional Map** and **Figure 2, Vicinity Map** the planning area is situated in the west central portion of the City of San Marcos, in an area defined as the Business/Industrial District by the City's General Plan. Regionally, the planning area is located adjacent to State Route 78 and approximately 0.17 mile from the nearest State Route 78 entrance. The site is approximately 4.5 miles from Interstate 15. Palomar College Transit Center is located approximately 0.85 mile from the planning area. Palomar College Transit Center is the largest North County Transit District hub within the City of San Marcos and consists of a bus depot on the north side of West Mission Road, near the main entrance to Palomar College, and a train station on the south side of West Mission Road that serves the SPRINTER hybrid rail train. Rail service and bus transit service offered at the Transit Center provide local and regional connections to schools, employment, shopping, and entertainment options within the City of San

Marcos, as well as San Diego and Riverside Counties. The Inland Rail Trail, a proposed and partially constructed 21-mile Class I bikeway, runs along the south side of West Mission Road and connects the Cities of Oceanside, Vista, San Marcos and Escondido as well us areas of unincorporated San Diego County.

The site is surrounded by light industrial and commercial uses as it's relatively close to major commercial hubs in San Marcos. Various light industrial suites and stand-alone buildings are located along Linda Vista Drive southwest of the project. State Route 78 bounds the project to the north and east. The Grand Plaza shopping center is located a short walk to the west of the site and San Marcos Boulevard, another commercial thoroughfare in San Marcos, is approximately a third of a mile to the south of the site.

2.5.2 Site Characteristics

As Illustrated in **Figure 3, Existing Conditions** the planning area includes 12 parcels (Assessor Parcel Numbers 219-152-42, 219-152-44, 219-152-45, 219-152-51, 219-152-61, 219-152-70, 219-152-74 [Las Posas Creek parcel], 219-152-75, 219-152-76, 219-152-77, 219-152-78, 219-152-79) located at the intersection of Linda Vista Drive and Grand Avenue. The planning area was originally designated for commercial uses and was previously graded into two separate development pads which were occupied by various commercial and light industrial uses. The most recent land use included vehicle sales dealerships. Remnants of the vehicle dealerships remain on the site. Large, disturbed areas of existing concrete are located on the south and eastern portion of the site. Three existing billboards are located on the site. Two at the northeast corner of the site facing State Route 78 and one at the northwestern portion of the site. The northwest portion of the site is disturbed. Vegetation on the site is limited to grasses and a few small shrubs. A few trees are located along the periphery of the site, adjacent to Las Posas Creek. Las Posas Creek splits the site running approximately northeast to the southwest where it continues through the City of San Marcos. The creek is currently restored and under a 5-year monitoring program. The City of San Marcos restored the portion of the creek running through the Specific Plan Area.

Marcos Specific Plan

2.5.3 Regulatory Setting and Site History

Prior to the adoption of this Specific Plan, the planning area was designated as Commercial by the General Plan and the San Marcos Zoning Code. The site was first developed sometime between the late 1960's and late 1970's. From the late 1970's to around 2008 the site was continuously occupied and fully developed. Around 2008 the site slowly began the transition from occupied development to the current undeveloped and disturbed state of the property through vacation and demolition. Concurrent with this Specific Plan, a General Plan Amendment and Rezone application were processed to re-designate the 12 parcels that comprise the planning area to "Specific Plan Area", thereby allowing for the development of the mixed-use medium high-density multi-family dwelling units and commercial/retail/live-work community proposed herein.

This Specific Plan implements AB 32, Strategy 3 of the San Marcos Climate Action Plan (CAP), SB 743, numerous General Plan Goals, and various other state regulations related to reducing greenhouse gas emissions. In accordance with AB 32, the Global Warming Solution Act, the State adopted SB 97, which revised the California Environmental Quality Act (CEQA) Guidelines to require an analysis of greenhouse gas emissions as part of the CEQA process and established standards for the content and approval process of plans to reduce GHG. To comply with these requirements, the City of San Marcos adopted the Climate Action Plan (CAP) in 2013. A CAP is a long-range planning document that identified strategies to reduce greenhouse gas emissions. Since then, the State and CARB have established stricter targets for reducing greenhouse gas emissions. In response, the City of San Marcos update the CAP in 2020 to reflect these new requirements. The State also adopted SB 743 to change the way CEQA evaluates traffic. Vehicle Miles Traveled (VMT) became the new metric to promote development that is walkable, has access to transit or bicycle facilities, and/or implements other mitigation measures that discourage the use of single occupancy vehicles. To implement SB 743 and Strategy 3 of the San Marcos CAP, the City of San Marcos adopted the Transportation Impact Analysis Guidelines in 2020. These Guidelines identify High Quality Transit Areas, where VMT is considered low due to the availability of transit. The intent is to encourage high-density housing and other appropriate uses within these High-Quality Transit Areas that encourage transit use potentially reduce GHG. Although the planning area is slightly more than a half-mile walk to the City's High Quality Transit Area, it is a mixed-use development capable of facilitating non-motorized internal movement of residents and business. In addition, the site is within a short walk of major shopping and employment centers.

The reduced demand for retail coupled with an increased demand for housing in California and the City and State's Climate Change goals have changed the planning area into a prime site for medium high-density, commercial/retail development.

2.6 Relationship to the San Marcos General Plan

Specific Plans are tools which allow for the systematic implementation of the city's General Plan, effectively linking the implementing policies of the General Plan to individual development proposals in a defined area. As such, Specific Plans are required to provide a detailed statement of the relationship of the Specific Plan to the General Plan, including consistency between both plans and a comparison of goals, objectives, and policies. The following sections discuss the various elements of the Marcos Specific Plan and compare the stated intent of each element to the development proposed by this Specific Plan.

2.6.1 Specific Plan Land Use

Chapter 20.250 of the San Marcos Zoning Ordinance establishes specific standards to regulate development by authority from the General Plan, describes specific plans as tools for the systematic implementation of the San Marcos General Plan. As a planning tool, the specific plan derives its authority from state and local law to provide a more precise framework for the distribution of land uses, infrastructure, development standards, resource conservation, and implementation measures necessary to carry out the goals of the General Plan. The Marcos Specific Plan accounts for the unique physical characteristics, constraints, and resources of the Planning area to provide specific development guidelines for projects within the planning area. According to Government Code Section 65454, a specific plan must be consistent with the adopted General Plan. The Marcos Specific Plan's consistency with the General Plan is described in more detail below.

2.6.2 Land Use and Community Design Element

As stated in the introduction to the Land Use and Community Design Element, the goals and policies of the general plan are designed to:

- Ensure land use diversity and balanced development that encourage an efficient and responsible relationship between land use, transit, open space, and areas of environmental sensitivity.
- Establish and maintain community connections that better connect people to places.
- Promote economic strength and stability by maintaining a strong local economy and employment base.
- Create a synergy between the business community and academia to promote San Marcos as the educational hub for North County.
- Encourage integration of high-quality and sustainable development through the establishment of development standards and land use patterns that encourage long-term environmental sustainability.
- Promote community design that produces a distinctive built environment with memorable places.
- Direct and sustain growth through management to ensure adequate provision of urban services.

The Specific Plan achieves this as follows:

- Development proposed by the Specific Plan takes the previously developed and currently disturbed site which includes Las Posas Creek restoration and revitalizes the site with unique commercial uses and multi-family residential dwelling units. The proximity to nearby transit opportunities, and shopping and employment centers provide an opportunity to maximize the efficient use of the property by producing infill development near existing infrastructure and amenities promoting walkability and thereby reducing environmental impacts.
- Walkways, architecture, and landscaping are designed to maximize pedestrian scale and connectivity. The bridge link between the residential component and the commercial development provides pedestrian access for residents of the West-End Planning Area to commercial, live-work, makerspace, and retail uses and connectivity to Linda Vista Drive.

- The proposed residential uses include entry-level, for-sale, workforce housing that will support local businesses by providing financially attainable housing opportunities for employees. Proximity to transit will also benefit the economic strength of the entire City and Region by providing connection between this workforce housing and employment centers.
- New buildings proposed by this Specific Plan will be designed to current Building Codes and Standards that include the most stringent requirements in the United States for water, material, and energy efficiency; improved air quality; and more. The specific plan implements the strategies of the city's Climate Action Plan to reduce greenhouse gases by including elements that support transit use, active modes of transportation, and the use of electric vehicles. Proximity to transit and trails and the walkable design of the Marcos community have the potential to significantly reduce vehicle miles traveled (VMT) for improved air quality.
- The Specific Plan provides a detailed set of architectural and landscape design guidelines to ensure a distinctive built environment with unique and memorable amenities and spaces.
- Infrastructure and service plans provided within this specific plan have been developed to ensure that adequate provisions for urban services are available. Financing for both the construction and long-term maintenance of necessary infrastructure and services has also been identified in the final chapter of this Specific Plan.

The Specific Plan planning area is located at the easterly portion of the Business/Industrial District. The General Plan describes the Business/Industrial District as having a diverse range of uses from rural residential uses including single family homes and mobile home communities in the western half of the district, and commercial and light industrial uses in the east. Palomar Community College Transit Station is also located in this neighborhood.

The General Plan identifies Focus Areas where changes are most likely to occur. Although the Specific Plan planning area is not within one of these Focus Areas, it is near to the Urban Core Focus Area –San Marcos Boulevard Focus Area (FA3). The vision for FA3 is for the city to create a commercial mixed-use "downtown" area giving the city residents a sense of place while also providing a destination area for people to enjoy. The area is mostly comprised of commercial and retail uses. The proximity of this Specific Plan area to the "downtown" core of San Marcos allows the proposed uses to compliment the nearby theme the city envisions for San Marcos Boulevard. The Marcos Specific Plan will achieve this complementary use of the Focus Area by providing a mix of housing and commercial uses thereby enhancing and extending the intent of the focus area to encompass this Specific Plan area.

2.6.3 Mobility Element

As stated in the introduction, the purpose of the Mobility Element is to strategically enhance and manage the mobility network as a critical component to enhance the City's vibrant commercial and industrial areas, its thriving residential neighborhoods, its diverse employment uses, and its unique student population. The Mobility Element focuses on maximizing the quality, comfort, safety, walkability, livability, and bikeability of the City's streets, sidewalks, trails, and multi-modal transportation system while incorporating sustainability elements into the program.

The Mobility Element identifies Linda Vista Drive and Grand Avenue as arterials with Class II or III Bicycle Facilities. Complete Street improvements will be constructed along the project frontage on Linda Vista Drive and Grand Avenue, which include bicycle lanes and sidewalks separated from vehicular lanes as well as planting areas. The Specific Plan further implements the mobility element as follows:

- Minimizing walls on the commercial planning area where possible and requiring multiple pedestrian connections to maximize the walkability of the community.
- Includes design guidelines requiring pedestrian friendly architecture and landscaping that engage the sidewalk along public roadways and promoting design concepts which promote internal connectivity.
- Installing EV charging stations and bicycle parking to support the use of electric vehicles and active modes of transportation.
- Promote alternative transportation options including ride sharing, car and vanpool, and public transportation opportunities.

2.6.4 Conservation and Open Space Element

As stated by the General Plan, the purpose of the Conservation and Open Space Element is to identify natural, cultural, historic, and open space resources. Las Posas Creek, which bisects the Specific Plan area includes resources which require preservation and conservation. The creek which runs northeast to southwest through the Planning area and is currently under a five-year monitoring restoration program with the City of San Marcos and regulatory wildlife agencies and shall remain preserved in perpetuity via an easement granted to the City. By preserving the creek and confining development to the previously developed and disturbed areas of the site, the Marcos Specific Plan area can alleviate development pressure on other sites that include other valuable resources.

The Conservation and Open Space Element also seeks to address air pollution, climate change, energy independence, water supply and water quality. Development proposed by the specific plan will be designed to current Building Codes and Standards that include the most stringent requirements in the United States for water, material, and energy efficiency; improved air quality; stormwater treatment; and more. The Specific Plan implements the strategies of the City's Climate Action Plan to reduce greenhouse gases by including elements that support transit use, active modes or transposition, and the use of electric vehicles. Proximity to transit and trails and the walkable design of the community have the potential to significantly reduce vehicle miles traveled (VMT) for improved air quality.

2.6.5 Parks, Recreation, and Community Health Element

According to the General Plan, the purpose of the Parks, Recreation, and Community Health Element is to maintain and increase access to parks, trails, recreational facilities, and community service programs. In addition, it aims to provide a healthy and safe community by taking into consideration community health and family enrichment needs of community members, including older adults, children, persons with special needs, and residents of all ages.

The Specific Plan includes an open space plan and an amenity package designed to address the specific recreational needs of the anticipated residential community demographics. Standards for both private open space and common recreational open space are provided to ensure an adequate amount of space is provided to support a high quality of life. Selected amenities cater to an urban lifestyle and consider not only families, but young singles and couples who are likely to be purchasing their first home within this community. Landscaped open space designs have been incorporated into the commercial portion of the Specific Plan area to enhance the visiting experience. Consideration was given to landscape and architecture design to promote pedestrian comfort, bicycle parking, and enhancement of the shopping and artistic experience for the commercial planning area. New development is also required to pay park fees to fund its fair share of public park and reactional facilities within the City.

2.6.6 Safety Element

The Safety Element is designed to ensure public health, safety, and welfare of residents and their property by identifying and planning for anticipated natural and human-caused safety issues including geologic and seismic hazards, flood, fire and more.

Hazards associated with the development proposed by the Specific Plan were evaluated as part of the CEQA process and no significant hazards were identified. The commercial area, homes, and landscaping will be designed, built, and installed to current safety codes and standards. Additionally, the specific plan includes development and design standards that incorporate Crime Prevention Through Environmental Design (CPTED) strategies. CPTED strategies consider design standards that deter criminal activity and build a sense of community between neighbors so that visitors and residents are encouraged to take ownership of their neighborhood, watch for and discourage crime, and protect one another.

2.6.7 Noise

The Noise Element Identifies potential problems and noise sources threatening community safety and comfort with the intent of limiting the community's exposure to excessive noise levels. Noise impacts to new residents as well as noise impacts generated by the development of the Specific Plan were evaluated as part of the CEQA process. Project features were proposed such as walls and building materials within current State and City of San Marcos building code standards which contribute to reducing potential noise impacts to a less than significant level. Additionally, new development proposed by the Specific Plan is subject to the City's noise standards.

The future development will separate, reduce, or mitigate noise by utilizing current construction codes and standards which provides additional measures preventing noise from entering dwelling units or commercial spaces. If needed, construction noise will be mitigated through proper maintenance of construction vehicles equipped with noise reduction intakes, exhaust mufflers, and engine shrouds, in accordance with the manufacturers' recommendations. When possible, electrical power shall be used to run air compressors and power tools. Equipment staging areas should be located as far as feasible from neighboring occupied properties. Finally, noise attenuation techniques shall be employed, as needed, to ensure noise levels remain at or below 65 dBA Leq at the Specific Plan boundary or as identified by noise analysis conducted for any proposed development within the Specific Plan Area. When combined, each design feature and construction mitigation measure will conform the project to the City's General Plan Noise Element requirements. These construction and mitigation measures are consistent with the goals and policies outlined in the City of San Marcos General Plan Noise Element.

2.6.8 Housing

As required by State law, the City of San Marcos Housing Element identifies the housing needs of both the existing and projected population and ensures that the land use plan provides adequate capacity to provide safe, suitable, and affordable housing for City residents. The Housing Element is coordinated with each element to ensure comprehensive policies and goals throughout the General Plan. These policies and goals form a framework that the Marcos Specific Plan will follow to systematically implement a comprehensive housing development plan that is consistent with these goals and policies. The residential uses proposed by Specific Plan will encompass approximately 5.03 acres within the West-End Planning Area and approximately 8,182 sq. ft. of live-work space (7 units) in the East-End Planning Area. The East-End Planning Area live-work units are intended to be long-term lease apartments. The West-End will include a maximum of 102 multi-family residential dwelling units for an approximate total density of 20.3 dwelling units per-acre (du/acre). This residential density equates to the Medium High Density Residential (MHDR) General Plan land use classification, which allows for 20.1-30.0 du/ac. Homes proposed by the Marcos Specific Plan are designed as workforce housing with a range of unit sizes and

price points, creating opportunities for home ownership that will be attractive to varying income levels. Therefore, the Marcos Specific Plan is consistent with the goals provided within the Housing Element of the General Plan.

2.7 CEQA Compliance

A Mitigated Negative Declaration (MND) was prepared for the Marcos Specific Plan in accordance with the California Environmental Quality Act (CEQA) and serves as a comprehensive environmental document for subsequent development within the planning area. The MND examines the relationship the Specific Plan implementation may have on potential environmental impacts to the planning area and makes determinations for mitigation measures to reduce impacts to below levels of significance. The MND was certified concurrently with the Specific Plan by the decision-making body.

A Mitigation Monitoring and Reporting Program (MMRP), adopted in accordance with Public Resources Code Section 21081.6, ensures the proper implementation of the mitigation measures outlined within the MND. All future development within the planning area is required to adopt and implement the mitigation measures specified in the MMRP, if applicable.

Subsequent development proposals within the Marcos Specific Plan planning area, if found by the City of San Marcos to be consistent with this Plan and the impact analysis and mitigation measures found in the certified MND, may be approved, and implemented without further public environmental review according to California Government Code Section 65457. Prior to amendment to this Specific Plan, the City of San Marcos shall determine if further environmental review and analysis is required to satisfy CEQA requirements.

2.8 Projects Requiring Consistency with the Specific Plan

Discretionary actions and projects proposed within the Specific Plan area are required to demonstrate consistency with this Specific Plan. The actions processed under this Specific Plan which require consistency prior to approval, and/or adoption by the San Marcos City Council are the General Plan Amendment (GPA) and Rezone (R) of the project site from Commercial (C) to Specific Plan Area (SPA), a Site Development Plan (SDP), a Multi-family Site Development Plan (MFSDP), a Conditional Use Permit (CUP), a Tentative Subdivision Map (TSM) and a Tentative Parcel Map (TPM). Subsequent projects proposed within the Specific Plan area must demonstrate compliance with the Specific Plan's policies, rules, regulations, and design standards. More discussion on what is considered a project under this Plan can be found in the Implementation Chapter.

Chapter 3: Land Use & Development Standards

3 Land Use and Development Standards

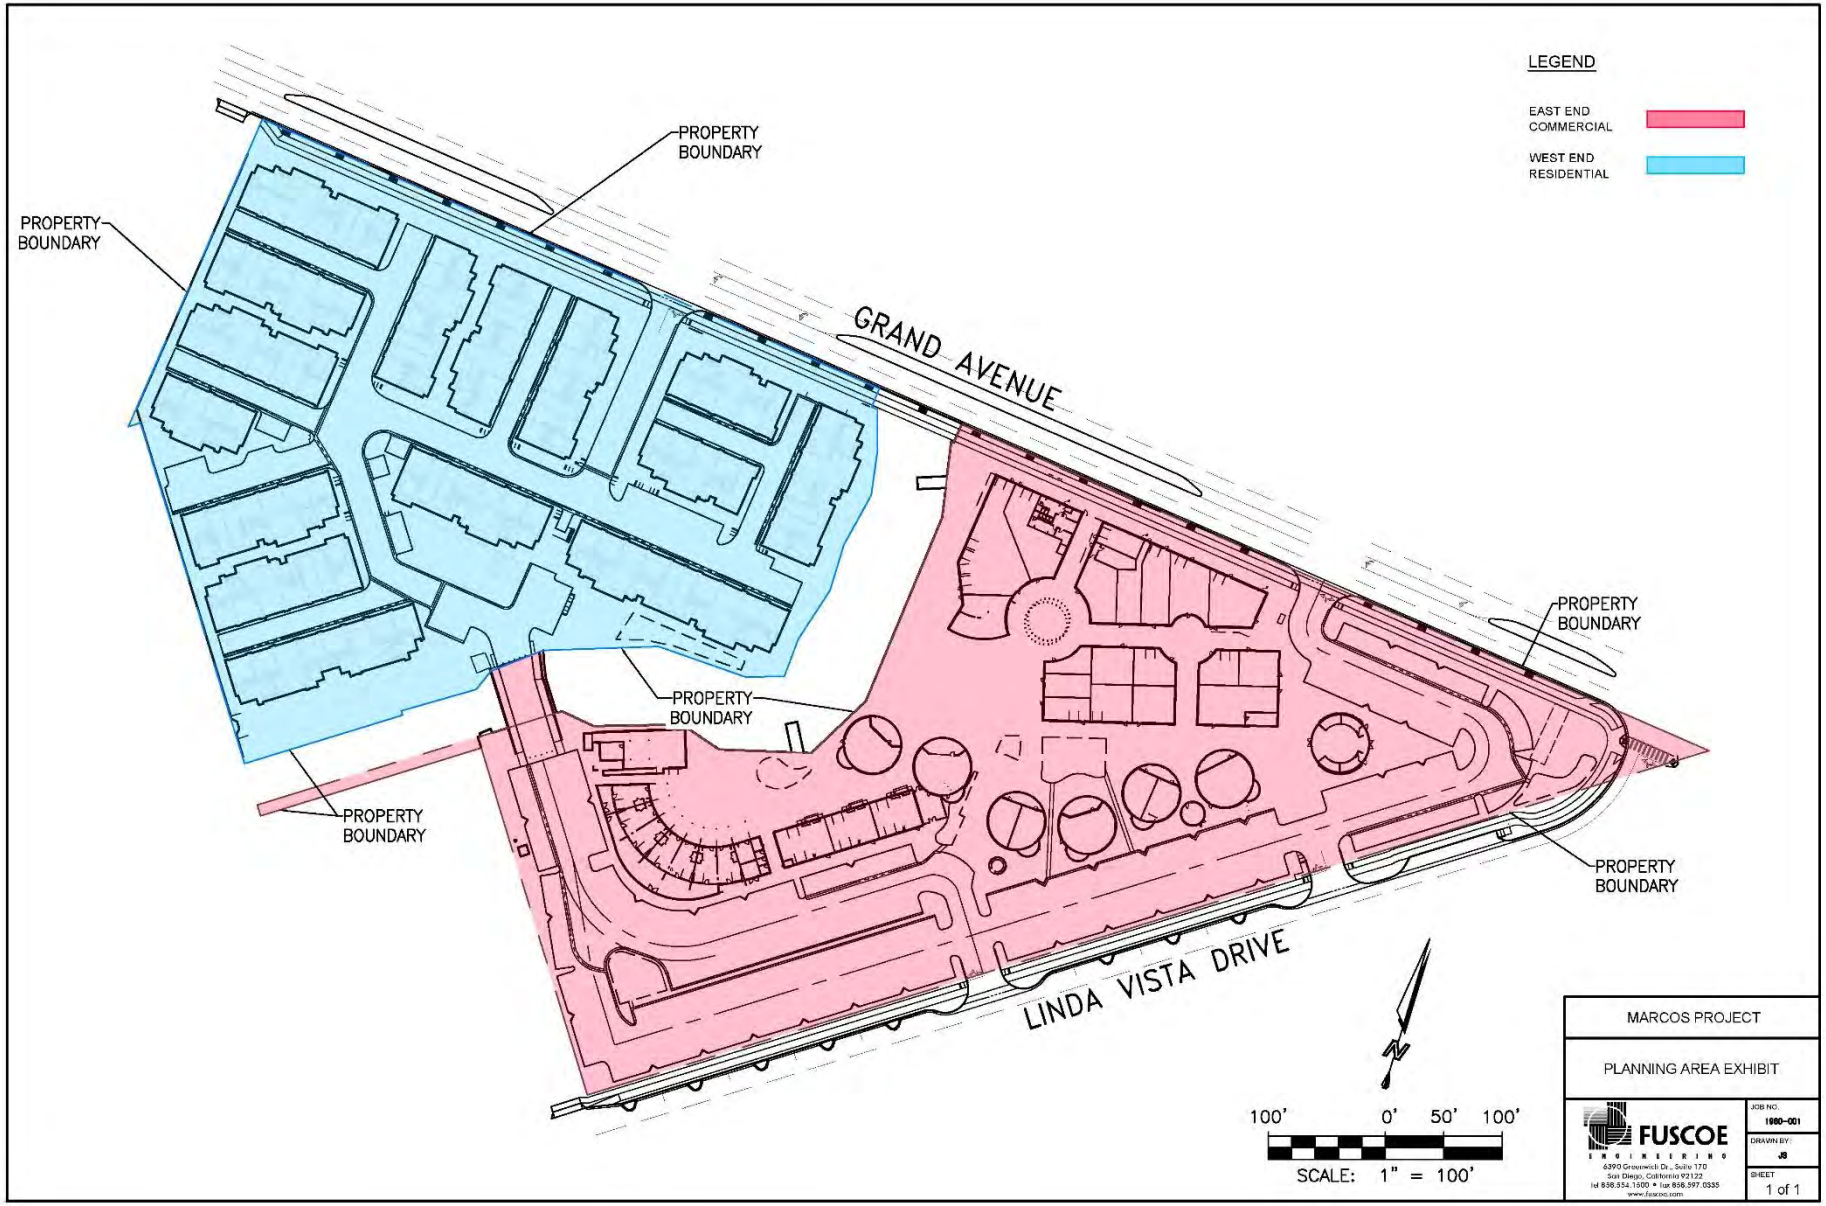
This chapter regulates the distribution and intensity of land uses and establishes development standards that will govern all future development within the Marcos Specific Plan. These standards and guidelines provide a foundation for the community's character and sense of place that willultimately result in an attractive and functional community.

3.1 Land Use and Development Standards Objectives

Marcos Specific Plan strives to create an appealing mixed-use community founded on solid design principles. The Plan area's relatively flat topography offers an ideal horizontal area for development while the Las Posas Creek which bisects the site creates a natural dividing line between residential and commercial uses and offers an opportunity to create a unique development that incorporates natural features into the built environment. The following design standards will provide the parameters for all development within the Specific Plan area and will drive the overall site design.

The Plan area will address community planning goals and will incorporate core residential, commercial, and recreational concepts as well as conservation concepts into the development design. Through careful engineering the site will present a horizontal mixed-use design conscious of recreational open space and orderly circulation design thereby reducing the projects' impacts while maximizing creek area conservation and urban development opportunities. These planning goals include:

- Create a sustainable development through careful balancing of land uses, connections to, and proximity to transportation options, and recreational opportunities.
- Create a land use plan that protects Las Posas Creek while using the creek as a natural dividing line between Planning Areas.
- Design a series of roadways that allow for safe bicycle, pedestrian, and vehicular circulation and which link the development to the larger community.
- Create a series of built features, using architecture design and landscape design, that provide a distinct built environment which is pleasing to residents and visitors.
- Maintain the feel of the community through use of building materials that complement and enhance the surrounding environment and neighborhoods.
- Create a distinct recreational environment though the careful placement of open space features that blend with natural landforms.



Conceptual Planning Areas

Figure 4

Marcos Specific Plan

3.2 Distribution of land Uses

The approximate 12.06-acre Specific Plan area is comprised of two primary land uses: Commercial/Retail land use (East-End Planning Area) and Multi-Family Residential land use (West-End Planning Area). The East-End Planning Area is made up of commercial, retail, restaurant, entertainment, and live-work uses and is approximately 6.05-acres with a total Floor Area Ratio of approximately 0.1. The West-End Planning Area is comprised of 102 units on approximately 5.03-acres which equates to approximately 20.3 dwelling units per acre (du/ac) which is a similar residential density to the City of San Marcos' Medium High Density Residential (MHDR) 20.1-30.0 du/ac General Plan land use classification. Other elements of the West-End Planning Area include landscaping area, biofiltration area, and recreational open space areas. Land use permit requirements, regulations, and development standards of this section shall be applicable to all existing and new uses, structures, modifications, additions, and activities within the Specific Plan Area.

Table 1 Distribution of Land Uses

Land Use	Total Gross Area (acres)	Target Density (DU/acre) [1]	Proposed DU's	Project Density/FAR[1]
East-End Planning Area	**6.05**	**n/a**	**7**	**0.1**
Commercial/Retail/Live-work Bldg. Area	1.12			
Driveways/Alleys/Parking/loading	2.18			
Landscaping/Open Space	2.75			
West-End Planning Area	**5.03**	**20.1-30.0**	**102**	**20.3**
Residential Bldg. Area	1.74			
Driveways/Alleys/Parking/loading	1.25			
Landscaping/Open Space	2.05			
Las Posas Creek	0.98			
Site Total[2]	**12.06**	**20.1-30.0 du/ac**	**109**	**20.3 du/ac. 0.1 FAR**

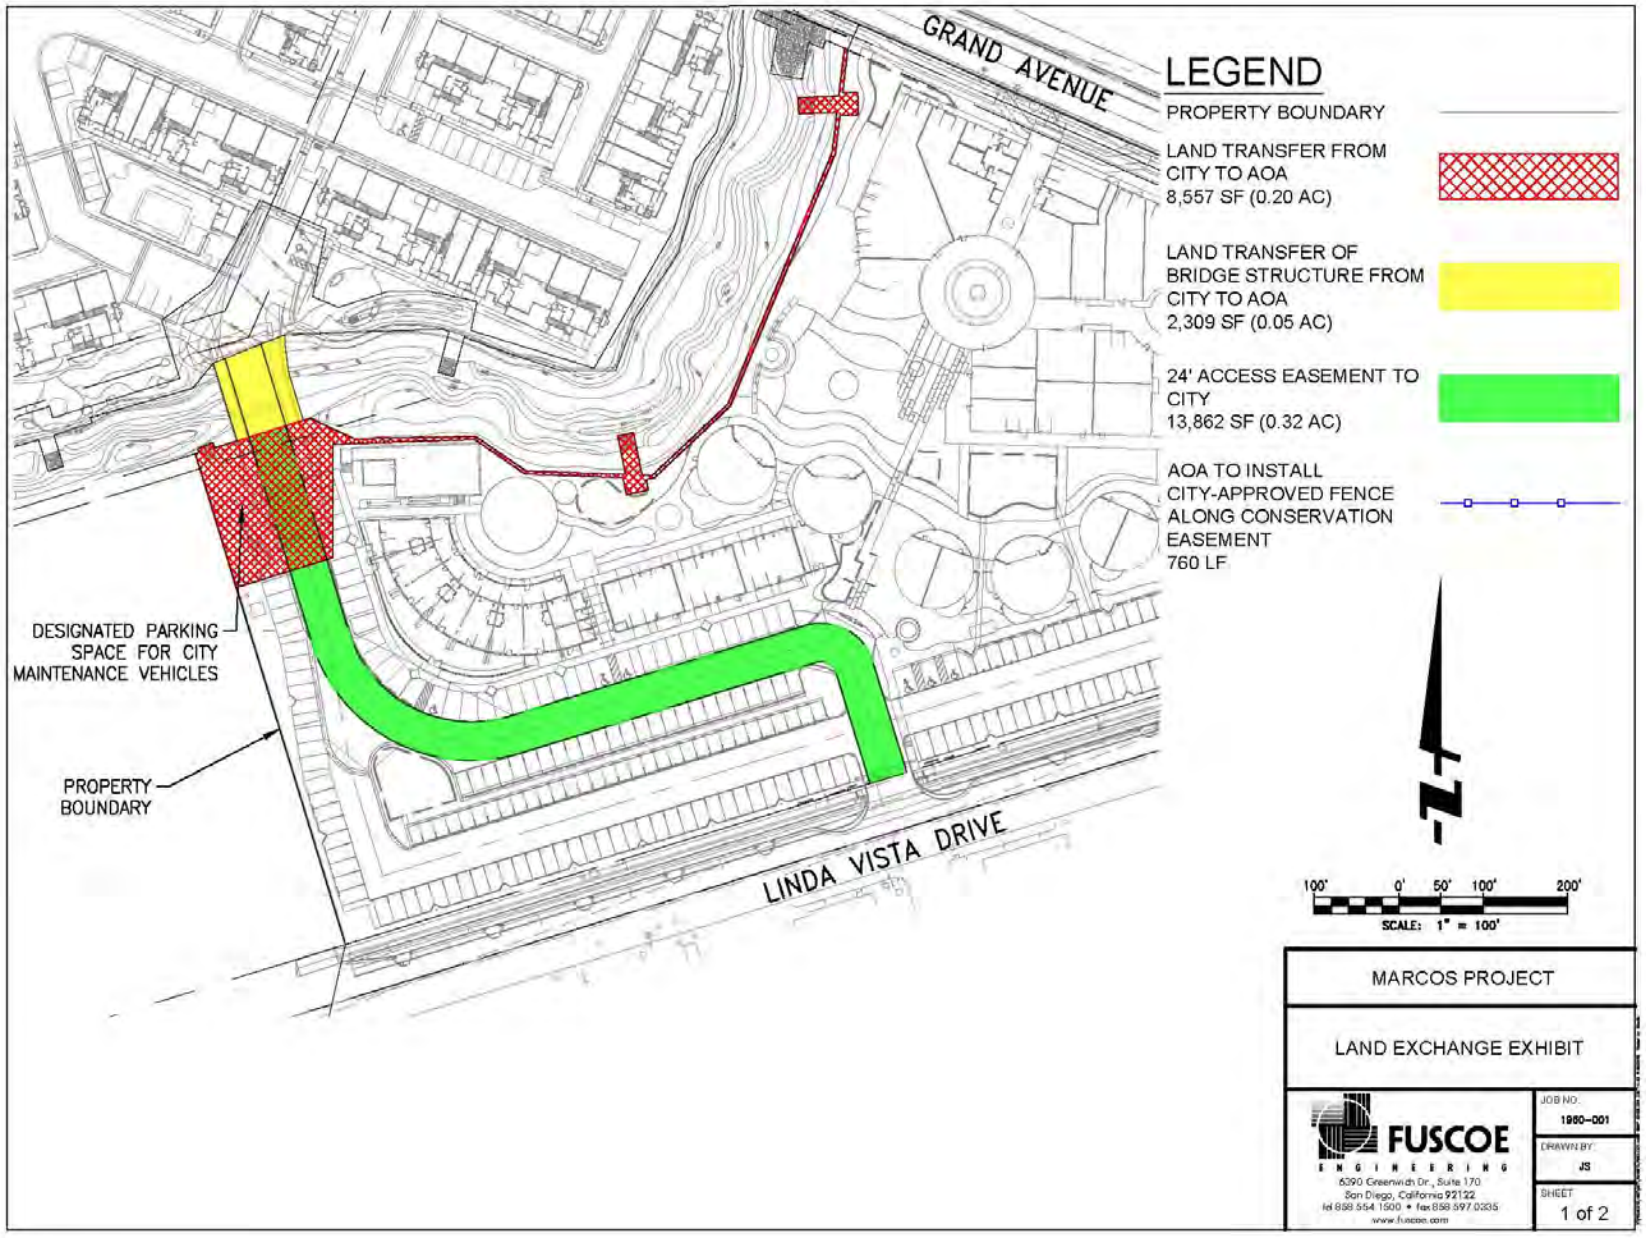
[1]Project Density and FAR calculated on the gross residential and commercial planning areas, respectively.

*Acreage totals may differ slightly due to rounding.

*The live-work unit density is considered in the East-End Planning Area FAR.

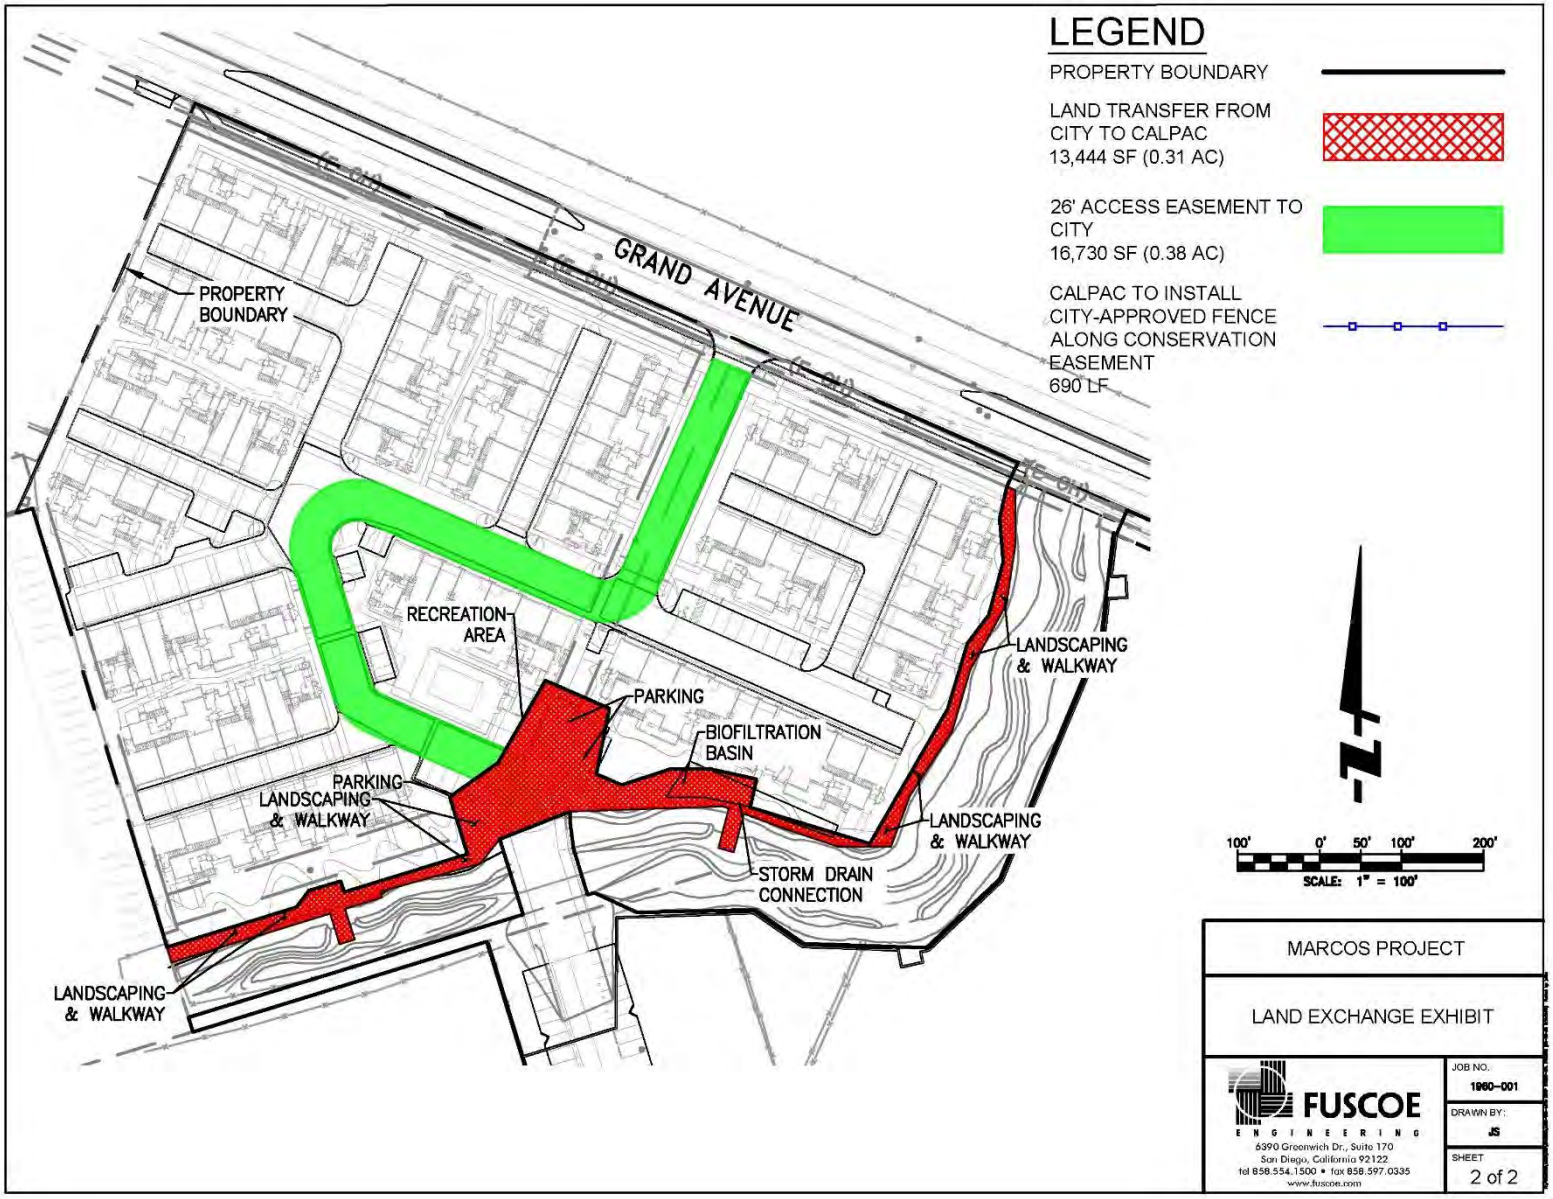
3.3 City-Owned Land Transfer

As part of the approval of this Specific Plan approximately 0.56-acre of city-owned property from parcel 219-152-74 was transferred to the property owners within the Marcos Specific Plan area. Parcel 219-152-74 includes the segment of Las Posas Creek within the boundary of the Marcos Specific Plan Area. The lot line adjustment of parcel 219-152-74 includes areas adjacent to the Las Posas Creek, excludes the riparian limits of the creek and conservation easement, and is considered usable area for development of buildings, circulation elements, stormwater facilities, landscaping and open space. The area adjacent to the creek shall be fenced to prevent public intrusion into the riparian area. The East-End Planning area acquired approximatelyo.20-acre of city-owned property as well as 0.05-acre bridge spanning Las Posas Creek. An easement over the bridge shall be granted to the West-End Planning Area for pedestrian circulation and emergency vehicle access. A 0.32-acre easement will be granted to the City of San Marcos via the East-End Planning Area for maintenance access of Las Posas Creek including access over the bridge. The West-End Planning Area acquired approximately 0.31-acre of land adjacent to Las Posas Creek. A 0.38-acre easement is granted to the city for creek maintenance access within the West-End Planning Area. The City of San Marcos will retain control of the remaining 0.98-acre parcel containing Las Posas Creek.



Eastend Planning Area Land Swap Figure 5

Marcos Specific Plan



Westend Planning Area Land Swap — Figure 6

Marcos Specific Plan

3.4 Planning Areas

Three Planning areas are proposed for the Marcos Specific Plan: The East-End Planning area which encompasses the portion of the Specific Plan Area east of Las Posas Creek and the West-End Planning Area which encompasses the portion of the Specific Plan Area west of Las Posas Creek, and the City-owned Las Posas Creek Planning Area, which encompasses the Las Posas Creek including the creek setback buffer area excepting the bridge area spanning the creek. The East-End and West-End Planning Areas share a bridge connection at the southwestern portion of the planning area which spans Las Posas Creek.

East-End Planning Area – The 6.05-acre East-End Planning area is comprised of all land east of Las Posas Creek. The East-End Planning Area will be comprised of modern-day facilities supporting arts, crafts, and entertainment-minded commercial, live-work, makerspace, and retail uses centered around outdoor communal gathering areas.

West-End Planning Area – The 5.03-acre West-End Planning Area is comprised of all parcels west of Las Posas Creek. The West-End Planning Area will include multi-family residential land use and its associated open space and residential common area recreational open spaces.

Las Posas Creek Planning Area – The 0.98 creek is comprised of the total area of the creek including the habitat setback area within the Marcos Specific Plan Area. The bridge spanning the creek is not considered in the Las Posas Creek Planning Area. The only land use allowed within Las Posas Creek Planning Area shall be conservation of open space. Only existing drainage structures and systems shall be allowed within this Planning Area. Fencing, as identified in **Section 4.3** shall be allowed on the perimeter of the conservation easement to prevent intrusion into the conservation easement.

3.5 Allowable Land Uses

Table 2, Allowable Land Uses identifies the permits required to establish uses allowed within the planning areas, consistent with this Specific Plan. Allowed uses shall be for the express purpose of establishing and protecting the residential living environment, commercial/retail operations, and Las Posas Creek envisioned by this Specific Plan. Residential, commercial/retail and Las Posas Creek open space uses are intended to be the primary permitted uses. All other uses are intended to support residential, commercial/retail, or Las Posas Creek open space uses. When indicated, please also refer to the sections identified under the "Additional Use Regulations" column for additional operational standards and regulations applicable to the use. When a use is not specifically listed, that use in not permitted; However, in accordance with Section 9.1.1 of Chapter 9 of this document, the Planning Director shall have the authority to determine whether the proposed use shall be permitted or conditionally permitted based on a finding of substantial conformance if the proposed use is similar to a use already listed in **Table 2**.

Table 2 Allowable Land Uses

Use		Additional Use Regulations/Definitions
East-End Planning Area Uses		
Commercial Artist/Production Studio Uses		
Commercial Artist/Production Studio, General	P	Any performing arts, graphic arts, craft arts or similar studio.
Music Venue, Indoor.	DP	Occupancy of indoor music venues shall be set at 1 person per 15 SF of usable space.
Tattoo Artist	P	Subject to SMMC Section 20.400.200 and Chapter 8.95 Only 1 tattoo shop shall be allowed.
Industrial/Maker Space Uses		
Alcohol Production, Brewery, Distillery, Winery	P	With or without a tasting room.
Catering	P	
Commercial Bakery	P	
Culinary Maker Space, General	P	Any use involving the manufacturing of food or drink products. Includes all variety of food production.
Craftworking Maker Space, General	P	Any arts and crafts maker space use.
Fermentation Farm	P	Manufacturing of probiotics and/or yeasts.
Woodworking/Metalworking	P	Craft woodworking and metal working makerspace.
Recreation, Education & Public Assembly Uses		
Visual & Performing Arts Schools/Classes, General	P	Any performing, visual, or craft art program.
College, Non-Traditional Campus	DP	Any alternative educational program. Not to exceed 50% of the site's total leasable area.
College, Traditional Campus	DP	Not to exceed 50% of the site's total leasable area.
Commercial Entertainment	P	May be a primary business or an accessory use. Includes special events and performances. Refer to Section 3.6.1.4. for regulations.
Commercial Recreation	P	
Museum, Library, or Gallery	P	
School	DP	Not to exceed 50% of the site's total leasable area.

General Retail Uses		
Retail, General	P	
Theater, Single Screen	DP	
Office, Professional, & Business Support Uses		
Office, General	P	
Food & Beverage Uses		
Bar	P	
Brewery Tasting Room	P	With or without on-site production.
Distillery Tasting Room	P	With or without on-site production.
Restaurant	P	
Wine Bar	P	With or without on-site production.
Residential Uses		
Live-Work Dwelling Units	P	A maximum of seven (7) live-work units.
Wellness Uses		
Day Spa	P	Subject to SMMC Section 20.400.250. Massage allowed as an accessory use only.
Wellness Studio, General	P	Includes fitness, yoga, and similar studios.
Nutritionist	P	Businesses providing nutritional advice and services.
Wellness Center	P	Any use focused on providing a good or service oriented toward health and beauty. Massage allowed as an accessory use only.
Accessory/Temporary Uses		
Art Installations	A, T	Includes two (2) billboards to remain on property. Refer Section 3.6.1.3 for regulations. Temporary art installations allowed.
Performing Arts Space, Small	A	
Instructional Classes/School	A	
Event Space/Conference Hall	T	
Gallery	A, T	
Kiosks	A	In locations shown on approved Site Development Plan
Museum	T	
Outdoor seating	A	Accessory to an approved/permitted use.
West-End Planning Area Land Uses		
Apartments	MFSDP	20.1-30.0 du/acre
Condominiums	MFSDP	20.1-30.0 du/acre
Guest Parking	A	Refer to Section 3.6.2.3
Recreational Amenities	A	Refer to Section 3.6.2.3
Las Posas Creek Planning Area Uses		
Conservation Open Space	P	City of San Marcos Las Posas Creek parcel.
Signage	P	Refer to SMMC; Per Consultations with City, State, and Federal Wildlife Agencies.
Fencing	P	Per Consultations with City, State, and Federal Wildlife Agencies.
Drainage Structures	P	
Specific Plan Area Accessory Uses		
Alternative Energy Systems	A	
Electric Vehicle Charging Facilities	A	
Wireless Communications Facility	A	Subject to current city permitting requirements. East-End Planning Area only.
Signs	A	Subject to approved Sign Program and/or SMMC Chapter 20.320.

Symbol:
P = Permitted use subject to compliance with all applicable provisions of the Marcos Specific Plan.
A = Accessory Use
T = Temporary Use = Any use of space for art installations or temporary accessory uses not to exceed 180 days unless authorized by the Planning Director.
DP= Directors Permit
CUP = Conditional Use Permit
MFSDP = Multi-Family Site Development Plan
SMMC = San Marcos Municipal Code. Municipal Code reference numbers subject to change by the City of San Marcos.

3.6 Development Standards

The development standards for all projects proposed within the Specific Plan area are presented in Table 3, Development Standards. These standards include building setbacks, height limitations, open space requirements, and more. **Figure 7** provides a visual representation of the Conceptual Site Plan including planning areas which may be included in the Specific Plan. Development standards apply to the residential and commercial/retail planning areas. The Las Posas Creek open space planning area includes separate standards intended to protect and preserve habitats and species from development encroachment or human and pet encroachment.

Table 3 Development Standards

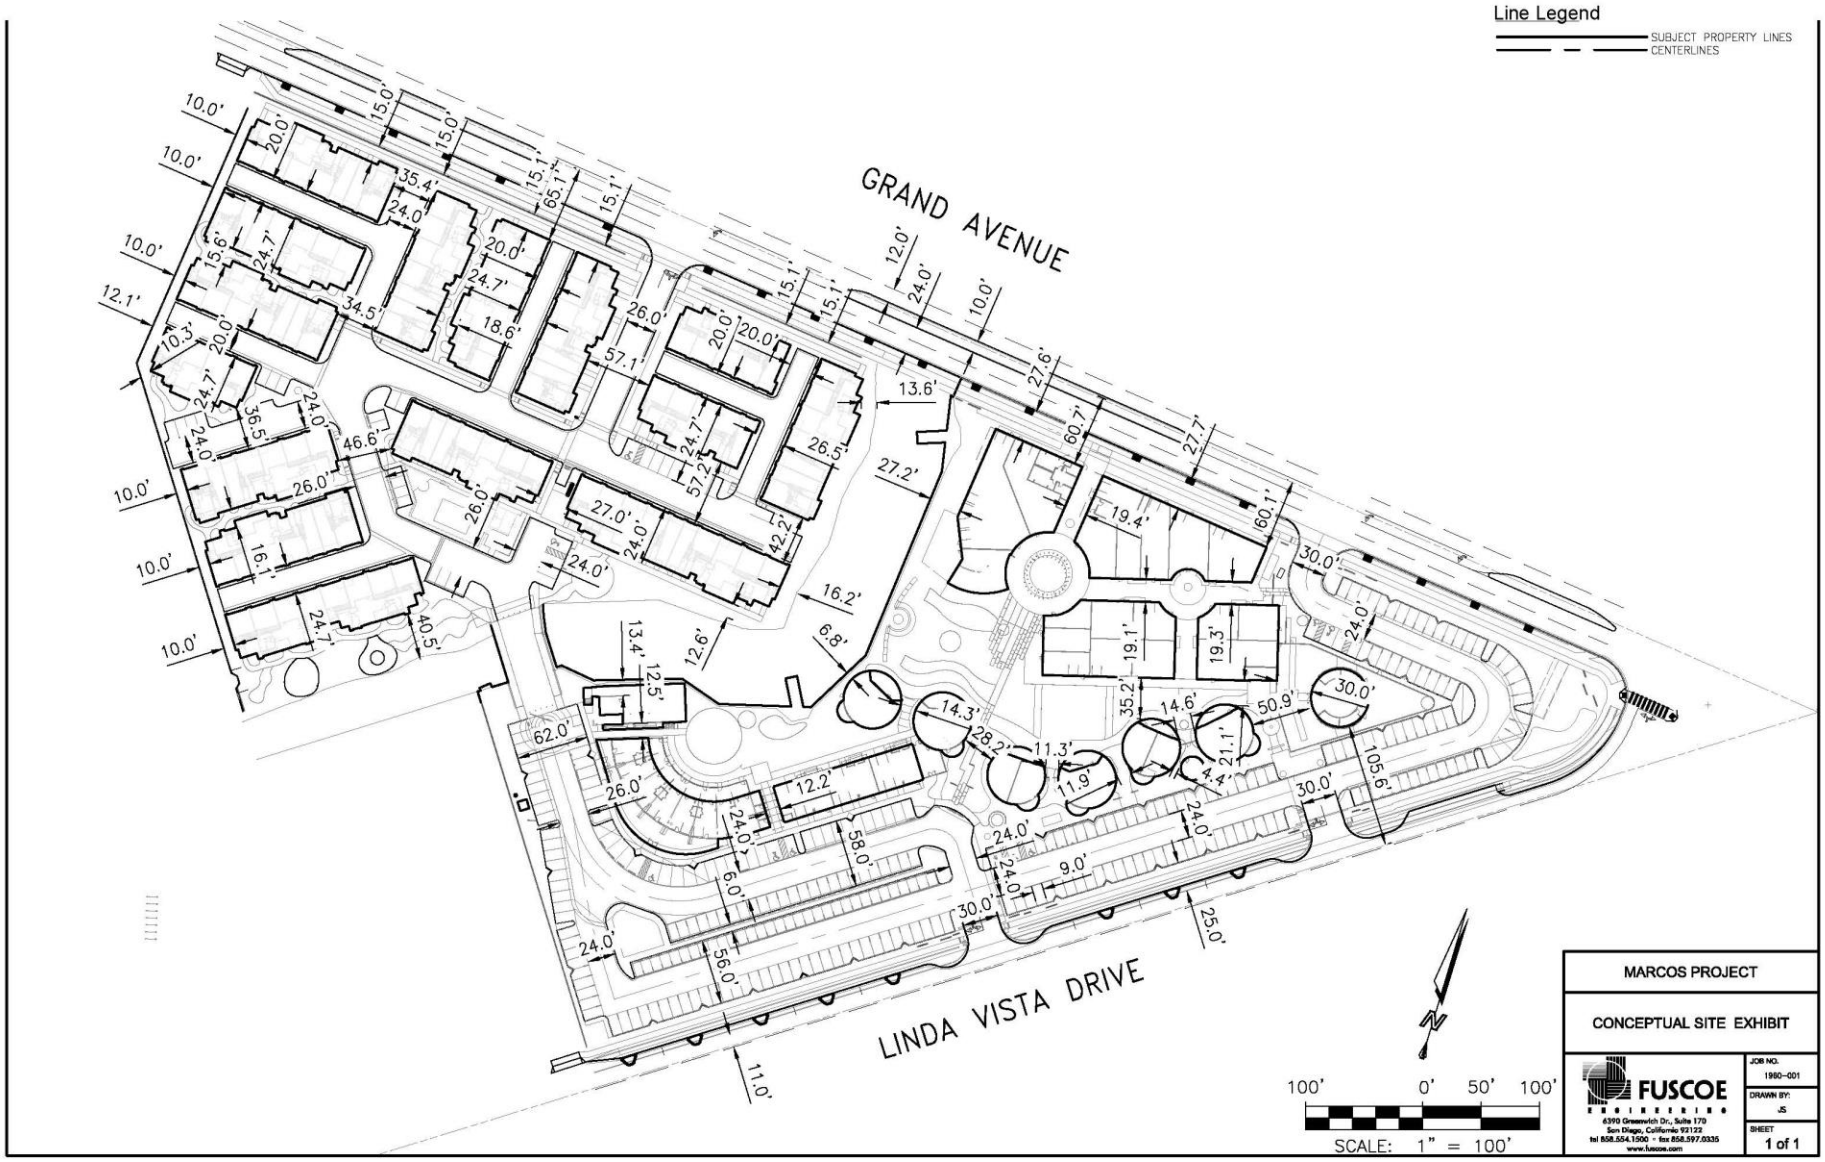
East-End Planning Area Standards		
Use	**Standards**	**Additional Standards/Notes**
Lot Standards		
Maximum FAR	0.7	
Lot Coverage	50%	
Maximum Building Height	60′	
Maximum Architectural Projections Heights	65′	Includes architectural wood frame feature
Maximum Live-Work Units	7	
Development Setbacks		
Grand Avenue	52′ min.	Measured from Grand Ave. centerline to buildings.
Linda Vista Drive	10′ min.	Measured from PL or Ultimate Right-of-Way to buildings.
Interior PL, Parking	5′ min.	
Building Separation	10′ min.	
Parking Standards		
Commercial Parking Total	278 min.	Refer to Shared Parking Analysis by C&R Associates, dated 12/4/2022.
Standard Parking Stall	9′ x 18′ min. or 9′ 16′ + 2′ overhang	
Compact Stall	8.5′ x 16′	20% of site parking total. Any overhang shall not extend into any required walkways or conflict with taller landscaping such as trees.
ADA Stall	9′ x 18′ + 5′ loading zone for standard ADA space & 12′ x 18′ + 5′ loading zone for van accessible space	

Bicycle	1 space/5,000 SF gross floor area	Refer to Section 3.6.1.9.D.
Open Space/Landscaping		
Landscaping	10% of net developable site	
Live-Work Private Open Space	Provide min. 140 sf of deck area per unit. Provide a minimum of 2,500 SF of common area open space	
Other Standards		
Walls and Fencing	7′ max	Refer to Section 4.1.7.3. Refer to Las Posas Creek Planning Area standards for creek fencing standard.
Signage		Refer to Section 4.1.7.4 & Chapter 20.320 of the SMMC

West-End Planning Area Standards		
Use	Standards	Additional Standards/Notes
Lot Standards		
Density	20.1 - 30.0 du/ac	
Minimum Lot Size	10,000 sq. ft.	
Maximum Lot Coverage	n/a	No standard.
Maximum Building Height	45 feet or 3 stories	Whichever is less, as measured from the adjacent grade to the top of the tallest roof or architectural feature.
Development Setbacks		
Grand Ave.	52′ min.	Measured from Grand Ave. centerline to buildings.
Property Line	10′ min.	
Interior PL, Parking	8′	
Interior Parking to Building	5′	
Private Driveway	3′	Measured from back of walk or from face of curb when no sidewalk is present.
Private Alley	3 feet or 18 feet plus	Measured from face of garage door.
Building Separation	15 feet minimum	Consistent with adopted Building Code on building design.
Parking Standards		
Garage	2 spaces per unit maximum	Refer to Section 3.6.2.2.
Guest	0.33 per unit maximum	Refer to Section 3.6.2.2.
Standard Parking Stall	9′ x 18′ min. or 9′ 16′ + 2′ overhang	
Compact Stall	8.5′ x 16′	Maximum 20% of total spaces may be compact spaces.
ADA Stall	9′ x 18′ + 5′ loading zone for standard ADA space & 12′ x 18′ + 5′ loading zone for van accessible space	
Bicycle	Individual unit garage space shall act as bicycle parking.	Refer to Section 3.6.2.2.

Open Space Standards		
Private Open Space	Provide units with ground floor living a minimum of 90 sf of patio and/or balcony space. Provide 50 sf balcony for 2nd story units and above	Refer to Section 3.6.2.3.
Common Open Space	Area equal to 30% of livable ground floor area of all units	Refer to Section 3.6.2.3.
Walls and Fencing	7' maximum	Refer to Section 3.6.2.3. Taller walls may be allowed for sound attenuation as approved by the Planning Director. Refer to Las Posas Creek Planning Area standards for creek fencing standard.

Las Posas Creek Planning Area Standards		
Use	Standards	Additional Standards/Notes.
Lot Standards		
Density	n/a	No development allowed.
Minimum Lot Size	0.98-acres	
Maximum Lot Coverage	n/a	No development allowed.
Setbacks	n/a	The modified parcel line for both the East-End & West-end Planning Area's aligns with the conservation easement. No development shall occur within the conservation easement area.
Fencing	4' maximum from grade	Split-rail wood fence with 2" x 2" wire mesh, or a combination thereof consistent with Negative Declaration 09-789.
Signage		Signage consistent with Negative Declaration 09-789



Conceptual Marcos Site Plan

Figure 7

Marcos Specific Plan

3.6.1 East-End Planning Area Development Standards

The East-End Planning Area encompasses a total of 6.05-acres and is comprised of commercial/retail, entertainment, and live-work uses along with associated landscaping and commercial recreational open space areas east of Las Posas Creek.

3.6.1.1 East-End Land Uses Governed by Conditional Use Permit

The East-End Planning Area includes a variety of commercial, retail, live-work, and makerspace uses which will be under an umbrella Conditional Use Permit (CUP). The following descriptions may be used as a guide to allow proposed uses within the East-End Planning Area. Due to the innovative nature of the Specific Plan area, there may be land uses that are compatible with the East-End Planning Area concept but not identified as an allowed land use in the **Table 2** and the descriptions below; therefore, any land use compatible with the allowed uses should be considered at the discretion of the Planning Division Manager. Land uses should generally be allowed to operate from any location within the East-End Planning Area unless a specific location for a use is noted or restricted per the land use guidelines herein.

A. **Commercial Artist/Production Studio Uses –** These spaces include businesses which focus on the creation and construction of visual arts as well as industrial or applied arts. Typical uses involve physical creation of artistic objects or performance arts studios. Businesses may involve the production of performance art or the creation of physical objects in fashion, photography, sculpture, woodworking, and general craftsman operations.

B. **Industrial/Maker Space Uses –** These uses typically focus on crafting spaces that allow individuals or groups/companies to manufacture and distribute craft products such as furniture, metal products, home goods, foods, beverages, and other craft-style products. These uses may utilize shared tools and equipment.

C. **Education Uses –** East-End Planning Area education uses generally will be utilized as accessory to an allowed use as instructional classes or similar. These uses should be focused on instruction and education in science, technology, audio arts, visual arts, performance arts, crafts, and culinary arts.

D. **General Retail –** These uses are focused on the general sale of retail items from storefronts and may include a variety of sales and services.

E. **Office Uses –** Office uses included in the East-End Planning Area allow for professional design consultants such as architecture, engineering and planning firms, design studios, fashion studios, graphic design studios, accounting offices, and other professional office uses.

F. **Food and Beverage Uses –** Typical food and beverage uses will operate throughout the East-End Planning Area and will include breweries, sit down restaurants, cafés, coffee shops, distilleries, wine tasting rooms, and other restaurant and food and beverage uses.

G. **Wellness Uses** – These uses typically provide health and wellness-oriented services related to healthy living. Uses may include spa's, salons, nutrition-focused businesses, yoga studios, pilates studios, meditation studios, and other mind and body related businesses.

H. **Accessory Uses** – Accessory uses may be related to any of the above uses such as patio dining for restaurant uses, outdoor yoga practice or similar activities, art showings and temporary

museums for maker and retail uses, billboards, and art installations (Section 3.6.1.3.), kiosks (Section 3.6.1.6.), as well as events covered in Section3.6.1.4.

3.6.1.2 ABC Permits

The East-End Planning Area allows for uses which may serve alcohol as well as allow for a shared premise to serve alcohol. Therefore, permits from the California Department of Alcohol Beverage Control (ABC) may be issued to businesses within the East-End Planning Area. The following standards apply to alcohol service and consumption within the East-End Planning Area:

1. The entire East-End Planning Area shall be treated as a shared ABC premise allowing spill out dining and tasting from restaurants, microbreweries, and tasting rooms into community gathering spaces. Control points will occur at entries to each community gathering area meeting ABC fencing and signage requirements.
   a. Bars having allocated patio space shall be allowed to seat patrons on the patio.
2. Any use serving alcohol, and which is allowed within this Specific Plan will not require a 500-foot separation from any other use allowed within the Specific Plan Area including residential uses, religious assemblies, schools, or other youth-oriented institutional activities.
3. Uses eligible for ABC licenses within the East-End Planning Area include:
   a. Bars
   b. Beer Gardens
   c. Breweries
   d. Distilleries
   e. Restaurants
   f. Retail Sales
   g. Wine Bars
4. Typical ABC License Types allowed within the East-End Planning Area:
   a. Type 04, Distilled Spirits Manufacturing
   b. Type 20, Off Sale Beer & Wine
   c. Type 23, Small Beer Manufacturing
   d. Type 41, On Sale Beer & Wine – Eating Place
   e. Type 47, On Sale General – Eating Place
   f. Type 48, On Sale General – Public Premise
5. ABC control Points
   a. Community gathering areas shall use walls, landscaping, landscape planters, benched seating, or similar landscape design features to funnel people through control points.
   b. Signage consistent with ABC guidelines shall be posted at entry and exits from control points.

Figure 8 ABC Shared Premise Boundary

3.6.1.3 Art Installations and Billboards

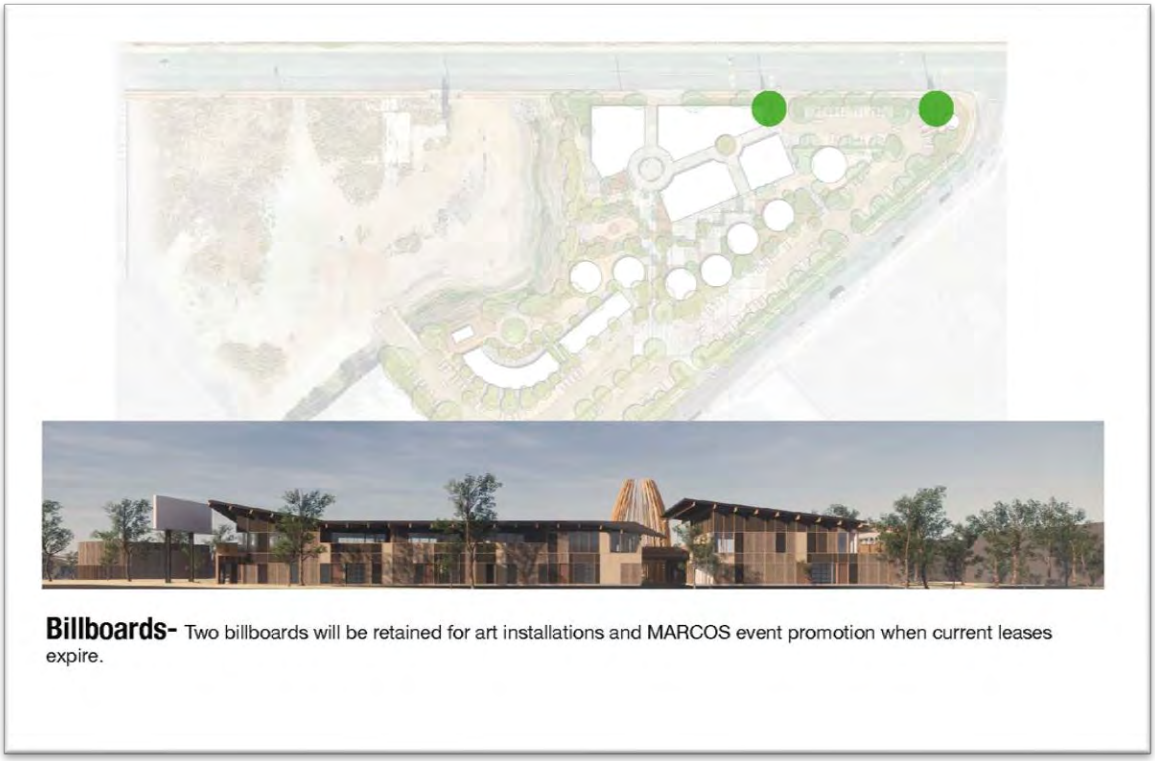
Art installations may be provided in the following forms:

1. Murals
2. Sculptures
3. Performance arts
4. Other – as approved by the city's Planning Director

The existing billboards on the north property line within the East-End Planning Area shall remain and shall be repurposed as East-End Planning Area art and event information billboards. The following standards apply to the billboard displays:

1. Art installations are allowed for billboard use.
2. Event advertising for East-End Planning Area events shall be allowed to use the billboards.
3. Billboards should avoid potentially offensive art installations.
4. No digital signage or performance art shall be allowed on the billboards.
5. No advertisements for offsite uses shall be displayed on billboards after occupancy of the East-End Planning Area.

Figure 9 Proposed Billboard Locations



3.6.1.4 Events and Entertainment

Events shall be allowed within the Specific Plan area and will occur within the various gardens and plazas spread throughout the East-End Planning Area. Events and entertainment not included in **Table 4** should reference the standards in Section 3.6.1.4, A to be considered an allowed event. Events similar in nature to those listed in **Table 4** shall be allowed within the parameters of the size categories below. Events and entertainment not included in section **Table 4** may be allowed subject to the Planning Director's decision. The following development standards apply to all events and outdoor entertainment proposed within the East-End Planning Area:

A. Allowable Events and Entertainment

Events within the Specific Plan shall be allowed based on the following criteria:

1. Events and entertainment must fall within the event size category identified in Section 3.6.1.4.B.
2. All proposed events and entertainment must comply with the parking requirements identified in Section 3.6.1.9.C.
3. Events and entertainment may occur from 10 a.m. to 10 p.m. Noise shall not exceed 65 dBA Leq at the property line per SMMC 20.300.070E.
4. Large Events and/or events requiring the use of parking areas shall require a special event permit issued by the City of San Marcos.
5. Prior to the first event, a final Parking Management Plan shall be approved by the Planning Director.

6. Offsite parking accommodation may be required to be secured prior to the event and/or other alternative methods utilized as identified in the latest approved Parking Management Plan.
7. Any proposed offsite parking agreements shall be provided to the city in advance of the event and/or application of a Special Event Permit.

B. Event Categories

Events which may occur on the site are anticipated to be classified in three categories:

1. Small Events (10-20 people):
   a. May occur on a weekly basis.
   b. Small events may be held indoors or in outdoor gathering spaces.
   c. Small outdoor events shall take place during regular business hours.

2. Medium Events (20-100 people)
   a. Medium events may occur twice monthly.
   b. Medium events may be held indoors or in outdoor gathering spaces.
   c. Medium events may take place on weekends between the hours of 4 p.m. to 10 p.m. or as approved by a special event permit issued by the City of San Marcos prior to the event.
   d. Medium events shall not utilize on-site parking areas unless a Special Event Permit is approved by the City prior to the event.

3. Large Events (100+ persons)
   a. Large events may take place once a quarter.
   b. Large events would be geared toward attracting the community.
   c. Large events shall be held in outdoor gathering spaces.
   d. Large events may take place between the hours of 10 a.m. to 10 p.m.
   e. Large events shall require a Special Event Permit approved by the City prior to the event. The Special Event Permit shall be accompanied by proof that adequate off-site parking has been secured.

4. Accessory Entertainment for Bars and Tasting Rooms
   a. Accessory entertainment will be allowed within bars and tasting rooms and on outdoor patio spaces allocated to bars and tasting rooms.

Table 4 Allowable Events

Event Category	Event Type Allowed	Event Location
Small Events (10-20 people)	Art Demonstrations & Educational Speakers	Indoor/Outdoor
	Art Lectures	Indoor/Outdoor
	Buskers in Makers Promenade	Indoor/Outdoor
	Live music	Indoor/Outdoor
	Movies	Indoor/Outdoor
	Wellness/Yoga	Indoor/Outdoor
Medium Events (20-100 people)	Concerts	Indoor/Outdoor
	Craft Fair	Indoor/Outdoor
	Music School Recitals	Indoor
	Open Studio Nights	Indoor/Outdoor
	Outdoor Movies	Outdoor
	Summer Movies Series (Art Film festival)	Indoor/Outdoor
Large Events (100+ people)	Concerts	Outdoor
	Craft Fair	Outdoor
	Craft Beer Festivals	Outdoor
	Farmers Market	Outdoor
	Food Festivals	Outdoor
	Holiday Festivals	Outdoor

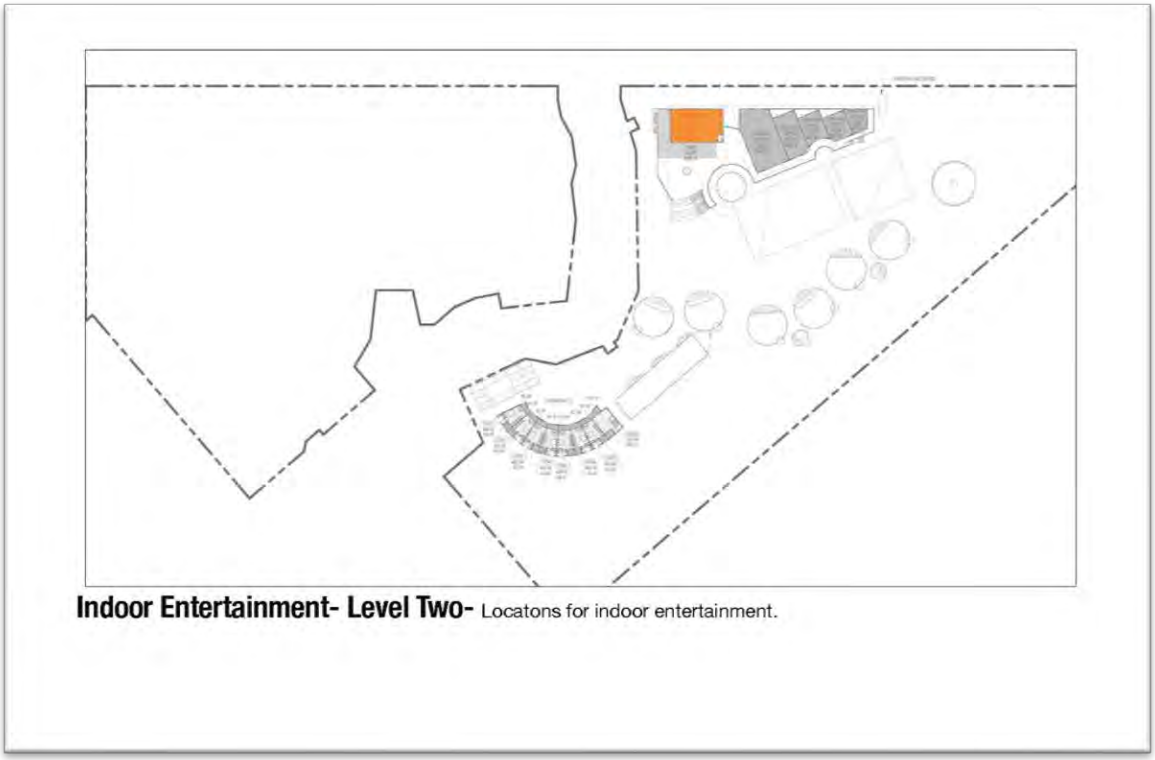
Figure 11 Second Story Indoor Event Locations



Indoor Entertainment- Level Two- Locatons for indoor entertainment.

Figure 12 Outdoor Festival and Market Locations

3.6.1.5 Floor Area Ratio (FAR)

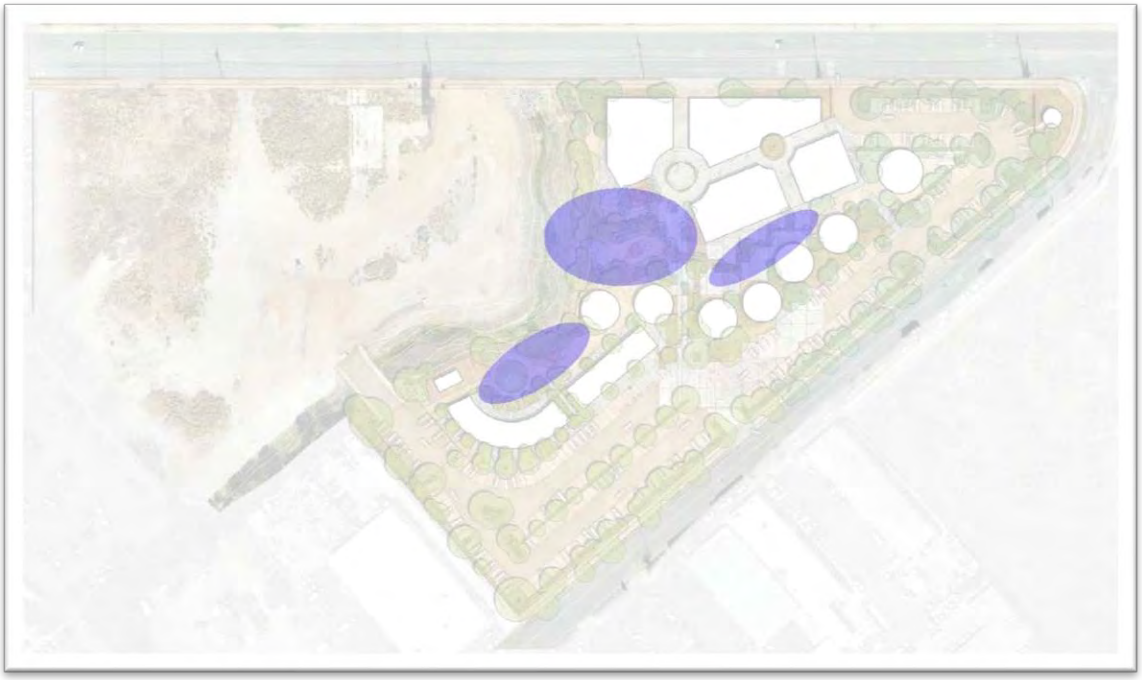
The East-End Planning Area is located on approximately 6.05- acres and includes approximately 51,269 sq. ft. of building area. This equates to a FAR of 0.1 for the Planning area, which is within the target FAR for the site.

3.6.1.6 Kiosks

Kiosks shall be allowed in various locations throughout the East-End Planning Area and shall comply with the following standards:

1. Kiosks shall not impede pedestrian traffic and shall maintain a minimum of 5' of clear walkway space.
2. Kiosks may be used for art fairs, holiday markets, night markets, and temporary pop-up uses for short-term events and shall be removed at the end of the event.
3. Kiosks may utilize vintage trailers, refurbished vehicles, or other similar items.
4. Two Permanent kiosk are included within the East-End Planning Area; however the Kiosks are designed as amenities and when not in use would be utilized as outdoor bench seating or other similar landscape design features.
    a. The permanent kiosks would operate during events.

Figure 13 Kiosk Locations



3.6.1.7 Live-Work Units Open Space

Live-work units will provide private open space in the form of deck space for each dwelling unit. In addition, approximately 2,059 SF of common area private open space located to the rear of the units will be available for use by all live-work residents.

1. A minimum of 151 SF of main entry courtyard space shall be provided for each live-work unit.
2. A minimum of 140 SF of exclusive use deck space shall be provided for each live-work dwelling unit.
3. The 2,059 SF common area private open space shall not be used as storage area.
    a. Common area private open space may include recreational amenities such as:
        i. Barbeques and seating area.
        ii. Picnic tables or seating.
        iii. Open turf area.
        iv. Lawn sports such as volleyball & bad mitten, bocce ball, etc.
        v. Fire pit.
        vi. Other similar recreational amenities.

3.6.1.8 Landscaping Regulations

All open space areas shall be landscaped in accordance with the City of San Marcos' Water Efficient Landscape Ordinance (WELO). All required landscaping shall be permanently maintained in a healthy condition free from weeds, trash, and debris per the city-approved landscape plan. Any deviations from the approved landscape plan shall be approved by the city.

1. Lighting Regulations

Lighting fixtures shall be directed and shielded so as not to illuminate surrounding properties and reduce glare and shall comply with the following standards, as verified through a photometric study:

a. Parking areas shall be illuminated to levels that achieve a uniform ratio of three to one (3:1) (average to minimum) and maintain an average of one (1) foot candle, with a minimum of one-half (1/2) foot candle.

b. Perimeter lighting, not affiliated with the lighting of parking lots, shall not exceed one-half (1/2) foot candle at any point along the property line of the subject or adjacent parcel.

c. No light shall spill over into neighboring properties or the Las Posas Creek open space land use.

d. All lighting shall be shielded and directed downward.

3.6.1.9 Parking & Rideshare

Off-street parking for the East-End Planning Area will be regulated in accordance with the SMMC and the following requirements:

A. General Requirements

1. Parking shall only be permitted in designated parking spaces. No parking shall be permitted in Private Drives, Private Drive Aisles, or driveways.

2. All circulation, ingress and egress, and off-street parking areas shall be surfaced with an asphalt, cement concrete paving, or compacted decomposed granite, designed to withstand repeated vehicular traffic. Other paving material may be used, such as pervious surfaces, subject to the approval of the Planning Director and City Engineer.

3. All guest parking spaces, Private Drives, Private Drive Aisles, pedestrian crossings, driveways, and fire lanes shall be striped or otherwise designated to provide safe access and circulation. Pavement markings signage, and other distinctions shall be maintained in a visible and legible manner.

4. Proposed uses within the Specific Plan shall reference the latest city-approved Shared Parking Analysis (currently produced by C&R Associates dated 10/21/2022) to determine their use is consistent with the maximum square footages identified for the respective use category. When a specific use is proposed which exceeds a use category's maximum square footage threshold for parking required, the use may still be allowed within the East-End Planning Area when the specific proposed use does not exceed the total required parking thresholds for all categories.

B. Parking and Loading

1. A minimum of 278 parking spaces shall be provided for the East-End Planning Area.

2. Live-work units will provide 1 parking space per unit.

3. Parking Space dimensions shall be provided as follows:

i. Perpendicular guest parking spaces shall have a minimum dimension of nine (9) feet wide by 18 feet long or 9 feet wide by 16 feet long with a two (2) foot overhang for regular

spaces and 8.5 feet wide by 16 feet long or 8.5 feet wide by 14 feet long with a two (2) foot overhang. Bumper guards or wheel stops shall be provided in such a manner as to ensure that no portion of any parked vehicle shall touch any wall, fence, building or project beyond any lot lines bounding a parking area facility. In lieu of bumper guards or wheel stops, the paved parking space length may be decreased by up to two (2) feet by providing an equivalentvehicle overhang into landscape areas or paved walkways. Such an overhang area shall not be considered as part of any open space requirement. In no case shall such overhang beconsidered part of a required walkway or sidewalk width.

ii. Parallel guest spaces shall provide a minimum dimension of nine (9) feet wide by 22 feet long. End spaces may be reduced to 18 feet long.

iii. 20% of the total spaces may be compact spaces.

4. Parking shall not be permitted within the setback area to Grand Ave. or Linda Vista Dr.

5. To provide shade and reduce heat island effect, rows of new parking shall be broken up with tree planters provided at a minimum of one (1) tree for every five (5) parking spaces. Tree planters shall have a minimum interior dimension of five (5) feet. Trees shall be a minimum 24-inch box size and shall be designed to achieve a goal of fifty percent (50%) shade requirement within fifteen (15) years of planting. Landscape irrigation shall be provided per the requirements of the City of San Marcos Water Efficient Landscape Standards (WELO).

6. Designated parking spaces for the disabled shall be provided in compliance with state law (Title 24) and the California Vehicle Code (Section 22507.8), including required number of parking spaces and design requirements.

7. Delivery/loading areas are identified in **Figure 14**.

C. Event Parking

Parking for special events shall be subject to the following development standards:

1. Events shall utilize existing commercial parking spaces, valet services, and/or offsite parking and shall be controlled by the latest approved Parking Management Plan prepared for the Specific Plan area and/or Special Event Permit issued by the City of San Marcos.

D. Bicycle Parking

The following standards promote the use of bicycles as an alternative to single occupancy vehicle use in accordance with Specific Plan Objectives #1 and #5:

1. Provide at minimum 1 bicycle parking space per 5,000 SF of Commercial area, 1 bicycle parking space per 10,000 SF of Office area, 1 bicycle parking space per 7,500 SF of retail area, and 1 bicycle parking space per 10,000 SF of makerspace.

2. For all area use classifications 25% shall be Class I bicycle parking facilities and 75% Class II bicycle parking facilities.

3. Guest bicycle parking shall consist of permanently anchored bicycle racks or other secure bicycle parking in a location readily visible to passers-by.

E. Electric Vehicle Parking and Charging

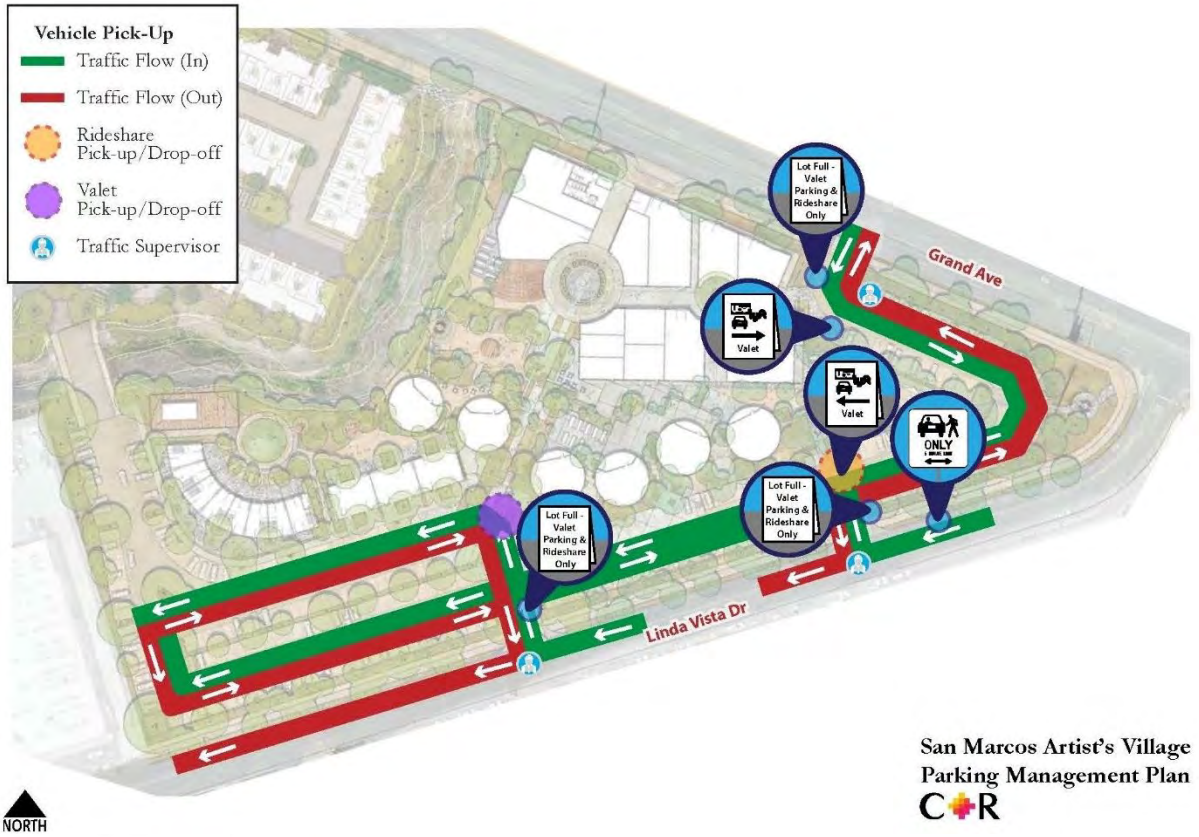
The following standards implement Specific Plan Objectives #1:

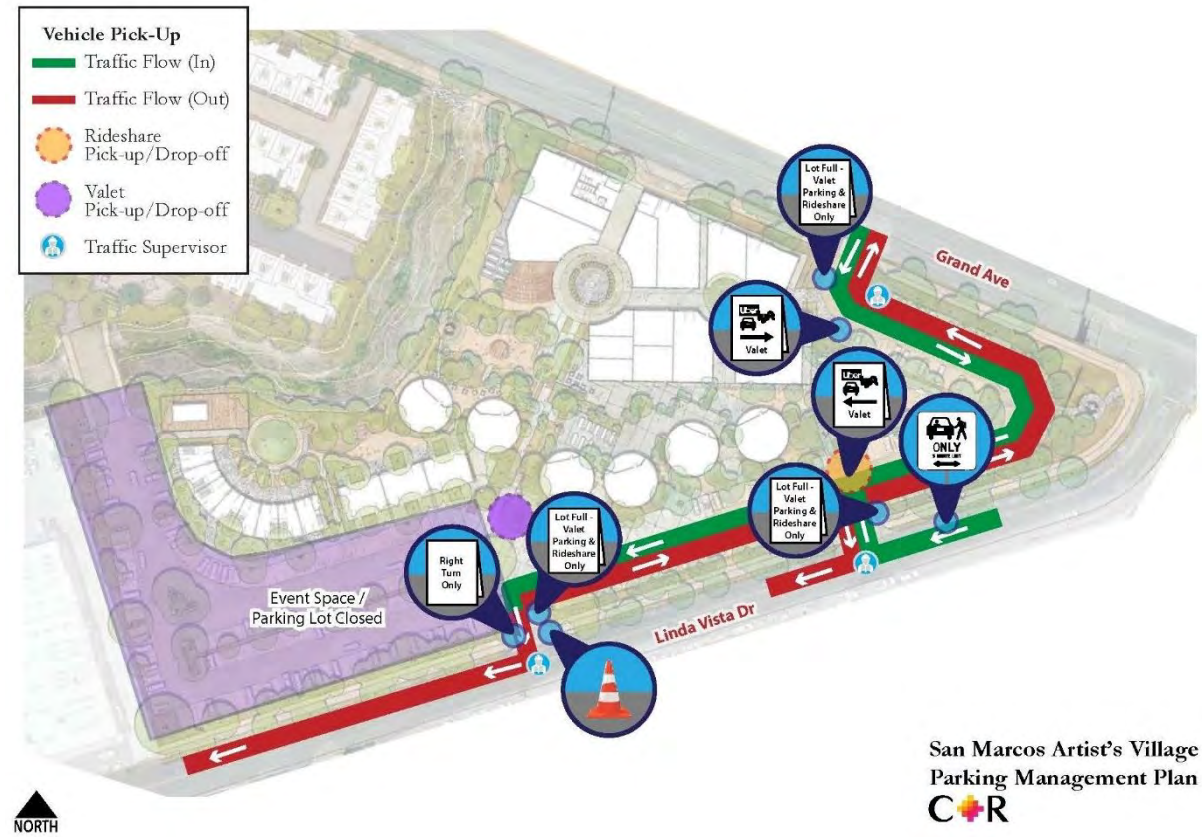
1. A minimum of five percent (5%) of the commercial/retail parking spaces required shall be equipped with EV charging stations or as otherwise required by CalGreen, whichever is more stringent. Calculations for the required number of spaces shall be rounded up to the nearest whole number.
2. Charging stations/spaces shall not interfere with on-site parking or pedestrian circulation.
3. Charging stations/spaces shall be maintained in functioning order in all respects.
4. Final EV stall locations will be determined prior to the issuance of a building permit.
5. Supercharging stations shall be allowed within the Specific Plan area and processed via building permits with the City of San Marcos.

F. Valet, Rideshare, and Delivery Services

Valet and rideshare shall be allowed within the East-End Specific Plan.

1. Valet parking shall be controlled by the latest city-approved Parking Management Plan prepared for the Marcos Specific Plan.
2. Valet and rideshare drop-off and pickup locations shall not block or interfere with emergency vehicle parking, i.e., red-striped curbs, or block fire hydrants or other fire equipment.
3. Valet services shall be utilized in accordance with the latest approved parking management plan during large events, or as demand increases and during holiday festivals.
4. A minimum of four (4) rideshare drop-off and pickup locations will be provided for the East-End Planning Area.
5. The Planning Area will provide three (3) short delivery service areas at a minimum. These areas shall not block or interfere with emergency vehicle parking, i.e., red-striped curbs, or block fire hydrants or other fire equipment. Valet and rideshare drop-off and pickup locations are identified in **Figure 14**.
6. Rideshare is encouraged when visiting the Specific Plan area.





Valet and Rideshare Options

Figure 14

Marcos Specific Plan

3.6.2 West-End Planning Area Development Standards

The principal residential land uses within the Specific Plan are located within the West-End Planning Area and include multi-family residential land uses and their respective private and common area recreational open space.

3.6.2.1 Density

The West-End Planning area is approximately 5.03-acres and may accommodate multi-family dwelling units at a density of 20.1-30.0 du/acre, which is consistent with the City of San Marcos Medium High Density Residential MHDR General Plan Land Use classification.

3.6.2.2 Parking

This section shall provide regulation of off-street parking for all residential development within the West-End Planning area of the Marcos Specific Plan. Parking standards have been developed in accordance with the SMMC Section 20.340 Off-Street Parking and Loading.

A. General Requirements

1. Parking shall only be permitted in designated parking spaces and inside garages. No parking shall be permitted in Private Drives, Private Drive Aisles, or driveways.
2. All circulation, ingress and egress, and off-street parking areas shall be surfaced with an asphalt or cement concrete paving, designed to withstand repeated vehicular traffic. Other paving material may be used, such as pervious surfaces, subject to the approval of the Planning Director and City Engineer.
3. All guest parking spaces, Private Drives, Private Drive Aisles, pedestrian crossings, driveways, and fire lanes shall be striped or otherwise designated to provide safe access and circulation. Pavement markings, signage, and other distinctions shall be maintained in a visible and legible manner.

B. Garages

The following standards shall apply to all residential garages within the West-End Planning Area:

1. Garages shall provide a minimum of two (2) parking spaces.
2. Each interior garage parking space shall maintain an unobstructed dimension of 40 feet long and 12 feet wide for tandem garages and 20' x 20' minimum for two-car side by side garages and a minimal vertical clearance of seven (7) feet, except the front three (3) feet of aparking space located at the front of the garage may have a vertical clearance of four (4) feet.
3. Twenty-five % (25) of West-End dwelling units may feature tandem garage parking.
4. Garages shall be designed to provide adequate storage for three (3) waste carts. Waste carts storage space shall not encroach into the required parking space area.
5. Bicycle parking shall be allowed within garages.
6. Garage spaces shall be used for parking and not storage, which shall be enforced through the Community's Covenants, Conditions, & Restrictions (CC&Rs).

C. Guest Parking

The following standards shall apply to all guest parking within the West-End Planning Area:

1. A minimum of 0.33 guest spaces per unit shall be required. Calculations for the required number of spaces of 0.5 or greater shall be rounded up to the nearest whole number.
2. Parking Space dimensions shall be provided as follows:
   i. Perpendicular guest parking spaces shall have a minimum dimension of nine (9) feet wide by 18 feet long. Bumper guards or wheel stops shall be provided in such a manner as to ensure that no portion of any parked vehicle shall touch any wall, fence, building or project beyond any lot lines bounding a parking area facility. In lieu of bumper guards or wheel stops, the paved parking space length may be decreased by up to two (2) feet by providing an equivalent vehicle overhang into landscape areas or paved walkways. Such an overhang area shall not be considered as part of any open space requirement. In no case shall such overhang beconsidered part of a required walkway or sidewalk width. The 20% allowed compact stalls shall be for guest spaces only and shall not permit any overhang.
   ii. Parallel guest spaces shall provide a minimum dimension of nine (9) feet wide by 22 feet long. End spaces may be reduced to 18 feet long.
3. Where possible, guest parking spaces should be evenly distributed throughout the Specific Plan area and designed to occur along private driveways where possible. Apartment building types may cluster parking adjacent to buildings.
4. Parking shall not be permitted within the setback area of any setback to Grand Ave. and should be located behind buildings and interior to the Specific Plan area, where feasible, such that parking visibility is minimized from the public right-of-way.
5. To provide shade and reduce heat island effect, rows of new parking shall be broken up with tree planters provided at a minimum of one (1) tree for every five (5) parking spaces. Tree planters shall have a minimum interior dimension of five (5) feet. Trees shall be a minimum 24-inch box size and shall be designed to achieve a goal of fifty percent (50%) shade requirement within fifteen (15) years of planting. Landscape irrigation shall be provided per the requirements of the City of San Marcos Water Efficient Landscape Standards (WELO).
6. Guest parking spaces shall be solely used for parking, not for storage; display or sale or lease; or repair of vehicles, trailers, recreation vehicles, boats, or similar.
7. In addition to required guest spaces, at least one (1) space shall be reserved for United States Postal Service and other delivery trucks per residential lot. Where possible, this delivery space should be conveniently located near grouped mailboxes.
8. Designated parking spaces for the disabled shall be provided in compliance with state law (Title 24) and the California Vehicle Code (Section 22507.8), including required number of parking spaces and design requirements.

D. Bicycle Parking

The following standards promote the use of bicycles as an alternative to single occupancy vehicle use in accordance with Specific Plan Objectives #1 and #5:

1. Each home shall provide a minimum of one (1) secure and weatherproof bicycle parking space oras otherwise required by CalGreen, whichever is more stringent. Space may be provided within a garage, locker, or accessible indoor area.

2. Provide guest bicycle parking at a ratio of one (1) bike per 5 units. Guest parking shall consist of permanently anchored bicycle racks or other secure bicycle parking in a location readily visible to passers-by.

E. Electric Vehicle Parking and Charging

The following standards implement Specific Plan Objectives #1:

1. A minimum of five percent (5%) of the guest parking spaces required shall be equipped with EV charging stations or as otherwise required by CalGreen, whichever is more stringent. Calculations for the required number of spaces shall be rounded up to the nearest whole number.
2. Garages shall be equipped with electric vehicle charging infrastructure in accordance with CalGreen.
3. Charging stations/spaces shall not interfere with on-site parking or pedestrian circulation.
4. Charging stations/spaces shall be maintained in functioning order in all respects.
5. Final EV stall locations will be determined prior to the issuance of the building permit.

3.6.2.3 Open Space

In accordance with SMMC, new multi-family residential developments are required to provide both private and common open space.

A. Private Open Space

Private open space is defined as open space areas intended for the private use of individual dwelling units. Each dwelling unit with living space on the second story and above should provide a minimum of 50 square feet of private open space. Units with ground floor living space shall provide a minimum of 90 square feet of patio space. Private open space areas shall be subject to the following requirements:

1. Private open space calculations may be averaged so long as the total private open space exceeds the minimum square footage required in the SMMC.
2. Private open space shall be directly accessible from the interior living space of the unit it is intended to serve.
3. Private open spaces shall be located on the same floor as the primary living area to maximize functionality.
4. Private open space shall not be used for storage.

B. Common Open Space

Common area open spaces are provided for the benefit of residents and their guests.

1. An area equal to 30% of the total livable ground floor area of all units shall be provided as usable common open space.
2. Common open space exceeding ten percent (10%) in slope shall not be considered usable open space.

3. Walkways and bike paths shall be used in the calculation of usable open space.
4. Children's play structures, including tot lots and playground equipment should be strategically spaced in the West-End planning area to maximize utility.
    a. A minimum of 400 square feet of tot lot area for every 25 dwelling units.
    b. Children's play areas shall be a minimum of 400 square feet of usable area.
    c. Children's play areas shall be effectively buffered/fenced from adjacent streets and parking areas.
    d. Play equipment should mimic the adjacent natural creek environment and include elements such as climbing boulders, rocks, salvaged logs, mounded earth berms, or other natural-looking play features.
5. In addition to the of tot lot play area requirements described above an additional 800 square feet of playground or tot lot area shall be provided.
    a. Playgrounds may be combined with tot lots to create larger enhanced play areas.
6. At least three (3) major recreational amenities shall be provided for the West-End Planning Area and may include similar amenities as the following:
    a. Basketball court
    b. Garden, community, meditation, or similar.
    c. Lawn game(s) such as bocce ball, cornhole, horseshoes, or similar.
    d. Multi-purpose recreation center.
    e. Off-leash pet area/dog park.
    f. Outdoor exercise area.
    g. Picnic space(s) with gas barbeque/outdoor kitchen.
    h. Playground.
    i. Pool or spa.
    j. Tennis court.
    k. Volleyball court.

    Other similar amenities may be allowed pending approval by the Planning Director.
7. Amenities should be distributed throughout the site and should be selected to cater to a diverse range of interests and lifestyles including pet owners, young families, singles and more. Spaces should be provided that offer opportunities to play, socialize, and relax.

C. Wall and Fences

Walls and fences within the West-End Planning Area serve as functional boundaries framing outdoor spaces as well as complementary pieces of the landscape design. The review of walls and fences shall be an integral part of any site plan, permit, or Multi-Family Site Development

Plan review application. Compliance with all wall and fence regulations contained herein shall be required unless otherwise approved by the Planning Director.

1. Walls, fences, and monuments may be used to create partitions between private open spaces, screen the development from roadways, reduce noise from roadways, and enhance the site design.
2. Development within the planning areas shall be designed to minimize walls and fences where possible to support an open community.
3. Walls and fences shall not exceed seven (7) feet in height. Decorative pilasters may exceed the maximum height by one (1) foot and shall have a maximum of 50' of separation. Taller walls or fences for sound attenuation may be allowed upon review and approval of the Planning Director.
4. Walls, fences, and architectural screening elements shall be compatible with the architectural treatments of the site buildings.
5. No wall, fence, or landscape element shall interfere with intersection visibility, line of sight, or other safety issues.
    a. Blank walls are prohibited. Where screening or security walls (excluding tubular steel or other "open" fence types) are located within ten (10) feet of public right-of-way, landscaping shall be provided between the wall and the right-of-way to a minimum height of four (4) feet to minimize opportunities for crime and unsafe conditions.
    b. All retaining walls are subject to the City of San Marcos Municipal Code and Engineering Standards.

3.6.2.4 Landscaping Regulations

All open space areas shall be landscaped in accordance with the City of San Marcos' Water Efficient Landscape Ordinance (WELO). All required landscaping shall be permanently maintained in a healthy condition free from weeds, trash, and debris per the city-approved landscape plan. Any deviations from the approved landscape plan shall be approved by the city.

2. **Lighting Regulations**

Lighting fixtures shall be directed and shielded so as not to illuminate surrounding properties and reduce glare and shall comply with the following standards, as verified through a photometric study:

e. Parking areas shall be illuminated to levels that achieve a uniform ratio of three to one (3:1) (average to minimum) and maintain an average of one (1) foot candle, with a minimum of one-half (1/2) foot candle.

f. Perimeter lighting, not affiliated with the lighting of parking lots, shall not exceed one-half (1/2) foot candle at any point along the property line of the subject or adjacent parcel.

g. No light shall spill over into neighboring properties or the Las Posas Creek open space land use.

h. All lighting shall be shielded and directed downward.

3. Signs

Signs are permitted within the Specific Plan area and shall be subject to the City of San Marcos sign code and as described herein.

One (1) Monument Sign is permitted at each West-End Planning Area entry. Monument signs shall be subject to the following requirements:

1. Each monument sign shall not exceed six (6) feet in height.

2. The sign face for each monument sign, exclusive of any decorative pilaster(s) or sign base, shall notexceed a maximum area of 20 square feet.

3. Monument signs shall be set back a minimum of five (5) feet from any property line, subject toEngineering Division approval.

4. Monument signs shall not interfere with intersection visibility, line of sight or other safety issues.

This page intentionally left blank

Chapter 4: Design Standards

4 Design Standards

The architectural design guidelines contained herein are meant to supplement the development standards outlined in Chapter 3. The design standards and regulations will help ensure a high-quality Specific Plan area designed to complement and enhance the community. To create successful communities, architectural design must embody methods which are flexible enough to meet the changing needs of the consumer market yet, must also create visually pleasing structures complementary to the surrounding area. For those reasons, the proposed architectural style has been presented for inclusion in the Marcos Specific Plan Area and was chosen based on its historic popularity with homeowners in California.

The following overview offers a brief description of the look and feel for the East-End Planning Area and the West-End Planning Area for the Marcos Specific Plan architectural style.

4.1 East-End Planning Area Design Standards

The East-End Planning area is comprised of commercial uses, live-work, makerspace, and retail uses and shall adopt an appropriate architectural style and design that complements the artistic nature of the planning area.

4.1.1 Architectural Style

The East-End Planning Area's art and craft-oriented business theme should reflect an area which is rich in art and cultural influences and therefore should exhibit a high-quality artistic design. The East-End Planning Area incorporates elements of Early Californian architecture and blends those into a modern-contemporary style. The planning area utilizes colors, forms, materials, and shapes including earth tones, natural wood, concrete, and stucco meant to complement the natural setting of San Marcos while remaining timeless. Those elements are then blended with modern forms such as exaggerated eaves and porches, broad roof overhangs, large walls of glass, open floor plans, and sharp lines. All architectural elements proposed for the East-End Planning Area should consider this theme when proposing designs.

4.1.2 Building Materials, Accents, and Colors

Materials and accents are a key factor in defining architectural style. They convey a sense of quality and contribute to the community character. Building color is the unifying component of structures, which creates a sense of variation for the streetscape and builds upon the foundation of the community aesthetic. The following design guidelines should be considered when selecting materials and colors:

1. Select materials, accents, and colors which are appropriate for each façade and contribute to enhancing the visual theme for the planning area and match the theme for the specific style of building to which they are applied.
2. Use materials and colors to accentuate changes in massing, define individual suites, and complement architectural materials and features.
3. Choose colors and materials that complement each other and add depth to the community.
4. Use color palettes to distinguish groupings of buildings within the planning area and improve the visual interest of streetscapes.

5. Appropriate materials include, but are not limited to, cement, wood, stone or brick veneer, glass, fabric sidings/sails, and stucco. Metal roofs, accents, and trims are acceptable within the planning area.
6. Choose colors to achieve a reasonable representation of a particular architectural style and which lend authenticity to the final product.
7. Accent colors should complement the palette of the main structure.
8. Patterns based on the colors identified in Table 5 may be incorporated into the paint schemes for buildings.

Table 5 East-End Planning Area Building Materials and Colors

Colors	Materials
Beige	Brick
Browns	Concrete Masonry Block
Creams	Corrugated Metal
Dark Browns	Fabric
Earthen Colors	Fiber Cement
Gray Tone's	Metal Roof
Rust	Metal Trim
Tans	Stone
	Stucco
	Wood
	Woven Reeds

4.1.3 Floor Plan Summary

Floor Plans for the East-End Planning Area shall accommodate the commercial/retail and live-work users' businesses. Floor plans will accommodate a variety of uses and may be modified by tenants in accordance with regulations in this document as well as through the City of San Marcos tenant improvement building plan process.

Live-work units shall provide storefront entry. Live-work units shall provide a minimum of 140 sf. of private open space for each unit. The private entry open space shall be shared between units and total approximately 2,847 sf. Trash receptacles shall be stored in the rear yards within a covered enclosure.

For clarity, conceptual elevations are grouped into districts and shown on **Figure 18 through Figure 20**.

4.1.4 Kiosk Design

Kiosks proposed for the East-End Planning area may take on a variety of forms and design styles. Kiosks should complement the overall theme of the Specific Plan Area. Kiosks may be mobile or permanently affixed. Proposed Kiosks which utilize permanent foundations shall require a building permit and should comply with the style and materials identified in this chapter. Non-permanent kiosks may utilize a variety of materials and colors as allowed by East-End Planning Area ownership group.

1. Permanent kiosks shall not exceed 100 SF.
2. Non-permanent kiosks shall not exceed 50 SF.

Conceptual Eastend Planning Area Elevations, District C

Figure 20

Marcos Specific Plan

4.1.5 Massing and Scale

Massing and scale contribute to the visual identity between commercial suites and the built environment. Those qualities help dictate the placement, size, and form for commercial/retail buildings within the East-End Planning Area. Building type placement was studied to achieve the best possible groupings as well as providing transition massing between the neighboring commercial and light industrial structures, thereby enhancing the visual character of the neighborhood. Incorporation of the following design concepts should be considered for the architecture within the Specific Plan Area:

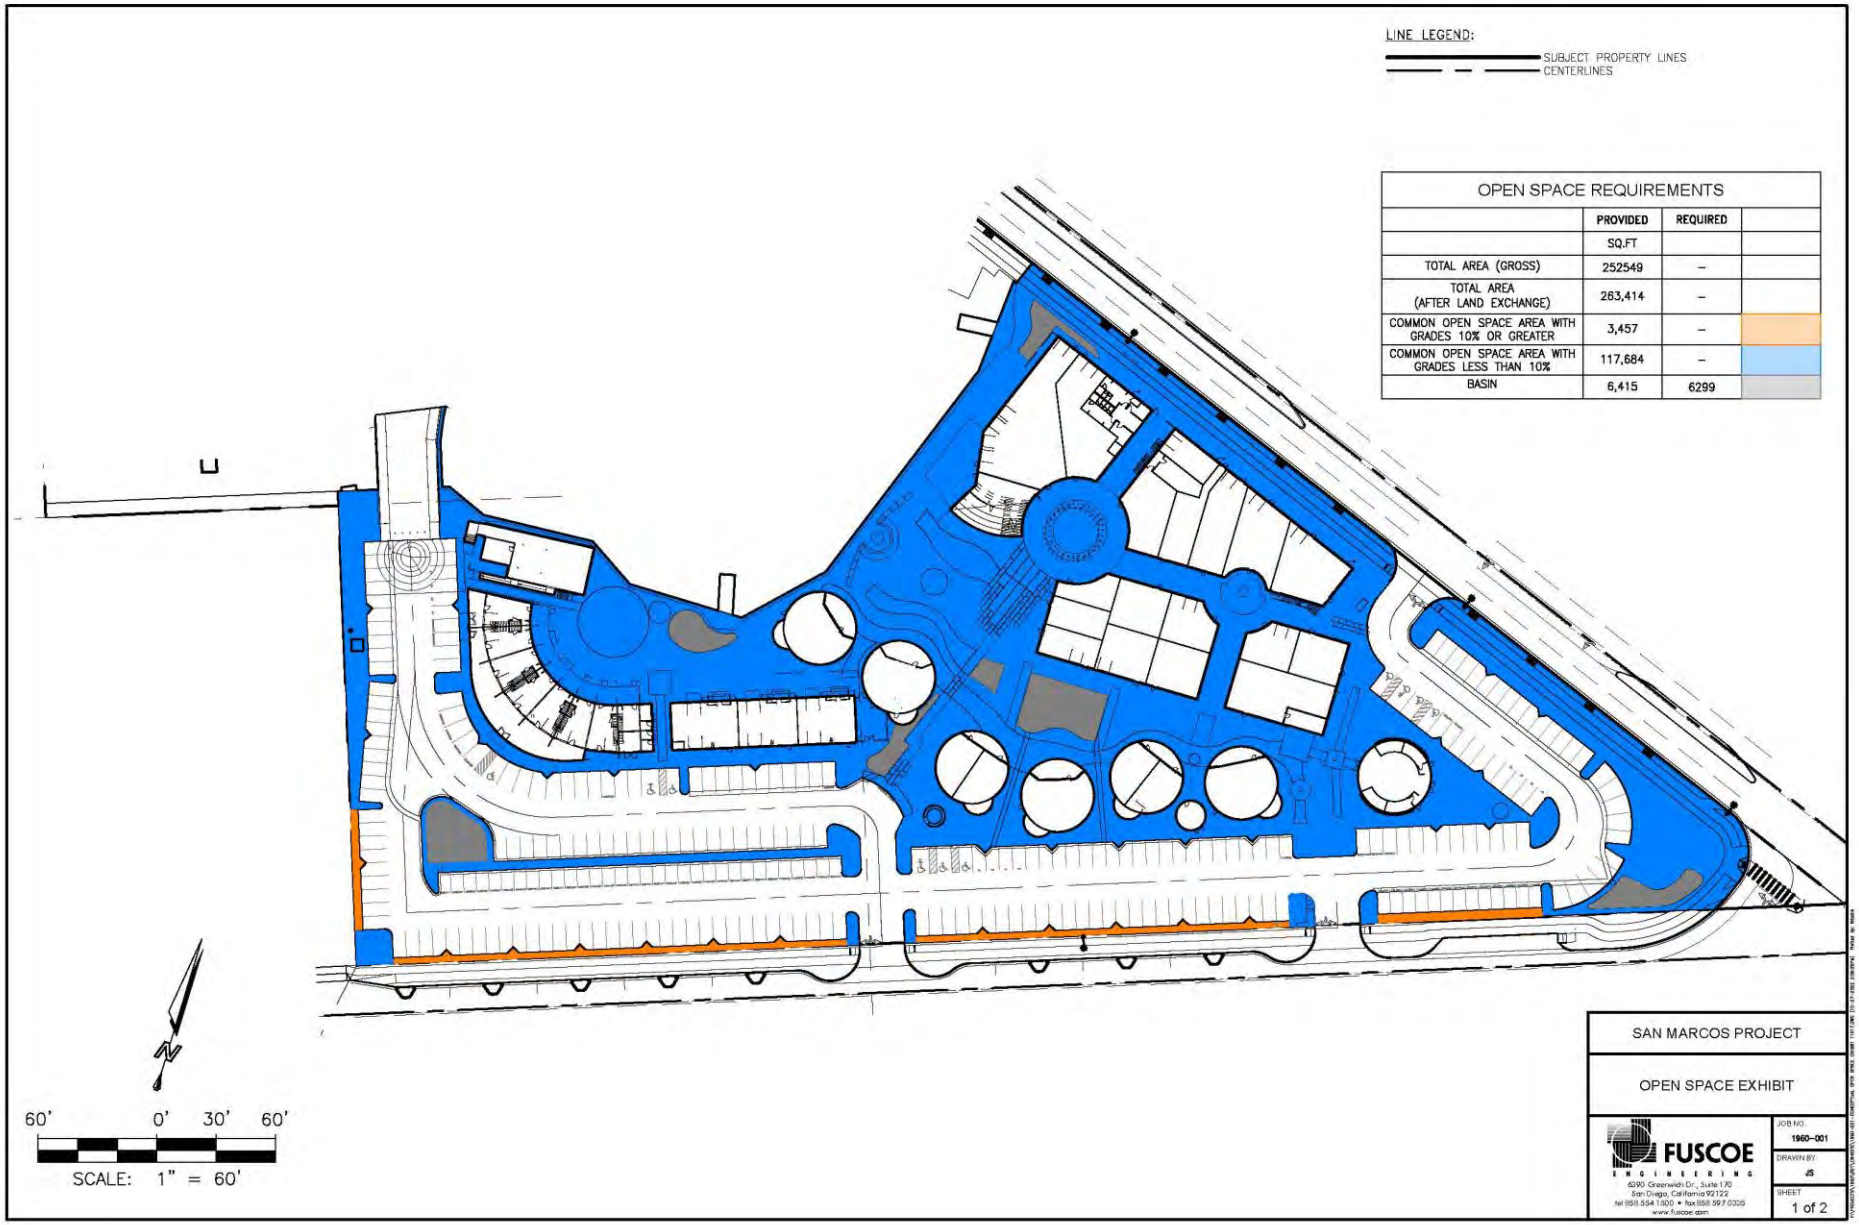
1. Utilize horizontal massing for building-form elements.
2. Utilize a mix of flat and gabled roofs with broad roof overhangs.
3. Utilize exposed steel application, unfinished concrete block, long-span steel trusses and wood finishes.
4. Permit open, column-free spaces.
5. Emphasize wood stains or alternative protective applications over paint to place emphasis on character of wood.
6. Utilize large expanses of glass to take advantage of views.
7. Incorporate circular designs for buildings and arches for unique building treatments on vernacular buildings.

4.1.6 Open Space Design

Open space is a critical component of the Specific Plan and is provided in several forms to improve the quality of the Specific Plan area. The open space component of this Plan provides community gathering space opportunities and a landscape theme to enhance the living experience for residents and visitors. Inclusion of these guidelines will contribute to a well-balanced Specific Plan and ensure open space is designed and implemented in an orderly manner. The Planning area shall provide a minimum of 10% of the net developable site as landscape area. The following points should be considered when designing open space concepts within the East-End Planning area:

1. Open space design within the East-End Planning Area shall serve three functions:
    a. Stormwater quality treatment.
    b. Visual complement to building architecture.
    c. Creation of community gathering areas.
2. Open space shall be designed around the buildings to create a sense of place.
3. Community gathering spaces should be focal points of the open space design.
4. Incorporate meandering pathway connections to community gathering areas, commercial/retail spaces, and live-work units.
5. Utilize a variety of amenities to complement the landscaping and activate gathering spaces.
6. Lighting placement should enhance outdoor spaces, highlight open space features, and provide lighting for safe pedestrian travel.

7. Plant Palettes should be chosen to accentuate the building architecture, provide visual pedestrian interest, and complement gathering spaces.
   a. Incorporate a variety of shrubs and trees to provide vertical and horizontal interest.
   b. Utilize plant color variation to provide visual interest.
   c. Provide a varied plant palette which mixes plant shapes and sizes to complement 7. a. and b.
   d. To the extent possible, utilize California native plants and naturalized plants in the landscape design.



Eastend Planning Area Open Space

Figure 21

Marcos Specific Plan

4.1.7 Landscape Design

To assure development of an attractive and cohesive community the following landscape guidelines have been provided. A landscape concept for the project can be seen on **Figure 23, Conceptual East-End Planning Area Landscape Plan**. Developers and/or builders will use the following information on the design, materials, lighting, and themes, which shall be incorporated into the Marcos Specific Plan Area. Although provided, the following information should be considered conceptual in nature. Minor changes may be necessary due to changing material guidelines, design theme modifications, or changes to State or local regulations. Final landscape design shall be approved by City of San Marcos Development Services Department.

Irrigation within the Specific Plan Area shall utilize the following:

1. Install automatic controllers which feature evapotranspiration or moisture sensing data, with manual and automatic shut-off.
2. Low volume heads, subsurface irrigation system designed to prevent runoff, low head drainage, and overspray.
3. Group plants by hydrozones and irrigate hydrozones separately.

4.1.7.1 Hardscape, Pavers, Walkways, and Wood Decking

Hardscape surfaces for the East-End Planning Area include walking pathways as well as gravel and decomposed granite areas used as walkways and groundcover in planting areas. Other materials may be allowed as approved by the Planning Director. The following design standards shall be applied to the hardscape and pathway design for the Planning Area:

1. Hardscape materials, decking, decomposed granite, gravel, flagstone, reclaimed concrete, pavers, and other similar materials should be utilized in conjunction with the landscaping to give the site a native Southern California design.
2. Materials should be locally sourced when possible and may be used in walkways, paths, parking areas, and as landscaping planting areas as allowed by ADA requirements.
3. Where decks are incorporated into the project design a natural look and stain is preferred.
4. Other materials and colors may be allowed with approval from the Planning Director.

Table 6 East-End Planning Area Hardscape Materials

Material	Color	Application
Brick Pavers	Earth Tones, Red, Rust	Parking Areas, Pathways, Patios
Decomposed Granite	California Gold, Desert Gold, other Earth Tones	Landscape Groundcover, Parking stalls, Patios, Walkways
Flagstone	Grey, Stone	Landscape applications, Patios, Walkways
Gravel	California Gold, Earth tones	Landscape Groundcover
Reclaimed Concrete	Gray	Landscape Groundcover, Walkways
Wood Decking	Earth Tones, Natural Wood	Boardwalks, Decks

4.1.7.2 Plant Material Guidelines

The Plant Material Guideline provided below in **Table 7** is intended to provided developers and/or builders of the Marcos Specific Plan Area with guidelines for landscape plantings of locations such as entries, streetscapes, biofiltration basins, and common open space areas. Plant materials selected for the project area should be chosen based on a multitude of factors and should strengthen the overall character of the community.

Plants used in the Marcos Specific Plan will be subdivided into two (2) categories. The first category includes general landscaping, while the second category covers slope plantings if slopes are included within the planning areas. These plants will conform to the City of San Marcos' requirement to utilize draught tolerant and California native plants and naturalized plant palettes when designing and implementing landscaping on all projects in the City of San Marcos. Landscaping within the Plan area has been designed to use specific plants in certain areas of the landscaping. These plants and the applicable planting areas are defined in **Table 7**.

All plants and trees included on the Marcos Specific Plan Plant Material Guidelines have been chosen for their appropriateness to the Specific Plan Area theme, local climate tolerance, soil conditions, and level of maintenance intensity. The selected plants are well suited to the local soils and have proven to flourish within the project area's climate and are consistent with AB 1881 requirements and the City of San Marcos Water Efficient Landscape Ordinance (WELO) and Municipal Code, Title 20. The following guidelines should be applied to all plant materials selected for residential land use planting within the planning area:

1. The plant materials selected should be tolerant of a wide range of temperatures and require very little water consumption.
2. No non-native invasive plant species shall be used per the California Exotic Pest Plant Council List A-1 and California Invasive Plant Council (Cal-IPC).
3. All street trees planted within 10' of public improvements shall have root barriers.

This Plant Material Guidelines should be considered fluid and subject to change, with final approval determined by the City of San Marcos Development Services Department. Should changes be necessary to the Plant Material Guidelines, the newly selected plants and trees should be similar in tolerance and water usage to the conceptual list provided. If those requirements are met, any proposed changes to the Plant Legend shall be considered minor. Details on any proposed changes to the Plant Legend are provided in Chapter 9, Specific Plan Administration.

Table 7 East-End Planning Area Conceptual Plant Palette

THA FEN	238	Perennials	Thalictrum fendleri v. polycarpum	Western Meadowrue	2'0"	1 gal	Mod	

4.1.7.3 Walls and Fences

Generally, walls and fences function in six (6) ways; they shall act as aesthetic boundaries for open space, sound attenuation, retaining barriers along roadways or lots, safety fencing around recreational areas, privacy fencing, and security fencing around preserved open space. Fence and wall types allowed within the Specific Plan Area include tubular steel, masonry block/earth-tone color, living hedge, wood, and post and rail fencing with wire mesh around conservation open space. Wall and fencing materials may be substituted with other wall and fence types and materials upon review and approval by the Development Services Department. The following guidelines should be applied to any walls or fencing within the Specific Plan area:

1. Walls and fencing should also be designed in such a way as to become a visual amenity.
2. Walls and fencing should be compatible with the surrounding natural landscapes, colors, and materials.
3. Standard masonry walls and masonry retention walls are suitable as retaining walls in areas where engineering requires more stability and strength.
4. Split-faced block walls in earth tones and textured materials including smooth stucco are required for any walls visible to a public street.

Table 8 East-End Planning Area Wall and Fence Materials

Wall and Fence Type	Application
Tubular Steel	Perimeter, adjacent to open space areas
Masonry Block	Sound attenuation, Retaining, ABC control areas
Living Hedge	Common walkways/Patios
Wood	Common walkways/Patios/ABC control areas
Vinyl	Common walkways/Patios/ABC control areas
Split-Rail Wood Fence with 2" x 2" wire mesh	Perimeter; adjacent to conservation open space areas

4.1.7.4 Signs

Signs are permitted within the Specific Plan area and shall be subject to the City of San Marcos sign code except as described herein.

1. Signs should attempt to incorporate a cohesive design and appearance with building architecture.
2. A Sign Program shall be approved by the Development Services Department for the East-End Planning Area.

4.1.7.5 Lighting

Lighting within the East-End Planning Area shall be used to accent landscaping and provide safety and accent lighting for building clusters. The following guidelines shall be incorporated into all lighting plans:

1. All lighting within the Plan area shall be energy efficient, architecturally appropriate fixtures designed to minimize glare, conflict, and light pollution, while providing illumination levels that create a safe environment for both vehicles and pedestrians.
2. All areas will be aptly lit to coincide with their relevant use and activities.
3. Street lighting will be full cut-off fixtures and will utilize side shields to reduce light trespass and prevent light pollution.
4. Lighting using the highest efficiency fixtures and lamps are preferred.

Conceptual lighting locations are illustrated in **Figure 24**. During the construction drawing phase, the builders will submit drawing details providing light fixtures (cut sheets) to the City of San Marcos for conformance with the lighting ordinance and standards.

Table 9 East-End Planning Area Conceptual Lighting Types

Fixture	Description	Application
Bollard Lighting	2'-4' pedestrian lights	Walks, Pathways, Trails
In-Grade Well Lighting	In-grade ground lighting	Landscape accents
Linear LED lighting	Concealed LED lighting runs	Pathways, Patios, Gathering Spaces, Architectural Features
Post Mount Light	Pole mounted area lighting	Parking and Area Lighting
String Light	Overhead string lighting strands	Pathways, Patios, Gathering Spaces
Wall Mounted Light	Wall mounted area lighting	Walks, Pathways, Trails, Patios, Gathering Spaces

4.1.8 Parking

East-End Planning Area shall develop a Shared Parking Analysis and Parking Management Plan to determine the parking capacity required based on proposed uses. Based on the information provided in the Shared Parking Analysis a total of 277 parking spaces will be sufficient to service the needs of all uses included in the Planning Area, however the East-End Planning Area will provide 278 parking spaces.

Table 10 East-End Planning Area Parking Schedule

Parking	Total	Application
Regular Spaces	196	9' x 18' or 9' 16' with 2' overhang
ADA Stalls[1]	10	12' x 18' + 5' loading area
Carpool	5	9' x 18' or 9' x 16' + 2' overhang
Compact parking	45	8.5' x 16'
Electric Vehicle Charging Spaces[1]	14	9' x 18' or 9' x 16' + 2' overhang
Reserved (live/work)	7	9' x 18' or 9' x 16' + 2' overhang
Rideshare	2	9' x 18' or 9' x 16' + 2' overhang
City Maintenance	1	9' x 18'
Total	**278**	

[1]2 van accessible spaces are included in the Electric vehicle charging spaces totals.

Conceptual Eastend Planning Area Lighting Plan

Figure 24

4.2 West-End Planning Area Design Standards

The West-End Planning area design standards are meant to aid in the development of design drawings for multi-family residential dwelling units, common and recreational open space areas, private open space area, and guest parking and driveways incorporated in the Planning Area.

4.2.1 Architectural Style

Two architectural styles are proposed to be included within the West-End Planning Area: regency and mission revival. These styles were selected for their popular representation in Southern California architecture. The regency architectural style interprets classical forms by incorporating a white color palette, formal gables, simple ornamentation, flat tile roofs, and arched openings **Figure 26 and Figure 27**. The mission revival architectural style utilizes thick walls with small accent windows and battered openings, scalloped parapets, Spanish accents, wood trim and decorative panels, white-washed walls, wood shutters, sloped sills, and clerestory windows **Figure 28 and 29**. Other similar styles may be selected for the West-End Planning Area if they include a style representative of the area and are approved by the Planning Director.

4.2.2 Building Materials, Accents, Colors

Building materials and colors contribute to the visual impact of residential buildings. Therefore, materials and colors should be carefully considered based on several factors that complement and enhance the immediate surrounding environment as well as the wider community. Materials and colors should substantially complement the architectural styles chosen for the Planning Area. Materials such as decorative lighting, tile inserts, metal railings, stucco, stucco accents and trims, wood rafter tails, wood shutters, and other similar materials should be utilized to accent and complement the building form and architectural style.

4.2.3 Floor Plan Summary

Floor plans for the West-End Planning Area have been developed to provide an efficient and varied building layout. Floor plans may make up a minimum of four-plex (4) buildings and a maximum of ten-plex (10), however deviations to the building makeup shall be allowed upon review and approval by approval by the Planning Director. A minimum of six (6) different floor plans should be included within the West-End Planning Area with minor variations of Plan One unit patio space. The Planning Area should include 2-3 bedrooms and 2-3.5-bathrooms in the form of flats, townhome, and carriage style two (2), and three (3) story dwelling units to maximize efficiency and options on size and affordability.

Table 11 Conceptual West-End Planning Area Floor Plan Summary

Floor Plans	No. of Units
Floor Plan Variation	Min. of six (6) Floor Plans
Min. Floor Plan SF	1,000 SF
max. Floor Plan SF	1,800
min. Bldg. Composition	Min. 4-Plex.
Max. Bldg. Composition	Max. 10-Plex

4.2.4 Massing and Scale

Massing and scale provide the visual identity between residential dwelling units and the environment. Those qualities help dictate the placement, size, and form for multi-family residential buildings within the West-End Planning Area. Building type placement within the West-End Planning Area should achieve the best possible groupings oriented around Las Posas Creek and Grand Avenue frontage, as well as provide transition massing between the neighboring industrial structures, thereby enhancing the visual character of the neighborhood. Floor plans for the West-End Planning Area may be grouped into multiple building configurations to aid in the efficiency of the site plan. Incorporation of the following design concepts should be considered for the architecture within the Specific Plan Area:

1. Utilize building-form massing elements, such as angles, towers, and other building elements to distinguish architecture,
2. Vertically and horizontally articulate building design for both front and rear elevations through architectural design elements such as, but not limited to, windows, and off-set roof planes,
3. Use second floor massing changes to create variation in the building form; and
4. Where possible avoid the use of long unbroken surfaces.

4.2.5 Landscape design

To assure development of an attractive and cohesive community the following landscape guidelines have been provided. A landscape concept for the project can be seen in **Figure 30, Conceptual West-End Planning Area Landscape Plan**. Developers and/or builders will use the following information on the design, materials, lighting, and themes, which shall be incorporated into the Marcos Specific Plan Area. Although provided, the following information should be considered conceptual in nature. Minor changes may be necessary due to changing material guidelines, design theme modifications, or changes to State or local regulations. Final landscape design shall be approved by City of San Marcos Development Services Department.

Irrigation within the Specific Plan Area shall utilize the following:

1. Install automatic controllers which feature evapotranspiration or moisture sensing data, with manual and automatic shut-off.
2. Low volume heads, subsurface irrigation system designed to prevent runoff, low head drainage, and overspray.
3. Group plants by hydrozones and irrigate hydrozones separately.

4.2.5.1 Hardscape, Pavers, and Walkways

Hardscaping and groundcover materials for the West-End Planning Area will utilize materials suitable for residential areas and will include sidewalks, pathways, and decomposed granite materials for groundcover areas. Other materials may be allowed as approved by the Planning Director.

1. Materials allowed within the Planning Area may include concrete, permeable pavers, rock mulch, and decomposed granite.
2. Hardscape materials should utilize colors native to the area.

Table 12 West-End Planning Area Hardscape Materials

Material	Color	Application
Concrete	Coral Buff, Earth Tone's, Sandstone	Parking Areas, Pathways, Patios
Decomposed Granite	California Gold, Desert Gold, other Earth Tones	Landscape Groundcover, Patios, Walkways
Permeable Paver	Earth Tone's	Tree Wells
Rock Mulch	Earth Tones	Landscape Groundcover

Figure 30

4.2.5.2 Plant Material Guidelines

The Plant Material Guidelines provided below in **Table 13** is intended to provide developers and/or builders of the Marcos Specific Plan Area with guidelines for landscape plantings of locations such as entries, streetscapes, biofiltration basins, and common open space areas. Plan materials selected for the project area should be chosen based on a multitude of factors and should strengthen the overall character of the community.

Plants used in the Marcos Specific Plan will be subdivided into two (2) categories. The first category includes general residential area landscaping, while the second category covers slope plantings if slopes are included within the planning areas. These plants will conform to the City of San Marcos' requirement to utilize draught tolerant and California native plant palettes when designing and implementing landscaping on all projects in the City of San Marcos. Landscaping within the Plan area has been designed to use specific plants in certain areas of the landscaping. These plants and the applicable planting areas are defined in **Table 13**.

All plants and trees included on the Marcos Specific Plan Plant Material Guidelines have been chosen for their appropriateness to the Specific Plan Area theme, local climate tolerance, soil conditions, and level of maintenance intensity. The selected plants are well suited to the local soils and have proven to flourish within the project area's climate and are consistent with AB 1881 requirements and the City of San Marcos Water Efficient Landscape Ordinance (WELO) and Municipal Code, Title 20. The following guidelines should be applied to all plant materials selected for residential land use planting within the planning area:

1. The plant materials selected should be tolerant of a wide range of temperatures and require very little water consumption.
2. No non-native invasive plant species shall be used per the California Exotic Pest Plant Council List A-1 and California Invasive Plant Council (Cal-IPC).
3. All street trees planted within 10' of public improvements shall have root barriers.

This Plant Material Guidelines should be considered fluid and subject to change, with final approval determined by the City of San Marcos Development Services Department. Should changes be necessary to the Plant Material Guidelines, the newly selected plants and trees should be similar in tolerance and water usage to the conceptual list provided. If those requirements are met, any proposed changes to the Plant Legend shall be considered minor. Details on any proposed changes to the Plant Legend are provided in Chapter 9, Specific Plan Administration.

yuc rec	35	Cacti-succulents	Yucca recurvifolia	Soft-leaved Yucca	3.00	5 gal	Low	

4.2.6 Open Space Design Standards

Open space design for the West-End Planning Area should provide adequate space and include a high-quality design for both common area recreational and landscape design as well as adequate private open space area.

Table 14 West-End Planning Area Open Space Summary

Type of Open Space	Min. Required (SF)	
Common Open Space	8,374 SF	
Private Open Space	10,500 SF	
Biofiltration Basins	As Required	
Children's Play Area	2, 432 SF	

4.2.6.1 Common Area Recreational Amenities

A minimum of 8,374 sf. of common recreational area is required to be provided for the West-End Planning Area. Additionally, within the required common open space provided by the West-End Planning Area a minimum of 1,632 sf of tot lot play area and an additional 800 sf of playground area shall be included. A minimum of three (3) recreational amenities should be chosen based on information found in Section 3.6.2.3 B. 6.

Table 15 Potential West-End Planning Area Recreational Amenities

Amenity	Description
Barbeque Area	Barbeque stations with picnic bench seating
Exercise Areas	Exercise stations, gyms, etc.
Pet Play Areas	Pet relief and pet play areas
Fire Pit Area	Fire pit areas with seating
Open Space Games	Bocce ball, horseshoes, badminton, volleyball
Open Turf Area	Turf area for lawn games and general recreation
Picnic Bench Seating	Picnic benches throughout Planning Area
Pool and Spa Area	Pool area with bathroom building
Playgrounds/Tot Lots	Boulder and log tot lots and children's play areas
Walkways	Meandering walkway adjacent to Las Posas Creek

Children's play amenities should incorporate natural looking features to blend with the adjacent Las Posas Creek. Play feature should consider the following:

1. Natural earthwork shapes should be incorporated into the play area design such as mounding earthen berms and meandering turf areas.
2. Play equipment should incorporate features such as climbable rocks and boulders, reclaimed logs placed in play formations, hollow logs, ropes, and other similar play structures.

Westend Planning Area Open Space

Figure 31

Marcos Specific Plan

4.2.6.2 Walls, Fences, Monuments

The information provided in this section should be used as a guide when designing any walls, fences, or monuments to be included within the West-End Planning Area.

1. Wall and fence design approved materials include wood, vinyl, stone, masonry, brick, block, stucco, living hedge, post and rail, and tubular steel. Comparable materials are permitted subject to approval by the Planning Director. Split-Rail fencing with 2" x 2" wire mesh may be permitted along the exterior perimeter of the Las Posas Creek open space as directed by jurisdictional agencies. Information on allowable fence type within the Las Posas Creek Planning Area and details of the creek fencing may be viewed in **Section 4.3**.
2. Prohibited materials include barbed wire, razor wire, concertina, corrugated metal and plastic, tarps, and electrified wire of any kind or configuration.
3. If included, monument design should incorporate similar materials to the overall landscape palette.

4.2.7 Private Open Space

Private open space within the Planning Area constitutes private patios, covered porches, and decks for individual dwelling units. Ground floor dwelling units and units with ground floor living area are required to have a patio and units with living area on the second (2nd) floor and above require balconies. The minimum required private open space equates to 8,374 SF. Units requiring patio space should provide a minimum of 90 SF. Units requiring deck space should provide a minimum of 50 SF.

4.2.8 Parking

Each Dwelling unit for the West-End Planning Area shall provide two garage parking spaces. Tandem garages are permitted on up to 20% of the total units. Each garage shall be equipped with a level 2 EV charger. Guest spaces shall include two (2) ADA spaces and their loading areas, and four (4) electric vehicle charging spaces. 20% of guest spaces may be compact spaces.

Table 16 West-End Planning Area Parking Schedule

Parking	Total	Application
Garage	204	20' x 20' 2-car garage
Tandem Garage[1]	48	12' x 40' 2-car tandem garage
Garage EV	102	Each garage equipped with level 2 EV charger
Guest, Standard	26	9'x 18' or 9' x 16' + 2' overhang
Guest ADA	2	12' x 18' + 5' loading area (van accessible) or 9' x 18' + 5' loading area (standard accessible)
Guest Electric Vehicle Charging Space[2]	4	2 standard stalls and 2 compact stalls
Guest, Compact	6	8.5'x 16'
Postal Service[3]	1	9' x 18'
Total	**238**	

[1]Included in garage totals.
[2]EV parking stall totals included in guest space totals.
[3]Postal space shared with guest parking.

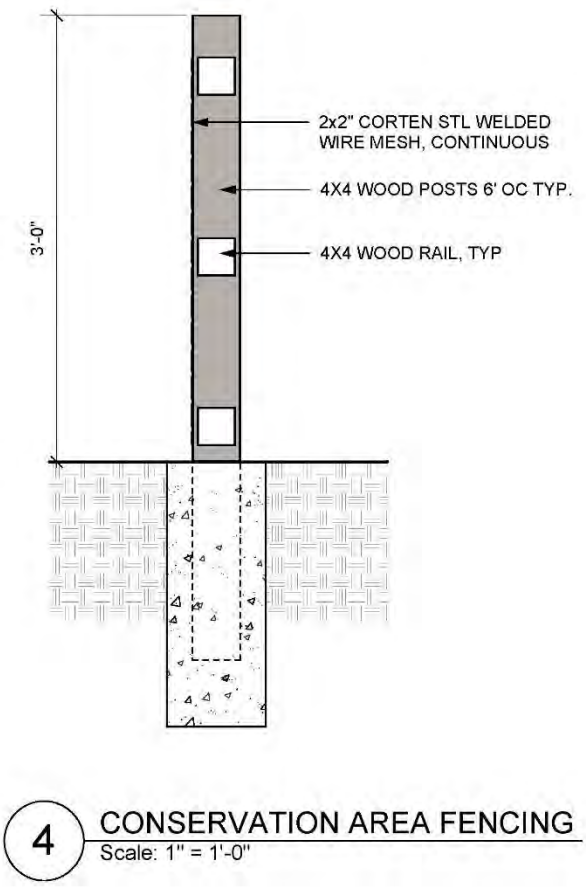
4.3 Las Posas Creek Planning Area Design Standards

The Las Posas Creek Planning Area totals approximately 0.98-acre and is comprised of a total of two (2) lots. Lot 1 is approximately 0.237-acre and Lot 2 is approximately 0.738-acre with both lots bisected by a bridge which is within the East-End Planning Area. As mentioned in **Section 3.4,** the only approved land use within the Las Posas Creek Planning Area is conservation open space. The only approved development allowed within the Planning Area are the existing storm drain structures. Fencing shall be installed along the perimeter of the Planning Area to prevent intrusion into the conservation easement.

4.3.1 Fencing

The only allowed fencing in the Planning Area may occur along the perimeter of the conservation easement to the Las Posas Creek Planning Area. The fence type shall be Split-rail wood fence with 2" x 2" wire mesh, or a combination thereof consistent with Negative Declaration 09-789. Prior approval of the fencing location and final fence type and design must be secured by the City of San Marcos and the responsible wildlife jurisdictional agencies.

Figure 32 Conservation Area Perimeter Fence Detail



This page intentionally left blank

Chapter 5: Circulation Plan

5 Circulation Plan

The Circulation Plan is an integrated component of the Specific Plan and facilitates an interconnected mobility system for bicycles, pedestrians, and vehicles. The Circulation Plan provides developers with the blueprint for designing safe and efficient movement within the Specific Plan Area, secondary access, and emergency vehicle access, connections to existing roadways within the vicinity of the Plan area, and access to regional arterial and highway networks. A minimum 24-foot width curb to curb private internal driveway provides connections to all East-End Planning Area driveways while the West-End Planning Area shall feature a 20' minimum alley and all other internal roadways featuring a 24' minimum drive surface.

5.1 External Roadways

The Specific Plan is bounded by two (2) external roadways: Linda Vista Drive traversing northeast to southwest and Grand Avenue traversing east to west. The Grand Avenue roadway surface fronting the Specific Plan Area is currently constructed to the ultimate width and will require improvements to the parkway, bicycle, and pedestrian facilities only. Linda Vista Drive will be constructed to a complete street design including improvements to lane configurations, parkway area, bicycle lanes, pedestrian path of travel, and loading/pick-up/drop-off zones.

Table 17 External Roadway ROW Improvements

Roadway Type	Exist. ROW Width	Proposed ROW Width	Pavement Width (feet)	Vehicle Lanes	Parking	Minimum Pedestrian Component
Grand Avenue	66'	82' Includes a 10' landscaped median.	48'	4	No	17'min, urban trail. 5.5' landscaped buffer, 6' bike lane, 5' pedestrian walk with a varied 0.5' landscaped strip
Linda Vista Drive	66'	66'	40'	2	Yes	16' urban trail. 3' landscaped parkway, 6' bike lane, 5' pedestrian walk, 2' landscape strip

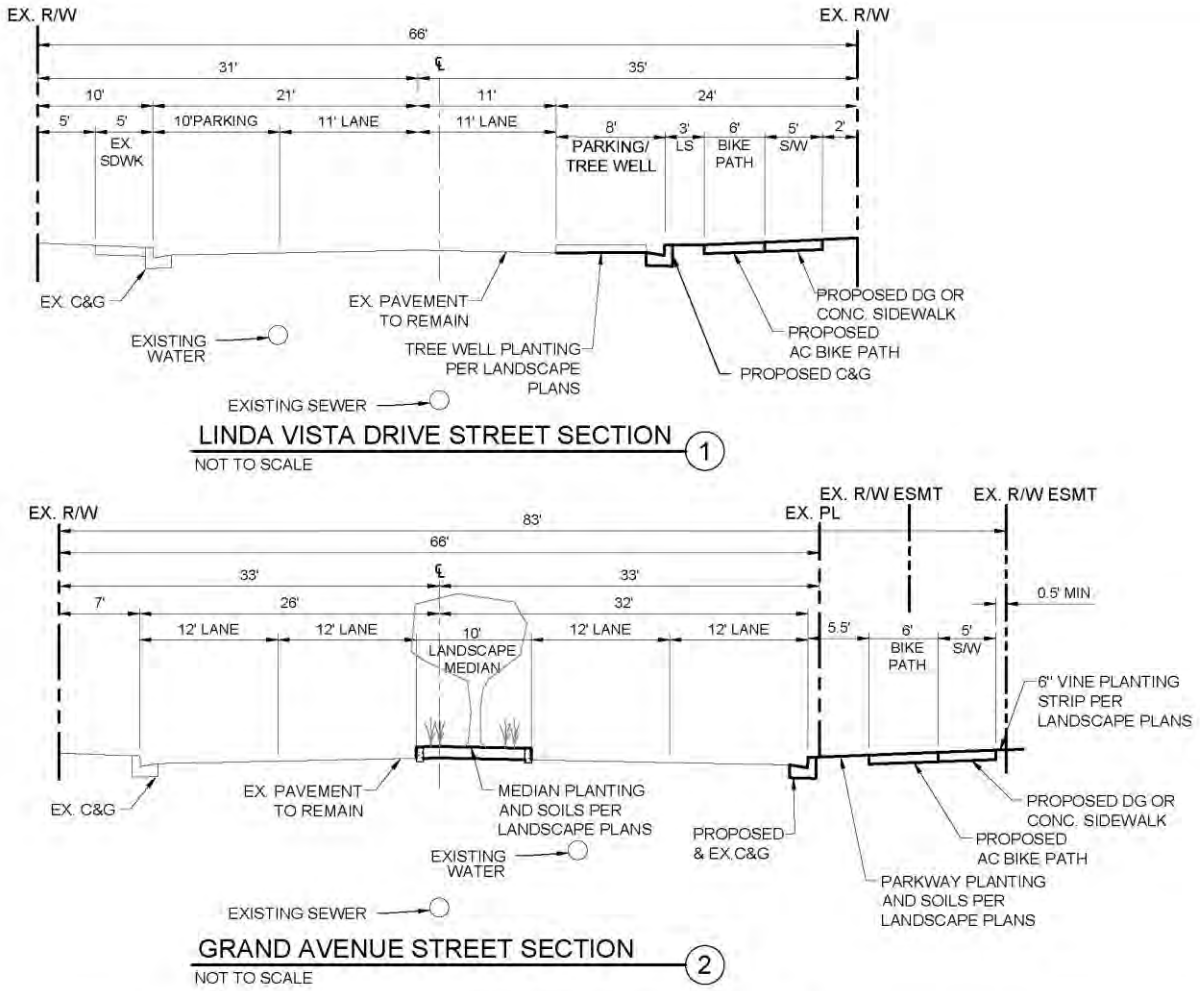
5.1.1 Grand Avenue

As mentioned above, Grand Avenue's roadway surface is currently constructed to the ultimate width and improvements for this section will come in the form of public trail improvements. Those improvements include construction of a minimum five and a half (5.5) feet of landscape buffer followed by a six (6) foot Class IV bike path, five (5) foot sidewalk or decomposed granite trail section, and a minimum of one half (0.5) foot landscape strip. Additionally, a ten (10) foot landscaped center median will be constructed

dividing east and westbound lanes. The proposed Class IV bike path transitions the current on-street bike facilities on Grand Avenue to a physically separated bike lane within the multi-purpose trail component for the Specific Plan Area. These improvements facilitate a safer bicycle lane along the Plan Area's frontage and help facilitate a safer and more connected bicycle network city-wide.

5.1.2 Linda Vista Drive

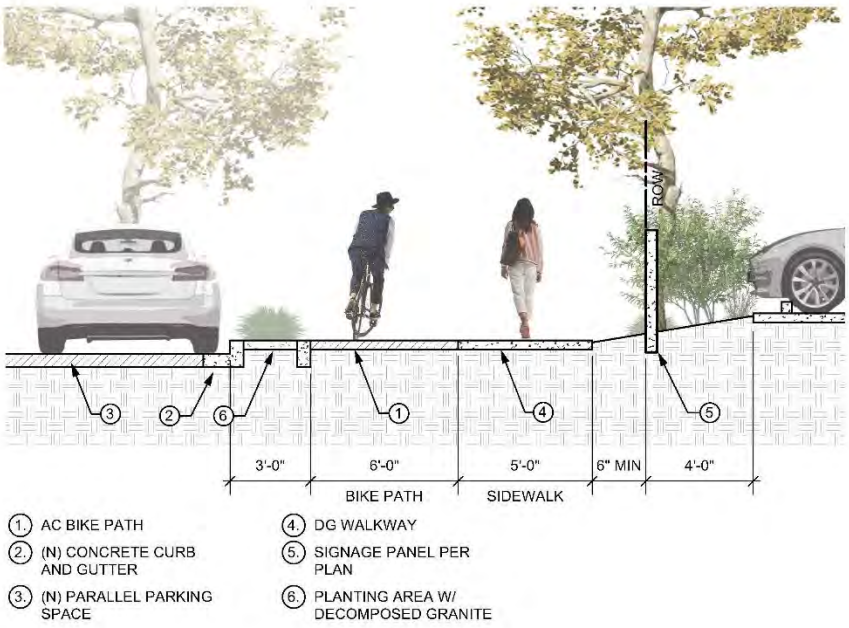
Linda Vista Drive will construct a complete street improvement to the Specific Plan side of the road which includes a bike and pedestrian sidewalk component and landscape parkway separated from vehicular lanes. Those improvements include construction of a five (3) foot landscape parkway followed by a six (6) foot Class IV bike path, five (5) foot sidewalk or decomposed granite trail section, and two (2) feet of additional landscape parkway. The Class IV bike lane planned for Linda Vista Drive is consistent with the General Plan Mobility Element's call for at least a Class II bike lane. The Class IV bike lane will separate bicyclists from vehicles with a physical barrier incorporated in the planned multi-purpose trail along the frontage and transitioning back to the on-street bike lane south of the Specific Plan Area. On-street parking will be maintained along the Plan Area frontage on Linda Vista Drive and will add tree pop-outs to blend the streetscape into the project landscaping.



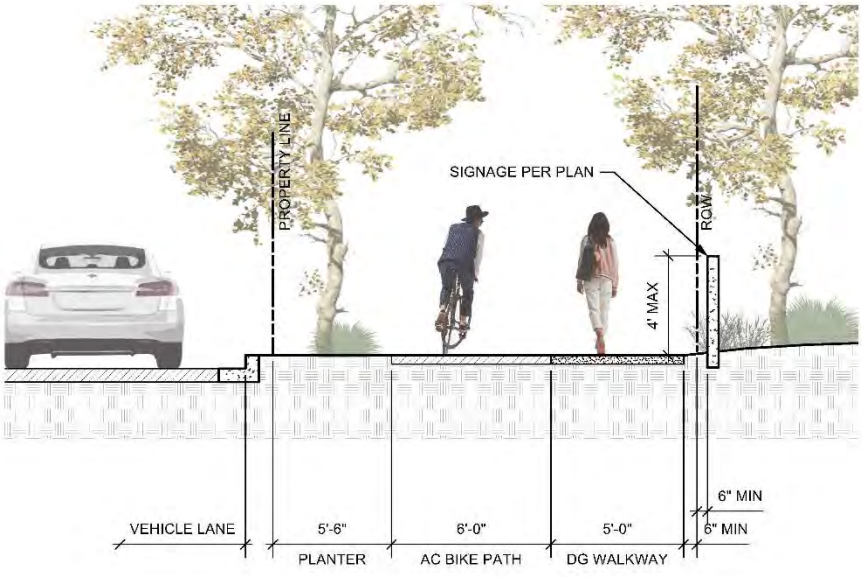
Public Street Sections

Figure 33

Marcos Specific Plan



1 STREET SECTION: LINDA VISTA DR
Scale: NTS



2 STREET SECTION: GRAND AVE
Scale: NTS

Public Road ROW Improvements Figure 34

5.2 Internal Circulation

The internal circulation system for the Marcos Specific Plan area consists of a combination of private internal driveways designed to safely accommodate the level of vehicular, bicycle, and pedestrian traffic generated by the West-End and East-End Planning Area's uses. The Conceptual Circulation Plan exhibit identifies the locations of the internal sidewalk and driveway systems designed for the Specific Plan area. The following exhibits and sections provide details and standards for any proposed roadway systems.

5.2.1 East-End Planning Area Circulation

The East-End Planning Area incorporates three internal driveway configurations and three access points to public roadways: one (1) access to Grand Avenue and two (2) access points to Linda Vista Drive. A fourth (4) emergency access is shared via the bridge spanning Las Posas Creek connecting to the West-End Planning Area. Internal road sections feature two (2) – 12' to 15' wide travel lanes with a decomposed granite (DG) walkway or concrete sidewalk component configured in three (3) roadway segments as shown on **Table 19**. Parking may be included on either side of the driveways.

5.2.2 West-End Planning Area Circulation

The West-End Planning Area incorporates one (1) main driveway entry and one (1) secondary emergency access via the bridge over Las Posas Creek, through the East-End Planning Area, and connecting to Linda Vista Drive. Four (4) roadway configurations are included in the Planning Area: Three (3) driveway configurations and one (1) alley configuration. Alleys will include a 20' minimum drive surface and three (3) feet of driveway apron area. Driveways will feature 12' – 13' travel lanes and a sidewalk component along certain segments to provide ADA connectivity.

Table 18 Internal Driveway Dimensions

Roadway Type	Street Section Width (feet)	Travel Lane Width (feet)	Vehicle Lanes	Parking	Minimum Pedestrian Component
East-End Planning Area Roadways					
Driveway A2	54 min.'	12'	2	Yes. Depth Varies	n/a
Driveway B2	30' min.	15'	2	Yes. Depth Varies	Sidewalk or DG walkway
Driveway C2	60' min.	12'	2	18' minimum to either side	Sidewalk or DG walkway
West-End Planning Area Roadways					
Alley (A2/E2)	24' min.	20'	1	No	2'4" driveway apron
Driveway B2	34' min.	12'	2	No	n/a2'4" driveway apron
Driveway C2	52' min.	13'	2	No	4' min. sidewalk
Driveway D2	24' min.	12'	2	Guest Spaces throughout	5' Sidewalk. 2'4" driveway apron

Marcos Specific Plan

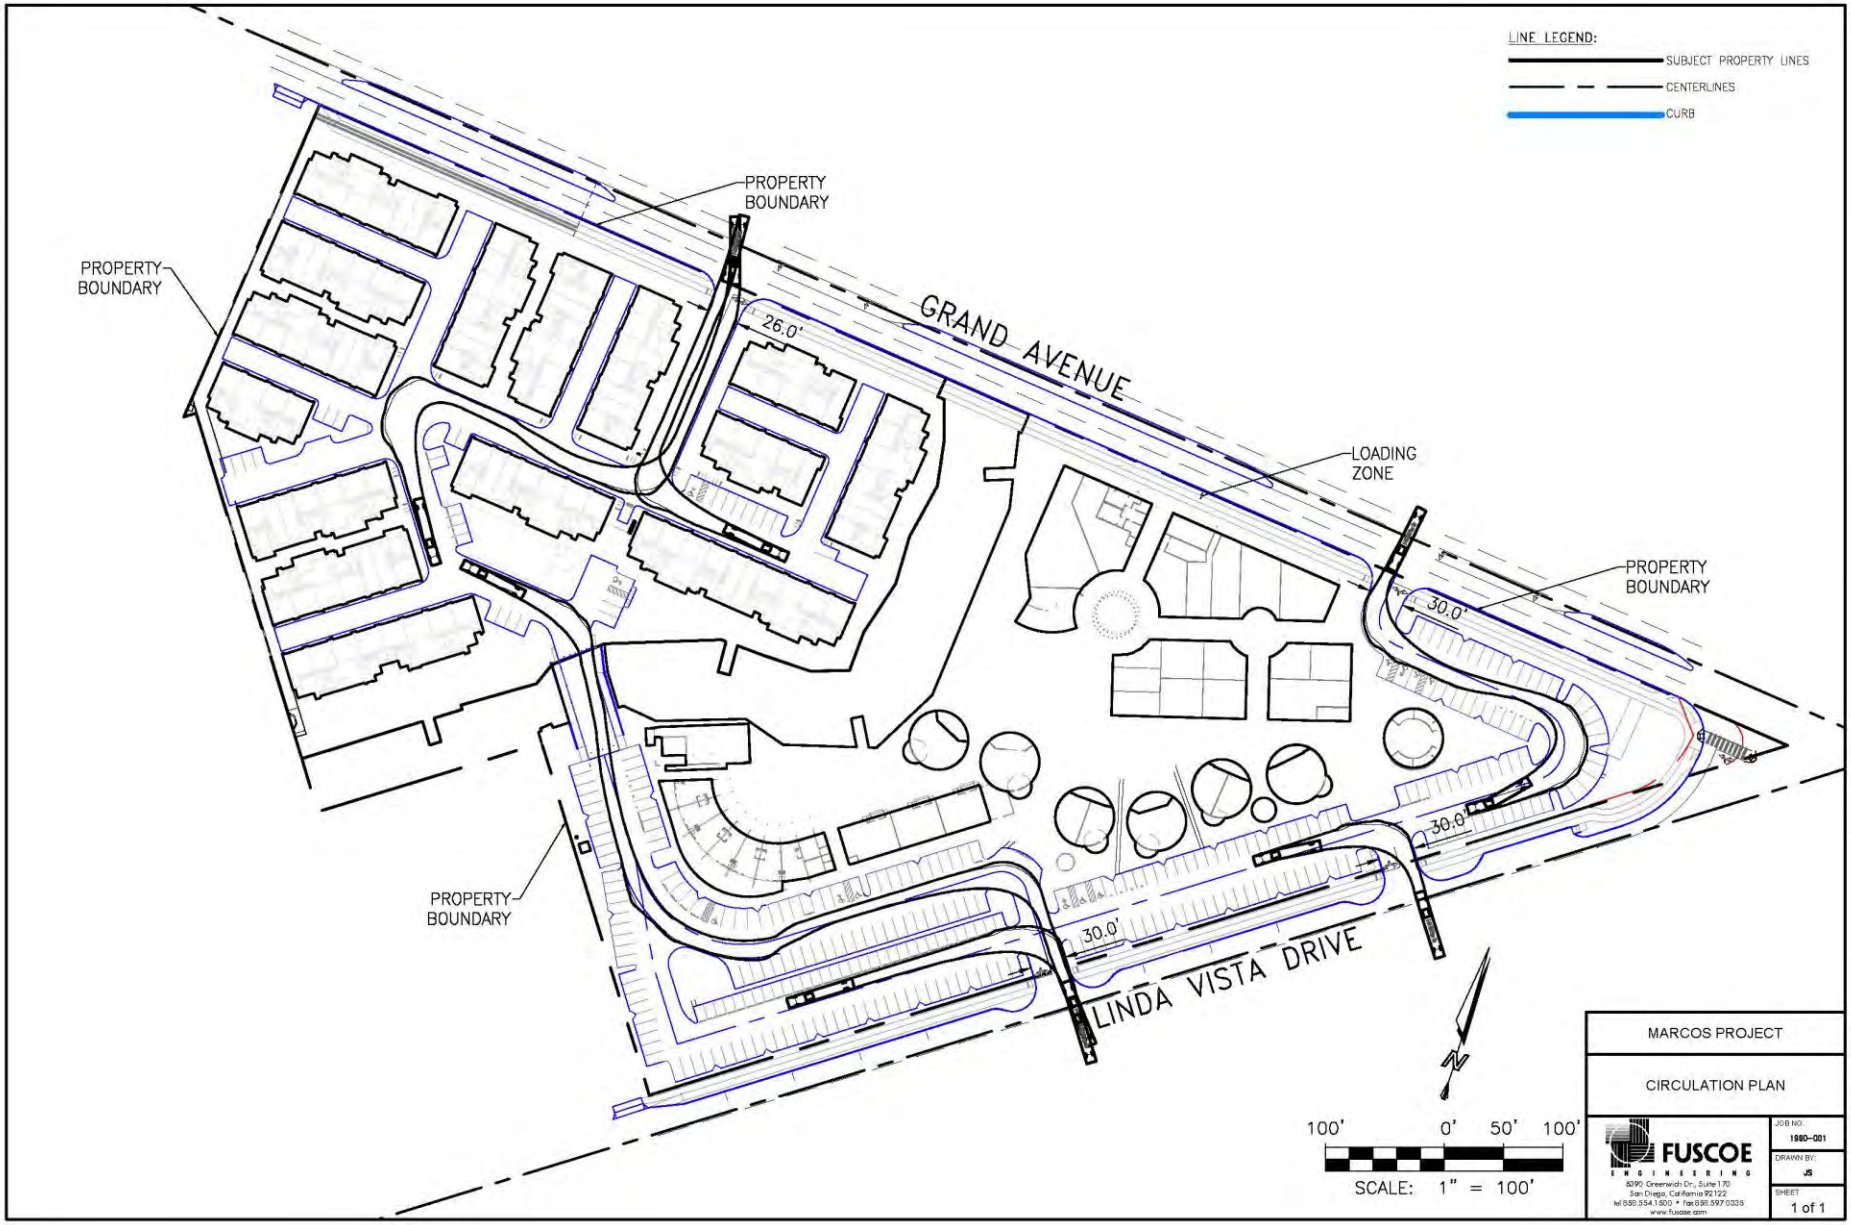
5.3 Emergency Vehicle Access

The California Fire Code, along with local fire agency authorities, administers the rules and regulations on fire access design. At a minimum, each Planning Area must present a design which affords fire and emergency responders suitable fire access roads dimensions and surfaces (Chapter 5, Section 503.1 through 503.4 of the California Fire Code), an adequate number of emergency rated entrances to the community (Appendix D, Section D106 of the California Fire Code), and entryway gate access for first responders (Chapter 5 of the California Fire Code, Section 503.6). All points of entry to the Specific Plan area have been designed to meet the requirements codified in the California Fire Code. Any gated entry into the Specific Plan area must include a Knox type entry, or another emergency entry device as approved by the City of San Marcos Fire Department.

The design of the Marcos Specific Plan provides three (3) access points to the East-End Planning Area and Two (2) to the West-End Planning Area. The bridge spanning Las Posas Creek serves as the secondary emergency access to the West-End Planning District.

5.4 Local and Regional Connectivity

As noted in Chapter 2, the Marcos Specific Plan Area is regionally connected to San Diego County and north to Riverside County through Interstate 15 via State Route 78. An existing system of expressways, arterial highways, and local roads such as the previously mentioned Grand Avenue and Linda Vista Drive link the Specific Plan Area to the City of San Marcos' circulation system and ultimately to State Route 78. As noted in Chapter 2, residents and visitors will be able to access State Route 78 eastbound via an onramp located approximately 0.25-mile west of the Specific Plan Area. From the 78 east onramp it's approximately an additional 5.5-miles to Interstate 15. Access to State Route 78 westbound is located at the Las Posas-78 overpass. These connections allow for convenient and rapid access to and from the Specific Plan Area to other communities, shopping centers, and employment centers thereby relieving stress residents would otherwise feel with limited transportation route options.



Emergency Vehicle Circulation

Figure 37

Marcos Specific Plan

5.5 Bicycle, Pedestrian, and Public Transit Options

Alternate forms of transportation may help alleviate modern congestion problems for municipalities while also reducing strain on environmental resources by reducing greenhouse gas emissions, thereby improving air quality. The City of San Marcos' General Plan includes policies and goals for new development to meet so they are in conformance with local and state climate and transportation goals. The Marcos Specific Plan area encompasses the intent of San Diego Association of Government's (SANDAG) Transit Oriented Development (TOD).

This Specific Plan area design and location reflects SANDAG's long-term transit development strategy. The Specific Plan area's density, product type, and most importantly the project's location, are consistent with several strategies outlined in SANDAG's Regional Transit Oriented Development Strategy as well as SANDAG's transit-oriented development growth models for 2035 and 2050, which encourage denser development along future expanded transit corridors.

The project meets the intent of the following SANDAG TOD Strategies:

- Strategy #1 strives to produce diverse and interconnected land use design within core TOD's. The Specific Plan area meets that definition via its inherent location in the middle of commercial, retail, light industrial land uses and near to major transit stations. In addition, the project is a horizontal mixed-use project capable of facilitating residential and commercial needs within the boundaries of the Specific Plan area.
- Strategy #3 promotes walking and biking to transit stations, connecting people to jobs in transit-oriented districts. The Marcos Specific Plan is a horizontal mixed-use development capable of supporting jobs to the residential portion of the Specific Plan area. The Marcos Specific Plan area is also near to commercial, retail and lighting industrial business and therefore within walking/biking distance to employment centers and shopping including the Grand Plaza shopping center. The Palomar College Transit Station is approximately one (1) mile walking/driving distance from the Specific Plan area facilitating quick access to the Sprinter rail line as well as bus routes that connect to the wider county. This centralized Specific Plan area enables residents to walk or bike to shop or work thereby lessening environmental impacts on the region.
- Strategy #4 seeks to manage the first and last mile gap to transit facilities to encourage ride share options as well as walking and biking. As identified in Section 5.1, The Specific Plan area will construct new Class IV bicycle lanes as part of ROW improvements on Grand Avenue and Linda Vista Drive. The addition of this feature will help make the first-last mile connection for residents of the Specific Plan area to the Palomar College Transit Station.
- Strategy #9 identifies community facilities and infrastructure program investments to aid in successful implementation of alternative transportation systems. The ROW improvements mentioned above help facilitate construction and maintenance of alternative transit usage and help to reduce the overall vehicle trips, thereby reducing the projects regional carbon footprint. The following section will provide information on available alternative transportation options and how this Specific Plan incorporates those options to conform to agency policy.

BREEZE bus service is provided by North County Transit District and includes 30 routes between Oceanside and La Jolla, as far east as Escondido. The bus stop nearest the Specific Plan area serves routes

347 and 445. These routes connect to other transit centers within the system, offering connectivity to all major destinations and other transit systems within North County, connections to South County transit systems, and the greyhound bus station in Escondido.

The Palomar College Transit Center also provides two (2) platforms at the train station with access to the SPRINTER hybrid Train. The SPRINTER is operated by North County Transit District (NCTD), which currently offers service to commuters every 30 minutes during peak demand times and every hour during off-peak demand times. The line extends between Oceanside and Escondido and provides connections to three (3) commuter rail lines: The Coaster, Metrolink Orange County Line, and Metrolink Inland Empire-Orange County Line. The SPRINTER also connects to Amtrak's Pacific Surfliner regional rail line.

5.5.1 Bicycle Storage Facilities

The East-End Planning Area shall provide 25% Class I bicycle parking facilities and 75% Class II bicycle parking facilities for all visitors to the Planning Area. Class II bicycle parking facilities are located as much as possible near the entries to East-End Planning Area and are meant as short-term bicycle parking for visitors who may be spending between two (2) to six (6) hours within the East-End Planning Area. Class I bicycle parking facilities are more secure long-term bike parking facilities for visitors or employees intending to stay on the site longer than six (6) hours. The Specific Plan Area is providing complete street facilities on the adjacent public roadways which allow for bicyclist to safely access public streets and to the broader City of San Marcos transportation systems.

Each dwelling unit within the West-End Planning area provides residents with the opportunity to store a bicycle within their private garage. The West-End Planning Area also enjoys connectivity to complete street transportation systems allowing bicyclist the opportunity to safely access San Marcos roadways.

5.5.2 ADA and Pedestrian Facilities

ADA path of travel shall be provided for persons with disabilities through a network of sidewalks, walkways, and pathways throughout the Marcos Specific Plan Area. ADA access allows for connectivity both within and outside the Specific Plan Area. Sidewalks shall connect the East-End Planning Area to two (2) connections on Grand Ave. as well as two (2) connections to Linda Vista Drive. These connections allow for broader pedestrian connectivity to the City of San Marcos. Similarly, the West-End Planning Area shall provide internal ADA circulation via sidewalks, which ultimately connect to Grand Avenue.

This page intentionally left blank

Chapter 6: Grading, Utilities, and Infrastructure Plan

6 Grading, Utilities, and Infrastructure Plan

The Grading and Utilities Plan provides the description of the infrastructure necessary to support each proposed land use within the Marcos Specific Plan Area. This section will discuss in detail the distribution, capacity, size, and extent of grading, utilities, and other infrastructure which must be constructed and installed to facilitate a safe and efficient mixed-use community. Information will be provided for grading and the following utilities: water, wastewater, stormwater drainage and detention, electricity and natural gas, and telecommunications services. **Table 19** identifies the utility providers anticipated for the Specific Plan Area.

Table 19 Utility Providers

Utility	Utility Provider
Water	Vallecitos Water District
Sewer	Vallecitos Water District
Stormwater Drainage & Detention	Developer/Builder
Natural Gas	San Diego Gas & Electric
Electricity	San Diego Gas & Electric
Telecommunications	Cox Communications

The design, distribution, capacity, size and extent of utility infrastructure, facilities, and service improvements is dependent upon the increased population resulting from development of new housing and commercial buildings anticipated to be constructed within the Specific Plan area. According to the 2020 Census, the estimated average number of persons per household is approximately 3.17. This means the 109 dwelling units proposed within this Specific Plan (inclusive of live-work units) will result in approximately 349 new residents for the City of San Marcos. The Specific Plan should also account for employees and visitors for approximately 63,641 sf. of commercial, retail, and makerspace. The following chapter explains how the Specific Plan will accommodate these additional residents, employees, and visitors through the provision of additional utilities, services, and facilities.

6.1 Phasing Plan

Phasing for the Specific Plan will be focused on construction phasing and would likely take place in 3-4 phases with the first two phases consisting of horizontal construction, i.e., site work and the final phases consisting of vertical construction, i.e., construction of all buildings. It is anticipated both the East and West Planning areas would follow similar phasing. Phase One will begin with the construction of all offsite improvements for both Planning Area's and will include but may not be limited to construction of the landscaped median on Grand Ave., bike and pedestrian improvements on Grand Ave. and Linda Vista Drive, electrical undergrounding of overhead power lines on Grand Ave., striping improvements on Grand Ave. and Linda Vista Drive, and any other public roadway improvements included in the Conditions of Approval. Phase One will also include mass grading and utility infrastructure construction for each Planning Area. This phase would rough grade the East-End and West-End Planning Areas and cut all trenches for water, sewer, and dry utilities as well as construction of all roads, alleys, and driveways. Phase Two will consist of precise grading of the site for final building pad and hardscape placement. Finally, Phase Three and/or Four will consist of vertical construction of all buildings and installation of landscaping.

6.2 Grading

As discussed in **Section 2.5.2**, except for Las Posas Creek which has been restored, the entire site was once fully developed and currently is a mix of old disturbed yard space, concrete pad area, and asphalt parking area bisected by the restored Las Posas Creek. The site is relatively flat but will require some cut and fill. The East-End Planning Area will cut approximately 2,065 cubic yards (CY) of material, fill approximately 2,635 CY of material with approximately 570 CY of the fill coming from import material. The West-End Planning Area will require approximately 70 CY of cut, 15,680 CY of fill of which approximately 15,610 CY will come from import material. Import and export of materials may be required depending on soils type identified in the geotechnical report as well as onsite observations of the geotechnical engineer. Spoils from foundations and trenching will be handled separately from the cut and fill material described in this section. Final and precise grading will include taking roads, lots, and landscape areas to finish grades with final surface, hardscape, and planting installations and preparation of the ground for any foundations for proposed residential and community buildings.

6.3 Wet Utilities

Wet utilities include stormwater conveyance infrastructure, domestic and fire water infrastructure, and wastewater infrastructure. All stormwater is treated and discharged in accordance with State and local rules and regulations. Water and wastewater systems will be designed in accordance with the responsible water and sewer agency rules and regulations.

6.3.1 Stormwater Drainage and Treatment

The San Diego Region Municipal Separate Storm Sewer System (MS4) permit requires all stormwater runoff generated from the Planning Areas to be appropriately captured and conveyed into storm water quality pollutant control and flow control systems to prevent pollutants from entering receiving waters, and prevent erosion, flooding, and damage. The Marcos Specific Plan drainage design has carefully considered stormwater flows and designed the system to direct all surface runoff from both the Planning Areas to the storm water quality facilities Additionally, the City's Engineering Standards in accordance with San Diego County's Hydrology Manual requires the on-site detention of the post-development net increase of the 100-year storm event to ensure storm water runoff does not increase water flows onto adjacent properties or properties downstream and upstream including the Las Posas Creek Planning Area. Once captured in storm water quality facilities, the stormwater runoff is directed to drainage detention facilities then discharged into Las Posas Creek.

All storm water runoff shall be conveyed into on-site private storm water quality facilities and storm drain system. Storm drain systems including storm water quality facilities shall be provided in accordance with the specifications of the City Engineer. Storm water runoff is subject to the requirements of the latest National Pollution Discharge Elimination System (NPDES) permit for the San Diego Region and City of San Marcos BMP Design Manual prior to discharging into Las Posas Creek.

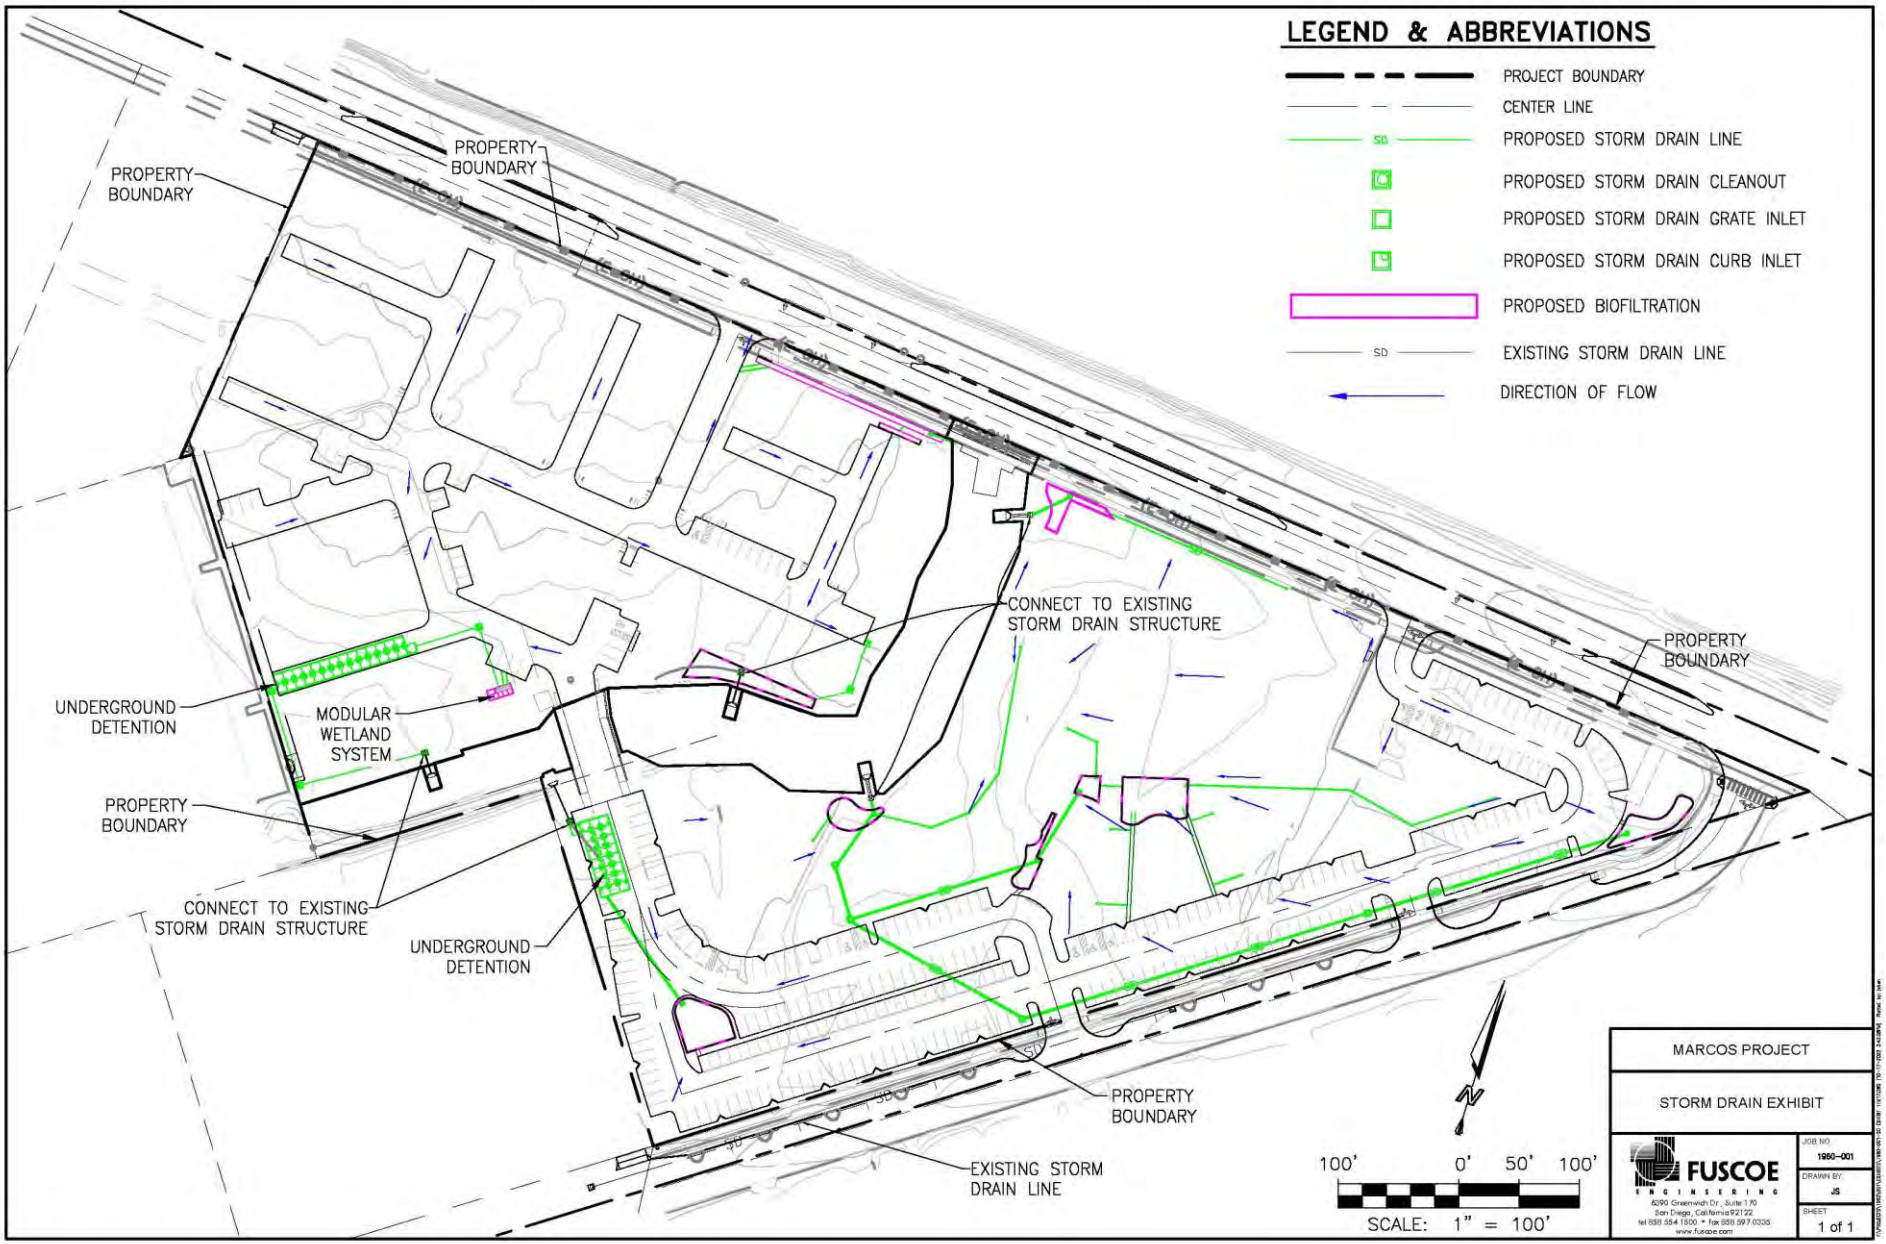
6.3.2 Water Supply

Water service to the Specific Plan Area will be provided by Vallecitos Water District (VWD). Services will include potable water connections and meters as well as fire water service lines. Services will connect to existing VWD water lines in Grand Avenue and Linda Vista Drive. Each Planning Area will feature its own water system which will include connections to existing Vallecitos Water District (VWD) potable and fire water infrastructure. The East-End Planning Area will include three connections to existing water lines; a potable and fire water line and backflow preventer will be located at the driveway entry and connect to

existing water lines in Grand Avenue and a second fire connection and backflow preventer will be located at the southeast corner of the site on Linda Vista Drive. The West-End Planning Area will feature one potable connection with backflow preventer and two fire water connections with backflow preventers. All West-End water connections will be made to existing VWD water service lines underneath Grand Avenue. A well may be drilled for the East-End Planning Area and West-End Planning Area to provide water for landscape irrigation. Wells shall be subject to approval by the County of San Diego Department of Environmental Health. If utilized, wells and well equipment shall be properly screened using landscaping and/or a fence or structure.

6.3.3 Wastewater

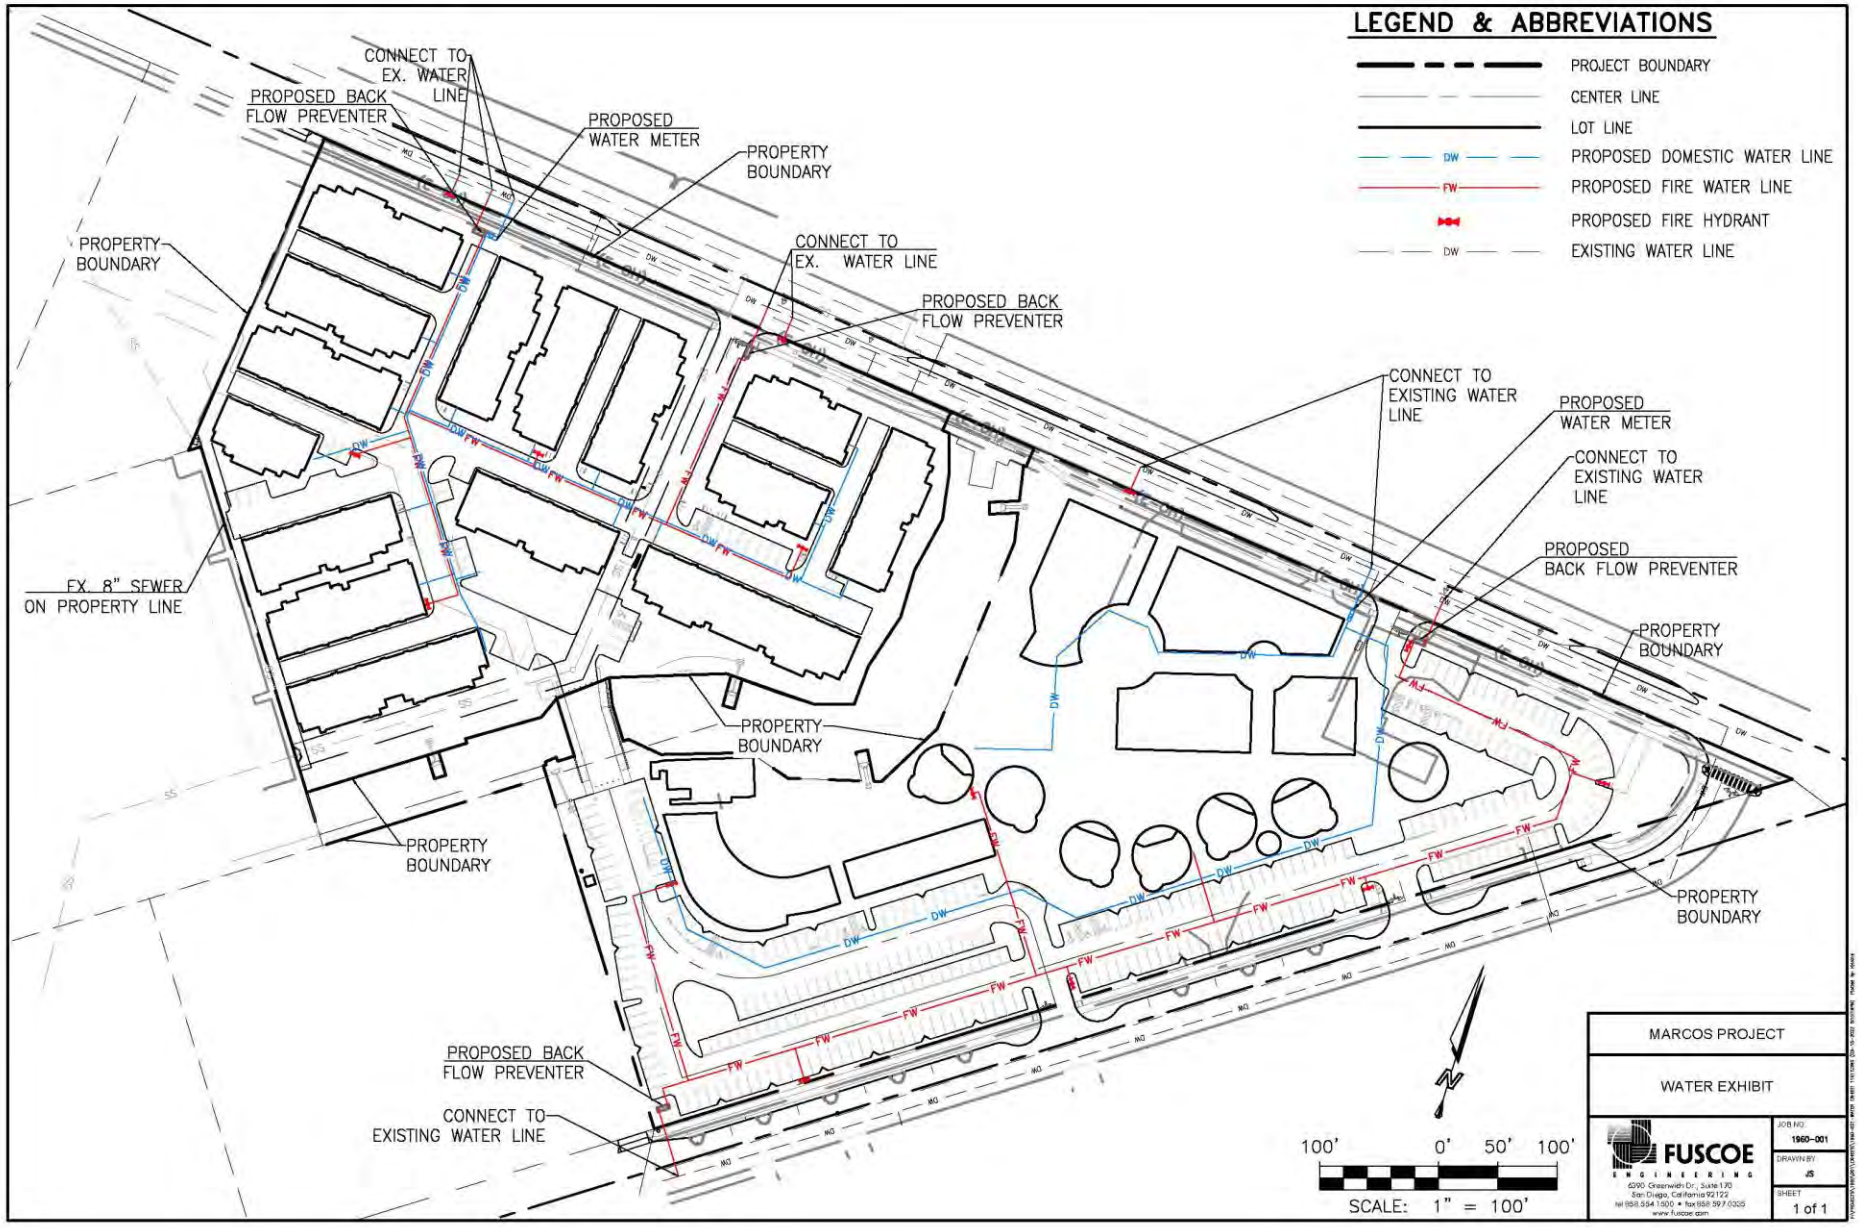
Wastewater service to the Specific Plan Area will be provided by VWD via existing sewer lines located in Grand Avenue and Linda Vista Drive. The East-End Planning Area will utilize a system of grease water drain lines located in areas anticipated to include uses generating grease. Grease traps will be installed at strategic locations before draining into the proposed sewer line connecting to existing VWD sewer infrastructure at the southeast portion of the site in Linda Vista Drive. The West-End Planning Area will gravity flow underneath proposed driveways to an existing sewer line and will make that connection at the adjacent property. A new 20' easement will be granted to VWD for the rerouted sewer line while VWD will maintain the rights to the existing 20' sewer easement through the site. A second sewer connection is proposed at the southern portion of the West-End Planning Area to an existing sewer line.



Proposed Stormwater Facilities Distribution

Figure 38

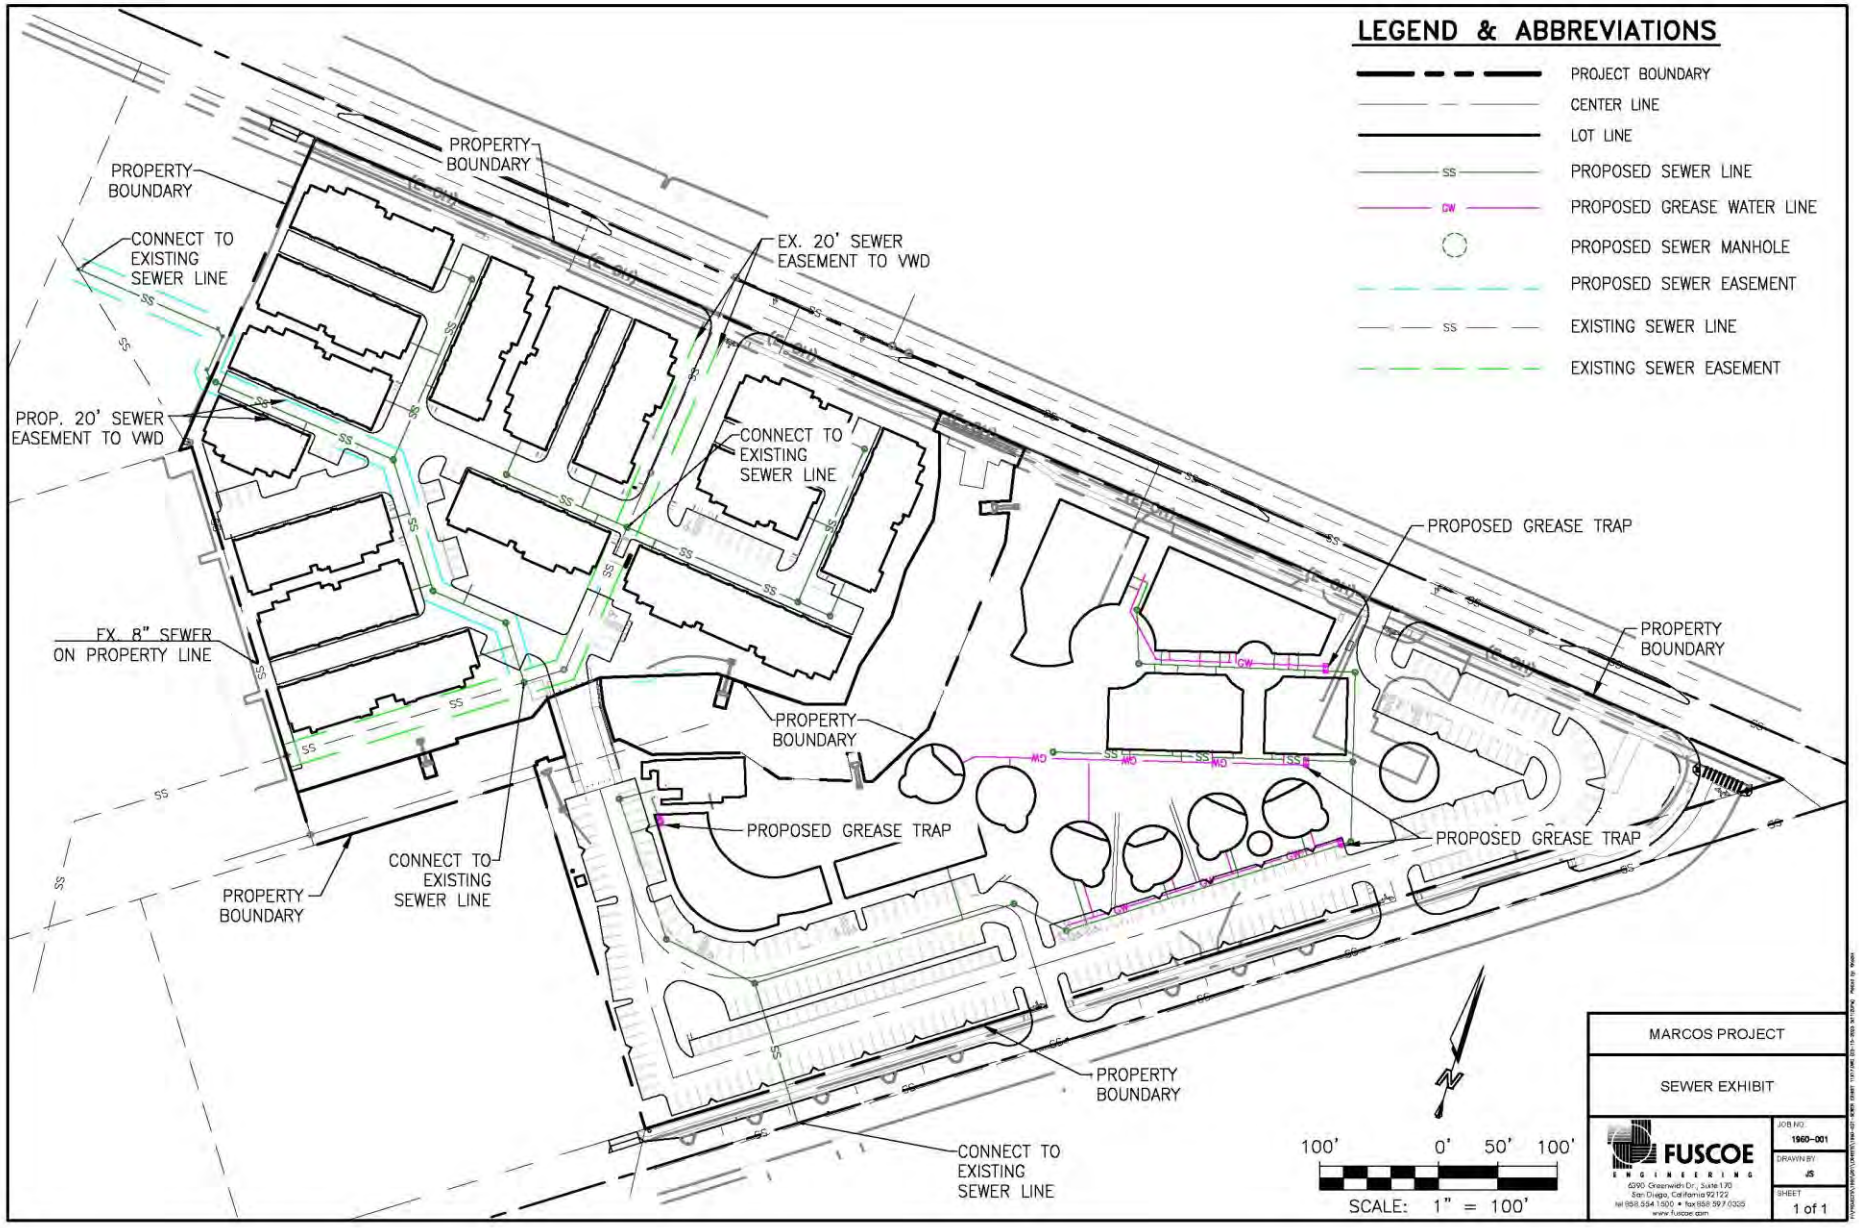
Marcos Specific Plan



Proposed Water Service Distribution

Figure 39

Marcos Specific Plan



Proposed Sewer Service Distribution

Figure 39

Marcos Specific Plan

6.4 Dry Utilities

Dry utilities include electricity, gas, and telecommunications infrastructure for the land uses included in this Specific Plan. Electricity and natural gas may provide the source for heat and air conditioning and power generation for homes and recreation facilities within the development. Photovoltaic power generating systems or other alternative energy generation systems as approved by the planning department shall be permitted within the Specific Plan area to supplement electricity and to help reduce or offset the projects carbon emissions. Any alternative energy program must be compliant with State and local regulations and ordinances. The following provides a description of the dry utility system distribution throughout the Specific Plan area.

6.4.1 Electricity

Electrical service distribution systems proposed for the Marcos Specific Plan area shall be provided by San Diego Gas and Electric (SDG&E). Developers of the East-End and West-End Planning Areas of the Marcos Specific Plan Area will be required to hire a contractor to provide all trenching, backfill, substructures, conduits, and transformer pads necessary for electrical utility installation work. Should SDG&E find installation of extra facilities is required for system reliability, it shall be the responsibility of the developer to perform the related work mentioned in this section. SDG&E shall be responsible for the installation of necessary cables, connectors, and pad-mounted equipment as required. Any proposed above-ground transformers and electrical facilities that solely service the Specific Plan area will be placed on-site and not within the City's right-of-way.

All existing aboveground utility poles along the project frontage on Grand Ave. shall be undergrounded. If undergrounding of utilities is infeasible, it will require concurrence from SDG&E.

In accordance with the current Building Code, all residential buildings will be equipped with photovoltaic panels to provide solar energy to the homes. In addition, homes will include energy conservation features such as exterior wall insulation, thermal breaks, low-e windows, advanced thermostats, energy star appliances, and sealed insulated ducts. Homes will meet all current Title 24 Energy Code standards.

6.4.2 Gas

SDG&E maintains a gas distribution system within Grand Avenue and Linda Vista Drive. If the project utilizes gas utilities, the gas lines will be extended to the developable area within the Specific Plan Area through the same joint trench alignment as electric, cable, and telephone facilities. It is likely that either a three (3) inch or four (4) inch pipeline will be utilized to deliver gas to the project site.

6.4.3 Telecommunications

Cable and telephone service will be provided through Cox Communications, AT&T or another telecommunications provider with infrastructure in the area. Cable connections will be stubbed for the property at the time of construction for dry utilities. Residents will be able to choose to connect to cable and telephone via several packages offered through the telecommunications provider.

This page intentionally left blank

Chapter 7: Public Services & Facilities Plan

7 Public Services & Facilities Plan

The Marcos Specific Plan Public Services and Facilities Plan focuses on those services and facilities related to the Specific Plan Area, which are required to provide a safe, healthy, and well-rounded development. This section will provide details on the scope of services and facilities needed to provide a comprehensive development while minimizing impacts to existing service providers and infrastructure including districts and schools for children of the Plan area, community facilities, police and fire protection, and finally solid waste disposal. Details on the financing and maintenance of public services and facilities the developer must provide can be read in Chapter 8.

The US Census Bureau has compiled information related to the average number of people per household. Based on the 2020 census, the average population of households within San Marcos equates to approximately 3.17 persons. The 109 multi-family units proposed in the Plan area would accommodate approximately 349 residents within the City of San Marcos. The impacts and contributions those additional residents have on public services and facilities are explained in more detail below.

7.1 Schools

This section of the Marcos Specific Plan will identify the school districts and individual schools which school age children residing within the Plan area will attend. The San Marcos Unified School District will provide educational instruction for children residing within the Specific Plan Area. Residents requiring access to schools will reside primarily within the West-End Planning Area. The following institutions have been identified as the primary education providers to the Plan area. Elementary and middle-school age students residing in the Marcos Specific Plan will attend La Mirada Academy located at 3697 La Mirada Dr. La Mirada Academy is located approximately one mile west of the plan area. All high school students living within the Specific Plan Area will attend San Marcos High School which is located approximately 1.6 miles from the Specific Plan Area at 16115 W. San Marcos Blvd.

Table 20 Schools

School	Grade Range	Address
La Mirada Academy	K-8	3697 La Mirada Dr.
San Marcos High School	9-12	16115 W. San Marcos Blvd.

The developer and/or builder for the Marcos Specific Plan will offset its expected increase in students through monetary contributions in the form of school district development fees paid to the San Marcos Unified School District.

7.2 Parks, Recreation, and Open Space

The Marcos Specific Plan incorporates private park and recreation space, and open space as a component of the land use concept. A total of approximately 34,715 SF of open space and landscaping is required to be provided throughout the Specific Plan Area. Per the City's Municipal Code, which is consistent with the Quimby Act, a total of 5 acres of public park space is required for every 1000 residents generated by a proposed project or the developer can opt to provide at least the minimum required open space and pay in-lieu fees. The applicant(s)/developer(s) has the option to pay the in-lieu fee as opposed to the development or dedication of new public park space to the City of San Marcos. Those fees are used by the city to construct new public park space and recreation facilities or to maintain existing public park and recreation facilities.

7.3 Library Services

The Marcos Specific Plan Area is served by the San Diego County Library System. The San Marcos branch is located at 2 Civic Center Drive and is approximately two miles from the Plan area. The San Marcos branch offers a variety of services to the public including book and music rentals, computer access, as well as literary programs and other programs beneficial to the community. Additional library resources are provided to the public through the two colleges located in San Marcos. Palomar Community College located at 1140 West Mission Road is a short distance from the Plan area and provides free access to materials with valid picture identification and proof of current mailing address. California State University San Marcos (CSUSM) is approximately two miles from the Specific Plan Area. Purchase of an annual Community Borrower Card for $30.00 allows the public access to privileges at CSUSM.

7.4 Fire Protection

The Marcos Specific Plan is located within the San Marcos Fire Protection District boundary. The San Marcos Fire Department (SMFD) will provide fire protection for urban and wildland fires and emergency services to the entire Plan area. SMFD services San Marcos with four stations, the closest of which is Fire Station One located at 180 W. Mission Road approximately two miles from the plan area. Fire Station One houses an engine, a truck, a brush engine, and an ambulance. The Marcos Specific Plan is surrounded by existing development however, the Plan area is located within proximity to open space areas with slopes, fuel, and fire hazards, therefore residents and tenants of the Marcos Specific Plan, in accordance with the Community Wildfire Protection Plan (CWPP) and Hazard Risk Assessment (HRA) doctrines adopted by the SMFD, shall be required to comply with the rules and regulations established within the CWPP and HRA. The measures incorporated in the above text contribute to the Specific Plan's comprehensive approach to fire safety.

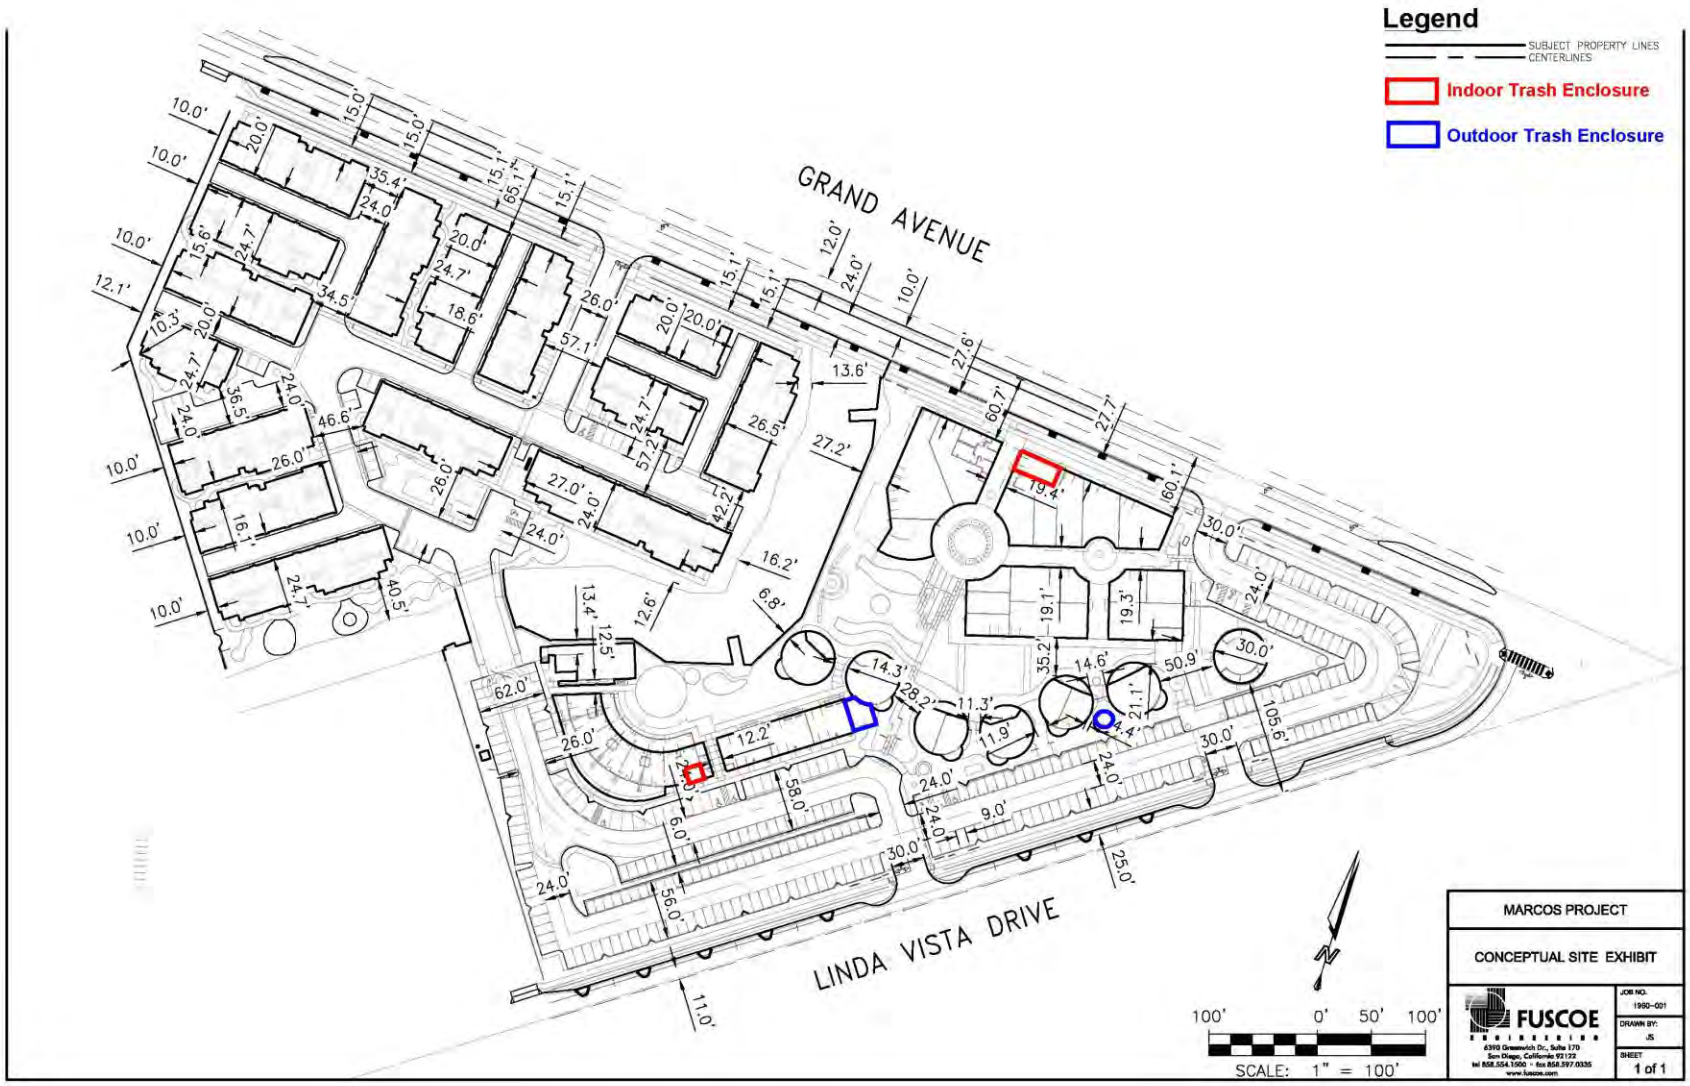
7.5 Police Protection

Police protection for the Marcos Specific Plan shall be provided by the County of San Diego Sheriff's Department. The County Sheriff provides contract law enforcement services to the City of San Marcos through the station located at 182 Santar Place located within City limits. The station's location is approximately two miles from the Plan area and provides services to San Marcos and the surrounding unincorporated areas. Community law enforcement services are provided year-round, 24-hours a day. The Sheriff's Department offers a variety of services to help keep the community safe. Deputies are responsible for general patrol services including traffic enforcement, suppression of drug activities, and response to theft and gang-related crimes. The San Marcos station has the only ASTREA (Sheriff's Aviation) landing pad in the County that is capable of aiding ground units and extending the range deputies can patrol. Additional services to the community include detective units responsible for crime investigations, the Community Oriented Policing and Problem Solving (COPPS) program assigned to investigate community quality of life issues, crime prevention units, crime analysis, and senior volunteers, as well as various administrative services. Child Protective Services, Adult Protective Services, and Juvenile Probation all operate out of the San Marcos Station. Together, these services offer the Marcos Specific Plan comprehensive law enforcement to help maintain community safety.

7.6 Solid Waste Disposal

Solid waste collection and recycling services to the Specific Plan Area shall be provided by EDCO Waste & Recycling. Non-recyclable waste, including general trash and green materials, is collected, and transported to the Sycamore Sanitary Landfill in Santee. Recyclable materials are transferred to the

Escondido Resources Recovery Transfer Station for further processing. Household hazardous waste can be disposed free of charge for residents of San Marcos at the Vista HHW Collection Facility at 1145 E. Taylor Street or the Poway HHW Collection Facility at 12325 Crosthwaite Circle. Each dwelling unit will be provided with a standard trash cart, recycling cart, and organic waste/green waste cart. East-End Planning Area commercial suites will utilize trash, recycling, and organic/green waste dumpsters. Day porters will be onsite during all business hours to maintain cleanliness and ensure trash receptacles are emptied and dumpsters are delivered to pick-up locations as approved by Edco.



Conceptual East-End Trash Pick-Up Locations Figure 41

Marcos Specific Plan

Conceptual West-End Trash Pick-Up Locations Figure 42

Chapter 8: Facilities Financing Plan

8 Facilities Financing Plan

This Chapter describes the various options for financing of the required improvements for the Marcos Specific Plan. A detailed financing plan has been prepared to ensure improvements to the Specific Plan Area are implemented in a successful manner and within an orderly timeframe. The financing plan will establish specific methods of financing to achieve the goals and policies set forth in this Chapter.

Financing mechanisms for each improvement shall be timed with any proposed phasing of the Specific Plan Area, established conditions of approval, and site plan and/or design review approval. The following descriptions provide information on possible methods which could be employed to finance improvements of the Specific Plan Area. It should be noted there may be other sources not listed below which would fulfill any mandates for the financing of improvements.

8.1 Methods of Financing for Public Improvements and Services

The developer(s) or builder(s) shall be responsible for their fair share of financing construction of any public improvements as well as the entirety of private infrastructure improvements required to support development within the Marcos Specific Plan. Improvements may include, however, may not be limited to, construction of internal and adjacent streets, water lines, sewer lines, and storm drains, and electrical and gas power delivery systems. The developer(s) or builder(s) can use a combination of financing mechanisms to achieve the required construction and maintenance of facilities and improvements; however, the developer or builder shall be ultimately responsible for all fair share costs identified with implementation of development within the Marcos Specific Plan, including but not limited to, costs associated with infrastructure construction, compliance with any mitigation measures identified within the MND conditions of approval, or any other associated requirements which may need to be fulfilled. It is anticipated that the developer(s) or builder(s) will construct all required public improvements. It is also anticipated that any long-term maintenance of public improvements or facilities will be maintained through CFD's.

8.1.1 Developer Funded Options

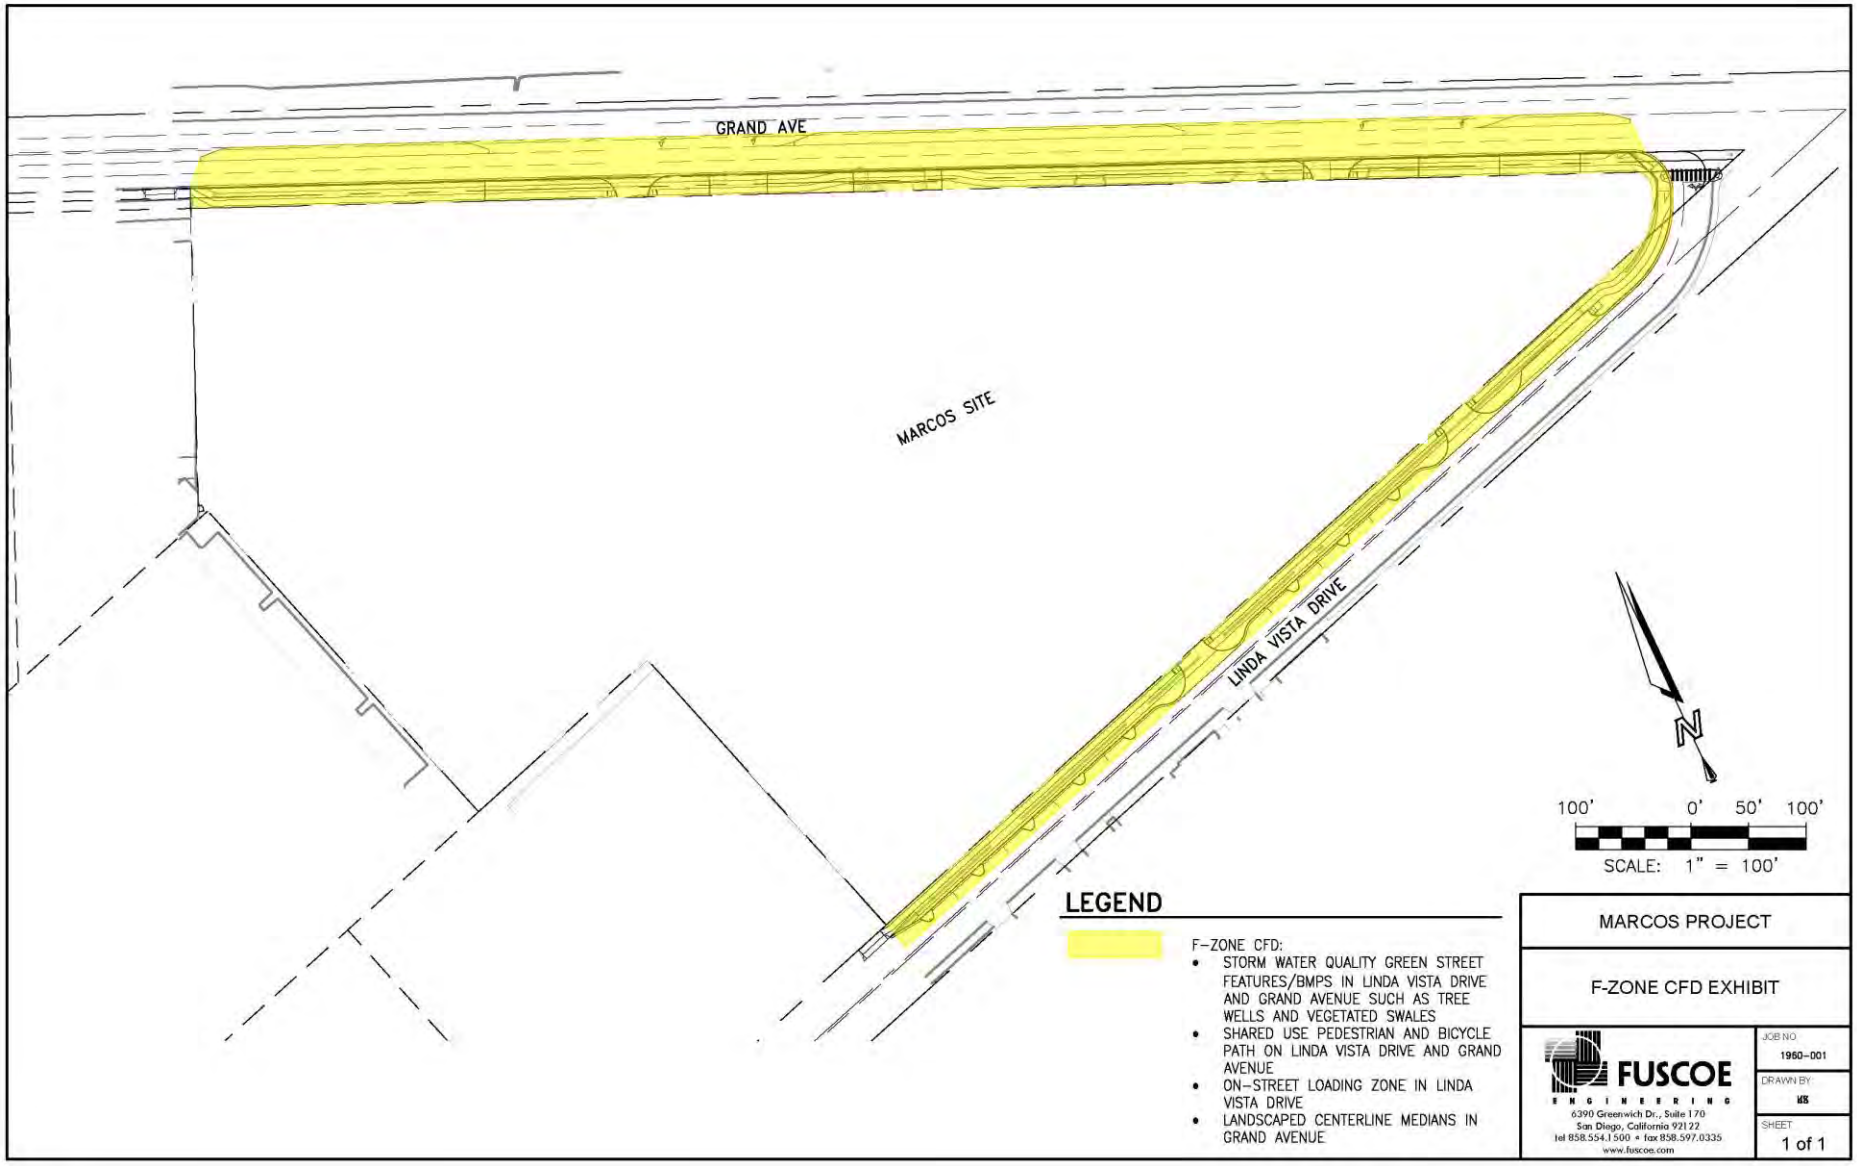
Many of the onsite facilities to be constructed will be financed and constructed entirely by the developer(s) or builder(s). Some examples of these types of improvements are onsite private streets, alleys, and driveways, utility connections from main trunk lines, and storm drain facilities excepting infrastructure of facilities related to the Las Posas Creek restoration. In the case of electricity connections, the developer(s) or builder(s) may be required to use the electricity providers, construction crews, or contractors provided from an approved list determined by the energy provider. In those cases, correspondence will occur between the parties to establish the funding method, at a cost to the developer or builder, to finance those improvements.

8.1.2 Special Assessment Districts

Special assessment districts may be used by the City of San Marcos to pay for improvements within a defined area so long as the property owner(s) vote to allow the assessment to proceed. Once an approval vote has been made, the city has the authority to form the special assessment district by the authority of the Improvement Act of 1911, and the Municipal Improvement Act of 1913. The property owner(s) will bond to pay for improvements such as streets, storm drains, sidewalks, landscape and lighting, water and sewer services, and other similar public improvements.

F-Zone District – The Marcos Specific Plan Area may form an F-Zone CFD to manage the funding mechanism for maintenance of public facilities within the ROW. Establishment of an F-Zone CFD would require the project owners to form the CFD and annex into the F-Zone CFD prior to or at the time construction permits are issued. Improvements that would be included within the F-Zone CFD are as follows:

- Storm water quality green street features/BMP's in Linda Vista such as tree wells, biofiltration basins, and vegetated swales.
- Shared use pedestrian and bicycle path on Linda Vista Drive and Grand Avenue.
- On-street loading zone on Linda Vista Drive.
- Landscaped center medians on Grand Avenue.



F-Zone District

Figure 43

Marcos Specific Plan

8.1.3 Community Facilities Districts and Mello-Roos

The City of San Marcos may use a Community Facility District and require Mello-Roos to finance public improvements for the Specific Plan Area. The Mello-Roos, Community Facilities Act of 1982 allows the City to establish special districts and to levy special taxes and issue tax exempt bonds to finance those improvements. Mello-Roos do not require municipalities to show any specific special benefit to assessed properties, therefore they may be used to finance a broad range of general improvements such as police and fire facilities, libraries, parks, and any improvements which may benefit specific properties.

8.1.4 Other Funding Sources

The developer or builder may secure other sources of funding to construct and maintain public and private facilities such as government grants, private developer coalitions, or various bonds not specifically mentioned above.

8.2 Financing of Public Improvements and Services

The orderly development of the Specific Plan Area requires the procurement of sufficient funding for public facilities and services. The following summaries provide details on financing of facilities and services for the Marcos Specific Plan required to be available at the time of need. The sections described below will provide information on specific financing options and implementation methods for facilities and service within the Specific Plan Area.

8.2.1 Circulation Improvements

The Marcos Specific Plan includes a comprehensive circulation plan, which includes private road improvements and may be required to provide public road improvements, public utility upgrades or other infrastructure improvements. Development within the Specific Plan Area is contingent upon the financing and maintenance of both private internal streets and external public road improvements, public streetscape improvements, and any mitigation measures for traffic impacts identified in the traffic study produced for the MND.

Internal private streets will be financed as a whole, by the developer(s) and/or builder(s).

Improvements to public external roads, rights-of-way, landscaped medians, and landscaping adjacent to the project's frontage identified by the City of San Marcos will be financed and constructed by the developer(s) and/or builder(s).

8.2.2 Fire, Paramedics, & Law Enforcement Facilities

Fire and Paramedic Services and Facilities

The Marcos Specific Plan is within the San Marcos Fire Protection District. To offset impacts to fire, paramedic services and facilities the developer(s) and/or builder(s) will pay fees to the City of San Marcos. Service to the Specific Plan Area shall be provided by the San Marcos Fire Department (SMFD). The developer will pay its fair share contribution to the City of San Marcos' CFD for fire service to the Specific Plan Area. Future homeowners will be assessed annual fees for this district with increases as determined by the city.

Law Enforcement Services

The County of San Diego Sheriff's Department, under contract with the City of San Marcos, will provide police protection services to the Marcos Specific Plan. The Marcos Specific Plan developer shall pay its

fair share contribution to the City of San Marcos' CFD for law enforcement service. Future homeowners will be assessed annual fees for this district with increases as determined by the city.

8.2.3 Schools

The Marcos Specific Plan is located within the San Marcos Unified School District (SMUSD). Impacts to SMUSD will be mitigated by a per square foot fee paid by the developer to the school district and based on total residential dwelling unit square footage.

8.2.4 Open Spaces, Parks, and Recreational facilities

The following categories of open space located within the Marcos Specific Plan to include private common-area open space, private recreation space, and private water quality features, will be financed, and constructed by the developer(s) and/or builder(s). The biological preserved area (Las Posas Creek), which has been restored, preserved, and maintained by the City of San Marcos. Maintenance responsibilities of private recreational facilities, and open space are described in Section 8.3. The developer and/or builder will pay Public Facilities Fees to offset the projects' impacts to City-owned parks and recreation facilities.

8.3 Operations and Maintenance of Public Improvements and Private Facilities

Maintenance of open space, recreational facilities, water quality features, private streets, public streets, water and sewer systems, and landscaping of public rights-of-way are important components to the image of Marcos Specific Plan and the functionality and safety of stormwater movement. This Section will define each entity responsible for maintenance of public improvements and private facilities which will have a prolonged impact on the Specific Plan Areas operations and appearance.

There are several options for funding operation and maintenance of public and private facilities and landscaping. For the operation and maintenance of private facilities, the Specific Plan Area will require the formation of a homeowner's association (HOA) for the West-End Planning Area. The East-End Planning Area shall privately fund facilities or in the case buildings are to be sold they shall establish a Commercial Owners Association (COA) to fund and maintain private facilities. These areas include, but are not limited to, common area open space, onsite landscaping, parks, recreational facilities, onsite private streets, private wet and dry utility connections, and storm water quality facilities and associated drainage facilities. Landscaping within each private lot within the Specific Plan Area shall be the sole responsibility of the homeowner or commercial ownership entity. Operation and maintenance responsibilities are defined in detail below. Each planning area shall establish a funding mechanism or owners' group and maintain its facilities independently.

- Private recreation areas and common area facilities maintenance within the Marcos Specific Plan Area shall be the responsibility of the Marcos Specific Plan HOA, private ownership group or COA.
- Maintenance of common area landscaping within the Marcos Specific Plan shall be the responsibility of the Marcos Specific Plan HOA, private ownership group or COA.
- Maintenance of landscaping within individual dwelling unit private open space shall be the responsibility of the homeowner.

- Maintenance within front yards of multifamily residential units (if included) shall be the responsibility of the HOA.
- Private streets, landscaped parkways, and entry monuments and gates shall be maintained by the Marcos Specific Plan HOA, and private ownership group or COA.
- All private stormdrain systems within the Specific Plan Area will be maintained by the HOA, and private ownership group or COA.
- Public water and sewer systems will be maintained by VWD. Private water/sewer systems within the Marcos Specific Plan will be maintained by the HOA, and private ownership group or COA.
- Maintenance of landscaping, lighting, and storm drain systems, in public right-of-way easements along public streets shall be the responsibility of the City of San Marcos with an assessment paid to the City of San Marcos by the property owner(s).
- Public street maintenance shall be the responsibility of the City of San Marcos.
- Bridge maintenance shall be maintained by the commercial ownership group or COA.

Table 21 Financial & Maintenance Responsibilities

Improvement	Installation/Financially Responsible Party	Long-term Maintenance Responsibility
Common Area landscaping	Developer(s)	HOA, commercial ownership entity or COA
Dry Utilities (gas and electricity)	Developer(s)	SDG&E
Las Posas Creek Bridge	City of San Marcos (currently built)	East-End Planning Area commercial entity or COA
Las Posas Creek	City of San Marcos	City of San Marcos
Private Open Space	Developer(s)	Homeowner, Commercial ownership entity or COA
Private Streets, Alley's, or Driveways	Developer(s)	HOA, Commercial ownership entity or COA
Public Landscaping in rights-of-way	CFD/Developer(s)	CFD
Private Storm Drain Systems	Developer(s)	HOA, commercial ownership entity or COA
Public Storm Drain Systems	Developer(s)	City of San Marcos
Public Water	Developer(s)	Vallecitos Water District
Public Sewer	Developer(s)	Vallecitos Water District
Private Water	Developer(s)	HOA, commercial ownership entity or COA
Private Sewer	Developer(s)	HOA, commercial ownership entity or COA

This page intentionally left blank

Chapter 9: Specific Plan Administration

9 Specific Plan Administration

This chapter of the Marcos Specific Plan Specific Plan is essential to establishing a thorough review process for proposed discretionary entitlements and other processes which may become necessary within the Specific Plan area. Sections within this chapter form the procedures for review of entitlements and modifications or amendments to the Specific Plan (i.e., administration authority of the Plan, descriptions of the entitlements to be processed concurrently with this Specific Plan, compliance with CEQA, and substantial conformance and amendments to the Plan). Those rules, regulations, and processes outlined within this chapter govern the lead agency's implementation of development within the Specific Plan area. In addition to the Marcos Specific Plan implementation, several discretionary entitlements will also be processed concurrently. This section provides a detailed description of the mechanisms needed for implementation of the Specific Plan and should be the primary document consulted when questions arise concerning future development or development changes within the Specific Plan area. As the lead agency, The City of San Marcos is responsible for the administration of the Marcos Specific Plan and as such is responsible for ensuring the rules and procedures described herein are implemented in a consistent manner with all City rules, regulations, and policies.

9.1 Implementation/Phasing

Subsequent approvals needed to implement this Specific Plan include a conditional use permit, tentative map, tentative condominium map, multi-family site development plan, final map(s), grading plan(s), improvement plans(s), and building permits. Once these subsequent approvals are acquired, the planning areas within the Specific Plan area will most likely be constructed in two (2) phases.

Phase one involves preparing the site for vertical construction. The first phase will consist of clearing grubbing the site of all vegetation, rough grading the land, redefine the shape of the property and bring elevation to within a few inches of the final design, installation of wet and dry utilities, roadway improvements, and finish grading to shape the final contours and establish building pads. Phase one is anticipated to be completed within six s after Final Map Approval. Each planning area will independently perform construction work within their respective planning areas.

The second phase will involve vertical construction which entails pouring foundations and sidewalks, construction buildings, and installing landscaping and amenities. Phase two may be broken down into subphases depending upon market conditions and the availability of materials as well as timing of commercial vs. residential construction. Phase two is anticipated to be completed within one year after the completion of Phase one.

9.1.1 East-End Planning Area Conditional Use Permit (CUP)

The master Conditional Use Permit issued for commercial development shall guide implementation of proposed uses within the East-End planning area. Uses which conform with the CUP can be found in chapter 3 Land Use and Development Standards, Section 3.5. Uses similar in nature to those identified in Chapter 3 may be allowed upon a determination by the City of San Marcos Planning Director.

9.1.2 West-End Planning Area CC&R's

Residential CC&R's will require a disclosure that commercial uses currently exist adjacent to the site and the residential units may be subject to impacts typically associated with these uses.

9.2 Administration

Any future development within the Specific Plan area may be subject to further review and subsequent discretionary permits and approval from the City of San Marcos Development Services Department. Application, fee, and processing requirements shall be in accordance with the City's regulations, unless modified by this Specific Plan. Applications for subsequent development projects or public improvements and other activities will be reviewed by the Development Services Department using established procedures to determine consistency with the Marcos Specific Plan and all pertinent development standards, design standards, and mitigation measures identified during the environmental review process, as well as other applicable conditions of approval adopted as part of this Specific Plan.

Review and analysis of a subsequent project permit(s) may trigger conditions of approval that the City determines to be reasonably necessary to ensure the projects application and or plans achieve compliance with this Specific Plan. Procedures to amend the Marcos Specific Plan are also detailed in this section, should the applicant or City staff determine changes to the project would trigger an amendment to this Specific Plan in order to remain compliant with the adopted Specific Plan.

9.2.1 Modifications and Specific Plan Amendments

Approval of this specific plan indicates acceptance by the City of San Marcos of a framework for community development within this Specific Plan. Part of that framework establishes specific development standards that constitute the zoning regulations for the Marcos Specific Plan. It is anticipated that certain modifications to the specific plan text, exhibits, and/or project may be necessary during the development of the project. Any modifications to this specific plan shall occur in accordance with the amendment process described herein. These amendments, should they occur, are divided into two categories. The first category, "Minor Modifications," as defined in further detail below, allows for minor changes to the specific plan without a discretionary review or public hearing and may be approved by the Planning Director. All other proposed changes are considered specific plan amendments and are required to be reviewed for approval by the Planning Commission and/or the City Council. In all cases, amendments must be found to be in substantial conformance with the objectives and development standards of the Marcos Specific Plan. Amendments may be requested at any time pursuant to Section 65453(a) of the California Government Code. If the amendment is deemed major by the Planning Director, it will be processed in the same manner as the original adopted Specific Plan. Proposed amendments deemed to be minor modifications by the Planning Director, as defined herein, will be processed administratively in accordance with the City's administrative review process. Depending upon the nature of a proposed Specific Plan Amendment, a supplemental environmental analysis may be required, pursuant to Section 15162 of the California Environmental Quality Act (CEQA).

Minor Modifications

Upon determination by the Planning Director, certain modifications to the specific plan text, graphics, and/or project design may not require specific plan amendments (e.g., review and approval through a public hearing). The following minor modifications to the specific plan do not require a specific plan amendment, and subject to review and approval by the Planning Director, are considered within substantial conformance with the intent of the provisions of this Specific Plan. The Planning Director, however, shall have the discretion to refer any such request for modification to the Planning Commission.

- Expansions or reductions of the net acreage covered by any given planning area by 15 percent or less.
- Any decrease in project density or FAR.

- Any unforeseen discrepancies or challenges with landscape maintenance, growth, or loss of vegetation that may arise within the Marcos Specific Plan Area.
- Any modifications or realignment of any street serving the project, if also reviewed and approved by the City Engineer and the City Fire Marshall.
- Any modifications or realignment of any lot lines except for the San Marcos Creek parcel, easement locations, or any grading adjustments, if also reviewed and approved by the City Engineer.
- Any collector or public road alignment revisions, when reviewed and approved by the City Engineer.
- Any changes made by any utility provider or public agency providing any utility services to the project.
- Any modifications or changes to any design criteria such as paving treatments, architectural details, landscape treatments, sidewalks, fencing, lighting, entry treatments, or any other changes in any design criteria prescribed in the Specific Plan, determined minor with the Marcos Specific Plan by the Planning Director.
- Modifications to any landscape, wall material, wall designs, wall alignment, or streetscape designs, as determined by the Planning Director and the Development Services Director.
- Any changes to recreational facilities or ancillary recreational amenities so long as the Planning Director determines they are consistent with the intent of the Specific Plan, and any minimum area requirements.
- Modifications to any of the architectural design guidelines such as variations of material within the particular architectural style and any variations in colors, as determined by the Planning Director.
- Any revisions to the Specific Plan graphics that would be consistent with the overall intent of the Specific Plan, determined as minor by the Planning Director.
- Any modifications to architecture, plotting, or unit size determined consistent with the overall intent of the specific plan by the Planning Director.
- Any other modifications or requested changes to any part of the Specific Plan or any design details of the Specific Plan that are deemed minor by the Planning Division Manager.

Specific Plan Amendments

All Specific Plan modifications that do not meet the criteria of a minor modification as defined above or as determined by the Planning Director, shall be deemed major and require approval of a Specific Plan Amendment by the Planning Commission and/or City Council of the City of San Marcos. In the event the proposed Specific Plan Amendment requires supplemental environmental analysis pursuant to Section 15162 of CEQA, the applicant(s) will be responsible for preparing the necessary CEQA documentation.

9.3 Environmental Review

Each subsequent development project requiring discretionary approval shall be reviewed to ensure consistency and compliance with the California Environmental Quality Act (CEQA) Guidelines 15162(c). The Mitigated negative Declaration (MND) shall be certified concurrently with the Marcos Specific Plan and shall serve as the primary environmental document for all subsequent discretionary entitlements

within the Specific Plan Area. Each discretionary development application shall be reviewed on a project-by-project basis to determine consistency with the certified MND. Subsequent administrative approvals are not subject to CEQA review, because they do not trigger the exercise of the city's discretionary powers (CEQA Guidelines 15060[c] [1]). Projects which are not fully consistent with the Specific Plan will require additional analysis for only those factors which create potential impacts. Additional analysis will be performed through the analysis methods described in **Section 9.2**.

9.3.1 Options for Further CEQA Review of Subsequent Discretionary Approvals

Supplemental or Subsequent MND

Subsequent or Supplemental MND review shall not be required for future discretionary development entitlements in the Plan area unless the City of San Marcos makes a determination that substantial evidence exists supporting findings set forth in CEQA Guidelines Section 15162 or 15163. If the findings from those CEQA Guidelines 15162 or 15163 substantiate the city's inquiry, a determination will be made by the City of San Marcos's Community Development Director as to the appropriate supplemental or subsequent environmental document.

MND Addendum

CEQA Guidelines Section 15164(a) gives the City of San Marcos the authority to prepare an Addendum to a previously certified MND if minor changes or additions are necessary, but none of the conditions set forth in CEQA Guideline Section 15162, which call for the preparation of a subsequent MND, have occurred.

Exemptions

For any project design conforming to the standards established within an adopted Specific Plan for which a certified MND is in place, and where substantial evidence exists that none of the events explained within CEQA Guidelines Section 15162 have occurred, no MND or Negative Declaration is required as per California Government Code Section 65457 and CEQA Guidelines Section 15182. The City of San Marcos may wish to document the relevance of the residential Specific Plan exemption through a checklist, initial study, or an MND Addendum.

In accordance with CEQA Guidelines Section 15097, a Mitigation and Monitoring Program (MMRP) shall be adopted for the Specific Plan area. Adoption of a MMRP ensures all mitigation measures identified in the MND are properly implemented. The monitoring program provides an overview of the adopted mitigation requirements for impacts identified within the MND, identifies the parties responsible for monitoring compliance of the mitigation measures, and identified the timing or phases in which the mitigation measure is to be completed. All future development projects within the Specific Plan Area shall comply with the MMRP implementation measure to achieve full compliance with the MND, unless lawfully modified.

Appendices

Appendix A: List of Acronyms and Definitions

ADA – Americans with Disabilities Act.

Accessory Use – A land use that is incidental and subordinate to the main use of the site and located on the same site as the main use.

Alcohol Production/tasting – Any use which distills, brews, or crafts beer, wine, or spirits.

Alley – Any roadway without curbs or sidewalk having a roadway not exceeding twenty-five (25) feet.

Area, Lot, or Site – The horizontal area within the property lines of a lot.

Building – A structure having a roof supported by columns or walls.

CEQA – California Environmental Quality Act.

CFD – Community Facility District.

CNEL – Community Noise Exposure Level.

Commercial Artist/Production Studio – Any commercial use or space for the creation, exhibition, or production of artistic or craft pieces.

Commercial Entertainment – Any place of business providing spectator entertainment for commercial purposes.

CSUSM – California State University San Marcos.

CWPP – Community Wildfire Protection plan.

CY – Cubic Yards.

dBA – A number of decibels read from a sound level meter with the meter switched to the weighting scale "A."

FAR – Floor area ratio.

HOA – Homeowners Association.

HRA – Hazard Risk Assessment.

Industrial, Maker Space – Any business providing or combining design and light fabrication or assembly of technology or crafts.

MMRP – Mitigation Monitoring and Reporting Program.

MND – Mitigated Negative Declaration

NCTD – North County Transit District.

Office, Professional, and Business Support Uses – Establishments providing direct services or support to clients such as architects, engineers, insurance agencies, real-estate, etc.

Recreation, Education, & Public Assembly – Any use which incorporates an educational and/or recreational component and/or a use which incorporates an assembly component where multiple people gather in a public space.

Retail, General – Commercial use which specializes in the sale of goods.

SDG&E – San Diego Gas and Electric.

SF – Square Footage.

SMMC – San Marcos Municipal Code.

SPA – Specific Plan Area.

VWD – Vallecitos Water District.

Wellness Uses – Business which provide healthy living such as physical fitness or therapy, nutritional services, salons and more.

ZEV	zero emission vehicle

1 Executive Summary

The purpose of this technical report is to assess the potential air quality and greenhouse gas (GHG) emissions impacts associated with implementation of the proposed Marcos Specific Plan Project (Project) in the City of San Marcos (City). This assessment utilizes the significance thresholds in Appendix G of the California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.) and is based on the emissions-based significance thresholds recommended by the San Diego Air Pollution Control District (SDAPCD) and other applicable thresholds of significance.

1.1 Project Summary

The proposed Marcos Specific Plan Project (Project) includes a request for a Specific Plan, General Plan Amendment, and Rezone for a residential mixed-use development project on approximately 12.03-acre site. The General Plan Amendment and Rezone would change the General Plan designation and Zoning from Commercial (C) to Specific Plan Area (SPA).

The project site is located at the northwest corner of Grand Avenue and Linda Vista Drive in the City of San Marcos (APNs 219-152-42, -44, -45, -51, -61, -70, -74, -75, -76, -77, -78, -79) The existing project site has been previously disturbed and is currently developed with paved areas and billboards. The project site is located in an urban area of the City surrounded on all sides by existing development, including commercial and industrial uses to the north, east, south, and west.

The Project consists of construction of 102 multi-family residential units on 5.03 acres of the project site, and construction of 7,658 square feet (sf) of office space and 49,266 sf of specialty retail space and 7 live-work residential dwelling units on 6.05 acres of the project site. Residential units would be contained within 15 townhome buildings, and units would be a mix of six different unit types, ranging in size from two- to three-bedrooms. Additionally, the residential area would include a pool building, pool and spa area, barbeque area, picnic area, and play area for residents. The residential buildings would be located on the northwestern portion of the site, and commercial uses and the live-work units would be placed along the southern and eastern project boundaries. Access to the residential area would be provided via Grand Avenue at a northern driveway, and access to the commercial area would be via Grand Avenue at a southern driveway and two driveways along Linda Vista Drive. The project would provide 204 garage parking spaces for residences, 34 residential guest parking spaces, and 278 commercial parking spaces.

The Project site is located within the San Diego Air Basin and is under the jurisdiction of the SDAPCD. Construction and operational criteria air pollutant and GHG emissions were estimated using the California Emissions Estimator Model (CalEEMod) Version 2022.

1.2 Air Quality Findings

The air quality impact analysis evaluated the potential for adverse impacts to air quality due to construction and operational emissions resulting from the Project. Impacts were evaluated for their significance based on the County of San Diego's mass daily criteria air pollutant thresholds of significance (County of San Diego 2007), which is based on SDAPCD Rules 20.2 and 20.3 (SDAPCD 1998 and 2021). Criteria air pollutants are defined as pollutants

for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. Criteria air pollutants include ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), particulate matter with an aerodynamic diameter less than or equal to 10 microns (PM_{10}), particulate matter with an aerodynamic diameter less than or equal to 2.5 microns ($PM_{2.5}$), and lead. Pollutants that are evaluated include volatile organic compounds (VOCs), oxides of nitrogen (NO_x), CO, sulfur oxides (SO_x), PM_{10}, and $PM_{2.5}$. VOCs and NO_x are important because they are precursors to O_3.

1.2.1 Air Quality Plan Consistency

Regarding consistency with local air quality plans, the Project would not result in a more intensive land use than currently allowed under the City's General Plan (City of San Marcos 2012), which SDAPCD's Regional Air Quality Strategy (RAQS) emissions forecast is based on. The Project site is designated as Commercial (C) in the City's General Plan and is zoned Commercial (C). Although the Project would redesignate the site to Specific Plan Area and would develop a mix of residential and commercial uses, it would be less intensive than the current designation. Further, the projected population, housing, and employment growth would be well within the SANDAG projections for the City. As such, the Project would be consistent with relevant air quality plans, and impacts would be **less than significant**.

1.2.2 Cumulatively Considerable Increase in Non-Attainment Criteria Air Pollutant Emissions

1.2.2.1 Construction Criteria Air Pollutant Emissions

Construction of the Project would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and VOC off-gassing) and off-site sources (i.e., on-road haul trucks, vendor trucks, and worker vehicle trips). Estimated maximum daily construction emissions would not exceed the applied significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$ during construction in all construction years (2024–2025). Therefore, Project construction air quality impacts would be **less than significant**.

1.2.2.2 Operational Criteria Air Pollutant Emissions

Operation of the Project would generate operational criteria air pollutants from mobile sources (i.e., vehicle trips), area sources (i.e., consumer product use, architectural coatings, and landscape maintenance equipment), and energy (i.e., natural gas). Maximum daily operational emissions would not exceed the County of San Diego's operational significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$. Therefore, Project operational air quality impacts would be **less than significant**.

1.2.3 Exposure of Sensitive Receptors

1.2.3.1 Carbon Monoxide Hotspots

Operation of the Project would generate minimal new daily vehicle trips and would not expose sensitive receptors to localized high concentrations of CO or contribute traffic volumes to intersections that would cause a CO hotspot. Operational CO hotspot impacts would be **less than significant**.

1.2.3.2 Toxic Air Contaminants

Construction activities would not generate emissions greater than the applied mass daily thresholds; therefore, Project-generated construction emissions are not anticipated to be substantial. Further, the exposure duration of toxic air contaminants (TACs) during construction would be a small portion of the 30-year exposure period and the nearest sensitive receptors are located at distance of over 2,000 feet away from the Project site. Given the short-term duration of construction and the dispersion of TACs through the intervening distance, the pollutant concentration would be further reduced.

Regarding long-term toxic air contaminant emissions, the Project would result in a minimal increase in daily truck traffic on the roadway network and would not require stationary sources (such as diesel emergency generators). Therefore, the exposure of Project-related TAC emission impacts to proximate sensitive receptors would be **less than significant**.

1.2.4 Other Emissions (Odors)

The analysis of other emissions is focused on the potential for an odor impact to occur. Potential odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment, architectural coatings, and asphalt pavement application, which would disperse rapidly from the Project site and generally occur at magnitudes that would not affect substantial numbers of people. In addition, the Project would not include land-use types that would generate offensive odors during operation. Therefore, Project construction and operations would result in odor impacts that are **less than significant**.

1.3 Greenhouse Gas Emissions Findings

Global climate change is primarily considered a cumulative impact but must also be evaluated on a project-level under CEQA. A project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHG emissions. GHGs are gases that absorb infrared radiation in the atmosphere. Principal GHGs regulated under state and federal law and regulations include carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). GHG emissions are measured in metric tons of CO_2 equivalent (MT CO_2e), which account for weighted global warming potential factors for CH_4 and N_2O.

The City of San Marcos adopted the Final Climate Action Plan (CAP) on December 8, 2020. The Project's GHG impact significance has been assessed based on compliance with the City's CAP Consistency Checklist. Construction and operational GHG emissions were quantified for informational purposes in accordance with the CEQA Guidelines 15064.4.

Construction of the Project would result in GHG emissions of 582.8 MT CO_2e. Estimated Project-generated construction emissions amortized over 30 years would be approximately 19.4 MT CO_2e per year.

The estimated GHG emissions from operation of the Project would be approximately 1,690.40 MT CO_2e per year, including amortized construction emissions.

Development of the Project site would be consistent with the City's CAP, which was prepared to be aligned with California Air Resources Board's (CARB) community-wide targets and put the City on trajectory to meet its proportional share of the 2050 state target identified in EO-S-3-05, as such the Project would not conflict with the California Air Resources Board (CARB) Scoping Plan or the San Diego Association of Governments Regional Transportation Plan/Sustainable Communities Strategy (SANDAG RTP/SCS).

Regarding the CARB's 2022 Scoping Plan and AB 1279 (2045 carbon neutrality), the City's CAP would provide its proportional share of reductions towards 2050, which would align with 2045 targets in concert with CARB measures for carbon capture and storage.

Based on the Project's consistency with the City's CAP, the Project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs or generate GHGs that may have a significant impact on the environment. This impact would be **less than significant**.

1.4 Summary of Findings

Table 1. Summary of Impact Determinations

Analysis	Report Section	CEQA Checklist Question	Significance Determinations	
			Unmitigated	Mitigated
Air Quality Management Plan	3.5.1	AQ-1	Less than Significant	No Mitigation Required.
Cumulatively Considerable Net Increase of Any Criteria Pollutant	3.5.2	AQ-2	Less than Significant	No Mitigation Required.
Sensitive Receptors	3.5.3	AQ-3	Less than Significant	No Mitigation Required.
Other Emissions and Odors	3.5.4	AQ-4	Less than Significant	No Mitigation Required.
GHG Emissions and GHG Reduction Plan	4.5.1	GHG-1 and GHG-2	Less than Significant	No Mitigation Required.

2 Introduction

2.1 Report Purpose and Scope

The purpose of this technical report is to assess the potential air quality and greenhouse gas (GHG) emissions impacts associated with implementation of the proposed Marcos Specific Plan Project (Project). This assessment uses the significance thresholds in Appendix G of the California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.) and is based on the emissions-based significance thresholds recommended by the County of San Diego (County), which is based on the San Diego Air Pollution Control District (SDAPCD) rules, and other applicable thresholds of significance.

This introductory Section provides a description of the Project and the Project location. Chapter 3, Air Quality, describes the air quality–related environmental setting, regulatory setting, existing air quality conditions, and thresholds of significance and analysis methodology, and presents an air quality impact analysis per Appendix G of the CEQA Guidelines. Chapter 4, Greenhouse Gas Emissions, follows the same format as Chapter 3 and similarly describes the GHG emissions–related environmental setting, regulatory setting, existing climate changes conditions, and thresholds of significance and analysis methodology, and presents a GHG emissions impact analysis per Appendix G of the CEQA Guidelines. Chapter 5, References Cited, includes a list of the references cited. Chapter 6, List of Preparers, includes a list of those who prepared this technical report.

2.2 Project Description

The proposed Project includes the development of a Specific Plan to guide future development on the approximately 12.03-acre Project site in the City of San Marcos in San Diego County (Figure 1, Project Location). The Project site is located at the northwest corner of Grand Avenue and Linda Vista Drive (Figure 2, Project Site). The existing site has been previously disturbed and is currently developed with paved areas and billboards. The Project site is located in an urban area of the City surrounded on all sides by existing development, including commercial and industrial uses to the north, east, south, and west.

The Project consists of construction of 102 multi-family residential units on 5.03 acres of the project site, and construction of 7,658 square feet (sf) of office space and 49,266 sf of specialty retail space and 7 live-work residential dwelling units on 6.05 acres of the project site (Figure 3, Site Plan). Residential units would be contained within 15 townhome buildings, and units would be a mix of six different unit types, ranging in size from two- to three-bedrooms. Additionally, the residential area would include a pool building, pool and spa area, barbeque area, picnic area, and play area for residents. The residential buildings would be located on the northwestern portion of the site, and commercial uses and the live-work units would be placed along the southern and eastern project boundaries. Access to the residential area would be provided via Grand Avenue at a northern driveway, and access to the commercial area would be via Grand Avenue at a southern driveway and two driveways along Linda Vista Drive. The Project would provide 204 garage parking spaces for residences, 34 residential guest parking spaces, and 278 commercial parking spaces.

The Project site is currently designated and zoned Commercial (C) under the City's General Plan and municipal code, respectively.

3 Air Quality

3.1 Environmental Setting

3.1.1 Meteorological and Topographical Conditions

The Project site is located within the San Diego Air Basin (SDAB) and is subject to the SDAPCD guidelines and regulations. The SDAB is one of 15 air basins that geographically divide the State of California. The primary factors that determine air quality are the locations of air pollutant sources and the quantity of pollutants emitted. Meteorological and topographical conditions, however, are also important. Factors such as wind speed and direction, air temperature gradients and sunlight, and precipitation and humidity interact with physical landscape features to determine the movement and dispersal of air pollutants. Meteorological and topographical factors that affect air quality in the SDAB are described below.[1]

3.1.1.1 Regional Climate and Meteorological Conditions

The climate of the San Diego region, as in most of Southern California, is influenced by the strength and position of the semi-permanent high-pressure system over the Pacific Ocean, known as the Pacific High. This high-pressure ridge over the west coast often creates a pattern of late-night and early-morning low clouds, hazy afternoon sunshine, daytime onshore breezes, and little temperature variation year-round. The SDAB is characterized as a Mediterranean climate with dry, warm summers and mild, occasionally wet winters. Average temperature ranges (in degrees Fahrenheit (°F)) from the mid-40s to the high 90s, with an average of 201 days warmer than 70°F. The SDAB experiences 9 to 13 inches of rainfall annually, with most of the region's precipitation falling from November through March, with infrequent (approximately 10%) precipitation during the summer. El Niño and La Niña patterns have large effects on the annual rainfall received in San Diego, where San Diego receives less than normal rainfall during La Niña years.

The interaction of ocean, land, and the Pacific High maintains clear skies for much of the year and influences the direction of prevailing winds (westerly to northwesterly). The winds tend to blow onshore in the day and offshore at night. Local terrain is often the dominant factor inland, and winds in inland mountainous areas tend to blow through the valleys during the day and down the hills and valleys at night.

The favorable climate of the San Diego region also works to create air pollution problems. Sinking, or subsiding air from the Pacific High, creates a temperature inversion known as a subsidence inversion, which acts as a "lid" to vertical dispersion of pollutants. Weak summertime pressure gradients further limit horizontal dispersion of pollutants in the mixed layer below the subsidence inversion. Poorly dispersed anthropogenic emissions combined with strong sunshine leads to photochemical reactions that result in the creation of ozone (O_3) at this surface layer. In addition, light winds during the summer further limit ventilation.

[1] The discussion of meteorological and topographical conditions of the SDAB is based on information provided in the SDAPCD *2016 Monitoring Plan* (SDAPCD 2017), the County of San Diego *Guidelines for Determining Significance – Air Quality* (County of San Diego 2007), the County of San Diego *General Plan Update EIR* (County of San Diego 2011), and the CARB *Recommended Area Designation for the 2010 Federal Sulfur Dioxide Standard* (CARB 2011).

In the fall months, the SDAB is often impacted by Santa Ana winds, which are the result of a high-pressure system over the Nevada and Utah regions that overcomes the westerly wind pattern and forces hot, dry winds from the east to the Pacific Ocean. The Santa Ana winds are powerful and can blow the SDAB's pollutants out to sea. However, a weak Santa Ana can transport air pollution from the South Coast Air Basin and greatly increase O_3 concentrations in the San Diego area.

Under certain conditions, atmospheric oscillation results in the offshore transport of air from the Los Angeles region to San Diego County. This often produces high O_3 concentrations, as measured at air pollutant monitoring stations within San Diego County. The transport of air pollutants from Los Angeles to San Diego can also occur within the stable layer of the elevated subsidence inversion, where high levels of O_3 are transported.

3.1.1.2 Topographical Conditions

Topography in the San Diego region varies greatly, from beaches in the west to mountains and desert in the east; much of the topography in between consists of mesa tops intersected by canyon areas. Along with local meteorology, topography influences the dispersal and movement of pollutants in the SDAB. Mountains to the east prohibit dispersal of pollutants in that direction and help trap pollutants in inversion layers.

The topography of the SDAB also drives pollutant levels, and the SDAB is classified as a "transport recipient," whereby pollutants are transported from the South Coast Air Basin to the north and, when the wind shifts direction, from Tijuana, Mexico, to the south.

3.1.2 Pollutants and Effects

3.1.2.1 Criteria Air Pollutants

Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. The national and California standards have been set, with an adequate margin of safety, at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons from illness or discomfort. Pollutants of concern include O_3, nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), particulate matter with an aerodynamic diameter less than or equal to 10 microns (PM_{10}), particulate matter with an aerodynamic diameter less than or equal to 2.5 microns ($PM_{2.5}$), and lead. In California, sulfates, vinyl chloride, hydrogen sulfide, and visibility-reducing particles are also regulated as criteria air pollutants. These pollutants, as well as toxic air contaminants (TACs), are discussed in the following paragraphs.[2]

Ozone. O_3 is a strong-smelling, pale blue, reactive, toxic chemical gas consisting of three oxygen atoms. It is a secondary pollutant formed in the atmosphere by a photochemical process involving the sun's energy and O_3 precursors. These precursors are mainly oxides of nitrogen (NO_x) and volatile organic compounds (VOCs). The maximum effects of precursor emissions on O_3 concentrations usually occur several hours after they are emitted and many miles from the source. Meteorology and terrain play major roles in O_3 formation, and ideal conditions occur during summer and early autumn on days with low wind speeds or stagnant air, warm temperatures, and

[2] The descriptions of the criteria air pollutants and associated health effects are based on the U.S. Environmental Protection Agency's "Criteria Air Pollutants" (EPA 2022a), as well as the California Air Resources Board's "Glossary" (CARB 2019a) and CARB's "Common Air Pollutants" (CARB 2022a).

cloudless skies. O_3 exists in the upper atmosphere O_3 layer (stratospheric O_3) and at the Earth's surface in the troposphere (ground-level O_3)[3]. The O_3 that the U.S. Environmental Protection Agency (EPA) and the California Air Resources Board (CARB) regulate as a criteria air pollutant is produced close to the ground level, where people live, exercise, and breathe. Ground-level O_3 is a harmful air pollutant that causes numerous adverse health effects and is thus considered "bad" O_3. Stratospheric, or "good," O_3 occurs naturally in the upper atmosphere, where it reduces the amount of ultraviolet light (i.e., solar radiation) entering the Earth's atmosphere. Without the protection of the beneficial stratospheric O_3 layer, plant and animal life would be seriously harmed.

O_3 in the troposphere causes numerous adverse health effects; short-term exposures (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes (EPA 2013).

Inhalation of O_3 causes inflammation and irritation of the tissues lining human airways, causing, and worsening a variety of symptoms. Exposure to O_3 can reduce the volume of air that the lungs breathe in, thereby causing shortness of breath. O_3 in sufficient doses increases the permeability of lung cells, rendering them more susceptible to toxins and microorganisms. The occurrence and severity of health effects from O_3 exposure vary widely among individuals, even when the dose and the duration of exposure are the same. Research shows adults and children who spend more time outdoors participating in vigorous physical activities are at greater risk from the harmful health effects of O_3 exposure. While there are relatively few studies on the effects of O_3 on children, the available studies show that children are no more or less likely to suffer harmful effects than adults. However, there are several reasons why children may be more susceptible to O_3 and other pollutants. Children and teens spend nearly twice as much time outdoors and engaged in vigorous activities as adults. Children breathe more rapidly than adults and inhale more pollution per pound of their body weight than adults. Also, children are less likely than adults to notice their own symptoms and avoid harmful exposures. Further research may be able to better distinguish between health effects in children and adults. Children, adolescents, and adults who exercise or work outdoors, where O3 concentrations are the highest, are at the greatest risk of harm from this pollutant (CARB 2019b).

Nitrogen Dioxide. NO_2 is a brownish, highly reactive gas that is present in all urban atmospheres. The major mechanism for the formation of NO_2 in the atmosphere is the oxidation of the primary air pollutant nitric oxide (NO), which is a colorless, odorless gas. NO_x plays a major role, together with VOCs, in the atmospheric reactions that produce O_3. NO_x is formed from fuel combustion under high temperature or pressure. In addition, NO_x is an important precursor to acid rain and may affect both terrestrial and aquatic ecosystems. The two major emissions sources are transportation and stationary fuel combustion sources such as electric utility and industrial boilers. NO_2 can irritate the lungs, cause bronchitis and pneumonia, and lower resistance to respiratory infections (EPA 2016a).

A large body of health science literature indicates that exposure to NO_2 can induce adverse health effects. The strongest health evidence, and the health basis for the ambient air quality standards for NO_2, results from controlled human exposure studies that show that NO_2 exposure can intensify responses to allergens in allergic asthmatics. In addition, several epidemiological studies have demonstrated associations between NO_2 exposure and premature death, cardiopulmonary effects, decreased lung function growth in children, respiratory symptoms, emergency room visits for asthma, and intensified allergic responses. Infants and children are particularly at risk because they have

[3] The troposphere is the layer of the Earth's atmosphere nearest to the surface of the Earth. The troposphere extends outward about 5 miles at the poles and about 10 miles at the equator.

disproportionately higher exposure to NO_2 than adults due to their greater breathing rate for their body weight and their typically greater outdoor exposure duration. Several studies have shown that long-term NO_2 exposure during childhood, the period of rapid lung growth, can lead to smaller lungs at maturity in children with higher levels of exposure compared to children with lower exposure levels. In addition, children with asthma have a greater degree of airway responsiveness compared with adult asthmatics. In adults, the greatest risk is to people who have chronic respiratory diseases, such as asthma and chronic obstructive pulmonary disease (CARB 2019c).

Carbon Monoxide. CO is a colorless, odorless gas formed by the incomplete combustion of hydrocarbon, or fossil fuels. CO is emitted almost exclusively from motor vehicles, power plants, refineries, industrial boilers, ships, aircraft, and trains. In urban areas, such as the Project location, automobile exhaust accounts for most CO emissions. CO is a nonreactive air pollutant that dissipates relatively quickly; therefore, ambient CO concentrations generally follow the spatial and temporal distributions of vehicular traffic. CO concentrations are influenced by local meteorological conditions—primarily wind speed, topography, and atmospheric stability. CO from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, which is a typical situation at dusk in urban areas from November to February. The highest levels of CO typically occur during the colder months of the year, when inversion conditions are more frequent.

CO is harmful because it binds to hemoglobin in the blood, reducing the ability of blood to carry oxygen. This interferes with oxygen delivery to the body's organs. The most common effects of CO exposure are fatigue, headaches, confusion and reduced mental alertness, light-headedness, and dizziness due to inadequate oxygen delivery to the brain. For people with cardiovascular disease, short-term CO exposure can further reduce their body's already compromised ability to respond to the increased oxygen demands of exercise, exertion, or stress. Inadequate oxygen delivery to the heart muscle leads to chest pain and decreased exercise tolerance. Unborn babies whose mothers experience high levels of CO exposure during pregnancy are at risk of adverse developmental effects. Unborn babies, infants, elderly people, and people with anemia or with a history of heart or respiratory disease are most likely to experience health effects with exposure to elevated levels of CO (CARB 2019d).

Sulfur Dioxide. SO_2 is a colorless, pungent gas formed primarily from incomplete combustion of sulfur-containing fossil fuels. The main sources of SO_2 are coal and oil used in power plants and industries; as such, the highest levels of SO_2 are generally found near large industrial complexes. In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits on the sulfur content of fuels.

Controlled human exposure and epidemiological studies show that children and adults with asthma are more likely to experience adverse responses with SO_2 exposure, compared with the non-asthmatic population. Effects at levels near the 1-hour standard are those of asthma exacerbation, including bronchoconstriction accompanied by symptoms of respiratory irritation such as wheezing, shortness of breath, and chest tightness, especially during exercise or physical activity. Also, exposure at elevated levels of SO_2 (above 1 parts per million [ppm]) results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality. Older people and people with cardiovascular disease or chronic lung disease (such as bronchitis or emphysema) are most likely to experience these adverse effects (CARB 2019e).

SO_2 is of concern both because it is a direct respiratory irritant and because it contributes to the formation of sulfate and sulfuric acid in particulate matter [National Research Council (NRC) 2005]. People with asthma are of particular concern, both because they have increased baseline airflow resistance and because their SO_2-induced increase in airflow resistance is greater than in healthy people, and it increases with the severity of their asthma (NRC 2005).

SO_2 is thought to induce airway constriction via neural reflexes involving irritant receptors in the airways (NRC 2005).

Particulate Matter. Particulate matter pollution consists of very small liquid and solid particles floating in the air, which can include smoke, soot, dust, salts, acids, and metals. Particulate matter can form when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. $PM_{2.5}$ and PM_{10} represent fractions of particulate matter. Coarse particulate matter (PM_{10}) consists of particulate matter that is 10 microns or less in diameter, which is about 1/7 the thickness of a human hair. Major sources of PM_{10} include crushing or grinding operations; dust stirred up by vehicles traveling on roads; wood-burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions. Fine particulate matter ($PM_{2.5}$) consists of particulate matter that is 2.5 microns or less in diameter, which is roughly 1/28 the diameter of a human hair. $PM_{2.5}$ results from fuel combustion (e.g., from motor vehicles and power generation and industrial facilities), residential fireplaces, and woodstoves. In addition, $PM_{2.5}$ can be formed in the atmosphere from gases such as sulfur oxides (SO_x), NO_x, and VOCs.

$PM_{2.5}$ and PM_{10} pose a greater health risk than larger-size particles. When inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances such as lead, sulfates, and nitrates can cause lung damage directly or be absorbed into the bloodstream, causing damage elsewhere in the body. Additionally, these substances can transport adsorbed gases such as chlorides or ammonium into the lungs, also causing injury. Whereas PM_{10} tends to collect in the upper portion of the respiratory system, $PM_{2.5}$ is so tiny that it can penetrate deeper into the lungs and damage lung tissue. Suspended particulates also damage and discolor surfaces on which they settle and produce haze and reduce regional visibility.

Several adverse health effects have been associated with exposure to both $PM_{2.5}$ and PM_{10}. For $PM_{2.5}$, short-term exposures (up to 24-hour duration) have been associated with premature mortality, increased hospital admissions for heart or lung causes, acute and chronic bronchitis, asthma attacks, emergency room visits, respiratory symptoms, and restricted activity days. These adverse health effects have been reported primarily in infants, children, and older adults with preexisting heart or lung diseases. In addition, of all the common air pollutants, $PM_{2.5}$ is associated with the greatest proportion of adverse health effects related to air pollution, both in the United States and worldwide based on the World Health Organization's Global Burden of Disease Project. Short-term exposures to PM_{10} have been associated primarily with worsening of respiratory diseases, including asthma and chronic obstructive pulmonary disease, leading to hospitalization and emergency department visits (CARB 2017a).

Long-term exposure (months to years) to $PM_{2.5}$ has been linked to premature death, particularly in people who have chronic heart or lung diseases, and reduced lung function growth in children. The effects of long-term exposure to PM10 are less clear, although several studies suggest a link between long-term PM_{10} exposure and respiratory mortality. The International Agency for Research on Cancer published a review in 2015 that concluded that particulate matter in outdoor air pollution causes lung cancer (CARB 2017a).

Lead. Lead in the atmosphere occurs as particulate matter. Sources of lead include leaded gasoline; the manufacturing of batteries, paints, ink, ceramics, and ammunition; and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. Between 1978 and 1987, the phaseout of leaded gasoline reduced the overall inventory of airborne lead by nearly 95%. With the phaseout of leaded gasoline,

secondary lead smelters, battery recycling, and manufacturing facilities are becoming lead-emissions sources of greater concern.

Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurological dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decrements in neurobehavioral performance, including intelligence quotient (IQ) performance, psychomotor performance, reaction time, and growth. Children are highly susceptible to the effects of lead.

Sulfates. Sulfates are the fully oxidized form of sulfur, which typically occur in combination with metals or hydrogen ions. Sulfates are produced from reactions of SO_2 in the atmosphere and can result in respiratory impairment, as well as reduced visibility.

Vinyl Chloride. Vinyl chloride is a colorless gas with a mild, sweet odor, which has been detected near landfills, sewage plants, and hazardous waste sites, due to the microbial breakdown of chlorinated solvents. Short-term exposure to high levels of vinyl chloride in air can cause nervous system effects, such as dizziness, drowsiness, and headaches. Long-term exposure through inhalation can cause liver damage, including liver cancer.

Hydrogen Sulfide. Hydrogen sulfide is a colorless and flammable gas that has a characteristic odor of rotten eggs. Sources of hydrogen sulfide include geothermal power plants, petroleum refineries, sewers, and sewage treatment plants. Exposure to hydrogen sulfide can result in nuisance odors, as well as headaches and breathing difficulties at higher concentrations.

Visibility-Reducing Particles. Visibility-reducing particles are any particles in the air that obstruct the range of visibility. Effects of reduced visibility can include obscuring the viewshed of natural scenery, reducing airport safety, and discouraging tourism. Sources of visibility-reducing particles are the same as for $PM_{2.5}$.

Volatile Organic Compounds. Hydrocarbons are organic gases that are formed from hydrogen and carbon and sometimes other elements. Hydrocarbons that contribute to formation of O_3 are referred to and regulated as VOCs [also referred to as reactive organic gases (ROGs)]. Combustion engine exhaust, oil refineries, and fossil-fueled power plants are the sources of hydrocarbons. Other sources of hydrocarbons include evaporation from petroleum fuels, solvents, dry cleaning solutions, and paint.

The primary health effects of VOCs result from the formation of O_3 and its related health effects. High levels of VOCs in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. Carcinogenic forms of hydrocarbons, such as benzene, are considered TACs. There are no separate ambient air quality standards for VOCs as a group.

3.1.2.2 Non-Criteria Air Pollutants

Toxic Air Contaminants. A substance is considered toxic if it has the potential to cause adverse health effects in humans, including increasing the risk of cancer upon exposure, or acute and/or chronic non-cancer health effects. A toxic substance released into the air is considered a TAC. TACs are identified by federal and state agencies based on a review of available scientific evidence. In the state of California, TACs are identified through a two-step process that was established in 1983 under the Toxic Air Contaminant Identification and Control Act. This two-step process

of risk identification and risk management and reduction was designed to protect residents from the health effects of toxic substances in the air. In addition, the California Air Toxics "Hot Spots" Information and Assessment Act, Assembly Bill (AB) 2588, was enacted by the legislature in 1987 to address public concern over the release of TACs into the atmosphere. The law requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over 5 years.

Examples include certain aromatic and chlorinated hydrocarbons, certain metals, and asbestos. TACs are generated by several sources, including stationary sources, such as dry cleaners, gas stations, combustion sources, and laboratories; mobile sources, such as automobiles; and area sources, such as landfills. Adverse health effects associated with exposure to TACs may include carcinogenic (i.e., cancer-causing) and non-carcinogenic effects. Non-carcinogenic effects typically affect one or more target organ systems and may be experienced on either short-term (acute) or long-term (chronic) exposure to a given TAC.

Diesel Particulate Matter. Diesel particulate matter (DPM) is part of a complex mixture that makes up diesel exhaust. Diesel exhaust is composed of two phases, gas and particle, both of which contribute to health risks. More than 90% of DPM is less than 1 micrometer in diameter (about 1/70 the diameter of a human hair), and thus is a subset of $PM_{2.5}$ (CARB 2019f). DPM is typically composed of carbon particles ("soot," also called black carbon) and numerous organic compounds, including over 40 known cancer-causing organic substances. Examples of these chemicals include polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, and 1,3-butadiene (CARB 2019f). The CARB classified "particulate emissions from diesel-fueled engines" (i.e., DPM) (17 CCR 93000) as a TAC in August 1998. DPM is emitted from a broad range of diesel engines: on-road diesel engines, including trucks, buses, and cars, and off-road diesel engines, including locomotives, marine vessels, and heavy-duty construction equipment, among others. Approximately 70% of all airborne cancer risk in California is associated with DPM (CARB 2000). To reduce the cancer risk associated with DPM, CARB adopted a diesel risk reduction plan in 2000 (CARB 2000). Because it is part of $PM_{2.5}$, DPM also contributes to the same non-cancer health effects as $PM_{2.5}$ exposure. These effects include premature death; hospitalizations and emergency department visits for exacerbated chronic heart and lung disease, including asthma; increased respiratory symptoms; and decreased lung function in children. Several studies suggest that exposure to DPM may also facilitate development of new allergies (CARB 2019f). Those most vulnerable to non-cancer health effects are children, whose lungs are still developing, and older people, who often have chronic health problems.

Valley Fever. Coccidioidomycosis, more commonly known as "Valley Fever," is an infection caused by inhalation of the spores of the *Coccidioides immitis* fungus, which grows in the soils of the southwestern United States. When fungal spores are present, any activity that disturbs the soil, such as digging, grading, or other earth-moving operations, can cause the spores to become airborne and thereby increase the risk of exposure. The ecologic factors that appear to be most conducive to survival and replication of the spores are high summer temperatures, mild winters, sparse rainfall, and alkaline sandy soils.

The reported number of cases in California was 7,217 cases in 2020, with the Coccidioidomycosis incidence rate of 18.1 per 100,000 population in 2020 (CDPH 2022). Valley Fever is not considered highly endemic to San Diego. Per the San Diego County Health and Human Services Agency, the 10-year average (2010–2019) for Coccidioidomycosis cases in the County of San Diego is 6.3 cases per 100,000 people per year. Similarly, among the total reported incidents of Valley Fever from 2009 through 2019, only 0.9% of the cases reported in the County were in in the City's zip code that includes the project site (92069) (County of San Diego 2021).

Even if present at a site, earth-moving activities may not result in increased incidence of Valley Fever. Propagation of *Coccidioides immitis* is dependent on climatic conditions, with the potential for growth and surface exposure highest following early seasonal rains and long dry spells. *Coccidioides immitis* spores can be released when filaments are disturbed by earth-moving activities, although receptors must be exposed to and inhale the spores to be at increased risk of developing Valley Fever. Moreover, exposure to *Coccidioides immitis* does not guarantee that an individual will become ill—approximately 60% of people exposed to the fungal spores are asymptomatic and show no signs of an infection (USGS 2000).

Odorous Compounds. Odors are generally regarded as an annoyance rather than a health hazard. Manifestations of a person's reaction to odors can range from psychological (e.g., irritation, anger, or anxiety) to physiological (e.g., circulatory, and respiratory effects, nausea, vomiting, and headache). The ability to detect odors varies considerably among the population and overall is quite subjective. People may have different reactions to the same odor. An odor that is offensive to one person may be perfectly acceptable to another (e.g., coffee roaster). An unfamiliar odor is more easily detected and is more likely to cause complaints than a familiar one. In a phenomenon known as odor fatigue, a person can become desensitized to almost any odor, and recognition may only occur with an alteration in the intensity. The occurrence and severity of odor impacts depend on the nature, frequency, and intensity of the source; wind speed and direction; and the sensitivity of receptors.

3.1.3 Sensitive Receptors

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. The SDAPCD identifies sensitive receptors as those who are especially susceptible to adverse health effects from exposure to TACs, such as children, the elderly, and the ill. Sensitive receptors include schools (grades Kindergarten through 12), day care centers, nursing homes, retirement homes, health clinics, and hospitals within two kilometers of the facility (SDAPCD 2019).

The nearest existing sensitive receptors is the Little People Preschool and Daycare located 707 feet south of the Project's southern boundary. Other sensitive receptors include Mission Sports Park located 1,760 feet northeast of the Project's northeastern boundary, multi-family residential uses located 2,020 feet southeast of the Project's southern boundary and Bradley Park located 3,400 feet west of the Project's western boundary.

3.2 Regulatory Setting

3.2.1 Federal Regulations

3.2.1.1 Criteria Air Pollutants

The federal Clean Air Act, passed in 1970 and last amended in 1990, forms the basis for the national air pollution control effort. The EPA is responsible for implementing most aspects of the Clean Air Act, including setting National Ambient Air Quality Standards (NAAQS) for major air pollutants; setting hazardous air pollutant (HAP) standards; approving state attainment plans; setting motor vehicle emission standards; issuing stationary source emission standards and permits; and establishing acid rain control measures, stratospheric O_3 protection measures, and enforcement provisions. Under the Clean Air Act, NAAQS are established for the following criteria pollutants: O_3, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and lead.

The NAAQS describe acceptable air quality conditions designed to protect the health and welfare of the citizens of the nation. The NAAQS (other than for O_3, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and those based on annual averages or arithmetic mean) are not to be exceeded more than once per year. NAAQS for O_3, NO_2, SO_2, PM_{10}, and $PM_{2.5}$ are based on statistical calculations over 1- to 3-year periods, depending on the pollutant. The Clean Air Act requires the EPA to reassess the NAAQS at least every 5 years to determine whether adopted standards are adequate to protect public health based on current scientific evidence. States with areas that exceed the NAAQS must prepare a state implementation plan that demonstrates how those areas will attain the NAAQS within mandated time frames.

3.2.1.2 Hazardous Air Pollutants

The 1977 federal Clean Air Act amendments required the EPA to identify National Emission Standards for Hazardous Air Pollutants to protect public health and welfare. HAPs include certain volatile organic chemicals, pesticides, herbicides, and radionuclides that present a tangible hazard, based on scientific studies of exposure to humans and other mammals. Under the 1990 federal Clean Air Act Amendments, which expanded the control program for HAPs, 187 substances and chemical families were identified as HAPs.

3.2.2 State Regulations

3.2.2.1 Criteria Air Pollutants

The federal Clean Air Act delegates the regulation of air pollution control and the enforcement of the NAAQS to the states. In California, the task of air quality management and regulation has been legislatively granted to CARB, with subsidiary responsibilities assigned to air quality management districts and air pollution control districts at the regional and county levels. CARB, which became part of the California Environmental Protection Agency in 1991, is responsible for ensuring implementation of the California Clean Air Act of 1988, responding to the federal Clean Air Act, and regulating emissions from motor vehicles and consumer products.

CARB has established California Ambient Air Quality Standards (CAAQS), which are generally more restrictive than the NAAQS. As stated previously, an ambient air quality standard defines the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without harm to the public's health. For each pollutant, concentrations must be below the relevant CAAQS before a basin can attain the corresponding CAAQS. Air quality is considered “in attainment” if pollutant levels are continuously below the CAAQS and violate the standards no more than once each year. The CAAQS for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, PM_{10}, and $PM_{2.5}$ and visibility-reducing particles are values that are not to be exceeded.

California air districts have based their thresholds of significance for CEQA purposes on the levels that scientific and factual data demonstrate that the air basin can accommodate without affecting the attainment date for the NAAQS or CAAQS. Since an ambient air quality standard is based on maximum pollutant levels in outdoor air that would not harm the public's health, and air district thresholds pertain to attainment of the ambient air quality standard, this means that the thresholds established by air districts are also protective of human health.

The NAAQS and CAAQS are presented in Table 2.

Table 2. Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[a]	National Standards[b]	
		Concentration[c]	Primary[c,d]	Secondary[c,e]
O_3	1 hour	0.09 ppm (180 µg/m³)	—	Same as primary standard[f]
	8 hours	0.070 ppm (137 µg/m³)	0.070 ppm (137 µg/m³)[f]	
NO_2[g]	1 hour	0.18 ppm (339 µg/m³)	0.100 ppm (188 µg/m³)	Same as primary standard
	Annual arithmetic mean	0.030 ppm (57 µg/m³)	0.053 ppm (100 µg/m³)	
CO	1 hour	20 ppm (23 mg/m³)	35 ppm (40 mg/m³)	None
	8 hours	9.0 ppm (10 mg/m³)	9 ppm (10 mg/m³)

Source: CARB 2016

Notes: O_3 = ozone; ppm = parts per million by volume; μg/m³ = micrograms per cubic meter; NO_2 = nitrogen dioxide; CO = carbon monoxide; mg/m³= milligrams per cubic meter; SO_2 = sulfur dioxide; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; PST = Pacific Standard Time.

[a] California standards for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, suspended particulate matter (PM_{10}, $PM_{2.5}$), and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[b] National standards (other than O_3, NO_2, SO_2, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once per year. The O_3 standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 μg/m³ is equal to or less than 1. For $PM_{2.5}$, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standard.

[c] Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based on a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[d] National primary standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.

[e] National secondary standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[f] On October 1, 2015, the national 8-hour O_3 primary and secondary standards were lowered from 0.075 to 0.070 ppm.

[g] To attain the national 1-hour standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 parts per billion (ppb). Note that the national 1-hour standard is in units of ppb. California standards are in units of ppm. To directly compare the national 1-hour standard to the California standards, the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

[h] On June 2, 2010, a new 1-hour SO_2 standard was established, and the existing 24-hour and annual primary standards were revoked. To attain the national 1-hour standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until 1 year after an area is designated for the 2010 standard, except that in areas designated nonattainment of the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

[i] On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 μg/m³ to 12.0 μg/m³. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 μg/m³, as was the annual secondary standard of 15 μg/m³. The existing 24-hour PM_{10} standards (primary and secondary) of 150 μg/m³ were also retained. The form of the annual primary and secondary standards is the annual mean averaged over 3 years.

[j] CARB has identified lead and vinyl chloride as TACs with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[k] The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 μg/m³ as a quarterly average) remains in effect until 1 year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

3.2.2.2 Toxic Air Contaminants

The state Air Toxics Program was established in 1983 under AB 1807 (Tanner). The California TAC list identifies more than 200 pollutants, of which carcinogenic and noncarcinogenic toxicity criteria have been established for a subset of these pollutants pursuant to the California Health and Safety Code. In accordance with AB 2728, the state list includes the (federal) HAPs. In 1987, the Legislature enacted the Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) to address public concern over the release of TACs into the atmosphere. AB 2588 law requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over 5 years. TAC emissions from individual facilities are quantified and prioritized. "High-priority" facilities are required to perform a health risk assessment, and if specific thresholds are exceeded, the facility operator is required to communicate the results to the public in the form of notices and public meetings.

In 2000, CARB approved a comprehensive Diesel Risk Reduction Plan to reduce diesel emissions from both new and existing diesel-fueled vehicles and engines (CARB 2000).. Additional regulations apply to new trucks and diesel fuel, including the On-Road Heavy Duty Diesel Vehicle (In-Use) Regulation, the On-Road Heavy Duty (New) Vehicle Program, the In-Use Off-Road Diesel Vehicle Regulation, and the New Off-Road Compression-Ignition (Diesel) Engines and Equipment program. These regulations and programs have timetables by which manufacturers must comply and existing operators must upgrade their diesel-powered equipment. There are several Airborne Toxic Control Measures (ATCMs) that reduce diesel emissions, including In-Use Off-Road Diesel-Fueled Fleets (13 CCR 2449 et seq.) and In-Use On-Road Diesel-Fueled Vehicles (13 CCR 2025).

Idling of Commercial Heavy-Duty Trucks (13 CCR 2485)

In July 2004, CARB adopted an ATCM to control emissions from idling trucks. The ATCM prohibits idling for more than five minutes for all commercial trucks with a gross vehicle weight rating over 10,000 pounds. The ATCM contains an exception that allows trucks to idle while queuing or involved in operational activities.

In-Use Off-Road Diesel-Fueled Fleets (13 CCR 2449 et seq.)

In July 2007, CARB adopted an ATCM for in-use off-road diesel vehicles. This regulation requires that specific fleet average requirements are met for NO_x emissions and for particulate matter emissions. Where average requirements cannot be met, best available control technology requirements apply. The regulation also includes several recordkeeping and reporting requirements.

In response to AB 8 2X, the regulations were revised in July 2009 (effective December 3, 2009) to allow a partial postponement of the compliance schedule in 2011 and 2012 for existing fleets. On December 17, 2010, CARB adopted additional revisions to further delay the deadlines reflecting reductions in diesel emissions due to the poor economy and overestimates of diesel emissions in California. The revisions delayed the first compliance date until no earlier than January 1, 2014, for large fleets, with final compliance by January 1, 2023. The compliance dates for medium fleets were delayed until an initial date of January 1, 2017, and final compliance date of January 1, 2023. The compliance dates for small fleets were delayed until an initial date of January 1, 2019, and final compliance date of January 1, 2028. Correspondingly, the fleet average targets were made more stringent in future compliance years. The revisions also accelerated the phaseout of older equipment with newer equipment added to existing large and medium fleets over time, requiring the addition of Tier 2 or higher engines starting on March 1, 2011, with some exceptions: Tier 2 or higher engines on January 1, 2013, without exception; and Tier 3 or higher engines on January 1, 2018 (January 1, 2023, for small fleets).

On October 28, 2011 (effective December 14, 2011), the Executive Officer approved amendments to the regulation. The amendments included revisions to the applicability section and additions and revisions to the definition. The initial date for requiring the addition of Tier 2 or higher engines for large and medium fleets, with some exceptions, was revised to January 1, 2012. New provisions also allow for the removal of emission control devices for safety or visibility purposes. The regulation also was amended to combine the particulate matter and NO_x fleet average targets under one, instead of two, sections. The amended fleet average targets are based on the fleet's NO_x fleet average, and the previous section regarding particulate matter performance requirements was deleted completely. The best available control technology requirements, if a fleet cannot comply with the fleet average requirements, were restructured and clarified. Other amendments to the regulations included minor administrative changes to the regulatory text.

In-Use On-Road Diesel-Fueled Vehicles (13 CCR 2025)

On December 12, 2008, CARB adopted an ATCM to reduce NO_x and particulate matter emissions from most in-use on-road diesel trucks and buses with a gross vehicle weight rating greater than 14,000 pounds. The original ATCM regulation required fleets of on-road trucks to limit their NO_x and particulate matter emissions through a combination of exhaust retrofit equipment and new vehicles. The regulation limited particulate matter emissions for most fleets by 2011, and limited NO_x emissions for most fleets by 2013. The regulation did not require any vehicle to be replaced before 2012 and never required all vehicles in a fleet be replaced.

In December 2009, the CARB Governing Board directed staff to evaluate amendments that would provide additional flexibility for fleets adversely affected by the struggling California economy. On December 17, 2010, CARB revised this ATCM to delay its implementation along with limited relaxation of its requirements. Starting on January 1, 2015, lighter trucks with a gross vehicle weight rating of 14,001 to 26,000 pounds with 20-year-old or older engines need to be replaced with newer trucks (2010 model year emissions equivalent as defined in the regulation). Trucks with a gross vehicle weight rating greater than 26,000 pounds with 1995 model year or older engines needed to be replaced as of January 1, 2015. Trucks with 1996 to 2006 model year engines must install a Level 3 (85% control) diesel particulate filter starting on January 1, 2012, to January 1, 2014, depending on the model year, and then must be replaced after eight years. Trucks with 2007 to 2009 model year engines have no requirements until 2023, at which time they must be replaced with 2010 model year emissions-equivalent engines, as defined in the regulation. Trucks with 2010 model year engines would meet the final compliance requirements. The ATCM provides a phase-in option under which a fleet operator would equip a percentage of trucks in the fleet with diesel particulate filters, starting at 30% as of January 1, 2012, with 100% by January 1, 2016. Under each option, delayed compliance is granted to fleet operators who have or will comply with requirements before the required deadlines.

On September 19, 2011 (effective December 14, 2011), the Executive Officer approved amendments to the regulations, including revisions to the compliance schedule for vehicles with a gross vehicle weight rating of 26,000 pounds or less to clarify that *all* vehicles must be equipped with 2010 model year emissions equivalent engines by 2023. The amendments included revised and additional credits for fleets that have downsized; implement early particulate matter retrofits; incorporate hybrid vehicles, alternative-fueled vehicles, and vehicles with heavy-duty pilot ignition engines; and implement early addition of newer vehicles. The amendments included provisions for additional flexibility, such as for low-usage construction trucks, and revisions to previous exemptions, delays, and extensions. Other amendments to the regulations included minor administrative changes to the regulatory text, such as recordkeeping and reporting requirements related to other revisions.

California Health and Safety Code Section 41700

Section 41700 of the Health and Safety Code states that a person shall not discharge from any source whatsoever quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public; or that endanger the comfort, repose, health, or safety of any of those persons or the public; or that cause, or have a natural tendency to cause, injury or damage to business or property. This Section also applies to sources of objectionable odors.

3.2.3 Local Regulations

3.2.3.1 San Diego Air Pollution Control District

San Diego Air Pollution Control District

While CARB is responsible for the regulation of mobile emission sources within the state, local air quality management districts and air pollution control districts are responsible for enforcing standards and regulating stationary sources. The project site is located within the SDAB, which is under the jurisdiction of the SDAPCD, and is therefore, subject to the guidelines and regulations of SDAPCD. Federal and State attainment plans adopted by the SDAPCD are summarized below.

Federal Attainment Plans

SDAPCD has prepared the 2020 Plan for Attaining the National Ambient Air Quality Standards for Ozone in San Diego County (2020 Attainment Plan) that demonstrates how the region will further reduce air pollutant emissions to attain the current NAAQS for ozone. The 2020 Attainment Plan was approved by the SDAPCD on October 14, 2020. On November 19, 2020, CARB adopted the 2020 Attainment Plan for attaining the Federal 8-hour 75 ppb and 70 ppb Ozone standards and projects attainment for the standards by 2026 and 2032, respectively (SDAPCD 2020a). The 2020 Attainment Plan will be submitted to the EPA as a revision to the California State Implementation Plan (SIP) for attaining the ozone NAAQS.

In December 2016, the SDAPCD adopted an update to the Eight-Hour Ozone Attainment Plan for San Diego County (2008 O_3 NAAQS). The 2016 Final Eight-Hour Ozone Attainment Plan for San Diego County indicates that local controls and state programs would allow the region to reach attainment of the federal 8-hour O_3 standard (1997 O_3 NAAQS) by 2018 (SDAPCD 2016a). In this plan, SDAPCD relies on the Regional Air Quality Strategy (RAQS) to demonstrate how the region will comply with the federal O_3 standard. The RAQS details how the region will manage and reduce O_3 precursors (NO_x and VOCs) by identifying measures and regulations intended to reduce these pollutants. The control measures identified in the RAQS generally focus on stationary sources; however, the emissions inventories and projections in the RAQS address all potential sources, including those under the authority of CARB and EPA. Incentive programs for reduction of emissions from heavy-duty diesel vehicles, off-road equipment, and school buses are also established in the RAQS.

Currently, the County is designated as moderate nonattainment for the 2008 O_3 NAAQS and maintenance for the 1997 O_3 NAAQS. As documented in the 2016 Final Eight-Hour Ozone Attainment Plan for San Diego County, the County has a likely chance of obtaining attainment due to the transition to low emission cars, stricter new source review rules, and continuing the requirement of general conformity for military growth and the San Diego International Airport. SDAPCD will also continue emission control measures including ongoing implementation of existing regulations in ozone precursor reduction to stationary and area-wide sources, subsequent inspections of facilities and sources, and the adoption of laws requiring Best Available Retrofit Control Technology for control of emissions (SDAPCD 2016a).

State Attainment Plans

SDAPCD and the San Diego Association of Governments (SANDAG) are responsible for developing and implementing the clean air plan for attainment and maintenance of the ambient air quality standards in the SDAB.

The RAQS for the SDAB was initially adopted in 1991 and is updated every 3 years, most recently in 2016 (SDAPCD 2016b). The RAQS outlines SDAPCD's plans and control measures designed to attain the CAAQS for O_3. The RAQS relies on information from CARB and SANDAG, including mobile and area source emissions, as well as information regarding projected growth in the County and the cities in the County, to forecast future emissions and then determine from that the strategies necessary for the reduction of emissions through regulatory controls. The CARB mobile source emission projections and SANDAG growth projections are based on population, vehicle trends, and land use plans developed by the County and the cities in the County as part of the development of their general plans (SANDAG 2020, 2021).

In December 2016, SDAPCD adopted the revised RAQS for the County. Since 2007, the San Diego region has reduced daily VOC emissions and NO_x emissions by 3.9% and 7.0%, respectively; SDAPCD expects to continue reductions through 2035 (SDAPCD 2016b). These reductions were achieved through implementation of six VOC control measures and three NO_x control measures adopted in SDAPCD's 2009 RAQS (SDAPCD 2009a); in addition, SDAPCD is considering additional measures, including three VOC measures and four control measures to reduce 0.3 daily tons of VOCs and 1.2 daily tons of NO_x, provided they are found to be feasible region-wide. In addition, SDAPCD has implemented nine incentive-based programs, has worked with SANDAG to implement regional transportation control measures, and has reaffirmed the state emission offset repeal.

The 2022 RAQS was adopted by the SDAPCD Board on March 9, 2023. The RAQS seeks to protect public health and the environment by improving air quality. The 2022 update also complements regional actions addressing greenhouse gases and climate change.

Regarding particulate matter emissions reduction efforts, in December 2005, SDAPCD prepared a report titled "Measures to Reduce Particulate Matter in San Diego County" to address implementation of Senate Bill (SB) 656 in San Diego County (SB 656 required additional controls to reduce ambient concentrations of PM_{10} and $PM_{2.5}$) (SDAPCD 2005). In the report, SDAPCD evaluated the implementation of source-control measures that would reduce particulate matter emissions associated with residential wood combustion; various construction activities including earthmoving, demolition, and grading; bulk material storage and handling; carryout and trackout removal and cleanup methods; inactive disturbed land; disturbed open areas; unpaved parking lots/staging areas; unpaved roads; and windblown dust (SDAPCD 2005).

SDAPCD Rules and Regulations

As stated previously, SDAPCD is responsible for planning, implementing, and enforcing federal and state ambient standards in the SDAB. The following rules and regulations apply to all sources in the jurisdiction of SDAPCD:

- SDAPCD Regulation IV: Prohibitions; Rule 50: Visible Emissions. Prohibits any activity causing air contaminant emissions darker than 20% opacity for more than an aggregate of 3 minutes in any consecutive 60-minute time period. In addition, Rule 50 prohibits any diesel pile-driving hammer activity causing air contaminant emissions for a period or periods aggregating more than 4 minutes during the driving of a single pile (SDAPCD 1997).
- SDAPCD Regulation IV: Prohibitions; Rule 51: Nuisance. Prohibits the discharge, from any source, of such quantities of air contaminants or other materials that cause or have a tendency to cause injury, detriment, nuisance, annoyance to people and/or the public, or damage to any business or property (SDAPCD 1976).
- SDAPCD Regulation IV: Prohibitions; Rule 55: Fugitive Dust. Regulates fugitive dust emissions from any commercial construction or demolition activity capable of generating fugitive dust emissions, including

active operations, open storage piles, and inactive disturbed areas, as well as track-out and carry-out onto paved roads beyond a project site (SDAPCD 2009b).

- SDAPCD Regulation IV: Prohibitions; Rule 67.0.1: Architectural Coatings. Requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories (SDAPCD 2015a).
- SDAPCD Regulation IV: Prohibitions; Rule 67.7: Cutback and Emulsified Asphalts. This rule prohibits manufacturers, distributors, and end users of cutback and emulsified asphalt materials for the paving, construction or maintenance of parking lots, driveways, streets and highways from applying asphalt material or road oils which contain more than 0.5 percent by volume VOC which evaporate at 260° C (500 ° F) or less (SDAPCD 1979).

3.2.3.2 San Diego Association of Governments

SANDAG is the regional planning agency for the County and serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. SANDAG serves as the federally designated metropolitan planning organization for the County. With respect to air quality planning and other regional issues, SANDAG has prepared San Diego Forward: The Regional Plan (Regional Plan) for the San Diego region (SANDAG 2015). The Regional Plan combines the big-picture vision for how the region will grow over the next 35 years with an implementation program to help make that vision a reality. The Regional Plan, including its Sustainable Communities Strategy (SCS), is built on an integrated set of public policies, strategies, and investments to maintain, manage, and improve the transportation system so that it meets the diverse needs of the San Diego region through 2050. The Regional Plan was updated in 2021, which was the result of years of planning, data analysis, and community engagement to reimagine the San Diego region with a transformative transportation system, a sustainable pattern of growth and development, and innovative demand and management strategies (SANDAG 2021). The 2021 Regional Plan includes a SCS, which describes coordinated transportation and land use planning that exceeds the state's target for reducing per capita GHG emissions set by CARB. The state-mandated target is a 19% reduction—compared with 2005—in per capita GHG emissions from cars and light-duty trucks by 2035. The 2021 Regional Plan achieves a 20% reduction by then. The 2021 Regional Plan also puts forth a forecasted development pattern that is driven by regional goals for sustainability, mobility, housing affordability, and economic prosperity.

3.2.3.3 City of San Marcos

The City's General Plan (City of San Marcos 2012) includes various policies related to reducing Air Quality and GHG emissions. Air quality policies that would be applicable to the Project include:

Land Use and Community Design Element

Policy LU-2.1: Promote compact development patterns that reduce air pollution and automobile dependence and facilitate walking, bicycling, and transit use.

Policy LU-3.1: Require that new development and redevelopment incorporate connections and reduce barriers between neighborhoods, transit corridors, and activity centers within the City.

Mobility Element

Policy M-2.1: Work with new development to design roadways that minimize traffic volumes and/or speed, as appropriate within residential neighborhoods; while maintaining the City's desire to provide connectivity on the roadway network.

Conservation and Open Space Element

Policy COS-4.6: Promote efficient use of energy and conservation of available resources in the design, construction, maintenance and operation of public and private facilities, infrastructure and equipment.

Policy COS-4.8: Encourage and support the generation, transmission and use of renewable energy.

3.3 Regional and Local Air Quality Conditions

3.3.1 San Diego Air Basin Attainment Designation

Pursuant to the 1990 federal Clean Air Act amendments, the EPA classifies air basins (or portions thereof) as "attainment" or "nonattainment" for each criteria air pollutant, based on whether the NAAQS have been achieved. Generally, if the recorded concentrations of a pollutant are lower than the standard, the area is classified as "attainment" for that pollutant. If an area exceeds the standard, the area is classified as "nonattainment" for that pollutant. If there is not enough data available to determine whether the standard is exceeded in an area, the area is designated as "unclassified" or "unclassifiable." The designation of "unclassifiable/attainment" means that the area meets the standard or is expected to be meet the standard despite a lack of monitoring data. Areas that achieve the standards after a nonattainment designation are re-designated as maintenance areas and must have approved Maintenance Plans to ensure continued attainment of the standards. The California Clean Air Act, like its federal counterpart, called for the designation of areas as "attainment" or "nonattainment," but based on CAAQS rather than the NAAQS. Table 3 depicts the current attainment status of the Project site with respect to the NAAQS and CAAQS.

Table 3. San Diego Air Basin Attainment Classification

Pollutant	Designation/Classification	
	National Standards	California Standards
Ozone (O_3) – 1-hour	Attainment (maintenance)[a]	**Nonattainment**
Ozone (O_3) – 8-hour	**Nonattainment (severe)**	**Nonattainment**
Nitrogen dioxide (NO_2)	Unclassifiable/attainment[b]	Attainment
Carbon monoxide (CO)	Unclassifiable/attainment	Attainment
Sulfur dioxide (SO_2)	Unclassifiable/attainment	Attainment
Respirable particulate matter (PM_{10})	Unclassifiable/attainment	**Nonattainment**
Fine particulate matter ($PM_{2.5}$)	Unclassifiable/attainment	**Nonattainment**
Lead (Pb)	Attainment	Attainment
Sulfates (SO_4)	No national standard	Attainment
Hydrogen sulfide (H_2S)	No national standard	Unclassified

Table 3. San Diego Air Basin Attainment Classification

Pollutant	Designation/Classification	
	National Standards	California Standards
Vinyl chloride	No national standard	No designation
Visibility-reducing particles	No national standard	Unclassified

Sources: EPA 2021a (national); CARB 2020 (state).
Definitions: Attainment = meets the standards; attainment/maintenance = achieve the standards after a nonattainment designation; nonattainment = does not meet the standards; unclassified or unclassifiable = insufficient data to classify; unclassifiable/attainment = meets the standard or is expected to be meet the standard despite a lack of monitoring data.
Notes: SDAB = San Diego; O_3 = ozone; CO = carbon monoxide; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; NO_2 = nitrogen dioxide; SO_2 = sulfur dioxide.
[a] The national 1-hour standard of 0.12 parts per million (ppm) was in effect from 1979 through June 15, 2005. The revoked standard is referenced here because it was employed for such a long period and because this benchmark is addressed in SIPs.
[b] The western and central portions of the SDAB are designated attainment, while the eastern portion is designated unclassifiable/ attainment.

In summary, the EPA has designated the SDAB as a nonattainment area for the federal 8-hour O_3 standard, and CARB has designated the SDAB as a nonattainment area for the state 1-hour and 8-hour O_3 standards. The SDAB has been designated as a nonattainment area for the state 24-hour and annual PM_{10} standards and as a nonattainment area for the state annual $PM_{2.5}$ standard. The SDAB is designated as unclassified or attainment for all other criteria air pollutants.

3.3.2 Local Ambient Air Quality

CARB, air districts, and other agencies monitor ambient air quality at approximately 250 air quality monitoring stations across the state. SDAPCD operates a network of ambient air monitoring stations throughout San Diego County, which measure ambient concentrations of pollutants and determine whether the ambient air quality meets the CAAQS and the NAAQS. Air quality monitoring stations usually measure pollutant concentrations 10 feet above ground level; therefore, air quality is often referred to in terms of ground-level concentrations. The SDAPCD monitors air quality conditions at 11 locations throughout the SDAB. Escondido – East Valley Parkway monitoring station ceased to collect data post-2015; thus, due to proximity to the site and similar geographic and climactic characteristics, the Camp Pendleton, San Diego-Rancho Carmel Drive, San Diego–Kearny Villa Road, and El Cajon-Lexington Elementary School monitoring station concentrations for all pollutants are considered most representative of the Project site. Ambient concentrations of pollutants from 2019 through 2021 are presented in Table 4.

Table 4. Local Ambient Air Quality Data

Averaging Time	Unit	Agency/ Method	Ambient Air Quality Standard	Measured Concentration by Year			Exceedances by Year		
				2019	2020	2021	2019	2020	2021
Ozone (O_3) – Camp Pendleton									
Maximum 1-hour concentration	ppm	State	0.12	0.075	0.094	0.074	0	0	0
Maximum 8-hour concentration	ppm	State	0.070	0.065	0.074	0.059	0	3	0
		Federal	0.070	0.064	0.074	0.059	0	3	0

Table 4. Local Ambient Air Quality Data

Averaging Time	Unit	Agency/ Method	Ambient Air Quality Standard	Measured Concentration by Year			Exceedances by Year		
				2019	2020	2021	2019	2020	2021
Nitrogen Dioxide (NO_2) – San Diego – Rancho Carmel Drive									
Maximum 1-hour concentration	ppm	State	0.18	0.054	0.054	0.054	0	0	0
		Federal	0.100	0.054	0.054	0.054	0	0	0
Annual concentration	ppm	State	0.030	0.014	0.014	0.013	—	—	—
		Federal	0.053	0.014	0.014	0.013	—	—	—

		Federal	12.0	7.0	8.7		—	—	—

Sources: CARB 2022b; EPA 2022a.

Notes: ppm = parts per million by volume; ND = insufficient data available to determine the value; — = not available; µg/m³ = micrograms per cubic meter.

Data taken from CARB iADAM (http://www.CARB.ca.gov/adam) and EPA AirData (http://www.epa.gov/airdata/) represent the highest concentrations experienced over a given year.

Daily exceedances for particulate matter are estimated days because PM_{10} and $PM_{2.5}$ are not monitored daily. All other criteria pollutants did not exceed federal or state standards during the years shown. There is no federal standard for 1-hour ozone, annual PM_{10}, or 24-hour SO_2, nor is there a state 24-hour standard for $PM_{2.5}$.

The Camp Pendleton monitoring station is located at 21441 West B Street, Camp Pendleton, California.

The San Diego-Rancho Carmel Drive monitoring station is located at 11403 Rancho Carmel Drive, San Diego, California.

The El Cajon-Lexington Elementary School monitoring station is located at 533 First Street, El Cajon, California.

[a] Measurements of PM_{10} and $PM_{2.5}$ are usually collected every 6 days and every 1 to 3 days, respectively. Number of days exceeding the standards is a mathematical estimate of the number of days concentrations would have been greater than the level of the standard had each day been monitored. The numbers in parentheses are the measured number of samples that exceeded the standard.

3.4 Significance Criteria and Methodology

3.4.1 Thresholds of Significance

The significance criteria used to evaluate the Project impacts to air quality is based on the recommendations provided in Appendix G of the CEQA Guidelines. For the purposes of this air quality analysis, a significant impact would occur if the Project would (14 CCR 15000 et seq.):

1. Conflict with or obstruct implementation of the applicable air quality plan.
2. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.
3. Expose sensitive receptors to substantial pollutant concentrations.
4. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.) indicates that, where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to determine whether the Project would have a significant impact on air quality.

County of San Diego and SDAPCD

Neither the City of San Marcos nor the SDAPCD have developed CEQA thresholds of significance for air quality; however, the County of San Diego has established CEQA screening-level thresholds for air quality impact analyses based on the SDAPCD Air Quality Impact Assessments trigger levels, which are based on emissions levels identified under the New Source Review program. As part of its air quality permitting process, SDAPCD has established thresholds in Rule 20.2 and Rule 20.3 requiring the preparation of Air Quality Impact Assessments for permitted stationary sources (non-major and major stationary sources, respectively) (SDAPCD 2020b, 2021). SDAPCD sets forth quantitative emission thresholds below which a stationary source would not have a significant impact on ambient air quality. Because SDAPCD Rules 20.2 and 20.3 do not identify a VOC threshold, the County of San Diego established a VOC threshold based on the South Coast Air Quality Management District's VOC threshold.

For CEQA purposes, the screening-level thresholds established by the County of San Diego can be used as numeric methods to demonstrate that a project's total emissions would not result in a significant impact to air quality for projects within San Diego County. Accordingly, the thresholds listed in Table 5 are used to evaluate whether Project-related emissions could cause a significant impact on air quality. For nonattainment pollutants, if emissions exceed the thresholds shown in Table 5, the Project could have the potential to result in a cumulatively considerable net increase in these pollutants and thus, could have a significant impact on the ambient air quality; conversely, emissions below the screening-level thresholds would not cause a significant impact. A project that involves a use that would produce objectionable odors would be deemed to have a significant odor impact if it would affect a considerable number of off-site receptors.

Table 5. Air Quality Significance Thresholds – Construction and Operational Emissions

Pollutant	Total Emissions		
	Pounds per Hour	Pounds per Day	Tons per Year
Respirable particulate matter (PM_{10})	—	100	15
Fine particulate matter ($PM_{2.5}$)	—	55	10
Oxides of nitrogen (NO_x)	25	250	40
Sulfur oxides (SO_x)	25	250	40
Carbon monoxide (CO)	100	550	100
Lead and lead compounds	—	3.2	0.6
Volatile organic compounds (VOC)	—	75[a]	13.7

Source: SDAPCD Rules 20.2(d)(2) and 20.3(d)(2).

[a] VOC threshold based on South Coast Air Quality Management District (SCAQMD) levels for Coachella Valley, which have similar federal and state attainment status to San Diego.

3.4.2 Approach and Methodology

The California Emissions Estimator Model (CalEEMod) Version 2022 was used to estimate emissions from construction and operation of the Project (CAPCOA 2022). CalEEMod is a statewide computer model developed in cooperation with air districts throughout the state to quantify criteria air pollutant and GHG emissions associated with construction activities and operation of a variety of land use projects, such as residential, commercial, and industrial facilities. CalEEMod input parameters, including the land use type used to represent the Project and its size, construction schedule, and anticipated use of construction equipment, were based on information provided by the Project applicant or default model assumptions if Project specifics were unavailable. Table 6 provides a summary of the land use inputs included in the CalEEMod modeling for construction and operation.

Table 6. CalEEMod Land Use Development Summary for the Proposed Project

Project Component	CalEEMod Land Use Type	Land Use Amount (Size)	Land Use Size Metric	Building Square Footage	Land Use Acreage
Multi-family Residential Townhomes including garages	Residential – Condo/Townhouse	109[a]	du	169,282[b]	3.0
Commercial Uses – Specialty Retail/Strip Commercial	Retail – Regional Shopping Center	49.266	ksf	49,266	2.0
Commercial Uses – Standard Office	Commercial – General Office Building	7.658	ksf	7,658	0.21
Commercial Parking and Residential Visitor Parking	Parking – Parking Lot	312[c]	sp	0	3.5
Residential streets/alleys	Parking – Other Asphalt Surfaces	2	ac	0	2

Table 6. CalEEMod Land Use Development Summary for the Proposed Project

Project Component	CalEEMod Land Use Type	Land Use Amount (Size)	Land Use Size Metric	Building Square Footage	Land Use Acreage
Miscellaneous surface areas (walkways, loading/unloading areas, etc.)	Parking – Other Non-Asphalt Surfaces	1.32	ac	0	1.32

Notes: ksf = 1,000 square feet; du = dwelling unit; ac = acre, sp = parking space
a. Includes 7 live-work units included on the commercial site.
b. Includes 16,293 square feet of common space, and 7,162 square feet of live/work space.
c. Includes 34 parking spaces for residential visitors

3.4.2.1 Construction Emissions

Criteria air pollutant emissions associated with construction of the Project were estimated using CalEEMod for the following emission sources: operation of off-road construction equipment, fugitive dust, VOC off-gassing from paving and architectural coating, on-road hauling, and vendor (material delivery) trucks, and worker vehicles. Construction scenario assumptions, including phasing, equipment mix, and vehicle trips, were based on CalEEMod default values with an estimated construction start date in February 2024 and buildout completed in May 2025.

Table 7 provides a summary of the Project construction schedule. The construction schedule used in the analysis represents a "worst-case" analysis scenario since emission factors for construction equipment decrease as the analysis year increases due to improvements in technology and more stringent regulatory requirements. The duration of construction activity and associated equipment represents a reasonable approximation of the expected construction fleet as required pursuant to CEQA guidelines.

Table 7. Project Construction Schedule

Construction Task	Start Date	End Date	Workdays
Demolition	2/6/2024	3/5/2024	20
Site Preparation	3/6/2024	3/20/2024	10
Grading	3/21/2024	4/18/2024	20
Building Construction	4/19/2024	3/7/2025	230
Paving	3/8/2025	4/5/2025	20
Architectural Coating	4/6/2025	5/4/2025	20

CalEEMod default trip length values were used for the distances for worker, vendor truck, and haul truck trips. It was assumed that heavy construction equipment would be operating at the site for approximately 5 days per week (22 days per month) during Project construction. Construction scenario assumptions, including phasing, vehicle trips, and equipment mix, used for estimating Project-generated construction emissions are shown in Table 8.

Table 8. Construction Scenario Assumptions

Task	One-Way Vehicle Trips			Equipment		
	Worker One-Way Trips per Day	Vendor Truck One-Way Trips per Day	Haul Truck One-Way Trips per Day	Equipment Type	Quantity	Daily Usage Hours
Demolition	14	0	64	Rubber-tired dozers	2	8
				Excavators	2	8
				Concrete/ Industrial Saws	1	8
Site Preparation	18	0	0	Rubber-tired dozers	3	8
				Tractors/loaders/ backhoes	4	8
Grading	20	0	0	Graders	1	8
				Excavators	2	8
				Tractors/ loaders/ backhoes	2	8
				Rubber-tired dozers	1	8
				Scrapers	2	8
Building Construction	92	22	0	Forklifts	3	8
				Generator sets	1	8
				Cranes	1	7
				Welders	1	8
				Tractors/ loaders/ backhoes	3	7
Paving	16	0	0	Pavers	2	8
				Paving equipment	2	8
				Rollers	2	8
Architectural Coating	20	0	0	Air compressors	1	6

Construction of Project components would be subject to SDAPCD Rule 55 – Fugitive Dust Control. This rule requires that construction of project components include steps to restrict visible emissions of fugitive dust beyond the property line (SDAPCD 2009b). Compliance with Rule 55 would limit fugitive dust (PM_{10} and $PM_{2.5}$) that may be generated during grading and construction activities. To reflect implementation of proposed dust control strategies, it was assumed that the exposed areas would be watered two times per day (55% reduction in PM_{10} and $PM_{2.5}$).

3.4.2.2 Operational Emissions

Project-generated operational criteria air pollutant emissions were estimated for area sources, energy sources, and mobile sources using CalEEMod. The first full year of operations was assumed to be 2026, consistent with the anticipated end of construction. This provides a conservative estimate as emissions would decrease as the buildout year increase because of improved vehicle technologies and more stringent regulations. The calculation of area, energy, and mobile air pollutant emissions is explained below.

Area Sources

CalEEMod was used to estimate operational emissions from area sources, including emissions from consumer product use, architectural coatings, and landscape maintenance equipment. Emissions associated with natural gas usage in space heating and water heating are calculated in the building energy use module of CalEEMod, as described in the following text. Given the Project's density, it was assumed that the residential portion of the project would not include woodburning fireplaces.

Consumer products are chemically formulated products used by household and institutional consumers, including detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn, and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products. Other paint products, furniture coatings, or architectural coatings are not considered consumer products (CAPCOA 2022). Consumer product VOC emissions are estimated in CalEEMod based on the floor area of nonresidential buildings and on the default factor of pounds of VOC per building square foot per day. For parking lot land uses, CalEEMod estimates VOC emissions associated with use of parking surface degreasers based on a square footage of parking surface area and pounds of VOC per square foot per day.

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings such as in paints and primers using during building maintenance. CalEEMod calculates the VOC evaporative emissions from application of nonresidential surface coatings based on the VOC emission factor, the building square footage, the assumed fraction of surface area, and the reapplication rate. The VOC emission factor is based on the VOC content of the surface coatings, and SDAPCD Rule 67.0.1 (Architectural Coatings) governs the VOC (or ROG) content for interior and exterior coatings, which is 50 grams per liter VOC for the interiors and exteriors of the buildings. The CalEEMod default of 100 grams per liter was assumed for parking area coatings. The model default reapplication rate of 10% of area per year is assumed. Consistent with CalEEMod defaults, it is assumed that the nonresidential surface area for painting equals 2.0 times the floor square footage, with 75% assumed for interior coating and 25% assumed for exterior surface coating (CAPCOA 2022). For the parking lot, the architectural coating area is assumed to be 6% of the total square footage, consistent with the supporting CalEEMod studies provided as an appendix to the CalEEMod User's Guide (CAPCOA 2022).

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, rototillers, shredders/grinders, blowers, trimmers, chain saws, and hedge trimmers. The emissions associated from landscape equipment use are estimated based on CalEEMod default values for emission factors (grams per square foot of nonresidential building space per day) and number of summer days (when landscape maintenance would generally be performed) and winter days. For San Diego County, the average annual "summer" days are estimated to 365 days; however, it is assumed that landscaping equipment would likely only operate during the week (not weekends), so operational days were assumed to be 180 days per year in CalEEMod (CAPCOA 2022).

Energy Sources

As represented in CalEEMod, energy sources include emissions associated with building electricity and natural gas usage (non-hearth). Electricity use would contribute indirectly to criteria air pollutant emissions; however, the emissions from electricity use are only quantified for GHGs in CalEEMod, because criteria pollutant emissions occur at the site of the power plant, which is typically off-site. Therefore, for the purposes of the air quality analysis, the energy source parameters focus on criteria air pollutants generated because of natural gas consumption within the built environment. Natural gas consumption is attributed to systems like heating, ventilation, and air conditioning and water heating. CalEEMod assumes compliance with the 2019 Title 24 code.

Mobile Sources

The Project would generate criteria pollutant emissions from mobile sources (vehicular traffic) because of the passenger vehicle trips associated with the residential uses and commercial uses (i.e. residents, visitors, employees, customers).

Emissions from the mobile sources during operation of the Project were estimated in CalEEMod. The daily trip rates were taken from Traffic Impact Analysis average daily trips per day with an 18% reduction for internal capture. The daily trip rate was assumed for 7 days per week. The residential passenger vehicle trips were assumed to be CalEEMod default trip lengths of 9.75 miles for home-work trips, 4.32 miles home-shopping, and 4.75 for home-other trips. A home-work trip represents trips traveling in either direction between home and work locations. A home-shop trip represents trips traveling in either direction between home and shopping destinations (generally retail). A home-other trip represents trips traveling in either direction between home and all other locations that are not work or shopping destinations (e.g., school, park, gym).

The commercial passenger vehicle trip lengths were assumed to be CalEEMod default trip lengths of 12.42 miles home-work trips, 6.65 miles for work-other trips, and 5.98 miles for other-other trips. A home-work trip is the same as defined above for residential. A work-other trip is made by an employee traveling in either direction between a work location and all other locations that are not home. An other-other trip is made by a person traveling in either direction between land uses that do not involve home or work locations (e.g. school, park, gym).

Vehicle emissions occur during startup, operation (running), and idling, as well as from evaporative losses when the engines are resting. The emissions factors for motor vehicles were determined using CalEEMod defaults.

3.5 Impact Analysis

3.5.1 Would the project conflict with or obstruct implementation of the applicable air quality plan? (AQ-1)

As previously discussed, the SDAPCD is responsible for developing and implementing the clean air plans for attainment and maintenance of the ambient air quality standards in the basin—specifically, the SIP and RAQS.[4] SANDAG is responsible for developing forecasts and data that are used by SDAPCD in preparing the SIP and RAQS. The federal O_3 maintenance plan, which is part of the SIP, was adopted in 2012. The SIP includes a demonstration

[4] For this discussion, the relevant federal air quality plan is the Ozone Maintenance Plan (SDAPCD 2012). The RAQS is the applicable plan for purposes of State air quality planning. Both plans reflect growth projections in the basin.

that current strategies and tactics will maintain acceptable air quality in the basin based on the NAAQS. The RAQS, most recently updated in 2016, outlines SDAPCD's plans and control measures designed to attain the state air quality standards for O_3. The SIP and RAQS rely on information from CARB and SANDAG, including mobile and area source emissions as well as information regarding projected growth in the County as a whole and the cities in the County, to project future emissions and determine the strategies necessary for the reduction of emissions through regulatory controls. CARB mobile source emission projections and SANDAG growth projections are based on population, vehicle trends, and land use plans developed by the County and the cities in the County as part of the development of their general plans.

While the SDAPCD and City do not provide guidance regarding the analysis of impacts associated with air quality plan conformance, the County's *Guidelines for Determining Significance and Report and Format and Content Requirements – Air Quality* does discuss conformance with the RAQS (County of San Diego 2007). The guidance indicates that, if the Project, in conjunction with other projects, contributes to growth projections that would not exceed SANDAG's growth projections for the City, the Project would not be in conflict with the RAQS (County of San Diego 2007). If a project includes development that is greater than that anticipated in the local plan and SANDAG's growth projections, the Project might conflict with the SIP and RAQS and may contribute to a potentially significant cumulative impact on air quality.

3.5.1.1 General Plan/Zoning Comparison of Development

The Project site is designated as Commercial (C) in the City's General Plan and is zoned Commercial (C). The Project proposes to redesignate the site to Specific Plan Area (SPA) and create a mixed-use development. The Project would add a total of 102 townhomes and 7 live/work units along with specialty retail/commercial/office uses. The City's Commercial designation and zoning allows for a several permitted uses. A mixture of commercial retail and office was selected to reflect potential development on the project site. Based on the City's development code, the Commercial designation would allow for greater development intensity based on generation of more vehicle trips and vehicle miles traveled as shown in Table 9, below. As such, the Project would result in less criteria air pollutant emissions, and thus less intensive uses, than development allowed under the existing Commercial designation.

Table 9. Development Intensity Comparison

Development	Land Use Developed	Residents	Employees	Total Vehicle Trips Per Year	Vehicle Miles Traveled
Proposed Project	102 townhomes, 7 live/work units 49,266 square feet of commercial/specialty retail 7,658 square feet of office	329	115	763,476	3,329,732
Existing General Plan Land Use Designation Commercial	Mixed Use Development - 129,000 square feet of regional retail and 40,000 square feet of office, 1 acre of parking (based on < 0.7 FAR)	0	366	1,829,408	7,413,261

Sources: City of San Marcos General Plan, 2012, City of San Marcos Municipal Code 2022, ITE 2008, SANDAG 2008

3.5.1.2 SANDAG Comparison of Population, Housing, Employment

SANDAG produces a Regional Growth Forecast, which is important for developing regional plans and strategies mandated by federal and state governments such as the Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS), the Program Environmental Impact Report (EIR) for the RTP/SCS, the Air Quality Management Plan, the Federal Transportation Improvement Program, and the Regional Housing Needs Assessment (RHNA). The most recent RTP/SCS was adopted in December 2021 with a planning horizon of 2016 through 2050. The growth forecasts are appended to the RTP/SCS. Appendix F of the 2021 Regional Plan describes the trends in population, housing, and employment. The San Diego region is expected to grow by nearly 437,000 people and the growth in population will add about 440,000 jobs and more than 280,000 housing units (SANDAG 2021).

The forecast process includes two main phases. The first phase of the forecast is produced using California Department of Finance (DOF) population projections and rates developed by SANDAG based on historic economic and demographic trends. The size and makeup of the working age population in the region and high labor force participation is used to project future job growth. The projected higher values in working age population, coupled with older residents staying in the labor force longer results in more jobs in the region by the end of the forecast period. Housing units and households in the region were forecasted based on rates developed from historical data as well as assumptions of housing unit development and household formation in the future. The second phase of the forecast allocates the forecasted growth down to the jurisdictions and smaller geographical areas. The subregional forecast distributes growth based on a variety of factors, including available capacity for housing and accessibility to jobs and transportation. SANDAG works with the region's 18 cities, the County of San Diego, and other agencies that manage land use to understand local land use plans, such as general plans, community plans, and specific plans, as well as constraints to development and already permitted projects to develop the subregional projections for housing and employment. Table 10 shows the population, housing units, and employment projections for the City and the San Diego region for the 2021 Regional Plan.

Table 10. Population, Housing, and Employment

Year	City of San Marcos			San Diego Region		
	Population	Housing Units	Employment	Population	Housing Units	Employment
2016	94,258	30,539	41,527	3,309,510	1,190,555	1,646,419
2025	102,775	34,681	47,021	3,470,848	1,288,216	1,761,747
2035	103,903	34,931	54,548	3,620,348	1,409,866	1,921,475
2050	120,247	41,016	62,306	3,746,073	1,471,299	2,086,318
Change in Number (2016-2050)	25,989 (27.6%)	10,477 (34.3%)	20,779 (50.0%)	436,563 (14.2%)	280,744 (23.6%)	439,899 (26.7%)

Source: SANDAG Regional Plan 2021, Appendix F: Regional Growth Forecast and Sustainable Communities Strategy Land Use Pattern

As shown above the Project is expected to add 329 residents in 109 dwelling units and 115 employment opportunities. The added residents would represent approximately 1.2% of the anticipated population growth, 1% of the housing growth, and 0.6% of the employment growth over the RTP/SCS planning horizon. Based on the above information, the increase in population and employment would be well within the growth projections.

Level of Significance Before Mitigation

Per CEQA Guideline Section 15206(b), the Project would not be considered regionally significant because it would not have the potential to substantially affect housing, employment, or population projections within the San Diego region, which are the basis of the RAQS projections. As such, the Project would not conflict with or obstruct implementation of the RAQS. Furthermore, the Project would not result in substantial construction or operational emissions that would conflict with the local Air Quality plan.

Therefore, implementation of the Project would not conflict with the RAQS or SIP and proposed development would be consistent with the growth in the region. Impacts would be **less than significant**.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

3.5.2 Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard? (AQ-2)

Past, present, and future development projects may contribute to the SDAB adverse air quality impacts on a cumulative basis. By its nature, air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development, and SDAPCD develops and implements plans for future attainment of ambient air quality standards. Based on these considerations, project-level thresholds of significance for criteria pollutants are used in the determination of whether a project's individual emissions would have a cumulatively considerable contribution on air quality. If a project's emissions would exceed the applied significance thresholds, it would have a cumulatively considerable contribution. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant.

Construction and operation of the Project would result in emissions of criteria air pollutants, which may result in a cumulatively considerable net increase in emissions of criteria air pollutants for which the SDAB is designated as nonattainment under the NAAQS or CAAQS. As discussed previously, the SDAB has been designated as a federal nonattainment area for O_3 and a state nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. The following discussion quantitatively evaluates potential short-term construction and long-term operational impacts that would result from implementation of the Project.

Construction Emissions

Proposed construction activities would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and VOC off-gassing from architectural coatings and asphalt pavement application) and off-site sources (i.e., on-road haul trucks, delivery trucks, and worker

vehicle trips). Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and for dust, the prevailing weather conditions. Therefore, such emissions levels can only be estimated, with a corresponding uncertainty in precise ambient air quality impacts.

As discussed under 3.4.2.1, criteria air pollutant emissions associated with construction activity were quantified using CalEEMod. Construction emissions were calculated for the estimated worst-case day over the construction period associated with each phase and reported as the maximum daily emissions estimated during each year of construction (2024–2025). Construction schedule assumptions, including phase type, duration, and sequencing, were based on information provided by the applicant or CalEEMod defaults and are intended to represent a reasonable scenario based on the best information available. NO_x and CO emissions would primarily result from the use of construction equipment and motor vehicles.

Fugitive dust (PM_{10} and $PM_{2.5}$) emissions would primarily result from grading and site preparation activities. The Project would be required to comply with SDAPCD Rule 55, Fugitive Dust Control. This rule requires that the Project take steps to restrict visible emissions of fugitive dust beyond the property line. Compliance with Rule 55 would limit fugitive dust (PM_{10} and $PM_{2.5}$) generated during grading and construction activities. To account for dust control measures in the calculations, it was assumed that the Project would ensure that active sites be watered at least two times daily. The application of architectural coatings, such as exterior application/interior paint and other finishes would produce VOC emissions. The contractor would be required to comply with the requirements of SDAPCD's Rule 67.7, Cutback and Emulsified Asphalt, which would limit VOC emissions from asphalt off-gassing.

Table 11 presents the estimated maximum daily construction emissions generated during construction of the Project. Details of the emission calculations are provided in Appendix A.

Table 11. Estimated Maximum Daily Construction Criteria Air Pollutant Emissions - Unmitigated

Year	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds Per Day					
2024	3.72	36.0	33.7	0.06	10.7	5.58
2025	70.5	11.5	17.1	0.03	1.36	0.63
Maximum Daily Emissions	**70.5**	**36.0**	**33.7**	**0.06**	**10.7**	**5.58**
Threshold	*75*	*250*	*550*	*250*	*100*	*55*
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns.
See Appendix A for complete results.
The values shown are the maximum summer or winter daily emissions results from CalEEMod. Although not considered mitigation, these estimates reflect the "mitigated" CalEEMod results to account for SDAPCD Rule 55 - Fugitive Dust Control, assuming watering of the Project site two times per day.

As shown in Table 11, maximum daily construction emissions would not exceed the significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$ during construction; and short-term construction air quality impacts would be less than significant.

Operation of the Project would generate VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$ emissions from mobile sources, including vehicular traffic generated by residents, employees, customers, and visitors; energy sources from natural gas usage; area sources, including the use of landscaping equipment, consumer products, natural gas hearths, and from architectural coatings. As discussed in Section 3.4.2.2, Operational Emissions, pollutant emissions associated with long-term operations were quantified using CalEEMod using a combination of Project-specific information and CalEEMod default values.

Table 12 and Table 13 present the maximum daily area, energy, and mobile source emissions associated with Project operation (year 2026) during summer and winter. Details of the emission calculations are provided in Appendix A.

Table 12. Estimated Maximum Operation Criteria Air Pollutant Emissions – Unmitigated (Summer)

Emissions Source	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds per Day					
Mobile	8.02	4.10	41.00	0.09	2.94	0.57
Area	1.22	1.77	9.38	0.01	0.14	0.14

See Appendix A for complete results. Totals may not sum due to rounding.

As shown in Table 12 and Table 13, maximum daily operational emissions from the Project would not exceed the significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or PM2.5; long-term air quality impacts would be less than significant.

As discussed in Section 3.3, Regional and Local Air Quality Conditions, the SDAB has been designated as a federal nonattainment area for O_3 and a state nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. The nonattainment status is the result of cumulative emissions from various sources of air pollutants and their precursors within the SDAB, including motor vehicles, off-road equipment, and commercial and industrial facilities. Construction and operation of the Project would generate VOC and NO_x emissions (which are precursors to O_3) and emissions of PM_{10} and $PM_{2.5}$. However, as indicated in Tables 11 and 12, Project-generated construction and operational emissions would not exceed the emission-based significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$.

Cumulative localized impacts would potentially occur if a construction project were to occur concurrently with another off-site project. Construction schedules for potential future projects near the Project area are currently unknown; therefore, potential construction impacts associated with two or more simultaneous projects would be considered speculative. However, future projects would be subject to CEQA and would require air quality analysis and, where necessary, mitigation if the project would exceed applied thresholds. Criteria air pollutant emissions associated with construction activity of future projects would be reduced through implementation of control measures required by the SDAPCD. For example, cumulative PM_{10} and $PM_{2.5}$ emissions would be reduced because all future projects would be subject to SDAPCD Rule 55 (Fugitive Dust), which sets forth general and specific requirements for all construction sites in the SDAB. In addition, cumulative VOC emissions would be subject to SDAPCD Rule 67.0.1 (Architectural Coatings).

Based on the Project-generated construction and operational emissions of VOC, NO_x, PM_{10}, and $PM_{2.5}$, the Project would not result in a cumulatively considerable increase in emissions of nonattainment pollutants. Therefore, the Project's cumulative air quality impact would be **less than significant**.

Level of Significance Before Mitigation

Impacts would be less than significant.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

3.5.3 Would the project expose sensitive receptors to substantial pollutant concentrations? (AQ-3)

Air quality varies as a direct function of the quantity of pollutants emitted into the atmosphere, the size and topography of the air basin, and the prevailing meteorological conditions. Air quality problems arise when the rate of pollutant emissions exceeds the rate of dispersion. Reduced visibility, eye irritation, and adverse health impacts on those persons termed "sensitive receptors" are the most serious hazards of existing air quality conditions in the area. Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution, as identified by CARB, include children, older adults, athletes, and people with cardiovascular and chronic respiratory diseases; however, for the purposes of this analysis, residents are also considered sensitive receptors. As such, sensitive

receptors include residences, schools, playgrounds, childcare centers, athletic facilities, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes.

Health Impacts of Carbon Monoxide

Mobile source impacts occur on two scales of motion. Regionally, Project-related travel would add to regional trip generation and increase the vehicle miles traveled within the local airshed and the SDAB. Locally, project generated traffic would be added to the roadway system near the Project site. If such traffic occurs during periods of poor atmospheric ventilation, is composed of many vehicles "cold-started" and operating at pollution-inefficient speeds and is operating on roadways already crowded with non-project traffic, there is a potential for the formation of microscale CO hotspots in the area immediately around points of congested traffic. Because of continued improvement in vehicular emissions at a rate faster than the rate of vehicle growth and/or congestion, the potential for CO hotspots in the SDAB is steadily decreasing.

CO transport is extremely limited, and CO disperses rapidly with distance from the source. Under certain extreme meteorological conditions, however, CO concentrations near a congested roadway or intersection may reach unhealthy levels, affecting sensitive receptors such as residents, school children, hospital patients, and the elderly. Typically, high CO concentrations are associated with urban roadways or intersections operating at an unacceptable level of service (LOS). Projects contributing to adverse traffic impacts may result in the formation of CO hotspots.

To verify that the Project would not cause or contribute to a violation of the CO standards, a screening evaluation of the potential for CO hotspots was conducted using the County of San Diego screening threshold of 3,000 peak trips (County of San Diego 2007). Based on the Transportation Impact Analysis prepared for the Project (CR Associates 2022), there would be approximately 126 trips during the AM peak-hour and 189 trips during the PM peak-hour, which would be minimal in comparison to the screening threshold of 3,000 peak trips. Therefore, the Project would not result in a CO hotspot and would result in a **less than significant** impact.

Health Effects of Other Criteria Air Pollutants

Project construction and operation would not exceed significance thresholds for VOC, NO_x, CO, SO_x, $PM_{10,}$ or $PM_{2.5}$. VOCs and NO_x are precursors to O_3, for which the SDAB is designated as nonattainment with respect to the NAAQS and CAAQS. The health effects associated with O_3 are generally associated with reduced lung function. The contribution of ROGs and NO_x to regional ambient O_3 concentrations is the result of complex photochemistry. The increases in O_3 concentrations in the SDAB due to O_3 precursor emissions tend to be found downwind from the source location to allow time for the photochemical reactions to occur. However, the potential for exacerbating excessive O_3 concentrations would also depend on the time of year that the VOC emissions would occur because exceedances of the O_3 CAAQS/NAAQS tend to occur between April and October when solar radiation is highest. The holistic effect of a single project's emissions of O_3 precursors is speculative due to the lack of reliable and meaningful quantitative methods to assess this impact. The Project would not exceed the significance thresholds for VOC or NO_x; therefore, implementation of the Project would contribute minimally to regional O_3 concentrations and the associated health effects.

In addition to O_3, NO_x emissions contribute to potential exceedances of the NAAQS and CAAQS for NO_2 (since NO_2 is a constituent of NO_x). Health effects that result from NO_2 and NO_x include respiratory irritation, which could be experienced by nearby receptors during the periods of heaviest use of off-road construction equipment. However, Project construction would be relatively short term, and off-road construction equipment would be operating at various portions of the site and would not be concentrated in one portion of the site at any one time. In addition,

existing NO_2 concentrations in the area are well below the NAAQS and CAAQS standards. Because Project generated NO_x emissions would not exceed the significance threshold, the Project would not result in potential health effects associated with NO_2 and NO_x.

CO tends to be a localized impact associated with congested intersections. The associated potential for CO hotspots were discussed previously and were determined to be a less-than-significant impact. Furthermore, the existing CO concentrations in the area are well below the NAAQS and CAAQS standards. Thus, the Project's CO emissions would not contribute to significant health effects associated with this pollutant.

Construction and operation of the Project would also not exceed thresholds for PM_{10} or $PM_{2.5}$ and would not contribute to exceedances of the NAAQS and CAAQS for particulate matter or would obstruct the SDAB from coming into attainment for these pollutants. Additionally, the Project would implement dust control strategies and be required to comply with SDAPCD Rule 55, Fugitive Dust Control, which limits the amount of fugitive dust generated during construction. Due to the minimal contribution of particulate matter during construction and operation, the Project is not anticipated to result in health effects associated with PM_{10} or $PM_{2.5}$.

In summary, the Project would not result in any potentially significant contribution to local or regional concentrations of nonattainment pollutants and would not result in a significant contribution to the adverse health impacts associated with those pollutants. Impacts would be **less than significant**. Furthermore, there are numerous scientific and technological complexities associated with correlating criteria air pollutant emissions from an individual project to specific health effects or potential additional nonattainment days, and there are currently no modeling tools that could provide reliable and meaningful additional information regarding health effects from criteria air pollutants generated by individual projects.

Health Impacts of Toxic Air Contaminants

In addition to impacts from criteria pollutants, Project impacts may include emissions of pollutants identified by the state and federal government as TACs or hazardous air pollutants. State law has established the framework for California's TAC identification and control program, which is generally more stringent than the federal program and aimed at TACs that are a problem in California. The state has formally identified more than 200 substances as TACs, including the federal hazardous air pollutants, and is adopting appropriate control measures for sources of these TACs. The greatest potential for TAC emissions during construction would be diesel particulate emissions from heavy equipment operations and heavy-duty trucks and the associated health impacts to sensitive receptors. The following measures are required by state law to reduce DPM emissions:

- Fleet owners of mobile construction equipment are subject to the CARB Regulation for In-use Off-road Diesel Vehicles (13 CCR 2449), the purpose of which is to reduce DPM and criteria pollutant emissions from in-use (existing) off-road diesel-fueled vehicles.
- All commercial diesel vehicles are subject to Title 13, Section 2485 of the California Code of Regulations, limiting engine idling time. Idling of heavy-duty diesel construction equipment and trucks during loading and unloading shall be limited to five minutes; electric auxiliary power units should be used whenever possible.

Health effects from carcinogenic air toxics are usually described in terms of cancer risk. The SDAPCD recommends an incremental cancer risk threshold of 10 in a million (SDAPCD 2015b). "Incremental cancer risk" is the net increased likelihood that a person continuously exposed to concentrations of TACs resulting from a project over a

9-, 30-, and 70-year exposure period will contract cancer based on the use of standard Office of Environmental Health Hazard Assessment (OEHHA) risk-assessment methodology (OEHHA 2015).

As shown in Table 11, maximum daily PM_{10} or $PM_{2.5}$ emissions generated by construction equipment operation and haul-truck trips during construction, which is based on exhaust and fugitive dust generated by equipment operation and vehicle travel, would be well below the significance thresholds. Moreover, total construction of the Project would last approximately 15 months, after which Project-construction TAC emissions would cease. Thus, the duration of the proposed construction activities would only constitute a small percentage of the total 30-year residential exposure period recommended by OEHHA. Concentrations of mobile-source DPM emissions are typically reduced by 70% at a distance of approximately 500 feet (CARB 2005). The nearest existing sensitive receptors are multi-family residential uses located 2,020 feet southeast of the Project site. Therefore, construction would take place substantially farther than 500 feet from the nearest sensitive receptors. Due to the temporary nature of construction activities and the dispersive properties of DPM, the nearest residential receptors would not be impacted regarding construction health risks. Regarding long-term TAC emissions, the Project would result in a minimal increase in daily truck traffic on the roadway network and would not require stationary sources (such as diesel emergency generators). Therefore, the exposure of Project-related TAC emission impacts to proximate sensitive receptors would be **less than significant**.

Valley Fever

As discussed above in Section 3.1.2.2, the average incidence rate within the County is below the statewide average. Furthermore, construction of the Project would comply with SDAPCD Rule 55, Fugitive Dust Control, which limits the amount of fugitive dust generated during construction. SDAPCD Rule 55 is intended to reduce PM_{10} emissions from any transportation, handling, construction, or storage activity that has the potential to generate fugitive dust. Based on the low incidence rate of coccidioidomycosis on the Project site and in the County, and with the Project's implementation of dust control strategies and Valley Fever awareness and training, it is not anticipated that earth-moving activities during Project construction would result in exposure of nearby sensitive receptors to Valley Fever. Therefore, the Project would have a **less-than-significant** impact with respect to Valley Fever exposure for sensitive receptors.

Level of Significance Before Mitigation

Impacts would be less than significant.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

3.5.4 Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people? (AQ-4)

Construction and operation of the Project would result in various emissions; however, criteria air pollutants, fugitive dust, and TACs are addressed under Sections 3.5.2 and 3.5.3 above. As such, this impact analysis is focused on the potential for an odor impact to occur. The occurrence and severity of potential odor impacts depends on numerous factors. The nature, frequency, and intensity of the source; the wind speeds and direction; and the sensitivity of receiving location each contribute to the intensity of the impact. Although offensive odors seldom cause physical harm, they can be annoying and cause distress among the public and generate citizen complaints.

Odors would be generated from vehicles and/or equipment exhaust emissions during construction of the Project. Odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment, architectural coatings, and asphalt pavement application. Such odors would disperse rapidly from the Project site and generally occur at magnitudes that would not affect substantial numbers of people. Therefore, impacts associated with odors during construction would be considered **less than significant.**

Land uses and industrial operations associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The Project does not propose and would not engage in any of these activities or other potential activities that would generate operational odors. The Project entails residential and commercial uses and would not create any new sources of substantial odors during operation. Therefore, the Project would result in an odor impact that is **less than significant.**

Level of Significance Before Mitigation

Impacts would be less than significant.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

4 Greenhouse Gas Emissions

4.1 Environmental Setting

4.1.1 Climate Change Overview

Climate change refers to any significant change in measures of climate, such as temperature, precipitation, or wind patterns, lasting for an extended period of time (i.e., decades or longer). The Earth's temperature depends on the balance between energy entering and leaving the planet's system. Many factors, both natural and human, can cause changes in Earth's energy balance, including variations in the sun's energy reaching Earth, changes in the reflectivity of Earth's atmosphere and surface, and changes in the greenhouse effect, which affects the amount of heat retained by Earth's atmosphere (EPA 2022b).

The greenhouse effect is the trapping and build-up of heat in the atmosphere (troposphere) near the Earth's surface. The greenhouse effect traps heat in the troposphere through a threefold process as follows: Short-wave radiation emitted by the Sun is absorbed by the Earth, the Earth emits a portion of this energy in the form of long-wave radiation, and GHGs in the upper atmosphere absorb this long-wave radiation and emit it into space and toward the Earth. The greenhouse effect is a natural process that contributes to regulating the Earth's temperature and creates a pleasant, livable environment on the Earth. Human activities that emit additional GHGs to the atmosphere increase the amount of infrared radiation that gets absorbed before escaping into space, thus enhancing the greenhouse effect and causing the Earth's surface temperature to rise.

The scientific record of the Earth's climate shows that the climate system varies naturally over a wide range of time scales and that, in general, climate changes prior to the Industrial Revolution in the 1700s can be explained by natural causes such as changes in solar energy, volcanic eruptions, and natural changes in GHG concentrations. Recent climate changes, in particular the warming observed over the past century, however, cannot be explained by natural causes alone. Rather, it is extremely likely that human activities have been the dominant cause of that warming since the mid-twentieth century and is the most significant driver of observed climate change (IPCC 2013; EPA 2022b). Human influence on the climate system is evident from the increasing GHG concentrations in the atmosphere, positive radiative forcing, observed warming, and improved understanding of the climate system (IPCC 2013). The atmospheric concentrations of GHGs have increased to levels unprecedented in the last 800,000 years, primarily from fossil fuel emissions and secondarily from emissions associated with land use changes (IPCC 2013). Continued emissions of GHGs will cause further warming and changes in all components of the climate system, which is discussed further in Section 4.3.2, Potential Effects of Climate Change.

4.1.2 Greenhouse Gases

A GHG is any gas that absorbs infrared radiation in the atmosphere; in other words, GHGs trap heat in the atmosphere. As defined in California Health and Safety Code, Section 38505(g), for purposes of administering many of the State's primary GHG emissions reduction programs, GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3). (See also CEQA Guidelines, Section 15364.5.) Some GHGs, such as CO_2, CH_4, and N_2O, occur naturally and are emitted into the atmosphere through natural processes and human activities. Of these gases, CO_2 and CH_4 are emitted in the greatest quantities from human activities. Manufactured GHGs, which have a much greater heat-absorption potential than CO_2,

include fluorinated gases, such as HFCs, PFCs, and SF_6, which are associated with certain industrial products and processes. The following paragraphs provide a summary of the most common GHGs and their sources.[5]

Carbon Dioxide. CO_2 is a naturally occurring gas and a by-product of human activities and is the principal anthropogenic GHG that affects the Earth's radiative balance. Natural sources of CO_2 include respiration of bacteria, plants, animals, and fungus; evaporation from oceans; volcanic out-gassing; and decomposition of dead organic matter. Human activities that generate CO_2 are from the combustion of fuels such as coal, oil, natural gas, and wood and changes in land use.

Methane. CH_4 is produced through both natural and human activities. CH_4 is a flammable gas and is the main component of natural gas. Methane is produced through anaerobic (without oxygen) decomposition of waste in landfills, flooded rice fields, animal digestion, decomposition of animal wastes, production and distribution of natural gas and petroleum, coal production, and incomplete fossil fuel combustion.

Nitrous Oxide. N_2O is produced through natural and human activities, mainly through agricultural activities and natural biological processes, although fuel burning and other processes also create N_2O. Sources of N_2O include soil cultivation practices (microbial processes in soil and water), especially the use of commercial and organic fertilizers, manure management, industrial processes (such as in nitric acid production, nylon production, and fossil-fuel-fired power plants), vehicle emissions, and using N_2O as a propellant (e.g., rockets, racecars, and aerosol sprays).

Fluorinated Gases. Fluorinated gases (also referred to as F-gases) are synthetic powerful GHGs emitted from many industrial processes. Fluorinated gases are commonly used as substitutes for stratospheric ozone-depleting substances (e.g., chlorofluorocarbons [CFCs], hydrochlorofluorocarbons [HCFCs], and halons). The most prevalent fluorinated gases include the following:

- **Hydrofluorocarbons:** HFCs are compounds containing only hydrogen, fluorine, and carbon atoms. HFCs are synthetic chemicals used as alternatives to ozone-depleting substances in serving many industrial, commercial, and personal needs. HFCs are emitted as by-products of industrial processes and are used in manufacturing.
- **Perfluorocarbons:** PFCs are a group of human-made chemicals composed of carbon and fluorine only. These chemicals were introduced as alternatives, with HFCs, to the ozone depleting substances. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Since PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere, these chemicals have long lifetimes, ranging between 10,000 and 50,000 years.
- **Sulfur Hexafluoride:** SF_6 is a colorless gas soluble in alcohol and ether and slightly soluble in water. SF_6 is used for insulation in electric power transmission and distribution equipment, semiconductor manufacturing, the magnesium industry, and as a tracer gas for leak detection.
- **Nitrogen Trifluoride:** NF_3 is used in the manufacture of a variety of electronics, including semiconductors and flat panel displays.

Chlorofluorocarbons. CFCs are synthetic chemicals that have been used as cleaning solvents, refrigerants, and aerosol propellants. CFCs are chemically unreactive in the lower atmosphere (troposphere) and the production of CFCs was prohibited in 1987 due to the chemical destruction of stratospheric O_3.

[5] The descriptions of GHGs are summarized from the Intergovernmental Panel on Climate Change (IPCC) Second Assessment Report (1995), IPCC Fourth Assessment Report (2007), CARB's "Glossary of Terms Used in GHG Inventories" (2015), and EPA's "Overview of Greenhouse Gases" (2016b).

Hydrochlorofluorocarbons. HCFCs are a large group of compounds, whose structure is very close to that of CFCs—containing hydrogen, fluorine, chlorine, and carbon atoms—but including one or more hydrogen atoms. Like HFCs, HCFCs are used in refrigerants and propellants. HCFCs were also used in place of CFCs for some applications; however, their use in general is being phased out.

Black Carbon. Black carbon is a component of fine particulate matter, which has been identified as a leading environmental risk factor for premature death. It is produced from the incomplete combustion of fossil fuels and biomass burning, particularly from older diesel engines and forest fires. Black carbon warms the atmosphere by absorbing solar radiation, influences cloud formation, and darkens the surface of snow and ice, which accelerates heat absorption and melting. Black carbon is a short-lived species that varies spatially, which makes it difficult to quantify the global warming potential. Diesel particulate matter emissions are a major source of black carbon and are TACs that have been regulated and controlled in California for several decades to protect public health. In relation to declining diesel particulate matter from the CARB's regulations pertaining to diesel engines, diesel fuels, and burning activities, CARB estimates that annual black carbon emissions in California have reduced by 70% between 1990 and 2010, with 95% control expected by 2020 (CARB 2014). The majority of anthropogenic sources come from transportation—specifically, heavy-duty vehicles. The share of black carbon emissions from transportation is dropping rapidly and is expected to continue to do so between now and 2030 as a result of California's air quality programs. The remaining black carbon emissions will come largely from woodstoves/fireplaces, off-road applications, and industrial/commercial combustion. The forestry category includes non-agricultural prescribed burning and wildfire emissions (CARB 2022f).

Water Vapor. The primary source of water vapor is evaporation from the ocean, with additional vapor generated by sublimation (change from solid to gas) from ice and snow, evaporation from other water bodies, and transpiration from plant leaves. Water vapor is the most important, abundant, and variable GHG in the atmosphere and maintains a climate necessary for life.

Ozone. Tropospheric O_3, which is created by photochemical reactions involving gases from both natural sources and human activities, acts as a GHG. Stratospheric O_3, which is created by the interaction between solar ultraviolet radiation and molecular oxygen (O_2), plays a decisive role in the stratospheric radiative balance. Depletion of stratospheric O_3, due to chemical reactions that may be enhanced by climate change, results in an increased ground-level flux of ultraviolet-B radiation.

Aerosols. Aerosols are suspensions of particulate matter in a gas emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light.

4.1.3 Global Warming Potential

Gases in the atmosphere can contribute to climate change both directly and indirectly. Direct effects occur when the gas itself absorbs radiation. Indirect radiative forcing occurs when chemical transformations of the substance produce other GHGs, when a gas influences the atmospheric lifetimes of other gases, and/or when a gas affects atmospheric processes that alter the radiative balance of the Earth (EPA 2022b). The Intergovernmental Panel on Climate Change (IPCC) developed the global warming potential (GWP) concept to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The GWP of a GHG is defined as the ratio of the time-integrated radiative forcing from the instantaneous release of 1 kilogram of a trace substance relative to that of 1 kilogram of a reference gas (IPCC 2014). The reference gas used is CO_2; therefore, GWP-weighted emissions are

measured in metric tons (MT) of carbon dioxide equivalent (CO_2e). The current version of CalEEMod (Version 2022) assumes that the GWP for CH_4 is 25 (so emissions of 1 MT of CH_4 are equivalent to emissions of 25 MT of CO_2), and the GWP for N_2O is 298, based on the IPCC Fourth Assessment Report (IPCC 2007). The GWP values identified in CalEEMod were applied to the Project.

4.2 Regulatory Setting

4.2.1 Federal Regulations

Massachusetts v. EPA. In *Massachusetts v. EPA* (April 2007), the U.S. Supreme Court directed the EPA administrator to determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In December 2009, the administrator signed a final rule with the following two distinct findings regarding GHGs under Section 202(a) of the federal Clean Air Act:

- The Administrator found that elevated concentrations of GHGs—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations. This is the "endangerment finding."
- The Administrator further found the combined emissions of GHGs—CO_2, CH_4, N_2O, and HFCs—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is the "cause or contribute finding."

These two findings were necessary to establish the foundation for regulation of GHGs from new motor vehicles as air pollutants under the Clean Air Act.

Energy Independence and Security Act of 2007. The Energy Independence and Security Act of 2007 (December 2007), among other key measures, would do the following, which would aid in the reduction of national GHG emissions:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020, and directs National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy-efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

Federal Vehicle Standards. In 2007, in response to the *Massachusetts v. EPA* U.S. Supreme Court ruling, the Bush Administration issued Executive Order (EO) 13432 directing the EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011; and, in 2010, the EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012 through 2016 (75 Fed. Reg. 25324–25728).

In 2010, President Obama issued a memorandum directing the Department of Transportation, Department of Energy, EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017 through 2025 light-duty vehicles. The proposed standards projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017 through 2021 (77 Fed. Reg. 62624–63200). On January 12, 2017, the EPA finalized its decision to maintain the current GHG emissions standards for model years 2022–2025 cars and light trucks.

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014 through 2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the EPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6% to 23% over the 2010 baselines (76 Fed. Reg. 57106–57513).

In August 2016, the EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion MT and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program (EPA and NHTSA 2016).

In August 2018, EPA and NHTSA proposed to amend certain fuel economy and GHG standards for passenger cars and light trucks and establish new standards for model years 2021 through 2026. Compared to maintaining the post-2020 standards then in place, the 2018 proposal would increase U.S. fuel consumption by about half a million barrels per day (2% to 3% of total daily consumption, according to the Energy Information Administration) and would impact the global climate by 3/1000th of one degree Celsius by 2100 (EPA and NHTSA 2018). California and other states have stated their intent to challenge federal actions that would delay or eliminate GHG reduction measures and have committed to cooperating with other countries to implement global climate change initiatives.

In 2019, the EPA and NHTSA published the Safer Affordable Fuel-Efficient Vehicles Rule Part One: One National Program (SAFE-1), which revoked California's authority to set its own GHG emissions standards and set zero-emission vehicle (ZEV) mandates in California. In March 2020, Part Two was issued which set CO2 emissions standards and corporate average fuel economy standards for passenger vehicles and light-duty trucks for model years 2021 through 2026. In March 2022, EPA reinstated California's authority under the Clean Air Act to implement its own GHG emission standards and ZEV sales mandate. EPA's March 2022 action concludes its reconsideration of the 2019 SAFE-1 rule by finding that the actions taken under the previous administration as a part of SAFE-1 were decided in error and are now entirely rescinded.

Inflation Reduction Act of 2022. The Inflation Reduction Act was signed into law by President Biden in August 2022. The bill includes specific investment in energy and climate reform and is projected to reduce GHG emissions within the U.S. by 40% as compared to 2005 levels by 2030. The bill allocates funds to boost renewable energy infrastructure (e.g., solar panels and wind turbines), includes tax credits for the purchase of electric vehicles, and includes measures that will make homes more energy efficient.

4.2.2 State Regulations

The statewide GHG emissions regulatory framework is summarized below by category: state climate change targets, building energy, renewable energy and energy procurement, mobile sources, solid waste, water, and other state regulations and goals. The following text describes EOs, legislation, regulations, and other plans and policies that would directly or indirectly reduce GHG emissions and/or address climate change issues.

State Climate Change Targets

The state has taken several actions to address climate change. These include EOs, legislation, and CARB plans and requirements. These are summarized below.

EO S-3-05. EO S-3-05 (June 2005) identified California's GHG emissions reduction targets and laid out responsibilities among the state agencies for implementing the EO and for reporting on progress toward the targets. This EO identified the following targets:

- By 2010, reduce GHG emissions to 2000 levels
- By 2020, reduce GHG emissions to 1990 levels
- By 2050, reduce GHG emissions to 80% below 1990 levels

EO S-3-05 also directed the California Environmental Protection Agency to report biannually on progress made toward meeting the GHG targets and the impacts to California due to global warming, including impacts to water supply, public health, agriculture, the coastline, and forestry. The Climate Action Team was formed, which subsequently issued reports from 2006 to 2010.

AB 32. In furtherance of the goals established in EO S-3-05, the Legislature enacted AB 32 (Núñez and Pavley). The bill is referred to as the California Global Warming Solutions Act of 2006 (September 27, 2006). AB 32 provided initial direction on creating a comprehensive multiyear program to limit California's GHG emissions at 1990 levels by 2020 and initiate the transformations required to achieve the state's long-range climate objectives.

EO B-30-15. EO B-30-15 (April 2015) identified an interim GHG reduction target in support of targets previously identified under S-3-05 and AB 32. EO B-30-15 set an interim target goal of reducing GHG emissions to 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80% below 1990 levels by 2050 as set forth in S-3-05. To facilitate achieving this goal, EO B-30-15 called for CARB to update the Scoping Plan to express the 2030 target in terms of MMT CO_2e. The EO also called for state agencies to continue to develop and implement GHG emission reduction programs in support of the reduction targets.

SB 32 and AB 197. SB 32 and AB 197 (enacted in 2016) are companion bills. SB 32 codified the 2030 emissions reduction goal of EO B-30-15 by requiring CARB to ensure that statewide GHG emissions are reduced to 40% below 1990 levels by 2030. AB 197 established the Joint Legislative Committee on Climate Change Policies, consisting of at least three members of the Senate and three members of the Assembly, to provide ongoing oversight over implementation of the state's climate policies. AB 197 also added two members of the Legislature to the Board as nonvoting members; requires CARB to make available and update (at least annually via its website) emissions data for GHGs, criteria air pollutants, and TACs from reporting facilities; and requires CARB to identify specific information for GHG emissions reduction measures when updating the scoping plan.

EO B-55-18. EO B-55-18 (September 2018) establishes a new statewide goal "to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter." This EO directs CARB to "work with relevant state agencies to ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal."

Assembly Bill 1279. The Legislature enacted AB 1279, the California Climate Crisis Act, in September 2022. The bill declares the policy of the state to achieve net zero GHG emissions as soon as possible, but no later than 2045, and achieve and maintain net negative GHG emissions thereafter. Additionally, the bill requires that by 2045, statewide anthropogenic GHG emissions be reduced to at least 85% below 1990 levels.

CARB's Climate Change Scoping Plan. One specific requirement of AB 32 is for CARB to prepare a "scoping plan" for achieving the maximum technologically feasible and cost-effective GHG emission reductions by 2020 (Health and Safety Code, Section 38561(a)), and to update the plan at least once every 5 years. In 2008, CARB approved the first scoping plan. The *Climate Change Scoping Plan: A Framework for Change* (*Scoping Plan*) included a mix of recommended strategies that combined direct regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs calculated to meet the 2020 statewide GHG emission limit and initiate the transformations needed to achieve the state's long-range climate objectives. The key elements of the Scoping Plan include the following (CARB 2008):

- Expanding and strengthening existing energy efficiency programs as well as building and appliance standards
- Achieving a statewide renewable energy mix of 33%
- Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system and caps sources contributing 85% of California's GHG emissions
- Establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets
- Adopting and implementing measures pursuant to existing state laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard (LCFS) (17 CCR, Section 95480 et seq.)
- Creating targeted fees, including a public goods charge on water use, fees on high GWP gases, and a fee to fund the administrative costs of the State of California's long-term commitment to AB 32 implementation

The Scoping Plan also identified local governments as essential partners in achieving California's goals to reduce GHG emissions because they have broad influence and, in some cases, exclusive authority over activities that contribute to significant direct and indirect GHG emissions through their planning and permitting processes, local ordinances, outreach and education efforts, and municipal operations. Specifically, the Scoping Plan encouraged local governments to adopt a reduction goal for municipal operations and for community emissions to reduce GHGs by approximately 15% from then levels (2008) by 2020. Many local governments developed community-scale local GHG reduction plans based on this Scoping Plan recommendation.

In 2014, CARB approved the first update to the Scoping Plan. The First Update to the Climate Change Scoping Plan: Building on the Framework (First Update) defined the state's GHG emission reduction priorities for the next 5 years and laid the groundwork to start the transition to the post-2020 goals set forth in EOs S-3-05 and B-16-2012. The First Update concluded that California is on track to meet the 2020 target but recommended a 2030 mid-term GHG reduction target be established to ensure a continuum of action to reduce emissions. The First Update recommended

a mix of technologies in key economic sectors to reduce emissions through 2050 including: energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings and industrial machinery; decarbonizing electricity and fuel supplies; and the rapid market penetration of efficient and clean energy technologies. As part of the First Update, CARB recalculated the state's 1990 emissions level, using more recent global warming potentials identified by the IPCC, from 427 MMT CO2e to 431 MMT CO2e (CARB 2014).

In 2015, as directed by EO B-30-15, CARB began working on an update to the Scoping Plan to incorporate the 2030 target of 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80% below 1990 levels by 2050 as set forth in S-3-05. The Governor called on California to pursue a new and ambitious set of strategies, in line with the five climate change pillars from his inaugural address, to reduce GHG emissions and prepare for the unavoidable impacts of climate change. In the summer of 2016, the Legislature affirmed the importance of addressing climate change through passage of SB 32 (Pavley, Chapter 249, Statutes of 2016).

In December 2017, CARB's Governing Board adopted the 2017 Climate Change Scoping Plan Update (2030 Scoping Plan) (CARB 2017b). The 2030 Scoping Plan builds on the successful framework established in the initial Scoping Plan and First Update, while identifying new, technologically feasible and cost-effective strategies that will serve as the framework to achieve the 2030 GHG target and define the state's climate change priorities to 2030 and beyond. The strategies' "known commitments" include implementing renewable energy and energy efficiency (including the mandates of SB 350), increased stringency of the LCFS, measures identified in the Mobile Source and Freight Strategies, measures identified in the proposed Short-Lived Climate Pollutant Plan, and increased stringency of SB 375 targets. To fill the gap in additional reductions needed to achieve the 2030 target, it recommends continuing the Cap-and-Trade Program and a measure to reduce GHGs from refineries by 20%.

The Scoping Plan recommends strategies for implementation at the statewide level to meet the goals of AB 32, SB 32, and the EOs and establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions. A project is considered consistent with the statutes and EOs if it meets the general policies in reducing GHG emissions to facilitate the achievement of the state's goals and does not impede attainment of those goals. As discussed in several cases, a given project need not be in perfect conformity with each and every planning policy or goals to be consistent. A project would be consistent, if it will further the objectives and not obstruct their attainment.

CARB released the 2022 Scoping Plan Update in November 2022, which outlines the state's plan to reach carbon neutrality by 2045 or earlier, while also assessing the progress the state is making toward reducing GHG emissions by at least 40% below 1990 levels by 2030, as is required by SB 32 and laid out in the Second Update. The carbon neutrality goal requires CARB to expand proposed actions from only the reduction of anthropogenic sources of GHG emissions to also include those that capture and store carbon (e.g., through natural and working lands, or mechanical technologies). The carbon reduction programs build on and accelerate those currently in place, including moving to zero-emission transportation; phasing out use of fossil gas use for heating homes and buildings; reducing chemical and refrigerants with high GWP; providing communities with sustainable options for walking, biking, and public transit; displacement of fossil-fuel fired electrical generation through use of renewable energy alternatives (e.g., solar arrays and wind turbines); and scaling up new options such as green hydrogen (CARB 2022f).

The 2022 Scoping Plan also emphasizes that there is no realistic path to carbon neutrality without carbon removal and sequestration, and to achieve the state's carbon neutrality goal, carbon reduction programs must be supplemented by strategies to remove and sequester carbon. Strategies for carbon removal and sequestration include carbon capture and storage from anthropogenic point sources, where CO_2 is captured as it leaves a facility's

smokestack and is injected into geologic formations or used in industrial materials (e.g., concrete); and carbon dioxide removal from ambient air, through mechanical (e.g., direct air capture with sequestration) or nature-based (e.g., management of natural and working lands) applications.

The 2022 Scoping Plan included Appendix D, Local Actions, which includes recommendations intended to build momentum for local government actions that align with the State's climate goals, with a focus on local GHG reduction strategies (commonly referred to as climate action planning) and approval of new land use development projects, including through environmental review under CEQA. The recommendations provided in Appendix D are non-binding and should not be interpreted as a directive to local governments, but rather as evidence-based analytical tools to assist local governments with their role as essential partners in achieving California's climate goals. Appendix D recognizes consistency with a CEQA-qualified GHG reduction plan such as a Climate Action Plan as a preferred option for evaluating potential GHG emission impacts under CEQA. Absent a qualified GHG reduction plan, Appendix D provides additional potential threshold options including key attributes that residential and mixed-use projects should achieve that would align with the State's climate goals, a net-zero threshold, and use of air district recommended thresholds of significance.[6]

CARB's Regulations for the Mandatory Reporting of Greenhouse Gas Emissions. CARB's Regulation for the Mandatory Reporting of Greenhouse Gas Emissions (17 CCR 95100–95157) incorporated by reference certain requirements that EPA promulgated in its Final Rule on Mandatory Reporting of Greenhouse Gases (Title 40, CFR, Part 98). Specifically, Section 95100(c) of the Mandatory Reporting Regulation incorporated those requirements that EPA promulgated in the Federal Register on October 30, 2009; July 12, 2010; September 22, 2010; October 28, 2010; November 30, 2010; December 17, 2010; and April 25, 2011. In general, entities subject to the Mandatory Reporting Regulation that emit over 10,000 MT CO_2e per year are required to report annual GHGs through the California Electronic GHG Reporting Tool. Certain sectors, such as refineries and cement plants, are required to report regardless of emission levels. Entities that emit more than the 25,000 MT CO_2e per year threshold are required to have their GHG emission report verified by a CARB-accredited third-party verified.

EO B-18-12. EO B-18-12 (April 2012) directed state agencies, departments, and other entities under the governor's executive authority to take action to reduce entity-wide GHG emissions by at least 10% by 2015 and 20% by 2020, as measured against a 2010 baseline. EO B-18-12 also established goals for existing state buildings for reducing grid-based energy purchases and water use.

SB 605 and SB 1383. SB 605 (2014) requires CARB to complete a comprehensive strategy to reduce emissions of short-lived climate pollutants (SLCPs) in the state; and SB 1383 (2016) requires CARB to approve and implement that strategy by January 1, 2018. SB 1383 also establishes specific targets for the reduction of SLCPs (40% below 2013 levels by 2030 for methane and HFCs, and 50% below 2013 levels by 2030 for anthropogenic black carbon) and provides direction for reductions from dairy and livestock operations and landfills. Accordingly, and as mentioned above, CARB adopted its *Short-Lived Climate Pollutant Reduction Strategy* (*SLCP Reduction Strategy*) in March 2017. The *SLCP Reduction Strategy* establishes a framework for the statewide reduction of emissions of black carbon, methane, and fluorinated gases.

Assembly Bill 1757. AB 1757 (September 2022) requires the California Natural Resources Agency (CNRA) to determine a range of targets for natural carbon sequestration, and for nature-based climate solutions that reduce

[6] The threshold approaches outlined in the 2022 Scoping Plan, Appendix D, are recommendations only and are not requirements; they do not supplant lead agencies' discretion to develop their own evidence-based approaches for determining whether a project would have a potentially significant impact on GHG emissions.

GHG emissions for future years 2030, 2038, and 2045. These targets are to be determined no later than January 1, 2024 and are established to support the state's goals to achieve carbon neutrality and foster climate adaptation and resilience.

Building Energy

Title 24, Part 6. The California Building Standards Code were established in 1978 and serves to enhance and regulate California's building standards. While not initially promulgated to reduce GHG emissions, Part 6 of Title 24 specifically established Building Energy Efficiency Standards that are designed to ensure that new and existing buildings in California achieve energy efficiency and preserve outdoor and indoor environmental quality. These energy efficiency standards are reviewed every few years by the Building Standards Commission and the California Energy Commission (CEC) and revised if necessary (California Public Resources Code Section 25402(b)(1)). The regulations receive input from members of industry, as well as the public, in order to "reduce the wasteful, uneconomic, inefficient, or unnecessary consumption of energy" (California Public Resources Code Section 25402). These regulations are carefully scrutinized and analyzed for technological and economic feasibility (California Public Resources Code Section 25402(d)) and cost effectiveness (California Public Resources Code Section 25402(b)(2–3)). As a result, these standards save energy, increase electricity supply reliability, increase indoor comfort, avoid the need to construct new power plants, and help preserve the environment. The current Title 24 standards are the 2022 Title 24 building energy efficiency standards, which became effective January 1, 2023.

The 2022 standards build upon the 2019 standards for new construction of, and additions and alterations to, residential and nonresidential buildings. The 2022 standards include measures that further reduce energy use in single family, multifamily, and nonresidential buildings, through the following strategies (CEC 2021a):

- New prescriptive and performance standards for electric heat pumps for space conditioning and water heating, as appropriate for the various climate zones in California,
- Require PV and battery storage systems for newly constructed multifamily and selected nonresidential buildings,
- Updated efficiency measures for lighting, building envelope, HVAC, and
- Improvements to reduce the energy loads of certain equipment covered by (i.e., subject to the requirements of) the Energy Code that perform a commercial process that is not related to the occupant needs in the building (such as refrigeration equipment in refrigerated warehouses, or air conditioning for computer equipment in data processing centers).

Title 24, Part 11. In addition to the CEC's efforts, in 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11 of Title 24) is commonly referred to as California's Green Building Standards (CALGreen) and establishes minimum mandatory standards and voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and interior air quality. The CALGreen standards took effect in January 2011 and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low-rise residential and state-owned buildings and schools and hospitals. The 2019 CALGreen standards are the current applicable standards. For nonresidential projects, some of the key mandatory CALGreen 2019 standards involve requirements related to bicycle parking, designated parking for clean air vehicles, electric vehicle (EV) charging stations, shade trees, water conserving plumbing fixtures and fittings, outdoor potable water use in landscaped areas, recycled

water supply systems, construction waste management, excavated soil and land clearing debris, and commissioning (24 CCR Part 11).

Title 20. Title 20 of the California Code of Regulations requires manufacturers of appliances to meet state and federal standards for energy and water efficiency. The CEC certifies an appliance based on a manufacturer's demonstration that the appliance meets the standards. New appliances regulated under Title 20 include refrigerators, refrigerator-freezers, and freezers; room air conditioners and room air-conditioning heat pumps; central air conditioners; spot air conditioners; vented gas space heaters; gas pool heaters; plumbing fittings and plumbing fixtures; fluorescent lamp ballasts; lamps; emergency lighting; traffic signal modules; dishwaters; clothes washers and dryers; cooking products; electric motors; low-voltage dry-type distribution transformers; power supplies; televisions and consumer audio and video equipment; and battery charger systems. Title 20 presents protocols for testing each type of appliance covered under the regulations and appliances must meet the standards for energy performance, energy design, water performance and water design. Title 20 contains three types of standards for appliances: federal and state standards for federally regulated appliances, state standards for federally regulated appliances, and state standards for non-federally regulated appliances.

SB 1. SB 1 (Murray) (August 2006) established a $3 billion rebate program to support the goal of the state to install rooftop solar energy systems with a generation capacity of 3,000 megawatts through 2016. SB 1 added sections to the Public Resources Code, including Chapter 8.8 (California Solar Initiative), that require building projects applying for ratepayer-funded incentives for photovoltaic systems to meet minimum energy efficiency levels and performance requirements. Section 25780 established that it is a goal of the state to establish a self-sufficient solar industry. The goals included establishing solar energy systems as a viable mainstream option for both homes and businesses within 10 years of adoption and placing solar energy systems on 50% of new homes within 13 years of adoption. SB 1, also termed "Go Solar California," was previously titled "Million Solar Roofs."

California AB 1470 (Solar Water Heating). This bill established the Solar Water Heating and Efficiency Act of 2007. The bill makes findings and declarations of the Legislature relating to the promotion of solar water heating systems and other technologies that reduce natural gas demand. The bill defines several terms for purposes of the act. The bill requires the commission to evaluate the data available from a specified pilot program, and, if it makes a specified determination, to design and implement a program of incentives for the installation of 200,000 solar water heating systems in homes and businesses throughout the state by 2017.

Renewable Energy and Energy Procurement

SB 1078. SB 1078 (Sher) (September 2002) established the Renewable Portfolio Standard (RPS) program, which required an annual increase in renewable generation by the utilities equivalent to at least 1% of sales, with an aggregate goal of 20% by 2017. This goal was subsequently accelerated, requiring utilities to obtain 20% of their power from renewable sources by 2010 (see SB 107, EO S-14-08, and S-21-09).

SB 1368. SB 1368 (September 2006) required the CEC to develop and adopt regulations for GHG emission performance standards for the long-term procurement of electricity by local publicly owned utilities. These standards must be consistent with the standards adopted by the California Public Utilities Commission.

AB 1109. Enacted in 2007, AB 1109 required the CEC to adopt minimum energy efficiency standards for general-purpose lighting, to reduce electricity consumption 50% for indoor residential lighting and 25% for indoor commercial lighting.

EO S-14-08. EO S-14-08 (November 2008) focused on the contribution of renewable energy sources to meet the electrical needs of California while reducing the GHG emissions from the electrical sector. This EO required that all retail suppliers of electricity in California serve 33% of their load with renewable energy by 2020. Furthermore, the EO directed state agencies to take appropriate actions to facilitate reaching this target. The CNRA, through collaboration with the CEC and California Department of Fish and Wildlife (formerly the California Department of Fish and Game), was directed to lead this effort.

EO S-21-09 and SBX1-2. EO S-21-09 (September 2009) directed CARB to adopt a regulation consistent with the goal of EO S-14-08 by July 31, 2010. CARB was further directed to work with the California Public Utilities Commission and CEC to ensure that the regulation builds upon the RPS program and was applicable to investor-owned utilities, publicly owned utilities, direct access providers, and community choice providers. Under this order, CARB was to give the highest priority to those renewable resources that provide the greatest environmental benefits with the least environmental costs and impacts on public health and can be developed the most quickly in support of reliable, efficient, cost-effective electricity system operations. On September 23, 2010, CARB initially approved regulations to implement a Renewable Electricity Standard. However, this regulation was not finalized because of subsequent legislation (SB X1-2, Simitian, statutes of 2011) signed by Governor Brown in April 2011.

SB X1 2 expanded the Renewables Portfolio Standard by establishing a renewable energy target of 20% of the total electricity sold to retail customers in California per year by December 31, 2013, and 33% by December 31, 2020, and in subsequent years. Under the bill, a renewable electrical generation facility is one that uses biomass, solar thermal, photovoltaic, wind, geothermal, fuel cells using renewable fuels, small hydroelectric generation (30 megawatts or less), digester gas, municipal solid waste conversion, landfill gas, ocean wave, ocean thermal, or tidal current, and that meets other specified requirements with respect to its location.

SB X1-2 applies to all electricity retailers in the state including publicly owned utilities, investor-owned utilities, electricity service providers, and community choice aggregators. All of these entities must meet the renewable energy goals previously listed.

SB 350. SB 350 (October 2015, Clean Energy and Pollution Reduction Act) further expanded the RPS by establishing a goal of 50% of the total electricity sold to retail customers in California per year by December 31, 2030. In addition, SB 350 included the goal to double the energy efficiency savings in electricity and natural gas final end uses (e.g., heating, cooling, lighting, or class of energy uses on which an energy-efficiency program is focused) of retail customers through energy conservation and efficiency. The bill also requires the California Public Utilities Commission, in consultation with the CEC, to establish efficiency targets for electrical and gas corporations consistent with this goal. Regarding mobile sources, as one of its elements, SB 350 establishes a statewide policy for widespread electrification of the transportation sector, recognizing that such electrification is required for achievement of the state's 2030 and 2050 reduction targets (see California Public Utilities Code Section 740.12).

SB 100. SB 100 (2018) increased the standards set forth in SB 350 establishing that 44% of the total electricity sold to retail customers in California per year by December 31, 2024, 52% by December 31, 2027, and 60% by December 31, 2030, be secured from qualifying renewable energy sources. SB 100 states that it is the policy of the state that eligible renewable energy resources and zero-carbon resources supply 100% of the retail sales of electricity to California. This bill requires that the achievement of 100% zero-carbon electricity resources do not increase the carbon emissions elsewhere in the western grid and that the achievement not be achieved through resource shuffling.

Senate Bill 1020. SB 1020 (September 2022) revises the standards from SB 100, requiring the following percentage of retail sales of electricity to California end-use customers come from eligible renewable energy resources and zero-carbon resources:

- 90% by December 31, 2035
- 95% by December 31, 2040
- 100% by December 31, 2045

Mobile Sources

State Vehicle Standards (AB 1493 and EO B-16-12). AB 1493 (July 2002) was enacted in a response to the transportation sector accounting for more than half of California's CO_2 emissions. AB 1493 required CARB to set GHG emission standards for passenger vehicles, light-duty trucks, and other vehicles determined by the state board to be vehicles that are primarily used for noncommercial personal transportation in the state. The bill required that CARB set GHG emission standards for motor vehicles manufactured in 2009 and all subsequent model years. CARB adopted the standards in September 2004. EO B-16-12 (March 2012) required that state entities under the governor's direction and control support and facilitate the rapid commercialization of zero-emissions vehicles. It ordered CARB, CEC, California Public Utilities Commission, and other relevant agencies to work with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to help achieve benchmark goals by 2015, 2020, and 2025. On a statewide basis, EO B-16-12 established a target reduction of GHG emissions from the transportation sector equaling 80% less than 1990 levels by 2050. This directive did not apply to vehicles that have special performance requirements necessary for the protection of the public safety and welfare.

As explained under the "Federal Vehicle Standards" description above, EPA and NHTSA approved the SAFE Vehicles Rule Part One and Two, which revoked California's authority to set its own GHG emissions standards and set zero-emission vehicle mandates in California. As also explained above, in March 2022, EPA reinstated California's authority under the Clean Air Act to implement its own GHG emission standards and ZEV sales mandate. EPA's action concludes its reconsideration of the 2019 SAFE-1 rule by finding that the actions taken under the previous administration as a part of SAFE-1 were decided in error and are now entirely rescinded.

Heavy Duty Diesel. CARB adopted the final Heavy-Duty Truck and Bus Regulation, Title 13, Division 3, Chapter 1, Section 2025, on December 31, 2014, to reduce PM and NO_x emissions from heavy-duty diesel vehicles. The rule requires PM filters be applied to newer heavier trucks and buses by January 1, 2012, with older vehicles required to comply by January 1, 2015. The rule will require nearly all diesel trucks and buses to be compliant with the 2010 model year engine requirement by January 1, 2023. CARB also adopted an Airborne Toxic Control Measure to limit idling of diesel-fueled commercial vehicles on December 12, 2013. This rule requires diesel-fueled vehicles with gross vehicle weights greater than 10,000 pounds to idle no more than 5 minutes at any location (13 CCR 2485).

EO S-1-07. EO S-1-07 (January 2007, implementing regulation adopted in April 2009) sets a declining LCFS for GHG emissions measured in CO_2e grams per unit of fuel energy sold in California. The initial target of the LCFS was to reduce the carbon intensity of California passenger vehicle fuels by at least 10% by 2020 (17 CCR 95480 et seq.). In September 2018, CARB approved amendments for the LCFS that require a 20% reduction in carbon intensity by year 2030. The carbon intensity measures the amount of GHG emissions in the lifecycle of a fuel, including extraction/feedstock production, processing, transportation, and final consumption, per unit of energy delivered.

SB 375. SB 375 (Steinberg) (September 2008) addresses GHG emissions associated with the transportation sector through regional transportation and sustainability plans. SB 375 requires CARB to adopt regional GHG reduction targets for the automobile and light-truck sector for 2020 and 2035 and to update those targets every 8 years. SB 375 requires the state's 18 regional metropolitan planning organizations (MPOs) to prepare a SCS as part of their RTP that will achieve the GHG reduction targets set by CARB. If a MPO is unable to devise an SCS to achieve the GHG reduction target, the MPO must prepare an Alternative Planning Strategy demonstrating how the GHG reduction target would be achieved through alternative development patterns, infrastructure, or additional transportation measures or policies.

A SCS does not: (i) regulate the use of land; (ii) supersede the land use authority of cities and counties; or (iii) require that a city's or county's land use policies and regulations, including those in a general plan, be consistent with it (California Government Code Section 65080[b][2][K]). Nonetheless, SB 375 makes regional and local planning agencies responsible for developing those strategies as part of the federally required metropolitan transportation planning process and the state-mandated housing element process.

In 2010, CARB adopted the SB 375 targets for the regional metropolitan planning organizations. The targets adopted for SANDAG in 2010 are a 7% reduction in per-capita passenger-vehicle GHG emissions by 2020 and a 13% reduction by 2035, measured relative to 2005 GHG emissions. In 2018, CARB adopted the second round of SB 375 reduction targets, and increased SANDAG's 2020 target to a 15% reduction in per-capita passenger-vehicle GHG emissions, and the 2035 target to a 19% reduction using the same 2005 baseline.

SANDAG completed and adopted its 2050 RTP/SCS in October 2011. In November 2011, CARB, by resolution, accepted SANDAG's GHG emissions quantification analysis and determination that, if implemented, the SCS would achieve CARB's 2020 and 2035 GHG emissions reduction targets for the region.

After SANDAG's 2050 RTP/SCS was adopted, a lawsuit was filed by the Cleveland National Forest Foundation and others (*Cleveland National Forest Foundation v. San Diego Association of Governments* (2017) 3 Cal. 5th 497). regarding analysis of EO S-3-05's 2050 goal of an 80% reduction in GHG emissions from 1990 levels. The Supreme Court of California held that the Environmental Impact Report at issue was sufficient to inform the public, based on the information available at the time, about the regional plan's GHG impacts and its potential inconsistency with state climate change goals without including an explicit analysis of the consistency of projected 2050 GHG emissions with the goals in the executive order.

In 2015, SANDAG adopted the next iteration of its RTP/SCS in accordance with statutorily mandated timelines and no subsequent litigation challenge was filed. More specifically, in October 2015, SANDAG adopted San Diego Forward: The Regional Plan (Regional Plan) (SANDAG 2015). Like the 2050 RTP/SCS, San Diego Forward: Regional Plan meets CARB's 2020 and 2035 reduction targets for the region (SANDAG 2015). In December 2015, CARB, by resolution, accepted SANDAG's GHG emissions quantification analysis and determination that, if implemented, the SCS would achieve CARB's 2020 and 2035 GHG emissions reduction targets for the region. The Regional Plan was updated in 2021, which was the result of years of planning, data analysis, and community engagement to reimagine the San Diego region with a transformative transportation system, a sustainable pattern of growth and development, and innovative demand and management strategies (SANDAG 2021).

Advanced Clean Cars Program and Zero-Emissions Vehicle Program. The Advanced Clean Cars (ACC) I program (January 2012) is a new emissions-control program for model years 2015 through 2025. The program combines the control of smog- and soot-causing pollutants and GHG emissions into a single coordinated package of

regulations: the Low-Emission Vehicle (LEV) regulation for criteria air pollutant and GHG emissions and a technology forcing regulation for zero-emission vehicles (ZEV) that contributes to both types of emission reductions (CARB 2022b). The package includes elements to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars. To improve air quality, CARB has implemented new emission standards to reduce smog-forming emissions beginning with 2015 model year vehicles. It is estimated that in 2025 cars will emit 75 percent less smog-forming pollution than the average new car sold in 2015. The ZEV program will act as the focused technology of the ACC I program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid EVs in the 2018 to 2025 model years.

The ACC II program establishes the next set of LEV and ZEV requirements for model years after 2025 to contribute to meeting federal ambient air quality ozone standards and California's carbon neutrality standards (CARB 2022c). The ACC II rulemaking package, also considers technological feasibility, environmental impacts, equity, economic impacts, and consumer impacts. The ACC II regulations were approved by the California Office of Administrative Law (OAL) and became effective on November 30, 2022.

AB 1236. AB 1236 (October 2015) (Chiu) requires a city, county, or city and county to approve an application for the installation of electric vehicle charging stations, as defined, through the issuance of specified permits unless the city or county makes specified written findings based upon substantial evidence in the record that the proposed installation would have a specific, adverse impact upon the public health or safety, and there is no feasible method to satisfactorily mitigate or avoid the specific, adverse impact. The bill provided for appeal of that decision to the planning commission, as specified. The bill provided that the implementation of consistent statewide standards to achieve the timely and cost-effective installation of electric vehicle charging stations is a matter of statewide concern. The bill required electric vehicle charging stations to meet specified standards. The bill required a city, county, or city and county with a population of 200,000 or more residents to adopt an ordinance, by September 30, 2016, that created an expedited and streamlined permitting process for electric vehicle charging stations, as specified. The bill also required a city, county, or city and county with a population of less than 200,000 residents to adopt this ordinance by September 30, 2017.

EO N-79-20 (September 2020) requires CARB to develop regulations as follows: (1) Passenger vehicle and truck regulations requiring increasing volumes of new ZEVs sold in the State towards the target of 100% of in-State sales by 2035; (2) medium- and heavy-duty vehicle regulations requiring increasing volumes of new zero-emission trucks and buses sold and operated in the State towards the target of 100% of the fleet transitioning to zero-emission vehicles by 2045 everywhere feasible and for all drayage trucks to be zero emission by 2035; and (3) strategies, in coordination with other State agencies, the EPA and local air districts, to achieve 100% zero-emission from off-road vehicles and equipment operations in the State by 2035. EO N-79-20 called for the development of a Zero-Emissions Vehicle Market Development Strategy, which was released February 2021, to be updated every 3 years, that ensures coordination and implementation of the EO and outlines actions to support new and used ZEV markets. In addition, the EO specifies identification of near-term actions, and investment strategies, to improve clean transportation, sustainable freight, and transit options; and calls for development of strategies, recommendations, and actions by July 15, 2021, to manage and expedite the responsible closure and remediation of former oil extraction sites as the State transitions to a carbon-neutral economy.

Advanced Clean Trucks (ACT) Regulation. The purpose of the ACT Regulation (June 2020) is to accelerate the market for zero-emission vehicles in the medium- and heavy-duty truck sector and to reduce emissions NO_x, fine particulate matter, TACs, GHGs, and other criteria pollutants generated from on-road mobile sources (CARB 2022c). Requiring medium- and heavy-duty vehicles to transition to zero-emissions technology will reduce health risks to people living

in and visiting California and is needed to help California meet established near- and long-term air quality and climate mitigation targets.

Water

EO B-29-15. In response to the ongoing drought in California, EO B-29-15 (April 2015) set a goal of achieving a statewide reduction in potable urban water usage of 25% relative to water use in 2013. The term of the EO extended through February 28, 2016, although many of the directives have become permanent water-efficiency standards and requirements. The EO includes specific directives that set strict limits on water usage in the state. In response to EO B-29-15, the California Department of Water Resources has modified and adopted a revised version of the Model Water Efficient Landscape Ordinance that, among other changes, significantly increases the requirements for landscape water use efficiency and broadens its applicability to include new development projects with smaller landscape areas.

EO B-37-16. Issued May 2016, EO B-37-16 directed the State Water Resources Control Board (SWRCB) to adjust emergency water conservation regulations through the end of January 2017 to reflect differing water supply conditions across the state. The SWRCB also developed a proposal to achieve a mandatory reduction of potable urban water usage that builds off the mandatory 25% reduction called for in EO B-29-15. The SWRCB and Department of Water Resources will develop new, permanent water use targets that build upon the existing state law requirements that the state achieve 20% reduction in urban water usage by 2020. EO B-37-16 also specifies that the SWRCB permanently prohibit water-wasting practices such as hosing off sidewalks, driveways, and other hardscapes; washing automobiles with hoses not equipped with a shut-off nozzle; using non-recirculated water in a fountain or other decorative water feature; watering lawns in a manner that causes runoff, or within 48 hours after measurable precipitation; and irrigating ornamental turf on public street medians.

EO N-10-21. In response to a state of emergency due to severe drought conditions, EO N-10-21 (July 2021) called on all Californians to voluntarily reduce their water use by 15% from their 2020 levels. Actions suggested in EO N-10-21 include reducing landscape irrigation, running dishwashers and washing machines only when full, finding and fixing leaks, installing water-efficient showerheads, taking shorter showers, using a shut-off nozzle on hoses, and taking cars to commercial car washes that use recycled water.

Solid Waste

AB 939, AB 341, AB 1826, and SB 1383. In 1989, AB 939, known as the Integrated Waste Management Act (California Public Resources Code, Sections 40000 et seq.), was passed because of the increase in waste stream and the decrease in landfill capacity. The statute established the California Integrated Waste Management Board, which oversees a disposal reporting system. AB 939 mandated a reduction of waste being disposed where jurisdictions were required to meet diversion goals of all solid waste through source reduction, recycling, and composting activities of 25% by 1995 and 50% by the year 2000.

AB 341 (Chapter 476, Statutes of 2011 [Chesbro]) amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is the policy goal of the state that not less than 75% of solid waste generated be source-reduced, recycled, or composted by the year 2020, and annually thereafter. In addition, AB 341 required the California Department of Resources Recycling and Recovery (CalRecycle) to develop strategies to achieve the state's policy goal. CalRecycle conducted several general stakeholder workshops and several focused workshops and in August 2015 published a discussion document titled AB 341 Report to the Legislature, which

identifies five priority strategies that CalRecycle believes would assist the state in reaching the 75% goal by 2020, legislative and regulatory recommendations and an evaluation of program effectiveness (CalRecycle 2012).

AB 1826 (Chapter 727, Statutes of 2014, effective 2016) requires businesses to recycle their organic waste (i.e., food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste) depending on the amount of waste they generate per week. This law also requires local jurisdictions across the state to implement an organic waste recycling program to divert organic waste generated by businesses, including multifamily residential dwellings that consist of five or more units. The minimum threshold of organic waste generation by businesses decreases over time, which means an increasingly greater proportion of the commercial sector will be required to comply.

SB 1383 (Chapter 395, Statutes of 2016) establishes targets to achieve a 50% reduction in the level of the Statewide disposal of organic waste from the 2014 level by 2020 and a 75% reduction by 2025. CalRecycle was granted the regulatory authority required to achieve the organic waste disposal reduction targets and establishes an additional target that not less than 20% of currently disposed edible food is recovered for human consumption by 2025 (CalRecycle 2019).

Other State Actions

SB 97. SB 97 (Dutton) (August 2007) directed the Governor's Office of Planning and Research to develop guidelines under CEQA for the mitigation of GHG emissions. In 2008, the Governor's Office of Planning and Research issued a technical advisory as interim guidance regarding the analysis of GHG emissions in CEQA documents. The advisory indicated that the lead agency should identify and estimate a project's GHG emissions, including those associated with vehicular traffic, energy consumption, water usage, and construction activities (OPR 2008). The advisory further recommended that the lead agency determine significance of the impacts and impose all mitigation measures necessary to reduce GHG emissions to a level that is less than significant. The CNRA adopted the CEQA Guidelines amendments in December 2009, which became effective in March 2010.

Under the amended Guidelines, a lead agency has the discretion to determine whether to use a quantitative or qualitative analysis or apply performance standards to determine the significance of GHG emissions resulting from a particular project (14 CCR 15064.4(a)). The Guidelines require a lead agency to consider the extent to which the Project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4(b)). The Guidelines also allow a lead agency to consider feasible means of mitigating the significant effects of GHG emissions, including reductions in emissions through the implementation of project features or off-site measures. The adopted amendments do not establish a GHG emission threshold, instead allowing a lead agency to develop, adopt, and apply its own thresholds of significance or those developed by other agencies or experts. The CNRA also acknowledges that a lead agency may consider compliance with regulations or requirements implementing AB 32 in determining the significance of a project's GHG emissions (CNRA 2009a).

With respect to GHG emissions, the CEQA Guidelines state in Section 15064.4(a) that lead agencies should "make a good faith effort, to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions. The CEQA Guidelines note that an agency may identify emissions by either selecting a "model or methodology" to quantify the emissions or by relying on "qualitative analysis or other performance-based standards" (14 CCR 15064.4(a)). Section 15064.4(b) states that the lead agency should consider the following when assessing the significance of impacts from GHG emissions on the environment: (1) the extent a project may

increase or reduce GHG emissions as compared to the existing environmental setting; (2) whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and (3) the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4(b)).

EO S-13-08. EO S-13-08 (November 2008) is intended to hasten California's response to the impacts of global climate change, particularly sea-level rise. Therefore, the EO directs state agencies to take specified actions to assess and plan for such impacts. The final 2009 California Climate Adaptation Strategy report was issued in December 2009, and an update, Safeguarding California: Reducing Climate Risk, followed in July 2014. To assess the state's vulnerability, the report summarizes key climate change impacts to the state for the following areas: Agriculture, Biodiversity and Habitat, Emergency Management, Energy, Forestry, Ocean and Coastal Ecosystems and Resources, Public Health, Transportation, and Water. Issuance of the Safeguarding California: Implementation Action Plans followed in March 2016. In January 2018, the CNRA released the Safeguarding California Plan: 2018 Update, which communicates current and needed actions that state government should take to build climate change resiliency.

4.2.3 Local Regulations

4.2.3.1 San Diego County Air Pollution Control District

The SDAPCD does not have established GHG rules, regulations, or policies.

4.2.3.2 City of San Marcos

City of San Marcos Climate Action Plan

The City adopted its CAP on December 8, 2020 (City of San Marcos 2020). The CAP acts as a roadmap to address challenges of climate change within the City. The CAP builds on the efforts and strategies identified in the City's 2013 CAP and establishes GHG emission reduction targets and identifies achievable, locally based actions to reduce GHG emissions from municipal and community activities. The CAP includes a baseline GHG emissions inventory for 2012, GHG emissions forecasts for 2020 and 2030, local GHG emissions reduction strategies and measures to help the City achieve the 2030 target, climate adaptation measures for the City, and implementation and monitoring mechanisms to ensure the City's measures and targets are achieved. The CAP established GHG emissions reduction goals of 4% below 2012 levels by 2020 and 42% below 2012 levels by 2030 (City of San Marcos 2020). The CAP was prepared in accordance with the requirements within CEQA Guidelines Section 15183.5, and the CAP Consistency Checklist was used to evaluate the Project's significance with respect to GHG emissions.

City of San Marcos General Plan

The City's General Plan (City of San Marcos 2012) includes various policies related to reducing Air Quality and GHG emissions. Applicable policies include the following:

Land Use and Community Design Element

Policy LU-2.1: Promote compact development patterns that reduce air pollution and automobile dependence and facilitate walking, bicycling, and transit use.

Policy LU-2.3: Promote landscaping (e.g., native, drought tolerant plants) that minimizes demands on water supply.

Policy LU-2.7: Promote the instillation of trees to reduce the urban heat-island effect and green infrastructure to reduce storm water runoff.

Policy LU-3.1: Require that new development and redevelopment incorporate connections and reduce barriers between neighborhoods, transit corridors, and activity centers within the City.

Mobility Element

Policy M-2.1: Work with new development to design roadways that minimize traffic volumes and/or speed, as appropriate within residential neighborhoods; while maintaining the City's desire to provide connectivity on the roadway network.

Conservation and Open Space Element

Policy COS-4.5: Encourage energy conservation and the use of alternative energy sources within the community.

Policy COS-4.6: Promote efficient use of energy and conservation of available resources in the design, construction, maintenance and operation of public and private facilities, infrastructure and equipment.

Policy COS-4.8: Encourage and support the generation, transmission and use of renewable energy.

Policy COS-4.9: Encourage use and retrofitting of existing buildings under Title 24 of the California Building Energy Code.

4.3 Greenhouse Gas Inventories and Climate Change Conditions

4.3.1 Sources of Greenhouse Gas Emissions

Anthropogenic GHG emissions worldwide in 2020 (the most recent year for which data is available) totaled approximately 49,800 MMT CO_2e, excluding land use change and forestry (PBL 2022). The five largest emitting countries and the European Union (EU-27), together account for about 60% of total global GHG emissions: China (27%), the United States (12%), the European Union (about 7%), India (7%), the Russian Federation (4.5%) and Japan (2.4%). These countries also have the highest CO2 emission levels. (PBL 2022).

Per the EPA Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2020 (EPA 2022b, total United States GHG emissions were approximately 5,981 MMT CO2e in 2020 (EPA 2022b). The primary GHG emitted by human activities in the United States was CO_2, which represented approximately 76.4% of total GHG emissions (4,760 MMT CO_2e). The largest source of CO_2, and of overall GHG emissions, was fossil-fuel combustion, which accounted for approximately 92.8% of CO_2 emissions in 2018 (5,031.8 MMT CO_2e). Relative to 1990, gross

United States GHG emissions in 2020 are lower by 7.3%, down from a high of 15.2% above 1990 levels in 2007. GHG emissions decreased from 2019 to 2020 by 10.6% and overall, net emissions in 2020 were 21.4% below 2005 levels (EPA 2022c).

According to California's 2000–2020 GHG emissions inventory (2022 edition), California emitted 369.2 MMT CO_2e in 2020, including emissions resulting from out-of-state electrical generation (CARB 2022d). The sources of GHG emissions in California include transportation, industrial uses, electric power production from both in-state and out-of-state sources, commercial and residential uses, agriculture, high-GWP substances, and recycling and waste. The California GHG emission source categories and their relative contributions in 2022 are presented in Table 14.

Table 14. Greenhouse Gas Emissions Sources in California

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total
Transportation	136.60	37%
Industrial uses	73.84	20%
Electricity generation[a]	59.07	16%
Residential and commercial uses	36.92	10%
Agriculture and Forestry	33.22	9%
High GWP substances	22.15	6%
Recycling and waste	7.38	2%
Totals	**369.2**	**100%**

Source: CARB 2022b.
Notes: GHG = greenhouse gas; GWP = global warming potential; MMT CO_2e = million metric tons of carbon dioxide equivalent. Emissions reflect 2020 California GHG inventory.
Totals may not sum due to rounding.
[a] Includes emissions associated with imported electricity, which account for 18.46 MMT CO_2e.

Per capita GHG emissions in California have dropped from a 2001 peak of 13.8 MT per person to 9.3 MT per person in 2020, a 33% decrease. In 2016, statewide GHG emissions dropped below the 2020 GHG Limit of 431 MMT CO_2e and have remained below the Limit since that time (CARB 2022a).

The City has established a goal to reduce its community-wide GHG to reduce GHG emissions 40% below 1990 levels by 2030 (City of San Marcos 2020). The City's community-wide GHG emissions inventory for baseline year 2012 is presented in Table 15 for informational purposes.

Table 15. City of San Marcos (Year 2012) Community-wide Greenhouse Gas Emissions Inventory

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total
On-Road Transportation	322,000	54%
Electricity	162,000	27%
Natural Gas	75,000	12%
Solid Waste	15,000	3%
Off-Road Transportation	14,000	2%
Water	9,000	1%

Table 15. City of San Marcos (Year 2012) Community-wide Greenhouse Gas Emissions Inventory

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total
Wastewater	3,000	<1%
Total	**599,000**	**100%**

Source: City of San Marcos 2020.
Note: GHG = greenhouse gas; MT CO_2e = metric tons of carbon dioxide equivalent per year
Totals may not sum due to rounding.

4.3.2 Potential Effects of Climate Change

In California, climate change impacts have the potential to affect sea-level rise, agriculture, snowpack and water supply, forestry, wildfire risk, public health, and electricity demand and supply. The primary effect of global climate change has been a rise in average global tropospheric temperature. Reflecting the long-term warming trend since pre-industrial times, observed mean surface temperature for the decade 2006–2015 was 0.87°C (likely between 0.75°C and 0.99°C) higher than the average over the 1850–1900 period (IPCC 2018). Scientific modeling predicts that continued emissions of GHGs at or above current rates would induce more extreme climate changes during the twenty-first century than were observed during the twentieth century. Human activities are estimated to have caused approximately 1.0°C (1.8°F) of global warming above pre-industrial levels, with a likely range of 0.8°C to 1.2°C (1.4°F to 2.2°F) (IPCC 2018). Global warming is likely to reach 1.5°C (2.7°F) between 2030 and 2052 if it continues to increase at the current rate (IPCC 2018).

Although climate change is driven by global atmospheric conditions, climate change impacts are felt locally. A scientific consensus confirms that climate change is already affecting California. The Office of Environmental Health Hazard Assessment identified various indicators of climate change in California, which are scientifically based measurements that track trends in various aspects of climate change. Many indicators reveal discernible evidence that climate change is occurring in California and is having significant, measurable impacts in the state. Changes in the state's climate have been observed, including an increase in annual average air temperature with record warmth from 2012 to 2016, more frequent extreme heat events, more extreme drought, a decline in winter chill, an increase in cooling degree days and a decrease in heating degree days, and an increase in variability of statewide precipitation (OEHHA 2018).

Warming temperatures and changing precipitation patterns have altered California's physical systems—the ocean, lakes, rivers and snowpack—upon which the state depends. Winter snowpack and spring snowmelt runoff from the Sierra Nevada and southern Cascade Mountains provide approximately one-third of the state's annual water supply. Impacts of climate on physical systems have been observed, such as high variability of snow-water content (i.e., amount of water stored in snowpack), decrease in snowmelt runoff, glacier change (loss in area), rise in sea levels, increase in average lake water temperature and coastal ocean temperature, and a decrease in dissolved oxygen in coastal waters (OEHHA 2018).

Impacts of climate change on biological systems, including humans, wildlife, and vegetation, have also been observed, including climate change impacts on terrestrial, marine, and freshwater ecosystems. As with global observations, species responses include those consistent with warming: elevational or latitudinal shifts in range, changes in the timing of key plant and animal life cycle events, and changes in the abundance of species and in

community composition. Humans are better able to adapt to a changing climate than plants and animals in natural ecosystems. Nevertheless, climate change poses a threat to public health, as warming temperatures and changes in precipitation can affect vector-borne pathogen transmission and disease patterns in California as well as the variability of heat-related deaths and illnesses. In addition, since 1950, the area burned by wildfires each year has been increasing.

The CNRA has released four California Climate Change Assessments (2006, 2009, 2012, and 2018), which have addressed the following: acceleration of warming across the state, more intense and frequent heat waves, greater riverine flows, accelerating sea level rise, more intense and frequent drought, more severe and frequent wildfires, more severe storms and extreme weather events, shrinking snowpack and less overall precipitation, and ocean acidification, hypoxia, and warming. To address local and regional governments need for information to support action in their communities, the Fourth Assessment includes reports for nine regions of the state, including the San Diego Region, where the Project is located. Key projected climate changes for the San Diego Region include the following (CNRA 2019):

- Temperature is projected to increase substantially, along with mean temperature, heat wave frequency will increase, with more intensity and longer duration.
- Precipitation will remain highly variable but will change in character, with wetter winters, drier springs, and more frequent and severe droughts punctuated by more intense individual precipitation events.
- Wildfire risk will increase in the future as climate warms. The risk for large catastrophic wildfires driven by Santa Ana wind events will also likely increase as a result of a drier autumns leading to low antecedent precipitation before the height of the Santa Ana wind season.
- The sea level along San Diego County is expected to rise. High tides combined with elevated shoreline water levels produced by locally and distantly driven wind-driven waves will drive extreme events. Longer-term sea level will increase rapidly in the second half of the century and will be punctuated by short periods of storm-driven extreme sea levels that will imperil existing infrastructure, structures, and ecosystems with increasing frequency.

Agriculture. Some of the specific challenges faced by the agricultural sector and farmers include more drastic and unpredictable precipitation and weather patterns; extreme weather events that range from severe flooding to extreme drought, to destructive storm events; significant shifts in water availably and water quality; changes in pollinator lifecycles; temperature fluctuations, including extreme heat stress and decreased chill hours; increased risks from invasive species and weeds, agricultural pests and plant diseases; and disruptions to the transportation and energy infrastructure supporting agricultural production.

Biodiversity and Habitat. Specific climate change challenges to biodiversity and habitat include species migration in response to climatic changes, range shift and novel combinations of species; pathogens, parasites and disease; invasive species; extinction risks; changes in the timing of seasonal life-cycle events; food web disruptions; threshold effects (i.e., a change in the ecosystem that results in a “tipping point” beyond which irreversible damage or loss has occurred).

Energy. Specific climate change challenges for the energy sector include temperature, fluctuating precipitation patterns, increasing extreme weather events, and sea-level rise.

Forestry. The most significant climate change related risk to forests is accelerated risk of wildfire and more frequent and severe droughts. Droughts have resulted in more large-scale mortalities and combined with increasing temperatures have led to an overall increase in wildfire risks. Increased wildfire intensity subsequently increases

public safety risks, property damage, fire suppression and emergency response costs, watershed and water quality impacts, and vegetation conversions.

Ocean and Coastal Ecosystems and Resources. Sea-level rise, changing ocean conditions, and other climate change stressors are likely to exacerbate long-standing challenges related to ocean and coastal ecosystems in addition to threatening people and infrastructure located along the California coastline and in coastal communities. Sea-level rise, in addition to more frequent and severe coastal storms and erosion, are threatening vital infrastructure such as roads, bridges, power plants, ports and airports, gasoline pipes, and emergency facilities, as well as negatively impacting the coastal recreational assets such as beaches and tidal wetlands.

Public Health. Climate change can impact public health through various environmental changes and is the largest threat to human health in the twenty-first century. Changes in precipitation patterns affect public health primarily through potential for altered water supplies, and extreme events such as heat, floods, droughts, and wildfires. Increased frequency, intensity, and duration of extreme heat and heat waves are likely to increase the risk of mortality due to heat-related illness, as well as exacerbate existing chronic health conditions. Other extreme weather events are likely to negatively impact air quality and increase or intensify respiratory illness, such as asthma and allergies.

Transportation. Although the transportation industry is a source of GHG emissions, it is also vulnerable to climate change risks. Increasing temperatures and extended periods of extreme heat threaten the integrity of the roadways and rail lines. High temperatures cause the road surfaces to expand, which leads to increased pressure and pavement buckling. High temperatures can also cause rail breakages, which could lead to train derailment. Other forms of extreme weather events, such as extreme storm events, can negatively impact infrastructure, which can impair movement of peoples and goods, or potentially block evacuation routes and emergency access roads. Increased wildfires, flooding, erosion risks, landslides, mudslides, and rockslides can all profoundly impact the transportation system and pose a serious risk to public safety.

Water. Climate change could seriously impact the timing, form, amount of precipitation, runoff patterns, and frequency and severity of precipitation events. Higher temperatures reduce the amount of snowpack and lead to earlier snowmelt, which can impact water supply availability, natural ecosystems, and winter recreation. Water supply availability during the intense dry summer months is heavily dependent on the snowpack accumulated during the winter time. Increased risk of flooding has a variety of public health concerns, including water quality, public safety, property damage, displacement, and post-disaster mental health problems. Prolonged and intensified droughts can also negatively groundwater reserves and result in increased overdraft and subsidence. The higher risk of wildfires can lead to increased erosion, which can negatively impact watersheds and result in poor water quality.

4.4 Significance Criteria and Methodology

4.4.1 Thresholds of Significance

The significance criteria used to evaluate the Project's GHG emissions impacts is based on the recommendations provided in Appendix G of the CEQA Guidelines. For the purposes of this GHG emissions analysis, the Project would have a significant environmental impact if it would (14 CCR 15000 et seq.):

1. Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?
2. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs?

Global climate change is a cumulative impact; a project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHGs. There are currently no established thresholds for assessing whether the GHG emissions of a project, such as the Project, would be considered a cumulatively considerable contribution to global climate change; however, all reasonable efforts should be made to minimize a project's contribution to global climate change. In addition, while GHG impacts are recognized exclusively as cumulative impacts (CAPCOA 2008), GHG emissions impacts must also be evaluated on a project-level under CEQA.

With respect to GHG emissions, the CEQA Guidelines Section 15064.4(a) states that lead agencies "shall make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions resulting from a project. The CEQA Guidelines note that an agency has the discretion to either quantify a project's GHG emissions or rely on a "qualitative analysis or performance-based standards" (14 CCR 15064.4[a]). A lead agency may use a "model or methodology" to estimate greenhouse gas emissions and has the discretion to select the model or methodology it considers "most appropriate to enable decision makers to intelligently take into account the project's incremental contribution to climate change" (14 CCR 15064.4[c]). The CEQA Guidelines provide that the lead agency should consider the following when determining the significance of impacts from GHG emissions on the environment (14 CCR 15064.4[b]):

- The extent a project may increase or reduce GHG emissions as compared to the existing environmental setting.
- Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
- The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

In addition, the CEQA Guidelines specify that "[w]hen adopting or using thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence" (14 CCR 15064.7[c]).

The extent to which a project increases or decreases GHG emissions in the existing environmental setting should be estimated in accordance with Section 15064.4, Determining the Significance of Impacts from Greenhouse Gas Emissions, of the State CEQA Guidelines. The State CEQA Guidelines indicate that when calculating GHG emissions resulting from a project, lead agencies shall make a good-faith effort based on scientific and factual data (Section 15064.4 (a)), and lead agencies have discretion to select the model or methodology deemed most appropriate for enabling decision makers to intelligently assess the project's incremental contribution to climate change (Section 15064.4 (c)).

The State CEQA Guidelines do not indicate an amount of GHG emissions that constitutes a significant impact on the environment. Instead, they authorize the lead agency to consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence (State CEQA Guidelines Sections 15064.4(a) and 15064.7(c)).

The Governor's Office of Planning and Research technical advisory titled, CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act (CEQA) Review, states that "public agencies are

encouraged but not required to adopt thresholds of significance for environmental impacts. Even in the absence of clearly defined thresholds for GHG emissions, the law requires that such emissions from CEQA projects must be disclosed and mitigated to the extent feasible whenever the lead agency determines that the project contributes to a significant, cumulative climate change impact" (OPR 2018). Furthermore, the advisory document indicates that "in the absence of regulatory standards for GHG emissions or other scientific data to clearly define what constitutes a 'significant impact,' individual lead agencies may undertake a project-by-project analysis, consistent with available guidance and current CEQA practice" (OPR 2008).

The City adopted the Final CAP on December 8, 2020. The City's CAP meets the requirements under Section 15183.5 of the CEQA Guidelines as a qualified plan for the reduction of GHG emissions for use in cumulative impact analysis pertaining to development projects. The CAP relies on a screening threshold and a CAP Consistency Checklist to determine whether a project's emissions would be consistent with GHG emissions estimated within the City's CAP. Projects that are consistent with the City's CAP, as determined through the CAP Consistency Checklist, would result in a less-than-significant cumulative impact regarding GHG emissions. If a project is not consistent with the City's CAP, as determined through the CAP Consistency Checklist, potentially significant cumulative GHG impacts would occur.

In accordance with CEQA Guidelines 15183.5, the Project's consistency with the CAP is the sole basis for determining the significance of the Project's GHG-related impacts on the environment. Nevertheless, in accordance with CEQA Guidelines Section 15064.4, GHG emissions resulting from construction and operation of the Project were quantitatively estimated.

4.4.2 Approach and Methodology

4.4.2.1 Construction

CalEEMod Version 2022 was used to estimate potential Project-generated GHG emissions during construction. Construction of the Project would result in GHG emissions primarily associated with use of off-road construction equipment, on-road hauling, and vendor (material delivery) trucks, and worker vehicles. All details for construction criteria air pollutants discussed in Section 3.4.2.1, are also applicable for the estimation of construction-related GHG emissions. As such, see Section 3.4.2.1 for a discussion of construction emissions calculation methodology and assumptions.

4.4.2.2 Operation

As with Air Quality, emissions from the operational phase of the Project were estimated using CalEEMod Version 2022. Operational year 2026 was assumed as the first full year after completion of Project construction.

Area Sources

CalEEMod was used to estimate GHG emissions from the Project's area sources, which include operation of gasoline-powered landscape maintenance equipment, which produce minimal GHG emissions. See Section 3.4.2.2, for a discussion of landscaping equipment emissions calculations.

Energy Sources

Title 24 of the California Code of Regulations serves to enhance and regulate California's building standards. The current Title 24, Part 6 standards, referred to as the 2019 Title 24 Building Energy Efficiency Standards, became effective on January 1, 2020. CalEEMod assumes compliance with the 2019 Title 24 code. The estimation of operational energy emissions for the Project were based on CalEEMod land use defaults and total area (i.e., square footage) of the Project's land use.

Furthermore, in compliance with the City's CAP, the Project would incorporate approximately 16,422 square feet of solar photovoltaic (PV) panels with an estimated 5,200-kilowatt hours (kwh) per unit. The total production is estimated at 530,400 kwh annually.

CalEEMod default energy intensity factors (CO_2, CH_4, and N_2O mass emissions per kilowatt-hour) for San Diego Gas and Electric (SDG&E) is based on the value for SDG&E's energy mix in 2021. These default intensity values were used for the Project analysis.

Mobile Sources

All details for criteria air pollutants discussed in Section 3.4.2.2 are also applicable for the estimation of operational mobile source GHG emissions.

Regulatory measures related to mobile sources include AB 1493 (Pavley) and related federal standards. AB 1493 required that CARB establish GHG emission standards for automobiles, light-duty trucks, and other vehicles determined by CARB to be vehicles that are primarily used for noncommercial personal transportation in the state. In addition, the NHTSA and EPA have established corporate fuel economy standards and GHG emission standards, respectively, for automobiles and light-, medium-, and heavy-duty vehicles. Implementation of these standards and fleet turnover (replacement of older vehicles with newer ones) will gradually reduce emissions from the Project's motor vehicles. The effectiveness of fuel economy improvements was evaluated for motor vehicles in 2026 to the extent it was captured in CalEEMod.

Solid Waste

The Project would generate solid waste, and therefore, result in CO_2e emissions associated with landfill off-gassing. CalEEMod default values for solid waste generation were used to estimate GHG emissions associated with solid waste for the Project. However, consistent with AB 939, a 50% waste diversion was assumed.

Water and Wastewater

Supply, conveyance, treatment, and distribution of water for the Project require the use of electricity, which would result in associated indirect GHG emissions. Similarly, wastewater generated by the Project requires the use of electricity for conveyance and treatment, and GHG emissions will be generated during wastewater treatment. Water consumption estimates for both indoor and outdoor water use and associated electricity consumption from water use and wastewater generation were estimated using CalEEMod default values. The electricity use for water supply, treatment, distribution, and wastewater treatment are based on the electricity intensity factors from CalEEMod for the County and the indoor and outdoor water use default values in CalEEMod. Regarding indoor water use, the Project would install low-flow water fixtures pursuant to CALGreen standards, which would reduce the Project's water consumption.

4.5 Impact Analysis

This section evaluates the GHG emissions impacts associated with the Project. The significance criteria described in Section 4.4.1, Thresholds of Significance, were used to evaluate impacts associated with the construction and operation of the Project.

4.5.1 GHG Emissions and GHG Emission Reduction Plans

Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment? (GHG-1)

Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases? (GHG-2)

Construction Emissions

Construction of the Project would result in GHG emissions, which are primarily associated with the use of off-road construction equipment, haul trucks, on-road vendor trucks, and worker vehicles.

Construction of the Project is anticipated to commence in February 2024 and would last approximately 15 months, ending in May 2025. On-site sources of GHG emissions include off-road equipment and off-site sources including vendor trucks and worker vehicles. Table 16 presents construction emissions for the Project in 2024 through 2025 from on-site and off-site emission sources.

Table 16. Estimated Annual Construction Greenhouse Gas Emissions - Unmitigated

Year	CO_2	CH_4	N_2O	R	CO_2e
	Metric Tons per Year				
2024	477	0.02	0.02	0.23	483
2025	99	<0.01	<0.01	0.05	100
Total	576	0.02	0.02	0.28	583
Amortized Construction Emissions Over 30 years					*19*

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; R=refrigerants, CO_2e = carbon dioxide equivalent.
The values shown are the annual emissions reflect CalEEMod "mitigated" output.
Totals may not add due to rounding.
See Appendix A for complete results.

As shown in Table 16, the estimated total GHG emissions during construction of would be approximately 583 MT CO_2e over the construction period. Estimated Project-generated construction emissions amortized over 30 years would be approximately 19 MT CO_2e per year. As with Project-generated construction criteria air pollutant emissions, GHG emissions generated during construction of the Project would be short-term in nature, lasting only for the duration of the construction period, and would not represent a long-term source of GHG emissions.

Operational Emissions

Operation of the Project would generate GHG emissions through vehicle trips by residents, employees, customers, and visitors to and from the Project site; landscape maintenance equipment operation; energy use (natural gas and generation of electricity consumed by the Project); solid waste disposal; and generation of electricity associated with water supply, treatment, and distribution and wastewater treatment.

The estimated operational Project-generated GHG emissions are shown in Table 17.

Table 17. Estimated Annual Operational Greenhouse Gas Emissions – Unmitigated

Emission Source	CO_2	CH_4	N_2O	R	CO_2e
	metric tons per year				
Mobile	1,339	0.09	0.07	1.97	1,364
Area	82	<0.01	<0.01	0	82
Energy	157	0.02	<0.01	0	159
Water	4	0.29	0.01	0	14
Waste	6	0.62	0.00	0	22
Refrigerants	0	0	0	0.24	0
Total	**1,588**	**1.03**	**0.08**	**2.21**	**1,641**
				Amortized 30-Year Construction Emissions	*19*
				Project Operations + Amortized Construction Total	**1,660**

Notes: The table shows the "mitigated" amounts from the CalEEMod output because the Project includes solar PV for the 102 townhomes and compliance with building code measures which CalEEMod shows as "mitigation".
CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; R=refrigerants; CO_2e = carbon dioxide equivalent
See Appendix A for complete results.

As shown in Table 16, estimated annual Project-generated GHG emissions would be approximately 1,660 MT CO_2e per year as a result of Project operation; with amortized construction emissions of approximately 19 MT CO_2e per year, total Project emissions would be approximately 1,660 MT CO_2e per year.

City of San Marcos' Climate Action Plan Consistency

This section evaluates the Project's impacts to GHG in accordance with the City's 2020 CAP Consistency Checklist. New discretionary development projects subject to CEQA review that are below the applicable screening size listed in the CAP Checklist would emit less than 500 MT CO_2e annually and would not contribute considerably to cumulative climate change impacts, and therefore, would be considered consistent with the CAP and associated emissions projections.

For projects that are subject to CAP consistency review, the next step in determining consistency is to assess the project's consistency with the growth projections used in development of the CAP. This section allows the City to determine a project's consistency with the land use assumptions used in the CAP.

Step 1

Question 1

Step 1 of the CAP Checklist determines land use consistency. Question 1 of Step 1 asks if a project is less than a certain size. If so, it is deemed consistent with the City's CAP by emitting fewer than 500 MT CO_2e per year and would be less than significant. As shown in Table 17, the Project exceeds 500 MT CO_2e, as such it exceeds the screening threshold, therefore the Project would answer "Yes" to this question and must proceed to Question 2 of Step 1.

Question 2

Question 2 of Step 1 asks if the project is consistent with the existing General Plan land use designation. The Project site is designated as Commercial (C) in the City's General Plan and is zoned Commercial (C). The Project is proposing a General Plan Amendment to redesignate the site as Specific Plan Area (SPA) and develop a mix of uses consisting of residential, commercial and office uses. The Project would answer "No" to this question and must proceed to Question 3 of Step 1.

Question 3

Question 3 of Step 1 asks for projects including a General Plan Amendment to determine if the project would generate GHG emissions equal to or less than estimated emissions generated under the existing designation. This question recognizes that a General Plan Amendment would not necessarily make the Project inconsistent with the growth projections included in the CAP. For example, if a project includes a General Plan land use amendment that would result in an equivalent or less GHG-intensive project when compared to the existing designations, it would still be within the projections assumed in the CAP. In addition to providing evidence to support the conclusion that the project would generate fewer emissions than existing designations, these projects would demonstrate consistency with the CAP through completion of Step 2 of the Checklist.

As discussed in Section 3.5.1.1, and shown in Table 9, the existing land use designation and zoning would result in greater vehicle trips and VMT compared to the proposed Project. Table 18 provides a comparison of GHG emissions between the existing land use designation and the proposed Project.

Table 18. Comparison of Estimated Annual Operational Greenhouse Gas Emissions – Unmitigated

Development	CO_2	CH_4	N_2O	R	CO_2e
	metric tons per year				
Proposed Project	1,605.00	1.66	0.08	2.21	1,671.00
Existing General Plan – Mixed Use Development Retail (129,000 sf) and Office (40,000 sf), and 1 acre of parking	2,752.00	0.20	0.14	4.03	2,804.00

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; R=refrigerants; CO_2e = carbon dioxide equivalent
See Appendix A for complete results.

As shown in Table 18, the proposed Project would generate fewer GHG emissions than the existing land use designation; the Project would answer "Yes" to this question and then proceed to Step 2 of the Checklist.

Step 2

The second step of CAP consistency review is to evaluate a project's consistency with the applicable strategies and measures of the CAP. Each checklist item is associated with a specific GHG reduction measure in the City's CAP. "N/A" should only be checked based on the direction provided in each checklist item question. All projects for which the measure is applicable must demonstrate that the project would implement measures consistent with the checklist item, or fully substantiate how the item would be infeasible for project implementation. "N/A" responses are subject to Planning Division review and approval. If "No" is provided as a response to a question, the project would be determined to be inconsistent with the CAP and would result in a significant GHG impact.

Checklist Item 1. Electric Vehicle Charging Stations (Measure T-2)

This checklist item applies to multi-family residential and non-residential projects. It asks if the project will install electric vehicle charging stations (Level 2 or better) in at least 5% of the total parking spaces provided on site.

The Project would answer "Yes" to this question. The CAP requires 12 Level 2 chargers on the west side of the Project (5% of 238 parking spaces) and 14 Level 2 Chargers on the east side of the Project (5% of 278 parking spaces.). The applicant would work with the City to ensure the appropriate percentage of Level 2 charges are incorporated into the site plan review and CAP consistency process.

Checklist Item 2. Bicycle Infrastructure (Measure T-8)

This checklist item applies to residential and non-residential projects. It asks if the following conditions are met, would the project pay its fair-share contribution to bicycle infrastructure improvements of the following:

- Intersection or roadway segment improvements are proposed as part of the project.
- The City's General Plan Mobility Element identifies bicycle infrastructure improvements at any intersection(s) or roadway segment(s) that would be improved as part of the project.

The Project would answer "Yes" to this checklist question. There are no Class II bicycle facilities along project frontage. However, per the City of San Marcos General Plan, there are planned Class II bicycle facilities along the segments of Grand Avenue and Linda Vista Drive fronting the Project. Based on the preliminary review of the Project site plan, the Project would construct a Class I bike path at its project frontage along the segments of Linda Vista Drive and Grand Avenue.

Checklist Item 3. Transportation Demand Management (Measure T-9)

This checklist item applies to residential and non-residential projects. Will the project develop and implement a Transportation Demand Management (TDM) Plan that includes, at a minimum, all of the TDM strategies listed below?

- Provide discounted monthly transit pass or provide at least 25 percent transit fare subsidy to residents/employees.
- Provide designated car-share, carpool, vanpool, and/or park-and-ride parking spaces.

- Provide pedestrian connections between all internal uses and to all existing or planned external streets around the project site(s).
- Provide secure bicycle parking spaces or bicycle racks, showers, and clothes lockers.
- Encourage telecommuting for employees (allow one telecommute day per week or compressed work weeks) or provide a telecommute work center with common office space and equipment available to residents.

-or

- Would the project implement and monitor for four (4) years a TDM program that demonstrates an alternative transportation (i.e. carpool, public transit, bicycle, walk, telecommute) mode share of at least 29 percent for all residents?

The Project would answer "Yes" to this checklist question.. The Transportation Impact Study prepared for the Project evaluated each land uses' VMT impacts independently as mixed-use project. Per Section 2.1.2.5 of the City's Transportation Impact Analysis Guidelines (TIAG), the Project is located in an efficient VMT per capita area, therefore, the residential component is deemed to have less than significant VMT impacts, however, the CAP measure for TDM would still apply. The retail component of the Project would develop less than 50,000 square feet, and as such, would be considered "local-serving retail", therefore, it would have less than significant VMT impacts, however CAP TDM measures would still be required. The office component of the Project was the only land use that was determined to result in a potentially significant VMT impact. Mitigation would be implemented to reduce the VMT impact to less than significant and would include voluntary TDM measures such as providing transit information to tenants, offering transit passes or fares, providing rideshare and micro mobility parking on-site as well as bicycle racks. Additionally, tenants within the office area would be encouraged to implement telecommuting, flexible work schedules, and/or compressed work weeks.

Checklist Item 4. Reduce Parking Near Transit (Measure T-12)

This checklist item applies to multi-family residential projects. If located within one-half mile of a major transit stop, would the project provide at least 27% fewer parking spaces than required for the same use based on the City's municipal code parking requirements?

The Project would answer "N/A" this checklist item. The City's CAP defines a major transit stop as a bus or light-rail station with fixed service and 10-minute minimum headways during peak hours. The Project site is within one half mile of the transit lines serviced by North County Transit District (NCTD) described below:

- Bus Route 347 – This bus route is serviced along West Mission Road and North Las Posas Road within the project study area. This bus route connects the Palomar College Transit Center to the CSU San Marcos SPRINTER Station. Operations start at 5:31 AM and end at 7:21 PM between Monday and Friday with 30-minute intervals. On Saturdays, operations start at 7:22 AM and ends at 7:08 PM with 60-minute intervals. This route does not operate on Sundays.
- Bus Route 445 – This bus route is serviced along West Mission Road and North Las Posas Road within the project study area. This bus route connects the Palomar College Transit Center to the Carlsbad Poinsettia Station (COASTER Connection). Between Monday and Friday, operations start at 6:34 AM and end at 10:19 AM with 30-minute intervals for the morning period. Similarly, between Monday and Friday, operates start

at 3:36 PM and ends at 7:19 PM with 30-minutes intervals for the afternoon period. This route does not operate on Saturdays or Sundays.

- SPRINTER – This light rail line runs between Oceanside Transit Center and Escondido Transit Center (eastbound and westbound direction). The nearest stop to the Project site is the Palomar College Transit Center. Operations start at 4:17 AM and end at 9:10 PM between Monday and Sunday with 30-minute intervals.

As shown above, although the Project is located near transit, however, none of the stops would qualify as a major transit stop, therefore, this measure would not be applicable.

Checklist Item 5. Water Heaters (Measure E-1)

This checklist item applies to residential projects and asks if the project would install one of, or a combination of, the following water heater types in place of natural gas water heaters:

- Electric heat pump water heater
- Instantaneous electric water heater
- Electric tank
- Solar water heater with heat pump water heater backup
- Solar water heater with electric tank backup

The Project would answer "Yes" to this checklist item. The Project would develop 102 townhomes and 7 live/work dwelling units; as such, this measure would be applicable. The applicant would work with the City to identify the exact technology that would be implemented during the site plan and CAP review process.

Checklist Item 6. Photovoltaic Installation (Measure E-2)

This checklist item applies to non-residential projects and asks if the project would install photovoltaic systems with a minimum capacity of two watts per square foot of gross floor area?

The Project would answer "Yes" to this checklist item. The Project is proposing to develop a Specific Plan Area, as such some of the final commercial building layouts and design may still be refined. In all circumstances, the applicant will work in concert with the City to install a photovoltaic system to meet the City's CAP requirement.

Checklist Item 7. Landscaping Water Use (Measure W-1)

This checklist item applies to residential and non-residential projects and asks if the project would comply with the City's Water Efficient Landscape Ordinance.

The Project would answer "Yes" to this checklist item. The Project design will comply with the City's Water Efficient Landscape Ordinance.

Checklist Item 8. Urban Tree Canopy (Measure C-2)

This checklist item applies to residential and non-residential projects and asks if the project is providing more than 10 parking spaces, will the project plant at least one tree per five parking spaces provided?

The Project would answer "Yes" to this checklist item. The Project would design its landscaping to meet the requirement of at least one tree per five parking spaced provided.

Summary

The Project was shown to implement all applicable checklist items within the City's CAP. Therefore, the Project would be consistent with the City's CAP, and impacts to GHG emissions would be **less than significant**.

Consistency with Senate Bill 32, Assembly Bill 1279, and Executive Order S-3-05

EO S-3-05 identified the following goals: GHG emissions should be reduced to 2000 levels by 2010, to 1990 levels by 2020, and to 80% below 1990 levels by 2050. SB 32 establishes a statewide GHG emissions reduction target whereby CARB, in adopting rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emissions reductions, shall ensure that statewide GHG emissions are reduced to at least 40% below 1990 levels by December 31, 2030. AB 1279 establishes a policy of the state to achieve net zero GHG emissions no later than 2045 and for statewide anthropogenic GHG emissions to be reduced to at least 85% below 1990 levels by 2045.

Each Scoping Plan builds upon the successful framework established by the initial Scoping Plan and subsequent updates, while also identifying new, technologically feasible, and cost-effective strategies to ensure that California meets increasingly stringent GHG reduction targets in a way that promotes and rewards innovation, continues to foster economic growth, and delivers improvements to the environment and public health, including in disadvantaged communities. The Scoping Plan updates have continued to express optimism in meeting future year targets of 2050 and 2030, as evaluated in the 2014 and 2017 Scoping Plans (respectively), and most recently, the 2045 goal addressed in the 2022 Scoping Plan under EO B-55-18, which AB 1279 codified and expanded on.

While there are no established protocols or thresholds of significance for that future year analysis, CARB forecasted in the 2014 Scoping Plan that compliance with the current Scoping Plan would put the state on a trajectory of meeting the long-term 2050 GHG goals, although the specific path to compliance was unknown at the time (CARB 2014). The 2017 Scoping Plan outlined a strategy to achieve the 2030 GHG reduction target. The proposed scenario in the 2022 Scoping Plan lays out a path not just to carbon neutrality by 2045, but also to the 2030 GHG emissions reduction target (CARB 2022d). The modeling indicates that, if the plan described in the proposed scenario is fully implemented, and done so on schedule, the state is on track to reduce its emissions to 260 MMT CO_2e by 2030 (CARB 2022d).

The City's CAP outlines the measures for the City to achieve its share of state GHG reductions. The City's GHG reduction targets are consistent with the CARB's recommendations for community-wide targets. As discussed in the CAP, by meeting the 2030 target, the City will meet the 2030 state goal identified in SB 32 and maintain a trajectory to meet its proportional share of the 2050 target identified in EO S-3-05. Regarding, AB 1279, it is important to note that the state's carbon neutrality goal does not preclude any individual project from emitting GHG emissions. AB 1279 codifies EO B-55-18, however, its enactment was linked to the concurrent enactment of SB 905, which requires CARB to create a Carbon Capture, Removal, Utilization, and Storage Program that, fundamentally, will sequester carbon emitted by other projects. Therefore, the state's carbon neutrality goal does not preclude all individual projects from emitting GHG emissions.

As discussed above, the Project would be consistent with the CAP and, therefore, would be consistent with state GHG reduction goals and progress towards achieving carbon neutrality.

Consistency with SANDAG RTP/SCS

At the regional level, the SANDAG's RTP/SCS has been adopted for the purpose of reducing GHG emissions attributable to passenger vehicles in the San Diego region. In October 2015, SANDAG adopted its Regional Plan, which was subsequently updated in 2021. The RTP/SCS is not directly applicable to the Project because the underlying purpose of the RTP/SCS is to provide direction and guidance on future regional growth (i.e., the location of new residential and nonresidential land uses) and transportation patterns throughout the City and greater San Diego County, as stipulated under Senate Bill 375. CARB has recognized that the approved RTP/SCS is consistent with Senate Bill 375. The SANDAG Regional Plan is generally consistent with the local government plans. Since the Project is within the scope of development that was anticipated in the General Plan (see Section 3.5.1), it would not result in growth that would conflict with the Regional Plan.

Summary

Based on the preceding considerations, the Project would not conflict with an applicable plan adopted for the purpose of reducing GHG emissions or generate GHG emissions that would have a significant impact on the environment; therefore, the Project's impacts on GHG emissions would be **less than significant**.

Level of Significance Before Mitigation

Impacts would be less than significant.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

San Marcos Specific Plan Detailed Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

2.2. Construction Emissions by Year, Unmitigated

2.3. Construction Emissions by Year, Mitigated

2.4. Operations Emissions Compared Against Thresholds

2.5. Operations Emissions by Sector, Unmitigated

2.6. Operations Emissions by Sector, Mitigated

3. Construction Emissions Details

3.1. Demolition (2024) - Unmitigated

3.2. Demolition (2024) - Mitigated

3.3. Site Preparation (2024) - Unmitigated

3.4. Site Preparation (2024) - Mitigated

3.5. Grading (2024) - Unmitigated

3.6. Grading (2024) - Mitigated

3.7. Building Construction (2024) - Unmitigated

3.8. Building Construction (2024) - Mitigated

3.9. Building Construction (2025) - Unmitigated

3.10. Building Construction (2025) - Mitigated

3.11. Paving (2025) - Unmitigated

3.12. Paving (2025) - Mitigated

3.13. Architectural Coating (2025) - Unmitigated

3.14. Architectural Coating (2025) - Mitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.1.2. Mitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.2. Electricity Emissions By Land Use - Mitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.2.4. Natural Gas Emissions By Land Use - Mitigated

4.3. Area Emissions by Source

4.3.2. Unmitigated

4.3.1. Mitigated

4.4. Water Emissions by Land Use

4.4.2. Unmitigated

4.4.1. Mitigated

4.5. Waste Emissions by Land Use

4.5.2. Unmitigated

4.5.1. Mitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.6.2. Mitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.7.2. Mitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.8.2. Mitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.9.2. Mitigated

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

4.10.4. Soil Carbon Accumulation By Vegetation Type - Mitigated

4.10.5. Above and Belowground Carbon Accumulation by Land Use Type - Mitigated

4.10.6. Avoided and Sequestered Emissions by Species - Mitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.2.2. Mitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.3.2. Mitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.9.2. Mitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.1.2. Mitigated

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.10.4. Landscape Equipment - Mitigated

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.11.2. Mitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.12.2. Mitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.13.2. Mitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

5.14.2. Mitigated

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

5.15.2. Mitigated

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

5.16.2. Process Boilers

5.17. User Defined

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

5.18.2.2. Mitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	San Marcos Specific Plan
Lead Agency	City of San Marcos
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.20
Precipitation (days)	9.80
Location	33.140389807114516, -117.18649824052213
County	San Diego
City	San Marcos
Air District	San Diego County APCD
Air Basin	San Diego
TAZ	6271
EDFZ	12
Electric Utility	San Diego Gas & Electric
Gas Utility	San Diego Gas & Electric

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Condo/Townhouse	109	Dwelling Unit	3.00	169,282	70,608	0.00	304	Residential Component

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-10-A	Water Exposed Surfaces
Transportation	T-14*	Provide Electric Vehicle Charging Infrastructure
Energy	E-10-B	Establish Onsite Renewable Energy Systems: Solar Power
Waste	S-1/S-2	Implement Waste Reduction Plan

* Qualitative or supporting measure. Emission reductions not included in the mitigated emissions results.

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	14.7	annual days of extreme heat
Extreme Precipitation	5.15	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	10.5	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score

Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	42.6
AQ-PM	28.1
AQ-DPM	76.8
Drinking Water	24.2
Lead Risk Housing	39.5
Pesticides	35.7
Toxic Releases	27.8
Traffic	61.5
Effect Indicators	—
CleanUp Sites	78.6
Groundwater	67.5
Haz Waste Facilities/Generators	82.7
Impaired Water Bodies	43.8
Solid Waste	96.6
Sensitive Population	—
Asthma	3.22
Cardio-vascular	14.1
Low Birth Weights	40.5
Socioeconomic Factor Indicators	—

Education	78.3
Housing	82.8
Linguistic	77.9
Poverty	78.2
Unemployment	36.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	14.57718465
Employed	17.95200821
Median HI	15.05196972
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	59.0
Healthy Places Index Score for Project Location (b)	15.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No

Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Project Description
Construction: Construction Phases	Estimated schedule
Construction: Off-Road Equipment	Estimated Equipment
Construction: Dust From Material Movement	Soil balanced on-site
Construction: Trips and VMT	Even numbered trips
Operations: Vehicle Data	Based on TIA
Operations: Hearths	No wood burning devices

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	14.7	annual days of extreme heat
Extreme Precipitation	5.15	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	10.5	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	1	1	1	2

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	42.6
AQ-PM	28.1
AQ-DPM	76.8
Drinking Water	24.2
Lead Risk Housing	39.5

Chris Bennett
AOA San Marcos LLC
709 Randolph Avenue
Costa Mesa, California 92626

Subject: Biological Resources Memorandum for the Marcos Specific Plan Project in San Marcos, California

Dear Chris Bennett:

This biological resources memorandum is intended to describe the existing conditions of biological resources within the approximately 12.06-acre biological study area (study area) for the Marcos Specific Plan Project within the City of San Marcos, California (Figure 1), evaluate impacts of the proposed project, discuss potential biological constraints associated with the study area as identified during the site visit conducted by Dudek on October 27, 2022, and recommend mitigation measures which would be necessary to reduce impacts to biological resources to a less than significant level.

The primary focus of the site visit was to evaluate the current conditions and potential biological resource constraints of the project area outside of the channel which bisects the study area. The study area was also reviewed for any potential ponded areas outside of the channel area which may support listed species associated with vernal pools. Because habitat within the channel is relevant to assessing potential indirect impacts of project activities which would occur outside of the channel area, updated vegetation mapping was conducted for the entire study area based on general physiognomy and species composition. Channel improvement work associated with the segment of Las Posas Creek within the study area, and the associated bridge over the channel, was previously permitted by the City of San Marcos, and the channel is currently subject to restoration maintenance activities following channel improvements within the permitted area (Conservation Area) (Figure 2). No focused surveys for special-status species were conducted for this biological assessment.

1 Location and Project Description

The study area is located at the corner of Grand Avenue and Linda Vista Drive (APNs 219-152-42, -44, -45, -51, -61, -70, -74, -75, -76, -77, -78, -79) and is zoned for commercial uses. The study area is located in Section 10 within the San Marcos quadrangle, in Township 12 South and Range 3 West. The 12.06-acre biological study area boundary was determined using the boundaries of all involved parcels for the proposed project, and therefore included a 0.99-acre portion of Linda Vista Drive in addition to the 11.07-acre project site referenced below.

The proposed project would include the development of 64,000 square feet of commercial uses consisting of office, restaurant, creative spaces, patios, common open space area, kiosks, and seven (7) live/work units; as well as development of 102 condominium units within 15 buildings, and associated amenities. Additions such as bollards may be added to the bridge over Las Posas Creek, and thus the bridge is included in the impact area. The proposed

Marcos Specific Plan Project (project) includes a request for a Specific Plan, General Plan Amendment, Rezone, Site Development Permit, and Tentative Parcel Map for a residential mixed-use development project on a 11.07-acre site. The General Plan Amendment and Rezone would change the General Plan designation and Zoning from Commercial (C) to Specific Plan Area (SPA). The Specific Plan has been prepared with the intent to provide a comprehensive plan to ensure the efficient development of a new mixed-use residential community. The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the General Plan. The Site Development Plan will configure the site for multi-family dwelling units, street configuration, infrastructure, recreational open space, and private open space.

2 Regulatory Context

2.1 Federal

2.1.1 Federal Endangered Species Act

The federal Endangered Species Act of 1973 (16 USC 1531 et seq.), as amended, is administered by the U.S. Fish and Wildlife Service (USFWS) for most plant and animal species, and by the National Oceanic and Atmospheric Administration National Marine Fisheries Service for certain marine species. This legislation is intended to provide a means to conserve the ecosystems upon which endangered and threatened species depend, and provide programs for the conservation of those species, thus preventing extinction of plants and wildlife. The federal Endangered Species Act defines an endangered species as "any species that is in danger of extinction throughout all or a significant portion of its range." A threatened species is defined as "any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range." Under the federal Endangered Species Act, it is unlawful to take any listed species, and "take" is defined as, "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct."

The federal Endangered Species Act allows for the issuance of incidental take permits for listed species under Section 7, which is generally available for projects that also require other federal agency permits or other approvals, and under Section 10, which provides for the approval of habitat conservation plans on private property without any other federal agency involvement. Upon development of a habitat conservation plan, USFWS can issue incidental take permits for listed species.

2.1.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) was originally passed in 1918 as four bilateral treaties, or conventions, for the protection of a shared migratory bird resource. The primary motivation for the international negotiations was to stop the "indiscriminate slaughter" of migratory birds by market hunters and others. Each of the treaties protects selected species of birds and provides for closed and open seasons for hunting game birds. The MBTA protects more than 800 species of birds and prohibits the take of any migratory bird or any part, nest, or eggs of any such bird. Under the MBTA, "take" is defined as pursuing, hunting, shooting, capturing, collecting, or killing, or attempting to do so (16 USC 703 et seq.). Additionally, Executive Order 13186, Responsibilities of Federal Agencies to Protect Migratory Birds, requires that any project with federal involvement address impacts of federal actions on migratory birds with the purpose of promoting conservation of migratory bird populations (66 FR 3853–3856). The executive

order requires federal agencies to work with USFWS to develop a memorandum of understanding. USFWS reviews actions that might affect these species.

Two species of eagles that are native to the United States, bald eagle (*Haliaeetus leucocephalus*) and golden eagle (*Aquila chrysaetos*), were granted additional protection within the United States under the Bald and Golden Eagle Protection Act (16 USC 668–668d) to prevent the species from becoming extinct.

2.1.3 Clean Water Act

Pursuant to Section 404 of the Clean Water Act, the U.S. Army Corps of Engineers (USACE) regulates the discharge of dredged and/or fill material into "waters of the United States." The term "wetlands" (a subset of waters of the United States) is defined in Title 33 of the Code of Federal Regulations, Section 328.3(b), as "those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas." In the absence of wetlands, the limits of USACE jurisdiction in non-tidal waters, such as intermittent streams, extend to the ordinary high water mark (OHWM), which is defined in Title 33 of the Code of Federal Regulations, Section 328.3(e).

2.2 State

2.2.1 California Endangered Species Act

The California Department of Fish and Wildlife (CDFW) administers the California Endangered Species Act (CESA), which prohibits the "take" of plant and animal species designated by the California Fish and Game Commission as endangered or threatened in California. Under CESA Section 86, take is defined as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." CESA Section 2053 stipulates that state agencies may not approve projects that will "jeopardize the continued existence of any endangered species or threatened species, or result in the destruction or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available consistent with conserving the species or its habitat which would prevent jeopardy."

CESA defines an endangered species as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease." CESA defines a threatened species as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by this chapter. Any animal determined by the [California Fish and Game] Commission as rare on or before January 1, 1985, is a threatened species." A candidate species is defined as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that the Commission has formally noticed as being under review by the department for addition to either the list of endangered species or the list of threatened species, or a species for which the Commission has published a notice of proposed regulation to add the species to either list." CESA does not list invertebrate species.

CESA authorizes the taking of threatened, endangered, or candidate species if take is incidental to an otherwise lawful activity and if specific criteria are met. These provisions also require CDFW to coordinate consultations with

USFWS for actions involving federally listed species that are also state-listed species. In certain circumstances, CESA allows CDFW to adopt a CESA incidental take authorization as satisfactory for CEQA purposes based on finding that the federal permit adequately protects the species and is consistent with state law.

A CESA permit may not authorize the take of "fully protected" species that are protected in other provisions of the California Fish and Game Code, discussed further below.

2.2.2 California Fish and Game Code

Sections 3511 (Birds), 4700 (Mammals), 5050 (Reptiles and Amphibians), and 5515 (Fish) of the California Fish and Game Code provide that designated fully protected species may not be taken or possessed without a permit. Incidental take of these species is not authorized by law.

Pursuant to Section 3503.5 of the California Fish and Game Code, it is unlawful to take, possess, or destroy any birds of prey; or to take, possess, or destroy any nest or eggs of such birds. Birds of prey refer to species in the orders Falconiformes and Strigiformes.

Nests of all other birds (except house sparrow [*Passer domesticus*] and European starling [*Sturnus vulgaris*]) are protected under Sections 3503 and 3513 of the California Fish and Game Code.

Pursuant to Section 1602 of the California Fish and Game Code, CDFW regulates all diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife. Diversion, obstruction, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife requires authorization from CDFW by means of entering into an agreement pursuant to Section 1602 of the California Fish and Game Code.

2.2.3 Porter–Cologne Water Quality Control Act

The Porter–Cologne Water Quality Control Act (Porter–Cologne Act) protects water quality and the beneficial uses of water. It applies to surface water and groundwater. Under this law, the State Water Resources Control Board develops statewide water quality plans, and the Regional Water Quality Control Boards (RWQCBs) develop regional basin plans that identify beneficial uses, water quality objectives, and implementation plans. The RWQCBs have the primary responsibility to implement the provisions of statewide plans and basin plans. Waters regulated under the Porter–Cologne Act include isolated waters that are not regulated by USACE. RWQCBs regulate discharging waste, or proposing to discharge waste, within any region that could affect a "water of the state" (California Water Code, Section 13260[a]). Waters of the state are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state" (California Water Code, Section 13050[e]). Developments with impacts on jurisdictional waters must demonstrate compliance with the goals of the Porter–Cologne Act by developing Stormwater Pollution Prevention Plans, Standard Urban Stormwater Mitigation Plans, and other measures to obtain a Clean Water Act Section 401 certification. If a Clean Water Act Section 404 permit is not required for a project, the RWQCB may still require a permit (i.e., Waste Discharge Requirement) for impacts to waters of the state under the Porter–Cologne Act.

2.2.4 California Environmental Quality Act

CEQA (California Public Resources Code Section 21000 et seq.) and the CEQA Guidelines (14 CCR 15000 et seq.) require identification of a project's potentially significant impacts on biological resources and feasible mitigation measures and alternatives that could avoid or reduce significant impacts. CEQA Guidelines Section 15380(b)(1) defines endangered animals or plants as species or subspecies whose "survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, disease, or other factors" (14 CCR 15000 et seq.). A rare animal or plant is defined in CEQA Guidelines Section 15380(b)(2) as a species that, although not currently threatened with extinction, exists "in such small numbers throughout all or a significant portion of its range that it may become endangered if its environment worsens; or … [t]he species is likely to become endangered within the foreseeable future throughout all or a significant portion of its range and may be considered 'threatened' as that term is used in the federal Endangered Species Act." Additionally, an animal or plant may be presumed to be endangered, rare, or threatened if it meets the criteria for listing, as defined further in CEQA Guidelines Section 15380(c). CEQA also requires identification of a project's potentially significant impacts on riparian habitats (such as wetlands, bays, estuaries, and marshes) and other sensitive natural communities, including habitats occupied by endangered, rare, and threatened species.

In Title 14 of the California Code of Regulations (CCR), Section 1.72 (14 CCR, Section 1.72), CDFW defines a "stream" (including creeks and rivers) as "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life. This includes watercourses having surface or subsurface flow that supports or has supported riparian vegetation."

In 14 CCR 1.56, CDFW's definition of "lake" includes "natural lakes or [human-built] reservoirs." Diversion, obstruction, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife requires authorization from CDFW by means of entering into an agreement pursuant to Section 1602 of the California Fish and Game Code.

CDFW recognizes that all plants with a California Rare Plant Rank of 1A, 1B, or 2, and some ranked 3, of the California Native Plant Society's Inventory of Rare and Endangered Plants in California (CNPS 2022) may meet the criteria for listing as threatened or endangered and should be considered under CEQA. Some of the California Rare Plant Rank 3 and 4 plants meet the criteria for determination as "rare" or "endangered" as defined in Section 1901, Chapter 10 (Native Plant Protection Act), Division 2, of the California Fish and Game Code, as well as Section 2062 and Section 2067, Chapter 1.5 (CESA), Division 3. Therefore, consideration under CEQA for these California Rare Plant Rank 3 and 4 species is strongly recommended by the California Native Plant Society (CNPS 2022).

For purposes of this report, animals considered "rare" under CEQA include endangered or threatened species, Birds of Conservation Concern, California Species of Special Concern, and fully protected species.

Section IV, Appendix G, Environmental Checklist Form, of the CEQA Guidelines (14 CCR 15000 et seq.) requires an evaluation of impacts to "any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service."

2.2.5 California Natural Community Conservation Planning Act

In 1991, the California Natural Community Conservation Planning (NCCP) Act was approved and the NCCP Coastal Sage Scrub program was initiated in Southern California. The 1991 NCCP Act was replaced by the NCCP Act of

2003, which has since been amended three times, in 2003, 2011, and most recently in 2012. California law (California Fish and Game Code Section 2800 et seq.) established the NCCP program "to provide for regional protection and perpetuation of natural wildlife diversity while allowing compatible land use and appropriate development and growth." The NCCP Act encourages preparation of plans that address habitat conservation and management on an ecosystem basis rather than one species or habitat at a time.

2.3 Local

2.3.1 North County Multiple Habitat Conservation Program

The North County Multiple Habitat Conservation Program (MHCP) is a long-term regional conservation plan established to protect sensitive species and habitats in northern San Diego County. The MHCP is divided into seven Subarea Plans—one for each jurisdiction within the MHCP—that are permitted and implemented separately from one another. The City of Carlsbad is the only city under the MHCP that has an approved and permitted Subarea Plan. The City of San Marcos Subarea Habitat Conservation Plan/Natural Community Conservation Plan (San Marcos Subarea Plan) has not been finalized or implemented, and the City is no longer an active participant in the Natural Community Conservation Plan program or the subregional MHCP conservation planning effort. However, it is the City's policy to comply with the conservation policies identified in the draft San Marcos Subarea Plan, including an assessment of a designated Biological Core and Linkage Area or MHCP Focused Planning Area in the context of a proposed project and the preservation of sensitive biological resources.

2.3.2 San Marcos General Plan

The San Marcos General Plan Update (General Plan) includes a General Plan Existing Conditions Report. Chapter 5 of the Existing Conditions Report identifies and describes aspects of conservation and natural resources within the City of San Marcos, including biological resources within the Planning Area. The report includes the following goals and policies related to biological resources (City of San Marcos 2021):

Goal COS-1: Identify, protect, and enhance significant ecological and biological resources within San Marcos and its adaptive Sphere of Influence.

- **Policy 1.1**: Support the protection of biological resources through the establishment, restoration, and conservation of high-quality habitat areas.
- **Policy 1.2**: Ensure that new development, including Capital Improvement Projects, maintain the biotic habitat value of riparian areas, oak woodlands, habitat linkages, and other sensitive biological habitats.
- **Policy 1.3**: Continue to work with other federal, State, regional, and local agencies.

Goal COS-2: The City is committed to conserving, protecting, and maintaining open space, agricultural, and limited resources for future generations. By working with property owners, local organizations, and State and federal agencies, the City can limit the conversion of resource lands to urban uses.

- **Policy 2.1**: Provide and protect open space areas throughout the City for its recreational, agricultural, safety, and environmental value.

- **Policy 2.2**: Limit, to the extent feasible, the conversion of open space to urban uses and place a high priority on acquiring and preserving open space lands for recreation, habitat protection and enhancement, flood hazard management, water and agricultural resources protection, and overall community benefit.

- **Policy 2.3**: Protect existing agricultural areas, encourage farm to consumer, promote public health, and promote small-scale agriculture such as community gardens and the growing of organic produce.

- **Policy 2.6**: Preserve healthy mature trees where feasible; where removal is necessary, trees shall be replaced at a ratio of 1:1.

3 Methods

3.1 Reconnaissance Survey

A reconnaissance survey of the study area was conducted by Dudek biologist Olivia Koziel on October 27, 2022. The entire study area was traversed on foot in meandering transects to ensure full coverage of the area. The focus of the reconnaissance survey was on identifying potential biological resource constraints outside of the channel area, and also on identifying any potential vernal pools present in the study area. Dudek also created a general map of the vegetation communities and land covers present within the study area, as well as documented plant and wildlife species observed or detected. A general habitat assessment was conducted concurrently for special-status species known to occur in the regional vicinity of the study area, including for potentially occurring sensitive resources that would not be apparent at the time of the survey (e.g., rare annual plants and special-status wildlife species).

3.1.1 Vegetation Mapping

Vegetation communities and land covers within the study area were mapped in the field based on general physiognomy and species composition. Data was recorded using the Field Maps mobile application over aerial base map imagery of the study area, and a geographic information system (GIS) coverage was created.

The vegetation community and land cover mapping follow the Draft Vegetation Communities of San Diego County (Oberbauer et. al. 2008), which is based on the Preliminary Descriptions of the Terrestrial Natural Communities of California (Holland 1986). Where vegetation observed in the field did not exactly match a community described within Oberbauer et. al. (2008), Dudek included additional descriptions to better represent the existing conditions observed (i.e., two vegetation communities combined to describe a mosaic of herbaceous wetland and southern willow scrub, and the addition of "disturbed" to describe the cover of non-native vegetation within the southern riparian woodland).

3.1.2 Identification of Flora and Fauna

Plant species encountered during the October 27th site visit were identified and recorded. Latin and common names for plant species with a California Rare Plant Rank (CRPR) follow the California Native Plant Society Online Inventory of Rare, Threatened, and Endangered Plants of California (CNPS 2022). For plant species without a California Rare Plant Rank, Latin names follow the *Jepson Interchange List of Currently Accepted Names of Native and Naturalized Plants of California* (Jepson Flora Project 2022), and common names follow the United States Department of

Agriculture (USDA) Natural Resources Conservation Service Plants Database (USDA 2022). A list of plant species observed within the study area is presented in Attachment A.

All wildlife species detected by sight, vocalizations, burrows, tracks, scat, and other signs were also recorded. Binoculars (10×50) were used to aid in the identification of observed wildlife. Latin and common names for vertebrate species referred to in this report follow Crother (2017) for amphibians and reptiles, Wilson and Reeder (2005) for mammals, and the American Ornithological Society *Checklist of North and Middle American Birds* (AOS 2022) for birds. A list of wildlife species observed within the study area is presented in Attachment B.

3.1.3 Survey Limitations

Limitations of the survey include seasonal constraints, a diurnal bias, and the absence of focused trapping for small mammals and reptiles. Low rainfall during the preceding spring may have limited the emergence, survival, and growth of some herbaceous plant species. No focused rare plant surveys, jurisdictional aquatic resource delineation, or focused or protocol-level surveys for special-status wildlife species were conducted during the site visit. However, due to the poor quality and disturbed condition of the habitat outside of the channel area, special-status plant and wildlife species are not expected to occur aside from species planted as a part of channel improvement work. Climatic conditions during the survey generally were favorable for the identification of wildlife. Surveys were conducted during the daytime to maximize visibility for the detection of plants and most animals. Since the focus of the survey was on biological constraints outside of the channel area, the plant species list included as Attachment A may not include all species which were present within the channel area.

4 Results

Based on historic aerials and geotechnical investigations, the study area was graded and developed between 1964 and 1987 to its current configuration, and was previously almost entirely developed with pavement, buildings, and roads with the exception of the channel. Fill soil material is located over older alluvium throughout the proposed project area to a depth of 4 feet below surface (Geotek 2021). Until buildings and infrastructure were demolished and removed from the study area in recent years, the majority of the study area was developed with the exception of biological resources associated with Las Posas Creek. All structures were removed from the study area by 2018, however large areas of pavement remain. Furthermore, prior to channel improvement and restoration work, when the site was almost entirely developed, the channel bisecting the study area was narrow and supported a much lower level of biodiversity than it supports currently (NetrOnline 2022). Outside of the channel area, the study area is a mosaic of urban/developed and disturbed habitat which supports limited vegetation. The study area, in general, is relatively flat with little topographic variation aside from the channel. The majority of sensitive vegetation communities mapped within the study area are encompassed within the Conservation Area, or immediately adjacent to it in areas that would not be directly impacted as a result of the proposed project. The Conservation Area is to remain under the City's jurisdiction and is subject to maintenance and monitoring per the terms of the associated Long Term Management Plan (LTMP) (Dudek 2018). As stated in the LTMP, the Corps, RWQCB, and CDFW have jurisdiction over the wetlands associated with the channel area, and the necessary permits were obtained for the channel improvement project impacts.

4.1 Vegetation Mapping

Six vegetation communities/land covers were identified in the biological study area including disturbed habitat (3.26 acres); disturbed wetland (0.03 acre); urban/developed (7.98 acre); coastal and valley freshwater marsh (0.33 acre); herbaceous wetland/southern willow scrub (0.42 acre); and disturbed southern riparian woodland (0.04 acre). These vegetation communities/land covers are described below, their acreages are presented in Table 1, and their spatial distributions are presented in Figure 2.

Table 1. Vegetation Communities and Land Covers within the Study Area

Vegetation Community or Land Cover Type	Mapping Unit Code[1]	Existing Acres Present Within Conservation Area[2]	Existing Acres Present Outside of Conservation Area[2]	Total Acres Present Within the Study Area
Disturbed Habitat	11000	0.04	3.22	3.26
Disturbed Wetland	11200	0.00	0.03	0.03
Urban/Developed	12000	0.14	7.84	7.98
Coastal and Valley Freshwater Marsh	52410	0.31	0.02	0.33
Herbaceous Wetland/ Southern Willow Scrub	52510/63320	0.40	0.02	0.42
Southern Riparian Woodland (Disturbed)	62500	0.00	0.04	0.04
	Total Acres	**0.89**	**11.17**	**12.06**

Notes:
1 Numeric code assigned to the vegetation community or land cover type according to Oberbauer et. al (2008).
2 Conservation Area refers to the existing conservation area surrounding the channel. Channel improvement work and maintenance activities have already been permitted and improvement work limits extended outside of the Conservation Area.

4.1.1 Disturbed Habitat (11000)

Disturbed habitats are areas that have been physically disturbed and are no longer recognizable as a native or naturalized vegetation association (Oberbauer et. al. 2008). These areas may continue to retain soil substrate. If vegetation is present, it is almost entirely composed of non-native vegetation, such as ornamentals or ruderal exotic species. Examples of these areas may include graded landscapes or areas, graded firebreaks, graded construction pads, temporary construction staging areas, off-road-vehicle trails, areas repeatedly cleared for fuel management, or areas that are repeatedly used in ways that prevent revegetation (e.g., parking lots, trails that have persisted for years). (Oberbauer et. al. 2008).

Within the study area, disturbed habitat is dominated by non-native weedy species such as Russian thistle (*Salsola* sp.) within areas of bare ground, and associated longbeak stork's bill (*Erodium botrys*) and mowed invasive grasses such as red brome (*Bromus rubens*). Very few native plant individuals, such as desertbroom (*Baccharis sarothroides*), are sprouting within these areas.

4.1.2 Disturbed Wetland (11200)

Disturbed wetland refers to areas that are permanently or periodically inundated by water that have been significantly modified by human activity. Disturbed wetlands include concrete-lined channels, Arizona crossings,

detention basins, culverts, and ditches. Disturbed wetlands are often unvegetated, but can contain scattered native or non-native vegetation, such as giant reed (*Arundo donax*), tamarisk (*Tamarix spp.*), eucalyptus (*Eucalyptus* spp.), palms (*Phoenix* spp*.; Washingtonia* spp.), Bermuda grass (*Cynodon dactylon*), willows (Salix spp.), and cattails (*Typha* spp.) (Oberbauer et. al. 2008).

Within the study area, disturbed wetland refers to an area of rip rap within the channel at the outfall of a culvert under Grand Avenue. This area has relatively low vegetative cover.

4.1.3 Urban/Developed (12000)

Urban/developed refers to areas that have been constructed on or disturbed so severely that native vegetation is no longer supported. Developed land includes areas with permanent or semi-permanent structures, pavement or hardscape, landscaped areas, and areas with a large amount of debris or other materials (Oberbauer et. al. 2008).

In the study area, this land cover generally represents areas of concrete and asphalt from previous development and associated parking lots, with mostly invasive non-native plant species such as fountain grass (*Pennisetum setaceum*) occupying cracks and gaps between pavements. The few native plants present in these areas include one Gooding's willow (*Salix gooddingii*) which is mostly surrounded by concrete. This mapping unit also includes a small artificially constructed biofiltration basin located just north of the main channel. The basin is irrigated and is dominated by San Diego sagewort (*Artemisia palmeri*) and Douglas' sagewort (*Artemisia douglasiana*).

4.1.4 Coastal and Valley Freshwater Marsh (52410)

Coastal and valley freshwater marsh is a wetland habitat that is permanently flooded by freshwater lacking a significant current (Oberbauer et. al. 2008). Because it is permanently flooded by fresh water, there is an accumulation of deep, peaty soils. It is typically dominated by species such as cattail, sedge (*Carex* spp.), yellow nutsedge (*Cyperus esculentus*), and bulrushes (*Scirpus* spp.).

This vegetation community was used to map the lowest, wet part of the channel which is dominated by southern cattail (*Typha domingensis*) with associated scattered young willows (*Salix* sp.).

4.1.5 Herbaceous Wetland/Southern Willow Scrub (52510/63320)

This combination of two vegetation communities is used to best describe the general current conditions on slopes adjacent to the channel as observed during the site visit. The composition and distribution of vegetation communities within the Conservation Area in and surrounding the channel may continue to evolve over time with continued implementation of maintenance and management activities.

Herbaceous wetlands are seasonal wetlands which may be found adjacent to drainages or in swales and typically contain primarily annual species. This vegetation community usually does not support species which are more characteristic of freshwater marsh, including *Typha*, *Scirpus*, and *Juncus* (Oberbauer et al. 2008). Southern willow scrub is a dense, broad-leafed, winter-deciduous riparian thicket dominated by several willow species, with scattered emergent Fremont cottonwood (*Populus fremontii*) and California sycamore (*Platanus racemosa*) (Oberbauer et. al. 2008).

Herbaceous wetland/southern willow scrub is mapped on channel slopes in the study area and is a generally dense mixture of several species including California mugwort, sweetscent (*Pluchea odorata*), some San Diego sagewort,

Canadian horseweed (*Erigeron canadensis*), young willows such as red willow (*Salix laevigata*) and arroyo willow (*Salix lasiolepis*), scattered planted lemonadeberry shrubs (*Rhus intergrifolia*), Hooker's evening primrose (*Oenothera elata* ssp. *hookeri*), and a low cover of young California sycamore. Vegetation to the south of the channel is generally denser than to the north of the channel, although overall species composition is similar.

4.1.6 Disturbed Southern Riparian Woodland (62500)

Southern riparian woodland is moderate density riparian woodland that is dominated by small trees or shrubs and has scattered taller riparian trees. Southern riparian woodland occurs within major river systems where flood scour occurs and smaller major tributaries. Characteristic species that are typically found in southern riparian woodland include broom baccharis, western sycamore, western cottonwood (*Populus* spp.), willows, and elderberry species (*Sambucus* spp.) (Oberbauer et. al. 2008).

Within the study area, this vegetation community is mapped in one area adjacent to the channel, and is mapped as disturbed southern riparian woodland due to the amount of non-native tree species cooccurring with native species. This area is dominated by larger willow trees, with associated eucalyptus and ornamental crimson bottlebrush (*Melaleuca citrina*).

4.2 Jurisdictional Resources

While the primary focus of this biological survey was on areas outside of the channel and a formal jurisdictional delineation was not conducted as a part of this effort, vegetation communities observed in and adjacent to the channel area were mapped.

Vegetation communities, including those classified as potential wetlands, were mapped within the study area and may be regulated by local, state, and federal agencies. These include disturbed wetland, coastal and valley freshwater marsh, herbaceous wetland/southern willow scrub, and disturbed southern riparian woodland. Communities below the OHWM within the channel are likely regulated USACE, pursuant to Section 404 of the federal Clean Water Act; CDFW, pursuant to Section 1602 of the California Fish and Game Code; and the RWQCB, pursuant to Section 401 of the federal Clean Water Act. Communities located outside of the OHWM but adjacent to the channel, such as disturbed southern riparian woodland, may be regulated as riparian habitat by CDFW. Communities located above the OHWM up to the top of the channel bank may be regulated by both CDFW and RWQCB.

4.3 Floral Diversity

A total of 60 species of native or naturalized plants, 30 native (50%) and 30 non-native (50%), were recorded in the study area during the site visit (Attachment A). The majority of native plant cover occurs within the Conservation Area within and surrounding the channel. However, some native species occur scattered throughout the disturbed and developed areas, occupying a low (i.e. less than 10%) cover overall in those areas.

4.3.1 Special-Status Plant Species

Two plant species with a California Rare Plant Rank (CRPR) were observed during the survey: San Diego sagewort (CRPR 4.2), and San Diego marsh-elder (*Iva hayesiana*; CRPR 2B.2). Plant species with a CRPR of 4 (i.e., San Diego sagewort) are considered limited distribution or watchlist species and less sensitive/rare than plant species with a CRPR of 1 through 3 (CNPS 2022). San Diego sagewort currently has a tentative global ranking of G3, which

corresponds to a moderate extinction risk "due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors" (CDFW 2022b).

These plant species are located primarily within in the existing Conservation Area associated with the channel, and were planted as part of the channel restoration work (Dudek 2011). No special-status plant species were observed during a previous biological reconnaissance survey of the channel area conducted by Dudek in December of 2008, prior to channel restoration work in the area (Dudek 2009). San Diego marsh elder is located within the Conservation Area adjacent to the channel. While the majority of San Diego sagewort present in the study area is located within the existing Conservation Area, some San Diego sagewort is located outside of the Conservation Area immediately to the southwest of the existing bridge near a storm drain, and within the small biofiltration basin to the east of the bridge on the northern side of the channel.

The study area was previously extensively graded for development, and undocumented fill was likely deposited throughout the entire project area to a depth of four feet, as described in the geotechnical report (Geotek 2021). Due to the disturbed, previously developed context of the study area supporting little to no appropriate habitat and suitable substrate, no special-status plant species other than those which were planted during channel restoration are expected to occur within the study area, and thus focused rare plant surveys are not necessary.

4.4 Wildlife Diversity

A total of 12 wildlife species were observed during the site visit, including 10 bird species, one mammal (California ground squirrel [*Otospermophilus beecheyi*]), and one reptile (western fence lizard [*Sceloporus occidentalis*]). All wildlife species observed in the study area are relatively common, widely distributed, and adapted to living in close proximity to urban development. A list of wildlife species observed during the site visit is included as Attachment B.

4.4.1 Special-Status Wildlife Species and Nesting Birds

While focused wildlife surveys were not conducted, no special-status wildlife species were observed during the 2022 reconnaissance survey. Due to the disturbed, previously developed context of the study area which is situated in a highly urbanized area, and the relatively limited extent of native habitat present, there is a low potential for special-status wildlife species to occur in the study area, especially outside of the Conservation Area.

Outside of the Conservation Area, the study area has limited potential to support nesting birds during the avian breeding season due to the disturbed nature of the majority of the area, lack of substantial vegetative cover, and surrounding development. Nesting in the study area would likely be limited to small, common bird species which are tolerant of disturbance from adjacent development and traffic. Vegetation within and adjacent to the channel provides denser cover for wildlife and primarily has the potential to support nesting of common, small riparian bird species such as common yellowthroat (*Geothlypis trichas*), while disturbed and urban/developed open areas could support common species such as mourning dove (*Zenaida macroura*) which sometimes nest on the ground. Mature willows located in the disturbed southern riparian woodland and tall eucalyptus trees located mostly adjacent to the western side of the study area have the potential to support nesting of common bird species in addition to raptors that are adapted to urban environments, such as Cooper's hawk (*Accipiter cooperii*).

Some scattered small mammal burrows, California ground squirrel and/or rabbit burrows are present in the study area where pavement isn't present. Due to the highly disturbed condition of the study area and the fact that a large amount of the area is paved and was historically almost entirely developed, the level of habitat suitability for special-

status wildlife species such as burrowing owl (*Athene cunicularia*) is low, and there is a low potential for the study area to support special-status small mammals. No burrowing owl sign was observed within the study area during the survey.

The study area is not expected to support special-status listed riparian birds such as least Bell's vireo (*Vireo bellii pusillus*) or southwestern willow flycatcher (*Empidonax traillii extimus*) because the riparian areas on site are too small and isolated to support these species. The area of the channel east of the bridge is not expected to support special-status riparian birds since it is comprised mostly of cattails in the channel with scattered small willows. West of the existing bridge, there is a denser cover of riparian vegetation including willows in the channel area, but the potential for the habitat to support least Bell's vireo is still low due to the urbanized status of the surrounding area and the relatively narrow and limited amount of mature native habitat present in the study area. Southwestern willow flycatcher occurrences are increasingly rare in southern California and would be expected in wider and more extensive riparian habitat than is present in and adjacent to the study area.

According to the California Natural Diversity Database (CNDDB), two special-status wildlife occurrences with one mile accuracy overlap the study area: American badger (*Taxidea taxus*) from an unknown year and Townsend's big-eared bat from 1930 (*Corynorhinus townsendii*) (CDFW 2022c). The study area does not contain suitable roosting or foraging habitat for Townsend's big-eared bat, and American badger is not expected to occur due to the disturbed and urbanized context of the study area. No designated or proposed critical habitat for special-status wildlife species occurs in the study area (USFWS 2022).

4.4.2 Wildlife Movement

The study area includes an approximately 770-foot-long (0.15-mile) segment of Las Posas Creek (encompassed within the Conservation Area). The Las Posas Creek is a north to southwest–trending urbanized channel originating in the foothills of San Marcos and flowing south through an urban corridor of the city before reaching its confluence with San Marcos Creek, approximately 1 mile downstream of the study area. The ability for this reach to provide a dispersal corridor for terrestrial wildlife and avifauna is restricted by road crossings, culverts, fences, buildings and other manmade structures that restrict wildlife use, fragment habitat, and impede movement. Terrestrial movement upstream is limited by culverts under Grand Avenue, which forms the northern boundary of the study area, and State Route 78 beyond Grand Avenue, and the entire study area is fenced with chain link fencing. Terrestrial movement downstream is limited by culverts under Via Vera Cruz, approximately 550 feet west of the study area.

A formal wildlife movement study has not been conducted; however, with wetland and riparian vegetation, stream bed, and perennial water supply, the Conservation Area likely facilitates limited wildlife movement. Because the channel at this location is earthen bottomed, vegetated, and supports perennial stream flow (due to urban runoff), it provides cover and aquatic resources for wildlife species in the area, and likely permits limited wildlife movement from Grand Avenue west to Via Vera Cruz, where the channel becomes contained within a closed channel conveyance system. Therefore, the study area likely provides resources primarily to birds. Other common urban wildlife such as coyote (*Canis latrans*), common raccoon (*Procyon lotor*), or striped skunk (*Mephitis mephitis*) may also occasionally use the study area for foraging, but due to fencing as well as the culverts and roads surrounding and fragmenting available habitat, the study area likely does not facilitate substantial movement opportunities for terrestrial wildlife. This area has not been designated as a regional wildlife corridor in the City's draft Subarea Plan to the MHCP and given the fragmented nature of Las Posas Creek, this area likely does not function as a regional wildlife corridor due to the constrained urban context of the study area and the fragmented nature of the channel.

4.5 Vernal Pool Assessment

A property located immediately south of Linda Vista Drive across from the study area is a managed vernal pool mitigation site known to contain vernal pools and sensitive species which are associated with vernal pool habitats. However, the study area has been graded and almost entirely developed with the exception of the channel, and extensively disturbed in the past, and no vernal pools were observed within the study area during the site visit. Although the survey was conducted outside of the usual wet season, no evidence of vernal pools or depressions that could support ponding were observed. Additionally, as determined during the geotechnical study, fill soil material is located over older alluvium throughout the proposed project area to a depth of 4 feet below surface, and undocumented fill was likely deposited throughout the entire project area (Geotek 2021). The study area does not support vernal pools and therefore is not expected to support special-status plant or wildlife species associated with vernal pools, such as listed large branchiopods.

5 Impacts, Constraints, and Mitigation

5.1 Definition of Impacts

Direct impacts were quantified by overlaying the impact limits over the mapped biological resources. For this report, direct impacts are defined as those that result in the direct removal of a biological resource through clearing, grubbing, and/or grading, and all impacts associated with the proposed project as shown in Figure 3 are assumed to be permanent.

Indirect impacts are reasonably foreseeable effects caused by implementation of the proposed project on remaining or adjacent biological resources outside the proposed limits of work. Indirect impacts may affect areas within the defined study area but outside the limits of grading, non-impacted areas, and areas outside the study area, such as downstream effects. Indirect impacts include short term effects immediately related to construction activities and long term or chronic effects related to trail use and development of the study area. In most cases, indirect effects are not quantified, but in some cases, quantification might be included, such as using a noise contour to quantify indirect impacts to nesting birds.

5.2 Impacts to Vegetation Communities and Land Covers

The impact limits of the proposed project are shown in Figure 3 over the vegetation mapping. As shown, the limits of work overlap approximately 11.01 acres of non-sensitive land covers which do not require mitigation for direct impacts. Direct impacts to sensitive vegetation communities would be completely avoided, and impacts would be limited to urban/developed and disturbed habitat land covers.

A summary of impacts to mapped vegetation communities and land covers and mitigation ratios typically required by the City of San Marcos in cooperation with regulatory agencies for impacts to the present vegetation communities are provided in Table 2. Mitigation ratios outlined below would ensure consistency with the MHCP and draft San Marcos Subarea Plan.

The proposed project would not impact the Conservation Area, and permanent fencing is to be installed around the Conservation Area. All mitigation ratios provided in Table 2 are for impacts outside of the Conservation Area.

Table 2. Impacts to Vegetation Communities and Land Covers in the Study Area

Vegetation Community or Land Cover Type	Existing Acres in Study Area	Impacts Proposed (Acres)	Mitigation Ratio Typically Required for Impacts	Mitigation Required (Acres)
Disturbed Habitat	3.26	3.19	N/A	0.00
Disturbed Wetland	0.03	0.00	2:1	0.00
Urban/Developed	7.98	7.82	N/A	0.00
Coastal and Valley Freshwater Marsh	0.33	0.00	2:1	0.00
Herbaceous Wetland/ Southern Willow Scrub	0.42	0.00	3:1	0.00
Southern Riparian Woodland (Disturbed)	0.04	0.00	3:1	0.00
Total Acres	**12.06**	**11.01**	—	**0.00**

Short-term indirect impacts associated with dust and erosion, and short- and long-term indirect impacts associated with increased human presence, could occur as a result of project implementation. Such impacts could negatively affect viability of sensitive native vegetation adjacent to the project footprint through decreasing photosynthetic ability and degradation due to unauthorized access. Indirect impacts resulting from project implementation would be less than significant with implementation of MM-BIO-1.

5.3 Impacts to Potential Jurisdictional Resources

Waters of the U.S., including wetlands, are considered sensitive and thus are regulated by local, state, and federal agencies. The proposed project would not result in direct impacts to potential jurisdictional resources which are located within the Conservation Area, and thus no permits for impacts to jurisdictional resources are required. Potential short- and long-term indirect impacts to potential jurisdictional resources located adjacent to the impact area, such as off-site transport of sediment and pollutants, would be avoided through implementation of measure MM-BIO-1 as described in section 5.5 below, and would be less than significant. As a part of the channel improvement project, native transitional species were planted along the widened channel slopes to serve as a native habitat buffer to the drainage channel to further protect riparian and wetland habitats beyond the permanent fencing which shall be installed around the Conservation Area.

5.4 Impacts to Special-Status Species and Nesting Birds

5.4.1 Special-Status Plants

Special-status plants observed in the study area during the site visit with a CRPR of 1 or 2 (San Diego marsh elder) are located entirely within the Conservation Area and would not be impacted by the proposed project. Plant species with a CRPR of 4 (i.e., San Diego sagewort) are considered limited distribution or watchlist species and less sensitive/rare than plant species with a CRPR of 1 through 3 (CNPS 2022). Some San Diego sagewort, a species which was not observed in the study area in 2008 but was planted during restoration activities (Dudek 2009; Dudek 2011), is located adjacent to, but outside of, the Conservation Area near a storm drain and within a small biofiltration basin and may be impacted by the proposed project.

CNPS specifies that plants with a CRPR of 4 are species which warrant population monitoring in general, but currently seem to have a low level of vulnerability to threat of extinction statewide (CNPS 2020). Furthermore, CRPR 4 species "generally do not currently appear to meet the criteria for listing as threatened or endangered", and thus typically are not required to have impacts assessed according to CEQA guidelines (CNPS 2020). Certain CRPR 4 species under specific population and geographic range-related circumstances may meet CEQA Section 15380 definitions which would qualify the species for impact assessment, including if the species is included in sensitive species lists maintained by the Bureau of Land Management (BLM), USFWS, or U.S. Forest Service (USFS) (CNPS 2020). The San Diego sagewort present was planted as part of the recent restoration effort and thus does not represent a natural occurrence of the species within the study area, and the species is not included on BLM, USFWS, or USFS sensitive plant species lists (BLM 2023; USFS 2023; USFWS 2023).

Because the Conservation Area would not be impacted, there would be no direct impacts to special-status plant species with a CRPR of 1 or 2, and therefore direct impacts to special-status plants as a result of the proposed project would be less than significant.

Potential indirect impacts to special-status plants are similar to those described for sensitive vegetation communities and would be less than significant with implementation of MM-BIO-1.

5.4.2 Special-Status Wildlife and Nesting Birds

The highly disturbed condition of the majority of the study area, with limited vegetative cover and surrounded by development, is not suitable habitat for most special-status wildlife. However, the study area and adjacent vegetation have the potential to support nesting birds. If clearing, grubbing, or other ground disturbance related to project construction occurs during the nesting bird season, any impacts to active nests or the young of nesting bird species would be significant.

Indirect impacts to protected nesting birds that have the potential to occur within or adjacent to the study area could result from construction activities. Potential temporary indirect impacts to nesting birds could occur as a result of excessive noise and increased human activity in close proximity to an active nest. Long-term indirect impacts could result from intense lighting adjacent to the Conservation Area, which could limit suitability of the native habitat for nesting birds, increased human activity in the vicinity of the Conservation Area, and an increase in the number of domestic pets, i.e. cats which may hunt and kill native wildlife if allowed to roam outdoors, or off-leash dogs which can also harm or kill wildlife. Impacts to nesting birds shall be mitigated to less than significant through nesting bird surveys and establishment of appropriate nest buffers, as described in MM-BIO-2 provided in Section 5.5 below, and lighting, increased human activity, and domestic pet impacts would be less than significant with implementation of MM-BIO-1.

5.4.3 Vernal Pools

The study area does not support vernal pools and therefore is not expected to support special-status plant or wildlife species associated with vernal pools, such as listed large branchiopods. No impacts to vernal pools would occur as a result of the proposed project.

5.5 Mitigation and Impact Avoidance Measures

The following measures are recommended to ensure that the proposed project is implemented in accordance with the City's General Plan, CEQA, and other pertinent local, state, and federal guidelines and regulations.

While the proposed project would not result in direct impacts to sensitive vegetation communities, special-status plants with a CRPR of 1 or 2, or potential jurisdictional resources, these resources are present in the channel area which is located adjacent to the impact areas, and thus are subject to potential short and long-term indirect impacts as described 5.2 and 5.3 above. Indirect impacts would be avoided and would be less than significant with implementation of MM-BIO-1.

The California Fish and Game Code protects bird nests and the MBTA prohibits the intentional take of any migratory bird or any part, nest, or eggs of any such bird. Construction-related ground-disturbing activities (clearing, grubbing, grading) or other activities that result in the removal of vegetation that occur during the nesting bird season, or any impacts to active nests or the young of nesting bird species, as well as impacts to raptors that could nest in the mature trees in or adjacent to the study area, would be significant. This impact shall be mitigated to less than significant through nesting bird surveys and establishment of appropriate buffers, as described in MM-BIO-2.

MM-BIO-1 Sensitive Vegetation and Resources Protection. Indirect impacts to sensitive riparian and wetland vegetation communities, sensitive habitat, and jurisdictional aquatic resources located within the existing Conservation Area, which will remain under the City's jurisdiction, shall be avoided through implementation of the following measures.

a. All proposed lighting systems associated with proposed future development shall comply with City standards for shielded low sodium, low wattage lighting designed to cut glare and light scatter and to direct light away from the Conservation Area.
b. Signage shall be installed by the project applicant or its designee along the development/open space interface and/or shall be provided at existing buildings where determined appropriate by the City for the purpose of identifying sensitive habitats and educating visitors and residents of sensitive habitats and/or restoration efforts. Signage shall include information regarding the importance of not allowing pets to roam outdoors and off-leash, both for the safety of pets and to protect native wildlife.
c. The Conservation Area shall be strategically fenced to ensure habitat protection and to minimize conflicts with adjacent neighborhoods. All necessary fencing shall be designed to allow for wildlife passage but deter human use of the Conservation Area. The Conservation Area shall be fenced using permanent chain-link fencing.
d. The limits of work shall be clearly defined and marked in the field and reviewed by a qualified biologist for consistency against the approved grading plan prior to initiation of project construction.

e. All site preparation and construction activities shall incorporate standard erosional best management practices (BMPs) including, but not limited to, straw bales, gravel bags, sand bags, the periodic watering of bare areas, and the direction of construction area drainage to existing storm drain facilities.

f. All equipment maintenance, staging areas, and dispensing of fuel, oil, or other toxicants shall occur in designated upland areas at least 50 feet from the Conservation Area.

g. Install silt fencing and other silt containment devices where necessary to prevent off-site transport of sediment and pollutants. Install oil and grease traps at any storm drain inlets which are adjacent to or within work areas.

h. Any post-construction BMPs shall be described in a Stormwater Management Plan to illustrate how runoff from proposed developments will be treated prior to its discharge into the drainage.

MM-BIO-2 Nesting Bird Surveys. Construction-related ground-disturbing activities (e.g., clearing/grubbing, grading, and other intensive activities) that occur during the breeding season (February 15 through August 31 for most species, and from January 15 through August 31 for raptors,) shall require a one-time biological survey for nesting bird species to be conducted by a qualified biologist within the limits of work within 72 hours prior to construction. This survey is necessary to ensure avoidance of impacts to nesting raptors and/or birds protected by the federal Migratory Bird Treaty Act and California Fish and Game Code, Sections 3503 and 3513. If any active nests are detected, the area shall be flagged and mapped on the construction plans or a biological resources figure, and the information provided to the construction supervisor and any personnel working near the nest buffer. Active nests shall have "no work zone" buffers established around them (e.g., 250 feet for passerines to 500 feet for raptors) by the project biologist in the field with brightly colored flagging tape, conspicuous fencing, or other appropriate barriers or signage. The project biologist shall serve as a construction monitor during those periods when construction activities occur near active nest areas to avoid inadvertent impacts to these nests. The project biologist may adjust the 250-foot or 500-foot setback at their discretion depending on the species and the location of the nest (e.g., if the nest is well protected in an area buffered by dense vegetation). However, if needed, additional qualified monitor(s) shall be provided in order to monitor active nest(s) or other project activities in order to ensure all of the project biologist's duties are completed. Once the nest is no longer occupied for the season as determined by the project biologist, construction may proceed in the setback areas.

If construction activities, particularly clearing/grubbing, grading, and other intensive activities, stop for more than 3 days, an additional nesting bird survey shall be conducted within the proposed impact area.

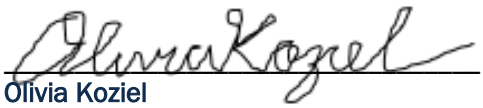
5.6 Consistency with Local and Regional Resource Planning

The proposed project would be consistent with the goals of the MHCP as well as with the San Marcos General Plan's goals and policies relating to natural resources included in section 2.3.2 above (City of San Marcos 2021). The study area is not within a designated Biological Core and Linkage Area or a MHCP Focused Planning Area. Sensitive biological resources in the study area, including potential jurisdictional aquatic resources, sensitive vegetation communities and habitat, and plants with a CRPR of 1 or 2, would be conserved. The Conservation Area contains

native habitat which has already been greatly enhanced through the recent restoration efforts, and sensitive habitat within the study area as well as any sensitive wildlife it supports would be protected through the measures of the proposed project, consistent with Goal COS-1 of the General Plan (City of San Marcos 2021). The proposed project would also be consistent with Policy 2.6 of Goal COS-2 of the General Plan, as project implementation would not be expected to result in the removal of healthy, mature trees (City of San Marcos 2021). Implementation of the project would introduce a landscape plan and more vegetation and trees than what currently exists in the study area, which would accomplish more than the 1:1 tree replacement rate required in the case that any trees within the study area are removed and are considered to be mature at the time clearing occurs for the proposed project. With implementation of proposed mitigation measures MM-BIO-1 and MM-BIO-2, the proposed project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other applicable plan related to biological resources.

Should you have any questions regarding this report and its findings, please do not hesitate to contact me at 760.557.0545 or at okoziel@dudek.com.

Sincerely,



Olivia Koziel

Vascular Species

Eudicots

AMARANTHACEAE – AMARANTH FAMILY

* *Amaranthus albus* – prostrate pigweed

ANACARDIACEAE – SUMAC OR CASHEW FAMILY

Malosma laurina – laurel sumac

Rhus integrifolia – lemonade berry

APIACEAE – CARROT FAMILY

* *Foeniculum vulgare* – fennel

ASTERACEAE – SUNFLOWER FAMILY

Ambrosia psilostachya – western ragweed

Artemisia californica – California sagebrush

Artemisia douglasiana – Douglas' sagewort

Artemisia palmeri – San Diego sagewort

Baccharis pilularis – coyote brush

Baccharis salicifolia – mulefat

Baccharis sarothroides – desertbroom

* *Centaurea melitensis* – Maltese star-thistle
* *Dittrichia graveolens* – stinkwort

Erigeron canadensis – Canadian horseweed

Heterotheca grandiflora – telegraphweed

Isocoma menziesii – Menzies's golden bush

Iva hayesiana – San Diego marsh-elder

* *Lactuca serriola* – prickly lettuce

Pluchea odorata – sweetscent

Stephanomeria diegensis – San Diego wirelettuce

BRASSICACEAE – MUSTARD FAMILY

* *Hirschfeldia incana* – shortpod mustard

CACTACEAE – CACTUS FAMILY

Opuntia littoralis – coast prickly pear

CHENOPODIACEAE – GOOSEFOOT FAMILY

* *Salsola australis* – Russian thistle
* *Salsola tragus* – prickly Russian thistle

EUPHORBIACEAE – SPURGE FAMILY

* *Euphorbia maculata* – spotted sandmat

FABACEAE – LEGUME FAMILY

* *Acacia cyclops* – coastal wattle
* *Melilotus albus* – yellow sweetclover
* *Melilotus indicus* – annual yellow sweetclover
* *Senna didymobotrya* – African senna

GERANIACEAE – GERANIUM FAMIL

* *Erodium botrys* – longbeak stork's bill

LAMIACEAE – MINT FAMILY

* *Marrubium vulgare* – horehound

MYRSINACEAE – MYRSINE FAMILY

* *Lysimachia arvensis* – scarlet pimpernel

MYRTACEAE – MYRTLE FAMILY

* *Eucalyptus* spp. – Eucalyptus
* *Melaleuca citrina* – crimson bottlebrush

ONAGRACEAE – EVENING PRIMROSE FAMILY

Epilobium brachycarpum – tall annual willowherb

Oenothera elata ssp. hookeri – Hooker's evening primrose

PLANTAGINACEAE – PLANTAIN FAMILY

* *Kickxia elatine* – sharpleaf cancerwort
* *Plantago lanceolata* – narrowleaf plantain

PLATANACEAE – PLANE TREE, SYCAMORE FAMILY

Platanus racemosa – California sycamore

POLYGONACEAE – BUCKWHEAT FAMILY

* *Polygonum aviculare* – prostrate knotweed
* *Rumex crispus* – curly dock

ROSACEAE – ROSE FAMILY

Rosa californica – California rose

SALICACEAE – WILLOW FAMILY

Populus fremontii – Fremont cottonwood

Salix gooddingii – Goodding's willow

Salix laevigata – red willow

Salix lasiolepis – arroyo willow

SOLANACEAE – NIGHTSHADE FAMILY

Datura wrightii – sacred thorn-apple

* *Nicotiana glauca* – tree tobacco

TAMARICACEAE – TAMARISK FAMILY

* *Tamarix ramosissima* – tamarisk

Monocots

ARECACEAE – PALM FAMILY

* *Washingtonia robusta* – Washington fan palm

CYPERACEAE – SEDGE FAMILY

Cyperus eragrostis – tall flatsedge

Schoenoplectus californicus – California bulrush

POACEAE – GRASS FAMILY

Bothriochloa barbinodis – cane bluestem

* *Bromus diandrus* – ripgut brome
* *Bromus rubens* – red brome
* *Cynodon dactylon* – Bermudagrass
* *Muhlenbergia rigens* – deer grass
* *Pennisetum setaceum* – fountain grass
* *Schismus barbatus* – common Mediterranean grass

TYPHACEAE – CATTAIL FAMILY

Typha domingensis – southern cattail

Subject: Archaeological Resources Inventory Report for the Marcos Specific Plan Project in San Marcos, California

Dear Mr. Bennett:

This letter documents the archaeological resources inventory conducted by Dudek for the Marcos Specific Plan Project (Project), located in the City of San Marcos, California (Figure 1). The Project would consist of 102 multi-family residential units, 7,658 square feet (sf) of office space, and 49,266 sf of specialty retail space on the on the 11.07-acre Project area (Figure 1). The City of San Marcos (City) is the lead agency responsible for compliance with the California Environmental Quality Act (CEQA). In accordance with CEQA, Dudek performed an archaeological resources inventory for the entire Project area, which consists of 11.07 acres that encompasses two parcels (Assessor Parcel Numbers [APNs] 219-152-14-00, 219-152-40, 42, 44, 45, 51, 61) (Figure 2). The report was prepared under the direct supervision of Dudek archaeologist Angela Pham, M.A., RPA, who meets the Secretary of the Interior's Standards for archaeology.

A records search for the Project including a surrounding one-mile radius search buffer was conducted by Dudek at the South Coastal Information Center (SCIC). The records search identified one cultural resource (CA-SDI-22954) within the Project area, which consists of a historic-age trash scatter. Moreover, an additional 47 cultural resources were identified within the one-mile buffer. A Native American Heritage Commission (NAHC) Sacred Lands File (SLF) search was requested on October 10, 2022. The results were received on November 30, 2022, and the SLF search is negative.

Based on historic aerials, portions of the Project area were graded and developed between the mid-1960s and late 1970s. Further, undocumented fill was likely deposited throughout the entire Project area ranging from 0 feet to 5 feet below ground surface, as described in the geotechnical report (Geotek 2021).

One previously recorded site, CA-SDI-22954, a historic-age trash scatter with approximately 60-70 artifacts comprised of glass fragments, metal fragments, and a small number of ceramics, was previously recorded within the Project area. The site was previously found not eligible for the National Register of Historic Places (NRHP). However, the site was not identified during the pedestrian survey and was determined to be destroyed by the restoration work along Los Posas Creek. It is not a historical resource as defined by CEQA.

Due to the presence of a cultural resource within the Project area, and a plethora of cultural resources within one-mile of the Project area, there is a moderate potential of identifying intact subsurface archaeological deposits during Project implementation, especially within the older alluvium sediments below the fill. Dudek recommends cultural resources monitoring, consisting of a qualified archaeological monitor and Luiseno Native American monitor, during all initial ground disturbing within native undisturbed soils. Monitoring can be reduced or terminated should no discoveries are made or if documentation is provided which demonstrates that ground-disturbing activities will be occurring in sediments with no potential for cultural resources.

1 Project Description and Location

The Project is located at the corner of Grand Avenue and Linda Vista Avenue, in the City of San Marcos (APN 219-152-14-00, 219-152-40, 42, 44, 45, 51, 61). The Project area falls within Section 10 of Township 12 South, Range 3 West of the San Marcos California 7.5-minute Quadrangle (Figure 1). The Project area has been previously disturbed and has several large, paved portions to the east and south. The Project area is located in an urban area of the City, surrounded on all sides by existing development, including Grand Avenue immediately to the north, commercial uses to the west, south, and east. There is also a vacant lot across Linda Vista Drive to the east. The Project area is relatively flat but will require some cut and fill. The East-End Planning Area will cut approximately 2,065 cubic yards (CY) of material, fill approximately 2,635 CY of material with approximately 570 CY of the fill coming from import material. The West-End Planning Area will require approximately 70 CY of cut, 15,680 CY of fill of which approximately 15,610 CY will come from import material. The Project includes a maximum height of 45 feet or 3 stories for the multi-family residential component (western portion of the Project area), and a maximum building height of 60 feet (65 feet with architectural projections) for the retail/office component (eastern portion of the Project area).

The Project consists of 102 multi-family residential units, 7,658 square feet (sf) of office space, and 49,266 sf of specialty retail space on the on the 11.07-acre Project area (Figure 2).

2 Regulatory Framework

2.1 The California Register of Historic Resources (Public Resources Code section 5020 et seq.)

Under CEQA, the term “historical resource” includes but is not limited to “any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California” (California Public Resources Code section 5020.1(j)). In 1992, the California legislature established CRHR “to be used by state and local agencies, private groups, and citizens to identify the state’s historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change” (California Public Resources Code section 5024.1(a)). A resource is eligible for listing in the CRHR if the State Historical Resources Commission determines that it is a significant resource and that it meets any of the following NRHP criteria:

- Associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
- Associated with the lives of persons important in our past.
- Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
- Has yielded, or may be likely to yield, information important in prehistory or history.

(California Public Resources Code section 5024.1(c).) Resources less than 50 years old are not considered for listing in the CRHR, but may be considered if it can be demonstrated that sufficient time has passed to understand the historical importance of the resource (see 14 CCR, section 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing on the NRHP are automatically listed on the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys. The State Historic Preservation Officer maintains the CRHR.

2.2 Native American Historic Cultural Sites (California Public Resources Code section 5097 et seq.)

State law addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction; establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project; and establishes the NRHC to resolve disputes regarding the disposition of such remains. In addition, the Native American Historic Resource Protection Act makes it a misdemeanor punishable by up to 1 year in jail to deface or destroy an Indian historic or cultural site that is listed or may be eligible for listing in the CRHR.

2.3 California Native American Graves Protection and Repatriation Act

The California Native American Graves Protection and Repatriation Act (California Repatriation Act), enacted in 2001, required all state agencies and museums that receive state funding and that have possession or control over collections of human remains or cultural items, as defined, to complete an inventory and summary of these remains and items on or before January 1, 2003, with certain exceptions. The California Repatriation Act also provides a process for the identification and repatriation of these items to the appropriate tribes.

2.4 California Environmental Quality Act

As described further below, the following CEQA statutes and CEQA Guidelines are of relevance to the analysis of archaeological and historic resources:

1. California Public Resources Code section 21083.2(g): Defines "unique archaeological resource."

2. California Public Resources Code section 21084.1 and CEQA Guidelines section 15064.5(a): Define historical resources. In addition, CEQA Guidelines section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource;" it also defines the circumstances when a project would materially impair the significance of a historical resource.
3. California Public Resources Code section 5097.98 and CEQA Guidelines section 15064.5(e): Set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
4. California Public Resources Code sections 21083.2(b)-(c) and CEQA Guidelines section 15126.4: Provide information regarding the mitigation framework for archaeological and historic resources, including options of preservation-in-place mitigation measures; preservation-in-place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context, and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

Under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California Public Resources Code section 21084.1; CEQA Guidelines section 15064.5(b)). If a site is either listed or eligible for listing in the CRHR, or if it is included in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of California Public Resources Code section 5024.1(q)), it is a "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (California Public Resources Code section 21084.1; CEQA Guidelines section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (California Public Resources Code section 21084.1; CEQA Guidelines section 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines section 15064.5(b)(1); California Public Resources Code section 5020.1(q)). In turn, the significance of a historical resource is materially impaired when a project:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA.

See Section 2.7, below for a discussion of the CEQA guidelines for determining significance and mitigating impacts to unique archaeological resources.

2.5 California Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98

CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in California Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98.

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. Health and Safety Code Section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the County coroner has examined the remains (California Health and Safety Code Section 7050.5[b]). If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (California Health and Safety Code Section 7050.5[c]). In accordance with California Public Resources Code Section 5097.98(a), the NAHC will notify the Most Likely Descendant (MLD). With the permission of the landowner, the MLD may inspect the site of discovery. Within 48 hours of being granted access to the site, the MLD may recommend means of treatment or disposition, with appropriate dignity, of the human remains and associated grave goods.

2.6 Assembly Bill 52

California Assembly Bill 52, which took effect July 1, 2015, establishes a consultation process between California Native American Tribes and lead agencies in order to address tribal concerns regarding project impacts and mitigation to "tribal cultural resources" (TCR). Public Resources Code section 21074(a) defines TCRs and states that a project that has the potential to cause a substantial adverse change to a TCR is a project that may have an adverse effect on the environment. A TCR is defined as a site, feature, place, cultural landscape, sacred place, and object with cultural value to a California Native American tribe that is either:

1. listed or eligible for listing in the CRHR or a local register of historical resources, or
2. determined by a lead agency to be a TCR.

2.7 Senate Bill 18

California Senate Bill 18 (SB 18), which took effect on March 1, 2005, requires local (city and county) governments to consult with California Native American tribes identified by the Native American Heritage Commission (NAHC) for the purpose of protecting, and/or mitigating impacts to cultural places in creating or amending general plans and specific plans (Government Code section 65352.3).

2.8 Guidelines for Determining Significance

According to CEQA (§15064.5b), a project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. CEQA defines a substantial adverse change:

> Substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired.

The significance of an historical resource is materially impaired when a project:

- Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the CRHR; or
- Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
- Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its eligibility for inclusion in the CRHR as determined by a lead agency for purposes of CEQA.

Section 15064.5(c) of CEQA applies to effects on archaeological sites and contains the following additional provisions regarding archaeological sites:

- When a project will impact an archaeological site, a lead agency shall first determine whether the site is an historical resource, as defined in subsection (a).
- If a lead agency determines that the archaeological site is a historical resource, it shall refer to the provisions of Section 21084.1 of the Public Resources Code, and this section, Section 15126.4 of the Guidelines, and the limits contained in Section 21083.2 of the Public Resources Code do not apply.
- If an archaeological site does not meet the criteria defined in subsection (a), but does meet the definition of a unique archaeological resource in Section 21083.2 of the Public Resources Code, the site shall be treated in accordance with the provisions of section 21083.2. The time and cost limitations described in Public Resources Code Section 21083.2 (c–f) do not apply to surveys and site evaluation activities intended to determine whether the project location contains unique archaeological resources.
- If an archaeological resource is neither a unique archaeological nor a historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment. It shall be sufficient that both the resource and the effect on it are noted in the Initial Study or Environmental Impact Report (EIR), if one is prepared to address impacts on other resources, but they need not be considered further in the CEQA process.

Section 15064.5(d) and (e) contain additional provisions regarding human remains. Regarding Native American human remains, paragraph (d) provides:

> When an initial study identifies the existence of, or the probable likelihood of, Native American human remains within the project, a lead agency shall work with the appropriate Native Americans

> as identified by the Native American Heritage Commission as provided in Public Resources Code SS5097.98. The applicant may develop an agreement for treating or disposing of, with appropriate dignity, the human remains and any items associated with Native American burials with the appropriate Native Americans as identified by the Native American Heritage Commission. Action implementing such an agreement is exempt from:
>
> 1. The general prohibition on disinterring, disturbing, or removing human remains from any location other than a dedicated cemetery (Health and Safety Code Section 7050.5); and
> 2. The requirement of CEQA and the Coastal Act.

Under CEQA, an EIR is required to evaluate any impacts on unique archaeological resources (California Public Resources Code section 21083.2.) A "unique archaeological resource" is defined as:

> [A]n archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:
>
> 1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
> 2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
> 3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

(California Public Resources Code section 21083.2(g)). An impact to a non-unique archaeological resource is not considered a significant environmental impact and such non-unique resources need not be further addressed in the EIR (Public Resources Code section 21083.2(a); CEQA Guidelines section 15064.5(c)(4)).

As stated above, CEQA contains rules for mitigation of "unique archaeological resources." For example, "[i]f it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts to be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. Examples of that treatment, in no order of preference, may include, but are not limited to, any of the following:

1. Planning construction to avoid archaeological sites.
2. Deeding archaeological sites into permanent conservation easements.
3. Capping or covering archaeological sites with a layer of soil before building on the sites.
4. Planning parks, greenspace, or other open space to incorporate archaeological sites." (Pub. Resources Code section 21083.2(b)(1)-(4).)

Public Resources Code section 21083.2(d) states that "[e]xcavation as mitigation shall be restricted to those parts of the unique archaeological resource that would be damaged or destroyed by the project. Excavation as mitigation shall not be required for a unique archaeological resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, if this determination is documented in the environmental impact report."

The rules for mitigating impacts to archaeological resources to qualify as "historic resources" are slightly different. According to CEQA Guidelines section 15126.4(b)(3), "[p]ublic agencies should, whenever feasible, seek to avoid damaging effects on any historic resource of an archaeological nature. The following factors shall be considered and discussed in an EIR for a project involving such an archaeological site:

A. Preservation in place is the preferred manner of mitigating impacts to archaeological sites. Preservation in place maintains the relationship between artifacts and the archaeological context. Preservation may also avoid conflict with religious or cultural values of groups associated with the site.
B. Preservation in place may be accomplished by, but is not limited to, the following:
    1. Planning construction to avoid archaeological sites;
    2. Incorporation of sites within parks, greenspace, or other open space;
    3. Covering the archaeological sites with a layer of chemically stable soil before building tennis courts, parking lots, or similar facilities on the site[; and]
    4. Deeding the site into a permanent conservation easement.

Thus, although section 21083.2 of the Public Resources Code, in addressing "unique archaeological sites," provides for specific mitigation options "in no order of preference," CEQA Guidelines section 15126.4(b), in addressing "historical resources of an archaeological nature," provides that "[p]reservation in place is the preferred manner of mitigating impacts to archaeological sites."

Under CEQA, "[w]hen data recovery through excavation is the only feasible mitigation," the lead agency may cause to be prepared and adopt a "data recovery plan," prior to any excavation being undertaken. The data recovery plan must make "provision for adequately recovering the scientifically consequential information from and about the historic resource." (CEQA Guidelines section 15126.4(b)(3)(C).) The data recovery plan also "must be deposited with the California Historical Resources Regional Information Center." (*Ibid*.) Further, "[i]f an artifact must be removed during project excavation or testing, curation may be an appropriate mitigation." (*Ibid*.)

However, "[d]ata recovery shall not be required for an historical resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the archaeological or historic resource, provided that determination is documented in the EIR and that the studies are deposited with the California Historical Resources Regional Information Center." (CEQA Guidelines section 15126.4(b)(3)(D).)

2.9 City of San Marcos General Plan

The Conservation and Open Space Element of the City's General Plan (adopted in 2012 and updated in 2013) describes the cultural and paleontological resources, regulatory framework, and policies and plans to protect such resources (City of San Marcos 2013). The planning goals and policies are described below.

The City of San Marcos Goal COS-11, in the Goals and Policies section, consists of three policies to assist in the implementation of preserving paleontological resources. The City's goal is to "continue to identify and evaluate cultural, historical, archaeological, paleontological, and architectural resources for protection from demolition and inappropriate actions" in compliance with CEQA guidelines (City of San Marcos 2013). The three policies pertain to the protection of the above resources. In summary, the policies are meant to: (1) identify and protect cultural resources; (2) prevent the destruction or removal of a historic structure without evaluating it and assessing the

possible preservation alternatives; and (3) identify "opportunities for adaptive reuse of historic sites and buildings to preserve and maintain their viability" (City of San Marcos 2013).

3.0 City of San Marcos Archaeological and Historical Resources Consultant Guidelines

The City of San Marcos published guidelines for archaeological and historical resources consultants in January 2023. The guidelines are generally meant to aide third party consultants who prepare archaeological or architectural history inventories, surveys, evaluations, and other technical documents. These guidelines include information pertaining to the minimum qualifications, records searches, tribal outreach, pedestrian surveys, reporting, research design, findings, discussion and evaluations, management conclusions, references, and appendices of inventories, surveys, evaluations, and other technical documents (City San Marcos 2023).

4 Project Background

4.1 Natural Setting

The Project area is located at the northwest corner of Grand Avenue and Linda Vista Drive in the City of San Marcos. The existing Project area has been previously disturbed and is currently developed with paved areas in the eastern and southern sections, and billboards in the northern section. The Project area is generally flat, and there is little to no topographic variation. The Project area is located in an urban area of the City surrounded on all sides by existing development, including commercial and industrial uses to the north, east, south, and west. Highway 78 is also less than 30 meters north of the Project area. Las Posas Creek transects the Project area and flows to the south and southwest. Vegetation adjacent to Los Posas Creek includes cattails, tumbleweeds, low-lying dry grasses.

4.2 Prehistoric Context

Evidence for continuous human occupation in Southern California spans the last 10,000 years. Various attempts to parse out variability in archaeological assemblages over this broad time frame have led to the development of several cultural chronologies; some of these are based on geologic time, most are based on temporal trends in archaeological assemblages, and others are interpretive reconstructions. Each of these reconstructions describes essentially similar trends in assemblage composition in more or less detail. This research employs a common set of generalized terms used to describe chronological trends in assemblage composition: Paleoindian (pre-5500 BC), Archaic (8000 BC–AD 500), Late Prehistoric (AD 500–1769), and Ethnohistoric (post-AD 1769).

4.2.1 Paleoindian Period (pre-5500 BC)

Evidence for Paleoindian occupation in coastal Southern California is tenuous, especially considering the fact that the oldest dated archaeological assemblages look nothing like the Paleoindian artifacts from the Great Basin. One of the earliest dated archaeological assemblages in coastal Southern California (excluding the Channel Islands) derives from CA-SDI-4669/W-12, in La Jolla. A human burial from CA-SDI-4669 was radiocarbon dated to 9,590–9,920 years before present (95.4% probability) (Hector 2007). The burial is part of a larger site complex that contained more than 29 human burials associated with an assemblage that fits the Archaic profile (i.e., large amounts of ground stone, battered cobbles, and expedient flake tools). In contrast, typical Paleoindian

assemblages include large stemmed projectile points, high proportions of formal lithic tools, bifacial lithic reduction strategies, and relatively small proportions of ground stone tools. Prime examples of this pattern are sites that were studied by Emma Lou Davis (1979) on Naval Air Weapons Station China Lake near Ridgecrest, California. These sites contained fluted and unfluted stemmed points and large numbers of formal flake tools (e.g., shaped scrapers, blades). Other typical Paleoindian sites include the Komodo site (CA-MNO-679)— a multicomponent fluted point site, and CA-MNO-680—a single component Great Basined Stemmed point site (see Basgall et al. 2002). At CA-MNO-679 and -680, ground stone tools were rare while finely made projectile points were common.

Turning back to coastal Southern California, the fact that some of the earliest dated assemblages are dominated by processing tools runs counter to traditional notions of mobile hunter–gatherers traversing the landscape for highly valued prey. Evidence for the latter—that is, typical Paleoindian assemblages—may have been located along the coastal margin at one time, prior to glacial desiccation and a rapid rise in sea level during the early Holocene (pre-7500 BP) that submerged as much as 1.8 kilometers of the San Diego coastline. If this were true, however, it would also be expected that such sites would be located on older landforms near the current coastline. Some sites, such as CA-SDI-210 along Agua Hedionda Lagoon, contained stemmed points similar in form to Silver Lake and Lake Mojave projectile points (pre-8000 BP) that are commonly found at sites in California's high desert (see Basgall and Hall 1993). CA-SDI-210 yielded one corrected radiocarbon date of 8520–9520 BP (see Warren et al. 2004). However, sites of this nature are extremely rare and cannot be separated from large numbers of milling tools that intermingle with old projectile point forms.

Warren et al. (2004) claimed that a biface manufacturing tradition present at the Harris site complex (CA-SDI-149) is representative of typical Paleoindian occupation in the San Diego region that possibly dates between 10,365 and 8200 BC (Warren et al. 2004). Termed San Dieguito (see also Rogers 1945), assemblages at the Harris site are qualitatively distinct from most others in the San Diego region because the site has large numbers of finely made bifaces (including projectile points), formal flake tools, a biface reduction trajectory, and relatively small amounts of processing tools (see also Warren 1964, 1968). Despite the unique assemblage composition, the definition of San Dieguito as a separate cultural tradition is hotly debated. Gallegos (1987, 1991) suggested that the San Dieguito pattern is simply an inland manifestation of a broader economic pattern. Gallegos' interpretation of San Dieguito has been widely accepted in recent years, in part because of the difficulty in distinguishing San Dieguito components from other assemblage constituents. In other words, it is easier to ignore San Dieguito as a distinct socioeconomic pattern than it is to draw it out of mixed assemblages.

The large number of finished bifaces (i.e., projectile points and non-projectile blades), along with large numbers of formal flake tools at the Harris site complex, is very different than nearly all other assemblages throughout the San Diego region, regardless of age. Warren et al. (2004) made this point, tabulating basic assemblage constituents for key early Holocene sites. Producing finely made bifaces and formal flake tools implies that relatively large amounts of time were spent for tool manufacture. Such a strategy contrasts with the expedient flake-based tools and cobble-core reduction strategy that typifies non-San Dieguito Archaic sites. It can be inferred from the uniquely high degree of San Dieguito assemblage formality that the Harris site complex represents a distinct economic strategy from non-San Dieguito assemblages.

San Dieguito sites are rare in the inland valleys, with one possible candidate, CA-RIV-2798/H, located on the shore of Lake Elsinore. Excavations at Locus B at CA-RIV-2798/H produced a toolkit consisting predominately of flaked stone tools, including crescents, projectile points, and bifaces, and lesser amounts of groundstone tools (handstones and millingstones), among other items (Grenda 1997). A calibrated and reservoir corrected radiocarbon date from a shell

produced a date of 6630 BC. Grenda (1997) suggested this site represents seasonal exploitation of lacustrine resources and small game, and resembles coastal San Dieguito assemblages and spatial patterning.

If San Dieguito truly represents a distinct socioeconomic strategy from the non-San Dieguito Archaic processing regime, its rarity implies that it was not only short-lived, but that it was not as economically successful as the Archaic strategy. Such a conclusion would fit with other trends in Southern California deserts, wherein hunting-related tools are replaced by processing tools during the early Holocene (see Basgall and Hall 1993; Basgall and McGuire 1988).

4.2.2 Archaic Period (8000 BC–AD 500)

The more than 2,500-year overlap between the presumed age of Paleoindian occupations and the Archaic period highlights the difficulty in defining a cultural chronology in the San Diego region. If San Dieguito is the only recognized Paleoindian component in the San Diego region, then the dominance of hunting tools implies that it derives from Great Basin adaptive strategies and is not necessarily a local adaptation. Warren et al. (2004) admitted as much, citing strong desert connections with San Dieguito. Thus, the Archaic pattern is the earliest local socioeconomic adaptation in the San Diego region (see Hale 2001, 2009).

The Archaic pattern is relatively easy to define with assemblages that consist primarily of processing tools: millingstones, handstones, battered cobbles, heavy crude scrapers, incipient flake-based tools, and cobble-core reduction. These assemblages occur in all environments across the San Diego region, with little variability in tool composition. Low assemblage variability over time and space among Archaic sites has been equated with cultural conservatism (see Byrd and Reddy 2002; Warren 1968; Warren et al. 2004). Despite enormous amounts of archaeological work at Archaic sites, little change in assemblage composition occurred until the bow and arrow was adopted at around AD 500, as well as ceramics at approximately the same time (Griset 1996; Hale 2009). Even then, assemblage formality remained low. After the bow was adopted, small arrow points appear in large quantities and already low amounts of formal flake tools are replaced by increasing amounts of expedient flake tools. Similarly, shaped millingstones and handstones decreased in proportion relative to expedient, unshaped ground stone tools (Hale 2009). Thus, the terminus of the Archaic period is equally as hard to define as its beginning because basic assemblage constituents and patterns of manufacturing investment remain stable, complimented only by the addition of the bow and ceramics.

4.2.3 Late Prehistoric Period (AD 500–1769)

The period of time following the Archaic and prior to ethnohistoric times (AD 1769) is commonly referred to as the Late Prehistoric (Rogers 1945; Wallace 1955; Warren et al. 2004). However, several other subdivisions continue to be used to describe various shifts in assemblage composition, including the addition of ceramics and cremation practices. In southwestern Riverside County and northern San Diego County, the post-A.D. 1450 period is called the San Luis Rey Complex (True 1980). Rogers (1929) also subdivided the last 1,000 years into the Yuman II and III cultures, based on the distribution of ceramics. Despite these regional complexes, each is defined by the addition of arrow points and ceramics, and the widespread use of bedrock mortars. Variances in the appearance of the bow and arrow and ceramics make the temporal resolution of the San Luis Rey complexes difficult. For this reason, the term Late Prehistoric is well-suited to describe the last 1,500 years of prehistory in this region.

Temporal trends in socioeconomic adaptations during the Late Prehistoric are poorly understood. This is partly due to the fact that the fundamental Late Prehistoric assemblage is very similar to the Archaic pattern, but includes arrow points, large quantities of fine debitage from producing arrow points, ceramics, and cremations. The

appearance of mortars and pestles is difficult to place in time because most mortars are found on bedrock surfaces; bowl mortars are actually rare in this region. Some argue that the ethnohistoric intensive acorn economy extends as far back as AD 500 (Bean and Shipek 1978). However, there is no substantial evidence that reliance on acorns, and the accompanying use of mortars and pestles, occurred prior to AD 1400. True (1980) argued that acorn processing and ceramic use in the northern San Diego region did not occur until the San Luis Rey pattern emerged after approximately AD 1450. Similar to True (1980), Hale (2009) argued that an acorn economy did not appear in the southern San Diego region until just prior to ethnohistoric times, and that when it did occur, a major shift in social organization followed. An acorn dependent economy likely appeared in southwestern Riverside County and Northern San Diego County around the same time, with equivalent social changes.

4.2.4 Ethnohistory

The proposed Project area lies within an area considered ancestral to the Luiseño. The Luiseño language belongs to the Cupan group of the Takic language branch of the Uto-Aztecan language family. Luiseño is a term given to Native Americans under the administration of Mission San Luis Rey, and later applied specifically to the Payomkawichum ethnic nation who were present in the region where the mission was founded. Meaning the "western people," the name Payomkawichum can also be applied to the closely related coastal Luiseño who lived north of the mission.

Luiseño territory was situated in the north half of San Diego County and the western edge of Riverside County. Their lands encompassed the southern Santa Margarita Mountains and the Palomar Mountains, and their foothills to the Pacific Ocean. The territory extended eastward into the San Jacinto Valley and the western foothills of the San Jacinto Mountains. Their neighbors to the were the Juaneño (Acjachemen) who spoke a Luiseño dialect; the Cahuilla and Cupeño to the east who spoke other Takic Cupan languages; and the Ipai (Kumeyaay) to the south who spoke a California-Delta Yuman language.

The Luiseño resided in permanent villages and associated seasonal camps. Village population ranged from 50–400 with social structure based on lineages and clans. A single lineage was generally represented in smaller villages, while multiple lineages and a dominant clan presided in larger villages. Each clan/village owned a resource territory and was politically independent, yet maintained ties to others through economic, religious, and social networks in the immediate region. There were contact period villages in the vicinity of this segment, near the towns of Vista, San Marcos, and Escondido, but researchers have been unable to place rancheria names from the mission registers with these locations.

Like other Indigenous California groups, the primary food staple was the acorn (Bean and Shipek 1978), supplemented by other plant resources, fish, shellfish, waterfowl, and marine and terrestrial mammals. Villages were situated near reliable sources of water, needed for the daily leaching of milled acorn flour. Other plant foods included pine nuts and grass seeds, manzanita, sunflower, sage, chia, lemonade berry, wild rose, holly-leaf cherry, prickly pear, and lamb's quarter. Large and small prey included deer, antelope, rabbit, jackrabbit, wood rat, mice, and ground squirrel, as well as quail, ducks, and other birds. Fish, such as trout, were caught in rivers and creeks.

The first direct European contact with the Luiseño occurred in July 1769 with the Spanish expedition led by Gaspar de Portolá. During the next six years, eight missions and forts were founded north and south of Luiseño territory. In 1776, Mission San Juan Capistrano was founded less than 10 miles north, and the populations of five northern Luiseño villages had been halved within 15 years. In 1798, Mission San Luis Rey was established within Luiseño territory, and the proselytizing among the Payomkawichum began in earnest.

Several Luiseño leaders signed the statewide 1852 treaty, locally known as the Treaty of Temecula (an interior Luiseño village), but the U.S. Congress never ratified it. By 1875, however, reservations for the Luiseño were established in the Palomar Mountains and nearby valleys, including Pala, Pauma, Rincon, Pechanga, and La Jolla.

4.3 Historic Period

Much of the area included within the City of San Marcos was originally part of Rancho Los Vallecitos de San Marcos. Before secularization of the missions, this land was one of the cattle-grazing tracts claimed by Mission San Luis Rey. In April of 1840, Governor Juan Bautista Alvarado granted the 8,877-acre Rancho Los Vallecitos de San Marcos (the Little Valleys of St. Mark) to Don José María Alvarado. Don José married Lugarda Osuna, daughter of the owner of San Dieguito Rancho, Don Juan María Osuna.

In 1846, shortly after the Battle of San Pasqual, Don José and ten other rancheros were captured by a band of Indians and taken to an Indian ranchería at Agua Caliente where they were slain (Bibb 1976; Moyer 1969:22). Lugarda later married Luis Machado, the owner of Rancho Buena Vista. It is unclear who owned Rancho Los Vallecitos de San Marcos in the years following her marriage, but in 1883 the U.S. Land Commission granted a patent to the rancho to Lorenzo Soto, who had fought against the Americans at the Battle of San Pasqual. Cave J. Couts, a former Army officer and owner of the adjacent Rancho Guajome and Buena Vista, later came into possession of the ranch. Couts ran cattle on the ranch, but did not build any substantial structures.

The transcontinental railroad connection to San Diego was completed in November 1885, resulting in an unprecedented real estate boom for San Diego City. The population of San Diego soared in the mid-1880s from a total population of 5,000 in 1885 to 40,000 in 1889 (MacPhail 1979). Settlers poured into San Diego, lured by real estate promotions offering a salubrious climate, cheap land, and the potential to realize great profits in agriculture and real estate. Speculators formed land companies and subdivided town sites throughout the county (Pourade 1964:167-191). The real estate boom also stimulated demand for agricultural land in the county, and the number of farms increased from 696 to 2,747 between 1880 and 1890 (Schaefer et al. 1994). This boom brought homesteaders to the San Marcos area. San Marcos was typical of the small agricultural communities that grew up in the hinterland of San Diego, characterized generally by widely dispersed settlements that were united by a common school district, post office, church, and general store (Van Wormer 1986a, 1986b, 1987).

Major Gustavus French Merriam from Topeka, Kansas made the first permanent settlement in the San Marcos area. Merriam homesteaded 160 acres in the north Twin Oaks Valley and began wine and honey production. German and Dutch immigrants began moving into the area in the early 1880s. In 1883 a few miles south of the settlement, John H. Barham founded the first town in the area, calling it Barham. By 1884, the town of Barham had a post office, blacksmith, feed store, and a weekly newspaper (City of San Marcos 2004). William Webster Borden published the town's first newspaper, called Our Paper and later The Plain Truth (Sherman 2001:44). Another small settlement called Buena grew up approximately 4 mi. northwest of Barham in the 1880s. By 1884, the town of Barham had a post office, blacksmith, feed store and weekly newspaper. A school was located here, but when the Vista Unified School District was formed in 1916, the former Vista, Buena, and Delpy school districts were subsumed into the new school district.

In 1887 Cave Couts' widow sold San Marcos Ranch to O. S. Hubbell, and he sold it to the San Marcos Land Company, headed by Jacob Gruendike, a San Diego Banker and his associate W. G. Jacobs, for $233,000. The San Marcos Land Company had been formed with the intention of developing a town site. The company laid out a town

site near the intersection of Grand Avenue and Rancho Santa Fe Road with 5- to 10-acre plots. A number of houses were built in addition to a hotel, post office and several stores. In 1892, there were 87 registered voters. In the late 1880s, the Santa Fe Railroad announced that it was going to lay tracks going through the valley. To the disappointment of the citizens, the tracks were laid 1 mi. away from the center of the town. The old town was abandoned in 1901, and many of the buildings were moved to the intersection of Mission and Pico (Moyer 1969:22-24). In 1903 the people of the town picked up their homes and moved a couple miles east along the railroad tracks to what now are Mission Road and Pico Avenue. By 1905, the town had every convenience, including rural mail delivery and telephone service. The first school in the area, which had started in Barham in 1880, was moved in 1889 to San Marcos. Later that same year, the Richland School was built, being the second school in San Marcos (City of San Marcos 2004).

San Marcos remained a quiet rural town through the first half of the twentieth century. While agriculture had dominated in the late 1800s and early 1900s, by the mid-1900s dairies and poultry production became a big part of the business in the town. San Marcos was chosen as the site of the future Palomar College in 1946. Classes initially took place in Vista, but Quonset huts were moved onto the San Marcos site in 1950 and the first permanent buildings were constructed in 1956. San Marcos experienced a period of growth from 1956 onward, when the first water from the Colorado River arrived. Population growth in San Marcos had been constrained by the lack of water resources in the region. The arrival of Colorado River water in the city in 1956, supplementing the existing local water supply, was a big boon to the city. After the arrival of water, several small businesses started and the population rapidly increased to 2,500. San Marcos, with a population of 3,200 residents, became incorporated on January 28, 1963. Through the 1960s, the city grew by a few thousand new residents, but in the 1970s, San Marcos was flourishing as the third-fastest growing city in the state, with a population of 17,479 by 1980. Growth has continued to boom in San Marcos, and in 2013 the population of the city was recorded at 89,387 (City of San Marcos 2004).

5 Methods

5.1 Records Search

A California Historical Resources Information Systems (CHRIS) records search of the Project area and a one-mile radius buffer was conducted by Dudek at the South Coastal Information Center (SCIC) on October 19 and November 2, 2022. The records search results indicate that 77 previous cultural resources studies have been conducted within one-mile of the Project area. Of the 77 previous studies, four studies intersect the Project area and are listed in Table 1 below. These studies consist of one archaeological report for the City of San Marcos General Plan Amendment, a cultural resources monitoring report, a draft environmental impact report, and an archaeological records search and literature review. The studies that do not intersect the area are included in a table in Confidential Appendix A. A review of the four reports indicates that approximately 10% of the Project area has been previously studied.

Table 1. Reports Intersecting Project Area

Report SD-18207, Cultural Resources Monitoring Report for the Los Posas and Grand Avenue Capital Improvement Project, City of San Marcos, San Diego County, California (Clark and Duran 2019), details Rincon Consultants' discovery and treatment of CA-SDI-22954, a historic-age trash scatter. Rincon Consultants submitted an incident report to the U.S. Army Corps of Engineers (USACE), which described the resource and recommended it ineligible for listing on the NRHP due to a lack of integrity. The USACE concurred with Rincon Consultants' recommendation and determined the site is not eligible. The State Historic Preservation Officer concurred with USACE's recommendation that the site not be included in the NRHP.

The SCIC records search identified one cultural resource (CA-SDI-22954), a historic-age trash scatter, within the Project area. The site is briefly discussed in the above paragraph and in more detail below. The records search also identified 47 cultural resources within the one-mile search radius buffer outside of the Project area (Table 2). Of the total 47 resources identified in the one-mile buffer, 30 are prehistoric sites, nine are historic sites, four are prehistoric isolates, three are multicomponent sites, and one resource lacks sufficient information to discern the age (Table 2). No historic addresses are located within the Project area, however, three are located within the one-mile search radius. The results of the records search and all DPR forms are attached as part of Confidential Appendix A.

CA-SDI-22954

CA-SDI-22954 consists of a historic-age trash scatter that was originally identified during cultural monitoring for the Los Posas Creek and Grand Avenue Capital Improvement Project in San Marcos in 2019 by Rincon Consultants. CA-SDI-22954 was recorded in the northern-central component of the current Project area, just south of Grand Avenue along the eastern bank of Los Posas Creek. It measures approximately 50 feet long (N/S) by 10 feet wide (E/W). The site consisted of approximately 60-70 artifacts, including bottle glass fragments (clear, brown, opaque, and blue), metal fragments, and a select few transfer print ceramics. Rincon Consultants' preliminary analysis of the makers' marks on several bottle bases suggested the artifacts likely dated to the 1920s and 1930s. Modern debris, such as a cassette tape and a few plastic bottles, were found intermixed with the historic trash scatter and suggested site disturbance. Rincon Consultants concluded that the site was probably an opportunistic dumping event. Rincon Consultants was also unable to associate the artifacts with a particular event or person. Due to the site's lack of integrity and disturbed nature, as well as the inability to directly associate the trash scatter with a particular event or person, the Rincon also recommended the site did not meet the eligibility requirements for listing on the NRHP under any criteria.

5.2 Archival Research

In addition to the SCIC records search, Dudek conducted an online review of historic aerial photographs of the Project area and general vicinity, to help determine the possible development and land use of the Project area in the past. Thirty-six historic aerial photographs of the Project area were available at various years from 1938 to 2020 (NETR 2022). The historic aerial photograph from 1938 reveals the Project area had a road intersecting the northwestern component of the Project area. It also appears that Grand Avenue is at the northern end of the Project boundary, and it was possibly paved. There also appears to be Las Posas Creek in the northern and central components of the Project area. No structures or land modifications (other than the roads) are identifiable in the image. The 1947 and 1953 aerials do not reveal any changes to the Project area. The 1964 aerial photo reveals approximately five small buildings, possibly residential buildings, adjacent to Grand Avenue at the northwest and northern sections of the Project area. The photograph also shows two small buildings, again possibly residential

buildings, near the southern section of the Project area, and the development of what appears to be present day Linda Vista Drive. The 1967 aerial photograph does not reveal significant changes. The 1978 aerial photograph shows more development in the center and northwestern sections of the Project area, as evidenced by a few more structures. The 1980 aerial photograph displays more distinct building development in the eastern section of the Project area. The 1980 aerial photograph also displays the possible demolition (or renovation/expansion) of at least two or three structures that began being visible in the 1964 aerial photograph, near the northern and southern aspects of the Project area. The 1981 through 1986 aerial photographs do not depict significant changes within the Project area. The 1987 aerial photograph possibly exhibits more building development in the central aspect of the Project area. The aerial photographs from 1988 through 1994 do not appear to reveal substantial changes within the Project area. The 1995 aerial photograph reveals slightly more building development within the Project area. The 1996 through 2010 historic aerial photographs do not indicate substantial changes to the Project area. The 2012 aerial photograph reveals structural demolition. The buildings that were demolished were near or at the northern, northwest, central, and eastern aspects of the Project area, which appear to be vacant pads in the 2012 aerial photograph. The buildings that were demolished generally begin appearing at the 1978 aerial photograph and continue increasing in number as the years progress, thus pointing to the likely destruction of modern structures by around 2012. The 2012 aerial photograph also displays the apparent demolition of the remaining structures from the 1964 photograph. The 2014 to 2020 aerial photographs do not appear to display significant changes to the Project area. The most recent 2020 aerial photograph does not display any structures within the Project area.

Historic topographic (topo) maps of the Project area also were reviewed. There are 18 topos available from various years from 1893 to 2018. The 1893 through 1965 topo maps do not show significant development within the Project area. The 1970 and 1979 topo maps reveal three structures within the Project area, and the structures generally resemble residential houses. The structures' locations on the 1970 and 1979 topographic maps appear to match the historical aerial photograph from 1964. The 1983 topographic map shows approximately ten new structures inside the Project area, which vary in size and generally correspond to the 1978 aerial photographs. The 2000 to 2018 topographic maps do not show substantial new development. The most recent topographic map from 2018 does not display any structures within the Project area.

5.3 Geotechnical Report Review

Geotek, Inc. conducted a geotechnical evaluation for the Project area in 2021. The evaluation included the summaries of previous geotechnical reports from earlier investigations within the Project area. The results of the reviews are summarized below.

Geobase, Inc. conducted investigations for the property next to the Project's southwest corner in 1990. Geobase's investigation consisted of two exploratory borings to a maximum depth of 20 feet below the surface. The boring logs for Geobase indicated about 1 to 1.5 feet of fill. Natural soils were encountered that consisted of "very stiff to hard sand clay, atop siltstone/sandstone bedrock at depths of about 4 to 4.5 feet" (Geotek 2021). Groundwater was recorded at 16.5-17 feet below grade.

In 1997, Vinje & Middleton Engineering, Inc., excavated four exploratory trenches were excavated to depths of between 8.5 to 10.5 feet below grade inside the northern-central portion of the current Project area, adjacent to Las Posas Creek (Geotek 2021). The investigation recorded 1.5 to 2 feet of fill within the trenches, which consisted of sandy to clayey soils. Alluvial deposits consisting of clays and interbedded sands were recorded below the fill

from approximately 6 feet below the surface. Bedrock, which consisted of sandstone and claystone, was recorded from 6 to 8.5 feet below the surface (Geotek 2021).

Geotek, Inc. also conducted geotechnical investigations within the Project area in April, May, and October of 2020. The investigations consisted of six hollow stem auger borings, eight percolation tests, and ten concrete core samples at various locations throughout the Project area (Geotek 2021). The borings maximum depth was between 10 to 50 feet below the surface. Half of the boring tests yielded a thin layer of asphalt on the surface. The investigations generally yielded asphalt (including a silty sand asphalt base) at maximum depths ranging from 3 inches to 8 inches below ground surface (bgs), artificial fill (sandy clay cuttings and clayey sand cuttings) at maximum depths ranging from 4 feet to 5 feet bgs, older alluvium (sandy clay and clayey sand with some silty sand) at maximum depths ranging from 4 feet to 5 feet bgs, and the beginning of the Santiago Formation (bedrock consisting of hard sandstone, clayey sandstone, and sandy claystone) at depths ranging from 4 feet to 10 feet bgs (Geotek 2021).

5.4 NAHC and Tribal Correspondence

Dudek requested a Native American Heritage Commission (NAHC) search of the Sacred Lands File (SLF) on October 10, 2022, for the Project area. The SLF consists of a database of known Native American resources. These resources may not be included in the SCIC database. The NAHC responded on November 30, 2022. The results were negative. The NAHC also provided a contact list of Native American representatives for tribes that are traditionally affiliated with the Project area. Outreach letters with a map and description of the planned Project were sent to these individuals and organizations on December 13, 2022. To date, one letter response has been received. A response was received by the San Pasqual Band of Mission Indians on January 13, 2023, which stated that the Project area is within the Tribe's Traditional Use Area, and the Tribe desires to engage in formal government to government consultation. Any additional tribal correspondence received will be forwarded to the City and included in the subsequent drafts of this report.

In compliance with Assembly Bill 52 and Senate Bill 18, the City, as lead agency, is responsible for conducting government to government consultation with pertinent tribal entities.

5.5 Intensive Pedestrian Survey

The intensive pedestrian survey was conducted by Dudek archaeologist David Faith on October 28, 2022, using standard archaeological procedures and techniques that meet the Secretary of Interior's standards and guidelines for cultural resources inventory. Jessica Alexander, a Luiseño monitor with Saving Sacred Sites, was also present during the entire pedestrian survey. The intensive level survey methods consisted of a walking 10 meter-wide transects across the Project area. The ground surface was examined for prehistoric artifacts (e.g., flaked stone tools, tool-making debris, stone milling tools, ceramics, fire-affected rock), soil discoloration that might indicate the presence of a cultural midden, soil depressions, features indicative of the current or former presence of structures or buildings (e.g., standing exterior walls, post holes, foundations), and historic-age artifacts (e.g., metal, glass, ceramics, building materials). Ground disturbances such as burrows, cut banks, and drainages were also visually inspected for exposed subsurface materials.

The Project area is significantly disturbed. Disturbances include several push piles, billboards, wood debris, drainage culverts, gravel piles, and restoration along Las Posas Creek. The western component of the Project area

shows evidence of being graded as evidenced by an elevated earthen berm adjacent to the bridge. The Project area is generally flat with little to no topographic variation. Asphalt covers most of the eastern and southern portions of the Project area. The western half of the Project area is a vacant field. Las Posas Creek transects the Project area from the north to the southwest corner near the southwest corner of the Project area. There is a modern-looking bridge that spans over the creek as well. Visibility within the entire Project area was excellent (80-100 %) in areas with no dense vegetation present. The only exception is near Las Posas Creek, which was low visibility (0-20%). The primary vegetation noted included tumbleweeds, low-lying dry grasses, and cat tails near Las Posas Creek.

Dudek revisited the location where CA-SDI-22954 was previously recorded and did not reidentify the site. No artifacts or features were identified within the site boundary during the current survey. Modern culverts slope contouring were present near the mapped location of CA-SDI-22954, which is likely associated with restoration work along the banks of Los Posas Creek. It appears that CA-SDI-22954, which was originally observed during a monitoring program, was destroyed as a result of the restoration work associated with Los Posas Creek for the Los Posas Creek and Grand Avenue Capital Improvement. .

No cultural artifacts or features were observed during the pedestrian survey. Further, the tribal monitor, Jessica Alexander, did not express any concerns during the pedestrian survey.

6 Summary and Management Considerations

6.1 Archaeological Recommendations

Dudek's archaeological resources inventory of the Project indicates that there is moderate sensitivity for identifying intact subsurface archaeological deposits during Project implementation. The SCIC records search identified one cultural resource, CA-SDI-22954, a historic-age trash scatter, within the Project area. CA-SDI-22954 was previously evaluated and determined to not be eligible for listing on the NRHP, however, it was not evaluated under CEQA or CRHR. The current pedestrian survey did not relocate CA-SDI-22954 or any other cultural resources within the Project area. Dudek determined that CA-SDI-22954 was destroyed by the restoration work associated with Los Posas Creek. Since CA-SDI-22954 was destroyed, it is not a historical resource as defined under CEQA. No further studies or mitigation is necessary for CA-SDI-22954. In addition, the records search identified 47 cultural resources within one-mile of the Project area. The presence of cultural resources located within the vicinity of Project area indicates that the surrounding area has been utilized extensively prehistorically and historically.

Based on historic aerials and Geotech investigations, the Project area was graded and developed between 1964 and 1987 to its current configuration. Fill soil material is located over older alluvium throughout the Project area to a depth of 4 feet below surface. No intact prehistoric or historic-age resources will be present within the fill sediment; however, because a previous resource was present within the Project area (CA-SDI-22954) and other cultural resources located within the one-mile search buffer, there is a potential to encounter cultural resources within the older alluvium sediments below the fill. Dudek recommends cultural resources monitoring, consisting of a qualified archaeological monitor and Luiseno Native American monitor, during all initial ground disturbing activities within the older alluvium sediments (below the fill). Monitoring can be reduced or terminated if no discoveries are made or if documentation is provided which demonstrates that ground-disturbing activities will be occurring in sediments with no potential for cultural resources. Archaeological monitoring is not recommended for ground disturbing activities in the fill as there is no potential for intact cultural resources within that stratum.

Should you have any questions relating to this report and its findings, please do not hesitate to contact me at 442.232.7313 or dfaith@dudek.com.

Subject: ***NAHC Sacred Lands File Records Search Request for the Marcos Specific Plan Project, City of San Marcos, California***

Dear NAHC Staff,

The Marcos Specific Plan Project is being proposed in the city of San Marcos, San Diego County, California. The proposed Project is located at the corner of Grand Avenue and Linda Vista Avenue. The proposed Project would include the development of 102,000 square feet of commercial uses consisting of office, retail, restaurant, event, studio, gallery, and creative spaces with outdoor walkways and patios. The proposed Project area comprises approximately 6.54 acres. This area falls within the following PLSS area: Township12S/Range 3W, Section 10; 7.5-minute Series San Marcos, Rancho Santa Fe Quadrangles, CA 1:24,000 USGS maps (Figure 1).

Dudek is requesting a NAHC search for any sacred sites or other Native American cultural resources that may fall within the proposed project location or a surrounding one-mile buffer. Please provide a Contact List with all Native American tribal representatives that may have traditional interests in this parcel or the surrounding search area. The results of this search can be emailed to me at dfaith@dudek.com.

If you have any questions relating to this investigation, please contact me directly by email or phone.

Regards,

David Faith, M.A., R.P.A.

Re: Marcos Specific Plan Project, San Diego County

Dear Mr. Faith:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Pricilla.Torres-Fuentes@nahc.ca.gov.

Sincerely,

Pricilla Torres-Fuentes

Subject: ***Information Request for the San Marcos Specific Plan Project in San Marcos, California***

Dear Mr. Aguilar,

The Marcos Specific Plan Project is being proposed in the city of San Marcos, San Diego County, California. The proposed Project is located at the corner of Grand Avenue and Linda Vista Avenue. The proposed Project would include the development of 102,000 square feet of commercial uses consisting of office, retail, restaurant, event, studio, gallery, and creative spaces with outdoor walkways and patios. The proposed Project area comprises approximately 6.54 acres. This area falls within the following PLSS area: Township12S/Range 3W, Section 10; 7.5-minute Series San Marcos, Rancho Santa Fe Quadrangles, CA 1:24,000 USGS maps (Figure 1).

As part of the cultural resources study prepared for the proposed project, Dudek contacted the California Native American Heritage Commission (NAHC) to request a Sacred Lands File (SLF) search and a list of Native American individuals and/or tribal organizations who may have knowledge of cultural resources in or near the proposed project area. The NAHC emailed a response on November 30, 2022, which stated that the SLF search did not identify the presence of Native American cultural resources in the immediate project area.

The NAHC recommended that we contact you regarding your knowledge of the presence of cultural resources that may be impacted by this project. If you have any knowledge of cultural resources that may exist within or near the proposed project area, please contact me directly at (760) 479-4855 or at apham@dudek.com within 30 days of receipt of this letter.

Please note that this letter does not constitute Assembly Bill (AB) 52 notification or initiation of consultation. AB 52 is a process between the lead agency and California Native American Tribes concerning potential impacts to tribal cultural resources. Tribes that wish to be notified of projects for the purposes of AB 52 must contact the lead agency, City of San Marcos, in writing (pursuant to Public Resources Code Section 21080.3.1 (b)).

Respectfully,

Ms. Shasta Gaughen, Tribal Historic Preservation Officer
Pala Band of Mission Indians
35008 Pala Temecula Rd.
Pala, CA 92059

Subject: ***Information Request for the San Marcos Specific Plan Project in San Marcos, California***

Dear Ms. Gaughen,

The Marcos Specific Plan Project is being proposed in the city of San Marcos, San Diego County, California. The proposed Project is located at the corner of Grand Avenue and Linda Vista Avenue. The proposed Project would include the development of 102,000 square feet of commercial uses consisting of office, retail, restaurant, event, studio, gallery, and creative spaces with outdoor walkways and patios. The proposed Project area comprises approximately 6.54 acres. This area falls within the following PLSS area: Township12S/Range 3W, Section 10; 7.5-minute Series San Marcos, Rancho Santa Fe Quadrangles, CA 1:24,000 USGS maps (Figure 1).

As part of the cultural resources study prepared for the proposed project, Dudek contacted the California Native American Heritage Commission (NAHC) to request a Sacred Lands File (SLF) search and a list of Native American individuals and/or tribal organizations who may have knowledge of cultural resources in or near the proposed project area. The NAHC emailed a response on November 30, 2022, which stated that the SLF search did not identify the presence of Native American cultural resources in the immediate project area.

The NAHC recommended that we contact you regarding your knowledge of the presence of cultural resources that may be impacted by this project. If you have any knowledge of cultural resources that may exist within or near the proposed project area, please contact me directly at (760) 479-4855 or at apham@dudek.com within 30 days of receipt of this letter.

Please note that this letter does not constitute Assembly Bill (AB) 52 notification or initiation of consultation. AB 52 is a process between the lead agency and California Native American Tribes concerning potential impacts to tribal cultural resources. Tribes that wish to be notified of projects for the purposes of AB 52 must contact the lead agency, City of San Marcos, in writing (pursuant to Public Resources Code Section 21080.3.1 (b)).

Respectfully,

_____

The Marcos Specific Plan Project is being proposed in the city of San Marcos, San Diego County, California. The proposed Project is located at the corner of Grand Avenue and Linda Vista Avenue. The proposed Project would include the development of 102,000 square feet of commercial uses consisting of office, retail, restaurant, event, studio, gallery, and creative spaces with outdoor walkways and patios. The proposed Project area comprises approximately 6.54 acres. This area falls within the following PLSS area: Township12S/Range 3W, Section 10; 7.5-minute Series San Marcos, Rancho Santa Fe Quadrangles, CA 1:24,000 USGS maps (Figure 1).

As part of the cultural resources study prepared for the proposed project, Dudek contacted the California Native American Heritage Commission (NAHC) to request a Sacred Lands File (SLF) search and a list of Native American individuals and/or tribal organizations who may have knowledge of cultural resources in or near the proposed project area. The NAHC emailed a response on November 30, 2022, which stated that the SLF search did not identify the presence of Native American cultural resources in the immediate project area.

The NAHC recommended that we contact you regarding your knowledge of the presence of cultural resources that may be impacted by this project. If you have any knowledge of cultural resources that may exist within or near the proposed project area, please contact me directly at (760) 479-4855 or at apham@dudek.com within 30 days of receipt of this letter.

Please note that this letter does not constitute Assembly Bill (AB) 52 notification or initiation of consultation. AB 52 is a process between the lead agency and California Native American Tribes concerning potential impacts to tribal cultural resources. Tribes that wish to be notified of projects for the purposes of AB 52 must contact the lead agency, City of San Marcos, in writing (pursuant to Public Resources Code Section 21080.3.1 (b)).

Respectfully,

Subject: ***Information Request for the San Marcos Specific Plan Project in San Marcos, California***

Dear Ms. Miller,

The Marcos Specific Plan Project is being proposed in the city of San Marcos, San Diego County, California. The proposed Project is located at the corner of Grand Avenue and Linda Vista Avenue. The proposed Project would include the development of 102,000 square feet of commercial uses consisting of office, retail, restaurant, event, studio, gallery, and creative spaces with outdoor walkways and patios. The proposed Project area comprises approximately 6.54 acres. This area falls within the following PLSS area: Township12S/Range 3W, Section 10; 7.5-minute Series San Marcos, Rancho Santa Fe Quadrangles, CA 1:24,000 USGS maps (Figure 1).

As part of the cultural resources study prepared for the proposed project, Dudek contacted the California Native American Heritage Commission (NAHC) to request a Sacred Lands File (SLF) search and a list of Native American individuals and/or tribal organizations who may have knowledge of cultural resources in or near the proposed project area. The NAHC emailed a response on November 30, 2022, which stated that the SLF search did not identify the presence of Native American cultural resources in the immediate project area.

The NAHC recommended that we contact you regarding your knowledge of the presence of cultural resources that may be impacted by this project. If you have any knowledge of cultural resources that may exist within or near the proposed project area, please contact me directly at (760) 479-4855 or at apham@dudek.com within 30 days of receipt of this letter.

Please note that this letter does not constitute Assembly Bill (AB) 52 notification or initiation of consultation. AB 52 is a process between the lead agency and California Native American Tribes concerning potential impacts to tribal cultural resources. Tribes that wish to be notified of projects for the purposes of AB 52 must contact the lead agency, City of San Marcos, in writing (pursuant to Public Resources Code Section 21080.3.1 (b)).

Subject: ***Information Request for the San Marcos Specific Plan Project in San Marcos, California***

Dear ,

The Marcos Specific Plan Project is being proposed in the city of San Marcos, San Diego County, California. The proposed Project is located at the corner of Grand Avenue and Linda Vista Avenue. The proposed Project would include the development of 102,000 square feet of commercial uses consisting of office, retail, restaurant, event, studio, gallery, and creative spaces with outdoor walkways and patios. The proposed Project area comprises approximately 6.54 acres. This area falls within the following PLSS area: Township12S/Range 3W, Section 10; 7.5-minute Series San Marcos, Rancho Santa Fe Quadrangles, CA 1:24,000 USGS maps (Figure 1).

As part of the cultural resources study prepared for the proposed project, Dudek contacted the California Native American Heritage Commission (NAHC) to request a Sacred Lands File (SLF) search and a list of Native American individuals and/or tribal organizations who may have knowledge of cultural resources in or near the proposed project area. The NAHC emailed a response on November 30, 2022, which stated that the SLF search did not identify the presence of Native American cultural resources in the immediate project area.

The NAHC recommended that we contact you regarding your knowledge of the presence of cultural resources that may be impacted by this project. If you have any knowledge of cultural resources that may exist within or near the proposed project area, please contact me directly at (760) 479-4855 or at apham@dudek.com within 30 days of receipt of this letter.

Please note that this letter does not constitute Assembly Bill (AB) 52 notification or initiation of consultation. AB 52 is a process between the lead agency and California Native American Tribes concerning potential impacts to tribal cultural resources. Tribes that wish to be notified of projects for the purposes of AB 52 must contact the lead agency, City of San Marcos, in writing (pursuant to Public Resources Code Section 21080.3.1 (b)).

Respectfully,

_____

RE: San Marcos Specific Plan

Dear Mr. Faith,

The San Pasqual Band of Mission Indians Tribal Historic Preservation Office has received your notification of the project referenced above. This letter constitutes our response on behalf of Desiree M. Whitman THPO of the San Pasqual Band of Diegueno Indians.

We have consulted our maps and determined that the project as described is not within the boundaries of the recognized San Pasqual Indian Reservation. It is, however, within the boundaries of the territory that the tribe considers its Traditional Use Area (TUA). Furthermore, As the project progresses, we would like to engage in formal government-to-government consultation under AB-52 so that San Pasqual can have a voice in the development of the measures that will be taken to protect these sites and mitigate any adverse impacts. We would appreciate being given access to any cultural resource reports that have been or will be generated during the environmental review process so we can contribute most effectively to the consultation process.

We appreciate your involvement with your initiative and look forward to working with you on future efforts. If you have questions or need additional information, please do not hesitate to contact me by telephone at 760-651-5142 or angelinag@sanpasqualtribe.org

Sincerely,

Angelina Gutierrez

Re: SP22-0003 San Marcos Specific Plan Project

Dear Mr. Farace,

This letter is written on behalf of the Rincon Band of Luiseño Indians ("Rincon Band" or "Tribe"), a federally recognized Indian tribe and sovereign government. Thank you for consulting with the Tribe on the above-mentioned project and providing us with Dudek's Cultural Resources Phase I Inventory Report for the San Marcos Specific Plan Project (Project).

The Rincon Band of Luiseño Indians Tribal Historic Preservation Office (THPO) has reviewed the provided documents and agrees with the proposed measures, which include archaeological and tribal monitoring, a monitoring report, and protocols for discovery of cultural material and human remains including reburial of cultural materials on-site. The THPO has no further comments or concerns regarding this project and can conclude consultation at this time. We do ask that if the project plans for this project changes, that you please notify the Rincon Band. In addition, we request a copy of the final monitoring report, when available and ask that Rincon be afforded the opportunity to monitor the ground disturbances associated with this project.

The Rincon Band reserves its right to continue to fully participate in the environmental review process and to review and submit additional information during the public review process. If you have additional questions or concerns, please do not hesitate to contact our office at your convenience at (760) 749 1092 ext. 323 or via electronic mail at cmadrigal@rincon-nsn.gov. Thank you for the opportunity to protect our cultural heritage.

Sincerely,

Cheryl Madrigal

RE: Confidential Communication Pursuant to California Public Resources Code section 21080.3.1 for MARCOs SP (APNs 760-248-07-00, 760-248-06-00, 760-248-02-00, 760-248-19-00, 219-152-14-00, 219-152-40-00, 219-152-61-00, 760-248-43-00, 219-152-42-00, 219-152-45-00, and 219-152-44-00) – Request to Conclude Consultation Between the City of San Marcos and SLR

Dear Mr. Farace:

This letter is in reference to the City of San Marcos and the San Luis Rey Band of Mission Indians ("SLR") continued consultation for the MARCOs (PN 3637-SD) Project. This is a confidential communication between the City and SLR and should not be shared and/or duplicated without SLR's expressed written consent.

Thank you for providing SLR with the proposed mitigation measures for tribal cultural resources (APNs 760-248-07-00, 760-248-06-00, 760-248-02-00, 760-248-19-00, 219-152-14-00, 219-152-40-00, 219-152-61-00, 760-248-43-00, 219-152-42-00, 219-152-45-00, and 219-152-44-00) for the project's environmental document. The Tribe has reviewed the mitigation measures and concurs with the City that they adequately address the Tribe's concerns as discussed during our previous consultations and are culturally-appropriate as required by CEQA.

If the aforementioned mitigation measures will be the recommended mitigation measures for tribal cultural resources for this Project, then the San Luis Rey Band of Mission Indians respectfully requests to conclude consultation pursuant to SB 18. If, however, the City will not recommend the aforementioned mitigation measures in their ***entirety*** to the City's decision-making body, then please immediately contact me at 760.917-1736 for a continued consultation meeting.

Sincerely,

Cami Mojado
Cultural Resources Manager

Subject: Geotechnical Evaluation
Proposed Commercial Development
Grand Avenue and Linda Vista Drive
San Marcos, California

Dear Mr. Bennett:

We are pleased to provide the results of our geotechnical evaluation for the subject project located in the City of San Marcos, California. This report presents the results of our evaluation and provides preliminary geotechnical recommendations for earthwork, foundation design, and construction. In our opinion, site development appears feasible from a geotechnical viewpoint provided that the recommendations included herein are incorporated into the design and construction phases of site development. The opportunity to be of service is sincerely appreciated. If you should have any questions, please do not hesitate to call our office.

Respectfully submitted,

1. PURPOSE AND SCOPE OF SERVICES

The purpose of this study was to evaluate and provide a general perspective of the geotechnical conditions on the site, that can be used for planning and general budget purposes. Services provided for this study included the following:

- Research and review of available geologic and geotechnical data, and general information pertinent to the site including records obtained by request sent to the city of San Marcos.
- Excavation of six hollow stem auger borings onsite and collection of relatively undisturbed and bulk soil samples for subsequent laboratory testing.
- Eight additional boring specifically to perform percolation tests and infiltration analyses.
- Ten concrete cores of the existing foundation slabs were obtained and tested for compressive strength. Additional subgrade bulk soil samples were obtained for Resistance Value (R-value) analyses.
- Laboratory testing of the soil samples collected during the field investigation.
- Review and evaluation of site seismicity.
- Geologic and engineering analyses of the data obtained.

Compilation of this geotechnical report which presents findings of pertinent site geotechnical conditions and geotechnical recommendations for site development.

2. SITE DESCRIPTION AND PROPOSED DEVELOPMENT

2.1 SITE DESCRIPTION

The subject project site is located west of the intersection of Grand Avenue and Linda Vista Drive in San Marcos, California. The general location of the site is shown in Figure 1.

The site is comprised of 12.1 acres of land including San Diego County Assessor Parcel Numbers (APNs) 760-248-07-00, 760-248-06-00, 760-248-02-00, 760-248-19-00, 219-152-14-00, 219-152-40-00, 219-152-61-00, 760-248-43-00, 219-152-42-00, 219-152-45-00, and 219-152-44-00. The

property is bisected by a small earthen channel that drains from Grand Avenue to the south and then to the west. Site topographic relief is gentle; elevations vary from approximately 535 feet (ft) in the channel at the western boundary to 547ft at the east corner and 543ft at the northern corner, sloping generally to the channel. The site contains the remnants of various, previously existing building foundations, pavements, slabs, and other improvements. According to the historical images by Google Earth, almost the entire site was developed before 1994, and the improvements were demolished sometime between 2010 and 2012. The reason for demolition is not known at this time.

The site is generally bounded to the west by various commercial properties, to the north and east by Grand Avenue followed by Ronald Packard Parkway (State Route 78), and to the south by Linda Vista Drive with existing commercial sites and vacant land beyond. The site is currently accessible via Grand Avenue and Linda Vista Drive.

2.2 PROPOSED DEVELOPMENT

The Conceptual Site Plan, prepared Lane Goodkind + Associates, undated, indicates the project will include the construction of various buildings to house restaurants/cafes, retail stores, studios, and the like. No details regarding the height of structures or possible foundation loads have been made available to us. We do anticipate a variety of different construction types likely mostly with slab-on-grade floor and conventionally reinforced shallow foundations; although some deepened foundations system might be warranted.

Site improvements such as parking/drive areas, utilities, hardscape and landscape areas are also expected. Access to the development would continue to be provided by driveways off Grand Avenue and Linda Vista Drive. A bridge structure is under construction crossing over the existing earthen channel to facilitate transit within the development. The proposed Conceptual Site Development is shown on Figure 3.

Portions of the existing slab are considered to remain in place and rehabilitated or modified aesthetically to be incorporated in the proposed development.

We were also informed that final project plans would likely include permeable pavers and/or detention basins as stormwater management at the property.

As site planning progresses and additional or revised plans become available, they should be provided to GeoTek for review and comment. Additional geotechnical studies field exploration, laboratory testing and engineering analyses may be necessary to provide specific earthwork recommendations and geotechnical design parameters for actual site development plans.

3. REVIEW OF PAST REPORTS

On June 13, 1997, Vinje & Middleton Engineering, Inc. (Vinje) issued a report entitled *Preliminary Soil Investigation, 0.92 Acre Parcel, Grand Avenue, San Marcos.* The investigation was conducted for Parcel 219-152-40-00 located within the north-central portion of the site and immediately east and adjacent to the existing earthen channel. The study included four exploratory trenches excavated to depths of 8.5 to 10.5 feet below grade. The trenches encountered a 1.5- to 2.0-feet thick layer of uncontrolled fill consisting of sandy to clayey soils. Below the fill, alluvial deposits were logged comprised of interbedded sands and clays in a soft/loose in-place condition. Bedrock materials were logged at depths of ranging from 6 to 8.5 feet consisting of interbedded sandstone and claystone. Minor water seepage was encountered at about 5 to 6 feet below grade in the two western trenches (T-1 and T-3), which were nearest the channel where standing water was reported.

Vinje recommended removals to bedrock for the entire site. It also stated that dewatering may be necessary to complete the grading near the western property line. Vinje anticipated soils with "very low" to "low" expansion potential at final finish grades.

Logs of the exploratory trenches and laboratory test results reported in the Vinje study are included in Appendix B. The approximate locations of these explorations are shown on the Boring Location Map presented as Figure 2.

In August of 1990, Geobase, Inc. (Geobase) issued a report entitled *Preliminary Geotechnical Investigation, 1020 Linda Vista Drive, San Marcos.* The report was conducted for the property adjacent to the project at the southwest corner. The investigation included two exploratory borings to maximum depths of 20 feet. The boring logs indicate about 1 to 1.5 feet of fill, underlain by natural soils of very stiff to hard sand clay, atop siltstone/sandstone bedrock at depths of about 4 to 4.5 feet. Groundwater was encountered in the borings at 16.5 and 17 feet below grade.

Geobase recommended complete fill removal within building areas. It also stated that the site soils have "low" expansion potential and negligible sulfate content.

We also reviewed "Subsurface Site Assessment, Assessor's Parcel Number 219-152-08, 1010 Linda Vista Drive, San Marcos, California" by SCS Engineers, dated January 26, 2016. This environmental assessment indicated the presence of groundwater at depths of 5-7 feet towards the southwest portion of the project.

4. FIELD EXPLORATION AND LABORATORY TESTING

4.1 FIELD EXPLORATION

Our field studies were conducted on April 20 to 21, May 10 to 12 and October 14, 2020 consisted of a site reconnaissance, excavation of six hollow stem auger borings, obtaining ten concrete cores, eight percolation tests, and collection of bulk and relatively undisturbed soil samples for subsequent laboratory testing. Geotechnical borings were advanced with a conventional truck mounted, CME-75, drill rig. The drill rig advanced four percolation test borings on April 10, 2020. A manual auger advanced four additional percolation test borings on May 11, 2020. A geologist from our firm visually logged the borings, obtained the concrete cores, and collected soil samples for laboratory analysis. Approximate locations of exploration locations are presented on the Boring Location Map, Figure 2. Logs of the borings are included in Appendix A.

On October 14, 2020, GeoTek cored ten samples from the existing slab, transported to our laboratory and evaluated for compressive strength in general accordance to ASTM C39 and ASTM C42. The following table presents a summary of the compressive strength of the cores.

Location	Sample ID	Thickness (in)	Compressive Strength (psi)
C-1	1	4.2	3,730
C-2	2	4.8	3,620
C-3	3	4.4	4,110
C-4	4	5.1	4,300
C-5	5	4.5	5,120
C-6	6	4.1	4,550
C-7	7	4.1	3,700
C-8	8	4.1	4,290
C-9	9	4.0	4,180
C-10	10	4.0	4,060

4.2 PERCOLATION AND INFILTRATION TESTING

Borings P-1 through P-8 were excavated within the most accessible areas of the site to be used as percolation test holes. The test holes were 3.5 to 8 inches in diameter and extended to about

2.5 to 5 feet below grade to assess to infiltration properties of the near surface soils for stormwater management. Following completion of the borings, percolation testing was performed by a representative from our firm in general conformance with the city of San Marcos BMP Design Manual (2016). The boreholes were presoaked overnight and the testing was performed the following day. Percolation testing was conducted by adding potable water to the borings, recording the initial depth to water, and allowing the water to percolate for 30 minutes and the depth to water was measured. In general, the percolation testing was performed for approximately six hours to allow rates to stabilize.

For design of stormwater infiltration systems, converting percolation rates to infiltration rates via the Porchet method is generally acceptable and appropriate, as this method factors out the sidewall component of the percolation results and represents the bottom conditions of a shallow basin (infiltration). Therefore, the percolation data obtained was converted via the Porchet method. This method is consistent with the guidelines referenced in the City of San Marcos BMP Design Manual. Results of our infiltration analysis without a factor of safety are presented in the follow table for each of the test areas.

SUMMARY OF INFILTRATION RATES

Location	Approximate Depth (ft)	Infiltration Rate (inches per hour)*
P-1	5	0.00
P-2	5	0.03
P-3	5	0.04
P-4	5	0.00
P-5	2.5	0.03
P-6	2.5	0.00
P-7	2.5	0.03
P-8	2.5	0.03

* Rate was converted to an infiltration rate via the Porchet method

Copies of infiltration conversion sheets are included in Appendix A.

The test results indicate negligible infiltration at the property. This is consistent with the clayey fill and alluvium present at the site. Based on these results we do not considered shallow infiltration as a significant component for stormwater management on the site.

4.3 LABORATORY TESTING

Laboratory testing was performed on bulk and relatively undisturbed soil samples collected during the field exploration. The purpose of the laboratory testing was to evaluate their physical and chemical properties for use in engineering design and analysis. Results of the laboratory testing program, along with a brief description and relevant information regarding testing procedures, are included in Appendix C.

5. GEOLOGIC AND SOILS CONDITIONS

5.1 REGIONAL SETTING

The subject property is located in the Peninsular Ranges geomorphic province. The Peninsular Ranges province is one of the largest geomorphic units in western North America and extends roughly 975 miles from the north and northeasterly adjacent the Transverse Ranges geomorphic province to the peninsula of Baja California. This province varies in width from about 30 to 100 miles. It is bounded on the west by the Pacific Ocean, on the south by the Gulf of California and on the east by the Colorado Desert Province.

The Peninsular Ranges are essentially a series of northwest-southeast oriented fault blocks. Several major fault zones are found in this province. The Elsinore Fault zone and the San Jacinto Fault zones trend northwest-southeast and are found in the near the middle of the province. The San Andreas Fault zone borders the northeasterly margin of the province. The Newport-Inglewood-Rose Canyon Fault zone meanders the southwest margin of the province. No faults are shown in the immediate site vicinity on the geologic map reviewed for the area.

5.2 EARTH MATERIALS

A brief description of the earth materials encountered during our subsurface exploration is presented in the following sections. Based on our field observations and review of published geologic maps and an older geotechnical report (Vinje, 1997), the project site is underlain by a veneer of undocumented fill materials over older alluvium underlain by bedrock of the Santiago Formation.

5.2.1 Undocumented Fill

Fill was encountered in all our borings to depths of about 4 to 5 feet. Fill was also encountered by Vinje (1997) to about 1.5 to 2 feet below grade within the north-central portion of the site. The fill is associated with previous site improvements. The fill consisted of dark brown to reddish

brown, moist, soft to stiff sandy clay and clayey sand. Due to variable insitu density, the existing fill is not considered to be engineered fill.

5.2.2 Older alluvium

Older alluvium was encountered in our excavations. The older alluvium mostly extended to depths ranging from 6 to 10 feet and consisted of sandy clay and clayey sand with some silty sand and sand. The older alluvium was red to orange brown in color, damp to moist, soft/loose to stiff/dense, based on our in-place density tests and field observations.

Alluvium was logged in trenches excavated by Vinje (1997) similarly described to the older alluvium we encountered. The Vinje study was near the creek that transects the property and this may suggest that there is less dense materials along the creek alignment.

5.2.3 Bedrock

The most recent regional geologic map showing the overall site geology (Kenney, M.P., 2007) shows Tertiary-aged Santiago Formation in the vicinity of the site. As encountered in our excavations and trenches by Vinje (1997), the Santiago sedimentary bedrock was noted at approximately 4.5 to 10 feet below grade within the project area and consists of white to light brown, hard sandstone, clayey sandstone, and sandy claystone.

5.3 SURFACE WATER AND GROUNDWATER

5.3.1 Surface Water

Surface, flowing water was only noted during our site visit within the existing channel crossing the center portion of the property. If encountered during earthwork construction, surface water on this site is likely the result of precipitation or possibly some minor surface run-off from immediately surrounding properties. Overall site area drainage is towards the existing channel. Provisions for surface drainage will need to be accounted for by the project civil engineer.

Groundwater was not encountered in the majority of our explorations with the exceptions of borings B-2 and B-4 at about 20 feet below grade. Vinje study was near the creek that transects the property and encountered seepage at 5 to 6 feet in trenches nearest the creek, suggesting this shallow condition may be associated with the creek. Geobase (1990) also reported groundwater conditions at depths ranging from 16.5 to 17 feet; this is reasonably consistent with our data.

The GeoTracker database (https://geotracker.waterboards.ca.gov/) shows five groundwater monitoring wells situated within the southwestern portion of the site. These were associated with an environmental study to assess a UST leakage conducted by SCS Engineering (SCS, 2016).

Copies of some of the associated documentation were provide to us, and indicate that indicate a depth to groundwater on the order of 5 to 7 feet. These were also near the creek alignment. Readers should review the state files and/or the specific reports for additional details regarding specifics of environmental contamination and site closure.

Based on the current groundwater level relative to anticipated depth of removals, ground water is not anticipated to be a factor throughout most of the site during site grading. Localized perched groundwater could be present due to seasonal fluctuations in rainfall and/or near the creek. This may warrant inclusion of subsurface drainage system. Groundwater may impact the excavation for deeper utilities. Additionally, seasonal water levels may impact storm water management.

5.4 EARTHQUAKE HAZARDS

5.4.1 Surface Fault Rupture

The geologic structure of the entire southern California area is dominated mainly by northwest-trending faults associated with the San Andreas system. The site is in a seismically active region. No active or potentially active fault is known to exist at this site nor is the site situated within an "Alquist-Priolo" Earthquake Fault Zone or a Special Studies Zone (Bryant and Hart, 2007). No faults transecting the site were identified on the readily available geologic maps reviewed. The nearest zoned fault is the Newport-Inglewood Rose Canyon fault located approximately 11.6 miles west of the site.

5.4.2 Liquefaction/Seismic Settlement

Liquefaction describes a phenomenon in which cyclic stresses, produced by earthquake-induced ground motion, create excess pore pressures in relatively cohesionless soils. These soils may thereby acquire a high degree of mobility, which can lead to lateral movement, sliding, consolidation and settlement of loose sediments, sand boils and other damaging deformations. This phenomenon occurs only below the water table, but, after liquefaction has developed, the effects can propagate upward into overlying non-saturated soil as excess pore water dissipates.

The factors known to influence liquefaction potential include soil type and grain size, relative density, groundwater level, confining pressures, and both intensity and duration of ground shaking. In general, materials that are susceptible to liquefaction are loose, saturated granular soils having low fines content under low confining pressures.

The liquefaction potential and seismic settlement potential on this site are considered negligible due to the presence of shallow bedrock and the cohesive nature of the on-site older alluvium.

5.4.3 Other Seismic Hazards

Due to the relatively flat nature of the site, the potential for landslides and rockfall is considered negligible. The potential for secondary seismic hazards such as seiche and tsunami is remote due to site elevation and distance from an open body of water.

6. CONCLUSIONS AND RECOMMENDATIONS

6.1 GENERAL

Development of the site appears feasible from a geotechnical viewpoint provided that the following recommendations are incorporated in the design and construction phases of the development. The following sections present general recommendations for currently anticipated site development plans.

As previously discussed, ten concrete cores were obtained and evaluated for compressive strength. Thickness of the concrete at the cord locations ranged between 4 and 5 inches thick and steel reinforcement was absent. It is our understanding the existing concrete to remain in place is proposed to be general flatwork, vehicle parking, and/or drive aisles. The average compressive strength of the cores tested is 4,156 PSI. In consideration of the compressive strength results, the existing concrete may be used for pedestrian areas. In consideration of the lack of reinforcement concrete repurposed for vehicle traffic, albeit light passenger models, and delivery/trash/service vehicles may pose flexural stresses not intended to be imposed on the concrete, concrete performance may degrade and increased maintenance costs may be incurred.

6.2 EARTHWORK CONSIDERATIONS

6.2.1 General

Earthwork and grading should be performed in accordance with the applicable grading ordinances of the city of San Marcos, the 2019 California Building Code (CBC), and recommendations contained in this report. The Grading Guidelines included in Appendix D outline general procedures and do not anticipate all site-specific situations. In the event of conflict, the recommendations presented in the text of this report should supersede those contained in Appendix D.

6.2.2 Site Clearing and Preparation

Site preparation should start with demolition/razing of existing site improvements and removal of deleterious materials and vegetation. Demolition should include removal of all pavements, slabs, foundations, and any other below-grade construction; particular care should be taken on in and around prior structure to remove subsurface improvements. These materials should generally be properly disposed of off-site, generally the soil can be separated and reused as fill. Inert materials (e.g. concrete) can be broken into small (less than 6inch) fragments and reused with the engineered fill. Voids resulting from site clearing (such as removals of underground utilities and trench backfill, foundations, etc.) should be filled to grade with engineered fill materials.

6.2.3 Remedial Grading

For areas not to remain (i.e. existing concrete slab), all existing fills and the upper loose/soft portions of the alluvial materials should be removed from proposed structural areas to expose competent older alluvium or bedrock. Competent older alluvium is defined as native materials that are visually relatively non-porous and having a relative compaction of at least 85 percent of the soil's maximum dry density as determined per ASTM D 1557. Competent bedrock is defined as firm and unyielding to an earthmoving scraper. Based on current data, combined fill and alluvial removals generally on the order of four to six feet below grade are anticipated to be required. Depending on actual field conditions encountered during grading, locally deeper and/or shallower areas of removal may be necessary. As a minimum, removals should extend down and away from foundation elements at a 1:1 (h:v) projection to the recommended removal depth or five feet, whichever is greater.

Soil behavior near boring B-5, at a depth of 5-8 feet, was found to exhibit very high expansion potential. The depth at this location is not anticipated to be encountered during remedial grading, however it is an indicator that soils with a higher expansion potential than a "medium" determination may be present onsite. If encountered, selective grading or burial of "high" and "very high" expansive soils may be desired. Additional remedial grading recommendations can be provided during rough grading operations.

A minimum 24 inches of engineered fill should be provided below the bottom of the proposed foundations.

All existing fill should be removed below hardscape areas. A minimum of 12 inches of engineered fill should be provided below asphaltic concrete pavement and Portland cement concrete hardscape areas. The horizontal extent of removals should extend at least two feet beyond the edge.

The bottom of all removals should be scarified to a minimum depth of six inches, brought to at least optimum moisture content, and compacted to minimum of 90 percent of the soil's maximum dry density as determined per ASTM D 1557.

6.2.4 Engineered Fill

Onsite materials are generally considered suitable for reuse as engineered fill provided they are free from significant organic material (vegatation, roots, etc.), and rock/concrete or hard lumps greater than six inches in maximum dimension. The earthwork contractor should have the proposed excavated materials to be used as engineered fill at this project approved by the soils engineer prior to placement.

Engineered fill materials should be moisture conditioned to at or above optimum moisture content and compacted in horizontal lifts not exceeding eight-inch in loose thickness to a minimum relative compaction of 90 percent per ASTM D 1557.

If fill is being placed on slopes steeper than 5:1 (h:v), the fill should be properly benched into the existing slopes and a sufficient size keyway shall be constructed in accordance with grading guidelines presented in Appendix D.

6.2.5 Excavation Characteristics

Excavations in the onsite soils and shallow weathered bedrock can generally be accomplished with heavy-duty earthmoving or excavating equipment in good operating condition.

6.2.6 Shrinkage and Bulking

Several factors will impact earthwork balancing on the site, including bedrock bulking, undocumented fill and alluvium shrinkage, trench spoil from utilities and footing excavations, as well as the accuracy of topography.

Shrinkage and bulking are dependent upon the degree of compactive effort achieved during construction. For planning purposes, a shrinkage factor ranging from five to ten percent may be considered for the undocumented fill and upper loose/soft older alluvium requiring removal and re-compaction. While true subsidence is not considered a factor, compaction of removal bottoms should be expected to result in 0.5 to 1.0 inches of ground loss which is often considered subsidence.

6.2.7 Trench Excavations and Backfill

Temporary excavations within the onsite materials should be stable at 1:1 (h:v) inclination for short durations during construction, and where cuts do not exceed ten feet in height. Temporary cuts to a maximum height of four feet can be excavated vertically. These may vary based on

exposed conditions. If groundwater is encountered in deeper utility trenches then shoring and possible dewatering may be needed. Test trenches along utility alignment should be considered to assess specific conditions where the invert elevations are greater than 6 feet below current site grades.

Trench excavations should conform to Cal-OSHA regulations. The contractor should have a competent person, per OSHA requirements, on site during construction to observe conditions and to make the appropriate recommendations.

Utility trench backfill should be compacted to at least 90 percent relative compaction of the maximum dry density as determined per ASTM D 1557. Under-slab trenches should also be compacted to project specifications.

Onsite materials is not anticipated to be suitable for use as bedding material but should be suitable as backfill provided materials larger than six inches are removed.

Compaction should be achieved with a mechanical compaction device. Ponding or jetting of trench backfill is not recommended. If backfill soils have dried out, they should be thoroughly moisture conditioned prior to placement in trenches.

6.3 DESIGN RECOMMENDATIONS

6.3.1 Stormwater Infiltration

Many factors control infiltration of surface waters into the subsurface, such as consistency of fill, native soil, and bedrock, geologic structure, material density differences, and existing groundwater conditions. Current site plans do not indicate specific locations and elevations of the proposed stormwater management systems. However, based on our test data and observations, stormwater infiltration is not feasible at the site due to the presence of clayey subsurface materials with negligible rate for infiltration.

6.3.2 Foundation Design Criteria

Preliminary foundation design criteria, in general conformance with the 2019 CBC, are presented herein, for smaller structure with continuous wall loads not extending 2500 pounds per lineal foot and column loads less than 30kips. These are typical design criteria and are not intended to supersede the design by the structural engineer. Specific foundation design criteria should be requested for larger structures.

Based on our visual classification of materials encountered onsite and as verified by laboratory testing, soils near subgrade are anticipate to have "low" (21 ≤ EI ≤ 50) to "medium" (51 ≤ EI ≤ 90) potential for expansion per ASTM D4829. Materials with "very high" expansiveness were also encountered at the property at depth. Additional laboratory testing should be performed at the completion of site grading to verify the expansion potential and plasticity index of the subgrade soils.

The following criteria for design of foundations are preliminary. Additional laboratory testing of the samples obtained during grading should be performed and final recommendations should be based on as-graded soil conditions.

DESIGN PARAMETES FOR CONVENTIONALL REINFORCED SHALLOW FOUNDATIONS		
Design Parameter	"Low" Expansion Potential (21≤EI≤50)	"Medium" Expansion Potential (51≤EI≤90)
Foundation Embedment Depth or Minimum Perimeter Beam Depth (inches below lowest adjacent finished grade)	One- and Two Story – 12	One- and Two Story – 18
Minimum Foundation Width (Inches)*	One- and Two Story – 12	One- and Two Story – 12
Minimum Slab Thickness (actual)	4 inches	4 inches
Minimum Slab Reinforcing	No. 3 rebar 24" on-center, each way, placed in the middle one-third of the slab thickness	No. 3 rebar 18" on-center, each way, placed in the middle one-third of the slab thickness
Minimum Footing Reinforcement	Two No. 4 reinforcing bars, one top and one bottom	Four No. 4 reinforcing bars, two top and two bottom
Effective Plasticity Index**	<15	20
Presaturation of Subgrade Soil (percent of optimum moisture content)	Minimum 110% to a depth of 12 inches	Minimum 120% to a depth of 18 inches

*Code minimums per Table 1809.7 of the 2019 CBC should be complied with.

**Effective Plasticity Index should be verified at the completion of the rough grading.

It should be noted that the above recommendations are based on soil support characteristics only. The structural engineer should design the slab and beam reinforcement based on actual loading conditions.

The following recommendations should be implemented into the design:

- An allowable bearing capacity of 2,000 pounds per square foot (psf) may be used for design of continuous and perimeter footings that meet the depth and width requirements in the table above. This value may be increased by 400 psf for each

additional 12 inches in depth and 100 psf for each additional 12 inches in width to a maximum value of 3,000 psf. Additionally, an increase of one-third may be applied when considering short-term live loads (e.g. seismic and wind loads).

- Based on our experience in the area, structural foundations may be designed in accordance with 2019 CBC, and to withstand a total settlement of 1 inch and maximum differential settlement of one-half of the total settlement over a horizontal distance of 30 feet. Seismically induced settlement is considered to be minimal.

- The passive earth pressure may be computed as an equivalent fluid having a density of 220 psf per foot of depth, to a maximum earth pressure of 2,500 psf for footings founded on engineered fill. A coefficient of friction between soil and concrete of 0.35 may be used with dead load forces. When combining passive pressure and frictional resistance, the passive pressure component should be reduced by one-third.

- A grade beam, a minimum of 12 inches wide and 12 inches deep, should be utilized across large entrances, however, the base of the grade beam should be at the same elevation as the bottom of the adjoining footings.

In lieu of conventionally reinforced shallow foundations, the proposed commercial structures can also utilize post-tensioned slab foundations designed in accordance to the following geotechnical parameters:

DESIGN PARAMETERS FOR POST-TENSIONED SLABS		
Design Parameter	"Low" Expansion Potential	"Medium" Expansion Potential
	LL≤33; PI≤13; Material Passing #200 Sieve = 54%; Clay Fines = 15%	LL≤45; PI≤20; Material Passing #200 Sieve = 60%; Clay Fines = 20%
Edge Moisture Variation Distance, e_m -Edge Lift (swelling) -Center Lift (shrinkage)	 4.8 ft 9.0 ft	 4.4 ft 8.5 ft
Soil Differential Movement, y_m -Edge Lift (swelling) -Center Lift (shrinkage)	 ≈ 0.56 in ≈ 0.24 in	 ≈ 0.89 in ≈ 0.37 in
Ext. Perimeter Beam Embedment	One- or Two-Story – 12 inches*	One- or Two-Story – 18 inches*
Presaturation of Subgrade Soil (Percent of Optimum)	Minimum 110% to a depth of 12 inches	Minimum 120% to a depth of 18 inches

* Required depth of perimeter beam/stiffening rib per structural calculations may govern.

The following assumptions were used to generate e_m and y_m values: Thornthwaite Moisture Index = -20; constant suction value = 3.9pF; post-equilibrium case assumed with wet (swelling) cycle going from 3.9pF to 3.0pF and drying (shrinking) cycle going from 3.9pF to 4.5pF

6.3.3 Underslab Moisture Membrane

A moisture and vapor retarding system should be placed below slabs-on-grade where moisture migration through the slab is undesirable. Guidelines for these are provided in the 2019 California Green Building Standards Code (CALGreen) Section 4.505.2 and the 2019 CBC Section 1907.1

It should be realized that the effectiveness of the vapor retarding membrane can be adversely impacted as a result of construction related punctures (e.g. stake penetrations, tears, punctures from walking on the vapor retarder placed atop the underlying aggregate layer, etc.). These occurrences should be limited as much as possible during construction. Thicker membranes are generally more resistant to accidental puncture that thinner ones. Products specifically designed for use as moisture/vapor retarders may also be more puncture resistant. Although the CBC specifies a 6 mil vapor retarder membrane, it is GeoTek's opinion that a minimum 10 mil membrane with joints properly overlapped and sealed should be considered, unless otherwise specified by the slab design professional.

Moisture and vapor retarding systems are intended to provide a certain level of resistance to vapor and moisture transmission through the concrete, but do not eliminate it. The acceptable level of moisture transmission through the slab is to a large extent based on the type of flooring used and environmental conditions. Ultimately, the vapor retarding system should be comprised of suitable elements to limit migration of water and reduce transmission of water vapor through the slab to acceptable levels. The selected elements should have suitable properties (i.e. thickness, composition, strength and permeability) to achieve the desired performance level.

Moisture retarders can reduce, but not eliminate, moisture vapor rise from the underlying soils up through the slab. Moisture retarder systems should be designed and constructed in accordance with applicable American Concrete Institute, Portland Cement Association, Post-Tensioning Concrete Institute, ASTM and California Building Code requirements and guidelines.

GeoTek does not practice in the field of moisture vapor transmission evaluation/migration, since that practice is not a geotechnical discipline. Therefore, we recommend that a qualified person, such as the flooring contractor, structural engineer, architect, and/or other experts specializing in moisture control within the building be consulted to evaluate the general and specific moisture and vapor transmission paths and associated potential impact on the proposed construction. That person (or persons) should provide recommendations relative to the slab moisture and vapor retarder systems and for migration of potential adverse impact of moisture vapor transmission on various components of the structures, as deemed appropriate. In addition, the

recommendations in this report and our services in general are not intended to address mold prevention; since we, along with geotechnical consultants in general, do not practice in the area of mold prevention. If specific recommendations addressing potential mold issues are desired, then a professional mold prevention consultant should be contacted.

6.3.4 Miscellaneous Foundation Recommendations

- To reduce moisture penetration beneath the slab on grade areas, utility trenches should be backfilled with engineered fill, lean concrete, or concrete slurry where they intercept the perimeter footing or thickened slab edge.

- Spoils from the footing excavations should not be placed in the slab-on-grade areas unless properly compacted and tested. The excavations should be free of loose/sloughed materials and be neatly trimmed at the time of concrete placement.

6.3.5 Foundation Set Backs

Where applicable, the following setbacks should apply to all foundations. Any improvements not conforming to these setbacks may be subject to lateral movements and/or differential settlements:

- The outside bottom edge of all footings should be set back a minimum of H/3 (where H is the slope height) from the face of any descending slope. The setback should be at least 7 feet and need not exceed 40 feet.

- The bottom of all footings for structures near retaining walls should be deepened so as to extend below a 1:1 (h:v) projection upward from the bottom inside edge of the wall stem. This applies to the existing retaining walls along the perimeter, if they are to remain.

- The bottom of any existing foundations for structures should be deepened so as to extend below a 1:1 (h:v) projection upward from the bottom of the nearest excavation.

6.3.6 Seismic Design Parameters

The site is located at approximately 33.1405 Latitude and -117.1862 Longitude. Site spectral accelerations (S_a and S_1), for 0.2 and 1.0 second periods for a Site Class "C" site, were determined from the SEAOC/OSHPD web interface that utilizes the USGS web services and retrieves the

seismic design data and presents that information in a report format. We have selected a Site Class "C" based on the presence of shallow bedrock under the site. The results are presented in the following table and are consistent with the 2019 CBC:

SITE SEISMIC PARAMETERS	
Mapped 0.2 sec Period Spectral Acceleration, S_S	0.897g
Mapped 1.0 sec Period Spectral Acceleration, S_1	0.331g
Site Coefficient for Site Class "C", F_a	1.2
Site Coefficient for Site Class "C", F_v	1.5
Maximum Considered Earthquake (MCE_R) Spectral Response Acceleration for 0.2 Second, S_{MS}	1.076g
Maximum Considered Earthquake (MCE_R) Spectral Response Acceleration for 1.0 Second, S_{M1}	0.496g
5% Damped Design Spectral Response Acceleration Parameter at 0.2 Second, S_{DS}	0.718g
5% Damped Design Spectral Response Acceleration Parameter at 1 second, S_{D1}	0.331g
Site Modified Peak Ground Acceleration, PGA_M	0.465g
Seismic Design Category	D

6.3.7 Soil Corrosivity

The soil resistivity at this site was tested in the laboratory on a sample collected during the field investigation. The results of the testing indicate that the onsite materials are "extremely corrosive" per current standards used by corrosion engineers (Roberge, P.R., 2005). We recommend that a corrosion engineer be consulted to provide recommendations for proper protection of buried metal at this site.

SUMMARY OF CORROSION TEST RESULTS					
Sample Location	Depth (feet)	Minimum Resistivity (ohm-cm)	Sulfates (wt%)	Chlorides (ppm)	pH
B-4	0-5	563	0.0252	417	7.53

6.3.8 Soil Sulfate Content

The sulfate content was determined in the laboratory for a soil sample collected during the field investigation. The results indicate water soluble sulfate is less than 0.1 percent by weight, which is considered "S0" as per Table 19.3.1.1 of ACI 318-14, as such no special recommendations for concrete are included herein.

6.3.9 Preliminary Pavement Design

Based on laboratory testing of onsite soils, preliminary pavement sections have been estimated for a R-value of 6. In the absence of specific Traffic Indices (TIs) provided by the designer, we have provided structural sections for a range of TIs.

PRELIMINARY ASPHALT PAVEMENT STRUCTURAL SECTION		
Traffic Index	Asphaltic Concrete Thickness (inches)	Aggregate Base Thickness (inches)
5.0	3	10
5.5	3	12
6.0	4	12
6.5	4	14

Traffic parameters used for design were selected based upon engineering judgment and not upon information furnished to us. Upon receiving a desired traffic index, our preliminary asphalt concrete pavement design can be updated.

The provided pavement sections are intended as a minimum guideline and final selection of pavement cross section parameters should be made by the project civil engineer, based upon the local laws and ordinates, expected subgrade and pavement response, and desired level of conservatism. If thinner or highly variable pavement sections are constructed, increased maintenance and repair could be expected. Irrigation adjacent to pavements, without a deep curb or other cutoff to separate landscaping from the paving will result in premature pavement failure. Final pavement design should be checked by testing of soils exposed at subgrade (the upper 12 inches) after final grading has been completed.

Asphalt concrete and aggregate base should conform to current Caltrans Standard Specifications Section 39 and 26-1.02, respectively. As an alternative, asphalt concrete can conform to Section 203-6 of the current Standard Specifications for Public Work (Green Book). Crushed aggregate base or crushed miscellaneous base can conform to Section 200-2.2 and 200-2.4 of the Green Book, respectively. Pavement base should be compacted to at least 95 percent of the ASTM D1557 laboratory maximum dry density (modified proctor).

6.3.10 Permeable Pavement Section

If desired, interlocking concrete permeable pavers may be utilized. The pavers are anticipated to be approximately 3.2 inches (80 millimeters) in thickness. We recommend that the pavers be underlain by 2.0 inches of bedding course (No. 8 stone), overlying a 4.0-inch thick open-graded base (No. 57 stone), overlying a 6.0-inch thick subbase reservoir (No. 2 stone). No. 8 stone

should be placed as joint/opening filler. Alternatively, No. 89 or No. 9 stone can be used to fill pavers with narrow joints.

Based on the *ASCE Standard 68-18 Permeable Interlocking Concrete Pavement* (ASCE, 2018), gradations for the bedding, base, and subbase reservoir material are presented in the tables below:

ASTM No. 8 Bedding and Joint/Opening Filler	
Sieve Size	Percent Passing
1/2 in.	100
3/8 in.	85 to 100
No. 4	10 to 30
No. 8	0 to 10
No. 16	0 to 5

ASTM No. 57 Open-Graded Base	
Sieve Size	Percent Passing
1 1/2 in.	100
1 in.	95 to 100
1/2 in.	25 to 60
No. 4	0 to 10
No. 8	0 to 5

ASTM No. 2 Subbase Reservoir	
Sieve Size	Percent Passing
3 in.	100
2 1/2 in.	90 to 100
2 in.	35 to 70
1 1/2 in.	0 to 15
3/4 in.	0 to 5

The permeable paver section should be constructed in accordance with the manufacturer's typical sections and specifications, as applicable. A geotextile such as Mirafi®RS380i or an approved equivalent, should be utilized along the bottom and sides of the subbase reservoir for separation, confinement, filtration and subgrade reinforcement. The placement of these materials should be observed by a representative of this firm.

Since the site soils have negligible infiltration, an underdrain systems is also recommended, with pavement subgrade gently sloped at a gradient of 2% to direct water towards them. The underdrain pipe should consist of a minimum 4-inch diameter schedule 40 pvc pipe with two holes at 120^0 apart from each other along the bottom of the drain pipe. The drain pipe should be placed with the holes facing down. The underdrain should be placed in a trench with minimum 2-inches of clearance between the sides, bottom and lowest adjacent grade of the subgrade.

The pavement section presented above is subject to the review and approval by the city of San Marcos. Performance of the pavement sections will ultimately be based largely on construction methods, traffic loading, and subgrade performance.

Minimum compaction requirements should be 95 percent for subgrade, as per ASTM D 1557 (modified proctor). Jurisdictional minimum compaction requirements in excess of the aforementioned minimums may govern.

Since for the paver section compaction of the bedding, base, and subbase cannot be tested, placement should be observed by a representative of this firm.

All pavement installation, including preparation and compaction of subgrade, compaction of base material, placement and rolling of asphaltic concrete, should be done in accordance with the city of San Marcos specifications, and under the observation and testing of GeoTek and a City Inspector where required. Jurisdictional minimum compaction requirements in excess of the aforementioned minimums may govern.

6.4 RETAINING WALL DESIGN AND CONSTRUCTION

6.4.1 General Design Criteria

Preliminary plans do not show planned retaining walls, if retaining walls are added at a later date, the recommendations presented herein may apply to typical masonry or concrete retaining walls to a maximum height of six feet of retained soil. Additional review and recommendations should be requested for higher walls.

Retaining wall foundations should be embedded a minimum of 12 inches into engineered fill in areas containing "low" expansive soils and a minimum of 18 inches into engineered fill for areas with "medium" expansive soils. Walls could be designed using an allowable bearing capacity of 2,000 psf. An increase of one-third may be applied when considering short-term live loads (e.g. seismic and wind loads). The passive earth pressure may be computed as an equivalent fluid having a density of 220 psf per foot of depth, to a maximum earth pressure of 2,500 psf. A

coefficient of friction between soil and concrete of 0.35 may be used with dead load forces. When combining passive pressure and frictional resistance, the passive pressure component should be reduced by one-third.

An equivalent fluid pressure approach may be used to compute the horizontal active pressure against the wall. The appropriate fluid unit weights are given in the table below for specific slope gradients of retained materials. Based on the site soils encountered, the retained materials presented below will likely require import.

ACTIVE EARTH PRESSURES		
Surface Slope of Retained Materials (h:v)	Equivalent Fluid Pressure (pcf) Imported Backfill*	Equivalent Fluid Pressure (pcf) Select Native Backfill**
Level	37	45
2:1	53	81

*The design pressures assume the imported backfill material has an expansion index less than or equal to 20 and a friction angle of at least 34 degrees. Backfill zone includes area between the back of the wall and footing to a plane (1:1 h:v) up from the bottom of the wall foundation to the ground surface.

**The design pressures assume the native backfill material has an expansion index less than or equal to 50 and a friction angle of at least 28 degrees. Backfill zone includes area between the back of the wall and footing to a plane (1:1 h:v) up from the bottom of the wall foundation to the ground surface.

The above equivalent fluid weights do not include other superimposed loading conditions such as expansive soil, vehicular traffic, structures, seismic conditions or adverse geologic conditions.

6.4.2 Restrained Retaining Walls

Retaining walls that will be restrained prior to placing and compacting backfill material or that have reentrant or male corners should be designed for an at-rest equivalent fluid pressure of 57 pcf, plus any applicable surcharge loading, for select imported backfill and level back slope condition. For select native backfill, an at-rest equivalent fluid pressure of 67 pcf should be used. For areas of male or reentrant corners, the restrained wall design should extend a minimum distance of twice the height of the wall laterally from the corner, or a distance otherwise determined by the project structural engineer.

6.4.3 Wall Backfill and Drainage

Wall backfill should include a minimum one-foot wide section of ¾- to 1-inch clean crushed rock (or approved equivalent). The rock should be placed immediately adjacent to the back of wall and extend up from the backdrain to within approximately 12 inches of finish grade. The upper

12 inches should consist of compacted onsite materials. If the walls are designed using the select native backfill or imported granular backfill design parameters, then such materials shall be placed within the active zone as defined by a 1:1 (h:v) projection from the back of the retaining wall footing up to the retained surface behind the wall. Presence of other materials might necessitate revision to the parameters provided and modification of wall designs.

The backfill materials should be placed in lifts no greater than eight inches in thickness and compacted to a minimum of 90 percent of the maximum dry density as determined in accordance with ASTM Test Method D 1557. Proper surface drainage needs to be provided and maintained. Water should not be allowed to pond behind retaining walls. Waterproofing of site walls should be performed where moisture migration through the wall is undesirable.

Retaining walls should be provided with an adequate pipe and gravel back drain system to reduce the potential for hydrostatic pressures to develop. A four-inch diameter perforated collector pipe (Schedule 40 PVC, or approved equivalent) in a minimum of one cubic foot per lineal foot of 3/8- to 1-inch clean crushed rock or equivalent, wrapped in filter fabric should be placed near the bottom of the backfill and be directed (via a solid outlet pipe) to an appropriate disposal area.

Drain outlets should be maintained over the life of the project and should not be obstructed or plugged by adjacent improvements.

6.5 CONCRETE FLATWORK

6.5.1 Exterior Concrete Slabs, Sidewalks, and Driveways

Exterior concrete slabs, sidewalks, and driveways should be designed using a four-inch minimum thickness. If the on-site materials are found to be predominantly "medium" expansive, we recommend that the subject improvements be reinforced with 6" x 6" – W2.9/W2.9 welded wire mesh placed on center or equivalent. Some shrinkage and cracking of the concrete should be anticipated as a result of typical mix designs and curing practices commonly utilized in construction.

Sidewalks and driveways may be under the jurisdiction of the governing agency. If so, jurisdictional design and construction criteria would apply, if more restrictive than the recommendations presented herein.

Soils below exterior flatwork should pre-moistened prior to placing concrete. Subgrade soils classified as having "low" expansion potential should be pre-saturated to a minimum of 110 percent of optimum moisture content to a depth of 12 inches. Subgrade soils with a "medium"

expansion potential should be pre-saturated to a minimum of 120 percent of optimum moisture content to a depth of 12 inches.

All concrete installation, including preparation and compaction of subgrade should be done in accordance with the City of San Marcos specifications and under the observation and testing of GeoTek and a City Inspector, if necessary.

6.5.2 Concrete Performance

Concrete cracks should be expected. These cracks can vary from sizes that are essentially unnoticeable to more than 1/8 inch in width. Most cracks in concrete, while unsightly, do not significantly impact long-term performance. While it is possible to take measures (proper concrete mix, placement, curing, control joints, etc.) to reduce the extent and size of cracks that occur, some cracking will occur despite the best efforts to minimize it. Concrete can also undergo chemical processes that are dependent on a wide range of variables, which are difficult, at best, to control. Concrete, while seemingly a stable material, is also subject to internal expansion and contraction due to external changes over time.

One of the simplest means to control cracking is to provide weakened control joints for cracking to occur along. These do not prevent cracks from developing; they simply provide a relief point for the stresses that develop. These joints are a widely accepted means to control cracks but are not always effective. Control joints are more effective the more closely spaced they are. GeoTek suggests that control joints be placed in two directions and located a distance apart roughly equal to 24 to 36 times the slab thickness.

Exterior concrete flatwork (patios, walkways, driveways, etc.) is often some of the most visible aspects of site development. They are typically given the least level of quality control, being considered "non-structural" components. We suggest that the same standards of care be applied to these features as to the structure itself.

6.6 POST CONSTRUCTION CONSIDERATIONS

6.6.1 Landscape Maintenance and Planting

Water has been shown to weaken the inherent strength of soil, and slope stability is significantly reduced by overly wet conditions. Positive surface drainage away from graded slopes should be maintained and only the amount of irrigation necessary to sustain plant life should be provided for planted slopes. Controlling surface drainage and runoff and maintaining a suitable vegetation

cover can minimize erosion. Plants selected for landscaping should be lightweight, deep-rooted types that require little water and are capable of surviving the prevailing climate.

Overwatering should be avoided. The soils should be maintained in a solid to semi-solid state as defined by the materials Atterberg Limits. Care should be taken when adding soil amendments to avoid excessive watering. Leaching as a method of soil preparation prior to planting is not recommended. An abatement program to control ground-burrowing rodents should be implemented and maintained. This is critical as burrowing rodents can decreased the long-term performance of slopes.

It is common for planting to be placed adjacent to structures in planter or lawn areas. This will result in the introduction of water into the ground adjacent to the foundation. This type of landscaping should be avoided. If used, then extreme care should be exercised with regard to the irrigation and drainage in these areas. Waterproofing of the foundation and/or subdrains may be warranted and advisable. We could discuss these issues, if desired, when plans are made available.

6.6.2 Drainage

The need to maintain proper surface drainage and subsurface systems cannot be overly emphasized. Positive site drainage should be maintained at all times. Drainage should not flow uncontrolled down any descending slope. Water should be directed away from foundations and not allowed to pond or seep into the ground adjacent to the footings. Site drainage should conform to Section 1804.4 of the 2019 CBC. Roof gutters and downspouts should discharge onto paved surfaces sloping away from the structure or into a closed pipe system which outfalls to the street gutter pan or directly to the storm drain system. Pad drainage should be directed toward approved areas and not be blocked by other improvements.

6.7 PLAN REVIEW AND CONSTRUCTION OBSERVATIONS

We recommend that site grading, specifications, retaining wall/shoring plans, and foundation plans be reviewed by this office prior to construction to check for conformance with the recommendations of this report. Additional recommendations may be necessary based on these reviews. We also recommend that GeoTek representatives be present during site grading and foundation construction to check for proper implementation of the geotechnical recommendations. The owner/developer should have GeoTek's representative perform at least the following duties:

- Observe site clearing and grubbing operations for proper removal of unsuitable materials.
- Observe and test bottom of removals prior to fill placement.

- Evaluate the suitability of on-site and import materials for fill placement and collect soil samples for laboratory testing when necessary.
- Observe the fill for uniformity during placement including utility trenches.
- Observe and test the fill for field density and relative compaction.
- Observe and probe foundation excavations to confirm suitability of bearing materials.

If requested, a construction observation and compaction report can be provided by GeoTek, which can comply with the requirements of the governmental agencies having jurisdiction over the project. We recommend that these agencies be notified prior to commencement of construction so that necessary grading permits can be obtained.

7. LIMITATIONS

The scope of our evaluation is limited to the area explored that is shown on the Boring Location Map (Figure 2). This evaluation does not and should in no way be construed to encompass any areas beyond the specific area of proposed construction as indicated to us by the client. The scope is based on our understanding of the project and the client's needs, our proposal (Proposal No. P-0100220-SD) dated February 18, 2020 and geotechnical engineering standards normally used on similar projects in this region.

The materials observed on the project site appear to be representative of the area; however, soil and bedrock materials vary in character between excavations and natural outcrops or conditions exposed during site construction. Site conditions may vary due to seasonal changes or other factors. GeoTek, Inc. assumes no responsibility or liability for work, testing or recommendations performed or provided by others.

Since our recommendations are based on the site conditions observed and encountered, and laboratory testing, our conclusions and recommendations are professional opinions that are limited to the extent of the available data. Observations during construction are important to allow for any change in recommendations found to be warranted. These opinions have been derived in accordance with current standards of practice and no warranty is expressed or implied. Standards of practice are subject to change with time.

APPENDIX A

EXPLORATORY BORING LOGS
AND INFILTRATION WORKSHEETS BY GEOTEK

GEOTEK

A - FIELD TESTING AND SAMPLING PROCEDURES

The Modified Split-Barrel Sampler (Ring)

The ring sampler is driven into the ground in accordance with ASTM Test Method D 3550. The sampler, with an external diameter of 3.0 inches, is lined with 1-inch long, thin brass rings with inside diameters of approximately 2.4 inches. The sampler is typically driven into the ground 12 or 18 inches with a 140-pound hammer free falling from a height of 30 inches. Blow counts are recorded for every 6 inches of penetration as indicated on the logs of borings. The samples are removed from the sample barrel in the brass rings, sealed, and transported to the laboratory for testing.

Bulk Samples (Large)

These samples are normally large bags of earth materials over 20 pounds in weight collected from the field by means of hand digging or exploratory cuttings.

B – BORING LOG LEGEND

The following abbreviations and symbols often appear in the classification and description of soil and rock on the logs of borings:

SOILS

USCS	Unified Soil Classification System
f-c	Fine to coarse
f-m	Fine to medium

GEOLOGIC

B: Attitudes	Bedding: strike/dip
J: Attitudes	Joint: strike/dip
C: Contact line	
……..	Dashed line denotes USCS material change
———	Solid Line denotes unit / formational change
———	Thick solid line denotes end of boring

(Additional denotations and symbols are provided on the logs)

GeoTek, Inc.

GEOTEK

Categorization of Infiltration Feasibility Condition	Form I-8

Part 1 - Full Infiltration Feasibility Screening Criteria

Would infiltration of the full design volume be feasible from a physical perspective without any undesirable consequences that cannot be reasonably mitigated?

Criteria	Screening Question	Yes	No
1	**Is the estimated reliable infiltration rate below proposed facility locations greater than 0.5 inches per hour?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.2 and Appendix D.		X

Provide basis:

The infiltration rate (not including a factor of safety) ranges from 0 to 0.04 inches per hour See geotechnical report prepared by GeoTek, Inc. "Geotechnical Evaluation, Proposed Commercial Development, Grand Avenue and Linda Vista Drive, San Marcos, California" Project No. 3637-SD, dated June 21, 2021.

Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.

2	**Can infiltration greater than 0.5 inches per hour be allowed without increasing risk of geotechnical hazards (slope stability, groundwater mounding, utilities, or other factors) that cannot be mitigated to an acceptable level?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.2.		

Provide basis:

Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.

Form I-8 Page 2 of 4			
Criteria	Screening Question	**Yes**	**No**
3	**Can infiltration greater than 0.5 inches per hour be allowed without increasing risk of groundwater contamination (shallow water table, storm water pollutants or other factors) that cannot be mitigated to an acceptable level?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.3.		
Provide basis: Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.			
4	**Can infiltration greater than 0.5 inches per hour be allowed without causing potential water balance issues such as change of seasonality of ephemeral streams or increased discharge of contaminated groundwater to surface waters?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.3.		
Provide basis: Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.			
Part 1 Result *	If all answers to rows 1 - 4 are "**Yes**" a full infiltration design is potentially feasible. The feasibility screening category is **Full Infiltration** If any answer from row 1-4 is "**No**", infiltration may be possible to some extent but would not generally be feasible or desirable to achieve a "full infiltration" design. Proceed to Part 2		NO

*To be completed using gathered site information and best professional judgment considering the definition of MEP in the MS4 Permit. Additional testing and/or studies may be required by Agency/Jurisdictions to substantiate findings

Form I-8 Page 3 of 4

Part 2 – Partial Infiltration vs. No Infiltration Feasibility Screening Criteria

Would infiltration of water in any appreciable amount be physically feasible without any negative consequences that cannot be reasonably mitigated?

Criteria	Screening Question	Yes	No
5	**Do soil and geologic conditions allow for infiltration in any appreciable rate or volume?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.2 and Appendix D.		X

Provide basis:

The infiltration rate (not including a factor of safety) ranges from 0 to 0.04 inches per hour See geotechnical report prepared by GeoTek, Inc. "Geotechnical Evaluation, Proposed Commercial Development, Grand Avenue and Linda Vista Drive, San Marcos, California" Project No. 3637-SD, dated June 21, 2021.

Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability and why it was not feasible to mitigate low infiltration rates.

6	**Can Infiltration in any appreciable quantity be allowed without increasing risk of geotechnical hazards (slope stability, groundwater mounding, utilities, or other factors) that cannot be mitigated to an acceptable level**? The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.2.		X

Provide basis:

Shallow impermeable bedrock and very dense older alluvial soils underlay the site. Groundwater mounding is a geotechnical concern.

Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability and why it was not feasible to mitigate low infiltration rates.

Form I-8 Page 4 of 4			
Criteria	Screening Question	**Yes**	**No**
7	**Can Infiltration in any appreciable quantity be allowed without posing significant risk for groundwater related concerns (shallow water table, storm water pollutants or other factors)?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.3.	X	
Provide basis: Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability and why it was not feasible to mitigate low infiltration rates.			
8	**Can infiltration be allowed without violating downstream water rights**? The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.3.	X	
Provide basis: Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability and why it was not feasible to mitigate low infiltration rates.			
Part 2 Result*	If all answers from row 5-8 are yes then partial infiltration design is potentially feasible. The feasibility screening category is **Partial Infiltration.** If any answer from row 5-8 is no, then infiltration of any volume is considered to be **infeasible** within the drainage area. The feasibility screening category is **No Infiltration.**	No Infiltration	

*To be completed using gathered site information and best professional judgment considering the definition of MEP in the MS4 Permit. Additional testing and/or studies may be required by Agency/Jurisdictions to substantiate findings

Factor of Safety and Design Infiltration Rate Worksheet				Form I-9	
Factor Category		Factor Description	Assigned Weight (w)	Factor Value (v)	Product (p) p = w x v
A	Suitability Assessment	Soil assessment methods	0.25	3	0.75
		Predominant soil texture	0.25	3	0.75
		Site soil variability	0.25	3	0.75
		Depth to groundwater / impervious layer	0.25	3	0.75
		Suitability Assessment Safety Factor, $S_A = \Sigma p$			3
B	Design	Level of pretreatment/ expected sediment loads	0.5	To Be Completed by Others	
		Redundancy/resiliency	0.25		
		Compaction during construction	0.25		
		Design Safety Factor, $S_B = \Sigma p$			
Combined Safety Factor, $S_{total} = S_A \times S_B$					
Observed Infiltration Rate, inch/hr, $K_{observed}$ (corrected for test-specific bias)					
Design Infiltration Rate, in/hr, $K_{design} = K_{observed} / S_{total}$					

Supporting Data

Briefly describe infiltration test and provide reference to test forms:

Infiltration testing was performed by borehole method.
See geotechnical report prepared by GeoTek, Inc. "Geotechnical Evaluation, Proposed Commercial Development, Grand Avenue and Linda Vista Drive, San Marcos, California" Project No. 3637-SD, dated June 21, 2021.

LABORATORY TEST RESULTS BY GEOTEK

GEOTEK

SUMMARY OF LABORATORY TESTING

Identification and Classification
Soils were identified visually in general accordance to the standard practice for description and identification of soils (ASTM D2488). The soil identifications and classifications are shown on the logs of exploratory borings in Appendix A.

In-Situ Moisture and Density
The natural water content was determined (ASTM D2216) on samples of the materials recovered from the subsurface exploration. In addition, in-place dry density determinations (ASTM D7263) were performed on relatively undisturbed samples to measure the unit weight of the subsurface soils. Results of these tests are shown on the boring logs at the appropriate sample depths in Appendix A.

Moisture-Density Relationship
Laboratory testing was performed on one sample collected during the subsurface exploration. The laboratory maximum dry density and optimum moisture content for the soil type was determined in general accordance with test method ASTM Test Procedure D1557. The test results are provided herein.

Collapse
Collapse tests were conducted on two undisturbed samples obtained from the site, in general accordance with ASTM D 4546. The test results are presented herein

Expansion Index
The expansion potential of the soils was determined by performing expansion index tests on two representative soil samples from the site in general accordance with ASTM D 4829. The results of these tests are presented herein.

Atterberg Limits
Atterberg limits testing were performed on two clayey samples collected from the site. The tests were performed in general accordance with ASTM D 4318. The test results are presented herein.

Percent of Soil Passing No 200 Sieve
The amount of soil finer than No. 200 sieve was determined for two clayey samples collected from the site. The tests were performed in general accordance with ASTM D 1140. The test results are presented herein.

R-Value
A sample of the subgrade soil was tested for its R-value in general accordance with CAL Test 301. The test result is presented herein.

Sulfate Content, Resistivity, and Chloride Content
Testing to determine the water-soluble sulfate content was performed by others in general accordance with ASTM D 4327. Resistivity testing was completed by others in general accordance with ASTM G51. Testing to determine the chloride content was performed by other in general accordance with ASTM D 4327. The results are included herein.

APPENDIX D

GENERAL EARTHWORK GRADING GUIDELINES

GEOTEK

GENERAL GRADING GUIDELINES

Guidelines presented herein are intended to address general construction procedures for earthwork construction. Specific situations and conditions often arise which cannot reasonably be discussed in general guidelines, when anticipated these are discussed in the text of the report. Often unanticipated conditions are encountered which may necessitate modification or changes to these guidelines. It is our hope that these will assist the contractor to more efficiently complete the project by providing a reasonable understanding of the procedures that would be expected during earthwork and the testing and observation used to evaluate those procedures.

General

Grading should be performed to at least the minimum requirements of governing agencies, Chapters 18 and 33 of the California Building Code, CBC (2019) and the guidelines presented below.

Preconstruction Meeting

A preconstruction meeting should be held prior to site earthwork. Any questions the contractor has regarding our recommendations, general site conditions, apparent discrepancies between reported and actual conditions and/or differences in procedures the contractor intends to use should be brought up at that meeting. The contractor (including the main onsite representative) should review our report and these guidelines in advance of the meeting. Any comments the contractor may have regarding these guidelines should be brought up at that meeting.

Grading Observation and Testing

1. Observation of the fill placement should be provided by our representative during grading. Verbal communication during the course of each day will be used to inform the contractor of test results. The contractor should receive a copy of the "Daily Field Report" indicating results of field density tests that day. If our representative does not provide the contractor with these reports, our office should be notified.
2. Testing and observation procedures are, by their nature, specific to the work or area observed and location of the tests taken, variability may occur in other locations. The contractor is responsible for the uniformity of the grading operations; our observations and test results are intended to evaluate the contractor's overall level of efforts during grading. The contractor's personnel are the only individuals participating in all aspect of site work. Compaction testing and observation should not be considered as relieving the contractor's responsibility to properly compact the fill.
3. Cleanouts, processed ground to receive fill, key excavations, and subdrains should be observed by our representative prior to placing any fill. It will be the contractor's responsibility to notify our representative or office when such areas are ready for observation.
4. Density tests may be made on the surface material to receive fill, as considered warranted by this firm.
5. In general, density tests would be made at maximum intervals of two feet of fill height or every 1,000 cubic yards of fill placed. Criteria will vary depending on soil conditions and size of the fill. More frequent testing may be performed. In any case, an adequate number of field density tests should be made to evaluate the required compaction and moisture content is generally being obtained.

6. Laboratory testing to support field test procedures will be performed, as considered warranted, based on conditions encountered (e.g. change of material sources, types, etc.) Every effort will be made to process samples in the laboratory as quickly as possible and in progress construction projects are our first priority. However, laboratory workloads may cause in delays and some soils may require a **minimum of 48 to 72 hours to complete test procedures**. Whenever possible, our representative(s) should be informed in advance of operational changes that might result in different source areas for materials.
7. Procedures for testing of fill slopes are as follows:
   a) Density tests should be taken periodically during grading on the flat surface of the fill, three to five feet horizontally from the face of the slope.
   b) If a method other than over building and cutting back to the compacted core is to be employed, slope compaction testing during construction should include testing the outer six inches to three feet in the slope face to determine if the required compaction is being achieved.
8. Finish grade testing of slopes and pad surfaces should be performed after construction is complete.

Site Clearing

1. All vegetation, and other deleterious materials, should be removed from the site. If material is not immediately removed from the site it should be stockpiled in a designated area(s) well outside of all current work areas and delineated with flagging or other means. Site clearing should be performed in advance of any grading in a specific area.
2. Efforts should be made by the contractor to remove all organic or other deleterious material from the fill, as even the most diligent efforts may result in the incorporation of some materials. This is especially important when grading is occurring near the natural grade. All equipment operators should be aware of these efforts. Laborers may be required as root pickers.
3. Nonorganic debris or concrete may be placed in deeper fill areas provided the procedures used are observed and found acceptable by our representative.

Treatment of Existing Ground

1. Following site clearing, all surficial deposits of alluvium and colluvium as well as weathered or creep effected bedrock, should be removed unless otherwise specifically indicated in the text of this report.
2. In some cases, removal may be recommended to a specified depth (e.g. flat sites where partial alluvial removals may be sufficient). The contractor should not exceed these depths unless directed otherwise by our representative.
3. Groundwater existing in alluvial areas may make excavation difficult. Deeper removals than indicated in the text of the report may be necessary due to saturation during winter months.
4. Subsequent to removals, the natural ground should be processed to a depth of six inches, moistened to near optimum moisture conditions and compacted to fill standards.
5. Exploratory back hoe or dozer trenches still remaining after site removal should be excavated and filled with compacted fill if they can be located.

Fill Placement

1. Unless otherwise indicated, all site soil and bedrock may be reused for compacted fill; however, some special processing or handling may be required (see text of report).

2. Material used in the compacting process should be evenly spread, moisture conditioned, processed, and compacted in thin lifts six (6) to eight (8) inches in compacted thickness to obtain a uniformly dense layer. The fill should be placed and compacted on a nearly horizontal plane, unless otherwise found acceptable by our representative.
3. If the moisture content or relative density varies from that recommended by this firm, the contractor should rework the fill until it is in accordance with the following:
   a) Moisture content of the fill should be at or above optimum moisture. Moisture should be evenly distributed without wet and dry pockets. Pre-watering of cut or removal areas should be considered in addition to watering during fill placement, particularly in clay or dry surficial soils. The ability of the contractor to obtain the proper moisture content will control production rates.
   b) Each six-inch layer should be compacted to at least 90 percent of the maximum dry density in compliance with the testing method specified by the controlling governmental agency. In most cases, the testing method is ASTM Test Designation D 1557.
4. Rock fragments less than eight inches in diameter may be utilized in the fill, provided:
   a) They are not placed in concentrated pockets;
   b) There is a sufficient percentage of fine-grained material to surround the rocks;
   c) The distribution of the rocks is observed by, and acceptable to, our representative.
5. Rocks exceeding eight (8) inches in diameter should be taken off site, broken into smaller fragments, or placed in accordance with recommendations of this firm in areas designated suitable for rock disposal. On projects where significant large quantities of oversized materials are anticipated, alternate guidelines for placement may be included. If significant oversize materials are encountered during construction, these guidelines should be requested.
6. In clay soil, dry or large chunks or blocks are common. If in excess of eight (8) inches minimum dimension, then they are considered as oversized. Sheepsfoot compactors or other suitable methods should be used to break up blocks. When dry, they should be moisture conditioned to provide a uniform condition with the surrounding fill.

Slope Construction

1. The contractor should obtain a minimum relative compaction of 90 percent out to the finished slope face of fill slopes. This may be achieved by either overbuilding the slope and cutting back to the compacted core, or by direct compaction of the slope face with suitable equipment.
2. Slopes trimmed to the compacted core should be overbuilt by at least three (3) feet with compaction efforts out to the edge of the false slope. Failure to properly compact the outer edge results in trimming not exposing the compacted core and additional compaction after trimming may be necessary.
3. If fill slopes are built "at grade" using direct compaction methods, then the slope construction should be performed so that a constant gradient is maintained throughout construction. Soil should not be "spilled" over the slope face nor should slopes be "pushed out" to obtain grades. Compaction equipment should compact each lift along the immediate top of slope. Slopes should be back rolled or otherwise compacted at approximately every 4 feet vertically as the slope is built.
4. Corners and bends in slopes should have special attention during construction as these are the most difficult areas to obtain proper compaction.
5. Cut slopes should be cut to the finished surface. Excessive undercutting and smoothing of the face with fill may necessitate stabilization.

UTILITY TRENCH CONSTRUCTION AND BACKFILL

Utility trench excavation and backfill is the contractors responsibility. The geotechnical consultant typically provides periodic observation and testing of these operations. While efforts are made to make sufficient observations and tests to verify that the contractors' methods and procedures are adequate to achieve proper compaction, it is typically impractical to observe all backfill procedures. As such, it is critical that the contractor use consistent backfill procedures.

Compaction methods vary for trench compaction and experience indicates many methods can be successful. However, procedures that "worked" on previous projects may or may not prove effective on a given site. The contractor(s) should outline the procedures proposed, so that we may discuss them **prior** to construction. We will offer comments based on our knowledge of site conditions and experience.

1. Utility trench backfill in slopes, structural areas, in streets and beneath flat work or hardscape should be brought to at least optimum moisture and compacted to at least 90 percent of the laboratory standard. Soil should be moisture conditioned prior to placing in the trench.
2. Flooding and jetting are not typically recommended or acceptable for native soils. Flooding or jetting may be used with select sand having a Sand Equivalent (SE) of 30 or higher. This is typically limited to the following uses:
   a) shallow (12 + inches) under slab interior trenches and,
   b) as bedding in pipe zone.

   The water should be allowed to dissipate prior to pouring slabs or completing trench compaction.
3. Care should be taken not to place soils at high moisture content within the upper three feet of the trench backfill in street areas, as overly wet soils may impact subgrade preparation. Moisture may be reduced to 2% below optimum moisture in areas to be paved within the upper three feet below sub grade.
4. Sand backfill should not be allowed in exterior trenches adjacent to and within an area extending below a 1:1 projection from the outside bottom edge of a footing, unless it is similar to the surrounding soil.
5. Trench compaction testing is generally at the discretion of the geotechnical consultant. Testing frequency will be based on trench depth and the contractors procedures. A probing rod would be used to assess the consistency of compaction between tested areas and untested areas. If zones are found that are considered less compact than other areas, this would be brought to the contractors attention.

JOB SAFETY

General

Personnel safety is a primary concern on all job sites. The following summaries are safety considerations for use by all our employees on multi-employer construction sites. On ground personnel are at highest risk of injury and possible fatality on grading construction projects. The company recognizes that construction activities will vary on each site and that job site safety is the contractor's responsibility. However, it is, imperative that all personnel be safety conscious to avoid accidents and potential injury.

In an effort to minimize risks associated with geotechnical testing and observation, the following precautions are to be implemented for the safety of our field personnel on grading and construction projects.

1. Safety Meetings: Our field personnel are directed to attend the contractor's regularly scheduled safety meetings.
2. Safety Vests: Safety vests are provided for and are to be worn by our personnel while on the job site.
3. Safety Flags: Safety flags are provided to our field technicians; one is to be affixed to the vehicle when on site, the other is to be placed atop the spoil pile on all test pits.

In the event that the contractor's representative observes any of our personnel not following the above, we request that it be brought to the attention of our office.

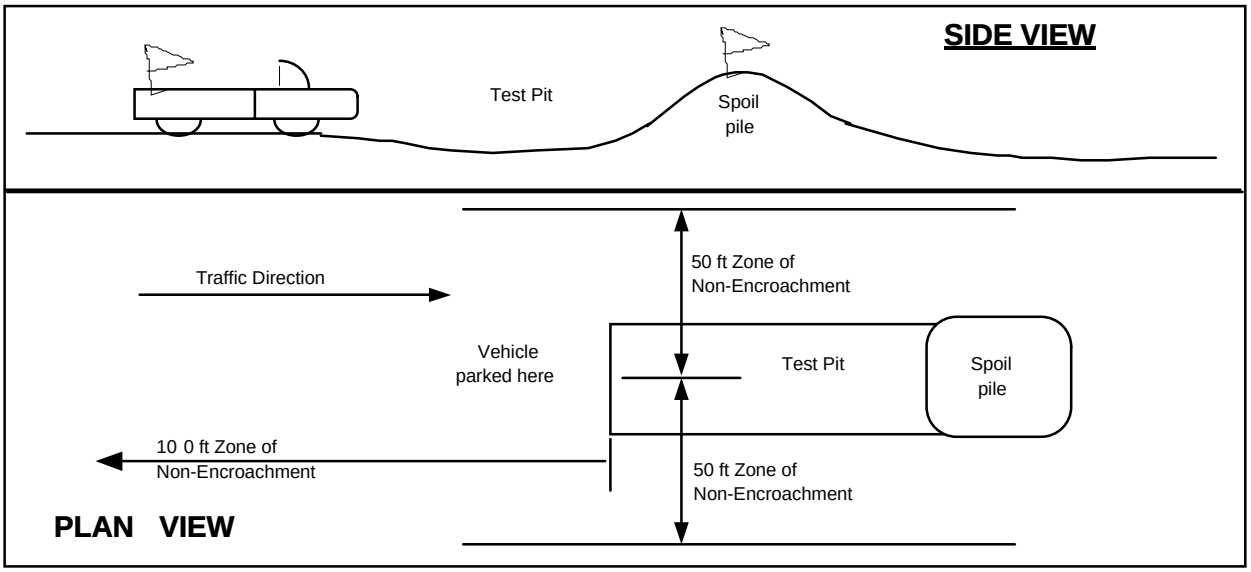
Test Pits Location, Orientation and Clearance

The technician is responsible for selecting test pit locations. The primary concern is the technician's safety. However, it is necessary to take sufficient tests at various locations to obtain a representative sampling of the fill. As such, efforts will be made to coordinate locations with the grading contractors authorized representatives (e.g. dump man, operator, supervisor, grade checker, etc.), and to select locations following or behind the established traffic pattern, preferably outside of current traffic. The contractors authorized representative should direct excavation of the pit and safety during the test period. Again, safety is the paramount concern.

Test pits should be excavated so that the spoil pile is placed away from oncoming traffic. The technician's vehicle is to be placed next to the test pit, opposite the spoil pile. This necessitates that the fill be maintained in a drivable condition. Alternatively, the contractor may opt to park a piece of equipment in front of test pits, particularly in small fill areas or those with limited access.

A zone of non-encroachment should be established for all test pits (see diagram below). No grading equipment should enter this zone during the test procedure. The zone should extend outward to the sides approximately 50 feet from the center of the test pit and 100 feet in the direction of traffic flow. This zone is established both for safety and to avoid excessive ground vibration, which typically decreases test results.

TEST PIT SAFETY PLAN



Slope Tests

When taking slope tests, the technician should park their vehicle directly above or below the test location on the slope. The contractor's representative should effectively keep all equipment at a safe operation distance (e.g. 50 feet) away from the slope during testing.

The technician is directed to withdraw from the active portion of the fill as soon as possible following testing. The technician's vehicle should be parked at the perimeter of the fill in a highly visible location.

Trench Safety

It is the contractor's responsibility to provide safe access into trenches where compaction testing is needed. Trenches for all utilities should be excavated in accordance with CAL-OSHA and any other applicable safety standards. Safe conditions will be required to enable compaction testing of the trench backfill.

All utility trench excavations in excess of 5 feet deep, which a person enters, are to be shored or laid back. Trench access should be provided in accordance with OSHA standards. Our personnel are directed not to enter any trench by being lowered or "riding down" on the equipment.

Our personnel are directed not to enter any excavation which;

1. is 5 feet or deeper unless shored or laid back,
2. exit points or ladders are not provided,
3. displays any evidence of instability, has any loose rock or other debris which could fall into the trench, or
4. displays any other evidence of any unsafe conditions regardless of depth.

If the contractor fails to provide safe access to trenches for compaction testing, our company policy requires that the soil technician withdraws and notifies their supervisor. The contractors representative will then be contacted in an effort to effect a solution. All backfill not tested due to safety concerns or other reasons is subject to reprocessing and/or removal.

Procedures

In the event that the technician's safety is jeopardized or compromised as a result of the contractor's failure to comply with any of the above, the technician is directed to inform both the developer's and contractor's representatives. If the condition is not rectified, the technician is required, by company policy, to immediately withdraw and notify their supervisor. The contractor's representative will then be contacted in an effort to effect a solution. No further testing will be performed until the situation is rectified. Any fill placed in the interim can be considered unacceptable and subject to reprocessing, recompaction or removal.

In the event that the soil technician does not comply with the above or other established safety guidelines, we request that the contractor bring this to technicians attention and notify our project manager or office. Effective communication and coordination between the contractors' representative and the field technician(s) is strongly encouraged in order to implement the above safety program and safety in general.

The safety procedures outlined above should be discussed at the contractor's safety meetings. This will serve to inform and remind equipment operators of these safety procedures particularly the zone of non-encroachment.

The safety procedures outlined above should be discussed at the contractor's safety meetings. This will serve to inform and remind equipment operators of these safety procedures particularly the zone of non-encroachment.

1 Executive Summary

Dudek conducted a Phase I Environmental Site Assessment (ESA) for the Marcos Specific Plan Project site located at the northwest corner of Grand Avenue and Linda Vista Drive in San Marcos, California. The Marcos Specific Plan Project site consists of 11.95 acres of land on 12 contiguous parcels with the following Assessor's Parcel Numbers (APNs) as identified on the San Diego Geographic Information Source database: 219-152-70-00, 219-152-51-00, 219-152-79-00, 219-152-77-00, 219-152-76-00, 219-152-75-00, 219-152-74-00, 219-152-78-00, 219-152-42-00, 219-152-45-00, 219-152-44-00, and 219-152-61-00 (subject property); see Figure 1, Subject Property Location.

The findings of this investigation are based on historical sources, information contained in regulatory agency databases, interviews, and a site reconnaissance.

Information gathered for this report indicated the following:

- The subject property was undeveloped until sometime after 1953; it was developed for commercial/industrial purposes by the early 1960s. Businesses that existed on the subject property included auto repair shops, construction companies, commercial and building retail, and concrete and metal manufacturers. All structures were removed by 2013.
- The subject property is currently vacant. Approximately 50% of the land is covered by degrading pavement and concrete from the prior businesses.
- Properties adjoining the subject property previously included small airfields to the northeast and south and currently include industrial and commercial properties in all directions apart from the one vacant lot to the south-southeast.
- Two former leaking underground storage tanks (LUST) cases and two former cleanup program cases were identified on the subject property. The former LUST case on the eastern end of the subject property was granted regulatory closure in 1988. The former LUST case on the southern end of the subject property was granted regulatory closure in 2017; an area of impacted soil was left in place. The former cleanup program cases were neighboring businesses on the western portion of the subject property. Regulatory closure was granted for both cases in 2012 based on future commercial use of the subject property.

Dudek performed this Phase I ESA of the subject property in conformance with the scope and limitations of the ASTM E1527-21 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process. This report summarizes the research and findings of the Phase I ESA. This assessment did not reveal evidence of recognized environmental conditions (RECs) in connection with the subject property. However, historical and controlled RECs and a vapor encroachment condition were identified as described below. Data gaps, which were determined not to be significant, are discussed in Section 13, Limitations.

- The former LUST cases on the eastern and southern ends of the subject property are considered historical RECs as they were granted regulatory closure. However, an area of impacted soil, portions of which exceed regulatory screening levels for diesel, remains in place. As such, a vapor encroachment condition could not be ruled out for the subject property.

- The former cleanup cases on the western portion of the subject property are considered controlled RECs as they were granted regulatory closure based on future commercial use. The regulatory agency noted in the closure letter that a change in land use may require reassessment.

Dudek recommends preparation of a soil management plan prior to construction of the subject property. The soil management plan should describe the known former impacts at the subject property and detail management procedures should contamination and/or any features (e.g., former tanks) related to former chemical use be discovered during construction. In addition, if the subject property is planned for residential use, reassessment may be required for the western portion of the subject property as noted in the San Diego Department of Environmental Health closure letter for 1031 Grand Avenue (APN 219-152-70) and 1023 Grand Avenue (APN 219-152-47). San Diego Department of Environmental Health and Quality would need to be notified of any planned residential use and they may request additional investigation.

Marcos Specific Plan

2 Introduction

This Phase I Environmental Site Assessment (ESA) was performed according to the guidelines stipulated in ASTM E1527-21 (ASTM 2021).[1] This Phase I ESA was conducted as part of environmental due diligence for redevelopment of the subject property.

2.1 Assessment Procedure and Scope of Investigation

Phase I ESAs assist in identifying past and present land use, including identification of possible releases or disposal of manufacturing or other wastes if such information is contained within regulatory reports or files and/or is currently visible on site. The assessment reviews federal (U.S. Environmental Protection Agency [EPA]), state, county, and local lists of known or potentially hazardous waste sites, landfills, and sites currently under investigation for environmental violations that may be of concern to a site.

The scope of this environmental investigation consisted of (1) a reconnaissance of the subject property; (2) a search of regulatory agency records; (3) a review of available historical aerial photographs, topographic maps, Sanborn fire insurance maps, city directory listings, and building department records; (4) interviews with the owner of the subject property and user of this report; and (5) preparation of this Phase I ESA report detailing the findings of the investigation.

These activities were conducted to identify RECs. The term *recognized environmental condition* (REC) means the presence or likely presence of any hazardous substances or petroleum products in, on, or at the subject property due to a release, likely release, past release, or material threat of a future release to the environment.

The term *controlled recognized environmental condition* is an environmental condition that would have been considered a REC in the past but that has been remediated and received risk-based closure by a regulatory agency (i.e., received a "no further action" letter) where residual contamination remains in place. Furthermore, the term *controlled REC* is used if the property is subject to a control or use restriction (i.e., property use restrictions, activity and use limitations, institutional controls, or engineering controls) due to residual on-site contamination.

The term *historical recognized environmental condition* is an environmental condition that would have been considered a REC in the past but that has been remediated and received unrestricted residential use closure by the regulatory agency. Therefore, no controls or use restrictions have been applied to the property.

The term REC is not intended to include de minimis conditions. De minimis conditions are conditions that generally do not present a material risk of harm to public health or the environment and thus would not be subject to an enforcement action if brought to the attention of governmental agencies.

[1] ASTM E1527-21 was released on November 17, 2021. EPA concurrence with the revised standard is pending. Thus, compliance with the All Appropriate Inquiries Rule to qualify for an exemption from CERCLA liability will remain under ASTM E1527-13 until EPA concurs with the new standard. This Phase I ESA meets the requirements of both ASTM E1527-13 and E1527-21.

2.2 Qualifications of Environmental Professionals

This Phase I ESA was prepared by Glenna McMahon, environmental engineer, and Nicole Tucker, hydrogeologist. Qualifications for Ms. McMahon and Ms. Tucker are included in Appendix A.

I, Glenna McMahon, declare that, to the best of my professional knowledge and belief, I meet the definition of environmental professional as defined in Section 312.10 of Title 40 of the Code of Federal Regulations, Part 312. I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in Title 40 of the Code of Federal Regulations, Part 312.

3 Site Location

The subject property consists of 12 contiguous parcels of land comprising 11.95 acres located.

The subject property is located at the northwestern corner of Grand Avenue and Linda Vista Drive in the City of San Marcos, San Diego County, California. According to records reviewed, it includes the following addresses: 931 to 1057 Grand Avenue and 930 and 1010 Linda Vista Drive. According to the San Diego Geographic Information Source database, the parcels for the subject property include Assessor's Parcel Numbers (APNs) 219-152-70-00, 219-152-51-00, 219-152-79-00, 219-152-77-00, 219-152-76-00, 219-152-75-00, 219-152-74-00, 219-152-78-00, 219-152-42-00, 219-152-45-00, 219-152-44-00, and 219-152-61-00.

The subject property is currently vacant and mostly covered in broken or unmaintained pavement and concrete with some areas with dirt and low-lying vegetation. A stream channel runs through the center of the subject property; a bridge crosses the stream on the western side of the subject property. Three billboards are located on the northern side of the subject property—one billboard on the eastern most corner of the subject property, the second billboard 330 feet further east of the stream channel, and the third billboard 120 feet west of the stream channel.

The subject property is surrounded by mostly industrial and commercial facilities. A landscaping company adjoins the subject property on the northwestern boundary. Grand Avenue followed by California State Route 78 adjoin the subject property to the north. A parking lot and undeveloped lot are adjoining off the eastern corner at the end of Linda Vista Drive. A metal fabrication shop, a cabinet and granite supply, and an agricultural supply store are south of the subject property and Linda Vista Drive. An auto repair shop is on the southern adjoining corner lot. The western adjoining property is an electronic manufacturer.

4 Environmental Setting

4.1 Topography and Geology

The subject property is located in the central western portion of the City of San Marcos (City), on the south side of California State Route 78.

General topographic information for the subject property and the surrounding area was obtained from a review of topographic maps (Appendix B), the Environmental Data Resources (EDR) Radius Map Report (Appendix C), and a site visit. The subject property lies within the San Marcos Creek valley along a tributary of the Los Posas Branch of San Marcos Creek, in the hills of San Marcos. The natural topography of the subject property consists of mostly flat terrain with a slight slope towards the southwest and San Marcos Creek except for the northwestern corner of the subject property where there is a slight downward gradient to the north. Las Posas Creek bisects the center of the subject property and runs from the center of the northern boundary south to a bend that turns to the west. The subject property sits at an average elevation of 550 feet above mean sea level.

No subsurface geologic investigations were performed as part of this Phase I ESA. According to the EDR Radius Map Report (Appendix C), the subject property is underlain by the Placentia sandy loam soil components. Placentia soils have a sandy loam texture, are partially hydric, and have very slow infiltration rates.

4.2 Groundwater

According to the EDR Radius Map Report, there are 240 water wells located within 1 mile of the subject property. The nearest groundwater monitoring wells, a set of five monitoring wells formerly located on the southern corner of the subject property, had reported depths to water of 4.46 to 7.21 feet below ground surface in November 2015. Based on records maintained by the State Water Resources Control Board GeoTracker website (SWRCB 2022) and County of San Diego Department of Environmental Health and Quality (DEHQ), the five monitoring wells were installed to monitor groundwater conditions related to petroleum hydrocarbon contamination from a former leaking underground storage tank (LUST). The wells were destroyed in March 2017 following DEHQ's concurrence for case closure; evidence of the former wells was not observed during the site reconnaissance. The groundwater gradient was reportedly to the southwest.

4.3 Agricultural Use

The subject property is not currently used for agricultural purposes. Historical sources (see Section 8, Site History) indicate the subject property was undeveloped until sometime after 1953 and developed commercially in the 1960s. Therefore, it is unlikely that historical agricultural use is an environmental concern.

5 Public Agency Records Search

Table 1 summarizes the environmental databases that were searched as required by ASTM E1527-21, as well as additional environmental databases providing information on hazardous materials and petroleum products on the subject property that were searched ("target property" is the term used by EDR.) The comprehensive list of databases is included in the EDR Radius Map Report, which was prepared on October 25, 2022 (Appendix C).

Table 1 lists the databases that were searched, search distances from the subject property, whether the subject property was listed, and the number of sites identified.

Table 1. Regulatory Database Search Summary

Acronym	Database	Search Distance	Subject Property Listed?	Number of Surrounding Sites Listed
NPL	National Priorities List (including proposed NPL sites and NPL Liens [target property only])	1 mile	No	0
Proposed NPL	Sites proposed for NPL	1 mile	No	0
Delisted NPL	NPL Deletions	1 mile	No	0
CERCLIS – Federal Facility	Comprehensive Environmental Response, Compensation, and Liability Information System for the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) with U.S. Environmental Protection Agency Federal Restoration and Reuse Office involvement	0.5 miles	No	0
CERCLIS – SEMS	CERCLA Superfund Enterprise Management System	0.5 miles	No	0
CERCLIS NFRAP (SEMS ARCHIVE)	No Further Remedial Action Planned – CERCLA SEMS Archive	0.5 miles	No	4
CORRACTS	Resource Conservation and Recovery Act (RCRA) Corrective Action	1 mile	No	2
RCRA TSDF	RCRA – Transportation, Storage, and Disposal Facilities	0.5 miles	No	1
RCRA-LQG	RCRA Large Quantity Generators	0.25 miles	No	0
RCRA-SQG	RCRA Small Quantity Generators	0.25 miles	No	10
RCRA-VSQG	RCRA Very Small Quantity Generators	0.25 miles	No	2
ERNS	Emergency Response Notification System	Target property	No	0
LUCIS	Land Use Control Information System – Institutional Control/Engineering Control	0.5 miles	No	0
US ENG CONTROLS	Federal sites with Engineering Controls	0.5 miles	No	0
US INST CONTROLS	Federal sites with Institutional Controls	0.5 miles	No	0
RESPONSE	State- and Tribal-Equivalent CERCLIS – Confirmed Release List	1 mile	No	0

Table 1. Regulatory Database Search Summary

Acronym	Database	Search Distance	Subject Property Listed?	Number of Surrounding Sites Listed
SWF/LF	State and Tribal Landfill and/or Solid Waste Disposal Site	0.5 miles	No	3
LUST	State Leaking Underground Storage Tank	0.5 miles	Yes	39
Indian LUST	Tribal LUST	0.5 miles	No	0
AST	State and Tribal Registered Aboveground Storage Tank	0.25 miles	No	3
UST	State and Tribal Registered Underground Storage Tank	0.25 miles	No	3
Indian UST	Registered Underground Storage Tank on Tribal Land	0.25 miles	No	0
FEMA UST	Federal Emergency Management Agency (FEMA) owned Registered UST	0.25 miles	No	0
Indian VCP	Voluntary Cleanup on Tribal Land	0.5 miles	No	0
VCP	State and Tribal Voluntary Cleanup	0.5 miles	No	0
Brownfields	State and Tribal Brownfields	0.5 miles	No	0
Additional environmental records, including local lists		*Varies*	*Yes*	*250*

Note: The search distances in the EDR report and listed in this table are equal to or greater than the search distances required by ASTM E1527-21.

5.1 Subject Property

The subject property was identified under the following names: Star Builders Supply; Star Builders Supply of San Marcos; Grand Ave Drainage Rd Improvement Project CIP 8821; GW Extraction, Las Posas Reach Flood Protection Co; 1x B R Slay; Astleford Construction Inc; TNT Blancard General Engineering; 1X Templeton Grating & Excavating, Grand Channel Bridge Project – City of San Marcos; Carpentry Plus; San Marcos Polishing; 1X Lancaster Auto Body; Cribwall Company Site; APEX Import Garage; Grand Avenue Metal Industrial Buildings; Rudys Radiator Shop; Scotts VW Paradise, San Marcos Polishing; Auto Tune; Retaining Walls; K&K Transmission; Dr Trans; B&R Porsche; Jerry's Equipment; Computer Edge Automotive; Johns Mobile; and Concrete Specialties. The aforementioned businesses were listed in the following databases[2]: AST, CERS, CIWQS, CORTESE, CPS-SLIC, ECHO, EDR HIST AUTO, ENF, FINDS, HAZNET, HIST CORTESE, HIST UST, HWTS, LUST, NPDES, RCRA NONGEN / NLR, RCRA-SQG, RGA LUST, SAN DIEGO CO LOP, SAN DIEGO CO. HMMD, SAN DIEGO CO. SAM, and SWEEPS UST.

HWTS and HAZNET: These databases present information about facilities, generator identification numbers, and waste manifests. Four listings were for former auto garages with an oil/water separator, waste oil, metal sludge, and unspecified sludge waste. One listing was for a car retail with photo-processing waste and surplus organics. Another listing was for disposal of asbestos-containing waste from buildings removed in 2011.

RCRA NonGen/NLR and RCRA-SQG: These databases identify hazardous waste generators. Two former auto garages on the subject property were listed in these databases.

[2] Definitions for acronyms not shown in Table 1 can be found in the EDR Radius Report in Appendix C.

ECHO and FINDS: These databases identify RCRA, LUST, and Superfund cases associated with the subject property. Listings on the subject property included a stormwater construction permit and construction dewatering permit for a creek improvement project, small quantity hazardous waste generator for a construction company, two LUST cases associated with two construction related companies, and two cleanup sites for a metal industrial supply and a concrete manufacturer.

CERS and San Diego County LOP: These databases present information about the facility and the regulatory status. Two closed Cleanup Program Site and two LUST cases are identified at the subject property.

AST HIST UST, SWEEPS UST, San Diego County HMMD, and San Diego County SAM: These databases include information about USTs previously located at the subject property. USTs at the subject property included one 1,000-gallon gasoline tank, four 12,000-gallon gasoline tanks, and one 1,000-gallon waste oil tank. All USTs were removed in 1994. The databases also include information about hazardous materials stored on the subject property. One business had permits for acetylene compressed gas, diesel fuel, ethylene glycol (antifreeze), lubricating oil, oxygen compressed gas, aqueous solution waste, hydrocarbon solvents waste (parts cleaner), waste oil, used batteries, and used oil filters.

EDR HIST AUTO: This database notes that an automotive repair shop operated at the subject property from 1982 through 2010.

LUST, RGA LUST, CPS-SLIC, CORTESE, and HIST CORTESE: These databases present information about releases at the subject property. Four releases were reported for the subject property. Two of the releases were identified after removing USTs at two different locations on the subject property. The other releases were related to previous industrial fabrication, auto repair, and industrial manufacturing businesses on the subject property. Additional information about the release cases is presented in Section 6.3.5.

5.2 Adjoining Properties

A total of 20 listings were identified adjoining the subject property with 13 unique addresses. Two release sites were identified adjoining the subject property.

American Fence Co. This site is located at 1075 Grand Avenue, adjoining the subject property to the west. It was identified in the SAN DIEGO CO. SAM, SAN DIEGO CO. HMMD, CORTESE, NPDES, SAN DIEGO CO LOP, CERS, LUST, HIST CORTESE, and SWEEPS databases. According to information included in the database listing and a review of DEHQ information, a 550-gallon gasoline UST was removed in 1988. Upon removal staining was observed near the tank and 56 cubic yards of soil were removed. Five monitoring wells were installed to investigate the release. Groundwater was monitored for total petroleum hydrocarbons (TPH) and benzene, toluene, ethylbenzene, and xylenes (BTEX) for several years. As concentrations of TPH and BTEX were below regulatory screening levels, the wells were destroyed in April 1992 and the case received closure in June 1992. Based on the groundwater flow direction (cross- to downgradient of the subject property), detections of TPH and BTEX below screening levels, and the regulatory sure closure, it is unlikely that this site impacted the environmental conditions of the subject property.

Spanjian/Dufour/North County Factory Outlet: This site is located at 1050 Los Vallecitos Boulevard, north of the subject property, on the north side of California State Route 78. It was identified in the RCRA-SQG, FINDS, ECHO, SAN DIEGO CO. SAM, CPS-SLIC, and CERS databases. According to information included in the database and a review of documents on GeoTracker, the site was used to manufacture sportswear. In 1989, a release of volatile organic compounds was discovered. Mineral spirits and multiple volatile organic compounds (1,1-DCA; 1,1-DCE;

1,4-Dioxane; Freon 113) were detected in soil and groundwater samples on the site over two decades. A soil and groundwater remediation system was operated from July 1991 to May 1992, which reduced dichloroethylene concentrations by approximately 60%. A cleanup and abatement order was issued in January 1993, which required 5 years of groundwater monitoring. An investigation into the soil and groundwater data in 1999 led to the conclusion that some of the contamination beneath the site had migrated from the upgradient Signet Armorlite facility. In 2000 a Phase I ESA reported that the Regional Water Quality Control Board had no additional remediation directives for the site. The plume was determined to be stable per a monitoring report in 2004, except for Freon 113, which was attributed to the Signet Armorlite facility. North County Factory Outlet and Signet Armorlite began coordinating efforts in 2009 to characterize the groundwater plumes. Following further monitoring and characterization of the plumes, a request for closure was made in 2013 and granted in 2014. The plumes were determined to be naturally attenuating or at concentrations too low to be a public health concern. Based on the 2013 report, the plumes do not extend as far as the subject property and would not be considered an environmental concern for the subject property.

5.3 Nearby Properties

A total of 128 listings were identified within the applicable search radii surrounding the subject property. There were 73 unique addresses associated with the 128 listings. Of the 73 unique sites, 33 were identified as sites with releases. Based on a review of GeoTracker and EnviroStor, all of the sites with known releases have received regulatory closure.

A total of 23 LUST cases were identified within 0.50 miles of the subject property. All of these cases have received closure. Based on the distance to the subject property and the regulatory status of the sites, it does not appear that these sites would have impacted the environmental condition of the subject property.

A total of 10 cleanup sites were identified within 1 mile of the subject property. Given the distance of the sites from the subject property and the contamination being limited to soil, it does not appear these sites would have impacted the environmental condition of the subject property.

Multiple sites are also listed as hazardous waste generators (RCRA-SQG, RCRA NonGen/NLR, MANIFEST), have hazardous materials stored on site (AST, UST), or are permitted solid waste disposal or recycling centers (SWRCY, SWF/LF). These listings are administrative in nature and do not necessarily indicate a release of hazardous materials to the environment, so it is unlikely that these sites have impacted the environmental conditions of the subject property.

5.4 Unmapped Sites

Unmapped sites are flagged by EDR but not mapped due to insufficient address information. They are usually included in the database search report because they are in the same zip code as the subject property. The EDR report identified three unmapped sites. One unmapped site, AT&T CALIFORNIA - DBV0, was found to be 0.75 miles west of the subject property and is listed in the HMMD San Diego database for a permit related to a Hazardous Materials Release Response Plan created for nickel cadmium batteries stored on site. The violations are related to housekeeping and not indicative of a release. Evans Dedicated Systems is located 0.4 miles east of the subject property, which is cross-gradient of the subject property. Sunny Fresh Cleaners is located somewhere along San Marcos Boulevard, which would also be cross-gradient or down-gradient of the subject property and too far, a minimum of 0.25 miles, from the subject property to pose an environmental concern.

6 Interviews

6.1 Site Representative Interview

Dudek sent a site background questionnaire to the user of this report on October 17,2022. A representative of AOA, the subject property owner, stated that "AOA has not owned the property long enough to have the history." Dudek sent the property background questionnaire to the former owner of the subject property, the City of San Marcos, on November 18, 2022. The City responded that the subject property was transferred to AOA Marcos in April 2019 and the City did not know specifics of its previous use. The lack of response to the site representative interview is considered a data gap.

6.2 User-Provided Information

In accordance with ASTM E1527-21, to qualify for one of the Landowner Liability Protections offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001, the tasks outlined in Section 6.2 through 6.6 of ASTM E1527-21 must be completed, including a search for environmental liens and activity use limitations. To facilitate this requirement, Dudek sent the following questions to the u of this report, AOA Marcos. Answers to these questions would fulfill the requirement of Sections 6.2 through 6.6 of the ASTM Standard. AOA Marcos did not provide responses to the questions below. As such, this is considered a data gap.

1. **Question:** Are you aware of any environmental cleanup liens against the property that are filed or recorded under federal, tribal, state, or local law?
2. **Question:** Are you aware of any activity and land use limitations, such as engineering controls, land use restrictions, or institutional controls that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state, or local law?
3. **Question:** As the user of this ESA, do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?
4. **Question:** Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?
5. **Question:** Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? (a) Do you know the past uses of the property, (b) do you know of specific chemicals that are present or once were present at the property, (c) do you know of spills or other chemical releases that have taken place at the property, or (d) do you know of any environmental cleanups that have taken place at the property?
6. **Question:** As the user of this ESA, based on your knowledge and experience related to the property, are there any obvious indicators that point to the presence or likely presence of contamination at the property?

6.3 Local Agency Records

6.3.1 City of San Marcos

Dudek contacted the City Clerk for the City of San Marcos for all building permits and hazardous material business plans, inspections, and violations. Dudek received a response on November 21, 2022, that there are building permits for the subject property. No current building permits were provided. The older building permits indicated that most of the buildings were demolished by 2011 and the building at 1010 Linda Vista Drive was the last to be demolished in 2013. The Fire Department confirmed there are no hazardous materials reports or violations on record and that San Diego County maintains hazmat records.

Zoning information for the subject property was obtained from the City website (City of San Marcos 2022). All parcels are zoned for commercial use. A mixed use plan application is under review for the subject property that would include multi-unit residential buildings, commercial space, and live/work units.

6.3.2 Vallecitos Water District

Dudek contacted the Vallecitos Water District for all records related to hazardous waste or material releases, USTs, or corrective actions for the subject property. Dudek received response on November 28, 2022, stating that they had no such records for the subject property.

6.3.3 San Diego County

6.3.3.1 Department of Planning and Development Services

Dudek reviewed the San Diego Department of Planning and Development Services online database (San Diego County 2022), which maintains records of building permit applications. However, no records were identified for the subject property.

6.3.3.2 Department of Environmental Health and Quality

Dudek contacted DEHQ, which acts as the County's Certified Unified Program Agency and as a local oversight regulatory program to obtain information about potential spills, cleanups, tanks, or chemical use that may have impacted the environmental conditions of the subject property. Dudek received a response on November 1, 2022. Files included information on hazardous material permits for multiple former businesses and further documentation on cleanup efforts for Star Builder Supply, Astleford Construction, the Cribwall Company Site, and Grand Avenue Metal Industrials site. Further details for all four cases are discussed in Section 6.3.5. Copies of the documents provided are presented in Appendix D.

6.3.3.3 Agriculture, Weights, and Measures

Dudek contacted San Diego County Agriculture, Weights, and Measures to obtain files related to agricultural land use and historical pesticide use. A response was received by November 28, 2022, stating that the agency has one record on file for the subject property under the weights and measures division and none for agriculture. However, no activity has been recorded since 2011 and no records are retained prior to that year.

6.3.4 CalRecycle Solid Waste Information System

Dudek reviewed the California Department of Resources Recycling and Recovery (CalRecycle) Solid Waste Information System online database (CalRecycle 2022). The database has information for all solid waste facilities, operation, and disposal sites in California.

No sites were identified on the subject property. Two sites, located at 224 S Las Posas Rd, were mapped approximately 0.3 miles west-northwest of the subject property. Both sites are active and permitted transfer/processing solid waste facilities. One site is for inert construction/demolition debris processing with monthly inspections. The second site is used for limited volume transfer of municipal waste with quarterly inspections. No violations or enforcement actions were noted.

Based on the nature of the facilities, distance from the subject property, and the cross-gradient location, it is unlikely that these sites have impacted the environmental conditions of the subject property.

6.3.5 State Water Resources Control Board

Dudek searched GeoTracker, the State Water Resources Control Board's data management system, for sites that impact, or have the potential to impact, water quality in California. Records include sites that require cleanup, various unregulated projects, and permitted facilities (SWRCB 2022). There were 24 sites identified within 0.5 miles of the subject property. These sites are also identified in the EDR database report; sites that may have impacted the subject property are discussed in Section 5, Public Agency Records Search.

Two former LUST cases and two former cleanup program cases for the subject property were identified in the GeoTracker database. As the records available on GeoTracker were incomplete, Dudek also submitted a request to review records to the Regional Water Quality Control Board. Records for the subject property were reviewed on November 4, 2022, and are discussed below in conjunction with the records from GeoTracker.

Star Builder Supply, 961 Grand Avenue: A 1,000-gallon UST was removed from the eastern portion of the subject property in December 1987. Upon removal, no gasoline was observed. However, there were three holes in the tank, an odor was present, and sand beneath the task was discolored. In January 1988, soil samples were collected from the excavation and backfill sand that had been directly beneath the tank. The samples were analyzed for fuel-constituents, including gasoline and BTEX. The only sample that exceeded screening levels was from the excavated backfill. No odor or discoloration was observed in the soil beneath the backfill. The excavated backfill was removed from the site and the excavation was filled and patched. The LUST case was closed in 1988.

Grand Channel Bridge Project/Astleford Construction, 1010 Linda Vista Drive (APN 219-152-08): Five underground storage tanks—four 12,000-gallon diesel tanks and one 1,000-gallon waste oil tank—were removed in 1991 from the former Astleford Construction company at 1010 Linda Vista Drive, formerly on the southern end of the subject property. Low levels of TPH were detected near the former tanks. The case was closed by DEHQ. An investigation was opened in 2014 when elevated concentrations of gasoline and diesel were found in soil and groundwater on the northern side of the site near the creek and in the vicinity of the former USTs. Site investigations and monitoring were conducted between 2015 and 2017. Per the 2017 closure report (DEHQ 2017), constituents of concern were not detected in groundwater during the three monitoring events and approximately 130 cubic yards of soil with concentrations of diesel exceeding the regulatory screening level in the top 5 feet (SCS 2016) were left in place on

the northern portion of the site (bordering the creek). The bridge that crosses the creek has since been built in this area; thus, some of the impacted soil may have been removed.

Grand Avenue Metal Industrials, 1031 Grand Avenue (APN 219-152-70) and Cribwall Company Site, 1023 Grand Avenue (APN 219-152-47): These were neighboring businesses formerly on the western portion of the subject property that conducted metal fabrication, auto repair, and manufacturing. Site features of concern included a former septic tank, former septic leach field, former parts washers, a wastewater trench drain, and former burial and forming pits. Site assessment, remediation, and monitoring for TPH and volatile organic compounds was conducted between 2006 and 2011. Ultimately, soil and groundwater data indicated that the primary contaminant of concern was TPH. A mitigation plan, based on the proposed commercial use of the site, was approved by DEHQ in 2012. Mitigation activities included excavation and off-site disposal of contaminated soils and further evaluation of the trench drain, as well as soil excavation, soil stockpile sampling, groundwater sampling, backfilling areas with clean fill, analysis of vapor risk, and dewatering and offsite disposal of extracted groundwater. Both properties were granted closure by DEHQ in July 2012 following the completion of the site mitigation plan. The closure is based on commercial use of the site. DEHQ noted in the closure letter (DEHQ 2012) the if the land use changes, reassessment may be required.

6.3.6 Department of Toxic Substances Control

Dudek searched the EnviroStor database management system used for tracking cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities and sites with known contamination (DTSC 2022). The subject property was not identified in the database; however, eight sites were identified within 1 mile of the subject property. Dudek reviewed these sites and based on distance, impacted media, hydrogeologic location, and/or regulatory case status, none of the sites were determined to have impacted the environmental conditions of the subject property.

Dudek also submitted a request to review records to the Department of Toxic Substances Control. The Department of Toxic Substances Control responded on November 1, 2022, that they had records for the Cribwall Construction Site. The files were determined to be the same as the files received from DEHQ (Appendix D).

6.3.7 California Environmental Protection Agency Regulated Site Portal

Dudek reviewed the California Environmental Protection Agency Regulated Site Portal, which contains data about environmentally regulated sites and facilities in California (CalEPA 2022). Data sources for the portal include California Environmental Reporting System, the Department of Toxic Substances Control EnviroStor, the State Water Resources Control Board GeoTracker, California Integrated Water Quality System, and the Federal Toxics Release Inventory.

California Environmental Protection Agency sites are generally administrative in nature, identifying sites that have environmental permits or that handle hazardous materials or generate hazardous waste, but that do not necessarily have an uncontrolled release of hazardous substances to the environment.

The subject property was listed for two LUST sites and two Cleanup Program Sites. Additional information about the subject property listings is presented in Section 6.3.5.

Over 100 sites were identified within 0.5 miles of the subject property. A total of 50 sites within 0.5 miles of the subject property have had violations. Only one of these sites has a violation regarding releases to the environment that was not discussed in Section 6.3.5; this site is discussed below.

Meadowlark CS #47772: This site is a sewerage system located at 201 Vallecitos De Oro, 0.25 miles east of the subject property on the northwest side. The site has had a total of 17 sewage system overflows between 1999 and 2004. The releases that have reached the waterway are noted to discharge to San Marcos Creek, not reaching the subject property. Based on the location of the site cross-gradient to the subject property, this site is unlikely to have impacted the environmental conditions of the subject property.

6.3.8 California Geologic Energy Management Division

Dudek reviewed the California Geologic Energy Management Division (CalGEM) database on November 2, 2022 (CalGEM 2022). One oil and gas well was mapped within 1 mile of the subject property. The idle well was mapped approximately 0.65 miles from the subject property. This information was also verified in the EDR Report (Appendix C). However, the report from CalGEM for the well identifies the well as 0.37 miles away and it is noted as capped.

6.3.9 National Pipeline Mapping System

Dudek searched the National Pipeline Mapping System online database, which provides data related to gas transmission and hazardous liquid pipelines, liquefied natural gas plants, and breakout tanks under the Department of Transportation Pipeline and Hazardous Material Safety Administration jurisdiction (NPMS 2022).

No pipelines were identified on the subject property. One pipeline was mapped near the subject property. An active natural gas transmission pipeline, operated by the San Diego Gas and Electric Company, is located 0.25 miles south-southeast of the subject property along San Marcos Boulevard. No accidents or incidents were reported within 1 mile of the subject property.

7 Site Reconnaissance

A site reconnaissance was conducted on October 28, 2022, by Nicole Tucker of Dudek. The site reconnaissance consisted of walking the subject property, taking notes on observations, and taking photographs. Photographs are presented in Appendix E.

7.1 Description of Subject Property and Surroundings

The subject property consists of an 11.95-acre irregularly shaped parcel of land. Access to the subject property is from the eastern side of Linda Vista Drive on the southeastern side of the subject property (Photograph 1). The subject property was surrounded by a chain-link fence. At the time of the site reconnaissance, the subject property was approximately 50% covered in broken pavement and cement from prior development, while the remainder of the subject property was dirt with some sparse vegetation (Photographs 2 and 3). A creek runs through the center of the subject property, entering from underneath Grand Avenue (Photograph 4) at the center of the northern boundary running south-southwest then turning towards the east and exiting out the middle western corner of the subject property. Along the banks of the creek were irrigation lines, with irrigation controls on the west side of the creek where the creek enters the subject property (Photograph 6). A few drainage swales were observed with storm drain inlets near the creek and in an old parking lot east of the creek along Grand Avenue (Photograph 7).

Old building pads were present primarily in the eastern and southern side of the subject property. A bridge across the stream was observed in the western corner of the subject (Photograph 8). Three billboards are located along the northern side of the subject property along Grand Avenue (Photograph 9). Powerlines were present along the sidewalk to the north between the subject property and Grand Avenue (Photograph 10). Subsurface utility boxes were observed in the right-of-way between the subject property and Linda Vista Drive.

As observed during the site reconnaissance, the subject property is bordered by the following:

- To the north by Grand Avenue and California State Route 78 followed by the boundary street Furniture Row and commercial properties.
- To the east by the intersection of Linda Vista Drive and Grand Avenue and a parking lot for a Costco retail store (Photograph 11).
- To the south-southeast by Linda Vista Drive followed by a vacant lot, a metal fabrication business, a stone and cabinet store (Photograph 12), and an agricultural supply store.
- To the west by an auto repair shop (Photograph 13), a parking lot for an electronics company, and a landscaping company (Photograph 14).

Primary areas of interest noted during the site reconnaissance are described in Section 7.2.

7.2 Summary of Observations

Potable Water Supply or Source

No potable water supply or wells were observed on the subject property. A few of the building pads had broken pipes and lines in a few places (Photograph 15) indicating water utilities used to connect to the building pads in the past. Irrigation lines were also observed along the creek.

Sewage Disposal System

Two sewer manholes were observed—one located just north of the bridge and the second approximately 150 feet north of the bridge.

Wetlands and Natural Waterways

Las Posas Creek enters the site from under Grand Avenue. The creek and banks were well vegetated with some trees on the western end of the creek. At the time of the site reconnaissance, the creek contained flowing water that was flowing in a westerly direction and continued beyond the subject property between the two western adjoining properties.

Surface Water Discharge

Surface water is conveyed through the creek and off the subject property to the west. Three swales in the vicinity of the creek collect in storm drain vaults near the creek. Surface runoff in the northwest corner of the subject property would run southwest to a storm drain outside the subject property. The storm drain is located on the northeast corner of the adjoining parking lot of the electronics building to the west (Photograph 16). Another stormwater drain is located just south of Grand Avenue in a former parking lot east of the creek. Surface runoff near the southern border of the subject property would flow towards Linda Vista Drive (Photograph 17).

Distressed Vegetation

No distressed vegetation was observed on the subject property.

Indications of Solid Debris Storage

A pile of bricks was observed on the northwest side of the creek and a pile of wood panels and broken concrete was observed in the eastern corner of the subject property. Four pallets of concrete building materials were near a second entrance further west on Linda Vista Drive (Photograph 18).

Hazardous Material and Petroleum Product Use and Storage

No hazardous material or petroleum products were observed on the subject property.

Unnaturally Discolored Ponds or Flowing Waters

The water in the creek was murky and slightly gray; however, odors were not present. No unnaturally discolored pools or flowing water were observed on other parts of the subject property.

Groundwater Wells, Cisterns, Cesspools, or Septic Tanks

No groundwater wells, cisterns, cesspools, or septic tanks were observed on the subject property.

Polychlorinated Biphenyl-Containing Items

Transformers were not observed on the subject property during the site reconnaissance. Transformers were mounted on some of the power line poles on the northern border of the subject property; no staining was observed. No other evidence of polychlorinated biphenyl-containing items, such as hydraulic equipment, was observed during the site reconnaissance.

Sumps or Ponds

No sumps or ponds were observed on the subject property.

Abnormal Odor

No abnormal odors were noted on the subject property.

Surface Staining, Corrosion, and Soil Disturbances

No staining or soil disturbances were observed during the site reconnaissance.

Tanks, Drums, Totes, and Intermediate Bulk Containers

No storage tanks, drums, totes, or other bulk containers were observed on the subject property.

Agricultural Use

No evidence of agricultural use was observed.

Off-Site Sources

There was no evidence of releases or other off-site sources of contamination that might have impacted the environmental condition of the subject property.

Fill Material

Fill material was likely used to make the grade even on the subject property. No source of fill or recent fill could be identified during the site reconnaissance.

Unidentified Substance Containers

No unidentified substance containers were observed on the subject property.

Pipelines

No hazardous material pipelines were observed on the subject property.

8 Site History

Based on a review of the historical aerial photographs, historical topographic maps, agency records, and the city directory report, the subject property was primarily used for commercial and industrial purposes. The subject property and much of the surrounding area appear to have been undeveloped until at least 1953. By 1964, the subject property was partially developed with several commercial/industrial buildings. Las Posas Creek, which transects the subject property, was improved by 1970, and several more industrial buildings were constructed, including the concrete and metal industrial buildings on the northwestern corner of the subject property. By 1979, the eastern corner of the subject property was developed and by the mid-1980s the subject property was mostly developed or paved with the exception of a small area east of the creek in the center of the subject property. Businesses included construction and hardware suppliers, auto repair shops, a car dealership, and concrete and metals manufacturers. By 2011, most of the buildings were removed with the exception of the construction company building in the southern portion of the subject property, which was demolished in 2013. The creek was widened and improved with a bridge constructed across it in 2019.

The adjoining properties were also historically used for primarily commercial/industrial purposes. The adjoining properties remained undeveloped, aside from Grand Avenue along the northern boundary of the subject property prior to 1946. In 1946, the northeastern and southern adjoining properties were developed with small airfields. By 1964, a few small commercial/industrial buildings were constructed on the western adjoining properties. California State Route 78 was constructed between 1953 and 1964 on the northern side of Grand Avenue, adjoining the subject property. By the late 1970s, more of the northern and southern adjoining properties were developed for commercial/industrial purposes and the airfields were no longer present. By the late 1980s, all adjoining properties were developed aside from the vacant lot on the eastern end of the southern boundary. The lot has remained undeveloped except for a portion developed as a parking lot in the early 2000s.

8.1 Historical Aerial Photographs

Dudek reviewed historical aerial photographs obtained from EDR for 1939, 1946, 1953, 1964, 1967, 1970, 1979, 1985, 1989, 1990, 1994, 1996, 2002, 2005, 2009, 2012, and 2016 (Appendix F). Dudek also reviewed aerial photographs from Google Earth for 2021 (Google Earth 2022). The photographs provided background information to assess the possibility of past activities that could present environmental concerns. The aerial photographs are described in Table 2.

Table 2. Summary of Aerial Photographs

Date	Subject Property	Adjoining and Surrounding Properties
1939	The subject property appears to be primarily undeveloped with most of the area cleared of vegetation. An east southeast–west southwest-trending road (present-day Grand Avenue) is parallel to the northern boundary of the subject property. A creek bed runs through the middle of the subject property from the middle of the northern boundary through the southwestern boundary.	The adjoining properties are observed to be mostly undeveloped land with some of the vegetation cleared. Evidence of agricultural use is not discernable. A small area to the northeast appears to be developed for residential use. In general, the remaining adjoining and surrounding properties appear to be partly cleared of vegetation and used for rural residential purposes.

Table 2. Summary of Aerial Photographs

Date	Subject Property	Adjoining and Surrounding Properties
1946	The subject property is mostly covered in vegetation since the 1939 aerial photograph.	A structure and several small planes are observed on the adjoining property to the south-southeast. A cleared runway path is west of the structure. The residential property observed to the northeast of the subject property appears to be further developed, with a large, cleared area and a long barn-like structure. Additional residential properties are observed to the east and southeast.
1953	The subject property appears to be similar to the 1946 aerial photograph.	A development of approximately 16 small structures is observed southeast of the subject property along present-day Grand Avenue. Additional development is observed south of the airfield, south of the subject property.
1964	The subject property has been developed with one larger structure in the southern corner on a dirt lot with vehicles and other miscellaneous items, three smaller structures on the eastern side, and five larger buildings on the north and northwest side of the subject property with other vehicles/trailer and miscellaneous items.	Three structures on two dirt lots are observed on the adjoining property immediately south of the subject property. Vehicles, trailers, and other miscellaneous items are on the lots. Another cleared lot with two buildings is observed on the northeastern adjoining property. An unimproved road (present-day Linda Vista Drive) runs parallel to the southeastern boundary of the subject property. A four-lane highway, California State Route 78, is observed parallel to Grand Avenue. Seven small planes, a cleared runway, and a set of 15 long structures appear in the vicinity of the residential structures northeast of the subject property. Two small structures are observed on the southern adjoining property. The residential structure south of the subject property appears to have been expanded; vehicles and other items are present surround the building. Two square structures are observed south-southeast of the subject property. Another eight more residential buildings are observed farther south of the subject property.
1967	The subject property appears similar to the 1964 photograph. Trailers and vehicles that were in the northwestern corner appear to have been removed. Three more structures appear in the area just south of where the trailers were.	Adjoining and surrounding properties are generally similar to the 1964 photograph, though the airfield to the north no longer appears to be in use and no planes are present. Trailers and vehicles on the property to the northeast appear to have been removed. A larger commercial/industrial building is present next to the residential development east of the subject property.
1970	The creek bed on the subject property appears to have been improved. A cluster of approximately eight small structures are observed in the northwestern corner of the subject property. Areas around the commercial/industrial buildings in the northwest and southern corners of the subject property are observed to be paved.	A large building is observed on the southwestern-adjoining property. A cluster of smaller structures are observed southwest of the subject property. Linda Vista Drive appears to have been improved and another road perpendicular to Linda Vista Drive appears under development. Trucks are present surrounding the larger structure to the south-southeast of the subject property. A large warehouse-like building appears northeast of the former airfield north of the subject property. Two larger and one small commercial/industrial buildings are observed 1,000 feet northwest of the subject property.

Table 2. Summary of Aerial Photographs

Date	Subject Property	Adjoining and Surrounding Properties
1979	The eastern portion of the subject property has been filled in with commercial developments and associated parking. A long building has replaced the smaller building including a paved lot in the northern center of the subject property west of the creek bed.	Much of the adjoining and surrounding area is developed with commercial and industrial buildings interspersed with vacant, undeveloped properties. The northwestern adjoining property has vehicles and other equipment stored in addition to several structures. Two small warehouse buildings, three small buildings, and vehicles/equipment are present farther to the west. Three long buildings are observed on the adjoining property south of Linda Vista Drive.
1985	The western portion of the subject property appears to have been cleared and equipment is stored in the area. The area south of the bend in the stream bed appears to have been cleared and partially paved. Otherwise, the subject property is similar to the 1979 photograph.	The surrounding area has been filled in further with commercial and industrial buildings. North of the subject property and State Route 78 is another large industrial warehouse building and two small commercial buildings. Southwest of the subject property is another development of industrial/commercial buildings. An additional industrial building is present south of the subject property.
1989	The lot on the western side of the subject property has rows of equipment stored in the area. In the eastern corner of the subject property, several trailers/trucks appear to be stored in the lot. Otherwise, the subject property is similar to the 1985 photograph.	A large industrial building and parking lot are observed on the previously undeveloped lot adjoining the subject property to the west. The stream channel that exits the subject property to the west was channeled south of the new parking lot and building, crossing under and continuing across the street, Via Vera Cruz. Another industrial/commercial development appears off the northwest corner of the subject property. An additional commercial/industrial building is located north of the subject property. A junk yard appears to be near the trucking company south-southwest of the subject property.
1990	The trailers/trucks stored on the eastern most corner of the subject property have been removed. Otherwise, the subject property appears similar to the 1989 aerial photograph.	The adjoining properties and surrounding area appear similar to the 1989 aerial photograph. A few smaller commercial/industrial buildings are present in the areas between some of the previous structures.
1994	Trucks have reappeared on the eastern corner of the subject property. Otherwise, the subject property appears similar to the 1990 aerial photograph.	The adjoining properties and surrounding areas appear similar to the 1990 aerial photograph.
1996	The subject property appears similar to the 1994 aerial photograph.	An additional commercial/industrial structure appears 1300 feet north-northeast of the subject property. The remainder of the adjoining properties and surrounding area appear similar to the 1994 aerial photograph.
2002	The lot south of the bend in the stream has materials stored on the previously empty lot. Otherwise, the subject property appears similar to the 1996 aerial photograph.	Part of the undeveloped land southeast of the subject property, south of Linda Vista Drive and the lot with the trucking company has been cleared. The stream channel east of Via Vera Cruz has been rerouted to follow the southern edge of the lot. The lot east-southeast of the subject property, along S Bent Ave, has an office building and several smaller trailers/buildings.

Table 2. Summary of Aerial Photographs

Date	Subject Property	Adjoining and Surrounding Properties
2005	The subject property appears similar to the 2002 aerial photograph.	The cleared lot adjoining the subject property, near the intersection of Grand Ave and Linda Vista Dr, is paved for a large parking lot and a new, large warehouse store is on the southwestern end of that lot. An office building is being constructed south of the subject property.
2009	Part of the previously undeveloped land west of the creek has been cleared and paved. The lot south of the bend in the creek has been cleared of the materials stored there. Two of the buildings on the northwestern corner appear to have been removed. Otherwise, the subject property appears similar to the 2005 aerial photograph.	The previously undeveloped lot west of the subject property, on the western side of Via Vera Cruz appears to be entirely developed as a shopping center. An access ramp along Grand Ave for State Route 78 is observed 890 feet west-northwest of the subject property. Another office building has been built south of the subject property in a previously undeveloped lot.
2012	All of the buildings on the subject property, except for one in the southern corner, have been demolished. The subject property appears to be vacant and cleared of most equipment and materials.	The adjoining properties and surrounding areas appear similar to the 2009 aerial photograph.
2016	The building in the southern corner of the subject property appears to be demolished. Otherwise, the subject property is similar to the 2012 photograph.	The adjoining and surrounding areas are similar to the 2012 photograph. The paved lot west-northwest of the subject property on the corner of Grand Ave and Via Vera Cruz is observed to have a fast-food restaurant. Two large apartment/condo complexes and one in development are present north of the subject property.
2021	The subject property appears to have become overgrown and the pavement and concrete appears broken. The stream bed appears to be wider, and a bridge appears over the stream on the western side of the subject property.	The adjoining properties appears similar to the 2016 aerial photograph. Another apartment/condo complex was built and the other was finished north of the subject property.

Note: See Appendix F for corresponding photographs for 1936 through 2016. The 2021 Google Earth photo is available online and therefore is not included in Appendix F.

8.2 Historical Topographic Maps

Dudek reviewed historical topographic maps from 1893, 1901, 1947, 1948, 1949, 1968, 1983, 1996, 2012, 2015, and 2018 (Appendix B). The topographic maps are a historical source that can be used to document the prior use of the subject property and surrounding area. The topographic maps are described in Table 3.

Table 3. Summary of Topographic Maps

Date	Subject Property	Adjoining and Surrounding Properties
1893	The subject property is located within a valley, east of the town of San Marcos and within Los Vallecitos de San Marcos. A slight slope is depicted toward the south-southwest. No structures are depicted on the subject property.	The areas adjoining the subject property are undeveloped. Improved roadways are present in the surrounding area, as wells as single structures near the roadways. Streams are present east and south of the subject property. A railway is present approximately 0.25 miles to the north of the subject property.
1901	The subject property is similar to its appearance on the 1893 topographic map.	The areas adjoining the subject property remain undeveloped. A road is observed north of the subject property starting at Grand Ave and continuing to the north-northeast. Two roads run between Grand Ave and San Marcos Blvd, one approximately 400 feet east and the other 400 feet west of the subject property. A structure is depicted 0.25 miles west-northwest south of Grand Ave. Another structure is depicted over 0.25 miles east of the subject property, north of Grand Ave.
1947	The subject property is depicted with a stream crossing through the western center of the subject property.	The areas adjoining the subject property remain undeveloped. Woodlands are depicted to the north of the subject property, adjoining to the subject property, north of Grand Ave. None of the structures depicted within the 0.5-mile radius of the subject property are present. A new structure is depicted 1,000 feet west-northwest of the subject property. The town of San Marcos is depicted east of the subject property. A school and at least a dozen more structures are depicted 0.5 miles west of the subject property around San Marcos Blvd. San Marcos Blvd is depicted as secondary highway. A primary highway is depicted roughly parallel with the railroad 0.5 miles north of the subject property. Orchards are depicted approximately 0.66 miles south of the subject property along San Marcos Creek.
1948	The stream is no longer depicted on the subject property.	The areas adjoining the subject property remain undeveloped. Grand Avenue adjoining to the subject property to the north is now depicted as a secondary highway. San Marcos Valley Airport is depicted northeast of the subject property with a long structure 0.25 miles away from the subject property. McCormick Airfield is 0.25 miles south of the subject property with a triangular shape to the airstrip and a structure on the eastern end. A structure is depicted south of the airfield, opposite Encinitas Road (San Marcos Blvd). The town of San Marcos has more buildings to the east. The orchards directly south are no longer present.
1949	The subject property is similar to its appearance on the 1948 topographic map.	The adjoining and surrounding area appear similar to the 1948 topographic map.
1968	The subject property has a total of five structures now. One larger and two smaller ones are in the northwestern portion of the subject	One small structure is depicted on the southwestern adjoining property. Two small structures are depicted on the northwestern adjoining property. A road now runs along the southeastern boundary. Neither of the airfields are depicted

Table 3. Summary of Topographic Maps

Date	Subject Property	Adjoining and Surrounding Properties
	property. One small structure is near the center along the location the stream was previously depicted. A larger structure is in the southernmost corner of the subject property.	on the nearby surrounding properties but the structures associated with them remain. California State Route 78 runs along Grand Ave to the north of the subject property. Approximately 0.25 miles west-northwest of the subject property is a cluster of a dozen smaller structures. Approximately 0.25 to 0.5 miles to the southeast are two larger structures and eight smaller structures. Over 0.25 miles south of the subject property along Encinitas Rd are 12 small structures and one large structure. The orchards to the south are no longer depicted. A trailer park, golf course, residential development, and San Marcos reservoir are depicted to the southwest. The town of San Marcos has expanded with more residential and commercial/industrial structures. Palomar College is depicted 0.75 miles to the north.
1983	One small and two longer structures are depicted on the eastern section of the subject property. Two larger buildings are depicted near the center on either side of the previously depicted stream channel. Seven smaller structures are depicted in the northwestern corner of the subject property.	The adjoining properties and surrounding 0.5 miles around the subject property have been developed with many commercial/industrial buildings. The adjoining property northwest of the subject property has two new larger buildings and three small buildings. A larger building is depicted on the adjoining southwestern corner, and three more just south of the road adjoining the southern boundary. North of the subject property and California State Route 78 are four warehouse sized structures and several large commercial/industrial structures.
1996	Individual structures are no longer depicted on the subject property. It is shaded as developed.	Most of the individual structures are no longer depicted in the adjoining and surrounding properties. Over 0.5 miles north, west, and southwest of the subject property are depicted as developed with one new warehouse sized building north of Route 78. Less than 0.5 miles south and west of the subject property are depicted as developed. Two larger structures are depicted on the western base of the hill east-northeast of the subject property. San Marcos Rd is now labelled as San Marcos Blvd to the south.
2012	Nothing is depicted on the subject property.	No individual structures or developed area are depicted on the map. Only roads, highways, locations, and physical features are depicted on the map. A new on/off ramp is depicted along State Route 78, 0.25 miles northwest of the subject property. The Twin Oaks Valley community is depicted a mile to the west-southwest of the subject property.
2015	The subject property appears similar to the 2012 topographic map.	A school is depicted 0.25 miles south-southwest of the subject property. The remaining adjoining and surrounding area are similar to the 2012 topographic map.
2018	The subject property appears similar to the 2015 topographic map.	A small wetland area is depicted on the adjoining property south-southeast of the subject property. More wetlands are depicted 0.25 to 0.5 miles west of the subject property and 0.5 miles south, north of San Marcos Creek.

Note: See Appendix B for corresponding maps.

8.3 Fire Insurance Maps

Historical Sanborn fire insurance maps were requested from EDR. Sanborn maps provide information regarding the historical uses of the subject property and surrounding properties. Sanborn maps typically exist for cities with populations of 2,000 or more; the coverage is dependent on the location of the subject site within the city limits. The Sanborn Map Report lists the subject property as an unmapped property; no additional information was included in the report. The Sanborn Map Report is provided in Appendix G.

8.4 City Directory

City directory listings were requested from EDR (Appendix H). Table 4 details the findings of the city directory abstract. The subject property has multiple addresses on both Grand Avenue and Linda Vista Drive. Findings for the subject property and for adjoining property addresses are summarized in Table 4.

Table 4. Summary of City Directory Listings

Address	Date	Listings
Subject Property		
1010 Linda Vista Dr	1971–1975	Metro Equipment
	1979–1982	Case Power and Equipment
	1986–1995	Construction company (Astleford Construction Inc, William Kirchnavy Construction)
	2000	Astleford Construction Inc, Phoenix Motorcycle Accessories
	2005	Astleford Construction Inc, Ranlin Construction
	2010	Amd Mortgage Svc Inc., Sky Valley Financial Inc
930 Linda Vista Dr	1992–2005	Alpine Mini Storage
931 Grand Ave	1975–1982	Fraley's Auto Clinic
	1986	Coast Tire & Automotive, San Marcos Vehicle Sales
	1992–2010	Auto Tune, Southwest RV (1992), Automotive Outlet (1995), Hertz Penske Truck Rental (1995), Allstar Auto (2000), Smog Check Stations San Marcos (2000), Mission Auto Sales (2005–2010)
939 Grand Ave	2005–2010	San Marcos Chamber of Commerce, Valley Of Discovery Education Fnd (2005)
961 Grand Ave	1971–2017	Star Plywood Lumber/Star Builders Supply, Ace Hardware (2000–2017)
983 Grand Ave	1979	Piano Organ Warehouse
	1986	Paint City, Wallpaper Salon
	1992–2010	Antique Village Mall
1003 Grand Ave	1975	White Stan Auto Repair
	1979–1986	Apex Import GRG
	2010	Newest Sheet Metal

Table 4. Summary of City Directory Listings

Address	Date	Listings
1025 Grand Ave	1971–1975	Formacel, Leslie Mfg Corp, Plexalswitch
	1979–1982	Leslie Mfg Corp
	1995	Pacific Rim Equipment
	2000	Jerry's Equipment

	1975	Esau Supply, residential
	1979	San Marcos Tire, Harrisons Auto
	1982–1995	VW Paradise, Buff N Stuff (1992)
	2000	K & K Transmission Incorporated
	2005	Dr Trans, Global Transmissions
1041-1049 Grand Ave	1971	Voler Products Inc, Art Kraft Aluminum, residential
	1975	residential
	1979	American Indus SVC, Cabanco Products, Rudy's Radiator Shop
	1982	Reborn Auto Body/Classic Motors, Arambulas Pnt & Body, Rupes Jack Rpr Service, Korte Iron Works
	1986–1992	May Co Auto Body & Pnt, Tire Mart, Window Awnings, Korte Iron Works, Franks Auto (1992)
	2000	Qualair Compressor Company, Franks Auto, Computer Edge Automotive
	2005	Qualair Compressor Company
	2010	San Marcos Polishing
	2014–2017	Qualair Compressor Company, California Compressor Company
1051-1057 Grand Ave	1971	Gibbs Trailer, Fraley's Auto Clinic, Curby Bit Co., Tri City Glass
	1975	Kleen Sweep of SD, Amer. Fence Company, R&O Engineering, Bike Sanctuary
	1979	Bike Sanctuary, Poes Auto Service
	1982	Grand Auto Body, Rudy's Radiator Shop
	1986–1995	CA Custom Upholstery (1986), Rudy's Radiator Shop, Acme Auto & Truck (1995)
Adjoining to the West		
1075 Grand Ave	1979–2017	American Fence Company, American Red Cross Vehicle Donation Program (2000)
237 Via Vera Cruz	This address was not included as part of the city directory address search performed by EDR. The current use for the site is an electronics manufacturer based on an online search.	
1030 Linda Vista Dr	2010–2014	residential

Table 4. Summary of City Directory Listings

Address	Date	Listings
1020 Linda Vista Dr	1971–1975	Equipment rental and construction company
	1979–1986	Trucking company, construction, tractor company, auto parts manufacturer
	1992–1995	Industrial light supply
	2005	Metal fabrication
	2010	Construction supply
	2014–2017	Auto repair, metal fabrication, fumigation services
Adjoining to the North		
1050 Los Vallecitos Blvd	Addresses were not included as part of the city directory address search performed by EDR. The current use of the properties is for motorcycle and furniture retail, based on observations from the site reconnaissance.	
1040 Los Vallecitos Blvd		
970 Los Vallecitos Blvd		
960 Los Vallecitos Blvd		
900 Los Vallecitos Blvd		
Adjoining to the East		
150 Bent Ave	This address was not included as part of the city directory address search performed by EDR. The current use is for a commercial warehouse store, based on observations from the site reconnaissance.	
Adjoining to the South		
1015 Linda Vista Dr	1975–1986	Commercial/irrigation supply, warehouse, metal finishing
	1992–1995	Engine, agricultural, and irrigation supplier
	2000–2017	Engine parts supplier, construction companies
985 Linda Vista Dr	1992–2000	Manufacturing
	2005	Industrial supply
	2017	Commercial retail
977 Linda Vista Dr	1979	Storage
	1982–2017	Metal fabrication
969 Linda Vista Dr	1979	Commercial supply
	1982	Limousine services
	1986	Chemical supply, repair shop
	1995–2005	Retail and commercial

8.5 Title Information/Environmental Liens

As discussed in Section 6.2, the user is required to complete a search for environmental liens and activity use limitations to satisfy the requirements of the All Appropriate Inquiries Rule for CERCLA (Comprehensive Environmental Response, Compensation and Liability Act) liability protection. Information regarding environmental liens or activity use limitations was not provided by the user of this report.

9 Previous Environmental Site Assessments

Five documents were provided by the user of this report for previous ESAs performed on the subject property. These documents are provided in Appendix D.

A Subsurface Assessment from 2010, a Subsurface Site Assessment from 2016, and a DEHQ correspondence letter from 2016 (DEHQ 2016) were provided for the 1010 Linda Vista Drive site, which is located on the southern portion of the subject property. The reports document the findings of a soil and groundwater investigation and monitoring actions conducted to assess and characterize impacts of a former LUST. The 2016 assessment concludes that there is an area of petroleum hydrocarbon-bearing soil on the southern side of the creek and that groundwater is not impacted by petroleum hydrocarbons. However, the report recommends an additional two quarters of groundwater monitoring. The DEHQ correspondence letter concurs with the findings of the site assessment. Results of the additional monitoring are discussed in Section 6.3.5.

A DEHQ case closure letter (DEHQ 2012) was provided for the former Cribwall Company and Industrial Metal cleanup cases at 1023–1031 Grand Avenue. The closure letter from July 3, 2012, concurs with the environmental investigation reports for the property that the cleanup goals have been met. It states that the current use of the site is commercial and that changes to its land use may require reassessment.

A geotechnical report from 2021 for proposed redevelopment of the subject property was provided with a feasibility analysis and recommendations for redevelopment of the subject property. The conclusions were that redevelopment was feasible with removal of all pavements, slabs, and foundations and that fill on the subject property could be reused as engineered fill, as well as other geotechnical recommendations.

10 Vapor Encroachment

Dudek evaluated vapor encroachment to determine whether there is a potential for vapors originating from contaminated soil and/or groundwater to occur in the subsurface below the existing and potential future on-site structures. Information obtained from other sources (geologic and hydrogeological information, site reconnaissance, local regulatory agency responses), as discussed in this report, was also considered. The vapor encroachment condition (VEC) assessment was conducted in accordance with ASTM E2600-15 guidance (ASTM 2015). The EDR Radius Map Report (Appendix C) was used to evaluate listed contaminated sites as identified in federal, state, and local databases. A VEC assessment report is provided in Appendix I.

The Grand Channel Bridge Project/Astleford Construction Inc. site at 1010 Linda Vista Drive, on the southern end of the subject property, had contamination related to former LUSTs. Following assessment and monitoring, case closure was granted in 2017. An estimated 130 cubic yards of soil with concentrations of diesel exceeding the regulatory screening level in the top 5 feet (SCS 2016) were left in place on the northern portion of the site (bordering the creek). As such, a VEC cannot be ruled out.

11 Non-ASTM Considerations

This section discusses non-ASTM scope considerations that were included in this Phase I ESA based on the conditions at the subject property. These items are not required to be evaluated per the ASTM Standard but may still pose environmental health and safety risks.

Asbestos

Asbestos has been specifically designated a hazardous substance pursuant to CERCLA Section 102, but abatement costs are generally not recoverable under CERCLA. Many building materials commonly contained asbestos until the late 1970s, and a smaller list of building materials contained asbestos in the 1980s, such as drywall, joint compounds, vinyl flooring, roofing, asbestos-cement products, and stucco. Under the Toxic Substances Control Act, EPA banned the use of asbestos in many products, with partial bans occurring in 1989 and 1993. However, a full ban of asbestos products did not occur until 2019. Therefore, if a building was constructed prior to 1989, it is likely it contains asbestos. If it was constructed between 1989 and 2019, it is less likely asbestos is present, but there is still a chance that asbestos was used.

No structures are currently present on the subject property; therefore, asbestos-containing building materials is not of concern for the subject property.

Lead-Based Paint

Paint manufacturers frequently used lead as a primary paint ingredient through the 1940s and gradually decreased its use in the 1950s and 1960s. The federal department of Housing and Urban Development estimates 30% of homes built in the United States before 1978 contain some lead-based paint. The Consumer Product Safety Commission prohibited the use of lead-based paints in residential buildings in 1978; however, the use of lead-based paints in commercial and industrial buildings is not prohibited.

Structures that previously occupied the subject property have been removed. Thus, it is unlikely that lead-based paint is a concern for the subject property.

Radon

Radon is a radioactive gas that is produced from the natural decay of uranium, radium, and thorium in soil, rock, and groundwater. When radon becomes trapped in buildings and concentrations accumulate, exposure to radon can be a concern.

The EDR report presents radon test results for the vicinity of the subject property. A total of five sites within San Diego County were evaluated. The radon concentration at these sites averaged 0.800 picocuries per liter (pCi/L) in the living area. The EPA radon zone for San Diego County is 3, which corresponds with average expected indoor radon levels < 2 pCi/L. The federal radon action level is 4 pCi/L.

12 Findings and Conclusions

Information gathered for this report indicated the following:

- The subject property was undeveloped until sometime after 1953; it was developed for commercial/industrial purposes by the early 1960s. Businesses that existed on the subject property included auto repair shops, construction companies, commercial and building retail, and concrete and metal manufacturers. All structures were removed by 2013.
- The subject property is currently vacant. Approximately 50% of the land covered by degrading pavement and concrete from the prior businesses.
- Properties adjoining the subject property previously included small airfields to the northeast and south and currently include industrial and commercial properties in all directions apart from the one vacant lot to the south-southeast.
- Two former LUST cases and two former cleanup program cases were identified on the subject property. The former LUST case on the eastern end of the subject property was granted regulatory closure in 1988. The former LUST case on the southern end of the subject property was granted regulatory closure in 2017; an area of impacted soil was left in place. The former cleanup program cases were neighboring businesses on the western portion of the subject property. Regulatory closure was granted for both cases in 2012 based on future commercial use of the subject property.

Dudek performed this Phase I ESA of the subject property in conformance with the scope and limitations of the ASTM E1527-21 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process. This report summarizes the research and findings of the Phase I ESA. This assessment did not reveal evidence of RECs in connection with the subject property. However, historical and controlled RECs and a VEC were identified as described below. Data gaps, which were determined not to be significant, are discussed in Section 13, Limitations.

- The former LUST cases on the eastern and southern ends of the subject property are considered historical RECs as they were granted regulatory closure. However, an area of impacted soil, portions of which exceed regulatory screening levels for diesel, remains in place. As such, a VEC could not be ruled out for the subject property.
- The former cleanup cases on the western portion of the subject property are considered controlled RECs as they were granted regulatory closure based on future commercial use. The regulatory agency noted in the closure letter that a change in land use may require reassessment.

Dudek recommends preparation of a soil management plan prior to construction of the subject property. The soil management plan should describe the known former impacts at the subject property and detail management procedures should contamination and/or any features (e.g., former tanks) related to former chemical use be discovered during construction. In addition, if the subject property is planned for residential use, reassessment may be required for the western portion of the subject property as noted in the closure letter for 1031 Grand Avenue (APN 219-152-70) and 1023 Grand Avenue (APN 219-152-47). DEHQ would need to be notified of any planned residential use and they may request additional investigation.

13 Limitations

13.1 Data Gaps and Data Failures

As defined in ASTM E1527-21, a data failure is a failure to achieve the historical research objective required by the ASTM Standard even after reviewing the standard historical resources that are reasonably ascertainable and likely to be useful. A data failure is a type of data gap.

The following data failures were identified for this Phase I ESA:

- Historical resources were not available between 1953 and 1964, which is greater than the 5-year interval required by the ASTM Standard. This constitutes a data failure. While this is a data failure, based on the site history, available historical and regulatory information, and present-day use, Dudek has determined this data failure is not a data gap.

As defined in ASTM E1527-21, a data gap is the lack of or inability to obtain information required by this practice despite good faith efforts. A data gap is considered significant when it affects the ability of the environmental professional to identify recognized environmental conditions.

The following data gaps were identified for this Phase I ESA:

- Responses to the background questionnaire were not provided by the site owner, AOA San Marcos. This constitutes a data gap. Based on information obtained from historical sources, regulatory documents and the site reconnaissance conducted as part of this Phase I ESA, this data gap is considered not significant.
- Responses to the user questionnaire were not provided by the user of this report, AOA San Marcos. This constitutes a data gap. Based on information obtained from historical sources, regulatory documents and the site reconnaissance conducted as part of this Phase I ESA, this data gap is considered not significant. However, the lack of responses limits landowner liability protections as discussed in Section 6.2.

Should Dudek receive information following submission of this Phase I ESA report that completes one of these data gaps and changes the findings of the Phase I ESA report, Dudek will submit the findings to the user in an addendum.

13.2 Report Limitations

The findings and conclusions presented in this report are professional opinions based solely on the indicated data described in this report, as reflected in the discussion in this report of the visual observations of the subject property and vicinity and documentation reviewed and, based on the foregoing, our interpretation of this information and these documents. Dudek makes no warranty, guarantee, or representation, express or implied, as to statements made by others or information included in documentation reviewed or otherwise provided to Dudek, as described in this report. This report does not purport to identify or describe all potential contamination or other issues related to the environment respecting the subject property and/or the vicinity. Likewise, it is understood that it is possible that conditions or contamination exist at the subject property or in the vicinity that are not identified in this Phase I ESA.

No warranties or guarantees or representations, expressed or implied, are made by Dudek, except for the representation that this report has been prepared in accordance with the current generally accepted practices and standards consistent with the level of care and skill exercised under similar circumstances by other professionals performing the same or similar services in the same or similar geographical locality. This report, including its conclusions and/or recommendations, are intended exclusively and solely for the purpose outlined herein and for the client identified hereunder. This report may not be relied upon by any other person or entity without the express advance written consent of Dudek specifically identifying such person or entity. Dudek reserves the right to further condition any such third-party use based on matters it deems appropriate under the circumstances, in its sole discretion.

This report is subject to the conditions and restrictions and limitations described in ASTM E1527-21.

In accordance with Section 4.6.1 of ASTM E1527-21, this Phase I ESA is valid as a general matter for not longer than 180 days from the date of the first interview, first review of government records, or first visual inspection. If this Phase I ESA has been prepared for the purposes of a transaction, the report must have been completed no more than 180 days prior to the transaction date to be considered viable. Otherwise, the report must be updated or revised in accordance with ASTM E1527-21.

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by DUDEK were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527-21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 07/26/2022 has revealed that there are 4 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Lists of Federal RCRA facilities undergoing Corrective Action

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 06/20/2022 has revealed that there are 2 CORRACTS sites within approximately 1 mile of the target property.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 06/20/2022 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Lists of Federal RCRA generators

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 06/20/2022 has revealed that there are 10 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-VSQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-VSQG list, as provided by EDR, and dated 06/20/2022 has revealed that there are 2 RCRA-VSQG sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EPA ID:: CAR000263012

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 07/25/2022 has revealed that there are 11 ENVIROSTOR sites within approximately 1 mile of the target property.

Lists of state and tribal landfills and solid waste disposal facilities

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, has revealed that there are 3 SWF/LF sites within approximately 0.5 miles of the target property.

Lists of state and tribal leaking storage tanks

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there are 37 LUST sites within approximately 0.5 miles of the target property.

CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CPS-SLIC list, as provided by EDR, has revealed that there are 11 CPS-SLIC sites within approximately 0.5 miles of the target property.

Lists of state and tribal registered storage tanks

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 3 UST sites within approximately 0.25 miles of the target property.

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 9 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 06/20/2022 has revealed that there are 40 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

DRYCLEANERS: A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaners' agents; linen supply; coin-operated laundries and cleaning; drycleaning plants except rugs; carpet and upholster cleaning; industrial launderers; laundry and garment services.

A review of the DRYCLEANERS list, as provided by EDR, has revealed that there is 1 DRYCLEANERS site within approximately 0.25 miles of the target property.

Database: DRYCLEANERS, Date of Government Version: 08/27/2021				
EPA Id: CAL000223784				

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency. This database begins with calendar year 1993.

A review of the HAZNET list, as provided by EDR, and dated 12/31/2021 has revealed that there are 17 HAZNET sites within approximately 0.001 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 2 EDR Hist Auto sites within approximately 0.125 miles of the target property.

Environmental Interest/Information System:
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Environmental Interest/Information System:
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Case Worker:	EM
RB Case Number:	Not reported
Local Agency:	SAN DIEGO COUNTY LOP
File Location:	Local Agency
Local Case Number:	DEH2014-LSAM-000278
Potential Media Affect:	Soil
Potential Contaminants of Concern:	Diesel
Site History:	This site is currently vacant land to be graded and developed by the city into a single span bridge on the northern portion of the site. This release was opened in 2014 due to elevated soil and groundwater samples with gasoline and diesel. Three phases of investigation were completed between October 2009 and April 2014. The elevated hydrocarbons in soil and groundwater were located in the area where five underground storage tanks and dispenser islands were removed in 1991. Five monitoring wells (MWs) were installed in October 2015. Three quarterly sampling events did not reveal any detectable levels of contaminants in groundwater. Figure 3 of the Second and Third Quarter Groundwater Monitoring Report shows the location of the five wells and groundwater flow direction. Figure 4 of that report shows historical concentrations of the MWs. It should be noted that the groundwater concentrations from B1-GW, B2-GW, B3-GW, B4-GW, B7-GW & B9-GW on Figure 4 are from soil boring grab groundwater samples taken in 2009 and are not considered to be representative groundwater concentrations at the site. The Second and Third Quarter 2016 Groundwater Monitoring Report dated November 11, 2016 included the evaluation and request for closure using the Low Threat Closure Policy (LTCP) closure because: Groundwater has not been impacted (soils-only case) based on the data from the five monitoring wells indicating Non Detect (ND) in all sampling events. There are no health risks to current structures since the site is a vacant lot. Soil impacts are limited to diesel. The consultant states that approximately 130 cubic yards of soil remains on site with over 100 mg/kg TPH. This soil is located in northern portion of the site in the area of the four former 12,000 gallon diesel tanks from 2’ -7’ bgs per Figures 4 & 5 of the 2016 Site Assessment Report. DEH concurs with the consultants conclusions and approves case closure by low risk criteria. Permit #DEH2017-LMWP-002801 was issued by DEH for

ASTLEFORD CONSTRUCTION INC (Continued) **1000348223**

destruction of the 5 wells associated with the site.

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

include dates, times, name of inspector, observations, and specifics of any needed repairs or corrective actions). (3 years for CE and PBR units, 5 years for CA). {CE: 25201.5(d)(4)&(5), 25201.14(c)(1); CA: 25200.3(c)(5)&(7); PBR: 67450.3(c)(8) & (9)(A) & (D), 66265.73(a)&(b)(1); 66265.15(b) & (d)}
Activity: ACTIVE

Permit Number: 108597
Update Date: 11/02/2012
Inspection Date: 07/13/2010
Violation Code: 6HV1741
Violation: SECONDARY CONTAINMENT INADEQ/ABSENT
Violation Citation: Proper secondary containment is not provided or is not: compatible with stored waste, free of cracks & leaks, protecting containers from contact with accumulated liquid, capable of containing a 24 hour/25 year storm precipitation plus 10% volume of all containers, or 100% largest container volume, whichever is greater. {Containers: 66264.175(a)&(b) for CA: 25200.3(c)(4) for PBR: 67450.3(c)(9)} {Tank systems: 66265.193 and .194}
Activity: ACTIVE

Permit Number: 108597
Update Date: 11/02/2012
Inspection Date: 07/13/2010
Violation Code: 6HV1756
Violation: WRITTEN ANALYSIS PLAN INADEQUATE/ABSENT
Violation Citation: Written waste analysis plan does not exist or is inadequate in specifying parameters of analysis, testing methods, frequency of analysis and sampling methods used to obtain representative samples. {66265.13(b) & 67450.3(c)(9)(A)}
Activity: ACTIVE

Permit Number: 108597
Update Date: 11/02/2012
Inspection Date: 04/17/2003
Violation Code: 6HV0402
Violation: TRAINING PROGRAM NOT ADEQUATE
Violation Citation: Personnel training is not adequate to ensure compliance with hazardous waste regulations. CCR 66265.16(a)&(b)
Activity: ACTIVE

Permit Number: 108597
Update Date: 11/02/2012
Inspection Date: 04/17/2003
Violation Code: 6HV0143
Violation: TP NOTIFICATION INCOMPLETE/INCORRECT
Violation Citation: TIERED PERMITTING: TP Notification has incomplete or incorrect information. 25201
Activity: ACTIVE

Permit Number: 108597
Update Date: 11/02/2012
Inspection Date: 06/10/2004

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Common Name: Gramoxone SL
Case Number: 1910-42-5

Record ID: DEH2009-HUPFP-210762
Permit Status: Permit Renewed
Active Permit: Y
Child Record Id: DEH2016-HCHEM-0107470
Trade Secret: N
Hazardous Material Type: Mixture
Last Updated: 2016-09-14T02:31:32.000
Chemical Name: Sodium Percarbonate
Common Name: GreenClean Pro
Case Number: mixture

Record ID: DEH2009-HUPFP-210762
Permit Status: Permit Renewed
Active Permit: Y
Child Record Id: DEH2016-HCHEM-0107471
Trade Secret: N
Hazardous Material Type: Mixture
Last Updated: 2016-09-14T02:31:32.000
Chemical Name: Phosmet
Common Name: Imidian 70-W
Case Number: 732-11-6

Record ID: DEH2009-HUPFP-210762
Permit Status: Permit Renewed
Active Permit: Y
Child Record Id: DEH2016-HCHEM-0107472
Trade Secret: N
Hazardous Material Type: Mixture
Last Updated: 2016-09-14T02:31:32.000
Chemical Name: Isopropylamine salt of glyphosate
Common Name: Kleen Up Pro
Case Number: 38641-94-0

Record ID: DEH2009-HUPFP-210762
Permit Status: Permit Renewed
Active Permit: Y
Child Record Id: DEH2016-HCHEM-0107473
Trade Secret: N
Hazardous Material Type: Mixture
Last Updated: 2016-09-14T02:31:32.000
Chemical Name: COPPER HYDROXIDE
Common Name: KOCIDE 3000
Case Number: 20427-59-2

NUTRIEN AG SOLUTIONS-SAN MARCOS (Continued) **S106060673**

Record ID:	DEH2009-HUPFP-210762
Permit Status:	Permit Renewed
Active Permit:	Y
Child Record Id:	DEH2016-HCHEM-0107474
Trade Secret:	N
Hazardous Material Type:	Mixture

Chemical Name:	Bromacil
Common Name:	Krovar DF
Case Number:	3147-40-9

Record ID:	DEH2009-HUPFP-210762
Permit Status:	Permit Renewed
Active Permit:	Y
Child Record Id:	DEH2016-HCHEM-0107504
Trade Secret:	N
Hazardous Material Type:	Mixture
Last Updated:	2016-09-14T02:31:32.000
Chemical Name:	Alkoxylated Polyols
Common Name:	Revert
Case Number:	MIXTURE

Record ID:	DEH2009-HUPFP-210762
Permit Status:	Permit Renewed
Active Permit:	Y
Child Record Id:	DEH2016-HCHEM-0107475
Trade Secret:	N
Hazardous Material Type:	Mixture
Last Updated:	2016-09-14T02:31:32.000
Chemical Name:	BLEND OF METHYLACETIC ACID, LECITHIN & SURFACTANT
Common Name:	LI 700
Case Number:	79-09-4

Record ID:	DEH2009-HUPFP-210762
Permit Status:	Permit Renewed
Active Permit:	Y
Child Record Id:	DEH2016-HCHEM-0107476
Trade Secret:	N
Hazardous Material Type:	Mixture
Last Updated:	2016-09-14T02:31:32.000
Chemical Name:	LECITHIN, METHYL ESTERS OF FATTY ACIDS, & ALCOHOL ETHOXYLATE
Common Name:	LIBERATE WITH LECI-TECH
Case Number:	34398-01-1

Record ID:	DEH2009-HUPFP-210762
Permit Status:	Permit Renewed
Active Permit:	Y
Child Record Id:	DEH2016-HCHEM-0107477
Trade Secret:	N
Hazardous Material Type:	Mixture
Last Updated:	2016-09-14T02:31:32.000
Chemical Name:	CHLORPYRIFOS
Common Name:	LORSBAN 15G
Case Number:	2921-88-2

Record ID:	DEH2009-HUPFP-210762
Permit Status:	Permit Renewed
