Section 1 – Project Description

Existing Conditions:

The project is located at the Southeast corner of El Camino Real and Forster Street in San Juan Capistrano. It is bound by the Historic Town Center Park to the north, commercial development to the east, El Camino Real, Forster Street and Camino Capistrano to the west and commercial/office development to the south.

The existing site improvements include a building slab, paved parking stalls and drive aisles, and mature landscaping. The existing site improvements will be demolished.

Proposed Conditions:

The proposed improvements include a mixed-use community, incorporating both commercial and residential uses. The commercial element of the project includes a free-standing 4,000 sf restaurant and 3,000 sf of commercial space attached to the residential building. The two commercial buildings sit on opposite corners of the project entrance. The restaurant building has a spacious courtyard for exterior seating. The residential element of the project will contain 95 multi-family homes with a mix of one- and two-bedroom apartment homes, surrounding a resort-style pool and recreational facility. A nearly 3,500 sf clubhouse building will sit at the entrance to the residences. Also included is a pool deck and partially submerged underground parking structure beneath the residential building. Two trash enclosures will serve the community and drive aisles and parking stalls will support vehicular movements throughout the project. New landscaping will be provided in all areas that are not hardscaped.

Driveway opening/closings and parkway (sidewalk and landscaping) improvements are the only offsite improvements proposed with this project.

Section 2 – Drainage Patterns

Existing Drainage Patterns:

The existing site drains in two general locations. The northwestern corner of the property sheet flows to the west to Camino Capistrano, where it is carried south in the street's curb and gutter. The remainder of the site is sloped towards two inlets at the southern corner of the property where it is collected in a catch basin and piped southwest in a 15" pipe to a public storm drain system in Del Obispo.

DA 1 consists of 0.271 acres which has approximately 38% impervious land cover. This land area includes the fountain at the corner of Camino Capistrano and Forster Street, and the adjacent landscaping. Runoff sheet flows to the west and over the sidewalk along Camino Capistrano, and into the curb and gutter in the roadway. Runoff is conveyed in the curb and gutter to the south. Ultimately, runoff is collected in a public catch basin at the intersection of Camino Capistrano and Del Obispo Street.

DA 2 & 3 consists of 2.884 acres which has approximately 87% impervious land cover. This area includes the balance of the property; the building slab, parking lot, drive aisles and other site improvements. Runoff sheet flows to two catch basins at the lower portion of the site. The higher catch basin conveys runoff via a 15" storm drain pipe to the lower catch basin. From the lower catch basin, storm water will be conveyed by a 12" pipe (Outlet 2). The 12" storm drain line carries runoff to the west and ultimately discharges into the public storm drain system in Del Obispo Street. The storm drain main in Del Obispo St. slopes west to the intersection of Camino Capistrano and Del Obispo. There is a secondary overflow just north of the Outlet 2, where high flow can overflow through an existing gate and sheet flow across the adjacent property, ultimately discharging into an existing catch basin on Del Obispo.

Proposed Drainage Patterns:

Generally, the developed drainage pattern is consistent with the existing drainage pattern for the ultimate storm water path.

The proposed development has five storm water drainage areas and two outlet discharge locations from the site.

DA 1A consists of 0.197 acres which has approximately 74.7% impervious land cover. This land area includes the restaurant building and the adjacent patio and hardscape. Runoff from the building discharges directly into the biofiltration planter adjacent to the patio. Runoff in the landscape areas and patio sheet flows directly to the biofiltration planter adjacent to the patio. This biofiltration planter (BMP A) captures runoff for treatment. Lower flows infiltrate through the planter and are collected at the bottom with an underdrain pipe. Higher flows

are collected at an inlet set above the ponding depth of the BMP. The underdrain and piping from the raised inlet discharge through a parkway drain to the curb and gutter in Camino Capistrano (Outlet 1). Ultimately, runoff from Camino Capistrano is conveyed south where it is collected in a public catch basin at the intersection of Camino Capistrano and Del Obispo Street.

DA 1B consists of 0.116 acres which has approximately 100% impervious land cover. This land area includes the reconfigured Forster intersection at El Camino Real. Runoff in this area is captured in curb and gutter and is conveyed to Camino Capistrano. Ultimately, runoff from Camino Capistrano is conveyed south where it is collected in a public catch basin at the intersection of Camino Capistrano and Del Obispo Street.

DA 1C consists of 0.456 acres which has approximately 90% impervious land cover. This land area includes the half-width of El Camino Real and Forster streets along the project frontage extending north to the high point at the intersection of El Camino Real and Old Mission Road. Runoff in this area is captured in curb and gutter and is conveyed from Old Mission Road south on El Camino Real, west of Forster and then south on Camino Capistrano to a public catch basin at the intersection of Del Obispo. Runoff for this area is included in the calculations and contributions from the Old Mission Place project at the SEC of ECR and Old Mission Road is noted in Section 4.

DA 2 consists of 0.855 acres which has approximately 89% impervious land cover. This area includes the fitness and residential building at the northern side of the site and the Forster extension from the intersection with El Camino Real. It also includes landscaping and a sidewalk adjacent to the building. Runoff from the building will be piped to an underground storm drain pipe system which will convey runoff to the east along Forster to a diversion manhole. Runoff from the drive aisle, stall areas and landscape areas will sheet flow to curb and gutter along the south edge of Forster where it will be collected by a catch basin. Storm water from catch basin will be piped to the diversion manhole. Low flow storm water from the diversion manhole will be piped to a Modular Wetlands System (MWS) for treatment (BMP B). From the MWS, storm water will be piped to the southwest, converging with higher flows from the diversion manhole, and ultimately to an underground storm drain detention system (System B). Downstream of the detention system, storm water will be conveyed to the 12" outlet point of the project (Outlet 2). The 12" storm drain line carries runoff to the west and ultimately discharges into the public storm drain system in Del Obispo Street. The storm drain main in Del Obispo St. slopes west to the intersection of Camino Capistrano and Del Obispo.

DA 3 consists of 0.282 acres which has approximately 69.5% impervious land cover. This land area includes approximately half of the parking lot at the northeast corner of the property. Storm water in this area is collected in a catch basin in the corner of the parking lot and is piped to a diversion manhole. Low flow storm water from the diversion manhole will be piped to a Modular Wetlands System (MWS) for treatment (BMP B). From the MWS, storm water will be piped to the southwest, converging with higher flows from the diversion manhole, and ultimately to an underground storm drain detention system (System B). Downstream of the detention system, storm water will be conveyed to the 12" outlet point of the project (Outlet 2). The 12" storm drain line carries runoff to the west and ultimately discharges into the public storm drain system in Del Obispo

Street. The storm drain main in Del Obispo St. slopes west to the intersection of Camino Capistrano and Del Obispo.

DA 4 consists of 0.862 acres which has approximately 85.2% impervious land cover. This area includes the clubhouse, pool area and residential building at the southern side of the site. It also includes landscaping and sidewalk adjacent to the building. Runoff from the building and internal walkways will be piped to a storm drain pipe system which will convey runoff to the west to the main drive aisle on the west side of the site. This pipe system conveys storm water to a catch basin at the southwest corner of the site. Runoff from the drive aisle, stall areas and landscape areas will sheet flow to curb and gutter along the west side of the drive aisle where it will be collected by a catch basin. Storm water from catch basin will be piped to a Modular Wetlands System (MWS) for treatment (BMP C). Lower flow rates will be treated, while higher flow rates will bypass internally through the system. From the MWS, storm water will be piped to the south and then east to an underground storm drain detention system (System A). Downstream of the detention system, storm water will be conveyed to the 12" outlet point of the project (Outlet 2). The 12" storm drain line carries runoff to the west and ultimately discharges into the public storm drain system in Del Obispo Street. The storm drain main in Del Obispo St. slopes west to the intersection of Camino Capistrano and Del Obispo.

DA 5 consists of 0.581 acres which has approximately 75% impervious land cover. This land area includes the lower parking lot and drive aisle along the southern edge of the property. It also includes a large portion of the project's landscaping. Storm water in this area is collected in a MWS (BMP D) with higher flows bypassing the MWS at grade with an adjacent catch basin. From the MWS and catch basin, storm water is piped to the 12" outlet point of the project (Outlet 2). The 12" storm drain line carries runoff to the west and ultimately discharges into the public storm drain system in Del Obispo Street. The storm drain main in Del Obispo St. slopes west to the intersection of Camino Capistrano and Del Obispo.

Ultimately, storm water from our site is conveyed to the south to the public storm drain system which is tributary to San Juan Creek, which flows to the Pacific Ocean.

DA 6 consists of 0.263 acres which has approximately 80.5% impervious land cover. This land area includes approximately half of the parking lot at the northeast corner of the property and the steep-sloping portion of the Forster extension. Storm water in this area is collected in a catch basin on the Forster Extension is piped to a diversion manhole. Low flow storm water from the diversion manhole will be piped to a Modular Wetlands System (MWS) for treatment (BMP B). From the MWS, storm water will be piped to the southwest, converging with higher flows from the diversion manhole, and ultimately to an underground storm drain detention system (System B). Downstream of the detention system, storm water will be conveyed to the 12" outlet point of the project (Outlet 2). The 12" storm drain line carries runoff to the west and ultimately discharges into the public storm drain system in Del Obispo Street. The storm drain main in Del Obispo St. slopes west to the intersection of Camino Capistrano and Del Obispo.

The proposed drainage map will utilize the existing secondary overflow as explain in the existing drainage pattern. This is to maintain historic overflow for this project site.

Run-On:

The site does not include any run-on.

Hydromodification:

Ultimately, the project drainage is captured in a public storm drain system downstream of the property where storm water is conveyed to San Juan Creek. San Juan Creek is an engineered channel, therefore, HCOC is not a concern for the project. In addition, our project site is included in the Engineered Channels/Large River exemptions area as shown on the San Juan Capistrano Exemption Map.

Flood Zone:

This project is not in a flood zone.

Section 3 – Methodology

RUNOFF DETERMINATION METHODS

The two primary methods used in the Orange County area to determine design discharges are the Rational Method and the Unit Hydrograph method. The Rational method is generally intended for use on small watersheds of less than 300 to 500-acres while the Synthetic Unit Hydrograph method is intended for use on watersheds in excess of these limits. For the purposes of this report, we will be using the Rational Method for the 25- and 100-year storm event.

RATIONAL METHOD

The Rational method is commonly used for determining peak discharge from relatively small drainage areas. The Rational method is based on the following equation:

$$Q = C \times I \times A$$

Where:

Q = peak discharge, in cubic feet per second (cfs)

C = runoff coefficient, proportion of the rainfall that runs off the surface (no units)

A = drainage area contributing to the design location, in acres

For this study, HydroCAD software was used to model the Rational Method using Intensity-Duration-Frequency (IDF) curves from the Orange County Manual. The IDF curves were input based on the criteria below from Figure B-3 from the OC Hydrology Manual:

I = average rainfall intensity for a duration equal to the T_c for the area, in inches per hour (Note: If the computed T_c is less than 5 minutes, use 5 minutes for computing the peak discharge, Q)

$I = A * (t)^B$ (in/hr)

t = Time of Concentration (min.)

$A & B$ = factors in the Intensity regression equation from the Orange County Hydrology Manual

$A = 10.209$ for 10-year storm

$A = 15.56$ for 100-year storm

$B = -0.573$ for 10-year & 100-year storm

A plot of the IDF curve is included in the Appendix.

The Tc values for each subarea were determined using nomographs from Figure D-1 from the OC Hydrology Manual. These Tc values are directly input for each subarea in the HydroCAD model. A Tc of 5 minutes was used for initial subareas with calculated Tc values less than 5 minutes.

The runoff coefficient (C) for each surface cover is also directly input for each subarea. The runoff coefficient is calculated based on section D.5 of the OC Hydrology Manual. The following factor was used for calculation of the runoff coefficient:

$$F_p = \text{Loss rate for Soils Group B (in/hr) from O.C. Hydrology Manual (0.20 for soil group D)}$$

Each subarea is entered into the HydroCAD model as a Subcatchment and linked to a downstream node. A Subcatchment is defined in the HydroCAD manual as “*a relatively homogenous area of land that typically drains into a reach or pond.*” A Reach is defined as “*a uniform stream, channel, or pipe that conveys water from one point to another*”. A Pond is defined as “*a pond, swamp, dam, catch basin, manhole, drywell, or other impoundment that fills with water from one or more sources and empties in a manner determined by a weir, culvert, or other outlet device(s).*” A Pond is also used to model the end point of the drainage study. A model of the drainage catchment area was created using Subcatchments, Reaches and Ponds. A diagram of the model is included in the Appendix for the existing and proposed conditions.

In the HydroCAD program, the rainfall duration and corresponding peak flow rate are calculated based on the Tc for each subarea using the Rational Method for the frequency storm specified. The program allows for the 2-, 5-, 10-, 25-, 50- and 100-year storm frequencies. As noted above, the 25- and 100-year storm frequencies will be calculated in this study.

Hydraulic Calculation Methods:

The Federal Highway Administration (FHWA) Hydraulic Toolbox program was used for this study to calculate pipe capacity, street flow capacity and catch basin sizing. This is a federally approved program and is generally accepted in Orange County.

Detention Modeling:

The OC Hydology Manual uses the Modified Puls method (also referred to as the Storage-Indication Method) for detention basin modeling. HydroCAD uses several methods for reach routing, including the Storage-Indication Method. For this project, we selected the Storage-Indication Method for analyzing detention basin routing. This

method was used within the Rational Method model to evaluate time-discharge rates for the two underground storage chamber systems. Please see the calculations in the Appendix for details.

Section 4 – Calculations

Runoff Calculations

Using HydroCAD software, the existing and proposed runoff for the project was calculated for the 25- & 100-Year Storm Events. A model was created based on the drainage areas for the existing and proposed conditions. The runoff calculations are shown in the reports in the Appendix.

Below is an estimate of street runoff for the frontage roads of El Camino Real and Forster Street tributary to the east and south half-widths, respectively. This total Q also accounts for contribution from the Old Mission Place Project Drainage Study with contributions from the onsite improvements, which is currently estimated at 4.29cfs per the project's March 2024 report, and the project's contribution from DA-1A (0.65 cfs)

100-yr Storm Event – El Camino Real and Forster Street Contribution

DA-1C

A=0.456 acres

A = 15.56 for 100-year storm

B = -0.573 for 10-year & 100-year storm

Impervious % = 90%

ai = 0.90

ap = 0.10

Fp = 0.20

Tc = 5 min

$$I = a * (t)^B \text{ (in/hr)} = 6.19 \text{ in/hr}$$

$$C = 0.75 * ai * 0.15 = 0.75$$

$$Q_{100} = C * I * A = 0.75 * 6.19 * 0.456 = 2.12 \text{ cfs} + 4.29 \text{ cfs} + 0.65 \text{ cfs} = 7.06 \text{ cfs}$$

Section 5 – Summary

As shown in the calculations and table below, runoff from the project will be decreased with the development of the project. Since the project is able to maintain a runoff less than that of the pre-developed conditions, no adverse effects will occur to the ultimate downstream conveyance system.

25-yr Storm Event

25-yr Storm	Camino Capistrano Contribution (Outlet 1) (cfs)	12" Pipe Contribution (Outlet 2) (cfs)	Totals
Existing Condition	1.02	5.31	6.33
Proposed Condition	1.13	3.60	4.73
Difference	0.09 (9%)	-1.71 (32%)	-1.60 (25%)

100-yr Storm Event

100-yr Storm	Camino Capistrano Contribution (Outlet 1) (cfs)	12" Pipe Contribution (Outlet 2) (cfs)	Totals
Existing Condition	1.31	5.35	6.66
Proposed Condition	1.48	4.66	6.14
Difference	0.17 (13%)	-0.69 (13%)	-0.52 (8%)

Summary for Pond 13P: Detention B

[44] Hint: Outlet device #1 is below defined storage

[63] Warning: Exceeded Reach 9R INLET depth by 0.23' @ 0.19 hrs

Inflow Area = 60,995 sf, 83.46% Impervious, Inflow Depth = 0.47" for 100-Year event
 Inflow = 6.70 cfs @ 0.10 hrs, Volume= 2,403 cf
 Outflow = 2.06 cfs @ 0.16 hrs, Volume= 2,391 cf, Atten= 69%, Lag= 3.9 min
 Primary = 2.06 cfs @ 0.16 hrs, Volume= 2,391 cf

Routing by Stor-Ind method, Time Span= 0.00-3.00 hrs, dt= 0.01 hrs
 Peak Elev= 98.62' @ 0.16 hrs Surf.Area= 1,791 sf Storage= 1,699 cf

Plug-Flow detention time= 13.2 min calculated for 2,383 cf (99% of inflow)
 Center-of-Mass det. time= 13.5 min (19.4 - 5.8)

Volume	Invert	Avail.Storage	Storage Description
#1A	96.80'	1,170 cf	10.33'W x 173.35'L x 2.00'H Field A 3,582 cf Overall - 656 cf Embedded = 2,926 cf x 40.0% Voids
