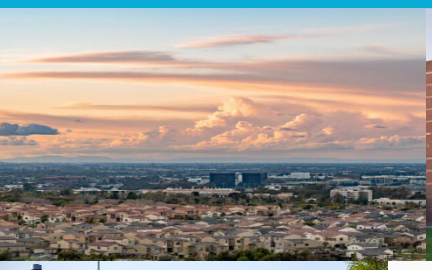
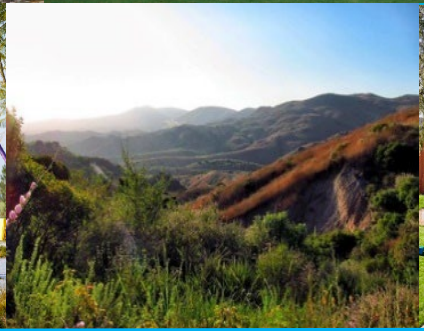
2045 GENERAL PLAN

DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT
March 2024

CITY OF IRVINE | 2045 GENERAL PLAN UPDATE





Draft
Program Environmental Impact Report for the City of Irvine 2045 General Plan Update
SCH #2023070463

Prepared for
City of Irvine
1 Civic Center Plaza
Irvine, CA 92606

Prepared by
RECON Environmental, Inc.
3111 Camino del Rio North, Suite 600
San Diego, CA 92108
P 619.308.9333

RECON Number 9919
March 2024

TABLE OF CONTENTS

List of Abbreviated Terms vi

Executive Summary S-1

1.0 Introduction 1-1
- 1.1 Type of EIR 1-1
- 1.2 List of Project Approvals 1-1
- 1.3 Statement of Legal Authority 1-2
- 1.4 Responsible/Trustee Agencies 1-2
- 1.5 PEIR Scope 1-4
- 1.6 PEIR Intended Use and Review Process 1-6

2.0 Environmental Setting 2-1
- 2.1 Planning Context 2-1
- 2.2 Existing Physical Site Conditions 2-4

3.0 Project Description 3-1
- 3.1 Project Background 3-1
- 3.2 Project Objectives 3-3
- 3.3 Project Description 3-3
- 3.4 Intended Uses of the EIR 3-8
- 3.5 Discretionary Actions, Permits, and other Project Approvals 3-8

4.0 Environmental Analysis 4-1
- 4.1 Aesthetics 4.1-1
- 4.2 Air Quality 4.2-1
- 4.3 Biological Resources 4.3-1
- 4.4 Cultural and Tribal Resources 4.4-1
- 4.5 Geology and Soils 4.5-1
- 4.6 Greenhouse Gas Emissions 4.6-1
- 4.7 Hazards and Hazardous Materials 4.7-1
- 4.8 Hydrology/Water Quality 4.8-1
- 4.9 Land Use and Planning 4.9-1
- 4.10 Noise 4.10-1
- 4.11 Population and Housing 4.11-1
- 4.12 Public Services, Parks, and Recreation 4.12-1
- 4.13 Transportation 4.13-1
- 4.14 Utilities and Service Systems 4.14-1
- 4.15 Wildfires 4.15-1

5.0 CEQA Mandated Analysis 5-1
5.1 Significant Environmental Effects Which Cannot Be Avoided if the Project is Implemented 5-1
5.2 Significant Irreversible Environmental Changes Which Would Result if the Project is Implemented 5-1
5.3 Growth Inducement 5-3
5.4 Conclusion 5-4
6.0 Effects Found Not to be Significant 6-1
6.1 Agricultural and Forestry Resources 6-1
6.2 Energy 6-2
6.3 Mineral Resources 6-7
7.0 Project Alternatives 7-1
7.1 Selection of Alternatives 7-1
7.2 Project Alternatives 7-2
7.3 Environmentally Superior Alternative 7-19
8.0 References Cited 8-1
9.0 List of Preparers 9-1

APPENDICES

A: NOP and Comment Letters
B: Irvine General Plan Update Air Quality and Greenhouse Gas Emissions Summary
C: Biological Technical Report City of Irvine General Plan Update
D: Paleontological and Cultural Resources Assessment Report for the City of Irvine General Plan Update
E: Greenhouse Gas Emissions Forecasts Report for the City of Irvine Draft Climate Action and Adaptation Plan
F-1: Greenhouse Gas Emissions for Hypothetical Project #1
F-2: Greenhouse Gas Emissions for Hypothetical Project #2
G: Irvine General Plan Update Traffic Noise Assessment
H: Irvine General Plan Update Vehicle Miles Traveled (VMT) Traffic Study
I: Proposed Conditions Infrastructure Report for Water, Sewer, Storm Drainage, and Water Quality

List of Abbreviations/Acronyms

°F	degrees Fahrenheit
AAQS	Ambient Air Quality Standards
AB	Assembly Bill
ACM	asbestos-containing materials
ADT	average daily traffic
AELUP	Airport Environs Land Use Plan
AF	acre-feet
AFY	acre-feet per year
ALUC	Airport Land Use Commission
ALUCP	Airport Land Use Compatibility Plan
AMI	area median income
APSA	Aboveground Petroleum Storage Act
AQMP	air quality management plan
BAAQMD	Bay Area Air Quality Management District
Basin	South Coast Air Basin
Basin Plan	Santa Ana Regional Water Quality Control Board Basin Plan
BAU	business as usual
BGEPA	Bald and Golden Eagle Protection Act
BLM	Bureau of Land Management
BMP	best management practice
BMR	Below Market Rate
BNSF	Burlington Northern Santa Fe
BP	Before Present
CAA	Clean Air Act
CAAP	Climate Action and Adaptation Plan
CAAQS	California Ambient Air Quality Standards
CAFE	Corporate Average Fuel Economy
Cal EPA	California Environmental Protection Agency
CAL FIRE	California Department of Forestry and Fire
CalARP	California Accidental Release Prevention
CalEEMod	California Emissions Estimator Model
CALGreen	California Green Building Standards Code
Cal-OSHA	California Occupational Safety and Health Administration
CalRecycle	California Department of Resources Recycling and Recovery
CalSTA	California State Transportation Agency
Caltrans	California Department of Transportation
CAPCOA	California Air Pollution Control Officers Association
CARB	California Air Resources Board
CBC	California Building Code
CCE	Community Choice Energy

CCR	California Code of Regulations
CDFW	California Department of Fish and Wildlife
CEC	California Energy Commission
CEQA	California Environmental Quality Act
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act
CESA	California Endangered Species Act
CFD	Community Facilities District
CFR	Code of Federal Regulations
CH^4	Methane
CHL	Historical Landmarks
CHRI	California Historical Resources Inventory
City	City of Irvine
CMP	Congestion Management Plan
CNDDB	California Natural Diversity Database
CNEL	Community Noise Equivalent Level
CNPS	California Native Plant Society
CO	carbon monoxide
CO_2	carbon dioxide
CPHI	California Points of Historical Interest
CPUC	California Public Utilities Commission
CREATE	Chicago Rail Efficiency and Transportation Efficiency
CRHR	California Register of Historic Resources
CUPA	Certified Union Program Agency
CWA	Clean Water Act
CZARA	Coastal Zone Act Reauthorization Amendments
DAMP	Drainage Area Management Plan
dB	decibel
dB(A)	A-weighted decibel
DPM	diesel particulate matter
DTSC	California Department of Toxic Substances Control
EIR	environmental impact report
EO	Executive Order
EOP	Emergency Operations Plan
EPCA	Environmental Protection and Climate Action
EV	Electric vehicle
FAA	Federal Aviation Administration
FAR	Federal Air Regulations
FAR	floor area ratio
FEMA	Federal Emergency Management Agency
FESA	Federal Endangered Species Act
FHSZ	Fire Hazard Severity Zone
FHWA	Federal Highway Administration
FICON	Federal Interagency Committee on Noise
FMMP	Farmland Mapping and Monitoring Program

FMP	Facilities Master Plan
FTA	Federal Transit Authority
FWCA	Fish and Wildlife Coordination Act
GHG	greenhouse gas
GIS	geographic information system
GWh	gigawatt-hours
GWP	global warming potential
HCD	California Department of Housing and Community Development
HCP	Habitat Conservation Plan
HMBEP	Hazardous Materials Business Emergency Plan
HRA	Health Risk Assessment
HVAC	heating, ventilation, and air conditioning
HWCL	Hazardous Waste Control Law
Hz	hertz
I-405	Interstate 405
I-5	Interstate 5
IBC	Irvine Business Complex
IGP	Industrial General Permit
in/sec	inch per second
IPCC	Intergovernmental Panel on Climate Change
IPD	Irvine Police Department
IRP	Integrated Resource Planning
IRWD	Irvine Ranch Water District
ITC	Irvine Transportation Center
IUSD	Irvine Unified School District
IVC	Irvine Valley College
LAWRP	Los Alisos Water Recycling Plant
LCP	Local Coastal Plan
LEED	Leadership in Energy and Environmental Design
L_{eq}	hourly equivalent sound level
LHMP	Local Hazard Mitigation Plan
LID	Low Impact Development
LIP	Local Implementation Plan
LOMR	Letter of Map Revision
LOS	Level of Service
L_{PW}	sound power
LRTP	Long Range Transportation Plan
LST	Localized Significance Threshold
MATES	Multiple Air Toxics Exposure Study
MBTA	Migratory Bird Treaty Act
MCAS	Marine Corps Air Station
MERV	minimum efficiency reporting value
mgd	million gallons per day
MLD	Most Likely Descendent

MMT CO_2E	million metric tons of carbon dioxide equivalent
MPAH	Master Plan of Arterial Highways
mpg	miles per gallon
mph	miles per hour
MPO	Metropolitan Planning Organization
MRZ	Mineral Resource Zone
MT CO_2E	metric tons of carbon dioxide equivalent
MWD	Metropolitan Water District of Southern California
MWDOC	Municipal Water District of Orange County
MWRP	Michelson Water Recycling Plant
NAAQS	National Ambient Air Quality Standards
NAGPRA	Native American Graves Protection and Repatriation Act
NAHC	Native American Heritage Commission
NAVD	North American Vertical Datum
NCCP	Natural Community Conservation Plan
NEPA	National Environmental Policy Act
NHPA	National Historic Preservation Act
NITM	North Irvine Transportation Mitigation
NO_2	nitrogen dioxide
NOI	Notice of Intent
NOP	Notice of Preparation
NO_x	oxides of nitrogen
NPDES	National Pollutant Discharge Elimination System
NRCS	Natural Resources Conservation Service
NRHP	National Register of Historic Places
NRHR	National Register of Historic Resources
NTS	natural treatment system
OCCOG	Orange County Council of Governments
OCFA	Orange County Fire Authority
OCFCD	Orange County Flood Control District
OCHCA	Orange County Health Care Agency
OCP	Orange County Projections
OCPA	Orange County Power Authority
OCPL	Orange County Public Libraries
OCPW	Orange County Public Works Department
OCSD	Orange County Sanitation District
OCTA	Orange County Transportation Authority
OCWD	Orange County Water District
OEHHA	Office of Environmental Health Hazard Assessment
OEM	Office of Emergency Management
OPR	Office of Planning and Research
OSHA	Occupational Safety and Health Administration
Pb	lead
PEIR	Program Environmental Impact Report

PM_{10}	particulate matter less than 10 microns in diameter
$PM_{2.5}$	particulate matter less than 2.5 microns in diameter
ppm	parts per million
PPP	plans, programs, or policies
PPV	peak particle velocity
PRC	Public Resources Code
project	City of Irvine 2045 Focused General Plan Update
RCP	Regional Comprehensive Plan
RCRA	Resource Conservation and Recovery Act
REMEL	Reference Energy Mean Emission Level
RHNA	Regional Housing Needs Allocation
ROG	reactive organic gases
RPS	Renewable Portfolio Standard
RTP	Regional Transportation Plan
RWQCB	Regional Water Quality Control Board
SAA	Streambed Alteration Agreement
SARA	Superfund Amendments and Reauthorization Act
SAUSD	Santa Ana Unified School District.
SB	Senate Bill
SCAG	Southern California Association of Governments
SCAQMD	South Coast Air Quality Management District
SCCIC	South Central Coastal Information Center
SCE	Southern California Edison
SCH	State Clearinghouse
SCRRA	Southern California Railroad Authority
SCS	Sustainable Communities Strategy
SFHA	Special Flood Hazard Area
SGC	Strategic Growth Council
SGMA	Sustainable Groundwater Management Act
SHMA	Seismic Hazard Mapping Act
SIP	State Implementation Plan
SMAQMD	Sacramento Metropolitan Air Quality Management District
SMARA	Surface Mining and Reclamation Act
SO_2	sulfur dioxide
SoCalGas	Southern California Gas Company
SOCCCD	South Orange County Community College District
SPCC	Spill Prevention, Control, and Countermeasure
SR-133	State Route 133
SR-241	State Route 241
SR-55	State Route 55
SR-73	State Route 73
SRA	Seismic Response Area
SVUSD	Saddleback Valley Unified School District
SWPPP	storm water pollution prevention plan

SWRCB	State Water Resources Control Board
TAC	toxic air contaminants
TCE	trichloroethylene
TDM	Transportation Demand Management
TMDL	total maximum daily load
TRIPS	Transportation for Irvine Residents with Disabilities
TUSD	Tustin Unified School District
U.S. EPA	United States Environmental Protection Agency
UCI	University of California, Irvine
USACE	United States Army Corps of Engineers
USC	United States Code
USC	United States Code
USDA	U.S. Department of Agriculture
USFWS	United States Fish and Wildlife Service
USGS	U.S. Geological Survey
UST	underground storage tank
UWMP	Urban Water Management Plan
VdB	vibration decibels
VMT	vehicle miles traveled
VOC	volatile organic compounds
vph	vehicles per hour
WDR	Waste Discharge Requirement
WMA	Watershed Management Areas
WQMP	Water Quality Management Plan
WRMP	Water Resources Master Plan
WSA	Water Supply Assessment
ZEVTP	Zero-Emission Vehicles Transition Plan

Executive Summary

S.1 Introduction

This Program Environmental Impact Report (PEIR; State Clearinghouse House [SCH] No. 2023070463) has been prepared consistent with Section 15168 of the California Environmental Quality Act (CEQA) Guidelines, to address potential environmental effects associated with implementation of the City of Irvine (City) 2045 General Plan Update (project).

As described in Section 15168 of the CEQA Guidelines, program-level environmental review documents are appropriate when a project consists of a series of actions related to the issuance of rules, regulations, and other planning criteria. The project that is the subject of this PEIR consists of a comprehensive update to the existing General Plan and updates to the City's Land Use Map that will provide long-term policy documents guiding future development. The purpose of this program-level EIR is intended to inform decision-makers and the public of the potential significant environmental impacts of the project. This PEIR also considers the availability of mitigation measures as required by Section 15100 of the CEQA Guidelines to minimize the project's significant impacts and evaluates reasonable alternatives to the project that may reduce or avoid one or more significant environmental effects.

A brief overview of each PEIR chapter is provided below:

Executive Summary: Summarizes the PEIR by providing an overview of the project, analysis of the potentially significant environmental impacts that could result from the project, a list of mitigation measures identified to reduce or avoid such impacts, a review of the alternatives to the project, including the identification of an environmentally superior alternative to the project.

1.0 Introduction: Provides an overview of the applicable legal authority, introduces the purpose for the PEIR and explains the PEIR process and the intended uses of the PEIR.

2.0 Environmental Setting: Provides a description of the project's regional context, location, and existing physical characteristics and land use within the City. More detailed descriptions of the environmental context pertaining to specific environmental topics are provided in each section of Chapter 4.0, Environmental Analysis.

3.0 Project Description: Provides a detailed description of the project, including the purpose and objectives of the project and descriptions of each component of the project.

4.0 Environmental Analysis. Analyzes the environmental impacts of the project. Impacts are organized by the following topic areas:

- 4.1 Aesthetics
- 4.2 Air Quality
- 4.3 Biological Resources
- 4.4 Cultural and Tribal Cultural Resources

4.5 Geology/Soils
4.6 Greenhouse Gas Emissions
4.7 Hazards and Hazardous Materials
4.8 Hydrology/Water Quality
4.9 Land Use/Planning
4.10 Noise
4.11 Population and Housing
4.12 Public Services and Recreation
4.13 Transportation
4.14 Utilities/Service Systems
4.15 Wildfire

Each topic area respectively provides a contextual description of the project's environmental setting, significance criteria, methodology, and potential impacts (project-level and cumulative).

5.0 CEQA Mandated Analysis: Summarizes the project's significant and unavoidable environmental impacts, significant irreversible environmental changes, and growth-inducing impacts per State CEQA Guidelines Section 15065 Mandatory Findings of Significance.

6.0 Effects Found Not to be Significant: Identifies all the issues determined in the scoping and preliminary environmental review process to be not significant based on CEQA criteria, and briefly summarizes the basis for these determinations. These topics include Agricultural and Forestry Resources, Energy, and Mineral Resources.

7.0 Project Alternatives: Presents a reasonable range of alternatives to the project and includes the following:

- A discussion of the environmental impacts associated with each alternative,
- A comparison of the relative impacts of each alternative to those of the project,
- A discussion of the relationship of each alternative to the project's objectives, and
- Identification of the environmentally superior alternative.

8.0 References: Lists documents and other information sources relied upon in the preparation of the PEIR and identifies the persons and organizations that contributed to the preparation of the PEIR.

9.0 List of Preparers: Lists persons involved in the preparation of the PEIR.

Technical appendices, used as a basis for portions of the environmental analysis in the PEIR, have been summarized in the PEIR, and are included as attachments to the PEIR.

S.2 Project Overview

The City is located within the coastal foothill region of central Orange County in the state of California. Located approximately two miles inland from the Pacific Ocean and 40 miles south of the City of Los Angeles, the City is adjacent to the cities of Newport Beach, Lake Forest, Tustin, Santa Ana, Laguna Hills, Laguna Woods, Costa Mesa, Orange, and Laguna Beach, as well as unincorporated areas of Orange County. The City is generally bounded on the southwest by State Route 73 and on

the northeast by State Route 241. Interstate 5. Interstate 405 and State Route 133 cross through the central portion of the City, and multiple interstates and state routes traverse the City and provide connection to surrounding communities throughout the southern California region. Air travel is available at John Wayne Airport, located immediately adjacent to the Irvine Business Complex (IBC).

California state law requires each city and county to adopt a general plan for its physical development. A general plan is a key tool that addresses a variety of subject areas and expresses the community's development goals related to future land uses in the jurisdiction. Incorporated in 1971, the City adopted the first General Plan in December 1973. The City's General Plan was last comprehensively updated in 2000 and has been updated over the years to address necessary General Plan amendments. Since 2000, the City has continued to grow, as the community has matured and evolved. The purpose of the project is to provide long-term policy direction and communicate the vision, values, and goals for the City's physical development and overall quality of life.

In addition to providing long-term policy direction, the City is required to update the appropriate elements of the General Plan to accommodate the residential site inventory from the 6th Cycle Housing Element Update effective 2021 to 2029 (2021-2029 Housing Element) (adopted in May 2022). The 2021-2029 Housing Element Regional Housing Needs Assessment (RHNA) allocation for the City is 23,610 units. To ensure consistency with housing statute, including no-net loss and affirmatively furthering fair housing requirements, the 2021-2029 Housing Element identified adequate sites to accommodate 57,656 new residential units. To implement the 2021-2029 Housing Element, the project would adopt residential and residential mixed-use overlay zones that would allow greater flexibility for property owners and developers proposing residential development projects with affordable housing units. The project also includes updates to the Land Use Element to accommodate the proposed residential and residential mixed-use overlay zones, as well as updates to the Open Space and Conservation, Safety, Circulation (Mobility) and Noise elements to address statutory requirements. The City would also introduce a new Environmental Protection and Climate Action Element. Health and wellness will also be incorporated throughout the updated General Plan.

In addition to the RHNA residential component, the project includes additional non-residential land uses in the Irvine Great Park (Great Park). Phase 1 of the Great Park Framework Plan is in the baseline (no build condition) and the remaining land uses supporting the buildout of the Great Park Framework (200 acres in total) are included as part of the project. Phase 2 (or the remaining buildout of the Great Park) includes the following: a botanical garden, a veteran's memorial garden, a library, a discovery center, two museums, a 65-acre central park area, an accessory restaurant use, three aquatic center pools, an aquatic stadium, an all-wheel park, and pickleball courts.

The project also includes the extension of Ada roadway from its current terminus in the parking lot of the Irvine train station south of the Southern California Railroad Authority railroad tracks is proposed to extend north under the railroad tracks to meet the future Marine Way extension north of the railroad tracks. The Ada roadway extension between the Irvine train station and Marine Way provides multi-modal connectivity to support the residential uses.

As required by State CEQA Guidelines Section 15124(b), this PEIR also includes project objectives, as described in detail in Chapter 3.0, Project Description. These objectives support the implementation of the City's 2021-2029 Housing Element, assist the City in identifying key focus areas, implements

Citywide policy direction, implements the use of overlay zones to allow for greater residential and mixed-used residential development, implements Phase 2 of the Great Park Framework Plan, and extends the key segment of the Ada roadway between Irvine Train Station and Marine Way to better support residential uses and improve multi-modal connectivity.

S.3 PEIR Process

The Notice of Preparation (NOP) was circulated on July 21, 2023, and a scoping meeting was held virtually via video conferencing on Tuesday, August 1, 2023. The NOP circulated for analysis of the project, related letters received, and comments made during the scoping meeting are included as Appendix A of this PEIR. The Draft PEIR was circulated for public review for a period commencing on Friday, March 15, 2024, through Monday, April 29, 2024 (Public Review Period). The Draft PEIR and all related appendices have been made available for public review and inspection during the Public Review Period at City Hall, located at 1 Civic Center, Irvine, California, and on the City's webpage at:

- https://www.cityofirvine.org/community-development/current-environmental-reviews
- https://www.cityofirvine.org/community-development/events-irvine-2045

Copies of the Notice of Availability of the Draft PEIR are also available at the City's three public library branches at the following locations:

- Heritage Park, located at 14361 Yale Avenue
- University Park, located at 4512 Sandburg Way
- Katie Wheeler, located at 13109 Old Myford Road

S.4 Issues to be Resolved by the Decision-Making Body

Issues to be resolved by the decision-making body include how to reduce programmatic significant, unavoidable adverse environmental impacts associated with the project to the maximum extent feasible while achieving project objectives, through adoption of mitigation measures and/or alternatives to the project identified in this PEIR.

S.5 Project Alternatives

CEQA Guidelines Section 15126.6 requires that the EIR compare the effects of a "reasonable range of alternatives" to the effects of the project. The CEQA Guidelines further specify that the project alternatives selected should attain most of the basic project objectives and avoid or substantially lessen one or more significant effects of the project. The "range of alternatives" is governed by the "rule of reason," which requires the EIR to set forth only those project alternatives necessary to permit an informed and reasoned choice by the City, as the Lead Agency, and to foster meaningful public participation (CEQA Guidelines Section 15126.6[f]). CEQA generally defines "feasible" to mean an alternative that is capable of being accomplished in a successful manner within a reasonable period of time, while also taking into account economic, environmental, social, technological, and legal factors.

Project alternatives are evaluated in Chapter 7.0 of this PEIR. The evaluations analyze the ability of each project alternative to further reduce or avoid the significant environmental effects of the project. Each major environmental topic that was determined to have significant impacts has been given consideration in the alternatives analysis. This PEIR evaluates two project alternatives: the No Project Alternative (continuation of the existing General Plan) and the Reduced Alternative.

S.5.1 No Project Alternative

The No Project Alternative involves the continuation of existing land uses permitted under the City's current General Plan. The No Project Alternative would not identify additional residential sites necessary to meet the City's RHNA allocation, and thereby result in less intensive development within the City. The No Project Alternative would also not include improvements to the Great Park or the proposed Ada roadway extension. Nonetheless, future development under the No Project Alternative would occur consistent with the City's adopted General Plan land use plan and would be subject to implementation of the City's General Plan existing Mitigation Monitoring Requirements. The No Project Alternative would not implement the overlay zone proposed under the project, and therefore would not provide the densities needed to accommodate the region's housing needs or the required levels of affordability.

Under the No Project Alternative, State Housing Law and legislative requirements for implementation of the project's planned goals, objectives, policies and actions aimed at increasing housing (in particular affordable housing) in the City would not occur. This alternative would not satisfy the project objectives because implementation of the No Project Alternative would not facilitate the future development of sufficient residential units needed to the meet the City's RHNA allocation and would not satisfy applicable legislative mandates associated with the City's adopted 2021-2029 Housing Element.

S.5.2 Reduced Project Alternative

The City has also developed a Reduced Project Alternative that would accommodate the City's RHNA requirement and implement the 2021-2029 Housing Element utilizing a smaller number of residential sites. Proposed Great Park improvements and the extension of the Ada roadway would be proposed as part of the Reduced Project Alternative, similar to the project.

Compared to the 57,656 units proposed under the project, the Reduced Project Alternative would only propose 42,637 residential units, a difference of 15,019 units. While the number of residential units proposed under the Reduced Project Alternative would be less than the project, this alternative would still exceed the City's RHNA allocation of 23,610 units, and therefore would be consistent with applicable housing statute, including no-net loss and affirmatively furthering fair housing requirements. The proposed number of residential units within Focus Area 3 would remain unchanged under the Reduced Project Alternative. However, the Reduced Project Alternative would decrease the number of proposed residential units within Focus Area 1 from 15,000 units to 11,242 units and in Focus Area 2 from 26,607 units to 19,811 units.

S.5.3 Environmentally Superior Alternative

CEQA Guidelines Section 15126.6(e)(2) requires an EIR to identify the environmentally superior alternative. If the No Project Alternative is the environmentally superior alternative, the EIR must identify an environmentally superior alternative from the other alternatives. The project itself may not be identified as the environmentally superior alternative.

The Reduced Project Alternative would be the environmentally superior alternative because it would incrementally reduce significant impacts associated with aesthetics, biological resources, cultural and tribal cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use, noise, population and housing, public services and recreation, utilities and services, and wildfire compared to the project. However, none of the potentially significant impacts of the project would be completely avoided.

Compared to the 57,656 units proposed under the project, the Reduced Project Alternative would only propose 42,637 residential units, a difference of 15,019 units. While the number of residential units proposed under the Reduced Project Alternative would be less than the project, this alternative would still exceed the City's RHNA allocation of 23,610 units, and therefore would be consistent with applicable housing statute, including no-net loss and affirmatively furthering fair housing requirements. Therefore, the Reduced Project Alternative would meet all the project's objectives.

S.6 Summary Table

Table S-1 summarizes the results of the environmental analysis including the potentially significant environmental impacts of the project and proposed mitigation measures to reduce or avoid these impacts. Impacts and mitigation measures are organized by issue in Chapter 4.0, Environmental Analysis.

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
4.1 Aesthetics				
Would the project have a substantial adverse effect on a scenic vista?	Less than Significant	Although future development and redevelopment would vary in building height, mass, form, and intensity, projects would generally be required to meet a minimum residential density of 50 dwelling units per acre, similar to the average density of recently approved projects within the three focus areas. Furthermore, by concentrating most of the development within the three focus areas, the project would ensure that buildout under the General Plan would not block public views of scenic vistas that are primarily located in undeveloped and open space areas of the City. Similarly, nonresidential growth within the Great Park area and the extension of Ada roadway would occur within areas that are not afforded scenic views of natural resources in the City. Future projects would also be required to comply with PPPs AES-2 and AES-5, which outline development standards guiding the design and character of structures, to further ensure that projects would not impact scenic vistas. Therefore, impacts related to obstruction of a scenic vista would be less than significant.	• PPP-AES-2 Compliance with Municipal Code Section 5-9-517 Special Nonresidential Building Provisions • PPP-AES-5 Compliance with Zoning Ordinance Chapter 3-37 Zoning District Land Use Regulations and Development Standards	Less than Significant
Would the project substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a State Scenic Highway?	Less than Significant	There are no state-designated or eligible scenic highways within the City. The closest eligible State Scenic Highway is a segment of I-405 in Long Beach, approximately 16 miles northwest of the City. This segment of scenic highway does not have distinct views of the Focus Areas. Therefore, future development under the project would not be located within the viewshed of any designated or eligible state scenic highways.	None.	Less than Significant
In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings (Public views are those that are experienced from publicly accessible vantage points)? If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	Less than Significant	The project would introduce additional development throughout the City using a residential and residential mixed-use overlay that would allow greater flexibility for property owners and developers. The overlay would promote higher density residential and residential mixed-use in three focus areas. Future development would be consistent with the visual quality and character of these focus areas, given their existing urban character. Additionally, some of underutilized sites within these focus areas consist of aging structures with poor visual quality, and redevelopment of these structures would result in new residential structures developed consistent with the visual requirements of existing PPPs (PPPs AES-1 through AES-8). Furthermore, development of vacant and underutilized sites would be required to adhere to the land use plans that provide supplemental development regulations of	• PPP-AES-1 Compliance with FAA requirements regarding the marking of or lighting of structures exceeding an overall height of 200 feet above ground level. • PPP-AES-2 Compliance with Municipal Code Section 5-9-517 Special Nonresidential Building Provisions • PPP-AES-3 Compliance with Zoning Ordinance Chapter 3-16 Lighting • PPP-AES-4 Compliance with Zoning Ordinance Chapter 3-15 Landscaping Standards • PPP-AES-5 Compliance with Zoning Ordinance Chapter 3-37 Zoning District Land Use Regulations and Development Standards • PPP-AES-6 Compliance with Zoning Ordinance Chapter 5-4 Hillside Overlay District • PPP-AES-7 Compliance with Zoning Ordinance Division 7 Signs	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		those sites, as well as the requirements of the Municipal Code and Zoning Ordinance. Development outside of the three focus areas is expected to occur on an incremental basis and would be required to occur in compliance with the City's Municipal Code and Zoning Ordinance (PPPs AES-1 through 8). Compliance with the City's code and site-specific review of the design of future projects would ensure their compatibility with the aesthetic character of the area in which they are proposed. Therefore, future development facilitated by the project would not result in the degradation of the existing scenic quality of the City, and impacts would be less than significant.	• PPP-AES-8 Compliance with Standard Condition 3.6 Site Lighting Requirements	
Would the project create a new source of substantial light or glare which would adversely affect daytime or nighttime views in the area?	Less than Significant	New development and increased density in the three focus areas will introduce new sources of light and glare associated with an increase in buildings and vehicles in the areas. However, each of the three focus areas is primarily characterized by an urbanized environment with existing light and glare sources. Therefore, future development would introduce similar sources of light to these areas. Compliance with existing City regulations related to lighting (PPPs AES-1, AES-2, and AES-8) would ensure that all project-related impacts with respect to light and glare would be less than significant.	• PPP-AES-1 Compliance with FAA requirements regarding the marking of or lighting of structures exceeding an overall height of 200 feet above ground level. • PPP-AES-3 Compliance with Zoning Ordinance Chapter 3-16 Lighting • PPP-AES-8 Compliance with Standard Condition 3.6 Site Lighting Requirements	Less than Significant
4.2 Air Quality				
Would the project conflict with or obstruct implementation of the applicable air quality plan?	Potentially Significant	Future development under the project would accommodate increases in population based on the Southern California Association of Governments' (SCAG's) demographic projections, and would therefore not induce unplanned growth. Buildout of the project would result in a decrease in emissions when compared to buildout of the City's adopted General Plan because it would . Therefore, buildout of the project would not exceed the assumptions used to develop the AQMP. The South Coast Air Basin is designated as in nonattainment for 8-hour ozone and 2.5-micron particulate matter ($PM_{2.5}$) standards. Because the proposed General Plan Update involves long-term growth associated with buildout of the City, cumulative emissions generated from operation of individual development projects would exceed the South Coast Air Quality Management District (SCAQMD) regional and localized thresholds. Future development would be required to adhere to the requirements of California Code of Regulations, Title 13, Section 2449 to reduce nonessential	• PPP 2-1 Construction activities will be conducted in compliance with California Code of Regulations, Title 13, Section 2449, which requires that nonessential idling of construction equipment be restricted to five minutes or less. • PPP 2-2 Construction activities will be conducted in compliance with any applicable SCAQMD rules and regulations, including but not limited to: o Rule 403, Fugitive Dust, for controlling fugitive dust and avoiding nuisance. o Rule 402, Nuisance, which states that a project shall not "discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property."	Significant and Unavoidable

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		idling (PPP 2-1), the construction requirements of SCAQMD rules and regulations (PPP 2-2), and the requirements of the City's grading code (PPP 2-3). Despite adherence to these policies and compliance with Standard Conditions and PPPs, buildout of the project could contribute to an increase in frequency or severity of air quality violations and delay attainment of the AAQS or interim emission reductions in the AQMP, and emissions generated from buildout would result in a significant air quality impact. Therefore, the General Plan Update would not be consistent with the AQMP under the second criterion and mitigation requiring project-specific air quality analyses is required.	o Rule 1113, which limits the volatile organic compound content of architectural coatings. o Rule 1466, Soil Disturbance. Projects that involve earth-moving activities of more than 50 cubic yards of soil with applicable toxic air contaminants are subject to this rule. • PPP 2-3: Compliance with the City of Irvine's Grading Code. • PPP 2-4: Compliance with the City of Irvine's Municipal Code guidance to reduce air pollution from motor vehicles. **AQ-1:** Applications for future development, wherein the Director of Community Development or their designee has determined a potential for air quality impacts associated with construction, shall prepare and submit a technical assessment evaluating potential project construction-related air quality impacts to the City for review and approval. The Director of Community Development or their designee shall make this determination based on the size of the project, whether the project would require a transportation impact analysis, or other criteria. The evaluation shall be prepared in conformance with South Coast Air Quality Management District (SCAQMD) methodology for assessing air quality impacts. The City shall require that applicants for new development projects with the potential to exceed the SCAQMD's adopted thresholds of significance to incorporate the measures listed below to reduce air pollutant emissions during construction activities. These identified measures shall be incorporated into all appropriate construction documents (e.g., construction management plans) submitted to the City and shall be verified by the City. Mitigation measures to reduce construction-related emissions could include, but are not limited to: • Require fugitive-dust control measures that exceed SCAQMD's Rule 403 requirements, such as: o Use of nontoxic soil stabilizers to reduce wind erosion. o Apply water every four hours to active soil-disturbing activities. o Tarp and/or maintain a minimum of 24 inches of freeboard on trucks hauling dirt, sand, soil, or other loose materials. • Use construction equipment rated by the United States Environmental Protection Agency as having Tier 3 (model	

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
			year 2006 or newer) or Tier 4 (model year 2008 or newer) emission limits, applicable for engines between 50 and 750 horsepower. • Ensure that construction equipment is properly serviced and maintained to the manufacturer's standards. • Limit nonessential idling of construction equipment to no more than five consecutive minutes. • Limit on-site vehicle travel speeds on unpaved roads to 15 miles per hour. • Install wheel washers for all exiting trucks or wash off all trucks and equipment leaving the project area. • Use Super-Compliant VOC paints for coating of architectural surfaces whenever possible. A list of Super-Compliant architectural coating manufactures can be found on the SCAQMD's website.	
Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	**Construction:** Potentially Significant **Operation:** Potentially Significant	**Construction:** Approval of the project would not specifically permit the construction of an individual project, and no specific development details are available at this program level of analysis. Future development would be required to implement construction Best Management Practices (BMPs) at all construction sites consistent with SCAQMD rules and regulations. Future construction activities would also be required to comply with PPP 2-1, which outlines compliance with California Code of Regulations, Title 13, Section 2449, which itself requires that nonessential idling of construction equipment be restricted to five minutes or less. Future construction activities would also be conducted in compliance with any applicable SCAQMD rules and regulations, as outlined in PPP 2-2. While individual site-specific projects may not exceed the SCAQMD regional significance thresholds, the scale and extent of construction activities associated with buildout of the City may result in some instances where future development would exceed the relevant SCAQMD thresholds. Therefore, construction-related regional air quality impacts would be potentially significant and mitigation requiring project-specific air quality analyses would be required.	• PPP 2-1 Construction activities will be conducted in compliance with California Code of Regulations, Title 13, Section 2449, which requires that nonessential idling of construction equipment be restricted to five minutes or less. • PPP 2-2 Construction activities will be conducted in compliance with any applicable SCAQMD rules and regulations, including but not limited to: o Rule 403, Fugitive Dust, for controlling fugitive dust and avoiding nuisance. o Rule 402, Nuisance, which states that a project shall not "discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property." o Rule 1113, which limits the volatile organic compound content of architectural coatings. o Rule 1466, Soil Disturbance. Projects that involve earth-moving activities of more than 50 cubic yards of soil with applicable toxic air contaminants are subject to this rule. • PPP 2-3: Compliance with the City of Irvine's Grading Code. • PPP 2-4: Compliance with the City of Irvine's Municipal Code guidance to reduce air pollution from motor vehicles.	**Construction:** Significant and Unavoidable **Operation:** Significant and Unavoidable

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		Operations: Buildout of the project would result in a decrease in emissions compared to buildout of the City's adopted General Plan. Most of the future residential growth would occur in the three focus areas that are most suited for new growth and development as they are located near existing job centers, which would reduce VMT and associated vehicle emissions. While individual site-specific projects may not exceed the SCAQMD regional significance thresholds, the scale and extent of emissions associated with buildout of the project may result in some instances where future development would exceed the relevant SCAQMD thresholds. Therefore, operational regional air quality impacts would be potentially significant, and mitigation requiring project-specific air quality analyses would be required.	See AQ-1 above. **AQ-2**: For individual projects that may exceed the daily operational emissions thresholds established by the SCAQMD, the owner/permitee shall conduct an analysis of the project's operational air quality impacts using the latest available CalEEMod mode, or other analytical method determined in conjunction with the City. If such analyses identify potentially significant regional or local air quality impacts, project-level mitigation and/or project design features would be required to reduce operational impacts to less than significant. Mitigation to reduce operational impacts depends on the specific project, but may include measures such as, but not limited to: • Demonstrate net zero energy expenditure. • Implementation of transportation demand management measures. • Prohibit the installation of woodstoves, hearths, and fireplaces in new construction facilitated by the General Plan Update. • Expand and facilitate completion of planned networks of active transportation infrastructure. • Implement electric vehicle charging infrastructure beyond requirements set forth in the 2022 CALGreen mandatory measures, such as Tier 2 voluntary measures set forth in 2022 CALGreen (or future more stringent) standards. • Implement traffic demand measures, such as unbundling parking fees from rent/lease options, encouraging/developing a ride-share program for the community, and provide car/bike sharing services, that will reduce daily individual car usage and reduce project VMT.	
Would the project expose sensitive receptors to substantial pollutant concentrations?	Potentially Significant	**Localized Carbon Monoxide Hot Spots** New development adjacent to heavily traveled streets or intersections would not expose sensitive receptors to substantial pollutant concentrations associated with CO hot spots, and impacts would be less than significant. The Level of Service Traffic Study determined that roadway segment and intersection volumes would not exceed 100,000 average daily trips (Iteris 2024). Consequently, the project would not produce the volume of traffic required to generate a CO hot spot either in the context	• PPP 2-1 Construction activities will be conducted in compliance with California Code of Regulations, Title 13, Section 2449, which requires that nonessential idling of construction equipment be restricted to five minutes or less. • PPP 2-2 Construction activities will be conducted in compliance with any applicable SCAQMD rules and regulations, including but not limited to: o Rule 403, Fugitive Dust, for controlling fugitive dust and avoiding nuisance.	Significant and Unavoidable

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		of the 2003 Los Angeles study or BAAQMD CO threshold considerations. Therefore, the project would not expose sensitive receptors to substantial pollutant concentrations associated with CO hot spots, and impacts would be less than significant. **Toxic Air Emissions** <u>Construction</u> Construction of future development and associated infrastructure implemented under the project would result in short-term diesel exhaust emissions from on-site heavy-duty equipment. Such emissions would have the potential to exceed the SCAQMD's LST thresholds. Additionally, construction of future projects would adhere to the requirements of California Code of Regulations, Title 13, Section 2449 to reduce nonessential idling (PPP 2-1), the construction requirements of SCAQMD rules and regulations (PPP 2-2), and the requirements of the City's grading code (PPP 2-3). Considering the highly dispersive nature of DPM, and the fact that construction activities would occur intermittently and at various locations over the lifetime of project buildout, DPM generated by construction is not expected to create conditions where the probability is greater than 10 in 1 million of developing cancer for the Maximally Exposed Individual, or to generate ground-level concentrations of non-carcinogenic TACs that exceed a Hazard Index greater than 1 for the Maximally Exposed Individual. Therefore, the project would not exceed the SCAQMD LST thresholds or expose sensitive receptors to toxic air emissions during construction of future development within the City, and impacts would be less than significant. <u>Stationary Sources</u> The project would not result in the construction and operation of a stationary source of TACs. Although future site-specific development under the project could be located near existing types of facilities, emissions of TACs are regulated by SCAQMD through permitting and monitoring requirements. Therefore, adherence with this regulatory framework would ensure that future development would not expose sensitive receptors to TACs associated with stationary sources within the City, and impacts would be less than significant.	○ Rule 402, Nuisance, which states that a project shall not "discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property." ○ Rule 1113, which limits the volatile organic compound content of architectural coatings. ○ Rule 1466, Soil Disturbance. Projects that involve earth-moving activities of more than 50 cubic yards of soil with applicable toxic air contaminants are subject to this rule. • PPP 2-3: Compliance with the City of Irvine's Grading Code. • PPP 2-4: Compliance with the City of Irvine's Municipal Code guidance to reduce air pollution from motor vehicles. **AQ-3**: For individual projects that may site new sensitive land uses within 500 feet of a freeway or urban roads with 100,000 or more vehicles/day, the applicant shall prepare a Health Risk Assessment (HRA) evaluating the potential for sensitive receptors to be exposed to TACs, which shall be required for such individual projects. The HRA shall be prepared in accordance with the policies and procedures of the state Office of Environmental Health Hazard Assessment (OEHHA) and the South Coast Air Quality Management District (SCAQMD). If the HRA shows that the incremental cancer risk and/or noncancer hazard index exceed the respective thresholds, as established by the SQAQMD at the time a project is considered (i.e., 10 in one million cancer risk and 1 hazard index), the project applicant will be required to identify and demonstrate that best available control technologies to reduce substantial exposure of sensitive receptors to TACs. Examples may include, but are not limited to, air intakes located away from high-volume roadways and/or truck loading zones unless it can be demonstrated that these are operational limitations and/or heating, ventilation, and air conditioning (HVAC) systems provided with appropriately sized maximum efficiency rating value (MERV) filters. Mitigation measures identified in the HRA shall be incorporated into the site development plan as a component of the proposed project. Air intake and MERV filter requirements shall be noted on all	

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		<u>Mobile Sources</u> Portions of the focus areas are located adjacent to these highways and freeways. Although the project itself would not expose sensitive receptors to substantial pollutant concentrations associated with mobile source emissions, the scale and extent of exposure of future development under the amended general plan to mobile sources of TACs cannot be known at this time, and impacts would be potentially significant. Mitigation requiring project- and site-specific Health Risk Assessments (HRAs) would be required.	building plans submitted to the City of Irvine Community Development Department.	
Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	Less than Significant	Construction of future development would not result in emissions (such as those leading to odors) adversely affecting a substantial number of people, and impacts would be less than significant, but may involve the use of standard construction equipment that could emanate temporary odors, such as those associated with diesel-powered equipment. These odors would be temporary, intermittent, and not expected to affect a substantial number of people. Future site-specific development under the project would include residential uses, as well as the extension of Ada roadway, and non-residential uses including a botanical garden, a veteran's memorial garden, a library, a discovery center, two museums, a 65-acre central park area, an accessory restaurant use, an aquatic center, an all-wheel park, and pickleball courts, that are generally not a source of objectionable odors. Additionally, with respect to all development under the project, nuisance odors are regulated under SCAQMD Rule 402, which requires abatement of any nuisance generating a verified odor complaint. Therefore, project operation would not result in odors affecting a substantial number of people, and impacts would be less than significant.	• PPP AQ-1 Construction activities will be conducted in compliance with California Code of Regulations, Title 13, Section 2449, which requires that nonessential idling of construction equipment be restricted to five minutes or less. • PPP AQ-2 Construction activities will be conducted in compliance with any applicable SCAQMD rules and regulations, including but not limited to: o Rule 403, Fugitive Dust, for controlling fugitive dust and avoiding nuisance. o Rule 402, Nuisance, which states that a project shall not "discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property." o Rule 1113, which limits the volatile organic compound content of architectural coatings. o Rule 1466, Soil Disturbance. Projects that involve earth-moving activities of more than 50 cubic yards of soil with applicable toxic air contaminants are subject to this rule.	Less than Significant
4.3 Biological Resources				
Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies or	Potentially Significant	Buildout of the project would have the potential to directly and/or indirectly impact candidate, sensitive, or special status species. Potential direct impacts would include removal of habitat through future development and redevelopment projects that support sensitive species. While future development would largely occur within the focus areas on developed and/or disturbed land and	• PPP BIO-4: Compliance with the MBTA • PPP BIO-6: Compliance with CESA **BIO-1:** Prior to project approvals, applicants for future development projects with the potential to disturb sensitive biological resources shall include a biological resources survey. The survey	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
regulations, or by the CDFW or USFWS?		avoid known occurrences of sensitive species, future development may occur throughout the City, including on vacant parcels with habitat types that may support sensitive species. Additionally, future development may result in indirect impacts to sensitive plant or wildlife species due to excess noise, lighting, or runoff generated during construction of projects both within and outside the focus areas. Furthermore, project construction could result in direct impacts to nesting or migratory birds from the removal of mature trees and/or native vegetation within project areas during the typical bird breeding season (January 15 to September 15). All future development would be required to demonstrate compliance with the California Endangered Species Act (CESA) (PPP BIO-6), as well as the requirements of the MBTA for the protection of nesting birds, especially during the breeding season (January 15–September 15). However, at a program level of analysis, it cannot be known with certainty that impacts to sensitive species could be fully avoided, which would be considered a potentially significant impact, and mitigation would be required.	shall be conducted by a qualified biologist. The biological resources survey shall include, but not be limited to: • A search of available literature and biological databases, such as CNDDB to determine sensitive biological resources that have been reported from the proposed project vicinity. • Mapping vegetation communities on the proposed project site. • A general assessment and mapping of all potential jurisdictional resources (wetlands and riparian habitats). • Evaluating wildlife movement corridors in the vicinity of the proposed project site. **BIO-2:** If the proposed development project site supports vegetation communities that may provide habitat for special status plant or animal species, a focused habitat assessment shall be conducted by a qualified biologist to determine the potential for special status plant and/or animal species to occur within or adjacent to the proposed development project area. **BIO-3:** If one or more special status species has the potential to occur within the proposed development project area, focused species surveys shall be conducted to determine the presence/absence of these species to adequately evaluate potential direct and/or indirect impacts to these species. **BIO-4:** If construction activities are not initiated immediately after focused surveys have been completed, additional pre-construction special status species surveys may be required to assure impacts are avoided or minimized to the extent feasible. If pre-construction activities are required, a qualified biologist would perform these surveys as required for each special status species that is known to occur or has a potential to occur within or adjacent to the proposed development project area. **BIO-5:** The results of the biological survey shall be presented in a biological survey letter report for proposed development projects with no significant impacts, or in a biological technical report for proposed development projects with significant	

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
			impacts that require mitigation to reduce the impacts to below a level of significant. **BIO-6:** If sensitive biological resources are identified within or adjacent to the proposed development project area, the construction limits shall be clearly flagged to ensure impacts to sensitive biological resources are avoided or minimized to the extent feasible. Prior to implementing construction activities, a qualified biologist shall verify that the flagging clearly delineates the construction limits and that sensitive resources to be avoided. **BIO-7:** If sensitive biological resources are known to occur within or adjacent to the proposed development project area, a project-specific contractor training program shall be developed and implemented to educate project contractors on the sensitive biological resources within and adjacent to the proposed development project area and measures being implemented to avoid and/or minimize impacts to these species. A qualified biologist shall develop and implement the contractor training program. **BIO-8:** If sensitive biological resources are present within or adjacent to the proposed development project area and impacts may occur from implementation of construction activities, a qualified biological monitor may be required during a portion or all of the construction activities to ensure impacts to the sensitive biological resources are avoided or minimized to the extent feasible. The specific biological monitoring requirements shall be evaluated on a project-by-project basis. The qualified biological monitor shall be approved by the City on a project-by-project basis based on applicable experience with the sensitive biological resources that may be impacted by the proposed development project activities.	
Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by CDFW or USFWS?	Potentially Significant	The project has been designed to minimize impacts to riparian and sensitive habitats by primarily focusing future development and redevelopment within the proposed Focus Areas. However, future development may occur throughout the City as part of the project, including on vacant parcels with riparian and sensitive habitats. These vacant parcels may possess riparian and other sensitive habitats. Future development would be required to demonstrate compliance with the Orange County Central and	• PPP BIO-5: Compliance with the Orange County Central and Coastal NCCP/HCP • PPP BIO-6: Compliance with CESA • PPP BIO-9: Compliance with Municipal Code Title 5 (Planning), Division 7 (Sustainability in Landscaping), Chapter 4 (Urban Forestry) • PPP BIO-10: Compliance with Standard Condition 2.20 (Wildlife Habitat Clearance)	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		Coastal NCCP/HCP (PPP BIO-5) and CESA (PPP BIO-6), as applicable. However, at a program level of analysis, it cannot be known with certainty that impacts to riparian and sensitive habitats could be fully avoided, which would be considered a potentially significant impact and would require mitigation.	**BIO-9:** Prior to project approval, if a proposed project has the potential to affect riparian and sensitive habitats and/or jurisdictional resources, a qualified biologist conduct a jurisdictional delineation following the methods outlined in the 1987 Corps Wetland Delineation Manual (USACE 1987) and the Regional Supplement to the Corps Wetland Delineation Manual: Arid West Region (USACE 2008) to map the extent of wetlands and non-wetland waters, determine jurisdiction, and assess potential impacts. The results of the delineation shall be presented in a wetland delineation letter report and shall be incorporated into the California Environmental Quality Act document(s) required for approval and permitting of the proposed project. **BIO-10:** If the results of mitigation measure BIO-9 above determine that a proposed project would impact riparian and sensitive habitats and/or jurisdictional features, permits and authorizations shall be obtained from the U.S. Army Corps of Engineers, California Department of Fish and Wildlife, and/or Regional Water Quality Control Board prior to project approval. The regulatory agency authorization(s) would include specific avoidance, minimization, and mitigation measures for impacts to riparian and sensitive habitats and/or jurisdictional resources, which may include monetary contributions to a mitigation bank or habitat creation, restoration, and/or enhancement.	

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
Would the project have a have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	Potentially Significant	The project has been designed to minimize impacts to jurisdictional wetlands and waters by primarily focusing future development and redevelopment within the proposed Focus Areas. Therefore, focusing development and redevelopment within these areas that consist primarily of developed and/or disturbed land would minimize adverse impacts to jurisdictional wetlands and waters. However, future development may occur throughout the City, including on vacant parcels with jurisdictional wetlands and waters. Future development would be required to demonstrate compliance with Section 404 of the Clean Water Act (CWA; PPP BIO-1), Section 401 of the CWA (PPP BIO-2), Section 1600 of the California Fish and Game Code (PPP BIO-3), and the Orange County Central and Coastal NCCP/HCP (PPP BIO-5) as applicable. However, at a program level of analysis, it cannot be known with certainty that impacts to jurisdictional wetlands and waters could be fully avoided, which would be considered a potentially significant impact, and would require mitigation.	• PPP BIO-1: Compliance with Section 404 of the CWA • PPP BIO-2: Compliance with Section 401 of the CWA • PPP BIO-3: Compliance with Section 1600 of the California Fish and Game Code • PPP BIO-5: Compliance with the Orange County Central and Coastal NCCP/HCP • PPP BIO-9: Compliance with Municipal Code Title 5 (Planning), Division 7 (Sustainability in Landscaping), Chapter 4 (Urban Forestry) • PPP BIO-10: Compliance with Standard Condition 2.20 (Wildlife Habitat Clearance) See mitigation measures BIO-9 and BIO-10 above.	Less than Significant
Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	Less than Significant	Future development under the project would not be within the Orange County Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP) areas, which have been placed over regional and local wildlife corridors. Much of the City's open space has already been reserved or designated as special linkages, including through the Irvine Open Space Initiative. Future development under the project would be required to demonstrate compliance with the Orange County Central and Coastal NCCP/HCP (PPP BIO-5) and CESA (PPP BIO-6), as applicable, including with respect to wildlife movement. Due to the anticipated location of development, combined with existing PPPs, the project would not substantially interfere with the movement of any native resident or migratory fish or wildlife species, or with established native resident migratory wildlife corridors, including linkages identified in the Irvine Open Space Initiative, and impacts would be less than significant.	• PPP BIO-5: Compliance with the Orange County Central and Coastal NCCP/HCP • PPP BIO-6: Compliance with CESA	No mitigation is required.
Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	Less than Significant	Future development would be required to demonstrate compliance with Section 404 of the CWA (PPP BIO-1), Section 401 of the CWA (PPP BIO-2), Section 1600 of the California Fish and Game Code (PPP BIO-3), and the Orange County Central and Coastal NCCP/HCP (PPP BIO-5) and CESA (PPP BIO-6). Furthermore, Conservation and Open Space Element Goal 2, Objective COS-2 and Goal 5, Objective COS-5 seek to conserve and restore natural resources. These efforts include implementing the NCCP/HCP to ensure long-term ecological sustainability and biodiversity	• PPP BIO-1: Compliance with Section 404 of the CWA • PPP BIO-2: Compliance with Section 401 of the CWA • PPP BIO-3: Compliance with Section 1600 of the California Fish and Game Code • PPP BIO-5: Compliance with the Orange County Central and Coastal NCCP/HCP • PPP BIO-6: Compliance with CESA	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		conservation and requirement future projects to avoid impacts to biological resources.		
Would the project conflict with the provisions of an adopted HCP, NCCP, or other approved local, regional, or state HCP?	Potentially Significant	Future development would be required to demonstrate compliance with Section 404 of the CWA (PPP BIO-1), Section 401 of the CWA (PPP BIO-2), Section 1600 of the California Fish and Game Code (PPP BIO-3), and the Orange County Central and Coastal NCCP/HCP (PPP BIO-5) and CESA (PPP BIO-6).	See mitigation measures BIO-1 through BIO-10 above. • PPP BIO-1: Compliance with Section 404 of the CWA • PPP BIO-2: Compliance with Section 401 of the CWA • PPP BIO-3: Compliance with Section 1600 of the California Fish and Game Code • PPP BIO-5: Compliance with the Orange County Central and Coastal NCCP/HCP	Less than Significant.
4.4 Cultural and Tribal Cultural Resources				
Would the project result in a substantial adverse change in the significance of a historical resource as defined in Section 15064.5?	Potentially Significant	Although there are no site-specific plans that would affect an identified historic resource, future developments, both within the focus areas and outside of those areas, may have the potential to affect a historic resource at the project level. Although future projects that would potentially affect historic resources would be required to comply with the National Historic Preservation Act (NHPA) and CEQA (when applicable and required (PPPs CUL-1 and CUL-2), mitigation would be required.	• PPP CUL-1: Compliance with the NHPA • PPP CUL-2: Compliance with CEQA CUL-1: The City of Irvine Director of Community Development, or designee, shall require applicants for future proposed projects proposing to renovate, alter, or demolish intact extant building(s) more than 45 years old or otherwise qualifying as a historical resource under CEQA Guidelines Section 15064.5 to provide a historic resource technical study evaluating the significance and data potential of the resource. If significance criteria are met, detailed mitigation recommendations are required as part of the technical study, which must be implemented to reduce impacts on the historical resource(s) to a less than significant level. All work shall be performed by a qualified architectural historian meeting Secretary of the Interior Standards.	Less than Significant
Would the project result in a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5; religious uses or tribal cultural resources?	Potentially Significant	Future development would primarily be in urbanized areas that have previously been disturbed, and therefore are unlikely to possess native soil with buried prehistoric resources. Additionally, future development under the project would be required to adhere to Sec.3-4-132 of the City's Municipal Code and applicable state laws, which prohibit the destruction of cultural resources (PPPs CUL-4, CUL-6, and CUL-7). Similarly, Standard Condition 2.5 requires an archaeological monitoring report to be prepared prior to grading permit issuance for projects that are located on land that includes potentially significant archeological resources (PPPs CUL-5). Future projects may also be required to comply with Assembly Bill 52 and Senate Bill 18 related to consultation with Native American representatives and CEQA, when appropriate	• PPP CUL-2: Compliance with CEQA • PPP CUL-3: Compliance with AB-52/SB-18 • PPP CUL-4: Compliance with Municipal Code Sections 3-4-132 (Protection of Natural, Cultural, Structural and Archaeological Resources) and 9-10-7 (special development standards) • PPP CUL-5: Compliance with Standard Condition 2.5 (construction monitoring) • PPP CUL-6: Compliance with California Health and Safety Code Sections 7050.5, 7051, and 7054 • PPP CUL-7: Compliance with Native American Historic Cultural and Sanctified Cemetery Sites (PRC Section 5097 et seq.)	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		and necessary, which would further reduce impacts related to tribal cultural resources (PPPs CUL-2 and CUL-3). Nonetheless, construction of future development would have the potential to unearth unknown cultural resources, including religious or sacred uses, particularly within areas that have been categorized as high sensitivity, and mitigation would be required.	**CUL-2**: Prior to project approval or the issuance of grading permits (whichever is applicable and comes first), the City of Irvine Director of Community Development, or designee, acting in a similar capacity shall require applicants for future proposed ground disturbing projects to either (1) provide a technical cultural resources assessment consisting of a record search, survey, background context and project specific recommendations performed by a qualified archaeologist meeting Secretary of the Interior Standards and certified by the County of Orange or (2) agree to full-time monitoring by an archaeologist and a designated representative from the tribe/ group(s) who is culturally linked to the site. If resources are known or reasonably anticipated, the applicant shall be required to provide and follow a detailed mitigation plan which shall require monitoring during grading and other earthmoving activities in undisturbed sediments. The plan will provide a treatment plan for potential resources that includes data to be collected, requires professional identification, other special studies as appropriate, and requires curation at a repository for artifacts meeting significance criteria. A comprehensive final mitigation compliance report including a catalog of specimens with museum numbers and an appendix containing a letter from the museum stating that they are in possession of the materials shall be required and shall be submitted to the City.	
Would the project result in the disturbance of any human remains, including those interred outside of formal cemeteries?	Potentially Significant	There are no known burial sites or cemeteries within the focus areas or any other locations within the City. However, future development associated with the project could disturb native soils and therefore could have the potential to encounter human remains, especially within areas that have been categorized as having a high sensitivity for cultural resources. Therefore, although considered unlikely, the project would have the potential to impact human remains. All development in the City must comply with all applicable laws related to the discovery of human remains, including but not limited to Health and Safety Code Section 7050.5 (PPP CUL-6) and Public Safety Code Section 5097.98 (PPP CUL-7). Future projects would also be required to comply with the City's Municipal Code and Standard Condition 2.5 to further avoid impacts to the discovery of human remains (PPP CUL-4 and CUL-5).	• PPP CUL-4: Compliance with Municipal Code Sections 3-4-132 (Protection of Natural, Cultural, Structural and Archaeological Resources) and 9-10-7 (special development standards) • PPP CUL-5: Compliance with Standard Condition 2.5 (construction monitoring) • PPP CUL-6: Compliance with California Health and Safety Code Sections 7050.5, 7051, and 7054 • PPP CUL-7: Compliance with Native American Historic Cultural and Sanctified Cemetery Sites (PRC Section 5097 et seq.)	Less than Significant
Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC Section 21074 as either a site, features,	Potentially Significant	Construction of future development associated with the project would have the potential to unearth unknown cultural resources, including religious or sacred uses, particularly within areas that have been categorized as high sensitivity. Where required under	• PPP CUL-2: Compliance with CEQA • PPP CUL-3: Compliance with AB-52/SB-18	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: Listed or eligible for listing in the CRHR, or in a local register or A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set form in subdivision c of PRC Section 5024.1?		AB 52, future site-specific development under the project would be subject to further consultation and/or CEQA review, which may identify unknown tribal cultural resources that have not been formally recorded during the consultation for the project (PPPs CUL-2 and CUL-3), as well as applicable provisions of the City's Municipal Code, Standard Condition 2.5, and state law regulating the discovery of resources (PPPs CUL-5 through CUL-7). Future projects would also be required to comply with mitigation measure CUL-2, which require site-specific evaluations for culturally significant resources and/or monitoring of ground-disturbing activities.	• PPP CUL-4: Compliance with Municipal Code Sections 3-4-132 (Protection of Natural, Cultural, Structural and Archaeological Resources) and 9-10-7 (special development standards) • PPP CUL-5: Compliance with Standard Condition 2.5 (construction monitoring) • PPP CUL-6: Compliance with California Health and Safety Code Sections 7050.5, 7051, and 7054 • PPP CUL-7: Compliance with Native American Historic Cultural and Sanctified Cemetery Sites (PRC Section 5097 et seq.) See mitigation measures CUL-2 above.	
4.5 Geology/Soils				
Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: • Rupture of a known earthquake fault, • Strong seismic ground shaking, • Seismic-related ground failure, including liquefaction, • Landslides? or Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	Less than Significant	Future projects introducing new development in the City associated with project approval could expose people to impacts related to seismic ground shaking. These projects would be required to adhere to safety requirements in the Municipal Code requirements related to the City's Building Code, Grading Code, Grading Manual, and site-specific geotechnical studies (PPPs GEO-4, GEO-5, GEO-6, and GEO-8), which would ensure that structures would be designed with the geologic hazards in mind to reduce risks associated with strong seismic ground shaking, seismic-related ground failure, and other geologic hazards such as liquefaction, lateral spreading, subsidence and landslides. Compliance with these regulations would reduce impacts related to seismic shaking to a less than significant level.	• PPP-GEO-1 Compliance with General Construction Permit • PPP GEO-4 Compliance with Municipal Code Title 5 (Planning), Division 9 (Building Regulations) California Building Code • PPP GEO-5 Compliance with Municipal Code Title 5 (Planning), Division 10 (Grading Code and Encroachment Regulations), Chapter 1 (Grading Code) • PPP GEO-6 Compliance with the City's Grading Manual • PPP GEO-7 Compliance with the Local Hazard Mitigation Plan • PPP GEO-8 Compliance with Standard Condition 2.6 Site Specific Geotechnical Study • PPP GEO-9 Compliance with Standard Condition 3.3 Disclosure Statements	Less than Significant
Would the project result in substantial soil erosion or the loss of topsoil?	Less than Significant	Future development under the project would have the potential to result in increased erosion both on- and off-site during construction and operation of future development. The statewide General Construction Permit (PPP HYD-1; SWRCB 2022) requires preparation and implementation of a Storm Water Pollution Prevention Plan (SWPPP) for projects that would disturb one or more acres and include construction or demolition activity,	• PPP-GEO-1 Compliance with General Construction Permit • PPP-GEO-3 Compliance with South Coast Air Quality Management District Rules 402 (Dust Suppression) and 403 (Fugitive Dust) • PPP GEO-4 Compliance with Municipal Code Title 5 (Planning), Division 9 (Building Regulations) California Building Code	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		including, but not limited to, clearing, grading, grubbing, or excavation, or any other activity that results in a land disturbance of equal to or greater than one acre (SWRCB 2022). The SWPPP would provide construction related BMPs to reduce erosion, resulting from construction associated with future development. Post-construction erosion resulting from increased runoff would also generally be avoided or reduced through site design and hydromodification control BMPs as required per PPP's, including those related to compliance with rules managing construction dust, grading activities, etc.. Therefore, with implementation of the PPPs, impacts related to soil erosion would be reduced to a less than significant level.	• PPP GEO-5 Compliance with Municipal Code Title 5 (Planning), Division 10 (Grading Code and Encroachment Regulations), Chapter 1 (Grading Code) • PPP GEO-6 Compliance with the City's Grading Manual • PPP GEO-8 Compliance with Standard Condition 2.6 Site Specific Geotechnical Study	
Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	Less than Significant	As noted by the City's 2020 Local Hazard Mitigation Plan (LHMP), although expansive soils exist, the City requires compliance with the California Building Code (PPP GEO-4), which is intended to mitigate hazards associated with this condition through professional consideration of foundation types and design criteria, including bearing capacity, for structures to be developed in the City to minimize the effects of expansive soils. Future development under the project would be required to adhere to safety requirements in the City's Municipal Code requirements related to the City's Building Code (PPP GEO-4), Grading Code (PPP GEO-5), Grading Manual (PPP GEO-6), and Standard Condition 2.6 Site Specific Geotechnical Study (PPP GEO-8) which would reduce impacts related expansive soils to a less than significant level. Compliance with these regulations would ensure that the project would not result in any impacts related to expansive soils, and impacts would be less than significant.	• PPP-GEO-1 Compliance with General Construction Permit • PPP-GEO-2 Compliance with California Public Resources Code Section 5097.5(a) regarding paleontological resources • PPP GEO-4 Compliance with Municipal Code Title 5 (Planning), Division 9 (Building Regulations) California Building Code • PPP GEO-5 Compliance with Municipal Code Title 5 (Planning), Division 10 (Grading Code and Encroachment Regulations), Chapter 1 (Grading Code) • PPP GEO-6 Compliance with the City's Grading Manual • PPP GEO-7 Compliance with the Local Hazard Mitigation Plan • PPP GEO-8 Compliance with Standard Condition 2.6 Site Specific Geotechnical Study • PPP GEO-9 Compliance with Standard Condition 3.3 Disclosure Statements	Less than Significant
Would the project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	No Impact	The project does not propose the use of septic tanks or alternative wastewater disposal systems. All future development under the project would be served by wastewater utility providers. Therefore, the project would not result in impacts related to soils incapable of supporting septic tanks or alternative wastewater disposal systems.	None.	No Impact

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	Potentially Significant	Future development within areas with high and moderate sensitivity would have the potential to disturb native soils, and therefore may impact paleontological resources. Per Standard Condition 2.5 (PPP-GEO-10), prior to the issuance of the first preliminary or precise grading permit for a project that is located on land that includes potentially significant archaeological and/or paleontological sites, and for any subsequent permit involving excavation to increased depth, the applicant must provide letters stating that a qualified archaeologist and paleontologist would be on-site during ground disturbing activities and would provide procedures for cultural/scientific resource surveillance. Despite compliance with Standard Condition 2.5, impacts would remain potentially significant and mitigation requiring a site-specific paleontological assessment and/or monitoring for all soils below 5 feet would be required (mitigation measure GEO-1).	• PPP-GEO-2 Compliance with California Public Resources Code Section 5097.5(a) regarding paleontological resources • PPP-GEO-10 Compliance with Standard Condition 2.5 Archaeologist/Paleontologist **GEO-1:** Prior to issuance of grading permits, applicants for future proposed ground disturbing projects in undisturbed sediments ranked moderate or above shall be required to either (1) provide a technical paleontological assessment consisting of a record search, survey, background context and project specific recommendations performed by a qualified paleontologist (with a graduate degree and a specialization in vertebrate paleontology) to the City of Irvine Department of Community Development or (2) agree to monitoring all excavations below five feet. If resources are known or reasonably anticipated the recommendations shall provide a detailed mitigation plan requiring monitoring during grading and other earthmoving activities in undisturbed sediments. The plan will establish a fossil recovery protocol that includes data to be collected, requires professional identification, radiocarbon dates and other special studies as appropriate, requires curation at local curation facility such as such as the John D. Cooper Center operated by the County of Orange for fossils meeting significance criteria. A comprehensive final mitigation compliance report including a catalog of fossil specimens with museum numbers and an appendix containing a letter from the museum stating that they are in possession of the fossils shall be required.	
4.6 Greenhouse Gas Emissions				
Would the project result in GHG emissions that may have a significant impact on the environment?	Potentially Significant	Future projects associated with buildout of the General Plan Update would be required to comply with Title 24, South Coast Air Quality Management District (SCAQMD) regulations, and City regulations pertaining to GHG emissions (PPPs GHG-1 through GHG-5. The updated General Plan also includes policy recommendations that would support GHG emission reductions and implementation of the General Plan land use plan would be supportive overall of an efficient land use and transportation, supporting GHG emissions reductions from mobile sources; however, buildout of the General Plan may still result in emissions that are not consistent with state GHG reduction goals. Furthermore, the City does not currently have an adopted CAAP. The CAAP that is currently being prepared is intended to	• PPP GHG-1: Compliance with Title 24, Part 6 – Energy Code • PPP GHG-2: Compliance with Title 24, Part 11 – California Green Building Standards Code • PPP GHG-3: Compliance with SCAQMD Regulations • PPP GHG-4: Compliance with SCAQMD CEQA Thresholds • PPP GHG-5: Compliance with Irvine Sustainable Community Initiative **GHG-1:** Applications for future development, wherein the Director of Community Development or their designee has determined a potential for GHG impacts the City shall evaluate the project to identify the potential for GHG emissions to exceed the SCAQMD thresholds detailed below. If a project may exceed the thresholds, the City shall require a technical assessment	Significant and Unavoidable

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		demonstrate how the City will reduce GHG emissions. As a result, at this program-level review, impacts related to GHG emissions resulting from General Plan buildout are considered significant and would require mitigation.	evaluating potential project GHG impacts to the City for review and approval. The significance of project-level GHG impacts shall be evaluated using one of the following criteria: 1. In the absence of a City plan to reduce GHG emissions, the evaluation shall be prepared in conformance with SCAQMD methodology for assessing GHG impacts, which consists of the following tiered approach: a. Tier 1 – The project is exempt from the California Environmental Quality Act (CEQA). b. Tier 2 – The project is consistent with an applicable regional GHG emissions reduction plan. If a project is consistent with a qualifying local GHG reduction plan, it does not have significant GHG emissions. c. Tier 3 – Project GHG emissions represent an incremental increase below or mitigated to less than a 3,000 MT CO_2E screening level. d. Tier 4 – The project achieves performance standards, where performance standards may include a percent emission reduction target or an efficiency target per service population. e. Tier 5 – Offsets along or in combination with the above target Significance Screening Level. Offsets must be provided for a 30-year project life, unless the project life is limited by permit, lease, or other legally binding condition. If GHG emissions are determined to have the potential to exceed the SCAQMD's recommended thresholds, the City shall require that applicants for new development projects incorporate features to reduce GHG emissions. These identified measures shall be incorporated into all appropriate documents submitted to the City and shall be verified by the City.	
Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emission of GHGs.	Potentially Significant	Although the General Plan policy framework includes various objectives and implementation measures that would supports GHG emission reductions, the City is not able to demonstrate whether the policy framework would be sufficient to meet state GHG emission reduction goals despite compliance with existing regulations (PPPs GHG-1 through GHG-5) aimed at minimizing GHG emissions. Impacts related to conflicts with an applicable	• PPP GHG-1: Compliance with Title 24, Part 6 – Energy Code • PPP GHG-2: Compliance with Title 24, Part 11 – California Green Building Standards Code • PPP GHG-3: Compliance with SCAQMD Regulations • PPP GHG-4: Compliance with SCAQMD CEQA Thresholds • PPP GHG-5: Compliance with Irvine Sustainable Community Initiative	Significant and Unavoidable

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		plan, policy, or regulation adopted for the purpose of reducing the emission of GHGs would be considered significant and would require mitigation to identify potential measures that would reduce GHG emissions below the applicable SCAQMD thresholds.	**GHG-1:** Applications for future development, wherein the Director of Community Development or their designee has determined a potential for GHG impacts the City shall evaluate the project to identify the potential for GHG emissions to exceed the SCAQMD thresholds detailed below. If a project may exceed the thresholds, the City shall require a technical assessment evaluating potential project GHG impacts to the City for review and approval. The significance of project-level GHG impacts shall be evaluated using one of the following criteria: 1. In the absence of a City plan to reduce GHG emissions, the evaluation shall be prepared in conformance with SCAQMD methodology for assessing GHG impacts, which consists of the following tiered approach: a. Tier 1 – The project is exempt from the California Environmental Quality Act (CEQA). b. Tier 2 – The project is consistent with an applicable regional GHG emissions reduction plan. If a project is consistent with a qualifying local GHG reduction plan, it does not have significant GHG emissions. c. Tier 3 – Project GHG emissions represent an incremental increase below or mitigated to less than a 3,000 MT CO_2E screening level. d. Tier 4 – The project achieves performance standards, where performance standards may include a percent emission reduction target or an efficiency target per service population. e. Tier 5 – Offsets along or in combination with the above target Significance Screening Level. Offsets must be provided for a 30-year project life, unless the project life is limited by permit, lease, or other legally binding condition. If GHG emissions are determined to have the potential to exceed the SCAQMD's recommended thresholds, the City shall require that applicants for new development projects incorporate features to reduce GHG emissions. These identified measures shall be incorporated into all appropriate documents submitted to the City and shall be verified by the City.	

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
4.7 Hazards and Hazardous Materials				
Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials? or Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment? or Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	Less than Significant	Construction activities associated with this development would likely require the transport, temporary storage, and use of asphalt fuels, oils, paints, and solvents during construction. However, these materials are not acutely hazardous, and use of these common hazardous materials in small quantities would not represent a significant hazard to the public or environment. Project construction would adhere to typical Best Management Practices regarding the use of hazardous materials, such as proper labeling and storage, removal of materials once completed, and offsite vehicle maintenance. Operation of the future project would likely include the use and storage of cleaning supplies, motor oil, building maintenance supplies, paints and solvents, pesticides, or other similar materials. However, these materials are not acutely hazardous, and the limited quantities and use of such products would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. As such, the project does not propose any development that is likely to generate or use acutely hazardous materials. Furthermore, the project would not allow for development of any uses that would generate or store substantial amounts of hazardous materials. Existing uses that handle hazardous materials independent of the project would continue to be subject to the requirements of CCR, Title 22, Division 4.5 regarding hazardous waste generators, transporters, treatment, storage, and disposal facilities, requirements of the California Hazardous Materials Management Act to prepare a HMBEP for management of hazardous materials and written procedures for response to an accidental release, as well as requirements of the California HWCL for the proper management of hazardous materials.	• PPP HAZ-1: Compliance with the Certified Union Program Agency for Orange County (hazardous materials)	Less than Significant
Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, create a significant hazard to the public or the environment?	Less than Significant	There are a total of 41 hazardous materials sites located throughout the City. Specifically, 18 sites are in Focus Area 1, one site is in Focus Area 2, 14 sites are in Focus Area 3, and the remaining 8 are located outside of the Focus Areas. In accordance with federal, state, regional, and local requirements, any new development or redevelopment that involves contaminated property would necessitate the clean-up and/or remediation of the property in accordance with applicable requirements and	• PPP HAZ-1: Compliance with the Certified Union Program Agency for Orange County (hazardous materials)	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		regulations. Therefore, adherence to applicable clean-up and/or remediation requirements and regulations, would ensure that the project would not create a significant hazard associated with known hazardous materials sites, and impacts would be less than significant.		
Would the project be located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, result in a safety hazard or excessive noise for people residing or working in the project area?	Less than Significant	All areas slated for future development as part of the project are outside of the area regulated by the John Wayne Airport Environs Land Use Plan (AELUP; PPP HAZ-5), with the exception of portions of Planning Areas 29 (University of California, Irvine- North Campus) and 36 (Irvine Business Complex), which are located within the John Wayne Airport safety zones, as well as the 70 community noise equivalent level (CNEL), 65 CNEL, and 60 CNEL John Wayne Airport noise contours. Future development within these planning areas would be subject to the land use restrictions for each of the compatibility zones, which provide development limitations to minimize potential incidents of off-airport accidents to persons and property on the ground. Proposed land use maps and zoning within these planning areas were developed with consideration to airport safety and Federal Aviation Regulation height limitations, and the residential and residential mixed-use overlay zones developed under the project would adhere to the same requirements. Through compliance with the regulatory requirements described above, the project would not result in a safety hazard or excessive noise for people residing or working in the project area, and impacts would be less than significant.	• PPP HAZ-5: Compliance with Orange County Airport Land Use Compatibility Plan (ALUCP) safety and noise compatibility standards for John Wayne Airport.	Less than Significant
Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	Less than Significant	The extension of Ada roadway is not anticipated to interfere with emergency response activities or plans, but rather would likely improve emergency responses by improving connectivity within this area of the City. Additionally, future development facilitated by the project, including new residential uses, the continuation of nonresidential uses at the same intensities permitted by the current General Plan, and nonresidential development within the Great Park area would be designed consistent with the requirements of the City's LHMP (PPP HAZ-2), the City's EOP (PPP HAZ-3), Municipal Code Title 4 (Public Safety), Division 9 (Emergency Services) (PPP HAZ-4), and Standard Condition 3.17 (Emergency Access Plan) (PPP HAZ-9). Therefore, the project would not impair implementation of or physically interfere with an	• PPP HAZ-2: Compliance with the City's LHMP • PPP HAZ-3: Compliance with the City's Emergency Operations Plan (EOP) • PPP HAZ-4: Compliance with Municipal Code Title 4 (Public Safety), Division 9 (Emergency Services) • PPP HAZ-9: Compliance with Standard Condition 3.17 (Emergency Access Plan	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		adopted emergency response plan or emergency evacuation plan, and impacts would be less than significant.		
Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	Less than Significant	Approximately 1,875 acres of land located in Focus Area 3 is designated as Very High fire severity zone. However, future housing development and proposed improvements to the Great Park are not likely to be located within the segment of Focus Area 3 designated as Very High fire severity zone, and any development near this area would be designed consistent with all applicable fire safety requirements. Future development and redevelopment could also occur outside of the proposed focus areas, which may be located along the City boundaries adjacent to land identified as having Moderate, High, or Very High fire severity zone designations. All new development and redevelopment in these areas would be required to prepare a fuel modification plan before approval of tentative maps and grading permits, per City Standard Condition 2.19 Open Space Fuel Modification (PPP HAZ-7) and Standard Condition 3.14 HOA/Fuel Modification (PPP HAZ-8). Adherence to these requirements would ensure that the project would not expose project occupants to significant risks involving wildfires or the uncontrolled spread of a wildfire, and impacts would be less than significant.	• PPP HAZ-7: Compliance with Standard Condition 2.19 (Open Space Fuel Modification) • PPP HAZ-8: Compliance with Standard Condition 3.14 (HOA/Fuel Modification)	Less than Significant
4.8 Hydrology/Water Quality				
Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality. or	Less than Significant	Construction activities associated with future development would likely involve grading, paving, utility installation, building construction, and landscaping installation, which could result in the generation of potential water quality pollutants such as silt, debris, chemicals, paints, and other pollutants with the potential to affect water quality. In addition, refueling and parking of construction vehicles and other construction equipment may result in oil, grease, or other related pollutant leaks and/or spills that may discharge into the storm drain system. Adherence to these PPP requirements during construction would ensure that all potential pollutants of concern are prevented, minimized, and/or otherwise appropriately treated prior to being discharged. Therefore, construction impacts associated with future developments are anticipated to be less than significant.	• PPP HYD-1 Compliance with General Construction Permit • PPP-HYD-10 Compliance with Municipal Code Title 5 (Planning), Division 10 (Grading Code and Encroachment Regulations), Chapter 1 (Grading Code) • PPP-HYD-12 Compliance with the City Grading Manual	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		Future priority development projects would be required to prepare Water Quality Management Plans (WQMPs) in accordance with the Model WQMP and to incorporate LID principles (PPP HYD-16). Furthermore, drainage patterns would largely be maintained and would utilize existing drainage facilities within the right-of-way. Because the City is primarily developed and because the three focus areas are largely urban in nature, new development would likely be development under buildout conditions. Therefore, overall operational impacts relating to stormwater quality would be less than significant.		
Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.	Less than Significant	The project has been designed to minimize the increase in impervious surfaces by primarily focusing future development and redevelopment within the proposed focus areas (which are existing urbanized areas), thereby reducing the amount of conversion of permeable land to impermeable surfaces which would otherwise occur with more development concentrated outside of the focus areas. Additionally, future development both inside and outside of the focus areas under the project would be required to comply with federal, state, regional and local plans, programs, and policies pertaining to groundwater. All future site-specific projects would be required to comply with the Orange County Water District groundwater management plan (PPP HYD-4). Adherence to the applicable laws, standards, and requirements (including PPP HYD-4 and HYD-13) would prevent the project from substantially depleting groundwater supplies and interfering substantially with groundwater recharge, and impacts would be less than significant.	• PPP-HYD-4 Compliance with the OCWD groundwater management plan • PPP-HYD-13 Compliance with City Standard Condition 2.7 Groundwater Survey • PPP-HYD-16 City Standard Condition 2.13 Water Quality Management Plan	Less than Significant
Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: i) result in a substantial erosion or siltation on- or off-site; ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;	Less than Significant	**Erosion** Future development under the project would have the potential to result in increased erosion or siltation both on- and off-site during construction and operation of future development. The alteration of drainage patterns and increase in runoff associated with the addition of impervious surfaces and structures can increase the frequency and amount of flooding which in turn could potentially result in an accelerated rate of erosion and siltation through the watershed.	• PPP HYD-1 Compliance with General Construction Permit • PPP-HYD-2 Compliance with Section 303(d) of the federal Clean Water Act • PPP-HYD-3 Compliance with the Santa Ana RWQCB Regional Water Quality Control Plan • PPP-HYD-4 Compliance with the OCWD groundwater management plan • PPP-HYD-5 Compliance with Orange County Municipal Water Stormwater Permit and Orange County Drainage Area Management Plan (DAMP)	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or iv) impede or redirect flood flows.		Operation of future development under the project, both within the focus areas and throughout the City, would have the potential to increase surface runoff and change stream-flow velocities or quantities. Although future site-specific development would be located primarily in the three focus areas, which are urbanized areas, the potential exists to affect downstream properties if drainage patterns are changed. Construction and operation of future projects facilitated by project approval would be required to comply with applicable state, regional, and local regulations (PPPs HYD-1 through HYD-16). Compliance with these regulations would ensure that the project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces. Therefore, impacts would be less than significant.	• PPP-HYD-6 Compliance with the OCFCD San Diego Creek 19999 Regional Flood Control Master Plan • PPP-HYD-7 Compliance with the IRWD Water Resources Master Plan • PPP-HYD-8 Compliance with the IRWD Urban Water Management Plan (UWMP) • PPP-HYD-9 Compliance with the City of Irvine Local Hazard Mitigation Plan • PPP-HYD-10 Compliance with Municipal Code Title 5 (Planning), Division 10 (Grading Code and Encroachment Regulations), Chapter 1 (Grading Code) • PPP-HYD-11 Compliance with Municipal Code Title 6 (Public Works), Division 8 (Pollution), Chapter 3 (Stormwater/Urban Runoff) • PPP-HYD-12 Compliance with the City Grading Manual • PPP-HYD-13 Compliance with City Standard Condition 2.7 Groundwater Survey • PPP-HYD-14 Compliance with City Standard Condition 2.11 Special Flood Hazard Area • -PPP-HYD-15 Compliance with City Standard Condition 2.12 Water Quality – Notice of Intent • PPP-HYD-16 City Standard Condition 2.13 Water Quality Management Plan	
In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation.	Less than Significant	The project is not located within a tsunami or seiche zone. Therefore, there are no potential impacts related to tsunamis. Hazardous conditions related to a seiche within North Lake or South Lake in the Woodbridge community are unlikely given the small size of the lakes and the height of the banks surrounding the lakes. No other enclosed waterbodies where a seiche could occur exist within the City . Future development within areas mapped as flood zones would be required to comply with compliance measures as specified by City Planning Commission Resolution No. 09-2968 with respect to Special Flood Hazard Areas (PPP-HYD-14). Therefore, compliance with applicable regulations would ensure that project impacts related to flood hazard, tsunami, or seiche zones would be less than significant.	• PPP-HYD-5 Compliance with Orange County Municipal Water Stormwater Permit and Orange County Drainage Area Management Plan (DAMP) • PPP-HYD-6 Compliance with the OCFCD San Diego Creek 19999 Regional Flood Control Master Plan • PPP-HYD-9 Compliance with the City of Irvine Local Hazard Mitigation Plan • PPP-HYD-14 Compliance with City Standard Condition 2.11 Special Flood Hazard Area • PPP-HYD-18 City Standard Condition 3.4 Special Flood Hazard Area • PPP-HYD-19 City Standard Condition 4.5 Special Flood Hazard Area • PPP-HYD-21 Compliance with sustainability in Landscaping Guideline Manual	Less than Significant
Would the project conflict with or obstruct implementation of a water	Less than Significant	Future development associated with the project has been designed to minimize the increase in impervious surfaces by primarily focusing future development and redevelopment within	• PPP HYD-1 Compliance with General Construction Permit • PPP-HYD-2 Compliance with Section 303(d) of the federal Clean Water Act	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
quality control plan or sustainable groundwater management plan?		the proposed focus areas which are existing urbanized areas, thereby reducing the amount conversion of permeable land to impermeable surfaces. Additionally, future development under the project would be required to comply with federal, state, regional and local plans, programs, and policies pertaining to groundwater. Construction and operation of the project would comply with PPPs HYD-1 through HYD-5, PPP HYD-7 through HYD-9, PPP HYD-11 through HYD-17, and PPP-HYD-20, which require compliance and implementation of existing water quality control plans and sustainable groundwater management plans. Therefore, the project would not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan, and impacts would be less than significant.	• PPP-HYD-3 Compliance with the Santa Ana RWQCB Regional Water Quality Control Plan • PPP-HYD-4 Compliance with the OCWD groundwater management plan • PPP-HYD-5 Compliance with Orange County Municipal Water Stormwater Permit and Orange County Drainage Area Management Plan (DAMP) • PPP-HYD-6 Compliance with the OCFCD San Diego Creek 19999 Regional Flood Control Master Plan • PPP-HYD-7 Compliance with the IRWD Water Resources Master Plan • PPP-HYD-8 Compliance with the IRWD Urban Water Management Plan (UWMP) • PPP-HYD-9 Compliance with the City of Irvine Local Hazard Mitigation Plan • PPP-HYD-11 Compliance with Municipal Code Title 6 (Public Works), Division 8 (Pollution), Chapter 3 (Stormwater/Urban Runoff) • PPP-HYD-12 Compliance with the City Grading Manual • PPP-HYD-13 Compliance with City Standard Condition 2.7 Groundwater Survey • -PPP-HYD-15 Compliance with City Standard Condition 2.12 Water Quality – Notice of Intent • PPP-HYD-16 City Standard Condition 2.13 Water Quality Management Plan • PPP-HYD-17 City Standard Condition 3.3 Disclosure Statements • PPP-HYD-20 Compliance with Local Implementation Plan (LIP)	
4.9 Land Use and Planning				
Would the project physically divide an established community?	Less than Significant	Implementation of the project would not include new major infrastructure, such as a freeway, that could physically divide an established community. The project would also strategically direct future development to the three focus areas to retain the existing character of more established residential communities in the central area of the City and concentrate higher-density development in more urban areas. The project also encourages the preservation of existing residential communities through infill development facilitated by the Residential and Residential Mixed-Use Overlay, which would reduce potential conflicts between contrasting land uses and would enhance existing neighborhoods by responsibly integrating new development into existing communities. Additionally, the proposed project includes non-residential improvements to the Great Park area and an extension to Ada, a local roadway. All Great Park improvements are	• PPP LU-4: Compliance with Zoning Ordinance	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		intended to serve visitors of the park and would occur within an area slated for buildout of a regionally serving park. Therefore, implementation of the project would ensure the development of cohesive neighborhoods without physically dividing existing communities.		
Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental impact?	Potentially Significant	**General Plan and Municipal Code**: Future development would be reviewed to consider consistency with all applicable plans, including the City's General Plan, Municipal Code, and Zoning Ordinance. Therefore, land use consistency impacts associated with adoption of the General Plan Update would be less than significant. **SCAG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS):** The project would serve as an important action towards implementing the City's 6th Cycle 2021-2029 Housing Element and the associated RHNA allocation of 23,610 units. Because the housing assessment in the RHNA is determined by SCAG, any future development of vacant and/or developed sites would accommodate planned increases in population based on SCAG's demographic projections. Future housing developed under the project would provide housing necessary to meet the City's RHNA allocation of 23,610 units, as well as accommodate future population growth and housing needs accounted for in SCAG's growth projections. Therefore, land use consistency impacts related to conflicts with SCAG would be less than significant. **John Wayne Airport Environs Land Use Plan (AELUP):** Future development in the area of the City subject to the AELUP would be required to comply with height, use and noise limitations designated in the AELUP. Additionally, future projects would be required to file for a consistency determination with ALUC as specified in Section 4.7 of the AELUP (PPP-LU-1). As with future projects, the proposed project (the General Plan Update) is required to be reviewed by ALUC for a consistency determination with the AELUP. If ALUC determines that the project is inconsistent with the AELUP, ALUC is required to notify the City. Therefore, land use compatibility impacts related to conflicts with the AELUP would be less than significant.	• PPP LU-1: Compliance with the Airport Environs Land Use Plan for John Wayne Airport • PPP LU-2: Compliance with the Orange County Central and Coastal Natural Community Conservation Plan (NCCP) • PPP LU-3: Compliance with the City Local Coastal Program and Zoning Ordinance Chapter 2-7 Coastal Zone Regulations for Developments Located in Coastal Zone • PPP LU-4: Compliance with Zoning Ordinance • PPP LU-5: Compliance with the City Parks Master Plan • PPP LU-6: Compliance with the UCI LDRP Refer to mitigation measures BIO-1 through BIO-10 above and in Section 4.3, Biological Resources.	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		Orange County Natural Community Conservation Plan (NCCP)/Habitat Conservation Plan (HCP): Future development resulting from implementation of the project would be required to comply with the NCCP/HCP. As part of the project approval process, each future proposed project with the potential to impact biological resources would be required to conduct an initial site assessment to determine if sensitive biological resources could be present within and/or adjacent to the proposed development project (refer to mitigation measure BIO-1). Individual projects would also be assessed for compliance with the NCCP/HCP depending on whether the project site lies inside the NCCP/HCP Reserve System (including the Irvine Open Space Preserve of the Irvine Open Space Initiative) or Special Linkage Areas. Therefore, land use compatibility impacts related to conflicts with the NCCP would be less than significant with mitigation incorporated. **Local Coastal Plan (LCP):** The proposed project would require an amendment to the City's Local Coastal Program to ensure consistency between the land use updates included as part of the project and the Local Coastal Program. The Local Coastal Program amendment is required to be reviewed and processed by the California Coastal Commission, a process that would start immediately following project approval. Once approved, any future development under the project that would be located within the coastal zone would be required to comply with development standards and applicable policies in the City's Local Coastal Program (PPP LU-3). Therefore, land use compatibility impacts related to conflicts with the City's Local Coastal Program would be less than significant. **Zoning Ordinance:** Future development under the project would be required to comply with land use regulations and development standards set forth in the City's Zoning Ordinance (PPP LU-4). Additionally, development within the City's Focus Areas would be required to adhere to the land use plans that provide supplemental development regulations for those areas, as well as applicable regulations in the Municipal Code that serve to reduce or avoid environmental impacts (PPP LU-3 Therefore, land use compatibility impacts related to conflicts with the City's Zoning Ordinance would be less than significant.		

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		Parks Master Plan: New development under the project would be consistent with this plan as it would implement or fund the implementation of the City Parks Master Plan (PPP LU-5). Therefore, land use compatibility impacts related to conflicts with the City's Parks Master Plan would be less than significant. **UCI LDRP:** Future development within the UCI campus would be subject to review with the UCI Long Range Development Plan (LDRP) (PPP LU-6) by UCI for consistency with the general types of campus development and land uses proposed through the plan horizon year of 2025-26. Therefore, land use compatibility impacts related to conflicts with the UCI's LRDP would be less than significant.		
4.10 Noise				
Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	**Traffic Noise:** Potentially Significant **Railroad Noise:** Potentially Significant **Stationary Noise:** Potentially Significant **Construction Noise:** Potentially Significant	**Traffic Noise:** <u>Ambient Noise</u> Under buildout of the adopted General Plan, off-site traffic noise level impacts would exceed noise level increase thresholds along 86 segments. Future development would be required to prepare noise studies in accordance with the City's environmental review procedure for all projects that are not "clearly compatible" with the future noise level at the site. These studies are required to identify all measures necessary to reduce noise levels to meet the City's interior and exterior noise compatibility standards and Single Event Noise Standard. Through implementation of these policies, noise levels at new noise-sensitive land uses would be evaluated and noise reduction techniques would be implemented to reduce noise exposure. However, the increase in ambient noise levels adjacent to the roadway segments specified in the Noise analysis would likely remain at levels that would expose existing noise-sensitive receptors to a significant increase in ambient noise levels, and impacts would be significant. <u>Land Use Compatibility</u> Future development would be required to prepare noise studies in accordance with the City's environmental review procedure for all projects that are not "clearly compatible" with the future noise level at the site. These studies are required to identify all measures necessary to reduce noise levels to meet the City's interior and exterior noise compatibility standards and Single Event Noise	• PPP NOS-1: Compliance with the California Code of Regulations interior noise standards. • PPP NOS-2: Compliance with Orange County ALUCP noise compatibility standards for John Wayne Airport. • PPP NOS-3: Compliance with the City's Municipal Code. **NOI-1:** Prior to the issuance of building permits, site-specific exterior noise analyses that demonstrate that the project would not place residential receptors in locations where the exterior existing or future noise levels would exceed the City's noise compatibility standards shall be required as part of the review of future residential development proposals. Noise reduction measures, including but not limited to building noise barriers, increased building setbacks, speed reductions on surrounding roadways, alternative pavement surfaces, or other relevant noise attenuation measures, may be used to achieve the noise compatibility standards. Exact noise mitigation measures and their effectiveness shall be determined by the site-specific exterior noise analyses. **NOI-2:** Prior to the issuance of building permits, site specific interior noise analyses demonstrating compliance with the City's interior noise compatibility standards and other applicable regulations shall be prepared for noise sensitive land uses located in areas where the exterior noise levels exceed the City's noise compatibility standards. Noise control measures, including but	**Traffic Noise:** Significant and Unavoidable **Railroad Noise:** Less than Significant. **Stationary Noise:** Less than Significant **Construction Noise:** Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		Standard. Conditional use permits would be required for noise-sensitive land uses such as hospitals, libraries, churches, and schools located in areas not "clearly compatible" to demonstrate how exterior noise exposure would be minimized, such as building orientation, shielding, or limiting outdoor programs. Additionally, mixed-use and multi-family residential developments are required to demonstrate noise compatibility between uses. However, traffic noise would likely remain at levels that that would exceed exterior and interior standards, and impacts would be significant. However, noise associated with railroad operations would likely remain at levels that would expose existing noise-sensitive receptors to a significant increase in ambient noise levels, and impacts would be significant and would require mitigation. **Railroad Noise:** Focus Areas 2 and 3 are exposed to significant railroad noise level. Noise-sensitive receivers in the vicinity of the railroad tracks could be exposed to noise levels that exceed the compatibility standards and would require mitigation. Noise associated with railroad operations would likely remain at levels that would expose existing noise-sensitive receptors to a significant increase in ambient noise levels. Therefore, because specific project details are not yet known, railroad noise impacts associated with new development would be significant. **Stationary Noise:** While noise-sensitive residential land uses would be exposed to noise associated with the operation of commercial and industrial uses, future development would be required to show compliance with the Municipal Code. However, noise associated with stationary noise would likely remain at levels that would expose existing noise-sensitive receptors to a significant increase in ambient noise levels, and impacts would be significant and would require mitigation. **Construction Noise:** Implementation of the project would increase development capacity within the City. Construction noise levels are variable and depend on specific locations, site plans, and construction details relative to specific projects. Significant noise impacts may occur associated with individual projects which have not yet been developed, particularly if construction techniques (e.g., pile driving) are proposed. However, construction would be localized and would occur intermittently for varying periods of time in	not limited to increasing roof, wall, window, and door sound attenuation ratings, placing HVAC in noise reducing enclosures, or designing buildings so that no windows face freeways or major roadways may be used to achieve the noise compatibility standards. Exact noise mitigation measures and their effectiveness shall be determined by the site specific exterior noise analyses. **NOI-3:** Prior to the issuance of a building permit, a site-specific acoustical/noise analysis of any on-site generated noise sources, including generators, mechanical equipment, and trucks, shall be prepared which identifies all noise-generating equipment, predicts noise levels at property lines from all identified equipment, and recommends mitigation to be implemented (e.g., enclosures, barriers, site orientation), to ensure compliance with the City's noise standards. Noise reduction measures shall include building noise-attenuating walls, limiting the hours of operation, or other attenuation measures. Additionally, future projects shall be required to buffer sensitive receptors from noise sources through the use of open space and other separation techniques as recommended after thorough analysis by a qualified acoustical engineer. Exact noise mitigation measures and their effectiveness shall be determined by the site specific noise analyses. **NOI-4**: Construction contractors shall implement the following measures for construction activities conducted in the City of Irvine. Construction plans submitted to the City shall identify these measures on demolition, grading, and construction plans submitted to the City: • The City of Irvine Community Development Department shall verify that grading, demolition, and/or construction plans submitted to the City include these notations prior to issuance of demolition, grading, and/or building permits. • Construction activity is limited to the hours: Between 7:00 AM to 7:00 PM Monday through Friday and 9:00 a.m. and 6:00 p.m. on Saturdays as prescribed in Municipal Code Section 66-8-205(A). No construction activities shall be permitted outside of these hours or on Sundays and federal holidays, except Columbus Day, unless a temporary waiver is granted by the Chief Building Official or their authorized representative.	

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		accordance with the City's Municipal Code, Zoning Ordinance, and Noise Element. Because project-level information is not yet available, it is not possible to quantify construction noise impacts at noise-sensitive receptors. In most cases, construction of individual projects would temporarily increase the ambient noise environment, potentially affecting existing and future sensitive receptors. However, because construction activities may occur near noise-sensitive uses and because noise disturbances could occur for prolonged periods of time or during noise-sensitive hours of the day, construction noise impacts associated with future development would be significant and would require mitigation.	• During the entire active construction period, equipment and trucks used for project construction shall use the best-available noise control techniques (e.g., improved mufflers, equipment re-design, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds), wherever feasible. • Impact tools (e.g., jack hammers and hoe rams) shall be hydraulically or electrically powered wherever possible. Where the use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used along with external noise jackets on the tools. • Stationary equipment, such as generators and air compressors shall be located as far as feasible from nearby noise-sensitive uses. • Stockpiling shall be located as far as feasible from nearby noise-sensitive receptors. • Construction traffic shall be limited, to the extent feasible, to approved haul routes established by the City of Irvine Community Development Department. • At least 10 days prior to the start of construction activities, a sign shall be posted at the entrance(s) to the job site, clearly visible to the public, that includes permitted construction days and hours, as well as the telephone numbers of the City's and contractor's authorized representatives that are assigned to respond in the event of a noise or vibration complaint. If the authorized contractor's representative receives a complaint, he/she shall investigate, take appropriate corrective action, and report the action to the City. • Signs shall be posted at the job site entrance(s), within the on-site construction zones, and along queueing lanes (if any) to reinforce the prohibition of unnecessary engine idling. All other equipment shall be turned off if not in use for more than 5 minutes. • During the entire active construction period and to the extent feasible, the use of noise-producing signals, including horns, whistles, alarms, and bells, shall be for safety warning purposes only. The construction manager shall use smart back-up alarms, which automatically adjust the alarm level based on the background noise level or switch off back-up alarms and replace with human spotters in compliance with all safety requirements and laws. • Erect temporary noise barriers (at least as high as the exhaust of equipment and breaking line-of-sight between noise sources and sensitive receptors), as necessary and feasible, to maintain construction noise levels at or below the performance standard of 80 dBA Leq. Barriers shall be constructed with a solid material that	

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
			has a density of at least 4 pounds per square foot with no gaps from the ground to the top of the barrier.	
Would the project result in generation of excessive groundborne vibration or ground borne noise levels?	**Construction:** Potentially Significant **Railroad:** Potentially Significant **Stationary Sources**: Less than Significant	**Construction** The City limits construction activities to 7:00 a.m. and 7:00 p.m. Mondays through Fridays, and 9:00 a.m. and 6:00 p.m. on Saturdays (PPP NOS-2. However, construction details and equipment for future project-level development is not known. Despite implementation of these policies and implementing actions, future development would result in potentially significant construction vibration impacts requiring mitigation. Mitigation measure NOI-5 requires project-specific measures for projects using construction equipment that could result in elevated vibration levels. **Railroad:** The Metrolink, Amtrak, and BNSF freight trains operate within the City. Construction of vibration-sensitive uses close to railroad tracks can cause rattling windows and vibration of floors. Despite implementation of policies and implementing actions meant to reduce vibrational impacts associated with rail, future development could result in potentially significant railroad vibration impacts. Mitigation measure NOI-6 requires preparation of a groundborne vibration and noise evaluation for projects proposing residential uses within 200 feet of existing railroad lines. **Stationary Sources**: Industrial manufacturing operations occasionally utilize equipment or processes that have a potential to generate groundborne vibration. The project does not propose any industrial manufacturing uses. Therefore, vibration impacts associated with stationary sources would be less than significant.	• PPP NOS-2: Compliance with the City's Municipal Code. **NOI-5:** Prior to issuance of a building permit for a project requiring pile driving during construction within 135 feet of fragile structures, such as historical resources, 100 feet of non-engineered timber and masonry buildings (e.g., most residential buildings), or within 75 feet of engineered concrete and masonry (no plaster); or a vibratory roller within 25 feet of any structure, the project applicant shall prepare a noise and vibration analysis to assess and mitigate potential noise and vibration impacts related to these activities. This noise and vibration analysis shall be conducted by a qualified and experienced acoustical consultant or engineer. The vibration levels shall not exceed Federal Transit Administration (FTA) architectural damage thresholds (e.g., 0.12 inches per second [in/sec] peak particle velocity [PPV] for fragile or historical resources, 0.2 in/sec PPV for non-engineered timber and masonry buildings, and 0.3 in/sec PPV for engineered concrete and masonry). If vibration levels would exceed this threshold, alternative uses such as drilling piles as opposed to pile driving and static rollers as opposed to vibratory rollers shall be used. If necessary, construction vibration monitoring shall be conducted to ensure vibration thresholds are not exceeded. **NOI-6**: New residential projects (or other noise-sensitive uses) located within 200 feet of existing railroad lines shall be required to conduct a groundborne vibration and noise evaluation consistent with Federal Transit Administration (FTA)-approved methodologies.	**Construction:** Significant and Unavoidable **Railroad:** Less than significant. **Stationary Sources** Less than Significant
Would the project be located within the vicinity of a private airstrip or an airport land use plan, or, where such a plan has not been adopted, within two miles of a public airport or public use airport, and expose people residing or working in the area to excessive noise levels?	Less than Significant	Future development would be required to prepare noise studies in accordance with the City's environmental review procedure for all projects that are not "clearly compatible" with the future noise level at the site. These studies are required to identify all measures necessary to reduce noise levels to meet the City's and State's interior and exterior noise compatibility standards and Single Event Noise Standard (PPPs NOS-1 and NOS-3). Future projects would also be required to comply with noise-related regulations in the Orange County ALUP and AELUP (PPP NOS-3). Therefore,	• PPP NOS-1: Compliance with the California Code of Regulations interior noise standards. • PPP NOS-2: Compliance with Orange County ALUCP noise compatibility standards for John Wayne Airport. • PPP NOS-3: Compliance with the City's Municipal Code.	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		adherence with the noise requirements of the ALUP (PPP NOS-2)would ensure that future development would not expose people to excessive aircraft noise levels, and impacts would be less than significant.		
4.11 Population and Housing				
Would the project induce substantial unplanned population growth in an area, either directly ((for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	Less than Significant	Approval of the project would serve as an important action towards implementing the City's 6th Cycle 2021-2029 Housing Element and the associated RHNA allocation of 23,610 units. Because the housing assessment in the RHNA is determined by SCAG, future development under the project would accommodate increases in population based on SCAG's demographic projections. Therefore, the project would accommodate planned growth projected by SCAG. Furthermore, the project would reduce the City's existing jobs/housing imbalance. As such, the project would account for planned population growth, would increase housing within the City, and improve the City's jobs/housing balance. Future development under the project would primarily be in developed areas that are already served by infrastructure, and it is not anticipated that future housing development facilitated by the project would induce unplanned population growth directly or indirectly through extension of roads or other infrastructure or otherwise. Additionally, the 2021-2029 Housing Element includes goals, policies and objectives aimed at managing future growth within the City by updating the land use element and Zoning Ordinance to comply with State law and by ensuring appropriate land use planning to provide adequate infrastructure, services, and facilities to serve residents. he project would implement the vision of the 2021-2029 Housing Element, and future development under the project would not induce substantial unplanned population growth in an area, either directly or indirectly, and impacts would be less than significant.	Refer to goals, policies, and objectives in the adopted 2021-2029 Housing Element and in Section 4.11,Population and Housing.	Less than Significant
Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	Less than Significant	Although some people may be displaced by a future site-specific redevelopment project, buildout of the project would provide an overall expansion of housing opportunities, and would be required to comply with all laws and regulations related to the displacement of tenants including Government Code §§66300 et seq. Furthermore, the project would exceed the state RHNA allocations assigned to the City, providing a buffer in all income		Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		categories. This exceedance of the City's RHNA allocation would provide additional housing that would accommodate residents displaced by future redevelopment projects, ensuring no net loss of housing, and that displaced residents would be able to find replacement housing. Therefore, displacement of people associated with implementation of the project would be temporary. Through the overall production of more housing and compliance with applicable laws related to the displacement of tenants, the project would not displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere, and impacts would be less than significant.		
4.12 Public Services and Recreation				
Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: • Fire Protection; • Police Protection; • Schools; • Parks/Recreational Facilities • Other Public Facilities?	Less than Significant	***Fire Protection:*** Future development facilitated by the project may necessitate construction of additional fire stations, fire-rescue personnel, equipment, and facilities to protect and serve the public. OCFA has identified potential locations of future fire stations within the City, and future development under the project would be required to pay a development impact fee (DIF) that would be used exclusively for future facility improvements necessary to ensure contribution of its fair share of the cost of facilities and equipment. Payment of the DIF would allow future site-specific development to contribute to its fair share cost of facilities and equipment due to the increased demand for fire protection services. However, future development would occur incrementally through 2045, based on market conditions and other factors, such that fire protection facilities and services are not overburdened at any given time. Staffing levels for fire protection services within the City would continue to be established by the Orange County Fire Authority (OCFA) based on its contract with the City. Development of site-specific future housing would not directly result in sufficient demand to require construction of new fire facilities, since each incremental housing development would pay its fair share toward anticipated fire facility needs. Therefore, the project would not result in the need for new or altered fire protection facilities, and impacts would be less than significant.	• PPP PS&R-1: Compliance with City Standard Condition 2.19 (Open Space Fuel Modification) • PPP PS&R-2: Compliance with City Standard Condition 3.14 (HOA/Fuel Modification) • PPP PS&R-3: Compliance with City Standard Condition 4.9 (Emergency Access Inspection) • PPP PS&R-4: Compliance with City Standard Condition 4.12 (Phased Occupancy of Multi-Building Residential Development) Police Protection • PPP PS&R-5: Compliance with City Standard Condition 3.6 (Site Lighting Requirement) • PPP PS&R-6: Compliance with City Standard Condition 3.17 (Emergency Access Plan) • PPP PS&R-7: Compliance with City Standard Condition 3.18 (Wayfinding (Directional) Plan) • PPP PS&R-8: Compliance with City Standard Condition 3.20 (Construction Site Security Plan) • PPP PS&R-9: Compliance with City Standard Condition 4.9 (Emergency Access Inspection)	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		Police Protection: Future site-specific development could potentially increase demand for police protection facilities. Actual needs and potential locations would be determined in the future as development occurs, but increases in demand would be greatest in all three focus areas since the majority of new housing would be located there. Future development would occur incrementally through 2045, based on market conditions and other factors, such that police protection facilities and services are not overburdened at any given time. Additionally, development site-specific future housing would not directly result in sufficient demand to require construction of new police facilities, since each incremental housing development would pay its fair share toward anticipated facility needs. Therefore, the project would not result in substantial adverse impacts associated with the need for new or altered police protection facilities, and impacts would be less than significant. ***Schools:*** Future site-specific residential development could potentially increase demand for additional school facilities. Actual needs and potential locations would be determined in the future as development occurs, but increases in demand would be greatest in all three focus areas since the majority of new housing would be located there. However, future development would occur incrementally through 2045, based on market conditions and other factors, such that school services are not overburdened at any given time. Pursuant to California Government Code Section 65995, the individual applicants shall pay developer fees to the appropriate school districts at the time building permits are issued; payment of the adopted fees would provide full and complete mitigation of school impacts. Per AB 2626 and SB 50, school districts may impose a fee in conjunction with the construction of new commercial or residential buildings and for those projects that are adding square footage to an existing commercial or residential building. In addition to Measure E,		

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		school funding consists of a contribution of local funding through a Community Facilities District (CFD), State funding, and/or other forms of mitigation negotiated with developers. Development of site-specific future housing would not directly result in sufficient demand to require construction of new school facilities, since each incremental housing development would pay its fair share toward anticipated facility needs. Therefore, the project would not result in substantial adverse physical impacts associated with the provision of new or physically altered school facilities, and impacts would be less than significant. ***Parks/Recreational Facilities:*** See issue below. ***Other Public Facilities:*** Development of future site-specific housing would not directly result in sufficient demand to require construction or expansion of additional public facilities (including libraries), since each incremental housing development would pay its fair share toward anticipated needs. Based on the incremental increase in demand and the payment of DIF to address increased demand on public facilities, the project would not result in substantial adverse physical impacts associated with the provision of new or physically altered public facilities, and impacts would be less than significant.		
Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated? or Would the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	Less than Significant	Future site-specific residential development could potentially increase the use of existing neighborhood and regional parks or other recreational facilities. The existing and projected deficit in population-based parks and recreation facilities would remain upon implementation of the project. However, future development would occur incrementally through 2045, based on market conditions and other factors, such that parks are not overburdened at any given time. As such, there would not be a sudden increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated. Future development under the project would also be subject to the requirements of the Quimby Act and the fee schedule established by the City for the payment of development impact fees to support the provision of new recreational facilities and the	• PPP PS&R-10: Compliance with City Standard Condition 1.10 (Easement for Public Trail) • PPP PS&R-11: Compliance with City Standard Condition 1.11 (Open Space Irrevocable Offer) • PPP PS&R-12: Compliance with City Standard Condition 1.12 (Public Park Dedication) • PPP PS&R-13: Compliance with City Standard Condition 2.15 (Private Trail Reservation) • PPP PS&R-14: Compliance with City Standard Condition 2.16 (Public Trail Dedication) • PPP PS&R-15: Compliance with City Standard Condition 2.17 (Public Park Dedication) • PPP PS&R-16: Compliance with City Standard Condition 2.18 (Park Construction Phasing)	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		rehabilitation of existing neighborhood parks or recreational facilities. Development of future site-specific housing would not directly result in sufficient demand to require construction of new parks, since each incremental housing development would pay its fair share toward anticipated park needs through the payment of fees. Therefore, based on the incremental demand that would occur project buildout for park facilities and compliance with applicable regulations (such as the City's parkland standards), the project would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated and would not have adverse physical effect on the environment caused by expansion or construction of recreational facilities, and impacts would be less than significant.	• PPP PS&R-17: Compliance with City Standard Condition 3.11 (Park Design Consistency) • PPP PS&R-18: Compliance with City Standard Condition 3.12 (Private Park Reservation)	
4.13 Transportation				
Would the project conflict with a plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?	Less than Significant	**Roadway System:** The updated Circulation Element includes objectives and policies aimed at improving the existing roadway network. The proposed project would also be consistent with the Complete Streets Act because it aims to prioritize multimodal transportation options, with a specific emphasis on reducing vehicle miles travelled through bikeway and/or pedestrian infrastructure improvements. Therefore, the project would not conflict with a plan, ordinance, or policy addressing roadway circulation, and impacts would be less than significant. **Public Transit System:** Increased development within the City is likely to increase demand for public transportation. Future site-specific development under the project may be required to provide bus bays, bus stops and bus shelters adjacent to roads and streets traversing or bounding the development, as requested by the City consistent with the requirements of Municipal Code Title 6 (Public Works), Division 3 (Transportation), Chapter 6 (Trip Reduction Facilities) (PPP TRA-1). Overall, the proposed project prioritizes multimodal transportation systems, supports first/last mile connectivity to transit, supports complete street improvements, which is consistent with regional transportation planning efforts. Therefore, the project would not conflict with a plan, ordinance, or	• PPP TRA-1 Compliance with Municipal Code Title 6 (Public Works), Division 3 (Transportation), Chapter 6 (Trip Reduction Facilities) • PPP TRA-2: Compliance with Standard Condition 6.4 (Privacy Gates–Vehicle Stacking) • PPP TRA-3: Compliance with Standard Condition 3.17 (Emergency Access Plan) • PPP TRA-4: Compliance with Standard Condition 4.9 (Emergency Access Inspection) • PPP TRA-5: Compliance with Standard Condition 3.27 (Construction Phasing Plan)	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		policy addressing pedestrian and public transportation, and impacts would be less than significant. **Pedestrian and Bicycle System:** The proposed project incorporates policies that support pedestrian and bicycle facilities. These include prioritizing multimodal systems, maintaining a network of complete streets to provide mobility opportunities for all users, promoting development of mixed-use projects (particularly within proximity villages within the three Focus Areas) to create pedestrian- and bicyclist-friendly areas, maintaining the existing bicycle and pedestrian network, and promoting pedestrian and bicyclist safety. Therefore, the project would not conflict with a plan, ordinance, or policy addressing pedestrian and bicycle travel, and impacts would be less than significant.		
Would the project conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?	Potentially Significant	Buildout of the project would generate a VMT per service population value of 24.94, which would require a 3.5 percent reduction in VMT to meet the significance threshold of 24.06.. Therefore, projected VMT generated under buildout of the project would be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b). This would be considered a potentially significant impact, and mitigation requiring on-site infrastructure improvements and TDM strategies would be required.	• PPP TRA-1 Compliance with Municipal Code Title 6 (Public Works), Division 3 (Transportation), Chapter 6 (Trip Reduction Facilities) **TRA-1**: On-Site Infrastructure The City of Irvine Director of Community Development, or designee, shall require applicants for future proposed projects that exceed VMT thresholds to incorporate on-site connectivity into site design in order to achieve a reduction of 2.5 percent VMT rate. Site design measures to achieve this VMT reduction would include promotion of bicycle activity (i.e., bike facilities) and pedestrian walkability (i.e., connected sidewalks from building entrances to public streets). **TRA-2** On-Site Transportation Demand Management The City of Irvine Director of Community Development, or designee, shall require applicants for future proposed projects that exceed VMT thresholds to incorporate a TDM program to achieve a reduction of up to 5 percent VMT rate. While TDM programs in the past have typically focused on employer sites, they can also be implemented to new residential developments with measures such as bike share or car share programs.	Significant and Unavoidable

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	Less than Significant	The General Plan Update includes several policies aimed at improving the City's circulation network that are aimed at reducing existing and potential transportation hazards. Future site-specific development under the project would be subject to the appropriate entitlement application review process as well as design and engineering review to ensure roads and access is configured consistent with established roadway design standards. Furthermore, future site-specific development under the project (including residential projects, Great Park improvements, and the Ada extension) would be subject to both a design and engineering review (and likely a review by the Orange County Fire Authority) to ensure roads and access is configured consistent with established roadway design standards. Future projects would also be required to comply Standard Condition 6.4, (PPP TRA-2) which outlines procedures to be followed should vehicle stacking result from the operation of residential privacy gates associated with residential development projects. Therefore, implementation of the project would not result in hazardous conditions, create conflicting uses, or cause a detriment to emergency vehicle access. Impacts would be less than significant.	• PPP TRA-2: Compliance with Standard Condition 6.4 (Privacy Gates–Vehicle Stacking)	Less than Significant
Would the project result in inadequate emergency access?	Less than Significant	Future projects would be subject to the City's design requirements regarding emergency access per Planning Commission Resolution No. 09.2968. City Standard Condition 3.17 (Emergency Access Plan)(PPP TRA-3) requires an applicant to submit and have approved by the Chief of Police an Emergency Access Plan, which identifies and locates all Knox Boxes, Knox key switches, and Click2Enter radio access control receivers per the Irvine Uniform Security Code requirements. Similarly, City Standard Condition 4.9 (Emergency Access Inspection)(PPP TRA-4) requires an applicant to pass an inspection, to be performed by the Police Department and the Orange County Fire Authority, to ensure compliance with the Emergency Access Plan requirements. The inspector shall verify test acceptance and locations of all Knox boxes, key switches and Click2Enter devices as depicted on the approved plan. Prior to construction, future development would prepare a construction phasing plan (PPP TRA-5) that would include measures to maintain emergency access. Therefore, compliance with these regulations would ensure that impacts would be less than significant.	• PPP TRA-3: Compliance with Standard Condition 3.17 (Emergency Access Plan) • PPP TRA-4: Compliance with Standard Condition 4.9 (Emergency Access Inspection) • PPP TRA-5: Compliance with Standard Condition 3.27 (Construction Phasing Plan)	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
4.14 Utilities and Service Systems				
Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	Less than Significant	**Water** Total project-related water demand would be within Irvine Ranch Water District capacity to serve the project. Future infrastructure improvement would be subject to the requirements of the City's engineering standard plans (PPP UTIL-1), and all construction would be performed in accordance with the Construction General Permit and all associated requirements. When considering impacts resulting from the installation of any required water infrastructure, all impacts are of a relatively short-term duration and would cease to occur once the installation is complete. Therefore, impacts associated with construction of new or expanded water facilities would be less than significant. **Wastewater** Total project-related wastewater demand would be within the Michelson Water Recycling Plant capacity to serve the project. Future infrastructure improvements would also be subject to the requirements of the City's engineering standard plans (PPP UTIL-1), which would ensure that all improvements comply to the City's standard requirements for infrastructure improvements. Therefore, impacts associated with construction of new or expanded wastewater facilities would be less than significant. **Stormwater** Current runoff is captured and conveyed by existing City or County storm drain infrastructure throughout the City before discharging to regional County flood control facilities and channels. The City is primarily built out, and no major changes in storm flows are anticipated. Future infrastructure improvement would be subject to the requirements of the City's engineering standard plans (PPP UTIL-1), and all construction would be performed in accordance with the Construction General Permit and all associated requirements. All impacts would be short-term and would cease to occur once the installation is complete. Therefore, impacts associated with construction of new or expanded stormwater facilities would be less than significant. **Electric Power, Natural Gas, and Telecommunications** Future development would occur incrementally through 2045, based on market conditions and other factors, such that demand for these utility services would not be overburdened at any given	• PPP-UTIL-1 Engineering Standard Plans • PPP-UTIL-2 Title 24 Code Cycles: Net-Zero Buildings (Residential & Non-Residential) • PPP-UTIL-3 Irvine Sustainability Community Initiative	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		time. Additionally, future development under the project would accommodate increases in population based on SCAG's demographic projections. Therefore, the project would accommodate planned growth, and would not exceed regionally forecasted demand for electric power by Southern California Edison and Orange County Power Authority or natural gas for SoCalGas. Furthermore, future development under the project would connect to the existing telecommunications infrastructure (telephone, internet, wireless services) present within the City. The City currently implements strategies to reduce energy consumption through compliance with the Title 24 Code Cycles: Net-Zero Buildings (Residential & Non-Residential) (PPP UTIL-2) and the Irvine Sustainability Community Initiative (PPP UTIL-3). Future development under the project would also comply with these requirements. Future infrastructure improvement would be subject to the requirements of the City's engineering standard plans (PPP UTIL-1), and all construction would be performed in accordance with the General Construction Permit and all associated requirements. Therefore, impacts associated with construction of new or expanded electric power, natural gas, and telecommunications facilities would be less than significant.		
Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	Less than Significant	IRWD is projected to have a water supply capacity of 178,727 acre feet per year (AFY) through 2040, which far exceeds IRWD's project water supply demand of 88,023 AFY through 2040. Consequently, IRWD would have a water supply surplus of 90,704 AFY through 2040, which would exceed the project's projected increase in water demand of 2,093 AFY. Furthermore, future development under the project would comply with the requirements to prepare a water supply assessment as applicable (PPP UTIL-4 and PPP UTIL-5) and utilize recycled water (PPP UTIL-6) as applicable. Therefore, sufficient water supplies would be available to serve the project, and impacts would be less than significant.	• PPP-UTIL-4 California Water Code Section 10912 and California Government Code Section 66473.7 • PPP-UTIL-5 Senate Bill 221 (SB 221) • PPP-UTIL-6 Requirement to Use Recycled Water	Less than Significant
Would the project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition	Less than Significant	MWRP has an existing surplus treatment capacity of 28 MGD. Buildout of the project is anticipated to increase sewer flows by approximately 2.04 MGD, which is well within the remaining treatment capacity of the MWRP. Additionally, the capacity expansion of MWRP through projects like the Phase 2 Expansion in 2014, which added 7 MGD, has ensured that the plant can	None.	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
to the provider's existing commitments?		accommodate additional demand. The MWRP currently operates at an average of 25 MGD, recycling about 9 billion gallons of water annually. OCSD's Plant No. 1, with a treatment capacity of 320 MGD, also remains capable of accommodating the projected increase in sewer flows. Therefore, the project would not exceed existing wastewater treatment capacity, and impacts would be less than significant.		
Would the project generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals? or Would the project comply with federal, state, or local management and reduction statutes and regulations related to solid waste?	Less than Significant	Future development would be subject to waste reduction measures to divert solid waste from landfills during construction and demolition (a 65 percent diversion rate per the City's C&D Program) and during operations through composting, recycling, and reuse through resource recovery. The City has a waste diversion goal of reducing organic waste disposal 75 percent by 2025. These goals are consistent with state regulations regarding solid waste, composting, and recycling. The City implements policies to reduce generation of solid waste through the City's debris recycling and reuse ordinance (PPP UTIL-7), waste reduction (PPP UTIL-8) and City standard conditions related to solid waste recycling (PPP UTIL-9 and PPP UTIL14-10). Therefore, the project would not generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, and impacts would be less than significant.	• PPP-UTIL-7 City of Irvine Construction and Demolition (C&D) Debris Recycling and Reuse Ordinance • PPP-UTIL-8 Waste Reduction • PPP-UTIL-9 City Standard Condition 2.24 (Solid Waste Recycling) • PPP-UTIL-10 City Standard Condition 3.7 (Solid Waste Recycling)	Less than Significant
4.15 Wildfire				
Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?	Less than Significant	The Emergency Evacuation Route Analysis both in the City's adopted LHMP and in the updated Safety Element identify potential vulnerabilities in the City in the event of a wildfire. The results of the analysis indicate that residents closest to the southern, northern, and eastern extents of the City are most vulnerable given the distance and number of roads needed to access an outbound road. However, the City has identified adequate evacuation routes in various wildfire scenarios for the vulnerable residents because of modelling and would continue to identify evacuation locations on site during emergency situations. Prior to construction, future development projects would be required to prepare and submit a plan check to the City for approval of adequate emergency access. Approval of new development throughout the City would be conditioned by Standard Condition 3.17 and Standard Condition 4.9 for review by the Irvine Police Department and OCFA to ensure adequate emergency access and compliance with the Emergency Access	• PPP Wildfire-3: Compliance with City Standard Condition 3.17 (Emergency Access Plan) • PPP Wildfire-4: Compliance with City Standard Condition 4.9 (Emergency Access Inspection)	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		Plan requirements (see PPPs Wildfire-3 and -4). Future development would also be designed, constructed, and maintained in accordance with applicable standards associated with the EOP and Emergency Access Plan, including vehicular access to ensure that adequate emergency access and evacuation would be maintained. Therefore, because buildout of the project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan, impacts would be less than significant. No mitigation would be required.		
Would the project, due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	Less than Significant	Most of the City consists of urban areas that are not designated as a fire severity zone. There is no land within Focus Areas 1 and 2 that are designated with a fire severity rating. Although approximately 1,875 acres of land located in Focus Area 3 is designated as Very High LRA, future housing development would not be located within this area of Focus Area 3. In the unlikely case that development near this area did occur, it would be designed to be consistent with all applicable fire safety requirements. Future development and redevelopment could also occur outside of the proposed focus areas, which may be located along the City boundaries adjacent to land identified as having Moderate, High, or Very High FHSZ designations. For instance, areas within the northeastern portion of the City, which extends through Orange County and into Riverside County to the east, are designated as Very High FHSZ. However, all new site-specific development in these areas is required to prepare a fuel modification plan (PPP Wildfire-1 and Wildfire-2) before approval of tentative maps and grading permits. Therefore, the project would not expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire, and impacts would be less than significant.	• PPP Wildfire-1: Compliance with City Standard Condition 2.19 (Open Space Fuel Modification) • PPP Wildfire-2: Compliance with City Standard Condition 3.14 (HOA/Fuel Modification)	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	Less than Significant	Utility infrastructure improvements that are anticipated to serve future development facilitated by the General Plan Update and buildout of the Great Park would be available in adjacent roadways. However, all impacts associated with infrastructure improvements, including any required measures to address fire safety, would be evaluated in their respective subsequent environmental documents for discretionary projects, including application of the City's Municipal Code and existing City building and fire code requirements. All new development would also be subject to review to ensure that adequate defensible space and fuel management zones would be implemented to avoid potential ignition risks around the associated infrastructure, such as power lines or other utilities. Furthermore, the Safety Element Update would include objectives and policies further supporting the City's goal of ensuring adequate infrastructure with respect to wildfires. Therefore, compliance with applicable PPPs would ensure that installation or maintenance of associated infrastructure associated with the project would not exacerbate fire risk, and impacts would be less than significant.	• PPP Wildfire-4: Compliance with City Standard Condition 4.9 (Emergency Access Inspection)	Less than Significant
Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	Less than Significant	Future development would be required to demonstrate that site-specific projects would be elevated out of the floodplain and would not affect the conveyance of flood waters through elevated building pads, and/or other compliance measures as specified by FEMA. Local guidance prohibits development within a flood zone unless adequate assurances are provided against flood hazards (see Zoning Ordinance Section 5-2-24 Standards of construction for flood hazard zones). These include anchoring structures, constructing structures with materials and utility equipment resistant to flood damage, constructing the structure above the base flood elevation, and certification by a registered professional engineer or surveyor, and verification by the City's Chief Building Official. The Safety Element Update also includes objectives and policies that further support the City's goals related to flood prevention. Future development under the project would be required to adhere to safety requirements in the Municipal Code requirements related to the City's Building Code, Grading Code, and Grading Manual which would reduce impacts related to	• PPP Wildfire-5: Compliance with City Standard Condition 2.11 (Special Flood Hazard Area) • PPP Wildfire-6: Compliance with City Standard Condition 3.4 (Special Flood Hazard Area) • PPP Wildfire-7: Compliance with City Standard Condition 4.5 (Flood Certification for Finished Construction)	Less than Significant

Table S-1 Summary of Environmental Impacts				
Threshold	Level of Significance Before Mitigation	Environmental Impact	Plans, Programs, and Polices [PPPs], Project Design Features, and Mitigation Measures	Significance After Mitigation
		landslide to a level less than significant. Furthermore, the updated Safety Element includes Goal 2, which aims to improve the community's resilience to seismic and geologic hazards with supporting policies aimed at coordination with local water agencies to reduce liquefaction and subsidence events and to strengthen utilities to minimize such impacts to local infrastructure. Compliance with and goals, objectives, and policies in the updated Safety Element would serve to further lessen such impacts. Therefore, compliance with applicable PPPs would ensure that the project would not increase risks associated with post-fire flooding or landslides, and impacts would be less than significant.		

Chapter 1.0
Introduction

1.1 Type of EIR

This Program Environmental Impact Report (PEIR; State Clearinghouse House [SCH] No. 2023070463) has been prepared consistent with Section 15168 of the California Environmental Quality Act (CEQA) Guidelines to address potential environmental effects associated with implementation of the City of Irvine (City) 2045 General Plan Update (project).

As described in Section 15168 of the CEQA Guidelines, program level environmental review documents are appropriate when a project consists of a series of actions related to the issuance of rules, regulations, and other planning criteria. The project that is the subject of this PEIR consists of a comprehensive update to the existing General Plan and updates to the City's Land Use and Zoning Maps and Zoning Ordinance, which will serve as the long-term policy documents guiding future development. The purpose of this program level PEIR is intended to inform decision-makers and the general public of the potential significant environmental impacts of the project. This program level EIR also considers the availability of mitigation measures as required by Section 15126.4 of the State CEQA Guidelines to minimize the project's significant impacts and evaluates reasonable alternatives to the project that may reduce or avoid one or more significant environmental effects as required by Section 15126.6 of the CEQA Guidelines.

1.2 List of Project Approvals

The project would require City Council approval of the following project components:

- 2045 General Plan Update
  - Land Use Element (Update)
    - Incorporates existing Irvine Business Complex Element
    - Incorporates existing Growth Management Element
  - Circulation Element (Update)
  - Conservation and Open Space Element (Update)
    - Incorporates existing Parks and Recreation, Public Facilities and Services, and Cultural Resources Elements
  - Safety Element (Update)
    - Incorporates existing Seismic Safety Element
  - Noise Element (Update)
  - Environmental Protection and Climate Action Element (New)
    - Incorporates existing Integrated Waste Management Element
    - Incorporates existing Energy Element

Additionally, the project would require approval of the following discretionary actions:

- Adopt a General Plan Amendment updating the General Plan elements and City's Land Use Map.
- Adopt a Zone Text Amendment to revise applicable sections of the Zoning Ordinance affected by the residential and residential mixed-use overlay program.
- Adopt a Zoning Map Amendment to illustrate the proposed overlay program.
- Certify the PEIR.
- Adopt the Mitigation Monitoring and Reporting Program.
- Adopt the Statement of Overriding Considerations.

1.3 Statement of Legal Authority

The City is the Lead Agency for the project pursuant to Article 4 (Sections 15050 and 15051) of the State CEQA Guidelines. The Lead Agency, as defined by State CEQA Guidelines Section 15367, is the public agency which has the principal responsibility and authority for carrying out or approving a project. The analysis and findings in this document reflect the independent, impartial conclusions of the City.

1.4 Responsible/Trustee Agencies

State law requires that all EIRs be reviewed by Responsible and Trustee Agencies. A Responsible Agency, defined pursuant to State CEQA Guidelines Section 15381, includes all public agencies other than the Lead Agency which have discretionary approval power over the project. A Trustee Agency is defined in Section 15386 of the State CEQA Guidelines as a state agency having jurisdiction by law over natural resources affected by a project that are held in trust for the people of the state of California. Implementation of the project would require subsequent actions or consultation from Responsible or Trustee Agencies. A brief description of some of the primary Responsible or Trustee Agencies that may have an interest in the project is provided below.

1.4.1 U.S. Army Corps of Engineers

The U.S. Army Corps of Engineers (USACE) has jurisdiction over development in or affecting the navigable waters of the United States. All permits issued by the USACE are subject to consultation and/or review by the U.S. Fish and Wildlife Service (USFWS) and the U.S. Environmental Protection Agency (U.S. EPA). Streambeds and drainages occurring in the City may contain wetlands, which may be classified as jurisdictional waters of the United States. No permits from USACE are required at this time; however, development that could occur with implementation of the project may require review and/or USACE permits in the future.

1.4.2 California Department of Transportation

Multiple California Department of Transportation (Caltrans) facilities are located within or adjacent to the City. State Route 55 (SR-55) runs adjacent and outside of the northern edge of the City limits (east and west direction). State Route 73 (SR-73) runs adjacent to the western edge of the City limits.

State Route 241 (SR-241) is a toll road that runs adjacent to the eastern edge of the City limits. State Route 133 (SR-133) bisects the City (east and west direction), and Interstate 5 (I-5) and Interstate 405 (I-405) splits at the southern boundary of the City from I-5 and continues through the center of the City in the north and south direction. No permits from Caltrans are required at this time; however, Caltrans approval would be required for any encroachments or construction of facilities in a Caltrans right-of-way associated with future development within the City.

1.4.3 California Department of Fish and Wildlife

An Agreement Regarding Proposed Stream or Lake Alteration (Streambed Alteration Agreement) with an agency or private party proposing to alter the bed, banks, or floor of any watercourse/stream, is under the authority of the California Department of Fish and Wildlife (CDFW) pursuant to Section 1600 et seq. of the California Fish and Game Code. The purpose of Code Sections 1600-1616 is to protect and conserve fish and wildlife resources that could be substantially adversely affected by a substantial diversion or obstruction of natural flow of, or substantial change or use of material from the bed, bank, or channel of, any river, stream, or lake. Streambeds and other drainages occurring within the City may contain wetlands. No permits from CDFW are required at this time; however, future development that could occur with implementation of the project may require review and/or Streambed Alteration Agreements in the future.

1.4.4 California Regional Water Quality Control Board - Santa Ana Region

The California Regional Water Quality Control Board (RWQCB) - Santa Ana Region regulates water quality through the federal Clean Water Act Section 401 certification process and oversees the National Pollutant Discharge Elimination System (NPDES), to protect water resources and control pollutants in runoff. The RWQCB is responsible for implementing permitting, compliance, and other activities to reduce pollutants in municipal, construction, and industrial storm water runoff. No permits from RWQCB are required at this time; however, future development that could occur with implementation of the project may require review and/or Section 401 certifications.

1.4.5 Orange County Airport Land Use Commission

The Airport Land Use Commission (ALUC) is governed by the Public Utilities Code Section 21670 and has a basic responsibility to assist local agencies in ensuring compatible land uses in the vicinity of all airports in the County. The ALUC reviews land use proposals near civilian and military airports and other land use issues which have a potential impact on airport operations. As a Responsible Agency, the Orange County ALUC would review future development proposals within the City, as applicable, and make "consistency determinations" with the provisions and policies set forth in the Airport Environs Land Use Plan for John Wayne Airport (Orange County Airport Land Use Commission, 2008) as well as with the General Plan Update. While ALUC is not an implementing agency in the manner of local governments and does not issue project permits, each local agency having jurisdiction over any area within the airport planning areas is required to submit its general plans for that area to the ALUC for a consistency/inconsistency determination prior to adoption by the local agency in

accordance with the Government Code for the State of California, Section 65302.3 and Public Utilities Code Section 21676.

1.4.6 California Coastal Commission

The California Coastal Act of 1976 established the California Coastal Commission to regulate the use of land and water in the coastal zone. Development activities, which are broadly defined by the Coastal Act to include construction of buildings, divisions of land, and activities that change the intensity of use of land or public access to coastal waters, generally require a coastal permit from either the Coastal Commission or the local government.

The project would require an amendment to the City's Local Coastal Program to ensure consistency between the land use updates included as part of the project and the Local Coastal Program. The Local Coastal Program amendment is required to be reviewed and processed by the California Coastal Commission, a process that would start immediately following project approval. Once approved, any future development under the project that would be located within the coastal zone would be required to comply with development standards and applicable policies in the City's Local Coastal Program.

1.5 PEIR Scope

The scope of analysis for this PEIR was determined by the City as a result of initial project review, consideration of agency and public comments received in response to the Notice of Preparation (NOP), which was circulated on July 21, 2023, and a scoping meeting was held virtually via video conferencing on Tuesday, August 1, 2023. The NOP circulated for analysis of the project, related letters received, and comments made during the scoping meeting are included as Appendix A of this PEIR.

The comments received during the NOP period generally included resident concerns over an increase in residential density on existing infrastructure, public services, and traffic congestion, requests from local developers to include analysis for sites suited for higher density development, and concurrence from the local cultural resource focused non-profit organization regarding culturally sensitive areas identified in the NOP. In addition, the Department of Conservation, California Geologic Survey identified recommendations concerning geologic issues related to the project area. The Irvine Unified School District provided enrollment and capacity data with a request for analysis to focus on impacts to capacity, need for future facilities, and on transportation and greenhouse gas emission impacts. The Orange County ALUC also provided comment on the airport review process for future development, including applicable regulations to include in the EIR, and noted that per Section 21676 of the Public Utilities Code, the ALUC must review the adoption or amendment of a general plan prior to local agency adoption.

A brief overview of each PEIR chapter is provided below:

Executive Summary: Summarizes the PEIR by providing an overview of the project, analysis of the potentially significant environmental impacts that could result from the project, a list of mitigation

measures identified to reduce or avoid such impacts, a review of the alternatives to the project, including the identification of an environmentally superior alternative to the project.

1.0 Introduction: Provides an overview of the applicable legal authority, introduces the purpose for the PEIR and explains the PEIR process and the intended uses of the PEIR.

2.0 Environmental Setting: Provides a description of the project's regional context, location, and existing physical characteristics and land use within the City. More detailed descriptions of the environmental context pertaining to specific environmental topics are provided in each section of Chapter 4: Environmental Analysis.

3.0 Project Description: Provides a detailed description of the project, including the purpose and objectives of the project and descriptions of each component of the project.

4.0 Environmental Analysis. Analyzes the environmental impacts of the project. Impacts are organized by the following topic areas:

- 4.1 Aesthetics
- 4.2 Air Quality
- 4.3 Biological Resources
- 4.4 Cultural and Tribal Cultural Resources
- 4.5 Geology and Soils
- 4.6 Greenhouse Gas Emissions
- 4.7 Hazards and Hazardous Materials
- 4.8 Hydrology/Water Quality
- 4.9 Land Use and Planning
- 4.10 Noise
- 4.11 Population/Housing
- 4.12 Public Services and Recreation
- 4.13 Transportation
- 4.14 Utilities and Service Systems
- 4.15 Wildfire

Each topic area respectively provides a contextual description of the project's environmental setting, significance criteria, methodology, and potential impacts (project-level and cumulative).

5.0 CEQA Mandated Analysis: Summarizes the project's significant and unavoidable environmental impacts, significant irreversible environmental changes, and growth-inducing impacts per State CEQA Guidelines Section 15065 Mandatory Findings of Significance.

6.0 Effects Found Not to be Significant: This chapter identifies all the issues determined in the scoping and preliminary environmental review process to be not significant based on CEQA criteria, and briefly summarizes the basis for these determinations. These topics include agricultural and forestry resources, energy, and mineral resources.

7.0 Project Alternatives: This chapter presents a reasonable range of alternatives to the project and includes the following:

- A discussion of the environmental impacts associated with each alternative,
- A comparison of the relative impacts of each alternative to those of the project,
- A discussion of the relationship of each alternative to the project's objectives, and
- Identification of the environmentally superior alternative.

8.0 References: Lists documents incorporated by reference, and other information sources (documents and websites) relied upon in the preparation of the PEIR and identifies the persons and organizations that contributed to the preparation of the PEIR.

9.0 List of Preparers: Lists persons involved in the preparation of the PEIR.

Technical appendices, used as a basis for portions of the environmental analysis in the PEIR, have been summarized in the PEIR, and are included as attachments to the PEIR.

1.6 PEIR Intended Use and Review Process

1.6.1 PEIR Intended Use

This document is intended to be used by the City, as Lead Agency, in evaluating the project and to ensure compliance with applicable regulations and mitigation framework included in this PEIR. As a PEIR, this document is intended to be used by the City when acting on subsequent applications for consideration of future development within the City.

1.6.2 PEIR Process

The PEIR review and certification process occurs in two basic stages. The first stage is the Draft PEIR, which offers agencies and the public the opportunity to comment on the document. The second stage is the Final PEIR, which provides the basis for approving the project.

1.6.2.1 Draft PEIR

In accordance with Sections 15085 and 15087(a)(1) of the State CEQA Guidelines, upon completion of the Draft PEIR a Notice of Completion is filed with the State Office of Planning and Research and Notice of Availability of the Draft PEIR is issued in a newspaper of general circulation in the area.

The Draft PEIR is distributed for review to the public and interested and affected agencies for the purpose of providing comments "on the sufficiency of the document in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the project might be avoided or mitigated" (Section 15204, State CEQA Guidelines). The Draft PEIR was circulated for public review for a period commencing March 15 through April 29, 2024 (Public Review Period). The Draft PEIR and all related appendices have been made available for public review and inspection

during the Public Review Period at City Hall, located at 1 Civic Center, Irvine, California, and on the following webpages:

- https://www.cityofirvine.org/community-development/current-environmental-reviews
- https://www.cityofirvine.org/community-development/events-irvine-2045

Copies of the Notice of Availability of the Draft PEIR were also available at the City's three public library branches at the following locations:

- Heritage Park, located at 14361 Yale Avenue
- University Park, located at 4512 Sandburg Way
- Katie Wheeler, located at 13109 Old Myford Road

1.6.2.2 Final PEIR

Following public review of the Draft PEIR, the City will provide written responses to comments per State CEQA Guidelines Section 15088 and will consider all comments in making its decision whether to certify the Final PEIR. Responses to the comments received during public review, associated revisions to the Draft PEIR sections, a Mitigation Monitoring and Reporting Program, Findings of Fact, and a Statement of Overriding Considerations (if applicable for any impacts identified in the Draft PEIR as significant and unmitigated), will be prepared and compiled as part of the Final PEIR.

The culmination of this process is a public hearing where the City Council will determine whether to certify the Final PEIR as being complete and in accordance with CEQA. The Final PEIR will be available for public review at least 10 days before the City Council makes a recommendation or final determination, in order to provide commenters the opportunity to review the written responses to the PEIR comment letters.

1.6.3 Subsequent Environmental Review

As allowed in State CEQA Guidelines Section 15168, Program EIR, future development proposals will be reviewed by the City in light of the Final PEIR. The PEIR and subsequent project review process, defined in Section 15168 of the State CEQA Guidelines, allows a PEIR to serve as the basis for environmental review of subsequent projects. Sections 15182 and 15183 of the State CEQA Guidelines provide additional review guidance for projects proposed in accordance with an adopted specific plan, or consistent with an adopted community plan, general plan, or zoning.

If any future site-specific projects have potentially significant adverse environmental effects that were not examined in this PEIR, an Initial Study shall be prepared for that project, leading to the preparation of a Mitigated Negative Declaration, Focused EIR, Supplement or Subsequent to this PEIR, or other appropriate environmental documentation. When additional environmental documentation for a new project is necessary, this PEIR may be incorporated by reference to address regional context, secondary effects, cumulative impacts, alternatives, and other factors that apply to the program as a whole.

Chapter 2.0
Environmental Setting

2.1 Planning Context

2.1.1 Project Location

The city of Irvine (City) is located within the coastal foothill region of central Orange County in the state of California. Located approximately two miles inland from the Pacific Ocean and 40 miles south of the city of Los Angeles, the City is bordered by unincorporated Orange County and a number of cities including Tustin, Santa Ana, Lake Forest, Costa Mesa, Newport Beach, Orange, Laguna Woods, and Laguna Hills. Figure 2-1 presents the regional location of the City.

The City is generally bounded on the southwest by State Route 73 (SR-73) and on the northeast by State Route 241 (SR-241). Interstate 5 (I-5), Interstate 405 (I-405), and State Route 133 (SR-133) cross through the central portion of the City, and multiple interstates and state routes traverse the City and provide connection to surrounding communities throughout the southern California region. Air travel is available at John Wayne Airport, located immediately adjacent to the Irvine Business Complex (IBC) in the southwest area of the City.

Development in the City is guided by the City's General Plan, which provides citywide and area-specific goals and policies; and more specifically by the regulations in the City's Municipal Code, Zoning Ordinance, adopted Master Plans, and the Local Coastal Program Land Use Plan. A detailed evaluation of the project's consistency with relevant plans and ordinances is provided in Section 4.9, Land Use and Planning, of this Program Environmental Impact Report (PEIR).

Per the most recent U.S. Census Bureau count from July 2022, the City has a population of approximately 313,685 residents with a varied demographic profile. The University of California, Irvine, is a driving factor in the City's demographics and the top employer in the City. The City has also been rated the safest Big City in the U.S. for 18 consecutive years.

2.1.2 Current Adopted Irvine General Plan

Most recently amended in 2015, the City's General Plan is a comprehensive, long-range vision for future development and preservation encompassing the built and natural environments, as well as the community and economy. The General Plan addresses all geographic areas of the City and its sphere of influence. It also addresses the community's relation to the region, local issues and trends, service priorities, and methods to guide development and conservation of resources (City of Irvine 2024a).

RECON

M:\JOBS5\9919\common_gis\EIR\fig2-1.mxd 03/07/2024 bma

FIGURE 2-1
Regional Location

The General Plan includes both the mandated elements of the California Government Code Section 65302 as they apply to the local conditions, and optional elements designed to address high priority topics of City interest. The General Plan is kept up to date with current issues, trends, and community needs through periodic amendments. When an amendment occurs, special attention is given to make sure that all components work in harmony and the plan maintains its internal consistency as required by state law.

The General Plan contains seven elements required by the state planning, zoning and development laws. Conservation and Open Space have been combined into a single element. There are also eight optional elements relating to the development of the City. They are as follows:

- Mandated Elements
  - Land Use
  - Circulation
  - Housing
  - Conservation and Open Space
  - Noise
  - Safety
- Optional Elements
  - Public Facilities and Services
  - Integrated Waste Management
  - Energy
  - Parks and Recreation
  - Cultural Resources
  - Growth Management
  - Seismic
  - Irvine Business Complex

It should be noted that the optional elements under the existing General Plan will be incorporated into the mandated elements under the General Plan Update and the City will be adding a new optional Environmental Protection and Climate Action Element.

2.1.3 Prior Planning Initiatives

The City completed several major planning initiatives subsequent to the adoption of the existing General Plan, which are summarized below.

2.1.3.1 2021-29 Housing Element

On May 24, 2022, the California Department of Housing and Community Development certified the 2021-2029 Housing Element. The 6th Cycle 2021-2029 Housing Element was adopted by the City Council on January 11, 2022, and an amended adopted 2021-2029 Housing Element was adopted by the City Council on May 10, 2022.

California Government Code Section 65588 requires that local governments review and revise the Housing Element of their comprehensive General Plans (e.g., Irvine General Plan) no less than once every eight years. Before the 6th Cycle Housing Element Update for the 2021–2029 planning period, the City's Housing Element was updated in 2013 for the 5th Cycle (2013–2021). The 6th Cycle Housing Element Update was prepared to comply with state housing laws, as amended, and federal, state, and local requirements as necessary to demonstrate compliance with state law and to gain state certification (City of Irvine 2024b).

2.1.4 Irvine Focused General Plan Update 2045 Process

The City initially adopted its General Plan in December 1973, and the last comprehensive update occurred in 2000 with as-needed General Plan amendments occurring over the ensuing years. Phase 1 of the 2045 General Plan Update commenced in 2015 with the City conducting face-to-face events, stakeholder meetings, and three surveys. Survey #1 identified community issues and priorities, while Survey #2 built on the results of Survey #1 by focusing on the Vision, Guiding Principles, and goals/topical areas for the Update. As directed by the City Council, an additional public outreach campaign, including Survey #3 and focus groups, commenced in summer 2020 by the City's outreach consultant.

During Phase 2 of the Update, continued input was provided from City commissions, the City Council, and stakeholders that will help serve as the foundation to develop and formulate a draft Update with specific goals, objectives, policies, and future implementation programs. Phase 2 Update work commenced in spring 2022 concurrent with the review process for state certification of the 6th Cycle Housing Element Update. Outreach for Phase 2 of the Update began in fall 2022 and included extensive community outreach efforts in various formats and settings. Community engagement occurred in the form of informational sessions, virtual and in-person workshops, open houses, stakeholder meetings, and pop-up events at City events such as the Great Park Farmer's Market and the Mid-Autumn Festival. The Update is a multi-year, multi-phase project with a completion deadline of mid-October 2024.

2.2 Existing Physical Site Conditions

2.2.1 Land Use

The City is divided into a series of master planned communities or neighborhoods called Planning Areas, with each Planning Area defined by its own character and development goals. Each Planning Area is also designed to serve a diversity of lifestyles. Prior to 2000, residential development was primarily concentrated within the central portions of the City, known as the residential core (Planning Areas 5, 8, 10, 11, 12, 14, 15, 19, 20, 21, 24, 36, 38, and 50). Since 2000, residential growth has occurred outside of the residential core in the Great Park (Planning Area 51), the IBC (Planning Area 36), the Spectrum (Planning Area 33), and the Northern Sphere (Planning Areas 1, 5B, 6, 9, and 40). Each Planning Area has a unique theme which provides a sense of identity through its design and connection with surrounding retail and other amenities. Existing neighborhoods include conveniently located parks and open space, retail, office, and public facilities to support residential development. The convenient location of community facilities, in relation to the residential areas, promotes their viability and vitality (City of Irvine 2015a). The northern and southern hillside areas of the City are largely undeveloped lands. These areas provide views of the surrounding mountains and the ocean. Portions of these hills will eventually be developed with residential units, while other portions will remain as permanent open space. Portions of these hills have been developed into the Great Park Neighborhood and Great Park, while others will eventually be developed with residential units or remain as permanent open space.

2.2.2 Aesthetic/Topographical Features

The City and its sphere of influence are located within the coastal and foothill region of central Orange County. Prominent landforms in the City include the Santiago Hills, northern flatlands, central flatlands, and San Joaquin Hills. The Santiago and San Joaquin Hills have ridgelines that can be seen from various vantage points within the City (including major roadways), while views of the flatlands and the Pacific Ocean can be seen from the higher elevations. San Diego Creek and numerous other washes run through the City. These resources are predominately protected through the City's Conservation/Open Space Dedication Program (City of Irvine 2015a).

The northern and southern hillside areas of the City are largely undeveloped lands. These areas provide a view of the surrounding mountains and the ocean, with much of this area falling within the Orange County Central/Coastal Subregion Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP) area. Under NCCP/HCP protection, development on this land is managed in alignment with habitat preservation and protection agreements and policies.

Table 2-1
Notable Visual Resources in the City

Type of Resource	Examples
Hills	The Santiago Hills and San Joaquin Hills, including canyons, plateaus, narrow ridges, and rock outcroppings
Natural watercourses[1]	San Diego Creek, Agua Chinon Wash, Bee Canyon Wash, Borrego Canyon Wash, Hicks Canyon Wash, Peters Canyon Wash, Sand Canyon Wash, and San Joaquin Freshwater Marsh
Artificial lakes	Woodbridge Lakes and the William R. Mason Regional Park lakes

SOURCE: City of Irvine 2020a.
[1]Notable visual resources are the natural portions of those watercourses only.

2.2.3 Air Quality and Climate Conditions

The state of California is divided geographically into 15 air basins for the purpose of managing the air resources of the state on a regional basis. Areas within each air basin are considered to share the same air masses and therefore are expected to have similar ambient air quality.

The City lies within the South Coast Air Basin (Basin), which is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). The 6,745-square-mile Basin encompasses Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties, and is bound by the Pacific Ocean to the west, the San Gabriel, San Bernardino, and Jacinto mountains to the north and east, respectively, and San Diego County to the south. The City is located within the southwestern portion of the Basin, which encompasses Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties.

The general region lies in the semi-permanent high-pressure zone of the eastern Pacific. As a result, the climate is mild, tempered by cool sea breezes. This usually mild weather pattern is interrupted

infrequently by periods of extremely hot weather, winter storms, and Santa Ana winds (SCAQMD 2022).

The most recently published Air Quality Management Plan (AQMP) and State Implementation Plan is the 2022 AQMP. The 2022 AQMP is a comprehensive strategy aimed at achieving and maintaining compliance with federal and state air quality standards. As outlined in the 2022 AQMP, the Basin has nonattainment status for 8-hour ozone, meaning that the region has not met the National Ambient Air Quality Standards (NAAQS) set by the U.S. Environmental Protection Agency (U.S. EPA) for a particular pollutant, in this case, 8-hour ozone.

2.2.4 Cultural and Tribal Cultural Resources

The City is located within the traditional territory of Indigenous Peoples who, after Spanish contact in historic times, were called the Gabrieleno. See Section 4.4 for a full discussion of tribal chronology. The largest concentrations of archaeological sites in the City exist in the Upper Newport Bay and the Santiago and San Joaquin Hills. The majority of archaeological resources in the City reflect the historical settlements and activities of the Gabrieleno people (also known as the Tongva), who began occupying the area approximately 3,000 years ago, and the Juaneño (also known as Acjachemen), who began occupying the area nearly 1,300 years ago.

Historical resources include current and former locations of historic buildings, historical archaeological sites (often near historic use areas), and the location of extant historic homes more than 45 years old. Old Town Irvine has the highest number of historic buildings.

2.2.5 Geology and Soils

The City is located within the northern extent of the California Geomorphic Province known as the Peninsular Ranges. The Peninsular Ranges geomorphic province extends from Mount San Jacinto in the north, through the tip of Baja, Mexico in the south. Subparallel to these ranges on the east is the San Andreas fault zone. The northwestwards motion of the Pacific Plate has created these ranges and their corresponding valleys.

The City and its sphere of influence are affected by both local and regional active faults. There are multiple regional faults located within Alquist-Priolo special study zones close to the City; however the City itself is not in an Alquist-Priolo earthquake fault zone. These faults pose potential seismic hazards in the event of an earthquake along any of them. Notable fault zones include the Newport-Inglewood-Rose Canyon fault zone (about 1.5 miles west of Irvine), Pelican Hill fault (around 1.5 miles west of Irvine), El Modena fault (approximately 5 miles north of Irvine), and Peralta Hills fault (roughly 5 miles north of Irvine).

Although several faults have been identified within the City itself, they are deemed inactive, having not exhibited surface movement in the past 13,000 years. Consequently, they are not subject to delineation within a special study zone. The San Joaquin Hills blind thrust fault is the only known fault that runs through Irvine and travels in an east-west/southeasterly direction through the City. The City and sphere of influence are located in Seismic Zone 4, as identified in the Uniform Building

Code. This zone indicates the highest classification of the four zones in the United States, with the most stringent requirements for building design.

2.2.6 Hydraulic Conditions

The City resides primarily within the Newport Bay Watershed, which is defined by the foothills of the Santa Ana Mountains to the east (Loma Ridge) and the San Joaquin Hills to the west and southwest. The Newport Bay Watershed is a part of the larger Orange County Watershed Management Areas (WMA), which is split into a south, north, and central WMA. The total area of the Newport Bay Watershed is approximately 154 square miles (98,500 acres) of the Central Orange County WMA. Each watershed is comprised of channels that ultimately deliver stormwater to the Pacific Ocean. Santa Ana Delhi Channel, Bonita Creek, Borrego Creek, Peter Canyons, San Diego Creek Reach 1, and Newport Bay City drain to the City's receiving water bodies.

The southwestern portion of the City is located within the Laguna Coastal Streams Watershed. Laguna Canyon Creek runs north to south, directly through the middle of its watershed, and ultimately discharges into the Pacific Ocean at Laguna Beach. The 11-square-mile watershed also includes portions of the cities of Aliso Viejo, Laguna Beach, Laguna Woods, and portions of unincorporated Orange County. Laguna Canyon Creek runs parallel to Laguna Canyon Road, underneath the San Joaquin Hills Transportation Corridor, through the city of Laguna Beach, and underneath the Pacific Coast Highway, before emptying into the Pacific Ocean. The creek is joined by a few small, unnamed drainages and larger tributaries as it makes its way through the watershed.

Surface water quality in the City is regulated by the Santa Ana Regional Water Quality Control Board (RWQCB). The Santa Ana Regional Water Quality Control Board Basin Plan (Basin Plan) (California Water Boards, Santa Ana – Region 8 2008) establishes water quality standards for all the ground and surface waters of the region. The Santa Ana RWQCB currently identifies five water bodies within the City as currently on the 303(d) list: Bonita Creek, Borrego Creek, Peter Canyons, San Diego Creek Reach 1, and Upper Newport Bay. The 303(d) list is a roster of waters failing to meet established water quality standards including beneficial uses, requisite water quality objectives to safeguard these uses, and the antidegradation policy, all detailed in the Basin Plan. Once a water body makes it onto the 303(d) List, it remains listed until the adoption of a Total Maximum Daily Loads targeting the pollutants responsible for standards violation and attainment of water quality standards are established, or until adequate data supports delisting due to standard compliance. See Section 4.8, Hydrology/Water Quality for a complete discussion of the existing hydrological setting of the City.

2.2.7 Noise

The most pervasive noise in the City comes from mobile noise sources such as motor vehicles, railroads, and aircraft. Major freeways including Santa Ana (I-5), San Diego (I-405), and Eastern Transportation Corridor toll roads (SR-133 and SR-261), railroad lines including Amtrak and Metrolink, and the John Wayne Airport (SNA) expose the City to significant noise impacts. Aircraft flight tracks also impact particular areas of the City. Aircraft noise generally affects areas within the airport vicinity during takeoffs and landings, and areas located around the flight tracks. Airborne noise sources currently include civil air operations at John Wayne Airport (City of Irvine 2015b). The City is also exposed to noise emanating from sources such as industrial, commercial, and construction activities.

Railway lines that pass through the central part of the City in an east/west direction are located on right-of-way that is owned and managed by the Orange County Transportation Authority. The railroad operation includes commuter trains and freight trains. There are also spur lines located within the IBC (Planning Area 36) and Irvine Spectrum Area (Planning Area 35). The noise generated by these spur lines is insufficient to provide community noise equivalent level contours in excess of 60 decibels outside the right-of-way.

2.2.8 Transportation

I-5 and I-405 bisect the City in an east/west alignment. SR-261 and SR-133 bisect the City along a north/south alignment, and SR-241 forms the northern boundary of the City, while SR-73 forms the southern boundary. The City is served by multiple modes of transportation, including bus, commuter rail, train, biking, and walking. The City partners with the Orange County Transportation Authority (OCTA), Amtrak, Metrolink, and Spectrumotion (City of Irvine 2020b).

The iShuttle is operated and managed by the OCTA and serves employees and employers to and from work. In the Irvine Spectrum Area, the iShuttle provides service to and from the Irvine Station and in the IBC it carries commuters to and from the Tustin Station. The OCTA also provides ACCESS which is a shared-ride service for people who are unable to use the regular, fixed-route bus service because of functional limitations caused by disability. Spectrumotion is a rideshare association that helps City residents commute to the Irvine Spectrum area.

The Irvine Station, located in the Spectrum area of the City, is a transportation hub in south Orange County, serving over one million commuters annually prior to the COVID pandemic. It is served by Amtrak and Metrolink. Amtrak is an intercity rail system that operates throughout the nation and has several stops throughout Orange County and southern California. Metrolink is a commuter rail system throughout southern California linking communities to employment and activity centers.

The Irvine Transit Vision, completed in 2022, recommended a Yale-Barranca route to connect residents in the heart of the City with parks, schools, community centers, hospitals, shopping centers, and the Irvine Station. A pilot of the Irvine CONNECT service will begin in spring 2024.

2.2.9 Utility and Services

Residential, institutional, regional commercial, and industrial solid waste is presently collected by private firms, with residential and village commercial collections franchised by the City. The waste collected is transported directly to the Frank Bowerman landfill, which is located north of Sand Canyon Avenue in Planning Area 3 (Limestone Canyon-Open Space) and is operated by the County of Orange. A solid waste transfer station also exists within Planning Area 36 (IBC).

The City's existing wastewater system is primarily managed by the Irvine Ranch Water District. The Orange County Sanitation District provides service to Planning Area 36 only. Most of the City's wastewater is collected and then treated at the Michelson Reclamation Plant located in Planning Area 23 (San Joaquin Marsh). The plant was constructed in 1966 and expanded in 1980 to its present capacity of 15.0 million gallons per day. Most treatment effluent from the plant is used in agricultural

and landscape irrigation, with some excess pumped to the Orange County Sanitation District for disposal.

2.2.10 Biological Resources

The City consists primarily of urban development, although natural habitat exists in the northern portion of the City, as well as south of I-405. There are 33 special status plant species known to occur historically in the region of the City. Ten of these species have been reported within the City or just outside the City limits (see Section 4.3). A variety of resident and migratory wildlife species are present within the City. Many of the resident species have adapted to survival within the interface of the urban lands and adjacent open space, parks, and preserves. The City provides habitat for both common and special status species including invertebrates, amphibians, reptiles, birds, and mammals. There are 59 special status wildlife species known to occur historically within the region. Twenty-four of these species have been reported within the City or just outside the City limits. Critical habitat has been designated by the U.S. Fish and Wildlife Service for two species within the City: Riverside fairy shrimp (*Streptocephalus woottoni*) and coastal California gnatcatcher (*Polioptila californica californica*) (see Section 4.3).

Chapter 3.0
Project Description

Consistent with Section 15168 of the California Environmental Quality Act (CEQA) Guidelines, this Program Environmental Impact Report (PEIR) provides a programmatic analysis of the potential environmental impacts associated with implementation of the goals, policies, actions, and projected buildout of the City of Irvine (City) 2045 General Plan Update (project). As described in Section 15168 of the CEQA Guidelines, program-level environmental review documents are appropriate when a project consists of a series of actions related to the issuance of rules, regulations, and other planning criteria. The project, which is the subject of this PEIR, is pursued by the City to provide long-term policy direction and to guide future development. In addition to providing long-term policy direction, the City is required to update the appropriate elements of the General Plan to accommodate the residential site inventory from the 6th Cycle Housing Element Update effective 2021 to 2029 (2021-2029 Housing Element) (adopted in May 2022) and to ensure consistency with state law guiding the contents of required General Plan elements.

In accordance with timeframes established by state law, the City previously prepared and adopted the 2021-2029 Housing Element. The 2021-2029 Housing Element identified and analyzed the City's existing and projected housing needs and presents a detailed outline and work program of the City's goals, policies, quantified objectives, and programs for the preservation, improvement, and development of housing for a sustainable future. The 2021-2029 Housing Element identifies ways in which the housing needs of all economic segments of the community, including residents and the local workforce, can be met. The overall goal of the 2021-2029 Housing Element is to provide safe and decent housing for all socioeconomic segments of the community. The overall goal of the 2021-2029 Housing Element is to provide safe and decent housing for all socioeconomic segments of the community.

As a general plan update, the project area would be citywide. The City itself is located within the coastal foothill region of central Orange County in the state of California. Located approximately two miles inland from the Pacific Ocean and 40 miles south of the city of Los Angeles, the City is bordered by unincorporated Orange County and a number of cities including Tustin, Santa Ana, Lake Forest, Costa Mesa, Newport Beach, Orange, Laguna Woods, and Laguna Hills. Figure 2-1 presents the regional location of the City.

3.1 Project Background and History

California state law requires each city and county to adopt a general plan for its physical development. A general plan is a key tool that addresses a variety of subject areas and expresses the community's development goals related to future land uses in the jurisdiction.

Incorporated in 1971, the City of Irvine adopted the first General Plan in December 1973. The City's General Plan was last comprehensively updated in 2000 and has been updated over the years to address necessary General Plan amendments. Since 2000, the City has continued to grow, as the

community has matured and evolved. In 2000, the City still had a significant amount of "greenfield" (vacant land utilized as farmland in the interim or generally undeveloped land) that was available for development. Now, there is limited greenfield land available, and such, the project seeks to address opportunities for infill and redevelopment. The purpose of the project is to provide long-term policy direction; provide a blueprint guiding future development in the City; and communicate the vision, values, and goals for the City's physical development and overall quality of life.

The 2021-2029 Housing Element Regional Housing Needs Assessment (RHNA) allocation for the City is 23,610 units. To ensure consistency with housing statute, including no-net loss and affirmatively furthering fair housing requirements, the 2021-2029 Housing Element identified adequate sites to accommodate 57,656 new residential units. To implement the Housing Element, the project would adopt a residential and residential mixed-use overlay zone that would allow greater flexibility for property owners and developers proposing residential development projects with affordable housing units in areas currently zoned for nonresidential uses.

The existing General Plan includes both the mandated elements of the State Government Code Section 65302 as they apply to the local conditions, and optional elements designed to address high priority topics of City interest. The General Plan is kept up to date with current issues, trends, and community needs through periodic amendments. When an amendment occurs, special attention is given to make sure that all components work in harmony and the plan maintains its internal consistency as required by state law.

The City's existing General Plan contains seven elements required by the State Planning, Zoning and Development Laws. Conservation and Open Space have been combined into a single element. There are also eight optional elements relating to the development of the City. They are as follows:

- Mandated Elements
  - Land Use
  - Circulation
  - Housing
  - Conservation and Open Space
  - Noise
  - Safety
- Optional Elements
  - Public Facilities and Services
  - Integrated Waste Management
  - Energy
  - Parks and Recreation
  - Cultural Resources
  - Growth Management
  - Seismic
  - Irvine Business Complex

The project would update the City's existing General Plan elements to reflect consistency with the adopted Housing Element and state law governing the contents within general plans. As part of the project, existing optional elements under the adopted General Plan will be incorporated into the mandated elements under the General Plan update and the City will be adding the Environmental Protection and Climate Action Element. Following project approval, the City's General Plan will include the following:

- Mandated Elements
  - Land Use
    Incorporates information from existing Growth Management and Irvine Business Complex Elements
  - Circulation
  - Housing
  - Conservation and Open Space
    Incorporates information from existing Parks and Recreation, Public Facilities and Services, and Cultural Resources Elements
  - Noise
  - Safety (includes information from Seismic Safety Element)
- Optional Elements
  - Environmental Protection and Climate Action Element
    Incorporates information from existing Energy, Public Facilities and Services, and Integrated Waste Management Elements

3.2 Project Objectives

In accordance with CEQA Guidelines Section 15124(b), the following primary objectives support the purpose of the project, assist the Lead Agency in developing a reasonable range of alternatives to be evaluated in this report, and ultimately aid decision-makers in preparing findings and overriding considerations, if necessary. The project objectives are as follows:

1. Implement land use changes necessary to implement the City's 2021-2029 Housing Element.
2. Identify areas of opportunity and provide options to enhance development in key focus areas of the City while maintaining the City's signature master plan concept.
3. Implement citywide policy direction to support a high quality-of-life for residents, businesses, and visitors into the future, including a focus on health and wellness.
4. Identify additional sites for residential and/or residential mixed-use development throughout the City using overlay zones to allow greater flexibility for property owners and developers.
5. Implement Phase 2 of the Great Park Framework Plan to serve residents and visitors in the City.
6. Extend Ada roadway between the Irvine Train Station and Marine Way to better support residential uses and improve multi-modal connectivity.

3.3 Project Description

The project would update the General Plan Land Use Element to support the City's RHNA allocation of 23,610 units. Table 3-1 provides a breakdown of the City's RHNA allocation by income category. As previously stated, the 2021-2029 Housing Element identified adequate sites to accommodate 57,656 new residential units to ensure consistency with housing statute, including no-net loss and

affirmatively furthering fair housing requirements. The 57,656 new residential units consist of 55,395 new dwelling units and 2,261 unbuilt units already in the General Plan.

Table 3-1 Regional Housing Needs Allocation (2021–2029)	
Income Category	Total Units
Extremely Low/Very Low Income (0–50 percent Area Median Income (AMI)	6,396
Low Income (51–80 percent AMI)	4,235
Moderate Income (80–120 percent AMI)	4,308
Above Moderate Income (Above 120 percent AMI	8,671
TOTAL	**23,610**

The project would accommodate the City's RHNA requirement and implement the 2021-2029 Housing Element through the introduction of additional residential and/or residential mixed-use development throughout the City using overlay zones that would allow greater flexibility for property owners and developers proposing to develop affordable housing projects. The overlays would promote higher density residential and mixed-use in three focus areas that are most suited for new growth and development as they are located near existing job centers and are along major travel corridors with access to existing and future public transit opportunities. Figure 3-1 presents the boundaries of the three focus areas. Descriptions of the three focus areas are presented below:

- Focus Area 1 would consist of the Greater Irvine Business Complex Area. This focus area includes Planning Area 36 (Irvine Business Complex) and Planning Area 19 (Rancho San Joaquin). Land use changes within Focus Area 1 include expanding a residential and/or mixed-use overlay to the entire Irvine Business Complex (IBC) and the specific sites identified in the 2021-2029 Housing Element site inventory located in Rancho San Joaquin. Over the past 20 years, the IBC has transitioned from predominantly nonresidential uses to a mixed-use area that is currently governed by the 2010 IBC Vision Plan. Under the existing General Plan, the IBC is allowed a maximum of 15,000 base units. The IBC continues to be one of the two employment centers located within the City and remains an opportunity area for high density residential development. The IBC is connected to the Tustin Transportation Center (Metrolink and Orange County Transportation Authority [OCTA]) transit service) through the iShuttle and has direct access to Interstate 405, State Route 73, and State Route 55. The project proposes to increase the total number of residential permitted in the Greater IBC area by an additional 15,000 units.

FIGURE 3-1
2045 General Plan Update Focus Areas

- Focus Area 2 would consist of the Greater Spectrum Area. This focus area includes Planning Area 13 (Irvine Spectrum 4), Planning Area 31 (Irvine Spectrum 6), Planning Area 32 (Irvine Spectrum 3), Planning Area 33 (Irvine Spectrum Center), and a portion of Planning Area 12 (Oak Creek). The Greater Spectrum Area incorporates three nonresidential Planning Areas (13, 31, and 32) that are located adjacent to the Irvine Spectrum Center area, emerging employment centers, and the Irvine Transportation Center (Metrolink, Amtrak, and OCTA transit service). With the introduction of a residential overlay, this area could transition to a network of micro-villages or residential nodes, connected by a variety of multi-modal and complete street strategies that provide new opportunities for residents and businesses in Irvine. The project would increase the residential intensity in Focus Area 2 by an additional 26,607 residential units.

- Focus Area 3 would consist of the Great Park Neighborhood Transit Village. This focus area would include Planning Area 51 (Great Park Neighborhood), which is an existing mixed-use area that features a mix of residential products at varying densities surrounding the Irvine Great Park. While the Great Park area has undergone significant development in recent years, a significant amount of Planning Area 51 remains vacant with no additional residential intensity. The project would increase the number of residential units permitted in the Great Park with a focus on higher density residential uses located near or adjacent to the Irvine Transportation Center. The Great Park Neighborhood Transit Village area would have direct access to Focus Area 2 (Greater Spectrum Area) through a network of proposed multi-modal improvements. The project would increase the residential intensity in Planning Area 51 with an additional 5,252 residential units.

The project would accommodate the remaining 8,536 residential units required by the City's RHNA assessment outside of the focus areas throughout the City. The remaining 8,536 residential units would be permitted throughout the City by increasing the number of dwelling units permitted to be developed in these areas both in the General Plan and Zoning Ordinance. Projects proposed outside of the three focus areas would be entitled using the City's existing development standards and entitlement procedures.

New development proposed under the project would be developed to be consistent with the Land Use Element, which encouraged a proximity village approach, building upon the City's current approach to master planning in the City. Utilizing a proximity village approach to planning would ensure that future development is balanced with a mix of uses including neighborhood-serving nonresidential square footage (retail, restaurants, medical offices, etc.) and parks and open space uses that are connected through multi-modal transportation and complete street strategies. Table 3-2 presents the distribution of proposed residential units within various Planning Areas throughout the City under the project, as well as the distribution of proposed residential units within various Planning Areas throughout the City under the Reduced Project Alternative, which is discussed in detail in Section 7.2.2 of this PEIR.

In addition to the RHNA residential component, the project includes additional nonresidential land uses in the Irvine Great Park (Great Park). Phase 1 of the Great Park Framework Plan is in the baseline (no build condition) and the remaining land uses supporting the buildout of the Great Park Framework (200 acres in total) are included as part of the project. Phase 2 (or the remaining buildout

of the Great Park) includes the following: a botanical garden, a veteran's memorial garden, a library, a discovery center, two museums, a 65-acre central park area, an accessory restaurant use, an aquatic center, an all-wheel park, and pickleball courts.

The project also includes the extension of the Ada roadway from its current terminus in the parking lot of the Irvine train station south of the Southern California Railroad Authority (SCRRA) railroad tracks to extend north under the railroad tracks to meet the future Marine Way extension north of the railroad tracks. The Ada roadway extension between the Irvine train station and Marine Way provides multi-modal connectivity to support the residential uses.

Table 3-2
Proposed Housing Units

Focus Area	Project Dwelling Units	Reduced Project Alternative Dwelling Units
Focus Area 1		
PA 19 (Rancho San Joaquin)	2,202	2,111
PA 36 (Irvine Business Complex)	12,798	9,131

PA 35 (Irvine Spectrum 2)	5,239	1,562
PA 39 (Los Olivos)	298	298
PA 40 (Cypress Village)	281	498
Non-Focus Areas Total	**8,536**	**4,073**
Total (Focus Areas and Non-Focus Areas)	**55,395**	**40,378**
Unbuilt Units in General Plan (IRWD Site and Market Place Site)	2,261	2,261
OVERALL TOTAL	**57,656**	**42,639**

PA = Planning Area
[1]Overlay applies to PA 13. However, no units are contemplated as part of the project.

3.3.1 Residential and Residential Mixed-Use Overlay

The project does not include any changes to existing General Plan land use designations or zoning classifications. Rather, the project includes a Residential and Residential Mixed-Use Overlay that would encourage residential infill projects. To adopt the proposed overlays, the project includes a Zone Text Amendment to include a new section establishing a Residential and Residential Mixed-Use Overlay and to revise applicable portions of the City of Irvine Zoning Ordinance affected by the proposed overlay to resolve any potential zoning inconsistencies resulting from adoption of the overlay. A corresponding Zoning Map Amendment would be prepared to illustrate the proposed overlay area on the City's Zoning Map. The project specifically proposes to amend the City of Irvine Zoning Ordinance to reflect the following overlay strategies aimed at encouraging residential infill projects:

- Focus Areas 1 through 3 – Residential and Residential Mixed-Use Overlay. Residential projects proposed within the three focus areas may be permitted on nonresidential properties should they include a minimum density of 50 dwelling units per acre and comply with the City's adopted Inclusionary Housing requirements (15 percent affordability). Furthermore, residential projects proposed in Focus Area 1 - Greater IBC may also be permitted to exceed existing Development Intensity Values if they include a minimum density of 50 dwelling units per acre and provide at least 20 percent of the total units on site as affordable to lower-income households (9 percent for very low-income households, 6 percent for low-income households, and 5 percent for moderate-income households in the 81–100 percent area median income (AMI). Incentives will be identified in the overlay development standards for non-residential uses, such as, but not limited to retail, restaurants, office, and community facilities that are complimentary to the residential and residential mixed-use uses and encourage the development of a proximity village.

3.4 Intended Uses of the PEIR

This PEIR examines the potential environmental impacts of implementing the project and identifies mitigation measures required to address significant impacts, as necessary. This evaluation is programmatic and does not evaluate the potential project-specific environmental impacts of individual development proposals that may be allowed under the project after its adoption. Subsequent projects would be reviewed by the City for consistency with the project and this PEIR, and adequate project-level environmental review would be conducted as required under CEQA.

3.5 Discretionary Actions, Permits, and other Project Approvals

In accordance with State CEQA Guidelines Sections 15050 and 15367, the City is the designated Lead Agency for the project and as such, has principal authority and jurisdiction for the CEQA actions and project approval. Responsible agencies are agencies that have jurisdiction or some authority over one or more aspects of a project and/or identified mitigation measures. Trustee Agencies are State agencies that have jurisdiction over natural resources affected by a project.

Discretionary actions are those actions taken by an agency that call for the exercise of judgment in deciding whether to approve or how to carry out a project. The City, as the Lead Agency, has jurisdiction over the following legislative and discretionary actions for this project:

- Adopt a General Plan Amendment updating the General Plan elements, and City's Land Use Map.
- Approve a Zone Text Amendment to revise applicable sections of the City of Irvine Zoning Ordinance affected by the overlay program.
- Approve Zoning Map Amendment to illustrate the proposed overlay program.
- Certify the PEIR.
- Adopt the Mitigation Monitoring and Reporting Program.
- Adopt the Statement of Overriding Considerations.

Additional Responsible/Trustee Agencies include the South Coast Air Quality Management District (SCAQMD), the Santa Ana Regional Water Quality Control Board (Santa Ana RWQCB), the California Coastal Commission, and the Airport Land Use Commission, and the U.S. Army Corps of Engineers. SCAQMD works with the Lead Agencies to ensure that air quality, greenhouse gas, and health risk impacts from proposed projects are accurately evaluated and mitigated where feasible. The Santa Ana RWQCB is responsible for the protection, and where applicable, the enhancement of the quality of waters within the Santa Ana River Basin. The Santa Ana RWQCB also implements state and federal laws and regulations as they pertain to water quality. The California Coastal Commission is responsible for reviewing the Local Coastal Program that is required to be updated following project approval. The Airport Land Use Commission is responsible for reviewing the General Plan and making a consistency/inconsistency determination in relation to the Airport Environs Land Use Plan. The U.S. Army Corps of Engineers has jurisdiction over development in or affecting the navigable waters of the United States.

Chapter 4.0
Environmental Analysis

The following sections analyze the potential environmental impacts that may occur through implementation of the project. Buildout of the project is anticipated to occur over an approximately 20-year horizon. Potential impacts are assessed against the current on-the-ground condition; therefore, due to the long-term buildout horizon, circumstances, and in-turn potential impacts, have the potential to change over time. The environmental issues subject to detailed analysis in the following sections include those identified as potentially significant during the environmental review process. Fifteen environmental issues are addressed in the following sections, in accordance with the California Environmental Quality Act Guidelines and Statutes. The remaining three environmental issues were found to be less than significant and are addressed in a more abbreviated manner in Chapter 6.0. Each issue analysis section is formatted to include a summary of existing conditions, including the regulatory context; the significance determination thresholds and methodology; an evaluation of potential project impacts; mitigation measures to address potentially significant impacts; and a conclusion of significance after mitigation.

4.1 Aesthetics

This section analyzes impacts to visual resources that could result from implementation of the project.

4.1.1 Existing Conditions

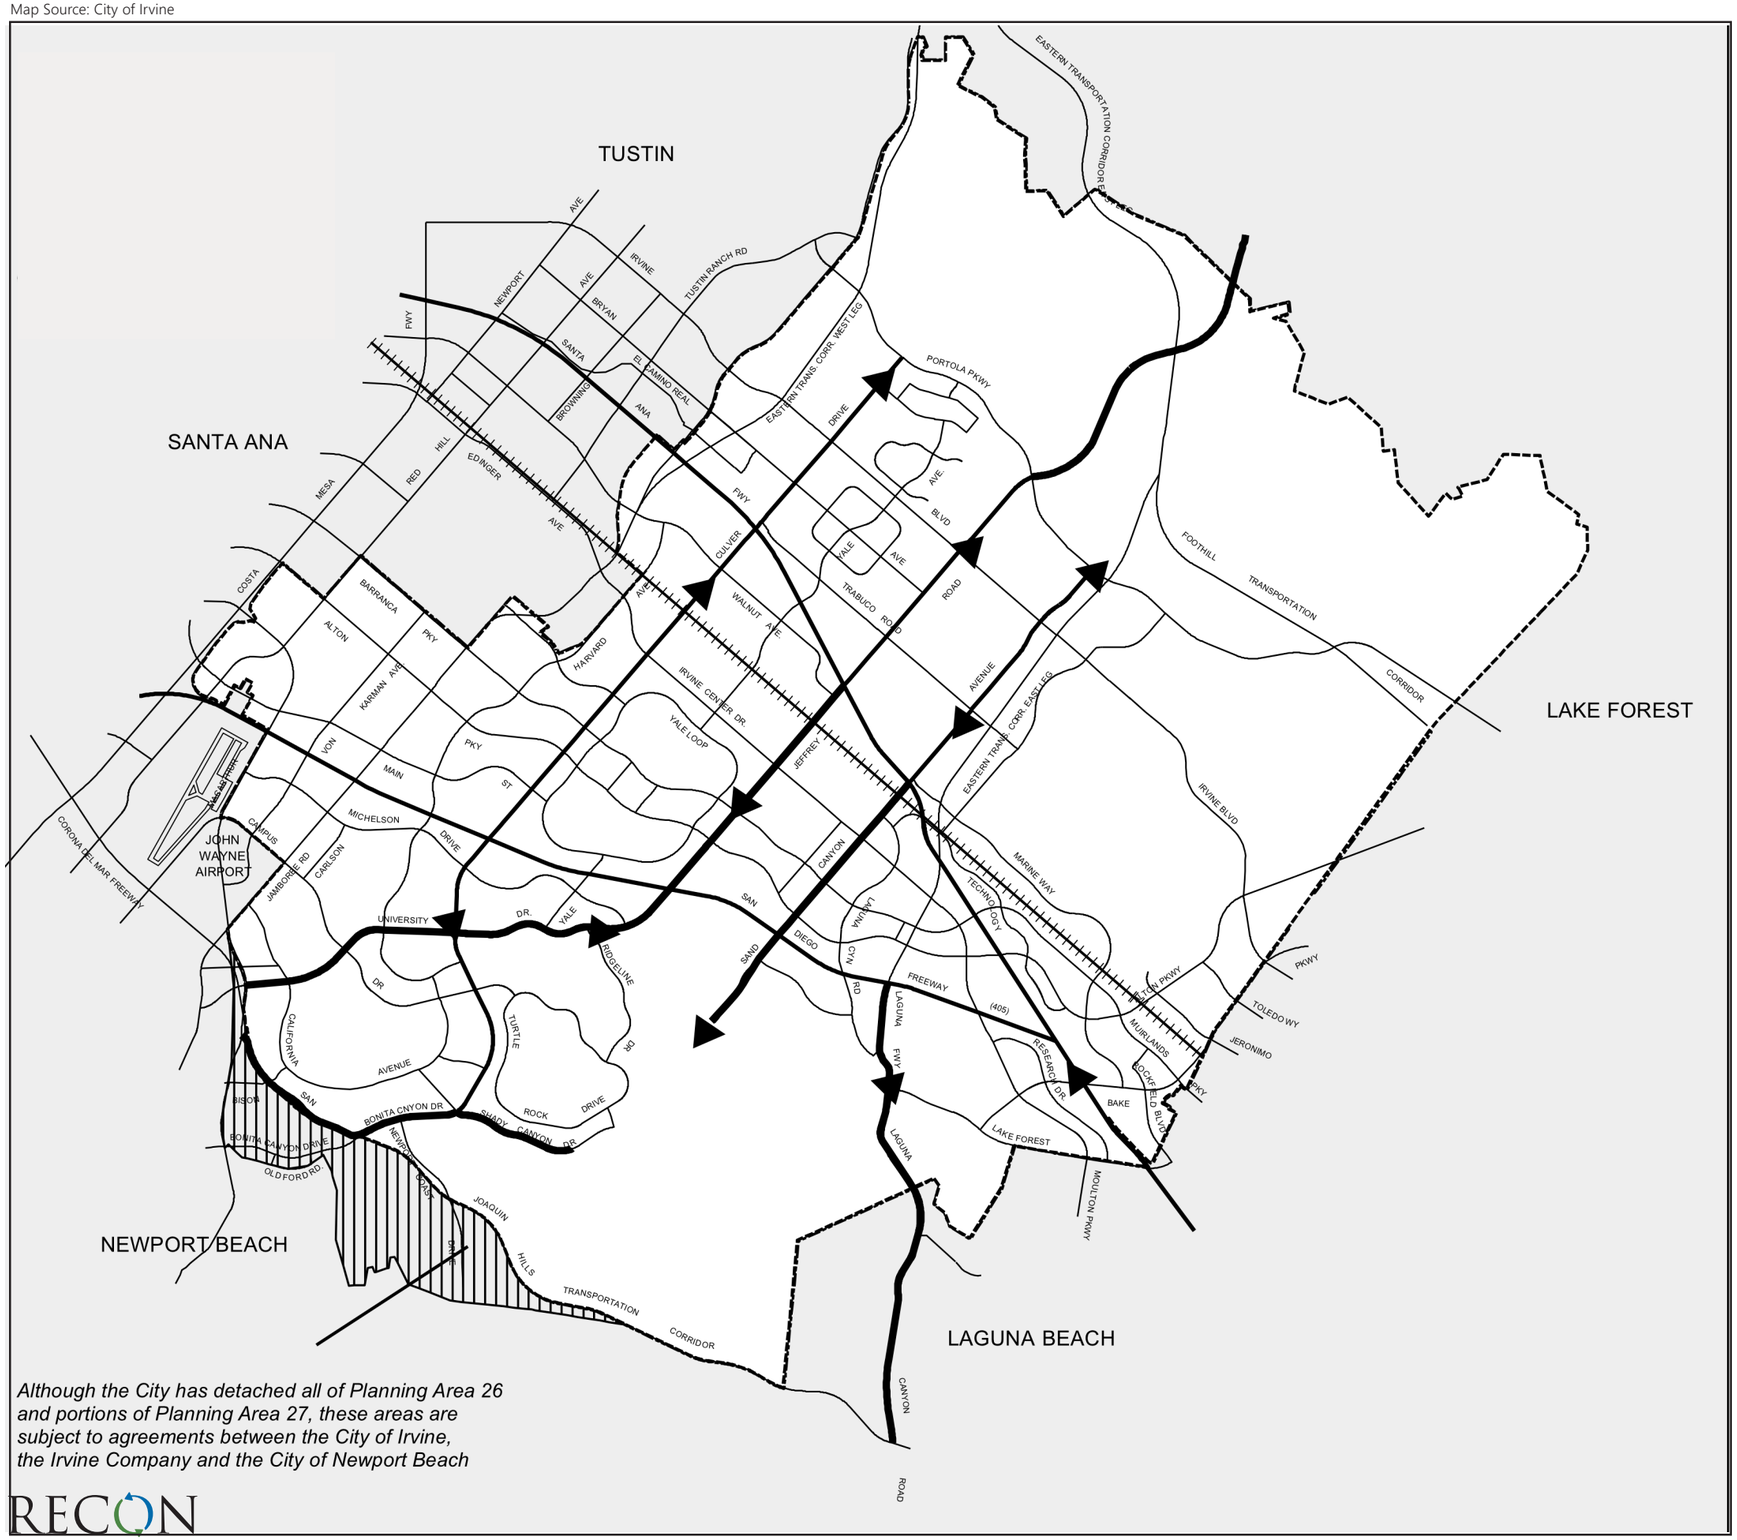
The City of Irvine (City) is divided into distinct master-planned communities or neighborhoods known as Planning Areas, each with its own unique characteristics and development objectives. Historically, residential growth was concentrated in the central parts of the City, referred to as the residential core. However, since 2000, residential development has expanded beyond this core to include areas such as the Great Park, the Northern Sphere, Spectrum, and the Irvine Business Complex (IBC).

Aesthetics generally refers to the identification of visual resources (natural and human-made) and the quality of what can be seen, as well as to an overall judgment (visual perception) of the visual environment. Aesthetic features occur in a diverse array of environments, ranging in character from urban centers to rural regions and wildlands. Features may include, but are not limited to:

- Open space
- Native or ornamental vegetation/landscaping
- Topographic or geologic features (including ridgelines of the Santiago and San Joaquin Hills)
- Natural water features
- Structures of architectural or historic significance or visual prominence
- Public plazas, art, or gardens
- Eucalyptus or other trees or plants protected by the City
- Landscaped medians or park areas

Prominent landforms in the City include the Santiago Hills, northern flatlands, central flatlands, and San Joaquin Hills. The Santiago and San Joaquin Hills have ridgelines that can be seen from various vantage points within the City (including major roadways), while views of the flatlands and the Pacific Ocean can be seen from the higher elevations. San Diego Creek and numerous other washes, as listed in Table 4.1-1, run through the City. Figure 4.1-1 presents the locations of these visual resources. These resources are predominately protected through the City's Conservation/Open Space Dedication Program and the Orange County Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP).

Map Source: City of Irvine



Although the City has detached all of Planning Area 26 and portions of Planning Area 27, these areas are subject to agreements between the City of Irvine, the Irvine Company and the City of Newport Beach

4.1.1.1 Significant Features

a. Viewsheds and Scenic Vistas

A viewshed is generally defined as an area that can be seen from a given vantage point and viewing direction. A viewshed is composed of foreground items (items closer to the viewer) that are seen in detail and background items (items at some distance from the viewer) that frame the view.

A scenic vista is generally defined as a view of undisturbed natural lands exhibiting a unique or unusual feature that comprises an important or dominant portion of the viewshed. Scenic vistas may also be represented by a particular distant view that provides visual relief from less attractive views of nearby features. Other designated federal and state lands, as well as local open space or recreational areas, may also offer scenic vistas if they represent a valued aesthetic view within the surrounding landscape.

b. Light and Glare

Night lighting in the City comes from various sources, such as streetlights, security lighting in parking lots and along walkways, sign and building illumination, vehicle headlights, and light emitted from the exteriors and interiors of buildings. Light sources surrounding the project site include general nighttime outdoor lights from the existing residential, office, industrial, and commercial uses, and vehicle lights from adjacent roads. Nighttime glare is generally limited to headlights reflecting off glass surfaces. During the day sunlight reflects off glass surfaces, creating glare.

4.1.2 Applicable Regulatory Requirements

4.1.2.1 Federal Regulations

a. Federal Aviation Administration

The Federal Aviation Administration (FAA) requires that any temporary or permanent structures exceeding an overall height of 200 feet above ground level be marked and/or lighted. While development associated with the project is not anticipated to exceed 200 feet in height, the FAA

may also recommend marking and/or lighting of a structure that does not exceed 200 feet above ground level because of the particular location of a structure. John Wayne Airport is located immediately adjacent to the southwestern boundary of the City and may trigger necessary notification of the FAA to ensure that proposed structures do not affect navigable airspace.

4.1.2.2 State Regulations

a. The California Scenic Highways and Historic Parkways Program

The California Scenic Highways and Historic Parkways Program was created in 1963 to preserve and protect highway corridors located in areas of outstanding natural beauty from changes that would diminish the aesthetic value of the adjacent lands. The California Department of Transportation (Caltrans) maintains its State Scenic Highways and Historic Parkways Program, through which segments of the state highway system are designated as being of particular scenic value or interest. A highway may be designated scenic depending upon how much of the natural landscape can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes upon the traveler's enjoyment of the view. Interstates, state highways, byways, and parkways are eligible for designation or for recognition as eligible for designation. The program is governed by the regulations found in the California Streets and Highways Code, Section 260 et seq.

California Streets and Highways Code Section 261 requires local government agencies to take the following actions to protect the scenic appearance of the scenic corridor:

- Regulate land use and density of development;
- Provide detailed land and site planning;
- Prohibit off-site outdoor advertising and control on-site outdoor advertising;
- Pay careful attention to and control of earth moving and landscaping; and
- Scrutinize the design and appearance of structures and equipment.

California Streets and Highways Code Section 263 allows the California State Legislature the authority to identify highways as eligible for designation as a scenic highway. The government with jurisdiction over land abutting a highway considered to be scenic is required to adopt a "scenic corridor protection program" that restricts development, outdoor advertising, and earth moving activities along the affected segment or corridor ("Corridor Protection Program"). Caltrans must also indicate that the highway segment meets established criteria for the roadway or segment to be designated as scenic.

State scenic highways in California are either formally recognized by the California Department of Transportation or meet the criteria outlined in the Streets and Highway Code, Section 260 of the California Scenic Highway Program. In Irvine, Caltrans hasn't officially designated any state scenic highways or identified segments that qualify. While the City hasn't designated any roadways as official state scenic highways, the Conservation and Open Space Element identifies certain roads in the community as having rural or natural scenic qualities, as well as urban scenic characteristics. Although not explicitly outlined in the General Plan, highways like State Routes 241 and 261 in Irvine offer picturesque views of the hillsides and the Pacific Ocean. While Portions of Sand Canyon Avenue, Jeffrey Road/University Drive, Laguna Canyon Road/Laguna Freeway, and Bonita Canyon

Road/Shady Canyon Road, and Culver Drive are scenic in nature, the closest eligible State Scenic Highways is a segment of Interstate 405 (I-405), located in Long Beach approximately 16 miles northwest the City.

b. California Building Standards Code

Title 24 of the California Building Standards Code serves as the basis for the design and construction of buildings in California. In addition to safety, sustainability, new technology, and reliability, the California Building Standards Code addresses light pollution and glare hazards through the establishment of maximum allowable backlight, up light, and glare (BUG) ratings.

4.1.2.3 Local Regulations

a. Existing General Plan (2000)

The existing General Plan Land Use and Conservation and Open Space Elements contain the following policies which pertain to aesthetics:

Land Use Element

A-1 (Policy (a)) Develop identifiable City edges, pathways, entry points, and landmarks, and conserve visual resources along scenic corridors which characterize Irvine.

A-3 (Policy (b)): Ensure development in the hillside areas retains the character and aesthetic value of the natural landform through use of the Hillside Development Ordinance.

Conservation and Open Space Element

The General Plan Conservation and Open Space Element contains the following policies which pertain to aesthetics:

L-5 (Policy (a)): Apply the following actions to all areas of the City and its sphere of influence:

- Encourage the use of development clustering approaches, landscaping, and grading techniques which will minimize physical and visual impacts on the City's valuable hillsides.

b. Municipal Code

Section 5-9-517 (Special Nonresidential Building Provisions) of Title 5 Planning, Division 9 Building Regulations, Chapter 5- Uniform Security Code discusses standards and requirements for lighting and glare in the City, including heights of lighting fixtures; design, installation, and maintenance of lighting fixtures; standards for new development of multifamily and nonresidential development; lighting for parking areas; and sign illumination. The Uniform Security Code is designed, in part, to limit light and glare to the extent feasible while providing sufficient light in a safe manner.

c. Zoning Ordinance

Chapter 3-8 (Wireless Communication Facility, Satellite Dish and Antenna Standards)

This chapter of the Zoning Ordinance establishes development standards for wireless communication facilities, satellite dish antennae, and all other forms of antennae and accessory wireless equipment designed to consider the general welfare of City residents and to be visually compatible with their surroundings while effectively serving the communication needs of the community. All wireless communication facilities, satellite dish antennae, and other forms of antennae are required to comply with the development standards outlined in this chapter, which include visual impact and screening standards.

Chapter 3-16 (Lighting)

Chapter 3-16 of the City's Zoning Ordinance requires that outdoor lighting be designed and installed so that all direct rays are confined to the site and adjacent properties are protected from glare. The level of lighting on the site shall comply with the requirements of the City's Uniform Security Code (Municipal Code, Title 5, Division 9, Chapter 5).

Chapter 3-15 (Landscaping Standards)

This chapter of the Zoning Ordinance outlines the minimum site landscaping and maintenance requirements. This chapter also outlines the screening and landscaping requirements for parking areas and parking structures.

Chapter 3-37 (Zoning District Land Use Regulations and Development Standards)

This chapter of the Zoning Ordinance outlines the regulations and development standards that are applicable to land uses proposed throughout the various Planning Areas of the City, including setbacks, building heights, landscaping, and maximum building intensity (IBC only).

Chapter 5-4 (Hillside Overlay District)

This chapter of the Zoning Ordinance provides regulations for the development of those areas in the City and its sphere of influence, which due to their topography, require special consideration to assure that they are developed in a way that will substantially maintain their natural character and environmental and aesthetic values in accordance with the policies set forth in Section 5-4-2 of the Zoning Ordinance.

Division 7 (Signs)

The intent of this division of the Zoning Ordinance, also known as the Sign Ordinance, is to promote and protect the public health, safety and welfare by regulating existing and proposed signs of all types within the City. This division outlines the standards and regulations that apply to the design and installation of signage, including quantity, location, dimensions, and lighting.

Design Guidelines

Development within specific areas of the City is also regulated by adopted design guidelines, which regulate the architectural theme, character, and overall design of new development. These design guidelines are unique to the Planning Area for which they apply and are applied on an individual

project basis. It should also be noted that the City is in the process of developing Objective Design Standards that would further regulate the development of residential projects throughout the City.

d. Initiative Resolution 88-1 and General Plan Amendment 16

In June 1988, Initiative Resolution 88-1, "An Initiative Resolution of the City of Irvine Directing the Amendment of the Conservation and Open Space Element and the Land Use Element of the Irvine General Plan" (Open Space Initiative), was adopted by City voters. This resulted in the establishment of the Conservation/Open Space Program that provides for the eventual public ownership of approximately 9,000 acres of open space to be accomplished through the transfer of development opportunities to areas that can better accommodate development in exchange for the transfer of open space to the public. By consolidating large contiguous areas of open space designated for preservation and permitting development in areas deemed to be of lesser open space value, the Conservation/Open Space Program preserves important open space resources.

Following approval of Resolution 88-1, the City and the Irvine Company executed a memorandum of understanding to implement the open space program and establish the Phased Dedication and Compensating Development Opportunities Program (Dedication/Development Program). The areas of the City directly affected by the Dedication/Development Program were divided into lettered "Implementation Districts" containing both designated open space dedication areas and corresponding development areas (see Figure 3.1-1 of the City CEQA Guidelines, Dedication/Development Program Implementation Districts).

e. Planning Commission Resolution No. 09.-2968

Standard Conditions are adopted by Planning Commission Resolution No. 09-2968. These conditions assist staff in applying standardized wording for frequently used conditions of approval for discretionary and subdivision applications. Standard conditions are applied on a case-by-case basis depending upon the specifics of the application. Companion conditions are cross-referenced and are required to be used together. The following standard conditions related to Aesthetics apply:

Standard Condition 3.6 Site Lighting Requirements

Prior to the issuance of building permits, the applicant shall demonstrate they have met the Irvine Uniform Security Code requirements for lighting by providing the below listed items for a complete review by the Police department. Failure to provide a complete lighting package will result in the delay of satisfaction of this condition. a. Electrical plan showing light fixture locations, type of light fixture, height of light fixture, lighting ratio, and point-by-point photometric lighting analysis overlaid onto a tree landscape plan with a legend. The photometric plan should only show those fixtures used to meet the Irvine Uniform Security Code requirements. b. Site plan demonstrating that landscaping shall not be planted so as to obscure required light levels per the Irvine Uniform Security Code. c. Site plans that are full-scale and legible.

f. Existing Plans, Programs, and Policies

The following measures are existing plans, programs, or policies (PPP) that apply to the project and will help to reduce and avoid potential impacts related to aesthetics:

- PPP-AES-1 Compliance with FAA requirements regarding the marking of or lighting of structures exceeding an overall height of 200 feet above ground level.
- PPP-AES-2 Compliance with Municipal Code Section 5-9-517 Special Nonresidential Building Provisions
- PPP-AES-3 Compliance with Zoning Ordinance Chapter 3-16 Lighting
- PPP-AES-4 Compliance with Zoning Ordinance Chapter 3-15 Landscaping Standards
- PPP-AES-5 Compliance with Zoning Ordinance Chapter 3-37 Zoning District Land Use Regulations and Development Standards
- PPP-AES-6 Compliance with Zoning Ordinance Chapter 5-4 Hillside Overlay District
- PPP-AES-7 Compliance with Zoning Ordinance Division 7 Signs
- PPP-AES-8 Compliance with Standard Condition 3.6 Site Lighting Requirements

Proposed General Plan Strategies and Policies

In addition to the above-listed PPPs, the following proposed Goals, Objectives, Policies, and Implementation Actions are applicable to the analysis of aesthetics and would replace existing goals, strategies, and policies outlined in the City's existing General Plan following project approval:

Land Use Element

Goal LU-1: Preserve and Strengthen Irvine's Identity as a Diverse and Innovative Community

Objective LU-1. To develop and implement land use policies that foster the preservation and enhancement of Irvine's diverse and innovative character, ensuring that the City remains a vibrant and inclusive community for all residents, businesses, and visitors.

- Policy a: Develop identifiable City edges, pathways, entry points, and landmarks, and conserve visual resources.

Goal LU-10: Encourage Land Use Development that Preserves the Beauty of the Natural Environment

Objective LU-10.1. To promote land use development that preserves and enhances the beauty of the natural environment throughout the City of Irvine by implementing sustainable land use policies and practices that protect ecologically sensitive areas, conserve natural resources, and promote biodiversity.

- Policy b: Ensure development in the hillside areas retains the character and aesthetic value of the natural landform through use of the Hillside Development Ordinance.

Conservation and Open Space Element:

Goal 3: Use and preserve geophysical resources, including, but not limited to, ridgelines, hillsides, and waterways, as part of the City's land use pattern.

Objective COS-3. Effectively utilize and safeguard geophysical resources, encompassing ridgelines, hillsides, and waterways, within the City's land use framework to maintain ecological integrity, enhance aesthetic value, and promote sustainable development practices that harmonize with the natural landscape.

Implementation Measures:

- Encourage development clustering approaches, landscaping, and grading techniques to minimize physical and visual impacts on the City's valuable hillsides.
- Ensure that any access roads or highways that must pass through hillside areas are the least environmentally damaging, feasible alternative which minimizes the impacts to the hillside ecological and/or aesthetic characteristics.

4.1.3 Significance Determination Thresholds

The City has adopted Appendix G of the State California Environmental Quality Act (CEQA) Guidelines as the significance thresholds for aesthetic resources. A project would normally have a significant effect on the environment, except as provided in Public Resources Code Section 21099, if the project would:

1) Have a substantial adverse effect on a scenic vista;

2) Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a State Scenic Highway;

3) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings (Public views are those that are experienced from publicly accessible vantage points). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality; or

4) Create a new source of substantial light or glare which would adversely affect daytime or nighttime views in the area.

4.1.4 Methodology

The visual resource analysis is based on an evaluation of the project in comparison to existing aesthetic conditions within the City. Any evaluation of visual impacts is necessarily subjective; however, community aesthetic values can be used to evaluate changes in views within a particular community. These values are found in General Plan policies and the Zoning Ordinance, and, where specific policies are absent, general design theory and visual analysis methods can be incorporated to evaluate aesthetic impacts.

4.1.5 Topic 1: Scenic Vistas

Would the project have a substantial adverse effect on a scenic vista?

4.1.5.1 Impact Analysis

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Under the project, growth will be concentrated within the Greater Irvine Business Complex Area, the Greater Irvine Spectrum Area, and the Great Park Neighborhood Transit Village.

- Greater Irvine Business Complex Area (Focus Area 1) - This focus area is comprised of Planning Area 36 (Irvine Business Complex) and Planning Area 19 (Rancho San Joaquin) and aims to expand residential mixed-use zoning across the entire Irvine Business Complex (IBC) and specified sites in Rancho San Joaquin. This expansion will add 15,000 residential units to the Greater Irvine Business Complex Area, doubling the previous allowance under the former General Plan.

- Greater Irvine Spectrum Area (Focus Area 2) - The Greater Spectrum Area encompasses nonresidential planning zones (Planning Areas, 13, 31, and 32) adjacent to the Irvine Spectrum Center, a significant employment hub near the Irvine Transportation Center (ITC – comprising Metrolink, Amtrak, and OCTA transit services). Planned growth aims to foster a series of residential clusters near commercial lifestyle hubs, linked by diverse multi-modal and complete street approaches, thereby creating fresh prospects for both Irvine residents and businesses. The project would increase the residential intensity in Focus Area 2 by an additional 26,607 residential units.

- Great Park Neighborhood Transit Village (Focus Area 3) - The Great Park Neighborhoods, designated as Planning Area 51, currently comprises a mixed-use zone with diverse residential offerings at different densities encircling the Irvine Great Park. Future growth projections indicate an emphasis on higher-density residential developments situated near the Irvine Transportation Center. The project would increase the residential intensity in PA 51 with an additional 5,252 residential units.

Development within the three focus areas would primarily occur in urbanized areas close to transit corridors. These areas currently provide a mix of uses, are in proximity to transit, and are more dense/intense than existing single-family neighborhoods throughout the City. Although future development and redevelopment would vary in building height, mass, form, and intensity, projects would generally be required to meet a minimum residential density of 50 dwelling units per acre, similar to the average density of recently approved projects within the three focus areas. Furthermore, by concentrating most of the development within the three focus areas, the project would ensure that buildout under the General Plan would not block public views of scenic vistas that are primarily located in undeveloped and open space areas of the City. Similarly, nonresidential growth within the Great Park area and the extension of Ada roadway would occur within areas that

are not afforded scenic views of natural resources in the City. Furthermore, the updated Land Use Element contains the policies LU-1.1 Policy a and LU-10.1 Policy b, which aim to concentrate development within specific areas of the City to conserve visual resources along scenic corridors and aim to ensure that development in hillside areas retains the character and aesthetic value of the natural landforms. The updated Conservation and Open Space Element also includes Objective COS-5, which aims to use and preserve ridgelines, hillsides, and waterways as part of the City's land use pattern. These objectives and policies would further support the City's goals of maintaining scenic vistas throughout the City. Therefore, impacts related to obstruction of a scenic vista would be less than significant.

4.1.5.2 Significance of Impacts

Future development facilitated by the project would primarily occur in urbanized areas that are not afforded expansive views of scenic vistas. Therefore, the project would not have a substantial adverse effect on a scenic vista, and impacts would be less than significant.

4.1.5.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.1.6 Topic 2: Scenic Resources

Would the project substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a State Scenic Highway?

4.1.6.1 Impact Analysis

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

There are no state-designated or eligible scenic highways within the City. The closest eligible State Scenic Highway is a segment of I-405 in Long Beach, approximately 16 miles northwest of the City. This segment of scenic highway does not have distinct views of the focus areas. Furthermore, the General Plan Land Use Element contains the following policies LU-10(a) and LU-10(b), which aim to concentrate development within specific areas of the City to conserve visual resources along scenic corridors and aim to ensure that development in hillside areas retains the character and aesthetic value of the natural landforms. Compliance with these policies would further support the City's goal of preserving views along scenic corridors. Therefore, future development under the project would not be located within the viewshed of any designated or eligible state scenic highways.

4.1.6.2 Significance of Impacts

There are no state-designated or eligible scenic highways within the City. As such, the project would not substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a State Scenic Highway, and impacts would be less than significant.

4.1.6.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.1.7 Topic 3: Visual Character or Quality

In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings (Public views are those that are experienced from publicly accessible vantage points). In an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

4.1.7.1 Impact Analysis

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

The project would introduce additional development throughout the City using a residential and mixed-use overlay that would allow greater flexibility for property owners and developers. The overlay would promote higher density residential and residential mixed-use in three focus areas that are most suited for new growth and development as they are located near existing job centers and are along major travel corridors with access to existing and future public transit opportunities. Future development would be consistent with the visual quality and character of these focus areas, given their existing urban character. As previously stated, future growth would also be developed at densities that are similar to recently approved projects within these areas. Furthermore, the height of future projects within the IBC (Focus Area 1) would also be subject to FAA regulations limiting building heights within the John Wayne Airport Area (PPP AES-1). Compliance with these standards would further ensure that future development would be consistent with the aesthetic character of this area. Additionally, some of underutilized sites within these focus areas consist of aging structures with poor visual quality, and redevelopment of these structures would result in new residential structures developed consistent with the visual requirements of existing PPPs (PPPs AES-1 through AES-8). Furthermore, development of vacant and underutilized sites would be required to adhere to the land use plans that provide supplemental development regulations of those sites, as well as the requirements of the Municipal Code and Zoning Ordinance.

Development outside of the three focus areas is expected to occur on an incremental basis and would be required to occur in compliance with the City's Municipal Code and Zoning Ordinance (PPPs AES-1 through 8). Compliance with the City's code and site-specific review of the design of future projects would ensure their compatibility with the aesthetic character of the area in which they are proposed.

Proposed improvements within the Great Park (Focus Area 3) would occur entirely within the boundaries of this Planning Area, which is currently developed with residential uses on the outer edge and recreational, parks, and open space uses within the Planning Area core. All planned improvements would be consistent with the existing aesthetic character of the Great Park area. Similarly, planned improvements to the Ada roadway, which would be extended as part of the

project, would be consistent with existing infrastructure in the area and would serve to improve mobility connections. As such, the extension of Ada would be consistent with the existing aesthetic character of the area. For the reasons stated above, future development facilitated by the project would not result in the degradation of the existing scenic quality of the City, and impacts would be less than significant.

4.1.7.2 Significance of Impacts

Buildout of the project would occur in areas that are currently developed and urban in nature. Future projects would be developed at densities that are consistent with existing uses in the area and would be required to comply with City standards outlined in the Municipal Code and Zoning Ordinance regulating building design and aesthetics. As such, the project would not conflict with applicable zoning and other regulations governing scenic quality, and impacts would be less than significant.

4.1.7.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.1.8 Topic 4: Light or Glare

Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

4.1.8.1 Impact Analysis

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Future development under the project would primarily be concentrated within three focus areas. Growth outside of these areas is expected to be incremental and limited, consistent with the City's Housing Elements Sites Inventory. New development and increased density in the three focus areas will introduce new sources of light and glare associated with an increase in buildings and vehicles in the areas. Focus Areas 1 and 2 are primarily characterized by an urbanized environment with existing light and glare sources. Therefore, future development would introduce similar sources of light to these areas. Proposed improvements within the Great Park (Focus Area 3) would occur entirely within the boundaries of this Planning Area, which is currently developed with residential uses on the outer edge and recreational, parks, and open space uses within the Planning Area core. All planned improvements would be consistent with the existing aesthetic character of the Great Park area.

All development envisioned as part of the project, would be required to comply with the California Building Energy Efficiency Standards for Residential and Nonresidential Buildings (Title 24, Part 6, of the California Code of Regulations, Municipal Code standards related to light and glare (Title 5, Division 9, Chapter 5), the Zoning Ordinance (Chapter 3-16- Lighting), and City Standard Condition 3.6 (Site Lighting Requirements), which requires that outdoor lighting be directed downward and away from adjoining properties and public rights-of-way. Compliance with existing PPPs AES-3

would also reduce impacts associated with light and glare. Compliance with existing City regulations would ensure that all project-related impacts with respect to light and glare would be less than significant.

4.1.8.2 Significance of Impacts

Buildout of the project would introduce new sources of light and potentially glare in areas that are already developed with uses that emit nighttime lighting. All future projects would be required to comply with state and local standards aimed at minimizing light and glare (PPPs AES-1 and AES-3). Therefore, the project would not create a new source of substantial light or glare which would adversely affect day or nighttime views in the area, and impacts would be less than significant.

4.1.8.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.1.9 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for aesthetics. The study area for the assessment of cumulative impacts related to aesthetics is defined as the City. Future development within the study area could have a cumulative impact on visual resources due to changes in the existing visual quality and aesthetics. These impacts could result from incremental increases in density and urbanization. This growth could gradually alter the visual quality of the study area. However, future development would be consistent with the visual quality and character of surrounding development based on application of required design review and consistency with the California Green Building Code, and the City's Municipal Code, Zoning Ordinance, General Plan, and Standard Conditions of Approval. Additionally, some of the underutilized sites consist of aging structures with poor visual quality, and redevelopment of these structures would result in new residential structures developed consistent with the visual requirements of the Municipal Code and Zoning Ordinance. Future development would also be required to comply with Municipal Code standards related to light and glare, which serve to minimize light pollution and trespass in order to preserve dark skies. Therefore, the project would not contribute to a significant cumulative impact related to aesthetics.

4.2 Air Quality

This section analyzes the air quality impacts that could result from implementation of the project. This analysis relies on the Irvine General Plan Update Air Quality and Greenhouse Gas Emissions Summary prepared by Urban Crossroads, Inc. (Appendix B).

4.2.1 Existing Conditions

4.2.1.1 South Coast Air Basin

The city of Irvine (City) is located within the South Coast Air Basin (Basin), which is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). The 6,745-square-mile Basin encompasses Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties, and is bound by the Pacific Ocean to the west, the San Gabriel, San Bernardino, and Jacinto mountains to the north and east, respectively, and San Diego County to the south. The Basin is designated as in attainment or unclassifiable attainment (expected to be meeting the standard despite a lack of monitoring data) for all federal air quality standards except 8-hour ozone and 2.5-micron particulate matter ($PM_{2.5}$) standards. The Basin is designated as in nonattainment for state air quality standards for 8-hour ozone and $PM_{2.5}$, and additionally is in nonattainment of state 10-micron particulate matter (PM_{10}) standards.

Air quality is commonly expressed as the number of days in which air pollution levels exceed state standards set by California Air Resources Board (CARB) or federal standards set by the U.S. Environmental Protection Agency (U.S. EPA). The SCAQMD maintains 41 active air quality monitoring sites located throughout the Basin. Air pollutant concentrations and meteorological information are continuously recorded at these stations. Measurements are then used by scientists to help forecast daily air pollution levels.

The nearest monitoring stations include the Mission Viejo monitoring station, located approximately three miles east of the City at 26081 Via Pera, and the Anaheim – Pampas Lane monitoring station, located approximately nine miles northwest of the City at 1630 West Pampas Lane. The Mission Viejo monitoring station measures ozone, PM_{10}, and $PM_{2.5}$, and the Anaheim monitoring station measures ozone, nitrogen dioxide (NO_2), PM_{10}, and $PM_{2.5.}$ Table 4.2-1 provides a summary of measurements collected at the Mission Viejo and Anaheim monitoring stations for the years 2018 through 2022.

Table 4.2-1 Summary of Air Quality Measurements Recorded at Mission Viejo and Anaheim Monitoring Stations

SOURCE: CARB 2024.
ppm = parts per million; $\mu g/m^3$ = micrograms per cubic meter; Na = Not available.
* Calculated days value. Calculated days are the estimated number of days that a measurement would have been greater than the level of the standard had measurements been collected every day. The number of days above the standard is not necessarily the number of violations of the standard for the year.

As shown in Table 4.2-1, there are exceedances of ozone, PM_{10}, and $PM_{2.5}$ standards. These exceedances occur throughout the Basin. Due to these exceedances, the Basin is designated as nonattainment for federal 8-hour ozone and $PM_{2.5}$ standards, and nonattainment for state 8-hour ozone, PM_{10}, and $PM_{2.5}$ standards. The 2016 Air Quality Management Plan (discussed later under Local Air Quality Regulations) addresses how the Basin plans to improve air quality and meet the attainment standards.

4.2.1.2 Regional Climate and Meteorology

The City is located within southern Orange County bordered by Unincorporated Orange County and a number of cities including Tustin, Santa Ana, Lake Forest, Costa Mesa, Newport Beach, Laguna Hills and Laguna Woods. The Santa Ana Mountains are located to the northeast. Air quality in the Basin is influenced by both topographical and meteorological conditions.

The City, like other inland valley areas in southern California, has a Mediterranean climate characterized by warm, dry summers and mild, wet winters. The average annual precipitation is 13 inches, falling primarily from November to April (National Oceanic and Atmospheric Administration 2024). Overall annual temperatures in the project area average about 67 degrees Fahrenheit (°F), winter low temperatures average about 48°F, and summer high temperatures average about 90°F.

The dominant meteorological feature affecting the region is the Pacific High Pressure Zone, which produces the prevailing westerly to northwesterly winds. These winds tend to blow pollutants away from the coast toward the inland areas. Consequently, air quality near the coast is generally better than that which occurs at the base of the coastal mountain range.

The prevailing westerly wind pattern is sometimes interrupted by regional "Santa Ana" conditions. A Santa Ana occurs when a strong high pressure develops over the Nevada–Utah area and overcomes the prevailing westerly coastal winds, sending strong, steady, hot, dry northeasterly winds over the mountains and out to sea.

4.2.2 Applicable Regulatory Requirements

4.2.2.1 Federal Air Quality Regulations

Ambient Air Quality Standards (AAQS) represent the maximum levels of background pollution considered safe, with an adequate margin of safety, to protect the public health and welfare. The federal Clean Air Act (CAA) was enacted in 1970 and amended in 1977 and 1990 [42 United States Code (USC) 7401] for the purposes of protecting and enhancing the quality of the nation's air resources to benefit public health, welfare, and productivity. In 1971, in order to achieve the purposes of Section 109 of the CAA [42 USC 7409], the U.S. EPA developed primary and secondary National Ambient Air Quality Standards (NAAQS).

Six criteria pollutants of primary concern have been designated: ozone, carbon monoxide (CO), sulfur dioxide (SO_2), NO_2, lead (Pb), and PM_{10} and $PM_{2.5}$. The primary NAAQS are requisite to protect the public health, and the secondary standards protect the public welfare from any known or anticipated adverse effects associated with the presence of such air pollutant in the ambient air [42 USC 7409(b)(2)]. The primary NAAQS were established, with a margin of safety, considering long-term exposure for the most sensitive groups in the general population (i.e., children, senior citizens, and people with breathing difficulties). The NAAQS are presented in Table 4.2-2 (CARB 2016).

4.2.2.2 State Air Quality Regulations

a. California Ambient Air Quality Standards

The U.S. EPA allows states the option to develop different (stricter) standards. The state of California has developed the California Ambient Air Quality Standards (CAAQS) and generally has set more stringent limits on the criteria pollutants (see Table 4.2-2). In addition to the federal criteria pollutants, the CAAQS also specify standards for visibility-reducing particles, sulfates, hydrogen sulfide, and vinyl chloride (see Table 4.2-2). Similar to the federal CAA, the state classifies specific geographic areas as either "attainment" or "nonattainment" areas for each pollutant based on the comparison of measured data with the CAAQS.

The state of California is divided geographically into 15 air basins for managing the air resources of the state on a regional basis. Areas within each air basin are considered to share the same air masses, and therefore are expected to have similar ambient air quality. If an air basin is not in either federal or state attainment for a particular pollutant, the basin is classified as a moderate, serious, severe, or extreme nonattainment area for that pollutant (there is also a marginal classification for federal nonattainment areas). Once a nonattainment area has achieved the air quality standards for a particular pollutant, it may be redesignated to an attainment area for that pollutant. To be redesignated, the area must meet air quality standards and have a 10-year plan for continuing to meet and maintain air quality standards, as well as satisfy other requirements of the federal CAA. Areas that have been redesignated to attainment are called maintenance areas.

Table 4.2-2
Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[1]		National Standards[2]		
		Concentration[3]	Method[4]	Primary[3,5]	Secondary[3,6]	Method[7]
Ozone[8]	1 Hour	0.09 ppm (180 µg/m^3)	Ultraviolet Photometry	–	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.07 ppm (137 µg/m^3)		0.070 ppm (137 µg/m^3)		
Respirable Particulate Matter (PM_{10})[9]	24 Hour	50 µg/m^3	Gravimetric or Beta Attenuation	150 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m^3		–		
Fine Particulate Matter ($PM_{2.5}$)[9]	24 Hour	No Separate State Standard		35 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m^3	Gravimetric or Beta Attenuation	12 µg/m^3	15 µg/m^3	
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m^3)	Non-dispersive Infrared Photometry	35 ppm (40 mg/m^3)	–	Non-dispersive Infrared Photometry
	8 Hour	9.0 ppm (10 mg/m^3)		9 ppm (10 mg/m^3)	–	
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m^3)		–	–	
Nitrogen Dioxide (NO_2)[10]	1 Hour	0.18 ppm (339 µg/m^3)	Gas Phase Chemi-luminescence	100 ppb (188 µg/m^3)	–	Gas Phase Chemi-luminescence
	Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)		0.053 ppm (100 µg/m^3)	Same as Primary Standard	
Sulfur Dioxide (SO_2)[11]	1 Hour	0.25 ppm (655 µg/m^3)	Ultraviolet Fluorescence	75 ppb (196 µg/m^3)	–	Ultraviolet Fluorescence; Spectro-photometry (Pararosaniline Method)
	3 Hour	–		–	0.5 ppm (1,300 µg/m^3)	
	24 Hour	0.04 ppm (105 µg/m^3)		0.14 ppm (for certain areas)[11]	–	
	Annual Arithmetic Mean	–		0.030 ppm (for certain areas)[11]	–	
Lead[12,13]	30 Day Average	1.5 µg/m^3	Atomic Absorption	–	–	High Volume Sampler and Atomic Absorption
	Calendar Quarter	–		1.5 µg/m^3 (for certain areas)[12]	Same as Primary Standard	
	Rolling 3-Month Average	–		0.15 µg/m^3		
Visibility Reducing Particles[14]	8 Hour	See footnote 14	Beta Attenuation and Transmittance through Filter Tape	No National Standards		
Sulfates	24 Hour	25 µg/m^3	Ion Chroma-tography			
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m^3)	Ultraviolet Fluorescence			
Vinyl Chloride[12]	24 Hour	0.01 ppm (26 µg/m^3)	Gas Chroma-tography			

See footnotes on next page.

Table 4.2-2
Ambient Air Quality Standards

SOURCE: CARB 2016.

ppm = parts per million; ppb = parts per billion; µg/m^3 = micrograms per cubic meter; – = not applicable.

[1] California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, particulate matter (PM_{10}, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[2] National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m^3 is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.

[3] Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[4] Any equivalent measurement method which can be shown to the satisfaction of the Air Resources Board to give equivalent results at or near the level of the air quality standard may be used.

[5] National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

[6] National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[7] Reference method as described by the U.S. EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the U.S. EPA.

[8] On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

[9] On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 µg/m^3 to 12.0 µg/m^3. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m^3, as was the annual secondary standards of 15 µg/m^3. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m^3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

[10] To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national standards are in units of ppb. California standards are in units of ppm. To directly compare the national standards to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

[11] On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated non-attainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.
Note that the 1-hour national standard is in units of ppb. California standards are in units of ppm. To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

[12] The Air Resources Board has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[13] The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 µg/m^3 as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated non-attainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

[14] In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

b. Toxic Air Contaminants

A toxic air contaminant (TAC) is any air pollutant that may cause or contribute to an increase in mortality or serious illness, or that may pose a present or potential hazard to human health. The public's exposure to TACs is a significant public health issue in California. Diesel-exhaust particulate matter emissions have been established as TACs. In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health (Assembly Bill [AB] 1807: Health and Safety Code Sections 39650–39674). The California Legislature established a two-step process to address the potential health effects from TACs. The first step is the risk assessment (or identification) phase. The second step is the risk management (or control) phase of the process.

The California Air Toxics Program establishes the process for the identification and control of TACs and includes provisions to make the public aware of significant toxic exposures and for reducing risk. Additionally, the Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, 1987, Connelly Bill) was enacted in 1987 and requires stationary sources to report the types and quantities of certain substances routinely released into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, to identify facilities having localized impacts, to ascertain health risks, to notify nearby residents of significant risks, and to reduce those significant risks to acceptable levels. The Children's Environmental Health Protection Act, California Senate Bill 25 (Chapter 731, Escutia, Statutes of 1999), focuses on children's exposure to air pollutants. The act requires CARB to review its air quality standards from a children's health perspective, evaluate the statewide air quality monitoring network, and develop any additional air toxic control measures needed to protect children's health.

Locally, toxic air pollutants are regulated through the SCAQMD's Regulation XIV. Of particular concern statewide are diesel-exhaust particulate matter emissions. Diesel-exhaust particulate matter was established as a TAC in 1998 and is estimated to represent a majority of the cancer risk from TACs statewide (based on the statewide average). Diesel exhaust is a complex mixture of gases, vapors, and fine particles. This complexity makes the evaluation of health effects of diesel exhaust a complex scientific issue. Some of the chemicals in diesel exhaust, such as benzene and formaldehyde, have been previously identified as TACs by the CARB and are listed as carcinogens either under the state's Proposition 65 or under the federal Hazardous Air Pollutants program.

Following the identification of diesel particulate matter (DPM) as a TAC in 1998, CARB has worked on developing strategies and regulations aimed at reducing the risk from DPM. The overall strategy for achieving these reductions is found in the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles (CARB 2000). To monitor the effectiveness of the efforts to reduce DPM, CARB has supported field campaigns that measure real-world emissions from heavy-duty vehicles, and results indicate that regulations aimed at reducing emissions of DPM have been successful.

In April 2005, CARB published the *Air Quality and Land Use Handbook: A Community Health Perspective* (CARB 2005). The handbook makes recommendations directed at protecting sensitive land uses from air pollutant emissions while balancing a myriad of other land use issues (e.g., housing, transportation needs, economics, etc.). It notes that the handbook is not regulatory or binding on local agencies and recognizes that application takes a qualitative approach. As reflected

in the CARB handbook, there is currently no adopted standard for the significance of health effects from mobile sources. Therefore, the CARB has provided guidelines for the siting of land uses near heavily traveled roadways. Of pertinence to this impact analysis, the CARB guidelines indicate that siting new sensitive land uses within 500 feet of a freeway or an urban road with 100,000 or more vehicles per day should be avoided when possible. Based on vehicle counts conducted by the California Department of Transportation (Caltrans) in 2021, in the vicinity of the City, Interstate 5 (I-5), Interstate 405 (I-405), State Route 55 (SR-55), and State Route 73 (SR-73) currently carry more than 100,000 vehicles per day (Caltrans 2021). The Level of Service Traffic Study determined that there are no roadway segments within the City with traffic volumes that exceed 100,000 vehicle trips per day (Iteris 2024).

As an ongoing process, CARB continues to establish new programs and regulations for the control of diesel-particulate and other air-toxics emissions as appropriate. The continued development and implementation of these programs and policies will ensure that the public's exposure to diesel particulate matter will continue to decline.

c. State Implementation Plan

The State Implementation Plan (SIP) is a collection of documents that set forth the state's strategies for achieving the NAAQS. In California, the SIP is a compilation of new and previously submitted plans, programs (such as monitoring, modeling, permitting, etc.), district rules, state regulations, and federal controls. The CARB is the lead agency for all purposes related to the SIP under state law. Local air districts and other agencies, such as the Department of Pesticide Regulation and the Bureau of Automotive Repair, prepare SIP elements and submit them to CARB for review and approval. The CARB then forwards SIP revisions to the U.S. EPA for approval and publication in the *Federal Register*. All of the items included in the California SIP are listed in the Code of Federal Regulations (CFR) at 40 CFR 52.220.

As the regional air quality management district, the SCAQMD is responsible for preparing and implementing the portion of the SIP applicable to the Basin. The air pollution control district for each county adopts rules, regulations, and programs to attain federal and state air quality standards, and appropriates money (including permit fees) to achieve these objectives.

d. California Code of Regulations Title 13: Motor Vehicles

California Code of Regulations, Title 13: Division 3, Chapter 10, Article 1, Section 2485: Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling. This measure seeks to reduce public exposure to DPM and other air contaminants by establishing idling restrictions, emission standards, and other requirements for heavy-duty diesel engines and alternative idle reduction technologies to limit the idling of diesel-fueled commercial motor vehicles. Any person that owns, operates, or causes to operate any diesel-fueled commercial motor vehicle must not allow a vehicle to idle for more than 5 consecutive minutes at any location or operate a diesel-fueled auxiliary power system for greater than 5 minutes at any location when within 100 feet of a restricted area.

California Code of Regulations, Title 13: Division 3, Chapter 9, Article 4.8, Section 2449: General Requirements for In-Use Off-Road Diesel-Fueled Fleets. This measure regulates NOX, DPM, and other criteria pollutant emissions from in-use, off-road diesel-fueled vehicles. This measure also requires each fleet to meet fleet average requirements or demonstrate that it has met "best available control technology" requirements. Additionally, this measure requires medium and large fleets to have a written idling policy that is made available to operators of the vehicles informing them that idling is limited to 5 consecutive minutes or less.

4.2.2.3 Regional Air Quality Regulations Air Quality Regulations

a. South Coast Air Quality Management District

The SCAQMD is the air pollution control agency in the Basin. The role of the local SCAQMD is to protect the people and the environment of the Basin from the effects of air pollution. SCAQMD shares responsibility with CARB for ensuring that NAAQS and CAAQS are achieved and maintained within the Basin. As the SCAQMD is designated as a nonattainment area for state air quality standards for 8-hour ozone, PM_{10}, and $PM_{2.5}$, SCAQMD periodically prepares air quality management plans (AQMPs) outlining measures to reduce these pollutants. The most recent AQMP is the 2022 Air Quality Management Plan (2022 AQMP). Additionally, SCAQMD provides the following rules and regulations:

- SCAQMD Rule 402 prohibits a person from discharging from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

- SCAQMD Rule 403 governs emissions of fugitive dust during construction and operation activities. Compliance with this rule is achieved through the application of standard BMPs, such as the application of water or chemical stabilizers to disturbed soils, covering haul vehicles, restricting vehicle speeds on unpaved roads to 15 miles per hour (mph), sweeping loose dirt from paved site access roadways, cessation of construction activity when winds exceed 25 mph, and establishing a permanent ground cover on finished sites.

  Rule 403 requires that fugitive dust be controlled with the Best Available Control Measures so that the presence of such dust does not remain visible in the atmosphere beyond the property line of the emission source. In addition, SCAQMD Rule 403 requires implementation of dust suppression techniques to prevent fugitive dust from creating a nuisance off-site. Applicable dust suppression techniques from Rule 403 are summarized below. Implementation of these dust suppression techniques can reduce the fugitive dust generation (and thus the PM10 component). Compliance with these rules would reduce impacts on nearby sensitive receptors. Rule 403 measures may include, but are not limited to, the following:

  - Apply non-toxic chemical soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for 10 days or more).

- Water active sites at least three times daily. (Locations where grading is to occur will be thoroughly watered prior to earthmoving.)
- Cover all trucks hauling dirt, sand, soil, or other loose materials or maintain at least 0.6 meters (2 feet) of freeboard (vertical space between the top of the load and top of the trailer) in accordance with the requirements of California Vehicle Code Section 23114.
- Reduce traffic speeds on all unpaved roads to 15 mph or less.
- Suspension of all grading activities when wind speeds (including instantaneous wind gusts) exceed 25 mph.
- Provide bumper strips or similar BMPs where vehicles enter and exit the construction site onto paved roads or wash off trucks and any equipment leaving the site each trip.
- Replant disturbed areas as soon as practical.
- During all construction activities, sweep on-site and off-site streets if silt is carried to adjacent public thoroughfares to reduce the amount of particulate matter on public streets. All sweepers shall be compliant with SCAQMD Rule 1186.1, Less Polluting Sweepers.

- SCAQMD Rule 1113 governs the sale, use, and manufacturing of architectural coating and limits the VOC content in paints and paint solvents. This rule regulates the VOC content of paints available during construction. Therefore, all paints and solvents used during construction and operation of the project must comply with SCAQMD Rule 1113.

- Rule 1466, Soil Disturbance. Projects that involve earth-moving activities of more than 50 cubic yards of soil with applicable toxic air contaminants are subject to this rule

b. SCAQMD Amicus Brief

A recent Supreme Court of California decision, *Sierra Club v. County of Fresno* (2019) 6 Cal. 5th 502 ("Friant Ranch"; California Supreme Court 2019), found that the EIR prepared for the Friant Ranch Specific Plan was inadequate because it did not relate the expected adverse air quality impacts to likely health consequences, or explain why it was not feasible to provide such an analysis. In response, the SCAQMD has provided amicus briefs explaining the difficulties in providing correlation between regional pollutant emissions and human health. Since the project would result in emissions of criteria pollutants, the California Supreme Court decision and the SCAQMD's amicus briefs are relevant to the project.

The California Supreme Court conceded that an explanation of the connection between an individual project's pollutant emissions in excess of thresholds and human health effects may not be possible given the current state of environmental science modeling. However, the California Supreme Court concluded that the Friant Ranch Project EIR itself must explain, in a manner reasonably calculated to inform the public, the scope of what is, and is not yet known, about the effect of the project's significant and unavoidable air quality impacts on human health. The specific language provided by the Court is provided below.

> The EIR fails to provide an adequate discussion of health and safety problems that will be caused by the rise in various pollutants resulting from the Project's development. At this point, we cannot know whether the required additional analysis

> will disclose that the Project's effects on air quality are less than significant or unavoidable, or whether that analysis will require reassessment of proposed mitigation measures. Absent an analysis that reasonably informs the public how anticipated air quality effects will adversely affect human health, an EIR may still be sufficient if it adequately explains why it is not scientifically feasible at the time of drafting to provide such an analysis.

With regard to the analysis of air quality-related health impacts, the SCAQMD has stated that "EIRs must generally quantify a project's pollutant emissions, but in some cases it is not feasible to correlate these emissions to specific, quantifiable health impacts (e.g., premature mortality; hospital admissions)." In such cases, a general description of the adverse health impacts resulting from the pollutants at issue may be sufficient.

The SCAQMD has further stated that from a scientific standpoint, it takes a large amount of additional precursor emissions to cause a modeled increase in ambient ozone levels over an entire region. SCAQMD further acknowledges that it may be feasible to analyze air quality related health impacts for projects on a regional scale with very high emissions of oxides of nitrogen (NOx) and volatile organic compounds (VOCs), where impacts are regional. The example SCAQMD provided was for proposed Rule 1315, which authorized various newly permitted sources to use offsets from the SCAQMD's "internal bank" of emission reductions. The California Environmental Quality Act (CEQA) analysis accounted for essentially all of the increases in emissions due to new or modified sources in the District between 2010 and 2030, or approximately 6,620 pounds per day of NOx and 89,947 pounds per day of VOC, to expected health outcomes from ozone and particulate matter (e.g., 20 premature deaths per year and 89,947 school absences in the year 2030 due to ozone).

c. Multiple Air Toxics Exposure Study

The Multiple Air Toxics Exposure Study (MATES) is a monitoring and evaluation study conducted in the Basin. The MATES V study, which is a follow up to previous air toxics studies in the Basin includes a fixed site monitoring program with 10 stations, an inventory of TACs, and a modeling effort to characterize risk across the Basin. The purpose of the MATES V fixed site monitoring is to characterize long-term regional air toxics levels in residential and commercial areas. MATES V predicts that the excess cancer risk for the City ranges from 250 to 450 in a million (SCAQMD 2021). The MATES IV study represents the baseline health risk for a cumulative analysis. The MATES VI update is currently being conducted.

4.2.2.4 Local Regulations

a. Municipal Code

Title 4 (Public Safety), Division 21 (Reduction of Air Pollution from Motor Vehicles)

This division is intended to support the SCAQMD's imposition of the vehicle registration fee and to bring the City into compliance with the requirements set forth in Health and Safety Code Section 44243 in order to receive fee revenues for the purpose of implementing programs to reduce air pollution from motor vehicles.

Title 5 (Planning), Division 10 (Grading Code and Encroachment Regulations), Chapter 1 (Grading Code)

The City's Grading Code establishes rules and regulations to control excavation, grading, and earthwork construction (including fills and embankments), and establishes administrative requirements for issuance of permits, approval of plans, and inspection of grading construction in accordance with the requirements for grading and excavation contained in the Uniform Building Code as adopted and modified by City ordinance. The Grading Code also outlines dust control requirements. For example, as outlined in Section 5-10-127 (Import and export of earth material), where an excess of 5,000 cubic yards of earth material per project site is moved on public roadways from or to the site of an earth grading operation, the following requirements shall apply:

A. Either water or dust palliative or both must be applied for the alleviation or prevention of excessive dust resulting from the loading or transportation of earth from, to or within the project site on public roadways. The permittee shall be responsible for maintaining public rights-of-way used for hauling purposes in a condition free of dust, earth or debris attributed to the grading operation.

b. Existing Plans, Programs, and Policies

Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required of the proposed project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute mitigation measures. The following measures are existing plans, programs, or policies (PPP) that apply to the proposed project and will help to reduce and avoid potential impacts related to air quality:

- PPP AQ-1 Construction activities will be conducted in compliance with California Code of Regulations, Title 13, Section 2449, which requires that nonessential idling of construction equipment be restricted to five minutes or less.
- PPP AQ-2 Construction activities will be conducted in compliance with any applicable SCAQMD rules and regulations, including but not limited to:
  - Rule 403, Fugitive Dust, for controlling fugitive dust and avoiding nuisance.
  - Rule 402, Nuisance, which states that a project shall not "discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property."
  - Rule 1113, which limits the volatile organic compound content of architectural coatings.
  - Rule 1466, Soil Disturbance. Projects that involve earth-moving activities of more than 50 cubic yards of soil with applicable toxic air contaminants are subject to this rule.
- PPP AQ-3: Compliance with the City of Irvine's Grading Code.
- PPP AQ-4: Compliance with the City of Irvine's Municipal Code guidance to reduce air pollution from motor vehicles.

Proposed General Plan Strategies and Policies

In addition to the above-listed PPPs, the following proposed goals, objectives, policies, and implementation actions are applicable to the analysis of air quality and would replace existing goals, strategies, and policies outlined in the City's existing General Plan following project approval:

Environmental Protection and Climate Action Element

Goal 4: Improve air quality and protect public health in Irvine by reducing air pollution and minimizing harmful emissions from various sources.

Objective EPCA-4. Achieve and maintain compliance with air quality standards set by regulatory agencies, such as the Environmental Protection Agency (EPA) and the California Air Resources Board (CARB), to ensure a healthy and sustainable environment for residents.

- **Policy (a):** Support the adoption of low-emission and alternative fuel vehicles through incentives, rebates, and infrastructure development.
- **Policy (b):** Encourage industries and commercial establishments to implement emission control technologies and practices to minimize air pollution from manufacturing processes, construction activities, and other operations.
- **Policy (c):** Encourage the use of clean and renewable energy sources, such as solar, wind, and geothermal, to reduce emissions from energy generation and promote a transition away from fossil fuels.

Goal 11: Foster a sustainable transportation system in Irvine that promotes air quality and enhances community resilience to climate change impacts.

Objective EPCA-11. Implement policies and initiatives that promote active transportation, public transit, and low-emission vehicles to reduce reliance on single-occupancy vehicles, minimize traffic congestion, and enhance mobility options for residents of all ages and abilities.

- **Policy (a):** Develop and maintain a comprehensive network of pedestrian-friendly sidewalks, bicycle lanes, and multi-use trails that connect residential neighborhoods, commercial districts, employment centers, and public amenities.
- **Policy (b):** Implement complete streets policies and design standards that prioritize safe and accessible walking, biking, and rolling infrastructure, including ADA-compliant facilities, pedestrian crossings, and bicycle parking facilities, in all transportation projects and street improvements.
- **Policy (c):** Encourage transit-oriented development (TOD) and mixed-use zoning around transit stations and major transit corridors to promote compact, walkable neighborhoods, reduce automobile dependency, and support sustainable land use patterns that integrate housing, jobs, and amenities.
- **Policy (d):** Expand the availability of EV charging stations, particularly in public parking facilities, multi-family residential complexes, commercial areas, and workplaces, to facilitate EV adoption and reduce range anxiety for drivers of electric vehicles.

4.2.3 Significance Determination Thresholds

Thresholds used to evaluate impacts to air quality are based on applicable criteria in the CEQA Guidelines (California Code of Regulations Sections 15000-15387), Appendix G. A significant impact would occur if the project would:

1) Conflict with or obstruct implementation of the applicable air quality plan;
2) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standards;
3) Expose sensitive receptors to substantial pollutant concentrations; or
4) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

4.2.3.1 SCAQMD Significance Thresholds

As discussed previously, the SCAQMD is the air pollution control agency responsible for protecting the people and the environment of the Basin from the effects of air pollution. Accordingly, the City evaluates project air quality emissions based on the quantitative emission thresholds originally established in the SCAQMD's CEQA Air Quality Handbook (SCAQMD 1993, 2023).

a. Regional Significance Thresholds

SCAQMD has adopted regional construction and operational emissions thresholds to determine a project's cumulative impact on air quality in the Basin. SCAQMD's significance thresholds for impacts to regional air quality are shown in Table 4.2-3.

Table 4.2-3
SCAQMD Air Quality Significance Thresholds – Mass Daily Thresholds

Pollutant	Emissions (pounds)	
	Construction	Operational
Oxides of Nitrogen (NO_X)	100	55
Volatile Organic Compounds (VOC)	75	55
Coarse Particulate Matter (PM_{10})	150	150
Fine Particulate Matter ($PM_{2.5}$)	55	55
Oxides of Sulfur (SO_X)	150	150
Carbon Monoxide (CO)	550	550
Lead (Pb)*	3	3
SOURCE: SCAQMD Air Quality Significance Thresholds (SCAQMD 2023).		

Projects that exceed the regional significance threshold contribute to the nonattainment designations of the Basin. The attainment designations are based on the AAQS, which are set at levels of exposure that are determined to not result in adverse health effects. Projects that do not exceed the regional significance thresholds in Table 4.2-3 would not violate any air quality standards or contribute substantially to an existing or projected air quality violation.

b. Localized Significance Thresholds

The SCAQMD's Final Localized Significance Threshold (LST) Methodology was developed as a tool to assist lead agencies to analyze localized air quality impacts to sensitive receptors in the vicinity of the project (SCAQMD 2008). Emissions of NO_2, CO, PM_{10}, and $PM_{2.5}$ generated at a project site could expose sensitive receptors to substantial concentrations of criteria air pollutants. Off-site mobile-source emissions are not included in the LST analysis. A project would generate a significant impact if it generates emissions that would violate the NAAQS or CAAQS (see Table 4.2-2) when added to the local background concentrations.

4.2.4 Methodology

Air quality impacts can result from the construction and operation of a project. Construction impacts are short term and result from fugitive dust, equipment exhaust, and indirect effects associated with construction workers and deliveries. Operational impacts can occur on two levels: regional impacts resulting from development or local effects stemming from sensitive receivers being placed close to roadways or stationary sources. Approval of the project would not specifically permit the construction of an individual project, and no specific development details are available at this program level of analysis. For the purposes of this analysis, emissions were calculated for buildout of the City's adopted General Plan (No Project Alternative) and buildout of the project.[1]

4.2.4.1 Construction Emissions

Construction-related activities are temporary, short-term sources of air emissions. Sources of construction-related air emissions include the following:

- Fugitive dust from grading activities;
- Construction equipment exhaust;
- Construction-related trips by workers, delivery trucks, and material-hauling trucks; and
- Construction-related power consumption.

Air pollutants generated by future development within the City would vary depending upon the number of projects occurring simultaneously and the size of each individual project. Construction-related emissions are likely to occur over time in locations dispersed throughout the City. As construction emissions create temporary, short-term sources of air emissions, evaluation of emissions of buildout of all future site-specific uses would not provide a reasonable estimation of construction emissions. Additionally, since all construction emissions will not occur at once, it would overestimate emissions at any one time. As such, construction-related emissions cannot be accurately determined at the program level of analysis. In order to consider the potential impact associated with construction emissions resulting from the project, a hypothetical project construction

[1] This scenario considers buildout of the project plus additional cumulative projects that are assumed to be built in the background conditions in both the City and in surrounding jurisdictions, including known future residential development in adjacent cities.

emission scenario was evaluated based on development of a large-scale project (1,500 units, with an average size of 670 square-feet [small apartments], on a 15-acre site). This analysis scenario would capture both emissions of a large individual construction project occurring at one time, in addition to several smaller construction projects occurring simultaneously in the same area. Since impacts of construction emissions are associated with emissions potentially exceeding thresholds in a localized area, affecting nearby sensitive receptors, this analysis approach would effectively characterize construction emissions associated with the project over time as housing is developed. CalEEMod modeling output files for construction activities are presented in Appendix B.

4.2.4.2 Operational Emissions

Operational emissions are long-term and include mobile, energy, and area sources. Sources of operational emissions associated with future development under the project include the following:

- Vehicle traffic;
- Natural gas consumption; and
- Area sources including architectural coatings, consumer products, fireplaces, and landscaping equipment.

Air pollutants generated by all land uses within the City were calculated for buildout of the City's adopted General Plan (No Project Alternative) and buildout of the project. The results of the emissions modeling are presented in Appendix B. Actual emissions would vary depending on future site-specific projects.

4.2.5 Topic 1: Air Quality Plans

Would the project conflict with or obstruct implementation of the applicable air quality plan?

4.2.5.1 Impact Analysis

The California CAA requires air basins that are designated nonattainment of state AAQS for criteria pollutants prepare and implement plans to attain the standards by the earliest practicable date. The Basin is designated as in attainment or unclassifiable attainment (expected to be meeting the standard despite a lack of monitoring data) for all federal air quality standards except 8-hour ozone and 2.5-micron particulate matter ($PM_{2.5}$) standards. The Basin is designated as in nonattainment for state air quality standards for 8-hour ozone and $PM_{2.5}$, and additionally is in nonattainment of state 10-micron particulate matter (PM_{10}) standards. The regional air quality plan, the 2022 AQMP, outlines measures to reduce emissions of ozone and $PM_{2.5}$. Reducing PM concentrations is achieved by reducing emissions of $PM_{2.5}$ to the atmosphere, reducing ozone concentrations is achieved by reducing the precursors of photochemical formation of ozone, VOC, and NO_X.

The growth forecasting for the AQMP is based in part on the land uses established by local general plans. These emissions budgets are used in statewide air quality attainment planning efforts. As such, projects that propose development at an intensity equal to or less than population growth projections and land use intensity are inherently consistent with the AQMP. Amending the adopted land uses to change development potential would not necessarily result in an inconsistency between

the current air quality plans (that are based on the City's adopted General Plan) and the project. Projects that propose a different land use than is identified in the local general plan may also be considered consistent with the AQMP if the proposed land use is less intensive than buildout under the current designation. For projects that propose a land use that is more intensive than the current designation, analysis that is more detailed is required to assess conformance with the AQMP. Consistency with the AQMP is further evaluated by comparing emissions that would occur under buildout of the City's adopted General Plan to the emissions that would occur under buildout of the project.

The two principal criteria for conformance with an AQMP are:

1. Whether the project would exceed the assumptions in the AQMP.

2. Whether the project would result in an increase in the frequency or severity of existing air quality violations, cause or contribute to new violations, or delay timeline attainment of air quality standards.

a. Criterion No. 1

The county-wide population would be the same under buildout of both the City's adopted General Plan and the project. As described in Section 4.11.5.1 below, future development under the project would accommodate increases in population based on SCAG's demographic projections, and would therefore not induce unplanned growth. Furthermore, the project would reduce VMT compared to buildout of the adopted General Plan. This reduction is due to the fact the City currently is a major employment center with a high jobs-to-population ratio. The City has more jobs than can be sustained by the City's own population. Shifting towards a more balanced jobs/population ratio as would occur under the project due to the introduction of more housing units within the City (a major employment center) can be expected to improve VMT metrics. Most of the future residential growth would occur in the three focus areas which include areas of the City that are most suited for new growth and development as they are located near existing job centers, which would reduce VMT. This reduction in VMT would in turn lead to a reduction in operational air quality emissions. Table 4.2-4 presents a comparison of operations emissions under buildout of the City's adopted General Plan and buildout of the project. Calculations are provided in Appendix B.

Table 4.2-4 Total Operational Emissions for the City						
Source	Pollutant (pounds per day)					
	VOC	NO_X	CO	SO_x	PM_{10}	$PM_{2.5}$
Adopted General Plan (2045)						
Mobile Source	1,068.28	1,839.69	33,999.83	119.11	14,476.88	3,698.14
Area Source	8,723.10	2,194.52	14,295.12	14.68	191.12	187.78
Energy Source	84.10	1,489.51	994.74	9.17	116.20	116.20
TOTAL	**9,875.47**	**5,523.72**	**49,289.69**	**142.96**	**14,784.21**	**4,002.13**
Project (2045)						
Mobile Source	56.42	88.80	1,795.78	6.29	764.63	195.33
Area Source	2,127.01	1,204.91	4,561.45	7.63	96.28	95.82
Energy Source	21.44	367.06	160.16	2.34	29.63	29.63
TOTAL	**2,204.88**	**1,660.77**	**6,517.39**	**16.26**	**890.54**	**320.78**
Change (Project – Adopted General Plan)	**-7,670.59**	**-3,862.95**	**-42,772.30**	**-126.70**	**-13,893.67**	**-3,681.35**

As shown in Table 4.2-4, buildout of the project would result in a decrease in emissions when compared to buildout of the City's adopted General Plan. Therefore, buildout of the project would not exceed the assumptions used to develop the AQMP.

b. Criterion No. 2

As previously stated, the Basin is designated as in attainment or unclassifiable attainment (expected to be meeting the standard despite a lack of monitoring data) for all federal air quality standards except 8-hour ozone and 2.5-micron particulate matter ($PM_{2.5}$) standards. The Basin is designated as in nonattainment for state air quality standards for 8-hour ozone and $PM_{2.5}$, and additionally is in nonattainment of state 10-micron particulate matter (PM_{10}) standards.

Because the proposed General Plan Update involves long-term growth associated with buildout of the City, cumulative emissions generated from operation of individual development projects would exceed the SCAQMD regional and localized thresholds (see discussion under Impact 2, below). Consequently, emissions generated during the construction of development projects in addition to existing sources in the City are considered to cumulatively contribute to the nonattainment designations of the Basin. Future development would be required to adhere to the requirements of California Code of Regulations, Title 13, Section 2449 to reduce nonessential idling (PPP AQ-1), the construction requirements of SCAQMD rules and regulations (PPP AQ-2), and the requirements of the City's grading code (PPP AQ-3).

The goals, objectives, and policies in the Environmental Protection and Climate Action (EPCA) Element would further support the City's goal of reducing air emissions by improving air quality and protect public health in Irvine by reducing air pollution and minimizing harmful emissions from various sources and achieving and maintaining compliance with air quality standards set by regulatory agencies (EPCA Policy). Refer to the above-listed EPCA goals and policies for a comprehensive list of applicable goals, objectives and policies related to air quality.

Despite adherence to these policies and compliance with Standard Conditions and PPPs, buildout of the project could contribute to an increase in frequency or severity of air quality violations and delay attainment of the AAQS or interim emission reductions in the AQMP, and emissions generated from buildout would result in a significant air quality impact. Therefore, the General Plan Update would not be consistent with the AQMP under the second criterion and mitigation requiring project-specific air quality analyses is required (mitigation measure AQ-1).

4.2.5.2 Significance of Impacts

Although the project would not exceed the assumptions used to develop the 2022 AQMP, construction activities associated with the project would result in an increase in the frequency or severity of existing air quality violations. Therefore, the project would conflict with implementation of the AQMP, and impacts would be potentially significant.

4.2.5.3 Mitigation

AQ-1: Applications for future development, wherein the Director of Community Development or their designee has determined a potential for air quality impacts associated with construction, shall prepare and submit a technical assessment evaluating potential project construction-related air quality impacts to the City for review and approval. The Director of Community Development or their designee shall make this determination based on the size of the project, whether the project would require a transportation impact analysis, or other criteria. The evaluation shall be prepared in conformance with South Coast Air Quality Management District (SCAQMD) methodology for assessing air quality impacts. The City shall require that applicants for new development projects with the potential to exceed the SCAQMD's adopted thresholds of significance to incorporate the measures listed below to reduce air pollutant emissions during construction activities. These identified measures shall be incorporated into all appropriate construction documents (e.g., construction management plans) submitted to the City and shall be verified by the City. Mitigation measures to reduce construction-related emissions could include, but are not limited to:

- Require fugitive-dust control measures that exceed SCAQMD's Rule 403 requirements, such as:
  - Use of nontoxic soil stabilizers to reduce wind erosion.
  - Apply water every four hours to active soil-disturbing activities.
  - Tarp and/or maintain a minimum of 24 inches of freeboard on trucks hauling dirt, sand, soil, or other loose materials.
- Use construction equipment rated by the United States Environmental Protection Agency as having Tier 3 (model year 2006 or newer) or Tier 4 (model year 2008 or newer) emission limits, applicable for engines between 50 and 750 horsepower.
- Ensure that construction equipment is properly serviced and maintained to the manufacturer's standards.
- Limit nonessential idling of construction equipment to no more than five consecutive minutes.
- Limit on-site vehicle travel speeds on unpaved roads to 15 miles per hour.

- Install wheel washers for all exiting trucks or wash off all trucks and equipment leaving the project area.
- Use Super-Compliant VOC paints for coating of architectural surfaces whenever possible. A list of Super-Compliant architectural coating manufactures can be found on the SCAQMD's website.

4.2.5.4 Significance of Impacts after Mitigation

The project would not exceed the assumptions used to develop the 2022 AQMP. However, construction activities associated with buildout of the project could generate short-term emissions that exceed the SCAQMD's significance thresholds during this time and cumulatively contribute to the nonattainment designations of the Basin. Implementation of mitigation measure AQ-1 would reduce criteria air pollutant emissions from construction-related activities to the extent feasible. However, construction time frames and equipment for site-specific development projects are not available at this time, and there is a potential for multiple development projects to be constructed at one time, resulting in significant construction-related emissions. Therefore, despite adherence to mitigation measure AQ-1, impacts associated with criteria pollutants would remain significant and unavoidable.

4.2.6 Topic 2: Criteria Pollutants

Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standards?

4.2.6.1 Impact Analysis

Air quality impacts can result from the construction and operation of a project. Construction impacts are short-term and result from fugitive dust, equipment exhaust, and indirect effects associated with construction workers and deliveries. Operational impacts can occur on two levels: regional impacts resulting from development or local effects stemming from sensitive receivers being placed close to roadways or stationary sources. In the case of the project, operational impacts would primarily be due to emissions from mobile sources associated with vehicular travel along the roadways.

a. Construction

The proposed project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

As discussed in Section 4.2.4.1 above, a residential project consisting of 1,500 units, with an average size of 670 square-feet (small apartments), on a 15-acre site was modeled to illustrate potential construction-related air quality impacts associated with future development under the project. The results are summarized in Table 4.2-5. CalEEMod output is contained in Appendix B.

Table 4.2-5 Construction Emissions – 15-Acre Mixed-Use Project						
Construction Phase	Pollutant (pounds per day)					
	VOC	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$
Maximum Daily Emissions	**315.37**	**31.70**	**76.14**	**<1**	**21.25**	**11.41**
SCAQMD Significance Threshold	*75*	*100*	*550*	*150*	*150*	*55*

For assessing the significance of the air quality emissions resulting during construction of the hypothetical project, the construction emissions were compared to the SCAQMD Significance Thresholds. As shown in Table 4.2-5, construction of the hypothetical project would exceed the applicable threshold for VOC. Additionally, if several future site-specific projects were to occur simultaneously, there is the potential to exceed significance thresholds.

Future development would be required to implement construction Best Management Practices (BMPs) at all construction sites consistent with SCAQMD rules and regulations. Future construction activities would also be required to comply with PPP AQ-1, which outlines compliance with California Code of Regulations, Title 13, Section 2449, which itself requires that nonessential idling of construction equipment be restricted to five minutes or less. Future construction activities would also be conducted in compliance with any applicable SCAQMD rules and regulations, as outlined in PPP AQ-2, including but not limited to:

- Rule 403, Fugitive Dust, for controlling fugitive dust and avoiding nuisance.
- Rule 402, Nuisance, which states that a project shall not "discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property."
- Rule 1113, which limits the volatile organic compound content of architectural coatings.
- Rule 1466, Soil Disturbance. Projects that involve earth-moving activities of more than 50 cubic yards of soil with applicable toxic air contaminants are subject to this rule.

The modeled project is illustrative only. Approval of the project would not specifically permit the construction of an individual project, and no specific development details are available at this program level of analysis. The thresholds presented above would be applied to future development within the City on a project-by-project basis and are not used for assessment of regional planning impacts. The information is presented to illustrate the potential scope of air impacts for a site-specific project that could be developed in the future. Additionally, the regulations at the federal, state, and local level provide a framework for developing project-level air quality protection measures for future projects.

The City's process for the evaluation of future discretionary projects would include environmental review and documentation pursuant to CEQA where applicable, as well as an analysis of those site-specific projects for consistency with the goals, policies, and recommendations of the General Plan. In addition to regulatory measures outlined above, mitigation imposed at the project-level may

include extension of construction schedules and/or use of special equipment and emission control measures in accordance with mitigation measure AQ-1.

While individual site-specific projects may not exceed the SCAQMD regional significance thresholds (demonstrated in Table 4.2-5), the scale and extent of construction activities associated with buildout of the City may result in some instances where future development would exceed the relevant SCAQMD thresholds. Therefore, construction-related regional air quality impacts would be potentially significant.

b. Operation

At the program level, the analysis compares emissions generated by project buildout to emissions generated under buildout of the City's adopted General Plan to determine if the emissions would exceed the emissions estimates included in the AQMP, and to determine whether it would obstruct attainment, or result in an exceedance of AAQS. Under this approach, the potential for future development within the City to result in a cumulatively considerable net increase in emissions based on the change in pollutant emissions that would result from buildout of the City's existing General Plan (adopted in 2000) in the year 2045 compared to buildout of the project in the year 2045. As shown in Table 2.4-4 above, buildout of the project would result in a decrease in emissions compared to buildout of the City's adopted General Plan. Most of the future residential growth would occur in the three focus areas that are most suited for new growth and development as they are located near existing job centers, which would reduce VMT and associated vehicle emissions.

The regulations at the federal, state, and local levels provide a framework for developing project-level air quality protection measures for future site-specific projects that could be developed in the future. The City's process for evaluation of future development that could be implemented under the project would also include environmental review and documentation pursuant to CEQA where applicable, as well as an analysis of those site-specific projects for consistency with the goals, policies, and recommendations of the project. While individual site-specific projects may not exceed the SCAQMD regional significance thresholds, the scale and extent of emissions associated with buildout of the project may result in some instances where future development would exceed the relevant SCAQMD thresholds. Therefore, operational regional air quality impacts would be potentially significant, and mitigation would be required (see mitigation measure AQ-2).

4.2.6.2 Significance of Impacts

a. Construction

The scale and extent of construction activities associated with buildout of the project could exceed the relevant SCAQMD thresholds for some future site-specific development projects. Construction impacts would be potentially significant, and mitigation would be required to implement construction practices and measures that would reduce emissions.

b. Operation

The project would not conflict with implementation of the AQMP,. However, the scale and extent of emissions associated with buildout of the project may result in some instances where operation of future development would exceed the relevant SCAQMD thresholds. Therefore, operational impacts would be potentially significant, and mitigation would be required to reduce emissions.

4.2.6.3 Mitigation

a. Construction

See mitigation measure AQ-1 above.

b. Operation

Impacts related to operational emissions would be significant, and the following mitigation shall be applied to future development:

AQ-2: For individual projects that may exceed the daily operational emissions thresholds established by the SCAQMD, the owner/permitee shall conduct an analysis of the project's operational air quality impacts using the latest available CalEEMod mode, or other analytical method determined in conjunction with the City. If such analyses identify potentially significant regional or local air quality impacts, project-level mitigation and/or project design features would be required to reduce operational impacts to less than significant. Mitigation to reduce operational impacts depends on the specific project, but may include measures such as, but not limited to:

- Demonstrate net zero energy expenditure.
- Implementation of transportation demand management measures.
- Prohibit the installation of woodstoves, hearths, and fireplaces in new construction facilitated by the General Plan Update.
- Expand and facilitate completion of planned networks of active transportation infrastructure.
- Implement electric vehicle charging infrastructure beyond requirements set forth in the 2022 CALGreen mandatory measures, such as Tier 2 voluntary measures set forth in 2022 CALGreen (or future more stringent) standards.
- Implement traffic demand measures, such as unbundling parking fees from rent/lease options, encouraging/developing a ride-share program for the community, and provide car/bike sharing services, that will reduce daily individual car usage and reduce project VMT.

4.2.6.4 Significance of Impacts after Mitigation

a. Construction

Buildout of the project would occur over a period of approximately 20 years or longer. Construction activities associated with buildout of the project could generate short-term emissions that exceed the SCAQMD's significance thresholds during this time and cumulatively contribute to the nonattainment designations of the Basin. Implementation of mitigation measure AQ-1 would reduce criteria air pollutant emissions from construction-related activities to the extent feasible. However, construction time frames and equipment for site-specific development projects are not available at this time, and there is a potential for multiple development projects to be constructed at one time, resulting in significant construction-related emissions. Therefore, despite adherence to mitigation measure AQ-1, impacts associated with criteria pollutants would remain significant and unavoidable.

b. Operation

The project would not conflict with implementation of the AQMP. Buildout of the project would occur over a period of approximately 20 years or longer. Operational emissions associated with buildout of the project could generate emissions that exceed the SCAQMD's significance thresholds during this time and cumulatively contribute to the nonattainment designations of the Basin. Implementation of mitigation measure AQ-2 would reduce criteria air pollutant emissions from construction-related activities to the extent feasible. However, site-specific development projects are not currently available, and there is a potential for operational emissions to exceed the SCAQMD's significance thresholds. Therefore, despite adherence to mitigation measure AQ-2, impacts associated with criteria pollutants would remain significant and unavoidable.

4.2.7 Topic 3: Sensitive Receptors

Would the project expose sensitive receptors to substantial pollutant concentrations?

4.2.7.1 Impact Analysis

a. Localized Carbon Monoxide Hot Spots

It has long been recognized that carbon monoxide (CO) hotspots are caused by vehicular emissions, primarily when idling at congested intersections. In response, vehicle emissions standards have become increasingly stringent in the last 20 years. Currently, the allowable CO emissions standard in California is a maximum of 3.4 grams/mile for passenger cars (there are requirements for certain vehicles that are more stringent). With the turnover of older vehicles, introduction of cleaner fuels, and implementation of increasingly sophisticated and efficient emissions control technologies, CO concentration in the SCAB is now designated as attainment. To establish a more accurate record of baseline CO concentrations affecting the SCAB a CO hotspot analysis was conducted in 2003 by the SCAQMD for four busy intersections in Los Angeles at the peak morning and afternoon time periods. This "hot spot" analysis did not predict any violation of CO standards. Based on the SCAQMD's 2003 AQMP and the 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan), peak carbon

monoxide concentrations in the SCAB were a result of unusual meteorological and topographical conditions and not a result of traffic volumes and congestion at a particular intersection. Similar considerations are also employed by other Air Districts when evaluating potential CO concentration impacts. More specifically, the Bay Area Air Quality Management District (BAAQMD) concludes that under existing and future vehicle emission rates, a given project would have to increase traffic volumes at a single intersection by more than 44,000 vehicles per hour (vph)—or 24,000 vph where vertical and/or horizontal air does not mix—in order to generate a significant CO impact. The busiest intersection evaluated was that at Wilshire Boulevard and Veteran Avenue in Los Angeles, which has a daily traffic volume of approximately 100,000 vph and AM/PM traffic volumes of 8,062 vph and 7,719 vph respectively. The 2003 AQMP estimated that the 1-hour concentration for this intersection was 4.6 parts per million (ppm); this indicates that, should the daily traffic volume increase four times to 400,000 vehicles per day, CO concentrations (4.6 ppm x 4= 18.4 ppm) would still not likely exceed the most stringent 1-hour CO standard (20.0 ppm). As such, the project considered herein along with background and cumulative development would not produce the volume of traffic required to generate a CO "hot spot" either in the context of the 2003 Los Angeles hot spot study or based on representative BAAQMD CO threshold considerations. Therefore, new development adjacent to heavily traveled streets or intersections would not expose sensitive receptors to substantial pollutant concentrations associated with CO hot spots, and impacts would be less than significant. The Level of Service Traffic Study determined that roadway segment and intersection volumes would not exceed 100,000 average daily trips (Iteris 2024). Consequently, the project would not produce the volume of traffic required to generate a CO hot spot either in the context of the 2003 Los Angeles study or BAAQMD CO threshold considerations. Therefore, the project would not expose sensitive receptors to substantial pollutant concentrations associated with CO hot spots, and impacts would be less than significant.

b. Toxic Air Emissions

Construction

The proposed project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Construction of future development and associated infrastructure implemented under the project would result in short-term diesel exhaust emissions from on-site heavy-duty equipment. Construction would result in the generation of diesel- exhaust diesel particulate matter (DPM) emissions from the use of off-road diesel equipment required for site grading and excavation, paving, and other construction activities and on-road diesel equipment used to bring materials to and from project sites. Such emissions would have the potential to exceed the SCAQMD's LST thresholds.

Generation of DPM from construction projects typically occurs in a single area for a short period. According to the Office of Environmental Health Hazard Assessment, health risk assessments, which determine the exposure of sensitive receptors to toxic emissions, should be based on a 30-year exposure period; however, such assessments should be limited to the period/duration of activities associated with the project (Office of Environmental Health Hazard Assessment 2015). Therefore, if

the duration of proposed construction activities near any specific sensitive receptor were a year, the exposure would be three percent of the total exposure period used for health risk calculation.

Considering this information, the highly dispersive nature of DPM, and the fact that construction activities would occur intermittently and at various locations over the lifetime of project buildout, DPM generated by construction is not expected to create conditions where the probability is greater than 10 in 1 million of developing cancer for the Maximally Exposed Individual, or to generate ground-level concentrations of non-carcinogenic TACs that exceed a Hazard Index greater than 1 for the Maximally Exposed Individual. Additionally, with ongoing implementation of U.S. EPA and CARB requirements for cleaner fuels; off-road diesel engine retrofits; and new, low-emission diesel engine types; the DPM emissions of individual equipment would be substantially reduced over the years as project buildout continues. Additionally, construction of future projects would adhere to the requirements of California Code of Regulations, Title 13, Section 2449 to reduce nonessential idling (PPP AQ-1), the construction requirements of SCAQMD rules and regulations (PPP AQ-2), and the requirements of the City's grading code (PPP AQ-3) Therefore, the project would not exceed the SCAQMD LST thresholds or expose sensitive receptors to toxic air emissions during construction of future development within the City, and impacts would be less than significant.

Stationary Sources

The project would not result in the construction and operation of a stationary source of TACs. Various uses, such as dry cleaners and gasoline-dispensing facilities, have the potential to be substantial stationary sources that would require a permit from the SCAQMD. Although future site-specific development under the project could be located near existing types of facilities, emissions of TACs are regulated by SCAQMD through permitting and monitoring requirements. The California Air Toxics Program establishes the process for the identification and control of TACs and includes provisions to make the public aware of significant toxic exposures and for reducing risk. In accordance with AB 2588, if adverse health impacts exceeding public notification levels are identified, the facility would provide public notice, and if the facility poses a potentially significant public health risk, the facility would be required to submit a risk reduction audit and plan to demonstrate how the facility would reduce health risks. Therefore, adherence with this regulatory framework would ensure that future development would not expose sensitive receptors to TACs associated with stationary sources within the City, and impacts would be less than significant.

Mobile Sources

In April 2005, CARB published the Air Quality and Land Use Handbook: A Community Health Perspective (CARB 2005). The handbook makes recommendations directed at protecting sensitive land uses from air pollutant emissions, while balancing a myriad of other land use issues (e.g., housing, transportation needs, economics, etc.). It notes that the handbook is not regulatory or binding on local agencies and recognizes that application takes a qualitative approach. As reflected in the CARB Handbook, there is currently no adopted standard for the significance of health effects from mobile sources. Therefore, the CARB has provided guidelines for the siting of land uses near heavily traveled roadways. Of pertinence to this impact analysis, the CARB guidelines indicate that siting new sensitive land uses within 500 feet of a freeway or urban roads with 100,000 or more vehicles/day should be avoided when possible.

The City is generally bounded on the southwest by SR-73 and on the northeast by State Route 241 (SR-241). I-5, I-405, and SR-133 cross through the central portion of the City, and multiple Interstates and State Routes traverse the City and provide connection to surrounding communities throughout the southern California region. Portions of the focus areas are located adjacent to these highways and freeways. However, CARB notes that these recommendations are advisory and should not be interpreted as defined "buffer zones," and that local agencies must balance other considerations such as transportation needs, the benefits of urban infill, community economic development priorities, and other quality-of-life issues. With careful evaluation of exposure, health risks, and affirmative steps to reduce risk, where necessary, CARB's position is that infill development, mixed use, higher density, transit-oriented development, and other concepts that benefit regional air quality can be compatible with protecting the health of individuals at the neighborhood level. Additionally, measures can be incorporated into future site-specific project design that would reduce the level of exposure for future residents. The California Air Pollution Control Officers Association (CAPCOA) published a guidance document, Health Risk Assessments for Proposed Land Use Projects, which provides recommended measures that reduce concentrations of DPM (CAPCOA 2009). These include planting vegetation between the receptor and the freeway, constructing barriers between the receptor and the freeway, and installing newer electrostatic filters in adjacent receptor buildings. Additionally, the 2022 California Building Code – Title 24 requires that all new residential uses include improved air filtration systems. Filters are categorized according to minimum efficiency reporting value (MERV) rating. The higher the MERV rating, the better the filtration. MERV-13 filters are effective at filtering DPM. Therefore, the project would not expose sensitive receptors to substantial pollutant concentrations associated with mobile source emissions and impacts would be less than significant. However, the scale and extent of exposure of future development under the amended general plan to mobile sources of TACs cannot be known at this time, and impacts would be potentially significant.

4.2.7.2 Significance of Impacts Topic 3: Sensitive Receptors

Buildout of the project would not result in a CO hot spot. Additionally, construction and operation of future development would not result in the exposure of sensitive receptors to TACs from construction activities or mobile sources. However, future development within the focus areas would potentially place future residential development near existing roadways, which would be considered potentially significant.

4.2.7.3 Mitigation

AQ-3: For individual projects that may site new sensitive land uses within 500 feet of a freeway or urban roads with 100,000 or more vehicles/day, the applicant shall prepare a Health Risk Assessment (HRA) evaluating the potential for sensitive receptors to be exposed to TACs, which shall be required for such individual projects. The HRA shall be prepared in accordance with the policies and procedures of the state Office of Environmental Health Hazard Assessment (OEHHA) and the South Coast Air Quality Management District (SQAQMD). If the HRA shows that the incremental cancer risk and/or noncancer hazard index exceed the respective thresholds, as established by the SQAQMD at the time a project is considered (i.e., 10 in one million cancer risk and 1 hazard index), the project applicant will be required to identify and demonstrate that best available control

technologies to reduce substantial exposure of sensitive receptors to TACs. Examples may include, but are not limited to, air intakes located away from high-volume roadways and/or truck loading zones unless it can be demonstrated that these are operational limitations and/or heating, ventilation, and air conditioning (HVAC) systems provided with appropriately sized maximum efficiency rating value (MERV) filters. Mitigation measures identified in the HRA shall be incorporated into the site development plan as a component of the proposed project. Air intake and MERV filter requirements shall be noted on all building plans submitted to the City of Irvine Community Development Department.

4.2.7.4 Significance of Impacts after Mitigation

Implementation of mitigation measure AQ-3 would reduce exposure of sensitive receptors to mobile source TACs to the extent feasible. However, site-specific development projects are not currently available, and there is a potential for TAC exposure to remain. Therefore, despite adherence to mitigation measure AQ-3, impacts associated with exposure of sensitive receptors to mobile source TACs would remain significant and unavoidable.

4.2.8 Topic 4: Odor

Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

4.2.8.1 Impact Analysis

In the context of land use planning, one of the most important factors influencing the potential for an odor impact to occur is the distance between the odor source and receptors. The greater the distance between an odor source and receptor, the less concentrated the odor emission would be when it reaches the receptor. Odors can be generated from a variety of source types including both construction and operational activities. Although less common, construction activities that include the operation of a substantial number of diesel-fueled construction equipment and heavy-duty trucks can generate odors from diesel exhaust emissions. A project's operations, depending on the project type, can generate a large range of odors that can be considered offensive to receptors. Examples of common land use types that typically generate significant odor impacts include, but are not limited to:

- Wastewater treatment plants
- Sanitary landfills
- Composting/green waste facilities
- Recycling facilities
- Petroleum refineries
- Chemical manufacturing plants
- Painting/Coating operations
- Rendering plants
- Food packaging plants

When land uses such as these or other odor-generating land uses are sited proximate to sensitive receptors, odor impacts may occur and further analysis of the nature of the odor source, the prevailing wind patterns, number of potentially effected receivers and other considerations would be warranted.

Emissions from construction equipment associated with future development facilitated by the proposed project, such as diesel exhaust, and VOCs from architectural coatings and paving activities may generate odors; however, these odors would be temporary, intermittent, and not expected to affect a substantial number of people. Additionally, noxious odors would be confined to the immediate vicinity of construction equipment. By the time such emissions reach a receptor (e.g., people in residential units, day care centers, schools, nursing homes, etc.), they would be diluted to well below any level of air quality concern. Furthermore, short-term construction-related odors are expected to cease upon the drying or hardening of the odor-producing materials. Therefore, construction would not result in emissions (such as those leading to odors) adversely affecting a substantial number of people, and impacts would be less than significant.

Future site-specific development under the project would include residential uses, as well as the extension of Ada roadway, and nonresidential uses including a botanical garden, a veteran's memorial garden, a library, a discovery center, two museums, a 65-acre central park area, an accessory restaurant use, an aquatic center, an all-wheel park, and pickleball courts, that are generally not a source of objectionable odors. Additionally, with respect to all development under the project, nuisance odors are regulated under SCAQMD Rule 402, which requires abatement of any nuisance generating a verified odor complaint. Therefore, project operation would not result in odors affecting a substantial number of people, and impacts would be less than significant.

4.2.8.2 Significance of Impacts Topic 4: Odor

The project would not result in emissions (such as those leading to odors) adversely affecting a substantial number of people, and impacts would be less than significant.

4.2.8.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.2.9 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probably future projects within the cumulative impact area for air quality. The cumulative study area would be considered the Basin. The evaluation of consistency with the AQMP was cumulative in nature because it considers project consistency with a regional air quality plan that relies on the land use plans of jurisdictions within the Basin. As discussed in Section 4.2.5.1 above, project buildout would generate fewer emissions compared to buildout of the City's adopted General Plan. The project would not exceed the assumptions used to develop the AQMP. However, construction of future development under the project would have the potential to increase in the frequency or severity of existing air quality violations .Although mitigation measure AQ-1 would include measures

to reduce construction emissions, construction time frames and equipment for site-specific development projects are not available at this time, and there is a potential for multiple development projects to be constructed at one time, resulting in cumulatively significant construction-related emissions. Similarly, mitigation measure AQ-2 proposes measures to reduce operation emissions associated with future development, site-specific development projects are not available at this time, and there is a potential for operational emissions to exceed the SCAQMD's significance thresholds, which would result in cumulatively significant impacts. Furthermore, future development may site new sensitive land uses within 500 feet of a freeway or urban roads with 100,000 or more vehicles/day. Although mitigation measure AQ-3 would require such projects to prepare an HRA identifying measures to reduce impacts to TACs, there is a potential for TAC exposure to remain, which would be cumulatively significant. Therefore, despite implementation of mitigation measures AQ-1 through AQ-3, project construction and operation is anticipated to result in cumulatively considerable air quality impacts.

4.3 Biological Resources

This section analyzes potentially significant impacts related to biological resources that could result from implementation of the project. This analysis relies on a biological resources technical report prepared by Alden Environmental, Inc. (Appendix C).

4.3.1 Existing Conditions

4.3.1.1 Vegetation Communities

Figure 4.3-1 presents the distribution of vegetation communities and land cover types within the city of Irvine (City). Table 4.3-1 presents the acreage of the vegetation communities and land cover types within the City. Seventeen vegetation communities and land cover types occur within the City. Additionally, some of these vegetation communities occur in transitional or ecotonal zones within the City (e.g., estuarine, lacustrine, riverine), where one or more of the definitions provided below may apply. To avoid repetition, each is described separately (e.g., riverine is described once instead of three times for riverine; riverine, barren; and estuarine, lacustrine, riverine). Descriptions of vegetation communities and land cover types present within the City are provided below.

Table 4.3-1
Vegetation Communities in the City

Vegetation Communities	Acres
Annual Grassland	98.83
Annual Grassland, Perennial Grassland	2,864.43
Barren	32.19
Coastal Oak Woodland	51.61
Coastal Scrub	4,587.65
Estuarine, Lacustrine, Riverine	98.54
Eucalyptus	13.86
Fresh Emergent Wetland	105.17
Lacustrine	107.61
Mixed Chaparral	26.81
Orchard-Vineyard, Evergreen Orchard, Irrigated Row and Field Crops	580.29
Perennial Grassland	56.31
Riverine	30.98
Riverine, Barren	50.06
Saline Emergent Wetland	26.47
Urban	45,659.43
Valley Foothill Riparian	788.04
TOTAL	**55,178.28**

FIGURE 4.3-1
Vegetation Communities and Land Cover Types

a. Annual Grassland

Annual grassland is open grassland composed primarily of annual plant species. The community's structure depends largely on weather patterns and livestock grazing. Dramatic differences in features, both between seasons and between years, are characteristic of this habitat. Introduced annual grasses are the dominant plant species. These species include wild oats, soft chess, ripgut brome, red brome, wild barley, and foxtail fescue. Common forbs include broadleaf filaree, redstem filaree, turkey mullein, true clovers, bur clover, popcorn flower, and others. California poppy, the State flower, may also be found in this habitat.

b. Perennial Grassland

Perennial grassland consists of climax stands of perennial bunchgrasses, such as purple needlegrass, on wetter sites.

c. Annual Grassland/Perennial Grassland

See Sections 4.3.1.1.a and 4.3.1.1.b above.

d. Coastal Oak Woodland

Coastal live oak woodland occurs in moderately moist areas of coastal California from Sonoma County south into Baja California, Mexico. These woodlands are found within a 50-mile radius of the coast. Fog is common in these areas, and the soils are typically well drained. Although not limited to these areas, coastal live oak woodland is common in ravines and moist drainages between grassy hillsides. The dominant plant species is coast live oak (*Quercus agrifolia*).

e. Mixed Chaparral

Mixed chaparral is a structurally homogeneous community dominated by shrubs with thick, evergreen leaves. Shrub height and crown cover vary considerably with age since last burn, precipitation regime, aspect, and soil type. At maturity, cismontane mixed chaparral typically is a dense, nearly impenetrable thicket with greater than 80 percent absolute shrub cover.

f. Coastal Scrub

Coastal scrub is dominated by semi-woody, low- to moderate-sized shrubs with shallow root systems. No single species is typical of all coastal scrub stands. Species composition changes with progressively drier conditions from north to south along the coast. Species dominance appears to shift from evergreen species in the north to drought-deciduous species in the south.

g. Lacustrine

Lacustrine habitats are inland depressions or dammed riverine channels containing standing water. Depth can vary from a few centimeters to hundreds of meters. Typically, lacustrine habitats include permanently flooded lakes and reservoirs, intermittent lakes, and ponds (including vernal pools).

h. Riverine

Riverine systems consist of intermittent or continually running water. A stream originates at an elevated source, such as a spring or lake, and flows downward at a rate relative to slope or gradient and the volume of surface runoff or discharge. Velocity generally declines at progressively lower altitudes, and the volume of water increases until the enlarged stream finally becomes sluggish. Some streams, except for occasional pools, dry up seasonally every year.

i. Barren

Barren land lacks vegetation, typically because of recent and/or continuous clearing of vegetation. It often consists of rock, gravel, and/or soil. These areas differ from "urban," discussed below, because they do not support buildings, paved roads, parking lots, or ornamental plantings.

j. Riverine, Barren

See Sections 4.3.1.1.h and 4.3.1.1.i above.

k. Estuarine, Lacustrine, Riverine

Estuarine habitats either (1) have constant exchange and interaction with ocean water or marine embayment (estuary, tidal flat, tidal marsh, or eel-grass meadow) or (2) are often separated from ocean water exchange (coastal lagoon). The latter situation is present in the City where lacustrine and riverine habitats in the western part of the City are often separated from Upper Newport Bay waters that occur west of State Route 73 outside the City limits. This same area in the City also supports lacustrine and riverine habitats. See above for descriptions of those habitats.

l. Valley Foothill Riparian

Valley foothill riparian habitats are found in valleys generally associated with low velocity water flow, floodplains, and gentle topography. Some dominant species in the canopy layer are cottonwood (*Populus* spp.), California sycamore (*Platanus racemosa*), and oak (*Quercus* spp.). Typical understory shrub layer plants include species such as wild grape (*Vitis girdiana*), wild rose (*Rosa californica*), California blackberry (*Rubus ursinus*), blue elderberry (*Sambucus nigra* ssp. *caerulea*), poison oak (*Toxicodendron diversilobum*), and willows (*Salix* spp.). The herbaceous layer consists of species such as sedges, rushes, grasses.

m. Eucalyptus

Eucalyptus is an introduced genus, whose tree species have been planted typically for wind blocking, ornamental, and hardwood production purposes. If sufficient moisture is available, this genus becomes naturalized and can reproduce and expand its areal coverage. Eucalyptus occurs in the City in naturalized patches, landscaping, and windrows.

n. Fresh Emergent Wetland

Fresh Emergent Wetlands are flooded frequently and are characterized by dominant vegetation generally consisting of perennial monocots up to 6.6 feet tall. Characteristic species on the upper margins of the habitat include those such as sedges and rushes, and on more alkali sites, saltgrass (*Distichlis* sp.). On wetter sites, potential dominant species include cattail (*Typha* spp.) and bulrushes (*Scirpus* spp.).

o. Saline Emergent Wetland

Saline emergent wetland occurs above intertidal sand and mud flats and below upland communities not subject to tidal action. It is characterized as salt or brackish marsh with characteristic species such as cordgrass (*Spartina* spp.), pickleweed and glasswort (*Salicornia* spp.), bulrushes, and carex (*Carex* spp.).

p. Orchard, Vineyard, Evergreen Orchard, Irrigated Row and Field Crops

Orchards, vineyards, and row crops are land uses primarily to produce food and fiber. On aerial imagery, the chief indications of agricultural activity are distinctive geometric field and road patterns on the landscape and the traces produced by mechanized equipment. The number of building complexes is smaller and the density of the road and highway network is much lower among these land uses than in Urban areas (see Urban below).

q. Urban

Urban lands typically support little to no native vegetation and are characterized by the presence of man-made structures such as buildings, paved roads, parking lots, parks, and residential areas that are either unvegetated or are dominated by exotic, ornamental plant species.

4.3.1.2 Sensitive Biological Resources

Sensitive biological resources include sensitive vegetation communities, special status plant species, special status wildlife species, wildlife movement corridors, and wetland/riparian resources. In general, the principal reason that a species, subspecies, or variety is considered sensitive is the documented or perceived decline or limitation of its population size or geographical extent and/or distribution resulting in most cases from habitat loss. Wildlife movement corridors or linkages also are considered sensitive by local, State, and federal resource and conservation agencies because these corridors allow wildlife to move between adjoining open space areas that are becoming increasingly isolated as open space becomes increasingly fragmented from urbanization, rugged terrain, or changes in vegetation. In addition, wetland and riparian resources are considered sensitive because of their limited distribution and high wildlife value.

Many sensitive biological resources are known to occur or have the potential to occur within the City based on historical data for the region identified through a query of the California Natural Diversity Database (CNDDB) and U.S. Fish and Wildlife Service (USFWS) database, the National Hydrography Dataset, and/or the presence of potentially suitable habitat within the City. Figure 4.3-2 presents the distribution of special status plant and wildlife species and critical habitat within the City. The following section describes these sensitive biological resources.

a. Plant Species

Despite the urbanization of most of the City, there are still areas within the City that provide open space and relatively untouched habitats that support native plant species. The City also supports many agricultural lands and developed areas. While these lands typically support planted crops and orchards as well as ornamental species, respectively, they likely support both native and non-native plant species. Native plant species that can tolerate disturbance, and even thrive in disturbed areas, can be found growing alongside planted crops or as the understory within the orchards. Some of the non-native plant species are likely invasive. Invasive species pose serious environmental threats because they can invade healthy, native ecosystems and degrade the quality of the habitat so that it no longer provides the functions and values of the native ecosystems that occurred there historically. For purposes of this report, special status plant species meet the following criteria:

- Listed or proposed for listing by federal or state agencies as threatened or endangered;
- Included on List 1B (considered endangered throughout its range) or List 2 (considered endangered in California but more common elsewhere) of the California Native Plant Society's (CNPS) Inventory of Rare and Endangered Vascular Plants of California;
- Are considered rare, endangered, or threatened by the California Department of Fish and Wildlife (CDFW) or other local conservation organizations or specialists; and/or
- Covered under the Natural Community Conservation Plan (NCCP)/Habitat Conservation Plan (HCP)

Noteworthy plant species are those listed on the following:

- List 3 (more information about the plant distribution and rarity needed) and
- List 4 (plants of limited distribution) of the CNPS Inventory.

There are 33 special status plant species known to occur historically in the region of the City. Ten of these species have been reported within the City or just outside the City limits (see Figure 4.3-2). All 33 special status plant species are summarized in Table 4.3-2. No critical habitat has been designated by the USFWS within the City for any plant species.

Hordeum intercedens Vernal barley	List 3.2	Coastal dunes, coastal scrub, grassland, vernal pools	May occur within the City because suitable habitat may be present.
Juncus acutus ssp. *leopoldii* Southwestern spiny rush	List 4.2	Mesic coastal dunes, meadows and (alkaline) seeps, coastal salt marshes and swamps	May occur within the City because suitable habitat may be present.
Lasthenia glabrata ssp. *coulteri* Coulter's goldfields	List 1B.1	Coastal salt marshes and swamps, playas, vernal pools	May occur within the City because suitable habitat may be present, and it was reported just outside the City limits (4.3-2).
Lepidium virginicum var. *robinsonii* Robinson's pepper- grass	List 4.3	Chaparral, coastal scrub	Reported in the City (4.3-2).
Lycium californicum California box- thorn	List 4.2	Coastal bluff scrub, coastal scrub	May occur within the City because suitable habitat may be present.
Malacothrix saxatalis var. *saxatalis* Cliff malacothrix	List 4.2	Coastal bluff scrub, coastal scrub	May occur within the City because suitable habitat may be present.
Microseris douglasii ssp. *platycarpha* Small-flowered microseris	List 4.2	Clay soils in cismontane woodland, coastal scrub, grassland, vernal pools	May occur within the City because suitable habitat may be present.
Nama stenocarpa Mud nama	List 2B.2	Marshes and swamps (lake margins, riverbanks)	Reported in the City (4.3-2).
Navarretia prostrata Prostrate vernal pool navarretia	List 1B.1	Mesic coastal scrub, meadows and seeps, grassland, vernal pools	May occur within the City because suitable habitat may be present.
Nemacaulis denudata var. *denudate* Coast woolly-heads	List 1B.2	Coastal dunes	Not likely to occur in the City due to lack of potential habitat.
Pentachaeta aurea ssp. *allenii* Allen's pentachaeta	List 1B.1	Coastal scrub and grassland	Reported in the City (4.3-2).
Romneya coulterii Coulter's matilija poppy	List 4.2 Covered	Chaparral, coastal scrub—often in burned areas	May occur within the City because suitable habitat may be present.
Senecio aphanactis haparral ragwort	List 2B.2	Chaparral, cismontane woodland, coastal scrub	Reported in the City (4.3-2).
Sidalcea Neomexicana Salt spring checkerbloom	List 2B.2	Mesic chaparral, coastal scrub, lower montane coniferous forest, Mojavean desert scrub, playas	May occur within the City because suitable habitat may be present.
Suaeda esteroa Estuary seablite	List 1B.2	Coastal salt marshes and swamps	May occur within the City because suitable habitat may be present.

Table 4.3-2 Special Status Plant Species Reported within the City or the Region			
Scientific Name / Common Name	Status	Habitat Description	Occurrence Info
Symphyotrichum defoliatum San Bernardino aster	List 1B.2	Near ditches, streams, springs--cismontane woodland, coastal scrub, lower montane coniferous forest, meadows and seeps, marshes and swamps, vernally mesic grassland	May occur within the City because potential habitat may be present.

b. Sensitive Wildlife

A variety of resident and migratory wildlife species occur within the City. The City provides habitat for both common and special status species including invertebrates, amphibians, reptiles, birds, and mammals. For purposes of this report, special status wildlife species meet the following criteria:

- Listed or proposed for listing as threatened or endangered by the USFWS or the CDFW;
- Designated as Birds of Conservation Concern by the USFWS;
- Designated as California Fully Protected or California Species of Special Concern by the CDFW; and/or
- Covered under the Orange County NCCP/HCP.

In addition, raptors (birds of prey) and active raptor nests are protected by the California Fish and Game Code 3503.5, which states that it is "unlawful to take, possess, or destroy any birds of prey or to take, possess, or destroy the nest or eggs of any such bird" unless authorized. The federal Migratory Bird Treaty Act (MBTA), which restricts the killing, taking, collecting, selling, or purchasing of native bird species or their parts, nests, or eggs, also provides legal protection for almost all breeding bird species occurring in the U.S. The MBTA is supplemented by the Bald and Golden Eagle Protection Act (BGEPA), which provides protection for both the bald eagle and the golden eagle by prohibiting the "take" of either of these species, including their parts, nests, or eggs. Noteworthy wildlife species are those given the informal designation of California Species of Concern by the CDFW. This designation applies to animals not listed under Federal and California Endangered Species Acts (FESA or CESA), but which nonetheless (1) are declining at a rate that could result in listing or (2) historically occurred in low numbers and known threats to their persistence currently exist. Species that are federal- or state-listed threatened or endangered are afforded a degree of protection that entails a permitting process, including specific mitigation measures to compensate for impacts to the species.

There are 59 special status wildlife species known to occur within the region historically. Twenty-four of these species have been reported within the City or just outside the City limits (4.3-2). All 59 special status wildlife species are summarized in Table 4.3-3. Critical habitat has been designated by the USFWS for two species within the City: Riverside fairy shrimp (*Streptocephalus woottoni*) and coastal California gnatcatcher (*Polioptila californica californica*) (see Figure 4.3-2).

Table 4.3-3 Special Status Wildlife Species Reported within the City or the Region			
Scientific Name / Common Name	Status	Habitat Description	Occurrence Info
Invertebrates			
Branchinecta sandiegonensis San Diego fairy shrimp	FE Covered	Vernal pools or other ephemeral basins in coastal southern California south to extreme northwestern Baja California, Mexico	May occur within the City because suitable habitat may be present.
Streptochephalus woottoni Riverside fairy shrimp	FE Covered	Restricted to a few vernal pools in southwestern Riverside, Orange, and San Diego counties	Reported in the City, and critical habitat has been designated in the City (Figure 4.3-2).
Fish			
Eucyclogobius newberryi Tidewater goby	FE CSC	Shallow brackish lagoons and lower stream reaches	May occur within the City because potential habitat may be present.
Amphibians			
Aneides lugubris Arboreal salamander	Covered	Moist places in a variety of habitats from coastal dunes to woodlands	May occur within the City because suitable habitat may be present.
Anaxyrus californicus Arroyo toad	FE CSC Covered	Breeds in shallow pools along stream edges with sand/gravel flats between March and June. Adults use sage scrub, mixed chaparral, oak woodland habitats up to within one mile of breeding sites.	May occur within the City because suitable habitat may be present.
Batrachoseps nigriventris Blackbelly slender salamander	Covered	Moist places, mainly in woodlands, but also found in grasslands and riparian habitats	May occur within the City because suitable habitat may be present.
Spea hammondii Western spadefoot	CSC Covered	Washes, river floodplains, alluvial fans, playas, alkali flats, temporary ponds, vernal pools in mixed woodlands, grasslands, coastal sage scrub, and chaparral. Surface activity October to April. Oviposition late February to May in temporal pools and slow-moving sections of streams	Reported in the City (Figure 4.3-2).
Taricha torosa Coast Range newt	CSC	In southern California, habitats include drier chaparral, oak woodland, and grasslands	Reported just outside the City limits (Figure 4.3-2).
Reptiles			
Phrynosoma blainvilii Coast horned lizard	CSC Covered	Scrubland, grassland, coniferous woods, and broadleaf woodlands, especially in areas with sandy soils, scattered shrubs, and ant colonies, such as along the edges of arroyo bottoms or dirt roads.	Reported in the City (Figure 4.3-2).
Aspidoscelis hyperythra Orange-throated whiptail	WL Covered	Open coastal sage scrub, chaparral, and streamside growth with loose sandy soils, revegetation sites.	Reported in the City (Figure 4.3-2).
Aspidoscelis tigris stejnegeri Coastal western whiptail	CSC Covered	Coastal sage scrub, chaparral, and wash habitats	Reported in the City (Figure 4.3-2).

Table 4.3-3 Special Status Wildlife Species Reported within the City or the Region			
Scientific Name / Common Name	Status	Habitat Description	Occurrence Info
Anniella stebbensi Southern California legless lizard	CSC	Found in leaf litter and loose soil on beaches and in coastal scrub, chaparral, and open riparian habitats. Sandy washes and beach dunes are used for burrowing, while logs and leaf litter are used for cover and feeding	May occur within the City because suitable habitat may be present.
Charina trivirgata rosy boa	Covered	Rocky areas in coastal sage scrub and chaparral	May occur within the City because potential habitat may be present.
Crotalus ruber red-diamond rattlesnake	CSC Covered	Arid scrub (including coastal sage scrub), chaparral, woodlands, and cultivated areas, often with large rocks or boulders	Reported in the City (figure 4.3-2).
Diadophis punctatus modestus San Bernardino ringneck snake	Covered	Semi-arid brushy areas and chaparral in canyons, rocky hillsides, and plains	May not occur in the City due to limited or lacking potential habitat.
Emys marmorata Western pond turtle	CSC	Slow-water aquatic habitats with available basking sites (e.g., submerged logs, open mud banks)	Reported in the City (Figure 4.3-2).
Plestiodon skiltonianus interparietalis Coronado skink	WL Covered	Occurs in variety of mesic habitats including coastal sage, chaparral, oak woodlands, pinon-juniper, and riparian woodlands to pine forests	May occur within the City because potential habitat may be present.
Salvadora hexalepis virgultea Coast patch-nosed snake	CSC	Semi-arid brushy areas and chaparral in canyons, rocky hillsides, and plains	May occur within the City because potential habitat may be present.
Thamnophis hammondii Two-striped garter snake	CSC	Permanent fresh water, inhabiting streams, ponds, vernal pools. Occupies adjacent coastal sage scrub and grasslands during the winter	May occur within the City because potential habitat may be present.
Birds			
Accipiter cooperii Cooper's hawk	WL	Occurs in various woodland habitats, including riparian	Reported in the City (Figure 4.3-2).
Accipiter striatus Sharp-shinned hawk	WL Covered	Woodland areas and open lowlands	May occur within the City because potential habitat may be present.
Agelaius tricolor Tricolored blackbird	BCC CSC, (SE Candidate)	Cattail or tule marshes; forages in fields, farms. Breeds in large freshwater marshes in dense stands of cattails or bulrushes. At all seasons (including when breeding), does most of its foraging in open habitats such as farm fields, pastures, cattle pens, and large. lawns	Reported in the City (Figure 4.3-2).
Aimophila ruficeps canescens Southern California rufous-crowned sparrow	WL Covered	Coastal sage scrub, coastal bluff scrub, low-growing chaparral	Reported in the City (Figure 4.3-2).
Ammodramus savannarum Grasshopper sparrow	CSC	Grasslands, prairies, hayfields, and open pastures with little to no scrub	Reported in the City (Figure 4.3-2).

Table 4.3-3 Special Status Wildlife Species Reported within the City or the Region			
Scientific Name / Common Name	Status	Habitat Description	Occurrence Info
		cover and often with some bare ground	
Aquila chrysaetos golden eagle	CFP, WL Covered	Requires vast foraging areas in grassland, broken chaparral, or sage scrub. Nests on cliffs and boulders	May not occur within the City because of limited potential habitat.
Athene cunicularia Burrowing owl	BCC CSC	Grassland, agricultural land, coastal dunes	Reported in the City (Figure 4.3-2).
Buteo lineatus Red-shouldered hawk	Covered	Riparian woodland	May occur within the City because suitable habitat may be present.
Buteo regalis Ferruginous hawk	BCC WL	Winter resident of grassland and agricultural areas in southwestern California	Reported in the City (Figure 4.3-2).
Campylorhynchus brunneicapillus sandiegensis (San Diego and Orange counties only) Coastal cactus wren	BCC CSC Covered	Coastal sage scrub and chaparral plant communities with substantial cacti (Opuntia spp.) stands	Reported in the City (Figure 4.3-2).
Charadrius alexandrinus nivosus Western snowy plover	FT, BCC CSC	Breeds primarily on coastal beaches from southern Washington to southern Baja California, Mexico. The Pacific coast population breeds above the high tide line on coastal beaches, sand spits, dune-backed beaches, sparsely vegetated dunes, beaches at creek and river mouths, and salt pans at lagoons and estuaries	May occur within the City because potential habitat may be present.
Circus hudsonius Northern harrier	CSC Covered	Open habitats, such as grasslands and fields, as well as marshes	May occur within the City because suitable habitat may be present.
Coccyzus americanus occidentalis western, yellow-billed cuckoo	FT, BCC SE	Extensive riparian woodlands	May not occur within the City because of limited or lacking potential habitat.
Elanus leucurus white-tailed kite	CFP	Nests in riparian woodland, oaks, sycamores and forages in open, grassy areas	Reported in the City (Figure 4.3-2).
Empidonax traillii extimus southwestern willow flycatcher	FE SE Covered	Nests in extensive willow- dominated riparian forests and woodlands, occasionally oak woodlands	May not occur within the City because of limited or lacking potential habitat.
Eremophila alpestris actia California horned lark		Short vegetation or bare ground and low-growing or fallow agricultural fields	Reported in the City (Figure 4.3-2).
Falco peregrinus anatum American peregrine falcon	BCC CFP Covered	Nests in open landscapes with cliffs or tall man-made structures. Found along coastlines, shorelines, etc. where shorebird or rock pigeon prey occurs	Reported just outside the City limits (Figure 4.3-2).
Icteria virens Yellow-breasted chat	CSC	Dense riparian woodland	Reported in the City (Figure 4.3-2).

Table 4.3-3 Special Status Wildlife Species Reported within the City or the Region			
Scientific Name / Common Name	Status	Habitat Description	Occurrence Info
Ixobrychus exilis Least bittern	BCC CSC	Dense marshes	May occur within the City because suitable habitat may be present.
Lanius ludovicianus loggerhead shrike	BCC CSC	Open-canopied valley foothill hardwood, valley foothill hardwood-conifer, valley foothill riparian, pinyon-juniper, juniper, desert riparian, and Joshua tree woodland habitats with scattered shrubs, trees, posts, fences, utility lines, or other perches	May occur within the City because potential habitat may be present.
Laterallus jamaicensis coturniculus California black rail	BCC ST, CFP	Salt marshes, freshwater marshes, and wet meadows	May occur within the City because suitable habitat may be present.
Passerculus sandwichensis beldingi Belding's savannah sparrow	SE	Coastal salt marsh	May occur within the City because potential habitat may be present.
Polioptila californica californica coastal California gnatcatcher	FT CSC Covered	Coastal sage scrub, maritime succulent scrub	Reported in the City (Figure 4.3-2).
Pelecanus erythrorhynchos American white pelican	CSC	Breeds mainly on isolated islands in freshwater lakes or on ephemeral islands in shallow wetlands. Forages in marshes, along lake or river edges, and in wetlands	May occur within the City because potential habitat may be present.
Pelecanus occidentalis californicus California brown pelican	CFP	Nests from the Channel Islands along the Baja California coast and in the Gulf of California to coastal southern Mexico. Builds nests of sticks on the ground, typically on Islands or offshore rocks. Between breeding seasons, wanders along the west coast	May not occur within the City because of limited or lacking potential habitat.
Phalacrocorax auratus Double-crested cormorant	WL	Lakes and ponds	May occur within the City because potential habitat may be present.
Plegadis chihi White-faced ibis	WL	Freshwater wetlands and marshes but also may feed in flooded meadows, agricultural fields, and estuarine wetlands	May occur within the City because potential habitat may be present.
Rallus obsoletus levipes Light-footed Ridgway's rail	FE SE, CFP	Salt marshes and lagoons	Reported in the City (Figure 4.3-2).
Rynchops niger Black skimmer	CSC	Mostly ocean beaches, tidewater. Favors coastal waters protected from open surf such as lagoons, estuaries, inlets, and sheltered bays. Occurs locally on inland lakes	May occur within the City because potential habitat may be present.
Setophaga petechia yellow warbler	BCC CSC	Well-developed riparian habitats, often with mature willows, usually in close proximity to water along streams and meadows	May occur within the City because suitable habitat may be present.

Table 4.3-3 Special Status Wildlife Species Reported within the City or the Region			
Scientific Name / Common Name	Status	Habitat Description	Occurrence Info
Sternula antillarum browni California least tern	FE SE, CFP	Nests are situated on barren to sparsely vegetated places near water, normally on sandy or gravelly substrates, and may appear along marine or estuarine shores in areas free from humans or predators. Wintering locations are unknown	May not occur within the City because of limited or lacking potential habitat.
Vireo bellii pusillus Least Bell's vireo	FE SE Covered	Dense, stratified canopy within willow-dominated woodland or scrub, Baccharis scrub, mixed oak/willow woodland, mesquite woodland, and elderberry scrub in riparian habitat	Reported in the City (Figure 4.3-2).
Mammals			
Antrozous pallidus pallid bat	CSC	Open desert scrub, grasslands, shrub lands, woodlands, and forests. Roosts in rock crevices, caves, mines, tree hollows, and buildings	May occur within the City because potential habitat may be present.
Chaetodipus fallax fallax Northwestern San Diego pocket mouse	CSC	Sparse, disturbed coastal sage scrub or grasslands with sandy soils.	May occur within the City because suitable habitat may be present.
Eumops perotis californicus western mastiff bat	CSC	Occurs in many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, grasslands, chaparral, etc., roosts in crevices in vertical cliff faces, high buildings, trees, and tunnels, and travels widely when foraging.	Reported in the City (Figure 4.3-2).
Lepus californicus bennettii San Diego black- tailed jackrabbit	CSC	Open areas of scrub, grasslands, agricultural fields with ample grasses and forbs.	May occur within the City because potential habitat may be present.
Neotoma lepida intermedia San Diego desert woodrat	CSC Covered	Coastal sage scrub and chaparral. Prefers rock outcrops.	Reported in the City (Figure 4.3-2).
Perognathus longimembris pacificus Pacific pocket mouse	FE CSC	Fine-grained, sandy or gravelly substrates in coastal strand, coastal dunes, river alluvium, and coastal sage scrub growing on marine terraces. Nearly all historic observations of are within 4 km (approximately 2.48 miles) of the Pacific coast, with a few as far as 6 km (approximately 3.72 miles). Currently known only from Dana Point Headlands in Orange County, California and three locations on Marine Corps Base Camp Pendleton in San Diego County.	May not occur within the City because it is largely too far inland.
Sorex ornatus salicornicus Southern California saltmarsh shrew	CSC	Salt marsh	May occur within the City because suitable habitat may be present.

Table 4.3-3 Special Status Wildlife Species Reported within the City or the Region			
Scientific Name / Common Name	Status	Habitat Description	Occurrence Info
Taxidea taxus American badger	CSC	Drier, open stages of shrub steppes, agricultural fields, open woodland forests, and large grass and sagebrush meadows and valleys with friable soils	May occur within the City because suitable habitat may be present.
Status: FE = Federal endangered; FT = Federal threatened; BCC = Birds of Conservation Concern; SE = State endangered; ST = State threatened; CFP = California Fully Protected; CSC = California Species of Special Concern; WL = CDFW Watch List; Covered = Covered under the NCCP/HCP			

c. Wildlife Movement Corridors

Wildlife corridors are essential to maintain populations of healthy and genetically diverse plant and wildlife species. Because the isolation of plant and wildlife populations can have many harmful effects on local and regional species' populations, and may contribute significantly to local species extinctions, wildlife corridors are important to sustain individual species distributions within these habitat fragments.

The Irvine Open Space Initiative created the framework to preserve large, contiguous open space areas for conservation and open space as phased master-planned growth occurred in other areas of the City. The City has committed to protect and manage the Irvine Open Space Preserve consistent with the NCCP. With respect to portions of the Orange County NCCP/HCP within the City, 10,587 acres are designated for the NCCP habitat reserve system, and 813 acres are non-reserve lands called special linkages. Figure 4.3-3 presents the portion of the NCCP/HCP habitat reserve system and the NCCP/HCP special linkages located in the City.

There are several wildlife corridors located within the City; Hicks Canyon, Rattlesnake Canyon, Loma Ridge, Limestone Canyon, and upper Borrego Canyon form wildlife corridors that stretch to the Cleveland National Forest. Wildlife corridors are also preserved along the Eastern Transportation Corridor at Agua Chinon and the State Route 241/State Route 133 interchange.

Historically, a wildlife corridor also connected lands in the City's northern sphere (e.g., Santiago Hills) to coastal lands along the Pacific Ocean. In 2013, the City Council adopted the Wildlife Corridor Plan, taking a step toward creating a wildlife corridor that would link protected lands in the Laguna Coast to wilderness areas that include the Cleveland National Forest, Whiting Ranch, and Limestone Canyon.

d. Critical Habitats

Sensitive vegetation communities are vegetation assemblages, associations, or subassociations that have cumulative losses throughout the region, have relatively limited distribution, support or potentially support sensitive plant or wildlife species, or have value to other wildlife. Typically, sensitive vegetation communities are considered sensitive whether or not they have been disturbed. Determination of the level of sensitivity is based on the Nature Conservancy Heritage Program Status Ranks that rank both species and plant communities on a global and statewide basis according to the number and size of remaining occurrences as well as recognized threats such as proposed development, habitat degradation, and invasion by non-native species.

Based on a California Sensitive Natural Communities search, 10 sensitive vegetation communities were identified within the City and are listed below. According to the CDFW (2018), natural communities with ranks of 1 to 3, or Y (for alliances), are considered sensitive.

Vegetation communities that are wetland and/or riparian resources are also considered sensitive biological resources and are regulated by the U.S. Army Corps of Engineers (USACE), CDFW, and/or Regional Water Quality Control Board (RWQCB) pursuant to several federal and state regulations.

- Perennial Grassland (Y)
- Annual/Perennial Grassland (Y; annual grassland is not sensitive, but perennial is)
- Coastal Oak Woodland (Y)
- Coastal Scrub (Y)
- Lacustrine (Wetland/Riparian)
- Riverine (Wetland/Riparian)
- Riverine (Wetland/Riparian), Barren (the barren portion of this community is not sensitive)
- Estuarine, Lacustrine, Riverine (Wetland/Riparian)
- Freshwater Emergent Wetland (Y, Wetland)
- Saline Emergent Wetland (Y, Wetland)

e. Wetland and Riparian Resources

Wetland and riparian resources within the City are considered sensitive biological resources and are regulated by the USACE, CDFW, and/or RWQCB pursuant to several federal and state regulations. Wetland and riparian resource types are listed in Section 4.3.1.2.d above. A description of each agency's jurisdiction is provided in this section, and the potential wetland and riparian resources within the City are discussed as well.

Potential jurisdictional resources in the City include streams/rivers, lakes/ponds, reservoirs, inundation areas, canals/ditches, and associated habitats (coast live oak woodland; estuarine, lacustrine, riverine; fresh emergent wetland; lacustrine; riverine; riverine, barren; saline emergent wetland; and valley foothill riparian). The major wetlands/waterways in the City include San Diego Creek, Peters Canyon Wash, and San Joaquin Wildlife Sanctuary.

The increased demand for housing and employment in Orange County has resulted in substantial land use changes from agriculture to urban development within the San Diego Creek's watershed. Most of the creek has been converted to a concrete flood control channel, but it does provide aquatic

and riparian habitats along its course and its tidal estuary near the San Joaquin Wildlife Sanctuary and Upper Newport Bay. Peters Canyon Wash, a tributary of San Diego Creek, is mostly channelized and flows southwest from the Peters Canyon Reservoir near the Orange/Tustin border to its confluence with San Diego Creek near the Irvine Civic Center Plaza.

The San Joaquin Wildlife Sanctuary is a 300-acre constructed wetland in the floodplain of San Diego Creek just above its outlet to Upper Newport Bay. The original restoration of the wetlands began in 1988 and was completed in 2000. The site serves a dual purpose of removing nitrates from the creek's water and providing bird habitat. The Southern California Wetlands Recovery Project has a plan to restore and enhance 120 acres of perennial marsh habitat in San Joaquin Marsh.

4.3.2 Applicable Regulatory Requirements

4.3.2.1 Federal Regulations

a. National Environmental Policy Act

The National Environmental Policy Act (NEPA), passed in 1969, created a nationwide framework aimed at protecting the environment. The policy ensures that all branches of the government must consider environmental effects prior to any major federal action that may significantly affect the environment. NEPA is applied when projects are undertaken, funded, or require the insurance of a permit by a federal agency. The federal agency proposing to implement the federal action holds responsibility in complying with NEPA; however, multiple federal agencies may be involved with the NEPA process for any given project, as Lead Agency or Cooperating Agency.

The Lead Agency has supervisory duties and is responsible for preparing the appropriate environmental document: a Categorical Exclusion, Finding of No Significant Impact, Environmental Assessment, or Environmental Impact Statement. The Cooperating Agency has an assisting role in the entire NEPA process. The U.S. Environmental Protection Agency (U.S. EPA) is required to review and publicly comment on the environmental impacts of major proposed federal actions, particularly when an Environmental Impact Statement is required. If the U.S. EPA determines that the environmental analysis is unsatisfactory or that the proposed action would have adverse environmental effects, it is required to involve the Council of Environmental Quality in the NEPA process.

b. Federal Endangered Species Act

The United States Congress passed the FESA in 1973 to provide a means for conserving endangered and threatened species to prevent species extinction and, extirpation. The FESA has three major components: the Section 7 requirement for federal agencies to consult with the USFWS to ensure that their actions are not likely to jeopardize the continued existence of species or result in the modification or destruction of critical habitat; the Section 9 prohibition against "taking" listed species; and the Section 10 provisions for permitting the incidental take of listed species. The term "take" is defined by the FESA to include the concept of "harm," which agency regulations define to include death or injury that results from modification or destruction of a species habitat (50 Code of Federal Regulations [CFR] 17.3). Each of these major components is described in more detail below.

Section 7 of the FESA

Section 7 of the FESA provides that each federal agency undertaking a federal action that could significantly affect FESA species shall consult with the Secretary of Interior or Commerce, that any actions authorized, funded, or carried out by the agency are "not likely to jeopardize the continued existence of any endangered or threatened species or result in the destruction or adverse modification of lands determined to be critical habitat" (16 United States Code [USC] Section 1536(a)(2)). The term "agency action" is broadly defined in a manner that includes nearly all actions taken by federal agencies such as permitting or carrying out a project, as well as actions by private parties that require federal agency permits or approval (50 CFR Section 402.02). The consultation requirement of Section 7 is triggered upon a determination that a proposed action "may affect" a listed species or designated Critical Habitat (50 CFR Section 402.14(a)). If the proposed action is a "major construction" activity, the federal agency proposing the action must prepare a biological assessment to include with its request for the initiation of Section 7 consultation.

Included in the USFWS Biological Opinion is an Incidental Take Statement (ITS) that authorizes a specified level of take anticipated to result from the proposed action. The ITS contains "reasonable and prudent measures" that are designed to minimize the level of incidental take, adverse modification, or destruction to critical habitat, and that must be implemented as a condition of the take authorization (50 CFR Section 402.14(i)(5)).

The issuance of a Biological Opinion concludes formal consultation, but consultation can be reinitiated if the amount or extent of incidental take authorized is exceeded, the action changes, new information reveals effects of the action not previously considered, or a new species is listed, or Critical Habitat is designated (50 CFR Section 402.16). Once the Biological Opinion is issued, the project applicant must implement the terms and conditions, and conservation measures, mandated by the USFWS. Monitoring and reporting is required to be coordinated with the USFWS during the implementation of conservation measures.

Section 9 of the FESA

Section 9 of the FESA prohibits any person from "taking" an endangered animal species. Regulations promulgated by USFWS and the National Oceanic and Atmospheric Administration make the "take" prohibition generally applicable to threatened animal species as well (50 CFR 17.71). Section 9 thus prohibits the clearing of habitat that results in death or injury to members of a protected species.

An authorization or permit to incidentally take listed species can be obtained either through the Section 7 consultation process or through the Section 10 incidental take permit process. In the context of Section 7, incidental take is authorized through an ITS that is issued consistent with a Biological Opinion. Measures required to conform to the ITS are contained in "reasonable and prudent measures," as are the terms and conditions necessary to implement those measures. In the context of Section 10, incidental take is authorized through an incidental take permit issued pursuant to Section 10(a)(1)(B). Measures contained in the incidental take permit reflect the measures set out in a habitat conservation plan developed by the applicant in conjunction with the USFWS.

Section 10 of the FESA

Under Section 10(a)(1)(B) of the FESA, the USFWS may permit the incidental take of listed species that may occur because of an otherwise lawful activity. To obtain a Section 10(a)(1)(B) permit, an applicant must prepare a habitat conservation plan that meets the following five criteria: (1) the taking will be incidental to an otherwise lawful activity; (2) the applicant will, to the maximum extent practicable, minimize and mitigate the impacts of such taking; (3) the applicant will ensure that adequate funding for the plan will be provided; (4) the taking will not appreciably reduce the likelihood of the survival and recovery of the species in the wild; and (5) other measures, if any, that the USFWS requires as being necessary or appropriate for purposes of the plan will be met (16 USC Section 1539(a)(2)(A)).

c. Clean Water Act of 1972 (33 USC 1251 et seq.)

Sections 404 and 401 of the Clean Water Act (CWA) of 1972 apply to potential impacts to wetlands, Waters of the U.S., and Waters of the State. The U.S. EPA administers the CWA; however, some sections of the CWA are administered by other agencies. Section 404 of the CWA regulates the discharge of dredged or fill material into navigable waters, including both wetlands and other Waters of the U.S. The discharge of dredged or fill material is typically associated with a variety of development projects, agricultural activities, and water resource projects. The USACE administers Section 404 of the CWA and is responsible for issuing general and individual permits and for making jurisdictional determinations. Section 401 of the CWA requires a State Water Quality Certification or waiver for any activity requiring a Section 404 permit. The State Water Quality Certification ensures the activity will not violate any established state water quality standards. The State Water Resources Control Board, in conjunction with the nine California RWQCBs, administers Section 401 of the CWA and is responsible for issuing permits pursuant to the Section 401 Water Quality Certification Program. The City is within the jurisdiction of the Santa Ana RWQCB (Region 8).

Prior to any installation of any new storm drain connections to and/or discharges into the San Diego Creek or San Joaquin Marsh, the City or other project applicants shall (1) obtain a permit or other authorization from the USACE pursuant to Section 404 of the federal CWA; (2) obtain a Section 401 Water Quality Certification from the California RWQCB, Santa Ana region, pursuant to Section 401 of the CWA, which requires any applicant for a federal permit, such as a CWA Section 404 permit, to provide the licensing agency a certification from RWQCB that the project will comply with adopted water quality standards; and 3) provide notification to the CDFW of the project pursuant to Section 16-2 of the Fish and Game Code and comply with any further actions required by CDFW.

d. Migratory Bird Treaty Act (16 USC 703 through 711)

The MBTA of 1918 implements various conventions and treaties between the United States and Canada, Mexico, Japan, and Russia for the protection of over 800 migratory bird species. Under the MBTA, it is unlawful to "pursue, hunt, take, capture, kill, attempt to take, capture or kill, possess, offer for sale, sell, offer to purchase, purchase, deliver for shipment, ship, cause to be shipped, deliver for transportation, transport, cause to be transported, carry, or cause to be carried by any means whatever, receive for shipment, transportation or carriage, or export, at any time, or in any manner, any migratory bird…or any part, nest, or egg of any such bird" (16 USC 703).

The MBTA is administered by USFWS. Take permits for MBTA species are rarely issued, except for specific actions to aid recovery of a species; however, USFWS establishes hunting seasons for species for which there is a long tradition of hunting, if hunting will not adversely impact their population status or long-term conservation. While the MBTA includes approximately 170 species of game birds, hunting is typically authorized for fewer than 60 of these species each year.

e. United States Army Corps of Engineers

The USACE has primary federal responsibility for administering regulations that concern waters and wetlands in the City. In this regard, the USACE acts under two statutory authorities, the Rivers and Harbors Act (33 USC, Sections 9 and 10), which governs specified activities in navigable waters, and the CWA (Section 404), which governs specified activities in waters of the U.S., including wetlands and special aquatic sites. Wetlands and non-wetland waters (e.g., rivers, streams, and natural ponds) are a subset of waters of the U.S. and receive protection under Section 404 of the CWA. The USACE has primary federal responsibility for administering regulations that concern waters and wetlands in the project area under statutory authority of the CWA (Section 404). In addition, the regulations and policies of various federal agencies mandate that the filling of wetlands be avoided to the maximum extent feasible. The USACE requires obtaining a permit if a project proposes placing structures within navigable waters and/or alteration of waters of the U.S.

f. Bald and Golden Eagle Protection Act (16 USC 668)

The BGEPA provides protection for both the bald eagle (*Haliaeetus leucocephalus*) and the golden eagle (*Aquila chrysaetos*) by prohibiting the "take" of either of these species, including their parts, nests, or eggs. The MBTA defines "take" as to "pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb" any bald or golden eagle. The BGEPA is administered by the USFWS, and limited take authorizations are granted for qualifying activities. Persons who "take, possess, sell, purchase, barter, offer to sell, purchase or barter, transport, export or import, at any time or any manner, any bald eagle [or any golden eagle], alive or dead, or any part, nest, or egg thereof" without prior approval are subject to criminal penalties.

g. Fish and Wildlife Coordination Act (16 USC 661 et seq.)

The Fish and Wildlife Coordination Act (FWCA) of 1934, as amended, requires coordination with USFWS and CDFW so that these agencies may evaluate impacts to fish and wildlife species that have the potential to result from proposed water resource development projects. Specifically, the FWCA requires that fish and wildlife species as well as habitats that may support them be given equal consideration to other project features. The FWCA also requires federal agencies that construct, license, or permit water resource development projects to first coordinate with USFWS and CDFW to determine impacts that may occur to fish and wildlife resources and establish appropriate avoidance, minimization, and/or mitigation measures to reduce these potential impacts.

h. Floodplain Management and Protection of Wetlands (42 FR 26961, 52 FR 34617)

Executive Order 11990, Protection of Wetlands, as amended, requires federal agencies to minimize the destruction, loss, or degradation of wetlands and to preserve and enhance functions and values

of these wetlands while carrying out their responsibilities pertaining to water supply, erosion and flood prevention, maintenance of natural systems, among others.

i. Invasive Species (64 FR 6138)

Executive Order 13112, Invasive Species, as amended, requires federal agencies to coordinate efforts that prevent the introduction of invasive species (both plant and wildlife species not native to the U.S.), manage existing invasive species, and minimize the economic, ecological, and human health impacts that are caused by invasive species. This order defines invasive species, requires federal agencies to address invasive species concerns, and prohibits new actions that would cause or promote the introduction of invasive species. To comply with this order, all enhancement, restoration, and creation activities should use native plants and should include measures to prevent the introduction of invasive species.

4.3.2.2 State Regulations

a. California Endangered Species Act (Fish and Game Code 2050 et seq.)

The CESA parallels FESA and protects and/or preserves native plant and wildlife species and their habitats, especially those that are threatened with extinction and those that are experiencing significant decline that may lead to a threatened or endangered designation, within the state of California. CESA designates special status species that are protected from unauthorized "take", which is defined as to "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill."

CESA is administered by the CDFW. A state lead agency is required to consult with the CDFW to ensure that a project is not likely to jeopardize the continued existence of a special status species or result in the destruction or adverse modification of essential habitat for a species. CESA allows for the issuance of incidental take permits for lawful development projects and emphasizes the benefits of early consultation between the lead agency and CDFW to avoid potential impacts to special status species and to develop appropriate mitigation measures to reduce impacts to and avoid loss of a special status species.

b. California Environmental Quality Act: Treatment of Listed Plant and Animal Species

FESA and CESA protect only those species formally listed as threatened or endangered (or rare in the case of the state list). Section 15380 of the California Environmental Quality Act (CEQA) Guidelines independently defines "endangered" species of plants or animals as those whose survival and reproduction in the wild are in immediate jeopardy and "rare" species as those who are in such low numbers that they could become endangered if their environment worsens. Therefore, a project normally would have a significant effect on the environment if it would substantially affect a rare or endangered species of animal or plant or the habitat of the species. The significance of impacts to a species under CEQA must be based on analyzing actual rarity and threat of extinction despite legal status or lack thereof.

c. California Fish and Game Code

Several sections of the California Fish and Game Code, which is administered by the CDFW, also may apply to future projects proposed in the City. These include Section 2081; Sections 1600 through 1616; Sections 1900, et seq.; Sections 2511, 4700, 5050, and 5515; Sections 3503, 3503.5, and 3513; and Title 14, California Code of Regulations, Section 670.2 and 670.6. Each of these sections is discussed in detail below.

Section 2081

Section 2081 of the California Fish and Game Code allows for the issuance of an incidental take permit from CDFW for projects that have the potential to take a special status species, including a State-listed species, if the impacts are minimized and fully mitigated and will not jeopardize the continued existence of a State-listed species. The measures required to minimize and fully mitigate impacts must be roughly proportional to the extent of the proposed impact to the species and must be capable of successful implementation while maintaining the applicant's objectives to the greatest extent feasible. The applicant must show that adequate funding is available to implement the required avoidance and mitigation measures and monitor the effectiveness of the mitigation measures.

Sections 1600 to 1616

Sections 1600 through 1616 of the California Fish and Game Code apply to all projects that would (1) substantially divert or obstruct the natural flow of, (2) substantially change or use any material from, or (3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement into the bed, channel, or bank of any river, stream, or lake. Sections 1600 through 1616 require any person, business, public utility, or state or local government agency that proposes any activity within or adjacent to a lake, river, or stream that flows at least intermittently through a bank or channel, including watercourses with a subsurface flow (e.g., ephemeral streams, desert washes) and some flood plains, to notify the regional CDFW office of the proposed activity. CDFW will determine if the proposed activity may substantially adversely affect fish and wildlife resources and if a Streambed Alteration Agreement (SAA) is necessary.

Other Sections

Additional sections of the California Fish and Game Code may apply to future projects proposed in the City, including, but not limited to, Sections 1900 through 1913; Sections 2511, 4700, 5050, and 5515; Sections 3503, 3503.5, and 3513; and Title 14, California Code of Regulations, Section 670.2 and 670.6. Sections 1900 through 1913 provide guidelines to preserve, protect, and enhance endangered or rare native plants within California. Sections 2511, 4700, 5050, and 5515 provide guidelines to protect wildlife species that are designated as "fully protected" by the CDFW, and therefore cannot be harmed, taken, or possessed. Sections 3503, 3503.5, and 3513 state that it is unlawful to take, possess, or destroy the nest or eggs of any bird species, except otherwise allowed by California Fish and Game Code. Section 3503.5 provides protection specifically in the orders Falconiformes (hawks, eagles, and flacons) and Strigiformes (owls), and Section 3513 provides protection specifically for migratory, non-game birds designated by the MBTA. Title 14, California Code of Regulations, Section

670.2 and 670.6 list wildlife species that are designated as California Species of Concern or are state listed as threatened or endangered species.

d. California Porter-Cologne Water Quality Control Act

The California Porter-Cologne Water Quality Control Act was enacted in 1969 and is administered by either the State Water Resources Control Board and/or the RWQCB. This act provides protection for Waters of the State, which are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state." If a proposed project involves alteration to any Waters of the State, the project proponent must file a Report of Waste Discharge with the appropriate RWQCB to obtain "Waste Discharge Requirements" (WDRs), which serve as the project discharge permit.

e. California Natural Community Conservation Plan Program

The California NCCP program was initiated in 1991 and is administered by CDFW. It is a cooperative effort by the CDFW and numerous public and private partners that takes a broad scale, ecosystem approach to planning for the protection and perpetuation of biological diversity throughout California by protecting both habitats and the species within these habitats while also accommodating compatible land use.

An NCCP plan identifies and provides for the regional protection of plants, wildlife, and their habitats, while allowing compatible and appropriate economic activity in the region. By including key interests in the process and by working with landowners, environmental organizations, and other interested parties, an NCCP plan provides the framework for a local agency to oversee the numerous activities that compose the development of a conservation plan. Within California, there are currently 23 active NCCP plans covering more than 11 million acres, and several draft NCCP plans are pending approval. The City is a signatory to the Implementation Agreement of the NCCP/HCP for the central and coastal subregion of Orange County. This is implemented at the local level through the Irvine Open Space Initiative. See Section 4.3.2.3.a for this information.

4.3.2.3 Regional Regulations

a. Orange County Central and Coastal Natural Community Conservation Plan/Habitat Conservation Plan

In May of 1996, the City, the County of Orange, various other cities, and landowners entered into an agreement to place certain lands within the NCCP/HCP Reserve and commit to certain responsibilities under this plan. Most of the northeastern part of the City is part of the NCCP/HCP. Additional NCCP/HCP reserve lands also exist in other parts of the City. Development is limited within the NCCP/HCP areas to "Covered Activities" and compatible uses. All proposals for development that are within the NCCP/HCP are required to meet these requirements and would be reviewed by the City prior to approval.

b. Local Coastal Program

Implementation of Coastal Act policies are accomplished primarily through the preparation of a Local Coastal Program (LCP). The LCP is typically prepared and adopted by a municipality or county, and then reviewed and approved by the Coastal Commission. Under the California Coastal Act, "environmentally sensitive area" denotes any area in which plant or animal life, or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which could be easily disturbed or degraded by human activities and developments. The LCP protects water quality and the biological productivity of coastal waters, promotes avoidance and minimization of dredging, diking, and filling sediments, and provides mitigation of wetland impacts. The LCP primarily covers 40 acres within the western area of the Irvine Business Complex.

4.3.2.4 Local Regulations

a. Irvine Open Space Initiative

In 1988, City residents approved the "Irvine Open Space Initiative." This initiative created the framework to preserve large, contiguous open space areas for conservation and open space as phased master-planned growth occurred in other areas of the City. This initiative set the stage for the preservation of natural open space resources that are home to a variety of wildlife species and habitats, including special status species. The Irvine Open Space Preserve, as it now is known, protects more than 93,000 acres of land from the "mountains to the sea," linking the Cleveland National Forest, San Joaquin Marsh (San Joaquin Wildlife Sanctuary), Laguna Coast Wilderness Park, and other resources.

The Cleveland National Forest encompasses 460,000 acres and is the southernmost national forest in California located in San Diego, Riverside, and Orange counties. The San Joaquin Wildlife Sanctuary is a 300-acre constructed wetland in the floodplain of San Diego Creek just above its outlet to Upper Newport Bay. The Laguna Coast Wilderness Park encompasses 7,000 acres in the San Joaquin Hills and features some of the last remaining undeveloped coastal canyons in southern California and the only natural lakes in Orange County.

The City has committed to protect and manage the Irvine Open Space Preserve consistent with the NCCP/HCP. The City and many other local governments and public and private agencies adopted the NCCP/HCP to cover this area. Of the NCCP/HCP acres in the City, 10,587 are designated for the habitat reserve system, and 813 acres are non-reserve lands called special linkages. The special linkages contain biological value that could enhance connectivity between elements of the reserve system. The City is required to implement the NCCP/HCP and review project proposals for consistency with the plan.

b. Existing General Plan (2000)

The existing general plan established a preservation land use designation with the aim of identifying lands that contain visually significant ridgelines, biotic communities of high significance, geologic constraints, and cultural resources. This designation covers more than 11,000 acres, or nearly one-

quarter of the land mass in the City. The Conservation and Open Space Element identifies goals, objectives, and policies to maintain and preserve these resources.

Key objectives and policies include, but are not limited to, the following:

Objective L-1: Implementation Action Program. Establish an implementation action program that provides the opportunity to permanently protect and preserve designated conservation and open space areas as development of designated commercial, industrial, institutional, and residential areas occurs.

Objective L-2: Biotic Resources. Maintain and preserve areas with significant and diverse biotic communities.

- Policy (f): Locate intensive human use in preservation areas away from areas with rare or endangered species, including migratory bird species and rare plant species..
- Policy (j): Light-sensitive biotic areas should be protected from glare caused by outdoor lighting fixtures.
- Policy (k): If determined necessary through project review, a wall or fence combined with vegetation screening shall be constructed between light-sensitive habitat areas and adjacent urban development. Similar measures should be taken wherever light and glare might produce adverse impacts upon light-sensitive biotic areas.

Objective L-3: NCCP/HCP Implementation Areas. Participate in the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP) program to accomplish multi-species and multi-habitat conservation.

Objective L-12: Water. Coordinate land planning efforts with the appropriate federal, state & local agencies and landowners to encourage the integration of existing and future water sources (reservoirs, lakes, and drainage courses) into development.

c. Municipal Code

Title 5 (Planning), Division 7 (Sustainability in Landscaping), Chapter 4 (Urban Forestry)

Chapter 4, also known as the Urban Forestry Ordinance, outlines the provisions for the protection and enhancement of the existing urban forest resource by application of sustainability in landscaping policies and through the provision of professional management. For example, if any trees are removed, the applicant is required to carry out a tree survey and obtain a permit for their removal in accordance with the City's urban forestry ordinance (including 1:1 replacement).

Title 3 (Community Services), Division 4 (Parks), Chapter 1 (In General)

Section 3-4-132 (Protection of Natural, Cultural, Structural and Archaeological Resources) of Chapter 1 prohibits any person from possessing, destroying, injuring, defacing, removing, digging or disturbing from its natural state any of the following: plants, wildlife, artifacts, minerals, landscape structures, improvements, wood, and natural products.

d. Zoning Ordinance

Chapter 5-8 (Irvine Business Complex Residential Mixed-Use Overlay District)

Section 5-8-4.A.1 (Development Adjacent to San Diego Creek or San Joaquin Marsh) of Chapter 5-8 outlines the provisions for development adjacent to the San Diego Creek or San Joaquin Marsh, including: the prohibition of highly reflective glass windows and use of building angles in order to reduce light and glare impacts on the creek and marsh environment and reduce the incidence of bird collisions, and the prohibition of the use of exotic plant species in landscape plans that may be invasive to native habitats.

Chapter 8-16 (Open Space Management and Conservation Plan)

Chapter 8-16 of the Zoning Ordinance, Open Space Management and Conservation Plan (OSMCP) requires the preparation of plans for qualified development projects. The OSMCP facilitates compliance with biotic policies identified in biotic resources objectives L-2, and L-3, and L-12 of the Conservation and Open Space Element, the timing and phasing of mitigation measures, and the responsibilities for implementation. It is required that the OSMCP is prepared in conjunction with a concept plan and/or zone change application and in accordance with the City's guidelines for open space management and conservation plan reports. Additionally, the plan must address "transition zones" described in the Zoning Ordinance.

e. Commission Resolution No. 09.2968

Standard conditions are adopted by Planning Commission Resolution No. 09-2968 that assist staff in applying standardized wording for frequently used conditions of approval to discretionary and subdivision applications. Standard conditions are applied on a case-by-case basis depending upon the specifics of the application. Companion conditions are cross-referenced and are required to be used together. The following standard conditions related to hazards and hazardous materials apply:

Standard Condition 2.20 (Wildlife Habitat Clearance)

Prior to the issuance of permits for any grading activity including, but not limited to, clearing, grubbing, mowing, discing, trenching, grading, fuel modification, agriculture planting activity, and/or other related construction activity for a project that will involve removal of native plant communities and wildlife habitat, the applicant shall obtain written authorization from the appropriate Federal, State, and local agencies having jurisdiction over the habitat area. The authorization shall state that said activity complies with the regulations enforced by those agencies. Additionally, any mitigation requirements set forth by such agencies shall be incorporated into the project's final design plans. This written authorization, along with plans and mitigation measures, shall be submitted to the

Director of Community Development for review and shall have been approved by the Director prior to issuance of a permit for any grading activity.

Standard Condition 3.13 (Open Space Education)

Prior to issuance of the first building permit for a project adjacent to open space, location, design, and text for wild land interface signage shall be approved by the Director of Community Services in conjunction with the approval of the Master Landscape and Trails Plan, if any, or the Landscape Plan. The signage shall be located at all trailheads adjacent to the development. The signage shall educate users of the responsibilities associated with wild land interface and shall address relevant issues including the role of natural predators in the wild lands and how to minimize impacts of human and domestic pets on native communities and their inhabitants.

Standard Condition 6.10 (Open Space Education)

For any project adjacent to open space, the project applicant or subsequent builder shall distribute a wild land interface brochure to all owners, residents, and/or tenants (to be obtained from The Nature Reserve of Orange County www.naturereserveoc.org) to educate owners, residents, and/or tenants of the responsibilities associated with living at the wild land interface. The brochure shall address relevant issues, including the role of natural predators in the wild lands and how to minimize impacts of human and domestic pets on native communities and their inhabitants.

Standard Condition 6.11 (Open Space Landscaping)

Prior to the issuance of landscape construction plans for lots adjacent to any open space areas, the interface between the natural and developed areas shall be designed to employ techniques to minimize slopes and decrease slope angles, as well as, where appropriate, recreate natural features (i.e., drainage courses, rock outcroppings, landscaping, etc.), especially within areas adjacent to the NCCP Reserve, pursuant to the provisions of the approved NCCP/HCP. The landscape plans shall be reviewed by the Director of Community Services, and approved by the Director of Public Works, with regard to the landscaped interface.

f. Existing Plans, Programs, and Policies

Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required of the proposed project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute mitigation measures. The following measures are existing plans, programs, or policies (PPP) that apply to the proposed project and will help to reduce and avoid potential impacts related to biological resources:

- PPP BIO-1: Compliance with Section 404 of the CWA
- PPP BIO-2: Compliance with Section 401 of the CWA
- PPP BIO-3: Compliance with Section 1600 of the California Fish and Game Code
- PPP BIO-4: Compliance with the MBTA
- PPP BIO-5: Compliance with the Orange County Central and Coastal NCCP/HCP
- PPP BIO-6: Compliance with CESA

- PPP BIO-7: Compliance with Zoning Ordinance Division 8- Conservation and Open Space Phased Dedication Districts, Chapter 8-16 (Open Space Management and Conservation Plan)
- PPP BIO-8: Compliance with Zoning Ordinance Chapter 5-8 (Irvine Business Complex Residential Mixed-Use Overlay District)
- PPP BIO-9: Compliance with Municipal Code Title 5 (Planning), Division 7 (Sustainability in Landscaping), Chapter 4 (Urban Forestry)
- PPP BIO-10: Compliance with Standard Condition 2.20 (Wildlife Habitat Clearance)

Proposed General Plan Strategies and Policies

In addition to the above-listed PPPs, the following proposed Goals, Objectives, Policies, and Implementation Actions are applicable to the analysis of biological resources and would replace existing goals, strategies, and policies outlined in the City's existing General Plan following project approval:

Conservation and Open Space Element

Goal 2: Implement the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP) agreement and program to accomplish multi-species and multi-habitat conservation.

Objective COS-2. Effectively implement the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP) agreement and program to achieve comprehensive conservation goals, including the preservation and management of diverse species and habitats across the designated area, ensuring long-term ecological sustainability and biodiversity conservation.

- **Policy (a)**: Review project proposals within the reserve system to assure consistency with the NCCP/HCP implementation agreement and program.
- **Policy (b)**: Assure that nonparticipating landowners provide evidence of payment of mitigation fees.
- **Policy (**c) Manage all City open space lands enrolled in the NCCP/HCP Reserve System consistent with the terms, conditions and obligations of the NCCP/HCP permit and Implementation Agreement and associated RRMPs, including the City's obligation to restore CSS habitat in exchange for development of the open space trail system authorized in the RRMP.
- **Policy (d)**: Use the NCCP as a Program EIR for CEQA purposes, applying the Coastal Sage Scrub (CSS) mitigation measures applicable to planned activities.
- **Policy (e)**: Adopt fuel modification ordinances and standards consistent with the Fuel Modification Zones established in the NCCP/HCP.
- **Policy (f)**: Encourage and avoid adverse impacts to wildlife movement corridors connecting the Santa Ana Mountains to the coast open space areas of Bommer and Shady Canyons, Laguna Coast Wilderness Park and Crystal Cove State Park.

Goal 5: Maintain and preserve large, contiguous areas which contain significant multiple hazards and resources.

Objective COS-5. Safeguard and conserve large, contiguous areas housing significant and diverse hazards and resources, ensuring their preservation and maintenance to mitigate environmental risks and support ecological sustainability within the City's conservation and open space framework.

- **Policy (d)**: Ensure that riparian vegetation is not significantly modified, except as necessary to provide fire protection, access roads, and flood control, drainage, water, sewer and utility facilities, and except where habitat is to be enhanced as part of a mitigation program approved by the California Department of Fish and Wildlife or Implementation of the NCCP/HCP.
- **Policy (e)**: Participate in cooperative efforts with federal, state, and county agencies and landowners in planning, managing, and restoring regionally significant conservation and open space areas within the City and its sphere of influence (Lomas Ridge, Bommer and Shady Canyons, and San Joaquin Marsh).
- **Policy (g)**: Maintain significant riparian areas within preservation areas as natural corridors, sources of shelter, and water for wildlife.
- **Policy (h)**: Minimize intensive human use in preservation areas which sustain rare or endangered species, including migratory birds and rare plant species. Ensure use patterns and levels remain consistent with the NCCP/HCP and associated Recreation and Resource Management Plan (RRMPs).
- **Policy (i)**: Preserve and enhance the San Joaquin Marsh as a habitat resource and mitigation bank through implementation of the "San Joaquin Marsh Habitat Enhancement and Wetlands Creation Program."
- **Policy (j)**: Seek the least environmentally damaging and feasible alternatives where modifications of the natural topography are necessary in preservation area. Ensure that all impacts to preservation areas enrolled in the NCCP/HCP reserve system are consistent with the Implementation Agreement and associated RRMPs.
- **Policy (k)**: Ensure that any public road, arterial highway, transportation corridor, or utility that must pass through preservation areas outside the NCCP/HCP Reserve is the least environmentally damaging feasible alternative to the preservation area's environmental characteristics.
- **Policy (l)**: Ensure continuity and continued enhancement of the Agua Chinon and Wildlife Corridor in Planning Area 51.
- **Policy (m)**: Encourage special linkages for wildlife corridors, when feasible and suitable, within the City and sphere of influence as well as in non NCCP/HCP Reserve areas containing "target and identified species."

4.3.3 Significance Determination Thresholds

The City has adopted Appendix G of the State CEQA Guidelines as the significance thresholds for biological resources. A project would normally have a significant effect on the environment if the project would:

1) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies or regulations, or by the California Department of Fish and Wildlife (CDFW) or US Fish and Wildlife Service (USFWS);

2) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or USFWS;

3) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

4) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;

5) Conflict with any local policies or ordinances protecting biological resources, such as tree preservation policy or ordinance; or

6) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

4.3.4 Methodology

A biological resources technical report was prepared for the project that included a review of current federal, state, and local regulations; aerial imagery; U.S. Geological Survey (USGS) topographic maps; U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) soil survey maps; climate information for the City; and reputable online resources that provide data for the region. In addition, existing biological resource documents for the Central and Coastal Subregion of Orange County, California NCCP/HCP were also reviewed for pertinent information. Queries were also made of the CNDDB and USFWS Listed Species Database to identify known sensitive biological resources in the vicinity of the City.

4.3.5 Topic 1: Sensitive Species

Would the project result in a substantial adverse impact, either directly or through habitat modifications, to any species identified as a candidate, sensitive, or special status species in local or regional plans, policies or regulations, or by the CDFW or USFWS?

4.3.5.1 Impact Analysis

The proposed project would facilitate future development consisting of residential uses required to meet the City's Regional Housing Needs Assessment (RHNA) requirement, nonresidential uses within the Great Park, continued development of nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Buildout of the project would have the potential to directly and/or indirectly impact candidate, sensitive, or special status species. Potential direct impacts would include removal of habitat through future development and redevelopment projects that support sensitive species. As noted below, while future development would largely occur within the focus areas on developed and/or disturbed land and avoid known occurrences of sensitive species, future development may occur throughout

the City, including on vacant parcels with habitat types that may support sensitive species. Additionally, future development may result in indirect impacts to sensitive plant or wildlife species due to excess noise, lighting, or runoff generated during construction of projects both within and outside the focus areas. Furthermore, project construction could result in direct impacts to nesting or migratory birds from the removal of mature trees and/or native vegetation within project areas during the typical bird breeding season (January 15 to September 15; PPP BIO-4).

The project has been designed to minimize impacts to sensitive species by primarily focusing on future development and redevelopment within the proposed Focus Areas. Figure 4.3-1 presents the locations of the proposed Focus Areas in relation to mapped vegetation communities. As shown in Figure 4.3-1, there are no mapped vegetation communities within Focus Area 1, limited amounts in Focus Area 2, and some habitat in Focus Area 3. Additionally, the mapped vegetation communities in Focus Area 2 overlap with the Orange County NCCP/HCP Non-Reserve Open Space presented in Figure 4.3-3, and the mapped vegetation communities in Focus Area 3 overlap with the Orange County NCCP Reserve. Therefore, focusing development and redevelopment within areas that consist primarily of developed and/or disturbed land would minimize adverse impacts to sensitive species. All future development would be required to demonstrate compliance with CESA (PPP BIO-6), as well as the requirements of the MBTA for the protection of nesting birds, especially during the breeding season (January 15 to September 15). Furthermore, Goal 2, Objective COS-2 and Goal 5, Objective COS-5 of the Conservation and Open Space Element Update includes objectives and policies aimed to further conserve and restore natural ecosystems, protect biodiversity, and expand access to green space. Compliance with updated Conservation and Open Space Element goals, objectives, and policies would serve to further support the City's goal of protecting biological resources.

Figure 4.3-2 presents the locations of the proposed Focus Areas in relation to recorded sensitive species observations within the City. As shown in Figure 4.3-2, the proposed Focus Areas have few sensitive species observations, with most observations located within surrounding conserved areas with habitat value. While future development would largely occur within the focus areas on developed and/or disturbed land and avoid known occurrences of sensitive species, future development may occur throughout the City, including on vacant parcels with habitat types that may support sensitive species. Additionally, future development may result in indirect impacts to sensitive plant or wildlife species due to excess noise, lighting, or runoff generated during construction of projects both within and outside the focus areas. Furthermore, project construction could result in direct impacts to nesting or migratory birds from the removal of mature trees and/or native vegetation within project areas during the typical bird breeding season (January 15 to September 15). At a program level of analysis, it cannot be known with certainty that impacts to sensitive species.

4.3.5.2 Significance of Impacts

At a program level of analysis, it cannot be known with certainty that impacts to sensitive species could be fully avoided, which would be considered a potentially significant impact.

4.3.5.3 Mitigation

As part of the project approval process, each future proposed project shall include an initial site assessment to determine if sensitive biological resources could be present within and/or adjacent to the proposed development project and whether the project site lies inside the NCCP/HCP Reserve System (including the Irvine Open Space Preserve of the Irvine Open Space Initiative) or Special Linkage Areas or whether it lies outside. If no sensitive biological resources have a potential to occur within and/or adjacent to the proposed project, the City may approve the proposed project to proceed without further biological resource analyses. If sensitive biological resources have potential to occur, the following general biological mitigation measures would apply.

BIO-1: Prior to project approvals, applicants for future development projects with the potential to disturb sensitive biological resources shall include a biological resources survey. The survey shall be conducted by a qualified biologist. The biological resources survey shall include, but not be limited to:

- A search of available literature and biological databases, such as CNDDB to determine sensitive biological resources that have been reported from the proposed project vicinity.
- Mapping vegetation communities on the proposed project site.
- A general assessment and mapping of all potential jurisdictional resources (wetlands and riparian habitats).
- Evaluating wildlife movement corridors in the vicinity of the proposed project site.

BIO-2: If the proposed development project site supports vegetation communities that may provide habitat for special status plant or animal species, a focused habitat assessment shall be conducted by a qualified biologist to determine the potential for special status plant and/or animal species to occur within or adjacent to the proposed development project area.

BIO-3: If one or more special status species has the potential to occur within the proposed development project area, focused species surveys shall be conducted to determine the presence/absence of these species to adequately evaluate potential direct and/or indirect impacts to these species.

BIO-4: If construction activities are not initiated immediately after focused surveys have been completed, additional pre-construction special status species surveys may be required to assure impacts are avoided or minimized to the extent feasible. If pre-construction activities are required, a qualified biologist would perform these surveys as required for each special status species that is known to occur or has a potential to occur within or adjacent to the proposed development project area.

BIO-5: The results of the biological survey shall be presented in a biological survey letter report for proposed development projects with no significant impacts, or in a

biological technical report for proposed development projects with significant impacts that require mitigation to reduce the impacts to below a level of significant.

BIO-6: If sensitive biological resources are identified within or adjacent to the proposed development project area, the construction limits shall be clearly flagged to ensure impacts to sensitive biological resources are avoided or minimized to the extent feasible. Prior to implementing construction activities, a qualified biologist shall verify that the flagging clearly delineates the construction limits and that sensitive resources to be avoided.

BIO-7: If sensitive biological resources are known to occur within or adjacent to the proposed development project area, a project-specific contractor training program shall be developed and implemented to educate project contractors on the sensitive biological resources within and adjacent to the proposed development project area and measures being implemented to avoid and/or minimize impacts to these species. A qualified biologist shall develop and implement the contractor training program.

BIO-8: If sensitive biological resources are present within or adjacent to the proposed development project area and impacts may occur from implementation of construction activities, a qualified biological monitor may be required during a portion or all of the construction activities to ensure impacts to the sensitive biological resources are avoided or minimized to the extent feasible. The specific biological monitoring requirements shall be evaluated on a project-by-project basis. The qualified biological monitor shall be approved by the City on a project-by-project basis based on applicable experience with the sensitive biological resources that may be impacted by the proposed development project activities.

4.3.5.4 Significance of Impacts after Mitigation

Implementation of mitigation measures BIO-1 through BIO-8 would identify potential impacts to sensitive species and appropriate measures to reduce the impacts to below a level of significance. Implementation of mitigation measure BIO-1 would reduce impacts on sensitive and special status species to a less than significant level.

4.3.6 Topic 2: Sensitive Riparian Habitats

Would the project result in a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or USFWS?

4.3.6.1 Impact Analysis

The proposed project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, continued development of nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

As described in Section 4.3.1.2.e above, several riparian resources have been identified within the City. The project has been designed to minimize impacts to riparian and sensitive habitats by primarily focusing future development and redevelopment within the proposed Focus Areas. Figure 4.3-1 presents the locations of the proposed Focus Areas in relation to mapped vegetation communities, some of which qualify as riparian and sensitive habitats. As shown in Figure 4.3-1, there are no mapped vegetation communities within Focus Area 1, limited amounts in Focus Area 2, and some habitat in Focus Area 3. Additionally, the mapped vegetation communities in Focus Area 2 overlap with the Orange County NCCP/HCP Non-Reserve Open Space presented in Figure 4.3-3, and the mapped vegetation communities in Focus Area 3 overlap with the Orange County NCCP Reserve. Therefore, focusing development and redevelopment within areas that consist primarily of developed and/or disturbed land would minimize adverse impacts to riparian and sensitive habitats. However, future development may occur throughout the City as part of the project, including on vacant parcels with riparian and sensitive habitats. These vacant parcels may possess riparian and other sensitive habitats. Future development would be required to demonstrate compliance with the Orange County Central and Coastal NCCP/HCP (PPP BIO-5) and CESA (PPP BIO-6), as applicable. Future projects would be required to comply with mitigation measures BIO-9 and BIO-10, which require jurisdictional delineations to be conducted for projects potentially affecting riparian habitats and all necessary authorizations to be obtained for projects affecting such resources. Furthermore, Goal 2 and Objective COS-2 of the Conservation and Open Space Element Update which seek to maintain compliance with the NCCP/HCP, with supporting policies aimed at continued compliance under this plan, would further support the City's goal of reducing impacts to riparian and sensitive habitats.

4.3.6.2 Significance of Impacts

At a program level of analysis, it cannot be known with certainty that impacts to riparian and sensitive habitats could be fully avoided, which would be considered a potentially significant impact.

4.3.6.3 Mitigation

Buildout of the project has the potential to adversely affect riparian and sensitive habitats. If no riparian and sensitive habitats have a potential to occur within and/or adjacent to the proposed project, the City may approve the proposed project to proceed without further biological resource analyses. If sensitive riparian and sensitive habitats have potential to occur, mitigation measures BIO-9 and BIO-10 below would apply.

BIO-9: Prior to project approval, if a proposed project has the potential to affect riparian and sensitive habitats and/or jurisdictional resources, a qualified biologist conduct a jurisdictional delineation following the methods outlined in the 1987 Corps Wetland Delineation Manual (USACE 1987) and the Regional Supplement to the Corps Wetland Delineation Manual: Arid West Region (USACE 2008) to map the extent of wetlands and non-wetland waters, determine jurisdiction, and assess potential impacts. The results of the delineation shall be presented in a wetland delineation letter report and shall be incorporated into the California Environmental Quality Act document(s) required for approval and permitting of the proposed project.

BIO-10: If the results of mitigation measure BIO-9 above determine that a proposed project would impact riparian and sensitive habitats and/or jurisdictional features, permits and authorizations shall be obtained from the U.S. Army Corps of Engineers, California Department of Fish and Wildlife, and/or Regional Water Quality Control Board prior to project approval. The regulatory agency authorization(s) would include specific avoidance, minimization, and mitigation measures for impacts to riparian and sensitive habitats and/or jurisdictional resources, which may include monetary contributions to a mitigation bank or habitat creation, restoration, and/or enhancement.

4.3.6.4 Significance of Impacts after Mitigation

Implementation of mitigation measures BIO-9 and BIO-10 would identify specific avoidance, minimization, and mitigation measures for impacts to riparian and sensitive habitats, which may include monetary contributions to a mitigation bank or habitat creation, restoration, and/or enhancement. Implementation of mitigation measures BIO-9 and BIO-10 would reduce impacts on riparian and sensitive habitats to a level less than significant.

4.3.7 Topic 3: Jurisdictional Wetlands and Waters

Would the project result in substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

4.3.7.1 Impact Analysis

The proposed project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, continued development of nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

As described in Section 4.3.1.2e above, jurisdictional wetlands and waters have been identified within the City. The project has been designed to minimize impacts to jurisdictional wetlands and waters by primarily focusing future development and redevelopment within the proposed Focus Areas. Figure 4.3-1 presents the locations of the proposed Focus Areas in relation to mapped vegetation communities, some of which qualify as jurisdictional wetlands and waters. As shown in Figure 4.3-1, there are no mapped vegetation communities within Focus Area 1, limited amounts in Focus Area 2, and some habitat in Focus Area 3. Additionally, the mapped vegetation communities in Focus Area 2 overlap with the Orange County NCCP/HCP Non-Reserve Open Space presented in Figure 4.3-3, and the mapped vegetation communities in Focus Area 3 overlap with the Orange County NCCP Reserve. Therefore, focusing development and redevelopment within these areas that consist primarily of developed and/or disturbed land would minimize adverse impacts to jurisdictional wetlands and waters. However, future development may occur throughout the City, including on vacant parcels with jurisdictional wetlands and waters. Future development would be required to demonstrate compliance with Section 404 of the CWA (PPP BIO-1), Section 401 of the CWA (PPP BIO-2), Section 1600 of the California Fish and Game Code (PPP BIO-3), and the Orange County

Central and Coastal NCCP/HCP (PPP BIO-5) as applicable. Future projects would also be required to comply with mitigation measure BIO-9 and BIO-10, which require jurisdictional delineations to be conducted for projects potentially affecting wetlands and all necessary authorizations to be obtained for projects affecting such resources. Furthermore, Goal 5, Objective COS-5 of the Conservation and Open Space Element Update which seeks to protect environmental quality would further the City's goal of reducing impacts to wetlands.

4.3.7.2 Significance of Impacts

At a program level of analysis, it cannot be known with certainty that impacts to jurisdictional wetlands and waters could be fully avoided, which would be considered a potentially significant impact.

4.3.7.3 Mitigation

See mitigation measures BIO-9 and BIO-10 above.

4.3.7.4 Significance of Impacts after Mitigation

Implementation of mitigation measures BIO-9 and BIO-10 would identify specific avoidance, minimization, and mitigation measures for impacts to jurisdictional resources, which may include monetary contributions to a mitigation bank or habitat creation, restoration, and/or enhancement. Implementation of mitigation measures BIO-9 and BIO-10 would reduce impacts on jurisdictional wetlands and waters to a less than significant level.

4.3.8 Topic 4: Wildlife Corridors

Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

4.3.8.1 Impact Analysis

The proposed project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Future development under the project would not be within the NCCP/HCP areas, which have been placed over regional and local wildlife corridors. Much of the City's open space has already been reserved or designated as special linkages, including through the Irvine Open Space Initiative. Future development under the project would be required to demonstrate compliance with the Orange County Central and Coastal NCCP/HCP (PPP BIO-5) and CESA (PPP BIO-6), as applicable, including with respect to wildlife movement. Additionally, Conservation and Open Space Element Goal 2, Objective COS-2 and Goal 5, Objective COS-5 seek to implement the NCCP/HCP and conserve and restore natural resources. These efforts include implementing the NCCP/HCP to ensure long-term ecological sustainability and biodiversity conservation and designing future projects to avoid impacts

to biological resources. Due to the anticipated location of development, combined with existing PPPs, the project would not substantially interfere with the movement of any native resident or migratory fish or wildlife species, or with established native resident migratory wildlife corridors, including linkages identified in the Irvine Open Space Initiative. Compliance with goals, objectives, and policies in the updated Conservation and Open Space Element would also further the City's goals of reducing impacts to migratory wildlife corridors or native wildlife nursery sites.

4.3.8.2 Significance of Impacts

The project would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites, and impacts would be less than significant.

4.3.8.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.3.8.4 Significance of Impacts after Mitigation

Impacts would be less than significant. No mitigation is required.

4.3.9 Topic 5: Local Ordinances

Would the project conflict with any local policies or ordinances protecting biological resources, such as tree preservation policy or ordinance?

4.3.9.1 Impact Analysis

The proposed project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, continued development of nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Future development would be required to demonstrate compliance with Section 404 of the CWA (PPP BIO-1), Section 401 of the CWA (PPP BIO-2), Section 1600 of the California Fish and Game Code (PPP BIO-3), and the Orange County Central and Coastal NCCP/HCP (PPP BIO-5) and CESA (PPP BIO-6). Furthermore, Conservation and Open Space Element Goal 2, Objective COS-2 and Goal 5, Objective COS-5 seek to conserve and restore natural resources. These efforts include implementing the NCCP/HCP to ensure long-term ecological sustainability and biodiversity conservation and requirement future projects to avoid impacts to biological resources. Therefore, impacts related to conflicts with local policies and ordinances intended to protect biological resources would be less than significant.

4.3.9.2 Significance of Impacts

The project would not conflict with local policies and ordinances intended to protect biological resources, and impacts would be less than significant.

4.3.9.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.3.9.4 Significance of Impacts after Mitigation

Impacts would be less than significant. No mitigation is required.

4.3.10 Topic 6: Habitat Conservation Plan

Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

4.3.10.1 Impact Analysis

a. Orange County NCCP

The City has committed to protect and manage the Irvine Open Space Preserve consistent with the NCCP/HCP. The City and many other local governments and public and private agencies adopted the NCCP/HCP to cover this area. Of the NCCP/HCP acres in the City, 10,587 are designated for the habitat reserve system, and 813 acres are non-reserve lands called special linkages. The special linkages contain biological value that could enhance connectivity between elements of the reserve system.

Future development resulting from implementation of the project would be required to comply with the NCCP/HCP. As part of the project approval process, each future proposed project with the potential to impact biological resources would be required to conduct an initial site assessment to determine if sensitive biological resources could be present within and/or adjacent to the proposed development project (refer to mitigation measure BIO-1). Individual projects would also be assessed for compliance with the NCCP/HCP depending on whether the project site lies inside the NCCP/HCP Reserve System (including the Irvine Open Space Preserve of the Irvine Open Space Initiative) or Special Linkage Areas. If no sensitive biological resources have a potential to occur within and/or adjacent to the proposed project, the City may approve the proposed project to proceed without further biological resource analyses. If sensitive biological resources have potential to occur, future development may have the potential to conflict with the NCCP/HCP.

b. Local Coastal Program

The proposed project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, continued

development of nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

A small portion of Focus Area 1 is located within the coastal zone of the City's Local Coastal Plan. The majority of this area is developed with industrial and office uses, with the remaining portion of the City's coastal zone located in an area that is regulated by University of California, Irvine and is therefore not covered by the City's Local Coastal Program. Any future development facilitated by the project that would be located within the coastal zone would be required to comply with the Local Coastal Program. Specifically, future projects would be required to file for a consistency determination with the Airport Land Use Commission (ALUC) as specified in Section 4.7 of the Airport Environs Land Use Plans (AELUP). If ALUC determines that a proposed project is inconsistent with the AELUP, ALUC is required to notify the City. The City may modify the project to be consistent with the AELUP and resubmit to ALUC or the City can overrule ALUC by following the procedures in Public Utilities Code Sections 21676 and 21676.5. This procedure would require the City to hold a public hearing on the matter, make specific findings that the proposed overruling is consistent with Public Utilities Code Section 2160, and overrule ALUC by at least two-thirds vote of the applicable governing body (likely the City's Planning Commission and/or City Council).

Furthermore, the project itself requires a Local Coastal Program amendment to ensure consistency between the proposed General Plan, Zoning Ordinance, and Zoning Map amendments. Approval of a Local Coastal Program would ensure consistency with the project and the Local Coastal Program and would therefore serve to further minimize impacts to biological resources.

4.3.10.2 Significance of Impacts

If sensitive biological resources have potential to occur, future development may have the potential to conflict with the NCCP/HCP, which would be considered significant. Conflicts with the LCP would be less than significant and would not require mitigation.

4.3.10.6 Mitigation

See mitigation measures BIO-1 through BIO-10 above regarding consistency with the NCCP/HCP. Conflicts with the LCP would be less than significant and would not require mitigation.

4.3.10.4 Significance of Impacts after Mitigation

Implementation of mitigation measures BIO-1 through BIO-10 would reduce conflicts with the NCCP/HCP to a level less than significant. Conflicts with the LCP would be less than significant and would not require mitigation.

4.3.11 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for biological resources. The study area for the assessment of cumulative impacts related to biological resources is inclusive of the City limits,

including the area covered by the LCP, as well as the Orange County Central and Coastal NCCP/HCP area, which identifies and provides for the regional protection of plants, wildlife, and their habitats, while allowing compatible and appropriate economic activity in the region. The project has focused development and redevelopment within areas that consist primarily of developed and/or disturbed land with limited biological value. Future development would be required to demonstrate compliance with Section 404 of the CWA (PPP BIO-1), Section 401 of the CWA (PPP BIO-2), Section 1600 of the California Fish and Game Code (PPP BIO-3), and the Orange County Central and Coastal NCCP/HCP (PPP BIO-5) and CESA (PPP BIO-6), as well as complete site-specific analysis that would identify the presence of sensitive species and appropriate mitigation would be applied to reduce potential impacts. Therefore, the project would not contribute to a cumulative impact to biological resources. Compliance with goals, objectives, and policies in the updated Conservation and Open Space Element would further the City's goals of reducing cumulative impacts to biological resources.

4.4 Cultural and Tribal Cultural Resources

This section analyzes potentially significant impacts related to cultural and tribal cultural resources that could result from implementation of the project. This analysis relies upon the results of the Paleontological and Cultural Resources Assessment Report for the project (Appendix D).

4.4.1 Existing Conditions

Cultural resources in the city of Irvine (City) include both historical and archaeological elements, providing tangible links to the City's past. Historical sites dating back to post-1542 AD hold significance for their historical, architectural, or cultural value, while archaeological sites reveal traces of human activity predating 1750 AD. The largest concentrations of archaeological sites, primarily reflecting the presence of the Gabrieleno and the Acjachemen (Juaneño), are found in specific regions like Upper Newport Bay and the Santiago and San Joaquin Hills. Hundreds of cultural resources have been identified within or near the City, including some of Orange County's earliest sites, with additional records maintained by the Office of Historic Preservation in Sacramento.

4.4.1.1 Cultural Setting

a. Prehistoric Setting

Table 4.4-1 presents the chronology of cultural change within the City over time. Archaeological data has revealed that from 8,500 to 3,500 years Before Present (BP), settlement within the region consisted of what is known today as Topanga groups of the Encinitas Pattern, which were relatively small and highly mobile populations. These people tended to settle along the coast in wetlands, bays, coastal plains, near-coastal valleys, marine terraces, and mountains. The Topanga toolkit is dominated by manos and metates with projectile points scarce. Beginning in 3,500 BP, the Encinitas Pattern was replaced by the Angeles Pattern, which restricted to the mainland and appears to have been less technologically conservative and more ecologically diverse, with a largely terrestrial focus and greater emphases on hunting and nearshore fishing (see Appendix D).

Table 4.4-1
Chronology of Cultural Change

Pattern	Phase	Dates (BP)	Material Traits	Other Traits
Encinitas	Topanga I	8,500 to 5,500	Abundant manos and metates, many core tools and scrapers, few but large points, charmstones, cogged stones, early discoidals, bone gorge fishhooks, faunal remains rare; Olivella spire/end lopped beads appear	Estuary/lagoon shellfish and sharks/rays common, hunting important, secondary burials under metate cairns (some with long bones only), some extended inhumations, no cremations
	Topanga II	5,000 to 3,500	Abundant but decreasing manos and metates, adoption of mortars and pestles, smaller points, cogged stones, late discoidals, fewer scraper planes and core tools, some stone balls and	Estuary/lagoon shellfish and sharks/rays common, addition of acorns, reburial of long bones only, addition of flexed

Table 4.4-1
Chronology of Cultural Change

Pattern	Phase	Dates (BP)	Material Traits	Other Traits
			charmstones; inhumations common; Olivella Grooved Rectangular beads introduced	inhumations (some beneath metate cairns), cremations rare
Angeles	Angeles I	3,500 to 2,600	Appearance of Elko dart points and an increase in the overall number of projectile points from Encinitas components; beginning of large-scale trade in small steatite artifacts (effigies, pipes, and beads) and Olivella shell beads; appearance of single-piece shell fishhooks and bone harpoon points; Coso obsidian becomes important; appearance of donut stones; appearance of Mytilus beads	apparent population increase; fewer and larger sites along the coast; collector strategy; less overall dependence on shellfish but fishing and terrestrial hunting more important; appearance of flexed and extended inhumations without cairns, cremations uncommon
	Angeles II	2,600 to 1,600	Continuation of basic Angeles I material culture with the addition of mortuary features containing broken tools and fragmented cremated human bone; fishhooks become more common	Shellfish change to mudflat species, more emphasis on fish, birds and mammals, continuation of basic Angeles I settlement and subsistence systems; appearance of a new funerary complex
	Angeles III	1,600 to 1,250	Appearance of bow and arrow technology (e.g., Marymount or Rose Spring points); changes in Olivella beads; asphaltum becomes important; reduction in obsidian use; Obsidian Butte obsidian largely replaces Coso	Larger seasonal villages; flexed primary inhumations but no extended inhumations and an increase in cremations; appearance of obsidian grave goods
	Angeles IV	1,250 to 800	Cottonwood points appear; some imported pottery appears; birdstone effigies at the beginning of the phase and "spike" effigies dropped by the end of the phase; possible appearance of ceramic pipes, Mytilus shell disks	Change in settlement pattern to fewer but larger permanent villages; flexed primary inhumations continue, cremations uncommon
	Angeles V	800 to 450	Trade of steatite artifacts from the southern Channel Islands becomes more intensive and extensive, with the addition or increase in more and larger artifacts, such as vessels and comals; larger and more elaborate effigies; portable mortars and pestles	Strengthening of ties, especially trade, with southern Channel Islands; expansion into the northern Santa Ana Mountains and San Joaquin Hills
	Angeles VI	450 to 150	Addition of Euroamerican material culture (e.g., glass beads and metal tools), locally made pottery, metal needle-drilled Olivella beads	Change of settlement pattern, movement close to missions and ranches; use of domesticated species obtained from Euroamericans; flexed primary inhumations continue; apparent adoption of Chingichngish religion

SOURCE: Appendix D.

b. Ethnography

The City is within the traditional tribal territory of the Gabrieleno with the Acjachemen (Juaneño) located immediately to the south. The traditional tribal territory of the Gabrieleno includes large portions of Los Angeles County, the northern part of Orange County, small sections of Riverside and San Bernardino counties as well as the southern Channel Islands of Santa Barbara, San Clemente, San Nicolas, and Santa Catalina. The traditional tribal territory of the Acjachemen includes northern San Diego County and southern Orange County. Tribal boundaries are fluid and the Acjachemen territory may have extended north to include the City. Background sections for both the Gabrieleno and Acjachemen are provided below.

Gabrieleno

The Gabrieleno are considered to have been one of the wealthiest tribes and to have greatly influenced tribes they traded with. Houses were domed, circular structures thatched with tule or similar materials. The best-known artifacts were made of steatite and were highly prized. Many common everyday items were decorated with inlaid shell or carvings reflecting an elaborately developed artisanship.

The main food zones utilized were marine, woodland, and grassland. Plant foods were, by far, the greatest part of the traditional diet. Acorns were the most important single food source. Villages were located near water sources necessary for the leaching of acorns, which was a daily occurrence. Grass seeds were the next most abundant plant food used along with chia. Seeds were parched, ground, and cooked as mush in various combinations according to taste and availability. Greens and fruits were eaten raw or cooked or sometimes dried for storage. Bulbs, roots, and tubers were dug in the spring and summer and usually eaten fresh. Mushrooms and tree fungus were prized as delicacies. Various teas were made from flowers, fruits, stems, and roots for medicinal cures as well as beverages.

The principal game animals were deer, rabbit, jackrabbit, woodrat, mice, ground squirrels, antelope, quail, dove, ducks, and other birds. Most predators were avoided as food, as were tree squirrels and most reptiles. Trout and other fish were caught in the streams, while salmon were caught when available in the larger creeks. Marine foods were extensively utilized. Sea mammals, fish, and crustaceans were hunted and gathered from both the shoreline and the open ocean, using reed and dugout canoes. Shellfish were the most common resource, including abalone, turbans, mussels, clams, scallops, bubble shells, and others.

Juaneño Acjachemen

About 1,300 years ago the Acjachemen (Juaneño), who were hunters and gatherers of the San Luis Rey Cultural Pattern, moved into southern Orange County. The Acjachemen speak a language that is part of the Takic language family. Their traditional tribal territory was situated partly in northern San Diego County and partly in southern Orange County. The boundaries were Las Pulgas Creek (south), Aliso Creek (north), the Pacific Ocean (west) and the Santa Ana Mountains (east). Villages were mostly along San Juan Creek, Trabuco Creek, and San Mateo Creek.

In prehistory, the Acjachemen had a patrilineal society and lived in groups with other relatives. These groups had established claims to places including the sites of their villages and resource areas. Marriages were usually arranged from outside villages establishing a social network of related peoples in the region. There was a well-developed political system including a hereditary chief. Religion was an important aspect of their society. Religious ceremonies included rites of passage at puberty and mourning rituals.

Houses were typically conical in shape and thatched with locally available plant materials. Work areas were often shaded by rectangular brush-covered roofs (ramada). Each village had a ceremonial structure in the center enclosed by a circular fence where all religious activities were performed.

Women are known to have been the primary gatherers of plant foods, but also gathered shellfish and trapped small game animals. Men hunted large game and most small game, fished, and assisted with plant food gathering, especially of acorns. Adults were actively involved in making tools including nets, arrows, bows, traps, food preparation items, pottery and ornaments. Tribal elders had important political and religious responsibilities and were involved in education of younger members.

c. Historic Setting

Spanish Exploration

Juan Cabrillo was the first European to sail along the coast of California in 1542 and was followed in 1602 by Sebastian Vizcaino. The Spanish colonization of what was then known as Alta California began with the 1769 overland expedition led by Gaspar de Portolá, with a crew of 63 men exploring the land between San Diego and Monterey. Between 1769 and 1822, the Spanish had colonized California and established missions, presidios, and pueblos and documented the people and landscape along the way.

Portola and his expedition crossed the area north of Lake Forest in July 1769, naming the perennial creek that empties from the Santa Ana Mountains "aliso". During the Mission period, many of the trees along the creek, including alder, oak, sycamore, and other species were cut down for the construction of ships and structures, charcoal production, and other uses.

Portions of the City lie within the boundaries of Rancho Santiago de Santa Ana, which was given to Jose Antonio Yorba and his nephew Pablo Peralta in 1810 by Governor José Joaquin de Arrillaga on behalf of the Spanish Government. The grant consisted of the lands east of the Santa Ana River to the Santa Ana Mountains (see Appendix D).

Mexican Period

In addition to the land granted for the Rancho Santiago de Santa Ana under the Spanish Government, additional land grants were given by the Mexican government, including Rancho San Joaquin and Rancho Lomas de Santiago. The Rancho San Joaquín land grant was a combination of the Rancho Cienega de las Ranas and the Ranch La Bolsa de San Joaquín. This land grant was issued to José Antonio Andrés Sepúlveda in 1837 and 1842, respectively. Rancho Lomas de Santiago was

granted to Teodosio Yorba by the Mexican Governor Pío Pico in 1846. Teodosio was the son of Jose Antonio Yorba, who was granted Rancho Santiago de Santa Ana (see Appendix D).

American Period

Following the cession of California to the United States after the Mexican-American War, the Treaty of Guadalupe Hidalgo in 1848 ensured that the land grants would be honored. In 1864 Sepúlveda sold his lands to Benjamin and Thomas Flint, Llewellyn Bixby, and James Irvine. In 1876, James Irvine bought out his partners and became the sole owner of the Irvine Ranch, which continued largely a ranching operation for many years. When Irvine died in 1886, James Irvine II took control of the ranch and increased its agricultural production. In 1894, James Irvine II incorporated the land holdings as the Irvine Company.

In 1899, the newly formed San Joaquin School District approached James Irvine II with the intent to build a school for the children of his ranch tenant. In 1911, the school and land upon which it resided was donated by Irvine II to Orange County. By the beginning of the twentieth century, Irvine II set aside 320 acres at the intersection of the Santa Fe Railroad tracks and Central Avenue for the purpose of developing a town for the residence of both his permanent and seasonal workers. In 1914, the Orange County town of Myford was renamed "Irvine." The Irvine Ranch's bean production reached its zenith during the First World War. In 1918, the ranch contained 60,000 acres of lima bean fields which produced 900,000 sacks, which equated to a total value of $6 million. After the First World War, significant changes occurred at the Irvine Ranch in the 1920s. The Irvine Service Station was enlarged to accommodate the area's growing car culture and the town initially planned by Irvine saw an increase in housing for workers. Seeking a site for the Navy's air operations, the Santa Ana Chamber of Commerce chose the Irvine Ranch's lima bean field. This resulted in the establishment of the El Toro Marine Corps Air Station and the Tustin Lighter-Than-Air base (see Appendix D).

Modern Period

As a result of the Second World War, pressure mounted towards the development of urban areas in California. Under the guidance of Myford Plum, Irvine, Cameo Highlands, Irvine Terrace, Harbor View Hills, Cameo Shores, Westcliff Batcrest, and Irvine Cove in Laguna were developed.

In 1960, the Irvine Company gifted 1,000 acres of land to the University of California with a provision for the sale of an additional 500 acres. The establishment of the university on the Irvine Ranch provided a central focus around which the company would create a master plan for Irvine Ranch, centering around both the City and University of California, Irvine. To create this master plan, the Irvine Company hired William Pereira & Associates, who divided the ranch into three sections (north, central, and south). The central section consisted of prime agricultural land, while the northern section consisted of a remote mountainous region, and the southern section consisted of a basin that was considered the top priority of urban development, as it ran from the coast to the alignment of the Interstate 405 (I-405; San Diego) Freeway. Development of each community underwent meticulous planning, as each "village" would include its own churches, shopping centers, and schools. The same attention to detail was utilized in master land-use plan in the development of the Irvine Industrial Complex and the Newport "downtown" Center. Pereira's plan for the university outlined the campus as a large wheel with a park at the center that would include a lake and an amphitheater as "the focus of university life". The University of California, Irvine was dedicated on June 20, 1964.

In 1965, much of the agricultural land on the ranch was being converted into housing tracts. Multiple electronic firms, aerospace companies, and research and development companies made their way to the Irvine Industrial Complex. In 1971, the City of Irvine was incorporated. The 1973 Irvine General Plan emphasized an increase in cycling, hiking, and equestrian trails, reduced car dependency, and an increase in access to recreational facilities (see Appendix D).

4.4.1.2 Existing Historic and Prehistoric Resources

A record search for archaeological and historical resources was completed on September 24 and 25, 2018 at the South Central Coastal Information Center (SCCIC) of the California Historical Resource Inventory System, located on the campus of the California State University, Fullerton. The record search covered the entire area within the boundaries of the City. The search radius included El Toro, San Juan Capistrano, Laguna Beach, Tustin, Orange, and Black Star Canyon 7.5-minute topographic quadrangle maps. The results of the record search indicated that 647 prior studies were located within the City. The records search also determined 379 previously recorded cultural resources are located within the City boundaries, which are summarized by resource type in Table 4.4-2 below.

In addition to the SCCIC records search, a variety of sources were consulted in October 2018[1] to obtain information regarding the cultural context of the City. Sources included the National Register of Historic Places (NRHP) and the California Register of Historic Resources (CRHR) which includes the California Historical Resources Inventory (CHRI),[2] California Historical Landmarks (CHL), and California Points of Historical Interest (CPHI). The Bureau of Land Management (BLM) General Land Office records were also searched.

Table 4.4-2
Previously Recorded Cultural Resources

Resource Type	Quantity
Prehistoric Site	216
Prehistoric Isolate	85
Multi-Component Site	9
Multi-Component Isolate	1
Unknown Isolate	1
Historic Resource	62
Historic Site	2
Historic Isolate	3
TOTAL	**379**

[1] Most developed suburban areas have been previously surveyed. However, certain areas with significant open space may remain unassessed, particularly if there hasn't been any ground disturbance. Despite the timing of the 2018 record searches and consultations, results and efforts remain relevant given the development trends that have occurred up to this point and the absence of ground disturbance in open space areas.

[2] The CHRI has been replaced by the California Built Environment Resource Database.

a. Historic Resources

Figure 4.4-1 presents the locations of historic resources within the City, and Table 4.4-3 provides a summary of these historic resources based on the type of historic designation.[3] Historic resources listed in Table 4.4-3 include four buildings listed on the NRHP and the CRHR, eight properties listed on the CHRI, one area with a CHL plaque, and three areas with a CPHI plaque. The Orange County Parks lists the Irvine Ranch Historic Park as a historic resource, and the City lists 19 historically important properties. Historic resources within the City include current and former locations of historic buildings, historical archaeological sites (often near historic use areas), and the location of extant historic homes more than 45 years old. Old Town Irvine has the highest number of historic buildings. Other resources north of I-405 include the railroad, a eucalyptus windbreak, Valencia Growers Packing House, and the Irvine Agricultural Headquarters Complex. Historic resources south of I-405 include the Rancho San Joaquin Adobe, the San Joaquin Gun Club, Phineas Banning House, Bommer Canyon Cattle Camp, and Barton's Mound. Only those resources that have been determined to be significant under the California Environmental Quality Act (CEQA) are presented in Figure 4.4-1.

b. Archaeological Resources

The cultural resources assessment completed for the project mapped all known prehistoric sites to help establish sensitivity rankings. However, the locations of all sites must remain confidential. Archaeological sites are most abundant in the San Joaquin Marsh area and San Joaquin Hills, both of which are located south of I-405. Prehistoric sites are also abundant in areas that had been permanent water sources in prehistoric times, such as creeks and springs, northeast of Irvine Boulevard. Only 10 known sites are present on the plain between I-405 and Irvine Boulevard. Based on this distribution of prehistoric sites, areas south of I-405 and north of Irvine Boulevard have been designated as highly sensitive, and the plain in between I-405 and Irvine Boulevard has been designated as less sensitive (Figure 4.4-2). Only two historical archaeological sites have been recorded in City. Both are in the eastern portion of the City and consist of historic domestic refuse. Due to the low number of sites, no sensitivity map was created.

[3] It should be noted that some sites have received multiple designations, and therefore are listed multiple times in Table 4.4-3.

4.4.2 Applicable Regulatory Requirements

4.4.2.1 Federal

a. National Historic Preservation Act of 1966

The National Historic Preservation Act of 1966 established the NRHP as the official federal list of cultural resources that have been nominated by state offices for their historical significance at the local, state, or national level. The NRHP, which is administered by the National Park Service, is "an authoritative guide to be used by federal, state, and local governments, private groups, and citizens to identify the nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment." Listing in the National Register assists in preservation of historic properties through the following actions: recognition that a property is of significance to the nation, the state, or the community; consideration in planning for federal or federally assisted projects; eligibility for federal tax benefits; consideration in the decision to issue a federal permit; and qualification for federal assistance for historic preservation grants, when funds are available.

Properties may qualify for NRHP listing if they qualify under the following criteria:

Criterion A: Associated with events that have made a significant contribution to the broad patterns of history;

Criterion B: Associated with the lives of persons significant in the past;

Criterion C: Embody the distinctive characteristics of a type, period, or method of construction; represent the work of a master; possess high artistic values, represent a significant and distinguishable entity whose components may lack individual distinction; or

Criterion D: Have yielded, or may be likely to yield, information important in prehistory or history.

Structures and features must usually be at least 50 years old to be considered for listing on the NRHP, barring exceptional circumstances. According to the NRHP guidelines, a resource must retain its integrity, or the "ability to convey its significance." The seven aspects of integrity are location, design, setting, materials, workmanship, feeling, and association.

b. Federal Native American Graves Protection and Repatriation Act

The Native American Graves Protection and Repatriation Act (NAGPRA) is a federal law that was established in 1990. NAGPRA provides a process for museums and federal agencies to return certain Native American cultural items – human remains, funerary objects, sacred objects, or objects of cultural patrimony – to lineal descendants, and culturally affiliated Indian tribes and Native Hawaiian organizations. NAGPRA includes provisions for unclaimed and culturally unidentifiable Native American cultural items, intentional and inadvertent discovery of Native American cultural items on federal and tribal lands, and penalties for noncompliance and illegal trafficking in these items. Implementation of the project would be conducted in compliance with NAGPRA. On March 15, 2010, the Department of the Interior issued a final rule on 43 Code of Federal Regulations (CFR) Part 10, of the NAGPRA Regulations – Disposition of Culturally Unidentifiable Human Remains. The final rule implements NAGPRA by adding procedures for the disposition of culturally unidentifiable Native American human remains in the possession or control of museums or federal agencies. The rule also amends sections related to purpose and applicability of the regulations, definitions, inventories of human remains and related funerary objects, civil penalties, and limitations and remedies. The rule became effective on May 14, 2010.

Federal curation regulations are also provided in 36 CFR 79, which apply to collections that are excavated or removed under the authority of the Antiquities Act (16 United States Code [USC] 431-433), the Reservoir Salvage Act (16 USC 469-469c), Section 110 of the National Historic Preservation Act (NHPA) (16 USC 470h-2), or the Archaeological Resources Protection Act (16 USC 470aa-mm). Such collections generally include those that are the result of a prehistoric or historic resources survey, excavation or other study conducted in connection with a federal action, assistance, license or permit.

4.4.2.2 State

a. CEQA Guidelines and California Register of Historical Resources

The California Code of Regulations (CCR), Title 14, Chapter 3, Section 15064.5 (the State CEQA Guidelines) establishes the procedure for determining the significance of impacts to archeological and historical resources, as well as classifying the type of resource. Cultural resources are aspects of the environment that require identification and assessment for potential significance. The evaluation of cultural resources under CEQA is based upon the definitions of resources provided in State CEQA Guidelines Section 15064.5, as follows:

- A resource listed in, or determined to be eligible by, the State Historical Resources Commission, for listing in the California Register of Historical Resources (Pub. Res. Code Section 5024.1, Title 14 CCR, Section 4850 et seq.).

- A resource included in a local register of historical resources, as defined in Section 5020.1(k) of the Public Resources Code (PRC), or identified as significant in a historical resource survey pursuant to the requirements of section 5024.1(g) of the PRC, shall be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.

- Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be an historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record.

Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the California Register of Historical Resources (Pub. Res. Code Section 5024.1, Title 14 CCR, Section 4852) including the following:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

2. Is associated with the lives of persons important in our past;

3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or

4. Has yielded, or may be likely to yield, information important in prehistory or history.

The fact that a resource is not listed in, or determined to be eligible for listing in, the CRHR, not included in a local register of historical resources (pursuant to Section 5020.1(k) of the PRC), or identified in a historical resources survey (meeting the criteria in Section 5024.1(g) of the PRC) does not preclude a lead agency from determining that the resource may be a historical resource as defined in PRC Sections 5020.1(j) or 5024.1.

The California Register may also include properties listed in local registers of historic properties. A "local register of historic resources" is broadly defined in Section 5020.1(k) as "a list of properties officially designated or recognized as historically significant by a local government pursuant to a local ordinance or resolution." Local registers of historic properties come in two forms: (1) surveys of historic resources conducted by a local agency in accordance with Office of Historic Preservation procedures and standards, adopted by the local agency and maintained as current and (2) landmarks designated under local ordinances or resolutions (PRC Sections 5024.1, 21804.1, and 15064.5). The minimum age criterion for the California Register is 50 years. Properties less than 50 years old may be eligible for listing on the California Register, if "it can be demonstrated that sufficient time has passed to understand its historical importance" [Chapter 11, Title 14, Section 4842(d)(2)].

A tribal cultural resource may be considered significant if it is included in a local or state register of historical resources or determined by the Lead Agency to be significant pursuant to criteria set forth

in PRC Section 5024.1; is a geographically defined cultural landscape that meets one or more of these criteria; or is a historical resource described in PRC Section 21084.1 or a unique archaeological resource described in PRC Section 21083.2, or a non-unique archaeological resource if it conforms with the above criteria.

b. California Health and Safety Code Sections 7050.5, 7051, and 7054

These sections collectively address the illegality of interference with human burial remains, as well as the disposition of Native American burials in archaeological sites. The law protects such remains from disturbance, vandalism, or inadvertent destruction, and establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project, including the treatment of remains prior to, during, and after evaluation, and reburial procedures. Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has determined the origin and disposition pursuant to PRC Section 5097 et seq. described in Section 4.4.2.2.c below. The County Coroner must be notified of the find immediately. If the human remains are determined to be prehistoric (Native American), the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendent (MLD). The MLD shall complete the inspection of the site within 48 hours of notification and may recommend scientific removal and non-destructive analysis of human remains and items associated with Native American burials.

c. Native American Historic Cultural and Sanctified Cemetery Sites (PRC Section 5097 et seq.)

State law addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction; establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project; and establishes the NAHC to resolve disputes regarding the disposition of such remains. In addition, the Native American Historic Resource Protection Act makes it a misdemeanor punishable by up to a year in jail to deface or destroy an Indian historic or cultural site that is listed or may be eligible for listing in the CRHR. In 2006, the law was amended to revise the process for the discovery of Native American remains during land development. The revisions encourage culturally sensitive treatment of Native American remains, and to require meaningful discussions and agreements concerning treatment of the remains at the earliest possible time. The intent is to foster the preservation and avoidance of human remains during development. The changes in the law allow additional time to notify, consult, and confer with the MLD/Native American representatives on any given project. In addition, the new language provides more protection for re-interment sites.

Specifically, PRC Section 5097.9 states that no public agency, and no private party using or occupying public property or operating on public property, shall interfere with the free expression or exercise of Native American religion, nor shall any such agency cause severe or irreparable damage to any Native American Sanctified Cemetery, place of worship, religious or ceremonial site, or sacred shrine located on public property, except on a clear and convincing showing that the public interest and necessity so require.

d. Assembly Bill 52

California Assembly Bill (AB) 52 specifies that a project that causes a substantial adverse change in the significance of a tribal cultural resources may have a significant effect on the environment. AB 52 requires that a lead agency consult with California Native American tribes that are traditionally and culturally affiliated with geographic areas and that request notification. AB 52 applies to projects that have a notice of preparation or a notice of negative declaration or mitigated negative declaration on or after July 1, 2015. This bill also required the separate consideration of tribal cultural resources in the CEQA thresholds.

AB 52 Consultation Process

1. Within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a project, the lead agency shall provide formal notification to California Native American tribes that are traditionally and culturally affiliated with the geographic area of the proposed project and have requested to the lead agency, in writing, to be informed of projects.

2. Such California Native American tribes have 30 days of receipt of formal notification to request consultation. Prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report for a project, the lead agency must begin consultation with the tribe who requested consultation.

Any project within the City that requires a notice of preparation, mitigated negative declaration, or negative declaration requires AB 52 consultation.

e. Senate Bill 18

California Senate Bill (SB) 18 helps tribes and jurisdictions define resources and sacred areas and incorporate protection of these places into the General Plan process. It is the first law in the nation to mandate tribal consultation at the local level. SB 18 consultation applies to the adoption and amendment of general plans proposed on or after March 1, 2005. SB 18 consultation is a "government to government" interaction between tribal representatives and representatives of the local jurisdiction.

SB 18 Consultation Process

1. Once a local government initiates a proposal to adopt or amend a general plan, the local government must send a written request to the Native American Heritage Commission asking for a list of tribes to consult.

2. Requests should clearly state that the local government is seeking information about tribes that are on the "SB 18 Tribal Consultation List."

3. The Native American Heritage Commission is mandated to provide local governments with a written contact list of tribes in the local government's jurisdiction in 30 days.

Since most of the development in the City is within an existing Planning Area, there would be few development proposals that would require SB 18 consultation. However, a general plan amendment triggers SB 18 consultation.

4.4.2.3 Local Regulations

a. Existing General Plan (2000)

The Cultural Resources Element of the existing General Plan includes goals and policies that would serve to preserve historical resources within the City. The goal is to facilitate the proper disposition of cultural resources, while fostering an increased understanding and appreciation for the community's heritage and region's history. The Cultural Resources Element's two main objectives are outlined below:

Cultural Resources Element

Objective E:1: Historical, Archaeological, and Paleontological Surveys: Identify and obtain information on the existence and significance of historical, archaeological, and paleontological sites and encourage land use planning which incorporates this information.

Objective E-2: Hazard Occurrence: Evaluate surveyed sites for their present and potential cultural, educational, recreational, and scientific value to the community and the region, and determine their proper disposition prior to the approval of any project which could adversely affect them.

b. Municipal Code

The Municipal Code contains the following policies relating to cultural resources:

Title 3 (Community Services), Division 4 (Parks), Chapter 1 (In General).

Section 3-4-132 (Protection of Natural, Cultural, Structural and Archaeological Resources) of Chapter 1 prohibits any person from possessing, destroying, injuring, defacing, removing, digging or disturbing from its natural state any of the following: plants, wildlife, artifacts, minerals, landscape structures, improvements, wood, and natural products.

c. Zoning Ordinance

Chapter 9-10 (Planning Area 10 (Walnut))

Section 9-10-7 (Special development standards) of Chapter 9-10 (Planning Area 10 (Walnut)) indicates that before obtaining grading permits for park or open space development proposals, the City's Historical, Archaeological, and Paleontological Committee evaluates them to protect archaeological sites. The Director of Community Development verifies developer notification of qualified archaeologists and paleontologists, who must oversee grading activities. These experts attend pre-grade meetings to discuss the importance of avoiding preserved areas and ensuring compliance.

Any additional sites discovered during grading must adhere to the City's historical, archaeological, and paleontological regulations.

d. Commission Resolution No. 09.2968

Standard conditions are adopted by Planning Commission Resolution No. 09-2968 that assist staff in applying standardized wording for frequently used conditions of approval to discretionary and subdivision applications. Standard conditions are applied on a case-by-case basis depending upon the specifics of the application. Companion conditions are cross-referenced and are required to be used together.

Standard Condition 2.5 (Archaeologist/Paleontologist)

Prior to the issuance of the first preliminary or precise grading permit for a project that is located on land that includes potentially significant archaeological and/or paleontological sites, and for any subsequent permit involving excavation to increased depth, the applicant shall provide letters from an archaeologist and a paleontologist. The letters shall state that the applicant has retained these individuals, and that the consultant(s) will be on call during all grading and other significant ground disturbing activities. Determination of the need for these consultants shall be based on the environmental analysis for the project. These consultants shall be selected from the roll of qualified archaeologists and paleontologists maintained by the County of Orange (OC Public Works/OC Planning). The archaeologist and paleontologist shall meet with Community Development staff, and shall submit written recommendations specifying procedures for cultural/scientific resource surveillance. These recommendations shall be reviewed and approved by the Director of Community Development prior to issuance of the grading permit and prior to any surface disturbance on the project site. Should any cultural/scientific resources be discovered during grading, no further grading shall occur in the area of the discovery until the Director of Community Development is satisfied that adequate provisions are in place to protect these resources. This condition and the approved recommendations shall be incorporated on the cover sheet of the grading plan under the general heading: "Conditions of Approval."

e. Existing Plans, Programs, and Policies

Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required of the project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute mitigation measures. The following measures are existing plans, programs, or policies (PPP) that apply to the project and will help to reduce and avoid potential impacts related to cultural and tribal cultural resources:

- PPP CUL-1: Compliance with the NHPA
- PPP CUL-2: Compliance with CEQA
- PPP CUL-3: Compliance with AB-52/SB-18
- PPP CUL-4: Compliance with Municipal Code Sections 3-4-132 (Protection of Natural, Cultural, Structural and Archaeological Resources) and 9-10-7 (special development standards)
- PPP CUL-5: Compliance with Standard Condition 2.5 (construction monitoring)

- PPP CUL-6: Compliance with California Health and Safety Code Sections 7050.5, 7051, and 7054
- PPP CUL-7: Compliance with Native American Historic Cultural and Sanctified Cemetery Sites (PRC Section 5097 et seq.)

Proposed General Plan Strategies and Policies

In addition to the above-listed PPPs, the following proposed Goals, Objectives, Policies, and Implementation Actions are applicable to the analysis of cultural and tribal cultural resources and would replace existing goals, strategies, and policies outlined in the City's existing General Plan following project approval:

Conservation and Open Space Element

Goal 4: Use and maintain societal resources, including, but not limited to, archaeological, historical, and paleontological resources, as part of the City's land use pattern.

Objective COS-4: To effectively utilize and preserve societal resources, encompassing archaeological, historical, and paleontological assets, within the City's land use framework, ensuring their integration and maintenance in alignment with conservation and open space goals.

- Policy (a): Continue to coordinate General Plan level resource information to determine the level and type of resource(s) potentially impacted by proposed development.
- Policy (b): Consider land that contains significant resource(s) for an open space use.
- Policy (c): Promote public awareness and appreciation of cultural resources by participating in educational programs and by helping to display artifacts that illuminate past cultures and by encouraging private development to include historic and archaeological displays where feasible and appropriate.

4.4.3 Significance Determination Thresholds

The City has adopted Appendix G of the State CEQA Guidelines as the significance thresholds for cultural resource impacts. A significant impact related to cultural resources would occur if the project would:

1) Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5;
2) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5; or
3) Disturb any human remains, including those interred outside of dedicated cemeteries.

Additionally, a significant impact related to tribal cultural resources would occur if the project would:

4) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC Section 21074 as either a site, feature, place, cultural landscape that is geographically

defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

a) Listed or eligible for listing in the CRHR, or in a local register of historical resources as defined in PRC Section 5020.1(k), or

b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of PRC Section 5024.1. In applying the criteria set forth in subdivision (c) of PRC Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American.

4.4.4 Methodology

A cultural resources assessment was prepared for the project to review and summarize available information regarding known archaeological and historical resources within the City (see Appendix D). Preparation of the report included conducting a records search to identify all previously recorded cultural resources (prehistoric and historic archaeological sites, historic buildings, structures, objects, or districts) within the City. All cultural resources, as well as cultural resource surveys, performed within the City boundaries were reviewed. This existing data was used to develop a cultural resources sensitivity map that was compared to the focus areas to determine the proximity of existing historic resources.

4.4.5 Topic 1: Historic Resources

Would the project cause a substantial adverse change in the significance of a historic-era resource pursuant to CEQA Section 15064.5?

4.4.5.1 Impact Analysis

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, continued development of nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

As shown in Figure 4.4-1 above, all focus areas have historical resources located within their boundaries. Focus Area 2 has the most resources, due to the presence of Old Town Irvine within its boundary, and Focus Area 1 includes concentrated areas of buildings 45 years or older.[4] Although there are no site-specific plans that would affect an identified historic resource, future developments, both within the focus areas and outside of those areas, may have the potential to affect a historic resource at the project level. As required by mitigation measure CUL-1, any project proposing to

[4] While the NRHP and California Register indicate that a building must be 50 years or older to be listed under their designation, overall, structures 45 years or older are eligible to be considered historic resources because there are more ways to be considered historic than just those two listings.

renovate, alter, or demolish intact extant building(s) more than 45 years old or otherwise qualifying as a historic structure or site shall provide a historic resource technical study evaluating the significance and data potential of the resource. If significance criteria are met, detailed mitigation recommendations are required as part of the technical study, which must be implemented to reduce impacts on the historical resource(s) to a less than significant level. All work shall be performed by a qualified architectural historian meeting Secretary of the Interior Standards. Future development and redevelopment would also be required to adhere to the PPPs listed above, where applicable, which provide guidance for the avoidance of potential impacts to historic resources. Additionally, the City's updated Conservation and Open Space Element includes Goal 4, which aims to maintain historical resources as part of the City's land use pattern. Compliance with this goal would further support the City's goal of considering and preserving historic resources. Nonetheless, the potential to have a significant impact on historic resources remains for future site-specific development to impact historic resources and mitigation would be required.

4.4.5.2 Significance of Impacts

At a program level of analysis, it cannot be known with certainty that impacts to historic resources could be fully avoided, which would be considered a potentially significant impact requiring implementation of mitigation measure CUL-1.

4.4.5.3 Mitigation

CUL-1: The City of Irvine Director of Community Development, or designee, shall require applicants for future proposed projects proposing to renovate, alter, or demolish intact extant building(s) more than 45 years old or otherwise qualifying as a historical resource under CEQA Guidelines Section 15064.5 to provide a historic resource technical study evaluating the significance and data potential of the resource. If significance criteria are met, detailed mitigation recommendations are required as part of the technical study, which must be implemented to reduce impacts on the historical resource(s) to a less than significant level. All work shall be performed by a qualified architectural historian meeting Secretary of the Interior Standards.

4.4.5.4 Significance of Impacts after Mitigation

Implementation of the mitigation measure CUL-1 described above would potentially reduce impacts on historic resources to a level less than significant. However, as no specific development projects have been identified at this time, it is not possible to ensure that every future project could fully mitigate potentially significant impacts. Therefore, impacts to historic resources would remain significant and unavoidable at this program level of review.

4.4.6 Topic 2: Archaeological Resources

Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Section 15064.5?

4.4.6.1 Impact Analysis

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, continued development of nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Future development would primarily be in urbanized areas that have previously been disturbed, and therefore are unlikely to possess native soil with buried prehistoric resources. Additionally, future development under the project would be required to adhere to Section 3-4-132 of the City's Municipal Code, which prohibits the destruction of cultural resources. Similarly, Standard Condition 2.5 requires an archaeological monitoring report to be prepared prior to grading permit issuance for projects that are located on land that includes potentially significant archeological resources. Nonetheless, construction of future development would have the potential to unearth unknown cultural resources, including religious or sacred uses, particularly within areas that have been categorized as high sensitivity. As shown in in Figure 4.4-2 above, the portion of Focus Area 1 south of I-405 and the northeastern portion of Focus Area 3 located north of Irvine Boulevard have been designated as having high sensitivity for prehistoric resources. Additionally, land south and west of Focus Areas 1 and 2 and land north and east of Focus Area 3 are also classified as highly sensitive. Additionally, the City's updated Conservation and Open Space Element includes Goal 4, which aims to maintain archaeological resources as part of the City's land use pattern. Compliance with this goal would further support the City's goal of considering and preserving archaeological resources. Nonetheless, future development within areas with high sensitivity would have the potential to disturb native soils, and therefore may impact cultural resources. Mitigation measure CUL-2, which requires a cultural resources assessment and/or full-time monitoring for projects proposing ground disturbing activities, would be required to minimize potential impacts to archaeological resources.

4.4.6.2 Significance of Impacts

At a program level of analysis, it cannot be known with certainty that impacts to cultural resources could be fully avoided, which would be considered a potentially significant impact.

4.4.6.3 Mitigation

CUL-2: Prior to project approval or the issuance of grading permits (whichever is applicable and comes first), the City of Irvine Director of Community Development, or designee, acting in a similar capacity shall require applicants for future proposed ground disturbing projects to either (1) provide a technical cultural resources assessment consisting of a record search, survey, background context and project specific recommendations performed by a qualified archaeologist meeting Secretary of the Interior Standards and certified by the County of Orange or (2) agree to full-time monitoring by an archaeologist and a designated representative from the tribe/ group(s) who is culturally linked to the site. If resources are known or reasonably anticipated, the applicant shall be required to provide and follow a detailed mitigation plan which shall require monitoring during grading and other earthmoving activities in undisturbed sediments. The plan will provide a treatment plan for

potential resources that includes data to be collected, requires professional identification, other special studies as appropriate, and requires curation at a repository for artifacts meeting significance criteria. A comprehensive final mitigation compliance report including a catalog of specimens with museum numbers and an appendix containing a letter from the museum stating that they are in possession of the materials shall be required and shall be submitted to the City.

4.4.6.4 Significance of Impacts after Mitigation

Implementation of mitigation measure CUL-2 would reduce impacts on cultural resources to a less than significant level.

4.4.7 Topic 3: Human Remains

Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

4.4.7.1 Impact Analysis

There are no known burial sites or cemeteries within the focus areas or any other locations within the City. However, future development associated with the project could disturb native soils and therefore could have the potential to encounter human remains, especially within areas that have been categorized as having a high sensitivity for cultural resources. Therefore, although considered unlikely, the project would have the potential to impact human remains. All development in the City must comply with all applicable laws related to the discovery of human remains, including but not limited to Health and Safety Code Section 7050.5 (PPP: CUL-6) and Public Safety Code Section 5097.98 (PPP: CUL-7). Health and Safety Code Section 7050.5 protects such remains from disturbance, vandalism, or inadvertent destruction, and establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project, including the treatment of remains prior to, during, and after evaluation, and reburial procedures. Similarly, Public Safety Code Section 5097.98 establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project; and establishes the NAHC to resolve disputes regarding the disposition of such remains.

4.4.7.2 Significance of Impacts

At a program level of analysis, it cannot be known with certainty that impacts to human remains could be fully avoided, which would be considered a potentially significant impact. Compliance with Health and Safety Code Section 7050.5 (PPP: CUL-6) and Public Safety Code Section 5097.98 (PPP: CUL-7) would ensure that inadvertent discovery of human remains would be handled properly. Therefore, the project would not disturb any human remains, including those interred outside of dedicated cemeteries, and impacts would be less than significant.

4.4.7.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.4.7.4 Significance of Impacts after Mitigation

Impacts would be less than significant. No mitigation is required.

4.4.8 Topic 4: Tribal Cultural Resources

Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC Section 21074 as either a site, features, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

i) Listed or eligible for listing in the CRHR, or in a local register or
ii) *A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision c of PRC Section 5024.1?*

4.4.8.1 Impact Analysis

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, continued development of nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

While much of the project areas have been developed, there is a potential for encountering buried resources associated within the cultural territory that was utilized for over thousands of years by indigenous persons. The potential for intact tribal cultural deposits at depth is probable at many locations where undocumented fill or alluvial deposition may mask buried resources, or in proximity to known recorded archaeological resources, which can also be tribal cultural resources as defined in CEQA (PRC Section 21074).

To determine the potential for tribal cultural resources to be impacted because of project implementation, Native American tribes were engaged. Consistent with the requirements of AB 52, the City sent notification letters to 26 Native America tribes that are traditionally and culturally affiliated with the geographic scope of the City on June 22, 2022, and again on August 8, 2023. The City received six responses to the notification letter dated June 22, 2022, and three responses to the letter dated August 8, 2023.

As described in Section 4.4.6.1 above, construction of future development associated with the project would have the potential to unearth unknown cultural resources, including religious or sacred uses, particularly within areas that have been categorized as high sensitivity. Additionally, where required under AB 52, future site-specific development under the project would be subject to further consultation, which may identify unknown tribal cultural resources that have not been formally

recorded during the consultation for the project. Furthermore, grading or excavation within native soils could also expose unknown buried tribal cultural resources and features, including sacred sites. Additionally, the City's updated Conservation and Open Space Element includes Goal 4, which aims to maintain cultural resources as part of the City's land use pattern. Compliance with this goal would further support the City's goal of considering and preserving cultural resources. Future projects would also be required to comply with mitigation measure CUL-2, which require site-specific evaluations for culturally significant resources and/or monitoring of ground-disturbing activities.

4.4.8.2 Significance of Impacts

At a program level of analysis, it cannot be known with certainty that impacts to tribal cultural resources could be fully avoided, which would be considered potentially significant.

4.4.8.3 Mitigation

Implementation of the regulations described above and mitigation measure CUL-2 would reduce impacts on tribal cultural resources to a less than significant level.

4.4.8.4 Significance of Impacts after Mitigation

Implementation of the regulations described above and mitigation measure CUL-2 would reduce impacts on tribal cultural resources to a level less than significant.

4.4.9 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for cultural resources. The study area for the assessment of cumulative impacts related to cultural and tribal cultural resources is defined as the City. However, implementation of mitigation measure CUL-2 would reduce impacts on cultural resources to a level less than significant. Compliance with Health and Safety Code Section 7050.5 (PPP: CUL-6) and Public Safety Code Section 5097.98 (PPP: CUL-7) would ensure that inadvertent discovery of human remains would be handled properly. Therefore, the project would not disturb any human remains, including those interred outside of dedicated cemeteries. Similarly, implementation of mitigation measure CUL-2, along with AB 52 consultation early during the development review process when applicable, would reduce impacts on tribal cultural resources to a level less than significant. Additionally, the City's updated Conservation and Open Space Element includes Goal 4, which aims to maintain historical resources as part of the City's land use pattern. Compliance with this goal would further support the City's goal of considering and preserving historic, archaeological, cultural and tribal cultural resources. The project would implement mitigation measure CUL-1, which would potentially reduce impacts on historic resources to a level less than significant. However, as no specific development projects have been identified at this time, it is not possible to ensure that every future project could fully mitigate potentially significant impacts on historic resources. Therefore, impacts to historic resources would remain significant and unavoidable. Therefore impacts on historic resources would be cumulatively considerable.

4.5 Geology/Soils

This section analyzes potentially significant impacts related to geology and soils that could result from implementation of the project. This analysis relies upon the results of the Paleontological and Cultural Resources Assessment Report for the project (Appendix D).

4.5.1 Existing Conditions

The city of Irvine (City) is located within the northern extent of the California Geomorphic Province known as the Peninsular Ranges, which extends from Mount San Jacinto in the north, through the tip of Baja, Mexico in the south. Subparallel to these ranges on the east is the San Andreas Fault Zone. The northwestwards motion of the Pacific Plate has created these ranges and their corresponding valleys (see Appendix D).

The City has a complicated paleoenvironmental history that began during the Mesozoic Era (the "Age of Dinosaurs"), about 93 million years ago. The past 93 million years ago has seen the City transition from deep water marine in the Late Cretaceous, to coastal lowlands during the Paleocene to Oligocene, to shallow marine during the early Miocene, to deep marine during the early to early-late Miocene, back to shallow marine in the latest Miocene through the Pliocene, and finally to increasingly arid terrestrial deposits from the Pleistocene to the Holocene. In addition, younger sediments have been washed into the ocean by action of streams.

4.5.1.1 Surface Rupture

A seismic event, or earthquake, is the movement of the earth's crust along a fault. The impact of a seismic event on any given location depends on two factors: geologic setting and geologic conditions. Geologic setting refers to an area's proximity to active earthquake faults, which are fractures in the earth's crust forming a boundary between rock masses that have shifted. For planning purposes, an active fault is usually defined as a fault that shows surface movement within the last 13,000 years.

The City and its sphere of influence are affected by both local and regional active faults. Figure 4.5-1 presents the City's location in relation to active faults. According to the U.S. Geological Survey and California Geological Survey, there are several regional faults within Alquist-Priolo Special Study Zones near the City that could result in seismic hazards should an earthquake occur along one of them, including Newport-Inglewood-Rose Canyon fault zone (approximately 1.5 miles west of Irvine), Pelican Hill fault (approximately 1.5 miles west of Irvine), El Modena fault (approximately 5 miles north of Irvine) and Peralta Hills fault (approximately 5 miles north of Irvine). In addition, numerous faults have been identified within the City; however, they are not considered active (shown movement at the surface in the past 13,000 years) and therefore, do not require delineation within a special study zone. Regardless, these faults should be accounted for in future development decisions.

FIGURE 4.5-1
Seismic Hazards

The San Joaquin Hills blind thrust fault is the only known fault that runs through Irvine and travels in an east-west/southeasterly direction through the City. The location of the fault is thought to run just north of the San Joaquin Hills, with the Irvine Civic Center sitting on top of the inferred location. However, the reliability of the inferred location is considered poor. If an earthquake were to occur on this blind thrust fault, the likelihood of surface rupture would be underground, thereby reducing potential risk to structures.

4.5.1.2 Ground Shaking

Geologic conditions refer to the stability of the soil during an earthquake. For example, loose, unconsolidated soil is more prone to liquefaction during an earthquake than compacted soil or rock. The City and its sphere of influence are in Seismic Zone 4, as identified in the Uniform Building Code. This zone indicates the highest classification of the four zones in the United States, with the most stringent requirements for building design. As the City is located within proximity to faults, the City could be subject to significant ground shaking which could damage buildings or infrastructure.

Ground shaking is the effect of surface motion generated by an earthquake that results in the majority of damage during seismic events (City of Irvine 2020). Several factors control how ground motion interacts with structures, making the hazard of ground shaking difficult to predict. Seismic waves propagating through the Earth's crust are responsible for the ground vibrations normally felt during an earthquake. Structures throughout the City could be affected by ground shaking during a seismic event. The City's Local Hazard Mitigation Plan (LHMP) includes a summary of the 2015 Third Uniform California Earthquake Rupture Forecast which provides the most recent assessment of the probability of a major earthquake on various faults between 2015 to 2044. The San Joaquin Hills Fault, located within the City, has a 40 percent probability of a major earthquake occurring while the Newport-Inglewood Fault, located 8 miles from the City, has a 95 percent probability of occurring. The LHMP also includes the U.S. Geological Survey forecasts regarding the severity of seismic shaking in different locations for various plausible earthquake scenarios. The U.S. Geological Survey scenarios show that the Newport-Inglewood and San Joaquin Hills faults could cause the strongest seismic shaking in Irvine. However, the largest magnitude events are anticipated to come from the more distant San Jacinto and San Andreas faults, which could cause earthquakes that have an overall higher magnitude than the Newport-Inglewood or San Joaquin Hills faults. However, due to the distance of the San Jacinto and San Andreas faults, the shaking intensity felt in Irvine would be reduced compared to the shaking that would be felt nearer the earthquakes' epicenters. The overall magnitude of potential earthquake scenarios occurring along the Newport-Inglewood and San Joaquin Hills faults is lower than some of the more regional faults but their proximity to Irvine means that the City would be subjected to high intensity shaking from these earthquakes. However, the likelihood of a powerful earthquake occurring along these faults per the 2015 Third Uniform California Earthquake Rupture Forecast within the next 25 years is exceptionally low.

4.5.1.3 Liquefaction

Liquefaction is a seismic phenomenon in which loose, saturated, granular soils behave similarly to a fluid when subject to high intensity ground shaking. Liquefaction occurs when three general conditions exist: (1) shallow groundwater; (2) low -density non-cohesive (granular) soils; and (3) high -intensity ground motion. Liquefaction is typified by a buildup of pore-water pressure in the affected

soil layer to a point where a total loss of shear strength occurs, causing the soil to behave as a liquid. Studies indicate that saturated, loose to medium dense, near surface cohesionless soils exhibit the highest liquefaction potential, while dry, dense, cohesionless soils and cohesive soils exhibit low to negligible liquefaction potential. According to the Department of Conservation, the Planning Areas encompass earthquake zones of required investigation for liquefaction as mapped by the California Geologic Survey. Liquefaction zones may also contain areas susceptible to the effects of earthquake-induced landslides. This situation typically exists at or near the toes of existing landslides, downslope from rockfall or debris flow source areas, or adjacent to steep stream banks.

Figure 4.5-1 presents where liquefaction zones have been identified throughout the City, and Table 4.5-1 presents the acreage of land within the City, as well as specifically in the focus areas, designated as liquefaction zones.

Table 4.5-1
Liquefaction Susceptibility Acreages

Area	Acres
Focus Area 1	2,250.27
Focus Area 2	46.15
Focus Area 3	440.28
Remainder of City	9,136.6
TOTAL	**11,873.3**

4.5.1.4 Soil Stability and Landslides

a. Landslides

Landslides occur when earth on slopes become destabilized, typically after heavy rains, when the precipitation saturates the soil and makes it less stable, or when significant erosion from rainfall destabilizes the ground. Slopes that have recently burned face a greater risk from rain-induced landslides, as the fires burn up many of the trees, brush, and other vegetation that help stabilize the earth. Earthquakes may also be a source of landslides as the shaking can destabilize already loosened soils (City of Irvine 2020).

There is the potential for landslides in the steeper portions of the foothills of the Santa Ana Mountains to the northeast of the City and the San Joaquin Hills to the southwest of the City. These areas are characterized with steep topography and geologic units that can become unstable. While no definitive scale for measuring landslides exists, landslide events are usually measured using the amount of material that is displaced (i.e., the cubic feet of earth that moved). In addition, to these landslide hazards, the California Geological Survey has mapped deep seated landslide hazards, which uses a scale of landslide susceptibility that is based on slope steepness and the strength of the underlying rock, with 0 being no susceptibility and 10 being the highest susceptibility. Figure 4.5-2 identifies the deep-seated landslide susceptibility within the City. Areas in the foothills of the Santa Ana Mountains and San Joaquin Hills show the greatest susceptibility within the City.

FIGURE 4.5-2
Deep-Seated Landslide Susceptibility

b. Subsidence

Subsidence occurs when the level of the ground decreases, as if the surface is sinking. Subsidence can either be sudden (as in a sinkhole) or happen gradually over time. It can be caused by mining, groundwater pumping, or fossil fuel extraction, creating empty underground spaces that can collapse and cause the soil above to drop. Erosion, natural cave collapses, and seismic activity can also cause subsidence (City of Irvine 2020).

The City identified the low-lying areas that sit on top of the Orange County Water District (OCWD) groundwater basin as the most likely locations for subsidence. Other sections of the City are potentially subject to subsidence in the event of a major earthquake (magnitude of 5.0 or greater), although the City does not have a history of seismically induced subsidence. In terms of extent, subsidence is typically measured by the distance that the ground has sunk from its original elevation (i.e., in feet or inches) or by using the rate of subsidence (i.e., inches or centimeters per year).

There is evidence of subsidence in most of Orange County because of excessive groundwater pumping in the first half of the 20th century, prior to the development of the California State Water Project, which siphons water from the Owens Valley. Currently it is estimated that the greater LA Basin (including Orange County) experiences approximately 20 millimeters of net subsidence seasonally due to groundwater pumping and artificial recharge (City of Irvine 2020).

4.5.1.5 Paleontological Resources

Figure 4.5-3 presents the designations of paleontological sensitivity throughout the City. The City classifies paleontological sensitivity based on the relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts within the known extent of geologic units (see Appendix D). Although significant localities may occasionally occur in a geologic unit, a few widely scattered important fossils or localities do not necessarily indicate a higher potential. The relative abundance of localities is intended to be the major determinant for the value assignment. Thousands of fossils have been recovered within the City boundaries. The following presents a summary of geologic units within the City and their assigned paleontological sensitivity:

- The Vaqueros, Sespe-Vaqueros, Sespe, Monterey, Puente and Capistrano Formations are assigned a high sensitivity. Formations assigned a moderate sensitivity include the Williams Formation Pleasants Sandstone Member, the Santiago Formation, the Topanga Group, the undifferentiated Puente Formation, and the Pliocene Niguel Formation.
- Pleistocene sediments generally lie beneath young sediments with no fossils. Shallow excavations should not impact Pleistocene fossils. Because the presence of Pleistocene fossils has been demonstrated the sediments have been ranked as moderate.
- The Silverado Formation has a low sensitivity along with young sediments. The El Modeno Volcanics and artificial fill are assigned no sensitivity (see Appendix D).

Paleontological Sensitivity

RECON

4.5.2 Applicable Regulatory Requirements

4.5.2.1 State Regulations

a. Earthquake Fault Zoning Act (Alquist-Priolo Act)

The State of California Alquist-Priolo Earthquake Fault Zoning Act (1972) was established to mitigate the hazard of surface faulting to structures for human occupancy. Pursuant to the act, the state geologist has established regulatory zones (known as earthquake fault zones) around surface traces of active faults. Application for a development permit for any project within a delineated earthquake fault zone shall be accompanied by a geologic report, prepared by a geologist registered in the state of California, that is directed to the problem of potential surface fault displacement through a project site.

b. Seismic Hazard Mapping Act

The Seismic Hazard Mapping Act (SHMA) was adopted in 1990 to protect the public from the effects of nonsurface fault rupture earthquake hazards, including strong ground shaking, liquefaction, seismically induced landslides, ground amplification or other ground failure caused by earthquakes. The goal of the act is to minimize loss of life and property by identifying and mitigating seismic hazards. The California Geological Survey is the primary agency responsible for the implementation of the SHMA. The California Geological Survey prepares maps identifying seismic hazard zones and provides them to local governments, which include areas susceptible to amplified shaking, liquefaction, earthquake-induced landslides, and other ground failures. SHMA requires responsible agencies to only approve projects within these zones following a site-specific investigation to determine if the hazard is present, and if so, the inclusion of appropriate mitigation(s). In addition, the SHMA requires real estate sellers and agents at the time of sale to disclose whether a property is within one of the designated seismic hazard zones.

c. California Building Standards Code (Title 24)

Title 24 of the California Code of Regulations (CCR) provides state regulations that govern the design and construction of buildings, associated facilities, and equipment. These regulations are also known as building standards (reference California Health and Safety Code Section 18909). Cities and counties are required by state law to enforce CCR Title 24 and may adopt ordinances making more restrictive requirements than provided by CCR Title 24 due to local climatic, geological, or topographical conditions.

d. State Water Resources Control Board General Construction Permit 2022

The State Water Resources Control Board (SWRCB) adopted the 2022 Construction Stormwater General Permit, Order 2022-0057-DWQ, on September 8, 2022, and it went into effect on September 1, 2023. State and regional water quality control boards have been charged with ensuring that beneficial uses and water quality objectives are established for all waters of the state. Development in the City would be subject to the National Pollutant Discharge Elimination System to protect water

resources and control pollutants in runoff. The GCP is administered at the local level by the Santa Ana Regional Water Quality Control Board.

e. California Public Resources Code Section 5097.5(a)

A person shall not knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological, or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands.

4.5.2.2 Regional Regulations

a. South Coast Air Quality Management District Rules 402 and 403

Rules 402 and 403 require that fugitive dust be controlled during construction activities to limit exposure of nearby sites to fugitive dust resulting from construction activities. Rule 402 requires dust suppression techniques be implemented to prevent dust and soil erosion from creating a nuisance offsite. Rule 403 requires that fugitive dust be controlled with best available control measures so that the presence of such dust does not remain visible in the atmosphere beyond the property line of the emissions source. This would reduce erosion potential during construction.

4.5.2.3 Local Regulations

a. Existing General Plan (2000)

The existing General Plan Seismic Element contains the following objectives and policies applicable to development in the project area:

Objective D-1: Potential Hazards: Take potential environmental hazards into account in the General Plan.

- Policy (a): Identify the locations of potential seismic hazards to minimize the effects of the potential hazard through special development constraints. Conduct a research program to develop more refined boundaries for seismic response areas, particularly for SRA 1.

Objective D-2: Response to Hazards: Require appropriate measures to protect public health and safety and to respond to seismic hazards in all public and private developments.

- Policy (a): Use Figure D-3 during development review to minimize the effects of environmental hazards as follows:
  - For development in Seismic Response Areas 1, 2, 3, and 4: Concurrent with submittal of applications for concept plans and zone changes, as well as the

preparation of environmental impact reports, preliminary geotechnical reports are required for the following uses:

1. All planning area level proposals.
2. Community/regional level shopping centers.
3. Major commercial/office centers.
4. Major public facilities
5. Major public utilities
6. Major transportation linkages.
7. Any facility critical to emergency response (i.e. hospitals, police and fire stations, municipal government centers, transportation linkages, and designated emergency centers).
8. Major industrial development (applies to SRA 1 only).

If a detailed geotechnical report confirms the existence of a seismic hazard, the City has the option to require special earthquake resistant design features or use limitations as appropriate to the specific case.

- For development in Seismic Response Area 5: Preliminary geotechnical reports shall be submitted with applications for concept plans and zone changes as well as with environmental impact reports for non-open space uses. Those reports should concentrate on addressing slope instability and probable changes to the environment which would occur if these areas would be developed.

  If a detailed geotechnical report confirms existence of potential seismic hazard, the City has the option to require special earthquake resistant design features or use limitations as appropriate to the specific case.

- Policy (d): Require detailed site studies to determine the potential for seismic hazards for facilities which are critical in an emergency. These facilities include but are not limited to:

  - Police and fire stations.
  - Municipal government centers.
  - Transportation infrastructure.
  - Major public utilities (electrical, gas and water facilities).
  - Designated emergency centers.
  - Buildings greater than 15 stories in height.

- Policy (g): Require a detailed geological and soils study as needed, in accordance with the requirements of the City's Subdivision Ordinance, before approving development.

b. Municipal Code

Title 5 (Planning), Division 9 (Building Regulations)

The City's Building Code Regulations are included in Division 9 of the City's Municipal Code, as adopted under Section 5-9-101 (Adoption of Building Code). Division 9 adopted by reference the most recent version of the California Building Code.

Title 5 (Planning), Division 10 (Grading Code and Encroachment Regulations), Chapter 1 (Grading Code)

The City's Grading Code establishes rules and regulations to control excavation, grading, and earthwork construction (including fills and embankments), and establishes administrative requirements for issuance of permits, approval of plans, and inspection of grading construction in accordance with the requirements for grading and excavation contained in the Uniform Building Code as adopted and modified by City ordinance. The Grading Code also contains water quality requirements.

c. Grading Manual

The City's Grading Manual is a compilation of rules, procedures, and interpretations necessary to carry out the provisions of the City's Grading Code. The purpose of the Grading Manual is to assist users of the Grading Code by supplementing it with detailed information regarding rules, interpretations, standard specifications, procedures, requirements, forms, and other information applicable to control excavation, grading and earthwork construction in the City. The Grading Manual also contains guidelines for the preparation of geotechnical and geology reports, slope stability analysis and erosion control plans. The geotechnical and geology reports, slope stability analysis and erosion control plan are required to be submitted as part of the grading plan and are reviewed and approved by the Building & Safety Division of the Community Development Department.

d. Local Hazard Mitigation Plan

The City developed the LHMP, most recently updated in 2020, to identify the hazards, estimate the probability of future occurrences, and set goals to mitigate potential risks to reduce or eliminate long-term natural or man-made hazard risks to human life and property for the City and its residents. The goals of the LHMP are to:

1. Protect against threats from natural hazards to life, injury, and property damage.
2. Increase public awareness of potential hazard events.
3. Preserve critical services and functions by protecting key facilities and infrastructure.
4. Protect natural systems from current and future hazard conditions.
5. Coordinate mitigation activities among City departments, neighboring jurisdictions, and with federal agencies.
6. Prepare for long-term change in hazard regimes.

The LHMP identifies local faults that may generate earthquakes and identifies potential vulnerabilities within the City that could be adversely affected by seismic events. The LHMP also identifies a mitigation strategy for reducing losses associated with seismic events.

The LHMP states that no active faults are located within the City; however, there are several nearby faults that could result in seismic hazards in the event of an earthquake. In addition to the hazards caused by seismic shaking, there is also a risk of liquefication in parts of the City due to the highwater table and types of soil present. THE LHMP documents historic southern California earthquakes that affected the Irvine region. The largest and most recent earthquake to occur within 100 miles of the City of Irvine was the 6.7 magnitude Northbridge Earthquake in 1994 that occurred approximately 56 miles from the City. Additional earthquakes that have occurred within the region since the beginning of the twentieth century are presented in Table 4.5-2.

Table 4.5-2
History of Major Southern California Earthquakes Since 1992

Year	Richter Scale Magnitude	Description
1933	6.4	Occurred near Long Beach, California, approximately 12 miles from Irvine
1937	6.0	Occurred near Oasis in Riverside County, approximately 92 miles from Irvine
1948	6.0	Occurred near Desert Hot Springs, California, approximately 88 miles from Irvine
1971	6.6	Occurred near San Fernando, California, approximately 61 miles from Irvine
1986	6.0	Occurred in the northern part of Palm Springs, California, approximately 72 miles from Irvine
1992	6.1	Occurred near Joshua Tree, California, approximately 87 miles from Irvine
1992	6.3	Occurred near Big Bear, California, approximately 66 miles from Irvine
1994	6.7	Northridge Earthquake occurred in a neighborhood of the city of Los Angeles and was 56 miles from Irvine
2019	7.1	Occurred roughly 11 miles northeast of Ridgecrest, California

SOURCE: City of Irvine 2020.

e. Planning Commission Resolution No. 09-2968

Standard Conditions are adopted by Planning Commission Resolution No. 09-2968. These conditions assist staff in applying standardized wording for frequently used conditions of approval for discretionary and subdivision applications. Standard conditions are applied on a case-by-case basis depending upon the specifics of the application. Companion conditions are cross-referenced and are required to be used together. The following standard conditions related to Geology and Soils apply:

Standard Condition 2.6 Site Specific Geotechnical Study

Prior to the issuance of grading permits, the applicant shall provide to the Chief Building Official a site-specific geotechnical study for each proposed structure. The geotechnical report shall be prepared by a registered civil engineer or certified engineering geologist, having competence in the field of seismic hazard evaluation and mitigation. The geotechnical report shall contain site-specific evaluations of the seismic hazard affecting the project and shall identify portions of the project site

containing seismic hazards. The report shall also identify any known off-site seismic hazards that could adversely affect the site in the event of an earthquake. The contents of the geotechnical report shall include, but shall not be limited to, the following:

a. Project description.
b. A description of the geologic and geotechnical conditions at the site, including an appropriate site location map.
c. Evaluation of site-specific seismic hazards based on geological and geotechnical conditions, in accordance with current industry standards of practice.
d. Recommendations for earthwork and construction.
e. Name of report preparer(s), and signature(s) of a certified engineering geologist and/or registered civil engineer, having competence in the field of seismic hazard evaluation and mitigation.
f. Include the official professional registration or certification number and license expiration date of each report preparer in the signature block of the report.

Standard Condition 3.3 Disclosure Statements

Prior to the issuance of building permits, the applicant shall submit to the Director of Community Development for review and approval a completed occupancy disclosure form for the project. The approved disclosure form, along with its attachments, shall be included as part of the rental/lease agreements and as part of the sales literature for the project. The disclosure statement shall include information, current as of the date of submittal, with respect to each item marked with an "x" on the list below. The items marked "n/a" need not be included.

a. Information on Noise resulting from aircraft and/or helicopter operations from John Wayne Airport.
b. Reference to Emergency Preparedness information available on the City of Irvine website at www.cityofirvine.org/office-emergency-management.
c. Map of Special Flood Hazard Area information for areas subject to inundation.
d. Notice that initial occupancy and any subsequent change in use or occupancy of any non-residential condominium space, requires the buyer or the new or existing occupant to apply to the Community Development Department and obtain approval by way of a of written zoning confirmation letter or obtain a building permit and obtain inspection approval for any necessary work to establish the use and/or occupancy consistent with that intended.
e. Notice that the property owner shall be responsible for continuous maintenance of the emergency access equipment thus ensuring these systems will be operational at all times, as required by the Chief of Police.
f. Notice that the property is located near and/or adjacent to private and/or public park(s) that may include recreational, field/court lighting, and other related improvements.
g. Notice that the property is located near and/or adjacent to public open space land that may include trails, trailheads, parking facilities, and other related improvements and operations.
h. Notice that the property is located near and/or adjacent to public trails and/or related improvements and operations.
i. Notice that residential buildings such as single-family homes, condominiums and apartments are prohibited from being used as short-term rentals (aka vacation rentals). A rental

arrangement for a term of less than 31 days is considered "short-term". For more detailed information contact the Community Development Department.

Standard Condition 2.5 Archaeologist/Paleontologist

Prior to the issuance of the first preliminary or precise grading permit for a project that is located on land that includes potentially significant archaeological and/or paleontological sites, and for any subsequent permit involving excavation to increased depth, the applicant shall provide letters from an archaeologist and a paleontologist. The letters shall state that the applicant has retained these individuals, and that the consultant(s) will be on call during all grading and other significant ground disturbing activities. Determination of the need for these consultants shall be based on the environmental analysis for the project. These consultants shall be selected from the roll of qualified archaeologists and paleontologists maintained by the County of Orange (OC Public Works / OC Planning). The archaeologist and paleontologist shall meet with Community Development staff, and shall submit written recommendations specifying procedures for cultural/scientific resource surveillance. These recommendations shall be reviewed and approved by the Director of Community Development prior to issuance of the grading permit and prior to any surface disturbance on the project site. Should any cultural/scientific resources be discovered during grading, no further grading shall occur in the area of the discovery until the Director of Community Development is satisfied that adequate provisions are in place to protect these resources. This condition and the approved recommendations shall be incorporated on the cover sheet of the grading plan under the general heading: "Conditions of Approval."

f. Existing Plans, Programs, and Policies

Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required of the project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute mitigation measures. The following measures are existing plans, programs, or policies (PPP) that apply to the project and will help to reduce and avoid potential impacts related to geology and soils:

- PPP-GEO-1 Compliance with General Construction Permit
- PPP-GEO-2 Compliance with California Public Resources Code Section 5097.5(a) regarding paleontological resources
- PPP-GEO-3 Compliance with South Coast Air Quality Management District Rules 402 (Dust Suppression) and 403 (Fugitive Dust)
- PPP GEO-4 Compliance with Municipal Code Title 5 (Planning), Division 9 (Building Regulations) California Building Code
- PPP GEO-5 Compliance with Municipal Code Title 5 (Planning), Division 10 (Grading Code and Encroachment Regulations), Chapter 1 (Grading Code)
- PPP GEO-6 Compliance with the City's Grading Manual
- PPP GEO-7 Compliance with the Local Hazard Mitigation Plan
- PPP GEO-8 Compliance with Standard Condition 2.6 Site Specific Geotechnical Study
- PPP GEO-9 Compliance with Standard Condition 3.3 Disclosure Statements
- PPP-GEO-10 Compliance with Standard Condition 2.5 Archaeologist/Paleontologist

Proposed General Plan Strategies and Policies

In addition to the above-listed PPPs, the following proposed Goals, Objectives, Policies, and Implementation Actions are applicable to the analysis of geology and soils and would replace existing goals, strategies, and policies outlined in the City's existing General Plan following project approval:

SafetyElement

Goal 3: Anticipate the risks and mitigate the effects that flood hazards pose to the community.

Objective S-3. Flood Hazards. The following policies support Goal S-3:

- **Policy (a):** Work with Orange County Flood Control District to ensure flood control facilities are adequately provided and maintained.
- **Policy (b)**: Collaborate with partner agencies and municipalities to align green infrastructure projects (i.e., projects that allow for the filtration of stormwater where it falls) and develop regulations for watersheds across jurisdictions to reduce impervious hard surfaces.
- **Policy (c):** Support efforts of other organizations and academic institutions to conduct studies of the impact combined riverine and coastal flooding, groundwater intrusion, and increased precipitation has on flood risk and vulnerability.
- **Policy (d)**: Support efforts of other organizations and academic institutions to inventory and map vegetation on hillsides with a specific focus on improving hillside stability in the case of extreme rainfall and seasonal erosion.
- **Policy (e):** Develop or update a long-term plan to address current and future flood risk to critical facilities.
- **Policy (g)**: Ensure resilience and long-term functionality of stormwater and sewer systems.
- **Policy (h):** Encourage the use of climate-smart landscaped surfaces (e.g., permeable pavement, stormwater parks, green streets) in new and existing developments to reduce runoff, minimize flood hazards, and maintain existing drainage ways.

Safety Element

Goal 2: Improve the community's resilience to seismic and geologic hazards by ensuring the integrity of the built environment.

Objective S-2. Seismic and Geologic Hazards. The following policies support Goal S-2:

- **Policy (a)**: Coordinate with Irvine Ranch Water District and Orange County Water District on emergency water storage and distribution following a liquefaction or landslide event.
- **Policy (b)**: Coordinate groundwater management with Orange County Water District to avoid subsidence impacts in Irvine.
- **Policy (c)**: Promote the strengthening of planned utilities, the retrofit and rehabilitation of existing weak structures and lifeline utilities, and the relocation or strengthening of certain critical facilities to increase public safety and minimize potential damage from seismic and geologic hazards.

- Policy (d): Encourage replanting bare or disturbed areas after landslides to reduce erosion.

4.5.3 Significance Determination Thresholds

The City has adopted Appendix G of the State California Environmental Quality Act (CEQA) Guidelines as the significance thresholds for geological resources. A significant impact would occur if the project would:

1) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:
   a. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault. Refer to Division of Mines and Geology Special Publication 42,
   b. Strong seismic ground shaking,
   c. Seismic-related ground failure, including liquefaction,
   d. Landslides;
2) Result in substantial soil erosion or the loss of topsoil;
3) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse;
4) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property;
5) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water;
6) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

4.5.4 Methodology

The potential for significant impacts associated with the project has been determined based upon review of existing secondary source information and data relative to the geology and soils resources available for the City. Additionally, a paleontological resources assessment was prepared for the project that included a records search at the Natural History Museum of Los Angeles County, as well as review of published literature, unpublished paleontological reports, and fossil databases (see Appendix D).

4.5.5 Topics 1 and 3: Seismic Hazards and Unstable Geology, and Topic 4: Expansive Soils

Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: (i) rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault (refer to Division of Mines and Geology Special Publication

42); (ii) strong seismic ground shaking? (iii) seismic-related ground failure, including liquefaction; or (iv) landslides?

Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

4.5.5.1 Impact Analysis

a. Earthquake Fault Rupture and Strong Seismic Ground Shaking

The City and its sphere of influence are affected by both local and regional active faults. As previously stated, the City's LHMP includes a summary of the most recent assessment of the probability of a major earthquake on various faults between 2015 to 2044. The San Joaquin Hills Fault, located within the City, has a 40 percent probability of a major earthquake occurring while the Newport-Inglewood Fault, located 8 miles from the City, has a 95 percent probability of occurring. The LHMP also includes the U.S. Geological Survey forecasts regarding the severity of seismic shaking. The scenarios show that the Newport-Inglewood and San Joaquin Hills faults could cause the strongest seismic shaking in Irvine. However, the largest magnitude events are anticipated to come from the more distant San Jacinto and San Andreas faults, which could cause earthquakes that have an overall higher magnitude than the Newport-Inglewood or San Joaquin Hills faults. However, due to distance of the distant of the San Jacinto and San Andreas faults, the shaking intensity felt in Irvine would be reduced compared to the shaking that would be felt nearer the earthquakes' epicenters. The overall magnitude of potential earthquake scenarios occurring along the Newport-Inglewood and San Joaquin Hills faults is lower than some of the more regional faults but their proximity to Irvine means that the City would be subjected to high intensity shaking from these earthquakes. However, the likelihood of a powerful earthquake occurring along these faults within the next 25 years is exceptionally low.

Future projects introducing new development in the City associated with project approval could expose people to impacts related to seismic ground shaking. These projects would be required to adhere to safety requirements in the Municipal Code requirements related to the City's Building Code, Grading Code, Grading Manual, and site-specific geotechnical studies (PPPs GEO-4, GEO-5, GEO-6, and GEO-8), which would ensure that structures would be designed with the geologic hazards in mind to reduce risks associated with strong seismic ground shaking, seismic-related ground failure, and other geologic hazards such as subsidence and landslides. Compliance with these regulations would reduce impacts related to seismic shaking to a less than significant level. Furthermore, safety requirements related to ruptures and seismic shaking include Safety Element Update Policy S-2(c), which promotes the strengthening of planned utilities, the retrofit and rehabilitation of existing weak structures and lifeline utilities, and the relocation or strengthening of certain critical facilities to increase public safety and minimize potential damage from seismic and geologic hazards. Updated Safety Element goals, objectives, and policies would further the City's goal of reducing seismic-related hazards.

b. Liquefaction, Landslides, Lateral Spreading, Subsidence, and Expansive Soils

Figure 4.5-1 presents where liquefaction zones have been identified throughout the City, and Table 4.5-1 presents the acreage of land within the City designated as a liquefaction zone. Approximately 2,250.26 acres of Focus Area 1, 46.15 acres of Focus Area 2, and 440.28 acres of Focus Area 3, and 9,136.6 acres in the remainder of the City are in the liquefaction susceptibility zone. Figure 4.5-2 identifies the areas of the City that are considered vulnerable to seismic induced landslides. As illustrated by this figure, there is the potential for landslides in the steeper portions of the foothills of the Santa Ana Mountains to the northeast of the City and the San Joaquin Hills to the southwest of the City. These areas are characterized with steep topography and geologic units that can become unstable. Even these areas; however, are designated as having a moderately low risk of landslides due to seismic conditions, and a low likelihood of a landslide under other conditions.

The City's LHMP identified that the most likely locations for subsidence in Irvine are the low-lying areas that sit on top of the OCWD groundwater basin as Irvine does not have a history of seismically induced subsidence. Since Irvine has not experienced acute subsidence events, it seems unlikely that subsidence will occur in the City's future and would be unlikely to impact new development as part of the project. The most likely cause of a future event would be linked to an extreme drought in the future that leads to intensified groundwater withdrawals from the groundwater aquifer. In addition, although the likelihood of occurrence is low, the City's proximity to seismically active faults suggest the potential for a significant earthquake exists, which could lead to seismically induced subsidence in the future. As discussed further in Section 4.8, Hydrology, future projects would be required to comply with the OCWD's groundwater management plan (PPP HYD-4), applicable Water Quality Management Plan requirements, and City Standard Condition 2.7 (PPP HYD-13) to minimize impacts related to groundwater depletion or intrusion. Safety Element Update Policy S-2(b) would further support the City's goal of coordinating with OCWD to avoid and reduce groundwater depletion.

As noted by the City's LHMP, although expansive soils exist, the City requires compliance with the California Building Code (PPP GEO-4), which is intended to mitigate hazards associated with this condition through professional consideration of foundation types and design criteria, including bearing capacity, for structures to be developed in the City to minimize the effects of expansive soils.

The project would facilitate future development consisting of residential uses required to meet the City's Regional Housing Needs Assessment (RHNA) requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Future development under the project would be required to adhere to safety requirements in the City's General Plan Safety Element Update and Municipal Code requirements related to the City's Building Code (PPP GEO-4), Grading Code (PPP GEO-5), Grading Manual (PPP GEO-6), and Standard Condition 2.6 Site Specific Geotechnical Study (PPP GEO-8) which would reduce impacts related liquefaction, landslide lateral spreading, subsidence, and expansive soils to a less than significant level. Furthermore, the project's Conservation and Open Space Element and Safety Element Update include the objectives and policies related to geologic hazards. For example, Conservation and Open Space Objective COS-3 aims to minimize the danger to life and property from geophysical hazards, including, but not limited to, unstable soils, liquefaction, steep slopes, and floodways, and Safety

Element Objective S-2 aims to improve the community's resilience to seismic and geologic hazards by ensuring the integrity of the built environment. Therefore, compliance with existing City's Municipal Code (PPP GEO-4 and GEO-5), Grading Manual (PPP GEO-6), LHMP (PPP GEO-7), and applicable standard conditions (PPPs GEO-1, PPP GEO-2, GEO-8, GEO-9) would ensure that both direct and indirect impacts related to the risk of loss, injury, or death involving: rupture of a known seismic-related ground failure, including liquefaction, landslides, lateral spreading. and expansive soils would be less than significant. Compliance with these measures would also limit impacts resulting from development on geology or soil that is unstable or that could become unstable, or located on expansive soil, to a less than significant level.

4.5.5.2 Significance of Impacts Topics 1 and 3: Seismic Hazards and Unstable Geology and Topic 4: Expansive Soils

Future projects would be required to comply with existing City's Municipal Code (PPP GEO-4 and GEO-5), Grading Manual (PPP GEO-6), LHMP (PPP GEO-7), and applicable standard conditions (PPPs GEO-1, PPP GEO-2, GEO-8, GEO-9). Compliance with these regulations would ensure that the project would not result in any impacts related to seismic hazards (rupture, shaking, failure, and landslides), unstable geology, or expansive soils, and impacts would be less than significant.

4.5.5.3 Mitigation Topics 1 and 3: Seismic Hazards and Unstable Geology and Topic 4: Expansive Soils

Impacts would be less than significant. No mitigation is required.

4.5.6 Topic 2: Soil Erosion

Would the project result in substantial soil erosion or the loss of topsoil?

4.5.6.1 Impact Analysis

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

As further described in Section 4.8, Hydrology, future development under the project would have the potential to result in increased erosion both on- and off-site during construction and operation of future development.

The statewide General Construction Permit (PPP HYD-1) requires preparation and implementation of a SWPPP for projects that would disturb one or more acres and include construction or demolition activity, including, but not limited to, clearing, grading, grubbing, or excavation, or any other activity that results in a land disturbance of equal to or greater than one acre (SWRCB 2022). The SWPPP would provide construction related BMPs to reduce erosion, resulting from construction associated with future development.

Post-construction erosion resulting from increased runoff would also generally be avoided or reduced through site design and hydromodification control BMPs as required per PPP-HYD-3, PPP-HYD-5, PPP-HYD-10, PPP-HYD-12, and PPP-HYD-16. Projects would also be required to adhere to the City's Municipal Code (PPP-HYD-10, PPP-HYD-11), Standard Conditions (PPP-HYD-14, PPP-HYD-15), Grading Manual (PPP-HYD-12), to reduce operational impacts associated with erosion. Additionally, General Plan Policies S-3(b), S-3(e), S-3(f), S-3(h), S-3(i), S-3(j), S-3(k), S-5(d), S-5(f), S-5(h), and S-5(j) would further the City's goals of reducing erosion and siltation impacts resulting from operation of future development associated with the project by increasing groundwater infiltration.

Therefore, with implementation of the PPPs above, impacts related to soil erosion would be reduced to a less than significant level.

4.5.6.2 Significance of Impacts

Future projects would be required to comply with existing City regulations and applicable standard conditions (PPPs HYD-1, HYD-3, PPP-HYD-5, PPP-HYD-10, PPP-HYD-11 PPP-HYD-12, PPP-HYD-14, PPP-HYD-15, and PPP-HYD-16). Compliance with these regulations would ensure that project would not result in any impacts related to substantial soil erosion or the loss of topsoil. Impacts would be less than significant.

4.5.6.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.5.6.4 Significance of Impacts after Mitigation

Impacts would be less than significant. No mitigation is required.

4.5.7 Topic 5: Septic Tanks

Would the project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

4.5.7.1 Impact Analysis

The project does not propose the use of septic tanks or alternative wastewater disposal systems. All future development under the project would be served by wastewater utility providers.

4.5.7.2 Significance of Impacts

All future development under the project would be served by wastewater utility providers. Therefore, the project would not have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater. No impact would occur.

4.5.7.3 Mitigation

No impact would occur. No mitigation is required.

4.5.8 Topic 6: Paleontological Resources and Unique Geology

Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

4.5.8.1 Impact Analysis

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Previous City documents used a four-tiered ranking system to assess the sensitivity of sediments for fossils (City of Irvine 2015). Using the City's system, geologic units are classified according to the relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts within the known extent of the geological unit described in Section 4.5.1.5.

As shown in Figure 4.5-3, the northeastern and southeastern portion of the city are interspersed with areas of high paleontological sensitivity rating, while the remaining majority of the City classified as having moderate paleontological sensitivity rating. Future development within areas with high and moderate sensitivity would have the potential to disturb native soils, and therefore may impact paleontological resources. Per Standard Condition 2.5 (PPP-GEO-10), prior to the issuance of the first preliminary or precise grading permit for a project that is located on land that includes potentially significant archaeological and/or paleontological sites, and for any subsequent permit involving excavation to increased depth, the applicant must provide letters stating that a qualified archaeologist and paleontologist would be on-site during ground disturbing activities and would provide procedures for cultural/scientific resource surveillance. Despite compliance with Standard Condition 2.5, impacts would remain potentially significant and mitigation requiring a site-specific paleontological assessment and/or monitoring for all soils below 5 feet would be required (mitigation measure GEO-1).

4.5.8.2 Significance of Impacts

At a program level of analysis, it cannot be known with certainty that impacts to paleontological resources could be fully avoided, which would be considered significant.

4.5.8.3 Mitigation

GEO-1: Prior to issuance of grading permits, applicants for future proposed ground disturbing projects in undisturbed sediments ranked moderate or above shall be required to either (1) provide a technical paleontological assessment consisting of a record search, survey, background context and project specific recommendations

performed by a qualified paleontologist (with a graduate degree and a specialization in vertebrate paleontology) to the City of Irvine Department of Community Development or (2) agree to monitoring all excavations below five feet. If resources are known or reasonably anticipated the recommendations shall provide a detailed mitigation plan requiring monitoring during grading and other earthmoving activities in undisturbed sediments. The plan will establish a fossil recovery protocol that includes data to be collected, requires professional identification, radiocarbon dates and other special studies as appropriate, requires curation at local curation facility such as such as the John D. Cooper Center operated by the County of Orange for fossils meeting significance criteria. A comprehensive final mitigation compliance report including a catalog of fossil specimens with museum numbers and an appendix containing a letter from the museum stating that they are in possession of the fossils shall be required.

4.5.8.4 Significance of Impacts after Mitigation Topic 5: Paleontological Resources

Impacts to paleontological resources would equate to a significant impact as paleontological resources are nonrenewable resources in nature. However, through implementation of GEO-1, the development of a technical paleontological assessment would reduce potential impacts to paleontological resources during ground disturbance on sites with moderate or high sensitivity sediments. In addition, GEO-1 requires that a fossil recovery protocol would be implemented in the event of unanticipated discovery during construction that would ensure that paleontological resource would not be destroyed. Projects would also be subject to compliance with PPP-GEO-10 (Standard Condition 2.5) which would ensure that ground disturbing activities during project construction are monitored by a qualified archaeologist and paleontologist. Impacts related to paleontological resources would therefore be mitigated to a less than significant level. Implementation of the mitigation measure GEO-1 described above would potentially reduce impacts on paleontological resources to a level less than significant. However, as no specific development projects have been identified at this time, it is not possible to ensure that every future project could fully mitigate potentially significant impacts. Therefore, impacts to paleontological resources would remain significant and unavoidable at this program level of review.

4.5.9 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for geology and soils. The study area for the assessment of cumulative impacts related to geologic resources is defined as the City. Future development could increase the number of people exposed to seismic and geologic hazards, and erosion rates could be accelerated by earthwork for new construction. Projects would be required to comply with applicable City regulations, including following the adopted Building Code, Municipal Code, and Standard Conditions to reduce the potential for seismic-related impacts and impacts related to soil erosion (PPPs GEO-1 through GEO-9). Additionally, increased development could encroach on areas with paleontological resources which could be lost if not monitored properly.

However, all future development would be required to adhere to all relevant PPP's described above (PPP-GEO-1 through PPP-GEO-10). Implementation of the mitigation measure GEO-1 described above would potentially reduce impacts on paleontological resources to a level less than significant. However, as no specific development projects have been identified at this time, it is not possible to ensure that every future project could fully mitigate potentially significant impacts. Therefore, impacts to paleontological resources would remain cumulatively considerable and significant and unavoidable.

4.6 Greenhouse Gas Emissions

This section analyzes the greenhouse gas (GHG) impacts that could result from implementation of the project. The analysis in this section is based on statewide GHG emissions reduction goals and GHG inventory data from the Greenhouse Gas Emissions Forecasts Report for the City of Irvine Draft Climate Action and Adaptation Plan (CAAP) dated August 8, 2023 (Appendix E). Additionally two hypothetical projects were modeled; emissions modeling results are included as Appendix F-1 and Appendix F-2.

4.6.1 Existing Conditions

4.6.1.1 Greenhouse Gases and Climate Change

There are numerous GHGs, both naturally occurring and resulting from human activities. Each GHG has variable atmospheric lifetime and global warming potential (GWP). The atmospheric lifetime of the gas is the average time a molecule stays stable in the atmosphere. Most GHGs have long atmospheric lifetimes, staying in the atmosphere hundreds or thousands of years. GWP is a measure of the potential for a gas to trap heat and warm the atmosphere. Although GWP is related to its atmospheric lifetime, many other factors including chemical reactivity of the gas also influence GWP. GWP is reported as a unitless factor representing the potential for the gas to affect global climate relative to the potential of carbon dioxide (CO_2). Because CO_2 is the reference gas for establishing GWP, by definition its GWP is 1. Although methane (CH_4) has a shorter atmospheric lifetime than CO_2, it has a 100-year GWP of 28; this means that CH_4 has 28 times more of an effect on global warming than CO_2 on a molecule--by-molecule basis.

GHG emissions estimates are typically represented in terms of equivalent metric tons of CO_2 (MT CO_2E). CO_2E emissions are the product of the amount of each gas by its GWP. The effects of several GHGs may be discussed in terms of MT CO_2E and can be summed to represent the total potential of these gases to warm the global climate. Table 4.6-1 summarizes some of the most common GHGs. All of the gases in Table 4.6-1 are produced by both biogenic (natural) and anthropogenic (human) sources. The GHGs of primary concern in this analysis are CO_2, CH_4, and N_2O.

Table 4.6-1 Global Warming Potentials and Atmospheric Lifetimes (years)			
Gas	Atmospheric Lifetime (years)	100-year GWP	20-year GWP
Carbon dioxide (CO_2)	50–200	1	1
Methane (CH_4)	12.4	28	84
Nitrous oxide (N_2O)	121	265	264
HFC-23	222	12,400	10,800
HFC-32	5.2	677	2,430
HFC-125	28.2	3,170	6,090
HFC-134a	13.4	1,300	3,710
HFC-143a	47.1	4,800	6,940
HFC-152a	1.5	138	506
HFC-227ea	38.9	3,350	5,360
HFC-236fa	242	8,060	6,940
HFC-43-10mee	16.1	1,650	4,310
CF_4	50,000	6,630	4,880
C_2F_6	10,000	11,100	8,210
C_3F_8	2,600	8,900	6,640
C_4F_{10}	2,600	9,200	6,870
c-C_4F_8	3,200	9,540	7,110
C_5F_{12}	4,100	8,550	6,350
C_6F_{14}	3,100	7,910	5,890
SF_6	3,200	23,500	17,500

4.6.1.2 GHG Inventories

a. State

The California Air Resources Board (CARB) performs statewide GHG inventories. The inventory is divided into the following sectors of economic activity: electricity generation, transportation, industrial, commercial, residential, agriculture and forestry. Emissions are quantified in million metric tons (MMT) of CO_2E. Table 4.6-2 shows the estimated statewide GHG emissions for the years 1990, 2019, and 2021. Although annual GHG inventory data is available for years 2000 through 2021, the years 1990, 2019, and 2021 are highlighted in Table 4.6-2 because 1990 is the baseline year for established reduction targets, 2019 corresponds to the year for which inventory data for the City is available, and 2021 is the most recent data available.

Table 4.6-2 California GHG Emissions by Sector in 1990, 2019, and 2021			
Sector	1990[1] Emissions in MMT CO_2E (% total)[2]	2019[3] Emissions in MMT CO_2E (% total)[2]	2021[3] Emissions in MMT CO_2E (% total)[2]
Electricity Generation	110.5 (25.7%)	60.4 (14.9%)	62.6 (16.4%)
Transportation	150.6 (35.0%)	166.4 (41.2%)	149.5 (39.2%)
Industrial	105.3 (24.4%)	92.2 (22.8%)	85.3 (22.4%)
Commercial	14.4 (3.4%)	23.0 (5.7%)	22.5 (5.9%)
Residential	29.7 (6.9%)	31.0 (7.7%)	30.5 (8.0%)
Agriculture & Forestry	18.9 (4.4%)	31.3 (7.7%)	30.9 (8.1%)
Not Specified	1.3 (0.3%)	--	--
TOTAL[4]	**430.7**	**404.3**	**381.3**

SOURCE: CARB 2007 and 2023.
[1]1990 data was obtained from the CARB 2007 source and are based on IPCC fourth assessment report GWPs.
[2]Percentages may not total 100 due to rounding.
[3]2019 and 2021 data was retrieved from the CARB 2023 source and are based on IPCC fourth assessment report GWPs.
[4]Totals may vary due to independent rounding.

As shown in Table 4.6-2, statewide GHG source emissions totaled about 430.7 MMT CO_2E in 1990, 404.3 MMT CO_2E in 2019, and 381.3 MMT CO_2E in 2021. Many factors affect year-to-year changes in GHG emissions, including economic activity, demographic influences, environmental conditions such as drought, and the impact of regulatory efforts to control GHG emissions. However, transportation-related emissions consistently contribute the most GHG emissions, followed by electricity generation and industrial emissions.

b. Local

A 2019 GHG emissions inventory was conducted in conjunction with preparation of the City's CAAP. The inventory covers GHG emissions from ten sectors within the boundaries of the City. The results are summarized in Table 4.6-3.

Table 4.6-3 City GHG Emissions in 2019		
	2019 Baseline Emissions	
Source	MT CO_2E	%
On-Road Transportation	1,144,205	51
Nonresidential Building Energy	550,138	24
Residential Building Energy	291,405	13
Solid Waste	160,626	7
Off-Road Vehicles and Equipment	68,756	3
Water Supply	30,798	1
Wastewater Treatment	5,665	<1
TOTAL	**2,251,593**	**100**

4.6.2 Applicable Regulatory Requirements

In response to rising concern associated with increasing GHG emissions and global climate change impacts, several plans and regulations have been adopted at the international, national, and state levels with the aim of reducing GHG emissions. The following is a discussion of the federal, state, and local plans and regulations most applicable to the project.

4.6.2.1 Federal Regulations

a. U.S. Environmental Protection Agency

In 2009, the U.S. Environmental Protection Agency (U.S. EPA) issued its science-based finding that the buildup of heat-trapping GHGs in the atmosphere endangers public health and welfare. The "Endangerment Finding" reflects the overwhelming scientific evidence on the causes and impacts of climate change. It was made after a thorough rulemaking process considering thousands of public comments and was upheld by the federal courts.

The U.S. EPA has many federal level programs and projects to reduce GHG emissions. The U.S. EPA provides technical expertise and encourages voluntary reductions from the private sector. One of the voluntary programs applicable to the project is the Energy Star program. Energy Star products such as appliances, building products, heating and cooling equipment, and other energy-efficient equipment would be utilized by the project.

Energy Star is a joint program of U.S. EPA and the U.S. Department of Energy, which promotes energy-efficient products and practices. Tools and initiatives include the Energy Star Portfolio Manager, which helps track and assess energy and water consumption across an entire portfolio of buildings, and the Energy Star Most Efficient 2020, which provides information on exceptional products which represent the leading edge in energy-efficient products in the year 2020 (U.S. EPA 2024a).

The U.S. EPA also collaborates with the public sector, including states, tribes, localities and resource managers, to encourage smart growth, sustainability preparation, and renewable energy and climate change preparation. These initiatives include the Clean Energy – Environment State Partnership Program, the Climate Ready Water Utilities Initiative, the Climate Ready Estuaries Program, and the Sustainable Communities Partnership (U.S. EPA 2024b).

b. Corporate Average Fuel Economy Standards

The project would generate vehicle trips that would consume fuel and generate GHG emissions. The federal Corporate Average Fuel Economy (CAFE) standards determine the fuel efficiency of certain vehicle classes in the U.S. The first phase of the program applied to passenger cars, new light-duty trucks, and medium-duty passenger cars with model years 2012 through 2016, and required these vehicles to achieve a standard equivalent to 35.5 miles per gallon (mpg). The second phase of the program applies to model years 2017 through 2025 and increased the standards to 54.5 mpg. Separate standards were also established for medium- and heavy-duty vehicles. The first phase applied to model years 2014 through 2018 and the second phase applies to model years 2018

through 2027. With improved gas mileage, fewer gallons of transportation fuel would be combusted to travel the same distance, thereby reducing nationwide GHG emissions associated with vehicle travel.

4.6.2.2 State Regulations

a. Statewide GHG Emission Targets

S-3-05—Statewide GHG Emission Targets

This executive order (EO) establishes the following GHG emissions reduction targets for the state of California:

- by 2010, reduce GHG emissions to 2000 levels;
- by 2020, reduce GHG emissions to 1990 levels; and
- by 2050, reduce GHG emissions to 80 percent below 1990 levels.

This EO also directs the secretary of the California Environmental Protection Agency to oversee the efforts made to reach these targets, and to prepare biannual reports on the progress made toward meeting the targets and on the impacts to California related to global warming, including impacts to water supply, public health, agriculture, the coastline, and forestry. With regard to impacts, the report shall also prepare and report on mitigation and adaptation plans to combat the impacts. The first Climate Action Team Assessment Report was produced in March 2006, and has since been updated every two years.

B-30-15—2030 Statewide GHG Emission Goal

This EO, issued on April 29, 2015, establishes an interim GHG emission reduction goal for the state of California by 2030 of 40 percent below 1990 levels. This EO also directed all state agencies with jurisdiction over GHG emitting sources to implement measures designed to achieve the new interim 2030 goal, as well as the pre-existing, long-term 2050 goal identified in EO S-3-05. Additionally, this EO directed CARB to update its Climate Change Scoping Plan to address the 2030 goal.

Assembly Bill 1279

Assembly Bill (AB) 1279, approved in September 2022, requires the state to achieve net zero GHG emissions as soon as possible, but no later than 2045, and achieve and maintain net negative GHG emissions thereafter, and to ensure that by 2045, statewide anthropogenic GHG emissions are reduced to at least 85 percent below 1990 levels. The bill would require the state board to work with relevant state agencies to ensure that updates to the scoping plan identify and recommend measures to achieve these policy goals and to identify and implement a variety of policies and strategies that enable carbon dioxide removal solutions and carbon capture, utilization, and storage technologies.

b. Assembly Bill 32—California Global Warming Solutions Act of 2006

In response to EO S-3-05, the California Legislature passed AB 32, the California Global Warming Solutions Act of 2006, and thereby enacted Sections 38500–38599 of the California Health and Safety

Code. The heart of AB 32 is its requirement that CARB establish an emissions cap and adopt rules and regulations that would reduce GHG emissions to 1990 levels by 2020. AB 32 also required CARB to adopt a plan by January 1, 2009, indicating how emission reductions would be achieved from significant GHG sources via regulations, market mechanisms, and other actions.

c. Senate Bill 32—California Global Warming Solutions Act Update

Approved in September 2016, Senate Bill (SB) 32 updates the California Global Warming Solutions Act of 2006 and enacts EO B-30-15. Under SB 32, the state would reduce its GHG emissions to 40 percent below 1990 levels by 2030. This is equivalent to an emissions level of approximately 260 MMT CO_2E for 2030. In implementing the 40 percent reduction goal, CARB is required to prioritize emissions reductions to consider the social costs of the emissions of GHGs; where "social costs" is defined as "an estimate of the economic damages, including, but not limited to, changes in net agricultural productivity; impacts to public health; climate adaptation impacts, such as property damages from increased flood risk; and changes in energy system costs, per metric ton of greenhouse gas emission per year."

d. Climate Change Scoping Plan

As directed by the California Global Warming Solutions Act of 2006, CARB adopted the Climate Change Scoping Plan: A Framework for Change (Scoping Plan) in 2008, which identifies the main strategies California will implement to achieve the GHG reductions necessary to reduce forecasted business as usual (BAU) emissions in 2020 to the state's historic 1990 emissions level (CARB 2008). In November 2017, CARB released the 2017 Climate Change Scoping Plan Update, the Strategy for Achieving California's 2030 Greenhouse Gas Target (2017 Scoping Plan; CARB 2017). The 2017 Scoping Plan identifies state strategies for achieving the state's 2030 interim GHG emissions reduction target codified by SB 32. Measures under the 2017 Scoping Plan Scenario build on existing programs such as the Low Carbon Fuel Standard, Advanced Clean Cars Program, Renewables Portfolio Standard (RPS), Sustainable Communities Strategy (SCS), Short-Lived Climate Pollutant Reduction Strategy, and the Cap-and-Trade Program. Additionally, the 2017 Scoping Plan proposes new policies to address GHG emissions from natural and working lands. The 2022 Scoping Plan Update for Achieving Carbon Neutrality (2022 Scoping Plan; CARB 2022) was adopted in December 2022. The 2022 Scoping Plan assesses the progress towards the 2030 GHG emissions reduction target identified in the 2017 Scoping Plan and lays out a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels no later than 2045, as directed by AB 1279. The 2022 Scoping Plan identifies strategies related to clean technology, energy development, natural and working lands, and others, and is designed to meet the state's long-term climate objectives and support a range of economic, environmental, energy security, environmental justice, and public health priorities.

e. Regional Emissions Targets—SB 375

SB 375, the 2008 Sustainable Communities and Climate Protection Act, was signed into law in September 2008 and requires CARB to set regional targets for reducing passenger vehicle GHG emissions in accordance with the Scoping Plan. The purpose of SB 375 is to align regional transportation planning efforts, regional GHG reduction targets, and fair-share housing allocations

under state housing law. SB 375 requires Metropolitan Planning Organizations (MPOs) to adopt a SCS or Alternative Planning Strategy to address GHG reduction targets from cars and light-duty trucks in the context of that MPO's Regional Transportation Plan (RTP). Southern California Association of Governments (SCAG) is the region's MPO. In 2018, CARB set targets for the SCAG region of an 8 percent reduction in GHG emissions per capita from automobiles and light-duty trucks compared to 2005 levels by 2020 and a 19 percent reduction by 2035. These targets are periodically reviewed and updated.

f. Renewables Portfolio Standard

The RPS promotes diversification of the state's electricity supply and decreased reliance on fossil fuel energy sources. Renewable energy includes (but is not limited to) wind, solar, geothermal, small hydroelectric, biomass, anaerobic digestion, and landfill gas. Originally adopted in 2002 with a goal to achieve a 20 percent renewable energy mix by 2020 (referred to as the "Initial RPS"), the goal has been accelerated and increased by EOs S-14-08 and S-21-09 to a goal of 33 percent by 2020. In April 2011, SB 2 (1X) codified California's 33 percent RPS goal. SB 350 (2015) increased California's renewable energy mix goal to 50 percent by year 2030. SB 100 (2018) further increased the standard set by SB 350 establishing the RPS goal of 44 percent by the end of 2024, 52 percent by the end of 2027, and 60 percent by 2030.

g. California Building Standards Code (Title 24)

The California Code of Regulations (CCR), Title 24, is referred to as the California Building Code (CBC). It consists of a compilation of several distinct standards and codes related to building construction including plumbing, electrical, interior acoustics, energy efficiency, handicap accessibility and so on. Of particular relevance to GHG emissions reductions are the CBC's energy efficiency and green building standards as outlined below.

Title 24, Part 6 – Energy Code

The California Code of Regulations, Title 24, Part 6 is the California Energy Efficiency Standards for Residential and Nonresidential Buildings (also known as the California Energy Code). This code, originally enacted in 1978, establishes energy-efficiency standards for residential and nonresidential buildings in order to reduce California's energy consumption. The Energy Code is updated periodically to incorporate and consider new energy-efficient technologies and methodologies as they become available, and incentives in the form of rebates and tax breaks are provided on a sliding scale for buildings achieving energy efficiency above the minimum standards.

The current 2022 Title 24 Building Energy Efficiency Standards went into effect on January 1, 2023. The 2022 Energy Code increases on-site renewable energy generation from solar, increases electric load flexibility to support grid reliability, reduces emissions from newly constructed buildings, reduces air pollution for improved public health, and encourages adoption of environmentally beneficial efficient electric technologies.

New construction and major renovations must demonstrate their compliance with the current Energy Code through submission and approval of a Title 24 Compliance Report to the local building permit review authority and the California Energy Commission (CEC). The compliance reports must

demonstrate a building's energy performance through use of CEC approved energy performance software that shows iterative increases in energy efficiency given the selection of various heating, ventilation, and air conditioning; sealing; glazing; insulation; and other components related to the building envelope.

Title 24, Part 11 – California Green Building Standards Code

The California Green Building Standards Code, referred to as CALGreen, was added to Title 24 as Part 11 first in 2009 as a voluntary code, which then became mandatory effective January 1, 2011 (as part of the 2010 CBC). The most recent 2022 CALGreen institutes mandatory minimum environmental performance standards for all ground-up new construction of nonresidential and residential structures. Local jurisdictions must enforce the minimum mandatory Green Building Standards and may adopt additional amendments for stricter requirements. The mandatory measures are related to planning and design, energy efficiency, water efficiency and conservation, material conservation and resource efficiency, and environmental quality. 2022 CALGreen also includes two tiers of residential and nonresidential voluntary measures that encourage local jurisdictions to raise the sustainability goals: Tier 1 adds additional requirements beyond the mandatory measures, and Tier 2 further increases the requirements.

Similar to the reporting procedure for demonstrating Energy Code compliance in new buildings and major renovations, compliance with the CALGreen mandatory requirements must be demonstrated through completion of compliance forms and worksheets.

4.6.2.3 Local

a. South Coast Air Quality Management District

The South Coast Air Quality Management District (SCAQMD) is the agency responsible for air quality planning and regulation in the South Coast Air Basin. The SCAQMD addresses the impacts to climate change of projects subject to SCAQMD permit as a lead agency if they are the only agency having discretionary approval for the project and acts as a responsible agency when a land use agency must also approve discretionary permits for the project. The SCAQMD acts as an expert commenting agency for impacts to air quality. This expertise carries over to GHG emissions, so the agency helps local land use agencies through the development of models and emission thresholds that can be used to address GHG emissions.

In 2008, SCAQMD formed a Working Group to identify GHG emissions thresholds for land use projects that could be used by local lead agencies in the South Coast Air Basin. The Working Group developed several different options that are contained in the SCAQMD Draft Guidance Document – Interim CEQA GHG Significance Thresholds for Stationary Sources, Rules, and Plans, which could be applied by lead agencies. The working group met again in 2010 to review the guidance. The SCAQMD Board has not approved the thresholds; however, the Guidance Document provides substantial evidence supporting the approaches to significance of GHG emissions that can be considered by the lead agency in adopting its own threshold. The current interim thresholds consist of the following tiered approach (SCAQMD 2008, 2010):

- Tier 1 – The project is exempt from the California Environmental Quality Act (CEQA).

- Tier 2 – The project is consistent with an applicable regional GHG emissions reduction plan. If a project is consistent with a qualifying local GHG reduction plan, it does not have significant GHG emissions.

- Tier 3 – Project GHG emissions represent an incremental increase below or mitigated to less than Significance Screening Levels, where
    - Residential/Commercial Screening Level
        - Option 1: 3,000 MT CO_2E screening level for all residential/commercial land uses
        - Option 2: Screening level thresholds for land use type acceptable if used consistently by a lead agency:
            - Residential: 3,500 MT CO_2E
            - Commercial: 1,400 MT CO_2E
            - Mixed-Use: 3,000 MT CO_2E
    - 10,000 MT CO_2E is the Permitted Industrial Screening Level

- Tier 4 – The project achieves performance standards, where performance standards may include:
    - Option 1: Percent emission reduction target. SCAQMD has no recommendation regarding this approach at this time.
    - Option 2: The project would implement substantial early implementation of measures identified in the CARB's Scoping Plan. This option has been folded into Option 3.
    - Option 3: SCAQMD Efficiency Targets.
        - 2020 Targets: 4.8 MT CO_2E per service population for project-level analyses or 6.6 MT CO_2E per service population for plan level analyses where service population includes residential and employment populations provided by a project.
        - 2035 Targets: 3.0 MT CO_2E per service population for project-level analyses or 4.1 MT CO_2E per service population for plan level analyses.

- Tier 5 – Offsets along or in combination with the above target Significance Screening Level. Offsets must be provided for a 30-year project life, unless the project life is limited by permit, lease, or other legally binding condition.

If a project complies with any one of these tiers, its impacts related to the generation of GHG emissions would be considered less than significant.

The SCAQMD's interim thresholds used the EO S-3-05 year 2050 goal as the basis for the Tier 3 screening level. Achieving the EO's objective would contribute to worldwide efforts to cap CO_2 concentrations at 450 parts per million, thus stabilizing global climate.

SCAQMD only has authority over GHG emissions from development projects that include air quality permits. At this time, it is unknown if the project would include stationary sources of emissions subject

to SCAQMD permits. Notwithstanding, if the project requires a stationary permit, it would be subject to the applicable SCAQMD regulations.

SCAQMD Regulation XXVII, adopted in 2009, includes the following rules:

- Rule 2700 defines terms and post global warming potentials.
- Rule 2701, SoCal Climate Solutions Exchange, establishes a voluntary program to encourage, quantify, and certify voluntary, high quality certified GHG emission reductions in the SCAQMD.
- Rule 2702, GHG Reduction Program created a program to produce GHG emission reductions within the SCAQMD. The SCAQMD will fund projects through contracts in response to requests for proposals or purchase reductions from other parties.

b. Southern California Association of Governments

In September 2020, SCAG adopted Connect SoCal, the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy. The Connect SoCal plan identifies land use strategies that focus on new housing and job growth in areas with a variety of destinations and mobility options that would support and complement the proposed transportation network. The overarching strategy in Connect SoCal is to provide for a plan that allows the southern California region to grow in more compact communities in transit priority areas and priority growth areas; provide neighborhoods with efficient and plentiful public transit; establish abundant and safe opportunities to walk, bike, and pursue other forms of active transportation; and preserve more of the region's remaining natural lands and farmlands (SCAG 2020). The Connect SoCal plan contains transportation projects to help more efficiently distribute population, housing, and employment growth as well as projected development that promotes active transport and reduces GHG emissions.

It should be noted that SCAG is currently in the process of updating this document and recently released the draft Connect SoCal 2024 for review and comment. The final Connect SoCal 2024 document is expected to go to the Regional Council for adoption in April 2024.

c. Existing General Plan (2000)

The City's current 2000 General Plan does not specifically address GHG emissions. Although the City's existing General Plan does not directly address GHG emissions, various elements include policies supporting GHG emissions including the Land Use, Energy, Solid Waste, and Conservation and Open Space elements. The Land Use Element includes policies supporting efficient land use patterns. Energy efficiency is addressed in the Energy Element, waste reduction and recycling policies are addressed in the Solid Waste Element, and open space and water conservation policies are included in the Conservation and Open Space Element. These elements are being updated and consolidated as part of the project and the proposed General Plan update will include measures to address GHG emissions to support compliance with state mandates.

d. Climate Action and Adaptation Plan

The City is developing its first CAAP, which will establish a plan to achieve reductions in GHG emissions from City operations and community activities. The CAAP will also recommend ways that the City can adapt to current and future climate-related impacts, like wildfires, extreme heat events, drought, extreme rain, and flooding.

GHG reduction targets to be addressed in the CAAP are informed by the state targets of 40 percent below 1990 levels by 2030 (per the 2022 California Air Resource Board Scoping Plan and SB 32) and 85 percent below 1990 levels by 2045 (per AB 1279).

The GHG Inventory prepared for the CAAP estimates emissions from 2019 and found the three following categories were responsible for the majority of the City's GHG emissions: on-road transportation, building energy, and solid waste sectors. Additional categories addressed in the CAAP include off-road vehicles and equipment, and other miscellaneous category topics including urban forestry, urban heat island reduction, green infrastructure, green business and jobs, and carbon sequestration.

e. Municipal Code

In Title 1 General Services, Division 13 Irvine Sustainable Community Initiative, Section 1.13.104 Development and implementation of programs and plans, the Code states that the City shall create and implement programs that encourage community members to participate in alternative transportation modes. Such modes include alternative fuel vehicles, reduced emission or zero emission vehicles, mass transit services, carpooling, bicycling, and walking.

f. Zero-Emission Vehicles Transition Plan

The purpose of the Zero-Emission Vehicles Transition Plan (ZEVTP) is to implement the following policies from the City's Strategic Energy Plan: (TLU-1) reduce emissions from city fleet vehicles; (TLU-3.1) create an infrastructure plan for public and private electric vehicle supply equipment (EVSE) needs citywide. Some of the policies the City considered while creating the plan include AB 32, SB 350, and CARB regulations. AB 32 requires that the state and its political subdivisions reduce carbon emissions by 80 percent from their 1990 levels by 2050. SB 350 requires that the state reduce its carbon emissions by 50 percent from their 1990 levels by 2030. The state's aggressive air quality and climate targets include a reduction GHGs of 40 percent below 1990 levels by 2030, an 80 percent reduction below 1990 levels by 2050, and a 50 percent reduction of petroleum use by 2030 (CARB 2021). The ZEVTP describes technological and infrastructural considerations for implementing ZEV technologies throughout the City and an analysis of fleet electrification needs. It also provides projections for EV needs throughout the community, funding opportunities to implement EV technologies throughout the City, and a monitoring plan.

g. Irvine ACHIEVES

Irvine ACHIEVES, a City Resolution adopted in August 2021, defines the City's goal for a zero-carbon local economy based on the latest climate science. It places a strong emphasis on environmental,

economic, and social justice in all climate initiatives, actively involving community stakeholders and prioritizing the protection of vulnerable communities from environmental harm.

h. Existing Plans, Programs, and Policies

Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required of the project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute mitigation measures. The following measures are existing plans, programs, or policies (PPP) that apply to the project and will help to reduce and avoid potential impacts related to greenhouse gases:

- PPP GHG-1: Compliance with Title 24, Part 6 – Energy Code
- PPP GHG-2: Compliance with Title 24, Part 11 – California Green Building Standards Code
- PPP GHG-3: Compliance with SCAQMD Regulations
- PPP GHG-4: Compliance with SCAQMD CEQA Thresholds
- PPP GHG-5: Compliance with Irvine Sustainable Community Initiative

Proposed General Plan Strategies and Policies

In addition to the above-listed PPPs, the following proposed Goals, Objectives, Policies, and Implementation Actions are applicable to the analysis of GHGs and would replace existing goals, strategies, and policies outlined in the City's existing General Plan following project approval:

Environmental Protection and Climate Action Element

Goal 3: Reduce greenhouse gas emissions and mitigate climate change impacts in Irvine to create a more sustainable and resilient community.

Objective EPCA-3: Achieve significant reductions in greenhouse gas emissions across all sectors within Irvine by implementing targeted policies and initiatives.

- Policy (a): Promote the transition to renewable energy sources, such as solar, wind, and geothermal, for electricity generation within Irvine.
- Policy (b): Encourage the adoption of energy-efficient technologies and practices in buildings, transportation, and industries to reduce reliance on fossil fuels.
- Policy (c): Prioritize investments in public transit infrastructure, walking and biking paths, and electric vehicle charging stations to reduce emissions from transportation.
- Policy (d): Promote energy conservation measures, such as retrofitting buildings with energy-efficient appliances, insulation, and lighting systems.

Goal 6: Reduce energy consumption and promote energy efficiency in Irvine.

Objective EPCA-6. Achieve significant reductions in per capita energy consumption across residential, commercial, and municipal sectors while promoting the adoption of renewable energy sources and energy-efficient technologies.

- **Policy (a)**: Through the efforts of CALGreen, establish and enforce energy efficiency standards and building codes for new construction and major renovations to improve the energy performance of buildings and reduce energy demand.
- **Policy (b)**: Require energy-efficient building design, insulation, HVAC systems, lighting, and appliances to minimize energy consumption and lower utility costs for residents and businesses.
- **Policy (c)**: Promote the adoption of renewable energy systems, such as solar photovoltaic (PV) panels, wind turbines, and geothermal heat pumps, to generate clean and sustainable electricity for onsite consumption or grid injection.
- **Policy (d)**: Streamline permitting processes and provide incentives, rebates, and financing options to encourage residents, businesses, and municipal facilities to invest in renewable energy installations.
- **Policy (e)**: Implement energy conservation programs and public awareness campaigns to educate residents and businesses about the importance of energy conservation, energy-saving practices, and behavioral changes to reduce energy waste.
- **Policy (f)**: Monitor federal, state, regional, and other local governments, utility companies, Irvine Ranch Water District (IRWD), and other private and public agencies energy programs. Obtain information and technical assistance for energy programs and implement federal and state energy programs.
- **Policy (g)**: Promote energy savings in buildings constructed before 1978.
- **Policy (h)**: Encourage voluntary retrofit energy programs for residential, commercial, and industrial buildings including energy conservation measures.
- **Policy (i)**: Maximize energy efficiency of the City's facilities and operations by use of recycled materials, renewable sources, and conservation measures.

4.6.3 Significance Determination Thresholds

Thresholds used to evaluate impacts to GHG emissions are based on applicable criteria in the CEQA Guidelines (California Code of Regulations Sections 15000-15387), Appendix G. A significant impact would occur if the project would:

1) Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or
2) Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emission of GHGs.

State CEQA Guidelines Section 15064.4 states that "the determination of the significance of greenhouse gas emissions (GHG) calls for careful judgment by the lead agency, consistent with the provisions in Section 15064. A lead agency should make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate, or estimate the amount of greenhouse gas emissions resulting from a project." Section 15064.4(b) further states that a lead agency should consider the following non-exclusive factors when assessing the significance of GHG emissions:

1. The extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting;

2. Whether the project emissions exceed a threshold of significance that the lead agency applies to the project; and

3. The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

State CEQA Guidelines Section 15064(h)(1) states that "the lead agency shall consider whether the cumulative impact is significant and whether the effects of the project are cumulatively considerable." A cumulative impact may be significant when the project's incremental effect, though individually limited, is cumulatively considerable. Therefore, for the purposes of this analysis, the significance of impacts was evaluated using criteria (1) and (3) above. Specifically, the following analysis determines that the Proposed Project would not result in a significant GHG impact because it would result in an overall reduction in GHG emissions per service population, and because it would be consistent with state, regional, and local strategies, goals, and policies to reduce GHG emissions.

4.6.4 Methodology

The City utilized a GHG emissions inventory (see Appendix E) that was developed for a the ongoing CAAP effort, which includes a 2019 GHG emissions inventory. The inventory does not account for the land use and population projections that would result from implementation of the General Plan Update; however, a comprehensive emissions inventory of all City emissions sources provides the best available data to estimate future GHG emissions, despite the General Plan Update growth not being included in the inventory. Similarly, the estimate of the GHG emissions projections for the years 2030, 2035, 2040, and 2045 represent best available data. Methodology for preparation of the CAAP baseline inventory and emission forecasts are detailed in Appendix E and summarized below.

The City prepared a 2019 emissions inventory and emission forecasts, as follows:

- The "Business as Usual" or BAU forecast provides an assessment of how emissions generated by community activities will change over time without further local, state, or federal action.
- The legislative adjusted BAU forecast assumes implementation of adopted legislative and regulatory actions at the state and federal levels that would reduce emissions without any local action, such as regulatory requirements to increase vehicle fuel efficiency and increase renewable energy sources in grid electricity portfolios.

Both the BAU and legislative-adjusted BAU emissions forecasts were based on population and employment from the City's land use database and the California State University, Fullerton, Center for Demographic Research Orange County Projections. As those population projections were from 2019, they do not account for the latest population and employment data incorporating land use changes proposed with the project. Although land use changes associated with the project were not incorporated into the emission projections in the 2019 emission inventory, the emission projections conducted for that effort is the best and most comprehensive available estimate of GHG emissions at this time due to the comprehensive nature of the emission inventory. As detailed in the 2019 inventory, population and employment are expected to increase by 21 and 28 percent, respectively, from 2019 to 2045 (Table 4.6-4). These growth factors were used to forecast emissions for most

sectors. Annual vehicle miles traveled (VMT) projections were developed using the origin-destination method using data from the Irvine Transportation Analysis Model (ITAM) Traffic Model 2021. Annual VMT by 2045 is projected to increase by 3.2 percent from 2019. VMT projections were used to scale emissions from the on-road transportation sector. Table 4.6-4 shows growth in population, employment, and annual VMT from 2019 to 2045.

The City also prepared municipal emissions forecasts to identify emissions associated with the City's municipal operations which would facilitate development of steps to reduce municipal emissions to meet statewide reduction mandates; however, communitywide emissions are the focus for project analysis due to future development having capacity to affect communitywide emissions.

Table 4.6-4
City Community Demographic and Vehicle Miles Traveled Forecasts

Forecast Factor	2019	2030	2035	2040	2045
Population	291,124	317,246	329,119	340,993	352,866
Employment	250,954	280,541	293,989	307,438	320,886
Annual VMT	2,910,428,375	2,950,103,309	2,968,137,370	2,986,171,431	3,004,205,493

SOURCE: Appendix E.
VMT = vehicle miles traveled.
NOTE: These projections are based on 2019 CAAP projections for disclosure of potential annual VMT. Data is independent of the General Plan Update and VMT per capita estimates contained in the VMT Traffic Study and is considered a conservative estimate due to the project VMT study (Appendix H) projecting reductions in VMT per capita with the project.

The BAU forecast is detailed in Table 4.6-5 and the legislative adjusted BAU forecasts are shown in Table 4.6-6. As shown, the largest emissions-generating sectors include on-road transportation and nonresidential and residential building energy.

Table 4.6-5
City Community GHG Emissions Inventory and BAU Forecasts ($MTCO_2E$)

Sector	2019	2030	2035	2040	2045
On-Road Transportation	1,140,206	1,155,749	1,162,814	1,169,879	1,176,944

TOTAL	**2,247,593**	**1,543,501**	**1,326,583**	**1,109,665**	**892,747**
Percent Change from 2019 Levels	—	-31%	-41%	-51%	-60%

NOTES: Total may not sum exactly due to independent rounding.
BAU = business-as-usual; GHG = greenhouse gas; MTCO2e = metric tons of carbon dioxide equivalent
Note: These projections are based on 2019 CAAP projections for disclosure of estimated GHG emissions at buildout. Emissions estimates are considered a conservative estimate due to the project VMT study (Appendix H) projecting reductions in VMT per capita with the project.

Emission reduction targets established in state law, include:

- Reduce statewide GHG emissions to 40 percent below 1990 levels by 2030 (SB 32, 2016)
- Achieve net zero GHG emissions statewide as soon as possible, but no later than 2045, and maintain net negative emissions thereafter; and ensure that by 2045, statewide anthropogenic greenhouse gas emissions are reduced to at least 85 percent below the 1990 levels. (AB 1279, 2022)

4.6.5 Topic 1: GHG Emissions

Would the project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

4.6.5.1 Impact Analysis

Development under the proposed General Plan Update, which includes new residential uses required to meet the City's RHNA goals, nonresidential uses within the Great Park, nonresidential uses at the same intensities associated with the existing General Plan, and the extension of Ada roadway, would contribute to direct and indirect emissions of GHG from land uses within the City. It is important to note that a general plan does not directly result in physical development without additional approvals. Before any development can occur in the City, it must be analyzed for consistency with the General Plan Update, zoning requirements, and other applicable local and state requirements; comply with the requirements of CEQA (when necessary); and obtain all necessary clearances and permits.

a. Buildout Year 2045 Emissions Forecast

Although the emission inventory and buildout projections detailed in Table 4.6-5 did not account for the General Plan Update, the General Plan Update would allow for residential land uses to occur primarily within areas currently designated for nonresidential development. As a result, due to market conditions and new allowances for residential uses, it is anticipated that buildout of the General Plan Update would result in a shift of existing unbuilt commercial capacity to residential land uses. Adding residential capacity within the City would improve the jobs to housing balance and potentially reduce the number of long commutes that are characteristic of the City's existing employment centers, which could reduce emissions estimates for on-road transportation, the greatest source of GHG emissions in the City. Because the General Plan Update would primarily add residential capacity on sites currently designated for nonresidential use, the 2019 GHG inventory and projections can be considered a reasonable, and potentially conservative, measure of GHG emissions at buildout of the General Plan Update. As detailed in Appendix E, VMT with the General Plan Update is anticipated to decrease by approximately 4 VMT per service population compared to the current General Plan. This demonstrates the General Plan Update would result in a decrease in on-road vehicle emissions compared to the existing plan and the emission projections described in Section 4.6.4.

As shown in Table 4.6-6 and detailed in Appendix E, GHG emissions associated with buildout of the City based on 2019 population and employment forecasts to 2045 would total 892,747 MT CO_2E per year, or 1.33 MT CO_2E per service population. When compared to the baseline 2019 emission inventory, on-road transportation GHG emissions at year 2045, the buildout year for the project, would decrease. The decrease is due to vehicle emission regulations and improved technologies that result in cleaner and more efficient vehicles. Additionally, as discussed previously, implementation of the project is intended to improve the jobs to housing ratio in the City which may reduce work related commutes and further support reductions in on-road vehicle emissions over time.

Development of the project is not forecasted to occur within a specific development timeframe but is assumed to occur over a period of 20 years or more. As such, GHG emissions associated with residential and nonresidential building energy use would decrease over time due to application of California's Building Energy Efficiency Standards (California Code of Regulations Title 24 Part 6, hereafter referred to as "Title 24"). Title 24 standards apply to new residential and nonresidential construction. Therefore, although the projections did not account for the General Plan Update allowances for residential, implementation of the General Plan Update is anticipated to result in a shift from projected commercial growth to more residential growth, based on allowances in the General Plan Update and market trends. The same energy efficiency standards would apply regardless of the land use. While average electricity use in new residential buildings is anticipated to rise (due to an increase in electrical demand associated with electric appliances installed instead of natural gas appliances); emissions from new residential buildings are expected to be lower than they would be under 2019 Title 24 as a result of overall lower building emissions intensities (due to lower emissions factors associated with electricity compared to natural gas).

As detailed in Table 4.6-6, by 2045, there would be a decrease in emissions per service population compared to the existing condition. These emission reductions are based solely on implementation of legislative mandates, and those reductions alone would not be sufficient to meet the statewide reduction targets.

b. City Reduction Measures

As part of the project, the City's existing General Plan is being updated to reflect City goals related to GHG emission reductions. For example, the Land Use Element aims to support a VMT efficient land use pattern, the updated Land Use Element supports placement of mixed-use cores of higher-density commercial and residential development that are supported by pedestrian activity center with access to services, food, childcare, and transit within walking distance of residences and employment. This approach to land use would support VMT efficiency by providing homes near jobs and goods and services.

As detailed in Section 4.16, Transportation, buildout of the project would result in a more efficient land use pattern, resulting in an overall reduction in VMT per service population (see Table 4.13-2). Compared to the VMT projections that would result from buildout of the existing General Plan, the project would reduce VMT per service population by accommodating more housing within three key focus areas, bringing homes in closer proximity to jobs. Addressing the existing jobs/housing imbalance by supporting more housing in the City is anticipated to support long term reductions in VMT per service population which would reduce GHG emissions per service population.

Future housing development facilitated by the project would also be required to meet the mandatory energy requirements of CALGreen and the Energy Code (CCR Title 24, Part 6) in effect at the time of development. These regulations require that new development incorporate design features to capture energy efficiencies associated with building heating, ventilating, and air conditioning mechanical systems, water heating systems, and lighting.

Additionally, each of the focus areas, where changes to land use would be incorporated through the introduction of a Residential and Residential Mixed-Use Overlay Zone Overlay Zone, which would support a VMT efficient land use pattern that could result in overall reduction in GHG emissions due to reduced mobile source emissions.

As previously noted, the project involves the creation of the Environmental Protection and Climate Action (EPCA) Element, which is an entirely new element of the General Plan. This element reflects the City's goal of reducing GHG emissions to achieve carbon neutrality, consistent with state GHG reduction targets. The EPCA Element includes objectives, policies, and implementation actions aimed at achieving significant reductions in GHGs across all sectors within the City by implementing targeted policies and initiatives. Compliance with Consistency with the Energy Code (PPP GHG-1), CAL California Green Building Standards Code (PPP GHG-2) would promote the transition to renewable resources within the City; the adoption of energy-efficient technologies, and practices in buildings, transportation, and industries to reduce reliance on fossil fuels; investments in public transit infrastructure, walking and biking paths, and electric vehicle charging stations to reduce GHGs

c. Typical Emissions for Residential Projects

GHG emissions would be generated during construction and operation of future projects implemented under the General Plan and proposed overlays, within the Great Park, and along Ada roadway. Construction activities would emit GHGs primarily through the combustion of fuels in on- and off-road equipment and vehicles. Operational emissions would likely include mobile, energy

(electricity and natural gas), area (landscape maintenance equipment), water and wastewater, solid waste, and refrigerant sources.

In order to identify the likely construction and operation emissions associated with a typical residential project and a worst-case residential project, the following two modeling scenarios were evaluated:

Hypothetical Project #1: 440 Unit Residential Development

Hypothetical project #1 is a 440-unit mid-rise apartment project. Detailed analysis and modeling results are included as Appendix F-1. GHG emissions for this hypothetical scenario were calculated using the California Emissions Estimator Model (CalEEMod) version 2022.1 (California Air Pollution Control Officers Association [CAPCOA] 2022). The CalEEMod program is a tool used to estimate emissions resulting from land development projects based on California specific emission factors. CalEEMod can estimate the required construction equipment when project specific information is unavailable. GHG emission estimates in CalEEMod are based on the duration of construction phases; construction equipment type, quantity, and usage; grading area; season; and ambient temperature, among other parameters.

The hypothetical 440-unit mid-rise apartment project would result in 2,938 MT annually based on an operational year of 2027 and assuming all model defaults. Based on the SCAQMD CEQA Thresholds (see PPP GHG-4), emissions would fall below the screening level threshold established by SCAQMD and impacts would be less than significant.

Hypothetical Project #2: 1500-Unit Residential Development Project

Hypothetical project #2 is a 1,500-unit mid-rise apartment project. Detailed analysis and modeling results are included as Appendix F-2. GHG emissions for this hypothetical scenario were calculated using the CalEEMod version 2022.1 (CAPCOA 2022). The large project would result in 11,321 MT annually based on the operational year of 2027 with the addition of amortized construction emissions and assuming all model defaults. Based on the SCAQMD CEQA Thresholds (see PPP GHG-4), emissions would exceed the screening level threshold established by SCAQMD and impacts would be potentially significant.

d. Conclusion

While the General Plan includes policy recommendations that would support GHG emission reductions and implementation of the General Plan land use plan would be supportive overall of an efficient land use and transportation, supporting GHG emissions reductions from mobile sources, buildout of the General Plan may still result in emissions that are not consistent with state GHG reduction goals.

Furthermore, the City does not currently have an adopted CAAP. The CAAP that is currently being prepared is intended to demonstrate how the City will reduce GHG emissions in alignment with statewide GHG emission reduction targets. While the draft CAAP is being prepared as a standalone document outside of the project/General Plan Update, the CAAP emission forecasts provide the best available data to estimate emissions through the year 2045, despite the inventory not being

consistent with the buildout year for the General Plan. As a result, at this program level review, impacts related to GHG emissions resulting from General Plan buildout are considered significant and would require mitigation.

4.6.5.2 Significance of Impacts

While project implementation would facilitate per capita GHG emission reductions over time as the EPCA Element and other General Plan Element policies are implemented and the land use plan is built out, without a comprehensive Citywide plan to reduce GHG emissions that can demonstrate how the City would meet statewide emission targets, impacts would be considered significant and would require mitigation.

4.6.5.3 Mitigation

The following mitigation measure is recommended for future development proposals:

GHG-1: Applications for future development, wherein the Director of Community Development or their designee has determined a potential for GHG impacts the City shall evaluate the project to identify the potential for GHG emissions to exceed the SCAQMD thresholds detailed below. If a project may exceed the thresholds, the City shall require a technical assessment evaluating potential project GHG impacts to the City for review and approval. The significance of project-level GHG impacts shall be evaluated using one of the following criteria:

1. In the absence of a City plan to reduce GHG emissions, the evaluation shall be prepared in conformance with SCAQMD methodology for assessing GHG impacts, which consists of the following tiered approach:
   a. Tier 1 – The project is exempt from the California Environmental Quality Act (CEQA).
   b. Tier 2 – The project is consistent with an applicable regional GHG emissions reduction plan. If a project is consistent with a qualifying local GHG reduction plan, it does not have significant GHG emissions.
   c. Tier 3 – Project GHG emissions represent an incremental increase below or mitigated to less than a 3,000 MT CO_2E screening level.
   d. Tier 4 – The project achieves performance standards, where performance standards may include a percent emission reduction target or an efficiency target per service population.
   e. Tier 5 – Offsets along or in combination with the above target Significance Screening Level. Offsets must be provided for a 30-year project life, unless the project life is limited by permit, lease, or other legally binding condition.

If GHG emissions are determined to have the potential to exceed the SCAQMD's recommended thresholds, the City shall require that applicants for new development projects incorporate features to reduce GHG emissions. These identified measures shall be incorporated into all appropriate documents submitted to the City and shall be verified by the City.

4.6.5.4 Significance after Mitigation

Although project implementation would support citywide goals to reduce GHG emissions and the General Plan Update includes goals and polices to support GHG emission reductions, the project does not include a quantified GHG emission reduction strategy to ensure statewide emission goals can be achieved by 2045. Therefore, impacts would remain significant and unavoidable after mitigation.

4.6.6 Topic 2: GHG Plans

Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emission of GHGs?

4.6.6.1 Impact Analysis

Applicable plans, policies, and regulations include statewide GHG emission targets established by AB 32 and SB 32; a longer-term statewide policy goals established by EO S-3-05; the 2017 Scoping Plan (which establishes a specific statewide plan to achieve the 2030 target); the 2020 Scoping Plan (which establishes targets for carbon neutrality by 2045); SCAG's RTP/SCS; regulations regarding increased use renewables for electricity production (RPS); and the California Energy Code.

a. State Plans

The Scoping Plan, approved by CARB on December 12, 2008, provides a framework for actions to reduce California's GHG emissions and requires CARB and other state agencies to adopt regulations and other initiatives to reduce GHGs. As such, the Scoping Plan is not directly applicable to specific projects. In the Final Statement of Reasons for the Amendments to the CEQA Guidelines, the California Natural Resources Agency observed that "[t]he [Scoping Plan] may not be appropriate for use in determining the significance of individual projects because it is conceptual at this stage and relies on the future development of regulations to implement the strategies identified in the Scoping Plan" (California Natural Resources Agency 2009). Under the Scoping Plan, however, there are several state regulatory measures aimed at the identification and reduction of GHG emissions. CARB and other state agencies have adopted many of the measures identified in the Scoping Plan. Most of these measures focus on area source emissions (e.g., energy usage, high-GWP GHGs in consumer products) and changes to the vehicle fleet (i.e., hybrid, electric, and more fuel-efficient vehicles) and associated fuels (e.g., Low Carbon Fuel Standard), among others. The project would comply with all applicable regulations adopted in furtherance of the Scoping Plan to the extent required by law.

Table 4.6-7 summarizes the project's consistency with 2017 Scoping Plan actions.

Table 4.6-7 Project Consistency with 2017 Scoping Plan		
Actions	Responsible Parties	Consistency
Implement SB 350 by 2030		
Increase the Renewables Portfolio Standard to 50% of retail sales by 2030 and ensure grid reliability.	California Public Utilities Commission, California Energy Commission (CEC), California Air Resources Board (CARB)	**Consistent.** Future development implemented under the project would use energy from Southern California Edison (SCE) which has committed to diversifying the portfolio of energy sources by increasing energy from wind and solar sources. The project would not interfere with or obstruct SCE energy source diversification efforts. Future development would also potentially use renewable energy from the Orange County Power Authority under the Community Choice Aggregation program.
Establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas end uses by 2030.		**Consistent.** Future development implemented under the project would be constructed in compliance with current California Building Code requirements. Currently, new buildings must achieve compliance with 2022 Title 24 Building Energy Efficiency Standards and the 2022 CALGreen requirements. Each version of the California Building Code improves the energy efficiency standards. Future development would be consistent with statewide energy requirements.
Reduce GHG emissions in the electricity sector through the implementation of the above measures and other actions as modeled in Integrated Resource Planning (IRP) to meet GHG emissions reductions planning targets in the IRP process. Load-serving entities and publicly- owned utilities meet GHG emissions reductions planning targets through a combination of measures as described in IRPs.		
Implement Mobile Source Strategy (Cleaner Technology and Fuels)		
At least 1.5 million zero emission and plug-in hybrid light-duty electric vehicles (EVs) by 2025.	CARB, California State Transportation Agency (CalSTA), Strategic Growth Council (SGC), California Department of Transportation (Caltrans), CEC, Governor's Office of Planning and Research (OPR), Local Agencies	**Consistent.** These strategies are a part of the CARB Mobile Source Strategy. The project would not obstruct or interfere with the implementation of these strategies. As these are CARB enforced standards, vehicles within the City are required to comply with the standards, and would therefore comply with these strategies.
At least 4.2 million zero emission and plug-in hybrid light-duty EVs by 2030		
Further increase GHG stringency on all light-duty vehicles beyond existing Advanced Clean cars regulations.		
GHG Phase 2 GHG emission standards for medium-duty/heavy-duty vehicles and trailers, Innovative Clean Transit, Advanced Clean Trucks, Ocean Going Vessels at Berth, Airport Shuttle.		

Table 4.6-7 Project Consistency with 2017 Scoping Plan		
Actions	Responsible Parties	Consistency
Innovative Clean Transit: Transition to a suite of to-be-determined innovative clean transit options. Assumed 20% of new urban buses purchased beginning in 2018 will be zero emission buses with the penetration of zero-emission technology ramped up to 100% of new sales in 2030. Also, new natural gas buses, starting in 2018, and diesel buses, starting in 2020, meet the optional heavy-duty low-NO_X standard.		**Not Applicable.** This strategy is not specifically applicable to the project. However, the City is served by the Orange County Transit Authority which has plans to convert 100 percent of its fleet to zero-emission technology by 2040.
Last Mile Delivery: New regulation that would result in the use of low NO_X or cleaner engines and the deployment of increasing numbers of zero-emission trucks primarily for class 3-7 last mile delivery trucks in California. This measure assumes ZEVs comprise 2.5% of new Class 3–7 truck sales in local fleets starting in 2020, increasing to 10% in 2025 and remaining flat through 2030.		**Not Applicable.** This strategy is not specifically applicable to the project. This is a CARB Mobile Source Strategy. The project would not obstruct or interfere with CARB efforts to improve last mile delivery emissions.
Further reduce VMT through continued implementation of SB 375 and regional Sustainable Communities Strategies; forthcoming statewide implementation of SB 743; and potential additional VMT reduction strategies not specified in the Mobile Source Strategy but included in the document "Potential VMT Reduction Strategies for Discussion."		**Consistent.** The project would be consistent with Connect SoCal (see Table 4.6-8), which is the region's SCS, and would therefore be consistent with SB 375. The project would support the goals of these strategies by implementing sustainable infill development that reduces VMT and supports walkable, bikeable, transit-oriented communities.
Increase stringency of SB 375 Sustainable Communities Strategy (2035 targets).		
Harmonize project performance with emissions reductions and increase competitiveness of transit and active transportation modes (e.g., via guideline documents, funding programs, project selection, etc.).	CalSTA, SGC, OPR, CARB, Governor's Office of Business and Economic Development, California Infrastructure and Economic Development Bank, Department of Finance, California Transportation Commission, Caltrans	**Consistent.** Although this is directed towards CARB and Caltrans, the project would support an increase in the use of transit and active transportation modes.
By 2019, develop pricing policies to support low-GHG transportation (e.g., low-emission vehicle zones for heavy duty, road user, parking pricing, transit discounts)	CalSTA, Caltrans, California Transportation Commission, OPR, SGC, CARB	**Not applicable.** This measure is not within the purview of the project.

Table 4.6-7
Project Consistency with 2017 Scoping Plan

Actions	Responsible Parties	Consistency
Implement California Sustainable Freight Action Plan		
Improve freight system efficiency.	CalSTA, California EPA, California Natural Resources Agency, CARB, Caltrans, CEC, Governor's Office of Business and Economic Development	**Not applicable.** These measures are not within the purview of the project.
Deploy over 100,000 freight vehicles and equipment capable of zero emission operation and maximize both zero and near-zero emission freight vehicles and equipment powered by renewable energy by 2030.		
Adopt a Low Carbon Fuel Standard with a Carbon Intensity reduction of 18%.		
Implement the Short-Lived Climate Pollutant Strategy (SLPS) by 2030		
40% reduction in methane and hydrofluorocarbon emissions below 2013 levels.	CARB, California Department of Resources Recycling and Recovery, California Department of Food and Agriculture, California State Water Resource Control Board, Local Air Districts	**Not applicable.** These measures are not within the purview of the project.
50% reduction in black carbon emissions below 2013 levels.		
By 2019, develop regulations and programs to support organic waste landfill reduction goals in the SLCP and SB 1383.		
Implement the post-2020 Cap-and-Trade Program with declining annual caps.		
By 2018, develop Integrated Natural and Working Lands Implementation Plan to secure California's land base as a net carbon sink		
Protect land from conversion through conservation easements and other incentives.	California Natural Resources Agency, Departments Within California Department of Food and Agriculture, California EPA, CARB	**Not applicable.** These measures are not within the purview of the project.
Increase the long-term resilience of carbon storage in the land base and enhance sequestration capacity.		
Utilize wood and agricultural products to increase the amount of carbon stored in the natural and built environments.		
Establish scenario projections to serve as the foundation for the Implementation Plan.		
Implement Forest Carbon Plan	California Natural Resources Agency, California Department of Forestry and Fire Protection, California EPA and Departments Within	
Identify and expand funding and financing mechanisms to support GHG reductions across all sectors.	State Agencies & Local Agencies	
SOURCE: CARB 2017.		

AB 1279, the California Climate Crisis Act, codified the carbon neutrality target as 85 percent below 1990 levels by 2045. The 2022 Scoping Plan lays out a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels no later than 2045, as directed by AB 1279. Appendix D of the 2022 Scoping Plan includes local actions that jurisdictions may take to reduce GHG emissions in line with AB 1279 goals. The following are key project attributes for residential and mixed-use projects (e.g., housing anticipated as part of the project) that can be used to qualitatively determine consistency with the 2022 Scoping Plan. A summary of the 2022 Scoping Plan Priority Strategies and the project's consistency with those strategies is provided in Table 4.6-8.

Table 4.6-8
Project Consistency with 2022 Scoping Plan Key Prioritization Strategies

Priority Area	Key Project Attribute	Project Consistency
Transportation Electrification	Provides EV charging infrastructure that, at minimum, meets the most ambitious voluntary standard in the California Green Building Standards Code at the time of project approval.	**Consistent.** The project includes the following implementation measure from the Environmental Protection and Climate Action (EPCA) Element: Promote Low-Emission and Electric Vehicles: Establish EV-friendly policies and regulations, such as streamlined permitting processes, dedicated parking spaces, and EV-ready building codes, to facilitate the installation of EV charging infrastructure in new developments and existing buildings.
VMT Reduction	Is located on infill sites that are surrounded by existing urban uses and reuses or redevelops previously undeveloped or underutilized land that is presently served by existing utilities and essential public services (e.g., transit, streets, water, sewer).	**Consistent.** The project would support growth near destinations and mobility options. Each of the focus areas would allow residential land use through a Residential and Residential Mixed-Use Overlay Zone which would bring homes closer to job centers. Additionally, the General Plan Update contains several goals, objectives, and policies that promote transit-oriented housing: The following policies in the Housing Element support infill development: HE-C.1: Promote infill development in appropriate areas and HE-C.2: Promote residential development fully served by public services and utilities.
	Does not result in the loss or conversion of natural and working lands.	**Consistent.** The General Plan land use and proposed overlays would focus development within infill areas of the City, retaining natural lands as open space.
	• Consists of transit-supportive densities (minimum of 20 residential dwelling units per acre), or • Is in proximity to existing transit stops (within a half mile), or • Satisfies more detailed and stringent criteria specified in the region's SCS.	**Consistent.** The proposed housing overlays would increase density through the use of housing overlays within the focus areas, which are approximate to transit.

Table 4.6-8 Project Consistency with 2022 Scoping Plan Key Prioritization Strategies		
Priority Area	Key Project Attribute	Project Consistency
	Reduces parking requirements by: • Eliminating parking requirements or including maximum allowable parking ratios (i.e., the ratio of parking spaces to residential units or square feet); or • Providing residential parking supply at a ratio of less than one parking space per dwelling unit; or • For multifamily residential development, requiring parking costs to be unbundled from costs to rent or own a residential unit.	**Consistent.** Future development would be subject to allowances for reduced parking standards in exchange for affordable housing.
	At least 20 percent of units included are affordable to lower-income residents.	**Consistent.** Implementation of the City's Housing Element and future residential development facilitated by the project would support provision of affordable housing including providing market rate housing with a 20 percent affordable component.
	Results in no net loss of existing affordable units.	**Consistent.** The 2021-2029 Housing Element RHNA allocation for the City is 23,610 units. To ensure consistency with housing statute, including no-net loss and affirmatively furthering fair housing requirements, the 2021-2029 Housing Element identified adequate sites to accommodate 57,656 new residential units.. The proposed General Plan Update and Zoning Ordinance amendments would facilitate the development of these housing units to ensure no-net-loss.
Building Decarbonization	Uses all-electric appliances without any natural gas connections and does not use propane or other fossil fuels for space heating, water heating, or indoor cooking.	**Consistent.** The General Plan Update includes EPCA objectives aimed at reducing greenhouse gas emissions. Various City policies and PPPs would also apply to future development, supporting all electric appliances.

b. Regional Plans

The project was evaluated for consistency with the SCS strategies contained in Connect SoCal. As discussed in Table 4.6-9 below, the project would be consistent with applicable Connect SoCal strategies due to the City's focus on adding housing within three key focus areas that are proximate to transit, and support a better jobs to population ratio.

Table 4.6-9 Project Consistency with Connect SoCal Strategies	
Strategy	Project Consistency
Focus Growth Near Destinations and Mobility Options	
• Emphasize land use patterns that facilitate multimodal access to work, educational, and other destinations. • Focus on a regional jobs/housing balance to reduce commute times and distances and expand job opportunities near transit and along center-focused main streets. • Plan for growth near transit investments and support implementation of first/last mile strategies. • Promote the redevelopment of underperforming retail developments and other outmoded nonresidential uses. • Prioritize infill and redevelopment of underutilized land to accommodate new growth, increase amenities and connectivity in existing neighborhoods. • Encourage design and transportation options that reduce the reliance on, and number of, solo car trips (this could include mixed uses or locating and orienting close to existing destinations). • Identify ways to "right size" parking requirements and promote alternative parking strategies (e.g., shared parking or smart parking).	**Consistent.** The project would be consistent with Connect SoCal's strategies to focus growth near destinations and mobility options. Each of the focus areas are proximate to SCAG transit priority areas. Changes to land use will be incorporated through the introduction of a Residential and Residential Mixed-Use Overlay Zone. Additionally, the General Plan Update Land Use Element contains policies that promote transit-oriented housing.: **Consistent.** The following policies in the Housing Element support Connect SoCal strategies of promoting infill development. • HE-C.1: Promote infill development in appropriate areas. • HE-C.2: Promote residential development fully served by public services and utilities.
Promote Diverse Housing Options	
• Preserve and rehabilitate affordable housing and prevent displacement. • Identify funding opportunities for new workforce and affordable housing development. • Create incentives and reduce regulatory barriers for building context sensitive accessory dwelling units to increase housing supply. • Provide support to local jurisdictions to streamline and lessen barriers to housing development that supports reduction of greenhouse gas emissions.	**Consistent:** The project would provide for an increased variety of housing options. The project increases mixed-use development in transit priority areas throughout the City. Below are some of the policies included in the Housing Element which aim to preserve affordable housing: • HE-A.1: Identify residential zones where allowable density can be increased or suitable Floor Area Ratio (FAR) specified for affordable housing, including for extremely low-income households. • HE-A.2: Identify commercial and institutional zones where zoning can be changed to allow for mixed-use and/or higher-density residential development. • HE-B.1: Expedite the entitlement process for affordable housing developments. • HE-D.1: Monitor affordable rental units at risk of converting to market rents and proactively reach out to property owners to discuss options. • HE-D.4: Work with property owners of existing assisted housing developments for lower-income households to determine methods to extend affordability covenants to preserve affordable units, including assistance from the City.

Table 4.6-9 Project Consistency with Connect SoCal Strategies	
Strategy	Project Consistency
	The following Land Use Element policies demonstrate consistency with Connect SoCals goals of providing more affordable housing as well. LU-13.1 • Policy (a): Partner with property owners to preserve existing affordable housing units throughout the City. • Policy (b): Utilize available public funding sources, promote density bonuses, and offer feasible incentives to encourage the development of new affordable housing units.
Leverage Technology Innovations	
• Promote low emission technologies such as neighborhood electric vehicles, shared ride hailing, car sharing, bike sharing and scooters by providing supportive and safe infrastructure such as dedicated lanes, charging and parking/drop-off space. • Improve access to services through technology, such as telework and telemedicine as well as other incentives such as a mobility wallet. • Identify ways to incorporate micro-power grids in communities, for example solar energy, hydrogen fuel cell power storage and power generation.	**Consistent.** By promoting more diverse and denser mixed-use focus areas, the project would include uses that would support low emission technologies include electric vehicle infrastructure, ridesharing services, bike and scooter sharing, and would improve the street infrastructure to create a more walkable and bikeable community. Strategies related to improved access to services through technology and micro-power grids are not directly applicable to the project. The project would not interfere with SCAG's efforts to promote low emission technologies, improve access to telework and telemedicine, or incorporate micro-power grids in communities.
Support Implementation of Sustainable Policies	
• Pursue funding opportunities to support local sustainable development implementation projects that reduce greenhouse gas emissions. • Support statewide legislation that reduces barriers to new construction and that incentivizes development near transit corridors and stations. • Support local jurisdictions in the establishment of Enhanced Infrastructure Financing Districts, Community Revitalization and Investment Authorities, or other tax increment or value capture tools to finance sustainable infrastructure and development projects including parks and open space. • Work with local jurisdictions/communities to identify opportunities and assess barriers for implementing sustainability strategies. • Enhance partnerships with other planning organizations to promote resources and best practices in the SCAG region. • Continue to support long range planning efforts by local jurisdictions. • Provide educational opportunities to local decisions makers and staff on new tools, best practices and policies related to implementing the Sustainable Communities Strategy.	**Not Applicable.** These strategies are not directly applicable to the project. The project would not interfere with SCAG's efforts to work with local jurisdictions, communities, and other planning organizations to implement sustainable policies. The project would support the goals of these strategies by implementing sustainable infill development that reduces VMT and supports walkable, bikeable, transit-oriented communities.

Table 4.6-9 Project Consistency with Connect SoCal Strategies	
Strategy	Project Consistency
Promote a Green Region	
• Support development of local climate adaptation and hazard mitigation plans as well as project implementation that improves community resiliency to climate change and natural hazards. • Support local policies for renewable energy production, reduction of urban heat islands and carbon sequestration. • Integrate local food production into the regional landscape. • Promote more resource efficient development focused on conservation, recycling and reclamation. • Preserve, enhance and restore regional wildlife connectivity. • Reduce consumption of resource areas, including agricultural land. • Identify ways to improve access to public park space.	**Consistent.** The EPCA Element includes several goals, objectives, and policies supporting GHG reductions (see above). The project would also encourage improvements in street infrastructure to create a safe walkable and bikeable community, reducing VMT and thereby improving air quality and reducing GHG emissions, and creating shaded pedestrian-friendly environments.
SOURCE: SCAG 2020.	

c. Local Plans

As discussed in Section 4.6.2.3.c, the City's General Plan does not specifically address GHG emissions. However, a draft CAAP is in process and other City sustainability initiatives have been adopted such as the Zero-Emission Vehicles Transition Plan. Implementation of the General Plan would support these policy initiatives by strengthening the City's policy framework around GHG emission reductions as detailed under Topic 1 and Tables 4.6-8 and 4.6-9. Furthermore, the EPCA Element includes objectives, policies, and implementation actions that would further the City's goal of achieving significant reductions in GHGs across all sectors within the City. Therefore, the project would not conflict with an applicable local plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

4.6.6.2 Significance of Impacts

Although the General Plan policy framework includes various objectives and implementation measures that would supports GHG emission reductions, the City is not able to demonstrate whether the policy framework would be sufficient to meet state GHG emission reduction goals. Impacts related to conflicts with an applicable plan, policy, or regulation adopted for the purpose of reducing the emission of GHGs would be considered significant and would require mitigation to identify potential measures that would reduce GHG emissions below the applicable SCAQMD thresholds.

4.6.6.3 Mitigation

See mitigation measure GHG-1 above.

4.6.6.4 Significance after Mitigation

Although project implementation would support citywide goals to reduce GHG emissions, the project does not include a comprehensive strategy to ensure statewide emission goals can be achieved by 2045. Therefore, impacts would remain significant and unavoidable after mitigation.

4.6.7 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for greenhouse gas emissions. The issue of global climate change is inherently a cumulative issue, as GHG emissions of individual projects cannot be shown to have a material effect on global climate change. Impacts would be cumulative in nature if they lead to a substantial increase in GHG emissions, when combined with other development. As discussed, the framework for assessing GHG emissions in the state has been created through AB 32, SB 32, EO S-3-05, the 2017 and 2022 Scoping Plan. If a project demonstrates that it is sufficiently reducing its overall GHG emissions consistent with statewide goals, the project's impact can be determined not to be cumulatively considerable as it would contribute to the state's GHG emission reduction targets. As discussed in Section 4.6.5.2 and 4.6.2.2 above, project implementation would support citywide goals to reduce GHG emissions; however, the project does not include a comprehensive strategy to ensure statewide emission goals can be achieved by 2045. Therefore, cumulative impacts would be considered potentially significant. Despite implementation of mitigation measure GHG-1, which requires project-specific GHG evaluations, it is anticipated that citywide impacts related to GHG emissions would remain significant and unavoidable.

4.7 Hazards and Hazardous Materials

This section analyzes potentially significant impacts related to hazards and hazardous materials that could result from implementation of the project. This analysis relies on secondary source information including but not limited to federal, regional, and City of Irvine (City) planning documents, and hazardous material databases.

4.7.1 Existing Conditions

Hazardous material sites can include any business or operation that has previously used, or currently uses, hazardous materials on a routine basis. It can also include any site where hazardous materials have been spilled. The State Water Resources Control Board (SWRCB) has a general database that indicates where hazardous materials are known to exist. Given Irvine's significant industrial activities and the presence of a decommissioned military base (Marine Corps Air Station [MCAS] El Toro), alongside its proximity to another military base (MCAS Tustin), the City has several identified hazardous waste sites throughout the City. As discussed further in this section, developers and builders are obligated to conduct thorough surveys, identification, and, if needed, remediation of their project sites in accordance with federal, state, and local regulations. Additionally, retail, commercial, and industrial sites involved in handling hazardous materials are also subject to regulation by local, state, and federal laws.

4.7.1.1 Emergency Response

The City's Office of Emergency Management (OEM) coordinates the City's preparedness efforts for hazards that could impact the community, including natural and human-caused disasters. The OEM works with all City departments, having primary responsibility for specific response functions, and ensures department-level plans and procedures are incorporated in the plan and its annexes. The OEM also maintains the Emergency Operations Center, trains emergency response staff and volunteers, and coordinates with Orange County Operational Area, California Office of Emergency Services, and Federal Emergency Management Agency (City of Irvine 2022).

4.7.1.2 Hazardous Materials Sites

The Hazardous Waste and Substances Sites (Cortese) List is a planning document that provides information about the location of hazardous materials release sites in the state. Government Code Section 65962.5 requires the California Environmental Protection Agency (CalEPA) to develop, at least annually, an updated Cortese List. The California Department of Toxic Substances Control (DTSC) is responsible for a portion of the information contained in the Cortese List that is contained in their Envirostor database.

The other main source of information for sites in the Cortese List is the SWRCB's Geotracker Database (Geotracker). "Geotracker" is the SWRCB's Internet-accessible database system used by the state board, regional boards, and local agencies to track and archive compliance data from authorized or unauthorized discharges of waste to land, or unauthorized releases of hazardous substances from

underground storage tanks. This system consists of a relational database, online compliance reporting features, a geographical information system interface, and other features that are utilized by the state board, regional boards, local agencies, regulated industry and the public to input, manage, or access compliance and regulatory tracking data.

Figure 4.7-1 presents the location of active Envirostor and Geotracker hazardous materials sites. As shown on Figure 4.7-1, there are several active Envirostor and Geotracker hazardous materials sites within the City. Table 4.7-1 lists each site location and describes the site listing. Additionally, the Irvine Ranch Water District, the Orange County Water District, and the United States Department of the Navy jointly completed the El Toro Groundwater Remediation Project, which is designed to clean up a trichloroethylene (TCE) plume associated with the former Marine Corps Air Station El Toro. The project began full operation in January 2007 and pumps water from the plume for treatment to remove the TCE. The treated water is then used for non-drinking water purposes (Irvine Ranch Water District 2024).

4.7.1.3 Airport Hazards

There are no airports located within the City's jurisdictional boundaries; however, the following airports are located near the City:

- John Wayne Airport (SNA) is located immediately adjacent to the southwestern boundary of the City within unincorporated Orange County.
- Fullerton Municipal Airport (FMA) is located approximately 14.5 miles northwest of the City.
- Long Beach Airport (LGB) is located approximately 17.5 miles west by northwest of the City.
- Ontario International Airport (ONT) is located approximately 20.5 miles north by northeast of the City.
- Los Angeles International Airport (LAX) is located approximately 33.9 miles west by northwest of the City.
- In addition to the public airports that operate in the region, Joint Forces Training Base Los Alamitos is also located approximately 12.0 miles west by northwest of the City. This facility is actively used for military training purposes; however, the frequency of flights is anticipated to be less than the amount from airports like John Wayne.

There are numerous flight paths (commercial and general aviation) that cross over the City. The City's 2020 Local Hazard Mitigation Plan (LHMP), which is designed to identify the City's hazards (including aircraft hazards), estimates the probability of future occurrences, and sets goals to mitigate potential risks associated with aircraft accidents and incidents. Title 49 of the Code of Federal Regulations Part 830, §830.2 distinguishes between an aircraft accident and aircraft incident as follows:

An "accident" is an occurrence associated with the operation of an aircraft that:

- Occurs between when the first boarding person enters the aircraft – with intention of flight – and the last person disembarks.
- Results in death or serious injury, or
- Causes substantial damage to the aircraft.

An "incident" is an occurrence – other than an accident (no intention of flight) – associated with the operation of an aircraft that affects or could affect the safety of operations.

4.7.1.4 Hazardous Materials Release

Hazardous materials release refers to a hazard event whereby harmful concentrations of hazardous or toxic substances are released into the environment. This occurs when storage containers of hazardous materials leak or fail. This can happen due to industrial accidents, vehicle crashes, as a direct result of other disasters (e.g., a flood or earthquake), or as a deliberate act.

The threat that hazardous materials pose to human health depends on the type of material, frequency, and duration of exposure, and whether chemicals are inhaled, penetrate skin, or are ingested, among other factors. Exposure to hazardous materials can result in short- or long-term effects, including major damage to organs and systems in the body, or death. Hazardous waste is any material with properties that make it dangerous or potentially harmful to human health or the environment. Hazardous materials can also cause health risks if they contaminate soil, groundwater, and air, potentially posing a threat long after the initial release.

The City's 2020 LHMP identifies two key potential sources of hazardous materials release: The San Joaquin Landfill (closed) and Lane Hill Landfill (closed), both of which are in the northwest part of the City close to University of California, Irvine.

4.7.2 Applicable Regulatory Requirements

4.7.2.1 Federal Regulations

a. Comprehensive Environmental Response, Compensation, and Liability Act

Discovery of environmental health damage from disposal sites prompted the U.S. Congress to pass the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund). The purpose of the CERCLA is to identify and clean up chemically contaminated sites that pose a significant environmental health threat. The Hazard Ranking System is used to determine whether a site should be placed on the National Priorities List for cleanup activities.

b. Superfund Amendments and Reauthorization Act

The Superfund Amendments and Reauthorization Act (SARA) pertain primarily to emergency management of accidental releases. It requires formation of state and local emergency planning committees, which are responsible for collecting, material handling, and transporting data for use as a basis for planning. Chemical inventory data are made available to the community at large under the "right-to-know" provision of the law. In addition, SARA also requires annual reporting of continuous emissions and accidental releases of specified compounds. These annual submissions are compiled into a nationwide Toxics Release Inventory.

c. Resource Conservation and Recovery Act

The Resource Conservation and Recovery Act (RCRA) Subtitle C addresses hazardous waste generation, handling, transportation, storage, treatment, and disposal. It includes requirements for a system that uses hazardous waste manifests to track the movement of waste from its site of generation to its ultimate disposition. The 1984 amendments to the RCRA created a national priority for waste minimization. Subtitle D establishes national minimum requirements for solid waste disposal sites and practices. It requires states to develop plans for the management of wastes within their jurisdictions. Subtitle I requires monitoring and containment systems for underground storage tanks that hold hazardous materials. Owners of tanks must demonstrate financial assurance for the cleanup of a potential leaking tank.

d. Hazardous Materials Transportation Act

The Hazardous Materials Transportation Act is the statutory basis for the extensive body of regulations aimed at ensuring the safe transport of hazardous materials on water, rail, highways, in the sky, or in pipelines. It includes provisions for materials classification, packaging, marking, labeling, placarding, and shipping documentation.

e. Rule 29 of the Code of Federal Regulations Part 1926

Federal law requires compliance with Rule 29 of the Code of Federal Regulations (CFR) Part 1926. Prior to site demolition activities, building materials shall be carefully assessed for the presence of lead-based paint, and its removal, where necessary, must comply with state and federal regulations, including Occupational Safety and Health Administration (OSHA) 29 CFR Part 1926. The OSHA rule establishes standards for occupational health and environmental controls for lead exposure. The standard also includes requirements addressing exposure assessment, methods of compliance, respiratory protection, protective clothing and equipment, hygiene facilities and practices, medical surveillance, medical removal protection, employee information and training, signs, recordkeeping, and observation of monitoring. Furthermore, the requirements of California Code of Regulations (CCR), Title 17, Division 1, Chapter 8, identify procedures that must be followed for accreditation, certification, and work practices for lead-based paint and lead hazards. Section 36100 thereof specifically sets forth requirements for lead-based paint abatement in public and residential buildings.

f. Federal Air Regulations, Part 77

The Federal Aviation Administration (FAA) is charged with the review of construction activities that occur in the vicinity of airports. Their role in reviewing these activities is to ensure that new structures do not result in a hazard to navigation and thus derogate the safety of the National Airspace System. The regulations contained in Federal Air Regulations (FAR) Part 77 are designed to ensure that no hazards are allowed to exist that would endanger the public. The FAA, through FAR Part 77, established a method of identifying surfaces that should be free from obstructions in order to maintain sufficient airspace around airports. FAR Part 77, in effect, identifies the maximum height at which a structure would be considered an obstacle at any given point around an airport. In addition, Part 77 establishes standards for determining whether objects constructed near airports will be considered obstructions in navigable airspace, sets forth notice requirements of certain types of proposed construction or alterations, and provides for aeronautical studies to determine the potential impacts of a structure on the flight of aircraft through navigable airspace.

4.7.2.2 State Regulations

a. California Code of Regulations

Most state and federal regulations and requirements that apply to generators of hazardous waste are spelled out in CCR, Title 22, Division 4.5. Title 22 contains the detailed compliance requirements for hazardous waste generators, transporters, treatment, storage, and disposal facilities. Because California is a fully authorized state according to RCRA, most RCRA regulations (those contained in 40 CFR 260, et seq.) have been duplicated and integrated into Title 22. However, because the DTSC regulates hazardous waste more stringently than the U.S. Environmental Protection Agency (U.S. EPA), the integration of California and federal hazardous waste regulations that make up Title 22 do not contain as many exemptions or exclusions as does 40 CFR 260. As with the California Health and Safety Code, Title 22 also regulates a wider range of waste types and waste management activities than do the RCRA regulations in 40 CFR 260. To aid the regulated community, California compiled the hazardous materials, waste and toxics-related regulations contained in CCR, Titles 3, 8, 13, 17, 19,

22, 23, 24, and 27 into one consolidated CCR, Title 26 "Toxics." However, the California hazardous waste regulations are still commonly referred to as Title 22. For the purposes of clarity, because of the extensive reach of Title 22 and Title 26, many common household products sold in grocery stores and home improvement warehouses qualify as hazardous materials. These items include household cleaners, detergents, paint, motor oil, lubricants, glues, pesticides, etc. The term "hazardous materials" is also defined to include many on-site materials as well, such as lubricants, fuel, etc.

b. Cortese List: Section 65962.5(a)

Government Code Section 65962.5 requires the CalEPA to develop, at least annually, an updated Hazardous Waste and Substances Sites list (Cortese List). The Cortese List is a planning document used by the state, local agencies, and developers to comply with California Environmental Quality Act (CEQA) requirements in providing information about the location of hazardous materials release sites. Release sites include or hazardous materials release sites may include the following:

- All hazardous waste facilities subject to corrective action pursuant to Section 25187.5 of the Health and Safety Code.
- All land designated as hazardous waste property or border zone property pursuant to Article 11 (commencing with Section 25220) of Chapter 6.5 of Division 20 of the Health and Safety Code.
- All information received by the DTSC pursuant to Section 25242 of the Health and Safety Code on hazardous waste disposals on public land.
- All sites listed pursuant to Section 25356 of the Health and Safety Code.
- All sites included in the Abandoned Site Assessment Program.

The California DTSC is responsible for a portion of the information contained in the Cortese List. Other state and local government agencies are required to provide additional hazardous material release information for the Cortese List.

c. The California Hazardous Material Management Act

The Hazardous Materials Management Act requires that businesses handling or storing certain amounts of hazardous materials prepare a Hazardous Materials Business Emergency Plan (HMBEP), which includes an inventory of hazardous materials stored on-site (above specified quantities), an emergency response plan, and an employee training program. An HMBEP is a written set of procedures and information created to help minimize the effects and extent of a release or threatened release of a hazardous material. The intent of the HMBEP is to satisfy federal and state community right-to-know laws and to provide detailed information for use by emergency responders.

Per the California Health and Safety Code, Chapter 6.95, Section 25500–25532, an HMBEP must be submitted by any business that handles a hazardous material or a mixture containing a hazardous material in quantities equal to, or greater than:

- A total weight of 500 pounds or a total volume of 55 gallons;
- 200 cubic feet of a compressed gas at standard temperature and pressure; and/or
- A radioactive material handled in quantities for which an emergency plan is required pursuant to Parts 30, 40, or 70 of Chapter 10, Title 10, CFR, or equal to or greater than the amounts specified above, whichever amount is less.

An HMBEP must be prepared prior to facility operation. Any business subject to HMBEP requirements shall submit an amendment of its HMBEP to the local implementing agency when there is:

- A 100 percent or more increase in the quantity of a previously disclosed hazardous material;
- Any handling of a previously undisclosed hazardous material subject to the inventory requirements;
- Change of business address;
- Change of ownership;
- Change of business name; and/or
- Change of contact information.

In addition, any business subject to HMBEP requirements is also required to certify the inventory of hazardous materials handled at the business every year. Businesses are also required to review their HMBEP at least once every three years to determine if a revision is necessary. Once the review has been conducted, the business must certify in writing to the local implementing agency that a review has been completed and necessary changes were made. For businesses within the City, HMBEPs are submitted to and approved by the Orange County Health Care Agency.

d. The California Hazardous Waste Control Law

The Hazardous Waste Control Law (HWCL) is the primary hazardous waste statute in the state of California. The HWCL requires a hazardous waste generator, which stores or accumulates hazardous waste for periods greater than 90 days at an on-site facility or for periods greater than 144 hours at an off-site or transfer facility, which treats, or transports hazardous waste, to obtain a permit to conduct such activities. The HWCL implements RCRA as a "cradle-to-grave" waste management system in the state of California. HWCL specifies that generators have the primary duty to determine whether their wastes are hazardous and to ensure their proper management. The HWCL also establishes criteria for the reuse and recycling of hazardous wastes used or reused as raw materials. The HWCL exceeds federal requirements by mandating source reduction planning and a much broader requirement for permitting facilities that treat hazardous waste. It also regulates the number of types of wastes and waste management activities that are not covered by federal law with RCRA.

e. State Aeronautics Act (Public Utilities Code Section 21670, et seq.)

The Public Utilities Code establishes the requirement for the creation of airport land use commissions for every county in which there is located an airport that is served by a scheduled airline. Additionally, these sections of the Public Utilities Code mandate the preparation of Comprehensive Land Use

Plans to provide for the orderly growth of each public airport and the area surrounding the airport. The purpose of Comprehensive Land Use Plans includes the protection of the general welfare of inhabitants within the vicinity of the airport and the general public.

f. California Emergency Services Act

Government Code 8550–8692 provides for the assignment of functions to be performed by various agencies during an emergency so that the most effective use may be made of all manpower, resources, and facilities for dealing with any emergency that may occur. The coordination of all emergency services is recognized by the state to mitigate the effects of natural, humanmade, or war-caused emergencies which result in conditions of disaster or extreme peril to life, property, and the resources of the state, and generally, to protect the health and safety and preserve the lives and property of the people of the state.

g. State Fire Plan

The state Board of Forestry and the California Department of Forestry and Fire Protection have drafted a comprehensive update of the State Fire Plan for wildland fire protection in California. The planning process defines a level of service measurement, considers assets at risk, incorporates the cooperative interdependent relationships of wildland fire protection providers, provides for public stakeholder involvement, and creates a fiscal framework for policy analysis.

h. Title 22, Division 4.5 of the California Code of Regulations

During site decommissioning and demolition activities, hazardous wastes must be managed in accordance with the requirements of Title 22, Division 4.5 of the California Code of Regulations. Title 22 sets forth the requirements with which hazardous-waste generators, transporters, and owners or operators of treatment, storage, or disposal facilities must comply. These regulations include the requirements for packaging, storage, labeling, reporting, and general management of hazardous waste prior to shipment. In addition, the regulations identify standards applicable to transporters of hazardous waste such as the requirements for transporting shipments of hazardous waste, manifesting, vehicle registration, and emergency accidental discharges during transportation.

i. Title 8 of the California Code of Regulations, Section 1529

During demolition, grading, and excavation, workers shall comply with the requirements of Title 8 of the CCR, Section 1529, which provides for exposure limits, exposure monitoring, respiratory protection, and good working practices by workers exposed to asbestos. Asbestos contaminated debris and other wastes shall be managed and disposed of in accordance with the applicable provision of the California Health and Safety Code.

4.7.2.3 Regional Regulations

a. Certified Union Program Agency for Orange County

The Environmental Health Division was designated as the Certified Union Program Agency (CUPA) for the County of Orange in 1997 by the State Secretary for Environmental Protection. CUPA serves as an administrative agency that coordinates regulation of hazardous materials and waste in Orange County. The CUPA oversees the following six agencies: Hazardous Materials Disclosure, Business Emergency Plan, Hazardous Waste, Underground Storage Tank, Aboveground Petroleum Storage Tank, and California Accidental Release Prevention. These agencies have developed specific plans for identifying and managing different types of hazardous waste, described in more detail below.

Hazardous Materials Disclosure and Business Emergency Plan: The HMBEP program requires businesses that handle hazardous materials such as hazardous waste or substances at reportable quantities to submit an HMBEP to the California Environmental Reporting System. The CUPA then verifies this information and provides it to agencies that are responsible for the protection of public health and the environment.

Hazardous Waste: The Hazardous Waste Inspection Program is overseen by the Environmental Health Division throughout Orange County. This program aims to manage the proper handling, recycling, treatment, storage, and disposal of all hazardous wastes generated by Orange County businesses. Through this program, specialists inspect facilities that generate hazardous waste, evaluate industries that generate hazardous waste, investigate reports of illegal hazardous waste disposal, and respond to emergency spills of hazardous chemicals. Additionally, specialists engage in public education programs that inform industries and residents about regulations relating to proper hazardous waste disposal.

Underground Storage Tank: The Underground Storage Tank (UST) Inspection Program serves to ensure that hazardous materials stored in underground tanks are not released into the environment, causing potential pollution of ground or surface waters. The UST inspection program is overseen by the Orange County Health Care Agency (OCHCA), Environmental Health Division in most cities of Orange County, except Anaheim and Orange. Environmental Health is responsible for implementing and enforcing underground storage tank codes. Specialists from Environmental Health inspect and monitor equipment and compliance of UST systems to ensure that they comply with relevant laws and regulations. The Environmental Health Division also aims to educate and help tank owners and operators navigate regulatory requirements.

Aboveground Petroleum Storage Tank: The Aboveground Petroleum Storage Act (APSA) defines "petroleum" as crude oil, or any fraction thereof, which is liquid at 60 degrees Fahrenheit temperature and 14.7 pounds per square inch absolute pressure. The Act applies to businesses with a total storage capacity at one site of more than 1,320 gallons of petroleum products in tanks or containers larger than 55 gallons. The OCHCA is the CUPA responsible for inspections of these storage facilities in all of Orange County, except for Anaheim, which is regulated by the City of Anaheim Hazardous Materials Section. Tank facilities regulated under APSA are also regulated by the U.S. EPA Region 9 Oil Program Clean Water Act Compliance Office. A tank facility may be regulated and inspected by just the EPA or both the EPA and Orange County. Facilities regulated under the APSA or the federal

Spill Prevention, Control, and Countermeasure (SPCC) Rule must prepare and implement a SPCC Plan. Regulated facilities fall into three different categories with corresponding required plans depending on the storage capacity present at the facility.

b. California Accidental Release Program (CalARP)

The California Accidental Release Program (CalARP) is administered in the City by the Orange County Fire Authority (OCFA). OCFA monitors and regulates identified industries in the City that have a stationary source of hazardous materials. The potential hazardous threat of CalARP facilities is determined by completing a land use compatibility analysis. The regulatory responsibilities of CalARP, including the development and implementation of a Risk Management Plan, are found in Title 19, Division2, Chapter 4.5 of the CCRs.

c. Orange County and Orange County Fire Authority Local Hazard Mitigation Plan

The federal Disaster Mitigation Act of 2000 requires all local governments to create a disaster plan in order to qualify for hazard mitigation funding. In 2010, Orange County partnered with the OCFA to produce a Multi-Jurisdiction Hazard Mitigation Plan. This plan outlines measures to mitigate natural hazards in County unincorporated areas, as well as fire hazards in the OCFA service area and County and OCFA facilities. The mission of the plan is to promote a policy that protects residents, facilities, infrastructure, key resources, property, and the environment from natural hazards, focusing on unincorporated areas of Orange County. Additionally, the plan aims to increase public awareness and outline resources for risk reduction and loss prevention.

d. South Coast Air Quality Management District Rule 1403

Prior to site demolition activities, building materials must be carefully assessed for the presence of asbestos-containing materials (ACM), and removal of this material, where necessary, must comply with state and federal regulations, including South Coast Air Quality Management District (SCAQMD) Rule 1403, which specifies work practices with the goal of minimizing asbestos emissions during building demolition and renovation activities, including the removal and associated disturbance of ACMs. The requirements for demolition and renovation activities include asbestos surveying; notification; ACM removal procedures and time schedules; ACM handling and cleanup procedures; and storage, disposal, and landfill disposal requirements for asbestos-containing waste materials.

e. Soil and/or Groundwater Contamination

Evidence of soil and/or groundwater contamination (e.g., chemical odors, staining) unrelated to above/underground storage tank releases may be encountered during site development. The appropriate agency (e.g., OCHCA, DTSC, or the Regional Water Quality Board) shall be notified if these conditions are encountered during construction or grading activities. With their oversight, an environmental site assessment would be completed and a determination shall be made as to whether a cleanup is required. Cleanup activities would be consistent with all applicable state and local rules, regulations, and laws. A cleanup would not be considered complete until confirmatory samples of soil and/or groundwater reveal levels of contamination below the standards established by the oversight agency. Alternatively, a risk assessment may be prepared for the site to determine that

there are no human or environmental risks associated with leaving contamination below specific levels in place. Construction in the impacted area shall not proceed until a "no further action" clearance letter or similar determination is issued by the oversight agency, or until a land use covenant is implemented.

4.7.2.4 Local Regulations

a. Existing General Plan (2000)

The current Safety Element provides guidelines for the protection of the community from hazards. Subsequent guidelines from the Board and Office of Planning and Research General Plan Guidelines will necessitate revisions to the Irvine General Plan Safety Element, which will be reflected in the General Plan Update.

The existing General Plan Safety Element includes the following objectives and policies related to hazards:

Safety Element

Objective J-1: Hazard Occurrence. Identify actions that the City, in concert with other jurisdictions, must take to reduce the probability of hazard occurrence.

- Policy (a): Regulate the type and intensity of development in areas associated with potential land use and air operational hazards through land use controls.
- Policy (c): Establish criteria for land development in hillside areas with emphasis on fire retardant materials, minimization of exposure risk to wildfire and adjacent structure fires, provision of access for fire fighting personnel and equipment, and removal of combustible vegetation.
- Policy (d): Use the most current available Airport Environs Land Use Plan (AELUP) as a planning resource for evaluating aircraft operations, land use compatibility and land use intensity.
- Policy (e): Require development proposals to be reviewed by the Orange County Fire Authority to ensure adequate fire protection and precautions occur.

Objective J-2: Disaster Response. Identify actions that the City, in conjunction with other jurisdictions, must take to reduce the severity of disasters.

- Policy (a): Ensure that developments will be properly served by police and fire service.
- Policy (b): Ensure that each development will have adequate emergency ingress and egress.
- Policy (c): Phase the timing of development in relation to the City's ability to provide police and fire service.
- Policy (d): Continue to maintain and implement the City of Irvine's Emergency Plan.

Seismic Element

Objective D-1: Potential Hazards. Take potential environmental hazards into account in the General Plan.

- Policy (a): Identify the locations of potential seismic hazards to minimize the effects of the potential hazard through special development constraints. Conduct a research program to develop more refined boundaries for seismic response areas, particularly for Seismic Response Area 1.

Objective D-2: Response to Hazards. Require appropriate measures to protect public health and safety and to respond to seismic hazards in all public and private developments.

- Policy (g): Require a detailed geological and soils study as needed, in accordance with the requirements of the City's Subdivision Ordinance, before approving development.
- Policy (h): Continue to require structures to conform to the seismic design requirements found in the Uniform Building Code.
- Policy (i): Ensure that the most recent adopted seismic standards are used for new construction.

b. Local Hazard Mitigation Plan

The City's LHMP (2020) is designed to identify the City's hazards, estimate the probability of future occurrences, and set goals to mitigate potential risks to reduce or eliminate long-term natural or man-made hazard risks to human life and property for the City and its residents. The 2020 LHMP is an update to the City's 2011 LHMP.

c. Emergency Operations Plan

The purpose of the City's Emergency Operations Plan (2020) is to establish a strategic response plan if an emergency occurs. The plan provides an overview of concepts and components of the City's emergency management organization within the Standardized Emergency Management System and describes responsibility of federal, state, and county entities to protect life and property.

d. Municipal Code

Title 4 (Public Safety), Division 9 (Emergency Services)

Title 4 (Public Safety), Division 9 (Emergency Services) of the Municipal Code provides guidance for the preparation and carrying out of plans for the protection of persons and property within this City in the event of an emergency; the direction of the emergency organization; and the coordination of the emergency functions of this City with all other public agencies, corporations, organizations, and affected private persons.

Title 4 (Public Safety), Division 17 (Hazardous Materials)

Title 4 (Public Safety), Division 17 (Hazardous Materials) of the Municipal Code outlines the system of disclosure that is required to provide that information essential to firefighters, health officials, planners, elected officials, and other emergency service personnel in meeting their responsibilities for the health and welfare of the community in such a fashion that trade secrecy is not abridged. This division also implements the community's right and need for basic information on the use and disposal of hazardous materials in the City and provides for an orderly system for the provision of such information.

Title 5 (Planning), Division 10 (Grading Code and Encroachment Regulations), Chapter 1 (Grading Code)

As outlined in Section 5.10-114 (Hazardous Conditions), of the Grading Code, hazardous conditions exist when the state of any natural ground, natural slopes, excavation, fill or drainage device, any of which exist on public or private property, is a menace to life or limb, or a danger to public safety, or endangers or adversely affects the safety, usability or stability of adjacent property, structures, or public or private facilities. This section of the City's Municipal Code outlines the authority given to the Chief Building Official for examining or causing to be examined every condition reported as hazardous as set forth in subsection A of this section. This section also outlines the provisions that may be undertaken in case of any such hazard.

Title 5 (Planning), Division 9 (Building Regulations) Chapter 1 (Adoption of Building and Fire Code)

Adoption of Building Regulations of the City's Municipal Code contains Section 5.9.102 Adoption of Fire Code, which states that the provisions of the California Fire code as amended by the provisions of this Division of the Municipal Code shall constitute the Fire Code Regulations of the City.

e. Zoning Ordinance

Chapter 2-13 (Hazardous Waste Facility Procedure)

This chapter of the Zoning Ordinance establishes uniform standards, land use regulations and a permit process for controlling the location, design, maintenance and safety of off-site hazardous waste facilities. This chapter also outlines the environmental review process for such facilities, including the requirement for an analysis of all anticipated air quality impacts associated with the project and proposed mitigation to ensure no degradation of air quality in the area.

Chapter 5-8 (Irvine Business Complex Residential Mixed-Use Overlay District)

Section 5-8-4.A.2 (Compatibility with Surrounding Land Uses) of Chapter 5-8 states that applicants for new residential and/or residential mixed use are required to submit data as determined by the Director of Community Development to evaluate compatibility uses with respect to issues including but not limited to noise, odors, truck traffic and deliveries, hazardous materials handling/storage, air emissions, soil/groundwater contamination, and John Wayne Airport compatibility.

Section 5-8-4.A.4 (Air Quality Standards) of Chapter 5-8 outlines the required standards for residential and residential mixed-use projects, including:

- Use, service and maintenance of construction equipment, including the use of Tier 3 or higher emissions standards for off-road construction equipment and restrictions on non-essential idling.
- Preparation of a dust control plan for ground-disturbing activities, which would include measures for fugitive dust control under Rule 403 of the South Coast Air Quality Management District.
- Limitations and restrictions on coatings and solvents that contain volatile organic compounds.
- Requirement for the installation of Minimum Efficiency Reporting Value (MERV) filters of MERV 14 or better in the intake of residential ventilation systems for residences located within 500 feet of Interstate 405.
- Requirement for the submittal of a Health Risk Assessment (HRA) for residential or residential mixed-use projects located within the distances to industrial uses outlined in Section 5-8-4.A.4.
- Requirement for the submittal of a HRA for residential or residential mixed-use projects located within 1,000 feet of an industrial facility that emits toxic air contaminants.
- Requirement for the submittal of an odor assessment for all residential projects located within 1,000 feet of an industrial facility that emits substantial odors.

Section 5-8-4.C (Airport Restrictions) of Chapter 5-8 outlines the provisions for development within the jurisdiction of the Airport Land Use Commission, including: building height limitations in accordance with the Orange County Environs Land Use Plan standards and Federal Aviation Administration Part 77 Imaginary Surfaces for John Wayne Airport; the prohibition of residential land uses within Safety Zone 3; and sound attenuation standards for residential and park uses.

f. Planning Commission Resolution No. 09.-2968

Standard Conditions are adopted by Planning Commission Resolution No. 09-2968. These conditions assist staff in applying standardized wording for frequently used conditions of approval for discretionary and subdivision applications. Standard conditions are applied on a case-by-case basis depending upon the specifics of the application. Companion conditions are cross-referenced and are required to be used together. The following standard conditions related to hazards and hazardous materials apply:

Standard Condition 2.19 (Open Space Fuel Modification)

Prior to issuance of precise grading permits for any lots adjacent to open space, the applicant shall submit a fuel modification plan prepared to the satisfaction of the Director of Community Development for review and approval, in consultation with the Director of Community Services. The fuel modification plan shall be approved by the OCFA. The requirements set forth in this condition

do not apply to developed, irrigated park land required or provided as part of the project design for this project.

Standard Condition 3.8 (Used Motor Oil Collection)

Prior to the issuance of building permits for a project that incorporates vehicle service bays, the applicant shall submit, and the Director of Community Development shall have approved, a plan to implement an on-site used oil (motor oil) collection program in accordance with state/local statutes and regulations.

Standard Condition 3.14 (HOA/Fuel Modification)

Prior to the issuance of building permits for any dwelling units on lots located adjacent to or within fuel modification zones, the applicant shall provide evidence that there is a requirement included in the Covenant, Condition and Restrictions that any changes to plant materials located within fuel modification zones must be approved by the Director of Community Development and be consistent with applicable OCFA requirements. For fuel modification zones adjacent to lands designated as Open Space, changes in plant materials shall also be reviewed by the Director of Community Services.

Standard Condition 3.17 (Emergency Access Plan)

Prior to the issuance of the first building permit, the applicant shall submit and have approved by the Chief of Police an Emergency Access Plan, which identifies and locates all Knox Boxes, Knox key switches, and Click2Enter radio access control receivers per the Irvine Uniform Security Code requirements. Said plan shall be incorporated into the plan set approved for building permits.

Standard Condition 3.18 (Wayfinding (Directional) Plan)

Prior to the issuance of the first building permit, a Wayfinding (directional) Plan including exterior building numbers, unit numbers, directional building/unit signs, vehicle directional signage, parking structure identification/directional signage, trail signage, and other signage as required by the Irvine Uniform Security Code, shall be approved by the Chief of Police. Said plan shall be incorporated into the plan set approved for building permits.

g. Fire Hazard Severity Zones

To assist each fire agency in addressing its responsibility area, the California Department of Forestry and Fire Prevention (CAL FIRE) uses a severity classification system to identify areas or zones of severity for fire hazards within the state. CAL FIRE is required to map these zones, which include moderate, high, and very high fire hazard severity zones (FHSZs).

As shown in Figure 4.7-2, most of the City consists of urban areas that are not designated as a FHSZ, although some areas adjacent to the City's borders are designated as moderate, high, and very high FHSZs. Approximately 11,915 acres (approximately 28.22 percent) of the City are mapped as Very High FHSZ. The topography of the foothills of the Santa Ana Mountains and San Joaquin Hills in the City is extremely conducive to wildfires. The community is bordered by natural, undeveloped hillsides

Fire Hazard Severity Zones

and mountains to the northeast and open space areas to the southwest. Most of the development within the City is located between these two areas. Approximately 11,915 acres of these natural, undeveloped areas are classified as Very High FHSZ by Cal FIRE. In the northeastern portion of the City, this zone extends throughout the Santa Ana Mountain range, which extends into Riverside County to the east. Additionally, approximately 1,875 acres of land located in Focus Area 3 are classified as Very High FHSZ by Cal FIRE.

h. John Wayne Airport Land Use Plan

The Airport Environ Land Use Plan (AELUP) for John Wayne Airport, described in Appendix F of the City CEQA Guidelines, Regulatory Information, contains land use restrictions that are meant to reduce the hazards associated with airport land use plans (Figure 4.7-3).

John Wayne Airport is in unincorporated Orange County along the western border of the City, adjacent to the Irvine Business Complex. A portion of Focus Area 1 is located within the Airport Environs Land Use Plan Airport Planning Areas. Structures in this area are required to abide by land use regulations within the Airport Land Use Plan such as safety and noise compatibility zones, and height restrictions.

Each local agency having jurisdiction over any area within the planning areas is required to submit its general plans for that area to the Commission for a determination in accordance with the Government Code for the State of California, Section 65302.3 and Public Utilities Code Section 21676. The submittals should highlight those areas which address the AELUP noise impact, safety compatibility, and height restriction zones. The only requirement is that the submittals illustrate how local agencies will incorporate the performance standards outlined in the airport land use plan into their planning, zoning, and development processes. Any amendments to a General Plan must be submitted to the Commission for a determination prior to its adoption by the local agency.

i. Existing Plans, Programs, and Policies

Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required of the project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute mitigation measures. The following measures are existing plans, programs, or policies (PPP) that apply to the project and will help to reduce and avoid potential impacts related to hazards and hazardous materials:

- PPP HAZ-1: Compliance with the Certified Union Program Agency for Orange County (hazardous materials)
- PPP HAZ-2: Compliance with the City's LHMP
- PPP HAZ-3: Compliance with the City's Emergency Operations Plan (EOP)
- PPP HAZ-4: Compliance with Municipal Code Title 4 (Public Safety), Division 9 (Emergency Services)
- PPP HAZ-5: Compliance with Orange County Airport Land Use Compatibility Plan (ALUCP) safety and noise compatibility standards for John Wayne Airport.
- PPP HAZ-6: Compliance with Orange County and Orange County Fire Authority Local Hazard Mitigation Plan
- PPP HAZ-7: Compliance with Standard Condition 2.19 (Open Space Fuel Modification)
- PPP HAZ-8: Compliance with Standard Condition 3.14 (HOA/Fuel Modification)
- PPP HAZ-9: Compliance with Standard Condition 3.17 (Emergency Access Plan)
- PPP HAZ-10: Compliance with Standard Condition 3.18 (Wayfinding (Directional) Plan)

Proposed General Plan Strategies and Policies

In addition to the above-listed PPPs, the following proposed goals, objectives, policies, and implementation actions are applicable to the analysis of hazards and hazardous materials and would replace existing goals, strategies, and policies outlined in the City's existing General Plan following project approval:

Land Use Element

Goal 6: Achieve Harmonious Land Use Patterns Throughout the City

Objective LU-6. To establish cohesive and harmonious land use patterns throughout the City by implementing integrated planning strategies that promote connectivity, sustainability, and community well-being while respecting the unique character and identity of different neighborhoods.

- Policy (a): Safeguard the public health, safety, and welfare of sensitive receptors/land uses when placing them near the following land uses: those dealing with hazardous substances, those causing excessive noise or dust, and those creating other conflicts. Simultaneously, ensure that proposed sensitive receptors/land uses do not impede the ongoing operation or expansion of airports, surface utilities, off-site hazardous waste facilities, solid waste facilities, manufacturing, research and development, mining and processing, or any land use involving hazardous substances as defined by federal and state regulations.

- **Policy (c)**: Ensure that the siting of any land use which handles, generates, and/or transports hazardous substances, as defined by federal and state regulations, will not hurt existing sensitive receptors/land uses.

Noise Element

Goal 1: Noise Control Through Land Use Planning and Design

Objective N-1. Maintain healthy and safe noise environments consistent with City Standards through site design and location.

- **Policy (a)**: Require all plans submitted for development review to demonstrate whether the plan area is located within an existing or future Noise Element noise contour, including vehicle, rail, and aircraft noise contours.
- **Policy (b)**: Avoid new residential development within the 65 dBA CNEL contour for aircraft, roadway, or rail noise unless "normally compatible" exterior noise standards can be maintained in private open spaces, and interior noise standards can be achieved through building design.

Goal 3: Noise Abatement

Objective N-3. Achieve maximum efficiency in noise abatement efforts through establishing minimum standards, intergovernmental coordination, and public information programs.

- **Policy (a)**: Coordinate efforts to reduce noise impacts with appropriate public and government agencies, such as aircraft and transit regulatory agencies.
- **Policy (e)**: Seek the cooperation of aircraft regulatory agencies in the modification and selection of flight paths that will reduce noise impacts on residential and other noise-sensitive areas.
- **Policy (f)**: Ensure that any proposal to update aircraft noise contours used by the City of Irvine for planning analysis is submitted, before adoption by the City, to the Airport Land Use Commission.

Safety Element

Goal 1*:* Protect and prepare the community for natural and human-caused hazards.

Objective S-1. Hazard Preparedness and Occurrence

- **Policy (a)**: Expand participation in the Irvine Community Emergency Response Team (CERT) program for residents and businesses, including offering training in a variety of languages.
- **Policy (b)**: Coordinate with Caltrans and Orange County Transit Authority for inspection and maintenance of primary evacuation routes.
- **Policy (c)**: Coordinate with regional transit providers to identify alternative routes, stops, and modes of transit if normal infrastructure is damaged or closed as a result of extreme events.
- **Policy (d):** Encourage collaboration with local and regional partners to support business resiliency through preparedness education, trainings, and resources.

- **Policy (e)**: Update the City's Local Hazard Mitigation Plan every five years, to ensure consistency and relevancy of hazards and issues within the City, and to maintain consistency with State and/or federal legislation.
- **Policy (f):** Update the Irvine Power Outage Response Plan (annex to the Emergency Operations Plan) to identify back-up energy technologies that are more resilient to climate impacts and communications locations for critical facilities, critical infrastructure (e.g., traffic signals), sensitive uses, and community lifelines (including water, sewer, telecommunications).
- **Policy (g)**: Continuously update response procedures for first responder departments to properly address new hazard events as they emerge.
- **Policy (h)**: Encourage community members to sign-up for disaster alerts.
- **Policy (i)**: Identify opportunities to expand access to emergency and evacuation notices via multiple sources, including voice, text, siren, radio, and outdoor broadcasts.
- **Policy (j)**: Increase understanding of all energy storage technologies including critical features such as storage capacity, efficiency, duration of power, lifestyle impacts, and realistic function to provide long-term, reliable sources of power during grid outages.

Goal 4: Safeguard the community from the threat of urban and wildfire hazards.

Objective S-4. Wildfire Hazards

- **Policy (a)**: Coordinate with regional partners to explore and deploy fire detection cameras as part of a wildfire monitoring network.
- **Policy (b):** Coordinate with surrounding municipalities and Orange County to enhance evacuation and emergency management protocols, agreements, and processes.
- **Policy (c)**: Coordinate with City of Irvine and Orange County Fire Authority first responders to create a rapid response plan to secure hospital, nursing, and assisted living facilities, especially those located within fire hazard severity zones.
- **Policy (d):** Work with the Irvine Ranch Water District to ensure the long-term integrity of water supplies for the City.
- Policy (e): Continue to work with the Orange County Health Care Agency Department of Public Health and other applicable health care agencies to convey notifications to the public regarding recommendations for outdoor activities, cancelled sporting events, and other recommendations for public health and safety during periods of poor air quality.
- **Policy (f):** Encourage public and private landowners to minimize the risk of wildfire moving from wildland areas to developed properties or from property-to-property by increasing structural hardening measures (e.g., fire-rated roofing and fire-resistant construction materials and techniques), maintaining and improving defensible space on site, and supporting vegetation management in adjacent undeveloped areas.
- **Policy (g)**: Encourage existing non-conforming development to update to contemporary fire safe standards (e.g., road standards, vegetative hazards).
- **Policy (h):** Encourage removal of highly flammable vegetation with little to no biological value in Very High, High, and Moderate Fire Hazard Severity Zones and replant with fire-adapted specimens.
- **Policy (i):** Promote the proper maintenance and separation of power lines and efficient response to fallen power lines in accordance with Title 14 CCR Division 1.5 Chapter 7 Article 4 (Fire Prevention Standards for Electric Utilities).

- **Policy (j)**: Encourage the use of underground power lines for replacement power lines, where feasible.
- **Policy (k)**: Ensure that all new development and redevelopment in the Very High Fire Hazard Severity Zone is developed in compliance with minimum structural fire protection standards in the adopted edition of the California Fire and Building Codes, applicable state or local fire safety and defensible space regulations or standards, and any applicable fire protection or risk reduction measures identified in locally adopted plans.
- **Policy (l):** Ensure future neighborhoods are designed with adequate fire access and evacuation egress in the event of an emergency.
- **Policy (m)**: Avoid expanding new residential development, essential public facilities, and critical infrastructure in areas subject to extreme threat or high risk, such as Very High Fire Hazard Severity Zones, or areas classified by the California Department of Forestry and Fire Protection as having an Extreme Threat classification on Fire Threat Maps, unless all feasible risk reduction measures have been incorporated into project designs or conditions of approval. Example risk reduction measures include, but are not limited to, fuel modification zones or defensible space, structure hardening, enclosed foundations, and highly visible street signs and property addresses.
- **Policy (n)**: Ensure adequate water supply for fire suppression and ensure that the water supply is protected from wildfire impacts, including providing back-up power, with priority for solar and battery storage back-up supplies.
- **Policy (o)**: Ensure future neighborhoods are designed with sufficient water pressure to maintain fire flow.
- **Policy (p)**: Encourage the use of underground power lines for new developments.
- **Policy (q)**: Ensure that private development subject to the California Environmental Quality Act evaluate hazard impacts to ensure adequate evacuation in the event of an emergency, and if required, develop standards for the protection of the community.
- **Policy (r):** Review development proposals and coordinate with regional transportation agencies to ensure that multiple evacuation routes are available under a range of scenarios and identify alternative routes that are accessible to people without life-supporting resources.
- **Policy (s):** Coordinate with fire protection, emergency service, and water providers to reassess fire hazards and future availability of water supplies after wildfire events to adjust fire prevention and suppression needs, as necessary, for both short- and long-term fire prevention.
- **Policy (t)**: Coordinate evaluations for redevelopment of areas that have been burned after a large fire.
- **Policy (u)**: Continue the long-term maintenance of fire reduction projects; including but not limited to, a roadside fuel reduction plan, defensible space clearances (including fuel beaks) around structures, subdivisions, and other development in the Very High Fire Hazard Severity Zone.
- **Policy (v):** Maintain established response time standards for fire and life safety service.
- **Policy (w)**: Encourage the continued development, implementation, and public awareness of fire prevention programs.

4.7.3 Significance Determination Thresholds

The City has adopted Appendix G of the State CEQA Guidelines as the significance thresholds for hazards and hazardous materials. A project would normally have a significant effect on the environment if the project would:

1) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
2) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;
3) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;
4) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, create a significant hazard to the public or the environment;
5) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, the project would result in a safety hazard for people residing or working in the project area;
6) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan;
7) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

4.7.4 Methodology

The potential for significant hazards and hazardous materials impacts associated with the project has been evaluated based upon review of existing secondary source information and data relative to hazardous or potentially hazardous materials.

4.7.5 Topics 1, 2, and 3: Transport, Use, or Disposal of Hazardous Materials/Accidental Release/Emissions Near a School

Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

4.7.5.1 Impact Analysis

Project buildout would allow for the future development of new residential uses associated with the proposed General Plan Update (57,656 residential units), the continued development of nonresidential uses that are currently permitted under the existing General Plan, nonresidential uses associated with the Great Park area, and the extension of Ada roadway. Construction activities associated with this development would likely require the transport, temporary storage, and use of asphalt fuels, oils, paints, and solvents during construction. However, these materials are not acutely hazardous, and use of these common hazardous materials in small quantities would not represent a significant hazard to the public or environment. Project construction would adhere to typical Best Management Practices regarding the use of hazardous materials, such as proper labeling and storage, removal of materials once completed, and offsite vehicle maintenance. Operation of the future project would likely include the use and storage of cleaning supplies, motor oil, building maintenance supplies, paints and solvents, pesticides, or other similar materials. However, these materials are not acutely hazardous, and the limited quantities and use of such products would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. As such, the project does not propose any development that is likely to generate or use acutely hazardous materials.

In the case of redevelopment projects, sites to be demolished would be subject to the inspection requirements of the SCAQMD Rule 1403, which would require an assessment for the ACM, and provides proper guidance for the removal of this material, when necessary. Similarly, Title 22, Division 4.5 of the CCRs provides guidance regarding the removal of hazardous materials during demolition activities, and Title 8 of the CCRs, Section 1529 provides guidance regarding limits, exposure monitoring, respiratory protection, and good working practices during demolition, grading, and excavation that may result in exposure to ACM. Title 8 of the CCRs, Section 1529 also provides guidance on how ACM and other wastes shall be managed and disposed of in accordance with the applicable provision of the California Health and Safety Code.

Furthermore, the project would not allow for development of any uses that would generate or store substantial amounts of hazardous materials. Existing uses that handle hazardous materials independent of the project would continue to be subject to the requirements of CCR, Title 22, Division 4.5 regarding hazardous waste generators, transporters, treatment, storage, and disposal facilities, requirements of the California Hazardous Materials Management Act to prepare a HMBEP for management of hazardous materials and written procedures for response to an accidental release, as well as requirements of the California HWCL for the proper management of hazardous materials. For example, polices aim to safeguard the public health, safety, and welfare of sensitive receptors/land uses when placing them near uses dealing with hazardous substances, those causing excessive noise or dust, and those creating other conflicts. Additionally, the Land Use Element includes policies that aim to ensure that proposed sensitive receptors/land uses do not impede the ongoing operation or expansion of airports, surface utilities, off-site hazardous waste facilities, solid waste facilities, manufacturing, research and development, mining and processing, or any land use involving hazardous substances as defined by federal and state regulations. Additionally, compliance

with the Certified Union Program Agency for Orange County (PPP HAZ-1) would ensure proper handling of hazardous materials.

Therefore, the project would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials, create foreseeable upset and accident conditions involving the release of hazardous materials, or emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school, and impacts would be less than significant. Furthermore, compliance with Land Use Element Update policies regarding handling of hazardous materials would further support the City's goal of minimizing land use conflicts and safety hazards associated with hazardous materials and/or emissions.

4.7.5.2 Significance of Impacts before Mitigation

Impacts would be less than significant. No mitigation is required.

4.7.5.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.7.6 Topic 4: Hazardous Materials Sites

Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, create a significant hazard to the public or the environment?

4.7.6.1 Impact Analysis

Project buildout would allow for the future development of new residential uses associated with the proposed General Plan Update (57,656 residential units), the continued development of nonresidential uses that are currently permitted under the existing General Plan, nonresidential uses associated with the Great Park area, and the extension of Ada roadway. While the project would allow for development citywide, future development is likely to be concentrated within the three focus areas.

As shown in Figure 4.7-1 and Table 4.7-1, there are a total of 41 hazardous materials sites located throughout the City. Specifically, 18 sites are in Focus Area 1, one site is in Focus Area 2, 14 sites are located in Focus Area 3, and the remaining 8 are located outside of the Focus Areas. In accordance with federal, state, regional, and local requirements, any new development or redevelopment that involves contaminated property would necessitate the clean-up and/or remediation of the property in accordance with applicable requirements and regulations. Compliance with the Certified Union Program Agency for Orange County (PPP HAZ-1) would ensure that projects would identify and remediate hazardous materials. Therefore, adherence to applicable clean-up and/or remediation requirements and regulations, would ensure that the project would not create a significant hazard associated with known hazardous materials sites, and impacts would be less than significant. Furthermore, compliance with Land Use Element Update policies regarding handling of hazardous

materials would further support the City's goal of minimizing land use conflicts and safety hazards associated with hazardous sites.

4.7.6.2 Significance of Impacts before Mitigation

Impacts would be less than significant. No mitigation is required.

4.7.6.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.7.7 Topic 5: Airport Hazards

Would the project be located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, result in a safety hazard or excessive noise for people residing or working in the project area?

4.7.7.1 Impact Analysis

The project would allow for the future development of new residential uses associated with the proposed General Plan Update (57,656 residential units), the continued development of nonresidential uses that are currently permitted under the existing General Plan, nonresidential uses associated with the Great Park area, and the extension of Ada roadway.

All areas slated for future development as part of the project are outside of the area regulated by the John Wayne AELUP, with the exception of portions of Planning Areas 29 (University of California, Irvine- North Campus) and 36 (Irvine Business Complex), which are located within the John Wayne Airport safety zones, as well as the 70 community noise equivalent level (CNEL), 65 CNEL, and 60 CNEL John Wayne Airport noise contours (see Figure 4.7-3). However, future development within these planning areas would be subject to the land use restrictions for each of the compatibility zones, which provide development limitations to minimize potential incidents of off-airport accidents to persons and property on the ground. Proposed land use maps and zoning within these planning areas were developed with consideration to airport safety and Federal Aviation Regulation height limitations, and the residential and residential mixed-use overlay zones developed under the project would adhere to the same requirements. Additionally, future development under the project would be subject to applicable notification requirements under FAR Part 77, which also identifies the maximum height at which a structure would be allowed to reach in areas subject to aircraft overflight restrictions. Compliance with the Orange County Airport Land Use Compatibility Plan (ALUCP) safety and noise compatibility standards for John Wayne Airport (PPP HAZ-5) would avoid safety hazards for future development near John Wayne Airport. The Noise Element Update includes objectives and policies to further address aircraft noise. For example, Goal 1, Objective N-1 aims to maintain healthy and safe noise environments consistent with City Standards through site design and location and Goal 3, Objective N-3 aims to achieve maximum efficiency in noise abatement efforts through establishing minimum standards, intergovernmental coordination, and public information programs. Supporting policies outline regulations for new noise-sensitive uses within areas susceptible to high noise levels. Compliance with the updated Noise Element would support the City's goal of minimizing

hazards associated with the airport. Through compliance with the regulatory requirements described above, the project would not result in a safety hazard or excessive noise for people residing or working in the project area, and impacts would be less than significant.

4.7.7.2 Significance of Impacts

Impacts would be less than significant. No mitigation is required.

4.7.7.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.7.8 Topic 6: Emergency Response

Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

4.7.8.1 Impact Analysis

Disaster preparedness throughout the City is managed by the City's OEM, who coordinates the City's preparedness efforts for hazards that could impact the community, including natural and human-caused disasters. The OEM works with all City departments, having primary responsibility for specific response functions, and ensures department-level plans and procedures are in place in the event of an emergency. Although the project could increase demand on emergency response and evacuation, future development would be located within existing developed areas and along major transportation corridors in the City that would allow for evacuation and response. Additionally, the City's LHMP (2020) provides a comprehensive assessment of the threats posed by natural and human caused hazard events and includes coordinated strategy to reduce those threats.

The project would allow for the future development of new residential uses associated with the proposed General Plan Update (57,656 residential units), the continued development of nonresidential uses that are currently permitted under the existing General Plan, nonresidential uses associated with the Great Park area, and the extension of Ada roadway.

The extension of Ada roadway is not anticipated to interfere with emergency response activities or plans, but rather would likely improve emergency responses by improving connectivity within this area of the City. Future development facilitated by the project, including new residential uses, the continuation of nonresidential uses at the same intensities permitted by the current General Plan, and nonresidential development within the Great Park area would be designed consistent with the requirements of the City's LHMP (PPP HAZ-2), the City's EOP (PPP HAZ-3), Municipal Code Title 4 (Public Safety), Division 9 (Emergency Services) (PPP HAZ-4), and Standard Condition 3.17 (Emergency Access Plan) (PPP HAZ-9). Therefore, the project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan, and impacts would be less than significant. Furthermore, the updated Safety Element includes goals and objectives related to emergency access (see Goal 1, Objective S-1 and supporting policies related to improved emergency response operations in the City). Compliance with the updated Safety Element

would further bolster and limit impacts of future development on emergency response and evacuation plans.

4.7.8.2 Significance of Impacts before Mitigation

Impacts would be less than significant. No mitigation is required.

4.7.8.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.7.9 Topic 7: Wildland Fires

Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

4.7.9.1 Impact Analysis

As shown in Figure 4.7-2, most of the City consists of urban areas that are not designated as a FHSZ. Although approximately 1,875 acres of land located in Focus Area 3 is designated as Very High FHSZ, future housing development and proposed improvements to the Great Park are not likely to be located within the segment of Focus Area 3 designated as Very High FHSZ, and any development near this area would be designed consistent with all applicable fire safety requirements. Future development and redevelopment could also occur outside of the proposed focus areas, which may be located along the City boundaries adjacent to land identified as having Moderate, High, or Very High FHSZ designations. For instance, areas within the northeastern portion of the City, which extends into Riverside County to the east are designated as Very High FHSZ. However, all new development and redevelopment in these areas would be required to prepare a fuel modification plan before approval of tentative maps and grading permits, per City Standard Condition 2.19 Open Space Fuel Modification (PPP HAZ-7) and Standard Condition 3.14 HOA/Fuel Modification (PPP HAZ-8) Adherence to these requirements would ensure that the project would not expose project occupants to significant risks involving wildfires or the uncontrolled spread of a wildfire, and impacts would be less than significant. Furthermore, the updated Safety Element includes Goal 4 which aims to safeguard the community from the threat of urban and wildfire hazards, and supporting policies aimed at improving emergency response during fire hazards and design standards to preventatively minimize potential wildfire risks. Compliance with the updated Safety Element would further support the City's goal of minimizing risks associated with wildfires.

4.7.9.2 Significance of Impacts before Mitigation

Impacts would be less than significant. No mitigation is required.

4.7.9.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.7.10 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for hazards and hazardous materials. The study area for the assessment of cumulative impacts related to hazards and hazardous materials is the City. As population growth increases, the number of people potentially exposed to hazards and hazardous materials would increase. Potential impacts associated with the release of hazardous materials are site-specific in nature and does not compound or increase in combination with impacts elsewhere. Asphalt, fuels, oils, paints, and solvents used during construction are not acutely hazardous, and use of these common hazardous materials in small quantities would not represent a significant hazard to the public or environment. Use and storage of cleaning supplies, motor oil, building maintenance supplies, paints and solvents, pesticides, or other similar materials during operation are not acutely hazardous, and the limited quantities and use of such products would not create a significant hazard to the public. Future development would be required to comply with existing regulatory requirements, which would ensure projects would remediate existing hazardous contamination before construction can commence. Compliance with the Certified Union Program Agency for Orange County (PPP HAZ-1) would ensure that projects would identify and remediate hazardous materials listed on the EnviroStor and Geotracker databases. Future residential development within the John Wayne Airport safety zones, as well as the 70 CNEL, 65 CNEL, and 60 CNEL John Wayne Airport noise contours would be subject to the land use restrictions for each of the compatibility zones, which provide development limitations to minimize potential incidents of off-airport accidents to persons and property on the ground. Future development would be located within existing developed areas and along major transportation corridors in the City that would allow for evacuation and response. Future development would also be designed consistent with all applicable safety requirements and would not physically interfere with any emergency response or evacuation plans, including the LHMP. Future development would also implement an Emergency Access Plan that would maintain emergency access to all properties within the project limits and the surrounding vicinity. All new development and redevelopment adjacent to a CAL FIRE designated FHSZ would be required to prepare a fuel modification plan and adhere to other fire protection requirements before approval of tentative maps and grading permits, per City Standard Condition 2.19 Open Space Fuel Modification (PPP HAZ-7) and Standard Condition 3.14 HOA/Fuel Modification (PPP HAZ-8). Furthermore, compliance with the updated Safety Element would further support the City's goal of minimizing land use conflicts and hazards associated with hazardous materials, emergencies, and hazardous sites. Therefore, the project would not contribute to a cumulative impact related to hazards and hazardous materials.

4.8 Hydrology/Water Quality

This section analyzes potentially significant impacts related to hydrology and water quality that could result from implementation of the project. This analysis relies upon the Proposed Conditions Infrastructure Report for Water, Sewer, Storm Drainage, and Water Quality prepared by Fuscoe Engineering, Inc. (Appendix I), the updated General Plan Safety Element, and the City of Irvine Local Hazard Mitigation Plan.

4.8.1 Existing Conditions

4.8.1.1 Watersheds/Water Quality

Figure 4.8-1 presents the location of the City of Irvine (City) in relation to regional watersheds. The City is located within the Newport Bay Watershed, which is defined by the foothills of the Santa Ana Mountains to the east (Loma Ridge), and the San Joaquin Hills to the west and southwest. The Newport Bay Watershed is a part of the larger Orange County Watershed Management Areas, which is split into a South, North, and Central Watershed Management Areas (WMA). The total area of the Newport Bay Watershed is approximately 154 square miles (98,500 acres) of the Central Orange County WMA. Each watershed is comprised of a network of municipal drains and channels that ultimately deliver stormwater to Newport Bay.

Section 303(d) of the federal Clean Water Act (CWA) requires states to identify and establish a list of water bodies for which technology-based effluent limitations required by section 301 of the CWA are not stringent enough to attain and maintain water quality standards. Table 4.8-1 lists Impaired Water Bodies in the City.

Table 4.8-1
Impaired Water Bodies in the City

Water Body/Channel	List of 303(d) Impairments	TMDL
Borrego Creek (Reach 2)	Ammonia, Indicator Bacteria	
Peters Canyon Channel	Benthic Community Effects, DDT, Indicator Bacteria, Malathion, pH, Selenium, Toxaphene, Toxicity	DDT, Toxaphene
San Diego Creek Reach 1	Benthic Community Effects, DDT, Indicator Bacteria, Malathion, Nutrients, Sedimentation/Siltation, Selenium, Toxaphene, Toxicity	Newport Bay/San Diego Creek Nutrient TMDL, Newport Bay Toxics TMDL,
San Diego Creek Reach 2	Sedimentation/Siltation, Nutrients, Indicator Bacteria, Benthic Community Effects, Toxicity

4.8.1.2 Storm Water Drainage Systems

Construction Site Runoff

Stormwater runoff is caused by natural precipitation, and urban runoff is water generated by human use, such as irrigation systems. Stormwater runoff from construction sites contains pollutants and sediment that can potentially be carried offsite via the storm drain system and to downstream water bodies, catch basins, and ultimately, to conveyance channels and to Newport Bay. Construction site sediments and pollution can cause chemical, biological, and physical harm to local waterways.

Post-construction Site Runoff

Post-construction runoff can come from landscaping irrigation (urban runoff) and natural precipitation (stormwater runoff). Under the Orange County permit (Order No. R8-2009-0030, amended by Order No. R8-2010-0062), new development and redevelopment must match the pre-project water balance (i.e., the amount of water that becomes runoff) for the two-year frequency storm event.

The local storm drain system is owned and maintained by the City and maintained by the Public Works and Transportation Department. The regional flood control system is owned and maintained by the Orange County Public Works Department (OCPW). Local storm drain facilities are designed to accommodate 25-year flow requirements, and the regional County facilities are designed to accommodate 100-year storm events. Figure 4.8-2 presents the existing storm drain system throughout the City. The City has an ongoing monitoring and maintenance procedure to ensure the storm drain system functions effectively. To prevent against significant flooding during storm events, OCPW and the City monitor and maintain its respective channels and storm drain system to ensure they are conveying storm flows as designed.

The City was designed as a master planned community. As such, the City is divided into various planning areas or "villages." As each planning area was developed, they were required to implement the necessary storm drain system for the full buildout of the planning area. This was repeated for all planning areas, resulting in a well-functioning storm drain system.

The City contains both natural areas where stormwater can be recharged into the ground and urbanized areas that are dominated by impervious (nonporous) surfaces and other hardscapes. However, most waterways in the City are channelized for flood control purposes. Because growth in the City has been master planned, stormwater infrastructure has been improved incrementally as the City has grown, keeping pace as development has occurred. Deficiencies in the system are limited. Periodically, the OCPW scours the San Diego Creek Channel to reduce sedimentation and ensure the proper functioning of channels.

FIGURE 4.8-2
Storm Drain System

In 1997, the Irvine Ranch Water District (IRWD) implemented a treatment program, by creating wetlands that use organisms, plants, and soil to naturally remove bacteria, nitrogen, and phosphorus from water. The wetlands at the San Joaquin Marsh and Wildlife Sanctuary in the City use this natural treatment process to handle urban runoff from San Diego Creek. Plants and soils in the manmade ponds take about seven to 10 days to remove nitrates and other pollutants and deliver cleaner water back into the creek before it makes its way through Upper Newport Bay to the ocean. The success of the program led to the expansion of the natural treatment system (NTS) created throughout the San Diego Creek watershed to treat urban runoff prior to reaching the San Joaquin Marsh. There are approximately 40 smaller NTS systems currently built and operating with additional sites under consideration. Overall, the NTS program has resulted in a significant improvement in water quality for dry weather flows and smaller storm events resulting in the protection of existing receiving waters.

4.8.1.3 Flooding and Dam Inundation

Dam failure can result from several causes such as earthquakes, rapidly rising floodwaters, and structural design flaws. These hazards can occur instantaneously or gradually depending on the source of the failure. Inundation associated with these events has the potential to cause loss of life, damage property, and other ensuing hazards, as well as the displacement of persons residing in the inundation path. There are seven dams that have the potential to inundate areas of the City if failure were to occur. Of these dams, three of them are located within Irvine and four are located outside of the City limits.

Flooding could occur from severe rainfall or from dam failure (Table 4.8-2). Dam inundation is flooding caused by the release of impounded water from structural failure or overtopping of a dam. Seiches or tsunamis can result from abrupt movements of large volumes of water due to earthquakes, landslides, volcanic eruptions, meteoric impacts, or onshore slope failure. Figure 4.8-3 presents the areas within the City that have been identified as having the potential to be subject to dam inundation. The risk of flooding due to dam failure is limited to the period during and immediately after major storms.

Table 4.8-2
Dams with Potential to Inundate Areas of Irvine

Dam Name	Owner/Operator	Year Built	Volume Water Impounded (acre-feet)
Rattlesnake Canyon Reservoir	Irvine Ranch Water District	1959	1,480

RECON

M:\JOBS5\9919\common_gis\EIR\fig4.8-3.mxd 03/14/2024 bma

The National Flood Insurance Act (1968) established the National Flood Insurance Program, which is based on the minimal requirements for flood plain management and is designed to minimize flood damage within Special Flood Hazard Areas. The Federal Emergency Management Agency (FEMA) is the agency that administrates the National Flood Insurance Program. Figure 4.8-4 presents the location of areas that have been mapped by FEMA as floodways, 100-year (1 percent annual chance of flooding) and 500-year flood hazard zones (0.2 percent annual chance of flooding)

Future development within a designated flood zone would be required to follow FEMA and the City's Floodplain District requirements, including flood analysis, proper setbacks, and sufficient pad elevations. Table 4.8-3a through 4.8-3d present the acreage of land within the City and three focus areas that are targeted for future development under the project, which have been assigned a FEMA flood zone designation. Descriptions of the focus areas can be found in Chapter 3.0 of this PEIR.

4.8.1.4 Groundwater

The City and its sphere of influence are located within the Coastal Plain of Orange County groundwater basin also known as Basin 8-1. Under the Sustainable Groundwater Management Act (SGMA), Basin 8-1 is classified as a medium priority basin, due to heavy reliance on the Basin's groundwater as a source of water supply. IRWD's local surface water supplies are the drainage tributary areas to the Irvine Lake and Harding Canyon Reservoir. On average, about 4,000-acre feet per year is captured for IRWD's demands. Water supplies available from the Harding Canyon are often limited due to dry weather conditions. Recycled water meets about 33 percent of IRWD's (non-potable; agricultural irrigation, landscape, golf course, commercial, and industrial uses) water demands. In 2020, approximately 24,626 AF of wastewater was recycled within the service area from the Michelson Water Recycling Plant and Los Alisos Water Recycling Plant (Table 6-3). In the case there are insufficient supplies of treated wastewater for use from the Michelson Water Recycling Plant and Los Alisos Water Recycling Plant, supplemental imported water can be used.

IRWD operates the Peters Canyon Channel Water Capture and Reuse Project which captures dry weather runoff from three storm drain diversion facilities prior to flows entering Peters Canyon Channel. The dry weather runoff is then delivered to Orange County Sanitation District for treatment and subsequent discharge to Orange County Water District's Groundwater Replenishment System for eventual groundwater recharge. There are currently no commitments for purchase of desalination water by IRWD.

Portions of the groundwater table beneath the City have high salts levels because of the natural geology and the history of agricultural use. The Irvine Desalter Project includes five wells located near the segment of Interstate5 within the City. Salty water is pumped from these wells and sent to the Irvine Desalter Project treatment facility. The treatment process uses reverse osmosis, decarbonation, and disinfection to make the water suitable for drinking purposes. Purified water provides 5,100 acre-feet or 1.6 billion gallons of drinking water, enough for 50,000 people per year.

The El Toro Groundwater Remediation program is designed to address trichloroethylene (TCE) in the groundwater basin beneath the former Marine Corps Air Station (MCAS) El Toro. TCE is a volatile organic compound that was used as a solvent for aircraft cleaning prior to the development of stricter environmental regulations. The IRWD, OCWD, and federal authorities are pumping water from a three-square-mile plume, treating the water, and returning the cleaned water to irrigate landscaping. This program provides 1.3 billion gallons of clean water annually.

Nitrate is one of the most common and widespread contaminants in groundwater supplies. Elevated levels of nitrate originate from fertilizer use, animal feedlots, wastewater disposal systems, and other sources. Plants and bacteria break down nitrate, but excess amounts can leach into groundwater. Certain portions of the City have nitrate levels exceeding maximum contaminant levels (MCLs) established in state law. IRWD Wells 21 and 22 contain nitrate at levels exceeding the primary MCL of 10 milligrams per liter and total dissolved solids concentrations above the secondary MCL. IRWD has therefore constructed a reverse osmosis treatment facility to reduce concentrations in the water to meet state water quality standards before conveying water to the potable supply distribution system.

Selenium is a naturally occurring micronutrient found in soils and groundwater in the Newport Bay Watershed. Selenium is essential for reproductive health and immune system function in humans, fish, and wildlife. However, selenium bio-accumulates in the food chain and can cause public health concerns. Prior to urban development, the Irvine Subbasin contained an area known as the Swamp of the Frogs. Runoff from local foothills over thousands of years accumulated selenium-rich deposits in the swamp. To make this region suitable for farming, drains and channels were constructed. This mobilized selenium from sediments into the shallow groundwater. Thus, the Nitrogen and Selenium Management Program was formed to develop and implement a work plan to address selenium and nitrate in the watershed to comply with the requirements of National Pollutant Discharge Elimination System (NPDES) Permits issued by the Santa Ana Regional Water Quality Control Board (RWQCB).

4.8.2 Applicable Regulatory Requirements

4.8.2.1 Federal Regulations

a. Federal Water Pollution Control Act (also known as Clean Water Act)

The CWA, enacted in 1972, is intended to restore and maintain the integrity of the nation's waters through a system of water quality standards, discharge limitations, and permits. The fundamental purpose of the CWA is to protect the designated beneficial uses of water resources. Section 303(d) of the CWA defines water quality standards as consisting of both the uses of surface waters (beneficial uses) and the water quality criteria applied to protect those uses (water quality objectives). State and regional water quality control boards have been charged with ensuring that beneficial uses and water quality objectives are established for all waters of the state. Development in the City would be subject to the NPDES to protect water resources and control pollutants in runoff.

Section 303(d) of the federal CWA requires states to identify and establish a list of water bodies for which technology-based effluent limitations required by section 301 of the CWA are not stringent enough to attain and maintain water quality standards. The list must be submitted by the State Water Resources Control Board (SWRCB) to the US Environmental Protection Agency every two years for review and approval. The water bodies on the 303(d) list are termed "impaired water bodies." For each water-quality-limited segment of water bodies identified in the 303(d) list, each respective RWQCB must develop a plan to determine the "total maximum daily load" (TMDL)—the maximum amount of a pollutant that a water body can receive per day and still attain water quality standards—or take other action to address the impairment. The implementation of and goal of a TMDL is to

reduce pollutant loads to an impaired water body so as to regain the beneficial uses of the water body.

b. Federal Emergency Management Agency

FEMA is the primary agency in charge of administering programs and coordinating with communities to establish effective floodplain management standards. FEMA is responsible for delineating areas of flood hazards. It is then the responsibility of state and local agencies to implement the means of carrying out FEMA requirements. Flood zones are geographic areas that FEMA has defined according to varying levels of flood risk. These zones are depicted on a community's Flood Insurance Rate Map (FIRM) or Flood Hazard Boundary Map. Each zone reflects the severity or type of flooding in the area.

4.8.2.2 State Regulations

a. Porter-Cologne Water Quality Control Act

This act, which is a portion of the State Water Code, established responsibilities and authorities of the State Water Resources Control Board (SWRCB) and its nine RWQCBs. Each RWQCB is directed to adopt water quality control plans for the waters of an area to include identification of beneficial uses, objectives to protect those uses, and an implementation plan to accomplish the objectives. The City is under the jurisdiction of the Santa Ana RWQCB.

b. Sustainable Groundwater Management Act

In 2014, California lawmakers passed the SGMA, which mandates that all groundwater basins within the state be managed to ensure long-term water supply reliability. Under SGMA, each high and medium priority basin, as identified by the California DWR, must have a groundwater sustainability agency that will be responsible for groundwater monitoring and the development of a groundwater sustainability plan to ensure long-term groundwater sustainability and prevent overdraft. While the Orange County Water District's (OCWD) water basin is not in overdraft, OCWD prepared a groundwater management plans to further long-term groundwater sustainability. The plan describes basin hydrogeology, water supply monitoring, management and operation of recharge facilities, groundwater replenishment system, seawater intrusion and barrier management, and water quality protection.

c. State Water Resources Control Board (SWRCB) General Construction Permit 2022

The State Water Board adopted the 2022 Construction Stormwater General Permit, Order 2022-0057-DWQ, on September 8, 2022, and it went into effect on September 1, 2023. State and regional water quality control boards have been charged with ensuring that beneficial uses and water quality objectives are established for all waters of the state. Development in the City would be subject to the NPDES to protect water resources and control pollutants in runoff. The General Construction Permit is administered at the local level by the Santa Ana RWQCB.

4.8.2.3 Regional Regulations

a. Orange County Municipal Stormwater Permit and Orange County Drainage Area Management Plan

The 2009 Orange County Municipal Stormwater Permit as amended by Order No. R8-2010-0062 is currently in effect. The Permit includes new development and significant redevelopment project requirements to demonstrate compliance with CWA regulations. Permit requirements are implemented through the Drainage Area Management Plan (DAMP), which includes the Model Water Quality Management Plan (WQMP) and Technical Guidance Document. These documents assist project proponents with addressing post-construction urban runoff and stormwater pollution from new development and significant redevelopment projects that qualify as Priority Projects. The specific water pollutant control elements of the Orange County Stormwater Program are documented in the DAMP which is the primary policy, planning and implementation document for municipal NPDES Stormwater Permit compliance. DAMP Section 7 ensures that all new development and significant redevelopment incorporate appropriate Site Design, Source Control and Treatment Control Best Management Practices (BMPs) to address specific water quality issues.

The Model WQMP has been developed to assist development project proponents with addressing post-construction urban runoff and stormwater pollution from new development and significant redevelopment projects that qualify as Priority Projects. In general, Priority Projects include new development that creates 10,000 square feet of impervious surface and significant redevelopment that adds or replaces 5,000 or more square feet of impervious area on an already developed site.

The Model WQMP describes the process that project proponents would employ for developing a Project WQMP for individual new development and significant redevelopment projects. A Project WQMP is a plan for minimizing the adverse effects of urbanization on site hydrology, runoff flow rates and pollutant loads. The Permit also encourages development of Conceptual or Preliminary WQMPs in the planning stage prior to submission of a final Project WQMP.

The Technical Guidance Document is intended to provide guidance on how to complete the Conceptual/Preliminary WQMP and/or the Project WQMP. The Municipal Stormwater Permit requires the use of Low Impact Development (LID), site design practices, hydromodification control BMPs, source control BMPs and treatment control BMPs as a stormwater management strategy. LID emphasizes retention or biotreatment and the use of site features integrated with distributed stormwater controls that are designed to more closely mimic natural hydrologic patterns of pre-development condition than traditional stormwater controls. The Technical Guidance Document includes preventative site design practices as well as mitigative LID best management practices.

Santa Ana Regional Water Quality Control Plan

Pursuant to the Santa Ana Region (North Orange County) NPDES Permit, the 2003 Orange County Drainage Area Management Plan for New Development and Significant Redevelopment lists the following potential impacts to be considered during CEQA review:

- Potential impact of project construction on stormwater runoff

- Potential impact of project's post-construction activity on stormwater runoff
- Potential for discharge of stormwater pollutants from areas of material storage, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas, loading docks, or other outdoor work areas
- Potential for discharge of stormwater to affect the beneficial uses of the receiving waters
- Potential for significant changes in the flow velocity or volume of stormwater runoff to cause environmental harm
- Potential for significant increases in erosion of the project site or surrounding areas
- Potential decreases in quality and quantity of recharge to groundwater
- Potential impact of pollutants in stormwater runoff from the project site on any 303(d) listed "impaired" water bodies

The Industrial General Permit (IGP) is an NPDES permit that regulates discharges associated with 10 broad categories of industrial activities. The IGP requires the implementation of management measures that would achieve the performance standard of best available technology that is economically achievable and best conventional pollutant control technology. The IGP also requires the development of a SWPPP and a monitoring plan. Through the SWPPP, sources of pollutants are identified and the means to manage the sources to reduce stormwater pollution are described.

b. Regional Flood Control Master Plan

The 1999 Regional Flood Control Master Plan for San Diego Creek serves as the comprehensive engineering and flood protection document for the City's regional flood control facilities. The Orange County Flood Control District (OCFCD) and the City use the master plan to regulate peak flow discharges and ensure that runoff is managed in accordance with the design parameters in the master plan. When the City processes major land use changes within the watershed, detailed studies and addendums to the master plan are required. The master plan is used to determine where detention and flow attenuation is required to match up with the ultimate conditions within the master plan. The City also pays its fair contribution for any large-scale OCFCD flood control improvements that benefit the City.

4.8.2.4 Local Regulations

a. Water Resources Master Plan

IRWD developed a comprehensive planning document titled Water Resources Master Plan (WRMP) that identifies existing and future planned water supply sources and demands to effectively manage such a large water system. The most recent updated occurred in 2019. The data within the WRMP is used for hydraulic modeling, the groundwater work plan, assessments of available water supply for specific development projects as required by CWC Section 10910, sub-area master plans and basin pumping projections. As part of the WRMP, the IRWD Capital Program identifies short-term and long-term projects needed to maintain future demands while accounting for replacement and

maintenance for existing facilities. In addition to the Capital Program, the Financial Plan includes infrastructure repair and replacement funds and identifies how to pay and manage the long-term funding requirements.

b. Urban Water Management Plans

Through Urban Water Management Plan (UWMP) reporting, IRWD uses population growth, climate scenarios, water supplies, water conservation, large development projects and approved specific plans and other factors to estimate future water demand and evaluate the ability to meet this demand through various water supply sources over a 20-year projection. This document is required by the California Water Code and based on the Water Resources Master Plan, with certain elements required by the water code. It is updated every five years, and the latest revision was prepared in 2020.

c. Local Hazard Mitigation Plan

The Local Hazard Mitigation Plan (LHMP) is designed to identify the City's hazards, estimate the probability of future occurrences, and set goals to mitigate potential risks to reduce or eliminate long-term natural or made-made hazard risks to life and property. The LHMP identifies specific hazards related to flooding and erosion that could result in damage to life and/or property. The LHMP also establishes hazard priority and identifies mitigation strategies for reducing losses associated with these hazards.

d. Municipal Code

The following regulations from the Municipal Code address hydrology and water quality.

Title 5 (Planning), Division 10 (Grading Code and Encroachment Regulations), Chapter 1 (Grading Code)

The City's Grading Code establishes rules and regulations to control excavation, grading, and earthwork, construction (including fills and embankments), and establishes administrative requirements for issuance of grading permits, approval of plans, and inspection of grading construction in accordance with the requirements for grading and excavation contained in the California Building Code as adopted and modified by City ordinance. The Grading Code also contains erosion control requirements and guidelines for the preparation of erosion control plans.

Title 6 (Public Works), Division 8 (Pollution), Chapter 3 (Stormwater/Urban Runoff)

This section of the Municipal Code also outlines the provisions for the control of stormwater/urban runoff in the City and provides legal authority to enforce the requirements within the City's NPDES Permit as it pertains to new development and significant redevelopment, such as the requirement for submittal of a Water Quality Management Plan.

e. Grading Manual

The City Grading Manual is a compilation of rules, procedures, and interpretations necessary to carry out the provisions of the City Grading Code. The purpose of the Grading Manual is to assist users of the Grading Code by supplementing it with detailed information regarding rules, interpretations, standard specifications, procedures, requirements, forms and other information applicable to control excavation, grading and earthwork construction in the City. The Grading Manual also contains erosion control requirements. For example, Section 9.4 (Disposal) of the Grading Manual states that all drainage generated within development, which includes surface water and all drainage facilities, shall drain independently within a system of disposal approved by the City. Drainage shall be designed to carry water to the nearest practical street, storm drain, or natural watercourse. Erosion of ground in the area of discharge, including a return of flow to a natural sheet flow condition, shall be prevented by installation of nonerosive down-drains, riprap, energy dissipators or other approved devices.

f. Planning Commission Resolution No. 09-2968

Standard Conditions are adopted by Planning Commission Resolution No. 09-2968. These conditions assist staff in applying standardized wording for frequently used conditions of approval to discretionary and subdivision applications. Standard conditions are applied on a case-by-case basis depending upon the specifics of the application. Companion conditions are cross-referenced and are required to be used together. The following standard conditions related to hydrology and water quality apply:

Standard Condition 2.7 (Groundwater Survey)

Prior to the issuance of precise grading permits, the applicant shall submit to the Chief Building Official a groundwater survey of the entire site. The analysis shall be prepared by a licensed geotechnical engineer versed in groundwater analysis and shall include the following information and analysis:

- Potential for perched groundwater intrusion into the shallow groundwater zone upon buildout.
- Analysis for relief of groundwater buildup and properties of soil materials on-site.
- Impact of groundwater potential on building and structural foundations.
- Proposed mitigation to avoid potential for groundwater intrusion within five feet of the bottom of the footings.

Standard Condition 2.11 (Special Flood Hazard Area)

Prior to the issuance of a precise grading permit for any lot or parcel wholly or partially located within the Special Flood Hazard Area (SFHA, FP 2 District), the applicant shall submit one of the following:

- The final approved Letter of Map Revision (LOMR) to the Flood Plain Administrator, as designated by the City Engineer; or

- Preliminary Elevation Certificates (North American Vertical Datum [NAVD] 1988) for each proposed structure based on construction documents to the Chief Building Official; or
- For nonresidential construction only, a preliminary Floodproofing Certificate based on construction documents to the Chief Building Official.

Standard Condition 2.12 (Water Quality – Notice of Intent)

Prior to the issuance of preliminary or precise grading permits for a project that would result in soil disturbance of one or more acres of land, the applicant shall provide the Chief Building Official with evidence that a Notice of Intent (NOI) has been filed with the State Water Resources Control Board. Such evidence shall consist of a copy of the NOI stamped by the State Water Resources Control Board or the Regional Water Quality Control Board, or a letter from either agency stating that the NOI has been filed.

Standard Condition 2.13 (Water Quality Management Plan)

Prior to the issuance of preliminary or precise grading permits, the applicant shall submit to the Chief Building Official for review and approval, a WQMP that would identify the BMPs and the full capture system that would be used on the site to control predictable pollutant runoff, and to meet Statewide Trash Provisions requirements.

Standard Condition 3.3 (Disclosure Statements)

Prior to the issuance of building permits, the applicant shall submit to the Director of Community Development for review and approval a completed occupancy disclosure form for the project. The approved disclosure form, along with its attachments, shall be included as part of the rental/lease agreements and as part of the sales literature for the project. The disclosure statement shall include information, current as of the date of submittal, with respect to each item marked with an "x" on the list below. The items marked "n/a" need not be included.

- Information on Noise resulting from aircraft and/or helicopter operations from John Wayne Airport.
- Reference to Emergency Preparedness information available on the City of Irvine website at www.cityofirvine.org/office-emergency-management.
- Map of Special Flood Hazard Area information for areas subject to inundation.
- Notice that initial occupancy and any subsequent change in use or occupancy of any nonresidential condominium space, requires the buyer or the new or existing occupant to apply to the Community Development Department and obtain approval by way of a of written zoning confirmation letter or obtain a building permit and obtain inspection approval for any necessary work to establish the use and/or occupancy consistent with that intended.
- Notice that the property owner shall be responsible for continuous maintenance of the emergency access equipment thus ensuring these systems will be operational at all times, as required by the Chief of Police.

- Notice that the property is located near and/or adjacent to private and/or public park(s) that may include recreational, field/court lighting, and other related improvements.
- Notice that the property is located near and/or adjacent to public open space land that may include trails, trailheads, parking facilities, and other related improvements and operations.
- Notice that the property is located near and/or adjacent to public trails and/or related improvements and operations.
- Notice that residential buildings such as single-family homes, condominiums and apartments are prohibited from being used as short-term rentals (aka vacation rentals). A rental arrangement for a term of less than 31 days is considered "short-term". For more detailed information contact the Community Development Department.

Standard Condition 3.4 (Special Flood Hazard Area)

Prior to the issuance of a building permit for any structure wholly or partially located within the floodplain (FP 2 District) of the Special Flood Hazard Area (SFHA), the applicant shall submit one of the following:

- The final approved Letter of Map Revision (LOMR) to the Flood Plain Administrator, as designated by the City Engineer; or
- Preliminary Elevation Certificates (based on North American Vertical Datum [NAVD] 1988) for each proposed structure based on construction documents to the Chief Building Official; or
- For nonresidential construction only, a preliminary Floodproofing Certificate for each building or structure based on construction documents showing floodproofing measures complying with adopted codes and standards and approved by the Chief Building Official.

Standard Condition 4.5 (Special Flood Hazard Area)

Prior to authorization to use, occupy, and/or operate, for any structure wholly or partially located within the Special Flood Hazard Area (SFHA, FP 2 District), the applicant shall submit one of the following:

- The final approved Letter of Map Revision (LOMR) to the Flood Plain Administrator, as designated by the City Engineer; or
- Final Elevation Certificates (based on North American Vertical Datum [NAVD] 1988) for each structure based on finished floor construction to the Chief Building Official; or
- For nonresidential construction only, a final Floodproofing Certificate for each building or structure based on completed construction.

g. Local Implementation Plan

Section A-7 of the Local Implementation Plan (LIP) has incorporated DAMP Section 7, which addresses new development and significant redevelopment. This approval processing framework ensures that both development and redevelopment occur in an organized and orderly manner that reflects the vision and needs of the community, assesses the environmental issues associated with

the proposed changes and provides a regulatory framework to ensure that standards set by the City are implemented and water quality requirements in the City's NPDES Permit are incorporated in the City's regulatory framework. The Model Water Quality Management Plan and the Technical Guidance Document provide the basis for project planning and design.

The City has also incorporated the model construction program described in DAMP Section 8 as the basis for Section A-8 of the LIP. This construction program presents requirements and guidelines for pollution prevention methods that must be used by construction site owners, developers, contractors, and other responsible parties, in order to prevent illicit discharges into the municipal storm drain system, implement and maintain structural and non-structural BMPs to reduce pollutants in storm water runoff discharged to the municipal storm drain system from construction sites, reduce construction site discharges of storm water pollutants from the municipal storm drain system to the maximum extent practicable, and prevent construction site discharges from the municipal storm drain system from causing or contributing to a violation of water quality standards in the receiving waters.

h. Sustainability in Landscaping Guideline Manual

The goal of the Sustainability in Landscaping Program is to ensure that environmental impacts and benefits of landscaping are considered throughout the planning and design process and will result in sustainable landscapes. The ordinance defines a sustainable landscape as one that provides positive levels of carbon storage and oxygen productivity after all demands for energy, water, soil improvement and maintenance activities to support have been accounted for. Concept plans and village-wide zone change applications require a proposed landscape design and management objectives which are consistent with the landscape manual. The manual includes design guidelines pertaining to: landscape productivity, plant associations, energy conservation, water conservation, microclimate improvement, and soil management.

i. Existing Plans, Programs, and Policies

Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required of the project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute mitigation measures. The following measures are existing plans, programs, or policies (PPP) that apply to the project and will help to reduce and avoid potential impacts related to hydrology and water quality:

- PPP HYD-1 Compliance with General Construction Permit
- PPP-HYD-2 Compliance with Section 303(d) of the federal Clean Water Act
- PPP-HYD-3 Compliance with the Santa Ana RWQCB Regional Water Quality Control Plan
- PPP-HYD-4 Compliance with the OCWD groundwater management plan
- PPP-HYD-5 Compliance with Orange County Municipal Water Stormwater Permit and Orange County Drainage Area Management Plan (DAMP)
- PPP-HYD-6 Compliance with the OCFCD San Diego Creek 19999 Regional Flood Control Master Plan
- PPP-HYD-7 Compliance with the IRWD Water Resources Master Plan
- PPP-HYD-8 Compliance with the IRWD Urban Water Management Plan (UWMP)

- PPP-HYD-9 Compliance with the City of Irvine Local Hazard Mitigation Plan
- PPP-HYD-10 Compliance with Municipal Code Title 5 (Planning), Division 10 (Grading Code and Encroachment Regulations), Chapter 1 (Grading Code)
- PPP-HYD-11 Compliance with Municipal Code Title 6 (Public Works), Division 8 (Pollution), Chapter 3 (Stormwater/Urban Runoff)
- PPP-HYD-12 Compliance with the City Grading Manual
- PPP-HYD-13 Compliance with City Standard Condition 2.7 Groundwater Survey
- PPP-HYD-14 Compliance with City Standard Condition 2.11 Special Flood Hazard Area
- -PPP-HYD-15 Compliance with City Standard Condition 2.12 Water Quality – Notice of Intent
- PPP-HYD-16 City Standard Condition 2.13 Water Quality Management Plan
- PPP-HYD-17 City Standard Condition 3.3 Disclosure Statements
- PPP-HYD-18 City Standard Condition 3.4 Special Flood Hazard Area
- PPP-HYD-19 City Standard Condition 4.5 Special Flood Hazard Area
- PPP-HYD-20 Compliance with Local Implementation Plan (LIP)
- PPP-HYD-21 Compliance with sustainability in Landscaping Guideline Manual

Proposed General Plan Strategies and Policies

In addition to the above-listed PPPs, the following proposed goals, objectives, policies, and implementation actions are applicable to the analysis of hydrology and water quality and would replace existing goals, strategies, and policies outlined in the City's existing General Plan following project approval:

Safety Element

Goal 2: Improve the community's resilience to seismic and geologic hazards by ensuring the integrity of the built environment.

Objective S-2: Seismic and Geologic Hazards. Anticipate the risks and mitigate the effects that seismic and egologic hazards pose to the community. The following policies support Goal 2:

- Policy S-2(b): Coordinate groundwater management with Orange county Water District to avoid subsidence impacts in Irvine.

Goal 3: Anticipate the risks and mitigate the effects that flood hazards pose to the community.

Objective S-3: Flood Hazards. The following policies support Goal 3:

- Policy (a): Work with Orange County Flood Control District to ensure flood control facilities are adequately provided and maintained.
- Policy (b): Collaborate with partner agencies and municipalities to align green infrastructure projects (i.e., projects that allow for filtration of stormwater where it falls) and develop regulations for watersheds across jurisdictions to reduce impervious hard surfaces.
- Policy (c): Support efforts of other organizations and academic institutions to conduct studies of the impact combined riverine and coastal flooding, groundwater intrusion, and increased precipitation has on flood risk and vulnerability.

- **Policy (d)**: Support efforts of other organizations and academic institutions to inventory and map vegetation on hillsides with a specific focus on improving hillside stability in the case of extreme rainfall and seasonal erosion.
- **Policy (e)**: Develop or update a long-term plan to address current and future flood risk to critical facilities.
- **Policy (f)**: Continue to partner with Orange County Public Works to proactively disseminate information from the "H2OC Stormwater Program" to educate home and small business owners on regulations and highlight the role that engaged residents can play to assist with community-based stormwater management.
- **Policy (g)**: Ensure resilience and long-term functionality of stormwater and sewer systems.
- **Policy (h)**: Encourage the use of climate-smart landscaped surfaces (e.g., permeable pavement, stormwater parks, green streets) in new and existing development to reduce runoff, minimize flood hazards, and maintain existing drainageways.
- **Policy (i)**: Continue to encourage the implementation of low-impact development (e.g., rain gardens and rainwater harvesting) to reduce flood risk, filter pollutants, and replenish groundwater over time.)
- **Policy (j)**: Continue to promote the application of nature-based solutions (e.g., greenways, tree trenches) to improve resilience and preserve biodiversity.
- **Policy (k)**: Coordinate with other agencies to increase the public awareness of flooding, stormwater management, and drought management issues and techniques for residents to mitigate those challenges on their property.

Goal 5: Protect the community from the threat of drought and extreme heat.

Objective S-5: Drought and Extreme Heat. The following policies support Goal 5:

- **Policy (a)**: Collaborate with federal, State, and local agencies and organizations to explore alternative water sources (e.g., desalinization) and improve capacity in consideration of increased demand and drought.
- **Policy (b)**: Continue to support Irvine Ranch Water District's recycled water program and explore opportunities to enhance water recycling.
- **Policy (c)**: Continue to support and participate in the development of a regional and local drought contingency plan.
- **Policy (d)**: Encourage drought-tolerant native landscaping, low-flow water fixtures beyond the state minimum code, and daytime watering restrictions on properties throughout the City to reduce water consumption.
- **Policy (e)**: Explore the feasibility of recycled water distribution for residential uses on all lot sizes.
- **Policy (f)**: Protect groundwater supply against contamination, degradation, or loss due to flooding.
- **Policy (g)**: Promote a system for rapidly detecting, reporting, and repairing water leaks in public facilities and the water conveyance system.
- **Policy (h)**: Promote nature-based methods and best management practices (BMPs) (e.g., bioswales, rain gardens, natural ground cover) through the City's stormwater program to promote groundwater infiltration and reduce the impacts of drought.

- Policy (i): Support regional partners in education and outreach efforts focused on water conservation measures (e.g., water reuse, water use, and irrigation efficiency) for City residents.

4.8.4 Significance Determination Thresholds

The City has adopted Appendix G of the State CEQA Guidelines as the significance thresholds for hydrology and water quality impacts. A project would normally have a significant effect on the environment if the project would:

1) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality;
2) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin;
3) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
    i) result in a substantial erosion or siltation on- or off-site;
    ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;
    iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or
    iv) impede or redirect flood flows;
4) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation; or
5) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

4.8.5 Methodology

The potential for significant impacts associated with the project has been determined based upon review of existing information and data relative to the hydrology and water quality resources available for the City. Additionally, an existing conditions infrastructure report was prepared for the project that included a review of existing City, local, and federal datasets.

4.8.6 Topic 1: Violate Water Quality Standards/Degrade Water Quality

Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

4.8.6.1 Impact Analysis

Buildout of the project would involve the construction of up to 57,565 residential units, nonresidential uses within the Great Park area, the extension of Ada, and the continuation of nonresidential uses at the same intensities currently permitted under the City's existing General Plan.

Construction activities associated with future development would likely involve grading, paving, utility installation, building construction, and landscaping installation, which could result in the generation of potential water quality pollutants such as silt, debris, chemicals, paints, and other pollutants with the potential to affect water quality. In addition, refueling and parking of construction vehicles and other construction equipment may result in oil, grease, or other related pollutant leaks and/or spills that may discharge into the storm drain system.

To minimize potential water quality impacts during construction, future development would be required to comply with the statewide Construction General Permit (PPP HYD-1; SWRCB 2022), which itself requires preparation and implementation of a Storm Water Pollution Prevention Plan (SWPPP) for projects that disturb one or more acre of land and include any construction or demolition activity, including, but not limited to, clearing, grading, grubbing, or excavation, or any other activity that results in a land disturbance of equal to or greater than one acre (SWRCB 2022). A SWPPP requires the identification and implementation of BMPs to control sediment, erosion, tracking, non-stormwater, and waste management during construction and prevent such contaminants and materials from entering receiving water bodies. Future projects would also be required to comply with the City Grading Code (PPP HYD-10;Title 5, Division 10, Chapter 1), and the City Grading Manual (PPP HYD-HYD-12), which establish erosion control requirements pertaining to construction related water quality impacts including but not limited to erosion control plans and BMPs. The Grading Manual establishes slope angle, stability, fill material, compaction, setback, and other requirements to ensure erosion and pollutant control during construction of future development. Adherence to these requirements during construction would ensure that all potential pollutants of concern are prevented, minimized, and/or otherwise appropriately treated prior to being discharged. Therefore, construction impacts associated with future developments are anticipated to be less than significant.

Post-construction activities associated with operation of proposed land uses resulting from adoption of the project may have long-term impacts on stormwater quality, subsequently impacting downstream water quality. For example, future developments could create new sources of runoff contamination from changing land uses and/or from changes in pervious to impervious surfaces. As a result, development proposed throughout the City, and within the three focus areas, may increase post-construction pollutant loadings of constituent pollutants associated with future developments.

To minimize potential post-construction water quality impacts , future priority development projects would be required to prepare WQMPs in accordance with the Model WQMP and incorporate LID principles (PPP HYD-16). As described in Section 4.8.2.3.a of this Draft PEIR, "in general, Priority Projects include new development that creates 10,000 square feet of new impervious surface and significant redevelopment that adds or replaces 5,000 or more square feet of impervious area on an already developed site." A WQMP is required in the following instances: for priority development projects as defined by Section 6-8-301 of the Municipal Code; projects requiring a discretionary action involving approval of a precise plan, including projects that need coordinated and/or early water quality planning; and projects involving a nonresidential plumbing permit having the potential to impact water quality. A WQMP is prepared in accordance with the City's LIP, Model WMP, and any mitigation measures, conditions and/or requirements established under the discretionary approval process. Additionally, General Plan Policies S-3(h), S-3(i), and S-3(j) encourage implementation of erosion control measures, climate-smart landscaped surfaces, implementation of LID, and nature-based solutions to further support the City's goal of preventing and reducing operational stormwater impacts.

Furthermore, drainage patterns would largely be maintained and would utilize existing drainage facilities within the right-of-way. Because the City is primarily developed and because the three focus areas are largely urban in nature, new development would likely be development under buildout conditions. Therefore, overall operational impacts relating to stormwater quality would be less than significant.

4.8.6.2 Significance of Impacts

Adherence to the applicable laws, standards, and requirements listed above would prevent the project from violating any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality. Accordingly, impacts would be less than significant.

4.8.6.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.8.7 Topic 2: Deplete Groundwater Supplies

Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

4.8.7.1 Impact Analysis

As described in section 4.8.1.4 above, the City and its sphere of influence are located within Basin 8-1, which is classified as a medium priority basin, due to heavy reliance on the Basin's groundwater as a source of water supply. There are minimal stormwater recovery systems. IRWD captures dry weather runoff via Peters Canyon Channel Water Capture and Reuse project (three intersections in

the channel are used to capture and send dry weather runoff to Orange County Sanitation District for treatment and eventual recharge into groundwater sources).

There are existing impacts to groundwater not associated with the project, including high levels of salt in portions of the groundwater table, TCE beneath the former MCAS El Toro, elevated nitrates resulting from agricultural uses and wastewater disposal, and selenium accumulation due to farming. Further discussion and treatment of these groundwater issues is described in section 4.8.1.4 above.

Buildout of the project would involve the construction of up to 57,565 residential units, nonresidential uses within the Great Park area, the extension of Ada, and nonresidential uses at the same intensities as permitted under the City's existing General Plan. Future development would increase impervious surfaces within the City, which would reduce the amount of rainwater that would infiltrate the soil and incrementally reduce groundwater recharge rates over time. However, the project has been designed to minimize the increase in impervious surfaces by primarily focusing future development and redevelopment within the proposed focus areas (which are existing urbanized areas), thereby reducing the amount conversion of permeable land to impermeable surfaces which would otherwise occur with more development concentrated outside of the focus areas. Additionally, future development both inside and outside of the focus areas under the project would be required to comply with federal, state, regional and local plans, programs, and policies pertaining to groundwater described in detail in section 4.8.2 above.

All future site-specific projects would be required to comply with the OCWD groundwater management plan (PPP HYD-4) . Pursuant to the Santa Ana Region (North Orange County) NPDES Permit, future development under the project would also be required to comply with WQMP new development and significant redevelopment requirements and would also be required to prepare a groundwater survey per City Standard Condition 2.7 (PPP HYD-13) prior to the issuance of precise grading permits, which would identify potential for groundwater intrusion, groundwater buildup, groundwater impact to building and structural foundations, and proposed site-specific mitigation to avoid potential for groundwater intrusion within five feet of the bottom of footings. Additionally, General Plan policies S-2(b), S-3(i), S-5(b), S-5(c), S-5(d), S-5(f), S-5(g), S-5(h), and S-5(i) within the Safety Element all support the integrity and conservation of existing groundwater supplies. Implementation of post-construction BMPs and LIDs established via a WQMP, described in more detail in Section 4.8.6.1 above, in accordance with PPP-HYD-16 would increase groundwater infiltration and replenishment, thus reducing groundwater related impacts. Therefore, construction and operation of future development projects facilitated by project approval would not interfere substantially with groundwater recharge.

4.8.7.2 Significance of Impacts

Adherence to the applicable laws, standards, and requirements listed above (including PPP HYD-4 and HYD-13) would prevent the project from substantially depleting groundwater supplies and interfering substantially with groundwater recharge, and impacts would be less than significant.

4.8.7.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.8.8 Topic 3: Drainage Patterns

Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: (i) result in a substantial erosion or siltation on- or off-site; (ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite; (iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or iv) impede or redirect flood flows?

4.8.8.1 Impact Analysis

As previously described, the City is largely developed and there are no major areas of undeveloped land. Future residential and residential mixed-use development associated with the project would largely be concentrated within three primary focus areas, which are characterized by urban and developed environments. Specifically, buildout of the project would involve the construction of up to 57,565 residential units, nonresidential uses within the Great Park area, the extension of Ada, and the continuation of nonresidential uses at the same intensities as permitted under the City's existing General Plan

a. Erosion, Siltation, and Increased Surface Runoff

Future development under the project would have the potential to result in increased erosion or siltation both on- and off-site during construction and operation of future development. The alteration of drainage patterns and increase in runoff associated with the addition of impervious surfaces and structures can increase the frequency and amount of flooding which in turn could potentially result in an accelerated rate of erosion and siltation through the watershed.

The statewide General Construction Permit (PPP HYD-1; SWRCB 2022) requires preparation and implementation of a SWPPP for projects that would disturb one or more acres and include construction or demolition activity, including, but not limited to, clearing, grading, grubbing, or excavation, or any other activity that results in a land disturbance of equal to or greater than one acre (SWRCB 2022). The SWPPP would provide construction related BMPs to reduce erosion, siltation, and runoff-related impacts resulting from construction associated with future development.

Operation of future development under the project, both within the focus areas and throughout the City, would have the potential to increase surface runoff and change stream-flow velocities or quantities. Although future site-specific development would be located primarily in the three focus areas, which are urbanized areas, the potential exists to affect downstream properties if drainage patterns are changed.

For smaller infill projects that would not substantially increase impervious surface area, compliance with City stormwater requirements would reduce operational impacts. Larger site-specific projects involving substantial changes in drainage patterns, impervious surfaces, and resulting surface runoff, require preparation of a hydrology or drainage study to determine the pre- and post-construction peak runoff flow rates and velocities exiting the project site, as well as the potential for siltation and

erosion for sites discharging to naturally lined waterbodies. Post-construction erosion and siltation resulting from increased runoff would generally be avoided or reduced through site design and hydromodification control BMPs as required per PPP-HYD-3, PPP-HYD-5, PPP-HYD-10, PPP-HYD-12, and PPP-HYD-16. Projects would also be required to adhere to the City's Municipal Code (PPP-HYD-10, PPP-HYD-11), Standard Conditions (PPP-HYD-14, PPP-HYD-15), Grading Manual (PPP-HYD-12), to reduce erosion, siltation and other runoff-related impacts. Additionally, General Plan Safety Element Policies S-3(b), S-3(e), S-3(f), S-3(h), S-3(i), S-3(j), S-3(k), S-5(d), S-5(f), S-5(h), and S-5(j) would further the City's goals of reducing erosion and siltation impacts resulting from operation of future development associated with the project by increasing groundwater infiltration.

Future site-specific development projects would also be required to prepare a WQMP and identify hydromodification control BMPs to address any hydrologic conditions of concern identified that impact downstream channels and aquatic habitats. As described in more detail in Section 4.8.6.1 above, a WQMP is required for priority projects which typically include new development that creates 10,000 square feet of new impervious surface and significant redevelopment that adds or replaces 5,000 or more square feet of impervious area on an already developed site.

Therefore, compliance with existing regulations addressing stormwater runoff-related impacts would reduce potential project-related construction and operational impacts to existing drainage patterns in the area to a level less than significant.

b. Exceed Capacity of Stormwater System

Operation of future development associated with the project could result in increased impervious surfaces resulting in increased volumes of storm water runoff affecting the existing storm water drainage system. Most rainfall becomes runoff because there are minimal opportunities for infiltration in developed areas, resulting in high peak flow rates for short durations. Although future development under the project would largely occur within the three focus areas, future development may result in an increase in impervious surfaces with the potential to change runoff characteristics, including the volume of runoff, rate of runoff, and drainage patterns, which could result in flooding.

Future development would be required to comply with PPP-HYD-11, PPP-HYD-16, and PPP-HYD-14 which outline provisions for the control of stormwater/urban runoff from new development and significant redevelopment. To minimize potential post-construction stormwater capacity impacts, future priority development projects would also be required to prepare WQMPs in accordance with the Model WQMP and incorporate LID principles. As described in Section 4.8.2.3.a of this PEIR "In general, Priority Projects include new development that creates 10,000 square feet of new impervious surface and significant redevelopment that adds or replaces 5,000 or more square feet of impervious area on an already developed site." A WQMP is required in the following instances: for priority development projects as defined by Section 6-8-301 of the Municipal Code; projects requiring a discretionary action involving approval of a precise plan, including projects that need coordinated and/or early water quality planning; and projects involving a nonresidential plumbing permit having the potential to impact water quality. Additionally, General Plan Safety Element Policies S-3(h), S-3(i), and S-3(j) encourage implementation of erosion control measures, climate-smart landscaped surfaces, implementation of low-impact development (LID), and nature-based solutions to allow for increased groundwater infiltration and reduced stormwater impacts. Compliance with existing

regional and local requirements addressing stormwater would reduce and avoid potential stormwater related impacts to a less than significant level.

c. Flood Flows

Operation of future development associated with the project could increase volumes of stormwater runoff, as described in Section 4.8.8.1.a and Section 4.8.8.1.b above, resulting in the impediment or redirection of flood flows. As described above, future development would be required to adhere to the NPDES requirements to control direct stormwater discharges, and to Title 6, Division 8, Chapter 3 of the City's Municipal Code, which outlines the provisions for the control of stormwater/urban runoff from new development and significant redevelopment. All future development would include BMPs to manage polluted runoff and minimize flow volume and velocity. Compliance with the described PPPs, including those requiring implementation of BMPs and LIDs which increase groundwater infiltration thereby reducing flood flows, would reduce potential flooding impacts to a less than significant level.

4.8.8.2 Significance of Impacts

Construction and operation of future projects facilitated by project approval would be required to comply with applicable state, regional, and local regulations (PPPs HYD-1 through HYD-16). Compliance with these regulations would ensure that the project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces. Therefore, impacts would be less than significant.

4.8.8.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.8.9 Topic 4: Flood hazard, Tsunami, or Seiche

In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation?

4.8.9.1 Impact Analysis

The project is not located within a tsunami or seiche zone. Therefore, there are no potential impacts related to tsunamis. Hazardous conditions related to a seiche within North Lake or South Lake in the Woodbridge community are unlikely given the small size of the lakes and the height of the banks surrounding the lakes. No other enclosed waterbodies where a seiche could occur exist within the city (City of Irvine 2024a).

As shown in Figure 4.8-4 above, portions of the City are in areas mapped as FEMA flood zones, including 211.78 acres of Focus Area 1, 195.85 acres of Focus Area 2, and 279.65 acres of Focus Area 3.

Future development within areas mapped as flood zones would be required to comply with compliance measures as specified by City Planning Commission Resolution No. 09-2968 with respect to Special Flood Hazard Areas (PPP-HYD-14). These include obtaining an approved LOMR, a Preliminary Elevation Certificate (NAVD 1988) for each proposed structure based on construction documents to the Chief Building Official, or for nonresidential construction, a preliminary Floodproofing Certificate based on construction documents to the Chief Building Official. These forms of documentation require a project applicant to demonstrate that a future site-specific project would not place future structures at flood risk, would not generate downstream flood risks that could affect other structures, and would not be subject to risks associated with dam failure. Furthermore, the Safety Element Update includes objectives and policies related to flooding. For example, Objective S-3 aims to anticipate flood risks and minimizes the effects that flood hazards pose to the community. Supporting policies include, but are not limited to, actions aiming to improve flood control facilities, developing long-term plans to address flood risks, and partnering with other agencies to collaboratively plan for and mitigate flood risks. Compliance with relevant PPPs (PPP-HYD-5, PPP-HYD-6, PPP-HYD-9, PPP-HYD-14, PPP-HYD-HYD-18, PPP-HYD-19 PPP-HYD-21) would require stormwater management practices and design features that would reduce and avoid potential impacts related to flooding. Therefore, impacts related to the release of pollutants due to project inundation in flood hazard, tsunami, and seiche zones would be less than significant.

4.8.9.2 Significance of Impacts

The project would be required to comply with PPP HYD-5, PPP-HYD-6, PPP-HYD-9, PPP-HYD-14, PPP-HYD-HYD-18, PPP-HYD-19 PPP-HYD-21, which address flooding. Compliance with these regulations would ensure that the project would result in less than significant impacts related to a flood hazard, tsunami, or seiche zones that would risk release of pollutants due to project inundation.

4.8.9.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.8.10 Topic 5: Water Quality Plans

Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

4.8.10.1 Impact Analysis

As described in Section 4.8.1.4 above, the City and its sphere of influence are located within Basin 8-1, which is classified as a medium priority basin, due to heavy reliance on the Basin's groundwater as a source of water supply.

As described in Section 4.8.6 and 4.8.7 above, future development associated with the project has been designed to minimize the increase in impervious surfaces by primarily focusing future development and redevelopment within the proposed focus areas which are existing urbanized areas, thereby reducing the amount conversion of permeable land to impermeable surfaces. For example, all future site-specific projects would be required to comply with the OCWD groundwater

management plan (PPP-HYD-4). Pursuant to the Santa Ana Region (North Orange County) NPDES Permit (PPP-HYD-1), future development under the project would also be required to comply with WQMP requirements for new development and significant redevelopment and would also be required to prepare a groundwater survey per City Standard Condition 2.7 (PPP-HYD-13) prior to the issuance of precise grading permits, which would identify potential for groundwater intrusion, groundwater buildup, groundwater impact to building and structural foundations, and proposed site-specific mitigation to avoid potential for groundwater intrusion within five feet of the bottom of footings.

Additionally, future development under the project would be required to comply with federal, state, regional and local plans, programs, and policies pertaining to groundwater described in detail in Section 4.8.2 above. Specifically, the following PPPs would require implementation and compliance with existing water quality control plans and sustainable groundwater management plans as conditions of approval for future development associated with the project: PPP-HYD-1, PPP-HYD-2, PPP-HYD-3, PPP-HYD-4, PPP-HYD-5, PPP-HYD-7, PPP-HYD-8, PPP-HYD-9, PPP-HYD-11, PPP-HYD-12, PPP-HYD-13, PPP-HYD-15, PPP-HYD-16, PPP-HYD-17, and PPP-HYD-20. Compliance with the existing PPPs would necessitate compliance and implementation of the existing water quality control plan and sustainable groundwater management plan, therefore impacts would be less than significant.

4.8.10.2 Significance of Impacts

Construction and operation of the project would comply with PPPs HYD-1 through HYD-5, PPP HYD-7 through HYD-9, PPP HYD-11 through HYD-17, and PPP-HYD-20, which require compliance and implementation of existing water quality control plans and sustainable groundwater management plans. Therefore, the project would not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan, and impacts would be less than significant.

4.8.10.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.8.11 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for hydrology and water quality. The study area for the assessment of cumulative impacts related to hydrology and water quality is the City. While future development under the project could increase the total amount of pollutants entering downstream rivers and water bodies and could increase rates and volumes of storm water runoff due to new impermeable surfaces, site-specific projects would be subject to the regulatory requirements described above. Specifically, future development would adhere to the requirements of the City's Municipal Permit, Municipal Code, Standard Conditions and Grading Manual, and would be required to prepare WQMPs to identify BMPs directed at pollution reduction and the maintenance of on-site drainage patterns. Additionally, adherence to the requirements of the joint NPDES Permit

from the Santa Ana RWQCB would avoid cumulative impacts due to the regional nature of these water quality planning documents. Future development within a Special Flood Hazard Area would need to obtain documentation demonstrating that future site-specific project would not place future structures at flood risk, would not generate downstream flood risks that could affect other structures, and would not be subject to risks associated with dam failure per PPP-HYD-17, PPP-HYD-18, and PPP-HYD-19. Moreover, the project would not result in flood hazards related to tsunami or seiche. Therefore, the project would not contribute to cumulative impact related to hydrology and water quality.

4.9 Land Use/Planning

This section analyzes potentially significant impacts related to land use and planning that could result from implementation of the project.

4.9.1 Existing Conditions

The City of Irvine (City) adopted its first General Plan in December 1973, and the last comprehensive update was completed in 2000. The General Plan has been updated over the years to address necessary General Plan amendments. With the adoption of the certified 2021-2029 Housing Element in May 2022, the City is required to update the appropriate elements of the General Plan to accommodate the residential site inventory from the 2021-2029 Housing Element (6th Cycle). Specifically, the updated General Plan address the additional 57,656 units needed to meet the City's 6th Cycle Housing Element Regional Housing Needs Assessment (RHNA). Other updates to the General Plan are also proposed to reflect changes in state law.

4.9.1.1 Existing Land Uses

The City is divided into a series of master-planned communities or neighborhoods called planning areas (otherwise referred to as "villages"), with each planning area having its own character and development goals (Table 4.9-1). Figure 4.9-1 presents the locations of the planning areas throughout the City.

Residential growth has primarily been concentrated within the northern and central flatlands of the City, with some residential uses in the northern and southern hillside areas. Prior to 2000, residential development has primarily been concentrated within the central portions of the City, known as the residential core. More recent residential growth has been concentrated within or near the job centers of the Irvine Business Complex (IBC), Irvine Spectrum, and Great Park areas. Employment growth (e.g., commercial, retail, office, industrial) has been concentrated adjacent to regional transportation facilities (e.g., John Wayne Airport, Interstate-5 and Interstate-405, Irvine Station) on the western and eastern edges of the City (i.e., Planning Area 35: Irvine Spectrum, Planning Area 36: Irvine Business Complex).

Land use issues can be divided into two general categories: land use compatibility and land use consistency. Land use compatibility addresses the placement of new sensitive land uses (e.g., residential, parks, schools, assisted living facilities, childcare, and hospitals) near sources of air pollutants, odors, and noise, and the placement of new industrial/commercial land uses near sensitive land uses. Land use consistency addresses the consistency or compliance of a site-specific project with adopted goals and policies described in Section 4.9.2 below. Land use consistency and compatibility are assessed in Section 4.9.5

4.9.2 Applicable Regulatory Requirements

This section describes the various planning documents and local planning initiatives that affect the City.

4.9.2.1 State and Regional

a. General Plan

California Planning and Zoning Law requires each city or county to prepare and adopt a comprehensive, long term general plan for the physical development of the City, and of any land outside its boundaries. The law requires the general plan to include the following elements:

1. Land Use Element;
2. Circulation Element;
3. Housing Element;
4. Conservation Element;
5. Open Space Element;
6. Noise Element;
7. Air Quality;
8. Safety Element; and
9. Environmental Justice Element (or policies related to this topic area must be addressed throughout a general plan) is required when there is a designated Disadvantaged Community

Agencies may also include additional optional elements.

The City and its sphere of influence encompass over 66 square miles located within the coastal and foothill region of central Orange County. Existing General Plan elements regulating development within the City and its sphere of influence include the land use, circulation, housing, seismic, cultural resources, noise, public facilities and services, integrated waste management, energy, safety, parks and recreation, conservation and open space, growth management, and Irvine Business Complex elements.

The City adopted a certified 2021-2029 Housing Element in May 2022 and is required to update the appropriate elements of the General Plan to accommodate the residential site inventory from the 2021-2029 Housing Element. This includes updates to the land use element and the circulation element. The City will also make updates to the open space element, safety element, and noise element to address statutory requirements, and will combine existing optional elements into the updated state-required elements The City will also introduce an optional environmental protection and climate action element. The updated General Plan will provide long-term policy direction and communicate the vision, values, and goals for the City's physical development and overall quality of life.

Proposed General Plan Updates:

Mandated Elements:

- Land Use
  Incorporates information from existing Growth Management and Irvine Business Complex Elements
- Circulation
- Housing
- Conservation and Open Space
  Incorporates information from existing Parks and Recreation, Public Facilities and Services, and Cultural Resources Elements
- Noise
- Safety (includes information from Seismic Safety Element)

Optional Elements:

- Environmental Protection and Climate Action Element
  Incorporates information from existing Energy, Public Facilities and Services, and Integrated Waste Management Elements

b. Subdivision Map Act

The Subdivision Map Act is a California state law established in 1972 that requires governments to review and approve land divisions. This law allows governments to regulate growth and establishes multiple types of land divisions. The law created a standard approval process to regulate subdivisions and ensure that infrastructure for new development is adequately funded. The map depicts required land improvements such as sidewalks, storm drains, and roads.

c. California Coastal Act

The California Coastal Act of 1976 established the California Coastal Commission to regulate the use of land and water in the coastal zone. Development activities, which are broadly defined by the Coastal Act to include construction of buildings, divisions of land, and activities that change the intensity of use of land or public access to coastal waters, generally require a coastal permit from either the Coastal Commission or the local government.

The Coastal Act addresses issues including shoreline public access and recreation, lower cost visitor accommodations, terrestrial and marine habitat protection, visual resources, landform alteration, agricultural lands, commercial fishers, industrial uses, water quality, offshore oil and gas development, transportation, development design, power plants, ports, and public works. It is implemented at the local and regional level via a Local Coastal Plan.

4.9.2.2 Regional Plans and Projects

a. Southern California Association of Governments Regional Transportation Plan/Sustainable Communities Strategy: Connect SoCal

The Southern California Association of Governments (SCAG) is responsible for developing long-range transportation plans and a Sustainable Communities Strategy for the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura. Connect SoCal 2020-2045 is a Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). Connect SoCal also includes a Regional Housing Supportive Infrastructure strategy.

The SCS recommends several land use tools that can be implemented at the local level to promote human-scale, compact and pedestrian-oriented development. These tools represent a menu of options that local jurisdictions are encouraged to utilize, however, are not bound to implementing. The tools include:

1. Center Focused Placemaking
2. Transit Priority Areas
3. High Quality Transit Areas
4. Spheres of Influence
5. Transfer of Development Rights
6. Urban Greening
7. Greenbelts & Community Separators

Connect SoCal implements the Federal Transportation Improvement Program, State Transportation Improvement Program, Interregional Transportation Program, and Regional Transportation Improvement Program and includes a project list for roadway improvement projects. Figure 4.9-2 shows Transit Priority Areas as defined by SCAG.

It should be noted that SCAG is currently in the process of updating this document and recently released the draft Connect SoCal 2024 for review and comment. The final Connect SoCal 2024 document is expected to go to the Regional Council for adoption in April 2024.

FIGURE 4.9-2
SCAG Priority Growth Areas

b. Southern California Association of Governments Regional Comprehensive Plan

The Regional Comprehensive Plan (RCP) is a voluntary framework that links broad principles to an action plan that moves the region towards collective transportation, housing, environmental, and economic goals. It contains nine chapters focusing on specific areas of planning or resource management including: land use and housing, open space and habitat, water, energy, air quality, solid waste, transportation, security and emergency preparedness, and economy. The document contains strategic initiatives, policies, and potential direct and indirect benefits. It also describes at which level of government or which entity should implement the action: for example, federal, state, regional, local governments, developers, or non-profits. The voluntary RCP was initiated by SCAG in 2008 and has not been updated since, therefore some of the voluntary strategic initiatives and policies may be outdated or are no longer relevant.

c. Airport Environs Land Use Plan John Wayne Airport

In 1975, the Airport Land Use Commission (ALUC) of Orange County adopted the Airport Environs Land Use Plan (AELUP), which was most recently amended in 2008. The AELUP covers John Wayne Airport, Fullerton Municipal Airport, and the Joint Forces Training Base Los Alamitos.

The AELUP is a land use compatibility plan that is intended to minimize adverse impacts to the public associated with aircraft noise, to ensure that people and facilities are not located in areas that are susceptible to aircraft accidents, and to ensure that no structures or activities adversely affect navigable air space. The AELUP identifies development standards for areas within the airport's planning area based on noise contours, accident potential zones, and building heights. ALUC is also authorized under state law to assist local agencies in ensuring land use compatibility in areas adjacent to airports. While ALUC is not an implementing agency in the manner of local governments and does not issue project permits, each local agency having jurisdiction over any area within the airport planning areas is required to submit its general plans for that area to the Airport Land Use Commission for a consistency/inconsistency determination prior to adoption by the local agency in accordance with the Government Code for the State of California, Section 65302.3 and Public Utilities Code Section 21676. The submittals should highlight those areas which address the AELUP noise impact, safety compatibility, and height restriction zones. The only requirement is that the submittals illustrate how local agencies will incorporate the performance standards outlined in the AELUP into their planning, zoning, and development processes.

John Wayne Airport is in the City of Santa Ana in unincorporated Orange County along the western border of the City, adjacent to the IBC. A portion of Focus Area 1 (greater IBC area) is located within the AELUP Airport Planning Areas. Structures in this area are required to abide by land use regulations within the Airport Land Use Plan (Table 4.9-2).

Within the boundaries of the AELUP, a land use may be found to be "inconsistent" with the AELUP if any of the following four conditions would occur:

1. Places people so that they are affected adversely by aircraft noise,
2. Concentrates people in areas susceptible to aircraft accidents,

3. Permits structures of excessive height in areas which would affect adversely the continued operation of the airport, or
4. Permits activities or facilities that would affect adversely aeronautical operations.

The following provides additional information related to each of these four conditions. Any land use which is in conformance with the general policies shall be consistent with the AELUP.

Aircraft Noise

Table 4.9-2
Airport Environs Land Use Plan Limitations on Land Use Due to Noise

Land Use Category	Community Noise Equivalent Level dB					
	55	60	65	70	75	80
Residential (all types): Single and Multi-Family Residences						
Community Facilities: Churches, Libraries, Schools, Preschools, Day-Care Centers, Hospitals, Nursing/Convalescent Homes, & Other noise sensitive uses						
Commercial: Retail, Office						
Industrial						

SOURCE: John Wayne AELUP (2008).

Normally Consistent
Conventional construction methods used. No special noise reduction requirements.

Conditionally Consistent
Must use sound attenuation as required by the California Noise Insulation Standards, Title 25, California Code of Regulations. Residential use sound attenuation required to ensure that the interior CNEL does not exceed 45 dB. Commercial and industrial structures shall be sound attenuated to meet Noise Impact Zone "1" criteria (refer to Section 3.2.3 of the AELUP).

Normally Inconsistent
All residential units are inconsistent unless they are sound attenuated to ensure that the interior CNEL does not exceed 45 dB, and that all units are indoor oriented so as to preclude noise impingement on outdoor living areas.

Aircraft Accidents

A land use may also be found to be inconsistent with the AELUP if it concentrates people in an area susceptible to aircraft accidents. Aircraft accidents are defined as a number of people situated on the ground so as to increase the potential magnitude of a major crash catastrophe (i.e., a larger number of fatalities or injuries than otherwise may occur).

Building Height

Adverse effects of structure height refer to a structure of such height and/or location that its existence would threaten the continued operation of the airport, or would decrease the airport's

utility, such as by creating an obstacle in the flight paths or other aircraft traffic patterns employed at the airport, or by interfering with visual or electronic navigation systems.

Aeronautical Operations

Adverse effects of activities or facilities refers to a land use that would hamper aeronautical operations within the boundaries of the AELUP of an airport by producing or causing excessive glare, light, steam, smoke, dust, or electronic interference, or by attracting birds.

d. Orange County Central and Coastal Natural Community Conservation Plan

In May of 1996, the City, the County of Orange, various other cities, and landowners entered into an agreement to place certain lands within the Natural Community Conservation Plan (NCCP) Reserve and commit to certain responsibilities under this plan. Most of the northeastern part of the City is part of the NCCP. Additional NCCP reserve lands also exist in other parts of the City. Development is limited within the NCCP areas to "Covered Activities" and compatible uses. All proposals for development that are within the NCCP are required to meet these requirements and would be reviewed by the City prior to approval.

e. California Coastal Act

The California Coastal Commission was established by voter initiative in 1972 (Proposition 20) and later made permanent by the Legislature through adoption of the California Coastal Act of 1976. In partnership with coastal cities and counties, the Coastal Commission plans and regulates the use of land and water in the coastal zone. Development activities, which are broadly defined by the Coastal Act to include (among others) construction of buildings, divisions of land, and activities that change the intensity of use of land or public access to coastal waters, generally require a coastal permit from either the Coastal Commission or the local government.

The Coastal Act includes specific policies that address issues such as shoreline public access and recreation, lower cost visitor accommodations, terrestrial and marine habitat protection, visual resources, landform alteration, agricultural lands, commercial fisheries, industrial uses, water quality, offshore oil and gas development, transportation, development design, power plants, ports, and public works. The policies of the Coastal Act constitute the statutory standards applied to planning and regulatory decisions made by the Commission and by local governments, pursuant to the Coastal Act.

4.9.2.3 Local Plans and Projects

a. Existing General Plan (2000)

The City's currently adopted General Plan consists of the land use, circulation, housing, seismic, cultural resources, noise, public facilities and services, integrated waste management, energy, safety, parks and recreation, conservation and open space, growth management, and Irvine Business Complex elements.

As previously noted, the project includes a comprehensive update to the City's General Plan to address increased development capacities needed to meet the City's RHNA requirements and updates needed to address changes in state law that have occurred since the last comprehensive General Plan update in 2000. While the existing vision, policies and objectives guide development and activities within the City, it is important to note that the newly proposed goals, objectives, policies, and implementation actions would serve as the guiding regulations if the project is adopted. These proposed goals, objectives, policies, and implementation actions are described throughout this Program Environmental Impact Report (PEIR) where relevant to each topic area.

Housing Element

The following goals and policies in the 2021-2029 Housing Element have informed development of the project and will affect land use:

Goals:

8.1.1 Goal I: Provide for safe and decent housing for all economic segments of the community.

Policies:

HE-A.1 Identify residential zones where allowable density can be increased or suitable Floor Area Ratio (FAR) specified for affordable housing, including for extremely low-income households.

HE-A.2 Identify commercial and institutional zones where zoning can be changed to allow for mixed-use and/or higher-density residential development.

HE-A.3 Ensure appropriate land use planning and developer mitigation/improvements are provided for adequate infrastructure, services, and facilities to serve existing and future residents.

HE-A.4 Monitor residential construction and the use of residential and mixed-use designated lands. Ensure adequate residential sites are available to meet the City's housing needs.

Goals:

8.1.2 Goal 2: Maximize land utilization for residential development.

Policies:

HE-C.1 Promote infill development in appropriate areas.

Goals:

8.1.7 Goal 7: Improve quality of life and promote placemaking.

Policies:

HE-L.1 Encourage placemaking and public spaces to serve residents of all incomes, interests, ages, physical abilities, and cultures.

HE-L.2 Encourage infill development that includes capital improvements, such as sidewalk repair and lighting improvements.
HE-L.3 Encourage development that includes active transportation infrastructure, such as new and wider sidewalks, trails, and protected bike lanes.
HE-L.4 Continue to preserve existing open space in the City.
HE-L.5 Encourage development that brings new community amenities and services like community meeting spaces, public art, community health clinics, after school programs, and childcare.

Level of Service

Per Senate Bill 743, the California Environmental Quality Act (CEQA) no longer mandates that transportation impacts are evaluated in terms of congestion, or level of service (LOS), and instead measures transportation impacts in terms of vehicle miles travelled (VMT). As such, this PEIR evaluates transportation impacts with respect to VMT. Refer to Section 4.13, Transportation, for additional information on project-related transportation impacts.

The City, as a policy, continues to examine transportation impacts with respect to LOS as a mechanism to determine necessary project-specific infrastructure improvement updates. However, LOS is not reviewed for the purposes of determining transportation impacts under this PEIR. This evaluation would continue under the project, with the following policy update included in the proposed Circulation Element:

Goal 1, Objective C-1:

Policy (c): Develop, on an incremental basis, a vehicular circulation system responding to local and regional access requirements. The following Level of Service (LOS) Standards shall be the goal applied to arterial highways, as shown in Figure B-1 and Figure B-5, which are in the City of Irvine or its sphere of influence, and which are under the City's jurisdiction.

1. LOS "E" or better shall be considered acceptable within the Irvine Business Complex (IBC) Planning Area (PA) 36), Irvine Spectrum Center (PA 33), and at the following three intersections: Bake Parkway and the I-5 northbound off-ramp, Bake Parkway and Marine Way, and Trabuco/Great Park Boulevard and SR-133 southbound ramps.
2. In conjunction with traffic studies for development proposed in Planning Areas 5B, 6, 8A and 9, a LOS "E" standard or better would be considered acceptable for application to intersections impacted in Planning Areas 13, 31, 32, 34, 35 and 39.
3. In conjunction with traffic studies for development proposed in Great Park (PA 51), a LOS "E" standard or better would be considered acceptable for application to intersections impacted in Planning Areas 13, 31, 32, 34, 35 and 39 and a portion of 51.
4. Applicable to 2a and 2b above. LOS "E" or better would be acceptable subject to the following:
    - Preparation, submittal, processing, and approval of a traffic study for the specific subdivision map.

- Level of Service "E" or better will only be considered acceptable for an intersection that does not contain a residential quadrant unless the residential development has a net density of 30 dwelling units per net acre or greater. No Level of Service "E" will be accepted along Sand Canyon except at the Sand Canyon/I-5 Interchange ramps/intersections.

- Participation/funding to an upgraded traffic signal system as defined in the Traffic Management Systems Operations Study (TMSOS) and/or a parking and mobility fund, as applicable and which may be in place at the time of processing of the individual traffic study. The City, in conjunction with the specific traffic study, shall determine the level of participation/funding using criteria and processes developed concurrently.

5. LOS "D" or better shall be considered acceptable within all other areas.

City of Irvine Local Coastal Program

The City of Irvine Local Coastal Program (LCP) was certified by the California Coastal Commission on March 3, 1982.

Approximately 250 acres within the City is located within the Coastal Zone, with most of this area dominated by the San Joaquin Marsh, which is owned by the University of California, Irvine, and is therefore not covered by the City's Local Coastal Program. However, a total of 40 acres of land within the IBC area at the intersection of MacArthur and Jamboree is owned by the City and is covered by the Local Coastal Program. The General Plan calls for this area to be restricted to research and light industrial uses. Figure 4.9-3 shows the portion of Irvine that is located within the Local Coastal Program area. All development occurring within this area must demonstrate compliance with the City's General Plan, Local Coastal Program, and Municipal Code.

According to the LCP, new development and public works facilities should not have adverse impacts on coastal resources according to the Coastal Zone Conservation Act of 1976. Regulations related to the LCP are included as Zoning Ordinance Chapter 2-7 Coastal Zone Regulations for Developments Located in Coastal Zone.

Zoning Ordinance

The Zoning Ordinance establishes land use regulations and development standards for the City. Division 9 of the Zoning Ordinance establishes planning areas and zones which are required to be vertically consistent with the General Plan. The Zoning Ordinance establishes over 30 planning areas. These planning areas (PAs) are located within the City, except for PA 3, which is in the unincorporated County within the City's sphere of influence. Each planning area contains various zoning districts and special development requirements that pertain only to those planning areas. Zoning districts establish land use, intensity, and development standards for individual parcels.

b. Parks Master Plan

The City's Parks Master Plan was adopted in 2017. The Master Plan helps guide the future maintenance, development, and operation of the City's parks and recreation system for the next 10 years. It highlights opportunities for enhancing the City's public parks, park facilities, and recreation programs to respond to evolving resident needs. The plan focuses on projects for public parks, park facilities, and recreation programs that may enhance the public experience and respond to evolving needs and expectations. The Master Plan also includes criteria that assists in the identification of projects to include in the annual Capital Improvement Program budget.

c. Parks and Park Facilities Standards

The purpose of the Parks and Park Facilities Standards is to establish park development standards for guidance in acceptance of park land, collection of park fees, or provision of in lieu improvements, and criteria for design of public and private parks. The City's General Plan and Subdivision Ordinance require developers to dedicate park land and/or improvements/amenities, and/or pay fees in lieu of dedication, at a rate of five acres per thousand population (General Plan, Element K and Subdivision Ordinance, Section 5-5-1004). The City's public park system is divided into two park categories: community parks and neighborhood parks. Neighborhood parks are further divided into public and private parks. The allocation of land and improvements is apportioned at 2 acres to community parks and 3 acres to public and/or private neighborhood parks. The following guidelines are used when planning parks:

1. To serve the community as a whole, a 20-acre improved community park for every 10,000 population is the Community Services Commission's goal when developing residential villages. Development agreements are considered when needed to vary the allocation of park credits to allow for development of community parks.
2. Public neighborhood parks are incorporated within residential developments to serve the immediate neighborhood, supplemented by private parks. Private parks and/or improvements to private parks shall be provided when they have a clear benefit to the community.
3. The Community Services Commission, working with the development community, endeavor to address the development of parks at the earliest stages of development, to communicate the City's park interests.

d. University of California, Irvine, Long Range Development Plan

The 2007 University of California, Irvine (UCI), Long Range Development Plan (LDRP) identifies general types of campus development and land uses to support projected expansion of existing academic programs and to enable new academic program initiatives at UCI through the plan horizon year of 2025-26. In addition, it provides a foundation for post-2025 development at UCI. The 2007 LDRP is accompanied by an EIR that identifies potential environmental effects of the plan and prescribes mitigation measures for reducing significant environmental impacts from campus physical development.

e. Existing Plans, Programs, and Policies

Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required of the project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute mitigation measures. The following measures are existing plans, programs, or policies (PPP) that apply to the project and will help to reduce and avoid potential impacts related to land use and planning:

- PPP LU-1: Compliance with the Airport Environs Land Use Plan for John Wayne Airport
- PPP LU-2: Compliance with the Orange County Central and Coastal Natural Community Conservation Plan (NCCP)
- PPP LU-3: Compliance with the City Local Coastal Program and Zoning Ordinance Chapter 2-7 Coastal Zone Regulations for Developments Located in Coastal Zone
- PPP LU-4: Compliance with Zoning Ordinance
- PPP LU-5: Compliance with the City Parks Master Plan
- PPP LU-6: Compliance with the UCI LDRP

Proposed General Plan Strategies and Policies

The following proposed goals, objectives, policies, and implementation actions are applicable to the analysis of land use and planning and would replace existing goals, strategies, and policies outlined in the City's existing General Plan following project approval:

Land Use Element

Goal 4: Manage Growth to Ensure Balanced Residential and Nonresidential Development Throughout the City.

Objective LU-4. To achieve a balanced and sustainable distribution of land uses throughout the City by implementing equitable and inclusive land use policies that optimize the efficient use of land, promote environmental stewardship, and enhance quality of life for all residents.

Goal 6: Achieve Harmonious Land Use Patterns Throughout the City.

Objective LU-6. To establish cohesive and harmonious land use patterns throughout the City by implementing integrated planning strategies that promote connectivity, sustainability, and community well-being while respecting the unique character and identity of different neighborhoods.

Goal 7: Develop Mixed Use Areas.

Objective LU-7. To cultivate vibrant mixed-use areas throughout the City by implementing land use policies and strategies that promote the integration of residential, commercial, recreational, and cultural uses within cohesive and walkable neighborhoods, enhancing livability, economic vitality, and community well-being.

Goal 12: Promote the Implementation of Proximity Villages.

Objective LU-12: Implement the use of proximity villages through a range of policies that promote sustainable and community-oriented development.

4.9.3 Significance Determination Thresholds

The City has adopted Appendix G of the State CEQA Guidelines as the significance thresholds for land use and planning impacts. A project would normally have a significant effect on the environment if the project would:

1) Physically divide an established community.
2) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

4.9.4 Methodology

Preparation of this section was based on review of existing land use conditions in the City including aerial images and geographical information systems land use data. This was followed by an evaluation of how the proposed General Plan Update land use, goals, and policies would affect existing land uses within the City.

4.9.5 Topic 1: Physically Divide an Established Community

Would the project physically divide an established community?

4.9.5.1 Impact Analysis

Implementation of the project would not include new major infrastructure, such as a freeway, that could physically divide an established community. The project applies to city-wide development, but focuses residential and residential mixed-use development in existing urbanized areas throughout the City using proposed overlay zones. The project would focus increased density in Focus Areas 1, 2 and 3, which are located near existing or planned travel corridors. Future development and redevelopment would utilize existing transportation facilities and would provide opportunities for new employment, housing, and recreational uses within existing planning areas.

Focus Area 1 is located in the IBC, which is one of the two employment centers located within the City. It connects to the Tustin Transportation Center and has direct access to the Tustin Transportation Center (Metrolink and Orange County Transportation Authority [OCTA] transit service) through the iShuttle and has direct access to Interstate 405, State Route 73, and State Route 55, which provide access to various city and countywide destinations. The project would allow for up to 15,000 new residential units within the subject focus area through the proposed overlay.

Focus Area 2 is located in the Greater Spectrum Area, which is an emerging employment center located near the Irvine Transportation Center (ITC– Metrolink, Amtrak, and OCTA transit service). The project would allow for up to 26,607 new residential units within Focus Area 2 through the proposed overlay.

Focus Area 3 is in the Great Park, which is an existing mixed-use planning area that features a mix of residential uses at varying densities surrounding the Irvine Great Park. The project would increase the number of residential units permitted in the Great Park with a focus on higher density near or adjacent to the ITC. Specifically, the project would allow for up to 13,989 new residential units within Focus Area 3 through the proposed overlay.

Outside of the three focus areas, the project would allow for the development of up to 8,536 units throughout the City. These units are expected to be developed as redevelopment/infill projects, on sites that are currently developed with low-intensity residential uses.

By strategically directing future development to the three focus areas, the project aims to retain the existing character of more established residential communities in the central area of the City and concentrate higher-density development in more urban areas. The project also encourages the preservation of existing residential communities through infill development facilitated by the Residential and Residential Mixed-Use Overlay, which would reduce potential conflicts between contrasting land uses and would enhance existing neighborhoods by responsibly integrating new development into existing communities. Furthermore, the Land Use Element Update includes applicable goals and objectives aimed at managing growth to ensure a balanced residential and nonresidential development pattern throughout the City and achieving harmonious land use to further the City's goal of minimizing potential land use conflicts. Supporting objectives would develop land use policies that promote the efficient use of land in the City, adopting planning strategies to promote the community well-being while respecting the unique character of existing neighborhoods, adopting strategies that promote the integration of all land use types in walkable and cohesive neighborhoods, and the use of proximity villages to promote community-oriented development that is also compatible with surrounding uses and neighborhoods. Therefore, implementation of the project would ensure the development of cohesive neighborhoods without physically dividing existing communities and while also maintaining the features that make each village in the City unique.

Additionally, the project includes nonresidential improvements to the Great Park area and an extension to Ada, a local roadway. All Great Park improvements are intended to serve visitors of the park and would occur within an area slated for buildout of a regionally serving park. Furthermore, the Ada extension is intended to increase connectivity in the area near the ITC. Both the improvements planned within the Great Park and improvements to Ada would occur within nonresidential areas (on nonresidential properties), and as such would not result in the physical division of established community.

4.9.5.2 Significance of Impacts

The project would introduce new residential land uses throughout the City in a manner that would be compatible with existing established communities and would not introduce any large-scale infrastructure or other improvements that would result in the physical division of the community. As such, impacts would be less than significant impacts.

4.9.5.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.9.6 Topic 2: Conflicts with Applicable Plans and Policies

Would the project cause a significant environmental impact due to a conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

4.9.6.1 Impact Analysis

The project is a comprehensive update to the City's existing General Plan in support of the City's RHNA goals. In total, the project would facilitate the future development of up to 57,656 new residential units, with most of these units concentrated in the three focus areas. Additional project-activities include nonresidential improvements to the Great Park area, the extension of Ada (a street in the area near the Irvine Transit Center), and the continuation of nonresidential uses permitted at the same intensities as allowed under the existing General Plan.

Typical plans and policies to be consulted for this analysis include the City's General Plan, City's Municipal Code, City's Zoning Ordinance, Local Coastal Plan, John Wayne AELUP, City's Parks Master Plan, and UCI's LRDP. Refer to Section 4.13, Transportation, for a discussion of land use compatibility impacts with respect to SCAG's RTP/SCS.

a. General Plan, Municipal Code, Zoning Ordinance

The project would encourage the future development of residential and residential mixed-use development in existing nonresidential areas throughout the City through implementation of residential overlay zones. Most increased housing is proposed near existing or planned travel corridors within the three focus areas. As such, future development and redevelopment would utilize existing transportation facilities and would provide opportunities for new employment, housing, and recreational uses within existing planning areas.

Adoption of the General Plan update would also ensure consistency with state law in regards to necessary updates to the City's General Plan required to address multiple state laws that have occurred since the City's last General Plan adoption (2020) and land use changes (i.e., the proposed overlay) required to accommodate the City's RHNA allocation. Once adopted, goals, objectives, policies, and implementation measures outlined in the proposed General Plan update would become the applicable regulations guiding development and other activities in the City.

Furthermore, future development would be reviewed to consider consistency with all applicable plans, including the City's General Plan, Municipal Code, and Zoning Ordinance. Additionally, development within the City's focus areas would be required to adhere to the land use plans that provide supplemental development regulations for those areas, as well as applicable regulations in the Municipal Code that serve to reduce or avoid environmental impacts. Therefore, land use

consistency impacts associated with adoption of the General Plan Update would be less than significant.

b. Southern California Association of Governments Regional Transportation Plan/Sustainable Communities Strategy: Connect SoCal

The project would serve as an important action towards implementing the City's 6th Cycle 2021-2029 Housing Element and the associated RHNA allocation of 23,610 units. Because the housing assessment in the RHNA is determined by SCAG, any future development of vacant and/or developed sites would accommodate planned increases in population based on SCAG's demographic projections. As described in Section 4.11.1.1 above, SCAG anticipates that the City's population will increase from 261,600 in 2016 to 327,700 in 2045, which would constitute an 11 percent increase in population during this 29-year time frame. Growth forecast data for the City of Irvine is provided to SCAG through Orange County Projections (OCP), Orange County's official growth forecast. OCP is prepared by the Center for Demographic Research with direct input from local jurisdictions, including the City of Irvine. According to OCP-2018, the growth forecast provided to SCAG for the development of 2020-2045 Connect SoCal, the City's housing is projected to increase from 93,300 in 2016 to 121,700 in 2045, which would constitute a 30 percent increase during that 29-year time frame. It is also important to note that in 2022, OCP was updated to reflect 2020 Census data. According to OCP-2022, the total number of housing units in the City is projected to increase from 117,544 in 2020 to 142,979 in 2050. This updated forecast reflects the more aggressive production of housing units that occurred between 2016 and 2020. Therefore, future housing developed under the project would provide housing necessary to meet the City's RHNA allocation of 23,610 units, as well as accommodate future population growth and housing needs accounted for in SCAG's growth projections. Therefore, land use consistency impacts related to conflicts with SCAG would be less than significant.

c. John Wayne AELUP

Airport operations and associated noise and safety hazards require careful land use planning on adjacent lands to ensure the safety of residents and visitors within the area. As previously noted, John Wayne Airport is directly adjacent to the IBC in Irvine (Focus Area 1), which was approved for the development of 15,000 residential units under the City's existing General Plan.

As previously noted, any land use within the boundaries of the AELUP may be found to be inconsistent with the AELUP which:

1) Places people so that they are affected adversely by aircraft noise,
2) Concentrates people in areas susceptible to aircraft accidents,
3) Permits structures of excessive height in areas which would affect adversely the continued operation of the airport, or
4) Permits activities or facilities that would affect adversely aeronautical operations.

As shown in Figure 4.7-3, a portion of Focus Area 1 is located within the John Wayne Airport Safety Zones 2, 3, 4 and 6. Zone 2 (Inner Approach/Departure Zone) prohibits residential uses except on large agricultural parcels and limits nonresidential uses to activities which attract few people. Zone 3

(Inner Turning Zone) limits residential uses to low densities when deemed to be acceptable due to noise and limits nonresidential uses having moderate to higher usage intensities. Zone 4 (Outer Approach/Departure Zone) limits residential uses to very low densities (if deemed to be acceptable when considering noise) and allows for higher densities as infill urban areas when alternate uses are impractical. Zone 4 includes similar limitations on nonresidential uses. Zone 6 (Traffic Pattern Zone) aims to avoid residential uses unless they are airport related and includes similar limitations on nonresidential uses to Zone 3.

In addition, it is expected that over the years, noise impacts to the City from aircraft operations at John Wayne Airport will not increase due to agreements in place restricting the number of flights, hours of noise, and aggregate noise. The John Wayne Airport noise contours are shown in Figure 4.10-3. Future development under the project would be subject to proposed General Plan Noise Element Goal 1, Objective N-1, Policy (a) which requires all plans submitted for development review to demonstrate whether the plan area is located within an existing or future Noise Element noise contour, including vehicle, rail, and aircraft noise contours. Portions of Focus Area 1 are also located within the FAR Part 77 Notification Area and Obstruction Imaginary Surfaces for John Wayne Airport and would therefore be subject to FAA height limits.

The project would retain all existing land use designations throughout the City, including in Focus Area 1. Future development resulting from implementation of the project would be required to comply with height, use and noise limitations designated in the AELUP. Additionally, future projects would be required to file for a consistency determination with ALUC as specified in Section 4.7 of the AELUP (PPP-LU-1). If ALUC determines that a project is inconsistent with the AELUP, ALUC is required to notify the City. The City may modify the project to be consistent with the AELUP and resubmit to ALUC or the City can overrule ALUC by following the procedures in Public Utilities Code Sections 21676 and 21676.5. This procedure would require the City to hold a public hearing on the matter, make specific findings that the proposed overruling is consistent with Public Utilities Code Section 2160, and overrule ALUC by at least two-thirds vote of the applicable governing body (likely the City's Planning Commission and/or City Council).

As with future projects, the project (the General Plan Update) is required to be reviewed by ALUC for a consistency determination with the AELUP. If ALUC determines that the project is inconsistent with the AELUP, ALUC is required to notify the City. The City may modify the project to be consistent with the AELUP and resubmit to ALUC or the City can overrule ALUC by following the procedures in Public Utilities Code Sections 21676 and 21676.5. In that event, the City would hold a public hearing on the matter, make specific findings that the proposed overruling is consistent with Public Utilities Code Section 2160, and overrule ALUC by at least two-thirds vote of the City Council.

For the reasons outlined above, land use compatibility impacts related to conflicts with the AELUP would be less than significant.

d. Orange County NCCP

In May of 1996, the City, the County of Orange, various other cities, and landowners entered into an agreement to place certain lands within the NCCP/Habitat Conservation Plan (HCP) Reserve and commit to certain responsibilities under this plan. Most of the northeastern part of the City is part of

the NCCP/HCP. Additional NCCP/HCP reserve lands also exist in other parts of the City. Development is limited within the NCCP/HCP areas to "Covered Activities" and compatible uses. All proposals for development that are within the NCCP/HCP are required to meet these requirements and would be reviewed by the City prior to approval (PPP LU-2).

Future development resulting from implementation of the project would be required to comply with the NCCP/HCP. As part of the project approval process, each future project with the potential to impact biological resources would be required to conduct an initial site assessment to determine if sensitive biological resources could be present within and/or adjacent to the proposed development project (refer to mitigation measure BIO-1). Individual projects would also be assessed for compliance with the NCCP/HCP depending on whether the project site lies inside the NCCP/HCP Reserve System (including the Irvine Open Space Preserve of the Irvine Open Space Initiative) or Special Linkage Areas. If no sensitive biological resources have a potential to occur within and/or adjacent to the project, the City may approve the project to proceed without further biological resource analyses. If sensitive biological resources have potential to occur, future development may have the potential to conflict with the NCCP/HCP.

e. City of Irvine Local Coastal Program

As illustrated by Figure 4.9-3, a small portion of the City within Focus Area 1 is located within the coastal zone of the City of Irvine Local Coastal Plan. Allowable uses within this area include commercial, industrial, light research, and development uses.

The project would require an amendment to the City's Local Coastal Program to ensure consistency between the land use updates included as part of the project and the Local Coastal Program. The Local Coastal Program amendment is required to be reviewed and processed by the California Coastal Commission, a process that would start immediately following project approval. Once approved, any future development under the project that would be located within the coastal zone would be required to comply with development standards and applicable policies in the City's Local Coastal Program (PPP LU-3). Therefore, land use compatibility impacts related to conflicts with the City's Local Coastal Program would be less than significant.

f. Zoning Ordinance

Future development under the project would be required to comply with land use regulations and development standards set forth in the City's Zoning Ordinance (PPP LU-4). Therefore, land use compatibility impacts related to conflicts with the City's Zoning Ordinance would be less than significant.

g. City Parks Master Plan

The City relies on the Quimby Act (Section 5-5-1004 of the Irvine Municipal Code) to acquire and pay for new parks related to new development. Future development would be subject to in lieu fees or would be required to provide both new recreational facilities and funds for the maintenance and enhancement of existing recreational resources as part of the implementation of the City Parks Master Plan (PPP LU-5). Impact fees would be triggered during the building permit process and

would be guided by the Parks and Park Facilities Standards to provide guidance in acceptance of park land, collection of park fees or provision of in lieu improvements, and criteria for design of public and private parks.

Pursuant to the Quimby Act, the Irvine's Parks and Recreation Element of the General Plan and the Subdivision Ordinance (Section 5-5-1004 of the Irvine Municipal Code) require developers to dedicate park land and/or improvements/amenities and/or pay fees in lieu of dedication, at a rate of five acres per 1,000 persons. New development under the project would be consistent with this plan as it would implement or fund the implementation of the City Parks Master Plan. Therefore, land use compatibility impacts related to conflicts with the City's Parks Master Plan would be less than significant.

h. UCI LDRP

If sensitive biological resources have potential to occur, future development may have the potential to conflict with the NCCP/HCP, which would be considered significant. Conflicts with all other plans would be less than significant.

4.9.6.2 Significance of Impacts

Implementation of mitigation measures BIO-1 through BIO-10 would reduce conflicts with the NCCP/HCP to a level less than significant. Conflicts with all other plans would be less than significant and would not require mitigation.

4.9.6.3 Mitigation

Refer to mitigation measures BIO-1 through BIO-10 in Section 4.3, Biological Resources regarding consistency with the NCCP/HCP. All other impacts would be less than significant and would not require mitigation.

4.9.6.4 Significance of Impacts after Mitigation

Implementation of mitigation measures BIO-1 through BIO-10 would reduce conflicts with the NCCP/HCP to a level less than significant. All other impacts would be less than significant and would not require mitigation.

4.9.7 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for land use. The study area for the assessment of cumulative impacts related to land use and planning is defined as the City. Given that the project involves a comprehensive update to the City's existing General Plan, the project itself is cumulative in nature, as it would shape growth in the City though 2045. As such, future development under the project would be required to comply with all applicable land use plans and regulations. All future development resulting from implementation of the project would also be required to

comply with all existing land use plans and policies. Additionally, future projects with the potential to impact biological resources would be required to comply with mitigation measures BIO-1 through BIO-10 to reduce potential conflicts with the NCCP/HCP. Compliance with these requirements and mitigation measures would ensure that individual site-specific projects would avoid cumulative impacts related to land use consistency.

The City is almost entirely developed with a wide variety of established land uses. Existing land use patterns within the three focus areas where future development is likely to be concentrated largely consist of mixed-use, residential, office, and retail development. As such, it is anticipated that future growth facilitated by the project would largely occur as infill development and redevelopment. Changes to the existing focus areas would likely occur through the conversion of underutilized land, and in limited cases, vacant land. Furthermore, changes proposed to the Great Park as part of the project are limited to visitor-serving recreational uses that would be compatible with the surrounding area and would be located within the existing park boundaries. Similarly, the extension of Ada roadway would be limited to an area that is developed and consists of roadway and associated right-of-way. The project has also incorporated policies to guide development consistent with existing regional and local land use plans and policies, ensuring land use compatibility and avoiding physical division of community.

Implementation of the project would not conflict with applicable land uses. Additionally, the project would address inconsistencies with the City's adopted Housing and General Plan, Zoning Ordinance, Zoning Map, and Local Coastal Program. Therefore, the project would not contribute to a cumulative impact related to land use.

4.10 Noise

This section analyzes the noise impacts that could result from implementation of the project. This analysis relies on the Irvine General Plan Update Traffic Noise Assessment prepared by Urban Crossroads, Inc. (Appendix G).

4.10.1 Existing Conditions

4.10.1.1 Fundamentals of Noise and Vibration

a. Fundamentals of Noise

Sound levels are described in units called the decibel (dB). Decibels are measured on a logarithmic scale that quantifies sound intensity in a manner similar to the Richter scale used for earthquake magnitudes. Thus, a doubling of the energy of a noise source, such as doubling of traffic volume, would increase the noise level by 3 dB; a halving of the energy would result in a 3 dB decrease.

Additionally, in technical terms, sound levels are described as either a "sound power level" or a "sound pressure level," which while often confused, are two distinct characteristics of sound. Both share the same unit of measure, the dB. However, sound power, expressed as L_{pw}, is the energy converted into sound by the source. The L_{pw} is used to estimate how far a noise will travel and to predict the sound levels at various distances from the source. As sound energy travels through the air, it creates a sound wave that exerts pressure on receivers such as an ear drum or microphone and is the sound pressure level. Noise measurement instruments only measure sound pressure, and noise level limits used in standards are generally sound pressure levels.

The human ear is not equally sensitive to all frequencies within the sound spectrum. To accommodate this phenomenon, the A-scale, which approximates the frequency response of the average young ear when listening to most ordinary everyday sounds, was devised. When people make relative judgments of the loudness or annoyance of a sound, their judgments correlate well with the A-scale sound levels of those sounds. Therefore, the "A-weighted" noise scale is used for measurements and standards involving the human perception of noise. Noise levels using A-weighted measurements are designated with the notation dB(A).

The impact of noise is not a function of loudness alone. The time of day when noise occurs and the duration of the noise are also important. Additionally, most noise that lasts for more than a few seconds is variable in its intensity. Consequently, a variety of noise descriptors has been developed. The noise descriptors used for this study are the one-hour equivalent noise level (L_{eq}) and the community noise equivalent level (CNEL). The CNEL is a 24-hour equivalent sound level. The CNEL calculation applies a 5 dB(A) penalty to noise occurring during evening hours, between 7:00 p.m. and 10:00 p.m., and a 10 dB(A) penalty is added to noise occurring during the night, between 10:00 p.m. and 7:00 a.m. These increases for certain times are intended to account for the added sensitivity of humans to noise during the evening and night.

Sound from a small, localized source (approximating a "point" source) radiates uniformly outward as it travels away from the source in a spherical pattern, known as geometric spreading. The sound level decreases or drops off at a rate of 6 dB(A) for each doubling of the distance.

Traffic noise is not a single, stationary point source of sound. The movement of vehicles makes the source of the sound appear to emanate from a line (line source) rather than a point when viewed over some time interval. The drop-off rate for a line source is 3 dB(A) for each doubling of distance.

The propagation of noise is also affected by the intervening ground, known as ground absorption. A hard site (such as parking lots or smooth bodies of water) receives no additional ground attenuation, and the changes in noise levels with distance (drop-off rate) are simply the geometric spreading of the source. A soft site (such as soft dirt, grass, or scattered bushes and trees) receives an additional ground attenuation value of 1.5 dB(A) per doubling of distance. Thus, a point source over a soft site would attenuate at 7.5 dB(A) per doubling of distance.

Human perception of noise has no simple correlation with acoustical energy. A change in noise levels is generally perceived as follows: 3 dB(A) barely perceptible, 5 dB(A) readily perceptible, and 10 dB(A) perceived as a doubling or halving of noise (California Department of Transportation [Caltrans] 2013, 2020).

b. Fundamentals of Vibration

Vibration consists of energy waves transmitted through solid material (Federal Transit Administration [FTA] 2018). Groundborne vibration propagates from the source through the ground to adjacent buildings by surface waves. Vibration may be composed of a single pulse, a series of pulses, or a continuous oscillatory motion. The frequency of a vibrating object describes how rapidly it is oscillating, measured in hertz (Hz). The normal frequency range of most groundborne vibration that can be felt generally starts from a low frequency of less than 1 Hz to a high of about 200 Hz (FTA 2018).

Groundborne vibration is measured by its peak particle velocity (PPV), which is normally described in inches per second (in/sec). PPV is appropriate for determining potential structure damage but does not evaluate human response to vibration. The ground motion caused by vibration may also be described in decibel notation (vibration decibels), referenced as VdB, which serves to compress the range of numbers required to describe vibration relative to human response. The general human response to different levels of groundborne vibration velocity levels is described in Table 4.10-1.

Table 4.10-1
Human Response to Different Levels of Groundborne Vibration

Vibration Velocity Level	Human Reaction
65 VdB	Approximate threshold of perception for many people.
75 VdB	Approximate dividing line between barely perceptible and distinctly perceptible. Many people find that transportation-related vibration at this level is unacceptable.
85 VdB	Vibration acceptable only if there are an infrequent number of events per day.

SOURCE: FTA 2018.
VdB = vibration decibel

Vibration energy spreads out as it travels through the ground, causing the vibration amplitude to decrease with distance away from the source. The way in which vibration is transmitted through the earth is called propagation. As vibration waves propagate from a source, the energy is spread over an ever-increasing area such that the energy level striking a given point is reduced with the distance from the energy source. This geometric spreading loss is inversely proportional to the square of the distance. Wave energy is also reduced with distance as a result of material damping in the form of internal friction, soil layering, and void spaces. The amount of attenuation provided by material damping varies with soil type and condition as well as the frequency of the wave.

Groundborne vibration can be a concern for nearby residents along a transit system route or maintenance facility, causing buildings to shake and rumbling sounds to be heard. Groundborne vibration is not a common environmental problem. It is unusual for vibration from sources such as buses and trucks to be perceptible, even in locations close to major roads. Some common sources of groundborne vibration are trains; buses on rough roads; and construction activities such as blasting, pile-driving, and operating heavy earth-moving equipment.

4.10.1.2 Ambient Noise Measurements

As part of this assessment, ambient noise levels were measured in the City to provide a characterization of the variability of noise and to assist in determining constraints and opportunities for future development. Eight 15-minute, one 1-hour, and one 19-minute daytime noise level measurements were conducted throughout the City. Noise measurements were taken with one Larson-Davis LxT Type 1 Integrating Sound Level Meters, serial number 3897. The following parameters were used:

Filter:	A-weighted
Response:	Slow
Time History Period:	5 seconds
Height of Instrument:	5 feet above ground level

Measurement locations are shown in Figure 4.10-1. A summary of the measurements is provided in Table 4.10-2, and traffic counts taken during measurements are summarized in Table 4.10-3. Based on the measurement data, daytime noise levels in the City are typical of an urban environment. Each measurement location and noise source observed during the measurements is discussed below.

Noise Measurement Locations

Table 4.10-2 Noise Measurements				
Measurement	Location	Date	Time	L_{eq}
1	Irvine Transit Center	2:29 p.m. - 3:29 p.m.	1 hour	57.4
2	Alton Parkway, 30 feet from edge of nearest travel lane	2:02 p.m. - 2:17 p.m.	15 minutes	60.2
3	Culver Drive, 30 feet from edge of nearest travel lane	9:51 a.m. - 10:06 a.m.	15 minutes	62.8
4	Sand Canyon Avenue, western corner of intersection with Burt Road	1:22 p.m. - 1:41 p.m.	19 minutes	72.3
5	Irvine Boulevard, 50 feet from nearest travel lane	12:30 p.m. - 12:45 p.m.	15 minutes	60.2
6	Culver Drive, 100 feet from edge of nearest travel lane	11:54 a.m. - 12:09 p.m.	15 minutes	55.6
7	Barranca Parkway, 50 feet from edge of nearest travel lane	10:45 a.m. - 11:00 a.m.	15 minutes	58.2
8	Jamboree Road, 50 feet from edge of nearest travel lane	8:28 a.m. - 8:43 a.m.	15 minutes	65.3
9	Irvine Boulevard and Sand Canyon Avenue, 25 feet from edge of nearest Irvine Boulevard travel lane	3:47 p.m. - 4:02 p.m.	15 minutes	62.7
10	Main Street, western corner of intersection with Von Karman Avenue	9:05 a.m. - 9:20 a.m.	15 minutes	71.0
L_{eq} = one-hour equivalent noise level.				

Table 4.10-3 Traffic Counts						
Measurement	Roadway	Autos	Medium Trucks	Heavy Trucks	Buses	Motorcycles
2	Alton Parkway	141	4	0	3	0
3	Culver Drive	535	15	2	2	0
4	Sand Canyon Avenue	325	8	3	1	0
5	Irvine Boulevard	340	0	0	0	0
6	Culver Drive	350	6	0	1	0
7	Barranca Parkway	122	5	0	1	0
8	Jamboree Road	300	12	1	0	0
9	Irvine Boulevard	803	7	0	3	1
10	Main Street	263	3	1	2	2

Measurement 1 was taken at the Irvine Transit Center (Metrolink Station) located at 15215 Barranca Parkway #1. The measurement was located at the fence adjacent to the Metrolink tracks, approximately 46 feet from the tracks. The main source of noise at this measurement location was two northbound trains and announcements over the speaker system. Other sources of noise included aircraft flyovers, buses and a garbage truck. The average measured noise level was 57.4 dB(A) L_{eq}.

Measurement 2 was located 30 feet from the nearest travel lane on Alton Parkway, and on the southern edge of 15615 Alton Parkway. The main source of noise at this location was vehicle traffic

on Alton Parkway. Traffic volumes on Alton Parkway were counted during the 15-minute measurement period. The average measured noise level was 60.2 dB(A) L_{eq}.

Measurement 3 was located 30 feet from the nearest travel lane on Culver drive, north of Interstate 405 (I-405), and along the edge of the Freeway trail. The main source of noise at this location was vehicle traffic on Culver Drive. Traffic volumes on Culver Drive were counted during the 15-minute measurement period. The average measured noise level was 62.8 dB(A) L_{eq}.

Measurement 4 was taken on the western corner of the Sand Canyon Avenue and Burt Road intersection. The main source of noise at this location was vehicle traffic on Sand Canyon Avenue. Other sources of noise included the cross walk signal. Traffic volumes on Sand Canyon Avenue were counted during the 19-minute measurement period. The average measured noise level was 72.3 dB(A) L_{eq}.

Measurement 5 was taken 50 feet from the nearest travel lane on Irvine Boulevard, approximately 368 feet northwest of the Irvine Boulevard and Marketplace intersection. The main source of noise at this location was vehicle traffic on Irvine Boulevard. Traffic volumes on Irvine Boulevard were counted during the 15-minute measurement period. The average measured noise level was 60.2 dB(A) L_{eq}.

Measurement 6 was taken 100 feet from the nearest travel land on Culver Drive, on the Walnut Trail, approximately 178 feet southwest of the Metrolink tracks. The main source of noise at this location was vehicle traffic on Culver Drive. Other sources included bird vocalizations. No train pass-bys were observed during the measurement period. Traffic volumes on Culver Drive were counted during the 15-minute measurement period. The average measured noise level was 55.6 dB(A) L_{eq}.

Measurement 7 was taken 50 feet from the nearest travel lane on Barranca Parkway, and south of Peters Canyon Trail. The main source of noise at this location was vehicle traffic on Barranca Parkways. Traffic volumes on Barranca Parkway were counted during the 15-minute measurement period. The average measured noise level was 58.2 dB(A) L_{eq}.

Measurement 8 was taken 50 feet from the edge of the nearest travel lane on the eastern corner of the Jamboree Road and Fairchild Road intersection. The main source of noise was vehicle traffic on Jamboree Road. Traffic volumes on Jamboree Road were counted during the 15-minute measurement period. The average measured noise level was 65.3 dB(A) L_{eq}.

Measurement 9 was taken 25 feet from the edge of the nearest Irvine Boulevard travel lane, approximately 140 feet northwest of the Irvine Boulevard and Sand Canyon Avenue intersection. The main source of noise was vehicle traffic on Irvine Boulevard and San Canyon Avenue. Other sources of noise included skateboards, bicycles, and a motorcycle. Traffic volumes on Irvine Boulevard were counted during the 15-minute measurement period. The average measured noise level was 62.7 dB(A) L_{eq}.

Measurement 10 was taken on the western corner of the Main Street and Von Karmen Avenue intersection. The main source of noise at this location was vehicle traffic on Main Street and Von Karmen Avenue. Other sources of noise included music from vehicles. Traffic volumes on Main Street were counted during the 15-minute measurement period. The average measured noise level was 71 dB(A) L_{eq}.

4.10.1.3 Existing Traffic Noise

The most pervasive noise in Irvine currently comes from mobile noise sources such as motor vehicles, railroads, and aircraft. The City is also exposed to noise emanating from sources such as industrial, commercial, and construction activities. Major roads/freeways generating the greatest noise level in the City are Interstate 5 (I-5) and I-405. Numerous other roads within the City are also major sources of noise. The noise contour distances represent the predicted noise level for each roadway without the attenuating effects of noise barriers, structures, topography, or dense vegetation. As intervening structures, topography, and dense vegetation would affect noise exposure at a particular location, the noise contours should not be considered site-specific but are rather guides to determine when detailed acoustic analysis should be undertaken.

Figure 4.10-2 shows the existing vehicle traffic noise contours for the City. As shown, existing noise levels at areas located closest to the roadways exceed 60 CNEL. The local freeways are the dominant noise sources in the City. Noise contours from the freeways in many cases overlap with and encompass the noise contours from local roadways.

4.10.1.4 John Wayne Airport Noise Contours

Aircraft noise generally affects areas within the airport vicinity during takeoffs and landings, and areas located around the flight tracks. Current airborne noise sources in the City result from civil air operations at John Wayne Airport, located immediately adjacent to the western boundary of the City. It is expected that over the years, noise impacts to the City from aircraft operations at John Wayne Airport will not increase due to agreements in place restricting the number of flights, hours of noise, and aggregate noise. As a civil airport, John Wayne Airport is subject to State Airport Noise Regulation (Title 21), requiring efforts to reduce airport noise impact on existing communities. The John Wayne Airport noise contours are shown in Figure 4.10-3 (Orange County Airport Land Use Commission [ALUC] 2008).

4.10.1.5 Railroad Noise

Railroad noise is the result of the mechanical processes of the engine, the interaction of the wheels with the track, and use of the whistle. The amount of noise generated is dependent upon the speed of the train and the number of cars. In the City, there are regular passenger rail services provided by Amtrak and Metrolink. The Irvine Station is located near the Spectrum Center in the southeastern part of the City. The railroad tracks are utilized by Metrolink's Orange County Line and Inland Empire–Orange County Line and Amtrak's Surfliner as well as Burlington Northern Santa Fe (BNSF) freight trains. The route alignment generally follows the I-5 corridor. Railroad noise contours are shown in Figure 4.10-4.

4.10.1.6 Stationary Noise

Stationary noise sources are the noise sources in the community such as industrial and mechanical equipment, which are often referred to as "fixed sources." Industrial noise generated by processing and operation is usually of long duration at relatively low frequencies. Industrial uses, including manufacturing, warehousing, and distribution-related uses, are another source of noise that can have a varying degree of impact on adjacent uses. Mechanical equipment, generators, and vehicles associated with these uses all contribute to noise levels at industrial sites. Construction sources generate high noise levels for temporary, but sometimes extended periods of time from operation of heavy equipment. Other land uses such as commercial development may result in generally nuisance noise exposure from high amounts of activity, maintenance activities, and mechanical noise. Examples of stationary sources within the City include:

- University of California, Irvine (special events)
- Frank R. Bowerman Landfill (hauling and operational activities)
- Heating, ventilation and air conditioning (HVAC) units
- Various power tools such as lawnmowers or leaf blowers; mechanical equipment required for operation such as car wash facilities
- Animal noise
- Human-related activities such as loud parties, loud music, radio, T.V., or children playing
- Event spaces and amphitheaters result in periodic noise exposure from amplified noise and crowd activity.

4.10.2 Applicable Regulatory Requirements

4.10.2.1 Federal

a. Construction Noise

The FTA provides financial and technical assistance to local public transit systems, including buses, subways, light rail, commuter rail, trolleys, and ferries. FTA also oversees safety measures. The FTA's Transit Noise and Vibration Impact Assessment manual indicates that 80 dB(A) L_{eq} is reasonable criteria for assessing construction noise levels at residential uses (FTA 2018). In the absence of local construction noise level limits, the FTA recommended 80 dB(A) L_{eq} criteria is often used to assess the significance of construction noise at residential receivers.

b. Vibration

The FTA provides criteria for acceptable levels of groundborne vibration for various types of buildings. Structures amplify groundborne vibration; wood-frame buildings, such as typical residential structures, are more affected by ground vibration than heavier buildings. The level at which groundborne vibration is strong enough to cause architectural damage has not been determined conclusively, but the standards recommended by the FTA are shown in Table 4.10-4.

Table 4.10-4 Construction Vibration Damage Criteria		
Building/Structural Category	PPV (in/sec)	Approximate VdB
I. Reinforced-concrete, steel or timber (no plaster)	0.5	102
II. Engineered concrete and masonry (no plaster)	0.3	98
III. Non-engineered timber and masonry buildings	0.2	94
IV. Buildings extremely susceptible to vibration damage	0.12	90
SOURCE: FTA 2018. PPV = peak particle velocity in/sec = inch per second VdB = vibration decibel		

The FTA also provides guidance for assessing vibration impacts from railroad operations. The criteria for determining the significance of impacts are presented in Table 4.10-5.

Table 4.10-5 Guidelines for Determining the Significance of Groundborne Vibration and Noise Impacts						
	Groundborne Vibration Impact Levels (VdB re 1 micro-inch per second)			Groundborne Noise Impact Levels (dB re 20 micro Pascals)		
Land Use Category	Frequent Events	Occasional Events	Infrequent Events	Frequent Events	Occasional Events	Infrequent Events
Category 1: Buildings where low ambient vibration is essential for interior operations (research & manufacturing facilities with special vibration constraints)6	65 VdB	65 VdB	65 VdB	N/A	N/A	N/A
Category 2: Residences and buildings where people normally sleep (hotels, hospitals, residences, & other sleeping facilities)6	72 VdB	75 VdB	80 VdB	35 dB(A)	38 dB(A)	43 dB(A)
Category 3: Institutional land uses with primarily daytime use (schools, churches, libraries, other institutions, & quiet offices)6	75 VdB	78 VdB	83 VdB	40 dB(A)	43 dB(A)	48 dB(A)
SOURCE: FTA 2018. VdB = vibration decibel; re = relative; N/A = not applicable "Frequent Events" is defined as more than 70 vibration events per day. Most rapid transit projects fall into this category. "Occasional Events" is defined as 30 to 70 vibration events per day. Most commuter trunk links fall into this category "Infrequent Events" is defined as fewer than 70 vibration events per day. This category includes most commuter rail systems.						

For Category 1 uses such as vibration sensitive equipment, the screening distance from the right-of-way is 600 feet. For Category 2 land uses such as residences and buildings where people would normally sleep, the screening distance is 200 feet. The screening distance for Category 3 land uses such as institutional land uses with primarily daytime uses, is 120 feet.

4.10.2.2 State

a. General Plan Guidelines

The state of California, through its General Plan Guidelines, discusses how ambient noise should influence land use and development decisions and includes a table of normally acceptable, conditionally acceptable, normally unacceptable, and clearly unacceptable uses at different noise levels, expressed in CNEL (Governor's Office of Planning and Research 2017). This table provides a tool to gauge the compatibility of land uses relative to existing and future noise levels. It provides land use compatibility guidelines that local jurisdictions can use as a guide for establishing its own General Plan noise compatibility levels that reflect the noise-control goals of the community, the particular community's sensitivity to noise, and the community's assessment of the relative importance of noise pollution. The compatibility guidelines identify normally acceptable, conditionally acceptable, and clearly unacceptable noise levels for various land uses. A conditionally acceptable designation implies new construction or development should be undertaken only after detailed analysis of the noise reduction requirements for each land use, and needed noise insulation features are incorporated in the design. By comparison, a normally acceptable designation indicates that standard construction can occur with no special noise reduction requirements.

b. California Code of Regulations

For residential uses, interior noise levels for habitable rooms are regulated also by Title 24 of the California Code of Regulations, California Noise Insulation Standards. Title 24, Chapter 12, Section 1206.4 of the 2022 California Building Code requires that interior noise levels attributable to exterior sources not exceed 45 CNEL in any habitable room within a residential structure. A habitable room is a room used for living, sleeping, eating, or cooking. Bathrooms, closets, hallways, utility spaces, and similar areas are not considered habitable rooms for this regulation.

For nonresidential structures, Title 24, Chapter 12, Section 1207.5 refers to 2022 California Green Building Standards, Chapter 5 – Nonresidential Mandatory Measures, Division 5.5 – Environmental Quality, Section 5.507 – Environmental Comfort, Subsection 5.507.4 – Acoustical Control. Pursuant to these standards, all nonresidential building construction shall employ building assemblies and components that achieve a composite sound transmission class rating of at least 50 or shall otherwise demonstrate that exterior noise shall not result in interior noise environment where noise levels exceed 50 dB(A) L_{eq} in occupied areas during any hour of operation.

4.10.2.3 Orange County Airport Land Use Commission

As discussed in Section 4.10.1.4, John Wayne Airport is located immediately adjacent to the western boundary of the City. The Orange County ALUC prepares airport land use compatibility plans (ALUCP) in order to promote compatibility between airports and the land uses surrounding them. ALUCPs set compatibility criteria applicable to local agencies in their preparation or amendment of land use plans and ordinances. The Airport Environs Land Use Plan (AELUP) for John Wayne Airport provides guidance specific to the airport. The AELUP noise compatibility standards are summarized in Table 4.10-6.

Table 4.10-6
AELUP Limitations on Land Use Due to Noise

Land Use Category	55	60	65	70	75	80
Residential (all types): Single and Multi-Family Residences						
Community Facilities: Churches, Libraries, Schools, Preschools, Day-Care Centers Hospitals, Nursing/Convalescent Homes & Other noise sensitive uses						
Commercial Retail, Office						
Industrial						

	NORMALLY CONSISTENT Conventional construction methods used. No special noise reduction requirements.
	CONDITIONALLY CONSISTENT Must use sound attenuation as required by the California Noise Insulation Standards, Title 25, California Code of Regulations. Residential use sound attenuation required to ensure that the interior CNEL does not exceed 45 dB. Commercial and industrial structures shall be sound attenuated to meet Noise Impact Zone "1" criteria.
	NORMALLY INCONSISTENT All residential units are inconsistent unless are sound attenuated to ensure that the interior CNEL does not exceed 45 dB, and that all units are indoor oriented so as to preclude noise impingement on outdoor living areas.

SOURCE: Orange County ALUC 2008.

4.10.2.4 City of Irvine

a. Current General Plan (2000)

The City's existing General Plan (2000) establishes acceptable interior and exterior noise standards (Table F-1) by land use type and establishes acceptable noise levels by each land use category to ensure land use compatibility (Table F-2). In addition, the existing General Plan includes the following objectives related to noise:

Objective F-1: Mobile Noise. Ensure that City residents are not exposed to mobile noise levels in excess of the CNEL Interior and Exterior Noise Standards (Table F-1), and Single Event Noise Standard.

Objective F-2: Stationary Noise. Ensure that City residents are not exposed to stationary noise levels in excess of the City Noise Ordinance standards.

Objective F-3: Noise Abatement. Achieve maximum efficiency in noise abatement efforts through intergovernmental coordination and public information programs.

b. Municipal Code

Operational Noise

The City regulates noise through the Municipal Code under Title 6 Public Morals, Division 8 Pollution, Chapter 2 Noise (Table 4.10-7). All properties are assigned to the following Noise Zones by the City:

1. Noise *zone 1:* All hospitals, libraries, churches, schools and residential properties.
2. Noise *zone 2:* All professional office and public institutional properties.
3. Noise *zone 3:* All commercial properties excluding professional office properties.
4. Noise *zone 4:* All industrial properties

Table 4.10-7
Municipal Code Noise Standards

Zone	Time of Day	Location	Noise Level dB(A) L_{eq} – Not to be exceed for:

		Interior	--	--	55	60	65

SOURCE: Irvine Municipal Code Title 6 Public Morals, Division 8 Pollution, Chapter 2 Noise.

Construction Noise

The Municipal Code limits construction activities in Section 66-8-205(A), which states:

> Construction activities and agricultural operations may occur between 7:00 a.m. and 7:00 p.m. Mondays through Fridays, and 9:00 a.m. and 6:00 p.m. on Saturdays. No construction activities shall be permitted outside of these hours or on Sundays and federal holidays, except Columbus Day, unless a temporary waiver is granted by the Chief Building Official or his or her authorized representative. Trucks, vehicles, and equipment that are making or are involved with material deliveries, loading, or transfer of materials, equipment service, maintenance of any devices or appurtenances for or within any construction project in the City shall not be operated or driven on City streets outside of these hours or on Sundays and federal holidays unless a temporary waiver is granted by the City. Any waiver granted shall take impact upon the community into consideration. No construction activity and agricultural operations will be permitted outside of these hours except in

> emergencies including maintenance work on the City rights-of-way that might be required.
>
> Deliveries to or pickups from any commercial property sharing a property line with any residential property may occur between 7:00 a.m. and 10:00 p.m. daily. No deliveries to or pickups from any such properties shall occur outside of these hours.

Construction noise is also addressed in Municipal Code Zoning Ordinance Chapter 5 Overlay Districts, Chapter 5-8 Irvine Business Complex Residential Mixed-Use Overlay District, Section 5-8-4 which states:

> Prior to issuance of grading permits, the project applicant shall incorporate the following measures as a note on the grading plan cover sheet to ensure that the greatest distance between noise sources and sensitive receptors during construction activities has been achieved.
>
> - Construction equipment, fixed or mobile, shall be equipped with properly operating and maintained noise mufflers consistent with manufacturer's standards.
> - Construction staging areas shall be located away from off-site sensitive uses during the later phases of project development.
> - The project contractor shall place all stationary construction equipment so that emitted noise is directed away from sensitive receptors nearest the project site, whenever feasible.
> - For construction of sound walls that have been incorporated into the project design, prior to construction of the building foundation, installation of temporary sound blankets (fences typically composed of poly-vinyl-chloride-coated outer shells with adsorbent inner insulation) shall be placed along the boundary of the project site during construction activities.

Vibration

The Municipal Code Zoning Ordinance Chapter 5 Overlay Districts, Chapter 5-8 Irvine Business Complex Residential Mixed-Use Overlay District, Section 5-8-4 Special development requirements states that projects involving vibration-intensive construction activities occurring near sensitive-receptors must be evaluated for potential vibration impacts. The use of less vibration intensive equipment or methods must be implemented if the construction-related vibration exceeds the Federal Transit Administration vibration-annoyance criteria for 78 VdB during the daytime.

c. Existing Plans, Programs, and Policies

Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required of the project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute mitigation measures. The

following measures are existing plans, programs, or policies (PPP) that apply to the project and will help to reduce and avoid potential impacts related to noise:

- PPP NOS-1: Compliance with the California Code of Regulations interior noise standards.
- PPP NOS-2: Compliance with the City's Municipal Code.
- PPP NOS-3: Compliance with Orange County ALUCP noise compatibility standards for John Wayne Airport.

d. Proposed General Plan Strategies and Policies

In addition to the above-listed PPPs, the following proposed goals, objectives, policies, and implementing actions are applicable to the analysis of noise and would replace existing goals, strategies, and policies outlined in the City's adopted General Plan following project approval.

Table 4.10-8 identifies the maximum interior and exterior noise levels for each land use category. The standards assume the incorporation of California state law requirements into all projects.

Table 4.10-8
Interior and Exterior Noise Standards Energy Average (CNEL)

Land Use Categories		Energy Average (CNEL)	
Categories	Uses	Interior[1]	Exterior[2]
Residential	Single-Family, Multiple Family	45[3] 55[4]	65[7]
	Mobile Home	--	65[5]
Commercial/Industrial	Hotel, Motel, Transient Lodging	45	65[6]
	Commercial, Retail, Bank, Restaurant	55	--

	Church, Library	45	--
Open Space	Parks	--	65

[1]Interior environment excludes bathrooms, toilets, closets, and corridors.
[2]Outdoor environment limited to private yard of single-family or multi-family residences private patio which is accessed by a means of exit from inside the unit; mobile home park; hospital patio; park picnic area; school playground; and hotel and motel recreation area.
[3]Noise level requirement with closed windows. Mechanical ventilating system or other means of natural ventilation shall be provided pursuant to Appendix Chapter 12, Section 1208 of UBC.
[4]Noise level requirement with open windows if they are used to meet natural ventilation requirement.
[5]Exterior noise level shall be such that interior noise level will not exceed 45 CNEL.
[6]Except for those areas affected by aircraft noise.
[7]Multi-family developments with balconies that do not meet the 65 CNEL are required to provide occupancy disclosure notices to all future tenants regarding potential noise impacts.

Table 4.10-9 identifies the compatibility of proposed projects and future noise levels. The diagram is used in evaluating new development projects, including General Plan amendments, zone changes, tentative maps, conditional use permits and master plans.

Interpretation:
Zone A (Clearly Compatible): Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.
Zone B (Normally Compatible): New construction or development should be undertaken only after detailed analysis of the noise reduction requirements are made and needed noise insulation features in the design are determined. Conventional construction, with closed windows and fresh air supply systems or air conditioning, will normally suffice.
Zone C (Normally Incompatible): New construction or development should normally be discouraged. If new construction or development does proceed, a detailed analysis or noise reduction requirements must be made, and needed noise insulation features must be included in the design
Zone D (Clearly Incompatible): New construction or development should generally not be undertaken.

Single Event Noise Standard: The maximum interior noise levels of the loudest 10 percent of single noise events [$L_{max(10)}$] for noise-sensitive land uses within the 60 CNEL of aircraft and railroad noise sources shall not exceed 65 dBA between 7 a.m. and 7 p.m. nor 55 dBA between 7 p.m. and 7 a.m.

for typical occupancy. (Note: The samples for single event noise measurement must include representative aircraft operation.)

Goal 1: Noise Control Through Land Use Planning and Design

Objective N-1. Maintain healthy and safe noise environments consistent with the standards in Table 1 through site design and location.

- Policy (a): Require all plans submitted for development review to demonstrate whether the plan area is located within an existing or future Noise Element noise contour, including vehicle, rail, and aircraft noise contours.
- Policy (b): Avoid new residential development within the 65 CNEL contour for aircraft, roadway, or rail noise unless "normally compatible" exterior noise standards can be maintained in private open spaces, and interior noise standards can be achieved through building design.
- Policy (c): Require noise studies to be prepared in accordance with the City's environmental review procedure for all projects that are not "clearly compatible" with the future noise level at the site. Require proposed development projects located in areas that are not "clearly compatible" to demonstrate the incorporation of adequate noise attenuation techniques to achieve compatible interior noise levels.
- Policy (d): Require noise attenuation for private usable outdoor spaces (back yards and single-family housing developments, and balconies or recreation areas in multifamily housing developments) in all developments where projected exterior noise levels exceed "normally compatible" exterior noise standards.
- Policy (e): Require the following Single Event Noise Standard for noise-sensitive land uses within the 60 CNEL of aircraft and railroad noise sources: The maximum interior noise levels of the loudest 10 percent of single noise events [$L_{max(10)}$] shall not exceed 65 dB(A) between 7 a.m. and 7 p.m. nor 55 dB(A) between 7 p.m. and 7 a.m. for typical occupancy. Noise monitoring conducted to determine maximum single-event noise must include representative aircraft operation.
- Policy (f): Require noise studies conducted per Policy € to identify all the reduction measures necessary to reduce noise levels to meet the interior and exterior noise compatibility standards [Table 4.10-8] and Single Event Noise Standard (Policy (N-1e)), as applicable.
- Policy (g): Continue requiring conditional use permits for noise-sensitive land uses such as hospitals, libraries, churches, and schools located in areas not "clearly compatible" to demonstrate how exterior noise exposure would be minimized, such as building orientation, shielding, or limiting outdoor programs.
- Policy (h): Require that mixed-use and multi-family residential developments demonstrate noise compatibility between uses. Structures will adequately isolate noise between adjacent uses through features such as orientation, window, and building insulation, or separation of common walls. Nuisance noise areas such as loading areas, parking lots, driveways, trash enclosures, mechanical equipment, and other noise sources will be located away from the residential portion of the development when physically feasible.
- Policy (i): Require that new development plans demonstrate that implementation would maintain clearly or normally compatible noise levels at existing receptors. In areas where existing ambient noise levels exceed acceptable noise criteria, require that the project

demonstrates that implementation would not result in a more than 3 CNEL change in ambient conditions, including from project-generated vehicle noise sources.

Goal 2: Stationary Noise Sources

Objective N-2. Reduce noise from non-transportation sources such that City residents are not exposed to stationary noise levels that exceed City Noise Ordinance standards.

- Policy (a): Require any new construction to meet the City Noise Ordinance standards. The project applicant will be required to submit construction-related noise reduction strategies for review and approval prior to the issuance of grading permits.
- Policy (b): Require project applicants to depict, on any appropriate development application review (including, but not limited to, zone change, subdivisions, conditional use permit, site plan, and building plans), any potential noise sources known at the time of submittal and reduction measures that ensure these noise sources meet the City Noise Ordinance standards. Such sources include, but are not limited to, the following:
  - Truck pickup and loading areas.
  - Mechanical and electrical equipment such as air conditioning, swimming pool pumps and filters, and spa pumps.
  - Exterior nuisances such as speaker boxes and outdoor public address systems.
- Policy (c): Limit the hours of operation for portions of parks and active recreation uses adjacent to residential areas to daytime hours to minimize disturbance to residents.
- Policy (d): Require outdoor events with amplified noise to implement best management practices to reduce nuisance noise exposure.

Goal 3: Noise Abatement

Objective N-3. Achieve maximum efficiency in noise abatement efforts through establishing minimum standards, intergovernmental coordination, and public information programs.

- Policy (a): Coordinate efforts to reduce noise impacts with appropriate public and government agencies, such as aircraft and transit regulatory agencies.
- Policy (b): Monitor federal and state legislation and programs that will reduce noise in Irvine.
- Policy (c): Use police power to enforce the appropriate noise standards in the state's motor vehicle code and other state and federal legislation for mobile noise sources, including regulation of illegal or faulty exhaust systems, and excessive speed laws.
- Policy (d): Update highway/railroad noise levels (Table 2 of the Noise Element) whenever the City's Irvine Traffic Analysis Model (ITAM) has been significantly changed.
- Policy (e): Seek the cooperation of aircraft regulatory agencies in the modification and selection of flight paths that will reduce noise impacts on residential and other noise-sensitive areas.
- Policy (f): Ensure that any proposal to update aircraft noise contours used by the City of Irvine for planning analysis is submitted, before adoption by the City, to the Airport Land Use Commission
- Policy (g): Minimize the use of noise barriers to reduce noise exposure. Consider other attenuation strategies, such as alternative development siting, soundproofing sensitive receptors, building orientation and setbacks, providing buffer areas or landscape berms, modifying source operating hours, modifying roadway design, or utilizing quieter pavement strategies, as applicable, prior to proposing noise barrier installation.
- Policy (h): Consider the following in the design of new highways and streets to minimize noise exposure:
    - Alignment: The three-dimensional position of the road, as it relates to distance from sensitive receptors.
    - Barriers: Any solid material that shields a receiver from a given source of noise. Types of barriers include walls, berms, hills, and intervening structures.
    - Lateral separation: The horizontal distance between the road and a receiver, which may position an alignment to maximize the distance to the receiver

  - Vertical profile: The path of a roadway in the vertical direction, either below-grade (depressed), above-grade (elevated), or at-grade relative to areas adjacent to the road. Generally, traffic noise levels along depressed roadways are substantially lower than those along roadways that are at grade.
- **Policy (i)**: Examine the existing and projected future noise environment when considering amendments to the City's circulation system. Conduct a noise study to determine whether the project would increase ambient noise levels by more than 3 dBA or cause noise levels to exceed acceptable noise standards for adjacent designated land use categories. If so, implement project features, such as the installation of upgraded windows, to achieve acceptable interior noise standards [Table 4.10-8] at affected receptors. For federally funded roadway construction projects, the applicable sound limits shall be the Federal Highway Administration Standards.
- **Policy (j)**: Reduce noise impacts from mobile sources by encouraging the use of alternative modes of transportation. (See Circulation Element)
- **Policy (k)**: Participate in cooperative efforts with Orange County Transit Authority to fund and construct grade separations, where feasible, through residential areas of the City, giving consideration to all potential funding sources.
- **Policy (l)**: Disseminate public information regarding City noise regulations and programs, the health effects of high noise levels, and means of reducing such levels.
- **Policy (m)**: Reduce community noise levels by continuing to maintain roadways so that the paving is in good condition to reduce noise-generating cracks, bumps, and potholes.
- **Policy (n)**: Encourage rail operators to minimize the level of noise produced by train movements and whistle noise within the City by reducing the number of nighttime operations and improving vehicle system technology.
- **Policy (o)**: Limit "through truck traffic" to designated routes to minimize noise impacts to residential neighborhoods and other noise-sensitive uses (See Circulation Element).

Goal 4: Ground-Borne Vibration

Objective N-4. Minimize exposure to ground-borne vibration such that City residents are not exposed to nuisance vibration or potential building damage.

- **Policy (a)**: Coordinate with rail operators to minimize vibration exposure through routine maintenance of wheel and rail surfaces.
- **Policy (b)**: Require all plans submitted for development review that include the use of pile-driving and blasting during construction to consider alternative methods to minimize the potential for building damage and temporary nuisance exposure.
- **Policy (c)**: Require all plans submitted for development review to utilize vibration standards published by the Federal Transit Administration to evaluate the potential effects of vibration exposure from new vibration sources, such as construction, or siting of new receptors near existing vibration sources, such as rail operations.

4.10.3 Significance Determination Thresholds

Thresholds used to evaluate noise impacts are based on applicable criteria in the California Environmental Quality Act (CEQA) Guidelines (California Code of Regulations Sections 15000-15387), Appendix G. A significant impact would occur if the project would:

1) Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

2) Generate excessive groundborne vibration or groundborne noise levels; or

3) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels.

4.10.4 Methodology

4.10.4.1 Vehicle Traffic Noise

The estimated roadway noise impacts from vehicular traffic were calculated using a computer program that replicates the Federal Highway Administration (FHWA) Traffic Noise Prediction Model-FHWA-RD-77-108. The FHWA Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). In California the national REMELs are substituted with the California Vehicle Noise (Calveno) Emission Levels. Adjustments are then made to the REMEL to account for: the roadway classification (e.g., collector, secondary, major or arterial), the roadway active width (i.e., the distance between the center of the outermost travel lanes on each side of the roadway), the total average daily traffic (ADT), the travel speed, the percentages of automobiles, medium trucks, and heavy trucks in the traffic volume, the roadway grade, the angle of view (e.g., whether the roadway view is blocked), the site conditions ("hard" or "soft" relates to the absorption of the ground, pavement, or landscaping), and the percentage of total ADT which flows each hour throughout a 24-hour period.

The off-site traffic noise analysis includes the following traffic scenarios.

- Existing Conditions
- Current General Plan Buildout/No Project Alternative
- Proposed Project (Conservative Alternative)
- Cumulative Proposed Project (Conservative) Alternative
- Reduced Project Alternative
- Cumulative Reduced Project Alternative

Noise contours were used to assess the project's incremental traffic-related noise impacts at land uses adjacent to roadways conveying project traffic. The noise contours represent the distance to noise levels of a constant value and are measured from the center of the roadway for the 70, 65, and 60 CNEL noise levels. The noise contours do not consider the effect of any existing noise barriers or

topography that may attenuate ambient noise levels. In addition, because the noise contours reflect modeling of vehicular noise on area roadways, they appropriately do not reflect noise contributions from the surrounding stationary noise sources within the City. Existing and future vehicle traffic noise calculations are provided in Appendix E.

4.10.4.2 Railroad Noise

The Metrolink, Amtrak, and BNSF freight trains operate within the City. Noise associated with railroad operations was modeled using the FTA recommended Chicago Rail Efficiency and Transportation Efficiency (CREATE) railroad noise model (Harris Miller & Hanson, Inc. 2006). The number of Amtrak and Metrolink trains that operate during the daytime and nighttime hours were obtained from published schedules. It was assumed that one freight train per hour would operate during the night. Noise contour distances were calculated assuming flat-site conditions and no intervening buildings that would provide noise attenuation.

4.10.4.3 Stationary Noise

Stationary sources of noise include activities associated with a given land use. Various land uses contain on-site stationary noise sources, including rooftop HVAC equipment; mechanical equipment; emergency electrical generators; parking lot activities; loading dock operations; and recreation activities. Stationary noise is considered a "point source" and attenuates over distance at a rate of 6 dB(A) for each doubling of distance. The exact location and nature of future stationary noise sources is not known at this time, and therefore cannot be calculated in this analysis. Impacts were assessed in this analysis by identifying potential types of stationary sources and locations of mixed-use land use interfaces and identifying applicable regulations and mitigation framework for addressing impacts.

4.10.4.4 Construction Noise

Construction noise has the potential to result in temporary ambient noise increases due to construction activities. Construction noise is usually generated by activities such as diesel-powered construction equipment used for site preparation and grading; removal of existing structures and pavement; loading, unloading, and placing materials and paving. Diesel engine-driven trucks also bring materials to the site and remove the spoils from excavation. Table 4.10-10 summarizes typical construction equipment noise levels.

Typical construction equipment would generate maximum noise levels between 70 and 95 dB(A) L_{max} at 50 feet from the source when in operation. During excavation, grading, and paving operations, equipment moves to different locations and goes through varying load cycles, and there are breaks for the operators and for non-equipment tasks, such as measurement. Average construction noise levels were calculated for the simultaneous operation of three common pieces of construction equipment: backhoe, excavator, and loader. The usage factors were applied to the maximum noise level at 50 feet for each piece of equipment, and then noise levels were added logarithmically. Hourly average noise levels would be approximately 83 dB(A) L_{eq} at 50 feet from the center of construction activity when assessing three pieces of common construction equipment working simultaneously. Noise levels would vary depending on the nature of the construction including the duration of

specific activities, nature of the equipment involved, location of the particular receiver, and nature of intervening barriers.

Table 4.10-10
Typical Construction Equipment Noise Levels

Equipment	Noise Level at 50 Feet [dB(A) L_{eq}]	Typical Duty Cycle
Auger Drill Rig	85	20%
Backhoe	80	40%
Blasting	94	1%
Chain Saw	85	20%
Clam Shovel	93	20%
Compactor (ground)	80	20%
Compressor (air)	80	40%
Concrete Mixer Truck	85	40%
Concrete Pump	82	20%
Concrete Saw	90	20%
Crane (mobile or stationary)	85	20%
Dozer	85	40%
Dump Truck	84	40%
Excavator	85	40%
Front End Loader	80	40%
Generator (25 kilovolt ampts or less)	70	50%
Generator (more than 25 kilovolt amps)	82	50%
Grader	85	40%
Hydra Break Ram	90	10%
Impact Pile Driver (diesel or drop)	95	20%
In situ Soil Sampling Rig	84	20%
Jackhammer	85	20%
Mounted Impact Hammer (hoe ram)	90	20%
Paver	85	50%
Pneumatic Tools	85	50%
Pumps	77	50%
Rock Drill	85	20%
Roller	74	40%
Scraper	85	40%
Tractor	84	40%
Vacuum Excavator (vac-truck)	85	40%
Vibratory Concrete Mixer	80	20%
Vibratory Pile Driver	95	20%

SOURCE: FHWA 2006.
dB(A) = A-weighted decibels
L_{eq} = one-hour equivalent noise level.

4.10.4.5 Vibration

Potential sources of groundborne vibration include construction activities, railroad activities, and stationary sources. Table 4.10-11 lists vibration levels for construction equipment.

Table 4.10-11 Vibration Levels for Construction Equipment	
Equipment	Approximate PPV Vibration Level at 25 feet (inch/second)
Pile Driver, Impact (Upper Range)	1.518
Pile Drive, Impact (Typical)	0.644
Pile Driver, Sonic (Upper Range)	0.734
Pile Drive, Sonic (Typical)	0.170
Vibratory Roller	0.210
Large Bulldozer	0.089
Caisson Drilling	0.089
Loaded Trucks	0.076
Jackhammer	0.035
Small Bulldozer	0.003
SOURCE: FTA 2018. PPV = peak particle velocity	

Vibration impacts due to construction equipment were evaluated using these source vibration levels, and the FTA criteria shown in Table 4.10-4. Vibration impacts due to railroad operations were evaluated using the FTA criteria shown in Table 4.10-5 and the FTA screening distances for each land use category. Vibration impacts due to stationary sources were addressed qualitatively.

4.10.5 Topic 1: Increase in Ambient Noise

Would the project generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

4.10.5.1 Impact Analysis

a. Traffic Noise

Increase in Ambient Noise

Noise level increases resulting from the project are evaluated based on Appendix G of the State CEQA Guidelines described above at the closest sensitive receiver locations. Under CEQA, consideration must be given to the magnitude of the increase, the existing baseline ambient noise levels, and the location of noise-sensitive receivers to determine if a noise increase represents a significant adverse environmental impact. This approach recognizes that there is no single noise increase that renders the noise impact significant. This is primarily because of the wide variation in individual thresholds of annoyance and differing individual experiences with noise. Thus, an important way of determining a person's subjective reaction to a new noise is the comparison of it to the existing environment to which one has adapted—the so-called ambient environment.

In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will typically be judged. The Federal Interagency Committee on Noise (FICON) developed guidance to be used for the assessment of project-generated increases in noise levels that consider the ambient noise level. The FICON recommendations are based on studies that relate aircraft noise levels to the percentage of persons highly annoyed by aircraft noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, these recommendations are often used in environmental noise impact assessments involving the use of cumulative noise exposure metrics, such as the average-daily noise level (CNEL) and equivalent continuous noise level (L_{eq}).

The FICON guidance provides an established source of criteria to assess the impacts of substantial temporary or permanent increase in baseline ambient noise levels. Based on the FICON criteria, the amount to which a given noise level increase is considered acceptable is reduced when the without project (baseline) noise levels are already shown to exceed certain land-use specific exterior noise level criteria. The specific levels are based on typical responses to noise level increases of 5 dB(A) or readily perceptible, 3 dB(A) or barely perceptible, and 1.5 dB(A) depending on the underlying without project noise levels for noise-sensitive uses. These levels of increases and their perceived acceptance are consistent with guidance provided by both the FHWA and Caltrans.

Based on this guidance, long-term traffic noise that affects sensitive land uses would be considered substantial and constitute a significant noise impact if the project would:

- Increase noise levels by 5 dB or more where the no project noise level is less than 60 CNEL;
- Increase noise levels by 3 dB or more where the no project noise level is 60 CNEL to 65 CNEL; or
- Increase noise levels by 1.5 dB or more where the no project noise level is greater than 65 CNEL.

Implementation of the project would include updates to the City's General Plan (and the resulting increased development capacity of 57,656 residential units), the continued implementation of nonresidential uses at the same intensities permitted under the City's General Plan, implementation of nonresidential uses within the Great Park, and the extension of the Ada roadway.

The noise analysis is based on the baseline (year 2016 for which a complete data set exists) and future (year 2045) traffic volume data. Without the project, existing noise levels are up to 79.0 CNEL at the nearest receiving land uses. With the project, future noise levels are expected to range from 53.2 to 79.2 CNEL at the nearest receiving land uses. Off-site traffic noise level impacts would exceed the noise level increase thresholds along 147 roadway segments. Table 4.10-12 summarizes the existing and future noise levels at the impacted roadway segments under buildout of the project. Based on the significance criteria for off-site traffic noise, land uses adjacent to these study area roadway segments would experience a significant noise level increases due to the Project-related traffic as compared to the existing traffic noise levels.

Table 4.10-12
Significant Traffic Noise Increases Along Study Roadway Segments

ID	Road	Segment	CNEL at Receiving Land Use			Incremental Noise Level Increase Threshold

SOURCE: Appendix G.

It should be noted that without approval of the project, a significant increase in ambient noise levels would also occur with buildout with the adopted General Plan. This is due to regional growth under the adopted General Plan (2000). Buildout conditions will range from 53.5 to 79.1 CNEL, except along Ada Street since it would not exist under the current General Plan. Under buildout of the adopted General Plan, off-site traffic noise level impacts would exceed noise level increase thresholds along 86 segments.

The Noise Element Update includes measures to reduce vehicle noise. As discussed in detail in the Land Use Compatibility section below, future development under the project would be subject to policies under Goal N-1, Objective N-1, which would require future development to control noise through land use planning and design. Future development would be required to prepare noise studies in accordance with the City's environmental review procedure for all projects that are not "clearly compatible" with the future noise level at the site. These studies are required to identify all measures necessary to reduce noise levels to meet the City's interior and exterior noise compatibility standards and Single Event Noise Standard. Through implementation of these policies, noise levels at new noise-sensitive land uses would be evaluated and noise reduction techniques would be implemented to reduce noise exposure.

For existing land uses exposed to significant increase in noise, the Noise Element Update contains policies under Goal N-3, Noise Abatement, Objective N-3. Policy (i) that would require an examination of the existing and future noise environment when considering amendments to the City's circulation system. It requires the implementation of project features, such as the installation of upgraded windows, to achieve acceptable interior noise standards at affected receptors. Policy (j) seeks to reduce noise impacts from mobile sources by encouraging the use of alternative modes of transportation. Policy (m) reduces community noise levels by continuing to maintain roadways so that the paving is in good condition to reduce noise-generating cracks, bumps, and potholes. However, the increase in ambient noise levels adjacent to the roadway segments listed above would likely remain at levels that would expose existing noise-sensitive receptors to a significant increase in ambient noise levels, and impacts would be significant.

Land Use Compatibility

Future vehicle traffic noise contours are shown in Figure 4.10-5. These noise contours account for future traffic generated by development of the project, as well as the extension of Ada roadway. A significant impact would occur if implementation of the project resulted in an exposure of people to current or future motor vehicle traffic noise levels that exceed standards established in the Noise Element Update (see Tables 4.10-8 and 4.10-9).

The project focuses mixed-use development in existing urbanized areas throughout the City using overlay zones. Most of the increased density is proposed in Focus Areas 1, 2 and 3, which are located near existing or planned travel corridors. Focus Area 1 is in the Irvine Business Complex (IBC) and would expand residential and mixed-uses to sites previously designated for nonresidential uses through implementation of the proposed residential and residential mixed-use overlay. Focus Area 2 is in the Greater Spectrum Area and would expand residential uses through the implementation of the new overlay. Focus Area 3 is in the Great Park Neighborhood Transit Village and would also allow for residential uses on nonresidential properties through implementation of the proposed overlay. The Great Park Neighborhood is an existing mixed-use planning area that features a mix of residential uses at varying densities surrounding the Irvine Great Park. The project would increase the number of residential units permitted in the Great Park with a focus on higher density near or adjacent to the Irvine Transit Center. Additionally, the project utilizes a customized concept of transit-oriented development to suit the unique context of the Greater Irvine Business Complex Area, the Greater Spectrum Area, and the Great Park Neighborhood Transit Village Area. Transit-oriented development permits greater residential densities and a wider range of land uses, such as offices, housing, retail, and services, in select geographic areas.

As shown in Figure 4.10-5, these focus areas are located adjacent to freeways and other heavily traveled roadways. Noise-sensitive uses that are developed near higher-volume roadways could experience noise levels exceeding the proposed Noise Element Update noise standards, particularly for those uses located near freeways. The Noise Element Update contains policies under Goal N-1, Objective N-1 that would require future development implemented under the project to control noise through land use planning and design. Future development would be required to prepare noise studies in accordance with the City's environmental review procedure for all projects that are not "clearly compatible" with the future noise level at the site. These studies are required to identify all measures necessary to reduce noise levels to meet the City's interior and exterior noise compatibility standards and Single Event Noise Standard. Conditional use permits would be required for noise-sensitive land uses such as hospitals, libraries, churches, and schools located in areas not "clearly compatible" to demonstrate how exterior noise exposure would be minimized, such as building orientation, shielding, or limiting outdoor programs. Additionally, mixed-use and multi-family residential developments are required to demonstrate noise compatibility between uses. Further, the Noise Element Update contains the following implementing actions under Goal N-1:

FIGURE 4.10-5
Future Traffic Noise Contours

- Conduct comprehensive noise impact assessments for proposed development projects to evaluate potential noise sources and their impact on surrounding areas. Use predictive modeling and noise mapping techniques to assess noise levels at different locations and identify reduction measures to ensure compliance with noise standards.
- Prioritize site selection for new development projects in areas with lower ambient noise levels and minimal exposure to noise sources, such as heavy traffic or industrial activities. Consider proximity to noise-sensitive land uses, such as residential areas, schools, hospitals, and parks, when siting new developments.
- Establish noise buffer zones or green spaces between noise-generating activities and noise-sensitive land uses to mitigate the transmission of noise and protect vulnerable populations. Designate setbacks or open space corridors to create natural barriers that absorb or deflect noise away from sensitive receptors.
- Orient buildings and structures to minimize exposure to noise sources and maximize natural sound attenuation. Design building layouts and configurations to create quiet zones or shield noise-sensitive areas from adjacent noise sources, such as roads, railways, or industrial facilities.
- Incorporate sound-absorbing materials, insulation, and architectural features into building design and construction to reduce indoor noise levels and enhance occupant comfort. Utilize noise-reducing technologies, such as double-glazed windows, soundproofing walls, and resilient flooring, to mitigate noise intrusion from external sources.
- Implement traffic calming measures, such as speed limits, traffic calming devices, and road design modifications, to reduce vehicle-related noise emissions and enhance pedestrian safety. Design access routes and circulation patterns to minimize noise impacts on adjacent properties and improve traffic flow efficiency.
- Utilize landscaping and vegetation strategies to create natural barriers and absorb sound waves, reducing the transmission of noise between land uses. Plant trees, shrubs, and hedges strategically to create green buffers and enhance visual screening while providing habitat and aesthetic benefits.
- Establish noise easements or restrictive covenants as part of property agreements to limit future development or land uses that could exacerbate noise impacts in sensitive areas. Ensure that developers and property owners adhere to noise reduction requirements and maintain compliance with noise standards over time.
- Engage with local communities, stakeholders, and residents early in the planning and design process to solicit input, address concerns, and build consensus around noise mitigation strategies. Foster collaboration and partnership with community organizations, neighborhood associations, and advocacy groups to ensure that noise considerations are integrated into decision-making processes.
- Implement monitoring programs to assess compliance with noise standards and evaluate the effectiveness of noise reduction measures over time. Conduct regular inspections, noise surveys, and performance evaluations to verify compliance with approved plans and address any non-compliance issues promptly.

However, traffic noise would likely remain at levels that that would exceed exterior and interior standards, and impacts would be significant.

b. Railroad Noise

The Metrolink, Amtrak, and BNSF freight trains operate within the City. Railroad noise contours are shown in Figure 4.10-4 and contour distances are summarized in Table 4.10-13.

Table 4.10-13
Railroad Noise Contour Distances

Station	Noise Level at 50 feet (CNEL)	Distance to Noise Contour (feet)		
		70 CNEL	65 CNEL	60 CNEL
Irvine Station	75	155	490	1,551

CNEL = community noise equivalent level

As shown in Figure 4.10-4, Focus Areas 2 and 3 are exposed to significant railroad noise level. Noise-sensitive receivers in the vicinity of the railroad tracks could be exposed to noise levels that exceed the compatibility standards. However, the Noise Element Update contains policies under Goal N-1, Objective N-1 that would require future development implemented under the project to control noise through land use planning and design. This includes development exposed to railroad noise. Additionally, Policy (e) implements the Single Event Noise Standard for noise-sensitive land uses within the 60 CNEL of aircraft and railroad noise sources. Policy (n) encourages rail operators to minimize the level of noise produced by train movements and whistle noise within the City by reducing the number of nighttime operations and improving vehicle system technology. However, noise associated with railroad operations would likely remain at levels that would expose existing noise-sensitive receptors to a significant increase in ambient noise levels, and impacts would be significant.

c. Stationary Noise

A significant impact would occur if implementation of the project resulted in the exposure of people to noise levels that exceed property line limits established in Municipal Code under Title 6 Public Morals, Division 8 Pollution, Chapter 2 Noise (see Table 4.10-7). Stationary sources of noise include activities associated with a given land use. For example, noise sources from commercial land uses would include car washes, fast food restaurants, auto repair facilities, parking lots, and a variety of other uses. Noise generated by residential or commercial uses is generally short-lived and intermittent, while noise generated by auto-oriented commercial and industrial uses is usually sporadic, highly variable, and spatially distributed. Noise sources from industrial uses would include mechanical equipment, generators, and trucks. Additionally, potential noise conflicts could occur in mixed-use areas where residential uses are close to commercial and retail uses.

The type of land uses proposed under the project would be similar to land uses that currently exist in the City. The project would primarily focus future development and redevelopment within the three focus areas. Noise levels within the City are currently dominated by vehicle traffic on freeways and heavily traveled area roadways and would continue to be the primary source of noise under

project buildout. Therefore, future noise levels from stationary sources throughout the City would not be expected to increase the hourly or daily average sound level with respect to current conditions. While noise-sensitive residential land uses would be exposed to noise associated with the operation of commercial and industrial uses, future development would be required to show compliance with the Municipal Code. Additionally, the Noise Element Update contains policies to reduce impacts associated with stationary sources of noise. Specifically, Goal N-2, Objective N-2, Policy (b) requires project applicants to depict, on any appropriate development application review (including, but not limited to, zone changes, subdivisions, conditional use permit, site plan, and building plans), any potential noise sources known at the time of submittal and reduction measures that ensure these noise sources meet the City Noise Ordinance standards. Policy (c) limits the hours of operation for portions of parks and active recreation uses adjacent to residential areas to daytime hours to minimize disturbance to residents.

The Noise Element Update also includes a comprehensive list of measures that are required for outdoor events with amplified music. These events could be held at the Irvine amphitheater located in the eastern portion of the City and at parks and other open spaces. Noise from amplified music could be a disturbance to residences and other noise-sensitive land uses located in the vicinity. However, Goal N-2, Objective N-2, Policy (d) requires outdoor events with amplified noise to implement best management practices to reduce nuisance noise exposure. Noise minimization measures would be required as a part of the permitting process for events.

However, noise associated with stationary noise would likely remain at levels that would expose existing noise-sensitive receptors to a significant increase in ambient noise levels, and impacts would be significant.

d. Construction Noise

Implementation of the project would result in various development projects being constructed simultaneously and over the duration of General Plan buildout. Future development implemented under the project could result in a temporary ambient noise increase due to construction activities. Due to the developed nature of the City, there is a high likelihood that construction activities would take place adjacent to existing structures and that sensitive receptors would be close to construction activities.

Construction noise typically occurs intermittently and varies depending upon the nature or phase of construction (e.g., demolition; land clearing, grading, and excavation; erection). Construction noise would be short term and would include noise from activities such as site preparation, truck hauling of material, pouring of concrete, and the use of power tools. Noise would also be generated by construction equipment use, including earthmovers, material handlers, and portable generators, and could reach high noise levels for brief periods.

As discussed in Section 4.13.3.4 above, hourly average noise levels would be approximately 83 dB(A) L_{eq} at 50 feet from the center of construction activity when assessing three pieces of common construction equipment working simultaneously. Noise levels would vary depending on the nature of the construction activities including the duration of specific activities, the equipment involved, the location of the sensitive receivers, and the presence of intervening barriers. Construction noise levels

of 83 dB(A) L_{eq} at 50 feet would attenuate to 80 dB(A) L_{eq} at 70 feet. Therefore, significant impacts would occur if sensitive land uses are located closer than 70 feet of construction activities.

The City regulates construction noise through Municipal Code Section 66-8-205(A) and Municipal Code Zoning Ordinance Chapter 5 Overlay Districts, Chapter 5-8 Irvine Business Complex Residential Mixed-Use Overlay District, Section 5-8-4. The City limits construction activities to 7:00 a.m. and 7:00 p.m. Mondays through Fridays, and 9:00 a.m. and 6:00 p.m. on Saturdays. Additionally, Goal N-2, Objective N-2, Policy (a) requires any new construction to meet the City Noise Ordinance standards.

Implementation of the project would increase development capacity within the City. As noted previously, construction noise levels are variable and depend on specific locations, site plans, and construction details relative to specific projects. Significant noise impacts may occur associated with individual projects which have not yet been developed, particularly if construction techniques (e.g., pile driving) are proposed. However, construction would be localized and would occur intermittently for varying periods of time in accordance with the City's Municipal Code, Zoning Ordinance, and Noise Element.

Because project-level information is not yet available, it is not possible to quantify construction noise impacts at noise-sensitive receptors. In most cases, construction of individual projects would temporarily increase the ambient noise environment, potentially affecting existing and future sensitive receptors. Mitigation measure NOI-1 and Noise Element goals, objectives, and policies (Goal N-2, Objective N-2, Policy (a)) would serve to minimize construction noise. However, because construction activities may occur near noise-sensitive uses and because noise disturbances could occur for prolonged periods of time or during noise-sensitive hours of the day, construction noise impacts associated with future development would be significant and would require mitigation.

4.10.5.2 Significance of Impacts

a. Traffic Noise

Increase in Ambient Noise

The increase in ambient noise levels adjacent to roadway segments listed in Table 4.10-12 would expose existing noise-sensitive receptors to a significant increase in ambient noise levels, and impacts would be significant.

Land Use Compatibility

Per existing General Plan Noise Element Policy F-1(d) and the Noise Element Update, future development proposals within the City would be required to conduct site-specific exterior and interior noise analyses to demonstrate that the proposed development would not place sensitive receptors in locations where the existing or future noise levels would exceed the land use compatibility standards. However, because specific project details are not yet known, impacts associated with land use compatibility conflicts would be significant.

b. Railroad Noise

The Noise Element Update contains policies under Goal N-1, Objective N-1 that would require future development implemented under the project to control noise through land use planning and design. This includes development exposed to railroad noise. However, because specific project details are not yet known, railroad noise impacts associated with new development would be significant.

c. Stationary Noise

Future development would be required to show compliance with the Municipal Code. Additionally, the Noise Element Update contains policies to reduce impacts associated with stationary sources of noise. However, because specific project details are not yet known, impacts associated with stationary sources of noise would be significant.

d. Construction Noise

The City limits construction activities to 7:00 a.m. and 7:00 p.m. Mondays through Fridays, and 9:00 a.m. and 6:00 p.m. on Saturdays. Additionally, Goal N-2, Objective N-2, Policy (a) requires any new construction to meet the City Noise Ordinance standards. However, because specific project details are not yet known and because construction activities could expose noise-sensitive uses to periods of high level construction noise, construction noise impacts associated with future development under the project would be significant. Despite adherence with the City's Municipal Code, Zoning Ordinance, and Noise Element, impacts would remain significant.

4.10.5.3 Mitigation

a. Traffic Noise

Increase in Ambient Noise

Impacts associated with the increase in ambient noise and land use compatibility would be significant without mitigation. For existing noise sensitive land uses, possible noise-reduction measures would include retrofitting older structures with acoustically rated windows and doors featuring higher Sound Transmission Class ratings, which is a measure of exterior noise reduction performance. However, there is no mechanism in place for implementing such a retrofit program. Because the significant noise impacts would be to existing homes and other noise-sensitive uses in an already urbanized area, there is no feasible mitigation. Mitigation for future development under the project is presented below.

NOI-1: Prior to the issuance of building permits, site-specific exterior noise analyses that demonstrate that the project would not place residential receptors in locations where the exterior existing or future noise levels would exceed the City's noise compatibility standards shall be required as part of the review of future residential development proposals. Noise reduction measures, including but not limited to building noise barriers, increased building setbacks, speed reductions on surrounding roadways, alternative pavement surfaces, or other relevant noise attenuation measures, may be

used to achieve the noise compatibility standards. Exact noise mitigation measures and their effectiveness shall be determined by the site-specific exterior noise analyses.

NOI-2: Prior to the issuance of building permits, site specific interior noise analyses demonstrating compliance with the City's interior noise compatibility standards and other applicable regulations shall be prepared for noise sensitive land uses located in areas where the exterior noise levels exceed the City's noise compatibility standards. Noise control measures, including but not limited to increasing roof, wall, window, and door sound attenuation ratings, placing HVAC in noise reducing enclosures, or designing buildings so that no windows face freeways or major roadways may be used to achieve the noise compatibility standards. Exact noise mitigation measures and their effectiveness shall be determined by the site specific exterior noise analyses.

Land Use Compatibility

See mitigation measures NOI-1 and NOI-2 above.

b. Railroad Noise

See mitigation measures NOI-1 and NOI-2 above.

c. Stationary Noise

NOI-3: Prior to the issuance of a building permit, a site-specific acoustical/noise analysis of any on-site generated noise sources, including generators, mechanical equipment, and trucks, shall be prepared which identifies all noise-generating equipment, predicts noise levels at property lines from all identified equipment, and recommends mitigation to be implemented (e.g., enclosures, barriers, site orientation), to ensure compliance with the City's noise standards. Noise reduction measures shall include building noise-attenuating walls, limiting the hours of operation, or other attenuation measures. Additionally, future projects shall be required to buffer sensitive receptors from noise sources through the use of open space and other separation techniques as recommended after thorough analysis by a qualified acoustical engineer. Exact noise mitigation measures and their effectiveness shall be determined by the site specific noise analyses.

d. Construction Noise

NOI-4: Construction contractors shall implement the following measures for construction activities conducted in the City of Irvine. Construction plans submitted to the City shall identify these measures on demolition, grading, and construction plans submitted to the City:

- The City of Irvine Community Development Department shall verify that grading, demolition, and/or construction plans submitted to the City include these notations prior to issuance of demolition, grading, and/or building permits.

- Construction activity is limited to the hours: Between 7:00 AM to 7:00 PM Monday through Friday and 9:00 a.m. and 6:00 p.m. on Saturdays as prescribed in Municipal Code Section 66-8-205(A). No construction activities shall be permitted outside of these hours or on Sundays and federal holidays, except Columbus Day, unless a temporary waiver is granted by the Chief Building Official or their authorized representative.
- During the entire active construction period, equipment and trucks used for project construction shall use the best-available noise control techniques (e.g., improved mufflers, equipment re-design, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds), wherever feasible.
- Impact tools (e.g., jack hammers and hoe rams) shall be hydraulically or electrically powered wherever possible. Where the use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used along with external noise jackets on the tools.
- Stationary equipment, such as generators and air compressors shall be located as far as feasible from nearby noise-sensitive uses.
- Stockpiling shall be located as far as feasible from nearby noise-sensitive receptors.
- Construction traffic shall be limited, to the extent feasible, to approved haul routes established by the City of Irvine Community Development Department.
- At least 10 days prior to the start of construction activities, a sign shall be posted at the entrance(s) to the job site, clearly visible to the public, that includes permitted construction days and hours, as well as the telephone numbers of the City's and contractor's authorized representatives that are assigned to respond in the event of a noise or vibration complaint. If the authorized contractor's representative receives a complaint, he/she shall investigate, take appropriate corrective action, and report the action to the City.
- Signs shall be posted at the job site entrance(s), within the on-site construction zones, and along queueing lanes (if any) to reinforce the prohibition of unnecessary engine idling. All other equipment shall be turned off if not in use for more than 5 minutes.
- During the entire active construction period and to the extent feasible, the use of noise-producing signals, including horns, whistles, alarms, and bells, shall be for safety warning purposes only. The construction manager shall use smart back-up alarms, which automatically adjust the alarm level based on the background noise level or switch off back-up alarms and replace with human spotters in compliance with all safety requirements and laws.
- Erect temporary noise barriers (at least as high as the exhaust of equipment and breaking line-of-sight between noise sources and sensitive receptors), as necessary and feasible, to maintain construction noise levels at or below the performance standard of 80 dBA Leq. Barriers shall be constructed with a solid

material that has a density of at least 4 pounds per square foot with no gaps from the ground to the top of the barrier.

4.10.5.4 Significance of Impacts after Mitigation

a. Traffic Noise

Increase in Ambient Noise

Impacts to existing sensitive land uses located in areas that would experience a significant increase in ambient noise levels exceeding the applicable land use and noise compatibility level would be significant and unavoidable at this program level of review. Implementation of mitigation measures NOI-1 and NOI-2 would reduce noise exposure for future development to the extent feasible. However, site-specific development projects are not currently available, and there is a potential for noise to exceed the City's noise standards. Therefore, despite adherence to mitigation measures NOI-1 and NOI-2, impacts associated with increases in ambient noise would remain significant and unavoidable.

Land Use Compatibility

Implementation of mitigation measures NOI-1 and NOI-2 would reduce noise exposure for future development to the extent feasible. However, site-specific development projects are not currently available, and there is a potential for noise to exceed the City's noise standards. Therefore, despite adherence to mitigation measures NOI-1 and NOI-2, impacts associated with land use incompatibility would remain significant and unavoidable.

b. Railroad Noise

Implementation of mitigation measures NOI-1 and NOI-2 would reduce impacts related to railroad noise to a level less than significant.

c. Stationary Noise

Implementation of mitigation measure NOI-3 would reduce impacts related to stationary noise to a level less than significant.

d. Construction Noise

Implementation of mitigation measure NOI-4 would reduce impacts related to construction noise to a level less than significant.

4.10.6 Topic 2: Vibration

Would the project generate excessive groundborne vibration or groundborne noise levels?

4.10.6.1 Impact Analysis

a. Construction

Construction activities may include demolition of existing structures, site preparation work, excavation of parking and subfloors, foundation work, and building construction. Demolition for an individual site may last several weeks to months and may produce substantial vibration. Excavation for underground levels could also occur on some development sites, and vibratory pile driving could be used to stabilize the walls of excavated areas. Piles or drilled caissons may also be used to support building foundations.

As with any type of construction, vibration levels during any phase may at times be perceptible. However, non-pile driving or foundation work construction phases that have the highest potential of producing vibration (such as jackhammering and other high-power tools) would be intermittent and would only occur for short periods of time for any individual development site. By use of administrative controls, such as scheduling construction activities with the highest potential to produce perceptible vibration to hours with least potential to affect nearby properties, perceptible vibration can be kept to a minimum and as such would result in a less than significant impact with respect to perception.

Pile driving has the potential to generate the highest groundborne vibration levels and is the primary concern for structural damage when it occurs within close to structures. As shown in Table 4.10-11, vibration generated by construction equipment has the potential to be substantial, since it has the potential to exceed the FTA criteria for architectural damage (e.g., 0.12 PPV for fragile or historical resources, 0.2 PPV for non-engineered timber and masonry buildings, and 0.3 PPV for engineered concrete and masonry). Construction details and equipment for future project-level development is not known. Noise Element Update contains policies under Goal N-4, Objective N-4 to minimize impacts associated with construction vibration. Specifically, Policy (b) requires all plans submitted for development review that include the use of pile-driving and blasting during construction to consider alternative methods to minimize the potential for building damage and temporary nuisance exposure. Policy (c) requires all plans submitted for development review to utilize vibration standards published by the Federal Transit Administration to evaluate the potential effects of vibration exposure from new vibration sources, such as construction, or siting of new receptors near existing vibration sources, such as rail operations. Despite implementation of these policies and implementing actions, future development would result in potentially significant construction vibration impacts requiring mitigation.

b. Railroad

The Metrolink, Amtrak, and BNSF freight trains operate within the City. Construction of vibration-sensitive uses close to railroad tracks can cause rattling windows and vibration of floors. Train vibration depends upon a variety of factors. The weight of the train, the travel speed, the condition of the track and the character of the subsoil all affect the observed vibration level. Vibration impacts due to the proximity of land uses to the rail corridor were analyzed using the FTA criteria shown in Table 4.13-5. Based on published schedules, 34 Metrolink trains and 20 Amtrak trains operate through the City each day. These are considered occasional events (30 to 70 per day). As shown in Table 4.13-5, a significant vibration impact may occur if Category 1, 2, and 3 land uses are exposed to vibration levels of 65, 75, and 78 VdB, respectively, for occasional events.

Figure 4.10-6 shows the generalized ground surface vibration curves that are based on measurements of ground-borne vibration at representative North American transit systems (FTA 2018). These curves can be used to represent vibration characteristics for standard transportation systems. Using these curves, Category 1 land uses would be exposed to significant vibration levels within approximately 350 feet of the railroad tracks, Category 2 land uses would be exposed to significant vibration levels within approximately 140 feet of the railroad tracks, and Category 3 land uses would be exposed to significant vibration levels within approximately 120 feet of the railroad tracks. Additionally, the Noise Element Update contains policies under Goal N-4, Objective N-4 to minimize impacts associated with railroad vibration. Specifically, Policy (a) requires the City to coordinate with rail operators to minimize vibration exposure through routine maintenance of wheel and rail surfaces. Policy (c) requires all plans submitted for development review to utilize vibration standards published by the Federal Transit Administration to evaluate the potential effects of vibration exposure from new vibration sources, such as construction, or siting of new receptors near existing vibration sources, such as rail operations. Further, the Noise Element Update contains the following implementing actions under Goal N-4 related to railroad vibration:

- Explore the use of quieter vehicles, buses, or trains or retrofit existing infrastructure with noise-reducing technologies.
- Develop and promote building design guidelines that incorporate measures to reduce the transmission of ground-borne vibration, such as adequate building separation, resilient building materials, or structural isolation systems.

Despite implementation of these policies and implementing actions, future development could result in potentially significant railroad vibration impacts.

Generalized Ground Surface Vibration Curve

RECON
M:\JOBS5\9919\nos\graphics\fig4-10.6.afdesign 03/04/24 bma

c. Stationary Sources

Industrial manufacturing operations occasionally utilize equipment or processes that have a potential to generate groundborne vibration. However, vibrations found to be excessive for human exposure that are the result of industrial machinery are generally addressed from an occupational health and safety perspective. The residual vibrations are typically of such low amplitude that they quickly dissipate into the surrounding soil and are rarely perceivable at the surrounding land uses. Furthermore, the project does not propose any industrial manufacturing uses. Residential and commercial uses do not typically generate vibration. Therefore, vibration impacts associated with stationary sources would be less than significant.

4.10.6.2 Significance of Impacts

a. Construction

The Noise Element Update contains policies and implementing actions under Goal N-4, Objective N-4 to minimize impacts associated with construction vibration. However, because specific project details are not yet known, construction vibration impacts would be significant.

b. Railroad

The Noise Element Update contains policies under Goal N-4, Objective N-4 to minimize impacts associated with railroad vibration. However, because specific project details are not yet known railroad vibration impacts would be significant.

c. Stationary Sources

Vibration impacts associated with stationary sources would be less than significant.

4.10.6.3 Mitigation

a. Construction

NOI-5: Prior to issuance of a building permit for a project requiring pile driving during construction within 135 feet of fragile structures, such as historical resources, 100 feet of non-engineered timber and masonry buildings (e.g., most residential buildings), or within 75 feet of engineered concrete and masonry (no plaster); or a vibratory roller within 25 feet of any structure, the project applicant shall prepare a noise and vibration analysis to assess and mitigate potential noise and vibration impacts related to these activities. This noise and vibration analysis shall be conducted by a qualified and experienced acoustical consultant or engineer. The vibration levels shall not exceed Federal Transit Administration (FTA) architectural damage thresholds (e.g., 0.12 inches per second [in/sec] peak particle velocity [PPV] for fragile or historical resources, 0.2 in/sec PPV for non-engineered timber and masonry buildings, and 0.3 in/sec PPV for engineered concrete and masonry). If vibration levels would exceed this threshold, alternative uses such as drilling piles as opposed to pile driving and

static rollers as opposed to vibratory rollers shall be used. If necessary, construction vibration monitoring shall be conducted to ensure vibration thresholds are not exceeded.

b. Railroad

NOI-6: New residential projects (or other noise-sensitive uses) located within 200 feet of existing railroad lines shall be required to conduct a groundborne vibration and noise evaluation consistent with Federal Transit Administration (FTA)-approved methodologies.

c. Stationary Sources

Impacts would be less than significant. No mitigation is required.

4.10.6.4 Significance of Impacts after Mitigation

a. Construction

Implementation of mitigation measure NOI-5 would reduce exposure to construction vibration to the extent feasible. However, site-specific development projects are not currently available, and there is a potential for construction vibration to exceed the applicable standards. Therefore, despite adherence to mitigation measure NOI-5, impacts associated with construction vibration would remain significant and unavoidable.

b. Railroad

Implementation of mitigation measure NOI-6 would reduce exposure to railroad vibration to a level less than significant.

c. Stationary Sources

Impacts would be less than significant. No mitigation is required.

4.10.7 Topic 3: Airports

Would the project expose people residing or working in the project area to excessive aircraft noise levels?

4.10.7.1 Impact Analysis

John Wayne Airport is located immediately adjacent to the western boundary of the City, generally bounded by I-405, State Route 55, State Route 73, and Campus Drive. Airport noise contours are shown in Figure 4.10-3 and the Orange County ALUC noise compatibility criteria are shown in Table 4.10-6. The 60 CNEL noise contour extends into the western portion of Focus Area 1. The project would expand residential and mixed-uses to sites previously designated for nonresidential

uses within Focus Area 1. Residential and other noise sensitive land uses located within the 60 CNEL contour for John Wayne Airport could be exposed to significant airport noise levels. However, the Noise Element Update contains policies under Goal N-1, Objective N-1 that would require future development implemented under the project to control noise through land use planning and design. This includes development exposed to airport noise. Future development would be required to prepare noise studies in accordance with the City's environmental review procedure for all projects that are not "clearly compatible" with the future noise level at the site. These studies are required to identify all measures necessary to reduce noise levels to meet the City's interior and exterior noise compatibility standards and Single Event Noise Standard. Additionally, policies contained under Goal N-3, Objective N-3 relate to noise abatement of aircraft noise. Policy (a) requires the City to coordinate efforts to reduce noise impacts with appropriate public and government agencies, such as aircraft and transit regulatory agencies. Policy (e) seeks the cooperation of aircraft regulatory agencies in the modification and selection of flight paths that will reduce noise impacts on residential and other noise-sensitive areas. Policy (f) ensures any proposal to update aircraft noise contours used by the City of Irvine for planning analysis is submitted, before adoption by the City, to the ALUC. Therefore, adherence with the noise requirements of the ALUCP (PPP NOI-2), the Noise Element Update policies, and associated FAA requirements would ensure that future development would not expose people to excessive aircraft noise levels, and impacts would be less than significant.

4.10.7.2 Significance of Impacts

Adherence with the noise requirements of the ALUCP, the Noise Element Update policies, and associated FAA requirements would ensure that future development would not expose people to excessive aircraft noise levels, and impacts would be less than significant.

4.10.7.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.10.7.4 Significance of Impacts after Mitigation

Impacts would be less than significant. No mitigation is required.

4.10.8 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for noise. The analysis of vehicle traffic noise provided above is cumulative in nature because the analysis considers noise impacts associated with buildout of the entirety of the City and the traffic assumptions used in the analysis include cumulative traffic associated with regional growth. Cumulatively, there would be additional new future development and associated travel demand within the City and in the surrounding region. The residences and other sensitive land uses located along most of the City roadways are currently affected by the existing traffic noise, and cumulative growth would result in a significant increase in ambient noise and would potentially result in noise levels that exceed the City's compatibility

standards. As outlined in the Irvine General Plan Update Traffic Noise Assessment, cumulative off-site traffic noise level impacts are expected to exceed noise level increase thresholds along 147 segments. Based on the significance criteria for off-site traffic noise, land uses adjacent to these study area roadway segments would experience a significant cumulative noise level increases due to the Project-related traffic as compared to the existing traffic noise levels. Therefore, impacts associated with increases in ambient traffic noise would be cumulatively considerable and would remain significant and unavoidable.

Stationary source of noise, construction noise, and vibration are generally localized impacts that do not have regional or cumulative considerations. Noise sources associated with past, present, and future development in the region include construction equipment, landscape and building maintenance activities, mechanical equipment, solid waste collection, parking lots, commercial, office, and industrial activities, and residential, school, and recreation activities and events. However, construction vibration would be cumulatively considerable and would remain significant and unavoidable.

4.11 Population and Housing

This section analyzes potentially significant impacts related to population and housing that could result from implementation of the project.

4.11.1 Existing Conditions

As the city of Irvine (City) continues to expand, there is a rising demand for housing to meet the needs of its growing population. The City's appeal as a residential destination stems from its prime location in Orange County, close proximity to employment opportunities, renowned school district, and exceptional safety record. The City's residential areas are organized into distinct villages, each with its unique density, character, and amenities. While initially focused on low-density, single-family homes, Irvine's housing landscape now includes a variety of property types.

4.11.1.1 Population, Housing, and Employment Trends

The Southern California Association of Governments (SCAG) is the metropolitan planning organization responsible for developing and adopting regional housing, population, and employment growth forecasts for local governments from Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura counties. SCAG is required to update these forecasts every four years. To facilitate regional planning efforts, SCAG's planning area is further organized into 14 subregions. The City is in the Orange County Council of Governments (OCCOG) subregion.

The regional and City population and housing trends outlined in SCAG's technical documents are discussed further below. However, it is important to note that the growth forecasts included in SCAG's technical documents are originally sourced from Orange County Projections (OCP), the official growth forecast for Orange County (all jurisdictions and the unincorporated County of Orange). OCP is developed by the Center for Demographic Research at California State University, Fullerton and is adopted by the OCCOG Board of Directors. Once OCP is adopted by the OCCOG, it is provided to subregional and regional agencies, including SCAG. OCP includes growth forecast data provided from and verified by the City.

a. Population

Per the 6th Cycle Housing Element Update effective 2021 to 2029 (2021-2029 Housing Element), the City's population has grown by 3 percent per year on an annual basis, while the SCAG region has experienced a growth rate of 0.7 percent per year. The City has experienced higher and more consistent growth rates compared to neighboring cities. Most of the City's population growth stems from the development of planning areas, which are primarily residential, including the Northern Sphere Planning Areas, the Great Park Neighborhoods, and the Irvine Business Complex.

Table 4.11-1 presents population growth forecast for the City in comparison to Orange County based on the 2020 Connect SoCal Demographic and Growth Forecast Technical Study (SCAG 2020). As shown in Table 4.11-1, the population of the City was projected to increase from 261,600 in 2016 to

327,700 in 2045, which would constitute a 25 percent increase during that 29-year time frame. The population within the County was projected to increase from 3,180,000 in 2016 to 3,535,000 in 2045, which would constitute an 11 percent increase during that 29-year time frame. In comparison, the City is projected to experience a higher amount of population growth compared to the County.

Table 4.11-1
Regional and Local Population Growth

	City			Orange County		
Year	Total Population	Population Increase	Percent Change[1]	Total Population	Population Increase	Percent Change[1]
2016	261,600	--	--	3,180,000	--	--
2045	327,700	66,100	25%	3,535,000	355,000	11%

SOURCE: 2020 Connect SoCal Demographics and Growth Technical Study (SCAG 2020).
[1]Change from 2016-2045.

In 2022, OCP was updated to reflect 2020 Census data. According to OCP 2022, the population of the City is projected to increase from 307,096 in 2020 to 334,107 in 2050.

b. Housing

According to the 2021-2029 Housing Element, approximately 39 percent of existing homes in the City are single-family detached homes, 44 percent are multi-family condominiums or apartments, 16 percent are single-family attached homes/townhomes, and 1 percent are mobile homes. Development trends indicate that significantly more multi-family units have been built in recent years as compared to single-family units. While single-family units have increased by 75 percent between 2000 and 2020, multi-family units have increased by 158 percent during this same period.

Table 4.11-2 presents housing growth forecast for the City in comparison to the County of Orange based on the SCAG 2020 Connect SoCal Demographics and Growth Technical Study. As shown in Table 4.11-2, the number of households within the City is projected to increase from 93,300 in 2016 to 121,700 in 2045, which would constitute a 30 percent increase during that 29-year time frame. The number of households within the County is projected to increase from 1,025,000 in 2016 to 1,154,000 in 2045, which would constitute a 13 percent increase during that 29-year time frame. In comparison, the City is projected to experience a greater amount of housing growth compared to the County.

Table 4.11-2
Regional and Local Housing Growth

	City			Orange County		
Year	Total Households	Household Increase	Percent Change[1]	Total Households	Household Increase	Percent Change[1]
2016	93,300	--	--	1,025,000	--	--
2045	121,700	28,400	30%	1,154,000	129,000	13%

SOURCE: 2020 Connect SoCal Demographics and Growth Technical Study (SCAG 2020).
[1]Change from 2016-2045.

In 2022, OCP was updated to reflect 2020 Census data. OCP also utilizes housing unit in the growth forecast as compared to household in the SCAG Connect SoCal document. According to OCP 2022, the total number of housing units in the City is projected to increase from 117,544 in 2020 to 142,979 in 2050. This updated forecast reflects the more aggressive production of housing units that occurred between 2016 and 2020.

c. Employment

According to the 2021-2029 Housing Element, the City is a major job center in Orange County. Numerous corporations have national or international headquarters in the City, and companies of all types have a robust presence. In addition, the City is home to highly ranked and well-regarded educational institutions, including the University of California, Irvine; Concordia University; Irvine Valley College; University of Southern California (Orange County Center); and campuses of University of La Verne and Pepperdine University.

Table 4.11-3 presents employment growth forecast for the City in comparison to the County based on the 2020 Connect SoCal Demographic and Growth Forecast Technical Study (SCAG, 2020). As shown in Table 4.11-3, the number of jobs within the City is projected to increase from 265,300 in 2016 to 330,200 in 2045, which would constitute a 24 percent increase during that 29-year time frame. The number of jobs within the County is projected to increase from 1,710,000 in 2016 to 1,980,000 in 2045, which would constitute a 16 percent increase during that 29-year time frame. In comparison, the City is projected to experience a higher amount of job growth compared to the County.

Table 4.11-3
Regional and Local Employment

	City			Orange County		
Year	Total Jobs	Jobs Increase	Percent Change[1]	Total Jobs	Jobs Increase	Percent Change[1]
2016	265,300	--	--	1,710,000	--	--
2045	330,200	64,900	24%	1,980,000	270,000	16%

[1]Change from 2016-2045.

4.11.2 Applicable Regulatory Framework

4.11.2.1 Federal Regulations

a. Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended (42 United States Code Section 4601)

The Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended (42 United States Code [USC] 4601 et seq.) (Uniform Act), provides important protections and assistance for people affected by federally funded projects in accordance with the following objectives:

(a) To ensure that owners of real property to be acquired for federal and federally-assisted projects are treated fairly and consistently, to encourage and expedite acquisition by agreements with such owners, to minimize litigation and relieve congestion in the courts, and to promote public confidence in federal and federally-assisted land acquisition programs;

(b) To ensure that persons displaced as a direct result of federal or federally-assisted projects are treated fairly, consistently, and equitably so that such displaced persons will not suffer disproportionate injuries as a result of projects designed for the benefit of the public as a whole; and

(c) To ensure that agencies implement these regulations in a manner that is efficient and cost effective.

4.11.2.2 State Regulations

a. Senate Bill 375

Senate Bill (SB) 375, the Sustainable Communities and Climate Protection Act, was approved in 2008. SB 375 provides incentives for cities and developers to bring housing and jobs closer together and to improve public transit. The goal is to reduce the number and length of automobile commuting trips, helping to meet the statewide targets for reducing greenhouse gas emissions set by Assembly Bill (AB) 32 (see Section 4.6 above). As a part of this effort, SB 375 requires that regional housing needs be addressed in conjunction with regional transportation to integrate housing, land use, and transportation planning together. SB 375 also requires the Regional Housing Needs Allocation (RHNA) be completed every eight years and, if a jurisdiction does not meet this requirement, penalties may be incurred in accordance with SB 375 and AB 1233.

b. Senate Bill 35

SB 35, or the Affordable Housing Streamlined Approval Process, was passed in 2017. It creates an opt-in program for developers that allows a streamlined ministerial process (i.e., not subject to a discretionary review, and therefore California Environmental Quality Act [CEQA] exempt) for developments in localities that have not yet made sufficient progress toward meeting their RHNA. Eligible developments must include a specified level of affordability; be located on an infill site; and comply with existing residential and mixed-use general plan or zoning provisions.

c. Senate Bill 330

The "Housing Crisis Act" was passed in 2019 and was supplemented by AB 8 in 2021. It allows a housing developer to submit a "preliminary application" to a local agency for a housing development project. Submittal of a preliminary application allows a developer to provide a specific subset of information on the proposed housing development before providing the full amount of information required by the local government for a housing development application. Upon submittal of a preliminary application and payment of a permit processing fee, a housing developer is allowed to "freeze" the applicable fees and development standards that apply to a project while the rest of the

material necessary for a full application submittal is assembled. After an application is deemed complete, local agencies cannot "disapprove" an eligible housing development project or condition its approval at a "lower density," as defined in Government Code Section 65589.5(g), if the project is consistent with objective standards. SB 330 also places additional limitations on an "affected" agency's ability to limit development, and requires the California Department of Housing and Community Development (HCD) to develop a list of "affected cities" and census designated places within the unincorporated county ("affected counties") that are prohibited from taking certain zoning-related actions, including, but not limited to the following:

- Downzoning or actions resulting in lesser intensification,
- Imposing a moratorium on development, and/or
- Imposing design standards that are not objective.

The law also requires jurisdiction-wide housing replacement when affordable housing to lower-income residents is demolished. The majority of these provisions sunset, or expire, on January 1, 2030, unless extended by the legislature and governor.

d. Senate Bill 6

The "Middle Crisis Housing Act" was passed in 2022. It allows residential development on property zoned for retail and office space without the need to rezone the site and allows project applicants to invoke the Housing Accountability Act (1982) to limit local discretion to deny or implement a conditional approval. SB 6 does not provide a ministerial approval pathway and requires applicants to commit to both prevailing wage and more costly "skilled and trained workforce" requirements for project labor. SB 6 does not contain any affordability requirements.

e. Assembly Bill 2011 (AB 2011)

The "Housing and High Roads Job Act" was passed in 2022 and sunsets in 2033. It creates a ministerial, CEQA-exempt, time-limited approval process for multi-family housing developments on commercially zoned property. Projects must pay prevailing wages to construction workers and meet specified Below Market Rate (BMR) affordable housing targets. The legislation provides two distinct options: one for 100 percent BMR projects and a second for mixed-income (typically 15 percent BMR) projects located specifically on "commercial corridors." Eligibility is further limited by numerous site and project criteria requiring careful review. The streamlined review process relies on Objective Design Standards.

4.11.2.3 Local Regulations

a. Connect SoCal

On September 3, 2020, SCAG's Regional Council unanimously voted to approve and adopt Connect SoCal (2020-2045 Regional Transportation Plan/Sustainable Communities Strategy). Connect SoCal is a regional planning document that SCAG is required to update every four years per federal and state law. Additionally, because most areas within the SCAG region have been designated as

nonattainment or maintenance areas for one or more transportation related criteria pollutants under the federal Clean Air Act, Connect SoCal must conform to the applicable State Implementation Plan.

It should be noted that SCAG is currently in the process of updating this document and recently released the draft Connect SoCal 2024 for review and comment. The final Connect SoCal 2024 document is expected to go to the Regional Council for adoption in April 2024.

b. Regional Housing Needs Assessment

To respond to state population and household growth, and to ensure the availability of decent affordable housing for all income groups, the state enacted a law that requires SCAG and other councils of governments to periodically distribute the state identified housing need for their regions. Local jurisdictions are required by state law (Government Code Section 65580 et seq.) to plan for their fair share of projected housing construction needs in their region over a specified planning period. Housing unit construction goals are set by the state HCD and allocated to cities through regional planning agencies. HCD is responsible for determining this regional need, initiating the process by which each region must then distribute their share of statewide need to all jurisdictions within its region. Future regional housing needs are calculated in terms of the following three factors:

1. The number of units needed to accommodate forecast population growth;
2. The number of units needed to replace demolition due to attrition in the housing stock (i.e., fire damage, obsolescence, redevelopment, and conversion to non-housing uses); and
3. Maintenance of an ideal vacancy rate for a well-functioning housing market (i.e., vacancy allowance).

After a RHNA determination has been made, a regional RHNA Plan must be developed. State Housing Element law (Government Code Section 65584 (d)) states that the RHNA Plan shall be consistent with four objectives:

1. Increasing the housing supply and the mix of housing types, tenure, and affordability in all cities and counties within the region in an equitable manner, which shall result in all jurisdictions receiving an allocation of units for low- and very low-income households.
2. Promoting infill development and socioeconomic equity, the protection of environmental and agricultural resources, the encouragement of efficient development patterns, and the achievement of the region's greenhouse gas reductions targets provided by the state Air Resources Board pursuant to Section 65080.
3. Promoting an improved intraregional relationship between jobs and housing, including an improved balance between the number of low-wage jobs and the number of housing units affordable to low-wage workers in each jurisdiction.
4. Allocating a lower proportion of housing need to an income category when a jurisdiction already has a disproportionately high share of households in that income category, as compared to the countywide distribution of households in that category from the most recent American Community Survey.

SCAG has developed a RHNA Plan to address the housing needs of the southern California region. Future housing need is assessed by each city or county jurisdiction. The RHNA Plan is based on the land use pattern in the 2020 Regional Transportation Plan and Sustainable Communities Strategy and the 2020 Regional Growth Forecast, in accordance with SB 375. This recent legislation, SB 375, as well as SB 575, affects the RHNA allocation process. The City's RHNA allocation for the 2021-2029 Housing Element is a total of 23,610 units, allocated by income level categories as follows:

- Extremely Low/Very Low Income: 6,396 units (27.1 percent of total)
- Low Income: 4,235 units (17.9 percent of total)
- Moderate Income: 4,308 units (18.2 percent of total)
- Above-Moderate Income: 8,671 units (36.7 percent of total)

c. 2021-2029 Housing Element

California State Housing Element Law (California Government Code Article 10.6) establishes the requirements for the Housing Element of the General Plan. Specifically, Government Code Section 65588 requires that local governments review and revise the Housing Element of their comprehensive General Plans not less than once every eight years. The City Council adopted the amended 2021-2029 Housing Element on May 10, 2022, and the HCD certified the 2021-2029 Housing Element on May 24, 2022.

The Housing Element, as part of the City's General Plan, establishes housing-related actionable programs intended to guide land-use planning and development activities for the 2021-2029 Housing Element planning period in accordance with the City's stated housing goals and state law. The 2021-2029 Housing Element includes strategies for maintenance of existing housing and action-oriented programs to increase the capacity for additional housing options within the local housing supply, as necessary, to meet the current and future needs of people living and working in the City.

The following eight major goals were identified by the City that are addressed by the Housing Plan in the 2021-2029 Housing Element:

- Provide for safe and decent housing for all economic segments of the community,
- Maximize land utilization for residential development,
- Preserve existing affordable housing,
- Encourage more affordable housing units,
- Maximize solutions for those experiencing or at risk of homelessness,
- Encourage and preserve homeownership,
- Improve quality of life and promote placemaking, and
- Affirmatively furthering fair housing.

d. Affordable Housing Strategy and Implementation Plan (2015)

The Affordable Housing Strategy Report and Implementation Plan reviews past accomplishments and presents new affordable housing opportunities and assists the City in identifying the process for implementing affordable housing.

e. Zoning Ordinance

Inclusionary Housing Ordinance

The City's Inclusionary Housing Ordinance program, adopted in 2003, requires that 15 percent of all new units be affordable. The affordable housing implementation procedure is a means for fulfilling the affordable housing requirements for certain developments or planning areas, as set forth in the General Plan 2021-2029 Housing Element. The implementation procedure describes the requirements for submitting the affordable housing plan to the City and to ensure that General Plan requirements are met.

f. Existing Plans, Programs, and Policies

There are no standard conditions applicable to population and housing. The following measures are existing plans, programs, or policies (PPP) that apply to the project and will help to reduce and avoid potential impacts related to population and housing. The City's Inclusionary Housing Ordinance (Affordable Housing Implementation Procedure), as contained in Chapter 2-3 of the Zoning Ordinance, should be considered in the analysis of a proposed project that consists of 50 residential units or more, as it requires a minimum of 15 percent of the total units that are constructed to be affordable units. The breakdown of income categories for the 15 percent, along with other requirements and guidelines, are outlined in detail in Chapter 2-3 of the Zoning Ordinance.

In addition, the adopted 2021-2029 Housing Element includes the following objective and policy related to the discussion of population and housing.

Goal 1: Provide for safe and decent housing for all economic segments of the community.

Objective A. Update the Land Use Element and Zoning Ordinance to achieve compliance with current State laws and to facilitate the development of diverse housing options.

- Policy HE-A.3: Ensure appropriate land use planning and developer mitigation/improvements are provided for adequate infrastructure, services, and facilities to serve existing and future residents.

Goal 5: Maximize solutions for those experiencing or at risk of homelessness.

Objective J. Increase tenant protections.

- Policy HE-J.1: Work with local nonprofit organizations to identify people experiencing or at risk of homelessness in vulnerable subpopulations in the City to navigate specialized services.

- Policy HE-J.2: Evaluate opportunities to leverage local, State, and Federal funding, as available, to maintain and continue rental assistance and financial assistance programs that were created to keep individuals housed and prevent homelessness during and following the COVID-19 pandemic

- **Proposed Program PP-J.2**: Displacement Prevention. Connect residents to resources to minimize the displacement of households with lower incomes and special needs whenever possible and where necessary to ensure that displacement is carried out in an equitable manner.

Proposed General Plan Strategies and Policies

There are no proposed goals, objectives, policies, and implementation actions that are applicable to the analysis of population and housing outside of what exists in the City's adopted General Plan, including the approved 2021-2029 Housing Element.

4.11.3 Significance Determination Thresholds

The City has adopted Appendix G of the State CEQA Guidelines as the significance thresholds. A significant impact related to population and housing would be significant if the project would:

1) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure); or
2) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

4.11.4 Methodology

Potential impacts associated with population and housing were evaluated through a comparison of project buildout with data derived from the SCAG Connect SoCal 2020 Demographics and Growth Technical Study and the 2021-2029 Housing Element (City of Irvine 2022).

4.11.5 Topic 1: Population Growth

Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

4.11.5.1 Impact Analysis

The proposed project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Approval of the project would serve as an important action towards implementing the City's 2021-2029 Housing Element and the associated RHNA allocation of 23,610 units. Because the housing assessment in the RHNA is determined by SCAG, future development under the project would accommodate increases in population based on SCAG's demographic projections. Therefore, the project would accommodate planned growth projected by SCAG. As described in Section 4.11.1.1

above, the City's population is projected to increase from 261,600 in 2016 to 327,700 in 2045, which would constitute an 25 percent increase in population during this 29-year time frame. Similarly, the City's housing is projected to increase from 93,300 in 2016 to 121,700 in 2045, which would constitute a 30 percent increase during that 29-year time frame. Therefore, future housing developed under the project would provide housing necessary to meet the City's RHNA allocation of 23,610 units, as well as accommodate future population growth and housing needs projected in SCAG's growth projections. Furthermore, the project would reduce the City's existing jobs/housing imbalance. The City currently has more jobs than can be sustained by the City's own population. Many of the jobs are in relatively high-paying professions, and employees are more likely and able to afford to make longer distance commutes from less dense residential areas within the City, as well as residential areas outside the City. Implementing the City's 2021-2029 Housing Element and the associated RHNA allocation would account for planned population growth, would increase housing within the City, and improve the City's jobs/housing balance.

Future development under the project would primarily be in developed areas that are already served by infrastructure. Given these conditions and the City's existing development and housing occupancy patterns, it is not anticipated that future housing development facilitated by the project would induce unplanned population growth directly or indirectly through extension of roads or other infrastructure or otherwise. Additionally, the 2021-2029 Housing Element includes Goal 1, Objective A and Policy HE-A.3, which aim to manage future growth within the City by updating the land use element and Zoning Ordinance to comply with State law and by ensuring appropriate land use planning to provide adequate infrastructure, services, and facilities to serve residents.

4.11.5.2 Significance of Impacts

The project would implement the vision of the 2021-2029 Housing Element, and future development under the project would not induce substantial unplanned population growth in an area, either directly or indirectly, and impacts would be less than significant.

4.11.5.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.11.6 Topic 2: Displacement of People or Housing

Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

4.11.6.1 Impact Analysis

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

The purpose of the project is to provide orderly growth in the City through the distribution, location, balance, and mix of land uses. The project would not change existing land use designations within

each of the three focus areas (and on select sites located outside of the focus areas), but rather would adopt a residential and mixed use overlay that would allow for residential and mixed-use projects to be developed within these areas. In accordance with these overlays, buildout of the project would increase the amount of housing within the City. Although some people may be displaced by a future site-specific redevelopment project, buildout of the project would provide an overall expansion of housing opportunities, and would be required to comply with all laws and regulations related to the displacement of tenants including Government Code §§ 66300 et seq. Furthermore, the project would exceed the state RHNA allocations assigned to the City, providing a buffer in all income categories. This exceedance of the City's RHNA allocation would provide additional housing that would accommodate residents displaced by future redevelopment projects, ensuring no net loss of housing, and that displaced residents would be able to find replacement housing. Therefore, displacement of people associated with implementation of the project would be temporary. In addition, the City's Inclusionary Housing Ordinance, as contained in Chapter 2-3 of the Zoning Ordinance, would be considered in the analysis of a future site-specific development that consists of 50 residential units or more to ensure adequate and accessible affordable housing. The Inclusionary Housing Ordinance requires a minimum of 15 percent of the total units that are constructed to be affordable units, providing an expansion of housing opportunities.

The project would also implement the policies of the 2021-2029 Housing Element related to displacement, including Policies HE-J.1, HE-J.2 and Proposed Program PP-J.2, which connects residents to resources to minimize the displacement of households with lower incomes and special needs.

4.11.6.2 Significance of Impacts

Through the overall production of more housing and compliance with applicable laws related to the displacement of tenants, the project would not displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere, and impacts would be less than significant.

4.11.6.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.11.7 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for population and housing. The study area considered for the population and housing cumulative impact analysis is defined as the SCAG region and is inclusive of a proportionate share of RHNA housing units from adjacent jurisdictions. Buildout of the project would respond to the City's allocation under RHNA and would accommodate the projected population growth in the region, consistent with adopted plans and regional growth principles. The purpose of this section is to evaluate any additional incremental impact that the proposed project is likely to cause over and above the combined impacts of recently already approved and proposed projects in the City and its sphere. At buildout, a total of 57,656 residential

units are projected for the City. The project implements the 2021-2029 Housing Element and provides jobs near existing and planned employment concentrations. For these reasons, the cumulative population and housing impact is beneficial and is not a significant cumulative impact. The proposed project increases the cumulative total of housing units and associated population approved in the City. In doing so, the project would provide benefits for the City by meeting existing and projected housing demand, regional housing goals that promote housing production in jobs-rich areas, regional growth policies that encourage housing production in the Focus Areas, City 2021-2029 Housing Element goals regarding workforce housing, and state-mandated fair share housing programs. Therefore, the project would not contribute to a cumulative significant impact related to population and housing.

Although some people may be displaced by a future site-specific redevelopment project, buildout of the Reduced Alternative would provide an overall expansion of housing opportunities, and would be required comply with all laws and regulations related to the displacement of tenants including Government Code §§ 66300 et seq. Furthermore, the Reduced Alternative would exceed the state RHNA allocations assigned to the City, providing a buffer in all income categories. This exceedance of the City's RHNA allocation would provide additional housing that would accommodate residents displaced by future redevelopment projects, ensuring no net loss of housing, and that displaced residents would be able to find replacement housing. Therefore, displacement of people associated with implementation of the Reduced Alternative would be temporary. Additionally, the City's Inclusionary Housing Ordinance, as contained in Chapter 2-3 of the Zoning Ordinance, would be considered in the analysis of a future site-specific development that consists of 50 residential units or more to ensure adequate and accessible affordable housing. The Inclusionary Housing Ordinance requires a minimum of 15 percent of the total units that are constructed to be affordable units, providing an expansion of housing opportunities. Therefore, impacts associated with population and housing would be less than significant, and less than the project.

4.12 Public Services and Recreation

This section analyzes potentially significant impacts related to public services and recreation that could result from implementation of the project.

4.12.1 Existing Conditions

In Irvine, public services are delivered by a combination of state and local public agencies, as well as quasi-public entities and private utility companies. These services encompass a broad spectrum, including public safety, education, and more. Alongside these services, the City of Irvine places significant emphasis on ensuring the availability of essential public facilities distributed across the City.

4.12.1.1 Fire and Emergency Service

a. Service and Response

Fire protection in the City is provided by the Orange County Fire Authority (OCFA). Most of the City is served by Division 2 of the OCFA, but other portions of the City are served by Divisions 4 and 5 as well. The OCFA serves the unincorporated portions of the county and some cities within the County with which they have service agreements. Table 4.12-1 presents the OCFA fire stations that serve the City and their locations. Figure 4.12-1 presents the locations of these fire stations.

Table 4.12-1
OCFA Fire Stations that Serve the City

Station	Location
Station 4	2 California Avenue
Station 6	3180 Barranca Parkway
Station 20	7050 Corsair

FIGURE 4.12-1
Police and Fire Stations

The OCFA has guidelines for the provision of services when an emergency call is received until the first unit is on scene:

- First-in engines should arrive on-scene to medical aids and/or fires within 5 minutes, 80 percent of the time.
- First-in truck companies should arrive on-scene to fires within 12 minutes, 80 percent of the time.
- First-in paramedic companies should arrive on-scene at all medical aids within 10 minutes, 90 percent of the time.
- Response times tie in with workload. A unit should have less than 3,500 responses per year to be a reliable asset to meet the response time guidelines.

From the time a call is received to arrival in an urban area within the OCFA service area is within eight minutes 45 seconds, 90 percent of the time. In rural areas, it is within 16 minutes 45 seconds, 90 percent of the time. In the wilderness area, it is within 14 minutes 19 seconds, 90 percent of the time. Overall, received-to-arrival time for all incidents is within eight minutes 46 seconds, 90 percent of the time.

It is important to note that the City is currently negotiating with OCFA regarding an amended contract for fire services or a potential cessation of the current contract to allow the City to operate its own fire authority. Details regarding this negotiation are ongoing and have not yet been finalized.

4.12.1.2 Police Service

a. Service and Staffing

The City of Irvine Police Department (IPD) operates out of the main headquarters at 1 Civic Centre Plaza. Table 4.12-2 describes the three geographic units that are served by IPD, as well as the neighborhoods within each geographic unit. Figure 4.12-1 presents the locations of the IPD police stations that serve the City.

Table 4.12-2
Irvine Police Department Stations

Unit	Neighborhoods
Portola	This area encompasses 14 residential communities, including Cypress Village, Lower Peter's Canyon, North Park, North Park Square, Northwood, Northwood Point, Orange County Great Park, Orchard Hills, Portola Springs, Racquet Club, Stonegate, West Irvine, Woodbury, and Woodbury East. This area also includes 13 Irvine and Tustin Unified School District campuses and several private schools and pre-schools.
Crossroads	This area encompasses 22 residential communities, including College Park, Deerfield, El Camino Glen, Greentree, Harvard Square, Heritage Park, Los Olivos, Oak Creek, Old Towne, Orange Tree, Quail Hill, Shady Canyon, Smoketree, The Colony, The Meadows, The Ranch, The Spectrum, The Willows, Walnut Square, Westpark, Windwood, and Woodbridge. This area also includes 18 Irvine Unified School District campuses and several private schools and pre-schools.

Unit	Neighborhoods
University	This area encompasses 9 residential communities, including Rancho San Joaquin, Turtle Ridge, Turtle Rock, University Park, University Town Center, West Park Village I, Bommer Canyon Open Space Preserve, Orchard Hills Open Space Preserve, and Quail Hill Open Space Preserve. This area also includes 11 Irvine Unified School District campuses, University of California, Irvine, and several private schools and pre-schools.
SOURCE: City or Irvine 2024a.	

4.12.1.3 Schools

The City is located within the attendance boundaries of four school districts: Irvine Unified School District (IUSD), Tustin Unified School District (TUSD), Saddleback Valley Unified School District (SVUSD), and Santa Ana Unified School District (SAUSD). Figure 4.12-2 presents the jurisdictional boundaries of these four school districts in relation to the City.

a. Irvine Unified School District

The IUSD provides service to students in grades preschool through 12 residing within Irvine, Tustin, and a portion of the unincorporated County of Orange. IUSD schools includes one early childhood learning center, twenty four elementary schools, five kindergarten through eighth-grade schools, six middle schools, five high schools, one alternative high school, and two virtual academies (for both middle and high school students) (Irvine Unified School District 2024a).

Table 4.12-3a presents student enrollment at all IUSD schools in the 2022-2023 school year (the most current year for which student enrollment data is available) for reference. However, Table 4.12-3b presents school capacity and student enrollment data from 2021-2022 (the most current year for which student capacity data is available). Based on the total enrollment of 36,159 students during 2021-2022, IUSD schools district-wide currently have excess capacity. This excess capacity is due to projects that the school district has funded through special tax bonds.

Table 4.12-3a includes most up-to-date student enrollment figures.			

IUSD School Facilities and Funding

In March 2011, IUSD developed a 20-year Comprehensive Facilities Master Plan (FMP) which includes Site Master Plans for each school site. IUSD opened six new school sites from 2016 to 2022. In addition to the new school sites, IUSD scheduled improvements to existing school sites funded by Measure E, which is a bond that was passed in 2016 to provide a maximum issuance of $319 million for facilities improvements at 28 existing schools. Improvements included the creation of collaborative learning spaces and innovation labs; improved accessibility, comfort, and safety; and modernized existing classrooms, science labs, and other school facilities (Irvine Unified School District 2022a).

In addition to Measure E, school funding consists of a contribution of local funding through a Community Facilities District (CFD), State funding, and/or other forms of mitigation negotiated with developers. School Districts rely on School Fees as a funding source for new school facilities required by new development. State law requires a nexus between the projected number of units to be constructed and the amount of fees levied. Non-mitigated units are projected future units that have not had their impacts mitigated. Per the 2022 Fee Justification Study, of the 1,205 Future Units that have not mitigated their impacts on the School District, all 1,205 are expected to be Multifamily Attached units. IUSD analyzed data to provide a student generation rate for new development which establishes a nexus between projected non-mitigated units and fees levied. Table 4.12-4 present the IUSD student generation rate for elementary, middle, and high school students for non-mitigated multi-family attached dwellings. The 2022 Fee Justification Study shows that 468 students would be generated from non-mitigated dwelling units. By multiplying this number by school facilities cost impacts per residential unit, the report estimated a total unmitigated cost of $9,881,352. The report then establishes a cost per square foot for different uses, and these fees are levied on new development.

Table 4.12-4
Irvine Unified School District
Student Generation Rates for Multi-Family Attached

Non-mitigated Future Dwelling Units[1]	School Type	Student Generation Rate	Students Generated
1,205	Elementary	0.2082	251
1,205	Middle	0.0633	77
1,205	High	0.1168	141
TOTAL		**0.3883**	**468**

SOURCE: Irvine Unified School District 2022b.
[1]As estimated in the Residential and Commercial/Industrial Development School Fee Justification Study for IUSD 2022.

b. Tustin Unified School District

Tustin Unified School District operates two elementary schools, one K through 8 school, and one high school in the City, with a total of 5,524 students (Table 4.12-5a). Additionally, 15 elementary schools, four intermediate schools, and three high schools are operated by TUSD but are not within City limits (Foothill, Hillview, Tustin). TUSD also operates one online school and one magnet school. Table 4.12-5a presents student enrollment at TUSD schools within the City for 2022-2023 (the most current year for which student enrollment data is available). However, Table 4.12-5b compares school capacity and student enrollment data from 2021-2022 (the most current year for which student capacity data is available). Based on the total enrollment of 22,038 students during 2021-22, TUSD schools district-wide currently has insufficient facilities to adequately house its current enrollment at both elementary and high school levels.

It is important to note that while enrollment currently exceeds capacity, school districts typically assess capacity on a district-wide basis and then implement school- or site-specific measures to address interim capacity issues (e.g., portables or temporary classrooms) and long-term solutions (i.e., new or expanded schools) for longer-term capacity issues.

Table 4.12-5a Tustin Unified School District Enrollment			
School Name	School Type	Enrollment (2021-2022)	Enrollment (2022-2023)
Arnold O. Beckman High	High School	2,811	2,798

TUSD School Facilities and Funding

School Districts rely on School Fees as a funding source for new school facilities required by new development. State law requires a nexus between the projected number of units to be constructed and the amount of fees levied. Non-mitigated units are projected future units that have not had their impacts mitigated. Per the 2022 Fee Justification Study, of the 4,104 Future Units that have not mitigated their impacts on the School District, comprised of 1,958 Multifamily Attached units, 2,122 Single-Family Attached, and 24 Single Family Detached. TUSD analyzed data to provide a student generation rate for new development which establishes a nexus between projected non-mitigated units and fees levied. Tables 4.12-6a-c present the TUSD student generation rate for elementary, middle, and high school students for non-mitigated multi-family attached dwellings. The 2022 Fee Justification Study shows that 1,314 students would be generated from non-mitigated dwelling units. By multiplying this number by school facilities cost impacts per residential unit, the report estimated a total unmitigated cost of $29,821,230. The report then establishes a cost per square foot for different uses, and these fees are levied on new development.

c. Santa Ana Unified School District

The Santa Ana Unified School District operates 33 elementary schools, eight intermediate schools, nine high schools, one dependent charter, one child development center, one virtual academy, a career technician education program, early childhood education programs, and deaf and hard of hearing regional programs (K through 6). Although none of these schools are within the City's

jurisdiction, residential development within the City may be incorporated into future school district boundaries. Table 4.12-7a presents student enrollment in Santa Ana Unified School District (the most current year for which student enrollment data is available). Table 4.12-7b presents existing school facilities capacity and student enrollment data from 2021-2022 (the most current year for which student capacity data is available). As illustrated by Table 4.12-7b, overall enrollment within the Santa Ana Unified School District is below the District's total capacity.

e. University of California, Irvine

The University of California, Irvine (UCI), is a 1,474 acre public research university that is part of the University of California system located 50 miles south of Los Angeles and five miles inland from the Pacific Ocean. UCI developed the 2007 Long Range Development Plan (LDRP) (University of California, Irvine 2007), which serves as a comprehensive land use plan to guide physical development on the UCI campus through the 2025-2026 school year. The LRDP is based on potential enrollment projections of 37,000 students by 2025-2026. It enables an expansion of on-campus student housing from 17,637 beds to 22,000 beds, and expansion of on-campus faculty and staff housing from an existing program of 1,100 dwelling units to 1,830 dwelling units. UCI employs 27,216 staff and enrolls 36,680 students as of fall of 2022 (University of California, Irvine 2023-24).

f. Concordia University

Concordia University Irvine is a private Lutheran university with two locations in the City: the Turtle Rock campus located at 1530 Concordia West, and the newly purchased Spectrum Campus located at 16355 Laguna Canyon Road. The Turtle Rock Campus is the primary campus consisting of a 72-acre site. The Spectrum Campus is a three-story, 113,882 square foot building located in the Spectrum 4 Planning Area (Planning Area 13) and will house the university's Bachelor of Science in Nursing program. Concordia enrollment is 4,123 students and employs 90 full time faculty (Concordia University 2023).

g. Irvine Valley College

Irvine Valley College (IVC) is a two-year degree community college consisting of 60 acres of facilities located at 5500 Irvine Center Drive. IVC is part of the South Orange County Community College District (SOCCCD). The SOCCD 2020-2025 District-Wide Strategic Plan anticipated declines in enrollment, which reflect anticipated regional declines in K though 12 enrollments due to declining birth rates associated with the Great Recession. A total of 16,134 students were enrolled for the 2023-2024 school year (SOCCCD 2020).

4.12.1.4 Parks/Recreational Facilities

The City's public park system provides more than 400 public recreation facilities including community parks, neighborhood parks, and special use sites (Table 4.12-9). The City provides 22 community parks, more than 40 neighborhood parks, and 6,500 acres of preserved open space. .

The four categories of parks defined by the City are as follows:

- Community Parks are medium to large, multi-purpose parks ranging from 10 to 48 acres in size. They support a variety of recreation opportunities and provide specialized facilities. They support recreation programs, special events, and large-group gatherings.
- Neighborhood parks are smaller parks that provide access to green space and essential recreation opportunities, ranging from 1 to 10 acres in size. They support playgrounds, picnic areas, and small group gatherings.
- Special use sites offer unique amenities and stand-alone facilities such as the Irvine Animal Care Center and Sepulveda Vista Point.
- Open space includes natural resource and wildlife habitats with restricted access, as well as some preserves that allow visitor use or are designed as trail corridors for public use.

4.12.1.5 Libraries

Library services within the City are provided by the Orange County Public Library system (OCPL), a network of 34 branches providing various services to residents throughout Orange County (Table 4.12-10). There are currently three libraries located within the City, but residents can access any of OCPL's libraries. On February 28, 2023, the City Council authorized and directed staff to send a letter of intent notifying the County of Orange that the City intends to withdraw from the OCPL system. However, negotiations are ongoing, and a decision has not yet been made. Any plans for staying with the OCPL system or withdrawing to create a City Library system will be brought before City Council for final decision (City of Irvine 2024b).

4.12.2 Applicable Regulatory Requirements

4.12.2.1 State

a. California Fire Code

The 2022 California Fire Code (California Code of Regulations Title 24, Part 9) establishes regulations to safeguard against the hazards of fire, explosion, or dangerous conditions in new and existing buildings, structures, and premises. The Fire Code also establishes requirements intended to provide safety for and assistance to firefighters and emergency responders during emergency operations. The provisions of the Fire Code apply to the construction, alteration, movement, enlargement,

replacement, repair, equipment, use and occupancy, location, maintenance, removal, and demolition of every building or structure throughout California. The Fire Code includes regulations regarding fire-resistance-rated construction, fire protection systems such as alarm and sprinkler systems, fire services features such as fire apparatus access roads, means of egress, fire safety during construction and demolition, and wildland-urban interface areas. The City has adopted the California Fire Code within Title 5, Division 9 the Municipal Code, including appendices addressing fire-flow requirements for buildings.

b. Assembly Bill 2926

Assembly Bill (AB) 2926, passed in 1986, allows school districts to collect impact fees from developers of new residential and commercial/industrial building space to assist in providing school facilities for students. Development impact fees (DIFs) are also referenced in the 1987 Leroy Greene Lease-Purchase Act, which requires school districts to contribute a matching share of costs for construction, modernization, and reconstruction projects.

c. Senate Bill 50 (Statutes of 1998), State School Funding, Education Code Section 17620

Senate Bill (SB) 50, adopted in 1998, limits the power of cities and counties to require mitigation of school facilities impacts as a condition of approving new development. It also authorizes school districts to levy statutory developer fees at levels higher than previously allowed and according to new rules. California Education Code 17620 establishes the authority of any school district to levy a fee, charge, dedication, or other requirements against any development within the school district for the purposes of funding the construction of school facilities, as long as the district can show justification for the fees.

d. Quimby Act

The City's Municipal Code Title 5, Division 5, Chapter 10 Section 5-5-1004, Park Dedication implements the 1975 Quimby Act (Government Code Section 66477). The Quimby Act authorizes only cities and/or counties, as part of the State Subdivision Map Act, to require subdividers to provide the dedication of parkland and/or fees. The fees must be paid, and land conveyed directly to the appropriate city and/or county agency, and not to a special district or homeowners association. Revenues generated through the Quimby Act cannot be used for the operation and maintenance of park facilities. Additionally, the Quimby Act requires that the fees/improvements be used only for the purpose of rehabilitating existing neighborhood parks or recreational facilities to serve the subdivision.

4.12.2.2 Local Regulations

a. Existing General Plan (2000)

Tables G-1 and G-2 of the General Plan Public Facilities and Services Element outline general guidelines and standards for the provision of public facilities and services, including police services,

fire services, school facilities, library services, child care and senior centers, community center/youth centers, and swimming pools.

The purpose of the Parks and Park Facilities Standards is to establish park development standards for guidance in acceptance of park land, collection of park fees, or provision of in lieu improvements, and criteria for design of public and private parks. The City's General Plan and Subdivision Ordinance require developers to dedicate park land and/or improvements/amenities, and/or pay fees in lieu of dedication, at a rate of five (5) acres per thousand (1,000) population (General Plan, Element K and Subdivision Ordinance, Section 5-5-1004). The City's public park system is divided into two park categories: community parks and neighborhood parks. Neighborhood parks are further divided into public and private parks. The allocation of land and improvements is apportioned at two acres to community parks and three acres to public and/or private neighborhood parks.

The following guidelines are used when planning parks:

1. To serve the community as a whole, a 20-acre improved community park for every 10,000 population is the Community Services Commission's goal when developing residential villages. Development agreements are considered when needed to vary the allocation of park credits to allow for development of community parks.
2. Public neighborhood parks are incorporated within residential developments to serve the immediate neighborhood, supplemented by private parks. Private parks and/or improvements to private parks shall be provided when they have a clear benefit to the community.
3. The Community Services Commission, working with the development community, endeavor to address the development of parks at the earliest stages of development, to communicate the City's park interests.

b. Orange County and Orange County Fire Authority Hazard Mitigation Plan

Orange County and the OCFA have partnered since 2010 to produce a Multi-Jurisdictional Hazard Mitigation Plan. Last updated in 2020, the plan outlines strategies for mitigating natural hazards including fire hazards in county unincorporated areas and areas that the OCFA services.

c. Parks Master Plan

The City's Parks Master Plan was adopted in 2017 and serves to guide maintenance, development, and operation of the City's parks and recreation system for 10 years. The plan identifies potential policy changes and opportunities for upgrading the City's 60 public parks. The plan focuses on projects for public parks, park facilities, and recreation programs that may enhance the public experience and respond to evolving needs and expectations. The Master Plan also includes criteria that assists in the identification of projects to include in the annual Capital Improvement Program budget.

d. Municipal Code

Title 3 (Community Services), Division 4 (Parks)

The parks ordinance establishes use and permitting requirements within City parks and open spaces. The code also establishes rules, procedures, policies, and regulations governing the use of parks and open spaces by the public.

Title 5 (Planning), Division 5 (Subdivisions), Chapter 10 (Dedications; Reservations).

Municipal Code Section 5-5-1004- Park Dedication, subsections C and D, authorize the Planning Commission, upon the recommendation of the Community Services Commission, to determine distribution of public/private neighborhood parks and/or fees. Additionally, the Municipal Code requires that all parks comply with the most current, applicable national and state codes, regulations, and standards. Provision of City parkland consistent with the Quimby Act requires that the City monitor the ratio of residents to parkland. Maintenance of this ratio not only ensures that the provision of park space keeps pace with demand caused by population growth, but also prevents the deterioration of existing facilities from overuse. The City established the required parkland space for subdivisions at five acres per 1,000 residents, which is consistent with the Quimby Act. The implementation of a project can affect this ratio. Therefore, individual projects have the potential to increase use of park facilities and hasten their deterioration. For this reason, it is important that environmental analysis disclose a project's potential to create such impacts and identify any need for additional facilities.

Prior to the issuance of building permits on land required as a private park by local and/or state development standards, applicants are required to submit, and the Directors of Community Development and Community Services shall approve, an instrument reserving such required park land in perpetuity.

C. Park Dedication Standards. All standards for park dedication a comply with the Quimby Act (State of California Government Code section 66477), the California Subdivision Map Act, and the City General Plan Parks and Recreation Element. The developer of residential subdivisions shall dedicate park land and/or fees in lieu, at the rate of five acres per 1,000 population, apportioned as follows:

- Two acres – Community parks
- Three acres – Neighborhood parks

E.2 Disposition of Land or Fees. All park fees shall be paid directly to the City prior to issuance of any residential building permits for the building site or sites from which fees are to be derived. These fees are to be used only for the purpose of developing new or rehabilitating existing park or recreational facilities to serve the subdivision.

e. Planning Commission Resolution No. 09.-2968

Standard Conditions are adopted by Planning Commission Resolution No. 09-2968. These conditions assist staff in applying standardized wording for frequently used conditions of approval for discretionary and subdivision applications. Standard conditions are applied on a case-by-case basis

depending upon the specifics of the application. Companion conditions are cross-referenced and are required to be used together. The following standard conditions related to hazards and hazardous materials apply:

Fire Protection

City Standard Condition 2.19 (Open Space Fuel Modification)

Prior to issuance of precise grading permits for any lots adjacent to open space, the applicant shall submit a fuel modification plan prepared to the satisfaction of the Director of Community Development for review and approval, in consultation with the Director of Community Services. The fuel modification plan shall be approved by the Orange County Fire Authority (OCFA). The requirements set forth in this condition do not apply to developed, irrigated park land required or provided as part of the project design for this project.

City Standard Condition 3.14 (HOA/Fuel Modification)

Prior to the issuance of building permits for any dwelling units on lots located adjacent to or within fuel modification zones, the applicant shall provide evidence that there is a requirement included in the CC&Rs that any changes to plant materials located within fuel modification zones must be approved by the Director of Community Development and be consistent with applicable OCFA requirements. For fuel modification zones adjacent to lands designated as Open Space, changes in plant materials shall also be reviewed by the Director of Community Services.

City Standard Condition 4.9 (Emergency Access Inspection)

Prior to authorization to use, occupy, and/or operate, the applicant shall arrange for and have passed an inspection, to be performed by the Police Department and the OCFA, to ensure compliance with the Emergency Access Plan requirements. The inspector shall verify test acceptance and locations of all Knox boxes, key switches and Click2Enter devices as depicted on the approved plan.

City Standard Condition 4.12 (Phased Occupancy of Multi-Building Residential Development)

Phased occupancy of any portion of this multi-building development project is subject to approval by Building and Safety and the OCFA. Such phasing shall provide a clear and effective separation between the areas open to building users and occupants and construction areas including staging and access. Additionally, all fire-life-safety, security, accessibility features, parking and other applicable planning standards and conditions serving those portions of the development to be occupied shall be installed, approved and accepted by the City and/or OCFA. Such features must remain in place and fully functional throughout the remaining project build-out.

Police Protection

City Standard Condition 3.6 (Site Lighting Requirement)

Prior to the issuance of building permits, the applicant shall demonstrate they have met the Irvine Uniform Security Code requirements for lighting by providing the below listed items for a complete

review by the Police department. Failure to provide a complete lighting package will result in the delay of satisfaction of this condition.

a. Electrical plan showing light fixture locations, type of light fixture, height of light fixture, lighting ratio, and point-by-point photometric lighting analysis overlaid onto a tree landscape plan with a legend. The photometric plan should only show those fixtures used to meet the Irvine Uniform Security Code requirements.
b. Site plan demonstrating that landscaping shall not be planted so as to obscure required light levels per the Irvine Uniform Security Code.
c. Site plans that are full-scale and legible.

City Standard Condition 3.17 (Emergency Access Plan)

Prior to the issuance of the first building permit, the applicant shall submit and have approved by the Chief of Police an Emergency Access Plan, which identifies and locates all Knox Boxes, Knox key switches, and Click2Enter radio access control receivers per the Irvine Uniform Security Code requirements. Said plan shall be incorporated into the plan set approved for building permits.

City Standard Condition 3.18 (Wayfinding (Directional) Plan)

Prior to the issuance of the first building permit, a Wayfinding (directional) Plan including exterior building numbers, unit numbers, directional building/unit signs, vehicle directional signage, parking structure identification/directional signage, trail signage, and other signage as required by the Irvine Uniform Security Code, shall be approved by the Chief of Police. Said plan shall be incorporated into the plan set approved for building permits.

City Standard Condition 3.20 (Construction Site Security Plan)

Prior to the issuance of the first building permit, a Construction Site Security Plan, per the Irvine Uniform Security Code, Section 5-9-521, shall be approved by the Chief of Police. Said plan shall be incorporated into the plan set approved for building permits.

City Standard Condition 4.9 (Emergency Access Inspection)

Prior to authorization to use, occupy, and/or operate, the applicant shall arrange for and have passed an inspection, to be performed by the Police Department and the Orange County Fire Authority, to ensure compliance with the Emergency Access Plan requirements. The inspector shall verify test acceptance and locations of all Knox boxes, key switches and Click2Enter devices as depicted on the approved plan.

Parks and Recreation

City Standard Condition 1.10 (Easement for Public Trail)

Prior to the release of a final map by the City, an irrevocable offer of dedication for nonexclusive easements for public use of any public trail(s) shall be shown on the final map. Improvements, recordation, and dedication of public trails shall be subject to the approval of the Director of

Community Services. At the discretion of the City Engineer and with consultation with the Director of Community Services, the easements may be recorded after the final map.

City Standard Condition 1.11 (Open Space Irrevocable Offer)

Prior to the release of a final map by the City for land that encompasses or lies within an Open Space Implementation Action Program District as shown on the City's General Plan and Zoning Ordinance or will be dedicated as public open space, the applicant shall submit an irrevocable offer of dedication for the preservation open space lot and/or easement, as required by the City's Phased Dedication and Compensating Development Opportunities Program. The irrevocable offer of dedication and/or easement shall be in the form approved by the City Attorney and prepared to the satisfaction of the Director of Community Development, the City Engineer, and the Director of Community Services. The offer shall be recorded concurrently with recordation of the final map.

City Standard Condition 1.12 (Public Park Dedication)

Prior to the release of the final map that includes public park land, the applicant shall submit all documents ready for recording of such dedication to the City Engineer and the Director of Community Services for review and approval. At the discretion of the City Engineer, the dedication of public park land may be recorded with the final map.

City Standard Condition 2.15 (Private Trail Reservation)

Prior to the issuance of the first grading permit on land required as a private trail, the applicant shall submit and the Directors of Community Development and Community Services shall have approved an instrument reserving such required park land in perpetuity.

City Standard Condition 2.16 (Public Trail Dedication)

Prior to the issuance of the first precise grading permit that includes public trails, the applicant shall submit all documents necessary to record nonexclusive easements for public use of such trails in a form or forms approved by the City Attorney and prepared to the satisfaction of the City Engineer, Director of Community Services, and Director of Community Development. The City Engineer may permit the public trail dedication to be recorded separately from the final map.

City Standard Condition 2.17 (Public Park Dedication)

Prior to the issuance of the first precise grading permit for a lot that is to be dedicated as a public park, the applicant shall submit all documents necessary to record the public parkland dedication in a form or forms approved by the City Attorney and prepared to the satisfaction of the City Engineer, Director of Community Services, and Director of Community Development.

City Standard Condition 2.18 (Park Construction Phasing)

Prior to the issuance of the first residential precise grading permit (with the exception of model homes), the applicant shall submit a park construction and phasing schedule to the Director of Community Development and obtain approval of the schedule from the Director of Community Services. The park construction and phasing schedule shall include the following information:

a. Number and types of residential units to be built and estimated population count.
b. Lot numbers and size of each public and private park.
c. Improvements to be built within each park.
d. A phasing plan specifying when each park will commence and complete construction.

City Standard Condition 3.11 (Park Design Consistency)

Prior to the issuance of a building permit for any park, the applicant shall demonstrate that all related construction plans are consistent with approved Park Design _____-PPD.

City Standard Condition 3.12 (Private Park Reservation)

Prior to the issuance of building permits on land required as a private park by local and/or state development standards, the applicant shall submit and the Directors of Community Development and Community Services shall have approved an instrument reserving such required park land in perpetuity.

f. Existing Plans, Programs, and Policies

Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required of the project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute mitigation measures. The following measures are existing plans, programs, or policies (PPP) that apply to the project and will help to reduce and avoid potential impacts related to public services and recreation:

- PPP PS&R-1: Compliance with City Standard Condition 2.19 (Open Space Fuel Modification)
- PPP PS&R-2: Compliance with City Standard Condition 3.14 (HOA/Fuel Modification)
- PPP PS&R-3: Compliance with City Standard Condition 4.9 (Emergency Access Inspection)
- PPP PS&R-4: Compliance with City Standard Condition 4.12 (Phased Occupancy of Multi-Building Residential Development)
- Police Protection
- PPP PS&R-5: Compliance with City Standard Condition 3.6 (Site Lighting Requirement)
- PPP PS&R-6: Compliance with City Standard Condition 3.17 (Emergency Access Plan)
- PPP PS&R-7: Compliance with City Standard Condition 3.18 (Wayfinding (Directional) Plan)
- PPP PS&R-8: Compliance with City Standard Condition 3.20 (Construction Site Security Plan)
- PPP PS&R-9: Compliance with City Standard Condition 4.9 (Emergency Access Inspection)
- Parks and Recreation
- PPP PS&R-10: Compliance with City Standard Condition 1.10 (Easement for Public Trail)
- PPP PS&R-11: Compliance with City Standard Condition 1.11 (Open Space Irrevocable Offer)
- PPP PS&R-12: Compliance with City Standard Condition 1.12 (Public Park Dedication)
- PPP PS&R-13: Compliance with City Standard Condition 2.15 (Private Trail Reservation)
- PPP PS&R-14: Compliance with City Standard Condition 2.16 (Public Trail Dedication)
- PPP PS&R-15: Compliance with City Standard Condition 2.17 (Public Park Dedication)
- PPP PS&R-16: Compliance with City Standard Condition 2.18 (Park Construction Phasing)
- PPP PS&R-17: Compliance with City Standard Condition 3.11 (Park Design Consistency)
- PPP PS&R-18: Compliance with City Standard Condition 3.12 (Private Park Reservation)

Proposed General Plan Strategies and Policies

In addition to the above-listed PPPs, the following proposed goals, objectives, policies, and implementation actions are applicable to the analysis of public services and recreation and would replace existing goals, strategies, and policies outlined in the City's existing General Plan following project approval:

Land Use Element

Goal 4: Manage Growth to Ensure Balanced Residential and Nonresidential Development Throughout the City.

Objective LU-4. To achieve a balanced and sustainable distribution of land uses throughout the City by implementing equitable and inclusive land use policies that optimize the efficient use of land, promote environmental stewardship, and enhance quality of life for all residents.

- Policy (a): Ensure that land uses enable the City to provide necessary municipal services by:
  - Adjustments to square footage will be included in the development monitoring program and reflected in the statistical tables through annual technical updates. Institutional uses will be considered consistent with the General Plan if the following criteria are met:
    - Infrastructure capacity under existing and future (build out) conditions can accommodate additional development in the areas of circulation, fire, police, water, and flood control services.

Goal 5: Promote Economic Prosperity by Ensuring City Revenues Meet Expenditures and Provide Quality Services Without Burdensome Levels of Fees or Taxes.

Objective LU-5. To optimize the fiscal sustainability of the City of Irvine by aligning land use policies with economic development strategies to ensure that city revenues meet expenditures, provide quality services, and maintain fiscal stability without imposing burdensome levels of fees or taxes on residents and businesses.

- Policy (a): Maintain or improve existing service levels while extending services to newly developed areas.
- Policy (b): Pursue cost-saving measures while maintaining the quality of city services.

Goal LU-6: Achieve Harmonious Land Use Patterns Throughout the City.

Objective LU-6. To establish cohesive and harmonious land use patterns throughout the City by implementing integrated planning strategies that promote connectivity, sustainability, and community well-being while respecting the unique character and identity of different neighborhoods.

- Policy (g): Ensure residential development proposed in the Irvine Business Complex is located in areas where adequate supporting uses and public services and facilities can be provided. Housing designed for senior citizens should be located only in areas that are within reasonable walking distance or accessible by public transportation to such facilities.

Conservation and Open Space Element

Goal 6: Establish and maintain a network of parks and recreational areas that offer a wide range of leisure opportunities while promoting their sustainable development and maintenance.

Objective COS-6. Develop and maintain a network of parks and recreational areas that provide a variety of recreational opportunities, and which link and integrate other conservation and open space areas into the land use fabric of the City.

- Policy (a): Continue to coordinate parks and recreational opportunities through the General Plan and Parks Master Plan to ensure adequate and timely development of parks and recreational areas.
- Policy (b): Expand opportunities and places for casual nature-related recreation and leisure (e.g. the Jeffrey Open Space Trail) that are distinct from turf parks and protected wildlands.

Goal 10. Enhanced open space accessibility and utilization, and conservation efforts of resources.

Objective COS-10. The City commits to creating and fostering well-integrated and sustainable open space resources available to City residents and visitors..

- Policy (a): Provide a variety of public and private parks to meet resident needs.
- Policy (c): Encourage the creation of dynamic parks as special and unique places, adding or incorporating art and historic resources, innovative features, diverse landscaping, nature, varied color palettes, and welcoming amenities.
- Policy (d): Balance access to open space for outdoor recreation with conservation needs.

4.12.3 Significance Determination Thresholds

The City has adopted Appendix G of the State CEQA Guidelines as the significance thresholds for cultural resource impacts. A significant impact related to cultural resources would occur if the project would:

1) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:
    i. Fire Protection;
    ii. Police Protection;
    iii. Schools;
    iv. Parks/Recreational Facilities; or
    v. Other Public Facilities;

2) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated; or

3) Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.

4.12.4 Methodology

The potential for significant impacts associated with the project have been determined based upon review of existing secondary source information cited above relative to the provisions of public services (police, fire and emergency service, schools, and libraries in the City.

4.12.5 Topic 1: Public Services

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:

i. Fire Protection;
ii. Police Protection;
iii. Schools;
iv. Parks/Recreational Facilities; or
v. Other Public Facilities?

4.12.5.1 Impact Analysis

a. Fire Protection

Impacts associated with public services are based on how an increase in population, whether it is permanent (residents) or temporary (workers), would affect the public service providers' ability to meet their demands. If an increase in population is substantial enough to require the construction of new facilities or the addition of new service units to meet growing needs, impacts would be potentially significant.

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway. Future development facilitated by the project may necessitate construction of additional fire stations. OCFA[1] has identified potential locations of future fire stations within the City, and future development under the project would be required to pay a DIF that would be used exclusively for future facility improvements necessary to ensure contribution of its fair share of the cost of facilities and equipment. Payment of the DIF would allow future site-specific development to contribute to its fair share cost of facilities and equipment due to the increased demand for fire protection services.

[1] Details regarding the City's ongoing negotiation with OCFA regarding a contract amendment or cessation of the existing contract to allow the City to operate its own fire authority are speculative and not yet known. Therefore, this impact analysis relies on existing data available from OCFA.

Construction of additional housing units over time may impact various public services and facilities. Such growth would likely require additional fire-rescue and police personnel, equipment, and facilities to protect and serve the public. Depending on actual demographic shifts and the number of units constructed, additional fire facilities may also be needed to serve the increases in population. Actual needs and potential locations would be determined in the future by the Fire Department as part of their planning process as development occurs, but increases in demand would be greatest in all three focus areas since the majority of new housing would be located there.

However, future development would occur incrementally through 2045, based on market conditions and other factors, such that fire protection facilities and services are not overburdened at any given time. Additionally, every project applicant shall be required to comply with all applicable OCFA codes, ordinance and standard conditions regarding fire prevention, and suppression measures relating to water improvement plans, fire hydrants, automatic fire extinguishing systems, fire access, access gates, combustible construction, water availability, and fire sprinkler systems. Future development would be required to comply with PPP PS&R-1 through PS&R-4 to further reduce impacts related to fire protection. Furthermore, Land Use Element goals and policies seeking to ensure balanced development throughout the City and s to ensure that land uses enable the City to provide necessary municipal services, including infrastructure capacity under existing and future (build out) conditions can accommodate additional development in the areas of circulation, fire, police, water, and flood control services.

Staffing levels for fire protection services within the City would continue to be established by the OCFA based on its contract with the City. Development of site-specific future housing would not directly result in sufficient demand to require construction of new fire facilities, since each incremental housing development would pay its fair share toward anticipated fire facility needs. Therefore, the project would not result in the need for new or altered fire protection facilities, and impacts would be less than significant.

b. Police Protection

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Future site-specific development could potentially increase demand for police protection facilities. Actual needs and potential locations would be determined in the future as development occurs, but increases in demand would be greatest in all three focus areas since the majority of new housing would be located there.

Future development would occur incrementally through 2045, based on market conditions and other factors, such that police protection facilities and services are not overburdened at any given time. Additionally, development site-specific future housing would not directly result in sufficient demand to require construction of new police facilities, since each incremental housing development would pay its fair share toward anticipated facility needs. Future development would also be required to comply with PPP PS&R-5 through PS&R-9 to further reduce impacts with respect to police services. Furthermore, Land Use Element Update goals and policies seeking to ensure balanced development

throughout the City and to ensure that land uses enable the City to provide necessary municipal services, including infrastructure capacity under existing and future (build out) conditions can accommodate additional development in the areas of circulation, fire, police, water, and flood control services would further the support the City in providing adequate police protection for new developments and their associated residents. Moreover, individual projects would be reviewed by City's Police Department to ensure they are designed with crime prevention features, natural surveillance, which deters unlawful behavior through the design of common spaces that are passively surveilled by building occupants and passerbys; territorial enforcement, which includes a hierarchy of spaces with the appropriate levels privacy and security; access control; and space management/maintenance to ensure maintenance and monitoring of lighting, access control hardware, and other features of the crime prevention through environmental design. Therefore, the project would not result in substantial adverse impacts associated with the need for new or altered police protection facilities, and impacts would be less than significant.

c. Schools

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Future site-specific residential development could potentially increase demand for additional school facilities. Actual needs and potential locations would be determined in the future as development occurs, but increases in demand would be greatest in all three focus areas since the majority of new housing would be located there. However, future development would occur incrementally through 2045, based on market conditions and other factors, such that school services are not overburdened at any given time. Pursuant to California Government Code Section 65995, the individual applicants shall pay developer fees to the appropriate school districts at the time building permits are issued; payment of the adopted fees would provide full and complete mitigation of school impacts. Per AB 2626 and SB 50, school districts may impose a fee in conjunction with the construction of new commercial or residential buildings and for those projects that are adding square footage to an existing commercial or residential building. A School Facilities Fee Determination Form shall be submitted in conjunction with the submittal of an application for Code Compliance Review and fees shall be paid per the City's Community Development Department School Facilities Fee Schedule. Alternatively, the applicant may enter into a school finance agreement with the school district(s) to address mitigation to school impacts in lieu of payment of developer fees, a mechanism that is often employed to develop future schools needed as a result of large-scale residential development in the City. The agreement shall establish financing mechanisms for funding facilities to serve the students from the project. If the applicant and the affected school district(s) do not reach a mutually satisfying agreement, then project impacts would be subject to developer fees. Development of site-specific future housing would not directly result in sufficient demand to require construction of new school facilities, since each incremental housing development would pay its fair share toward anticipated facility needs. Therefore, the project would not result in substantial adverse physical impacts associated with the provision of new or physically altered school facilities, and impacts would be less than significant.

d. Other Public Facilities

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Future site-specific residential development could potentially increase demand for other public facilities. Actual needs and potential locations would be determined in the future as development occurs, but increases in demand would be greatest in all three focus areas since the majority of new housing would be located there. However, future development would occur incrementally through 2045, based on market conditions and other factors, such that public facilities are not overburdened at any given time. Future development would be subject to the payment of a DIF that would be used exclusively for future facility improvements necessary to ensure contribution of its fair share of the cost of facilities. Development of future site-specific housing would not directly result in sufficient demand to require construction or expansion of additional public facilities (including libraries), since each incremental housing development would pay its fair share toward anticipated needs. Furthermore, Land Use Element Update goals and policies seeking to ensure balanced development throughout the City and to ensure that land uses enable the City to provide necessary municipal services, including infrastructure capacity under existing and future (build out) conditions can accommodate additional development in the areas of circulation, fire, police, water, and flood control services would further support the City in providing adequate public facilities for future residents and visitors associated with new development projects. Based on the incremental increase in demand and the payment of DIF to address increased demand on public facilities, the project would not result in substantial adverse physical impacts associated with the provision of new or physically altered public facilities, and impacts would be less than significant.

4.12.5.2 Significance of Impacts

Future site-specific development would not directly result in sufficient demand to require construction of new public service facilities, since each incremental development would pay its fair share toward anticipated facility needs. Construction of any future public facilities would require separate environmental review and approval. Future development would be required to comply with these policies to further ensure that impacts with respect to public services would be less than significant. Furthermore, the updated Land Use Element includes Goal 4, Objective LU-4, Policy (a), which aims to ensure that future land uses are provided the necessary municipal services required for such uses, Goal 5, Objective LU-5, Policy(a), which aims to maintain or improve existing service levels while extending service to newly developed areas, and Goal 6, Objective LU-6, Policy (h), which aims to ensure that residential uses in the IBC area have adequate public services and facilities. Compliance with these goals would further support the City in providing adequate fire, police and other public facilities for visitors and residents associated with new development projects.

4.12.5.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.12.6 Topics 2 and 3: Parks and Recreational Facilities

Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Would the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

4.12.6.1 Impact Analysis

The City has established a parkland dedication requirement of five acres per 1,000 population, apportioned as follows: two acres for Community parks and three acres for Neighborhood parks. Based on data provided in the most recent Master Park Plan (1,847.6 acres of neighborhood and community parks, 345 acres of regional parks, and 12,683.7 acres of open space) and current population data (303,051 residents as of 2023) (City of Irvine 2024c), the City is under the required service standard. With a population of 303,051 residents, the required number of acres of park area is 1,515.3 acres, while the current total, excluding undeveloped open space, is 1,145 acres. Most of the City is built out, so future park planning efforts will include some new sites but will primarily focus on maintaining and upgrading existing sites. The Master Park Plan provides the vision for improving parks and recreational opportunities.

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Future site-specific residential development could potentially increase the use of existing neighborhood and regional parks or other recreational facilities. The existing and projected deficit in population-based parks and recreation facilities would remain upon implementation of the project. However, future development would occur incrementally through 2045, based on market conditions and other factors, such that parks are not overburdened at any given time. As such, there would not be a sudden increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated. However, development under the project would be required to adhere to PPP PS&R-10 through PS&R-18, which would reduce impacts associated with increased need for park area and increased utilization of existing parks and recreation spaces. Future development under the project would also be subject to the requirements of the Quimby Act and the fee schedule established by the City for the payment of development impact fees to support the provision of new recreational facilities and the rehabilitation of existing neighborhood parks or recreational facilities. The proposed objective and policies in the update General Plan elements related to recreation would support the expansion of the City's recreational facility network as development occurs. For example, the updated Conservation and Open Space Element includes Goal 6, Objective COS-9,6 which aims to develop and maintain a network of recreational areas that provide a variety of recreational opportunities throughout the City. Policy (a) seeks to explore options to obtain lands for recreational uses, and Policy (b) seeks to continue to coordinate recreational opportunities through the General Plan to ensure adequate and timely development of recreational areas. Goal 10, Objective COS-1510 commits the City to creating and fostering integrated and sustainable open space resources for recreational purposes, and Policy (a) seeks to provide a variety of public and private parks to meet resident needs.

Development of future site-specific housing would not directly result in sufficient demand to require construction of new parks, since each incremental housing development would pay its fair share toward anticipated park needs through the payment of fees. Therefore, based on the incremental demand that would occur project buildout for park facilities and compliance with applicable regulations (such as the City's parkland standards), the project would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated and would not have adverse physical effect on the environment caused by expansion or construction of recreational facilities, and impacts would be less than significant.

4.12.6.2 Significance of Impacts

Development of future site-specific housing would not directly result in sufficient demand to require construction of new park facilities, since each incremental housing development would pay its fair share toward anticipated park needs. Additionally, future development would occur incrementally through 2045, based on market conditions and other factors, such that parks are not overburdened at any given time. As such, there would not be a sudden increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated. Therefore, impacts associated with park and recreation facilities would be less than significant.

4.12.6.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.12.7 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for public serves and recreation. The study area for the assessment of cumulative impacts related to public services and recreation is the City. The impact analysis presented in Sections 4.12.5.1 and 4.12.5.2 above is cumulative in nature because it considers the need for future facilities to serve the entire City. As described in Sections 4.12.5 and 4.12.6 above, impacts with respect to fire, police, and other public facilities would be less than significant. However, the existing and projected deficit in population-based parks and recreation facilities would remain upon implementation of the project. However, future development would occur incrementally through 2045, based on market conditions and other factors, such that parks are not overburdened at any given time. As such, there would not be a sudden increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated. Furthermore, future site-specific development would be subject to the payment of a DIF that would be used exclusively for future facility improvements necessary to ensure contribution of its fair share of the cost of facilities and equipment determined to be necessary to adequately accommodate new development in the City. Payment of the DIF would allow future site-specific development to contribute to its fair share cost of facilities and equipment Therefore, the project would not contribute to a significant cumulative impact related to public services and recreation.

4.13 Transportation

This section evaluates potential impacts related to transportation due to implementation of the project. The analysis in this section is based on the Irvine General Plan Update Vehicle Miles Traveled (VMT) Traffic Study (2024; Appendix G).

4.13.1 Existing Conditions

4.13.1.1 Existing Roadway System

Arterial highways are designed to handle significant traffic volumes and/or high speeds. The current general plan categorizes types of arterial highways based on criteria set by the Orange County Master Plan of Arterial Highways (MPAH), overseen by the Orange County Transportation Authority (OCTA). Figure 4.13-1 presents an overview of the City of Irvine's (City) Master Plan of Arterial Highways. The defined categories are outlined as follows:

- Freeway: A divided state highway with restricted access solely through grade-separated interchanges, efficiently accommodating high volumes of traffic between cities. In Irvine, examples include the I-5 and I-405, forming the "El Toro Y" interchange, and the State Route 55 extending along the City's western border.
- Transportation Corridor: A multi-use facility with controlled access, featuring a wide median suitable for fixed rail or high occupancy vehicle lanes, alongside general purpose lanes, facilitating traffic flow between cities. In Irvine, toll roads like State Route 241 (Foothill Transportation Corridor), State Route 261, and State Route 133 (part of Eastern Transportation Corridor), and State Route 73 (San Joaquin Hills Transportation Corridor) serve this purpose.
- Expressway: An arterial highway with divided lanes and grade-separated intersections or access ramps, such as Jamboree Road in Irvine, linking the Irvine Business Complex (IBC) to northern neighborhoods and passing through former Marine Corps Air Station Tustin.
- Major Highway: A divided arterial highway with six to eight through lanes, connecting planning areas and providing access to freeways or transportation corridors. Examples in Irvine include Irvine Boulevard, Irvine Center Drive, and parts of Jamboree Road, Jeffrey Road, and Sand Canyon Avenue.
- Primary Highway: A divided arterial highway with four through lanes, connecting planning areas and activity centers within them, as well as serving as conduits to and from freeways or transportation corridors. Examples in Irvine include Barranca Parkway, Bryan Avenue, Trabuco Road, and Walnut Avenue.
- Secondary Highway: An undivided arterial highway with four through lanes, facilitating traffic movement between planning areas and activity centers within them. Examples in Irvine include Yale Loop, Ridgeline Drive, Research Drive, and Shady Canyon Drive.
- Commuter Highway: A two-lane undivided highway mainly serving as a collector road for through-traffic movements between arterials. Examples in Irvine include Harvard Avenue, Michelson Drive, and Turtle Rock Drive.

FIGURE 4.13-1
Master Plan of Arterial Highways

The City's roadway system stands out for its well-defined hierarchy, contrasting with the typical layout seen in many large California cities. Unlike the scattered networks of streets often found elsewhere, Irvine's major arterial roads follow a predetermined master plan. Similarly, the City's minor streets, alleys, and trails are meticulously designed to serve specific land uses rather than adhering to a simple grid pattern. Collector streets may feature landscaped areas and offer views into public spaces, while residential streets often form curvilinear networks with cul-de-sacs. This deliberate layout reflects Irvine's segmented land use pattern, characterized by distinct enclaves, which contrasts with the continuous urban fabric seen in other cities.

- Local Streets: In the City, local streets are characterized by their low speed and traffic volume, primarily serving as access routes to residential, business, and adjacent properties. These streets often accommodate parking and witness significant pedestrian traffic. Examples are abundant in single-family residential neighborhoods, facilitating access to individual driveways and garages. Adjacent sidewalks may run parallel to the road or be separated by landscaping features.
- Alleys: Narrow, linear roadways behind buildings in Irvine, alleys link two or more local streets and offer direct access to garages or carports. Unlike older urban areas, Irvine has relatively few traditional alleys due to its post-World War II development.
- Driveways/Drive Aisle: Off-street roadways providing direct access to garages, carports, or parking lots are termed driveways, while those leading to multiple garages or parking spaces are drive aisles. In Irvine, multi-family residential complexes use internal drive-aisle networks to connect individual units to streets and provide guest parking, often landscaped with paths or gates.
- Private Ways and Private Courts: The City has several private ways and private courts, which are slow-speed roads within neighborhoods providing access to residential units, garages, and parking areas. Private courts are low-traffic dead-end lanes serving the same function but accommodating fewer daily vehicle trips.

4.13.1.2 Public Transit System

As operating costs for private autos rise, roadway congestion grows, and certain groups, such as the elderly, handicapped, and low-income individuals, face challenges in accessing private vehicles, public transit becomes a more attractive transportation option. As Irvine and the surrounding region continue to develop, regional transit providers are enhancing their services to meet the growing demand. Figure 4.13-2 presents an overview of transit services in the City.

- Rail Transit: The City enjoys convenient access to multiple rail transit options, including Amtrak and Metrolink. The Amtrak Pacific Surfliner provides regional passenger rail service with stops in key cities such as Fullerton, Anaheim, Santa Ana, Irvine, San Juan Capistrano, and San Clemente. Positioned between San Diego and Los Angeles, Irvine serves as a central stop in Orange County, boasting one of the nation's busiest Amtrak stations.

M:\JOBS5\9919\env\graphics\EIR\Fig4.13-2.afdesign 03/11/24 bma

FIGURE 4.13-2
Transit Services

- Metrolink: Metrolink operates trains along the Los Angeles to San Diego railroad right-of-way, including the Orange County Line and the Inland Empire-Orange County Line, offering weekday and weekend rail service. The Irvine Transportation Center, Orange County's busiest station, serves over a million commuters annually and offers connections to express, local, and rail-feeder bus services operated by OCTA and iShuttle. The station provides free parking in a 1,500-space structure, with extended parking options available for Amtrak customers through registration with on-site security.

- Local Transit: OCTA provides comprehensive transit services throughout Orange County, including Irvine, with routes catering to various needs, from regional commuters to local shuttles. In 2016, OCTA assumed operation and maintenance of the City's iShuttle program. The City offers Transportation for Irvine Residents with Disabilities (TRIPS) service, providing door-to-door transportation for residents aged 18 and above with permanent physical and/or cognitive disabilities. TRIPS operates during evenings, weekends, and holidays based on demand.

- Shuttle Service: The iShuttle, a clean-fuel, rubber-tire shuttle bus, operates within Irvine during weekday peak commute hours.

- Anteater Express: Managed by University of California, Irvine, the Anteater Express connects the campus with nearby neighborhoods, housing complexes, and destinations like Diamond Jamboree and the Irvine Spectrum. While some routes are free, others require a limited fare.

- Additional Public Transit: The City provides various transit options for seniors and individuals with special needs, including free transportation for seniors to medical appointments through the Senior Service Program. Age Well Senior Transportation Services offer nonemergency medical transportation countywide. The American Cancer Society provides complimentary transport for cancer treatments, and services are accessible for disabled American veterans. The City's Mobility Guide serves as a comprehensive directory of transit services tailored to seniors and special needs individuals.

4.13.1.3 Pedestrian and Bicycle Systems

Southern California is recognized for its heavy reliance on cars, often resulting in goods and services being distant from residential areas and limited accessibility within neighborhoods for accessing local amenities. However, owing to the City's meticulous master planning, the City boasts a robust network of pedestrian trails and bicycle routes. This well-constructed system of trails and pedestrian bridges has been strategically developed to facilitate unrestricted movement for both pedestrians and cyclists throughout the community. Figure 4.13-3 presents an overview of pedestrian facilities in the City and Figure 4.13-4 presents an overview of bicycle facilities in the City.

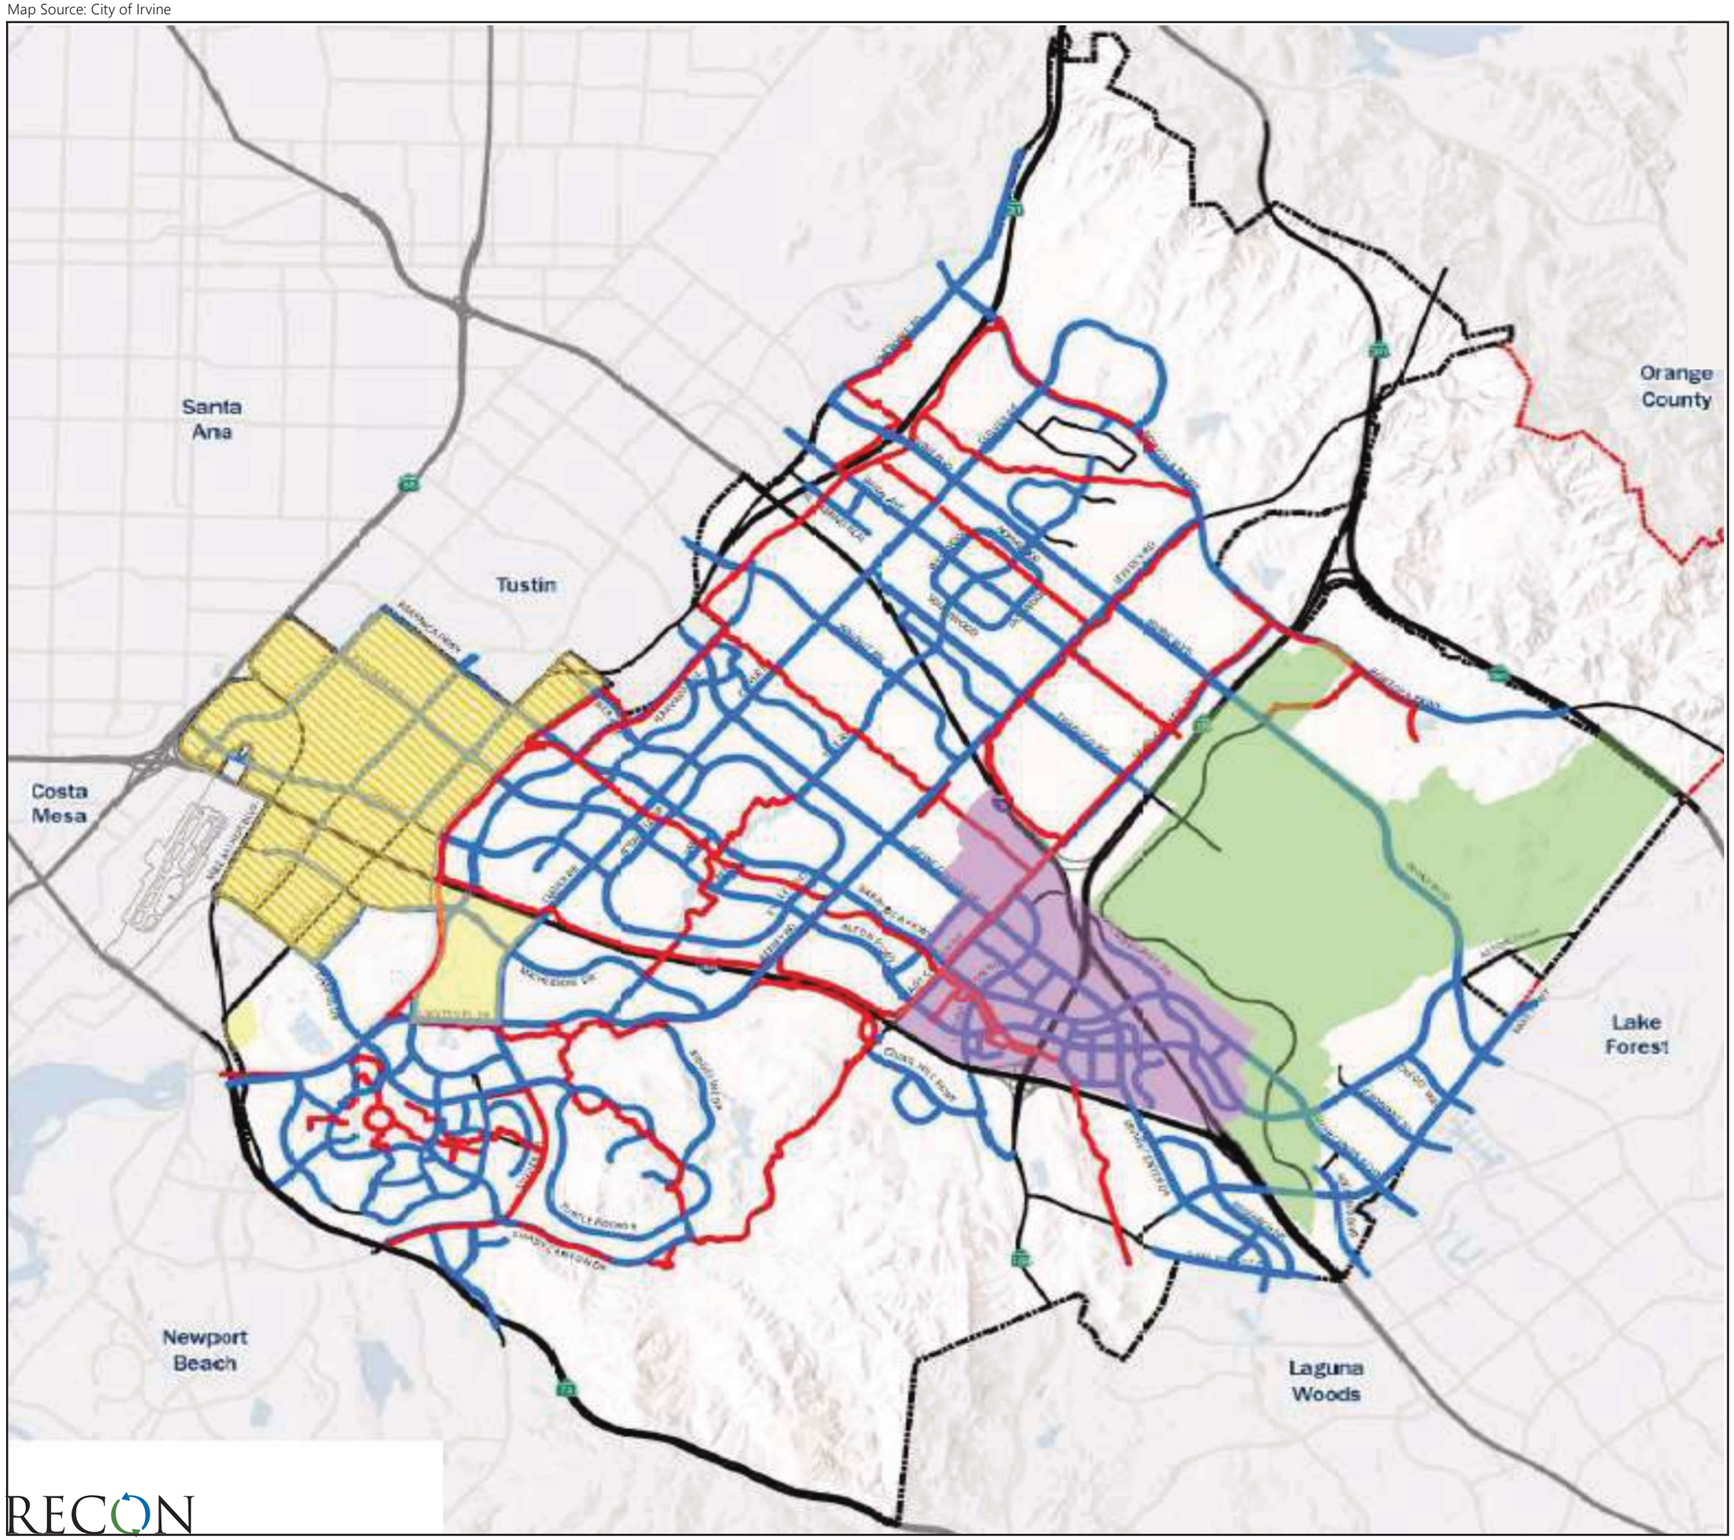
Pedestrian Facilities

Map Source: City of Irvine



RECON

M:\JOBS5\9919\env\graphics\EIR\Fig4.13-4.afdesign 03/11/24 bma

FIGURE 4.13-4
Bicycle Facilities

- Sidewalks: The City boasts an extensive pedestrian-friendly sidewalk network, designed to enhance accessibility, and promote an active lifestyle. Most residential neighborhoods have well-served sidewalks, with parks conveniently located within walking distance. However, areas like the IBC historically lacked sidewalks due to their focus on commerce and industry, though recent residential development has spurred demand for pedestrian infrastructure. The City is responding by prioritizing new sidewalk construction aligned with the IBC Vision Plan. UC Irvine's campus is pedestrian and bicycle-friendly, with a layout focused on these modes of transportation. Pedestrian paths and a "ring road" facilitate convenient access to academic buildings and leisure activities. Informal trails in nature preserves like Quail Hill Preserve provide outdoor recreation opportunities.

- Pedestrian and Bicycle Bridges: Irvine's circulation system features numerous bridges and grade-separated crossings, enhancing safety and accessibility for cyclists and pedestrians. Notable examples include bridges within the Woodbridge community, across UC Irvine's campus, along the Jeffrey Open Space Trail, and planned bridges over Irvine Boulevard and Jamboree Road. These bridges are funded by area-wide fees and public benefit improvement funds.

- Bicycle Trails: Irvine's bicycle infrastructure includes Class I, II, and III bikeways, offering exclusive bike and pedestrian paths, marked lanes on streets, and shared routes with pedestrians or vehicles. With over 50 miles of off-street bikeways and 301 miles of on-street bikeways, Irvine provides extensive cycling opportunities along named routes like West Irvine Trail, Peters Canyon Trail, Jeffrey Open Space Trail, Sand Canyon Trail, and Portola Trail.

4.13.2 Applicable Regulatory Requirements

4.13.2.1 State Regulations

a. Assembly Bill 1358 (Complete Streets)

The California Complete Streets Act (Assembly Bill [AB] 1358) of 2008 requires circulation elements to address the transportation system from a multimodal perspective. The bill states that streets, roads, and highways must "meet the needs of all users . . . in a manner suitable to the rural, suburban, or urban context of the general plan." The Complete Streets Act requires that circulation elements plan for all modes of transportation where appropriate, including walking, biking, car travel, and transit, and that streets are designed and operated to enable safe access for all users, including pedestrians, bicyclists, motorists, and transit riders of all ages and abilities.

b. Senate Bill 375 (Sustainable Communities and Climate Protection Act)

The Sustainable Communities and Climate Protection Act (Senate Bill [SB] 375) provides guidance to reduce the number and length of automobile commuting trips, helping to meet the statewide targets for reducing greenhouse gas emissions set by AB 32.

SB 375 requires each Metropolitan Planning Organization to add a broader vision for growth to its transportation plan through development of a Sustainable Communities Strategy (SCS). The SCS

must lay out a plan to meet the region's transportation, housing, economic, and environmental needs in a way that enables the area to lower greenhouse gas emissions. The SCS should integrate transportation, land use, and housing policies to plan for achievement of the emissions target for each region. The latest Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) was adopted in 2020.

c. Senate bill 743 (General CEQA Reform, VMT)

SB 743 was signed into law on September 27, 2013. This legislation seeks to balance the needs of congestion management, infill development, public health, greenhouse gas reductions, and other goals. Passage of SB 743 resulted in revisions to the California Environmental Quality Act (CEQA) Guidelines, including elimination of auto delay, level of service (LOS), and similar measurements of vehicular roadway capacity and traffic congestion as the basis for determining significant impacts, which were replaced with vehicle miles traveled (VMT) as the preferred CEQA transportation metric. The Office of Planning and Research released the Technical Advisory on Evaluating Transportation Impacts in CEQA in December 2018 to provide recommendations for the use of VMT metrics when analyzing land use projects and plans under CEQA.

d. California Fire Code

The California Fire Code establishes requirements pertaining to fire and life safety, including for building materials and methods, fire protection systems in buildings, emergency access to buildings, and handling and storage of hazardous materials (California Code of Regulations Title 24 Part 9).

4.13.2.2 Regional Regulations

a. Transportation Demand Management

Transportation Demand Management (TDM) refers to a comprehensive strategy to reduce driving and resulting VMT by promoting alternatives such as public transit, carpooling, bicycling, walking, and telecommuting. While some TDM measures can be undertaken by the City, such as investments in facilities and programs to encourage alternative modes of transportation, other TDM measures require collaboration with other jurisdictions, for example with transit providers to seek expanded service, or with employers to encourage flexible work schedules and the provision of on-site childcare, preferential carpool parking, and subsidized transit passes.

SCAG has developed a long-range planning vision to balance future mobility and housing needs with economic, environmental, and public health goals. The SCAG's 2020-2045 RTP/SCS has allocated $7.3 billion through 2045 to implement TDM strategies throughout the region. There are three primary goals of SCAG's TDM program:

- Reduce the number of single-occupant vehicle trips and per capita VMT through ridesharing (which includes carpooling and vanpooling) and providing first/last mile services to and from transit;
- Redistribute or eliminate vehicle trips during peak demand periods by supporting telecommuting and alternative work schedules; and

- Reduce the number of single-occupant vehicle trips through use of other modes such as transit, rail, bicycling, and walking, or other micro-mobility modes.

It should be noted that SCAG is currently in the process of updating this document and recently released the draft Connect SoCal 2024 for review and comment. The final Connect SoCal 2024 document is expected to go to the Regional Council for adoption in April 2024.

b. Orange County Congestion Management Program

The passage of Proposition 111 in June 1990 established a process for each metropolitan county in California, including Orange County, to prepare a Congestion Management Plan (CMP). The OCTA prepared the County's CMP in consultation with the County of Orange and the cities within Orange County. The Orange County CMP sets forth regional mobility objectives to reduce traffic congestion, provide a system for coordinating land-use and development decisions that support the regional economy, and to support gas tax funding eligibility. The CMP outlines policies for monitoring and managing system performance issues. The OCTA developed these policies in conjunction with local jurisdictions, the California Department of Transportation, and South Coast Air Quality Management District.

c. OC Go (Measure M2)

Measure M is a 30-year half-cent sales tax for transportation improvements in Orange County from 2011 to 2041. To be eligible for Measure M2 funds, a local jurisdiction must satisfy the following requirements:

- Comply with the conditions and requirements of the Orange County CMP.
- Establish a policy which requires new development to pay its fair share of transportation related improvements associated with their new development.
- Adopt a General Plan Circulation Element consistent with the MPAH.
- Adopt and update a Capital Improvement Program.
- Participate in Traffic Forums.
- Adopt and maintain a Local Signal Synchronization Plan.
- Adopt and update biennially a Pavement Management Plan.
- Adopt and provide an annual Expenditure Report to OCTA.
- Provide OCTA with a Project Final Report within six months following completion of a project funded with Net Revenues.
- Agree to expend Net Revenues received through M2 within three years of receipt.
- Satisfy Maintenance of Effort requirements.
- Agree that Net Revenues shall not be used to supplant developer funding.
- Consider, as part of the eligible jurisdiction's General Plan, land use and planning strategies that accommodate transit and non-motorized transportation

d. Orange County Transportation Authority Long Range Transportation Plan

The OCTA Long Range Transportation Plan (LRTP) outlines the vision and plan for multimodal transportation in Orange County. OCTA prepares the LRTP and submits it to SCAG so that county

transportation projects will be incorporated into the regional transportation plan and subsequently programmed into the Federal Transportation Improvement Program. The 2022 LRTP has four goals: (1) deliver on commitments; (2) improve transportation system performance, (3) expand transportation system choices; and (4) support sustainability.

e. Master Plan of Arterial Highways

The MPAH was established in 1956 to ensure that a regional arterial highway network would be developed to supplement Orange County's developing freeway system. OCTA is responsible for administering the MPAH, including the review and approval of amendments. The MPAH map is a critical element of transportation planning and operations because it defines a countywide circulation system in response to existing and planned land uses. It is regularly updated to reflect changing development and traffic patterns. In order to be eligible for OC Go (Measure M2) revenues and programs, a city's circulation element must be consistent with the MPAH and maintain the minimum number of lanes on each arterial in the MPAH.

f. Districts 1 and 2 Bikeways Strategy (2013)

OCTA's regional bikeways planning expanded the 2009 OCTA Commuter Bicycle Strategic Plan to identify potential regional bikeway improvements. The Districts 1 and 2 Bikeways Strategy was completed in 2013 and identifies 11 regional bikeway corridors that collectively comprise over 120 miles. These corridors connect to major activity centers, including employment areas, transit stations, and colleges and universities. The corridors also include key connections to regional bikeway routes and major destinations within the districts.

g. OCTA's OC Transit Vision

The OC Transit Vision is a 30-year plan for enhancing and expanding public transit service in Orange County. Adopted in 2018, the Transit Vision focuses future investments along transit opportunity corridors on major arterials and freeways. The Transit Vision also supports improvements to rail service planned by Metrolink and other partner agencies, including plans to improve station access and reduce the number of at-grade road crossings. The circulation mobility element adopts the transit opportunity corridors as part of its transit plan.

OCTA is currently developing the 2024 OC Transit Vision, which aims to integrate, enhance, and expand multimodal transportation services in Orange County. The OC Transit Vision will analyze current transit corridors, modes, transit supportive design, and policy recommendations. In addition, the plan will address the latest in transit technologies, respond to evolving ridership trends, and outline potential funding sources. The updated OC Transit Vision will provide a consistent, countywide transit approach that will be shared with local jurisdictions and other partner agencies to encourage coordination for advancing, funding, and implementation of transit-related recommendations both locally and regionally.

4.13.2.3 Local Regulations

a. Current General Plan (2000)

The Circulation Element of the City's existing General Plan (2000) includes the following objectives related to circulation:

Objective B-1: Roadway Development: Plan, provide and maintain an integrated vehicular circulation system to accommodate projected local and regional needs. This objective includes Policy (c), which establishes level of service (LOS) E as the acceptable standard of roadway operations.

Objective B-2: Roadway Design: Develop a vehicular circulation system consistent with high standards of transportation engineering safety and with sensitivity to adjoining land uses.

Objective B-3: Pedestrian Circulation: Establish a pedestrian circulation system to support and encourage walking as a mode of transportation.

Objective B-4: Bicycle Circulation: Plan, provide and maintain a comprehensive bicycle trail network that together with the regional trail system, encourages increased use of bicycle trails for commuters and recreational purposes.

Objective B-5: Riding and Hiking Trail Networks: Plan, develop and maintain a riding and hiking trail network and support facilities to satisfy the needs of riders and hikers.

Objective B-6: Public Transit Program: Work with Orange County Transportation Authority to implement a public transit system for trips within the City and adjacent areas.

b. Municipal Code

Title 6 (Public Works), Division 3 (Transportation), Chapter 6 (Trip Reduction Facilities)

This chapter is intended to meet the requirements of California Government Code Section 65089.3(b)(3), which requires development of a trip reduction and travel demand element to the Congestion Management Plan, and California Government Code Section 65089.3(b), which requires adoption and implementation of a trip reduction and travel demand ordinance. Developers of commercial, industrial, and mixed-use projects are required to provide the trip reduction support measures set forth in Section 6-3-605, as applicable, within each such development. Measures include:

1. A percentage of parking spaces, located as close as is practical to the entrance(s) of the use they are intended to serve, shall be reserved for use of carpool vehicles.
2. Secure, adequate, and convenient storage shall be provided for bicycles pursuant to the Zoning Code of the City.
3. Bus bays, bus stops and bus shelters shall be provided adjacent to roads and streets traversing or bounding the development, as requested by the City and pursuant to proposed

or existing bus stop locations identified by Orange County Transit District or its successor agency (i.e., Orange County Transportation Authority).
4. A transportation information center shall be provided within each building generating 100 or more employees.
5. A shower and locker room facility for each sex shall be provided in each building generating 400 or more employees.
6. Sidewalks or other paved pathways following direct and safe routes from the external pedestrian circulation system to each building in the development shall be provided.

Title 6 (Public Works), Division 3 (Transportation), Chapter 7 (North Irvine Transportation Mitigation Program)

The North Irvine Transportation Mitigation Program (NITM Program) is established for the purpose of providing funding for the coordinated and phased installation of required traffic and transportation improvements required under CEQA documents previously certified or adopted by the City in connection with land use entitlements for City Planning Areas 1/2, 5, 6, 8, 9, 40, and 30/51. The requirements regarding the preparation of traffic studies, reports, and analyses set forth in this chapter shall supersede the requirements regarding the preparation of traffic studies, reports, and analyses set forth in other City ordinances, resolutions, or determinations. This section also outlines the required NITM fees.

c. Zoning Ordinance

Chapter 5-8 (Irvine Business Complex Residential Mixed-Use Overlay District)

Section 5-8-4.C (Airport Restrictions) of Chapter 5-8 outlines the provisions for development within the jurisdiction of the Airport Land Use Commission, including: building height limitations in accordance with the Orange County Environs Land Use Plan standards and Federal Aviation Administration Part 77 Imaginary Surfaces for John Wayne Airport; the prohibition of residential land uses within Safety Zone 3; and sound attenuation standards for residential and park uses.

Chapter 9-36 (Planning Area 36-Irvine Business Complex)

As outlined in Section 9-36-14 (IBC Traffic Improvement Fee Program) of Chapter 9-36, the intent of the IBC Traffic Improvement Fee Program is to provide partial funding for implementation of the area-wide circulation mitigation program identified in the Final Program EIR for the IBC Vision Plan. Section 9-36-14 requires all development projects within the IBC for which building permits are issued after the effective date of the 2010 IBC Vision Plan to comply with the requirements of the 2010 IBC Traffic Improvement Fee Program, including the payment of fees prior to the issuance of building permits as established by this section for the construction of area-wide traffic improvements, or if selected by the project applicant, construction of area-wide improvements in lieu of payment of fees.

d. Planning Commission Resolution No. 09-2968

City Standard Condition 1.5 (Shared Access Agreement)

Prior to the release of a final map by the City, the applicant shall submit to the City for review by the City Attorney the required shared access agreement. The City Engineer and the Director of Community Development shall have approved, appropriate documents (e.g., shared access agreement, Covenant, Conditions & Restrictions, etc.) which ensure that utilities, access, parking, landscape areas, and drainage (including private catch basins) will be commonly shared and maintained.

City Standard Condition 3.17 (Emergency Access Plan)

Prior to the issuance of the first building permit, the applicant shall submit and have approved by the Chief of Police an Emergency Access Plan, which identifies and locates all Knox Boxes, Knox key switches, and Click2Enter radio access control receivers per the Irvine Uniform Security Code requirements. Said plan shall be incorporated into the plan set approved for building permits.

City Standard Condition 3.27 (Construction Phasing Plan)

Prior to the issuance of building permits, the applicant shall submit a proposed Construction Phasing Pan for review and approval by the Chief Building Official. The following is the list of specific items that should be provided in Construction Phasing Plan.

- An Exhibit showing:
  - Separation zones between Construction areas and Public areas, as required to maintain occupied areas safe based on projected construction schedules and absorption rates.
  - Laydown areas.
  - Carpool parking areas.
  - Delivery procedures and approved delivery areas.
  - Orange County Fire Authority (OCFA) no parking zones.
  - If the project is part of a master development then information about all the other projects shall also be included in the exhibit for detailed safety evaluation. In addition, the master developer shall identify one individual responsible for the oversight of the entire project including implementation of all the phasing requirements.

Should the phasing plan change during construction, a revised phasing shall be submitted to the Chief Building Official for review and approval prior to MEPS inspection. Construction Site Security requirements shall be in place at all the times during construction. This condition shall not apply to single-phase projects.

City Standard Condition 4.9 (Emergency Access Inspection)

Prior to authorization to use, occupy, and/or operate, the applicant shall arrange for and have passed an inspection, to be performed by the Irvine Police Department and the OCFA, to ensure compliance with the Emergency Access Plan requirements. The inspector shall verify test acceptance and locations of all Knox boxes, key switches and Click2Enter devices as depicted on the approved plan.

City Standard Condition 6.4 (Privacy Gates–Vehicle Stacking)

If the Director of Public Works and Transportation determines that the operation of the residential privacy gates approved with this application is negatively affecting the flow of traffic on an adjacent public roadway, the property owner or homeowners association may be required to submit a plan to the Director of Community Development that identifies specific measures to resolve these problems. The plan shall be submitted within 30 days of notification by the Public Works and Transportation Department and shall be reviewed and approved by the Director of Community Development in consultation with the Director of Public Works and Transportation. The property owner or homeowners association shall be required, at its sole expense, to implement any modifications required by the plan within 30 days of written notice from the Director of Community Development to implement such measures, or in such time frame as directed by the Director of Community Development in consultation with the Director of Public Works and Transportation.

e. Existing Plans, Programs, and Policies

Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required of the proposed project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute mitigation measures. The following measures are existing plans, programs, or policies (PPP) that apply to the proposed project and will help to reduce and avoid potential impacts related to transportation:

- PPP TRA-1 Compliance with Municipal Code Title 6 (Public Works), Division 3 (Transportation), Chapter 6 (Trip Reduction Facilities)
- PPP TRA-2: Compliance with Standard Condition 6.4 (Privacy Gates–Vehicle Stacking)
- PPP TRA-3: Compliance with Standard Condition 3.17 (Emergency Access Plan)
- PPP TRA-4: Compliance with Standard Condition 4.9 (Emergency Access Inspection)
- PPP TRA-5: Compliance with Standard Condition 3.27 (Construction Phasing Plan)

Proposed General Plan Strategies and Policies

In addition to the above-listed PPPs, the following proposed goals, objectives, policies, and implementation actions are applicable to the analysis of transportation and would replace existing goals, strategies, and policies outlined in the City's existing General Plan following project approval:

Circulation Element:

Goal 1: To facilitate the planning, provision, and maintenance of a well-integrated roadway network that effectively meets the anticipated demands of both local communities and the broader regional transportation system.

Objective C-1. Plan, provide, and maintain an integrated vehicular circulation system to accommodate projected local and regional needs.

- Policy (a): Use the Circulation and Land Use Elements to determine roadway sizing and phasing while striving to maintain a balanced transportation system.

- **Policy (b):** Use Figure B-1, Master Plan of Arterial Highways (presented as Figure 4.13-1), for the purpose of detailed planning of the circulation network. Calls for the City to develop, on an incremental basis, a vehicular circulation system responding to local and regional access requirements consistent with the City's Level of Service (LOS) Standards. Future development under the project would be required to demonstrate compliance with this policy through preparation and approval of a traffic study demonstrating that vehicle trips generated would not cause intersection and roadway segment operations to drop below LOS E. Policies (d) through (r) in the updated Circulation Element provide additional guidance to improve the City's roadway system. Future site-specific development under the project would be required to provide the trip reduction support measures consistent with the requirements of Municipal Code Title 6 (Public Works), Division 3 (Transportation), Chapter 6 (Trip Reduction Facilities).

Goal 2: To design a circulation system for roadways that adheres to the highest standards of transportation engineering safety while taking into account the surrounding land uses and their sensitivities.

Objective C-2. Develop a vehicular circulation system consistent with high standards for transportation engineering safety and with sensitivity to adjoining land uses.

- **Policy (a):** Design alignment, intersections and classification of roadways to facilitate the neighboring land uses while minimizing noise, emissions, and visual impacts of the proposed development.

- **Policy (d):** Ensure roadways are designed to complement other circulation networks and minimize the need to complete major reconstruction on the existing network.

- **Policy (e):** Ensure safe and efficient traffic flow while providing adequate and convenient access to retail sites.

Goal 3: To establish a pedestrian circulation system that supports and promotes walking as a viable mode of transportation within the community.

Objective C-3. Pedestrian Circulation. Establish a pedestrian circulation system to support and encourage walking as a mode of transportation. The following policies support Objective C-3:

- **Policy (a)**: Link residences with schools, job centers, shopping centers, parks and other public facilities/destination centers, both within a planning area and to adjacent planning areas, through an internal system consisting of pedestrian facilities (e.g., sidewalks and/or shared-use paths).
- **Policy (b)**: Encourage proposed developments to provide safe, convenient, and direct pedestrian access to surrounding land uses, on-street parking, and transit stops, as applicable, emphasizing active transportation and supporting the Complete Streets Act.
- **Policy (c)**: Design and locate land uses that facilitate access by non-automotive means (e.g., walking and/or bicycling).

- Policy (d): Continue to implement the existing sidewalk improvement program and enhance standards for improved active transportation and connectivity to create an interconnected system of pedestrian-friendly boulevards, avenues, and streets.

Goal 4: To develop and maintain a comprehensive bicycle network that encourages increased bicycle usage for both commuting and recreational purposes.

Objective C-4: Plan, provide, and maintain a comprehensive bicycle network that encourages increased use of bicycles for commuters and recreational purposes. The following policies support Objective C-4:

- Policy (a): Encourage proposed developments to provide connectivity to the existing bicycle circulation network, both on- and off-street, and within the proposed planning area. Such trails shall be linked to the system shown in Figure B-4. The on-street and off-street trails shall be designed for the safety of all users per the Complete Streets initiative, using design guidelines from the Active Transportation Plan which may include buffered bikeways and/ or other means of protected bikeways.
- Policy (b): Accommodate cyclists of all levels of experience and provide for both recreation and functional transportation when designing shared-use pathways.
- Policy (c): Enhance the existing bicycle network to improve connectivity between residential areas, employment areas, schools, parks, community facilities, commercial centers, and transit facilities.
- Policy (d): Encourage new developments to include detailed circulation plans for pedestrian and bicycle trails providing access to the subject property, adjacent properties, and community facilities, as applicable.
- Policy (e): Bicycle trip destinations, including community facilities, commercial centers, and transit facilities, shall be equipped with appropriate bicycle facilities/amenities including, but not limited to, the provision of bike racks, shade trees, drinking fountains, benches and showers, where feasible.
- Policy (f): Encourage grade-separated crossings for pedestrians and cyclists, wherever feasible, to increase safety and efficiency.
- Policy (g): Encourage off-street bicycle trails and shared-use paths in areas with minimal cross traffic, such as open space spine, flood control and utility easements, where feasible.
- Policy (h): Support programs and engage the community to increase public awareness of bicycle safety and bicycling as an alternative mode of transportation.
- Policy (i): Incorporate, where appropriate, school and park locations within the design of the bicycle system.

Goal 6: To plan, develop, and maintain a comprehensive trail network that caters to the needs of both equestrian riders and hikers, ensuring accessibility and enjoyment for all.

Objective C-6. Plan, develop, and maintain a trail network to support facilities that support the needs of equestrian riders and hikers. The following policies support Objective C-5:

- **Policy (a)**: Phase expansion and improve the existing trail network consistent with the City's growth, incorporating the needs of the equestrian and hiking community.
- **Policy (b)**: Continue to maintain, support, and evolve the equestrian and hiking trails as illustrated on Figure B-5, Trails Network, and in areas identified as permanent open space, scenic highway corridors, agricultural edges, public utility rights of way and easements, flood control channels, and areas designated for rural and estate density.
- **Policy (c)**: Encourage the development of trail facilities that minimize impacts on existing or planned development and wildlife preservation areas.
- **Policy (d)**: Continue to provide and maintain equestrian staging areas, rest stops, and boarding centers at locations which provide easy access to the trail system and are away from high-density urban areas.
- **Policy (e)**: Continue to encourage developer dedication and final improvements to the trail alignments.
- **Policy (f)**: Monitor and seek funds for trail system development and maintenance from all available sources.

Goal 7: Foster collaboration and coordination with regional transportation agencies to improve connectivity, accessibility, and efficiency of transportation networks serving Irvine and neighboring communities.
Objective C-7 Maintain a public transit system for trips within the City and to/from adjacent areas.

- **Policy (a):** Plan residential, commercial, and industrial areas to enable effective use of public transit.
- **Policy (b):** Consider designating excess right-of-way areas on arterial highways for potential public transit corridors or for emergency parking lanes.
- **Policy (c):** Continue to expand the bus service network within the City and regionally as an alternative mode of transportation through the following:
  - Pursue additional transit service to and within the City e.g., increase frequency and/or provide service to new developments.
  - Provide infrastructure at transit stops for convenience and safety (e.g., proper lighting, covered shelter and safe crossings) to encourage commuting to work.
  - Incorporate public art and green infrastructure to enhance existing and future transit stops.
  - Continue to expand the bus service network within the City and regionally as an alternative mode of transportation.
- **Policy (d):** Continue planning efforts as necessary to further develop the advanced transit network providing connection to all local and activity center systems encompassing the City and its sphere of influence.
- **Policy (e)** Coordinate the development of intra-county and regional transit stops with Irvine's intracity transit system.

- **Policy (f):** Encourage the short-term use of rights of way reserved for the various circulation systems for other uses, such as recreational open space.
- **Policy (g):** Consider the use of railroad rights of way as transportation corridors.
- **Policy (h):** Explore the use of technology to communicate transit patterns, promote safety, and attract passengers.
- **Policy (i):** Consider implementing and supporting proposed guidelines for near- and long-term improvements to transit infrastructure within the City limits.

4.13.3 Significance Determination Thresholds

Thresholds used to evaluate impacts to transportation are based on applicable criteria in the CEQA Guidelines (California Code of Regulations Sections 15000-15387), Appendix G. A significant impact would occur if the project would:

1) Conflict with a plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities;

2) Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b);

3) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment); or

4) Result in inadequate emergency access.

4.13.4 Methodology

The analysis included in this section is based on the VMT Traffic Study evaluated project impacts associated with additional residential and non-residential land uses that may occur under the project in accordance with the City's Traffic Study Guidelines and consistent with Section 15064.3 of the CEQA Guidelines (Appendix G).

4.13.5 Topic 1: Circulation System

Would the project conflict with a plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?

4.13.5.1 Impact Analysis

a. Roadway System

Implementation of the project would allow for the future development of new residential uses associated with the proposed General Plan Update (57,656 residential units), the development of nonresidential uses that are also currently permitted under the existing General Plan, and nonresidential uses associated with the Great Park area, and the extension of Ada roadway. Increased

development within the City is likely to increase the use of the City's roadway network.[1] In order to meet this anticipated increase in demand, the updated Circulation Element includes the following objectives and policies that would be consistent with the planning goals established by OCTA in their LRTP and would improve the City's roadway network. The extension of Ada from its current terminus in the parking lot of the Irvine train station south of the Southern California Railroad Authority (SCRRA) railroad tracks to extend approximately one-quarter of a mile north under the railroad tracks to meet the future Marine Way extension north of the railroad tracks is proposed with the project. The Ada roadway extension between the Irvine train station and Marine Way provides vehicle, pedestrian, and other multi-modal connectivity to support the residential uses. The Ada roadway extension will be included in the updated.

The Circulation Element which includes objectives and policies aimed at improving the existing roadway network. For example, Objective C-1 aims to improve an integrated roadway network that accommodates existing and projected local and regional needs, and Objective C-2 aims to develop a high-quality vehicle circulation system. Supporting policies are aimed at designing roadways to be safe and efficient, while minimizing environmental impacts. The proposed project would also be consistent with the Complete Streets Act because the project aims to prioritize multimodal transportation options, with a specific emphasis on reducing vehicle miles travelled through bikeway and/or pedestrian infrastructure improvements. Therefore, the project would not conflict with a plan, ordinance, or policy addressing roadway circulation, and impacts would be less than significant.

b. Public Transit System

The proposed project would allow for the future development of new residential uses associated with the proposed General Plan Update (57,656 residential units), the development of nonresidential uses that are also currently permitted under the existing General Plan, and nonresidential uses associated with the Great Park area, and the extension of Ada roadway. Increased development within the City is likely to increase demand for public transportation. In order to meet this anticipated increase in demand, the updated Circulation Element includes objectives and policies related to public transit. Planned development associated with the project are expected to utilize the public transit system, and the project supports this by planning development near the Irvine Transit Station, IBC Proposed concentration of future development near the Irvine Transit Station within the Spectrum (adjacent the Focus Area 2 and 3),and Tustin Transit Station near Focus Area 1 which is served by the iShuttle-citywide transit provided by OCTA. For example, Objective C-6 encourages continued coordination with transit authorities to maintain the public transit system. Supporting policies aim to encourage and promote expanded transit service within the City.

Future site-specific development under the project may be required to provide bus bays, bus stops and bus shelters adjacent to roads and streets traversing or bounding the development, as requested

[1]As a separate policy requirement, the City conducted an LOS analysis for the proposed project, which resulted in recommended infrastructure improvements. Specific projects associated with recommended improvements are not proposed as part of the project and have not yet been identified. However, future infrastructure projects would be required to undergo a separate environmental review process and would likely be identified in the City's CIP at the time they are proposed and details on such projects are available.

by the City consistent with the requirements of Municipal Code Title 6 (Public Works), Division 3 (Transportation), Chapter 6 (Trip Reduction Facilities) (PPP TRA-1).

In summary, the proposed project prioritizes multimodal transportation systems, supports first/last mile connectivity to transit, supports complete street improvements, which is consistent with regional transportation planning efforts. Therefore, the project would not conflict with a plan, ordinance, or policy addressing pedestrian and public transportation, and impacts would be less than significant.

c. Pedestrian and Bicycle System

The proposed project would allow for the future development of new residential uses associated with the proposed General Plan Update (57,656 residential units), the development of nonresidential uses that are also currently permitted under the existing General Plan, and nonresidential uses associated with the Great Park area, and the extension of Ada roadway. Because implementation of the project would increase the amount of housing within the City, the project is also anticipated to increase demand for pedestrian and multi-modal travel opportunities including bicycle and other wheeled travel opportunities. In order to meet this anticipated increase in demand, the updated Circulation Element includes several objectives and policies that would support various forms of pedestrian and bicycle travel. For example, Objective C-3 aims to establish a pedestrian circulation system that supports and encourages walking as a mode of transportation, while Objective C-4 aims to plan, provide, and maintain a comprehensive bicycle network that encourages increased use of bicycles for commutes and recreational purposes. Supporting policies aim to link pedestrian and bicycle infrastructure with residences, schools, job centers, retail, parks, and other public facilities.

In summary, the proposed project incorporates policies that support pedestrian and bicycle facilities. These include prioritizing multimodal systems, maintaining a network of complete streets to provide mobility opportunities for all users, promoting development of mixed-use projects (particularly within proximity villages within the three Focus Areas) to create pedestrian- and bicyclist-friendly areas, maintaining the existing bicycle and pedestrian network, and promoting pedestrian and bicyclist safety. Therefore, the project would not conflict with a plan, ordinance, or policy addressing pedestrian and bicycle travel, and impacts would be less than significant.

Therefore, the project would not conflict with a plan, ordinance, or policy addressing airplane travel, and impacts would be less than significant.

d. Conclusion

Implementation of the proposed project would increase the demand for public transit, bicycle, pedestrian, and airport facilities, particularly within the three Focus Areas where most of the planned residential units are located. This increased demand would require improvements and expansions to the existing circulation system. The proposed project includes a number of goals, policies, objectives, and implementation actions aimed at supporting transit, bicycles, pedestrians, and airports within and adjacent to the City. These are consistent with regional and local planning efforts supporting these modes of travel.

4.13.5.2 Significance of Impacts

The project would not conflict with a plan, ordinance, or policy addressing the circulation system, and impacts would be less than significant.

4.13.5.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.13.6 Topic 2: Vehicle Miles Traveled

Would the project conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?

4.13.6.1 Impact Analysis

CEQA Guidelines Section 15064.3 requires that the determination of significance for transportation impacts be based on VMT instead of a congestion metric such as LOS. The change in the focus of transportation analysis is the result of SB 743, as detailed in 4.13.2.1c above. The VMT Traffic Study evaluated project impacts associated with additional residential units proposed project, non-residential land uses within the Great Park,[2] and the Ada extension that may occur under the project in accordance with the City's Traffic Study Guidelines and consistent with Section 15064.3 of the CEQA Guidelines (Appendix G). The adopted methodology in the Traffic Study Guidelines identifies thresholds of significance for residential and non-residential projects based on a 15 percent reduction of existing countywide average VMT per population or employment. Similarly, the threshold of significance applied for the Citywide plan is based on a 15 percent reduction of existing countywide average VMT per service population of which service population is the sum of the countywide population and employment. This analysis utilized a VMT per service population metric for this evaluation.

Table 4.13-1 identifies the existing residential VMT per resident, the non-residential VMT per employee, as well as the VMT per service population with their respective significance thresholds using the City's VMT traffic model. The residential VMT significance threshold is based on the countywide population VMT divided by the countywide population. The non-residential VMT significance threshold is based on the countywide commute and other (i.e., customer and client) VMT trips divided by the number of countywide employees. The VMT per service population threshold is based on the total countywide VMT divided by the summation of the total countywide population and countywide employees. If the project VMT rate exceeds the significance threshold for VMT per service population (24.06), then the project would have a significant impact.

[2]Nonresidential uses in all other areas of the City would be permitted at the same intensities identified in the City's currently adopted General Plan.

Table 4.13-1 VMT Rate Threshold Goals for Projects within the City			
VMT Metric	Existing	Threshold Goal (15 Percent Reduction)	VMT Metric
VMT per resident	17.50	14.88	VMT per resident
VMT per employee	48.66	41.36	VMT per employee
VMT per service population	28.30	24.06	VMT per service population
SOURCE: Appendix G.			

Consistent with the 2021-2029 Housing Element, the project would update the General Plan Land Use Element to support the City's RHNA allocation of 23,610 units. The 6th Cyle 2021-2029 Housing Element (2021-2029 Housing Element) identified adequate sites to accommodate 57,656 new residential units to ensure consistency with housing statute, including no-net loss and affirmatively furthering fair housing requirements. The City's existing General Plan has a significant amount of unbuilt non-residential square footage available throughout the City's Planning Areas identified in the 2021-2029 Housing Element site inventory that would remain available for development as part of the proposed project

The proposed project would accommodate the City's RHNA requirement and implement the 2021-2029 Housing Element through the introduction of additional residential and/or mixed-use development throughout the City using residential and residential mixed-use overlay zones that would allow greater flexibility for property owners and developers proposing to develop affordable housing projects. The overlays would promote higher density residential and mixed-use in three Focus Areas, targeted retail centers, conversion of hotel/motel sites, and on religious and school sites. Most of the future residential growth would occur in the three focus areas that are most suited for new growth and development as they are located near existing job centers and are along major travel corridors with access to existing and future public transit opportunities. Focus Area 1 consists of the Greater IBC and would be allowed a maximum of 15,000 base units under the proposed project. Focus Area 2 would consist of the Greater Spectrum Area. The project would increase the residential intensity in Focus Area 2 by an additional 26,607 residential units. Focus Area 3 would consist of the Great Park Neighborhood Transit Village. The project would increase the residential intensity in Focus Area 3 with an additional 5,252 residential units. Refer to Chapter 3.0 for further details related to development proposed as part of the project.

The project would also accommodate the remaining 8,536 residential units required by the City's RHNA assessment outside of the aforementioned focus areas throughout the City. These units would be accommodated using the same proposed residential overlay.

Overall, new residential units proposed as part of the project would be developed under a proximity village approach, building upon the City's current approach to master planning in the City. The primary intent of the proximity village approach would ensure that future development is balanced with a mix of uses including neighborhood-serving non-residential square footage (retail, restaurants, medical offices, etc.) and parks and open space uses that are connected through multi-modal transportation and complete street strategies.

Non-residential land uses: In addition to the RHNA residential component, the project includes additional non-residential land uses in the Irvine Great Park (Great Park). Phase 1 of the Great Park Framework Plan is in the baseline (no build condition) and the remaining land uses supporting the buildout of the Great Park Framework (200 acres in total) are included as part of the project. Phase 2 (or the remaining buildout of the Great Park) includes the following: a botanical garden, a veteran's memorial garden, a library, a discovery center, two museums, a 65-acre central park area, an accessory restaurant use, an aquatic center, an aquatic stadium, an all-wheel park, and pickleball courts.

Transportation Improvements: The project also includes the extension of Ada from its current terminus in the parking lot of the Irvine train station south of the SCRRA railroad tracks to extend north under the railroad tracks to meet the future Marine Way extension north of the railroad tracks. The Ada roadway extension between the Irvine train station and Marine Way provides multi-modal connectivity to support the residential uses.

Table 4.13-2 presents the results of the VMT analysis comparing buildout of the Existing General Plan (or a No Project Scenario) to buildout of the project.[3] As shown in Table 4.13-2, both scenarios exceed the City's VMT per service population threshold of 24.06 VMT per service population. Buildout of the General Plan would result in an average VMT per service population value of 28.97, which would require a 17.0 percent reduction in VMT to meet the significance threshold. Buildout of the project would generate a VMT per service population value of 24.94, which would require a 3.5 percent reduction in VMT to meet the significance threshold. Based on these results, the project would reduce VMT compared to buildout of the adopted General Plan (or a No Project Scenario). This reduction is due to the fact the City currently is a major employment center with a high jobs-to-population ratio.[4] The City has more jobs than can be sustained by the City's own population. Many of the jobs are in relatively high-paying professions, and employees are more likely and able to afford to make longer distance commutes from less dense residential areas within the City, as well as residential areas outside the city. While some of this long-distance travel may occur on freeways outside the city, a large proportion of the VMT will end up on city streets and intersections. Shifting towards a more balanced jobs/population ratio as would occur under the project can be expected to improve VMT metrics.

[3] A conservative approach was used for the preparation of the VMT impact analysis. VMT impact identification and resulting mitigation is based on a non-cumulative approach that identifies more mitigation requirement than the cumulative condition."

[4] The City currently has roughly double the number of jobs per population as the rest of Orange County (1.01 vs. 0.49).

Table 4.13-2 VMT Analysis Results Summary							
Scenario	Total VMT (miles)	Total Population	Total Employees	Service Population	VMT Per Service Population	VMT Per Service Rate Above Threshold	Percent VMT Reduction Needed
Adopted General Plan	20,426,702	368,261	336,730	704,991	28.97	4.98	17.0
Project	21,337,558	517,654	337,910	855m564	24,94	0.88	3.5
SOURCE: Appendix G.							

4.13.6.2 Significance of Impacts

Buildout of the existing adopted General Plan would result in an average VMT per service population value of 28.97, which would require a 17.0 percent reduction in VMT to meet the significance threshold. Buildout of the project would generate a VMT per service population value of 24.94, which would require a 3.5 percent reduction in VMT to meet the significance threshold. Based on these results, the project would reduce VMT compared to buildout of the existing adopted General Plan. Nonetheless, the project would still exceed the VMT per service population threshold and would require a 3.5 percent reduction in VMT to meet the significance threshold. This would be considered a significant impact. Therefore, projected VMT generated under buildout of the project would be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b). This would be considered a potentially significant impact.

4.13.6.3 Mitigation

The City's Traffic Study Guidelines contain a two-tier system for the VMT Mitigation Program:

TRA-1: On-Site Infrastructure

The City of Irvine Director of Community Development, or designee, shall require applicants for future proposed projects that exceed VMT thresholds to incorporate on-site connectivity into site design in order to achieve a reduction of 2.5 percent VMT rate. Site design measures to achieve this VMT reduction would include promotion of bicycle activity (i.e., bike facilities) and pedestrian walkability (i.e., connected sidewalks from building entrances to public streets).

TRA-2 On-Site Transportation Demand Management

The City of Irvine Director of Community Development, or designee, shall require applicants for future proposed projects that exceed VMT thresholds to incorporate a TDM program to achieve a reduction of up to 5 percent VMT rate. While TDM programs in the past have typically focused on employer sites, they can also be implemented to new residential developments with measures such as bike share or car share programs.

4.13.6.4 Significance of Impacts after Mitigation

Implementation of the mitigation measures TRA-1 and TRA-2 described above would potentially reduce impacts related to VMT to a level less than significant. However, as no specific development projects have been identified at this time, it is not possible to ensure that every future project could fully mitigate potentially significant impacts. Therefore, impacts related to VMT would remain significant and unavoidable at this program level of review.

4.13.7 Topic 3: Hazards Due to a Design Feature

Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

4.13.7.1 Impact Analysis

Buildout of the proposed project would involve the alteration, intensification, and redistribution of residential land uses in the City. Specifically, buildout of the project would allow for the future development of new residential uses associated with the proposed General Plan Update (57,656 residential units), the development of nonresidential uses that are also currently permitted under the existing General Plan, and nonresidential uses associated with the Great Park area, and the extension of Ada roadway.

The General Plan Update includes several policies aimed at improving the City's circulation network that are aimed at reducing existing and potential transportation hazards. Future site-specific development under the project would be subject to the appropriate entitlement application review process (Conditional Use Permit or Master Plan) as well as design and engineering review to ensure roads and access is configured consistent with established roadway design standards. As described in Section 4.13.5.1a above, update Circulation Element Objective C-2 seeks to "Develop a circulation system consistent with high standards for transportation engineering safety and with sensitivity to adjoining land uses." Furthermore, Policy (i) encourages that "intersections and public right of ways to be designed to provide adequate and safe access for all users including pedestrians, bicyclists, and motorists of all ages and abilities." Furthermore, future site-specific development under the project (including residential projects, Great Park improvements, and the Ada extension) would be subject to both a design and engineering review (and likely a review by the Orange County Fire Authority) to ensure roads and access is configured consistent with established roadway design standards. Future projects would also be required to comply Standard Condition 6.4, (PPP TRA-2) which outlines procedures to be followed should vehicle stacking result from the operation of residential privacy gates associated with residential development projects. Therefore, implementation of the project would not result in hazardous conditions, create conflicting uses, or cause a detriment to emergency vehicle access.

4.13.7.2 Significance of Impacts

The project would not substantially increase hazards due to a geometric design feature of incompatible uses, and impacts would be less than significant.

4.13.7.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.13.8 Topic 4: Emergency Access

Would the project result in inadequate emergency access?

4.13.8.1 Impact Analysis

Future site-specific development under the project allow for the future development of new residential uses associated with the proposed General Plan Update (57,656 residential units), the development of nonresidential uses at the same intensities permitted under the existing General Plan, nonresidential uses associated with the Great Park area, and the extension of Ada roadway.. Future projects would be subject to the City's design requirements regarding emergency access per Planning Commission Resolution No. 09.2968. City Standard Condition 3.17 (Emergency Access Plan) requires an applicant to submit and have approved by the Chief of Police an Emergency Access Plan, which identifies and locates all Knox Boxes, Knox key switches, and Click2Enter radio access control receivers per the Irvine Uniform Security Code requirements. Similarly, City Standard Condition 4.9 (Emergency Access Inspection) requires an applicant to pass an inspection, to be performed by the Police Department and the Orange County Fire Authority, to ensure compliance with the Emergency Access Plan requirements. The inspector shall verify test acceptance and locations of all Knox boxes, key switches and Click2Enter devices as depicted on the approved plan. Prior to construction, future development would prepare a construction phasing plan (PPP TRA-5) that would include measures to maintain emergency access.

4.13.8.2 Significance of Impacts

The project would not result in inadequate emergency access, and impacts would be less than significant. With compliance with the above PPPs, impacts would be less than significant.

4.13.8.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.13.9 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for hazards and transportation. The study area for the assessment of cumulative impacts related to transportation is the City. The nature of the project is also inherently cumulative as it establishes a long-term plan that would improve the circulation network through project buildout in 2045. This would include implementing objective and policies described above that would improve the circulation network, ensure future projects would

not introduce hazards onto the circulation network, and ensure future development and redevelopment would not interfere with emergency access.

Cumulative transportation impacts associated with buildout of the project were evaluated in the VMT Traffic Study (Appendix G) that was prepared for the project. The analysis within that study assumed a cumulative scenario that included buildout of the proposed General Plan, cumulative projects (cumulative projects in the City and residential uses associated with neighboring jurisdictions' RHNA requirements) as well as buildout of the Great Park area and the extension of Ada.

The Proposed Project Plus Cumulative Scenario would generate a VMT per service population of 24.88. Therefore, there would be a significant impact under CEQA that would require a 3.3 percent reduction in VMT to meet this threshold. Although mitigation as described in Section 4.13.6.3 above would be feasible under the cumulative alternative, no specific projects have been identified. Therefore, cumulative impacts related to VMT would remain significant and unavoidable. Therefore, projected VMT generated under buildout of the project would be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b), and the project would result in cumulative impacts related to VMT.

4.14 Utilities and Service System

This section evaluates potential impacts related to public utilities (storm drain, wastewater, water, water supply, solid waste disposal, electrical power, natural gas, and telecommunications) that could result from implementation of the project. The analysis area covers the entirety of the city of Irvine (City). This analysis relies upon the Proposed Conditions Infrastructure Report for Water, Sewer, Storm Drainage, and Water Quality prepared by Fuscoe Engineering, Inc. (Appendix I), impacts associate with natural gas, energy, and telecommunications facilities, and solid waste have been assessed at using publicly available data.

4.14.1 Existing Conditions

4.14.1.1 Water Infrastructure and Supply

a. Water System

The City's existing potable water system is fully encompassed within the potable and non-potable water service area of the Irvine Ranch Water District (IRWD). IRWD also services portions of the surrounding cities of Tustin, Santa Ana, Orange, Costa Mesa, Lake Forest, Newport Beach, and unincorporated areas of the County of Orange. Altogether the service area is approximately 181 square miles with the City and its sphere of influence accounting for approximately 41 percent (74 square miles) of IRWDs service area.

IRWD serves about 20 percent of Orange County, and has facilities worth over $1 billion, including more than 1,500 miles of drinking water pipelines, more than 900 miles of sewer pipes, 53 reservoirs, and two large water recycling facilities. Distribution pipelines within the City range in diameter between 1-inch and 72-inches and have a total length of approximately 78 miles. Most of the water pipes throughout the City are 8-inch pipes and most of the pipelines were constructed in the 1970s through the 2000s.

b. Water Demand

The water demands generated within the City and its three Focus Areas are representative of a portion of all IRWD's customer water use, water demand forecasting. All connections throughout IRWDs service area are metered and IRWD employs water use factors that assign water demands to various land use types and then aggregates these demands. The water use factors are based on average water use and incorporate the effect of IRWD's tiered-rate conservation pricing (budget-based rates). During 2020, IRWD reported that the top three water users were multi-family residential units (44 percent of total), commercial uses (13 percent of total), and single-family residential units (12 percent of total). Table 4.14-1 presents additional data regarding IRWD water demand in 2020.

Table 4.14-1 IRWD 2020 Water Demand		
Water Use Type	Level of Treatment When Delivered	Volume (acre-feet)
Multi-Family	Drinking Water	24,955
Commercial	Drinking Water	7,281
Single Family	Drinking Water	6,885
Industrial	Drinking Water	4,581
Landscape	Drinking Water	4,211
Institutional/Governmental	Drinking Water	1,454
Other Potable	Drinking Water	238
Agricultural Irrigation	Drinking Water	117
Agricultural Irrigation	Raw Water	599
Industrial	Raw Water	441
Landscape*	Raw Water	1,965
Agricultural Irrigation*	Raw Water	461
Other Non-Potable*	Raw Water	96
Commercial*	Raw Water	39
Industrial*	Raw Water	2
Losses**	Drinking Water	3,049
TOTAL		56,374
SOURCE: IRWD 2020 UWMP - Table 4-1 Retail: Demands for Potable and Non-Potable Water Demands – Actual *Supplement to Recycled Water system **Distribution System Real Losses		

As shown in Table 4.14-1, IRWD delivered 56,374 acre-feet (AF) of potable and non-potable water with residential demands (multifamily and single family) accounting for 57 percent of water demand within the service area. In comparison to previous water years, water use in 2020 was significantly lower than the 71,086 AF that IRWD estimated in the 2015 Urban Water Management Plan (UWMP). Historically, water demands in the IRWD service area have decreased over time due to conservation campaigns, tiered and allocation-based rate structures, and advances in water savings technologies. IRWD's three largest water users in 2015 were single family homes (24,024 AF), commercial uses (7,856 AF), and multifamily units (6,286 AF). These decreases in residential and commercial driven water use trends are consistent with conservation efforts and land use/development throughout IRWDs service area.

c. Existing Water Supply

IRWD's water resource portfolio consists of imported water, local groundwater, recycled water, and local surface water. Treated and untreated imported water is purchased from the Metropolitan Water District of Southern California (Metropolitan or MWD) through the Municipal Water District of Orange County (MWDOC). Potable and non-potable groundwater supplies are extracted from both the Main Orange County Groundwater Basin and the Irvine Sub-Basin. Recycled water production at IRWD's Michelson and Los Alisos Water Recycling Plants are primary supplies to IRWD's non-potable

distribution system. Table 4.14-2 presents the sources for IRWD potable and non-potable water in 2020.

Table 4.14-2
IRWD 2020 Water Supply

Water Supply	Additional Details	Actual Volume (AF)
Purchased or Imported Water	MWD	12,861
Purchased or Imported Water	MWD (SAC)	1,168
Surface water (not desalinated)	Irvine Lake	6,600
Groundwater (not desalinated)		37,990
Groundwater (not desalinated)	Non-Potable	4,437
Recycled Water	MWRP & LAWRP	24,627
TOTAL		87,683

SOURCE: IRWD 2020 Urban Water Management Plan, Table 6-8 Retail: Water Supplies — Actual

IRWD's water supply system includes imported water from MWDOC (16 percent of total), local groundwater and surface water supplies (56 percent of total), and recycled water (28 percent of total). The MWDOC is a wholesale importer and member agency of the Metropolitan Water District (MWD) and is entitled to receive water from the available sources of MWD, including Colorado River and Northern California surface water. IRWD also has contracts with Kern County to store up to 126,000 AF of groundwater storage and extract up to 28,750 AF per year during dry years.

Groundwater

The City and its sphere of influence are located within the Coastal Plain of Orange County groundwater basin, also known as Basin 8-1. Under the Sustainable Groundwater Management Act (SGMA), the Basin 8-1 is classified as a medium priority basin, due to heavy reliance on the Basin's groundwater as a source of water supply. The IRWD's local surface water supplies are the drainage tributary areas to the Irvine Lake and Harding Canyon Reservoir. On average, about 4,000 acre-feet per year (AFY) is captured for IRWD's demands. Water supplies available from the Harding Canyon are often limited due to dry weather conditions. Recycled water meets about 33 percent of IRWD's (non-potable; agricultural irrigation, landscape, golf course, commercial, and industrial uses) water demands. In 2020, approximately 24,626 AF of wastewater was recycled within the service area from the Michelson Water Recycling Plant (MWRP) and Los Alisos Water Recycling Plant (LAWRP). In the case there isn't sufficient supplies of treated wastewater for use from the MWRP and LAWRP, supplemental untreated imported water can be used.

IRWD operates the Peters Canyon Channel Water Capture and Reuse Pipeline Project which captures dry weather runoff from three storm drain diversion facilities prior to flows entering Peters Canyon Channel. The dry weather runoff is then delivered to Orange County Sanitation District (OCSD) for treatment and subsequent discharge to Orange County Water District's Groundwater Replenishment System for eventual groundwater recharge. There are currently no commitments for purchase of desalination water by IRWD.

Recycled Water

Water recycling is an essential part of IRWD's water supply portfolio, as it reduces the demand for high-quality potable drinking water. IRWD's recycled water program began with the focus of providing tertiary treated Title 22 recycled water to supply agricultural irrigation demands. Today, new developments must install dual plumbing that allows recycled water to be used for landscaping, toilets, and other uses not requiring potable water. IRWD recycled water meets the standards as set forth in Title 22, California Code of Regulations, for uses, including landscape irrigation, toilet flushing, cooling towers, industrial processes, composting, grading, and compaction.

IRWD maintains an extensive infrastructure system for recycled water. This includes a recycled water pipeline system that includes more than 500 miles of dual distribution pipelines. Water is recycled at the MWRP and LAWRP. The MWRP has a permitted tertiary treatment capacity of 28 million gallons per day (mgd) and recycles 90 percent of the plant's sewage inflow. To support the over 5,400 recycled water users, IRWD has 15 reservoirs with storage capacity of 4,536 acre-feet of recycled water.

Drinking Water Quality

IRWD strives to provide residents and business consumers with safe drinking water supplies. IRWD, OCWD, and the MWD conduct extensive testing for regulated and unregulated chemicals in their water supplies. OCWD manages the quality of the groundwater basin, MWD supplies imported treated surface water, and IRWD operates a surface water treatment plant and several ground water treatment plants.

Communities are required to adhere to stringent state regulations regarding primary and secondary drinking water standards. Primary standards are legally enforceable standards that are needed to protect public health. Secondary standards affect the color, appearance, and taste of drinking water, but are not health-related standards. Adherence to standards is measured in terms of maximum contaminant levels allowed in drinking water. Progress toward public health goals, as described below, is also required to be reported.

The EPA, the Office of Environmental Health Hazard Assessment, and the SWRCB Division of Drinking Water have set voluntary drinking water quality goals for some contaminants. The most common measure is public health goals. Water quality goals are often set at such low levels that they are not achievable in practice and are not directly measurable. Nevertheless, these goals provide useful guideposts and direction for water management practices. IRWD strives to meet public health goals, although state and federal law do not require adherence. IRWD produces an annual consumer confidence report that tracks the quality of the City's drinking water. IRWD continues to meet and/or exceed all primary and secondary drinking water standards that are required by state and federal law.

4.14.1.2 Sewer and Wastewater Infrastructure

a. Existing Sewer System

IRWD owns and operates a complex sewer collection system that stretches 963 miles to serve its current and future customers. The sewer system and drainage are defined by the physical geography of the San Diego Creek and Peters Canyon Channel. IRWD's service area is bounded on the northeast by the Santa Ana Mountains and on the south by the San Joaquin Hills. As a result of these dominant drainage features, IRWD's sewer system flows generally from northeast to southwest. The majority of the IRWD sewer system serves the City, although there are some additional service areas that fall outside the City, including portions of the Cities of Lake Forest, Newport Beach, Costa Mesa, and unincorporated areas of Orange County. A portion of wastewater generated in Newport Beach and the City is collected by trunk sewers owned, operated, and maintained by IRWD, then discharged into sewers owned and maintained by the OCSD.

As of 2018 there are 23 sewage lift stations and 12 are considered major facilities. IRWD operates and maintains 1,100 miles of sanitary sewer mains and 12 miles of force mains, spanning 181 square miles (84,000 acres) of service area in Orange County.

The system also includes 19 siphons that are used to convey wastewater flows under human-made and natural obstructions, and seven diversion structures to divert or split the upstream flows into two separate downstream pipelines. The collection consists primarily of vitrified clay pipe and polyvinyl chloride sewer mains that range from 4 to 60 inches, in addition to 32 trunk lines that are the most critical components of the sewer collection system. The ultimate destination of wastewater collected in IRWD's system include the MWRP, the Los Alisos WRP or treatment plants operated by the El Toro Water District, the Santa Margarita Water District, or the OCSD.

b. Existing Sewer Flows

Wastewater in the City travels through IRWD's collection system to the Michelson Water Reclamation Plant and Los Alisos Water Recycling Plant, where it is treated through the reclamation process for use in landscaping, agricultural irrigation, and other non-potable water uses. However, one part of the City, the Irvine Business Complex (IBC), is not within the IRWD collection system. The IBC is in the OCSD, tributary zone No. 7, and wastewater generated in the IBC flows to OCSD treatment facilities located in Fountain Valley and/or Huntington Beach.

Table 4.14-3 Existing Sewer and Wastewater Flows					
Wastewater Collection Agency	Volume Metered or Estimated?	Volume Collected (AF)	Receiving Agency	Treatment Plant	Located within IRWD Service Area?
IRWD[1]	Metered	22,575	IRWD	MWRP	Yes
IRWD	Metered	3,760	IRWD	LAWRP[2]	Yes
OCSD	Metered	7,568	OCSD	OCSD	Yes
IRWD	Estimated	112	SMWD	Chiquita Water Reclamation Plant	No
TOTAL		34,015			
SOURCE: IRWD 2020 Urban Water Management Plan – Table 6-2 Retail: Wastewater Collected Within Service Area in 2020 Includes 1.09 mgd from outside service area 7 (SA-7). Includes English Canyon flows (outside UWMP service area).					

Overall, the system is very highly managed and is in relatively "young health" by sewer system standards. In addition, when specific plans or major projects are processed (over 400 residential units or equivalent mixed-use projects with similar sewer demands), IRWD requires subarea master plans that identify projected water and sewer demands, required sewer and water infrastructure, and conformance with the sewer collection system master plan. This process enables IRWD to manage the sewer and water systems in a comprehensive manner.

4.14.1.3 Storm Drainage

a. Existing Drainage System

Figure 4.8-2 in Section 4.8.1.3 above presents the storm drain system within the City. The local storm drain system is owned by the City and maintained by the City's Public Works and Transportation Department. The regional flood control system is owned and maintained by the Orange County Public Works Department (OCPW). Lines typically range in size from 18 to 60 inches (with some up to 96 inches), with the local drainage system consisting of the smaller diameter pipes and the larger flood control facilities consisting of trapezoidal channels or riverine systems. Drainage facilities are typically either RCP pipe or box culverts to convey stormwater. Local storm drain facilities are designed to accommodate 25-year flow requirements, and the regional County facilities are designed to accommodate 100-year storm events. The City conveys stormwater to OCPW regional conveyance facilities and has an ongoing monitoring and maintenance procedure to ensure the overall system functions effectively. To prevent significant flooding during storm events, OCPW and the City monitors and maintains its respective channels and storm drain systems to ensure they are conveying storm flows as designed.

- In addition, the City currently requires individual drainage analyses for new development and redevelopment to ensure conformity with the entire Citywide drainage system. New development and significant redevelopment must analyze the 25-year storm event to determine if there are any impacts to the public storm drain system. The City is located entirely within the Santa Ana Regional Water Quality Control Board (RWQCB) jurisdictional

area. The watershed and water quality issues are generally discussed in more detail in Section 4.8.

4.14.1.4 Solid Waste

Transfer and recovery facilities are owned and operated by private entities and licensed and overseen by the state. The County maintains three closed landfills in Irvine. There is a total of 21 actively maintained and monitored landfills Countywide. The County operates compost facilities at all three existing landfills.

Residential, institutional, regional commercial, and industrial solid waste is presently collected by private firms, with residential and village commercial collections franchised by the City. OC Waste & Recycling manages three active landfills conveniently located in the northern, central and southern regions of the County: Olinda Alpha Landfill is located near the City of Brea, Frank R. Bowerman Landfill is located near the City of Irvine and the Prima Deshecha Landfill is located partially in a County unincorporated area, the City of San Juan Capistrano and the City of San Clemente (Orange County Waste and Recycling 2016). A solid waste transfer station exists within Planning Area 36 (Irvine Business Complex) (City of Irvine 2005).

a. Waste Diversion

In 1989, the State Legislature passed Assembly Bill 939 (AB 939), the Integrated Waste Management Act, which required cities and county to prepare, adopt, and submit a "source reduction and recycling element" to the County that characterizes waste disposal, source reduction, recycling, composting, solid waste capacity, education/public information, funding, special waste, and household hazardous waste to ensure sufficient solid waste disposal capacity. In addition, AB 939 mandated that by January 1, 2000, each city must achieve a waste diversion goal of 50 percent through source reduction, recycling, and composting activities. In October 2011, the Legislature passed AB 341, which increased the goal of diversion of waste from landfills from 50 percent to 75 percent by 2020. In addition, AB 341 requires mandatory commercial waste recycling. Further, AB 1826 requires that businesses and multifamily residences of five or more units that generate a specified amount of organic waste to arrange recycling services for organic waste.

Senate Bill 1383 (SB 1383)

SB 1383 is known as the Short-Lived Climate Pollutants bill and is designed to significantly reduce the amount of food, food soiled paper, and green waste going into landfills.

Zero Waste Resolution

The City adopted a resolution to support Zero Waste principles on July 10, 2007. The City encourages many Zero Waste practices through residential curbside recycling, parks recycling (where City parks are equipped with special recycling receptacles for public use), recycling at City facilities, and the City's purchasing policy to buy recycled products when feasible. In addition, all City environmental programs' public education materials include the State's adopted Slogan: "Zero Waste, You Make It Happen."

Construction and Demolition Debris Recycling Ordinance

The City adopted a Construction and Demolition Debris Recycling Ordinance (07-18) in 2007. Under this ordinance, projects are required to recycle or reuse 75 percent of concrete and asphalt, and at least 65 percent of all debris generated. Covered projects include new residential and nonresidential development and most projects involving nonresidential demolition and/or renovation in accordance with requirements of the California Green Building Standards Code. Applicants for projects are required to submit a waste management plan to the City prior to obtaining permits for construction, demolition, or renovation activities covered by the ordinance.

Sustainability Community Initiative

The City adopted the Sustainable Community Initiative (Initiative Ordinance 10-11) as Initiative Measure S in 2010. The ordinance was adopted to ratify and implement policies in support of renewable energy and environmental programs for a sustainable community. It outlines the City's direction for continuing to develop and implement programs geared toward green building, renewable energy, and sustainability. For example, the City would continue to develop and implement recycling, zero waste, or other innovative onsite business programs to divert waste from landfills and also continue to develop and implement the use of native, California-friendly, and drought-tolerant landscaping.

Existing General Plan (2000)

The City's existing general plan contains a chapter on integrated waste management. The stated goal is to encourage solid waste reduction through diversion of organic and recyclable material that would be otherwise landfilled without deteriorating the environment.

Integrated Waste Management Element

Objective H-1: Solid Waste: Cooperate in guiding the development and improvement of a solid waste disposal system within the County of Orange that will meet the needs of the City and protect the City from damage by unplanned disposal of refuse.

Policy (a): Use the General Plan land use categories and building intensity standards as a basis for estimating waste disposal requirements and program needs.

Policy (b): Encourage continued study of alternative waste disposal methods and technology with emphasis on reuse of solid waste materials and on waste-to-energy.

Policy (c): Develop all waste disposal programs in cooperation with landowners, the county, and other jurisdictional and regulatory agencies.

Policy (d): Work closely with the operator(s) of existing landfill sites to minimize deleterious effects on surrounding land uses including possible.

4.14.1.5 Electricity, Natural Gas, and Telecommunications Facilities

Electricity and Natural Gas

Electricity is provided to the City by the Orange County Power Authority and is accessed by customers via Southern California Edison's (SCE) infrastructure. SCE is one of the nation's largest electric utilities providing electricity service to more than 50 million people in a 50,000-square-mile area of central, coastal, and Southern California. SCE's total mid-electricity consumption in SCE's service area was 2,102 gigawatt-hour (GWh) in 2024 and is forecast to increase to 2,541 GWh in 2035 (the year furthest out for which there is data available). Therefore, the total mid-electricity consumption in SCE's service area is forecast to increase by approximately 439 GWh between 2024 and 2035 (CEC 2022).

Community Choice Energy

The passage of AB 117 in 2002 established Community Choice Aggregation in California allowing municipalities at the local and county levels to form independent, locally-governed and not-for-profit energy providers. Community Choice Energy (CCE) programs enable local government control over energy procurement to purchase power, set competitive rates, and collect revenue. Customers have the option of choosing increased percentages of renewable energy. CCE programs in California generally procure and resell a power mix between 50 percent and 100 percent renewable energy to their customers.

The Orange County Power Authority (OCPA) was established in 2021. On February 8, 2022, the Irvine City Council unanimously voted to select the 100% Renewable Energy default service level for all Orange County Power Authority customers in Irvine. The OCPA began providing commercial and municipal service in April 2022, followed by residential service in October 2022. OCPA purchases energy from clean, renewable sources including solar, wind, biomass, geothermal and hydroelectric. 100 percent renewable energy is the default tier for customers unless they choose a lower tier or opt out and remain with SCE.

Natural Gas

Irvine's natural gas is provided by the Southern California Gas Company (SoCalGas). SoCalGas service area includes most of southern California, from Imperial County on the southeast to San Luis Obispo County on the northwest, to part of Fresno County on the north, to Riverside County and most of San Bernardino County on the east. Total natural gas supplies available to SoCalGas in the year 2022 is estimated at 2,416 million cubic feet per day.

Telecommunications

Internet, phone, and satellite television services are currently provided by a variety of private sources, including AT&T, Time Warner Cable, Spectrum, Verizon, and more.

4.14.2 Applicable Regulatory Requirements

4.14.2.1 Federal

a. Clean Water Act

Originally enacted in 1948 and amended in 1972 and 1987, the Clean Water Act (CWA) establishes two national goals: eliminate the discharge of pollutants into the nation's waters and achieve water quality that is both "fishable" and "swimmable". Discharge of pollutants into waters of the United States from any "point source" (i.e., a discharge pipe) is prohibited, unless authorized by a National Pollutant Discharge Elimination System (NPDES) permit. The 1987 amendments direct the U.S. Environmental Protection Agency (U.S. EPA) to establish a permitting framework under the NPDES program to address stormwater discharges associated with urban areas and certain industrial activities.

b. Federal NPDES Permit Program

Section 402 of the CWA prohibits the discharge of pollutants in waters of the United States from any point source without an NPDES permit. Results of the Nationwide Urban Runoff Program also identified contaminated stormwater (a non-point source) as a primary cause of water quality impairment. To regulate stormwater discharges, the EPA developed a two-phased NPDES permit program. Phase I of the program requires municipalities which own and operate separate storm drains systems serving populations of 100,000 or more to obtain municipal stormwater NPDES permits. Municipalities must have a stormwater management program to obtain a permit.

c. Energy Independence and Security Act of 2007

The Energy Independence and Security Act was signed into law in December 2007 and is an energy policy law that contains provisions designed to increase energy efficiency and the availability of renewable energy. This act contains provisions for increasing fuel economy standards for cars and light trucks, while establishing new minimum efficiency standards for lighting as well as residential and commercial appliance equipment.

d. Energy Policy Act of 2005

The Energy Policy Act was passed in July 2005 and includes a comprehensive set of provisions to address energy issues. Energy Policy Act includes tax incentives for the following: energy conservation improvements in commercial and residential buildings; fossil fuel production and clean coal facilities; and construction and operation of nuclear power plants, among other things. Subsidies are also included for geothermal, wind energy, and other alternative energy producers.

e. National Energy Policy

The National Energy Policy was established in 2001 by the National Energy Policy Development Group, this policy is designed to help the private sector and state and local governments promote

dependable, affordable, and environmentally sound production and distribution of energy for the future. Key issues addressed by the energy policy are energy conservation, repair, and expansion of energy infrastructure, and ways of increasing energy supplies while protecting the environment.

4.14.2.2 State

a. Urban Water Management Planning Act

The Urban Water Management Planning Act of 1983, California Water Code Sections 10610 et seq., requires preparation of a plan that:

- Plans for water supply and assesses reliability of each source of water, over a 20-year period, in five-year increments.
- Identifies and quantifies adequate water supplies, including recycled water, for existing and future demands, in normal, single-dry, and multiple-dry years.
- Implements conservation and the efficient use of urban water supplies. Significant new requirements for quantified demand reductions have been added by the Water Conservation Act of 2009 (Senate Bill 7 of Special Extended Session 7 [SBX7-7]), which amends the act and adds new water conservation provisions to the California Water Code.

b. California Water Plan

The California Water Plan is the state's strategic plan for managing and developing water resources statewide for current and future generations, as required by the California Water Code. The plan is updated every five years.

c. Water Quality Control Plan for Ocean Waters of California (Ocean Plan)

Created by the State Water Resources Control Board (SWRCB) in 1972 and amended in 1997, the Ocean Plan aims to protect ocean water quality for use by residents of the state. The provisions apply to both point source and non-point source discharges and establishes water quality objectives and effluent limitations for all bordering oceans of the state.

d. The Porter-Cologne Water Quality Control Act

Under the Porter-Cologne Water Quality Control Act, the SWRCB is given the ultimate authority of state water rights and water quality policy. It also establishes nine RWQCBs. The entire City is in the jurisdictional area of the Santa Ana RWQCB.

e. The California Coastal Non-Point Pollution Control Program

The 1990 Coastal Zone Act Reauthorization Amendments (CZARA) require states with coastal zones to develop and implement Coastal Non-point Pollution Control Programs so that states and local authorities will work together to control non-point source pollution. CZARA provides guidance on

required management measures to address various sources of non-point source pollution, including certain urban runoff but excluding discharges regulated by NPDES permits. CZARA requirements also apply to stormwater discharges that are not regulated under the current Phase I NPDES program.

f. California NPDES Permit Programs

The U.S. EPA has delegated administration of the NPDES permit program to the SWRCB and its nine Regional Boards.

g. California Senate Bill 1087: Sewer and Water Service Priority for Housing Affordable to Lower-Income Households (2006)

This statute requires local governments to provide a copy of the updated housing element to water and sewer providers immediately after adoption. Water and sewer providers must grant priority for service allocation to proposed development that includes housing units affordable to lower-income households. Additionally, urban water management plans (UWMPs) are required to include projected water use for future lower-income households.

h. California State Senate Bill 221 and Senate Bill 610 (January 2002)

Senate Bill (SB) 610 requires water suppliers to prepare a Water Supply Assessment (WSA) report for inclusion by land use agencies within the California Environmental Quality Act (CEQA) process for new developments. SB 221 requires water suppliers to prepare written verification that sufficient water supplies are planned to be available prior to approval of large-scale subdivisions. As defined in SB 221 and SB 610, large-scale projects include residential development projects that include more than 500 residential units and/or shopping centers or business establishments resulting in a net increase of more than 1,000 employees or more than 500,000 square feet of floor space.

i. 2006 Waste Discharge Requirements Order

The SWRCB adopted Statewide General Waste Discharge Requirements for Sewer Systems (Order No. 2006-0003-DWQ). The intent of the order is to regulate all collections systems in the state to reduce or eliminate the number of sanitary sewer overflows, which by their nature, pollute the environment. A sanitary sewer overflow is any overflow, spill, release, discharge, or diversion of wastewater from a sewer system. The order is applicable for all publicly owned sewage collection systems with more than one mile of sewer pipe.

j. California Integrated Waste Management Act of 1989 (as amended by AB 341)

Originally, the Integrated Waste Management Plan mandated to divert 25 percent of their solid waste by 1995 and 50 percent by 2000. AB 341 amended these requirements as follows: (1) CalRecycle to issue a report to the Legislature that includes strategies and recommendations that would enable the state to divert 75 percent of the solid waste generated in the state from disposal by January 1, 2020; (2) requires businesses that meet specified thresholds in the bill to arrange for recycling services by January 1, 2012; (3) streamlines the amendment process for non-disposal facility elements,

by allowing changes without review and comment from a local task force; and (4) allows a solid waste facility to modify their existing permit, instead of having to undergo a permit revision, under specified circumstances.

k. California AB 3232

Signed into law in September 2018, California AB 3232 calls on the California Energy Commission (CEC) (working in consultation with the California Public Utilities Commission [CPUC]) and other state agencies) to develop and articulate plans and projections, by year 2021, to reduce GHG emissions of California's residential and commercial buildings to 40 percent below 1990 levels by 2030. Much of the reduction will likely occur by replacing some buildings' gas end-use applications with electric ones.

l. California Building Code: Building Energy Efficiency Standards

Energy conservation standards for new residential and non-residential buildings were adopted by the California Energy Resources Conservation and Development Commission (now the CEC) in 1977. Title 24 requires the design of buildings to conserve energy. The standards are updated periodically to allow for consideration and possible incorporation of new energy efficiency technologies and methods.

The 2022 Building Energy Efficiency Standards (Energy Code) encourages efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, strengthens ventilation standards, and more. Buildings whose permit applications are applied for on or after January 1, 2023, must comply with the 2022 Energy Code. The 2022 Energy Code also introduced new requirements for low-rise multi-family buildings. These include requirements to register low-rise multi-family compliance documents with a CEC-approved residential data registry when field verification and diagnostic testing will be required to demonstrate compliance with the Energy Code.

m. Appliance Efficiency Regulations

California's Appliance Efficiency Regulations (California Code of Regulations [CCR] Title 20, Parts 1600–1608) contain energy performance, energy design, water performance, and water design standards for appliances that are sold or offered for sale in California. These standards are updated regularly to allow consideration of new energy efficiency technologies and methods.

n. Title 24 Code Cycles: Net-Zero Buildings (Residential & Non-Residential)

The California Public Utilities Commission adopted its Long-Term Energy Efficiency Strategic Plan on September 18, 2008, presenting a roadmap for all new residential and commercial construction to achieve a zero-net energy standard. This Plan outlines the goal of reaching zero net energy in residential construction by 2020 and in commercial construction by 2030. Achieving this goal will require increased stringency in each code cycle of California's Energy Code (Title 24).

o. Governor's Green Building Executive Order (S-20-04)

On December 14, 2004, California's governor signed Executive Order S-20-04, creating a Green Building Action Plan to improve the energy performance of all state buildings. In general, the Executive Order required increased investments in energy efficiency for state-owned buildings and encouraged cities, counties and private businesses to reduce their energy use. Governor Schwarzenegger stated a goal of reducing electricity used in existing government and private commercial buildings by 10 percent per square foot by 2010 and 20 percent per square foot by 2015. He also mandated that all new and renovated buildings paid for with state funds be certified as Leadership in Energy and Environmental Design ("LEED") Silver standard or higher, and that office spaces and office equipment leased or purchased by the state be ENERGY STAR-qualified where cost-effective.

4.14.2.3 Local

a. Irvine Ranch Water District Water Use Efficiency and Conservation Policies

IRWD's published water conservation policies, practices, and procedures in 2018 to provide long-term water reliability for existing and future customers. IRWD water conservation policies include the following:

1. IRWD is committed to "Making Water Conservation a California Way of Life."
2. An integrated and sustainable approach to California water resource management must recognize the role that water use efficiency and supply development play in ensuring an adequate and reliable water supply for California's many diverse communities.
3. Water efficiency and conservation programs are most successful if they are locally designed, implemented and managed.
4. Water use efficiency and conservation programs should be cost effective and economically viable.
5. Local agencies should take steps to preserve fiscal stability and water affordability when implementing water use efficiency and conservation programs.
6. The benefits and consequences of statewide, regional, and local water use efficiency and conservation policies should be understood prior to being implemented. At a minimum, the benefits and consequences to water and wastewater management, systems, infrastructure, operations, and recycled water supplies should be examined.
7. Statewide and regional policies should encourage and reward previous investments in beneficial water use efficiency strategies, including water recycling, water-budget based rate structures that create a nexus between those overusing water and those bearing the costs of overuse, and investments in distribution system integrity, among others.
8. Statewide and regional water use efficiency goals must incentivize and account for local investments in drought resilient supplies, including investments in recycled water and potable reuse.
9. Conservation strategies should include promoting both the expansion and efficient use of recycled water and potable reuse.

10. State agencies should engage urban retail water suppliers during implementation and development of methodologies, and regulations related to "Making Water Conservation a California Way of Life."

b. Municipal Code

The City's Municipal Code Ordinance 21-19 , § 3(Exh. A), 12-14-21 provides standards for the provision of solid waste (refuse) and recyclable material storage areas in compliance with state law (California Solid Waste Reuse and Recycling Access Act, Public Resources Code Sections 42900 through 42911). Additionally, the City's Building Code requires development projects to complete and submit a Waste Management and Recycling Plan for approval prior to issuance of building permits. The Waste Management and Recycling Plan would identify the project type and estimate the amount of materials to be recycled during construction. The following provisions in the Municipal Code apply to future development resulting from implementation of the project:

Title 5 (Planning), Division 7 (Sustainability in Landscaping)

The purpose of this division is to provide policies, standards, procedures, and guidelines to achieve long-term levels of sustainability in landscapes. Sustainability is a concept which emphasizes the environmental impacts and benefits of landscapes. In most instances, a sustainable landscape is one which provides positive levels of carbon storage and oxygen productivity after all demands for energy, water, soil improvement and maintenance activities to support have been considered. This division is intended to promote actions that conserve, recycle, and reuse the resources which are invested in landscapes.

Title 6 (Public Works & Transportation: Project Delivery & Sustainability), Division 7 (Solid Waste; Organic Waste Diversion; Construction and Demolition Waste) – Chapter 10 (Recycling and Diversion of Construction and Demolition Waste)

Municipal Code (Title 6, Division 7 – Chapter 10) and the California Green Building Standards Code ("CALGreen" Sections 4.408, 5.408, and 5.713.8) require that construction development, renovation, and demolition projects recycle or otherwise divert construction and demolition debris from landfills. These requirements promote the reuse of resources and help extend the useful life of landfills in compliance with the CALGreen Code and state laws including the California Integrated Waste Management Act (AB939, Sher) and Mandatory Construction and Demolition Waste Diversion (SB1374, Kuehl).

Title 5 (Planning), Division 9 (Building Regulations), Chapter 1 (Adoption of Building and Fire Code) Building and Energy Efficiency Standards (California Code of Regulations Title 24)

Prior to the issuance of a building permit for residential, commercial, or office structures in the Irvine Business Complex, development plans for these structures shall be required to demonstrate that the project meets the current Building and Energy Efficiency Standards, as adopted and amended by the City. Commonly known as Title 24, these standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. Plans submitted for building permits shall include written notes demonstrating compliance with the current energy standards and shall be reviewed and approved by the Public Utilities Department prior to issuance

of building permits. Design strategies to meet this standard may include maximizing solar orientation for daylighting and passive heating/cooling, installing appropriate shading devices and landscaping, utilizing natural ventilation, and installing cool roofs. Other techniques include installing insulation (high R value) and radiant heat barriers, low-e window glazing, or double-paned windows.

d. Zoning Ordinance

The following provisions in the Zoning Ordinance would apply to future development resulting from implementation of the project:

Chapter 3-23 (Solid Waste Collection Standards)

This chapter of the Zoning Ordinance outlines the solid waste collection standards that apply to all residential and nonresidential developments. This chapter includes standards for collecting and loading recyclable materials in development projects as specified below pursuant to the California Solid Waste Refuse and Recycling Access Act of 1991 (AB 1327).

Chapter 3-31 (Solar Energy System Standards)

This chapter encourages investment in solar energy systems on all parcels in the City, both residential and nonresidential, while providing guidelines for the installation of those systems that are consistent with the architectural and building standards of the City. All solar energy systems shall comply with all applicable provisions of the City Codes and the standards of this chapter.

Chapter 5-8 (Irvine Business Complex Residential Mixed-Use Overlay District)

As outlined in Section 5-8-4.A.7 (Green-Point Rated Development) of Chapter 5- 8, applicants for new residential development in the IBC are required to submit evidence to the satisfaction of the Director of Community Development that proposed buildings have been designed and constructed to be Green-Point Rated.

Chapter 9-36 (Planning Area 36-Irvine Business Complex)

Section 9-36-20 (Environmental Standards) of Chapter 9-36 outlines the environmental standards that are applicable to new development projects in the IBC. Provisions include the following:

- Requirement that construction contractors provide alternative transportation mode incentives, such as bus passes, and/or carpooling for workers to and from the worksite on days that construction activities require 200 or more workers.
- Submittal of evidence that the project uses recycled materials for at least 20 percent of construction materials.
- Submittal of evidence that toilets, urinals, sinks, showers, and other water fixtures installed onsite are ultra-low-flow fixtures that exceed the Uniform Building Code.
- Submittal of evidence that the projects' landscape irrigation system is an automated, high-efficient irrigation system that reduces water waste.
- Requirement to use reclaimed water on all master landscaped areas.

- Requirement for the provision of onsite recycling facilities on all new developments as required by the Director of Public Works and Transportation.
- Submittal of evidence for new non-residential developments that proposed buildings are designed and constructed to achieve the "Designed to Earn the Energy Star" rating.

e. Construction and Demolition (C&D) Debris Recycling and Reuse Ordinance

The C&D ordinance requires that (1) all residential projects of more than one unit, (2) nonresidential developments on 5,000 square feet or larger, and (3) nonresidential demolition/renovations with more than 10,000 square feet of building recycle or reuse a minimum of 75 percent of concrete and asphalt and 50 percent of nonhazardous debris generated.

f. Irvine Sustainability Community Initiative

The Irvine Sustainability Community Initiative (Initiative Ordinance 10-11), adopted by the voters of the City as Initiative Measure S on November 2, 2010, and certified by the City Council on December 14, 2010, became effective December 24, 2010. The ordinance was adopted to ratify and implement policies in support of renewable energy and environmental programs for a sustainable community. It outlines the City's direction for continuing to develop and implement programs geared towards green building, renewable energy and sustainability. For example, the City would continue to develop and implement recycling, zero waste or other innovative onsite business programs to divert waste from landfills and also continue to develop and implement the use of native, California-friendly and drought-tolerant landscaping.

g. Requirement to Use Recycled Water

IRWD will identify customers in a zone identified in the Plan ("the Plan" collectively refers to the Water Resources Master Plan, Sewer Master Plan, Natural Treatment System Master Plan, and addenda thereto) as an area capable of receiving service from the IRWD's recycled water system, and will determine the feasibility of providing recycled water service to these customers. IRWD will also review applications for new permits to determine the feasibility of providing recycled water service to these applicants. If recycled water service is determined by IRWD to be feasible, applicants for new water service shall be required to install on-site facilities to accommodate both potable water and recycled water service in accordance with these Rules and Regulations. IRWD may also require existing customers to retrofit existing on-site water service facilities to accommodate recycled water service. If IRWD does not require the use of recycled water service, the customer may obtain recycled water service upon request but only if IRWD has determined that recycled water service to the customer is feasible and authorizes such use.

h. Planning Commission Resolution No. 09-2968

Standard Conditions are adopted by Planning Commission Resolution No. 09-2968. These conditions assist staff in applying standardized wording for frequently used conditions of approval to discretionary and subdivision applications. Standard conditions are applied on a case-by-case basis depending upon the specifics of the application. Companion conditions are cross-referenced and are required to be used together. The following standard conditions related to utilities apply:

City Standard Condition 2.24 (Solid Waste Recycling)

Prior to the issuance of grading permits for a project that involves the demolition of an asphalt or concrete parking lot on site, the applicant shall submit a waste management plan demonstrating compliance with the requirements of Title 6, Division 7 of the Municipal Code relating to recycling and diversion of demolition waste as applicable to said project. Over the course of demolition or construction, the applicant shall ensure compliance with all code requirements related to the use of City authorized waste haulers.

City Standard Condition 3.7 (Solid Waste Recycling)

Prior to the issuance of building permits for a project that involves new construction or that involves the demolition or renovation of existing buildings on site, the applicant shall comply with requirements of Title 6, Division 7 of the Municipal Code relating to recycling and diversion of construction and demolition waste as applicable to said project. Over the course of demolition or construction, the applicant shall ensure compliance with all code requirements related to the use of City authorized waste haulers.

i. Existing Plans, Programs, and Policies Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required of the proposed project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute mitigation measures. The following measures are existing plans, programs, or policies (PPP) that apply to the proposed project and will help to reduce and avoid potential impacts related to utilities:

- PPP-UTIL-1 Engineering Standard Plans
- PPP-UTIL-2 Title 24 Code Cycles: Net-Zero Buildings (Residential & Non-Residential)
- PPP-UTIL-3 Irvine Sustainability Community Initiative
- PPP-UTIL-4 California Water Code Section 10912 and California Government Code Section 66473.7
- PPP-UTIL-5 Senate Bill 221 (SB 221)
- PPP-UTIL-6 Requirement to Use Recycled Water
- PPP-UTIL-7 City of Irvine Construction and Demolition (C&D) Debris Recycling and Reuse Ordinance
- PPP-UTIL-8 Waste Reduction
- PPP-UTIL-9 City Standard Condition 2.24 (Solid Waste Recycling)
- PPP-UTIL-10 City Standard Condition 3.7 (Solid Waste Recycling)

If a proposed development is considered a project as defined by California Water Code Section 10912 and/or a subdivision as defined by California Government Code Section 66473.7, then a water supply assessment shall be prepared and included in the analysis and appendices of the environmental document being prepared for the project.

General Plan Update

In addition to the above-listed PPPs, the following proposed Goals, Objectives, Policies, and Implementation Actions are applicable to the analysis of utilities and would replace existing goals, strategies, and policies outlined in the City's existing General Plan following project approval:

Environmental Protection and Climate Action Element

Goal 3: Reduce greenhouse gas emissions and mitigate climate change impacts in Irvine to create a more sustainable and resilient community.

- Policy (a): Promote the transition to renewable energy sources, such as solar, wind, and geothermal, for electricity generation within Irvine.

Goal 5: Protect and enhance water quality in Irvine through policy implementation and measures to prevent pollution, conserve water resources, and ensure access to safe and clean water.

Objective EPCA-5: Achieve and maintain compliance with water quality standards set by regulatory agencies, such as the Environmental Protection Agency (EPA) and the California State Water Resources Control Board (SWRCD), to safeguard public health and the environment.

- Policy (a): Implement measures to prevent and control pollution from various sources, including industrial discharges, stormwater runoff, agricultural activities, and wastewater treatment plants.

- Policy (c): Implement green infrastructure projects, such as rain gardens, bioswales, and permeable pavement, to manage stormwater runoff and reduce nonpoint source pollution.

- Policy (d): Promote water conservation practices and sustainable water use behaviors among residents, businesses, and municipal operations to reduce water consumption and minimize strain on water resources.

- Policy (e): Implement water-efficient landscaping standards, irrigation technology upgrades, and leak detection programs to optimize water use and reduce wastage.

Goal 6: Reduce energy consumption and promote energy efficiency in Irvine.

Objective EPCA-6: Achieve significant reductions in per capita energy consumption across residential, commercial, and municipal sectors while promoting the adoption of renewable energy sources and energy-efficient technologies.

- Policy (a): Through the efforts of CALGreen, establish and enforce energy efficiency standards and building codes for new construction and major renovations to improve the energy performance of buildings and reduce energy demand.

- Policy (b): Require energy-efficient building design, insulation, HVAC systems, lighting, and appliances to minimize energy consumption and lower utility costs for residents and businesses.

- **Policy (c):** Promote the adoption of renewable energy systems, such as solar photovoltaic (PV) panels, wind turbines, and geothermal heat pumps, to generate clean and sustainable electricity for onsite consumption or grid injection.

Goal 7: Minimize waste generation, promote sustainable waste management practices, and maximize resource recovery in Irvine.

Objective EPCA-7: Achieve significant reductions in per capita waste generation and increase diversion rates through comprehensive waste reduction, reuse, recycling, and composting initiatives, while minimizing landfill disposal and associated greenhouse gas emissions.

- **Policy (d)**: Cooperate in guiding the development and improvement of a solid waste disposal system within the County of Orange that will meet the needs of the City and protect the City from damage by unplanned disposal of refuse.

- **Policy (e)**: Control the siting of solid waste disposal facilities to minimize impact on adjacent or existing planned land uses.

Goal 10: Promote sustainable land use practices in Irvine.

Objective EPCA-10: Implement policies and initiatives that prioritize sustainable land management, smart growth principles, and equitable development strategies to ensure the efficient use of land while protecting environmental quality and promoting community well-being.

- **Policy (c)**: Integrate green infrastructure elements, such as parks, greenways, and open spaces, into land use planning and development projects to manage stormwater runoff, improve air and water quality, and enhance ecological connectivity and biodiversity.

Conservation and Open Space Element

Goal 10. Enhanced open space accessibility and utilization, and conservation efforts of resources.

Objective COS-10: The City commits to creating and fostering well-integrated and sustainable open space resources available to City residents and visitors.

- **Policy (i):** Coordinate conservation of water resources in alignment with Environmental Protection and Climate Action Elements objectives and policies to encourage the integration of existing and future water sources (reservoirs, lakes, and drainage courses) into development.

4.14.3 Significance Determination Thresholds

The City has adopted Appendix G of the State CEQA Guidelines as the significance thresholds for utilities and service systems. Thus, an initial study should consider whether a project will:

1) Require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electrical power, natural gas, or telecommunications

facilities, the construction or relocation of which could cause significant environmental effects;

2) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years;

3) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments;

4) Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals; or

5) Comply with federal, state, or local management and reduction statutes and regulations related to solid waste.

4.14.4 Methodology

Impacts associated with utilities have been assessed through consideration of existing utility infrastructure within the City and whether the expansion of existing utility infrastructure would be necessary to serve these developments. The potential for significant impacts to occur associated with such utilities as water, storm drainage, and water quality has been determined based upon the analysis presented in Appendix I and summarized here. Other topics not covered by the Appendix I report, such as solid waste and natural gas, energy, and telecommunications facilities, has been assessed at the City-wide level using publicly available data and City reports to address whether the anticipated buildout of the project would increase demands on this utility to warrant an expansion or construction of new infrastructure which would cause a significant impact to the environment.

4.14.5 Topic 1: Utility Infrastructure

Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electrical power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

4.14.5.1 Impact Analysis

a. Water

Implementation of the project has the potential to increase water demand over existing conditions by approximately 2,093 AFY. As described in greater detail in Section 4.14.6.1 below, IRWD is projected to have a water supply capacity of 178,727 AFY through 2040, which far exceeds IRWD's project water supply demand of 88,023 AFY through 2040. Consequently, IRWD would have a water supply surplus of 90,704 AFY through 2040, which would exceed the project's projected increase in water demand of 2,093 AFY.

While the total project-related water demand would be within IRWD's capacity to serve the project, implementation of the future projects facilitated by approval of the project would require construction of new water infrastructure where existing water lines are not sufficient to accommodate the increased water demand. These determinations would be made on a project-by-project basis, including site-specific fire flow tests and hydraulic pressure analyses as projects are developed. The proposed improvements may include upsizing water lines on-site and off-site and additions of boosters in low pressure areas. In those conditions, where hydraulic or capacity impacts affect other service areas within the Improvement District, the developer would be responsible for paying for the impacts through their connection fees (see Appendix I). Furthermore, because the City's UWMP is required to include projected water use by land use type (i.e., accommodate the new General Plan land uses), the City's 2025 UWMP would be required to incorporate the proposed land use changes into their water demand and supply projections out to 2050.

The construction of the on-site and off-site water lines and associated improvements would primarily include trenching for the pipelines. Future infrastructure improvement would be subject to the requirements of the City's engineering standard plans (PPP UTIL-1), and all construction would be performed in accordance with the Construction General Permit and all associated requirements. Any work that may affect services to the existing water lines would be coordinated with the City and IRWD. When considering impacts resulting from the installation of any required water infrastructure, all impacts are of a relatively short-term duration and would cease to occur once the installation is complete. Therefore, impacts associated with construction of new or expanded water facilities would be less than significant.

b. Wastewater

Implementation of the proposed project has the potential to increase sewer flows by approximately 2.04 mgd. As described in greater detail in Section 4.14.7.1 below, this increase falls within the remaining treatment capacity of the MWRP, which has an existing surplus treatment capacity of 28 mgd. Furthermore, the capacity expansion of MWRP through projects like the Phase 2 Expansion in 2014, which added 7 mgd, has ensured that the plant can accommodate additional demand. Additionally, OCSD's Plant No. 1, with a treatment capacity of 320 mgd, remains capable of accommodating the projected increase in sewer flows.

Implementation of the project would likely require construction of new sewer infrastructure where existing sewer lines are not sufficient to accommodate the increased flows. The locations of these sewer improvements would be based on the project-specific locations. These determinations would be made on a project-by-project basis, including site specific sewer flow monitoring and hydraulic sewer analysis. All project applicants would be required to submit detailed information to IRWD regarding product type, size, number of units or square feet, projected demands (indoor and outdoor), and other project details, so impacts on the existing sewer system could be managed properly. In those conditions, where hydraulic or capacity impacts affect other service areas or users within the Improvement District, the developer would be responsible for paying for the impacts through their connection fees. When capital projects are identified for regional sewer improvements within the Improvement District, the costs are shared 50/50 between developer connection fees and existing users through property tax assessments. Furthermore, on a citywide scale, the City's Capital

Improvement Program (CIP) would identify and prioritize necessary projects as developments under the project come online (see Appendix I).

The construction of the on-site and off-site sewer lines and associated improvements would primarily include trenching for the pipelines. All construction would be required to be performed in accordance with the Construction General Permit and all associated requirements. Any work that may affect services to the existing sewer lines would be coordinated with the City and IRWD. IRWD also has Sewer Improvement Districts which allows the District to assess improvements per Improvement Area and collect fees accordingly. This process ensures that the fees collected are consistent with the improvements needed within the respective District being improved. Furthermore, future infrastructure improvements would also be subject to the requirements of the City's engineering standard plans (PPP UTIL-1), which would ensure that all improvements comply to the City's standard requirements for infrastructure improvements. Therefore, impacts associated with construction of new or expanded wastewater facilities would be less than significant.

c. Stormwater

As described in Appendix I, most of the development under the project would consist of infill vacant lots (new development) or redevelopment of existing non-residential properties into high density residential, particularly within the three focus areas. In both circumstances, the surrounding area has already been developed and the primary public storm drain system and points of connection are set in place. Implementation of the proposed land uses would rely on the existing drainage systems to convey runoff. Current runoff is captured and conveyed by existing City or County storm drain infrastructure throughout the City before discharging to regional County flood control facilities and channels. From there, the runoff is ultimately discharged into the Newport Bay. The City is primarily built out, and no major changes in storm flows are anticipated. As noted previously, the City and the County have policies in-place associated with the MS4 Permit that would require design and installation of detention systems to mitigate peak flows for certain development projects, and/or if downstream drainage facilities ever become deficient (see Appendix I). Future infrastructure improvement would be subject to the requirements of the City's engineering standard plans (PPP UTIL-1), and all construction would be performed in accordance with the Construction General Permit and all associated requirements. All impacts would be short-term and would cease to occur once the installation is complete. Therefore, impacts associated with construction of new or expanded stormwater facilities would be less than significant.

d. Electric Power, Natural Gas, and Telecommunications

Future development under the project would increase demand for electric, natural gas transmission, and telecommunication services. However, future development would occur incrementally through 2045, based on market conditions and other factors, such that demand for these utility services would not be overburdened at any given time. Additionally, future development under the project would accommodate increases in population based on SCAG's demographic projections. Therefore, the project would accommodate planned growth, and would not exceed regionally forecasted demand for electric power by SCE and OCPA or natural gas for SoCalGas. Furthermore, future development under the project would connect to the existing telecommunications infrastructure (telephone, internet, wireless services) present within the City.

Construction of the necessary improvements and/or extensions creates the potential for additional impacts such as dust, air emissions, and noise. Impacts associated with the construction of these facilities are found throughout the PEIR in the analysis of impacts to such topics as air quality and noise. Any applicable mitigation measures and PPPs identified in those sections would address potential significant impacts associated with construction of telecommunications infrastructure.

Additionally, the City currently implements strategies to reduce energy consumption through compliance with the Title 24 Code Cycles: Net-Zero Buildings (Residential & Non-Residential) (PPP UTIL-2) and the Irvine Sustainability Community Initiative (PPP UTIL-3). Future development under the project would also comply with these requirements. Future infrastructure improvement would be subject to the requirements of the City's engineering standard plans (PPP UTIL-1), and all construction would be performed in accordance with the General Construction Permit and all associated requirements. All impacts would be short-term and would cease to occur once the installation is complete. Therefore, impacts associated with construction of new or expanded electric power, natural gas, and telecommunications facilities would be less than significant.

4.14.5.2 Significance of Impacts

Overall, project related demands for water, wastewater, electric, natural gas, and telecommunications facilities would be within the service capacity for each service provider. All infrastructure improvements would be required to comply with applicable City regulations, including PPPs UTIL-1 related to compliance with engineering standard plans; UTIL-2 and UTIL-3 related to energy usage; and PPPs UTIL-3, UTIL-5, and UTIL-6 related to water reduction. Therefore, impacts related to the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electrical power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects, would be less than significant.

4.14.5.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.14.6 Topic 2: Water Supply

Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

4.14.6.1 Impact Analysis

As described in Section 4.14.5.1a above, implementation of the project would have the potential to increase water demand over existing conditions by approximately 2,093 AFY. However, Appendix I determined that IRWD is projected to have a water supply capacity of 178,727 AFY through 2040, which far exceeds IRWD's project water supply demand of 88,023 AFY through 2040. Consequently, IRWD would have a water supply surplus of 90,704 AFY through 2040, which would exceed the project's projected increase in water demand of 2,093 AFY. Furthermore, future development under the project would comply with the requirements to prepare a water supply assessment as applicable (PPP UTIL-4 and PPP UTIL-5) and utilize recycled water (PPP UTIL-6) as applicable. Additional goals,

objectives, and policies in the updated Conservation and Open Space and Environmental Protection and Climate Action Elements would further the City's goal of reducing water demand on a citywide basis. Therefore, sufficient water supplies would be available to serve the project, and impacts would be less than significant.

4.14.6.2 Significance of Impacts

Project-related increase in water demand would be within the available supply capacity of IRWD. However, the project would be required to comply with City regulations pertaining to water suppl and usage (PPPs UTIL-4, UTIL-5, and UTIL-6), which would further reduce potential water supply demands. Therefore, impacts would be less than significant. No mitigation is required.

4.14.6.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.14.7 Topic 3: Wastewater Treatment

Would the project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

4.14.7.1 Impact Analysis

Wastewater for the City is treated at the MWRP, which is operated by IRWD. MWRP has an existing surplus treatment capacity of 28 mgd. Buildout of the project is anticipated to increase sewer flows by approximately 2.04 mgd, which is well within the remaining treatment capacity of the MWRP. Additionally, the capacity expansion of MWRP through projects like the Phase 2 Expansion in 2014, which added 7 mgd, has ensured that the plant can accommodate additional demand. The MWRP currently operates at an average of 25 mgd, recycling about 9 billion gallons of water annually. OCSD's Plant No. 1, with a treatment capacity of 320 mgd, also remains capable of accommodating the projected increase in sewer flows (see Appendix I). Therefore, the project would not exceed existing wastewater treatment capacity, and impacts would be less than significant.

4.14.7.2 Significance of Impacts

Project-related increase in wastewater would be within the capacity of the MWRP. Therefore, impacts related to inadequate capacity of a wastewater treatment provider to serve the project would be less than significant.

4.14.7.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.14.8 Topics 4 and 5: Solid Waste

Would the project generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Would the project comply with federal, state, or local management and reduction statutes and regulations related to solid waste?

4.14.8.1 Impact Analysis

Commercial solid waste generated within the City is disposed of at the Frank R. Bowerman Landfill, which has permitted for 11,500 tons per day (TPD) maximum with an 8,500 TPD annual average. The landfill has enough projected capacity to serve businesses until approximately 2053 (OC Waste and Recycling 2024). All other solid waste is disposed off at the Olinda Alpha Landfill in Brea and at the Prima Deshecha Landfill in San Juan Capistrano (Orange County Waste and Recycling 2022). The Olinda Alpha Landfill (SWIS No. 30-AB-0035) has a permitted capacity is 8,000 tons per day and a remaining capacity of 18 percent and is anticipated to serve the community through 2028 (Orange County Waste and Recycling 2024; Orange County Grand Jury 2017; and Orange County Waste and Recycling 2016). The Prima Deshecha Landfill (SWIS No. 30-AB-0019) has a permitted capacity is 4,000 tons per day and a remaining capacity of 99 percent and is anticipated to serve the community through 2099 (Orange County Waste and Recycling 2024; Orange County Grand Jury 2017; and Orange County Waste and Recycling 2016).

Future development would be subject to waste reduction measures to divert solid waste from landfills during construction and demolition (a 65 percent diversion rate per the City's C&D Program) and during operations through composting, recycling, and reuse through resource recovery. The City has a waste diversion goal of reducing organic waste disposal 75 percent by 2025. These goals are consistent with state regulations regarding solid waste, composting, and recycling. The City implements policies to reduce generation of solid waste through the City's debris recycling and reuse ordinance (PPP UTIL-7), waste reduction (PPP UTIL-8) and City standard conditions related to solid waste recycling (PPP UTIL-9 and PPP UTIL-10). Future development under the project would also be required to comply with these standards. Additionally, EPCA Element Goal 7 and its supporting objectives and policies would serve to further support the City's goal of reducing solid waste through reduction and recycling efforts for all land use types. Therefore, the project would not generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, and impacts would be less than significant.

4.14.8.2 Significance of Impacts

Project-related increases in solid waste would be required to comply with City standards related to solid waste reduction efforts (PPPs UTIL-7 through UTIL-10), as well as all applicable federal and state reduction statutes. Therefore, impacts would be less than significant. No mitigation is required.

4.14.8.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.14.9 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for utilities and services. The study area for the assessment of cumulative impacts related to utilities and services is the City. The impact analysis presented in Sections 4.14.5 through 4.14.8 above is cumulative in nature, because it considers the need for future facilities and available capacity for the entire City. IRWD would have a water supply surplus of 90,704 AFY through 2040, which would exceed the project's projected increase in water demand of 2,093 AFY. Similarly, MWRP operated by IRWD has an existing surplus treatment capacity of 28 mgd, which would be able to accommodate the increased sewer flows of 2.04 MGD associated with the project, and OCSD's Plant No. 1 has a treatment capacity of 320 MGD, remains capable of accommodating the projected increase in sewer flows. Future development would occur incrementally through 2045, based on market conditions and other factors, such that demand for these utility services would not be overburdened at any given time. Additionally, future development under the project would accommodate increases in population based on SCAG's demographic projections. Therefore, the project would accommodate planned growth, and would not exceed regionally forecasted demand for electric power by SCE and OCPA or natural gas for SoCalGas. Furthermore, future development under the project would connect to the existing telecommunications infrastructure (telephone, internet, wireless services) present within the City. Furthermore, Frank R. Bowerman Landfill has enough projected capacity to serve residents and businesses until approximately 2053. Therefore, the project would not contribute to a significant cumulative impact related to utilities and services.

4.15 Wildfire

This section analyzes potentially significant impacts related to wildfire that could result from implementation of the project. This analysis relies on secondary source information including City programs and plans, and data available from the California Department of Forestry and Fire Protection (CAL FIRE) and other applicable agencies.

4.15.1 Existing Conditions

The majority of the city of Irvine (City) lies within a wide, level valley bordered by the Santa Ana Mountains and San Joaquin Hills, characterized by predominantly urbanized areas devoid of fire-prone vegetation. However, the northern and southern areas of the City feature canyons, ridges, and hillsides harbor dry grasses and woody shrubs highly susceptible to ignition. Despite the urban setting, the presence of flammable vegetation poses a persistent fire hazard in the City and the surrounding area.

4.15.1.1 Wildfire Hazards

Threat from wildfire hazards is determined based on several factors, including fuel loading (vegetation); topography; climatic conditions, such as wind, humidity, and temperature; and the proximity of structures and urban development to fire hazards. Wildland fire hazards are most pronounced in wildland-urban interface areas, or where urban development is located close to open space areas where vegetation can serve as fuel. Generally, the periods of greatest risk for wildland fire are the late summer and early fall when vegetation is at its driest. Human activity, including residential and agricultural burning, campfires, and the use of fireworks can all trigger fires. Natural causes such as lightning strikes may also start fires.

To assist each fire agency in addressing its responsibility area, CAL FIRE uses a severity classification system to identify areas or zones of severity for fire hazards within the state. CAL FIRE is required to map these zones, which include moderate, high, and very high fire severity zones that were developed for community planning and real estate disclosure purposes and are meant to help limit wildfire damage to structures through planning, prevention, and the application of risk reduction measures. The mapped areas, or "zones," are based on factors such as fuel (e.g., flammable vegetation), slope, and fire weather. As shown in Figure 4.7-2 and detailed in Table 4.15-1, most of the City consists of urban areas that are not designated as a fire severity zone. Approximately 11,915 acres (approximately 28.22 percent) of the City are mapped as Very High Fire Hazard Severity Zone (FHSZ). The topography of the foothills of the Santa Ana Mountains and San Joaquin Hills in the City is extremely conducive to wildfires. The community is bordered by natural, undeveloped hillsides and mountains to the northeast and open space areas to the southwest. Most development within the City is located between these two areas. Approximately 11,915 acres of these natural, undeveloped areas are classified as Very High FHSZ by CAL FIRE. In the northeastern portion of the City, this zone extends throughout the Santa Ana Mountain range, which extends into Riverside County to the east. Additionally, approximately 1,875 acres of land located in Focus Area 3 are classified as Very High FHSZ by CAL FIRE.

Table 4.15-1 Fire Hazard Severity Zone Acreages		
Row Labels	Acres	Percentage
Moderate	-	-
High	-	-
Very High	11,915	28.22
No Rating	30,305	71.78
TOTAL	42.220	100

4.15.1.2 History of Wildfire

The City's Local Hazard Mitigation Plan (LHMP) documented past wildfire events as detailed in Table 4.15-2 below.

Table 4.15-2 History of Fire in the City and Surrounding Areas		
Year	Fire Name	Fire Description
2020	Silverado Fire	On October 26, 2020, sustained winds of 45 miles per hour (mph) with gusts to 75 mph, prompted a vegetation fire to erupt off Santiago Canyon Road and Limestone Ridge. Approximately 33 percent of the City was evacuated, but no structures were lost or damaged.
2017	Canyon Fire	A 2017 wildfire that burned in the Anaheim Hills area of Orange County. In total the fire burned 9,217 acres, destroyed 25 structures and damaged another 55. In total, 16,570 people were evacuated from their homes in Anaheim, Orange, and Tustin.
2008	Freeway Complex Fire	A 2008 wildfire that burned parts of Yorba Linda, Anaheim, Brea, Chino Hills, and Diamond Bar. Over 30,000 acres were burned destroying 314 homes, 43 outbuildings, and 4 commercial structures. No fatalities were reported during this event.
2007	Santiago Fire	Began on October 21, 2007, in the foothills north of the City and east of the City of Orange. Over 28,000 acres were burned, resulting in the destruction of 14 homes and 24 outbuildings. No fatalities were reported during this event.
1998	Blackstar/Santiago Canyon Fire	The Blackstar/Santiago Canyon Fire required precautionary activation of the Orange County Emergency Operations Center as smoke threatened the wildland/urban interface.
1997	Baker Canyon Fire	In 1997, the Baker Canyon fire just east of the City, burned 6,317 acres of vegetation. Strong Santa Ana winds prompted a decision to evacuate the City's Northwood community.
1993	Laguna Beach Firestorms	The Laguna Beach firestorms burned 400 acres of explosive hillside brush and chaparral in the City. Although no structures were destroyed, 4,000 people were evacuated to local shelters overnight.
1889	Santiago Canyon Fire	Dating back to 1889, this massive wildfire is one of the largest in the state's history. Totaling at least 300,000 acres, the conditions that contributed to the fire included a much longer and more severe annual drought than usual.
SOURCES: City of Irvine 2020, 2022.		

4.15.1.3 Wildfire Preparedness

a. Service and Response

Details of fire protection services are provided in Section 4.12.1.1 of this Program Environmental Impact Report (PEIR). The following is a summary as it relates to wildfire preparedness.

Wildfire preparedness and education within the City is a joint effort between the Irvine Police Department's Office of Emergency Management, the City's Open Space and Wildland Management program, and the Orange County Fire Authority (OCFA). However, OCFA is the primary response agency for fires and provides a full range of fire prevention services including public education, code enforcement, plan check and inspection services for new and existing construction, and fire investigation.

OCFA has established a target response time of 5 minutes from dispatch to arrival for 80 percent of calls for first-in engines to arrive on-scene to medical aids and/or fires and first-in truck companies should arrive on-scene to fires within 12 minutes, 80 percent of the time.

Existing and proposed fire stations are shown on Figure 4.12-1 presented in Section 4.12 of this EIR. The 2023 Unit Strategic Plan outlines goals and strategies for fire protection services throughout the City, including facility needs and improvements, training requirements, and disaster preparedness.

4.15.2 Applicable Regulatory Requirements

4.15.2.1 Federal Regulations

a. Disaster Mitigation Act

The Disaster Mitigation Act of 2000 requires that a state mitigation plan, as a condition of disaster assistance, add incentives for increased coordination and integration of mitigation activities at the state level through the establishment of requirements for two different levels of state plans: "Standard" and "Enhanced." The Disaster Mitigation Act also established a new requirement for local mitigation plans. It states that jurisdictions that wish to be eligible for federal hazard mitigation grant funding must prepare a hazard mitigation plan that meets a certain set of guidelines and submit this plan to the Federal Emergency Management Agency (FEMA) for review and approval. These guidelines are outlined in the Code of Federal Regulations, Title 44, Part 201.

4.15.2.2 State Regulations

a. California Wildland-Urban Interface Code

On September 20, 2005, the California Building Standards Commission approved the Office of the State Fire Marshal's emergency regulations amending the California Building Code (CBC) (California Code of Regulations [CCR] Title 24, Part 2). Chapter 7A of the CBC includes regulations addressing

materials and construction methods for exterior wildfire exposure and applies to new buildings located in state responsibility areas or fire severity zones in local response areas.

b. California Fire Code

The 2022 California Fire Code (Fire Code; CCR Title 24, Part 9) establishes regulations to safeguard the public health, safety, and general welfare from hazards of fire, explosion, or dangerous conditions in new and existing buildings, structures, and premises. The Fire Code also establishes requirements intended to provide safety for and assistance to firefighters and emergency responders during emergency operations. The provisions of the Fire Code apply to the construction, alteration, movement, enlargement, replacement, repair, equipment, use and occupancy, location, maintenance, removal, and demolition of every building or structure throughout California. The Fire Code includes regulations regarding fire-resistance-rated construction, fire protection systems such as alarm and sprinkler systems, fire services features such as fire apparatus access roads, means of egress, fire safety during construction and demolition, and wildland-urban interface areas. The City has adopted the Fire Code as Title 5, Division 9, Chapter 1 the Municipal Code.

c. California Public Resources Code

Public Resources Code Section 4201-4204 and Government Code Section 51175-89

Public Resources Code (PRC) Section 4201-4204 and Government Code Section 51175-89 requires CAL FIRE to map areas of significant fire hazards and identifies fire hazard severity zones within the state. Fire hazard severity zones are identified as very high, high, and medium. Local agencies are required to designate very high fire hazard severity zones within their jurisdiction.

Public Resources Code Section 4125-4137

PRC Section 4125-4137 establishes a process for the state to identify lands that are state responsibility area fire severity zones and procedures associated with such areas.

Public Resources Code Sections 4290 and 4291

PRC Sections 4290 and 4291 require local jurisdictions to make specified findings that a subdivision is consistent with fire safety and defensible space regulations, and that fire protection and suppression services are available for the subdivision (Government Code Section 66474.02), before approving a tentative subdivision map or parcel map (for which a tentative map was not required) within a state responsibility area fire severity zone. Furthermore, regulations provide that local jurisdiction shall provide to CAL FIRE notices of applications for building permits, tentative parcel maps, tentative maps, and installation or use permits for construction or development within an area designated as a very high fire severity zone. These regulations do not require findings for these notices of applications.

d. California Government Code

Senate Bill 379 California Government Code Section 65302 (g)(4)

California Government Code Section 65302 (g)(4), also known as Senate Bill (SB) 379, requires that the safety element of a community's general plan address the hazards created or exacerbated by climate change. The safety element must identify how climate change is expected to affect hazard conditions in the community and include measures to adapt and be more resilient to these anticipated changes.

Because the LHMP can be incorporated into the safety element, including these items in the LHMP can satisfy the state requirement. SB 379 requires that climate change be addressed in the safety element when the LHMP is updated after January 1, 2017, for communities that already have an LHMP, or by January 1, 2022, for communities without an LHMP.

4.15.2.3 Local Regulations

a. Existing General Plan (2000)

The current Safety Element's guidelines concerning wildland fire hazards encompass policies aimed at establishing fuel modification standards (Policy J-1 [c]) and mandating the review of new development proposals by OFCA (Policy J-1 [e]). The current Public Facilities and Services Element reinforces OCFA service standards, aligned with National Fire Protection Association guidelines, covering responses for fire and basic life safety, advanced life support, and other service priorities. Additional regulations are outlined in the City's Municipal Code, Zoning Ordinance, Building Code, and OCFA plans. The current general plan includes updated mapping in compliance with SB 1241, conducted concurrently with the previous housing element. However, the Board of Forestry and Fire Protection only implemented SB 1241 regulations in full in 2015. Subsequent guidelines from the Board and OPR General Plan Guidelines will necessitate revisions to the Irvine General Plan Safety Element, which will be reflected in the General Plan Update.

The existing General Plan Safety and Seismic elements include the following objectives and policies related to wildfire and associated risks:

Safety Element

Objective J-1. Hazard Occurrence. Identify actions that the City, in concert with other jurisdictions, must take to reduce the probability of hazard occurrence.

- Policy (c): Establish criteria for land development in hillside areas with emphasis on fire retardant materials, minimization of exposure risk to wildfire and adjacent structure fires, provision of access for fire fighting personnel and equipment, and removal of combustible vegetation.
- Policy (e): Require development proposals to be reviewed by the Orange County Fire Authority to ensure adequate fire protection and precautions occur.

Objective J-2. Disaster Response. Identify actions that the City, in conjunction with other jurisdictions, must take to reduce the severity of disasters.

- Policy (a): Ensure that developments will be properly served by police and fire service.
- Policy (b): Ensure that each development will have adequate emergency ingress and egress.
- Policy (c): Phase the timing of development in relation to the City's ability to provide police and fire service.
- Policy (d): Continue to maintain and implement the City of Irvine's Emergency Plan.

Seismic Element

Objective D-1. Potential Hazards. Take potential environmental hazards into account in the General Plan.

- Policy (a): Identify the locations of potential seismic hazards to minimize the effects of the potential hazard through special development constraints. Conduct a research program to develop more refined boundaries for seismic response areas, particularly for Seismic Response Area 1.

Objective D-2. Response to Hazards. Require appropriate measures to protect public health and safety and to respond to seismic hazards in all public and private developments.

- Policy (g): Require a detailed geological and soils study as needed, in accordance with the requirements of the City's Subdivision Ordinance, before approving development.
- Policy (h): Continue to require structures to conform to the seismic design requirements found in the Uniform Building Code.
- Policy (i): Ensure that the most recent adopted seismic standards are used for new construction.

b. Municipal Code

The City regulates building safety and fire code through specific requirements in its Municipal Code. The following are sections of the Municipal Code that are relevant to the project related to wildfire and associated risks:

Title 5 (Planning), Division 9 (Building Regulations)

The City adopted and amended California's building, residential, and fire codes, and amended the state code with local considerations. Refer to Chapter 1 Adoption of Building and Fire Code and Chapter 4 Amendments to Building and Fire Code Technical Regulations of Division 9 (Building Regulations).

c. Zoning Ordinance

Chapter 5-2 (Floodplain District)

In all areas of special flood hazards, development would be required to be constructed with standards identified in Section 5-2-24 (Standards of construction for flood hazard zones) of the Zoning Ordinance, which include anchoring, constructing new development with materials and utility equipment resistant to flood damage below base floodplain elevations, using methods and practices that minimize flood damage, and with adequate drainage paths around structures on slopes to guide floodwaters around and away from proposed structures. Upon the completion of the structure, the elevation of the lowest floor, including basement, shall be certified by a registered professional engineer or surveyor, and verified by the City's Chief Building Official, to be properly elevated. Such certification or verification shall be provided to the Floodplain Administrator.

d. Planning Commission Resolution No. 09-2968

Standard conditions are adopted by Planning Commission Resolution No. 09-2968. These conditions assist staff in applying standardized wording for frequently used conditions of approval for discretionary and subdivision applications. Standard conditions are applied on a case-by-case basis depending upon the specifics of the application. Companion conditions are cross-referenced and are required to be used together. The following standard conditions related to hazards and hazardous materials apply:

City Standard Condition 2.19 (Open Space Fuel Modification)

Prior to issuance of precise grading permits for any lots adjacent to open space, the applicant shall submit a fuel modification plan prepared to the satisfaction of the Director of Community Development for review and approval, in consultation with the Director of Community Services. The fuel modification plan shall be approved by OCFA. The requirements set forth in this condition do not apply to developed, irrigated park land required or provided as part of the project design for this project.

City Standard Condition 3.14 (HOA/Fuel Modification)

Prior to the issuance of building permits for any dwelling units on lots located adjacent to or within fuel modification zones, the applicant shall provide evidence that there is a requirement included in the CC&Rs that any changes to plant materials located within fuel modification zones must be approved by the Director of Community Development and be consistent with applicable OCFA requirements. For fuel modification zones adjacent to lands designated as Open Space, changes in plant materials shall also be reviewed by the Director of Community Services.

Standard Condition 3.17 (Emergency Access Plan)

Prior to the issuance of the first building permit, the applicant shall submit and have approved by the Chief of Police an Emergency Access Plan, which identifies and locates all Knox Boxes, Knox key switches, and Click2Enter radio access control receivers. Said plan shall be incorporated into the plan set approved for building permits.

City Standard Condition 4.9 (Emergency Access Inspection)

Prior to authorization to use, occupy, and/or operate, the applicant shall arrange for and have passed an inspection, to be performed by the Police Department and the OCFA, to ensure compliance with the Emergency Access Plan requirements. The inspector shall verify test acceptance and locations of all Knox boxes, key switches as depicted on the approved plan.

City Standard Condition 2.11 (Special Flood Hazard Area)

Prior to the issuance of a precise grading permit for any lot or parcel wholly or partially located within the Special Flood Hazard Area (SFHA, FP 2 District), the applicant shall submit one of the following:

a) The final approved Letter of Map Revision (LOMR) to the Flood Plain Administrator, as designated by the City Engineer; or
b) Preliminary Elevation Certificates (North American Vertical Datum [NAVD] 1988) for each proposed structure based on construction documents to the Chief Building Official; or
c) For non-residential construction only, a preliminary Floodproofing Certificate based on construction documents to the Chief Building Official.

City Standard Condition 3.4 (Special Flood Hazard Area)

Prior to the issuance of a building permit for any structure wholly or partially located within the floodplain (FP 2 District) of the Special Flood Hazard Area (SFHA), the applicant shall submit one of the following:

a) The final approved Letter of Map Revision (LOMR) to the Flood Plain Administrator, as designated by the City Engineer; or
b) Preliminary Elevation Certificates (based on North American Vertical Datum [NAVD] 1988) for each proposed structure based on construction documents to the Chief Building Official; or
c) For non-residential construction only, a preliminary Floodproofing Certificate for each building or structure based on construction documents showing floodproofing measures complying with adopted codes and standards and approved by the Chief Building Official.

City Standard Condition 4.5 (Flood Certification for Finished Construction).

Prior to authorization to use, occupy, and/or operate, for any structure wholly or partially located within the Special Flood Hazard Area (SFHA, FP 2 District), the applicant shall submit one of the following:

a) The final approved Letter of Map Revision (LOMR) to the Flood Plain Administrator, as designated by the City Engineer; or
b) Final Elevation Certificates (based on North American Vertical Datum [NAVD] 1988) for each structure based on finished floor construction to the Chief Building Official; or
c) For non-residential construction only, a final Floodproofing Certificate for each building or structure based on completed construction.

e. Local Hazard Mitigation Plan

The City's LHMP (2020) provides a comprehensive assessment of the threats posed by natural and human caused hazard events and includes coordinated strategy to reduce those threats. The LHMP is designed to identify the City's hazards, including threat of wildfire, especially for those portions of the City that are mapped within high fire hazard areas. The LHMP includes strategies for the minimization of damage from wildfires including the identification of high fire risk areas. The LHMP also contains the City's evacuation plan including the identification of evacuation centers and evacuation map.

f. Emergency Operations Plan

The City's Emergency Operations Plan (EOP; 2022) provides a resiliency framework for the City to prepare for, respond to, recover from, and mitigate against all hazards including natural, human-caused, and technological disasters, and national security emergencies. It includes an overview of operational concepts, identifies components of the City's emergency management organization consistent with the Standardized Emergency Management System and the National Incident Management System, and describes the overall responsibilities of federal, state, and county entities, and the City for protecting life and property and assuring the overall well-being of the population. The plan identifies wildfire as a potential risk to life and property and identifies areas of concern. The plan provides a threat assessment and develops an approach to combatting wildfire, alerting, and warning, shelter and mass care, donation management, volunteer management, evacuation, damage assessment, as well as preventive measures.

g. Orange County Fire Authority 2023 Unit Strategic Fire Plan

The OCFA 2023 Unit Strategic Plan addresses such topics as firefighter and public safety, Wildland Urban Interface challenges, impactful cost-effective solutions, community preparedness, prioritization, collaborative partnerships, program, project and policy evaluation and adaptability.

h. Existing Plans, Programs, and Policies

Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required of the proposed project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute mitigation measures. The following measures are existing plans, programs, or policies (PPP) that apply to the project and will help to reduce and avoid potential impacts related to wildfires:

- PPP Wildfire-1: Compliance with City Standard Condition 2.19 (Open Space Fuel Modification)
- PPP Wildfire-2: Compliance with City Standard Condition 3.14 (HOA/Fuel Modification)
- PPP Wildfire-3: Compliance with City Standard Condition 3.17 (Emergency Access Plan)
- PPP Wildfire-4: Compliance with City Standard Condition 4.9 (Emergency Access Inspection)
- PPP Wildfire-5: Compliance with City Standard Condition 2.11 (Special Flood Hazard Area)
- PPP Wildfire-6: Compliance with City Standard Condition 3.4 (Special Flood Hazard Area)
- PPP Wildfire-7: Compliance with City Standard Condition 4.5 (Flood Certification for Finished Construction)

Proposed General Plan Strategies and Policies

In addition to the above-listed PPPs, the following proposed goals, objectives, policies, and implementation actions are applicable to the analysis of wildfire and would replace existing goals, strategies, and policies outlined in the City's existing General Plan following project approval:

Safety Element

Goal 1: Protect and prepare the community for natural and human-caused hazards.

Objective S-1. Hazard Preparedness and Occurrence:

- **Policy (a):** Expand participation in the Irvine Community Emergency Response Team (CERT) program for residents and businesses, including offering training in a variety of languages.
- **Policy (b)**: Coordinate with Caltrans and Orange County Transit Authority for inspection and maintenance of primary evacuation routes.
- **Policy (c)**: Coordinate with regional transit providers to identify alternative routes, stops, and modes of transit if normal infrastructure is damaged or closed as a result of extreme events.
- **Policy (d)**: Encourage collaboration with local and regional partners to support business resiliency through preparedness education, trainings, and resources.
- **Policy (e)**: Update the City's Local Hazard Mitigation Plan every five years, to ensure consistency and relevancy of hazards and issues within the City, and to maintain consistency with State and/or federal legislation.
- **Policy (f)**: Update the Irvine Power Outage Response Plan (annex to the Emergency Operations Plan) to identify back-up energy technologies that are more resilient to climate impacts and communications locations for critical facilities, critical infrastructure (e.g., traffic signals), sensitive uses, and community lifelines (including water, sewer, telecommunications).
- **Policy (g)**: Continuously update response procedures for first responder departments to properly address new hazard events as they emerge.
- **Policy (h)**: Encourage community members to sign-up for disaster alerts.
- **Policy (i)**: Identify opportunities to expand access to emergency and evacuation notices via multiple sources, including voice, text, siren, radio, and outdoor broadcasts.
- **Policy (j)**: Increase understanding of all energy storage technologies including critical features such as storage capacity, efficiency, duration of power, lifestyle impacts, and realistic function to provide long-term, reliable sources of power during grid outages.

Goal 2: Improve the community's resilience to seismic and geologic hazards by ensuring the integrity of the built environment.

Objective S-2. Seismic and Geologic Hazards

- **Policy (a)**: Coordinate with Irvine Ranch Water District and Orange County Water District on emergency water storage and distribution following a liquefaction or landslide event.
- **Policy (b)**: Coordinate groundwater management with Orange County Water District to avoid subsidence impacts in Irvine.
- **Policy (c)**: Promote the strengthening of planned utilities, the retrofit and rehabilitation of existing weak structures and lifeline utilities, and the relocation or strengthening of certain

critical facilities to increase public safety and minimize potential damage from seismic and geologic hazards.
- **Policy (d)**: Encourage replanting bare or disturbed areas after landslides to reduce erosion.

Goal 3: Anticipate the risks and mitigate the effects that flood hazards pose to the community.

Objective S-3. Flood Hazards

- **Policy (a)**: Work with Orange County Flood Control District to ensure flood control facilities are adequately provided and maintained.
- **Policy (b)**: Collaborate with partner agencies and municipalities to align green infrastructure projects (i.e., projects that allow for filtration of stormwater where it falls) and develop regulations for watersheds across jurisdictions to reduce impervious hard surfaces.
- **Policy (c)**: Support efforts of other organizations and academic institutions to conduct studies of the impact combined riverine and coastal flooding, groundwater intrusion, and increased precipitation has on flood risk and vulnerability.
- **Policy (d)**: Support efforts of other organizations and academic institutions to inventory and map vegetation on hillsides with a specific focus on improving hillside stability in the case of extreme rainfall and seasonal erosion.
- **Policy (e)**: Develop or update a long-term plan to address current and future flood risk to critical facilities.
- **Policy (f)**: Continue to partner with Orange County Public Works to proactively disseminate information from the "H2OC Stormwater Program" to educate home and small business owners on regulations and highlight the role that engaged residents can play to assist with community-based stormwater management.
- **Policy (g)**: Ensure resilience and long-term functionality of stormwater and sewer systems.
- **Policy (h)**: Encourage the use of climate-smart landscaped surfaces (e.g., permeable pavement, stormwater parks, green streets) in new and existing development to reduce runoff, minimize flood hazards, and maintain existing drainageways.
- **Policy (i)**: Continue to encourage the implementation of low-impact development (e.g., rain gardens and rainwater harvesting) to reduce flood risk, filter pollutants, and replenish groundwater over time.
- **Policy (j)**: Continue to promote the application of nature-based solutions (e.g., greenways, tree trenches) to improve resilience and preserve biodiversity.
- **Policy (k)**: Coordinate with other agencies to increase the public awareness of flooding, stormwater management, and drought management issues and techniques for residents to mitigate those challenges on their property.

Goal 4: Safeguard the community from the threat of urban and wildfire hazards.

Objective S-4. Wildfire Hazards

- **Policy (a):** Coordinate with regional partners to explore and deploy fire detection cameras as part of a wildfire monitoring network.
- **Policy (b):** Coordinate with surrounding municipalities and Orange County to enhance evacuation and emergency management protocols, agreements, and processes.

- **Policy (c):** Coordinate with City of Irvine and Orange County Fire Authority first responders to create a rapid response plan to secure hospital, nursing, and assisted living facilities, especially those located within fire hazard severity zones.
- **Policy (d):** Work with the Irvine Ranch Water District to ensure the long-term integrity of water supplies for the City.
- **Policy (e):** Continue to work with the Orange County Health Care Agency Department of Public Health and other applicable health care agencies to convey notifications to the public regarding recommendations for outdoor activities, cancelled sporting events, and other recommendations for public health and safety during periods of poor air quality.
- **Policy (k):** Ensure that all new development and redevelopment in the Very High Fire Hazard Severity Zone is developed in compliance with minimum structural fire protection standards in the adopted edition of the California Fire and Building Codes, applicable state or local fire safety and defensible space regulations or standards, and any applicable fire protection or risk reduction measures identified in locally adopted plans. (See Action J-4-8 and Action J-4-15)
- **Policy (l):** Ensure future neighborhoods are designed with adequate fire access and evacuation egress in the event of an emergency. (See Action J-4-9)
- **Policy (m):** Avoid expanding new residential development, essential public facilities, and critical infrastructure in areas subject to extreme threat or high risk, such as Very High Fire Hazard Severity Zones, or areas classified by the California Department of Forestry and Fire Protection as having an Extreme Threat classification on Fire Threat Maps, unless all feasible risk reduction measures have been incorporated into project designs or conditions of approval. Example risk reduction measures include, but are not limited to, fuel modification zones or defensible space, structure hardening, enclosed foundations, and highly visible street signs and property addresses.
- **Policy (n):** Ensure adequate water supply for fire suppression and ensure that the water supply is protected from wildfire impacts, including providing back-up power, with priority for solar and battery storage back-up supplies.
- **Policy (o):** Ensure future neighborhoods are designed with sufficient water pressure to maintain fire flow. (See Action J-4-8 and Action J-4-16)
- **Policy p):** Encourage the use of underground power lines for new developments.
- **Policy (q):** Ensure that private development subject to the California Environmental Quality Act evaluate hazard impacts to ensure adequate evacuation in the event of an emergency, and if required, develop standards for the protection of the community.
- **Policy (r):** Review development proposals and coordinate with regional transportation agencies to ensure that multiple evacuation routes are available under a range of scenarios and identify alternative routes that are accessible to people without life-supporting resources.
- **Policy (s):** Coordinate with fire protection, emergency service, and water providers to reassess fire hazards and future availability of water supplies after wildfire events to adjust fire prevention and suppression needs, as necessary, for both short- and long-term fire prevention.
- **Policy (t):** Coordinate evaluations for redevelopment of areas that have been burned after a large fire.
- **Policy (u):** Continue the long-term maintenance of fire reduction projects; including but not limited to, a roadside fuel reduction plan, defensible space clearances (including fuel beaks)

around structures, subdivisions, and other development in the Very High Fire Hazard Severity Zone.
- **Policy (v):** Maintain established response time standards for fire and life safety service.
- **Policy (w):** Encourage the continued development, implementation, and public awareness of fire prevention programs.

4.15.3 Significance Determination Thresholds

The City has adopted Appendix G of the State California Environmental Quality Act (CEQA) Guidelines as the significance thresholds for wildfire. A project would normally have a significant effect on the environment if the project would:

1) Substantially impair an adopted emergency response plan or emergency evacuation plan;

2) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire;

3) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment; or

4) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

4.15.4 Methodology

The potential for significant impacts associated with the project has been determined based upon review of existing secondary source information and data relative to wildfires available for the City.

4.15.5 Topic 1: Emergency Response Plans

Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?

4.15.5.1 Impact Analysis

The project would facilitate future development consisting of residential uses required to meet the City's Regional Housing Needs Assessment (RHNA) requirement, nonresidential uses within the Great Park, continued development of nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

Consistent with the Best Practices for Analyzing and Mitigating Wildfire Impacts of Development Projects Under the California Environmental Quality Act Memorandum (Bonta Memo) (State of California Office of the Attorney General 2022), the City has assessed potential project impacts with respect to wildfire. Under Section IV C. Analyzing the Project's Impact on Evacuation and Emergency

Access, the Bonta Memo notes that a lead agency would be best positioned to ensure that a proposed development project facilitates emergency access and ease constraints on evacuation with an assessment of evacuation modelling and planning prior to project approval. As several historical wildfires in the Santa Ana Mountains and San Joaquin Hills have impacted Irvine, resulting in evacuations and indirect effects from smoke and traffic congestion, the City has prepared an Emergency Evacuation Route Analysis as part of the Safety Element to assess the impacts of buildout of the project on emergency access and evacuation. Figure 4.15-1 presents residential evacuation routes identified in the City.

Both the updated Safety Element and the 2022 EOP Evacuation Annex (City of Irvine 2019) include the Evacuation Zones Map for the City and are key resources in identifying emergency evacuation routes in the community based on evacuation zones. The Evacuation Zones Map in the EOP identifies appropriate evacuation routes based on pre-identified community areas (evacuation management zones) that may be evacuated in phases, but acknowledges that routes may not necessarily be used during an evacuation as circumstances may dictate alternate routes. Authorities would jointly determine evacuation routes and traffic flow direction based on incident circumstances. The 2020 LHMP (City of Irvine 2020) and the updated Safety Element also provide a comprehensive assessment of the threats the City faces from natural and human-caused hazard events and identifies a coordinated strategy to reduce the impacts of these threats to the City.

The Emergency Evacuation Route Analysis both in the LHMP and in the Safety Element build upon the evacuation management zones and LHMP and identify potential vulnerabilities in the City in the event of a wildfire. Evacuation route viability is largely determined by the location of the hazard. Because Irvine is surrounded by Very High FHSZs to the south, northeast, east, and north/northwest, the City considered the following four wildfire scenarios: (1) a fire originating in the south, (2) a fire originating in the northeast, (3) a fire originating in the east, and (4) a fire originating in the northwest. Residential parcels lacking at least two points of egress were also identified in the Emergency Evacuation Route Analysis to further identify potential vulnerabilities in Irvine. The results of the analysis indicate that residents closest to the southern, northern, and eastern extents of the City are most vulnerable given the distance and number of roads needed to access an outbound road. However, the City has identified adequate evacuation routes in various wildfire scenarios for the vulnerable residents because of modelling and would continue to identify evacuation locations on-site during emergency situations. Furthermore, consistent with Objective S-4 and Policy S-4(l), the City would ensure that future neighborhoods are designed with adequate fire access and evacuation egress in the event of an emergency. Prior to construction, future development projects would also be required to prepare and submit a plan check to the City for approval of adequate emergency access. Approval of new development throughout the City would be conditioned by Standard Condition 3.17 and Standard Condition 4.9 for review by the Irvine Police Department and OCFA to ensure adequate emergency access and compliance with the Emergency Access Plan requirements. Future development would also be designed, constructed, and maintained in accordance with applicable standards associated with the EOP and Emergency Access Plan, including vehicular access to ensure that adequate emergency access and evacuation would be maintained. This is consistent with Action S-4(6) of the updated Safety Element, which requires the City to continue to involve the Orange County Fire Authority in the review of development applications to minimize fire hazards.

FIGURE 4.15-1
Residential Evacuation

Policy S-4(r) would also require the City to review development proposals and coordinate with regional transportation agencies to ensure that multiple evacuation routes are available under a range of scenarios and identify alternative routes that are accessible to people without life-supporting resources. The City's Safety Element also includes Policy S-4(q), which further requires that private development subject to the CEQA evaluates hazard impacts to ensure adequate evacuation in the event of an emergency, and if required, develop standards for the protection of the community. Furthermore, the Safety Element Update would include the objectives and policies that would further support the City's goal of providing adequate emergency response. For example, Objective S-1 aims to protect and prepare the community for natural and human-caused hazards, with supporting policies aimed at improving the City's response to such hazards (including wildfires). Therefore, because buildout of the project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan, impacts would be less than significant.

4.15.5.2 Significance of Impacts

Impacts would be less than significant. No mitigation is required.

4.15.5.3 Mitigation

Impacts would be less than significant. No mitigation would be required.

4.15.6 Topic 2: Wildfire

Due to slope, prevailing winds, and other factors, would the project exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

4.15.6.1 Impact Analysis

The project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

As shown in Figure 4.7-2, most of the City consists of urban areas that are not designated as a fire severity zone. There is no land within Focus Areas 1 and 2 that are designated with a fire severity rating. Although approximately 1,875 acres of land located in Focus Area 3 is designated as Very High FHSZ, future housing development would not be located within this area of Focus Area 3. In the unlikely case that development near this area did occur, it would be designed to be consistent with all applicable fire safety requirements. Future development and redevelopment could also occur outside of the proposed focus areas, which may be located along the City boundaries adjacent to land identified as having Moderate, High, or Very High FHSZ designations. For instance, areas within the northeastern portion of the City, which extends through Orange County and into Riverside County to the east, are designated as Very High FHSZ. However, all new site-specific development in these areas is required to prepare a fuel modification plan before approval of tentative maps and grading permits, per City Standard Condition 2.19 Open Space Fuel Modification and Standard

Condition 3.14 HOA/Fuel Modification (PPPs Wildfire-1 and Wildfire-2). Furthermore, the Safety Element Update would include objectives and policies related to preventing and minimizing impacts that would further support the City's goal of responding to, and minimizing the effects of, wildfires. For example, Goal S-4 aims to safeguard the community from the threat of urban and wildfires with supporting policies aimed at improving responses to wildfires and using design techniques (such as fuel modification zones) to prevent urban and wildfires. Therefore, the project would not expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire, and impacts would be less than significant.

4.15.6.2 Significance of Impacts

Impacts would be less than significant. No mitigation is required.

4.15.6.3 Mitigation

Impacts would be less than significant. No mitigation would be required.

4.15.7 Topic 3: Infrastructure

Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

4.15.7.1 Impact Analysis

The proposed project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, continued development of nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway. Implementation of the Ada roadway extension would serve to improve circulation within this area of the City, which would improve emergency evacuation activities in the event of an emergency, including a fire.

As described in Section 4.14.5, utility infrastructure improvements that are anticipated to serve future development facilitated by the General Plan Update and buildout of the Great Park would be available in adjacent roadways. Per City Standard Condition 4.9 Emergency Access Inspection, the Police Department and the OCFA would ensure compliance with the Emergency Access Plan requirements which may result in the potential inclusion of new roadways with subsequent projects that would result in impacts to the environment or that may exacerbate fire risk. However, all impacts associated with infrastructure improvements, including any required measures to address fire safety, would be evaluated in their respective subsequent environmental documents for discretionary projects, including application of the City's Municipal Code and existing City building and fire code requirements. As detailed in Section 5-9-401 of the Municipal Code, new buildings located in any FHSZ or any Wildland-Urban Interface Fire Area would be subject to the materials and construction methods detailed in Chapter 7A of the CBC to reduce risks associated with wildfire exposure and would have a fuel modification plan reviewed and submitted to a Fire Code Official prior to approvals and permit issuance. This is consistent with City Standard Condition 2.19 Open Space Fuel

Modification, Standard Condition 3.14 HOA/Fuel Modification Standard Condition 3.17 Emergency Access Plan, and Standard Condition 4.9 Emergency Access Inspection (PPPs Wildfire-1 through Wildfire-4). All new development would also be subject to review to ensure that adequate defensible space and fuel management zones would be implemented to avoid potential ignition risks around the associated infrastructure, such as power lines or other utilities. Furthermore, the Safety Element Update would include objectives and policies further supporting the City's goal of ensuring adequate infrastructure with respect to wildfires. For example, Goal SE S-4 aims to safeguard the community from wildfire impacts, with supporting policies aimed at ensuring that new development within areas prone to wildfires are designed in a manner that such impacts would be minimized. Therefore, compliance with applicable PPPs would ensure that installation or maintenance of associated infrastructure associated with the project would not exacerbate fire risk, and impacts would be less than significant.

4.15.7.2 Significance of Impacts

Impacts would be less than significant. No mitigation is required.

4.15.7.3 Mitigation

Impacts would be less than significant. No mitigation is required.

4.15.8 Topic 4: Flooding or Landslide

Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

4.15.8.1 Impact Analysis

The proposed project would facilitate future development consisting of residential uses required to meet the City's RHNA requirement, nonresidential uses within the Great Park, nonresidential uses at the same intensities as permitted under the existing General Plan, and the extension of Ada roadway.

As described in Section 4.8 above, future development would be required to demonstrate that site-specific projects would be elevated out of the floodplain and would not affect the conveyance of flood waters through elevated building pads, and/or other compliance measures as specified by FEMA. City Standard Condition 2.11 (Special Flood Hazard Area), 3.4 (Special Flood Hazard Area), and 4.5 (Flood Certification for Finished Construction) (PPPs Wildfire-5 through Wildfire-7) would require that prior to the issuance of a precise grading permit for any lot or parcel within a FHSZ, the Floodplain Administrator and Chief Building Official would be sent a final approved Letter of Map Revision, Preliminary Elevation Certificates, and/or a floodproofing certificate. This would reduce risks associated with flooding. Moreover, local guidance prohibits development within a flood zone unless adequate assurances are provided against flood hazards (see Zoning Ordinance Section 5-2-24 Standards of construction for flood hazard zones). These include anchoring structures, constructing structures with materials and utility equipment resistant to flood damage, constructing the structure above the base flood elevation, and certification by a registered professional engineer or surveyor, and verification by the City's Chief Building Official. The Safety Element Update also includes

objectives and policies that further support the City's goals related to flood prevention. For example, Goal S-3 aims to anticipate the risks and mitigate the effects that flood hazards pose to the community, with supporting policies aimed at collaborating with local agencies to address flooding potential through long-range plan and infrastructure improvements.

As noted in Chapter 4.5, Geology and Soils, there is the potential for landslides in the steeper portions of the foothills of the Santa Ana Mountains to the northeast of the City and the San Joaquin Hills to the southwest of the City. Even these areas, however, are designated as having a low likelihood of a landslide under other conditions, such as post-fire instability. However, future development under the project would be required to adhere to safety requirements in the Municipal Code requirements related to the City's Building Code, Grading Code, and Grading Manual which would reduce impacts related to landslide to a level less than significant. Furthermore, the updated Safety Element includes Goal 2, which aims to improve the community's resilience to seismic and geologic hazards with supporting policies aimed at coordination with local water agencies to reduce liquefaction and subsidence events and to strengthen utilities to minimize such impacts to local infrastructure. As such, the updated Safety Element would further support the City's goals of addressing seismic hazards, including those related to liquefaction and subsidence, throughout the City and within its infrastructure. Therefore, compliance with applicable PPPs would ensure that the project would not increase risks associated with post-fire flooding or landslides, and impacts would be less than significant. Compliance with and goals, objectives, and policies in the updated Safety Element would serve to further lessen such impacts.

4.15.8.2 Significance of Impacts

Impacts would be less than significant. No mitigation is required.

4.15.8.3 Mitigation

Impacts would be less than significant. No mitigation would be required.

4.15.9 Cumulative Analysis

As defined in Section 15130 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for wildfire. The study area for the assessment of cumulative impacts related to wildfire is the City. New development throughout the City would be conditioned by Standard Condition 3.17 (Emergency access plan) and Standard Condition 4.9 (Emergency access test) for review by the Irvine Police Department and OCFA to ensure adequate emergency access and to ensure compliance with the Emergency Access Plan requirements. Future development would be designed, constructed, and maintained in accordance with applicable standards associated with the Safety Element Update, LHMP, EOP, and Emergency Access Plan, including vehicular access to ensure that adequate emergency access and evacuation would be maintained. Future development near a wildfire severity zone would be required to prepare a fuel modification plan before approval of tentative maps and grading permits. New development and redevelopment would also need to consider water supply, access, building ignition and fire resistance, fire protection systems and equipment, defensible space, and vegetation management,

and demonstrate consistency with the requirements of CBC Chapter 7A, the International Wildland-Urban Interface Code, and the City Municipal Code. All new development would also be subject to review to ensure that adequate defensible space and fuel management zones would be implemented to avoid potential ignition risks around the associated infrastructure, such as power lines or other utilities. Future development would also be required to demonstrate that they would not increase risks associated with post-fire flooding or landslides. Furthermore, the updated Safety Element includes goals, objectives, and policies addressing wildfires that would further support the City's goals of addressing wildfire events. Therefore, the project would not contribute to a cumulative impact related to wildfires.

Chapter 5.0
CEQA Mandated Analysis

The California Environmental Quality Act (CEQA) Guidelines Section 15126.2(b) and (c) require that the significant unavoidable impacts of the project, as well as any significant irreversible environmental changes that would result from project implementation, be addressed in the Environmental Impact Report (EIR). Additionally, CEQA Guidelines Section 15126.2(e) requires that an EIR evaluate the "growth-inducing" effects of a project. The following paragraphs discuss these mandated topics associated with implementation of the project. The analysis area covers the entire City.

5.1 Significant Environmental Effects Which Cannot Be Avoided if the Project is Implemented

In accordance with CEQA Guidelines Section 15126.2(b) any significant unavoidable impacts of a project, including those impacts that can be mitigated but not reduced to below a level of significance despite the applicant's willingness to implement all feasible mitigation measures, must be identified in the Program Environmental Impact Report (PEIR). Implementation of the project would result in significant, unavoidable impacts associated with the following issues: air quality (air quality plan consistency; criteria pollutants; sensitive receptors), cultural resources (historic resources), geology and soils (paleontological resources), greenhouse gas (emissions; policy consistency), noise (ambient noise; vibration), and transportation (vehicle miles traveled).

These impacts would remain significant and unavoidable as a result of the project. A Statement of Overriding Considerations, consistent with CEQA Guidelines Section 15093, will be prepared for certification with the Final PEIR, identifying specific economic, legal, social, technological, or other benefits of the project which allow approval of the project to outweigh the unavoidable impacts.

5.2 Significant Irreversible Environmental Changes Which Would Result if the Project is Implemented

In accordance with CEQA Guidelines Section 15126.2(d):

> Uses of nonrenewable resources during the initial and continued phases of the project may be irreversible since a large commitment of such resources makes removal or nonuse thereafter unlikely. Primary impacts and, particularly, secondary impacts (such as highway improvements which provide access to a previously inaccessible area) generally commit future generations to similar uses. Also irreversible damage can result from environmental accidents associated with the project. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified.

Nonrenewable resources generally include agricultural land; biological, archaeological, and paleontological resources; mineral deposits; water bodies; and some energy sources. The project has been designed to minimize impacts to sensitive biological resources by primarily focusing future development and redevelopment within the focus areas. These areas are most suited for new growth and development as they are located near existing job centers and are along major travel corridors with access to existing and future public transit opportunities. Furthermore, the project would avoid development within the natural undeveloped portions of Focus Area 3. Focusing development and redevelopment within the urbanized segments of the focus areas would minimize adverse impacts to sensitive species (see Section 4.3). Similarly, focusing future development and redevelopment within the focus areas would minimize impacts on cultural and tribal cultural resources (see Section 4.4).

There exists some potential for paleontological resources to be present within the City, primarily within areas that have been identified as having a high potential for paleontological resources. However, implementation of the paleontological mitigation framework would reduce impacts associated with future grading and development to a less than significant level (see Section 4.5). As described in Section 4.8, implementation of the project would result in less than significant impacts to water bodies (drainage and water quality). Furthermore, the City does not support any mineral extraction activities (see Section 6.0). Therefore, impacts related to mineral resources would be less than significant. Furthermore, while the project would allow for some agricultural properties to be converted to nonagricultural uses, existing agricultural activities on these sites are considered interim uses associated with development limitations related to the former Marine Corps Air Station El Toro and are not designated as Unique, Prime, or Farmland of Statewide Importance. Furthermore, Conservation and Open Space Element Update Objective COS – 7, policy (f) allows for the conversion of interim and permanent agricultural uses to development to provide land for the construction of housing units consistent with the Land Use and Housing elements (see Section 6.0). Therefore, impacts related to agricultural resources would be less than significant.

Actions related to future development would result in an irretrievable commitment of nonrenewable resources, including as energy supplies and construction materials, such as lumber, steel, and aggregate. Nonrenewable energy resources (coal, natural gas, oil) would be used in construction, heating, refrigeration of food and water, transportation, lighting, and other associated energy needs. Residential and mixed-use development anticipated within the focus areas, together with other projects in the City, would require the commitment or destruction of other nonrenewable and slowly renewable resources. These resources include (but are not limited to) lumber and other forested products; sand and gravel; asphalt; petrochemical construction materials; steel, copper, lead, other metals; and water. However, through required compliance with the building code in effect at the time of development, the amount and rate of consumption of these resources would not result in significant environmental impacts or the unnecessary, inefficient, or wasteful use of resources.

In summary, construction and operation of future housing sites would result in the irretrievable commitment of limited, slowly renewable, and nonrenewable resources, which would limit the availability of these particular resource quantities for future generations or for other uses. However, the project would update the City's General Plan and Zoning Ordinance to comply with state law and implement the City's Housing Element, which would meet the City's future housing needs and meet the City's Regional Housing Needs Assessment (RHNA) allocation provided by the Southern

California Association of Governments (SCAG). Therefore, use of such resources would not exceed what is already anticipated to occur under SCAG's regional growth forecasts for the City. Therefore, although irreversible environmental changes would result from future development, such changes would not be considered significant.

5.3 Growth Inducement

CEQA Guidelines Section 15126.2(e) requires that an EIR:

> Discuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Included in this are projects which would remove obstacles to population growth (for example, a major expansion of a waste water treatment plant might, for example, allow for more construction in service areas). Increases in the population might tax existing community services facilities, requiring construction of new facilities that could cause significant environmental effects. Also discuss the characteristic of some projects which may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively. It must not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment.

A project can directly or indirectly induce growth. Construction of new housing would directly induce population growth. However, if a project creates substantial new permanent employment opportunities, it could indirectly induce growth by stimulating the need for additional housing and services to support the new employment demand. It could also indirectly induce growth by removing infrastructure limitations or regulatory constraints on a required public service, such as roads or water service.

5.3.1 Population and Housing Growth

The project does not propose the construction of new housing or other development; rather it provides capacity for future development consistent with state Housing Element Law and regional plans including the SCAG Connect SoCal 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy. The California Department of Finance is responsible for developing the total statewide housing demand projection. With the state Department of Housing and Community Development, this demand is apportioned to each of the state's regions. SCAG is responsible for allocating the region's projected new housing demand in each of its member jurisdictions through the RHNA process (see Chapter 3.0, Project Description). The allocation takes into account factors such as market demand for housing, employment opportunities, the availability of suitable sites and public facilities, commuting patterns, type and tenure of housing need, and others. Therefore, the project contains policies and implementation programs that would provide for housing development consistent with the City's share of the regional housing need as identified in the RHNA.

Compared to the 57,656 units proposed under the Conservative Alternative, the Reduced Project Alternative would only propose 42,637 residential units. The 42,637 residential units proposed under

the Preferred Alternative would exceed the City's RHNA allocation of 23,610 units. This exceedance of the RHNA allocation would ensure that the City can continue to provide a buffer in housing units for all income categories and would ensure the City can meet the no net loss provisions of the state Housing Element law throughout the planning period. The project has been designed to primarily focus future development and redevelopment within the focus areas that are most suited for new growth and development as they are located near existing job centers and are along major travel corridors with access to existing and future public transit opportunities. As such, future development under the project would be in developed areas that are already served by infrastructure. Given these conditions and the City's existing development and housing occupancy patterns, it is not anticipated that future housing development facilitated by the project would induce population growth indirectly through extension of roads or other infrastructure. Therefore, the project would accommodate projected future housing needs in the City and would not induce population growth.

5.3.2 Removal of an Impediment to Growth

The project does not propose the construction or expansion of new housing, services, or other infrastructure development; rather it provides for future development consistent with state Housing Element Law. The project has been designed to primarily focus future development and redevelopment within focus areas that are most suited for new growth and development as they are located near existing job centers and are along major travel corridors with access to existing and future public transit opportunities. Future development outside of the focus areas would occur in areas that are already served by infrastructure and would not require extensions into unserved portions of the City. Therefore, future infrastructure development would occur within areas that are already served by essential roads, utilities, and public services, and the project would not remove an impediment to growth.

5.3.3 Foster Economic or Employment Growth

The project does not propose or provide direct development rights to new major retail, commercial or employment centers that would encourage substantial economic or employment growth. Rather, it provides opportunities for housing development in close proximity to existing job centers. New housing would increase the workforce in the City but would not increase substantial amounts of economic or employment growth, as the project does not introduce new employment centers. Therefore, future economic and employment growth associated with the project would not induce growth.

5.4 Conclusion

Overall, the project would not be growth-inducing as it would accommodate projected growth as required by state law. The project would not remove an impediment to growth, nor does it propose to develop, or permit the encroachment into an isolated area adjacent to open space, or foster economic and employment expansion. As discussed above, the project would accommodate projected population growth and would not be considered growth inducing because it would provide housing capacity for projected population growth. The opportunities to provide housing would be consistent with the City's need to establish a resilient housing base for the community and comply with state law.

Chapter 6.0
Effects Found Not to be Significant

Section 15128 of the California Environmental Quality Act (CEQA) Guidelines requires that an Environmental Impact Report (EIR) briefly describe potential environmental effects that were determined not to be significant, and therefore were not discussed in detail in the EIR. Based on initial environmental review, the City of Irvine (City) determined that the project would not have the potential to cause significant impacts associated with the environmental categories discussed below.

6.1 Agricultural and Forestry Resources

According to CEQA Guidelines Appendix G, a significant impact on agricultural and forestry resources would occur if the project would:

1) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use;
2) Conflict with existing zoning for agricultural use, or a Williamson Act contract;
3) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220[g]), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104[g]);
4) Result in the loss of forest land or conversion of forest land to non-forest use; or
5) Involve other changes in the existing environment, which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use.

The California Department of Conservation, Division of Land Resource Protection, identified important farmland throughout the state through its Farmland Mapping and Monitoring Program (FMMP). The FMMP is non-regulatory and was developed to inventory land and provide categorical definitions of important farmlands and consistent and impartial data to decision makers for use in assessing present status, reviewing trends, and planning for the future of California's agricultural land resources. The FMMP classifies the majority of the City as Urban and Built-Up Land and Other Land. Small amounts of land are classified as Prime Farmland, Unique Farmland, and Farmland of Statewide of Importance (generally located in the northern portion of City and in areas near the Great Park-Planning Area 51), some of which are in active agricultural cultivation. Most of these areas are surrounded by undeveloped land and are not contemplated for development under the project. Furthermore, agricultural uses near the Great Park exist as interim uses due to their adjacency to the former Marine Corps Air Station (MCAS) El Toro air base, which historically limited development on these properties due to potential conflicts with flight paths and air space in these areas. Since the closure of MCAS El Toro, the adopted Housing Element (which is being implemented by the project)

identified a potential housing site on a parcel within the Great Park area that is currently occupied by agricultural uses.

It is important to note that the project itself does not contemplate any confirmed development projects on agricultural sites, including those identified in the adopted Housing Element, but rather would allow for residential uses on nonresidential sites through a new Residential and Residential Mixed-Use Overlay. The overlay would retain all existing land use and zoning designations/classifications on properties throughout the City (refer to Chapter 3.0, Project Description, for more details). Should future projects facilitated by project approval occur on existing agricultural sites, site-specific evaluations would be required in compliance with the CEQA to determine project-specific impacts to agricultural lands.

There is no forest land within the City, and the City does not possess any zoning classifications for forestland, timberland, or timberland production zones. Similarly, there are no lands protected by a Williamson Act Contract within the City. Therefore, impacts to agricultural and forestry resources that would occur as a result of project implementation would be less than significant. Similarly

6.2 Energy

According to CEQA Guidelines Appendix G, a significant impact on energy would occur if the project would:

1) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation; or

2) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

The Environmental Protection and Climate Action Element includes the following objectives and policies that would serve to further reduce energy consumption.

Goal 6: Reduce energy consumption and promote energy efficiency in Irvine.

Objective EPCA-6. Achieve significant reductions in per capita energy consumption across residential, commercial, and municipal sectors while promoting the adoption of renewable energy sources and energy-efficient technologies.

- Policy (a): Through the efforts of CALGreen, establish and enforce energy efficiency standards and building codes for new construction and major renovations to improve the energy performance of buildings and reduce energy demand.
- Policy (b): Require energy-efficient building design, insulation, HVAC systems, lighting, and appliances to minimize energy consumption and lower utility costs for residents and businesses.
- Policy (c): Promote the adoption of renewable energy systems, such as solar photovoltaic (PV) panels, wind turbines, and geothermal heat pumps, to generate clean and sustainable electricity for onsite consumption or grid injection.

- **Policy (d)**: Streamline permitting processes and provide incentives, rebates, and financing options to encourage residents, businesses, and municipal facilities to invest in renewable energy installations.
- **Policy (e)**: Implement energy conservation programs and public awareness campaigns to educate residents and businesses about the importance of energy conservation, energy-saving practices, and behavioral changes to reduce energy waste.
- **Policy (f)**: Monitor federal, state, regional, and other local governments, utility companies, Irvine Ranch Water District (IRWD), and other private and public agencies energy programs. Obtain information and technical assistance for energy programs and implement federal and state energy programs.
- **Policy (g)**: Promote energy savings in buildings constructed before 1978.
- **Policy (h)**: Encourage voluntary retrofit energy programs for residential, commercial, and industrial buildings including energy conservation measures.
- **Policy (i)**: Maximize energy efficiency of the City's facilities and operations by use of recycled materials, renewable sources, and conservation measures.

Goal 8: Mitigate the impacts of climate change, enhance resilience, and transition to a climate-resilient community in Irvine.

Objective EPCA-8. Reduce greenhouse gas emissions, adapt to the effects of climate change, and promote climate resilience through comprehensive policies, programs, and initiatives that engage stakeholders, foster innovation, and prioritize equitable and sustainable solutions.

- **Policy (b)**: Encourage the adoption of renewable energy targets, energy efficiency standards, and building codes to promote clean energy adoption, reduce energy consumption, and decarbonize the built environment, while incentivizing the use of renewable technologies and sustainable practices.

Goal 10: Promote sustainable land use practices in Irvine.

Objective EPCA-10. Implement policies and initiatives that prioritize sustainable land management, smart growth principles, and equitable development strategies to ensure the efficient use of land while protecting environmental quality and promoting community well-being.

- **Policy (f)**: Encourage and incentivize the adoption of Leadership in Energy and Environmental Design (LEED) building standards for new construction and major renovations within the City.
- **Policy (g)**: Explore the adoption of green building standards, energy-efficient design guidelines, and sustainable construction practices to reduce greenhouse gas emissions, promote energy conservation, and minimize environmental impacts associated with new development and redevelopment projects.

6.2.1 Construction

Grading and construction activities consume energy through the operation of heavy off-road equipment, trucks, and worker traffic. At the program level, it is too speculative to quantify total construction-related energy consumption of future development, either in total or by fuel type. However, a worst-case project-level construction scenario for a future development occurring because of project implementation is expected to include the development of 1,500 units, with an average size of 670 square feet (small apartments), on a 15-acre site. Emissions associated with this worst-case project were calculated as part of the air quality analysis prepared for the project (Appendix B). Based on CalEEMod model defaults, construction of this project would last approximately 18 months. Fuel consumption associated with on-road worker trips and delivery trips were calculated using EMFAC2021 fuel consumption rates. Fuel consumption associated with on-site construction equipment was calculated using CARB's OFFROAD model. Off-site and on-site fuel consumption that would occur over the entire construction period is summarized in Tables 6-1 and 6-2, respectively.

Table 6-1
Off-site Construction Vehicle Fuel Consumption

Trip Type	Total Vehicle Miles Traveled	Total Fuel Consumption (gallons)		Electricity Consumption
		Gasoline	Diesel	kWh
Workers	6,099,450	207,167	3,903	137,969
Deliveries	2,112	1,089	3,929	297
TOTAL	**6,101,562**	**208,286**	**7,832**	**138,266**

Table 6-2
On-site Construction Equipment Fuel Consumption

Phase	Phase Length (days)	Equipment	Amount	Total Usage Hours	Total Diesel Fuel Consumption (gallons)
Demolition	20	Rubber Tired Dozers	2	320	1,721
		Excavators	3	480	1,424
		Concrete/Industrial Saw	1	160	221
Site Preparation	10	Rubber Tired Dozers	3	240	1,291
		Tractors/Loaders/Backhoes	4	320	702
Grading	30	Excavators	2	480	1,424
		Grader	1	240	1,067
		Rubber Tired Dozer	1	240	1,291
		Tractors/Loaders/Backhoes	2	480	1,052
		Scrapers	2	480	4,217
Building Construction	300	Crane	1	2,100	9,402
		Forklifts	3	7,200	15,809
		Generator Set	1	2,400	5,472
		Tractors/Loaders/Backhoes	3	6,300	13,811
		Welder	1	2,400	3,338

Table 6-2 On-site Construction Equipment Fuel Consumption					
Phase	Phase Length (days)	Equipment	Amount	Total Usage Hours	Total Diesel Fuel Consumption (gallons)
Paving	20	Pavers	2	320	1,039
		Paving Equipment	2	320	1,020
		Rollers	2	320	602
Architectural Coatings	20	Air Compressor	1	210	131
TOTAL					65,034

Energy used during future construction of the project areas is not considered significant given typical energy use associated with the type of development proposed (primarily residential and residential mixed-use projects) and short-term nature of the energy consumption. Consistent with state requirements, all construction equipment would meet California Air Resources Board (CARB) Tier 3 In-Use Off-Road Diesel Engine Standards. Engines are required to meet certain emission standards, and groups of standards are referred to as Tiers. A Tier 0 engine is unregulated with no emission controls, and each progression of standard level (i.e., Tier 1, Tier 2, Tier 3, etc.) generate lower emissions, use less energy, and are more advanced technologically than the previous tier. CARB's Tier 3 In-Use Off-Road Diesel Engine Standards requires that construction equipment fleets become cleaner and use less energy over time. All construction equipment is subject to the CARB In-Use Off-Road Diesel-Fueled Fleets Regulation, which limits unnecessary idling to 5 minutes, requires all construction fleets to be labeled and reported to CARB, and requires that fleets comply with Best Available Control Technology requirements. Therefore, the project would not result in a wasteful and inefficient use of energy resources during the construction of future development, and impacts would be less than significant.

6.2.2 Long-term Operations

Long-term operational energy use associated with buildout of the project would include fuel consumption of vehicles; electricity and natural gas consumption by residents and commercial operations, and energy consumption related to obtaining water. However, the majority of the future housing units would be multi-family housing, which is a more efficient way to provide housing than lower density single-family development. Although the project would provide capacity for future housing and residential-mixed use development that could increase energy use, associated energy demand would be consistent with energy demand within other cities in the region and would not be associated with inefficient or wasteful energy use. Therefore, operational energy use would not result in wasteful, inefficient, or unnecessary consumption of energy resources, and impacts would be less than significant.

Future development would be subject to compliance with the California Building Code (CBC; Title 24), which seeks to reduce excessive and inefficient energy use. The CBC is regularly updated and includes higher energy-efficiency standards in comparison to other states. Individual development projects in the City would be required to comply with applicable federal, state, and local energy and

building regulations. Therefore, the project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency, and impacts would be less than significant,

6.2.2.1 Transportation

Buildout of the project would consume energy associated transportation uses. Trips by individuals traveling to, from, and within the City would largely rely on passenger vehicles or public transit. Passenger vehicles would be mostly powered by gasoline, with some fueled by diesel or electricity. Public transit would be powered by diesel or natural gas and could potentially be fueled by electricity.

Pursuant to the Federal Energy Policy and Conservation Act of 1975, the National Highway Traffic and Safety Administration is responsible for establishing vehicle standards and for revising existing standards. Compliance with federal fuel economy standards is not determined for each individual vehicle model. Rather, compliance is determined based on each manufacturer's average fuel economy for the portion of their vehicles produced for sale in the United States. Over time, fuel economy standards have increased and reduced the greenhouse gas emissions footprint of vehicles. Furthermore, the California state law, Advanced Clean Cars II, passed in 2022 requiring all new cars sold in 2035 and beyond be zero-emission vehicles, which includes battery electric vehicles, plug-in hybrid electric vehicles, and fuel cell electric vehicles. Additionally, future development would be required to install electric vehicle charging infrastructure in accordance with 2022 California Green Building Standards Code (CALGreen) mandatory requirements, at a minimum. Therefore, the project would not create a land use pattern that would result in a wasteful, inefficient, or unnecessary use of transportation-related energy, and impacts would be less than significant.

6.2.2.2 Electricity and Natural Gas

Non-transportation energy use would be associated with electricity and natural gas. The Renewables Portfolio Standard (RPS) promotes diversification of the state's electricity supply and decreased reliance on fossil fuel energy sources. Renewable energy includes (but is not limited to) wind, solar, geothermal, small hydroelectric, biomass, anaerobic digestion, and landfill gas. Originally adopted in 2002 with a goal to achieve a 20 percent renewable energy mix by 2020 (referred to as the "Initial RPS"), the goal has been accelerated and increased by Executive Orders S-14-08 and S-21-09 to a goal of 33 percent by 2020. In April 2011, SB 2 (1X) codified California's 33 percent RPS goal. SB 350 (2015) increased California's renewable energy mix goal to 50 percent by year 2030. SB 100 (2018) further increased the standard set by SB 350 establishing the RPS goal of 44 percent by the end of 2024, 52 percent by the end of 2027, and 60 percent by 2030.

The City is served by Southern California Edison (SCE). Based on the most recent annual report, SCE has already procured 36 percent (California Public Utilities Commission [CPUC] 2023) renewable energy and is on track to procure 60 percent by 2030.

The California Code of Regulations, Title 24, is referred to as the CBC. It consists of a compilation of several distinct standards and codes related to building construction, including plumbing, electrical, interior acoustics, energy efficiency, handicap accessibility, and so on. Of particular relevance to greenhouse gas reductions are the CBC's energy efficiency and green building standards as outlined below.

Title 24, Part 11 of the CBC is CALGreen. Beginning in 2011, CALGreen instituted mandatory minimum environmental performance standards for all ground-up new construction of commercial and low-rise residential buildings, state-owned buildings, schools, and hospitals. It also includes voluntary tiers (I and II) with stricter environmental performance standards for these same categories of residential and nonresidential buildings. Local jurisdictions must enforce the minimum mandatory requirements and may adopt CALGreen with amendments for stricter requirements.

Future development would, at a minimum, be required to comply with the mandatory measures included in the current 2022 Energy Code (California Code of Regulations, Title 24, Part 6) and the 2022 CALGreen standards. The 2022 Energy Code increases on-site renewable energy generation from solar, increases electric load flexibility to support grid reliability, reduces emissions from newly constructed buildings, reduces air pollution for improved public health, and encourages adoption of environmentally beneficial efficient electric technologies. The 2022 CALGreen mandatory measures are related to planning and design, energy efficiency, water efficiency and conservation, material conservation and resource efficiency, and environmental quality. The 2022 CALGreen also includes two tiers of residential and nonresidential voluntary measures that encourage local jurisdictions to raise the following sustainability goals: Tier 1 adds additional requirements beyond the mandatory measures, and Tier 2 further increases the requirements.

New construction and major renovations must demonstrate their compliance with the current Energy Code through submission and approval of a Title 24 Compliance Report to the local building permit review authority and the California Energy Commission (CEC). The compliance reports must demonstrate a building's energy performance through use of CEC approved energy performance software that shows iterative increases in energy efficiency given the selection of various heating, ventilation, and air conditioning; sealing; glazing; insulation; and other components related to the building envelope.

The project does not involve any unusual characteristics that would result in excessive long-term operational demand for electricity or natural gas. The applicable state plans that address renewable energy and energy efficiency are CALGreen, the California Energy Code, and RPS, and the applicable local plan is the General Plan. All future development projects would be required to meet the mandatory energy requirements of the 2022 CALGreen and the 2022 California Energy Code, at a minimum. The project would not conflict with or obstruct implementation of CALGreen and the California Energy Code, or with SCE's implementation of RPS. Adherence to RPS, 2022 CALGreen, and the 2022 California Energy Code requirements would reduce the City's collective long-term operational energy use. Therefore, the project would not result in a wasteful, inefficient, or unnecessary consumption of electricity and natural gas, nor conflict with or obstruct a state or local plan for renewable energy or energy efficiency, and impacts would be less than significant.

6.3 Mineral Resources

According to CEQA Guidelines Appendix G, a significant impact on mineral resources would occur if the project would:

1) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state; or

2) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

Mineral resources encompass vital construction materials such as sand, gravel, and crushed rock, integral for the production of construction materials like Portland cement and asphaltic concrete. Additionally, nonfuel mineral resources include metals like gold, silver, iron, copper, as well as industrial metals such as boron compounds, rare-earth elements, clays, limestone, gypsum, salt, and dimension stone.

Classification of the significance of mineral resources in Irvine adheres to the California Surface Mining and Reclamation Act of 1975, empowering the State Mining and Geology Board to designate lands with mineral deposits of regional or statewide importance. Lands are classified according to the following Mineral Resource Zones (MRZ).

Lands classified as MRZ-2 hold the utmost significance to California, indicating areas underlain by proven mineral resources or where data suggests substantial measured or indicated resources exist. MRZ-2 areas are acknowledged as "regionally significant" by the state board, necessitating that land use decisions consider the importance of the mineral resource to the region or state, beyond the lead agency's jurisdiction. Irvine's MRZ classification areas, mainly MRZ-1 and MRZ-3, are depicted in the California Geological Survey mineral resources map of Orange County, known as the "Generalized Mineral Land Classification of Orange County, California: Aggregate Resources Only." No areas in Irvine have been designated MRZ-2 or as regionally significant mineral deposits.

While gas and oil exploration have occurred in Irvine, the City did not yield significant reserves compared to other locales. Irvine currently has no known gas, oil, or geothermal fields. However, the Department of Conservation estimates there are 24 oil and gas wells in Irvine, with all but three existing as capped and abandoned. The remaining wells are currently inactive.

Furthermore, the majority of the City is urbanized and cannot be used for mineral resource extraction. Substantial amounts of the undeveloped land within the City are preserved under the Orange County Natural Community Conservation Plan/Habitat Conservation Plan, which would preclude mineral resource extraction. Undeveloped land that is not preserved is in proximity to existing residential and commercial uses, which also would preclude mineral resource extraction. Therefore, no impacts to mineral resources would occur.

Chapter 7.0
Project Alternatives

The California Environmental Quality Act (CEQA) Guidelines Section 15126.6 requires that an Environmental Impact Report (EIR) compare the effects of a "reasonable range of alternatives" to the project. The State CEQA Guidelines further specify that the alternatives selected should attain most of the basic project objectives and avoid or substantially lessen one or more significant effects of the project. The "range of alternatives" is governed by the "rule of reason," which requires the EIR to set forth only those alternatives necessary to permit an informed and reasoned choice by the lead agency, and to foster meaningful public participation (CEQA Guidelines Section 15126.6[f]). CEQA generally defines "feasible" to mean an alternative that is capable of being accomplished in a successful manner within a reasonable period of time, while also taking into account economic, environmental, social, technological, and legal factors.

7.1 Selection of Alternatives

Chapter 4.0 of this Program EIR (PEIR) provides a detailed analysis of the potential for the project to have a significant effect on the environment.

The project would result in significant unavoidable environmental impacts related to air quality (air quality plan consistency, criteria pollutants, and sensitive receptors), cultural resources (historic resources), geology and soils (paleontological resources), greenhouse gas (GHG) emissions (emissions; policy consistency), noise (ambient noise and vibration), and transportation (vehicle miles traveled [VMT]). All other impacts were determined to be less than significant or would be mitigated to a level less than significant.

In developing the alternatives to be addressed, consideration was given to their ability to meet the basic objectives of the project and eliminate or substantially reduce significant environmental impacts. As identified in Chapter 3.0, project objectives include the following:

1. Implement land use changes necessary to implement the City's 26th Cycle Housing Element Update effective 2021 to 2029 (2021-2029 Housing Element).

2. Identify areas of opportunity and provide options to enhance development in key focus areas of the City while maintaining the City's signature master plan concept.

3. Implement Citywide policy direction to support a high quality-of-life for residents, businesses, and visitors into the future, including a focus on health and wellness.

4. Identify additional sites for residential and/or residential mixed-use development throughout the City using overlay zones to allow greater flexibility for property owners and developers.

5. Implement Phase 2 of the Great Park Framework Plan to serve residents and visitors in the City.

6. Extend Ada roadway between the Irvine Train Station and Marine Way to better support residential uses and improve multi-modal connectivity.

Alternatives selected for consideration include the No Project (Adopted General Plan) Alternative and the Reduced Project Alternative.

As required under Section 15126.6 (e)(2) of the CEQA Guidelines, an EIR must identify the environmentally superior alternative. Pursuant to the CEQA Guidelines, if the No Project Alternative is determined to be the most environmentally superior project, then another alternative among the alternatives evaluated must be identified as the environmentally superior project. Section 7.3 addresses the environmentally superior alternative selected.

The following section provides an analysis of each major issue area included in the impact analysis for the project. Table 7-1 provides a matrix comparison of the significant impacts of the project as compared to each alternative.

Table 7-1
Matrix Comparison of the Project and Alternatives Impacts

Environmental Issue Area	Project	No Project (Adopted Plan) Alternative	Reduced Project Alternative
Aesthetics	LTS	LTS/LESS	LTS/LESS
Agricultural and Forestry Resources	LTS	LTS/LESS	LTS/LESS
Air Quality	SU	SU/GREATER	SU/GREATER
Biological Resources	SM	SM/LESS	SM/LESS
Cultural and Tribal Cultural Resources	SU	SU/LESS	SU/LESS
Energy	LTS	LTS/LESS	LTS/LESS
Geology and Soils	SU	SU/LESS	SU/LESS
Greenhouse Gas Emissions	SU	SU/GREATER	SU/GREATER
Hazards and Hazardous Materials	LTS	LTS/LESS	LTS/LESS
Hydrology and Water Quality	LTS	LTS/LESS	LTS/LESS
Land Use and Planning	LTS	SU/GREATER	SM/LESS
Mineral Resources	NI	NI/SAME	NI/SAME
Noise	SU	SU/LESS	SU/LESS
Population and Housing	LTS	LTS/LESS	LTS/LESS
Public Services and Recreation	LTS	LTS/LESS	LTS/LESS
Transportation	SU	SU/GREATER	SU/GREATER
Utilities and Service System	LTS	LTS/LESS	LTS/LESS
Wildfire	LTS	LTS/LESS	LTS/LESS
NI = no impact; LTS = less than significant; SM = significant and mitigated; SU = significant and unavoidable			

7.2 Project Alternatives

Consistent with CEQA Guidelines Section 15126(d), the alternatives described below are analyzed to include sufficient information to allow a meaningful analysis and comparison with the project. For purposes of this analysis, those subject areas included in Chapter 4.0 are also included in the analysis of the alternatives. The following sections include a discussion of the impacts of the alternatives

compared to the project. The conclusion for each alternative also provides an overview of how the alternative meets, partially meets, or fails to meet the project objectives.

7.2.1 No Project Alternative

The following discussion of the No Project Alternative is based on the CEQA Guidelines Section 15126.6(e)(3)(A) which states:

> When the project is the revision of an existing land use or regulatory plan, policy or ongoing operation, an alternative will be the continuation of the existing plan, policy or operation into the future. Typically this is a situation where other projects initiated under the existing plan will continue while the new plan is developed. Thus, the projected impacts of the proposed plan or alternative plans would be compared to the impacts that would occur under the existing plan.

Consistent with CEQA Guidelines Section 15126.6(e)(3)(A), the No Project Alternative represents the continued implementation of the adopted General Plan land use and zoning for the project areas.

7.2.1.1 Description of the No Project Alternative

The No Project Alternative involves the continuation of existing land uses permitted under the City's current General. The No Project Alternative would not identify additional residential sites necessary to meet the City's RHNA allocation, and thereby result in less intensive development within the City. The No Project Alternative would also not include improvements to the Great Park or the proposed Ada roadway extension. Nonetheless, future development under the No Project Alternative would occur consistent with the City's adopted General Plan land use plan and would be subject to implementation of the City's General Plan Mitigation Monitoring Requirements. The No Project Alternative would not implement the overlay zones proposed under the project, and therefore would not provide the densities needed to accommodate the region's housing needs or the required levels of affordability.

Under the No Project Alternative, State Housing Law and legislative requirements for implementation of the project's planned goals, objectives, policies and actions aimed at increasing housing (in particular affordable housing) in the City would not occur. This alternative would not satisfy the project objectives because implementation of the No Project Alternative would not facilitate the future development of sufficient residential units needed to the meet the City's RHNA allocation and would not satisfy applicable legislative mandates associated with the City's adopted Housing Element.

7.2.1.2 Environmental Analysis of the No Project Alternative

a. Aesthetics

Future development under the No Project Alternative would be subject to relevant portions of the California Building Code, the City's Municipal Code, Zoning Ordinance, Standard Conditions, and relevant General Plan policies that serve to protect visual resources. Future development under this

alternative would also be required to comply with Municipal Code standards related to light and glare, which requires that outdoor lighting be directed downward and away from adjoining properties and public rights-of-way. Therefore, impacts related to aesthetics under the No Project Alternative would be less than significant and would be less than the project.

b. Agricultural and Forestry Resources

Small amounts of land are classified as Prime Farmland, Unique Farmland, and Farmland of Statewide of Importance (generally located in the northern portion of City and in areas near the Great Park-Planning Area 51), some of which are in active agricultural cultivation. Most of these areas are surrounded by undeveloped land and are not contemplated for development under the adopted General Plan. Furthermore, agricultural uses near the Great Park exist as interim uses due to their adjacency to the former Marine Corps Air Station (MCAS) El Toro air base, which historically limited development on these properties due to potential conflicts with flight paths and air space in these areas. There is no forest land within the City, and the City does not possess any zoning classifications for forestland, timberland, or timberland production zones. Similarly, there are no lands protected by a Williamson Act Contract within the City. Therefore, impacts related to agricultural and forestry resources under the No Project Alternative would be less than significant and would be less than the project.

c. Air Quality

Development would continue under the No Project Alternative consistent with the City's adopted General Plan land use plan, and without guidance provided by the Environmental Protection and Climate Action (EPCA) Element. Therefore, impacts related to air quality would remain significant and unavoidable at this program level of review, greater than the project.

d. Biological Resources

Future development under the No Project Alternative would occur consistent with the City's adopted General Plan land use plan and would be subject to implementation of the City's existing General Plan Mitigation Monitoring Requirements for biological resources, which would reduce impacts related to sensitive species, riparian habitats, wetlands, and wildlife corridors to a level less than significant. Future development under the No Project Alternative would be required to demonstrate compliance with Section 404 of the Clean Water Act (CWA) (PPP BIO-1), Section 401 of the CWA (PPP BIO-2), Section 1600 of the California Fish and Game Code (PPP BIO-3), and the Orange County Central and Coastal Central and Coastal Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP) (PPP BIO-5) and California Endangered Species Act (CESA) (PPP BIO-6. Furthermore, overall habitat impacts would be slightly reduced because the No Project Alternative would not allow for as much development compared to the project. Therefore, impacts related to biological resources under the No Project Alternative would be less than significant, and slightly reduced compared to the project.

e. Cultural and Tribal Cultural Resources

Future development under the No Project Alternative would occur consistent with the City's adopted General Plan land use plan and would be subject to Municipal Code Sections 3-4-132 (Protection of Natural, Cultural, Structural and Archaeological Resources) and 9-10-7 (special development standards) (PPP CUL-4) and City Standard Condition 2.5 (construction monitoring) (PPP CUL-5), which would reduce impacts related to a level less than significant. Future development under the No Project Alternative would likely also be subject to the requirements of AB 52 consultation when applicable and necessary. Overall impacts would be slightly reduced when compared to the project because the No Project Alternative would not allow for as much development. Therefore, impacts related to cultural and tribal cultural resources under the No Project Alternative would remain significant and unavoidable at this program level of review, and slightly reduced compared to the project.

f. Energy

Development would continue under the No Project Alternative consistent with the City's adopted General Plan land use plan. The No Project Alternative would develop fewer residential uses, and thereby consume less energy. Therefore, impacts related to energy would be less than significant, and would be less than the project.

g. Geology and Soils

Future site-specific development under the No Project Alternative would be subject to the requirements related to the City's Building Code (PPP GEO-4), Grading Code (PPP GEO-5), Grading Manual (PPP GEO-6), and Standard Condition 2.6 Site Specific Geotechnical Study (PPP GEO-8), which would ensure that structures would be designed with the geologic hazards in mind to reduce risks associated with strong seismic ground shaking, seismic-related ground failure, and other geologic hazards such as liquefaction, landslide lateral spreading, subsidence, and expansive soils to a level less than significant. Post-construction erosion resulting from increased runoff would also generally be avoided or reduced through site design and hydromodification control BMPs as required per PPP-HYD-3, PPP-HYD-5, PPP-HYD-10, PPP-HYD-12, and PPP-HYD-16. Projects would also be required to adhere to the City's Municipal Code (PPP-HYD-10, PPP-HYD-11), Standard Conditions (PPP-HYD-14, PPP-HYD-15), Grading Manual (PPP-HYD-12), to reduce operational impacts associated with erosion. However, site-specific development under the No Project Alternative would have the potential to impact paleontological resources, which would be considered significant and unavoidable, and less than the project.

h. Greenhouse Gas Emissions

The No Project Alternative would not include the new objectives and policies associated with the EPCA Element described above would not be certified. Development would continue under the No Project Alternative consistent with the City's adopted General Plan land use plan, and without guidance provided by the EPCA Element. Therefore, impacts related to GHG would remain significant and unavoidable, and would be greater than the project.

i. Hazards and Hazardous Materials

Future development under the No Project Alternative would not require use of materials that are acutely hazardous, and use of common hazardous materials in small quantities would not represent a significant hazard to the public or environment. Project construction would adhere to typical Best Management Practices regarding the use of hazardous materials, such as proper labeling and storage, removal of materials once completed, and offsite vehicle maintenance. Compliance with the Certified Union Program Agency for Orange County (PPP HAZ-1) would ensure that projects would identify and remediate any known hazardous materials sites. Future residential development within the John Wayne Airport safety zones, as well as the 70 CNEL, 65 CNEL, and 60 CNEL John Wayne Airport noise contours would be subject to the land use restrictions for each of the compatibility zones, which provide development limitations to minimize potential incidents of off-airport accidents to persons and property on the ground. Future development would be located within existing developed areas and along major transportation corridors in the City that would allow for evacuation and response. Future development would also be designed consistent with all applicable safety requirements and would not physically interfere with any emergency response or evacuation plans, including the LHMP. Future development would also implement an Emergency Access Plan that would maintain emergency access to all properties within the project limits and the surrounding vicinity. All new development and redevelopment adjacent to a CAL FIRE designated fire hazard severity zone would be required to prepare a fuel modification plan and adhere to other fire protection requirements before approval of tentative maps and grading permits, per City Standard Condition 2.19 Open Space Fuel Modification (PPP HAZ-7) and Standard Condition 3.14 HOA/Fuel Modification (PPP HAZ-8). Therefore, impacts associated with hazards would be less than significant, and less than the project.

j. Hydrology and Water Quality

The No Project Alternative would not include relevant new General Plan policies that would further reduce impacts related to hydrology and water quality. To minimize potential water quality impacts during construction, future development under the No Project Alternative would be required to comply with the statewide Construction General Permit (PPP HYD-1). Future projects would also be required to comply with the City Grading Code (PPP HYD-10), and the City Grading Manual (PPP HYD-HYD-12). Adherence to the following PPPs would require implementation and compliance with existing water quality control plans and sustainable groundwater management plans as conditions of approval for future development associated with the project: PPP-HYD-1, PPP-HYD-2, PPP-HYD-3, PPP-HYD-4, PPP-HYD-5, PPP-HYD-7, PPP-HYD-8, PPP-HYD-9, PPP-HYD-11, PPP-HYD-12, PPP-HYD-13, PPP-HYD-15, PPP-HYD-16, PPP-HYD-17, and PPP-HYD-20. Future development under the No Project Alternative would be subject to the regulatory requirements described above for the project, including the City's National Pollutant Discharge Elimination System (NPDES) Permit, Municipal Code, Standard Conditions and Grading Manual, and would be required to prepare WQMPs per PPP-HYD-16, described in further detail in Section 4.8.6.1 above, to identify Best Management Practices (BMPs) directed at pollution reduction and the maintenance of on-site drainage patterns. Additionally, future development under the No Project Alternative would also adhere to the joint NPDES permit from the Santa Ana RWQCB. Therefore, impacts associated with hydrology and water quality would be less than significant, less than the project.

k. Mineral Resources

Irvine currently has no known gas, oil, or geothermal fields. However, the Department of Conservation estimates there are 24 oil and gas wells in Irvine, with all but three existing as capped and abandoned. The remaining wells are currently inactive. Furthermore, the majority of the City is urbanized and cannot be used for mineral resource extraction. Substantial amounts of the undeveloped land within the City are preserved under the Orange County Natural Community Conservation Plan/Habitat Conservation Plan, which would preclude mineral resource extraction. Undeveloped land that is not preserved is in proximity to existing residential and commercial uses, which also would preclude mineral resource extraction. Therefore, no impacts to mineral resources would occur. Therefore, no impacts related to mineral resources would occur, the same as the project.

l. Land Use and Planning

Development would continue under the No Project Alternative consistent with the City's adopted General Plan. However, the new objectives and policies associated with the General Plan Update described above would not be certified. As such, the No Project Alternative would result in a land use inconsistency between the City's adopted Housing Element and the existing General Plan, Zoning Ordinance, and Zoning Map. This inconsistency would also result in inconsistencies with state housing laws requiring local agencies to implement the necessary land use tools to accommodate their fair-share RHNA requirements. Furthermore, future development under the project would not benefit from the policies and land use planning direction that would increase connectivity and utilize proximity-based planning that would foster social interactions and community engagement. Therefore, impacts related to land use would be significant and unavoidable and would be greater than the project.

m. Noise

The No Project Alternative would not include goals and policies associated with the Noise Element Update and would not be certified. Development would continue under the No Project Alternative consistent with the City's adopted General Plan land use plan and would result in increases in ambient noise and vibration levels that exceed applicable standards. Therefore, impacts related to noise and vibration would remain significant and unavoidable at this program level of review, less than the project.

n. Population and Housing

Residential development would continue under the No Project Alternative, consistent with the City's adopted General Plan land use plan. Future development under the No Project Alternative would be in areas that are already served by infrastructure, and therefore would not induce population growth. The No Project Alternative would not displace substantial number of people or housing. Therefore, impacts associated with inducing unplanned population and housing growth and displacement of people and housing would be less than significant, less than the project.

o. Public Services and Recreation

Future site-specific development under the No Project Alternative would not directly result in sufficient demand to require construction of new fire protection, police protection, school, library, or park and recreation facilities, since each incremental housing development would pay its fair share toward anticipated facility needs. Pursuant to California Government Code Section 65995, applicants for future projects under the No Project Alternative would be continue to be required to pay developer fees to the appropriate school districts at the time building permits are issued; payment of the adopted fees would provide full and complete mitigation of school impacts. Per AB 2626 and SB 50, school districts may impose a fee in conjunction with the construction of new commercial or residential buildings and for those projects that are adding square footage to an existing commercial or residential building. Future development under the No Project Alternative would also be subject to the requirements of the Quimby Act and the fee schedule established by the City for the payment of development impact fees to support the provision of new recreational facilities and the rehabilitation of existing neighborhood parks or recreational facilities. Therefore, impacts associated with public services and recreation would be less than significant, less than the project.

p. Transportation

The No Project Alternative would not include the new objectives and policies associated with the Circulation Element Update and would not be certified. Although the Circulation Element Update would not be certified, future development under the No Project Alternative would be subject to the City's existing regulatory requirements.

Buildout of the City's Existing General Plan would require a 17.0 percent reduction in VMT to meet the significance threshold, while the project requires a 3.5 percent reduction in VMT needed to meet the significance threshold under the project. This is because the No Project Alternative would not introduce the housing overlays that would allow for increased residential development necessary to meet the City's RHNA allocation, and therefore would not reduce the jobs/housing imbalance that exists in the City.

The No Project Alternative could meet the VMT threshold with the implementation of a combination of on-site infrastructure improvements (2.5 percent) and on-site TDM programs (5 percent), which could provide an overall 7.5 percent reduction in VMT in certain areas of the City where a TDM program exists or could be introduced as part of a development agreement. However, no specific projects have been identified at this time, and it is not possible to ensure that every future project could fully mitigate potentially significant impacts. Future development under the No Project Alternative would be subject to existing City mitigation measures to incorporate on-site connectivity into site design to achieve a reduction of 2.5 percent VMT rate and incorporate a TDM program to achieve a reduction of up to 5 percent VMT rate if applicable. However, as no specific projects have been identified at this time, it is not possible to ensure that every future project could fully mitigate potentially significant impacts. Therefore, impacts related to VMT would remain significant and unavoidable under the No Project Alternative and would be greater than the project.

q. Utilities and Service System

Adequate water, wastewater, and solid waste capacity exists to accommodate future growth within the City. Since the No Project Alternative would generate less development than the project, water, wastewater, and solid waste capacity would exist to serve this alternative. The No Project Alternative would also consume less electrical power, natural gas, and telecommunications services that the project. Future development under the No Project Alternative would be subject to existing City requirements to comply with the Title 24 Code Cycles: Net-Zero Buildings (Residential & Non-Residential) (PPP 14-2) and the Irvine Sustainability Community Initiative (PPP 14-3) to reduce energy consumption. Therefore, impacts associated with utilities and services would be less than significant, less than the project.

r. Wildfire

Future development under the No Project Alternative would be designed, constructed, and maintained in accordance with applicable standards associated with the LHMP, EOP, and Emergency Access Plan. New development and redevelopment under the No Project Alternative would also need to consider water supply, access, building ignition and fire resistance, fire protection systems and equipment, defensible space, and vegetation management, and demonstrate consistency with the requirements of California Building Code Chapter 7A, the International Wildland-Urban Interface Code, and the City Municipal Code. Therefore, impacts associated with wildfire would be less than significant, and less than the project.

7.2.1.3 Conclusion Regarding the No Project Alternative

As described in Section 7.2.1.2 above, the No Project Alternative would not identify additional residential sites necessary to meet the City's RHNA allocation, and thereby would result in development of fewer residential units. The No Project Alternative would not include necessary improvements within the Great Park or the extension of Ada roadway. Development would continue under the No Project Alternative consistent with the City's adopted General Plan land use plan. Therefore, impacts associated with aesthetics, agricultural and forestry resources, biological resources, energy, geology and soils, hazards and hazardous materials, hydrology and water quality, population and housing, public services and recreation, utilities and services, and wildfire would be less than significant, the same as the project, but the intensity of those impacts would be less than the project due to development of fewer residential units. Impacts associated with historic resources, paleontological resources, and noise would remain significant and unavoidable, the same as the project, but the intensity of those impacts would be less than the project due to development of fewer residential units. Impacts associated with air quality, GHG, and transportation would be significant and unavoidable, the same as the project, but the intensity of those impacts would be greater than the project. This is because the No Project Alternative would not introduce the housing overlays that would allow for increased residential development necessary to meet the City's RHNA allocation, and therefore would not reduce the jobs/housing imbalance that exists in the City resulting in greater vehicle miles traveled and associated air quality and GHG emissions. In the absence of adopting the General Plan Update prepared under the project, this alternative would not implement State Housing Law requirements and would not implement the updates of the general plan elements. Therefore, impacts associated with land use would be significant and unavoidable,

greater than the project. This alternative would not satisfy the project objectives stated in Chapter 3.0, Project Description, because buildout of the No Project Alternative would not provide enough residential units to meet the City's RHNA allocation, would not satisfy legislative mandates to implement State Housing Law requirements, would not enhance development or provide development opportunities within the three focus areas, would not include improvements to the Great Park, and would not extend the Ada roadway.

7.2.2 Reduced Project Alternative

7.2.2.1 Description of the Reduced Project Alternative

The City has developed a Reduced Project Alternative that would accommodate the City's RHNA requirement and implement the 2021-2029 Housing Element utilizing a smaller number of residential sites. Compared to the 57,656 units proposed under the project, the Reduced Project Alternative would only propose 42,637 residential units, a difference of 15,019 units. Similar to the project, the Reduced Project Alternative would also include the 2,261 unbuilt units already in the General Plan. While the number of residential units proposed under the Reduced Project Alternative would be less than the project, this alternative would still exceed the City's RHNA allocation of 23,610 units, and therefore would be consistent with applicable housing statute, including no-net loss and affirmatively furthering fair housing requirements. The proposed number of residential units within Focus Area 3 would remain unchanged under the Reduced Project Alternative. However, the Reduced Project Alternative would decrease the number of proposed residential units within Focus Area 1 from 15,000 units to 11,242 units and in Focus Area 2 from 26,607 units to 19,811 units. Table 3-2 in Chapter 3.0 presents the distribution of proposed residential units within various PAs throughout the City under the Reduced Project Alternative.

In addition to the RHNA residential component, the Reduced Project Alternative includes additional non-residential land uses in the Irvine Great Park (Great Park). Phase 1 of the Great Park Framework Plan is in the baseline (no build condition) and the remaining land uses supporting the buildout of the Great Park Framework are included as part of the Reduced Project Alternative. Phase 2 (or the remaining buildout of the Great Park) includes the following: a botanical garden, a veteran's memorial garden, a library, a discovery center, two museums, a 65-acre central park area, an accessory restaurant use, three aquatic center pools, an aquatic stadium, an all-wheel park, and pickleball courts.

The Reduced Project Alternative would also include the extension of the Ada roadway from its current terminus in the parking lot of the Irvine train station south of the SCRRA railroad tracks to extend north under the railroad tracks to meet the future Marine Way extension north of the railroad tracks. The Ada roadway extension between the Irvine train station and Marine Way provides multi-modal connectivity to support the residential uses.

7.2.2.2 Environmental Analysis of the Reduced Project Alternative

a. Aesthetics

Like the project, development under this alternative would be subject to relevant portions of the California Building Code, the City's Municipal Code, Zoning Ordinance, Standard Conditions, and relevant General Plan policies that serve to protect visual resources (PPPs AES-1 through AES-8), including those related to (but not limited to) building height limitations under Federal Aviation Administration (FAA) regulations, landscaping, and design standards. Future development under this alternative would also be required to comply with Municipal Code standards related to light and glare, which requires that outdoor lighting be directed downward and away from adjoining properties and public rights-of-way. Therefore, impacts related to aesthetics under the Reduced Project Alternative would be less than significant and would be less than the project.

b. Agricultural and Forestry Resources

Small amounts of land are classified as Prime Farmland, Unique Farmland, and Farmland of Statewide of Importance (generally located in the northern portion of City and in areas near the Great Park-Planning Area 51), some of which are in active agricultural cultivation. Most of these areas are surrounded by undeveloped land and are not contemplated for development under the Reduced Project Alternative. Furthermore, agricultural uses near the Great Park exist as interim uses due to their adjacency to the former MCAS El Toro air base, which historically limited development on these properties due to potential conflicts with flight paths and air space in these areas. Since the closure of MCAS El Toro, the adopted Housing Element (which would be implemented by the Reduced Project Alternative) identified a potential housing site on a parcel within the Great Park area that is currently occupied by agricultural uses.

It is important to note that the Reduced Project Alternative itself would not contemplate any confirmed development projects on agricultural sites, including those identified in the adopted Housing Element, but rather would allow for residential uses on nonresidential sites through a new Residential and Residential Mixed-Use Overlay. The overlay would retain all existing land use and zoning designations/classifications on properties throughout the City (refer to Chapter 3.0, Project Description, for more details). Should future projects facilitated by approval of the Reduced Project Alternative occur on existing agricultural sites, site-specific evaluations would be required in compliance with the CEQA to determine project-specific impacts to agricultural lands.

There is no forest land within the City, and the City does not possess any zoning classifications for forestland, timberland, or timberland production zones. Similarly, there are no lands protected by a Williamson Act Contract within the City. Therefore, impacts related to agricultural and forestry resources under the Reduced Project Alternative would be less than significant and would be less than the project.

c. Air Quality

The reduced amount of development under this alternative would be subject to the objectives and policies associated with the EPCA Element aimed at improving air quality. Although mitigation would

be required to reduce construction emissions (AQ-1), operational emissions (AQ-2), and reduce exposure of sensitive receptors to TACs (AQ-3), no specific projects have been identified at this time, and it is not possible to ensure that every future project could fully mitigate potentially significant impacts. Furthermore, the Reduced Project Alternative would develop less housing in the City, and therefore would not reduce the jobs/housing imbalance that exists in the City to the same degree as the project, and therefore would generate greater vehicle emissions than the project. Therefore, impacts related to air quality would remain significant and unavoidable at this program level of review and would be greater than the project.

d. Biological Resources

Future development under the Reduced Project Alternative would be required to demonstrate compliance with Section 404 of the CWA (PPP BIO-1), Section 401 of the CWA (PPP BIO-2), Section 1600 of the California Fish and Game Code (PPP BIO-3), and the Orange County NCCP/HCP (PPP BIO-5) and California Endangered Species Act (CESA) (PPP BIO-6). Future site-specific development under the Reduced Project Alternative would be required to implement mitigation measures BIO-1 through BIO-10, which would require project-specific biological assessments and jurisdictional delineations for projects meeting specific requirements and would require future projects affecting such resources to obtain all necessary authorizations from respective resource agencies. Furthermore, overall habitat impacts would be slightly reduced because the Reduced Project Alternative would not allow for as much development compared to the project. Compliance with goals, objectives, and policies in the updated Conservation and Open Space Element would further the City's goals of reducing impacts to biological resources. Therefore, impacts related to biological resources under the Reduced Project Alternative would be mitigated to a less than significant level and would be slightly reduced compared to the project.

e. Cultural and Tribal Cultural Resources

Overall impacts would be slightly reduced because the Reduced Project Alternative would not allow for as much development compared to the project. Future development under the Reduced Project Alternative, where required, would conduct tribal consultation under Assembly Bill 52 to avoid impacts to tribal cultural resources. Future projects would also continue to be required to comply with City regulations (including Standard Conditions) aimed at reducing impacts to cultural and tribal cultural resources and would also be required to implement mitigation measure CUL-2 to reduce potentially significant impacts to cultural and tribal and cultural resources, similar to the project. Mitigation measure CUL-2 would require that, at the discretion of the City of Irvine Director of Community Development, or designee, acting in a similar capacity, applicants for future proposed ground disturbing projects to either (1) provide a technical cultural resources assessment consisting of a record search, survey, background context and project specific recommendations performed by a qualified archaeologist meeting Secretary of the Interior Standards and certified by the County of Orange or (2) agree to full-time monitoring by an archaeologist and a designated representative from the tribe/ group(s) who is culturally linked to the site. Additionally, the City's updated Conservation and Open Space Element includes Goal 4, which aims to maintain historical resources as part of the City's land use pattern. Compliance with this goal would further support the City's goal of considering and preserving historic, archaeological, cultural, and tribal cultural resources. The Reduced Project Alternative would implement mitigation measure CUL-1, which would reduce

impacts on historic resources. However, as no specific development projects have been identified at this time, it is not possible to ensure that every future project could fully mitigate potentially significant impacts on historic resources. Therefore, impacts to historic resources would remain significant and unavoidable at this program level of review, and would be slightly reduced compared to the project.

f. Energy

Overall, the No Reduced Alternative would develop fewer residential uses, and thereby consume less energy. Construction under the Reduced Project Alternative would be required to meet would meet California Air Resources Board (CARB) Tier 3 In-Use Off-Road Diesel Engine Standards Future development would be subject to compliance with the California Building Code (CBC; Title 24), which seeks to reduce excessive and inefficient energy use. The CBC is regularly updated and includes higher energy-efficiency standards in comparison to other states. Individual development projects in the City would be required to comply with applicable federal, state, and local energy and building regulations. Future development would also be required to install electric vehicle charging infrastructure in accordance with 2022 California Green Building Standards Code (CALGreen) mandatory requirements, at a minimum. Therefore, impacts related to energy would be less than significant, and would be less than the project.

g. Geology and Soils

F Future site-specific development under the Reduced Project Alternative would be subject to the requirements related to the City's Building Code (PPP GEO-4), Grading Code (PPP GEO-5), Grading Manual (PPP GEO-6), and Standard Condition 2.6 Site Specific Geotechnical Study (PPP GEO-8), which would ensure that structures would be designed with the geologic hazards in mind to reduce risks associated with strong seismic ground shaking, seismic-related ground failure, and other geologic hazards such as liquefaction, landslide lateral spreading, subsidence, and expansive soils to a level less than significant. Post-construction erosion resulting from increased runoff would also generally be avoided or reduced through site design and hydromodification control BMPs as required per PPP-HYD-3, PPP-HYD-5, PPP-HYD-10, PPP-HYD-12, and PPP-HYD-16. Projects would also be required to adhere to the City's Municipal Code (PPP-HYD-10, PPP-HYD-11), Standard Conditions (PPP-HYD-14, PPP-HYD-15), Grading Manual (PPP-HYD-12), to reduce operational impacts associated with erosion. Implementation of the mitigation measure GEO-1 would potentially reduce impacts on paleontological resources. However, as no specific development projects have been identified at this time, it is not possible to ensure that every future project could fully mitigate potentially significant impacts. Therefore, impacts to paleontological resources would remain significant and unavoidable, and would be less than the project.

h. Greenhouse Gas Emissions

The reduced amount of development under this alternative would be subject to the objectives and policies associated with the Land Use and EPCA Elements. Although mitigation requiring identification of potential measures that would reduce GHG emissions below the applicable South Coast Air Quality Management District (SCAQMD) thresholds (mitigation measure GHG-1) would be feasible under the Reduced Project Alternative, no specific projects have been identified at this time,

and it is not possible to ensure that every future project could fully mitigate potentially significant impacts. Furthermore, the Reduced Project Alternative would develop less housing in the City, and therefore would not reduce the jobs/housing imbalance that exists in the City to the same degree as the project, and therefore would generate greater vehicle emissions than the project. Therefore, impacts related to GHG would remain significant and unavoidable at this program level of review and would be greater than the project.

i. Hazards and Hazardous Materials

Future site-specific development under the Reduced Project Alternative would be subject to the regulatory requirements described above for the project, which would ensure projects would remediate existing hazardous contamination before construction can commence. Compliance with the Certified Union Program Agency for Orange County (PPP HAZ-1) would ensure that projects would identify and remediate any known hazardous materials sites. Future development under the Reduced Project Alternative would be located within existing developed areas and along major transportation corridors in the City that would allow for evacuation and response. Future development under the Reduced Project Alternative would also be designed consistent with all applicable safety requirements, would implement an Emergency Access Plan, and would not physically interfere with any emergency response or evacuation plans. Future development under the Reduced Project Alternative would not be located within the segment of Focus Area 3 designated as a Very High fire severity zone, and any development near this area would be required to prepare a fuel modification plan and adhere to other fire protection requirements before approval of tentative maps and grading permits, per City Standard Condition 2.19 Open Space Fuel Modification (PPP HAZ-7) and Standard Condition 3.14 HOA/Fuel Modification (PPP HAZ-8). Furthermore, compliance with the updated Safety Element would further support the City's goal of minimizing land use conflicts and hazards associated with hazardous materials, emergencies, and hazardous sites. Therefore, impacts associated with hazards would be less than significant, less than the project.

j. Hydrology and Water Quality

To minimize potential water quality impacts during construction, future development would be required to comply with the statewide Construction General Permit (PPP HYD-1). Future projects would also be required to comply with the City Grading Code (PPP HYD-10), and the City Grading Manual (PPP HYD-HYD-12). Adherence to the following PPPs would require implementation and compliance with existing water quality control plans and sustainable groundwater management plans as conditions of approval for future development associated with the project: PPP-HYD-1, PPP-HYD-2, PPP-HYD-3, PPP-HYD-4, PPP-HYD-5, PPP-HYD-7, PPP-HYD-8, PPP-HYD-9, PPP-HYD-11, PPP-HYD-12, PPP-HYD-13, PPP-HYD-15, PPP-HYD-16, PPP-HYD-17, and PPP-HYD-20. Future site-specific development under the Reduced Project Alternative would be subject to the regulatory requirements described above for the project, including the City's Municipal Permit, Municipal Code, Standard Conditions and Grading Manual, and would be required to prepare Water Quality Management Plans (WQMPs) per PPP-HYD-16 to identify Best Management Practices (BMPs) directed at pollution reduction and the maintenance of on-site drainage patterns. Additionally, future development under the Reduced Project Alternative would also adhere to the joint NPDES permit from the Santa Ana Regional Water Quality Control Board (RWQCB). Therefore, impacts associated with hydrology and water quality would be less than significant, less than the project.

k. Land Use and Planning

The reduced amount of development under this alternative would occur within infill sites (primarily in the three focus areas) and would be subject to the objectives and policies associated with the Land Use Element Update and the City regulatory requirements pertaining to land use. Development would simply occur at less densities. As such, the reduced Project Alternative would also not result in the physical division of established communities. Approval of the Reduce Project Alternative would include the same land use plan amendments to the City's General Plan, Zoning Ordinance, Zoning Map, and Local Coastal Program that are also required for the project. Furthermore, all future development resulting from implementation of the project would be required to comply with all existing land use plans and policies. Additionally, future projects would be required to comply with mitigation measures BIO-1 through BIO-10 to reduce potential conflicts with the NCCP/HCP. As such, the Reduced Project Alternative would also not result in inconsistencies with adopted plans regulating land use in the City. Therefore, impacts related to land use would be mitigated to a level less than significant, less than the project.

l. Mineral Resources

Irvine currently has no known gas, oil, or geothermal fields. However, the Department of Conservation estimates there are 24 oil and gas wells in Irvine, with all but three existing as capped and abandoned. The remaining wells are currently inactive. Furthermore, the majority of the City is urbanized and cannot be used for mineral resource extraction. Substantial amounts of the undeveloped land within the City are preserved under the Orange County Natural Community Conservation Plan/Habitat Conservation Plan, which would preclude mineral resource extraction. Undeveloped land that is not preserved is in proximity to existing residential and commercial uses, which also would preclude mineral resource extraction. Therefore, no impacts to mineral resources would occur. Therefore, no impacts related to mineral resources would occur, the same as the project.

m. Noise

The reduced amount of development under this alternative would be subject to the goals and policies associated with the Noise Element Update described above. Under the Reduced Project Alternative, off-site traffic noise level impacts will exceed noise level increase thresholds along 129 segments which is less than the 147 impacted segments under the project. Construction related noise impacts under the Reduced Project Alternative would be similar compared to the project. Similarly, the Reduced Project Alternative would not develop any vibration generating uses, and future development near John Wayne Airport would be subject to the noise requirements of the Airport Land Use Plan, Noise Element Update policies, and associated FAA requirements. Future development under the Reduced Project Alternative would be subject to mitigation measures NOI-1 through NOI-4 related to ambient noise and mitigation measures NOI-5 and NOI-6 related to vibration developed for the project. Impacts related to ambient noise increases associated with railroads, stationary sources, and construction would be mitigated to a level less than significant. Although the Reduced Project Alternative would develop fewer residential units and generate less vehicle traffic, impacts related to increases in ambient traffic noise would remain significant and unavoidable. Similarly, impacts associated with railroad vibration would be mitigated to a level less

than significant, but impacts associated with construction vibration would remain significant and unavoidable. Therefore, impacts associated with noise and vibration would remain significant and unavoidable at this program level of review and would be less than the project.

n. Population and Housing

Because the housing assessment in the RHNA is determined by the Southern California Association of Governments (SCAG), future development under the Reduced Project Alternative would accommodate increases in population based on SCAG's demographic projections. Therefore, future housing developed under the Reduced Project Alternative would provide housing necessary to meet the City's RHNA allocation of 23,610 units, as well as accommodate future population growth and housing needs projected in SCAG's growth projections. Additionally, the Reduced Project Alternative would reduce the City's existing jobs/housing imbalance. Future development under the Reduced Project Alternative would primarily be in developed areas that are already served by infrastructure. Given these conditions and the City's existing development and housing occupancy patterns, it is not anticipated that future housing development facilitated by the Reduced Project Alternative would induce unplanned population growth directly or indirectly through extension of roads or other infrastructure or otherwise.

Although some people may be displaced by a future site-specific redevelopment project, buildout of the Reduced Project Alternative would provide an overall expansion of housing opportunities and would be required to comply with all laws and regulations related to the displacement of tenants including Government Code §§ 66300 et seq. Furthermore, the Reduced Project Alternative would exceed the state RHNA allocations assigned to the City, providing a buffer in all income categories. This exceedance of the City's RHNA allocation would provide additional housing that would accommodate residents displaced by future redevelopment projects, ensuring no net loss of housing, and that displaced residents would be able to find replacement housing. Therefore, displacement of people associated with implementation of the Reduced Project Alternative would be temporary. Additionally, the City's Inclusionary Housing Ordinance, as contained in Chapter 2-3 of the Zoning Ordinance, would be considered in the analysis of a future site-specific development that consists of 50 residential units or more to ensure adequate and accessible affordable housing. The Inclusionary Housing Ordinance requires a minimum of 15 percent of the total units that are constructed to be affordable units, providing an expansion of housing opportunities. Therefore, impacts associated with population and housing would be less than significant and would be less than the project.

o. Public Services and Recreation

Future site-specific development under the Reduced Project Alternative would not directly result in sufficient demand to require construction of new fire protection, police protection, school, library, or park and recreation facilities, since each incremental housing development would pay its fair share toward anticipated facility needs. Although this alternative would reduce the potential for development of approximately 15,019 residential units, the Reduced Project Alternative would still potentially meet the City's RHNA allocation. Similar to the project, under the Reduced Project Alternative, the existing and projected deficit in population-based parks and recreation facilities would remain upon implementation of the project. However, future development would occur

incrementally through 2045, based on market conditions and other factors, such that parks are not overburdened at any given time. As such, there would not be a sudden increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated. Pursuant to California Government Code Section 65995, applicants shall pay developer fees to the appropriate school districts at the time building permits are issued; payment of the adopted fees would provide full and complete mitigation of school impacts. Per AB 2626 and SB 50, school districts may impose a fee in conjunction with the construction of new commercial or residential buildings and for those projects that are adding square footage to an existing commercial or residential building. Future development under the project would also be subject to the requirements of the Quimby Act and the fee schedule established by the City for the payment of development impact fees to support the provision of new recreational facilities and the rehabilitation of existing neighborhood parks or recreational facilities. Therefore, impacts associated with public services and recreation would be less than significant, and less than the project.

p. Transportation

The City has also developed a Reduced Project Alternative that would accommodate the City's RHNA requirement and implement the 2021-2029 Housing Element utilizing a smaller number of residential sites but would include the same amount of nonresidential development within the Great Park and the extension of Ada roadway. However, compared to the 57,656 units proposed under the project, the Reduced Project Alternative would only propose 42,639 residential units, a difference of 15,017 units. However, the 42,639 residential units proposed under the Reduced Project Alternative would exceed the City's RHNA allocation of 23,610 units, and therefore would be consistent with applicable housing statute, including no-net loss and affirmatively furthering fair housing requirements. The proposed number of residential units within Focus Area 3 would remain unchanged under the Reduced Project Alternative. However, the Reduced Project Alternative would decrease the number of proposed residential units within Focus Area 1 from 15,000 units to 11,242 units and in Focus Area 2 from 26,607 to 19,811.

Development under this alternative would be subject to the objectives and policies associated with the updated Circulation Element and the City regulatory requirements described above. The Vehicle Miles Travelled (VMT) Traffic Study prepared for the project included an evaluation of the Reduced Project Alternative compared to the project. Table 7-2 presents a comparison of VMT generated under the Reduced Project Alternative to the project. As shown in Table 7-2, the Reduced Project Alternative would require a 6.7 percent reduction in VMT to meet the significance threshold, which is greater than the 3.5 percent reduction in VMT needed to meet the significance threshold under the project. This is because the Reduced Project Alternative would develop less housing in the City, and therefore would not reduce the jobs/housing imbalance that exists in the City to the same degree as the project. Future development under the Reduced Project Alternative would be subject to mitigation measures to incorporate on-site connectivity into site design to achieve a reduction of 2.5 percent VMT rate (TRA-1) and incorporate a TDM program to achieve a reduction of up to 5 percent VMT rate (TRA-2). However, as no specific projects have been identified at this time, it is not possible to ensure that every future project could fully mitigate potentially significant impacts. Therefore, impacts related to VMT would remain significant and unavoidable at this program level of review, greater than the project.

Table 7-2 VMT Analysis Results Comparison of the Reduced Project Alternative to the Project							
Scenario	Total VMT (miles)	Total Population	Total Employees	Service Population	VMT Per Service Population	VMT Per Service Rate Above Threshold	Percent VMT Reduction Needed
Reduced Project Alternative	21,008,186	477,019	337,910	814,929	25.78	1.72	.36.7
Project	21,337,558	517,654	337,910	855,564	24.94	0.88	3.5
SOURCE: Appendix H.							

q. Utilities and Service System

Adequate water, wastewater, and solid waste capacity exists to accommodate future growth within the City. Since the Reduced Project Alternative would develop fewer residential uses than the project, water, wastewater, and solid waste capacity would exist to serve this alternative. The Reduced Project Alternative would also consume less electrical power, natural gas, and telecommunications services that the project. Future development under the Reduced Project Alternative would be subject to existing City requirements to comply with the Title 24 Code Cycles: Net-Zero Buildings (Residential & Non-Residential) (PPP 14-2) and the Irvine Sustainability Community Initiative (PPP 14-3) to reduce energy consumption. Therefore, impacts associated with utilities and services would be less than significant, less than the project.

s. Wildfire

The reduced amount of development under this alternative would be designed, constructed, and maintained in accordance with applicable standards associated with the Safety Element Update, Local Hazard Mitigation Plan (LHMP), Emergency Operations Plan (EOP), and Emergency Access Plan. New development and redevelopment under the Reduced Project Alternative would also need to consider water supply, access, building ignition and fire resistance, fire protection systems and equipment, defensible space, and vegetation management, and demonstrate consistency with the requirements of California Building Code Chapter 7A, the International Wildland-Urban Interface Code, and the City Municipal Code. Furthermore, the updated Safety Element includes goals, objectives, and policies addressing wildfires that would further support the City's goals of addressing wildfire events. Therefore, impacts associated with wildfire would be less than significant and less than the project.

7.2.2.3 Conclusion Regarding the Reduced Project Alternative

As described in Section 7.2.2.2 above, the Reduced Project Alternative would result in the same significance conclusions as the project, but the intensity of the impacts would be different. Impacts associated with aesthetics, agricultural and forestry resources, energy, geology and soils, hazards and hazardous materials, hydrology and water quality, population and housing, public services and recreation, utilities and services, and wildfire would be less than significant, the same as the project,

but the intensity of those impacts would be less than the project due to development of fewer residential units. Impacts associated with biological resources and land use would be mitigated to a level less than significant, the same as the project, but the intensity of those impacts would be less than the project due to development of fewer residential units. Impacts associated with historic resources, paleontological resources, and noise would be mitigated but remain significant and unavoidable, the same as the project, but the intensity of those impacts would be less than the project due to development of fewer residential units. Impacts associated with air quality, greenhouse gases (GHGs), and transportation would be significant and unavoidable, the same as the project, but the intensity of those impacts would be greater than the project. This is because the Reduced Project Alternative would develop less housing in the City, and therefore would not reduce the jobs/housing imbalance that exists in the City to the same degree as the project, resulting in greater vehicle miles traveled and associated air quality and GHG emissions.

7.3 Environmentally Superior Alternative

CEQA Guidelines Section 15126.6(e)(2) requires an EIR to identify the environmentally superior alternative. If the No Project Alternative is the environmentally superior alternative, the EIR must identify an environmentally superior alternative from the other alternatives. The project itself may not be identified as the environmentally superior alternative. The no project alternative is the superior alternative due to a lower cumulative impact on the environment than is expected for the proposed project and the Reduced Project Alternative.

The Reduced Project Alternative would be the environmentally superior alternative, other than the No Project Alternative, because it would incrementally reduce significant impacts associated with aesthetics, biological resources, cultural and tribal cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use, noise, population and housing, public services and recreation, utilities and services, and wildfire compared to the project. However, none of the potentially significant impacts of the project would be completely avoided.

Compared to the 57,656 units proposed under the project, the Reduced Project Alternative would only propose 42,637 residential units, a difference of 15,019 units. While the number of residential units proposed under the Reduced Project Alternative would be less than the project, this alternative would still exceed the City's RHNA allocation of 23,610 units, and therefore would be consistent with applicable housing statute, including no-net loss and affirmatively furthering fair housing requirements. Therefore, the Reduced Project Alternative would meet all the project's objectives.

Chapter 9.0
List of Preparers

This document has been completed by the City of Irvine's (City) Community Development Department and is based on independent analysis and determinations made pursuant to California Environmental Quality Act.

A list of contributing City and consultant staff members, their titles, and affiliations is provided below.

City of Irvine

- Eric Tolles-Interim Director of Community Development
- Marika Poynter, Manager of Planning Services, Community Development Department
- Sun-Sun Murillo, Transportation Planning Manager, Community Development Department
- Alyssa Matheus, Principal Planner, Community Development Department
- Tiffany Lin, Senior Planner, Community Development Department
- Justin Equina, Senior Planner, Community Development Department
- Claudia Landeras-Sobaih, Deputy Building Official, Community Development Department
- Bryan Choi, Senior Plan Check Engineer, Community Development Department
- Tom Polson, Senior Plan Check Engineer, Community Development Department
- Vu Tran, Senior Civil Engineer, Project Delivery and Sustainability
- Thomas Lo, Water Quality Administrator, Community Development Department
- Keri Bullock, Neighborhood Services Administrator, Community Development Department
- Stephanie Takigawa, Senior Housing Analyst, Community Development Department
- Lisa Thai, Supervising Transportation Analyst, Community Development Department
- Ali Banava, Senior Transportation Analyst, Community Development Department
- Wendy Wang, Senior Transportation Analyst, Community Development Department
- Corey Lakin, Deputy Director of Community Services, Community Services
- Robert Simmons, Emergency Management Administrator, Public Safety
- Mike Davis, Transit and Transportation Administrator, Public Works and Transportation
- Casey Gnatt, Open Space Administrator, Public Works and Transportation
- Kathleen Haton, Senior Planner, Project Delivery and Sustainability
- Selene Lawrence, Administrator, Project Delivery and Sustainability

Rutan and Tucker (City Counsel)

- Jeffery Melchin, Partner, Government and Regulatory team (City Attorney)
- Jennifer Farrell Partner, Government and Regulatory team
- Jessica Sanders, Associate, Government and Regulatory team

RECON Environmental, Inc.

Environmental Analysis and Report Preparation

- Jennifer Campos, Principal
- Nick Larkin, Project Manager, Senior Environmental Analyst
- Annie Lee, AICP, Associate Environmental Planner
- Morgan Weintraub, Associate Environmental Planner
- Amy DeNinno, Environmental Analyst
- Wendy Loeffler, Senior Project Manager/Biologist
- Beth Procsal, Senior Biologist
- Carmen Zepeda-Herman, Archaeology Project Director
- Jesse Fleming, Senior Noise, Air, and GHG Technical Specialist
- Frank McDermott, GIS Manager/Coordinator
- Benjamin Arp, GIS Specialist
- Stacey Higgins, Senior Production Specialist
- Jennifer Gutierrez, Production Specialist

Urban Crossroads, Inc.

Air Quality and Noise Modeling

- William Maddux, Senior Noise Technical Specialist
- Haseeb Qureshi, Senior Air Quality Technical Specialist

NOP and Comment Letters

NOTICE OF PREPARATION

Program Environmental Impact Report

Irvine 2045 Focused General Plan Update

Date: July 21, 2023

To: Reviewing Agencies, Interested Parties, and Organizations

Subject: Notice of Preparation of a Program Environmental Impact Report for the Irvine 2045 General Plan Update

Scoping Meeting: Tuesday, August 1, 2023 at 6:00 p.m.
Virtual meeting accessible at the following link:
https://us06web.zoom.us/j/85141324890?pwd=eWdCN2NQaURTN21Vd245VmRHWE8zZz09
Passcode: 085026

Comment Period: July 21, 2023 to August 21, 2023

The City of Irvine (City) is preparing the 2045 Focused General Plan Update (project) that will serve as the long-range vision of the City for the next 20 to 25 years. The City as the lead agency has determined that the project will require the preparation of a Program Environmental Impact Report (Program EIR) in compliance with the California Environmental Quality Act (CEQA; California Public Resources Code, Section 21000 et seq.), and Title 14 of the California Code of Regulations (CCR; hereafter CEQA Guidelines, 14 CCR 15000 et seq.). The City has prepared this Notice of Preparation (NOP) in accordance with CEQA Guidelines Sections 15082(a) and 15375.

We need to know your views or the views of your agency or organization as to the scope and content of the environmental information that is germane to your agency's statutory responsibilities in connection with the project. If applicable, your agency will need to use the Program EIR prepared by our agency when considering your permit(s) or other approval(s) for the project. The project description, location, and the potential environmental effects are contained in the attached materials. Since the City has determined that a Program EIR is required for the project, pursuant to Section 15060(d) of the CEQA Guidelines (14 CCR 15000 et seq.), preparation of an Initial Study is not required and, therefore, one has not been prepared. Due to time limits mandated by state law, your response to this NOP must be submitted at the earliest possible date but no later than the close of the NOP review period, which runs as follows: July 21, 2023 to August 21, 2023. Written comments should be addressed to:

Marika Poynter
City of Irvine
1 Civic Center Plaza
Irvine, CA 92606-5207
mpoynter@cityofirvine.org

Project Title: Irvine 2045 Focused General Plan Update

Project Applicant: City of Irvine

PROJECT SETTING

The City and its sphere of influence (SOI) encompass over 66 square miles located within the coastal and foothill region of central Orange County. Irvine is adjacent to the cities of Newport Beach, Lake Forest, Tustin, Santa Ana, Laguna Hills, Laguna Woods, and Laguna Beach. The City is a growing community with an increasing need for housing to accommodate its population. According to the California Department of Finance (DOF), the City has a total population of 303,051 (including 16,432 living in group quarters), which represents a 43 percent increase since 2010 and a 112 percent increase since 2000. The City of Irvine is the second largest jurisdiction in the County of Orange.

PROJECT DESCRIPTION

With the adoption of the certified 2021-2029 Housing Element in May 2022, the City is required to update the appropriate elements of the General Plan to accommodate the residential site inventory from the 2021-2029 Housing Element. This includes updates to the land use element and the circulation element. Additionally, the City would update the open space element, safety element, and noise element to address statutory requirements. The City would introduce an environmental protection and climate action element and would also incorporate health and wellness throughout the updated General Plan. The project would provide long-term policy direction and communicate the vision, values, and goals for the City's physical development and overall quality of life. The project would serve to identify areas of opportunity and provide options to enhance development in key focus areas of the City.

Consistent with the 2021-2029 Housing Element, the project would update the General Plan land use element to support the City's Regional Housing Needs Assessment (RHNA) of 23,610 units. To ensure consistency with housing statute, including no-net loss and affirmatively furthering fair housing requirements, the 2021-2029 Housing Element identified adequate sites to accommodate 57,656 new residential units. The City's existing General Plan has a significant amount of unbuilt non-residential square footage available throughout the planning areas identified in the 2021-2029 Housing Element site inventory that would be available to convert to residential at a rate of 60 percent. This results in a residential equivalent of 23,113 units. Additionally, there are a remaining 4,249 units entitled throughout the City in the General Plan. As a result, the City would need to add an additional 30,294 new units to the General Plan. Specifically, to accommodate the City's RHNA requirement for new residential units, the project would implement 2021-

2029 Housing Element through the introduction of additional residential and/or mixed-use development throughout the City using overlay zones and/or specific plans to allow greater flexibility for property owners and developers. The overlays would promote higher density residential and mixed use in three main focus areas, targeted retail centers, conversion of hotel/motel, and on religious and school sites. The majority of the future residential growth would occur in the three main focus areas that are most suited for new growth and development as they are located near existing job centers, are along major travel corridors with access to existing and future public transit opportunities. Descriptions of these three key focus areas with the majority of the future residential potential are presented below:

- Focus Area 1 – Greater Irvine Business Complex Area: Planning Area 36 (Irvine Business Complex) and Planning Area 19 (Rancho San Joaquin) : Focus Area 1 includes expanding a residential and/or mixed-use overlay to the entire Irvine Business Complex (IBC) and the specific sites identified in the 2021-2029 Housing Element site inventory located in Rancho San Joaquin. Over the past 20 years, the IBC has transitioned from predominantly non-residential uses to a mixed-use area that is currently governed by the 2007 IBC Vision Plan. Under the existing General Plan, the IBC has a maximum of 15,000 units. The IBC continues to be one of the two employment centers located within the City and remains an opportunity area for high density residential. The IBC is connected to the Tustin Transportation Center (Metrolink and OCTA transit service) through the iShuttle and has direct access to Interstate 405, State Route 73, and State Route 55. The project proposes a new residential overlay and/or specific plan that would increase the total number of residential permitted in the Greater Irvine Business Complex Area by an additional 15,000 units.

- Focus Area 2 - Greater Spectrum Area: Planning Area 13 (Irvine Spectrum 4), Planning Area 31 (Irvine Spectrum 6), Planning Area 32 (Irvine Spectrum 3), and Planning Area 33 (Irvine Spectrum Center): The Greater Spectrum Area incorporates three non-residential planning areas (13, 31, and 32) that are located adjacent to the Irvine Spectrum Center area, are emerging employment centers, are located near the Irvine Transportation Center (ITC – Metrolink, Amtrak, and OCTA transit service), and with the introduction of a residential overlay and/or specific plan could transition to a network of micro-villages or residential nodes, connected by a variety of multi-modal and complete street strategies that provide new opportunities for residents and businesses in Irvine. The project proposes a new residential overlay and/or specific plan that would introduce a total number of 20,000 residential units to the Greater Spectrum Area.

- Focus Area 3 – Great Park Neighborhood Transit Village: Planning Area 51 (Great Park Neighborhood): The Great Park Neighborhood is an existing mixed-use planning area that features a mix of residential products at varying densities surrounding the Irvine Great Park. There are approximately 1,900 units remaining in the existing General Plan intensity, but a significant amount of the planning area remains vacant with no additional residential intensity. The project would increase

the number of residential units permitted in the Great Park with a focus on higher density product located near or adjacent to the ITC. The Great Park Neighborhood Transit Village area would have direct access to Focus Area 2, the Greater Spectrum Area through a network of proposed multi-modal improvements. The project would increase the residential intensity in Planning Area 51 by an additional 13,989 residential units.

The remaining units required by the City's RHNA assessment would be accommodated outside of the aforementioned focus areas, throughout the City, using the same residential overlays and/or specific plans. The project would encourage a micro-village approach, building upon the City's current approach to master planning in the City of Irvine. Utilizing a micro-village approach to planning would ensure that future development is balanced with a mix of uses including neighborhood supporting square footage, open space, and non-residential square footage that are connected through multi-modal transportation and complete street strategies. Figure 1 presents the boundaries of the three focus areas.

PROBABLE ENVIRONMENTAL EFFECTS

The City has determined that a Program EIR will be prepared for the project. Section 15168 of the CEQA Guidelines states that a Program EIR may be prepared on a series of actions that can be characterized as one large project and are related either: (1) geographically; (2) as logical parts in the chain of contemplated actions; (3) in connection with issuance of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program; (4) as individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar environmental effects that can be mitigated in similar ways.

The Program EIR will be prepared in accordance with the requirements of CEQA Statute and Guidelines, as amended. Pursuant to Section 15146 of the CEQA Guidelines, the degree of specificity in the Program EIR will correspond to the degree of specificity involved in the project. The Program EIR will focus on the primary effects that can be expected to follow from adoption of the project and would allow future development in the three specific focus areas to move forward with streamlined environmental review. Specific development or construction projects within the three focus areas may be required to prepare subsequent site-specific analysis as required by the Program EIR, including traffic and/or access related studies. Based on the preliminary analysis of the project, the following environmental impact categories and their associated impact thresholds will be examined in the Program EIR: Aesthetics, Agricultural/Forest Resources, Air Quality, Biological Resources, Cultural Resources, Energy, Geology and Soils, Greenhouse Gas Emissions, Hazard/Hazardous Materials, Hydrology/Water Quality, Land Use/Planning, Mineral Resources, Noise, Population/Housing, Public Services, Recreation, Transportation, Tribal Cultural Resources, Utilities/Service Systems, and Wildfire.

The Draft Program EIR will address the short- and long-term effects of the project on the environment. A mitigation framework will be proposed for impacts that are determined to

be significant. A mitigation monitoring program will also be developed as required by Section 15100 of the CEQA Guidelines.

SCOPING MEETING

Pursuant to Section 21083.9(a)(2) of CEQA (California Public Resources Code, Section 21000 et seq.), scoping meetings are required for projects that may have statewide, regional, or area-wide environmental impacts. The City has determined that this project meets this threshold. A public scoping meeting has been scheduled and will be held by the City on Tuesday, August 1, 2023 at 6:00 p.m. The meeting will be virtual and can be accessed at the link provided above. Verbal and written comments regarding the scope of the proposed Program EIR will be accepted at the meeting. Written comments can also be mailed to the above-mentioned address, addressed to Marika Poynter, before the close of the NOP public comment period.

Please contact Marika Poynter at mpoynter@cityofirvine.org with any questions regarding this notice or the scoping meeting.

Subject: Notice of Preparation of a Program EIR for the Irvine 2045 General Plan Update

Dear Ms. Poynter:

Thank you for the opportunity to provide comments on the Notice of Preparation (NOP) of a Program EIR for the Irvine 2045 General Plan Update. In the context of the Airport Environs Land Use Plan for John Wayne Airport *(AELUP for JWA)*, the Airport Land Use Commission for Orange County (ALUC) offers the following comments and requests consideration of these comments as you proceed with your DEIR and General Plan Update.

The City of Irvine is located within the AELUP Notification Area for JWA. The DEIR and General Plan should address height restrictions and imaginary surfaces by discussing Federal Aviation Administration (FAA) Federal Aviation Regulation (FAR) Part 77 as the criteria for determining height restrictions for projects located within the airport planning area. To ensure the safe operation of aircraft activity at JWA, structures anywhere in the JWA airport planning area should not exceed the applicable elevations defined in FAR Part 77 (Objects Affecting Navigable Air Space). The General Plan should include height policy language and a mitigation measure in the DEIR that states that no buildings will be allowed to penetrate the FAR Part 77 imaginary surfaces for JWA to ensure the protection of its airspace.

Development proposals within the City, which include the construction or alteration of structures more than 200 feet above ground level, require filing with the FAA and Airport Land Use Commission (ALUC) notification. Projects meeting this threshold must comply with procedures provided by Federal and State law, and with all conditions of approval imposed or recommended by FAA and ALUC including filing a Notice of Proposed Construction or Alteration (FAA Form 7460-1). Depending on the maximum building heights that will be allowed within the General Plan, the City may wish to consider a mitigation and condition of approval specifying this 200 feet above ground level height threshold. In addition, any project that penetrates the Notification Surface for JWA is required to file FAA Form 7460-1.

Portions of the City of Irvine fall within the 60 and 65 dB CNEL noise contours for JWA including sections of the Irvine Business Complex (Planning Area 36) located to the north and west of the Airport. ALUC does not support residential uses within the 65 dB CNEL contour. In

accordance with the *AELUP for JWA* Section 3.2.3, all residential units within the 65 dB CNEL contour are inconsistent in this area unless it can be shown conclusively that such units are sufficiently sound attenuated for present and projected noise exposure so as not to exceed an interior standard of 45 dB CNEL.

As for residential development within the 60 dB CNEL contour, the ALUC may not find residential units incompatible in this area but would strongly recommend that residential units be limited or excluded from this area unless sufficiently sound attenuated not to exceed an interior level of 45 db. Because of the IBC proximity to airport noise, any prospective resident should be notified of the presence of aircraft overflight. We recommend that the DEIR include reference to where in the City's General Plan or Zoning Code this notification requirement can be found.

Portions of the City of Irvine are located within Safety Zones 2, 3, 4 and 6, and the primary approach corridor for JWA. The DEIR and General Plan should include a discussion of how to minimize locating residential and other noise-sensitive uses within these Safety Zones.

We also recommend that the DEIR and the General Plan Update identify if the development of heliports will be allowed within your jurisdiction. Should the development of heliports occur within your jurisdiction, proposals to develop new heliports may be submitted through the City to the ALUC for review and action pursuant to Public Utilities Code Section 21661.5. Proposed heliport projects must comply fully with the state permit procedure provided by law and with all conditions of approval imposed or recommended by FAA, by the ALUC for Orange County and by Caltrans/Division of Aeronautics.

To address consistency with the *AELUP for Heliports* we suggest adding the following language to your General Plan Update and inclusion as a mitigation measure in the DEIR:

> "The City will ensure that development proposals including the construction or operation of a heliport or helistop comply fully with permit procedures under State law, including referral of the project to the ALUC by the applicant, and with all conditions of approval imposed or recommended by the Federal Aviation Administration (FAA), ALUC, and Caltrans, including the filing of a Form 7480-1 (Notice of Landing Area Proposal) with the FAA. This requirement shall be in addition to all other City development requirements."

Section 21676 of the PUC requires that prior to the adoption or amendment of a general plan or specific plan, or the adoption or approval of a zoning ordinance or building regulation within the planning boundary established by the Airport Land Use Commission pursuant to Section 21675, the local agency shall first refer the proposed action to the ALUC. We recommend that the City include policy in its General Plan and a mitigation measure in the DEIR that states that the City shall refer projects to the Airport Land Use Commission (ALUC) for Orange County as required by Section 21676 of the California Public Utilities Code to determine consistency of projects with the *AELUP for JWA.*

With respect to submittals, please note that the Commission requests that referrals be submitted - to the ALUC for a determination between the Planning Commission and City Council hearings. Since the ALUC meets on the third Thursday afternoon of each month, complete submittals must be received in the ALUC office by the first of the month to ensure sufficient time for review, analysis, and agendizing. A General Plan submittal form is available at:

https://www.ocair.com/about/administration/airport-governance/commissions/airport-land-use-commission/

A separate form should be used for each element of the General Plan that is being amended. Thank you for the opportunity to comment on this Notice of Preparation. Please contact Julie Fitch at (949) 252-5284 or via email at jfitch@ocair.com with any questions.

Sincerely,

Lea U. Choum

CAUTION: EXTERNAL EMAIL

Dear Marika Poynter,

The California Geological Survey (CGS) has received the Notice of Preparation of a Program Environmental Impact Report (Program EIR) for the Irvine 2045 General Plan Update. This email conveys the following recommendations from CGS concerning geologic issues related to the project area:

1. Liquefaction and Landslide Hazards

The project area encompasses earthquake zones of required investigation (ZORI) for liquefaction and landslides mapped by CGS. CGS has published Earthquake Zones of Required
Investigation Maps (EZRIM) for liquefaction and landsliding covering the Tustin, Lake Forest, and Laguna Beach quadrangles, all of which affect the City of Irvine and the project area. The Program EIR and supporting documents should address this hazard as it relates to project development.
The combined extent of these EZRIM can be viewed here:
https://maps.conservation.ca.gov/cgs/EQZApp/app/
Individual Seismic Hazard Zone Reports, EZRIM, and associated GIS data are available for download here:
https://maps.conservation.ca.gov/cgs/informationwarehouse/index.html?map=regulatorymaps

CGS suggests the hazard and the zones of required investigation for liquefaction and landsliding be shown and discussed in the Program EIR.

2. Ground Shaking Hazards

The project area is not located in an Earthquake Fault Zone mapped by CGS. However, several active faults are nearby, and the site could be subject to significant ground shaking. The Program EIR and supporting documents should address this hazard as it relates to the project development. Additional information about ground shaking hazard can be obtained at the following sites: https://usgs.maps.arcgis.com/apps/webappviewer/index.html?id=14d2f75c7c4f4619936dac0d14e1e468
https://earthquake.usgs.gov/scenarios/catalog/bssc2014/

If you have any additional comments or questions, please feel free to call or email.

Thank you,
Judy Zachariasen

Subject: Response to Notice of Preparation, Program Environmental Impact Report, Irvine 2045 Focused General Plan Update

Dear Ms. Poynter:

Thank you for the opportunity to provide comments on the scope for the upcoming Program Draft Environmental Impact Report (EIR) for the 2045 Focused General Plan Update (Project). The Irvine Unified School District (District) welcomes the opportunity to review the Draft EIR for potential environmental impacts on its schools and to work collaboratively with the City to maintain the District's reputation for high quality education.

It is our understanding that the General Plan update is required following the adoption of the 2021-2029 Housing Element in May 2022. Moreover, the City plans to update the land use, circulation, open space, safety, and noise elements to add 30,294 residential units to the Genal Plan. To accomplish this, the City will establish "overlay zones" and/or specific plans to allow greater flexibility for property owners and developers. The overlays would promote higher density residential and mixed use in three (3) main focus areas, targeted retail centers, conversion of hotel/motel, and on religious and school sites. The majority of the future residential growth would occur in the following three (3) main focus areas:

- **Focus Area 1 – Greater Irvine Business Complex Area: Planning Area 36 (Irvine Business Complex) and Planning Area 19 (Rancho San Joaquin)**

  The Project entails a new overlay or specific plan to increase the total number of residential units by 15,000.

- **Focus Area 2 – Greater Spectrum Area: Planning Area 13 (Irvine Spectrum 4), Planning Area 31 (Irvine Spectrum 6), Planning Area 32 (Irvine Spectrum 3), and Planning Area 33 (Irvine Spectrum Center)**

  The Project would create a new overlay or specific plan to allow a total of 20,000 residential units within the Greater Spectrum Area. The increase in units is not identified.

- **Focus Area 3 Great Park Neighborhood Transit Village: Planning Area 51 (Great Park Neighborhood)**

  The Project would increase the number of residential units allowed by 13,989.

BOARD OF EDUCATION
PAUL BOKOTA / LAUREN BROOKS / JEFF KIM / KATIE MCEWEN / CYRIL YU
TERRY L. WALKER, *Superintendent of Schools*
JOHN FOGARTY, *Assistant Superintendent, Business Services* / BRIANNE FORD, *Assistant Superintendent, Information Technology*
EAMONN O'DONOVAN, *Assistant Superintendent, Human Resources* / CASSIE PARHAM, *Assistant Superintendent, Education Services*
IUSD . . . providing the highest quality educational experience we can envision.

IRVINE UNIFIED SCHOOL DISTRICT

In addition, beyond the Focus Areas, the City will address additional units as follows:

- **Remaining Regional Housing Needs Allocation (RHNA) Units**

  The remaining units required by the City's RHNA assessment would be accommodated through overlays and specific plans across the city outside the focus areas. The City plans to target retail centers, conversion of hotels/motels, and religious and school sites.

Comments on the Notice of Preparation

The District's student generation rates for grades K-6, 7-8, and 9-12 are presented in Table 1. The District requests that the Draft EIR identify the number, type, and location of units anticipated and apply these generation rates to determine the total number of students.

The District requests additional detail on the type of units anticipated, because the number of students generated is largely determined by the type of unit. The Notice of Preparation (NOP) does not provide details on the types of units proposed.

Please clarify the increase in the number of residential units in Focus Area 2. The NOP references 20,000 total units but does not include the increase.

TABLE 1. STUDENT GENERATION RATES

PRODUCT TYPE	K-6	7-8	9-12
High Density Multifamily (IBC)	0.040	0.007	0.017
High Density Multifamily (Spectrum)	0.086	0.016	0.026
Multifamily (Apartments)	0.133	0.038	0.056
Affordable (Apartments)	0.197	0.101	0.176
Single-Family Attached (Condos)	0.263	0.065	0.111
Single-Family Detached (Homes)	0.352	0.090	0.154

In addition to these generation rates, a new State-mandated Pre-Kindergarten (PK) program will be fully implemented in 2025. The District projects that enrollment in the PK program will be 80 to 90 percent of the Kindergarten cohort. The District requests that the Draft EIR include these additional students in its assessment of the Project's impact on school facilities. Note that PK and Kindergarten classes have special room requirements to accommodate young students.

Tables 2, 3, and 4 present the existing 2022-2023 enrollment data and capacities of the District's elementary/K-8, middle, and high schools, respectively. The reported capacities assume every classroom seat is perfectly filled with the correct grade-level student, which is infeasible. To accommodate the ebb and flow of students throughout the year, the District operates with 90 percent of capacity as full capacity. The District requests that the City use 90 percent of seats as full capacity in the analysis of the Project's school facility impacts.

IRVINE UNIFIED SCHOOL DISTRICT

TABLE 2. ELEMENTARY AND K-8 SCHOOL ENROLLMENT AND CAPACITY

SCHOOL	2022-2023 ENROLLMENT	CAPACITY AS # OF SEATS*
Alderwood Elementary and PK	812	905
Beacon Park K-8	1,035	1,061
Bonita Canyon Elementary	404	503
Brywood Elementary	560	599
Cadence Park K-8 and PK	924	1,000
Canyon View Elementary and PK	736	826
College Park Elementary	568	707
Culverdale Elementary and PK	576	783
Cypress Village Elementary and PK	1,057	1,141
Deerfield Elementary and PK	640	660
Eastshore Elementary	534	665
Eastwood and PK	627	697
Greentree Elementary	449	548
Loma Ridge Elementary	676	708
Meadow Park Elementary and PK	602	754
Northwood Elementary	516	676
Oak Creek Elementary	895	937
Plaza Vista K-8	798	975
Portola Springs and PK	886	972
Santiago Hills and PK	546	650
Solis Park Elementary (K-8 in 2024)	429	779
Springbrook Elementary and PK	506	670

University High School	2,165	2,600
Woodbridge High School	2,219	2,600

*Note: Operational capacity runs at 90% of the number of seats available.

The students generated by the addition of 30,294 residential units should be applied to the schools within their attendance areas. Please see Focus Areas 1, 2, and 3 below for the locations of District schools.

- **Focus Area 1**
  - Area Elementary Schools: Culverdale ES, Westpark ES, University Park ES
  - Area Middle Schools: Rancho San Joaquin MS, South Lake MS
  - Area High Schools: University HS, Woodbridge HS

- **Focus Area 2**
  - Area Elementary Schools: Cadence Park K-8, Oak Creek ES
  - Area Middle Schools: Cadence Park K-8, South Lake MS
  - Area High Schools: Portola HS, University HS

- **Focus Area 3**
  - Area Elementary/Middle Schools: Beacon Park K-8, Cadence Park K-8, Solis Park K-8
  - Area High Schools: Portola HS

IRVINE UNIFIED SCHOOL DISTRICT

The analysis of school impacts should identify the Focus Area schools that will reach capacity because of the proposed Project. Each school's impact should be addressed and the District's overall ability to fund all such supporting improvements should be considered including reservation of land for educational facility uses and the land acquisition and construction costs for potential new schools. A lack of sufficient funding may impact various other environmental issues, including the home-to-school travel distances. These issues should be addressed in the Draft EIR.

The NOP states that the City is targeting retail centers, conversion of hotels/motels, and religious and school sites for additional residential development. Please identify the number and type of residential units anticipated outside of the Focus Areas. Please explain how the City plans to target the District's school sites for future housing development.

The District requests that the Draft EIR address potential circulation/pedestrian safety impacts at school sites associated with additional residential development. To the extent that student generation exceeds the capacity of the schools in the Focus Area attendance areas and these students must attend more remote schools, the District requests the Draft EIR address the increase in traffic, vehicle miles traveled (VMT) and greenhouse gas (GHG) emissions.

We welcome the opportunity to work closely with the City throughout the California Environmental Quality Act process and would welcome the opportunity to discuss these issues further.

If you have any questions, please contact me at (949) 936-5305 or kelvinokino@iusd.org.

Sincerely,

Kelvin Okino
Executive Director of Facilities and Construction
Irvine Unified School District

Irvine, CA 92606

August 21, 2023

Re: Response to Notice of Preparation for 2045 General Plan Update Environment Impact Report

PEG Companies and its affiliates (together "PEG") would like to submit for inclusion of the Environmental Impact Study for the 2045 General Plan Update a proposed mixed-use residential and hospitality project located at 18700 McArthur Boulevard ("Project"). The tentative details of the Project are outlined below for your consideration.

PEG is pursuing 800 Class A, highly-amenitized residential units in conjunction with a 150 key high-end select-service hotel. The 6.45 acre site is currently home to the Artium Hotel, which will be completely redeveloped in pursuit of the Project. Congruent with the objectives of Focus Area 1 of the General Plan Update, the Project will provide a significant number of residential units designed to enhance the community fabric of the Irvine Business Complex, provide residential opportunities adjacent to major employers with walkability in mind, and integrate residents into the existing transportation infrastructure. Additionally, the hotel component of the Project will attract and accommodate travelers within walking distance of the John Wayne Airport.

PEG would welcome the opportunity to further discuss the proposed Project in concert with Irvine's Comprehensive Plan Update process.

Sincerely,

Tyler Phelps
Director, Development

Marika A. Poytner
Manager of Planning Services
City of Irvine
1 Civic Center Plaza
Irvine, CA 92606

Re: Notice of Preparation for 2045 General Plan Update Environment Impact Report / 2722 Michelson Drive

Ms. Poytner:

Affiliates of IRA Capital own the approximately 9.35 acre site located at 2722 Michelson Drive on the southwest corner of Jamboree Road and Michelson Drive (APNs 445-102-11 and 445-102-12). By this letter, IRA respectfully requests that the Program Environmental Impact Report for the Irvine 2045 General Plan Update evaluate a mixed-use residential and/or hospitality project at this site consisting of up to one or more of the following:

1. 200 Residential Units per acre (i.e., 1,870 total Residential Units)
2. 500 Key Hotel
3. 200 Senior Housing Units
4. 500,000 SF Office

We believe the property is ideally suited for this level of density given its proximity to the airport, two freeways, as well as existing housing, employment, and commercial centers. We look forward to discussing our vision with City staff at your convenience.

Sincerely,

Daniel Sitz
Managing Director

Project Title: Notice of Preparation Program Environmental Impact Report (PEIR) Irvine 2045 Focused General Plan Update

Project Applicant: City of Irvine

Dear Ms. Poynter:

My name is Anne Whitehair, and I am writing to you as a representative and Board member of the California Cultural Resources Preservation Alliance, Inc. (CCRPA). CCRPA is a 501 (c) 3 non-profit organization with a mission to protect and preserve cultural resources such as sacred sites, archaeological sites, historical sites, and Traditional Cultural Places in Southern California, with a focus on Orange and Los Angeles Counties.

Thank you for the opportunity to comment on the Notice of Preparation of a Draft Environmental Impact Report for the proposed Irvine 2045 Focused General Plan Update. We believe that the project areas identified in the Notice are culturally sensitive and may contain archaeological sites. In particular, Focus Area 3 in the Great Park is geographically close to known areas of pre-historic tribal activity by the Acjachemen People in the Tomato Springs area near present-day Portola Springs Community Center.

We concur with your decision to examine multiple environmental impact categories in the Program EIR, particularly the categories of Cultural Resources and Tribal Cultural Resources. We look forward to the opportunity to review the Draft Program EIR and the proposed mitigation framework and monitoring programs when they are available.

Sincerely,

Anne R. Whitehair, MA
Bioarchaeology
Board Member and Secretary
California Cultural Resources Preservation Alliance, Inc.

CAUTION: EXTERNAL EMAIL

Ms. Poynter:

I'm a 10 year resident of Stonegate Village near the Great Park. I'm writing in response to the Notice of Preparation of a Program Environmental Impact Report for the Irvine 2045 General Plan.

The concept of building almost 14,000 additional units in the Great Park is unrealistic given the lack of infrastructure to support them. The Woodbury Town Center is already seriously overcrowded because the Great Park does not have a locally available retail center. The Spectrum doesn't provide basic shopping needs for groceries, pharmacy, banking, etc. That's evident when it's hard to find parking in Woodbury on evenings and weekends. People prefer convenient neighborhood access that isn't always crowded. Irvine was built as a collection of self-contained villages, but the Great Park doesn't conform to that model.

Traffic is already heavy on Sand Canyon, especially during morning, mid afternoon, and evening rush times. The supposed timing of the lights hasn't significantly improved traffic flow. The reduction of one lane as you get closer to the 5 freeway makes the situation worse. It can take 15 minutes or more to drive the 4 miles from Crean High School to the 5 Freeway junction on Sand Canyon. Adding 14,000 units plus the 15,000 seat amphitheater and other planned amenities will severely impact traffic, and local residents.

I'm strongly opposed to the 2045 General Plan as currently proposed. Please consider common sense neighborhood consequences from intensive and excessive building. The vicinity around the Great Park can not absorb a dense urban plan in a suburban environment.

Concerned Resident,

Michele Jacknik

CAUTION: EXTERNAL EMAIL

Dear Ms. Poyneter,
My name is Larry Lin and I am a Stonegate home owner at 55 Cummings.
I came across a new proposal by city of Irvine's 2045 development plan that called for nearly 14,000 units in the Great Park. Not to mentioned the upcoming development of houses at the corner of Portola Parkway and Jeffrey up on the hill.
I can hardly imagine the impact on local streets this new development would bring about. With the Woodbury town center is already like a flee market with all the excessive residents coming this way to shop. We could not even find a parking place at the center Saturday morning when all grocery shoppers gushed out to the center. Other amenities like the planned 15,000 seat amphitheater will only add to magnitude of the problem.
I plead for the review and revisit of the proposal as an Irvine law abiding tax paying resident that the city of Irvine not to made the already deteriorating quality of living even worst.

Re: Input on General Plan Updates

Dear Tim Gehrich and Staff Planners,

We are writing to weigh in on forthcoming General Plan updates in the City of Irvine to address climate resilience locally and regionally, with particular focus on the need to incorporate wildlife connectivity as a vital part of the City vision going forward.

As you know, In 2013, the City, FivePoint, and nonprofit partners achieved an important milestone - establishing a portion of the Irvine Wildlife Corridor at the Great Park. However, the Irvine Wildlife Corridor is only one segment of the longer Irvine-Laguna Wildlife Corridor (ILWC), spanning an urban landscape and connecting six miles between the Santa Ana Mountains and South Coast Wilderness.

There is State support for connectivity. Governor Newsom's 30 x 30 plan highlights connectivity within statewide guidelines for conservation. The ILWC has now been named as the first priority project for climate resiliency in the Southland region, and is a multi-benefit project that is essential for retaining and enriching the biodiversity and mitigation of the effects of climate change. Additionally, AB 2344 (Safe Roads Bill) directs transportation departments to prioritize connectivity in projects throughout the State.

This General Plan update is a special opportunity for the City to again be on the leading edge of conservation and climate change planning. We hope the City will reflect a robust attention to wildlife connectivity in light of emerging findings about how vital connectivity is to long-term urban sustainability.

We are grateful for the opportunity to participate in this process and look forward to a continued mutually beneficial relationship with the City of Irvine.

Sincerely,

Norm Grossman

APPENDIX B

Irvine General Plan Update Air Quality and Greenhouse Gas Emissions Summary

MEMORANDUM

URBAN | CROSSROADS

DATE: March 12, 2024
TO: Nick Larkin, Recon Environmental, Inc.
FROM: Haseeb Qureshi, Shannon Wong
JOB NO: AQ & GHG Assessment

IRVINE GENERAL PLAN UPDATE AIR QUALITY & GREENHOUSE GAS EMISSIONS SUMMARY

Nick Larkin,

Urban Crossroads, Inc. is pleased to provide the following Air Quality & Greenhouse Gas Emissions Summary for the Irvine General Plan Update (**Project**). The City of Irvine is adjacent to the cities of Newport Beach, Costa Mesa, Orange, Lake Forest, Tustin, Santa Ana, Laguna Hills, Laguna Woods, and Laguna Beach, as well as unincorporated areas of the County. With the adoption of the certified 2021-2029 Housing Element in May 2022, the City is required to update the appropriate elements of the General Plan to accommodate the residential site inventory from the 2021-2029 Housing Element. This includes updates to the land use element and the circulation element. Additionally, the City would update the open space element, safety element, and noise element to address statutory requirements. The City would introduce an environmental protection and climate action element and would also incorporate health and wellness throughout the updated General Plan. The Draft Program EIR will address the short- and long-term effects of the project on the environment.

PROJECT SCENARIOS

The Project Scenarios evaluated in the Air Quality & Greenhouse Gas Emissions Summary are as follows:

- **Current General Plan/No Project** – This scenario represents the currently approved Buildout land uses. Future development includes unbuilt dwelling units and non-residential uses. The Great Park Framework Plan Phase 1 land uses are also included in this scenario. The Current General Plan land uses modeled for this assessment were obtained from Table 3-2 from the *Irvine General Plan Update VMT Study* prepared by Iteris, Inc.

- **Conservative Project Scenario** – This alternative evaluates the Current General Plan plus 57,656 RHNA housing units within the adopted Housing Site Inventory sites. The 57,656 new residential units consist of 55,395 new dwelling units and 2,261 unbuilt units already in the General Plan. For the purpose of evaluating potential effects, 55,395 dwelling units are analyzed under this alternative. Both Phase 1 and Buildout of the Great Park Framework Plan land uses and the extension of Ada from the Irvine Metrolink/Amtrak Station to Marine Way are also included in this scenario. The Conservative Project Scenario land uses modeled for this assessment were obtained from Tables 2-1 and 2-3 from the *Irvine General Plan Update VMT Study* prepared by Iteris, Inc.
- **Cumulative Plus Conservative Project Scenario** – This scenario evaluates the Conservative Project Scenario plus additional cumulative projects that are assumed to be built in the background conditions in both the City of Irvine and in surrounding jurisdictions. Cumulative projects include known future residential development in adjacent Cities. The Cumulative Plus Conservative Project Scenario land uses modeled in this assessment were obtained from Tables 2-1, 2-3, and 2-4 from the *Irvine General Plan Update VMT Study* prepared by Iteris, Inc.

AIR QUALITY EMISSIONS

REGIONAL CONSTRUCTION EMISSIONS SUMMARY

Based on information provided by the City, a worst-case construction scenario for a future development occurring as a result of project implementation is expected to include the development of 1,500 units, with an average size of 670 square-feet (small apartments), on a 15-acre site. The estimated maximum daily construction emissions without mitigation are summarized on Table 1. Detailed construction model outputs are presented in Attachment A.

TABLE 1: OVERALL REGIONAL CONSTRUCTION EMISSIONS SUMMARY

Source	Emissions (lbs/day)[1]					
	VOC	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Summer						
2025	5.10	31.70	76.14	0.06	21.25	11.41
2026	4.82	18.26	72.45	0.06	15.90	4.07

[5] The total maximum daily emissions number may not add up due to rounding.

CO HOTSPOT ANALYSIS

It has long been recognized that CO hotspots are caused by vehicular emissions, primarily when idling at congested intersections. In response, vehicle emissions standards have become increasingly stringent in the last 20 years. Currently, the allowable CO emissions standard in California is a maximum of 3.4 grams/mile for passenger cars (there are requirements for certain vehicles that are more stringent). With the turnover of older vehicles, introduction of cleaner fuels, and implementation of increasingly sophisticated and efficient emissions control technologies, CO concentration in the SCAB is now designated as attainment. To establish a more accurate record of baseline CO concentrations affecting the SCAB a CO "hot spot" analysis was conducted in 2003 by the SCAQMD for four busy intersections in Los Angeles at the peak morning and afternoon time periods. This "hot spot" analysis did not predict any violation of CO standards. Based on the SCAQMD's 2003 AQMP and the 1992 Federal Attainment Plan for Carbon Monoxide (*1992 CO Plan*), peak carbon monoxide concentrations in the SCAB were a result of unusual meteorological and topographical conditions and not a result of traffic volumes and congestion at a particular intersection. Similar considerations are also employed by other Air Districts when evaluating potential CO concentration impacts. More specifically, the Bay Area Air Quality Management District (BAAQMD) concludes that under existing and future vehicle emission rates, a given project would have to increase traffic volumes at a single intersection by more than 44,000 vehicles per hour (vph)—or 24,000 vph where vertical and/or horizontal air does not mix—to generate a significant CO impact. The busiest intersection evaluated was that at Wilshire Boulevard and Veteran Avenue in Los Angeles, which has a daily traffic volume of approximately 100,000 vph and AM/PM traffic volumes of 8,062 vph and 7,719 vph respectively. The *2003 AQMP* estimated that the 1-hour concentration for this intersection was 4.6 ppm; this indicates that, should the daily traffic volume increase four times to 400,000 vehicles per day, CO concentrations (4.6 ppm x 4= 18.4 ppm) would still not likely exceed the most stringent 1-hour CO standard (20.0 ppm). The Level of Service Traffic Study completed for the project determined that roadway segment and intersection volumes under the Cumulative Plus Conservative Project Scenario would not exceed 100,000 average daily trips. Therefore, the Cumulative Plus Conservative Project Scenario would not produce the volume of traffic required to generate a CO "hot spot" either in the context of the 2003 Los Angeles hot spot study or based on representative BAAQMD CO threshold considerations. Therefore, new development adjacent to heavily traveled streets or intersections would not expose sensitive receptors to substantial pollutant concentrations associated with CO hot spots, and impacts would be less than significant.

GREENHOUSE GAS EMISSIONS

CURRENT GENERAL PLAN/NO PROJECT SCENARIO

The estimated greenhouse gas emissions from the Current General Plan/No Project Scenario are summarized on Table 6. Detailed operation model outputs are presented in Attachment B.

TABLE 6: CURRENT GENERAL PLAN GHG EMISSIONS

Source	Emission (MT/year)[6]				
	CO_2	CH_4	N_2O	R	Total CO_2e

CUMULATIVE PLUS CONSERVATIVE/PROPOSED PROJECT SCENARIO

The estimated greenhouse gas emissions from the Cumulative Plus Conservative/Proposed Project Scenario are summarized in Table 8. Detailed operation model outputs are presented in Attachment D.

TABLE 8: CUMULATIVE PLUS CONSERVATIVE/PROPOSED PROJECT SCENARIO GHG EMISSIONS

Source	Emission (MT/year)[8]				
	CO_2	CH_4	N_2O	R	Total CO_2e
Annual construction-related emissions amortized over 30 years	102.34	2.73E-03	5.73E-03	1.27E-01	104.24
Mobile	97,790.77	2.02	2.73	10.94	98,665.00

Total CO_2e (All Sources)	**255,781.80**				

[8] The total CO_2e number may not add up due to rounding.

GREENHOUSE GAS EMISSIONS SUMMARY

The estimated greenhouse gas emissions from all Project Scenarios are summarized in Table 9.

TABLE 9: TOTAL GHG EMISSIONS BY PROJECT SCENARIO

Emission Source	Total CO_2e[9]
Current General Plan/No Project Scenario	2,721,332.67
Current General Plan + Conservative/Proposed Project Scenario	2,926,270.34
Current General Plan + Cumulative + Conservative/Proposed Project Scenario	2,977,114.47

[9] The total CO_2e number may not add up due to rounding.

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

2.2. Construction Emissions by Year, Unmitigated

3. Construction Emissions Details

3.1. Demolition (2025) - Unmitigated

3.3. Site Preparation (2025) - Unmitigated

3.5. Grading (2025) - Unmitigated

3.7. Building Construction (2025) - Unmitigated

3.9. Building Construction (2026) - Unmitigated

3.11. Paving (2026) - Unmitigated

3.13. Architectural Coating (2026) - Unmitigated

4. Operations Emissions Details

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	15937 - Irvine GPU (Construction)
Construction Start Date	6/2/2025
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.50
Precipitation (days)	19.6
Location	33.688397, -117.841364
County	Orange
City	Irvine
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	6804
EDFZ	7
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.21

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Apartments High Rise	1,500	Dwelling Unit	15.0	1,005,000	0.00	—	4,470	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.03	annual days of extreme heat
Extreme Precipitation	3.50	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	1.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—

AQ-Ozone	58.2
AQ-PM	68.7
AQ-DPM	84.2
Drinking Water	53.2
Lead Risk Housing	28.7
Pesticides	11.8
Toxic Releases	91.4
Traffic	88.9
Effect Indicators	—
CleanUp Sites	97.3
Groundwater	99.0
Haz Waste Facilities/Generators	98.4
Impaired Water Bodies	83.0
Solid Waste	97.7
Sensitive Population	—
Asthma	17.0
Cardio-vascular	20.8
Low Birth Weights	54.8
Socioeconomic Factor Indicators	—
Education	49.2
Housing	39.2
Linguistic	59.4
Poverty	55.5
Unemployment	5.57

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	47.45284229
Employed	76.27357885
Median HI	69.01065058
Education	—
Bachelor's or higher	70.42217375
High school enrollment	100
Preschool enrollment	16.21968433
Transportation	—
Auto Access	57.21801617
Active commuting	69.0619787
Social	—
2-parent households	42.17887848
Voting	31.99024766
Neighborhood	—
Alcohol availability	44.80944437
Park access	28.53843193
Retail density	94.63621199
Supermarket access	58.28307455
Tree canopy	29.41100988
Housing	—
Homeownership	19.54317978
Housing habitability	30.20659566
Low-inc homeowner severe housing cost burden	97.88271526
Low-inc renter severe housing cost burden	75.33684075
Uncrowded housing	22.40472219

Health Outcomes	—
Insured adults	50.3143847
Arthritis	98.6
Asthma ER Admissions	82.6
High Blood Pressure	98.8
Cancer (excluding skin)	96.0
Asthma	65.7
Coronary Heart Disease	98.7
Chronic Obstructive Pulmonary Disease	94.6
Diagnosed Diabetes	98.6
Life Expectancy at Birth	99.4
Cognitively Disabled	52.2
Physically Disabled	81.6
Heart Attack ER Admissions	76.4
Mental Health Not Good	58.7
Chronic Kidney Disease	99.0
Obesity	94.5
Pedestrian Injuries	72.5
Physical Health Not Good	93.2
Stroke	98.4
Health Risk Behaviors	—
Binge Drinking	4.3
Current Smoker	42.3
No Leisure Time for Physical Activity	69.0
Climate Change Exposures	—
Wildfire Risk	0.0
SLR Inundation Area	0.0

Children	25.4
Elderly	82.5
English Speaking	49.5
Foreign-born	80.9
Outdoor Workers	61.4
Climate Change Adaptive Capacity	—
Impervious Surface Cover	18.1
Traffic Density	92.8
Traffic Access	65.3
Other Indices	—
Hardship	52.6
Other Decision Support	—
2016 Voting	59.2

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	64.0
Healthy Places Index Score for Project Location (b)	56.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Taken from client data
Construction: Construction Phases	Project start date taken from client data
Construction: Off-Road Equipment	T/L/B replaced with Crawler Tractor to accurately calculate disturbance for Site Preparation and Grading phases. Standard 8 hours work days.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.03	annual days of extreme heat
Extreme Precipitation	3.50	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	1.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2

Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	58.2
AQ-PM	68.7
AQ-DPM	84.2
Drinking Water	53.2
Lead Risk Housing	28.7
Pesticides	11.8
Toxic Releases	91.4
Traffic	88.9
Effect Indicators	—
CleanUp Sites	97.3
Groundwater	99.0

Haz Waste Facilities/Generators	98.4
Impaired Water Bodies	83.0
Solid Waste	97.7
Sensitive Population	—
Asthma	17.0
Cardio-vascular	20.8
Low Birth Weights	54.8
Socioeconomic Factor Indicators	—
Education	49.2
Housing	39.2
Linguistic	59.4
Poverty	55.5
Unemployment	5.57

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	47.45284229
Employed	76.27357885
Median HI	69.01065058
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	64.0
Healthy Places Index Score for Project Location (b)	56.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Operations: Hearths	SCAQMD Rule 445 no wood burning devices. Wood burning devices added to gas devices.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.03	annual days of extreme heat
Extreme Precipitation	3.50	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	1.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A

Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	58.2
AQ-PM	68.7
AQ-DPM	84.2
Drinking Water	53.2
Lead Risk Housing	28.7
Pesticides	11.8
Toxic Releases	91.4
Traffic	88.9
Effect Indicators	—
CleanUp Sites	97.3
Groundwater	99.0
Haz Waste Facilities/Generators	98.4
Impaired Water Bodies	83.0
Solid Waste	97.7
Sensitive Population	—
Asthma	17.0
Cardio-vascular	20.8
Low Birth Weights	54.8
Socioeconomic Factor Indicators	—
Education	49.2
Housing	39.2

Linguistic	59.4
Poverty	55.5
Unemployment	5.57

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	47.45284229
Employed	76.27357885
Median HI	69.01065058
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	64.0
Healthy Places Index Score for Project Location (b)	56.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Operations: Hearths	SCAQMD Rule 445 no wood burning devices. Wood burning devices added to gas devices.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.03	annual days of extreme heat
Extreme Precipitation	3.50	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	1.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score

Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	58.2
AQ-PM	68.7
AQ-DPM	84.2
Drinking Water	53.2
Lead Risk Housing	28.7
Pesticides	11.8
Toxic Releases	91.4
Traffic	88.9
Effect Indicators	—
CleanUp Sites	97.3
Groundwater	99.0
Haz Waste Facilities/Generators	98.4
Impaired Water Bodies	83.0
Solid Waste	97.7
Sensitive Population	—
Asthma	17.0
Cardio-vascular	20.8
Low Birth Weights	54.8
Socioeconomic Factor Indicators	—

Education	49.2
Housing	39.2
Linguistic	59.4
Poverty	55.5
Unemployment	5.57

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	47.45284229
Employed	76.27357885
Median HI	69.01065058
Education	—
Bachelor's or higher	70.42217375

Park access	28.53843193
Retail density	94.63621199

Supermarket access	58.28307455
Tree canopy	29.41100988
Housing	—
Homeownership	19.54317978
Housing habitability	30.20659566
Low-inc homeowner severe housing cost burden	97.88271526
Low-inc renter severe housing cost burden	75.33684075
Uncrowded housing	22.40472219
Health Outcomes	—
Insured adults	50.3143847
Arthritis	98.6
Asthma ER Admissions	82.6
High Blood Pressure	98.8
Cancer (excluding skin)	96.0
Asthma	65.7
Coronary Heart Disease	98.7
Chronic Obstructive Pulmonary Disease	94.6
Diagnosed Diabetes	98.6
Life Expectancy at Birth	99.4
Cognitively Disabled	52.2
Physically Disabled	81.6
Heart Attack ER Admissions	76.4
Mental Health Not Good	58.7
Chronic Kidney Disease	99.0
Obesity	94.5
Pedestrian Injuries	72.5
Physical Health Not Good	93.2

Stroke	98.4
Health Risk Behaviors	—
Binge Drinking	4.3
Current Smoker	42.3
No Leisure Time for Physical Activity	69.0
Climate Change Exposures	—
Wildfire Risk	0.0
SLR Inundation Area	0.0
Children	25.4
Elderly	82.5
English Speaking	49.5
Foreign-born	80.9
Outdoor Workers	61.4
Climate Change Adaptive Capacity	—
Impervious Surface Cover	18.1
Traffic Density	92.8
Traffic Access	65.3
Other Indices	—
Hardship	52.6
Other Decision Support	—
2016 Voting	59.2

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	64.0
Healthy Places Index Score for Project Location (b)	56.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No

Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Operations: Hearths	SCAQMD Rule 445 no wood burning devices. Wood burning devices added to gas devices.

1.0 INTRODUCTION

This Biological Technical Report describes the existing biological conditions within the City of Irvine (City; Figures 1 and 2). The information contained in this report will be used to inform the General Plan Update and Environmental Impact Report (EIR) for the City. Detailed information provided in this report includes regulatory context, existing biological conditions, sensitive biological resources, future opportunities to protect the natural environment, and constraints to development.

2.0 METHODS

Research for this report included a review of current federal, State, and local regulations; aerial imagery; U.S. Geological Survey (USGS) topographic maps; U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) soil survey maps; climate information for the City; and reputable online resources that provide data for the region. In addition, existing biological resource documents for the Natural Community Conservation Plan/Habitat Conservation Plan for the Central and Coastal Subregion of Orange County, California (NCCP/HCP) were also reviewed for pertinent information. Queries were also made of the California Natural Diversity Database (CNDDB) and U.S. Fish and Wildlife Service (USFWS) Listed Species Database to identify known sensitive biological resources in the vicinity of the City.

3.0 EXISTING BIOLOGICAL RESOURCES SETTING

This section describes the regulatory context, existing biological conditions, and sensitive biological resources found within the City.

3.1 REGULATORY CONTEXT

To establish the regulatory context for the City General Plan Update, a variety of federal, State, and local regulations were evaluated to determine if they may be applicable to future proposed projects within the City. In addition, regional land use and management, including established parks, reserves, and linkages were evaluated to provide the regional regulatory framework for the City General Plan Update.

3.1.1 Federal Regulations

Several federal regulations may apply to future projects that are proposed within the City. These include, but are not limited to:

- National Environmental Policy Act
- Federal Endangered Species Act of 1973 (16 United States Code [USC] 1531 *et seq.*)
- Clean Water Act of 1972 (33 USC 1251 *et seq.*)
- Migratory Bird Treaty Act of 1918 (16 USC 703 through 711)
- Bald and Golden Eagle Protection Act (16 USC 668)
- Fish and Wildlife Coordination Act (16 USC 661 *et seq.*)
- Floodplain Management and Protection of Wetlands (42 FR 26961, 52 FR 34617)
- Invasive Species (64 FR 6138)

These federal regulations are described in detail below.

National Environmental Policy Act

The National Environmental Policy Act (NEPA) was passed in 1969 and established a broad national framework for protecting the environment by assuring that all branches of government give proper consideration to the environment prior to undertaking any major federal action that has the potential to significantly affect the environment. NEPA applies to projects undertaken, funded, or requiring the issuance of a permit by a federal agency, including projects associated with airports, buildings, military complexes, highways, parkland purchases, and other federal activities are proposed.

NEPA is administered by the President's Council on Environmental Quality (CEQ), which is supported by a staff of environmental professionals. CEQ's main responsibilities in the NEPA process are to gather information on the conditions and trends in environmental quality, to evaluate federal programs in light of the goals established by NEPA, to develop and promote national policies to improve environmental quality, and to conduct studies, surveys, research, and analyses relating to ecosystems and environmental quality. In addition, federal agencies may involve the California Environmental Quality Act (CEQA) in the NEPA process when there are disagreements concerning the environmental effects of a proposed action.

The federal agency responsible for complying with NEPA is the agency that is proposing to implement the federal action; however, several federal agencies may be involved with the NEPA process based on an agency's expertise and relationship to the proposed action. A federal agency may be a Lead Agency or a Cooperating Agency in the NEPA process.

A Lead Agency is designated when more than one federal agency is involved in a proposed action. The Lead Agency is responsible for supervising the environmental analysis and the preparation of the appropriate environmental document, such as a Categorical Exclusion (CE), Finding of No Significant Impact (FONSI), Environmental Assessment (EA), or Environmental Impact Statement (EIS).

A Cooperating Agency is a federal, State, local, or tribal agency that has jurisdiction over a proposed action or that has special expertise with an environmental issue associated with the proposed action. The Cooperating Agency assists the Lead Agency by participating in the entire NEPA process, including the scoping, environmental analysis, and document preparation.

Any federal lead agency may be a Lead Agency or a Cooperating Agency, depending upon the specifics of the proposed action. However, the Environmental Protection Agency (EPA) has a unique role in the NEPA review process because it is required to review and publicly comment on the environmental impacts of major proposed federal actions, specifically those for which an EIS is required. If the EPA determines that the environmental analysis is unsatisfactory or that the proposed action would have adverse environmental effects, it is required to involve CEQ in the NEPA process.

Federal Endangered Species Act of 1973 (16 United States Code [USC] 1531 *et seq.*)

The Federal Endangered Species Act of 1973 (FESA) was designed to protect critically imperiled plant and wildlife species from extinction by eliminating or reducing the threats to these species and by aiding in the recovery and/or maintenance of the species populations. FESA designates species that are endangered or threatened, as well as species that are candidates for listing and protects these species from unauthorized "take", which is defined as to "harass, harm, pursue, hunt, shoot, wound, kill trap, capture, or collect, or to attempt to engage in any such conduct." FESA also designates critical habitat for federally listed species and protects these species from interference with vital breeding and behavioral activities and from critical habitat degradation.

FESA is administered by the USFWS for freshwater fish and terrestrial wildlife and the National Oceanic and Atmospheric Administration (NOAA) for marine and anadromous species. A person, defined as an "individual, corporation, partnership, trust, association, or any other private entity; or any officer, employee, agent, department, or instrumentality of the Federal Government, of any State, municipality, or political subdivision of a State, or of any foreign government; any State, municipality, or political subdivision of a State; or any other entity subject to the jurisdiction of the United States," is prohibited from taking a listed species until an appropriate permit pursuant to Section 7, 9, and/or 10 of the FESA has been obtained from USFWS and/or NOAA.

Clean Water Act of 1972 (33 USC 1251 *et seq.*)

Sections 404 and 401 of the Clean Water Act of 1972 (CWA) apply to potential impacts to wetlands, Waters of the U.S., and Waters of the State. The EPA administers the CWA; however, some sections of the CWA are administered by other agencies.

Section 404 of the CWA regulates the discharge of dredged or fill material into navigable waters, including both wetlands and other Waters of the U.S. The discharge of dredged or fill material is typically associated with a variety of development projects, agricultural activities, and water resource projects. The U.S. Army Corps of Engineers (Corps) administers Section 404 of the CWA and is responsible for issuing general and individual permits and for making jurisdictional determinations.

Section 401 of the CWA requires a State Water Quality Certification or waiver for any activity requiring a Section 404 permit. The State Water Quality Certification ensures the activity will not violate any established State water quality standards. The State Water Resources Control Board (SWRCB), in conjunction with the nine California Regional Water Quality Control Boards (RWQCBs), administers Section 401 of the CWA and is responsible for issuing permits pursuant to the Section 401 Water Quality Certification Program.

Migratory Bird Treaty Act of 1918 (16 USC 703 through 711)

The Migratory Bird Treaty Act of 1918 (MBTA) implements various conventions and treaties between the United States and Canada, Mexico, Japan, and Russia for the protection of over 800 migratory bird species. Under the MBTA, it is unlawful to "pursue, hunt, take, capture, kill, attempt to take, capture or kill, possess, offer for sale, sell, offer to purchase, purchase, deliver for shipment, ship, cause to be shipped, deliver for transportation, transport, cause to be transported, carry, or cause to be carried by any means whatever, receive for shipment, transportation or carriage, or export, at any time, or in any manner, any migratory bird…or any part, nest, or egg of any such bird" (16 USC 703).

The MBTA is administered by USFWS. Take permits for MBTA species are rarely issued, except for specific actions to aid recovery of a species; however, USFWS establishes hunting seasons for species for which there is a long tradition of hunting, as long as hunting will not adversely impact their population status or long-term conservation. While the MBTA includes approximately 170 species of game birds, hunting is typically authorized for fewer than 60 of these species each year.

Bald and Golden Eagle Protection Act (16 USC 668)

The Bald and Golden Eagle Protection Act (BGEPA) provides protection for both the bald eagle (*Haliaeetus leucocephalus*) and the golden eagle (*Aquila chrysaetos*) by prohibiting the "take" of either of these species, including their parts, nests, or eggs. The MBTA defines "take" as to "pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb" any bald or golden eagle. The BGEPA is administered by the USFWS, and limited take authorizations are granted for qualifying activities. Persons who "take, possess, sell, purchase, barter, offer to sell, purchase or barter, transport, export or import, at any time or any manner, any bald eagle [or any golden eagle], alive or dead, or any part, nest, or egg thereof" without prior approval are subject to criminal penalties.

Fish and Wildlife Coordination Act (16 USC 661 *et seq.*)

The Fish and Wildlife Coordination Act of 1934, as amended, requires coordination with USFWS and CDFW so that these agencies may evaluate impacts to fish and wildlife species that have the potential to result from proposed water resource development projects. Specifically, the Act requires that fish and wildlife species as well as habitats that may support them be given equal consideration to other project features. This Act also requires federal agencies that construct, license, or permit water resource development projects to first coordinate with USFWS and CDFW to determine impacts that may occur to fish and wildlife resources and establish appropriate avoidance, minimization, and/or mitigation measures to reduce these potential impacts.

Floodplain Management and Protection of Wetlands (42 FR 26961, 52 FR 34617)

Executive Order 11990, Protection of Wetlands, as amended, requires federal agencies to minimize the destruction, loss, or degradation of wetlands and to preserve and enhance functions and values of these wetlands while carrying out their responsibilities pertaining to water supply, erosion and flood prevention, maintenance of natural systems, among others.

Invasive Species (64 FR 6138)

Executive Order 13112, Invasive Species, as amended, requires federal agencies to coordinate efforts that prevent the introduction of invasive species (both plant and wildlife species not native to the U.S.), manage existing invasive species, and minimize the economic, ecological, and human health impacts that invasive species cause. This order defines invasive species, requires federal agencies to address invasive species concerns, and prohibits new actions that would cause or promote the introduction of invasive species. To comply with this Order, all enhancement, restoration, and creation activities should use native plants and should include measures to prevent the introduction of invasive species.

3.1.2 State Regulations

Several State regulations may apply to future projects that are proposed within the City. These include, but are not limited to the:

- California Environmental Quality Act
- California Endangered Species Act (Fish and Game Code 2050 *et seq.*)
- California Fish and Game Code
- California Porter-Cologne Water Quality Control Act
- California Natural Community Conservation Planning Program

These State regulations are described in detail below.

California Environmental Quality Act

The CEQA was passed in 1970 as the State counterpart to NEPA to institute a statewide policy of environmental protection. CEQA applies to projects undertaken, funded, or requiring the issuance of a permit by a State or local public agency and requires the project proponent to identify significant environmental impacts as well as avoidance, minimization, and/or mitigation measures to reduce these impacts to below a level of significance.

The CDFW has jurisdiction over the conservation, protection, and management of native habitats, plant species, and wildlife species found within California and is responsible for maintaining sustainable populations of these habitats and species. The CDFW provides biological expertise to review and comment on CEQA documents, including the impacts resulting from proposed project activities and the proposed avoidance, minimization, and mitigation measures associated with these impacts. The CDFW may play various roles in the CEQA process; the CDFW is always a Trustee Agency and may also be a Lead Agency or a Responsible Agency.

The CDFW is one of four trustee agencies, which also include the State Lands Commission, the Department of Parks and Recreation, and the University of California. As a Trustee Agency, the CDFW has jurisdiction over certain resources held in trust for the people of California and is typically required to be notified of CEQA documents that are relevant to its jurisdiction, such as documents for projects involving fish and wildlife resources. As a Trustee Agency, the CDFW cannot approve or disapprove a project; however, the lead and responsible agencies must consult

with the CDFW, and the CDFW reviews the CEQA document(s) and provides recommendations regarding the resources under their jurisdiction (Fish and Game Code Section 1802).

When the CDFW proposes to implement its own project, it is designated as the Lead Agency in the CEQA process and serves as the California government agency with principle responsibility for implementing or approving the proposed project. Such projects typically include projects in state wildlife areas and state fish hatcheries as well as habitat or stream restoration projects. Additionally, the CDFW is the Lead Agency when it is the only agency issuing a permit, as is sometimes the case with Streambed Alteration Agreements. As the Lead Agency for such projects, the CDFW is responsible for preparing the CEQA document and determines whether a Negative Declaration or an EIR is required by CEQA (CEQA Statutes, Sections 21080.3 and 21104.2; Guidelines, Sections 15050 and 15367).

The CDFW is also sometimes designated as a Responsible Agency, which is an agency, other than the Lead Agency, that has the legal responsibility for implementing and approving a proposed project. The CDFW is designated as the Responsible Agency when the Lead Agency requires a 1600 Streambed Alteration Agreement or a 2081(b) California Endangered Species Act Incidental Take Permit for a project. As a Responsible Agency, CDFW actively participates in the CEQA process by reviewing the Lead Agency's CEQA document and using that document to make decisions about the proposed project, to prepare and issue its own findings regarding the project (CEQA Guidelines, Sections 15096 and 15381), and to determine whether or not to issue an incidental take permit.

California Endangered Species Act (CESA; Fish and Game Code 2050 *et seq.*)

The CESA parallels FESA and protects and/or preserves native plant and wildlife species and their habitats, especially those that are threatened with extinction and those that are experiencing significant decline that may lead to a threatened or endangered designation, within the State of California. CESA designates special status species that are protected from unauthorized "take", which is defined as to "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill."

CESA is administered by the CDFW. A State lead agency is required to consult with the CDFW to ensure that a proposed project is not likely to jeopardize the continued existence of a special status species or result in the destruction or adverse modification of essential habitat for a species. CESA allows for the issuance of incidental take permits for lawful development projects and emphasizes the benefits of early consultation between the lead agency and CDFW to avoid potential impacts to special status species and to develop appropriate mitigation measures to reduce impacts to and avoid loss of a special status species.

California Fish and Game Code

Several sections of the California Fish and Game Code, which is administered by the CDFW, also may apply to future projects proposed in the City. These include Section 2081; Sections 1600 through 1616; Sections 1900, et seq.; Sections 2511, 4700, 5050, and 5515; Sections 3503, 3503.5, and 3513; and Title 14, California Code of Regulations, Section 670.2 and 670.6. Each of these sections is discussed in detail below.

Section 2081

Section 2081 of the California Fish and Game Code allows for the issuance of an incidental take permit from CDFW for projects that have the potential to take a special status species, including a State-listed species, as long as the impacts are minimized and fully mitigated and will not jeopardize the continued existence of a State-listed species. The measures required to minimize and fully mitigate impacts must be roughly proportional to the extent of the proposed impact to the species and must be capable of successful implementation while maintaining the applicant's objectives to the greatest extent feasible. The applicant must show that adequate funding is available to implement the required avoidance and mitigation measures and monitor the effectiveness of the mitigation measures.

Sections 1600 through 1616

Sections 1600 through 1616 of the California Fish and Game Code apply to all projects that would 1) substantially divert or obstruct the natural flow of, 2) substantially change or use any material from, or 3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement into the bed, channel, or bank of any river, stream, or lake. Sections 1600 through 1616 require any person, business, public utility, or state or local government agency that proposes any activity within or adjacent to a lake, river, or stream that flows at least intermittently through a bank or channel, including watercourses with a subsurface flow (e.g., ephemeral streams, desert washes) and some flood plains, to notify the regional CDFW office of the proposed activity. CDFW will determine if the proposed activity may substantially adversely affect fish and wildlife resources and if a Streambed Alteration Agreement (SAA) is necessary.

Other Sections

Additional sections of the California Fish and Game Code may apply to future projects proposed in the City, including, but not limited to, Sections 1900 through 1913; Sections 2511, 4700, 5050, and 5515; Sections 3503, 3503.5, and 3513; and Title 14, California Code of Regulations, Section 670.2 and 670.6. Sections 1900 through 1913 provide guidelines to preserve, protect, and enhance endangered or rare native plants within California. Sections 2511, 4700, 5050, and 5515 provide guidelines to protect wildlife species that are designated as "fully protected" by the CDFW and as therefore cannot be harmed, taken, or possessed. Sections 3503, 3503.5, and 3513 state that it is unlawful to take, possess, or destroy the nest or eggs of any bird species except otherwise allowed by the or any regulation made pursuant to the California Fish and Game Code. Section 3503.5 provides protection specifically in the orders Falconiformes (hawks, eagles, and flacons) and Strigiformes (owls), and Section 3513 provides protection specifically for migratory, non-game birds designated by the MBTA. Title 14, California Code of Regulations, Section 670.2 and 670.6 list wildlife species that are designated as California Species of Concern or are State-listed as threatened or endangered species.

California Porter-Cologne Water Quality Control Act

The California Porter-Cologne Water Quality Control Act was enacted in 1969 and is administered by either the SWRCB and/or the RWQCB. This Act provides protection for Waters of the State, which are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state." If a proposed project involves alteration to any Waters of the State, the project proponent must file a Report of Waste Discharge with the appropriate RWQCB to obtain "Waste Discharge Requirements" (WDRs), which serve as the project discharge permit.

California Natural Community Conservation Planning Program

The California Natural Community Conservation Planning (NCCP) program was initiated in 1991 and is administered by CDFW. It is a cooperative effort by the CDFW and numerous public and private partners that takes a broad scale, ecosystem approach to planning for the protection and perpetuation of biological diversity throughout California by protecting both habitats and the species within these habitats while also accommodating compatible land use.

An NCCP plan identifies and provides for the regional protection of plants, wildlife, and their habitats, while allowing compatible and appropriate economic activity in the region. By including key interests in the process and by working with landowners, environmental organizations, and other interested parties, an NCCP plan provides the framework for a local agency to oversee the numerous activities that compose the development of a conservation plan. Within California, there are currently 23 active NCCP plans covering more than 11 million acres, and several draft NCCP plans are pending approval. The City is a signatory to the Implementation Agreement of the NCCP/HCP for the Central and Coastal Subregion of Orange County (R.J. Meade Consulting, Inc. 1996a, 1996b).

Irvine Open Space Initiative

In 1988, Irvine residents approved the "Irvine Open Space Initiative." This initiative created the framework to preserve large, contiguous open space areas for conservation and open space as phased master-planned growth occurred in other areas of the City. This initiative set the stage for the preservation of natural open space resources that are home to a variety of wildlife species and habitats, including special status species. The Irvine Open Space Preserve, as it now is known, protects more than 93,000 acres of land from the "mountains to the sea," linking the Cleveland National Forest, San Joaquin Marsh (San Joaquin Wildlife Sanctuary), Laguna Coast Wilderness Park, and other resources.

The Cleveland National Forest encompasses 460,000 acres and is the southernmost national forest in California located in San Diego, Riverside, and Orange counties. The San Joaquin Wildlife Sanctuary is a 300-acre constructed wetland in the floodplain of San Diego Creek just above its outlet to Upper Newport Bay. The Laguna Coast Wilderness Park encompasses 7,000 acres in the San Joaquin Hills and features some of the last remaining undeveloped coastal canyons in southern California and the only natural lakes in Orange County.

The City has committed to protect and manage the Irvine Open Space Preserve consistent with the NCCP. The City and many other local governments and public and private agencies adopted the NCCP/HCP to cover this area. Of the NCCP/HCP acres in Irvine, 10,587 are designated for the habitat reserve system, and 813 acres are non-reserve lands called special linkages. The special linkages contain biological value that could enhance connectivity between elements of the reserve system. The City is required to implement the NCCP/HCP and review project proposals for consistency with the plan.

3.1.3 Local Regulations

Existing General Plan

Irvine's existing General Plan (City 2015) established a Preservation land use designation to identify lands that contain visually significant ridgelines, biotic communities of high significance, geologic constraints, and cultural resources. This designation covers more than 11,000 acres, or nearly one-quarter of the land mass in the City. The Conservation and Open Space Element identifies goals, objectives, and policies to maintain and preserve these resources.

Key objectives and policies include, but are not limited to, the following:

• Objective L-1: Establish a program to permanently protect and preserve designated conservation and open space areas. Supporting policy addresses implementation of the phased dedication and compensating development program.

• Objective L-2: Maintain and preserve areas with significant, diverse biotic communities. Supporting policies address preservation of natural resource areas identified in the Master Environmental Assessment and development in biotic resource areas.

• Objective L-3: Participate in the NCCP/HCP to accomplish multi-species and multi-habitat conservation. Supporting policies ensure compliance with and implementation of the NCCP, including review of project proposals, payment of mitigation fees, and acquisition.

• Objective L-12: Coordinate land planning efforts with the appropriate federal, State & local agencies and landowners to encourage the integration of existing and future water sources (reservoirs, lakes, and drainage courses) into development.

Municipal Code

In Chapter 8-16 of the Zoning Code, Open Space Management and Conservation Plan (OSMCP), the City requires the preparation of such plans for qualified development projects. The OSMCP shall be utilized as the primary implementation tool for complying with biotic policies identified in biotic resources objectives L-2(a) and L-2(b) of the Conservation and Open Space Element, the timing and phasing of mitigation measures, and the responsibilities for implementation. This plan shall be prepared in conjunction with a concept plan and/or zone change application and in accordance with the City's guidelines for open space management and conservation plan reports. In addition, the plan will address "transition zones" described in the zoning code.

3.2 EXISTING BIOLOGICAL CONDITIONS

3.2.1 Environmental Setting

The City of Irvine lies within the coastal and foothill region of central Orange County, California (Figures 1 and 2).

The average, annual high temperature in the City is 72.7 degrees Fahrenheit. The warmest month, August, averages a high of 83 degrees Fahrenheit. The coolest months, December/January, average a low of 47 degrees Fahrenheit. The City receives average annual precipitation, as rainfall, of 14.42 inches, with most of the rain falling from November through March (U.S. Climate Data 2018).

The City has four major landform areas (Figure 2) that are generally described below.

Santiago Hills

The Santiago Hills consist of moderately steep to steep, unbuildable slopes, canyons, plateaus, and narrow ridges, which reach an elevation of 1,700 feet. Eroded sandstone gorges known as the "sinks" are the most significant physical feature in the southeast corner. Other important features are the canyons—Agua Chinon, Bee, Hicks, Little Joaquin, Rattlesnake, and Round. Santiago Hills have retained most of their natural biotic character; their biotic communities are freshwater marsh, coastal sage scrub, oak woodland, and grassland.

Northern Flatlands

The flatlands extend from the Santiago Hills to the Santa Ana Freeway (Interstate 5). This area is nearly flat, gradually sloping from the northeast to the southwest and traversed by many streams that are part of the San Diego Creek Watershed that originates in the Santiago Hills.

The increased demand for housing and employment in Orange County has resulted in substantial land use changes from agriculture to urban development within the San Diego Creek Watershed. Agricultural uses, which began in the 19th century, already altered the watershed's natural conditions and hydrology, including increased runoff in Newport Bay and channelization of San Diego Creek (Corps 2008b rev. 2009).

The natural biotic communities of the Northern Flatlands have been altered by agricultural activities, except near the perimeters. This area hosts orchards, row crops, eucalyptus windrows, and non-native, ornamental vegetation.

Central Flatlands

The central flatlands are also a portion of the Tustin Plain between Interstate 5 and the San Diego Freeway (Interstate 405). The area is extremely flat and crossed by San Diego Creek and Peters Canyon Wash. The natural biotic communities have, for the most part, been altered by agricultural activities and urban development. The primary biotic communities are farmland/rural and urban, except for the riparian community in Planning Areas 12 and 13.

San Joaquin Hills

The San Joaquin Hills consist of rolling terrain with moderately steep slopes, canyons, narrow ridges, and spectacular rock outcroppings, many of which contain eroded sandstone caves. Wildlife habitats and vegetation types include both rare and common wildlife and plant species. Important habitat for the coastal California gnatcatcher (*Polioptila californica californica*) and coastal cactus wren (*Campylorhynchus brunneicapillus sandiegensis*) is in the northeastern and southeastern corners of the City and unincorporated Orange County.

3.2.2 Topography and Soils

The topography within the City consists generally of flatlands and hills as described above in Section 3.2.1 of this report. Elevations in the City range from approximately 10 to 1,700 feet above mean sea level. Forty-two soil types are mapped by the USDA NRCS within the City as listed in Table 1.

Table 1 SOIL TYPES WITHIN THE CITY	
Name	**Percent Slope**
Alo clay	9-50
Alo variant clay	9-50
Anaheim clay loam	15-75
Anaheim loam	15-50
Balcom-Rock outrock complex	15-50
Balcom clay loam	9-50
Bosanko-Balcom complex	15-50
Bosanko clay	9-50
Botella clay loam	2-15
Botella loam	2-9
Calleguas clay loam	50-75
Capistrano sandy loam	2-15
Chesterton loamy sand	2-30
Chino silty clay loam	NA
Cieneba-Rock outcrop complex	9-75
Cieneba sandy loam	15-75
Corralitos loamy sand	NA
Cropley clay	2-9
Gabino gravelly clay loam	15-50
Marina loamy sand	2-9
Metz loamy sand	NA
Mocho loam	0-9
Mocho sandy loam	0-2
Myford sandy loam	0-30
Omni clay	NA
Omni silt loam	NA
Pits	NA
Riverwash	NA
Rock outcrop-Cieneba complex	30-75
San Andreas sandy loam	15-30
San Emigdio fine sandy loam	0-9

Sorrento loam	0-9
Sorrento sandy loam	0-2
Thapto-Histic Fluvaquents	NA
Tidal Flats	NA
Water	NA
Yorba cobbly sandy loam	9-30
Yorba gravelly sandy loam	2-15

3.2.3 Vegetation and Land Cover Types

Vegetation and land cover types that occur within the City (Figure 3) were identified through the most current (2015) vegetation mapping from the Nature Reserve of Orange County. Based on this information, 17 types occur within the City and include:

- Annual Grassland
- Perennial Grassland
- Annual Grassland/Perennial Grassland
- Coastal Oak Woodland
- Mixed Chaparral
- Coastal Scrub
- Lacustrine
- Riverine
- Barren
- Riverine, Barren
- Estuarine, Lacustrine, Riverine
- Valley Foothill Riparian
- Eucalyptus
- Fresh Emergent Wetland
- Saline Emergent Wetland
- Orchard-Vineyard, Evergreen Orchard, Irrigated Row and Field Crops
- Urban

Each of these types is described in detail below. Because the Nature Reserve of Orange County vegetation map does not include descriptions of the land cover classifications, the descriptions below are based on information obtained from various resources that provide general vegetation community descriptions, including the CDFW Wildlife Habitat Relationships System among others.

In addition, some of these vegetation communities occur in transitional or ecotonal zones within the City (e.g., Estuarine, Lacustrine, Riverine), where one or more of the definitions provided below may apply. To avoid repetition, each is described separately (e.g., Riverine is described once instead of three times for Riverine; Riverine, Barren; and Estuarine, Lacustrine, Riverine).

Annual Grassland

Annual grassland is open grassland composed primarily of annual plant species. The community's structure depends largely on weather patterns and livestock grazing. Dramatic differences in physiognomy, both between seasons and between years, are characteristic of this habitat. Introduced annual grasses are the dominant plant species. These species include wild oats, soft chess, ripgut brome, red brome, wild barley, and foxtail fescue. Common forbs include broadleaf filaree, redstem filaree, turkey mullein, true clovers, bur clover, popcorn flower, and others. California poppy, the State flower, may also be found in this habitat (CDFW Wildlife Habitat Relationships System 2005).

Perennial Grassland

Perennial grassland consists of climax stands of perennial bunchgrasses, such as purple needlegrass, on wetter sites (CDFW Wildlife Habitat Relationships System 2005).

Coast Oak Woodland

Coastal live oak woodland occurs in more mesic areas of coastal California from Sonoma County south into Baja California, Mexico. These woodlands are found within a 50-mile radius of the coast. Fog is common in these areas, and the soils are typically well drained. Although not limited to these areas, coastal live oak woodland is common in ravines and moist drainages between grassy hillsides. The dominant plant species is coast live oak (*Quercus agrifolia*; Cal Poly 2018).

Mixed Chaparral

Mixed Chaparral is a structurally homogeneous community dominated by shrubs with thick, evergreen leaves. Shrub height and crown cover vary considerably with age since last burn, precipitation regime, aspect, and soil type. At maturity, cismontane Mixed Chaparral typically is a dense, nearly impenetrable thicket with greater than 80 percent absolute shrub cover (Hanes 1977).

Coastal Scrub

Coastal scrub is dominated by semi-woody, low- to moderate-sized shrubs with shallow root systems. No single species is typical of all Coastal Scrub stands. Species composition changes with progressively more xeric conditions from north to south along the coast. Species dominance appears to shift from evergreen species in the north to drought-deciduous species in the south (CDFW Wildlife Habitat Relationships System undated).

Lacustrine

Lacustrine habitats are inland depressions or dammed riverine channels containing standing water (Cowardin et al. 1979). Depth can vary from a few centimeters to hundreds of meters. Typically, lacustrine habitats include permanently flooded lakes and reservoirs, intermittent lakes, and ponds (including vernal pools; CDFW Wildlife Habitat Relationships System undated).

Riverine

Riverine systems consist of intermittent or continually running water. A stream originates at an elevated source, such as a spring or lake, and flows downward at a rate relative to slope or gradient and the volume of surface runoff or discharge. Velocity generally declines at progressively lower altitudes, and the volume of water increases until the enlarged stream finally becomes sluggish (McNaughton and Wolf 1973). Some streams, except for occasional pools, dry up seasonally every year (CDFW Wildlife Habitat Relationships System undated).

ALDEN ENVIRONMENTAL, INC

Figure 3

Vegetation and Land Cover Types

BIOLOGICAL TECHNICAL REPORT
CITY OF IRVINE
GENERAL PLAN UPDATE

Barren

Barren land lacks vegetation, typically because of recent and/or continuous clearing of vegetation. It often consists of rock, gravel, and/or soil. These areas differ from "urban," discussed below, because they do not support buildings, paved roads, parking lots, or ornamental plantings.

Riverine, Barren

See Riverine and Barren as described above.

Estuarine, Lacustrine, Riverine

Estuarine habitats either 1) have constant exchange and interaction with ocean water or marine embayment (estuary, tidal flat, tidal marsh, or eel-grass meadow) or 2) are often separated from ocean water exchange (coastal lagoon; CDFW Wildlife Habitat Relationships 2002). The latter situation is present in the City where Lacustrine and Riverine habitats in the western part of the City are often separated from Upper Newport Bay waters that occur west of State Route 73 outside the City limits. This same area in the City also supports Lacustrine and Riverine habitats. See above for descriptions of those habitats.

Valley Foothill Riparian

Valley Foothill Riparian habitats are found in valleys generally associated with low velocity water flow, flood plains, and gentle topography (Cheatham and Haller 1975). Some dominant species in the canopy layer are cottonwood (*Populus* spp.), California sycamore (*Platanus racemosa*), and oak (*Quercus* spp). Typical understory shrub layer plants include species such as wild grape (*Vitis girdiana*), wild rose (*Rosa californica*), California blackberry (*Rubus ursinus*), blue elderberry (*Sambucus nigra* ssp. *caerulea*), poison oak (*Toxicodendron diversilobum*), and willows (*Salix* spp.). The herbaceous layer consists of species such as sedges, rushes, grasses (CDFW Wildlife Habitat Relationships undated).

Eucalyptus

Eucalyptus an introduced genus, whose tree species have been planted typically for wind blocking, ornamental, and hardwood production purposes. If sufficient moisture is available, this genus becomes naturalized and is able to reproduce and expand its areal coverage. Eucalyptus occurs in the City in naturalized patches, landscaping, and windrows.

Fresh Emergent Wetland

Fresh Emergent Wetlands are flooded frequently and are characterized by dominant vegetation generally consisting of perennial monocots to 6.6 feet tall (Cheatham and Haller 1975, Cowardin et al. 1979). Characteristic species on the upper margins of the habitat include those such as sedges and rushes, and on more alkali sites, saltgrass (*Distichlis* sp.). On wetter sites, potential dominant species include cattail (*Typha* spp.) and bulrushes (*Scirpus* spp.; CDFW Wildlife Habitat Relationships undated).

Saline Emergent Wetland

Saline Emergent Wetland occurs above intertidal sand and mud flats (Küchler 1977) and below upland communities not subject to tidal action (Macdonald 1977). It is characterized as salt or brackish marsh with characteristic species such as cordgrass (*Spartina* spp.), pickleweed and glasswort (*Salicornia* spp.), bulrushes, and carex (*Carex* spp.).

Orchard, Vineyard, Evergreen Orchard, Irrigated Row and Field Crops

Orchards, vineyards, and row crops are land uses primarily for the production of food and fiber. On aerial imagery, the chief indications of agricultural activity are distinctive geometric field and road patterns on the landscape and the traces produced by mechanized equipment. The number of building complexes is smaller and the density of the road and highway network is much lower among these land uses than in Urban areas (see Urban below).

Urban

Urban lands typically support little to no native vegetation and are characterized by the presence of man-made structures such as buildings, paved roads, parking lots, parks, and residential areas that are either unvegetated or are dominated by exotic, ornamental plant species.

3.2.4 Flora

Despite the urbanization of most of the City, there are still areas within the City that provide open space and relatively untouched habitats that support native plant species.

The City also supports many agricultural lands and developed areas. While these lands typically support planted crops and orchards as well as ornamental species, respectively, they likely support both native and non-native plant species. Native plant species that can tolerate disturbance, and even thrive in disturbed areas, probably can be found growing alongside of the planted crops or as the understory within the orchards.

Some of the non-native plant species are likely invasive. These species likely have replaced native habitats that historically occurred because they produce larger quantities of seeds than the native plant species, have aggressive root systems that spread long distances and can steal resources (e.g., water, minerals) from native plant species, have dense root systems that smother the root systems of surrounding vegetation, and/or produce chemicals that inhibit the growth of other plant species around them. Invasive species pose serious environmental threats because they can invade healthy, native ecosystems and degrade the quality of the habitat so that it no longer provides the functions and values of the native ecosystems that occurred there historically.

3.2.5 Fauna

A variety of resident and migratory wildlife species occur within the City. Many of the resident species have adapted to survival within the interface of the urban lands and adjacent open space, parks, and preserves. The City provides habitat for both common and special status species including invertebrates, amphibians, reptiles, birds, and mammals.

Birds are the most numerous type of readily observable wildlife that occur within the City. Many common bird species can be seen such as mourning dove (*Zenaida macroura*), northern mockingbird (*Mimus polyglottos*), European starling (*Sturnus vulgaris*), house sparrow (*Passer domesticus*), and lesser goldfinch (*Spinus psaltria*). Common small and large mammals are also likely present in the City. Some of these species include woodrats (*Neotoma* spp.), mice (e.g., *Peromyscus* and *Chaetodipus* spp.), coyote (*Canis latrans*), raccoon (*Procyon lotor*), Virginia opossum (*Didelphis virginiana*), and striped skunk (*Mephitis mephitis*). Both the bobcat (*Lynx rufus*) and mountain lion (*Puma concolor*) have also been reported in the City.

3.3 SENSITIVE BIOLOGICAL RESOURCES

Sensitive biological resources include sensitive vegetation communities, special status plant species, special status wildlife species, wildlife movement corridors, and wetland/riparian resources. In general, the principal reason that a species, subspecies, or variety is considered sensitive is the documented or perceived decline or limitation of its population size or geographical extent and/or distribution resulting in most cases from habitat loss. Wildlife movement corridors or linkages also are considered sensitive by local, State, and federal resource and conservation agencies because these corridors allow wildlife to move between adjoining open space areas that are becoming increasingly isolated as open space becomes increasingly fragmented from urbanization, rugged terrain, or changes in vegetation (Beier and Loe 1992). In addition, wetland and riparian resources are considered sensitive because of their limited distribution and high wildlife value.

Many sensitive biological resources are known to occur or have the potential to occur within the City based on historical data for the region identified through a query of the CNDDB and USFWS database, the National Hydrography Dataset, and/or the presence of potentially suitable habitat within the City. The following section describes these sensitive biological resources.

3.3.1 Sensitive Vegetation Communities

Sensitive vegetation communities are vegetation assemblages, associations, or subassociations that have cumulative losses throughout the region, have relatively limited distribution, support or potentially support sensitive plant or wildlife species, or have particular value to other wildlife. Typically, sensitive vegetation communities are considered sensitive whether or not they have been disturbed. Sensitive vegetation communities are regulated by various local, State, and federal resource agencies.

The CNDDB provides an inventory of natural communities that are considered sensitive by State and federal resource agencies, academic institutions, and conservation groups such as the California Native Plant Society (CNPS). Determination of the level of sensitivity is based on the Nature Conservancy Heritage Program Status Ranks that rank both species and plant communities on a global and statewide basis according to the number and size of remaining occurrences as well as recognized threats such as proposed development, habitat degradation, and invasion by non-native species.

Based on a California Sensitive Natural Communities (CDFW 2018) search, ten sensitive vegetation communities were identified within the City and are listed below. According to the CDFW (2018), natural communities with ranks of 1 to 3, or Y (for alliances), are considered sensitive. Since the specific species composition and dominance in each of the communities in the City is not known for this report, the sensitivity for the alliance was used.

Vegetation communities that are wetland and/or riparian resources are also considered sensitive biological resources and are regulated by the Corps, CDFW, and/or RWQCB pursuant to several federal and State regulations. Wetland and/or riparian resources are also identified in the list below. See Section 3.3.5 of this report for more information about wetland and riparian resources.

- Perennial Grassland (Y)
- Annual/Perennial Grassland (Y; annual grassland is not sensitive, but perennial is)
- Coastal Oak Woodland (Y)
- Coastal Scrub (Y)
- Lacustrine (Wetland/Riparian)
- Riverine (Wetland/Riparian)
- Riverine (Wetland/Riparian), Barren (the barren portion of this community is not sensitive)
- Estuarine, Lacustrine, Riverine (Wetland/Riparian)
- Freshwater Emergent Wetland (Y, Wetland)
- Saline Emergent Wetland (Y, Wetland)

3.3.2 Special Status Plant Species

For purposes of this report, special status plant species include those that are:

- listed or proposed for listing by federal or State agencies as threatened or endangered;
- on List 1B (considered endangered throughout its range) or List 2 (considered endangered in California but more common elsewhere) of the CNPS' *Inventory of Rare and Endangered Vascular Plants of California*;
- considered rare, endangered, or threatened by the CDFW or other local conservation organizations or specialists; and/or
- covered under the NCCP/HCP

Noteworthy plant species are considered to be those on:

- List 3 (more information about the plant distribution and rarity needed) and
- List 4 (plants of limited distribution) of the CNPS *Inventory*.

The CNPS is a Statewide resource conservation organization that has developed an inventory of California's sensitive plant species. The CNPS listing is sanctioned by the CDFW and essentially serves as an early warning list of potential candidate species for threatened or endangered status.

According to USFWS, a federal endangered species is defined as a species facing extinction throughout all or a significant portion of its geographic range, and a federally threatened species is defined as a species that is likely to become endangered within the foreseeable future throughout all or a significant part of its range. CDFW defines an endangered species as one whose prospects of survival and reproduction are in immediate jeopardy, a threatened species as one present in such small numbers throughout its range that it is likely to become an endangered species in the near future in the absence of special protection or management, and a rare species as one present in such small numbers throughout its range that it may become endangered if its present environment worsens.

Species that are federal- or State-listed threatened or endangered species; are designated as CNPS List 1B or 2 species; and/or are considered rare, endangered, or threatened by the CDFW and are afforded a degree of protection that entails a permitting process including specific mitigation measures to compensate for impacts to the species. Species that are proposed to be listed by the USFWS are treated similarly to listed species by that agency. Recommendations of the USFWS, however, are advisory rather than mandatory in the case of proposed species. Although plant species that are classified as List 3 or 4 species by CNPS are not provided legal protection, this designation is used to identify declining plant species that are considered sensitive by the CNPS but not considered threatened or endangered.

There are 33 special status plant species known to occur historically from the region of the City. Ten of these species have been reported within the City or just outside the City limits (Figure 4). All 33 special status plant species are summarized in Table 2. No critical habitat has been designated by the USFWS within the City for any plant species.

Table 2
SPECIAL STATUS PLANT SPECIES REPORTED WITHIN THE CITY OF IRVINE OR THE REGION

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
Aphanisma blitoides	Aphanisma	List 1B.2	Coastal bluffs	May occur within the City because potential habitat may be present.
Astragalus brauntonii	Braunton's milk-vetch	FE List 1B.1	Chaparral, coastal scrub, grassland—recent burns or disturbed areas	May occur within the City because potential habitat may be present.
Atriplex coulteri	Coulter's saltbush	List 1B.2	Grassland, sage scrub, eroded coastal terrace	Reported in the City (Figure 4).
Atriplex serenana var. *davidsonii*	Davidson's saltscale	List 1B.2	Alkaline coastal bluff scrub, coastal scrub	Reported in the City (Figure 4).
Atriplex pacifica	South Coast saltscale	List 1B.2	Coastal bluff scrub, coastal dunes, coastal scrub, playas	May occur within the City because suitable habitat may be present.
Calochortus catalinae	Catalina mariposa lily	List 4.2 Covered	Chaparral, cismontane woodland, coastal scrub, grassland	May occur within the City because suitable habitat may be present.
Calochortus weedii var. *intermedius*	Intermediate mariposa-lily	List 1B.2 Covered	Rocky, calcareous chaparral, coastal scrub, grassland.	Reported in the City (Figure 4).
Camissoniopsis lewisii	Lewis' evening-primrose	List 3.0	Sand bars with salt marsh	May occur within the City because suitable habitat may be present.
Chloropyron maritimum ssp. *maritimum*	Salt marsh bird's-beak	FE SE List 1B.2	Salt marsh	May occur within the City because suitable habitat may be present.
Chorizanthe polygonoides var. *longispina*	Long-spined spineflower	List 1B.2	Chaparral, coastal scrub, meadows and seeps, grassland, vernal pools—often with clay soils	May occur within the City because suitable habitat may be present.
Cistanthe maritima	Seaside calandrinia	List 4.2	Sandy coastal bluff scrub, coastal scrub, grassland	May occur within the City because suitable habitat may be present.
Convolvulus simulans	Small-flowered morning glory	List 4.2	Grassland with clay soil	May occur within the City because suitable habitat may be present.
Deinandra paniculata	Paniculate tarplant	List 4.2	Coastal scrub, grassland vernal pools	May occur within the City because suitable habitat may be present.

Table 2
SPECIAL STATUS PLANT SPECIES REPORTED WITHIN THE CITY OF IRVINE OR THE REGION

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
Dichondra occidentalis	Western dichondra	List 4.2 Covered	Chaparral, cismontane woodland, coastal scrub, grassland	May occur within the City because suitable habitat may be present.
Dudleya multicaulis	Many-stemmed dudleya	List 1B.2	Coastal scrub, chaparral, grassland—often with clay soil	Reported in the City (Figure 4).
Eleocharis parvula	Small spike-rush	List 4.3	Marshes and swamps	May occur within the City because suitable habitat may be present.
Centromadia parryi ssp. *australis*	Southern tarplant	List 1B.1	Margins of marshes and swamps, mesic grassland, vernal pools	Reported in the City (Figure 4).
Hordeum intercedens	Vernal barley	List 3.2	Coastal dunes, coastal scrub, grassland, vernal pools	May occur within the City because suitable habitat may be present.
Juncus acutus ssp. *leopoldii*	Southwestern spiny rush	List 4.2	Mesic coastal dunes, meadows and (alkaline) seeps, coastal salt marshes and swamps	May occur within the City because suitable habitat may be present.
Lasthenia glabrata ssp. coulteri	Coulter's goldfields	List 1B.1	Coastal salt marshes and swamps, playas, vernal pools	May occur within the City because suitable habitat may be present, and it was reported just outside the City limits (Figure 4).
Lepidium virginicum var. *robinsonii*	Robinson's pepper-grass	List 4.3	Chaparral, coastal scrub	Reported in the City (Figure 4).
Lycium californicum	California box-thorn	List 4.2	Coastal bluff scrub, coastal scrub	May occur within the City because suitable habitat may be present.
Malacothrix saxatalis var. *saxatalis*	Cliff malacothrix	List 4.2	Coastal bluff scrub, coastal scrub	May occur within the City because suitable habitat may be present.
Microseris douglasii ssp. *platycarpha*	Small-flowered microseris	List 4.2	Clay soils in cismontane woodland, coastal scrub, grassland, vernal pools	May occur within the City because suitable habitat may be present.
Nama stenocarpa	Mud nama	List 2B.2	Marshes and swamps (lake margins, riverbanks)	Reported in the City (Figure 4).

Special Status Plant and Wildlife Species and Critical Habitat

BIOLOGICAL TECHNICAL REPORT
CITY OF IRVINE
GENERAL PLAN UPDATE

3.3.3 Special Status Wildlife Species

For purposes of this report, special status wildlife species include those that are 1) listed or proposed for listing as threatened or endangered by the USFWS or the CDFW; 2) designated as Birds of Conservation Concern by the USFWS; 3) designated as California Fully Protected or California Species of Special Concern by the CDFW; and/or 4) covered under the NCCP/HCP. In addition, raptors (birds of prey) and active raptor nests are protected by the California Fish and Game Code 3503.5, which states that it is "unlawful to take, possess, or destroy any birds of prey or to take, possess, or destroy the nest or eggs of any such bird" unless authorized. The federal MBTA, which restricts the killing, taking, collecting, selling, or purchasing of native bird species or their parts, nests, or eggs, also provides legal protection for almost all breeding bird species occurring in the U.S. The MBTA is supplemented by the BGEPA, which provides protection for both the bald eagle and the golden eagle by prohibiting the "take" of either of these species, including their parts, nests, or eggs. Noteworthy wildlife species are those given the informal designation of California Species of Concern by the CDFW. This designation applies to animals not listed under FESA or CESA but which nonetheless (1) are declining at a rate that could result in listing or (2) historically occurred in low numbers and known threats to their persistence currently exist.

According to the USFWS, a federal endangered species is defined as a species facing extinction throughout all or a significant portion of its geographic range, and a federal threatened species is defined as a species that is likely to become endangered within the foreseeable future throughout all or a significant part of its range. The CDFW defines an endangered species as one whose prospects of survival and reproduction are in immediate jeopardy, a threatened species as one present in such small numbers throughout its range that it is likely to become an endangered species in the near future in the absence of special protection or management, a California Fully Protected species as one that is rare or faces possible extinction, and a California Species of Concern as one that is declining in numbers.

Species that are federal- or State-listed threatened or endangered are afforded a degree of protection that entails a permitting process, including specific mitigation measures to compensate for impacts to the species. Species that are proposed to be listed by the USFWS are treated similarly to listed species by that agency. Recommendations of the USFWS, however, are advisory rather than mandatory in the case of proposed species. As regulated by the CDFW, Fully Protected species may not be taken or possessed at any time and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation of the bird species for the protection of livestock. Wildlife species classified as California Species of Concern or Watch List by the CDFW are not typically provided legal protection; however, there are exceptions for some species such as the burrowing owl (*Athene cunicularia*). Similarly, Birds of Conservation Concern refers to non-listed subspecies or populations of federal threatened or endangered species.

There are 59 special status wildlife species known to occur historically from the region. Twenty-four of these species have been reported within the City or just outside the City limits (Figure 4). All 59 special status wildlife species are summarized in Table 3. Critical habitat has been designated by the USFWS for two species within the City: Riverside fairy shrimp (*Streptocephalus woottoni*) and coastal California gnatcatcher (Figure 4).

Table 3
SPECIAL STATUS WILDLIFE SPECIES REPORTED WITHIN THE CITY OF IRVINE OR THE REGION

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
Invertebrates				
Branchinecta sandiegonensis	San Diego fairy shrimp	FE Covered	Vernal pools or other ephemeral basins in coastal southern California south to extreme northwestern Baja California, Mexico	May occur within the City because suitable habitat may be present.
Streptochephalus woottoni	Riverside fairy shrimp	FE Covered	Restricted to a few vernal pools in southwestern Riverside, Orange, and San Diego counties	Reported in the City, and critical habitat has been designated in the City (Figure 4).
Fish				
Eucyclogobius newberryi	Tidewater goby	FE CSC	Shallow brackish lagoons and lower stream reaches	May occur within the City because potential habitat may be present.
Amphibians				
Aneides lugubris	Arboreal salamander	Covered	Moist places in a variety of habitats from coastal dunes to woodlands	May occur within the City because suitable habitat may be present.
Anaxyrus californicus	Arroyo toad	FE CSC Covered	Breeds in shallow pools along stream edges with sand/gravel flats between March and June. Adults use sage scrub, mixed chaparral, oak woodland habitats up to within one mile of breeding sites.	May occur within the City because suitable habitat may be present.
Batrachoseps nigriventris	Blackbelly slender salamander	Covered	Moist places, mainly in woodlands, but also found in grasslands and riparian habitats	May occur within the City because suitable habitat may be present.
Spea hammondii	Western spadefoot	CSC Covered	Washes, river floodplains, alluvial fans, playas, alkali flats, temporary ponds, vernal pools in mixed woodlands, grasslands, coastal sage scrub, and chaparral. Surface activity October to April. Oviposition late February to May in temporal pools and slow-moving sections of streams	Reported in the City (Figure 4).
Taricha torosa	Coast Range newt	CSC	In southern California, habitats include drier chaparral, oak woodland, and grasslands	Reported just outside the City limits (Figure 4).
Reptiles				
Phrynosoma blainvillii	Coast horned lizard	CSC Covered	Scrubland, grassland, coniferous woods, and broadleaf woodlands, especially in areas with sandy soils, scattered shrubs, and ant colonies, such as along the edges of arroyo bottoms or dirt roads.	Reported in the City (Figure 4).
Aspidoscelis hyperythra	Orange-throated whiptail	WL Covered	Open coastal sage scrub, chaparral, and streamside growth with loose sandy soils, revegetation sites.	Reported in the City (Figure 4).

Table 3
SPECIAL STATUS WILDLIFE SPECIES REPORTED WITHIN THE CITY OF IRVINE OR THE REGION

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
Aspidoscelis tigris stejnegeri	Coastal western whiptail	CSC Covered	Coastal sage scrub, chaparral, and wash habitats	Reported in the City (Figure 4).
Anniella stebbinsi	Southern California legless lizard	CSC	Found in leaf litter and loose soil on beaches and in coastal scrub, chaparral, and open riparian habitats. Sandy washes and beach dunes are used for burrowing, while logs and leaf litter are used for cover and feeding.	May occur within the City because suitable habitat may be present.
Charina trivirgata	rosy boa	Covered	Rocky areas in coastal sage scrub and chaparral	May occur within the City because potential habitat may be present.
Crotalus ruber	red-diamond rattlesnake	CSC Covered	Arid scrub (including coastal sage scrub), chaparral, woodlands, and cultivated areas, often with large rocks or boulders	Reported in the City (Figure 4).
Diadophis punctatus modestus	San Bernardino ringneck snake	Covered	Semi-arid brushy areas and chaparral in canyons, rocky hillsides, and plains	May not occur in the City due to limited or lacking potential habitat.
Emys marmorata	Western pond turtle	CSC	Slow-water aquatic habitats with available basking sites (e.g., submerged logs, open mud banks)	Reported in the City (Figure 4).
Plestiodon skiltonianus interparietalis	Coronado skink	WL Covered	Occurs in variety of mesic habitats including coastal sage, chaparral, oak woodlands, pinon-juniper, and riparian woodlands to pine forests	May occur within the City because suitable habitat may be present.
Salvadora hexalepis virgultea	Coast patch-nosed snake	CSC	Semi-arid brushy areas and chaparral in canyons, rocky hillsides, and plains	May occur within the City because potential habitat may be present.
Thamnophis hammondii	Two-striped garter snake	CSC	Permanent fresh water, inhabiting streams, ponds, vernal pools. Occupies adjacent coastal sage scrub and grasslands during the winter.	May occur within the City because suitable habitat may be present.
Birds				
Accipiter cooperii	Cooper's hawk	WL	Occurs in various woodland habitats, including riparian	Reported in the City (Figure 4).
Accipiter striatus	Sharp-shinned hawk	WL Covered	Woodland areas and open lowlands	May occur within the City because potential habitat may be present.
Agelaius tricolor	Tricolored blackbird	BCC CSC, (SE Candidate)	Cattail or tule marshes; forages in fields, farms. Breeds in large freshwater marshes in dense stands of cattails or bulrushes. At all seasons (including when breeding), does most of its foraging in open habitats such as farm fields, pastures, cattle pens, and large lawns.	Reported in the City (Figure 4).

Table 3
SPECIAL STATUS WILDLIFE SPECIES REPORTED WITHIN THE CITY OF IRVINE OR THE REGION

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
Aimophila ruficeps canescens	Southern California rufous-crowned sparrow	WL Covered	Coastal sage scrub, coastal bluff scrub, low-growing chaparral	Reported in the City (Figure 4).
Ammodramus savannarum	Grasshopper sparrow	CSC	Grasslands, prairies, hayfields, and open pastures with little to no scrub cover and often with some bare ground	Reported in the City (Figure 4).
Aquila chrysaetos	golden eagle	CFP, WL Covered	Requires vast foraging areas in grassland, broken chaparral, or sage scrub. Nests on cliffs and boulders.	May not occur within the City because of limited potential habitat.
Athene cunicularia	Burrowing owl	BCC CSC	Grassland, agricultural land, coastal dunes	Reported in the City (Figure 4).
Buteo lineatus	Red-shouldered hawk	Covered	Riparian woodland	May occur within the City because suitable habitat may be present.
Buteo regalis	Ferruginous hawk	BCC WL	Winter resident of grassland and agricultural areas in southwestern California	Reported in the City (Figure 4).
Campylorhynchus brunneicapillus sandiegensis (San Diego and Orange counties only)	Coastal cactus wren	BCC CSC Covered	Coastal sage scrub and chaparral plant communities with substantial cacti (*Opuntia* spp.) stands	Reported in the City (Figure 4).
Charadrius alexandrinus nivosus	Western snowy plover	FT, BCC CSC	Breeds primarily on coastal beaches from southern Washington to southern Baja California, Mexico. The Pacific coast population breeds above the high tide line on coastal beaches, sand spits, dune-backed beaches, sparsely-vegetated dunes, beaches at creek and river mouths, and salt pans at lagoons and estuaries.	May occur within the City because potential habitat may be present.
Circus hudsonius	Northern harrier	CSC Covered	Open habitats, such as grasslands and fields, as well as marshes.	May occur within the City because suitable habitat may be present.
Coccyzus americanus occidentalis	western yellow-billed cuckoo	FT, BCC SE	Extensive riparian woodlands	May not occur within the City because of limited or lacking potential habitat.
Elanus leucurus	white-tailed kite	CFP	Nests in riparian woodland, oaks, sycamores and forages in open, grassy areas	Reported in the City (Figure 4).

Table 3
SPECIAL STATUS WILDLIFE SPECIES REPORTED WITHIN THE CITY OF IRVINE OR THE REGION

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
Empidonax traillii extimus	southwestern willow flycatcher	FE SE Covered	Nests in extensive willow-dominated riparian forests and woodlands, occasionally oak woodlands	May not occur within the City because of limited or lacking potential habitat.
Eremophila alpestris actia	California horned lark		Short vegetation or bare ground and low-growing or fallow agricultural fields	Reported in the City (Figure 4).
Falco peregrinus anatum	American peregrine falcon	BCC CFP Covered	Nests in open landscapes with cliffs or tall man-made structures. Found along coastlines, shorelines, etc. where shorebird or rock pigeon prey occurs.	Reported just outside the City limits (Figure 4).
Icteria virens	Yellow-breasted chat	CSC	Dense riparian woodland	Reported in the City (Figure 4).
Ixobrychus exilis	Least bittern	BCC CSC	Dense marshes	May occur within the City because suitable habitat may be present.
Lanius ludovicianus	loggerhead shrike	BCC CSC	Open-canopied valley foothill hardwood, valley foothill hardwood-conifer, valley foothill riparian, pinyon-juniper, juniper, desert riparian, and Joshua tree woodland habitats with scattered shrubs, trees, posts, fences, utility lines, or other perches	May occur within the City because potential habitat may be present.
Laterallus jamaicensis coturniculus	California black rail	BCC ST, CFP	Salt marshes, freshwater marshes, and wet meadows	May occur within the City because suitable habitat may be present.
Passerculus sandwichensis beldingi	Belding's savannah sparrow	SE	Coastal salt marsh	May occur within the City because suitable habitat may be present.
Polioptila californica californica	coastal California gnatcatcher	FT CSC Covered	Coastal sage scrub, maritime succulent scrub.	Reported in the City (Figure 4).
Pelecanus erythrorhynchos	American white pelican	CSC	Breeds mainly on isolated islands in freshwater lakes or on ephemeral islands in shallow wetlands. Forages in marshes, along lake or river edges, and in wetlands.	May occur within the City because potential habitat may be present.
Pelecanus occidentalis californicus	California brown pelican	CFP	Nests from the Channel Islands along the Baja California coast and in the Gulf of California to coastal southern Mexico. Builds nests of sticks on the ground, typically on islands or offshore rocks. Between breeding seasons, wanders along the west coast.	May not occur within the City because of limited or lacking potential habitat.

Table 3
SPECIAL STATUS WILDLIFE SPECIES REPORTED WITHIN THE CITY OF IRVINE OR THE REGION

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
Phalacrocorax auritus	Double-crested cormorant	WL	Lakes and ponds	May occur within the City because potential habitat may be present.
Plegadis chihi	White-faced ibis	WL	Freshwater wetlands and marshes but also may feed in flooded meadows, agricultural fields, and estuarine wetlands.	May occur within the City because potential habitat may be present.
Rallus obsoletus levipes	Light-footed Ridgway's rail	FE SE, CFP	Salt marshes and lagoons	Reported in the City (Figure 4).
Rynchops niger	Black skimmer	CSC	Mostly ocean beaches, tidewater. Favors coastal waters protected from open surf such as lagoons, estuaries, inlets, and sheltered bays. Occurs locally on inland lakes	May occur within the City because potential habitat may be present.
Setophaga petechia	yellow warbler	BCC CSC	Well-developed riparian habitats, often with mature willows, usually in close proximity to water along streams and meadows	May occur within the City because suitable habitat may be present.
Sternula antillarum browni	California least tern	FE SE, CFP	Nests are situated on barren to sparsely vegetated places near water, normally on sandy or gravelly substrates, and may appear along marine or estuarine shores in areas free from humans or predators. Wintering locations are unknown.	May not occur within the City because of limited or lacking potential habitat.
Vireo bellii pusillus	Least Bell's vireo	FE SE Covered	Dense, stratified canopy within willow-dominated woodland or scrub, *Baccharis* scrub, mixed oak/willow woodland, mesquite woodland, and elderberry scrub in riparian habitat.	Reported in the City (Figure 4).
Mammals				
Antrozous pallidus	pallid bat	CSC	Open desert scrub, grasslands, shrub lands, woodlands, and forests. Roosts in rock crevices, caves, mines, tree hollows, and buildings.	May occur within the City because suitable habitat may be present.
Chaetodipus fallax fallax	Northwestern San Diego pocket mouse	CSC	Sparse, disturbed coastal sage scrub or grasslands with sandy soils.	May occur within the City because suitable habitat may be present.
Eumops perotis californicus	western mastiff bat	CSC	Occurs in many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, grasslands, chaparral, etc.; roosts in crevices in vertical cliff faces, high buildings, trees, and tunnels, and travels widely when foraging.	Reported in the City (Figure 4).
Lepus californicus bennettii	San Diego black-tailed jackrabbit	CSC	Open areas of scrub, grasslands, agricultural fields with ample grasses and forbs.	May occur within the City because suitable habitat may be present.

Table 3
SPECIAL STATUS WILDLIFE SPECIES REPORTED WITHIN THE CITY OF IRVINE OR THE REGION

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
Neotoma lepida intermedia	San Diego desert woodrat	CSC Covered	Coastal sage scrub and chaparral. Prefers rock outcrops.	Reported in the City (Figure 4).
Perognathus longimembris pacificus	Pacific pocket mouse	FE CSC	Fine-grained, sandy or gravelly substrates in coastal strand, coastal dunes, river alluvium, and coastal sage scrub growing on marine terraces. Nearly all historic observations of are within 4 km (approximately 2.48 miles) of the Pacific coast, with a few as far as 6 km (approximately 3.72 miles). Currently known only from Dana Point Headlands in Orange County, California and three locations on Marine Corps Base Camp Pendleton in San Diego County (Spencer 2005).	May not occur within the City because it is largely too far inland.
Sorex ornatus salicornicus	Southern California saltmarsh shrew	CSC	Salt marsh	May occur within the City because suitable habitat may be present.
Taxidea taxus	American badger	CSC	Drier, open stages of shrub steppes, agricultural fields, open woodland forests, and large grass and sagebrush meadows and valleys with friable soils.	May occur within the City because suitable habitat may be present.

Status: FE=Federal endangered; FT=Federal threatened; BCC=Birds of Conservation Concern; SE=State endangered; ST=State threatened; CFP=California Fully Protected; CSC=California Species of Special Concern; WL=CDFW Watch List; Covered = Covered under the NCCP/HCP

3.3.4 Wildlife Movement Corridors

Wildlife corridors are essential to maintain populations of healthy and genetically diverse plant and wildlife species. At a minimum, wildlife corridors promote colonization of habitat and genetic variability for both plant and wildlife species by connecting fragments of habitat that are separated by otherwise foreign or inhospitable habitats. Because the isolation of plant and wildlife populations can have many harmful effects on local and regional species' populations and may contribute significantly to local species extinctions, wildlife corridors are important to sustain individual species distributions within these habitat fragments. Studies have concluded that many wildlife species would not likely persist in these habitat fragments over time because isolation through fragmentation would prohibit the infusion of new individuals and genetic information into the population (Harris and Gallagher 1989). While the debate over the value of corridors has been extensive (Noss 1987, Beier and Loe 1992, Beier and Noss 1998, Haddad et al. 2002, Beier and Noss 2000), most leading wildlife corridor biologists agree that, if corridors are used in appropriate situations and designed properly, they can be useful tools in conservation.

Wildlife corridors are considered sensitive by local, State, and federal resource and conservation agencies because these corridors allow wildlife to move between adjoining open space areas that are becoming increasingly isolated as open space becomes fragmented from urbanization, rugged terrain, and/or changes in vegetation (Beier and Loe 1992). In southern California, habitat fragmentation is one of the main concerns for the maintenance of healthy wildlife populations because natural areas are often scarce and maintaining connectivity between these habitats is perhaps one of the best feasible options for preventing localized extinctions and enhancing biodiversity (Penrod et al. 2001). In addition, roadway mortality must be considered when evaluating the importance of maintaining habitat connectivity and providing well-designed wildlife crossings (e.g., over/underpasses). If animals are inclined to move between habitat patches, a narrow road or even a wider highway isn't an absolute barrier. However, if these animals choose to cross these roadways, the likelihood of mortality increases and potentially could depress regional species' populations if these failed crossing attempts become a common occurrence.

As explained in Section 3.1.3 of this report, the Irvine Open Space Initiative created the framework to preserve large, contiguous open space areas for conservation and open space as phased master-planned growth occurred in other areas of the City. The Irvine Open Space Preserve, as it now is known, protects more than 93,000 acres of land from the "mountains to the sea," linking the Cleveland National Forest, San Joaquin Wildlife Sanctuary, Laguna Coast Wilderness Park, and other resources.

The City has committed to protect and manage the Irvine Open Space Preserve consistent with the NCCP. Of the NCCP/HCP acres in Irvine, 10,587 are designated for the NCCP habitat reserve system, and 813 acres are non-reserve lands called special linkages. The special linkages contain biological value that enhance connectivity between elements of the larger reserve system. The City's portion of the NCCP habitat reserve system and the NCCP special linkages in the City are shown on Figure 5.

Irvine has several wildlife corridors—Hicks Canyon, Rattlesnake Canyon, Loma Ridge, Limestone Canyon, and upper Borrego Canyon form wildlife corridors that stretch to the Cleveland National Forest. Wildlife corridors are also preserved along the Eastern Transportation Corridor at Agua Chinon and the SR-241/133 interchange (Figure 5).

Historically, a wildlife corridor also connected lands in Irvine's northern sphere (e.g., Santiago Hills) to coastal lands along the Pacific Ocean. In 2013, the Irvine City Council adopted the Irvine Wildlife Corridor Plan, taking a step toward creating a wildlife corridor that would link protected lands in the Laguna Coast to wilderness areas that include the Cleveland National Forest, Whiting Ranch, and Limestone Canyon.

3.3.5 Wetland and Riparian Resources

Wetland and riparian resources within the City are considered sensitive biological resources and are regulated by the Corps, CDFW, and/or RWQCB pursuant to several federal and State regulations. A description of each agency's jurisdiction is provided in this section, and the potential wetland and riparian resources within the City are discussed as well.

Biological Resources and NCCP Areas

BIOLOGICAL TECHNICAL REPORT
CITY OF IRVINE
GENERAL PLAN UPDATE

United States Army Corps of Engineers Jurisdiction

In accordance with Section 404 of the CWA, the Corps has regulatory authority over the discharge of dredged or fill material into waters of the U.S. (including non-wetland Waters of the U.S. and wetlands). Federal jurisdiction is dependent on a demonstrated nexus between the subject water feature and navigable waters or interstate commerce.

The Corps and EPA define wetlands as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted to life in saturated soil conditions" (Corps 1987 and 2008). To be considered a Corps jurisdictional wetland under Section 404 of the CWA, an area must possess three wetland characteristics: 1) hydrophytic vegetation, 2) hydric soils, and 3) wetland hydrology. The definition of a wetland includes the phrase “under normal circumstances” because there are situations in which the vegetation of a wetland has been removed or altered as a result of recent natural event or human activities (Corps 1987). The terms “atypical situation” and “problem area” are used to describe wetlands that exhibit these conditions. An atypical situation refers to a wetland area in which one or more wetland parameters (vegetation, soil, and/or hydrology) have been sufficiently altered by recent human activities or natural events to preclude the presence of wetland indicators of the parameter (Corps 1987 and 2008). A problem area refers to a wetland area in which wetland indicators of one or more wetland parameters may be periodically lacking due to normal seasonal or annual variations in environmental conditions that result from causes other than human activities or catastrophic natural events (e.g., seasonal wetlands, wetlands on drumlins, prairie potholes, and vegetated flats; Corps 1987 and 2008). Although atypical situations and problem areas may lack one or more wetland parameters, these areas may still be considered wetlands if background information on the previous condition of the area and field observations indicate that the missing wetland criteria were present before the disturbance and would occur at the site under normal circumstances.

The Corps defines non-wetland Waters of the U.S. as drainages, or portions thereof, which have strong hydrology indicators such as the presence of seasonal flows and an ordinary high watermark (OHWM). An OHWM is defined as “that line on the shore established by the fluctuations of water and indicated by physical characteristics such as [a] clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas” (Corps 1987 and 2008). Areas delineated as non-wetland waters of the U.S. may lack hydrophytic vegetation or hydric soil characteristics. Hydrophytic vegetation may be absent for various reasons such as the lack of sufficient water flow to support hydrophytic vegetation or the influence of frequent scouring due to rapid water flow. Hydric soil indicators may be missing for various reasons such as the lack of sufficient water or the presence of steep topography that precludes ponding and prohibits the development of hydric soils. Non-wetland Waters of the U.S. are delineated by the lateral and upstream/downstream extent of the OHWM of the particular drainage or depression.

The Corps developed the Special Area Management Plan for the San Diego Creek Watershed (SAMP; Corps 2008b rev. 2009) with the CDFW to integrate a watershed approach to address anticipated regulated activities and aquatic resource conservation needs. The SAMP process was initiated in 1998 as a coordinated process with local landowner/managers and State and federal agencies to consider known projects and anticipated regulated activities resulting in a watershed approach to issuing CWA permits and SAAs.

The SAMP reflects a front-end analysis of the watershed's aquatic resources and consideration of how regulated activities may affect those resources. The SAMP allows the Corps and CDFW to target staff review and evaluation time towards regulated activities and projects with greater potential to result in adverse impacts to the overall integrity of aquatic resources in the watershed. Conversely, projects and regulated activities with minor impacts that affect low-integrity aquatic resources would undergo modified permitting procedures to improve efficiency. Low-integrity resources are those with low hydrology, water quality, and habitat integrity; little habitat value for threatened and/or endangered species; or low wildlife connectivity value. Regardless of value, the permanent loss of aquatic resources would require compensatory mitigation for unavoidable impacts.

California Department of Fish and Wildlife Jurisdiction

In accordance with Sections 1600 to 1616 of the Fish and Game Code, the CDFW regulates activities that would divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake that supports fish or wildlife. These sections discuss the process by which an individual, government agency, or public utility must notify the CDFW prior to any activity that would substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake. The CDFW regulates wetland areas only to the extent that those wetlands are part of a river, stream, or lake as defined by the CDFW. Following such notification, the CDFW must inform the individual, agency, or utility of the existence of any fish and wildlife resources that may be substantially adversely affected by the activity. The CDFW must also include a proposal called the Streambed Alteration Agreement for measures to protect fish and wildlife resources.

The CDFW exerts jurisdiction over all Waters of the State, such as streams and rivers (measured from bank to bank) and any "riparian" vegetation associated with the waters. Streams and rivers are defined by the presence of a channel bed and banks, and at least an intermittent flow of water. The term "riparian" vegetation refers to vegetation that occurs in and/or adjacent to a watercourse. Typical "riparian" vegetation includes willows, mule fat (*Baccharis salicifolia*), western sycamore (*Platanus racemosa*), Fremont cottonwoods (*Populus fremontii*), cattails, and other vegetation found in moist areas and typically associated with the banks of a stream or lake shoreline. CDFW jurisdictional areas are delineated by the outer edge of riparian vegetation or from the top of one channel bank to the top of the opposite channel bank, whichever is wider. Thus, defining the limits of the CDFW jurisdiction based on riparian habitat will include wetland areas and may include areas that do not meet the Corps criteria for soils and/or hydrology. In addition, the CDFW may take jurisdiction over isolated wetlands and streambeds in cases where the Corps may not. Therefore, the CDFW jurisdiction is typically equal to or greater than the Corps jurisdiction.

The CDFW developed the SAMP with the Corps to integrate a watershed approach to address anticipated regulated activities and aquatic resource conservation needs. See the SAMP discussion under the heading, *United States Army Corps of Engineers* Jurisdiction, above.

Regional Water Quality Control Board

The RWQCB is the primary agency responsible for protecting water quality in California. The RWQCB regulates discharges to surface waters under Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act. The RWQCB's jurisdiction extends to all Waters of the State and to all Waters of the U.S. as considered jurisdictional by the Corps and CDFW. The RWQCB also regulates isolated wetlands, such as vernal pools, that are not regulated by the Corps. Section 401 of the CWA and the state Porter-Cologne Water Quality Control Act give the RWQCB the authority to regulate any proposed activity that may affect water quality. Water quality certification and/or a Report of Waste Discharge must be based upon a finding that the proposed discharge will comply with water quality standards.

Wetland and Riparian Resources in the City

Potential jurisdictional wetland and riparian resources that occur within the City are based on data from the USGS National Hydrography Dataset (Figure 6) and the most current (2015) vegetation mapping for the City from the Nature Reserve of Orange County (Figure 3). All wetland and riparian resources must be protected according to federal, State, and local regulations. These potential jurisdictional resources in the City include streams/rivers, lakes/ponds, reservoirs, inundation areas, canals/ditches, and associated habitats (coast live oak woodland; estuarine, lacustrine, riverine; fresh emergent wetland; lacustrine; riverine; riverine, barren; saline emergent wetland; and valley foothill riparian). The major wetlands/waterways in the City include San Diego Creek, Peters Canyon Wash, and San Joaquin Wildlife Sanctuary.

San Diego Creek is a 16-mile-long waterway with its headwaters in the City of Laguna Woods that flows into Upper Newport Bay. The increased demand for housing and employment in Orange County has resulted in substantial land use changes from agriculture to urban development within the creek's watershed, especially over the last several decades. Agricultural uses, which began in the 19th century, had previously altered the watershed′s natural conditions and hydrology, including increased runoff in Newport Bay and channelization of San Diego Creek (Corps 2008b rev 2009). According to the City (Storm Drainage Utilities), this waterbody is currently impaired by fecal coliform, indicator bacteria, nutrients, pesticides, sedimentation, selenium, and toxaphene.

Most of the creek has been converted to a concrete flood control channel, but it does provide aquatic and riparian habitats along its course and its tidal estuary near the San Joaquin Wildlife Sanctuary and Upper Newport Bay (Figure 3). Peters Canyon Wash is a tributary of San Diego Creek that is approximately 11.8 miles long, mostly channelized, and flows in a relatively straight course southwest from the Peters Canyon Reservoir near the Orange/Tustin border to its confluence with San Diego Creek near the Irvine Civic Center Plaza (Figure 3). According to the City (Storm Drainage Utilities), this wash is currently impaired by DDT, bacteria, pH, and toxaphene.

The San Joaquin Wildlife Sanctuary is a 300-acre constructed wetland in the floodplain of San Diego Creek just above its outlet to Upper Newport Bay. The site is owned by the Irvine Ranch

Water District; it was used for farmland in the 1950s and 1960s, and (prior to its reconstruction) as a duck hunting range. Original restoration of the wetlands began in 1988 and was completed in 2000. The site serves a dual purpose of removing nitrates from the creek's water and providing bird habitat. The Southern California Wetlands Recovery Project (2019), a partnership of public agencies, scientists, and local communities that work cooperatively to acquire and restore wetlands in coastal Southern California, has a plan to restore and enhance 120 acres of perennial marsh habitat in San Joaquin Marsh.

4.0 EVALUATION OF FUTURE ENVIRONMENTAL OPPORTUNITIES, CONSTRAINTS, AND MITIGATION MEASURES

The City's opportunities to protect the natural environment within the City as the potential development constraints for future projects associated with the natural resources that could potentially occur are discussed in this section.

4.1 OPPORTUNITIES

While much of Irvine's open space has been reserved or designated as special linkages (Figure 5), the potential still exists for the identification and acquisition of additional non-designated open space areas to provide preservation of biological resources, particularly NCCP/HCP-covered species, and active recreation opportunities such as walking, equestrian, or bike trails. The opportunity exists for the City to ensure that allowances are made through General Plan policies to encourage or require proposed development plans to allocate open space areas.

The large area in the City (and sphere of influence), as well as non-reserve areas containing species covered under the NCCP/HCP, will result in limitations on development, though some impact is anticipated under specific permitting and mitigation requirements already in the NCCP/HCP. The disposition and/or suitability of other open space areas remain uncertain; however, the special linkages that are slated for wildlife corridors in the vicinity of the formerly proposed El Toro National Wildlife Sanctuary to the San Joaquin Hills are being addressed by the Irvine Wildlife Corridor Plan (Glenn Lukos Associates, Inc. 2013). This Plan is to establish a wildlife corridor that provides opportunity for movement from Irvine Boulevard to Interstate 5 through the length of the MCAS El Toro base property for NCCP/HCP target species in a manner that allows demographic and genetic exchange between populations or subpopulations.

4.2 CONSTRAINTS AND COMPENSATORY MITIGATION MEASURES

Local, State, and federal agencies regulate sensitive biological resources and require an assessment of their presence or potential presence to be conducted for each proposed project site. These assessments should be conducted for all sensitive vegetation communities and special status species that have the potential to occur within or adjacent to a proposed project site prior to the approval and implementation of that project. Because the information provided in this report is based solely on an analysis of existing literature and historical data for the region, and no surveys were conducted to prepare this report, future development projects will require a more refined evaluation of biological resources.

BIOLOGICAL TECHNICAL REPORT
CITY OF IRVINE
GENERAL PLAN UPDATE

Sensitive biological resources in the City include, but are probably not limited to, those addressed in this report. The City's environment is not static and may change over time as a result of development, fire, or other factors. In addition, vegetation communities may become sensitive and/or species may become listed in the future. For future proposed development projects, it is the responsibility of each Project Proponent to evaluate the known and potential sensitive biological resources within the proposed project area.

This section provides the City and future Project Proponents with guidelines to evaluate potential project-related impacts and design appropriate avoidance, minimization, and/or mitigation measures to assure impacts are reduced to below a level of significance as defined by CEQA. These measures are not intended to replace requirements outlined in the NCCP/HCP, General Plan, Municipal Code, and the SAMP.

4.2.1 General Measures for Impact Assessments

As part of the project approval process, each future proposed project should include an initial site assessment to determine if sensitive biological resources could be present within and/or adjacent to the proposed development project and whether the project site lies inside the NCCP/HCP Reserve System (including the Irvine Open Space Preserve of the Irvine Open Space Initiative) or Special Linkage Areas or whether it lies outside.

If no sensitive biological resources have a potential to occur within and/or adjacent to the proposed project, the City may approve the proposed project to proceed without further biological resource analyses.

If sensitive biological resources have potential to occur, the following general biological mitigation measures would apply.

Bio-1: Applicants for future development projects shall include a biological resources survey. The survey shall be conducted by a qualified biologist. The biological resources survey shall include, but not be limited to:

- A search of available literature and biological databases, such as CNDDB to determine sensitive biological resources that have been reported from the proposed project vicinity.
- Mapping vegetation communities on the proposed project site.
- A general assessment and mapping of all potential jurisdictional resources (wetlands and riparian habitats).
- Evaluating wildlife movement corridors in the vicinity of the proposed project site.

Bio 2: If the proposed development project site supports vegetation communities that may provide habitat for special status plant or animal species, a focused habitat assessment shall be conducted by a qualified biologist to determine the potential for special status plant and/or animal species to occur within or adjacent to the proposed development project area.

Bio-3: If one or more special status species has the potential to occur within the proposed development project area, focused species surveys shall be conducted to determine the presence/absence of these species to adequately evaluate potential direct and/or indirect impacts to these species.

Bio-4: If construction activities are not initiated immediately after focused surveys have been completed, additional pre-construction special status species surveys may be required to assure impacts are avoided or minimized to the extent feasible. If pre-construction activities are required, a qualified biologist would perform these surveys as required for each special status species that is known to occur or has a potential to occur within or adjacent to the proposed development project area.

Bio-5: The results of the biological survey shall be presented in a biological survey letter report for proposed development projects with no significant impacts, or in a biological technical report for proposed development projects with significant impacts that require mitigation to reduce the impacts to below a level of significance.

Bio-6: If sensitive biological resources are identified within or adjacent to the proposed development project area, the construction limits shall be clearly flagged to ensure impacts to sensitive biological resources are avoided or minimized to the extent feasible. Prior to implementing construction activities, a qualified biologist shall verify that the flagging clearly delineates the construction limits and that sensitive resources to be avoided.

Bio-7: If sensitive biological resources are known to occur within or adjacent to the proposed development project area, a project-specific contractor training program shall be developed and implemented to educate project contractors on the sensitive biological resources within and adjacent to the proposed development project area and measures being implemented to avoid and/or minimize impacts to these species. A qualified biologist shall develop and implement the contractor training program.

Bio-8: If sensitive biological resources are present within or adjacent to the proposed development project area and impacts may occur from implementation of construction activities, a qualified biological monitor may be required during a portion or all of the construction activities to ensure impacts to the sensitive biological resources are avoided or minimized to the extent feasible. The specific biological monitoring requirements shall be evaluated on a project-by-project basis. The qualified biological monitor shall be approved by the City on a project by project basis based on applicable experience with the sensitive biological resources that may be impacted by the proposed development project activities.

Bio-9: If birds that are protected by the MBTA are identified within or adjacent to the proposed development project area, the proposed development project may result in direct or indirect impacts to these species, especially during breeding season. If impacts cannot be avoided, potential impacts during the breeding season may be considered significant depending on the species and the extent of the impact. To ensure that active nests are not impacted, pre-construction general nesting bird surveys shall be conducted within all suitable nesting habitat that may be impacted by active construction during the general avian breeding season (February 1 through August 31). The pre-construction surveys shall be conducted no more than 7 days prior to initiation of construction. If no active avian nests are identified within the proposed development project area or within a 300-foot buffer of the proposed development project area, no further mitigation is necessary. If active nests of avian species protected by the MBTA are detected within the proposed development project area or within a 300-foot buffer of the proposed development project area, construction shall be halted until the young have fledged, until a qualified biologist has determined the nest is

inactive, or until appropriate mitigation measures that respond to the specific situation have been developed and implemented in consultation with the regulatory agencies.

4.2.2 Measures for Impacts to Jurisdictional Areas

Impacts to jurisdictional areas could be considered significant under CEQA depending on the extent of the proposed impact. Survey requirements and mitigation measures for unavoidable impacts to jurisdictional areas resulting from future proposed development projects are discussed below.

Bio-10: If a proposed project has the potential to affect jurisdictional resources, a qualified biologist shall conduct a jurisdictional delineation following the methods outlined in the 1987 Corps Wetland Delineation Manual (Corps 1987) and the Regional Supplement to the Corps Wetland Delineation Manual: Arid West Region (Corps 2008a) to map the extent of wetlands and non-wetland waters, determine jurisdiction, and assess potential impacts. The results of the delineation shall be presented in a wetland delineation letter report and shall be incorporated into the CEQA document(s) required for approval and permitting of the proposed project.

Bio-11: If a proposed project would impact jurisdictional features, permits and authorizations shall be obtained from the Corps, CDFW, and/or RWQCB. The regulatory agency authorization(s) would include impact avoidance and minimization measures as well as mitigation measures for unavoidable impacts. Specific avoidance, minimization, and mitigation measures for impacts to jurisdictional resources shall be determined through discussions with the regulatory agencies during the proposed project permitting process and may include monetary contributions to a mitigation bank or habitat creation, restoration, and/or enhancement.

SUMMARY OF FINDINGS

The objective of this study is to review and summarize available information regarding known paleontological, archaeological, and historical resources within the boundaries of the City of Irvine (City) to support the update of the City's General Plan. The update will provide long-term policy direction and communicate the vision, values, and goals for the City's physical development and overall quality of life. The City of Irvine 2045 General Plan will serve to identify areas of opportunity and provide options to enhance development in key focus areas of the City.

The City has a complicated paleontological history which began at the age of dinosaurs about 100.5 million years (Ma) ago. The past 100.5 Ma has seen the City transition back and forth several times from marine to terrestrial deposits. A search for paleontological records was completed by the Natural History Museum of Los Angeles County and in the literature. Numerous fossils have been recovered in the City and an updated sensitivity map is provided.

The Vaqueros, Sespe-Vaqueros, Sespe, Monterey, Puente and Capistrano Formations are assigned a high paleontological sensitivity. Formations assigned a moderate sensitivity include the Williams Formation Pleasants Sandstone Member, the Santiago Formation, the Topanga Group, the undifferentiated Puente Formation, and the Pliocene Niguel Formation. A programmatic mitigation measure is recommended.

Cogstone conducted a search of the California Historic Resources Inventory System at the South Central Coastal Information Center on September 24 and 25, 2018. Results of the record search indicate that 647 previous cultural resources studies have been completed within the boundaries of the City. The records search also determined 379 previously recorded cultural resources are located within the City boundaries; over half are prehistoric resources.

Prehistoric sites/Tribal Cultural Resources are most abundant in the San Joaquin Marsh area and San Joaquin Hills, both south of Interstate 405. Sites are also abundant along what were, at the time, permanent water sources such as creeks and springs northeast of Irvine Blvd. Only ten sites are known on the plain between I-405 and Irvine Blvd. On this basis the areas south of I-405 and north of Irvine Blvd. are ranked as highly sensitive and the plain in between as less sensitive. An updated sensitivity map is provided. Three programmatic mitigation measures are recommended.

INTRODUCTION

PURPOSE OF STUDY

The objective of this study is to review and summarize available information regarding known paleontological, archaeological, and historical resources within the boundaries of the City of Irvine (City) to support an update of the City's General Plan. The City is located in southern Orange County and covers 42,175.58 acres with an additional Sphere of Influence (SOI) of 4,830.83 acres (Figure 1).

PROJECT LOCATION AND DESCRIPTION

Located in Orange County, the City of Irvine is located approximately two miles inland east of the Pacific Ocean (refer to Figure 1). The City is bounded by Tustin to the north with a small portion bordering Orange County unincorporated land by SR 261, Santa Ana to the northwest, Lake Forest to the East, Laguna Hills and Laguna Woods to the southeast, Costa Mesa to the west, and Newport Beach to the southwest. The City of Irvine is located primarily within the Tustin and El Toro United States Geographical Survey (USGS) 7.5-minute topographic maps but also includes portions of the Black Star Canyon, Laguna Beach, Orange, and San Juan Capistrano USGS 7.5'-minute topographic maps (Table 1).

Table 1. City of Irvine Cadastral Information

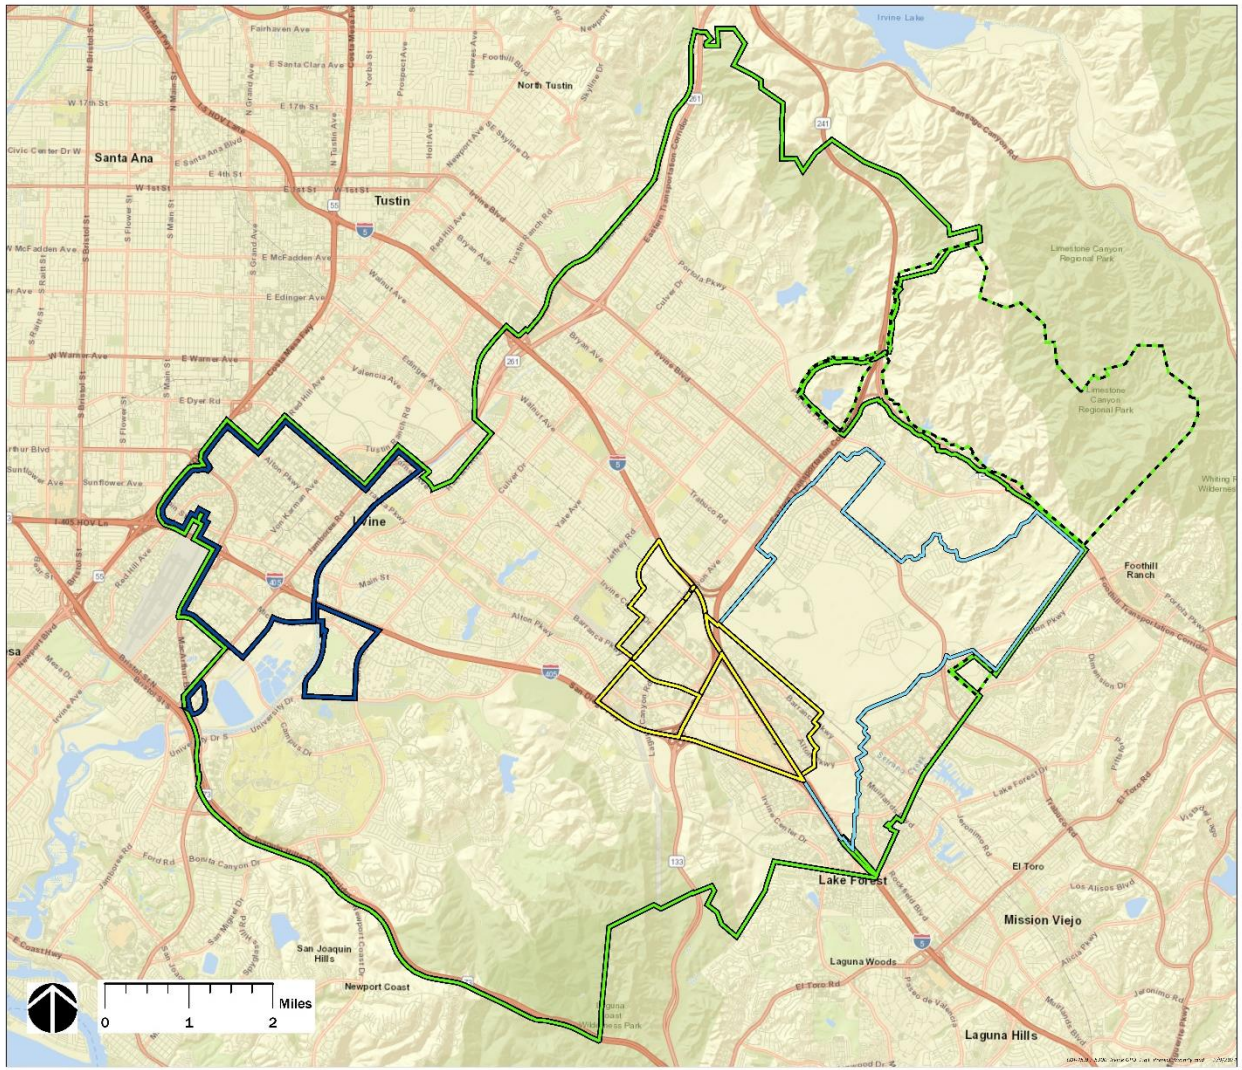

Figure 1. Project Vicinity Map

Incorporated in 1971, the City of Irvine adopted the first General Plan in December 1973. The City's General Plan was last comprehensively updated in 2000 and has been updated over the years to address necessary General Plan amendments. Since 2000, the City has continued to grow and the community has matured and evolved. As Irvine moves forward, the focus of the General Plan objectives and policies must be reexamined to ensure that the high quality-of-life factors that make Irvine exceptional are maintained and enhanced for residents, businesses, and visitors into the future. The update will provide long-term policy direction and communicate the vision, values, and goals for the City's physical development and overall quality of life. The City of Irvine 2045 General Plan will serve to identify areas of opportunity and provide options to enhance development in key focus areas of the City.

In addition, with the adoption of the certified 2021-2029 Housing Element in May 2022, the City is required to update the appropriate elements of the General Plan to accommodate the residential site inventory from the 2021-2029 Housing Element.

Project Buildout

The City is preparing the 2045 Focused General Plan Update that will serve as the long-range vision of the City for the next 20 to 25 years. The City as the lead agency has determined that the project will require the preparation of a Program Environmental Impact Report (Program EIR) in compliance with the California Environmental Quality Act (CEQA; California Public Resources Code, Section 21000 et seq.), and Title 14 of the California Code of Regulations (CCR).

Consistent with the 2021-2029 Housing Element, the Project would update the General Plan land use element to support the City's Regional Housing Needs Assessment (RHNA) of 23,610 units. To ensure consistency with State housing statutes, including no-net loss and affirmatively furthering fair housing requirements, the 2021-2029 Housing Element identified adequate sites to accommodate 57,656 new residential units. However, the City's current General Plan has a significant amount of unbuilt non-residential square footage available throughout the planning areas identified in the 2021-2029 Housing Element site inventory that would be available for the potential conversion to residential uses. As a result of the likely conversion of non-residential uses to residential uses, the City would need to add 15,019 fewer units under the Reduced Project Alternative (the Preferred Project) compared to the Proposed Project (the Conservative Alternative). In total, the Reduced Project Alternative would add 42,637 new units to the General Plan as compared to the 57,656 units proposed as part of the Project. The Project would accommodate the City's RHNA requirement for new residential units and implement the 2021-2029 Housing Element through the introduction of additional residential and/or mixed-use development throughout the City using overlay zones and/or master plans to allow greater flexibility for property owners and developers. The overlays would promote higher density residential and mixed-use in three focus areas, targeted retail centers, conversion of hotel/motel,

and on religious and school sites. It is anticipated that the majority of the future residential growth would occur in the three focus areas that are most suited for new growth and development as they are located near existing job centers and are along major travel corridors with access to existing and future public transit opportunities. Focus Area 1 is the Irvine Business Complex (Planning Area [PA] 19, 36); Focus Area 2 is the Spectrum area (PAs 13, 31, 32, and 33); and Focus Area 3 is Great Park Neighborhoods (PA 51), each of which is shown in Figure 1.

Focus Area 1 – Greater Irvine Business Complex Area: Planning Area 36 (Irvine Business Complex) and Planning Area 19 (Rancho San Joaquin): Focus Area 1 includes expanding a residential and/or mixed-use overlay to the entire Irvine Business Complex (IBC) and the specific sites identified in the 2021-2029 Housing Element site inventory located in Rancho San Joaquin. Over the past twenty years, the IBC has transitioned from predominantly non-residential uses to a mixed-use area that is currently governed by the 2007 IBC Vision Plan. Under the existing General Plan, the IBC has a maximum of 15,000 units. The IBC continues to be one of the two employment centers located within the City and remains an opportunity area for high density residential. The IBC is connected to the Tustin Transportation Center (Metrolink and OCTA transit service) through the iShuttle and has direct access to Interstate 405, State Route 73, and State Route 55. The General Plan Update proposes a new residential overlay and/or specific plan that will increase the total number of residential permitted in the Greater Irvine Business Complex Area by an additional 15,000 units.

Focus Area 2 - Greater Spectrum Area: Planning Area 13 (Irvine Spectrum 4), Planning Area 31 (Irvine Spectrum 6), Planning Area 32 (Irvine Spectrum 3), and Planning Area 33 (Irvine Spectrum Center): The Greater Spectrum Area incorporates three non-residential planning areas (13, 31, and 32) that are located adjacent to the Irvine Spectrum Center area, are emerging employment centers, are located near the Irvine Transportation Center (ITC – Metrolink, Amtrak, and OCTA transit service), and with the introduction of a residential overlay and/or specific plan could transition to a network of micro-villages or residential nodes, connected by a variety of multi-modal and complete street strategies that provide new opportunities for residents and businesses in Irvine. The General Plan Update proposes a new residential overlay and/or specific plan that will introduce a total number of 26,607 residential units to the Greater Spectrum Area.

Focus Area 3 – Great Park Neighborhood Transit Village: Planning Area 51 (Great Park Neighborhood): The Great Park Neighborhoods is an existing mixed-use planning area that features a mix of residential products at varying densities surrounding the Irvine Great Park. There are approximately 1,900 units remaining in the existing General Plan intensity, but a significant amount of the planning area remains vacant with no additional residential intensity. The proposed General Plan Update will increase the number of residential units permitted in the

Great Park with a focus on higher density product located near or adjacent to the Irvine Transportation Center. The Great Park Neighborhood Transit Village area will have direct access to Focus Area 2, the Greater Spectrum Area through a network of proposed multi-modal improvements. The General Plan Update will increase the residential intensity in Planning Area 51 by an additional 5,252 residential units.

The remaining units will be accommodated throughout the City per the 2021-2029 Housing Element site inventory. The residential overlays and/or specific plans will encourage a micro-village approach, building upon the historic and successful approach to master planning in the City of Irvine. Utilizing a micro-village approach to planning will ensure the focus areas are balanced with a mix of uses including neighborhood supporting square footage, open space, and non-residential square footage that are connected through multi-modal transportation and complete street strategies.

PROJECT PERSONNEL

Cogstone Resource Management (Cogstone) conducted the cultural and paleontological resources studies. Qualifications of Cogstone personnel are provided (Appendix A).

- Molly Valasik served as the Principal Archaeologist for the Project and reviewed the report. Valasik has an M.A. in Anthropology from Kent State University, a B.A. in Anthropology from Ohio State University, and 15 years of experience in southern California archaeology.

- Kim Scott served as the Principal Paleontologist for the Project and wrote the geological and paleontological portions of this report. Scott has an M.S. in Biology with paleontology emphasis from California State University, San Bernardino, a B.S. in Geology with paleontology emphasis from the University of California, Los Angeles, and over 29 years of experience in California paleontology and geology.

- Holly Hickman authored portions of the report. Ms. Hickman has a B.A. in Archaeology and History from Simon Fraser University, British Columbia, Canada, and 11 years of experience in southern California archaeology.

- Sherri Gust (late) wrote the prehistoric and ethnographic sections of this report. Ms. Gust was a Registered Professional Archaeologist (RPA) with an M.S. in Anatomy (Evolutionary Morphology) from the University of Southern California, a B.S. in Anthropology from the University of California at Davis and over 36 years of experience in California.

- Shannon Lopez conducted the archaeological and historic records search and wrote the historic context. Lopez has an M.A. in Architectural History from California State University, Fullerton, and a B.A. in History from California State University, Dominguez Hills, and five years of professional experience.

- Logan Freeberg prepared the GIS maps for the report. Mr. Freeberg has a B.A. in Anthropology from UC Santa Barbara and a GIS certification from CSU Fullerton and over 20 years of experience in California archaeology.

REGULATORY ENVIRONMENT

CALIFORNIA ENVIRONMENTAL QUALITY ACT

CEQA states that: “It is the policy of the state that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects, and that the procedures required are intended to assist public agencies in systematically identifying both the significant effects of proposed project and the feasible alternatives or feasible mitigation measures which will avoid or substantially lessen such significant effects.”

CEQA declares that it is State policy to: "take all action necessary to provide the people of this state with...historic environmental qualities." It further states that public or private projects financed or approved by the state are subject to environmental review by the state. All such projects, unless entitled to an exemption, may proceed only after this requirement has been satisfied. CEQA requires detailed studies that analyze the environmental effects of a proposed project. In the event that a project is determined to have a potential significant environmental effect, the act requires that alternative plans and mitigation measures be considered. If archaeological or paleontological resources are identified as being within the proposed project study area, the sponsoring agency must take those resources into consideration when evaluating project effects. The level of consideration may vary with the importance of the resource.

TRIBAL CULTURAL RESOURCES

In 2015, CEQA was amended and established that “[a] project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment” (Public Resources Code [PRC] § 21084.2). In order to be considered, a “tribal cultural resource” must be a site, feature, place, cultural landscape, sacred place, or object, which is of cultural value to a California Native American Tribe and is either:

(1) listed, or determined to be eligible for listing, on the national, state, or local register of historic resources, or
(2) a resource that the lead agency chooses, in its discretion, to treat as a tribal cultural resource.

To help determine whether a project may have such an effect, the lead agency must consult with any California Native American tribe that requests consultation and is traditionally and culturally affiliated with the geographic area of a proposed project. California Native American tribe means a Native American tribe located in California that is on the contact list maintained by the

Native American Heritage Commission for the purposes of Chapter 905 of the Statutes of 2004 (PRC §21073.2.5). Consultation must take place prior to the determination of whether a negative declaration, mitigated negative declaration, or environmental impact report is required for a project (PRC § 21080.3.1).

In applying those criteria, a lead agency must consider the value of the resource to the tribe. For example, in considering the criterion that a resource is "associated with the lives of persons important in our past," a lead agency would ask whether the resource is associated with the lives of persons important to the relevant tribe's past. That determination must be supported with substantial evidence which is defined in PRC §20180 (e) (1) as "fact, a reasonable assumption predicated on fact, or expert opinion supported by fact".

If a lead agency determines that a project may cause a substantial adverse change to tribal cultural resources, the lead agency must consider measures to mitigate that impact. PRC §20184.3 (b) (2) provides examples of mitigation measures that lead agencies may consider to avoid or minimize impacts to tribal cultural resources.

CALIFORNIA REGISTER OF HISTORICAL RESOURCES

The California Register of Historical Resources (CRHR) is a listing of all properties considered to be significant historical resources in the state. The California Register includes all properties listed or determined eligible for listing on the National Register, including properties evaluated under Section 106, and State Historical Landmarks number No. 770 and above. The California Register statute specifically provides that historical resources listed, determined eligible for listing on the California Register by the State Historical Resources Commission, or resources that meet the California Register criteria are resources that must be given consideration under CEQA (see above). Other resources, such as resources listed on local registers of historic registers or in local surveys, may be listed if they are determined by the State Historic Resources Commission to be significant in accordance with criteria and procedures to be adopted by the Commission and are nominated; their listing in the California Register, is not automatic.

Resources eligible for listing include buildings, sites, structures, objects, or historic districts that retain historical integrity and are historically significant at the local, state or national level under one or more of the following four criteria:

1) It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States;
2) It is associated with the lives of persons important to local, California, or national history;

3) It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master or possesses high artistic values; or
4) It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

In addition to having significance, resources must have integrity for the period of significance. The period of significance is the date or span of time within which significant events transpired, or significant individuals made their important contributions. Integrity is the authenticity of a historical resource's physical identity as evidenced by the survival of characteristics or historic fabric that existed during the resource's period of significance.

Alterations to a resource or changes in its use over time may have historical, cultural, or architectural significance. Simply, resources must retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance. A resource that has lost its historic character or appearance may still have sufficient integrity for the California Register, if, under Criterion 4, it maintains the potential to yield significant scientific or historical information or specific data.

PUBLIC RESOURCES CODE SECTION

Section 5097.5: No person shall knowingly and willfully excavate upon, or remove, destroy, injure or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, or any other archaeological, paleontological or historical feature, situated on public lands (lands under state, county, city, district or public authority jurisdiction, or the jurisdiction of a public corporation), except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor. As used in this section, "public lands" means lands owned by, or under the jurisdiction of, the state, or any city, county, district, authority, or public corporation, or any agency thereof.

NATIVE AMERICAN HUMAN REMAINS

Sites that may contain human remains important to Native Americans must be identified and treated in a sensitive manner, consistent with state law (i.e., Health and Safety Code §7050.5 and Public Resources Code §5097.9). In the event that human remains are encountered during project development and in accordance with the Health and Safety Code Section 7050.5, the County Coroner must be notified if potentially human bone is discovered. The Coroner will then determine within two working days of being notified if the remains are subject to his or her authority. If the Coroner recognizes the remains to be Native American, he or she shall contact

the Native American Heritage Commission (NAHC) by phone within 24 hours, in accordance with Public Resources Code Section 5097.98. The NAHC will then designate a Most Likely Descendant (MLD) with respect to the human remains. The MLD then has the opportunity to recommend to the property owner or the person responsible for the excavation work means for treating or disposing, with appropriate dignity, the human remains and associated grave goods.

CALIFORNIA ADMINISTRATIVE CODE, TITLE 14, SECTION 4307

This section states that "No person shall remove, injure, deface or destroy any object of paleontological, archeological or historical interest or value."

CITY GUIDELINES

The City of Irvine General Plan includes Element E on Cultural Resources. It recognizes the importance of historical, archaeological and paleontological resources in the City and establishes a process for their early identification, consideration, and where appropriate, preservation. It requires assessment of potential resources on projects and utilizes planning policies, ordinances, approval conditions and mitigation measures to protect the resources. This Project is itself a General Plan Update and may include updates to these goals and objectives.

ELEMENT E: CULTURAL RESOURCES

GOAL: Ensure the proper disposition of historical, archaeological, and paleontological resources to minimize adverse impacts, and to develop an increased understanding and appreciation for the community's historic and prehistoric heritage, and that of the region.

OBJECTIVE E-1: HISTORICAL, ARCHAEOLOGICAL, PALEONTOLOGICAL SURVEYS
Identify and obtain information on the existence and significance of historical, archaeological, and paleontological sites and encourage land use planning which incorporates this information.

OBJECTIVE E-2: HAZARD OCCURRENCE
Evaluate surveyed sites for their present and potential cultural, educational, recreational, and scientific value to the community and the region, and determine their proper disposition prior to the approval of any project which could adversely affect them.

DEFINITION OF SIGNIFICANCE FOR PALEONTOLOGICAL RESOURCES

Only qualified, trained paleontologists with specific expertise in the type of fossils being evaluated can determine the scientific significance of paleontological resources. Fossils are considered to be significant if one or more of the following criteria apply:

1. The fossils provide information on the evolutionary relationships and developmental trends among organisms, living or extinct;
2. The fossils provide data useful in determining the age(s) of the rock unit or sedimentary stratum, including data important in determining the depositional history of the region and the timing of geologic events therein;
3. The fossils provide data regarding the development of biological communities or interaction between paleobotanical and paleozoological biotas;
4. The fossils demonstrate unusual or spectacular circumstances in the history of life;
5. The fossils are in short supply and/or in danger of being depleted or destroyed by the elements, vandalism, or commercial exploitation, and are not found in other geographic locations.

As so defined, significant paleontological resources are determined to be fossils or assemblages of fossils that are unique, unusual, rare, uncommon, or diagnostically important. Significant fossils can include remains of large to very small aquatic and terrestrial vertebrates or remains of plants and animals previously not represented in certain portions of the stratigraphy. Assemblages of fossils that might aid stratigraphic correlation, particularly those offering data for the interpretation of tectonic events, geomorphologic evolution, and paleoclimatology are also critically important (Scott and Springer 2003, Scott et al. 2004).

BACKGROUND

GEOLOGICAL SETTING

The project area is in the northern extent of the California Geomorphic Province known as the Peninsular Ranges. The Peninsular Ranges geomorphic province extends from Mount San Jacinto in the north, through the tip of Baja, Mexico in the south. Subparallel to these ranges on the east is the San Andreas Fault Zone. The northwestwards motion of the Pacific Plate has created these ranges and their corresponding valleys (Wagner 2002).

PALEONTOLOGICAL SETTING

The City has a complicated paleoenvironmental history that began during the Mesozoic Era (the "Age of Dinosaurs"), about 93 million years ago (93 Ma; Table 2). The past 93 Ma has seen the City transition from deep water marine in the Late Cretaceous, to coastal lowlands during the Paleocene to Oligocene, to shallow marine during the early Miocene, to deep marine during the early to early-late Miocene, back to shallow marine in the latest Miocene through the Pliocene, and finally to increasingly arid terrestrial deposits from the Pleistocene to the Holocene. In addition, younger sediments have been washed into the ocean by action of streams. Detail on each geological unit is in the Stratigraphy Section below.

STRATIGRAPHY

Geologic mapping by Morton and Miller (2006) maps the area as 27 separate rock units ranging from modern deposits to Late Cretaceous sediments (Table 2; Figure 2). Geological units are discussed in order from oldest to youngest.

Table 2. Geologic units within the City from oldest to youngest

Rock Unit Name		Paleoenvironment	Epoch	Epoch Age Range
Williams Formation, Pleasants Sandstone Member (Kwps)		shallow marine	Late Cretaceous	~100.5 Ma - ~66 Ma
Silverado Formation (Tsi)		coastal nonmarine to very shallow-marine	Paleocene	~66 Ma - ~56 Ma
Santiago Formation (Tsa)		coastal nonmarine to very shallow-marine	middle Eocene	~47.8 Ma to ~37.8 Ma
Sespe Formation (Ts)		nonmarine	late Eocene to early Miocene	~41.2 Ma - ~17.4 Ma
Vaqueros Formation (Tv)		shallow marine	latest Oligocene to latest early Miocene	~27 Ma - ~16 Ma
Vaqueros-Sespe Formation (Tvs)		shallow marine - nonmarine		
El Modeno Volcanics (Tiemd, Tiemd?)		volcanics	middle Miocene	middle Miocene
Topanga Group	Paulerino Formation (Ttp)	shallow marine		
	Los Trancos Formation (Ttlt)	shallow marine		
	Bommer Formation (Ttb)	shallow marine		
Monterey Formation (Tm)		deep marine	late Miocene	~11.6 Ma - ~5.3 Ma
Puente Formation (Tp, Tpsq, Tplv)		deep marine, submarine fan		
Capistrano Formation, Oso Member (Tco)		shallow marine	late Miocene to early Pliocene	~11.6 Ma - ~3.6 Ma
Niguel Formation (Tn)		shallow marine	Pliocene	~5.3 Ma - ~2.6 Ma
very old alluvial-fan deposits (Qvof)		alluvial fan	early to middle Pleistocene	~2.6 million years (Ma) - ~126 ka -
very old axial-channel deposits (Qvoa)		flood-plains		
old paralic and alluvial fan deposits (Qopf)		shoreline overlain by alluvial fans	middle to late Pleistocene	~774 ka - ~11.7 ka –
young landslide deposits (Qyls?)		landslide	late Pleistocene to Holocene	<126 ka
young alluvial-fan deposits (Qyf)		alluvial fan		
young colluvium (Qyc)		slope deposit		
young axial-channel deposits (Qya)		flood-plains		
very young slope wash deposits (Qsw)		slope wash	late Holocene	<5,000 years (<5 ka)
very young landslide deposits (Qls, Qls?)		slope wash		
artificial fill (Qaf)		human-made	modern	<200 years

Figure 2b. Geology Map, 2 of 4

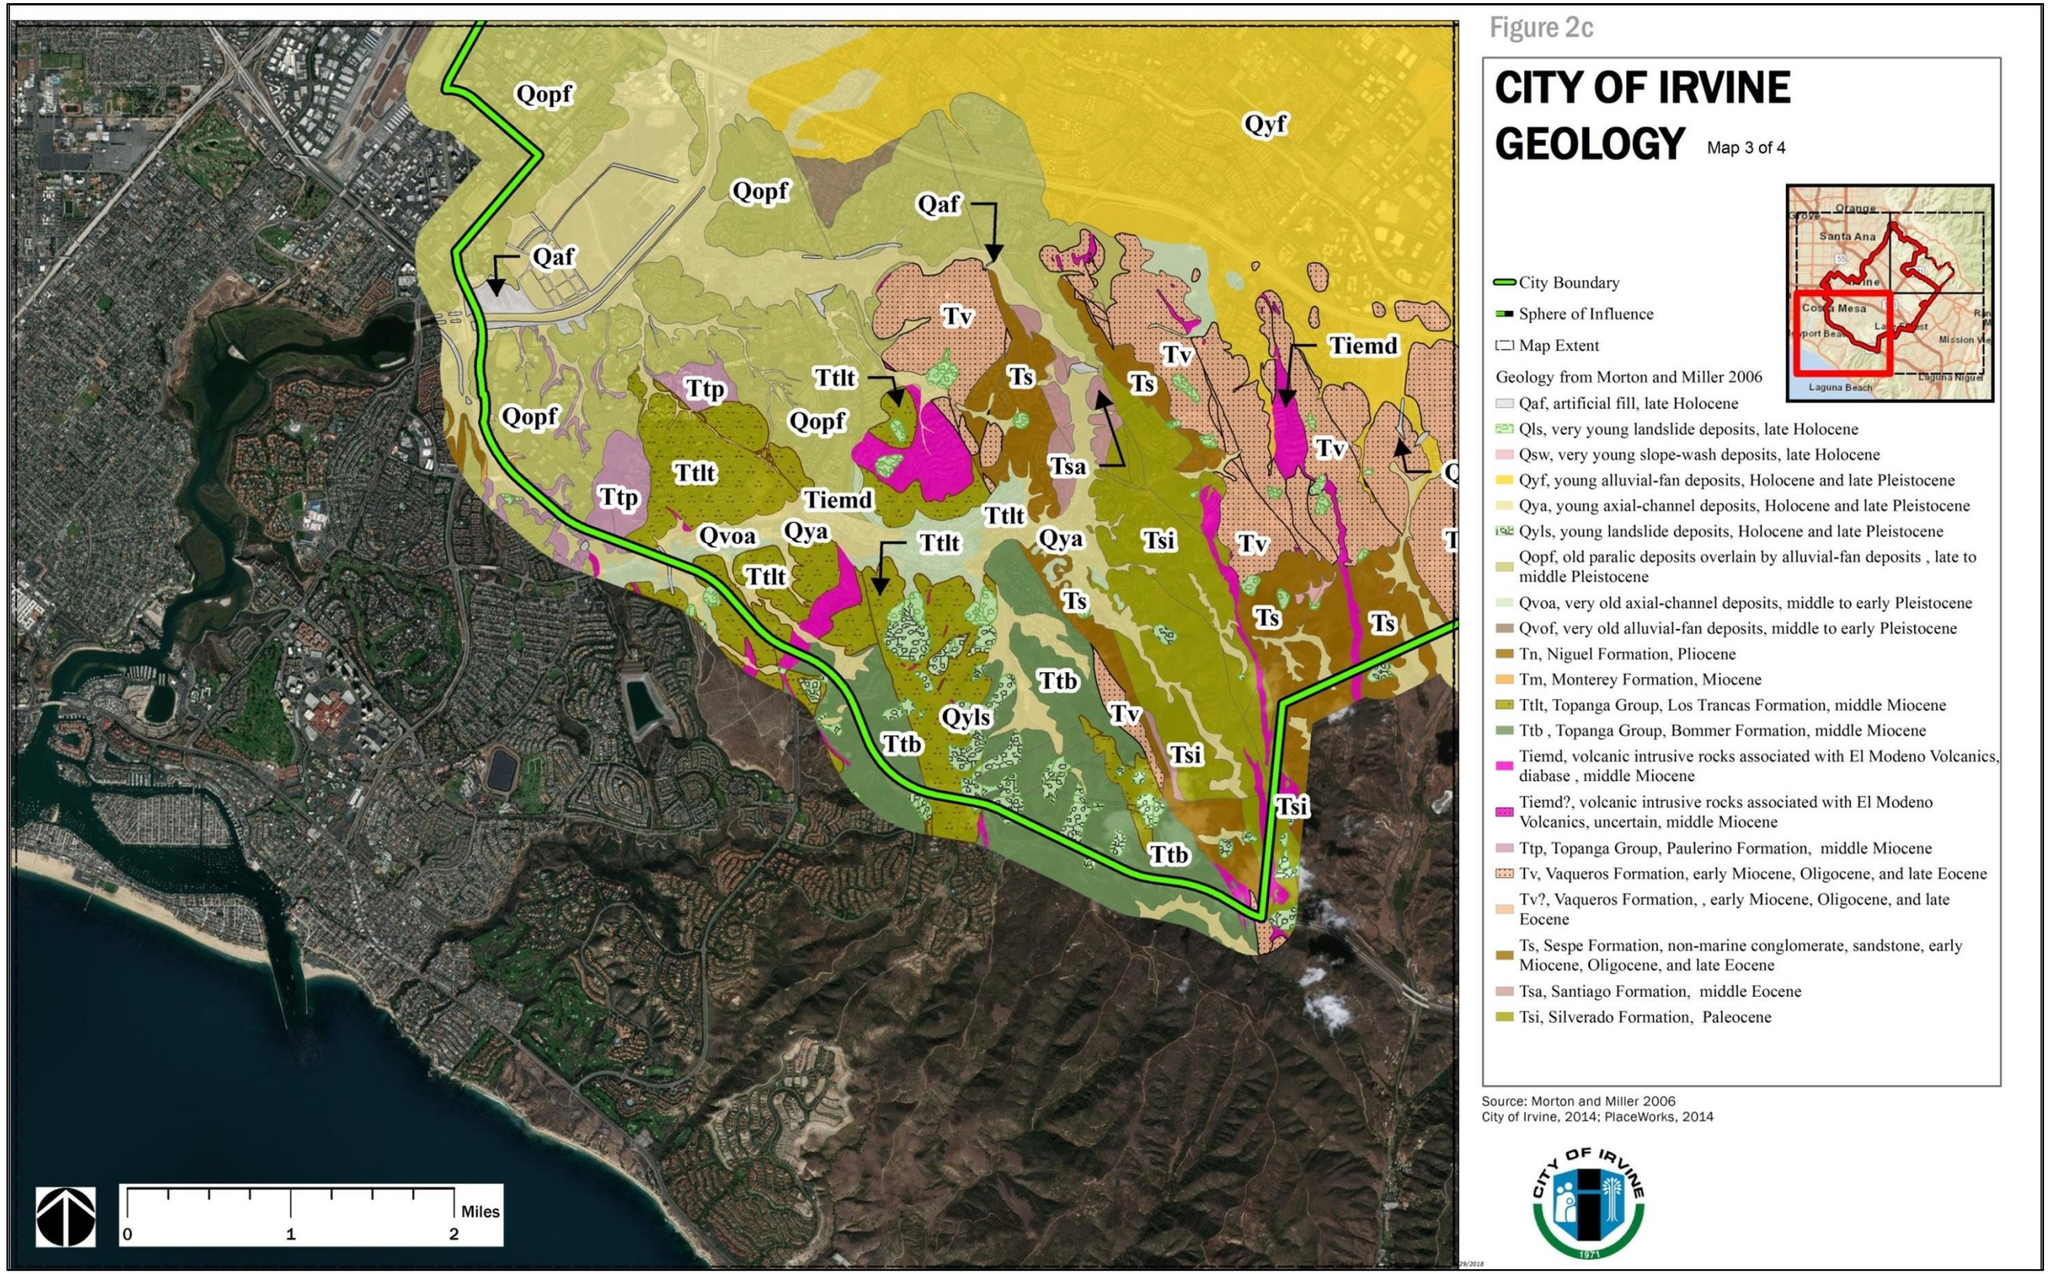

Figure 2c. Geology Map, 3 of 4

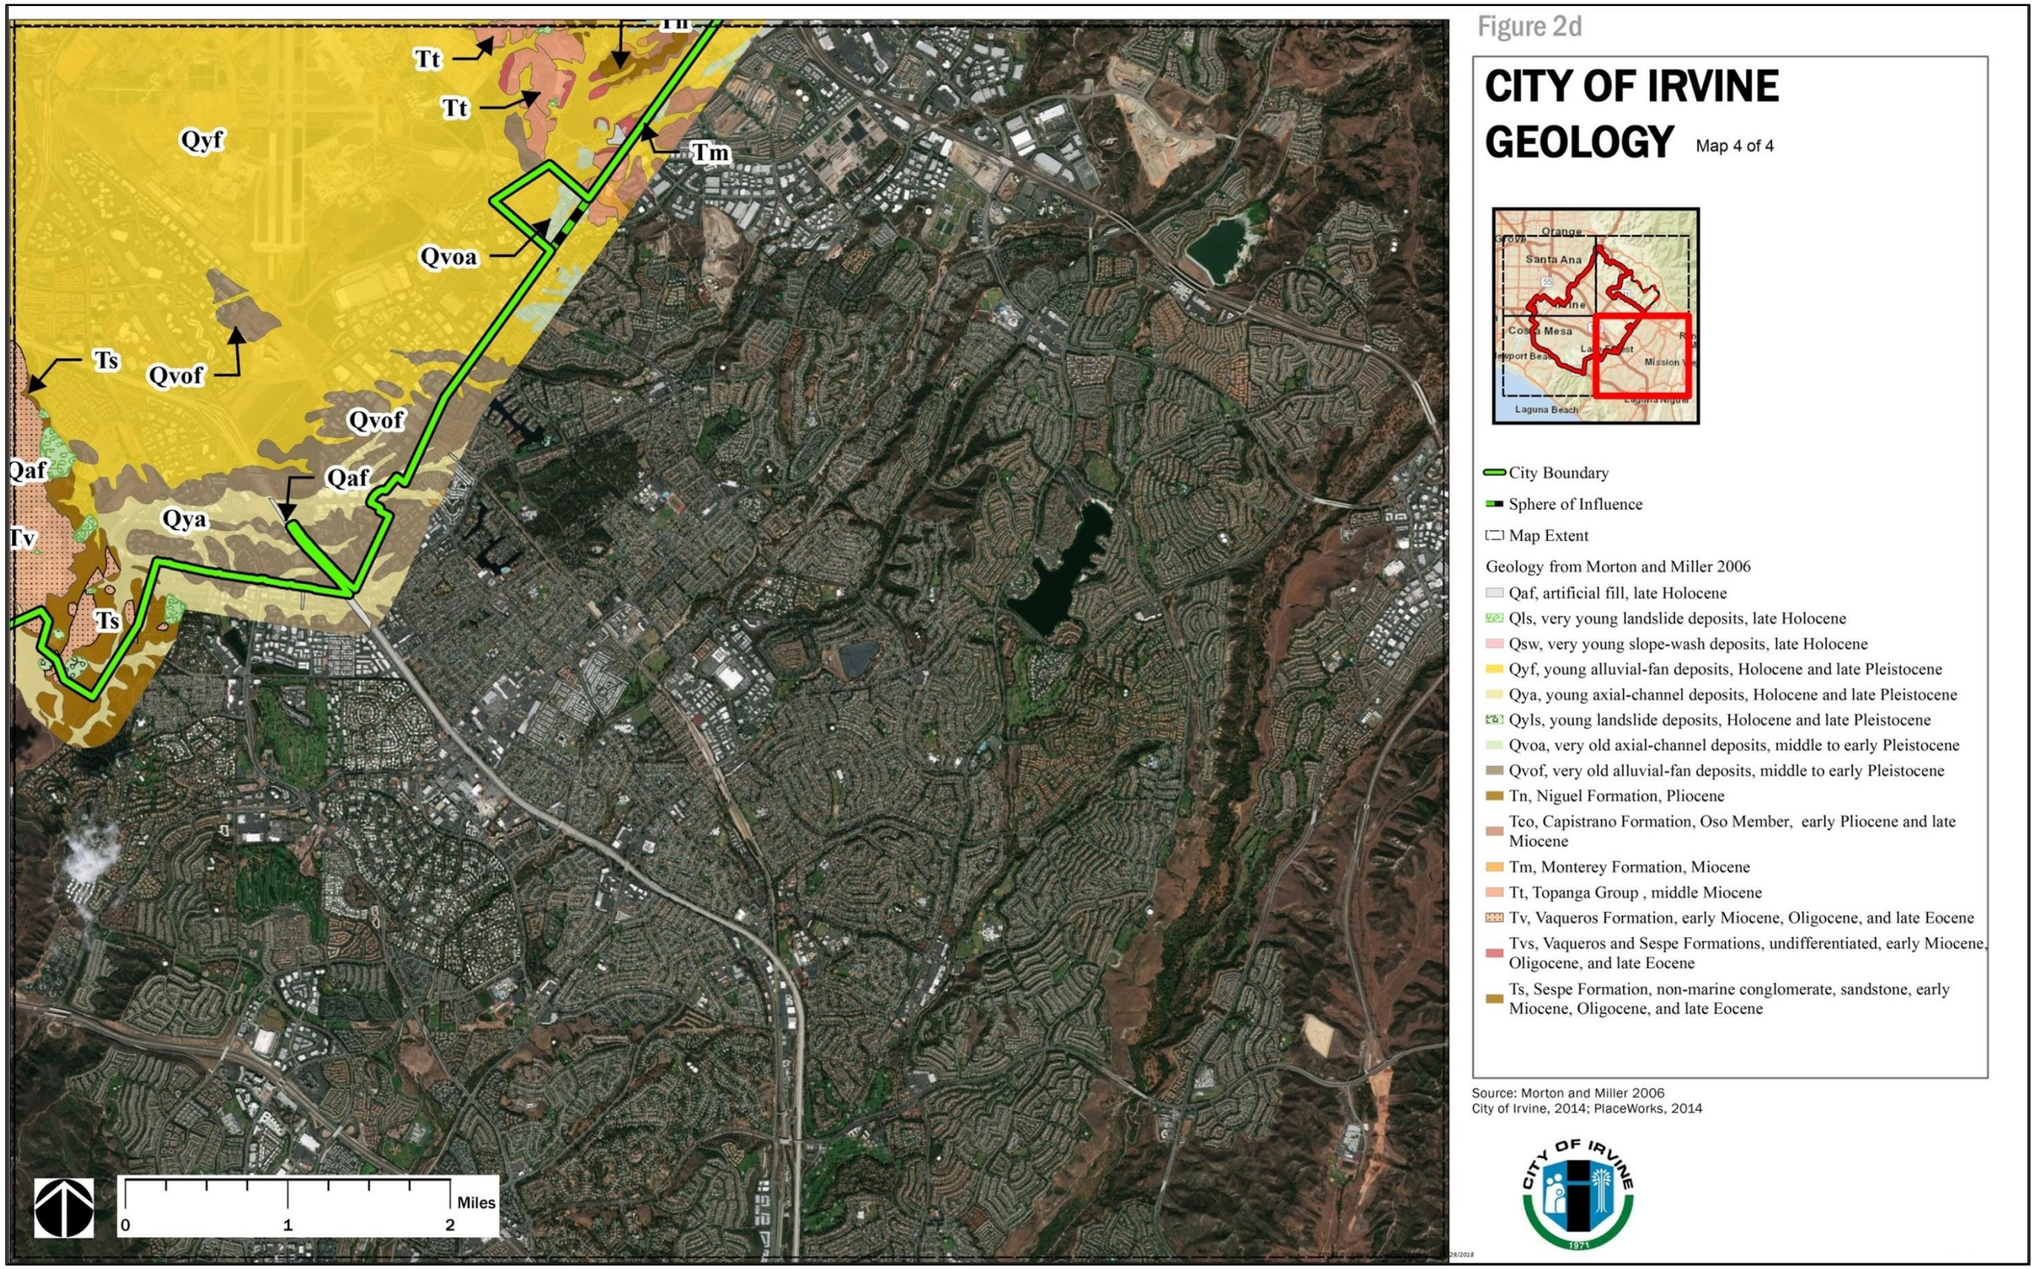

Figure 2d. Geology Map, 4 of 4

Late Cretaceous Rocks (~100.5 million years old [Ma] to ~66 Ma)

Williams Formation, Pleasants Sandstone Member (Kwps)

The thickness of this shallow marine sandstone ranges from 0 m to 150 m in the Santa Ana Mountains. The lower portion of this formation consists of a massive sandstone with biotite, black carbonaceous fragments, scattered conglomerate lenses, and thin-bedded, biotite- and muscovite-bearing sandstone. The upper portion consists of poorly bedded, white to pale gray, feldspathic sandstone (Schoellhamer et al. 1981, Morton and Miller 2006).

Paleocene Rocks (~66 Ma to ~56 Ma)

Silverado Formation (Tsi)

Deposited in coastal nonmarine swamps and sloughs to very shallow-marine deltas and bays, the thickness of this formation ranges from 200 m to 450 m in the Santa Ana Mountains. This formation is divided into a basal conglomerate (Tsicg) overlain by sandstone and siltstone of the undifferentiated Silverado Formation (Tsi; Schoellhamer et al. 1981, Morton and Miller 2006).

Above the basal conglomerate, the Silverado Formation consists of marine and nonmarine, sandstone and siltstone. Clasts are largely of quartz and clay with some conglomerate. The locally mapped Serrano Clay (Tsis) is present within the upper Silverado Formation. It is a 1 m thick marker bed composed of pale gray to white, soft and plastic clay and quartz with carbonaceous shale and lignite beds (Schoellhamer et al. 1981, Eisentraut and Cooper 2002, Morton and Miller 2006).

Middle Eocene Deposits (~47.8 Ma to ~37.8 Ma)

Santiago Formation (Tsa)

These sediments consist of marine and nonmarine deposits from a coastal lowland paleoenvironment. At the base is a conglomerate with the clasts that originated from western central Mexico where the Santiago Formation was originally deposited. The north-westerly movement of the Pacific Plate by the San Andreas Fault Zone brought these sediments into southern California. Pale gray sandstone and some interbedded siltstone occurs above the conglomerate (Schoellhamer et al. 1981, Morton and Miller 2006).

Late Eocene to latest early Miocene Deposits (~41.2 Ma to ~17.4 Ma)

Sespe Formation (Ts)

This red to grey, non-marine mudstone to conglomerate occurs as massive to thick bedded deposits with poorly developed bedforms (Eisentraut and Cooper 2002, Morton and Miller

2006). This terrestrial deposit includes fluvial, floodplain, and alluvial fan deposits. This formation also reflects a major drop in global sea levels (Eisentraut and Cooper 2002, McCulloch and Bayer 2004).

Miocene Epoch (~23 Ma to ~5.3 Ma)

The Miocene Epoch was a dramatic time in southern California. The San Andreas Fault began bringing Pacific Plate lands from the south, volcanoes erupted, mountain grew, and numerous coastal marine basins were formed. Orange County rests in one of these basins - the Los Angeles Basin. During the Miocene, the Los Angeles Basin was tectonically active. Opening of the basin began about 17.4 Ma (McCulloch and Bayer 2004) and was followed by subsidence and creation of a deep marine depositional basin. Sediments are estimated to be up to six miles thick, one of the thickest Neogene stratigraphic successions in the world (Eisentraut and Cooper 2002).

Latest Oligocene to latest early Miocene (~27 Ma to ~16 Ma)

Sespe-Vaqueros Formation (Tvs)

These two formations interfinger so much in many areas of California that they are mapped together. Sespe Formation sediments are generally coarser than those of the Vaqueros Formation. The Vaqueros-Sespe section and can reach thicknesses between 1,500 and 2,000 feet in the Lake Forest area (McCulloch and Bayer 2004). See the individual descriptions for each for more information.

Sespe Foramation (Ts)

This formation is of terrestrial origin and consists of sandstones and conglomerates from riverine, shoreline and floodplain environments. Commonly, the sandstones weathers to reddish-brown, maroon, pinkish-gray, tan and green colors. Many of the sandstones are resistant to erosion and thus form dramatic outcrops and ridgelines.

Vaqueros Formation (Tv)

The shallow marine Vaqueros Formation occurs as greenish-gray to very dark gray, massive- to thick-bedded silty sandstone. Sandstone beds interfinger with thin-bedded siltstone and shale, mudstone, and minor conglomerate (McCulloch and Bayer 2004, Morton and Miller 2006). Deposition of the Vaqueros Formation began about 24 Ma and ended in most of the Los Angeles area between 17.5 Ma and 17.4 Ma based on the dating of volcanics, marine mollusks, benthic foraminifea, magnetic polarity stratigraphy, and other methods (Nagle and Parker 1971, Yerkes and Campbell 1979, Schoellhamer et al. 1981, Blake 1983, Mason and Swisher 1989, Nourse et al. 1998, Prothero et al. 1996, Lucas et al. 1997, Liddicoat 2001, McCulloch et al. 2001, Prothero and Donohoo 2001, McCulloch et al. 2002, Ludtke and Prothero 2003, Lander et al. 2003,

Whistler and Lander 2003, McCulloch and Bayer 2004). The appearance of marine sediments after the non-marine Sespe Formation indicates rising global sea levels.

Middle Miocene Deposits (~17.4 Ma to ~11.6 Ma)

El Modeno Volcanics (Tiemd)

This unit consists of a fine grained diabasic intrusive rock (Morton and Miller 2006) created by volcanic eruptions.

Topanga Group, undifferentiated (Tt)

Undifferentiated Topanga Group (Tt) sediments consist primarily of coarse-grained, massive to thick-bedded sandstone and conglomerate. A basal tan to grey, well indurated, sandy conglomerate bed ranging from 2 m to 9 m is present (Schoellhamer et al. 1981). Clasts in this basal unit are predominantly granitic and gneissic with some volcanics. Above the basal conglomerate, are interfingering, thinly bedded, fine to coarse-grained sandstone, siltstone, and minor amounts of diatomaceous and partially silicified shale. While the shale is grey to greyish-white, coarser sediments are yellow to yellowish-tan (Morton and Miller 2006). Deposition began about 17.4 Ma and ended about 15.9 Ma based on dating of underlying and overlying volcanics (Turner and Campbell 1979, McCulloch et al. 2002, McCulloch and Bayer 2004).

The shallow to deep marine Topanga Group was one of the first units to be deposited in the rapidly deepening Los Angeles Basin. Much of these deep submarine fan and plain deposits occurred between 13 Ma and 5 Ma and corresponds with deposition of the Topanga and Monterey formations (Redin 1991, McCulloch and Bayer 2004). The Los Angeles Basin/ Tustin Plain continues to be filled by modern deposition today.

Formations of the Topanga Group (Ttb, Ttlt, Ttp)

In Orange County, the Topanga Group includes three formations: the basal Bommer Formation (Ttb), the middle Los Trancos Formation (Ttlt), and the upper Paulerino Formation (Ttp). Prior to Morton and Miller (2006) the Topanga Group formations were member level.

The basal Bommer Formation consists of gray to brownish-gray, thick-bedded, medium- to coarse-grained sandstone with interfingering fine-grained sandstone and siltstone. The formation is locally conglomeratic. The pale gray to brownish-gray, thin- to medium-bedded, siltstone and fine-grained sandstone of the Los Trancos Formation is up to 945 m thick. The upper Paulerino Formation consists of pale gray, tuffaceous sandstone and thin-bedded siltstone (Morton and Miller 2006).

Late Miocene Deposits (~11.6 Ma to ~5.3 Ma)

Monterey Formation (Tm)

This siliceous and diatomaceous marine mudstone, shale, diatomite, and some chert is primarily white to pale brown and thinly laminated or bedded. In the San Juan Capistrano area, lower part of Puente Formation grades laterally southward into Monterey Formation (Morton and Miller 2006). Sediments are part of a deep submarine fan and plain deposits that were deposited between 13 Ma and 5 Ma (Redin 1991). Locally named "Pecten Reef", a limestone in the Aliso Viejo area has produced abundant invertebrate and vertebrate fossils. The Monterey Formation was deposited at the same time as the Soquel Member, La Vida Member, and the lower portion of the undifferentiated Puente Formation (Morton and Miller 2006).

Puente Formation (Tp, Tpsq, Tplv)

The deep marine Puente Formation has produced numerous fossil localities of marine animals and algae as well as terrestrial plants and animals that were washed in from the land. These sediments were deposited at the same time as the Monterey Formation. Within the City are three units: the undifferentiated Puente Formation (Tp), the younger Soquel Member (Tpsq), and the basal La Vida Member (Tplv; Morton and Miller 2006).

The undifferentiated Puente Formation (Tp) consists of sandstone, siltstone, and shale. The Soquel Member (Tpsq) is primarily marine sandstone with minor amounts of shale. Beds are yellowish grey to grey, massive to well-bedded, silts to very coarse grained sandstone, interbedded with matrix supported pebble conglomerate (Morton and Miller 2006). The member ranges from 200 to 310 feet thick in the eastern Puente Hills and the sediments have been interpreted to be middle to inner submarine fan facies (Cooper 1981).

The basal La Vida Member (Tplv) sediments are primarily light-gray to black, massive to well-bedded, generally friable siltstone with some sandstone beds from 2 cm to over 1 meter thick. Fish remains are common and include deep water species (Morton and Miller 2006).

Late Miocene to early Pliocene Deposits (~11.6 Ma to ~3.6 Ma)

Capistrano Formation, Oso Sand (Tco)

The Oso Sand of the Capistrano Formation consists of white to light gray, massive, medium- to coarse-grained, friable, marine sandstone with scattered matrix-supported pebbles, cobbles, and concretions (Morton and Miller 2006). The bay that occupied the region was named the Capistrano Embayment (Reed and Hollister 1936). This embayment was a broad flat-bottomed structural trough that extended at least 22 miles inland from the present-day shoreline. How far offshore it extended is undetermined because of its merging with the deep offshore basins. Water depths in the Capistrano Embayment reached nearly 2,000 meters at it deepest point (Ingle 1979).

Pliocene Deposits (~5.3 Ma to ~2.6 Ma)

Niguel Formation (Tn)

These very near-shore marine, brownish-gray, poorly sorted, coarse-grained sandstones are interbedded with conglomeratic sandstone and conglomerates. The paleoenvironment represented is near-shore marine (Vedder 1960, Morton and Miller 2006).

Early to middle Pleistocene Deposits (2.6 Ma to 126,000 years old [120 ka])

Very old axial channel deposits (Qvoa)

Axial channel deposits were emplaced adjacent to streams in through-going stream valleys. Undifferentiated very old axial channel sediments are dominated by sand, but contain scattered gravel and pebble layers, as well as silt and clay-bearing alluvium. These deposits are moderately to well-indurated, reddish-brown, and are highly pigmented in upper parts. The upper surfaces are typically very dissected (Morton and Miller 2006).

Very old alluvial fan deposits (Qvof)

Alluvial fan deposits are deposited into our valleys from local mountains via the mouths of canyons. Sediments are moderately to well indurated, silts to bouldery conglomerates, with slightly to moderately dissected fan surfaces. In much of Peninsular Ranges these sediments are moderately well indurated, orangish brown sand and silt with well dissected fan surfaces (Morton and Miller 2006). Clasts coarsen upstream with boulders up to several meters across being deposited near the mountains during flash floods

Middle to late Pleistocene Deposits (774,000 [774 ka] to 126 ka)

Old paralic deposits (Qopf)

Paralic deposits were emplaced adjacent to the ocean and include interfingered strandline, beach, estuarine, and colluvial deposits. These poorly sorted, moderately permeable, reddish-brown, are composed of silt, sand, and cobbles. The top of the unit is capped by thin but extensive sand-rich alluvial fan deposits derived from local sources (Morton and Miller 2006).

Late Pleistocene to Holocene Deposits (less than 126 ka)

Young axial channel deposits (Qya)

Axial channel deposits were emplaced adjacent to streams in through-going stream valleys. Sediments are slightly to moderately indurated and consist of silts to pebbles (Morton and Miller 2006).

Young colluvial deposits (Qyc)
Colluvium is present as scree, soils, or other materials and is primarily found at the base of hills. These sediments have been emplaced by rain wash or slow continuous downslope creep. The young deposits are undissected to slightly dissected, unconsolidated to slightly consolidated and have minor amounts of soil development (Morton and Miller 2006).

Young alluvial fan deposits (Qyf)
Alluvial fan deposits are deposited into our valleys from local mountains via the mouths of canyons. Sediments are unindurated to moderately indurated, silts to bouldery conglomerates, with slightly to moderately dissected fan surfaces (Morton and Miller 2006). Clasts coarsen upstream with boulders up to several meters across being deposited near the mountains during flash floods.

Young landslide deposits (Qyls?)
Landslides are the result of slope failures and typically result in chaotically emplaced sediments. Slides may or may not be active and have slightly dissected or modified surfaces (Morton and Miller 2006). In less chaotic slides and slumps beds can sometimes be traced and given stratigraphic context.

Late Holocene Deposits (less than 5 ka)

Very young landslide deposits (Qls, Qls?)
Landslides are the result of slope failures and typically result in chaotically emplaced sediments. Slides may or may not be active and have well preserved morphology (Morton and Miller 2006). In less chaotic slides and slumps beds can sometimes be traced and given stratigraphic context.

Very young slope wash deposits (Qsw)
Very similar to the colluvial deposits, slope wash is also associated with hillsides. The unconsolidated, typically angular, sand to boulder sized clasts have been emplaced by water not confined to channels (Morton and Miller 2006).

Modern Deposits (less than 200 years old)

Artificial fill (Qaf)
Modern fill is frequently not mapped on geologic maps due to its ubiquitous nature. Although fill is typically less than a few feet thick, it can be substantially thicker in the areas of overpasses, freeways, and other large earthworks. Any fossils that may be encountered therein are not scientifically significant.

ETHNOGRAPHY

The City of Irvine is located within the traditional tribal territory of the Gabrielino with the Acjachemen (Juaneño) located immediately to the south (McCawley 1996, Figure 3). The traditional tribal territory of the Gabrielino includes large portions of Los Angeles County, the northern part of Orange County, small sections of Riverside and San Bernardino Counties as well as the southern Channel Islands of Santa Barbara, San Clemente, San Nicolas, and Santa Catalina (McCawley 1996, Figure 3). The traditional tribal territory of the Acjachemen includes northern San Diego County and southern Orange County (O'Neil and Evans 1980). Tribal boundaries are fluid and the Acjachemen territory may have extended north to include the City of Irvine. Background sections for both the Gabrielino and Acjachemen are provided below.

GABRIELINO

The Gabrielino are considered to have been one of the wealthiest tribes and to have greatly influenced tribes they traded with (Kroeber 1976:621). Houses were domed, circular structures thatched with tule or similar materials (Bean and Smith 1978:542). The best known artifacts were made of steatite and were highly prized. Many common everyday items were decorated with inlaid shell or carvings reflecting an elaborately developed artisanship (Bean and Smith 1978:542).

The main food zones utilized were marine, woodland and grassland (Bean and Smith 1978). Plant foods were, by far, the greatest part of the traditional diet at contact. Acorns were the most important single food source. Villages were located near water sources necessary for the leaching of acorns, which was a daily occurrence. Grass seeds were the next most abundant plant food used along with chia. Seeds were parched, ground, and cooked as mush in various combinations according to taste and availability. Greens and fruits were eaten raw or cooked or sometimes dried for storage. Bulbs, roots, and tubers were dug in the spring and summer and usually eaten fresh. Mushrooms and tree fungus were prized as delicacies. Various teas were made from flowers, fruits, stems, and roots for medicinal cures as well as beverages (Bean and Smith 1978:538-540).

The principal game animals were deer, rabbit, jackrabbit, woodrat, mice, ground squirrels, antelope, quail, dove, ducks, and other birds. Most predators were avoided as food, as were tree squirrels and most reptiles. Trout and other fish were caught in the streams, while salmon were available when they ran in the larger creeks. Marine foods were extensively utilized. Sea mammals, fish, and crustaceans were hunted and gathered from both the shoreline and the open ocean, using reed and dugout canoes. Shellfish were the most common resource, including abalone, turbans, mussels, clams, scallops, bubble shells, and others (Bean and Smith 1978:538-540).

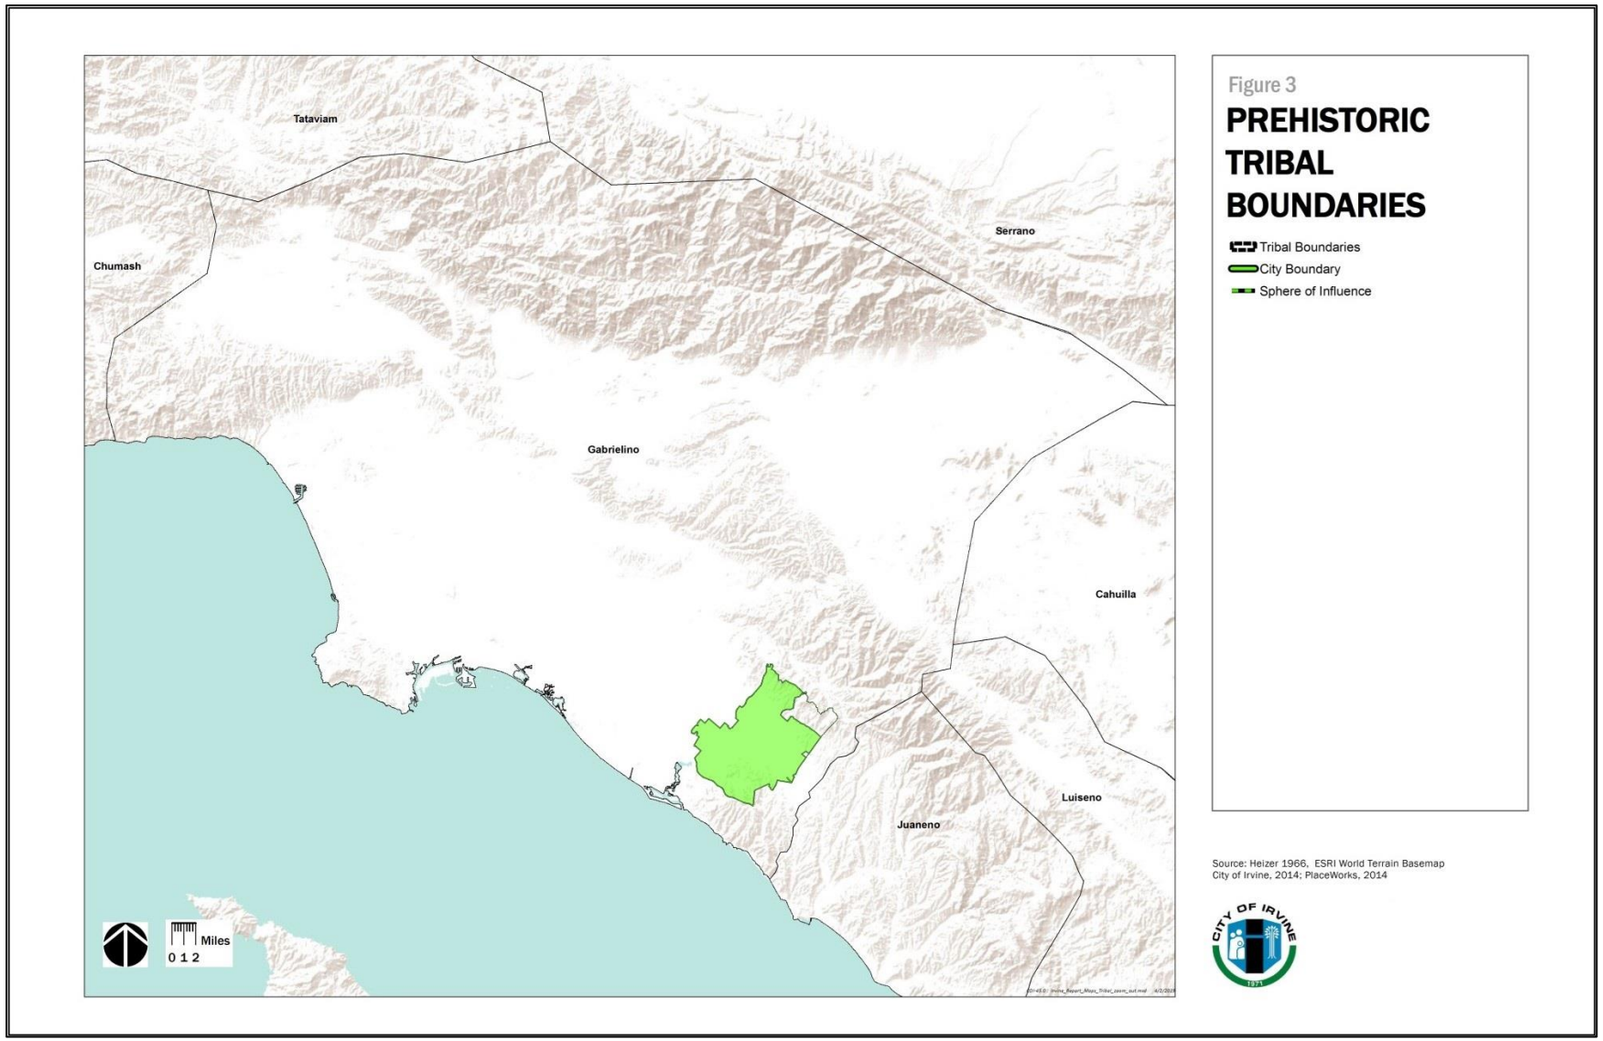

Figure 3. Tribal Territory Map

JUANEÑO ACJACHEMEN

About 1,300 years ago the Acjachemen (Juaneño), who were hunters and gatherers of the San Luis Rey Cultural Pattern, moved into southern Orange County. The Acjachemen speak a language that is part of the Takic language family. Their traditional tribal territory was situated partly in northern San Diego County and partly in southern Orange County (see Figure 3). The boundaries were Las Pulgas Creek (south), Aliso Creek (north), the Pacific Ocean (west) and the Santa Ana Mountains (east). Villages were mostly along San Juan Creek, Trabuco Creek and San Mateo Creek (O'Neil and Evans 1980).

In prehistory, the Acjachemen had a patrilineal society and lived in groups with other relatives. These groups had established claims to places including the sites of their villages and resource areas. Marriages were usually arranged from outside villages establishing a social network of related peoples in the region. There was a well-developed political system including a hereditary chief. Religion was an important aspect of their society. Religious ceremonies included rites of passage at puberty and mourning rituals (Kroeber 1925).

Houses were typically conical in shape and thatched with locally available plant materials. Work areas were often shaded by rectangular brush-covered roofs (ramada). Each village had a ceremonial structure in the center enclosed by a circular fence where all religious activities were performed (Bean and Shipek 1978).

Women are known to have been the primary gatherers of plant foods, but also gathered shellfish and trapped small game animals. Men hunted large game, most small game, fished, and assisted with plant food gathering, especially of acorns. Adults were actively involved in making tools including nets, arrows, bows, traps, food preparation items, pottery and ornaments. Tribal elders had important political and religious responsibilities and were involved in education of younger members (Bean and Shipek 1978).

PREHISTORIC SETTING

Review of archaeological data has resulted in a revised synthesis of cultural change as evidenced by material culture and archaeologically visible cultural practices. A large part of what was previously referred to as the Millingstone Period is now called the Topanga pattern of the Encinitas Tradition. This pattern is replaced in the Project Area by the Angeles pattern of the Del Rey Tradition later in time (Sutton 2010; Table 3).

Table 3. Culture Change Chronology

Pattern	Phase	Dates (BP)	Material Traits	Other Traits
Encinitas	Topanga I	8,500 to 5,000	Abundant manos and metates, many core tools and scraper s, few but large points, charmstones, cogged stones, early discoidals, bone gorge fishhooks, faunal remains rare; Olivella spire/end lopped beads appear	Estuary/lagoon shellfish and sharks/rays common, hunting important, secondary burials under metate cairns (some with long bones only), some extended inhumations, no cremations
	Topanga II	5,000 to 3,500	Abundant but decreasing manos and metates, adoption of mortars and pestles, smaller points, cogged stones, late discoidals, fewer scraper planes and core tools, some stone balls and charmstones; inhumations common; Olivella Grooved Rectangular beads introduced	Estuary/lagoon shellfish and sharks/rays common, addition of acorns, reburial of long bones only, addition of flexed inhumations (some beneath metate cairns), cremations rare
Angeles	Angeles I	3,500 to 2,600	Appearance of Elko dart points and an increase in the overall number of projectile points from Encinitas components; beginning of large-scale trade in small steatite artifacts (effigies, pipes, and beads) and *Olivella* shell beads; appearance of single-piece shell fishhooks and bone harpoon points; Coso obsidian becomes important; appearance of donut stones; appearance of Mytilus beads	apparent population increase; fewer and larger sites along the coast; collector strategy; less overall dependence on shellfish but fishing and terrestrial hunting more important; appearance of flexed and extended inhumations without cairns, cremations uncommon
	Angeles II	2,600 to 1,600	Continuation of basic Angeles I material culture with the addition of mortuary features containing broken tools and fragmented cremated human bone; fishhooks become more common	Shellfish change to mudflat species, more emphasis on fish, birds and mammals, continuation of basic Angeles I settlement and subsistence systems; appearance of a new funerary complex
	Angeles III	1,600 to 1,250	Appearance of bow and arrow technology (e.g., Marymount or Rose Spring points); changes in *Olivella* beads; asphaltum becomes important; reduction in obsidian use; Obsidian Butte obsidian largely replaces Coso	larger seasonal villages; flexed primary inhumations but no extended inhumations and an increase in cremations; appearance of obsidian grave goods
	Angeles IV	1,250 to 800	Cottonwood points appear; some imported pottery appears; birdstone effigies at the beginning of the phase and "spike" effigies dropped by the end of the phase; possible appearance of ceramic pipes, *Mytilus* shell disks	change in settlement pattern to fewer but larger permanent villages; flexed primary inhumations continue, cremations uncommon

Pattern	Phase	Dates (BP)	Material Traits	Other Traits
	Angeles V	800 to 450	Trade of steatite artifacts from the southern Channel Islands becomes more intensive and extensive, with the addition or increase in more and larger artifacts, such as vessels and comals; larger and more elaborate effigies; portable mortars and pestles	strengthening of ties, especially trade, with southern Channel Islands; expansion into the northern Santa Ana Mountains and San Joaquin Hills
	Angeles VI	450 to 150	Addition of Euroamerican material culture (e.g., glass beads and metal tools), locally made pottery, metal needle-drilled *Olivella* beads	change of settlement pattern, movement close to missions and ranches; use of domesticated species obtained from Euroamericans; flexed primary inhumations continue; apparent adoption of Chingichngish religion

Topanga Pattern groups were relatively small and highly mobile. Sites tend to be along the coast in wetlands, bays, coastal plains, near-coastal valleys, marine terraces and mountains. The Topanga toolkit is dominated by manos and metates with projectile points scarce (Sutton and Gardner 2010: 9).

In Topanga Phase I other typical characteristics were a few mortars and pestles, abundant core tools (scraper planes, choppers, and hammerstones), relatively few large, leaf-shaped projectile points, cogged stones, and early discoidals (Table 3). Secondary inhumation under cairns was the common mortuary practice. In Orange County as many as 600 flexed burials were present at one site and dated 6, 435 calibrated radiocarbon years before present (Sutton and Gardner 2010: 9, 13).

In Topanga Phase II, flexed burials and secondary burial under cairns continued. Adoption of the mortar and pestle is a marker of this phase. Other typical artifacts include manos, mutates, scrapers, core tools, discoidals, charmstones, cogged stones, and an increase in the number of projectile points. In Orange County stabilization of sea level during this time period resulted in increased use of estuary, near shore and local terrestrial food sources (Sutton and Gardner 2010: 14-16).

The Angeles pattern generally is restricted to the mainland and appears to have been less technologically conservative and more ecologically diverse, with a largely terrestrial focus and greater emphases on hunting and nearshore fishing. In Angeles Phase I Elko points for atlatls or darts appear, small steatite objects such as pipes and effigies are found, shell beads and ornaments increase, fishing technologies increase including bone harpoons/fishhooks and shell

fishhooks, donut stones appear, and hafted micro blades for cutting/graving wood or stone appear. In addition, several Encinitas traits, such as discoidals, cogged stones, plummet-like charm stones and cairn burials virtually disappear from the record. Mortuary practices changed to consist of primarily flexed primary inhumations, with extended inhumations becoming less common. Settlement patterns made a shift from general use sites being common to habitation areas separate from functional work areas. Subsistence shifted from mostly collecting to increased hunting and fishing.

The Angeles Phase II is identified primarily by the appearance of a new funerary complex, with other characteristics similar to Angeles I. The complex features killed (broken) artifacts plus highly fragmented cremated human bones and a variety of faunal remains. In addition to the cremains, the other material also often burned. None of the burning was performed in the burial feature.

The Angeles III Phase is the beginning of what has been known as the Late Period and is marked by several changes from Angeles I and II. These include the appearance of small projectile points, steatite shaft straighteners and increased use of asphaltum all reflecting adoption of bow and arrow technology, obsidian sources changed from mostly Coso to Obsidian Butte and shell beads from Gulf of California species began to appear. Subsistence practices continued as before and the geographic extent of the Angeles Pattern increased (Sutton 2010).

Angeles Phase IV is marked by new material items including Cottonwood points for arrows, Olivella cupped beads and Mytilus shell disks, birdstones (zoomorphic effigies with magico-religious properties) and trade items from the Southwest including pottery. It appears that populations increased and there was a change in the settlement pattern to fewer but larger permanent villages. Presence and utility of steatite vessels may have impeded the diffusion of pottery into the Los Angeles Basin. Smaller, special-purpose sites continued to be used (Sutton 2010).

Angeles Phase V components contain more and larger steatite artifacts, including larger vessels, more elaborate effigies, and comals. Settlement locations shifted from woodland to open grasslands. The exploitation of marine resources seems to have declined and use of small seeds increased. Many Gabrielino inhumations contained grave goods while cremations did not (Sutton 2010).

The Angeles Phase VI reflects the ethnographic mainland Gabrielino of the post-contact (i.e., post-A.D. 1542) period. One of the first changes in Gabrielino culture after contact was undoubtedly population loss due to disease, coupled with resulting social and political disruption. Angeles Phase VI material culture is essentially Angeles Phase V, augmented by a number of Euro-American tools and materials, including glass beads and metal tools such as knives and needles (used in bead manufacture). The frequency of Euro-American material culture increased

through time until it constituted the vast majority of materials used. Locally produced brownware pottery appears along with metal needle-drilled Olivella disk beads (Sutton 2010).

The ethnographic mainland Gabrielino subsistence system was based primarily on terrestrial hunting and gathering; although nearshore fish and shellfish played important roles. Sea mammals, especially whales (likely from beached carcasses), were prized. In addition, a number of European plant and animal domesticates were obtained and exploited. Ethnographically, the mainland Gabrielino practiced interment and some cremation (Sutton 2010).

HISTORIC SETTING

Spanish Exploration

Juan Cabrillo was the first European to sail along the coast of California in 1542 and was followed in 1602 by Sebastian Vizcaino (Bean and Rawls 1993). The Spanish colonization of what was then known as Alta California began with the 1769 overland expedition led by Gaspar de Portolá with a crew of 63 men in order to explore the land between San Diego and Monterey (Fox 1979). Between 1769 and 1822 the Spanish had colonized California and established missions, presidios, and pueblos and documented the people and landscape along the way (McCawley 1996).

Portola and his expedition crossed the area north of Lake Forest in July 1769, naming the perennial creek that empties from the Santa Ana Mountains "*aliso*", the Spanish work alder; an error on the Spanish identifier, since they were in fact, referring to the sycamore tree, which still grow along the creek. It should be noted that the Juaneño term for the creek was *Seeevenga*, meaning "at the sycamores" (O'Neil 1988). However, historically, alder and sycamore trees were much more prominent, particularly in the riparian and floodplain areas where an oak-woodland habitat existed. During the Mission period, many of the trees along the creek, including alder, oak, sycamore, and other species were cut down for the construction of ships and structures, charcoal production, and other uses (Nasser 2003).

Following the Portolá Expedition, vast tracts of land were granted to the Missions. The seventh of the Franciscan missions in California was Mission San Juan Capistrano, founded in 1776; shortly after Portolá's visit to the area. The goals of the missions were tri-fold: they helped establish a Spanish presence on the west coast, allowed for a means to Christianize the native peoples, and served to exploit the native population as laborers. The Spanish also hoped each mission would become a town center, whereas, "the pueblo would receive a ground of four square leagues of land… and other property would be parceled out among the Indians." The missionaries, or padres, would essentially serve as a mayor, or head of the town (Bean 1978:29-30).

Portions of Irvine lie within the boundaries of Rancho Santiago de Santa Ana (Figure 4). The Rancho Santiago de Santa Ana was given to Jose Antonio Yorba and his nephew Pablo Peralta in 1810 by Governor José Joaquin de Arrillaga on behalf of the Spanish Government. This grant was extremely rare at this time and was the only land grant in present-day Orange County to be given under Spanish Rule. The grant consisted of the lands east of the Santa Ana River to the Santa Ana Mountains. The land was originally petitioned for by Juan Pablo Grijalva, who was a Spanish soldier that had travelled to California with the De Anza expedition. He died before the grant was approved, which resulted in the land being granted to his son-in-law (Yorba) and grandson (Peralta).

Mexican Period

In 1821 Mexico won its independence from Spain and worked to lessen the wealth and power held by the missions. The Secularization Act was passed in 1833, appropriating the vast mission lands to the Mexican governor and downgrading the missions' status to that of parish churches. The governor then redistributed the former mission lands, in the form of land grants, to private owners (Bean and Rawls 1993; Robinson 1948). The lands were typically granted to soldiers who proved their loyalty to the Mexican government once liberated from the Spanish crown.

In addition to the land granted for the Rancho Santiago de Santa Ana under the Spanish Government, additional land grants were given by the Mexican government including Rancho San Joaquin and Rancho Lomas de Santiago (Figure 4). The Rancho San Joaquín land grant was a combination of the Rancho Cienega de las Ranas and the Ranch La Bolsa de San Joaquín. This land grant was issued to José Antonio Andrés Sepúlveda in 1837 and 1842, respectively. The Spanish *Cienega de las Ranas* means "marsh of the frogs" and *bolsa* means "pocket", and together refers to a wetlands area. Rancho Lomas de Santiago was granted to Teodosio Yorba by the Mexican Governor Pío Pico in 1846. Teodosio was the son of Jose Antonio Yorba, who was granted Rancho Santiago de Santa Ana

American Period

Following the cession of California to the United States after the Mexican-American War, the Treaty of Guadalupe Hidalgo in 1848 ensured that the land grants would be honored. In 1852 a claim for Rancho Santiago de Santa Ana was filed with the Public Land Commission as required by the Land Act of 1851, and the grant was patented to Bernardo Teodoro and Ramón Yorba in 1883. The Yorba family sold the Rancho to José Antonio Andrés Sepúlveda in 1854 and Sepúlveda later lost the lands due to bankruptcy caused by trying to uphold his land claims in court. Sepúlveda also filed a land claim for Rancho San Joaquin in 1852, which was patented to José Sepulveda in 1867. In 1864 Sepúlveda sold his lands to Benjamin and Thomas Flint, Llewellyn Bixby and James Irvine.

In 1876, James Irvine bought out his partners in Flint, Bixby and Co. and became the sole owner of the Irvine Ranch. It continued to be largely a ranching operation for many years. James Irvine and James McFadden played pivotal roles in the history of the City of Irvine. James Irvine was the largest landholder in the region and was interested in identifying the most lucrative agricultural uses for the enormous tract of land. When he died in 1886, James II took control of the ranch and increased its agricultural production. In 1894 James Irvine II incorporated the land holdings as the Irvine Company.

In 1899, the newly formed San Joaquin School District approached James Irvine with the intent to build a school for the children of his ranch tenant. A spot was chosen, upon which the school house was raised. In 1911, the school and land upon which it resided was donated by Irvine to Orange County. By this point 100 pupils were enrolled in the school. The same year in 1899, a post office was opened in a boarding house across the street from the school. Irvine named the post office "Myford" after his young son (Liebeck 1990, Figure 5).

In 1909, Frederick Culver received Irvine's permission to build a blacksmith shop near the ranch's warehouse operations. The shop was used to maintain farm machinery as well as making buggy parts, wagon wheels, and horseshoes. By the beginning of the 20th century Irvine set aside 320 acres at the intersection of the Santa Fe Railroad tracks and Central Avenue for the purpose of developing a town for the residence of both his permanent and seasonal workers. In 1914, the Orange County town of Myford was renamed "Irvine" (Liebeck 1990).

While already the number one producer of lima beans in the world, the Irvine Ranch's bean production reached its zenith during the First World War. In 1918, the ranch contained 60,000 acres of lima bean fields which produced 900,000 sacks equating to a total value of $6 million. After WW1, the 1920s saw significant changes to the Irvine Ranch. The Irvine Service Station was enlarged to accommodate the area's growing car culture and the town initially planned by Irvine saw an increase in housing for workers.

The Second World War saw to the end of the Irvine's "Agricultural Empire" (Liebeck 1990). Seeking a site for the Navy's air operations the Santa Ana Chamber of Commerce chose the Irvine Ranch's prime 17,000-acre lima bean field. Despite Irvine's attempts to offer the Navy alternative sites on his ranch the Navy refused and continued with the purchase of Irvine's two of the best pieces of agricultural land. This resulted in the establishment of the El Toro Marine Corps Air Station and the Tustin Lighter-Than-Air base. The Navy's purchase of Irvine's land allowed for the Orange County Assessor's Office to reassess the ranch's property value. Up to this point, the ranch has paid a tax base far below those of other county lands and with the reassessment this advantage was soon removed (Liebeck 1990).

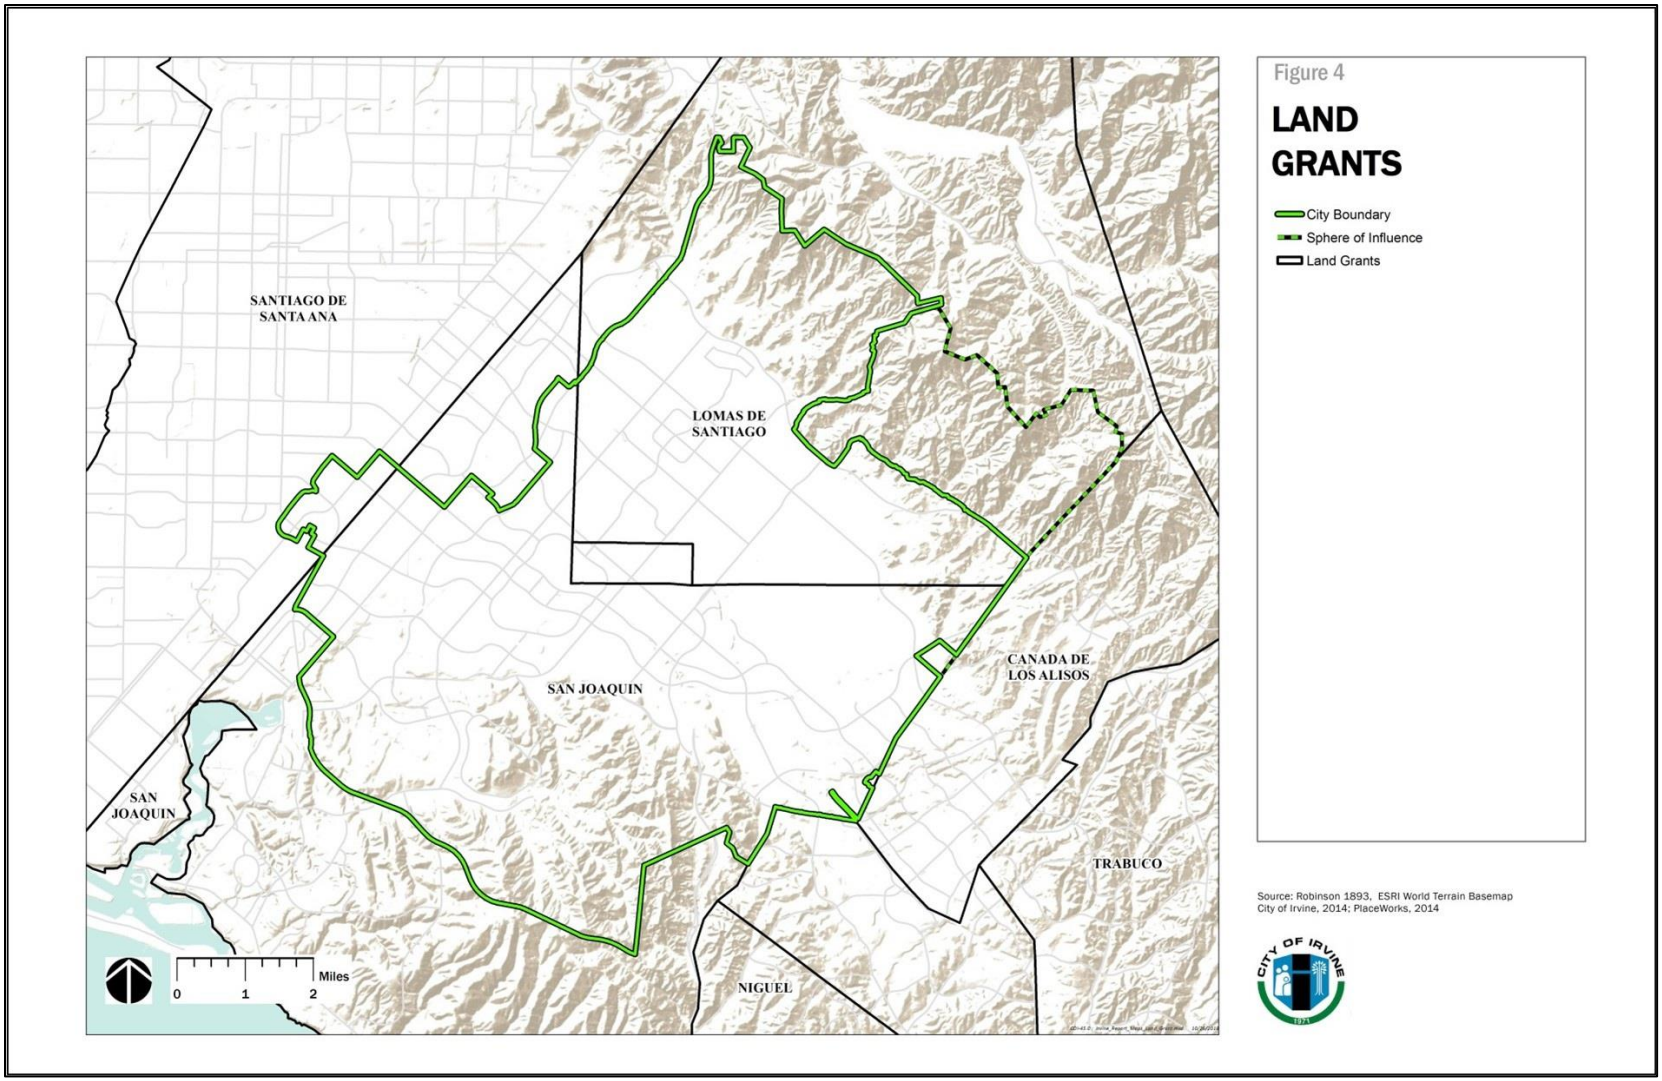

Figure 4. Map of Land Grants

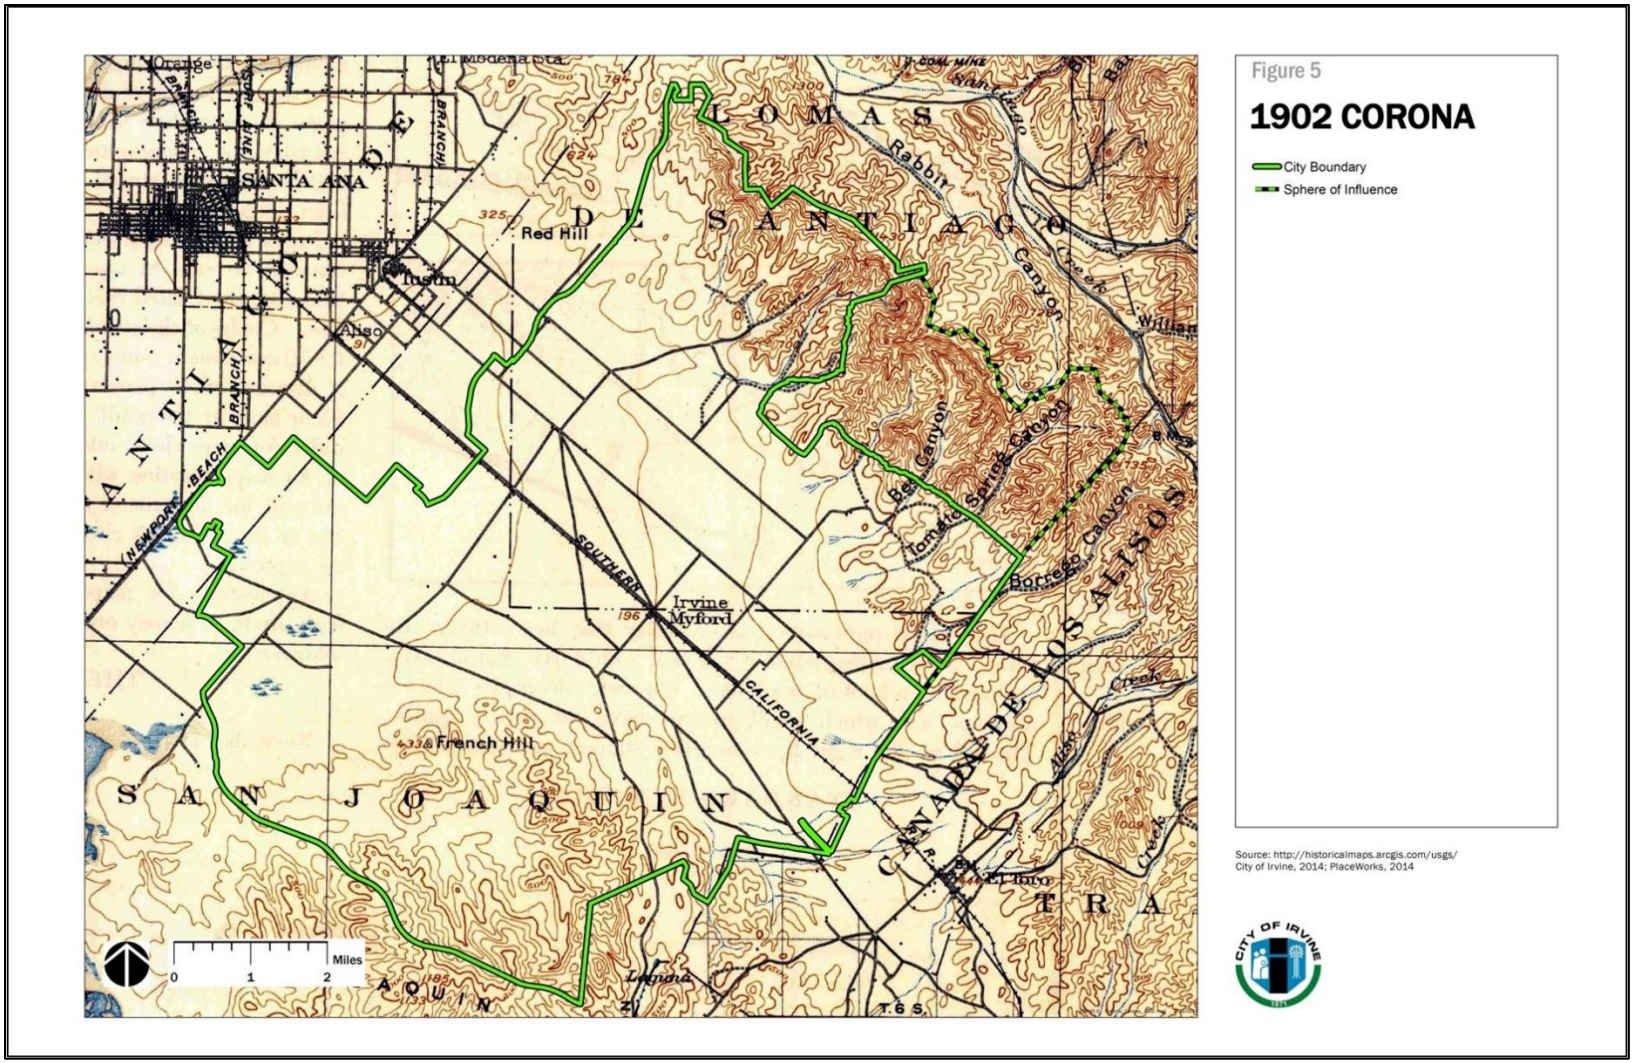

Figure 5. 1902 Corona Topographic Map

While the Irvine Ranch would continue to produce food for the war effort significant damage was incurred upon the fields surrounding the Tustin and El Toro bases as planes and rescue vehicles would cut through, tearing the crops to shreds (Liebeck 1990).

Modern Period

As a result of the Second World War pressure mounted towards the development of urban areas in California. However, private farm owners such as the Irvine Company kept developers away from the central and south county. However, after James Harvey Irvine, Sr.'s death on August 24, 1947, control of The Irvine Company fell to his last remaining child Myford Plum Irvine. Unlike his predecessors, Myford did not have a passion for farming. Instead, Myford was interested in the development of residential communities. Under his guidance, Cameo Highlands, Irvine Terrace, Harbor View Hills, Cameo Shores, Westcliff Batcrest, and Irvine Cove in Laguna were developed (Liebeck 1990)

In 1957, Myford granted the first industrial lease on the Irvine Ranch to the Philco Corporation, a subsidiary of the Ford Motor Company. In 1957, representatives of the firm Pereira & Luckman were commissioned by the regents of the University of California System (U.C.S) to scout out possible locations for a new University as a reaction of major shifts in population towards southern Los Angeles. The firm decided on the Irvine Ranch as a choice location and intense negotiation underwent between the Irvine Company and regent of the U.C.S. (Liebeck 1990).

On January 11, 1959, Myford was found shot to death in the basement of the Irvine family home. The day of Myford's funeral Arthur McFadden was elected president of The Irvine Company. Under this new leadership, the company saw greater profit in the real-estate market and thus transitioned into full-scale property development (Liebeck 1990)

In 1960, the Irvine Company gifted 1,000 acres of land to the University of California with a provision for the sale of an additional 500 acres. The establishment of the University provided a central focus around which the company would create a master plan for the Irvine Ranch. To create this master plan, The Irvine Company hired William Pereira & Associates. The intent of Pereira was to prevent uncontrolled suburbanization of Ranch property and to keep out outside developers (Liebeck 1990).

Pereira divided the ranch into three sections: north, central, and south. The central section represented prime agricultural land, the north contained a remote mountainous region, and the southern basin. The southern basin was considered the top priority of urban development as it ran from the coast to the alignment of the 405 (San Diego) Freeway. Development of each community underwent meticulous planning as each "village" would include its own churches, shopping centers, and schools. The same attention to detail was utilized in master land-use plan in the development of the Irvine Industrial Complex and the Newport "downtown" Center.

Pereira's plan for the university outlined the campus as a large wheel. The park would include a lake and an amphitheater as "the focus of university life." The University of California at Irvine was dedicated on June 20, 1964. (Liebeck 1990)

In September 2, 1965, the "Old" Irvine town started by James Irvine at the turn of the century was renamed "East Irvine." At this time, much for the agricultural land on the ranch was being converted into housing tracts. Multiple electronic firms, aerospace companies, and research and development companies made their way to the Irvine Industrial Complex. Thousands of new job opportunities emerged and as many wealthy white-collar employees arrived so increased the need for comfortable residential neighborhoods. (Liebeck 1990)

In 1971, the Irvine Company campaigned for cityhood and in that same year the city of Irvine was incorporated. The new city's council's first act was to temporarily freeze all new development project within the city to reevaluate and revise the master plan. A consulting firm was hired to assist in the drafting of the 1973 Irvine General Plan. The following plan emphasized an increase in cycling, hiking, and equestrian trails, reduce car dependency, and increase access to recreational facilities. (Liebeck 1990)

In 1977, the Irvine Historical Society was formed and sought to protect historic structures on the Irvine Ranch. By 1981, the Irvine Historical Society discussed plans on the preservation of East Irvine. By 1990, after a series of buy-outs and lawsuits, the involvement of the Irvine family in the Irvine Company ceased when Joan Irvine Smith and her daughter Athalie Clark received $149 million for their remaining shares in the company from Donald Bren. (Liebeck 1990)

According to the 2020 census, 307,665 people lived within the City. The census indicates that in 2020 Irvine had a total of 110,465 households. (U.S. Census Bureau n.d.)

RECORD SEARCHES AND LITERATURE REVIEW

PALEONTOLOGICAL

A search for paleontological records was completed by the Natural History Museum of Los Angeles County (LACM; McLeod 2018a; Appendix B). Published literature, unpublished paleontological reports, and fossil databases were also searched for fossil records (Appendix C). Databases included the Orange County Paleontology Database (OCPC 2018), the Paleobiology Database (PBDB 2018), the San Diego Natural History Museum (SDNHM 2018), and the University of California Museum of Paleontology (UCMP 2018).

A deficit in the data reported here was created by closure of the John D. Cooper Center by the County of Orange in May 2018. More recently, the former Cooper Center re-opened as the John D. Cooper Laboratory, and a record search request was submitted on April 18, 2023. Unfortunately, the Cooper Lab has not responded to our request as of this reporting. The Cooper Lab maintains the database of fossils recovered in the County that we are not able to access. We list fossils by scientific and common name in Appendix C. When available, data of the location where the fossils were collected have been included. Please note that many entirely marine formations contain small numbers of land animal and plant fossils that were washed down streams into the ocean.

Sediments that are geologically young (artificial fill, Holocene sediments) or heat altered (El Modeno Volcanics) do not contain fossils. Landslides of any age may contain fossils; however, sediment jumbling makes it frequently difficult to determine stratigraphic context. This results in variable significance of the specimens. The rest of the formations have produced fossils from within the City. In some cases, the units or members were not listed in the literature or databases. Formations are discussed from oldest to youngest.

Williams Formation. Two localities are known from the Pleasants Sandstone Member and 53 are known from the undifferentiated sediments. These have produced marine invertebrates including ammonites, crabs, bivalves, gastropods, sea urchins, and sand dollars. Marine vertebrates known are including sharks, fishes and turtles. Plant fossils including wood and leaves have also been recovered.

Silverado Formation. Two localities are known within the City. These produced a sea tortoise and a leaf, possibly of a willow.

Santiago Formation. Within the City, one locality is known based on currently available information. It produced fossils of a crocodile and plants.

Sespe-Vaqueros Formation. A minimum of 38 localities are known within the City. These have produced marine vertebrates including baleen whales, toothed whales, fishes, sharks and rays. Marine invertebrates include brachiopods, bivalves, gastropods, crabs, and sand dollars. Terrestrial vertebrates known are rodents, shews, birds, snakes and lizards. Plant fossils include wood, palm fronds and tree leaves.

Vaqueros Formation. Eight localities are known within the City based on information currently available. These have produced baleen whale, bivalves, and gastropods.

Topanga Group. A minimum of three localities are known in the City. They have produced fossils of fishes, sharks, sea urchins, algae, and terrestrial leaves.

Monterey Formation. Localities within the City number 28. These localities have produced vertebrate fossils of baleen and toothed whales, pinnipeds, fishes, and sharks. Invertebrates known include marine bivalves and crabs. Tree leaves of many species are also known.

Puente Formation. A minimum of three localities are known in the City. These have produced fishes and terrestrial leaves.

Capistrano Formation. Three localities are known in the City. These localities have produced fossils of baleen whale, sea cow, walrus, and fur seal.

Niguel Formation. Two localities are known from the Niguel Formation within the City. These localities have produced fossils of fish, sharks, and marine invertebrates.

Pleistocene deposits. These fossils are listed by time period due to lack of geological detail in most records which would permit discussion by sediment unit. About forty localities are known based on currently available information. Abundant terrestrial fossils have been recovered from the San Joaquin Marsh area between MacArthur Blvd, Highway 405, and San Diego Creek. These localities have produced fossils of mammoth, mastodon, giant ground sloth, ancient bison, horse, tapir, camel, llama, diminutive pronghorn, dire wolf, coyote, bear, American lion, and saber-toothed cat along with bats, rodents, birds, reptiles, and amphibians. Additionally, six localities within the City have produced marine bivalve invertebrates from approximately 60 feet deep just north of Jamboree and Michelson (Cogstone 2018).

CULTURAL

CALIFORNIA HISTORIC RESOURCES INVENTORY SYSTEM

The purpose of the records search is to identify all previously recorded cultural resources (prehistoric and historic archaeological sites, historic buildings, structures, objects, or districts) within the Project Area. All cultural resources, as well as cultural resource surveys, performed within the city boundaries were reviewed.

Shannon Lopez performed a search for archaeological and historical records on the September 24 and 25, 2018 at the South Central Coastal Information Center (SCCIC) of the California Historical Resource Inventory System (CHRIS) located on the campus of the California State University, Fullerton. The record search covered the entire area within the boundaries of the City of Irvine. The search radius included El Toro, San Juan Capistrano, Laguna Beach, Tustin, Orange, and Black Star Canyon 7.5-minute topographic quad maps.

The results of the record search indicated that 647 prior studies were located within the City (Appendix D). The records search also determined 379 previously recorded cultural resources are located within the City boundaries, which are summarized in the tables below (Table 4; Appendix E).

Table 4. Cultural Resources within the City of Irvine by Type

Resource Type	Quantity
Prehistoric Site	216
Prehistoric Isolate	85
Multi-Component Site	9
Multi-Component Isolate	1
Unknown Isolate	1
Historic Resource	62
Historic Site	2
Historic Isolate	3
Grand Total	**379**

Well known prehistoric villages were centered around Turtle Rock and Tomato Springs but others were numerous in the marsh, hills and mountains. Historic resources by contrast are mostly on the plain and include Mexican period resources like the Don Jose Sepulveda adobe, American period resources like the San Joaquin Gun Club and early 20th century buildings including homes.

OTHER SOURCES

In addition to the SCCIC records search, a variety of sources were consulted in October 2018 to obtain information regarding the cultural context of the City of Irvine. Sources included the National Register of Historic Places (NRHP) and the California Register of Historic Resources (CRHR) which includes the California Historical Resources Inventory (CHRI)[1], California Historical Landmarks (CHL), and California Points of Historical Interest (CPHI). The Bureau of Land Management (BLM) General Land Office records were also searched.

Four buildings within the City are listed on the NRHP and the CRHR (Table 8). Eight properties are listed on the CHRI (Table 5). One area has a CHL plaque (Table 8). Three areas have CPHI plaques. The Orange County Parks lists the Irvine Ranch Historic Park. The City of Irvine lists 19 historically important properties.

Table 5. Additional Sources Consulted

Source	Results
Historic USGS Topographic Maps	Positive. See historic setting section.
Historic US Department of Agriculture Aerial Photographs	Positive. See historic setting section.
National Register of Historic Places (NRHP)	Positive: (1) NRL#:77000319, "Frances Packing House", Listed 8/2/1977. (2) NRL#: 86000068, "Irvine Bean and Growers Association Building", Listed 1/13/1986. (3) NRL#: 86000452, "Irvine Blacksmith Shop", 3/20/1986. (4) NRL#: 93000300, "Christ College Site", 4/16/1993.
California Register of Historic Resources (CRHR)	Positive: (1) "Frances Packing House", (2) "Irvine Bean and Growers Association Building",. (3) "Irvine Blacksmith Shop", (4) "Christ College Site".
California Historical Resource Inventory (CHRI)	Positive: (1) Tustin USAR Center, 1963; (2) Christ College Site; (3) Val Verde Sportsmen's Club, 1924; (4) The Echberria Home, 1925; (5) Buffalo Ranch/ Urnabus Square, 1962; (6) Agricultural Shed, 1930; (7) Transi Housing; Irvine Hotel, 1913; (8) South Coast Gun Club, 1945
California Historical Landmarks (CHL)	Positive: Plaque #: 1004 "Old Town Irvine", Listed 11/8/1991.
California Point of Historical Interest (CPHI)	Positive: (1) Plaque #: P753, "Irvine Bean and Grain Growers Building", Listed 8/8/1991. (2) Plaque #: P630, "Irvine Historical Society Museum/ Rancho San Joaquin Headquarters., Listed 5/31/1984. (3) Plaque #:P485, "Irvine Park", Listed 9/1/1976.
County of Orange	Positive: OC Parks: Irvine Ranch Historic Park.
Irvine Historic Resources List	(1) Lambert Reservoir, (2) First Irvine Office/ Ranch Headquarters, (3) Irvine Family Home Site and Gardens, (4) C.F. Kraus Residence, (5) Irvine Employee Housing, (6) Irvine Community Center/ Public School, (7) Irvine Bean Warehouse, (8) East Irvine Garage and Service Station, (9) A.T.S.F. Station, (10) East Irvine Post Office/ General Store/ Blacksmith Shop, (11) Dirigible Hangars "Lighter Than Air" Base, (12) Live Oaks-Laguna Canyon Road, (13) Site of Michelson Vacuum Tube (Speed of Light Experiments), (14) First Home in University Park, (15) French Hill-AKA, Turtle Rock, (16), Martin Airport (original site of Orange County Airport), (17) San Joaquin Marsh/Peat Bogs, (18) Bommer Canyon Cattle Camp, (19) Urbanus Square (Old Buffalo Ranch).

[1] The CHRI has been replaced by the California Built Environment Resource Database (BERD)

SENSITIVITY

PALEONTOLOGICAL SENSITIVITY

Previous City documents used a four-tiered ranking system to assess the sensitivity of sediments for fossils (General Plan Element E). Using the City's system, geologic units are classified according to the relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts within the known extent of the geological unit (Table 6, Figure 6). Although significant localities may occasionally occur in a geologic unit, a few widely scattered important fossils or localities do not necessarily indicate a higher potential; instead, the relative abundance of localities is intended to be the major determinant for the value assignment. Thousands of fossils have been recovered within the City boundaries.

The Vaqueros, Sespe-Vaqueros, Sespe, Monterey, Puente and Capistrano Formations are assigned a high sensitivity. Formations assigned a moderate sensitivity include the Williams Formation Pleasants Sandstone Member, the Santiago Formation, the Topanga Group, the undifferentiated Puente Formation, and the Pliocene Niguel Formation.

Pleistocene sediments generally lie beneath young sediments with no fossils. Shallow excavations should not impact Pleistocene fossils. Because the presence of Pleistocene fossils has been demonstrated we have ranked the sediments as moderate.

The Silverado Formation has a low sensitivity along with young sediments. The El Modeno Volcanics and artificial fill are assigned no sensitivity (Table 6).

All three Focus Areas are mapped as moderate sensitivity for fossils with small areas of high sensitivity in Focus Areas 2 and 3.

Table 6. Paleontological Sensitivity Rankings

Age	Unit Name		City Paleontological Sensitivity Zones			
			none	low	moderate	high
modern	artificial fill (Qaf)		X			
late Holocene	very young landslide (Qls, Qls?)			X		
	very young slope wash (Qsw)			X		
Pleistocene	unlisted			X[1]		
late Pleistocene to Holocene	young axial-channel (Qya)			X[1]		
	young colluvium (Qyc)			X		
	young alluvial-fan (Qyf)			X[2]		
	young landslide (Qyls?)			X		
middle to late Pleistocene	old paralic and alluvial fan (Qopf)			X[1]		
early to middle Pleistocene	very old axial-channel (Qvoa)			X[1]		
	very old alluvial-fan (Qvof)			X[2]		
Pliocene	Niguel Fm. (Tn)				X	
late Miocene to early Pliocene	Capistrano Fm., Oso Mbr. (Tco)			X[1]		X
late Miocene	Puente Fm	La Vida Mbr. (Tplv)				X
		Soquel Mbr. (Tpsq)			X	
		unlisted			X	
	Monterey Fm. (Tm)				X	
middle Miocene	Topanga Group	Paulerino Fm. (Ttp)			X	
		Los Trancos Fm. (Ttlt)			X	
		Bommer Fm. (Ttb)			X	
		unlisted			X	
	El Modeno Volcanics (Tiemd, Tiemd?)		X			
latest Oligocene to latest early Miocene	Vaqueros Fm. (Tv)					X
	Sespe-Vaqueros Fm. (Tvs)					X
late Eocene to early Miocene	Sespe Fm. (Ts)					X
middle Eocene	Santiago Fm. (Tsa)				X	
Paleocene	Silverado Fm. (Tsi)			X		
Late Cretaceous	Williams Fm., Pleasants Sandstone Mbr. (Kwps)				X	

Fm. - Formation

Mbr. - Member

[1] Indicates that the unit has low sensitivity at depths of less than 8 feet.

[2] Indicates that the low sensitivity in Mtns and increases to moderate sensitivity on the plain.

Figure 6. Paleontological Sensitivity of the City

ARCHAEOLOGICAL SENSITIVITY

Prehistoric site locations are confidential to protect them from vandalism. All known sites were mapped to help establish sensitivity rankings. Prehistoric sites are most abundant in the San Joaquin Marsh area and San Joaquin Hills, both south of Interstate 405 (I-405). Sites are also abundant along what were, at the time, permanent water sources such as creeks and springs northeast of Irvine Blvd. Only ten sites are known on the plain between I-405 and Irvine Blvd. On this basis we rank the areas south of I-405 and north of Irvine Blvd. as highly sensitive and the plain in between as less sensitive (Figure 7). All known sites have been mitigated. Unknown resources may be present.

Only two historical archaeological sites have been recorded in Irvine. Both are in the eastern portion of the City and consisted of historic domestic refuse. Due to the low number of sites, no sensitivity map was created.

Portions of Focus Areas 1 and 3 are mapped as highly sensitivity for prehistoric archaeological sites. Focus Area 2 is mapped entirely as less sensitive for prehistoric archaeological sites.

HISTORICAL SENSITIVITY

Historical resources include current and former locations of historic buildings, historical archaeological sites (often near historic use areas) and the location of extant historic homes more than 45 years old (Figure 8). Old Town Irvine has the highest number of historic buildings. Other resources north of I-405 include the railroad, a eucalyptus windbreak, Valencia Growers Packing House and the Irvine Agricultural Headquarters Complex. South of I-405 they include the Rancho San Joaquin Adobe, the San Joaquin Gun Club, Phineas Banning House, Bommer Canyon Cattle Camp and Barton's Mound. Only those that have been determined to be significant under CEQA are mapped (Figure 8).

All Focus Areas have historical resources located within their boundaries. Focus Area 2 has the most resources due to Old Town Irvine's location within its boundary. Focus Area 1 includes concentrated areas of buildings 45 years or older.

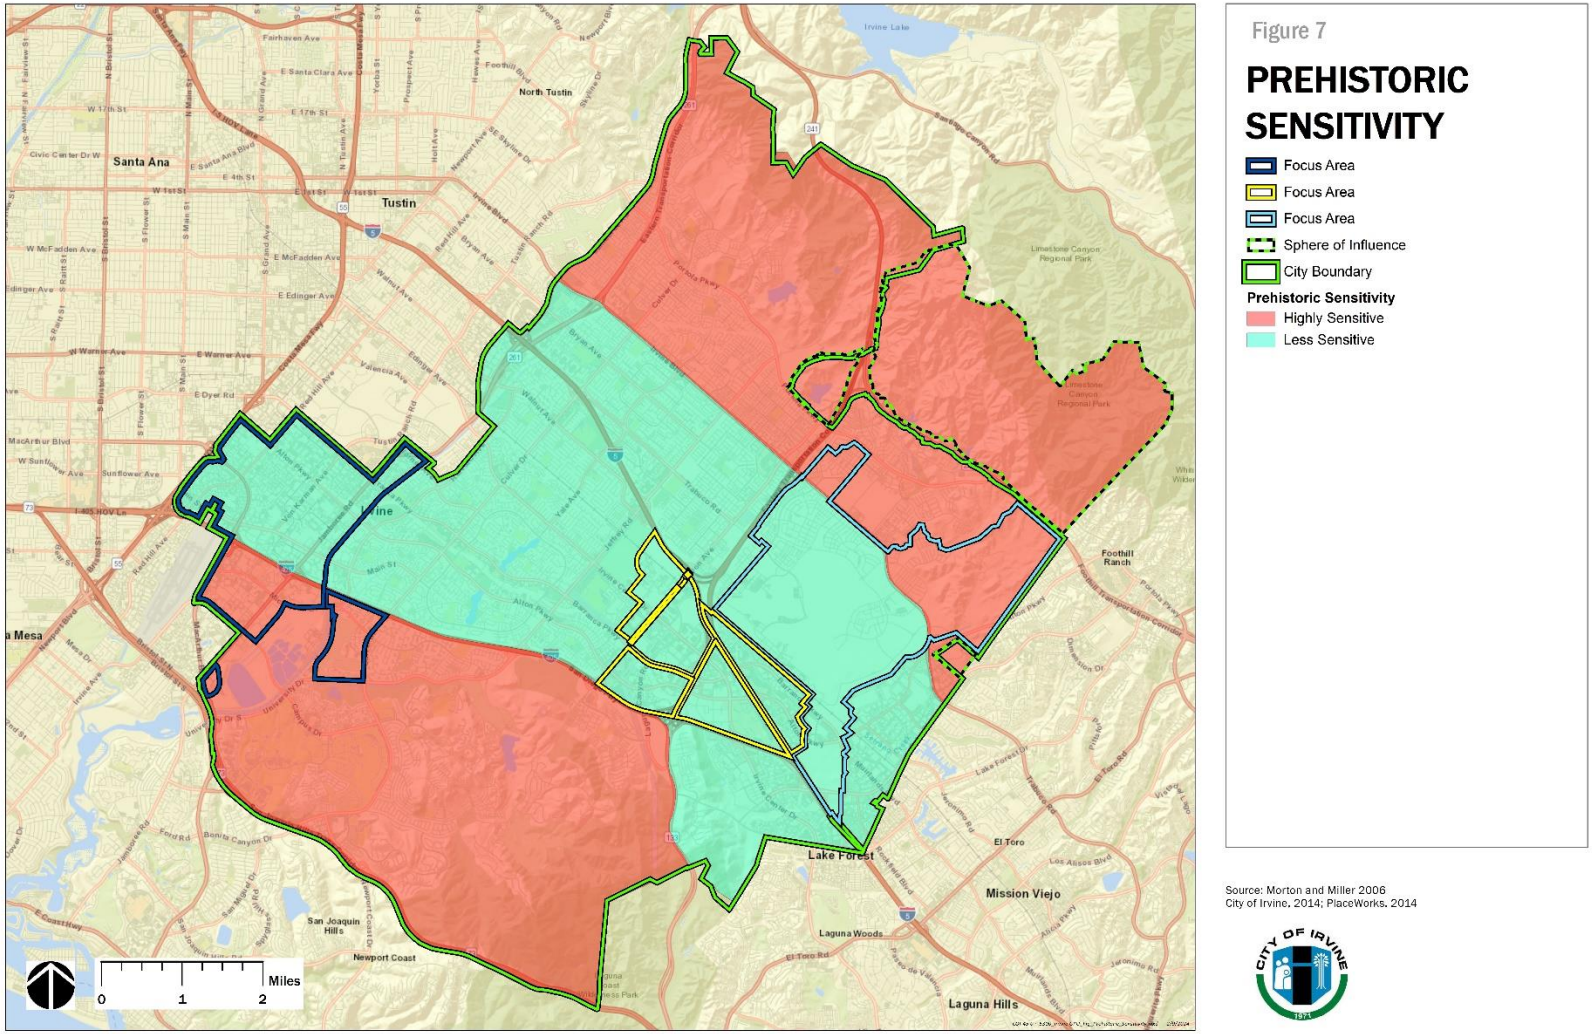

Figure 7. Prehistoric Sensitivity

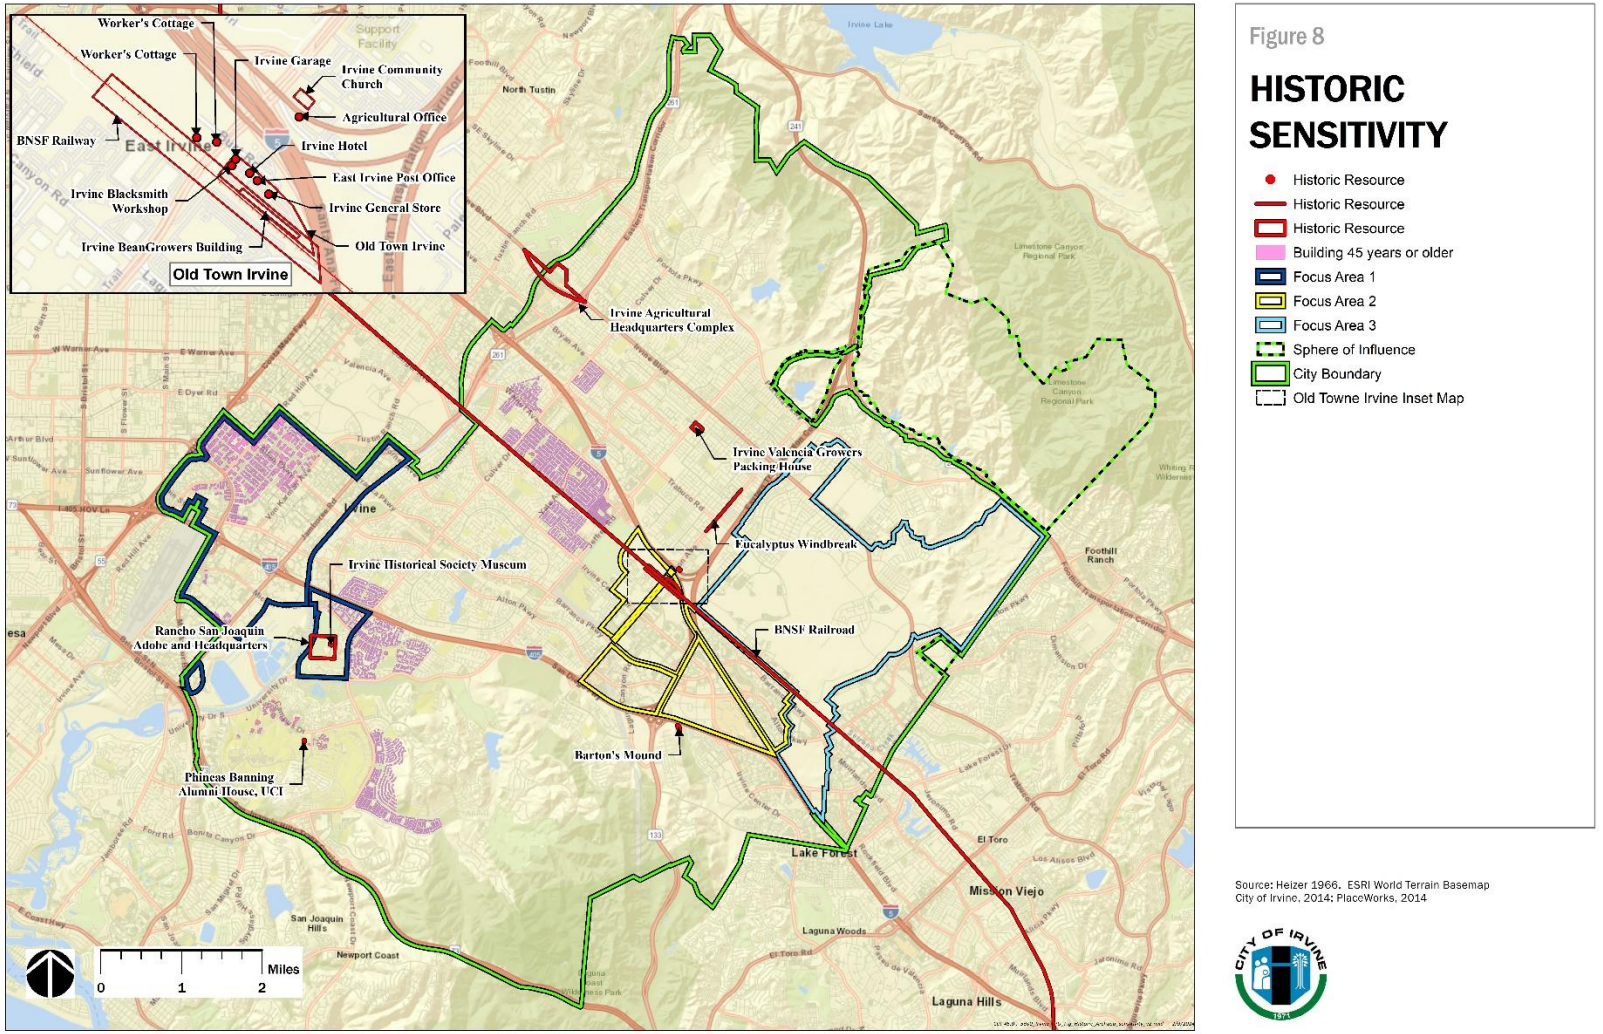

Figure 8. Historic Resources Sensitivity

MITIGATION MEASURES

Future proposed projects within the City of Irvine have the potential to impact paleontological and cultural resources. The following mitigation measures are recommended.

MM GEO-1. City staff shall require applicants for future proposed ground disturbing projects in undisturbed sediments ranked moderate or above to either (1) provide a technical paleontological assessment consisting of a record search, survey, background context and project specific recommendations performed by a qualified paleontologist (with a graduate degree and a specialization in vertebrate paleontology) or (2) agree to monitoring all excavations below five feet. If resources are known or reasonably anticipated the recommendations shall provide a detailed mitigation plan requiring monitoring during grading and other earthmoving activities in undisturbed sediments. The plan will establish a fossil recovery protocol that includes data to be collected, requires professional identification, radiocarbon dates and other special studies as appropriate and requires curation at local curation facility such as such as the John D. Cooper Center operated by the County of Orange for fossils meeting significance criteria. A comprehensive final mitigation compliance report including a catalog of fossil specimens with museum numbers and an appendix containing a letter from the museum stating that they are in possession of the fossils shall be required.

MM CUL-1. City staff shall require applicants for future proposed projects with intact extant building(s) more than 45 years old to provide a historic resource technical study evaluating the significance and data potential of the resource. If significance criteria are met, detailed mitigation recommendations are required as part of the technical study. All work shall be performed by a qualified architectural historian meeting Secretary of the Interior Standards.

MM CUL-2. City staff shall require applicants for future proposed ground disturbing projects to either (1) provide a technical cultural resources assessment consisting of a record search, survey, background context and project specific recommendations performed by a qualified archaeologist meeting Secretary of the Interior Standards and certified by the County of Orange or (2) agree to full-time monitoring by an archaeologist and a Native American. If resources are known or reasonably anticipated the recommendations shall provide a detailed mitigation plan which shall require monitoring during grading and other earthmoving activities in undisturbed sediments. The plan will provide a treatment plan for potential resources that includes data to be collected, requires professional identification, other special studies as appropriate, and requires curation at a repository for artifacts meeting significance criteria. A comprehensive final mitigation compliance report including a catalog of specimens with museum numbers and an appendix containing a letter from the museum stating that they are in possession of the materials shall be required.

MM CUL-3. Unanticipated discoveries of human remains shall require immediate cessation of ground disturbance within 50 feet and notification to City staff and the Coroner and shall follow state law as stated in Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98.

PALEONTOLOGY - ARCHAEOLOGY - HISTORY

MOLLY VALASIK
Principal Investigator for Archaeology

EDUCATION

2009 M.A., Anthropology, Kent State University, Kent, Ohio
2006 B.A., Anthropology, Ohio State University, Columbus, Ohio

EXPERIENCE

Ms. Valasik serves as Cogstone's CEO and CFO and helps guide the vision and direction of Cogstone. She has been with the company since 2009 and has helped transition Cogstone from sole ownership to multiple owners with an active board of directors. Ms. Valasik is a Registered Professional Archaeologist (RPA) with 15 years of experience. She is a skilled professional who is well-versed in the compliance procedures of the California Environmental Quality Act (CEQA), the National Environmental Policy Act (NEPA), and Sections 106 and 110 of the National Historic Preservation Act (NHPA) and regularly prepares cultural resources assessment reports for a variety of federal, state, and local agencies throughout California. Ms. Valasik has managed a variety of projects at Cogstone in the water, transportation, energy, development, and federal sectors. She meets the qualifications required by the Secretary of the Interior's *Standards and Guidelines for Archaeology and Historic Preservation*. She is accepted as a Principal Investigator for prehistoric archaeology by the State Historic Preservation Office (SHPO) and is listed as a Principal Investigator on Cogstone's Bureau of Land Management (BLM) Cultural Resource Use Permit.

SELECTED PROJECTS

Laguna Niguel General Plan Update, City of San Juan Capistrano, Orange County, CA. Cogstone reviewed and summarized available information regarding known paleontological, archaeological, and historical resources within the City of Laguna Niguel to support the General Plan Update Project. Cogstone conducted a Sacred Lands File search from the Native American Heritage Commission (NAHC), cultural and paleontological resources records searches, and consultation with local historical societies. A Cultural and Paleontological Resources Assessment report was prepared that outlined culturally sensitive areas within the city and included recommendations for mitigation. The City of San Juan Capistrano was the lead agency under the California Environmental Quality Act (CEQA). Sub to De Novo Planning Group. Project Manager. 2023

Camino Capistrano Mixed-Use Project, City of San Juan Capistrano, Orange County, CA. Cogstone conducted a cultural and paleontological resources assessment to determine the potential impacts to cultural and paleontological resources during the project, which consisted of the retention and rehabilitation of two National Register of Historic Places (NRHP)-listed adobe buildings; reconstruction of a contributing barn that was recently dismantled and stored onsite; removal, offsite relocation, and rehabilitation of a second contributing barn that is extant; and the construction of three new buildings. The project area and vicinity are known to be archaeologically sensitive areas. Cogstone's services included records searches, a Sacred Lands File search from the Native American Heritage Commission (NAHC), a pedestrian survey, and the preparation of a Cultural and Paleontological Resources Assessment Report. Site updates were prepared on California Department of Parks and Recreation (DPR 523) forms for the two previously recorded adobe buildings. The City of San Juan Capistrano was the lead agency under the California Environmental Quality Act (CEQA). Sub to 31871 Camino Capistrano LLC. Principal Archaeologist. 2023-*ongoing*

City of San Juan Capistrano, In-N-Out 31791 Del Obispo Street, San Juan Capistrano, CA. Cogstone conducted a Historic Resources Project Review to determine potential impacts to historical resources resulting from the proposed construction of a 3,897 square foot In-N-Out Restaurant with a drive-through and related site improvements on two adjoining lots totaling 1.77 acres. Cogstone's services included a cultural resources records search, built environment survey, updates to existing DPR 523 forms, National Register of Historic Places (NRHP) eligibility assessments, and preparation of a Historic Resource Project Review Report. Cogstone also reviewed design plans of the proposed commercial building for compatibility with the NRHP-listed Blas Aguilar Adobe and attended an in-person public hearing with the public and the San Juan Capistrano Cultural Heritage Commission. The assessment was completed in compliance with the requirements of CEQA with the City of San Juan Capistrano as the lead agency under CEQA. Project Manager. 2021

cogstone
PALEONTOLOGY - ARCHAEOLOGY - HISTORY

KIM SCOTT
Principal Investigator for Paleontology

EDUCATION

2013 M.S., Biology with a paleontology emphasis, California State University, San Bernardino
2000 B.S., Geology with paleontology emphasis, University of California, Los Angeles

SUMMARY QUALIFICATIONS

Scott has over 29 years of experience in California as a paleontologist and sedimentary geologist. She has worked extensively in the field surveying, monitoring, and salvaging fossils on hundreds of projects. In addition, she has special skills in jacketing large fossils, fossil preparation (cleaning and stabilization) and in the preparation of stratigraphic sections and other documentation for fossil localities. Ms. Scott frequently authors paleontological assessments, paleontological mitigation plans, and monitoring compliance reports to all agency requirements. She authors and conducts crew sensitivity training, serves as company safety officer, and has authored both the company safety and paleontology manuals. She is a Member of the Society of Vertebrate Paleontology and the Geological Society of America.

SELECTED PROJECTS

Valley Boulevard Widening Project, City of Menifee, Riverside County, CA. The City of Menifee proposed to widen the existing Valley Boulevard roadway and extend the roadway through two existing gaps, providing local residents with one continuous route. The project included raised medians, turn lanes, and seven new traffic signals at major intersections. Additionally, sidewalks and bike lanes would be constructed on both sides of the roadway. Soundwalls would be incorporated along the roadway where applicable. Cogstone conducted a paleontological resources assessment which consisted of records searches, a pedestrian survey, and preparation of a Paleontological Resources Assessment Report. The project area was determined to have a moderate potential for fossils, and Worker Environmental Awareness Program (WEAP) training was recommended for all construction personnel. The City of Menifee was the lead agency under the California Environmental Quality Act (CEQA). Sub to Dokken Engineering. Principal Investigator for Paleontology. 2022

The Terraces Project, City of Murrieta, Riverside County, CA. The purpose of this study was to determine the potential effect on paleontological resources by the Terraces Project, which involved construction of 900 apartment units in 12 four-story buildings on a 37.8-acre site. Parking spaces, a leasing center, clubhouse, swimming pool, various walking paths and green space areas, and a dog park or other outdoor open space area would be provided throughout the project site. Planned vertical impacts would be in excess of 10 feet during grading. Cogstone performed records searches, a pedestrian survey, and produced a Paleontological Resources Assessment Report. All work was done in compliance with the mitigation measures for the project. The City of Murrieta was the lead municipal agency under CEQA. Sub to Birdseye Planning Group, LLC. Principal Investigator for Paleontology. 2021-2022

Purple Line Extension (Westside Subway) Sections 1 and 2 Construction Management, Los Angeles County Metropolitan Transportation Authority, Los Angeles, Los Angeles County, CA. The project involves construction of seven stations from the existing Purple Line at Wilshire/Western Avenue along Wilshire Boulevard to the Veterans Administration Hospital in Westwood for 8.6 miles. Cogstone manages all paleontological services for Sections 1 and 2 of the subway project including budgets, WEAP training, monitoring, fossil recovery, fossil preparation, identification, cataloguing curation with the Natural History Museum of Los Angeles County, and reporting. Sub to JV West (Stantec/Jacobs JV; Section 1), AECOM (Section 2). Principal Investigator for Paleontology. 2014-*ongoing*

Cold Canyon Landfill Expansion Module 12, Arroyo Grande, San Luis Obispo County, CA. Cogstone conducted archaeological and paleontological resources monitoring for the expansion of an existing landfill. In addition, Cogstone provided WEAP training for all construction personnel. Upon completion of monitoring, Cogstone prepared a Cultural and Paleontological Resources Monitoring Compliance Report. Sub to Waste Connections, Inc. Principal Investigator for Paleontology. 2022

.

cogstone
PALEONTOLOGY - ARCHAEOLOGY - HISTORY

HOLLY HICKMAN
Archaeologist

EDUCATION

2009 B.A., Archaeology/History, Simon Fraser University, Canada

SUMMARY QUALIFICATIONS

Ms. Hickman is a qualified archaeologist and cross-trained paleontologist with over 11 years of experience in pedestrian survey, monitoring, excavation and burial recovery, as well as the identification of human and faunal skeletal remains. She is proficient in the preparation of cultural resources assessment reports for a variety of federal, state, and local agencies throughout California and the eastern United States. Ms. Hickman is responsible for the organization of field data, supervision, preparing California Department of Parks and Recreation 523 (DPR 523) forms, as well as identifying and cataloging prehistoric and historic artifacts. She also has experience with preparing artifact collections for curation at a variety of different repositories throughout California and the eastern United States.

SELECTED PROJECTS

Pacific Gas and Electric (PG&E) Master Services Agreement, Statewide, CA. Cogstone was sub-contracted to provide on-call cultural resources monitoring services for various PG&E projects throughout California. Cogstone has conducted archaeological monitoring for over 30 task orders. In addition, Cogstone assisted in burial recovery and repatriation of human remains in consultation with the Most Likely Descendant (MLD), PG&E, and Cardno on one project. Sub to Cardno (now Stantec). Project Manager/Supervisor. 2019-2022

Southern California Edison (SCE) Environmental Clearance On-Call Program, Statewide, CA. Cogstone was subcontracted to provide on-call cultural resources monitoring services for various SCE projects throughout California. Projects have included new pole and tower placements, existing pole and tower replacements, vegetation clearance, underground repairs, and general maintenance. Cogstone has conducted archaeological monitoring and surveys, GIS mapping, and prepared technical reports for over 130 task orders. Sub to Cardno (now Stantec). Project Manager/Supervisor. 2018-2021

New Cuyama Dump Sites 1, 2, and 3, Bureau of Land Management (BLM) Bakersfield Office, Santa Barbara County, CA. The Project involved identifying archaeological and historical resources present within three illegal dump sites on BLM land. This study included an assessment of the historic potential of dump refuse and National Register of Historic Places (NRHP) eligibility recommendations for debris demonstrating affirmative evidence for an age of greater than 45 years. A Class III Cultural Resources survey was conducted and included an intensive-level pedestrian survey of the Area of Potential Effect (APE) with no larger than ten-meter-wide transects when used. Smaller transects were used in narrower areas of the APE and during investigations of newly identified archaeological sites and isolates. A total of three historic trash scatters were identified during the survey and a total of four historic isolates were identified. These resources were recorded on Department of Parks and Recreation 523 (DPR 523) forms. No archaeological sites or isolates were identified. No artifacts were collected. Cogstone was able to meet the scheduled deadlines for the Project and completed the work within the budget. The deliverables were accepted by the BLM without revisions. Project Manager and Archaeologist. 2020-2021

Morro Bay Water Facility, City of Morro Bay, San Luis Obispo County, CA. The City of Morro Bay has proposed to construct a new water reclamation facility. Federal funding for the project required compliance with Section 106 of the NHPA along with the California Environmental Quality Act (CEQA). The United States Environmental Protection Agency (EPA) acted as federal lead and the City acted as state lead agency, with permitting by the California Coastal Commission (CCC), California Department of Transportation (Caltrans), and the State Water Resources Control Board. Cogstone conducted Workers Environmental Awareness Program (WEAP) trainings for all construction personnel, cultural and paleontological resources monitoring, and prepared a Cultural Resources Monitoring Compliance Report upon completion of construction. Sub to Filanc Black & Veatch Joint Venture. Supervisor. 2020-2021

cogstone
PALEONTOLOGY - ARCHAEOLOGY - HISTORY

LOGAN FREEBERG
GIS Supervisor

EDUCATION

2018 Geographic Information Systems (GIS) Certificate, California State University, Fullerton
2003 B.A., Anthropology, University of California, Santa Barbara

SUMMARY OF QUALIFICATIONS

Mr. Freeberg has over 20 years of experience in cultural resource management and has extensive experience in field surveying, data recovery, monitoring, and excavation of archaeological and paleontological resources associated with land development projects in the private and public sectors. He has conducted all phases of archaeological work, including fieldwork, laboratory analysis, research, and reporting. Mr. Freeberg also has a strong grounding in conventional field and laboratory methods and is skilled in the use of ArcGIS.

SELECTED PROJECTS

Bell Gardens Water Reservoir Project, City of Bell Gardens, Los Angeles County, CA. Cogstone conducted a cultural and paleontological resources assessment to determine the potential impacts to cultural and paleontological resources during improvements which included a new two-million-gallon reservoir, booster pump station, well to be drilled, and other components. Services included record searches, Sacred Lands File search from the Native American Heritage Commission, and an intensive pedestrian survey of the 1.7-acre project area. Sub to Infrastructure Engineers. GIS Supervisor. 2019-2020

Santiago Canyon Estates Fuel Mod Project, unincorporated Orange County, CA. Cogstone conducted a cultural resources assessment to determine the potential for surface cultural resources for compliance with Orange County Fire Authority's Precise Fuel Modification Plan for zones of the Santiago Canyon Estates Community. Services included a cultural resources records search, Sacred Lands File search from the Native American Heritage Commission, and a reconnaissance survey. Sub to Fire Safe Council East Orange County Canyons. GIS Supervisor. 2020

State Route 108/Highway 49 and Mackey Ranch Road Intersection Improvements Project, Caltrans District 10, Tuolumne County, CA. The Chicken Ranch Rancheria of Me-Wuk Indians of California (Tribe), in partnership with the California Department of Transportation (Caltrans), proposed to replace an intersection and convert to a roundabout designed to accommodate forecasted future traffic volumes and provide an alternative access route to the Chicken Ranch Rancheria. Cogstone completed an intensive-level pedestrian survey, CHRIS records search, sacred lands file search from the NAHC, Native American consultation, consulted with local history societies and preservation groups, and produced a Historical Resources Compliance Report (HRCR) and Archaeological Survey Report (ASR). Sub to Foothill Associates. GIS Supervisor. 2019-2020

Dogwood Road Project, City of El Centro, Imperial County, CA. Cogstone conducted a cultural resources assessment to determine the potential effects to cultural resources resulting from the construction of United States Department of Agriculture (USDA) Part 70-B RD Funding assisted housing on a 2.2-acre parcel. Cogstone conducted a record search, pedestrian survey, and determined that no further cultural resources work was necessary. The assessment provided environmental documentation as required by Section 106 of the National Historic Preservation Act (NHPA) and the California Environmental Quality Act (CEQA). The City of El Centro acted as the lead agency. Sub to Partner Science & Engineering, Inc. GIS Supervisor. 2019-2020

Laguna Creek Trail and Bruceville Road Project, Caltrans District 3, City of Elk Grove, Sacramento County, CA. The City of Elk Grove, in cooperation with Caltrans, proposed multiple trail extensions and gap closures in effort to provide connecting links that would ultimately provide trail users with access to a vast system of trails, with connections to parks, schools, community centers, commercial retail and office areas, and transit facilities. Cogstone conducted pedestrian surveys, records search, and prepared an Archaeological Survey Report (ASR) and a Historic Property Survey Report (HPSR). Sub to Helix Environmental. GIS Supervisor. 2019-2020

cogstone
PALEONTOLOGY - ARCHAEOLOGY - HISTORY

SHANNON LOPEZ
Architectural Historian

EDUCATION

2022 Certificate in Historic Preservation, The Boston Architectural College, Boston
2018 M.A., History (with an emphasis in architecture), California State University, Fullerton
2012 B.A., History, Minor in Asian-Pacific Studies, California State University, Dominguez Hills

SUMMARY QUALIFICATIONS

Ms. Lopez is a qualified architectural historian with over five years of experience who meets or exceeds the Secretary of the Interior's Standards and Guidelines for Architectural History. Her experience includes architectural history research and surveys with photo documentation and recording of built environment resources for local and federal projects. She has extensive knowledge with Native American consultation, consultation with local and state historical societies, and in the analysis of primary and secondary sources. Ms. Lopez is acknowledged as an approved Architectural Historian by Caltrans and is listed as a Principal Investigator on Cogstone's Bureau of Land Management (BLM) Cultural Resources Use Permit. She is accepted as a Principal Investigator for Architectural History and History by the State Historic Preservation Office (SHPO). Additionally, she is an approved Reader at the Huntington Library by the Los Angeles Office of Historic Resources.

RELEVANT EXPERIENCE

San Gabriel River Commuter Bikeway and Big Dalton Wash Commuter Bikeway, City of Baldwin Park, Los Angeles County, CA. Cogstone conducted a cultural and historic built environment resources assessment to determine the potential impacts to cultural and historical resources for the proposed construction of approximately five miles of new bikeway/pedestrian pathway. Services included pedestrian surveys, records searches, a Sacred Lands File search from the Native American Heritage Commission (NAHC), preparation of California Department of Parks and Recreation 523 (DPR 523) forms, National Register of Historic Places (NRHP) eligibility assessments, and reporting. The project required a Section 408 permit from the United States Army Corps of Engineers (USACE) due to the proximity of the federally managed San Gabriel River and tributaries. All work was completed in compliance with Section 106 of the National Historic Preservation Act (NHPA). The City of Baldwin Park acted as lead agency under the California Environmental Quality Act (CEQA). Sub to Infrastructure Engineering Corporation. Architectural Historian. 2020-2021

Irwindale Concrete Tilt-Up Warehouse Building, City of Irwindale, Los Angeles County, CA. Cogstone conducted an assessment to determine the potential impacts to cultural, historic built environment, and paleontological resources in compliance with the California Environmental Quality Act (CEQA) for the construction of an approximately 129,830 square foot stand-alone concrete tilt-up warehouse building with an office mezzanine. The project required the demolition of an existing building constructed in 1956. Cogstone's services included cultural and paleontological resources records searches, a Sacred Lands File search from the Native American Heritage Commission (NAHC), Assembly Bill 52 (AB 52) consultation support, and an intensive pedestrian survey. A Pepsi-Cola bottling plant constructed in the late 1950s was identified during the survey and was fully documented on California Department of Parks and Recreation 523 (DPR 523) forms and was evaluated for listing in the California Register of Historical Resources (CRHRCogstone prepared a Cultural and Paleontological Resources Assessment Report. The City of Irwindale was the lead agency for the project under CEQA. Sub to PlaceWorks. Architectural Historian. 2021

City of San Juan Capistrano, In-N-Out 31791 Del Obispo Street, San Juan Capistrano, CA. Cogstone conducted a Historic Resources Project Review to determine potential impacts to historical resources resulting from the proposed construction of a 3,897 square foot In-N-Out Restaurant with a drive-through and related site improvements on two adjoining lots totaling 1.77 acres. Cogstone's services included a cultural resources records search, built environment survey, updates to existing DPR 523 forms, NRHP eligibility assessments, and preparation of a Historic Resource Project Review Report. The assessment was completed in compliance with the requirements of CEQA with the City of San Juan Capistrano as the lead agency under CEQA. Architectural Historian. 2021

Attn: Megan Wilson, Archaeologist & GIS Technician

re: Vertebrate Paleontology Records Check for paleontological resources for the proposed City of Irvine General Plan Update, Phase 2, Project, Cogstone Project # 4339, in the City of Irvine, Orange County, project area

Dear Megan:

I have conducted a thorough search of our paleontology collection records for the locality and specimen data for the proposed City of Irvine General Plan Update, Phase 2, Project, Cogstone Project # 4339, in the City of Irvine, Orange County, project area as outlined on the portions of the Orange, Black Star Canyon, Tustin, El Toro, Laguna Beach, and San Juan Capistrano USGS topographic quadrangle maps that you sent to me via e-mail on 18 September 2018. We have at least 23 vertebrate fossil localities that lie directly within the boundaries of the proposed project area, and other localities nearby or at some distance from the same sedimentary deposits that occur in the proposed project area.

In the elevated terrain of the San Joaquin Hills in the southwestern portion of the proposed project area there are some exposures of intrusive igneous rocks that will not contain any recognizable fossils. From oldest to youngest the elevated terrain of the San Joaquin Hills also has exposures of the marine Paleocene Silverado Formation, the early Eocene Santiago Formation, the late Eocene through earliest Miocene Sespe Formation, the marine Eocene through earliest Miocene Vaqueros Formation and the marine middle Miocene Paulerino, Los Trancos, and Bommer Members of the Topanga Formation.

In the elevated terrain of the northern portion of the proposed project area, from the Loma Ridge area southeastward, there are exposures of the marine late Cretaceous Williams Formation, the marine Paleocene Silverado Formation, the early Eocene Santiago Formation, the late Eocene through earliest Miocene Sespe and Vaqueros Formations undifferentiated, the marine middle to late Miocene Monterey Formation, the marine late Miocene Oso, La Vida, and Soquel Members of the Capistrano Formation, and the marine Pliocene Niguel Formation.

In the slightly less elevated terrain in the eastern and southern portions of the proposed project area there are surface deposits of older Quaternary Alluvium, mostly geologically mapped as terrestrial Quaternary terrace deposits but mapped as a mixture of terrestrial and marine Quaternary terrace deposits in the southwestern portion of the proposed project area closer to Upper Newport Back Bay. Most of the proposed project area though, the less elevated terrain in the southeastern portion of the Orange County Coastal Plain, has surface deposits of younger Quaternary Alluvium, derived as alluvial fan deposits from the surrounding hills and mountains.

We do not have any vertebrate fossil localities identified as coming from the Williams Formation. Our vertebrate fossil locality LACM (CIT) 592, though, was originally listed as coming from either the Ladd Formation or Williams Formation in the Santiago Canyon area. Locality LACM (CIT) 592 produced a rare specimen of a fossil dinosaur, Hadrosauridae, from California, published and later figured in the scientific literature by W. J. Morris (1973. Journal of Paleontology, 47(3):551-561; 1982. SEPM Field Trip Volume & Guidebook, 89-90). Our vertebrate fossil locality LACM 1895, in the Santa Ana Mountains east of Santiago Canyon, produced a fossil specimen of mackerel shark, *Squalicorax falcatus*. This specimen was figured in the scientific literature by S.P. Applegate (1964. First Record of the Extinct Shark, *Squalicorax falcatus*, from California. Bulletin of the Southern California Academy of Sciences, 63(1):42-43) and published again by B.J. Welton et.al. (1981. A Preliminary Note on the Late Cretaceous Sharks of the Chatsworth Formation at Dayton Canyon, Simi Hills, Los Angeles County, California. September Guidebook). Applegate described the specimen as coming from the Pleasants Sandstone Member of the Williams Formation, but more likely it came from the the Holz Shale Member of the Ladd Formation.

Our only vertebrate fossil locality indicated as being from the Silverado Formation, LACM 4634, is an older locality only identified as coming from the Irvine Ranch in the Santa Ana Mountains. Locality LACM 4634 produced a specimen of an unidentified fossil tortoise, Testudinidae.

All of our fossil vertebrate localities from the Santiago Formation, LACM 3881, 3883-3884, 3979, 4022, 5346-5347, 6926 and 68102, occur in the northwestern part of San Diego County, clustered around Carlsbad. These localities produced a suite of vertebrate fossils including turtles, crocodiles, birds, rodents, insectivores, brontothere, and amynodont rhinoceroses. David J. Golz (1976. Eocene Artiodactyla of Southern California. Los Angeles County Museum Science Bulletin, 26:1-85) published on the LACM specimens of the protoceratid artiodactyl *Leptoreodon leptolophus* and the camels *Protylopus petersoni* and *Protylopus stocki* from our Santiago Formation locality LACM 68102.

We have a number of Vaqueros Formation localities that occur within the proposed project area: LACM 7505, 7548-7553, 7675-7678, and 7712, all situated in the southeastern portion of the proposed project area south of the San Diego Freeway (I-405) mostly west of the Laguna Freeway (Highway 133) between about the Laguna Reservoir and the Sand Canyon Reservoir. These localities has so far produced a marine fauna containing fossil specimens of eagle ray, *Myliobatis*, basking shark, *Cetorhinus*, requiem shark, Carcharhinidae, quadrupedal marine mammal, Desmostylia, long snouted dolphin, *Argyrocetus*, shark-toothed dolphin, Squalodontidae, early toothless whale, Eomysticetidae, and primitive baleen whale, Cetotheriidae, We have two more vertebrate fossil localities, LACM 5448, and 6666, that occur within the proposed project area and are designated as being from the Sespe / Vaqueros Formations undifferentiated. Both localities have produced marine fossils though and are likely from the Vaqueros facies of the Sespe / Vaqueros Formations undifferentiated. Locality LACM 5448, jut inside the eastern border of the proposed project area east of the current Orange County Great Park in the hills on the southern side of the Borrego Canyon Wash, produced fossil specimens of undetermined bird, Aves, and whale, Cetacea. Locality LACM 6666, in the eastern portion of the proposed project area near the Lambert Reservoir and Tomato Springs, produced a fossil specimen of the quadrupedal marine mammal *Desmostylus*.

We have one locality, LACM 8016, from the Los Trancos Member of the Topanga Formation, that occurs within the boundaries of the proposed project area on the southern side of the University of California at Irvine campus near Bonita Canyon Drive. Locality LACM 8016 produced a marine fauna contain fossil specimens of requiem shark, *Carcharhinus*, tiger shark, *Galeocerdo*, snaggletooth shark, *Hemipristis*, hammerhead shark, *Sphyrna*, raggedtooth shark, *Odontaspis*, bramble shark, *Echinorhinus*, herring, *Xyne grex*, and mora, Moridae.

We have no Monterey Formation localities that occur within the proposed project area boundaries, but we do have a number of Monterey Formation localities that occur in Lake Forest just outside the boundaries of the southeastern portion of the proposed project area: 3198, 3486, 3209-3210, 3412-3413, and 4103-4114. These localities produced a suite of fossil marine vertebrates including hammerhead shark, *Sphyrna*, giant white shark, *Carcharocles megalodon*, bonito sharks, *Isurus benedeni* and *Isurus oxyrinchus*, bramble shark, *Paraechinorhinus barnesi*, eel, Anguilliformes, jack, Carangidae, bonito, *Sarda*, barracuda, *Sphyraena*, crocodile, *Crocodylus*, bird, Aves, sea lion, Otariidae, dugong, *Dioplotherium allisoni*, baleen whale, Mysticeti, and dolphin, Kentriodontidae. A specimen of the dugongid sirenian *Dioplotherium allisoni* from locality LACM 3210 was figured in the scientific literature by D. P. Domning in 1978 (Sirenian Evolution in the North Pacific Ocean. University of California Publications in Geological Sciences, 118:1-176). Specimens of the fossil crocodile *Crocodylus* from localities LACM 3209 and 3210 were published in the scientific literature by C. A. Brochu in 1999 (Phylogenetics, Taxonomy, and Historical Biogeography of Alligatoroidea. Journal of Vertebrate Paleontology, 19(2):9-100). F. H. Pfeil designated the holotype (name bearing specimen for a species new to science) of the echinorhinid shark *Paraechinorhinus barnesi* from locality LACM 3198 (1983. Zahnmorphologische Untersuchungen an rezenten und fossilen Haien der Ordnungen Chlamydoselachiformes und Echinorhiniformes. Palaeoichthyologica. 1:1-315).

Near the southwestern portion of the proposed project area, on the eastern side of Newport Back Bay in the bluffs along Backbay Drive west of Jamboree Road and south of San Joaquin Hills Road, we have two Monterey Formation localities, LACM 1160 and 7139, that produced undetermined fossils of bony fish, Osteichthyes and baleen whale, Mysticeti.

We do not have any Puente Formation localities that occur within the proposed project area boundaries. Our closest locality, LACM 6287, from the La Vida Member of the Puente Formation, occurs to the northeast of the northeastern portion of the proposed project area along East Santiago Canyon Road in Limestone Canyon near Blue Diamond Haul Road and produced fossil specimens of tonguefish, *Symphurus*.

We have two localities from the Oso Member of the Capistrano Formation that occur within the boundaries of the northeastern portion of the proposed project area: LACM 3866 and 4171. Locality LACM 4171, at Tomato Springs near the mouth of Round Canyon, produced a fossil specimen of undetermined baleen whale, Mysticeti. Locality LACM 3866, on the southwestern side of the Lambert Reservoir just to the southwest, produced fossil specimens of walrus, *Pontolis magnus*, and dugongid sea cow, *Dioplotherium allisoni*. The skeleton of Pontolis Magnus from locality LACM 3866 was published by the scientific literature by J. Vélez-Juarbe (2017. *Eotaria citrica*, sp. nov., a new stem otariid from the "Topanga" formation of Southern California. PeerJ, 5(e3022):1-25). In Round Canyon just to the northeast, but outside the proposed project area boundaries, our Capistrano Formation LACM 7539 produced a fossil specimen of undetermined fur seal, Otariidae.

We have two Niguel Formation localities that occur within the southwestern boundaries of the proposed project area: LACM 3977 and 3986, along what is now MacArthur Boulevard near University Drive. Locality LACM 3977 produced fossil specimens undetermined bony fish, Osteichthyes, in addition to brachiopods and mollusks. Locality LACM 3986 produced fossil specimens of chimaera, Chimaeroidei, spiny dogfish, *Squalus acanthias*, Pacific hake, *Merluccius productus*, mora, Moridae, queenfish, *Seriphus*, sculpin, Cottidae, and rockfish, *Sebastes*.

Also within the southwestern boundaries of the proposed project area we have the older Quaternary localities LACM 1068, just east of MacArthur Boulevard and north of what is now Bison Avenue, LACM 3978, adjacent to the southeastern side of the intersection of University Drive and MacArthur Boulevard, and LACM 1069, on the south side of University Drive east of MacArthur Boulevard. Locality LACM 1069 produced fossil specimens of undetermined mammals, Mammalia. Locality LACM 3978 produced fossil specimens of undetermined even-toed ungulate, Artiodacyla and turkey, *Meleagris*. The turkey specimen from locality LACM 3978 was published in the scientific literature by D.W. Steadman (1980. A Review of the Osteology and Paleontology of Turkeys (Aves: Meleagridinae). LACM Contributions in Science, 330:131-207). Locality LACM 1068 produced fossil specimens of ground sloth, *Paramylodon*, rabbit, *Sylvilagus*, tapir, *Tapirus californicus*, horse, *Equus*, camel, *Camelops*, deer, *Odocoileus*, and bison, *Bison*. The tapir from locality LACM 1068 was published in the

scientific literature by G.T. Jefferson (1989. Late Cenozoic Tapirs (Mammalia: Perissodactyla) of Western North America. LACM Contributions in Science, 406:1-21). In the southeastern portion of the proposed project area, on the western side of the Laguna Freeway (Highway 133) at the southern end of the interchange with the San Diego Freeway (I-405), we have another older Quaternary locality, LACM 7713, that produced a fossil specimen of ground sloth, Mylodontidae. In the central eastern portion of the proposed project area, in the Orange County Great Park near the end of 5th Street, our older Quaternary locality LACM 7867 produced fossil specimens of pocket gopher, *Thomomys*.

Excavations in the intrusive igneous rocks exposed in the San Joaquin Hills in the southern portion of the proposed project area will not contain recognizable fossils. Shallow excavations in the uppermost few feet of the younger Quaternary alluvial deposits exposed in the lower lying terrain in most of the proposed project area probably will not uncover significant fossil vertebrate remains. Deeper excavations in those portions of proposed project area that extend down into older sedimentary deposits, as well as any excavations in the Williams Formation, the Silverado Formation, the Santiago Formation, the Sespe & Vaqueros Formations, the Topanga Formation, the Monterey Formation, the Puente Formation, the Capistrano Formation, the Niguel Formation, or the older Quaternary deposits, exposed in the more elevated terrain in the proposed project area, however, may well encounter significant vertebrate fossils. Any substantial excavations in the sedimentary deposits in the proposed project area, therefore, should be closely monitored to quickly and professionally collect any specimens without impeding development. Also, sediment samples should be collected and processed to determine the small fossil potential in the proposed project area. Any fossils recovered during mitigation should be deposited in an accredited and permanent scientific institution for the benefit of current and future generations.

This records search covers only the vertebrate paleontology records of the Natural History Museum of Los Angeles County. It is not intended to be a thorough paleontological survey of the proposed project area covering other institutional records, a literature survey, or any potential on-site survey.

Sincerely,

Samuel A. McLeod

Samuel A. McLeod, Ph.D.
Vertebrate Paleontology

APPENDIX C. FOSSIL LIST

Group	Taxon	Common Name	Formation
Bivalve	*Aphrodina* sp.	clam	Williams, Pleasants M
Bivalve	*Astarte* sp.	clam	Williams
Bivalve	Bivalvia	bivalve	Williams
Bivalve	Bivalvia	clam	Williams
