1 Introduction

1.1 Project Overview

The proposed Restaurant Row Project (project) includes a request for a Specific Plan (SP22-0004), General Plan Amendment (GPA22-0002), Rezone (R22-0002), Site Development Plan (SDP22-0006) for the private development , and Vesting Tentative Subdivision Map (TSM22-0003) for a mixed-use residential development project on a 10.5-acre site in the City of San Marcos (City; see Figure 1, Project Location, and Figure 2, Project Site). Additionally, the project requests a separate Site Development Plan (SDP23-0004) for the development of a proposed 1.1-acre neighborhood public park. The General Plan Amendment and Rezone would change the General Plan designation and Zoning from Mixed-Use 1 (MU 1) and Light Industrial (L-I) to Specific Plan Area (SPA). The Specific Plan (Appendix M) has been prepared with the intent to provide a comprehensive plan to ensure the efficient development of a new mixed-use residential community. The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the General Plan. The Site Development Plan would configure the site for multifamily dwelling units, ground floor commercial mixed-use space, recreational open space, and private open space. The Tentative Subdivision Map presents specific infrastructure and lot and street configurations for the site.

The project consists of demolition of 63,484 square feet of existing (primarily vacant) restaurant uses on site, and redevelopment of 202 multifamily residential units and 10,400 square feet of commercial retail uses on the 10.5-acre project site (Figure 3, Conceptual Site Plan). Residential units would consist of 8 three-bedroom townhomes over commercial (town over commercial); 17 front street townhomes ranging in size from three to four bedrooms; 57 greencourt townhomes ranging in size from two to four bedrooms; and 120 motorcourt units ranging in size from two to three bedrooms. The residential and mixed-use buildings A through T would be developed on site as shown in Figure 3. Useable open space amenities would be located in the north-central/northeastern portion of the project site, including the proposed public park, the proposed dog parks and proposed private tot lots and barbeque area, while commercial uses would be placed along the southern and eastern project boundaries. Primary project access would be via West San Marcos Boulevard at the project's southern boundary. The project would provide 501 parking spaces.

Due to the widening of San Marcos Boulevard and the addition of the multi-way improvements, there would be numerous utility structures that would need to relocate to accommodate these improvements. The San Diego Gas and Electric (SDG&E) items that would be moved are SDG&E Fuse Cabinet, SDG&E 2-3316 primary handholes, SDG&E 1-3314 primary handhole, SDG&E 1-3421 single phase transformer, SDG&E 2-secondary handholes, SDG&E 1-PME switch, and City of San Marcos 1-meter pedestal serving irrigation and streetlights. Additionally, due to the project development requirements, there would be a need to relocate an SDGE fuse cabinet from a partial easement position to a franchise/partial position.

1.2 California Environmental Quality Act Compliance

This document has been prepared to satisfy the California Environmental Quality Act (CEQA) (California Public Resources Code, Section 21000 et seq.), and the CEQA Guidelines (14 CCR 15000 et seq.). CEQA requires that all state and local government agencies consider the environmental consequences of projects over which they have discretionary authority before acting on those projects. CEQA Section 15152 encourages lead agencies to tier

environmental analysis to avoid repetitive discussion within subsequent environmental documents and focus on issues directly related to the topic of evaluation.

1.3 Project Planning Setting

The project site is located at 1020 West San Marcos Boulevard (northwest corner of West San Marcos Boulevard and Via Vera Cruz), in the City of San Marcos (Assessor's Parcel Numbers 219-200-30, 219-200-31, and 219-200-45). Please refer to Figure 1, Project Location and Figure 2, Project Site. The existing project site has been previously disturbed and is currently developed with existing, primarily vacant, commercial uses and associated parking. Partial demolition of an existing on-site building would occur as part of the project. The project site is located in an urban area of the City surrounded on all sides by existing development, including industrial uses to the north, and commercial uses and associated paved parking to the east, west, and south.

1.4 Public Review Process

In accordance with CEQA, a good faith effort has been made during the preparation of this Initial Study/Mitigated Negative Declaration (IS/MND) to contact affected agencies, organizations, and persons who may have an interest in this project.

In reviewing the IS/MND, affected public agencies and the interested public should focus on the sufficiency of the document in identifying and analyzing the project's possible impacts on the environment. The Draft IS/MND and related documents are available for review on City's website:

https://www.san-marcos.net/departments/development-services/planning/environmental-review-sustainability/environmental-documents

Comments on the IS/MND may be made in writing before the end of the public review period. The public review period for this IS/MND is August 21 through September 20, 2023. Following the close of the public comment period, the City will consider this IS/MND and comments thereto in determining whether to approve the proposed project.

Written comments on the IS/MND should be sent to the following address by September 20, 2023, by 4:30 p.m.

City of San Marcos
Planning Division
1 Civic Center Drive
San Marcos, California 92069
Contact: Sean del Solar
Email: sdelsolar@san-marcos.net

1.5 Initial Study Checklist

Dudek, under the City's guidance, prepared the project's Environmental Checklist (i.e., IS) per CEQA Guidelines Sections 15063–15065. The CEQA Guidelines include a suggested checklist to indicate whether a project would have an adverse impact on the environment. The checklist is found in Section 2 of this document. Following the Environmental Checklist, Sections 2.1 through 2.21 include an explanation and discussion of each significance determination make in the checklist for the project.

For this IS/MND, the following four possible responses to each individual environmental issue area are included in the checklist:

1. Potentially Significant Impact
2. Less-than-Significant Impact with Mitigation Incorporated
3. Less-than-Significant Impact
4. No Impact

The checklist and accompanying explanation of checklist responses provide the information and analysis necessary to assess relative environmental impacts of the project. In doing so, the City will determine the extent of additional environmental review, if any, for the project.

INTENTIONALLY LEFT BLANK

2 Initial Study Checklist

1. **Project title:**

   Restaurant Row Project

2. **Lead agency name and address:**

   City of San Marcos
   Development Services Department, Planning Division
   1 Civic Center Drive
   San Marcos, California 92069

3. **Contact person:**

   Sean del Solar, Senior Planner
   760.744.1050 ext. 3223
   sdelsolar@san-marcos.net

4. **Project location:**

   The project site is located at 1020 West San Marcos Boulevard (northwest corner of West San Marcos Boulevard and Via Vera Cruz), in the City of San Marcos (Assessor's Parcel Numbers 219-200-30, 219-200-31, and 219-200-45). Please refer to Figure 1, Project Location, and Figure 2, Project Site.

5. **Project sponsor's name and address:**

   Lennar
   16465 Via Esprillo, Suite 150
   San Diego, California 92127

6. **General plan designation:**

   The existing General Plan land use designations for the project site are Mixed-Use 1 (MU 1) and Light Industrial (L-I). The project includes a General Plan Amendment to change the existing General Plan designations of all parcels within the project area to Specific Plan Area (SPA).

7. **Zoning:**

   The existing zoning designations for the project site are Mixed-Use 1 (MU-1) and Light Industrial (L-I). The project includes a change of the existing zoning of all parcels within the project area to Specific Plan Area (SPA).

8. **Description of project. (Describe the whole action involved, including but not limited to later phases of the project, and any secondary, support, or off-site features necessary for its implementation. Attach additional sheets if necessary):**

   The project includes a General Plan Amendment, Zoning Amendment, Specific Plan, Tentative Map, and two Site Development Plans (one for the residential mixed-use development and one for the public park). The General Plan Amendment and Rezone would change the General Plan designation and zoning from

Light Industrial (L-I) and Mixed Use (MU-1) to Specific Plan Area (SPA). The Specific Plan (Appendix M to this IS/MND) serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the General Plan. The Tentative Map presents the specific lot configuration for the site. The Site Development Plan will configure the site for townhome dwelling units, street configuration, infrastructure, recreational public open space, and private open space.

The project consists of redevelopment of a 10.5-acre site to include 10,400 square feet of commercial space, a 1.1-acre neighborhood public park, and 202 multifamily residential homes linked together by a series of pedestrian paseos and common use areas (Figure 3, Conceptual Site Plan). The project would require the demolition of 63,484 square feet of existing (primarily vacant) restaurant uses on site. However, elements from the Old California Restaurant Row would be preserved and incorporated into the project design to create an old meets new aesthetic that celebrates the history of the site. The approximate grading quantities for the project include approximately 4,500 cubic yards of cut, 16,800 cubic yards of fill, and 12,300 cubic yards of import.

Residential Component

Residential homes would consist of 8 three-bedroom townhomes over commercial (town over commercial); 17 “front street” townhomes ranging in size from three to four bedrooms; 57 “greencourt” townhomes ranging in size from two to four bedrooms; and 120 “motorcourt” townhomes ranging in size from two to three bedrooms. Private balcony/patio space would be included for each residential unit. Development of the project would be guided by the project’s Specific Plan, which provides development guidelines, policies, and regulatory measures (Appendix M).

Commercial and Mixed Use Component

The 10,400 square feet of proposed commercial and mixed-use spaces would be located along street frontages and adjacent to proposed plazas and paseos. As outlined in the Specific Plan (Appendix M), the intent of the pending commercial uses is to complement the existing restaurants adjacent to the project site. The goal of the commercial nodes along the southern project boundary adjacent to San Marcos Boulevard is to activate street activity by encouraging residents and visitors to shop, eat, linger, and stay along the San Marcos Boulevard corridor. The commercial nodes along the eastern project boundary would offer a place of connection to integrate the park, Western Paseo, and parking, into Restaurant Row. The commercial spaces would be limited to 10,400-square feet as allowed by the Specific Plan and would generally be located on the ground floor. Commercial tenant spaces would be built to suit and vary in size. The commercial spaces located below the Town over Commercial homes are smaller in size and range less than 15 feet in height. The commercial areas will have the ability to be subdivided depending on the retail market.

Commercial nodes, woven throughout residential and mixed-use buildings, would be located along the southern and eastern project boundaries, to encourage walkability and convenient access to on-site commercial uses as well as along West San Marcos Boulevard. The commercial nodes along the southern project boundary activate Restaurant Row, link commercial activity from adjacent properties along West San Marcos Boulevard, and create a new pedestrian-oriented street frontage encouraging residents and visitors to shop and eat along the San Marcos Boulevard corridor. The commercial node along the eastern project boundary offers a connecting space to interface with the park, Western Paseo, and parking into Restaurant Row.

Neighborhood Park Component

The public park design was developed through a series of public workshops, whereby multiple amenities were explored with the community. Based on the public workshops, the public park would include bench seating and tables, pergola, wayfinding signage, four standard pickleball courts with bleacher seating, a playground with rubber surfacing and play equipment, connecting walkways, a passive lawn area with amphitheater seating and hillside seating, and restroom facilities. The project would also provide for homeowners association (HOA)-maintained public gathering spaces on site, and a public dog park separated into two areas for large breed dogs and small breed dogs. All proposed common areas would be maintained by the HOA, with the exception of the public park which would be publicly owned and maintained. Public park parking would be maintained by the HOA.

Access, Roadways, and Off-Site Improvements

Primary project access would be via two driveways off West San Marcos Boulevard at the project's southern boundary. A secondary project access would be on the east from Via Vera Cruz via the alleyway (private drive G) heading westerly to the project. In alignment with the San Marcos Boulevard Multi-Way Complete Street Project, the project would construct a continuous center median along the project frontage on West San Marcos Boulevard. This would eliminate the left-turn ingress and egress movements at the western project driveway. The project would also include the following off-site improvements:

- Move the existing northern curb line along West San Marcos Boulevard approximately 16 feet into the project site to accommodate the proposed multi-way roadway improvements.
- Construct a raised curb along its frontage on West San Marcos Boulevard, which would separate the multi-way facility from the through travel lanes on West San Marcos Boulevard. These improvements would be non-vehicular capacity enhancing.
- As part of the multi-way improvements, the project includes reconstruction and widening of the existing sidewalk along its frontage, which would be constructed to City standards and would be Americans with American Disabilities Act (ADA) compliant.
- The project would replace the existing Class II bike lane along San Marcos Boulevard with the same facilities as in existing conditions.

The site would be linked together through a series of landscaped promenades and paseos that not only facilitate pedestrian and bicycle connectivity but create public spaces for people to congregate. The pedestrian connections would be punctuated with social gathering nodes and opportunities for public art. The north and south connecting paseo would link to the public park in the northeast portion of the Specific Planning area (Figure 5, Conceptual Public and Private Park Plan).

All project driveways would provide for full turning movements and would be designed to meet the design requirements codified in the California Fire Code. Additionally, adequate corner and stopping site distances would be maintained at all driveway locations.

The project would include circulation amenities such as an interconnected mobility system for bicycles, pedestrians, and vehicles in order to provide residents with safe movement within the project site; connections to existing roadways within the vicinity of the project site; and access to regional arterial and highway networks and Sprinter/Breeze transit services.

Based on the final multi-way design, the existing San Marcos Boulevard and Via Vera Cruz bus stop, located on the northwest corner of the West San Marcos Boulevard / Via Vera Cruz intersection, may be moved slightly in comparison to existing conditions, if moved at all. However, this change, would not substantially change the bus stop spacing along the route and would have minimum to no impact on the route's operations. The existing amenities at the bus stop would be replaced in kind to current conditions with additional new amenities being implemented for the relocation of bus stop.

Infrastructure and Utility Improvements

A Federal Emergency Management Agency (FEMA)-mapped 100-year floodplain, 500-year floodplain, and regulatory floodway occur across the northern portion of the site. The project would fill areas north and south of the floodway to raise the proposed buildings above the 100-year floodplain elevations with required freeboard. Grading and encroachments would be minimized within the floodway area. As part of the project, a park would be implemented in the existing floodway area with a variety of amenities tolerant of inundation (Figure 3, Conceptual Site Plan). The site design is intended to minimize floodway encroachments and results in minor changes to the existing condition 100-year water surface elevations. The proposed condition water surface elevations are generally lower than existing conditions (please see Section 2.10 below and Appendices F and G to this IS/MND).

The on-site drainage improvements in proposed conditions would consist of private streets, gutters, and curb inlets that tie into underground storm drain systems. The project would upsize the existing 30-inch public storm drainpipe that conveys the majority of the site to a double 36-inch storm drainpipe with a new alignment that transitions to a dual reinforced concrete box (RCP) before it discharges to the existing concrete channel. In addition, the project would construct some public improvements and street widening along the project frontage. These public improvements include center median improvements and a new side median for multi-way improvement lanes in West San Marcos Boulevard. The proposed drainage patterns would be relatively the same as in existing conditions, and the site would generally drain towards the existing 100-year floodway and drain to the west toward the existing concrete channel. The project is located within Vallecitos Water District's (VWD) boundaries for water and wastewater service. The proposed project would construct systems to connect to existing VWD infrastructure that currently serves the existing buildings on site; including construction of approximately 1,188 feet of new 10-inch PVC water main into the project site and replacement of approximately 714 feet of existing 8-inch ACP water main with new 10-inch PVC water main in the Alley Way. All water services to the site would be connected to a new 10-inch water main installed north of the project site in Alley Way (private drive G) and would upsize existing facilities to 10 inches. Sewer facilities would also be extended through Alley Way (private drive G), including construction of 1,541 feet of 8-inch PVC sewer main into the project site. Please refer to Section 2.19 below and Appendix F to this IS/MND.

Electricity and natural gas would be provided by SDG&E. Electrical facilities throughout the City include a combination of aboveground and belowground electrical distribution lines and utilities structures. The City's fiber-optic network is facilitated by a 72-strand fiber-optic line that runs on various streets throughout the City. All major arterials in the City have implemented fiber optics. The proposed project would require construction of private utility lines to connect to existing electrical lines and natural gas that currently serve the site. Due to the project development requirements, there will be a need to relocate an SDG&E fuse cabinet from a partial easement position to a franchise position.

Parking

Project development would result in the removal of 822 existing parking spaces that currently serve the Restaurant Row site, within the project boundaries. The project would remove 7 spaces that currently serve the Buffalo Wild Wings sites to accommodate the implementation of the multi-way along San Marcos Boulevard. The proposed project would provide 501 parking spaces on site, with 392 private garage spaces being reserved for project residents and 109 spaces being open to guests, retail patrons, park users, and other uses within the shopping center. The project would provide 4 electric vehicle (EV) charging stations and 17 EV ready stalls on site and would install charging stations in all private garage parking stalls. The project would also include four ADA parking stalls as part of the proposed parking, and one ADA van accessible space.

Landscaping

The project would include approximately 84,770 square feet of landscaped area throughout the project. Implementation of the project would introduce a landscape plan, and more vegetation and trees would be incorporated into site design than what currently exists on site (Figure 4, Conceptual Landscape Plan). Existing trees would need to be removed as a result of median reconfiguration; however, these trees would be replaced, and the project would add trees to the right-of-way. The City has a General Plan policy of 1-to-1 tree replacement for development projects. The project would remove 140 existing trees on site (47 existing standard trees and 93 existing palm trees), would protect 13 existing trees on site, and would plant 243 trees on site (204 proposed standard trees and 39 proposed palm trees).

Streetscape Design

The project would include streetscape design features such as street furniture, trash and recycling areas, bicycle racks, signage, and lighting to aid in the cohesive design of the project as outlined in the Specific Plan (Appendix M). Any street furnishing within the right-of-way along San Marcos Boulevard would be reviewed and approved by the City. A variety of fencing is proposed throughout the site. The type of fencing selected is based on location and use; types of fencing include residential horizontal wood fencing, solid vinyl fence, steel picket fencing, cable railing, vinyl-coated chain-link fence for the dog park, vinyl-coated chain-link fence for the pickle ball courts, and a glass and concrete masonry unit block combo wall separating the public park from proposed residential units to the south.

Construction Sequence and Development Phasing

As outlined in the Specific Plan prepared for the project site (Appendix M), construction of the proposed project is planned to be accomplished in four stages. Development of the site would be accomplished in six phases. Construction sequence and development phasing is subject to change and would be approved by the City's Building Division. The four stages of construction include: (1) land development – demolition of the existing structures and mass grading of the site; (2) residential construction – model homes from each product type would be completed in the initial production phases to enable sales to begin, with the rest of the homes to follow; (3) retail – construction of the commercial and mixed-use buildings would be completed; and (4) public improvements, including San Marcos multi-way and the public park, which are subject to additional review and permitting. It is anticipated that some of construction stages 2, 3 and 4 would overlap. The Conditions of Approval for the project would specify timing for each of the proposed stages.

After construction stage 1 is complete, residential construction would begin with model homes for each product type, followed by the rest of the homes to be built in six phases, during construction stage 2. Please refer to the Specific Plan for additional details related to construction sequencing and phasing (Appendix M).

Project Design Features

The project would incorporate the following project design features (PDFs) as a condition of approval:

PDF-1: The project would include 501 total parking spaces; 4 EV charging stations and 17 EV ready spaces would be included. Charging stations will be installed in all garage parking stalls.

PDF-2: The project would pay its fair-share contribution to bicycle infrastructure improvements.

PDF-3: The project would provide pedestrian connections throughout all uses on site and connection to adjacent sidewalks and existing roadways. The project would provide communal bicycle parking, and all living units would provide bicycle storage.

PDF-4: The project would install instantaneous electric water heaters without water tanks.

PDF-5: Based on the 10,400 square feet of commercial retail uses, the project would install a (10,400 x 2)/1,000 = 20.8 kilowatt solar photovoltaic system.

PDF-6: The project's landscaping would meet the requirements within the City's Water Efficient Landscape Ordinance. The project would include a landscape area of approximately 84,770 square feet.

PDF-7: The project would include a total of 243 trees.

PDF-8: Project implementation of permanent storm water quality best management practices (BMPs) that comprise of proprietary and non-proprietary biofiltration, hydromodification, and source control, and site design BMPs would effectively treat post-construction stormwater runoff prior to discharge from the site in compliance with the requirements of the City's 2023 BMP Design Manual and BMPs outlined in the project's Storm Water Quality Management Plan (SWQMP).

PDF-9: For residences with yard area that lies adjacent to the southern, eastern, or northern project site boundary, a 6-foot-high solid fence or landscape wall would be provided along the yard/project site boundary in order to ensure exterior noise levels from roadway traffic and adjacent commercial uses does not exceed 65 A-weighted decibels (dBA) Community Noise Equivalent Level (CNEL) in these yard areas.

PDF-10: For residences in the first row of structures adjacent to San Marcos Boulevard, to achieve the interior criterion of 45 dBA CNEL, exterior doors and windows located on the building façade facing San Marcos Boulevard should have a minimum Sound Transmission Classification (STC) rating of 35.

9. Surrounding land uses and setting (Briefly describe the project's surroundings):

The existing project site has been previously disturbed and is currently developed with existing, primarily vacant, commercial uses and associated parking and is located within Old California Restaurant Row in the City of San Marcos. The project site is currently situated on three parcels between the former Sears site

directly to the west, and three restaurants and a bank to the east. The project site is located in an urban area of the City surrounded on all sides by existing development, including industrial uses to the north, and commercial uses and associated paved parking to the east, west, and south. Surrounding uses include Wells Fargo Bank, a Buffalo Wild Wings restaurant, and additional restaurants to the east as well as health service and commercial buildings to the north. An unoccupied commercial site and a Regal Edwards Cinema are to the west. Vacant land and commercial uses are south along the opposite side of West San Marcos Boulevard.

10. Other public agencies whose approval is required (e.g., permits, financing approval, or participation agreement):

N/A.

11. Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1? If so, is there a plan for consultation that includes, for example, the determination of significance of impacts to tribal cultural resources, procedures regarding confidentiality, etc.?

Note: Conducting consultation early in the CEQA process allows tribal governments, lead agencies, and project proponents to discuss the level of environmental review, identify and address potential adverse impacts to tribal cultural resources, and reduce the potential for delay and conflict in the environmental review process. (See Public Resources Code section 21080.3.2.) Information may also be available from the California Native American Heritage Commission's Sacred Lands File per Public Resources Code section 5097.96 and the California Historical Resources Information System administered by the California Office of Historic Preservation. Please also note that Public Resources Code section 21082.3(c) contains provisions specific to confidentiality.

Yes, in compliance with Assembly Bill (AB) 52 and Senate Bill (SB) 18, the City, as lead agency, is responsible for conducting government to government consultation with pertinent tribal entities. To date, four Tribes have requested consultation, including San Luis Rey Band of Mission Indians on July 14, 2022; San Pasqual Band of Mission Indians on September 19, 2022; Rincon Band of Luiseño Indians on September 21, 2022; and Campo Band of Mission Indians on October 3, 2022. The City conducted consultation meetings with representatives of the San Luis Rey Band of Mission Indians on November 17, 2022; January 12, 2023; and February 16, 2023. Consultation with the San Luis Rey Band of Mission Indians concluded on April 16, 2023. The City conducted consultation meetings with representatives of the Rincon Band of Luiseño Indians on August 19, 2022, and December 20, 2022, with consultation concluding on December 21, 2022. Both the San Luis Rey Band of Mission Indians and Rincon Band of Luiseño Indians concluded formal consultation with the understanding that the project would implement the City's standard Tribal Cultural Resource mitigation measures. The project would implement these mitigation measures as outlined under MM-CUL-1 through MM-CUL-4 in Section 2.5 below. The City held one consultation meeting with the San Pasqual Band of Mission Indians on May 11, 2023. A consultation close-out letter was requested by the City on May 15, 2023. On October 18, 2023, the City notified the Campo Band of Mission Indians by letter of the opportunity to consult on the project. On October 3, 2022, the City received an emailed request from the tribe's Cultural Resources Manager, Daniel Tsosie, to consult under Senate Bill 18. The City transmitted the cultural resources report to Campo on October 18, 2022, and subsequent attempts to communicate with the tribe were not successful. The City attempted again on April 20 and July 24, 2023, to which the tribe did not respond or provide information on tribal cultural resources. Therefore, in accordance with Section 21082.3.(d)(2) of the Public Resources Code, which states that the tribe had requested consultation but failed to provide comments to the City, or otherwise failed to engage in the consultation process, the City concluded consultation with Campo on August 15, 2023.

Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact," as indicated by the checklist on the following pages.

☐ Aesthetics	☐ Agriculture and Forestry Resources	☐ Air Quality
☒ Biological Resources	☒ Cultural Resources	☐ Energy
☐ Geology and Soils	☐ Greenhouse Gas Emissions	☐ Hazards and Hazardous Materials
☐ Hydrology and Water Quality	☐ Land Use and Planning	☐ Mineral Resources
☐ Noise	☐ Population and Housing	☒ Public Services
☐ Recreation	☐ Transportation	☒ Tribal Cultural Resources
☐ Utilities and Service Systems	☐ Wildfire	☐ Mandatory Findings of Significance

Determination (To be completed by the Lead Agency)

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier ENVIRONMENTAL IMPACT REPORT or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier ENVIRONMENTAL IMPACT REPORT or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Date

Evaluation of Environmental Impacts

5. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
6. All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
7. Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an Environmental Impact Report (EIR) is required.
8. "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from "Earlier Analyses," as described in (5) below, may be cross-referenced).
9. Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:
    a. Earlier Analysis Used. Identify and state where they are available for review.
    b. Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
    c. Mitigation Measures. For effects that are "Less Than Significant With Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.
10. Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.
11. Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.
12. This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
13. The explanation of each issue should identify:
    a. The significance criteria or threshold, if any, used to evaluate each question; and
    b. The mitigation measure identified, if any, to reduce the impact to less than significance

2.1 Aesthetics

		Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
I.	**AESTHETICS –** Except as provided in Public Resources Code Section 21099, would the project**:**				
a)	Have a substantial adverse effect on a scenic vista?	☐	☐	☒	☐
b)	Substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☒	☐
c)	In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☐	☐	☒	☐
d)	Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☒	☐

a) Would the project have a substantial adverse effect on a scenic vista?

Less-than-Significant Impact. A scenic vista is typically defined as a public view of highly valued visual and scenic resources such as the ocean and distant mountain ranges, particularly from public vantage points. As discussed in the City's General Plan, hillside and ridgeline areas visible throughout the City, as viewed from the State Route (SR-) 78 corridor and other locations such as parks and scenic roads, are considered valuable. The City's General Plan does not identify any designated scenic vistas; however, the General Plan more generally aims to protect the City's scenic resources such as the San Marcos, Merriam, and Double Peak Mountains; creek corridors; mature trees; rock outcroppings; and ocean views. The project site and surrounding valley terrain are encompassed by mountains to the west and south that provide opportunities for elevated vantage points offering long and broad views, which may include views of the project site. However, due to the relatively flat terrain of the project site and surrounding area, and the project site's location on a currently developed site in an urbanized area, development of the proposed project is not expected to impede views of existing scenic vistas; nor is the project site considered a scenic vista. As such, impacts would be less than significant.

b) Would the project substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Less-than-Significant Impact. SR-78 is located approximately 0.5 miles north of the project site. However, the section of SR-78 proximate to the project site is not identified as a Scenic Highway per the California

Department of Transportation (Caltrans) State Scenic Highways Program (Caltrans 2022). Additionally, a portion of SR-78 is also identified as an Eligible State Scenic Highway; however, this eligible segment begins approximately 26 miles east of the project site in Santa Ysabel. The nearest eligible state scenic highway is Interstate 5 (I-5). I-5 is located approximately 7 miles west of the project site and is not visible due to distance.

Although the project site is not located within a viewshed of a state scenic highway, the City has designated SR-78 as a view corridor to surrounding ridgelines. However, views of the project site from SR-78 are generally limited due to existing commercial developments, existing landscaping, and the speed of motorists on SR-78. Even with development of the proposed project, views of the surrounding hillsides and ridgelines are not expected to be substantially obstructed from SR-78. In addition, the project site is located on a currently developed site within an urbanized area. Visual quality would not substantially differ from existing conditions. Impacts would be less than significant.

c) ***In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?***

Less-than-Significant Impact. The City of San Marcos is considered an urbanized area pursuant to California Public Resources Code Section 21071. Therefore, the first question of Threshold c) does not apply to the proposed project, as it is directed at non-urbanized areas.

The visual character of the site would be altered by the proposed project, as it would change the existing restaurant uses into a higher density mixed-use residential development. While the proposed project would change the existing visual character on the site, it is not characterized as substantial degradation since few public vantage points of the project site exist and the site is entirely surrounded by adjacent development in a highly urbanized area. Although the proposed mixed-use residential uses would differ in land use designation and visual character in comparison to the immediately surrounding commercial and industrial land uses, the proposed mixed-use residential development would conform to the existing urbanized character of the surrounding area and would not substantially change the views from any public viewpoint. With City approval of the proposed land use and zoning change from Mixed-Use 1 (MU 1) and Light Industrial (L-I) to Specific Plan Area (SPA), the proposed project would be required to comply with design standards of the approved Specific Plan (Appendix M) for the project site, including building placement and building height. Building height would allow for 2 stories minimum, with up to an additional 15 feet that may be permitted for special architectural features and roof line variation. Additionally, the Specific Plan includes landscaping standards, including specifics for tree selections that shall be upright, vertically oriented species.

As described in the Specific Plan (Appendix M), the goal of the architectural design is to encourage connection, while providing a transition zone to the residential areas within the Specific Plan area. The architecture along San Marcos Boulevard frames large plazas and outdoor dining areas that wrap the site and lead to the park at the northeast corner of the development. Private residential areas are reinforced by the use of private drives/streets and tighter paseos framed by taller buildings compared to the open spaces and common plazas shared by the retail and dining areas. The project would draw inspiration from Old California Restaurant Row through its colors and materials. Referential materials and colors would occur off San Marcos Boulevard and in the commercial buildings adjacent to the park. These materials would be contrasted by the contemporary residential developments characterized by contemporary colors, materials, and forms. The proposed design on-site intends to create a stronger contrast between the history

of the site and the new architectural development. The project would incorporate Old California Restaurant Row inspired materials, and would pair them with cool and muted grays of various shades to give the area a modern aesthetic. Residential components of the project site would include materials such as smooth stucco, metal shading elements, wood accents, stone veneer, lap siding accents, and contemporary brick; while the mixed-use components of the project would include materials such as wooden beams, various wooden siding, tumbled brick with heavy mortar joints, heavy metal accents and metal siding, corrugated metal, and integration of historical features (i.e., bells, beams, signage details).

The proposed project would not conflict with any applicable zoning or other regulations governing scenic quality. Therefore, impacts are determined to be less than significant.

d) Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Less-than-Significant Impact. Lighting in the project vicinity is associated with roadway lighting and lighting associated with the existing commercial and industrial uses that surround the project site. Development of the proposed project would result in new sources of light from the residential units, commercial uses, landscaping lighting, security lighting, and internal circulation and pedestrian lighting. Although more light sources are anticipated from the proposed project in comparison to existing conditions, the increase in lighting is not expected to be substantial, seeing as the site is developed in existing conditions and surrounded by lighting associated with adjacent development and roadways. Additionally, all lighting associated with the project would be required to comply with the City of San Marcos Municipal Code (SMMC) Section 20.300.080, Light and Glare Standards (City of San Marcos 2022a), as well as the conceptual lighting plan and lighting standards outlined in the Specific Plan (Appendix M). The project includes catenary, bollard, york mount, arm mount, and wall mount lighting throughout the project site. Although the proposed project would result in new sources of light in the area, the project site is in an urbanized area and is surrounded by existing development with existing sources of day and nighttime lighting. Compliance with the SMMC would minimize and restrict nighttime light pollution and light trespass on adjacent properties.

Implementation of the proposed project could potentially include sources of glare from architectural finishes or amenities on site. The project developer would be required by the SMMC Section 20.300.080, Light and Glare Standards, to minimize use of reflective building materials and finishes, as well as reflective lighting structures and metallic surfaces to the extent feasible to impede any potential-generated glare. The proposed project would not propose any features that would be characterized as creating a substantial new source of glare that would adversely affect daytime or nighttime views in the area. Compliance with the SMMC would result in less-than-significant impacts associated with light and glare.

2.2 Agriculture and Forestry Resources

		Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
II.	**AGRICULTURE AND FORESTRY RESOURCES** – In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:				
a)	Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b)	Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒
c)	Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☒
d)	Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e)	Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

a) ***Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?***

No Impact. The project site is designated as Urban and Built-Up Land by the California Department of Conservation Farmland Mapping and Monitoring Program (CDC 2016). As a result, the proposed project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural uses.

No Prime Farmland, Unique Farmland, nor Farmland of Statewide Importance exist within the immediate vicinity of the project site. The proposed project would not result in substantial changes that could result in

the conversion of farmland to non-agricultural use. The proposed project site is surrounded entirely by developed land, with the exception of one vacant lot adjacent to the southern portion of the site. This vacant lot is designated as "Other Land" by the CDC Farmland Mapping and Monitoring Program. Surrounding development adjacent to the project site include industrial, mixed Use, and commercial uses. Given the extent of development surrounding the proposed project site, the proposed project would not result in the conversion of any existing farmland, and no impact would occur.

b) ***Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?***

No Impact. The project site is not zoned for agricultural use or designated as land under the Williamson Act, nor is the project site zoned for forest land or timberland production (CDC 2016). Therefore, implementation of the proposed project would not result in the loss or conversion of forest land. No impact would occur regarding conflicts with existing zoning for agricultural use or forest land.

c) ***Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?***

No Impact. Please see response to Thresholds a) and b) above.

d) ***Would the project result in the loss of forest land or conversion of forest land to non-forest use?***

No Impact. Please see response to Thresholds a) and b) above.

e) ***Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?***

No Impact. Please see response to Thresholds a) and b) above.

2.3 Air Quality

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
III. AIR QUALITY – Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☒	☐
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	☐	☐	☒	☐
c) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☒	☐

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☐	☐	☒	☐

Dudek prepared an Air Quality and Greenhouse Gas Emissions Analysis Technical Report for the project which is included as Appendix A to this IS/MND. The analysis herein is based on findings of Appendix A. Full details regarding air quality as it relates to the project can be found in Appendix A.

a) Would the project conflict with or obstruct implementation of the applicable air quality plan?

Less-than-Significant Impact. The project site is located within the San Diego Air Basin (SDAB) and is subject to San Diego Air Pollution Control District (SDAPCD) guidelines and regulations. The SDAB lies in the southwest corner of California, which comprises the entire San Diego region, and covers approximately 4,260 square miles. The SDAPCD is the regional agency responsible for the regulation and enforcement of federal and state regulations. California Air Resources Board (CARB) is responsible for the regulation of mobile emissions sources within the state, local air quality management districts and air pollution control districts are responsible for enforcing air quality standards and regulating stationary sources.

An area is designated in attainment when it is in compliance with the National Ambient Air Quality Standards (NAAQS) (federal) and/or California Ambient Air Quality Standards (CAAQS) (state). These standards are set by the Environmental Protection Agency or the CARB for the maximum level of a given air pollutant that can exist in the outdoor air without unacceptable effects on human health or the public welfare. The criteria pollutants of primary concern that are considered in an air quality assessment include ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), particulate matter less than or equal to 10 microns in diameter (PM_{10}), particulate matter less than or equal to 2.5 microns in diameter ($PM_{2.5}$), lead, and toxic air contaminants. Volatile organic compounds (VOCs) and oxides of nitrogen (NO_x) are precursors to the formation of ground-level O_3.

The Regional Air Quality Strategy (RAQS) outlines SDAPCD's plans and regulatory control measures designed to attain state air quality standards for ozone. The RAQS, which was adopted by the San Diego County Air Pollution Control Board in 1992, is updated on a triennial basis, with the most recent revision adopted in 2023. The State Implementation Plan (SIP) and RAQS rely on information from CARB and the San Diego Association of Governments (SANDAG), including mobile and area source emissions as well as information regarding projected growth in the County as a whole and the cities in the County, to project future emissions and determine the strategies necessary for the reduction of emissions through regulatory controls. CARB mobile source emission projections and SANDAG growth projections are based on population, vehicle trends, and land use plans developed by the County and the cities in the County as part of the development of their general plans.

If a project involves development that is greater than that anticipated in the local plan and SANDAG's growth projections, the project might be in conflict with the SIP and RAQS and may contribute to a potentially significant cumulative impact on air quality. The northern portion of the project site includes 1.63 acres of

existing vacant light industrial zoned land, while the remaining portion of the total 10.5-acre project area is zoned Mixed-Use 1 (MU-1) and built with an existing 63,484 square feet of restaurant uses. Therefore, the project requires a General Plan Amendment and rezone to change the General Plan designation and zoning from Mixed-Use 1 (MU-1) and Light Industrial (L-I) to Specific Plan Area (SPA). The current RAQS assumptions would include the project site based on emissions of VOC and NO_x from land uses of zoning of L-I and MU-1 It should be noted that the current low-density single-story restaurant complex does not conform with the current zoning, and the proposed SPA would result in development standards that conform substantially to the MU-1 development standards.

The Air Quality and Greenhouse Gas Emissions Analysis Technical Report prepared for the proposed project determined that the project would not result in a more intensive land use than currently allowed under the City's General Plan (City of San Marcos 2012a), which SDAPCD's RAQS emissions forecast is based on. Therefore, the proposed project would not conflict with the SIP and RAQS and would result in a less-than-significant impact on air quality. As presented in the July 2021, General Plan Housing Element, the most recent Regional Housing Needs Assessment from SANDAG stated that San Marcos's share of regional future housing needs is 3,116 new units between April 15, 2021, and April 15, 2029. As of June 30, 2020, 546 housing units have been planned or approved for development, with 2,570 units remaining needed to be developed in the City. The project is expected to bring 202 units to market in 2027, which would be within SANDAG's growth projection for housing during the 6th Cycle planning horizon.

The General Plan Amendment and zone change to Specific Plan Area (SPA) is not anticipated to result in air quality impacts that were not envisioned in the growth projections and RAQS, and this minor increase in residential units (202 units) in the region would not obstruct or impede implementation of local air quality plans. The project would be consistent at a regional level with the underlying growth forecasts emissions in the RAQS. Impacts would be less than significant.

b) Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Less-than-Significant Impact. The Air Quality and Greenhouse Gas Emissions Analysis Technical Report prepared for the proposed project evaluated the potential for adverse impacts to air quality due to construction and operational emissions resulting from the project. Impacts were evaluated for their significance based on the County of San Diego's mass daily criteria air pollutant thresholds of significance (County of San Diego 2007), which is based on SDAPCD Rules 20.2 and 20.3 (SDAPCD 1998, 2021). Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. Criteria air pollutants include ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), particulate matter with an aerodynamic diameter less than or equal to 10 microns (PM_{10}), particulate matter with an aerodynamic diameter less than or equal to 2.5 microns ($PM_{2.5}$), and lead. Pollutants that are evaluated include VOCs, oxides of nitrogen (NO_x), CO, sulfur oxides (SO_x), PM_{10}, and $PM_{2.5}$. VOCs and NO_x are important because they are precursors to O_3.

Construction Emissions

Proposed construction activities would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and VOC off-gassing from architectural coatings and asphalt pavement application) and off-site sources (i.e., on-road haul trucks,

delivery trucks, and worker vehicle trips). Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and for dust, the prevailing weather conditions. Therefore, such emissions levels can only be estimated, with a corresponding uncertainty in precise ambient air quality impacts.

Criteria air pollutant emissions associated with construction activity were quantified using the California Emissions Estimator Model (CalEEMod). Construction emissions were calculated for the estimated worst-case day over the construction period associated with each phase and reported as the maximum daily emissions estimated during each year of construction (2024–2026). Construction schedule assumptions, including phase type, duration, and sequencing, were based on information provided by the applicant or CalEEMod defaults and are intended to represent a reasonable scenario based on the best information available. NO_x and CO emissions would primarily result from the use of construction equipment and motor vehicles.

Fugitive dust (PM_{10} and $PM_{2.5}$) emissions would primarily result from grading and site preparation activities. The project would be required to comply with SDAPCD Rule 55, Fugitive Dust Control, which would require the project to limit fugitive dust (PM_{10} and $PM_{2.5}$) generated during grading and construction activities. To account for dust control measures in the calculations, it was assumed that the project would ensure that active sites be watered at least two times daily. The application of architectural coatings, such as exterior application/interior paint and other finishes would produce VOC emissions. The contractor would also be required to comply with the requirements of SDAPCD's Rule 67.7, Cutback and Emulsified Asphalt, which would limit VOC emissions from asphalt off-gassing.

Table 8 in Appendix A presents the estimated maximum daily construction emissions generated during construction of the project. Details of the emission calculations are provided in Appendix A. As determined in the Air Quality and Greenhouse Gas Emissions Analysis Technical Report, maximum daily construction emissions would not exceed the significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$ during construction (Appendix A).

Operational Emissions

Following the completion of construction activities, the project would generate VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$ emissions from mobile sources, including vehicular traffic; energy sources from natural gas usage; and area sources, including the use of landscaping equipment, consumer products, and from architectural coatings. Pollutant emissions associated with long-term operations were quantified using CalEEMod using a combination of project-specific information and CalEEMod default values.

Table 9 in Appendix A presents the maximum daily area, energy, and mobile source emissions associated with project operation. Details of the emission calculations are provided in Appendix A. As shown in Table 9 in Appendix A, the maximum daily emissions of the project would not exceed the significance thresholds for any criteria air pollutants.

The SDAB has been designated as a federal nonattainment area for O_3 and a state nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. The nonattainment status is the result of cumulative emissions from various sources of air pollutants and their precursors within the SDAB, including motor vehicles, off-road equipment, and commercial and industrial facilities. Construction and operation of the project would generate VOC and NO_x emissions (which are precursors to O_3) and emissions of PM_{10} and $PM_{2.5}$. However, as indicated in Tables 1

and 2 of Appendix A, project-generated construction and operational emissions would not exceed the emission-based significance thresholds for VOC, NO_x, PM_{10}, or $PM_{2.5}$.

Cumulative localized impacts would potentially occur if a construction project were to occur concurrently with another off-site project. Construction schedules for potential future projects near the project area are currently unknown; therefore, potential construction impacts associated with two or more simultaneous projects would be considered speculative. However, future projects would be subject to CEQA and would require air quality analysis and, where necessary, mitigation if the project would exceed applied thresholds. Criteria air pollutant emissions associated with construction activity of future projects would be reduced through implementation of control measures required by the SDAPCD. Cumulative air quality impacts are basin-wide, and air quality is affected by all pollutant sources in the basin. As the individual project thresholds are designed to help achieve attainment with cumulative basin-wide standards, they are also appropriate for assessing the project's contribution to cumulative impacts. As shown in Tables 8 and 9 of Appendix A, emissions would be less than applicable screening thresholds. As emissions would be less than the screening thresholds, the project would not result in cumulative considerable impact. Therefore, the project's cumulative air quality impact would be less than significant.

c) Would the project expose sensitive receptors to substantial pollutant concentrations?

Less-than-Significant Impact. Air quality varies as a direct function of the amount of pollutants emitted into the atmosphere, the size and topography of the air basin, and the prevailing meteorological conditions. Air quality problems arise when the rate of pollutant emissions exceeds the rate of dispersion. Reduced visibility, eye irritation, and adverse health impacts on those persons termed "sensitive receptors" are the most serious hazards of existing air quality conditions in the area. Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution, as identified by CARB, include children, older adults, athletes, and people with cardiovascular and chronic respiratory diseases. As such, sensitive receptors include residences, schools, playgrounds, childcare centers, athletic facilities, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes.

The SDAPCD identifies sensitive receptors as those who are especially susceptible to adverse health effects from exposure to toxic air contaminants (TACs), such as children, the elderly, and the ill. Sensitive receptors include schools (grades Kindergarten through 12), day care centers, nursing homes, retirement homes, health clinics, and hospitals within 2 kilometers of the facility (SDAPCD 2019). Based on SDAPCD guidance, the nearest existing sensitive receptors include single-family residential (>1,000 feet away), EZ Living Mobile Home Park (~1,500 feet away), and Big Future Preschool (>850 feet).

Health Impacts of Carbon Monoxide

Regionally, project-related travel would add to regional trip generation and increase the vehicle miles traveled within the local airshed and the SDAB. Locally, project-generated traffic would be added to the County's roadway system near the project site. If such traffic occurs during periods of poor atmospheric ventilation, is composed of a large number of vehicles "cold-started" and operating at pollution-inefficient speeds, and is operating on roadways already crowded with non-project traffic, there is a potential for the formation of microscale CO hotspots in the area immediately around points of congested traffic. Because of continued improvement in vehicular emissions at a rate faster than the rate of vehicle growth and/or congestion, the potential for CO hotspots in the SDAB is steadily decreasing. In addition, according to the

Local Transportation Assessment (Appendix I), the project would reduce average daily trips coming from the project site, compared to the existing restaurants. As shown in Table 6 in Appendix A, the project would result in an estimated reduction of 4,665 average daily trips to local roadways.

To verify that the project would not cause or contribute to a violation of the CO standards, a screening evaluation of the potential for CO hotspots was conducted using the County of San Diego screening threshold of 3,000 peak trips (Appendix A). The trip rates for the project are based on the Local Transportation Assessment and Vehicle Miles Traveled Analysis prepared for the project (Appendix I and Appendix J) . Based on this data, there would be approximately 118 trips during the AM peak-hour and 153 trips during the PM peak-hour, which would be minimal in comparison to the screening threshold of 3,000 peak trips. In addition, the project would reduce average daily trips coming from the project site, compared to the existing restaurants. Therefore, the project would not result in a CO hotspot and would result in a less-than-significant impact.

Health Effects of Other Criteria Air Pollutants

As discussed above, project construction and operation would not exceed significance thresholds for VOC, NO_x, CO, SO_x, $PM_{10,}$ or $PM_{2.5}$. VOCs and NO_x are precursors to O_3, for which the SDAB is designated as nonattainment with respect to the NAAQS and CAAQS. The increases in O_3 concentrations in the SDAB due to O_3 precursor emissions tend to be found downwind from the source location to allow time for the photochemical reactions to occur. However, the potential for exacerbating excessive O_3 concentrations would also depend on the time of year that the VOC emissions would occur because exceedances of the O_3 CAAQS/NAAQS tend to occur between April and October when solar radiation is highest. The project would not exceed the significance thresholds for VOC or NO_x; therefore, implementation of the project would contribute minimally to regional O_3 concentrations and the associated health effects.

In addition to O_3, NO_x emissions contribute to potential exceedances of the NAAQS and CAAQS for NO_2. However, project construction would be relatively short term, and off-road construction equipment would be operating at various portions of the site and would not be concentrated in one portion of the site at any one time. In addition, existing NO_2 concentrations in the area are well below the NAAQS and CAAQS standards. As such, the project would not result in potential health effects associated with NO_2 and NO_x.

Construction and operation of the project would also not exceed thresholds for PM_{10} or $PM_{2.5}$ and would not contribute to exceedances of the NAAQS and CAAQS for particulate matter or obstruct the SDAB from coming into attainment for these pollutants. Additionally, the project would implement dust control strategies and be required to comply with SDAPCD Rule 55, Fugitive Dust Control, which limits the amount of fugitive dust generated during construction. Due to the minimal contribution of particulate matter during construction and operation, the project is not anticipated to result in health effects associated with PM_{10} or $PM_{2.5}$.

The project would not result in any potentially significant contribution to local or regional concentrations of nonattainment pollutants and would not result in a significant contribution to the adverse health impacts associated with those pollutants. Impacts would be less than significant.

Health Impacts of Toxic Air Contaminants

In addition to impacts from criteria pollutants, project impacts may include emissions of pollutants identified by the state and federal government as TACs or hazardous air pollutants. State law has

established the framework for California's TAC identification and control program, which is generally more stringent than the federal program and aimed at TACs that are a problem in California. The state has formally identified more than 200 substances as TACs, including the federal hazardous air pollutants, and is adopting appropriate control measures for sources of these TACs. The greatest potential for TAC emissions during construction would be diesel particulate emissions from heavy equipment operations and heavy-duty trucks and the associated health impacts to sensitive receptors. The following measures are required by state law to reduce DPM emissions:

- Fleet owners of mobile construction equipment are subject to the CARB Regulation for In-use Off-road Diesel Vehicles (13 CCR 2449), the purpose of which is to reduce diesel particulate matter and criteria pollutant emissions from in-use (existing) off-road diesel-fueled vehicles.
- All commercial diesel vehicles are subject to Title 13, Section 2485 of the California Code of Regulations, limiting engine idling time. Idling of heavy-duty diesel construction equipment and trucks during loading and unloading shall be limited to five minutes; electric auxiliary power units should be used whenever possible.

Health effects from carcinogenic air toxics are usually described in terms of cancer risk. The SDAPCD recommends an incremental cancer risk threshold of 10 in a million (SDAPCD 2015b). "Incremental cancer risk" is the net increased likelihood that a person continuously exposed to concentrations of TACs resulting from a project over a 9-, 30-, and 70-year exposure period will contract cancer, per the standard Office of Environmental Health Hazard Assessment risk-assessment methodology (OEHHA 2015). The project would not require the extensive operation of heavy-duty construction equipment, which is subject to a CARB Airborne Toxics Control Measure for in-use diesel construction equipment to reduce diesel particulate emissions and would not involve extensive use of diesel trucks, which are also subject to a CARB Airborne Toxics Control Measure.

As shown in Table 7 in Appendix A, maximum daily PM_{10} or $PM_{2.5}$ emissions generated by construction equipment operation and haul-truck trips during construction, which is based on exhaust and fugitive dust generated by equipment operation and vehicle travel, would be well below the significance thresholds. Moreover, total construction of the project would last approximately 30 months, after which project-construction TAC emissions would cease. Thus, the duration of the proposed construction activities would only constitute a small percentage of the total 30-year exposure period. In regard to long-term TAC emissions and as a residential project, the project would result in a minimal increase in daily truck traffic on the roadway network and would not require stationary sources (such as diesel emergency generators). As previously described, the nearest existing sensitive receptors are located more than 850 feet away from the project site and diesel particulate matter would disperse quickly. Therefore, the exposure of project-related TAC emission impacts to proximate sensitive receptors would be less than significant.

Valley Fever

Coccidioidomycosis, more commonly known as "Valley Fever," is an infection caused by inhalation of the spores of the *Coccidioides immitis* fungus, which grows in the soils of the southwestern United States. Valley Fever is not considered highly endemic to San Marcos. Even if present at a site, earth-moving activities may not result in increased incidence of Valley Fever. Construction of the project would comply with SDAPCD Rule 55, Fugitive Dust Control, which limits the amount of fugitive dust generated during construction. SDAPCD Rule 55 is intended to reduce PM_{10} emissions from any transportation, handling,

construction, or storage activity that has the potential to generate fugitive dust. Based on the low incidence rate of coccidioidomycosis on the project site and in the County, and with the project's implementation of dust control strategies and Valley Fever awareness and training, it is not anticipated that earth-moving activities during project construction would result in exposure of nearby sensitive receptors to Valley Fever. Therefore, the project would have a less-than-significant impact with respect to Valley Fever exposure for sensitive receptors.

d) Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Less-than-Significant Impact. Potential odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment, architectural coatings, and asphalt pavement application, which would disperse rapidly from the project site and generally occur at magnitudes that would not affect substantial numbers of people. In addition, the project would not include land-use types that would generate odors during operation. Therefore, project construction and operations would result in odor impacts that are determined to be less than significant.

2.4 Biological Resources

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
IV. BIOLOGICAL RESOURCES – Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☒	☐	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☐	☒	☐
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☒	☐
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☒	☐

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☒	☐
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☒	☐

Dudek prepared a Biological Resources Letter Report for the project, which is included as Appendix B to this IS/MND. The analysis herein is based on findings of Appendix B. Full details regarding biological resources as it relates to the project can be found in Appendix B.

a) Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Potentially Significant Unless Mitigated**.** According to the Biological Resources Letter Report (Appendix B) prepared for the project, the project site consists entirely of Urban/Developed land cover type, consisting of commercial retail and paved parking lots, with associated minor ornamental landscaping and structures. Urban/Developed refers to areas that have been constructed on or disturbed so severely that native vegetation is no longer supported. Urban development is present to the north, south, east, and west of the site. No natural land covers or potential habitat is located on or adjacent to the site. Because of the singular land cover type present (Urban/Developed), no specific investigation of species present within land cover types was warranted, as no natural land cover types or habitat are present within the site or directly adjacent.

The site consists entirely of Urban/Developed land cover type and does not contain any natural vegetation communities of land cover types that are known to provide habitat to any special status wildlife species. Similarly, the site does not contain any natural vegetation communities or land cover types that are known to provide habitat to any special status plant species.

Based on the results of the site assessment and land cover type mapped in the project site, the site does not contain sensitive habitat and does not have the potential to support special-status species that would require mitigation if impacted. While no land cover types were observed that have a likelihood of utilization for nesting by migratory birds, native bird species have the potential to perch, or otherwise utilize non-native ornamental trees within the landscaping and would be protected by the Migratory Bird Treaty Act (MBTA). In order to comply with the MBTA, a pre-construction nesting bird survey will be conducted if demolition or construction occurs within the nesting season (January 15 to August 31) (mitigation measure **MM-BIO-1**). As such, due to the lack of natural vegetation communities that would provide habitat to special wildlife species, impacts are determined to be less than significant with mitigation incorporated.

MM-BIO-1: To comply with the Migratory Bird Treaty Act, a pre-construction nesting bird survey would be conducted if demolition or construction occurs within the nesting season (January 15 to August 31).

b) Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Less-than-Significant Impact. As described above, a Biological Resources Letter Report (Appendix B) has been prepared for the proposed project, which outlines that the project site consists entirely of Urban/Developed land cover type, consisting of commercial retail and paved parking lots, with associated minor ornamental landscaping and structures. No natural land covers or potential habitat is located on or adjacent to the site. The site consists entirely of Urban/Developed land cover type and does not contain any natural vegetation communities of land cover types that are known to provide habitat to any special-status wildlife species. Similarly, the site does not contain any natural vegetation communities of land cover types that are known to provide habitat to any special status plant species.

Based on the results of the site assessment and land cover type mapped in the project site, the site does not contain riparian habitat or other sensitive natural communities. Therefore, impacts would be less than significant.

c) Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Less-than-Significant Impact. As described above, a Biological Resources Letter Report (Appendix B) has been prepared for the proposed project, which outlines that the project site consists entirely of Urban/Developed land cover type, consisting of commercial retail and paved parking lots, with associated minor ornamental landscaping and structures. No natural land covers or potential habitat is located on or adjacent to the site. The site consists entirely of Urban/Developed land cover type and does not contain any natural vegetation communities of land cover types that are known to provide habitat to any special-status wildlife species. Similarly, the site does not contain any natural vegetation communities of land cover types that are known to provide habitat to any special status plant species.

No potentially jurisdictional aquatic features were observed within the site, as it is entirely developed. No wetlands or other aquatic features were observed, though a formal jurisdictional delineation was not conducted during the site review. Las Posas Creek and San Marcos creek are located to the west and south of the site, respectively. Since these two streams are greater than 1,000 feet away from the site, with the major streets of South Las Posas Road and West San Marcos Creek Boulevard located between the site and the streams, no indirect or peripheral impacts to these nearby aquatic resources are likely to result from project implementation.

Based on the results of the site assessment and land cover type mapped in the project site, the site does not contain any state or federally protected wetlands. As such, implementation of the project would not result in a substantial adverse effect on wetland habitat, and impacts would be less than significant.

d) Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Less-than-Significant Impact. As described above, a Biological Resources Letter Report (Appendix B) has been prepared for the project, which outlines that the project site consists entirely of Urban/ Developed land cover type, consisting of commercial retail and paved parking lots, with associated minor ornamental landscaping and structures. The site consists entirely of Urban/Developed land cover type and does not contain any natural vegetation communities of land cover types that are known to provide habitat to any special status wildlife species. Similarly, the site does not contain any natural vegetation communities of land cover types that are known to provide habitat to any special status plant species.

Based on the results of the site assessment and land cover type mapped in the project site, the site does not contain sensitive habitat and does not have the potential to support special-status species that would require mitigation if impacted. While no land cover types were observed which have a likelihood of utilization for nesting by migratory birds, native bird species have the potential to perch, or otherwise utilize non-native ornamental trees within the landscaping and would be protected by the MBTA. As previously discussed, in order to comply with the MBTA, a pre-construction nesting bird survey would be conducted if demolition or construction occurs within the nesting season (January 15 to August 31). With the incorporation of the pre-construction nesting bird survey, impacts would be less than significant.

e) Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Less-than-Significant Impact. Section 14.12.200 of the City's Municipal Code provides that where a permit is required for excavation, fill, or obstruction for installation or repair of utilities under any public street, sidewalk, trail, or public place, such construction should be located away from trees. As described above, the project site consists entirely of Urban/Developed land cover type, consisting of commercial retail and paved parking lots, with associated minor ornamental landscaping and structures. The site consists entirely of Urban/Developed land cover type and does not contain any natural vegetation communities of land cover types. As part of project construction, the majority of existing trees would need to be removed as a result of median reconfiguration; however, these trees would be replaced, and the project would add trees to the right-of-way. The City has a General Plan policy of 1-to-1 tree replacement for development projects. The project would remove 140 existing trees on site (47 existing standard trees and 93 existing palm trees); would protect 13 existing trees on site; and would plant 243 trees on site (204 proposed standard trees and 39 proposed palm trees). Implementation of the project would introduce a landscape plan, and more vegetation and trees would be incorporated into site design than what currently exists on site (Figure 4, Conceptual Landscape Plan). As such, the project would comply with the City's Municipal Code, and impacts would be less than significant.

f) Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Less-than-Significant Impact**.** In June 2022, Dudek performed a general review of the project site to assess and document existing conditions of biological resources present, and to evaluate the presence of appropriate habitat for nesting birds and special-status plant and wildlife species. Dudek created an updated map of the land cover types present within the study area. No physical site visit was conducted,

based on the singular land cover type of Urban/Developed. Dudek reviewed regional California Natural Diversity Database occurrence data (CDFW 2023) to identify special-status plant and wildlife species that are known to occur within a nine-quad radius of the project site. Database search results are provided as part of Appendix B to this IS/MND. Land covers within the survey area were mapped in a geographic information system (GIS)-based on general definition criteria. Aerial base map imagery of the study area, and GIS coverage was created. The vegetation community and land cover mapping follow the Draft Vegetation Communities of San Diego County (Oberbauer et al. 2008), which is based on the Preliminary Descriptions of the Terrestrial Natural Communities of California (Holland 1986).

The project site consists entirely of Urban/Developed land cover type, consisting of commercial retail and paved parking lots, with associated minor ornamental landscaping and structures. As discussed in response to Threshold e) above, the majority of the existing trees on site would need to be removed as a result of median reconfiguration. The project would remove 140 existing trees on site (47 existing standard trees and 93 existing palm trees); would protect 13 existing trees on site; and would plant 243 trees on site (204 proposed standard trees and 39 proposed palm trees). The site consists entirely of Urban/Developed land cover type and does not contain any natural vegetation communities of land cover types that are known to provide habitat to any special-status wildlife species. Similarly, the site does not contain any natural vegetation communities of land cover types that are known to provide habitat to any special-status plant species. Nevertheless, in order to comply with the MBTA, a pre-construction nesting bird survey (MM-BIO-1, identified above under Threshold 2.4a) will be conducted if demolition or construction occurs within the nesting season (January 15 to August 31).

Based on the results of the Biological Resources Letter Report (Appendix B), implementation of the proposed project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Plan, or other applicable plan related to biological resources. Therefore, impacts would be less than significant.

2.5 Cultural Resources

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
V. CULTURAL RESOURCES – Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?	☐	☐	☒	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	☐	☒	☐	☐
c) Disturb any human remains, including those interred outside of dedicated cemeteries?	☐	☐	☒	☐

Dudek prepared Cultural Resources Phase I Inventory Report for the project, which is included as Appendix C to this IS/MND. The analysis herein is based on findings of Appendix C. Full details regarding cultural resources as it relates to the project can be found in Appendix C. Additionally, a Built Environment Historic Resources Memorandum was

prepared for the project by Dudek and is included as Appendix O to this IS/MND. The historic resources analysis herein is based on findings of Appendix O.

a) Would the project cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?

Less-than-Significant Impact. A historical resource is one that meets the eligibility criteria for the California Register of Historical Resources. This includes "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (PRC Section 5020.1[j]). The significance of a historic resource is impaired when a project demolishes or materially alters those physical characteristics that convey its significance.

As discussed in the Cultural Report (Appendix C), the records search conducted for the project identified 25 cultural resources within the 1-mile search radius outside the project site. None of the identified resources occur within the project site. The project site consists entirely of Urban/Developed land cover type, consisting of commercial retail and paved parking lots, with associated minor ornamental landscaping and structures. As outlined in the Built Environment Historic Resources Memorandum prepared for the project (Appendix O), there are buildings located within the proposed project site associated with "Old California Restaurant Row" that appear to date to 1978, which as of 2023 would make them 45 years old. No previously identified built environment cultural resources, including the extant buildings located within the project site, have been previously recorded, evaluated, considered eligible, or were found during research to be formally listed in a federal, state, or local register. In consideration of these factors, there are no known historical resources for the purposes of CEQA located within the project site.

As described in the project description, the project would require the demolition of 63,484 square feet of existing (primarily vacant) restaurant uses on site. However, elements from the Old California Restaurant Row would be preserved and incorporated into the project design to create an old meets new aesthetic that celebrates the history of the site. Because none of the existing buildings are designated as historical resources, it is determined that impacts would be less than significant.

b) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

Potentially Significant Unless Mitigated. The project site consists entirely of Urban/Developed land cover type, consisting of commercial retail and paved parking lots, with associated minor ornamental landscaping and structures. No archaeological resources were observed within the project site during the pedestrian survey. However, based on the results of the record search and previously identified cultural resources in the project area, the surrounding area has been utilized extensively prehistorically resulting in a moderate sensitivity for identifying intact subsurface archaeological deposits during project implementation. Implementation of the proposed project could potentially impact archaeological resources during construction.

Undocumented fill was likely deposited in the project area in the mid-1970s, ranging from 3 feet to 19 feet below ground surface. No prehistoric or historic age resources will be present within the fill sediment; however, there is potential to encounter cultural resources within young alluvium sediments below the fill.

In order to mitigate potentially significant impacts to buried archaeological resources that could be encountered during site grading, mitigation measures **MM-CUL-1** through **MM-CUL-4** would be implemented. With the implementation of MM-CUL-1 through MM-CUL-4 outlined below, potential impacts related to archaeological resources would be less than significant.

MM-CUL-1: Pre-excavation Agreement. Prior to the issuance of a grading permit or ground-disturbing activities, the Applicant/Owner shall enter into a Tribal Cultural Resources Treatment and Repatriation Agreement (Pre-excavation Agreement) with a Traditionally and Culturally Affiliated Native American Tribe (TCA Tribe), identified in consultation with the City. The purpose of the Pre-excavation Agreement shall be to formalize protocols and procedures between the Applicant/Owner and the TCA Tribe for the protection, treatment, and repatriation of Native American human remains, funerary objects, cultural and/or religious landscapes, ceremonial items, traditional gathering areas, and other Tribal Cultural Resources. Such resources may be located within and/or discovered during ground-disturbing and/or construction activities for the proposed project, including any additional culturally appropriate archaeological studies, excavations, geotechnical investigations, grading, preparation for wet and dry infrastructure, and other ground-disturbing activities. Any project-specific monitoring plans and/or excavation plans prepared by the project archaeologist shall include the TCA Tribe requirements for protocols and protection of Tribal Cultural Resources that were agreed to during the tribal consultation.

The landowner shall relinquish ownership of all non-burial related tribal cultural resources collected during construction monitoring and from any previous archaeological studies or excavations on the project site to the TCA Tribe for proper treatment and disposition per the Pre-excavation Agreement, unless ordered to do otherwise by responsible agency or court of competent jurisdiction. The requirement and timing of such release of ownership, and the recipient thereof, shall be reflected in the Pre-excavation Agreement. If the TCA Tribe does not accept the return of the cultural resources, then the cultural resources will be subject to curation.

MM-CUL-2: Construction Monitoring. Prior to the issuance of a grading permit or ground-disturbing activities, the Applicant/Owner or grading contractor shall provide written documentation (either as signed letters, contracts, or emails) to the City's Planning Division stating that a Qualified Archaeologist and Traditionally and Culturally Affiliated Native American monitor (TCA Native American monitor) have been retained at the Applicant/Owner or grading contractor's expense to implement the construction monitoring program, as described in the Pre-excavation Agreement.

In the event that one or more TCA Tribe chooses not to enter into an agreement, or fails to respond to the offer, the City shall extend the opportunity for another tribe to provide a monitor. In the event that more than one TCA Tribe requests to provide a TCA Native American monitor for activities subject to these measures, the City will allow for either: 1) up to one monitor from each consulting tribe to be

present simultaneously; or 2) for the tribes to develop a rotating schedule that alternates monitoring between the tribes on a daily or weekly basis.

The monitors shall be provided at least 72 hours' notice of the initiation of construction and be kept reasonably apprised of changes to the construction schedule. In the event that a monitor is not present at the scheduled time, work can continue without the monitor present, as long as the notice was given and documented.

The Qualified Archaeologist and TCA Native American monitor shall be invited to attend all applicable pre-construction meetings with the General Contractor and/or associated subcontractors to present the construction monitoring program. The Qualified Archaeologist and TCA Native American monitor shall be present on site during grubbing, grading, trenching, and/or other ground disturbing activities that occur in areas of native soil or other permeable natural surfaces that have the potential to unearth any evidence of potential archaeological resources or tribal cultural resources. In areas of artificial paving, the Qualified Archaeologist and TCA Native American monitor shall be present on site during grubbing, grading, trenching, and/or other ground-disturbing activities that have the potential to disturb more than 6 inches below the original pre-project ground surface to identify any evidence of potential archaeological or Tribal Cultural Resources. No monitoring of fill material, existing or imported, will be required if the general contractor or developer can provide documentation to the satisfaction of the City that all fill materials being utilized at the site are either (1) from existing commercial (previously permitted) sources of materials or (2) are from private or other non-commercial sources that have been determined to be absent of Tribal Cultural Resources by the Qualified Archaeologist and TCA Native American monitor.

The Qualified Archaeologist and TCA Native American monitor shall maintain ongoing collaborative coordination with one another during all ground-disturbing activities. The requirement for the construction monitoring program shall be noted on all applicable construction documents, including demolition plans, grading plans, etc. The Applicant/Owner or grading contractor shall provide written notice to the Planning Division and the TCA Tribe, preferably through e-mail, of the start and end of all ground-disturbing activities.

Prior to the release of any grading bonds, or prior to the issuance of any project Certificate of Occupancy, an archaeological monitoring report, which describes the results, analysis, and conclusions of the construction monitoring, shall be submitted by the Qualified Archaeologist, along with any TCA Native American monitor's notes and comments received by the Qualified Archaeologist, to the Planning Division Manager for approval. Once approved, a final copy of the archaeological monitoring report shall be retained in a confidential City project file and may be released, as a formal condition of Assembly Bill 52 consultation, to San Luis Rey Band of Mission Indians, San Pasqual Band of Mission Indians, and Rincon Band of Luiseño Indians, or any parties involved in the project specific monitoring or consultation process. A final copy of the report, with all confidential

site records and appendices, will also be submitted to the South Coastal Information Center after approval by the City.

MM-CUL-3: Unanticipated Discovery Procedures: Both the Qualified Archaeologist and the Traditionally and Culturally Affiliated (TCA) Native American monitor may temporarily halt or divert ground-disturbing activities if potential archaeological resources or Tribal Cultural Resources are discovered during construction activities. Ground-disturbing activities shall be temporarily directed away from the area of discovery for a reasonable amount of time to allow a determination of the resource's potential significance. Isolates and clearly non-significant archaeological resources (as determined by the Qualified Archaeologist, in consultation with the TCA Native American monitor) will be minimally documented in the field. All unearthed archaeological resources or Tribal Cultural Resources will be collected, temporarily stored in a secure location (or as otherwise agreed upon by the Qualified Archaeologist and the TCA Tribe), and repatriated according to the terms of the Pre-excavation Agreement, unless ordered to do otherwise by responsible agency or court of competent jurisdiction.

If a determination is made that the archaeological resources or Tribal Cultural Resources are considered potentially significant by the Qualified Archaeologist, the TCA Tribe, and the TCA Native American monitor, then the City and the TCA Tribe shall determine, in consultation with the Applicant/Owner and the Qualified Archaeologist, the culturally appropriate treatment of those resources.

If the Qualified Archaeologist, the TCA Tribe, and the TCA Native American monitor cannot agree on the significance or mitigation for such resources, these issues will be presented to the Planning Division Manager for decision. The Planning Division Manager shall make a determination based upon the provisions of the California Environmental Quality Act and California Public Resources Code Section 21083.2(b) with respect to archaeological resources, and California Public Resources Section 21704 and 21084.3 with respect to Tribal Cultural Resources, and shall take into account the religious beliefs, cultural beliefs, customs, and practices of the TCA Tribe.

All sacred sites, significant Tribal Cultural Resources, and/or unique archaeological resources encountered within the project area shall be avoided and preserved as the preferred mitigation. If avoidance of the resource is determined to be infeasible by the City as the lead agency, then the City shall require additional culturally appropriate mitigation to address the negative impact to the resource, such as, but not limited to, the funding of an ethnographic study and/or a data recovery plan, as determined by the City in consultation with the Qualified Archaeologist and the TCA Tribe. The TCA Tribe shall be notified and consulted regarding the determination and implementation of culturally appropriate mitigation and the drafting and finalization of any ethnographic study and/or data recovery plan, and/or other culturally appropriate mitigation. Any archaeological isolates or other cultural materials that cannot be avoided or preserved in place as the preferred mitigation shall be temporarily stored in a secure location on site

(or as otherwise agreed upon by the Qualified Archaeologist and TCA Tribe) and repatriated according to the terms of the Pre-excavation Agreement, unless ordered to do otherwise by responsible agency or court of competent jurisdiction. The removal of any artifacts from the project site will be inventoried with oversight by the TCA Native American monitor.

If a data recovery plan is authorized as indicated above and the TCA Tribe does not object, then an adequate artifact sample to address research avenues previously identified for sites in the area will be collected using professional archaeological collection methods. If the Qualified Archaeologist collects such resources, the TCA Native American monitor must be present during any testing or cataloging of those resources. Moreover, if the Qualified Archaeologist does not collect the cultural resources that are unearthed during the ground-disturbing activities, the TCA Native American monitor may, at their discretion, collect said resources for later reburial or storage at a local curation facility, as described in the Pre-excavation Agreement.

In the event that curation of archaeological resources or Tribal Cultural Resources is required by a superseding regulatory agency, curation shall be conducted by an approved local facility in San Diego County, and the curation shall be guided by California State Historical Resources Commission's Guidelines for the Curation of Archaeological Collections. The City shall provide the Applicant/Owner final curation language and guidance on the project grading plans prior to issuance of the grading permit, if applicable, during project construction. The Applicant/Owner shall be responsible for all repatriation and curation costs and provide to the City written documentation from the TCA Tribe or the curation facility, whichever is most applicable, that the repatriation and/or curation have been completed.

MM-CUL-4: Human Remains. As specified by California Health and Safety Code Section 7050.5, if human remains, or remains that are potentially human, are found on the project site during ground-disturbing activities or during archaeological work, the person responsible for the excavation, or his or her authorized representative, shall immediately notify the San Diego County Medical Examiner's Office by telephone. No further excavation or disturbance of the discovery or any nearby area reasonably suspected to overlie adjacent remains (as determined by the Qualified Archaeologist and/or the Traditionally and Culturally Affiliated [TCA] Native American monitor) shall occur until the Medical Examiner has made the necessary findings as to origin and disposition pursuant to Public Resources Code 5097.98.

If such a discovery occurs, a temporary construction exclusion zone shall be established surrounding the area of the discovery so that the area would be protected (as determined by the Qualified Archaeologist and/or the TCA Native American monitor), and consultation and treatment could occur as prescribed by law. As further defined by state law, the Medical Examiner will determine within 2 working days of being notified if the remains are subject to his or her authority. If the Medical Examiner recognizes the remains to be Native American, and not under his or her jurisdiction, then he or she shall contact the Native American Heritage Commission by telephone within 24 hours. The Native American Heritage

Commission will make a determination as to the Most Likely Descendent, who shall be afforded 48 hours from the time access is granted to the discovery site to make recommendations regarding culturally appropriate treatment.

If suspected Native American remains are discovered, the remains shall be kept in situ (in place) until after the Medical Examiner makes its determination and notifications, and until after the Most Likely Descendent is identified, at which time the archaeological examination of the remains shall only occur on site in the presence of the Most Likely Descendent. The specific locations of Native American burials and reburials will be proprietary and not disclosed to the general public. According to California Health and Safety Code, six or more human burials at one location constitute a cemetery (Section 8100), and disturbance of Native American cemeteries is a felony (Section 7052). In the event that the Applicant/Owner and the Most Likely Descendant are in disagreement regarding the disposition of the remains, state law will apply, and the mediation process will occur with the Native American Heritage Commission. In the event that mediation is not successful, the landowner shall rebury the remains at a location free from future disturbance (see Public Resources Code Sections 5097.98(e) and 5097.94(k)).

c) Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

Less-than-Significant Impact. The project site is not within a known cemetery or burial ground. In the highly unlikely event that human remains are uncovered during ground-disturbing activities, there are regulatory provisions to address the handling of human remains in California Health and Safety Code Section 7050.5, Public Resources Code Section 5097.98, and CEQA Guidelines Section 15064.5(e). Pursuant to these codes, in the event that human remains are discovered, disturbance of the site would be halted until the County coroner has conducted an investigation into the circumstances, manner, and cause of any death, and the recommendations concerning the treatment and disposition of the human remains have been made to the person responsible for the excavation or to his or her authorized representative, in the manner provided in Section 5097.98 of the Public Resources Code. The County coroner is required to make a determination within 2 working days of notification of the discovery of the human remains. If the County coroner determines that the remains are not subject to his or her authority, and if he or she recognizes or has reason to believe the human remains to be those of a Native American, he or she shall consult with the Native American Heritage Commission by telephone within 24 hours, to designate a Most Likely Descendant who shall recommend appropriate measures to the landowner regarding the treatment of the remains. If the owner does not accept the Most Likely Descendant's recommendations, the owner or the Most Likely Descendant may request mediation by the Native American Heritage Commission. Therefore, with compliance with existing state law and implementation of MM-CUL-4, impacts associated with human remains would be less than significant.

2.6 Energy

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
VI. Energy – Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☐	☐	☒	☐
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	☐	☐	☒	☐

a) Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Less-than-Significant Impact. Temporary use of electricity and petroleum would be required during construction of the proposed project. Use of these materials during construction would not be considered wasteful or inefficient. The amount of electricity used during construction would be minimal relative to the total power used in the region or state and typical of what is required to construct a development like the project. Typical demand would stem from the use of electrically powered hand tools and several construction trailers by managerial staff during the hours of construction activities. Natural gas is not anticipated to be required during project construction. Heavy-duty construction equipment of various types would be used during each phase of construction. The CalEEMod analysis discussed in Appendix A to this IS/MND, includes the proposed construction schedule and equipment usage. CalEEMod assumes compliance with the Title 24 code. Based on that analysis, impacts related to energy consumption is determined to be less than significant.

Operation of the proposed project would require electricity for multiple purposes, including cooling, lighting, appliances, and various equipment; the supply, conveyance, treatment, and distribution of water; and transportation to/from the site. The project would implement applicable City of San Marcos Climate Action Plan (CAP) Consistency Checklist measures that would reduce operational electricity consumption. As outlined above under PDFs to be incorporated as part of the project, the project would include EV parking (PDF-1), would install instantaneous electric water heaters without water tanks (PDF-4), would install approximately 20.8 kilowatt solar photovoltaic system (PDF-5), and would comply with the City's Water Efficient Landscape Ordinance (PDF-6). Furthermore, as described under Section 2.17 below, the project is projected to generate 10,460 vehicle miles traveled (VMT), which is 23,756 VMT less than the existing Restaurant Row uses, which were calculated to generate 34,216 VMT.

Although electricity consumption would likely increase at the project site due to project implementation of residential uses, the project would be required to comply with current Title 24 code and the City's CAP Consistency Checklist by implementing energy-efficient measures. The project would be subject to the Title 24 building code that is adopted at the time building permits are obtained and thus may be subject to a more stringent energy standard than what was assumed in preparation of the Air Quality and Greenhouse

Gas Technical Report prepared for the project (Appendix A). Construction and operation of the proposed project is not expected to result in wasteful or inefficient energy use and is expected to result in similar use to surrounding development and previous development on site. Therefore, impacts are determined to be less than significant.

b) Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Less-than-Significant Impact. The proposed project would be subject to and would comply with, at a minimum, the California Building Energy Efficiency Standards (24 CCR, Part 6). Part 6 of Title 24 establishes energy efficiency standards for residential and nonresidential buildings constructed in California in order to reduce energy demand and consumption. The proposed project would also be subject to Part 11 of Title 24, also known as the CalGreen building standards. Construction and operation of the proposed project is not expected to conflict with a state or local plan for renewable energy or energy efficiency. Therefore, impacts are determined to be less than significant.

2.7 Geology and Soils

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
VII. GEOLOGY AND SOILS – Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involve ing:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☒	☐
i) ii) Strong seismic ground shaking?	☐	☐	☒	☐
ii) iii) Seismic-related ground failure, including liquefaction?	☐	☐	☒	☐
iii) iv) Landslides?	☐	☐	☒	☐
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☐	☐	☒	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	☐	☐	☒	☐

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☒
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☐	☒	☐

Geocon Inc. prepared a Geotechnical Investigation for the project, which is included as Appendix D to this IS/MND. The analysis herein is based on findings and recommendations contained in Appendix D. Full details regarding geology and soils as it relates to the project site can be found in Appendix D.

a) Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

ii) Strong seismic ground shaking?

Less-than-Significant Impact. The project site is located in tectonically active Southern California. However, no Alquist-Priolo Fault Hazard Zones or other known active faults run through the project site. The closest known active fault is the Newport-Inglewood/Rose Canyon Fault, located 11 miles southwest of the project site. Based on the lack of active or potentially active faults underlying the project area, the potential for surface rupture is low, and the project site would not be subject to a greater seismic risk than other locations within the region. Additionally, per the Alquist-Priolo Earthquake Fault Zoning Act, because the project site is not located in an Alquist-Priolo Fault Zone, the proposed project would not place any prohibited uses (e.g., uses containing structures with a capacity of 300 people or more; uses with the potential to severely damage the environment or cause major loss of life; or specific civic uses including police and fire stations, schools, hospitals, rest homes, nursing homes, and emergency communication facilities) within an Alquist–Priolo Fault Zone. Thus, the potential for loss, injury, or death involving rupture of a known earthquake fault is considered low.

The proposed project would be designed in accordance with applicable California Building Code criteria, including those specific to resistance to seismic shaking. Furthermore, the proposed project would be constructed in accordance with other applicable regulations, current seismic design specifications of the Structural Engineers Association of California, and applicable requirements of the State of California Occupational Safety and Health Administration. These required seismic design considerations are used to minimize structural damage in the event of ground shaking. The Geotechnical Investigation prepared for the project (Appendix D) confirms there are no active faults crossing the property. Therefore, impacts are determined to be less than significant.

iii) Seismic-related ground failure, including liquefaction?

Less-than-Significant Impact. Liquefaction typically occurs when a site is subjected to strong seismic shaking; on-site soils are cohesionless; groundwater is encountered within 50 feet of the surface; and soil relative densities are less than approximately 70%. Pursuant to SMMC Chapter 17.32, Building, Construction, and Related Activities, all applications for grading permits are required to be accompanied by a geotechnical report (SMMC 17.32.040(d)). The geotechnical report is required to address on-site soils and geology and include conclusions regarding the adequacy of the site to be developed as proposed and provide recommendations specific to the project site (SMMC 17.32.040(f)). Consistent with City regulations, a Geotechnical Investigation was prepared for the project.

The project site is underlain by undocumented fill and young alluvium with groundwater encountered at a depth ranging from 7 feet to 21 feet below the existing ground surface; however, as outlined in the Geotechnical Investigation, December 2022 (Appendix D) prepared for the proposed project, the potential for liquefaction and dynamic settlement to occur on site is considered low due to the relative density of the older alluvium. Additionally, due to the developed nature of the existing site, impacts related to liquefaction are not anticipated. Although no geologic conditions were encountered that would preclude development of the property as proposed, the Geotechnical Investigation included soil removal/excavation, grading, and seismic design recommendations to be performed during project development.

Future projects within the Specific Plan would be required to adhere to the applicable recommendation stated in the Geotechnical Investigation (Appendix D). Through implementation of all relevant geological recommendations, development of the project site would not result in seismic-related ground failure, including liquefaction. Impacts would be less than significant.

iv) Landslides?

Less-than-Significant Impact. The project site is flat, currently consisting of existing development and paved parking. The project site is identified in the City's Safety Element as having "Zero Susceptibility" to landslides (Figure 6-1 of the General Plan) (City of San Marcos 2012a). Additionally, the Geotechnical Investigation concurred with previous reports that found the potential for landslides or slope instabilities to occur is negligible. Therefore, the project site is not considered susceptible to landslides, and proposed project impacts would be less than significant.

b) Would the project result in substantial soil erosion or the loss of topsoil?

Less-than-Significant Impact. The project site is flat, currently consisting of existing development and paved parking. During re-development, the proposed project would be required to comply with the City's Grading Ordinance, which contains design standards and performance requirements that must be met to avoid or reduce, to an acceptable level, excessive erosion. Furthermore, in accordance with SMMC Chapter 17.32, Building, Construction, and Related Activities includes requirements for preparation of site-specific geotechnical reports (SMMC 17.32.040(d) and 17.32.040(f)), the proposed project would be required to implement all recommendations outlined in the Geotechnical Investigation (Appendix D) pertaining to soil erosion or loss of topsoil. Therefore, impacts are determined to be less than significant.

c) Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Less-than-Significant Impact. As described above, the project site is flat, currently consisting of existing development and paved parking. The Geotechnical Investigation determined that the potential for landslides, liquefaction, or slope instabilities to occur is negligible. The proposed project would be required to comply with the recommendations outlined in the Geotechnical Investigation (see Appendix D) prepared for the project. Therefore, impacts are determined to be less than significant.

d) Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Less-than-Significant Impact. Expansive soils are clay-based and tend to increase in volume due to water absorption and decrease in water volume due to drying. The Geotechnical Investigation prepared for the project found the project site underlain by undocumented fill, young alluvium, old alluvium, and metavolcanic rock. The potential for expansive soil is not anticipated at the project site. However, the Geotechnical Investigation determined that the potential for on-site soil expansion ranges from "low" to "high." The proposed project would be required to comply with the recommendations outlined in the Geotechnical Investigation (Appendix D) completed for the project. Therefore, impacts are determined to be less than significant.

e) Would the project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

No Impact. The proposed project would not include septic tanks or alternative wastewater disposal systems. As described in Section 2.19, Utilities and Service Systems, the proposed project would construct private, on-site sewer lines that would connect to existing City infrastructure. Therefore, no impacts relating to septic tanks or alternative wastewater disposal systems would occur.

f) Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Less-than-Significant Impact. Although ground-disturbing activities associated with the proposed project have the potential to unearth previously unidentified paleontological resources, due to the existing development on site, the potential for paleontological resources to be located on the project site is considered low. Therefore, impacts are determined to be less than significant.

2.8 Greenhouse Gas Emissions

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
VIII. GREENHOUSE GAS EMISSIONS – Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☒	☐
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☒	☐

Dudek prepared an Air Quality and Greenhouse Gas Emissions Analysis Technical Report for the project, which is included as Appendix A to this IS/MND. The analysis herein is based on findings of Appendix A. Full details regarding greenhouse gas (GHG) emissions as it relates to the project can be found in Appendix A.

a) Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Less-than-Significant Impact. Global climate change is primarily considered a cumulative impact but must also be evaluated on a project-level under CEQA. A project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHG emissions. GHGs are gases that absorb infrared radiation in the atmosphere. Principal GHGs regulated under state and federal law and regulations include carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). GHG emissions are measured in metric tons of CO_2 equivalent (MT CO_2e), which account for weighted global warming potential factors for CH_4 and N_2O.

The City of San Marcos adopted the Final Climate Action Plan (CAP) on December 8, 2020. The CAP relies on a screening threshold of 500 MT CO_2e per year based on land use size and a CAP Consistency Checklist to determine whether a project's emissions would be consistent with GHG emissions estimated within the City's CAP. For projects that are subject to CAP consistency review, the next step in determining consistency is to assess the project's consistency with the growth projections used in development of the CAP. This allows the City to determine a project's consistency with the land use assumptions used in the CAP.

Step 1 of the CAP Checklist determines land use consistency. Question 1 of Step 1 asks if a project is less than a certain size. It is deemed consistent with the City's CAP by emitting fewer than 500 MT CO_2e per year and would be less than significant. In order to determine if the project emits less than 500 MT CO_2e per year, construction and operational GHG emissions were quantified. Construction of the project would result in GHG emissions, which are primarily associated with the use of off-road construction equipment, haul trucks, on-road vendor trucks, and worker vehicles. CalEEMod was used to calculate the annual GHG emissions based on the construction scenario. On-site sources of GHG emissions include off-road equipment and off-site sources including trucks and worker vehicles. As shown in Table 11 in Appendix A, the estimated total GHG emissions during construction of would be approximately 2,870.48 MT CO_2e over

the construction period. Estimated project-generated construction emissions amortized over 30 years would be approximately 96 MT CO_2e per year. As with project-generated construction criteria air pollutant emissions, GHG emissions generated during construction of the project would be short-term in nature, lasting only for the duration of the construction period, and would not represent a long-term source of GHG emissions. Amortized construction emissions were added to operational emissions to be compared to the project for this assessment. CalEEMod was used to estimate potential operational GHG emissions from area sources (landscaping equipment), energy sources (natural gas and electricity), mobile sources, solid waste, and water supply and wastewater treatment for the project. As shown in Table 13 in Appendix A, the estimated GHG emissions from operation of the project would be approximately 1,714 MT CO_2e per year, including amortized construction emissions. Pursuant to the City's 2020 CAP Consistency Checklist, since the project would emit greater than 500 MT CO_2e per year, then CAP Step 1, Question 2 must be addressed as follows.

Question 2 of Step 1 asks if the proposed project is consistent with the City's existing General Plan land use designation. The answer to this would be no: the project requires a General Plan Amendment and Rezone to change the General Plan designation and Zoning from Mixed-Use 1 (MU-1) and Light Industrial (L-I) to Specific Plan Area (SPA). Pursuant to the City's 2020 CAP Consistency Checklist, since the project is not consistent with the City's existing General Plan land use, then CAP Step 1, Question 3 must be addressed as follows.

Question 3 of Step 1 asks that for projects not consistent with the existing General Plan land use designation, does the project include a General Plan Amendment that would generate GHG emissions equal to or less than estimated emissions generated under the existing designation. The answer to this question would be yes: the project would generate GHG emissions equal to or less than estimated emission generated under the existing designation as detailed in Section 3.5 of Appendix A.

Step 2 of the CAP Checklist determines the project's consistency with the applicable strategies and measures of the CAP. As outlined below, and as shown in Attachment B to Appendix A, CAP Checklist, the project has demonstrated consistency with the applicable strategies and measures of the CAP as required by Step 2 of the CAP Checklist. Therefore, the project is deemed consistent with the City's CAP, and impacts would be less than significant.

The following summarizes the checklist items as presented in Attachment B to Appendix A:

Checklist Item 1. Electric Vehicle Charging Stations (Measure T-2)

This checklist item applies to multifamily residential and nonresidential projects. It asks if the project will install electric vehicle charging stations (Level 2 or better) in at least 5% of the total parking spaces provided on site.

The project would comply with this checklist item. The proposed multifamily residential project would include 501 total parking spaces; 4 EV charging stations, and 17 EV ready spaces would be included. Charging stations will be installed in the 392 garage parking stalls. The project would answer "Yes" to this question.

Checklist Item 2. Bicycle Infrastructure (Measure T-8)

This checklist item applies to residential and nonresidential projects. It asks if the following conditions are met, would the project pay its fair-share contribution to bicycle infrastructure improvements of the following:

- Intersection or roadway segment improvements are proposed as part of the project.
- The City's General Plan Mobility Element identifies bicycle infrastructure improvements at any intersection(s) or roadway segment(s) that would be improved as part of the project.

The project would comply with this checklist item. The project will determine specific details based on discussions with the City regarding San Marcos Boulevard multi-way.

Accordingly, the proposed project would answer "Yes" to this question.

Checklist Item 3. Transportation Demand Management (Measure T-9)

This checklist item applies to residential and non-residential projects. Will the project develop and implement a Transportation Demand Management (TDM) Plan that includes, at a minimum, all of the TDM strategies listed below?

- Provide discounted monthly transit pass or provide at least 25% transit fare subsidy to residents/employees.
- Provide designated car-share, carpool, vanpool, and/or park-and-ride parking spaces.
- Provide pedestrian connections between all internal uses and to all existing or planned external streets around the project site(s).
- Provide secure bicycle parking spaces or bicycle racks, showers, and clothes lockers.
- Encourage telecommuting for employees (allow one telecommute day per week or compressed work weeks) or provide a telecommute work center with common office space and equipment available to residents.

or

- Would the project implement and monitor for four (4) years a TDM program that demonstrates an alternative transportation (i.e., carpool, public transit, bicycle, walk, telecommute) mode share of at least 29 percent for all residents?

The proposed project would not result in a VMT-related impact, and therefore, a TDM plan is not required. The proposed project units are for sale units that would be managed by an HOA; therefore, the project providing discounted monthly transit passes to residents would not be sensible. Future tenants of the proposed commercial/retail space would be encouraged to provide employees with discounted monthly transit passes; however, that would be at the discretion of the tenant. Due to the shared parking agreement for the project site, as required by the City, the project does not designate car-share, carpool, vanpool, and/or park-and-ride spaces; however, such could be provided with direction from the City. The project would provide pedestrian connections throughout all uses on site and connection to adjacent sidewalks and existing roadways. The project would provide communal bicycle parking, and all living units would

provide bicycle storage and showers. Telecommuting is resident- and tenant-based but will be encouraged. The TDM Plan is a proposed condition of approval prior to building occupancy.

Accordingly, the proposed project would answer "Yes" to this question.

Checklist Item 4. Reduce Parking Near Transit (Measure T-12)

This checklist item applies to multifamily residential projects. If located within 0.5 miles of a major transit stop, would the project provide at least 27% fewer parking spaces than required for the same use based on the City's municipal code parking requirements?

The project is not located within 0.5 miles of a major transit stop defined as a bus or light-rail station with fixed service and 10-minute minimum headways during peak hours. Therefore, the proposed project would answer "N/A" to this question.

Checklist Item 5. Water Heaters (Measure E-1)

This checklist item applies to residential projects and asks if the project would install one of, or a combination of, the following water heater types in place of natural gas water heaters:

- Electric heat pump water heater
- Instantaneous electric water heater
- Electric tank
- Solar water heater with heat pump water heater backup
- Solar water heater with electric tank backup

The project would comply with this checklist item. The project would install instantaneous electric water heaters without water tanks that would meet the requirements of this checklist item. The project would answer "Yes" to this checklist question.

Checklist Item 6. Photovoltaic Installation (Measure E-2)

This checklist item applies to nonresidential projects. The item requires nonresidential projects to install a minimum photovoltaic system of 2 watts per square foot of gross floor area.

The project would include 202 multifamily residential units and 10,400 square feet of commercial retail uses. Therefore, this checklist item would only apply to the 10,400 square feet of commercial retail use. Based on the 10,400 square feet of commercial retail uses, the project would install a (10,400 x 2)/1,000 = 20.8 kilowatt solar photovoltaic system. The project would answer "Yes" to this checklist question.

Checklist Item 7. Landscaping Water Use (Measure W-1)

This checklist item applies to residential and nonresidential projects and asks if the project would comply with the City's Water Efficient Landscape Ordinance.

The proposed project would comply with this checklist item. The project's landscaping would meet the requirements within the City's Water Efficient Landscape Ordinance. Per SMMC Section 20.330.020, water

efficient landscape standards are applicable to new construction with an aggregate landscape area equal to or greater than 500 square feet. The project will include a landscape area of approximately 87,500 square feet, which is greater than 500 square feet. Accordingly, the proposed project would answer "Yes" to this question.

Checklist Item 8. Urban Tree Canopy (Measure C-2)

This checklist item applies to residential and nonresidential projects and asks if the project is providing more than 10 parking spaces, will the project plant at least one tree per five parking spaces provided.

The project would comply with this checklist item. The project is providing 501 parking spaces and will plant at least 97 trees to satisfy this checklist requirement. As detailed on the project landscape plan, the project would include a total of 243 trees. Accordingly, the proposed project would answer "Yes" to this question.

In summary, as described above, the project has demonstrated consistency with the applicable strategies and measures of the CAP and would implement project design features PDF-1 through PDF-7. Therefore, impacts are determined to be less than significant.

b) Would the project generate conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Less-than-Significant Impact. Numerous plans, policies, and regulations have been adopted for the purpose of reducing GHG emissions. The principal overall state plan and policy are AB 32 and the follow-up legislation, SB 32. The quantitative goal of AB 32 is to reduce GHG emissions to 1990 levels by 2020 and the goal of SB 32 is to reduce GHG emissions to 40% below 1990 levels by 2030. The City's CAP outlines the measures for the City to achieve its share of state GHG reductions. The project would be consistent with the CAP and, therefore, would be consistent with state GHG reduction goals.

At the regional level, SANDAG's Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) has been adopted for the purpose of reducing GHG emissions attributable to passenger vehicles in the San Diego region. In October 2015, SANDAG adopted its Regional Plan, which was subsequently updated in 2021. The RTP/SCS is not directly applicable to the project because the underlying purpose of the RTP/SCS is to provide direction and guidance on future regional growth (i.e., the location of new residential and nonresidential land uses) and transportation patterns throughout the City and greater San Diego County, as stipulated under SB 375. CARB has recognized that the approved RTP/SCS is consistent with SB 375. The SANDAG Regional Plan is generally consistent with the local government plans. As presented in the July 2021, General Plan Housing Element, the most recent Regional Housing Needs Assessment from SANDAG stated that San Marcos's share of regional future housing needs is 3,116 new units between April 15,2021, and April 15, 2029. As of June 30, 2020, 546 housing units have been planned or approved for development, with 2,570 units remaining needed to be developed in the City. The project is expected to bring 202 units to market in 2027, which would be within SANDAG's growth projection for housing during the 6th Cycle planning horizon. Since the project is within the scope of development that was anticipated in the General Plan, it would not result in growth that would conflict with the Regional Plan.

Based on the preceding considerations, the project would not conflict with an applicable plan adopted for the purpose of reducing GHG emissions or generate GHG emissions that would have a significant impact on the environment; therefore, the project's impacts on GHG emissions would be less than significant.

2.9 Hazards and Hazardous Materials

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
IX. HAZARDS AND HAZARDOUS MATERIALS – Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☒	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☒	☐
d) Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☒	☐
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☒	☐
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	☐	☐	☒	☐

A Phase I Environmental Site Assessment (ESA) was prepared for the project by Geocon, which is included as Appendix E to this IS/MND. The analysis herein is based on findings of Appendix E. Full details regarding hazards and hazardous materials as it relates to the project site can be found in Appendix E. Additionally, a Fire Response Technical Memorandum was prepared for the project, which is included as Appendix L to this IS/MND. Information from the Fire Response Technical Memorandum is referenced in the analysis herein.

a) Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

and

b) Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Less-than-Significant Impact. Construction of the proposed project would entail transport, use, or disposal of potentially hazardous materials including, but not limited to, diesel fuel, gasoline, equipment fluids, concrete, cleaning solutions and solvents, lubricant oils, adhesives, human waste, and chemical toilets. Direct impacts to human health and biological resources from accidental spills of small amounts of hazardous materials from construction equipment could occur with the transport, use, or disposal of these materials. However, existing federal and state standards related to the handling, storage, and transport of these materials would be implemented during construction of the proposed project. These regulations include the Federal Chemical Accident Prevention Provisions (Part 68 of the Code of Federal Regulations), California Highway Patrol and Caltrans container and licensing requirements for transportation of hazardous waste on public roads, the International Fire Code, the Resource Conservation and Recovery Act of 1976 as amended by the Hazardous and Solid Waste Amendments of 1984, California's Hazardous Waste Control Law, the California Fire Code, California Health and Safety Code Hazardous Materials Release Response Plans and Inventory, the California Integrated Waste Management Act, regulations developed by California Occupational Safety and Health Administration, and the state Hazardous Waste Control Act.

During operation of the proposed project, the only hazardous materials anticipated for transport, use, or disposal associated with the project would be routinely used household products such as cleaners, paint, solvents, motor oil/automotive products, batteries, and garden maintenance products, typical of residential and commercial retail uses. The use, handling, and disposal of these products is addressed by household hazardous waste programs that are part of the Integrated Waste Management Plan of the County of San Diego. The Household Hazardous Waste Element of the Integrated Waste Management Plan specifies the means by which hazardous wastes generated by households shall be collected, recycled, treated, and disposed of safely (County of San Diego 2005).

The proposed project's compliance with all standards required through federal, state, county, and municipal regulations, in addition to project-specific plans reviewed by the City, would ensure potential impacts to the public or the environment through routine transport, use, or disposal of hazardous materials would not be substantial. Furthermore, the project would comply with all recommendations outlined in the Phase I ESA prepared for the proposed site, including the recommendation that any suspect asbestos-containing material from demolition of the existing site be actively managed in accordance with a property-specific asbestos operations and management program until construction, demolition, or renovations warrant positive identification and/or building material removal . Therefore, impacts of the proposed project are determined to be less than significant.

c) Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Less-than-Significant Impact. The project site is not located within 0.25 miles of an existing or proposed school. The closest schools to the project site are Discovery Elementary School, located approximately 0.45 miles south of the project site, and High Tech High North County, located approximately 0.70 miles west of the project site. However, the proposed project is not expected to emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste beyond routinely used household products such as cleaners, paint, solvents, motor oil/automotive products, batteries, and garden maintenance products. Residential use of the project site is also expected to handle fewer hazardous materials and emit reduced hazardous emissions compared to the light industrial and mixed-use uses designated under the existing zoning for the project site. Furthermore, the project would comply with all recommendations outlined in the Phase I ESA prepared for the proposed site. Therefore, impacts are determined to be less than significant.

d) Would the project be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Less-than-Significant Impact. Geocon prepared a Phase I ESA for the project site in June 2021. As outlined in the Phase I ESA, Environmental Data Resources Inc. searched federal, state, and local databases regarding the known contaminated sites within 1 mile of the site. The databases that list the project site and/or properties/facilities within 1 mile of the site and the number of properties/facilities listed are summarized in Section 4 of Appendix E. The project site is listed on the National Pollution Discharge Elimination System and California Integrated Water Quality System Project databases; however, the Phase I ESA identified no evidence of recognized environmental conditions in connection with the project site. A recognized environmental condition is the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. As no recognized environmental conditions were identified, additional environmental assessments are not warranted at this time. Therefore, impacts are determined to be less than significant.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

Less-than-Significant Impact. The closest airport to the project site is the McClellan-Palomar Airport, which is located approximately 5 miles west of the project site. The project site is not located within any of the McClellan-Palomar Airport Influence Areas (San Diego County Regional Airport Authority 2011). Therefore, this impact would be less than significant.

f) Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Less-than-Significant Impact. According to the General Plan Safety Element, the San Marcos Emergency Operations Plan (EOP) governs the operations of the City during a disaster. The EOP addresses response to

moderate evacuation scenarios, including the identification of evacuation points and general routes (City of San Marcos 2012a). The proposed project would be required to abide by the standards set forth in the San Marcos EOP. Implementation of the proposed project is not expected to impact any roadway or staging areas that are identified in any emergency planning documents and would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. As required under the California Fire Code, the proposed project would be required to present development plans that afford fire and emergency responders suitable fire access roads dimensions and surfaces (Chapter 5, Sections 503.1 through 503.4 of the California Fire Code), an adequate number of emergency rated entrances to the community (Appendix D; Section D106 of the California Fire Code), and entryway gate access for first responders (Chapter 5 of the California Fire Code, Section 503.6). The proposed points of entry and private driveways have been reviewed and approved by San Marcos Fire Department (SMFD) and are required to meet the qualifications for emergency access to and from the project site. Furthermore, a Fire Response Technical Memorandum (Appendix L) has been prepared for the proposed project, which outlines fire protection services and emergency response as it relates to development of the project. Based on response travel time modelling, it is concluded that the project site is within the SMFD's internal response timeframes with up to 24 seconds of additional time available. For these reasons, the project would not interfere with emergency response plans, and impacts would be less than significant.

g) Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?

Less-than-Significant Impact. The project site is currently developed with restaurants and associated paved parking on site. The proposed re-designation of the project site from Light Industrial and Mixed-Use to residential uses under a Specific Plan would not exacerbate wildfire risks in comparison to existing conditions. The proposed project site is located in a developed area of the City and is not located within or adjacent to a fire hazard severity zone. The redevelopment of the existing project site with proposed land uses would not exacerbate fire risk. The proposed project would be required to comply with all applicable state and local fire codes, including compliance with the California Fire Code as adopted by the City of San Marcos and the San Marcos Fire Department, which require a design that affords fire and emergency responders suitable fire access roads dimensions and surfaces (Chapter 5, Sections 503.1 through 503.4 of the California Fire Code), an adequate number of emergency rated entrances to the community (Appendix D; Section D106 of the California Fire Code), and entryway gate access for first responders (Chapter 5 of the California Fire Code, Section 503.6). Furthermore, a Fire Response Technical Memorandum (Appendix L) has been prepared for the proposed project, which outlines fire protection services and emergency response as it relates to development of the project. The Fire Response Technical Memorandum concludes that the increased on-site density and intensity of uses would not cause a significant stress on existing call volume or response capabilities. The project site would be served for a fire emergency within SMFD's internal response time frames. Therefore, impacts are determined to be less than significant.

2.10 Hydrology and Water Quality

		Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
X.	**HYDROLOGY AND WATER QUALITY – Would the project:**				
a)	Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	☐	☐	☒	☐
b)	Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☐	☐	☒	☐
c)	Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
	i) result in substantial erosion or siltation on or off site;	☐	☐	☒	☐
	ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;	☐	☐	☒	☐
	iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	☐	☐	☒	☐
	iv) impede or redirect flood flows?	☐	☐	☒	☐
d)	In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	☐	☐	☒	☐
e)	Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☐	☐	☒	☐

The Hydrology and Water Quality Section of this IS/MND is based on the results of the Preliminary Hydrology/Drainage Study and Hydraulics Analysis and Floodplain Study, which are included as Appendices F and G, respectively. Additionally, this section refers to the SWQMP prepared for the project, included as Appendix N to this IS/MND.

a) Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Less-than-Significant Impact. Construction activities associated with the proposed project could result in potentially significant impacts to water quality. In addition to sediment erosion from ground-disturbing activities on the project site, fuels, oils, lubricants, and other hazardous substances used during construction could be released and potentially impact water quality.

The proposed project would be required to comply with the National Pollutant Discharge Elimination System State Water Resources Control Board Region-wide Municipal Separate Storm Sewer System (MS4) Permit - Order No. R9-2013-0001, as amended by Orders R9-2015-0001 and R9-2015-0100, and Construction General Permit Order No. 2022-0057-DWQ for stormwater discharges and general construction activities, and would incorporate standard BMPs, such as regular cleaning or sweeping of construction areas and impervious areas, and filtration media screens. In compliance with the Construction General Permit, a stormwater pollution prevention plan, including an erosion control plan, will be prepared for the project, prior to issuance of grading permits, that would specify construction BMPs that would be implemented during construction to minimize impacts to water quality. Furthermore, project implementation of permanent storm water quality BMPs that compromise of proprietary and non-proprietary biofiltration, hydromodification, source control, and site design BMPs would effectively treat post-construction stormwater runoff prior to discharge from the site in compliance with the requirements of the City's 2023 BMP Design Manual and BMPs outlined in the project's SWQMP (PDF-8). Proposed drainage management areas and BMP sites are shown on the drainage management areas map on page 45 of the SWQMP, provided as Appendix N to this IS/MND.

As detailed in the Preliminary Hydrology Report and SWQMP prepared for the project, water quality requirements would be addressed with permanent stormwater quality BMPs, including a modular wetland systems (proprietary biofiltration), and green-street biofiltration BMP, and hydromodification requirements would be addressed with underground storage vaults. The on-site permanent BMPs would be maintained by the HOA, and sediment and debris collected in the proposed hydromodification vault would be maintained via a vactor truck procedure. Both the pollutant-removal BMPs and the hydromodification vaults would have strategically placed access holes in order to facilitate maintenance. The BMPs would be inspected regularly to inspect for sedimentation. The project includes green street biofiltration within the multi-way median, as part of the proposed multi-way improvements. The property owner is required, pursuant to SMMC Section 14.15 and the City's BMP Design Manual, to enter into a stormwater management and discharge control maintenance agreement for the installation and maintenance of permanent BMPs prior to issuance of construction permits. Through implementation of the construction and permanent BMPs and the adherence to water quality regulations, the project would not violate any stormwater quality standards or waste discharge requirements, nor degrade surface or ground water quality. As outlined in Appendix F, the project would meet state National Pollutant Discharge Elimination System construction and municipal stormwater permit requirements. Therefore, impacts associated with water quality and stormwater drainage and runoff would be less than significant.

b) Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Less-than-Significant Impact. As outlined in the Geotechnical Investigation (Appendix D) completed for the project, groundwater was encountered in all the exploratory borings performed across the site, which

varied between 8 and 24 feet below the existing ground surface. The groundwater elevations are expected to fluctuate seasonally and may affect remedial grading. In this regard, remedial grading may encounter wet soils and excavation and compaction difficulty, particularly if grading is planned during the winter months. Additionally, a non-operational/abandoned well was observed in the northwestern portion of the property and would be properly abandoned/removed in accordance with San Diego County regulatory requirements (Appendix D). Due to anticipated removal depths, the current location of groundwater and the condition and compression characteristics of the alluvium that underlies the site, a compression study was completed for the site which found that older alluvial deposits were encountered at depths of 3 to 9 feet below the existing ground surface. To evaluate the possibility of leaving this unit in-place, consolidation testing was performed on several relatively undisturbed samples of this material. Based on the laboratory test results presented in Appendix B of Appendix D to this IS/MND, the older alluvium possesses adequate engineering properties to remain in-place and receive the proposed fills and/or structural loads. Construction of the project is not anticipated to interfere with groundwater recharge; nevertheless, the project would be required to comply with all conclusions and recommendations outlined in Appendix D to this MND. Specifically, all grading shall be performed in accordance with *the* Recommended Grading Specifications in the Geotechnical Investigation (Appendix D), and all earthwork should be observed and all fills tested for proper compaction by Geocon Inc.

All stormwater would be adequately treated by the modular wetland system prior to being discharged to natural/undisturbed areas that could allow the runoff to infiltrate into the ground and eventually reach groundwater. The use of permanent BMPs that would effectively treat stormwater runoff, would ensure that project implementation would not have a potentially significant adverse impact on groundwater quality or cause or contribute to an exceedance of applicable groundwater receiving water quality objectives or degradation of beneficial uses.

The project would receive water from VWD, who in turn, receives its water from the Metropolitan Water District of Southern California (MWD). MWD obtains water from local sources as well as the Colorado River, via the Colorado River Aqueduct, and the Sacramento-San Joaquin Delta, via the State Water Project (MWD 2016). As the project would not use groundwater for construction or operation, and would not interfere with infiltration and groundwater recharge, implementation of the proposed project would not decrease groundwater basins through increasing water demand on site or impede sustainable groundwater management of any groundwater basin, and impacts would be less than significant.

c) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i) Result in substantial erosion or siltation on or off site?

Less-than-Significant Impact. The proposed project would be required to implement BMPs during construction and incorporate storm drain systems including proprietary and non-proprietary biofiltration BMPs and hydromodification vaults into the development design. With implementation of the proposed stormwater quality BMPs , the project would not generate runoff volumes that would significantly alter the overall drainage on site. Additionally, project-related runoff would be adequately treated prior to discharge into planned drainage systems via stormwater quality BMPs such that the proposed project would not provide substantial additional sources of polluted runoff.

The proposed project is required to accommodate adequate drainage capacity on site, and connections to existing facilities, in project-specific plans that will be reviewed and approved by the City. Further, implementation of BMPs and a stormwater pollution prevention plan would ensure construction of the project would not result in substantial erosion or siltation on or off site. Compliance with the stormwater pollution prevention plan and project specific SWQMP would ensure impacts related to erosion or siltation on- or -off-site would be less than significant.

ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site?

Less-than-Significant Impact. There are no existing streams or rivers on site that would be substantially altered as a result of project implementation. The project site is within Zone AE of the Special Flood Hazard Area that is subject to inundation by the 1% annual chance flood. Zone AE is defined as areas with "base flood elevations determined." The northern portion of the site is within the floodway areas in Zone AE. The floodway is the channel of a stream plus any adjacent areas that must be kept free of encroachment so that the 1% annual flood chance can be carried without substantial increases in flood heights.

Under existing conditions, the project area is fully developed and consists of commercial development with a large parking lot area and a number of restaurants. The project site generally drains towards the center, towards the middle of the large parking lot. Surface drains along the project site collect site runoff and convey the runoff in an existing 30-inch pipe that runs west through the project site. This 30-inch pipe connects a 36-inch x 60-inch elliptical pipe in Via Vera Cruz upstream and an existing concrete channel west of the site downstream. San Marcos Creek is located approximately 1,000 feet southwest of the project site, downstream of the project outfall point. The on-site drainage improvements proposed consist of private streets, gutters, and curb inlets that tie into underground storm drain systems. The project would upsize the existing 30-inch storm drain that conveys majority of the stormwater on site to a double 36-inch storm drain with a new alignment, which would ultimately transition to a dual RCB before it discharges to the existing concrete channel. In addition, the project proposes to construct some public improvements and street widening along the project frontage. These public improvements include center median improvements, and a new side median for multi-way lane in West San Marcos Boulevard. Hydrology modeling was prepared for these improvement areas.

As the project grading has been designed to fit into the existing landform, the proposed drainage areas mimic the existing condition and consist of one on-site drainage system and one off-site drainage system. As outlined in Table 2 in Appendix F, peak flows for the proposed condition would decrease compared to existing conditions. Therefore, 100-year detention is not required since 100-year post-project peak flows are less than 100-year pre-project peak flows. The project would fill areas north and south of the floodway to raise the proposed buildings above the 100-year floodplain elevations with required freeboard. Grading and encroachments would be minimized within the floodway area.

The project would introduce new pervious areas on site through open space and landscaped areas that currently do not existing in current conditions. The proposed on-site drainage improvements include private streets, gutters, storm drain pipes, and curb inlets that would connect to underground storm drain systems. In addition, post-development condition of the project site would continue to drain towards San Marcos Creek; however, as shown above, flow-rate for the proposed condition would be reduced compared to the existing condition.

As described in the project description and the Hydraulic Analysis (Appendix G), FEMA has mapped a 100-year floodplain, 500-year floodplain, and regulatory floodway within the site. These are associated with the "North Split" from the San Marcos Creek (as shown on the Flood Insurance Rate Map 06073C0793G) and would remain partially contained within the redeveloped area and would not inundate future buildings. As discussed above, the project would fill areas north and south of the floodway to raise the proposed buildings above the 100-year floodplain elevations with required freeboard. As part of the project, a park would be implemented in the existing floodway area with a variety of amenities tolerant of inundation (Figure 3, Conceptual Site Plan). The site design is intended to minimize floodway encroachments and results in minor changes to the existing condition 100-year water surface elevations. As described in Appendix G, the proposed condition water surface elevations are generally lower than existing conditions.

As shown above and as outlined in Appendix F and G, the hydrology results indicate that the post-project flow rates do not exceed pre-project flow rates, due to an increase of landscape areas compared to existing conditions. The proposed buildings would be elevated above the 100-year flood elevation. For the reasons outlined above, impacts are determined to be less than significant.

iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Less Than Significant Impact. As previously addressed, the project would increase pervious surfaces and decrease peak flows through the project site. The project would include a new engineered stormwater drainage system that would be designed to conform with applicable federal, state, and local requirements related to drainage, hydrology, and water quality. As described previously, the project would upsize the existing 30-inch storm drain that conveys the majority of the site to a double 36-inch storm drain with a new alignment that would ultimately transition to a dual RCB before it discharges to the existing concrete channel. As the project grading has been designed to fit into the existing landform, the proposed drainage areas mimic the existing condition and consist of one on-site drainage system and one off-site drainage system. As outlined in Table 2 in Appendix F, peak flows for the proposed condition would decrease compared to existing conditions. Therefore, 100-year detention is not required since 100-year post-project peak flows are less than 100-year pre-project peak flows.

The on-site drainage system would be consistent with all applicable standards related to the collection and treatment of stormwater. Therefore, impacts associated with altering the existing drainage pattern of the project site and stormwater would be less than significant.

iv) Impede or redirect flood flows?

Less-than-Significant Impact. The proposed drainage patterns would be relatively the same as in existing conditions. The site would generally drain towards the existing 100-year floodway and drain to the west towards the existing concrete channel. Most of the roof drainage for the residential motorcourts would drain to the center of their courtyards and would be collected in inlets and conveyed through the storm drainpipes. The drainage pattern on West San Marcos Boulevard would remain the same as in existing conditions. The project would fill areas north and south of the floodway to raise the proposed buildings above the 100-year floodplain elevations with required freeboard. Grading and encroachments would be minimized within the floodway area. As part of the project, a park would be implemented in the existing floodway area with a variety of amenities tolerant of inundation (Figure 3, Conceptual Site Plan). The site design is intended to minimize floodway encroachments and results in minor changes to the existing

condition 100-year water surface elevations. As described in Appendix G, the proposed condition water surface elevations are generally lower than existing conditions. The proposed condition would include more pervious landscaping areas compared to existing conditions, which contribute to lower flow rates; therefore no 100-year detention is required for the project.

The project would be required to comply with recommendations in the Hydrology/Drainage Report and Hydraulic Analysis and would be required to incorporate all requirements and BMPs outlined in the stormwater pollution prevention plan and SWQMP prepared for the project. Based on the analysis above, impacts would be less than significant.

d) In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation?

Less-than-Significant Impact. As described above, FEMA-mapped 100-year floodplain, 500-year floodplain, and regulatory floodway occur across the northern portion of the site. The project would fill areas north and south of the floodway to raise the proposed buildings above the 100-year floodplain elevations with required freeboard. Grading and encroachments would be minimized within the floodway area. As part of the project, a park would be implemented in the existing floodway area with a variety of amenities tolerant of inundation (Figure 3, Conceptual Site Plan). The site design is intended to minimize floodway encroachments and results in minor changes to the existing condition 100-year water surface elevations.

The project site is approximately 8 miles inland from the Pacific Ocean and would not be subject to inundation by tsunami. The project site is not located within a tsunami or seiche zone. Given that the project site is not located near a large standing body of water, inundation by seiche (or standing wave) is considered negligible. The project site is generally flat with no steep slopes and does not contain slopes subject to mudflows; therefore, potential impacts related to release of pollutants due to inundation are determined to be less than significant.

e) Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Less-than-Significant Impact. The Carlsbad Management Area Water Quality Improvement Plan was prepared in June 2016 for the Carlsbad Watershed Management Area Responsible Agencies, which include the Cities of Carlsbad, Encinitas, Escondido, Oceanside, San Marcos, Solana Beach, and Vista, and the County of San Diego. The purpose of the Carlsbad Water Quality Improvement Plan is to guide the Responsible Agencies' jurisdictional runoff management plans towards achieving improved water quality in MS4 discharges (or stormwater discharges) and receiving water bodies. The proposed project is located within the San Marcos Hydrologic Area, which is the second largest within the Carlsbad Watershed Management Area. The Carlsbad Management Area Water Quality Improvement Plan outlines areas of priority water quality conditions and highest priority water quality conditions. No potential wetland or non-wetland water features are present within the biological study area. As such, the proposed project would not conflict with or obstruct implementation of the Carlsbad Management Area Water Quality Improvement Plan or any other water quality plan. Further, the site is not located within a sustainable groundwater management plan area. Therefore, impacts are determined to be less than significant.

2.11 Land Use and Planning

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
XI. LAND USE AND PLANNING – Would the project:				
a) Physically divide an established community?	☐	☐	☒	☐
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☒	☐

a) Would the project physically divide an established community?

Less-than-Significant Impact. As described under Section 1 above, the project is a mixed-use residential development project on a 10.5-acre site. The project consists of demolition of 63,484 square feet of existing (primarily vacant) restaurant uses on site, re-development with 202 multifamily residential units, 10,400 square feet of commercial retail uses, and a 1.1 acre public park (Figure 3, Conceptual Site Plan). Residential units would consist of 8 three-bedroom townhomes over commercial ("town over commercial"); 17 "front street" townhomes ranging in size from three to four bedrooms; 57 "greencourt" townhomes ranging in size from two to four bedrooms; and 120 "motorcourt" townhomes ranging in size from two- to three-bedrooms. Private balcony/patio space would be included for each residential unit. Development of the project would be guided by the project's Specific Plan, which provides development guidelines, policies, and regulatory measures (Appendix M). Open space amenities would be located in the northeastern portion of the project site, and commercial uses would be placed along the southern and eastern project boundaries. Primary project access would be via West San Marcos Boulevard at the project's southern boundary. The project would provide 501 parking spaces.

The project includes a General Plan Amendment and Rezone to change the General Plan designation and Zoning from Mixed-Use 1 (MU-1) and Light Industrial (L-I) to Specific Plan Area (SPA) to allow for the proposed multifamily dwelling unit development, associated amenities, private open space, and a public park. The Specific Plan has been prepared with the intent to provide a comprehensive plan to ensure the efficient development of a new mixed-use residential community and to ensure compatibility with surrounding land uses. The project site is located in an urban part of the City within close proximity to a range of existing infrastructure and development including commercial/restaurant uses immediately north, east, and west; Bradley Park approximately 1 mile northwest; Lake San Marcos approximately 1 mile southwest; single and multifamily residential approximately 0.5 miles south; and schools/educational facilities, including San Marcos High School approximately 1 mile west. The proposed project would not incorporate new roads or require removal of roads that currently provide access to the area. Furthermore, due to the location of the project site surrounded on all sides by existing roadways, no separation or disruption of surrounding uses would occur as a result of project implementation. Because the project site is surrounded on all sides by existing development and will maintain existing pedestrian and vehicle access

through the site, it is determined that the proposed project would not divide an established community, and therefore, this impact is considered less than significant.

b) Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Less-than-Significant Impact. The proposed project would change the project site's current General Plan and Zoning designations of Light Industrial (L-I) and Mixed-Use (MU-1) for the site. The proposed Restaurant Row Project (project) includes a request for a Specific Plan, General Plan Amendment, Rezone, two Site Development Plans (one for the development and one for the public park), and a Vesting Tentative Subdivision Map for a mixed-use residential development project on a 10.5-acre site. The General Plan Amendment and Rezone would change the General Plan designation and Zoning from Mixed-Use 1 (MU-1) and Light Industrial (L-I) to Specific Plan Area (SPA). The Specific Plan has been prepared with the intent to provide a comprehensive plan to ensure the efficient development of a new mixed-use residential community. The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the General Plan. The Site Development Plan will configure the site for multifamily dwelling units, street configuration, infrastructure, recreational open space, and private open space. The Tentative Subdivision Map presents specific lot configurations for the site. A separate Site Development Plan will describe the development of the public park, consistent with the feedback gathered at a series of public workshops.

Upon City approval of the General Plan Amendment/Rezone to Specific Plan Area, the proposed project would be required to comply with the allowable multifamily residential uses and development standards outlined in the Specific Plan prepared for the project site (Appendix M). The Specific Plan includes a General Plan consistency analysis (Appendix M). Although the proposed project would amend the land use designation, the proposed project would not result in a conflict with the City's General Plan Land Use Element goals, and project implementation would not impede the City's ability to achieve these goals. The proposed 1.1-acre park, that would be publicly owned and maintained, complies with the City's General Plan Parks, Recreation and Community Health Element, and the City's Parks Master Plan Update as a location identified for a future park (City of San Marcos 2018). The proposed project would not conflict with an applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Therefore, with approval of the proposed General Plan Amendment/Rezone, project impacts related to land use and planning would be less than significant.

2.12 Mineral Resources

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
XII. MINERAL RESOURCES – Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	☐	☐	☐	☒

a) Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

and

b) Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

No Impact. According to the City's General Plan – Conservation and Open Space Element, the City has land classified in all four Mineral Resource Zones (MRZ) (City of San Marcos 2012a). The different MRZs are defined as follows:

MRZ-1: Areas where adequate information indicates that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence.

MRZ-2: Areas where adequate information indicates that significant mineral deposits are present or where it is judged that a high likelihood for their presence exists.

MRZ-3: Areas containing mineral deposits the significance of which cannot be evaluated from available data.

MRZ-4: Areas where available information is inadequate for assignment to any other MRZ zone.

California does not require that local governments protect land designated as MRZ-1, MRZ-3, or MRZ-4. However, the City is responsible for recognizing lands designated as MRZ-2 and protecting these areas from premature development incompatible with mining. City lands designated as MRZ-2 include small portions between Double Peak, Mt. Whitney, and Franks Peak; and small portions in the northern Sphere of Influence within Twin Oaks Valley Neighborhood (City of San Marcos 2012a). These locations do not overlap with the proposed project site; therefore, no loss of known mineral resources would occur.

Furthermore, the project site is currently developed and not designated as a locally important mineral resource recovery site on any local General Plan, Specific Plan, or other land use plan (City of San Marcos 2012a). Thus, due to the location and nature of the proposed project, there would be no impact to mineral resources.

2.13 Noise

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
XIII. NOISE – Would the project result in:				
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☐	☒	☐
b) Generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☒	☐
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☒	☐

Dudek prepared a Noise Study for the project which is included as Appendix H to this IS/MND. The analysis herein is based on findings of Appendix H. Full details regarding noise as it relates to the project can be found in Appendix H.

a) ***Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?***

Less-than-Significant Impact.

Short-Term Construction

Construction noise and vibration are temporary phenomena. Construction noise and vibration levels vary from hour to hour and day to day, depending on the equipment in use, the operations performed, and the distance between the source and receptor. SMMC Chapter 10.24: Noise addresses construction noise (City of San Marcos 2020a). Erection and demolition of buildings is exempt between 7:00 a.m. and 6:00 p.m. Monday through Friday and on Saturdays from 8:00 a.m. to 5:00 p.m. The SMMC does not set noise limits on construction activities. Through adherence to the limitation of allowable construction times provided in the SMMC, construction-related noise levels would not exceed local standards. However, were the City to consider adoption of the County of San Diego's Noise Ordinance noise limit of 75 dBA (8-hour energy equivalent noise level [L_{eq}]) for construction activities, then for information purposes this assessment will compare predicted construction noise against the County's 75 dBA 8-hour L_{eq} threshold. The analysis assumes that the 8-hour period over which the County's 75 dBA L_{eq} could apply would be within the aforementioned exempt hours as allowed by the City of San Marcos.

Construction assumptions, including timing, phasing, and equipment type and quantity, as well as worker and vendor truck trips, were based on information provided by the applicant. Default values provided by CalEEMod were used since detailed project site-specific information is not currently available. Equipment that could be in use during construction would include, in part, graders, backhoes, concrete saws, excavators, dump trucks, loaders, cranes, manlifts, cement mixers, pavers, rollers, welders, and air compressors. The typical maximum noise levels for various pieces of construction equipment at a distance of 50 feet are presented in Table 6 in Appendix H. Usually, construction equipment operates in alternating cycles of full power and low power, producing average noise levels over time that are less than the listed maximum noise level. The average sound level of construction activity also depends on the amount of time that the equipment operates and the intensity of construction activities during that time.

Aggregate noise emission from assumed construction activities, broken down by sequential phase, was predicted at two distances to the nearest apparent existing noise-sensitive receptor: (1) from the nearest position of the construction site boundary; (2) from the nearest position of construction activity for the "main" portion of the site (the closest receiver to construction activity is adjacent to the northern extension of the project site, which would contain six multifamily residential structures); and (3) from the geographic center of the construction site, which serves as the time-averaged location or geographic *acoustical centroid* of active construction equipment for the phase under study.

The intent of the former distance is to help evaluate anticipated construction noise from a limited quantity of equipment or vehicle activity expected to be at the boundary for some period of time, which would be most appropriate for phases such as site preparation, grading, and paving. The latter distance is used in a manner similar to the general assessment technique as described in Federal Transit Administration guidance for construction noise assessment (FTA 2018), when the location of individual equipment for a given construction phase is uncertain over some extent of (or the entirety of) the construction site area. Because of this uncertainty, all the equipment for a construction phase is assumed to operate—on average—from the acoustical centroid. Table 7 in Appendix H summarizes these three distances to the apparent closest noise-sensitive receptor for each of the five sequential construction phases. Adoption of the County's noise ordinance threshold would mean that an "occupied property," which could be a residence or any occupied building, would be the nearest noise-sensitive receptor in this context. At the site boundary, this analysis assumes that the equipment may be operating up to 8 hours per day (i.e., comparable to a typical on-site work shift).

A Microsoft Excel–based noise prediction model emulating and using reference data from the Federal Highway Administration Roadway Construction Noise Model (FHWA 2008) was used to estimate construction noise levels at the nearest occupied noise-sensitive land use.

As presented in Table 8 in Appendix H, the estimated maximum construction noise levels at the closest noise-sensitive receptor (church) are predicted to be greater than 75 dBA L_{eq}, when activities take place within the rectangular extended site area at the northern end of the project site. Note that these estimated noise levels at a source-to-receiver distance of 50 feet occur when noted pieces of heavy equipment would each operate at the same location along the northern property boundary of the northern site extension area for a cumulative period of 8 hours a day. However, construction equipment would move through the project area throughout an 8-hour day, resulting in average 8-hour noise levels that are less than the maximum noise levels. Although maximum construction noise at the closest off-site noise-sensitive receiver could exceed 75 dB(A) L_{eq}, the analysis of these noise levels is extremely conservative, because it assumes all equipment in the phase is working simultaneously in the same location along the northern boundary. Given

the analysis at this distance is very conservative, and because San Marcos has not adopted the San Diego County ordinance, construction noise impacts even within the northern site extension area would be considered less than significant.

The site extension area at the north end of the project site has a depth of approximately 300 feet, as measured perpendicular to the closest noise-sensitive receptor. The construction noise model was run with this distance separation for construction activities, the results of which are also presented in Table 8 in Appendix H (Nearest Noise Sensitive Receptor to Main Construction Area). As can be seen in Table 8 in Appendix H, the estimated construction noise levels at the closest noise-sensitive receptor (church) are predicted to be less than 75 dBA L_{eq} averaged over an 8-hour period, when activities take place no closer than the boundary of the main project site (along the northern project site boundary, excluding the extension or pop-out near the middle of the northern project site boundary). Note that these estimated noise levels at a source-to-receiver distance of 300 feet occur when noted pieces of heavy equipment would each operate for a cumulative period of 8 hours a day. Therefore, for construction activities taking place within the main project site boundaries, construction noise levels at the closest noise-sensitive receptor would comply with the County's standard, and therefore, mitigation would not be required for construction activities occurring within the main project site (i.e., no closer than 300 feet to the adjacent church).

Finally, Table 8 in Appendix H provides the results of the construction noise analysis based upon the distance from the acoustical centroid to the closest noise-sensitive receptor. This scenario is meant to address construction activities distributed across the site, rather than those occurring along the closest site boundary to the sensitive receptor. The values based on the acoustical centroid are considered to be more representative of average construction noise exposure levels at adjacent properties across the entire construction period. As illustrated in Table 8 in Appendix H, noise levels based on the acoustical centroid would average no more than approximately 66 dBA, which is the equivalent of normal conversation levels. Thus, when considered over the entire construction process, it is anticipated that construction noise levels at the closest noise-sensitive receptor would not be intrusive or disruptive.

Compared to measurements of the daytime outdoor ambient sound level at representative sample locations as shown in Table 5 in Appendix H, predicted construction noise levels ranging in the lower to middle seventies of dBA as appearing in Table 8 in Appendix H are considerably higher and would be clearly perceptible to an average listener having healthy human hearing. However, there are no residences within 1,000 feet of the project site; the nearest noise-sensitive uses are a church and a pre-school. At the nearby church and pre-school, exposure to such construction-related noise would typically be relatively short term and temporary—lasting only as long as construction occurs during allowable hours. And because it is anticipated that construction activities associated with future development as a result of the proposed project would take place within the hours of 7:00 a.m. and 6:00 p.m. Monday through Friday and on Saturdays from 8:00 a.m. to 5:00 p.m., the noise-producing activity would thus be in compliance with the SMMC with respect to allowable hours. Construction noise impacts would be considered less than significant.

Long-Term Operational

Roadway Traffic Noise

The proposed project's residences and commercial space would result in the introduction of vehicle trips on local arterial roadways (i.e., San Marcos Boulevard, Via Vera Cruz, and South Las Posas). However, the project would eliminate several existing restaurants that have a fairly high trip generation rate. According

to the project traffic impact assessment (Appendix I), the project would reduce average daily trips coming from the project site, compared to the existing restaurants. Table 9 in Appendix H presents the conclusion of the traffic analysis, which is shown as estimated reduction of 551 average daily trips to local roadways.

Given the project would reduce traffic trips from the site to area roadways, traffic noise on area roadways would not change as a result of project implementation. Thus, a less-than-significant impact is expected for proposed project-related off-site traffic noise affecting existing residences in the vicinity.

Exterior Noise Exposure for Future Project Occupants

Aside from exposure to aviation traffic noise, current CEQA noise-related guidelines at the state level do not require an assessment of exterior-to-interior noise intrusion, environmental noise exposure to occupants of newly created project residences, or environmental noise exposure to exterior nonresidential uses attributed to the potential future development at the proposed project site. Nevertheless, the City's CEQA guidelines and the California Building Code requires that interior background noise levels not exceed a CNEL of 45 decibels (dB) within habitable rooms. Hence, the following predictive analysis of traffic noise exposure and commercial noise sources at the exteriors of occupied residences and outdoor living areas is provided to support evaluation of the project for Noise Element policy compliance, which includes exterior noise compatibility levels of 65 dBA CNEL for multifamily residential uses and 60 dBA CNEL for parks. A detailed description of applicable State and Local regulations related to noise is outlined in Section 2 of Appendix H.

Traffic Noise

Potential noise exposure for future project residents from vehicular traffic on adjacent roadways was assessed using worksheets based upon the Federal Highway Administration's Traffic Noise Model version 2.5. Year 2019 traffic volumes were obtained from the City of San Marcos Public Works Division (City of San Marcos 2023) and Year 2030 traffic volumes were calculated using a 1.5% annual growth rate (which is representative of regional traffic growth in California, and compares well to the current actual annual growth rate for San Marcos of 1.9% annually). Table 10 in Appendix H presents the results of traffic noise modeling. It should be noted that proposed new driveways/roads interior to the project site were not assessed for noise generation, due to the much lower quantity of trips on these roadways compared to Las Posas or Via Vera Cruz, both of which were found to generate noise levels less than 60 dBA CNEL.

The traffic noise exposure levels in Table 10 in Appendix H are calculated for the project boundary closest to the identified roadway segment. As outlined in Table 10 in Appendix H, estimated Year 2023 traffic noise exposure levels at the project boundary closest to Las Posas Road would be approximately 58 dBA CNEL; traffic noise levels at the project boundary closest to Via Vera Cruz would be approximately 59 dBA CNEL; and traffic noise levels at the project boundary closest to San Marcos Boulevard would be approximately 71 dBA CNEL. For project boundaries closest to Las Posas Road and Via Vera Cruz, a number of existing structures exist between the roadway segment and the project boundary. These existing buildings would provide some shielding for traffic noise propagation, and thus calculated roadway traffic noise levels along these project boundaries would be lower than the calculated value presented in Table 10 in Appendix H (the values represent a conservative worst-case with no intervening buildings). The project boundary adjacent to San Marcos Boulevard has unobstructed exposure to the street, and therefore, the traffic noise value in Table 10 in Appendix H for San Marcos Boulevard represents expected future conditions, with no conservatism.

The proposed park would extend from the project boundary closest to Las Posas Road to the project boundary closest to Via Vera Cruz. The maximum traffic noise level exposure at the ends of the park closest to these roadways would be no greater than 59.2 dBA CNEL, which is below the Noise Element recommended 60 dBA CNEL maximum for parks. Proposed residences along these project boundaries would also be exposed to traffic noise levels below the Noise Element Policy limit of 65 dBA CNEL for multifamily residences (Appendix H).

The project would place five rows of two-story structures between San Marcos Boulevard and the park area, which would be expected to reduce traffic noise exposure within the park area by a minimum of 20 dBA CNEL. Therefore, traffic noise exposure levels from San Marcos Boulevard in the park area would not be anticipated to exceed 50 dBA CNEL. Traffic noise exposure levels in the park area would therefore remain within the Noise Element policy limits of 60 dBA CNEL.

Based on the Year 2030 results of the above traffic noise analysis, the first row of structures adjacent to San Marcos Boulevard could have traffic noise levels in front yard areas and at the façade facing San Marcos Boulevard of approximately 70 dBA CNEL. To achieve compliance with the Noise Element multifamily residential exterior exposure limits of 65 dBA CNEL in yard areas immediately adjacent to San Marcos Boulevard, a solid fence or landscape wall of 6 feet in height would be provided between the yard area and San Marcos Boulevard (PDF-9). The wall would reduce traffic noise exposure in the yard areas to approximately 63 dBA CNEL.

The first building row adjacent to San Marcos Boulevard is proposed to be two stories in height, effectively spanning the project property frontage except for one entry drive. This row of buildings would reduce traffic noise exposure at the next row of residences by a minimum of 10 dBA CNEL, and the further distance from the traffic noise source would reduce levels by another 3 dBA CNEL. Therefore, residences interior to the project site would not be exposed to traffic noise exposure levels greater than approximately 57 dBA CNEL, comfortably within the Noise Element limit of 65 dBA CNEL.

California Code of Regulations Title 24 requires that an interior noise analysis be performed where exterior noise exposure would exceed 60 dBA CNEL, which would be the case for the façades of the first row of buildings immediately adjacent to San Marcos Boulevard. California Code of Regulations Title 24 and the City of San Marcos also require that interior noise levels due to exterior noise sources not exceed 45 dBA CNEL for multifamily residences. An interior noise analysis is not currently required under CEQA, but a preliminary discussion for informational purposes is provided below.

No exterior wall assembly has been provided yet, but it is assumed the exterior wall for the project structures will be of standard construction and consist of three-coat stucco or exterior paneling over sheathing, on wood studs with a single layer of gypsum board on the interior and batt insulation in the cavity. This assembly has an attenuation capacity of typically 40–45 (identified by a Sound Transmission Classification [STC] rating), which means the exterior solid wall could reduce exterior noise levels by at least 40 dBA in interior spaces. However, windows and doors are not as effective in reducing noise levels from exterior to interior spaces. Therefore, for residences in the first row of structures adjacent to San Marcos Boulevard, to achieve the interior criterion of 45 dBA CNEL, exterior doors and windows located on the building façade facing San Marcos Boulevard should have a minimum STC rating of 35 (PDF-10).

Exterior Noise Exposure Levels from Adjacent Commercial and Industrial Land Uses

Existing commercial uses, including restaurants, commercial offices, and a bank, would be preserved on the property immediately to the east and north of the project site. Roof-mounted heating, ventilation, and air conditioning (HVAC) equipment on the closest restaurant to the eastern project site boundary is located approximately 100 feet from the eastern property boundary of the project site. Based on a Carrier brand 20-ton package HVAC unit, the sound level for the HVAC equipment at the closest restaurant would be 77 dBA at 10 feet, attenuated to approximately 59 dBA at the project site eastern boundary. Parking lots associated with the commercial uses north and east of the project site would be the primary noise source that would continue to exist adjacent to the project. The average noise level for a commercial parking lot is approximately 63 dBA L_{eq} at 50 feet from the edge of the parking lot (Appendix H). The closest parking stalls to the project site would be located at approximately 50 feet from future residences within the project. Adding HVAC noise to the parking lot noise would result in noise exposure no greater than approximately 66 dBA L_{eq} at residences along the northern and eastern project site boundary. With standard residential construction capable of providing an exterior to interior attenuation of 25 dBA, interior noise levels should remain below 45 dBA L_{eq}. The adjacent businesses would not be anticipated to operate between 10:00 p.m. and 7:00 a.m., and therefore, industrial and commercial uses should not result in interior noise levels within project homes that exceed 45 dBA CNEL. For the first row of residences along the northern and eastern project site boundaries, noise could be marginally above the recommended exterior limits (66 dBA CNEL compared to a limit of 65 dBA CNEL) where yards are provided between the residences and the project site boundary. Solid fencing or landscape walls 6 feet in height at the yard boundary closet to the project site boundary would reduce noise levels below 65 dBA, which would prevent exterior noise exposure that exceeds the Noise Element limit at proposed yard areas adjacent to the northern and eastern project site boundaries.

Exterior Noise Exposure – Recreational Noise Sources

The proposed recreation area within the project site includes four proposed pickleball courts, at the extreme east end of the park site. The pickleball courts' locations are between approximately 50 and 108 feet from the closest residence on the site (immediately south of the pickleball courts). Other on-site residences in the area (along the southern park boundary) would be located between 60 and 200 feet from the pickleball courts. Pickleball play has been demonstrated to generate average sound levels of approximately 64 dBA L_{eq} at 30 feet (Appendix H). Pickleball noise could average 62 dBA L_{eq} at the closest on-site residence while all the courts are in use; other on-site residences further away would experience lower pickleball noise levels. These noise levels would comply with the SMMC daytime limit of 65 dBA L_{eq} for multifamily residence zoning. The pickleball courts would not be anticipated to be used in the nighttime period (i.e., later than 10:00 p.m.), and therefore would not need to comply with the nighttime SMMC limit of 55 dBA L_{eq}. Daytime/evening only use of the pickleball courts would produce exterior noise levels no greater than 63 dBA CNEL at the closest residence, which would result in interior noise levels no greater than 38 dBA CNEL, given an exterior to interior attenuation performance for residential construction. While the pickleball noise would not be expected to exceed applicable limits in the SMMC, the use of sound attenuating material on the court fences would reduce the potential for residence annoyance from pickleball play. Sound levels at the closest property line from pickleball play would attenuate to approximately 63 dBA L_{eq}, and therefore, pickleball noise would also be compliant with the SMMC limit of 65 dBA L_{eq} within the commercial zone to the east of the project site. The conceptual park plan also includes a proposed lawn area with some casual tiered seating, with no proposed amplified sound system. In addition to the pickleball courts, proposed

active recreational uses include a tot lot and all-wheel rolling plaza (i.e., area for rollerblading, skating, skateboarding, etc.); neither of these two active recreation areas would be equipped with an amplified sound system. As such, sound levels generated by use of the tot lot and roller plaza would be anticipated to remain well below the SMMC daytime limit of 65 dBA L_{eq} at the nearest multifamily residences; neither the tot lot nor roller plaza are anticipated to be open in the nighttime period. As a public park, the Parks Department would need to issue a permit for a special event at the tiered lawn area or within other areas of the proposed park. Due to the proximity of the park to homes, it is anticipated the City would restrict special event permits to prohibit the use or portable amplified sound systems.

Stationary Operations No-ise

Future residential and commercial development on the project site will add a variety of noise-producing mechanical equipment, primarily involving HVAC equipment for habitable spaces. While there would be some commercial space included in the proposed development, residential structures would be the dominant land use and the quantity of HVAC units would substantially outnumber the systems dedicated to commercial spaces Therefore this stationary equipment operations noise analysis focuses on residential space HVAC equipment. Within the park component, the only substantial noise source would be the proposed skatepark and pickleball courts (discussed above). Modeling of project stationary source noise levels at areas adjacent to the project site does include both residential HVAC sources and the pickleball courts. Operational noise levels were calculated using Dudek's NoisePro (Appendix H).

As proposed, structures would be arranged to create a relatively continuous building block along the exterior project site. The gaps between structures would be minor compared to the length of connected structures, and therefore, the first row of buildings along the exterior lot boundary would present an effective sound barrier for stationary noise sources more internal to the project site. The noise model therefore includes air conditioner condenser units for the first row of buildings closest to the exterior perimeter of the project site. Dudek used the reference sound level (68 dBA at 1 meter) for a Carrier 16NA-48 5-ton HVAC unit to represent the HVAC system for each residential unit located along the project site boundary. A total of 64 HVAC units were included in the model for the residences along the project site boundaries. A sound level reference of 64 dBA at 30 feet was included in the model for each of the four pickleball courts. A total of seven receiver points were included in the model space, along the project property boundary adjacent to concentrations of project stationary noise sources, to represent the worst-case noise levels for simultaneous operation of all air conditioners in residential units along the site boundaries, and with games on each of the four pickleball courts.

Table 11 in Appendix H presents the results of the project operational noise prediction modeling at the seven receiver locations (R1-R7) in the NoisePro model space, as well as at the two closest ambient noise measurement locations (ST2 and ST3). Refer to Figure 4 of Appendix H for the locations of R1-R7, ST2, and ST3. These modeled receptor positions are intended to represent project operational sound levels along the project site property boundaries as well as at the noise-sensitive uses closest to the project site, for comparison to City of San Marcos noise ordinance limits. Properties immediately adjacent to the project site include commercial land uses to the west, south, and east, as well as north of the eastern half of the project site, where the applicable SMMC limit in the overnight period is 55 dBA $L_{eq.}$ and during the daytime is 65 dBA $L_{eq.}$ Uses to the north of the western half of the project site are industrial, where the applicable SMMC limit in the overnight period is 60 dBA $L_{eq.}$ and during the daytime is 65 dBA $L_{eq.}$

As indicated in Table 11 in Appendix H, project operational noise levels at each modeled location except R4 and R5 would range from 42 to 53 dB(A) L_{eq} and would fall below the more stringent nighttime limits, indicating that even if all equipment is operating in the overnight period, the project noise levels would comply with the SMMC. At receivers R4 and R5, the modeled noise levels reflect use of all four pickleball courts simultaneously. Since the courts would not be anticipated to be open in the overnight period from 10:00 p.m. to 7:00 a.m., noise levels from the courts at the adjacent project site boundaries would be subject to the daytime limit for commercial zones of 65 dBA $L_{eq;}$ the modeled noise levels of 60 and 57 dBA L_{eq} at the property lines adjacent to the pickleball courts would comply with the commercial zone daytime limit of 65 dBA $L_{eq.}$ NoisePro also generates an exhibit with noise contours depicting the noise levels resulting from project operations, that illustrates noise levels extending several hundred feet from the site. Refer to Figure 4 in Appendix H for the noise contour map from the NoisePro modeling.

Dudek also compared the predicted operational noise to ambient noise levels documented during the ambient noise survey, as reported for locations ST1, ST2, ST3, and ST4. Table 12 in Appendix H presents the predicted project operational noise levels to the measured ambient noise levels; predicted project operational noise levels at each ambient noise measurement point would fall below the measured ambient noise level. Adding the project operational noise to the ambient noise level would in each case result in less than a 3 dB increase.

On the basis of comparing predicted project operational noise levels against both noise ordinance limits and ambient noise levels, a less-than-significant impact would occur for proposed project operational noise.

Cumulative Noise Assessment

Transportation Sources

The proposed project would result in a reduction in the total number of traffic trips added to the local roadway network, when compared to the existing restaurant uses, which would be eliminated by the project. Therefore, the project would not have a considerable contribution to cumulative traffic impacts in the region.

Construction Activities

Temporary changes to the outdoor sound environment could also occur not only due to project construction noise that has already been presented herein, but as a cumulative result of potential concurrent project construction activity noise and the noise emission from construction of other projects in the vicinity.

Due to the decrease in noise levels with distance and the presence of physical barriers (i.e., intervening buildings and topography), noise due to construction of other projects would not meaningfully combine with that of the proposed project and produce a cumulative noise effect during construction. By way of illustration, if there are two concurrent construction projects of comparable sound emission intensity, and the activity nearest to a common studied noise-sensitive receptor is compliant with the aforementioned 75 dBA 8-hour L_{eq}, then the other activity could be no closer than three times the distance of the receptor to the nearest activity and not make a cumulatively measurable contribution to the total noise exposure level. If, on the other hand, two concurrent projects were comparably close to a receptor, the cumulative noise would be one of the following:

- the louder (in dBA) of the two concurrent activities; or
- a logarithmic sum of the two activity noise levels that, per acoustic principles, cannot be more than 3 dBA greater than the louder of the two individual noise-producing activities.

In sum, cumulative construction noise is likely to be dominated by the closest or loudest activity to the receptor, and the combination will be no more than a barely perceptible difference (i.e., up to a 3 dBA change). On the basis of such a barely perceptible cumulative construction noise level occurring due to the proposed project and what may be a nearby concurrent construction activity, the impact would be considered less than significant.

Stationary Operational Sources

Similar to the preceding discussion of cumulative construction noise, operation noise from stationary equipment attributed to the proposed project (as already presented herein) and any others potentially operating in the future and in the vicinity of a common off-site noise-sensitive receptor would need to be compliant with the City's applicable standards. Cumulative contribution of the proposed project to this future aggregate noise level from multiple established projects or facilities assumed to have comparable individual noise emission from stationary sources would be bounded by the same potential outcomes as follows:

- the louder (in dBA) of the two concurrently operating projects or facilities; or
- a logarithmic sum of the two operation noise levels that, per acoustic principles, cannot be more than 3 dBA greater than the louder of the two individual levels.

In sum, cumulative operation noise is likely to be dominated by the closest or loudest project to the receptor, and the combination will be no more than a barely perceptible difference (i.e., up to a 3 dBA change). On the basis of such a barely perceptible cumulative operation noise level occurring due to the proposed project and what may be nearby and concurrent operation of off-site stationary noise sources, the impact would be considered less than significant.

b) Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Less-than-Significant Impact. Construction activities may expose persons to excessive groundborne vibration or groundborne noise, causing a potentially significant impact. Caltrans has collected groundborne vibration information related to construction activities. Information from Caltrans indicates that continuous vibrations with a peak particle velocity (PPV) of approximately 0.1 inches per second (ips) could be considered annoying on the basis of it being "strongly perceptible" by building occupants. For context, heavier pieces of construction equipment, such as a bulldozer that may be expected on the project site, have PPVs of approximately 0.089 ips PPV or less at a reference distance of 25 feet (Appendix H).

Groundborne vibration attenuates rapidly, even over short distances. The attenuation of groundborne vibration as it propagates from source to receptor through intervening soils and rock strata can be estimated with expressions found in Federal Transit Administration and Caltrans guidance. By way of example, for a bulldozer operating on site and as close as the northern project boundary (i.e., 50 feet from the nearest occupied property) the estimated vibration velocity level would be 0.03 ips PPV per the equation as follows (FTA 2018):

$$PPV_{rcvr} = PPV_{ref} * (25/D)^{1.5} = 0.089 * (25/50)^{1.5} = 0.006$$

In the above equation, PPV_{rcvr} is the predicted vibration velocity at the receiver position, PPV_{ref} is the reference value at 25 feet from the vibration source (the bulldozer), and D is the actual horizontal distance

to the receiver. Therefore, at this predicted PPV, the impact of vibration-induced annoyance to occupants of nearby existing homes would be less than 0.1 ips PPV and therefore less than significant.

Construction vibration, at sufficiently high levels, can also present a building damage risk. However, anticipated construction vibration associated with future development on site would yield levels of 0.03 ips, which do not surpass the guidance limit of 0.2 to 0.3 ips PPV for preventing damage to residential structures (Caltrans 2020). Because the predicted vibration level at 50 feet is less than this guidance limit, the risk of vibration damage to nearby structures is considered less than significant.

c) ***For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?***

No Impact. There are no private airstrips within the vicinity of the project site. The closest airport to the project site is the McClellan Palomar Airport located approximately 4.6 miles west of the site. The project site is not located within the boundaries of the land use plan adopted for this airport. Therefore, no Impact would occur.

2.14 Population and Housing

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
XIV. POPULATION AND HOUSING – Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☒	☐

a) ***Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?***

Less-than-Significant Impact. The proposed project consists of demolition of 63,484 square feet of existing (primarily vacant) restaurant uses on site, and re-development of 202 multifamily residential units and 10,400 square feet of commercial retail uses on the 10.5-acre project site (Figure 3, Conceptual Site Plan).

As of 2022, the City has a persons per household ratio of 3.01 (DOF 2022). (DOF 2022). Using this household ratio of 3.01, development of 202 residential dwelling units at the project site would accommodate approximately 608 people. Although not all residents of the development would be new to the City of

San Marcos, residential development on the project site would result in unplanned growth for the City because residential development within the project site was not accounted for in the City's General Plan.

However, development of the project would not directly induce further population growth in the area. The area surrounding the project site is already developed with commercial and residential uses, and the proposed project site is currently developed with existing access roads and utility service. Therefore, no indirect impacts associated with the extension or construction of roads or expansion of public utilities are expected to occur as a result of the proposed project.

The City of San Marcos is forecasted to grow from 98,915 persons in 2020 to 109,095 persons in 2035, which is a population increase of 10,180 (SANDAG 2013). Additionally, SANDAG allocated 3,116 housing units to the San Marcos area for the 2021–2029 Housing Element Cycle (SANDAG 2020). Approval of the proposed project would accommodate the substantial population growth projected to occur within the City and the need for housing.

The proposed project would be subject to compliance with the City's General Plan Housing Element goals and policies and compliance with housing-related ordinances in the SMMC, and would be subject to applicable development fees, as outlined below.

The City's Growth Management Ordinance (SMMC Chapter 20.315) was adopted to implement the General Plan and to manage the projected growth of residential, industrial, and commercial development. The ordinance requires that all new development bear the cost of providing the public facilities and services needed to effectively serve the new development. The Growth Management Ordinance does not limit density of development or cap the number of residential building permits that can be issued within the planning period. To the contrary, the ordinance will ensure that public facilities and services are, or will be, provided to serve future residential development anticipated by the Regional Housing Needs Assessment.

The City's Inclusionary Housing Ordinance, established in May 2000, requires housing developers of one or more units to contribute to housing for extremely low, very low-, low-, and moderate-income households as defined by the U.S. Department of Housing and Urban Development. Developers of for-sale single-family projects and rental projects of six or fewer units may pay an in-lieu fee in accordance with SMMC Section 20.310.050. In-lieu fees are deposited into an interest-accruing account to provide housing opportunities for target households. The City has the discretion to accept an irrevocable dedication of land or other non-monetary contribution that is not less in value than the otherwise required in-lieu fee if the non-monetary alternative furthers the goals and policies of the Housing Element.

The City of San Marcos charges fees to process plans submitted for residential projects and to finance the provision of important services that are needed to accommodate housing and population growth. Fees and exactions are used to finance public facilities, roadways, water and sewer infrastructure, schools, and other community services. Nearly all of these fees are assessed through a pro rata share system, based on the magnitude of the project's impact or the extent of the benefit that will be derived. The City's fees have not been found to act as a constraint to the development of housing in San Marcos. For new residential projects, developers in San Marcos may be required to pay one or more of the following fees depending on the location, type, and size of the project: Planning, Building and Environmental Fees; City Impact Fees; and Regional Impact Fees (City of San Marcos 2021).

In summary, implementation of the project would change the site's land use designation and zoning from Light Industrial (L-I) and Mixed-Use 1 (MU-1) to Specific Plan Area (SPA) in a manner that would accommodate development of 202 residential units, 10,400 square feet of commercial use, and associated open space amenities and parking. The project would generate housing anticipated to accommodate approximately 608 people, in a location where housing was not previously accounted for by the City. However, based on existing growth projections and the need to provide housing opportunities to accommodate projected growth, the proposed project would not induce substantial unplanned population growth in the City. Additionally, the portion of the project site with an existing MU-1 zoning has a development capacity of 266 units (20–30 dwelling units per acre), which is more than the 202 units proposed under the project. Further, because the proposed project site is currently developed with existing access roads and utilities, no indirect impacts associated with the extension or construction of roads or expansion of public utilities are expected to occur as a result of the proposed project. As the proposed project would be required to comply with City regulations and applicable fees outlined above, impacts associated with the proposed project are determined to be less than significant.

*b) **Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?***

Less-than-Significant Impact. The project site is currently developed with commercial uses and associated parking. The site does not include any existing residences. Implementation of the proposed project would displace existing restaurants (most of which are vacant) but would not displace any existing housing or necessitate the construction of replacement housing elsewhere. Impacts are determined to be less than significant.

2.15 Public Services

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
XV. PUBLIC SERVICES				
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:				
iv) Fire protection?	☐	☒	☐	☐
v) Police protection?	☐	☒	☐	☐
vi) Schools?	☐	☐	☒	☐
vii) Parks?	☐	☐	☒	☐
viii) Other public facilities?	☐	☐	☒	☐

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:

Fire protection?

Potentially Significant Unless Mitigated. Residential uses were not considered at the project site in the City's General Plan, and the land use change from Light Industrial (L-I) and Mixed-Use 1 (MU-1) to Specific Plan Area (SPA) to accommodate the proposed residential development could result in an increase in demand on SMFD. The proposed project would result in development of 202 residential dwelling units and 10,400 square feet of commercial uses. The proposed residential units are expected to house approximately 608 residents. The estimated generation of 608 residents is calculated based on an average of 3.01 occupants per household. The proposed project would increase the demand on SMFD resources in comparison to the existing development on site and that allowed under the current land use designation of Light Industrial and Mixed-Use. Although not all residents of the project would be new to the City, the estimated additional numbers of residents at the project site would increase the need for fire protection services related to routine fire and emergency medical calls and would increase the demand on SMFD Station 1, which would provide primary response to the project site; with SMFD Station 2 responding, as necessary.

The proposed project would be required to comply with the City's Development Services Fees outlined in SMMC Section 17.44.030. Payment of the Development Services Fees go towards City services, which include the Fire Protection District, to ensure adequate fire protection facilities are provided. In addition, the project would be required to annex into Community Facility District CFD 2001-01 (Fire and Paramedic) (mitigation measure MM-PS-1). This would offset the project's increase in demand for fire protection services. Furthermore, the project would be required to comply with any recommendations outlined in the Fire Response Technical Memorandum prepared for the project (Appendix L to this IS/MND). The Fire Response Technical Memorandum prepared for the project determined that both SMFD Stations 1 and 2 are well-within the City's time response goal for first-in fire engine and medic ambulance to the entire project site. Furthermore, the addition of approximately 1 call per 3.5 days anticipated as a result of the project is not considered a significant increase. This is modeled off a conservative approach of four persons per unit as described in the Fire Response Technical Memorandum. The project would not warrant construction of new fire facilities that could create physical impacts; therefore, with implementation of MM-PS-1, impacts would be less than significant.

MM-PS-1: Prior to the issuance of a grading permit, the applicant/developer/property owner shall submit an executed version of petition to annex into and establish, with respect to the property, the special taxes levied by the following Community Facility District: CFD 2001-01 (Fire and Paramedic).

Police protection?

Potentially Significant Unless Mitigated. The proposed residential development would develop 202 residential dwelling units, generating approximately 608 residents at the project site. Residential development at the project site would increase the demand on police protection services in comparison to the existing uses on site and uses allowed under the current land use designation due to the introduction

of residents. Although not all residents would be new to the City, the proposed project could increase the need for police protection services through routine police and emergency calls and could increase the demand on the San Diego County Sheriff's Department San Marcos Station, which would serve the project site. The San Marcos Station is located approximately 4-miles east of the project site.

Implementation of the proposed project would be expected to increase the frequency of emergency and non-emergency calls to the Sherriff's Department. However, over 100 deputies, volunteers, and professional staff serve the residents of the City. Law enforcement services include general patrol, criminal investigation, crime prevention, juvenile services, narcotics and gang investigations, communications and dispatch, and various management support services. Unlike fire services, which respond solely to emergencies, law enforcement services consist of patrolling large areas 24 hours a day, 365 days a year. Police units are continuously mobile, and service calls are responded to by the nearest available mobile unit. At the San Marcos Station, patrol deputies are assigned to a geographical "beat" area, allowing deputies to become familiar with citizens and problems within their "beats" (SDCSD 2023). Accordingly, service ratios and response times are anticipated to remain adequate with implementation of the proposed project. As such, the proposed project is not expected to affect police protection such that new or physically altered governmental facilities are needed.

Additionally, the proposed project would be required to comply with the City's Development Services Fees outlined in SMMC Section 17.44.030. Payment of the Development Services Fees funds needed City services, which include the Sheriff's Department. Furthermore, the project applicant/developer/property owner shall annex the site into the preexisting Community Facilities District for Police Services (CFD 98-02IA1) (mitigation measure **MM-PS-2**). Participation in the CFD will offset the cost of increases in necessary services resulting from implementation of the proposed project.

Therefore, while the proposed project would likely place a slight increase in demand on police protection services, it is not anticipated that the proposed project would result in the need for construction or expansion of existing police facilities and impacts to police protection resulting from the proposed project would be less than significant with implementation of MM-PS-2.

MM-PS-2: Prior to the issuance of a grading permit, the applicant/developer/property owner shall annex the site into the preexisting Community Facilities District for Police Services (CFD 98-02IA1).

Schools?

Less-than-Significant Impact. Primary education throughout the City is served by the San Marcos Unified School District (SMUSD). La Mirada Academy (serving grades K-8) and San Marcos High School (serving grades 9-12) are the schools within SMUSD that would be expected to serve grade-school residents at the project site. Using the SMUSD student generation rates as described in the City's General Plan – Land Use and Community Design Element (elementary students = 0.2271, middle school students = 0.0963, high school students = 0.1032), the proposed project would generate approximately 46 elementary school students, 19 middle school students, and 21 high school students, respectively (City of San Marcos 2012a).

Prior to project approval, the project would be required to obtain will-serve letters from the SMUSD or servicing schools to confirm such schools have adequate capacity. Furthermore, the project would be required to contribute development fees to SMUSD pursuant to California Education Code Section 17620

et seq. and Government Code Sections 65995(h) and 65996(b), and the SMMC Section 17.52.050. The project developer/applicant would be required to pay the school mitigation fees that are in effect at the time of building permit issuance unless a direct agreement otherwise has been made with SMUSD. The current school fee for residential development required by SMUSD is $4.44 per square foot; however, this fee amount could change between the drafting of the CEQA document for the project and the time of building permit issuance (SMUSD 2020). Further, consistent with General Plan Policy LU-11.2, the project would be required to provide a letter from the school district(s) to the City prior to the issuance of building permits confirming these fees have been paid (City of San Marcos 2012a). SB 50 states that the fees imposed by school districts shall constitute the exclusive method of considering and mitigating impacts on school facilities caused by a development project. Such payment shall provide "full and complete mitigation of the impacts of any legislative or adjudicative act…on the provision of adequate school facilities" (Government Code Section 65995(h)). As such, with contribution of required development fees, impacts to schools as a result of the proposed project would be less than significant.

Parks?

Less-than-Significant Impact. As previously described, the proposed project would develop 202 residential dwelling units, generating approximately 608 residents. This increase in residents would increase demands for neighborhood and regional parks and other recreational facilities. The City requires any project that increases the demands for park and recreation needs to pay into the City's Public Facility Fees (PFF). This fee is to be used for developing public neighborhood parks, regional parks, and recreational facilities, as outlined in the City's Park Master Plan Update (City of San Marcos 2018). The provision of useable common open space, private open space, and payment of the PFF would maintain the City's service standard for parks within the City.

The site would be linked together through a series of landscaped promenades and paseos that not only facilitate pedestrian and bike connectivity but create public spaces for people to congregate. The pedestrian connections would be punctuated with social gathering nodes and opportunities for public art. The project includes development of a 1.1-acre public park. The north and south connecting paseo would link to the public park in the northeast portion of the Specific Planning area (Figure 5, Conceptual Public and Private Park Plan). The public park design was developed through a series of public workshops, during which multiple amenities were explored with the community. Based on the public workshops, the public park would include bench seating and tables, pergola, wayfinding signage, four standard pickleball courts with bleacher seating, a playground with rubber surfacing and play equipment, connecting walkways, a passive lawn area with amphitheater seating and hillside seating, and restroom facilities. The project would also provide for HOA-maintained public gathering spaces on site, including a barbeque area with benches and tables, and a public dog park separated into two areas for large breed dogs and small breed dogs.

Implementation of the 1.1-acre public park would offset the project demand on surrounding recreational facilities in the City. Development of the public park has been analyzed throughout this IS/MND as part of the project. Development of the public park on-site would not result in significant environmental impacts, and impacts are determined to be less than significant.

Other public facilities?

Less-than-Significant Impact. The proposed project would develop 202 units, generating approximately 608 residents at the project site. Although not all of these residents would be new residents to the City, the

generation of residents at the project site would increase the demands on library services and resources in comparison to the project site's current development and land use designations. However, additional library services are available in the County through a cooperation of County libraries, independent city libraries, and the Imperial County Library, which collectively form the Serra Library System. This system enables County library cardholders to check out library materials from the other Serra member libraries (Serra Cooperative Library System 2023). In addition, community members can purchase a community borrower card to obtain borrowing privileges at the California State University San Marcos campus.) Community members can also borrow materials at Palomar Community College with a valid picture ID and proof of current mailing address. These additional library resources are located in the San Marcos community and provide over 200,000 square feet of additional library space. Therefore, impacts to other public facilities in the City as a result of the proposed project would be less than significant.

2.16 Recreation

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
XVI. RECREATION				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☒	☐
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☒	☐

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

and

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?

Less-than-Significant Impact. According to the California Department of Finance (DOF), there are approximately 3.01 persons per housing unit in San Marcos (DOF 2022). The project involves development of 202 residential dwelling units, which is estimated to generate approximately 608 residents using the Department of Finance's 3.01 persons per household unit estimate (see Section 3.12, Population and Housing). This increase in residents would increase demands for neighborhood and regional parks and other recreational facilities. The City of San Marcos provides over 290 acres of park land with 24 community parks, 13 neighborhood parks, and 3 recreation centers. Additionally, the City provides over 72 miles of trail network for hiking, biking, running and equestrian use (City of San Marcos 2022b). The closest park to the project site is Bradley Park located approximately 0.5 miles northwest.

In addition to private balcony/patio space for each residential unit, the project would allot 20% of the site as common open space area for residents. The project would be required to comply with SMMC requirements, which outline recreation and open space requirements of residential development. In addition, the project would be required to pay the City's Public Facility Fees (PFF), required to all projects that increase the demand for park and recreation needs in the City. The PFF money would go towards the acquisition and development of local and community park facilities throughout the City to offset the demand on public park space, as described in SMMC Chapters 17.36 and 17.44. Payment of the PFF shall be made prior to City issuance of the first building permit for the project. Therefore, payment, which would ultimately contribute to development of new parks and recreational facilities, would offset the increase in demand of parks and recreational facilities generated by residential development at the project site, such that existing facilities would not substantially deteriorate.

Furthermore, as described in Section 2.15 above, the project includes development of a 1.1-acre public park that would be publicly owned and maintained. The north and south connecting paseo would link to the public park in the northeast portion of the Specific Planning area (Figure 5, Conceptual Public and Private Park Plan). The public park design was developed through a series of public workshops, in which multiple amenities were explored with the community. Based on the public workshops, the public park would include bench seating and tables, pergola, wayfinding signage, four standard pickleball courts with bleacher seating, a playground with rubber surfacing and play equipment, connecting walkways, a passive lawn area with amphitheater seating and hillside seating, and restroom facilities. The project would also provide for HOA-maintained public gathering spaces on site, including a barbeque area with benches and tables, and a public dog park separated into two areas for large breed dogs and small breed dogs.

Implementation of the 1.1-acre public park would further offset the project demand on surrounding recreational facilities in the City. Development of the public park on site would not result in significant environmental impacts. Therefore, proposed project impacts to existing neighborhood and regional parks are determined to be less than significant.

2.17 Transportation

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
XVII. TRANSPORTATION – Would the project:				
a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?	☐	☒	☐	☐
b) Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?	☐	☐	☒	☐
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☒	☐
d) Result in inadequate emergency access?	☐	☐	☒	☐

Intersecting Metrics prepared a Local Transportation Assessment (LTA) and a Vehicle Miles Traveled (VMT) Impact Analysis, which are included as Appendices I and J to this IS/MND, respectively. The analysis herein is based on findings of Appendices I and J. Full details regarding traffic and transportation as it relates to the project can be found in Appendices I and J.

a) Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?

Potentially Significant Unless Mitigated. The project site is located in an urban part of the City with numerous bicycle, pedestrian, and transit facilities. Class II bike lanes and pedestrian sidewalks are generally provided throughout the area, with pedestrian crossings located at intersections surrounding the project site. The site is also served by existing transit. The site is located in an area with moderately high employment density given the surrounding commercial and light industrial land uses. The well-developed commercial area along West San Marcos Boulevard would serve the shopping and dining demand of future residents within easy walking distance. Schools, parks, and other facilities are also walkable/bikeable from the site. The project site is adjacent to bus stops with connections to Sprinter service at Palomar College Station.

The LTA prepared for the project (see Appendix I) analyzed Level of Service (LOS) methodology for the project. Per the City's LTA guidelines, the proposed project is considered having a substantial effect if the traffic from the proposed project causes an intersection currently operating at acceptable LOS A through D to operate at LOS E or F or adds 2 or more seconds to the average vehicle delay. If an intersection is already operating at LOS E, then the proposed project is considered to have a substantial effect if the proposed project adds 2 or more seconds to the average vehicle delay. To ensure the project does not affect the current flow of traffic and roads remain operational consistent with City standards, the project includes a number of off-site/roadway improvements. As outlined in Appendix I, all study area intersections are anticipated to operate at an acceptable LOS C or better during both the AM and PM peak hours, with the anticipated changes in the traffic patterns associated with the proposed project. Additionally, the reconfiguration of the western driveway on West San Marcos Boulevard from right-in/right-out only would eliminate the failing movement (the southbound left-turn out of the project site), resulting in much improved operations at the driveway (see Appendix I),

As outlined in Table 1 of Appendix I, implementation of the proposed project is anticipated to result in a net decrease of 4,665 daily trips, a net increase of 54 AM peak hour trips (-7 inbound; 61 outbound), as well as a net decrease of 355 PM peak hour trips (-257 inbound; -98 outbound).

Primary project access would be via West San Marcos Boulevard at the project's southern boundary. A secondary project access would be on the east from Via Vera Cruz via the alleyway heading west to the project. In alignment with the San Marcos Boulevard Multi-Way Complete Streets project outlined in the City's General Plan, the project would construct a modified center median along the project frontage on West San Marcos Boulevard. This would eliminate the left-turn ingress and egress movements at the western project driveway but allow continued left-turn ingress for the existing driveway on the south side of West San Marcos Boulevard. The project would also move the existing northern curb line along West San Marcos Boulevard approximately 16 feet into the project site, with additional public street easement dedications, to accommodate the proposed multi-way roadway improvements. Furthermore, the project would implement a raised curb median along its frontage on West San Marcos Boulevard, which would separate the multi-way facility from the through travel lanes on West San Marcos Boulevard. These improvements would be non-vehicular capacity enhancing. As part of the multi-way improvements, the

project would reconstruct the existing sidewalk along its frontage, which would be constructed to City standards and would be ADA compliant. The project would replace and enhance the existing Class II bike lane along San Marcos Boulevard, as the project would remove and replace the existing bike lane with a buffered bike lane as part of the multi-way improvements.

Based on the final multi-way design, the existing San Marcos Boulevard and Via Vera Cruz bus stop, located on the northwest corner of the West San Marcos Boulevard/Via Vera Cruz intersection, may be moved slightly in comparison to existing conditions, if moved at all. However, this change, would not substantially change the bus stop spacing along the route and would have minimum to no impact on the route's operations. The existing amenities at the bus stop would be replaced in kind to current conditions with additional new amenities being implemented for the relocation of bus stop.

Project development would result in the removal of 822 existing parking spaces that currently serve the Restaurant Row site, within the project boundaries. The project would remove 7 spaces that currently serve the Buffalo Wild Wings sites to accommodate the implementation of the multi-way along San Marcos Boulevard. The proposed project would provide 501 parking spaces on site, with 392 private garage spaces being reserved for project residents and 109 spaces being open to guests, retail patrons, park users, and other uses within the shopping center. The project would provide 4 EV charging stations and 17 EV ready stalls on-site and would install charging stations in all garage parking stalls. The project would also include four ADA parking stalls as part of the proposed parking, and one ADA van accessible space. The parking requirements for each land use proposed was derived from the requirements outlined in SMMC Section 20.340.

Although this analysis determines that the project would not result in any direct traffic related impacts, the project would contribute to City-wide traffic resulting in potential cumulative impacts. Prior to issuance of a grading permit, application for annexation into Community Facility District CFD2011-01 (Congestion Management) shall be required to mitigate these impacts (mitigation measure **MM-TR-1**).

With the inclusion of the off-site/roadway improvements and parking plans, implementation of the project would not conflict with applicable plans, such as SANDAG's San Diego Forward 2021 Regional Plan, City of San Marcos Bikeway Master Plan, City of San Marcos General Plan Mobility Element, or the SMMC. Therefore, with implementation of MM-TR-1, impacts are determined to be less than significant.

MM-TR-1: Prior to the issuance of a grading permit, the applicant/developer/property owner shall submit an executed version of petition to annex into and establish, with respect to the property, the special taxes levied by the following Community Facility District: CFD2011-01 (congestion management).

b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

Less-than-Significant Impact. CEQA Guidelines Section 15064.3 replaces LOS with VMT as the appropriate metric to be used in assessing a project's transportation related impacts. Under CEQA Guidelines section 15063.4(b)(1), VMT exceeding an applicable threshold of significance may indicate a significant impact, although development projects within 0.5 miles of a major transit stop are presumed to cause a less-than-significant transportation impact. A "major transit stop" includes a site containing an existing rail or bus rapid transit station, or the intersection of two or more major bus routes based on frequency of service intervals. (Public Resource Code section 21064.3.)

The North County Transit District provides public transportation within the City and the County of San Diego for Coaster rail service, Sprinter light rail service, and Breeze bus service. Sprinter service operates between Escondido and Oceanside, with connections to I-5 and the Coaster rail service operating out of the City of Oceanside. The North County Transit District operates the Palomar College Station Sprinter and Breeze transit station located approximately 0.8 miles north of the proposed project. Therefore, the project site falls just outside the 0.5-mile threshold under CEQA Guidelines Section 15064.3 subdivision (b). However, it should be noted that a Breeze bus service stops along West San Marcos Boulevard and Via Vera Cruz along the project site's southern border. As described in the project description above, based on the final multi-way design, the existing San Marcos Boulevard and Via Vera Cruz bus stop, located on the northwest corner of the West San Marcos Boulevard / Via Vera Cruz intersection, will be relocated in conjunction with the installation of improvements to San Marcos Blvd. This would not substantially change the bus stop spacing along the route and would have minimum to no impact on the route's operations. The existing amenities at the bus stop would be replaced in kind to current conditions with additional new amenities (such as an upgraded bench and shelter) being implemented for the relocation of bus stop.

Because the project site is located just beyond 0.5 miles from a major transit stop, and in compliance with the City's Transportation Impact Analysis Guidelines (TIAG; City of San Marcos 2020b), a quantitative VMT analysis was prepared for the project and is included as Appendix J to this IS/MND. As outlined in Appendix J, Section 2.1.3 of the City's TIAG, identifies the impact thresholds that should be applied to the different types of land development projects within the City. Since the proposed project would be replacing existing land uses, it is considered a redevelopment project; therefore, the following impact threshold was applied to identify VMT related impacts:

> Redevelopment Projects (Replaces Existing Uses) – As noted in Section 2.1.3.2 of the TIAG, per CEQA, a redevelopment project that replaces existing uses and results in a net decrease in VMT can be presumed to have a less-than-significant transportation impact and would not require a detailed VMT analysis; a redevelopment project that replaces existing uses and results in a net increase in VMT will require a VMT analysis. This should be calculated by estimating the total VMT for the previous and proposed land uses using SANDAG trip generation rates and citywideaverage trip lengths from the California Household Travel Survey (CHTS). If a project replaces existing uses and the project leads to a net overall increase in VMT compared to the previous uses, then the appropriate metrics and thresholds should be applied to each proposed use. If the project is a mixed-use project, then internalization should be considered when estimating its total VMT and each component's trip generation should be multiplied by its respective trip length; if the project results in a net increase in VMT, then each individual use should be analyzed under its respective threshold. In addition, the proposed land uses should be analyzed without incorporating a credit or reduction for the displacement of existing land uses at the project site.

Table 2 in Appendix J calculates the VMT the project is anticipated to generate and compares it to the VMT generated by the current uses on the project site. As shown in Table 2 in Appendix J, the project is projected to generate 10,407 VMT, which is 23,809 VMT less than the existing Restaurant Row uses, which were calculated to generate 34,216 VMT. Therefore, as per Section 2.1.3.2 of the City's TIAG, implementation of the project would result in a less-than-significant impact related to VMT.

c) Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less-than-Significant Impact. The project site is located in an urban area of the City bounded by West San Marcos Boulevard to the south, and existing commercial and light industrial uses to the north, east, and west. Under existing conditions, site access is provided from two points off West San Marcos Boulevard at the southern boundary of the project site. The project will similarly be served by two driveways located off West San Marcos Boulevard. All proposed circulation improvements would be designed in accordance with the City's roadway design standards to ensure proper safety requirements are met. The internal circulation network for the project would not include any hazardous design features or incompatible uses. All driveways would provide for full turning movements and provide for adequate emergency access. The project would include circulation amenities such as an interconnected mobility system for bicycles, pedestrians, and vehicles in order to provide residents with safe movement within the project site; connections to existing roadways within the vicinity of the project site; and access to regional arterial and highway networks and Sprinter/Breeze transit services. All final project plans are subject to review and approval by the City and the SMFD, and all roadway improvements implemented as part of the project would be designed consistent with City policy and guidelines.

As described in response to Threshold a) above, in alignment with the San Marcos Boulevard Multi-Way Complete Streets project outlined in the City's General Plan, the project would construct a modified center median along the project frontage on West San Marcos Boulevard. This would eliminate the left-turn ingress and egress movements at the western project driveway but allow continued left-turn ingress for the existing driveway on the south side of West San Marcos Boulevard. The project would also move the existing northern curb line along West San Marcos Boulevard approximately 16 feet into the project site, with additional public street easement dedications, to accommodate the proposed multi-way roadway improvements. Furthermore, the project would implement a raised curb median along its frontage on West San Marcos Boulevard, which would separate the multi-way facility from the through travel lanes on West San Marcos Boulevard. These improvements would be non-vehicular capacity enhancing. As part of the multi-way improvements, the project would reconstruct the existing sidewalk along its frontage, which would be constructed to City standards and would be ADA compliant. The project would replace and enhance the existing Class II bike lane along West San Marcos Boulevard, as the project would remove and replace the existing bike lane with a buffered bike lane as part of the multi-way improvements.

Furthermore, considering the proposed residential uses for the project site, no incompatible uses, such as farm equipment or motorsport vehicles, would be operated on site during project construction or operation. As such, impacts related to design features and incompatible uses would be less than significant.

d) Would the project result in inadequate emergency access?

Less-than-Significant Impact. The proposed project would have four primary access points, which include the two unsignalized driveways on West San Marcos Boulevard, and two unsignalized driveways on Via Vera Cruz (the existing northern and southern Restaurant Row driveways). The western driveway on West San Marcos Boulevard would be converted from full-access to right-in-right-out access only. The northern driveway on Via Vera Cruz would connect to the existing east–west roadway that traverses through the existing Restaurant Row site and the Regal Edwards San Marcos theater lot and connects to South Las Posas Road. The project site would have access to the driveway on South Las Posas Road, but it is anticipated to serve a negligible amount of project trips as it would be a circuitous path for people accessing

the project site from the east or north. All driveways would provide for full turning movements and would be designed to meet the design requirements codified in the California Fire Code. Additionally, adequate corner and stopping site distances would be maintained at all driveway locations.

According to the General Plan Safety Element, the San Marcos EOP governs the operations of the City during a disaster. This plan addresses response to moderate evacuation scenarios, including the identification of evacuation points and general routes (City of San Marcos 2012a). The project would be required to abide by standards as set forth in the San Marcos EOP. Implementation of the project would not impact any roadway or staging areas that are identified in any emergency planning documents and would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Additionally, a Fire Response Technical Memorandum has been prepared for the project, which includes recommendations related to emergency access and fire hazards and confirms project compliance with existing response time standards.

Furthermore, the California Fire Code, along with the SMFD, administers the rules and regulations on fire access design. Final site plans will be required to show fire and emergency responders suitable fire access roads dimensions and surfaces (California Fire Code Chapter 5, Sections 503.1 through 503.4), an adequate number of emergency rated entrances to the community (Appendix D; California Fire Code Section D106), and entryway gate access for first responders (California Fire Code Chapter 5, Section 503.6). All final project plans and the VMT Analysis prepared for the proposed project are subject to review and approval by the City and the SMFD. Proposed circulation improvements would be designed in accordance with the City's roadway design standards to ensure proper safety requirements are met (City of San Marcos 2019). Therefore, it impacts related to emergency access would be less than significant.

2.18 Tribal Cultural Resources

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
XVIII. TRIBAL CULTURAL RESOURCES				
Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	☐	☐	☒	☐

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?	☐	☒	☐	☐

a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

Less-than-Significant Impact. As described under Section 2.5 of this IS/MND, the records search conducted for the project identified 25 cultural resources within the 1-mile search radius outside the project site. None of the identified resources occur within the project site. The project site consists entirely of Urban/Developed land cover type, consisting of commercial retail and paved parking lots, with associated minor ornamental landscaping and structures. Although there are existing structures on site, none are designated historical resources. Therefore, the project would not adversely affect Tribal Cultural Resources that are listed or eligible for listing in the state or local register. Impacts would be less than significant.

ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

Potentially Significant Unless Mitigated. Under California's AB 52, Tribal Cultural Resources are defined as archaeological resources that are eligible for or listed in the California Register of Historical Resources, or resources that the lead agency determines to be a Tribal Cultural Resource with a substantial burden of evidence. Considering the developed nature of the existing site, the discovery of Tribal Cultural Resources on-site are not anticipated. To date, no Tribal Cultural Resources have been identified on the project site that would be impacted by project implementation. However, tribal consultation with the City is ongoing, and outreach letters to all Native American group representatives included on the Native American Heritage Commission contact list were mailed out on June 30, 2022, as part of preparation of the Cultural Resources report to be completed for the project. To date, four Tribes have requested consultation, including San Luis

Rey Band of Mission Indians on July 14, 2022; San Pasqual Band of Mission Indians on September 19, 2022; Rincon Band of Luiseño Indians on September 21, 2022; and Campo Band of Mission Indians on October 3, 2022. The City conducted consultation meetings with representatives of the San Luis Rey Band of Mission Indians on November 17, 2022; January 12, 2023; and February 16, 2023. Consultation with the San Luis Rey Band of Mission Indians concluded on April 16, 2023. The City conducted consultation meetings with representatives of the Rincon Band of Luiseño Indians on August 19, 2022, and December 20, 2022, with consultation concluding on December 21, 2022. Both the San Luis Rey Band of Mission Indians and Rincon Band of Luiseño Indians concluded formal consultation with the understanding that the project would implement the City's standard Tribal Cultural Resource mitigation measures. The project would implement these mitigation measures as outlined under MM-CUL-1 through MM-CUL-4 in Section 2.5. The City held one consultation meeting with the San Pasqual Band of Mission Indians on May 11, 2023. A consultation close-out letter was requested by the City on May 15, 2023. On October 18, 2023, the City notified the Campo Band of Mission Indians by letter of the opportunity to consult on the project. On October 3, 2022, the City received an emailed request from the tribe's Cultural Resources Manager, Daniel Tsosie, to consult under Senate Bill 18. The City transmitted the cultural resources report to Campo on October 18, 2022, and subsequent attempts to communicate with the tribe were not successful. The City attempted again on April 20 and July 24, 2023, to which the tribe did not respond or provide information on tribal cultural resources. Therefore, in accordance with Section 21082.3.(d)(2) of the Public Resources Code, which states that the tribe had requested consultation but failed to provide comments to the City, or otherwise failed to engage in the consultation process, the City concluded consultation with Campo on August 15, 2023.

While considered unlikely based on the current developed state of the project site, and other information received by the City to date, there remains the potential for the project to encounter previously unknown and unanticipated Tribal Cultural Resources during construction of the proposed project. In the unlikely event that construction encounters unanticipated archaeological resources, mitigation measures MM-CUL-1 through MM-CUL-4 would be implemented, as outlined in Section 2.5 above. With the implementation of MM-CUL-1 through MM-CUL-4, impacts related to Tribal Cultural Resources would be less than significant.

2.19 Utilities and Service Systems

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
XIX. UTILITIES AND SERVICE SYSTEMS – Would the project:				
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☐	☐	☒	☐
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?	☐	☐	☒	☐

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
c) Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☒	☐
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☐	☐	☒	☐
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☒	☐

VWD prepared a Water and Sewer Study for the project, which is included as Appendix K to this IS/MND. The analysis herein is based on findings of Appendix K. Full details regarding water and sewer service as it relates to the project site can be found in Appendix K.

a) ***Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?***

Less-than-Significant Impact. The proposed project development would be served by VWD. Multifamily residential sites in the VWD are typically served by on-site private water systems, which consist of separate fire and domestic systems on site. Private fire systems typically supply on-site fire hydrants and building fire sprinkler systems and require a backflow preventer at the connection to the public water system. There are existing water facilities in the vicinity of the project site which serve the existing on-site and surrounding uses.

Water service for potable residential use and fire service to the project site would be provided by VWD. VWD receives its water from the San Diego County Water Authority (Water Authority). The Water Authority is San Diego County's predominant source of water, supplying from 75% to 95% of the region's water needs (Water Authority 2016). The population within the Water Authority's service area was approximately 3.3 million people in 2020 and is projected to increase to roughly 3.8 million people by 2045. The County of San Diego is expected to develop an additional 130,000 acres between 2020 and 2050, with the majority (125,000 acres) of development dedicated to residential land uses. These regional growth projections are based on the SANDAG Series 14 Regional Growth Forecast, developed for its 2019 Federal Regional Transportation Plan, which was adopted by SANDAG's Board of Directors on October 25, 2019. In fiscal year 2020, total water demand in the Water Authority's service area was 463,128 acre-feet, of which 92% was for municipal and industrial use and 8% was for agricultural water use. By 2045, the Water Authority's total water demands are projected to reach 630,771 AF. This projection accounts for planned future water conservation savings (Water Authority 2016).

VWD prepared a Sewer and Water Study for the proposed project in January 2023 (Appendix K), which determined adequate utility service, including water and wastewater, is available for the project. The entire project site lies within VWD's 855 Pressure Zone. As described in Appendix K, the proposed project would increase the projected average water demand from the 2018 Master Plan land use (Mixed Use 1 and Light Industrial) by 45,810 gallons per day.

An existing 6-inch water main and existing 14-inch water main are in San Marcos Boulevard along the project frontage. There is also an existing 12-inch water main along the alley way on the north end of the property within the VWD easement, as well as an existing 8-inch water main in the alley way that connects to Via Vera Cruz. Both the 14-inch and 12-inch water mains are in the 920-pressure zone and are not available for new service connections. Appendix K found that the project did not create any distribution system deficiencies under average day demand but did under maximum day plus fire flow demand conditions. This would require that all water services to the site be connected to a new 10-inch water main installed north of the project site in Alley Way and that existing facilities be upsized to 10 inches. Additionally, the analysis found that water storage capacity is currently available to serve the project's increased storage requirements. Master Plan projects address and accommodate the ultimate buildout storage deficiency, and Water Capital Facility Fees paid by the project would be used for the increase in storage necessitated by the project's demand.

The proposed project site lies completely within VWD sewer shed 30C. Similar to water demand, the proposed project would increase the projected average wastewater generation from the 2018 Master Plan land use by 33,594 gallons per day. However, as shown in Appendix K, the modeling results showed that no deficiencies were identified under the currently approved density under peak wet weather flows during ultimate buildout conditions. Similar to water, the project would extend future sewer facilities on the north end of the project property in the Alley Way within the VWD easement, including construction of approximately 1,541 feet of 8-inch PVC sewer main into the project site.

As described in Appendix K, VWD currently has water and sewer capacity available to serve the project as proposed with project implementation of the conditions outlined in Appendix K. The project would comply with the recommendations and conditions outlined in the VWD Water and Sewer Study (Appendix K).

The project site lies within an existing 100-year floodway and floodplain, just downstream of the San Marcos Creek highway 78 Splitflow. Under existing condition, the project area consists of commercial development with a large parking lot area and a number of restaurants. The project site generally drains towards the center, towards the middle of the large parking lot. Surface drains along the project site collect site runoff and convey the runoff in an existing 30-inch pipe that runs west through the project site. This 30-inch pipe connects a 36-inch x 60-inch elliptical pipe in Via Vera Cruz upstream and an existing concrete channel west of the site downstream. San Marcos Creek is located approximately 1,000 feet southwest of the project site, downstream of the project outfall point.

In proposed conditions, a public park would be implemented in the existing floodway with a variety of amenities tolerant of inundation. The proposed site would allow for opportunity to program special events for the community. In addition, a smaller residential park is proposed just south and out of the floodway, in order to provide playground structures for children of different age groups. The site design is intended to minimize floodway encroachments and results in minor changes to the existing condition 100-year water surface elevations. The on-site drainage improvements in proposed conditions would consist of private streets, gutters, and curb inlets that tie into underground storm drain systems. The project would upsize

the existing 30-inch public storm drainpipe that conveys the majority of the site to a double 36-inch storm drain pipe with a new alignment, that would ultimately transition to a dual RCB before it discharges to the existing concrete channel. In addition, the project would construct some public improvements and street widening along the project frontage. These public improvements include center median improvements, and a new frontage road median for the multi-way frontage road in West San Marcos Boulevard. The proposed drainage patterns would be relatively the same as in existing conditions, and the site would generally drain towards the existing 100-year floodway and drain to the west towards the existing concrete channel. The project would implement all BMPs outlined in the project's SWQMP.

SDG&E would provide electric power service to the project. Any proposed aboveground transformers and electrical facilities that solely service the project site would be placed on site and not within the City's right-of-way. At full buildout, the project's operational phase would require electricity for building operations (appliances, lighting, etc.). In addition, the project would be required to comply with the 2022 Title 24 standards or the most recent standards at the time of building permit issuance. The energy-using fixtures within the project would likely be newer technologies, using less electrical power. Therefore, impacts associated with electrical power facilities would be less than significant.

SDG&E would provide natural gas. The project would comply with 2022 Title 24 building energy efficiency standards, reducing energy used in the state. Based on compliance with Title 24, the project would generate a need for natural gas that is consistent with multifamily homes, commercial and office uses. Therefore, impacts associated with natural gas facilities would be less than significant.

The City is served by multiple telephone service providers. Since the project site is in an urbanized area and is nearby other residential uses, there are existing telecommunication facilities that would be able to serve the project site, including Cox Communications and AT&T. Once the project is completed, the residents of the project would be able to connect to existing telecommunication services without the need for expansion or construction of new facilities.

In summary, development of the project would not require relocation or any new substantial construction of utility facilities, and impacts would be less than significant.

b) Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?

Less-than-Significant Impact. As described above, the entire project site lies within VWD's 855 Pressure Zone. As described in Appendix K, the proposed project would increase the projected average water demand from the 2018 Master Plan land use (Mixed Use 1 and Light Industrial) by 45,810 gallons per day.

According to the City's General Plan, the VWD receives its water from MWD, which imports water from the Colorado River and Northern California (City of San Marcos 2012b). MWD obtains water from local sources as well as the Colorado River, via the Colorado River Aqueduct, and the Sacramento-San Joaquin Delta, via the State Water Project. MWD's Urban Water Management Plan (UWMP) documents the availability of these supplies to meet future demands. With a projected annual water demand of 4,925,000 acre-feet per year for 2025, the MWD UWMP concludes that, with implementation of required conservation measures, MWD has supply capabilities sufficient to meet expected demands through 2045 under normal, single dry, and multiple dry water years (MWD 2021). The Water Authority is the largest member agency of MWD. The Water Authority's 2020 UWMP was approved on May 27, 2021. The Water Authority's mission is to provide

a safe and reliable supply of water to its 24 member agencies serving the San Diego region, which includes VWD, and is San Diego County's predominant source of water, supplying from 75% to 95% of the region's water needs (Water Authority 2021).

Additionally, the analysis in Appendix K found that water storage capacity is currently available to serve the project's increased storage requirements. Master Plan projects address and accommodate the ultimate buildout storage deficiency, and Water Capital Facility Fees paid by the project would be used for the increase in storage necessitated by the project's demand. Further, the project site would be developed in compliance with the California Green Building Code (CALGreen), which implements water efficiency standards for appliances and fixtures. Compliance with CALGreen would further reduce project water usage in combination with VWD and MWD's ongoing water conservation practices.

As concluded in Appendix K, VWD currently has water capacity available to serve the project as proposed, so long as the project implements the required conditions outlined in Appendix K, including construction of approximately 1,188 feet of new 10-inch PVC water main into the project site and replacement of approximately 714 feet of existing 8-inch ACP water main with new 10-inch PVC water main in the Alley Way. Additionally, the project would be required to pay all applicable Water Capital Facility Fees in affect at the time service is committed in accordance with VWD rules and regulations. Furthermore, VWD Construction and Board acceptance of all on-site and off-site water facilities would be required prior to service. Project compliance with all VWD requirements would ensure sufficient water supplies would be available to serve the project as proposed, and impacts would be less than significant.

c) Would the project result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Less-than-Significant Impact. Wastewater generated by the proposed project would be treated by the Meadowlark Water Reclamation Facility, which has a capacity of 5 million gallons per day, with a wet weather treatment capacity of 8 million gallons per day, and treats wastewater at 0.25 million gallons per day. Sewer facilities to serve the project would require the construction of private on-site sewer lines connecting to the public system at one or more locations. The applicant of the project would be required to pay all applicable Wastewater Capital Facility Fees in effect at the time service is committed in accordance with VWD rules and regulations. Acceptance by VWD of all wastewater facilities required to be constructed to service the project would also be required. With implementation of City and VWD requirements for sewer service, and considering the scope of existing and proposed infrastructure, the proposed project is not anticipated to exceed current capacities or significantly impact existing wastewater treatment systems.

As described above, the proposed project would increase the projected average wastewater generation from the 2018 Master Plan land use by 33,594 gallons per day. However, as shown in Appendix K, the modeling results showed that no deficiencies were identified under the currently approved density under peak wet weather flows during ultimate buildout conditions. Due to the extensive upgrades required to provide service to the project from facilities located in West San Marcos Boulevard and VWD's desire to remove flows from the already burdened sewer facilities, the District's preference is to extend future sewer facilities on the north end of the project property in the Alley Way within the VWD easement.

As outlined in Appendix K, VWD currently has sewer capacity available to serve the project as proposed, so long as the project implements the required conditions outlined in Appendix K, including construction of

approximately 1,541 feet of 8-inch PVC sewer main into the project site in the Alley Way. Additionally, the project would be required to pay all applicable Water Capital Facility Fees in affect at the time service is committed in accordance with VWD rules and regulations. Furthermore, VWD Construction and Board acceptance of all on-site and off-site sewer facilities would be required prior to service. Project compliance with all VWD requirements would ensure sufficient sewer service would be available to serve the project as proposed, and impacts would be less than significant.

d) Would the project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Less-than-Significant Impact. Demolition of the existing site and construction of the proposed project would result in the generation of solid waste such as scrap lumber, concrete, residual wastes, packing materials, and plastics. Operation of the proposed project would represent an increase in intensity of uses and generation of solid waste on the project site compared to existing conditions. Solid waste generated by the project would be serviced by EDCO, and solid waste would then be transferred to Sycamore Landfill. According to the California Department of Resources Recycling and Recovery (CalRecycle), the facility has a daily permitted capacity of 5,000 tons per day for solid waste. As of December 2016, the remaining capacity of Sycamore Sanitary Landfill is 147,908,000 cubic yards, or approximately 40 million tons, with an anticipated closure date of 2042. Further, four other landfills in the County accept municipal solid waste, including Borrego Landfill, Miramar Landfill, Otay Landfill, and Ramona Landfill (CalRecycle 2022).

The anticipated operational solid waste generation from the proposed project was estimated using CalRecycle's Estimated Solid Waste Generation Rates (CalRecycle 2019). It is estimated that the project (202 units) would generate approximately 2,470.46 pounds of solid waste per day (12.23 pounds per household). This does not consider any waste diversion through recycling. According to CalRecycle, the City of San Marcos has a disposal rate target of 8.9 pounds per person per day. If the City meets this target, the City is considered in compliance with the 50% diversion requirement of AB 939. The most recent data from CalRecycle identifies the annual per-capital disposal rate is 5.4 pounds per person per day (CalRecycle 2019). Thus, the City is exceeding their targets for diversion.

The project would be required to comply with applicable state and local regulations related to solid waste, waste diversion, and recycling at the time of development. Implementation of the proposed project is not expected to generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals, and impacts related to solid waste are determined to be less than significant.

e) Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Less-than-Significant Impact. The proposed project would be required to comply with all federal, state, and local statutes and regulations related to solid waste, diversion of waste, and recycling. All solid waste facilities, including landfills, require solid waste facility permits to operate. In San Diego County, Public Resources Code Sections 44001–44018 and California Code of Regulations Title 27, Division 2, Subdivision 1, Chapter 4 (Section 21440 et seq.) authorize the County Department of Environmental Health and Quality, Local Enforcement Agency to issue solid waste facility permits. Sycamore Sanitary Landfill is a permitted facility and EDCO is a licensed hauler. Lastly, beginning in 2022, SB 1383 requires every jurisdiction to provide organic waste collection services to all residents and businesses. Organic waste includes food, green material,

landscape and pruning waste, organic textiles and carpets, lumber, wood, paper products, and printing and writing paper. The project would provide trash, recycle, and organic waste bins throughout the project site for both residential and public use. For these reasons, and the reasons stated above, impacts related to solid waste as a result of project implementation would be less than significant.

2.20 Wildfire

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
XX. WILDFIRE – Would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☒	☐
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☒	☐
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☒	☐

Dudek prepared a Fire Response Technical Memorandum for the project which is included as Appendix L to this IS/MND. The analysis herein is based on findings of Appendix L. Full details regarding wildfire as it relates to the project can be found in Appendix L.

a) Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?

Less-than-Significant Impact. According to the General Plan Safety Element, the San Marcos EOP governs the operations of the City during a disaster. This plan addresses response to moderate evacuation scenarios, including the identification of evacuation points and general routes (City of San Marcos 2012a). The proposed project would be required to abide by the standards set forth in the San Marcos EOP. Implementation of the proposed project is not expected to impact any roadway or staging areas that are identified in any emergency planning documents and would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. As required under the California Fire Code, the proposed project would be required to present development plans which afford

fire and emergency responders suitable fire access roads dimensions and surfaces (California Fire Code Chapter 5, Sections 503.1 through 503.4), an adequate number of emergency rated entrances to the community (Appendix D; California Fire Code Section D106), and entryway gate access for first responders (California Fire Code, Chapter 5, Section 503.6). SMFD would review the proposed points of entry and private driveways, which would be required to meet the qualifications for emergency access to and from the project site. Furthermore, a Fire Response Technical Memorandum has been prepared for the proposed project (Appendix L) that outlines fire protection services and emergency response as it relates to development of the project. As outlined in Appendix L, both SMFD Stations 1 and 2 are well within the City's time response goal for first-in fire engine and medic ambulance to the entire project site. For these reasons, impacts are determined to be less than significant.

b) Due to slope, prevailing winds, and other factors, would the project exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

Less-than-Significant Impact. The proposed project site is located in a developed area of the City and is not located within or adjacent to a fire hazard severity zone. The redevelopment of the existing project site with proposed land uses would not exacerbate fire risk. The preliminary site plans and emergency access for the proposed project would be reviewed and approved by SMFD prior to development, and all project plans would be required to comply with the California Fire Code. It has been determined that the proposed project would not exacerbate wildfire risks, exposing occupants to pollutants; therefore, impacts would be less than significant.

c) Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

Less-than-Significant Impact**.** While the proposed project would require the installation of water sources and other underground utilities to connect to the City's existing infrastructure (refer to Section 2.19, Utilities and Service Systems), these would not exacerbate fire risks, as the proposed project is not located within or adjacent to a fire hazard severity zone, and these improvements would be constructed within an existing right-of-way or within the project site boundary. The project does not include any new overhead utility lines or construction of roads to serve the project site. The proposed project would not require the installation or maintenance of such infrastructure that would exacerbate fire risk, and therefore, impacts are determined to be less than significant.

d) Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

Less-than-Significant Impact. The project is not located in a fire hazard severity zone, and risk of wildfire is considered low within the project area due to the location within a relatively flat and highly urbanized area of the City. The Geotechnical Evaluation (Appendix E) also does not note any significant landslide risks based on the soil types. The project would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes. Therefore, impacts are determined to be less than significant.

2.21 Mandatory Findings of Significance

	Potentially Significant Impact	Potentially Significant Unless Mitigated	Less Than Significant Impact	No Impact
XXI. MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☐	☒	☐	☐
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☐	☒	☐	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☐	☒	☐	☐

a) ***Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?***

Potentially Significant Unless Mitigated. As outlined in the Biological Resources Letter Report prepared for the proposed project (Appendix B), the project site consists entirely of Urban/Developed land cover type, consisting of commercial retail and paved parking lots, with associated minor ornamental landscaping and structures. Urban/Developed refers to areas that have been constructed on or disturbed so severely that native vegetation is no longer supported. Urban development is present to the north, south, east, and west of the site. No natural land covers or potential habitat is located on or adjacent to the site, and the site does not contain any natural vegetation communities or land cover types that are known to provide habitat to any special-status wildlife species. Similarly, the site does not contain any natural vegetation communities of land cover types that are known to provide habitat to any special-status plant species. However, mitigation measure MM-BIO-1 is proposed in order to comply with the MBTA, and pre-construction

nesting bird survey(s) will be conducted if demolition or construction occurs within the nesting season (January 15 to August 31).

As described throughout this IS/MND, the project would not degrade the quality of the environment; would not substantially reduce the habitats of fish or wildlife species, would not cause a fish or wildlife population to drop below self-sustaining levels, would not threaten to eliminate a plant or animal, and would not eliminate important examples of major periods of California history or prehistory. The project includes implementation of MM-CUL-1 through MM-CUL-4 to address potential impacts related to discovery of archaeological resources.

The project would require the demolition of 63,484 square feet of existing (primarily vacant) restaurant uses on site. However, elements from the Old California Restaurant Row would be preserved and incorporated into the project design to create an old meets new aesthetic that celebrates the history of the site. The project is not anticipated to eliminate important examples of the major periods of California history or prehistory, and therefore, impacts are determined to be less than significant.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Potentially Significant Unless Mitigated. Implementation of the proposed project, when combined with other approved and proposed projects in the City and outlying areas, could potentially contribute to cumulative degradation of the environment as a result of potential impacts related to air quality, cultural resources, greenhouse gas emissions, hydrology and water quality, noise, public services, transportation, tribal cultural resources, and utilities and services systems. As analyzed throughout Section 2 of this MND, all potential impacts are determined to be less than significant, with the exception of impacts related to Biological Resources, Cultural Resources, Public Services, Transportation and Tribal Cultural Resources, which are determined to be less than significant with mitigation incorporated (MM-BIO-1; MM-CUL-1 through MM-CUL-4; MM-PS-1 – MM-PS-2; and MM-TR-1). All cumulative projects would be required to complete a similar environmental analysis and incorporate mitigation as necessary to reduce the potential for cumulative impacts.

Although cumulative impacts are always possible, the proposed project, by incorporating all mitigation measures outlined herein, would reduce its contribution to any such cumulative impacts to less than cumulatively considerable; therefore, the project would result in individually limited, but not cumulatively considerable, less-than-significant impacts with mitigation incorporated.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Potentially Significant Unless Mitigated. As evaluated throughout this IS/MND, with incorporation of mitigation identified herein, all environmental impacts associated with the project would be reduced to less-than-significant levels. Thus, the project would not directly or indirectly cause substantial adverse effects on human beings. Impacts would be less than significant with mitigation incorporated.

ZEV	zero emission vehicle

Executive Summary

The purpose of this technical report is to assess the potential air quality and greenhouse gas (GHG) emissions impacts associated with implementation of the proposed Restaurant Row Project (Project). This assessment utilizes the significance thresholds in Appendix G of the California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.).

Project Overview

The Project site is located at 1020 West San Marcos Boulevard on the northeast corner of West San Marcos Boulevard and Via Vera Cruz (APNs 219-200-30, 31, and 45). The proposed Restaurant Row Project (project) consists of demolition of 63,484 square feet (sf) of existing (primarily vacant) restaurant uses on-site, and re-development of 202 multi-family residential units and 10,400 sf of commercial retail uses on the 10.5-acre project site. Residential units would consist of eight (8) three-bedroom townhomes over commercial (town over commercial); 17 front street townhomes ranging in size from three- to four-bedrooms; 57 court townhomes ranging in size from two- to four-bedrooms; and 120 motor court units ranging in size from two- to three-bedrooms. The project would also incorporate a 1.1-acre neighborhood public park including dedicated dog areas, four tot lots, a rolling plaza (for roller skates/roller blades), skaters bowl, open lawn area and 4 pickleball courts. The park would not include an amphitheater or event space, and no outdoor amplified sound system is proposed. From the perspective of potential noise generation for the neighborhood park component, the pickleball courts represent the only potential noise source of concern.

The project includes a request for a Specific Plan, General Plan Amendment, Rezone, Site Development Plan for the private development, and Vesting Tentative Subdivision Map for a mixed-use residential development project on a 10.5-acre site in the City of San Marcos. Additionally, the project requests a separate Site Development Plan for the development of a proposed 1.1-acre neighborhood public park. The General Plan Amendment and Rezone would change the General Plan designation and Zoning from Mixed-Use 1 (MU-1) and Light Industrial (L-1) to Specific Plan Area (SPA). The Specific Plan has been prepared with the intent to provide a comprehensive plan to ensure the efficient development of a new mixed-use residential community. The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the General Plan. The Site Development Plan would configure the site for multi-family dwelling units, ground floor commercial mixed-use space, recreational open space, and private open space. The Tentative Subdivision Map presents specific infrastructure, and lot and street configurations for the site.

Air Quality

The air quality impact analysis evaluated the potential for adverse impacts to air quality due to construction and operational emissions resulting from the Project. Impacts were evaluated for their significance based on the County of San Diego's mass daily criteria air pollutant thresholds of significance (County of San Diego 2007), which is based on SDAPCD Rules 20.2 and 20.3 (SDAPCD 1998 and 2018). Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. Criteria air pollutants include ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), particulate matter with an aerodynamic diameter less than or equal to 10 microns (PM_{10}), particulate matter with an aerodynamic diameter less than or equal to 2.5 microns ($PM_{2.5}$), and lead. Pollutants that are evaluated include volatile organic compounds (VOCs), oxides of nitrogen (NO_x), CO, sulfur oxides (SO_x), PM_{10}, and $PM_{2.5}$. VOCs and NO_x are important because they are precursors to O_3.

Air Quality Plan Consistency

Regarding consistency with local air quality plans, the Project would not result in a more intensive land use than currently allowed under the City's General Plan (City of San Marcos 2012), which SDAPCD's Regional Air Quality Strategy (RAQS) emissions forecast is based on. The northern portion of the Project site includes 1.63 acres of existing vacant light industrial zoned land, while the remaining portion of the total 10.5-acre project area is zoned Mixed-Use 1 (MU-1) and built with an existing 63,484 SF of restaurant uses. Therefore, the Project requires a General Plan Amendment and Rezone to change the General Plan designation and Zoning from Mixed-Use 1 (MU-1) and Light Industrial (L-1) to Specific Plan Area (SPA).. However, the proposed Project development of the Project would result in a reduction of ozone precursors, VOC and NOx, of 11.35 tons per year (TPY) and 0.21 TPY, respectively, compared to the buildout of the existing site as currently zoned. Therefore, the proposed Project would not conflict with the SIP and RAQS and would result in a less than significant impact on air quality. As such, the Project would be consistent with relevant air quality plans, and impacts would be **less than significant**.

Construction Criteria Air Pollutant Emissions

Construction of the Project would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and VOC off-gassing) and off-site sources (i.e., on-road haul trucks, vendor trucks, and worker vehicle trips). Estimated maximum daily construction emissions would not exceed the applied significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$ during construction in all construction years (2024–2026). Therefore, Project construction air quality impacts would be **less than significant**.

Operational Criteria Air Pollutant Emissions

Operation of the Project would generate operational criteria air pollutants from mobile sources (i.e., vehicle trips), area sources (i.e., consumer product use, architectural coatings, and landscape maintenance equipment), and energy (i.e., natural gas). Maximum daily operational emissions would not exceed the County of San Diego's operational significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$. Therefore, Project operational air quality impacts would be **less than significant**.

Exposure of Sensitive Receptors

Carbon Monoxide Hotspots

Operation of the Project would generate minimal new daily vehicle trips and would not expose sensitive receptors to localized high concentrations of CO or contribute traffic volumes to intersections that would cause a CO hotspot. In addition, according to the project traffic impact assessment (Intersection Metrics, June 2022), the project would reduce average daily trips coming from the Project site, compared to the existing restaurants. Potential operational CO hotspot impacts would be **less than significant**.

Toxic Air Contaminants

Construction activities would not generate emissions in excess of the applied mass daily thresholds; therefore, Project-generated construction emissions are not anticipated to be substantial. In addition, diesel equipment used during Project construction would be subject to the California Air Resources Board air toxic control measures for in-use off-road diesel fleets, which would minimize diesel particulate matter emissions.

In regards to long-term toxic air contaminant emissions, the Project would result in a minimal increase in daily truck traffic on the roadway network and would not require stationary sources (such as diesel emergency generators). Therefore, the exposure of Project-related TAC emission impacts to proximate sensitive receptors would be **less than significant**.

Other Emissions (Odors)

The analysis of other emissions is focused on the potential for an odor impact to occur. Potential odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment, architectural coatings, and asphalt pavement application, which would disperse rapidly from the Project site and generally occur at magnitudes that would not affect substantial numbers of people. In addition, the Project would not include land-use types that would generate odors during operation. Therefore, Project construction and operations would result in odor impacts that are **less than significant**.

Greenhouse Gas Emissions

Global climate change is primarily considered a cumulative impact, but must also be evaluated on a project-level under CEQA. A project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHG emissions. GHGs are gases that absorb infrared radiation in the atmosphere. Principal GHGs regulated under state and federal law and regulations include carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). GHG emissions are measured in metric tons of CO_2 equivalent (MT CO_2e), which account for weighted global warming potential factors for CH_4 and N_2O.

The City of San Marcos adopted the Final Climate Action Plan (CAP) on December 8, 2020. The CAP relies on a screening threshold of 500 MT CO_2e per year based on land use size and a CAP Consistency Checklist to determine whether a project's emissions would be consistent with GHG emissions estimated within the City's CAP. The Project would result in annual emissions greater than 500 MT CO_2e and therefore relies of the CAP Checklist for consistency with the City's CAP. As presented in Appendix B, per Step 1 of the Checklist, the project would generate GHG emissions equal to or less than estimated emission generated under the existing designation. Step 2 of the CAP Checklist determines the project's consistency with the applicable strategies and measures of the CAP. As shown in Attachment B, CAP Checklist, the Project has demonstrated consistency with the applicable strategies and measures of the CAP as required by Step 2 of the CAP Checklist. Therefore, the Project is deemed consistent with the City's CAP and would be **less than significant**.

1 Introduction

1.1 Report Purpose and Scope

The purpose of this technical report is to assess the potential air quality and greenhouse gas (GHG) emissions impacts associated with implementation of the proposed Restaurant Row Project (Project). This assessment uses the significance thresholds in Appendix G of the California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.), and is based on the emissions-based significance thresholds recommended by the County of San Diego (County), which is based on the San Diego Air Pollution Control District (SDAPCD) rules, and other applicable thresholds of significance.

This introductory Section provides a description of the Project and the Project location. Chapter 2, Air Quality, describes the air quality–related environmental setting, regulatory setting, existing air quality conditions, and thresholds of significance and analysis methodology, and presents an air quality impact analysis per Appendix G of the CEQA Guidelines. Chapter 3, Greenhouse Gas Emissions, follows the same format as Chapter 2 and similarly describes the GHG emissions–related environmental setting, regulatory setting, existing climate changes conditions, and thresholds of significance and analysis methodology, and presents a GHG emissions impact analysis per Appendix G of the CEQA Guidelines. Chapter 4, References Cited, includes a list of the references cited. Chapter 5, List of Preparers, includes a list of those who prepared this technical report.

1.2 Project Description

The Project site is located at 1020 West San Marcos Boulevard on the northeast corner of West San Marcos Boulevard and Via Vera Cruz (APNs 219-200-30, 31, and 45). The proposed Restaurant Row Project (project) consists of demolition of 63,484 square feet (sf) of existing (primarily vacant) restaurant uses on-site, and re-development of 202 multi-family residential units and 10,400 sf of commercial retail uses on the 10.5-acre project site. Residential units would consist of eight (8) three-bedroom townhomes over commercial (town over commercial); 17 front street townhomes ranging in size from three- to four-bedrooms; 57 court townhomes ranging in size from two- to four-bedrooms; and 120 motor court units ranging in size from two- to three-bedrooms. The project would also incorporate a 1.1 acre neighborhood public park including dedicated dog areas, four tot lots, a rolling plaza (for roller skates/roller blades), skaters bowl, open lawn area and 4 pickleball courts. The park would not include an amphitheater or event space, and no outdoor amplified sound system is proposed. From the perspective of potential noise generation for the neighborhood park component, the pickleball courts represent the only potential noise source of concern.

The project includes a request for a Specific Plan, General Plan Amendment, Rezone, Site Development Plan for the private development, and Vesting Tentative Subdivision Map for a mixed-use residential development project on a 10.5-acre site in the City of San Marcos. Additionally, the project requests a separate Site Development Plan for the development of a proposed 1.1-acre neighborhood public park. The General Plan Amendment and Rezone would change the General Plan designation and Zoning from Mixed-Use 1 (MU-1) and Light Industrial (L-1) to Specific Plan Area (SPA). The Specific Plan has been prepared with the intent to provide a comprehensive plan to ensure the efficient development of a new mixed-use residential community. The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the General Plan. The Site Development Plan would configure the site for multi-family dwelling units, ground floor commercial mixed-use space, recreational open space, and private open space. The Tentative Subdivision Map

presents specific infrastructure, and lot and street configurations for the site. The Project site is located within the San Diego Air Basin and is under the jurisdiction of the San Diego Air Pollution Control District (SDAPCD). The Project location is shown on Figure 1. Figure 2, provides the Project Site Plan.

2 Air Quality

2.1 Environmental Setting

2.1.1 Meteorological and Topographical Conditions

The Project site is located within the San Diego Air Basin (SDAB) and is subject to the SDAPCD guidelines and regulations. The SDAB is one of 15 air basins that geographically divide the State of California. The primary factors that determine air quality are the locations of air pollutant sources and the amount of pollutants emitted. Meteorological and topographical conditions, however, are also important. Factors such as wind speed and direction, air temperature gradients and sunlight, and precipitation and humidity interact with physical landscape features to determine the movement and dispersal of air pollutants. Meteorological and topographical factors that affect air quality in the SDAB are described below.[1]

Regional Climate and Meteorological Conditions

The climate of the San Diego region, as in most of Southern California, is influenced by the strength and position of the semi-permanent high-pressure system over the Pacific Ocean, known as the Pacific High. This high-pressure ridge over the west coast often creates a pattern of late-night and early-morning low clouds, hazy afternoon sunshine, daytime onshore breezes, and little temperature variation year-round. The SDAB is characterized as a Mediterranean climate with dry, warm summers and mild, occasionally wet winters. Average temperature ranges (in degrees Fahrenheit (°F)) from the mid-40s to the high 90s, with an average of 201 days warmer than 70°F. The SDAB experiences 9 to 13 inches of rainfall annually, with most of the region's precipitation falling from November through March, with infrequent (approximately 10%) precipitation during the summer. El Niño and La Niña patterns have large effects on the annual rainfall received in San Diego, where San Diego receives less than normal rainfall during La Niña years.

The interaction of ocean, land, and the Pacific High maintains clear skies for much of the year and influences the direction of prevailing winds (westerly to northwesterly). The winds tend to blow onshore in the day and offshore at night. Local terrain is often the dominant factor inland, and winds in inland mountainous areas tend to blow through the valleys during the day and down the hills and valleys at night.

The favorable climate of San Diego also works to create air pollution problems. Sinking, or subsiding air from the Pacific High, creates a temperature inversion known as a subsidence inversion, which acts as a "lid" to vertical dispersion of pollutants. Weak summertime pressure gradients further limit horizontal dispersion of pollutants in the mixed layer below the subsidence inversion. Poorly dispersed anthropogenic emissions combined with strong sunshine leads to photochemical reactions that result in the creation of ozone (O_3) at this surface layer. In addition, light winds during the summer further limit ventilation.

In the fall months, the SDAB is often impacted by Santa Ana winds, which are the result of a high-pressure system over the Nevada and Utah regions that overcomes the westerly wind pattern and forces hot, dry winds from the east

[1] The discussion of meteorological and topographical conditions of the SDAB is based on information provided in the SDAPCD *2016 Monitoring Plan* (SDAPCD 2017), the County of San Diego *Guidelines for Determining Significance – Air Quality* (County of San Diego 2007), the County of San Diego *General Plan Update EIR* (County of San Diego 2011), and the CARB *Recommended Area Designation for the 2010 Federal Sulfur Dioxide Standard* (CARB 2011).

to the Pacific Ocean. The Santa Ana winds are powerful and can blow the SDAB's pollutants out to sea. However, a weak Santa Ana can transport air pollution from the South Coast Air Basin and greatly increase O_3 concentrations in the San Diego area.

Under certain conditions, atmospheric oscillation results in the offshore transport of air from the Los Angeles region to San Diego County. This often produces high O_3 concentrations, as measured at air pollutant monitoring stations within San Diego County. The transport of air pollutants from Los Angeles to San Diego can also occur within the stable layer of the elevated subsidence inversion, where high levels of O_3 are transported.

Topographical Conditions

Topography in the San Diego region varies greatly, from beaches in the west to mountains and desert in the east; much of the topography in between consists of mesa tops intersected by canyon areas. Along with local meteorology, topography influences the dispersal and movement of pollutants in the SDAB. Mountains to the east prohibit dispersal of pollutants in that direction and help trap pollutants in inversion layers.

The topography of the SDAB also drives pollutant levels, and the SDAB is classified as a "transport recipient," whereby pollutants are transported from the South Coast Air Basin to the north and, when the wind shifts direction, from Tijuana, Mexico, to the south.

2.1.2 Pollutants and Effects

2.1.2.1 Criteria Air Pollutants

Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. The national and California standards have been set, with an adequate margin of safety, at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons from illness or discomfort. Pollutants of concern include O_3, nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), particulate matter with an aerodynamic diameter less than or equal to 10 microns (PM_{10}), particulate matter with an aerodynamic diameter less than or equal to 2.5 microns ($PM_{2.5}$), and lead. In California, sulfates, vinyl chloride, hydrogen sulfide, and visibility-reducing particles are also regulated as criteria air pollutants. These pollutants, as well as toxic air contaminants (TACs), are discussed in the following paragraphs.[2]

Ozone. O_3 is a strong-smelling, pale blue, reactive, toxic chemical gas consisting of three oxygen atoms. It is a secondary pollutant formed in the atmosphere by a photochemical process involving the sun's energy and O_3 precursors. These precursors are mainly oxides of nitrogen (NO_x) and volatile organic compounds (VOCs). The maximum effects of precursor emissions on O_3 concentrations usually occur several hours after they are emitted and many miles from the source. Meteorology and terrain play major roles in O_3 formation, and ideal conditions occur during summer and early autumn on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies. O_3 exists in the upper atmosphere O_3 layer (stratospheric O_3) and at the Earth's surface in the troposphere

[2] The descriptions of the criteria air pollutants and associated health effects are based on the U.S. Environmental Protection Agency's "Criteria Air Pollutants" (EPA 2018), as well as the California Air Resources Board's "Glossary" (CARB 2019a) and "Fact Sheet: Air Pollution Sources, Effects and Control" (CARB 2009).

(ground-level O_3).[3] The O_3 that the U.S. Environmental Protection Agency (EPA) and the California Air Resources Board (CARB) regulate as a criteria air pollutant is produced close to the ground level, where people live, exercise, and breathe. Ground-level O_3 is a harmful air pollutant that causes numerous adverse health effects and is thus considered "bad" O_3. Stratospheric, or "good," O_3 occurs naturally in the upper atmosphere, where it reduces the amount of ultraviolet light (i.e., solar radiation) entering the Earth's atmosphere. Without the protection of the beneficial stratospheric O_3 layer, plant and animal life would be seriously harmed.

O_3 in the troposphere causes numerous adverse health effects; short-term exposures (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes (EPA 2013).

Inhalation of O_3 causes inflammation and irritation of the tissues lining human airways, causing and worsening a variety of symptoms. Exposure to O_3 can reduce the volume of air that the lungs breathe in, thereby causing shortness of breath. O_3 in sufficient doses increases the permeability of lung cells, rendering them more susceptible to toxins and microorganisms. The occurrence and severity of health effects from O_3 exposure vary widely among individuals, even when the dose and the duration of exposure are the same. Research shows adults and children who spend more time outdoors participating in vigorous physical activities are at greater risk from the harmful health effects of O_3 exposure. While there are relatively few studies on the effects of O_3 on children, the available studies show that children are no more or less likely to suffer harmful effects than adults. However, there are a number of reasons why children may be more susceptible to O_3 and other pollutants. Children and teens spend nearly twice as much time outdoors and engaged in vigorous activities as adults. Children breathe more rapidly than adults and inhale more pollution per pound of their body weight than adults. Also, children are less likely than adults to notice their own symptoms and avoid harmful exposures. Further research may be able to better distinguish between health effects in children and adults. Children, adolescents and adults who exercise or work outdoors, where O_3 concentrations are the highest, are at the greatest risk of harm from this pollutant (CARB 2019b).

Nitrogen Dioxide. NO_2 is a brownish, highly reactive gas that is present in all urban atmospheres. The major mechanism for the formation of NO_2 in the atmosphere is the oxidation of the primary air pollutant nitric oxide (NO), which is a colorless, odorless gas. NO_x plays a major role, together with VOCs, in the atmospheric reactions that produce O_3. NO_x is formed from fuel combustion under high temperature or pressure. In addition, NO_x is an important precursor to acid rain and may affect both terrestrial and aquatic ecosystems. The two major emissions sources are transportation and stationary fuel combustion sources such as electric utility and industrial boilers. NO_2 can irritate the lungs, cause bronchitis and pneumonia, and lower resistance to respiratory infections (EPA 2016).

A large body of health science literature indicates that exposure to NO_2 can induce adverse health effects. The strongest health evidence, and the health basis for the ambient air quality standards for NO_2, results from controlled human exposure studies that show that NO_2 exposure can intensify responses to allergens in allergic asthmatics. In addition, a number of epidemiological studies have demonstrated associations between NO_2 exposure and premature death, cardiopulmonary effects, decreased lung function growth in children, respiratory symptoms, emergency room visits for asthma, and intensified allergic responses. Infants and children are particularly at risk because they have disproportionately higher exposure to NO_2 than adults due to their greater breathing rate for their body weight and their typically greater outdoor exposure duration. Several studies have shown that long-term NO_2 exposure during

[3] The troposphere is the layer of the Earth's atmosphere nearest to the surface of the Earth. The troposphere extends outward about 5 miles at the poles and about 10 miles at the equator.

childhood, the period of rapid lung growth, can lead to smaller lungs at maturity in children with higher levels of exposure compared to children with lower exposure levels. In addition, children with asthma have a greater degree of airway responsiveness compared with adult asthmatics. In adults, the greatest risk is to people who have chronic respiratory diseases, such as asthma and chronic obstructive pulmonary disease (CARB 2019c).

Carbon Monoxide. CO is a colorless, odorless gas formed by the incomplete combustion of hydrocarbon, or fossil fuels. CO is emitted almost exclusively from motor vehicles, power plants, refineries, industrial boilers, ships, aircraft, and trains. In urban areas, such as the Project location, automobile exhaust accounts for the majority of CO emissions. CO is a nonreactive air pollutant that dissipates relatively quickly; therefore, ambient CO concentrations generally follow the spatial and temporal distributions of vehicular traffic. CO concentrations are influenced by local meteorological conditions—primarily wind speed, topography, and atmospheric stability. CO from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, which is a typical situation at dusk in urban areas from November to February. The highest levels of CO typically occur during the colder months of the year, when inversion conditions are more frequent.

CO is harmful because it binds to hemoglobin in the blood, reducing the ability of blood to carry oxygen. This interferes with oxygen delivery to the body's organs. The most common effects of CO exposure are fatigue, headaches, confusion and reduced mental alertness, light-headedness, and dizziness due to inadequate oxygen delivery to the brain. For people with cardiovascular disease, short-term CO exposure can further reduce their body's already compromised ability to respond to the increased oxygen demands of exercise, exertion, or stress. Inadequate oxygen delivery to the heart muscle leads to chest pain and decreased exercise tolerance. Unborn babies whose mothers experience high levels of CO exposure during pregnancy are at risk of adverse developmental effects. Unborn babies, infants, elderly people, and people with anemia or with a history of heart or respiratory disease are most likely to experience health effects with exposure to elevated levels of CO (CARB 2019d).

Sulfur Dioxide. SO_2 is a colorless, pungent gas formed primarily from incomplete combustion of sulfur-containing fossil fuels. The main sources of SO_2 are coal and oil used in power plants and industries; as such, the highest levels of SO_2 are generally found near large industrial complexes. In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits on the sulfur content of fuels.

Controlled human exposure and epidemiological studies show that children and adults with asthma are more likely to experience adverse responses with SO_2 exposure, compared with the non-asthmatic population. Effects at levels near the 1-hour standard are those of asthma exacerbation, including bronchoconstriction accompanied by symptoms of respiratory irritation such as wheezing, shortness of breath, and chest tightness, especially during exercise or physical activity. Also, exposure at elevated levels of SO_2 (above 1 parts per million [ppm]) results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality. Older people and people with cardiovascular disease or chronic lung disease (such as bronchitis or emphysema) are most likely to experience these adverse effects (CARB 2019e).

SO_2 is of concern both because it is a direct respiratory irritant and because it contributes to the formation of sulfate and sulfuric acid in particulate matter (NRC 2005). People with asthma are of particular concern, both because they have increased baseline airflow resistance and because their SO_2-induced increase in airflow resistance is greater than in healthy people, and it increases with the severity of their asthma (NRC 2005). SO_2 is thought to induce airway constriction via neural reflexes involving irritant receptors in the airways (NRC 2005).

Particulate Matter. Particulate matter pollution consists of very small liquid and solid particles floating in the air, which can include smoke, soot, dust, salts, acids, and metals. Particulate matter can form when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. $PM_{2.5}$ and PM_{10} represent fractions of particulate matter. Coarse particulate matter (PM_{10}) consists of particulate matter that is 10 microns or less in diameter, which is about 1/7 the thickness of a human hair. Major sources of PM_{10} include crushing or grinding operations; dust stirred up by vehicles traveling on roads; wood-burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions. Fine particulate matter ($PM_{2.5}$) consists of particulate matter that is 2.5 microns or less in diameter, which is roughly 1/28 the diameter of a human hair. $PM_{2.5}$ results from fuel combustion (e.g., from motor vehicles and power generation and industrial facilities), residential fireplaces, and woodstoves. In addition, $PM_{2.5}$ can be formed in the atmosphere from gases such as sulfur oxides (SO_x), NO_x, and VOCs.

$PM_{2.5}$ and PM_{10} pose a greater health risk than larger-size particles. When inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances such as lead, sulfates, and nitrates can cause lung damage directly or be absorbed into the bloodstream, causing damage elsewhere in the body. Additionally, these substances can transport adsorbed gases such as chlorides or ammonium into the lungs, also causing injury. Whereas PM_{10} tends to collect in the upper portion of the respiratory system, $PM_{2.5}$ is so tiny that it can penetrate deeper into the lungs and damage lung tissue. Suspended particulates also damage and discolor surfaces on which they settle and produce haze and reduce regional visibility.

A number of adverse health effects have been associated with exposure to both $PM_{2.5}$ and PM_{10}. For $PM_{2.5}$, short-term exposures (up to 24-hour duration) have been associated with premature mortality, increased hospital admissions for heart or lung causes, acute and chronic bronchitis, asthma attacks, emergency room visits, respiratory symptoms, and restricted activity days. These adverse health effects have been reported primarily in infants, children, and older adults with preexisting heart or lung diseases. In addition, of all of the common air pollutants, $PM_{2.5}$ is associated with the greatest proportion of adverse health effects related to air pollution, both in the United States and worldwide based on the World Health Organization's Global Burden of Disease Project. Short-term exposures to PM_{10} have been associated primarily with worsening of respiratory diseases, including asthma and chronic obstructive pulmonary disease, leading to hospitalization and emergency department visits (CARB 2017a).

Long-term exposure (months to years) to $PM_{2.5}$ has been linked to premature death, particularly in people who have chronic heart or lung diseases, and reduced lung function growth in children. The effects of long-term exposure to PM_{10} are less clear, although several studies suggest a link between long-term PM_{10} exposure and respiratory mortality. The International Agency for Research on Cancer published a review in 2015 that concluded that particulate matter in outdoor air pollution causes lung cancer (CARB 2017a).

Lead. Lead in the atmosphere occurs as particulate matter. Sources of lead include leaded gasoline; the manufacturing of batteries, paints, ink, ceramics, and ammunition; and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. Between 1978 and 1987, the phaseout of leaded gasoline reduced the overall inventory of airborne lead by nearly 95%. With the phaseout of leaded gasoline, secondary lead smelters, battery recycling, and manufacturing facilities are becoming lead-emissions sources of greater concern.

Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurological dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decrements in neurobehavioral performance, including intelligence quotient (IQ) performance, psychomotor performance, reaction time, and growth. Children are highly susceptible to the effects of lead.

Sulfates. Sulfates are the fully oxidized form of sulfur, which typically occur in combination with metals or hydrogen ions. Sulfates are produced from reactions of SO_2 in the atmosphere and can result in respiratory impairment, as well as reduced visibility.

Vinyl Chloride. Vinyl chloride is a colorless gas with a mild, sweet odor, which has been detected near landfills, sewage plants, and hazardous waste sites, due to the microbial breakdown of chlorinated solvents. Short-term exposure to high levels of vinyl chloride in air can cause nervous system effects, such as dizziness, drowsiness, and headaches. Long-term exposure through inhalation can cause liver damage, including liver cancer.

Hydrogen Sulfide. Hydrogen sulfide is a colorless and flammable gas that has a characteristic odor of rotten eggs. Sources of hydrogen sulfide include geothermal power plants, petroleum refineries, sewers, and sewage treatment plants. Exposure to hydrogen sulfide can result in nuisance odors, as well as headaches and breathing difficulties at higher concentrations.

Visibility-Reducing Particles. Visibility-reducing particles are any particles in the air that obstruct the range of visibility. Effects of reduced visibility can include obscuring the viewshed of natural scenery, reducing airport safety, and discouraging tourism. Sources of visibility-reducing particles are the same as for $PM_{2.5}$.

Volatile Organic Compounds. Hydrocarbons are organic gases that are formed from hydrogen and carbon and sometimes other elements. Hydrocarbons that contribute to formation of O_3 are referred to and regulated as VOCs (also referred to as reactive organic gases). Combustion engine exhaust, oil refineries, and fossil-fueled power plants are the sources of hydrocarbons. Other sources of hydrocarbons include evaporation from petroleum fuels, solvents, dry cleaning solutions, and paint.

The primary health effects of VOCs result from the formation of O_3 and its related health effects. High levels of VOCs in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. Carcinogenic forms of hydrocarbons, such as benzene, are considered TACs. There are no separate ambient air quality standards for VOCs as a group.

2.1.2.2 Non-Criteria Air Pollutants

Toxic Air Contaminants. A substance is considered toxic if it has the potential to cause adverse health effects in humans, including increasing the risk of cancer upon exposure, or acute and/or chronic non-cancer health effects. A toxic substance released into the air is considered a TAC. TACs are identified by federal and state agencies based on a review of available scientific evidence. In the state of California, TACs are identified through a two-step process that was established in 1983 under the Toxic Air Contaminant Identification and Control Act. This two-step process of risk identification and risk management and reduction was designed to protect residents from the health effects of toxic substances in the air. In addition, the California Air Toxics "Hot Spots" Information and Assessment Act, Assembly Bill (AB) 2588, was enacted by the legislature in 1987 to address public concern over the release of TACs

into the atmosphere. The law requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over 5 years.

Examples include certain aromatic and chlorinated hydrocarbons, certain metals, and asbestos. TACs are generated by a number of sources, including stationary sources, such as dry cleaners, gas stations, combustion sources, and laboratories; mobile sources, such as automobiles; and area sources, such as landfills. Adverse health effects associated with exposure to TACs may include carcinogenic (i.e., cancer-causing) and non-carcinogenic effects. Non-carcinogenic effects typically affect one or more target organ systems and may be experienced on either short-term (acute) or long-term (chronic) exposure to a given TAC.

Diesel Particulate Matter. Diesel particulate matter (DPM) is part of a complex mixture that makes up diesel exhaust. Diesel exhaust is composed of two phases, gas and particle, both of which contribute to health risks. More than 90% of DPM is less than 1 micrometer in diameter (about 1/70 the diameter of a human hair), and thus is a subset of $PM_{2.5}$ (CARB 2019f). DPM is typically composed of carbon particles ("soot," also called black carbon) and numerous organic compounds, including over 40 known cancer-causing organic substances. Examples of these chemicals include polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, and 1,3-butadiene (CARB 2019f). The CARB classified "particulate emissions from diesel-fueled engines" (i.e., DPM) (17 CCR 93000) as a TAC in August 1998. DPM is emitted from a broad range of diesel engines: on-road diesel engines, including trucks, buses, and cars, and off-road diesel engines, including locomotives, marine vessels, and heavy-duty construction equipment, among others. Approximately 70% of all airborne cancer risk in California is associated with DPM (CARB 2000). To reduce the cancer risk associated with DPM, CARB adopted a diesel risk reduction plan in 2000 (CARB 2000). Because it is part of $PM_{2.5}$, DPM also contributes to the same non-cancer health effects as $PM_{2.5}$ exposure. These effects include premature death; hospitalizations and emergency department visits for exacerbated chronic heart and lung disease, including asthma; increased respiratory symptoms; and decreased lung function in children. Several studies suggest that exposure to DPM may also facilitate development of new allergies (CARB 2019f). Those most vulnerable to non-cancer health effects are children, whose lungs are still developing, and older people, who often have chronic health problems.

Valley Fever. Coccidioidomycosis, more commonly known as "Valley Fever," is an infection caused by inhalation of the spores of the *Coccidioides immitis* fungus, which grows in the soils of the southwestern United States. When fungal spores are present, any activity that disturbs the soil, such as digging, grading, or other earth-moving operations, can cause the spores to become airborne and thereby increase the risk of exposure. The ecologic factors that appear to be most conducive to survival and replication of the spores are high summer temperatures, mild winters, sparse rainfall, and alkaline sandy soils.

The reported number of cases in California was 7,515 cases in 2018, with the Coccidioidomycosis incidence rate of 18.8 per 100,000 population in 2018 (CDPH 2019). Valley Fever is not considered highly endemic to San Marcos. Per the San Diego County Health and Human Services Agency, the 10-year average (2008–2017) for Coccidioidomycosis cases in the County of San Diego is 4.5 cases per 100,000 people per year. Similarly, among the total reported incidents of Valley Fever from 2010 through 2019, the cases reported in the County were in in the City's zip code that includes the Project site (92078) were at a rate of 4.1 cases per 100,000 population (County of San Diego 2021).

Even if present at a site, earth-moving activities may not result in increased incidence of Valley Fever. Propagation of *Coccidioides immitis* is dependent on climatic conditions, with the potential for growth and surface exposure highest following early seasonal rains and long dry spells. *Coccidioides immitis* spores can be released when filaments are disturbed by earth-moving activities, although receptors must be exposed to and inhale the spores to be at increased risk of developing Valley Fever. Moreover, exposure to *Coccidioides immitis* does not guarantee that an individual will become ill—approximately 60% of people exposed to the fungal spores are asymptomatic and show no signs of an infection (USGS 2000).

Odorous Compounds. Odors are generally regarded as an annoyance rather than a health hazard. Manifestations of a person's reaction to odors can range from psychological (e.g., irritation, anger, or anxiety) to physiological (e.g., circulatory and respiratory effects, nausea, vomiting, and headache). The ability to detect odors varies considerably among the population and overall is quite subjective. People may have different reactions to the same odor. An odor that is offensive to one person may be perfectly acceptable to another (e.g., coffee roaster). An unfamiliar odor is more easily detected and is more likely to cause complaints than a familiar one. In a phenomenon known as odor fatigue, a person can become desensitized to almost any odor, and recognition may only occur with an alteration in the intensity. The occurrence and severity of odor impacts depend on the nature, frequency, and intensity of the source; wind speed and direction; and the sensitivity of receptors.

2.1.3 Sensitive Receptors

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. The SDAPCD identifies sensitive receptors as those who are especially susceptible to adverse health effects from exposure to TACs, such as children, the elderly, and the ill. Sensitive receptors include schools (grades Kindergarten through 12), day care centers, nursing homes, retirement homes, health clinics, and hospitals within two kilometers of the facility (SDAPCD 2019).

Based on SDAPCD guidance, the nearest existing sensitive receptors site include; single family residential (>1,000 feet away) and EZ Living Mobile Home Park (~1,500 feet away) and Big Future Preschool (>850 feet) the most proximate.

2.2 Regulatory Setting

2.2.1 Federal Regulations

2.2.1.1 Criteria Air Pollutants

The federal Clean Air Act, passed in 1970 and last amended in 1990, forms the basis for the national air pollution control effort. The EPA is responsible for implementing most aspects of the Clean Air Act, including setting National Ambient Air Quality Standards (NAAQS) for major air pollutants; setting hazardous air pollutant (HAP) standards; approving state attainment plans; setting motor vehicle emission standards; issuing stationary source emission standards and permits; and establishing acid rain control measures, stratospheric O_3 protection measures, and enforcement provisions. Under the Clean Air Act, NAAQS are established for the following criteria pollutants: O_3, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and lead.

The NAAQS describe acceptable air quality conditions designed to protect the health and welfare of the citizens of the nation. The NAAQS (other than for O_3, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and those based on annual averages or arithmetic mean) are not to be exceeded more than once per year. NAAQS for O_3, NO_2, SO_2, PM_{10}, and $PM_{2.5}$ are based on statistical calculations over 1- to 3-year periods, depending on the pollutant. The Clean Air Act requires the EPA to reassess the NAAQS at least every 5 years to determine whether adopted standards are adequate to protect public health based on current scientific evidence. States with areas that exceed the NAAQS must prepare a state implementation plan that demonstrates how those areas will attain the NAAQS within mandated time frames.

2.2.1.2 Hazardous Air Pollutants

The 1977 federal Clean Air Act amendments required the EPA to identify National Emission Standards for Hazardous Air Pollutants to protect public health and welfare. HAPs include certain volatile organic chemicals, pesticides, herbicides, and radionuclides that present a tangible hazard, based on scientific studies of exposure to humans and other mammals. Under the 1990 federal Clean Air Act Amendments, which expanded the control program for HAPs, 187 substances and chemical families were identified as HAPs.

2.2.2 State Regulations

2.2.2.1 Criteria Air Pollutants

The federal Clean Air Act delegates the regulation of air pollution control and the enforcement of the NAAQS to the states. In California, the task of air quality management and regulation has been legislatively granted to CARB, with subsidiary responsibilities assigned to air quality management districts and air pollution control districts at the regional and county levels. CARB, which became part of the California Environmental Protection Agency in 1991, is responsible for ensuring implementation of the California Clean Air Act of 1988, responding to the federal Clean Air Act, and regulating emissions from motor vehicles and consumer products.

CARB has established California Ambient Air Quality Standards (CAAQS), which are generally more restrictive than the NAAQS. As stated previously, an ambient air quality standard defines the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without harm to the public's health. For each pollutant, concentrations must be below the relevant CAAQS before a basin can attain the corresponding CAAQS. Air quality is considered “in attainment” if pollutant levels are continuously below the CAAQS and violate the standards no more than once each year. The CAAQS for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, PM_{10}, and $PM_{2.5}$ and visibility-reducing particles are values that are not to be exceeded.

California air districts have based their thresholds of significance for CEQA purposes on the levels that scientific and factual data demonstrate that the air basin can accommodate without affecting the attainment date for the NAAQS or CAAQS. Since an ambient air quality standard is based on maximum pollutant levels in outdoor air that would not harm the public's health, and air district thresholds pertain to attainment of the ambient air quality standard, this means that the thresholds established by air districts are also protective of human health.

All others are not to be equaled or exceeded. The NAAQS and CAAQS are presented in Table 1.

Table 1. Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[a]	National Standards[b]	
		Concentration[c]	*Primary*[c,d]	*Secondary*[c,e]
O_3	1 hour	0.09 ppm (180 µg/m³)	—	Same as Primary Standard[f]
	8 hours	0.070 ppm (137 µg/m³)	0.070 ppm (137 µg/m³)[f]	
NO_2[g]	1 hour	0.18 ppm (339 µg/m³)	0.100 ppm (188 µg/m³)	Same as Primary Standard
	Annual Arithmetic Mean	0.030 ppm (57 µg/m³)	0.053 ppm (100 µg/m³)	
CO	1 hour	20 ppm (23 mg/m³)	35 ppm (40 mg/m³)	None
	8 hours	9.0 ppm (10 mg/m³)	9 ppm (10 mg/m³)	
SO_2[h]	1 hour	0.25 ppm (655 µg/m³)	0.075 ppm (196 µg/m³)	—
	3 hours	—	—	0.5 ppm (1,300 µg/m³)
	24 hours	0.04 ppm (105 µg/m³)	0.14 ppm (for certain areas)[g]	—
	Annual	—	0.030 ppm (for certain areas)[g]	—
PM_{10}[i]	24 hours	50 µg/m³	150 µg/m³	Same as Primary Standard
	Annual Arithmetic Mean	20 µg/m³	—	
$PM_{2.5}$[i]	24 hours	—	35 µg/m³	Same as Primary Standard
	Annual Arithmetic Mean	12 µg/m³	12.0 µg/m³	15.0 µg/m³
Lead[j,k]	30-day Average	1.5 µg/m³	—	—
	Calendar Quarter	—	1.5 µg/m³ (for certain areas)[k]	Same as Primary Standard
	Rolling 3-Month Average	—	0.15 µg/m³	
Hydrogen sulfide	1 hour	0.03 ppm (42 µg/m³)	—	—
Vinyl chloride[j]	24 hours	0.01 ppm (26 µg/m³)	—	—
Sulfates	24 hours	25 µg/m³	—	—
Visibility reducing particles	8 hours (10:00 a.m. to 6:00 p.m. PST)	Insufficient amount to produce an extinction coefficient of 0.23 per kilometer due to the number of particles when the relative humidity is less than 70%	—	—

Source: CARB 2016.

Notes: µg/m³ = micrograms per cubic meter; mg/m³= milligrams per cubic meter; ppm = parts per million by volume; O_3 = ozone; NO_2 = nitrogen dioxide; CO = carbon monoxide; SO_2 = sulfur dioxide; PM_{10} = particulate matter with an aerodynamic diameter less than or equal to 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter less than or equal to 2.5 microns.

[a] California standards for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, suspended particulate matter (PM_{10}, $PM_{2.5}$), and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[b] National standards (other than O_3, NO_2, SO_2, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once per year. The O_3 standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m³ is equal to or less than 1. For $PM_{2.5}$, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standard.

[c] Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based on a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[d] National Primary Standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.

[e] National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[f] On October 1, 2015, the national 8-hour O_3 primary and secondary standards were lowered from 0.075 to 0.070 ppm.

[g] To attain the national 1-hour standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 parts per billion (ppb). Note that the national 1-hour standard is in units of ppb. California standards are in units of ppm. To directly compare the national 1-hour standard to the California standards, the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

[h] On June 2, 2010, a new 1-hour SO_2 standard was established, and the existing 24-hour and annual primary standards were revoked. To attain the national 1-hour standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until 1 year after an area is designated for the 2010 standard, except that in areas designated nonattainment of the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

[i] On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 µg/m³ to 12.0 µg/m³. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m³, as was the annual secondary standard of 15 µg/m³. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m³ were also retained. The form of the annual primary and secondary standards is the annual mean averaged over 3 years.

[j] CARB has identified lead and vinyl chloride as TACs with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[k] The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 µg/m³ as a quarterly average) remains in effect until 1 year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

2.2.2.2 Toxic Air Contaminants

The state Air Toxics Program was established in 1983 under AB 1807 (Tanner). The California TAC list identifies more than 700 pollutants, of which carcinogenic and noncarcinogenic toxicity criteria have been established for a subset of these pollutants pursuant to the California Health and Safety Code. In accordance with AB 2728, the state list includes the (federal) HAPs. In 1987, the Legislature enacted the Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) to address public concern over the release of TACs into the atmosphere. AB 2588 law requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over 5 years. TAC emissions from individual facilities are quantified and prioritized. "High-priority" facilities are required to perform a health risk assessment, and if specific thresholds are exceeded, the facility operator is required to communicate the results to the public in the form of notices and public meetings.

In 2000, CARB approved a comprehensive Diesel Risk Reduction Plan to reduce diesel emissions from both new and existing diesel-fueled vehicles and engines (CARB 2000). The regulation is anticipated to result in an 80% decrease in statewide diesel health risk in 2020 compared with the diesel risk in 2000. Additional regulations include Airborne Toxic Control Measures (ATCMs), several of which are described below.

Idling of Commercial Heavy Duty Trucks (13 CCR 2485)

In July 2004, CARB adopted an Airborne Toxic Control Measure (ATCM) to control emissions from idling trucks. The ATCM prohibits idling for more than five minutes for all commercial trucks with a gross vehicle weight rating over 10,000 pounds. The ATCM contains an exception that allows trucks to idle while queuing or involved in operational activities.

In-Use Off-Road Diesel-Fueled Fleets (13 CCR 2449 et seq.)

In July 2007, CARB adopted an ATCM for in-use off-road diesel vehicles. This regulation requires that specific fleet average requirements are met for NO_x emissions and for particulate matter emissions. Where average requirements cannot be met, best available control technology requirements apply. The regulation also includes several recordkeeping and reporting requirements.

In response to AB 8 2X, the regulations were revised in July 2009 (effective December 3, 2009) to allow a partial postponement of the compliance schedule in 2011 and 2012 for existing fleets. On December 17, 2010, CARB adopted additional revisions to further delay the deadlines reflecting reductions in diesel emissions due to the poor economy and overestimates of diesel emissions in California. The revisions delayed the first compliance date until no earlier than January 1, 2014, for large fleets, with final compliance by January 1, 2023. The compliance dates for medium fleets were delayed until an initial date of January 1, 2017, and final compliance date of January 1, 2023. The compliance dates for small fleets were delayed until an initial date of January 1, 2019, and final compliance date of January 1, 2028. Correspondingly, the fleet average targets were made more stringent in future compliance years. The revisions also accelerated the phaseout of older equipment with newer equipment added to existing large and medium fleets over time, requiring the addition of Tier 2 or higher engines starting on March 1, 2011, with some exceptions: Tier 2 or higher engines on January 1, 2013, without exception; and Tier 3 or higher engines on January 1, 2018 (January 1, 2023, for small fleets).

On October 28, 2011 (effective December 14, 2011), the Executive Officer approved amendments to the regulation. The amendments included revisions to the applicability section and additions and revisions to the definition. The initial date for requiring the addition of Tier 2 or higher engines for large and medium fleets, with some exceptions, was revised to January 1, 2012. New provisions also allow for the removal of emission control devices for safety or visibility purposes. The regulation also was amended to combine the particulate matter and NO_x fleet average targets under one, instead of two, sections. The amended fleet average targets are based on the fleet's NO_x fleet average, and the previous section regarding particulate matter performance requirements was deleted completely. The best available control technology requirements, if a fleet cannot comply with the fleet average requirements, were restructured and clarified. Other amendments to the regulations included minor administrative changes to the regulatory text.

In-Use On-Road Diesel-Fueled Vehicles (13 CCR 2025)

On December 12, 2008, CARB adopted an ATCM to reduce NO_x and particulate matter emissions from most in-use on-road diesel trucks and buses with a gross vehicle weight rating greater than 14,000 pounds. The original ATCM regulation required fleets of on-road trucks to limit their NO_x and particulate matter emissions through a combination of exhaust retrofit equipment and new vehicles. The regulation limited particulate matter emissions for most fleets by 2011, and limited NO_x emissions for most fleets by 2013. The regulation did not require any vehicle to be replaced before 2012 and never required all vehicles in a fleet be replaced.

In December 2009, the CARB Governing Board directed staff to evaluate amendments that would provide additional flexibility for fleets adversely affected by the struggling California economy. On December 17, 2010, CARB revised this ATCM to delay its implementation along with limited relaxation of its requirements. Starting on January 1, 2015, lighter trucks with a gross vehicle weight rating of 14,001 to 26,000 pounds with 20-year-old or older engines need to be replaced with newer trucks (2010 model year emissions equivalent as defined in the regulation). Trucks with a gross vehicle weight rating greater than 26,000 pounds with 1995 model year or older engines needed to be replaced as of January 1, 2015. Trucks with 1996 to 2006 model year engines must install a Level 3 (85% control) diesel particulate filter starting on January 1, 2012, to January 1, 2014, depending on the model year, and then must be replaced after eight years. Trucks with 2007 to 2009 model year engines have no requirements until 2023, at which time they must be replaced with 2010 model year emissions-equivalent engines, as defined in the regulation. Trucks with 2010 model year engines would meet the final compliance requirements. The ATCM provides a phase-in option under which a fleet operator would equip a percentage of trucks in the fleet with diesel particulate filters, starting at 30% as of January 1, 2012, with 100% by January 1, 2016. Under each option, delayed compliance is granted to fleet operators who have or will comply with requirements before the required deadlines.

On September 19, 2011 (effective December 14, 2011), the Executive Officer approved amendments to the regulations, including revisions to the compliance schedule for vehicles with a gross vehicle weight rating of 26,000 pounds or less to clarify that *all* vehicles must be equipped with 2010 model year emissions equivalent engines by 2023. The amendments included revised and additional credits for fleets that have downsized; implement early particulate matter retrofits; incorporate hybrid vehicles, alternative-fueled vehicles, and vehicles with heavy-duty pilot ignition engines; and implement early addition of newer vehicles. The amendments included provisions for additional flexibility, such as for low-usage construction trucks, and revisions to previous exemptions, delays, and extensions. Other amendments to the regulations included minor administrative changes to the regulatory text, such as recordkeeping and reporting requirements related to other revisions.

California Health and Safety Code Section 41700

Section 41700 of the Health and Safety Code states that a person shall not discharge from any source whatsoever quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public; or that endanger the comfort, repose, health, or safety of any of those persons or the public; or that cause, or have a natural tendency to cause, injury or damage to business or property. This Section also applies to sources of objectionable odors.

2.2.3 Local Regulations

2.2.3.1 San Diego Air Pollution Control District

San Diego Air Pollution Control District

While CARB is responsible for the regulation of mobile emission sources within the state, local air quality management districts and air pollution control districts are responsible for enforcing standards and regulating stationary sources. The Project site is located within the SDAB, which is under the jurisdiction of the SDAPCD, and is therefore, subject to the guidelines and regulations of SDAPCD. Federal and State attainment plans adopted by the SDAPCD are summarized below.

Federal Attainment Plans

SDAPCD has prepared the 2020 Plan for Attaining the National Ambient Air Quality Standards for Ozone in San Diego County (2020 Attainment Plan) that demonstrates how the region will further reduce air pollutant emissions in order to attain the current NAAQS for ozone. The 2020 Attainment Plan was approved by the SDAPCD on October 14, 2020. On November 19, 2020, CARB adopted the 2020 Attainment Plan for attaining the Federal 8-hour 75 ppb and 70 ppb Ozone standards and projects attainment for the standards by 2026 and 2032, respectively (SDAPCD 2020a). The 2020 Attainment Plan will be submitted to the EPA as a revision to the California State Implementation Plan (SIP) for attaining the ozone NAAQS.

In December 2016, the SDAPCD adopted an update to the Eight-Hour Ozone Attainment Plan for San Diego County (2008 O_3 NAAQS). The 2016 Final Eight-Hour Ozone Attainment Plan for San Diego County indicates that local controls and state programs would allow the region to reach attainment of the federal 8-hour O_3 standard (1997 O_3 NAAQS) by 2018 (SDAPCD 2016a). In this plan, SDAPCD relies on the Regional Air Quality Strategy (RAQS) to demonstrate how the region will comply with the federal O_3 standard. The RAQS details how the region will manage and reduce O_3 precursors (NO_x and VOCs) by identifying measures and regulations intended to reduce these pollutants. The control measures identified in the RAQS generally focus on stationary sources; however, the emissions inventories and projections in the RAQS address all potential sources, including those under the authority of CARB and EPA. Incentive programs for reduction of emissions from heavy-duty diesel vehicles, off-road equipment, and school buses are also established in the RAQS.

Currently, the County is designated as severe nonattainment for the 2008 O_3 NAAQS and maintenance for the 1997 O_3 NAAQS. As documented in the 2016 Final Eight-Hour Ozone Attainment Plan for San Diego County, the County has a likely chance of obtaining attainment due to the transition to low emission cars, stricter new source review rules, and continuing the requirement of general conformity for military growth and the San Diego International Airport. SDAPCD will also continue emission control measures including ongoing implementation of existing regulations in ozone precursor reduction to stationary and area-wide sources, subsequent inspections of facilities and sources, and the adoption of laws requiring Best Available Retrofit Control Technology for control of emissions (SDAPCD 2016a).

State Attainment Plans

SDAPCD and the San Diego Association of Governments (SANDAG) are responsible for developing and implementing the clean air plan for attainment and maintenance of the ambient air quality standards in the SDAB. The RAQS for the SDAB was initially adopted in 1991 and is updated every 3 years, most recently in 2023 (SDAPCD 2023). The RAQS outlines SDAPCD's plans and control measures designed to attain the CAAQS for O_3. The RAQS relies on information from CARB and SANDAG, including mobile and area source emissions, as well as information regarding projected growth in the County and the cities in the County, to forecast future emissions and then determine from that the strategies necessary for the reduction of emissions through regulatory controls. The CARB mobile source emission projections and SANDAG growth projections are based on population, vehicle trends, and land use plans developed by the County and the cities in the County as part of the development of their general plans (SANDAG 2017a, 2017b).

In December 2016, SDAPCD adopted the revised RAQS for the County. Since 2007, the San Diego region has reduced daily VOC emissions and NO_x emissions by 3.9% and 7.0%, respectively; SDAPCD expects to continue reductions through 2035 (SDAPCD 2016b). These reductions were achieved through implementation of six VOC

control measures and three NO_x control measures adopted in SDAPCD's 2009 RAQS (SDAPCD 2009a); in addition, SDAPCD is considering additional measures, including three VOC measures and four control measures to reduce 0.3 daily tons of VOCs and 1.2 daily tons of NO_x, provided they are found to be feasible region-wide. In addition, SDAPCD has implemented nine incentive-based programs, has worked with SANDAG to implement regional transportation control measures, and has reaffirmed the state emission offset repeal.

On March 9, 2023, SDAPCD adopted the 2022 RAQS. The 2022 RAQS guides the SDAPCD in deploying tools, strategies, and resources to continue reducing pollutants that are precursors to ground-level O3, including NOx and VOC. The 2022 RAQS emphasizes O3 control measures but also identifies complementary measures and strategies that can reduce emissions of Greenhouse Gases (GHGs) and PM. It also includes new analyses exploring O3 and its relationship to public health, mobile sources, under-resourced communities, and GHGs and climate change. Further, the 2022 RAQS identifies strategies to expand SDAPCD regional partnerships, identify more opportunities to engage the public and communities of concern, and integrate environmental justice and equity across all proposed measures and strategies.

In regard to particulate matter emissions reduction efforts, in December 2005, SDAPCD prepared a report titled "Measures to Reduce Particulate Matter in San Diego County" to address implementation of Senate Bill (SB) 656 in San Diego County (SB 656 required additional controls to reduce ambient concentrations of PM_{10} and $PM_{2.5}$) (SDAPCD 2005). In the report, SDAPCD evaluated the implementation of source-control measures that would reduce particulate matter emissions associated with residential wood combustion; various construction activities including earthmoving, demolition, and grading; bulk material storage and handling; carryout and trackout removal and cleanup methods; inactive disturbed land; disturbed open areas; unpaved parking lots/staging areas; unpaved roads; and windblown dust (SDAPCD 2005).

SDAPCD Rules and Regulations

As stated previously, SDAPCD is responsible for planning, implementing, and enforcing federal and state ambient standards in the SDAB. The following rules and regulations apply to all sources in the jurisdiction of SDAPCD:

- **SDAPCD Regulation IV: Prohibitions; Rule 50: Visible Emissions.** Prohibits any activity causing air contaminant emissions darker than 20% opacity for more than an aggregate of 3 minutes in any consecutive 60-minute time period. In addition, Rule 50 prohibits any diesel pile-driving hammer activity causing air contaminant emissions for a period or periods aggregating more than 4 minutes during the driving of a single pile (SDAPCD 1997).
- **SDAPCD Regulation IV: Prohibitions; Rule 51: Nuisance.** Prohibits the discharge, from any source, of such quantities of air contaminants or other materials that cause or have a tendency to cause injury, detriment, nuisance, annoyance to people and/or the public, or damage to any business or property (SDAPCD 1976).
- **SDAPCD Regulation IV: Prohibitions; Rule 55: Fugitive Dust.** Regulates fugitive dust emissions from any commercial construction or demolition activity capable of generating fugitive dust emissions, including active operations, open storage piles, and inactive disturbed areas, as well as track-out and carry-out onto paved roads beyond a project site (SDAPCD 2009b).
- **SDAPCD Regulation IV: Prohibitions; Rule 67.0.1: Architectural Coatings.** Requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories (SDAPCD 2015a).

- **SDAPCD Regulation IV: Prohibitions; Rule 67.7: Cutback and Emulsified Asphalts.** This rule prohibits manufacturers, distributors, and end users of cutback and emulsified asphalt materials for the paving, construction or maintenance of parking lots, driveways, streets and highways from applying asphalt material or road oils which contain more than 0.5 percent by volume VOC which evaporate at 260° C (500 ° F) or less (SDAPCD 1979).

2.2.3.2 San Diego Association of Governments

SANDAG is the regional planning agency for the County and serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. SANDAG serves as the federally designated metropolitan planning organization for the County. With respect to air quality planning and other regional issues, SANDAG has prepared San Diego Forward: The Regional Plan (Regional Plan) for the San Diego region (SANDAG 2015). The Regional Plan combines the big-picture vision for how the region will grow over the next 35 years with an implementation program to help make that vision a reality. The Regional Plan, including its Sustainable Communities Strategy (SCS), is built on an integrated set of public policies, strategies, and investments to maintain, manage, and improve the transportation system so that it meets the diverse needs of the San Diego region through 2050. The Regional Plan was updated in 2021, which was the result of years of planning, data analysis, and community engagement to reimagine the San Diego region with a transformative transportation system, a sustainable pattern of growth and development, and innovative demand and management strategies (SANDAG 2021). The 2021 Regional Plan includes a SCS, which describes coordinated transportation and land use planning that exceeds the state's target for reducing per capita GHG emissions set by CARB. The state-mandated target is a 19% reduction—compared with 2005—in per capita GHG emissions from cars and light-duty trucks by 2035. The 2021 Regional Plan achieves a 20% reduction by then. The 2021 Regional Plan also puts forth a forecasted development pattern that is driven by regional goals for sustainability, mobility, housing affordability, and economic prosperity.

2.2.3.3 City of San Marcos

The City's General Plan (City of San Marcos 2012) includes various policies related to reducing Air Quality and GHG emissions. Air quality policies that would be applicable to the Project include:

Land Use and Community Design Element

Policy LU-2.1: Promote compact development patterns that reduce air pollution and automobile dependence and facilitate walking, bicycling, and transit use.

Policy LU-3.1: Require that new development and redevelopment incorporate connections and reduce barriers between neighborhoods, transit corridors, and activity centers within the City.

Mobility Element

Policy M-2.1: Work with new development to design roadways that minimize traffic volumes and/or speed, as appropriate within residential neighborhoods; while maintaining the City's desire to provide connectivity on the roadway network.

Conservation and Open Space Element

Policy COS-4.6: Promote efficient use of energy and conservation of available resources in the design, construction, maintenance and operation of public and private facilities, infrastructure and equipment.

Policy COS-4.8: Encourage and support the generation, transmission and use of renewable energy.

2.3 Regional and Local Air Quality Conditions

2.3.1 San Diego Air Basin Attainment Designation

Pursuant to the 1990 federal Clean Air Act amendments, the EPA classifies air basins (or portions thereof) as "attainment" or "nonattainment" for each criteria air pollutant, based on whether the NAAQS have been achieved. Generally, if the recorded concentrations of a pollutant are lower than the standard, the area is classified as "attainment" for that pollutant. If an area exceeds the standard, the area is classified as "nonattainment" for that pollutant. If there is not enough data available to determine whether the standard is exceeded in an area, the area is designated as "unclassified" or "unclassifiable." The designation of "unclassifiable/attainment" means that the area meets the standard or is expected to be meet the standard despite a lack of monitoring data. Areas that achieve the standards after a nonattainment designation are re-designated as maintenance areas and must have approved Maintenance Plans to ensure continued attainment of the standards. The California Clean Air Act, like its federal counterpart, called for the designation of areas as "attainment" or "nonattainment," but based on CAAQS rather than the NAAQS. Table 2 depicts the current attainment status of the Project site with respect to the NAAQS and CAAQS, as well as the attainment classifications for the criteria pollutants are outlined in Table 2.

Table 2. San Diego Air Basin Attainment Status

Pollutant	Designation/Classification	
	National Standards	*State Standards*
Ozone (O_3) – 1-hour	Attainment (maintenance)[a]	**Nonattainment**
Ozone (O_3) – 8-hour	**Nonattainment (severe)**	**Nonattainment**
Nitrogen dioxide (NO_2)	Unclassifiable/attainment[b]	Attainment
Carbon monoxide (CO)	Unclassifiable/attainment	Attainment
Sulfur dioxide (SO_2)	Unclassifiable/attainment	Attainment
Respirable particulate matter (PM_{10})	Unclassifiable/attainment	**Nonattainment**
Fine particulate matter ($PM_{2.5}$)	Unclassifiable/attainment	**Nonattainment**
Lead (Pb)	Attainment	Attainment
Sulfates (SO_4)	No national standard	Attainment
Hydrogen sulfide (H_2S)	No national standard	Unclassified
Vinyl chloride	No national standard	No designation
Visibility-reducing particles	No national standard	Unclassified

Sources: EPA 2021a (national); CARB 2020 (state).

Definitions: Attainment = meets the standards; attainment/maintenance = achieve the standards after a nonattainment designation; nonattainment = does not meet the standards; unclassified or unclassifiable = insufficient data to classify; unclassifiable/attainment = meets the standard or is expected to be meet the standard despite a lack of monitoring data.
Notes: SDAB = San Diego; O_3 = ozone; CO = carbon monoxide; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; NO_2 = nitrogen dioxide; SO_2 = sulfur dioxide.

[a] The national 1-hour standard of 0.12 parts per million (ppm) was in effect from 1979 through June 15, 2005. The revoked standard is referenced here because it was employed for such a long period and because this benchmark is addressed in SIPs.

[b] The western and central portions of the SDAB are designated attainment, while the eastern portion is designated unclassifiable/ attainment.

In summary, the EPA has designated the SDAB as a nonattainment area for the federal 8-hour O_3 standard, and CARB has designated the SDAB as a nonattainment area for the state 1-hour and 8-hour O_3 standards. The SDAB has been designated as a nonattainment area for the state 24-hour and annual PM_{10} standards and as a nonattainment area for the state annual $PM_{2.5}$ standard. The SDAB is designated as unclassified or attainment for all other criteria air pollutants.

2.3.2 Local Ambient Air Quality

CARB, air districts, and other agencies monitor ambient air quality at approximately 250 air quality monitoring stations across the state. SDAPCD operates a network of ambient air monitoring stations throughout San Diego County, which measure ambient concentrations of pollutants and determine whether the ambient air quality meets the CAAQS and the NAAQS. Air quality monitoring stations usually measure pollutant concentrations 10 feet above ground level; therefore, air quality is often referred to in terms of ground-level concentrations. The SDAPCD monitors air quality conditions at 11 locations throughout the SDAB. Escondido – East Valley Parkway monitoring station cease to collect data post-2015; thus, due to proximity to the site and similar geographic and climactic characteristics, the Camp Pendleton, San Diego-Rancho Carmel Drive, San Diego–Kearny Villa Road, and El Cajon-Lexington Elementary School monitoring station concentrations for all pollutants are considered most representative of the Project site. Ambient concentrations of pollutants from 2019 through 2021 are presented in Table 3.

Table 3. Local Ambient Air Quality Data

Averaging Time	Unit	Agency/ Method	Ambient Air Quality Standard	Measured Concentration by Year			Exceedances by Year		
				2019	*2020*	*2021*	*2019*	*2020*	*2021*
Ozone (O_3) – Camp Pendleton									
Maximum 1-hour concentration	ppm	State	0.12	0.075	0..094	0.074	0	0	0
Maximum 8-hour concentration	ppm	State	0.070	0.065	0.074	0.059	0	3	0
		Federal	0.070	0.064	0.074	0.059	0	3	0
Nitrogen Dioxide (NO_2) – San Diego – Rancho Carmel Drive									
Maximum 1-hour concentration	ppm	State	0.18	0.054	0.054	0.054	0	0	0
		Federal	0.100	0.054	0.054	0.054	0	0	0

		Federal	0.053	0.014	0.014	0.013	—	—	—

Table 3. Local Ambient Air Quality Data

Averaging Time	Unit	Agency/ Method	Ambient Air Quality Standard	Measured Concentration by Year			Exceedances by Year		
				2019	*2020*	*2021*	*2019*	*2020*	*2021*
Carbon Monoxide (CO) – San Diego – Rancho Carmel Drive									
Maximum 1-hour concentration	ppm	State	20	4.1	3.3	3.0	0	0	0
		Federal	35	4.1	3.3	3.0	0	0	0
Maximum 8-hour concentration	ppm	State	9.0	2.5	1.7	1.8	0	0	0
		Federal	9	2.5	1.7	1.8	0	0	0
Sulfur Dioxide (SO_2) – El Cajon-Lexington Elementary School									
Maximum 1-hour concentration	ppm	Federal	0.075	0.0008	0.0017	0.0016	0	0	0
Maximum 24-hour concentration	ppm	Federal	0.14	0.0003	0.0004	0.0003	0	0	0
Annual concentration	ppm	Federal	0.030	0.00007	0.00009	0.0011	—	—	—
Coarse Particulate Matter (PM_{10})[a] – El Cajon-Lexington Elementary School									
Maximum 24-hour concentration	µg/m³	State	50	37.4	ND		0.0 (0)	ND (0)	ND (0)
		Federal	150	38.7	ND		0.0 (0)	ND (0)	ND (0)
Annual concentration	µg/m³	State	20	20.1	ND		—	—	—
Fine Particulate Matter ($PM_{2.5}$)[a] – San Diego – Kearny Villa Road									
Maximum 24-hour concentration	µg/m³	Federal	35	16.2	47.5	20.9	0.0 (0)	0.0 (0)	5.8 (2)
Annual concentration	µg/m³	State	12	ND	ND		—	—	—
		Federal	12.0	7.0	8.7	7.6	—	—	—

Sources: CARB 2022; EPA 2021b.

Notes: ppm = parts per million by volume; ND = insufficient data available to determine the value; — = not available; µg/m³ = micrograms per cubic meter.

Data taken from CARB iADAM (http://www.CARB.ca.gov/adam) and EPA AirData (http://www.epa.gov/airdata/) represent the highest concentrations experienced over a given year.

Daily exceedances for particulate matter are estimated days because PM_{10} and $PM_{2.5}$ are not monitored daily. All other criteria pollutants did not exceed federal or state standards during the years shown. There is no federal standard for 1-hour ozone, annual PM_{10}, or 24-hour SO_2, nor is there a state 24-hour standard for $PM_{2.5}$.

The Camp Pendleton monitoring station is located at 21441 West B Street, Camp Pendleton, California.

The San Diego-Rancho Carmel Drive monitoring station is located at 11403 Rancho Carmel Drive, San Diego, California.

The El Cajon-Lexington Elementary School monitoring station is located at 533 First Street, El Cajon, California.

The San Diego-Kearny Villa Road monitoring station is located at 6125A Kearny Villa Road, San Diego, California.

[a] Measurements of PM_{10} and $PM_{2.5}$ are usually collected every 6 days and every 1 to 3 days, respectively. Number of days exceeding the standards is a mathematical estimate of the number of days concentrations would have been greater than the level of the standard had each day been monitored. The numbers in parentheses are the measured number of samples that exceeded the standard.

2.4 Significance Criteria and Methodology

2.4.1 Thresholds of Significance

The significance criteria used to evaluate the Project impacts to air quality is based on the recommendations provided in Appendix G of the CEQA Guidelines. For the purposes of this air quality analysis, a significant impact would occur if the Project would (14 CCR 15000 et seq.):

1. Conflict with or obstruct implementation of the applicable air quality plan.
2. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.
3. Expose sensitive receptors to substantial pollutant concentrations.
4. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.) indicates that, where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to determine whether the Project would have a significant impact on air quality.

County of San Diego and SDAPCD

Neither the City of San Marcos nor the SDAPCD have developed CEQA thresholds of significance for air quality; however, the County of San Diego has established CEQA screening-level thresholds for air quality impact analyses based on the SDAPCD Air Quality Impact Assessments trigger levels, which are based on emissions levels identified under the New Source Review program. As part of its air quality permitting process, SDAPCD has established thresholds in Rule 20.2 and Rule 20.3 requiring the preparation of Air Quality Impact Assessments for permitted stationary sources (non-major and major stationary sources, respectively) (SDAPCD 2020b, 2021). SDAPCD sets forth quantitative emission thresholds below which a stationary source would not have a significant impact on ambient air quality. Because SDAPCD Rules 20.2 and 20.3 do not identify a VOC threshold, the County of San Diego established a VOC threshold based on the South Coast Air Quality Management District's VOC threshold.

For CEQA purposes, the screening-level thresholds established by the County of San Diego can be used as numeric methods to demonstrate that a project's total emissions would not result in a significant impact to air quality for projects within San Diego County. Accordingly, the thresholds listed in Table 4 are used to evaluate whether Project-related emissions could cause a significant impact on air quality. For nonattainment pollutants, if emissions exceed the thresholds shown in Table 4, the Project could have the potential to result in a cumulatively considerable net increase in these pollutants and thus, could have a significant impact on the ambient air quality; conversely, emissions below the screening-level thresholds would not cause a significant impact. A project that involves a use that would produce objectionable odors would be deemed to have a significant odor impact if it would affect a considerable number of off-site receptors.

Table 4. Air Quality Significance Thresholds

Construction and Operational Emissions			
	Total Emissions		
Pollutant	*Pounds per Hour*	*Pounds per Day*	*Tons per Year*
Respirable particulate matter (PM_{10})	—	100	15
Fine particulate matter ($PM_{2.5}$)	—	55	10
Oxides of nitrogen (NO_x)	25	250	40
Sulfur oxides (SO_x)	25	250	40
Carbon monoxide (CO)	100	550	100
Lead and lead compounds	—	3.2	0.6
Volatile organic compounds (VOC)	—	75[a]	13.7

Source: SDAPCD Rules 20.2(d)(2) and 20.3(d)(2).

[a] VOC threshold based on South Coast Air Quality Management District (SCAQMD) levels for Coachella Valley, which have similar federal and state attainment status to San Diego.

2.4.2 Approach and Methodology

2.4.2.1 Construction Emissions

Emissions from the construction phase of the Project were estimated using CalEEMod Version 2020.4.0. Construction scenario assumptions, including phasing, equipment mix, and vehicle trips, were based on information provided by the Project applicant and CalEEMod default values when Project specifics were not known.

For purposes of estimating Project emissions, and based on information provided by the Project applicant, it is assumed that construction of the Project would commence in January 2024[4] and would last approximately 30 months, ending in May 2026. The analysis contained herein is based on the following assumptions (duration of phases is approximate):

- Demolition: 34 days (January 2024 – February 2024)
- Site Preparation: 10 days (January 2024 – February 2024)
- Grading: 147 days (February 2024 – September 2024)
- Building Construction: 560 days (March 2024 – May 2026)
- Paving: 66 days (September 2024 – December 2024)
- Architectural Coating: 490 days (June 2024 – May 2026)

Demolition includes removal of 63,484 sqft of existing structures and approximately 376,358 sqft of paved surface. Grading was assumed to require 184,420 cubic yards of soil for import. The construction equipment mix and vehicle trips used for estimating the Project-generated construction emissions are shown in Table 5.

[4] The analysis assumes a construction start date of January 2024, which represents the earliest date construction would initiate. Assuming the earliest start date for construction represents the worst-case scenario for criteria air pollutant and GHG emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years.

Table 5. Construction Scenario Assumptions

Construction Phase	One-Way Vehicle Trips			Equipment		
	Average Daily Worker Trips	*Average Daily Vendor Truck Trips*	*Total Haul Truck Trips*	*Equipment Type*	*Quantity*	*Daily Usage Hours*
Demolition	16	4	1,878	Concrete/Industrial Saws	1	8
				Excavators	3	8
				Rubber Tires Dozers	2	8
Site Preparation	18	4	0	Rubber Tires Dozers	3	8
				Tractors/Loaders/ Backhoes	4	8
Grading	20	4	23,052	Excavators	2	8
				Graders	1	8
				Rubber Tired Dozers	1	8
				Scrappers	2	8
				Tractors/Loaders/ Backhoes	2	8
Building Construction	240	60	0	Cranes	1	7
				Forklifts	3	8
				Generator Sets	1	8
				Tractors/Loaders/ Backhoes	3	7
				Welders	1	8
Paving	16	0	0	Pavers	2	8
				Paving Equipment	2	8
				Rollers	2	8
Architectural Coating	48	0	0	Air Compressors	1	6

Notes: See Appendix A for details.

Construction of project components would be subject to SDAPCD Rule 55 – Fugitive Dust Control. This rule requires that construction of project components include steps to restrict visible emissions of fugitive dust beyond the property line (SDAPCD 2009b). Compliance with Rule 55 would limit fugitive dust (PM_{10} and $PM_{2.5}$) that may be generated during grading and construction activities. To reflect implementation of proposed dust control strategies, it was assumed that the exposed areas would be watered two times per day (55% reduction in PM_{10} and $PM_{2.5}$).

2.4.2.2 Operational Emissions

Emissions from the operational phase of the Project were estimated using CalEEMod Version 2020.4.0. Operational year 2027 was assumed as the first full year after completion of Project construction.

Area Sources

CalEEMod was used to estimate operational emissions from area sources, including emissions from consumer product use, architectural coatings, and landscape maintenance equipment. Emissions associated with natural gas usage in space heating and water heating are calculated in the building energy use module of CalEEMod, as described in the following text.

Consumer products are chemically formulated products used by household and institutional consumers, including detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn, and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products. Other paint products, furniture coatings, or architectural coatings are not considered consumer products (CAPCOA 2021). Consumer product VOC emissions are estimated in CalEEMod based on the floor area of buildings and on the default factor of pounds of VOC per building square foot per day. For parking lot land uses, CalEEMod estimates VOC emissions associated with use of parking surface degreasers based on a square footage of parking surface area and pounds of VOC per square foot per day.

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings such as in paints and primers using during building maintenance. CalEEMod calculates the VOC evaporative emissions from application of residential surface coatings based on the VOC emission factor, the building square footage, the assumed fraction of surface area, and the reapplication rate. The VOC emission factor is based on the VOC content of the surface coatings, and SDAPCD Rule 67.0.1 (Architectural Coatings) governs the VOC (or ROG) content for interior and exterior coatings. The CalEEMod default of 250 grams per liter was assumed for parking area coatings. The model default reapplication rate of 10% of area per year is assumed. Consistent with CalEEMod defaults, it is assumed that the residential surface area for painting equals 2.7 times the floor square footage, with 75% assumed for interior coating and 25% assumed for exterior surface coating (CAPCOA 2021). For the parking lot, the architectural coating area is assumed to be 6% of the total square footage, consistent with the supporting CalEEMod studies provided as an appendix to the CalEEMod User's Guide (CAPCOA 2021).

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, rototillers, shredders/grinders, blowers, trimmers, chain saws, and hedge trimmers. The emissions associated from landscape equipment use are estimated based on CalEEMod default values for emission factors (grams per square foot of residential building space per day) and number of summer days (when landscape maintenance would generally be performed) and winter days. For San Diego County, the average annual "summer" days are estimated to 365 days; however, it is assumed that landscaping equipment would likely only operate during the week (not weekends), so operational days were assumed to be 180 days per year in CalEEMod (CAPCOA 2021).

Energy Sources

As represented in CalEEMod, energy sources include emissions associated with building electricity and natural gas usage (non-hearth). Electricity use would contribute indirectly to criteria air pollutant emissions; however, the emissions from electricity use are only quantified for GHGs in CalEEMod, because criteria pollutant emissions occur at the site of the power plant, which is typically off-site. Therefore, for the purposes of the air quality analysis, the energy source parameters focus on criteria air pollutants generated as a result of natural gas consumption within the built environment. Natural gas consumption is attributed to systems like heating, ventilation, and air conditioning and water heating. CalEEMod assumes compliance with the 2019 Title 24 code.

Mobile Sources

Mobile sources for the Project would be motor vehicles (e.g., automobiles, trucks, and buses) traveling to and from the Project site. Motor vehicles may be fueled with gasoline, diesel, or alternative fuels. The trip rates for the proposed Project are based on OCRR Transportation Due Diligence Memorandum conducted by Intersecting Metrics, July 2023. CalEEMod default data, including temperature, trip characteristics, variable start information, and emissions factors, were conservatively used for the model inputs. The project traffic impact assessment (Intersection Metrics, July 2023), indicates that the project would reduce average daily trips coming from the Project site, compared to the existing restaurants. Table 6 presents the conclusion of the traffic analysis, which is shown as estimated reduction of 4,665 average daily trips to local roadways.,

Table 6. Project Traffic Generation Versus Current Uses Traffic

Land Use	Units	Trip Rate	Average Daily Trips (ADT)
Multi-Family Units	202 Dwelling Units	6 /Dwelling Unit	1,212
Specialty Retail	10,400 square feet	40 / thousand sq. ft.	416
City Park	1.1 Acres	50 Trips/Acre	55
Existing Uses (to be eliminated)			
Existing Restaurants	-63,484	100/KSF	6,348
Net Trip Generation	--	--	-4,665

Source: (Intersection Metrics, July 2023.

2.5 Impact Analysis

Threshold 1: Would the Project conflict with or obstruct implementation of the applicable air quality plan?

As stated in Section 4.3, Local, SDAPCD and SANDAG are responsible for developing and implementing the clean air plans for attainment and maintenance of the NAAQS and CAAQS in the SDAB; specifically, the SIP and RAQS.[5] The federal O_3 maintenance plan, which is part of the SIP, was adopted in 2020. The SIP includes a demonstration that current strategies and tactics will maintain acceptable air quality in the SDAB based on the NAAQS. The RAQS was initially adopted in 1991 and is updated every 3 years (most recently in 2023). The RAQS outlines SDAPCD's plans and control measures designed to attain the CAAQS for O_3. The SIP and RAQS rely on information from CARB and SANDAG, including mobile and area source emissions, as well as information regarding projected growth in San Diego County and the cities in the County, to project future emissions and then determine from that the strategies necessary for the reduction of emissions through regulatory controls. CARB mobile source emission

[5] For the purpose of this discussion, the relevant federal air quality plan is the O_3 maintenance plan (SDAPCD 2016b). The RAQS is the applicable plan for purposes of state air quality planning. Both plans reflect growth projections in the SDAB.

projections and SANDAG growth projections are based on population, vehicle trends, and land use plans developed by San Diego County and the cities in the County as part of the development of their general plans.

If a project proposes development that is greater than that anticipated in the local plan and SANDAG's growth projections, the project might be in conflict with the SIP and RAQS and may contribute to a potentially significant cumulative impact on air quality. The northern portion of the Project site includes 1.63 acres of exiting vacant light industrial zoned land, while the remaining portion of the total 10.5-acre project area is zoned Mixed-Use 1 (MU-1) and built with an existing 63,484 SF of restaurant uses. Therefore, the Project requires a General Plan Amendment and Rezone to change the General Plan designation and Zoning from Mixed-Use 1 (MU-1) and Light Industrial (L-1) to Specific Plan Area (SPA).

As stated above, the RAQS outlines SDAPCD's plans and control measures designed to attain the CAAQS for O_3. The RAQS is developed to attain ozone standards through control measures targeting VOC and NO_x emissions as precursors to ozone formation. The SDAPCD mobile source emissions projection and SANDAG growth projections are based on population and vehicle trends and land use plans developed by the city. As such, the current RAQS assumptions would include the Project site based on emissions of VOC and NOx from land uses of zoning of L-1 and MU-1 It should be noted that the current low-density single-story restaurant complex does not conform with the current zoning and the proposed SPA would result in development standards that conform substantially to the MU-1 development standards.

Because the Project proposes a general plan amendment and zone change from L-1 and MU-1 to SPA, a comparison of emissions of NOx and VOC (precursors to O_3) between existing zone buildout and the proposed Project are preformed to determine if the emissions resulting from the proposed Project are equal to or less than that which would have been accounted for in the SIP and RAQS. If the estimated emissions of the new zoning (SPA) is equal to or less than the existing (LI-1 and MU-1) then the strategies propose in the RAQS are sufficient to capture the project emissions and the project would not be in conflict or obstruction of the RAQS.

Per City of San Marcos General Plan, Table 2-2. General Plan Land Use Designation Density, the maximum Density/Intensity for Light Industrial is 0.60 Floor Area Ratio (FAR). For this analysis, and per City guidance, the existing parcels would be modeled based on the alternative project utilized in the Fiscal Impact Study (DTA 2023) for the project, which includes: 173-unit townhomes, 10,400 square feet of commercial retail, is 28,436 square feet of office building and 133 parking spaces. CalEEMod default values were utilized for alternative project land uses to develop representative emissions. Table 7 provides a summary of the annual CalEEMod estimated VOC and NO_x emissions, of alternative project compared to the Project.

Table 7. Estimated Annual Operational Ozone(O_3) Precursor Emissions

Source	VOC	NO_x
	Tons per Year	
Fiscal Impact Study Alternative		
Area	12.59	0.23
Energy	0.01	0.09
Mobile	0.63	0.65
Total	**13.23**	**0.97**

Proposed Project SPA		
Area	1.22	0.02
Energy	0.01	0.07
Mobile	0.67	0.69
Total	**1.90**	**0.78**
Difference (Proposed Project - Existing)	**-11.33**	**-0.19**

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen
See Appendix A for complete results.

As shown in Table 7, the proposed Project development would result in a reduction of ozone precursors, VOC and NOx, of 11.33TPY and 0.19 TPY, respectively, compared to the Fiscal Impact Study alternative. Therefore, the proposed Project would not conflict with the SIP and RAQS and would result in a less than significant impact on air quality.

As presented in the July 2021, General Plan Housing Element, the most recent Regional Housing Needs Assessment (RHNA) from SANDAG stated that San Marcos's share of regional future housing needs is 3,116 new units between April 15,2021, and April 15, 2029. As of June 30, 2020, 546 housing units have been planned or approved for development, with 2,570 units remaining needed to be developed in the City. The Project is expected to bring 202 units to market in 2027 which would be within SANDAG's growth projection for housing during the 6th Cycle planning horizon.

Conclusion

The general plan amendment and zone change to specific plan area is not anticipated to result in air quality impacts that were not envisioned in the growth projections and RAQS, and this minor increase in residential units (202 units) in the region would not obstruct or impede implementation of local air quality plans. The Project would be consistent at a regional level with the underlying growth forecasts emissions in the RAQS. Impacts would be **less than significant**.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

Threshold 2: Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Past, present, and future development projects may contribute to the SDAB adverse air quality impacts on a cumulative basis. By its nature, air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development, and SDAPCD develops and implements plans for future attainment of ambient air quality standards. Based on these considerations, project-level thresholds of significance

for criteria pollutants are used in the determination of whether a project's individual emissions would have a cumulatively considerable contribution on air quality. If a project's emissions would exceed the applied significance thresholds, it would have a cumulatively considerable contribution. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant.

Construction and operation of the Project would result in emissions of criteria air pollutants, which may result in a cumulatively considerable net increase in emissions of criteria air pollutants for which the SDAB is designated as nonattainment under the NAAQS or CAAQS. As discussed previously, the SDAB has been designated as a federal nonattainment area for O_3 and a state nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. The following discussion quantitatively evaluates potential short-term construction and long-term operational impacts that would result from implementation of the Project.

Construction Emissions

Proposed construction activities would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and VOC off-gassing from architectural coatings and asphalt pavement application) and off-site sources (i.e., on-road haul trucks, delivery trucks, and worker vehicle trips). Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and for dust, the prevailing weather conditions. Therefore, such emissions levels can only be estimated, with a corresponding uncertainty in precise ambient air quality impacts.

As discussed under 2.4.2.1, criteria air pollutant emissions associated with construction activity were quantified using CalEEMod. Construction emissions were calculated for the estimated worst-case day over the construction period associated with each phase and reported as the maximum daily emissions estimated during each year of construction (2024–2026). Construction schedule assumptions, including phase type, duration, and sequencing, were based on information provided by the applicant or CalEEMod defaults and are intended to represent a reasonable scenario based on the best information available. NO_x and CO emissions would primarily result from the use of construction equipment and motor vehicles.

Fugitive dust (PM_{10} and $PM_{2.5}$) emissions would primarily result from grading and site preparation activities. The Project would be required to comply with SDAPCD Rule 55, Fugitive Dust Control. This rule requires that the Project take steps to restrict visible emissions of fugitive dust beyond the property line. Compliance with Rule 55 would limit fugitive dust (PM_{10} and $PM_{2.5}$) generated during grading and construction activities. To account for dust control measures in the calculations, it was assumed that the Project would ensure that active sites be watered at least two times daily. The application of architectural coatings, such as exterior application/interior paint and other finishes would produce VOC emissions. The contractor would also be required to comply with the requirements of SDAPCD's Rule 67.7, Cutback and Emulsified Asphalt, which would limit VOC emissions from asphalt off-gassing.

Table 8 presents the estimated maximum daily construction emissions generated during construction of the Project. Details of the emission calculations are provided in Appendix A.

Table 8. Estimated Maximum Daily Construction Criteria Air Pollutant Emissions - Unmitigated

Year	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds per day					
2024	20.85	82.28	74.26	0.24	17.85	7.81
2025	15.93	16.70	24.82	0.06	3.38	1.32
2026	15.89	16.63	24.46	0.06	3.38	1.32
Maximum daily emissions	**20.85**	**82.28**	**74.26**	**0.24**	**17.85**	**7.81**
Emission threshold	75	250	550	250	100	55
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns.
See Appendix A for complete results.
The values shown are the maximum summer or winter daily emissions results from CalEEMod. Although not considered mitigation, these estimates reflect the "mitigated" CalEEMod results in order to account for SDAPCD Rule 55 - Fugitive Dust Control, assuming watering of the project site two times per day.

As shown in Table 8, maximum daily construction emissions would not exceed the significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$ during construction.

Operational Emissions

Following the completion of construction activities, the Project would generate VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$ emissions from mobile sources, including vehicular traffic; energy sources from natural gas usage; area sources, (including the use of landscaping equipment, consumer products, and from architectural coatings. As discussed in Section 2.4.2.2, Operational Emissions, pollutant emissions associated with long-term operations were quantified using CalEEMod using a combination of Project-specific information and CalEEMod default values.

Table 9 presents the maximum daily area, energy, and mobile source emissions associated with Project operation. Details of the emission calculations are provided in Appendix A.

Table 9. Estimated Operational Criteria Air Pollutant Emissions - Unmitigated

Emission Source	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds per day					
Area	6.92	0.19	16.66	<0.01	0.09	0.09
Energy	0.04	0.38	0.16	<0.01	0.03	0.03
Mobile	4.07	4.08	35.99	0.08	8.94	2.42
Total	**11.03**	**4.65**	**52.81**	**0.08**	**9.06**	**2.54**
Emission Threshold	75	250	550	250	100	55
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns; <0.01 = reported value less than 0.01; negative values are presented in parentheses.
See Appendix A for complete results. Totals may not sum due to rounding.

As shown in Table 9, the maximum daily emissions of the Project would not exceed the significance thresholds for any criteria air pollutants.

As discussed in Section 2.3, Regional and Local Air Quality Conditions, the SDAB has been designated as a federal nonattainment area for O_3 and a state nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. The nonattainment status is the result of cumulative emissions from various sources of air pollutants and their precursors within the SDAB, including motor vehicles, off-road equipment, and commercial and industrial facilities. Construction and operation of the Project would generate VOC and NO_x emissions (which are precursors to O_3) and emissions of PM_{10} and $PM_{2.5}$. However, as indicated in Tables 7 and 8, Project-generated construction and operational emissions would not exceed the emission-based significance thresholds for VOC, NO_x, PM_{10}, or $PM_{2.5}$.

Cumulative localized impacts would potentially occur if a construction project were to occur concurrently with another off-site project. Construction schedules for potential future projects near the Project area are currently unknown; therefore, potential construction impacts associated with two or more simultaneous projects would be considered speculative. However, future projects would be subject to CEQA and would require air quality analysis and, where necessary, mitigation if the project would exceed applied thresholds. Criteria air pollutant emissions associated with construction activity of future projects would be reduced through implementation of control measures required by the SDAPCD. For example, cumulative PM_{10} and $PM_{2.5}$ emissions would be reduced because all future projects would be subject to SDAPCD Rule 55 (Fugitive Dust), which sets forth general and specific requirements for all construction sites in the SDAB. In addition, cumulative VOC emissions would be subject to SDAPCD Rule 67.0.1 (Architectural Coatings).

Cumulative air quality impacts are baisin-wide, and air quality is affected by all pollutant sources in the basin. As the individual project thresholds are designed to help achieve attainment with cumulative basin-wide standards, they are also appropriate for assessing the Project's contribution to cumulative impacts. As shown in Tables 8 and 9, emission would be less than applicable screening thresholds. As emissions would be less than the screening thresholds, the Project would not result in cumulative considerable impact. Therefore, the Project's cumulative air quality impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

Threshold 3: Would the Project expose sensitive receptors to substantial pollutant concentrations?

Air quality varies as a direct function of the amount of pollutants emitted into the atmosphere, the size and topography of the air basin, and the prevailing meteorological conditions. Air quality problems arise when the rate of pollutant emissions exceeds the rate of dispersion. Reduced visibility, eye irritation, and adverse health impacts on those persons termed "sensitive receptors" are the most serious hazards of existing air quality conditions in the area. Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution, as identified by CARB, include children, older adults, athletes, and people with cardiovascular and chronic respiratory diseases;

however, for the purposes of this analysis, residents are also considered sensitive receptors. As such, sensitive receptors include residences, schools, playgrounds, childcare centers, athletic facilities, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes.

The SDAPCD identifies sensitive receptors as those who are especially susceptible to adverse health effects from exposure to TACs, such as children, the elderly, and the ill. Sensitive receptors include schools (grades Kindergarten through 12), day care centers, nursing homes, retirement homes, health clinics, and hospitals within two kilometers of the facility (SDAPCD 2019). Based on SDAPCD guidance, the nearest existing sensitive receptors include; single family residential (>1,000 feet away) and EZ Living Mobile Home Park (~1,500 feet away) and Big Future Preschool (>850 feet) the most proximate.

Health Impacts of Carbon Monoxide

Mobile source impacts occur on two scales of motion. Regionally, Project-related travel would add to regional trip generation and increase the vehicle miles traveled within the local airshed and the SDAB. Locally, project generated traffic would be added to the County's roadway system near the Project site. If such traffic occurs during periods of poor atmospheric ventilation, is composed of a large number of vehicles "cold-started" and operating at pollution-inefficient speeds, and is operating on roadways already crowded with non-project traffic, there is a potential for the formation of microscale CO hotspots in the area immediately around points of congested traffic. Because of continued improvement in vehicular emissions at a rate faster than the rate of vehicle growth and/or congestion, the potential for CO hotspots in the SDAB is steadily decreasing. In addition, according to the project traffic impact assessment (Intersection Metrics, July 2023), the project would reduce average daily trips coming from the Project site, compared to the existing restaurants. As shown in Table 6 the Project would result in an estimated reduction of 4,665 average daily trips to local roadways.,

CO transport is extremely limited and CO disperses rapidly with distance from the source. Under certain extreme meteorological conditions, however, CO concentrations near a congested roadway or intersection may reach unhealthy levels, affecting sensitive receptors such as residents, school children, hospital patients, and the elderly. Typically, high CO concentrations are associated with urban roadways or intersections operating at an unacceptable level of service (LOS). Projects contributing to adverse traffic impacts may result in the formation of CO hotspots.

To verify that the Project would not cause or contribute to a violation of the CO standards, a screening evaluation of the potential for CO hotspots was conducted using the County of San Diego screening threshold of 3,000 peak trips (County of San Diego 2007). The trip rates for the proposed Project are based OCRR Transportation Due Diligence Memorandum conducted by Intersecting Metrics, July 2023.. Based on this data, there would be approximately 118 trips during the AM peak-hour and 153 trips during the PM peak-hour, which would be minimal in comparison to the screening threshold of 3,000 peak trips. In addition, the project would reduce average daily trips coming from the Project site, compared to the existing restaurants. Therefore, the Project would not result in a CO hotspot and would result in a **less than significant** impact.

Health Effects of Other Criteria Air Pollutants

Project construction and operation would not exceed significance thresholds for VOC, NO_x, CO, SO_x, $PM_{10,}$ or $PM_{2.5}$. VOCs and NO_x are precursors to O_3, for which the SDAB is designated as nonattainment with respect to the NAAQS and CAAQS. The health effects associated with O_3 are generally associated with reduced lung function. The contribution of ROGs and NO_x to regional ambient O_3 concentrations is the result of complex photochemistry. The increases in O_3 concentrations in the SDAB due to O_3 precursor emissions tend to be found downwind from the source location

to allow time for the photochemical reactions to occur. However, the potential for exacerbating excessive O_3 concentrations would also depend on the time of year that the VOC emissions would occur because exceedances of the O_3 CAAQS/NAAQS tend to occur between April and October when solar radiation is highest. The holistic effect of a single project's emissions of O_3 precursors is speculative due to the lack of reliable and meaningful quantitative methods to assess this impact. The Project would not exceed the significance thresholds for VOC or NO_x; therefore, implementation of the Project would contribute minimally to regional O_3 concentrations and the associated health effects.

In addition to O_3, NO_x emissions contribute to potential exceedances of the NAAQS and CAAQS for NO_2 (since NO_2 is a constituent of NO_x). Health effects that result from NO_2 and NO_x include respiratory irritation, which could be experienced by nearby receptors during the periods of heaviest use of off-road construction equipment. However, Project construction would be relatively short term, and off-road construction equipment would be operating at various portions of the site and would not be concentrated in one portion of the site at any one time. In addition, existing NO_2 concentrations in the area are well below the NAAQS and CAAQS standards. Because Project generated NO_x emissions would not exceed the significance threshold, the Project would not result in potential health effects associated with NO_2 and NO_x.

CO tends to be a localized impact associated with congested intersections. The associated potential for CO hotspots were discussed previously and were determined to be a less-than-significant impact. Furthermore, the existing CO concentrations in the area are well below the NAAQS and CAAQS standards. Thus, the Project's CO emissions would not contribute to significant health effects associated with this pollutant.

Construction and operation of the Project would also not exceed thresholds for PM_{10} or $PM_{2.5}$ and would not contribute to exceedances of the NAAQS and CAAQS for particulate matter or would obstruct the SDAB from coming into attainment for these pollutants. Additionally, the Project would implement dust control strategies and be required to comply with SDAPCD Rule 55, Fugitive Dust Control, which limits the amount of fugitive dust generated during construction. Due to the minimal contribution of particulate matter during construction and operation, the Project is not anticipated to result in health effects associated with PM_{10} or $PM_{2.5}$.

In summary, the Project would not result in any potentially significant contribution to local or regional concentrations of nonattainment pollutants and would not result in a significant contribution to the adverse health impacts associated with those pollutants. Impacts would be **less than significant**. Furthermore, there are numerous scientific and technological complexities associated with correlating criteria air pollutant emissions from an individual project to specific health effects or potential additional nonattainment days, and there are currently no modeling tools that could provide reliable and meaningful additional information regarding health effects from criteria air pollutants generated by individual projects.

Health Impacts of Toxic Air Contaminants

In addition to impacts from criteria pollutants, project impacts may include emissions of pollutants identified by the state and federal government as TACs or hazardous air pollutants. State law has established the framework for California's TAC identification and control program, which is generally more stringent than the federal program and aimed at TACs that are a problem in California. The state has formally identified more than 200 substances as TACs, including the federal hazardous air pollutants, and is adopting appropriate control measures for sources of these TACs. The greatest potential for TAC emissions during construction would be diesel particulate emissions from heavy equipment operations and heavy-duty trucks and the associated health impacts to sensitive receptors. The following measures are required by state law to reduce DPM emissions:

- Fleet owners of mobile construction equipment are subject to the CARB Regulation for In-use Off-road Diesel Vehicles (13 CCR 2449), the purpose of which is to reduce DPM and criteria pollutant emissions from in-use (existing) off-road diesel-fueled vehicles.
- All commercial diesel vehicles are subject to Title 13, Section 2485 of the California Code of Regulations, limiting engine idling time. Idling of heavy-duty diesel construction equipment and trucks during loading and unloading shall be limited to five minutes; electric auxiliary power units should be used whenever possible.

Health effects from carcinogenic air toxics are usually described in terms of cancer risk. The SDAPCD recommends an incremental cancer risk threshold of 10 in a million (SDAPCD 2015b). "Incremental cancer risk" is the net increased likelihood that a person continuously exposed to concentrations of TACs resulting from a project over a 9-, 30-, and 70-year exposure period will contract cancer based on the use of standard Office of Environmental Health Hazard Assessment risk-assessment methodology (OEHHA 2015). The Project would not require the extensive operation of heavy-duty construction equipment, which is subject to a CARB Airborne Toxics Control Measure for in-use diesel construction equipment to reduce diesel particulate emissions and would not involve extensive use of diesel trucks, which are also subject to a CARB Airborne Toxics Control Measure.

As shown in Table 7, maximum daily PM_{10} or $PM_{2.5}$ emissions generated by construction equipment operation and haul-truck trips during construction, which is based on exhaust and fugitive dust generated by equipment operation and vehicle travel, would be well below the significance thresholds. Moreover, total construction of the Project would last approximately 30 months, after which Project-construction TAC emissions would cease. Thus, the duration of the proposed construction activities would only constitute a small percentage of the total 30-year exposure period. In regards to long-term TAC emissions and as a residential project, the Project would result in a minimal increase in daily truck traffic on the roadway network and would not require stationary sources (such as diesel emergency generators). As previously described the nearest existing sensitive receptors are located to the greater than 850 feet away from the project site and DPM would disperse quickly. Therefore, the exposure of Project-related TAC emission impacts to proximate sensitive receptors would be **less than significant**.

Valley Fever

As discussed above in Section 2.1.2.2, the average incidence rate within the County is below the statewide average. Furthermore, construction of the Project would comply with SDAPCD Rule 55, Fugitive Dust Control, which limits the amount of fugitive dust generated during construction. SDAPCD Rule 55 is intended to reduce PM_{10} emissions from any transportation, handling, construction, or storage activity that has the potential to generate fugitive dust. Based on the low incidence rate of coccidioidomycosis on the Project site and in the County, and with the Project's implementation of dust control strategies and Valley Fever awareness and training, it is not anticipated that earth-moving activities during project construction would result in exposure of nearby sensitive receptors to Valley Fever. Therefore, the Project would have a **less-than-significant** impact with respect to Valley Fever exposure for sensitive receptors.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

Threshold 4: Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Based on available information, the Project is not anticipated to result in other emissions that have not been addressed under Threshold 1 through Threshold 3 above. As such, this analysis focuses on the potential for the Project to generate odors. The occurrence and severity of potential odor impacts depends on numerous factors. The nature, frequency, and intensity of the source; the wind speeds and direction; and the sensitivity of receiving location each contribute to the intensity of the impact. Although offensive odors seldom cause physical harm, they can be annoying and cause distress among the public and generate citizen complaints.

Odors would be generated from vehicles and/or equipment exhaust emissions during construction of the Project. Odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment and architectural coatings. Such odors would disperse rapidly from the Project site and generally occur at magnitudes that would not affect substantial numbers of people. Therefore, impacts associated with odors during construction would be considered **less than significant**.

Land uses and industrial operations associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The Project would not engage in any of these activities. Therefore, the Project would result in an odor impact that is **less than significant**.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

INTENTIONALLY LEFT BLANK

3 Greenhouse Gas Emissions

3.1 Environmental Setting

3.1.1 Climate Change Overview

Climate change refers to any significant change in measures of climate, such as temperature, precipitation, or wind patterns, lasting for an extended period of time (i.e., decades or longer). The Earth's temperature depends on the balance between energy entering and leaving the planet's system. Many factors, both natural and human, can cause changes in Earth's energy balance, including variations in the sun's energy reaching Earth, changes in the reflectivity of Earth's atmosphere and surface, and changes in the greenhouse effect, which affects the amount of heat retained by Earth's atmosphere (EPA 2017).

The greenhouse effect is the trapping and build-up of heat in the atmosphere (troposphere) near the Earth's surface. The greenhouse effect traps heat in the troposphere through a threefold process as follows: Short-wave radiation emitted by the Sun is absorbed by the Earth, the Earth emits a portion of this energy in the form of long-wave radiation, and GHGs in the upper atmosphere absorb this long-wave radiation and emit it into space and toward the Earth. The greenhouse effect is a natural process that contributes to regulating the Earth's temperature and creates a pleasant, livable environment on the Earth. Human activities that emit additional GHGs to the atmosphere increase the amount of infrared radiation that gets absorbed before escaping into space, thus enhancing the greenhouse effect and causing the Earth's surface temperature to rise.

The scientific record of the Earth's climate shows that the climate system varies naturally over a wide range of time scales and that, in general, climate changes prior to the Industrial Revolution in the 1700s can be explained by natural causes such as changes in solar energy, volcanic eruptions, and natural changes in GHG concentrations. Recent climate changes, in particular the warming observed over the past century, however, cannot be explained by natural causes alone. Rather, it is extremely likely that human activities have been the dominant cause of that warming since the mid-twentieth century and is the most significant driver of observed climate change (IPCC 2013; EPA 2017). Human influence on the climate system is evident from the increasing GHG concentrations in the atmosphere, positive radiative forcing, observed warming, and improved understanding of the climate system (IPCC 2013). The atmospheric concentrations of GHGs have increased to levels unprecedented in the last 800,000 years, primarily from fossil fuel emissions and secondarily from emissions associated with land use changes (IPCC 2013). Continued emissions of GHGs will cause further warming and changes in all components of the climate system, which is discussed further in Section 3.3.2, Potential Effects of Climate Change.

3.1.2 Greenhouse Gases

A GHG is any gas that absorbs infrared radiation in the atmosphere; in other words, GHGs trap heat in the atmosphere. As defined in California Health and Safety Code, Section 38505(g), for purposes of administering many of the State's primary GHG emissions reduction programs, GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3). (See also CEQA Guidelines, Section 15364.5.) Some GHGs, such as CO_2, CH_4, and N_2O, occur naturally and are emitted into the atmosphere through natural processes and human activities. Of these gases, CO_2 and CH_4 are emitted in the greatest quantities from human activities. Manufactured GHGs, which have a much greater heat-absorption potential than CO_2,

include fluorinated gases, such as HFCs, PFCs, and SF_6, which are associated with certain industrial products and processes. The following paragraphs provide a summary of the most common GHGs and their sources.[6]

Carbon Dioxide. CO_2 is a naturally occurring gas and a by-product of human activities and is the principal anthropogenic GHG that affects the Earth's radiative balance. Natural sources of CO_2 include respiration of bacteria, plants, animals, and fungus; evaporation from oceans; volcanic out-gassing; and decomposition of dead organic matter. Human activities that generate CO_2 are from the combustion of fuels such as coal, oil, natural gas, and wood and changes in land use.

Methane. CH_4 is produced through both natural and human activities. CH_4 is a flammable gas and is the main component of natural gas. Methane is produced through anaerobic (without oxygen) decomposition of waste in landfills, flooded rice fields, animal digestion, decomposition of animal wastes, production and distribution of natural gas and petroleum, coal production, and incomplete fossil fuel combustion.

Nitrous Oxide. N_2O is produced through natural and human activities, mainly through agricultural activities and natural biological processes, although fuel burning and other processes also create N_2O. Sources of N_2O include soil cultivation practices (microbial processes in soil and water), especially the use of commercial and organic fertilizers, manure management, industrial processes (such as in nitric acid production, nylon production, and fossil-fuel-fired power plants), vehicle emissions, and using N_2O as a propellant (e.g., rockets, racecars, and aerosol sprays).

Fluorinated Gases. Fluorinated gases (also referred to as F-gases) are synthetic powerful GHGs emitted from many industrial processes. Fluorinated gases are commonly used as substitutes for stratospheric ozone-depleting substances (e.g., chlorofluorocarbons [CFCs], hydrochlorofluorocarbons [HCFCs], and halons). The most prevalent fluorinated gases include the following:

- **Hydrofluorocarbons:** HFCs are compounds containing only hydrogen, fluorine, and carbon atoms. HFCs are synthetic chemicals used as alternatives to ozone-depleting substances in serving many industrial, commercial, and personal needs. HFCs are emitted as by-products of industrial processes and are used in manufacturing.
- **Perfluorocarbons:** PFCs are a group of human-made chemicals composed of carbon and fluorine only. These chemicals were introduced as alternatives, with HFCs, to the ozone depleting substances. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Since PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere, these chemicals have long lifetimes, ranging between 10,000 and 50,000 years.
- **Sulfur Hexafluoride:** SF_6 is a colorless gas soluble in alcohol and ether and slightly soluble in water. SF_6 is used for insulation in electric power transmission and distribution equipment, semiconductor manufacturing, the magnesium industry, and as a tracer gas for leak detection.
- **Nitrogen Trifluoride:** NF_3 is used in the manufacture of a variety of electronics, including semiconductors and flat panel displays.

Chlorofluorocarbons. CFCs are synthetic chemicals that have been used as cleaning solvents, refrigerants, and aerosol propellants. CFCs are chemically unreactive in the lower atmosphere (troposphere) and the production of CFCs was prohibited in 1987 due to the chemical destruction of stratospheric O_3.

[6] The descriptions of GHGs are summarized from the Intergovernmental Panel on Climate Change (IPCC) Second Assessment Report (1995), IPCC Fourth Assessment Report (2007), CARB's "Glossary of Terms Used in GHG Inventories" (2015a), and EPA's "Glossary of Climate Change Terms" (2016c).

Hydrochlorofluorocarbons. HCFCs are a large group of compounds, whose structure is very close to that of CFCs—containing hydrogen, fluorine, chlorine, and carbon atoms—but including one or more hydrogen atoms. Like HFCs, HCFCs are used in refrigerants and propellants. HCFCs were also used in place of CFCs for some applications; however, their use in general is being phased out.

Black Carbon. Black carbon is a component of fine particulate matter, which has been identified as a leading environmental risk factor for premature death. It is produced from the incomplete combustion of fossil fuels and biomass burning, particularly from older diesel engines and forest fires. Black carbon warms the atmosphere by absorbing solar radiation, influences cloud formation, and darkens the surface of snow and ice, which accelerates heat absorption and melting. Black carbon is a short-lived species that varies spatially, which makes it difficult to quantify the global warming potential. Diesel particulate matter emissions are a major source of black carbon and are TACs that have been regulated and controlled in California for several decades to protect public health. In relation to declining diesel particulate matter from the CARB's regulations pertaining to diesel engines, diesel fuels, and burning activities, CARB estimates that annual black carbon emissions in California have reduced by 70% between 1990 and 2010, with 95% control expected by 2020 (CARB 2014).

Water Vapor. The primary source of water vapor is evaporation from the ocean, with additional vapor generated by sublimation (change from solid to gas) from ice and snow, evaporation from other water bodies, and transpiration from plant leaves. Water vapor is the most important, abundant, and variable GHG in the atmosphere and maintains a climate necessary for life.

Ozone. Tropospheric O_3, which is created by photochemical reactions involving gases from both natural sources and human activities, acts as a GHG. Stratospheric O_3, which is created by the interaction between solar ultraviolet radiation and molecular oxygen (O_2), plays a decisive role in the stratospheric radiative balance. Depletion of stratospheric O_3, due to chemical reactions that may be enhanced by climate change, results in an increased ground-level flux of ultraviolet-B radiation.

Aerosols. Aerosols are suspensions of particulate matter in a gas emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light.

3.1.3 Global Warming Potential

Gases in the atmosphere can contribute to climate change both directly and indirectly. Direct effects occur when the gas itself absorbs radiation. Indirect radiative forcing occurs when chemical transformations of the substance produce other GHGs, when a gas influences the atmospheric lifetimes of other gases, and/or when a gas affects atmospheric processes that alter the radiative balance of the Earth (EPA 2017). The Intergovernmental Panel on Climate Change (IPCC) developed the global warming potential (GWP) concept to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The GWP of a GHG is defined as the ratio of the time-integrated radiative forcing from the instantaneous release of 1 kilogram of a trace substance relative to that of 1 kilogram of a reference gas (IPCC 2014). The reference gas used is CO_2; therefore, GWP-weighted emissions are measured in metric tons (MT) of carbon dioxide equivalent (CO_2e).The current version of California Emissions Estimator Model (CalEEMod) (Version 2020.4.0) assumes that the GWP for CH_4 is 25 (so emissions of 1 MT of CH_4 are equivalent to emissions of 25 MT of CO_2), and the GWP for N_2O is 298, based on the IPCC Fourth Assessment Report (IPCC 2007). The GWP values identified in CalEEMod were applied to the Project.

3.2 Regulatory Setting

3.2.1 Federal Regulations

Massachusetts v. EPA. In *Massachusetts v. EPA* (April 2007), the U.S. Supreme Court directed the EPA administrator to determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In December 2009, the administrator signed a final rule with the following two distinct findings regarding GHGs under Section 202(a) of the federal Clean Air Act:

- The Administrator found that elevated concentrations of GHGs—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations. This is the "endangerment finding."
- The Administrator further found the combined emissions of GHGs—CO_2, CH_4, N_2O, and HFCs—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is the "cause or contribute finding."

These two findings were necessary to establish the foundation for regulation of GHGs from new motor vehicles as air pollutants under the Clean Air Act.

Energy Independence and Security Act of 2007. The Energy Independence and Security Act of 2007 (December 2007), among other key measures, would do the following, which would aid in the reduction of national GHG emissions (EPA 2007):

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020, and directs National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy-efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

Federal Vehicle Standards. In *Massachusetts v. EPA* (April 2007), the U.S. Supreme Court directed the EPA administrator to determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In December 2009, the administrator signed a final rule with the following two distinct findings regarding GHGs under section 202(a) of the federal Clean Air Act:

- The administrator found that elevated concentrations of GHGs—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations. This is the "endangerment finding."

- The administrator further found that the combined emissions of GHGs—CO_2, CH_4, N_2O, and HFCs—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is the "cause or contribute finding."

These two findings were necessary to establish the foundation for regulation of GHGs from new motor vehicles as air pollutants under the Clean Air Act (42 U.S.C. § 7401).

In 2007, in response to the *Massachusetts v. EPA* U.S. Supreme Court ruling, the Bush Administration issued Executive Order (EO) 13432 directing the EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011; and, in 2010, the EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012 through 2016 (75 Fed. Reg. 25324–25728).

In 2010, President Obama issued a memorandum directing the Department of Transportation, Department of Energy, EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017 through 2025 light-duty vehicles. The proposed standards projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017 through 2021 (77 Fed. Reg. 62624–63200). On January 12, 2017, the EPA finalized its decision to maintain the current GHG emissions standards for model years 2022–2025 cars and light trucks.

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014 through 2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the EPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6% to 23% over the 2010 baselines (76 Fed. Reg. 57106–57513).

In August 2016, the EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion MT and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program (EPA and NHTSA 2016).

In August 2018, EPA and NHTSA proposed to amend certain fuel economy and GHG standards for passenger cars and light trucks and establish new standards for model years 2021 through 2026. Compared to maintaining the post-2020 standards then in place, the 2018 proposal would increase U.S. fuel consumption by about half a million barrels per day (2% to 3% of total daily consumption, according to the Energy Information Administration) and would impact the global climate by 3/1000th of one degree Celsius by 2100 (EPA and NHTSA 2018). California and other states have stated their intent to challenge federal actions that would delay or eliminate GHG reduction measures and have committed to cooperating with other countries to implement global climate change initiatives.

In 2019, the EPA and NHTSA published the Safer Affordable Fuel-Efficient Vehicles Rule Part One: One National Program (SAFE-1), which revoked California's authority to set its own GHG emissions standards and set zero-emission vehicle (ZEV) mandates in California. In March 2020, Part Two was issued which set CO2 emissions standards and corporate average fuel economy standards for passenger vehicles and light-duty trucks for model years 2021 through 2026. In March 2022, EPA reinstated California's authority under the Clean Air Act to implement its own GHG emission standards and ZEV sales mandate. EPA's March 2022 action concludes its reconsideration of the 2019 SAFE-1 rule by finding that the actions taken under the previous administration as a part of SAFE-1 were decided in error and are now entirely rescinded.

3.2.2 State Regulations

The statewide GHG emissions regulatory framework is summarized below by category: state climate change targets, building energy, renewable energy and energy procurement, mobile sources, solid waste, water, and other state regulations and goals. The following text describes EOs, Assembly Bills (ABs), Senate Bills (SBs), and other plans and policies that would directly or indirectly reduce GHG emissions and/or address climate change issues.

State Climate Change Targets

The state has taken a number of actions to address climate change. These include EOs, legislation, and CARB plans and requirements. These are summarized below.

EO S-3-05. EO S-3-05 (June 2005) established California's GHG emissions reduction targets and laid out responsibilities among the state agencies for implementing the EO and for reporting on progress toward the targets. This EO established the following targets:

- By 2010, reduce GHG emissions to 2000 levels
- By 2020, reduce GHG emissions to 1990 levels
- By 2050, reduce GHG emissions to 80% below 1990 levels

EO S-3-05 also directed the California Environmental Protection Agency to report biannually on progress made toward meeting the GHG targets and the impacts to California due to global warming, including impacts to water supply, public health, agriculture, the coastline, and forestry. The Climate Action Team was formed, which subsequently issued reports from 2006 to 2010 (CAT 2016).

SB 32 and AB 197. SB 32 and AB 197 (enacted in 2016) are companion bills. SB 32 codified the 2030 emissions reduction goal of EO B-30-15 by requiring CARB to ensure that statewide GHG emissions are reduced to 40% below 1990 levels by 2030. AB 197 established the Joint Legislative Committee on Climate Change Policies, consisting of at least three members of the Senate and three members of the Assembly, in order to provide ongoing oversight over implementation of the state's climate policies. AB 197 also added two members of the Legislature to the Board as nonvoting members; requires CARB to make available and update (at least annually via its website) emissions data for GHGs, criteria air pollutants, and TACs from reporting facilities; and, requires CARB to identify specific information for GHG emissions reduction measures when updating the scoping plan.

EO B-30-15. EO B-30-15 (April 2015) identified an interim GHG reduction target in support of targets previously identified under S-3-05 and AB 32. EO B-30-15 set an interim target goal of reducing GHG emissions to 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80% below 1990 levels by 2050 as set forth in S-3-05. To facilitate achieving this goal, EO B-30-15 called for CARB to update the Scoping Plan to express the 2030 target in terms of million metric tons (MMT) CO_2e. The EO also called for state agencies to continue to develop and implement GHG emission reduction programs in support of the reduction targets.

EO B-55-18. EO B-55-18 (September 2018) establishes a new statewide goal "to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter." This EO directs CARB to "work with relevant state agencies to ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal."

Assembly Bill 1279. The Legislature enacted AB 1279, the California Climate Crisis Act, in September 2022. The bill declares the policy of the state to achieve net zero GHG emissions as soon as possible, but no later than 2045, and achieve and maintain net negative GHG emissions thereafter. Additionally, the bill requires that by 2045, statewide anthropogenic GHG emissions be reduced to at least 85% below 1990 levels. Although AB 1279 establishes an overall policy to achieve net zero greenhouse gas emissions as soon as possible, but no later than 2045, recognizing the need to implement carbon dioxide removal and carbon capture, utilization and storage technologies, the Legislature established a specific target of 85% below 1990 levels by 2045 for anthropogenic GHG emissions. Therefore, the net zero target does not directly apply to development projects, but the 2045 target of 85% below 1990 levels represents the reductions required to contribute to accomplishing the State's overall net zero policy.

AB 32 and California Air Resources Board's Climate Change Scoping Plan. One specific requirement of AB 32 was for CARB to prepare a scoping plan for achieving the maximum technologically feasible and cost-effective GHG emission reductions by 2020 (Health and Safety Code Section 38561[a]), and to update the plan at least once every 5 years. In 2008, CARB approved the first scoping plan. The Climate Change Scoping Plan: A Framework for Change (Scoping Plan) included a mix of recommended strategies that combined direct regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs calculated to meet the 2020 statewide GHG emissions limit and initiate the transformations needed to achieve the state's long-range climate objectives. The key elements of the Scoping Plan include the following (CARB 2008):

1. Expanding and strengthening existing energy efficiency programs, as well as building and appliance standards.
2. Achieving a statewide renewable energy mix of 33%.
3. Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system and caps sources contributing 85% of California's GHG emissions.
4. Establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets.
5. Adopting and implementing measures pursuant to existing state laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard (17 CCR 95480 et seq.).
6. Creating targeted fees, including a public goods charge on water use, fees on high GWP gases, and a fee to fund the administrative costs of the State of California's long-term commitment to AB 32 implementation.

The Scoping Plan also identified local governments as essential partners in achieving California's goals to reduce GHG emissions because they have broad influence and, in some cases, exclusive authority over activities that contribute to significant direct and indirect GHG emissions through their planning and permitting processes, local ordinances, outreach and education efforts, and municipal operations. Specifically, the Scoping Plan encouraged local governments to adopt a reduction goal for municipal operations, and for community emissions to reduce GHGs by approximately 15% from then levels (2008) by 2020. Many local governments developed community-scale local GHG reduction plans based on this Scoping Plan recommendation.

In 2014, CARB approved the first update to the Scoping Plan. The First Update to the Climate Change Scoping Plan: Building on the Framework (First Update) defined the state's GHG emission reduction priorities for the next 5 years, and laid the groundwork to start the transition to the post-2020 goals set forth in EO S-3-05 and EO B-16-2012. The First Update concluded that California is on track to meet the 2020 target but recommended a 2030 mid-term GHG reduction target be established to ensure a continuum of action to reduce emissions. The First Update recommended a mix of technologies in key economic sectors to reduce emissions through 2050, including energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and the rapid market penetration of efficient and clean energy technologies. As part of the First Update, CARB recalculated the state's 1990 emissions level, using more recent GWPs identified by the IPCC, from 427 MMT CO_2e to 431 MMT CO_2e (CARB 2014).

In 2015, as directed by EO B-30-15, CARB began working on an update to the Scoping Plan to incorporate the 2030 target of 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80% below 1990 levels by 2050 as set forth in EO S-3-05. The governor called on California to pursue a new and ambitious set of strategies, in line with the five climate change pillars from his inaugural address, to reduce GHG emissions and prepare for the unavoidable impacts of climate change. In the summer of 2016, the legislature affirmed the importance of addressing climate change through passage of SB 32.

In December 2017, CARB adopted California's 2017 Climate Change Scoping Plan (2017 Scoping Plan) for public review and comment (CARB 2017). The 2017 Scoping Plan builds on the successful framework established in the initial Scoping Plan and First Update while identifying new, technologically feasible and cost-effective strategies that will serve as the framework to achieve the 2030 GHG target as established by SB 32 and define the state's climate change priorities to 2030 and beyond. The strategies' commitments include implementing renewable energy and energy efficiency strategies (including the mandates of SB 350), increasing stringency of the Low Carbon Fuel Standard, implementing measures identified in the Mobile Source and Freight Strategies, implementing measures identified in the proposed Short-Lived Climate Pollutant Reduction Strategy, and increasing stringency of SB 375 targets. To fill the gap in additional reductions needed to achieve the 2030 target, it recommends continuing the Cap-and-Trade Program and a measure to reduce GHGs from refineries by 20%.

For local governments, the 2017 Scoping Plan replaced the initial Scoping Plan's 15% reduction goal with a recommendation to aim for a community-wide goal of no more than 6 MT CO_2e per capita by 2030, and no more than 2 MT CO_2e per capita by 2050, which are consistent with the state's long-term goals. These goals are also consistent with the Under 2 Memorandum of Understanding (Under 2 2016) and the Paris Agreement, which are developed around the scientifically based levels necessary to limit global warming to below 2°C. The 2017 Scoping Plan recognized the benefits of local government GHG planning (e.g., through CAPs) and provided more information

regarding tools CARB is working on to support those efforts. It also recognized the CEQA streamlining provisions for project-level review where there is a legally adequate CAP.[7]

The Scoping Plan recommends strategies for implementation at the statewide level to meet the goals of AB 32, SB 32, and the executive orders, and establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions. A project is considered consistent with the statutes and executive orders if it meets the general policies in reducing GHG emissions to facilitate the achievement of the state's goals and does not impede attainment of those goals. A project would be consistent if it will further the objectives and not obstruct their attainment.

CARB adopted the 2022 Scoping Plan Update in December 2022, which outlines the state's plan to reach carbon neutrality by 2045 or earlier, while also assessing the progress the state is making toward reducing GHG emissions by at least 40% below 1990 levels by 2030, as is required by SB 32 and laid out in the Second Update. The carbon neutrality goal requires CARB to expand proposed actions from only the reduction of anthropogenic sources of GHG emissions to also include those that capture and store carbon (e.g., through natural and working lands, or mechanical technologies). The carbon reduction programs build on and accelerate those currently in place, including moving to zero-emission transportation; phasing out use of fossil gas use for heating homes and buildings; reducing chemical and refrigerants with high GWP; providing communities with sustainable options for walking, biking, and public transit; displacement of fossil-fuel fired electrical generation through use of renewable energy alternatives (e.g., solar arrays and wind turbines); and scaling up new options such as green hydrogen (CARB 2022b).

The 2022 Scoping Plan also emphasizes that there is no realistic path to carbon neutrality without carbon removal and sequestration, and to achieve the state's carbon neutrality goal, carbon reduction programs must be supplemented by strategies to remove and sequester carbon. Strategies for carbon removal and sequestration include carbon capture and storage from anthropogenic point sources, where CO_2 is captured as it leaves a facility's smokestack and is injected into geologic formations or used in industrial materials (e.g., concrete); and carbon dioxide removal from ambient air, through mechanical (e.g., direct air capture with sequestration) or nature-based (e.g., management of natural and working lands) applications.

The 2022 Scoping Plan included Appendix D, Local Actions, which includes recommendations intended to build momentum for local government actions that align with the State's climate goals, with a focus on local GHG reduction strategies (commonly referred to as climate action planning) and approval of new land use development projects, including through environmental review under CEQA. The recommendations provided in Appendix D are non-binding and should not be interpreted as a directive to local governments, but rather as evidence-based analytical tools to assist local governments with their role as essential partners in achieving California's climate goals. Appendix D recognizes consistency with a CEQA-qualified GHG reduction plan such as a Climate Action Plan as a preferred option for evaluating potential GHG emission impacts under CEQA. Absent a qualified GHG reduction plan, Appendix D provides additional potential threshold options including key attributes that residential and mixed-use projects should achieve that would align with the State's climate goals, a net-zero threshold, and use of air district recommended thresholds of significance.8

[7] *Sierra Club v. County of Napa* (2004) 121 Cal.App.4th 1490; *San Francisco Tomorrow et al. v. City and County of San Francisco* (2015) 229 Cal.App.4th 498; *San Franciscans Upholding the Downtown Specific Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656; *Sequoyah Hills Homeowners Assn. v. City of Oakland* (1993) 23 Cal.App.4th 704, 719.

[8] The threshold approaches outlined in the 2022 Scoping Plan, Appendix D, are recommendations only and are not requirements; they do not supplant lead agencies' discretion to develop their own evidence-based approaches for determining whether a project would have a potentially significant impact on GHG emissions.

SB 605 and SB 1383. SB 605 (2014) required CARB to complete a comprehensive strategy to reduce emissions of short-lived climate pollutants (SLCPs) in the state; and SB 1383 (2016) required CARB to approve and implement that strategy by January 1, 2018. SB 1383 also establishes specific targets for the reduction of SLCPs (40% below 2013 levels by 2030 for methane and HFCs, and 50% below 2013 levels by 2030 for anthropogenic black carbon), and provides direction for reductions from dairy and livestock operations and landfills. Accordingly, and as mentioned above, CARB adopted its *Short-Lived Climate Pollutant Reduction Strategy* (*SLCP Reduction Strategy*) in March 2017. The *SLCP Reduction Strategy* establishes a framework for the statewide reduction of emissions of black carbon, methane, and fluorinated gases (CARB 2017c).

Building Energy

Title 24, Part 6. Title 24 of the California Code of Regulations was established in 1978 and serves to enhance and regulate California's building standards. While not initially promulgated to reduce GHG emissions, Part 6 of Title 24 specifically established Building Energy Efficiency Standards that are designed to ensure new and existing buildings in California achieve energy efficiency and preserve outdoor and indoor environmental quality. These energy efficiency standards are reviewed every few years by the Building Standards Commission and the California Energy Commission (CEC) (and revised if necessary) (California Public Resources Code, Section 25402[b][1]). The regulations receive input from members of industry, as well as the public, with the goal of "reducing of wasteful, uneconomic, inefficient, or unnecessary consumption of energy" (California Public Resources Code, Section 25402). These regulations are carefully scrutinized and analyzed for technological and economic feasibility (California Public Resources Code, Section 25402[d]) and cost effectiveness (California Public Resources Code, Sections 25402[b][2] and [b][3]). As a result, these standards save energy, increase electricity supply reliability, increase indoor comfort, avoid the need to construct new power plants, and help preserve the environment.

The 2022 Title 24 standards are the currently applicable building energy efficiency standards, and became effective on January 1, 2023. The 2022 Title 24 standards improve upon the 2019 standards for new construction of, and additions and alterations to, residential and nonresidential buildings. The CEC adopted the 2022 Title 24 Energy Code in August 2021 and the California Building Standards Commission approved incorporating the updated code into the California Building Standards Code (CALGreen) in December 2021. The 2022 Energy Code went into effect on January 1, 2023. The 2022 Energy Code focuses on four key areas in newly constructed homes and businesses:

- Encouraging electric heat pump technology for space and water heating, which consumes less energy and produces fewer emissions than gas-powered units.
- Establishing electric-ready requirements for single-family homes to position owners to use cleaner electric heating, cooking, and electric vehicle (EV) charging options whenever they choose to adopt those technologies.
- Expanding solar photovoltaic (PV) system and battery storage standards to make clean energy available onsite and complement the state's progress toward a 100% clean electricity grid.
- Strengthening ventilation standards to improve indoor air quality.

Title 24, Part 11. In addition to the CEC's efforts, in 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11 of Title 24) is commonly referred to as California's Green Building Standards (CALGreen), and establishes minimum mandatory standards and voluntary standards pertaining to the planning and design of sustainable site development, energy

efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and interior air quality. The CALGreen standards took effect in January 2011 and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low-rise residential and state-owned buildings and schools and hospitals. The CALGreen 2022 standards, which are the current standards, became effective January 1, 2023..

Title 20. Title 20 of the California Code of Regulations requires manufacturers of appliances to meet state and federal standards for energy and water efficiency. The CEC certifies an appliance based on a manufacturer's demonstration that the appliance meets the standards. New appliances regulated under Title 20 include refrigerators, refrigerator-freezers, and freezers; room air conditioners and room air-conditioning heat pumps; central air conditioners; spot air conditioners; vented gas space heaters; gas pool heaters; plumbing fittings and plumbing fixtures; fluorescent lamp ballasts; lamps; emergency lighting; traffic signal modules; dishwaters; clothes washers and dryers; cooking products; electric motors; low-voltage dry-type distribution transformers; power supplies; televisions and consumer audio and video equipment; and battery charger systems. Title 20 presents protocols for testing each type of appliance covered under the regulations and appliances must meet the standards for energy performance, energy design, water performance and water design. Title 20 contains three types of standards for appliances: federal and state standards for federally regulated appliances, state standards for federally regulated appliances, and state standards for non-federally regulated appliances.

SB 1. SB 1 (Murray) (August 2006) established a $3 billion rebate program to support the goal of the state to install rooftop solar energy systems with a generation capacity of 3,000 megawatts through 2016. SB 1 added sections to the Public Resources Code, including Chapter 8.8 (California Solar Initiative), that require building projects applying for ratepayer-funded incentives for photovoltaic systems to meet minimum energy efficiency levels and performance requirements. Section 25780 established that it is a goal of the state to establish a self-sufficient solar industry. The goals included establishing solar energy systems as a viable mainstream option for both homes and businesses within 10 years of adoption, and placing solar energy systems on 50% of new homes within 13 years of adoption. SB 1, also termed "Go Solar California," was previously titled "Million Solar Roofs."

Renewable Energy and Energy Procurement

SB 1078. SB 1078 (Sher) (September 2002) established the Renewable Portfolio Standard (RPS) program, which required an annual increase in renewable generation by the utilities equivalent to at least 1% of sales, with an aggregate goal of 20% by 2017. This goal was subsequently accelerated, requiring utilities to obtain 20% of their power from renewable sources by 2010 (see SB 107, EO S-14-08, and S-21-09).

SB 1368. SB 1368 (September 2006), required the CEC to develop and adopt regulations for GHG emission performance standards for the long-term procurement of electricity by local publicly owned utilities. These standards must be consistent with the standards adopted by the California Public Utilities Commission (CPUC).

AB 1109. Enacted in 2007, AB 1109 required the CEC to adopt minimum energy efficiency standards for general-purpose lighting, to reduce electricity consumption 50% for indoor residential lighting and 25% for indoor commercial lighting.

EO S-14-08. EO S-14-08 (November 2008) focused on the contribution of renewable energy sources to meet the electrical needs of California while reducing the GHG emissions from the electrical sector. This EO required that all retail suppliers of electricity in California serve 33% of their load with renewable energy by 2020. Furthermore, the

EO directed state agencies to take appropriate actions to facilitate reaching this target. The California Natural Resources Agency (CNRA), through collaboration with the CEC and California Department of Fish and Wildlife (formerly the California Department of Fish and Game), was directed to lead this effort.

EO S-21-09 and SBX1-2. EO S-21-09 (September 2009) directed CARB to adopt a regulation consistent with the goal of EO S-14-08 by July 31, 2010. CARB was further directed to work with the CPUC and CEC to ensure that the regulation builds upon the RPS program and was applicable to investor-owned utilities, publicly owned utilities, direct access providers, and community choice providers. Under this order, CARB was to give the highest priority to those renewable resources that provide the greatest environmental benefits with the least environmental costs and impacts on public health and can be developed the most quickly in support of reliable, efficient, cost-effective electricity system operations. On September 23, 2010, CARB initially approved regulations to implement a Renewable Electricity Standard. However, this regulation was not finalized because of subsequent legislation (SB X1-2, Simitian, statutes of 2011) signed by Governor Brown in April 2011.

SB X1 2 expanded the Renewables Portfolio Standard by establishing a renewable energy target of 20% of the total electricity sold to retail customers in California per year by December 31, 2013, and 33% by December 31, 2020, and in subsequent years. Under the bill, a renewable electrical generation facility is one that uses biomass, solar thermal, photovoltaic, wind, geothermal, fuel cells using renewable fuels, small hydroelectric generation (30 megawatts or less), digester gas, municipal solid waste conversion, landfill gas, ocean wave, ocean thermal, or tidal current, and that meets other specified requirements with respect to its location.

SB X1-2 applies to all electricity retailers in the state including publicly owned utilities, investor-owned utilities, electricity service providers, and community choice aggregators. All of these entities must meet the renewable energy goals previously listed.

SB 350. SB 350 (October 2015, Clean Energy and Pollution Reduction Act) further expanded the RPS by establishing a goal of 50% of the total electricity sold to retail customers in California per year by December 31, 2030. In addition, SB 350 included the goal to double the energy efficiency savings in electricity and natural gas final end uses (e.g., heating, cooling, lighting, or class of energy uses on which an energy-efficiency program is focused) of retail customers through energy conservation and efficiency. The bill also requires the California Public Utilities Commission, in consultation with the CEC, to establish efficiency targets for electrical and gas corporations consistent with this goal. Regarding mobile sources, as one of its elements, SB 350 establishes a statewide policy for widespread electrification of the transportation sector, recognizing that such electrification is required for achievement of the state's 2030 and 2050 reduction targets (see California Public Utilities Code Section 740.12).

SB 100. SB 100 (2018) increased the standards set forth in SB 350 establishing that 44% of the total electricity sold to retail customers in California per year by December 31, 2024, 52% by December 31, 2027, and 60% by December 31, 2030, be secured from qualifying renewable energy sources. SB 100 states that it is the policy of the state that eligible renewable energy resources and zero-carbon resources supply 100% of the retail sales of electricity to California. This bill requires that the achievement of 100% zero-carbon electricity resources do not increase the carbon emissions elsewhere in the western grid and that the achievement not be achieved through resource shuffling.

Mobile Sources

State Vehicle Standards (AB 1493 and EO B-16-12). AB 1493 (July 2002) was enacted in a response to the transportation sector accounting for more than half of California's CO_2 emissions. AB 1493 required CARB to set GHG emission standards for passenger vehicles, light-duty trucks, and other vehicles determined by the state board to be vehicles that are primarily used for noncommercial personal transportation in the state. The bill required that CARB set GHG emission standards for motor vehicles manufactured in 2009 and all subsequent model years. CARB adopted the standards in September 2004. EO B-16-12 (March 2012) required that state entities under the governor's direction and control support and facilitate the rapid commercialization of zero-emissions vehicles. It ordered CARB, CEC, California Public Utilities Commission, and other relevant agencies to work with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to help achieve benchmark goals by 2015, 2020, and 2025. On a statewide basis, EO B-16-12 established a target reduction of GHG emissions from the transportation sector equaling 80% less than 1990 levels by 2050. This directive did not apply to vehicles that have special performance requirements necessary for the protection of the public safety and welfare.

EO S-1-07. EO S-1-07 (January 2007, implementing regulation adopted in April 2009) sets a declining LCFS for GHG emissions measured in CO_2e grams per unit of fuel energy sold in California. The target of the LCFS is to reduce the carbon intensity of California passenger vehicle fuels by at least 10% by 2020 (17 CCR 95480 et seq.). The carbon intensity measures the amount of GHG emissions in the lifecycle of a fuel, including extraction/feedstock production, processing, transportation, and final consumption, per unit of energy delivered.

SB 375. SB 375 (Steinberg) (September 2008) addresses GHG emissions associated with the transportation sector through regional transportation and sustainability plans. SB 375 requires CARB to adopt regional GHG reduction targets for the automobile and light-truck sector for 2020 and 2035 and to update those targets every 8 years. SB 375 requires the state's 18 regional metropolitan planning organizations (MPOs) to prepare a Sustainable Communities Strategy (SCS) as part of their Regional Transportation Plan (RTP) that will achieve the GHG reduction targets set by CARB. If a MPO is unable to devise an SCS to achieve the GHG reduction target, the MPO must prepare an Alternative Planning Strategy demonstrating how the GHG reduction target would be achieved through alternative development patterns, infrastructure, or additional transportation measures or policies.

Pursuant to California Government Code Section 65080(b)(2)(K),an SCS does not: (i) regulate the use of land; (ii) supersede the land use authority of cities and counties; or (iii) require that a city's or county's land use policies and regulations, including those in a general plan, be consistent with it (California Government Code Section 65080[b][2][K]). Nonetheless, SB 375 makes regional and local planning agencies responsible for developing those strategies as part of the federally required metropolitan transportation planning process and the state-mandated housing element process.

SANDAG serves as the MPO for the San Diego region and is responsible for developing and adopting a SCS that integrates transportation, land use, and housing to meet GHG reduction targets set by CARB. The RTP/SCS is updated every 4 years in collaboration the 18 cities and unincorporated County of San Diego, in addition to regional, state, and federal partners. The most recent, *San Diego Forward: The 2021 Regional Plan* was adopted in 2021 and provides guidance on meeting or exceed GHG targets through implementation of five key transportation strategies, including complete corridors, high-speed transit services, mobility hubs, flexible fleets, and a digital platform to tie the transportation system together. Through these strategies, the *2021 Regional Plan* is projected

to reduce per capita GHG emissions from cars and light-duty trucks to 20% below 2005 levels by 2035, exceeding the regions state-mandated target of 19% (SANDAG 2021).

Advanced Clean Cars Program and Zero-Emissions Vehicle Program. The Advanced Clean Cars (ACC) I program (January 2012) is an emissions-control program for model years 2015 through 2025. The program combines the control of smog- and soot-causing pollutants and GHG emissions into a single coordinated package of regulations: the Low-Emission Vehicle (LEV) regulation for criteria air pollutant and GHG emissions and a technology forcing regulation for zero-emission vehicles (ZEV) that contributes to both types of emission reductions (CARB 2021a). The package includes elements to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars. To improve air quality, CARB has implemented new emission standards to reduce smog-forming emissions beginning with 2015 model year vehicles. It is estimated that in 2025 cars will emit 75 percent less smog-forming pollution than the average new car sold in 2015. The ZEV program will act as the focused technology of the ACC I program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid EVs in the 2018 to 2025 model years.

The ACC II program is currently in development to establish the next set of LEV and ZEV requirements for model years after 2025 to contribute to meeting federal ambient air quality ozone standards and California's carbon neutrality standards (CARB 2021a). The main objectives of ACC II are:

1. Maximize criteria and GHG emission reductions through increased stringency and real-world reductions.

2. Accelerate the transition to ZEVs through both increased stringency of requirements and associated actions to support wide-scale adoption and use.

The ACC II program establishes the next set of LEV and ZEV requirements for model years after 2025 to contribute to meeting federal ambient air quality ozone standards and California's carbon neutrality standards (CARB 2022c). The ACC II rulemaking package also considers technological feasibility, environmental impacts, equity, economic impacts, and consumer impacts. The ACC II regulations were approved by the California Office of Administrative Law (OAL) and became effective on November 30, 2022.

EO N-79-20. EO N-79-20 (September 2020) requires CARB to develop regulations as follows: (1) Passenger vehicle and truck regulations requiring increasing volumes of new ZEVs sold in the State towards the target of 100% of in-state sales by 2035; (2) medium- and heavy-duty vehicle regulations requiring increasing volumes of new zero-emission trucks and buses sold and operated in the State towards the target of 100% of the fleet transitioning to zero-emission vehicles by 2045 everywhere feasible and for all drayage trucks to be zero emission by 2035; and (3) strategies, in coordination with other State agencies, the EPA and local air districts, to achieve 100% zero-emission from off-road vehicles and equipment operations in the State by 2035. EO N-79-20 called for the development of a Zero-Emissions Vehicle Market Development Strategy, which was released February 2021, to be updated every 3 years, that ensures coordination and implementation of the EO and outlines actions to support new and used ZEV markets. The primary mechanism for achieving the ZEV target for passenger cars and light trucks is the Advanced Clean Cars II (ACCII) Program, approved in August 2022. In addition to ACC II, the Clean Miles Standard regulation will also help enable the goal of 100 percent ZEV sales in 2035 by creating demand for ZEVs. This regulation will have aggressive requirements for electric miles that will transition ride-hailing fleets to zero-emission operations starting in 2023 and ramping up through 2030. This regulation was approved by the Board in 2021.

Advanced Clean Trucks Regulation. The Advanced Clean Trucks (ACT) Regulation was also approved by CARB in 2020. The purpose of the ACT Regulation is to accelerate the market for zero-emission vehicles in the medium- and heavy-duty truck sector and to reduce air pollutant emissions generated from on-road mobile sources (CARB 2021b). The regulation has two components including (1) a manufacturer sales requirement and (2) a reporting requirement:

1. Zero-emission truck sales: Manufacturers who certify Class 2b-8 chassis or complete vehicles with combustion engines will be required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales would need to be 55% of Class 2b – 3 truck sales, 75% of Class 4 – 8 straight truck sales, and 40% of truck tractor sales.

Company and fleet reporting: Large employers including retailers, manufacturers, brokers and others will be required to report information about shipments and shuttle services. Fleet owners, with 50 or more trucks, will be required to report about their existing fleet operations. This information will help identify future strategies to ensure that fleets purchase available zero-emission trucks and place them in service where suitable to meet their needs.

Water

EO B-29-15. In response to the ongoing drought in California, EO B-29-15 (April 2015) set a goal of achieving a statewide reduction in potable urban water usage of 25% relative to water use in 2013. The term of the EO extended through February 28, 2016, although many of the directives have become permanent water-efficiency standards and requirements. The EO includes specific directives that set strict limits on water usage in the state. In response to EO B-29-15, the California Department of Water Resources has modified and adopted a revised version of the Model Water Efficient Landscape Ordinance that, among other changes, significantly increases the requirements for landscape water use efficiency and broadens its applicability to include new development projects with smaller landscape areas.

EO B-37-16. Issued May 2016, EO B-37-16 directed the State Water Resources Control Board (SWRCB) to adjust emergency water conservation regulations through the end of January 2017 to reflect differing water supply conditions across the state. The SWRCB also developed a proposal to achieve a mandatory reduction of potable urban water usage that builds off the mandatory 25% reduction called for in EO B-29-15. The SWRCB and Department of Water Resources will develop new, permanent water use targets that build upon the existing state law requirements that the state achieve 20% reduction in urban water usage by 2020. EO B-37-16 also specifies that the SWRCB permanently prohibit water-wasting practices such as hosing off sidewalks, driveways, and other hardscapes; washing automobiles with hoses not equipped with a shut-off nozzle; using non-recirculated water in a fountain or other decorative water feature; watering lawns in a manner that causes runoff, or within 48 hours after measurable precipitation; and irrigating ornamental turf on public street medians.

EO N-10-21. In response to a state of emergency due to severe drought conditions, EO N-10-21 (July 2021) called on all Californians to voluntarily reduce their water use by 15% from their 2020 levels. Actions suggested in EO N-10-21 include reducing landscape irrigation, running dishwashers and washing machines only when full, finding and fixing leaks, installing water-efficient showerheads, taking shorter showers, using a shut-off nozzle on hoses, and taking cars to commercial car washes that use recycled water.

Solid Waste

AB 939, AB 341, AB 1826, and SB 1383. In 1989, AB 939, known as the Integrated Waste Management Act (California Public Resources Code, Sections 40000 et seq.), was passed because of the increase in waste stream and the decrease in landfill capacity. The statute established the California Integrated Waste Management Board, which oversees a disposal reporting system. AB 939 mandated a reduction of waste being disposed where jurisdictions were required to meet diversion goals of all solid waste through source reduction, recycling, and composting activities of 25% by 1995 and 50% by the year 2000.

AB 341 (Chapter 476, Statutes of 2011 [Chesbro]) amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is the policy goal of the state that not less than 75% of solid waste generated be source-reduced, recycled, or composted by the year 2020, and annually thereafter. In addition, AB 341 required the California Department of Resources Recycling and Recovery (CalRecycle) to develop strategies to achieve the state's policy goal. CalRecycle has conducted multiple workshops and published documents that identify priority strategies that it believes would assist the state in reaching the 75% goal by 2020. AB 341 sets a statewide goal for 75 percent disposal reduction by the year 2020. This is not written as a 75 percent diversion mandate for each jurisdiction. The 50 percent disposal reduction mandate still stands for cities, counties, and State agencies (including community colleges) under AB 939 and AB 75, respectively. CalRecycle will continue to evaluate program implementation as it has in the past through the Annual Report review process for entities subject to either AB 939 or AB 75. Similarly, AB 341 does not mandate a diversion goal for businesses, it simply requires that they implement a commercial recycling program.

AB 1826 (Chapter 727, Statutes of 2014, effective 2016) requires businesses to recycle their organic waste (i.e., food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste) depending on the amount of waste they generate per week. This law also requires local jurisdictions across the state to implement an organic waste recycling program to divert organic waste generated by businesses, including multifamily residential dwellings that consist of five or more units. The minimum threshold of organic waste generation by businesses decreases over time, which means an increasingly greater proportion of the commercial sector will be required to comply.

SB 1383 (2016) requires a 50% reduction in organic waste disposal from 2014 levels by 2020, and a 75% reduction by 2025—essentially requiring the diversion of up to 27 million tons of organic waste—to reduce GHG emissions. SB 1383 also requires that not less than 20% of edible food that is currently disposed be recovered for human consumption by 2025.

Other State Actions

SB 97. SB 97 (Dutton) (August 2007) directed the Governor's Office of Planning and Research to develop guidelines under CEQA for the mitigation of GHG emissions. In 2008, the Governor's Office of Planning and Research issued a technical advisory as interim guidance regarding the analysis of GHG emissions in CEQA documents. The advisory indicated that the lead agency should identify and estimate a project's GHG emissions, including those associated with vehicular traffic, energy consumption, water usage, and construction activities (OPR 2008). The advisory further recommended that the lead agency determine significance of the impacts and impose all mitigation measures necessary to reduce GHG emissions to a level that is less than significant. The CNRA adopted the CEQA Guidelines amendments in December 2009, which became effective in March 2010.

Under the amended Guidelines, a lead agency has the discretion to determine whether to use a quantitative or qualitative analysis or apply performance standards to determine the significance of GHG emissions resulting from a particular project (14 CCR 15064.4(a)). The Guidelines require a lead agency to consider the extent to which the Project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4(b)). The Guidelines also allow a lead agency to consider feasible means of mitigating the significant effects of GHG emissions, including reductions in emissions through the implementation of project features or off-site measures. The adopted amendments do not establish a GHG emission threshold, instead allowing a lead agency to develop, adopt, and apply its own thresholds of significance or those developed by other agencies or experts. The CNRA also acknowledges that a lead agency may consider compliance with regulations or requirements implementing AB 32 in determining the significance of a project's GHG emissions (CNRA 2009a).

With respect to GHG emissions, the CEQA Guidelines state in Section 15064.4(a) that lead agencies should "make a good faith effort, to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions. The CEQA Guidelines note that an agency may identify emissions by either selecting a "model or methodology" to quantify the emissions or by relying on "qualitative analysis or other performance-based standards" (14 CCR 15064.4(a)). Section 15064.4(b) states that the lead agency should consider the following when assessing the significance of impacts from GHG emissions on the environment: (1) the extent a project may increase or reduce GHG emissions as compared to the existing environmental setting; (2) whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and (3) the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4(b)).

EO S-13-08. EO S-13-08 (November 2008) is intended to hasten California's response to the impacts of global climate change, particularly sea-level rise. Therefore, the EO directs state agencies to take specified actions to assess and plan for such impacts. The final 2009 California Climate Adaptation Strategy report was issued in December 2009 (CNRA 2009b), and an update, Safeguarding California: Reducing Climate Risk, followed in July 2014 (CNRA 2014). To assess the state's vulnerability, the report summarizes key climate change impacts to the state for the following areas: Agriculture, Biodiversity and Habitat, Emergency Management, Energy, Forestry, Ocean and Coastal Ecosystems and Resources, Public Health, Transportation, and Water. Issuance of the Safeguarding California: Implementation Action Plans followed in March 2016 (CNRA 2016). In January 2018, the CNRA released the Safeguarding California Plan: 2018 Update, which communicates current and needed actions that state government should take to build climate change resiliency (CNRA 2018).

3.2.3 Local Regulations

3.2.3.1 San Diego County Air Pollution Control District

The SDAPCD does not have established GHG rules, regulations, or policies.

3.2.3.2 City of San Marcos

City of San Marcos Climate Action Plan

The City adopted its CAP on December 8, 2020 (City of San Marcos 2020). The CAP acts as a roadmap to address challenges of climate change within the City. The CAP builds on the efforts and strategies identified in the City's 2013 CAP and establishes GHG emission reduction targets and identifies achievable, locally based actions to reduce GHG emissions from municipal and community activities. The CAP includes a baseline GHG emissions inventory for 2012, GHG emissions forecasts for 2020 and 2030, local GHG emissions reduction strategies and measures to help the City achieve the 2030 target, climate adaptation measures for the City, and implementation and monitoring mechanisms to ensure the City's measures and targets are achieved. The CAP established GHG emissions reduction goals of 4% below 2012 levels by 2020 and 42% below 2012 levels by 2030 (City of San Marcos 2020). The CAP was prepared in accordance with the requirements within CEQA Guidelines Section 15183.5, and the CAP Consistency Checklist was used to evaluate the Project's significance with respect to GHG emissions.

City of San Marcos General Plan

The City's General Plan (City of San Marcos 2012) includes various policies related to reducing Air Quality and GHG emissions. Applicable policies include the following:

Land Use and Community Design Element

Policy LU-2.1: Promote compact development patterns that reduce air pollution and automobile dependence and facilitate walking, bicycling, and transit use.

Policy LU-2.3: Promote landscaping (e.g., native, drought tolerant plants) that minimizes demands on water supply.

Policy LU-2.7: Promote the instillation of trees to reduce the urban heat-island effect and green infrastructure to reduce storm water runoff.

Policy LU-3.1: Require that new development and redevelopment incorporate connections and reduce barriers between neighborhoods, transit corridors, and activity centers within the City.

Mobility Element

Policy M-2.1: Work with new development to design roadways that minimize traffic volumes and/or speed, as appropriate within residential neighborhoods; while maintaining the City's desire to provide connectivity on the roadway network.

Conservation and Open Space Element

Policy COS-4.5: Encourage energy conservation and the use of alternative energy sources within the community.

Policy COS-4.6: Promote efficient use of energy and conservation of available resources in the design, construction, maintenance and operation of public and private facilities, infrastructure and equipment.

Policy COS-4.8: Encourage and support the generation, transmission and use of renewable energy.

Policy COS-4.9: Encourage use and retrofitting of existing buildings under Title 24 of the California Building Energy Code.

3.3 Greenhouse Gas Inventories and Climate Change Conditions

3.3.1 Sources of Greenhouse Gas Emissions

Anthropogenic GHG emissions worldwide in 2019 (the most recent year for which data is available) totaled approximately 52,400 MMT of CO_2e, excluding land use change and forestry (PBL 2020). The top six GHG emitters include China, the United States, the Russian Federation, India, Japan, and the European Union, which accounted for approximately 62% of the total global emissions, or approximately 32,500 MMT CO_2e (PBL 2020).

Per the EPA Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990 to 2019 (EPA 2021c), total United States GHG emissions were approximately 6,558.3 MMT CO_2e in 2019 (EPA 2021c). The primary GHG emitted by human activities in the United States was CO_2, which represented approximately 80.1% of total GHG emissions (5,255.8 MMT CO_2e). The largest source of CO_2, and of overall GHG emissions, was fossil-fuel combustion, which accounted for approximately 92.4% of CO_2 emissions in 2019 (4,856.7 MMT CO_2e). Relative to 1990, gross United States GHG emissions in 2019 were 1.8% higher; however, the gross emissions were down from a high of 15.6% above 1990 levels in 2007. GHG emissions decreased from 2018 to 2019 by 1.7% (113.1 MMT CO_2e) and overall, net emissions in 2019 were 13% below 2005 levels (EPA 2021c).

According to California's 2000–2019 GHG emissions inventory (2021 edition), California emitted approximately 418 MMT CO2e in 2019, including emissions resulting from out-of-state electrical generation (CARB 2021c). The sources of GHG emissions in California include transportation, industry, electric power production from both in-state and out-of-state sources, residential and commercial activities, agriculture, high-GWP substances, and recycling and waste. Table 10 presents California GHG emission source categories and their relative contributions to the emissions inventory in 2019. Between 2000 and 2019, per-capita GHG emissions in California have dropped from a peak of 14.0 MT per person in 2001 to 10.5 MT per person in 2019, representing an approximate 25% decrease. In addition, total GHG emissions in 2019 were approximately 7 MMT CO_2e lower than 2018 emissions (CARB 2021c).

Table 10. Greenhouse Gas Emissions Sources in California

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total
Transportation	166.1	39.7%
Industrial	88.2	21.1%
Electric power	58.8	14.1%
Commercial and residential	43.8	10.5%
Agriculture	31.8	7.6%
High global-warming potential substances	20.6	4.9%
Recycling and waste	8.9	2.1%
Totals	**418.2**	**100%**

Source: CARB 2021c.

Notes: GHG = greenhouse gas; GWP = global warming potential; MMT CO_2e = million metric tons of carbon dioxide equivalent.
Emissions reflect 2019 California GHG inventory.
Totals may not sum due to rounding.

The City has established a goal to reduce its community-wide GHG to reduce GHG emissions 40% below 1990 levels by 2030 (City of San Marcos 2020). The City's community-wide GHG emissions inventory for baseline year 2012 is presented in Table 10 for informational purposes.

Table 11. City of San Marcos (Year 2012) Communitywide Greenhouse Gas Emissions Inventory

Community Sector	Total MT CO_2e/year	CO_2e (%)
On-Road Transportation	322,000	54%
Electricity	162,000	27%
Natural Gas	75,000	12%
Solid Waste	15,000	3%
Off-Road Transportation	14,000	2%
Water	9,000	1%
Wastewater	3,000	<1%
Total	**599,000**	**100%**

Source: City of San Marcos 2020.
Note: GHG = greenhouse gas; MT CO_2e = metric tons of carbon dioxide equivalent per year
Totals may not sum due to rounding.

3.3.2 Potential Effects of Climate Change

In California, climate change impacts have the potential to affect sea-level rise, agriculture, snowpack and water supply, forestry, wildfire risk, public health, and electricity demand and supply. The primary effect of global climate change has been a rise in average global tropospheric temperature. Reflecting the long-term warming trend since pre-industrial times, observed mean surface temperature for the decade 2006–2015 was 0.87°C (likely between 0.75°C and 0.99°C) higher than the average over the 1850–1900 period (IPCC 2018). Scientific modeling predicts that continued emissions of GHGs at or above current rates would induce more extreme climate changes during the twenty-first century than were observed during the twentieth century. Human activities are estimated to have caused approximately 1.0°C (1.8°F) of global warming above pre-industrial levels, with a likely range of 0.8°C to 1.2°C (1.4°F to 2.2°F) (IPCC 2018). Global warming is likely to reach 1.5°C (2.7°F) between 2030 and 2052 if it continues to increase at the current rate (IPCC 2018).

Although climate change is driven by global atmospheric conditions, climate change impacts are felt locally. A scientific consensus confirms that climate change is already affecting California. The Office of Environmental Health Hazard Assessment identified various indicators of climate change in California, which are scientifically based measurements that track trends in various aspects of climate change. Many indicators reveal discernible evidence that climate change is occurring in California and is having significant, measurable impacts in the state. Changes in the state's climate have been observed, including an increase in annual average air temperature with record warmth from 2012 to 2016, more frequent extreme heat events, more extreme drought, a decline in winter chill, an increase in cooling degree days and a decrease in heating degree days, and an increase in variability of statewide precipitation (OEHHA 2018).

Warming temperatures and changing precipitation patterns have altered California's physical systems—the ocean, lakes, rivers and snowpack—upon which the state depends. Winter snowpack and spring snowmelt runoff from the Sierra Nevada and southern Cascade Mountains provide approximately one-third of the state's annual water supply. Impacts of climate on physical systems have been observed, such as high variability of snow-water content (i.e., amount of water stored in snowpack), decrease in snowmelt runoff, glacier change (loss in area), rise in sea levels, increase in average lake water temperature and coastal ocean temperature, and a decrease in dissolved oxygen in coastal waters (OEHHA 2018).

Impacts of climate change on biological systems, including humans, wildlife, and vegetation, have also been observed, including climate change impacts on terrestrial, marine, and freshwater ecosystems. As with global observations, species responses include those consistent with warming: elevational or latitudinal shifts in range, changes in the timing of key plant and animal life cycle events, and changes in the abundance of species and in community composition. Humans are better able to adapt to a changing climate than plants and animals in natural ecosystems. Nevertheless, climate change poses a threat to public health, as warming temperatures and changes in precipitation can affect vector-borne pathogen transmission and disease patterns in California as well as the variability of heat-related deaths and illnesses. In addition, since 1950, the area burned by wildfires each year has been increasing.

The CNRA has released four California Climate Change Assessments (2006, 2009, 2012, and 2018), which have addressed the following: acceleration of warming across the state, more intense and frequent heat waves, greater riverine flows, accelerating sea level rise, more intense and frequent drought, more severe and frequent wildfires, more severe storms and extreme weather events, shrinking snowpack and less overall precipitation, and ocean acidification, hypoxia, and warming. To address local and regional governments need for information to support action in their communities, the Fourth Assessment includes reports for nine regions of the state, including the San Diego Region, where the Project is located. Key projected climate changes for the San Diego Region include the following (CNRA 2019):

- Temperature is projected to increase substantially, along with mean temperature, heat wave frequency will increase, with more intensity and longer duration.
- Precipitation will remain highly variable but will change in character, with wetter winters, drier springs, and more frequent and severe droughts punctuated by more intense individual precipitation events.
- Wildfire risk will increase in the future as climate warms. The risk for large catastrophic wildfires driven by Santa Ana wind events will also likely increase as a result of a drier autumns leading to low antecedent precipitation before the height of the Santa Ana wind season.
- The sea level along San Diego County is expected to rise. High tides combined with elevated shoreline water levels produced by locally and distantly driven wind-driven waves will drive extreme events. Longer-term sea level will increase rapidly in the second half of the century and will be punctuated by short periods of storm-driven extreme sea levels that will imperil existing infrastructure, structures, and ecosystems with increasing frequency.

Agriculture. Some of the specific challenges faced by the agricultural sector and farmers include more drastic and unpredictable precipitation and weather patterns; extreme weather events that range from severe flooding to extreme drought, to destructive storm events; significant shifts in water availably and water quality; changes in pollinator lifecycles; temperature fluctuations, including extreme heat stress and decreased chill hours; increased risks from invasive species and weeds, agricultural pests and plant diseases; and disruptions to the transportation and energy infrastructure supporting agricultural production.

Biodiversity and Habitat. Specific climate change challenges to biodiversity and habitat include species migration in response to climatic changes, range shift and novel combinations of species; pathogens, parasites and disease; invasive species; extinction risks; changes in the timing of seasonal life-cycle events; food web disruptions; threshold effects (i.e., a change in the ecosystem that results in a "tipping point" beyond which irreversible damage or loss has occurred).

Energy. Specific climate change challenges for the energy sector include temperature, fluctuating precipitation patterns, increasing extreme weather events, and sea-level rise.

Forestry. The most significant climate change related risk to forests is accelerated risk of wildfire and more frequent and severe droughts. Droughts have resulted in more large-scale mortalities and combined with increasing temperatures have led to an overall increase in wildfire risks. Increased wildfire intensity subsequently increases public safety risks, property damage, fire suppression and emergency response costs, watershed and water quality impacts, and vegetation conversions.

Ocean and Coastal Ecosystems and Resources. Sea-level rise, changing ocean conditions, and other climate change stressors are likely to exacerbate long-standing challenges related to ocean and coastal ecosystems in addition to threatening people and infrastructure located along the California coastline and in coastal communities. Sea-level rise, in addition to more frequent and severe coastal storms and erosion, are threatening vital infrastructure such as roads, bridges, power plants, ports and airports, gasoline pipes, and emergency facilities, as well as negatively impacting the coastal recreational assets such as beaches and tidal wetlands.

Public Health. Climate change can impact public health through various environmental changes and is the largest threat to human health in the twenty-first century. Changes in precipitation patterns affect public health primarily through potential for altered water supplies, and extreme events such as heat, floods, droughts, and wildfires. Increased frequency, intensity, and duration of extreme heat and heat waves are likely to increase the risk of mortality due to heat-related illness, as well as exacerbate existing chronic health conditions. Other extreme weather events are likely to negatively impact air quality and increase or intensify respiratory illness, such as asthma and allergies.

Transportation. Although the transportation industry is a source of GHG emissions, it is also vulnerable to climate change risks. Increasing temperatures and extended periods of extreme heat threaten the integrity of the roadways and rail lines. High temperatures cause the road surfaces to expand, which leads to increased pressure and pavement buckling. High temperatures can also cause rail breakages, which could lead to train derailment. Other forms of extreme weather events, such as extreme storm events, can negatively impact infrastructure, which can impair movement of peoples and goods, or potentially block evacuation routes and emergency access roads. Increased wildfires, flooding, erosion risks, landslides, mudslides, and rockslides can all profoundly impact the transportation system and pose a serious risk to public safety.

Water. Climate change could seriously impact the timing, form, amount of precipitation, runoff patterns, and frequency and severity of precipitation events. Higher temperatures reduce the amount of snowpack and lead to earlier snowmelt, which can impact water supply availability, natural ecosystems, and winter recreation. Water supply availability during the intense dry summer months is heavily dependent on the snowpack accumulated during the winter time. Increased risk of flooding has a variety of public health concerns, including water quality, public safety, property damage, displacement, and post-disaster mental health problems. Prolonged and intensified droughts can also negatively groundwater reserves and result in increased overdraft and subsidence. The higher risk of wildfires can lead to increased erosion, which can negatively impact watersheds and result in poor water quality.

3.4 Significance Criteria and Methodology

3.4.1 Thresholds of Significance

The significance criteria used to evaluate the Project's GHG emissions impacts is based on the recommendations provided in Appendix G of the CEQA Guidelines. For the purposes of this GHG emissions analysis, the Project would have a significant environmental impact if it would (14 CCR 15000 et seq.):

1. Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?
2. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs?

Global climate change is a cumulative impact; a project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHGs. There are currently no established thresholds for assessing whether the GHG emissions of a project, such as the Project, would be considered a cumulatively considerable contribution to global climate change; however, all reasonable efforts should be made to minimize a project's contribution to global climate change. In addition, while GHG impacts are recognized exclusively as cumulative impacts (CAPCOA 2008), GHG emissions impacts must also be evaluated on a project-level under CEQA.

The CEQA Guidelines do not prescribe specific methodologies for performing an assessment, do not establish specific thresholds of significance, and do not mandate specific mitigation measures. Rather, the CEQA Guidelines emphasize the lead agency's discretion to determine the appropriate methodologies and thresholds of significance consistent with the manner in which other impact areas are handled in CEQA (CNRA 2009a).

The City adopted the Final CAP on December 8, 2020. The CAP relies on a screening threshold of 500 MT CO_2e per year based on land use size and a CAP Consistency Checklist to determine whether a project's emissions would be consistent with GHG emissions estimated within the City's CAP. Projects that are consistent with the City's CAP, as determined through the CAP Consistency Checklist, would result in a less-than-significant cumulative impact regarding GHG emissions. If a project is not consistent with the City's CAP, as determined through the CAP Consistency Checklist, potentially significant cumulative GHG impacts would occur.

3.4.2 Approach and Methodology

3.4.2.1 Construction

CalEEMod Version 2020.4.0 was used to estimate potential Project-generated GHG emissions during construction. Construction of the Project would result in GHG emissions primarily associated with use of off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. All details for construction criteria air pollutants discussed in Section 2.4.2.1, are also applicable for the estimation of construction-related GHG emissions. As such, see Section 2.4.2.1 for a discussion of construction emissions calculation methodology and assumptions.

3.4.2.2 Operation

As with Air Quality, emissions from the operational phase of the Project were estimated using CalEEMod Version 2020.4.0. Operational year 2027 was assumed as the first full year after completion of Project construction.

Area Sources

CalEEMod was used to estimate GHG emissions from the Project's area sources, which include operation of gasoline-powered landscape maintenance equipment, which produce minimal GHG emissions. See Section 2.4.2.2, for a discussion of landscaping equipment emissions calculations.

Energy Sources

Title 24 of the California Code of Regulations serves to enhance and regulate California's building standards. The 2022 Title 24 standards are the currently applicable building energy efficiency standards, and became effective on January 1, 2023.. CalEEMod assumes compliance with the 2019 Title 24 code. Therefore, this is a conservative evaluation since the Project would be required to comply with the 2022 Title 24 standards, and each revision of the standards results in greater energy efficiency. The estimation of operational energy emissions for the Project were based on CalEEMod land use defaults and total area (i.e., square footage) of the Project's land use.

CalEEMod default energy intensity factors (CO_2, CH_4, and N_2O mass emissions per kilowatt-hour) for San Diego Gas and Electric (SDG&E) is based on the value for SDG&E's energy mix in 2021. These default intensity values were used for the Project analysis.

Mobile Sources

All details for criteria air pollutants discussed in Section 2.4.2.2 are also applicable for the estimation of operational mobile source GHG emissions.

Regulatory measures related to mobile sources include AB 1493 (Pavley) and related federal standards. AB 1493 required that CARB establish GHG emission standards for automobiles, light-duty trucks, and other vehicles determined by CARB to be vehicles that are primarily used for noncommercial personal transportation in the state. In addition, the NHTSA and EPA have established corporate fuel economy standards and GHG emission standards, respectively, for automobiles and light-, medium-, and heavy-duty vehicles. Implementation of these standards and fleet turnover (replacement of older vehicles with newer ones) will gradually reduce emissions from the Project's motor vehicles. The effectiveness of fuel economy improvements was evaluated using the CalEEMod emission factors for motor vehicles in 2027 to the extent it was captured in EMFAC2017.

Solid Waste

The Project would generate solid waste, and therefore, result in CO_2e emissions associated with landfill off-gassing. CalEEMod default values for solid waste generation were used to estimate GHG emissions associated with solid waste for the Project.

Water and Wastewater

Supply, conveyance, treatment, and distribution of water for the Project require the use of electricity, which would result in associated indirect GHG emissions. Similarly, wastewater generated by the Project requires the use of electricity for conveyance and treatment, and GHG emissions will be generated during wastewater treatment. Water consumption estimates for both indoor and outdoor water use and associated electricity consumption from water use and wastewater generation were estimated using CalEEMod default values. The electricity use for water supply, treatment, distribution, and wastewater treatment are based on the electricity intensity factors from CalEEMod for the County and the indoor and outdoor water use default values in CalEEMod. Regarding indoor water use, the Project would install low-flow water fixtures pursuant to CALGreen standards, which would reduce the Project's water consumption.

3.5 Impact Analysis

This section evaluates the GHG emissions impacts associated with the Project. The significance criteria described in Section 3.4.1, Thresholds of Significance, were used to evaluate impacts associated with the construction and operation of the Project.

Threshold 1: Would the Project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Threshold 2: Would the Project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

City of San Marcos' Climate Action Plan Consistency

This section evaluates the Project's impacts to GHG in accordance with the City's 2020 CAP Consistency Checklist. New discretionary development projects subject to CEQA review that emit less than 500 MT CO_2e annually would not contribute considerably to cumulative climate change impacts, as stated in the City's 2020 CAP Consistency Checklist, and therefore, would be considered consistent with the CAP and associated emissions projections.

For projects that are subject to CAP consistency review, the next step in determining consistency is to assess the project's consistency with the growth projections used in development of the CAP. This section allows the City to determine a project's consistency with the land use assumptions used in the CAP.

Step 1

Step 1 of the CAP Checklist determines land use consistency. Question 1 of Step 1 asks if a project is less than a certain size. It is deemed consistent with the City's CAP by emitting fewer than 500 MT CO_2e per year and would be

less than significant. In order to determine if the Project emits less than 500 MT CO_2e per year, construction and operational GHG emissions were quantified (as described in Section 3.4.2) and are summarized below.

Construction of the Project would result in GHG emissions, which are primarily associated with the use of off-road construction equipment, haul trucks, on-road vendor trucks, and worker vehicles. CalEEMod was used to calculate the annual GHG emissions based on the construction scenario. On-site sources of GHG emissions include off-road equipment and off-site sources including trucks and worker vehicles. Table 12 presents construction emissions for the Project in 2024 through 2026 from on-site and off-site emission sources.

Table 12. Estimated Annual Construction Greenhouse Gas Emissions - Unmitigated

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
2024	1,839.73	0.28	0.14	1,888.47
2025	710.24	0.08	0.03	720.61
2026	257.64	0.03	0.01	261.40
Total	**2,807.60**	**0.39**	**0.18**	**2,870.48**
Amortized Construction Emissions Over 30-years				*95.68*

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent; <0.01 = reported value less than 0.01. See Appendix A for complete results. Totals may not add due to rounding.

As shown in Table 12, the estimated total GHG emissions during construction of would be approximately 2,870.48 MT CO_2e over the construction period. Estimated Project-generated construction emissions amortized over 30 years would be approximately 96 MT CO_2e per year. As with Project-generated construction criteria air pollutant emissions, GHG emissions generated during construction of the Project would be short-term in nature, lasting only for the duration of the construction period, and would not represent a long-term source of GHG emissions. Amortized construction emissions were added to operational emissions to be compared to the Project for this assessment.

CalEEMod was used to estimate potential operational GHG emissions from area sources (landscaping equipment), energy sources (natural gas and electricity), mobile sources, solid waste, and water supply and wastewater treatment for the Project. Table 13 presents the net increase in GHG emissions from the Project.

Table 13. Estimated Annual Operational Greenhouse Gas Emissions

Emission Source	CO_2	CH_4	N_2O	CO_2e
	metric tons per year			
Area	2.45	<0.01	0	2.51
Energy	303.91	0.02	<0.01	305.22
Mobile	1,181.26	0.09	0.05	1,199.76
Solid waste	21.11	1.25	0	52.31
Water supply and wastewater	79.23	0.46	0.01	94.05
Total	**1,587.96**	**1.82**	**0.06**	**1,653.85**
Amortized Construction Emissions Over 30-Years				*95.68*
Project Operations + Amortized Construction Total				**1,749.53**

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent; <0.01 = reported value less than 0.01.

See Appendix A for complete results. Totals may not add due to rounding.
The values shown are the annual emissions reflected in the CalEEMod "mitigated" output in order to account for implementation of PDF-GHG-1 (PV panels) and consistency with regulations, specifically AB 939 (50% waste diversion) and CALGreen (low-flow fixtures requirement).

As shown in Table 13, the estimated GHG emissions from operation of the Project would be approximately 1,750 MT CO_2e per year, including amortized construction emissions. Pursuant to the City's 2020 CAP Consistency Checklist, since the Project would emit greater than 500 MT CO_2e per year, then CAP Step 1, Question 2 must be address as follows.

Step 1, Question 2 of Step 1 asks if the proposed project is consistent with the City's existing General Plan land use designation? No, the Project requires a General Plan Amendment and Rezone to change the General Plan designation and Zoning from Mixed-Use 1 (MU-1) and Light Industrial (L-1) to SPA. Pursuant to the City's 2020 CAP Consistency Checklist, since the Project is not consistent with the City's existing General Plan land use, then CAP Step 1, Question 3 must be address as follows.

Step 1, Question 3 of Step 1 states that for projects not consistent with the existing General Plan land use designation, does the project include a General Plan Amendment that would generate GHG emissions equal to or less than estimated emissions generated under the exiting designation?

Yes, the project would generate GHG emissions equal to or less than estimated emission generated under the existing designation as detailed below.

Table 14, Estimated Operational Greenhouse Gas Emissions, provides estimated GHG emissions from both the Fiscal Impact Study Alternative Land Use and Proposed Land Use Scenarios. For this analysis, and per City guidance, the existing parcels would be modeled based on the alternative project utilized in the Fiscal Impact Study (DTA 2023) for the project, which includes: 173-unit townhomes, 10,400 square feet of commercial retail, is 28,436 square feet of office building and 133 parking spaces. CalEEMod default values were utilized for alternative project land uses to develop representative emissions.

Table 14. Estimated Operational Greenhouse Gas Emissions

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
Fiscal Impact Study Alternative Land Use Scenario				
Area	255.75	0.17	0.01	264.11
Energy (natural gas and electricity)	387.33	0.02	<0.01	389.00
Mobile	1,097.05	0.08	0.05	1,114.36
Solid waste	23.74	1.40	0	58.81
Water supply and wastewater	89.00	0.56	0.01	107.16
Amortized Construction Emissions Over 30-Years				**69.25**
Fiscal Impact Study Alternative Land Use Operational Emissions				**2,002.69**

Table 14. Estimated Operational Greenhouse Gas Emissions

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
Proposed Land Use Scenario				
Project Operations + Amortized Construction Total (from Table 13)				1,749.53
Difference (Proposed Project - Existing)				-253.16

Detailed calculations are provided as Attachment B, CAP Checklist.

As shown in Table 14, the project would generate GHG emissions less than estimated emission generated under the Fiscal Impact Alternative Scenario. The difference between the Fiscal Impact Alternative Scenario use scenario emissions and the proposed land use scenario emissions is a reduction of 253 MT CO_2E per year.

Step 2

Step 2 of the CAP Checklist determines the project's consistency with the applicable strategies and measures of the CAP. As shown in Attachment B, CAP Checklist, the Project has demonstrated consistency with the applicable strategies and measures of the CAP as required by Step 2 of the CAP Checklist. Therefore, the Project is deemed consistent with the City's CAP and would be **less than significant**. The following summarizes the Checklist items as presented in Attachment B.

Checklist Item 1. Electric Vehicle Charging Stations (Measure T-2)

This checklist item applies to multi-family residential and non-residential projects. It asks if the project will install electric vehicle charging stations (Level 2 or better) in at least 5% of the total parking spaces provided on site.

The project would comply with this checklist item. The proposed multi-family residential project would include 501 total parking spaces, 25 of which would include EV charging stations. Charging stations will be installed in all garage parking stalls. The project would answer Yes to this question.

Checklist Item 2. Bicycle Infrastructure (Measure T-8)

This checklist item applies to residential and non-residential projects. It asks if the following conditions are met, would the project pay its fair-share contribution to bicycle infrastructure improvements of the following:

- Intersection or roadway segment improvements are proposed as part of the project.
- The City's General Plan Mobility Element identifies bicycle infrastructure improvements at any intersection(s) or roadway segment(s) that would be improved as part of the project.

The project would comply with this checklist item. The project will determine specific details based on discussions with the City regarding San Marcos Boulevard thru-way.

Accordingly, the proposed project would answer "Yes" to this question.

Checklist Item 3. Transportation Demand Management (Measure T-9)

This checklist item applies to residential and non-residential projects. Will the project develop and implement a Transportation Demand Management (TDM) Plan that includes, at a minimum, all of the TDM strategies listed below?

- Provide discounted monthly transit pass or provide at least 25 percent transit fare subsidy to residents/employees.
- Provide designated car-share, carpool, vanpool, and/or park-and-ride parking spaces.
- Provide pedestrian connections between all internal uses and to all existing or planned external streets around the project site(s).
- Provide secure bicycle parking spaces or bicycle racks, showers, and clothes lockers.
- Encourage telecommuting for employees (allow one telecommute day per week or compressed work weeks) or provide a telecommute work center with common office space and equipment available to residents.

-or

- Would the project implement and monitor for four (4) years a TDM program that demonstrates an alternative transportation (i.e. carpool, public transit, bicycle, walk, telecommute) mode share of at least 29 percent for all residents?

The proposed Project would not result in a VMT related impact, and therefore a TDM Plan is not required. The proposed project units are for sale units that would be managed by a HOA; therefore, the project providing discounted monthly transit passes to residents would not be sensible. Future tenants of the proposed commercial/retail space would be encouraged to provide employees with discounted monthly transit passes; however, that would be at the discretion of the tenant. Due to the shared parking agreement for the project site, as required by the City, the project does not designate car-share, carpool, vanpool and/or park-and-ride spaces; however, such could be provided with direction from the City. The project would provide pedestrian connections throughout all uses on-site and connection to adjacent sidewalks and existing roadways. The project would provide communal bicycle parking, and all living units would provide bicycle storage and showers. Telecommuting is resident and tenant-based but will be encouraged. The TDM Plan is a proposed condition of approval prior to building occupancy.

Accordingly, the proposed project would answer “Yes” to this question.

Checklist Item 4. Reduce Parking Near Transit (Measure T-12)

This checklist item applies to multi-family residential projects. If located within one-half mile of a major transit stop, would the project provide at least 27% fewer parking spaces than required for the same use based on the City’s municipal code parking requirements?

The project is not located within ½ mile of a major transit stop defined as a bus or light-rail station with fixed service and 10-minute minimum headways during peak hours. Therefore, the proposed project would answer “N/A” to this question.

Checklist Item 5. Water Heaters (Measure E-1)

This checklist item applies to residential projects and asks if the project would install one of, or a combination of, the following water heater types in place of natural gas water heaters:

- Electric heat pump water heater
- Instantaneous electric water heater
- Electric tank
- Solar water heater with heat pump water heater backup
- Solar water heater with electric tank backup

The project would comply with this checklist item. The project would install instantaneous electric water heaters without water tanks that would meet the requirements of this checklist item. The project would answer Yes to this checklist question.

Checklist Item 6. Photovoltaic Installation (Measure E-2)

This checklist item applies to non-residential projects. The item requires non-residential projects to install a minimum photovoltaic system of two watts per square foot of gross floor area.

The project would include 202 multi-family residential units and 10,400 square feet of commercial retail uses. Therefore, this checklist item would only apply to the 10,400 square feet of commercial retail use. Based on the 10,400 square feet of commercial retail uses the project would install a (10,400 x 2)/1,000 = 20.8 kW solar photovoltaic system. The project would answer Yes to this checklist question.

Checklist Item 7. Landscaping Water Use (Measure W-1)

This checklist item applies to residential and non-residential projects and asks if the project would comply with the City's Water Efficient Landscape Ordinance.

The proposed project would comply with this checklist item. The project's landscaping would meet the requirements within the City's Water Efficient Landscape Ordinance. Per San Marcos Municipal Code Section 20.330.020 water efficient landscape standards are applicable to new construction with an aggregate landscape area equal to or greater than 500 sqft, The Project will include landscape area greater than 500 sqft, approximately 87,500 sqft. Accordingly, the proposed project would answer "Yes" to this question.

Checklist Item 8. Urban Tree Canopy (Measure C-2)

This checklist item applies to residential and non-residential projects and asks if the project is providing more than 10 parking spaces, will the project plant at least one tree per five parking spaces provided?

The project would comply with this checklist item. The project is providing 501 parking spaces and will plant at least 97 trees to satisfy this checklist requirement. As detailed on the Project landscape plan, the project would include a total of 243 trees. Accordingly, the proposed project would answer "Yes" to this question.

Plan, Policy or Regulation Consistency

Numerous plans, policies, and regulations have been adopted for the purpose of reducing GHG emissions. The principal overall state plan and policy are AB 32 and the follow-up legislation, SB 32. The quantitative goal of AB 32 is to reduce GHG emissions to 1990 levels by 2020 and the goal of SB 32 is to reduce GHG emissions to 40% below 1990 levels by 2030. The City's CAP outlines the measures for the City to achieve its share of state GHG reductions. As discussed above, the project would be consistent with the CAP and, therefore, would be consistent with state GHG reduction goals.

At the regional level, the SANDAG's RTP/SCS has been adopted for the purpose of reducing GHG emissions attributable to passenger vehicles in the San Diego region. In October 2015, SANDAG adopted its Regional Plan, which was subsequently updated in 2021. The RTP/SCS is not directly applicable to the Project because the underlying purpose of the RTP/SCS is to provide direction and guidance on future regional growth (i.e., the location of new residential and nonresidential land uses) and transportation patterns throughout the City and greater San Diego County, as stipulated under Senate Bill 375. CARB has recognized that the approved RTP/SCS is consistent with Senate Bill 375. The SANDAG Regional Plan is generally consistent with the local government plans. As discussed in Section 2.5, Threshold 1, as presented in the July 2021, General Plan Housing Element, the most recent Regional Housing Needs Assessment (RHNA) from SANDAG stated that San Marcos's share of regional future housing needs is 3,116 new units between April 15,2021, and April 15, 2029. As of June 30, 2020, 546 housing units have been planned or approved for development, with 2,570 units remaining needed to be developed in the City. The Project is expected to bring 202 units to market in 2027 which would be within SANDAG's growth projection for housing during the 6th Cycle planning horizon. Since the Project is within the scope of development that was anticipated in the General Plan (see Section 2.5, Threshold 1), it would not result in growth that would conflict with the Regional Plan.

Based on the preceding considerations, the Project would not conflict with an applicable plan adopted for the purpose of reducing GHG emissions, or generate GHG emissions that would have a significant impact on the environment; therefore, the Project's impacts on GHG emissions would be **less than significant**.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

CAP Checklist

CLIMATE ACTION PLAN CONSISTENCY REVIEW CHECKLIST

INTRODUCTION

The City of San Marcos (City) adopted an updated Climate Action Plan (CAP) in December, 2020. The CAP outlines strategies and measures that the City will undertake to achieve its proportional share of State greenhouse gas (GHG) emissions reduction targets. The purpose of the CAP Consistency Checklist (Checklist), in conjunction with the CAP, is to provide a streamlined review process for all proposed development projects that are subject to discretionary review and/or trigger environmental review pursuant to the California Environmental Quality Act (CEQA).

Analysis of GHG emissions and potential climate change impacts from new development is required under CEQA. The City's CAP is a qualified greenhouse gas (GHG) emissions reduction plan in accordance with State CEQA Guidelines Section 15183.5. Pursuant to CEQA Guidelines Sections 15064(h)(3), 15130(d), and 15183(b), a project's incremental contribution to a cumulative GHG emissions effect may be determined not to be cumulatively considerable if it complies with the requirements of a CAP.

The purpose of this Checklist is to implement GHG reduction measures from the CAP that apply to new discretionary development projects. New development would demonstrate consistency with relevant CAP strategies and would not conflict with the City's ability to achieve the identified GHG reduction targets through implementation of applicable measures. Projects that are consistent with the CAP, as determined through the use of this Checklist, may rely on the CAP for the cumulative impact analysis of GHG emissions. Projects that are not consistent with the CAP must prepare a comprehensive project-specific analysis of GHG emissions, including quantification of existing and projected GHG emissions and incorporation of the measures in this Checklist to the extent feasible. Cumulative GHG impacts would be significant for any project that is not consistent with the CAP.

This Checklist may be updated periodically to incorporate new GHG reduction techniques or to comply with later amendments to the CAP or local, State, or federal law. Comprehensive updates to this Checklist will be coordinated with each CAP update. Administrative updates to the Checklist may occur regularly, as necessary for the purpose of keeping the Checklist up-to-date and implementable. Updates to the CAP Checklist associated with an update to the City's CAP would also require City Council approval and shall comply with CEQA.

Appendix

APPLICABILITY AND PROCEDURES

This Checklist is required only for discretionary projects[1] that are subject to and not exempt from CEQA. Projects that are exempt from CEQA are deemed to be consistent with the City's CAP, and no further review is necessary, with the exception of a Class 32 "In-Fill Development Projects" categorical exemption (State CEQA Guidelines Section 15332), for which projects are required to demonstrate consistency with the CAP through this Checklist.

General procedures for Checklist compliance and review are described below. Specific guidance is also provided under each of the questions under Steps 1 and 2 of the Checklist.

- The City's Development Services - Planning Division reviews development applications and makes determinations regarding environmental review requirements under CEQA.
- The specific applicable requirements outlined in the Checklist shall be required as conditions of project approval.
- The project must provide written documentation and supporting evidence that demonstrate how the proposed project would implement each applicable Checklist requirement described herein to the satisfaction of the Planning Division.
- If a question in the Checklist is deemed not applicable (N/A) to a project, written documentation and evidence supporting that conclusion shall be provided to the satisfaction of the Planning Division. Each Checklist question provides the scenario(s) where checking N/A may be acceptable. If a measure is deemed not applicable for reasons other than those outlined in each question, supporting evidence will need to be provided and would be subject to Planning Division approval. A project may be determined to be inconsistent with the CAP if the N/A response is deemed to be not supported by credible evidence.
- Development projects requiring discretionary review that cannot demonstrate consistency with the CAP using this Checklist shall prepare a separate, project-level GHG analysis as part of the CEQA document prepared for the project.

[1] In this context, a project is any action that meets the definition of a "Project" in Section 15378 of the State CEQA Guidelines.

Application Information

Contact Information

Project No. and Name: San Marcos Restaurant Row

Property Address and APN: 1020 West San Marcos Boulevard on the northwest cornerof West San Marcos Boulevard and Via Vera Cruz (APNs 219-200-30, 31, 45, 46).

Applicant Name and Co.: Lennar Homes of California, LLC

Contact Phone: (858) 618-4942 Contact Email: David.Shepherd@lennar.com

Was a consultant retained to complete this checklist? ☑ Yes ☐ No

If Yes, complete the following:

Consultant Name: Dudek (David Larocca) Contact Phone: 971-930-1712

Company Name: Dudek Contact Email: dlarocca@dudek.com

Project Information

1. What is the size of the project site (acres)? 10.5

2. Identify all applicable proposed land uses:

   ☐ Residential (indicate # of single-family dwelling units):

   ☑ Residential (indicate # of multi-family dwelling units): 202

   ☑ Commercial (indicate total square footage): 10,400

   ☐ Industrial (indicate total square footage):

   ☐ Other (describe):

3. Provide a description of the project proposed. This description should match the basic project description used for the CEQA document. The description may be attached to the Checklist if there are space constraints.

The project site is located at 1020 West San Marcos Boulevard on the northwest corner of West San Marcos Boulevard and Via Vera Cruz (APNs 219-200-30, 31, 45, 46). The Proposed Project will replace 63,484 square feet (SF) of existing restaurant uses with 202 multi-family dwelling units and 10,400 SF of commercial retail uses on the 10.5-acrea project site. The project would provide 501 parking spaces, and common space area throughout the project site.

STEP 1: LAND USE CONSISTENCY

The first step in this section evaluates a project's GHG emissions consistent with the City's *Guidance to Demonstrating Consistency with the City of San Marcos Climate Action Plan: For Discretionary Projects Subject to CEQA* (Guidance Document). New discretionary development projects subject to CEQA review that emit fewer than 500 metric tons of carbon dioxide equivalent ($MTCO_2e$) annually would not contribute considerably to cumulative climate change impacts as stated in the City's Guidance Document, and therefore, would be considered consistent with the CAP and associated emissions projections.

For projects that are subject to CAP consistency review, the next step in determining consistency is to assess the project's consistency with the growth projections used in the development of the CAP. This section allows the city to determine a project's consistency with the land use assumptions used in the CAP.

Step 1: Land Use Consistency			
	Checklist Item (Check the appropriate box and provide an explanation and supporting documentation for your answer)	**Yes**	**No**
1.	The size and type of projects listed below would emit fewer than 500 $MTCO_2e$ per year. Based on this threshold, does the proposed project exceed these characteristics? ▪ Single Family Housing: 36 dwelling units ▪ Multi-Family Housing: 55 dwelling units ▪ Office: 43,000 square feet ▪ Commercial Space: 20,000 square feet ▪ Regional Shopping Center: 18,000 square feet ▪ Hotel: 37 rooms ▪ Restaurant (Sit-Down): 6,500 square feet ▪ Restaurant (Drive-Thru, High Turnover): 2,400 square feet ▪ General Light Industrial: 58,000 square feet ▪ University: 263 students ▪ Mixed-Use: See *Guidance to Demonstrating Consistency* memorandum for methods to estimate mixed-use development thresholds ▪ Other: For project types not listed in this section the need for GHG analysis and mitigation will be made on a project-specific basis, considering the 500 $MTCO_2e$ per year screening threshold. If **"Yes",** proceed to Question 2 of Step 1. If **"No",** in accordance with the City's CAP screening criteria, the project's GHG impact is less than significant and is not subject to the measures of the CAP.	☑	☐
2.	Is the proposed project consistent with the City's existing General Plan land use designation? If **"Yes"**, proceed to Step 2. If **"No"**, proceed to Question 3 of Step 1	☐	☑
3.	For projects not consistent with the existing General Plan land use designation, does the project include a General Plan Amendment that would generate GHG emissions equal to or less than estimated emissions generated under the existing designation? If **"Yes"**, proceed to Step 2 and provide estimated project emissions under both existing and proposed designation(s) for comparison. If **"No"**, the project's GHG impact is potentially significant, and a GHG analysis must be prepared in accordance with the City's Guidance Document and applicable CEQA guidelines. The project must incorporate each of the measures identified in Step 2 to mitigate cumulative GHG emissions impacts, along with	☑	☐

other mitigation measures as necessary based on a project specific GHG analysis.. Proceed and complete a project specific GHG analysis, and Step 2 of the Checklist.		

STEP 2: CAP MEASURES CONSISTENCY

The second step of CAP consistency review is to evaluate a project's consistency with the applicable strategies and measures of the CAP. Each Checklist item is associated with a specific GHG reduction measure in the City's CAP. "N/A" should only be checked based on the direction provided in each Checklist Item question. All projects for which the measure is applicable must demonstrate that they would implement measures consistent with the Checklist Item, or fully substantiate how the item would be infeasible for project implementation. "N/A" responses are subject to Planning Division review and approval. If "No" is provided as a response to a question, the project would be determined to be inconsistent with the CAP and result in a significant GHG impact.

Step 2: CAP Measures Consistency			
Checklist Item (Check the appropriate box and provide an explanation for your answer. Please use additional sheets if necessary)	**Yes**	**No**	**N/A**
Project Design			
1. Electric Vehicle Charging Stations (Measure T-2) Multi-Family Residential and Non-Residential: Will the project install electric vehicle charging stations (Level 2 or better) in at least five percent of the total parking spaces provided on-site? Check "N/A" if the project is a single-family residential project or would not provide any parking.	☑	☐	☐
Please substantiate how the project satisfies question 1: The Proposed Project includes a total of 501 parking spaces, 25 of which will include level 2 or of better electric vehicle charging stations. Charging stations will be installed in all garage parking stalls.			
2. Bicycle Infrastructure (Measure T-8) Residential and Non-Residential Projects: If the following conditions are met, would the project pay its fair-share contribution to bicycle infrastructure improvements? ☑ Intersection or roadway segment improvements are proposed as part of the project and, ☑ The City's General Plan Mobility Element identifies bicycle infrastructure improvements at any intersection(s) or roadway segment(s) that would be improved as part of the project. Check "N/A" if the conditions above would not be met.	☑	☐	☐
Please substantiate how the project satisfies question 2: Specific details to be determined based on discussions with the City regarding San Marcos BLVD thru-way.			

Step 2: CAP Measures Consistency			
Checklist Item (Check the appropriate box and provide an explanation for your answer. Please use additional sheets if necessary)	**Yes**	**No**	**N/A**
3. Transportation Demand Management (Measure T-9) <u>Multi-Family Residential and Non-Residential:</u> Will the project develop and implement a TDM plan that includes, at a minimum, all of the TDM strategies listed below? ☐ Provide discounted monthly transit pass or provide at least 25 percent transit fare subsidy to residents/employees. ☐ Provide designated car-share, carpool, vanpool, and/or park-and-ride parking spaces.[2] ☐ Provide pedestrian connections between all internal uses and to all existing or planned external streets around the project site(s). ☐ Provide secure bicycle parking spaces or bicycle racks, showers, and clothes lockers. ☐ Encourage telecommuting for employees (allow one telecommute day per week or compressed work weeks) or provide a telecommute work center with common office space and equipment available to residents. *-or-* ☑ Would the project implement and monitor for four (4) years a TDM program that demonstrates an alternative transportation (i.e. carpool, public transit, bicycle, walk, telecommute) mode share of at least 29 percent [3] for all residents? Check "N/A" if the project is a single-family residential project or is not subject to the City's TDM Ordinance.	☑	☐	☐

[2] The designated number of car-share, carpool, vanpool, and/or park-and-ride parking spaces provided at a rate equal to or greater than CALGreen minimum requirements.
[3] Measure T-10 requires projects to increase alternative mode share by seven percent. The baseline mode share for alternative transportation (i.e. carpool, public transit, bicycle, walk, and telecommute) is 22 percent based on 2010 Census Data.

Step 2: CAP Measures Consistency			
Checklist Item (Check the appropriate box and provide an explanation for your answer. Please use additional sheets if necessary)	**Yes**	**No**	**N/A**

Please state which measure option the project for which the project would comply and substantiate how the project satisfies question 3:

The Proposed Project is not anticipated to have a VMT related impact; however, preparation of a TDM is anticipated for the project and will include an alternative mode share for 29 percent of all residents. The TDM Plan is a proposed condition of approval prior to issuance of the first building permit.

4. Reduce Parking Near Transit (Measure T-12) Multi-Family Residential: If located within a half-mile of a major transit stop[4], would the project provide at least 27 percent fewer parking spaces than required for the same use based on the City's municipal code parking requirements? Check "N/A" if the project is a single-family residential or non-residential project.	☐	☐	☑

Please substantiate how the project satisfies question 4:

Not applicable, the nearest major transit center, Palomar College Transit Center, is located greater than a half-mile from the proposes project site.

[4] Major transit stop is defined as a bus or light-rail station with fixed service and 10-minute minimum headways during peak hours. Project applicants should confirm with City staff if the project site would fall within this proximity tot a major transit stop.

Step 2: CAP Measures Consistency			
Checklist Item (Check the appropriate box and provide an explanation for your answer. Please use additional sheets if necessary)	**Yes**	**No**	**N/A**
5. Water Heaters (Measure E-1) Residential: Will the project install one of, or a combination of, the following water heater types in place of natural gas water heaters? ☐ Electric heat pump water heater ☑ Instantaneous electric water heater ☐ Electric tank ☐ Solar water heater with heat pump water heater backup ☐ Solar water heater with electric tank backup Check "N/A" if the project is a non-residential project.	☑	☐	☐
Please substantiate how the project satisfies question 5: The Proposed Project would include solar and instant electric water heaters without water tanks.			
6. Photovoltaic Installation (Measure E-2) Non-Residential: Will the project install photovoltaic systems with a minimum capacity of two watts per square foot of gross floor area? Check "N/A" if the project is a residential project or if installation of on-site photovoltaic would be infeasible.	☑	☐	☐
Please substantiate how the project satisfies question 6: The gross floor area of the Proposed Project is 309,915 SF and the minimum solar panel capacity to be installed onsite is (309,915)x2/1,000 = 620 kW			

Step 2: CAP Measures Consistency			
Checklist Item (Check the appropriate box and provide an explanation for your answer. Please use additional sheets if necessary)	**Yes**	**No**	**N/A**
7. Landscaping Water Use (Measure W-1) Residential and Non-Residential: Will the project comply with the City's Water Efficient Landscape Ordinance?[5] Check "N/A" if the project is not proposing any landscaping or is not subject to the City's Water Efficient Landscape Ordinance.	☑	☐	☐
Please substantiate how the project satisfies question 7: Per San Marcos Municipal Code Section 20.330.020, water efficient landscape standards are applicable to new construction with an aggregate landscape area equal to or greater than 500 sqft. The Proposed Project will include landscape area greater than 500 sqft, approximately 87,500 sqft, and therefore is subject to the City specifically, the Proposed Project will meet the design standards outlined in Section 20.330.040 - Landscape Standards.			
8. Urban Tree Canopy (Measure C-2) Single-Family Residential: Will the project plant a minimum of one tree per single-family residential unit? *-or-* Multi-Family Residential and Non-Residential: If the project is providing more than 10 parking spaces, will the project plant at least one tree per five parking spaces provided? Check "N/A" if planting the required number of trees on-site would be infeasible.	☑	☐	☐
Please substantiate how the project satisfies question 8: It is anticipated that the project would plant at least one tree per five parking spaces. The project would provide 501 parking spaces and therefore would be required to plant 97 trees. As detailed on the project landscape plan, the project would include a total of 243 trees.			

[5] City of San Marcos Landscape Manual: https://www.san-marcos.net/home/showdocument?id=13984

Attachment 1. Climate Action Plan Consistency Review Checklist - Step 2. Item 3.

Item 3. Transportation Demand Management (Measure T-9)

The proposed Project would not result in a VMT related impact, and therefore a TDM Plan is not required. The proposed project units are for sale units that would be managed by a HOA; therefore, the project providing discounted monthly transit passes to residents would not be sensible. Future tenants of the proposed commercial/retail space would be encouraged to provide employees with discounted monthly transit passes; however, that would be at the discretion of the tenant. Due to the shared parking agreement for the project site, as required by the City, the project does not designate car-share, carpool, vanpool and/or park-and-ride spaces; however, such could be provided with direction from the City. The project would provide pedestrian connections throughout all uses on-site and connection to adjacent sidewalks and existing roadways. The project would provide communal bicycle parking, and all living units would provide bicycle storage and showers. Telecommuting is resident and tenant-based but will be encouraged. The TDM Plan is a proposed condition of approval prior to building occupancy.

Attachment A

San Marcos CAP Checklist Step 1

Analysis

CAP Checklist Step 1: Land Use Consistency

Item No. 3. For projects not consistent with the existing General Plan land use designation, does the project include a General Plan Amendment that would generate GHG emissions equal to or less than estimated emission generated under the existing designation?

Response. Yes, the project would generate GHG emissions equal to or less than estimated emission generated under the existing designation as detailed below.

The northern portion of the project site includes 1.63 acres of exiting vacant light industrial zoned land, while the remaining portion of the total 10.5-acre project area is zoned Mixed-Use 1 (MU-1) and built with an existing 63,484 SF of restaurant uses. For this analysis, and per City guidance, the existing parcels would be modeled based on the alternative project utilized in the Fiscal Impact Study (DTA 2023) for the project, which includes: 173-unit townhomes, 10,400 square feet of commercial retail, is 28,436 square feet of office building and 133 parking spaces. CalEEMod default values were utilized for alternative project land uses to develop representative emissions. The proposed project plans to develop 202 multi-family residential units, and 10,400 sf of commercial retail uses with associated parking spaces, and landscaping within the 10.5-acre project site. In response to Item No. 3, GHG emissions from construction and operation of the proposed Fiscal Impact Study alternative are compared with the proposed construction and development of the Project within the SPA.

Table 1, Estimated Operational Greenhouse Gas Emissions, provides estimated GHG emissions from both the Existing Land Use and Proposed Land Use Scenarios of the 1.63 area development area.

Table 1. Estimated Operational Greenhouse Gas Emissions

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
Fiscal Impact Study Alternative Land Use Scenario				
Area	255.75	0.17	0.01	264.11
Energy (natural gas and electricity)	387.05	0.02	<0.01	389.00
Mobile	1,097.05	0.08	0.05	1,114.36
Solid waste	23.74	1.40	0	58.81
Water supply and wastewater	89.00	0.56	0.01	107.16
			Amortized Construction Emissions Over 30-Years	**69.25**
			Fiscal Impact Study Alternative Land Use Operational Emissions	**2,002.69**
Proposed Land Use Scenario				
Area	2.45	<0.01	0	2.51
Energy (natural gas and electricity)	303.91	0.02	<0.01	305.22
Mobile	1,181.26	0.09	0.05	1,199.76
Solid waste	21.11	1.25	0	52.31

Table 1. Estimated Operational Greenhouse Gas Emissions

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
Water supply and wastewater	79.23	0.46	0.01	94.05
Amortized Construction Emissions Over 30-Years				95.68
Proposed Land Use (Project) Project Operations + Amortized Construction Total				1,749.53

Detailed calculations are provided as attached, CalEEMod Output Files.

As shown in Table 1, the project would generate GHG emissions less than estimated emission generated under the existing designation. The difference between the Fiscal Impact Study Alternative land use scenario emissions and the proposed land use scenario emissions is -253.16 MT CO_2E per year.

Subject: Biological Resources Letter Report for the Restaurant Row Project in San Marcos, California

Dear Mr. del Solar:

The following letter report describes the results of a biological site assessment performed by Dudek and a summary of identified potential biological constraints and recommendations for the future development of the Restaurant Row project (Project) within the City of San Marcos, California (Attachment A, Figure 1, Project Site and Location).

This site assessment letter report is intended to provide a current description of the existing conditions of biological resources within the Project site, discuss special-status biological resources with potential to occur on site, and recommend any focused studies or likely mitigation requirements. A general site review was conducted, but no focused surveys for special-status species were conducted during this preliminary assessment.

1 Project Description

The proposed Restaurant Row Project (project) consists of demolition of 63,484 square feet (sf) of existing (primarily vacant) restaurant uses on-site, and re-development of 202 multi-family residential units and 10,400 sf of commercial retail uses on the 10.5-acre project site (attached Figure 1). Residential units would consist of eight (8) three-bedroom townhomes over commercial (town over commercial); 17 front street townhomes ranging in size from three- to four-bedrooms; 57 court townhomes ranging in size from two- to four-bedrooms; and 120 motorcourt units ranging in size from two- to three-bedrooms. The project includes a request for a Specific Plan, General Plan Amendment, Rezone, Site Development Plan for the private development, and Vesting Tentative Subdivision Map for a mixed-use residential development project on a 10.5-acre site in the City of San Marcos (Figure 1). Additionally, the project requests a separate Site Development Plan for the development of a proposed 1.1-acre neighborhood public park. The General Plan Amendment and Rezone would change the General Plan designation and Zoning from Mixed-Use 1 (MU-1) and Light Industrial (L-1) to Specific Plan Area (SPA). The Specific Plan has been prepared with the intent to provide a comprehensive plan to ensure the efficient development of a new mixed-use residential community. The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the General Plan. The Site Development Plan would configure the site for multi-family dwelling units, ground floor commercial mixed-use space, recreational open space, and private open space. The Tentative Subdivision Map presents specific infrastructure, and lot and street configurations for the site.

2 Location

The project site is located at 1020 West San Marcos Boulevard (northwest corner of West San Marcos Boulevard and Via Vera Cruz), in the City of San Marcos (APNs 219-200-30, 31, 45, and 46) (Figure 1). The existing project site has been previously disturbed and is currently developed with existing, primarily vacant, commercial uses and associated parking. The project site is located in an urban area of the City surrounded on all sides by existing development, including commercial uses to the north, and commercial uses and associated paved parking to the east, west, and city streets to the south.

3 Methods

In June, 2022 Dudek Biologist Christopher Oesch performed a general review of the Project site to assess and document existing conditions of biological resources present, and to evaluate the presence of appropriate habitat for nesting birds and special-status plant and wildlife species. Dudek created an updated map of the land cover types present within the study area. No physical site visit was conducted, based on the singular land cover type of Urban/ Developed.

Dudek reviewed regional California Natural Diversity Database (CNDDB) occurrence data (CDFW 2023) to identify special-status plant and wildlife species that are known to occur within a nine-quad radius of the site. Database search results are provided as Appendix A and B.

Land covers within the survey area were mapped in GIS based on general definition criteria. Aerial base map imagery of the study area, and a geographic information system (GIS) coverage was created.

The vegetation community and land cover mapping follow the *Draft Vegetation Communities of San Diego County* (Oberbauer et. al. 2008), which is based on the *Preliminary Descriptions of the Terrestrial Natural Communities of California* (Holland 1986). Certain vegetation communities or land covers may be used that are not included within Oberbauer et. al. 2008, but were included in order to best represent existing resources present.

4 Results

The Project site consists entirely of Urban/ Developed land cover type, consisting of commercial retail and paved parking lots, with associated minor ornamental landscaping and structures (Figure 1). Urban development is present to the north, south, east and west of the site. No natural land covers or potential habitat is located adjacent the site on any side. Because of the singular land cover type present (Urban/ Developed), no specific physical site investigation of species present within land cover types was warranted.

Vegetation Communities and Land Covers

Urban/ Developed

Urban/ Developed refers to areas that have been constructed on or disturbed so severely that native vegetation is no longer supported. Developed land includes areas with permanent or semi-permanent structures, pavement or hardscape, landscaped areas, and areas with a large amount of debris or other materials (Oberbauer et. al. 2008).

Urban/ Developed land within the study area consists primarily of commercial structures and paved parking lots, with minor presence of isolated, ornamental landscaped plantings.

The site is entirely bordered by urban development in the form of parking lots, commercial development and primary city streets. No natural land cover types or habitat are present within the site or directly adjacent.

Special Status Wildlife

The site consists entirely of Urban/ Developed land cover type, and does not contain any natural vegetation communities of land cover types that are known to provide habitat to any special status wildlife species.

Special Status Plants

The site consists entirely of Urban/ Developed land cover type, and does not contain any natural vegetation communities of land cover types that are known to provide habitat to any special status plant species.

Jurisdictional Aquatic Resources

No potentially jurisdictional aquatic features were observed within the site, as it is entirely developed. No wetlands or other aquatic features were observed, though a formal jurisdictional delineation was not conducted during the site review. Las Posas Creek and San Marcos creek are located to the west and south of the site respectively. Since these two streams are greater than 1,000ft away from the site, with the major streets of South Las Posas Road and West San Marcos Creek Boulevard located between the site and the streams, no indirect or peripheral impacts to these nearby aquatic resources are likely to result from the implementation of this project.

5 Discussion and Recommendations

Based on the results of the site assessment and land cover type mapped in the Project site, the site does not contain sensitive habitat and does not have the potential to support special-status species that would require mitigation if impacted.

While no land cover types were observed which have a likelihood of utilization for nesting by migratory birds, native bird species (including ones with special status) have the potential to perch, or otherwise utilize non-native ornamental trees within the landscaping or built structures and would be protected by the Migratory Bird Treaty Act (MBTA). In order to comply with the MBTA and verify avoidance of take of listed species, a pre-construction nesting bird survey will be conducted if demolition or construction occurs within the nesting season (January 15 to August 31).

6 Conclusion

The fully developed nature of the site has precluded presence of native or natural vegetation communities or habitat types. Given the lack of wildlife and plant species habitat and lack of potentially jurisdictional aquatic features, no further focused studies or delineations are warranted.

In order to comply with the MBTA, a pre-construction nesting bird survey will be conducted if demolition or construction occurs within the nesting season (January 15 to August 31).

The proposed project will be required to meet all goals and objectives of the City of San Marcos' General Plan and Zoning Ordinance, including compliance with all CEQA regulations.

If you have any questions or comments regarding the contents of this biological resources letter report, please do not hesitate to contact me at 619.977.6507 or via email at coesch@dudek.com.

Sincerely,

Christopher Oesch
Senior Biologist – Project Manager

CNDDB Database Results,
Plant Species Potential to Occur

Scientific Name	Common Name	Status (Federal/ State/CRPR)	San Diego MHCP	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Blooming during survey?	Elevation appropriate?	Habitats Appropriate?	Potential to Occur
Abronia maritima	red sand-verbena	None/None/4.2	None	Coastal dunes/perennial herb/Feb–Nov/0–330	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Abronia villosa var. *aurita*	chaparral sand-verbena	None/None/1B.1	None	Chaparral, Coastal scrub, Desert dunes; Sandy/ annual herb/(Jan)Mar–Sep/245–5,245	Y	Y	N	Not expected to occur. No suitable vegetation present.
Acanthomintha ilicifolia	San Diego thorn-mint	FT/SE/1B.1	Covered; Narrow Endemic	Chaparral, Coastal scrub, Valley and foothill grassland, Vernal pools; Clay, Openings/annual herb/Apr–June/35–3,145	Y	Y	N	Not expected to occur. No suitable vegetation present.
Acmispon prostratus	Nuttall's acmispon	None/None/1B.1	Covered; Narrow Endemic	Coastal dunes, Coastal scrub/annual herb/ Mar–June(July)/0–35	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Adolphia californica	California adolphia	None/None/2B.1	None	Chaparral, Coastal scrub, Valley and foothill grassland; Clay/perennial deciduous shrub/ Dec–May/35–2,425	Y	Y	N	Not expected to occur. No suitable vegetation present.
Agave shawii var. *shawii*	Shaw's agave	None/None/2B.1	None	Coastal bluff scrub, Coastal scrub/perennial leaf/ Sep–May/10–395	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Allium marvinii	Yucaipa onion	None/None/1B.2	None	Chaparral/perennial bulbiferous herb/Apr–May/ 2,490–3,490	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Ambrosia pumila	San Diego ambrosia	FE/None/1B.1	Covered; Narrow Endemic	Chaparral, Coastal scrub, Valley and foothill grassland, Vernal pools; Alkaline (sometimes), Clay (sometimes), Disturbed areas (often), Loam (sometimes), Sandy (sometimes)/perennial rhizomatous herb/Apr–Oct/65–1,360	Y	Y	N	Not expected to occur. No suitable vegetation present.
Aphanisma blitoides	aphanisma	None/None/1B.2	None	Coastal bluff scrub, Coastal dunes, Coastal scrub; Gravelly (sometimes), Sandy (sometimes)/annual herb/Feb–June/5–1,000	Y	Y	N	Not expected to occur. No suitable vegetation present.
Arctostaphylos glandulosa ssp. *crassifolia*	Del Mar manzanita	FE/None/1B.1	Covered; Narrow Endemic	Chaparral/perennial evergreen shrub/June–Apr/ 0–1,195	Y	Y	N	Not expected to occur. No suitable vegetation present.
Arctostaphylos rainbowensis	Rainbow manzanita	None/None/1B.1	None	Chaparral/perennial evergreen shrub/Dec–Mar/ 675–2,195	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Artemisia palmeri	San Diego sagewort	None/None/4.2	None	Chaparral, Coastal scrub, Riparian forest, Riparian scrub, Riparian woodland; Mesic, Sandy/perennial deciduous shrub/(Feb)May–Sep/50–3,000	Y	Y	N	Not expected to occur. No suitable vegetation present.
Asplenium vespertinum	western spleenwort	None/None/4.2	None	Chaparral, Cismontane woodland, Coastal scrub; Rocky/perennial rhizomatous herb/Feb–June/ 590–3,280	Y	Y	N	Not expected to occur. No suitable vegetation present.
Atriplex coulteri	Coulter's saltbush	None/None/1B.2	None	Coastal bluff scrub, Coastal dunes, Coastal scrub, Valley and foothill grassland; Alkaline (sometimes), Clay (sometimes)/perennial herb/Mar–Oct/ 10–1,505	Y	Y	N	Not expected to occur. No suitable vegetation present.
Atriplex pacifica	south coast saltscale	None/None/1B.2	None	Coastal bluff scrub, Coastal dunes, Coastal scrub, Playas/annual herb/Mar–Oct/0–460	Y	Y	N	Not expected to occur. No suitable vegetation present.
Baccharis vanessae	Encinitas baccharis	FT/SE/1B.1	Covered; Narrow Endemic	Chaparral, Cismontane woodland; Sandstone/ perennial deciduous shrub/Aug–Nov/195–2,360	Y	Y	N	Not expected to occur. No suitable vegetation present.

Scientific Name	Common Name	Status (Federal/ State/CRPR)	San Diego MHCP	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Blooming during survey?	Elevation appropriate?	Habitats Appropriate?	Potential to Occur
Bloomeria clevelandii	San Diego goldenstar	None/None/1B.1	Narrow Endemic	Chaparral, Coastal scrub, Valley and foothill grassland, Vernal pools; Clay/perennial bulbiferous herb/Apr–May/165–1,525	Y	Y	N	Not expected to occur. No suitable vegetation present.
Brodiaea filifolia	thread-leaved brodiaea	FT/SE/1B.1	Narrow Endemic	Chaparral, Cismontane woodland, Coastal scrub, Playas, Valley and foothill grassland, Vernal pools; Clay (often)/perennial bulbiferous herb/ Mar–June/80–3,670	Y	Y	N	Not expected to occur. No suitable vegetation present.
Brodiaea orcuttii	Orcutt's brodiaea	None/None/1B.1	None	Chaparral, Cismontane woodland, Closed-cone coniferous forest, Meadows and seeps, Valley and foothill grassland, Vernal pools; Clay, Mesic/ perennial bulbiferous herb/May–July/100–5,550	Y	Y	N	Not expected to occur. No suitable vegetation present.
Calandrinia breweri	Brewer's calandrinia	None/None/4.2	None	Chaparral, Coastal scrub; Burned areas, Disturbed areas, Loam (sometimes), Sandy (sometimes)/ annual herb/(Jan)Mar–June/35–4,000	Y	Y	N	Not expected to occur. No suitable vegetation present.
Calochortus plummerae	Plummer's mariposa-lily	None/None/4.2	None	Chaparral, Cismontane woodland, Coastal scrub, Lower montane coniferous forest, Valley and foothill grassland; Granitic, Rocky/perennial bulbiferous herb/May–July/330–5,575	Y	Y	N	Not expected to occur. No suitable vegetation present.
Camissoniopsis lewisii	Lewis' evening-primrose	None/None/3	None	Cismontane woodland, Coastal bluff scrub, Coastal dunes, Coastal scrub, Valley and foothill grassland; Clay (sometimes), Sandy (sometimes)/annual herb/ Mar–May(June)/0–985	Y	Y	N	Not expected to occur. No suitable vegetation present.
Caulanthus simulans	Payson's jewelflower	None/None/4.2	None	Chaparral, Coastal scrub; Granitic, Sandy/annual herb/(Feb)Mar–May(June)/295–7,215	Y	Y	N	Not expected to occur. No suitable vegetation present.
Ceanothus cyaneus	Lakeside ceanothus	None/None/1B.2	None	Chaparral, Closed-cone coniferous forest/perennial evergreen shrub/Apr–June/770–2,475	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Ceanothus verrucosus	wart-stemmed ceanothus	None/None/2B.2	Covered	Chaparral/perennial evergreen shrub/Dec–May/ 5–1,245	Y	Y	N	Not expected to occur. No suitable vegetation present.
Centromadia parryi ssp. *australis*	southern tarplant	None/None/1B.1	None	Marshes and swamps, Valley and foothill grassland, Vernal pools/annual herb/May–Nov/0–1,570	Y	Y	N	Not expected to occur. No suitable vegetation present.
Centromadia pungens ssp. *laevis*	smooth tarplant	None/None/1B.1	None	Chenopod scrub, Meadows and seeps, Playas, Riparian woodland, Valley and foothill grassland; Alkaline/annual herb/Apr–Sep/0–2,095	Y	Y	N	Not expected to occur. No suitable vegetation present.
Chaenactis glabriuscula var. *orcuttiana*	Orcutt's pincushion	None/None/1B.1	None	Coastal bluff scrub, Coastal dunes/annual herb/ Jan–Aug/0–330	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Chamaebatia australis	southern mountain misery	None/None/4.2	None	Chaparral/perennial evergreen shrub/Nov–May/ 985–3,345	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Chorizanthe orcuttiana	Orcutt's spineflower	FE/SE/1B.1	Covered; Narrow Endemic	Chaparral, Closed-cone coniferous forest, Coastal scrub; Openings, Sandy/annual herb/Mar–May/ 10–410	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Chorizanthe polygonoides var. *longispina*	long-spined spineflower	None/None/1B.2	None	Chaparral, Coastal scrub, Meadows and seeps, Valley and foothill grassland, Vernal pools; Clay (often)/annual herb/Apr–July/100–5,015	Y	Y	N	Not expected to occur. No suitable vegetation present.
Cistanthe maritima	seaside cistanthe	None/None/4.2	None	Coastal bluff scrub, Coastal scrub, Valley and foothill grassland; Sandy/annual herb/(Feb)Mar–June(Aug)/ 15–985	Y	Y	N	Not expected to occur. No suitable vegetation present.

Scientific Name	Common Name	Status (Federal/ State/CRPR)	San Diego MHCP	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Blooming during survey?	Elevation appropriate?	Habitats Appropriate?	Potential to Occur
Clarkia delicata	delicate clarkia	None/None/1B.2	None	Chaparral, Cismontane woodland; Gabbroic (often)/ annual herb/Apr–June/770–3,280	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Comarostaphylis diversifolia ssp. *diversifolia*	summer holly	None/None/1B.2	Covered	Chaparral, Cismontane woodland/perennial evergreen shrub/Apr–June/100–2,590	Y	Y	N	Not expected to occur. No suitable vegetation present.
Convolvulus simulans	small-flowered morning-glory	None/None/4.2	None	Chaparral, Coastal scrub, Valley and foothill grassland; Clay, Seeps, Serpentinite/annual herb/ Mar–July/100–2,425	Y	Y	N	Not expected to occur. No suitable vegetation present.
Corethrogyne filaginifolia var. *linifolia*	Del Mar Mesa sand aster	None/None/1B.1	Covered; Narrow Endemic	Chaparral, Coastal bluff scrub, Coastal scrub; Sandy/perennial herb/May–Sep/15–490	Y	Y	N	Not expected to occur. No suitable vegetation present.
Cryptantha wigginsii	Wiggins' cryptantha	None/None/1B.2	None	Coastal scrub; Clay (often)/annual herb/Feb–June/ 65–900	Y	Y	N	Not expected to occur. No suitable vegetation present.
Deinandra paniculata	paniculate tarplant	None/None/4.2	None	Coastal scrub, Valley and foothill grassland, Vernal pools; Sandy (sometimes), Vernally Mesic (usually)/annual herb/(Mar)Apr–Nov/80–3,080	Y	Y	N	Not expected to occur. No suitable vegetation present.
Dichondra occidentalis	western dichondra	None/None/4.2	None	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland/perennial rhizomatous herb/(Jan)Mar–July/165–1,640	Y	Y	N	Not expected to occur. No suitable vegetation present.
Dudleya alainae	Banner dudleya	None/None/3.2	None	Chaparral, Lower montane coniferous forest, Sonoran desert scrub; Rocky/perennial herb/ Apr–July/2,425–3,935	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Dudleya blochmaniae ssp. *blochmaniae*	Blochman's dudleya	None/None/1B.1	None	Chaparral, Coastal bluff scrub, Coastal scrub, Valley and foothill grassland; Clay (often), Rocky, Serpentinite/perennial herb/Apr–June/15–1,475	Y	Y	N	Not expected to occur. No suitable vegetation present.
Dudleya multicaulis	many-stemmed dudleya	None/None/1B.2	None	Chaparral, Coastal scrub, Valley and foothill grassland; Clay (often)/perennial herb/Apr–July/50–2,590	Y	Y	N	Not expected to occur. No suitable vegetation present.
Dudleya variegata	variegated dudleya	None/None/1B.2	Narrow Endemic	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland, Vernal pools; Clay/perennial herb/Apr–June/10–1,900	Y	Y	N	Not expected to occur. No suitable vegetation present.
Dudleya viscida	sticky dudleya	None/None/1B.2	None	Chaparral, Cismontane woodland, Coastal bluff scrub, Coastal scrub; Rocky/perennial herb/ May–June/35–1,800	Y	Y	N	Not expected to occur. No suitable vegetation present.
Ericameria palmeri var. *palmeri*	Palmer's goldenbush	None/None/1B.1	None	Chaparral, Coastal scrub; Mesic/perennial evergreen shrub/(July)Sep–Nov/100–1,965	Y	Y	N	Not expected to occur. No suitable vegetation present.
Eryngium aristulatum var. *parishii*	San Diego button-celery	FE/SE/1B.1	Narrow Endemic	Coastal scrub, Valley and foothill grassland, Vernal pools; Mesic/annual/perennial herb/Apr–June/ 65–2,030	Y	Y	N	Not expected to occur. No suitable vegetation present.
Eryngium pendletonense	Pendleton button-celery	None/None/1B.1	None	Coastal bluff scrub, Valley and foothill grassland, Vernal pools; Clay, Vernally Mesic/perennial herb/ Apr–June(July)/50–360	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Erysimum ammophilum	sand-loving wallflower	None/None/1B.2	None	Chaparral, Coastal dunes, Coastal scrub; Openings, Sandy/perennial herb/Feb–June(July–Aug)/0–195	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Erythranthe diffusa	Palomar monkeyflower	None/None/4.3	None	Chaparral, Lower montane coniferous forest; Gravelly (sometimes), Sandy (sometimes)/annual herb/Apr–June/4,000–6,000	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.

Scientific Name	Common Name	Status (Federal/ State/CRPR)	San Diego MHCP	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Blooming during survey?	Elevation appropriate?	Habitats Appropriate?	Potential to Occur
Euphorbia misera	cliff spurge	None/None/2B.2	Covered	Coastal bluff scrub, Coastal scrub, Mojavean desert scrub; Rocky/perennial shrub/(Oct)Dec–Aug/ 35–1,640	Y	Y	N	Not expected to occur. No suitable vegetation present.
Ferocactus viridescens	San Diego barrel cactus	None/None/2B.1	Covered	Chaparral, Coastal scrub, Valley and foothill grassland, Vernal pools/perennial stem/May–June/ 10–1,475	Y	Y	N	Not expected to occur. No suitable vegetation present.
Githopsis diffusa ssp. *filicaulis*	Mission Canyon bluecup	None/None/3.1	None	Chaparral/annual herb/Apr–June/1,475–2,295	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Harpagonella palmeri	Palmer's grapplinghook	None/None/4.2	None	Chaparral, Coastal scrub, Valley and foothill grassland; Clay, Openings/annual herb/Mar–May/ 65–3,130	Y	Y	N	Not expected to occur. No suitable vegetation present.
Hazardia orcuttii	Orcutt's hazardia	None/ST/1B.1	Covered; Narrow Endemic	Chaparral, Coastal scrub; Clay (often)/perennial evergreen shrub/Aug–Oct/260–280	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Heterotheca sessiliflora ssp. *sessiliflora*	beach goldenaster	None/None/1B.1	None	Chaparral, Coastal dunes, Coastal scrub/perennial herb/Mar–Dec/0–4,015	Y	Y	N	Not expected to occur. No suitable vegetation present.
Holocarpha virgata ssp. *elongata*	graceful tarplant	None/None/4.2	None	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland/annual herb/ May–Nov/195–3,605	Y	Y	N	Not expected to occur. No suitable vegetation present.
Hordeum intercedens	vernal barley	None/None/3.2	None	Coastal dunes, Coastal scrub, Valley and foothill grassland, Vernal pools/annual herb/Mar–June/ 15–3,280	Y	Y	N	Not expected to occur. No suitable vegetation present.

Lepidium virginicum var. *robinsonii*	Robinson's pepper-grass	None/None/4.3	None	Chaparral, Coastal scrub/annual herb/Jan–July/ 5–2,900	Y	Y	N	Not expected to occur. No suitable vegetation present.
Leptosyne maritima	sea dahlia	None/None/2B.2	None	Coastal bluff scrub, Coastal scrub/perennial herb/ Mar–May/15–490	Y	Y	N	Not expected to occur. No suitable vegetation present.
Lycium californicum	California box-thorn	None/None/4.2	None	Coastal bluff scrub, Coastal scrub/perennial shrub/ Mar–Aug(Dec)/15–490	Y	Y	N	Not expected to occur. No suitable vegetation present.
Microseris douglasii ssp. *platycarpha*	small-flowered microseris	None/None/4.2	None	Cismontane woodland, Coastal scrub, Valley and foothill grassland, Vernal pools; Clay/annual herb/ Mar–May/50–3,510	Y	Y	N	Not expected to occur. No suitable vegetation present.
Monardella hypoleuca ssp. *intermedia*	intermediate monardella	None/None/1B.3	None	Chaparral, Cismontane woodland, Lower montane coniferous forest/perennial rhizomatous herb/ Apr–Sep/1,310–4,100	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Monardella hypoleuca ssp. *lanata*	felt-leaved monardella	None/None/1B.2	None	Chaparral, Cismontane woodland/perennial rhizomatous herb/June–Aug/985–5,165	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Myosurus minimus ssp. *apus*	little mousetail	None/None/3.1	Covered; Narrow Endemic	Valley and foothill grassland, Vernal pools/annual herb/Mar–June/65–2,095	Y	Y	N	Not expected to occur. No suitable vegetation present.
Nama stenocarpa	mud nama	None/None/2B.2	None	Marshes and swamps/annual/perennial herb/ Jan–July/15–1,640	Y	Y	N	Not expected to occur. No suitable vegetation present.
Navarretia fossalis	spreading navarretia	FT/None/1B.1	Covered; Narrow Endemic	Chenopod scrub, Marshes and swamps, Playas, Vernal pools/annual herb/Apr–June/100–2,145	Y	Y	N	Not expected to occur. No suitable vegetation present.
Nemacaulis denudata var. *denudata*	coast woolly-heads	None/None/1B.2	None	Coastal dunes/annual herb/Apr–Sep/0–330	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Nemacaulis denudata var. *gracilis*	slender cottonheads	None/None/2B.2	None	Coastal dunes, Desert dunes, Sonoran desert scrub/annual herb/(Mar)Apr–May/-,165–1,310	Y	Y	N	Not expected to occur. No suitable vegetation present.
Nolina cismontana	chaparral nolina	None/None/1B.2	None	Chaparral, Coastal scrub; Gabbroic (sometimes), Sandstone (sometimes)/perennial evergreen shrub/(Mar)May–July/460–4,180	Y	Y	N	Not expected to occur. No suitable vegetation present.
Ophioglossum californicum	California adder's-tongue	None/None/4.2	None	Chaparral, Valley and foothill grassland, Vernal pools; Mesic/perennial rhizomatous herb/ Jan–June(Dec)/195–1,720	Y	Y	N	Not expected to occur. No suitable vegetation present.
Orcuttia californica	California Orcutt grass	FE/SE/1B.1	Covered; Narrow Endemic	Vernal pools/annual herb/Apr–Aug/50–2,165	Y	Y	N	Not expected to occur. No suitable vegetation present.
Orobanche parishii ssp. *brachyloba*	short-lobed broomrape	None/None/4.2	None	Coastal bluff scrub, Coastal dunes, Coastal scrub; Sandy/perennial herb (parasitic)/Apr–Oct/ 10–1,000	Y	Y	N	Not expected to occur. No suitable vegetation present.
Pentachaeta aurea ssp. *aurea*	golden-rayed pentachaeta	None/None/4.2	None	Chaparral, Cismontane woodland, Coastal scrub, Lower montane coniferous forest, Riparian woodland, Valley and foothill grassland/annual herb/Mar–July/260–6,065	Y	Y	N	Not expected to occur. No suitable vegetation present.
Pinus torreyana ssp. *torreyana*	Torrey pine	None/None/1B.2	Covered	Chaparral, Closed-cone coniferous forest; Sandstone/perennial evergreen tree//100–525	Y	Y	N	Not expected to occur. No suitable vegetation present.
Pogogyne abramsii	San Diego mesa mint	FE/SE/1B.1	None	Vernal pools/annual herb/Mar–July/295–655	Y	Y	N	Not expected to occur. No suitable vegetation present.

Scientific Name	Common Name	Status (Federal/ State/CRPR)	San Diego MHCP	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Blooming during survey?	Elevation appropriate?	Habitats Appropriate?	Potential to Occur
Pseudognaphalium leucocephalum	white rabbit-tobacco	None/None/2B.2	None	Chaparral, Cismontane woodland, Coastal scrub, Riparian woodland; Gravelly, Sandy/perennial herb/(July)Aug–Nov(Dec)/0–6,885	Y	Y	N	Not expected to occur. No suitable vegetation present.
Psilocarphus brevissimus var. *multiflorus*	Delta woolly-marbles	None/None/4.2	None	Vernal pools/annual herb/May–June/35–1,640	Y	Y	N	Not expected to occur. No suitable vegetation present.
Quercus dumosa	Nuttall's scrub oak	None/None/1B.1	Covered	Chaparral, Closed-cone coniferous forest, Coastal scrub; Clay, Loam, Sandy/perennial evergreen shrub/Feb–Apr(May–Aug)/50–1,310	Y	Y	N	Not expected to occur. No suitable vegetation present.
Quercus engelmannii	Engelmann oak	None/None/4.2	Covered	Chaparral, Cismontane woodland, Riparian woodland, Valley and foothill grassland/perennial deciduous tree/Mar–June/165–4,265	Y	Y	N	Not expected to occur. No suitable vegetation present.
Rupertia rigida	Parish's rupertia	None/None/4.3	None	Chaparral, Cismontane woodland, Lower montane coniferous forest, Meadows and seeps, Pebble (Pavement) plain, Valley and foothill grassland/ perennial herb/June–Aug/2,295–8,200	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Salvia munzii	Munz's sage	None/None/2B.2	None	Chaparral, Coastal scrub/perennial evergreen shrub/Feb–Apr/375–3,490	Y	Y	N	Not expected to occur. No suitable vegetation present.
Selaginella cinerascens	ashy spike-moss	None/None/4.1	None	Chaparral, Coastal scrub/perennial rhizomatous herb//65–2,095	Y	Y	N	Not expected to occur. No suitable vegetation present.
Sidalcea neomexicana	salt spring checkerbloom	None/None/2B.2	None	Chaparral, Coastal scrub, Lower montane coniferous forest, Mojavean desert scrub, Playas; Alkaline, Mesic/perennial herb/Mar–June/50–5,015	Y	Y	N	Not expected to occur. No suitable vegetation present.
Sphaerocarpos drewiae	bottle liverwort	None/None/1B.1	None	Chaparral, Coastal scrub; Openings/ephemeral liverwort//295–1,965	Y	Y	N	Not expected to occur. No suitable vegetation present.
Sphenopholis interrupta ssp. *californica*	prairie false oat	None/None/1B.1	None	Chaparral; Clay/annual herb/Apr/50–50	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Stemodia durantifolia	purple stemodia	None/None/2B.1	None	Sonoran desert scrub/perennial herb/ (Jan)Apr–Dec/590–985	Y	Y	N	Not expected to occur. No suitable vegetation present.
Stipa diegoensis	San Diego County needle grass	None/None/4.2	None	Chaparral, Coastal scrub; Mesic (often), Rocky/ perennial herb/Feb–June/35–2,620	Y	Y	N	Not expected to occur. No suitable vegetation present.
Suaeda esteroa	estuary seablite	None/None/1B.2	None	Marshes and swamps/perennial herb/ (Jan–May)July–Oct/0–15	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Suaeda taxifolia	woolly seablite	None/None/4.2	None	Coastal bluff scrub, Coastal dunes, Marshes and swamps/perennial evergreen shrub/Jan–Dec/ 0–165	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Tetracoccus dioicus	Parry's tetracoccus	None/None/1B.2	Covered	Chaparral, Coastal scrub/perennial deciduous shrub/Apr–May/540–3,280	Y	Y	N	Not expected to occur. No suitable vegetation present.
Viguiera laciniata	San Diego County viguiera	None/None/4.3	None	Chaparral, Coastal scrub/perennial shrub/ Feb–June(Aug)/195–2,460	Y	Y	N	Not expected to occur. No suitable vegetation present.
Xanthisma junceum	rush-like bristleweed	None/None/4.3	None	Chaparral, Coastal scrub/perennial herb/Jan–Oct/ 785–3,280	Y	N	N	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.

Appendix B

CNDDB Database Results,
Wildlife Species Potential to Occur

	Common Name	Status (Federal/ State)	San Diego MHCP San Marcos Subarea	San Diego MHCP	Habitat	Appropriate habitats?	Potential to Occur
Amphibians							
Anaxyrus californicus	arroyo toad	FE/SSC	Covered	Covered	Semi-arid areas near washes, sandy riverbanks, riparian areas, palm oasis, Joshua tree, mixed chaparral and sagebrush; stream channels for breeding (typically third order); adjacent stream terraces and uplands for foraging and wintering	N	Not expected to occur. No suitable vegetation present.
Rana draytonii	California red-legged frog	FT/SSC	None	None	Lowland streams, wetlands, riparian woodlands, livestock ponds; dense, shrubby or emergent vegetation associated with deep, still or slow-moving water; uses adjacent uplands	N	Not expected to occur. No suitable vegetation present.
Spea hammondii	western spadefoot	None/SSC	None	Covered	Primarily grassland and vernal pools, but also in ephemeral wetlands that persist at least 3 weeks in chaparral, coastal scrub, valley–foothill woodlands, pastures, and other agriculture	N	Not expected to occur. No suitable vegetation present.
Taricha torosa (Monterey Co. south only)	California newt	None/SSC	None	None	Wet forests, oak forests, chaparral, and rolling grassland	N	Not expected to occur. No suitable vegetation present.
Birds							
Accipiter cooperii (nesting)	Cooper's hawk	BCC/WL	Covered	Covered	Nests and forages in dense stands of live oak, riparian woodlands, or other woodland habitats often near water	N	Not expected to occur. No suitable vegetation present.
Accipiter striatus (nesting)	sharp-shinned hawk	None/WL	None	None	Nests in coniferous forests, ponderosa pine, black oak, riparian deciduous, mixed conifer, Jeffrey pine; winters in lowland woodlands and other habitats	N	Not expected to occur. No suitable vegetation present.
Agelaius tricolor (nesting colony)	tricolored blackbird	BCC/SSC, ST	Covered	Covered	Nests near freshwater, emergent wetland with cattails or tules, but also in Himalayan blackberry; forages in grasslands, woodland, and agriculture	N	Not expected to occur. No suitable vegetation present.
Aimophila ruficeps canescens	Southern California rufous-crowned sparrow	BCC/WL	Covered	Covered	Nests and forages in open coastal scrub and chaparral with low cover of scattered scrub interspersed with rocky and grassy patches	N	Not expected to occur. No suitable vegetation present.
Ammodramus savannarum (nesting)	grasshopper sparrow	None/SSC	Covered	Covered	Nests and forages in moderately open grassland with tall forbs or scattered shrubs used for perches	N	Not expected to occur. No suitable vegetation present.
Aquila chrysaetos (nesting and wintering)	golden eagle	None/FP, WL	None	Covered	Nests and winters in hilly, open/semi-open areas, including shrublands, grasslands, pastures, riparian areas, mountainous canyon land, open desert rimrock terrain; nests in large trees and on cliffs in open areas and forages in open habitats	N	Not expected to occur. No suitable vegetation present.
Ardea alba (nesting colony)	great egret	None/None	None	None	Nests and roosts in large trees over water or on islands, both in freshwater and marine estuarine habitats; forages in wetlands, including marshes, streams, ditches, and fish-rearing ponds, but also in irrigated pastures and croplands	N	Not expected to occur. No suitable vegetation present.
Ardea herodias (nesting colony)	great blue heron	None/None	None	None	Nests in large trees or snags; forages in wetlands, water bodies, watercourses, and opportunistically in uplands, including pasture and croplands	N	Not expected to occur. No suitable vegetation present.
Artemisiospiza belli belli	Bell's sage sparrow	None/WL	Covered	Covered	Nests and forages in coastal scrub and dry chaparral; typically in large, unfragmented patches dominated by chamise; nests in more dense patches but uses more open habitat in winter	N	Not expected to occur. No suitable vegetation present.
Asio otus (nesting)	long-eared owl	BCC/SSC	None	None	Nests in riparian habitat, live oak thickets, other dense stands of trees, edges of coniferous forest; forages in nearby open habitats	N	Not expected to occur. No suitable vegetation present.
Athene cunicularia (burrow sites and some wintering sites)	burrowing owl	BCC/SSC	None	Covered	Nests and forages in grassland, open scrub, and agriculture, particularly with ground squirrel burrows	N	Not expected to occur. No suitable vegetation present.

	Common Name	Status (Federal/ State)	San Diego MHCP San Marcos Subarea	San Diego MHCP	Habitat	Appropriate habitats?	Potential to Occur
Aythya americana (nesting)	redhead	None/SSC	None	None	Nests in deep (>3 ft) permanent or semi-permanent wetlands of at least 1 acre; 75% open water; emergent tules, *Scirpus* spp., and *Typha* spp. 3 feet in height; winters in coastal estuaries and large, deep ponds, lakes, and reservoirs of the interior	N	Not expected to occur. No suitable vegetation present.
Botaurus lentiginosus	American bittern	None/None	None	None	Nests in marshes with fairly tall freshwater vegetation (3-4 feet) and shallow water (less than 1 foot) near rivers, ponds, and lakes	N	Not expected to occur. No suitable vegetation present.
Buteo regalis (wintering)	ferruginous hawk	None/WL	None	None	Winters and forages in open, dry country, grasslands, open fields, agriculture	N	Not expected to occur. No suitable vegetation present.
Buteo swainsoni (nesting)	Swainson's hawk	None/ST	None	None	Nests in open woodland and savanna, riparian, and in isolated large trees; forages in nearby grasslands and agricultural areas such as wheat and alfalfa fields and pasture	N	Not expected to occur. No suitable vegetation present.
Calypte costae (nesting)	Costa's hummingbird	BCC/None	None	None	Nests and forages in desert wash, edges of riparian and valley–foothill riparian, coastal scrub, desert scrub, desert succulent scrub, lower-elevation chaparral, and palm oasis	Y	XXXX potential to occur.
Campylorhynchus brunneicapillus sandiegensis (San Diego and Orange Counties only)	coastal cactus wren	None/SSC	None	Covered	Southern cactus scrub patches	N	Not expected to occur. No suitable vegetation present.
Cerorhinca monocerata (nesting colony)	rhinoceros auklet	None/WL	None	None	Marine pelagic and subtidal habitats	N	Not expected to occur. No suitable vegetation present.
Chaetura vauxi (nesting)	Vaux's swift	None/SSC	None	None	Late-stage conifer forest and mixed-conifer/deciduous forest; nests in redwood (*Sequoia sempervirens*), Douglas-fir (*Pseudotsuga* spp.), and other conifers, and occasionally buildings and chimneys	N	Not expected to occur. No suitable vegetation present.
Charadrius montanus (wintering)	mountain plover	BCC/SSC	None	None	Winters in shortgrass prairies, plowed fields, open sagebrush, and sandy deserts	N	Not expected to occur. No suitable vegetation present.
Charadrius nivosus nivosus (nesting)	western snowy plover	FT, BCC/SSC	None	Covered	On coasts nests on sandy marine and estuarine shores; in the interior nests on sandy, barren or sparsely vegetated flats near saline or alkaline lakes, reservoirs, and ponds	N	Not expected to occur. No suitable vegetation present.
Circus hudsonius (nesting)	northern harrier	BCC/SSC	Covered	Covered	Nests in open wetlands (marshy meadows, wet lightly-grazed pastures, old fields, freshwater and brackish marshes); also in drier habitats (grassland and grain fields); forages in grassland, scrubs, rangelands, emergent wetlands, and other open habitats	N	Not expected to occur. No suitable vegetation present.
Cistothorus palustris clarkae	Clark's marsh wren	None/SSC	None	None	Nests and forages in freshwater and brackish marsh dominated by bulrushes and cattails	N	Not expected to occur. No suitable vegetation present.
Coccyzus americanus occidentalis (nesting)	western yellow-billed cuckoo	FT/SE	None	None	Nests in dense, wide riparian woodlands and forest with well-developed understories	N	Not expected to occur. No suitable vegetation present.
Contopus cooperi (nesting)	olive-sided flycatcher	BCC/SSC	None	None	Nests in mixed-conifer, montane hardwood–conifer, Douglas-fir, redwood, red fir, and lodgepole pine habitats; usually close to water	N	Not expected to occur. No suitable vegetation present.
Cypseloides niger (nesting)	black swift	BCC/SSC	None	None	Nests in moist crevices, caves, and cliffs behind or adjacent to waterfalls in deep canyons; forages over a wide range of habitats	N	Not expected to occur. No suitable vegetation present.

	Common Name	Status (Federal/ State)	San Diego MHCP San Marcos Subarea	San Diego MHCP	Habitat	Appropriate habitats?	Potential to Occur
Dendrocygna bicolor (nesting)	fulvous whistling-duck	None/SSC	None	None	Nests in freshwater wetlands, especially shallow impoundments managed for rice production and temporarily flooded grasslands; also nests in pastures, haylands, and small grain fields adjacent to rice fields	N	Not expected to occur. No suitable vegetation present.
Egretta thula (nesting colony)	snowy egret	None/None	None	None	Nests in dense marshes and trees; forages in wetlands or aquatic habitats, including estuaries, emergent wetlands, slow-moving rivers, irrigation ditches, and wet fields	Y	XXXX potential to occur.
Elanus leucurus (nesting)	white-tailed kite	None/FP	None	None	Nests in woodland, riparian, and individual trees near open lands; forages opportunistically in grassland, meadows, scrubs, agriculture, emergent wetland, savanna, and disturbed lands	N	Not expected to occur. No suitable vegetation present.
Empidonax traillii (nesting)	willow flycatcher	None/SE	None	None	Nests in wet meadow and montane willow riparian	N	Not expected to occur. No suitable vegetation present.
Empidonax traillii brewsteri (nesting)	little willow flycatcher	None/SE	None	None	Nests in riparian willow, montane meadows, and along streams	N	Not expected to occur. No suitable vegetation present.
Empidonax traillii extimus (nesting)	southwestern willow flycatcher	FE/SE	Covered	Covered	Nests in dense riparian habitats along streams, reservoirs, or wetlands; uses variety of riparian and shrubland habitats during migration	N	Not expected to occur. No suitable vegetation present.
Eremophila alpestris actia	California horned lark	None/WL	None	None	This subspecies of horned lark occurs on the state's southern and central coastal slope and in the San Joaquin Valley. Nests and forages in grasslands, disturbed lands, agriculture, and beaches.	N	Not expected to occur. No suitable vegetation present.
Falco columbarius (wintering)	merlin	None/WL	None	None	Forages in semi-open areas, including coastline, grassland, agriculture, savanna, woodland, lakes, and wetlands	N	Not expected to occur. No suitable vegetation present.
Falco mexicanus (nesting)	prairie falcon	None/WL	None	None	Forages in grassland, savanna, rangeland, agriculture, desert scrub, alpine meadows; nest on cliffs or bluffs	N	Not expected to occur. No suitable vegetation present.
Falco peregrinus anatum (nesting)	American peregrine falcon	FPD/FP, SCD	None	Covered	Nests on cliffs, buildings, and bridges; forages in wetlands, riparian, meadows, croplands, especially where waterfowl are present	N	Not expected to occur. No suitable vegetation present.
Gavia immer (nesting)	common loon	None/SSC	None	None	Extirpated as a breeder from California; winters in coastal waters such as bays, channels, coves, and inlets; also winters inland at large, deep lakes and reservoirs	N	Not expected to occur. No suitable vegetation present.
Gelochelidon nilotica (nesting colony)	gull-billed tern	BCC/SSC	None	None	Nests at the Salton Sea and in estuaries in San Diego County; forages in emergent wetland, lakes, mudflats, cropland, and grassland	N	Not expected to occur. No suitable vegetation present.
Gymnogyps californianus	California condor	FE/FP, SE	None	None	Nests in rock formations, deep caves, and occasionally in cavities in giant sequoia trees (Sequoiadendron giganteus); forages in relatively open habitats where large animal carcasses can be detected	N	Not expected to occur. No suitable vegetation present.
Haliaeetus leucocephalus (nesting and wintering)	bald eagle	FPD/FP, SE	None	None	Nests in forested areas adjacent to large bodies of water, including seacoasts, rivers, swamps, large lakes; winters near large bodies of water in lowlands and mountains	N	Not expected to occur. No suitable vegetation present.
Hydroprogne caspia (nesting colony)	Caspian tern	None/None	None	None	Coastal estuarine, saltmarsh, and barrier islands; nests on islands in rivers and salt lakes	N	Not expected to occur. No suitable vegetation present.
Icteria virens (nesting)	yellow-breasted chat	None/SSC	None	Covered	Nests and forages in dense, relatively wide riparian woodlands and thickets of willows, vine tangles, and dense brush	N	Not expected to occur. No suitable vegetation present.
Ixobrychus exilis (nesting)	least bittern	None/SSC	None	None	Nests in freshwater and brackish marshes with dense, tall growth of aquatic and semi-aquatic vegetation	N	Not expected to occur. No suitable vegetation present.
Lanius ludovicianus (nesting)	loggerhead shrike	None/SSC	None	None	Nests and forages in open habitats with scattered shrubs, trees, or other perches	N	Not expected to occur. No suitable vegetation present.

	Common Name	Status (Federal/ State)	San Diego MHCP San Marcos Subarea	San Diego MHCP	Habitat	Appropriate habitats?	Potential to Occur
Larus californicus (nesting colony)	California gull	BCC/WL	None	None	Nests in alkali and freshwater lacustrine habitats; abundant in coastal and interior lowlands during non-nesting period	N	Not expected to occur. No suitable vegetation present.
Laterallus jamaicensis coturniculus	California black rail	None/FP, ST	None	None	Tidal marshes, shallow freshwater margins, wet meadows, and flooded grassy vegetation; suitable habitats are often supplied by canal leakage in Sierra Nevada foothill populations	N	Not expected to occur. No suitable vegetation present.
Mycteria americana	wood stork	None/SSC	None	None	Nests in freshwater and marine-estuarine forested habitats; forages in natural and artificial wetlands; roosts in trees, usually over water	N	Not expected to occur. No suitable vegetation present.
Numenius americanus (nesting)	long-billed curlew	None/WL	None	None	Nests in grazed, mixed grass, and short-grass prairies; localized nesting along the California coast; winters and forages in coastal estuaries, mudflats, open grassland, and cropland	N	Not expected to occur. No suitable vegetation present.
Nycticorax nycticorax (nesting colony)	black-crowned night-heron	None/None	None	None	Nests in dense-foliaged trees and dense fresh or brackish emergent wetlands associated with marshes, ponds, reservoirs, and estuaries	N	Not expected to occur. No suitable vegetation present.
Pandion haliaetus (nesting)	osprey	None/WL	None	Covered	Large waters (lakes, reservoirs, rivers) supporting fish; usually near forest habitats, but widely observed along the coast	N	Not expected to occur. No suitable vegetation present.
Passerculus sandwichensis alaudinus	Bryant's savannah sparrow	None/SSC	None	None	Nests and forages in low tidally influenced habitats, adjacent ruderal areas, moist grassland within and just above fog belt, and drier grassland	N	Not expected to occur. No suitable vegetation present.
Passerculus sandwichensis beldingi	Belding's savannah sparrow	BCC/SE	None	Covered	Nests and forages in coastal saltmarsh dominated by pickleweed (*Salicornia* spp.)	N	Not expected to occur. No suitable vegetation present.
Pelecanus erythrorhynchos (nesting colony)	American white pelican	BCC/SSC	None	None	Nests colonially on sandy, earthen, or rocky substrates on isolated islands in freshwater lakes; minimal disturbance from predators; access to foraging areas on inland marshes, lakes, or rivers; winters on shallow coastal bays, inlets, and estuaries	N	Not expected to occur. No suitable vegetation present.
Pelecanus occidentalis californicus (nesting colonies and communal roosts)	California brown pelican	FPD/FP, SCD	None	Covered	Forages in warm coastal marine and estuarine environments; in California, nests on dry, rocky offshore islands	N	Not expected to occur. No suitable vegetation present.
Piranga rubra (nesting)	summer tanager	None/SSC	None	None	Nests and forages in mature desert riparian habitats dominated by cottonwoods and willows	N	Not expected to occur. No suitable vegetation present.
Plegadis chihi (nesting colony)	white-faced ibis	None/WL	Covered	Covered	Nests in shallow marshes with areas of emergent vegetation; winter foraging in shallow lacustrine waters, flooded agricultural fields, muddy ground of wet meadows, marshes, ponds, lakes, rivers, flooded fields, and estuaries	N	Not expected to occur. No suitable vegetation present.
Polioptila californica californica	coastal California gnatcatcher	FT/SSC	Covered	Covered	Nests and forages in various sage scrub communities, often dominated by California sagebrush and buckwheat; generally avoids nesting in areas with a slope of greater than 40%; majority of nesting at less than 1,000 feet above mean sea level	N	Not expected to occur. No suitable vegetation present.
Polioptila melanura	black-tailed gnatcatcher	None/WL	None	None	Nests and forages in wooded desert wash and desert scrub	N	Not expected to occur. No suitable vegetation present.
Progne subis (nesting)	purple martin	None/SSC	None	None	Nests and forages in woodland habitats including riparian, coniferous, and valley foothill and montane woodlands; in the Sacramento region often nests in weep holes under elevated freeways	N	Not expected to occur. No suitable vegetation present.

	Common Name	Status (Federal/ State)	San Diego MHCP San Marcos Subarea	San Diego MHCP	Habitat	Appropriate habitats?	Potential to Occur
Pyrocephalus rubinus (nesting)	vermilion flycatcher	None/SSC	None	None	Nests in riparian woodlands, riparian scrub, and freshwater marshes; typical desert riparian with cottonwood, willow, mesquite adjacent to irrigated fields, ditches, or pastures	N	Not expected to occur. No suitable vegetation present.
Rallus obsoletus levipes	Ridgway's rail	FE/FP, SE	None	Covered	Coastal wetlands, brackish areas, coastal saline emergent wetlands	N	Not expected to occur. No suitable vegetation present.
Riparia riparia (nesting)	bank swallow	None/ST	None	None	Nests in riparian, lacustrine, and coastal areas with vertical banks, bluffs, and cliffs with sandy soils; open country and water during migration	Y	XXXX potential to occur.
Rynchops niger (nesting colony)	black skimmer	BCC/SSC	None	None	Nests on barrier beaches, shell banks, spoil islands, and saltmarsh; forages over open water; roosts on sandy beaches and gravel bars	N	Not expected to occur. No suitable vegetation present.
Selasphorus rufus (nesting)	rufous hummingbird	BCC/None	None	None	Does not nest in California; migrates through a wide variety of habitats including coastal scrub, valley–foothill hardwood, and valley–foothill riparian habitats, and residential areas with feeders	N	Not expected to occur. No suitable vegetation present.
Setophaga petechia (nesting)	yellow warbler	None/SSC	None	None	Nests and forages in riparian and oak woodlands, montane chaparral, open ponderosa pine, and mixed-conifer habitats	N	Not expected to occur. No suitable vegetation present.
Spinus lawrencei (nesting)	Lawrence's goldfinch	BCC/None	None	None	Nests and forages in open oak, arid woodlands, and chaparral near water	N	Not expected to occur. No suitable vegetation present.
Sternula antillarum browni (nesting colony)	California least tern	FE/FP, SE	None	Covered	Forages in shallow estuaries and lagoons; nests on sandy beaches or exposed tidal flats	N	Not expected to occur. No suitable vegetation present.
Thalasseus elegans (nesting colony)	elegant tern	BCC/WL	None	Covered	Inshore coastal waters, bays, estuaries, and harbors; forages over open water	N	Not expected to occur. No suitable vegetation present.
Vireo bellii pusillus (nesting)	least Bell's vireo	FE/SE	Covered	Covered	Nests and forages in low, dense riparian thickets along water or along dry parts of intermittent streams; forages in riparian and adjacent shrubland late in nesting season	N	Not expected to occur. No suitable vegetation present.
Nannopterum auritum (nesting colony)	double-crested cormorant	None/WL	None	None	Nests in riparian trees near ponds, lakes, artificial impoundments, slow-moving rivers, lagoons, estuaries, and open coastlines; winter habitat includes lakes, rivers, and coastal areas	N	Not expected to occur. No suitable vegetation present.
Fishes							
Eucyclogobius newberryi	tidewater goby	FE/None	None	None	Brackish water habitats along the California coast from Agua Hedionda Lagoon, San Diego County, to the mouth of the Smith River	N	Not expected to occur. No suitable vegetation present.
Gila orcuttii	arroyo chub	None/SSC	None	None	Warm, fluctuating streams with slow-moving or backwater sections of warm to cool streams at depths >40 centimeters (16 inches); substrates of sand or mud	N	Not expected to occur. No suitable vegetation present.
Oncorhynchus mykiss irideus pop. 10	southern steelhead - southern California DPS	FE/SCE	None	None	Clean, clear, cool, well-oxygenated streams; needs relatively deep pools in migration and gravelly substrate to spawn	N	Not expected to occur. No suitable vegetation present.
Invertebrates							
Bombus crotchii	Crotch bumble bee	None/SCE	None	None	Open grassland and scrub communities supporting suitable floral resources.	Y	XXXX potential to occur.
Branchinecta sandiegonensis	San Diego fairy shrimp	FE/None	None	Covered	Vernal pools, non-vegetated ephemeral pools	N	Not expected to occur. No suitable vegetation present.
Cicindela senilis frosti	senile tiger beetle	None/None	None	None	Inhabits marine shoreline, from Central California coast south to saltmarshes of San Diego; also found at Lake Elsinore	N	Not expected to occur. No suitable vegetation present.

	Common Name	Status (Federal/ State)	San Diego MHCP San Marcos Subarea	San Diego MHCP	Habitat	Appropriate habitats?	Potential to Occur
Euphydryas editha quino	quino checkerspot butterfly	FE/None	None	Covered	Annual forblands, grassland, open coastal scrub and chaparral; often soils with cryptogamic crusts and fine-textured clay; host plants include *Plantago erecta*, *P. patagonica*, and *Antirrhinum coulterianum*, among others	N	Not expected to occur. No suitable vegetation present.
Euphyes vestris harbisoni	Harbison dun skipper	None/None	None	None	Oak riparian drainages and adjacent seeps supporting host plant *Carex spissa*	N	Not expected to occur. No suitable vegetation present.
Lycaena hermes	Hermes copper	FT/None	Covered	Covered	Mixed woodlands, chaparral, and coastal scrub	N	Not expected to occur. No suitable vegetation present.
Panoquina errans	wandering skipper	None/None	(blank)	Covered	Saltmarsh	N	Not expected to occur. No suitable vegetation present.
Streptocephalus woottoni	Riverside fairy shrimp	FE/None	None	Covered	Vernal pools, non-vegetated ephemeral pools	N	Not expected to occur. No suitable vegetation present.
Tryonia imitator	mimic tryonia (=California brackishwater snail)	None/None	None	None	Inhabits coastal lagoons, estuaries, and saltmarshes, from Sonoma County south to San Diego County	N	Not expected to occur. No suitable vegetation present.
Cicindela latesignata	western beach tiger beetle	None/None	None	None	Mudflats and beaches in coastal Southern California	N	Not expected to occur. No suitable vegetation present.
Danaus plexippus plexippus pop. 1	monarch - California overwintering population	FC/None	None	None	Wind-protected tree groves with nectar sources and nearby water sources	N	Not expected to occur. No suitable vegetation present.
Mammals							
Aeorestes cinereus	northern hoary bat	None/None	None	None	Forest, woodland riparian, and wetland habitats; also juniper scrub, riparian forest, and desert scrub in arid areas; roosts in tree foliage and sometimes cavities, such as woodpecker holes	N	Not expected to occur. No suitable vegetation present.
Antrozous pallidus	pallid bat	None/SSC	None	None	Grasslands, shrublands, woodlands, forests; most common in open, dry habitats with rocky outcrops for roosting, but also roosts in man-made structures and trees	N	Not expected to occur. No suitable vegetation present.
Chaetodipus californicus femoralis	Dulzura pocket mouse	None/SSC	None	None	Open habitat, coastal scrub, chaparral, oak woodland, chamise chaparral, mixed-conifer habitats; disturbance specialist; 0 to 3,000 feet above mean sea level	N	Not expected to occur. No suitable vegetation present.
Chaetodipus fallax fallax	northwestern San Diego pocket mouse	None/SSC	Covered	Covered	Coastal scrub, mixed chaparral, sagebrush, desert wash, desert scrub, desert succulent shrub, pinyon–juniper, and annual grassland	N	Not expected to occur. No suitable vegetation present.
Chaetodipus fallax pallidus	pallid San Diego pocket mouse	None/SSC	None	None	Desert wash, desert scrub, desert succulent scrub, and pinyon–juniper woodland	N	Not expected to occur. No suitable vegetation present.
Choeronycteris mexicana	Mexican long-tongued bat	None/SSC	None	None	Desert and montane riparian, desert succulent scrub, desert scrub, and pinyon–juniper woodland; roosts in caves, mines, and buildings	N	Not expected to occur. No suitable vegetation present.
Corynorhinus townsendii	Townsend's big-eared bat	None/SSC	None	None	Mesic habitats characterized by coniferous and deciduous forests and riparian habitat, but also xeric areas; roosts in limestone caves and lava tubes, man-made structures, and tunnels	N	Not expected to occur. No suitable vegetation present.
Dasypterus xanthinus	western yellow bat	None/SSC	None	None	Valley–foothill riparian, desert riparian, desert wash, and palm oasis habitats; below 2,000 feet above mean sea level; roosts in riparian and palms	N	Not expected to occur. No suitable vegetation present.
Dipodomys simulans	Dulzura kangaroo rat	None/None	None	None	Coastal scrub, chaparral, grassland at elevation <4,500 feet above mean sea level	N	Not expected to occur. No suitable vegetation present.
Dipodomys stephensi	Stephens' kangaroo rat	FT/ST	None	Covered	Annual and perennial grassland habitats, coastal scrub or sagebrush with sparse canopy cover, or in disturbed areas	N	Not expected to occur. No suitable vegetation present.

	Common Name	Status (Federal/ State)	San Diego MHCP San Marcos Subarea	San Diego MHCP	Habitat	Appropriate habitats?	Potential to Occur
Enhydra lutris nereis	southern sea otter	FT/SSC, FP	None	None	Nearshore marine environments	N	Not expected to occur. No suitable vegetation present.
Eumops perotis californicus	western mastiff bat	None/SSC	None	None	Chaparral, coastal and desert scrub, coniferous and deciduous forest and woodland; roosts in crevices in rocky canyons and cliffs where the canyon or cliff is vertical or nearly vertical, trees, and tunnels	N	Not expected to occur. No suitable vegetation present.
Leptonycteris yerbabuenae	lesser long-nosed bat	FPD/SSC	None	None	Sonoran desert scrub, semi-desert grasslands, lower oak woodlands	N	Not expected to occur. No suitable vegetation present.
Lepus californicus bennettii	San Diego black-tailed jackrabbit	None/None	Covered	Covered	Arid habitats with open ground; grasslands, coastal scrub, agriculture, disturbed areas, and rangelands	N	Not expected to occur. No suitable vegetation present.
Myotis ciliolabrum	western small-footed myotis	None/None	None	None	Arid woodlands and shrublands, but near water; roosts in caves, crevices, mines, abandoned buildings	N	Not expected to occur. No suitable vegetation present.
Myotis volans	long-legged myotis	None/None	None	None	Primarily coniferous forests, but also seasonally in riparian and desert habitats; roosts in crevices in cliffs, caves, mines, buildings, exfoliating tree bark, and snags	N	Not expected to occur. No suitable vegetation present.
Myotis yumanensis	Yuma myotis	None/None	None	None	Riparian, arid scrublands and deserts, and forests associated with water (streams, rivers, tinajas); roosts in bridges, buildings, cliff crevices, caves, mines, and trees	N	Not expected to occur. No suitable vegetation present.
Neotoma lepida intermedia	San Diego desert woodrat	None/SSC	None	None	Coastal scrub, desert scrub, chaparral, cacti, rocky areas	N	Not expected to occur. No suitable vegetation present.
Nyctinomops femorosaccus	pocketed free-tailed bat	None/SSC	None	None	Pinyon–juniper woodlands, desert scrub, desert succulent shrub, desert riparian, desert wash, alkali desert scrub, Joshua tree, and palm oases; roosts in high cliffs or rock outcrops with drop-offs, caverns, and buildings	N	Not expected to occur. No suitable vegetation present.
Nyctinomops macrotis	big free-tailed bat	None/SSC	None	None	Rocky areas; roosts in caves, holes in trees, buildings, and crevices on cliffs and rocky outcrops; forages over water	N	Not expected to occur. No suitable vegetation present.
Onychomys torridus ramona	southern grasshopper mouse	None/SSC	None	None	Grassland and sparse coastal scrub	N	Not expected to occur. No suitable vegetation present.
Perognathus longimembris pacificus	Pacific pocket mouse	FE/SSC	None	None	fine-grained sandy substrates in open coastal strand, coastal dunes, and river alluvium	N	Not expected to occur. No suitable vegetation present.
Taxidea taxus	American badger	None/SSC	None	None	Dry, open, treeless areas; grasslands, coastal scrub, agriculture, and pastures, especially with friable soils	Y	XXXX potential to occur.
Lasiurus frantzii	western red bat	None/SSC	None	None	Forest, woodland, riparian, mesquite bosque, and orchards, including fig, apricot, peach, pear, almond, walnut, and orange; roosts in tree canopy	N	Not expected to occur. No suitable vegetation present.
Reptiles							
Anniella stebbinsi	southern California legless lizard	None/SSC	None	None	Coastal dunes, stabilized dunes, beaches, dry washes, valley–foothill, chaparral, and scrubs; pine, oak, and riparian woodlands; associated with sparse vegetation and moist sandy or loose, loamy soils	N	Not expected to occur. No suitable vegetation present.
Arizona elegans occidentalis	California glossy snake	None/SSC	None	None	Arid scrub, rocky washes, grasslands, chaparral, open areas with loose soil	N	Not expected to occur. No suitable vegetation present.
Aspidoscelis hyperythra	orange-throated whiptail	None/WL	Covered	Covered	Low-elevation coastal scrub, chaparral, and valley–foothill hardwood	N	Not expected to occur. No suitable vegetation present.
Aspidoscelis tigris stejnegeri	San Diegan tiger whiptail	None/SSC	None	None	Hot and dry areas with sparse foliage, including chaparral, woodland, and riparian areas.	N	Not expected to occur. No suitable vegetation present.

	Common Name	Status (Federal/ State)	San Diego MHCP San Marcos Subarea	San Diego MHCP	Habitat	Appropriate habitats?	Potential to Occur
Chelonia mydas	green sea turtle	FT/None	None	None	Shallow waters of lagoons, bays, estuaries, mangroves, eelgrass, and seaweed beds	N	Not expected to occur. No suitable vegetation present.
Coleonyx variegatus abbotti	San Diego banded gecko	None/SSC	None	None	Rocky areas within coastal scrub and chaparral	N	Not expected to occur. No suitable vegetation present.
Crotalus ruber	red diamondback rattlesnake	None/SSC	None	None	Coastal scrub, chaparral, oak and pine woodlands, rocky grasslands, cultivated areas, and desert flats	N	Not expected to occur. No suitable vegetation present.
Diadophis punctatus modestus	San Bernardino ring-necked snake	None/None	None	None	Moist habitats including wet meadows, rocky hillsides, gardens, farmland grassland, chaparral, mixed-conifer forest, and woodland	N	Not expected to occur. No suitable vegetation present.
Diadophis punctatus similis	San Diego ringneck snake	None/None	None	None	Moist habitats including wet meadows, rocky hillsides, gardens, farmland grassland, chaparral, mixed-conifer forest, and woodland habitats	N	Not expected to occur. No suitable vegetation present.
Emys marmorata	western pond turtle	None/SSC	Covered	Covered	Slow-moving permanent or intermittent streams, ponds, small lakes, and reservoirs with emergent basking sites; adjacent uplands used for nesting and during winter	N	Not expected to occur. No suitable vegetation present.
Phrynosoma blainvillii	Blainville's horned lizard	None/SSC	Covered	Covered	Open areas of sandy soil in valleys, foothills, and semi-arid mountains including coastal scrub, chaparral, valley–foothill hardwood, conifer, riparian, pine–cypress, juniper, and annual grassland habitats	N	Not expected to occur. No suitable vegetation present.
Plestiodon skiltonianus interparietalis	Coronado skink	None/WL, SCE	None	None	Woodlands, grasslands, pine forests, and chaparral; rocky areas near water	N	Not expected to occur. No suitable vegetation present.
Salvadora hexalepis virgultea	coast patch-nosed snake	None/SSC	None	None	Brushy or shrubby vegetation; requires small mammal burrows for refuge and overwintering sites	N	Not expected to occur. No suitable vegetation present.
Thamnophis hammondii	two-striped gartersnake	None/SSC, SCE	None	None	Streams, creeks, pools, streams with rocky beds, ponds, lakes, vernal pools	N	Not expected to occur. No suitable vegetation present.
Thamnophis sirtalis ssp. (Southern California coastal plain from Ventura County to San Diego County, and from sea level to about 850 m)	south coast garter snake	None/SSC	None	None	Marsh and upland habitats near permanent water and riparian vegetation	N	Not expected to occur. No suitable vegetation present.

San Marcos, California 92069

Subject: Cultural Resources Phase I Inventory Report for the Restaurant Row Project in San Marcos, California

Dear Mr. del Solar:

This letter documents the negative cultural resources Phase I inventory conducted by Dudek for the Restaurant Row Project (Project), located in the City of San Marcos, California (Figure 1). The proposed Restaurant Row Project (project) consists of demolition of 63,484 square feet (sf) of existing (primarily vacant) restaurant uses on-site, and re-development of 202 multi-family residential units and 10,400 sf of commercial retail uses on the 10.5-acre project site (Figure 1). The City of San Marcos (City) is the lead agency responsible for compliance with the California Environmental Quality Act (CEQA). In accordance with CEQA, Dudek performed a Phase I cultural resources inventory for the entire Project area. The Project area consists of an approximately 10.5-acre area covering one parcel (APNs 219-200-30, 31, and 45) (Figure 2).

CEQA refers to sequential stages of cultural resources investigation, including Inventory, Evaluation, and Mitigation. Phase I (Inventory), Phase II (Evaluation), and Phase III (Mitigation) are vernacular terms used in the cultural resources industry. For the purposes of this report, Phase I is defined as an Inventory and includes archival research for archaeological resources and Tribal Cultural Resources (TCRs), pedestrian surveys, and other inventory methods.

A records search for the proposed Project including a surrounding one-mile radius buffer was conducted by the South Coastal Information Center (SCIC) staff. The records search did not identify any cultural resources within the Project area; however, 25 cultural resources were identified within the one-mile radius. A Native American Heritage Commission (NAHC) Sacred Lands File (SLF) search was requested on May 31, 2022. The results of the SLF search were negative.

The SCIC records search and the pedestrian survey did not identify cultural resources within the Project area. However, the SCIC identified 25 cultural resources are located within one-mile of the Project area and determined that that only <25% of the Project area has not been previously studied. The presence of cultural resources located within the vicinity of Project area indicates that the surrounding area has been utilized extensively prehistorically and historically.

Based on historic aerials, the Project area was graded and developed by the mid-1970s. Undocumented fill was deposited in the Project area and varied in thickness ranging from 3 feet to 5 feet below ground surface, and Young Alluvium deposits up to 6.5 feet thick, as described in the geotechnical report (Reist et al. 2022). No prehistoric or historic age resources will be present within the fill sediment; however, due to the presence of cultural resources within the vicinity of the Project area, there is potential to encounter cultural resources within Young Alluvium sediments below the fill.

There is moderate sensitivity for identifying intact subsurface archaeological deposits during Project implementation. Dudek recommends cultural resources monitoring, consisting of a qualified archaeological monitor and Luiseno Native American monitor, during all initial ground disturbing within native soils (below the fill sediment). Monitoring can be reduced or terminated should no discoveries are made or if documentation is provided which demonstrates that ground-disturbing activities will be occurring in sediments with no potential for cultural resources.

The current buildings located within the Project area are over 45 years old and are considered built environment resources. These structures were evaluated in a separate built environment memorandum (Haley and Frank 2023).

3 Project Description and Location

The Project is located at 1020 West San Marcos Boulevard (northwest corner of West San Marcos Boulevard and Via Vera Cruz), in the City of San Marcos (APNs 219-200-30, 31, and 45). The Project area falls within Section 15 of Township 12 South, Range 3 West of the San Marcos, California 7.5-minute Quadrangle (Figure 1). The existing Project site has been previously disturbed and is currently developed with existing, primarily vacant, commercial uses and associated parking. The project site is located in an urban area of the City surrounded on all sides by existing development, including commercial uses to the north, and commercial uses and associated paved parking to the east, west, and city streets to the south.

The proposed Project consists of demolition of 63,484 square feet (sf) of existing (primarily vacant) restaurant uses on-site, and re-development of 202 multi-family residential units and 10,400 sf of commercial retail uses on the 10.5-acre project site (Figure 3, Conceptual Site Plan). Residential units would consist of eight (8) three-bedroom townhomes over commercial (town over commercial); 17 front street townhomes ranging in size from three- to four-bedrooms; 57 court townhomes ranging in size from two- to four-bedrooms; and 120 motorcourt units ranging in size from two- to three-bedrooms. The project includes a request for a Specific Plan, General Plan Amendment, Rezone, Site Development Plan for the private development, and Vesting Tentative Subdivision Map for a mixed-use residential development project on a 10.5-acre site in the City of San Marcos (Figure 1, Project Location, and Figure 2, Project Site). Additionally, the project requests a separate Site Development Plan for the development of a proposed 1.1-acre neighborhood public park. The General Plan Amendment and Rezone would change the General Plan designation and Zoning from Mixed-Use 1 (MU-1) and Light Industrial (L-1) to Specific Plan Area (SPA).

2 Regulatory Framework

2.1 The California Register of Historic Resources (Public Resources Code section 5020 et seq.)

Under CEQA, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California Public Resources Code section 5020.1(j)). In 1992, the California legislature established the California Register of Historic Resources (CRHR) "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (California Public Resources Code section 5024.1(a)). A resource is eligible for listing in the CRHR if the State Historical Resources Commission determines that it is a significant resource and that it meets any of the following National Register of Historic Places (NRHP) criteria:

- Associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
- Associated with the lives of persons important in our past.
- Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
- Has yielded, or may be likely to yield, information important in prehistory or history.

(California Public Resources Code section 5024.1l.) Resources less than 50 years old are not considered for listing in the CRHR, but may be considered if it can be demonstrated that sufficient time has passed to understand the historical importance of the resource (see 14 CCR, section 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing on the NRHP are automatically listed on the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys. The State Historic Preservation Officer maintains the CRHR.

2.2 Native American Historic Cultural Sites (California Public Resources Code section 5097 et seq.)

State law addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction; establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project; and establishes the Native American Heritage Commission (NAHC) to resolve disputes regarding the disposition of such remains. In addition, the Native American Historic Resource Protection Act makes it a misdemeanor punishable by up to 1 year in jail to deface or destroy an Indian historic or cultural site that is listed or may be eligible for listing in the CRHR.

2.3 California Native American Graves Protection and Repatriation Act

The California Native American Graves Protection and Repatriation Act (California Repatriation Act), enacted in 2001, required all state agencies and museums that receive state funding and that have possession or control over collections of human remains or cultural items, as defined, to complete an inventory and summary of these remains and items on or before January 1, 2003, with certain exceptions. The California Repatriation Act also provides a process for the identification and repatriation of these items to the appropriate tribes.

2.4 California Environmental Quality Act

As described further below, the following CEQA statutes and CEQA Guidelines are of relevance to the analysis of archaeological and historic resources:

1. California Public Resources Code section 21083.2(g): Defines "unique archaeological resource."
2. California Public Resources Code section 21084.1 and CEQA Guidelines section 15064.5(a): Define historical resources. In addition, CEQA Guidelines section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource;" it also defines the circumstances when a project would materially impair the significance of a historical resource.
3. California Public Resources Code section 5097.98 and CEQA Guidelines section 15064.5(e): Set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
4. California Public Resources Code sections 21083.2(b)-(c) and CEQA Guidelines section 15126.4: Provide information regarding the mitigation framework for archaeological and historic resources, including options of preservation-in-place mitigation measures; preservation-in-place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context, and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

Under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California Public Resources Code section 21084.1; CEQA Guidelines section 15064.5(b)). If a site is either listed or eligible for listing in the CRHR, or if it is included in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of California Public Resources Code section 5024.1(q)), it is a "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (California Public Resources Code section 21084.1; CEQA Guidelines section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (California Public Resources Code section 21084.1; CEQA Guidelines section 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines section 15064.5(b)(1); California Public Resources Code section 5020.1(q)). In turn, the significance of a historical resource is materially impaired when a project:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA.

See Section 2.7, below for a discussion of the CEQA guidelines for determining significance and mitigating impacts to unique archaeological resources.

2.5 California Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98

CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in California Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98.

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. Health and Safety Code Section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the County coroner has examined the remains (California Health and Safety Code Section 7050.5[b]). If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (California Health and Safety Code Section 7050.5[c]). In accordance with California Public Resources Code Section 5097.98(a), the NAHC will notify the Most Likely Descendant (MLD). With the permission of the landowner, the MLD may inspect the site of discovery. Within 48 hours of being granted access to the site, the MLD may recommend means of treatment or disposition, with appropriate dignity, of the human remains and associated grave goods.

2.6 Assembly Bill 52

California Assembly Bill 52, which took effect July 1, 2015, establishes a consultation process between California Native American Tribes and lead agencies in order to address tribal concerns regarding project impacts and mitigation to “tribal cultural resources” (TCR). Public Resources Code section 21074(a) defines TCRs and states that a project that has the potential to cause a substantial adverse change to a TCR is a project that may have an adverse effect on the environment. A TCR is defined as a site, feature, place, cultural landscape, sacred place, and object with cultural value to a California Native American tribe that is either:

1. listed or eligible for listing in the CRHR or a local register of historical resources, or

2. determined by a lead agency to be a TCR.

2.7 Senate Bill 18

California Senate Bill 18 (SB 18), which took effect on March 1, 2005, requires local (city and county) governments to consult with California Native American tribes identified by the Native American Heritage Commission (NAHC) for the purpose of protecting, and/or mitigating impacts to cultural places in creating or amending general plans, including specific plans (Government Code section 65352.3).

2.8 Guidelines for Determining Significance

According to CEQA (§15064.5b), a project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. CEQA defines a substantial adverse change:

> Substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired.

The significance of an historical resource is materially impaired when a project:

- Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the CRHR; or

- Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

- Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its eligibility for inclusion in the CRHR as determined by a lead agency for purposes of CEQA.

Section 15064.5(c) of CEQA applies to effects on archaeological sites and contains the following additional provisions regarding archaeological sites:

- When a project will impact an archaeological site, a lead agency shall first determine whether the site is an historical resource, as defined in subsection (a).

- If a lead agency determines that the archaeological site is a historical resource, it shall refer to the provisions of Section 21084.1 of the Public Resources Code, and this section, Section 15126.4 of the Guidelines, and the limits contained in Section 21083.2 of the Public Resources Code do not apply.

- If an archaeological site does not meet the criteria defined in subsection (a), but does meet the definition of a unique archaeological resource in Section 21083.2 of the Public Resources Code, the site shall be treated in accordance with the provisions of section 21083.2. The time and cost limitations described in Public Resources Code Section 21083.2 (c–f) do not apply to surveys and site evaluation activities intended to determine whether the project location contains unique archaeological resources.

- If an archaeological resource is neither a unique archaeological nor a historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment. It shall be sufficient that both the resource and the effect on it are noted in the Initial Study or Environmental Impact Report (EIR), if one is prepared to address impacts on other resources, but they need not be considered further in the CEQA process.

Section 15064.5(d) aI(e) contain additional provisions regarding human remains. Regarding Native American human remains, paragraph (d) provides:

> When an initial study identifies the existence of, or the probable likelihood of, Native American human remains within the project, a lead agency shall work with the appropriate Native Americans as identified by the Native American Heritage Commission as provided in Public Resources Code Section 5097.98. The applicant may develop an agreement for treating or disposing of, with appropriate dignity, the human remains and any items associated with Native American burials with the appropriate Native Americans as identified by the Native American Heritage Commission. Action implementing such an agreement is exempt from:
>
> 1. The general prohibition on disinterring, disturbing, or removing human remains from any location other than a dedicated cemetery (Health and Safety Code Section 7050.5); and
>
> 2. The requirement of CEQA and the Coastal Act.

Under CEQA, an EIR is required to evaluate any impacts on unique archaeological resources (California Public Resources Code section 21083.2.) A "unique archaeological resource" is defined as:

> [A]n archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:
>
> 1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
>
> 2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
>
> 3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

(California Public Resources Code section 21083.2(g)). An impact to a non-unique archaeological resource is not considered a significant environmental impact and such non-unique resources need not be further addressed in the EIR (Public Resources Code section 21083.2(a); CEQA Guidelines section 15064.5(c)(4)).

As stated above, CEQA contains rules for mitigation of "unique archaeological resources." For example, "[i]f it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts to be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. Examples of that treatment, in no order of preference, may include, but are not limited to, any of the following:

1. Planning construction to avoid archaeological sites.

2. Deeding archaeological sites into permanent conservation easements.

3. Capping or covering archaeological sites with a layer of soil before building on the sites.

4. Planning parks, greenspace, or other open space to incorporate archaeological sites." (Pub. Resources Code section 21083.2(b)(1)-(4).)

Public Resources Code section 21083.2(d) states that "[e]xcavation as mitigation shall be restricted to those parts of the unique archaeological resource that would be damaged or destroyed by the project. Excavation as mitigation shall not be required for a unique archaeological resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, if this determination is documented in the environmental impact report."

The rules for mitigating impacts to archaeological resources to qualify as "historic resources" are slightly different. According to CEQA Guidelines section 15126.4(b), "[p]ublic agencies should, whenever feasible, seek to avoid damaging effects on any historic resource of an archaeological nature. The following factors shall be considered and discussed in an EIR for a project involving such an archaeological site:

A. Preservation in place is the preferred manner of mitigating impacts to archaeological sites. Preservation in place maintains the relationship between artifacts and the archaeological context. Preservation may also avoid conflict with religious or cultural values of groups associated with the site.

B. Preservation in place may be accomplished by, but is not limited to, the following:

    1. Planning construction to avoid archaeological sites;

    2. Incorporation of sites within parks, greenspace, or other open space;

    3. Covering the archaeological sites with a layer of chemically stable soil before building tennis courts, parking lots, or similar facilities on the site[; and]

    4. Deeding the site into a permanent conservation easement.

Thus, although section 21083.2 of the Public Resources Code, in addressing "unique archaeological sites," provides for specific mitigation options "in no order of preference," CEQA Guidelines section 15126.4(b), in addressing "historical resources of an archaeological nature," provides that "[p]reservation in place is the preferred manner of mitigating impacts to archaeological sites."

Under CEQA, "[w]hen data recovery through excavation is the only feasible mitigation," the lead agency may cause to be prepared and adopt a "data recovery plan," prior to any excavation being undertaken. The data recovery plan must make "provision for adequately recovering the scientifically consequential information from and about the historical resource." (CEQA Guidelines section 15126.4(b)(3)(C).) The data recovery plan also "must be deposited with the California Historical Resources Regional Information Center." (*Ibid*.) Further, "[i]f an artifact must be removed during project excavation or testing, curation may be an appropriate mitigation." (*Ibid*.)

However, "[d]ata recovery shall not be required for an historical resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the archaeological or historical resource, provided that determination is documented in the EIR and that the studies are deposited with the California Historical Resources Regional Information Center." (CEQA Guidelines section 15126.4(b)(3)(D).)

2.9 City of San Marcos General Plan

The Conservation and Open Space Element of the City's General Plan (adopted in 2012 and updated in 2013) describes the cultural and paleontological resources, regulatory framework, and policies and plans to protect such resources (City of San Marcos 2013). The planning goals and policies are described below.

The City of San Marcos Goal COS-11, in the Goals and Policies section, consists of three policies to assist in the implementation of preserving paleontological resources. The City's goal is to "continue to identify and evaluate cultural, historical, archaeological, paleontological, and architectural resources for protection from demolition and inappropriate actions" in compliance with CEQA guidelines (City of San Marcos 2013).

3 Methods

3.1 Records Search

A California Historical Resources Information Systems (CHRIS) records search of the Project area and a one-mile radius buffer was conducted by the South Coastal Information Center (SCIC) staff on June 22, 2022. The records search results indicate that 65 previous cultural resources studies have been conducted within one-mile of the Project area. Of the 65 previous studies, four studies intersect the Project area and are listed in Table 1 below. These studies consist of two Archaeological reports, a cultural resources final monitoring report, and a draft environmental impact report (DEIR). Only a portion (approximately <25%) of the Project site has been previously studied. The studies that do not intersect the area are included in a table in Confidential Appendix A.

Table 1. Reports Intersecting Project Area

Report Number	Authors	Date	Title
SD-01031	Gallegos, Dennis	1983	Archaeological Report for Business/Industrial, Richmar, Lake San Marcos and Barham/Discovery Community Plan, San Marcos, California

SD-02043	Michael Brandman Associates, Inc.	1989	Draft Environmental Impact Report San Marco Flood Control Channel San Marcos Creek/Las Posas Reach SCH #88061505
SD-10551	Arrington, Cindy	2006	Cultural Resources Final Report of Monitoring and Findings for the Qwest Network Construction Project, State of California
SD-14140	Robbins-Wade, Mary	2003	Archaeological Records Search and Literature Review, Vallecitos Water District Master Plan Update, San Diego County, California

The SCIC records search did not identify any cultural resources within the Project area. The records search did identify 25 cultural resources within the one-mile search radius buffer outside of the Project area (Table 2). Of the total 25 resources identified in the one-mile buffer, 13 are prehistoric resources, three are prehistoric isolates, six are historic resources, and three are multicomponent site (Table 2). No historic addresses are located within the Project area, however, two are located within the one-mile search radius. The results of the records search and all DPR forms are attached as part of Confidential Appendix A.

Table 2. Previously Recorded Cultural Resources in the One-Mile Record Search Radius

Primary Number	Trinomial	Age	Description	In/ Out of Project Area
P-37-005583	CA-SDI-005583	Prehistoric	Lithic Scatter	Out
P-37-005584	CA-SDI-005584	Prehistoric	Lithic Scatter; Bedrock Milling	Out

P-37-039088	CA-SDI-022954	Historic	Historic Refuse Scatter	Out

3.2 Archival Research

In addition to the SCIC records search, Dudek conducted an on-line review of historic aerial photographs of the Project area and general vicinity, to help determine the possible development and land use of the Project area in the past. Historic aerial photographs of the Project area were available for 1938, 1947, 1953, 1964, 1967, 1978, 1980-1991, 1993-2000, 2002, 2003, 2005, 2009, 2010, 2012, 2014, 2016, and 2018 (NETR 2022). The historic aerial from 1938 reveals that the Project area was undeveloped. It appears that San Marcos Boulevard Road had been paved just south of the Project area by 1938. The 1947 to 1967 aerials do not reveal any changes to the Project area. The 1978 aerial shows that the Project area has been developed with two commercial structures and parking lots. There are no changes to the Project area on the 1980 aerial. The 1981 aerial reveals that the larger commercial building located on the eastern portion of the Project area has changed in style/construction and there is an open space within the center of the structure. There are no changes to the Project area on the 1982 to 1984 aerials. The 1985 aerials shows changes to the larger commercial building located on the eastern portion of the Project area which appear to be additions/remodeling to the structure. The 1986 aerial shows grading within the northern portion of the Project area. There are no changes to the Project area on the 1987 aerial. The 1988 aerial shows the expansion of a parking lot to the northern portion of the Project area. There are no changes to the Project area on the 1989 aerial. The 1990 aerial shows a smaller commercial structure to the west of the larger square and smaller square structures that have been present within the Project area since 1978. The 1991 to 1993 aerials do not reveal major changes to the Project area. The 1994 aerial shows a strip of commercial development within the western portion of the Project area just east of one of the 1978 structures and north of the 1990 commercial structure. One of the buildings has been partially removed on the west side. There are no changes to the Project area on the 1995 to 2018 aerials. A review of the historic aerials reveal that the Project area is currently used for commercial purposes. There are two historic age structures located within the Project area. The larger commercial structure located on the eastern portion of the Project may have been remodeled in the 1980s. These structures are considered as built environment resources. These structures were evaluated in a separate built environment memorandum (Haley and Frank 2023).

Historic topographic (topo) maps of the Project area were reviewed (earliest map available is 1893). The 1983 topo map is the only topo map to show three structures within the Project area. All maps prior to 1983 show the Project area as undeveloped.

3.3 Geotechnical Report Review

Geocon Incorporated conducted a geotechnical (geotech) review of three reports for the project and conducted explorations of seven hollow-stem auger borings to evaluate the soil conditions in December 2022. Based on

Geocon's review and geotech investigation, it was determined that undocumented fill was encountered and varied in thickness ranging from 3 to 5 feet, and Young Alluvium deposits up to 6.5 feet thick feet below ground surface are present within the Project area. Groundwater is present at depths ranging from 8 feet to 24 feet below ground surface (Reist et al. 2022).

3.4 NAHC and Tribal Correspondence

Dudek requested a NAHC search of the SLF on May 31, 2022, for the Project area. The SLF consists of a database of known Native American resources. These resources may not be included in the SCIC database. The SLF results were received on June 30, 2022. The results were negative. The NAHC also provided a contact list of Native American representatives for tribes that are traditionally affiliated with the Project area. Outreach letters with a map and a description of the Project were sent to these individuals and organizations on July 1, 2022. Two responses have been received to date (Appendix B). Additional responses to the letters will be forwarded to the City and included in subsequent drafts of this report.

San Luis Rey Band of Mission Indians responded by email to the outreach letter on July 14, 2022. San Luis Rey stated that they have intimate knowledge about discoveries made throughout the Project area and within proximity to the area. They requested that a Luiseno Native American monitor be present during all ground disturbing activities, including all boring activities. They also requested a copy of all cultural resource surveys completed for the Project (Appendix B).

Rincon Band of Luiseno Indians responded by email to the outreach letter on July 14, 2022. The Tribe requested to consult directly with the lead agency for this Project (Appendix B).

In compliance with Assembly Bill 52 and Senate Bill 18, the City, as lead agency, is responsible for conducting government to government consultation with pertinent tribal entities.

3.5 Intensive Pedestrian Survey

Dudek archaeologist Makayla Murillo conducted an intensive level pedestrian survey of the Project area on July 5, 2022. Saving Sacred Sites Native American monitor Jessica Alexander participated in the pedestrian survey. All survey work was conducted employing standard archaeological procedures and techniques consistent with the Secretary of the Interior Standards. Fifteen-meter interval survey transects were conducted where possible for the Project area. However, the majority of the Project area is developed with buildings and paved surfaces. Where transects were not feasible (such as areas where the ground surface was obscured by development and landscaping) transects were not utilized. Instead, a mixed approach (opportunistic survey) was utilized, selectively examining terraces and exposed sediments where possible. The ground surface was examined for prehistoric artifacts (e.g., flaked stone tools, tool-making debris, stone milling tools, ceramics, fire-affected rock), soil discoloration that might indicate the presence of a cultural midden, soil depressions, features indicative of the current or former presence of structures or buildings (e.g., standing exterior walls, post holes, foundations), and historic artifacts (e.g., metal, glass, ceramics, building materials). Ground disturbances such as burrows, cut banks, and drainages were also visually inspected for exposed subsurface materials.

The entire Project area is developed with three existing commercial buildings and a parking lot. Vegetation observed within the Project area include landscaped flower beds with palm trees, and bushes. Ground visibility was very poor

(0-25%) overall as the ground surface was obscured by commercial buildings and parking lots. The only exposed ground in the Project area is limited to the landscaped flower beds. The exposed ground surface shows evidence of being graded and disturbed by previous development for the existing commercial buildings and parking lot. The pedestrian survey did not identify any cultural resources within the Project area. The commercial buildings located in the center and western sections of the Project area appear to be the same structures shown on the 1978 historic aerial photograph. The buildings are considered built environment resources and were evaluated in a separate built environment memorandum (Haley and Frank 2023).

4 Summary and Management Considerations

4.1 Archaeological Recommendations

Dudek's Phase I cultural resources inventory of the Project indicates that there is moderate sensitivity for identifying intact subsurface archaeological deposits during Project implementation. The SCIC records search and the pedestrian survey did not identify any cultural resources within the Project area. However, the SCIC identified 25 cultural resources are located within one-mile of the Project area and determined that that entire Project area has not been previously studied. The presence of cultural resources located within the vicinity of Project area indicates that the surrounding area has been utilized extensively prehistorically and historically.

Based on historic aerials, the Project area was undeveloped until the mid-1970s. Undocumented fill was likely deposited in the Project area in the mid-1970s, ranging from 3 feet to 5 feet below ground surface. No prehistoric or historic age resources will be present within the fill sediment; however, due to the presence of cultural resources within the vicinity of the Project area, there is potential to encounter cultural resources within Young Alluvium sediments below the fill. Dudek recommends cultural resources monitoring, consisting of a qualified archaeological monitor and Luiseno Native American monitor, during all initial ground disturbing activities within the Young Alluvium (below the fill sediment) (Figure 3). Monitoring can be reduced or terminated should no discoveries are made or if documentation is provided which demonstrates that ground-disturbing activities will be occurring in sediments with no potential for cultural resources. Monitoring is not recommended for ground disturbing activities in the fill as there is no potential for intact cultural resources within that stratum.

The current buildings located within the Project area are over 45 years old and are considered built environment resources. These structures were evaluated in a separate built environment memorandum (Haley and Frank 2023).

Should you have any questions relating to this report and its findings, please do not hesitate to contact me at 760.479.4855 or apham@dudek.com.

Respectfully Submitted,

Re: San Marcos Restaurant Row (13844) Project, San Diego County

Dear Ms. Murillo:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

July 1, 2022

Mr. Temet Aguilar, Chairperson
Pauma & Yuima Reservation
P.O. Box 369
Pauma Valley, CA 92061

Subject: ***Information Request for the Restaurant Row Project in San Marcos, California***

Dear Mr. Aguilar,

The Restaurant Row Project is located in the City of San Marcos, San Diego County, California. The Project would consist of demolition of 63,484 square feet (sf) of existing (primarily vacant) restaurant uses on-site, and re-development of 202 multi-family residential units and 10,400 sf of commercial retail uses on the 10.5-acre project site. The Project area falls within Section 15 of Township 12 South, Range 3 West of the San Marcos, California 7.5-minute Quadrangle (Figure 1).

As part of the cultural resources study prepared for the proposed project, Dudek contacted the California Native American Heritage Commission (NAHC) to request a Sacred Lands File (SLF) search and a list of Native American individuals and/or tribal organizations who may have knowledge of cultural resources in or near the proposed project area. The NAHC emailed a response on June 30, 2022, which stated that the SLF search did not identify the presence of Native American cultural resources in the immediate project area.

The NAHC recommended that we contact you regarding your knowledge of the presence of cultural resources that may be impacted by this project. If you have any knowledge of cultural resources that may exist within or near the proposed project area, please contact me directly at (760) 479-4855 or at apham@dudek.com within 30 days of receipt of this letter.

Please note that this letter does not constitute Assembly Bill (AB) 52 notification or initiation of consultation. AB 52 is a process between the lead agency and California Native American Tribes concerning potential impacts to tribal cultural resources. Tribes that wish to be notified of projects for the purposes of AB 52 must contact the lead agency, City of San Marcos, in writing (pursuant to Public Resources Code Section 21080.3.1 (b)).

Respectfully,

Angela Pham, M.A., RPA

The NAHC emailed a response on June 30, 2022, which stated that the SLF search did not identify the presence of Native American cultural resources in the immediate project area.

The NAHC recommended that we contact you regarding your knowledge of the presence of cultural resources that may be impacted by this project. If you have any knowledge of cultural resources that may exist within or near the proposed project area, please contact me directly at (760) 479-4855 or at apham@dudek.com within 30 days of receipt of this letter.

Please note that this letter does not constitute Assembly Bill (AB) 52 notification or initiation of consultation. AB 52 is a process between the lead agency and California Native American Tribes concerning potential impacts to tribal cultural resources. Tribes that wish to be notified of projects for the purposes of AB 52 must contact the lead agency, City of San Marcos, in writing (pursuant to Public Resources Code Section 21080.3.1 (b)).

Mr. Paul Macarro, Cultural Resources Manager
Pechanga Band of Mission Indians
P.O. Box 1477
Temecula, CA 92593

Subject: Information Request for the Restaurant Row Project in San Marcos, California

Dear Mr. Macarro,

The Restaurant Row Project is located in the City of San Marcos, San Diego County, California. The Project would consist of demolition of 63,484 square feet (sf) of existing (primarily vacant) restaurant uses on-site, and re-development of 202 multi-family residential units and 10,400 sf of commercial retail uses on the 10.5-acre project site. The Project area falls within Section 15 of Township 12 South, Range 3 West of the San Marcos, California 7.5-minute Quadrangle (Figure 1).

As part of the cultural resources study prepared for the proposed project, Dudek contacted the California Native American Heritage Commission (NAHC) to request a Sacred Lands File (SLF) search and a list of Native American individuals and/or tribal organizations who may have knowledge of cultural resources in or near the proposed project area. The NAHC emailed a response on June 30, 2022, which stated that the SLF search did not identify the presence of Native American cultural resources in the immediate project area.

The NAHC recommended that we contact you regarding your knowledge of the presence of cultural resources that may be impacted by this project. If you have any knowledge of cultural resources that may exist within or near the proposed project area, please contact me directly at (760) 479-4855 or at apham@dudek.com within 30 days of receipt of this letter.

Please note that this letter does not constitute Assembly Bill (AB) 52 notification or initiation of consultation. July 1, 2022

Mr. Robert Pinto, Chairperson
Ewiaapaayp Tribe
4054 Willow Rd.
Alpine, CA 91901

Subject: Information Request for the Restaurant Row Project in San Marcos, California

Dear Mr. Pinto,

The Restaurant Row Project is located in the City of San Marcos, San Diego County, California. The Project would consist of demolition of 63,484 square feet (sf) of existing (primarily vacant) restaurant uses on-site, and re-development of 202 multi-family residential units and 10,400 sf of commercial retail uses on the 10.5-acre project site. The Project area falls within Section 15 of Township 12 South, Range 3 West of the San Marcos, California 7.5-minute Quadrangle (Figure 1).

As part of the cultural resources study prepared for the proposed project, Dudek contacted the California Native American Heritage Commission (NAHC) to request a Sacred Lands File (SLF) search and a list of Native American individuals and/or tribal organizations who may have knowledge of cultural resources in or near the proposed project area. The NAHC emailed a response on June 30, 2022, which stated that the SLF search did not identify the presence of Native American cultural resources in the immediate project area.

The NAHC recommended that we contact you regarding your knowledge of the presence of cultural resources that may be impacted by this project. If you have any knowledge of cultural resources that may exist within or near the proposed project area, please contact me directly at (760) 479-4855 or at apham@dudek.com within 30 days of receipt of this letter.

Please note that this letter does not constitute Assembly Bill (AB) 52 notification or initiation of consultation. AB 52 is a process between the lead agency and California Native American Tribes concerning potential impacts to tribal cultural resources. Tribes that wish to be notified of projects for the purposes of AB 52 must contact the lead agency, City of San Marcos, in writing (pursuant to Public Resources Code Section 21080.3.1 (b)).

Respectfully,

Angela Pham, M.A., RPA
Archaeologist

SAN MARCOS RESTAURANT ROW
SAN MARCOS, CALIFORNIA

Dear Mr. Shepherd:

In accordance with your request, and our Proposal No. LG-21392, dated August 16, 2021, we have performed an update geotechnical investigation on the subject property in San Marcos, California. The accompanying report presents the recent and previous subsurface information, laboratory testing, and our conclusions and recommendations pertaining to the geotechnical aspects of project development. The results of our study indicate that the site can be developed as planned, provided the recommendations of this report are followed.

If there are any questions regarding this report, or if we may be of further service, please contact the undersigned at your convenience.

Very truly yours,

UPDATE GEOTECHNICAL INVESTIGATION

1. PURPOSE AND SCOPE

This report presents the results of an update geotechnical investigation for a proposed residential development located at 1020-1080 West San Marcos Boulevard in San Marcos, California (see Vicinity Map, Figure 1). The purpose of this study was to evaluate the compression characteristics of the soils underlying the proposed building areas and provide updated remedial grading and foundation design recommendations based on the current California Building Code (CBC) guidelines. In addition, this report is intended to update our previous report entitled Update Geotechnical Investigation, Old California Restaurant Row, 1000-1080 West San Marcos Boulevard, San Marcos, California, dated February 6, 2020 (Project No. G2487-42-01) and to address the current plans prepared by Project Design Consultants (PDC) provided to us on December 15, 2022.

The scope of our recent study consisted of the following:

- Reviewing readily available published and unpublished geologic literature.
- Reviewing the site plans prepared by PDC, which were utilized as our base map to present our subsurface information.
- Advancing seven hollow-stem auger borings to evaluate the underlying soil and geologic conditions and to collect samples for laboratory testing (see Appendix A for boring logs).
- Performing laboratory tests on selected soil samples to evaluate their physical and chemical properties for engineering analysis (see Appendix B).
- Providing storm water BMP design information (See Appendix C).
- Preparing this report presenting our exploratory information and our conclusions and recommendations regarding the geotechnical aspects of developing the site as presently proposed. The approximate locations of the subsurface excavations are shown on the *Geologic Map*, Figure 2.

2. PREVIOUS GEOTECHNICAL STUDY

A previous geotechnical study entitled *Geotechnical Investigation, Old California Restaurant Row Renovation and Additional Retail Buildings and Pavement Rehabilitation, 1000-1080 San Marcos Blvd, San Marcos, California,* was prepared by Leighton Consulting Incorporated, dated January 12, 2015. The purpose of the study was to identify and evaluate the existing soil and geologic conditions in order to provide recommendations for additional restaurant/retail buildings and pavement repairs. The study consisted of advancing eight small diameter borings and performing limited laboratory testing. We have included the borings logs in Appendix A. The approximate locations of the borings are shown on Figure 2, except Boring B-5, which was missing from their map.

3. SITE AND PROJECT DESCRIPTION

The proposed development is located at 1020-1080 West San Marcos Boulevard in San Marcos, California. The approximate 11-acre site was originally developed in 1978 with several dining establishments known as Old California Restaurant Row, which included over a dozen restaurant locations and associated asphalt concrete parking areas. It is our understanding that the proposed project consists of redeveloping the property for a 3-story, 202-unit condominium complex with associated infrastructure improvements including a 1.1-acre neighborhood park and 10,400 square feet of dining and retail space. No subterranean parking or basements are planned.

The geometric grading volume provided by PDC consists of approximately 41,140 cubic yards of cut and 225,560 cubic yards of fill, which would require approximately 184,420 cubic yards of import to achieve the desired finish grades. However, these quantities do not consider remedial grading or shrinking of the materials. Maximum cut and fill depths prior to remedial grading will be on the order of 3 and 8 feet, respectively.

The descriptions contained herein are based upon the site reconnaissance and our understanding of the project. If project details vary significantly from those outlined herein, Geocon Incorporated should be notified for review and possible revisions to this report prior to final design submittal.

4. SOIL AND GEOLOGIC CONDITIONS

The geologic units encountered on the property include undocumented fill and younger and older alluvium. Each of the units is described below in order of increasing age. Their mapped extent is shown on the *Geologic Map.*

4.1 Undocumented Fill (Qudf)

Undocumented fill was encountered in each of the exploratory borings and varied in thickness between 3 and 5 feet. The fill consists of damp to very moist, silty to clayey sands and clays. These fills are unsuitable for additional fill loads and will require remedial grading.

4.2 Younger Alluvium (Qya)

Younger alluvial deposits, up to 6½-feet-thick, were encountered in Boring B-4 and the previous borings advanced by Leighton (Borings B-6 through B-8) within the north central portion of the site. The younger alluvium consists of stiff, very moist to wet, dark gray, sandy clay and clayey sands. The younger alluvium is potentially compressible and will require remedial grading within areas of planned development.

4.3 Older Alluvium (Qoa)

Older alluvial deposits were encountered in each of the exploratory borings advanced across the site. These deposits consist of medium dense to very dense, silty to clayey, fine to coarse sands and hard, sandy to silty clays and silts with some gravels present below 17 feet. A compression study was performed on the material to evaluate the potential for leaving this unit in place as discussed in *Section 5.0* below.

5. COMPRESSION STUDY

Older alluvial deposits were encountered at depths of approximately 3 to 9 feet below the existing ground surface. To evaluate the possibility of leaving this unit in-place, consolidation testing was performed on several relatively undisturbed samples of this material. Based on the laboratory test results presented in Appendix B, the older alluvium possesses adequate engineering properties to remain in-place and receive the proposed fills and/or structural loads.

6. GROUNDWATER

Groundwater was encountered in all the exploratory borings performed across the site, which varied between 8 and 24 feet below the existing ground surface. The groundwater elevations are expected to fluctuate seasonally and may affect remedial grading. In this regard, remedial grading may encounter wet soils and excavation and compaction difficulty, particularly if grading is planned during the winter months.

A non-operational/abandoned well was observed in the northwestern portion of the property (see Figure 2). The well should be properly abandoned/removed in accordance with San Diego County regulatory requirements.

7. GEOLOGIC HAZARDS

7.1 Ground Rupture

USGS (2016) shows that there are no mapped Quaternary faults crossing or trending toward the property. In addition, the site is not located within a currently established Alquist-Priolo Earthquake Fault Zone.

The nearest known active faults are the Rose Canyon Fault zone and the Newport-Inglewood Fault, located approximately 10 miles west of the site. Based on this study, it is our opinion that the risk associated with ground rupture hazard is considered low.

7.2 Seismicity

San Diego County and Southern California region is seismically active. Considerations important in seismic design include the frequency and duration of motion and the soil conditions underlying the site. Seismic design of structures should be performed in accordance with the CBC guidelines currently adopted by the local agency. The risk associated with strong ground shaking due to earthquakes at the site is no greater than that for the region.

7.3 Liquefaction

Liquefaction typically occurs when a site is located in a zone with seismic activity, onsite soils are cohesionless, groundwater is encountered within 50 feet of the surface, and soil densities are less than about 70 percent of the maximum dry densities. If all four criteria are met, a seismic event could result in a rapid increase in pore water pressure from the earthquake-generated ground accelerations. The potential for liquefaction at the site is considered to be low due to the relative density of the older alluvium.

7.4 Landslides

No evidence of ancient landslide deposits was encountered at the site during the geotechnical investigation.

8. CONCLUSIONS AND RECOMMENDATIONS

8.1 General

8.1.1 No soil or geologic conditions were encountered that, in the opinion of Geocon Incorporated, would preclude the development of the property as proposed, provided the recommendations of this report are followed.

8.1.2 The site is underlain by undocumented fill, younger and older alluvium. The undocumented fill and younger alluvial deposits are unsuitable in their present condition and will require remedial grading in the form of removal and compaction where improvements are planned. The actual extent of unsuitable soil removal will be determined in the field by the geotechnical engineer and/or engineering geologist.

8.1.3 The proposed structures can be supported by conventional continuous and isolated spread foundations supported entirely in compacted fill or competent older alluvium.

8.1.4 The existing structures, foundation systems, pavement, utility lines, etc., should be removed and exported from the site prior to grading. Undocumented fills associated with these items and with past underground improvements should also be removed and properly compacted. Geocon Incorporated should observe the underlying geologic conditions and provide testing and observation services during the backfill of the resulting excavations where necessary.

8.1.5 The existing well identified during our field reconnaissance should be destroyed in accordance with the County of San Diego Department of Environmental Health. Once the project has been approved, a licensed drilling contractor with a valid C57 license will need to be contracted to properly destroy the well.

8.2 Excavation and Soil Characteristics

8.2.1 Excavation of the surficial deposits (undocumented fill and younger alluvium) should be possible with light to moderate effort using conventional heavy-duty equipment. These deposits may be very moist to saturated during the winter or early spring depending on preceding precipitation. Overly wet soils will require drying or mixing with drier material prior to their use as compacted fill.

8.2.2 The soils encountered in the field investigation are considered to be “expansive” (expansion index [EI] of 90 or less) as defined by 2019 California Building Code (CBC) Section 1803.5.3. Table 8.2.1 presents soil classifications based on the expansion index. We

expect a majority of the soil encountered possesses a “low” to “medium” expansion potential (expansion index of 90 or less).

TABLE 8.2.1
EXPANSION CLASSIFICATION BASED ON EXPANSION INDEX

Expansion Index (EI)	ASTM 4829 Expansion Classification	2019 CBC Expansion Classification
0 – 20	Very Low	Non-Expansive
21 – 50	Low	Expansive
51 – 90	Medium	
91 – 130	High	
Greater Than 130	Very High	

8.2.3 The laboratory test results indicate that the near-surface on-site materials at the locations tested possess *Not Applicable* sulfate severity to concrete structures as defined by 2019 CBC Section 1904 and ACI 318-14 Chapter 19. Table 8.2.2 presents a summary of concrete requirements set forth by 2019 CBC Section 1904 and ACI 318. ACI guidelines should be followed when determining the type of concrete to be used. The presence of water-soluble sulfates is not a visually discernible characteristic; therefore, other soil samples from the site could yield different concentrations. Additionally, over time landscaping activities (i.e., addition of fertilizers and other soil nutrients) may affect the concentration.

TABLE 8.2.2
REQUIREMENTS FOR CONCRETE EXPOSED TO SULFATE-CONTAINING SOLUTIONS

Exposure Class		Water-Soluble Sulfate (SO_4) Percent by Weight	Cement Type (ASTM C 150)	Maximum Water to Cement Ratio by Weight[1]	Minimum Compressive Strength (psi)
S0		SO_4<0.10	No Type Restriction	n/a	2,500
S1		0.10≤SO_4<0.20	II	0.50	4,000
S2		0.20≤SO_4≤2.00	V	0.45	4,500
S3	Option 1	SO_4>2.00	V+Pozzolan or Slag	0.45	4,500
	Option 2		V	0.40	5,000

[1] Maximum water to cement ratio limits do not apply to lightweight concrete

8.2.4 Geocon Incorporated does not practice in the field of corrosion engineering. Therefore, if improvements that could be susceptible to corrosion are planned, we recommend that further evaluation by a corrosion engineer be performed.

8.3 Grading Recommendations

8.3.1 All grading should be performed in accordance with the attached *Recommended Grading Specifications* (Appendix D). Where the recommendations of this section conflict with Appendix D, the recommendations of this section take precedence. All earthwork should be observed and all fills tested for proper compaction by Geocon Incorporated.

8.3.2 Prior to commencing grading, a preconstruction conference should be held at the site with the owner or developer, grading contractor, civil engineer, and geotechnical engineer in attendance. Special soil handling and/or the grading plans can be discussed at that time.

8.3.3 Site preparation should begin with the removal of all deleterious material and vegetation. The depth of removal should be such that material exposed in cut areas or soils to be used as fill are relatively free of organic matter and construction debris. Material generated during stripping and/or site demolition should be exported from the site.

8.3.4 All existing underground improvements and building foundations within proposed structural areas should be removed and the resulting depressions properly backfilled in accordance with the procedures described herein.

8.3.5 The undocumented fill and younger alluvium across the site should be removed to expose unyielding older alluvium, moisture conditioned, and properly compacted to provide uniform foundation conditions. The actual extent of unsuitable soil removal will be determined in the field by the geotechnical engineer and/or engineering geologist.

8.3.6 After removal of unsuitable materials is performed, the site should then be brought to final subgrade elevations with structural fill compacted in layers. In general, soils native to the site are suitable for re-use as fill if free from vegetation, debris, and other deleterious material. Layers of fill should be no thicker than will allow for adequate bonding and compaction. All fill, including backfill and scarified ground surfaces, should be compacted to at least 90 percent of maximum dry density at or above optimum moisture content, as determined in accordance with ASTM Test Procedure D1557. Fill materials below optimum moisture content will require additional moisture conditioning prior to placing additional fill.

8.3.7 Where practical, the upper 3 feet of the building pads should be comprised of soil with a “very low” to “low” expansion potential (i.e., Expansion Index of 50 or less). The more highly expansive fill soils should be placed in the deeper fill areas, if present.

8.3.8 Prior to placing fill, the ground surface should be scarified to a depth of 12 inches, moisture conditioned, and compacted to a dry density of at least 90 percent of the laboratory maximum dry density near to slightly above optimum moisture content, as determined by ASTM Test Method D 1557. Deeper processing and/or removal may be necessary in areas where loose, wet or dry soils are encountered.

8.3.9 It is the responsibility of the contractor to ensure that all excavations and trenches are properly shored and maintained in accordance with applicable OSHA rules and regulations in order to maintain safety and maintain the stability of adjacent existing improvements.

8.3.10 Import fill should consist of granular materials with a "very low" to "low" expansion potential (EI of 50 or less) free of deleterious material or stones larger than 3 inches, and should be compacted as recommended above. Geocon Incorporated should be notified of the import soil source and should perform laboratory testing of import soil prior to its arrival at the site to determine its suitability as fill material.

8.4 Seismic Design Criteria

8.4.1 Table 8.4.1 summarizes site-specific design criteria obtained from the 2019 California Building Code (CBC; Based on the 2018 International Building Code [IBC] and ASCE 7-16), Chapter 16 Structural Design, Section 1613 Earthquake Loads. We used the computer program *U.S. Seismic Design Maps*, provided by the Structural Engineers Association (SEA) to calculate the seismic design parameters. The short spectral response uses a period of 0.2 second. We evaluated the Site Class based on the discussion in Section 1613.2.2 of the 2019 CBC and Table 20.3-1 of ASCE 7-16. The values presented herein are for the risk-targeted maximum considered earthquake (MCE_R). Sites designated as Site Class D, E and F may require additional analyses if requested by the project structural engineer and client.

TABLE 8.4.1
2019 CBC SEISMIC DESIGN PARAMETERS

Parameter	Value	2019 CBC Reference
Site Class	D	Section 1613.2.2
MCE_R Ground Motion Spectral Response Acceleration – Class B (short), S_S	0.896g	Figure 1613.2.1(1)
MCE_R Ground Motion Spectral Response Acceleration – Class B (1 sec), S_1	0.33g	Figure 1613.2.1(2)
Site Coefficient, F_A	1.141	Table 1613.2.3(1)
Site Coefficient, F_V	1.97*	Table 1613.2.3(2)
Site Class Modified MCE_R Spectral Response Acceleration (short), S_{MS}	1.023g	Section 1613.2.3 (Eqn 16-36)
Site Class Modified MCE_R Spectral Response Acceleration – (1 sec), S_{M1}	0.651g*	Section 1613.2.3 (Eqn 16-37)
5% Damped Design Spectral Response Acceleration (short), S_{DS}	0.682g	Section 1613.2.4 (Eqn 16-38)
5% Damped Design Spectral Response Acceleration (1 sec), S_{D1}	0.434g*	Section 1613.2.4 (Eqn 16-39)

***** Using the code-based values presented in this table, in lieu of a performing a ground motion hazard analysis, requires the exceptions outlined in ASCE 7-16 Section 11.4.8 be followed by the project structural engineer. Per Section 11.4.8 of ASCE/SEI 7-16, a ground motion hazard analysis should be performed for projects for Site Class "E" sites with Ss greater than or equal to 1.0g and for Site Class "D" and "E" sites with S1 greater than 0.2g. Section 11.4.8 also provides exceptions which indicates that the ground motion hazard analysis may be waived provided the exceptions are followed.

8.4.2 Table 8.4.2 presents the mapped maximum considered geometric mean (MCE_G) seismic design parameters for projects located in Seismic Design Categories of D through F in accordance with ASCE 7-16.

TABLE 8.4.2
ASCE 7-16 PEAK GROUND ACCELERATION

Parameter	Value	ASCE 7-16 Reference
Mapped MCE_G Peak Ground Acceleration, PGA	0.387g	Figure 22-7
Site Coefficient, F_{PGA}	1.213	Table 11.8-1
Site Class Modified MCE_G Peak Ground Acceleration, PGA_M	0.47g	Section 11.8.3 (Eqn 11.8-1)

8.4.3 Conformance to the criteria in Tables 8.4.1 and 8.4.2 for seismic design does not constitute any kind of guarantee or assurance that significant structural damage or ground failure will not occur in the event of a large earthquake. The primary goal of seismic design is to protect life, not to avoid all damage, since such design may be economically prohibitive.

8.4.4 The project structural engineer and architect should evaluate the appropriate Risk Category and Seismic Design Category for the planned structures. The values presented herein assume a Risk Category of II and resulting in a Seismic Design Category D. Table 8.4.3 presents a summary of the risk categories in accordance with ASCE 7-16.

TABLE 8.4.3
ASCE 7-16 RISK CATEGORIES

Risk Category	Building Use	Examples
I	Low risk to Human Life at Failure	Barn, Storage Shelter
II	Nominal Risk to Human Life at Failure (Buildings Not Designated as I, III or IV)	Residential, Commercial and Industrial Buildings
III	Substantial Risk to Human Life at Failure	Theaters, Lecture Halls, Dining Halls, Schools, Prisons, Small Healthcare Facilities, Infrastructure Plants, Storage for Explosives/Toxins
IV	Essential Facilities	Hazardous Material Facilities, Hospitals, Fire and Rescue, Emergency Shelters, Police Stations, Power Stations, Aviation Control Facilities, National Defense, Water Storage

8.5 Foundation and Concrete Slabs-On-Grade Recommendations

8.5.1 The foundation recommendations herein are for proposed one- to three-story residential structures. The foundation recommendations have been separated into three categories based on either the maximum and differential fill thickness or Expansion Index. The foundation category criteria are presented in Table 8.5.1.

TABLE 8.5.1
FOUNDATION CATEGORY CRITERIA

Foundation Category	Maximum Fill Thickness, T (Feet)	Differential Fill Thickness, D (Feet)	Expansion Index (EI)
I	$T<20$	--	$EI \leq 50$
II	$20 \leq T<50$	$10 \leq D<20$	$50<EI \leq 90$
III	$T \geq 50$	$D \geq 20$	$90<EI \leq 130$

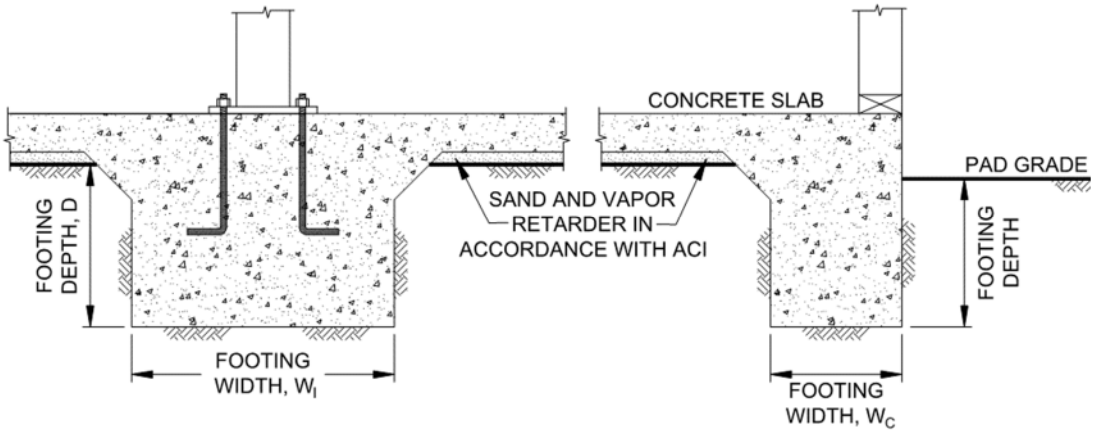
8.5.2 We will provide final foundation categories for each building or lot after finish pad grades have been achieved, the underlying fill-bedrock geometry is evaluated and we perform laboratory testing of the subgrade soil.

8.5.3 Table 8.5.2 presents minimum foundation and interior concrete slab design criteria for conventional foundation systems.

TABLE 8.5.2
CONVENTIONAL FOUNDATION RECOMMENDATIONS BY CATEGORY

Foundation Category	Minimum Footing Embedment Depth, D (inches)	Minimum Continuous Footing Reinforcement	Minimum Footing Width (Inches)
I	12	Two No. 4 bars, one top and one bottom	12 – Continuous, W_C 24 – Isolated, W_I
II	18	Four No. 4 bars, two top and two bottom	
III	24	Four No. 5 bars, two top and two bottom	

8.5.4 The foundations should be embedded in accordance with the recommendations herein and the Wall/Column Footing Dimension Detail. The embedment depths should be measured from the lowest adjacent pad grade for both interior and exterior footings. Footings should be deepened such that the bottom outside edge of the footing is at least 7 feet horizontally from the face of the slope (unless designed with a post-tensioned foundation system as discussed herein).



Wall/Column Footing Dimension Detail

8.5.5 The proposed structures can be supported on a shallow foundation system founded in the compacted fill/formational materials. Table 8.5.3 provides a summary of the foundation design recommendations.

TABLE 8.5.3
SUMMARY OF FOUNDATION RECOMMENDATIONS

Parameter	Value
Allowable Bearing Capacity	2,000 psf
Bearing Capacity Increase	500 psf per Foot of Depth
	300 psf per Foot of Width
Maximum Allowable Bearing Capacity	4,000 psf
Estimated Total Static Settlement*	1 Inch
Estimated Differential Static Settlement*	½ Inch in 40 Feet

8.5.6 The bearing capacity values presented herein are for dead plus live loads and may be increased by one-third when considering transient loads due to wind or seismic forces.

8.5.7 The concrete slab-on-grades should be a designed in accordance with Table 8.5.4.

TABLE 8.5.4
CONVENTIONAL SLAB-ON-GRADE RECOMMENDATIONS BY CATEGORY

Foundation Category	Minimum Concrete Slab Thickness (inches)	Interior Slab Reinforcement	Typical Slab Underlayment
I	4	6 x 6 - 10/10 welded wire mesh at slab mid-point	3 to 4 Inches of Sand/Gravel/Base
II	4	No. 3 bars at 24 inches on center, both directions	
III	5	No. 3 bars at 18 inches on center, both directions	

8.5.8 Slabs that may receive moisture-sensitive floor coverings or may be used to store moisture-sensitive materials should be underlain by a vapor retarder. The vapor retarder design should be consistent with the guidelines presented in the American Concrete Institute's (ACI) *Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials* (ACI 302.2R-06). The vapor retarder used should be specified by the project architect or developer based on the type of floor covering that will be installed and if the structure will possess a humidity controlled environment.

8.5.9 The bedding sand thickness should be determined by the project foundation engineer, architect, and/or developer. However, we should be contacted to provide recommendations if the bedding sand is thicker than 6 inches. It is common to see 3 inches and 4 inches of sand

below the concrete slab-on-grade for 5-inch and 4-inch thick slabs, respectively, in the southern California area. The foundation design engineer should provide appropriate concrete mix design criteria and curing measures to assure proper curing of the slab by reducing the potential for rapid moisture loss and subsequent cracking and/or slab curl. We suggest that the foundation design engineer present the concrete mix design and proper curing methods on the foundation plans. It is critical that the foundation contractor understands and follows the recommendations presented on the foundation plans.

8.5.10 As an alternative to the conventional foundation recommendations, consideration should be given to the use of post-tensioned concrete slab and foundation systems for the support of the proposed structures. The post-tensioned systems (foundation dimensions and embedment depths, slab thickness and steel placement) should be designed by a structural engineer experienced in post-tensioned slab design and design criteria of the Post-Tensioning Institute (PTI) DC 10.5-12 *Standard Requirements for Design and Analysis of Shallow Post-Tensioned Concrete Foundations on Expansive Soils* or *WRI/CRSI Design of Slab-on-Ground Foundations*, as required by the 2019 California Building Code (CBC Section 1808.6.2). Although this procedure was developed for expansive soil conditions, it can also be used to reduce the potential for foundation distress due to differential fill settlement. The post-tensioned design should incorporate the geotechnical parameters presented in Table 8.5.5 for the particular Foundation Category designated. The parameters presented in Table 8.5.5 are based on the guidelines presented in the PTI DC 10.5 design manual.

TABLE 8.5.5
POST-TENSIONED FOUNDATION SYSTEM DESIGN PARAMETERS

Post-Tensioning Institute (PTI) DC10.5 Design Parameters	Foundation Category		
	I	II	III
Thornthwaite Index	-20	-20	-20
Equilibrium Suction	3.9	3.9	3.9
Edge Lift Moisture Variation Distance, e_M (Feet)	5.3	5.1	4.9
Edge Lift, y_M (Inches)	0.61	1.10	1.58
Center Lift Moisture Variation Distance, e_M (Feet)	9.0	9.0	9.0
Center Lift, y_M (Inches)	0.30	0.47	0.66

8.5.11 The foundations for the post-tensioned slabs should be embedded in accordance with the recommendations of the structural engineer. If a post-tensioned mat foundation system is planned, the slab should possess a thickened edge with a minimum width of 12 inches and extend below the clean sand or crushed rock layer.

8.5.12 If the structural engineer proposes a post-tensioned foundation design method other than PTI, DC 10.5:

- The deflection criteria presented in Table 8.5.5 are still applicable.
- Interior stiffener beams should be used for Foundation Categories II and III.
- The width of the perimeter foundations should be at least 12 inches.
- The perimeter footing embedment depths should be at least 12 inches, 18 inches and 24 inches for foundation categories I, II, and III, respectively. The embedment depths should be measured from the lowest adjacent pad grade.

8.5.13 Foundation systems for the lots that possess a foundation Category I and a "very low" expansion potential (expansion index of 20 or less) can be designed using the method described in Section 1808 of the 2019 CBC. If post-tensioned foundations are planned, an alternative, commonly accepted design method (other than PTI, DC 10.5) can be used. However, the post-tensioned foundation system should be designed with a total and differential deflection of 1 inch. Geocon Incorporated should be contacted to review the plans and provide additional information, if necessary.

8.5.14 If an alternate design method is contemplated, Geocon Incorporated should be contacted to evaluate if additional expansion index testing should be performed to identify the lots that possess a "very low" expansion potential (expansion index of 20 or less).

8.5.15 Our experience indicates post-tensioned slabs may be susceptible to excessive edge lift from tensioning, regardless of the underlying soil conditions. Placing reinforcing steel at the bottom of the perimeter footings and the interior stiffener beams may mitigate this potential. The structural engineer should design the foundation system to reduce the potential of edge lift occurring for the proposed structures.

8.5.16 During the construction of the post-tension foundation system, the concrete should be placed monolithically. Under no circumstances should cold joints form between the footings/grade beams and the slab during the construction of the post-tension foundation system unless designed by the structural engineer.

8.5.17 Isolated footings outside of the slab area, if present, should have the minimum embedment depth and width recommended for conventional foundations for a particular Foundation Category. The use of isolated footings, which are located beyond the perimeter of the building and support structural elements connected to the building, are not recommended for Category III. Where this condition cannot be avoided, the isolated footings should be connected to the building foundation system with grade beams in both directions. In addition, consideration

should be given to connecting patio slabs, which exceed 5 feet in width, to the building foundation to reduce the potential for future separation to occur.

8.5.18 Interior stiffening beams should be incorporated into the design of the foundation system in accordance with the PTI design procedures.

8.5.19 Special subgrade presaturation is not deemed necessary prior to placing concrete; however, the exposed foundation and slab subgrade soil should be moisture conditioned, as necessary, to maintain a moist condition as would be expected in any such concrete placement.

8.5.20 Where buildings or other improvements are planned near the top of a slope 3:1 (horizontal:vertical) or steeper, special foundation and/or design considerations are recommended due to the tendency for lateral soil movement to occur.

- For fill slopes less than 20 feet high or cut slopes regardless of height, footings should be deepened such that the bottom outside edge of the footing is at least 7 feet horizontally from the face of the slope.
- When located next to a descending 3:1 (horizontal:vertical) fill slope or steeper, the foundations should be extended to a depth where the minimum horizontal distance is equal to H/3 (where H equals the vertical distance from the top of the fill slope to the base of the fill soil) with a minimum of 7 feet but need not exceed 40 feet. The horizontal distance is measured from the outer, deepest edge of the footing to the face of the slope. A post-tensioned slab and foundation system or mat foundation system can be used to reduce the potential for distress in the structures associated with strain softening and lateral fill extension. Specific design parameters or recommendations for either of these alternatives can be provided once the building location and fill slope geometry have been determined.
- If swimming pools are planned, Geocon Incorporated should be contacted for a review of specific site conditions.
- Swimming pools located within 7 feet of the top of cut or fill slopes are not recommended. Where such a condition cannot be avoided, the portion of the swimming pool wall within 7 feet of the slope face be designed assuming that the adjacent soil provides no lateral support. This recommendation applies to fill slopes up to 30 feet in height, and cut slopes regardless of height. For swimming pools located near the top of fill slopes greater than 30 feet in height, additional recommendations may be required and Geocon Incorporated should be contacted for a review of specific site conditions.
- Although other improvements, which are relatively rigid or brittle, such as concrete flatwork or masonry walls, may experience some distress if located near the top of a slope, it is generally not economical to mitigate this potential. It may be possible, however, to incorporate design measures which would permit some lateral soil movement without causing extensive distress. Geocon Incorporated should be consulted for specific recommendations.

8.5.21 The recommendations of this report are intended to reduce the potential for cracking of slabs and foundations due to expansive soil (if present), differential settlement of fill soil with

varying thicknesses. However, even with the incorporation of the recommendations presented herein, foundations, stucco walls, and slabs-on-grade placed on such conditions may still exhibit some cracking due to soil movement and/or shrinkage. The occurrence of concrete shrinkage cracks is independent of the supporting soil characteristics. Their occurrence may be reduced by limiting the slump of the concrete, proper concrete placement and curing, and by the placement of crack control joints at periodic intervals, in particular, where re-entrant slab corners occur.

8.5.22 Concrete slabs should be provided with adequate crack-control joints, construction joints and/or expansion joints to reduce unsightly shrinkage cracking. The design of joints should consider criteria of the American Concrete Institute when establishing crack-control spacing. Additional steel reinforcing, concrete admixtures and/or closer crack control joint spacing should be considered where concrete-exposed finished floors are planned.

8.5.23 Geocon Incorporated should be consulted to provide additional design parameters as required by the structural engineer.

8.5.24 We should observe the foundation excavations prior to the placement of reinforcing steel to check that the exposed soil conditions are similar to those expected and that they have been extended to the appropriate bearing strata. If unexpected soil conditions are encountered, foundation modifications may be required.

8.6 Concrete Flatwork

8.6.1 The following recommendations apply to exterior concrete flatwork where near surface soils are low to medium expansive (EI less than 90). Exterior slabs not subjected to vehicular traffic should be a minimum of 4 inches thick and reinforced with 6 x 6-6/6 welded wire mesh or No. 3 rebar spaced at 24 inches on center in both directions. The mesh should be placed in the middle of the slab. Proper mesh positioning is critical to future performance of the slabs. The contractor should take extra measures to provide proper mesh placement. Prior to construction of slabs, the upper 12 inches of subgrade soils should be moisture conditioned at or slightly above optimum moisture content and compacted to at least 90 percent of the laboratory maximum dry density per ASTM 1557.

8.6.2 Where highly expansive soils (EI greater than 90) are present near finish grade, the following recommendations apply. Exterior slabs should be at least 5 inches thick and reinforced with No. 3 steel bars spaced 18 inches on center each direction positioned at the slab midpoint. Driveways should be constructed with a 6-inch deep slab edge (measured from the bottom of the slab). Slabs should be doweled to the building foundation where they abut the stem wall.

Sidewalks should be doweled to the curbs. Prior to construction of slabs, the upper 12 inches of subgrade soils should scarified and moisture conditioned to **a minimum of 3% above optimum moisture content** just prior to placing the concrete. Moisture conditioning should be observed and checked by a representative of Geocon Incorporated.

8.6.3 Consideration should be given to adding concrete cut-off walls beneath exterior flatwork supported by highly expansive soils (EI greater than 90). The cut-off walls are recommended where any water (e.g. landscape) may migrate laterally beneath the flatwork and cause adverse soil movement. The cut-off walls should be located along the perimeter of the concrete slab adjacent to landscaping areas and extend at least 6-inches into the soil subgrade.

8.6.4 Concrete flatwork should be provided with crack control joints to reduce and/or control shrinkage cracking. Crack control spacing should be determined by the project structural engineer based upon the slab thickness and intended usage. Criteria of the American Concrete Institute (ACI) should be taken into consideration when establishing crack control spacing. A 4-inch-thick slab should have a maximum joint spacing of 10 feet. Subgrade soil for exterior slabs not subjected to vehicle loads should be compacted in accordance with criteria presented above prior to concrete placement. Subgrade soil should be properly compacted and the moisture content of subgrade soil should be checked prior to placing concrete.

8.6.5 The recommendations of this report are intended to reduce the potential for cracking of slabs due to expansive soil (if present), differential settlement of existing soil or soil with varying thicknesses. However, even with the incorporation of the recommendations presented herein, foundations, stucco walls, and slabs-on-grade placed on such conditions may still exhibit some cracking due to soil movement and/or shrinkage. Periotic maintenance such as slab replacement and/or grinding of elevated slab margins may be necessary due to the highly expansive soils. The occurrence of concrete shrinkage cracks is independent of the supporting soil characteristics. Their occurrence may be reduced and/or controlled by limiting the slump of the concrete, proper concrete placement and curing, and by the placement of crack control joints at periodic intervals, in particular, where re-entrant slab corners occur.

8.7 Preliminary Pavement Recommendations

8.7.1 We calculated the preliminary flexible pavement sections in general conformance with the *Caltrans Method of Flexible Pavement Design* (Highway Design Manual, Section 608.4) using an estimated Traffic Index (TI) of 4.5, 5.0, 6.0, and 7.0 for parking stalls, driveways, medium truck traffic areas, and heavy truck traffic areas, respectively. The project civil engineer and owner should review the pavement designations to determine appropriate locations for pavement thickness. The final pavement sections for the driveways and parking areas should be based on the R-Value of the subgrade soil encountered at final subgrade

elevation. We have assumed an R-Value of 5 and 78 for the subgrade soil and base materials, respectively, for the purposes of this preliminary analysis. Table 8.7.1 presents the preliminary flexible pavement sections.

TABLE 8.7.1
PRELIMINARY FLEXIBLE PAVEMENT SECTION

Location	Assumed Traffic Index	Assumed Subgrade R-Value	Asphalt Concrete (inches)	Class 2 Aggregate Base (inches)
Parking stalls for automobiles and light-duty vehicles	4.5	20	3	8
Driveways for automobiles and light-duty vehicles	5.0	20	3	10
Medium truck traffic areas	6.0	20	3.5	15
Driveways for heavy truck traffic	7.0	20	4	16

8.7.2 Prior to placing base materials, the upper 12 inches of the subgrade soil should be scarified, moisture conditioned as necessary, and compacted to a dry density of at least 95 percent of the laboratory maximum dry density near to slightly above optimum moisture content as determined by ASTM D 1557. Similarly, the base material should be compacted to a dry density of at least 95 percent of the laboratory maximum dry density near to slightly above optimum moisture content. Asphalt concrete should be compacted to a density of at least 95 percent of the laboratory Hveem density in accordance with ASTM D 2726.

8.7.3 Base materials should conform to Section 26-1.02A of the *Standard Specifications for The State of California Department of Transportation (Caltrans)* with a ¾-inch maximum size aggregate. The asphalt concrete should conform to Section 203-6 of the *Standard Specifications for Public Works Construction (Greenbook).*

8.7.4 A rigid Portland cement concrete (PCC) pavement section should be placed in driveway entrance aprons and trash bin loading/storage areas. The concrete pad for trash truck areas should be large enough such that the truck wheels will be positioned on the concrete during loading. We calculated the rigid pavement section in general conformance with the procedure recommended by the American Concrete Institute report ACI 330R-08 *Guide for Design and Construction of Concrete Parking Lots* using the parameters presented in Table 8.7.2.

TABLE 8.7.2
RIGID PAVEMENT DESIGN PARAMETERS

Design Parameter	Design Value
Modulus of subgrade reaction, k	50 pci
Modulus of rupture for concrete, M_R	500 psi
Traffic Category, TC	A and C
Average daily truck traffic, ADTT	10 and 100

8.7.5 Based on the criteria presented herein, the PCC pavement sections should have a minimum thickness as presented in Table 8.7.3.

TABLE 8.7.3
RIGID PAVEMENT RECOMMENDATIONS

Location	Portland Cement Concrete (inches)
Automobile Parking Areas (TC=A)	6.0
Heavy Truck and Fire Lane Areas (TC=C)	7.5

8.7.6 The PCC pavement should be placed over subgrade soil that is compacted to a dry density of at least 95 percent of the laboratory maximum dry density near to slightly above optimum moisture content. This pavement section is based on a minimum concrete compressive strength of approximately 3,000 psi (pounds per square inch).

8.7.7 A thickened edge or integral curb should be constructed on the outside of concrete slabs subjected to wheel loads. The thickened edge should be 1.2 times the slab thickness or a minimum thickness of 2 inches, whichever results in a thicker edge, and taper back to the recommended slab thickness 4 feet behind the face of the slab (e.g., a 7-inch-thick slab would have a 9-inch-thick edge). Reinforcing steel should consist of No. 3 steel bars spaced at 24 inches on center, both directions.

8.7.8 To control the location and spread of concrete shrinkage cracks, crack-control joints (weakened plane joints) should be included in the design of the concrete pavement slab. Crack-control joints should not exceed 30 times the slab thickness with a maximum spacing of 12.5 feet and 15 feet for the 5.5- and 7-inch-thick slabs, respectively, and should be sealed with an appropriate sealant to prevent the migration of water through the control joint to the subgrade materials. The depth of the crack-control joints should be determined by the referenced ACI report.

8.7.9 Concrete curb/gutter should be placed on soil subgrade compacted to a dry density of at least 90 percent of the laboratory maximum dry density near to slightly above optimum moisture content. Cross-gutters should be placed on subgrade soil compacted to a dry density of at least 95 percent of the laboratory maximum dry density near to slightly above optimum moisture content. Base materials should not be placed below the curb/gutter, cross-gutters, or sidewalk so water is not able to migrate from the adjacent parkways to the pavement sections. Where flatwork is located directly adjacent to the curb/gutter, consideration may be given to structurally connecting the concrete flatwork to the curbs to help reduce the potential for offsets between the curbs and the flatwork if differential settlement occurs.

8.8 Conventional Retaining Walls

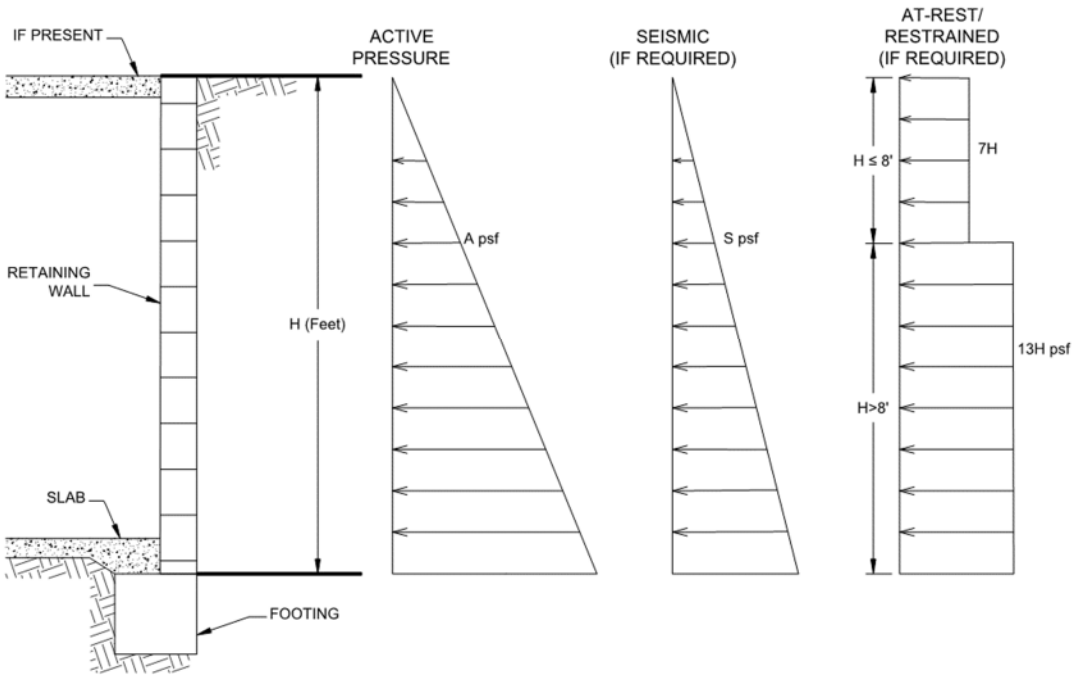
8.8.1 Retaining walls should be designed using the values presented in Table 8.8.1. Soil with an expansion index (EI) of greater than 50 should not be used as backfill material behind retaining walls.

TABLE 8.8.1
RETAINING WALL DESIGN RECOMMENDATIONS

Parameter	ValueP
Active Soil Pressure, A (Fluid Density, Level Backfill)	35 pcf
Active Soil Pressure, A (Fluid Density, 2:1 Sloping Backfill)	50 pcf
Seismic Pressure, S	16H psf
At-Rest/Restrained Walls Additional Uniform Pressure (0 to 8 Feet High)	8H psf
At-Rest/Restrained Walls Additional Uniform Pressure (8+ Feet High)	12H psf
Expected Expansion Index for the Subject Property	EI≤50

H equals the height of the retaining portion of the wall

8.8.2 The project retaining walls should be designed as shown in the Retaining Wall Loading Diagram.



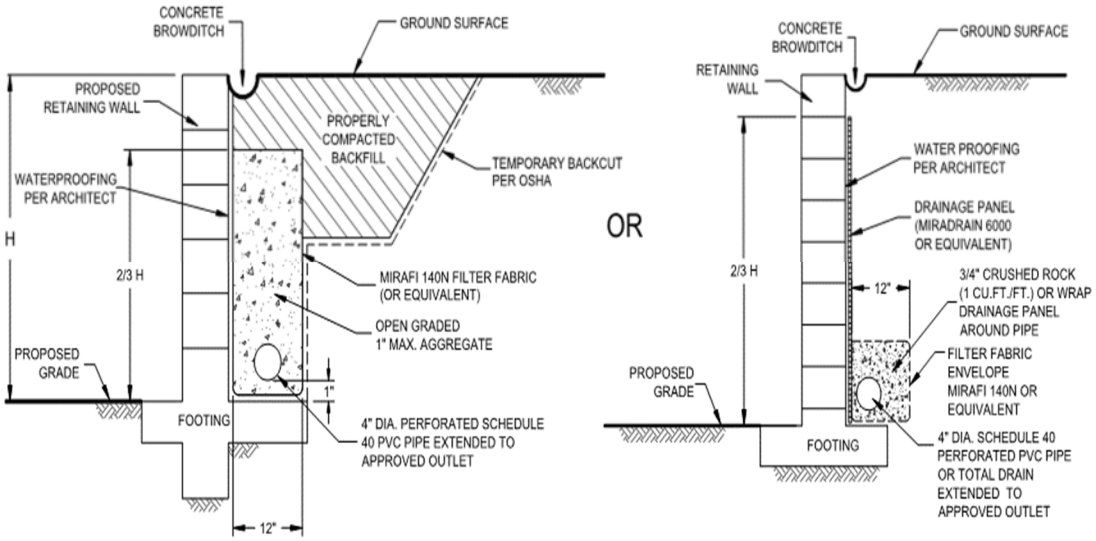
Retaining Wall Loading Diagram

8.8.3 Unrestrained walls are those that are allowed to rotate more than 0.001H (where H equals the height of the retaining portion of the wall) at the top of the wall. Where walls are restrained from movement at the top (at-rest condition), an additional uniform pressure should be applied to the wall. For retaining walls subject to vehicular loads within a horizontal distance equal to two-thirds the wall height, a surcharge equivalent to 2 feet of fill soil should be added.

8.8.4 The structural engineer should determine the Seismic Design Category for the project in accordance with Section 1613.3.5 of the 2019 CBC or Section 11.6 of ASCE 7-16. For structures assigned to Seismic Design Category of D, E, or F, retaining walls that support more than 6 feet of backfill should be designed with seismic lateral pressure in accordance with Section 1803.5.12 of the 2019 CBC. The seismic load is dependent on the retained height where H is the height of the wall, in feet, and the calculated loads result in pounds per square foot (psf) exerted at the base of the wall and zero at the top of the wall.

8.8.5 Retaining walls should be designed to ensure stability against overturning sliding, and excessive foundation pressure. Where a keyway is extended below the wall base with the intent to engage passive pressure and enhance sliding stability, it is not necessary to consider active pressure on the keyway.

8.8.6 Drainage openings through the base of the wall (weep holes) should not be used where the seepage could be a nuisance or otherwise adversely affect the property adjacent to the base of the wall. The recommendations herein assume a properly compacted granular (EI of 90 or less) free draining backfill material with no hydrostatic forces or imposed surcharge load. The retaining wall should be properly drained as shown in the Typical Retaining Wall Drainage Detail. If conditions different than those described are expected, or if specific drainage details are desired, Geocon Incorporated should be contacted for additional recommendations.



Typical Retaining Wall Drainage Detail

8.8.7 The retaining walls may be designed using either the active and restrained (at-rest) loading condition or the active and seismic loading condition as suggested by the structural engineer. Typically, it appears the design of the restrained condition for retaining wall loading may be adequate for the seismic design of the retaining walls. However, the active earth pressure combined with the seismic design load should be reviewed and also considered in the design of the retaining walls.

8.8.8 In general, wall foundations should be designed in accordance with Table 8.8.2. The proximity of the foundation to the top of a slope steeper than 3:1 could impact the allowable soil bearing pressure. Therefore, retaining wall foundations should be deepened such that the bottom outside edge of the footing is at least 7 feet horizontally from the face of the slope.

TABLE 8.8.2
SUMMARY OF RETAINING WALL FOUNDATION RECOMMENDATIONS

Parameter	Value
Minimum Retaining Wall Foundation Width	12 inches
Minimum Retaining Wall Foundation Depth	12 Inches
Minimum Steel Reinforcement	Per Structural Engineer
Allowable Bearing Capacity	2,000 psf
Bearing Capacity Increase	500 psf per Foot of Depth
	300 psf per Foot of Width
Maximum Allowable Bearing Capacity	4,000 psf
Estimated Total Static Settlement*	1 Inch
Estimated Differential Static Settlement*	½ Inch in 40 Feet

8.8.9 The recommendations presented herein are generally applicable to the design of rigid concrete or masonry retaining walls. In the event that other types of walls (such as mechanically stabilized earth [MSE] walls) are planned, Geocon Incorporated should be consulted for additional recommendations.

8.8.10 Unrestrained walls will move laterally when backfilled and loading is applied. The amount of lateral deflection is dependent on the wall height, the type of soil used for backfill, and loads acting on the wall. The retaining walls and improvements above the retaining walls should be designed to incorporate an appropriate amount of lateral deflection as determined by the structural engineer.

8.8.11 Soil contemplated for use as retaining wall backfill, including import materials, should be identified in the field prior to backfill. At that time, Geocon Incorporated should obtain samples for laboratory testing to evaluate its suitability. Modified lateral earth pressures may be necessary if the backfill soil does not meet the required expansion index or shear strength. City or regional standard wall designs, if used, are based on a specific active lateral earth pressure and/or soil friction angle. In this regard, on-site soil to be used as backfill may or may not meet the values for standard wall designs. Geocon Incorporated should be consulted to assess the suitability of the on-site soil for use as wall backfill if standard wall designs will be used.

8.9 Lateral Loading

8.9.1 Table 8.9 should be used to help design the proposed structures and improvements to resist lateral loads for the design of footings or shear keys. The allowable passive pressure assumes

a horizontal surface extending at least 5 feet, or three times the surface generating the passive pressure, whichever is greater. The upper 12 inches of material in areas not protected by floor slabs or pavement should not be included in design for passive resistance.

TABLE 8.9
SUMMARY OF LATERAL LOAD DESIGN RECOMMENDATIONS

Parameter	Value
Passive Pressure Fluid Density	300 pcf
Coefficient of Friction (Concrete and Soil)	0.35
Coefficient of Friction (Along Vapor Barrier)	0.2 to 0.25*

*Per manufacturer's recommendations.

8.9.2 The passive and frictional resistant loads can be combined for design purposes. The lateral passive pressures may be increased by one-third when considering transient loads due to wind or seismic forces.

8.10 Site Drainage and Moisture Protection

8.10.1 Adequate site drainage is critical to reduce the potential for differential soil movement, erosion, and subsurface seepage. Under no circumstances should water be allowed to pond adjacent to footings. The site should be graded and maintained such that surface drainage is directed away from structures in accordance with 2019 CBC 1804.3 or other applicable standards. In addition, surface drainage should be directed away from the top of slopes into swales or other controlled drainage devices. Roof and pavement drainage should be directed into conduits that carry runoff away from the proposed structure.

8.10.2 Underground utilities should be leak free. Utility and irrigation lines should be checked periodically for leaks, and detected leaks should be repaired promptly. Detrimental soil movement could occur if water is allowed to infiltrate the soil for prolonged periods of time.

8.11 Grading and Foundation Plan Review

8.11.1 Geocon Incorporated should review the grading and foundation plans for the project prior to final design submittal to determine if additional analysis and/or recommendations are required.

LIMITATIONS AND UNIFORMITY OF CONDITIONS

1. The firm that performed the geotechnical investigation for the project should be retained to provide testing and observation services during construction to provide continuity of geotechnical interpretation and to check that the recommendations presented for geotechnical aspects of site development are incorporated during site grading, construction of improvements, and excavation of foundations. If another geotechnical firm is selected to perform the testing and observation services during construction operations, that firm should prepare a letter indicating their intent to assume the responsibilities of project geotechnical engineer of record. A copy of the letter should be provided to the regulatory agency for their records. In addition, that firm should provide revised recommendations concerning the geotechnical aspects of the proposed development, or a written acknowledgement of their concurrence with the recommendations presented in our report. They should also perform additional analyses deemed necessary to assume the role of Geotechnical Engineer of Record.

2. The recommendations of this report pertain only to the site investigated and are based upon the assumption that the soil conditions do not deviate from those disclosed in the investigation. If any variations or undesirable conditions are encountered during construction, or if the proposed construction will differ from that anticipated herein, Geocon Incorporated should be notified so that supplemental recommendations can be given. The evaluation or identification of the potential presence of hazardous or corrosive materials was not part of the scope of services provided by Geocon Incorporated.

3. This report is issued with the understanding that it is the responsibility of the owner, or of his representative, to ensure that the information and recommendations contained herein are brought to the attention of the architect and engineer for the project and incorporated into the plans, and that the necessary steps are taken to see that the contractor and subcontractors carry out such recommendations in the field.

4. The findings of this report are valid as of the present date. However, changes in the conditions of a property can occur with the passage of time, whether they are due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and should not be relied upon after a period of three years.

APPENDIX A

APPENDIX A

FIELD INVESTIGATION

The field investigation was performed on November 7 and 11, 2022, and consisted of a site reconnaissance and the excavation of seven hollow-stem borings (B-1 through B-7). The approximate locations of the borings are shown on the *Geologic Map*, Figure 2, including the previous borings performed by Leighton, except Boring B-5 which was missing from their report.

The borings were performed by North County Drilling and were advanced to a maximum depth of 41 feet below existing grade using an Ingersoll Rand A-300 drill rig equipped with 6-inch hollow-stem augers. Relatively undisturbed samples were obtained by driving a California split-spoon (CAL) split-tube sampler into the "undisturbed" soil mass. The CAL sampler was equipped with 1-inch by 2⅜-inch, brass sampler rings to facilitate removal and testing. Logs of the borings depicting the soil and geologic conditions encountered and the depth at which samples were obtained are presented on Figures A-1 through A-7. Leighton's boring logs follow Figure A-7.

The soils encountered in the excavations were visually classified and logged in general accordance with American Society for Testing and Materials (ASTM) practice for Description and Identification of Soils (Visual Manual Procedure D 2488).

APPENDIX B

LABORATORY TESTING

Laboratory tests were performed in accordance with generally accepted test methods of the American Society for Testing and Materials (ASTM) or other suggested procedures. Selected soil samples were tested for their in-place dry density and moisture content, expansion potential, soluble sulfate content, and consolidation. The in-place dry density and moisture content results are indicated on the exploratory boring logs. The results of our laboratory tests are summarized on Tables B-I and B-II and the following figures.

TABLE B-I

STORM WATER MANAGEMENT INVESTIGATION

FOR

SAN MARCOS RESTAURANT ROW
SAN MARCOS, CALIFORNIA

PROJECT NO. G2487-32-03

APPENDIX C

STORM WATER MANAGEMENT INVESTIGATION

We understand storm water management devices are being proposed in accordance with the *2016 City of San Marcos BMP Design Manual,* commonly referred to as the *Storm Water Standards* (SWS). If not properly constructed, there is a potential for distress to improvements and properties located hydrologically down gradient or adjacent to these devices. Factors such as the amount of water to be detained, its residence time, and soil permeability have an important effect on seepage transmission and the potential adverse impacts that may occur if the storm water management features are not properly designed and constructed. We have not performed a hydrogeological study at the site. If infiltration of storm water runoff occurs, downstream properties may be subjected to seeps, springs, slope instability, raised groundwater, movement of foundations and slabs, or other undesirable impacts as a result of water infiltration.

Hydrologic Soil Group

The United States Department of Agriculture (USDA), Natural Resources Conservation Services (NRCS), possesses general information regarding the existing soil conditions for areas within the United States. The USDA NRCS website also provides the Hydrologic Soil Group. Table C-1 presents the descriptions of the hydrologic soil groups. In addition, the USDA website also provides an estimated saturated hydraulic conductivity for the existing soil.

TABLE C-1
HYDROLOGIC SOIL GROUP DEFINITIONS

Soil Group	Soil Group Definition
A	Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.
B	Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.
C	Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.
D	Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high-water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

The property is underlain by four units identified as Placentia sandy loam (PaE, PeC and PfA), and Ramona sandy loam (RaB) . The Placentia and Ramona sandy loams are classified as Soil Groups C and D. Table C-2 presents the information from the USDA NRCS website for the subject property.

TABLE C-2
USDA WEB SOIL SURVEY – HYDROLOGIC SOIL GROUP

Map Unit Name	Map Unit Symbol	Approximate Percentage of Property	Hydrologic Soil Group	k_{SAT} of Most Limiting Layer (inches/hour)
Placentia sandy loam	PeA	3	C	0.06 – 0.60
Placentia sandy loam	PeC	61	C	0.06 – 0.60
Placentia sandy loam	PfA	35	D	0.00 – 0.06
Ramona sandy loam	RaB	1	C	0.20 – 0.57

STORM WATER MANAGEMENT CONCLUSIONS

The *Geologic Map*, Figure 2, depicts the existing property, proposed development, the approximate lateral limits of the geologic units, and locations of the recent and previous exploratory borings.

Soil Types

Proposed Compacted Fill – Compacted fill will be placed across the entire property during site development. Proposed remedial grading will consist of removing the upper 3 to 9 feet of soil and replacement as compacted fill. The proposed storm water BMP's will be founded in compacted fill placed above older alluvium. The compacted fill will be comprised of on-site clays which exhibit very low infiltration rates not suitable for infiltration BMP's. The fill will be compacted to a dry density of at least 90 percent of the laboratory maximum dry density. In our experience, compacted fill does not possess infiltration rates appropriate for infiltration BMP's. Hazards that occur as a result of fill soil saturation include a potential for hydro-consolidation of the granular fill soils, long term fill settlement, differential fill settlement, heaving of expansive clay soil, and lateral movement associated with saturated fill relaxation. The potential for lateral water migration to adversely impact existing or proposed structures, foundations, utilities, and roadways, is high. Therefore, full infiltration should be considered infeasible.

Section D.4.2 of the *2016 Storm Water Standards* (SWS) provides a discussion regarding fill materials used for infiltration. The SWS states:

- *For engineered fills, infiltration rates may still be quite uncertain due to layering and heterogeneities introduced as part of construction that cannot be precisely controlled.* Due to these uncertainties, full and partial infiltration should be considered geotechnically infeasible and liners and subdrains should be used in areas where infiltration BMP's are founded in compacted fill.

- *Where possible, infiltration BMPs on fill material should be designed such that their infiltrating surface extends into native soils.* The underlying older alluvium below the compacted fill is expected to be approximately 5 to 10 feet below existing grade. Full and partial infiltration

should be considered geotechnically infeasible within the compacted fill and liners and subdrains should be used. If the infiltration BMP's extended below the compacted fill, partial infiltration may be feasible if the infiltration BMP extends below the compacted fill.

- *Because of the uncertainty of fill parameters as well as potential compaction of the native soils, an infiltration BMP may not be feasible.* Therefore, full infiltration should be considered geotechnically infeasible. Partial infiltration may be feasible if the infiltration BMP extends below the compacted fill.

Older Alluvium – Older alluvium will underlie the compacted fill, which consists of medium dense to very dense, silty/clayey sand and hard, sandy silt and clay. The infiltration rates in the older alluvial deposits typically exhibit very poor permeability characteristics, which do not support full or partial infiltration.

Groundwater Elevations

Groundwater was encountered approximately 8 to 24 feet below existing grades. Groundwater is not anticipated to significantly impact project development as presently proposed. Proper surface drainage of irrigation and rainwater will be important to future performance of the project.

Soil or Groundwater Contamination

Based on our review of the Geotracker website, no soil or groundwater contamination is suspected.

New or Existing Utilities

Existing utilities are present within right of ways adjacent to the existing streets, generally beneath public sidewalks and roadways. We expect that all on-site utilities will be removed prior to site development. Full infiltration near existing or proposed utilities should be avoided to prevent lateral water migration into the permeable trench backfill materials.

Existing and Planned Structures

Commercial developments currently surround the property and are in close proximity to the property boundaries. If water is allowed to infiltrate into the soil, the water could potentially migrate laterally and into other properties in the vicinity of the subject site. The water migration may negatively affect other buildings and improvements in the area.

Slopes

Infiltration BMP's situated in close proximity to descending fill slopes are not recommended due to the potential for daylight water seepage and lateral water migration.

Recommendations

Due to the very low infiltration rates expected for the clayey older alluvial deposits, and close proximity to public and private improvements, foundations, and roadways, full and partial infiltration of storm water is considered geotechnically infeasible. Liners and subdrains should be incorporated into the design and construction of the planned storm water devices. The liners should be impermeable (e.g. High-density polyethylene, HDPE, with a thickness of about 30 mil or equivalent Polyvinyl Chloride, PVC) to prevent water migration. The subdrains should be perforated within the liner area, installed at the base and above the liner, be at least 4 inches in diameter and consist of Schedule 40 PVC pipe. The subdrains outside of the liner should consist of solid pipe. Seams and penetrations of the liners should be properly waterproofed. The subdrains should be connected to a proper outlet. The devices should also be installed in accordance with the manufacturer's recommendations.

Storm Water Standard Worksheets

The SWS requests the geotechnical engineer complete the *Categorization of Infiltration Feasibility Condition* (Worksheet C.4-1 or I-8) worksheet information to help evaluate the potential for infiltration on the property. The attached Form 1-8 presents the completed information for the submittal process.

The regional storm water standards also have a worksheet (Worksheet D.5-1 or Form I-9) that helps the project civil engineer estimate the factor of safety based on several factors. Table C-3 describes the suitability assessment input parameters related to the geotechnical engineering aspects for the factor of safety determination.

TABLE C-3
SUITABILITY ASSESSMENT RELATED CONSIDERATIONS
FOR INFILTRATION FACILITY SAFETY FACTORS

Consideration	High Concern – 3 Points	Medium Concern – 2 Points	Low Concern – 1 Point
Assessment Methods	Use of soil survey maps or simple texture analysis to estimate short-term infiltration rates. Use of well permeameter or borehole methods without accompanying continuous boring log. Relatively sparse testing with direct infiltration methods	Use of well permeameter or borehole methods with accompanying continuous boring log. Direct measurement of infiltration area with localized infiltration measurement methods (e.g., Infiltrometer). Moderate spatial resolution	Direct measurement with localized (i.e. small-scale) infiltration testing methods at relatively high resolution or use of extensive test pit infiltration measurement methods.
Predominant Soil Texture	Silty and clayey soils with significant fines	Loamy soils	Granular to slightly loamy soils
Site Soil Variability	Highly variable soils indicated from site assessment or unknown variability	Soil boring/test pits indicate moderately homogenous soils	Soil boring/test pits indicate relatively homogenous soils
Depth to Groundwater/ Impervious Layer	<5 feet below facility bottom	5-15 feet below facility bottom	>15 feet below facility bottom

Based on our geotechnical investigation and the information in Table C-3, Table C-4 presents the estimated factor values for the evaluation of the factor of safety. This table only provides the suitability assessment safety factor (Part A) of the worksheet. The project civil engineer should evaluate the safety factor for design (Part B) and use the combined safety factor for the design infiltration rate.

TABLE C-4
FACTOR OF SAFETY WORKSHEET DESIGN VALUES – PART A[1]

Suitability Assessment Factor Category	Assigned Weight (w)	Factor Value (v)	Product (p = w x v)
Assessment Methods	0.25	3	0.75
Predominant Soil Texture	0.25	3	0.75
Site Soil Variability	0.25	2	0.50
Depth to Groundwater/ Impervious Layer	0.25	2	0.50
Suitability Assessment Safety Factor, $S_A = \sum p$			2.50

[1] The project civil engineer should complete Worksheet D.5-1 or Form I-9 using the data on this table. Additional information is required to evaluate the design factor of safety.

Categorization of Infiltration Feasibility Condition	Form I-8

Part 1 - Full Infiltration Feasibility Screening Criteria

Would infiltration of the full design volume be feasible from a physical perspective without any undesirable consequences that cannot be reasonably mitigated?

Criteria	Screening Question	Yes	No
1	**Is the estimated reliable infiltration rate below proposed facility locations greater than 0.5 inches per hour?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.2 and Appendix D.		X

Provide basis:

Based on the results of previous infiltration testing by others, the in-situ infiltration rates in two locations and using the Porchet Method to convert percolation rate to infiltration rate, were less than 0.02 and 0.01 inches per hour (iph). After applying a feasibility factor of safety of 2, the design infiltration rates are less than 0.01 iph. In addition, the USDA NRCS web soil survey indicates the proposed BMP's are located in soil belonging to Hydrologic Soil Group D with anticipated rates of 0.0 to 0.06 iph, which are not conducive to infiltration.

Based on the infiltration rates, full infiltration is infeasible.

2	**Can infiltration greater than 0.5 inches per hour be allowed without increasing risk of geotechnical hazards (slope stability, groundwater mounding, utilities, or other factors) that cannot be mitigated to an acceptable level?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.2.		X

Provide basis:

If water is allowed to infiltrate into the underlying highly expansive soils, there is an increased risk for heaving and soil movement that could adversely impact nearby structures and improvements. The potential for groundwater mounding exists. Groundwater is located between 10 to 20 feet below existing grades.

Form I-8 Page 2 of 4			
Criteria	Screening Question	**Yes**	**No**
3	**Can infiltration greater than 0.5 inches per hour be allowed without increasing risk of groundwater contamination (shallow water table, storm water pollutants or other factors) that cannot be mitigated to an acceptable level?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.3.	X	
Provide basis: Groundwater is located approximately 10 to 20 feet from the ground surface. No contamination is suspected based on review of the Storm Water Standards Manual and Geotracker website. Per the SWS Manual, infiltration BMP's should be located at least 10 feet from groundwater if the groundwater is considered of beneficial use.			
4	**Can infiltration greater than 0.5 inches per hour be allowed without causing potential water balance issues such as change of seasonality of ephemeral streams or increased discharge of contaminated groundwater to surface waters?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.3.	X	
Provide basis: We do not expect infiltration will cause water balance issues such as seasonality of ephemeral streams or increased discharge of contaminated groundwater to surface waters. However, evaluating water balance issues is beyond the scope of the geotechnical engineer and should be evaluated by others.			
Part 1 Result *	If all answers to rows 1 - 4 are "**Yes**" a full infiltration design is potentially feasible. The feasibility screening category is **Full Infiltration** If any answer from row 1-4 is "**No**", infiltration may be possible to some extent but would not generally be feasible or desirable to achieve a "full infiltration" design. Proceed to Part 2		No

*To be completed using gathered site information and best professional judgment considering the definition of MEP in the MS4 Permit. Additional testing and/or studies may be required by Agency/Jurisdictions to substantiate findings

Form I-8 Page 3 of 4

Part 2 – Partial Infiltration vs. No Infiltration Feasibility Screening Criteria

Would infiltration of water in any appreciable amount be physically feasible without any negative consequences that cannot be reasonably mitigated?

Criteria	Screening Question	Yes	No
5	**Do soil and geologic conditions allow for infiltration in any appreciable rate or volume?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.2 and Appendix D.		X

Provide basis:

Based on the results of previous infiltration testing by others, the in-situ infiltration rates in two locations and using the Porchet Method to convert percolation rate to infiltration rate, were less than 0.02 and 0.01 inches per hour (iph). After applying a feasibility factor of safety of 2, the design infiltration rates are less than 0.01 iph. A design infiltration rate of 0.05 iph is considered necessary to consider partial infiltration. In addition, the USDA NRCS web soil survey indicates the proposed BMP's are located in soil belonging to Hydrologic Soil Group D with anticipated rates of 0.0 to 0.06 iph, which are not conducive to infiltration.

Based on the infiltration rates, partial infiltration is considered infeasible.

6	**Can Infiltration in any appreciable quantity be allowed without increasing risk of geotechnical hazards (slope stability, groundwater mounding, utilities, or other factors) that cannot be mitigated to an acceptable level**? The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.2.		X

Provide basis:

If water is allowed to infiltrate into the underlying highly expansive soils, there is an increased risk for heaving and soil movement that could adversely impact nearby structures and improvements. The potential for groundwater mounding exists. Groundwater is located between 10 to 20 feet below existing grades.

Form I-8 Page 4 of 4			
Criteria	Screening Question	**Yes**	**No**
7	**Can Infiltration in any appreciable quantity be allowed without posing significant risk for groundwater related concerns (shallow water table, storm water pollutants or other factors)?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.3.	X	
Provide basis: Groundwater is located approximately 10 to 20 feet from the ground surface. No contamination is suspected based on review of the Storm Water Standards Manual and Geotracker website. Per the SWS Manual, infiltration BMP's should be located at least 10 feet from groundwater if the groundwater is considered of beneficial use.			
8	**Can infiltration be allowed without violating downstream water rights**? The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.3.	X	
Provide basis: We do not expect infiltration to violate downstream water rights, however, evaluating water rights is not a geotechnical issue and should be evaluated by others.			
Part 2 Result*	If all answers from row 5-8 are yes then partial infiltration design is potentially feasible. The feasibility screening category is **Partial Infiltration.** If any answer from row 5-8 is no, then infiltration of any volume is considered to be **infeasible** within the drainage area. The feasibility screening category is **No Infiltration.**	No Infiltration	

*To be completed using gathered site information and best professional judgment considering the definition of MEP in the MS4 Permit. Additional testing and/or studies may be required by Agency/Jurisdictions to substantiate findings

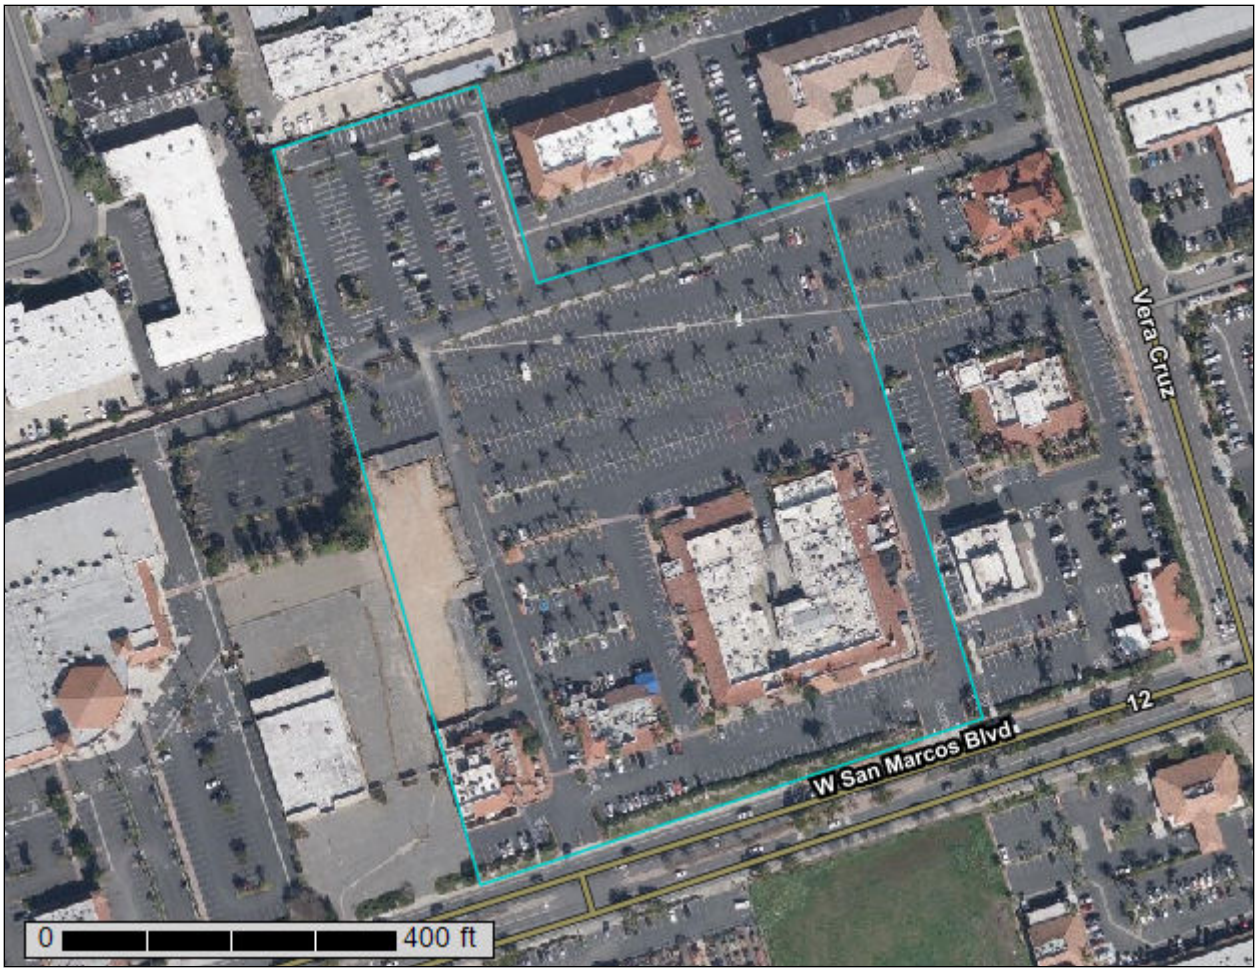
Custom Soil Resource Report for San Diego County Area, California

Restaurant Row, San Marcos, CA



June 23, 2022

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Diego County Area, California
Survey Area Data: Version 16, Sep 13, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jan 23, 2020—Feb 13, 2020

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI

PeC	Placentia sandy loam, 2 to 9 percent slopes, warm MAAT, MLRA 19	6.7	61.5%
PfA	Placentia sandy loam, thick surface, 0 to 2 percent slo pes	3.8	34.6%
RaB	Ramona sandy loam, 2 to 5 percent slopes	0.1	1.0%
Totals for Area of Interest		**10.9**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it

was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

San Diego County Area, California

PeA—Placentia sandy loam, 0 to 2 percent slopes, warm MAAT, MLRA 19

Map Unit Setting

National map unit symbol: 2tyyl
Elevation: 200 to 2,520 feet
Mean annual precipitation: 17 to 19 inches
Mean annual air temperature: 63 to 64 degrees F
Frost-free period: 270 to 360 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Placentia and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Placentia

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Convex
Parent material: Alluvium derived from granitoid

Typical profile

H1 - 0 to 13 inches: sandy loam
H2 - 13 to 34 inches: sandy clay
H3 - 34 to 53 inches: sandy clay loam
H4 - 53 to 63 inches: sandy clay loam

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Low
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.60 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Very slightly saline to moderately saline (2.0 to 8.0 mmhos/cm)
Sodium adsorption ratio, maximum: 25.0
Available water supply, 0 to 60 inches: High (about 9.3 inches)

Interpretive groups

Land capability classification (irrigated): 4s
Land capability classification (nonirrigated): 4s
Hydrologic Soil Group: C
Ecological site: R019XD061CA - CLAYPAN (1975)
Hydric soil rating: No

Minor Components

Placentia, thick surface
Percent of map unit: 7 percent
Hydric soil rating: No

Ramona
Percent of map unit: 7 percent
Hydric soil rating: No

Typic natrixeralfs, occasionally ponded
Percent of map unit: 1 percent
Landform: Depressions
Hydric soil rating: Yes

PeC—Placentia sandy loam, 2 to 9 percent slopes, warm MAAT, MLRA 19

Map Unit Setting
National map unit symbol: 2tyyn
Elevation: 150 to 2,950 feet
Mean annual precipitation: 13 to 18 inches
Mean annual air temperature: 62 to 64 degrees F
Frost-free period: 270 to 360 days
Farmland classification: Farmland of statewide importance

Map Unit Composition
Placentia and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Placentia

Setting
Landform: Terraces, alluvial fans
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear, convex
Parent material: Alluvium derived from granitoid

Typical profile
A1 - 0 to 4 inches: sandy loam
A2 - 4 to 13 inches: sandy loam
Bt1 - 13 to 21 inches: sandy clay
Bt2 - 21 to 34 inches: sandy clay
BC - 34 to 53 inches: sandy clay loam
C - 53 to 63 inches: sandy clay loam

Properties and qualities
Slope: 2 to 9 percent

Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Low
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.60 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Very slightly saline to moderately saline (2.0 to 8.0 mmhos/cm)
Sodium adsorption ratio, maximum: 25.0
Available water supply, 0 to 60 inches: High (about 9.2 inches)

Interpretive groups

Land capability classification (irrigated): 4e
Land capability classification (nonirrigated): 4e

Map Unit Setting

National map unit symbol: hbfm
Elevation: 50 to 2,500 feet
Mean annual precipitation: 12 to 18 inches
Mean annual air temperature: 63 to 64 degrees F
Frost-free period: 200 to 300 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Placentia and similar soils: 85 percent
Minor components: 11 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Placentia

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Base slope, rise
Down-slope shape: Linear
Across-slope shape: Convex
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 13 inches: sandy loam
H2 - 13 to 34 inches: clay
H3 - 34 to 63 inches: clay loam

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Moderately well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Very slightly saline to moderately saline (2.0 to 8.0 mmhos/cm)
Sodium adsorption ratio, maximum: 25.0
Available water supply, 0 to 60 inches: Low (about 5.1 inches)

Interpretive groups

Land capability classification (irrigated): 3s
Land capability classification (nonirrigated): 4s
Hydrologic Soil Group: D
Ecological site: R019XD061CA - CLAYPAN (1975)
Hydric soil rating: No

RaB—Ramona sandy loam, 2 to 5 percent slopes

Map Unit Setting

National map unit symbol: hbfr
Elevation: 250 to 3,500 feet
Mean annual precipitation: 10 to 20 inches
Mean annual air temperature: 63 degrees F
Frost-free period: 230 to 320 days
Farmland classification: Prime farmland if irrigated

Map Unit Composition

Ramona and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Ramona

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Base slope, rise
Down-slope shape: Linear
Across-slope shape: Convex
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 17 inches: sandy loam
H2 - 17 to 60 inches: sandy clay loam
H3 - 60 to 74 inches: fine sandy loam

Properties and qualities

Slope: 2 to 5 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Medium
Capacity of the most limiting layer to transmit water (Ksat): Moderately high (0.20 to 0.57 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Moderate (about 8.5 inches)

Interpretive groups

SAN MARCOS RESTAURANT ROW
SAN MARCOS, CALIFORNIA

PROJECT NO. G2487-32-03

RECOMMENDED GRADING SPECIFICATIONS

1. GENERAL

1.1 These Recommended Grading Specifications shall be used in conjunction with the Geotechnical Report for the project prepared by Geocon. The recommendations contained in the text of the Geotechnical Report are a part of the earthwork and grading specifications and shall supersede the provisions contained hereinafter in the case of conflict.

1.2 Prior to the commencement of grading, a geotechnical consultant (Consultant) shall be employed for the purpose of observing earthwork procedures and testing the fills for substantial conformance with the recommendations of the Geotechnical Report and these specifications. The Consultant should provide adequate testing and observation services so that they may assess whether, in their opinion, the work was performed in substantial conformance with these specifications. It shall be the responsibility of the Contractor to assist the Consultant and keep them apprised of work schedules and changes so that personnel may be scheduled accordingly.

1.3 It shall be the sole responsibility of the Contractor to provide adequate equipment and methods to accomplish the work in accordance with applicable grading codes or agency ordinances, these specifications and the approved grading plans. If, in the opinion of the Consultant, unsatisfactory conditions such as questionable soil materials, poor moisture condition, inadequate compaction, and/or adverse weather result in a quality of work not in conformance with these specifications, the Consultant will be empowered to reject the work and recommend to the Owner that grading be stopped until the unacceptable conditions are corrected.

2. DEFINITIONS

2.1 **Owner** shall refer to the owner of the property or the entity on whose behalf the grading work is being performed and who has contracted with the Contractor to have grading performed.

2.2 **Contractor** shall refer to the Contractor performing the site grading work.

2.3 **Civil Engineer** or **Engineer of Work** shall refer to the California licensed Civil Engineer or consulting firm responsible for preparation of the grading plans, surveying and verifying as-graded topography.

2.4 **Consultant** shall refer to the soil engineering and engineering geology consulting firm retained to provide geotechnical services for the project.

2.5 **Soil Engineer** shall refer to a California licensed Civil Engineer retained by the Owner, who is experienced in the practice of geotechnical engineering. The Soil Engineer shall be responsible for having qualified representatives on-site to observe and test the Contractor's work for conformance with these specifications.

2.6 **Engineering Geologist** shall refer to a California licensed Engineering Geologist retained by the Owner to provide geologic observations and recommendations during the site grading.

2.7 **Geotechnical Report** shall refer to a soil report (including all addenda) which may include a geologic reconnaissance or geologic investigation that was prepared specifically for the development of the project for which these Recommended Grading Specifications are intended to apply.

3. MATERIALS

3.1 Materials for compacted fill shall consist of any soil excavated from the cut areas or imported to the site that, in the opinion of the Consultant, is suitable for use in construction of fills. In general, fill materials can be classified as *soil* fills, *soil-rock* fills or *rock* fills, as defined below.

3.1.1 **Soil fills** are defined as fills containing no rocks or hard lumps greater than 12 inches in maximum dimension and containing at least 40 percent by weight of material smaller than ¾ inch in size.

3.1.2 **Soil-rock fills** are defined as fills containing no rocks or hard lumps larger than 4 feet in maximum dimension and containing a sufficient matrix of soil fill to allow for proper compaction of soil fill around the rock fragments or hard lumps as specified in Paragraph 6.2. **Oversize rock** is defined as material greater than 12 inches.

3.1.3 **Rock fills** are defined as fills containing no rocks or hard lumps larger than 3 feet in maximum dimension and containing little or no fines. Fines are defined as material smaller than ¾ inch in maximum dimension. The quantity of fines shall be less than approximately 20 percent of the rock fill quantity.

3.2 Material of a perishable, spongy, or otherwise unsuitable nature as determined by the Consultant shall not be used in fills.

3.3 Materials used for fill, either imported or on-site, shall not contain hazardous materials as defined by the California Code of Regulations, Title 22, Division 4, Chapter 30, Articles 9

and 10; 40CFR; and any other applicable local, state or federal laws. The Consultant shall not be responsible for the identification or analysis of the potential presence of hazardous materials. However, if observations, odors or soil discoloration cause Consultant to suspect the presence of hazardous materials, the Consultant may request from the Owner the termination of grading operations within the affected area. Prior to resuming grading operations, the Owner shall provide a written report to the Consultant indicating that the suspected materials are not hazardous as defined by applicable laws and regulations.

3.4 The outer 15 feet of *soil-rock* fill slopes, measured horizontally, should be composed of properly compacted *soil* fill materials approved by the Consultant. *Rock* fill may extend to the slope face, provided that the slope is not steeper than 2:1 (horizontal:vertical) and a soil layer no thicker than 12 inches is track-walked onto the face for landscaping purposes. This procedure may be utilized provided it is acceptable to the governing agency, Owner and Consultant.

3.5 Samples of soil materials to be used for fill should be tested in the laboratory by the Consultant to determine the maximum density, optimum moisture content, and, where appropriate, shear strength, expansion, and gradation characteristics of the soil.

3.6 During grading, soil or groundwater conditions other than those identified in the Geotechnical Report may be encountered by the Contractor. The Consultant shall be notified immediately to evaluate the significance of the unanticipated condition.

4. CLEARING AND PREPARING AREAS TO BE FILLED

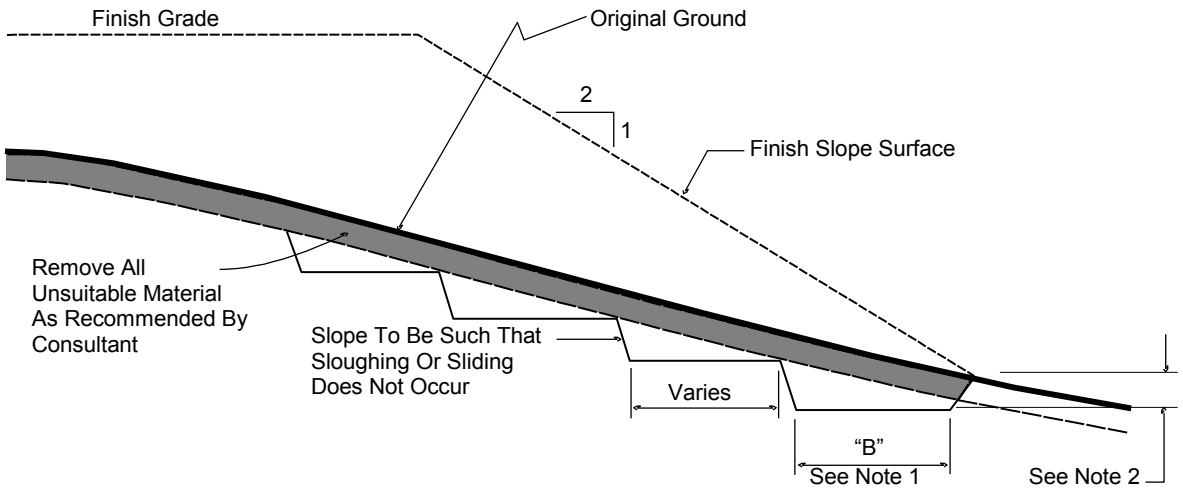
4.1 Areas to be excavated and filled shall be cleared and grubbed. Clearing shall consist of complete removal above the ground surface of trees, stumps, brush, vegetation, man-made structures, and similar debris. Grubbing shall consist of removal of stumps, roots, buried logs and other unsuitable material and shall be performed in areas to be graded. Roots and other projections exceeding 1½ inches in diameter shall be removed to a depth of 3 feet below the surface of the ground. Borrow areas shall be grubbed to the extent necessary to provide suitable fill materials.

4.2 Asphalt pavement material removed during clearing operations should be properly disposed at an approved off-site facility or in an acceptable area of the project evaluated by Geocon and the property owner. Concrete fragments that are free of reinforcing steel may be placed in fills, provided they are placed in accordance with Section 6.2 or 6.3 of this document.

4.3 After clearing and grubbing of organic matter and other unsuitable material, loose or porous soils shall be removed to the depth recommended in the Geotechnical Report. The depth of removal and compaction should be observed and approved by a representative of the Consultant. The exposed surface shall then be plowed or scarified to a minimum depth of 6 inches and until the surface is free from uneven features that would tend to prevent uniform compaction by the equipment to be used.

4.4 Where the slope ratio of the original ground is steeper than 5:1 (horizontal:vertical), or where recommended by the Consultant, the original ground should be benched in accordance with the following illustration.

TYPICAL BENCHING DETAIL



No Scale

DETAIL NOTES:

(1) Key width "B" should be a minimum of 10 feet, or sufficiently wide to permit complete coverage with the compaction equipment used. The base of the key should be graded horizontal, or inclined slightly into the natural slope.

(2) The outside of the key should be below the topsoil or unsuitable surficial material and at least 2 feet into dense formational material. Where hard rock is exposed in the bottom of the key, the depth and configuration of the key may be modified as approved by the Consultant.

4.5 After areas to receive fill have been cleared and scarified, the surface should be moisture conditioned to achieve the proper moisture content, and compacted as recommended in Section 6 of these specifications.

5. COMPACTION EQUIPMENT

5.1 Compaction of *soil* or *soil-rock* fill shall be accomplished by sheepsfoot or segmented-steel wheeled rollers, vibratory rollers, multiple-wheel pneumatic-tired rollers, or other types of acceptable compaction equipment. Equipment shall be of such a design that it will be capable of compacting the *soil* or *soil-rock* fill to the specified relative compaction at the specified moisture content.

5.2 Compaction of *rock* fills shall be performed in accordance with Section 6.3.

6. PLACING, SPREADING AND COMPACTION OF FILL MATERIAL

6.1 *Soil* fill, as defined in Paragraph 3.1.1, shall be placed by the Contractor in accordance with the following recommendations:

6.1.1 *Soil* fill shall be placed by the Contractor in layers that, when compacted, should generally not exceed 8 inches. Each layer shall be spread evenly and shall be thoroughly mixed during spreading to obtain uniformity of material and moisture in each layer. The entire fill shall be constructed as a unit in nearly level lifts. Rock materials greater than 12 inches in maximum dimension shall be placed in accordance with Section 6.2 or 6.3 of these specifications.

6.1.2 In general, the *soil* fill shall be compacted at a moisture content at or above the optimum moisture content as determined by ASTM D 1557.

6.1.3 When the moisture content of *soil* fill is below that specified by the Consultant, water shall be added by the Contractor until the moisture content is in the range specified.

6.1.4 When the moisture content of the *soil* fill is above the range specified by the Consultant or too wet to achieve proper compaction, the *soil* fill shall be aerated by the Contractor by blading/mixing, or other satisfactory methods until the moisture content is within the range specified.

6.1.5 After each layer has been placed, mixed, and spread evenly, it shall be thoroughly compacted by the Contractor to a relative compaction of at least 90 percent. Relative compaction is defined as the ratio (expressed in percent) of the in-place dry density of the compacted fill to the maximum laboratory dry density as determined in accordance with ASTM D 1557. Compaction shall be continuous over the entire area, and compaction equipment shall make sufficient passes so that the specified minimum relative compaction has been achieved throughout the entire fill.

6.1.6 Where practical, soils having an Expansion Index greater than 50 should be placed at least 3 feet below finish pad grade and should be compacted at a moisture content generally 2 to 4 percent greater than the optimum moisture content for the material.

6.1.7 Properly compacted *soil* fill shall extend to the design surface of fill slopes. To achieve proper compaction, it is recommended that fill slopes be over-built by at least 3 feet and then cut to the design grade. This procedure is considered preferable to track-walking of slopes, as described in the following paragraph.

6.1.8 As an alternative to over-building of slopes, slope faces may be back-rolled with a heavy-duty loaded sheepsfoot or vibratory roller at maximum 4-foot fill height intervals. Upon completion, slopes should then be track-walked with a D-8 dozer or similar equipment, such that a dozer track covers all slope surfaces at least twice.

6.2 *Soil-rock* fill, as defined in Paragraph 3.1.2, shall be placed by the Contractor in accordance with the following recommendations:

6.2.1 Rocks larger than 12 inches but less than 4 feet in maximum dimension may be incorporated into the compacted *soil* fill, but shall be limited to the area measured 15 feet minimum horizontally from the slope face and 5 feet below finish grade or 3 feet below the deepest utility, whichever is deeper.

6.2.2 Rocks or rock fragments up to 4 feet in maximum dimension may either be individually placed or placed in windrows. Under certain conditions, rocks or rock fragments up to 10 feet in maximum dimension may be placed using similar methods. The acceptability of placing rock materials greater than 4 feet in maximum dimension shall be evaluated during grading as specific cases arise and shall be approved by the Consultant prior to placement.

6.2.3 For individual placement, sufficient space shall be provided between rocks to allow for passage of compaction equipment.

6.2.4 For windrow placement, the rocks should be placed in trenches excavated in properly compacted *soil* fill. Trenches should be approximately 5 feet wide and 4 feet deep in maximum dimension. The voids around and beneath rocks should be filled with approved granular soil having a Sand Equivalent of 30 or greater and should be compacted by flooding. Windrows may also be placed utilizing an "open-face" method in lieu of the trench procedure, however, this method should first be approved by the Consultant.

6.2.5 Windrows should generally be parallel to each other and may be placed either parallel to or perpendicular to the face of the slope depending on the site geometry. The minimum horizontal spacing for windrows shall be 12 feet center-to-center with a 5-foot stagger or offset from lower courses to next overlying course. The minimum vertical spacing between windrow courses shall be 2 feet from the top of a lower windrow to the bottom of the next higher windrow.

6.2.6 Rock placement, fill placement and flooding of approved granular soil in the windrows should be continuously observed by the Consultant.

6.3 *Rock* fills, as defined in Section 3.1.3, shall be placed by the Contractor in accordance with the following recommendations:

6.3.1 The base of the *rock* fill shall be placed on a sloping surface (minimum slope of 2 percent). The surface shall slope toward suitable subdrainage outlet facilities. The *rock* fills shall be provided with subdrains during construction so that a hydrostatic pressure buildup does not develop. The subdrains shall be permanently connected to controlled drainage facilities to control post-construction infiltration of water.

6.3.2 *Rock* fills shall be placed in lifts not exceeding 3 feet. Placement shall be by rock trucks traversing previously placed lifts and dumping at the edge of the currently placed lift. Spreading of the *rock* fill shall be by dozer to facilitate *seating* of the rock. The *rock* fill shall be watered heavily during placement. Watering shall consist of water trucks traversing in front of the current rock lift face and spraying water continuously during rock placement. Compaction equipment with compactive energy comparable to or greater than that of a 20-ton steel vibratory roller or other compaction equipment providing suitable energy to achieve the required compaction or deflection as recommended in Paragraph 6.3.3 shall be utilized. The number of passes to be made should be determined as described in Paragraph 6.3.3. Once a *rock* fill lift has been covered with *soil* fill, no additional *rock* fill lifts will be permitted over the *soil* fill.

6.3.3 Plate bearing tests, in accordance with ASTM D 1196, may be performed in both the compacted *soil* fill and in the *rock* fill to aid in determining the required minimum number of passes of the compaction equipment. If performed, a minimum of three plate bearing tests should be performed in the properly compacted *soil* fill (minimum relative compaction of 90 percent). Plate bearing tests shall then be performed on areas of *rock* fill having two passes, four passes and six passes of the compaction equipment, respectively. The number of passes required for the *rock* fill shall be determined by comparing the results of the plate bearing tests for the *soil* fill and the *rock* fill and by evaluating the deflection

variation with number of passes. The required number of passes of the compaction equipment will be performed as necessary until the plate bearing deflections are equal to or less than that determined for the properly compacted *soil* fill. In no case will the required number of passes be less than two.

6.3.4 A representative of the Consultant should be present during *rock* fill operations to observe that the minimum number of "passes" have been obtained, that water is being properly applied and that specified procedures are being followed. The actual number of plate bearing tests will be determined by the Consultant during grading.

6.3.5 Test pits shall be excavated by the Contractor so that the Consultant can state that, in their opinion, sufficient water is present and that voids between large rocks are properly filled with smaller rock material. In-place density testing will not be required in the *rock* fills.

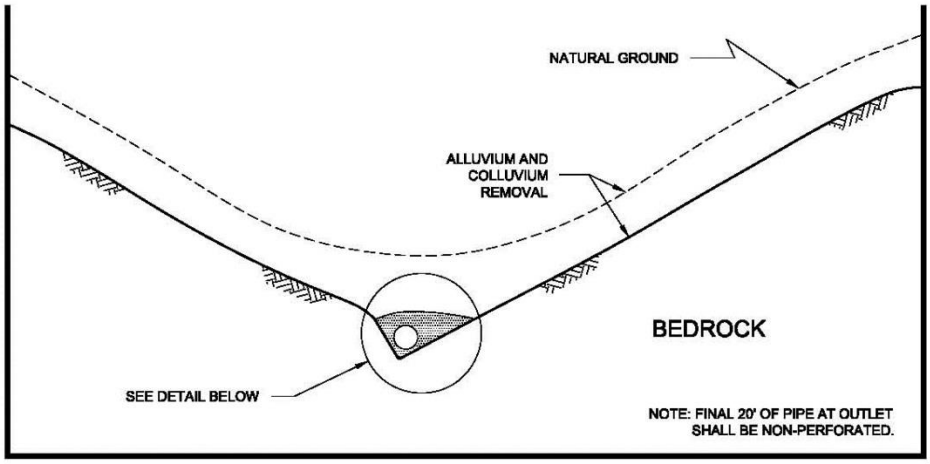
6.3.6 To reduce the potential for "piping" of fines into the *rock* fill from overlying *soil* fill material, a 2-foot layer of graded filter material shall be placed above the uppermost lift of *rock* fill. The need to place graded filter material below the *rock* should be determined by the Consultant prior to commencing grading. The gradation of the graded filter material will be determined at the time the *rock* fill is being excavated. Materials typical of the *rock* fill should be submitted to the Consultant in a timely manner, to allow design of the graded filter prior to the commencement of *rock* fill placement.

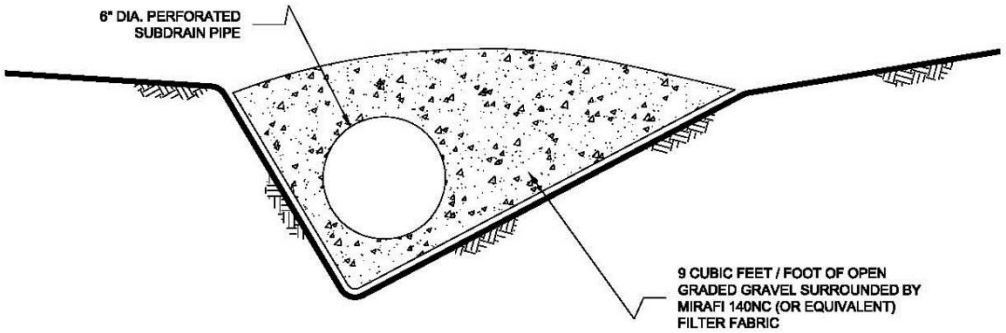
6.3.7 *Rock* fill placement should be continuously observed during placement by the Consultant.

7. SUBDRAINS

7.1 The geologic units on the site may have permeability characteristics and/or fracture systems that could be susceptible under certain conditions to seepage. The use of canyon subdrains may be necessary to mitigate the potential for adverse impacts associated with seepage conditions. Canyon subdrains with lengths in excess of 500 feet or extensions of existing offsite subdrains should use 8-inch-diameter pipes. Canyon subdrains less than 500 feet in length should use 6-inch-diameter pipes.

TYPICAL CANYON DRAIN DETAIL





NOTES:

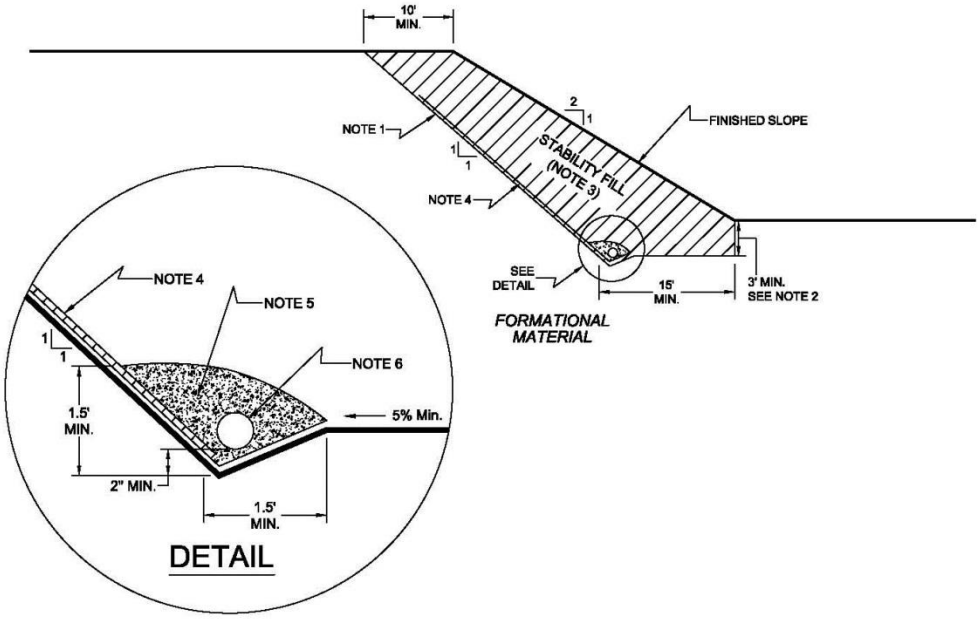
1.....6-INCH DIAMETER, SCHEDULE 80 PVC PERFORATED PIPE FOR FILLS
IN EXCESS OF 100-FEET IN DEPTH OR A PIPE LENGTH OF LONGER THAN 500 FEET.

2.....6-INCH DIAMETER, SCHEDULE 40 PVC PERFORATED PIPE FOR FILLS
LESS THAN 100-FEET IN DEPTH OR A PIPE LENGTH SHORTER THAN 500 FEET.

NO SCALE

7.2 Slope drains within stability fill keyways should use 4-inch-diameter (or lager) pipes.

TYPICAL STABILITY FILL DETAIL



NOTES:

1.....EXCAVATE BACKCUT AT 1:1 INCLINATION (UNLESS OTHERWISE NOTED).

2.....BASE OF STABILITY FILL TO BE 3 FEET INTO FORMATIONAL MATERIAL, SLOPING A MINIMUM 5% INTO SLOPE.

3.....STABILITY FILL TO BE COMPOSED OF PROPERLY COMPACTED GRANULAR SOIL.

4.....CHIMNEY DRAINS TO BE APPROVED PREFABRICATED CHIMNEY DRAIN PANELS (MIRADRAIN G200N OR EQUIVALENT) SPACED APPROXIMATELY 20 FEET CENTER TO CENTER AND 4 FEET WIDE. CLOSER SPACING MAY BE REQUIRED IF SEEPAGE IS ENCOUNTERED.

5.....FILTER MATERIAL TO BE 3/4-INCH, OPEN-GRADED CRUSHED ROCK ENCLOSED IN APPROVED FILTER FABRIC (MIRAFI 140NC).

6.....COLLECTOR PIPE TO BE 4-INCH MINIMUM DIAMETER, PERFORATED, THICK-WALLED PVC SCHEDULE 40 OR EQUIVALENT, AND SLOPED TO DRAIN AT 1 PERCENT MINIMUM TO APPROVED OUTLET.

NO SCALE

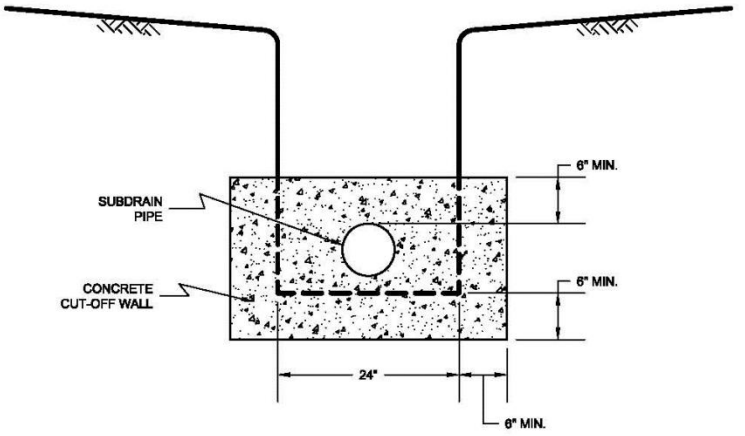
7.3 The actual subdrain locations will be evaluated in the field during the remedial grading operations. Additional drains may be necessary depending on the conditions observed and the requirements of the local regulatory agencies. Appropriate subdrain outlets should be evaluated prior to finalizing 40-scale grading plans.

7.4 *Rock* fill or *soil-rock* fill areas may require subdrains along their down-slope perimeters to mitigate the potential for buildup of water from construction or landscape irrigation. The subdrains should be at least 6-inch-diameter pipes encapsulated in gravel and filter fabric. *Rock* fill drains should be constructed using the same requirements as canyon subdrains.

7.5 Prior to outletting, the final 20-foot segment of a subdrain that will not be extended during future development should consist of non-perforated drainpipe. At the non-perforated/ perforated interface, a seepage cutoff wall should be constructed on the downslope side of the pipe.

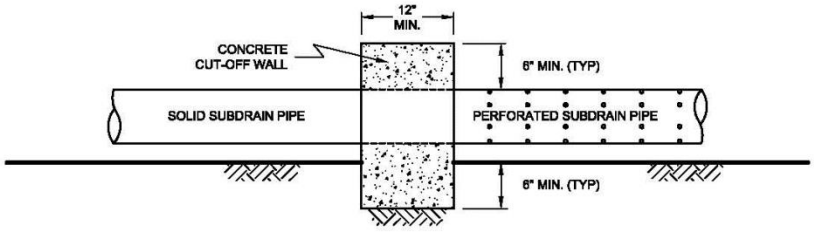
TYPICAL CUT OFF WALL DETAIL

FRONT VIEW



NO SCALE

SIDE VIEW

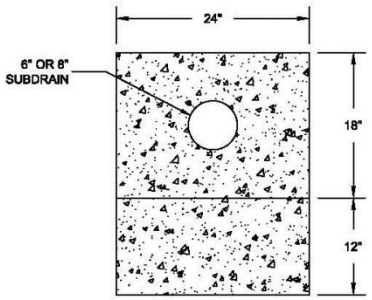


NO SCALE

7.6 Subdrains that discharge into a natural drainage course or open space area should be provided with a permanent headwall structure.

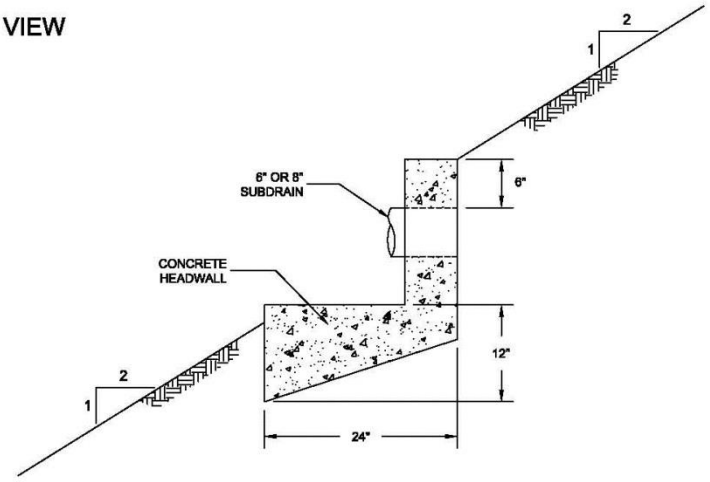
TYPICAL HEADWALL DETAIL

FRONT VIEW



NO SCALE

SIDE VIEW



NOTE: HEADWALL SHOULD OUTLET AT TOE OF FILL SLOPE OR INTO CONTROLLED SURFACE DRAINAGE

NO SCALE

7.7 The final grading plans should show the location of the proposed subdrains. After completion of remedial excavations and subdrain installation, the project civil engineer should survey the drain locations and prepare an "as-built" map showing the drain locations. The final outlet and connection locations should be determined during grading operations. Subdrains that will be extended on adjacent projects after grading can be placed on formational material and a vertical riser should be placed at the end of the subdrain. The grading contractor should consider videoing the subdrains shortly after burial to check proper installation and functionality. The contractor is responsible for the performance of the drains.

8. OBSERVATION AND TESTING

8.1 The Consultant shall be the Owner's representative to observe and perform tests during clearing, grubbing, filling, and compaction operations. In general, no more than 2 feet in vertical elevation of *soil* or *soil-rock* fill should be placed without at least one field density test being performed within that interval. In addition, a minimum of one field density test should be performed for every 2,000 cubic yards of *soil* or *soil-rock* fill placed and compacted.

8.2 The Consultant should perform a sufficient distribution of field density tests of the compacted *soil* or *soil-rock* fill to provide a basis for expressing an opinion whether the fill material is compacted as specified. Density tests shall be performed in the compacted materials below any disturbed surface. When these tests indicate that the density of any layer of fill or portion thereof is below that specified, the particular layer or areas represented by the test shall be reworked until the specified density has been achieved.

8.3 During placement of *rock* fill, the Consultant should observe that the minimum number of passes have been obtained per the criteria discussed in Section 6.3.3. The Consultant should request the excavation of observation pits and may perform plate bearing tests on the placed *rock* fills. The observation pits will be excavated to provide a basis for expressing an opinion as to whether the *rock* fill is properly seated and sufficient moisture has been applied to the material. When observations indicate that a layer of *rock* fill or any portion thereof is below that specified, the affected layer or area shall be reworked until the *rock* fill has been adequately seated and sufficient moisture applied.

8.4 A settlement monitoring program designed by the Consultant may be conducted in areas of *rock* fill placement. The specific design of the monitoring program shall be as recommended in the Conclusions and Recommendations section of the project Geotechnical Report or in the final report of testing and observation services performed during grading.

8.5 We should observe the placement of subdrains, to check that the drainage devices have been placed and constructed in substantial conformance with project specifications.

8.6 Testing procedures shall conform to the following Standards as appropriate:

8.6.1 Soil and Soil-Rock Fills:

8.6.1.1 Field Density Test, ASTM D 1556, *Density of Soil In-Place By the Sand-Cone Method.*

8.6.1.2 Field Density Test, Nuclear Method, ASTM D 6938, *Density of Soil and Soil-Aggregate In-Place by Nuclear Methods (Shallow Depth).*

8.6.1.3 Laboratory Compaction Test, ASTM D 1557, *Moisture-Density Relations of Soils and Soil-Aggregate Mixtures Using 10-Pound Hammer and 18-Inch Drop*.

8.6.1.4. Expansion Index Test, ASTM D 4829, *Expansion Index Test*.

9. PROTECTION OF WORK

9.1 During construction, the Contractor shall properly grade all excavated surfaces to provide positive drainage and prevent ponding of water. Drainage of surface water shall be controlled to avoid damage to adjoining properties or to finished work on the site. The Contractor shall take remedial measures to prevent erosion of freshly graded areas until such time as permanent drainage and erosion control features have been installed. Areas subjected to erosion or sedimentation shall be properly prepared in accordance with the Specifications prior to placing additional fill or structures.

9.2 After completion of grading as observed and tested by the Consultant, no further excavation or filling shall be conducted except in conjunction with the services of the Consultant.

10. CERTIFICATIONS AND FINAL REPORTS

10.1 Upon completion of the work, Contractor shall furnish Owner a certification by the Civil Engineer stating that the lots and/or building pads are graded to within 0.1 foot vertically of elevations shown on the grading plan and that all tops and toes of slopes are within 0.5 foot horizontally of the positions shown on the grading plans. After installation of a section of subdrain, the project Civil Engineer should survey its location and prepare an *as-built* plan of the subdrain location. The project Civil Engineer should verify the proper outlet for the subdrains and the Contractor should ensure that the drain system is free of obstructions.

10.2 The Owner is responsible for furnishing a final as-graded soil and geologic report satisfactory to the appropriate governing or accepting agencies. The as-graded report should be prepared and signed by a California licensed Civil Engineer experienced in geotechnical engineering and by a California Certified Engineering Geologist, indicating that the geotechnical aspects of the grading were performed in substantial conformance with the Specifications or approved changes to the Specifications.

Subject: PHASE I ENVIRONMENTAL SITE ASSESSMENT REPORT
1020-1080 WEST SAN MARCOS BOULEVARD
SAN MARCOS, CALIFORNIA

Dear Mr. Shepherd:

In accordance with your request and our change order dated July 6, 2022 to our Proposal No. LE-21265, we have performed a Phase I Environmental Site Assessment (ESA) of the property and improvements located at 1020-1080 West San Marcos Boulevard (the Site) in San Marcos, California.

We performed the Phase I ESA to assess the Site for the potential presence of recognized environmental conditions (RECs) as defined by the American Society for Testing and Materials *Designation E 1527-21, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* as part of Lennar's due diligence prior to purchasing the Site. The enclosed report describes the Phase I ESA and presents our findings.

We appreciate the opportunity to have performed this Phase I ESA. Please contact us if you have any questions concerning this report or if we may be of further service.

Very truly yours,

GEOCON INCORPORATED

PHASE I ENVIRONMENTAL SITE ASSESSMENT REPORT

1. INTRODUCTION

We have performed a Phase I Environmental Site Assessment (ESA) of the property at 1020-1080 West San Marcos Boulevard (the Site) located in San Marcos, California. We performed the Phase I ESA for Lennar to assess the Site for the potential presence of recognized environmental conditions (RECs) at the Site as part of Lennar's due diligence prior to purchasing the Site.

This report is organized as follows:

- *Section 1.0 Introduction*- provides a description of the purpose and objectives of the Phase I ESA, defines what constitutes an REC, other qualified RECs, and potential environmental concerns, and describes the Phase I ESA services, limitations, and any identified data gaps;
- *Section 2.0 Site Description*- describes the Site's physical setting and conditions and that of the surrounding area;
- *Section 3.0 User-Provided Information*- summarizes information regarding the Site provided by the Client as the "user" of the Phase I ESA;
- *Section 4.0 Records Review*- summarizes readily available records for the Site and surrounding properties obtained from regulatory and administrative agencies and other sources;
- *Section 5.0 Historical Use*- describes the historical use of the Site and surrounding area ascertained from historical records and information sources;
- *Section 6.0 Site Reconnaissance*- describes our observations of the Site and surrounding properties and facilities from our site and vicinity reconnaissance;
- *Section 7.0 Interviews*- summarizes information obtained from past and present owners, operators and occupants familiar with the Site;
- *Section 8.0 Conclusions and Recommendations*- presents the findings of the Phase I ESA, our conclusions regarding the environmental conditions of the Site, and our recommendations for further environmental assessment, if any;
- *Section 9.0 References*- lists the references for information sources used and cited in the report; and
- *Section 10.0 Qualifications*- provides a qualifications statement from the environmental professional responsible for the Phase I ESA and report.

1.1 Purpose and Objectives

We performed the Phase I ESA to identify evidence or indications of 'RECs at the Site as defined by the American Society for Testing and Materials (ASTM) *Designation E 1527-21 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.* Section 1.1.1 of ASTM *Designation E 1527-21* defines an REC as "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment. A de minimis condition is not a recognized environmental condition." De minimis conditions are those that generally do not present a threat to human health or the environment and that generally would not be the subject of enforcement action if brought to the attention of appropriate governmental agencies.

ASTM *Designation E1527-21* also defines 'Historical' and 'Controlled' RECs (HREC and CREC, respectively). An 'Historical REC' is defined as "a previous release of hazardous substances or petroleum products affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls (for example, activity and use limitations or other property use limitations)." A 'Controlled REC' is defined as "recognized environmental condition affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to implementation of required controls (for example, activity and use limitations or other property use limitations)." An HREC is not an REC if a property meets current standards for unrestricted residential use. A CREC remains an REC by definition when the property does not meet the unrestricted residential use requirements unconditionally.

We also conducted the Phase I ESA in general accordance with the requirements of 40 Code of Federal Regulations (CFR) Part 312 titled *Standards and Practices for All Appropriate Inquiries*, as required under Sections 101(35)(B)(ii) and (iii) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The purpose of conducting an all appropriate inquiries investigation into the previous ownership and uses of a property is to meet the provisions necessary for the landowner, contiguous property owner, and/or bona fide prospective purchaser to qualify for certain landowner liability protections under CERCLA.

The following principles are an integral part of ASTM *Designation E1527-21*:

- **"Uncertainty Not Eliminated -** No environmental site assessment can wholly eliminate uncertainty regarding the potential for recognized environmental conditions in connection

with a subject property. Performance of this practice is intended to reduce, but not eliminate, uncertainty regarding the potential for recognized environmental conditions in connection with a subject property, and this practice recognizes reasonable limits of time and cost."

- **"Not Exhaustive -** All Appropriate Inquiries does not mean an exhaustive assessment of a property. There is a point at which the cost of information obtained or the time required to gather it outweighs the usefulness of the information and, in fact, may be a material detriment to the orderly completion of transactions. One of the purposes of this practice is to identify a balance between the competing goals of limiting the costs and time demands inherent in performing an environmental site assessment and the reduction of uncertainty about unknown conditions resulting from additional information."

- **"Level of Inquiry is Variable -** Not every property will warrant the same level of assessment. Consistent with good commercial and customary practice, the appropriate level of environmental site assessment will be guided by the type of property subject to assessment, the expertise and risk tolerance of the user, and the information developed in the course of the inquiry."

- **Level of Inquiry is Variable** - Not every property will warrant the same level of assessment. Consistent with good commercial and customary standards and practices as defined at 42 U.S.C. § 9601(35)(B), the appropriate level of environmental site assessment will be guided by the type of property subject to assessment, the expertise and risk tolerance of the user, future intended uses of the subject property disclosed to the environmental professional, and the information developed in the course of the inquiry."

- **"Comparison with Subsequent Inquiry** - It should not be concluded or assumed that an inquiry was not all appropriate inquiries merely because the inquiry did not identify recognized environmental conditions in connection with a subject property. Environmental site assessments must be evaluated based on the reasonableness of judgments made at the time and under the circumstances in which they were made. Subsequent environmental site assessments should not be considered valid standards to judge the appropriateness of any prior assessment based on hindsight, new information, use of developing technology or analytical techniques, or other factors."

- **"Point in Time** - The environmental site assessment is based upon conditions at the time of completion of the individual environmental site assessment elements." The elements include:

    - Physical Setting Resources – Obtain information about the location and physical characteristics of the Site including its size, topography, geologic, soil, and hydro- and hydrogeologic conditions;

    - User Responsibilities – The user (or the Client) may provide the environmental professional with land title reports and sale agreements for the Site and information about specialized knowledge, commonly known or reasonably ascertainable knowledge, valuation reduction for environmental issues, and/or environmental liens or activity and use limitations for the Site;

    - Government Records – Review readily available federal, state, and local regulatory agency records pertaining to the Site and properties and facilities in the vicinity of the Site;

- Historical Records – Compile and analyze historical information and develop a history of the previous uses of the Site, adjoining and adjacent properties, and surrounding area to help identify the likelihood of past uses having led to RECs for the Site.

- Site Reconnaissance – Visit the Site to make observations to help identify RECs in connection with the Site;

- Owner/Operator/Occupant Interviews – Interview past and present owner(s), operator(s), and occupant(s) to obtain information identifying RECs in connection with the Site.

- Local Government Officials Interviews – Interview state and/or local government agency personnel to obtain information identifying RECs in connection with the Site; and

- Evaluation and Report – Evaluate the Site and prepare the Phase I ESA report in general accordance with Section 12 of ASTM *Designation E1527-21*.

1.2 Scope of Services

We performed the scope of services outlined in our Proposal No. LE-21265 dated May 24, 2021, with the exception that we did not review Sanborn fire insurance maps, as Environmental Data Resources, Inc. (EDR) indicated that there are none available for the Site or surrounding vicinity. The main components of the Phase I ESA and their objectives, as specified by the referenced standards, include the following:

- **Physical Setting:** we reviewed physical setting references for information concerning the topographic, geologic, and hydrogeologic characteristics of the Site and vicinity. Such information may be indicative of pathways (i.e., direction and/or extent) that a contaminant could migrate along in the event of a spill or release.

- **Regulatory Agency Records Review:** we reviewed publicly available Federal, State, and local regulatory agency records for information regarding the use, storage, and disposal of hazardous substances and/or petroleum products at the Site and facilities and properties adjoining or within ¼ mile of the Site. Such records may identify RECs at or potentially affecting the Site.

- **Site History:** we reviewed information regarding the historical uses of the Site and adjoining and nearby facilities and properties back to the Site's and other properties' first use or 1940, whichever is earlier, that could have led to RECs on or near the Site. Historical sources reviewed included aerial photographs, topographic maps, and city directories. In addition, we conducted interviews with persons who were expected to be reasonably knowledgeable about historical and/or current conditions at and uses of the Site.

- **Site Reconnaissance:** we performed a site reconnaissance to observe site conditions and activities for evidence of RECs. The site reconnaissance was for the Site only. We viewed offsite properties and features solely from the vantage of the Site and public thoroughfares.

1.3 Report Limitations

We prepared this Phase I ESA report exclusively for the Client. The information obtained is only relevant for the dates of the records reviewed, the latest site visit, and completion of interviews. The following table lists the report sections and the date completed for the Phase I ESA elements described in Section 1.1.

Phase I ESA Elements	Report Section	Date Completed
Site Description	2.0	July 18, 2022
User-Provided Information	3.0	July 21, 2022
Records Review	4.0	July 20, 2022
Historical Records	5.0	July 19, 2022
Site Reconnaissance	6.0	July 19, 2022
Interviews	7.0	July 21, 2022
Evaluation and Report	8.0	July 25, 2022

Therefore, the information contained herein is only valid as of July 18, 2022, and may require an update after 180 days to reflect updated records and another site reconnaissance to assess current site conditions.

The Client should recognize that a Phase I ESA is not a comprehensive site characterization and should not be construed as such. The findings and conclusions presented in this report are predicated on the site reconnaissance, information in the specified regulatory records, and information regarding the historical usage of the Site, as presented in this report. The Client should also understand that we did not assess the Site for wetlands or perform testing (sample collection and analysis) for asbestos-containing building materials, lead-containing paint, lead in drinking water, radon, methane, mold, per- and polyfluoroalkyl substances, or potential naturally occurring hazards such as asbestos and arsenic as part of this Phase I ESA.

Therefore, the report should only be deemed conclusive with respect to the information obtained. No guarantee or warranty of the results of the Phase I ESA is implied within this report or any subsequent reports, correspondence or consultation, either express or implied. We strived to conduct the services summarized herein in accordance with the local standard of care in the geographic region at the time the services were rendered.

1.4 Data Gaps and Significant Data Gaps

A data gap is defined by ASTM *Designation E 1527-21* as "a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information." Data gaps could include such things as insufficient historical information, the inability to interview persons with direct site knowledge (e.g., the owner(s), past owner(s), tenants, workers, etc.) or the lack of access to all parts of a site during the site reconnaissance.

A significant data gap is defined by ASTM Designation E 1527-21 as "a data gap that affects the ability of the environmental professional to identify a recognized environmental condition." These data gaps are only significant if "other information and/or professional experience raises reasonable concerns involving the effects of that data gap on the ability of the environmental professional to render an opinion regarding whether conditions exist that are indicative of recognized environmental conditions or controlled recognized environmental conditions."

We identified no data gaps or significant data gaps during this Phase I ESA. As described in Section 1.2, we did not review Sanborn maps for the Site as EDR indicated that Sanborn map coverage does not exist for the Site and vicinity. However, we were able to review other sufficient historical information and therefore do not consider the lack of Sanborn map coverage a data gap.

2. SITE DESCRIPTION

This section provides information regarding the location and physical characteristics of the Site including its size, topography, geologic, soil, and hydrogeologic conditions.

2.1 Location and Legal Description

The 10.52-acre Site is located at 1020-1080 West San Marcos Boulevard in San Marcos, California (Figure 1). The Site is situated southwest of State Route 78. The San Diego County assessor's parcel numbers (APNs) for the Site are 219-200-30, -31, & -45. A copy of the parcel map is in Appendix A.

The Site is depicted in the northwestern quarter of Section 15 of Township 12 South, Range 3 West, San Bernardino Base and Meridian on the United States Geological Survey's (USGS) *San Marcos, California,* 7.5-minute topographic map (USGS, 2012).

2.2 Site and Vicinity General Characteristics

The Site is developed with several commercial (multi-tenant restaurants) and retail stores. The surrounding vicinity includes commercial office and retail development. Figure 2 depicts the site

boundaries and features and surrounding properties. Further site description is provided in Sections 2.4 and 6.

2.2.1 Topography

The topography of the site vicinity is characterized by a broad, relatively flat alluvial plain that drains to the west-southwest. The USGS *San Marcos, California*, 7.5-minute topographic map (USGS, 2012), depicts the elevation at the Site as approximately ranging from 525 to 535 feet above mean sea level.

2.2.2 Geologic and Soil Conditions

The Site is located in the Peninsular Ranges geomorphic province of Southern California (Norris and Webb, 1990). This geomorphic province extends approximately 900 miles from its northern terminus against the Transverse Ranges and Los Angeles Basin, south to the tip of Baja California. In general, the province is characterized by rugged mountains in Mesozoic igneous and metamorphic rocks to the east, with a dissected coastal plain on Cenozoic sediments to the west. The Peninsular Ranges vary in width from approximately 30 to 100 miles, and are traversed fault zones trending roughly northwest-southeast.

Information concerning the surficial geologic conditions at and in proximity to the Site from the *Geologic Map of the Oceanside 30' X 60' Quadrangle, San Diego County, California* (USGS, 2005) indicates that the Site is underlain by Holocene and late-Pleistocene flood plain deposits, which are typically poorly consolidated, poorly sorted, and permeable.

Information concerning the soil conditions at and in proximity to the Site from the United States Department of Agriculture, Natural Resources Conservation Service, Web Soil Survey (http://websoilsurvey.nrcs.usda.gov/app/HomePage.htm) indicates that site soil is Placentia sandy loam, which is well drained.

2.2.3 Hydrologic and Hydrogeologic Conditions

Groundwater quality and occurrence information available from the California Department of Water Resources and the California State Water Resources Control Board (SWRCB) indicates that the Site is located in the Richland Hydrologic Sub-Area (904.52) of the San Marcos Hydrologic Area (904.50) Carlsbad Hydrologic Unit (904.00). Groundwater in the Richland Hydrologic Sub-Area has existing beneficial use designations for municipal, agricultural, and industrial supply purposes (SWRCB, 2016).

In an effort to assess local groundwater conditions, we reviewed reports available on the SWRCB's GeoTracker online database (http://geotracker.waterboards.ca.gov) for nearby facilities with a groundwater monitoring well array. Groundwater monitoring wells were installed to the northwest of the Site in 1995 related to assessment of County of San Diego Department of Environmental Health (DEH) Leaking Underground Storage Tank (LUST) case #H04990-002 (described further in Section 4.1.1). The depth to groundwater within these wells was reported to be approximately 11 and 12 feet with groundwater flow towards the southwest.

2.3 Current and Planned Uses of the Site

The majority of the Site is currently used for commercial purposes (restaurants). The Client reported that they plan to develop the majority of the Site for residential use. Further description of the Site is provided in Section 6.

2.4 Descriptions of Structures, Roads, Other Improvements on the Site

The Site is improved with a variety of restaurants, sports bars, eateries, and coffee shops. Further description of the Site is provided in Section 6.3.

2.5 Current Uses of Adjoining Properties

Current uses of adjoining properties are primarily commercial (office and retail). Further information regarding adjoining properties is provided in Section 6.4.

3. USER–PROVIDED INFORMATION

This section summarizes site information provided by the Client – the "user" of this Phase I ESA. On July 6, 2022, we emailed David Shepherd with Lennar a "user" questionnaire and requested any previous environmental reports and/or documents pertaining to the Site. The information provided has been summarized below and a copy of the completed questionnaire is in Appendix B.

3.1 Title, Appraisal and Sale Agreement Records

Mr. Shepherd provided a Preliminary Title Report (PTR) for the Site prepared by First American Title Insurance Company and dated June 14, 2022. The PTR indicates that the site parcels are owned by San Marcos Row, LLC. The PTR identifies no issues regarding the environmental condition of the Site.

3.2 Environmental Liens or Activity and Use Limitations

Mr. Shepherd indicated that he has no knowledge of environmental liens on or activity and use limitations for the Site.

3.3 Specialized Knowledge

Mr. Shepherd indicated he has no specialized knowledge of the Site.

3.4 Commonly Known or Reasonably Ascertainable Information

Mr. Shepherd indicated he is not aware of commonly known or reasonably ascertainable information pertaining to the Site.

3.5 Valuation Reduction for Environmental Issues

Ms. Shepherd is not aware of any environmental conditions on the Site that could lead to a potential valuation reduction for the Site.

3.6 Owner, Property Manager, and Occupant Information

Mr. Shepherd indicated the Site is owned by San Marcos Row, LLC. An owner/occupant questionnaire was sent to Elizaberth Papera, which is summarized in *Section 7*.

3.7 Reason for Performing the Phase I ESA

The Phase I ESA was requested to update the previous Phase I for City submittal.

4. RECORDS REVIEW

This section summarizes information we obtained from readily available agency records for the Site and properties and facilities in the surrounding vicinity.

4.1 Standard Environmental Record Sources

EDR searched federal, state, and local databases regarding the use, storage, disposal, or release of hazardous substances and/or petroleum products for the Site and area within one mile of the Site. The databases that list the Site and/or properties/facilities within one mile of the Site and the number of properties/facilities listed are summarized in the table below. A copy of *The EDR Radius Map™ Report with GeoCheck,* dated July 6, 2022, is in Appendix C.

Database Name	Search Radius (Mile)	Number of Listings
FEDERAL DATABASES		
RCRA CORRACTS (Corrective action activity)	1	2
RCRA-LQG (Resource Conservation and Recovery Act - Large Quantity Generators)	¼	1
RCRA-SQG (Small Quantity Generators)	¼	9
RCRA-VSQG	¼	1
STATE AND LOCAL DATABASES		
SEMS - ARCHIVE	½	1
CA ENVIROSTOR (Department of Toxic Substance Control Database)	1	10
SWF/LF (Solid waste Facilities/Landfill Sites)	½	3
SAN DIEGO CO. SAM (Diego County Site Assessment and Mitigation Program)	½	18
LUST (Leaking Underground Storage Tanks)	½	31
CA SLIC (Spills, Leaks, Investigation, and Cleanup Program)	½	8
CA UST (Underground Storage Tanks)	¼	4
CA AST (Aboveground Storage Tanks)	¼	2
CA FID UST	¼	1
CA SWEEPS UST (Statewide Environmental Evaluation and Planning System)	¼	5
CA HIST UST (Historical Underground Storage Tanks)	¼	3
CERS TANKS	¼	2
SWRCY (Solid Waste Recycling Facilities)	½	1
CERS HAZ WASTE	¼	19
PFAS	½	1
RCRA-NonGen (Resource Conservation and Recovery Act – Non-Generators)	½	29
DRYCLEANERS	¼	1
CORTESE	½	18
HIST CORTESE	½	17
HWP (Hazardous Waste Permit)	1	2
CIWQS	Site Only	1
CA Notify 65	1	2
NPDES (National Pollution Discharge Elimination System)	½	1
EDR HIGH RISK HISTORICAL DATABASES AND EDR RECOVERED GOVERNMENT ARCHIVES		
EDR Historical Auto Stations	¼	1
EDR Historical Cleaner	¼	1

4.1.1 Site

The Site is listed on the NPDES and CIWQS databases. None of these listings are suspected of having caused an REC at the Site.

4.1.2 Offsite Properties

No offsite properties within ⅛ mile (or ¼ mile for LUST facilities) of the Site are identified in the regulatory databases reviewed. Distances reported by EDR may differ from actual distances.

4.1.3 Orphan Summary

EDR's Orphan Summary identifies properties with incomplete address information and therefore cannot be accurately plotted. Four properties are listed but because they are all greater than ½ mile from the Site none are suspected of having caused an REC at the Site.

4.2 Additional Environmental Record Sources

This section summarizes information from additional, readily available environmental record sources regarding the Site and properties/facilities within one mile from the Site.

4.2.1 GeoTracker and EnviroStor Databases

We reviewed GeoTracker and the California Department of Toxic Substance Control's (DTSC) EnviroStor online database (http://www.envirostor.dtsc.ca.gov/public/) for information regarding the Site and nearby properties/facilities that are within ¼ mile of the Site. GeoTracker lists one LUST facility within ¼ mile of the Site which has been granted regulatory closure. EnviroStor does not have information pertaining to the Site any properties/facilities within ¼ mile of the Site.

4.2.2 State of California Department of Conservation, Geologic Energy Management Division

We reviewed the California Geologic Energy Management Division (CalGem) website (https://maps.conservation.ca.gov/doggr/wellfinder) to evaluate the potential for existing/former oil, gas, or geothermal wells on the Site or properties proximal to the Site. CalGem information indicates that no former or current wells are or were located within one mile of the Site.

4.2.3 County of San Diego Department of Agriculture, Weights and Measures

We submitted a request to the County of San Diego, Department of Agriculture, Weights and Measures (DAWM), Pesticide Use Enforcement Division regarding possible use of restricted pesticides/herbicides at the Site. That office maintains such records for approximately 4 years. The DAWM indicated that no record of restricted pesticide/herbicide use was reported for the site APNs for the period of 2018 through 2022.

4.2.4 San Diego Air Pollution Control District

We submitted a request to the San Diego Air Pollution Control District (APCD) for records pertaining to the Site. The APCD indicated that no records are on file for the site APNs.

4.2.5 County of San Diego Department of Environmental Health

We submitted a request to the DEH for records pertaining to the Site. A San Diego Regional Hazardous Materials Questionnaire conducted in 2017 for the Old California Mining Company restaurant located at 1020 San Marcos Boulevard was provided. No evidence of RECs was observed in this questionnaire. These documents are presented in Appendix D.

4.2.6 San Diego Gas and Electric Company

Pad-mounted transformers are present on the Site. Documented discussions with San Diego Gas & Electric Company (SDG&E) representatives regarding transformers indicate that SDG&E has never specified polychlorinated biphenyl (PCB)-containing transformers for its electrical distribution system. Regardless, SDG&E has determined that some older (pre-1980s) mineral transformers were inadvertently contaminated with PCBs by the manufacturer. Based on a statistical sampling and testing program reportedly performed by SDG&E, it is unlikely that transformers found within its service area contain PCBs.

4.3 Previous Documents/Reports

Following are summaries of documents pertaining to the Site.

Advantage Environmental Consultants, LLC - *Phase I Environmental Site Assessment, Old California Restaurant Row, 1020-1080 West San Marcos Boulevard, San Marcos, California, 92078* dated December 1, 2014.

Advantage Environmental Consultants, LLC (AEC) performed a Phase I ESA for the Site in December of 2014 and found no RECs in connection to the Site. AEC also performed a limited asbestos containing materials (ACM) survey. Their findings were as follows:

According to available historical information, the Site buildings were constructed in the late 1970s. AEC performed a limited survey of suspect ACM at the Site. Areas that were not readily accessible, such as enclosed structural columns, enclosed pipe chases, inner walls, above fixed ceilings, etc., were not surveyed. Building materials not addressed in this survey (i.e. roof materials and materials hidden by enclosures) should be considered suspect ACM and handled accordingly until appropriate sampling and analysis determines whether or not they contain asbestos. Building plans were not available for review at the time of the Site visit.

As per the Phase I Environmental Site Assessment and Report Scope of Work, Exhibit A. II.C.2.d (Asbestos Containing Materials), only damaged friable suspect materials were to be sampled and analyzed as part of this survey. No damaged friable suspect ACM was noted. Suspect friable and non-friable materials were observed on-Site and are recorded in the following table.

ASBESTOS SURVEY RESULTS

Location	Type of Material	Friable	Condition of Material	Potential for Disturbance	Asbestos Content	Recommendation
Throughout	Wallboard & plaster/joint compound	No	Good	Moderate	NS	O&M Program
Throughout	Drywall/plaster ceiling	No	Good	Low	NS	O&M Program
Throughout	Ceiling Tile	No	Good	Low	NS	O&M Program
Bathrooms	Vinyl floor tile & mastic	No	Good	Moderate	NS	O&M Program
Throughout	Roofing materials	No	Unknown	Low	NS	O&M Program
Throughout	Insulation (standard and mica)	No	Moderate to Good	Low	NS	O&M Program
Throughout	Exterior Stucco	No	Moderate to Good	Moderate	NS	O&M Program

NS- Not Sampled; O&M- Operations and Management

AEC recommends that suspect ACM be actively managed in accordance with a property-specific Asbestos O&M Program until construction, demolition, or renovations warrant positive identification and/or building material removal.

Geocon, Inc. – *Phase I Environmental Site Assessment, 1010-1080 West San Marcos Boulevard, San Marcos, California*, dated June 10, 2021.

We performed a Phase I ESA for the Site in June of 2021. Our assessment found no evidence of RECs in connection with the Site.

5. HISTORICAL USE

On July 19, 2022, we evaluated the historical uses of the Site and adjacent properties through review of historical aerial photographs, topographic maps, and city directories provided by EDR. This section summarizes information obtained from these sources.

5.1 Aerial Photographs

We reviewed historical aerial photographs for the years 1939, 1946, 1953, 1964, 1967, 1970, 1979, 1985, 1989, 1990, 1994, 1996, 2002, 2005, 2009, 2012 and 2016 (Appendix E) for indications of past land uses that had the potential to have impacted the Site through the use, storage or disposal of hazardous substances and/or petroleum products. The following table summarizes our observations of the Site and adjacent properties.

Year	Observations	
	Site	**Adjacent Properties**
1939 (1" = 500')	The Site appears to have been vacant land with natural vegetation.	Adjacent properties appear to have been vacant land with natural vegetation.
1946 (1" = 500')	Conditions appear to have been similar to those observed on the 1939 aerial photograph.	Conditions appear to have been similar to those observed on the 1939 aerial photograph with the exception that the adjacent property to the east appears to have been developed with a single structure and an airfield landing/departing zone.
1953 (1" = 500')	Conditions appear to have been similar to those observed on the 1946 aerial photograph.	Conditions appear to have been similar to those observed on the 1946 aerial photograph except that the adjacent property to the south appears to have been developed with five elongated structures.
1964 (1" = 500')	Conditions appear to have been similar to those observed on the 1953 aerial photograph.	Conditions appear to have been similar to those observed on the 1953 aerial photograph.
1967 (1" = 500')	Conditions appear to have been similar to those observed on the 1964 aerial photograph.	Conditions appear to have been similar to those observed on the 1964 aerial photograph.

Year	Observations	
	Site	**Adjacent Properties**
1970 (1" = 500')	Conditions appear to have been similar to those observed on the 1967 aerial photograph.	Conditions appear to have been similar to those observed on the 1967 aerial photograph.
1979 (1" = 500')	Conditions appear to have been similar to those observed on the 1970 aerial photograph with the exception that a group of structures appear to have been developed in the central portion of the Site.	Conditions appear to have been similar to those observed on the 1970 aerial photograph with the exception that the adjacent properties to the east and west appear to have been developed with structures.
1985 (1" = 500')	Conditions appear to have been similar to those observed on the 1979 aerial photograph.	Conditions appear to have been similar to those observed on the 1979 aerial photograph with the exception the adjacent properties to the north, northeast, and northwest appear to have been developed with commercial structures.
1989 (1" = 500')	Conditions appear to have been similar to those observed on the 1985 aerial photograph with the exception that the paved parking lot has been extended further north on the Site.	Conditions appear to have been similar to those observed on the 1985 aerial photograph.
1990 (1" = 500')	Conditions appear to have been similar to those observed on the 1989 aerial photograph.	Conditions appear to have been similar to those observed on the 1989 aerial photograph.
1994 (1" = 500')	Conditions appear to have been similar to those observed on the 1990 aerial photograph.	Conditions appear to have been similar to those observed on the 1990 aerial photograph.
1996 (1" = 500')	Conditions appear to have been similar to those observed on the 1994 aerial photograph.	Conditions appear to have been similar to those observed on the 1994 aerial photograph.
2002 (1" = 500')	Conditions appear to have been similar to those observed on the 1996 aerial photograph.	Conditions appear to have been similar to those observed on the 1996 aerial photograph with the exception that the property adjacent to the west appears to have been developed with a commercial facility.
2005 (1" = 500')	Conditions appear to have been similar to those observed on the 2002 aerial photograph.	Conditions appear to have been similar to those observed on the 2002 aerial photograph.
2009 (1" = 500')	Conditions appear to have been similar to those observed on the 2005 aerial photograph.	Conditions appear to have been similar to those observed on the 2005 aerial photograph.
2012 (1" = 500')	Conditions appear to have been similar to those observed on the 2009 aerial photograph.	Conditions appear to have been similar to those observed on the 2009 aerial photograph.
2016 (1" = 500')	Conditions appear to have been similar to those observed on the 2012 aerial photograph.	Conditions appear to have been similar to those observed on the 2012 aerial photograph.

We observed no conditions on or uses of the Site or adjoining properties on the historical aerial photographs with the potential to have caused an REC at the Site.

5.2 Topographic Maps

We reviewed historical topographic maps for the years 1893, 1901, 1947, 1948, 1949, 1968, 1983, 1996, 2012, 2015, and 2018 (Appendix E). The following table summarizes observations of the Site and adjacent properties on the historical topographic maps.

Year	Observations	
	Site	**Adjacent Properties**
1893 (1:62,500)	No structures or land use are depicted on the Site.	No structures or land use are depicted on the adjacent properties.
1901 (1:62,500)	Conditions are similar to those depicted on the 1893 topographic map.	Conditions are similar to those depicted on the 1893 topographic map.
1947 (1:50,000)	Conditions are similar to those depicted on the 1901 topographic map with the exception that a stream is depicted extending roughly east to west.	Conditions are similar to those depicted on the 1901 topographic map with the exception that multiple streams are depicted extending roughly from the northeast to the southeast across the adjacent properties to the north, east, and west.
1948 (1:24,000)	Conditions are similar to those depicted on the 1947 topographic map.	Conditions are similar to those depicted on the 1947 topographic map with the exception that a single structure and airfield are depicted on the adjacent property to the east.
1949 (1:24,000)	Conditions are similar to those depicted on the 1948 topographic map.	Conditions are similar to those depicted on the 1948 topographic map.
1968 (1:24,000)	Conditions are similar to those depicted on the 1949 topographic map.	Conditions are similar to those depicted on the 1949 topographic map with the exception that two structures are depicted on the adjacent properties to the south.
1983 (1:24,000)	Conditions are similar to those depicted on the 1968 topographic map with the exception that four structures are depicted in the central portion of the Site and are shaded pink depicting an urban environment.	Conditions are similar to those depicted on the 1968 topographic map with the exception that structures adjacent to the east, south, and west are shaded pink indicating an urban environment.
1996 (1:24,000)	The Site is shaded pink indicating an urban environment.	The adjacent properties are shaded pink indicating an urban environment.
2012 (1:24,000)	No shading or structures are depicted.	No shading or structures are depicted.
2015 (1:24,000)	No shading or structures are depicted.	No shading or structures are depicted.
2018 (1:24,000)	No shading or structures are depicted.	No shading or structures are depicted.

The historical topographic maps depict no conditions, structures, or uses on the Site or adjacent properties that would suggest the presence of RECs.

5.3 City Directories

EDR prepared an abstract of city directories including city, cross-reference, and telephone directories summarized in the *EDR-City Directory Image Report* dated July 11, 2022. The directories were reviewed at approximately 5-year intervals, if available, from 1971 to 2017. A copy of the EDR city directory abstract including information regarding offsite facilities is in Appendix G. Commercial businesses located at the Site are listed from 1986 to 2017. Adjoining properties listed in the EDR report include a variety of commercial business names. None of the listed commercial businesses suggest the storage or use of hazardous substances or petroleum products on their properties.

6. SITE RECONNAISSANCE

This section summarizes observations of the Site and surrounding properties made during the site reconnaissance.

6.1 Methodology and Limiting Conditions

Cole E. Mikesell, Senior Staff Geologist with Geocon, performed the site reconnaissance unaccompanied on July 19, 2022, by walking the Site. Mr. Mikesell performed the offsite survey by observing adjacent properties from the Site and adjacent public streets. Weather on the day of the site reconnaissance was clear with temperatures in the mid-70s. Photographs of various site features and offsite properties are appended. Figure 2 is a Site Plan illustrating selected site features.

6.2 Site Setting

The Site is located in an area of predominantly commercial and retail use. The Site is surrounded by commercial and retail facilities to the north, east, south and west.

6.3 Onsite Survey

The Site is a relatively flat site with asphalt concrete paved parking areas and several commercial buildings occupied by current and former restaurant tenants (Photographs 1 through 6). A recycling, utilities, and equipment storage area is located in the central portion of 1020 West San Marcos Boulevard (Photographs 7 through 9). A non-operational well was observed in the northwestern portion of the Site (Photograph 10). The majority of the Site consists of paved parking areas supporting the onsite and offsite commercial tenants (Photographs 11 through 18). We observed no odors, pools of liquid, significantly stained soil or distressed vegetation on the Site. We observed no evidence of RECs on the Site.

Although, we did not access the interior of the buildings during our recent site reconnaissance, our previous assessment in June 2021 did not observe evidence of RECs. Based on the recent assessment, site use and condition of the property, we do not consider this a significant data gap.

6.4 Offsite Survey

Properties within the site vicinity include:

- **North:** Commercial and retail use (Photographs 19 and 20).
- **South:** Commercial and retail use (Photograph 21).
- **East:** Commercial and retail use (Photograph 22).
- **West:** Commercial and retail use (Photographs 23 and 24).

We observed no evidence of RECs on the surrounding properties.

7. INTERVIEWS

On July 6, 2022, the current property owner representative, Elizaberth Papera, reported via a site owner/occupant questionnaire (Appendix B), that the Site is currently used for retail purposes. The owner/occupant questionnaire identifies no environmental concerns.

8. CONCLUSIONS AND RECOMMENDATIONS

We have performed a Phase I ESA, in general conformance with the scope and limitations of ASTM *Designation E 1527-21* of the 10.52-acre property located at 1020-1080 West San Marcos Boulevard in San Marcos, California. Exceptions to, or deletions from, this practice are described in Section 1.4 of this report.

The Phase I ESA has revealed no evidence of RECs or significant data gaps in connection with the Site. No further environmental investigation of the Site appears to be warranted at this time.

If soil staining or petroleum odors are observed during redevelopment, we recommend retaining Geocon to observe and possibly sample areas of potential impact to determine if further action is warranted. Additionally, any undocumented subsurface structures or areas of apparent contamination encountered during site redevelopment activities including septic tanks, USTs, wells, etc. should be properly abandoned/removed in accordance with San Diego County regulatory requirements.

10. QUALIFICATIONS

This Phase I ESA report was prepared by Cole E. Mikesell with oversight by Troy K. Reist, CEG, MBA. We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in Section 312.10 of 40 CFR Part 312. We have the specific qualifications based on education, training, and experience, to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Mr. Mikesell has a BS degree in Geology with an emphasis in Environmental Geosciences and is a certified Geologist-In-Training in the State of California. Mr. Mikesell has 6 years of experience in the geotechnical and environmental consulting industry. He has performed exploratory drilling, infiltration testing, foundation and earthworks observation, and prepared Phase I and Phase II ESAs throughout southern California.

Mr. Reist has over 24 years of experience in the environmental and geotechnical consulting industry in California. Mr. Reist is a Professional Geologist and Certified Engineering Geologist with a BS degree in Geology and a master's degree in Business Administration. His personal experience includes performing environmental site assessments, geotechnical investigations, and management of residential, commercial, and industrial projects throughout California.

CLIENT–PROVIDED INFORMATION FOR THE SITE

Site: 1020-1080 West San Marcos Boulevard, San Marcos, CA; Project No. G2487-62-02B

***Please elaborate on any question answered "yes." If the question does not apply to the site, please answer "N/A".**

1. If possible, please provide us with the title, appraisal, or sale agreement records to review and discuss in the Phase I ESA.
   PTR included with email containing this questionnaire

2. Are you aware of any environmental liens or activity and use limitations associated with the Site?
   No.

3. Do you have any specialized knowledge of the Site?
   No.

4. Please provide any commonly known or reasonably ascertainable information about the Site.
   No.

5. Who currently owns, manages, and operates the Site?
   San Marcos Row, LLC

6. Has the monetary value of the Site been reduced due to environmental issues associated with the Site or adjacent properties?
   No.

7. Why are you requesting a Phase I ESA for the Site?
   Update to previous Phase 1 for City submittal.

PROPERTY BACKGROUND INFORMATION QUESTIONNAIRE FOR SITE OWNER, OCCUPANT, OR REPRESENTATIVE

SITE: 1020-1180 W. San Marcos Blvd; Project No. G2487-62-02A

***Please elaborate on any question answered "yes." If the question does not apply to the site, please answer "N/A".**

1) Describe the current uses of the Site. **RETAIL**

2) How long has the Site been used for theses purposes? **DON'T KNOW**

3) How long have you occupied the Site? **DON'T OCCUPY**

4) List the existing structures on the property and their age. **DON'T KNOW**

5) Describe the past uses, owners, and operators of the Site. (Be as detailed as possible and note approximate time periods.) **DON'T KNOW**

6) Utilities including electricity, natural gas, water, sewer, and trash removal are provided to the Site by which utility/companies.

Water – Vallecitos Water District
Sewer – Vallecitos Water District
Electricity - SDGE
Natural Gas - SDGE
Trash – EDCO

7) What type of heating, ventilating, and air conditioning (HVAC) system is located at the Site and how is the HVAC system powered? **DON'T KNOW**

8) Have the Site or adjoining properties been used for industrial activities, such the following? (Please note that an adjoining property is a property that is contiguous with, or directly across the street from the Site.)

Gasoline Station	[ ] Yes [ ] No
Printing Facility	[ ] Yes [ ] No
Metal Plating Manufacturing	[ ] Yes [ ] No
Landfill	[ ] Yes [ ] No.
Motor Repair Facility	[ ] Yes [ ] No
Dry Cleaners	[ ] Yes [ ] No
Junkyard	[ ] Yes [ ] No
Waste Treatment	[ ] Yes [ ] No
Storage, Disposal, or Recycling Facility	[ ] Yes [ ] No

DON'T KNOW ANSWER TO ANY OF THESE
Describe other industrial activities, if any.

9) Have any hazardous substances, petroleum products, unidentified waste materials, tires, automotive or industrial batteries, or other waste materials been dumped aboveground, buried, or burned on the Site?

[ ] Yes [ ] No. DON'T KNOW

10) Have any of the following items been stored on the Site in containers greater than 5 gallons?

Paint [ ] Yes [ ] No
Chemicals [ ] Yes [ ] No
Pesticides [ ] Yes [ ] No

DON'T KNOW

11) Are hazardous wastes generated at the Site? If yes, describe the means of disposal and frequency of disposal.

[ ] Yes [ ] No

DON'T KNOW

12) Have petroleum products been stored on the Site or transferred across the Site in pipelines, either above or belowground?

[ ] Yes [ ] No

DON'T KNOW

13) Has fill dirt been brought onto the Site from an offsite source?

[ ] Yes [ ] No

DON'T KNOW

14) Is there evidence that the fill dirt in Question 13 may be contaminated?

[ ] Yes [ ] No

DON'T KNOW

15) Are there currently any pits, ponds, or lagoons on the Site?

[ ] Yes [ ] No
DON'T KNOW

16) Have any pits, ponds, or lagoons previously existed on the Site?

[ ] Yes [ ] No
DON'T KNOW

17) Are there currently areas on the Site with stained soil?

[ ] Yes [ ] No

DON'T KNOW

18) Have stained soils previously existed on the Site?

[ ] Yes [ ] No

DON'T KNOW

19) Do chemical-containing underground or aboveground storage tanks exist, or have they existed previously on the Site?

[ ] Yes [ ] No

DON'T KNOW

20) Do fill pipes, vent pipes, or access ways indicating the presence of current or former underground storage tanks exist on the Site?

[ ] Yes [ ] No

DON'T KNOW

21) Have fill pipes or vent pipes which may indicate the presence of a current or former underground storage tank been removed from the Site?

[ ] Yes [ ] No

DON'T KNOW

22) Are floor drains stained with anything other than water in any area on the Site?

[ ] Yes [ ] No

DON'T KNOW

23) Do floor drains on the Site emit foul odors?

[ ] Yes [ ] No

DON'T KNOW

24) Is the Site served by a private well or a non-public water source?

[ ] Yes [ ] No

25) Are contaminants known to exist in any private well or non-public water system serving the Site?

[ ] Yes [ ] No

DON'T KNOW

26) Does the Site discharge wastewater, other than domestic wastewater or storm water, into the sewer?

[ ] Yes [ ] No

DON'T KNOW

27) Other than permission for domestic hookup, have any city, county, or local permits for wastewater discharge been issued to the Site?
[ ] Yes [ ] No

DON'T KNOW

28) Does a septic tank exist, or has one existed previously on the Site?

[ ] Yes [ ] No

DON'T KNOW

29) Do cesspools or cisterns currently exist on the Site?

[ ] Yes [ ] No

DON'T KNOW

30) Have cesspools or cisterns previously existed on the Site?

[ ] Yes [ ] No

DON'T KNOW

31) Other than storm water, does the Site discharge waste water onto the neighboring Site?

[ ] Yes [ ] No

DON'T KNOW

32) Is there a transformer or capacitor that may contain PCBs on the Site?

[ ] Yes [ ] No

DON'T KNOW

33) Is there hydraulic equipment such as automobile lifts or elevators on the Site?

[ ] Yes [ ] No

DON'T KNOW

34) Are PCBs contained in hydraulic oil associated with hydraulic equipment located on the Site?

[ ] Yes [ ] No

DON'T KNOW

35) Has an asbestos and/or lead-based paint survey been conducted at the Site? If so, what were the findings?

[ ] Yes [ ] No

DON'T KNOW

36) Other than small quantities of legal pesticides used for landscape maintenance (e.g., Roundup), have pesticides, herbicides, or insecticides been applied on the Site?
[ ] Yes [ ] No

DON'T KNOW

37) Are you aware of any environmental liens against the Site that are filed or recorded under federal, tribal, state, or local law?

[ ] Yes [ ] No

DON'T KNOW

38) Have any environmental violations or citations associated with activities conducted on the Site been issued?

[ ] Yes [ ] No

DON'T KNOW

39) Has the Site been included in other environmental assessments? If so, can copies of the reports be provided?

[ ] Yes [ ] No

DON'T KNOW

40) Have other environmental assessments identified hazardous substances or petroleum products that exist, or may have existed on the Site?

[ ] Yes [ ] No

DON'T KNOW

41) Are there any pending lawsuits that involve the release or threatened release of hazardous substances associated with the Site?

[ ] Yes [ ] No

DON'T KNOW

42) Are you aware of any activity and land use limitations, such as engineering controls, land use restrictions or institutional controls that are in place on the Site and/or have been filed or recorded in a registry under federal, tribal, state or local law?

[ ] Yes [ ] No

DON'T KNOW

43) Are you aware of any commonly known or reasonably ascertainable information about the Site that would help the environmental professional to identify conditions indicative of hazardous substance releases or threatened hazardous substance releases?

[ ] Yes [ ] No

DON'T KNOW

44) Do you have any specialized knowledge or experience related to the Site or nearby properties, including the knowledge of the chemicals and processes used by this type of business?

[ ] Yes [ ] No

DON'T KNOW

45) Based in your knowledge or experience related to the Site, are there any obvious indicators that point to the presence or likely presence of contamination at the Site?

[ ] Yes [ ] No

DON'T KNOW

46) If the purchase price of the Site was below fair market value, did this occur because contamination was/is known or believed to be present on the Site?

[ ] Yes [ ] No [ ] N/A
DON'T KNOW

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527-21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no

further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 04/27/2022 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

Lists of Federal RCRA facilities undergoing Corrective Action

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 06/20/2022 has revealed that there are 2 CORRACTS sites within approximately 1 mile of the target property.

Lists of Federal RCRA generators

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 06/20/2022 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EPA ID:: CAR000118356

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 06/20/2022 has revealed that there are 9 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-VSQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-VSQG list, as provided by EDR, and dated 06/20/2022 has revealed that there is 1 RCRA-VSQG site within approximately 0.25 miles of the target property.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 01/24/2022 has revealed that there are 10 ENVIROSTOR sites within approximately 1 mile of the target property.

Lists of state and tribal landfills and solid waste disposal facilities

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, has revealed that there are 3 SWF/LF sites within approximately 0.5 miles of the target property.

CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CPS-SLIC list, as provided by EDR, has revealed that there are 8 CPS-SLIC sites within approximately 0.5 miles of the target property.

Lists of state and tribal registered storage tanks

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 4 UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 06/20/2022 has revealed that there are 29 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.125 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click Here:

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal

Z M C CORP (Continued) **1001404396**

facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Inspection Date:	2019-09-19T15:11:58.000
Violation Code:	2030036 (TCR 9b) Failure to comply with one or more of the following overfill prevention equipment requirements: 1. Alert the transfer operator when the tank is 90% full by restricting the flow into the tank or triggering an audible and visual alarm; or 2. Restrict delivery of flow to the tank at least 30m before the tank overfills, provided the restriction occurs when the tank is filled to no more than 95% of capacity and activate an audible alarm at least 5m before the tank overfills; or 3. Provide positive shut-off of flow to the tank when the tank is filled to no more than 95% of capacity; or 4. Provide positive shut-off of flow to the tank so that none of the fittings located on the top of the tank are exposed to product due to overfilling. 5. Install/retrofit overfill prevention equipment that does not use flow restrictors on vent piping to meet overfill prevention equipment requirements when the overfill prevention equipment is installed, repaired, or replaced on and after October 1, 2018. 6. For USTs installed before October 1, 2018, perform an inspection by October 13, 2018 and every 36 months thereafter. 7. For USTs installed on and after October 1, 2018, perform an inspection at installation and every 36 months thereafter. 8. Inspected within 30 days after a repair to the overfill prevention equipment. 9. Inspected using an applicable manufacturer guidelines, industry codes, engineering standards, or a method approved by a professional engineer. 10. Inspected by a certified UST service technician. 11. Maintain records of overfill prevention equipment inspection for 36 months. 23 CCR 2635(c)(1), 2635(d), 2637.2(a-c), 2665, 2712(b)(1)(G)

Violation Description:	Failure to comply with one or more of the following overfill prevention equipment requirements: Alert the transfer operator when the tank is 90 percent full by restricting the flow into the tank or triggering an audible and visual alarm; or Restrict delivery of flow to the tank at least 30 minutes before the tank overfills, provided the restriction occurs when the tank is filled to no more than 95 percent of capacity; and activate an audible alarm at least five minutes before the tank overfills; or Provide positive shut-off of flow to the tank when the tank is filled to no more than 95 percent of capacity; or Provide positive shut-off of flow to the tank so that none of the fittings located on the top of the tank are exposed to product due to overfilling. Install/retrofit overfill prevention equipment that does not use flow restrictors on vent piping to meet overfill prevention equipment requirements when the overfill prevention equipment is installed, repaired, or replaced on and after October 1, 2018. For USTs installed before October 1, 2018, perform an inspection by October 13, 2018 and every 36 months thereafter. For USTs installed on and after October 1, 2018, perform an inspection at installation and every 36 months thereafter. Inspected within 30 days after a repair to the overfill prevention equipment. Inspected using an applicable manufacturer guidelines, industry codes, engineering standards, or a method approved by a professional engineer. Inspected by a certified UST service technician. Maintain records of overfill prevention equipment inspection for 36 months.
Violation Notes:	Returned to compliance on 09/19/2019. Inspection Sequence ID:6243605;Tank ID:27359,27360,27361,27358;Violation Description:(TCR 9b) Failure to comply with one or more of the following overfill prevention equipment requirements: 1. Alert the transfer operator when the tank is 90% full by restricting the flow into the tank or triggering an audible and visual alarm; or 2. Restrict delivery of flow to the tank at least 30m before the tank overfills, provided the restriction occurs when the tank is filled to no more than 95% of capacity and activate an audible alarm at least 5m before the tank overfills; or 3. Provide positive shut-off of flow to the tank when the tank is filled to no more than 95% of capacity; or 4. Provide positive shut-off of flow to the tank so that none of the fittings located on the top of the tank are exposed to product due to overfilling. 5. Violation Code:	2030013 Failure to comply with one or more of the following designated operator (DO) monthly inspection requirements: Be performed by an ICC certified DO. Inspect monthly alarm history report, check that alarms are documented and responded to appropriately, and attach a copy. Inspect for the presence of liquid/debris in spill containers. Inspect for the presence of liquid/debris in under dispenser containment (UDC) and ensure that the monitoring equipment is positioned correctly. Inspect for liquid or debris in containment sumps where an alarm occurred with no service visit. Check that all testing and maintenance has been completed and documented. Verify that all facility employees have been properly trained. 23 CCR 2715(c)

Citation:	HSC 6.7 25284.2 - California Health and Safety Code, Chapter 6.7, Section(s) 25284.2
Violation Description:	"Failure to meet one or more of the following requirements: Install or maintain a liquid-tight spill container. Have a minimum capacity of five gallons. Have a functional drain valve or other method for the removal of liquid from the spill container. Be resistant to galvanic corrosion. Perform a tightness test at installation, every 12 months thereafter, or within 30 days after a repair to the spill container. Tested using applicable manufacturer guidelines, industry codes, engineering standards, or a method approved by a professional engineer. Tested by a certified UST service technician. Maintain records of spill containment testing for 36 months. "
Violation Notes:	Returned to compliance on 08/08/2019. Inspection Sequence ID:6225291;Tank ID:28802,28801;Violation Description:(TCR 9a) Failure to meet one or more of the following requirements: Install or maintain a liquid-tight spill container. Have a minimum capacity of 5 gallons. Have a functional drain valve or other method for the removal of liquid from the spill container. Be resistant to galvanic corrosion.
