Initial Study

The City of San Leandro, as the Lead Agency, prepared this Initial Study for the 14143-14273 Washington Avenue Warehouse Project in compliance with the California Environmental Quality Act (CEQA), the CEQA Guidelines (California Code of Regulations [CCR] Section 15000 et. seq.), and the regulations and policies of the City of San Leandro, California. The 14143-14273 Washington Avenue Warehouse Project (hereinafter referred to as "proposed project" or "project") would involve construction of a one-story, 52,269 square-foot warehouse structure, including a 5,000 square-feet office, and associated site improvements and landscaping.

1. Project Title

14143-14273 Washington Avenue Warehouse Project

2. Lead Agency Name and Address

City of San Leandro
835 East 14th Street
San Leandro, California 94577
510-577-3458

3. Contact Person and Phone Number

Binh Nguyen, Associate Planner
Office: 510-577-3314
Email: bnguyen@sanleandro.org

4. Project Sponsor's Name and Address

First Industrial Realty Trust
1111 Broadway, Third Floor
Oakland, California 94067
510-851-6769

5. Project Location

The project site is located on the west side of Washington Avenue, south of its intersection with 139th Avenue and north of its intersection with 143rd Avenue in San Leandro, California. The site, which totals 3.45 acres, consists of the following Assessor's Parcel Numbers:

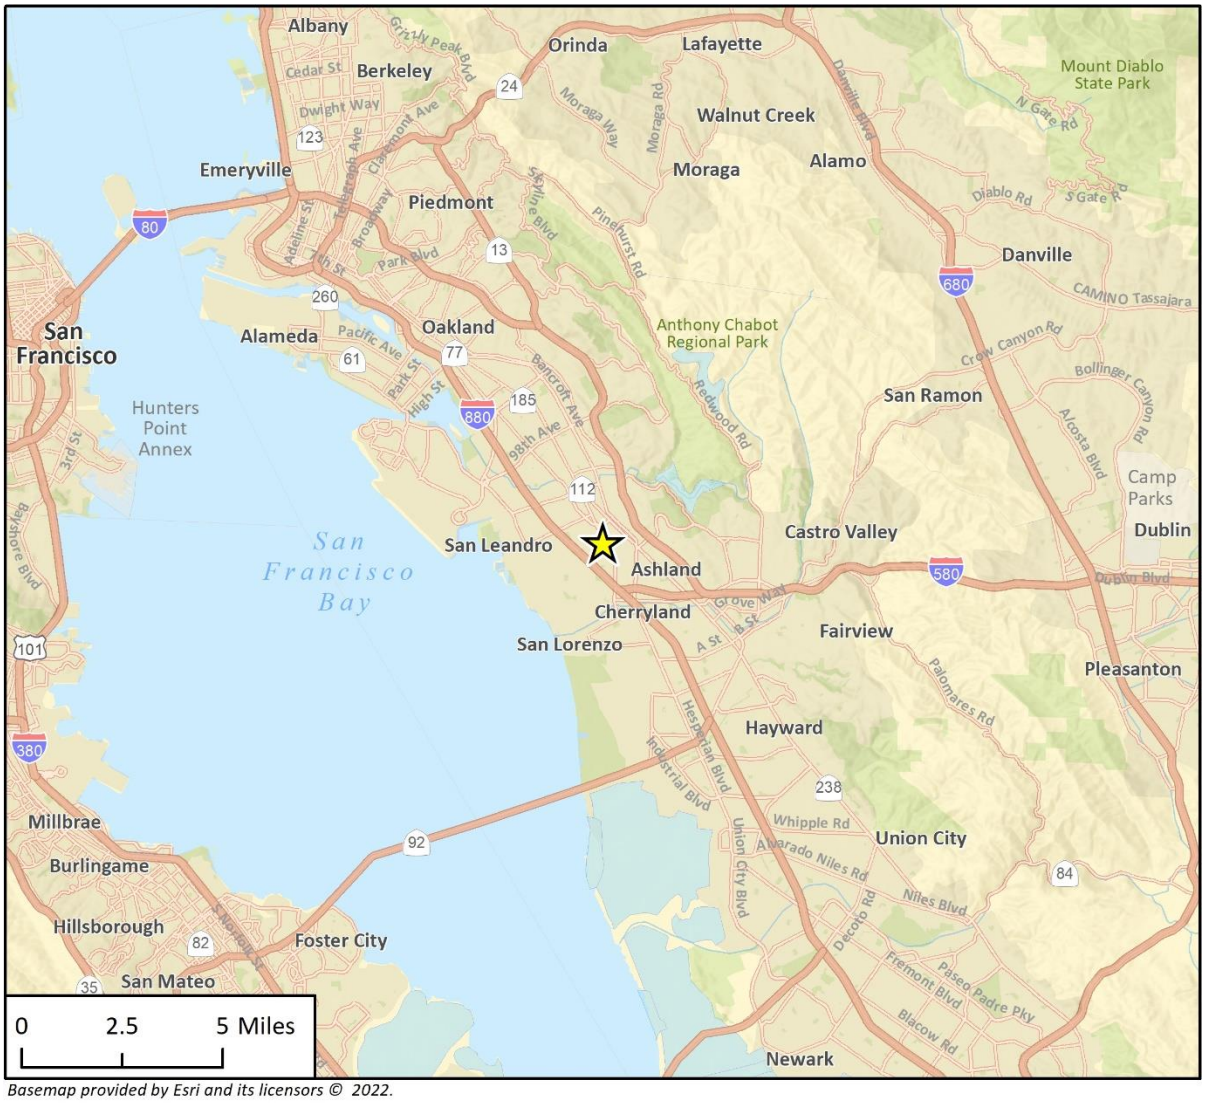
- 77B-1222-3-3
- 77B-1222-4-3
- 77B-1222-5-3
- 77B-1222-6-15
- 77B-1222-6-17
- 77B-1222-6-18

Regional access is available to the site from Interstate 880 (I-880), located 0.6 mile west of the site; I-580, located one mile east of the site; and I-238, located one mile south of the site. Local access to the site is available from Washington Avenue via Halcyon Drive and San Leandro Boulevard. Figure 1 shows the regional location of the project site, and Figure 2 provides an aerial image of the project site in its neighborhood context.

6. General Plan Designation

The City of San Leandro 2035 General Plan designates the project site as Industrial Transition. (IT) According to the City's General Plan, the Industrial Transition designation corresponds to the IT, Industrial Transition District, and is conditionally compatible with the IG, Industrial General, CC, Commercial Community, IL, Industrial limited, and IP, Industrial Park Zoning Districts. IT areas have historically been industrial but have transitioned or may transition in the future to a more diverse mix of uses, including general commercial activities (City of San Leandro 2016a).

7. Zoning



The project site is zoned as Commercial Community (CC)with an Assembly Use (AU)overlay. Pursuant to San Leandro Zoning Code (SLZC) Section 2.08.200, uses permitted in Commercial Community zones include but are not limited to business services and offices. Commercial Community zones require a minimum lot area of 10,000 square feet, a maximum building height of 50 feet, and a maximum floor area ratio (FAR) of 1.0, and a minimum landscaped area of 10 percent, among other requirements. The Assembly Use overlay applied to the project site allows for assembly uses, including but not limited to union halls, social clubs, and youth centers, on a conditional basis. This area was rezone from industrial to commercial in the late 1990s, with the vision that the southern portion of Washington Ave would become a commercial gateway into the City. However, due to the strong economy of the industrial businesses, few commercial developments have occurred.

8. Surrounding Land Uses and Setting

The project site is located within a developed commercial and light industrial area. Surrounding land uses include outdoor landscaping suppliers to the north; commercial, storage, and automobile repair shops to the east; a home supply store to the south; and the City Public Works Department and warehouses to the west. Union Pacific railroad tracks border the site to the west. The nearest residential areas are located approximately 500 feet southwest and 1,000 feet east of the project site.

The project site was previously developed with several structures, including a recreational vehicle rental and storage facility, an ironwork shop, and two single-family residences, both of which were used as part of an ironworks business. However, these structures were destroyed in a structural fire in August 2022, and the site is currently vacant. Demolition of the remaining structures was undertaken by the City under emergency safety permits; therefore, demolition is not part of the proposed project. There are 23 trees on site, and the site is relatively flat with an elevation of approximately 40 feet. Photographs of existing conditions on the project site are shown in Figure 3.

Photograph 3. Interior of the central portion of the site looking northwest from site frontage on Washington Avenue

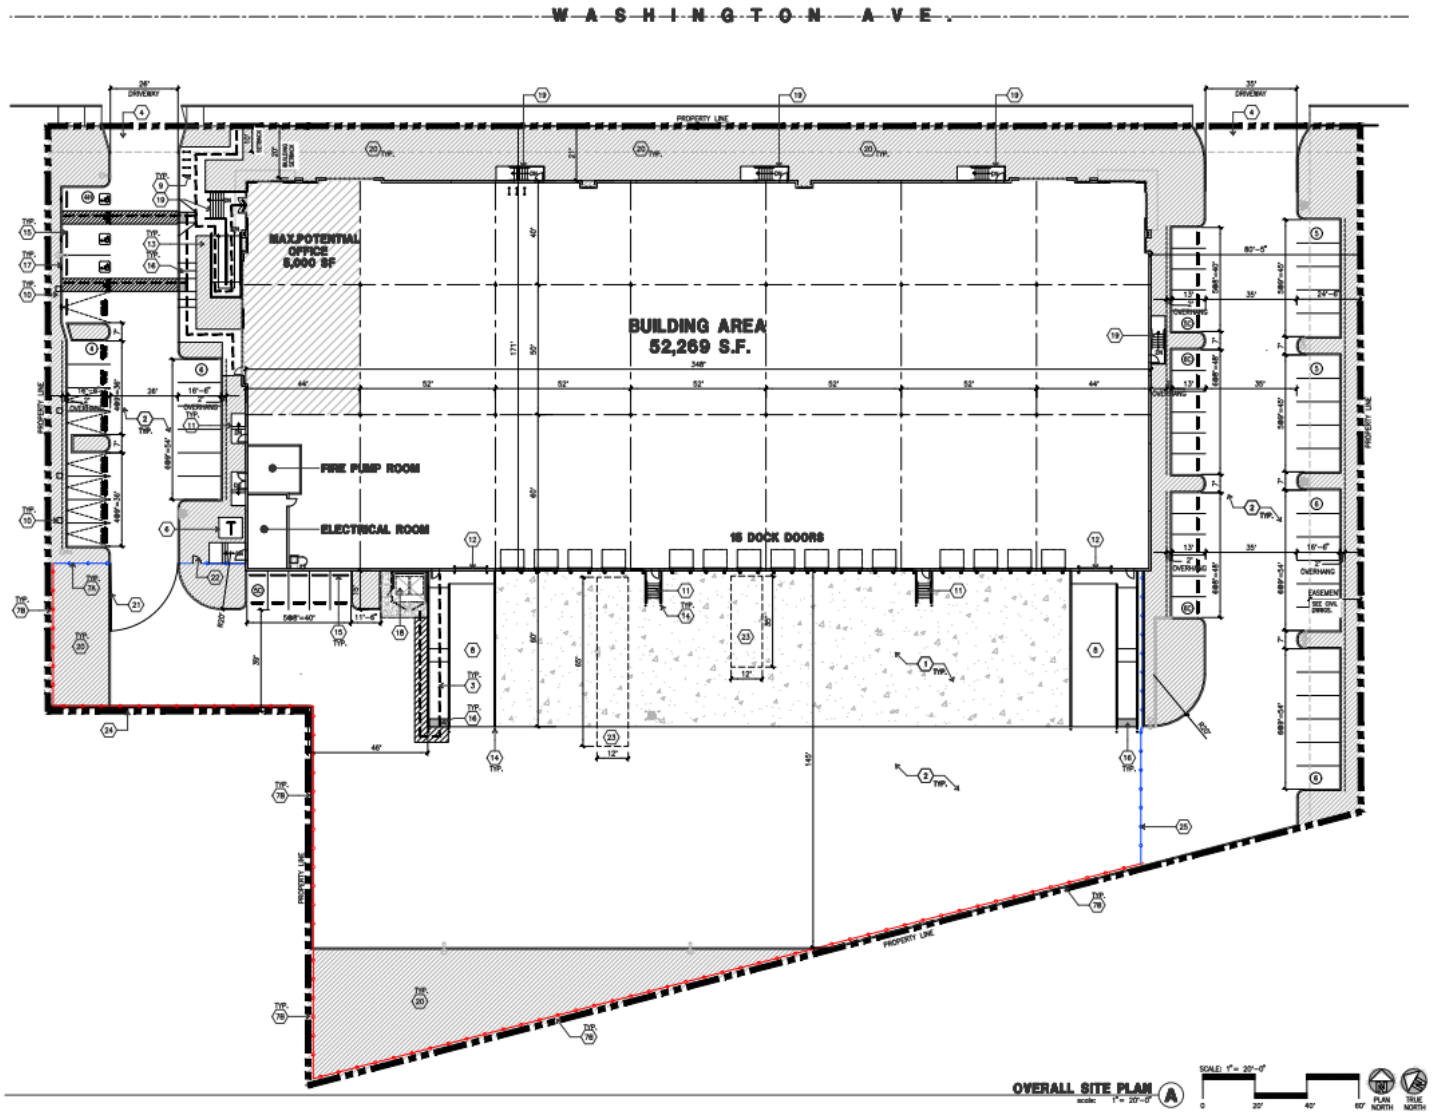
Photograph 4. Interior of the site looking southwest from site frontage on Washington Avenue

9. Project Description

The project is a speculative development construction of a one-story, 52,269 square-foot warehouse structure with 15 truck bays for truck parking, which would include up to 5,000 square feet of office space. The project would also include construction of a surface parking lot with 64 vehicle parking spaces,14 bicycle parking spaces, as well as on-site landscaping. Figure 4 shows the proposed site plan, and Figure 5 shows the proposed elevations from each direction.

The project would require a lot line adjustment (merger) to create a single lot. The project would also require a rezone from Commercial Community, Assembly Use Overlay (CC (AU)) to Industrial General (IG). The proposed warehouse would be 47 feet in height, which would exceed the height limit of 35 feet for IG Districts. Pursuant to SLZC Section 2.12.312, a maximum building height of 50 feet in the IG District may be approved by the Zoning Enforcement Official.

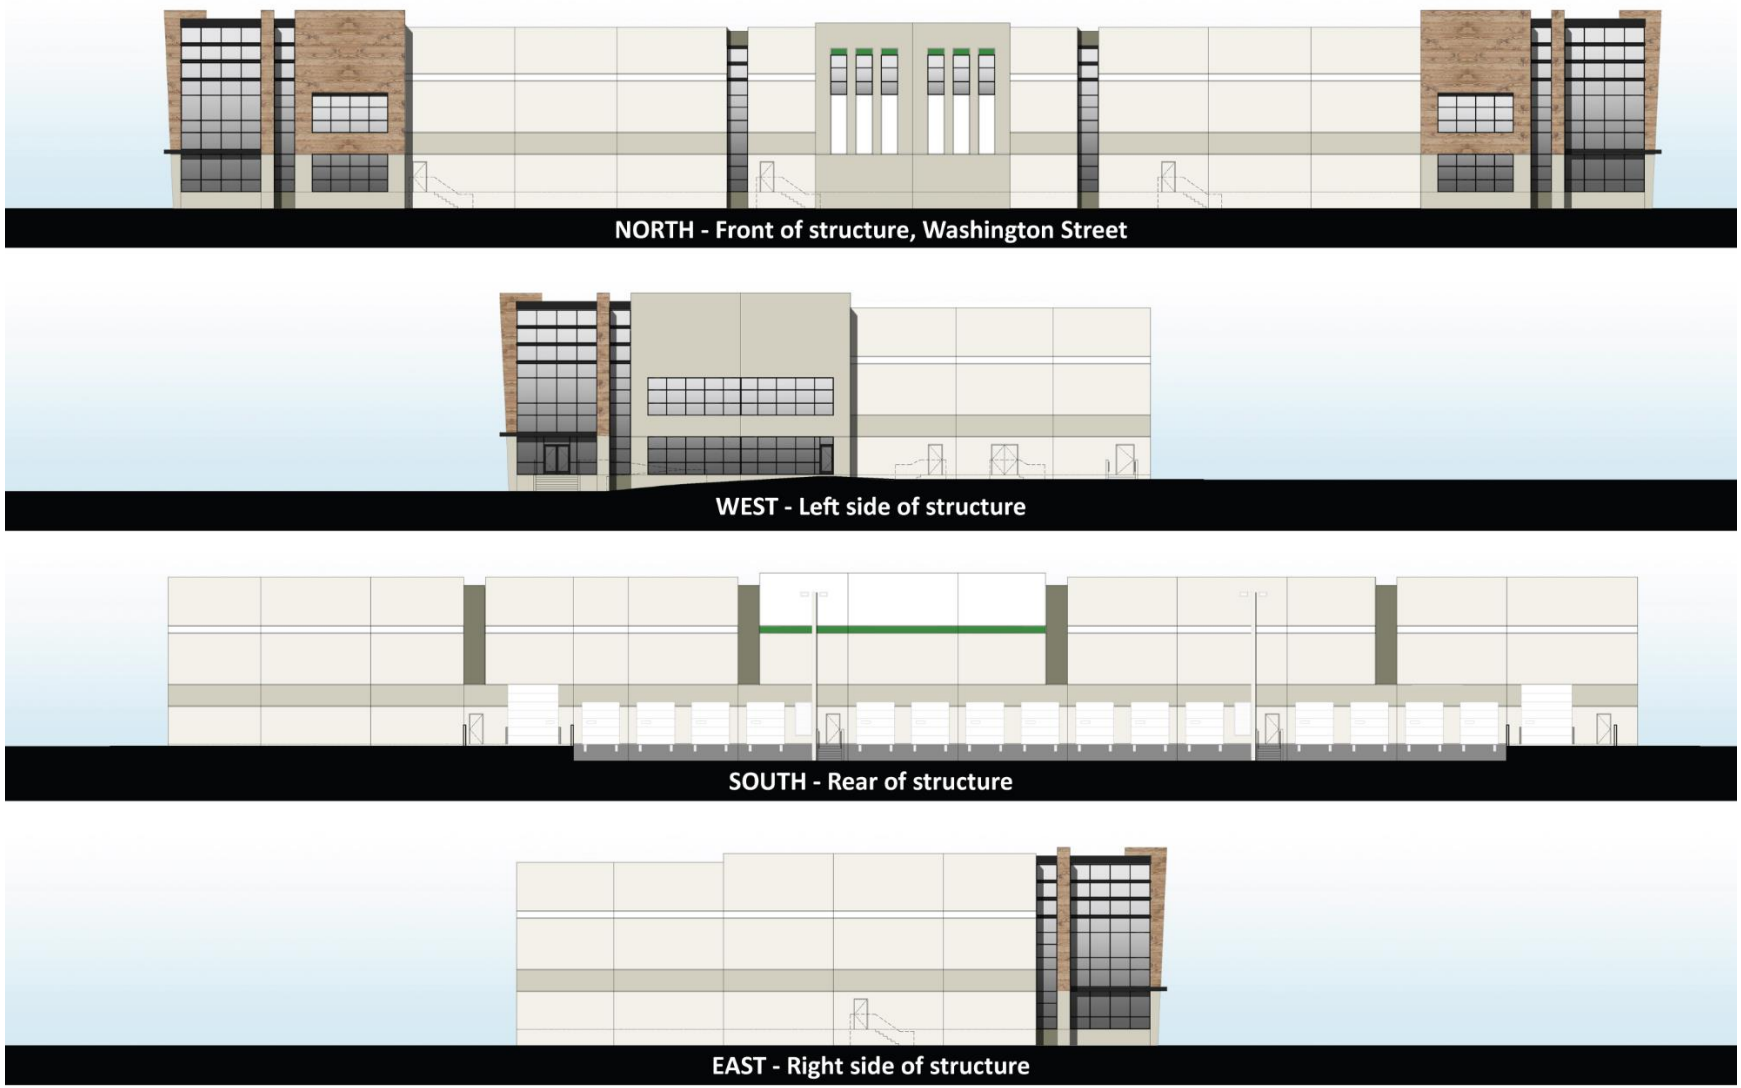
The structure's interior area would consist primarily of warehouse space, with the proposed office space, an electrical room, and a fire pump room located at the northern end of the structure. The west side of the structure would have 15 dock doors for vehicle shipping and receiving access. The structure would be surrounded by 26-foot wide internal drive aisles and parking to the north and south, with vehicle maneuvering space provided to the west. Two drive-in doors would also be provided along the dock doors on the structure's west side. A trash enclosure would be located on the western side of the structure.



Materials for the exterior of the structure would include concrete painted off-white and beige neutral colors, with wood paneling and windows located on the northern and southern faces of the structure. Windows would be treated with grey glazing and set in black metal trim. Wall-mounted and pole light fixtures would be located on the structure's exterior and in the parking areas to provide nighttime lighting. A final photometric plan would be required at the building permit stage and the project would be conditioned to meet the applicable provisions of SLZC Section 4.08.156, *Lighting.*

Landscaping and Open Space

There are 23 trees on the project site. Demolition and site preparation would include the removal of 10 trees. Of the 10 trees to be removed, eight trees are located within the proposed construction footprint and two trees are located within the proposed parking and driveway areas. Trees to be removed would include coast redwoods, valley oaks, ginkgo, loquat, and Victorian box trees. None of these trees are street trees and thus, would not be subject to SLMC Chapter 5-2 (Appendix A). As part of the proposed site landscaping, the project would involve planting 12 trees along the site's frontage with Washington Avenue and 17 trees within the parking areas of the project site.



Landscaping for the project would consist of trees, shrubs, grasses, and groundcover plants along the perimeter of the project site, around the proposed warehouse structure, and a maintained area along the western boundary of the project site. Approximately 15 percent of the site's area, or approximately 21,000 square feet, would include landscaping that would comply with the State's Model Water Efficient Landscape Ordinance (MWELO) and bioswales that would help with stormwater treatment.

Figure 4 Proposed Site Plan

Source: First Industrial Realty Trust 2022

Figure 5 Proposed Structure Elevations

Source: HPA Architecture, 07/22/21.

Site Access, Circulation, and Parking

Vehicle access to the project site would be available via two existing two-way driveways on Washington Avenue, located in the southeast and northeast corners of the project site, respectively. Pedestrian access to the project site would be provided via concrete sidewalks along all sides of the proposed structure, except alongside the 15 dock doors. These sidewalks would lead to exterior stairwells and entryways. Pedestrian access to the warehouse would be provided via seven pedestrian doors; three located on the structure's north side, three on the structure's eastern side along Washington Avenue, and one located on the structure's south side. Two doors, separated from the project site driveway by a fence, would provide exterior access to the electrical room and the fire pump room. Pedestrian entrances to the structure would be above grade and accessible via concrete stairways.

The proposed project would be required to provide 49 vehicle parking spaces and 13 bicycle parking spaces pursuant to the SLZC. A total of 64 vehicle parking spaces would be provided and 14 bicycle parking spaces would be provided. Parking provided would exceed the requirement for off street parking and loading for manufacturing and warehouse facilities, located along the northern, southern, and western sides of the proposed warehouse structure. Three accessible parking spaces, seven electric vehicle charging spaces, and one clean air vehicle space would be located on the northern side of the project site. Remaining parking spaces would consist of 31 standard vehicle and 22 compact vehicle spaces. The drive aisle from each driveway on Washington Avenue would allow vehicles to access a paved area in the western portion of the site, which would provide vehicle maneuvering space adjacent to the 15 dock doors. There would be 14 bicycle parking spaces located on the northern end of the proposed warehouse structure.

Table 1 provides a summary of parking to be provided on the project site.

Table 1 Parking Summary

Parking	Number of Stalls
Vehicle	**64**
Standard	31
Compact	22
Accessible	3
Electric Vehicle – regular	7
Clean Air Vehicle	1
Loading space	2
Bicycle	**14**
Short-term	6
Long-term	8

Source: First Industrial Realty Trust 2022

Green Building Features

Construction of the project would incorporate several green building features. The project would utilize energy efficient LED lighting and controls that would exceed the requirements of Title 24 of the California Energy Commission's Building Energy Efficiency Standards, as well as City energy efficiency requirements. Plumbing fixtures used for the proposed project would be high-efficiency fixtures, which would minimize the potential inefficient or wasteful consumption of energy related to water and wastewater. The project would not use natural gas in accordance with City of San Leandro reach codes effective as of January 2023.

Utilities and Public Services

Water would be provided to the project site by the East Bay Municipal Utility District and the applicant was provided a Will Serve Letter from EBMUD on October 7, 2021. Wastewater treatment for the project site would be served by the Oro Loma Sanitary District (OLSD). The City of San Leandro Department of Public Works owns and maintains 175 miles of storm drain conduits throughout the city. The project would continue to connect to the existing storm drain system operated and maintained by the City of San Leandro. Stormwater from the project site drains west to Washington Avenue, where it is collected by storm drains into the City's stormwater system. Electricity would be provided to the project site by East Bay Community Energy (EBCE) via Pacific Gas and Electric Company (PG&E) infrastructure, and the project would occasionally involve use of a 500 horsepower backup generator. Infrastructure capable of supporting electric and telecommunications is present at the project site and in the project vicinity. The project site would be served by existing public services within the city. The Alameda County Fire Department (ACFD) would provide fire protection and emergency medical service to the project site. The San Leandro Police Department (SLPD) would provide law enforcement services to the project site.

10. Site Preparation and Construction

Site preparation would include demolition of paving and other onsite features as well as grading. Construction activities would include construction, paving, and architectural coating. Construction is anticipated to begin in early 2024 and would be completed in spring 2025. Pursuant to Section 4-1.1115 of SLMC, construction would occur between the hours of 7:00 a.m. and 7:00 p.m., Monday through Friday, and 8:00 a.m. and 7:00 p.m. on Saturday and Sunday. Table 2 below describes the estimated site preparation and construction schedule, which is based on data provided in the Air Quality and Greenhouse Gas Emissions Impacts Report prepared by FirstCarbon Solutions (Appendix B).

Table 2 Projected Site Preparation and Construction Timeline

Stage	Start Date	End Date
Demolition	January 2024	February 2024
Site Preparation	February 2024	March 2024
Grading	February 2024	March 2024
Building Construction	February 2024	January 2025
Paving	January 2025	February 2025
Architectural Coating	February 2025	March 2025

11. City of San Leandro Permits and Approvals Required

The following permits and approvals are required from the City of San Leandro prior to project construction:

- Lot Line Adjustment (lot merger)
- Site Plan Review
- Conditional Use Permit
- Building Height Adjustment
- Building Permit
- Rezoning from CC (AU), Commercial Community, Assembly Use Overlay, to Industrial General

12. Other Public Agencies Whose Approval is Required

The proposed project does not require the discretionary approval of any other public agency except for the City of San Leandro.

13. Have California Native American Tribes Traditionally and Culturally Affiliated with the Project Area Requested Consultation Pursuant to Public Resources Code Section 21080.3.1?

No California Native American Tribes have requested notification of new development within San Leandro. On June 7, 2022, the City of San Leandro, pursuant to Public Resources 21080.3.1 and AB 52, sent via email and a certified mail notification letter regarding the proposed project to the following tribes:

- Amah Mutsun Tribal Band of Mission San Juan Bautista
- Costanoan Rumsen Carmel Tribe
- Indian Canyon Mutsun Band of Costanoan
- Muwekma Ohlone Indian Tribe of the San Francisco Bay Area
- The Ohlone Indian Tribe
- Wuksache Indian Tribe/Eshom Valley Band
- The Confederated Villages of Lisjan Nation
- North Valley Yokuts Tribe

Additional information regarding consultation is included in Environmental Checklist Section 18, *Tribal Cultural Resources.*

Environmental Factors Potentially Affected

This project would potentially affect the environmental factors checked below, involving at least one impact that is "Potentially Significant" or "Less than Significant with Mitigation Incorporated" as indicated by the checklist on the following pages.

□	Aesthetics	□	Agriculture and Forestry Resources	■	Air Quality
■	Biological Resources	■	Cultural Resources	□	Energy
■	Geology and Soils	□	Greenhouse Gas Emissions	■	Hazards and Hazardous Materials
□	Hydrology and Water Quality	□	Land Use and Planning	□	Mineral Resources
□	Noise	□	Population and Housing	□	Public Services
□	Recreation	□	Transportation	■	Tribal Cultural Resources
□	Utilities and Service Systems	□	Wildfire	□	Mandatory Findings of Significance

Determination

Based on this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

■ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions to the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "less than significant with mitigation incorporated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☒ I find that although the proposed project could have a significant effect on the environment, because all potential significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Environmental Checklist

1 Aesthetics

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Except as provided in Public Resources Code Section 21099, would the project:				
a. Have a substantial adverse effect on a scenic vista?	□	□	□	■
b. Substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	□	□	□	■
c. Substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from a publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	□	□	■	□
d. Create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the area?	□	□	■	□

Setting

The site is currently vacant but mostly paved. Surrounding land uses include commercial and light industrial structures of one to two stories and outdoor storage of materials. The surrounding landscape includes street trees, landscaped areas around commercial and industrial development, and ruderal vegetation.

The nearest officially designated or eligible State Scenic Highway is Interstate 580 (I-580), which is officially designated as a State Scenic Highway north of San Leandro Creek and eligible for designation south of San Leandro Creek (California Department of Transportation [Caltrans] 2018). The project site is approximately 1.75 miles southeast of the officially designated portion and approximately 1 mile east of the eligible portion at their closest points.

Regulatory Setting

San Leandro 2035 General Plan

The following Land Use Element policy of the San Leandro 2035 General Plan describes the intended aesthetic vision for the Washington corridor.

LAND USE ELEMENT

Policy LU-8.5: Maintain areas in the City that are appropriate for lumberyards, construction suppliers, automotive repair shops, and other commercial uses that are industrial in character or that are typically located in industrial areas. While development standards in these areas should respect the operational characteristics of these uses, they should still promote aesthetic improvements, adequate buffering for nearby uses, traffic safety, and a more positive visual image.

San Leandro Zoning Code

While the project site is currently zoned as Commercial Community, Assembly Use Overlay, the project would involve rezoning the site to Industrial General. San Leandro Zoning Code (SLZC) establishes use and development regulations for industrial districts. These regulations are summarized below in Table 3.

Table 3 Industrial General Development Regulations

Feature	Requirement
Minimum Lot Area	5,000 square feet
Minimum Lot Width	50 feet
Minimum Setback	20 feet (required for structures over 40 feet in height)
Maximum Height	Up to 50 feet with approval by the Zoning Enforcement Official
Maximum Lot Coverage	75%, Floor Area Ratio (FAR) of 1.0
Minimum Site Landscaping	5%

The following section of SLZC would also be applicable to the project.

Section 4.08.156 **Lighting**. Outdoor lighting in a landscaped parking area shall not employ a light source higher than 12 feet. Outdoor parking area lighting shall create no cone of direct illumination greater than 60 degrees from a light source higher than six feet and shall not directly shine onto an adjacent street. Maximum illumination at ground level shall be three foot candles and shall not exceed one-half foot candles in an R district.

Impact Analysis

a. Would the project have a substantial adverse effect on a scenic vista?

A scenic vista is usually defined as a panoramic view from an elevated position or a long-range view from a public vantage point. This can include views of natural features or of the built environment, when architecture and landscaped boulevards offer high-value views of an area considered important to the sense of place.

The San Leandro 2035 General Plan does not formally recognize specific scenic vistas in the city. However, the General Plan does designate scenic views, which the City has identified as aesthetic priorities that contribute to a sense of place. These scenic views include long-range views of the San Francisco Bay to the west and views of hills above I-580 to the east. Due to intervening development and distance, there are no views of the San Francisco Bay from the project site. Intermittent views of the hills above I-580 to the west are visible from the project site; however, these views are to the west from public viewpoints along Washington Avenue and would not be affected by the project, which is on the east side of the street. The proposed warehouse structure would not substantially alter views of these scenic views, the surrounding built environment, or distant scenic features. Therefore, the project would not result in a substantial adverse effect on a scenic vista, and there would be no impact.

NO IMPACT

b. Would the project substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

I-580 is a designated State Scenic Highway north of San Leandro Creek and eligible for designation south of San Leandro Creek (Caltrans 2018). Due to intervening development and distance, the project site is not visible from either highway segment. Therefore, implementation of the project would have no effect on scenic resources in view of a State Scenic Highway. There would be no impact.

NO IMPACT

c. Would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from a publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

The project site is a vacant property in an urbanized area, surrounded by automobile repair shops to the north; commercial, storage, and automobile repair shops to the east; a home supply store to the south; and the City Public Works Department and warehouses to the west. Table 4 and Table 5 below show policies and standards from the City's General Plan and the SLZC that govern scenic quality and demonstrates the project's consistency with both.

Table 4 Project Consistency with General Plan and Municipal Code

Policy/Standard	Project Consistency
City of San Leandro 2035 General Plan	
Policy LU-8.5. Maintain areas in the City that are appropriate for lumberyards, construction suppliers, automotive repair shops, and other commercial uses that are industrial in character or that are typically located in industrial areas. While development standards in these areas should respect the operational characteristics of these uses, they should still promote aesthetic improvements, adequate buffering for nearby uses, traffic safety, and a more positive visual image.	**Consistent.** The project would involve construction and operation of a warehouse structure. Existing land uses surrounding the project site include warehouses, automotive repair shops, and home supply stores. Therefore, the proposed warehouse would be consistent with the existing commercial and industrial character of the project site surroundings. Additionally, as described in the *Project Description,* the proposed warehouse's exterior would include concrete painted off-white and beige neutral colors, wood paneling, and metal trim, which would result in aesthetic improvements compared to existing conditions and promote a positive visual image in the project area. Therefore, the project would be consistent with this policy.

Source: City of San Leandro 2016a;; First Industrial Realty Trust 2022

The project would involve rezoning the project site from Commercial Community, Assembly Use Overlay to Industrial General, and a lot line adjustment to combine all parcels into a single lot. Table 5 below demonstrates that the proposed project would be in compliance with Industrial General standards, specifically those that regulate scale and massing, pursuant to SLZC Section 2.12.300. Compliance with these standards would ensure that the scale and massing of the proposed project would be limited as required by the SLZC, which would affect the visual character of the project consistent with the City's vision for the area and would ensure that the project would be designed to be visually compatible with the surrounding area.

Table 5 Project Consistency with City Zoning Requirements

Feature	Zoning Requirements	Proposed Warehouse Feature[1]
Minimum Lot Area	5,000 square feet	146,000 square feet
Minimum Lot Width	50 feet	300 feet
Minimum Setback	20 feet (required for structures over 40 feet in height)	20 feet
Maximum Height	Up to 50 feet with Zoning Enforcement Official approval	47 feet[2]
Maximum Lot Coverage	75%, Floor Area Ratio (FAR) of up to 1.0	34.7%, FAR of 0.34
Minimum Site Landscaping	5%	15.4%

[1] Feature with all three lots combined

[2] Would require approval from City zoning enforcement official

As shown above, the project would be consistent with applicable San Leandro General Plan policies and standards related to aesthetics. The project would either comply with applicable SLZC standards or receive approval from the City to exceed lighting and building height requirements. Impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

d. Would the project create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the area?

The project site is in an urban area with moderate levels of existing lighting. Lighting sources around the project site include wall-mounted security lights on adjacent buildings, streetlights on Washington Avenue, and lights from vehicles on Washington Avenue or in surrounding parking lots. The primary source of glare in the area is sunlight reflected off light-colored and reflective building materials and finishes, and metallic and glass surfaces of vehicles parked in parking lots adjacent to or across the street from the project site.

The proposed warehouse structure would include windows on its exteriors, which would be treated with grey glazing to reduce reflectivity. Glare from sunlight generally occurs on the east side of buildings in the morning and west side in the afternoon. The proposed building would be located along the west of Washington Avenue which runs north to south and would likely not create substantial sun reflection to drivers in the morning or afternoon because drivers would not be directly facing the east or west sides of the buildings. Additionally, the north, east, and west sides of the building would be partially blocked by proposed landscaping along the northern, eastern, and western perimeters of the project site. Further, the project would be located in a commercial area with existing sources of light and reflection and would not adversely affect daytime views of the area. The project would be required to comply with applicable provisions of SLZC Section 4.08.156, Lighting, which would be reflected in the conditions of approval. The project site is in an area already developed with commercial and light industrial uses, including existing warehouses, a home supply store, and an outdoor landscaping supplier. Additional nighttime lighting at the project site would be consistent with surrounding land uses. Further, the nearest residences to the project site (approximately 500 feet southwest and 1,000 feet east) are separated by intervening development and privacy fences; therefore, nighttime lighting would not be substantially visible from the nearest residences, and there are no parks or similar recreational or gathering spaces adjacent. The project would not substantially alter conditions in the vicinity. Therefore, impacts related to project light and glare would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

This page intentionally left blank.

2 Agriculture and Forestry Resources

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	■
b. Conflict with existing zoning for agricultural use or a Williamson Act contract?	☐	☐	☐	■
c. Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)); timberland (as defined by Public Resources Code Section 4526); or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?	☐	☐	☐	■
d. Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	■
e. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	■

Setting

The project site is located within an urban area of San Leandro. The site was previously developed and is zoned for Commercial Community, Assembly Use Overlay.

The California Department of Conservation (DOC) manages the Farmland Mapping and Monitoring Program to assess and record suitability of land for agricultural purposes. In each county, the land is analyzed for soil and irrigation quality. The highest quality land is designated as Prime Farmland. According to the Alameda County Important Farmland Map prepared by the DOC, the project site and vicinity are designated as Urban and Built-Up Land and the site does not have any identified agriculture or forest land (DOC 2016).

Regulatory Setting

The DOC's Farmland Mapping and Monitoring Program (FMMP) monitors the conversion of the State's farmland to and from agricultural use. County-level data is collected, and a series of maps are prepared that identify eight classifications and uses based on a minimum mapping unit size of 10 acres. The program also produces a biennial report on the amount of land converted from agricultural to non-agricultural use. The program maintains an inventory of State agricultural land and updates the Important Farmland Series Maps every two years. The FMMP is an informational service only and does not constitute State regulation of local land use decisions. Agricultural land is rated according to several variables, including soil quality and irrigation status with Prime Farmland being considered the most optimal for farming practices. Other FMMP designations include Farmland of Local Importance, Grazing Land, and Water.

Land Conservation Act

Better known as the "Williamson Act" (California Administrative Code Section 51200 et seq.), the California Land Conservation Act of 1965 creates a legal arrangement whereby private landowners' contract with local governments to voluntarily restrict land to agricultural and open space uses, protecting it from unnecessary or premature conversion to urban uses. In return, restricted parcels are assessed for property tax purposes at a rate consistent with their actual use rather than potential market value, which saves landowners from 20 percent to 75 percent in property tax liability each year.

Generally, Williamson Act contracts have an initial term of ten years, with renewal occurring automatically each year thereafter. The contracts run with the land and are binding on all succeeding landowners. Land must be in an agricultural preserve to enter into a Williamson Act contract. Agricultural preserves under Williamson Act contract contain at least 100 contiguous acres of agricultural land unless specific findings are made.

Non-renewal initiations are requested either by the landowner or the local government and are often filed in anticipation of converting farmland to other uses. Most contracted land is terminated through non-renewal. Upon the expiration of the contract, the restrictions are removed and the property tax assessment, which had been gradually increasing over the previous nine-year non-renewal period, returns to full market value.

To characterize the environmental baseline for agricultural resources, Important Farmland Maps produced by the DOC were reviewed. Unless otherwise expressed, the future use of "Important Farmland" specifically includes the following definitions provided by the DOC:

- **Prime Farmland:** Land which has the best combination of physical and chemical characteristics for producing crops. It has the soil quality, growing season, and moisture supply needed to produce sustained high yields of crops when treated and managed, including water management, according to current farming standards.
- **Unique Farmland:** Land of lesser quality soils used for the production of specific high economic value crops. It has the special combination of soil quality, location, growing season and moisture supply needed to produce sustained high quality or high yields of a specific crop when treated and managed according to current farming methods. It is usually irrigated but may include non-irrigated orchards or vineyards as found in some climatic zones in California. Examples of crops include oranges, olives, avocados, rice, grapes and cut flowers.

- **Farmland of Local Importance:** Land of importance to the local agricultural economy as determined by each county's board of supervisors following recommendations by a local advisory committee.

PRC Section 12220(g) defines forest land as:

> land that can support 10-percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits.

PRC Section 4526 defines timberland as:

> land, other than land owned by the federal government and land designated by the board as experimental forest land, which is available for, and capable of, growing a crop of trees of a commercial species used to produce lumber and other forest products, including Christmas trees. Commercial species shall be determined by the board on a district basis.

Government Code Section 51104(g) defines a timberland production zone as:

> an area which has been zoned pursuant to Section 51112 or 51113 and is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses, as defined in subdivision (h).

Impact Analysis

a. Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

The project site is not designated as, is not adjacent to, and is not proximate to lands classified as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, as shown by maps prepared by the DOC's Farmland Mapping and Monitoring Program maps (DOC 2016a). The rezone of the project site from Commercial Community, Assembly Use Overlay to Industrial General would not result in the rezone of an agricultural use to a non-agricultural use. The project would only modify the project site; therefore, no Prime Farmland, Unique Farmland, or Farmland of Statewide Importance would be affected by project implementation and no impact would occur.

NO IMPACT

b. Would the project conflict with existing zoning for agricultural use or a Williamson Act contract?

The project site and surrounding areas are not subject to Williamson Act contracts (DOC 2016b). The project would only involve construction and modification at the project site, an industrial site. The rezone of the project site from Commercial Community, Assembly Use Overlay to Industrial General would not result in the rezone of an agricultural use or Williamson Act contract land to a non-agricultural use. Therefore, no Williamson Act contracts would be affected by project implementation and no impact would occur.

NO IMPACT

c. Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)); timberland (as defined by Public Resources Code Section 4526); or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?

d. Would the project result in the loss of forest land or conversion of forest land to non-forest use?

e. Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?

The project site does not currently provide forest and timber resources and would not be used for forest and timber resources. While some landscaping trees are present on the industrial project site, the site itself is not considered forest or timberland (California Department of Fish and Wildlife 2021). As such, the project would not convert forest or timberland uses, and no impact would occur.

NO IMPACT

3 Air Quality

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Conflict with or obstruct implementation of the applicable air quality plan?	□	□	■	□
b. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	□	■	□	□
c. Expose sensitive receptors to substantial pollutant concentrations?	□	□	■	□
d. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	□	□	■	□

Information in this section is based on the Air Quality and Greenhouse Gas Emissions Impacts Report prepared for the project by FirstCarbon Solutions in August 2022. This report was peer reviewed by Rincon Consultants in October 2022, and FirstCarbon Solutions prepared a revised report in April 2023. Rincon Consultants also prepared updated air quality modeling in September 2023. The revised Air Quality and Greenhouse Gas Emissions Impacts Report, peer review memorandum, and updated air quality modeling are included as Appendix B.

Overview of Air Pollution

The federal and State Clean Air Acts (CAA) mandate the control and reduction of certain air pollutants. Under these laws, the U.S. Environmental Protection Agency (USEPA) and the California Air Resources Board (CARB) have established the National Ambient Air Quality Standards (NAAQS) and the California Ambient Air Quality Standards (CAAQS) for "criteria pollutants" and other pollutants. Some pollutants are emitted directly from a source (e.g., vehicle tailpipe, an exhaust stack of a factory, etc.) into the atmosphere, including carbon monoxide, volatile organic compounds (VOC)/reactive organic gases (ROG),[1] nitrogen oxides (NO_X), particulate matter with diameters of ten microns or less (PM_{10}) and 2.5 microns or less ($PM_{2.5}$), sulfur dioxide, and lead. Other pollutants are created indirectly through chemical reactions in the atmosphere, such as ozone, which is created by atmospheric chemical and photochemical reactions primarily between ROG and NO_X. Secondary pollutants include oxidants, ozone, and sulfate and nitrate particulates (smog).

[1] CARB defines VOC and ROG similarly as, "any compound of carbon excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate," with the exception that VOC are compounds that participate in atmospheric photochemical reactions. For the purposes of this analysis, ROG and VOC are considered comparable in terms of mass emissions, and the term ROG is used in this IS-MND.

Air pollutant emissions are generated primarily by stationary and mobile sources. Stationary sources can be divided into two major subcategories:

- Point sources occur at a specific location and are often identified by an exhaust vent or stack. Examples include boilers or combustion equipment that produce electricity or generate heat.
- Area sources are widely distributed and include such sources as residential and commercial water heaters, painting operations, lawn mowers, agricultural fields, landfills, and some consumer products.

Mobile sources refer to emissions from motor vehicles, including tailpipe and evaporative emissions, and can also be divided into two major subcategories:

- On-road sources that may be legally operated on roadways and highways.
- Off-road sources include aircraft, ships, trains, and self-propelled construction equipment.

Air pollutants can also be generated by the natural environment, such as when high winds suspend fine dust particles.

Toxic Air Contaminants

Toxic air contaminants (TACs) are a diverse group of air pollutants that may cause or contribute to an increase in deaths or serious illness, or that may pose a present or potential hazard to human health. TACs include both organic and inorganic chemical substances that may be emitted from a variety of common sources, including gasoline stations, motor vehicles, dry cleaners, industrial operations, painting operations, and research and teaching facilities. One of the main sources of TACs in California is diesel engine exhaust that contains solid material known as diesel particulate matter (DPM). More than 90 percent of DPM is less than one micron in diameter (about $1/70^{th}$ the diameter of a human hair) and thus is a subset of $PM_{2.5}$. Because of their extremely small size, these particles can be inhaled and eventually trapped in the bronchial and alveolar regions of the lungs (CARB 2022).

TACs are different than criteria pollutants because ambient air quality standards have not been established for TACs. TACs occurring at extremely low levels may still cause health effects and it is typically difficult to identify levels of exposure that do not produce adverse health effects. TAC impacts are described by carcinogenic risk and by chronic (i.e., long duration) and acute (i.e., severe but of short duration) adverse effects on human health.

TACs include both organic and inorganic chemical substances. While DPM is a main source, TACs may be emitted from a variety of common sources, including gasoline stations, motor vehicles, dry cleaners, industrial operations, painting operations, and research and teaching facilities. People exposed to toxic air pollutants at sufficient concentrations and durations may have an increased chance of developing cancer or experiencing other serious health effects. These health effects can include damage to the immune system, as well as neurological, reproductive (e.g., reduced fertility), developmental, respiratory, and other health problems (USEPA 2020).

Regulatory Setting

California Clean Air Act

The California CAA, signed into law in 1988, requires all areas of the State to achieve and maintain the CAAQS by the earliest practical date. CARB is the State air pollution control agency and is a part

of CalEPA. CARB is the agency responsible for coordination and oversight of State and local air pollution control programs in California, and for implementing the requirements of the California CAA. CARB overseas local district compliance with federal and California laws, approves local air quality plans, submits the State implementation plans to the U.S. EPA, monitors air quality, determines and updates area designations and maps, and sets emissions standards for new mobile sources, consumer products, small utility engines, off-road vehicles, and fuels.

Air Quality Standards and Attainment

The project site is located in the San Francisco Bay Area Air Basin (SFBAAB), which is under the jurisdiction of the Bay Area Air Quality Management District (BAAQMD). BAAQMD has jurisdiction over much of the nine-county Bay Area, including Alameda County. As the local air quality management agency, BAAQMD is required to monitor air pollutant levels to ensure that the NAAQS and CAAQS are met and, if they are not met, to develop strategies to meet the standards. Depending on whether the standards are met or exceeded, the SFBAAB is classified as being in "attainment" or "nonattainment." In areas designated as non-attainment for one or more air pollutants, a cumulative air quality impact exists for those air pollutants, and the human health impacts associated with these criteria pollutants, presented in Table 6, are already occurring in that area as part of the environmental baseline condition.

Under state law, air districts are required to prepare a plan for air quality improvement for pollutants for which the district is in non-compliance. The SFBAAB is designated a nonattainment area for the federal 8-hour ozone standard, federal $PM_{2.5}$ annual and 24-hour standards, state 8-hour and 1-hour ozone standards, state PM_{10} annual and 24-hour standards, and the state $PM_{2.5}$ annual standard (BAAQMD 2022). This nonattainment status is a result of several factors, such as mobile sources, wood burning, industrial combustion, and dust, in the SFBAAB.

Table 6 Health Effects Associated with Non-Attainment Criteria Pollutants

Pollutant	Adverse Effects
Ozone	(1) Short-term exposures: (a) pulmonary function decrements and localized lung edema in humans and animals and (b) risk to public health implied by alterations in pulmonary morphology and host defense in animals; (2) long-term exposures: risk to public health implied by altered connective tissue metabolism and altered pulmonary morphology in animals after long-term exposures and pulmonary function decrements in chronically exposed humans; (3) vegetation damage; and (4) property damage.
Suspended particulate matter (PM_{10})	(1) Excess deaths from short-term and long-term exposures; (2) excess seasonal declines in pulmonary function, especially in children; (3) asthma exacerbation and possibly induction; (4) adverse birth outcomes including low birth weight; (5) increased infant mortality; (6) increased respiratory symptoms in children such as cough and bronchitis; and (7) increased hospitalization for both cardiovascular and respiratory disease (including asthma).[1]
Suspended particulate matter ($PM_{2.5}$)	(1) Excess deaths from short- and long-term exposures; (2) excess seasonal declines in pulmonary function, especially in children; (3) asthma exacerbation and possibly induction; (4) adverse birth outcomes, including low birth weight; (5) increased infant mortality; (6) increased respiratory symptoms in children, such as cough and bronchitis; and (7) increased hospitalization for both cardiovascular and respiratory disease, including asthma.

Source: United States Environmental Protection Agency 2021

California Low-Emission Vehicle Program

CARB first adopted Low-Emission Vehicle (LEV) program standards in 1990. These first LEV standards ran from 1994 through 2003. LEV II regulations, running from 2004 through 2010, represent continuing progress in emission reductions. As the State's passenger vehicle fleet continues to grow and more sport utility vehicles and pickup trucks are used as passenger cars rather than work vehicles, the more stringent LEV II standards were adopted to provide reductions necessary for California to meet federally mandated clean air goals outlined in the 1994 SIP. In 2012, CARB adopted the LEV III amendments to California's LEV regulations. These amendments, also known as the Advanced Clean Car Program, include more stringent emission standards for model years 2017 through 2025 for both criteria pollutants and greenhouse gas (GHG) emissions for new passenger vehicles.

California On-Road Heavy-Duty Vehicle Program

CARB has adopted standards for emissions from various types of new on-road heavy-duty vehicles. Section 1956.8, Title 13, California Code of Regulations contains California's emission standards for on-road heavy-duty engines and vehicles, and test procedures. CARB has also adopted programs to reduce emissions from in-use heavy-duty vehicles including the Heavy-Duty Diesel Vehicle Idling Reduction Program, the Heavy-Duty Diesel In-Use Compliance Program, the Public Bus Fleet Rule and Engine Standards, and the School Bus Program and others.

Verified Diesel Emission Control Strategies

USEPA and CARB tiered off-road emission standards only apply to new engines and off-road equipment can last several years. CARB has developed Verified Diesel Emission Control Strategies (VDECS), which are devices, systems, or strategies used to achieve the highest level of pollution control from existing off-road vehicles, to help reduce emissions from existing engines. VDECS are designed primarily for the reduction of diesel PM emissions and have been verified by CARB. There are three levels of VDECS, the most effective of which is the Level 3 VDECS. Tier 4 engines are not required to install VDECS because they already meet the emissions standards for lower tiered equipment with installed controls.

California Diesel Risk Reduction Plan

CARB Diesel Risk Reduction Plan has led to the adoption of new state regulatory standards for all new on-road, off-road, and stationary diesel-fueled engines and vehicles to reduce DPM emissions by about 90 percent overall from year 2000 levels. The projected emission benefits associated with the full implementation of this plan, including federal measures, are reductions in DPM emissions and associated cancer risks of 75 percent by 2010, and 85 percent by 2020.

Tanner Air Toxics Act and Air Toxics Hot Spots Information and Assessment Act

Toxic Air Contaminants (TACs) in California are primarily regulated through the Tanner Air Toxics Act (AB 1807) and the Air Toxics Hot Spots Information and Assessment Act of 1987 (AB 2588), also known as the Hot Spots Act. To date, CARB has identified more than 21 TACs and has adopted the USEPA list of Hazardous Air Pollutants (HAPs) as TACs.

Air Quality Management

Because the SFBAAB currently exceeds the federal ozone and $PM_{2.5}$ standards and the state ozone, PM_{10}, and $PM_{2.5}$ standards, BAAQMD is required to implement strategies to reduce pollutant levels to achieve attainment of the NAAQS and CAAQS. BAAQMD adopted the 2017 Clean Air Plan (2017 Plan) as an update to the 2010 Clean Air Plan. The 2017 Plan provides a regional strategy to protect public health and the climate. Consistent with the greenhouse gas (GHG) reduction targets adopted by the state, the 2017 Plan lays the groundwork for a long-term effort to reduce Bay Area GHG emissions to 40 percent below 1990 levels by 2030 and 80 percent below 1990 levels by 2050. To fulfill state ozone planning requirements, the 2017 control strategy includes all feasible measures to reduce emissions of ozone precursors (ROG and NO_X) and reduce transport of ozone and its precursors to neighboring air basins. In addition, the 2017 Plan builds upon and enhances BAAQMD's efforts to reduce emissions of fine particulate matter and toxic air contaminants (TAC) (BAAQMD 2017).

Sensitive receptors are facilities or land uses that include members of the population who are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses. According to BAAQMD, sensitive receptors are defined as facilities or land uses that include members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses. Examples include schools, hospitals and residential areas (BAAQMD 2017). The nearest sensitive receivers are residences approximately 500 feet southwest and 1,000 feet east of the project site.

City of San Leandro General Plan

The current City of San Leandro General Plan contains objectives and policies that minimize air pollutant emissions and reduce population exposed to significant health risk. The following objectives and policies from the City's General Plan are relevant to air quality and apply to the project:

Policy EH-3.3: **Land Use Compatibility.** Discourage new uses with potential adverse air quality impacts, including the mission of toxic air contaminants and fine particulates, near residential neighborhoods, schools, hospitals, nursing homes, and other locations where public health could potentially be affected.

Policy EH-3.4: **Design, Construction, and Operation.** Require new development to be designed and constructed in a way that reduces the potential for future air quality problems, such as odors and the emission of any and all air pollutants. This should be done by:

a) Requiring construction and grading practices that minimize airborne dust and particulate matter;

b) Ensuring that best available control technology is used for operations that could generate air pollutants;

c) Encouraging energy conservation and low-polluting energy sources;

d) Promoting landscaping and tree planting to absorb carbon monoxide and other pollutants;

e) Implementing the complementary strategies to reduce greenhouse gases identified in the Climate Action Plan.

Policy EH-5.4: **Separation from Sensitive Uses.** Provide adequate and safe separation between areas where hazardous materials are present and sensitive uses such as schools, residences, and public facilities. Zoning and other development regulations should include performance standards to avoid safety hazards and achieve compatibility between uses.

Policy LU-10.2: **Off-Site Impacts.** Consider the setting and context of each site when evaluating proposals for development in industrial areas. The potential for impacts on adjacent uses, including the potential for land use conflicts and increased parking demand and truck traffic, should be a key consideration.

Significance Thresholds

The BAAQMD has adopted guidelines for quantifying and determining the significance of air quality emissions in its *California Environmental Quality Act Air Quality Guidelines* (BAAQMD 2022). BAAQMD recommends that lead agencies determine appropriate air quality emissions thresholds of significance based on substantial evidence in the record. BAAQMD's significance thresholds in the updated 2022 *CEQA Air Quality Guidelines* for project operations within the SFBAAB are the most appropriate thresholds for use in determining air quality impacts of the project. BAAQMD developed screening criteria to provide lead agencies and project applicants with a conservative indication of whether a project could result in potentially significant air quality impacts.

Table 7 presents the significance thresholds for construction and operational-related criteria air pollutant and precursor emissions used for the purposes of this analysis. These represent the levels at which a project's individual emissions of criteria air pollutants or precursors would result in a cumulatively considerable contribution to the SFBAAB existing air quality conditions. For the purposes of this analysis, the project would result in a significant impact if construction or operational emissions would exceed any of the thresholds shown in Table 7.

Table 7 Criteria Air Pollutant Significance Thresholds

	Construction Thresholds	Operational Thresholds	
Pollutant	Average Daily Emissions (lbs/day)	Average Daily Emissions (lbs/day)	Maximum Annual Emissions (tons/year)
ROG	54	54	10
NO_X	54	54	10
PM_{10}	82 (exhaust)	82	15
$PM_{2.5}$	54 (exhaust)	54	10
Fugitive Dust	Construction Dust Ordinance or other Best Management Practices	Not Applicable	

OG = reactive organic gases, NO_X = nitrogen oxides, PM_{10} = particulate matter 10 microns in diameter or less, $PM_{2.5}$ = particulate matter 2.5 microns in diameter or less; lbs/day = pounds per day, BAAQMD = Bay Area Air Quality Management District

Source: BAAQMD 2022

BAAQMD maintains rules and regulations to regulate sources of air pollution. Applicable rules and regulations are listed below. Additionally, BAAQMD does not have quantitative thresholds for fugitive dust emissions during construction. Instead, BAAQMD recommends Best Management Practices (BMPs) be implemented to reduce fugitive dust emissions, which are also listed below.

BAAQMD Rules and Regulations

REGULATION 2, RULE 1 (PERMITS–GENERAL REQUIREMENTS)

The BAAQMD regulates new sources of air pollution and the modification and operation of existing sources through the issuances of authorities to construct and permits to operate. Regulation 2, Rule 1 provides an orderly procedure which the project would be required to comply with to receive authorities to construct or permits to operate from the BAAQMD, for new sources of air pollutants, as applicable.

REGULATION 2, RULE 5 (NEW SOURCE REVIEW PERMITTING)

The BAAQMD regulates backup emergency generators, fire pumps, and other sources of TACs through its New Source Review (Regulation 2, Rule 5) permitting process. Although emergency generators are intended to be used only during periods of power outages, monthly testing of each generator is required. BAAQMD limits testing to no more than 50 hours per year. Each emergency generator installed is assumed to meet a minimum of Tier 2 emission standards (before control measures). As part of the permitting process, the BAAQMD limits the excess cancer risk from any facility to no more than 10 per 1-million-population for any permits that are applied for within a 2-year period, and would require any source that would result in an excess cancer risk greater than 1 per 1 million to install Best Available Control Technology for Toxics.

REGULATION 6, RULE 1 (PARTICULATE MATTER–GENERAL REQUIREMENTS)

The BAAQMD regulates PM emissions through Regulation 6 by means of establishing limitations on emission rates, emissions concentrations, and emission visibility and opacity. Regulation 6, Rule 1 provides existing standards for PM emissions that could result during project construction or operation that the project would be required to comply with, as applicable, such as the prohibition of emissions from any source for a period or aggregate periods of more than 3 minutes in any hour which are equal to or greater than 20 percent opacity.

REGULATION 6, RULE 6, (PARTICULATE MATTER–PROHIBITION OF TRACKOUT)

One rule by which the BAAQMD regulates PM includes Regulation 6, Rule 6, which prohibits PM trackout during project construction and operation. Regulation 6, Rule 6 requires the prevention or timely cleanup of trackout of solid materials onto paved public roads outside the boundaries of large bulk material sites, large construction sites, and large disturbed surface sides such as landfills.

REGULATION 8, RULE 3 (ARCHITECTURAL COATINGS)

This rule governs the manufacture, distribution, and sale of architectural coatings and limits the reactive organic gases content in paints and paint solvents. Although this rule does not directly apply to the project, it does dictate the ROG content of paint available for use during the construction.

BAAQMD Best Management Practices for Construction-Related Fugitive Dust Emissions

The applicant shall require all construction contractors to implement the basic construction mitigation measures recommended by BAAQMD to reduce fugitive dust emissions. Emission reduction measures will include, at a minimum, the following measures:

1. All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day.
2. All haul trucks transporting soil, sand, or other loose material off-site shall be covered.
3. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
4. All vehicle speeds on unpaved roads shall be limited to 15 mph.
5. All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.
6. All excavation, grading, and/or demolition activities shall be suspended when average wind speeds exceed 20 mph.
7. All trucks and equipment, including their tires, shall be washed off prior to leaving the site.
8. Unpaved roads providing access to sites located 100 feet or further from a paved road shall be treated with a 6- to 12-inch compacted layer of wood chips, mulch, or gravel.
9. Publicly visible signs shall be posted with the telephone number and name of the person to contact at the lead agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. The Air District's General Air Pollution Complaints number shall also be visible to ensure compliance with applicable regulations.

In the absence of a qualified Community Risk Reduction Plan,[2] BAAQMD has established the following *Thresholds of Significance* for local community risks and hazards associated with TACs and $PM_{2.5}$ for assessing individual source impacts at a local level. Impacts would be significant if:

- The project would result in an increased cancer risk of > 10 in one million
- The project would result in an increased non-cancer (i.e., Chronic or Acute) risk of > 1.0 Hazard Index
- The project would result in an ambient $PM_{2.5}$ concentration increase of > 0.3 $\mu g/m^3$ annual average

A project would be considered to have a cumulatively considerable impact if the aggregate total of current and proposed TAC sources within a 1,000 feet radius of the project fence-line in addition to the project would exceed the *Cumulative Thresholds of Significance*. Impacts would be significant if:

- The project would result in an increased cancer risk of > 100 in one million
- The project would result in an increased non-cancer (i.e., Chronic or Acute) risk of > 10 Hazard Index
- The project would result in an ambient $PM_{2.5}$ concentration increase of > 0.8 $\mu g/m^3$ annual average

Excess cancer risks are defined as those occurring in excess of or above and beyond those risks that would normally be associated with a location or activity if toxic pollutants were not present. Non-

[2] The goal of a Community Risk Reduction Plan is to bring TAC and $PM_{2.5}$ concentrations for the entire community covered by the Plan down to acceptable levels as identified by the local jurisdiction and approved by the Air District. This approach provides local agencies a proactive alternative to addressing communities with high levels of risk on a project-by-project approach. The Air District has developed detailed guidelines for preparing Community Risk Reduction Plans which can be found on the Air District web site at: https://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/draft_community_risk_reduction_plan_guidelines_may_2010.pdf

carcinogenic health effects are expressed as a hazard index, which is the ratio of expected exposure levels to an acceptable reference exposure level.

BAAQMD defines sensitive receptors as facilities or land uses that include members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and those with pre-existing health problems. These facilities include schools, parks, daycare centers and pre-schools, medical care facilities, and residential communities (BAAQMD 2022).

BAAQMD establishes operational screening criteria for criteria air pollutants and precursors. If a project meets the screening criteria outlined in Section 4.1.2 and Table 4-1 of the BAAQMD CEQA Guidelines (BAAQMD 2022), the project would not result in the generation of operational-related criteria air pollutants and/or precursors that exceed the emissions thresholds shown in Table 7 above. Although the proposed project would not exceed the size screening level of 452,000 square feet for warehouse projects, the project would include operation of a backup generator, which would be subject to BAAQMD rules and regulations. Therefore, an air quality analysis and quantification of operational project-generated air pollutants is required.

Methodology

The project's construction and operational emissions were estimated using the California Emissions Estimator Model (CalEEMod), version 2022.1.1.19. CalEEMod uses project-specific information including the project's land uses, square footage for different uses (e.g., office building, parking lot, and landscaped area), and location, to model a project's construction and operational emissions. Calculations are included at the end of Appendix B.

Construction emissions modeled include emissions generated by construction equipment used on site and emissions generated by vehicle trips associated with construction, such as workers and vendor trips. Project construction was analyzed based on the applicant-provided information regarding the construction schedule and types of construction equipment used. Standardized assumptions were used where project-specific information was unknown. This analysis also includes all applicable regulatory standards the project would be required to comply with. In particular, the project would comply with the 2022 Building Energy Efficiency Standards (Energy Code), CalGreen, the City of San Leandro's General Plan, and BAAQMD's rules and regulations. Specifically, the project would be required to comply with BAAQMD Regulation 8, Rule 3, which limits the quantity of volatile organic compounds in architectural coatings.

Operational emissions modeled include mobile source emissions (i.e., passenger vehicle and truck emissions), and area source emissions. Mobile source emissions are generated by vehicle trips to and from the project site. The project's trip generation rates are provided in the transportation analysis (Appendix C) prepared by Kittelson and Associates. The project trip generation rates were based on the Institute of Transportation Engineers (ITE), *Trip Generation Manual, 10th Edition*. CalEEMod default fleet mixes were adjusted to reflect light-duty and heavy-duty truck activity at the proposed warehouse, and the model considers emissions from idling in addition to vehicle travel. Area source emissions are generated by landscape maintenance equipment, consumer products and architectural coatings. There would be no air quality emissions associated with energy sources since the project would not utilize natural gas.

Emissions that could result in health risks associated with toxic air contaminants were analyzed using the Hotspots Analysis and Reporting Program (HARP2) program. HARP2was used to calculate cancer risk during project construction and assumed a receptor type of an individual resident over two years of construction.

Impact Analysis

a. Would the project conflict with or obstruct implementation of the applicable air quality plan?

The California Clean Air Act requires that air districts create a Clean Air Plan that describes how the jurisdiction will meet air quality standards. The most recently adopted applicable air quality plan is BAAQMD's 2017 Plan. As described in the *Air Quality Management* Section, the 2017 Plan updates the most recent Bay Area ozone plan, the 2010 Clean Air Plan. Pursuant to air quality planning requirements, the 2017 control strategy includes all feasible measures to reduce emissions of ozone precursors – ROG and NO_x – and reduce transport of ozone and its precursors to neighboring air basins. The 2017 Plan builds upon and enhances BAAQMD's efforts to reduce emissions of fine particulate matter and TACs. The 2017 Plan does not include control measures that apply directly to individual development projects. Instead, the control strategy includes control measures related to stationary sources, transportation, energy, buildings, agriculture, natural and working lands, waste management, water, and super GHG-pollutants. The 2017 Plan focuses on two goals:

- Protect air quality and health at the regional and local scale by attaining all national and state air quality standards and eliminating disparities among Bay Area communities in cancer health risk from TACs
- Protect the climate by reducing Bay Area GHG emissions to 40 percent below 1990 levels by 2030, and 80 percent below 1990 levels by 2050

Under BAAQMD's methodology, a determination of consistency with the 2017 Plan should demonstrate that a project:

- Supports the primary goals of the air quality plan
- Includes applicable control measures from the air quality plan
- Does not disrupt or hinder implementation of any air quality plan control measures

A project that would not support the 2017 Plan's goals would not be considered consistent with the 2017 Plan. On an individual project basis, consistency with BAAQMD quantitative thresholds is interpreted as demonstrating support for the clean air plan's goals.

The project would include applicable control measures from the 2017 Plan. Applicable control measures such as green building construction, waste diversion, and water conservation would indicate support for the clean air plan goals on an individual project basis. The proposed project would include construction of seven electric vehicle charging stations. Additionally, the project would utilize energy efficient LED lighting and controls that would exceed the requirements of Title 24 of the California Energy Commission's Building Energy Efficiency Standards, as well as City energy efficiency requirements. Plumbing fixtures used for the proposed project would be high-efficiency fixtures, which would minimize the potential inefficient or wasteful consumption of energy related to water and wastewater. The project would not use natural gas in accordance with City of San Leandro reach codes effective as of January 2023. As shown in the response to criteria b and c (see below), the proposed project would not result in exceedances of BAAQMD 2017 thresholds for criteria air pollutants and thus, would not disrupt or hinder implementation of 2017 Plan control measures. Therefore, the proposed project would be consistent with the criteria of the 2017 Clean Air Plan. Impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

b. Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

The SFBAAB is designated as a nonattainment area for the NAAQS for ozone and PM 2.5, and the CAAQS of ozone, PM_{10} and $PM_{2.5}$. The following subsections discuss emissions associated with construction and operation of the proposed project.

Construction Emissions

Project construction would generate temporary air pollutant emissions associated with fugitive dust (PM_{10} and $PM_{2.5}$) and exhaust emissions from heavy construction equipment and construction vehicles in addition to ROG emissions that would be released during the drying phase of architectural coating. Table 8 summarizes the estimated maximum daily emissions of pollutants during project construction.

Table 8 Estimated Daily Construction Emissions

	Estimated Maximum Daily Emissions (lbs/day)			
Construction Activity	**ROG**	**NO_X**	**Exhaust PM_{10}**	**Exhaust $PM_{2.5}$**
2024	0.28	3.02	0.03	0.03
2025	0.15	0.92	<0.01	<0.01
BAAQMD Thresholds	**54**	**54**	**82**	**54**
Threshold Exceeded?	No	No	No	No

ROG = reactive organic gases, NO_X = nitrogen oxides, PM_{10} = particulate matter 10 microns in diameter or less, $PM_{2.5}$ = particulate matter 2.5 microns in diameter or less; lbs/day = pounds per day, BAAQMD = Bay Area Air Quality Management District

Notes: All emissions modeling was completed using CalEEMod in accordance with applicant-provided information and data. Emissions presented are the highest of the winter and summer modeled emissions.

See the end of Appendix B for updated model output results.

As shown in Table 8, construction-related emissions would not exceed BAAQMD thresholds. Therefore, project construction would not result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard. Impacts would be less than significant.

Fugitive Dust

Site preparation and grading may cause wind-blown dust that could contribute particulate matter into the local atmosphere. BAAQMD does not have quantitative thresholds for fugitive dust emissions during construction. Instead, BAAQMD recommends Best Management Practices (BMPs) be implemented to reduce fugitive dust emissions. The project would include implementation of Mitigation Measure AQ-1, BAAQMD Basic Construction Mitigation Measures. The BAAQMD CEQA Air Quality Guidelines consider construction criteria air pollutant emissions impacts that are below BAAQMD thresholds to be less than significant with the incorporation of BAAQMD BMPs. Impacts would be less than significant with implementation of Mitigation Measure AQ-1.

Operational Emissions

Operation of the project would generate criteria air pollutant emissions associated with area sources (e.g., architectural coatings, consumer products, and landscaping equipment), energy sources (i.e., nonrenewable energy sources) and mobile sources (i.e., vehicle trips and truck trips to

and from the project site). Table 9 summarizes the project's maximum annual operational emissions by emission source and maximum daily operational emissions.

Table 9 Estimated Operational Emissions

	Emissions			
Emissions Source	**ROG**	**NO_x**	**PM_{10}**	**$PM_{2.5}$**
Annual Emissions (tons/year)				
Area	0.27	<0.01	<0.01	<0.01
Energy	<0.01	0.02	<0.01	<0.01
Mobile	<0.01	<0.01	<0.01	<0.01
Total Emissions	**0.27**	**0.02**	**<0.01**	**<0.01**
Significance Threshold	**10**	**10**	**15**	**10**
Threshold Exceeded?	**No**	**No**	**No**	**No**
Daily Emissions (pounds/day)				
Average Daily Emissions	1.49	0.13	0.02	0.01
Significance Threshold (pounds/day)	**54**	**54**	**82**	**54**
Threshold Exceeded?	**No**	**No**	**No**	**No**

ROG = reactive organic gases, NO_X = nitrogen oxides, PM_{10} = particulate matter 10 microns in diameter or less, $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; lbs/day = pounds per day, BAAQMD = Bay Area Air Quality Management District

Note: The updated emissions modeling was completed using CalEEMod in accordance with applicant-provided information and data. Some numbers may not add up due to rounding. Emissions presented are the highest of the winter and summer modeled emissions. See the end of Appendix B for updated model output results.

As shown in Table 9, operational emissions would not exceed BAAQMD regional thresholds for criteria pollutants. Therefore, project operation would not result in a cumulatively considerable net increase of a criteria pollutant for which the project region is in non-attainment, and impacts would be less than significant.

Mitigation Measure

AQ-1 BAAQMD Best Management Practices for Construction-Related Fugitive Dust Emissions

The project applicant shall require all construction contractors to implement the basic construction mitigation measures recommended by BAAQMD to reduce fugitive dust emissions. Emission reduction measures will include, at a minimum, the following measures:

1. All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day.
2. All haul trucks transporting soil, sand, or other loose material off-site shall be covered.
3. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
4. All vehicle speeds on unpaved roads shall be limited to 15 mph.
5. All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.

6. All excavation, grading, and/or demolition activities shall be suspended when average wind speeds exceed 20 mph.
7. All trucks and equipment, including their tires, shall be washed off prior to leaving the site.
8. Unpaved roads providing access to sites located 100 feet or further from a paved road shall be treated with a 6- to 12-inch compacted layer of wood chips, mulch, or gravel.
9. Publicly visible signs shall be posted with the telephone number and name of the person to contact at the lead agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. The Air District's General Air Pollution Complaints number shall also be visible to ensure compliance with applicable regulations.

LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED

c. Would the project expose sensitive receptors to substantial pollutant concentrations?

Certain population groups, such as children, the elderly, and people with health problems, are particularly sensitive to air pollution. Therefore, the majority of sensitive receptor locations are schools, hospitals, and residences. Sensitive receptors in the project vicinity include single- and multi-family residences located 500 feet south of the project site.

The following four criteria based on BAAQMD health risk and hazard significance thresholds were applied to determine if the proposed project would significantly impact the exposure of sensitive receptors to project emissions (Appendix B). The project would have a significant impact if:

- Construction of the project would generate toxic air contaminants (TACs) that exceed health risk significance thresholds;
- The cumulative health impact would exceed cumulative health risk significance thresholds;
- Operation of the project would result in an exceedance of the health risk significance thresholds;
- A carbon monoxide (CO) hotspot assessment demonstrates that the project would result in a CO hotspot which would exceed ambient air quality standards.

These criteria are discussed in the following subsections.

Project Construction TACs

FirstCarbon Solutions conducted an assessment of potential health impacts to surrounding sensitive receptors resulting from construction TAC emissions, using the methodology described under *Methodology* in this section. The detailed assessment is provided in Appendix B.

Diesel particulate matter (DPM) has been identified by CARB as a carcinogenic substance. Major sources of DPM include off-road construction equipment and heavy-duty trucks used for construction. For the purposes of this analysis, DPM is represented as exhaust emissions of $PM_{2.5.}$ Generation of DPM from construction projects typically occurs in a single area for a short period.

BAAQMD developed a set of guidelines and thresholds for estimating health risks resulting from exposure to TACs at the Maximally Impacted Receptor (MIR). For the proposed project, the MIR includes single family residences located approximately 500 feet southwest of the project site on Monogram Street. Table 10 below summarizes $PM_{2.5}$ exhaust emissions generated during project construction.

Table 10 Estimated Cancer Risks and Chronic Non-Cancer Hazards

	Cancer Risk (risk per million)	Chronic Non-Cancer Hazard Index[1]	TAC Concentration (micrograms per cubic meter)
Residential MIR	7.29	<0.01	0.02
Significance Threshold	**10**	**1**	**0.3**
Threshold Exceeded?	**No**	**No**	**No**

MIR = Maximally Impacted Receptor

TAC = toxic air contaminants

[1] Chronic non-cancer hazard index was estimated by dividing the annual DPM concentration (as PM2.5 exhaust) by the DPM reference exposure level of 5 micrograms per cubic meter

Threshold source: BAAQMD 2022. See Appendix B for the cancer health risk model output results. This assessment uses outputs from the CalEEMod modeling conducted using a previous model version, which estimated greater construction emissions than the updated CalEEMod outputs attached to the end of Appendix B. Therefore, this cancer risk assessment is more conservative in that is utilizes greater estimated emissions.

As shown above, the proposed project's construction emissions would not exceed applicable BAAQMD significance thresholds. Project construction would not result in significant health impacts to nearby sensitive receptors.

Cumulative Health Risk Assessment

FirstCarbon Solutions conducted a health risk assessment for potential cumulative impacts from TAC sources within 1,000 feet of a project, which was peer-reviewed by Rincon Consultants. The health risk assessment incorporated BAAQMD pre-calculated air pollutant concentrations and associated traffic volumes for analyzing health risks associated with local roadways; BAAQMD pre-estimated cancer risks and $PM_{2.5}$ concentration increases associated with nearby highways (I-880 and SR 185); emissions from permitted stationary sources; and $PM_{2.5}$ concentrations associated with railroad operations at the western boundary of the project. The results of the construction cumulative health risk assessments are shown in Table 11.

Table 11 Summary of Cumulative Health Impacts at MIR during Construction

Emissions Source		Distance from MIR (feet)	Cancer Risk (per million)	Chronic Non-Cancer Hazard Index	TAC Concentration (micrograms per cubic meter)
Proposed Project					
Project construction	Diesel construction equipment	500	7.29	<0.01	0.02
Roadways					
Existing Local Roadway Network		–	15.3	ND	0.04
Freeways					
Existing Freeways		>1,000	20.32	ND	0.33
Stationary Sources					
The Garage Body Shop (ID 11632)	ND	740	ND	ND	ND
Rodgers Trucking (ID 111710)	Gas Dispensing Facility	570	<0.01	0	0
City of San Leandro (ID 106590)	Gas Dispensing Facility	140	0.59	0	0
Rail					
Existing Rail Line		10	12.28	ND	0.02
Cumulative Health Risks					
Cumulative Maximum with project DPM Emissions			**42.01**	**<0.01**	**0.41**
Significance Threshold			**100**	**10**	**0.8**
Threshold Exceeded?			**No**	**No**	**No**

DPM= diesel particulate matter

MIR = Maximally Impacted Receptor

ND = no data

Source: updated emissions modeling is included at the end of Appendix B

As shown above, the cumulative impacts from project construction and existing sources of TACs would be less than BAAQMD cumulative thresholds of significance. Therefore, the proposed project would not be cumulatively considerable or result in a significant health risk impact.

Operational Toxic Air Pollutants

The proposed project would include operation of a warehouse, which would not include land uses that could result in substantial on-site TAC sources during operation such as metal smelting or refining operations. The proposed project would not include use of stationary source equipment (e.g., back-up generators, fire pumps), and any stationary source equipment which would be greater than 50 horsepower that would require permitting through the BAAQMD to be installed and operated. Compliance with mandatory permitting requirements would ensure that permitted source would not have a significant impact related to health risk impacts.

The proposed project would result in approximately 123 daily truck trips (Appendix C), which was incorporated into operational air quality modeling. As described under threshold (b), operational emissions would not exceed applicable thresholds; therefore, vehicle activities associated with project operation are not anticipated to result in a substantial source of TACs.

CO Hotspots

CO emissions from traffic generated by the proposed project are a concern at the local level because congested intersections can result in high, localized concentrations of CO referred to as CO hotspots. BAAQMD recommends comparing a project's attributes with the following screening criteria as a first step to evaluating whether the project would result in the generation of CO concentrations that would substantially contribute to an exceedance of the *Thresholds of Significance*. The project would result in a less than significant impact to localized CO concentrations if:

1. The project is consistent with an applicable congestion management program established by the county congestion management agency for designated roads or highways, the regional transportation plan, and local congestion management agency plans;
2. The project would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour; or
3. Project-generated traffic would not increase traffic volumes at affected intersections to more than 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited (e.g., tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway).

Based on the Traffic Impact Analysis prepared for the proposed project (Appendix C), the intersection with the most vehicles per hour in the vicinity of the project site would be the Washington Avenue and Halcyon Drive intersection during the PM peak hour. Under the Cumulative Plus Project conditions analyzed in the Traffic Impact Analysis, this intersection would experience 5,017 vehicles per hour. The proposed project would generate an estimated 40 total PM peak-hour trips. Therefore, the proposed project would not cause a nearby roadway segment or intersection to exceed 44,000 vehicles per hour. Localized CO emissions would not be significant.

Overall, the proposed project would not expose sensitive receptors to substantial pollutant concentrations and impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

d. Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

During construction activities, heavy equipment and vehicles would emit odors associated with vehicle and engine exhaust and during idling. However, these odors would be intermittent and temporary and would cease upon completion of construction activities, and odors would disperse with distance. Overall, project construction would not generate other emissions, such as those leading to odors, affecting a substantial number of people. Construction-related impacts would be less than significant.

Table 5-4 in the BAAQMD 2022 *CEQA Air Quality Guidelines* provides screening distances for land uses that have the potential to generate substantial odor complaints. The uses in the table include wastewater treatment plants, landfills or transfer stations, refineries, composting facilities, confined animal facilities, food processing facility, smelting plants, and chemical manufacturing facilities (BAAQMD 2022). Warehouse buildings are not included in this list, and operation of the project would not generate other emissions, such as those leading to odors, which would affect a substantial number of people. Furthermore, truck idling at the proposed warehouse would be limited to 5 minutes at any location as required by CARB's Commercial Vehicle Idling Airborne Toxics

Control Measure (CARB 2005), which would minimize generation of odors from trucks at the project site. No operational impacts would occur.

LESS-THAN-SIGNIFICANT IMPACT

This page intentionally left blank.

4 Biological Resources

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	□	■	□	□
b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	□	■	□	□
c. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	□	□	□	■
d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	□	■	□	□
e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	□	□	■	□
f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	□	□	□	■

The analysis in this section is based in part upon a biological resource analysis prepared by FirstCarbon Solutions in April 2022 (Appendix D) and an arborist report prepared by HortScience and Bartlett Consulting in February 2022 (Appendix A). Both of these reports were peer reviewed by Rincon Consultants in October 2022, and a revised biological resources analysis was prepared by FirstCarbon Solutions in April 2023. The revised biological resources analysis and peer review memorandum are included in Appendix D, and the arborist report and peer review memorandum are included in Appendix A.

Setting

The project site is currently vacant but has been previously developed. The site contains ruderal vegetation and 23 trees. The site is in an urbanized area, surrounded by paved parking lots, commercial and industrial buildings, and landscaped areas and trees. The site is approximately 2.5 miles east of the San Francisco Bay, 2.2 miles northwest of San Lorenzo Creek, and 1.5 miles south of San Leandro Creek. The site is relatively flat with an elevation of approximately 40 feet.

Regulatory Setting

Federal and State

Regulatory authority over biological resources is shared by federal, state, and local agencies under a variety of laws, ordinances, regulations, and statutes. Primary authority for biological resources lies with the land use control and planning authority of local jurisdictions (in this instance, the City of San Leandro).

The California Department of Fish and Wildlife (CDFW) is a trustee agency for biological resources throughout the state under CEQA and has direct jurisdiction under the California Fish and Game Code (CFGC). Under the California Endangered Species Act and the federal Endangered Species Act, the CDFW and the U.S. Fish and Wildlife Service (USFWS), respectively, have direct regulatory authority over species formally listed as threatened or endangered (and listed as rare for CDFW). Native and/or migratory bird species are protected under the CFGC Sections 3503, 3503.5, and 3511.

Statutes in the Clean Water Act (CWA), CFGC, and CCR protect wetlands and riparian habitat. The U.S. Army Corps of Engineers (USACE) has regulatory authority over wetlands and waters of the United States under Section 404 of the CWA. The State Water Resources Control Board (SWRCB) and the nine Regional Water Quality Control Boards (RWQCBs) ensure water quality protection in California pursuant to Section 401 of the CWA and Section 13263 of the Porter-Cologne Water Quality Control Act. The CDFW regulates waters of the State under the CFGC Section 1600 et seq.

Special-status species are those plants and animals: 1) listed, proposed for listing, or candidates for listing as Threatened or Endangered by the USFWS and the National Marine Fisheries Service (NMFS) under the federal Endangered Species Act; 2) listed or proposed for listing as Rare, Threatened, or Endangered by the CDFW under the California Endangered Species Act; 3) recognized as California Species of Special Concern by the CDFW; 4) afforded protection under CFGC; and 5) occurring on Lists 1 and 2 of the CDFW California Rare Plant Rank (CRPR) system.

Local

Chapter 5-2 of SLMC establishes tree preservation requirements that would apply to the project. Section 5-2-205 establishes all street trees within the city as property of the City, and Section 5-2-220 outlines requirements for street tree planting and replacement.

SAN LEANDRO MUNICIPAL CODE SECTION 5-2-220

(a) Upon approval of the Director, any person may undertake privately, or by agreement with a private nursery or tree service, the planting of a street tree provided that the location, species and manner of planting are acceptable to the Director.

(b) The Director shall prepare a list of those tree species which are acceptable for use as street trees. The Director shall also establish such criteria relating to the location and manner of planting such street trees as will protect public safety and public and private improvement.

(c) All new planting of street trees as replacements for street trees existing on the effective date of this Chapter shall conform to the species and planting criteria set forth in subsection (b) of this section.

(d) There may be imposed a condition of approval for all parcel and subdivision maps that the subdivider plant street trees at such locations and in such manner as may be determined by the Director.

Impact Analysis

a. *Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?*

b. *Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?*

d. *Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?*

As described in the *Setting* section above, the project site is in an urbanized area of San Leandro and has been previously developed with structures, surface parking lots, roadways, and limited perimeter landscaping, including trees (Appendix D). Vegetation observed on the project site included shortpod mustard (*Hirschfeldia incana*), ripgut brome (*Bromus diandrus*), fennel (*Foeniculum vulgare*), wild oat (*Avena fatua*), dandelion (*Taraxacum* sp.), bristly ox tongue (*Helminthotheca echioides*), burclover (*Medicago polymorpha*), cheeseweed (*Malva parviflora*), bamboo (subfamily Bambusoideae), stinkwort (*Dittrichia graveolens*), English ivy (*Helix hedera*), prickly lettuce (*Lactuca serriola*) (Appendix D). The project site contains multiple clusters of ornamental trees. Because of the small and disjunct canopy cover, landscaped or hardscaped understory, and the species composition, these clusters of trees do not meet the characteristics of a woodland (Appendix A).

The site does not contain riparian habitat and is not located within a known regional wildlife movement corridor or other sensitive biological area as indicated by the USFWS Critical Habitat

portal (USFWS 2022; Appendix D). Moreover, according to the San Leandro 2035 General Plan EIR, the project site does not contain habitat for species identified as a candidate, sensitive, or special-status species (City of San Leandro 2016b). Based on the developed nature of the area and surroundings and lack of native or riparian habitat located on or adjacent to the site, no federal-or state-listed endangered, threatened, rare, or otherwise sensitive flora or fauna are anticipated to be located within the project site.

Existing trees on and around the parcels within the area could contain bird nests and birds that are protected under the Migratory Bird Treaty Act (MBTA) (Appendix D). Protected birds include all common songbirds, waterfowl, shorebirds, hawks, owls, eagles, ravens, crows, native doves and pigeons, swifts, martins, swallows, and others, including their body parts (feathers, plumes, etc.), nests, and eggs. The trees located on-site and in the immediate vicinity could provide suitable habitat for migratory or resident nesting birds. No signs of bat roosts were observed during the field survey; however, trees on site and many small openings in the existing structures on-site could provide roosting habitat for bats (Appendix D). The proposed project would involve removal of 10 existing trees on the project site. In addition, construction activity associated with the project may affect protected nesting birds or bats in existing trees. Therefore, mitigation measures BIO-1 and BIO-2 are required to reduce potentially significant impacts to a less-than-significant level.

Mitigation Measure

BIO-1 Nesting Bird Avoidance and Minimization Measures

The following avoidance and minimization measures shall be implemented during project construction activities:

- Initial site disturbance should occur outside the general avian nesting season (February 1 through September 15), if feasible.
- If initial site disturbance occurs in a work area within the general avian nesting season indicated above, a qualified biologist shall conduct a pre-construction nesting bird survey no more than 14 days prior to initial disturbances in the work area. The survey shall include the entire area of disturbance area plus a 50-foot buffer (relevant to non-raptor species) and 300-foot buffer (relevant to raptors) around the site. If active nests are located, all construction work shall be conducted outside a buffer zone from the nest to be determined by the qualified biologist. The buffer should be a minimum of 50 feet for non-raptor bird species and at least 300 feet for raptor species. Larger buffers may be required and/or smaller buffers may be established depending upon the species, status of the nest, and construction activities occurring in the vicinity of the nest. The buffer area(s) shall be closed to all construction personnel and equipment until the adults and young are no longer reliant on the nest site. A qualified biologist shall confirm that breeding/nesting is completed and young have fledged the nest prior to removal of the buffer.
- If construction activities in a given work area cease for more than 14 days, additional surveys shall be conducted for the work area. If active nests are located, the aforementioned buffer zone measures shall be implemented.

BIO-2 Roosting Bats Avoidance and Minimization Measures

A qualified biologist shall survey trees, vegetation, and existing structures with features capable of supporting roosting bats (both maternity and wintering or hibernation roosts) prior to their removal or demolition. Vegetation and existing structures shall be surveyed for bat roosts or evidence of bat

roosting (e.g., guano, urine staining and scent, dead bats) no more than 14 days before the start of disturbance, including vegetation removal. If active roosts are discovered, a protection zone of no less than 50 feet around the active roost shall be established by the qualified biologist. Disturbance may occur within the once active roosting ceases, as determined by the qualified biologist.

Significance After Mitigation

Implementation of Mitigation Measure BIO-1 would reduce the potential for project construction activities to result in the loss of active bird nests through a pre-construction nesting bird survey and establishment of avoidance buffers around active nests, if present. Implementation of Mitigation Measure BIO-2 would reduce the potential for project construction activities to result in the loss of bat roosts through a pre-construction survey and establishment of avoidance buffers around active roosts, if present. Implementation of these measures would reduce project impacts to special-status plant and wildlife species to a less-than-significant level.

LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED

c. Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

The National Wetlands Inventory (NWI) was reviewed to determine if wetland and/or non-wetland waters had been previously documented and mapped on or in the vicinity of the project site (USFWS 2020). No such features occur on or adjacent to the project site. As described in *Setting,* the nearest creeks (San Leandro Creek and San Lorenzo Creek) are approximately 1.5 miles and 2.2 miles from the project site, respectively. Construction and operation of the proposed project would not involve or require the direct removal, filling, hydrological interruption, or other means to the bed, bank, channel, or adjacent upland area of any creek or wetland. No impact would occur.

NO IMPACT

e. Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

As described in the Project Description, construction activities associated with the proposed project would result in the removal of ten trees. As shown in the arborist report prepared for the project site, none of these trees are street trees and therefor are not subject to SLMC Chapter 5-2 (Appendix A). Further, the trees are not designated as historic resources and would not be subject to SLMC Chapter 4-26. Therefore, the project would not conflict with policies regarding tree preservation in SLMC. Impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

f. Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

The project site is not located in an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan (City of San Leandro 2016b). Therefore, the project would not conflict with such a plan and no impact would occur.

NO IMPACT

This page intentionally left blank.

5 Cultural Resources

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?	□	□	□	■
b. Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	□	■	□	□
c. Disturb any human remains, including those interred outside of dedicated cemeteries?	□	□	■	□

FirstCarbon Solutions prepared a Phase I Cultural Resources Assessment for the proposed project in July 2022, which was peer reviewed by Rincon Consultants in September 2022. A revised Phase I Cultural Resources Assessment was prepared in January 2023. The revised report and the peer review memorandum are included in Appendix CR.

This section provides an analysis of the project's impacts on cultural resources, including historical and archaeological resources, as well as human remains. CEQA requires a lead agency to determine whether a project may have a significant effect on historical resources (Public Resources Code [PRC], Section 21084.1). A historical resource is a resource listed in, or determined to be eligible for listing in, the California Register of Historical Resources (CRHR); a resource included in a local register of historical resources; or any object, building, structure, site, area, place, record, or manuscript a lead agency determines to be historically significant (CEQA Guidelines, Section 15064.5[a] [1-3]).

A resource is considered historically significant in the California Register of Historical Resources if it:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
2. Is associated with the lives of persons important in our past;
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
4. Has yielded, or may be likely to yield, information important in prehistory or history.

In addition, if it can be demonstrated that a project would cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that resources cannot be left undisturbed, mitigation measures are required (PRC, Section 21083.2[a], [b]).

PRC, Section 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information;
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type; or
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

Methodology

FirstCarbon Solutions conducted a records search at the Northwest Information Center (NWIC) at Sonoma State University on May 4, 2022, for the project site and 0.5 radius beyond the project boundaries. This records search included a search of the National Register of Historic Places (NRHP), the California Register of Historical Resources (CRHR) the California Historical Landmarks list, the California Points of Historical Interest list, and the California Built Environment Resource Directory for Alameda County.

FirstCarbon Solutions sent a Sacred Lands File (SLF) search request to the native American Heritage Commission (NAHC) on April 27, 2022. A response was received on May 29, 2022, indicating that the SLF search was negative. The NAHC included a list of the following tribes that may have knowledge of tribal cultural resources:

- Amah Mutsun Tribal Band of Mission San Juan Bautista
- Costanoan Rumsen Carmel Tribe
- Indian Canyon Mutsun Band of Costanoan
- Muwekma Ohlone Indian Tribe of the San Francisco Bay Area
- The Ohlone Indian Tribe
- Wuksache Indian Tribe/Eshom Valley Band
- The Confederated Villages of Lisjan Nation
- North Valley Yokuts Tribe

The City of San Leandro sent tribal consultation request letters to all provided tribal contacts on June 7, 2022. One response was received from the Confederated Villages of Lisjan Nation, which stated the tribe had no further information or comments regarding the proposed project. No other tribal consultation responses were received.

On May 13, 2022, FirstCarbon Solutions archaeologists surveyed the project site to identify unrecorded cultural resources within the project site. The archaeologists surveyed the site in transects spaced at 15-meter intervals when possible. Existing structures within the project site were also evaluated for eligibility for the NRHP and CRHR.

Impact Analysis

a. Would the project cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?

FirstCarbon Solutions completed a review of historical topographic maps and aerial imagery to ascertain the development history of the project site. Historical topographic maps from 1946 to 2018 indicate that the garage and vehicle repair facility that previously occupied the site was built between 1968 and 1980, and that residences located at 14123, 14173, and 14193 Washington Avenue were constructed after 1980 (Appendix E).

The six structures within the project site appeared to be over 45 years in age and had not been previously evaluated for their historical significance. These structures included the garage and vehicle repair facility buildings and single-family residences. However, these structures were destroyed by structural fires. Accordingly, the properties are not eligible for inclusion in the CRHR or NRHP as they are no longer able to convey historical integrity. No additional prehistoric or historic resources were found within the project site (Appendix CR). Therefore, no built environment resources are present that may be impacted by the project. There would be no impact to built environment resources on the project site.

NO IMPACT

b. Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

The NWIC records search identified 14 cultural resources studies conducted within a 0.5-mile radius of the project site, none of which evaluated portions of the project site. The NWIC search identified one previously recorded cultural resource within a 0.5-mile radius of the project site, which did not occur within the project site (Appendix E).

The project site has been disturbed by development and demolition since approximately 1968. Additionally, substantial development surrounds the project site in all directions. The pedestrian survey conducted in May 2022 found evidence of previous disturbance and development, including subsurface sewer and water utility access points. No prehistoric or historic-period archaeological or built environment resources were identified during the efforts; therefore, it was concluded that no resources would be affected by the project (Appendix E).

As the SLF search was returned with negative results, and no prehistoric resources were identified within the project site, the project site is considered to have low archaeological sensitivity. However, it is always possible that unanticipated archaeological deposits and/or human remains could be encountered and damaged during ground-disturbing activities, especially if those activities would occur in less-disturbed areas. Implementation of Mitigation Measure CR-1 would be required.

Mitigation Measures

CR-1 Unanticipated Discovery of Cultural Resources

In the event that archaeological resources are unexpectedly encountered during ground-disturbing activities, work within 50 feet of the find shall halt and an archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for archaeology (National Park Service 1983) shall be contacted immediately to evaluate the find. If the resource is determined by the qualified archaeologist to be prehistoric, then a Native American representative shall also be contacted to

participate in the evaluation of the resource. If the qualified archaeologist and/or Native American representative determines it to be appropriate, archaeological testing for CRHR eligibility shall be completed. If the resource proves to be eligible for the CRHR and impacts to the resource cannot be avoided via project redesign, a qualified archaeologist shall prepare a data recovery plan tailored to the physical nature and characteristics of the resource, per the requirements of CCR Guidelines Section 15126.4(b)(3)(C). The data recovery plan shall identify data recovery excavation methods, measurable objectives, and data thresholds to reduce any significant impacts to cultural resources related to the resource. Pursuant to the data recovery plan, the qualified archaeologist and Native American representative, as appropriate, shall recover and document the scientifically consequential information that justifies the resource's significance. The City shall review and approve the treatment plan and archaeological testing as appropriate, and the resulting documentation shall be submitted to the regional repository of the CHRIS, per CCR Guidelines Section 15126.4(b)(3)(C).

Mitigation Measure CR-1 includes procedures for the appropriate handling of unanticipated discoveries of cultural resources. Implementation of Mitigation Measure CR-1 would reduce potential impacts to archeological resources to a less-than-significant level.

LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED

c. Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

The cultural resources records search did not identify cemeteries or archaeological resources containing human remains within the project site (Appendix E). However, the discovery of human remains is always a possibility during ground disturbing activities, as would be required for development within the site. Human burials outside of dedicated cemeteries often occur in prehistoric archaeological contexts. In addition to being potential archaeological resources, human burials have specific provisions for treatment in California Public Resources Code Section 5097. Additionally, the California Health and Safety Code (Sections 7050.5, 7051, and 7054) has specific provisions for the protection of human burial remains. Existing regulations address the illegality of interfering with human burial remains, and protects them from disturbance, vandalism, or destruction. Public Resources Code Section 5097.98 also addresses the disposition of Native American burials, protects such remains, and establishes the NAHC as the entity to resolve any related disputes.

If human remains are found, the State of California Health and Safety Code Section 7050.5 states that no further disturbance may occur until the County coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. In the event of an unanticipated discovery of human remains, the County coroner must be notified immediately. If the human remains are determined to be prehistoric, the coroner will notify the NAHC, which will determine and notify a most likely descendant (MLD). The MLD must complete the inspection of the site within 48 hours of notification and may recommend scientific removal and nondestructive analysis of human remains and items associated with Native American burials. Compliance with Public Resources Code Section 5097.98 and State of California Health and Safety Code Section 7050.5 would ensure that impacts to human remains are less than significant.

LESS-THAN-SIGNIFICANT IMPACT

6 Energy

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	□	□	■	□
b. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	□	□	■	□

Electricity is primarily consumed by the built environment for lighting, appliances, heating and cooling systems, and other uses such as industrial processes in addition to being consumed by alternative fuel vehicles. Most of California's electricity is generated in state, with approximately 30 percent imported from the northwest and southwest regions of the United States in 2020 (California Energy Commission [CEC] 2021). In addition, approximately 33 percent of California's electricity supply in 2020 came from renewable energy sources, such as wind, solar photovoltaic, geothermal, and biomass (CEC 2021). In 2018, Senate Bill 100 accelerated the state's Renewable Portfolio Standards Program, codified in the Public Utilities Act, by requiring electricity providers to increase procurement from eligible renewable energy and zero-carbon resources to 33 percent of total retail sales by 2020, 60 percent by 2030, and 100 percent by 2045.

The smallest scale at which energy consumption information is readily available is the county level. Therefore, energy consumption in Alameda County is used herein to characterize the city's existing consumption of electricity and natural gas. According to the California Energy Commission (CEC), Alameda County consumed approximately 10,247 GWh of electricity in 2020 from residential and non-residential uses (CEC 2022a). San Leandro is served by East Bay Community Energy (EBCE), which supplies electricity to all accounts (residential, business, and municipal) and is delivered through Pacific Gas and Electric (PG&E) infrastructure. EBCE buys power mainly from clean sources like wind, solar, and hydropower. 'BCE's Board of Directors established the goal of purchasing 100 percent clean power for all customers by 2030 (EBCE 2022). Alameda County consumed approximately 367 millions of therms of natural gas in 2019 in both residential and non-residential uses (CEC 2022b).

Petroleum fuels are primarily consumed by on-road vehicles and trucks and off-road equipment in addition to some industrial processes, with California being one of the top petroleum-producing states in the nation (CEC 2021b). Gasoline, which is used by light-duty cars, pickup trucks, and sport utility vehicles, is the most used transportation fuel in California with 12.6 billion gallons sold in 2020 (CEC 2021c). Diesel, which is used primarily by heavy duty-trucks, delivery vehicles, buses, trains, ships, boats and barges, farm equipment, and heavy-duty construction and military vehicles, is the second most used fuel in California with 1.7 billion gallons sold in 2021 (CEC 2021c). Table 12

summarizes the petroleum fuel consumption for Alameda County, in which the project site would be located, as compared to statewide consumption.

Table 12 2020 Annual Gasoline and Diesel Consumption

Fuel Type	Alameda County (millions of gallons)	California (millions of gallons)	Proportion of Statewide Consumption[1]
Gasoline	492	13,818	3.5%
Diesel	53	1,883	2.8%

[1] For reference, the population of Alameda County (1,651,979 persons) is approximately 4.2 percent of the population of California (39,185,605 persons) (California Department of Finance 2022).
Source: CEC 2021c

Energy consumption is directly related to environmental quality in that the consumption of nonrenewable energy resources releases criteria air pollutant and GHG emissions into the atmosphere. The environmental impacts of air pollutant and GHG emissions associated with the project's energy consumption are discussed in detail in Section 3, *Air Quality*, and Section 8, *Greenhouse Gas Emissions*, respectively.

Regulatory Setting

Title 24, California Code of Regulations (CCR)

CCR, Title 24, Part 6, is California's Energy Efficiency Standards for Residential and Non-Residential Buildings. The CEC established Title 24 in 1978 in response to a legislative mandate to create uniform building codes to reduce California's energy consumption and provide energy efficiency standards for residential and nonresidential buildings. The standards are updated on an approximately three-year cycle to allow consideration and possible incorporation of new efficient technologies and methods. In 2019, the CEC updated Title 24 standards with more stringent requirements effective January 1, 2020. All buildings for which an application for a building permit is submitted on or after January 1, 2020 must follow the 2019 standards. The 2022 update was adopted August 11, 2021 and goes into effect January 1, 2023. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The building efficiency standards are enforced through the local plan check and building permit process. Local government agencies may adopt and enforce additional energy standards for new buildings as reasonably necessary due to local climatologic, geologic, or topographic conditions, provided that these standards exceed those provided in Title 24.

Part 6 (Building Energy Efficiency Standards)

Part 6 of Title 24 contains the 2016 Building Energy Efficiency Standards for new residential and CCR Title 24, Part 6 is the Building Energy Efficiency Standards or California Energy Code. This code, originally enacted in 1978, establishes energy-efficiency standards for residential and non-residential buildings in order to reduce California's energy demand. New construction and major renovations must demonstrate their compliance with the current Energy Code through submittal and approval of a Title 24 Compliance Report to the local building permit review authority and the California Energy Commission (CEC). The most current standards are the 2019 Title 24 standards. The 2019 Standards focus on four key areas: 1) smart residential photovoltaic systems; 2) updated thermal envelope standards (preventing heat transfer from the interior to exterior and vice versa);

3) residential and nonresidential ventilation requirements; 4) and nonresidential lighting requirements (CEC 2018). Under the 2019 Standards, nonresidential buildings will be 30 percent more energy-efficient compared to the 2016 Standards. The CEC adopted the 2022 Energy Code on August 11, 2021, and applies starting January 1, 2023. The 2022 Energy Code encourages efficient electric heat pumps, establishes electric-ready requirements, expands solar and battery storage standards, and other stricter requirements.

California Green Building Standards Code (2019), CCR Title 24, Part 11

California's green building code, referred to as CALGreen, was developed to provide a consistent approach to green building within the State. CALGreen lays out the minimum requirements for newly constructed residential and nonresidential buildings to reduce GHG emissions through improved efficiency and process improvements. The requirements pertain to energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and internal air contaminants. It also includes voluntary tiers to further encourage building practices that improve public health, safety, and general welfare by promoting a more sustainable design.

Plan Bay Area 2050

Plan Bay Area 2050 is a State-mandated, integrated long-range transportation, land-use, and housing plan, known as a Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), that would support a growing economy, provide more housing and transportation choices, and reduce transportation-related pollution in the nine-county San Francisco Bay Area (ABAG/MTC 2021). Plan Bay Area 2050 focuses on advancing equity and improving resiliency in the Bay Area by creating strategies in the following four elements: Housing, Economy, Transportation, and Environment. Strategies include allowing higher-density in proximity to transit-corridors, optimizing the existing roadway network, creating complete streets, providing subsides for public transit, and reducing climate emissions, which will reduce overall per capita energy use from non-renewable resources.

San Leandro Municipal Code

San Leandro's Municipal Code Chapter 7.5.7, Energy Code, mandates the implementation of California Building Standards Code, Title 24, Part 6, the California Energy Code, which has specific requirements for building design to reduce energy consumption. Some of the measures in the California Energy Code include the use of certain building materials to ensure a greater degree of energy efficiency during building operation and construction and energy efficiency standards for appliances, lighting amenities, and water fixtures, among other project components. San Leandro's Municipal Code Chapter 3.19 requires all new municipal building projects to meet the United States Green Building Council LEED Silver rating. San Leandro Municipal Code Chapter 7.5.6, Green Building Code, adopts California Building Standards Code, Title 24, part 11, Green Building Standards Code (CALGreen).

San Leandro 2021 Climate Action Plan

In July 2021, the City of San Leandro adopted an update to its Climate Action Plan (CAP), a citywide strategy to reduce greenhouse gas emissions (GHG). Chapter 4 of the CAP includes strategies that target energy reduction through energy efficiency and conservation, including prioritizing increasing and installing renewable energy generation systems and energy storage systems on rental homes, multi-family buildings, and affordable housing; reducing automobile dependency and increasing

transit-oriented development; and committing to developing a reach code limiting natural gas use in new construction, or as directed by the State or regional agencies (City of San Leandro 2021).

2035 General Plan

There are several energy-related policies of the 2035 General Plan in the Open Space and Conservation, Environmental Hazards, Land Use, and Transportation Elements. Policies include using best practices for energy conservation in building and construction, using renewable energy sources where possible, utilizing energy-reducing transportation strategies and alternative fuel vehicles, reducing VMT and increasing active transportation options, and reducing emissions.

Impact Analysis

a. Would the project result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

The proposed project would use nonrenewable and renewable resources for construction and operation of the project. The anticipated use of these resources is detailed in the following subsections. Applicant-provided information, the CalEEMod outputs for the air pollutant and GHG emissions modeling (Appendix B), and the vehicle miles traveled (VMT) calculations based on the Traffic Impact Analysis prepared for the project (Appendix C) were used to estimate energy consumption associated with the proposed project.

Construction Energy Demand

The project would require site preparation and grading, including hauling material off-site; building construction; architectural coating; and landscaping and hardscaping. During project construction, energy would be consumed in the form of petroleum-based fuels used to power off-road construction vehicles and equipment on the project site, construction worker travel to and from the project site, and vehicles used to deliver materials to the site. As shown in Table 13, project construction would require approximately 6,988 gallons of gasoline and approximately 44,931 gallons of diesel fuel. These construction energy estimates are conservative because they assume that the construction equipment used in each phase of construction would operate every day of construction.

Table 13 Proposed Project Construction Energy Usage

	Fuel Consumption (gallons)	
Source	**Gasoline**	**Diesel**
Construction Equipment & Vendor/Hauling Trips	–	45,169
Construction Worker Vehicle Trips	6,988	–

Source: Appendix F

Energy use during construction would be temporary in nature, and construction equipment used would be typical of similar-sized construction projects in the region. In addition, construction contractors would be required to comply with the provisions of California Code of Regulations Title 13 Sections 2449 and 2485, which prohibit diesel-fueled commercial motor vehicles and off-road diesel vehicles from idling for more than five minutes and would minimize unnecessary fuel consumption. Construction equipment would be subject to the USEPA Construction Equipment Fuel

Efficiency Standard, which would also minimize inefficient, wasteful, or unnecessary fuel consumption. Furthermore, per applicable regulatory requirements such as 2022 CalGreen or its most recent iteration, the project would comply with construction waste management practices to divert a minimum of 65 percent of construction debris. These practices would result in efficient use of energy necessary to construct the project. In the interest of cost-efficiency, construction contractors also would not utilize fuel in a manner that is wasteful or unnecessary. While the proposed project would include some demolition, grading, site preparation and removal of existing infrastructure, there are no other unique site features of project characteristics that would necessitate the use of construction equipment that would be less energy efficient than at comparable construction sites in other parts of the state. Therefore, the project would not involve the inefficient, wasteful, and unnecessary use of energy during construction, and construction impacts related to energy consumption would be less than significant.

Operational Energy Demand

Operation of the project would contribute to regional energy demand by consuming electricity and gasoline and diesel fuels. Electricity would be used for heating and cooling systems, lighting, appliances, and water and wastewater conveyance, among other purposes. Gasoline and diesel consumption would be associated with vehicle trips generated by customers and employees. Table 14 summarizes estimated operational energy consumption for the proposed project.

Table 14 Estimated Project Annual Operational Energy Consumption

Source	Energy Consumption[1]	
Gasoline	39,599 gallons	4,347 MMBtu
Diesel	109,841 gallons	14,000 MMBtu
Electricity	0.66 GWh	2,254 MMBtu

MMBtu = million metric British thermal units; GWh = gigawatt-hours

[1] Energy consumption is converted to MMBtu for each source

See Appendix F for energy calculation sheets and the updated modeling outputs at the end of Appendix B for CalEEMod output results for electricity usage.

As shown therein, project operation would require approximately 39,599 gallons of gasoline and 109,841 gallons of diesel for transportation fuels, and 0.66 GWh of electricity annually. Vehicle trips associated with future workers, customers, and deliveries would represent the greatest operational use of energy associated with the proposed project.

The project would be required to comply with all standards set in the latest iteration of the California Building Standards Code (California Code of Regulations Title 24), which would minimize the wasteful, inefficient, or unnecessary consumption of energy resources by the built environment during operation. California's CalGreen standards (California Code of Regulations Title 24, Part 11) require implementation of energy-efficient light fixtures and building materials into the design of new construction projects. The City of San Leandro also requires new construction to comply with the California Green Building Standards Code and incorporates requirements to be consistent with the City's greenhouse gas reduction goals. Further, the 2022 Building Energy Efficiency Standards (California Code of Regulations Title 24, Part 6) require newly constructed buildings to meet energy performance standards set by the CEC. These standards are specifically crafted for new buildings to result in energy efficient performance so that the buildings do not result in wasteful, inefficient, or unnecessary consumption of energy. Therefore, it would be expected that building energy consumption associated with the proposed project would not be more inefficient, wasteful, or

unnecessary than for any other similar buildings in the region. Pursuant to CalGreen, all plumbing fixtures used for the proposed project would be high-efficiency fixtures, which would minimize the potential inefficient or wasteful consumption of energy related to water and wastewater.

Project operation would not result in potentially significant environmental effects due to the wasteful, inefficient, or unnecessary consumption of energy, and impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

b. Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

The City of San Leandro's 2035 General Plan and Climate Action Plan (CAP) include energy conservation and energy efficiency strategies intended to enable the State and the City to achieve GHG reduction and energy conservation goals. As shown in Table 15 and Table 16, the project would be consistent with (and not conflict with nor obstruct) State and local renewable energy and energy efficiency plans.

Table 15 Project Consistency with State Renewable Energy and Energy Efficiency Plans

Renewable Energy or Energy Efficiency Plan	Proposed Project Consistency
2019 Integrated Energy Policy Report. The 2019 report highlights the implementation of California's innovative policies and the role they have played in establishing a clean energy economy, as well as provides more detail on several key energy policies, including decarbonizing buildings, increasing energy efficiency savings, and integrating more renewable energy into the electricity system.	**Consistent.** The project would be required to comply with San Leandro Municipal Code (SLMC) Chapter 7.5.7, which mandates the implementation of Title 24. Further, electricity would be provided either by PG&E or EBCE, which source some or all their power from renewable sources. Given these features, the project would involve reduced GHG emissions from power, an increase in energy efficiency savings, and integration of more renewable energy into the electricity system. Therefore, the project would not conflict with or obstruct implementation of the 2019 Integrated Energy Policy Report.
California Renewable Portfolio Standard. California's RPS obligates investor-owned utilities, energy service providers, and community choice aggregators to procure 33 percent total retail sales of electricity from renewable energy sources by 2020, 60 percent by 2030, and 100 percent by 2045.	**Consistent.** EBCE and PG&E supply electricity in the city and they are required to generate electricity that would increase renewable energy resources to 60 percent by 2030 and 100 percent by 2045. EBCE already has an option for residents to source 100 percent renewable energy. Because PCE and PG&E would provide electricity service to the project site, the project would not conflict with or obstruct implementation of the California Renewable Portfolio Standard.
Energy Action Plan. In the October 2005, the CEC and CPUC updated their energy policy vision by adding some important dimensions to the policy areas included in the original EAP, such as the emerging importance of climate change, transportation-related energy issues, and research and development activities. The CEC adopted an update to the EAP II in February 2008 that supplements the earlier EAPs and examines the state's ongoing actions in the context of global climate change. The nine major action areas in the EAP include energy efficiency, demand response, renewable energy, electricity adequacy/reliability/infrastructure, electricity market	**Consistent.** Development facilitated by the project would be required to comply with SLMC Chapter 7.5.7, which mandates the implementation of Title 24. Further, electricity would be provided either by PG&E or EBCE, which source some or all their power from renewable sources. Given these features, the project would involve reduced GHG emissions from power, an increase in energy efficiency savings, and integration of more renewable energy into the electricity system. Therefore, the project would not conflict with or obstruct implementation of the EAP.

Renewable Energy or Energy Efficiency Plan	Proposed Project Consistency
structure, natural gas supply/demand/infrastructure, transportation fuels supply/demand/infrastructure, research/development/demonstration, and climate change.	
AB 1007: State Alternative Fuels Plans. The State Alternative Fuels Plan assessed various alternative fuels and developed fuel portfolios to meet California's goals to reduce petroleum consumption, increase alternative fuels use, reduce GHG emissions, and increase in-state production of biofuels without causing a significant degradation of public health and environmental quality. **Bioenergy Action Plan, EO S-06-06.** The EO establishes the following targets to increase the production and use of bioenergy, including ethanol and biodiesel fuels made from renewable resources: produce a minimum of 20 percent of its biofuels in California by 2010, 40 percent by 2020, and 75 percent by 2050.	**Consistent**. The project would not interfere with or obstruct the production of biofuels in California. Vehicles used by future project site tenants would be fueled by gasoline and diesel fuels blended with ethanol and biodiesel fuels as required by CARB regulations. Therefore, the project would not conflict with or obstruct implementation of the Bioenergy Action Plan or the State Alternative Fuels Plan.
Title 24, CCR – Part 6 (Building Energy Efficiency Standards) and Part 11 (CALGreen). The 2022 Building Energy Efficiency Standards move toward cutting energy use in new homes by more than 50 percent and will require installation of solar photovoltaic systems for single-family homes and multi-family buildings of three stories and less. The CALGreen Standards establish green building criteria for residential and nonresidential projects. The 2022 Standards include the following: increasing the number of parking spaces that must be prewired for electric vehicle chargers in residential development; requiring all residential development to adhere to the Model Water Efficient Landscape Ordinance; and requiring more appropriate sizing of HVAC ducts.	**Consistent.** The project would be required to comply with SLMC Chapter 7.5.7, which mandates the implementation of Title 24. Therefore, the project would not conflict with or obstruct implementation of the Title 24 standards. The project would also be required to comply with CALGreen standards pursuant to Section 7-5-600 of the SLMC. Therefore, the project would not conflict with or obstruct implementation of CALGreen.

Table 16 Project Consistency with the 2035 General Plan and Climate Action Plan

Renewable Energy or Energy Efficiency Plan	Proposed Project Consistency
General Plan Policies	
Goal OSC-8: Energy. Promote the efficient use of energy and the increased use of renewable energy by San Leandro residents and businesses. **Policy OSC-8.2: Planning and Building Practices.** Encourage construction, landscaping, and site planning practices that minimize heating and cooling costs and ensure that energy is efficiently used. Local building codes and other City regulations and procedures should meet or exceed state and federal standards for energy conservation and efficiency and support the City's greenhouse gas reduction goals.	**Consistent.** The project would be required to comply with SLMC Chapter 7.5.7, which mandates the implementation of Title 24. The project would be required to use efficient lighting and appliances. EBCE and PG&E supply electricity in the city and they are required to generate electricity that would increase renewable energy resources to 60 percent by 2030 and 100 percent by 2045. EBCE already has an option with 100 percent renewable energy sources, which is the default option for businesses and residences. Because EBCE and PG&E would provide electricity service to the project site, the project would be consistent with the general plan's goals and policies regarding energy efficiency and renewable energy mix.
Climate Action Plan Measures	
Measure RE-1: Encourage San Leandro households and businesses to switch from PG&E electricity supplies to East Bay Community Energy, and commit to defaulting to Renewable 100 tier for 100-percent renewable energy.	**Consistent.** EBCE and PG&E supply electricity in the City and they are required to generate electricity that would increase renewable energy resources to 60 percent by 2030 and 100 percent by 2045. EBCE already has an option for residents to source 100 percent renewable energy. Because PCE and PG&E would provide electricity service to the project site, the project would not conflict with or obstruct implementation of the City's CAP. The project would be required to comply with SLMC Chapter 7.5.7, which mandates the implementation of Title 24. Therefore, the project would not conflict with or obstruct implementation of the Title 24 standards.

Source: City of San Leandro 2016a, 2021

As shown in Table 15 and Table 16, The project would be consistent with State plans and the City's adopted energy conservation and efficiency strategies contained in the 2035 General Plan, SLMC, and the City's CAP. Therefore, impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

7 Geology and Soils

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
1. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?	□	□	■	□
2. Strong seismic ground shaking?	□	□	■	□
3. Seismic-related ground failure, including liquefaction?	□	□	■	□
4. Landslides?	□	□	■	□
b. Result in substantial soil erosion or the loss of topsoil?	□	□	■	□
c. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?	□	□	■	□
d. Be located on expansive soil, as defined in Table 1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	□	□	■	□
e. Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	□	□	□	■
f. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	□	■	□	□

Analysis in this section is based in part on the geotechnical investigation prepared for the project by Cornerstone Earth Group in March 2021. The geotechnical investigation is included as Appendix G.

Setting

Active faults are defined by the State of California to be a fault that has surface displacement within the Holocene time (approximately the last 10,000 years). Potentially active faults as defined by the State of California to be a fault that has shown evidence of surface displacement during the Quaternary (last 1.6 million years). Any fault that is sufficiently active describes a fault that has some evidence of Holocene displacement on one or more of its segments or branches. Associated issues with earthquakes include liquefaction, which is the rapid transformation of sediment to a fluid-like state. It occurs when water-saturated, loose to medium dense, relatively clay-free sands and silts are subjected to earthquake ground motion.

The Bay Area contains both active and potentially active faults. Major active faults in the area are the San Andreas, San Gregorio, Hayward, and Calaveras faults. The project site itself is not located within an Earthquake Fault Zone (California Geological Survey [CGS] 2016).

Expansive soils are soils that swell in density and volume as they absorb water and contract as they lose water. Associated problems include cracking and deterioration of roadway surface, as they expand and contract during seasonal wet and dry cycles. The surface soils of the site have been mapped as Clear Lake clay by United States Department of Agriculture Natural Resources Conservation Service (Natural Resources Conservation Service [NRCS] 2018a), which are not known to be expansive.

Regulatory Setting

Alquist-Priolo Earthquake Fault Zoning Act

Following the 1989 Loma Prieta earthquake, the Seismic Hazards Mapping Act (SHMA) was passed by the California legislature in 1990. The SHMA (PRC Chapter 7.8, Section 2690-2699.6) directs the Department of Conservation, California Geological Survey to identify and map areas prone to liquefaction, earthquake-induced landslides and amplified ground shaking. It also requires that agencies only approve projects in seismic hazard zones following site-specific geotechnical investigations to determine if the identified hazard is present and the inclusion of appropriate mitigation to reduce earthquake-related hazards.

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act of 1990 was enacted, in part, to address seismic hazards not included in the Alquist-Priolo Act, including strong ground shaking, landslides, and liquefaction. Under the Alquist-Priolo Act, the State Geologist is responsible for identifying and mapping seismic hazards. CGS Special Publication 117, adopted in 1997 by the State Mining and Geology Board, constitutes guidelines for evaluating seismic hazards other than surface faulting and for recommending mitigation measures as required by PRC Section 2695(a). In accordance with the mapping criteria, the CGS seismic hazard zone maps identifies areas with the potential for a ground shaking event that corresponds to 10 percent probability of exceedance in 50 years.

The purpose of the Seismic Hazards Mapping Act is to reduce the threat to public health and safety and to minimize the loss of life and property by identifying and mitigating seismic hazards. Cities, counties, and state agencies are directed to use seismic hazard zone maps developed by CGS in their

land-use planning and permitting processes. The Seismic Hazards Mapping Act requires site-specific geotechnical investigations prior to permitting most urban development projects in seismic hazard zones.

California Building Code (CBC)

The California Building Code (CBC), Title 24, Part 2, provides building codes and standards for the design and construction of structures in California. The purpose of the CBC is to establish minimum standards to safeguard the public health, safety, and general welfare through structural strength, means of egress facilities, and general stability by controlling the design, construction, quality of materials, use and occupancy, location, and maintenance of building and structures. The CBC contains specific requirements for seismic safety, excavation, foundations, retaining walls, soil conditions, and site demolition. It also regulates grading activities, including drainage and erosion control. Chapter 16 of the CBC contains definitions of seismic sources and the procedure used to calculate seismic forces on structures.

The CBC is updated every three years by order of the legislature, with supplements published in intervening years. State law mandates that local governments enforce the CBC. In addition, a city and/or county may establish more restrictive building standards reasonably necessary because of local climatic, geological, or topographical conditions. The 2022 CBC is based on the International Building Code.

City of San Leandro 2035 General Plan

Policy EH-1. **Risk Management.** Minimize risks from geologic, seismic, flood, and climate change-related hazards by ensuring the appropriate location, site planning, and design of new development. The City's development review process, and its engineering and building standards, should ensure that new construction is designed to minimize the potential for damage.

Impact Analysis

a.1. Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

The project site is not within an Earthquake Fault Zone as defined by the Alquist-Priolo Earthquake Fault Zoning Act, and no known active or potentially active faults exist on the site (CGS 2016). The nearest known Alquist-Priolo Earthquake Fault Zone is the Hayward Fault zone located approximately one mile east of the site. Direct ground rupture of a known earthquake fault would be unlikely, and impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

a.2. Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking?

The nearest mapped active fault, the Hayward Fault, is one mile east of the project site (CGS 2016). The United States Geological Survey (USGS) has stated that there is a 72 percent chance of at least one magnitude 6.7 or greater earthquake striking the San Francisco Bay region between 2014 and 2043 (USGS 2016). Therefore, the site could be subjected to at least one moderate to severe

earthquake that would cause strong ground shaking. Project construction would be required to comply with the seismic safety requirements in the International Building Code, the CBC, and the City of San Leandro Building Code. Compliance with such requirements would reduce seismic ground shaking impacts to the maximum extent practicable with current engineering methods. Therefore, impacts related to strong seismic ground shaking would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

a.3. Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction?

c. Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

Soils that are most susceptible to liquefaction are clean, loose, uniformly graded, saturated, fine-grained sands that lie close to the ground surface. The project site is identified as having Clear Lake clay, which are defined as poorly-drained and fine-textured (NRCS 2018b). The project site is located in an identified liquefaction zone, according to maps prepared by CGS (CGS 2016).

Most land in San Leandro is underlain by materials that have moderate to very high liquefaction potential. In addition, according to the USGS the project site is in an area that experiences moderate liquefaction susceptibility (USGS 2019). However, the proposed structure would be required to be constructed in compliance with the California Building Code (CBC), which requires structures to be designed and constructed to resist liquefaction potential from seismic-related ground failure.

The geotechnical investigation prepared for the project (Appendix G) analyzed the potential for liquefaction induced settlements, and provided recommendations for the design of the proposed structure's foundation. Recommendations for the proposed structure's foundation include the removal of existing fill, exploration test pits to determine depth of fills prior to grading, subgrade stabilization measures including scarification and drying. Pursuant to SLMC Section 7-5-100, the City of San Leandro adopted the CBC; Section 1803.1.1.3 of the CBC states that the building department of each locality (in this case the San Leandro Building & Safety Division) would need to approve the soil investigation or geotechnical investigation (Appendix G) if it determines that the recommended action is likely to prevent structural damage. As a condition of the building permit, the approved recommended action would be incorporated into project construction. Therefore, pursuant to the SLMC and the CBC, the recommendations included in the geotechnical investigation (Appendix G) would be incorporated into the design of the project and verified by the City prior to issuance of a building permit.

With adherence to SLMC, the CBC, and implementation of recommendations in the design-level geotechnical investigation, impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

a.4. Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving landslides?

Earthquakes can trigger landslides that may cause injuries and damage many types of structures. Landslides are typically a hazard on or near slopes or hillside areas, rather than on generally level areas, like the project site. The project site is not within an area mapped as having landslides (CGS 2019). Therefore, the project has a low potential for slope instability occurring at the site and impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

b. Would the project result in substantial soil erosion or the loss of topsoil?

Project construction, particularly grading and site preparation, could result in erosion and loss of topsoil from the project site. The project developer would be required to follow applicable CBC and SLMC requirements to reduce soil erosion, including SLMC Section 7-12-230, which requires erosion and sedimentation control measures and drainage plans to be prepared by a civil engineer and submitted to the City for approval prior to issuance of a grading permit. Where appropriate, the control measures must include measures including, but not limited to, short-term erosion control planting, waterproof slope covers, stormwater retention basins, and devices to trap, store, and filter sediment during project construction and operation. Compliance with federal, State, and City regulations would reduce impacts related to soil erosion and the loss of topsoil to less than significant levels.

LESS-THAN-SIGNIFICANT IMPACT

d. Would the project be located on expansive soil, as defined in Table 1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Expansive soils are those that have a potential to undergo significant changes in volume, either shrinking or swelling, due to their composition and moisture content. Periodic shrinking and swelling of expansive soils can cause extensive damage to other structures and roads. According to the NRCS, soil within and around the project site consists of Clear Lake clay. Clear Lake clay is very deep, poorly drained soil formed from mixed rock resources, and are not known to be expansive (NRCS 2018a; 2018b). Therefore, the project would not be located on expansive soil, and impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

e. Would the project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

The project site would be served by the municipal sewer system and would not require the installation of an on-site septic tank or alternate wastewater treatment systems. Therefore, no impacts from septic systems or alternative wastewater disposal systems would occur.

NO IMPACT

f. Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Paleontological resources, or fossils, are the evidence of once-living organisms preserved in the rock record. They include both the fossilized remains of ancient plants and animals and the traces thereof (e.g., trackways, imprints, burrows, etc.). Paleontological resources are not found in "soil" but are contained within the geologic deposits or bedrock that underlies the soil layer. Typically, fossils are greater than 5,000 years old (i.e., older than middle Holocene in age) and are typically preserved in sedimentary rocks. Although rare, fossils can also be preserved in volcanic rocks and low-grade metamorphic rocks under certain conditions (Society of Vertebrate Paleontology [SVP] 2010). Fossils occur in a non-continuous and often unpredictable distribution within some sedimentary units, and the potential for fossils to occur within sedimentary units depends on several factors. It is possible to evaluate the potential for geologic units to contain scientifically important paleontological resources, and therefore evaluate the potential for impacts to those resources and provide mitigation for paleontological resources if they are discovered during construction of a development project.

Rincon evaluated the paleontological sensitivity of the geologic units that underlie the project site to assess the project's potential for significant impacts to scientifically important paleontological resources. The analysis was based on the results of a review of existing information in the scientific literature regarding known fossils within geologic units mapped at the project site. According to the SVP (2010) classification system, geologic units can be assigned a high, low, undetermined, or no potential for containing scientifically significant nonrenewable paleontological resources. Following the literature review, a paleontological sensitivity classification was assigned to each geologic unit mapped within the project site. This criterion is based on rock units within which vertebrate or significant invertebrate fossils have been determined by previous studies to be present or likely to be present. The potential for impacts to significant paleontological resources is based on the potential for ground disturbance to directly impact paleontologically sensitive geologic units. The project site is located in the Coast Ranges geomorphic province, one of the eleven geomorphic provinces of California (California Geological Survey 2002). The Coast Ranges extend along the majority of California's coast from the California-Oregon border to Point Arguello in Santa Barbara County in the south and consist of northwest-trending mountain ranges and valleys. The Coast Ranges are composed of Mesozoic and Cenozoic sedimentary, igneous, and metamorphic strata. The eastern side is characterized by strike-ridges and valleys in the Upper Mesozoic strata. The Coast Ranges province runs parallel to and overlaps the San Andreas Fault in some areas (California Geological Survey 2002). Locally, the project site is on the East Bay Plain which lies between the San Lorenzo Hills to the east and San Francisco Bay to the west.

The region surrounding the project site was mapped by Graymer (2000), who identified a single geologic unit, Holocene alluvial fan and fluvial deposits, underlying the project site. Holocene alluvial fan and fluvial deposits are brown to tan, medium-dense sand that fines upward to sandy or silty clay. Holocene sediments are generally considered too young (i.e., less than 5,000 years old) to preserve paleontological resources (SVP 2010). Therefore, Holocene alluvial fan and fluvial deposits have low paleontological sensitivity.

A geotechnical report conducted for this project encountered 3 feet of artificial fill in each of its test borings, below which they encountered alluvial sediments consisting of sandy clay with interbeds of silty sand down to the maximum observed depth of 40 feet (Appendix GEO). These observations are consistent with the Holocene alluvial fan and fluvial deposits mapped by Graymer (2000).

Ground-disturbing activities for this project will include overall grading of the site and excavations for stormwater catch basins and storm drains. These activities are anticipated to reach up to 12 feet below the current grade. The depth at which these sediments become old enough to preserve paleontological resources (i.e., 5,000 years old; SVP 2010) is unknown. Maguire and Holroyd (2016) report Pleistocene-aged fossils (e.g., mammoth, horse, ground sloth) at depths as shallow as 9 feet below the current surface from sediments mapped as Holocene at the surface in Santa Clara County. Although, this project is in Alameda County rather than Santa Clara County, the data of Maguire and Holroyd (2016) does show the depths at which fossil-bearing sediments can occur in the San Francisco Bay area. Therefore, the 12-foot-deep excavations anticipated for this project may impact sediments that are old enough to contain paleontological resources. As a result, mitigation measure GEO-1 is recommended to ensure that potential impacts to paleontological resources are less than significant by providing training to construction personnel on the appearance of fossils and establishing procedures to be followed in the event that an unanticipated paleontological resource is discovered. These procedures will effectively mitigate impacts to paleontological resources through their recovery, identification, and curation.

GEO-1 Unanticipated Fossil Discovery

PALEONTOLOGICAL WORKER ENVIRONMENTAL AWARENESS PROGRAM

Prior to the start of construction, a Qualified Professional Paleontologist, as defined by SVP (2010), or their designee shall conduct a paleontological Worker Environmental Awareness Program (WEAP) training for construction personnel regarding the appearance of fossils and the procedures for notifying paleontological staff should fossils be discovered by construction personnel.

UNANTICIPATED DISCOVERY OF PALEONTOLOGICAL RESOURCES

The project developer shall include a standard inadvertent discovery clause in every construction contract to inform contractors of this requirement. If a potential fossil is discovered during project construction, construction activity within 50 feet of the find shall cease until the discovery is examined by a Qualified Professional Paleontologist. If the find is determined to be significant, the Qualified Professional Paleontologist shall direct all mitigation measures related to paleontological resources consistent with the SVP (2010) standards.

LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED

This page intentionally left blank.

8 Greenhouse Gas Emissions

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	□	□	■	□
b. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	□	□	■	□

FirstCarbon Solutions prepared an Air Quality and Greenhouse Gas Emissions Impacts Report (AQ-GHG Report) in August 2022, which was peer-reviewed by Rincon Consultants in September 2022. FirstCarbon Solutions prepared a revised AQ-GHG Report in April 2023. Rincon Consultants also prepared updated air quality modeling in September 2023. The revised Air Quality and Greenhouse Gas Emissions Impacts Report, peer review memorandum, and updated air quality modeling are included as Appendix B.

Overview of Climate Change and Greenhouse Gases

Climate change is the observed increase in the average temperature of the Earth's atmosphere and oceans along with other substantial changes in climate (such as wind patterns, precipitation, and storms) over an extended period of time. Climate change is the result of numerous, cumulative sources of GHG emissions contributing to the "greenhouse effect," a natural occurrence which takes place in Earth's atmosphere and helps regulate the temperature of the planet. The majority of radiation from the sun hits Earth's surface and warms it. The surface, in turn, radiates heat back towards the atmosphere in the form of infrared radiation. Gases and clouds in the atmosphere trap and prevent some of this heat from escaping into space and re-radiate it in all directions.

GHG emissions occur both naturally and as a result of human activities, such as fossil fuel burning, decomposition of landfill wastes, raising livestock, deforestation, and some agricultural practices. GHGs produced by human activities include carbon dioxide (CO_2), methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. Different types of GHGs have varying global warming potentials (GWP). The GWP of a GHG is the potential of a gas or aerosol to trap heat in the atmosphere over a specified timescale (generally, 100 years). Because GHGs absorb different amounts of heat, a common reference gas (CO_2) is used to relate the amount of heat absorbed to the amount of the gas emitted, referred to as "carbon dioxide equivalent" (CO_2e), which is the amount of GHG emitted multiplied by its GWP. Carbon dioxide has a 100-year GWP of one. By contrast, methane has a GWP of 30, meaning its global warming effect is 30 times greater

than CO_2 on a molecule per molecule basis (Intergovernmental Panel on Climate Change [IPCC] 2022).[3]

The principal climate change gases resulting from human activity that enter and accumulate in the atmosphere are listed below:

- **Carbon Dioxide**. CO_2 enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), solid waste, trees and wood products, and chemical reactions (e.g., the manufacture of cement). CO_2 is also removed from the atmosphere (or "sequestered") when it is absorbed by plants as part of the biological carbon cycle.
- **Methane**. CH_4 is emitted during the production and transport of coal, natural gas, and oil. CH_4 emissions also result from livestock and agricultural practices and the decay of organic waste in municipal solid waste landfills.
- **Nitrous Oxide**. N_2O is emitted during agricultural and industrial activities as well as during combustion of fossil fuels and solid waste.
- **Hydrofluorocarbons (HFC)**. HFCs are one of several high global warming potential (GWP) gases that are not naturally occurring and are generated from industrial processes. HFC (refrigerant) emissions from vehicle air conditioning systems occur due to leakage, losses during recharging, or release from scrapping vehicles at end of their useful life.
- **Perfluorocarbons (PFC)**. PFCs are another high GWP gas that are not naturally occurring and are generated in a variety of industrial processes.
- **Sulfur Hexafluoride (SF_6)**. SF_6 is another high GWP gas that is not naturally occurring and is generated in a variety of industrial processes.

There are uncertainties as to exactly what the climate changes will be in various local areas of the earth. There are also uncertainties associated with the magnitude and timing of other consequences of a warmer planet: sea level rise, spread of certain diseases out of their usual geographic range, the effect on agricultural production, water supply, sustainability of ecosystems, increased strength and frequency of storms, extreme heat events, increased air pollution episodes, and the consequence of these effects on the economy.

Regulatory Setting

California Global Warming Solutions Act of 2006 (Assembly Bill 32, and Senate Bill 32, and Assembly Bill 1279)

The "California Global Warming Solutions Act of 2006," (Assembly Bill [AB] 32), outlines California's major legislative initiative for reducing GHG emissions. AB 32 codifies the statewide goal of reducing GHG emissions to 1990 levels by 2020 and requires CARB to prepare a Scoping Plan that outlines the main state strategies for reducing GHG emissions to meet the 2020 deadline. In addition, AB 32 requires CARB to adopt regulations to require reporting and verification of statewide GHG emissions. Based on this guidance, CARB approved a 1990 statewide GHG level and 2020 target of 431 million metric tons (MMT) of carbon dioxide equivalents (CO_2e), which was achieved in 2016. CARB approved the Scoping Plan on December 11, 2008, which included GHG emission reduction strategies related to energy efficiency, water use, and recycling and solid waste, among others

[3] The Intergovernmental Panel on Climate Change's (2022) *Sixth Assessment Report* determined that methane has a GWP of 30. However, the 2017 Climate Change Scoping Plan published by the California Air Resources Board uses a GWP of 25 for methane, consistent with the Intergovernmental Panel on Climate Change's (2007) *Fourth Assessment Report*. Therefore, this analysis utilizes a GWP of 25.

(CARB 2009). Many of the GHG reduction measures included in the Scoping Plan (e.g., Low Carbon Fuel Standard, Advanced Clean Car standards, and Cap-and-Trade) have been adopted since the Scoping Plan's approval.

The CARB approved the 2013 Scoping Plan update in May 2014 (CARB 2014). The update defined the CARB's climate change priorities for the next five years, set the groundwork to reach post-2020 statewide goals, and highlighted California's progress toward meeting the "near-term" 2020 GHG emission reduction goals defined in the original Scoping Plan. It also evaluated how to align the state's longer term GHG reduction strategies with other state policy priorities, including those for water, waste, natural resources, clean energy, transportation, and land use (CARB 2014).

On September 8, 2016, the governor signed Senate Bill (SB) 32 into law, extending the California Global Warming Solutions Act of 2006 by requiring the state to further reduce GHG emissions to 40 percent below 1990 levels by 2030 (the other provisions of AB 32 remain unchanged). On December 14, 2017, the CARB adopted the 2017 Scoping Plan, which provides a framework for achieving the 2030 target. The 2017 Scoping Plan relies on the continuation and expansion of existing policies and regulations, such as the Cap-and-Trade Program, and implementation of recently adopted policies and legislation, such as SB 1383 and SB 100 (discussed later). The 2017 Scoping Plan also puts an increased emphasis on innovation, adoption of existing technology, and strategic investment to support its strategies. As with the 2013 Scoping Plan update, the 2017 Scoping Plan does not provide project-level thresholds for land use development. Instead, it recommends that local governments adopt policies and locally appropriate quantitative thresholds consistent with statewide per capita goals of six MT CO_2e by 2030 and two MT CO_2e by 2050 (CARB 2017). As stated in the 2017 Scoping Plan, these goals may be appropriate for plan-level analyses (city, county, sub-regional, or regional level), but not for specific individual projects because they include all emissions sectors in the state (CARB 2017).

AB 1279, "The California Climate Crisis Act," was passed on September 16, 2022 and declares the State would achieve net zero GHG emissions as soon as possible, but no later than 2045, and to achieve and maintain net negative GHG emissions thereafter. In addition, the bill states that the State would reduce GHG emissions by 85 percent below 1990 levels no later than 2045. CARB's 2022 Scoping Plan for achieving Carbon Neutrality lays out a path to achieve AB 1279 targets and SB 32 (CARB 2022). The actions and outcomes in the 2022 Scoping Plan would achieve significant reductions in fossil fuel combustion by deploying clean technologies and fuels, further reductions in short-lived climate pollutants, support for sustainable development, increased action on natural and working lands to reduce emissions and sequester carbon, and the capture and storage of carbon.

City of San Leandro 2035 General Plan

The City of San Leandro's 2035 General Plan, adopted in September 2016, lists several GHG-reduction goals, policies, and actions as part of the Transportation Element and Open Space, Parks, and Conservation Element that support the goal of reducing GHG emissions. The following goals and policies are applicable to the proposed project (City of San Leandro 2016):

Policy T-5.2 **Evaluating Development Impacts.** Use vehicle miles traveled (VMT) as the primary metric for evaluating the transportation impacts of new development proposals. Traffic impact studies may also consider the total number of trips generated and the resulting impact on traffic volumes and congestion (e.g., "Level of Service"), but VMT shall provide the primary basis for determining appropriate mitigation measures.

Goal OSC-7 Promote recycling, water conservation, green building, and other programs which reduce greenhouse gas emissions and create a more sustainable environment.

Policy OSC-7.8 **Green Building.** Promote green building in new construction and remodels.

Goal OSC-8 Promote the efficient use of energy and the increased use of renewable energy by San Leandro residents and businesses.

Policy OSC-8.1 **Conservation and Energy Efficiency.** Strongly advocate for increased energy conservation by San Leandro residents and businesses, and ensure that the City itself is a conservation role model.

Policy OSC-8.2 **Planning and Building Practices.** Encourage construction, landscaping, and site planning practices that minimize heating and cooling costs and ensure that energy is efficiently used. Local building codes and other City regulations and procedures should meet or exceed state and federal standards for energy conservation and efficiency, and support the City's greenhouse gas reduction goals.

City of San Leandro Municipal Code

Section 3.24.400 of the SLMC requires commercial business organic waste generators and multi-family dwelling units to participate in organic waste collection services. These uses must subscribe to collection services for compost containers, recycling containers, and landfill containers.

Section 7.5.600 of the SLMC requires compliance with the California Green Building Code, Title 24, Part 11, which details requirements for energy conservation and green design. Section 7.5.700 of the SLMC requires compliance with the California Energy Code, Title 24, Part 6, which details requirements for the use of energy-efficient design and technologies as well as provisions for incorporating renewable energy resources into building design.

Significance Thresholds

Individual projects do not generate sufficient GHG emissions to influence climate change directly. However, physical changes caused by a project can contribute incrementally to significant cumulative effects, even if individual changes resulting from a project are limited. The issue of climate change typically involves an analysis of whether a project's contribution towards an impact would be cumulatively considerable. "Cumulatively considerable" means the incremental effects of an individual project are significant when considered in conjunction with the effects of past projects, other current projects, and probable future projects (*CEQA Guidelines* Section 15064[h][1]).

According to *CEQA Guidelines* Section 15183.5(b), projects can tier from a qualified GHG reduction plan, which allows for project-level evaluation of GHG emissions through the comparison of the project's consistency with the GHG reduction policies included in a qualified GHG reduction plan. This approach is considered by the Association of Environmental Professionals (2016) in its white paper, *Beyond Newhall and 2020: A Field Guide to New CEQA Greenhouse Gas Thresholds and Climate Action Plan Targets for California*, to be the most defensible approach presently available under CEQA to determine the significance of a project's GHG emissions.

The 2022 BAAQMD *CEQA Thresholds for Evaluating the Significance of Climate Impacts From Land Use Projects and Plans* guidance document contains two approaches for determining significance of GHGs (BAAQMD 2022). The two approaches are as follows:

1. Projects must include, at a minimum, the following project design elements:
   - **Buildings**
     - The project will not include natural gas appliances or natural gas plumbing (in both residential and nonresidential development).
     - The project will not result in any wasteful, inefficient, or unnecessary energy usage as determined by the analysis required under CEQA Section 21100(b)(3) and Section 15126.2(b) of the State CEQA Guidelines.
   - **Transportation**
     - Achieve a reduction in project-generated vehicle miles traveled (VMT) below the regional average consistent with the current version of the California Climate Change Scoping Plan (currently 15 percent) or meet a locally adopted Senate Bill 743 VMT target, reflecting the recommendations provided in the Governor's Office of Planning and Research's Technical Advisory on Evaluating Transportation Impacts in CEQA:
       - Residential projects: 15 percent below the existing VMT per capita
       - Office projects: 15 percent below the existing VMT per employee
       - Retail projects: no net increase in existing VMT
     - Achieve compliance with off-street electric vehicle requirements in the most recently adopted version of CALGreen Tier

2. Projects must be consistent with a local GHG reduction strategy that meets the criteria under State CEQA Guidelines Section 15183.5(b).

According to the 2022 BAAQMD CEQA Thresholds for Evaluating the Significance of Climate Impacts From Land Use Projects and Plans, a qualified GHG reduction strategy that can enable CEQA streamlining benefits for future land use projects must:

- Quantify GHG emissions, both existing and projected over a specified period, resulting from activities in a defined geographic area
- Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable
- Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated in the geographic area
- Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level
- Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels
- Be adopted in a public process following environmental review

This analysis will evaluate the project in terms of consistency with the San Leandro 2021 Climate Action Plan, a local GHG reduction strategy that contains all of the components required under Criterion 2 above.

Methodology

GHG emissions were modeled under the same assumptions and methodology outlined in Section 3, *Air Quality.* As discussed under *Significance Thresholds* above, projects consistent with a qualified climate action plan (CAP) are assumed to have less-than-significant impacts related to GHG emissions. Therefore, the proposed project's estimated GHG emissions during construction and operation are presented for informational purposes only.

Impact Analysis

a. Would the project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

b. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction

The proposed project would generate GHG emissions during construction activities, resulting from emission sources such as construction equipment, haul trucks, vendor deliveries, and construction worker vehicles. Although these emissions would be temporary and short-term in nature, they could represent a substantial contribution of GHG emissions. Construction emissions were modeled using CalEEMod. Table 17 below summarizes the annual construction GHG emissions in terms of metric tons (MT) of carbon dioxide equivalents (CO_2e) per year. BAAQMD has not established a quantitative significance threshold for evaluating construction related emissions, but it does recommend quantifying and disclosing construction-generated GHG emissions. The total emissions generated during construction were amortized over 30 years, a typical estimated operational lifetime for a project, and added to the operational emissions.

Table 17 Project Construction GHG Emissions

Construction Year	Total GHG Emissions (MT CO_2e)
2024	365
2025	14.7
Total Construction Emissions	**379.7**
Construction Emissions Amortized over 30 years	**13**

GHG = greenhouse gas

MT CO_2e = metric tons of carbon dioxide equivalent

Totals may not sum due to rounding. Construction emissions are amortized over the 30-year lifetime of the project.

Source: updated modeling outputs are included at the end of Appendix B

Operation

Operational GHG emissions would occur over the life of the project. Sources of operation GHG emissions include passenger vehicle and truck use associated with the project, stationary sources, electricity and power, area sources such as landscaping, water use, and waste generation. Table 18 summarizes estimated annual GHG emissions from the project's operational activities.

Table 18 Project Operational GHG Emissions

GHG Emissions Source	Total GHG Emissions (MT CO_2e per year)
Warehouse	584.5
Office Use	129.2
Parking Lot	44.6
Landscaping	0.6
Amortized Construction Emissions	13
Total Annual Operational Emissions	**772**

GHG = greenhouse gas

MT CO_2e = metric tons of carbon dioxide equivalent

Mobile sources include estimated passenger vehicle and truck use associated with the project.

Totals may not sum due to rounding. Construction emissions are amortized over the 30-year lifetime of the project.

Source: updated modeling outputs are included at the end of Appendix B

The City of San Leandro updated and approved its CAP in July 2021, which outlines strategies for reducing GHG emissions through various activities, including but not limited to water conservation, energy conservation, land use design and orientation, transportation-oriented development, and renewable energy source use. According to the CAP, "The CAP is prepared consistent with CEQA Guidelines for Plans for the Reduction of Greenhouse Gas Emissions (CEQA Guidelines Section 15183.5). Additionally, the CAP meets the criteria from the BAAQMD CEQA Thresholds for Evaluating the Significance of Climate Impacts from Land Use Projects and Plans, as described under *Significance Thresholds.* This allows the 2021 CAP to support and streamline environmental review of GHG emissions related to future development projects within the city." Therefore, a project that would comply with the goals and policies of the City's CAP would have less-than-significant GHG impacts.

Table 19 below compares the project's consistency with the City's CAP. As shown therein, the proposed project would be consistent with the CAP and accordingly would be consistent with an adopted, qualified GHG reduction strategy. Therefore, the proposed project would not generate GHG emissions that would have a significant impact on the environment. Impacts would be less than significant.

Table 19 Project Consistency with the San Leandro CAP

San Leandro CAP Measure	Project Consistency
Building Efficiency (BE)	
BE-1: Electrified retrofits. Incentivize significant building retrofits with fewer or no natural gas appliances to reduce pollution and increase cost savings.	**Not applicable**. The proposed project would include the development of a new light industrial warehouse and would not retrofit existing buildings.
BE-2: Electrified new construction. Commit to developing a reach code limiting natural gas use in new construction, or as directed by the State or regional agencies.	**Consistent**. The City of San Leandro has adopted a reach code limiting natural gas use in new construction, and the project would not include natural gas infrastructure.
Residential Energy Efficiency (RF)	
RF-1: Increase education and outreach for existing energy efficiency financing mechanisms, including theProgram for All-Inclusive Elder Care (PACE) programs and utility programs. Create new financing programs, such as a revolving loan program. **RF-2:** Prioritize City-funded energy retrofit programsin majority people of color census tracts or high energy cost burdened households. **RF-3:** Homeowner energy retrofits. Continue to promote energy efficiency programs and incentivesavailable to residential property owners. **RF-4:** Work with landlords and tenants' groups to increase energy efficiency and decrease energy costsin rental homes, including multi-family properties. Mitigate displacement risk by strengthening tenant protections, including relocation assistance and rightof return for tenants temporarily displaced by housing retrofits. Utilize methods such as the green lease to address the split incentive issue and preventtenants paying for property improvements.	**Not applicable.** The proposed project would include the development of a new light industrial warehouseand would not include residential uses.
Renewable Energy (RE)	
RE-1: East Bay Community Energy participation Encourage San Leandro households and businesses toswitch from PG&E electricity supplies to East Bay Community Energy, and commit to defaulting to Renewable 100 tier for 100 percent renewable energy.	**Consistent**. The project site is located in the East Bay Community Energy service area and tenants would be able to register for this electricity provider.
RE-2: Residential owner-occupied renewable energyPromote greater adoption of renewable energy generation and energy storage systems on owner- occupied new and existing homes. Leverage existing solar financing, tax, and rebate opportunities, and consider new financial incentives as needed.	**Not Applicable**. The proposed project would include the development of a new light industrial warehouse and would not include residential uses.
RE-3: Prioritize increasing and installing renewable energy generation systems and energy storage systems on rental homes, multi-family buildings, and affordable housing.	**Not Applicable**. The proposed project would include the development of a new light industrial warehouse and would not include residential uses.
RE-4: Increase renewable energy generation and energy storage capacity at nonresidential properties.Encourage the use of non-fossil fuel backup generation systems as much as possible.	**Consistent.** The proposed project would be required to comply with SLMC Chapter 7-5, Article 6 Green Building Code, which would require all new development to be consistent with Title 24, including the provision for solar-ready rooftop infrastructure.

San Leandro CAP Measure	Project Consistency
Reducing Auto Dependency (AD)	
AD-1: Traffic calming. Continue to provide the Neighborhood Traffic Calming Program and related efforts to reduce travel speeds and cut through traffic in residential areas.	**Consistent**. The proposed project would not include a roadway that could be used to cut through residential neighborhoods and would facilitate travel to the proposed project driveways.
AD-2: Transit-oriented development. Continue to concentrate multi-family development and pedestrian-oriented mixed-use development within existing [Transit Oriented Development] TOD areas and along major transit corridors.	**Not Applicable**. The proposed project is not a multi-family development or pedestrian-oriented mixed-use development.
AD-3: Infill development. Focus new housing development on underutilized or vacant infill sites on flatter lands and continue to discourage new development in hillside areas.	**Not Applicable**. The proposed project include the development of a new light industrial warehouse and would not include residential uses.
AD-4: Evaluate parking standards. Evaluate parking standards and continue to support shared parking and other efforts to ensure the availability of necessary parking while reducing vehicle miles traveled.	**Consistent**. The proposed project would provide parking consistent with development standards contained in the SLMC.
Active and Alternative Transportation (AT)	
AT-1: Transportation Demand Management (TDM). Require local employers above a certain number of employees to develop programs that promote ride sharing, flextime, telecommuting, and other means to reduce commute trips and congestion, and target 10 percent mode shift.	**Consistent**. Although the number of employees that would be employed by the proposed project is unknown at the time of preparation of this report, the proposed project would comply with any City TDM programs should they apply. In addition, the CAP does not provide a numerical number of employees where a TDM program would be applicable.
AT-2: Bicycle infrastructure. Expand San Leandro's bicycle network and supportive bicycle infrastructure, including funding buildout of the City's bicycle network as identified in the current Bicycle and Pedestrian Master Plan, to meet commute trip, non-commute trip, and recreational needs.	**Consistent**. The proposed project would not inhibit the expansion of the City's bicycle network, because it would be consistent with existing Building Codes and would not prevent the installation of bicycle lanes or infrastructure adjacent to the project site. Additionally, the project would include 14 bicycle parking spaces.
AT-3: Active transportation and micro-mobility. Commit to implementing bikeshare, scooters, and micro-mobility options, and accompanying creative payment options, such as accepting cash deposits foraccess. **AT-4:** Walkability. Improve walkability of all streets and paths in San Leandro, including removing barriersto walking and adding places of rest and shade. Prioritize new infrastructure and modernized curb ramps in majority people of color census tracts andnear assisted living facilities and senior centers. **AT-5:** Public transit. Work collaboratively with AC Transit and BART for abundant, affordable, and accessible public transit through improved servicefrequency, coverage, and quality throughout San Leandro. Support efforts to increase schedule integration. **AT-6:** BART shuttles. Continue LINK and FLEX shuttlebus services connecting BART stations and other major activity centers, including efforts to improve shuttle efficiency and comprehensiveness.	**Not Applicable.** These CAP measures would be the responsibility of the City of San Leandro to implement, rather than individual development projects.

San Leandro CAP Measure	Project Consistency
AT-7: Car sharing. Expand car sharing through additional incentives, location of car sharing sites,and education and outreach. **AT-8:** Autonomous vehicles. Explore opportunities to effectively reduce GHG emissions associated with autonomous vehicles.	
Transportation Electrification and Low-Carbon Fuels (TE)	
TE-1: Electric vehicle adoption. Conduct education and outreach to inform members of the public aboutthe availability of EVs, and the economic incentives available to encourage EV adoption. **TE-2:** Increase the availability of publicly accessible EV charging stations at multi-family residential buildings,retail centers, offices, and public facilities.	**Consistent.** The proposed project includes the development of a new warehouse that would be subject to Title 24 requirements mandating EV charging infrastructure.
TE-3: Alternative commercial fuels. Support increasesin community-wide uses of biomethane, biofuels from sustainable sources, and other emerging clean fuel technologies. **TE-4:** Municipal fleet fuel reduction. Further reducefossil fuel use in municipal fleet operations. **TE-5:** EV financing. Support funding mechanisms (e.g., revolving loan fund, grants, public bank finance) to enable low-income truck owner-operators to upgradeto EVs without undue debt burden. **TE-6:** Electric taxis and TNCs. Promote fuel efficiencyand alternative fuels for taxis and Transportation Network Companies (TNCs), including a funding mechanism to support ride sharing drivers to move from fossil-fueled cars to EVs (e.g., require Lyft/Uberto pay for upgrade).	**Not Applicable.** These CAP measures would be the responsibility of the City of San Leandro to implement rather than individual development projects.
Waste Management (WM)	
WM-1: Increased curbside recycling. Increase participation in curbside recycling programs, includingefforts to reduce material contamination and improvements to waste educational programs.	**Consistent**. The proposed project would be required to comply with the City's construction debris and waste recycling ordinance. The proposed project would be provided waste removal services by Oro Loma Sanitary District,which provides recycling services for residential uses.
WM-2: Curbside composting. Expand participation in composting programs, including partnerships with community organizations such as StopWaste and a mandatory curbside composting program for all businesses.	**Consistent**. The Oro Loma Sanitary District would provide Green Waste bins for the proposed project's waste disposal and the proposed project would participate in mandatory composting practices for businesses.
WM-3: Recycling expansion. Continue to promoteprograms for recycling electronic waste and othermaterials that are not accepted in curbside bins.	**Not Applicable**. This CAP measure would be the responsibility of the City of San Leandro to implement, rather than individual development projects.
Waste Reduction and Reuse (WR)	
WR-1: Waste minimization. Explore emerging opportunities for waste minimization, includingmaker spaces, material reuse, and tool-lending libraries.	**Not Applicable**. This CAP measure would be the responsibility of the City of San Leandro to implement, rather than individual development projects.
WR-2: Construction and Demolition waste. Explore opportunities to exceed State requirements for construction and demolition materials by encouraging deconstruction and material reuse.	**Consistent**. The proposed project construction contractor would be required to comply with SLMC Section 3-7 related to constructionwaste and debris recycling.

San Leandro CAP Measure	Project Consistency
WR-3: Commercial food waste reduction. Work with restaurants and other food-processing businesses toreduce food waste.	**Not Applicable.** The proposed project would not include restaurant or food processing land uses.
WR-4: Industrial waste reduction. Work with business leaders and organizations to reduce industrial waste, including packaging materials.	**Consistent.** The City would initiate coordination with the proposed project owners to identify industrial waste reduction goals or programs that would apply and would seek to develop a plan to reduce industrial waste.
WR-5: Styrofoam and single-use plastics reduction.Continue to enforce bans on Styrofoam for food- related businesses and explore opportunities to reduce single-use plastic items. **WR-6:** Local compost. Support programs for locally-produced compost, including programs run by localand regional partners.	**Not Applicable**. This CAP measure would be the responsibility of the City of San Leandro to implement, rather than individual development projects.
Water Efficiency (WE)	
WE-1: Reclaimed water. Expand San Leandro'sreclaimed water system. **WE-2:** Greywater retrofits. Support installation of greywater recycling systems and other systems thatcapture runoff for domestic use and landscaping. **WE-3**: Water-efficient retrofits. Promote water efficiency in existing homes and businesses.	**Not Applicable**. This CAP measure would be the responsibility of the City of San Leandro to implement, rather than individual development projects. **Not Applicable**. This CAP measure would be the responsibility of the City of San Leandro to implement, rather than individual development projects. **Not Applicable**.
WE-4: New Greywater Installations. Continue to require water conservation and green infrastructurestrategies as a condition of approval for major developments.	**Consistent.** The proposed project would include drought landscaping consistent with Title 24 and Cityof San Leandro requirements that would be appropriate for the local climate and contribute to conserving outdoor water use.
Community Consumption (CC)	
CC-1: Environmentally Preferred Purchasing**.** Continue to promote and enforce Environmentally Preferred Purchasing policies for City operations andencourage community businesses to adopt similar policies. **CC-2:** Local Goods and Services. Continue Keep It Local SL campaign efforts and encourage businessesproviding a variety of goods and services to locate inSan Leandro. **CC-3:** Low Carbon Building Materials**.** Work with local, regional, and State partners to expand the awareness of, availability, and cost-effectiveness oflow carbon or carbon-free construction materials.	**Not Applicable.** These CAP measures would be the responsibility of the City of San Leandro to implement, rather than not individual development projects.
CC-4: Carbon Sequestration. Promote increasing soilcarbon and planting high carbon sequestering, climate appropriate species in landscaping projects.	**Consistent.** The proposed project would include landscaping consistent with City of San Leandro requirements that would be appropriate for the local climate and contribute to carbon sequestration on- site.

San Leandro CAP Measure	Project Consistency
Equity and Just Transition (EJ)	
EJ-1: Green Job Training. Maximize opportunities forgreen jobs by supporting workforce training and other economic development activities in a manner that supports labor unions and improved equity. **EJ-2: Workforce Equity.** Prioritize formerly incarcerated individuals, individuals with barriers to employment for green workforce development programs through 'ban the box' and other procurement standards. Perform culturally-sensitivetargeted outreach for these programs. **EJ-3: Just Transition.** Work to replace environmentally harmful industries with green jobs in a manner that benefits the health and well-being of workers from these industries.	**Not Applicable.** These CAP measures would be the responsibility of the City of San Leandro to implement, rather than individual development projects.

LESS-THAN-SIGNIFICANT IMPACT

9 Hazards and Hazardous Materials

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	□	□	■	□
b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	□	□	■	□
c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school?	□	□	■	□
d. Be located on a site that is included on a list of hazardous material sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	□	■	□	□
e. For a project located in an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	□	□	■	□
f. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	□	□	□	■
g. Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?	□	□	□	■

Hazards and Hazardous Materials Setting

A Phase I Environmental Site Assessment (ESA) was prepared for the project site by Roux Associates, Inc. (Roux) in November 2021. Rincon Consultants, Inc. peer reviewed this ESA in December 2022. As part of the Phase I ESA, Environmental Data Resources, Inc. (EDR) was contracted to provide a database search of public lists of sites that generate, store, treat, or dispose of hazardous materials or sites for which release or incident has occurred for the project site and surrounding area. Federal, state, and country lists were reviewed as part of the research effort. The Phase I ESA and peer review memorandum are presented in Appendix H.

Methodology

Roux performed two site assessments and a records review to identify Recognized Environmental Conditions (RECs). American Society for Testing Materials(ASTM) International is an international standards organization that develops and publishes voluntary consensus technical standards for a wide range of materials, products, systems, and services (ASTM 2023). ASTM International defines RECs as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property due to a release to the environment, under conditions indicative of a release to the environment, or under conditions that pose a material threat of a future release to the environment. In addition, Roux evaluated the site for Controlled Recognized Environmental Conditions (cRECs) and Historical Recognized Environmental Conditions (hRECs). cRECs are RECs that have been addressed to the satisfaction of the applicable regulatory authority with hazardous substances allowed to remain in place subject to the implementation of required controls. hRECs are a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority without subjecting the property to any required controls (Appendix H).

Roux contracted with EDR to review databases maintained by local, state, and federal government agencies, and other records available from commercial and online sources. Roux also contacted government agencies, including the United States Environmental Protection Agency, the San Francisco Bay RWQCB, BAAQMD, the Alameda County Public Works Agency, the Alameda County Department of Environmental Health, and the City of San Leandro, for information regarding potential environmental conditions at the site.

No known or suspected RECs or cRECs were identified in connection with the current and historical operations at the project site (Appendix H).

Based on information obtained from the site assessments and records review, the following hRECs are associated with current and historical operations at the project site or adjacent properties (Appendix H):

- **hREC 1: Custom Ironwork Facility.** The building located at 14143-A Washington Avenue within the northeastern portion of the project site was a custom ironworks shop for over 20 years. Miscellaneous paints, cleaners, and lubricating/cutting oils in consumer-sized containers were observed throughout the structure. Given the long-term operation of the ironworks shop and the relatively poor housekeeping of materials within the structure, this facility was determined to pose a potential concern in relation to the project site. Roux completed subsurface investigations, which did not indicate subsurface contamination resulting from the ironworks shop; therefore, this item is considered an hREC.
- **hREC 2: Oil/Water Separator.** Roux observed a belowground oil/water separator located south of the car wash structure in the central portion of the project site. Wastewater from the former

wash station in this structure likely entered a floor drain in the structure and was discharged into the separator prior to being discharged into the municipal sewer system. Waste fluids such as motor vehicle fuels, new and used engine oil, hydraulic oil, coolant, battery acid, and other vehicle fluids may have been discharged into the separator. Subsurface investigations completed by Roux did not indicate subsurface contamination resulting from this former project site use; therefore, this item is considered a hREC.

- **hREC 3: Former Underground Storage Tank (UST) without Regulatory Closure.** Of the four USTs known to have existed on the project site, three received regulatory closure. A 550-gallon waste oil tank located along the southern boundary of the project site was removed under the oversight of the San Leandro Fire Department; subsurface investigations performed by Roux did not indicate subsurface contamination resulting from this UST; therefore, this item is considered an hREC.
- **hREC 4: Former USTs with Regulatory Closure.** Three USTs, including two 1,000-gallon diesel tanks and one 5,000-gallon gasoline tank were removed from the project site in 1991 and 1992. Records indicate that these USTs were removed under the oversight of the San Leandro Fire Department and received regulatory closure from the San Francisco Bay RWQCB in 1997. Subsurface investigations performed by Roux did not indicate subsurface contamination resulting from these USTs; therefore, these items are considered hRECs.

Regulatory Setting

Department of Toxic Substances Control

As a department of CalEPA, the Department of Toxic Substances Control (DTSC) regulates hazardous waste, cleans up existing contamination, and looks for ways to reduce the hazardous waste produced in California. DTSC regulates hazardous waste in California primarily under the authority of the Resource Conservation and Recovery Act (RCRA) and the California Health and Safety Code.

DTSC also administers the California Hazardous Waste Control Law (HWCL) to regulate hazardous wastes. While the HWCL is generally more stringent than RCRA, until the USEPA approves the California program, both state and federal laws apply in California. The HWCL lists 791 chemicals and approximately 300 common materials that may be hazardous; establishes criteria for identifying, packaging, and labeling hazardous wastes; prescribes management controls; establishes permit requirements for treatment, storage, disposal, and transportation; and identifies some wastes that cannot be disposed of in landfills.

Government Code Section 65962.5 requires the DTSC, the State Department of Health Services, SWRCB, and the California Department of Resources Recycling and Recovery (CalRecycle) compile and annually update lists of hazardous waste sites and land designated as hazardous waste sites throughout the state. The Secretary for Environmental Protection consolidates the information submitted by these agencies and distributes it to each city and county where sites on the lists are located. Before the lead agency accepts an application for any development project as complete, the applicant must consult these lists to determine if the site at issue is included.

If any soil is excavated from a site containing hazardous materials, it is considered a hazardous waste if it exceeds specific criteria in Title 22 of the CCR. Remediation of hazardous wastes found at a site may be required if excavation of these materials is performed, or if certain other soil disturbing activities would occur. Even if soil or groundwater at a contaminated site does not have the characteristics required to be defined as hazardous waste, remediation of the site may be

required by regulatory agencies subject to jurisdictional authority. Cleanup requirements are determined on a case-by-case basis by the agency taking jurisdiction.

Regional Water Quality Control Board

The Regional Water Quality Control Board (RWQCB) regulates discharges and releases to surface and groundwater in the project area. The RWQCB generally oversees cases involving groundwater contamination. The County of Alameda Department of Environmental Health handles most leaking underground storage tank cases, so the RWQCB may oversee cases involving other groundwater contaminants, i.e., Spills, Leaks, Incidents, and Clean-up cases. In the case of spills at a project site, the responsible party would notify the County of Alameda, RWQCB, or DTSC and a lead would be determined.

RWQCB has established guidelines used to evaluate the potential risk associated with chemicals found in soil or groundwater where a release of hazardous materials has occurred called Environmental Screening Levels (ESLs). ESLs were developed to expedite the identification and evaluation of potential environmental concerns at contaminated sites. ESLs address soil, groundwater, soil gas, and indoor air and cover a range of concerns (e.g., impacts to drinking water, aquatic habitat, and vapor intrusion).

San Leandro Environmental Services Section

The City of San Leandro Environmental Services Section is designated as the City's Certified Unified Program Agency (CUPA), which is overseen by the California Environmental Protection Agency and coordinates the regulation of hazardous materials and hazardous wastes in the City. CUPA ensures the consistent application of statewide standards during administrative, permitting, inspection, and enforcement activities associated with hazardous materials and hazardous wastes. If a business operated at the project site would use and store hazardous materials and generate hazardous wastes, CUPA would require the electronic submittal of chemical and facility information, a Hazardous Materials Business Plan, and hazardous waste generator permits to the California Environmental Reporting System online database. If operations at the project site would include the treatment, storage, and/or disposal of hazardous waste, the City Environmental Services Section would regulate these activities under a tiered permitting system.

CUPA, through the Hazardous Materials Office, regulates USTs containing hazardous materials, including installation, operation and maintenance, temporary closure, and removal and disposal of USTs. Additionally, CUPA holds the responsibility and authority to implement the Aboveground Petroleum Storage Act, which regulates aboveground petroleum storage tanks through administrative requirements, permitting, inspections, and enforcement. Any aboveground or underground storage tanks present at the project site would be managed by the City Environmental Services Section.

The Hazardous Materials Office administers the California Accidental Release Prevention (CalARP) Program, which aims to reduce the likelihood and impact of accidental releases of regulated toxic and flammable substances through administrative and operational procedures, and facility inspections. If the facility located on the project site would be regulated under the CalARP Program, the facility would file a written Risk Management Plan with the City Environmental Services Section.

San Leandro 2035 General Plan

The following Environmental Hazards Element policies of the San Leandro 2035 General Plan reduce potential hazards related to hazardous materials.

ENVIRONMENTAL HAZARDS ELEMENT

Goal EH-5 Protect local residents and workers from the risks associated with hazardous materials.

Policy EH-5.1 **Regulatory Compliance.** Work with the appropriate county, regional, state, and federal agencies to develop and implement programs for hazardous waste reduction, hazardous material facility siting, hazardous waste handling and disposal, public education, and regulatory compliance.

Policy EH-5.2 **Clean-Up of Contaminated Sites.** Ensure that the necessary steps are taken to clean up residual hazardous wastes on any contaminated sites proposed for redevelopment or reuse. Require soil evaluations as needed to ensure that risks are assessed and appropriate remediation is provided.

Policy EH-5.4 **Separation from Sensitive Uses.** Provide adequate and safe separation between areas where hazardous materials are present and sensitive uses such as schools, residences, and public facilities. Zoning and other development regulations should include performance standards to avoid safety hazards and achieve compatibility between uses.

Impact Analysis

a. Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

b. Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction

Project construction may include the temporary transport, storage, use, or disposal of potentially hazardous materials including fuels, lubricating fluids, cleaners, solvents, or contaminated soils. If spilled, these substances could pose a risk to the environment and to human health. However, the transport, storage, use, or disposal of hazardous materials is subject to various federal, state, and local regulations designed to reduce risks associated with hazardous materials, including potential risks associated with upset or accident conditions. Hazardous materials would be required to be transported under U.S. Department of Transportation (USDOT) regulations (USDOT Hazardous Materials Transport Act, 49 Code of Federal Regulations), which stipulate the types of containers, labeling, and other restrictions to be used in the movement of such material on interstate highways. In addition, the use, storage, and disposal of hazardous materials are regulated through the RCRA. DTSC is responsible for implementing the RCRA program, as well as California's own hazardous waste laws. DTSC regulates hazardous waste, cleans up existing contamination, and looks for ways to control and reduce the hazardous waste produced in California. It does this primarily under the authority of RCRA and in accordance with the HWCL (California H&SC Division 20, Chapter 6.5) and

the Hazardous Waste Control Regulations (Title 22, California Code of Regulations, Divisions 4 and 4.5). DTSC also oversees permitting, inspection, compliance, and corrective action programs to ensure that hazardous waste managers follow federal and state requirements and other laws that affect hazardous waste specific to handling, storage, transportation, disposal, treatment, reduction, cleanup, and emergency planning. Compliance with existing regulations would reduce the risk of potential release of hazardous materials during construction. Impacts would be less than significant.

Operation

Commercial warehouse structures typically do not use or store large quantities of hazardous materials other than those typically used for office cleaning, maintenance, and landscaping. If the operation of the proposed project would require handling of hazardous materials, the use, storage, and disposal of hazardous materials would be regulated through the RCRA which is implemented by DTSC. Transport of hazardous materials, during the operation of the proposed project, would be required to be transported under U.S. Department of Transportation (USDOT) regulations (USDOT Hazardous Materials Transport Act, 49 Code of Federal Regulations), which stipulate the types of containers, labeling, and other restrictions to be used in the movement of such material on interstate highways. In the case of spills at a project site, the responsible party would notify the County of Alameda, RWQCB, or DTSC and a lead would be determined. Therefore, project operation would not involve the use, storage, transportation, or disposal of substantial quantities of hazardous materials and would not result in the release of such materials into the environment. Impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

c. Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school?

There are no schools within 0.25 mile of the project site, the closest school is James Monroe Elementary, approximately 0.5 miles southwest of the site, and project operation would not involve the use or storage of hazardous materials. Though potentially hazardous materials, substances, and waste such as fuels, lubricants, solvents, and oils could be used during project construction, the transport, use and storage of hazardous materials would be required to be conducted in accordance with all applicable State and federal laws, such as the Hazardous Materials Transportation Act, RCRA, the California Hazardous Material Management Act, and the CCR, Title 22. The project would have a less than significant impact on hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school.

LESS-THAN-SIGNIFICANT IMPACT

d. Would the project be located on a site that is included on a list of hazardous material sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

In addition to the database review conducted for the Phase I ESA, the following resources were reviewed to determine if hazardous materials may be present at the project site.

- **Department of Toxic Substances Control (DTSC)**
  - Online Cortese List of Hazardous Waste and Substances Sites (DTSC 2022)

- **California State Water Resources Control Board (SWRCB)**
  - Online GeoTracker database search for leaking underground storage tanks (LUST) and other cleanup sites (SWRCB 2022a)
  - Polyfluoroalkyl substances (PFAS) Investigation online Public Map Viewer (SWRCB 2022b)
- **California Department of Conservation Geologic Energy Management Division (CalGEM)**
  - Online Mapping System (CalGEM 2022)
- **U.S. Department of Transportation (USDOT)**
  - National Pipeline Mapping System (NPMS) online Public Map Viewer (USDOT 2022)
- **California Department of Resources Recycling and Recovery (CalRecycle)**
  - Solid Waste Information System (SWIS) (CalRecycle 2019)

DTSC Database Review

A review of the online Cortese List of Hazardous Waste and Substances Sites determined that the project site is not listed as a hazardous waste and substances site. One state response site is within 1,000 feet of the project site; however, the site enacts an annual monitoring program and was certified by DTSC as of October 2006.

SWRCB GeoTracker Database Review

A review of the online GeoTracker database determined that the project site contains a closed Leaking Underground Storage Tank cleanup site, which was closed in 1997. The project site is not listed as a hazardous waste and substances site. There are eight sites listed in the GeoTracker Database within 1,000 feet of the project site; five sites were determined to be completed by SWRCB and their cases were closed, and two are inactive. The remaining site, approximately 600 feet north of the project site, has a cleanup status of "open – site assessment" as of December 2016 (SWRCB 2022a).

PFAS Database Review

Beginning in 2019, the California SWRCB sent assessment requirements to property owners of sites that may be potential sources of PFAS. These sites currently include select landfills, airports, chrome plating facilities, publicly owned treatment works facilities, Department of Defense (DoD) sites, and bulk fuel storage terminals and refineries. According to the SWRCB, "PFAS are a large group of human-made substances that do not occur naturally in the environment and are resistant to heat, water, and oil" (SWRCB 2021). A review conducted on October 24, 2022 of the California Statewide PFAS Investigation online Public Map Viewer indicates that there are no current chrome plating, airport, landfill, publicly owned treatment works, DoD, or bulk fuel storage terminal or refinery PFAS orders at any facilities listed as located on the site or within one-half mile of the project site (SWRCB 2022b).

Well Finder Database Review

A review of the CalGEM Online Mapping System indicates that no oil wells are located on the project site, adjacent properties, or within 0.25 mile of the project site (CalGEM 2022).

Pipeline Database Review

The NPMS online Public Map Viewer indicates that one Pacific Gas and Electric Company-operated natural gas pipeline with an active status is located along Washington Avenue, which is adjacent to the north of the project site. The NPMS Viewer does not depict an accident or incident along the pipeline (USDOT 2022).

Landfill Database Review

The SWIS online database indicates that no landfills are located within one-half mile of the project site (CalRecycle 2019).

Review Summary

The project site is not listed as a DTSC Cortese hazardous material site compiled pursuant to Government Code Section 65962.5. Based on the database research conducted, the project site is not within one-half mile of a facility that could be a potential source of PFAS or a well containing PFOA or PFOS. Additionally, there are no oil wells, landfills, or pipelines with reported instances within 0.25 mile of the site.

While the Leaking Underground Storage Tank cleanup site within the project site is closed, it is possible that residual fuels and contaminants may be present in soils, which would be disturbed during project grading and construction. Release of soil vapors or contaminants would potentially create a hazard to the public or the environment. Mitigation Measure HAZ-1 would be required.

Mitigation Measure

HAZ-1 Preparation of a Soil Management Plan

The project applicant shall retain a qualified environmental consultant (Professional Geologist [PG] or Professional Engineer [PE]), to prepare a Soil Management Plan (SMP) prior to construction. The SMP or equivalent document shall be prepared to address onsite handling and management of impacted soils or other impacted wastes, and to reduce hazards to construction workers and offsite receptors during construction. The plans shall establish remedial measures and/or soil management practices to ensure construction worker safety, the health of future workers and visitors, and the off-site migration of contaminants from the site. These measures and practices may include, but are not limited to:

- Stockpile management including stormwater pollution prevention and the installation of BMPs
- Proper disposal procedures of contaminated materials
- Monitoring and reporting
- A health and safety plan for contractors working at the site that addresses the safety and health hazards of each phase of site construction activities with the requirements and procedures for employee protection

The City shall review and approve the development site plans for prior to ground disturbing or construction activities. Recommendations listed within the SMP shall be implemented as indicated prior to (preparation of the SMP) and during (adherence to the SMP) construction of the proposed project.

Mitigation Measure HAZ-1 would ensure that the disturbance of hazardous materials during ground-disturbing activities would result in a less than significant impact to workers, the public, and the environment. Impacts related to the release of hazardous materials into the environment would be less than significant with mitigation incorporated.

LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED

e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

The project site is approximately 3.8 miles east of Oakland International Airport and 3.3 miles north of the Hayward Executive Airport. The project site is not within the noise or safety compatibility zones of Oakland International Airport or Hayward Executive Airport (Alameda County Community Development Agency 2010; Alameda County Airport Land Use Commission 2010). Therefore, the project would not result in a safety hazard or excessive noise for people working in the project area. Impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

f. Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Project construction would not require the closure of nearby roads and would not result in the need for detours. Construction activities would be limited to the project site and equipment and vehicles would be stationed within the site. The proposed project would not obstruct existing roadways or require the construction of new roadways or access points. Therefore, the proposed project would not block emergency response or evacuation routes or interfere with adopted emergency response and emergency evacuation plans. No impact would occur.

NO IMPACT

g. Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?

The project site is in a developed, urbanized area surrounded by commercial development and roadways. No wildlands or densely vegetated areas are located nearby that would represent a significant fire hazard. The project does not fall within a High Fire Hazard Severity Zone or Very High Fire Hazard Severity Zone for wildland fires; the nearest Fire Hazard Severity Zone is 1.2 miles west of the project site (CALFIRE 2006). As discussed further in Section 20, *Wildfire*, the project would not expose people or structures to significant hazards related to wildland fires and there would be no impact.

NO IMPACT

This page intentionally left blank.

10 Hydrology and Water Quality

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	□	□	■	□
b. Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	□	□	■	□
c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
(i) Result in substantial erosion or siltation on- or off-site;	□	□	■	□
(ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;	□	□	■	□
(iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	□	□	■	□
(iv) Impede or redirect flood flows?	□	□	■	□
d. In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	□	□	■	□
e. Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	□	□	■	□

Setting

The project site is approximately 3.45 acres and generally flat, with an elevation of 40 feet above sea level (Google Earth 2022). There is an existing storm drain system on Washington Avenue. The site is approximately 2.5 miles east of the San Francisco Bay, 2.2 miles northwest of San Lorenzo Creek, and 1.5 miles south of San Leandro Creek. Both creeks flow to the west and terminate in the San Francisco Bay. The City of San Leandro receives approximately 21 inches of rain annually, with rainfall concentrated in the winter months (National Oceanic and Atmospheric Administration 2022).

Regulatory Setting

Clean Water Act

Congress enacted the CWA, formerly the Federal Water Pollution Control Act of 1972, with the intent of restoring and maintaining the chemical, physical, and biological integrity of the waters of the U.S. The CWA requires states to set standards to protect, maintain, and restore water quality through the regulation of point source and non-point source discharges to surface water. The National Pollutant Discharge Elimination System (NPDES) permit process regulates those discharges (CWA Section 402). NPDES permitting authority is administered by the SWRCB and its nine RWQCBs. The project site is in a watershed administered by the San Francisco Bay RWQCB (San Francisco Bay RWQCB 2022).

California Porter Cologne Water Quality Control Act

The Porter Cologne Water Quality Control Act of 1967 requires the SWRCB and the nine RWQCBs to adopt water quality criteria to protect State waters. These criteria include the identification of beneficial uses, narrative and numerical water quality standards, and implementation procedures. The criteria for state waters in the region are contained in the *Water Quality Objectives* Chapter of the Basin Plan for the San Francisco Bay RWQCB (San Francisco Bay RWQCB 2017). The Water Quality Control Plan, or Basin Plan, protects designated beneficial uses of State waters through the issuance of Waste Discharge Requirements and through the development of total maximum daily loads. Anyone proposing to discharge waste that could affect the quality of the waters of the State must make a report of the waste discharge to the RWQCB or SWRCB, as appropriate, in compliance with Porter-Cologne.

Alameda County Clean Water Program

The City of San Leandro is a member agency of the Alameda County Clean Water Program (ACCWP), which was established in response to federal stormwater NPDES regulations. Pursuant to the ACCWP Stormwater C.3 Technical Guidance (ACCWP 2017), projects that create or replace 10,000 square feet or more of impervious surface must comply with Provision C.3, which requires incorporation of appropriate source control, site design, and stormwater treatment measures in new development and redevelopment projects to address stormwater runoff pollutant discharges and prevent increases in runoff flows. The proposed project would be subject to this provision and would be required to implement appropriate measures.

Municipal Regional Permit Provision C.3

The San Francisco Bay RWQCB re-issued the Municipal Regional Stormwater NPDES Permit (MRP) in 2015 to regulate stormwater discharges from municipalities and local agencies (co-permittees) in

Alameda, Contra Costa, San Mateo, and Santa Clara counties. Under Provision C.3 of the MRP, new and redevelopment projects that create or replace 10,000 square feet or more of impervious surface area are required to implement site design, source control, and Low Impact Development (LID)-based stormwater treatment controls to treat post-construction stormwater runoff. LID-based treatment controls are intended to maintain or restore the site's natural hydrologic functions, maximizing opportunities for infiltration and evapotranspiration, and using stormwater as a resource (e.g., rainwater harvesting for non-potable uses). The MRP also requires that stormwater treatment measures are properly installed, operated, and maintained. In addition, the City would require a Stormwater Treatment Measures and Hydromodifications Management Controls Maintenance Agreement.

In addition to water quality controls, the MRP requires new development and redevelopment projects that create or replace one acre or more of impervious surface to manage development-related increases in peak runoff flow, volume, and duration, where such hydromodification is likely to cause increased erosion, silt pollutant generation, or other impacts to local rivers, streams, and creeks. Projects may be deemed exempt from these requirements if they do not meet the minimized size threshold, drain into tidally influenced areas or directly into the Bay, or drain into hardened channels, or if they are infill projects in subwatersheds or catchment areas that are greater than or equal to 65 percent impervious.

The project would be required to comply with all requirements in the MRP. This permit was reissued the Regional Water Quality Control Board in May 2022.

City of San Leandro Municipal Code

Chapter 3-15 of SLMC regulates discharges into the City's stormwater system. Chapter 3-15 requires implementation of stormwater and erosion best management practices and compliance with the CWA and NPDES permits to eliminate non-stormwater discharges to the municipal separate storm sewer. Further, Chapter 7-12 of SLMC requires development projects to submit erosion and sedimentation control plans and drainage plans to the City for approval prior to project construction.

City of San Leandro 2035 General Plan

The following policies are applicable to the proposed project:

OSC-7.2 **Water Conservation.** Promote the efficient use of existing water supplies through a variety of water conservation measures, including the use of recycled water for landscaping.

OSC-7.3 **Drought Tolerant Landscaping.** Encourage the use of native vegetation and Bay-friendly landscaping and enforce the State Department of Water Resources Model Water Efficient Landscape Ordinance.

Impact Analysis

a. Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

b. Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Construction

Project construction has the potential to impact water quality through erosion and through debris carried in runoff. Construction would involve heavy equipment that could result in an increase in fuel, oil, and lubricants in stormwater runoff due to leaks or accidental releases. To minimize these impacts, the project would be required to comply with SLMC Chapter 7-12, which details requirements for erosion and sediment control plans, and with SLMC Chapter 3-15, which regulates discharge of materials into curbside gutters, storm sewers, and storm drains. The project would be required to implement BMPs for drainage and erosion control during construction and meet requirements for stormwater and sewer discharge.

In addition, as the project would disturb more than one acre, the project applicant would be required to obtain coverage under the statewide NPDES General Permit for Discharges of Storm Water associated with Construction Activity, Construction General Permit Order 2009-0009 DWQ (Construction General Permit), administered by the State Water Resources Control Board pursuant to Section 402 of the Clean Water Act. Coverage under the NPDES Permit would require implementation of a Stormwater Pollution Prevention Program and various site-specific BMPs to reduce erosion and loss of topsoil during project construction. Compliance with the NPDES permit and BMPs during construction such as straw wattles, silt fencing, concrete washouts, and inlet protection during construction would reduce impacts resulting from loss of topsoil. Construction would require water for dust suppression, but water use would be temporary and would cease upon the completion of construction. The project would not extract groundwater or directly interfere with the groundwater table through construction activities on the site, as ground disturbance would not occur below the water table. Compliance with state and local requirements would reduce impacts to surface and ground water quality to less than significant levels.

Operation

The City of San Leandro overlies the Santa Clara Valley (East Bay Plain) Groundwater Subbasin, which is bounded by San Pablo Bay to the north, the Diablo Range to the east, the San Francisco Bay to the west, and a groundwater divide near the City of Hayward to the south (California's Groundwater 2004). Currently, the project site is almost completely developed with hardscaped surfaces; the project would reduce the amount of impervious surfaces on the site through the inclusion of approximately 18,000 square feet of landscaped areas. These landscaped areas, consisting of planters along the eastern, western, and southern boundaries of the project site, would be bioretention treatment areas that would filter runoff and facilitate groundwater recharge. Remaining water that would not recharge into the groundwater would be released into the City's existing storm drain system via the storm drain on Washington Avenue, which outfalls into the San Francisco Bay. The project would be required to comply with SLMC Chapter 3-15, which requires development to implement permanent stormwater pollution prevention measures that are consistent with the City's NPDES permit. The project applicant would be required to submit a

stormwater management plan that would be subject to City approval prior to issuance of a grading permit.. The project would also comply with the City's C.3 Stormwater Guidelines, which outlines acceptable stormwater controls under the NPDES permit issued by RWQCB. Therefore, project operation would not substantially interfere with groundwater recharge, impact groundwater quality, or impede sustainable groundwater management of the Santa Clara Valley (East Bay Plain) Groundwater Subbasin.

The East Bay Municipal Utility District (EBMUD) would supply water to the project site. Approximately 90 percent of the EBMUD water supply originates from the melting snowpack of the Sierra Nevada. The principal water source is the Mokelumne River watershed, a 575-square mile area located in Alpine, Amador, and Calaveras Counties. Water is stored in reservoirs in the Sierra foothills and is transported by aqueduct to filter plants and reservoirs in the East Bay Hills. The other 10 percent of the EBMUD's water comes from runoff on protected East Bay Area watershed lands. EBMUD also has a contract for water supply intake from the Central Valley Project (CVP) on the Sacramento River. EBMUD relies on CVP deliveries during dry and critically dry periods (EBMUD 2021). The project would not extract groundwater or directly interfere with the groundwater table through operational activities on the site. Because the project would be served by a water utility with enough supply that does not extract groundwater, and the project would not interfere with groundwater recharge, impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

c.(i) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site?

c.(ii) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

c.(iii) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner that would create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

c.(iv) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows?

The nearest creeks to the project site, San Lorenzo Creek and San Leandro Creek, are 2.2 miles and 1.5 miles away from the site, respectively. Existing development between the project site and San Lorenzo and San Leandro Creeks include roadways as well as residential, commercial, and industrial developments. Neither project construction nor operation would alter the course of these creeks or other nearby creeks, streams, or rivers.

The project site was previously developed but is currently vacant and mostly paved. The project is designed to include six drainage management areas that would direct stormwater flows to stormwater drains and landscaped areas. Because the site is currently developed almost entirely with impervious surfaces, the landscaping included in the project would result in a net decrease in

impervious surfaces. The project would result in a net increase of 18,104 square feet of pervious surfaces. Portions of project landscaping, located in the along the western and eastern boundaries of the project site and adjacent to proposed parking areas would serve as bioretention areas to promote filtration and infiltration of stormwater from the project site. Project landscaping would provide 5,622 square feet of stormwater treatment area, which would filter stormwater prior to its discharge into the existing storm drain system or infiltration into groundwater sources. Additionally, the project would be required to incorporate stormwater control measures and NPDES permit requirements to reduce the amount of runoff that would enter the storm drain system compared to existing conditions. Therefore, impacts would be less than significant.

The project would connect to the City's storm drain system, which delivers stormwater and other runoff into local streams and creeks and ultimately to the San Francisco Bay. The project would incorporate stormwater bioretention areas to ensure that post project stormwater runoff would not exceed existing conditions. Therefore, the project would not result in flooding on or off site or substantial erosion or siltation of a creek or river.

LESS-THAN-SIGNIFICANT IMPACT

d. In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation?

According to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map, the project site is located in Zone X, which is characterized as an area of minimal flood hazard and having a less than 0.2 percent annual chance to be inundated by flood waters as a result of a storm event (Map #06001C0259G, August 3, 2009) (FEMA 2022). According to the California Governor's Office of Emergency Services (Cal OES) MyHazards online database, the project site is not located in a 100-year floodplain (Cal OES 2015).

The project site is located approximately 2.5 miles east of the San Francisco Bay and is not located in a tsunami or seiche zone, as shown in the Alameda County Tsunami Hazard Areas maps produced by the California Department of Conservation (DOC) (DOC 2021). The nearest body of water that could experience seiche (water level oscillations in an enclosed or partially enclosed body of water) is the San Francisco Bay. No other large bodies of water with the potential to inundate the project site by a seiche are located near the site. Therefore, the proposed project would not result in the risk of release of pollutants due to inundation by a tsunami, seiche, or flooding. Impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

e. Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

EBMUD would serve the project site and this agency maintains an Urban Water Management Plan. EBMUD maintains a wastewater treatment plant in Oakland to ensure that water quality standards and goals are met. As discussed above in Criterion a, the project would not interfere with the ability of the City to maintain water quality standards pursuant to EBMUD's Urban Water Management Plan (UWMP) (EBMUD 2021). EBMUD does not rely on groundwater sources. Therefore, project implementation would not conflict with a sustainable groundwater management plan. Moreover, as outlined above in item (a), the proposed grading would be required to comply with applicable provisions of SLMC 7-12, which ensures protection of watercourses and drainages. Impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

11 Land Use and Planning

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Physically divide an established community?	□	□	□	■
b. Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	□	□	□	■

Setting

As stated in the *Project Description*, the project site has a General Plan land use designation of Industrial Transition and is zoned as Commercial Community. The Industrial Transition designation corresponds to areas that have historically been industrial but have transitioned or may transition in the future to a more diverse mix of uses, including general commercial activities (City of San Leandro 2016a). Commercial Community zones include but are not limited to business services and office uses. Allowable intensity on the project site is up to 1 FAR, and maximum building height is up to 50 feet with City approval.

Impact Analysis

a. Would the project physically divide an established community?

The project would involve redevelopment of an existing site. No new roads, linear infrastructure, or other development features are proposed that would divide an established community or limit movement, travel, or social interaction between established land uses. Project construction would not physically divide an established community; there would be no impact to established communities.

NO IMPACT

b. Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

San Leandro 2035 General Plan

The City's General Plan contains several land use policies with the purpose of avoiding or mitigating an environmental effect. Table 20 shows applicable General Plan land use policies that aim to avoid or mitigate environmental effects and the project's consistency with those policies.

Table 20 Project Consistency with San Leandro 2035 General Plan Land Use Policies

General Plan Policy	Project Consistency
Policy LU 1.14. Construction Impacts. Ensure that construction activities are regulated and monitored in a manner that minimizes the potential for adverse off-site impacts such as noise, dust, erosion, exposure to hazardous materials, and truck traffic.	**Consistent.** The project would comply with existing applicable regulations that would minimize impacts to noise, dust, erosion, and exposure to hazardous materials. As discussed in Section 13, *Noise,* project construction and operation would not exceed noise limits established by the City and would not result in a significant impact. As discussed in Section 3, *Air Quality,* the project would not exceed applicable thresholds for particulate matter and would not result in a significant impact related to dust or air quality. As discussed in Section 10, *Hydrology and Water Quality,* the project would be required to comply with Section 3-15 and Section 7-12 of the SLMC, which outline construction erosion and stormwater best management practices and require the preparation of an erosion and sedimentation control plan. As concluded therein, the project would not result in substantial erosion or runoff. Finally, as discussed in Section 9, *Hazards and Hazardous Materials,* the project would not result in the release of hazardous materials to the environment and would not expose project occupants to substantial hazards and hazardous materials. As a warehouse development, the project would involve truck traffic. As discussed in Section 17, *Transportation,* traffic generated by the project would be consistent with existing commercial and light industrial uses in the project area, and would not result in significant impacts related to VMT.
Policy LU-10.2. Off-Site Impacts. Consider the setting and context of each site evaluating proposals for development in industrial areas. The potential for impacts on adjacent uses, including the potential for land use conflicts and increased parking demand and truck traffic, should be a key consideration.	**Consistent.** The project would involve development of a warehouse structure, which would be consistent with surrounding land uses including automobile repair shops to the north; commercial, storage, and automobile repair shops to the east; a home supply store to the south; and the City Public Works Department and warehouses to the west. Additionally, the project would involve rezoning the site from Commercial Community to Industrial General, which would facilitate project consistency with City zoning. The project would not result in a land use conflict. The project would include 64 parking spaces, which would exceed the 47 parking spaces required by City parking standards. As discussed in Section 17, *Transportation,* traffic generated by the project would be consistent with existing commercial and light industrial uses in the project area, and would not result in significant impacts related to VMT.

Source: City of San Leandro 2016a

As shown above, the project would be consistent with applicable City's General Plan policies that aim to avoid or mitigate environmental effects.

San Leandro Municipal Code

The SLMC contains several regulations that intend to avoid or mitigate environmental effects in the City. Table 21 shows policies that aim to avoid or mitigate environmental effects and the project's consistency with those regulations.

Table 21 Project Consistency with the SLMC

San Leandro Municipal Code	Project Consistency
Section 7-5-600. SLMC Section 7-5-600 adopts the California Green Building Standards Code (CALGreen) as the Green Building Code of San Leandro.	**Consistent.** As described in Section 6, *Energy,* the project would be required to implement the California Green Building Standards Code.
Chapter 5-2. Chapter 5-2 establishes that street trees in San Leandro are property of the City, and outlines requirements for removal and planting of street trees.	**Consistent.** According to the arborist report (Appendix A), the project would not require removal of street trees. As described in the *Project Description,* the project would involve removal of 10 onsite trees, none of which are street trees protected by this ordinance. The project would be consistent with this chapter of SLMC.
Chapter 3-15. Chapter 3-15 of SLMC contains standards and requirements for development projects to avoid non-stormwater discharges into the municipal separate storm sewer. **Chapter 7-12.** Chapter 7-12 contains standards and permit requirements for grading and excavation, and requires preparation of an erosion and sedimentation control plan and drainage plan in order to reduce water quality impacts of stormwater runoff from the site for the life of the project.	**Consistent.** As described in Section 10, *Hydrology and Water Quality,* the project would be required to comply with NPDES permit requirements, C.3 Stormwater Guidelines, and would involve the installation of bioretention areas to treat and direct stormwater flows. The project would also be required to comply with grading and excavation regulations established by the City and obtain appropriate permits prior to project approval. The project would be consistent with these chapters of the SLMC.
Chapter 3-22. Chapter 3-22 outlines Bay-friendly landscaping requirements for projects in San Leandro, which consists of native, low-water use vegetation.	**Consistent.** As described in the *Project Description,* the project would incorporate water efficient landscaping for plantings throughout the project site.

Source: SLMC 2022

As shown above, the project would be consistent with the SLMC and applicable building codes that intend to avoid or mitigate environmental effects.

LESS-THAN-SIGNIFICANT IMPACT

This page intentionally left blank.

12 Mineral Resources

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State?	☐	☐	☐	■
b. Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	☐	☐	☐	■

Setting

According to mapping completed by the State of California for suitability of use as construction materials, it was determined that no minerals or aggregate resources of statewide importance are located within San Leandro (California Department of Conservation 1996). In addition, there are no natural gas, oil, or geothermal resources identified in or adjacent to San Leandro.

Regulatory Setting

Surface Mining and Reclamation Act of 1975

Pursuant to the mandate of the Surface Mining and Reclamation Act of 1975, the State Mining and Geology Board requires all cities to incorporate into their general plans mapped mineral resources designations approved by the State Mining and Geology Board.

Impact Analysis

a. Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

b. Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

The project site and surrounding properties are part of an urbanized area with no current oil or gas extraction. San Leandro's 2035 General Plan does not identify mineral deposits of regional significance within the city (City of San Leandro 2016a). No mineral resource activities would be altered or displaced by the proposed project. There would be no impact.

NO IMPACT

This page intentionally left blank.

13 Noise

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project result in:				
a. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☐	■	☐
b. Generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	■	☐
c. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	■

Analysis in this section is based in part on a Noise Impact Analysis Report prepared by FirstCarbon Solutions in July 2022, which was peer-reviewed by Rincon Consultants in October 2022. FirstCarbon Solutions prepared a revised Noise Impact Analysis Report in January 2023. The revised report and peer review memorandum is included as Appendix I.

Noise Fundamentals

The unit of measurement used to describe a noise level is the decibel (dB). However, the human ear is not equally sensitive to all frequencies within the sound spectrum. Therefore, a method called "A-weighting" is used to filter noise frequencies that are not audible to the human ear. A-weighting approximates the frequency response of the average young ear when listening to most ordinary everyday sounds. When people make relative judgments of the loudness or annoyance of a sound, their judgments correlate well with the "A-weighted" levels of those sounds. Therefore, the A-weighted noise scale is used for measurements and standards involving the human perception of noise. In this analysis, all noise levels are A-weighted, and the abbreviation "dBA" is understood to identify the A weighted decibel.

Decibels are measured on a logarithmic scale that quantifies sound intensity in a manner similar to the Richter scale used for earthquake magnitudes. A 10 dB increase represents a 10-fold increase in sound intensity, a 20 dB increase is a 100-fold intensity increase, a 30 dB increase is a 1,000-fold intensity increase, etc. Similarly, a doubling of a noise source, such as doubling of traffic volume, would increase the noise level by 3 dB; a halving of the noise source would result in a 3 dB decrease.

Human perception of noise has no simple correlation with acoustical energy. The perception of noise is not linear in terms of dBA or in terms of acoustical energy. Two equivalent noise sources combined do not sound twice as loud as one source. It is widely accepted that the average healthy ear can barely perceive changes of 3 dBA (increase or decrease); that a change of 5 dBA is readily perceptible; and that an increase or decrease of 10 dBA sounds twice (half) as loud (California Department of Transportation [Caltrans] 2013).

Descriptors

The impact of noise is not a function of loudness alone. The time of day when noise occurs and the duration of the noise are also important. In addition, most noise that lasts for more than a few seconds is variable in its intensity. Consequently, a variety of noise descriptors has been developed. The noise descriptors used for this analysis are the one-hour equivalent noise level (L_{eq}) and the community noise equivalent level (CNEL).

The L_{eq} is the level of a steady sound that, in a specific time period and at a specific location, has the same A-weighted sound energy as the time-varying sound. For example, $L_{eq(1h)}$ is the equivalent noise level over a 1-hour period and $L_{eq(8h)}$ is the equivalent noise level over an 8-hour period. $L_{eq(1h)}$ is a common metric for limiting nuisance noise, whereas $L_{eq(8h)}$ is a common metric for evaluating construction noise.

The CNEL is a 24-hour equivalent sound level. The CNEL calculation applies an additional 5 dBA penalty to noise occurring during evening hours (between 7:00 p.m. and 10:00 p.m.) and an additional 10 dBA penalty to noise occurring during the night (between 10:00 p.m. and 7:00 a.m.). These increases for certain times are intended to account for the added sensitivity of humans to noise during the evening and night.

Propagation

Sound from a small, localized source (approximating a “point” source) radiates uniformly outward as it travels away from the source in a spherical pattern, known as geometric spreading. The sound level decreases or drops off at a rate of 6 dBA for each doubling of distance.

Traffic noise is not a single, stationary point source of sound. Over some time interval, the movement of vehicles makes the source of the sound appear to emanate from a line (line source) rather than a point. The drop-off rate for a line source is 3 dBA for each doubling of distance.

Vibration

Groundborne vibration of concern in environmental analysis consists of the oscillatory waves that move from a source through the ground to adjacent structures. The number of cycles per second of oscillation makes up the vibration frequency, described in terms of hertz (Hz). The frequency of a vibrating object describes how rapidly it oscillates. The normal frequency range of most groundborne vibration that can be felt by the human body is from a low of less than 1 Hz up to a high of about 200 Hz.

While people have varying sensitivities to vibrations at different frequencies, in general they are most sensitive to low-frequency vibration. Vibration in buildings, such as from nearby construction activities, may cause windows, items on shelves, and pictures on walls to rattle. Vibration of building components can also take the form of an audible low-frequency rumbling noise, referred to as groundborne noise. Groundborne noise may result in adverse effects, such as building damage, when the originating vibration spectrum is dominated by frequencies in the upper end of the range

(60 to 200 Hz). Vibration may also damage infrastructure when foundations or utilities, such as sewer and water pipes, physically connect the structure and the vibration source (Federal Transit Administration 2018). Although groundborne vibration is sometimes noticeable in outdoor environments, it is almost never annoying to people who are outdoors. The primary concern from vibration is that it can be intrusive and annoying to building occupants and vibration-sensitive land uses.

Vibration energy spreads out as it travels through the ground, causing the vibration level to diminish with distance away from the source. High-frequency vibrations diminish much more rapidly than low frequencies, so low frequencies tend to dominate the spectrum at large distances from the source. Discontinuities in the soil strata can also cause diffractions or channeling effects that affect the propagation of vibration over long distances (Caltrans 2013). When a building is impacted by vibration, a ground-to-foundation coupling loss will usually reduce the overall vibration level. However, under rare circumstances, the ground-to-foundation coupling may actually amplify the vibration level due to structural resonances of the floors and walls.

Vibration amplitudes are usually expressed in peak particle velocity (ppv) or RMS vibration velocity. The ppv and RMS velocity are normally described in inches per second (in/sec). The ppv is defined as the maximum instantaneous positive or negative peak of a vibration signal. The Federal Transit Administration established standards for vibration impact assessments These guidelines are published in its Transit Noise and Vibration Impact Assessment Manual and are summarized below in Table 22.

Table 22 Federal Transit Administration Construction Vibration Impact Criteria

Building Category	in./sec. ppv
Reinforced – Concrete, Steel, or Timber (no plaster)	0.5
Engineered Concrete and Masonry (no plaster)	0.3
Non-engineered Timber and Masonry Buildings	0.2
Buildings Extremely Susceptible to Vibration Damage	0.12

Source: Appendix I

Regulatory Setting

California Code of Regulations

The CCR, Title 24, Section 1207.4 requires interior noise levels attributable to exterior sources to be at or below 45 dBA in any habitable room of a development based on the noise metric used in the noise element of the local general plan. All residential windows, exterior doors, and exterior wall assemblies would be required to have sound transmission class ratings that would ensure adequate attenuation of noise at a range of frequencies. The Environmental Hazards Element of the City of San Leandro 2035 General Plan uses a noise metric of CNEL, consistent with the reference level for State noise law. Therefore, interior noise levels of the project would need to be at or below 45 dBA CNEL to be compliant with CCR requirements.

City of San Leandro 2035 General Plan

The Environmental Hazards Element of the General Plan provides goals, policies, and program to assure the appropriateness of new development with the noise environment of San Leandro.

Table 23 shows the General Plan's land use compatibility chart. Applicable goals and policies are as follows:

Goal NOI-1 Ensure that noise associated with the day-to-day activities of San Leandro residents and businesses does not impede the peace and quiet of the community.

EH-7.1 **Noise Compatibility Table.** Ensure that potential noise impacts are considered when new development is proposed. Projects that could significantly increase noise levels should incorporate mitigation measures to reduce such impacts. Apply the standards shown in Chart 7-2 when evaluating applications for future development. Chart 7-2 specifies the maximum noise levels that are normally acceptable, conditionally acceptable, and normally unacceptable for new development.

Table 23 City of San Leandro Noise and Land use Compatibility Guidelines

	Community Noise Exposure (CNEL dBA)			
Land Use Category	**Normally Acceptable**	**Conditionally Acceptable**	**Normally Unacceptable**	**Clearly Unacceptable**

City of San Leandro Municipal Code

Chapter 4-1 of the City's Municipal Code provides restrictions and regulations for noise within San Leandro. The noise-related code does not contain numerical noise level limits and is aimed more at prohibiting "disturbing, excessive and offensive noises" so as to abate public nuisances relative to noise. The following section forms the framework for these nuisance-related restrictions.

Section 4-1-110 of SLMC establishes a general prohibition of noise which causes discomfort or annoyance to reasonable persons of normal sensitivity. The factors which should be considered in determining whether a violation of this section exists include but are not limited to the sound level of the objectionable and ambient noise, the proximity of the noise to residential property, and the duration of the noise.

Section 4-1-115 prohibits certain acts related to noise, such as construction-related noise near residential uses outside of the hours of 7 a.m. and 7 p.m. on weekdays and 8 a.m. and 7 p.m. on weekends. Noise within public parks and noise that conflicts with residential uses is also prohibited.

Neither the City of San Leandro nor the County of Alameda has specific and/or quantitative regulatory standards for construction or operational vibration sources. San Leandro Zoning Code Part IV, Article 16, Division 3, Provision 4-1670B, Vibration, requires that no use, activity, or process produce vibrations that are perceptible without instruments by a reasonable person at the property lines of a site. This performance standard applies to all land use classifications in all zoning districts.

Project Noise Setting

Sensitive Receivers

Noise exposure goals for various types of land uses reflect the varying noise sensitivities associated with those uses. The San Leandro General Plan Environmental Hazards Element identifies noise-sensitive land uses as residential land uses, schools, and open space and recreation areas (City of San Leandro 2016b). The nearest sensitive receivers are single-family residences located approximately 500 feet southwest of the project site, which are shielded from the project site by an existing 8-foot high wooden sound wall at their east and north side property boundary (Appendix I).

Methodology

Construction Noise

For purposes of this analysis, a significant impact would occur if construction activities would result in a substantial temporary increase in ambient noise levels that exceeds standards established in City's General Plan or noise ordinance. The SLMC has established limits on permissible hours of construction for any construction work or related activity adjacent to or across a street of right-of-way from residential use, except between the hours of 7:00 a.m. to 7:00 p.m., Monday through Friday, and 8:00 a.m. to 7:00 p.m. on Saturday and Sunday. Noise impacts from construction activities associated with the proposed project would be a function of the noise generated by construction equipment, equipment location, sensitivity of nearby land uses, and the timing and duration of the construction activities.

Operational Noise

A significant impact would occur if implementation of the proposed project would result in a substantial increase in traffic noise levels compared to existing noise levels (Federal Highway Administration [FHWA] 2018). The City of San Leandro considers an increase of 3 dBA as a significant adverse impact in ambient noise levels (FHWA 2018; Appendix I). As noted in the characteristics of noise discussion, audible increases in noise levels generally refer to a change of 3 dBA or more, as this level has been found to be barely perceptible to the human ear in outdoor environments. A change of 5 dBA is considered the minimum readily perceptible change to the human ear in outdoor environments. Therefore, for purposes of this analysis, an increase of greater than 3 dBA above existing traffic noise levels would be considered a substantial permanent increase in traffic noise levels.

Traffic noise levels along selected roadway segments in the project vicinity were modeled using the FHWA Traffic Noise Prediction Model (FHWA-RD-77-108). This model uses site-specific information, such as roadway traffic volumes, roadway active width, source-to-receiver distances, travel speed,

noise source and receiver heights, and the percentages of automobiles, medium trucks, and heavy trucks that the traffic is made up of throughout the day, among other variables. The daily traffic volumes were obtained from the traffic analysis prepared for the project by Kittelson & Associates (Appendix C).

Groundborne Vibration

Groundborne noise is generated when vibrating building components radiate sound, or noise generated by groundborne vibration. In general, if groundborne vibration levels do not exceed levels considered to be perceptible, then groundborne noise levels would not be perceptible in most interior environments. Therefore, this analysis focuses on determining exceedances of groundborne vibration levels.

A significant impact would occur if the project would generate groundborne vibration or groundborne noise levels in excess of established standards. The City of San Leandro has not adopted criteria for groundborne vibration impacts. Therefore, this analysis uses the FTA's vibration impact criteria established in the Transit Noise and Vibration Impact Assessment Manual. These standards are summarized in Table 22.

Impact Analysis

a. Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Noise

Short-term noise impacts during construction could result from increases in traffic flow on local streets associated with the transport of workers, equipment, and materials to and from the project site. The transport of workers and construction equipment and materials to the project site would incrementally increase noise levels on roads leading to the site. Typically, a doubling of the Average Daily Traffic (ADT) hourly volumes on a roadway segment is required in order to result in an increase of 3 dBA in traffic noise levels, which is the lowest change that can be perceptible to the human ear in outdoor environments. ADT was estimated in the Traffic Impact Analysis, and the roadway segments along the project site have approximate ADT volumes of 15,600 to 17,400 trips (Appendix C). The CalEEMod analysis performed to estimate air quality and GHG emissions impacts estimated that the project would result in approximately 550 construction worker and vendor trips (Appendix F). Therefore, project-related construction trips would not double the hourly or daily traffic volumes along roadway segments in the project vicinity. Short-term intermittent noise from construction trips would not be expected to result in a perceptible increase in hourly- or daily average traffic noise levels in the project vicinity, and short-term construction-related noise impacts associated with the transportation of workers and equipment to the project site would be less than significant.

Short-term construction noise impacts would also be generated during project construction phases. Table 24 lists typical construction equipment noise levels, based on a distance of 50 feet between the equipment and a noise receptor.

Table 24 Typical Construction Equipment Maximum Noise Levels

Type of Equipment	Noise Level at 50 Feet (dBA)
Rollers	85
Bulldozers	85
Tractors	84
Front-End Loaders	80
Backhoe	80
Excavator	85
Graders	85
Air Compressors	80
Dump Truck	84
Concrete Mixer Truck	85
Pickup Truck	55
Scraper	85

dBA = A-weight decibels

Source: Federal Highway Administration 2006.

Project construction would occur over several phases, each of which would involve various construction equipment. The site preparation phase, which includes excavation and grading of the site, typically generates the highest noise levels through the use of earthmoving equipment. Earthmoving equipment includes excavating machinery and compacting equipment, such as bulldozers, draglines, backhoes, front loaders, roller compactors, scrapers, and graders. Construction of the project is expected to require the use of scrapers, bulldozers, water trucks, haul trucks, and pickup trucks.

Based on typical construction equipment, this analysis assumes simultaneous operation of a scraper, a bulldozer, and a vibratory roller. As shown in Table 24, the maximum noise level generated by each scraper is assumed to be 85 dBA L_{max} at 50 feet from this equipment. Each bulldozer would also generate 85 dBA L_{max} at 50 feet. The maximum noise level generated by rollers is approximately 85 dBA L_{max} at 50 feet. Assuming that each piece of construction equipment operates generally near the center of the project site, a conservative noise level during this phase of construction would be 90 dBA L_{max} at a distance of 50 feet from the center of the project site. This would result in an hourly average of 86 dBA L_{eq}.

The nearest sensitive receptors are single-family residences located approximately 500 feet southwest of the project site. Noise would attenuate over this distance at rate of approximately 6 dBA per each doubling of distance; additionally, residences are shielded from the project site by an existing eight-foot sound wall. Assuming minimal shielding from the existing sound wall, maximum construction noise levels would attenuate to below 59 dBA L_{max} at the nearest sensitive receptors (Appendix I). Although there could be intermittent periods of high noise levels, impacts to ambient construction noise at an hourly or daily level would be less than significant. Additionally, the project would be required to comply with the City's noise ordinance which restricts construction activities to the daytime hours of between 7:00 a.m. and 7:00 p.m. on weekdays, or between 8:00 a.m. and 7:00 p.m. on Sunday and Saturday, which would avoid potential impacts to nearby sensitive receptors during nighttime hours.

Therefore, construction noise levels would not result in a substantial temporary increase in ambient noise levels in excess of standards established in the City's General Plan or noise ordinance. Construction impacts would be less than significant.

Operational Noise

Mobile Source Operational Noise

Additional vehicle trips on area roadways generated by the proposed project could result in increases to ambient noise levels. Existing noise levels along adjacent roadway segments were compared to estimated levels of noise generated by additional vehicle trips associated with the project. The model inputs and outputs are provided in Appendix I. Table 25 shows existing traffic noise levels and predicted noise increases at project area roadway segments.

Table 25 Traffic Noise Increase Summary

Roadway Segment	Existing Noise Level (dBA CNEL)	Existing plus Project Estimated Noise Level (dBA CNEL)	Increase over Existing Noise Level (dBA CNEL)
Washington Avenue – San Leandro Boulevard to 139th Avenue	73.6	73.6	<0.1
Washington Avenue – 139th Avenue to 143rd Avenue	72.3	72.3	<0.1
Washington Avenue – 143rd Avenue to Halcyon Drive	72.6	72.6	<0.1

dBA = A-weighted decibel
CNEL = Community Noise Equivalent Level
Source: Appendix I

As shown in Table 25, implementation of the proposed project would result in a negligible increase in traffic noise levels on roadway segments adjacent to the project site where the highest concentration of project trips would occur. This is due to the minimal ADT generated by the project, 329 net new daily trips including approximately 56 truck trips, compared to existing traffic volumes on Washington Avenue (Appendix C). Therefore, impacts related to project-related traffic noise levels would be less than significant.

Stationary Source Operational Noise

The proposed project would generate operational noise associated with truck delivery; loading and unloading activities at commercial loading areas; parking lot activities, which would include people conversing, doors shutting, engine startup, and slow-moving vehicles; and from new exterior mechanical equipment sources, such as proposed rooftop ventilation systems. Potential impacts from these noise sources are discussed below.

TRUCK LOADING ACTIVITIES

Noise would be generated by truck operation activities at the loading docks along the southern, western, and northern sides of the proposed warehouse. The project would generate an estimated 56 daily truck trips (Appendix C). Typical noise levels from truck operation, including but not limited to truck loading and unloading, trucks docking and maneuvering, and truck back-up alarms range from 70 dBA to 80 dBA L_{max} as measured at 50 feet (Appendix I).

The nearest sensitive receptors to the proposed truck loading areas are single-family residences located 500 feet southwest of the project site. The proposed loading docks would be located approximately 650 feet from this closest sensitive receptor. Noise would attenuate over this distance at rate of approximately 6 dBA per each doubling of distance. Additionally, sensitive receptors would also be shielded by the existing 8-foot high sound wall. For a conservative analysis, it is assumed that these activities would occur for a 24-hour period and that the sound wall would provide minimal shielding. Truck operation activities would result in a 24-hour average noise level of 56 dBA L_{dn} as measured at the nearest sensitive receptors. Calculations are included in Appendix I.

As shown in Table 25, existing traffic noise levels along Washington Avenue adjacent to the project site average at least 72 dBA L_{dn}. The nearest residential receptors are located approximately 280 feet from the centerline of Washington Avenue. At this distance, noise levels from traffic on Washington Avenue would attenuate to 58 dBA L_{dn}. Therefore, noise levels from truck operation activities would not exceed existing background noise levels as measured at the nearest residential receptor. Noise levels from truck operation activities would not generate a substantial temporary or permanent increase in ambient noise levels. Project operation noise would not exceed standards established in the City's General Plan or municipal code, and impacts would be less than significant.

PARKING LOT ACTIVITIES

Typical parking lot activities include people conversing, doors shutting, and vehicles idling, which generate noise levels ranging from approximately 60 dBA to 70 dBA L_{max} at a distance of 50 feet (Appendix I). These activities are anticipated to occur sporadically throughout the day, as visitors and staff arrive and leave parking lot areas at the project site.

The nearest noise-sensitive receptor to proposed parking areas are single-family residences located 500 feet southwest of the project site. The proposed parking areas would be located approximately 560 feet from the closest sensitive receptor and would be shielded from the project site by the existing eight-foot high sound wall. It was conservatively assumed that these activities would occur for a 24-hour period and that minimal shielding would be provided by the sound wall. Noise levels generated from typical parking lot activity would result in a 24-hour average noise level of 44 dBA L_{dn} at the nearest sensitive receptors. Calculations are included in Appendix I.

Existing traffic noise from traffic on Washington Avenue would attenuate at a rate of 6 dBA per doubling of distance to be 42 dBA L_{dn} as measured at the nearest residential receptor (Appendix I). Therefore, noise levels from project-related parking lot activity would not exceed existing background noise levels as measured at the nearest residential receptor, and would not generate a substantial temporary or permanent increase in ambient noise levels in the project vicinity. Parking lot activity noise would not exceed noise standards established in the City's General Plan or municipal code, and impacts would be less than significant.

MECHANICAL EQUIPMENT OPERATIONS

At the time of preparation of this analysis, specifications of the proposed rooftop mechanical ventilation systems were not available. A reference noise level of 50 dBA to 60 dBA L_{eq} at a distance of 25 feet was used for commercial rooftop mechanical ventilation equipment (Appendix I).

The nearest sensitive receptors to the proposed rooftop mechanical ventilation equipment are the single-family residences located 500 feet southwest of the project site. It was conservatively assumed that mechanical ventilation equipment would operate over 24 hours and the existing sound wall would provide minimal shielding. Noise levels generated from rooftop mechanical

ventilation equipment would attenuate over this distance at rate of approximately 6 dBA per each doubling of distance and would result in a 24-hour average noise level of 38 dBA L_{dn} at the nearest sensitive receptors. As noted previously under *Truck Loading Activities* and *Parking Lot Activities*, existing traffic noise from traffic on Washington Avenue would attenuate to 58 dBA Ldn as measured at the nearest residential receptor (Appendix I).Calculations are included in Appendix I.

Noise levels from rooftop mechanical ventilation equipment operations would not exceed existing background noise levels as measured at the nearest residential receptor. Therefore, noise levels from mechanical ventilation equipment operations would not generate a substantial temporary or permanent increase in ambient noise levels. Noise would not exceed standards established by the City's General Plan or municipal code, and impacts would be less than significant.

Altogether, construction and operation associated with the proposed project would not result in a substantial increase to ambient noise levels and would not generate noise in excess of standards as established by the 2035 General Plan or SLMC. Impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

b. Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Construction Vibration

The site preparation phase of project construction would involve use of large vibratory rollers, which would produce the greatest groundborne vibration levels during project construction. Large vibratory rollers produce groundborne vibration levels ranging up to 0.201 in/sec ppv at a distance of 25 feet. The nearest receptor to the project site is a lumber store, located 70 feet northwest of the project site. At this distance, groundborne vibration levels would be approximately 0.04 ppv (Appendix I). This would be below the Federal Transit Administration's Construction Vibration Impact Criteria of 0.2 ppv for this type of structure – non-engineered timber and masonry buildings (Table 22). Therefore, project construction activities would not generate groundborne vibration or groundborne noise levels in excess of established standards. Impacts related to construction vibration would be less than significant.

Operational Vibration

Operation of the project would not include new sources of vibration. Temporary sources of vibration, such as trucks, are not considered sources of groundborne vibration levels as vibration from trucks would not be substantially perceptible at sensitive receivers (Appendix I). Additionally, there are no active sources of groundborne vibration in the project vicinity that would produce perceptible levels of vibration. Therefore, the project would not generate groundborne vibration or groundborne noise levels in excess of established standards and there would be no impact related to operational groundborne vibration.

LESS-THAN-SIGNIFICANT IMPACT

c. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

The nearest public airport to the project site is the Oakland International Airport, located approximately 3.3 miles northwest of the project site. According to the airport's noise exposure map, the project site is located outside of the 60 dBA CNEL airport noise contours (Appendix I). While flying aircraft noise is occasionally audible on the project site, aircraft noise associated with nearby airport activity would not expose people residing or working near the project site to excessive noise levels. Therefore, implementation of the project would not expose persons residing or working in the project vicinity to noise levels from airport activity that would be in excess of normally acceptable standards for the proposed land use development, and no impact would occur.

NO IMPACT

This page intentionally left blank.

14 Population and Housing

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure)?	□	□	■	□
b. Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	□	□	□	■

Setting

According to the California Department of Finance (DOF), San Leandro had an estimated population of 87,497 people with 33,223 housing units as of January 2023 (DOF 2022). The average number of persons per household is estimated at 2.75. The City of San Leandro General Plan Environmental Impact Report provides projections for the City's population through the year 2030. The population of San Leandro is projected to be 103,300 by the year 2030 (City of San Leandro 2016b).

Impact Analysis

a. Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

The project would involve the construction of a warehouse structure; it would not involve the construction of new dwelling units and would therefore not directly induce population growth in the City. The project could facilitate the creation of jobs that could indirectly cause population growth through employee relocations to the project area. According to default occupancy rates established by the United States Green Building Council, general office spaces generate one employee per 250 square feet, and distribution warehouses generate one employee per 2,500 square feet (United States Green Building Council 2008). Applying these employee occupancy rates to the 5,000 square feet of office space and the 52,269 square feet of warehouse space, the project would generate an estimated 41 employees.[4] Considering a conservative, maximum-growth scenario where each employee relocates to San Leandro, the proposed project could generate approximately 113 new residents, based on 41 employees and the average of 2.75 persons per household in San Leandro (DOF 2022). As of January 2023, San Leandro's estimated population is 87,497 (DOF 2022).The population of San Leandro is projected to be 103,300 by 2030, an increase of 15,803 from the

[4] 5,000 square feet of office space divided by 250 square feet per office employee is 20 employees. 52,269 square feet of warehouse space divided by 2,500 square feet per warehouse employee is approximately 21 employees.

current 2023 estimated population.[5] The addition of 113 new residents from the proposed project would constitute less than one percent[6] of the total growth until 2030 and the potential population increase as a result of the proposed project under this scenario would be well within this projected population increase. Therefore, the project would not induce substantial or unplanned growth. Impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

b. Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

The project site was previously developed with two single-family residences that were destroyed during a structural fire in 2022; however, these residences were abandoned and unoccupied prior to the fire. Therefore, the project would not displace existing people or housing and no impact would occur.

NO IMPACT

[5] 103,300 (projected population)-87,497(current population) = 15,803
[6] (113/15,803) x 100 = 0.7

15 Public Services

		Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a.	Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
	1 Fire protection?	☐	☐	■	☐
	2 Police protection?	☐	☐	■	☐
	3 Schools?	☐	■	☐	☐
	4 Parks?	☐	☐	■	☐
	5 Other public facilities?	☐	☐	■	☐

Setting

The Alameda County Fire Department (ACFD) provides fire protection and emergency medical service to San Leandro. ACFD is divided into four branches: Operations, Special Operations, Fire Prevention, and Administrative Support Services (ACFD 2021a). ACFD operates six fire stations in San Leandro (Station Nos. 9 through 13 and 24) (ACFD 2021b). The closest fire station to the project site is ACFD Station No. 12, located 1,500 feet northeast of the project site at 1065 [1]43rd Avenue (ACFD 2021b).

The San Leandro Police Department (SLPD) provides law enforcement services for the city. SLPD has one police station located at San Leandro City Hall at 835 East 14th Street, approximately 1.6 miles north of the project site. As of 2019, SLPD is staffed by 90 sworn personnel and 44 civilian employees (SLPD 2019).

The San Leandro Unified School District (SLUSD) and San Lorenzo Unified School District provide public educational services to San Leandro. SLUSD serves approximately 8,712 students across eight elementary schools, two middle schools, two high schools, and one adult education school (California Department of Education 2022). According to SLUSD's 2020 Developer Fee Justification Study, the district is slightly under capacity, with enrollment availability for 73 additional students. Broken down by grade level, kindergarten through 6th grade facilities are over capacity by 282 students, 7th through 8th grades have an available capacity for 532 students, and 9th through 12th

grade facilities are over capacity by 178 students (SLUSD 2020). San Lorenzo Unified School District, specifically Dayton Elementary School and Corvalis Elementary School, serve a small portion of southwestern San Leandro (San Lorenzo Unified School District 2022).

The City of San Leandro Public Works Department maintains neighborhood parks, special use recreation areas, community parks, and golf courses in the city, totaling 382.8 acres of improved parkland. The City's General Plan Open Space, Parks, and Conservation Element outlines a goal to provide at least 5 acres of improved parkland for every 1,000 residents (City of San Leandro 2016a). As discussed in Section 14, *Population and Housing,* the population of San Leandro is currently estimated at 87,497 people; therefore, the City has approximately 4.37 acres of improved parkland per 1,000 residents.[7]

Regulatory Setting

San Leandro 2035 General Plan

The City of San Leandro's 2035 General Plan Community Services and Facilities Element addresses the provision of community services, including fire protection and police protection. Additionally, the element emphasizes the importance of reducing risk and the effects of disaster prevention and/or preparedness (City of San Leandro 2016a). The following policies found within the element are applicable to fire and police protection services within the City:

Goal CSF-1. Provide and maintain high-quality police, fire, and emergency medical services.

Policy CSF-1.1 Maintain high-quality police and fire protection services through the most efficient and effective possible means. The following minimum level of service standards for police and fire response time (exclusive of dispatch time) shall be maintained: (a) Police Services: 5 minute response time for 90 percent of all Priority One calls; (b) Fire Services: 5 minute response time for first due company for 90 percent of all emergency incidents, excluding freeway responses (3 firefighters including at least one paramedic); 10 minute response time for 90 percent for a full first alarm assignment response (17 firefighters).

Policy CSF-1.5 Require Police and Fire Department review of proposed development plans to ensure that sufficient provisions for emergency access and response are made, fire code requirements are satisfied, and adequate levels of service can be provided.

The Community Services and Facilities Element also addresses parkland, open space, and recreational facilities in and nearby San Leandro. The following policies found within the element are applicable to recreational facilities within the City:

Goal OSC-2 Develop additional parkland in the city to better meet existing needs and to respond to future needs.

Policy OSC-2.1 Achieve the following service standard for parks: (a) At least 5.00 acres of improved parkland per 1,000 residents; (b) A park within one-half mile of each San Leandro resident.

[7] 382.8 acres of improved parkland divided by 87,497 thousand residents in San Leandro is approximately 4.37 acres.

San Leandro Municipal Code

Section 7-5-800 adopts the California Fire Code, which contains regulations for safeguarding life and property from the hazards of fire and explosion; dangerous conditions arising from the storage, handling, and use of hazardous materials; and hazardous conditions in the use of occupancy of buildings. Development within San Leandro would be required to comply with the requirements on the California Fire Code.

Article 8 of Title 7 of the SLMC enables the City Council to require dedication of lands deemed necessary for the purpose of constructing schools necessary to assure the residents of a subdivision have adequate elementary school service as a condition of final map approval for a subdivision.

SLMC Chapter 7-13 establishes the City's park facilities development impact fee which, pursuant to Government Code Section 66001, allows the City to apply fees to new development to pay for new or renovated park facilities. Development in San Leandro is required to pay appropriate park development fees. Further, SLMC Section 7-1-810 requires that as a condition of approval of a tentative map or parcel map, subdivisions are required to offer to dedicate parkland, pay a fee in lieu, or a combination of both (at the option of the City).

Impact Analysis

a. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

1 Fire protection?

2 Police Protection?

3 Schools?

4 Parks?

5 Other public facilities?

ACFD Fire Station No. 12 is located approximately 0.3-mile northeast of the project site at 1065 143rd Avenue. The project site is located within a developed area already served by ACFD, and the project would not require new or expanded fire facilities. The project would be required to comply with California Fire Code regulations for construction and operation, and would be subject to review by ACFD. The project would also be required to pay an impact fee that would be collected at the time project building permits would be issued to maintain acceptable service ratios and response times. Therefore, impacts to fire protection services would be less than significant.

The SLPD station is located at San Leandro City Hall at 835 East 14th Street, approximately 1.6 miles north of the project site. As discussed in Section 14, *Population and Housing,* the project could add approximately 113 residents to the city in a maximum-growth scenario. However, the project site is in an urban area that is currently served by SLPD, and the growth that could be generated by the project would be well within population projections established by the City's General Plan. The addition of up to 113 residents to the SLPD's service area would not require new or expanded facilities. As the project site is currently served by SLPD, there would not be an increase in response times such that the construction of additional police protection facilities would be required. Impacts to police protection services would be less than significant.

The project would involve the construction of a warehouse structure and would not create additional housing. However, as discussed in Section 14, *Population and Housing,* the project could generate approximately 113 new residents in San Leandro in a conservative, maximum growth scenario wherein all employees would relocate to the region. According to the United States Census Bureau, approximately 20.6 percent of Alameda County's population is school-aged, or 18 years old and younger. Applying this rate to the estimated project population, the project could generate approximately 24 students in the SLUSD or San Lorenzo Unified School District areas (United States Census Bureau 2020). This would represent an incremental increase in student population. In addition, school fees would be paid at the time the building permit is issued to reduce impacts as a result of the proposed project. Pursuant to Section 65995(3)(h) of the California Government Code (Senate Bill 50, chaptered August 27, 1998), the payment of statutory fees "...is deemed to be full and complete mitigation of the impacts of any legislative or adjudicative act, or both, involving, but not limited to, the planning, use, or development of real property, or any change in governmental organization or reorganization." Thus, payment of the development fees is considered full mitigation for the proposed project's impacts related to schools under CEQA and impacts would be less than significant.

The nearest park to the proposed project is Halcyon Park located approximately 0.4 mile east of the project site. The project would not directly increase the City's population as it does not involve the creation of housing units. However, the project could indirectly result in the addition of up to 113 new residents to the city. As of January 2022, the City of San Leandro had a population of 88,404 people (DOF 2022). As described under *Setting,* the City has approximately 4.33 acres of improved parkland per 1,000 residents. The potential addition of 113 residents would not substantially affect this ratio and would not hinder the City's goal of providing five acres of parkland per 1,000 residents. Additionally, the project applicant would be required to pay City park facilities development impact fees pursuant to SLMC Chapter 7-13, which would support the addition of new parks or renovations to existing parks. Therefore, impacts to parks and recreational facilities would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

16 Recreation

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	□	□	■	□
b. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	□	□	■	□

Setting

As discussed in Section 15, *Public Services,* the City of San Leandro Public Works Department maintains approximately 382.8 acres of improved parkland, and that there are approximately 4.33 acres of improved parkland per 1,000 residents. The nearest park to the project site is Halcyon Park, located 0.4 mile east of the project site.

Regulatory Setting

Quimby Act

California Government Code Section 66477, also known as the Quimby Act, was enacted by the California legislature in 1965. The Quimby Act authorizes cities and counties to enact ordinances requiring the dedication of land, or the payment of fees for park and/or recreational facilities in lieu thereof, or both, by developers of residential subdivisions as a condition to the approval of a tentative tract map or parcel map.

See Section 15, *Public Services*, subsection *Regulatory Setting* for additional policies and regulations relevant to recreation.

Impact Analysis

a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

b. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

As discussed in Section 14, *Population and Housing*, the project could result in an incremental increase in the City's population and recreation facilities in San Leandro would likely see increased use. In a maximum job-creation scenario, the project would potentially introduce 113 new residents to the city. This potential increase of less than one percent would be well within the General Plan's projected 2030 population of 103,300. Therefore, the project would not introduce a substantial number of new residents to the city and thus, would not contribute to the substantial physical deterioration of facilities or require the provision of new or expanded park facilities. In addition, no recreational facilities are proposed as part of the project. This impact would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

17 Transportation

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	□	□	■	□
b. Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?	□	□	■	□
c. Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible use (e.g., farm equipment)?	□	□	■	□
d. Result in inadequate emergency access?	□	□	■	□

The information and analysis included in this section is based upon the Traffic Impact Analysis report prepared by Kittelson and Associates in May 2022. The report is included as Appendix C.

Setting

The site is located on Washington Avenue, which is locally accessible via San Leandro Boulevard and Halcyon Drive. Regional access is available to the site from I-880, which is approximately 0.6 miles west of the site. The following descriptions are provided for roadways that would provide access to the site and are most likely to serve most of the project's generated vehicle, bicycle, pedestrian and transit traffic.

Existing Roadway Network

- **I-880** is a nine-lane, north-south freeway that connects San Leandro with nearby cities, such as Hayward and Oakland, and regional destinations, such as Fremont and San Jose. It also provides access to the greater freeway network with direct connections to Interstates 80, 580, 980, 238, US Highway 101, and State Routes 92, 237 and 17. The project site is served by the interchange at Washington Avenue. The average daily traffic on I- 880 in the vicinity of Washington Avenue ranges between 190,000 and 237,500 vehicles per day.
- **I-238** is a seven-lane, east-west freeway that serves as a connection between I-880 and I-580. The project site is served by the interchange at Washington Avenue. The average daily traffic on I-238 in the vicinity of Washington Avenue ranges between 162,000 and 102,000 vehicles per day.
- **I-580** is an eight-lane, north-south freeway that connects San Leandro with nearby cities, such as Oakland and Pleasanton, and regional destinations, such as Stockton. It also provides access

to the greater freeway network with direct connections to Interstates 5, 205, 238, 680, 80 and 880, and State Routes 13, 24, and 84. The project site is served by the interchange at Fairmont Drive. The average daily traffic on I-580 in the vicinity of Fairmont Drive ranges between 119,300 and 143,500 vehicles per day.

- **Washington Avenue** is a north-south road with four lanes and extends from Grant Avenue to W Juana Avenue in Downtown San Leandro. Sidewalks are located along the east and west sides of Washington Avenue in the project area, with the exception of the overpass between Springlake Drive to Beatrice Street, where there is a sidewalk only on the west side of the roadway. It is also designated as a through truck route.
- **Halcyon Drive** is a four-lane, east-west residential arterial approximately 0.5 mile southeast of the project site. It spans from Hesperian Drive to Washington Avenue. To the east, Halcyon Drive transitions to Fairmont Drive, and to the west, it transitions to Floresta Boulevard. Halcyon Drive is designated as a local truck route. Sidewalks are provided on both sides of the street in the project area.
- **San Leandro Boulevard** is a north-south arterial approximately 0.5 miles north of the project site. San Leandro Boulevard is a four-lane road with a landscaped median separating the northbound and southbound lanes. It is a designated truck through route. Sidewalks are provided on both sides of the street, and parking is permitted along some segments.

Existing Bicycle Facilities

Bicycle facilities are defined by the following four classes by the California Department of Transportation Highway Design Manual:

- **Class I (Bike Path):** Provides a completely separate facility designed for the exclusive use of bicyclists and pedestrians with crossing points minimized. Bike paths typically serve corridors not served by streets and highways or where wide right of way exists, permitting such facilities to be constructed away from the influence of parallel streets.
- **Class II (Bike Lane):** Provides a restricted right-of-way designated lane for the exclusive or semi-exclusive use of bicycles with through travel by motor vehicles or pedestrians prohibited, but with vehicle parking and cross-flows by pedestrians and motorists permitted. Bike lanes are established along streets in corridors where there is significant bicycle demand, and where there are distinct needs that can be served by them.
- **Class III (Bike Route):** Shared facilities which provide continuity to other bicycle facilities (usually Class II bikeways) or designate preferred routes through high demand corridors.
- **Class IV (Separated Bikeways):** Provides an exclusive right-of-way including a separation required between the separated bikeway and the through vehicular traffic.

There are sections of Class II bikes lanes in the project vicinity. There are marked Class II bike lanes on:

- Washington Avenue between 139th Avenue and 143rd Avenue
- Washington Avenue between Caliente Drive and Springlake Drive
- Floresta Boulevard/Farnsworth Street between Washington Avenue and Purdue Street
- Fremont Avenue between Floresta Boulevard and Alvarado Street
- Halcyon Drive between Olivia Street and Hesperian Boulevard
- San Leandro Boulevard between East 14th Street and Creekside Plaza

- Hesperian Boulevard/Bancroft Avenue between Grace Street and Springlake Drive

There are also several Class III bike routes that provide connections between bike lane facilities. These include:

- Bancroft Avenue between East 14th Street and 146th Avenue
- Alvarado Street between Fremont Avenue and Teagarden Street
- Castro Street between Washington Avenue and East 14th Street
- Sybil Avenue between East 14th Street and Grand Avenue
- 150th Avenue between Hesperian Boulevard and eastern city limits
- Washington Avenue between West Juana Avenue and San Leandro Boulevard

Existing Pedestrian Facilities

At the project site, the main pedestrian facilities are an eight-foot sidewalk (west side) and seven-foot sidewalk (east side) on either side of Washington Avenue along the west side of the project site. There are two at grade railroad crossings (one active, one inactive) located south of the project site. Two signalized intersections (Washington Avenue/139th Avenue and Washington Avenue/143rd Avenue) with marked crosswalks are located within one quarter-mile of the project site.

Existing Transit Facilities

The transit system in the study area includes bus and rail services provided by Alameda-Contra Costa Transit District (AC Transit) and Bay Area Rapid Transit (BART). As presented in Table 26, AC Transit provides three routes in the study area: Line 10, Line 28, and Line 40, which operate on weekdays and weekends. Line 10 runs along on East 14th Street, approximately 0.6 miles east of the project site and connects to the San Leandro BART station. Line 28 runs along Halcyon Drive, approximately 0.6 miles south of the project site and also connects to the San Leandro BART station. Line 40 runs along Bancroft Avenue, approximately 0.7 miles east of the project site and connects to the Bayfair BART station. Both the San Leandro and Bayfair BART stations are less than 2 miles from the project site. The two bus stops nearest the project site are both served by Line 28 and are located along Halcyon Drive/Floresta Boulevard south of the project site. The Washington Avenue/Halcyon Drive stop is about 400 feet from Washington Avenue/Halcyon Drive/Floresta Boulevard (signalized intersection with marked crossings), and the Fremont Avenue/Floresta Boulevard stop is about 600 feet from the Fremont Avenue/Floresta Boulevard intersection. AC Transit lines that serve the project site are shown in Table 26.

Table 26 AC Transit Service near the Project Site

Route	Service Area	Connections	Service Schedule	Times		
				First	Last	Frequency
10	San Leandro, Hayward	San Leandro BART, Bayfair BART, Hayward BART	Weekday	4:58 A.M.	12:39 A.M.	20 minutes
			Weekend	6:20 A.M.	12:28 A.M.	20 minutes
28	San Leandro, Castro Valley, Hayward	San Leandro BART, Castro Valley BART, Bayfair BART, Hayward BART	Weekday	5:45 A.M.	10:37 P.M.	60 minutes
			Weekend	6:00 A.M.	10:54 P.M.	60 minutes
40	Oakland, San Leandro	Bayfair BART, Eastmont Transit Center	Weekday	5:18 A.M.	12:26 P.M.	20 minutes
			Weekend	5:25 A.M.	12:14 P.M.	30 minutes

Source: Appendix C

Regulatory Setting

The determination of significance for project impacts is based on applicable policies, regulations, goals, and guidelines defined by the City of San Leandro, Santa Clara County, the Metropolitan Transportation Commission, and the State.

State Regulations

SENATE BILL 743

On September 27, 2013, SB 743 was signed into law. The legislature found that with the adoption of the Sustainable Communities and Climate Protection Act of 2008 (SB 375), the State had signaled its commitment to encourage land use and transportation planning decisions and investments that reduce vehicle miles traveled and thereby contribute to the reduction of greenhouse gas emissions, as required by the California Global Warming Solutions Act of 2006 (AB 32). In December 2018, the Governor's Office of Planning and Research (OPR) finalized new CEQA guidelines (CEQA Guidelines section 15064.3), that identify VMT as the most appropriate criteria to evaluate a project's transportation impacts.

In November 2017, OPR released a technical advisory containing recommendations regarding the assessment of VMT, proposed thresholds of significance, and potential mitigation measures for lead agencies to use while implementing the required changes contained in Senate Bill 743 (SB 743). Also in November 2017, OPR released the proposed text for Section 15064.3, "Determining the Significance of Transportation Impacts," which summarized the criteria for analyzing transportation impacts for land use projects and transportation projects and directs lead agencies to "choose the most appropriate methodology to evaluate a project's vehicle miles traveled, including whether to express the change in absolute terms, per capita, per household or in any other measure." OPR recommends that for most instances a per service population threshold should be adopted and that a fifteen percent reduction below that of existing development would be a reasonable threshold.

CALIFORNIA ASSEMBLY BILL 32, SENATE BILL 32, AND SENATE BILL 375

The "California Global Warming Solutions Act of 2006" (AB 32) outlines California's major legislative initiative for reducing GHG emissions. AB 32 codifies the statewide goal of reducing GHG emissions to 1990 levels by 2020, a reduction of approximately 15 percent below emissions expected under a "business as usual" scenario. On September 8, 2016, the governor signed Senate Bill 32 (SB 32) into law, extending the California Global Warming Solutions Act of 2006 by requiring the state to further

reduce GHG emissions to 40 percent below 1990 levels by 2030 (the other provisions of AB 32 remain unchanged).

The Sustainable Communities and Climate Protection Act of 2008 (SB 375), signed in August 2008, enhances the state's ability to reach AB 32 goals by directing CARB to develop regional GHG emission reduction targets to be achieved from passenger vehicles by 2020 and 2035. SB 375 aligns regional transportation planning efforts, regional GHG reduction targets, and affordable housing allocations. Metropolitan Planning Organizations (MPOs) are required to adopt a Sustainable Communities Strategy (SCS), which allocates land uses in the MPO's Regional Transportation Plan (RTP). Qualified projects consistent with an approved SCS or Alternative Planning Strategy (categorized as "transit priority projects") can receive incentives to streamline CEQA processing.

On March 22, 2018, CARB adopted updated regional targets for reducing GHG emissions from 2005 levels by 2020 and 2035. ABAG was assigned a 19 percent reduction in per capita GHG emissions from passenger vehicles by 2035. SB 375 also provides the option for the coordinated development of subregional plans by the subregional councils of governments and the county transportation commissions to meet SB 375 requirements. On October 21, 2021, ABAG formally adopted the RTP/SCS titled Plan Bay Area 2050, which meets the requirements of SB 375.

Local Regulations

SAN LEANDRO 2035 GENERAL PLAN TRANSPORTATION ELEMENT

The San Leandro 2035 General Plan Transportation Element establishes the following applicable goals and policies relevant to transportation:

Policy T-1.2 Mitigation of Development Impacts. Require developers to address the impacts that their projects will have on the City's transportation system. A variety of mitigation measures, including impact fees, street improvements, traffic signal and Intelligent Transportation Systems (ITS) improvements, transportation demand management (TDM) measures, and improvement of non-automobile transportation modes, should be considered.

Policy T-1.10 Reduced Trip Generation. Encourage local employers to develop programs that promote ridesharing, flextime and telecommuting, bicycle use, and other modes of transportation that reduce the number and distance of vehicle trips generated.

Policy T-2.6 Building Design and Site Planning. Ensure that the site planning and design of new development promotes the use of non-auto modes of transportation by including amenities such as sidewalks, bike lockers, and bus shelters.

Policy T-3.5. Accommodation of Bicycles and Pedestrians. Require new development to incorporate design features that make walking, bicycling, and other forms of nonmotorized transportation more convenient and attractive. Facilities for bicycles and pedestrians, including secured bicycle parking, clearly marked crosswalks, well-lit streets and sidewalks, landscaping, and street furniture should be provided within new employment areas, shopping destinations, multi-modal transportation facilities, and community facilities.

Policy T-6.7 Siting of Businesses with Truck Traffic. To the extent feasible, locate businesses projected to generate large amounts of truck traffic away from residential areas. Ingress and egress for such businesses should be designed to minimize the possibility of truck traffic impacting residential streets.

The Transportation Element also establishes a tiered Level of Service (LOS) system. LOS is a measure of the quality or performance of a transportation system based on factors such as travel time, traffic volume, and congestion. LOS is typically evaluated on a scale of "A," corresponding to no congestion and free-flowing traffic, to "F," corresponding to extreme congestion and delays. For planning purposes, LOS D is the minimum acceptable service level for intersections outside of designated Priority Development Areas and LOS E is the minimum acceptable service level for intersections within designated Priority Development Areas.

SCREENING CRITERIA AND THRESHOLDS OF SIGNIFICANCE

Since the City of San Leandro has not adopted VMT impact thresholds of significance, the Alameda County Transportation Commission (ACTC) VMT impact thresholds are used to evaluate VMT impacts. This is generally consistent with OPR's technical advisory, which provided recommended metrics and impact thresholds for residential, office, and retail projects, since they tend to have the greatest influence of land use projects on VMT in California (Appendix C).

Given that the project would be located in an industrial park with primarily industrial uses and other minor supporting uses, it was determined that the employment industrial threshold (VMT per employee below the Central Planning Area average) would be appropriate to apply to the project.

OPR recommends before any VMT analysis is undertaken, the project should undergo screening using the City's screening criteria to determine if it can be expected to cause a less-than-significant impact without conducting a detailed VMT study. OPR and ACTC's suggested screening criteria for projects include projects that:

1. Have less than 110 weekday daily trips;
2. Are served by high-capacity transit stops (15-minute frequency) within a half-mile of the project site; or
3. Are located in areas with below Central Planning Area average VMT per employee.

Impact Analysis

a. Would the project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Trip Generation

Trip generation refers to the process of estimating the amount of vehicular traffic a project would add to the surrounding roadway system. Kittelson and Associates developed estimated project trip generation for the proposed project based on published trip generation rates from the Institute of Transportation Engineers' (ITE) publication *Trip Generation (10th Edition).* Table 27 shows the trips expected to be generated by the proposed project.

Table 27 Project Trip Generation

Vehicle Type	Daily Trips	AM Peak Hour			PM Peak Hour		
		In	Out	Total	In	Out	Total
Passenger Cars	204	25	3	**28**	3	23	**26**
2 Axle Truck	31	4	0	**4**	0	3	**3**
3 Axle Truck	20	2	0	**2**	0	2	**2**
4+ Axle Truck	74	9	1	**10**	1	8	**9**
Total Project Trips	**329**	**40**	**4**	**44**	**4**	**36**	**40**

Source: Appendix C

Roadways

Pursuant to SB 743 and CEQA Guidelines Section 15064.3, congestion on roadways is not considered a significant impact pursuant to CEQA. Additional congestion as a result of project implementation would not result in significant impacts under CEQA. While SB 743 prohibits the use of level of service or automobile delay in the determination of environmental significance, the City's General Plan Transportation Element has LOS standards that it desires to maintain, as described under *Local Regulations*. For informational purposes, a LOS analysis has been performed in accordance with City standards; this analysis is not used for the purpose of determining impacts under CEQA. According to the City of San Leandro, an adverse effect on intersection operations occurs when the analysis demonstrates that a project would cause an intersection to operate at LOS D or lower outside of Priority Development Areas. The project site is not within a Priority Development Area and would be subject to this threshold.

Table 28 shows the existing LOS of intersections near the project site and the projected LOS of these intersections with the project and other cumulative development in the project area.

Table 28 Project and Cumulative Development Intersection Level of Service

Intersection	Existing LOS		Projected Cumulative LOS		Cumulative plus Project LOS		Impact?
	AM	PM	AM	PM	AM	PM	
Washington Avenue and San Leandro Boulevard	D	D	**F**	**E**	**F**	**E**	No
Washington Avenue and 143rd Avenue	B	A	B	A	B	A	No
Washington Avenue and Halcyon Drive/Floresta Boulevard	**E**	D	**E**	D	**E**	D	No
Washington Avenue and Driveway A[1]	B	C	-	-	C	D	No
Washington Avenue and Driveway B[1]	B	B	-	-	B	B	No

Bold denotes exceeds City standard

[1] refers to the driveway in the southeast corner of the project site.

[2] refers to the driveway in the northwest corner of the project site.

Source: Appendix C

As shown above, the Washington Avenue and San Leandro Boulevard intersection would operate below LOS D during AM and PM peak hours, and the Washington Avenue and Halcyon Drive/ Floresta Boulevard intersection would operate below LOS D during AM peak hours. However, these effects to LOS at these intersections would be projected to occur without implementation of the project, and the project would negligibly contribute to LOS effects at these intersections (Appendix TRA). Therefore, the proposed project would not result in substantially adverse effects related to LOS, and the project would be consistent with the City's General Plan. Impacts would be less than significant.

Public Transit Facilities

The project would generate additional public transit trips on existing transit services near the project site. Because the project would not be expected to substantially increase vehicle traffic or vehicle speed in the existing roadway network around the project site, the project would not result in delays or interruptions to existing transit services. Due to the project's proposed warehouse use, it would be expected to generate negligible transit trips (Appendix C). The project would not include features that would conflict with City of regional plans, policies, or ordinances pertaining to public transit. No significant impacts to transit facilities would occur, and the project would not conflict with the City's General Plan.

Bicycle Facilities

An impact would occur to bicycle facilities if the proposed project were to disrupt existing bicycle facilities or be inconsistent with adopted City standards. There are several bike facilities in the vicinity of the project site, as described under *Existing Bicycle Facilities.* Because the project would not be anticipated to substantially increase vehicle traffic or vehicle speed in the existing roadway network around the project site, the bicycle level of traffic stress would not substantially change as a result of the project. Further, the project would provide one short term bicycle rack and four long term bicycle storage enclosures. The project would not include features that would be hazardous to bicycles, nor would it generate bicycle demand that would exceed the capacity of the area's bicycle network. The project would not conflict with City or regional plans, policies or ordinances pertaining to bicycle facilities or travel (Appendix C). No significant impacts to bicycle facilities would occur.

Pedestrian Facilities

An impact to pedestrian facilities would occur if the project were to disrupt existing pedestrian facilities or be inconsistent with pedestrian system plans, guidelines, or policies. Because the project would not be anticipated to substantially increase vehicle traffic or vehicle speed in the existing roadway network around the project site, the pedestrian facilities in the project site vicinity would not be substantially diminished as a result of the project. The project would include several pedestrian improvements to the site including lighting, internal sidewalks, improved landscaping, and pedestrian amenities. Adequate street lighting would be provided by additional proposed street lighting and internal lighting on the project site. Therefore, no impact to pedestrian facilities would occur.

Table 29 below describes project consistency with applicable policies from the San Leandro General Plan Transportation Element.

Table 29 Project Consistency with General Plan Transportation Element

Policy	Consistency
Policy T-1.2. Mitigation of Development Impacts. Require developers to address the impacts that their projects will have on the City's transportation system. A variety of mitigation measures, including impact fees, street improvements, traffic signal and Intelligent Transportation Systems (ITS) improvements, transportation demand management (TDM) measures, and improvement of non-automobile transportation modes, should be considered.	**Consistent.** The project applicant would be required to pay development impact fees pursuant to Chapter 7-11 of the SLMC.
Policy T-1.10. Reduced Trip Generation. Encourage local employers to develop programs that promote ridesharing, flextime and telecommuting, bicycle use, and other modes of transportation that reduce the number and distance of vehicle trips generated.	**Consistent.** The project would include bicycle parking spaces and would be located near public transit stops, which would encourage alternative modes of transportation. Additionally, as discussed under *Roadways,* the project would not generate a number of trips that would adversely affect the LOS of intersections near the project site.
Policy T-2.6. Building Design and Site Planning. Ensure that the site planning and design of new development promotes the use of non-auto modes of transportation by including amenities such as sidewalks, bike lockers, and bus shelters.	**Consistent**. The project would include 14 bicycle parking spaces and improved sidewalks.
Policy T-3.5. Accommodation of Bicycles and Pedestrians. Require new development to incorporate design features that make walking, bicycling, and other forms of nonmotorized transportation more convenient and attractive. Facilities for bicycles and pedestrians, including secured bicycle parking, clearly marked crosswalks, well-lit streets and sidewalks, landscaping, and street furniture should be provided within new employment areas, shopping destinations, multi-modal transportation facilities, and community facilities.	**Consistent**. The project would include 14 bicycle parking spaces, maintaining existing sidewalks, and exterior lighting to accommodate bicycles and pedestrians.
Policy T-6.7. Siting of Businesses with Truck Traffic. To the extent feasible, locate businesses projected to generate large amounts of truck traffic away from residential areas. Ingress and egress for such businesses should be designed to minimize the possibility of truck traffic impacting residential streets**.**	**Consistent**. As shown in Table 27, the project would generate approximately 125 truck trips per day. The project site would utilize the two existing driveways for ingress and egress, and truck docks would be located at the rear of the warehouse structure, which would minimize truck traffic impacts on Washington Avenue. The rear parking lot and truck docking stations would also be shielded by an existing sound wall.

Source: City of San Leandro 2016a

The project would be consistent with the San Leandro General Plan Transportation Element. Impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

b. Would the project conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?

As described under *Setting*, *CEQA Guidelines* Section 15064.3 identifies VMT as the most appropriate criteria to evaluate a project's transportation impacts. As described under *Screening Criteria and Thresholds of Significance,* the project must be consistent with ACTC screening criteria in order to assume that VMT impacts would be less than significant.

A project in the Central Planning Area with below-average VMT per employee would be consistent with ACTC VMT screening criterion number three, listed under *Screening Criteria and Thresholds of Significance.* The project site is located in the Central Planning Area, which has an average VMT per employee of 19.2. Therefore, the VMT reduction target for the Central Planning Area is 16.3 VMT per employee (15 percent below 19.2). The project site is located within an ACTC transportation analysis zone with an average VMT per employee of 15.23 (truck trips are considered be a part of the total VMT for the area meaning this VMT analysis addressed the full area over which the project would affect travel behavior in two scenarios, with and without the project [OPR 2018]) (Appendix C). Therefore, the project would be located in an area with below-average VMT per employee in the Central Planning Area and would be consistent with ACTC screening criterion number three. A detailed VMT analysis is not required, and the project can be assumed to have less-than-significant impacts related to VMT.

LESS-THAN-SIGNIFICANT IMPACT

c. Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible use (e.g., farm equipment)?

Vehicle access to the project site would be available via two existing two-way driveways on Washington Avenue, located in the southeast and northeast corners of the project site. A total of 64 vehicle parking spaces would be provided, located along the northern, southern, and western sides of the proposed warehouse structure. Emergency vehicles would be able to enter the project site via either driveway and, if necessary, circulate through the parking lot on the southern side of the proposed warehouse to turn around or exit via the other driveway. Pedestrian access to the project site would be provided via concrete sidewalks along all sides of the proposed structure, except alongside the 15 dock doors. These sidewalks would lead to exterior stairwells and entryways. Pedestrian access to the warehouse would be provided via seven pedestrian doors. The project would not involve geometric design features or incompatible uses that would substantially increase hazards at the project site. Impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

d. Would the project result in inadequate emergency access?

The project would not require lane or road closures during construction. During operation, emergency access to the project site would be available via the two existing two-way driveways that provide access to Washington Avenue. The parking lot is adjacent to the proposed warehouse and would provide adequate emergency access to the structure. If necessary, emergency vehicles would be able to circulate through the parking lot to make a U-turn or turn through the swing gates to turn around and exit onto Washington Avenue. The project would provide adequate emergency access, and impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

18 Tribal Cultural Resources

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in a Public Resources Code Section 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or	□	■	□	□
b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	□	■	□	□

Regulatory Setting

Assembly Bill 52

As of July 1, 2015, California Assembly Bill 52 of 2014 (AB 52) was enacted and expands CEQA by defining a new resource category, "tribal cultural resources." AB 52 establishes that "A project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment" (PRC Section 21084.2). It further states that the lead agency shall establish measures to avoid impacts that would alter the significant characteristics of a tribal cultural resource, when feasible (PRC Section 21084.3).

PRC Section 21074 (a)(1)(A) and (B) defines tribal cultural resources as "sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe" and is:

1. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or
2. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying these criteria, the lead agency shall consider the significance of the resource to a California Native American tribe.

AB 52 establishes a formal consultation process for California Tribes regarding those resources. The consultation process must be completed before a CEQA document can be certified. Under AB 52, lead agencies are required to "begin consultation with a California Native American Tribe that is traditionally and culturally affiliated with the geographic area of the proposed project." Native American tribes to be included in the process are those that have requested notice of projects proposed within the jurisdiction of the lead agency.

On June 7, 2022, the City of San Leandro, pursuant to Public Resources 21080.3.1 and AB 52, sent via email and a certified mail notification letter to the following tribes:

- Amah Mutsun Tribal Band of Mission San Juan Bautista
- Costanoan Rumsen Carmel Tribe
- Indian Canyon Mutsun Band of Costanoan
- Muwekma Ohlone Indian Tribe of the San Francisco Bay Area
- The Ohlone Indian Tribe
- Wuksache Indian Tribe/Eshom Valley Band
- The Confederated Villages of Lisjan Nation
- North Valley Yokuts Tribe

One response was received from the Confederated Villages of Lisjan Nation, which stated the tribe had no further information or comments regarding the proposed project. No other tribal consultation responses were received, and consultation was deemed complete on July 7, 2022.

Impact Analysis

a. Would the project cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code Section 21074 that is listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)?

b. Would the project cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code Section 21074 that is a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1?

As described in Section 5, *Cultural Resources,* neither the cultural resources records search nor Sacred Lands File search identified cultural resources listed on or eligible for listing on the CRHR or a local register within the project site. However, there is always potential to uncover buried archaeological and tribal cultural resources during ground disturbing activities, which could potentially be considered tribal cultural resources eligible for listing in the CRHR or a local register or be considered tribal cultural resources. Should project construction activities encounter and damage or destroy a tribal cultural resource or resources, impacts would be potentially significant. Implementation of Mitigation Measure TCR-1 would be required.

Mitigation Measures

TCR-1 Unanticipated Discovery of Tribal Cultural Resources

In the event that cultural resources of Native American origin are identified during project construction, all earth-disturbing work within 50 feet of the find shall be temporarily suspended or redirected until an archaeologist has evaluated the nature and significance of the find as a cultural resource and an appropriate local Native American representative is consulted. If the City, in consultation with local Native American tribes, determines that the resource is a tribal cultural resource and thus significant under CEQA, a mitigation plan shall be prepared and implemented in accordance with state guidelines and in consultation with local Native American group(s). The plan shall include avoidance of the resource or, if avoidance of the resource is infeasible, the plan shall outline the appropriate treatment of the resource in coordination with the appropriate local Native American tribal representative and, if applicable, a qualified archaeologist. The plan shall include measures to ensure the find is treated in a manner that respectfully retains, to the degree feasible, the qualities that render the resource of significance to the local Native American group(s). Examples of appropriate mitigation for tribal cultural resources include, but are not limited to, protecting the cultural character and integrity of the resource, protecting traditional use of the resource, protecting the confidentiality of the resource, or heritage recovery.

Significance After Mitigation

Implementation of Mitigation Measure TCR-1 would minimize impacts to tribal cultural resources encountered during project construction. Impacts would be less than significant with mitigation incorporated.

LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED

This page intentionally left blank.

19 Utilities and Service Systems

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Would the project:				
a. Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☐	☐	■	☐
b. Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	☐	☐	■	☐

e. Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☐	☐	■	☐

Setting

Potable Water

Water service to the City of San Leandro is provided by the East Bay Municipal Utility District (EBMUD), a public utility. EBMUD is responsible for service connections and water delivery to most of Alameda County and much of Contra Costa County. San Leandro comprises about 6 percent of the EMBUD's customer base and uses about 5 percent of its water. As discussed in Section 10, *Hydrology and Water Quality,* approximately 90 percent of the EBMUD water supply originates from the Sierra Nevada via the Mokelumne River watershed, with the other 10 percent sourced from

runoff on East Bay Area watershed lands. Water delivered to San Leandro customers is treated at the Orinda or Upper San Leandro water treatment plants (EBMUD 2021).

Each water district adopts an Urban Water Management Plan (UWMP), which is a long-range planning document used to assess current and projected water usage, water supply planning and conservation and recycling efforts. The EBMUD adopted a 2020 UWMP and a 2020 Water Shortage Contingency Plan which determined that under base condition assumptions, EBMUD can meet customer demand out to 2050 during normal years and single dry years; however, during multi-year droughts, even with customer demand reduction measures in place, EBMUD will need to obtain supplemental supplies to meet customer demands (EBMUD 2021). Projections are summarized across the different water supply scenarios through the year 2050 in Table 30.

Table 30 EBMUD Normal and Dry Year Supply and Demand Comparison 2020-2050

EBMUD Planning Level of Demand	2020	2025	2030	2035	2040	2045	2050

mgd = million gallons per day
taf = thousand acre-feet
CVP = Central Valley Project
Source: EBMUD 2021

EBMUD distributes its water through a system of pipelines, storage reservoirs, water treatment plants, and pumping plants Within the EBMUD service area, the water distribution network includes 4,200 miles of pipe, 167 water distribution reservoirs, and 131 water pumping plants. EBMUD's water supply system delivers 325 mgd to its 1.4 million customers and has a capacity of 830 million gallons (EBMUD 2021, City of San Leandro 2016b).

There are currently no major water storage facilities in San Leandro. Rather, the city is served by nearby facilities in Castro Valley and Oakland, including the Dunsmuir Reservoir just outside the northeastern city limits. Pipelines in San Leandro range from 4 to 36 inches in diameter. EBMUD operates and maintains all water distribution lines within the city and is responsible for all facilities up to the location of the water meter (City of San Leandro 2016b).

Wastewater

The city's sewer system consists of approximately 130 miles of pipe, ranging from 6 inches to 42 inches in diameter, and 13 remote lift stations. The City maintains roughly two thirds of the sewers within the city limits, primarily serving the northern portion of the city. The remainder of the city, including the project site, is served by the Oro Loma Sanitary District (OLSD).. The San Francisco RWQCB established wastewater treatment requirements for the OLSD wastewater treatment plant and the EBDA outfall in an NPDES Permit (Order No. R2-2012-0004), adopted in 2012. The NPDES Order sets a framework for operation of the plant and effluent from the plant (City of San Leandro 2016b).

The OLSD serves a population of approximately 141,000, which includes residents and businesses. OLSD and Castro Valley Sanitary District jointly own OLSD's treatment plant, which has a permitted capacity of 20 mgd and treats an average dry weather flow of 12 mgd (OLSD 2022).

Stormwater

The City of San Leandro Department of Public Works owns and maintains 175 miles of storm drain conduits throughout the city. The city's storm drain system feeds into a larger system owned and operated by the Alameda County Flood Control and Water Conservation District. Stormwater from the project site drains west to Washington Avenue, where it is collected by storm drains into the City's stormwater system. Stormwater runoff is collected and disposed of by an integrated system of storm drains, inlets, curbside gutters, catch basins, drainage ditches, and man-made channels. Ultimately, stormwater that enters the City's system drains to the San Francisco Bay (City of San Leandro 2022).

Solid Waste

The City of San Leandro has two distinct service areas for refuse and recycling services: San Leandro Sanitary District and Oro Loma Sanitary District. The two service providers that serve these areas are Alameda County Industries (City's franchisee) and Waste Management of Alameda County (OLSD's franchisee). As of 2019, the City's solid waste was sent to seven landfills, as summarized below in Table 31. About 81 percent of San Leandro's solid waste was sent to the Altamont Landfill Resource Recovery Facility and the Vasco Road Sanitary Landfill (CalRecycle 2019).

Table 31 Estimated Landfill Capacities and Closure Date

Landfill Facility	Permitted Capacity (cubic yards)	Remaining Capacity (cubic yards)	Maximum Permitted Throughput (tons per day)	Anticipated Closure Date
Altamont Landfill Resource Recovery Facility	124,400,000	65,400,000	11,150	2070
Fink Road Landfill	14,640,000	7,184,701	2,400	2023[1]
North County Landfill and Recycling Center	41,200,000	35,400,000	825	2048
Potrero Hills Landfill	83,100,000	13,872,000	4,330	2048
Recology Hay Road Landfill	37,000,000	30,433,000	2,400	2077
Redwood Landfill	26,077,000	26,000,000	2,300	2036
Vasco Road Sanitary Landfill	40,207,100	11,560,000	2,518	2051

CalRecycle identifies Maximum Permitted Throughput only in Tons/Day, while Maximum Permitted Capacity and Remaining Capacity are only provided in Cubic Yards; therefore, standard conversion factors provided by the EPA (U.S. EPA 2016) are used to provide all figures in both Tons and Cubic Yards. EPA identifies a standard conversion factor for Municipal Solid Waste (MSW) compacted to "Landfill Density" of 1,700 pounds per cubic yard, equating to approximately 0.8 ton per cubic yard of compacted MSW.

[1] Fink Road Landfill has an estimated cease operation date of December 1, 2023

Source: United States Environmental Protection Agency 2016

Source: CalRecycle 2019

Other Utilities

Electricity would be provided to the project site by EBCE via Pacific Gas and Electric Company (PG&E) infrastructure. Infrastructure capable of supporting electric and telecommunications is present at the project site and in the project vicinity.

Regulatory Setting

State

CALIFORNIA GREEN BUILDING STANDARDS CODE

In January 2020, the state of California adopted CalGreen that establishes mandatory green building standards for all buildings in California. The code covers five categories: planning and design, energy efficiency, water efficiency and conservation, material conservation and resource efficiency, and indoor environmental quality. These standards include a mandatory set of guidelines, as well as more rigorous voluntary measures, for new construction projects to achieve specific green building performance levels.

- Reducing indoor water use by 20 percent
- Reducing wastewater by 20 percent
- Recycling and/or salvaging 50 percent of nonhazardous construction and demolition debris
- Providing readily accessible areas for recycling by occupant

ASSEMBLY BILL (AB) 939

The California Integrated Waste Management Act (AB 939, Sher, Chapter 1095, Statutes of 1989 as amended [IWMA]) made all California cities, counties, and approved regional solid waste management agencies responsible for enacting plans and implementing programs to divert 25 percent of their solid waste by 1995 and 50 percent by year 2000. Later legislation mandates the 50

percent diversion requirement be achieved every year. The California Department of Resources Recycling and Recovery (CalRecycle) oversees and provides assistance to local governments as they develop and implement plans to meet the mandates of the IWMA and subsequent legislation.

City of San Leandro

SAN LEANDRO 2035 GENERAL PLAN

The following policies of the City's General Plan are related to the provision of utilities and service systems in San Leandro:

Policy CSF-6.2 **Fair Share Costs.** Require future development to pay its fair share of the cost of improving the water, sewer, storm drainage, and other infrastructure systems needed to serve that development. Development impact fees, development agreements, and other appropriate forms of mitigation should be used to cover the costs of upgrading or expanding public infrastructure.

Policy CSF-6.4 **Wastewater Collection and Treatment.** Maintain efficient, environmentally sound, and cost-effective wastewater collection and treatment services in San Leandro.

Policy CSF-6.5 **Capacity.** Maintain adequate capacity at the San Leandro wastewater treatment plant to accommodate projected levels of growth within the service area and encourage the Oro Loma Sanitary District to do the same. Support efforts to maintain and/or improve the high quality of treated effluent at both plants and increase the feasibility and cost-effectiveness of using recycled wastewater for non-potable purposes.

SAN LEANDRO STORMWATER MANAGEMENT AND DISCHARGE CONTROL ORDINANCE

The City of San Leandro manages stormwater and regulates discharge into storm drains through a Storm Water Management and Discharge Control Ordinance. The City adheres to the SWRCB requirements for permitting for specific types of industrial and construction activities, such as obtaining a NPDES permit prior to construction.

Impact Analysis

a. Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

b. Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

c. Would the project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Water

The project would increase future water demand at the project site. The estimated water usage for project operation would be approximately 252,700 gallons per year. This estimation is based on

water duty factors of 15 gallons per square foot of office space per year and 3.4 gallons per square foot of warehouse space per year (US Energy Information Administration 2017).[8]

252,700 gallons per year equates to less than 0.01 mgd, which would represent less than 0.01 percent of projected EBMUD water supplies across normal, single dry, and multiple dry years. As determined in the EBMUD UWMP, there is adequate water supply available to serve anticipated growth within Alameda County through the year 2050. Additionally, the project applicant was provided a Will Serve Letter from EBMUD on October 7, 2021. EBMUD adopted a 2020 Water Shortage Contingency Plan which aims to protect the water supply in the event of an emergency such as a drought or earthquake, and to implement and enforce regulations and restrictions for managing a water shortage (EBMUD 2020b). Additionally, EBMUD provided water to the project site's land uses prior to their demolition and water infrastructure exists to serve the site. Therefore, the project would represent a negligible net increase in water demand at the project site. The project would not require or result in the relocation or construction of new or expanded water facilities, and the project would have sufficient water supplies available to serve the project during normal, dry, and multiple dry years. Impacts would be less than significant.

Wastewater

Conservatively assuming that the project's sewer flow would be 100 percent of its anticipated water use, the project would generate approximately 252,700 gallons of wastewater per year. The project would be served by OLSD and would have a connection to the OLSD sewer system, which directs wastewater to the treatment plant jointly owned by OLSD and Castro Valley Sanitary District. The treatment plant has a permitted capacity of 20 mgd, and treats an average dry weather flow of 12.4 mgd (OLSD 2022). Therefore, the OLSD treatment plant has approximately 7.6 mgd of remaining capacity.

The 252,700 gallons of wastewater per year generated by the project equates to approximately 0.25 million gallons per year, or less than 0.001 mgd. This daily wastewater generation rate would represent less than 0.01 percent of the OLSD treatment plant's remaining capacity. Additionally, the project applicant would be required to submit a sanitary sewer plan to the District for approval, and obtain an OLSD district permit prior to connecting to the OLSD sewer system. The project would not require or result in the relocation or construction of new or expanded wastewater facilities, and would be served by a wastewater treatment provider with adequate capacity for the project's projected demand. Impacts would be less than significant.

Stormwater

The project would continue to connect to the existing storm drain system operated and maintained by the City of San Leandro. As discussed in Section 10, *Hydrology and Water Quality,* the project would decrease the amount of impervious surfaces at the project site compared to existing conditions, so that the amount of runoff would decrease. The bioretention treatment areas within proposed project landscaping would collect and facilitate recharge of stormwater on the project site. Additionally, the project would also be required to comply with NPDES permit requirements and C.3 Stormwater Guidelines. Impacts would be less than significant.

[8] 15 gallons per square foot of office space per year, multiplied by 5,000 square feet of office space, equals 75,000 gallons per year. 3.4 gallons per square foot of warehouse space per year, multiplied by 52,269 square feet of office space, equals approximately 177,700 gallons per year. 177,700 gallons per year plus 75,000 gallons per year equals approximately 242,700 gallons per year.

Electricity, Natural Gas, and Telecommunications

As discussed in Section 6, *Energy*, the project would not result in the wasteful, inefficient, or unnecessary consumption of energy. In addition, the project would not require the construction of new electric power, natural gas, or telecommunications facilities because it is located in an urban area already served by those utilities and would not require additional capacity.

Therefore, the project would not result in significant environmental impacts due to the construction of new utility facilities. Impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

d. Would the project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

e. Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

The proposed project would generate solid waste during construction and operation. During construction, the current CalGreen code would require that 65 percent of construction and demolition debris be diverted. Because the existing structures on the project site were destroyed by a fire, demolition of remaining structures was undertaken by the City under emergency safety permits. Handling of debris and waste generated during construction would be subject to CalGreen requirements and Chapter 3-7 of SLMC, which would require the project applicant to submit a Debris Recycling Statement. This statement would require the applicant to report the estimated volume or weight of construction debris, the amount of debris that was diverted via reuse or recycling, and information regarding the facility the applicant proposed to use to salvage, collect, or receive diverted material. Therefore, the project would not impair the attainment of solid waste reduction goals.

Operation of the project would generate an estimated 775 pounds of solid waste per day. This estimation is based on solid waste generation rates provided by CalRecycle, which estimate that office uses generate 6 pounds of solid waste per 1,000 square feet per day and warehouse uses generate 1.42 pounds per 100 square feet per day (CalRecycle 2015).[9] The generated 775 pounds of solid waste per day would equate to 0.07 tons per day or 142 tons per year.

Solid waste from the project site would be collected by Waste Management of Alameda County and likely sent to the Altamont Landfill Resource Recovery Facility. Table 32 shows the project's estimated solid waste generation and the remaining capacity of these landfills (CalRecycle 2019).

Table 32 Generated Solid Waste and Estimated Landfill Capacity

Project Solid Waste Generation (tons/day)	Permitted Throughput of Altamont (tons/day)	Remaining Capacity of Altamont (cubic yards)
0.07	11,150	65,400,000

Source: CalRecycle 2019

[9] 6 pounds per 1,000 square feet of office space per day, multiplied by 5,000 square feet of office use, is 30 pounds of solid waste generated per day by office uses. 1.42 pounds per 100 square feet of warehouse space per day, multiplied by 52,269 square feet of warehouse use, is approximately 745 pounds per day. 30 pounds plus 745 pounds is approximately 775 pounds of solid waste generated by the project per day.

Project generated waste would be less than 0.01 percent of Altamont Landfill's allowable waste limit and less than 0.01 percent of Altamont Landfill's remaining capacity. The project would be required to comply with City and State plans and policies to reduce solid waste generation, including a requirement to divert at least 50 percent of solid waste and recyclables as required by Assembly Bill 939. The project's incremental increase in solid waste would not adversely affect solid waste facilities. Impacts would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT

20 Wildfire

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a. Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	■
b. Due to slope, prevailing winds, and other factors, exacerbate wildfire risks and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☐	■
c. Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☐	■
d. Expose people or structures to significant risks, including downslopes or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☐	■

Setting

According to maps prepared by the California Department of Forestry and Fire Protection (CAL FIRE), most of San Leandro is within a Local Responsibility Area and is not located within a Fire Hazard Severity Zone. However, small portions of the city along its eastern border are classified as Very High Fire Hazard Severity Zones within Local Responsibility Areas (CAL FIRE 2006). The project site is not within a Fire Hazard Severity Zone and is located approximately one mile west of the nearest Very High Fire Hazard Severity Zone.

Impact Analysis

a. If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project substantially impair an adopted emergency response plan or emergency evacuation plan?

b. If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project due to slope, prevailing winds, and other factors, exacerbate wildfire risks and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

c. If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

d. If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project expose people or structures to significant risks, including downslopes or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

The project site is not in a CAL FIRE designated Very High Fire Hazard Severity Zone and is located approximately 1.2 miles west of the nearest Very High Fire Hazard Severity Zone (CALFIRE 2006). The project site is separated from the nearest Very High Fire Hazard Severity Zone by urban development, which does not facilitate the spread of wildfire. Additionally, the prevailing wind direction in San Leandro is west to east for nine months of the year and from north to south for three months of the year (WeatherSpark 2022); therefore, prevailing winds would blow wildfires away from the project site and from the city.

Project implementation would not impair an adopted emergency response plan or emergency evacuation plan, as discussed in Section 9, *Hazards and Hazardous Materials,* or exacerbate wildfire risks. Further, the project would not require the installation or maintenance of associated infrastructure that may exacerbate fire risk or expose people or structures to significant risks, including downslopes or downstream flooding or landslides, as a result of runoff, post fire slope instability, or drainage changes in or near state responsibility areas or lands classified as very high fire severity zones. No impact would occur.

NO IMPACT

21 Mandatory Findings of Significance

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
Does the project:				
a. Have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	□	■	□	□
b. Have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	□	■	□	□
c. Have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	□	■	□	□

a. Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

As discussed in Section 4, *Biological Resources*, the project would not substantially reduce the habitat of a fish or wildlife species; cause a fish or wildlife species population to drop below self-sustaining levels; threaten to eliminate a plant or animal community; or reduce the number or restrict the range of a rare or endangered plant or animal. The project could result in potentially significant impacts to nesting birds or roosting bats. Implementation of mitigation measures BIO-1 and BIO-2 would reduce impacts to protected birds and bats to less than significant levels.

As discussed in Section 5, *Cultural Resources*, and Section 7, *Geology and Soils,* no historical, archaeological, or paleontological resources were identified on site. Additionally, as discussed in Section 18, *Tribal Cultural Resources,* there are no known tribal cultural resources within the project site. Nevertheless, it is always possible to encounter cultural, paleontological, or tribal cultural resources during ground disturbing activities. Implementation of mitigation measures CR-1, GEO-1, and TCR-1 would reduce impacts to previously undiscovered cultural, tribal cultural resources, and paleontological resources to less than significant levels by providing a process for evaluating and, as necessary, avoiding impacts to any resources found during construction. Therefore, impacts to important examples of California history or prehistory would be less than significant.

As noted throughout the Initial Study, other potential environmental impacts related to the quality of the environment would be less than significant.

LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED

b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

As described in Sections 1 through 20, the project would not result in significant and unmitigable impacts to the environment with respect to all environmental issues. This is largely because project construction activities would be temporary, and construction and operational activities and would not significantly alter the environmental baseline condition.

As defined in *CEQA Guidelines* Section 15335, "cumulative impacts" refer to two or more individual impacts that, when considered together, are substantial or will compound other environmental impacts. Cumulative impacts are the changes in the environment that result from the incremental impact of development of the proposed project when added to other closely related past, present and reasonably foreseeable probable future nearby projects. If a significant cumulative impact is identified, it must then be determined whether the project's contribution to that impact would be cumulatively considerable. Cumulative impacts could occur if the construction of other projects occurred recently, at the same time as the proposed project or is proposed in the near future, and in the same geographic scope, such that the effects of similar impacts of multiple projects combine to create greater levels of impact than would occur at the project-level. For example, if the construction of other projects in the area occurs at the same time as project activities, combined air quality and noise impacts may be greater than at the project-level.

Seven planned development projects are in the vicinity of the project site, which are summarized in Table 33. The exact implementation timing of these projects is not known at this time; therefore, it is conservatively assumed that construction of these planned projects could overlap with construction of the proposed project.

Table 33 Cumulative Development Projects

No.	Project Name	Project Location	Project Components	Status
1	B22-1812	14347 Washington Avenue, 800 feet southeast of project site	Removal of two underground storage tanks (10,000 gallons and 2,000 gallons)	Under consideration by the City
2	B22-1409	14240 Rose Drive, 0.4 mile northeast of project site	Construction of 740 square foot accessory dwelling unit	Under consideration by the City
3	B21-2359	1530 146th Avenue, 0.7 mile northeast of project site	Construction of 800 square foot accessory dwelling unit	Under consideration by the City
4	B21-1360	2483 Washington Avenue, 0.5 mile north of project site	Demolition of shed, reconfiguration of parking lot, and remodeling of commercial structure	Building permits issued
5	B22-1730	2274 Washington Avenue, 0.7 mile north of project site	Residential conversion and renovation	Under consideration by the City
6	B22-1470	2824 Halcyon Drive, 0.5 mile southeast of project site	Construction of 1,678 square foot single family residence	Under consideration by the City
7	B22-1832	854 Portola Drive, 0.5 mile southwest of project site	Trenchless installation of sewer lateral replacement from residence to main line in street	Approved by the City

Source: Cit of San Leandro 2022

Construction impacts are primarily temporary, localized effects. Therefore, the potential for the project to contribute to cumulative impacts would be limited to the infrequent periods of project activities and the following issue areas:

- **Air Quality.** Because the San Francisco Bay Area Air Basin currently exceeds the federal ozone and $PM_{2.5}$ standards and the state ozone, PM_{10}, and $PM_{2.5}$ standards, cumulative air quality impacts currently exist for these pollutants. As discussed in Section 3, *Air Quality*, project construction activities would not generate emissions of air pollutants exceeding BAAQMD significance thresholds, which are intended to assess whether a project's contribution to existing cumulative air quality impacts is considerable. Therefore, the project's contribution to cumulative air quality impacts would not be cumulatively considerable.
- **Biological Resources.** Most cumulative impacts to biological resources occur when a disproportionate number of development projects occur at once and regionally impact a local population of a special status species, riparian habitat, sensitive natural communities, wetlands, or other locally protected biological resources. In this case, all cumulative projects would occur within previously developed areas, and would not be anticipated to result in significant impacts to special status plant and wildlife species or sensitive natural communities. Additionally, the proposed project would be required to implement mitigation measures BIO-1 and BIO-2 to reduce its impacts to biological resources to a less-than-significant level such that project-level impacts would not result in a cumulatively considerable impact to biological resources.
- **Cultural and Tribal Cultural Resources.** Cumulative development in the region would continue to disturb areas with the potential to contain cultural and tribal cultural resources. The cumulative development projects have undergone or would be required to undergo CEQA review, which would determine the extent of potential cultural and tribal cultural resources impacts and mitigate those impacts appropriately. If these cumulative projects would result in impacts to known or unknown cultural or tribal cultural resources, impacts to such resources would be addressed on a case-by-case basis. Given the uncertainty in the extent of impacts

associated with these projects, this analysis conservatively assumes a significant cumulative impact to cultural and tribal cultural resources would occur. Nevertheless, the proposed project would be required to implement mitigation measures CR-1 and TCR-1 to reduce its impacts to cultural and tribal cultural resources to a less-than-significant level such that project-level impacts would not result in a cumulatively considerable contribution to this cumulative impact.

- **Greenhouse Gas Emissions.** GHG emissions and climate change are, by definition, cumulative impacts. As discussed in Section 8, *Greenhouse Gas Emissions*, the adverse environmental impacts of cumulative GHG emissions are already occurring. As a result, cumulative impacts related to GHG emissions are significant. Thus, the issue of climate change involves an analysis of whether a project's contribution towards an impact is cumulatively considerable. As discussed in Section 8, *Greenhouse Gas Emissions*, project emissions would be below the identified threshold of significance and therefore would not be cumulatively considerable.
- **Hazards and Hazardous Materials.** Similar to the proposed project, cumulative projects would be required to comply with regulations applicable to the use, disposal, and transportation of hazardous materials during construction activities, and compliance with applicable regulations would reduce potential cumulative impacts to less-than-significant levels. With respect to the use and accidental release of hazardous materials in the environment at construction, effects are generally limited to site-specific conditions. As part of project approval for the cumulative projects, the City would assess the need for fire protection services, which would inform efforts to improve or expand needed facilities. Cumulative development would comply with emergency access requirements as directed by respective city and fire department regulations. Therefore, cumulative impacts related to hazards and hazardous materials would be less than significant.
- **Noise.** Overlapping construction activities associated with cumulative development projects in conjunction with proposed project activities could result in cumulative noise impacts related to a temporary increase in ambient noise levels at the same noise-sensitive receivers located throughout the area, especially during construction activities. However, similar to the proposed project, cumulative development projects would be subject to compliance with the noise level limits established in SLMC Chapter 4-1. Therefore, cumulative construction noise impacts would be less than significant. Although there could be other cumulative projects simultaneously under construction near construction of the proposed project, the potential for construction groundborne vibration and noise impacts is within relatively close distances (e.g., within approximately 25 feet for a vibratory roller). Since no two construction cumulative projects would both be within 25 feet of a given sensitive structure, cumulative groundborne vibration and noise impacts would be less than significant.
- **Public Services.** Cumulative developments would be required to comply with the California Fire Code, Part 9 of the CBC and would follow standards for fire safety such as fire flow requirements for buildings, fire hydrant location and distribution criteria, automated sprinkler systems, and fire-resistant building materials. For these reasons, the cumulative projects would not result in the need to construct new or expand existing fire protection or emergency medical services facilities beyond those anticipated for expected population growth. Therefore, the cumulative impact related to fire protection facilities would be less than significant. Cumulative plans and projects within the service area of the SLPD would be reviewed for impacts on police protection services, would be required to address any potential impacts with mitigation, and would need to provide adequate emergency access for police services with proper signage and lighting. Because demand for law enforcement services is highly dependent on a number of factors that vary substantially by project (clientele, hours of operation, crime prevention measures, etc.), it is unlikely that there would be substantial overlap in demand that would result such that new

facilities are necessary. The cumulative impact related to police protection facilities would be less than significant. Cumulative projects would be required to pay development impact fees towards school operation which, pursuant to Section 65995(3)(h) of the California Government Code (Senate Bill 50, chaptered August 27, 1998), are "deemed to be full and complete mitigation of the impacts of any legislative or adjudicative act, or both, involving, but not limited to, the planning, use, or development of real property, or any change in governmental organization or reorganization." Therefore, the cumulative impact related to school facilities would be less than significant.

- **Transportation.** Overlapping construction schedules associated with cumulative development projects in conjunction with proposed project activities could result in cumulative transportation impacts. Similar to the proposed project, cumulative projects would be required to be consistent with VMT screening criteria or complete a VMT analysis, and also be consistent with LOS standards established by the City's General Plan. The proposed project would not result in significant impacts related to VMT or significant adverse effects related to LOS. Therefore, cumulative transportation impacts would be less than significant.
- **Utilities and Service Systems.** Operation of cumulative development projects in conjunction with proposed project activities could result in cumulative utilities impacts. Similar to the proposed project, cumulative projects would be required to undergo individual environmental review for potential impacts to existing utilities that serve the City of San Leandro. The project would not require or result in the relocation or construction of new or expanded water facilities, and the project would have sufficient water supplies available to serve the project during normal, dry, and multiple dry years. The project would not require or result in the relocation or construction of new or expanded wastewater facilities, and would be served by a wastewater treatment provider with adequate capacity for the project's projected demand. The project would not require the construction of new electric power, natural gas, or telecommunications facilities because it is located in an urban area already served by those utilities and would not require additional capacity. Therefore, cumulative utilities impacts would be less than significant.

Based on this information, the proposed project would not result in a cumulatively considerable contribution to a significant cumulative impact with mitigation incorporated.

LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED

c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

In general, impacts to human beings are associated with air quality, hazards and hazardous materials, and noise impacts. As discussed in Section 3, *Air Quality,* the project would implement Mitigation Measure AQ-1, which would require implementation of BAAQMD Basic Construction Mitigation Measures related to architectural coatings and construction fugitive dust. As discussed in Section 9, *Hazards and Hazardous Materials*, impacts related to groundwater, vapor, or soil contamination would not be significant as a result of project implementation with Mitigation Measure HAZ-1 and would not have a cumulatively considerable contribution to significant cumulative hazards impacts. As discussed in Section 13, *Noise*, the project would not have significant noise impacts in construction or operation. Therefore, the project would not cause substantial adverse effects on human beings with implementation of applicable mitigation measures.

LESS THAN SIGNIFICANT WITH MITIGATION INCORPORATED

Introduction and Overview

First Industrial Realty Trust, Inc. is planning the redevelopment of 14143-14273 Washington Avenue in San Leandro, CA. The site is currently a mix of commercial and residential buildings with associated parking lots and landscapes. HortScience | Bartlett Consulting was asked to prepare a **Preliminary Arborist Report** for the site as part of the application to the City of San Leandro. This report is preliminary because plans provided were conceptual in nature and did not include accurate trunk or canopy locations. In addition, grading, drainage, stormwater, utility and landscape plans that could impact trees have yet to be prepared and were not reviewed for this report.

This report provides the following information:

1. Assessment of the health and structural condition of the trees within the proposed project area based on a visual inspection from the ground.
2. Evaluation of the impacts to trees based on development plans.
3. Guidelines for tree preservation during the design, construction and maintenance phases of development.

Tree Assessment Methods

Trees were assessed on January 10, 2022. The assessment included all trees 6" and greater, located within and adjacent to the project area. There were no offsite trees. The assessment procedure consisted of the following steps:

1. Identifying the tree species.
2. Verifying or tagging trees and recording locations on a map.
3. Measuring the trunk diameter at a point 54 inches above grade.
4. Evaluating the health and structural condition using a scale of 1 – 5:
    - ***5*** - A healthy, vigorous tree, reasonably free of signs and symptoms of disease, with good structure and form typical of the species.
    - ***4*** - Tree with slight decline in vigor, small amount of twig dieback, minor structural defects that could be corrected.
    - ***3*** - Tree with moderate vigor, moderate twig and small branch dieback, thinning of crown, poor leaf color, moderate structural defects that might be mitigated with regular care.
    - ***2*** - Tree in decline, epicormic growth, extensive dieback of medium to large branches, significant structural defects that cannot be abated.
    - ***1*** - Tree in severe decline, dieback of scaffold branches and/or trunk; most of foliage from epicormics; extensive structural defects that cannot be abated.
5. Rating the suitability for preservation as "high", "moderate" or "low". Suitability for preservation considers the health, age and structural condition of the tree, and its potential to remain an asset to the site for years to come.
    - ***High***: Trees with good health and structural stability that have the potential for longevity at the site.
    - ***Moderate***: Trees with somewhat declining health and/or structural defects than can be abated with treatment. The tree will require more intense management, monitoring, and may have shorter life span than those in 'high' category.
    - ***Low***: Trees in poor health or with significant structural defects that cannot be mitigated. Tree is expected to continue to decline, regardless of treatment. The species or individual may have characteristics that are undesirable for landscapes, and generally are unsuited for use areas.

Description of Trees

Twenty-three (23) trees representing six species were evaluated (Table 1). Coast redwoods and valley oaks are native to the Alameda County area, trees of these two species, however, are unlikely indigenous to the site. The remaining five trees were ornamental species. All of the trees were located on the eastern half of the property with the majority located along the edge of Washington Avenue. Overall, 16 trees (70%) were in good condition, four (17%) were in fair condition, and three (13%) were in poor condition (Table 1). Descriptions of each tree are found in the ***Tree Assessment Form***, and approximate locations are plotted on the ***Tree Assessment Map*** (see Exhibits).

Table 1. Condition ratings and frequency of occurrence of trees 14143-14273 Washington Avenue, San Leandro, CA

Common Name	Scientific Name	Condition			Total
		Poor (1-2)	Fair (3)	Good (4-5)	
Norfolk island pine	*Araucaria heterophylla*	-	-	2	**2**
Loquat	*Eriobotrya japonica*	1	-	-	**1**
Ginkgo	*Ginkgo biloba*	-	1	-	**1**
Victorian box	*Pittosporum undulatum*	1	-	-	**1**
Valley oak	*Quercus lobata*	1	1	-	**2**
Coast redwood	*Sequoia sempervirens*	-	2	14	**16**
Total		**3**	**4**	**16**	**23**

Among the 16 coast redwoods, 14 were in good condition, trees #111 and #120 were fair, and none were in poor condition. Trees ranged in development from young to mature with trunk diameters from 9 to 45 inches (Photo 1).

Photo 1 (right): Looking southeast along Washington Avenue at trees #101-104 (back to front). Trees #101 and 102 were close to average size for coast redwoods at the site, while #103 and 104 were two of the smallest.

The remaining species were represented by two or fewer individuals:

- Female ginkgo #118 was growing along the south edge of the driveway for 14143 Washington Avenue. Fruit covered the driveway below its canopy. It was semi-mature in development and 14 inches in trunk diameter. The ginkgo was in fair condition with multiple attachments throughout the canopy.

- Loquat #119 was growing adjacent to the north of the building at 14173. It was semi-mature in development with two stems (7 and 4 inches in diameter). It was in poor condition.
- Norfolk Island pines #113 and #122 were growing along Washington Avenue on the northern half of the property. Both trees were mature in development with trunk diameters of 23 and 26 inches respectively. Both trees were in good condition and had been pruned for utilities (Photo 2).

Photo 2 (left): Looking north along Washington Avenue at Norfolk Island pine #122. Both Norfolk Island pines had similar structure, with #122 the more vigorous of the two.

- Valley oaks #114 and #123 were located on the north half of the property. Both trees were semi-mature in development and had trunk diameters of 8 and 13 inches respectively. Tree #114 was in poor condition while #123 was fair. Both trees had multiple attachments along their trunks.
- Victorian box #121 was located at the northern corner of the property. It was mature in development with multiple stems. It was almost dead with very poor structure.

San Leandro's Municipal Code only protects *Street Trees* growing within the public right-of-way. Although the extent of the ROW was not marked in the field, no trees appeared to be *Street Trees*. It appears that none of the trees included in this assessment require a permit to be removed.

Suitability for Preservation

Before evaluating the impacts that will occur during development, it is important to consider the quality of the tree resource itself, and the potential for individual trees to function well over an extended length of time. Trees that are preserved on development sites must be carefully selected to make sure that they may survive development impacts, adapt to a new environment and perform well in the landscape.

Our goal is to identify trees that have the potential for long-term health, structural stability and longevity. For trees growing in open fields, away from areas where people and property are present, structural defects and/or poor health present a low risk of damage or injury if they fail. However, we must be concerned about safety in use areas. Therefore, where development encroaches into existing plantings, we must consider their structural stability as well as their potential to grow and thrive in a new environment. Where development will not occur, the normal life cycles of decline, structural failure and death should be allowed to continue.

Evaluation of suitability for preservation considers several factors:

- **Tree health**
  Healthy, vigorous trees are better able to tolerate impacts such as root injury, demolition of existing structures, changes in soil grade and moisture, and soil compaction than are non-vigorous trees. For example, valley oak #114 was in poor condition and should be removed regardless of construction impact.

- **Structural integrity**
  Trees with significant amounts of wood decay and other structural defects that cannot be corrected are likely to fail. Such trees should not be preserved in areas where damage to people or property is likely. For example, Victorian box #121 had a decayed trunk and multiple attachments.

- **Species response**
  There is a wide variation in the response of individual species to construction impacts and changes in the environment. For instance, loquats and ginkgoes have good tolerance to root pruning under more general conditions while coast redwoods are more tolerant of root pruning when soil is adequately moist.

- **Tree age and longevity**
  Mature trees, while having significant emotional and aesthetic appeal, have limited physiological capacity to adjust to an altered environment. Young trees are better able to generate new tissue and respond to change. The coast redwoods were generally young and are expected to have a high degree of adaptability to site changes. Meanwhile, Victorian box #121 is overly mature and expected to decline or die with any adjacent construction activity.

- **Species invasiveness**
  Species that spread across a site and displace desired vegetation are not always appropriate for retention. This is particularly true when indigenous species are displaced. The California Invasive Plant Inventory Database http://www.cal-ipc.org/plants/inventory/ lists species identified as being invasive. San Leandro is part of the Central West Floristic Province. No invasive trees were growing on the site.

Each tree was rated for suitability for preservation based upon its age, health, structural condition and ability to safely coexist within a development environment (see ***Tree Assessment*** in Exhibits, and Table 2). We consider trees with “high” suitability for preservation to be the best candidates for preservation. We do not recommend retention of trees with “low” suitability for preservation in areas where people or property will be present. Retention of trees with “moderate” suitability for preservation depends upon the intensity of proposed site changes.

Table 2. Tree suitability for preservation
14143-14273 Washington Avenue, San Leandro, CA

High	These are trees with good health and structural stability that have the potential for longevity at the site. Sixteen (16) trees, including 14 coast redwoods and both Norfolk Island pines, had "high" suitability for preservation.
Moderate	Trees in this category have fair health and/or structural defects that may be abated with treatment. These trees require more intense management and monitoring, and may have shorter life-spans than those in the "high" category. Coast redwoods #111 and #120, ginkgo #118, and valley oak #123 had "moderate" suitability for preservation.
Low	Trees in this category are in poor health or have significant defects in structure that cannot be abated with treatment. These trees can be expected to decline regardless of management. The species or individual tree may possess either characteristics that are undesirable in landscape settings or be unsuited for use areas. Valley oak #114, loquat #119, and Victorian box #121 had "low" suitability for preservation.

Preliminary Evaluations of Impacts and Recommendations

Appropriate tree retention develops a practical match between the location and intensity of construction activities with the quality and health of trees. The ***Tree Assessment*** was the reference point for tree condition and quality. Impacts from construction were estimated given the project information available to date. I referred to the Topographic Survey C1.0 (dated 10.22.2021), Conceptual Site Plan Washington Avenue (dated 03.11.2021), and SITE Model (undated) to evaluate impacts.

All plans were conceptual in nature. No trunk locations or canopy outlines for the trees were included on the provided plans. As such, the assessment of impacts to trees is preliminary. The development proposes to demolish an existing set of commercial buildings and construct a new building with parking spaces and associated sidewalks. Development will encompass the entire site, limiting opportunity for preservation of on-site trees.

Based on the proposed plan, I recommend preservation of 13 trees and removal of 10 (Table 3). The 13 trees recommended for preservation had a high suitability for preservation. Those trees recommended for preservation included coast redwoods #101 to 110 and #112, and Norfolk Island pines #113 and #122.

Retention of these trees is predicated on strict adherence to the ***Preliminary Tree Preservation Guidelines***. If construction activity is kept at least 1.5 to 3.5 feet from the trunk AND at least 60 percent of the total root area is retained, I expect that impacts will be within the tolerance of the trees (see Table 3 "Notes" for exact minimum distances by tree).

For the coast redwoods, some amount of canopy and root pruning may be required. Although the driplines of these trees are within the proposed construction area, coast redwoods are tolerant of root pruning and can be retained even with activity in the root zone. Additionally, these trees provide significant benefits to the site in their current location. They provide good screening of surrounding infrastructure and property boundaries as well as shading of adjacent asphalt. **[*recommendations continued on following page*]**

Preliminary Evaluations of Impacts and Recommendations (continued)

Among the 10 trees to be removed are eight trees within the proposed building footprint and two trees within the proposed parking and driveway construction. This includes five coast redwoods, valley oaks #114 and #123, ginkgo #118, loquat #119, and Victorian box #121. Three coast redwoods had a high suitability for preservation while the remaining trees had low to moderate suitability.

Table 3: Preliminary disposition
14143-14273 Washington Avenue, San Leandro, CA

Tree No.	Species	Trunk Diameter (in.)	Protected Tree?	Condition 1=poor 5=excellent	Suitability for Preservation	Disposition	Comments
101	Coast redwood	21	No	5	High	Preserve	W/in proposed landscape area. Preservation possible w/ minor modifications to plans. Construction impacts must be >3' from root crown.

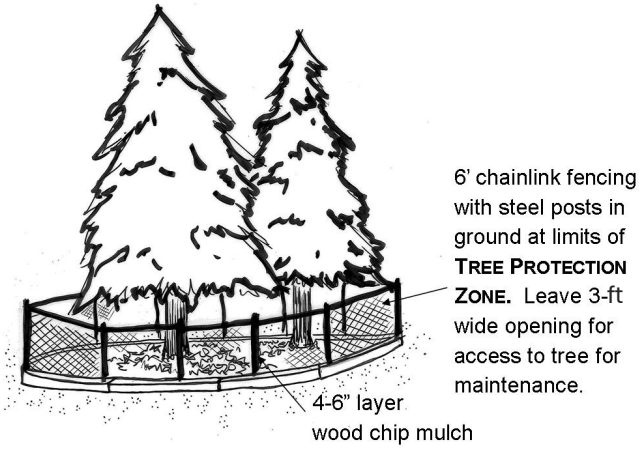
122	Norfolk island pine	26	No	4	High	Preserve	W/in proposed landscape area. Preservation possible w/ minor modifications to plans. Construction impacts must be >3.5' from root crown.
123	Valley oak	13	No	3	Moderate	Remove	Within proposed building project area.



Preliminary Tree Preservation Guidelines

The following recommendations will help reduce impacts to trees from development as well as maintain and improve their health and vitality through the clearing, grading and construction phases. The key elements of a tree preservation plan for the Washington Avenue site would include:

- Retaining select trees with high or moderate suitability for preservation.
- Establishing **Tree Protection Zones** for each tree to be preserved. **Tree Protection Zones** are identified by the Consulting Arborist based on species tolerances, tree condition, trunk diameters and the nature and proximity of the proposed disturbance.
- Providing supplemental irrigation prior to and during the demolition and construction phases.

Design recommendations

1. All plans affecting trees shall be reviewed by the Consulting Arborist with regard to tree impacts. These include, but are not limited to, demolition plans, grading and utility plans, landscape and irrigation plans.
2. For trees identified for preservation, designate a **Tree Protection Zone** in which no construction, grading and underground services including utilities, sub-drains, water or sewer will be located (Figure 1). For design purposes, the **Tree Protection Zone** should be either the dripline or edge of proposed construction. The **TPZ** should begin no closer than the minimum distances listed in Table 3 (page 6) and encompass at least 60 percent of each tree's root mass. Depending on the tree to be preserved, additional space beyond the dripline may be required.
3. No grading, excavation, construction or storage of materials shall occur within the **Tree Protection Zone**.
4. No underground services including utilities, sub-drains, water or sewer shall be placed in the **Tree Protection Zone**.

Detail A: Redwood Tree Protection Fencing

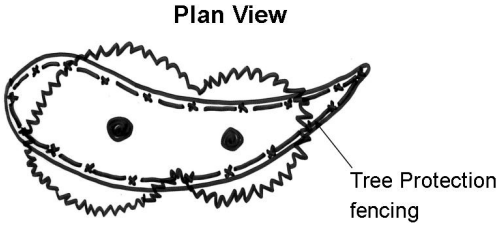


Figure 1: An example of a **Tree Protection Zone** which encroaches slightly on the dripline of the trees but designates the edge of proposed construction.

5. Irrigation systems must be designed so that no trenching will occur within the **Tree Protection Zone**.

6. As trees withdraw water from the soil, expansive soils may shrink within the root area. Therefore, foundations, footings and pavements on expansive soils near trees should be designed to withstand differential displacement.

7. Consider having a temporary irrigation system installed (using soaker hoses or PVC pipes laid on the ground and covered with mulch) as soon as possible to supply the trees with water and help them recover and prepare them for impacts associated with the demolition and construction process.

8. Consider the vertical clearance requirements near trees during design. Avoid designs that would require pruning more than 20% of a tree's canopy.

Pre-construction treatments and recommendations

1. The demolition contractor shall meet with the Consulting Arborist before beginning work to discuss work procedures and tree protection.

2. Where possible, cap and abandon all existing underground utilities within the **TPZ** in place. Removal of utility boxes by hand is acceptable but no trenching should be performed within the **TPZ** in an effort to remove utilities, irrigation lines, etc.

3. Fence all trees to be retained to completely enclose the **Tree Protection Zone** prior to demolition, grubbing or grading. Fences shall be 6 ft. chain link or equivalent as approved by the Consulting Arborist. Fences are to remain until all grading and construction is completed.

4. Prune trees to be preserved to clean the crown of dead branches 1 inch and larger in diameter and raise canopies as needed for construction activities. All pruning shall be done by a State of California Licensed Tree Contractor (C61/D49). All pruning shall be done by Certified Arborist or Certified Tree Worker in accordance with the Best Management Practices for Pruning (International Society of Arboriculture, 2002) and adhere to the most recent editions of the American National Standard for Tree Care Operations (Z133.1) and Pruning (A300). The Consulting Arborist will provide pruning specifications prior to site demolition. Branches extending into the work area that can remain following demolition shall be tied back and protected from damage.

5. All tree work shall comply with the Migratory Bird Treaty Act as well as California Fish and Wildlife code 3503-3513 to not disturb nesting birds. Tree pruning and removal should be scheduled outside of the breeding season to avoid scheduling delays. Breeding bird surveys should be conducted prior to tree work. Qualified biologists should be involved in establishing work buffers for active nests.

6. Tree(s) to be removed that have branches extending into the canopy of tree(s) to remain must be removed by a qualified arborist and not by construction contractors. The qualified arborist shall remove the tree in a manner that causes no damage to the tree(s) and understory to remain. Tree stumps shall be ground 12 inches below ground surface.

7. Trees to be removed shall be felled so as to fall away from **Tree Protection Zone** and avoid pulling and breaking of roots of trees to remain. If roots are entwined, the consultant may require first severing the major woody root mass before extracting the trees, or grinding the stump below ground.

8. Apply and maintain 4-6 inches of wood chip mulch within the **Tree Protection Zone.**

Recommendations for tree protection during construction

1. Prior to beginning work, the contractors working in the vicinity of trees to be preserved are required to meet with the Consulting Arborist at the site to review all work procedures, access routes, storage areas and tree protection measures.

2. All contractors shall conduct operations in a manner that will prevent damage to trees to be preserved.

3. Any grading, construction, demolition or other work that is expected to encounter tree roots should be monitored by the Consulting Arborist.

4. Tree protection fences are to remain until all site work has been completed. Fences may not be relocated or removed without permission of the Consulting Arborist.

5. Construction trailers, traffic and storage areas must remain outside fenced areas at all times.

6. Prior to grading, pad preparation, excavation for foundations/footings/walls, trenching, trees may require root pruning outside the **Tree Protection Zone** by cutting all roots cleanly to the depth of the excavation. Roots shall be cut by manually digging a trench and cutting exposed roots with a saw, with a vibrating knife, rock saw, narrow trencher with sharp blades, or other approved root pruning equipment. The Consulting Arborist will identify where root pruning is required and monitor all root pruning activities.

7. If injury should occur to any tree during construction, it should be evaluated as soon as possible by the Consulting Arborist so that appropriate treatments can be applied.

8. No excess soil, chemicals, debris, equipment or other materials shall be dumped or stored within the **Tree Protection Zone**.

9. Any additional tree pruning needed for clearance during construction must be performed by a Certified Arborist and not by construction personnel.

10. All trees shall be irrigated on a schedule to be determined by the Consulting Arborist (every 3 to 6 weeks April through October is typical). Each irrigation shall wet the soil within the **Tree Protection Zone** to a depth of 24 inches.

Maintenance of impacted trees

Our procedures included assessing trees for observable defects in structure. This is not to say that trees without significant defects will not fail. Failure of apparently defect-free trees does occur, especially during storm events. Wind forces, for example, can exceed the strength of defect-free wood causing branches and trunks to break. Wind forces coupled with rain can saturate soils, reducing their ability to hold roots, and blow over defect-free trees. Although we cannot predict all failures, identifying those trees with observable defects is a critical component of enhancing public safety.

Furthermore, trees change over time. Our inspections represent the condition of the tree at the time of inspection. As trees age, the likelihood of failure of branches or entire trees increases. Annual tree inspections are recommended to identify changes to tree health and structure. In addition, trees should be inspected after storms of unusual severity to evaluate damage and structural changes. Initiating these inspections is the responsibility of the client and/or tree owner.

Preserved trees will experience a physical environment different from that of pre-development. As a result, tree health and structural stability should be monitored. Occasional pruning, fertilization, mulch, pest management, replanting and irrigation may be required. In addition, provisions for monitoring both tree health and structural stability following construction must be made a priority.

If you have any questions about my observations or recommendations, please contact me.

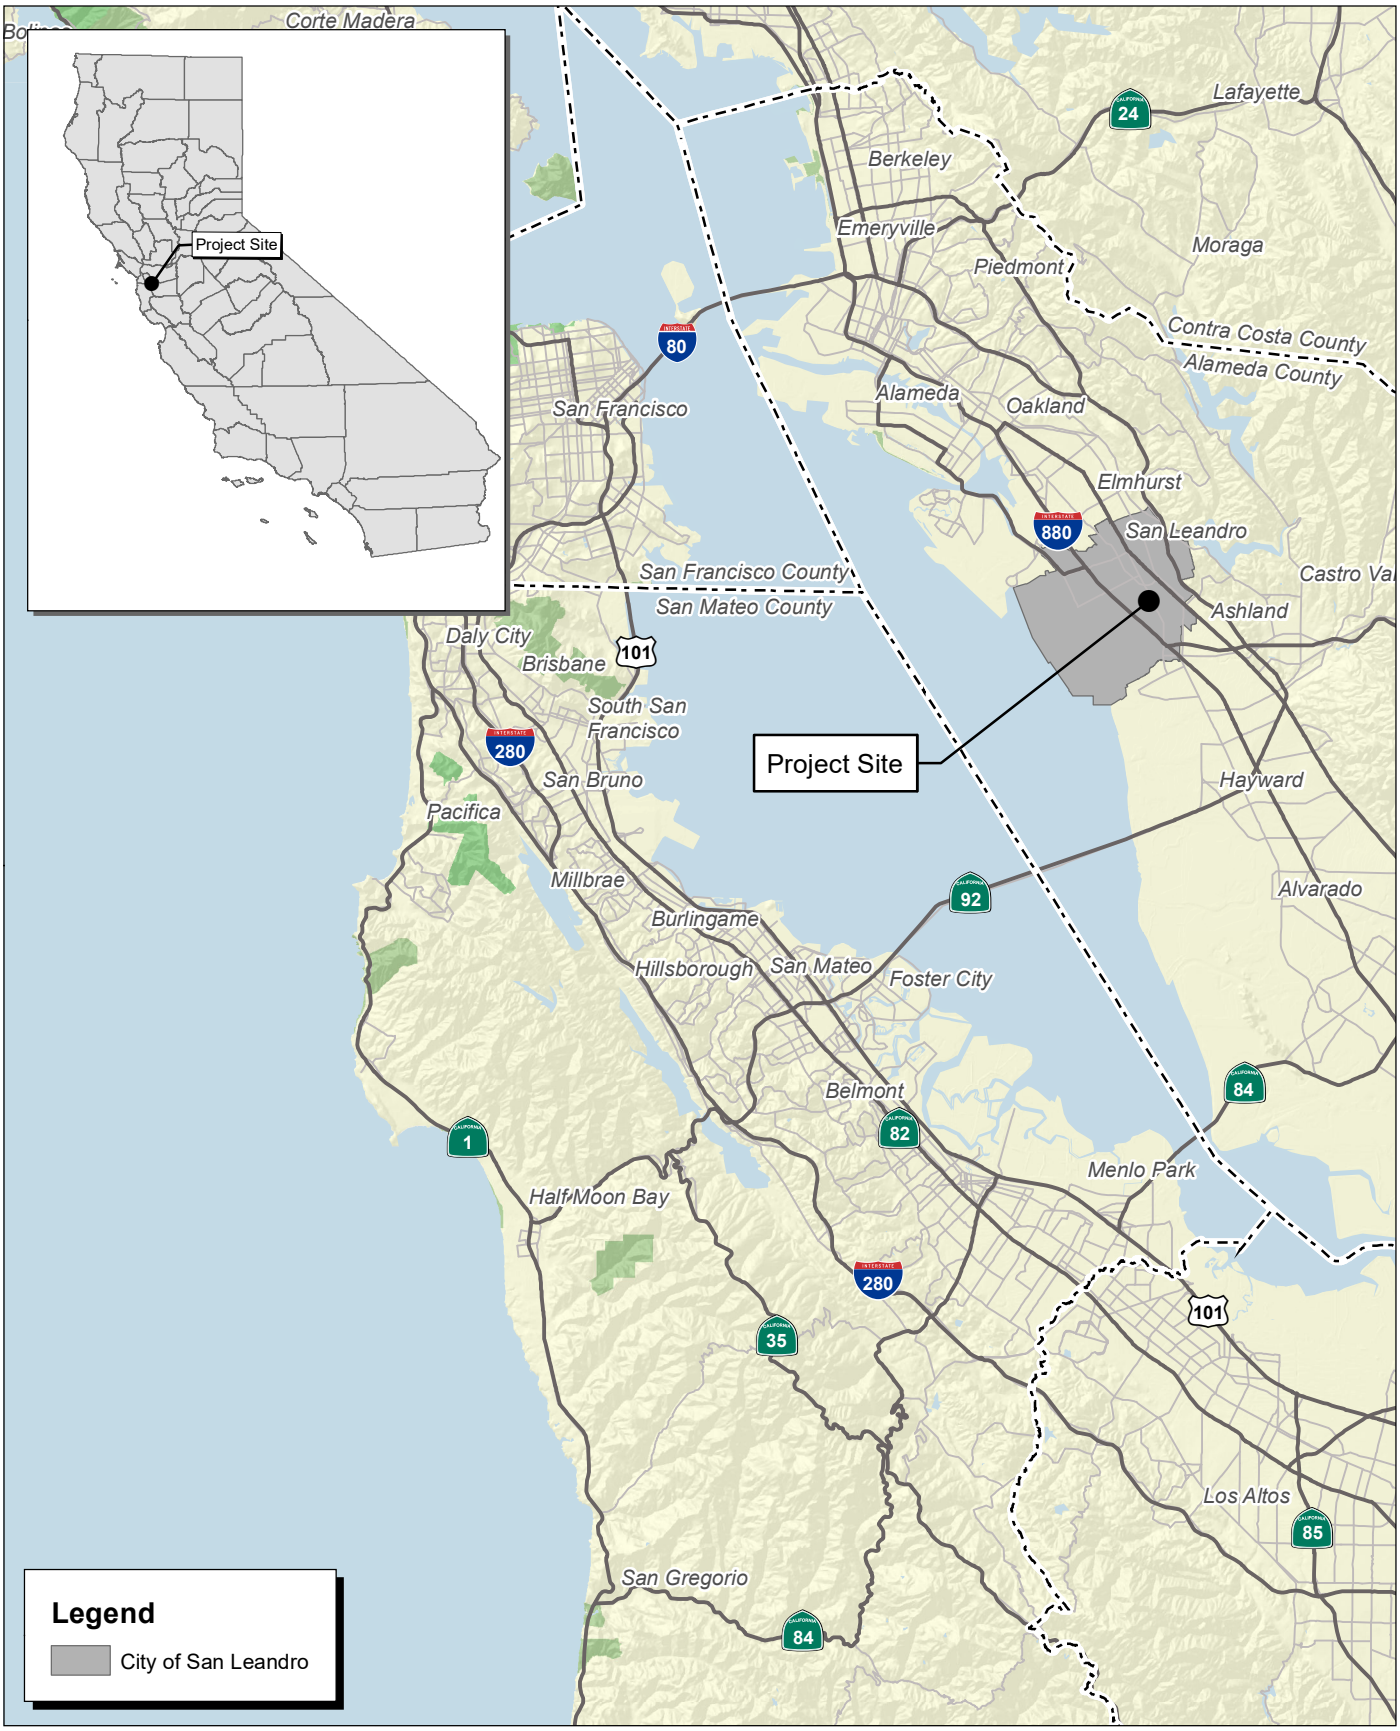
SECTION 1: INTRODUCTION

1.1 - Purpose of Analysis and Study Objectives

This memorandum summarizes the findings of an Air Quality and Greenhouse Gas Emissions Impacts Constraints Analysis conducted by FirstCarbon Solutions (FCS) for the property located at 14143-14273 Washington Avenue in San Leandro, California. Recommended measures to avoid or minimize potential project-related impacts to sensitive receptors in the project vicinity are included as appropriate.

1.2 - Project Understanding



1.2.1 - Site Location

The project site is located in the City of San Leandro, in Alameda County, California (Exhibit 1). The project scope will include combining six parcels into one lot with a total area of 3.45 acres at 14143-14273 Washington Avenue in San Leandro (Assessor's Parcel Numbers [APNs] 77B-1222-3-3, 77B-1222-4-3, 77B-1222-5-3, 77B-1222-6-15, 77B-1222-6-17, 77B-1222-6-18) (Exhibit 2). The project applicant, First Industrial Realty Trust, Inc., proposes to develop a 52,500-square-foot building which includes 5,000 square feet of office uses and 47,500 square feet of warehouse uses on the proposed project site (Exhibit 3).[1] The proposed project would include 64 automobile parking stalls, five truck parking stalls, as well as 15 dock-high doors and two drive-in doors in the rear of the building. Outside of the proposed building and pavement, the site shall be fully landscaped and irrigated.

The project site is bounded by Washington Avenue to the east, 139th Avenue to the north, and railroad tracks to the south and west. As part of the proposed project, the existing three buildings at the site would be demolished and the debris would be removed from the site. (Note: since the following analysis was completed, the buildings were damaged in a fire and have been demolished. This does not change the conclusions of this report.) Surrounding the project site are industrial transition land uses to the north, public/institutional land uses to the west across the railroad tracks, industrial transition land uses to the south, and industrial transition land uses to the east.

[1] Note, the land use totals described herein are based on a preliminary site plan. Although the land uses described in the Noise Impact Analysis Report (5,000 square feet of office space and 47,269 square feet of warehouse space) are different from what is described in this Air Quality, Greenhouse Gas, and Energy Report, this report estimates project impacts based on the same amount of office space and a greater amount of warehouse space. As such, this analysis presents a conservative analysis that demonstrates the maximum possible impacts from the construction and operation of the proposed project.

SECTION 2: ENVIRONMENTAL SETTING

2.1 - Air Quality

The City of San Leandro is located within the San Francisco Bay Area Air Basin (Air Basin or SFBAAB). The Air Basin is approximately 5,600 square miles in area and consists of nine counties that surround the San Francisco Bay, including all of Alameda, Contra Costa, Marin, San Francisco, San Mateo, Santa Clara, and Napa counties; the southwestern portion of Solano County; and the southern portion of Sonoma County. The San Francisco Bay Area has a Mediterranean climate characterized by mild, dry summers and mild, moderately wet winters, moderate daytime onshore breezes, and moderate humidity.

A semi-permanent, high-pressure area centered over the northeastern Pacific Ocean dominates the summer climate of the West Coast. Because this high-pressure cell is persistent, storms rarely affect the California coast during the summer. Thus, the conditions that persist along the coast of California during summer are a northwest airflow and negligible precipitation. A thermal low-pressure area from the Sonoran-Mojave Desert also causes air to flow onshore over the Bay Area much of the summer.

The steady northwesterly flow around the eastern edge of the Pacific High (a high-pressure cell) exerts stress on the ocean surface along the West Coast. This airflow pattern induces upwelling of cold water from below the surface. Upwelling produces a band of cold water off San Francisco that is approximately 80 miles wide. During July, the surface waters off San Francisco are 3°F (degrees Fahrenheit) cooler than those off Vancouver, British Columbia, more than 900 miles to the north. Air approaching the California coast, already cool and moisture-laden from its long trajectory over the Pacific Ocean is further cooled as it flows across this cold bank of water near the coast, thus accentuating the temperature contrast across the coastline. This cooling is often sufficient to produce condensation–a high incidence of fog and stratus clouds along the Northern California coast in summer.

In summer, the northwest winds to the west of the Pacific coastline are drawn into the interior through the gap in the western Coast Ranges, known as the Golden Gate, and over the lower portions of the San Francisco Peninsula. Immediately to the south of Mount Tamalpais, the northwesterly winds accelerate considerably and come nearly from the west as they stream through the Golden Gate. This channeling of the flow through the Golden Gate produces a jet that sweeps eastward but widens downstream, producing southwest winds at Berkeley and northwest winds at San José; a branch also curves eastward through the Carquinez Straits and into the Central Valley. Wind speeds may be locally strong in regions where air is channeled through a narrow opening such as the Golden Gate, the Carquinez Strait, or San Bruno Gap. For example, the average wind speed at San Francisco International Airport from 3:00 a.m. to 4:00 p.m. in July is about 20 miles per hour (mph), compared with only about 8 mph at San José and less than 7 mph at the Farallon Islands.

The sea breeze between the coast and the Central Valley[2] commences near the surface along the coast in late morning or early afternoon; it may first be observed only through the Golden Gate. Later in the day, the layer deepens and intensifies while spreading inland. As the breeze intensifies and deepens, it flows over the lower hills farther south along the peninsula. This process frequently can be observed as a bank of stratus clouds "rolling over" the coastal hills on the west side of the Bay. The depth of the sea breeze depends in large part upon the height and strength of the inversion. The generally low elevation of this stable layer of air prevents marine air from flowing over the coastal hills. It is unusual for the summer sea breeze to flow over terrain exceeding 2,000 feet in elevation.

In winter, the SFBAAB experiences periods of storminess, moderate-to-strong winds, and periods of stagnation with very light winds. Winter stagnation episodes are characterized by outflow from the Central Valley, nighttime drainage flows in coastal valleys, weak onshore flows in the afternoon, and otherwise light and variable winds.

A primary factor in air quality is the mixing depth (the vertical air column available for diluting contaminant sources). Generally, the air temperature decreases with height, creating a gradient from warmer air near the ground to cooler air at elevation caused by the sun converting large amounts of energy to sensible heat at the ground, which warms the air at the surface. The warm air rises in the atmosphere, where it expands and cools. Sometimes, however, the temperature of air increases with height. This condition is known as a temperature inversion because the atmosphere's temperature profile is "inverted" from its usual state. Over the SFBAAB, the frequent occurrence of temperature inversions limits mixing depth and, consequently, limits the availability of air for dilution.

2.1.1 - Air Pollutant Types, Sources, and Effects

Criteria Air Pollutants

Air pollutants are termed criteria air pollutants if they are regulated by developing specific public health- and welfare-based criteria as the basis for setting permissible levels. Table 1 provides a summary of the types, sources, and effects of criteria air pollutants.

Table 1: Description of Criteria Pollutants of National and California Concern

Criteria Pollutant	Physical Description and Properties	Sources	Most Relevant Effects from Pollutant Exposure
Ozone	Ozone is a photochemical pollutant as it is not emitted directly into the atmosphere but is formed by a complex series of chemical reactions between volatile organic compounds (VOC), nitrous oxides (NO_X), and sunlight.	Ozone is a secondary pollutant; thus, it is not emitted directly into the lower level of the atmosphere. The primary sources of ozone precursors (VOC and NO_X) are mobile	Irritate respiratory system; reduce lung function; breathing pattern changes; reduction of breathing capacity; inflame and damage cells that line the lungs; make lungs more susceptible to infection; aggravate asthma; aggravate other chronic lung

[2] A flat valley that dominates the geographical center of California stretching 450 miles from north-northwest to south-southeast, inland from and parallel to the Pacific Ocean coast. It is bound by the Sierra Nevada to the east and the Coast Range to the west.

Criteria Pollutant	Physical Description and Properties	Sources	Most Relevant Effects from Pollutant Exposure
	Ozone is a regional pollutant that is generated over a large area and is transported and spread by the wind.	sources (on-road and off-road vehicle exhaust).	diseases; cause permanent lung damage; some immunological changes; increased mortality risk; vegetation and property damage.
Particulate matter (PM_{10}) Particulate matter ($PM_{2.5}$)	Suspended particulate matter is a mixture of small particles that consist of dry solid fragments, droplets of water, or solid cores with liquid coatings. The particles vary in shape, size, and composition. PM_{10} refers to particulate matter that is between 2.5 and 10 microns in diameter, (one micron is one-millionth of a meter). $PM_{2.5}$ refers to particulate matter that is 2.5 microns or less in diameter, about one-thirtieth the size of the average human hair.	Stationary sources include fuel or wood combustion for electrical utilities, residential space heating, and industrial processes; construction and demolition; metals, minerals, and petrochemicals; wood products processing; mills and elevators used in agriculture; erosion from tilled lands; waste disposal, and recycling. Mobile or transportation-related sources are from vehicle exhaust and road dust. Secondary particles form from reactions in the atmosphere.	Short-term exposure (hours/days): irritation of the eyes, nose, throat; coughing; phlegm; chest tightness; shortness of breath; aggravate existing lung disease, causing asthma attacks and acute bronchitis; those with heart disease can suffer heart attacks and arrhythmias. Long-term exposure: reduced lung function; chronic bronchitis; changes in lung morphology; death.
Nitrogen dioxide (NO_2)	During combustion of fossil fuels, oxygen reacts with nitrogen to produce nitrogen oxides—NO_X (NO, NO_2, NO_3, N_2O, N_2O_3, N_2O_4, and N_2O_5). NO_X is a precursor to ozone, PM_{10}, and $PM_{2.5}$ formation. NO_X can react with compounds to form nitric acid and related small particles and result in particulate matter related health effects.	NO_X is produced in motor vehicle internal combustion engines and fossil fuel-fired electric utility and industrial boilers. Nitrogen dioxide forms quickly from NO_X emissions. NO_2 concentrations near major roads can be 30 to 100 percent higher than those at monitoring stations.	Potential to aggravate chronic respiratory disease and respiratory symptoms in sensitive groups; risk to public health implied by pulmonary and extra-pulmonary biochemical and cellular changes and pulmonary structural changes; contributions to atmospheric discoloration; increased visits to hospital for respiratory illnesses.
Carbon monoxide (CO)	CO is a colorless, odorless, toxic gas. CO is somewhat soluble in water; therefore, rainfall and fog can suppress CO conditions. CO enters the body through the lungs, dissolves in the blood, replaces oxygen as an attachment to	CO is produced by incomplete combustion of carbon-containing fuels (e.g., gasoline, diesel fuel, and biomass). Sources include motor vehicle exhaust, industrial	Ranges depending on exposure: slight headaches; nausea; aggravation of angina pectoris (chest pain) and other aspects of coronary heart disease; decreased exercise tolerance in persons with peripheral vascular disease and

Criteria Pollutant	Physical Description and Properties	Sources	Most Relevant Effects from Pollutant Exposure
	hemoglobin, and reduces available oxygen in the blood.	processes (metals processing and chemical manufacturing), residential wood burning, and natural sources.	lung disease; impairment of central nervous system functions; possible increased risk to fetuses; death.
Sulfur dioxide (SO_2)	Sulfur dioxide is a colorless, pungent gas. At levels greater than 0.5 parts per million (ppm), the gas has a strong odor, similar to rotten eggs. Sulfur oxides (SO_X) include sulfur dioxide and sulfur trioxide. Sulfuric acid is formed from sulfur dioxide, which can lead to acid deposition and can harm natural resources and materials. Although sulfur dioxide concentrations have been reduced to levels well below State and federal standards, further reductions are desirable because sulfur dioxide is a precursor to sulfate and PM_{10}.	Human-caused sources include fossil fuel combustion, mineral ore processing, and chemical manufacturing. Volcanic emissions are a natural source of sulfur dioxide. The gas can also be produced in the air by dimethyl sulfide and hydrogen sulfide. Sulfur dioxide is removed from the air by dissolution in water, chemical reactions, and transfer to soils and ice caps. The sulfur dioxide levels in the State are well below the maximum standards.	Bronchoconstriction accompanied by symptoms which may include wheezing, shortness of breath and chest tightness, during exercise or physical activity in persons with asthma. Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient sulfur dioxide levels. It is not clear whether the two pollutants act synergistically, or one pollutant alone is the predominant factor.
Lead (Pb)	Lead is a solid heavy metal that can exist in air pollution as an aerosol particle component. Leaded gasoline was used in motor vehicles until around 1970. Lead concentrations have not exceeded State or federal standards at any monitoring station since 1982.	Lead ore crushing, lead ore smelting, and battery manufacturing are currently the largest sources of lead in the atmosphere in the United States. Other sources include dust from soils contaminated with lead-based paint, solid waste disposal, and crustal physical weathering.	Lead accumulates in bones, soft tissue, and blood and can affect the kidneys, liver, and nervous system. It can cause impairment of blood formation and nerve conduction, behavior disorders, mental retardation, neurological impairment, learning deficiencies, and low IQs.

Toxic Air Contaminants

Concentrations of toxic air contaminants (TACs) are also used as indicators of air quality conditions. Air pollutant human exposure standards are identified for many TACs, including the following common TACs relevant to development projects: particulate matter, fugitive dust, lead, and asbestos. These air pollutants are called TACs because they are air pollutants that may cause or contribute to an increase in mortality or in serious illness or that may pose a hazard to human health. TACs are usually present in minute quantities in the ambient air; however, their high toxicity or health impact may pose a threat to public health even at low concentrations. TACs can cause long-term health effects (such as cancer, birth defects, neurological damage, asthma, bronchitis, or genetic damage) or short-term acute affects (such as eye watering, respiratory irritation, runny nose, throat pain, or headaches).

TACs are separated into carcinogens and noncarcinogens based on the nature of the physiological effects associated with exposure to a particular TAC. Carcinogens are assumed to have no safe threshold below which health impacts would not occur. Cancer risk is typically expressed as excess cancer cases per million exposed individuals, typically over a lifetime exposure or other prolonged duration. For noncarcinogenic substances, there is generally assumed to be a safe level of exposure below which no negative health impact is believed to occur. These levels may vary depending on the specific pollutant. Acute and chronic exposure to noncarcinogens is expressed as a hazard index (HI), which is the ratio of expected exposure levels to an acceptable reference exposure levels (RELs). Table 2 provides a summary of the types, sources, and effects of TACs.

Table 2: Description of Toxic Air Contaminants of National and California Concern

Toxic Air Contaminant	Physical Description and Properties	Sources	Most Relevant Effects from Pollutant Exposure
Diesel Particulate Matter (DPM)	DPM is a source of $PM_{2.5}$—diesel particles are typically 2.5 microns and smaller. Diesel exhaust is a complex mixture of thousands of particles and gases that is produced when an engine burns diesel fuel. Organic compounds account for 80 percent of the total particulate matter mass, which consists of compounds such as hydrocarbons and their derivatives, and polycyclic aromatic hydrocarbons and their derivatives. Fifteen polycyclic aromatic hydrocarbons are confirmed carcinogens, a number of which are found in diesel exhaust.	Diesel exhaust is a major source of ambient particulate matter pollution in urban environments. Typically, the main source of DPM is from combustion of diesel fuel in diesel-powered engines. Such engines are in on-road vehicles such as diesel trucks, off-road construction vehicles, diesel electrical generators, and various pieces of stationary construction equipment.	Some short-term (acute) effects of DPM exposure include eye, nose, throat, and lung irritation, coughs, headaches, light-headedness, and nausea. Studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems. Human studies on the carcinogenicity of DPM demonstrate an increased risk of lung cancer, although the increased risk cannot be clearly attributed to diesel exhaust exposure.
VOCs	Reactive organic gases (ROGs), or VOCs, are defined as any compound of carbon—excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate—that participates in atmospheric photochemical reactions. Although there are slight differences in the definition of ROGs and VOCs, the two terms are often used interchangeably.	Indoor sources of VOCs include paints, solvents, aerosol sprays, cleansers, tobacco smoke, etc. Outdoor sources of VOCs are from combustion and fuel evaporation. A reduction in VOC emissions reduces certain chemical reactions that contribute to the formulation of ozone. VOCs are transformed into organic aerosols in the atmosphere, which contribute to higher PM_{10} and lower visibility.	Although health-based standards have not been established for VOCs, health effects can occur from exposures to high concentrations because of interference with oxygen uptake. In general, concentrations of VOCs are suspected to cause eye, nose, and throat irritation; headaches; loss of coordination; nausea; and damage to the liver, the kidneys, and the central nervous system. Many VOCs have been classified as TACs.
Benzene	Benzene is a VOC. It is a clear or colorless light-yellow, volatile, highly flammable liquid with a gasoline-like odor. The EPA has classified benzene as a "Group A" carcinogen.	Benzene is emitted into the air from fuel evaporation, motor vehicle exhaust, tobacco smoke, and from burning oil and coal. Benzene is used as a solvent for paints, inks, oils, waxes, plastic, and rubber. Benzene	Short-term (acute) exposure of high doses from inhalation of benzene may cause dizziness, drowsiness, headaches, eye irritation, skin irritation, and respiratory tract irritation, and at higher levels, loss of

Toxic Air Contaminant	Physical Description and Properties	Sources	Most Relevant Effects from Pollutant Exposure
		occurs naturally in gasoline at 1 to 2 percent by volume. The primary route of human exposure is through inhalation.	consciousness can occur. Long-term (chronic) occupational exposure of high doses has caused blood disorders, leukemia, and lymphatic cancer.
Asbestos	Asbestos is the name given to a number of naturally occurring fibrous silicate minerals that have been mined for their useful properties such as thermal insulation, chemical and thermal stability, and high tensile strength. The three most common types of asbestos are chrysotile, amosite, and crocidolite.	Chrysotile, also known as white asbestos, is the most common type of asbestos found in buildings. Chrysotile makes up approximately 90 to 95 percent of all asbestos contained in buildings in the United States.	Exposure to asbestos is a health threat; exposure to asbestos fibers may result in health issues such as lung cancer, mesothelioma (a rare cancer of the thin membranes lining the lungs, chest, and abdominal cavity), and asbestosis (a non-cancerous lung disease that causes scarring of the lungs). Exposure to asbestos can occur during demolition or remodeling of buildings that were constructed prior to the 1977 ban on asbestos for use in buildings. Exposure to naturally occurring asbestos can occur during soil-disturbing activities in areas with deposits present.
Hydrogen Sulfide	Hydrogen sulfide (H_2S) is a flammable, colorless, poisonous gas that smells like rotten eggs.	Manure, storage tanks, ponds, anaerobic lagoons, and land application sites are the primary sources of hydrogen sulfide. Anthropogenic sources include the combustion of sulfur containing fuels (oil and coal).	High levels of hydrogen sulfide can cause immediate respiratory arrest. It can irritate the eyes and respiratory tract and cause headache, nausea, vomiting, and cough. Long exposure can cause pulmonary edema.
Sulfates	Sulfates occur in combination with metal and/or hydrogen ions. Many sulfates are soluble in water.	Sulfates are particulates formed through the photochemical oxidation of sulfur dioxide. In California, the main source of sulfur compounds is combustion of gasoline and diesel fuel.	(a) Decrease in ventilatory function; (b) aggravation of asthmatic symptoms; (c) aggravation of cardiopulmonary disease; (d) vegetation damage; (e) degradation of visibility; (f) property damage.

Toxic Air Contaminant	Physical Description and Properties	Sources	Most Relevant Effects from Pollutant Exposure
Visibility-Reducing Particles	Suspended particulate matter is a mixture of small particles that consist of dry solid fragments, droplets of water, or solid cores with liquid coatings. The particles vary in shape, size, and composition. PM_{10} refers to particulate matter that is between 2.5 and 10 microns in diameter (1 micron is one-millionth of a meter). $PM_{2.5}$ refers to particulate matter that is 2.5 microns or less in diameter, about one-thirtieth the size of the average human hair.	Stationary sources include fuel or wood combustion for electrical utilities, residential space heating, and industrial processes; construction and demolition; metals, minerals, and petrochemicals; wood products processing; mills and elevators used in agriculture; erosion from tilled lands; waste disposal; and recycling. Mobile or transportation-related sources are from vehicle exhaust and road dust. Secondary particles form from reactions in the atmosphere.	Short-term exposure (hours/days): irritation of the eyes, nose, throat; coughing; phlegm; chest tightness; shortness of breath; aggravates existing lung disease, causing asthma attacks and acute bronchitis; those with heart disease can suffer heart attacks and arrhythmias. Long-term exposure: reduced lung function; chronic bronchitis; changes in lung morphology; death.
Vinyl Chloride	Vinyl chloride, or chloroethene, is a chlorinated hydrocarbon and a colorless gas with a mild, sweet odor. In 1990, the California Air Resources Board (ARB) identified vinyl chloride as a toxic air contaminant and estimated a cancer unit risk factor.	Most vinyl chloride is used to make polyvinyl chloride plastic and vinyl products, including pipes, wire and cable coatings, and packaging materials. It can be formed when plastics containing these substances are left to decompose in solid waste landfills. Vinyl chloride has been detected near landfills, sewage plants, and hazardous waste sites.	Short-term exposure to high levels of vinyl chloride in the air causes central nervous system effects, such as dizziness, drowsiness, and headaches. Epidemiological studies of occupationally exposed workers have linked vinyl chloride exposure to development of a rare cancer, liver angiosarcoma, and have suggested a relationship between exposure and lung and brain cancers.
Lead (Pb)	Lead is a solid heavy metal that can exist in air pollution as an aerosol particle component. Leaded gasoline was used in motor vehicles until around 1970. Lead concentrations have not exceeded State or federal standards at any monitoring station since 1982.	Lead ore crushing, lead ore smelting, and battery manufacturing are currently the largest sources of lead in the atmosphere in the United States. Other sources include dust from soils contaminated with lead-based paint, solid waste disposal, and crustal physical weathering.	Lead accumulates in bones, soft tissue, and blood and can affect the kidneys, liver, and nervous system. It can cause impairment of blood formation and nerve conduction, behavior disorders, mental retardation, neurological impairment, learning deficiencies, and low IQs.

Air Quality

Air quality is a function of both the rate and location of pollutant emissions under the influence of meteorological conditions and topographic features. Atmospheric conditions such as wind speed, wind direction, and air temperature inversions interact with the physical features of the landscape to determine the movement and dispersal of air pollutant emissions and, consequently, their effect on air quality.

Regional Air Quality

The Bay Area Air Quality Management District (BAAQMD) is the regional agency regulating air quality within the nine-county SFBAAB. The SFBAAB includes Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, and Santa Clara counties, the western portion of Solano County, and the southern portion of Sonoma County.

Air Pollutant Standards and Attainment Designations

Air pollutant standards have been adopted by the EPA and the ARB for the following six criteria air pollutants that affect ambient air quality: ozone, NO_2, CO, SO_2, lead, and PM, which is subdivided into two classes based on particle size: PM with aerodynamic diameters equal to or less than 10 microns (PM_{10}), and PM with aerodynamic diameters equal to or less than 2.5 microns ($PM_{2.5}$). These air pollutants are called "criteria air pollutants" because they are regulated by developing specific public health- and welfare-based criteria as the basis for setting permissible levels. California has also established standards for TACs such as visibility-reducing particles, sulfates, hydrogen sulfide, and vinyl chloride. Table 3 presents the National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS) for these aforementioned air pollutants. Note that there are no State or federal ambient air quality standards for reactive organic gases (ROGs), benzene, or DPM.

Table 3: Federal and State Air Quality Standards in the San Francisco Bay Area Air Basin

Air Pollutant	Averaging Time	California Standard (CAAQS)	Federal Standard[a] (NAAQS)
Ozone	1 Hour	0.09 ppm	—
	8 Hours	0.070 ppm	0.070 ppm[f]
Nitrogen dioxide[b] (NO_2)	1 Hour	0.18 ppm	0.100 ppm
	Annual	0.030 ppm	0.053 ppm
Carbon monoxide (CO)	1 Hour	20 ppm	35 ppm
	8 Hours	9.0 ppm	9 ppm
Sulfur dioxide[c] (SO_2)	1 Hour	0.25 ppm	0.075 ppm
	3 Hours	—	0.5 ppm
	24 Hours	0.04 ppm	0.14 (for certain areas)
	Annual	—	0.030 ppm (for certain areas)
Lead[e]	30-day	1.5 µg/m^3	—
	Quarter	—	1.5 µg/m^3
	Rolling 3-month average	—	0.15 µg/m^3
Particulate matter (PM_{10})	24 hours	50 µg/m^3	150 µg/m^3
	Mean	20 µg/m^3	—
Particulate matter ($PM_{2.5}$)	24 Hours	—	35 µg/m^3
	Annual	12 µg/m^3	12.0 µg/m^3
Visibility-reducing particles	8 Hours	See note below[d]	
Sulfates	24 Hours	25 µg/m^3	—
Hydrogen sulfide	1 Hour	0.03 ppm	—
Vinyl chloride[e]	24 Hours	0.01 ppm	—

Air Pollutant	Averaging Time	California Standard (CAAQS)	Federal Standard[a] (NAAQS)

Notes:
ppm = parts per million (concentration)
µg/m^3 = micrograms per cubic meter Annual = Annual Arithmetic Mean
30-day = 30-day average
Quarter = Calendar quarter

a Federal standard refers to the primary National Ambient Air Quality Standard (NAAQS), or the levels of air quality necessary, with an adequate margin of safety to protect the public health. All standards listed are primary standards except for 3-Hour SO_2, which is a secondary standard. A secondary standard is the level of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

b To attain the 1-hour nitrogen dioxide national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 parts per billion (0.100 ppm).

c On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 part per billion (ppb). The 1971 SO_2 national standards (24-hour and annual) remain in effect until 1 year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

d Visibility-reducing particles: In 1989, the ARB converted both the general Statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the Statewide and Lake Tahoe Air Basin standards, respectively.

e The ARB has identified lead and vinyl chloride as "toxic air contaminants" with no threshold level of exposure for adverse health effects determined. These actions allow for implementing control measures at levels below the ambient concentrations specified for these pollutants.

f The EPA Administrator approved a revised 8-hour ozone standard of 0.07 ppb on October 1, 2015. The new standard went into effect 60 days after publication the Final Rule in the Federal Register. The Final Rule was published in the Federal Register on October 26, 2015, and became effective on December 28, 2015.

California Air Resources Board (ARB). 2016. Ambient Air Quality Standards. May 4. Website: https://ww2.arb.ca.gov/sites/default/files/2020-07/aaqs2.pdf. Accessed June 3, 2022.

Air quality monitoring stations operated by the ARB and BAAQMD measure ambient air pollutant concentrations in the SFBAAB. In general, the SFBAAB experiences low concentrations of most pollutants compared to federal or State standards.

Both the EPA and ARB use ambient air quality monitoring data to designate areas according to their attainment status for criteria air pollutants. These designations identify the areas with air quality problems and initiate planning efforts for improvement. The three basic designation categories are nonattainment, attainment, and unclassified. "Attainment" status refers to those regions that are meeting federal and/or State standards for a specified criteria pollutant. "Nonattainment" refers to regions that do not meet federal and/or State standards for a specified criteria pollutant. "Unclassified" refers to regions with insufficient data to determine the region's attainment status for a specified criteria air pollutant. Each standard has a different definition, or "form" of what constitutes attainment, based on specific air quality statistics. For example, the federal 8-hour CO standard is not to be exceeded more than once per year; therefore, an area is in attainment of the CO standard if no more than one 8-hour ambient air monitoring values exceeds the threshold per year. In contrast, the federal annual $PM_{2.5}$ standard is met if the 3-year average of the annual average $PM_{2.5}$ concentration is less than or equal to the standard.

Table 4 shows the current attainment designations for the SFBAAB. The SFBAAB is designated as nonattainment for the State ozone, PM_{10}, and $PM_{2.5}$ standards, and the national ozone and $PM_{2.5}$ standards.

Table 4: San Francisco Bay Area Air Basin Attainment Status

Pollutant	State Status	National Status
Ozone	Nonattainment	Nonattainment
CO	Attainment	Attainment
NO_2	Attainment	Attainment
SO_2	Attainment	N/A
PM_{10}	Nonattainment	Unclassified
$PM_{2.5}$	Nonattainment	Nonattainment
Sulfates	Attainment	N/A
Hydrogen Sulfates	Unclassified	N/A
Visibility-reducing Particles	Unclassified	N/A
Lead	N/A	Attainment

Notes:
N/A = information not available.

Air Quality Index

The health impacts of the various air pollutants of concern can be presented in a number of ways. The clearest comparison is to the State and federal ozone standards. If concentrations are below the standard, it is safe to say that no health impact would occur to anyone. When concentrations exceed the standard, impacts will vary based on the amount by which the standard is exceeded. The EPA developed the Air Quality Index (AQI) as an easy-to-understand measure of health impacts compared with concentrations in the air. Table 5 provides a general description of the health impacts of ozone at different concentrations.

Table 5: Air Quality Index and Health Effects from Ozone

Air Quality Index/ 8-hour Ozone Concentration	Health Effects Description
AQI—0–50—Good Concentration 0–54 ppb	**Sensitive Groups**: Children and people with asthma are the groups most at risk.
	Health Effects Statements: None.
	Cautionary Statements: None.

Air Quality Index/ 8-hour Ozone Concentration	Health Effects Description
AQI—51–100—Moderate Concentration 55–70 ppb	**Sensitive Groups**: Children and people with asthma are the groups most at risk.
	Health Effects Statements: Unusually sensitive individuals may experience respiratory symptoms.
	Cautionary Statements: Unusually sensitive people should consider limiting prolonged outdoor exertion.
AQI—101–150—Unhealthy for Sensitive Groups Concentration 71–85 ppb	**Sensitive Groups**: Children and people with asthma are the groups most at risk.
	Health Effects Statements: Increasing likelihood of respiratory symptoms and breathing discomfort in active children and adults, and people with respiratory disease, such as asthma.
	Cautionary Statements: Active children and adults, and people with respiratory disease, such as asthma, should limit prolonged outdoor exertion.
AQI—151–200—Unhealthy Concentration 86–105 ppb	**Sensitive Groups**: Children and people with asthma are the groups most at risk.
	Health Effects Statements: Greater likelihood of respiratory symptoms and breathing difficulty in active children and adults and people with respiratory disease, such as asthma; possible respiratory effects in general population.
	Cautionary Statements: Active children and adults, and people with respiratory disease, such as asthma, should avoid prolonged outdoor exertion; everyone else, especially children, should limit prolonged outdoor exertion.
AQI—201–300—Very Unhealthy Concentration 106–200 ppb	**Sensitive Groups**: Children and people with asthma are the groups most at risk.
	Health Effects Statements: Increasingly severe symptoms and impaired breathing likely in active children and adults and people with respiratory disease, such as asthma; increasing likelihood of respiratory effects in general population.
	Cautionary Statements: Active children and adults, and people with respiratory disease, such as asthma, should avoid all outdoor exertion; everyone else, especially children, should limit outdoor exertion.

Local Air Quality

Air quality is a function of both the rate and location of pollutant emissions under the influence of meteorological conditions and topographic features. Atmospheric conditions such as wind speed, wind direction, and air temperature inversions interact with the physical features of the landscape to determine the movement and dispersal of air pollutant emissions and, consequently, their effect on air quality.

Existing levels of ambient air quality and historical trends and projections in the vicinity of San Leandro are best documented by measurements made by the BAAQMD. The air quality monitoring station closest to San Leandro is the Oakland-9925 International Boulevard Monitoring Station. Data from this station are summarized in Table 6; however, for the years 2019 through 2021, no stations in Alameda County monitored PM_{10}, SO_2, CO, or NO_2. Therefore, the State and federal standards for those pollutants are presumed to not have been exceeded at stations in the County during this time. The data show that the area regularly exceeded the federal $PM_{2.5}$ standard and occasionally exceeded the State O_3 standard.

Table 6: Air Quality Monitoring Summary

Air Pollutant	Averaging Time	Item	2019	2020	2021
Ozone	1 Hour	Max 1-Hour (ppm)	0.098	0.090	0.090.083
		Days > State Standard (0.09 ppm)	1	0	0
	8 Hour	Max 8-Hour (ppm)	0.073	0.066	0.061
		Days > State Standard (0.07 ppm)	2	0	0
		Days > National Standard (0.070 ppm)	2	0	0
CO	8 Hour	Max 8-Hour (ppm)	ND	ND	ND
		Days > State Standard (9.0 ppm)	ND	ND	ND
		Days > National Standard (9 ppm)	ND	ND	ND
NO_2	Annual	Annual Average (ppm)	0.009	0.009	0.008
	1 Hour	Max 1-Hour (ppm)	0.062	0.059	0.049
		Days > State Standard (0.18 ppm)	0	0	0
SO_2	Annual	Annual Average (ppm)	ND	ND	ND
	24 Hour	Max 24-Hour (ppm)	ND	ND	ND
		Days > State Standard (0.04 ppm)	ND	ND	ND
Inhalable coarse particles (PM_{10})	Annual	Annual Average (µg/m^3)	ND	ND	ND
	24 Hour	Max 24-Hour (µg/m^3)	ND	ND	ND
		Days > State Standard (50 µg/m^3) (3)	ND	ND	ND
		Days > National Standard (150 µg/m^3)	ND	ND	ND
Fine particulate matter ($PM_{2.5}$)	Annual	Annual Average (µg/m^3)	6.7	11.4	8.0
	24 Hour	Max 24-Hour (µg/m^3)	24.7	167.7	33.0
		Days > National Standard (35 µg/m^3)	0	11	0

Notes:
> = exceed
µg/m^3 = micrograms per cubic meter
Bold = exceedance
ID = insufficient data
max = maximum
National Standard = National Ambient Air Quality Standard (NAAQS).

Sensitive Receptors

Air pollution does not affect every individual in the population in the same way, and some groups are more sensitive to adverse health effects than others are. Land uses such as residences, schools, day care centers, hospitals, nursing and convalescent homes, and parks are considered the most sensitive to poor air quality because the population groups associated with these uses have increased susceptibility to respiratory distress or, as in the case of residential receptors, their exposure time is greater than that for other land uses. Therefore, these groups are referred to as sensitive receptors. Exposure assessment guidance typically assumes that residences would receive exposure to air pollution 24 hours per day, 350 days per year, for 30 years. The BAAQMD defines sensitive receptors as children, adults, and seniors occupying or residing in residential dwellings, schools, day care centers, hospitals, and senior care facilities.

Project Vicinity–Sensitive Receptors

The closest off-site air pollution sensitive receptors near the project site in each direction include the following:

- Single-family residences approximately 500 feet southwest of the project site.
- Single-family residences approximately 730 feet south of the project site.
- Single-family residences approximately 950 feet northeast of the project site.
- Multi-family residences approximately 960 feet east of the project site.

Project Vicinity–Community Pollutant Sources

The primary sources of air pollutants (both criteria air pollutant and TACs) in the project site vicinity include the various other surrounding industrial properties, building-related energy use, and motor-related vehicle trips associated with the local business use, particularly from the Union Pacific Railroad Company. The project site is adjacent to Union Pacific railroad tracks, approximately 3,000 feet northeast of Interstate 880 (I-880), and 5,000 feet southwest of Interstate 580 (I-580). Other activities that result in emissions include space and water heating, landscape maintenance, and any surrounding industrial uses that can store, produce, decommission, or otherwise handle hazardous materials.

2.2 - Greenhouse Gas Emissions

2.2.1 - Greenhouse Effect, Global Warming, and Climate Change

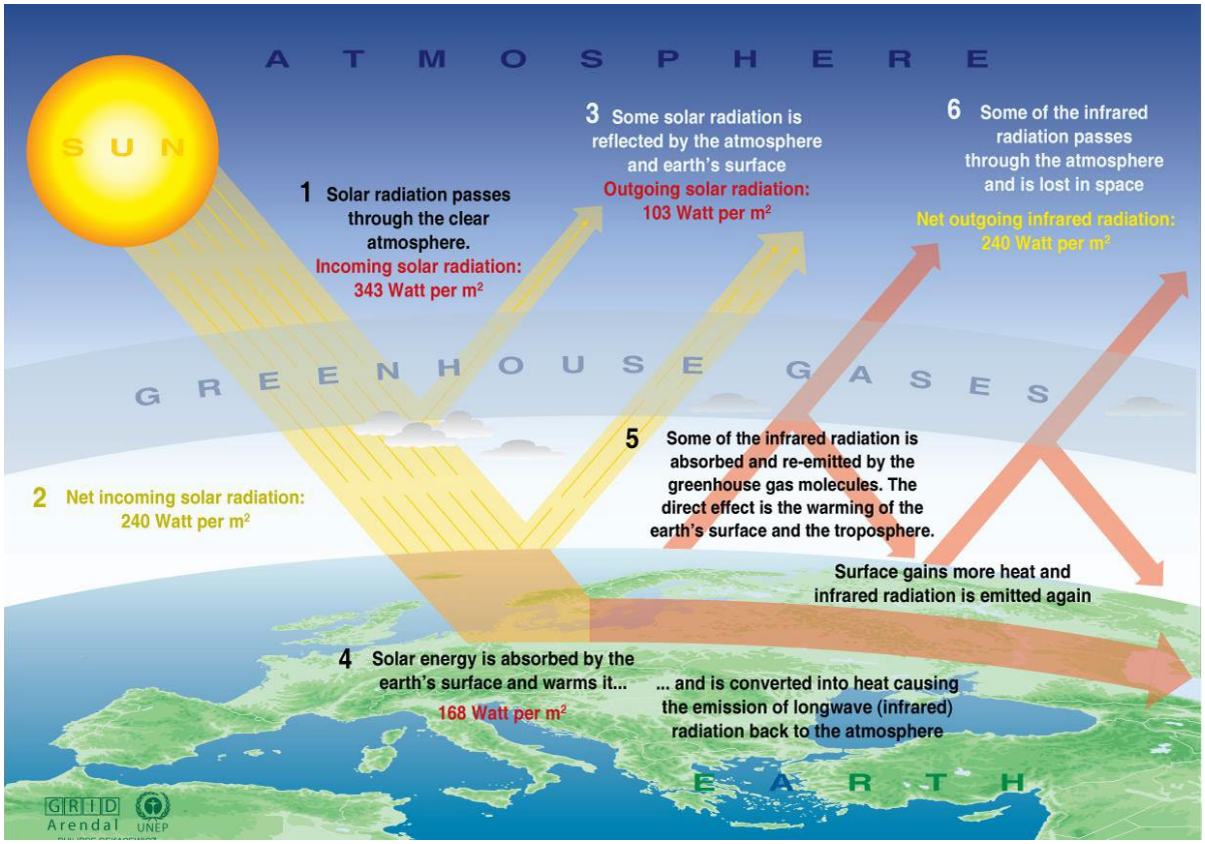
Most of the energy that affects the Earth's climate comes from the sun. Some solar radiation is absorbed by the Earth's surface, and a smaller portion of this radiation is reflected by the atmosphere back toward space. As the Earth absorbs high-frequency solar radiation, its surface gains heat and then re-radiates lower frequency infrared radiation back into the atmosphere.[3]

Most solar radiation passes through gases in the atmosphere classified as greenhouse gas (GHG) emissions; however, infrared radiation is selectively absorbed by GHGs. GHGs in the atmosphere play a critical role in maintaining the balance between the Earth's absorbed and radiated energy, the Earth's radiation budget,[4] by trapping some of the infrared radiation emitted from the Earth's surface that otherwise would have escaped to space (Figure 1). Radiative forcing is the difference between the incoming energy and outgoing energy.[5] Specifically, GHGs affect the atmosphere's radiative forcing,[6] which in turn affects the Earth's average surface temperature. This phenomenon, the *greenhouse effect*, keeps the Earth's atmosphere near the surface warmer than it would be otherwise and allows successful habitation by humans and other forms of life.

Combustion of fossil fuels and deforestation release carbon into the atmosphere that historically has been stored underground in sediments or in surface vegetation, thus exchanging carbon from the geosphere and biosphere to the atmosphere in the carbon cycle. With the accelerated increase in fossil fuel combustion and deforestation since the Industrial Revolution of the nineteenth century, concentrations of GHGs in the atmosphere have increased exponentially. Such emissions of GHGs in excess of natural ambient concentrations contribute to the enhancement of the natural greenhouse effect. This enhanced greenhouse effect has contributed to *global warming*, an increased rate of warming of the Earth's average surface temperature.[7] Specifically, increases in GHGs lead to increased absorption of infrared radiation by the Earth's atmosphere and warm the lower atmosphere further, thereby increasing temperatures and evaporation rates near the surface.

Variations in natural phenomena such as volcanoes and solar activity produced most of the global temperature increase that occurred during preindustrial times; more recently, however, increasing atmospheric GHG concentrations resulting from human activity have been responsible for most of the observed global temperature increase.[8]

[3] Frequencies at which bodies emit radiation are proportional to temperature. The Earth has a much lower temperature than the sun and emits radiation at a lower frequency (longer wavelength) than the high-frequency (short-wavelength) solar radiation emitted by the sun.



[4] This includes all gains of incoming energy and all losses of outgoing energy; the planet is always striving to be in equilibrium.

[5] Positive forcing tends to warm the surface while negative forcing tends to cool it.

[6] This is the change in net irradiance at the tropopause after allowing stratospheric temperatures to readjust to radiative equilibrium, but with surface and tropospheric temperatures and state held fixed at the unperturbed values.

[7] This condition results when the Earth has to work harder to maintain its radiation budget, because when more GHGs are present in the atmosphere, the Earth must force emissions of additional infrared radiation out into the atmosphere.

[8] These basic conclusions have been endorsed by more than 45 scientific societies and academies of science, including all of the national academies of science of the major industrialized countries. Since 2007, no scientific body of national or international standing has maintained a dissenting opinion.

Figure 1: The Greenhouse Effect

Global warming affects global atmospheric circulation and temperatures; oceanic circulation and temperatures; wind and weather patterns; average sea level; ocean acidification; chemical reaction rates; precipitation rates, timing, and form; snowmelt timing and runoff flow; water supply; wildfire risks; and other phenomena, in a manner commonly referred to as *climate change*. Climate change is a change in the average weather of the Earth that is measured by alterations in wind patterns, storms, precipitation, and temperature. These changes are assessed using historical records of temperature changes occurring in the past, such as during previous ice ages. Many of the concerns regarding climate change use this data to extrapolate a level of statistical significance specifically focusing on temperature records from the last 150 years (the Industrial Age) that differ from previous climate changes in rate and magnitude.

Greenhouse Gases and Global Emission Sources

Gases that trap heat in the atmosphere are referred to as GHGs. The effect is analogous to the way a greenhouse retains heat. Prominent GHGs that naturally occur in the Earth's atmosphere are water vapor, carbon dioxide (CO_2), methane (CH_4), oxides of nitrogen (NO_X), and ozone. Anthropogenic (human-caused) GHG emissions include releases of these GHGs plus release of human-made gases with high Global Warming Potential (GWP) (ozone-depleting substances such as chlorofluorocarbons (CFCs)[9] and aerosols, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride

[9] CFCs destroy stratospheric ozone. The Montreal Protocol on Substances that Deplete the Ozone Layer prohibited CFCs production in 1987.

(SF_6). The GHGs listed by the IPCC (CO_2, methane, nitrous oxide, HFCs, PFCs, and sulfur hexafluoride) are discussed below, in order of abundance in the atmosphere. Water vapor, despite being the most abundant GHG, is not discussed below because natural concentrations and fluctuations far outweigh anthropogenic influences, making it impossible to predict. Ozone is not included because it does not directly affect radiative forcing. Ozone-depleting substances, which include chlorofluorocarbons, halons, carbon tetrachloride, methyl chloroform, and hydrochlorofluorocarbons, are not included because they have been primarily replaced by HFCs and PFCs.

The GWP is the potential of a gas or aerosol to trap heat in the atmosphere. The GWP of a gas is essentially a measurement of the radiative forcing of a GHG compared with the reference gas, carbon dioxide (CO_2).

Individual GHG compounds have varying potential for contributing to global warming. For example, methane is 25 times as potent as CO_2, while sulfur hexafluoride is 22,200 times more potent than CO_2 on a molecule-per-molecule basis. To simplify reporting and analysis, methods have been set forth to describe emissions of GHGs in terms of a single gas. The most commonly accepted method for comparing GHG emissions is the GWP methodology defined in the IPCC reference documents (IPCC, 2001a). The IPCC defines the GWP of various GHG emissions on a normalized scale that recasts all GHG emissions in terms of carbon dioxide equivalents (CO_2e), which compares the gas in question to that of the same mass of CO_2 (by definition, CO_2 has a GWP of 1). The GWP of a GHG is a measure of how much a given mass of a GHG is estimated to contribute to global warming. Thus, to describe how much global warming a given type and amount of GHG may cause, the CO_2e is used. A CO_2e is the mass emissions of an individual GHG multiplied by its GWP. As such, a high GWP represents high absorption of infrared radiation and a long atmospheric lifetime compared to CO_2. One must also select a time horizon to convert GHG emissions to equivalent CO_2 emissions to account for chemical reactivity and lifetime differences among various GHG species. The standard time horizon for climate change analysis is 100 years. Generally, GHG emissions are quantified in terms of metric tons (MT) of CO_2e (MT CO_2e) emitted per year.

The atmospheric residence time of a gas is equal to the total atmospheric abundance of the gas divided by its rate of removal.[10] The atmospheric residence time of a gas is, in effect, a half-life measurement of the length of time a gas is expected to persist in the atmosphere when accounting for removal mechanisms such as chemical transformation and deposition.

Table 7 lists the GWP of each GHG and its lifetime. Units commonly used to describe the concentration of GHGs in the atmosphere are parts per million (ppm), parts per billion (ppb), and parts per trillion (ppt), referring to the number of molecules of the GHG in a sampling of 1 million, 1 billion, or 1 trillion molecules of air. Collectively, HFCs, PFCs, and sulfur hexafluoride are referred to as high GWP gases. CO_2 is by far the largest component of worldwide CO_2e emissions, followed by methane, nitrous oxide, and high GWP gases, in order of decreasing contribution to CO_2e.

[10] Seinfeld, J.H. and S.N. Pandis. 2006. Atmospheric Chemistry and Physics: From Air Pollution to Climate Change, 2nd Edition. New York. John Wiley & Sons.

The primary human processes that release GHGs include the burning of fossil fuels for transportation, heating, and electricity generation; agricultural practices that release methane, such as livestock grazing and crop residue decomposition; and industrial processes that release smaller amounts of high GWP gases. Deforestation and land cover conversion have also been identified as contributing to global warming by reducing the Earth's capacity to remove CO_2 from the air and altering the Earth's albedo or surface reflectance, thus allowing more solar radiation to be absorbed. Specifically, CO_2 emissions associated with fossil fuel combustion are the primary contributors to human-induced climate change. CO_2, methane, and nitrous oxide emissions associated with human activities are the next largest contributors to climate change.

GHGs of California concern are defined by California Assembly Bill (AB) 32 (see the Regulatory Environment subsection below for a description) and include CO_2, CH_4, NO_X, HFCs, PFCs, and SF_6. A seventh GHG, nitrogen trifluoride (NF_3), was also added under the California Health and Safety Code Section 38505(g)(7) as a GHG of concern. These GHGs are described in Table 7 in terms of their physical description and properties, GWP, atmospheric residence lifetime, sources, and atmospheric concentration in 2005.

Table 7: Description of Greenhouse Gases of California Concern

Greenhouse Gas	Physical Description and Properties	Global Warming Potential (100 years)	Atmospheric Residence Lifetime (years)	Sources
Carbon dioxide (CO_2)	Odorless, colorless, natural gas.	1	50-200	burning coal, oil, natural gas, and wood; decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; oceanic evaporation; volcanic outgassing; cement production; land use changes
Methane (CH_4)	Flammable gas and is the main component of natural gas.	25	12	geological deposits (natural gas fields) extraction; landfills; fermentation of manure; and decay of organic matter
Nitrous oxide (N_2O)	Nitrous oxide (laughing gas) is a colorless GHG.	298	114	microbial processes in soil and water; fuel combustion; industrial processes
Chloro-fluoro-carbons (CFCs)	Nontoxic, nonflammable, insoluble, and chemically unreactive in the	3,800-8,100	45-640	refrigerants aerosol propellants; cleaning solvents

Greenhouse Gas	Physical Description and Properties	Global Warming Potential (100 years)	Atmospheric Residence Lifetime (years)	Sources
	troposphere (level of air at the Earth's surface); formed synthetically by replacing all hydrogen atoms in methane or ethane with chlorine and/or fluorine atoms.			
Hydro-fluoro-carbons (HFCs)	Synthetic human-made chemicals used as a substitute for CFCs and contain carbon, chlorine, and at least one hydrogen atom.	140 to 11,700	1-50,000	automobile air conditioners; refrigerants
Per-fluoro-carbons (PFCs)	Stable molecular structures and only break down by ultraviolet rays about 60 kilometers above Earth's surface.	6,500 to 9,200	10,000-50,000	primary aluminum production; semiconductor manufacturing
Sulfur hexafluoride (SF_6)	Human-made, inorganic, odorless, colorless, and nontoxic, nonflammable gas.	22,800	3,200	electrical power transmission equipment insulation; magnesium industry, semiconductor manufacturing; a tracer gas
Nitrogen trifluoride (NF_3)	Inorganic, is used as a replacement for PFCs, and is a powerful oxidizing agent.	17,200	740	electronics manufacture for semiconductors and liquid crystal displays

Climate and Topography

Climate is the accumulation of daily and seasonal weather events over a long period of time, whereas weather is defined as the condition of the atmosphere at any particular time and place. For a detailed discussion of existing regional and project site climate and topography, see Section 3.2, Air Quality.

Existing GHG Emissions

United States GHG Inventory

Total U.S. GHG emissions have increased by 1.8 percent from 1990 to 2019.[11] Figure 2 presents the trend in U.S. GHG emissions by economic sector from 1990 to 2019. Total U.S. GHG emissions increased by 2.8 percent from 1990 to 2019 (an increase of 142.4 million metric tons [MMT] CO_2e). Since 1990, U.S. emissions have increased at an average annual rate of 0.3 percent. Transportation emissions also increased because of an increase in Vehicle Miles Traveled (VMT). Within the United States, fossil fuel combustion accounted for 92.4 percent of CO_2 emissions in 2019. Transportation was the largest emitter of CO_2 in 2019, accounting for 28.6 percent of emissions, followed by electric power generation, accounting for 25.1 percent.

Note: Emissions shown do not include carbon sinks such as change in land uses and forestry.
Source: United States Environmental Protection Agency (EPA). 2021. Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2019–Executive Summary.

Figure 2: U.S. Greenhouse Gas Emissions Allocated to Economic Sectors (1990-2019)

California GHG Inventory

As the second largest emitter of GHG emissions in the United States., California contributes a large quantity (418.2 MMT CO_2e in 2019) of GHG emissions to the atmosphere.[12,13] Human-related emissions of CO_2 are largely byproducts of fossil fuel combustion and are attributable to transportation, industry/ manufacturing, electricity generation, natural gas consumption, and agriculture processes. In California, the transportation sector is the largest emitter at 41 percent of GHG emissions, followed by industrial at 24 percent of GHG emissions.[14]

Bay Area Air Quality Management District GHG Inventory

The BAAQMD prepared a GHG inventory for the San Francisco Bay Area (Bay Area), which provides an estimate of GHG emissions in the base year 2011 for all counties located in the jurisdiction of

[11] United States Environmental Protection Agency (EPA). 2021. Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2019 – Executive Summary.

[14] California Air Resources Board (ARB). 2018. California Greenhouse Gas Emissions for 2000 to 2019—Graphs. July 28.

BAAQMD: Alameda, Contra Costa, Marin, San Francisco, San Mateo, Santa Clara, Napa, and the southern portions of Solano and Sonoma.[15] This GHG inventory is based on the standards for criteria pollutant inventories and is intended to support BAAQMD's climate protection activities.

Table 8 shows the 2011 breakdown of emissions by end-use sector for each county within the BAAQMD's jurisdiction. 2011 GHG emissions are provided here as they are the most recent region-wide inventory currently available. The estimated GHG emissions are presented in CO_2e, which weights each GHG by its GWP. The GWPs used in the BAAQMD inventory are from the Second Assessment Report of the IPCC.

In 2011, GHG emissions from Alameda County accounted for approximately 15 percent of the Bay Area's total GHG emissions (13.2 MMT CO_2e out of 86.6 MMT CO_2e).[16] Transportation is the largest GHG emissions sector in the County, followed by industrial/commercial, residential fuel usage, electricity generation and cogeneration, off-road equipment, and agriculture and farming, in that order.

Table 8: 2011 GHG Emissions by Sector and County (MMT CO_2e/Year)

Sector	Alameda	Contra Costa	Marin	Napa	San Francisco	San Mateo	Santa Clara	Solano*	Sonoma*
Industrial/Commercial	2.7	17.8	0.4	0.2	1.2	1.4	4.1	2.7	0.5
Residential Fuel	1.3	1.0	0.3	0.1	0.9	0.8	1.5	0.3	0.4

Climate Change Trends and Effects

CO_2 accounts for more than 75 percent of all anthropogenic GHG emissions, the atmospheric residence time of CO_2 is decades to centuries, and global atmospheric concentrations of CO_2 continue to increase at a faster rate than ever previously recorded. Thus, the warming impacts of CO_2 will persist for hundreds of years after mitigation is implemented to reduce GHG concentrations.

San Leandro

Climate Change Hazards in San Leandro[17]

San Leandro, like most communities in California, is expected to experience multiple direct impacts as a result of climate change, including potential flooding, sea-level rise (SLR), wildfires, drought, extreme heat, and negative effects on public health and biodiversity. Research suggests that California will experience hotter and drier conditions, reductions in winter snow and increases in winter rains, SLR, significant changes to the water cycle, and an increased occurrence of extreme weather events. Such compounded impacts will affect economic systems throughout the State, with likely ramifications in San Leandro.

Bayshore Flooding

Low-lying coastal areas, such as the Oyster Bay Regional Shoreline, San Leandro Shoreline, and Mission Bay are most susceptible to the effects of bayshore flooding. Households within the Mulford Gardens, Marina Faire, and Heron Bay neighborhoods will be affected by bayshore flooding. Low-income households may live in structures that are not waterproofed or built above the current 100-year flood elevation. Bayshore flooding can damage homes, cause mildew and mold to grow, and destroy infrastructure. The Mission Bay and Sandev mobile home parks are within the 2050 bayshore flooding area. Mobile homes are generally less resilient than conventionally built structures and more susceptible to damage. Additionally, many industrial centers are within the bayshore

[17] City of San Leandro. 2021. Climate Action Plan (CAP). Website: https://www.sanleandro.org/984/Climate-Action-Plan. Accessed June 3, 2022

flooding area. Flooding can interrupt economic activity and damage buildings or cause the release of harmful chemicals used in industrial processes. Multiple freight lines are within the bayshore flood areas in San Leandro. Coastal flooding can damage track bed and ballast material, and the entire local rail system could shut down, interrupting both freight and passenger rail services.

Water and wastewater services can be disrupted by bayshore flooding if wastewater treatment plants' functionality is disrupted. The San Leandro Water Treatment Plant is within the 2050 bayshore flooding area. Bayshore flooding can exacerbate wet weather flows into the treatment plant and prevent the plant from functioning properly. Pumps and control panels that are not waterproofed or salt-resistant could fail. Failure of treatment plants pumps could cause sewer systems to backup and potentially contaminate streams and water systems with raw sewage. Neptune, Bermuda, Catalina, and potentially other sewer lift stations are susceptible to bayshore flooding. Failure of these systems would cause direct discharge of raw sewage to the Bay. At four feet in elevation, the Wicks storm pump station is susceptible to flooding from the Bay. Storm pump stations can be hardened and protected from bayshore flooding. They can also be lifted above the flood levels. However, if inundation is consistent, pump station functionality may decline. Bayshore flooding is expected to inundate the wetland habitat in the Mission Bay area by 2050. The wildlife habitat, recreation, and flood protection that these ecosystems provide may not be able to be sustained.

Drought

A drought occurs when conditions are drier than normal for an extended period, making less water available for people and ecosystems. Droughts are a regular occurrence in California; however, scientists expect that climate change will lead to more frequent and more intense droughts Statewide. Overall, precipitation levels are expected to remain similar, with more years of extreme precipitation events. East Bay Municipal Utility District (EBMUD) obtains fresh water supplies for San Leandro and other East Bay communities from the Mokelumne River watershed in the Sierra Nevada.

Drought conditions can cause smaller streams to run dry, which can subsequently harm the plants and animal habitats within the ecosystem. In an early-century drought (2023 to 2042), the City could experience a drop in average precipitation from an average of 19.0 inches per year to an average of 16.7 inches per year, which would lower baseflows in streams from an average of 4.9 inches per day to 3.7 inches per day. In a late century drought (2051 to 2070), precipitation could also drop to an average of 16.7 inches per year and cause baseflows in streams to drop to 3.6 inches per day. Drought conditions could lower water quality and raise water temperatures, reducing dissolved oxygen levels and promoting algae growth that can harm a variety of fish species. Wetlands and riparian habitats could experience increased soil erosion, degradation of landscape quality, and loss of biological productivity.

Since wetlands act as a buffer between developed areas and San Francisco Bay, helping to protect the community from SLR and bayshore flooding, degradation of wetlands could reduce the amount of water that the ecosystem can absorb and limit the protection that the wetlands provide. Drought

conditions can also dry out vegetation, increasing its vulnerability to pests and disease and promoting wildfire conditions.

Extreme Heat

Extreme heat occurs when temperatures rise significantly above normal levels. In San Leandro, an extreme heat day occurs when temperatures reach above 88.8 degrees Fahrenheit (°F). The number of extreme heat days in San Leandro is projected to increase from 4 days historically, to an average of 12 extreme heat days per year by midcentury and an average of up to 22 extreme heat days per year by the end of the century.

Extreme heat can also occur in the form of warmer nights when temperatures do not drop overnight and provide relief from the heat. In San Leandro, a warm night occurs when the temperature remains above 60.9°F. The number of warm nights in San Leandro is projected to increase from an average of four historically, to an average of 50 warm nights per year by midcentury, and an average of up to 120 warm nights per year by the end of the century.

Extreme heat can interrupt sleep and daily activities, exacerbate respiratory and cardiovascular conditions, and cause a variety of severe health impacts and illnesses, including heat cramps, heat exhaustion, heat stroke, and death. The most vulnerable populations are those that spend a disproportionately high amount of time outside, such as children, outdoor workers, and persons experiencing homelessness; those who cannot easily adjust to their environments in order to reduce heat exposure, such as households in poverty; and those whose health makes them particularly sensitive to heat, including those with sensitive or compromised immune systems, persons with chronic illnesses, and seniors.

Extreme heat can regularly cause power outages due to a combination of mechanical failure of electrical grid equipment, heat damage to the wires themselves, and high demand for electricity as a result of cooling equipment, all of which causes stress on the grid. As extreme heat events become more frequent and intense, disruptions in service are likely to become more frequent. Although high temperatures in the City may not damage energy services, transmission lines going through inland areas can be damaged or not function properly due to extreme heat.

Additional vulnerabilities include outdoor recreation, as people may be deterred from recreating outdoors in high temperatures, and aquatic and wetland habitats, whose water quality may decline as temperatures increase.

Flooding

As explained by the California Fourth Climate Change Assessment, California's water system is structured and operated to balance between water storage for dry months and flood protection during rainy seasons. Although climate change is likely to lead to a drier climate overall, risks from higher frequency, more intense rainfall events can generate more frequent and/or more severe flooding that upsets this managed balance between storage and protection.

Climate change forecasts for the San Leandro region predict more intense rainfall events, more frequent or extensive runoff, and more flooding. According to Cal-Adapt, historically, intense rain

events occurred an average of two times per year; they are projected to increase to an average of 3.5 events per year by midcentury and an average of 4.25 events by the end of the century.

Inland flooding can cause significant harm to buildings, people, and infrastructure. Floodwater can be deep enough to drown people and may move fast enough to carry away people or heavy objects (such as cars). Flooding can be caused by heavy rainfall, long periods of moderate rainfall, or clogged storm drains during periods of rainfall. In rare instances, a break in a water pipe or water tank can also cause flooding. Storm drainage systems throughout the City collect stormwater runoff and convey water to prevent localized flooding. However, these systems are typically designed based on winter storms recorded in the past and may not be designed to accommodate more intense storms.

Areas in San Leandro within the 100-year flood zone include land adjacent to San Leandro Creek, San Lorenzo Creek, and the Estudillo Canal; land along flood control channels in the vicinity of Bayfair Center and Bonaire Park; and coastal areas surrounding Oyster Bay Regional Shoreline, the San Leandro Shoreline, and Mission Bay.

An additional consequence of a property's designation within the 100-year flood zone is that flood insurance is required for federally-insured mortgage loans and may be required by other mortgage lenders. Additionally, the City's Flood Plain Management Ordinance requires that new construction, additions, and major home improvement projects be raised at least one foot above the base flood elevation.

Human Health Hazards

Human health hazards are bacteria, viruses, parasites, and other organisms that can cause diseases and illness in people. Some of these diseases may only cause mild inconvenience, but others are potentially life threatening. These diseases can be and often are carried by animals such as mice and rats, ticks, and mosquitos. Warmer temperatures and high levels of precipitation can lead to increased populations of disease-carrying animals, creating a greater risk of disease and increased rates of infection. Other human health hazards include poor air quality, such as ozone pollution and smoke from wildfires, which can affect respiratory systems of those exposed for prolonged periods.

Landslide and Debris Flow

Landslides occur when a hillside becomes unstable, causing soil and rocks to slide downslope. Landslides can include rock falls, deep failures of slopes, and shallow debris flows. Landslides are most common on steep slopes and hillsides made of loose soil or other material, where excavation and grading, drainage alterations, or changes in vegetation have occurred. The vulnerability assessment looks at landslides that are caused by precipitation, although earthquakes can also trigger landslides. Hillsides commonly absorb water, which increases instability of the slope and may increase the risk of slope failure. Steep slopes made up of loose or fractured material are more likely to slide. In some cases, hillsides can become so saturated that slope failures result in a mudslide (a mixture of soil and water moving downslope). Steeper slopes in the San Leandro Hills are in high landslide susceptibility areas.

Landslides and mudslides can move fast enough to damage or destroy homes or other structures in their path, block roadways (including evacuation routes), and injure or kill people caught in them. The most vulnerable populations are those that may be unable to evacuate due to limited mobility, lack of access to a vehicle, or language barriers that may prevent awareness of emergency notifications. Those living on single-access roadways in the hilly portion of the City or those living in less resilient housing may lose access to their homes if roadways or the structures are damaged or destroyed by a landslide. Infrastructure, such as natural gas pipelines and water or wastewater infrastructure, can break or malfunction if the soil supporting them fails. This can lead to disruptions in energy delivery and water or wastewater services.

Sea-level Rise

As global temperatures rise, glaciers and other land ice near the north and south poles melt. The water flows into the ocean, increasing sea levels across the globe. Higher temperatures also cause water to expand in oceans, causing further rising of sea levels. SLR is a gradual process, taking place over years or decades. In California, guidance suggests that sea levels will increase by 6 to 10 inches in most places by 2030, 13 to 23 inches by 2050, and 41 to 83 inches by 2100. However, it is possible that sea levels could rise faster than these projections. Along the San Leandro Bay shoreline, sea levels are projected to rise approximately 24 inches by 2050 and as much as 84 inches by 2100.

Rising sea levels can increase the frequency and severity of bay shoreline flooding. Since SLR raises ocean levels, shoreline floods, such as king tides and storm surges, can reach further onto land. For example, a storm that has a 1 in 10 chance of occurring in a given year (known as a 10-year storm), can create a temporary increase in sea levels of approximately 28 to 30 inches. This means that if sea levels rise by 24 inches during normal conditions, a 10-year storm event would create a temporary SLR of around 52 inches. Bayshore flooding zones in 2050 and 2100 are shown in Figure 9 of San Leandro's 2021 Climate Action Plan (CAP). Higher sea levels can also give a "boost" to smaller floods that would not have been large enough to flood dry land during normal conditions, making shoreline flooding more frequent.

Eventually, sea level may increase enough to permanently flood low-lying areas in the eastern portion of San Leandro along the bayshore. Homes within the Mulford Gardens, Marina Faire, and Heron Bay neighborhoods are within the SLR inundation area. SLR can increase residential flooding in these neighborhoods, causing mold and mildew to grow. Eventually, homes in these neighborhoods may become uninhabitable. Homes and structures built above sea level can still be harmed if the higher levels of water erode the rock or soil supporting the structures, potentially making them unsafe or at risk of collapse.

Many industrial centers are within the bayshore flooding area. SLR can inundate the foundations of buildings or cause more frequent flooding, causing the release of harmful chemicals used in industrial processes.

Water and wastewater services can be disrupted from SLR. The Water Pollution Control Plant (WPCP) is within the 2050 SLR area. Pumps and control panels that are not waterproofed or salt-resistant could fail or be damaged by SLR. Failure of these treatment plant components could cause the sewer

systems to backup and potentially contaminate streams and potable water systems with raw sewage. Saltwater inundation can exacerbate wet weather flows caused by stormwater and bayshore flooding, preventing the system from functioning properly. Wetlands included in the herbaceous ecosystem will be inundated by rising sea levels. The wildlife habitat, passive recreation, and flood protection that these ecosystems provide may not be able to be sustained.

Severe Storms

Severe storms include windstorms, hail, lightning, thunderstorms, and heavy rainfall. Severe weather is usually caused by intense storm systems, although some types of strong winds can occur without a storm. The connection between climate change and severe storms is not as well established as other exposures, but new evidence suggests that severe storms may occur more often and become more intense than in the past. Severe winds—over 50 to 60 miles per hour but up to 100 miles per hour can damage or destroy buildings and infrastructure. Hail can damage buildings and plants (and in extreme cases injure people), and lightning can spark fires, injure people, or cause fatalities. Heavy rainfall, which is characterized by rainfall amounts that exceed normal levels, can lead to flooding throughout San Leandro. Strong winds and heavy rainfall are the most common types of severe weather in the City.

The energy delivery system is especially vulnerable to windstorms, which can damage transmission lines or cause public safety power shutoff events. Windstorms can also damage warehouses that hold harmful materials and prevent people from traveling to work, which can affect important economic drivers in the City.

Increased Rate of Wildfires

Wildfires are a regular feature of the landscape in much of California. They can be sparked by lightning, malfunctioning equipment, vehicle crashes, or many other causes. Warmer temperatures, an increase in drought conditions, and extreme wind events are likely to create more fuel for fires in natural and rural areas, leading to a greater chance that a spark will grow into a potentially dangerous blaze. Climate change is also expected to extend the fire season throughout much (or even all) of the year.

The City of San Leandro is adjacent to thousands of acres of potentially flammable coastal scrub and forested space. Fire hazard severity zones in San Leandro, include very high fire hazard severity zones along the eastern edges of the Bay-O-Vista neighborhood and the Daniels Drive area. Because wildfires burn the trees and other vegetation that help stabilize a hillside and absorb water, more areas burned by fire may also lead to an increase in landslides and debris flows. According to Cal-Adapt, the annual average area burned by wildfire in the region is projected to experience a modest increase. Historically, the annual average area burned in Alameda County was approximately 4,020 acres. According to Cal-Adapt, under the higher emissions scenario, this could increase to an average annual burn area of approximately 4,600 acres. Although most of this increased wildfire activity is unlikely to occur in San Leandro itself, San Leandro residents will still be impacted by smoke from wildfires in other parts of the county or the State.

SECTION 3: REGULATORY FRAMEWORK

3.1.1 - Federal

Clean Air Act

Congress established much of the basic structure of the Clean Air Act (CAA) in 1970, and made major revisions in 1977 and 1990. Six common air pollutants (also known as criteria pollutants) are addressed in the CAA. These are particulate matter, ground level ozone, CO, sulfur oxides, nitrogen oxides, and lead. The EPA calls these pollutants criteria air pollutants because it regulates them by developing human health-based and/or environmentally based criteria (science-based guidelines) for setting permissible levels. The set of limits based on human health are called primary standards. Another set of limits intended to prevent environmental and property damage are called secondary standards. The NAAQS provide benchmarks for determining whether air quality is healthy at specific locations and whether development activities will cause or contribute to a violation of the standards. The criteria pollutants are:

- Ozone
- Nitrogen dioxide (NO_2)
- Lead
- Particulate matter (PM_{10} and $PM_{2.5}$)
- Carbon monoxide (CO)
- Sulfur dioxide

The NAAQS were set to protect public health, including that of sensitive individuals; thus, the EPA is tasked with updating the standards as more medical research is available regarding the health effects of the criteria pollutants. Primary federal standards are the levels of air quality necessary, with an adequate margin of safety, to protect the public health.

The CAA also requires each state to prepare an air quality control plan referred to as a State Implementation Plan (SIP). The federal CAA Amendments of 1990 added requirements for states with nonattainment areas to revise their SIPs to incorporate additional control measures to reduce air pollution. The SIP is periodically modified to reflect the latest emissions inventories, planning documents, and rules and regulations of the air basins, as reported by their jurisdictional agencies.

EPA Emission Standards for New Off-Road Equipment

Before 1994, there were no standards to limit the amount of emissions from off-road equipment. In 1994, the EPA established emission standards for hydrocarbons, NO_X, CO, and PM to regulate new pieces of off-road equipment. These emission standards came to be known as Tier 1. Since that time, increasingly more stringent Tier 2, Tier 3, and Tier 4 (interim and final) standards were adopted by the EPA, as well as by the ARB. Each adopted emission standard was phased in over time. New engines built in and after 2015 across all horsepower sizes must meet Tier 4 final emission standards. In other words, new manufactured engines cannot exceed the emissions established for Tier 4 final emissions standards.

Massachusetts et al. v. EPA (U.S. Supreme Court GHG Endangerment Ruling)

Massachusetts et al. v. EPA (Supreme Court Case 05-1120) was argued before the United States Supreme Court on November 29, 2006, in which it was petitioned that the United States Environmental Protection Agency (EPA) regulate four GHGs, including CO_2, under Section 202(a)(1) of the CAA. A decision was made on April 2, 2007, in which the Supreme Court found that GHGs are air pollutants covered by the CAA. The Court held that the Administrator must determine whether emissions of GHGs from new motor vehicles cause or contribute to air pollution, which may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. On December 7, 2009, the EPA Administrator signed two distinct findings regarding GHGs under Section 202(a) of the CAA:

- **Endangerment Finding:** The Administrator finds that the current and projected concentrations of the six key well-mixed greenhouse gases—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations; and
- **Cause or Contribute Finding:** The Administrator finds that the combined emissions of these well-mixed GHG emissions from new motor vehicles and new motor vehicle engines contribute to the GHG emission pollution, which threatens public health and welfare.

These findings do not impose requirements on industry or other entities. However, this was a prerequisite for implementing GHG emissions standards for vehicles, as discussed under "Clean Vehicles" below. After a lengthy legal challenge, the U.S. Supreme Court declined to review an Appeals Court ruling which upheld the EPA Administrator findings.

United States Clean Air Act Permitting Programs (New GHG Source Review)

The EPA issued a final rule on May 13, 2010, which establishes thresholds for GHGs that define when permits under the New Source Review Prevention of Significant Deterioration and Title V Operating Permit programs are required for new and existing industrial facilities. This final rule "tailors" the requirements of these CAA permitting programs to limit which facilities will be required to obtain Prevention of Significant Deterioration and Title V permits. In the preamble to the revisions to the Code of Federal Regulations, the EPA states:

> This rulemaking is necessary because without it the Prevention of Significant Deterioration and Title V requirements would apply, as of January 2, 2011, at the 100 or 250 tons per year levels provided under the Clean Air Act, greatly increasing the number of required permits, imposing undue costs on small sources, overwhelming the resources of permitting authorities, and severely impairing the functioning of the programs. EPA is relieving these resource burdens by phasing in the applicability of these programs to greenhouse gas sources, starting with the largest greenhouse gas emitters. This rule establishes two initial steps of the phase-in. The rule also commits the agency to take certain actions on future steps addressing smaller sources, but excludes certain smaller sources from Prevention of Significant Deterioration and Title V permitting for greenhouse gas emissions until at least April 30, 2016.

The EPA estimates that facilities responsible for nearly 70 percent of the national GHG emissions from stationary sources will be subject to permitting requirements under this rule. This includes the nation's largest GHG emitters—power plants, refineries, and cement production facilities.

Energy Independence and Security Act

The Energy Policy Act of 2005 created the Renewable Fuel Standard program. The Energy Independence and Security Act of 2007 expanded this program by:

- Expanding the Renewable Fuel Standard program to include diesel in addition to gasoline;
- Increasing the volume of renewable fuel required to be blended into transportation fuel from 9 billion gallons in 2008 to 36 billion gallons by 2022;
- Establishing new categories of renewable fuel, and setting separate volume requirements for each one; and
- Requiring EPA to apply lifecycle GHG performance threshold standards to ensure that each category of renewable fuel emits fewer GHGs than the petroleum fuel it replaces.

This expanded Renewable Fuel Standard program lays the foundation for achieving substantial reductions of GHG emissions from the use of renewable fuels, reducing the use of imported petroleum, and encouraging the development and expansion of the nation's renewable fuels sector.

Signed on December 19, 2007 by President George W. Bush, the Energy Independence and Security Act of 2007 (EISA) aims to:

- Move the United States toward greater energy independence and security.
- Increase the production of clean renewable fuels.
- Protect consumers.
- Increase the efficiency of products, buildings, and vehicles.
- Promote research on and deploy GHG emission capture and storage options.
- Improve the energy performance of the federal government.
- Increase U.S. energy security, develop renewable fuel production, and improve vehicle fuel economy.

EISA reinforces the energy reduction goals for federal agencies put forth in Executive Order 13423 and introduces more aggressive requirements. The three key provisions enacted are the Corporate Average Fuel Economy Standards, the Renewable Fuel Standard, and the appliance/lighting efficiency standards.

The EPA is committed to developing, implementing, and revising both regulations and voluntary programs under the following subtitles in EISA, among others:

- Increased Corporate Average Fuel Economy Standards
- Federal Vehicle Fleets
- Renewable Fuel Standard

- Biofuels Infrastructure
- Carbon Capture and Sequestration[18]

EPA and National Highway Traffic Safety Administration Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards Final Rule

Congress first passed the Corporate Average Fuel Economy law in 1975 to increase the fuel economy of cars and light-duty trucks. The law has become more stringent over time. On May 19, 2009, President Barack Obama put in motion a new national policy to increase fuel economy for all new cars and trucks sold in the United States. On April 1, 2010, the EPA and the Department of Transportation's National Highway Traffic Safety Administration (NHTSA) announced a joint final rule establishing a national program that would reduce GHG emissions and improve fuel economy for new cars and trucks sold in the United States.

The first phase of the national program would apply to passenger cars, light-duty trucks, and medium-duty passenger vehicles, covering model years 2012 through 2016. They require these vehicles to meet an estimated combined average emissions level of 250 grams of CO_2 per mile, equivalent to 35.5 miles per gallon if the automobile industry were to meet this CO_2 level solely through fuel economy improvements. Together, these standards would cut CO_2 emissions by an estimated 960 MMT and 1.8 billion barrels of oil over the lifetime of the vehicles sold under the program (model years 2012-2016).

The EPA and the NHTSA issued final rules on a second phase joint rulemaking, establishing national standards for light-duty vehicles for model years 2017 through 2025 in August 2012.[19] The new standards for model years 2017 through 2025 apply to passenger cars, light-duty trucks, and medium-duty passenger vehicles. The final standards are projected to result in an average industry fleet wide level of 163 grams/mile of CO_2 in model year 2025, which is equivalent to 54.5 miles per gallon if achieved exclusively through fuel economy improvements.

The EPA and NHTSA issued final rules for the first national standards to reduce GHG emissions and improve fuel efficiency of heavy-duty trucks and buses on September 15, 2011, which became effective November 14, 2011. For combination tractors, the agencies are proposing engine and vehicle standards that began in the 2014 model year and achieve up to a 20 percent reduction in CO_2 emissions and fuel consumption by the 2018 model year. For heavy-duty pickup trucks and vans, the agencies are proposing separate gasoline and diesel truck standards, which phase in starting in the 2014 model year and achieve up to a 10 percent reduction for gasoline vehicles, and a 15 percent reduction for diesel vehicles by 2018 model year (12 and 17 percent respectively if accounting for air conditioning leakage). Lastly, for vocational vehicles, the engine and vehicle standards would achieve up to a 10 percent reduction in fuel consumption and CO_2 emissions from the 2014 to 2018 model years.

[18] United States Environment Protection Agency (EPA). 2007. Summary of the Energy Independence and Security Act. Website: https://www.epa.gov/laws-regulations/summary-energy-independence-and-security-act. Accessed June 7, 2022.

[19] United States Environmental Protection Agency (EPA). 2012. EPA and NHTSA Set Standards to Reduce Greenhouse Gases and Improve Fuel Economy for Model Years 2017-2025 Cars and Light Trucks. EPA-420-F-12-051. August.

The State of California has received a waiver from the EPA to have separate, stricter Corporate Average Fuel Economy Standards. Although global climate change did not become an international concern until the 1980s, efforts to reduce energy consumption began in California in response to the oil crisis in the 1970s, resulting in the incidental reduction of GHG emissions. In order to manage the State's energy needs and promote energy efficiency, AB 1575 created the CEC in 1975.

3.1.2 - State

California Air Quality Control Plan (State Implementation Plan)

An SIP is a document prepared by each state describing existing air quality conditions and measures that will be followed to attain and maintain federal standards. The SIP for the State of California is administered by the ARB, which has overall responsibility for Statewide air quality maintenance and air pollution prevention. California's SIP incorporates individual federal attainment plans for regional air districts—an air district prepares their federal attainment plan, which is sent to the ARB to be approved and incorporated into the California SIP. Federal attainment plans include the technical foundation for understanding air quality (e.g., emission inventories and air quality monitoring), control measures and strategies, and enforcement mechanisms for attaining and maintaining air quality standards.

Areas designated nonattainment must develop air quality plans and regulations to achieve standards by specified dates, depending on the severity of the exceedances. For much of the country, implementation of federal motor vehicle standards and compliance with federal permitting requirements for industrial sources are adequate to attain air quality standards on schedule. For many areas of California, however, additional State and local regulation is required to achieve the standards.

California Clean Air Act

The California Legislature enacted the California Clean Air Act (CCAA) in 1988 to address air quality issues of concern not adequately addressed by the federal CAA at the time. California's air quality problems were and continue to be some of the most severe in the nation, and required additional actions beyond the federal mandates. The ARB administers the CAAQS for the 10 air pollutants designated in the CCAA. The 10 State air pollutants are the six federal standards listed above as well as visibility-reducing particulates, hydrogen sulfide, sulfates, and vinyl chloride. The EPA authorized California to adopt its own regulations for motor vehicles and other sources that are more stringent than similar federal regulations implementing the CAA. Generally, the planning requirements of the CCAA are more stringent than the federal CAA; therefore, consistency with the CAA will also demonstrate consistency with the CCAA.

Other ARB responsibilities include but are not limited to overseeing local air district compliance with California and federal laws; approving local air quality plans; submitting SIPs to the EPA; monitoring air quality; determining and updating area designations and maps; conducting basic research aimed at providing a better understanding between emissions and public well-being, and setting emissions standards for new mobile sources, consumer products, small utility engines, off-road vehicles, and fuels.

California Health and Safety Code Section 39655 and California Code of Regulations Title 17 Section 93000 (Substances Identified as Toxic Air Contaminants)

The ARB identifies substances as TACs as defined in Health and Safety Code Section 39655 and listed in Title 17, Section 93000 of the California Code of Regulations, "Substances Identified As Toxic Air Contaminants." A TAC is defined as an air pollutant that may cause or contribute to an increase in mortality or serious illness, or that may pose a hazard to human health. TACs are usually present in minute quantities in the ambient air; however, their high toxicity or health risk may pose a threat to public health even at low concentrations. In general, for those TACs that may cause cancer, there are thresholds set by regulatory agencies below which adverse health impacts are not expected to occur. This contrasts with the criteria pollutants for which acceptable levels of exposure can be determined and for which the State and federal government have set ambient air quality standards. According to the California Almanac of Emissions and Air Quality, the majority of the estimated health risk from TACs for the State of California can be attributed to relatively few compounds, the most important of which is diesel particulate matter (DPM) from diesel-fueled engines.

California Low Emission Vehicle Program

The ARB first adopted Low Emission Vehicle (LEV) program standards in 1990. These first LEV standards ran from 1994 through 2003. LEV II regulations, running from 2004 through 2010, represent continuing progress in emission reductions. As the State's passenger vehicle fleet continues to grow and more sport utility vehicles and pickup trucks are used as passenger cars rather than work vehicles, the more stringent LEV II standards were adopted to provide reductions necessary for California to meet federally mandated clean air goals outlined in the 1994 SIP. In 2012, the ARB adopted the LEV III amendments to California's LEV regulations. These amendments, also known as the Advanced Clean Car Program, include more stringent emission standards for model years 2017 through 2025 for both criteria pollutants and GHG emissions for new passenger vehicles.

California On-Road Heavy-Duty Vehicle Program

The ARB has adopted standards for emissions from various types of new on-road heavy-duty vehicles. Section 1956.8, Title 13, California Code of Regulations contains California's emission standards for on-road heavy-duty engines and vehicles, and test procedures. The ARB has also adopted programs to reduce emissions from in-use heavy-duty vehicles including the Heavy-Duty Diesel Vehicle Idling Reduction Program, the Heavy-Duty Diesel In-Use Compliance Program, the Public Bus Fleet Rule and Engine Standards, and the School Bus Program and others.

California In-Use Off-Road Diesel Vehicle Regulation

On July 26, 2007, the ARB adopted a regulation to reduce DPM and NO_X emissions from in-use (existing) off-road heavy-duty diesel vehicles in California. Such vehicles are used in construction, mining, and industrial operations. The regulation limits idling to no more than five consecutive minutes, requires reporting and labeling, and requires disclosure of the regulation upon vehicle sale. The ARB is enforcing that part of the rule with fines up to $10,000 per day for each vehicle in violation. Performance requirements of the rule are based on a fleet's average NO_X emissions, which can be met by replacing older vehicles with newer, cleaner vehicles or by applying exhaust retrofits. The regulation was amended in 2010 to delay the original timeline of the performance requirements, making the first compliance deadline January 1, 2014, for large fleets (over 5,000

horsepower), 2017 for medium fleets (2,501-5,000 horsepower), and 2019 for small fleets (2,500 horsepower or less).

The latest amendments to the Truck and Bus Regulation became effective on December 31, 2014. The amended regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Newer heavier trucks and buses must meet PM filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses are required to have 2010 model year engines or equivalent.

The regulation applies to nearly all privately and federally owned diesel-fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating greater than 14,000 pounds. The regulation provides a variety of flexibility options tailored to fleets operating low use vehicles, fleets operating in selected vocations like agricultural and construction, and small fleets of three or fewer trucks.

California Airborne Toxic Control Measures for Asbestos

The ARB has adopted Airborne Toxic Control Measures (ATCM) for sources that emit a particular TAC. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure below that threshold. If there is no safe threshold, the measure must incorporate Best Available Control Technology (BACT) to minimize emissions.

In July 2001, the ARB approved an ATCM for construction, grading, quarrying and surface mining operations to minimize emissions of naturally occurring asbestos. The regulation requires application of Best Management Practices (BMPs) to control fugitive dust in areas known to have naturally occurring asbestos and requires notification to the local air district prior to commencement of ground-disturbing activities. The measure establishes specific testing, notification and engineering controls prior to grading, quarrying, or surface mining in construction zones where naturally occurring asbestos is located on projects of any size. There are additional notification and engineering controls at work sites larger than one acre in size. These projects require the submittal of a “Dust Mitigation Plan” and approval by the air district prior to the start of a project.

Construction sometimes requires the demolition of existing buildings where construction occurs. Asbestos is also found in a natural state, known as naturally occurring asbestos. Exposure and disturbance of rock and soil that naturally contain asbestos can result in the release of fibers into the air and consequent exposure to the public. Asbestos most commonly occurs in ultramafic rock that has undergone partial or complete alteration to serpentine rock (serpentinite) and often contains chrysotile asbestos. In addition, another form of asbestos, tremolite, can be found associated with ultramafic rock, particularly near faults. Sources of asbestos emissions include unpaved roads or driveways surfaced with ultramafic rock, construction activities in ultramafic rock deposits, or rock quarrying activities where ultramafic rock is present.

The ARB has an ATCM for construction, grading, quarrying, and surface mining operations, requiring the implementation of mitigation measures to minimize emissions of asbestos-laden dust. The measure applies to road construction and maintenance, construction and grading operations, and

quarries and surface mines when the activity occurs in an area where naturally occurring asbestos is likely to be found. Areas are subject to the regulation if they are identified on maps published by the Department of Conservation as ultramafic rock units or if the Air Pollution Control Officer or owner/operator has knowledge of the presence of ultramafic rock, serpentine, or naturally occurring asbestos on the site. The measure also applies if ultramafic rock, serpentine, or asbestos is discovered during any operation or activity. Review of the Department of Conservation maps indicates that no ultramafic rock has been found near the project site.[20]

Verified Diesel Emission Control Strategies

The EPA and the ARB tiered off-road emission standards only apply to new engines and off-road equipment can last several years. The ARB has developed Verified Diesel Emission Control Strategies (VDECS), which are devices, systems, or strategies used to achieve the highest level of pollution control from existing off-road vehicles, to help reduce emissions from existing engines. VDECS are designed primarily for the reduction of DPM emissions and have been verified by ARB. There are three levels of VDECS, the most effective of which is the Level 3 VDECS. Tier 4 engines are not required to install VDECS because they already meet the emissions standards for lower tiered equipment with installed controls.

California Diesel Risk Reduction Plan

The ARB Diesel Risk Reduction Plan has led to the adoption of new State regulatory standards for all new on-road, off-road, and stationary diesel-fueled engines, and vehicles to reduce DPM emissions in 2020 by about 90 percent overall from year 2000 levels. The estimated emission benefits associated with the full implementation of this plan, including federal measures, are reductions in DPM emissions and associated cancer risks of 75 percent by 2010, and 85 percent by 2020.

Tanner Air Toxics Act and Air Toxics Hot Spots Information and Assessment Act

TACs in California are primarily regulated through the Tanner Air Toxics Act (AB 1807) and the Air Toxics Hot Spots Information and Assessment Act of 1987 (AB 2588), also known as the Hot Spots Act. To date, the ARB has identified more than 21 TACs, and has adopted the EPA's list of Hazardous Air Pollutants (HAPs) as TACs.

Carl Moyer Memorial Air Quality Standards Attainment Program

The Carl Moyer Memorial Air Quality Standards Attainment Program (Carl Moyer Program), a partnership between the ARB and local air districts, issues grants to replace or retrofit older engines and equipment with engines and equipment that exceed current regulatory requirements to reduce air pollution. Money collected through the Carl Moyer Program complements California's regulatory program by providing incentives to effect early or extra emission reductions, especially from emission sources in environmental justice communities and areas disproportionately affected by air pollution. The program has established guidelines and criteria for the funding of emissions reduction projects. Within the SFBAAB, the BAAQMD administers the Carl Moyer Program. The program has established guidelines and criteria for the funding of emissions reduction projects and has

[20] Department of Conservation. 2011. Map Sheet 59: Reported Historic Asbestos Mines, Historic Asbestos Prospects, and Other Natural Occurrences of Asbestos in California.

established cost-effectiveness criteria for funding emission reductions projects, which under the final 2017 Carl Moyer Program Guidelines are $30,000 per weighted ton of NO_X, ROG, and PM.

California Assembly Bill 32: Global Warming Solutions Act and Scoping Plan

The California State Legislature enacted AB 32, the California Global Warming Solutions Act of 2006. AB 32 requires that GHGs emitted in California be reduced to 1990 levels by the year 2020. "Greenhouse gases" as defined under AB 32 include CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6. Since AB 32 was enacted, a seventh chemical, nitrogen trifluoride, has also been added to the list of GHGs. The ARB is the State agency charged with monitoring and regulating sources of GHGs. AB 32 states the following:

> Global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California. The potential adverse impacts of global warming include the exacerbation of air quality problems, a reduction in the quality and supply of water to the State from the Sierra snowpack, a rise in sea levels resulting in the displacement of thousands of coastal businesses and residences, damage to marine ecosystems and the natural environment, and an increase in the incidences of infectious diseases, asthma, and other human health-related problems.

The ARB approved the 1990 GHG emissions level of 427 MMT CO_2e on December 6, 2007.[21] Therefore, to meet the State's target, emissions generated in California in 2020 were required to be equal to or less than 427 MMT CO_2e. Emissions in 2020 in a business-as-usual (BAU) scenario were estimated to be 596 MMT CO_2e, which do not account for reductions from AB 32 regulations.[22] At that rate, a 28 percent reduction was required to achieve the 427 MMT CO_2e 1990 inventory. In October 2010, the ARB prepared an updated 2020 forecast to account for the effects of the 2008 recession and slower forecasted growth. The 2020 inventory without the benefits of adopted regulation is now estimated at 545 MMT CO_2e. Therefore, under the updated forecast, a 21.7 percent reduction from a BAU scenario is required to achieve 1990 levels.[23]

The State has made steady progress in implementing AB 32. The progress is shown in updated emission inventories prepared by ARB for 2000 through 2012 to show progress achieved to date.[24] The State also achieved its target for 2010 of reducing GHG emissions to 2000 levels. As shown below, the 2010 emission inventory achieved this target. Also shown are the average reductions needed from all Statewide sources (including all existing sources) to reduce GHG emissions back to 1990 levels.

- **1990:** 427 MMT CO_2e (AB 32 2020 Target)
- **2000:** 463 MMT CO_2e (an average 8 percent reduction needed to achieve 1990 base)

[23] California Air Resources Board (ARB). 2014. GHG 2020 Business-as-Usual Emissions Projection. Website: https://ww2.arb.ca.gov/ghg-bau. Accessed June 7, 2022.
[24] California Air Resources Board (ARB). 2014. California Greenhouse Gas Emissions for 2000 to 2012—Trends of Emissions and Other Indicators. Website: http://www.arb.ca.gov/cc/inventory/pubs/reports/ghg_inventory_00-12_report.pdf. Accessed June 7, 2022.

- **2010:** 450 MMT CO_2e (an average 5 percent reduction needed to achieve 1990 base)
- **2020:** 545 MMT CO_2e BAU (an average 21.7 percent reduction from BAU needed to achieve 1990 base)

The ARB's initial Climate Change Scoping Plan (Scoping Plan) contained measures designed to reduce the State's emissions to 1990 levels by the year 2020 to comply with AB 32.[25] The Scoping Plan identified recommended measures for multiple GHG emission sectors and the associated emission reductions needed to achieve the year 2020 emissions target—each sector had a different emission reduction target. Most of the measures target the transportation and electricity sectors. As stated in the Scoping Plan, the key elements of the strategy for achieving the 2020 GHG target include:

- Expanding and strengthening existing energy efficiency programs as well as building and appliance standards;
- Achieving a Statewide renewables energy mix of 33 percent;
- Developing a California Cap-and-Trade Program that links with other Western Climate Initiative partner programs to create a regional market system;
- Establishing targets for transportation-related GHG emissions for regions throughout California and pursuing policies and incentives to achieve those targets;
- Adopting and implementing measures pursuant to existing State laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard (LCFS); and
- Creating targeted fees, including a public goods charge on water use, fees on high GWP gases, and a fee to fund the administrative costs of the State's long-term commitment to AB 32 implementation.

In addition, the Scoping Plan differentiates between "capped" and "uncapped" strategies. Capped strategies are subject to the ARB's Cap-and-Trade Program. The Scoping Plan states that the inclusion of these emissions within the Cap-and-Trade Program would help ensure that the year 2020 emission targets were met despite some degree of uncertainty in the emission reduction estimates for any individual measure. Implementation of the capped strategies is calculated to achieve sufficient reductions by 2020 to achieve the emission target contained in AB 32. Uncapped strategies that will not be subject to the cap-and-trade emissions limits and requirements were provided as a margin of safety by accounting for additional GHG emission reductions.[26]

The Cap-and-Trade Program remains a key element of the Scoping Plan. It sets a Statewide limit on sources responsible for 85 percent of California's GHG emissions and establishes a price signal needed to drive long-term investment in cleaner fuels and more efficient use of energy. The program is designed to provide covered entities the flexibility to seek out and implement the lowest cost options to reduce emissions. The program conducted its first auction in November 2012. Compliance obligations began for power plants and large industrial sources in January 2013. Other significant

[25] California Air Resources Board (ARB). 2008. Climate Change Scoping Plan, a framework for change. December.
[26] California Air Resources Board (ARB). 2008. Climate Change Scoping Plan, a framework for change. December.

milestones include linkage to Québec's cap-and-trade system in January 2014 and starting the compliance obligation for distributors of transportation fuels, natural gas, and other fuels in January 2015.[27]

The Cap-and-Trade Program provides a firm cap, ensuring that the 2020 Statewide emission limit would not be exceeded. An inherent feature of the Cap-and-Trade Program is that it does not guarantee GHG emissions reductions in any discrete location or by any particular source. Rather, GHG emissions reductions are only guaranteed on an accumulative basis. As summarized by the ARB in the First Update:

> The Cap-and-Trade Regulation gives companies the flexibility to trade allowances with others or take steps to cost-effectively reduce emissions at their own facilities. Companies that emit more have to turn in more allowances or other compliance instruments. Companies that can cut their GHG emissions have to turn in fewer allowances. But as the cap declines, aggregate emissions must be reduced. In other words, a covered entity theoretically could increase its GHG emissions every year and still comply with the Cap-and-Trade Program if there is a reduction in GHG emissions from other covered entities. Such a focus on aggregate GHG emissions is considered appropriate because climate change is a global phenomenon, and the effects of GHG emissions are considered cumulative.[28]

The Cap-and-Trade Program works with other direct regulatory measures and provides an economic incentive to reduce emissions. If California's direct regulatory measures reduce GHG emissions more than expected, then the Cap-and-Trade Program will be responsible for relatively fewer emissions reductions. If California's direct regulatory measures reduce GHG emissions less than expected, then the Cap-and-Trade Program will be responsible for relatively more emissions reductions. Thus, the Cap-and-Trade Program assures that California will meet its 2020 GHG emissions reduction mandate:

> The Cap-and-Trade Program establishes an overall limit on GHG emissions from most of the California economy—the "capped sectors." Within the capped sectors, some of the reductions are being accomplished through direct regulations, such as improved building and appliance efficiency standards, the [Low Carbon Fuel Standard] LCFS, and the 33 percent [Renewables Portfolio Standard] RPS. Whatever additional reductions are needed to bring emissions within the cap is accomplished through price incentives posed by emissions allowance prices. Together, direct regulation and price incentives assure that emissions are brought down cost-effectively to the level of the overall cap. The Cap-and-Trade Regulation provides assurance that California's 2020 limit will be met because the regulation sets a firm limit on 85 percent of California's GHG emissions. In sum, the Cap-and-Trade Program will achieve aggregate, rather than site-specific or project-level, GHG emissions reductions.

[27] California Air Resources Board (ARB). 2015. ARB Emissions Trading Program. February 9.
[28] California Air Resources Board (ARB). 2014. First Update to the Climate Change Scoping Plan. May.

Also, due to the regulatory architecture adopted by ARB in AB 32, the reductions attributed to the Cap-and-Trade Program can change over time depending on the State's emissions forecasts and the effectiveness of direct regulatory measures.[29]

California Senate Bill 32

The Governor signed SB 32 in September of 2016, giving the ARB the statutory responsibility to include the 2030 target previously contained in Executive Order B-30-15 in the 2017 Scoping Plan Update. SB 32 states, "In adopting rules and regulations to achieve the maximum technologically feasible and cost-effective greenhouse gas emissions reductions authorized by this division, the state [air resources] board shall ensure that Statewide greenhouse gas emissions are reduced to at least 40 percent below the Statewide greenhouse gas emissions limit no later than December 31, 2030." As such, SB 32 lays the foundation for the legislative reduction targets for 2030.

2017 Scoping Plan

The most recent version of the ARB's Scoping Plan, the 2017 Climate Change Scoping Plan Update, addresses the SB 32 targets and was adopted on December 14, 2017. The major elements of the framework proposed to achieve the 2030 target are as follows:

1. SB 350
   - Achieve 50 percent Renewables Portfolio Standard by 2030.
   - Doubling of energy efficiency savings by 2030.
2. Low Carbon Fuel Standard
   - Increased stringency (reducing carbon intensity 18 percent by 2030, up from 10 percent in 2020).
3. Mobile Source Strategy (Cleaner Technology and Fuels Scenario)
   - Maintaining existing GHG standards for light- and heavy-duty vehicles.
   - Put 4.2 million Zero-Emission Vehicles (ZEVs) on the roads.
   - Increase ZEV buses, delivery and other trucks.
4. Sustainable Freight Action Plan
   - Improve freight system efficiency.
   - Maximize use of near-ZEVs and equipment powered by renewable energy.
   - Deploy over 100,000 zero-emission trucks and equipment by 2030.
5. Short-Lived Climate Pollutant Reduction Strategy
   - Reduce emissions of methane and hydrofluorocarbons 40 percent below 2013 levels by 2030.
   - Reduce emissions of black carbon 50 percent below 2013 levels by 2030.
6. SB 375 Sustainable Communities Strategies
   - Increased stringency of 2035 targets.
7. Post-2020 Cap-and-Trade Program
   - Declining caps, continued linkage with Québec, and linkage to Ontario, Canada.

[29] California Air Resources Board (ARB). 2015. ARB Emissions Trading Program. February 9.

- The ARB will look for opportunities to strengthen the program to support more air quality co-benefits, including specific program design elements. In Fall 2016, the ARB staff described potential future amendments including reducing the offset usage limit, redesigning the allocation strategy to reduce free allocation to support increased technology and energy investment at covered entities and reducing allocation if the covered entity increases criteria or toxics emissions over some baseline.

8. 20 percent reduction in GHG emissions from the refinery sector.
9. By 2018, develop Integrated Natural and Working Lands Action Plan to secure California's land base as a net carbon sink.

California Senate Bill 350: Clean Energy and Pollution Reduction Act

In 2015, the State Legislature approved, and the Governor signed, SB 350, which reaffirmed California's commitment to reducing its GHG emissions and addressing climate change. Key provisions include an increase in the RPS, higher energy efficiency requirements for buildings, initial strategies toward a regional electricity grid, and improved infrastructure for electric vehicle charging stations. Provisions for a 50 percent reduction in the use of petroleum Statewide were removed from the Bill due to opposition and concern that it would prevent the Bill's passage. Specifically, SB 350 requires the following to reduce Statewide GHG emissions:

- Increase the amount of electricity procured from renewable energy sources from 33 percent to 50 percent by 2030, with interim targets of 40 percent by 2024, and 25 percent by 2027.
- Double the energy efficiency in existing buildings by 2030. This target will be achieved through the California Public Utility Commission, the CEC, and local publicly owned utilities.
- Reorganize the Independent System Operator (ISO) to develop more regional electrified transmission markets and to improve accessibility in these markets, which will facilitate the growth of renewable energy markets in the western United States.[30]

California Senate Bill 100: Renewable Portfolio Standard Program

On September 10, 2018, Governor Newsom signed SB 100, requiring California electricity utility providers to supply all in-State end users with electricity sourced from renewable or carbon-free sources by 2045. Specifically, SB 100 accelerates previously established RPS goals and requires that the program achieve 50 percent of electricity sourced from renewables by December 31, 2026, 60 percent by December 31, 2030, and 100 percent of electricity sourced from carbon-free sources by December 31, 2045. For clarification, renewable sources, as described herein, includes all renewable sources (e.g., solar, small hydro, wind) but notably omits large-scale hydroelectric and nuclear electricity generation; carbon-free sources include all renewable sources as well as large-scale hydroelectric and nuclear electricity generation.

[30] California Legislative Information (California Leginfo). 2015. Senate Bill 350 Clean Energy and Pollution Reduction Act of 2015. Website: https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201520160SB350. Accessed June 7, 2022.

California Assembly Bill 1493: Pavley Regulations and Fuel Efficiency Standards

California AB 1493, enacted on July 22, 2002, required the ARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light-duty trucks. Implementation of the regulation was delayed by lawsuits filed by automakers and by the EPA's denial of an implementation waiver. The EPA subsequently granted the requested waiver in 2009, which was upheld by the U.S. District Court for the District of Columbia in 2011.[31]

The standards were to be phased in during the 2009 through 2016 model years. When fully phased in, the near-term (2009–2012) standards were to result in an approximately 22 percent reduction compared with the 2002 fleet, and the mid-term (2013–2016) standards were to result in about a 30 percent reduction. Several technologies stand out as providing significant reductions in emissions at favorable costs. These include discrete variable valve lift or camless valve actuation to optimize valve operation rather than relying on fixed valve timing and lift as has historically been done; turbocharging to boost power and allow for engine downsizing; improved multi-speed transmissions; and improved air conditioning systems that operate optimally, leak less, and/or use an alternative refrigerant.[32]

The second phase of the implementation for the Pavley Bill was incorporated into Amendments to the LEV Program referred to as LEV III or the Advanced Clean Cars program. The Advanced Clean Car program combines the control of smog-causing pollutants and GHG emissions into a single coordinated package of requirements for model years 2017 through 2025. The regulation will reduce GHGs from new cars by 34 percent from 2016 levels by 2025. The new rules will reduce pollutants from gasoline and diesel-powered cars, and deliver increasing numbers of zero-emission technologies, such as full battery electric cars, newly emerging plug-in hybrid electric vehicles (EVs) and hydrogen fuel cell cars. The regulations will also ensure adequate fueling infrastructure is available for the increasing numbers of hydrogen fuel cell vehicles planned for deployment in California.[33]

California Senate Bill 375: Sustainable Communities and Climate Protection Act

SB 375 was signed into law on September 30, 2008. According to SB 375, the transportation sector is the largest contributor of GHG emissions, which emits over 40 percent of the total GHG emissions in California. SB 375 states, "Without improved land use and transportation policy, California will not be able to achieve the goals of AB 32." SB 375 does the following: (1) requires metropolitan planning organizations to include sustainable community strategies in their regional transportation plans for reducing GHG emissions, (2) aligns planning for transportation and housing, and (3) creates specified incentives for the implementation of the strategies.

California Senate Bill 1368: Emission Performance Standards

In 2006, the State Legislature adopted SB 1368, which the Governor subsequently signed into law. SB 1368 directs the California Public Utilities Commission to adopt a performance standard for GHG

[31] California Air Resources Board (ARB). 2013. Clean Car Standards—Pavley, Assembly Bill 1493. Website: https://www.gsweventcenter.com/GSW_RTC_References/2015_0915_CleanAirStandards_Pavley.pdf. Accessed June 7, 2022.
[32] California Air Resources Board (ARB). 2011. Facts About the Advanced Clean Cars Program. November 9.
[33] California Air Resources Board (ARB). 2011. Status of Scoping Plan Recommended Measures.

emissions for the future power purchases of California utilities. SB 1368 seeks to limit carbon emissions associated with electrical energy consumed in California by forbidding procurement arrangements for energy longer than 5 years from resources that exceed the emissions of a relatively clean, combined cycle natural gas power plant. Because of the carbon content of its fuel source, a coal-fired plant cannot meet this standard because such plants emit roughly twice as much carbon as natural gas, combined cycle plants. Accordingly, the new law effectively prevents California's utilities from investing in, otherwise financially supporting, or purchasing power from new coal plants located in or out of the State. The California Public Utilities Commission adopted the regulations required by SB 1368 on August 29, 2007. The regulations implementing SB 1368 establish a standard for baseload generation owned by, or under long-term contract to, publicly owned utilities of 1,100 lb. CO_2 per megawatt-hour (MWh).

California Senate Bill X7-7: Water Conservation Act

This 2009 legislation directed urban retail water suppliers to set individual 2020 per capita water use targets and begin implementing conservation measures to achieve those goals. Meeting this Statewide goal of 20 percent decrease in demand would have resulted in a reduction of almost 2 million acre-feet in urban water use.

California Air Resources Board's Truck and Bus Regulation

As part of the ARB's Sustainable Freight Strategy, the ARB adopted the Truck and Bus Regulation. The latest amendments to the Truck and Bus Regulation became effective on December 31, 2014. The amended regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Newer heavier trucks and buses had to meet particulate matter filter requirements as of January 1, 2012. Lighter and older heavier trucks had to be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent.

This regulation applies to nearly all privately and federally owned diesel-fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating greater than 14,000 pounds. The regulation provides a variety of flexibility options tailored to fleets operating low use vehicles, fleets operating in selected vocations like agricultural and construction, and small fleets of three or fewer trucks.[34]

California Air Resources Board's Advanced Clean Trucks Rule

To further advance the State's Sustainable Freight Strategy, the ARB adopted the Advanced Clean Trucks (ACT) Rule in July 2020, which requires manufacturers of vehicle class 2b through vehicle class 8 trucks to begin meeting escalating in-State ZEV sales from 2024 through 2035. By 2035, the ACT Rule will require 55 percent of trucks class 2b through class 3 to be ZEVs, 75 percent of trucks class 4 through class 8 to be ZEVs, and 40 percent of truck tractors to be ZEVs. [35] Complementary to the ACT Rule, and as discussed further below, Executive Order N-79-20 set a goal of 100 percent of all in-State drayage truck sales to be ZEVs by 2035 and 100 percent of all in-State heavy-duty vehicle sales

[34] California Air Resources Board (ARB). 2015. On-Road Heavy-Duty Diesel Vehicles (In-Use) Regulation. Website: http://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm. Accessed June 7, 2022.

[35] California Air Resources Board (ARB). 2021. Advanced Clean Trucks Fact Sheet. Website: https://ww2.arb.ca.gov/resources/fact-sheets/advanced-clean-trucks-fact-sheet. Accessed June 7, 2022.

to be ZEVs by 2045.The ARB is also in process of developing an Advanced Clean Fleet (ACF) Rule to accelerate the ACT Rule by requiring 100 percent of all in-State sales to be ZEVs in 2040 for class 2b through class 3 trucks, class 4 through class 8 vocational trucks, and class 7 through class 8 tractor trucks. The ACF Rule would also provide a clear timeline for requirements for phasing in in-State ZEV sales targets through 2040.[36]

California Code of Regulations Title 20: Appliance Efficiency Regulations

California Code of Regulations, Title 20: Division 2, Chapter 4, Article 4, Sections 1601-1608: Appliance Efficiency Regulations regulates the sale of appliances in California. The Appliance Efficiency Regulations include standards for both federally regulated appliances and non-federally regulated appliances. Twenty-three categories of appliances are included in the scope of these regulations. The standards within these regulations apply to appliances that are sold or offered for sale in California, except those sold wholesale in California for final retail sale outside the State and those designed and sold exclusively for use in recreational vehicles or other mobile equipment.

California Code of Regulations Title 24: Energy Efficiency Standards

Part 6 (Energy Efficiency Standards for Residential and Nonresidential Buildings)

California Code of Regulations Title 24 Part 6 (California's Energy Efficiency Standards for Residential and Nonresidential Buildings) was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy-efficient technologies and methods. Energy-efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The 2022 Building Energy Efficiency Standards went into effect on January 1, 2023.

California Code of Regulations Title 24: California Green Building Standards Code

California Code of Regulations Title 24, Part 11, is a comprehensive and uniform regulatory code for all residential, commercial, and school buildings that went into effect on January 1, 2011. The Code is updated on a regular basis, with the most recent update consisting of the 2022 California Green Building Standards Code (CALGreen) that became effective January 1, 2023. Local jurisdictions are permitted to adopt more stringent requirements, as State law provides methods for local enhancements. The Code recognizes that many jurisdictions have developed existing construction ordinances and defers to them as the ruling guidance, provided that they provide a minimum 50 percent diversion requirement. The Code also provides exemptions for areas not served by construction and demolition recycling infrastructure. The State Building Code provides the minimum standard that buildings need to meet in order to be certified for occupancy, which is generally enforced by the local building official.

CALGreen (California Code of Regulations [CCR] Title 24, Part 11) requires:

- **Short-term bicycle parking**. If a commercial project is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily

[36] California Air Resources Board (ARB). 2022. Path to Zero Emission Trucks FAQ. Website: https://ww2.arb.ca.gov/resources/documents/path-zero-emission-trucks-faq. Accessed June 7, 2022.

visible to passers-by, for 5 percent of visitor motorized vehicle parking capacity, with a minimum of one two-bike capacity rack (5.106.4.1.1).

- **Long-term bicycle parking**. For buildings with over 10 tenant-occupants, provide secure bicycle parking for 5 percent of tenant-occupied motorized vehicle parking capacity, with a minimum of one space (5.106.4.1.2).
- **Designated parking**. Provide designated parking in commercial projects for any combination of low-emitting, fuel-efficient and carpool/van pool vehicles as shown in Table 5.106.5.2 (5.106.5.2).
- **Recycling by Occupants**. Provide readily accessible areas that serve the entire building and are identified for the depositing, storage and collection of nonhazardous materials for recycling (5.410.1).
- **Construction waste**. A minimum 65 percent diversion of construction and demolition waste from landfills. (5.408.1, A5.408.3.1 [nonresidential], A5.408.3.1 [residential]). All (100 percent) of trees, stumps, rocks and associated vegetation and soils resulting from land clearing shall be reused or recycled (5.408.3).
- **Wastewater reduction**. Each building shall reduce the generation of wastewater by one of the following methods:

    1. The installation of water-conserving fixtures or
    2. Using nonpotable water systems (5.303.4).

- **Water use savings**. 20 percent mandatory reduction in indoor water use with voluntary goal standards for 30, 35, and 40 percent reductions (5.303.2, A5303.2.3 [nonresidential]).
- **Water meters**. Separate water meters for buildings in excess of 50,000 square feet or buildings projected to consume more than 1,000 gallons per day (5.303.1).
- **Irrigation efficiency**. Moisture-sensing irrigation systems for larger landscaped areas (5.304.3).
- **Materials pollution control**. Low-pollutant emitting interior finish materials such as paints, carpet, vinyl flooring and particleboard (5.404).
- **Building commissioning**. Mandatory inspections of energy systems (i.e., heat furnace, air conditioner, mechanical equipment) for nonresidential buildings over 10,000 square feet to ensure that all are working at their maximum capacity according to their design efficiencies (5.410.2).

California Model Water Efficient Landscape Ordinance

The Model Water Efficient Landscape Ordinance (Ordinance) was required by the AB 1881 Water Conservation Act. The Ordinance required local agencies to adopt a local landscape ordinance at least as effective in conserving water as the Model Ordinance by January 1, 2010. Reductions in water use of 20 percent consistent with the SB X7-7 2020 mandate were required. Governor Brown's Drought Executive Order of April 1, 2015 (Executive Order B-29-15) directed DWR to update the Ordinance through expedited regulation. The California Water Commission approved the revised Ordinance on July 15, 2015, which became effective on December 15, 2015. New development

projects that include landscaped areas of 500 square feet or more are subject to the Ordinance. The update requires:

- More efficient irrigation systems
- Incentives for graywater usage
- Improvements in on-site stormwater capture
- Limiting the portion of landscapes that can be planted with high water use plants
- Reporting requirements for local agencies.

California Public Utilities Code

The California Public Utilities Commission (CPUC) regulates privately owned telecommunication, electric, natural gas, water, railroad, rail transit, and passenger transportation companies. It is the responsibility of the CPUC to (1) assure California utility customers receive safe, reliable utility service at reasonable rates; (2) protect utility customers from fraud; and (3) promote a healthy California economy. The Public Utilities Code, adopted by the legislature, defines the jurisdiction of the CPUC.

California Executive Order B-55-18 (GHG Emissions Reduction Targets)

On September 10, 2018, former California Governor Jerry Brown issued Executive Order B-55-18, which established the following GHG emissions reduction target:

By 2045, California shall achieve carbon net neutrality.

Executive Order B-55-18 identifies that new Statewide goal is to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net neutrality emissions thereafter. This emissions goal is in addition to the existing targets established by Executive Orders S-3-05 and B-30-15 and SB 32, as described in greater detail below. This Executive Order also directs the ARB to work with other State agencies to identify and recommend measures to achieve this goal.

California Executive Order S-01-07: Low Carbon Fuel Standard

The Governor signed Executive Order S 01-07 on January 18, 2007. The order mandated that a Statewide goal be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. In particular, the Executive Order established an LCFS and directed the Secretary for Environmental Protection to coordinate the actions of the CEC, the ARB, the University of California, and other agencies to develop and propose protocols for measuring the "lifecycle carbon intensity" of transportation fuels.

California Executive Order N-79-20

On September 23, 2020, Governor Gavin Newsom issued Executive Order N-79-20 establishing a goal that 100 percent of new passenger cars and trucks sold in California shall be zero-emission by 2035. The Executive Order also sets a goal that, where feasible, all operations include zero-emission medium- and heavy-duty trucks by 2045, and drayage trucks by 2035. Off-road vehicles have a goal to transition to 100 percent ZEVs by 2035, where feasible. While in-State sales of EVs will increase

through 2045, the State does not currently have legislation which will restrict or preclude the use of fossil fueled vehicles by or after 2045.

California Executive Order S-13-08

Executive Order S-13-08 states that "climate change in California during the next century is expected to shift precipitation patterns, accelerate sea level rise and increase temperatures, thereby posing a serious threat to California's economy, to the health and welfare of its population and to its natural resources." Pursuant to the requirements in the order, the 2009 California Climate Adaptation Strategy was adopted, which is the ". . . first Statewide, multi-sector, region-specific, and information-based climate change adaptation strategy in the United States." Objectives include analyzing risks of climate change in California, identifying and exploring strategies to adapt to climate change, and specifying a direction for future research.

California Executive Order B-30-15

On April 29, 2015, the Governor issued an Executive Order to establish a California GHG emissions reduction target of 40 percent below 1990 levels by 2030. The Governor's Executive Order aligns California's GHG reduction targets with those of leading international governments ahead of the United Nations Climate Change Conference in Paris late 2015. The Executive Order sets a new interim Statewide GHG emission reduction target to reduce GHG emissions to 40 percent below 1990 levels by 2030 in order to ensure California meets its target of reducing GHG emissions to 80 percent below 1990 levels by 2050 and directs the ARB to update the Climate Change Scoping Plan to express the 2030 target in terms of MMT CO_2e. The Executive Order also requires the State's climate adaptation plan to be updated every three years and for the State to continue its climate change research program, among other provisions. As with Executive Order S-3-05, this Executive Order is not legally enforceable against local governments and the private sector. Legislation that would update AB 32 to make post 2020 targets and requirements a mandate is in process in the State Legislature.

California Senate Bill 97 and the California Environmental Quality Act Guidelines Update

Passed in August 2007, SB 97 added Section 21083.05 to the Public Resources Code. SB 97 states "(a) On or before July 1, 2009, the Office of Planning and Research shall prepare, develop, and transmit to the Resources Agency guidelines for the mitigation of GHG emissions or the effects of GHG emissions as required by this division, including, but not limited to, effects associated with transportation or energy consumption. (b) On or before January 1, 2010, the Resources Agency shall certify and adopt guidelines prepared and developed by the Office of Planning and Research pursuant to subdivision (a)."

The 2010 California Environmental Quality Act (CEQA) Amendments first guided public agencies regarding the analysis and mitigation of the effects of GHG emissions in CEQA documents. The 2010 CEQA Amendments fit within the existing CEQA framework by amending existing CEQA Guidelines to reference climate change. The 2010 CEQA Amendments also revised Appendix F of the CEQA Guidelines, which focuses on Energy Conservation, and the sample environmental checklist in Appendix G was amended to include GHG questions.

The most recent 2018 CEQA Amendments expanded upon the previous guidance by specifying that:

> The lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project's emissions to the effects of climate change. A project's incremental contribution may be cumulatively considerable even if it appears relatively small compared to Statewide, national, or global emissions. The agency's analysis should consider a timeframe that is appropriate for the project. The agency's analysis also must reasonably reflect evolving scientific knowledge and State regulatory schemes. In determining the significance of impacts, the lead agency may consider a project's consistency with the State's long-term climate goals or strategies, provided that substantial evidence supports the agency's analysis of how those goals or strategies address the project's incremental contribution to climate change and its conclusion that the project's incremental contribution is not cumulatively considerable.

A lead agency may use a model or methodology to estimate GHG emissions resulting from a project. The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision-makers to intelligently take into account the project's incremental contribution to climate change. The lead agency must support its selection of a model or methodology with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use.

The 2010 changes to CEQA Guidelines Sections 15126.4 and 15130, which address mitigation measures and cumulative impacts, respectively, remained unchanged by the 2018 CEQA Amendment. The cumulative impact discussion requirement (CEQA Guidelines § 15130) simply directs agencies to analyze GHG emissions in an Environmental Impact Report (EIR) when a project's incremental contribution of emissions may be cumulatively considerable; however, it does not answer the question of when emissions are cumulatively considerable.

Under CEQA Guidelines Section 15064.4(b), a lead agency should consider the following factors, among others, when determining the significance of impacts from GHG emissions on the environment:

(1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;
(2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
(3) The extent to which the project complies with regulations or requirements adopted to implement a Statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions.

CEQA Guidelines Section 15183.5 continues to permit programmatic GHG analysis and later project-specific tiering, as well as the preparation of Greenhouse Gas Reduction Plans. Compliance with such plans can support a determination that a project's cumulative effect is not cumulatively considerable, according to Section 15183.5(b).

CEQA emphasizes that the effects of GHG emissions are cumulative and should be analyzed in the context of CEQA's requirements for cumulative impacts analysis (see CEQA Guidelines § 15130(f)).

Center for Biological Diversity v. California Department of Fish and Wildlife (California Supreme Court GHG Ruling)

In a November 30, 2015, ruling, the California Supreme Court in *Center for Biological Diversity v. California Department of Fish and Wildlife* on the Newhall Ranch project concluded that assessing whether the project was consistent with meeting Statewide emission reduction goals is a legally permissible approach for assessing significance, but the significance finding for the project was not supported by a reasoned explanation based on substantial evidence. The Court offered potential solutions on pages 25–27 of the ruling to address this issue, as summarized below.

Specifically, the Court advised that:

- **Substantiation of Project Reductions from BAU**. A lead agency may use a BAU comparison based on the Scoping Plan's methodology if it also substantiates the reduction a particular project must achieve to comply with Statewide goals. The Court suggested a lead agency could examine the "data behind the Scoping Plan's business-as-usual model" to determine the necessary project-level reductions from new land use development at the proposed location (p. 25).
- **Compliance with Regulatory Programs or Performance Based Standards**. A lead agency "might assess consistency with AB 32's goal in whole or part by looking to compliance with regulatory programs designed to reduce greenhouse gas emissions from particular activities. (See Final Statement of Reasons, supra, at p. 64 [greenhouse gas emissions 'may be best analyzed and mitigated at a programmatic level.'].)" To the extent a project's design features comply with or exceed the regulations outlined in the Scoping Plan and adopted by the Air Resources Board or other state agencies, a lead agency could appropriately rely on their use as showing compliance with 'performance based standards' adopted to fulfill 'a Statewide . . . plan for the reduction or mitigation of greenhouse gas emissions' (CEQA Guidelines § 15064.4(a)(2), (b)(3); see also id., § 15064(h)(3) [determination that impact is not cumulatively considerable may rest on compliance with previously adopted plans or regulations, including 'plans or regulations for the reduction of greenhouse gas emissions']) (p. 26).
- **Compliance with GHG Reduction Plans or Climate Action Plans**. A lead agency may utilize "geographically specific GHG emission reduction plans" such as climate action plans or greenhouse gas emission reduction plans to provide a basis for the tiering or streamlining of project-level CEQA analysis (p. 26).

  Compliance with Local Air District Thresholds. A lead agency may rely on "existing numerical thresholds of significance for greenhouse gas emissions" adopted by, for example, local air districts (p. 27).

3.1.3 - Regional

BAAQMD California Environmental Quality Act Air Quality Guidelines

The BAAQMD is the primary agency responsible for ensuring that air quality standards (NAAQS and CAAQS) are attained and maintained in the SFBAAB through comprehensive planning, regulation, enforcement, technical innovation, and promotion of the understanding of air quality issues. The BAAQMD prepares plans to attain ambient air quality standards in the SFBAAB and prepares ozone attainment plans for the national ozone standard, clean air plans for the California standard, and PM plans to fulfill federal air quality planning requirements. The BAAQMD also inspects stationary sources of air pollution; responds to citizen complaints; monitors ambient air quality and meteorological conditions; and implements programs and regulations required by the CAA and the CCAA.

The BAAQMD developed quantitative thresholds of significance for its CEQA Guidelines in 2010, which were also included in its updated 2011 Guidelines. The BAAQMD's adoption of the 2010 thresholds of significance was later challenged in court. In an opinion issued on December 17, 2015, related to the BAAQMD CEQA Guidelines, the California Supreme Court held that CEQA does not generally require an analysis of the impacts of locating development in areas subject to environmental hazards unless the proposed project would exacerbate existing environmental hazards. The California Supreme Court also found that CEQA requires the analysis of exposing people to environmental hazards in specific circumstances, including the location of development near airports, schools near sources of toxic contamination, and certain exemptions for infill and workforce housing. The California Supreme Court also held that public agencies remain free to voluntarily conduct this analysis not required by CEQA for their own public projects (*CBIA v. BAAQMD (2016)* 2 Cal.App.5th 1067, 1083).

In view of the California Supreme Court's opinion, the BAAQMD published a new version of its CEQA Guidelines in May 2017. The BAAQMD CEQA Guidelines state that local agencies may rely on

Since preparation of this report, BAAQMD has adopted the 2022 CEQA Guidelines. Refer to Section 3, Air Quality, of the IS-MND for an updated discussion on BAAQMD's CEQA Guidelines.

BAAQMD Particulate Matter Plan

To fulfill federal air quality planning requirements, the BAAQMD adopted a $PM_{2.5}$ emissions inventory for the year 2010 at a public hearing on November 7, 2012. The Bay Area Clean Air Plan also included several measures for reducing PM emissions from stationary sources and wood burning. On January 9, 2013, the EPA issued a final rule determining that the Bay Area has attained the 24-hour $PM_{2.5}$ NAAQS, suspending federal SIP planning requirements for the SFBAAB. Despite this EPA action, the SFBAAB will continue to be designated as nonattainment for the national 24-hour $PM_{2.5}$ standard until the BAAQMD submits a redesignation request and a maintenance plan to the EPA, and the EPA approves the proposed redesignation.

The Air Basin is designated nonattainment for the State PM_{10} and $PM_{2.5}$ standards, but the Air Basin is currently unclassified for the federal PM_{10} standard and nonattainment for federal $PM_{2.5}$ standards. The EPA lowered the 24-hour $PM_{2.5}$ standard from 65 µg/m^3 to 35 µg/m^3 in 2006, and designated the Air Basin as nonattainment for the new $PM_{2.5}$ standard effective December 14, 2009.

On December 8, 2011, the ARB submitted a "clean data finding" request to the EPA on behalf of the Bay Area. If the clean data finding request is approved, then EPA guidelines provide that the region can fulfill federal $PM_{2.5}$ SIP requirements by preparing either a redesignation request and a $PM_{2.5}$ maintenance plan, or a "clean data" SIP submittal. Because peak $PM_{2.5}$ levels can vary from year to year based on natural, short-term changes in weather conditions, the BAAQMD believes that it would be premature to submit a redesignation request and $PM_{2.5}$ maintenance plan at this time. Therefore, the BAAQMD will prepare a "clean data" SIP to address the required elements, including:

- An emission inventory for primary $PM_{2.5}$, as well as precursors to secondary PM formation
- Amendments to the BAAQMD's New Source Review regulation to address $PM_{2.5}$

BAAQMD 2017 Clean Air Plan

In May 2017, the BAAQMD adopted the final Bay Area 2017 Clean Air Plan. The BAAQMD prepared the 2017 Clean Air Plan in cooperation with the Metropolitan Transportation Commission (MTC) and the Association of Bay Area Governments (ABAG). The goals of the 2017 Clean Air Plan are to reduce regional air pollutants and climate pollutants to improve the health of Bay Area residents for the next decades. The 2017 Clean Air Plan aims to lead the region into a post-carbon economy, continue progress toward attaining all State and federal air quality standards, and eliminate health risk disparities from air pollution exposure in Bay Area communities. The Plan includes 85 distinct control measures to help the region reduce air pollutants and has a long-term strategic vision that forecasts what a clean air Bay Area will look like in the year 2050. The 2017 Clean Air Plan envisions a future whereby the year 2050:

- Buildings will be energy efficient—heated, cooled and powered by renewable energy.
- Transportation will be a combination of EVs, both shared and privately owned; autonomous public transit fleets; with a large share of trips by bicycling, walking, and transit.
- The Bay Area will be powered by clean, renewable electricity and will be a leading incubator and producer of clean energy technologies leading the world in the carbon-efficiency of our products.
- Bay Area residents will have developed a low carbon lifestyle by driving EVs, living in zero-net-energy homes, eating low carbon foods, and purchasing goods and services with low carbon content.
- Waste will be greatly reduced, waste products will be reused or recycled, and all organic waste will be composted and put to productive use.

The focus of control measures includes aggressively targeting the largest source of GHG, ozone pollutants and particulate matter emissions—transportation. This includes more incentives for EV

infrastructure, off-road electrification projects such as Caltrain and shore power at ports, and reducing emissions from trucks, school buses, marine vessels, locomotives, and off-road equipment. Additionally, the BAAQMD will continue to work with regional and local governments to reduce VMT through the further funding of rideshare, bike and shuttle programs.

In addition to the BAAQMD's 2017 CEQA Air Quality Guidelines, the BAAQMD adopted an updated Justification Report to support BAAQMD newly updated-recommended GHG significance thresholds in April 2022.[37] The Justification Report provides recommended significance thresholds for GHGs for land use development projects and plans and replaces those recommended in the BAAQMD's 2017 CEQA Air Quality Guidelines. The new thresholds state that if a project would contribute its "fair share" of what will be required to achieve California's long-term climate goal of carbon neutrality by 2045, then a reviewing agency can find that the impact will not be significant because the project will help to solve the problem of global climate change. The thresholds for new land use projects require projects to meet either criterion A or criterion B. If a land use development project cannot demonstrate consistency with Criterion A or Criterion B, then that project would result in a potentially significant impact related to GHG emissions.

A. Projects must be consistent with a local GHG reduction strategy that meets the criteria under State CEQA Guidelines Section 15183.5(b).
B. Projects must include, at a minimum, the following project design elements.
    a. Buildings:
        i. The project will not include natural gas appliances or natural gas plumbing (in both residential and nonresidential development).
        ii. The project will not result in any wasteful, inefficient, or unnecessary electrical usage as determined by the analysis required under CEQA Section 21100(b)(3) and Section 15126.2(b) of the State CEQA Guidelines.
    b. Transportation:
        i. Achieve compliance with EV requirements in the most recently adopted version of CALGreen Tier 2.
        ii. Achieve a reduction in project-generated VMT below the regional average consistent with the current version of the California Climate Change Scoping Plan (currently 15 percent) or meet a locally adopted SB 743 VMT target, reflecting the recommendations provided in the Governor's Office of Planning and Research's Technical Advisory on Evaluating Transportation Impacts in CEQA:
            1. Residential projects: 15 percent below the existing VMT per capita.
            2. Office projects: 15 percent below the existing VMT per employee.
            3. Retail projects: no net increase in existing VMT.

[37] Bay Area Air Quality Management District (BAAQMD). 2022. Justification Report: CEQA Thresholds for Evaluating the Significance of Climate Impacts from Land Use Projects and Plans. April.

BAAQMD Regulations

Regulation 2, Rule 1 (Permits–General Requirements)

The BAAQMD regulates new sources of air pollution and the modification and operation of existing sources through the issuances of authorities to construct and permits to operate. Regulation 2, Rule 1 provides an orderly procedure which the project would be required to comply with to receive authorities to construct or permits to operate from the BAAQMD for new sources of air pollutants, as applicable.

Regulation 2, Rule 5 (New Source Review Permitting)

The BAAQMD regulates backup emergency generators, fire pumps, and other sources of TACs through its New Source Review (Regulation 2, Rule 5) permitting process. Although emergency generators are intended for use only during periods of power outages, monthly testing of each generator is required; however, the BAAQMD limits testing to no more than 50 hours per year. Each emergency generator installed is assumed to meet a minimum of Tier 2 emission standards (before control measures). As part of the permitting process, the BAAQMD limits the excess cancer risk from any facility to no more than 10 per 1-million-population for any permits that are applied for within a 2-year period and would require any source that would result in an excess cancer risk greater than 1 per 1 million to install BACT for Toxics.

Regulation 6, Rule 1 (Particulate Matter–General Requirements)

The BAAQMD regulates particulate matter emissions through Regulation 6 by means of establishing limitations on emission rates, emissions concentrations, and emission visibility and opacity. Regulation 6, Rule 1 provides existing standards for particulate matter emissions that could result during project construction or operation that the project would be required to comply with, as applicable, such as the prohibition of emissions from any source for a period or aggregate periods of more than three minutes in any hour which are equal to or greater than 20 percent opacity.

Regulation 6, Rule 6, (Particulate Matter–Prohibition of Trackout)

One rule by which the BAAQMD regulates particulate matter includes Regulation 6, Rule 6, which prohibits particulate matter trackout during project construction and operation. Regulation 6, Rule 6 requires the prevention or timely cleanup of trackout of solid materials onto paved public roads outside the boundaries of large bulk material sites, large construction sites, and large disturbed surface sides such as landfills.

Regulation 8, Rule 3 (Architectural Coatings)

This rule governs the manufacture, distribution, and sale of architectural coatings and limits the ROG content in paints and paint solvents. Although this rule does not directly apply to the proposed project, it does dictate the ROG content of paint available for use during the construction.

Regulation 8, Rule 15 (Emulsified and Liquid Asphalts)

Although this rule does not directly apply to the proposed project, it does dictate the reactive organic gases content of asphalt available for use during the construction through regulating the sale and use of asphalt and limits the ROG content in asphalt.

Regulation 9, Rule 8 (Inorganic Gaseous Pollutants–Nitrogen Oxides and Carbon Monoxide from Stationary Internal Combustion Engines)

Under Regulation 9, Rule 8, the BAAQMD regulates the emissions of nitrogen oxides and carbon monoxide from stationary internal combustion engines with an output rated by the manufacturer at more than 50 brake horsepower. As such, any proposed stationary source equipment (e.g., backup generators, fire pumps) which would be greater than 50 horsepower would require a BAAQMD permit under Regulation 9, Rule 8 to operate.

Regulation 11, Rule 2 (Hazardous Pollutants–Asbestos Demolition, Renovation, and Manufacturing)

Under Regulation 11, Rule 2, the BAAQMD regulates emissions of asbestos to the atmosphere during demolition, renovation, milling, and manufacturing, and establish appropriate waste disposal procedures. Any of these activities which pose the potential to generate emissions of airborne asbestos are required to comply with the appropriate provisions of this regulation.

Regulation 1, Rule 301 (Odorous Emissions)

The BAAQMD is responsible for investigating and controlling odor complaints in the Bay Area. The agency enforces odor control by helping the public to document a public nuisance. Upon receipt of a complaint, the BAAQMD sends an investigator to interview the complainant and to locate the odor source if possible. The BAAQMD typically brings a public nuisance court action when there are a substantial number of confirmed odor events within a 24-hour period. An odor source with five or more confirmed complaints per year, averaged over 3 years is considered to have a substantial effect on receptors.

Several BAAQMD regulations and rules apply to odorous emissions. Regulation 1, Rule 301 is the nuisance provision that states that sources cannot emit air contaminants that cause nuisance to several people. Regulation 7 specifies limits for the discharge of odorous substances where the BAAQMD receives complaints from 10 or more complainants within a 90-day period. Among other things, Regulation 7 precludes discharge of an odorous substance that causes the ambient air at or beyond the property line to be odorous after dilution with four parts of odor-free air and specifies maximum limits on the emission of certain odorous compounds.

Lastly, the BAAQMD enforces the Portable Equipment Registration Program (PERP) ATCM on behalf of the ARB. Under the PERP, owners or operators of portable engines and other types of equipment which meet the qualifications of the ATCM can register their equipment to operate throughout California. However, owners and operators of portable engines which meet the qualifications of this ATCM that do not register their equipment under the PERP must obtain individual permits from local air districts. Permits issued under the PERP must be honored by all air districts throughout California.

Plan Bay Area 2050

On July 18, 2013, ABAG and the MTC approved the Plan Bay Area. The Plan Bay Area includes integrated land use and transportation strategies for the region and was developed through OneBayArea, a joint initiative between ABAG, BAAQMD, MTC, and the San Francisco Bay Conservation and Development Commission. The plan's transportation policies focus on maintaining the extensive existing transportation network and utilizing these systems more efficiently to handle

density in Bay Area transportation cores. Assumptions for land use development come from local and regional planning documents. Emission forecasts in the Bay Area Clean Air Plan rely on projections of VMT, population, employment, and land use projections made by local jurisdictions during development of Plan Bay Area. The Plan Bay Area 2050 was adopted 2021 and is the most recent update to the Plan Bay Area.

Plan Bay Area 2050, published by the MTC and ABAG, is a long-range integrated transportation and land use/housing strategy through 2050 for the Bay Area. Plan Bay Area 2050 functions as the sustainable communities' strategy mandated by SB 375. As a regional land use plan, Plan Bay Area 2050 aims to reduce per capita GHG emissions by promoting more compact, mixed-use residential and commercial neighborhoods located near transit. Plan Bay Area 2050 is a limited and focused update that builds upon a growth pattern and strategies developed in the original Plan Bay Area but with updated planning assumptions that incorporate key economic, demographic, and financial trends from the release of the previous Plan Bay Area version.

3.1.4 - Local

City of San Leandro General Plan 2035

The City of San Leandro adopted its General Plan on September 19, 2016, which contains objectives and policies that help address air quality and GHGs, and to reduce the community's vulnerability to air pollution. The following objectives and policies from the City's General Plan are relevant to air quality and GHGs, and apply to the proposed project:

EH-3.1 **Clean Air Plan Implementation.** Cooperate with the appropriate regional, state, and federal agencies to implement the region

EH-3.2 **Transportation Control Measures.** Promote strategies that help improve air quality and reduce greenhouse gas emissions by reducing the necessity of driving. These strategies include more reliable public transportation, carpooling and vanpooling programs, employer Transportation Demand Management (TDM) programs, better provisions for bicyclists and pedestrians, and encouraging mixed use and higher density development around transit stations.

EH-3.3 **Land Use Compatibility.** Discourage new uses with potential adverse air quality impacts, including the emission of toxic air contaminants and fine particulates, near residential neighborhoods, schools, hospitals, nursing homes, and other locations where public health could potentially be affected.

EH-3.4 **Design, Construction, and Operation**. Require new development to be designed and constructed in a way that reduces the potential for future air quality problems, such as odors and the emission of any and all air pollutants. This should be done by: (a) Requiring construction and grading practices that minimize airborne dust and particulate matter; (b) Ensuring that Best Available Control Technology is used for operations that could generate air pollutants; (c) Encouraging energy conservation and low-polluting energy sources; (d) Promoting landscaping and tree planting to

absorb carbon monoxide and other pollutants; and (e) Implementing the complementary strategies to reduce greenhouse gases identified in the Climate Action Plan.

EH-3.5 **Odors.** Ensure prompt response to complaints about odor problems and other potential air quality nuisances and hazards reported by residents and businesses.

EH-3.8 **Regulatory Changes.** Stay apprised of changes in State and federal air quality regulations and implement programs as required to ensure local compliance.

EH-3.9 **Alternative Fuel Vehicles.** Promote the development of infrastructure which supports the use of alternative fuel (i.e., electric) vehicles, including electric charging stations and preferential parking for electric vehicles.

EH-3.10 **Downwind Impacts.** Consider the direction of prevailing winds in the siting of facilities likely to generate smoke, dust, and odors. Ensure that such facilities are sited to minimize the impacts on downwind residential areas and other sensitive uses.

OSC-7.2 **Water Conservation.** Promote the efficient use of existing water supplies through a variety of water conservation measures, including the use of recycled water for landscaping.

OSC-7.3 **Drought-Tolerant Landscaping.** Encourage the use of native vegetation and Bay-friendly landscaping and enforce the State Department of Water Resources Model Water Efficient Landscape Ordinance (WELO).

OSC-7.4 **Development Standards.** Maintain local planning and building standards that require the efficient use of water through such measures as low-flow plumbing fixtures and water-saving appliances. Require water conservation measures as a condition of approval for major developments.

OSC-7.8 **Green Building.** Promote green building in new construction and remodels.

OSC-7.9 **Reducing Greenhouse Gases Through Land Use and Transportation Choices.** Locate and design new development in a manner which maximizes the ability to use transit, walk, or bicycle for most trips, reduce dependence on fossil fuel powered vehicles, and reduce vehicle miles traveled.

OSC-8.1 **Conservation and Energy Efficiency.** Strongly advocate for increased energy conservation by San Leandro residents and businesses, and ensure that the City itself is a conservation role model.

OSC-8.2 **Planning and Building Practices.** Encourage construction, landscaping, and site planning practices that minimize heating and cooling costs and ensure that energy is efficiently used. Local building codes and other City regulations and procedures

should meet or exceed state and federal standards for energy conservation and efficiency, and support the City's greenhouse gas reduction goals.

OSC-8.4 **Local Energy Resources.** Accommodate the use of local alternative energy resources, such as solar power, wind, methane gas, and industrial waste heat (cogeneration). Ensure that alternative energy infrastructure is compatible with surrounding land uses and minimizes environmental impacts on the community.

City of San Leandro General Plan 2035 Environmental Impact Report Mitigation

As part of the City's General Plan update, the City prepared an EIR that prescribed a series of mitigation that would apply to future development proposals depending on the proposed activity and the project's land use type. The following lists the General Plan EIR mitigation would apply to the proposed project.[38]

AQ-2 Prior to the issuance of construction permits, development project applicants that are subject to CEQA and exceed the screening sizes in the Bay Area Air Quality Management District's (BAAQMD) CEQA Guidelines shall prepare and submit to the City of San Leandro a technical assessment evaluating potential air quality impacts related to the project's operational phase. The evaluation shall be prepared in conformance with the BAAQMD methodology in assessing air quality impacts. If operational-related criteria air pollutants are determined to have the potential to exceed the BAAQMD thresholds of significance, as identified in BAAQMD's CEQA Guidelines, the City of San Leandro Community Development Department shall require that applicants for new development projects incorporate mitigation measures to reduce air pollutant emissions during operation activities.

AQ-2B-1 As part of the City's development approval process, the City shall require applicants for future development projects to comply with the current Bay Area Air Quality Management District's basic control measures for reducing construction emissions of PM_{10} (Table 8-1, Basic Construction Mitigation Measures Recommended for All Proposed Projects, of the BAAQMD CEQA Guidelines).

AQ-2B-2 Prior to issuance of construction permits, development project applicants that are subject to CEQA and exceed the screening sizes in the BAAQMD's CEQA Guidelines shall prepare and submit to the City of San Leandro a technical assessment evaluating potential project construction-related air quality impacts. The evaluation shall be prepared in conformance with the BAAQMD methodology in assessing air quality impacts. If construction-related criteria air pollutants are determined to have the potential to exceed the BAAQMD thresholds of significance, as identified in the BAAQMD CEQA Guidelines, the City of San Leandro shall require that applicants for new development projects incorporate mitigation measures to reduce air pollutant emissions during construction activities to below these thresholds (Table 8-2, Additional Construction Mitigation Measures Recommended for Projects with

[38] City of San Leandro. 2016. San Leandro General Plan Update Appendix A: Mitigation Monitoring and Reporting Program.

Construction Emissions Above the Threshold, of the BAAQMD CEQA Guidelines, or applicable construction mitigation measures subsequently approved by BAAQMD). These identified measures shall be incorporated into all appropriate construction documents (e.g., construction management plans) submitted to the City and shall be verified by the City's Engineering/Transportation Department, Building and/or Planning Division, and/or Community Development Department.

AQ-3 Applicants for future nonresidential land uses within the City that: (1) have the potential to generate 100 or more diesel truck trips per day or have 40 or more trucks with operating diesel-powered TRUs, and (2) are within 1,000 feet of a sensitive land use (e.g., residential, schools, hospitals, nursing homes), as measured from the property line of a proposed project to the property line of the nearest sensitive use, shall submit a Health Risk Assessment (HRA) to the City of San Leandro prior to future discretionary project approval. The HRA shall be prepared in accordance with policies and procedures of the California Office of Environmental Health Hazard Assessment and the Bay Area Air Quality Management District. If the HRA shows that the incremental cancer risk exceeds 10 in one million (10E-06), $PM_{2.5}$ concentrations exceed 0.3 µg/m^3, or the appropriate non-cancer hazard index exceeds 1.0, the applicant will be required to identify and demonstrate that mitigation measures are capable of reducing potential cancer and non-cancer risks to an acceptable level, including appropriate enforcement mechanisms. Mitigation measures may include but are not limited to:

- Restricting idling on-site beyond Air Toxic Control Measures idling restrictions, as feasible.
- Electrifying warehousing docks.
- Requiring use of newer equipment and/or vehicles.
- Restricting off-site truck travel through the creation of truck routes.

Mitigation measures identified in the project-specific HRA shall be identified as mitigation measures in the environmental document and/or incorporated into the site development plan as a component of a proposed project.

City of San Leandro 2021 Climate Action Plan

The City of San Leandro adopted its CAP on July 19, 2021, which contains objectives and policies that help address the reduction of greenhouse gas. The City of San Leandro's 2021 CAP is considered qualified, meeting CEQA Guidelines. Consistent with CEQA Guidelines Section 15183.5(b), the City's CAP includes adopted plans for the reduction of GHG emissions meeting 2030 reduction targets set forth by SB 32 and the State's long-term climate goal of carbon neutrality by 2045a.

3.1.5 - Thresholds of Significance

Air Quality

The BAAQMD recommends using their established air pollutant and precursor screening criteria, when appropriate, for determining whether a proposed project's air quality emissions would result

in an exceedance of BAAQMD significance thresholds. The BAAQMD's CEQA Air Quality Guidelines contains a series of screening criteria to help identify whether a project may result in potentially significant air quality impacts. If a project exceeds the screening size for the appropriate land use type, that project would present the potential to exceed significance thresholds for criteria pollutants or ozone precursors. As shown in Table 3-1 of the BAAQMD's CEQA Air Quality Guidelines, the operational screening size for the "warehouse" land use type is 864,000 square feet. In addition, the construction-related screening size is 259,000 square feet; however, utilization of the construction screening criteria cannot be relied upon for a significance determination if demolition, substantial soil movement, or more than two concurrent construction phases would occur during project construction.[39] While this analysis includes consideration of these screening criteria, where applicable, emissions from the proposed project's construction and operation have been quantified and are compared against the applicable quantitative significance thresholds for informational purposes.

Table 10 shows the BAAQMD thresholds of significance. In developing the thresholds of significance for air pollutants, the BAAQMD considered the emission levels for which a project's individual emissions would be cumulatively considerable. If a project exceeds the identified significance thresholds, its emissions would be cumulatively considerable, resulting in significant adverse air quality impacts on the region's existing air quality conditions.

Table 10: BAAQMD Thresholds of Significance

Pollutant	Construction Thresholds Average Daily Emissions (pounds/day)	Operational Thresholds	
		Average Daily Emissions (pounds/day)	Annual Average Emissions (tons/year)
Criteria Air Pollutants			
ROG	54	54	10
NO_X	54	54	10
PM_{10}	82 (exhaust)	82	15
$PM_{2.5}$	54 (exhaust)	54	10
CO	Not Applicable	9.0 ppm (8-hour average) or 20.0 ppm (1-hour average)	
Fugitive Dust	Construction Dust Ordinance, other Best Management Practices (BAAQMD Basic Construction Mitigation Measures)	Not Applicable	
Health Risks and Hazards for New Sources			
Excess Cancer Risk	$\geq$ 10 per one million	$\geq$ 10 per one million	
Chronic or 1-hour Acute Hazard Index	$\geq$ 1.0	$\geq$ 1.0	
Incremental annual average $PM_{2.5}$	$\geq$ 0.3 µg/m^3	$\geq$ 0.3 µg/m^3	

[39] Bay Area Air Quality Management District (BAAQMD). 2017. CEQA Air Quality Guidelines. May.

Pollutant	Construction Thresholds Average Daily Emissions (pounds/day)	Operational Thresholds	
		Average Daily Emissions (pounds/day)	Annual Average Emissions (tons/year)
Health Risks and Hazards for Sensitive Receptors (Cumulative from All Sources within 1,000-foot Zone of Influence) and Cumulative Thresholds for New Sources			
Excess Cancer Risk	≥ 100 per 1 million		
Chronic Hazard Index	≥ 10.0		
Annual Average $PM_{2.5}$	≥ 0.8 µg/m^3		

Notes:
µg/m^3 = micrograms per cubic meter
CO= carbon monoxide
NO_X = nitrogen oxides
PM_{10} = particulate matter 10 microns in diameter
$PM_{2.5}$ = particulate matter 2.5 microns in diameter
ppm = parts per million
ROG = reactive organic gases
Source: Bay Area Air Quality Management District (BAAQMD). 2017. CEQA Air Quality Guidelines. May.

Greenhouse Gas Emissions

In April 2022, the BAAQMD adopted updated GHG thresholds of significance that represent what is required of new land use development projects to achieve California's long-term climate goal of carbon neutrality by 2045. The BAAQMD has found that new land use development projects being built today need to incorporate the following design element thresholds shown in Table 11 to do their "fair share" of implementing the goal of carbon neutrality by 2045.

Table 11: BAAQMD Climate Change Thresholds for Land Use Projects

Project Must Include A or B, as Outlined Below:
A. Projects must include, at a minimum, the following project design elements: 1. Buildings a. The project will not include natural gas appliances or natural gas plumbing (in both residential and nonresidential development). b. The project will not result in any wasteful, inefficient, or unnecessary energy usage as determined by the analysis required under CEQA Section 21100(b)(3) and Section 15126.2(b) of the State CEQA Guidelines. 2. Transportation a. Achieve a reduction in project-generated Vehicle Miles Traveled (VMT) below the regional average consistent with the current version of the California Climate Change Scoping Plan (currently 15 percent) or meet a locally adopted Senate Bill 743 target, reflecting the recommendations provided in the Governor's Office of Planning and Research's Technical Advisory on Evaluating Transportation Impacts in CEQA: i. Residential projects: 15 percent below the existing VMT per capita ii. Office projects: 15 percent below the existing VMT per employee iii. Retail projects: no net increase in existing VMT b. Achieve compliance with off-street electric vehicle requirements in the most recently adopted version of CALGreen Tier 2.
B. Projects must be consistent with a local GHG reduction strategy that meets the criteria under State CEQA Guidelines Section 15183.5(b)

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 4: AIR QUALITY IMPACTS CONSTRAINTS ANALYSIS

According to the CEQA Guidelines Appendix G Environmental Checklist, to determine whether impacts to air quality are significant environmental effects, the following questions are analyzed and evaluated.

Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations.

Would the project:

a) Conflict with or obstruct implementation of the applicable air quality plan?

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or State ambient air quality standard?

c) Expose sensitive receptors to substantial pollutant concentrations?

d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

The above questions are analyzed and evaluated below.

a) Conflict with or obstruct implementation of the applicable air quality plan?

Less than significant impact. The BAAQMD has adopted several air quality policies and plans to address the attainment and maintenance of State and federal air quality standards. The most recent BAAQMD plan is the 2017 Clean Air Plan, which was adopted in April of 2017. The 2017 Clean Air Plan serves as the regional Air Quality Plan (AQP) for the Air Basin for attaining federal ambient air quality standards. The primary goals of the 2017 Clean Air Plan are to protect public health and protect the climate. The 2017 Clean Air Plan acknowledges that the BAAQMD's two stated goals of protection are closely related. As such, the 2017 Clean Air Plan identifies a wide range of control measures intended to decrease both criteria air pollutants and GHG emissions.[40,41] The 2017 Clean Air Plan also accounts for projections of population growth provided by ABAG and VMT provided by the MTC and identifies strategies to bring regional emissions into compliance with federal and State air quality standards. A project would be judged to conflict with or obstruct the 2017 Clean Air Plan implementation if it would result in substantial new regional emissions not foreseen in the air quality planning process.

[40] The United States Environmental Protection Agency (EPA) has established National Ambient Air Quality Standards (NAAQS) for six of the most common air pollutants—carbon monoxide, lead, ground level ozone, particulate matter, nitrogen dioxide, and sulfur dioxide—known as "criteria" air pollutants (or simply "criteria pollutants").

[41] A greenhouse gas is any gaseous compound in the atmosphere that is capable of absorbing infrared radiation, thereby trapping and holding heat in the atmosphere. By increasing the heat in the atmosphere, greenhouse gases are responsible for the greenhouse effect, which ultimately leads to global warming.

The BAAQMD does not provide a numerical threshold of significance for project-level consistency analysis with AQPs. Therefore, the following criteria will be used for determining a project's consistency with the AQP.

- **Criterion 1:** Does the project support the primary goals of the AQP?
- **Criterion 2:** Does the project include applicable control measures from the AQP?
- **Criterion 3:** Does the project disrupt or hinder implementation of any AQP control measures?

Criterion 1

The primary goals of the 2017 Clean Air Plan, the current AQP to date, are to:

- Attain air quality standards;
- Reduce population exposure to unhealthy air and protecting public health in the Bay Area; and
- Reduce GHG emissions and protect the climate.

A measure for determining whether the proposed project supports the primary goals of the AQP is if the proposed project would result in an increase in the frequency or severity of existing air quality violations, cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQPs. The development of the AQP is based, in part, on the General Plan land use determinations of the various cities and counties that constitute the Air Basin. The City of San Leandro General Plan designates the project site as Industrial Transition,[42] which corresponds to areas that have historically been industrial but have transitioned or may transition in the future to a more diverse mix of uses, including general commercial activities. These areas include large floor-plate industrial buildings that can be adaptively reused to serve new technology, advanced manufacturing, and "maker" industries. According to the General Plan, the maximum floor area ratio (FAR), a measurement of the amount of floor space that can be developed on a particular parcel of land, allowed in the Industrial Transition areas is 1.0. The proposed project would include the development of a 52,500-square-foot building that includes 5,000 square feet of office uses and 47,500 square feet of warehouse uses on the proposed project site. As a result, the proposed project would result in a FAR value of 0.35,[43] which would be within the allowable FAR of the Industrial Transition land use. In addition, the proposed project use as a light industrial warehouse would be consistent with the intended use of the General Plan land use designation because the proposed project would be able to be reused for many purposes due to its minimal design features and would include a larger floor-plate. The site would be fully landscaped and irrigated, and will accommodate the required automobile and bike parking, trash enclosure, and off-street loading spaces in the truck court. Therefore, the proposed project is considered consistent with the General Plan land use designation.

The Traffic Impact Analysis (TIA) indicates that the proposed project does not significantly impact traffic operations after the construction of the proposed project.[44] The per employee target VMT in

[42] City of San Leandro. 2017. 2035 General Plan Map. April 19.
[43] Calculation: 52,500 square feet of building area ÷ 150,487-square-foot project site area = 0.349
[44] Kittelson & Associates. 2022. San Leandro 14143 Washington Avenue Industrial Traffic Impact Analysis – Draft. May.

the Central Planning Area is 16.3, which represents a 15 percent reduction from the regional average. Since the proposed project has an average VMT per employee of 15.23, it is therefore located in an area with a per employee VMT below the City's target. As such, it is reasonable to conclude that the proposed project and the associated VMT would be accounted for within the AQP and would be not adversely affect the implementation of the AQP.

Moreover, as further discussed below, the proposed project would not create a localized violation of State or federal air quality standards or significantly contribute to cumulative nonattainment pollutant violations after the application of recommended measures. Therefore, the proposed project would be consistent with Criterion 1.

Criterion 2

The 2017 Clean Air Plan contains 85 control measures that describe specific actions to reduce air pollutants and GHGs at the local, regional, and global levels. Along with the traditional stationary, area, mobile source, and transportation control measures, the 2017 Clean Air Plan contains several control measures designed to protect the climate, promote mixed use, and compact development to reduce vehicle emissions and exposure to pollutants from stationary and mobile sources. The 2017 Clean Air Plan also includes an account of the implementation status of control measures identified in the 2010 Clean Air Plan.

Table 12 lists the relevant Clean Air Plan policies to the proposed project and evaluates the proposed project's consistency with the policies. As shown below, the proposed project would be consistent with applicable measures.

Table 12: Project Consistency with Applicable Clean Air Plan Control Measures

Control Measure	Project Consistency
Buildings Control Measures	
BL1: Green Buildings	**Consistent.** The proposed project would not conflict with implementation of this measure. The proposed project will comply with the applicable State and local energy efficiency standards and incorporate applicable energy efficiency features designed to reduce project energy consumption. Furthermore, the City of San Leandro Building Code Enforcement department would verify all Green Building Code measures would be included in project design and plans during the permit review process.
BL4: Urban Heat Island Mitigation	**Consistent.** The proposed project would incorporate landscaping throughout the site. The proposed project would provide landscaping in accordance with City standards that would serve to reduce the urban heat island effect and would comply with the applicable requirements of the City's Tree Ordinance.
Energy Control Measures	
EN1: Decarbonize Electricity Generation	**Consistent.** The proposed project would not conflict with the implementation of this measure. The proposed project would comply with the latest energy efficiency standards such as the 2022 California Title 24 Energy Code and incorporate applicable energy efficiency features designed to reduce project energy consumption.

Control Measure	Project Consistency
EN2: Decrease Electricity Demand	**Consistent.** The project applicant would be required to conform to the California Building Standards Code energy efficiency requirements, also known as Title 24, which was adopted to meet an Executive Order in the Green Building Initiative to improve the energy efficiency of buildings through aggressive standards. The 2022 Title 24 Standards went into effect on January 1, 2023. Proposed buildings that receive building permits after January 1, 2023, are subject to the 2022 Title 24 Standards.
Natural and Working Lands Control Measures	
NW2: Urban Tree Planting	**Consistent.** The proposed project would incorporate landscaping throughout the site. The proposed project would provide landscaping according to City standards that would reduce the urban heat island effect and would comply with the applicable requirements of the City's Tree Ordinance.
WA3: Green Waste Diversion	**Consistent.** The proposed project's waste service provider will be required to meet the Assembly Bill (AB) 341, Senate Bill (SB) 939, and SB 1374 requirements that require waste service providers to divert green waste. All plant and green refuse generated during operations of the proposed project would be recycled off-site.
WA4: Recycling and Waste Reduction	**Consistent.** The proposed project's waste service provider will be required to meet the AB 341, SB 939, and SB 1374 requirements that require waste to be recycled. The proposed project would be required to recycle and/or salvage for reuse a minimum of 65 percent of the nonhazardous construction and demolition waste per 2022 California Green Building. Standard Code.
Stationary Control Measures	
SS36: Particulate Matter from Trackout	**Consistent.** Mud and dirt that may be tracked out onto the nearby public roads during construction activities should be removed promptly by the contractor based on the BAAQMD's requirements. General Plan Mitigation Measure (MM) AQ-2B-1 would require the implementation of Best Management Practices (BMPs) recommended by BAAQMD for fugitive dust emissions during construction. As this mitigation measure would apply to all new development in the City, the proposed project would be required to implement these BMPs as part of compliance with existing regulations.
SS37: Particulate Matter from Asphalt Operations	**Consistent.** Asphalt used during project construction would be subject to BAAQMD Regulation 8, Rule 15-Emulsified and Liquid Asphalts. Although this rule does not directly apply to the proposed project, it does limit the ROG content of asphalt available for use during construction through regulating the sale and use of asphalt. By using asphalt from facilities that meet BAAQMD regulations, the proposed project would be consistent with this Clean Air Plan measure.
Transportation Control Measures	
TR9: Bicycle and Pedestrian Access and Facilities	**Consistent.** The site will accommodate the required automobile and bike parking facilities. Existing sidewalks would be accessible along Washington Avenue. The proposed project would not limit or obstruct pedestrian or bicycle access in the vicinity of the project site. Therefore, the proposed project would not conflict with, and would be consistent with, the BAAQMD's effort to encourage planning for bicycle and pedestrian facilities.
Source: Bay Area Air Quality Management District (BAAQMD). 2017. Final 2017 Clean Air Plan. April 19.	

Additionally, General Plan Mitigation Measure (MM) AQ-2B-1 would ensure applicants of future development projects, including the proposed project, would comply with the current BAAQMD basic control measures for reducing construction emissions of PM_{10}. As this mitigation measure would apply to all new development in the City, the proposed project would be required to implement these BMPs as part of compliance with existing regulations. In summary, the proposed project would not conflict with any applicable measures under the 2017 Clean Air Plan; therefore, the proposed project would be consistent with Criterion 2.

Criterion 3

The proposed project would not preclude extension of a transit line or bike path, propose excessive parking beyond parking requirements, or otherwise create an impediment or disruption to implementing any AQP control measures. Table 12 illustrates that the proposed project would incorporate several AQP control measures as project design features. Considering this information, the proposed project would not disrupt or hinder the implementation of any AQP control measures. Therefore, the proposed project would be consistent with Criterion 3.

Summary

As addressed above, the proposed project would be consistent with all three criteria. Thus, the proposed project would not conflict with the 2017 Clean Air Plan. Therefore, impacts associated with conflicting with or obstructing the 2017 Clean Air Plan's implementation would be less than significant.

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or State ambient air quality standard?

Less than significant impact. This impact is related to the cumulative effect of a project's regional criteria pollutant emissions. By its nature, air pollution is largely a cumulative impact resulting from emissions generated over a large geographic region. The nonattainment status of regional pollutants results from past and present development within the Air Basin, and this regional impact is a cumulative impact. Therefore, new development projects (such as the proposed project) within the Air Basin would contribute to this impact only on a cumulative basis. No single project would be sufficient in size, by itself, to result in nonattainment of regional air quality standards. Instead, a project's emissions may be individually limited, but cumulatively considerable when evaluated in combination with past, present, and future development projects.

Potential localized and regional impacts could result in exceedances of State or federal standards for NO_X, particulate matter (PM_{10} and $PM_{2.5}$), or carbon monoxide (CO). NO_X emissions are of concern because of potential health impacts from exposure to NO_X emissions during construction and operation and as a precursor in the formation of ground level ozone. PM_{10} and $PM_{2.5}$ are of concern during construction because the operation of off-road construction equipment generates emissions of particulate matter consisting of uncombusted fuel and fugitive dust. Particulate matter is also of concern during both construction and operation due to the operation of motor vehicles generating aerated brake particulates and aerated tire particulates from vehicle wear and tear. CO emissions are

of concern during project operation because operational CO hotspots are related to increases in on-road vehicle congestion and their consequential health impacts.

ROG emissions are also important because of their participation in the formation of ground level ozone. Ozone is a respiratory irritant and an oxidant that increases susceptibility to respiratory infections that can cause substantial damage to vegetation and other materials. Excessive ozone concentrations result in reduced lung function, particularly during vigorous physical activity. This health problem is particularly acute in sensitive receptors such as the sick, elderly, and young children.

The cumulative analysis focuses on whether a specific project would result in cumulatively considerable emissions. According to Section 15064(h)(4) of the CEQA Guidelines, the existence of significant cumulative impacts caused by other projects alone does not constitute substantial evidence that the project's incremental effects would be cumulatively considerable. Rather, the determination of cumulative air quality impacts for construction and operational emissions is based on whether that project would result in regional emissions that exceed the BAAQMD thresholds of significance for construction and operations on a project level. The thresholds of significance represent the allowable emissions each project can generate without generating a cumulatively considerable contribution to regional air quality impacts. Therefore, a project that would not exceed the BAAQMD thresholds of significance on a project level also would not be considered to result in a cumulatively considerable contribution to these regional air quality impacts. Construction and operational emissions are discussed separately below.

Construction Emissions

During construction, fugitive dust would be generated from site preparation, grading, and other earthmoving activities. The majority of this fugitive dust would remain localized and deposited near the project site; however, the potential for impacts from fugitive dust exists unless control measures are implemented to reduce this source's emissions. Exhaust emissions would also be generated from the operation of the off-road construction equipment. As required by General Plan MM AQ-2B-2, this construction-related air quality analysis was prepared according to BAAQMD CEQA Guidelines.

Construction Fugitive Dust

The BAAQMD does not recommend a numerical threshold for fugitive dust particulate matter emissions. Instead, the BAAQMD bases the determination of significance for fugitive dust on a consideration of the control measures to be implemented, referred to as BMPs. If all appropriate emissions control measures are implemented for a project as recommended by the BAAQMD, then fugitive dust emissions during construction are not considered significant. During construction activities, air pollution control measures would be implemented as outlined in General Plan MM AQ-2B-1. MM AQ-2B-1 is required for all development projects within the City of San Leandro and includes the same basic construction measures as the BAAQMD measures. With the incorporation of this measure, short-term construction impacts associated with a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or State ambient air quality standard would be less than significant for fugitive dust.

Construction Air Pollutant Emissions: ROG, NO_X, PM_{10}, and $PM_{2.5}$ (Exhaust Emissions)

As previously mentioned, the BAAQMD's CEQA Air Quality Guidelines identifies that the construction screening size for a warehouse development is 259,000 square feet; however, utilization of the BAAQMD's construction screening criteria cannot be relied upon for a significance determination if demolition, substantial soil movement, or more than two concurrent construction phases would occur during project construction.[45] As the proposed project would involve the demolition of approximately 9,000 square feet of building space and 100,000 square feet of pavement, the proposed project is disqualified from utilizing the BAAQMD's construction screening criteria. The significance of the proposed project's construction impacts are therefore determined utilizing a quantitative analysis of project emissions against the BAAQMD's criteria pollutant and ozone precursor significance thresholds.

California Emissions Estimator Model (CalEEMod), Version 2020.4.0, was used to estimate the proposed project's construction emissions. CalEEMod provides a consistent platform for estimating construction and operational emissions from various land use projects and is the model recommended by the BAAQMD for estimating project emissions. Estimated construction emissions are compared with the applicable thresholds of significance established by the BAAQMD to assess ROG, NO_X, exhaust PM_{10}, and exhaust $PM_{2.5}$ construction emissions to determine significance for this impact.

As presented in Table 13, the proposed project's construction is expected to start in January 2023 and conclude in February 2024. It should be noted that if the construction schedule moved to later years, construction emissions would likely decrease because of improvements in technology, replacement of older polluting equipment with newer and cleaner equipment, and the imposition of more stringent regulatory requirements. See Appendix A for more detailed modeling assumptions and information.

Table 13: Project Construction Schedule

The project construction schedule has been updated since preparation of this report. Refer to Table 2 in the Project Description of the IS-MND, and the updated CalEEMod results included at the end of this appendix.

[45] Bay Area Air Quality Management District (BAAQMD). 2017. CEQA Air Quality Guidelines. May.

According to applicant-provided information, the proposed project would involve the demolition and removal of an estimated 9,000 square feet of existing structures and 100,000 square feet of hardscape demolition. Average daily construction emissions are compared with the significance thresholds in Table 14. It should be noted that the emission estimates shown in Table 14 include the implementation of General Plan MM AQ-2B-1, which includes the BMPs recommended by the BAAQMD to reduce potential impacts related to fugitive dust emissions from construction equipment.

Table 14: Unmitigated Construction Emissions (Average Daily Rate)

Refer to the updated CalEEMod results included at the end of this appendix.

As shown in Table 14, the average daily construction emissions from all construction activities are below the BAAQMD thresholds of significance; therefore, project construction would have a less than significant impact regarding emissions of ROG, NO_X, exhaust PM_{10}, and exhaust $PM_{2.5}$. As previously discussed, the proposed project would implement General Plan MM AQ-2B-1 for the BMPs recommended by the BAAQMD to reduce potential impacts related to fugitive dust emissions from construction equipment. In addition, the proposed project would not satisfy the BAAQMD's construction screening criteria and would therefore require a detailed emissions analysis to

demonstrate potential impacts and identify necessary mitigation, as required under MM AQ-2B-2 of the City's General Plan EIR. As demonstrated herein, the proposed project's detailed emissions analysis shows that project construction would result in less than significant construction impacts with respect to a cumulative considerable increase in criteria air pollutants. Therefore, the proposed project would be compliant with General Plan MM AQ-2B-2, and project construction impacts would be less than significant.

Operational Emissions

Operational Air Pollutant Emissions: ROG, NO_X, PM_{10}, and $PM_{2.5}$

Operational emissions would include area, energy, and mobile sources. Area sources would include emissions from architectural coatings, consumer products, and landscape equipment. Energy sources include emissions from the combustion of natural gas for water heaters and other heat sources. Mobile sources include exhaust and road dust emissions from the automobiles that would travel to and from the project site. Stationary sources include emissions from stationary source equipment, such as backup generators, which would require a permit issued by the BAAQMD. Pollutants of concern include ROG, NO_X, PM_{10}, and $PM_{2.5}$.

As previously mentioned, Table 3-1 of the BAAQMD's CEQA Air Quality Guidelines identifies the operational screening size for the "warehouse" land use type to be 864,000 square feet. As such, the proposed project falls within this operational screening size, and the proposed project would be consistent with the requirements of General Plan MM AQ-2. Specifically, General Plan MM AQ-2 requires an operations-related air quality assessment that evaluates potential project operational emissions according to the BAAQMD CEQA Guidelines. Nonetheless, the proposed project's operational emissions have been quantified and are compared against the applicable quantitative significance thresholds for informational purposes.

As indicated by the construction schedule provided in Table 13, the proposed project is anticipated to be fully operational after completion of construction activities in February 2024. Therefore, the proposed project's operational emissions are based on full buildout starting in 2024 and are presented in Table 15.

According to the TIA for the proposed project, the proposed project is expected to generate a total of 260 daily trips.[46] In addition, the project applicant identified the need for a fire pump to be included in the project; however, the specifics related to the fire pump were unknown at the time of this analysis. The exact location, type of fire pump, and size of the fire pump were unknown at the time of this analysis. As such, the proposed project was assumed to include the operation of a diesel-fueled, 500-horsepower fire pump for 50 hours a year, the maximum annual hours permitted by the BAAQMD for non-emergency maintenance and testing purposes. It should be noted that the emission estimates provided below do not include the emissions generated by operations currently existing on the project site, which would reduce the proposed project's incremental increase of

[46] Kittelson & Associates. 2022. San Leandro 14143 Washington Avenue Industrial Traffic Impact Analysis – Draft. May.

emissions. Therefore, the emission estimates provided in this analysis serve as a conservative assessment of the proposed project's operational impacts.

Table 15: Unmitigated Operational Emissions

Refer to the updated CalEEMod results included at the end of this appendix.

Operational Carbon Monoxide Hotspot

The CO emissions from traffic generated by the proposed project are a concern at the local level because congested intersections can result in high, localized concentrations of CO (referred to as a CO hotspot).

The BAAQMD recommends a screening analysis to determine whether a project has the potential to contribute to a CO hotspot. The screening criteria identify when site-specific CO dispersion modeling is necessary. The proposed project would result in a less than significant impact to air quality for local CO emissions if all of the following screening criteria are met:

- The project is consistent with an applicable congestion management program established by the county congestion management agency for designated roads or highways, regional transportation plan, and local congestion management agency plans; and
- The project traffic would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour; and
- The project traffic would not increase traffic volumes at affected intersections to more than 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited (e.g., tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway).

Congestion Management Program Consistency

To determine whether the proposed project would be consistent with the applicable congestion management program, the TIA for the proposed project analyzed the potential impact on VMT. As described in the TIA, the City of San Leandro has not adopted specific methodology or thresholds for evaluating VMT. As such, the proposed project's VMT impacts were evaluated against the methodology and recommendations outlined in the Alameda County Transportation Commission (CTC) per the Governor's Office of Planning and Research (OPR) Technical Advisory. The Alameda CTC has developed detailed maps and an online Geographic Information System (GIS) tool showing the VMT generated for each Traffic Analysis Zone (TAZ), as well as data tables showing the average VMT figures by city, planning area, and county for model years 2020 and 2040. The TIA determined that the appropriate VMT threshold for the proposed project would be the Central Planning Area because this planning area encompasses the City of San Leandro and Hayward, which have similar land use densities and types as the proposed project. In addition, the TIA describes that the Central Planning Area VMT per employee average threshold is appropriate for this project and not the Alameda County-wide VMT per employee average threshold because at the County level, the north, south, east, and central Planning Areas were included which encompasses various land use types including high-density areas with high transit, pedestrian and bike access, which is not characteristic of the project site and immediate vicinity.

The TIA describes that OPR requires, before any VMT analysis is undertaken, that the proposed project must undergo screening using the City's screening criteria to determine whether it can be expected to cause a less than significant impact without conducting a detailed VMT study. OPR and Alameda CTC's suggested screening criterion for projects analyzed under the employment-industrial threshold is:

- If the project has less than 110 weekday daily trips per day.
- If there is high-capacity transit (15-minute frequency) within half mile of the project available.
- If the project is located in areas with below Central Planning Area average VMT per employee.

The Central Planning Area average VMT per employee generates 19.2 VMT per employee with a 15 percent reduction goal of 16.3. As a result, if the proposed project would result in 16.3 VMT or less then it would meet the screening criterion. As shown in Figure 4 of the TIA,[47] The proposed project site is in a TAZ with an average VMT per employee of 15.23. As a result, the proposed project's operational VMT would be in an area with more than 15 percent VMT below the Central Planning Area average and the proposed project would be consistent with the Alameda CTC. Therefore, the proposed project would not conflict with an applicable congestion management program established by the county congestion management agency for designated roads or highways.

Traffic Volumes More Than 44,000 Vehicles Per Hour

As indicated by the TIA, the proposed project would generate an estimated 44 total AM peak-hour vehicle trips and 40 total PM peak-hour vehicle trips. The proposed project would generate approximately 260 daily vehicle trips with 204 passenger vehicles trips and 56 heavy heavy-duty (HHD) truck trips.

The TIA analyzed the proposed project's impact to cumulative traffic conditions on nearby intersections. The intersection with the most vehicles per hour would occur at the Washington Avenue and Halcyon Drive intersection during the PM peak-hour. During the Cumulative Plus Project conditions 5,017 vehicles per hour would travel through this intersection, which is less than 44,000 vehicles. Therefore, the proposed project is not anticipated to cause any nearby roadway segment or intersection to exceed 44,000 vehicles per hour.

Traffic Volumes More Than 24,000 Vehicles Per Hour Where Vertical and/or Horizontal Mixing is Substantially Limited

Nonetheless, CO hotspots can occur when a transportation facility's design or orientation prevents the adequate dispersion of CO emissions from vehicles, resulting in the accumulation of local CO concentrations. The design or orientation of a transportation facility that may prevent CO emissions dispersion includes tunnels, parking garages, bridge underpasses, natural or urban canyons, below-grade roadways, or other features where vertical or horizontal atmospheric mixing is substantially limited. Aside from a BART overpass approximately 550 feet east of the project site, adjacent roadways that would receive new vehicle trips generated by the proposed project do not include roadway segments where vertical or horizontal atmospheric mixing is substantially limited. Therefore, based on the above criteria, the proposed project would not exceed the CO screening criteria and would have a less than significant impact related to CO.

c) Expose sensitive receptors to substantial pollutant concentrations?

Less than significant impact. The BAAQMD defines sensitive receptors as the following: "Facilities or land uses that include members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses. Examples include schools, hospitals, and residential areas." In this analysis, the Maximally Impacted Sensitive Receptor (MIR)

[47] Kittelson and Associates. May 2022. San Leandro 14143 Washington Avenue Industrial Traffic Impact Analysis, Figure 4: VMT Per Employee Central Planning Area Screening Map.

during project construction was identified as the closest residence to the project site approximately 500 feet to the southwest.

The following four criteria were applied to determine whether the proposed project would significantly impact the exposure of sensitive receptors to project emissions based on the health risk and hazard significance thresholds shown in Table 10. The proposed project would be considered to have a significant impact if:

- **Criterion 1:** Construction of the project would exceed the health risk significance thresholds.
- **Criterion 2:** The cumulative health impact would exceed the cumulative health risk significance thresholds.
- **Criterion 3:** The project's operation would result in an exceedance of the health risk significance thresholds.
- **Criterion 4:** A CO hotspot assessment demonstrates that the project would result in a CO hotspot development that would cause an exceedance of the CO ambient air quality standards.

Criterion 1: Project Construction Toxic Air Pollutants

An assessment was made of the potential health impacts to surrounding sensitive receptors resulting from TAC emissions during construction. A summary of the assessment is provided below, while the detailed assessment is provided as part of Appendix A.

DPM has been identified by the ARB as a carcinogenic substance. Major sources of DPM include off-road construction equipment and heavy-duty delivery truck and worker activities. For purposes of this analysis, DPM is represented as exhaust emissions of $PM_{2.5}$.

Estimation of Construction DPM Emissions

Construction DPM emissions were estimated using CalEEMod, Version 2020.4.0, as described under the discussion for Impact(b). As presented in Table 16, the proposed project's construction is anticipated to occur from January 2023 through February 2024. It is important to note that the proposed project would be constructed over a single construction phase, becoming operational upon completion.

The emissions generated on-site were assumed to be distributed as an area source over the entire project site. Off-site emissions generated by the exhaust from the various construction vehicles was represented as a volume source as the traffic travels within 1,000 feet of the project site along Washington Avenue, 139th Avenue, and 143rd Avenue. On-site and off-site emissions generated during project construction were modeled with a working schedule of 8 hours per day, 5 days per week. Table 16 presents the unmitigated project DPM construction on-site and off-site emissions.

Table 16: Project DPM Construction Emissions

Refer to the updated CalEEMod results included at the end of this appendix.

To assess impacts to off-site sensitive receptors during full project construction and on-site sensitive receptors during project construction, the American Meteorological Society/EPA Regulatory Model (AERMOD) air dispersion model was used to estimate the DPM emission concentrations at nearby sensitive receptors within 1,000 feet of the project site.

Estimation of Cancer Risks

The BAAQMD has developed a set of guidelines for estimating cancer risks resulting from exposure to TACs.[48,49] These guidelines recommend the use of Hotspots Analysis and Reporting Program (HARP2) software to identify the cancer risk associated with DPM generated during construction activities. The HARP2 risk scenario inputs used to calculate cancer risk during project construction are summarized below and provided, in detail, as part of Appendix A:

1. Receptor Type: Individual Resident
2. Exposure Duration: User Defined (Tier 2)–2 Years, Third Trimester Start Age
   - Third Trimester Bin: 0.25 year
   - 0<2 Years Bin: 2 years
3. Intake Rate Percentile: 95th (High End)
4. Pathways to Evaluate: Inhalation Only

Estimation of Non-Cancer Hazards

An evaluation of the potential non-cancer effects of chronic chemical exposures was also conducted. Risk characterization for non-cancer health hazards from TACs is expressed as a HI. The HI is a ratio of the predicted concentration resulting from the proposed project's emissions to the specific REL for the TAC being analyzed. RELs are airborne concentrations of a chemical that are not anticipated to result in adverse non-cancer health effects for specified exposure durations in the general population, including sensitive subpopulations. The HI assumes that chronic sub-threshold exposures adversely affect a specific organ or organ system (toxicological endpoint). For each

[48] Bay Area Air Quality Management District (BAAQMD). 2016. BAAQMD Air Toxics NSR Program Health Risk Assessment Guidelines.
[49] Bay Area Air Quality Management District (BAAQMD). 2020. BAAQMD Health Risk Assessment Modeling Protocol.

discrete chemical exposure, target organs presented in regulatory guidance were used. Each chemical concentration or dose is divided by the appropriate toxicity reference exposure level to calculate the HI. For compounds affecting the same toxicological endpoint, this ratio is summed. Where the total equals or exceeds 1, a health hazard is presumed to exist. For purposes of this assessment, the TAC of concern is DPM for which the California Office of Environmental Health Hazard Assessment (OEHHA) has defined a chronic REL for DPM of 5 micrograms per cubic meter ($\mu g/m^3$). The principal toxicological endpoint assumed in this assessment was through inhalation.

The acute HI is a ratio of maximum 1-hour average concentrations of TACs in the air to established RELs. An acute HI below 1.0 indicates that adverse non-cancer health effects from infrequent short-term exposure are not expected. As previously noted, the TAC of concern for this project is DPM. The OEHHA and ARB have not established acute toxicity factors for DPM.

Estimation of Health Risks and Hazards from Project Construction

Table 17 summarizes the cancer risk and HI results for unmitigated project construction at the MIR, a single-family residence approximately 500 feet southwest of the project site. As shown in Table 17, $PM_{2.5}$ exhaust emissions generated during unmitigated project construction would result in an incremental cancer risk of approximately 7.29 individuals per one million, which is below the BAAQMD's significance threshold of 10 individuals per one million.

Table 17: Estimated Cancer Risks and Chronic Non-Cancer Hazards (Unmitigated)

Impact Scenario	Cancer Risk (risk per million)	Chronic Non-Cancer Hazard Index[1]	TAC Concentration ($\mu g/m^3$)
Residential MIR	7.29	<0.01	0.02
Thresholds of Significance	**10**	**1**	**0.3**
Exceeds Individual Source Threshold?	**No**	**No**	**No**

Notes:
DPM = diesel particulate matter
MIR = Maximally Impacted Sensitive Receptor
$PM_{2.5}$ = particulate matter, including dust, 2.5 micrometers or less in diameter
REL = reference exposure level
TAC = toxic air contaminants
$\mu g/m^3$ = micrograms per cubic meter
[1] Chronic non-cancer hazard index was estimated by dividing the annual DPM concentration (as $PM_{2.5}$ exhaust) by the DPM REL of 5 $\mu g/m^3$.
Emissions Source: Appendix A.
Thresholds Source: Bay Area Air Quality Management District (BAAQMD). 2017. California Environmental Quality Act Air Quality Guidelines.

As shown in Table 17 above, the proposed project's construction emissions would not exceed any applicable BAAQMD significance threshold. Therefore, project construction would not result in significant health impacts to nearby sensitive receptors.

Criterion 2: Cumulative Health Risk Assessment

The BAAQMD recommends assessing the potential cumulative impacts from sources of TACs within 1,000 feet of a project. As a result, a cumulative HRA was performed that examined the cumulative impacts of the proposed project's construction emissions and sources of TAC emissions within 1,000 feet of the project site. As previously discussed, the MIR was determined to be a residence approximately 500 feet southwest of the project site.

- **Health Risks for Local Roadways.** The BAAQMD pre-calculated concentrations and the associated potential cancer risks and $PM_{2.5}$ concentration increases for each county within their jurisdiction for roadways that carry at least 30,000 average daily trips. For certain areas, the BAAQMD also includes local roadways that meet BAAQMD's "major roadway" criteria of 10,000 vehicles or 1,000 trucks per day. The latest available screening tool is in the form of a GIS raster file. The BAAQMD Raster Tool and data was used to provide the basis for the cumulative cancer risk and hazard analysis. The proposed project is located within the BAAQMD designated Western Alameda County Community Air Risk Evaluation (CARE) Program area; therefore, the BAAQMD's Local Roadway tool will account for nearby roadways that experience at least 10,000 vehicles per day.[50,51]
- **Freeway Screening Analysis Tool**. The BAAQMD prepared a GIS tool that contains pre-estimated cancer risk and $PM_{2.5}$ concentration increases for highways within the Bay Area. The closest highways to the project site are I-880 approximately 2,830 feet to the west, Highway 185 approximately 2,600 feet to the east, and I-580 approximately 4,800 feet to the east.
- **Stationary Source Risk and Hazard Screening Tools**. The BAAQMD prepared a web-based tool with the location of permitted stationary sources. For each emissions source, the BAAQMD provides conservative estimates of cancer risk and $PM_{2.5}$ concentrations. Based on information from the GIS tool, three BAAQMD-permitted stationary sources exist within approximately 1,000 feet of the project site.[52]
- **Rail Screening Tools.** The BAAQMD prepared GIS tools that contains estimated cancer risks and $PM_{2.5}$ concentrations from railroad operations at any point within the Air Basin. The closest rail line to the proposed project is adjacent to the western boundary of the project site.

The cumulative HRA results are summarized during project construction in Table 18. Cumulative health risk results shown therein are representative of the health risks to the MIR that would experience the highest concentration of pollutants and associated cancer risks.

BAAQMD's Cumulative Thresholds of Significance			**100**	**10**	**0.8**
Threshold Exceedance?			**No**	**No**	**No**

Notes:
BAAQMD = Bay Area Air Quality Management District
DPM = diesel particulate matter
HI = health index
MIR = Maximally Impacted Sensitive Receptor
ND = No Data
$PM_{2.5}$ = particulate matter, including dust, 2.5 micrometers or less in diameter
$\mu g/m^3$ = micrograms per cubic meter
[1] The MIR was identified as a residence approximately 500 feet southwest of the project site.
[2] Assumes emissions remain constant with time.
Source: Appendix A.

As noted in Table 18 above, the cumulative impacts from project construction and existing sources of TACs would be less than the BAAQMD cumulative thresholds of significance. Therefore, the proposed project would not be cumulatively considerable or result in a significant cumulative health risk impact.

Criterion 3: Project-Specific Operational Toxic Air Pollutants

The proposed project is a warehouse project and would not be a specific land use which may result in substantial amounts of on-site sources of TACs during operation, such as metal smelting or refineries. Although a diesel fire pump is included in the operational modeling and is assumed to be 500 horsepower and to be operative for up to 50 hours per year, it was included to present a conservative estimate of regional emissions. However, the specifics related to the fire pump were unknown at the time of this analysis. Any proposed stationary source equipment (e.g., backup generators, fire pumps) which would be greater than 50 horsepower would require permitting through the BAAQMD to be installed and operated. Therefore, a diesel fire pump greater than 50 horsepower would be subject to permitting under BAAQMD Regulation 2–Permits and any rules identified during the permitting process. Compliance with BAAQMD permitting would require any potential fuel-powered fire pump to include BACT, which would include emissions control techniques. Compliance with mandatory permitting requirements would ensure that permitted source would not have a significant impact related to health risk impacts. Specifically, the BAAQMD evaluates health risk impacts from the proposed source and requires that the equipment permit unit shall not be operated contrary to the conditions specified in the permit to operate.

According to the ARB's Air Quality and Land Use Handbook: A Community Health Perspective,[53] projects should avoid siting new sensitive receptors within 1,000 feet of warehouse type land uses that accommodates more than 100 trucks per day, more than 40 trucks with operating Transport Refrigeration Units (TRUs) per day, or where TRU unit operations exceed 300 hours per week. Moreover, General Plan MM AQ-3 requires a Health Risk Assessment (HRA) be prepared according to BAAQMD and OEHHA procedures if a project would have the potential to generate 100 or more diesel truck trips per day or have 40 or more trucks with operating diesel-powered TRUs, and is within 1,000 feet of a sensitive land use. As such, the proposed project is analyzed against the land use types and activities identified in the ARB's Air Quality and Land Use Handbook to provide a screening determination of whether the proposed project could result in a potentially significant health impact to existing sensitive receptors within 1,000 feet of the project site during project operation, necessitating the preparation of site-specific air dispersion modeling.

As described previously, the proposed project would not include cold storage or TRUs. Further, the proposed project would result in an estimated 56 truck trips daily, which is described in the project-specific TIA[54] and included in the air quality modeling. As a result, the proposed project would not constitute a land use or activity described in the ARB's Air Quality and Land Use Handbook that would warrant site-specific air dispersion modeling to determine associated impacts. ARB's Air Quality and Land Use Handbook and the City's General Plan MM AQ-3specify that site-specific air dispersion modeling should be conducted if a site accommodates greater than 100 trucks daily, as these projects could result in potentially significant health impacts to nearby sensitive receptors during operation. Other vehicle trips generated by the proposed project would principally consist of passenger vehicles and would not represent a substantial source of TAC emissions. Therefore, the

[53] California Air Resources Board (ARB). 2005. Air Quality and Land Use Handbook: A Community Health Perspective.
[54] Kittelson & Associates. 2022. San Leandro 14143 Washington Avenue Industrial Traffic Impact Analysis – Draft. May.

passenger vehicle and trucking activities during project operation are not anticipated to result in a substantial TAC source which may significantly impact nearby sensitive receptors.

Criterion 4: Carbon Monoxide Hotspot Analysis

As discussed under Impact(b), the operational CO hotspot impact as a result of project operations would be less than significant.

As discussed above, the proposed project's potential impacts to sensitive receptors during project construction and operation would be less than significant, thereby demonstrating compliance with General Plan EIR MM AQ-3. As such, this impact would be less than significant.

d) Result in other emission (such as those leading to odors) adversely affecting a substantial number of people?

Less than significant impact. As stated in the BAAQMD 2017 Air Quality Guidelines,[55] odors are generally regarded as an annoyance rather than a health hazard. The ability to detect odors varies considerably among the populations and is subjective. The BAAQMD does not have a recommended odor threshold for construction activities. However, the BAAQMD recommends operational screening criteria based on the distance between receptors and types of sources known to generate odors. For projects within the screening distances, the BAAQMD has the following threshold for project operations:

Two circumstances have the potential to cause odor impacts:

- A source of odors is proposed to be located near existing or planned sensitive receptors, or
- A sensitive receptor land use is proposed near an existing or planned source of odor.

Projects that would introduce a new odor source or a receptor farther than the applicable screening distance, shown in Table 19 below, would not likely result in a significant odor impact.

Table 19: Odor Screening Distances

Land Use/Type of Operation	Project Screening Distance
Wastewater Treatment Plant	2 miles
Wastewater Pumping Facilities	1 mile
Sanitary Landfill	2 miles
Transfer Station	1 mile
Composting Facility	1 mile
Petroleum Refinery	2 miles
Asphalt Batch Plant	2 miles
Chemical Manufacturing	2 miles

Project Construction

Diesel exhaust and ROGs would be emitted during the construction of the proposed project, which may be objectionable to some; however, emissions would disperse rapidly from the project site and therefore would not create objectionable odors affecting a substantial number of people. As such, construction odor impacts would be less than significant.

Project Operation

Land uses typically associated with odors include wastewater treatment facilities, waste disposal facilities, agricultural operations, or other operations listed in Table 19. The proposed project would introduce a light industrial warehouse development that is not expected to produce any offensive odors that would result in odor complaints. During operation of the proposed project, odors would primarily consist of exhaust from passenger vehicles and HHD trucks traveling to and from the site. These occurrences would not produce objectionable odors affecting a substantial number of people because exhaust emissions are temporary and immediately disperse into the atmosphere such that no individual receptors near the site would be impacted. Therefore, operational impacts associated with the proposed project's potential to create objectionable odors or expose a substantial number of people to objectionable odors would be less than significant. Mitigation

General Plan Mitigation

The following General Plan Mitigation Measures are relevant to the proposed project: AQ-2, AQ-2B-1, AQ-2B-2, and AQ-3. However, the air quality impact analysis above has demonstrated consistency with the following measures: AQ-2, AQ-2B-2, AQ-3. The mitigation measure below would be required during construction of the proposed project:

AQ-2B-1 As part of the City's development approval process, the City shall require applicants for future development projects to comply with the current Bay Area Air Quality Management District's basic control measures for reducing construction emissions of PM_{10} (Table 8-1, Basic Construction Mitigation Measures Recommended for All Proposed Projects, of the BAAQMD CEQA Guidelines).

AQ-3 Applicants for future nonresidential land uses within the City that: (1) have the potential to generate 100 or more diesel truck trips per day or have 40 or more trucks with operating diesel-powered TRUs, and (2) are within 1,000 feet of a sensitive land use (e.g., residential, schools, hospitals, nursing homes), as measured from the property line of a proposed project to the property line of the nearest sensitive use, shall submit a Health Risk Assessment (HRA) to the City of San Leandro prior to future discretionary project approval. The HRA shall be prepared in accordance with policies and procedures of the California Office of Environmental Health Hazard Assessment and the Bay Area Air Quality Management District. If the HRA shows that the incremental cancer risk exceeds 10 in one million (10E-06), $PM_{2.5}$ concentrations exceed 0.3 $\mu g/m^3$, or the appropriate non-cancer hazard index exceeds 1.0, the applicant will be required to identify and demonstrate that mitigation measures are capable of reducing potential cancer and non-cancer risks to an acceptable level, including appropriate enforcement mechanisms. Mitigation measures may include but are not limited to:

- Restricting idling on-site beyond Air Toxic Control Measures idling restrictions, as feasible.
- Electrifying warehousing docks.
- Requiring use of newer equipment and/or vehicles.
- Restricting off-site truck travel through the creation of truck routes.

Mitigation measures identified in the project-specific HRA shall be identified as mitigation measures in the environmental document and/or incorporated into the site development plan as a component of a proposed project.

Additional Recommended Mitigation

None recommended.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 5: GREENHOUSE GAS EMISSIONS IMPACT ANALYSIS

According to the CEQA Guidelines Appendix G Environmental Checklist, to determine whether impacts to GHG emissions are significant environmental effects, the following questions are analyzed and evaluated.

Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations.

Would the project:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

The above questions are analyzed and evaluated below.

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Less than significant impact. The proposed project would generate GHG emissions due to construction activity and project operations. According to the BAAQMD, if a project is consistent with an adopted Qualified Greenhouse Gas Reduction Strategy that addresses the project's GHG emissions, it can be presumed that the proposed project will not have significant GHG emission impacts. A Qualified Greenhouse Gas Reduction Strategy (or similar adopted policies, ordinances, and programs) is one that is consistent with all of the AB 32 Scoping Plan and SB 32 measures and goals.[56] In addition, the proposed project's estimated GHG emissions during construction and operation are presented for informational purposes only.

Construction

The proposed project would generate GHG emissions during construction activities, resulting from emission sources such as construction equipment, haul trucks, and construction worker vehicles. Although these emissions would be temporary and short-term in nature, they could represent a substantial contribution of GHG emissions. Construction emissions were modeled using CalEEMod Version 2020.4.0. Table 20 below, shows the annual construction GHG emissions.

[56] Bay Area Air Quality Management District (BAAQMD). May 2017. CEQA Guidelines.

Table 20: Proposed Project Construction GHG Emissions

Refer to the updated CalEEMod results included at the end of this appendix and Table 17 of the IS-MND.

Operation

Operational or long-term emissions occur over the life of the project. Project operations were modeled for the 2024 operational year, immediately following the completion of construction. Sources for operational GHG emissions include:

- **Motor Vehicles:** These emissions refer to GHG emissions contained in the exhaust from the cars and trucks that would travel to and from the project site.
- **Natural Gas:** These emissions refer to the GHG emissions that occur when natural gas is burned on the project site. Natural gas uses could include heating water, space heating, dryers, stoves, or other uses.
- **Stationary:** These emissions refer to the GHG emissions that would be emitted when a diesel-powered 500 HP fire pump is tested for up to 50 hours per year. However, the specifics related to the fire pump were unknown at the time of this analysis. The exact location, type of fire pump, and size of the fire pump were unknown at the time of this analysis. As such, the proposed project was assumed to include the operation of a diesel-fueled, 500-horsepower fire pump for 50 hours a year, the maximum annual hours permitted by the BAAQMD for non-emergency maintenance and testing purposes, to provide a conservate estimate of emissions.
- **Indirect Electricity:** These emissions refer to those generated by off-site power plants to supply electricity required for the project.
- **Area Sources:** These emissions refer to those produced during activities such as landscape maintenance.

- **Water Transport:** These emissions refer to those generated by the electricity required to transport and treat the water to be used on the project site.
- **Waste:** These emissions refer to the GHG emissions produced by decomposing waste generated by the project.

Table 21 presents the estimated annual GHG emissions from the project's operational activities.

Table 21: Proposed Project Operational Emissions

Refer to the updated CalEEMod results included at the end of this appendix and Table 18 of the IS-MND.

On July 19, 2021, the City of San Leandro updated its CAP, which outlines strategies for reducing GHG emissions through various activities, including but not limited to water conservation, energy conservation, land use design and orientation, transportation-oriented development, and renewable energy source use. According to the CAP, "The CAP is prepared consistent with CEQA Guidelines for Plans for the Reduction of Greenhouse Gas Emissions (CEQA Guidelines § 15183.5). This allows the 2021 CAP to support and possibly streamline environmental review of GHG emissions related to future development projects within the City." Therefore, consistent with the BAAQMD's significance threshold criterion B—as shown in Table 11—and CEQA Guidelines Section 15183.5, determining the significance the proposed project's impacts related to GHG emissions and consistency with a local plan or policy adopted for the purpose of reducing GHG emissions is based on whether the proposed project would comply with the goals and policies of the City's CAP. Table 22 presents the goals and measures contained therein, if these goals and measures would apply to the proposed project, and how the proposed project would be consistent.

Table 22: Consistency with San Leandro Climate Action Plan Update

San Leandro CAP Reduction Measure	Project Consistency
Building Efficiency (BE)	
BE-1: Electrified retrofits. Incentivize significant building retrofits with fewer or no natural gas appliances to reduce pollution and increase cost savings.	**Not applicable.** The proposed project would include the development of a new light industrial warehouse and would not retrofit existing buildings.
BE-2: Electrified new construction. Commit to developing a reach code limiting natural gas use in new construction, or as directed by the State or regional agencies.	**Not applicable.** The City of San Leandro has not adopted a reach code limiting natural gas use in new construction; this calls for the City to commit to developing a reach code limiting natural gas use in new construction and would not be applicable at the individual development project level. However, the proposed project would be built to the latest Title 24 standards in effect at the time building permits are issued.
Residential Energy Efficiency (RF)	
RF-1: Increase education and outreach for existing energy efficiency financing mechanisms, including the Program for All-Inclusive Elder Care (PACE) programs and utility programs. Create new financing programs, such as a revolving loan program. **RF-2:** Prioritize City-funded energy retrofit programs in majority people of color census tracts or high energy cost burdened households. **RF-3:** Homeowner energy retrofits. Continue to promote energy efficiency programs and incentives available to residential property owners. **RF-4:** Work with landlords and tenants' groups to increase energy efficiency and decrease energy costs in rental homes, including multi-family properties. Mitigate displacement risk by strengthening tenant protections, including relocation assistance and right of return for tenants temporarily displaced by housing retrofits. Utilize methods such as the green lease to address the split incentive issue and prevent tenants paying for property improvements.	**Not applicable.** The proposed project would include the development of a new light industrial warehouse and would not include residential uses.
Renewable Energy (RE)	
RE-1: East Bay Community Energy participation Encourage San Leandro households and businesses to switch from PG&E electricity supplies to East Bay Community Energy, and commit to defaulting to Renewable 100 tier for 100 percent renewable energy.	**Consistent**. The project site is located in the East Bay Community Energy service area and tenants would be able to register for this electricity provider.
RE-2: Residential owner-occupied renewable energy Promote greater adoption of renewable energy generation and energy storage systems on owner-	**Not Applicable**. The proposed project would include the development of a new light industrial warehouse and would not include residential uses.

San Leandro CAP Reduction Measure	Project Consistency
occupied new and existing homes. Leverage existing solar financing, tax, and rebate opportunities, and consider new financial incentives as needed. **RE-3:** Prioritize increasing and installing renewable energy generation systems and energy storage systems on rental homes, multi-family buildings, and affordable housing.	
RE-4: Increase renewable energy generation and energy storage capacity at nonresidential properties. Encourage the use of non-fossil fuel backup generation systems as much as possible.	**Consistent.** The proposed project would be required to comply with City Municipal Code Chapter 7-5, Article 6 Green Building Code, which would require all new development to be consistent with Title 24, including the provision for solar-ready rooftop infrastructure.
(AD)	
AD-1: Traffic calming. Continue to provide the Neighborhood Traffic Calming Program and related efforts to reduce travel speeds and cut through traffic in residential areas.	**Consistent**. The proposed project would not include a roadway that could be used to cut through residential neighborhoods and would facilitate travel to the proposed project driveways.
AD-2: Transit-oriented development. Continue to concentrate multi-family development and pedestrian-oriented mixed-use development within existing [Transit Oriented Development] TOD areas and along major transit corridors.	**Not Applicable**. The proposed project include the development of a new light industrial warehouse and is not located within a TOD area.
AD-3: Infill development. Focus new housing development on underutilized or vacant infill sites on flatter lands and continue to discourage new development in hillside areas.	**Not Applicable**. The proposed project include the development of a new light industrial warehouse and would not include residential uses.
AD-4: Evaluate parking standards. Evaluate parking standards and continue to support shared parking and other efforts to ensure the availability of necessary parking while reducing vehicle miles traveled.	**Consistent**. The proposed project would provide parking consistent with development standards contained in Municipal Code.
(AT)	
AT-1: Transportation Demand Management (TDM). Require local employers above a certain number of employees to develop programs that promote ride sharing, flextime, telecommuting, and other means to reduce commute trips and congestion, and target 10 percent mode shift	**Consistent.** Although the number of employees that would be employed by the proposed project is unknown at the time of preparation of this report, the proposed project would comply with any City TDM programs should they apply. In addition, the CAP does not provide a numerical number of employees where a TDM program would be applicable.
AT-2: Bicycle infrastructure. Expand San Leandro's bicycle network and supportive bicycle infrastructure, including funding buildout of the City's bicycle network as identified in the current Bicycle and Pedestrian Master Plan, to meet commute trip, non-commute trip, and recreational needs.	**Consistent.** The proposed project would not inhibit the expansion of the City's bicycle network, because it would be consistent with existing Building Codes and would not prevent the installation of bicycle lanes or infrastructure adjacent to the project site.

San Leandro CAP Reduction Measure	Project Consistency
AT-3: Active transportation and micro-mobility. Commit to implementing bikeshare, scooters, and micro-mobility options, and accompanying creative payment options, such as accepting cash deposits for access. **AT-4:** Walkability. Improve walkability of all streets and paths in San Leandro, including removing barriers to walking and adding places of rest and shade. Prioritize new infrastructure and modernized curb ramps in majority people of color census tracts and near assisted living facilities and senior centers. **AT-5:** Public transit. Work collaboratively with AC Transit and BART for abundant, affordable, and accessible public transit through improved service frequency, coverage, and quality throughout San Leandro. Support efforts to increase schedule integration. **AT-6:** BART shuttles. Continue LINK and FLEX shuttle bus services connecting BART stations and other major activity centers, including efforts to improve shuttle efficiency and comprehensiveness. **AT-7:** Car sharing. Expand car sharing through additional incentives, location of car sharing sites, and education and outreach. **AT-8:** Autonomous vehicles. Explore opportunities to effectively reduce GHG emissions associated with autonomous vehicles.	**Not Applicable.** These CAP measures would be the responsibility of the City of San Leandro to implement and not individual development projects.
(TE)	
TE-1: Electric vehicle adoption. Conduct education and outreach to inform members of the public about the availability of EVs, and the economic incentives available to encourage EV adoption. **TE-2:** Increase the availability of publicly accessible EV charging stations at multi-family residential buildings, retail centers, offices, and public facilities.	**Consistent.** The proposed project includes the development of a new light industrial warehouse that would be subject to Title 24 requirements mandating EV charging infrastructure.
TE-3: Alternative commercial fuels. Support increases in community-wide uses of biomethane, biofuels from sustainable sources, and other emerging clean fuel technologies. **TE-4:** Municipal fleet fuel reduction. Further reduce fossil fuel use in municipal fleet operations. **TE-5:** EV financing. Support funding mechanisms (e.g., revolving loan fund, grants, public bank finance) to enable low-income truck owner-operators to upgrade to EVs without undue debt burden. **TE-6:** Electric taxis and TNCs. Promote fuel efficiency and alternative fuels for taxis and Transportation Network Companies (TNCs), including a funding mechanism to support ride sharing drivers to move	**Not Applicable.** These CAP measures would be the responsibility of the City of San Leandro to implement and not individual development projects.

San Leandro CAP Reduction Measure	Project Consistency
from fossil-fueled cars to EVs (e.g., require Lyft/Uber to pay for upgrade).	
(WM)	
WM-1: Increased curbside recycling. Increase participation in curbside recycling programs, including efforts to reduce material contamination and improvements to waste educational programs.	**Consistent**. The proposed project would comply with the City's construction debris and waste recycling ordinance. The proposed project would be provided waste removal services by Oro Loma Sanitary District, which provides recycling services for residential uses.
WM-2: Curbside composting. Expand participation in composting programs, including partnerships with community organizations such as StopWaste and a mandatory curbside composting program for all businesses.	**Consistent**. The Oro Loma Sanitary District would provide Green Waste bins for the proposed project's waste disposal and the proposed project would participate in composting by separating landscaping and yard waste into the appropriate bins.
WM-3: Recycling expansion. Continue to promote programs for recycling electronic waste and other materials that are not accepted in curbside bins.	**Not Applicable**. This CAP measure would be the responsibility of the City of San Leandro to implement and not individual development projects.
(WR)	
WR-1: Waste minimization. Explore emerging opportunities for waste minimization, including maker spaces, material reuse, and tool-lending libraries.	**Not Applicable**. This CAP measure would be the responsibility of the City of San Leandro to implement and not individual development projects.
WR-2: Construction and Demolition waste. Explore opportunities to exceed State requirements for construction and demolition materials by encouraging deconstruction and material reuse.	**Consistent**. The proposed project construction contractor would be required to comply with Municipal Code Section 3-7 related to construction waste and debris recycling.
WR-3: Commercial food waste reduction. Work with restaurants and other food-processing businesses to reduce food waste.	**Not Applicable.** The proposed project would not include commercial land uses.
WR-4: Industrial waste reduction. Work with business leaders and organizations to reduce industrial waste, including packaging materials.	**Consistent.** The proposed project owners would coordinate and work with the City on any industrial waste reduction goals or programs that would apply.
WR-5: Styrofoam and single-use plastics reduction. Continue to enforce bans on Styrofoam for food-related businesses and explore opportunities to reduce single-use plastic items. **WR-6:** Local compost. Support programs for locally-produced compost, including programs run by local and regional partners.	**Not Applicable**. This CAP measure would be the responsibility of the City of San Leandro to implement and not individual development projects.
(WE)	
WE-1: Reclaimed water. Expand San Leandro's reclaimed water system. **WE-2:** Greywater retrofits. Support installation of greywater recycling systems and other systems that capture runoff for domestic use and landscaping.	**Not Applicable**. This CAP measure would be the responsibility of the City of San Leandro to implement and not individual development projects.

San Leandro CAP Reduction Measure	Project Consistency
WE-3: Water-efficient retrofits. Promote water efficiency in existing homes and businesses.	
WE-4: New Greywater Installations. Continue to require water conservation and green infrastructure strategies as a condition of approval for major developments.	**Consistent.** The proposed project would include drought landscaping consistent with Title 24 and City of San Leandro requirements that would be appropriate for the local climate and contribute to conserving outdoor water use.
(CC)	
CC-1: Environmentally Preferred Purchasing. Continue to promote and enforce Environmentally Preferred Purchasing policies for City operations and encourage community businesses to adopt similar policies. **CC-2: Local Goods and Services.** Continue Keep It Local SL campaign efforts and encourage businesses providing a variety of goods and services to locate in San Leandro. **CC-3: Low Carbon Building Materials.** Work with local, regional, and State partners to expand the awareness of, availability, and cost-effectiveness of low carbon or carbon-free construction materials.	**Not Applicable.** These CAP measures would be the responsibility of the City of San Leandro to implement and not individual development projects.
CC-4: Carbon Sequestration. Promote increasing soil carbon and planting high carbon sequestering, climate appropriate species in landscaping projects.	**Consistent.** The proposed project would include landscaping consistent with City of San Leandro requirements that would be appropriate for the local climate and contribute to carbon sequestration on-site.
(EF)	
EJ-1: Green Job Training. Maximize opportunities for green jobs by supporting workforce training and other economic development activities in a manner that supports labor unions and improved equity. **EJ-2: Workforce Equity.** Prioritize formerly incarcerated individuals, individuals with barriers to employment for green workforce development programs through 'ban the box' and other procurement standards. Perform culturally-sensitive targeted outreach for these programs. **EJ-3: Just Transition.** Work to replace environmentally harmful industries with green jobs in a manner that benefits the health and well-being of workers from these industries.	**Not Applicable.** These CAP measures would be the responsibility of the City of San Leandro to implement and not individual development projects.
Source of San Leandro CAP Reduction Measures: City of San Leandro 2021 Climate Action Plan. July 21, 2021.	

As shown in Table 22, the proposed project would be consistent with the City's 2021 CAP and as a result, would be consistent with an adopted Qualified Greenhouse Gas Reduction Strategy that

addresses the proposed project's GHG emissions. Therefore, the proposed project would not generate GHG emissions that would have a significant impact on the environment and impacts would be less than significant.

5.1 - Mitigation

General Plan Mitigation

None.

Additional Recommended Mitigation

None.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 6: CONCLUSION

Based on the project understanding described above, the proposed project would result in less than significant impacts to air quality after incorporation of General Plan MM AQ-2B-1. As this mitigation measure would apply to all new development in the City, the proposed project would be required to implement these BMPs as part of compliance with existing regulations and would not be considered a new, additional mitigation measure.

The analysis further determined that the proposed project would not generate criteria pollutant, TAC, or GHG emissions, either directly or indirectly, that may have a significant impact on the environment or surrounding receptors; nor would the proposed project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions.

Graphical Representation of AERMOD Inputs and Dispersion Trend Calculated Using Unit Emissions

PLOT FILE OF PERIOD VALUES AVERAGED ACROSS 0 YEARS FOR SOURCE GROUP: ALL ug/m^3

Max: 345 [ug/m^3] at (575375.90, 4173620.14)

COMMENTS:	SOURCES: **4**	COMPANY NAME:	
	RECEPTORS: **775**	MODELER:	
	OUTPUT TYPE: **Concentration**	SCALE: 1:17,337 0 0.5 km	
	MAX: **345 ug/m^3**	DATE: **7/27/2022**	PROJECT NO.:

Control Pathway

Dispersion Options

Titles

C:\Lakes\AERMOD View\41940003 Washington Ave\41940003 Washington Ave

Dispersion Options

- ☐ Regulatory Default
- ☒ Non-Default Options

- ☒ Flat & Elevated Terrain
- ☐ No Stack-Tip Downwash (NOSTD)
- ☐ Run in Screening Mode
- ☐ Conversion of NOx to NO2 (OLM or PVMRM)
- ☐ No Checks for Non-Sequential Met Data
- ☐ Fast All Sources (FASTALL)
- ☐ Fast Area Sources (FASTAREA)
- ☐ Optimized Area Source Plume Depletion
- ☐ Gas Deposition

BETA Options:

- ☐ Capped and Horizontal Stack Releases
- ☐ Adjusted Friction Velocity (u*) in AERMET (ADJ_U*)
- ☐ Low Wind Options

- ☐ SCIM (Sampled Chronological Input Model)
- ☐ Ignore Urban Night / Daytime Transition (NOURBTRAN)

Dispersion Coefficient

Rural

Output Type

- ☒ Concentration
- ☐ Total Deposition (Dry & Wet)
- ☐ Dry Deposition
- ☐ Wet Deposition

Plume Depletion

- ☐ Dry Removal
- ☐ Wet Removal

Output Warnings

- ☐ No Output Warnings
- ☐ Non-fatal Warnings for Non-sequential Met Data

Pollutant / Averaging Time / Terrain Options

Pollutant Type

PM2.5

Averaging Time Options

Hours: ☒ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 6 ☐ 8 ☐ 12 ☐ 24

- ☐ Month
- ☒ Period
- ☐ Annual

Exponential Decay

- ☐ Yes
- ☒ No

Terrain Height Options

- ☐ Flat
- ☒ Elevated

SO: Meters
RE: Meters
TG: Meters

Flagpole Receptors

- ☒ Yes
- ☐ No

Default Height = 1.50 m

Chronic HI

Chronic non-cancer hazard index was estimated by dividing the annual DPM concentration (as $PM_{2.5}$ exhaust) by the DPM REL of 5 $\mu g/m^3$.

14143 Washington Ave Warehouse Project v2 Custom Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

2.2. Construction Emissions by Year, Unmitigated

2.3. Construction Emissions by Year, Mitigated

2.4. Operations Emissions Compared Against Thresholds

2.5. Operations Emissions by Sector, Unmitigated

2.6. Operations Emissions by Sector, Mitigated

3. Construction Emissions Details

3.1. Demolition (2024) - Unmitigated

3.2. Demolition (2024) - Mitigated

3.3. Site Preparation (2024) - Unmitigated

3.4. Site Preparation (2024) - Mitigated

3.5. Grading (2024) - Unmitigated

3.6. Grading (2024) - Mitigated

3.7. Building Construction (2024) - Unmitigated

3.8. Building Construction (2024) - Mitigated

3.9. Building Construction (2025) - Unmitigated

3.10. Building Construction (2025) - Mitigated

3.11. Paving (2025) - Unmitigated

3.12. Paving (2025) - Mitigated

3.13. Architectural Coating (2025) - Unmitigated

3.14. Architectural Coating (2025) - Mitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.1.2. Mitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.2. Electricity Emissions By Land Use - Mitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.2.4. Natural Gas Emissions By Land Use - Mitigated

4.3. Area Emissions by Source

4.3.1. Unmitigated

4.3.2. Mitigated

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

4.4.2. Mitigated

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

4.5.2. Mitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.6.2. Mitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.7.2. Mitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.8.2. Mitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.9.2. Mitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.2.2. Mitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.3.2. Mitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.9.2. Mitigated

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.11.2. Mitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.12.2. Mitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.13.2. Mitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

5.14.2. Mitigated

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

5.15.2. Mitigated

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

5.16.2. Process Boilers

5.17. User Defined

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

5.18.2.2. Mitigated

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	14143 Washington Ave Warehouse Project v2
Construction Start Date	1/1/2024
Operational Year	2025
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	3.30
Precipitation (days)	27.6
Location	37.70690910478942, -122.14525650152146
County	Alameda
City	San Leandro
Air District	Bay Area AQMD
Air Basin	San Francisco Bay Area
TAZ	1426
EDFZ	1
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.19

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description

Unrefrigerated Warehouse-No Rail	47.5	1000sqft	1.09	47,500	0.00	—	—	—
General Office Building	5.00	1000sqft	0.11	5,000	0.00	—	—	—
Parking Lot	90.3	1000sqft	2.07	0.00	0.00	—	—	—
City Park	0.17	Acre	0.17	0.00	0.00	0.00	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-2*	Limit Heavy-Duty Diesel Vehicle Idling
Construction	C-10-A	Water Exposed Surfaces
Transportation	T-14*	Provide Electric Vehicle Charging Infrastructure
Transportation	T-33*	Locate Project near Bike Path/Bike Lane
Transportation	T-34*	Provide Bike Parking
Energy	E-15	Require All-Electric Development
Waste	S-4*	Recycle Demolished Construction Material

* Qualitative or supporting measure. Emission reductions not included in the mitigated emissions results.

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Section 1

Executive Summary

EXECUTIVE SUMMARY

This report presents the findings of the transportation impact analysis conducted for the proposed warehousing development (Project) located at 14143-14273 Washington Avenue (APN: 077B 1222 003 03,et al, and Plan Check # PLN21-0031) in the City of San Leandro, California. The purpose of the study is to analyze and address traffic operations issues associated with the proposed Project.

The results of this study indicate that the project does not significantly impact traffic operations after the construction of the Project. WB-50 and WB-67 trucks would be accommodated at the Project driveways (Driveway B) and on-site; emergency vehicles would be accommodated and both site driveways.

FINDINGS

The following are the key findings of the traffic impact analysis conducted by Kittelson & Associates, Inc.

Proposed Development Plan

The Project is an approximately 47,500 -square-foot warehouse and a 5,000 square foot office, for a combined of a total 52,500 square foot project site area. The Project anticipates uses such as warehousing and industrial uses. The Project is proposing two project full access driveways on Washington Avenue – the northern driveway (Driveway A) is proposed to serve mostly automobile trips while the southern driveway (Driveway B) would be dedicated to truck traffic to access the loading docks at the rear of the building and some automobile traffic as well.

For purposes of this analysis, the total number of Project-generated trips were evaluated for Existing Plus Project and Cumulative (2035) Plus Project conditions.

Traffic Operations

Based on traffic operation results, some of the intersections do not operate within the threshold under Existing and Cumulative conditions however, none of the study intersections cause significant impact under Existing, Existing Plus Project, Cumulative, and Cumulative Plus Project traffic conditions during the weekday AM and PM peak hour.

Table 1 summarizes traffic operations for the study intersections under year 2022 Existing traffic conditions, year 2022 Existing Plus Project traffic conditions, year 2035 Cumulative traffic conditions, and year 2035 Cumulative Plus Project traffic conditions. Based on traffic operation results, some of the intersections do not operate within the threshold under Existing and Cumulative conditions however, none of the study intersections cause significant impact under Existing, Existing Plus Project, Cumulative, and Cumulative Plus Project traffic conditions during the weekday AM and PM peak hour.

Table 1. Study Intersections Operations Summary

#	North-South Street	East-West Street	Control Type[1]	Peak Hour	Existing			Existing Plus Project			Impact?	Cumulative			Cumulative Plus Project			Impact?
					V/C[2]	Delay	LOS[3]	V/C	Delay	LOS		V/C	Delay	LOS	V/C	Delay	LOS	
1	Washington Avenue	San Leandro Boulevard	Signal	AM	0.73	51.4	D	0.73	52.7	D	NO	0.90	103.0	*F*	0.92	103.6	*F*	NO

2	Washington Avenue	143rd Avenue	Signal	AM	0.66	10.4	B	0.67	10.6	B	NO	0.76	12.5	B	0.77	13.1	B	NO
				PM	0.49	7.1	A	0.49	7.1	A	NO	0.58	7.3	A	0.59	7.3	A	NO
3	Washington Avenue	Halcyon Drive/Floresta Boulevard	Signal	AM	0.73	80.4	*F*	0.74	79.9	*E*	NO	0.86	77.4	*E*	0.87	77.2	*E*	NO
				PM	0.58	41.6	D	0.59	41.6	D	NO	0.72	45.4	D	0.72	45.4	D	NO
A	Washington Avenue	Driveway A	TWSC	AM	-	-	-	0.01	14.0	B	NO	-	-	-	0.01	17.3	C	NO
				PM	-	-	-	0.10	18.2	C	NO	-	-	-	0.16	27.1	D	NO
B	Washington Avenue	Driveway B	TWSC	AM	-	-	-	0.00	10.0	B	NO	-	-	-	0.03	10.6	B	NO
				PM	-	-	-	0.01	12.3	B	NO	-	-	-	0.01	13.9	B	NO

[1] Intersection control type: TWSC = two-way-stop-control, Signal = Traffic Signal | [2]V/C = volume-to-capacity ratio (HCM 2000) | [3]LOS = Intersection Level of Service | Intersections that do not meet agency thresholds for LOS D (signal); Intersections operating at unacceptable level of service under cumulative conditions without the project have a significant impact if the project increases the average delay at unsignalized intersections by more than 5 seconds, or increases the v/c ratio by 0.05 or more at a signalized intersection are shown highlighted and in bold and *italics.* (Bold denotes exceeds City standard. Bold and Shaded denotes Project Impact).

Existing Conditions

- Under Existing conditions, all study intersections would operate acceptably at LOS D or better during the weekday AM and PM peak hours except:
    - Washington Avenue/Halcyon Drive/Floresta Boulevard during the weekday AM peak period (LOS F).
- Turn queues at Washington Avenue/San Leandro Boulevard and Washington Avenue/Halcyon Drive/Floresta Boulevard exceed capacity of their left-turn and right-turn pockets as presented in Table 5 and Table 6 of the study.
- Under Existing Plus Project conditions with the addition of Project traffic, all study intersections would continue to operate acceptably at LOS D or better during the weekday AM and PM peak hours except:
    - Washington Avenue/Halcyon Drive/Floresta Boulevard during the weekday AM peak period (LOS E). However, the addition of the Project does not result in a significant impact as the increase in v/c ratio is less than 0.05.
- Left-turn queues and right-turn queues that will exceed their respective turn pockets during the AM and PM peak hours under Existing conditions without the Project would experience minimal change in length with the addition of the Project traffic.
- Washington Avenue/Driveway A and Washington Avenue/Driveway B (Intersection A & B) operate within the threshold. Around three northbound left-turning vehicles are expected at Driveway B during the weekday AM peak hours under Existing Plus Project conditions.

Vehicle Miles Traveled Impact Analysis

- The Vehicle Miles Traveled (VMT) analysis was conducted using the Alameda County transportation Commission (ACTC) guidelines to determine if the project constitutes a VMT impact under SB-743.
- The average target (with a 15% reduction from the target value) VMT per employee in the Central Planning Area is 16.3, and the project area zone has an average VMT per employee of 15.23. Since the project is located in an area with below average VMT based on the threshold, the project would have a less-than-significant VMT impact and can be screened out of a detailed VMT analysis.

Trip Generation and Distribution

- The Project would generate a net new 329 daily trips, 44 AM peak hour trips (40 inbound/4 outbound) and 40 PM peak hour trips (4 inbound/36 outbound). The distribution of Project trips was developed using the Countywide Model.

Cumulative (2035) Conditions

- Under Cumulative (2035) Conditions, all study intersections would operate acceptably at LOS D or better during the weekday AM and PM peak hours except:
    - Washington Avenue/San Leandro Boulevard during the weekday AM peak period (LOS F) and weekday PM peak period (LOS E)

  - Washington Avenue/Halcyon Drive/Floresta Boulevard during the weekday AM peak period (LOS E)

- Turn queues at all study intersections exceed capacity of their left-turn and right-turn pockets as presented in Table 14 and Table 15 of the study.
- Under Cumulative (2035) Plus Project conditions with the addition of Project traffic, all study intersections would continue to operate acceptably at LOS D or better during each peak hour except:
  - Washington Avenue/San Leandro Boulevard during the weekday AM peak period (LOS F) and weekday PM peak period (LOS E)
  - Washington Avenue/Halcyon Drive/Floresta Boulevard during the weekday AM peak period (LOS E)
- Left-turn queues and right-turn queues that will exceed their respective turn pockets during the AM and PM peak hours under Cumulative (2035) conditions without the Project would experience minimal change in queue length with the addition of the Project traffic.
- Washington Avenue/Driveway A and Washington Avenue/Driveway B (Intersection A & B) operate within the threshold. Around three northbound left-turning vehicles are expected at Driveway B during the weekday AM peak hours under Cumulative Plus Project conditions.

Site Access and On-Site Circulation

- Analysis of truck turns at the driveways demonstrated that Driveway B on Washington Avenue can accommodate WB-50 and WB-67 trucks. Both Driveway A and Driveway B can accommodate emergency vehicles. Based on the roadway width and width at Driveway B shown in the site plan, WB-50 and WB-67 trucks exiting the Driveway B should do so first before trucks enter the driveway.
- Analysis of on-site truck maneuvers demonstrated that the drive aisles can accommodate circulation of WB-67 trucks, WB-50 trucks and emergency vehicles, including maneuvering to back a trailer to a dock.

Truck Operations

- The Project would generate a total of 56 daily truck trips, 8 AM peak hour trips (7 inbound/1 outbound) and 7 PM peak hour trips (1 inbound/6 outbound). Therefore, the Project would generate approximately 5 trucks per hour on a daily basis

Parking

- Based on the site plan, the Project provides 69 parking stalls, which meets the City requirement of 53 spaces.

Transit, Bicycle, and Pedestrian Facilities

- Due to its industrial nature, the Project is expected to generate negligible transit, bicycle, and pedestrian trips. As such, the Project's impact on transit, bicycle, and pedestrian facilities is expected to be minimal and not significant during Existing Plus Project and Cumulative (2035) Plus Project conditions.

Alameda CTC Congestion Management Plan

- The project generates less than 50 vehicle trips in the PM peak hour, and therefore a CMP analysis is not required.

RECOMMENDATIONS

- Based on the findings of the traffic impact analysis conducted, no recommendations are suggested for this study.

Introduction

INTRODUCTION

This report presents the findings of the transportation impact analysis conducted for the proposed warehousing development (Project) located at 14143-14273 Washington Avenue (APN: 077B 1222 003 03,et al, and Plan Check # PLN21-0031) in the City of San Leandro, California (City). The purpose of this study is to analyze and address traffic operations issues associated with the proposed Project.

PROJECT DESCRIPTION

The Project is an approximately 47,500 square-foot warehouse and a 5,000 square foot office, for a combined of a total 52,500 square foot project site area. To be conservative, the team assumed 52,500 square feet of General Light Industrial facility. The Project anticipates uses ranging from warehousing to wholesale or retail distribution. The Project is proposing two project full access driveways on Washington Avenue – the northern driveway is proposed to serve mostly automobile trips while the southern driveway would be dedicated to truck traffic to access the loading docks at the rear of the building and some automobile traffic as well.

The Project is located in the southern part of San Leandro in a predominantly industrial area surrounded by residential neighborhoods. Access to the regional network for trucks and autos is provided by I-880 and I-238 to the south, and I-580 to the east, for autos only. Bay Fair Center is immediately to the east via Halcyon Drive and it is anticipating a planned major upgrade via the current Bay Fair Specific Plan and EIR.

Figure 1 shows the Project's location. Figure 2 shows the site plan.

STUDY OBJECTIVES

This study analyzes the transportation-related effects of the Project, in particular:

- Operations and queuing at three signalized most likely to be impacted;
- Vehicle queuing at driveways;
- Operation at transit, bike, and pedestrian facilities;
- Site access; and
- On-site circulation and parking.
- VMT Assessment

ANALYSIS METHODOLOGIES AND LEVEL OF SERVICE STANDARDS

The assessment of the Project is based on transportation impact criteria per the City of San Leandro. "Levels of service" describe the operating conditions experienced by motorists. Level of service (LOS) is a qualitative measure of the effect of a number of factors, including speed and travel time, traffic interruptions, freedom to maneuver, driving comfort, and convenience. LOS are designated A through F, from best to worst, which cover the entire range of traffic operations that might occur. LOS A through E generally represent traffic volumes at less than roadway capacity while LOS F represents over-capacity and/or forced-flow conditions. Per City guidelines, LOS D is generally considered to represent the minimum acceptable design standard.

Intersection LOS

Intersection analysis was conducted using the operational methodology outlined in the *Highway Capacity Manual (HCM) 6th Edition* at all intersections, as operationalized by Synchro version 11 software tool. The HCM methodology assigns a level of service (LOS) grade to an intersection based on the delay for vehicles at the intersection, ranging from LOS A to LOS F; LOS A signifies very slight delay with no approach phase fully utilized, while LOS F signifies very high delays and congestion, frequent cycle failures, and long queues. For signalized

and all-way stop-controlled intersections, the average control delay for all vehicles is assessed; for two-way stop-controlled intersections, the intersection approach with the highest delay is utilized.

Table 2 presents LOS based on the Highway Capacity Manual (HCM) 6th edition definitions and Table LU-1 (Level Of Service Interpretation For Intersections and Freeways) of the San Leandro 2035 General Plan.

Table 2: Level of Service Standards

LOS	Description of Traffic Conditions at Intersections	Delay Per Vehicle (Seconds)	
		Signalized Intersection	Unsignalized Intersection
A	Free flowing. Most vehicles do not have to stop.	< 10.0	< 10.0
B	Minimal delays. Some vehicles have to stop, although waits are not bothersome.	> 10.0 to 20.0	> 10.0 to 15.0
C	Acceptable delays. Significant numbers of vehicles have to stop because of steady, high traffic volumes. Still, many pass without stopping.	> 20.0 to 35.0	> 15.0 to 25.0
D	Tolerable delays. Many vehicles have to stop. Drivers are aware of heavier traffic. Cars may have to wait through more than one red light. Queues begin to form, often on more than one approach.	> 35.0 to 55.0	> 25.0 to 35.0
E	Significant delays. Cars may have to wait through more than one red light. Long queues form, sometimes on several approaches.	> 55.0 to 80.0	> 35.0 to 50.0
F	Excessive delays. Intersection is jammed. Many cars have to wait through more than one red light, or more than 60 seconds. Traffic may back up into "up-stream" intersections.	> 80.0	> 50.0

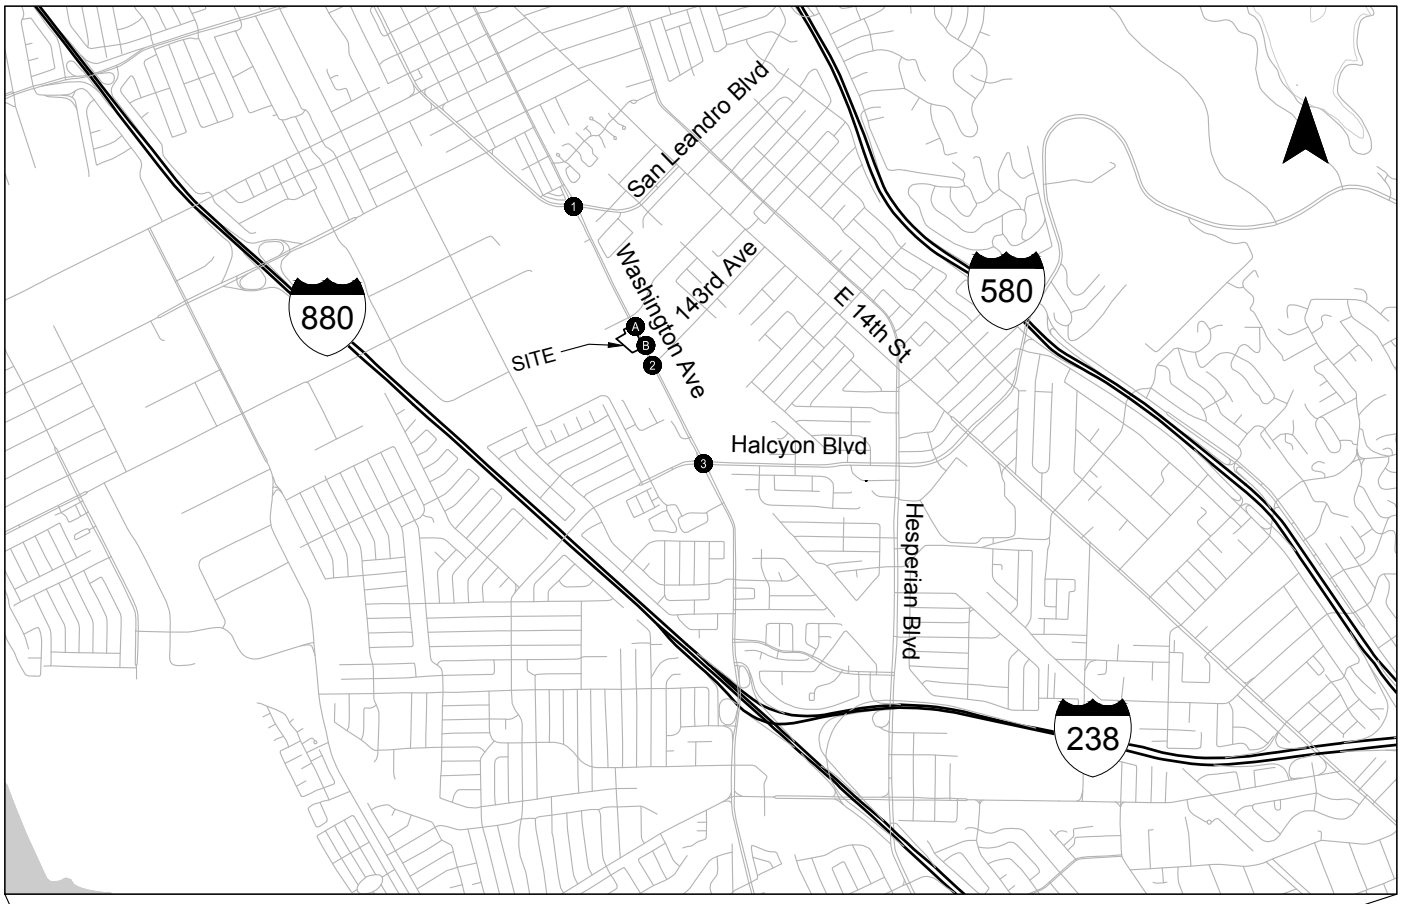
Source: *Highway Capacity Manual, 6th Edition*

Significant Impact Threshold

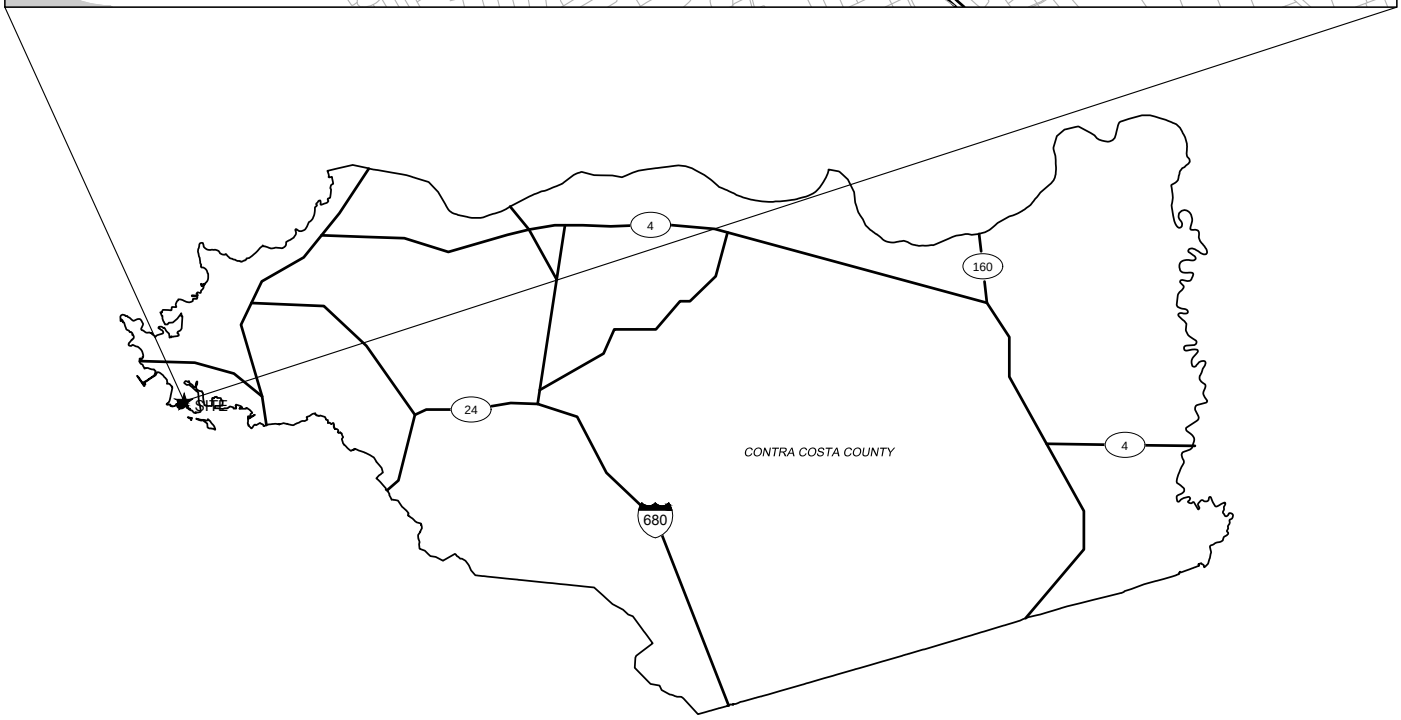
The San Leandro General Plan 2035 establishes the standard for intersection operations at LOS D. An impact is considered significant for intersections when the Project causes the facility to change from LOS D or better to LOS E or worse. LOS D may only be exceeded where the following circumstances exists:

- Road improvements are not possible because the necessary right-of-way does not exist and cannot be acquired without significant impact on adjacent buildings and properties
- The intersection or road segment is in a pedestrian district, such as Downtown where the priority is on pedestrian, bicycle, and public transit access rather than vehicle traffic.

For facilities that are, or will be (cumulative condition), operating at an unacceptable level of service without the Project, an impact is considered significant if the Project increases the volume-to-capacity (v/c) ratio by 0.05 or more at a signalized intersection; or increases the average delay at unsignalized intersections by more than 5 seconds.



Queuing Analysis



Intersection queueing compared 95th percentile queues with existing available storage lengths. These 95th percentile queues at the study intersections were reviewed to identify locations where they may exceed the available storage. The 95th percentile queue lengths represent queues that have only a 5-percent probability of exceeding the available storage lengths. This measure is typically used in traffic engineering as a

conservative measure of queuing, and since it only has a 5-percent probability of being exceeded, the average driver would likely experience shorter queue lengths than what is being reported.

Additional Analysis

The analysis also considers the Project's potential effects on site access and circulation, truck operations, parking, transit operations, bicycling and walking.

SCOPE OF THE REPORT

The analyses performed for this report determine the transportation-related effects of the proposed Project and were prepared in accordance with the scope of work prepared on March 22, 2022, City of San Leandro Generic Scope of Work for Traffic Impact Analysis (2016), and discussions with City staff.

The scoping agreement memorandum is presented in Appendix A.

This report evaluates the following transportation elements for the site:

- Roadway Network Overview
- Traffic Conditions: LOS analysis was performed to assess the performance of the circulation system for the weekday morning (AM) and evening (PM) peak hours for the following four scenarios:
    - *Intersection operations analysis for 3 signalized intersections under Existing Conditions, Existing Plus Project Conditions, Cumulative Conditions and Cumulative Plus Project Conditions*
    - *Intersection operations analysis for 2 unsignalized full access driveways under Plus Project Conditions, and Cumulative Plus Project Conditions*
- Vehicle Miles Traveled Impact Analysis
- Project Trip Generation and Distribution
- Site Circulation and Analysis
- Truck Operations
- Parking Needs Assessment
- Transit, Bicycle and Pedestrian Facilities Evaluation

STUDY INTERSECTIONS

The following 3 intersections were selected for morning weekday (AM) and evening weekday (PM) peak hour analysis based on their proximity to the Project site and the time of day that travel to and from the Project site would have the greatest effect on the transportation system:

- Intersection #1: Washington Avenue & San Leandro Boulevard
- Intersection #2: Washington Avenue & 143rd Avenue
- Intersection #3: Washington Avenue & Halcyon Drive/Floresta Boulevard

These intersections are shown in Figure 1.

Section 3

Existing Conditions

EXISTING CONDITIONS

The Existing Conditions analysis identifies the site conditions and current operational and geometric characteristics of the study intersections as well as transit services, bicycle, and pedestrian facilities near the project site.

ROADWAY NETWORK

The existing roadway network in the study area is comprised of the freeway system that serves Alameda County and an extensive street system made up of arterial and local roads.

Freeways

Interstate 880 (I-880) is a nine-lane freeway in the vicinity of the Project with a posted speed limit of 65 miles per hour. The north-south freeway connects San Leandro with nearby cities, such as Hayward and Oakland, and regional destinations, such as Fremont and San Jose. It also provides access to the greater freeway network with direct connections to Interstates 80, 580, 980, 238, US Highway 101, and State Routes 92, 237 and 17. The Project site is served by the interchange at Washington Avenue. The average daily traffic on I-880 in the vicinity of Washington Avenue ranges between 190,000 and 237,500 vehicles per day[1]. Bicycling and walking are not allowed on this facility. I-880 is the primary route for large trucks from the Airport and Port to San Leandro.

Interstate 238 (I-238) is a seven-lane freeway in the vicinity of the Project with a posted speed limit of 65 miles per hour. The east-west freeway serves as a connection between Interstate 880 and Interstate 580. The Project site is served by the interchange at Washington Avenue. The average daily traffic on I-880 in the vicinity of Washington Avenue ranges between 162,000 and 102,000 vehicles per day[2]. Bicycling and walking are not allowed on this facility.

Interstate 580 (I-580) is an eight-lane freeway in the vicinity of the Project with a posted speed limit of 65 miles per hour. The north-south freeway connects San Leandro with nearby cities, such as Oakland and Pleasanton, and regional destinations, such as Stockton. It also provides access to the greater freeway network with direct connections to Interstates 5, 205, 238, 680, 80 and 880, and State Routes 13, 24, and 84. The Project site is served by the interchange at Fairmont Drive. The average daily traffic on I-880 in the vicinity of Fairmont Drive ranges between 119,300 and 143,500 vehicles per day[3]. Bicycling and walking are not allowed on this facility. Trucks are prohibited on the section of I-580 north of I-238.

Arterials

Washington Avenue is an east-west road that has four lanes in the Project vicinity. The posted speed limit is 35 miles per hour. It extends from the Grant Avenue to W Juana Avenue in Downtown San Leandro. Sidewalks are located along the east and west sides of Washington Boulevard in the study area, with the exception of the overpass between Springlake Drive to Beatrice Street, where there is a sidewalk only on the west side of the roadway. It is also designated as a through truck route.

Halcyon Drive is a four-lane, east-west residential arterial with a posted speed limit of 40 miles per hour in the Project vicinity. It spans from Hesperian Drive to Washington Avenue. To the east, Halcyon Drive transitions to

[1] 2019 Traffic Volumes, California Department of Transportation (Caltrans) http://www.dot.ca.gov/trafficops/census/
[2] 2019 Traffic Volumes, California Department of Transportation (Caltrans) http://www.dot.ca.gov/trafficops/census/
[3] 2019 Traffic Volumes, California Department of Transportation (Caltrans) http://www.dot.ca.gov/trafficops/census/

Fairmont Drive, and to the west, it transitions to Floresta Boulevard. Halcyon Drive is designated as a local truck route. Sidewalks are provided on both sides of the street in the study area.

San Leandro Boulevard is a north-south arterial connecting the City of San Leandro to Fruitvale near Alameda. In the Project vicinity, it is a four-lane road with a landscaped median separating the northbound and southbound lanes. The posted speed is 40 miles per hour, and it is a designated truck through route. Sidewalks are provided on both sides of the street, and parking is permitted along some segments.

Collector

143rd Avenue (collector) is a two-lane, east-west collector, connecting Washington Avenue and 14th Street. The posted speed limit is 30 miles per hour, and parking is permitted on both sides of the street. It is also a designated local truck route and crosses over railroad tracks about 650 feet east of the intersection at 143rd Avenue and Washington Avenue.

Pedestrian Facilities

At the Project site, the main pedestrian facilities are an eight-foot sidewalk (west side) and seven-foot sidewalk (east side) on either side of Washington Avenue along the west side of the site. There are two at-grade railroad crossings (one active, one inactive) located south of the Project site. Two signalized intersections (Washington Avenue/139th Avenue and Washington Avenue/143rd Avenue) with marked crosswalks are located within one quarter of a mile of the Project site.

Bicycle Facilities

Bicycling facilities are important components of the transportation network in the study area. They offer non-vehicular opportunities for commuting and also provide connections to BART and bus stations that allow access to the regional's transit network.

Bicycle facilities are defined by the following four classes in Chapter 1000 of California Department of Transportation's Highway Design Manual:

Class I (Bike Path) – Provides a completely separated facility designed for the exclusive use of bicyclists and pedestrians with crossing points minimized. Bike paths typically serve corridors not served by streets and highways or where wide right of way exists, permitting such facilities to be constructed away from the influence of parallel streets.

Class II (Bike Lane) – Provides a restricted right-of-way designated lane for the exclusive or semi-exclusive use of bicycles with through travel by motor vehicles or pedestrians prohibited, but with vehicle parking and cross-flows by pedestrians and motorists permitted. Bike lanes are established along streets in corridors where there is significant bicycle demand, and where there are distinct needs that can be served by them.

Class III (Bike Route) – Shared facilities which provide continuity to other bicycle facilities (usually Class II bikeways) or designate preferred routes through high demand corridors.

Class IV (Separated Bikeways) – Provides a exclusive right-of-way including a separation required between the separated bikeway and the through vehicular traffic

There are sections of Class II bikes lanes in the Project vicinity. There are marked Class II bike lanes on:

- Washington Avenue between 139th Avenue Drive and 143rd Avenue,
- Washington Avenue between Caliente Drive and Anza Way,
- Floresta Boulevard/Farnsworth Street between Washington Avenue and Corvallis Street,
- Fremont Avenue between Floresta Boulevard and Alvarado Street,
- Halcyon Drive between Hesperian Boulevard and the railroad crossing immediately west of Adason Drive,

- San Leandro between East 14th Street and Creekside Plaza, and
- Hesperian Boulevard/Bancroft Avenue between East 14th Street and Springlake Drive.

There are also several Class III bike routes that provide connections between bike lane facilities. These include:

- Bancroft Avenue between East 14th Street and 146th Avenue,
- Alvarado Street between Fremont Avenue and Teagarden Street,
- Castro Street between Washington Avenue and E 14th Street,
- Sybil Avenue between E 14th Street and Grand Avenue,
- 143rd Avenue between Washington Avenue and Bancroft Avenue, and
- 150th Avenue between Hesperian Boulevard and East City Limits.

The San Leandro Bicycle and Pedestrian Master Plan (2018 Update) proposed a number of improvements to better connect the existing bicycle network in the city, including several segments in the study area. The Plan proposed Class II bike lanes that would close gaps on Halcyon Drive between Washington Avenue and the railroad tracks, and on Washington Avenue between Halcyon Drive and 143rd Avenue. The Plan also proposed Class I bike paths along the railway tracks to connect the proposed Class II facility on Washington Avenue and Halcyon Drive to the Class II facility on San Leandro. The proposed Class I bike paths would not only connect the San Leandro and Bay Fair BART stations, but would also provide access to Halcyon Drive and Washington Avenue in the Project area.

Transit Service

The transit system in the study area includes bus and rail services provided by Alameda-Contra Costa Transit District (AC Transit) and Bay Area Rapid Transit (BART). As presented in Table 3, AC Transit provides three routes in the study area, Line 10, Line 28 and Line 40, which operate on weekdays and weekends. Line 10 runs along on E 14th Street on the east side of the Project site and connects to the San Leandro BART station. Line 28 runs along Halcyon Drive on the south side of the Project site and connects to the San Leandro BART station a swell. Line 40 runs along Bancroft Avenue on the east side of the Project site and connects to the Bayfair BART station. Both the San Leandro and Bayfair BART stations are less than 2 miles from the Project site. There are two bus stops in close proximity to the Project site. Both stops are served by Line 28 and is located along Halcyon Drive/Floresta Boulevard, located south of the Project. The Washington Avenue/Halcyon Drive stop is about 400 feet from Washington Avenue/Halcyon Drive/Floresta Boulevard (signalized intersection with marked crossings) and the Fremont Avenue/Floresta Boulevard stop is about 600 feet from the intersection; the Project site is about 0.5 miles away from Washington Avenue/Halcyon Drive/Floresta Boulevard.

Table 3: AC Transit Bus Service in the Study Area

Route	Serving	Main Timepoints	Day	Times	
10	San Leandro, Hayward	San Leandro BART; Bay Fair BART; Hayward BART	Weekday	First	4:58 AM
				Last	12:39 AM
				Frequency	20 minutes
			Weekend	First	6:20 AM
				Last	12:28 PM

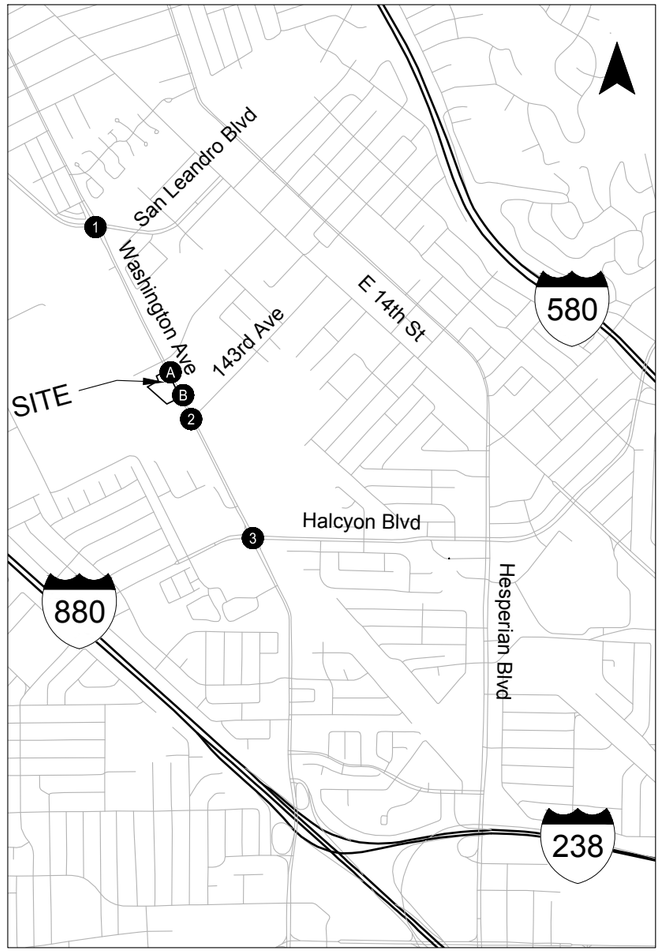
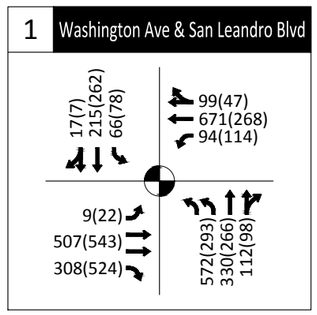
Kittelson & Associates, Inc., 2022

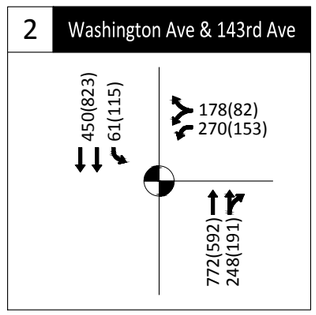
Railroad Crossing



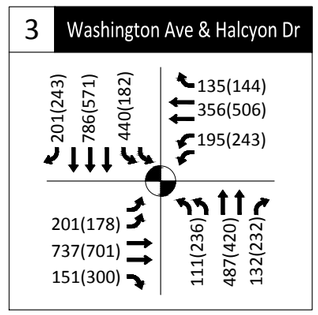
In the study area, Washington Avenue and Halcyon Drive are bisected by at-grade railroad crossings. As observed using aerial photography, all of the at-grade crossings in the study area appear to be provided with adequate features to facilitate traffic crossings for people driving, biking, and walking, including concrete pavement beds, warning bells, and crossing gates. There are two at-grade railroad crossings near the Project site. To the south of the Project, there is a rail crossing just east of the intersection of Washington Avenue and Halcyon Drive. There is another railroad crossing west of the Project site, just north of the Washington Avenue and Halcyon Drive intersection (north of Chapman Road).



EXISTING TRAFFIC OPERATIONS



The three study intersections listed in Section 2 and shown in Figure 1 were selected for morning weekday (AM) and evening weekday (PM) peak hour analysis based on their proximity to the Project site and the time of day that travel to and from the Project site would have the greatest effect on the transportation system.



Due to Covid conditions, new counts were not available, so traffic counts collected for the San Leandro Business Center at 100 Halcyon Drive in June 2017 were used for intersections in order to establish a basis for analysis in this study. These counts were adjusted by 1% per year (5% total) to reflect 2022 conditions.

The existing geometries and peak hour volumes for Existing Conditions are shown in Figure 3. The traffic count sheets used in this study are presented in Appendix B.

INTERSECTION OPERATIONS

The existing operations at the three study intersections are shown in Table 4. The results indicate that all study intersections are operating at LOS D or better during both peak hours, except:

- Intersection #3: Washington Avenue/ Halcyon Drive/Floresta Boulevard: During the weekday AM peak period, this intersection operates unacceptably at LOS F under Existing conditions.

The detailed LOS worksheets are presented in Appendix C.

Table 4: Existing Conditions Intersection Operations Results

#	North-South Street	East-West Street	Control Type	Peak Hour	Existing		
					V/C	Delay	LOS
1	Washington Avenue	San Leandro Boulevard	Signal	AM	0.73	51.4	D
				PM	0.52	41.9	D
2	Washington Avenue	143rd Avenue	Signal	AM	0.66	10.4	B
				PM	0.49	7.1	A
3	Washington Avenue	Halcyon Drive/Floresta Boulevard	Signal	AM	0.73	80.4	*F*
				PM	0.58	41.6	D

Intersection Queues

The 95th percentile queue represents the near maximum expected queue for an intersection turn movement during a peak hour. As mentioned in Section 2, five percent (5%) of the peak hour would experience queues longer than the 95th percentile queues reported in Table 5 and Table 6. During the remaining 95 percent of the peak hour, queues would be shorter than the queue lengths reported in these tables.

As shown in the following tables, some left-turn and right-turn queues currently exceed their respective turn pockets during part of the AM and PM peak hours.

Eastbound right-turn queues during the weekday PM peak hour and westbound left-turn queues during the weekday AM and PM peak hour at Washington Avenue/San Leandro Boulevard exceed the storage capacity by one vehicle length. Westbound right-turn queues from the intersection of Washington Avenue/Halcyon Drive/Floresta Boulevard do not reach the railroad crossing located on Washington Avenue east of the intersection. Westbound left-turn queues are within the storage capacity but spill back beyond the railroad crossing located on Halcyon Drive east of the intersection so when a train is present, vehicles are required to stop east of the crossing gate.

The detailed queue worksheets are presented in Appendix C.

Table 5: 95th Percentile Queue under Existing Conditions, AM Peak Hour

#	Intersection		Eastbound		Westbound		Northbound		Southbound	
			Left	Right	Left	Right	Left	Right	Left	Right

Section 4

Vehicle Miles Traveled Impact Analysis

VEHICLE MILES TRAVELED IMPACT ANALYSIS

The project is located at 14143-14273 Washington Avenue (APN: 077B 1222 003 03,et al, and Plan Check # PLN21-0031), in the City of San Leandro, CA. The proposed project consists of the development of one new warehousing spec building.

The project is 52,500 square feet (sf) of industrial/warehouse uses consisting of 47,500 sf of warehouse and 5,000 sf of office space. Access to the project site would be via two driveways along Washington Avenue. One driveway would be located at the northern portion of the site and the other driveway would be located at the southern portion of the site with access to Washington Avenue via both driveways. The project site and study area are shown in Figure 1. The proposed site plan is shown in Figure 2.

This section discusses the results of the Vehicle Miles Traveled (VMT) analysis using the Alameda County transportation Commission (ACTC) guidelines and OPR recommendations to determine if the project constitutes a VMT impact under SB-743.

EQUIVALENT LAND USE AND APPLICABLE THRESHOLDS AND SCREENING CRITERIA

Since the City of San Leandro has not developed VMT impact thresholds of significance that cover different land-use types, the ACTC VMT impact thresholds are used to evaluate VMT impacts. This is generally consistent with OPR's technical advisory, which provided recommended metrics and impact thresholds for residential, office, and retail projects, since they tend to have the greatest influence of land use projects on VMT in California.

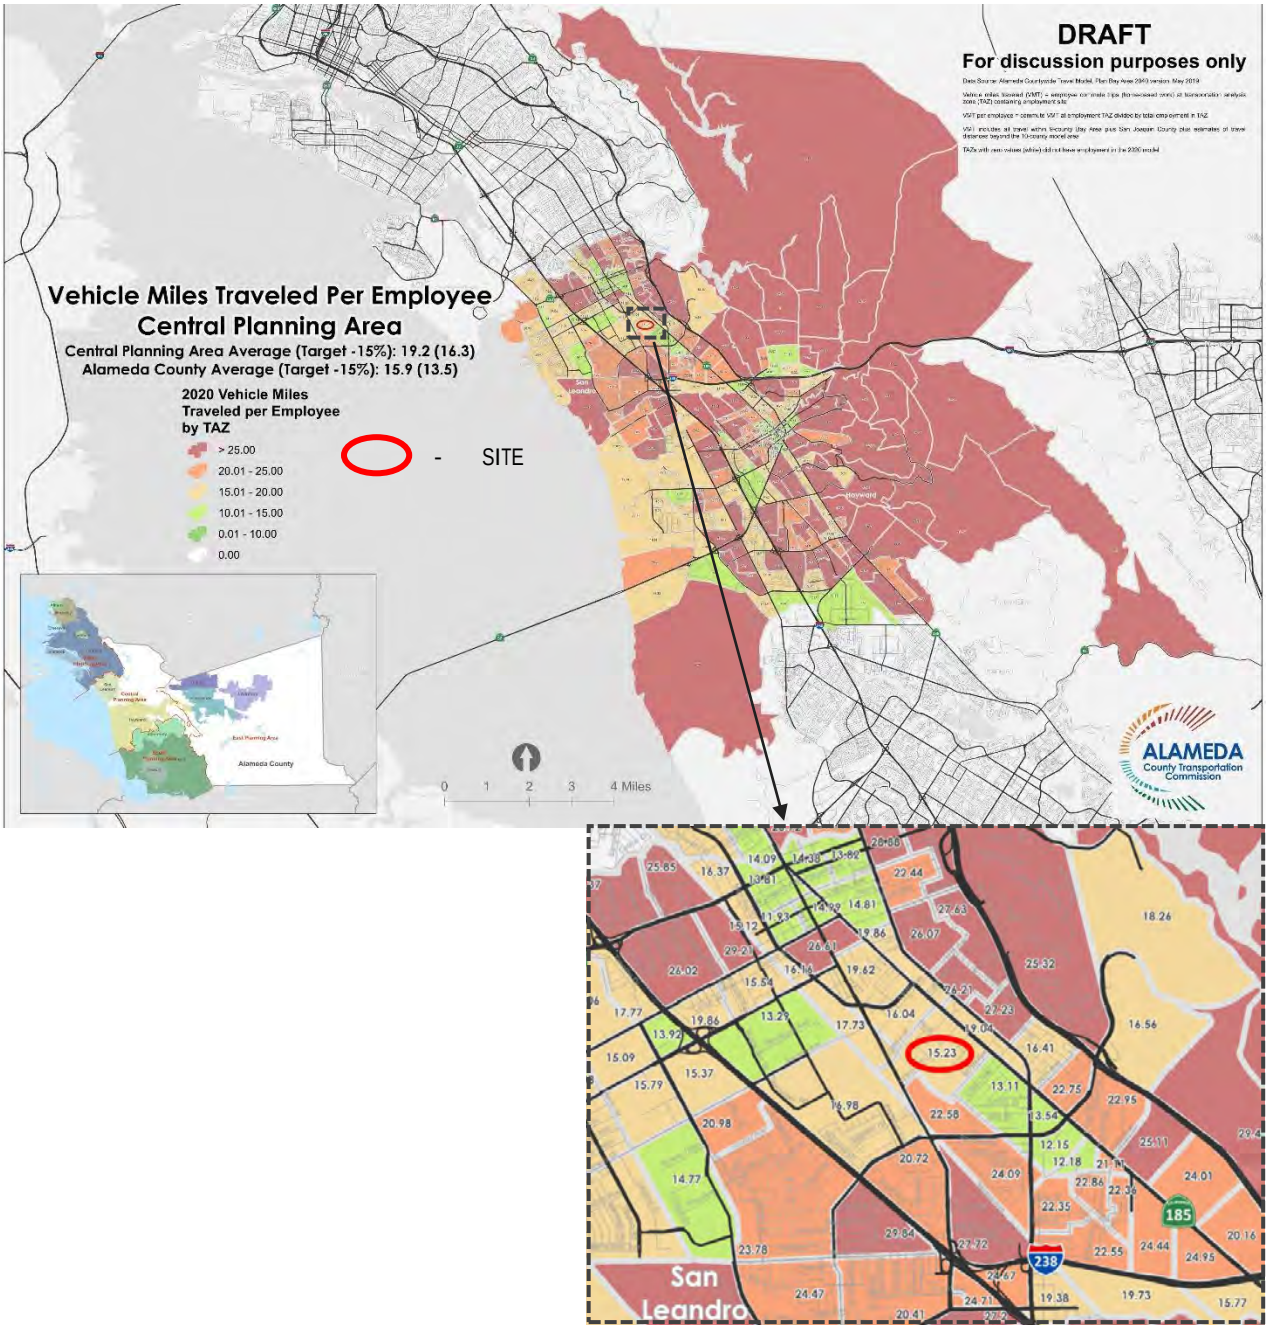
ACTC's thresholds of significance by land use are shown in Figure 4. Given that the project is an industrial park with primarily industrial uses and other minor supporting uses, it was determined that the employment-industrial threshold (VMT per employee below the Central Planning Area average) would be appropriate to apply to the project. The Central Planning Area VMT per employee average threshold is appropriate for this project and not the Alameda County VMT per employee average threshold since at the County level, the North, South, East and Central Planning Areas are included which encompasses various land-use types including high-density areas with high transit, pedestrian and bike access whereas, at the Central Planning Area level, the majority of the area encompasses the City of San Leandro and City of Hayward and both cities have similar land-use type and density characteristics.

VMT SCREENING

OPR recommends before any VMT analysis is undertaken, the Project must undergo screening using the City's screening criteria to determine if it can be expected to cause a less-than-significant impact without conducting a detailed VMT study.

OPR and ACTC's suggested screening criterion for projects analyzed under the employment-industrial threshold is detailed below:

- If the project has less than 110 weekday daily trips per day
- If there is high-capacity transit (15-minute frequency) within half mile of the project available.
- If the project is located in areas with below Central Planning Area average VMT per employee



The low-VMT area screening criterion applies to this project and the project can be screened out of a detailed VMT analysis for the following reasons:

- As shown in Figure 4, the project is located in an area with below average VMT.

The average target (with a 15% reduction from the target value) VMT per employee in the Central Planning Area is 16.3, and the project area zone has an average VMT per employee of 15.23. Therefore, the project is in an area that reports less than the target (with a 15% reduction from the target value) VMT per employee. Therefore, VMT reductions would not be needed for the project.

The low-VMT area criterion for industrial projects can therefore be applied to the project and it would not require a detailed VMT analysis. Therefore, the project would have a less-than-significant VMT impact.

Figure 4: VMT Per Employee Central Planning Area Screening Map

Section 5

Traffic Impact Analysis

TRAFFIC IMPACT ANALYSIS

The transportation impact analysis identifies how the study area's transportation system will operate when the proposed Project is operational. The effects of traffic that would be generated by the Project during the typical weekday AM and PM peak hours were examined as follows:

- Site-generated trips were estimated for a 52,500-square-foot General Light Industrial facility.
- The site trip distribution was developed using the Alameda CTC Countywide Model as modified in 2016 for the City of San Leandro General Plan land use buildout (Countywide Model).
- Existing Plus Project conditions accounting for existing traffic volumes and new trips associated with the Project were analyzed during the AM and PM peak hours.
- Cumulative (2035) conditions accounting for increased future background traffic, both without and with Project trips, were analyzed during the AM and PM peak hours.
- Site access and circulation associated with the Project were analyzed.
- Potential mitigation measures and roadway improvements were identified to alleviate any impacts caused by Project traffic.

THRESHOLDS OF SIGNIFICANCE

The assessment of the Project is based on transportation impact criteria per the San Leandro General Plan 2035. The General Plan establishes the standard for intersection operations at LOS D. An impact is considered significant for intersections when the Project causes the operations to change from LOS D or better to LOS E or worse. LOS D may only be exceeded where the following circumstances exists:

- Road improvements are not possible because are necessary right-of-way does not exist and cannot be acquired without significant impact on adjacent buildings and properties
- The intersection or road segment is in a pedestrian district, such as Downtown where the priority is on pedestrian, bicycle, and public transit access rather than vehicle traffic.

For facilities that are, or will be (cumulative condition), operating at an unacceptable level of service without the Project, an impact is considered significant if the Project increases the volume-to-capacity (v/c) ratio by 0.05 or more at a signalized intersection; or increases the average delay at unsignalized intersections by more than 5 seconds.

PROJECT ANALYSIS

The Project is an approximately 47,500 square-foot warehouse and a 5,000 square foot office, for a combined of a total 52,500 square foot project site area. To be conservative, the team assumed 52,500 square feet of General Light Industrial facility. The Project is proposing a northern driveway, Driveway A, serving mostly automobile trips and fire access and southern driveway, Driveway B, dedicated to truck traffic to access the loading docks at the rear of the building on Washington Avenue. Since there is significant truck activity at this site, truck trips were converted to percent car equivalents (PCE) to be more conservative.

The number of trips estimated to be generated by the Project as well as how these trips would be distributed onto the transportation network is discussed in this section.

TRIP GENERATION

Trip generation by the Project was developed based on the ITE *Trip Generation Manual*, 10th edition. To be conservative, The ITE land use types most closely matching the Project is General Light Industrial (Land Use Code 110). Average trip generation rates were used to develop Project trip generation for the proposed Project. Table 7 and Table 8 document average trip generation rates and project trip generation respectively. Table 9 documents vehicle mix and Passenger Car Equivalent (PCE) factors that are used to calculate total project trips shown in Table 8. As summarized in Table 8, the Project would generate a net new 329 daily trips, 44 AM peak hour trips (40 inbound/4 outbound) and 40 PM peak hour trips (4 inbound/36 outbound).

Table 7: Average Trip Generation Rates

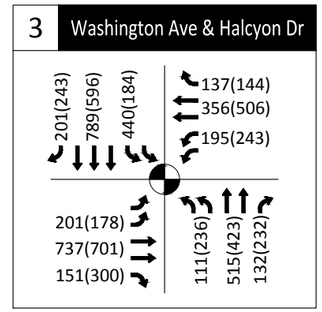
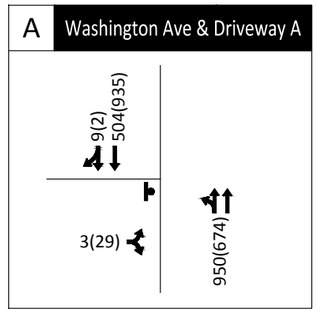
EXISTING PLUS PROJECT CONDITIONS



The potential effects of the proposed Project on the existing operations at the study intersections are discussed in this section. Other impacts, such as those associated with site access, on-site circulation, trucks, and parking, are discussed in the Additional Transportation Needs Assessments section.



Traffic volumes for Existing Plus Project conditions were developed using an additive approach. Estimated traffic generated by the proposed Project, presented in Figure 5, was added to existing volumes on the roadway network, presented in Figure 3, based on the trip distribution patterns from the Countywide Model to develop the volumes for the Existing Plus Project conditions. Existing Plus Project turning movement volumes are shown in Figure 6.

INTERSECTION OPERATIONS

As shown in Table 10, with the addition of Project traffic, all study intersections would continue to operate within the standard of LOS D or better during both peak hours, except:

- Intersection #3: Washington Avenue/ Halcyon Drive/Floresta Boulevard: During the weekday AM peak period, this intersection operates unacceptably at LOS F under Existing conditions and at LOS E under Existing Plus Project conditions. The increase in v/c is expected to be less than 0.05, therefore it does not cause a significant impact.

Detailed LOS worksheets are presented in Appendix D.

Table 10: Existing and Existing Plus Project Intersection Operations

#	North-South Street	East-West Street	Control Type	Peak Hour	Existing			Existing Plus Project			Impact?

Intersection Queues

Table 11 and Table 12 compares the 95th percentile queue lengths expected under Existing conditions without and with the Project. As shown in the tables, some of the left-turn and right-turn queues will exceed their respective turn pockets under Existing and Existing Plus Project conditions however, queues would remain unchanged or would experience minimal change in length with the Project.

The addition of the Project traffic is not expected to increase the queue by more than one vehicle at any of the roadways. Exceedance of queue length by one to two vehicle lengths was not considered a significant impact, given that the minimal exceedance would occur during a brief period of the peak hours (i.e., during five percent of the peak hour).

Detailed queuing worksheets are presented in Appendix D.

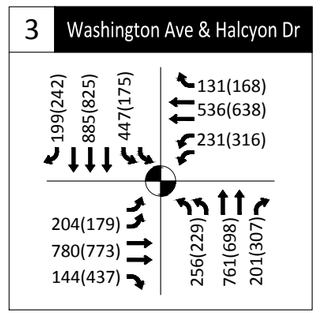
CUMULATIVE (2035) CONDITIONS



Cumulative (2035) conditions and the potential impacts of the Project on Cumulative intersection operations are discussed in this section.

Trips associated with future background growth, resulting from future development and land use changes, were added to Existing volumes to develop the Cumulative conditions. The Project trips from the recently approved San Leandro Business Center at 100 Halcyon Drive project were added to develop the Cumulative Conditions. These volumes were developed by determining the full background growth increment in the Countywide Model, interpolating for the difference between the 2010 base year model to 2016 counts, and from the 2040 cumulative year model to 2035 to maintain consistency with the San Leandro General Plan horizon year. Cumulative volumes are shown in Figure 7.

INTERSECTION OPERATIONS

Table 13 presents intersection operations for Cumulative conditions without the Project. The results indicate that all study intersections are operating at LOS D or better during both peak hours, except:

- Intersection #1: Washington Avenue/ San Leandro Boulevard: During the weekday AM and PM peak period, this intersection operates unacceptably at LOS F and LOS E respectively under Cumulative Conditions.
- Intersection #3: Washington Avenue/ Halcyon Drive/Floresta Boulevard: During the weekday AM peak period, this intersection operates unacceptably at LOS E under Cumulative Conditions.

The detailed LOS worksheets are presented in Appendix E.

Intersection Queues

Table 14 and Table 15 present the 95th percentile queue lengths expected under Cumulative (No Project) conditions. As shown in the tables, some left-turn and right-turn queues may exceed their respective turn pockets during the AM and PM peak hours without the addition of the Project traffic.

At Washington Avenue/San Leandro Boulevard, northbound left-turn queues during the weekday AM peak hour exceed storage capacity by seven vehicles; eastbound right-turn queues during the weekday PM peak hour exceed storage capacity by eight vehicles; and westbound left-turn queues during the weekday AM and PM peak hour exceed the storage capacity by one vehicle. Westbound left-turn queues at Washington Avenue/143rd Avenue exceed storage capacity by two feet and westbound right-turn queues at Washington Avenue/Halcyon Drive/Floresta Boulevard exceed storage by one vehicle during the AM peak hour and by two vehicles during the PM peak hour. Westbound left-turn queues are within the storage capacity but spill back beyond the railroad crossing located on Halcyon Drive east of the intersection so when a train is present, vehicles are required to stop east of the crossing gate.

Detailed queuing worksheets are presented in Appendix E.

Intersection Queues

Table 17 and Table 18 present the 95th percentile queue lengths expected under Cumulative (2035) Plus Project conditions during the AM and PM peak hours respectively.

Similar to Existing conditions results, the addition of the Project traffic is not expected to increase the queue by more than one vehicle at any of the roadways. Exceedance of queue length by one to two vehicle lengths was not considered a significant impact given the minimal exceedance would occur during a brief period of the peak hours (i.e., during five percent of the peak hour).

Detailed queuing worksheets are presented in Appendix F.

ADDITIONAL TRANSPORTATION NEEDS ASSESSMENTS

In addition to analyzing the operations of the study intersections, site access, on-site circulation, and parking capacity were analyzed. The goal of these analyses was to determine an efficient and safe way for trucks and vehicles to access the site and to confirm that the site plan complies with the City of San Leandro parking code requirements.

SITE ACCESS

Vehicles can access the Project site via two driveways on Washington Avenue – the northern driveway (Driveway A) is 26 feet wide and is proposed to serve mostly automobile trips while the southern driveway (Driveway B) is 32 feet wide and would be dedicated to truck traffic to access the loading docks at the rear of the building and some automobile traffic as well. Driveway A on Washington Avenue is located approximately 420 feet north of Washington Avenue/143rd Avenue, and Driveway B on Washington Avenue is located approximately 210 feet north of Washington Avenue/143rd Avenue. The queue analysis results find that there will be minimal queueing at the Project driveways. Truck-turning analysis at Driveway B demonstrated that the driveway could accommodate WB-50 and WB-67 trucks. Emergency vehicle access to the project site is accommodated at both site driveways and within the drive aisles in the parking lot. The emergency vehicle turning analysis was preformed using the Arrow XT Quint 105 template. The proposed site plan provides adequate lane width and curb radii to accommodate WB-50 trucks, WB-67 trucks and emergency vehicles, however, based on the roadway width and width at Driveway B, trucks exiting the driveway should do so first before trucks enter the driveway. Truck turning templates are included as Appendix G.

Washington Avenue is an at-grade, straight road adjacent to the Project site, and allow for visibility of vehicles entering and exiting the Project driveways. Landscaping and signage as part of the Project should be designed and placed along Washington Avenue in a manner that considers and maintains the sight lines of drivers who are exiting the Project site.

SITE CIRCULATION

The site plan is configured so that all trucks could enter Driveway B and circulate within the site at the designated trucks paths. Truck trailer parking stalls and docks are located behind the site, close to the railroad tracks. Analysis of on-site truck circulation demonstrated that all drive aisles which require truck access can accommodate emergency vehicles, WB-50, and WB-67 trucks. The analysis included an evaluation of truck maneuvers to back a trailer to a dock along the rear of the building. Truck circulation paths are included as Appendix G.

Other-size vehicles (smaller trucks and cars) may enter and exit through either driveway. Standard parking spaces are provided on either side of the building, and both driveways provide access to all parking areas.

TRUCK OPERATIONS

As shown in Table 8, the Project would generate a total of 56 daily truck trips, 8 AM peak hour trips (7 inbound/1 outbound) and 7 PM peak hour trips (1 inbound/6 outbound). Therefore, the Project would generate approximately 5 trucks per hour on a daily basis.

PARKING NEEDS ASSESSMENT

The number of parking spaces required on site, according to the use classification of the City of San Leandro Zoning Code 4.08.108, is indicated in Table 19.

Table 19: Off-Street Parking and Loading Spaces Required – San Leandro, California Zoning Code Requirements

Zoning Land Use Category	Application to Project	Code Requirement for Parking	Square Footage	Required Spaces
Industry: Custom and General	Industrial Park	1 space per 1,000 sq. ft.	52,500	53
Total spaces required (Based on site plan):				48
Total spaces provided (Based on site plan):				69
Meets Code?				Yes

Source: City of San Leandro Zoning Code 4.1704
Kittelson & Associates, Inc., 2022

The proposed Project is approximately 52,500 square feet of industrial park space and the City of San Leandro Zoning Code requires 53 parking spaces for the Project. As shown on the site plan (Figure 2), the Project will provide 64 standard parking spaces and 5 truck trailer stalls (69 total stalls). Therefore, this provision of parking would meet City requirements. Moreover, the truck trailer stalls are large enough for tandem parking for standard vehicles, which would allow the Project site to accommodate over 69 vehicles.

TRANSIT, BICYCLE AND PEDESTRIAN FACILITIES EVALUATION

Due to its industrial nature, the Project is expected to generate negligible transit, bicycle, and pedestrian trips. As such, the Project's impact on transit, bicycle, and pedestrian facilities is expected to be minimal and not significant during Existing Plus Project and Cumulative (2035) Plus Project conditions.

ALAMEDA CTC CONGESTION MANAGEMENT PROCESS

As part of the Congestion Management Program (CMP), the Alameda CTC requires all land use projects that generate more than 100 PM peak hour trips to evaluate the project on key CMP and Metropolitan Transportation System (MTS) roadways. However, based on the project trips shown in in Table 8, the project generates less than 50 vehicle trips in the PM peak hour, and therefore a CMP analysis is not required.

Section 6
Conclusion

CONCLUSION

The traffic impact analysis results in the following conclusions:

Proposed Development Plan

The Project is an approximately 47,500 square-foot warehouse and a 5,000 square foot office, for a combined of a total 52,500 square foot project site area. The Project anticipates uses such as warehousing and industrial uses. The Project is proposing two project full access driveways on Washington Avenue – the northern driveway (Driveway A) is proposed to serve mostly automobile trips while the southern driveway (Driveway B) would be dedicated to truck traffic to access the loading docks at the rear of the building and some automobile traffic as well.

For purposes of this analysis, the total number of Project-generated trips were evaluated for Existing Plus Project and Cumulative (2035) Plus Project conditions.

Traffic Operations

Table 20 summarizes traffic operations for the study intersections under year 2022 Existing traffic conditions, year 2022 Existing Plus Project traffic conditions, year 2035 Cumulative traffic conditions, and year 2035 Cumulative Plus Project traffic conditions. Based on traffic operation results, some of the intersections do not operate within the threshold under Existing and Cumulative conditions however, none of the study intersections cause significant impact under Existing, Existing Plus Project, Cumulative, and Cumulative Plus Project traffic conditions during the weekday AM and PM peak hour.

Table 20. Study Intersections Operations Summary

#	North-South Street	East-West Street	Control Type[1]	Peak Hour	Existing			Existing Plus Project			Impact?	Cumulative			Cumulative Plus Project			Impact?
					V/C[2]	Delay	LOS[3]	V/C	Delay	LOS		V/C	Delay	LOS	V/C	Delay	LOS	
1	Washington Avenue	San Leandro Boulevard	Signal	AM	0.73	51.4	D	0.73	52.7	D	NO	0.90	103.0	*F*	0.92	103.6	*F*	NO

				PM	0.49	7.1	A	0.49	7.1	A	NO	0.58	7.3	A	0.59	7.3	A	NO
3	Washington Avenue	Halcyon Drive/Floresta Boulevard	Signal	AM	0.73	80.4	*F*	0.74	79.9	*E*	NO	0.86	77.4	*E*	0.87	77.2	*E*	NO
				PM	0.58	41.6	D	0.59	41.6	D	NO	0.72	45.4	D	0.72	45.4	D	NO
A	Washington Avenue	Driveway A	TWSC	AM	-	-	-	0.01	14.0	B	NO	-	-	-	0.01	17.3	C	NO
				PM	-	-	-	0.10	18.2	C	NO	-	-	-	0.16	27.1	D	NO
B	Washington Avenue	Driveway B	TWSC	AM	-	-	-	0.00	10.0	B	NO	-	-	-	0.03	10.6	B	NO
				PM	-	-	-	0.01	12.3	B	NO	-	-	-	0.01	13.9	B	NO

[1]Intersection control type: TWSC = two-way-stop-control, Signal = Traffic Signal | [2]V/C = volume-to-capacity ratio (HCM 2000) | [3]LOS = Intersection Level of Service | Intersections that do not meet agency thresholds for LOS D (signal); Intersections operating at unacceptable level of service under cumulative conditions without the project have a significant impact if the project increases the average delay at unsignalized intersections by more than 5 seconds, or increases the v/c ratio by 0.05 or more at a signalized intersection are shown highlighted and in bold and *italics.* (Bold denotes exceeds City standard. Bold and Shaded denotes Project Impact).

Existing Conditions

- Under Existing conditions, all study intersections would operate acceptably at LOS D or better during the weekday AM and PM peak hours except:
    - Washington Avenue/Halcyon Drive/Floresta Boulevard during the weekday AM peak period (LOS F).
- Turn queues at Washington Avenue/San Leandro Boulevard and Washington Avenue/Halcyon Drive/Floresta Boulevard exceed capacity of their left-turn and right-turn pockets as presented in Table 5 and Table 6 of the study.
- Under Existing Plus Project conditions with the addition of Project traffic, all study intersections would continue to operate acceptably at LOS D or better during the weekday AM and PM peak hours except:
    - Washington Avenue/Halcyon Drive/Floresta Boulevard during the weekday AM peak period (LOS E). However, the addition of the Project does not result in a significant impact as the increase in v/c ratio is less than 0.05.
- Left-turn queues and right-turn queues that will exceed their respective turn pockets during the AM and PM peak hours under Existing conditions without the Project would experience minimal change in length with the addition of the Project traffic.
- Washington Avenue/Driveway A and Washington Avenue/Driveway B (Intersection A & B) operate within the threshold. Around three northbound left-turning vehicles are expected at Driveway B during the weekday AM peak hours under Existing Plus Project conditions.

Vehicle Miles Traveled Impact Analysis

- The Vehicle Miles Traveled (VMT) analysis was conducted using the Alameda County transportation Commission (ACTC) guidelines to determine if the project constitutes a VMT impact under SB-743.
- The average target (with a 15% reduction from the target value) VMT per employee in the Central Planning Area is 16.3, and the project area zone has an average VMT per employee of 15.23. Since the project is located in an area with below average VMT based on the threshold, the project would have a less-than-significant VMT impact and can be screened out of a detailed VMT analysis.

Trip Generation and Distribution

- The Project would generate a net new 329 daily trips, 44 AM peak hour trips (40 inbound/4 outbound) and 40 PM peak hour trips (4 inbound/36 outbound). The distribution of Project trips was developed using the Countywide Model.

Cumulative (2035) Conditions

- Under Cumulative (2035) Conditions, all study intersections would operate acceptably at LOS D or better during the weekday AM and PM peak hours except:
    - Washington Avenue/San Leandro Boulevard during the weekday AM peak period (LOS F) and weekday PM peak period (LOS E)
    - Washington Avenue/Halcyon Drive/Floresta Boulevard during the weekday AM peak period (LOS E)

- Turn queues at all study intersections exceed capacity of their left-turn and right-turn pockets as presented in Table 14 and Table 15 of the study.
- Under Cumulative (2035) Plus Project conditions with the addition of Project traffic, all study intersections would continue to operate acceptably at LOS D or better during each peak hour except:
    - Washington Avenue/San Leandro Boulevard during the weekday AM peak period (LOS F) and weekday PM peak period (LOS E)
    - Washington Avenue/Halcyon Drive/Floresta Boulevard during the weekday AM peak period (LOS E)
- Left-turn queues and right-turn queues that will exceed their respective turn pockets during the AM and PM peak hours under Cumulative (2035) conditions without the Project would experience minimal change in queue length with the addition of the Project traffic.
- Washington Avenue/Driveway A and Washington Avenue/Driveway B (Intersection A & B) operate within the threshold. Around three northbound left-turning vehicles are expected at Driveway B during the weekday AM peak hours under Cumulative Plus Project conditions.

Site Access and On-Site Circulation

- Analysis of truck turns at the driveways demonstrated that Driveway B on Washington Avenue can accommodate WB-50 and WB-67 trucks. Both Driveway A and Driveway B can accommodate emergency vehicles. Based on the roadway width and width at Driveway B shown in the site plan, WB-50 and WB-67 trucks exiting the Driveway B should do so first before trucks enter the driveway.
- Analysis of on-site truck maneuvers demonstrated that the drive aisles can accommodate circulation of WB-67 trucks, WB-50 trucks and emergency vehicles, including maneuvering to back a trailer to a dock.

Truck Operations

- The Project would generate a total of 56 daily truck trips, 8 AM peak hour trips (7 inbound/1 outbound) and 7 PM peak hour trips (1 inbound/6 outbound). Therefore, the Project would generate approximately 5 trucks per hour on a daily basis

Parking

- Based on the site plan, the Project provides 69 parking stalls, which meets the City requirement of 53 spaces.

Transit, Bicycle, and Pedestrian Facilities

- Due to its industrial nature, the Project is expected to generate negligible transit, bicycle, and pedestrian trips. As such, the Project's impact on transit, bicycle, and pedestrian facilities is expected to be minimal and not significant during Existing Plus Project and Cumulative (2035) Plus Project conditions.

Alameda CTC Congestion Management Plan

- The project generates less than 50 vehicle trips in the PM peak hour, and therefore a CMP analysis is not required.

San Leandro 14143 Washington Avenue Warehousing TIA – Kittelson Traffic Study Scope

Dear Richard:

Attached is a proposal for transportation planning services associated with the proposed warehousing development at 14143-14273 Washington Avenue in San Leandro, CA. We understand the Project involves development of a proposed 47,500 square foot warehouse and a 5,000 square foot office, for a combined total of 52,500 square foot. The project is listed as APN: 077B 1222 003 03, et al, and Plan Check # PLN21-0031.

Based on comments from City staff dated September 14, 2021, the City of San Leandro has requested a detailed traffic impact study to address potential VMT and traffic operational impacts. This scope was developed based on consultation with City staff regarding required components. We understand that City will use this to determine the next steps. If there are any, we would address those in a subsequent amendment.

Kittelson has significant experience working in San Leandro, and more specifically having conducted the 2017 Citywide General Plan, and a recent traffic study at 100 Halcyon Drive.

Part "A" identifies our proposed services for the project in accordance with the terms and conditions outlined in Part "B" (let us know if you prefer to use your own contracting terms). This scope was developed based on our discussions with you, our review of the proposed development plan, and our familiarity with the City.

We propose to conduct the services (detailed in Part "A" herein) based on time and materials for a not to exceed amount of $33,000 (detailed in Table 1 of the attached Part "B"). We will invoice monthly based on T&M and progress for that month. We can commit to delivering a draft technical report within 8 weeks of receiving a notice to proceed and an electronic signed contract. This proposal (scope of work, budget, and timeline) is effective for sixty days.

I will serve as the Project Manager, and Laurence Lewis will serve as project principal. Any questions of a technical or contractual nature can be directed to either of us.

If the attached Professional Services Agreement is satisfactory, please email us a scanned signed copy. A fully executed, electronic copy will be returned for your records. Thank you for the opportunity to propose on this project. If you have any questions, please call me at 510-433-8083.

Sincerely,
KITTELSON & ASSOCIATES, INC.

Damian Stefanakis
Principal Planner

Laurence Lewis
Principal Planner

PROFESSIONAL SERVICES AGREEMENT

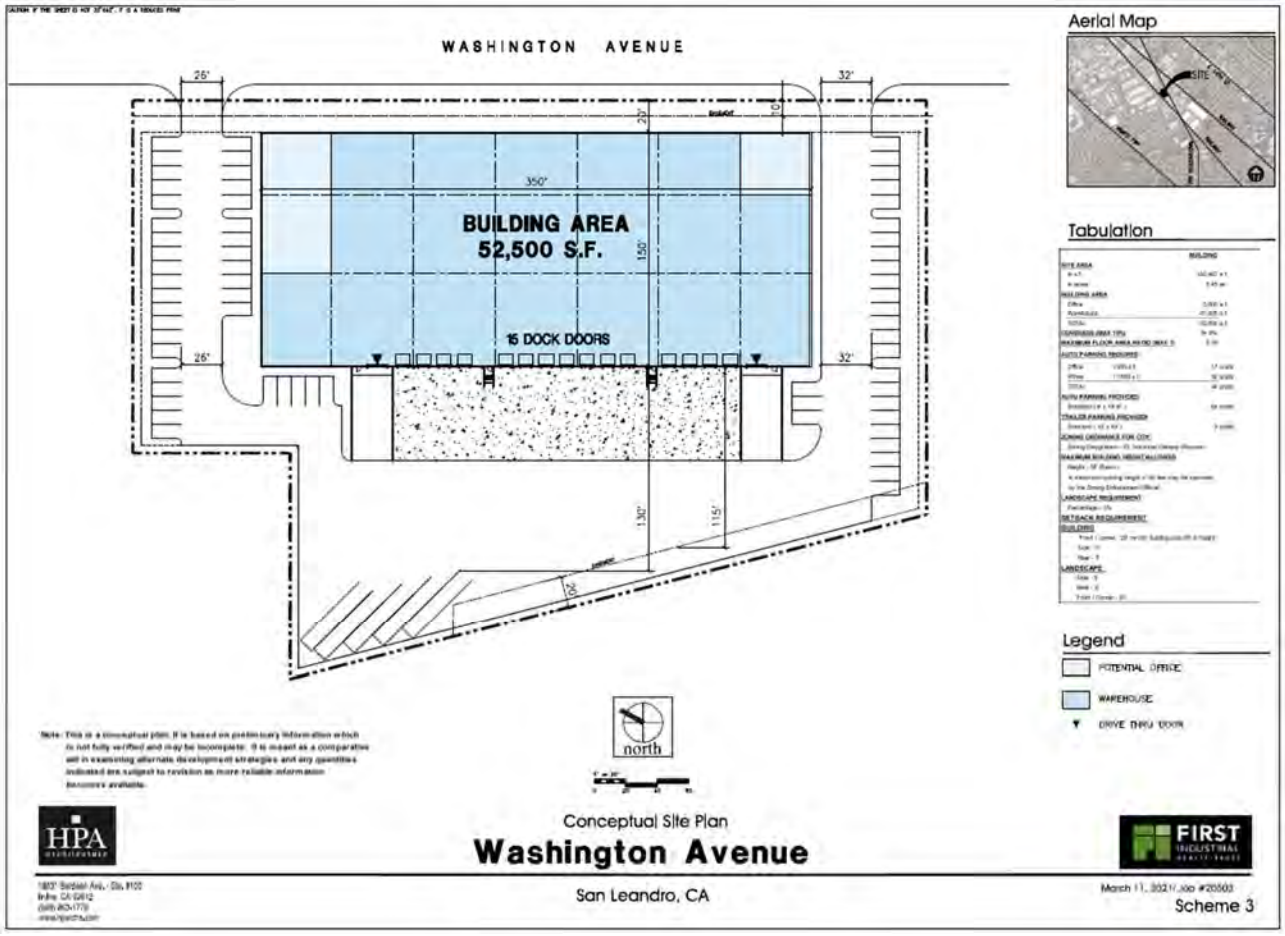
March 22, 2022

Kittelson & Associates, Inc.
155 Grand Avenue, Suite 505
Oakland, CA 94612
510.433-8083 (Direct)
510.839.0871 (F)

First Industrial Realty Trust, Inc. with an office at 1111 Broadway, 3rd Floor, Oakland, CA 94607 (the "CLIENT") hereby enters into this Professional Services Agreement (this "Agreement") with KITTELSON & ASSOCIATES, INC. to perform the services as described in this Agreement's Part "A" - Scope of Work (the "Services") for the **San Leandro Washington Warehouse TIA** (the "Project"), subject to all of the provisions described in Part "B" Terms and Conditions.

PART A – SCOPE OF WORK

BACKGROUND



The proposed project is located at 14143-14273 Washington Avenue, in San Leandro (APN: 077B 1222 003 03, et al, and Plan Check # PLN21-0031). We understand the Project involves development of a proposed 47,500 square foot warehouse with a small ancillary 5,000 square foot office, for a combined total of 52,500 square foot. The project location is shown in Figure 1, and the current site plan is shown in Figure 2 below. Two project driveways are proposed on Washington Avenue, with the northern driveway serving mostly automobile trips and fire access, and the southern driveway dedicated to truck traffic to access the loading docks at the rear of the building.

Figure 1: Project Location

Source: Applicant, 2022

Figure 2: Project Site Plan

Source: HPA Architects, March 11, 2021

CITY REQUIREMENT

For the proposed project, the City of San Leandro Transportation wants to quantify the project trip generation and determine any potential traffic impacts to the surrounding area. An assessment of VMT will also be conducted under VMT analysis per SB 743 in the event this project requires an initial study or EIR. Specifically, the City has asked for:

44. The applicant shall submit an Overall Traffic Study that examines potential traffic impacts from the project. The City reserves the right to offer additional comments once the final study is submitted. Said Traffic Study shall be submitted for review before Conditions of Approval are drafted for the project.
Please contact Shelia Marquises, Principal Engineer, for more information or questions and to scope this report in advance of its preparation and submittal at (510) 577-3433 or smarquises@sanleandro.org.

45. The Traffic Study shall also include a truck traffic analysis but is not limited to:

a. *Complete Analysis of impacts to the adjacent street should include at the minimum adjacent streets to project including but not limited to Washington Ave, Halcyon Drive, San Leandro Boulevard and 143rd Avenue.*
b. *VMT Baseline Analysis*
c. *Time of Day & Frequency of trucks expected to drive from and to the site*
d. *Number of Trucks per day to the site*
e. *Truck turning exhibit for WB50 shows truck turning from parking lane.*

Given the allotted square footage designated for warehouse and office usage, the project may potentially qualify as a "small project" generating less than 110 trips per day under the Office of Planning and Research (OPR)'s Technical Guidelines. As such, the project may screen out for VMT. Final determination will be made by Public Works-Transportation staff upon review of applicant's formal application/1st submittal. Based on this, Kittelson is proposing the following tasks for the traffic study:

WORKSCOPE

Task 1 – Review of Site Plan and Project Description

Kittelson will review the project description and determine which ITE trip generation category best describes the project. Kittelson will review this with the applicant and City transportation staff before proceeding.

Task 2 – VMT Baseline Analysis

Kittelson will use appropriate ACTC/County or Office of Planning and Research (OPR) Guidelines to determine the project VMT and compare that to the baseline VMT for the area to see if the project constitutes a VMT impact under SB-743. Kittelson will utilize the ACTC Countywide model to compute the VMT.

We understand that the City has not get developed VMT Guidelines and thresholds, so we plan to use existing Alameda CTC (or County) or Office of Planning and Research (OPR) recommendations.

Based on OPR, It is possible this project may screen out for VMT if it meets certain criteria, including, small project, proximity to high quality transit, or resides in a low VMT area per the ACTC Countywide model VMT Maps for industrial employment.

Screening Review:

- If the project has less than 110 trips per day, then it may screen out for VMT.
- If there is available high capacity transit (15 minute frequency within half mile of the project), then it would screen out for VMT.

- If the project resides in a low VMT area, then would screen out for VMT.

Kittelson will document the VMT findings as part of the traffic report.

Task 3 – Impact Analysis

Task 3.1 Trip Generation

Kittelson will prepare trip generation calculations for the proposed development. The analysis will utilize ITE 10th Edition rates as required by the City and address weekday daily, AM peak hour, and PM peak hour time periods. In particular, City has asked for the following:

- Estimated Trip Generation (using ITE)
- Percent trucks for PCE calculation.

There are a number of potential ITE categories that can describe this land use.

- General Warehousing - ITE category 150
- Office – ITE category 710 (first determine if office is already included as part of ITE warehouse).
- General Light Industrial – ITE category 110

Most likely the appropriate category is general warehousing, but Kittelson coordinated with City staff and has proposed the more conservative GLI (ITE 110) category to allow the applicant more flexibility with potential tenants. The trip difference between General Warehousing and GLI is shown in the tables below. Overall, GLI has 44 AM and 40 PM trips (Warehousing has 13 AM and 13 PM trips). Kittelson will move forward on the traffic study with the trips from the GLI category. Since the GLI trips are less than 100 PM peak trips, then there is no need to complete the Alameda CTC CMP Land Use Analysis.

Warehousing (Code 150) Trips

Table 1 Trip Generation Rates

			Trip Generation[1]						
				AM Peak Hour			PM Peak Hour		
Land Use	ITE Code	Unit[2]	Daily	In	Out	Total	In	Out	Total
Warehousing	150	TSF	1.74	0.13	0.04	0.17	0.05	0.14	0.19

[1] Trip generation rates for peak hour of adjacent streets, per the ITE Trip Generation Manual 10th Edition.
[2] Thousand Square Feet

Table 2 Project Trip Generation

		Trip Generation[1]						
			AM Peak Hour			PM Peak Hour		
Land Use	TSF	Daily	In	Out	Total	In	Out	Total
Project Trips (Vehicles)	53	91	7	2	9	3	7	10
Project Trips (PCE)	53	116	10	3	13	3	10	13

Estimated Trucks	19	1	0	2	1	1	2

[1]Trip generation rates for peak hour of adjacent streets, per the ITE Trip Generation Manual 10th Edition.

General Light Industrial (Code 110) Trips

Table 3 Trip Generation Rates

Land Use	ITE Code	Unit[2]	Trip Generation[1]						
			Daily	AM Peak Hour			PM Peak Hour		
				In	Out	Total	In	Out	Total
General Light Industrial	110	TSF	4.96	0.62	0.08	0.70	0.08	0.55	0.63

[1] Trip generation rates for peak hour of adjacent streets, per the ITE Trip Generation Manual 10th Edition.
[2] Thousand Square Feet

Table 4 Project Trip Generation

Land Use	TSF	Trip Generation[1]						
		Daily	AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
Project Trips (Vehicles)	53	260	32	4	36	4	29	33
Project Trips (PCE)	53	329	40	4	44	4	36	40
Estimated Trucks		56	7	1	8	1	6	7

[1]Trip generation rates for peak hour of adjacent streets, per the ITE Trip Generation Manual 10th Edition.

Task 3.2 Impact Analysis

Given the Covid conditions, Kittelson will rely on historical counts from prior studies in the vicinity to quantify complete analysis of impacts, including traffic level of service (LOS) impacts at the following roadway segments:

1. Washington Avenue
2. Halcyon Drive
3. San Leandro Boulevard
4. 143rd Street

The roadway segment analysis will use HCM methods to determine if the added traffic causes LOS operational deficiencies (previously known as impacts) based on City LOS guidelines.

And the following three study intersections:

1. Washington Avenue/ San Leandro Boulevard
2. Washington Avenue/ 143rd Street
3. Washington Avenue/ Halcyon Drive

The analysis will be conducted for the following scenarios to determine if the added traffic causes LOS impacts based on City guidelines:

1. Existing
2. Existing plus Project
3. Cumulative
4. Cumulative plus Project

The existing scenario will be based on recent historic counts factored up to 2022 using an appropriate growth factor. The cumulative scenario will be based on 2040 volumes from the ACTC Countywide model (or extracted from nearby prior studies for consistency).

Kittelson will utilize the Synchro software to compute the LOS and determine if the proposed project creates operational deficiencies (impacts) under the City's General Plan significance criteria.

Should any offsite operational deficiencies be identified, then Kittelson will propose feasible mitigations or improvements (usually signal modifications, signing or striping or right of way).

Appropriate fair share will be computed so the City can assign cost sharing with other nearby projects undergoing approval and may have disclosed similar improvements.

A review of potential left turns out of or into the project driveways from the northbound Washington Avenue will also be conducted, especially for the trucks, including any queuing impacts. If the right of way or proximity to 143rd Avenue prevents left turns (especially at the southern driveway), then northbound turn prohibitions may need to be applied.

Since it is expected this project will generate less than 100 PM peak hour trips, no ACTC CMP analysis will be conducted.

Task 3.3 – Site Analysis, Parking and Trucks

Kittelson will prepare a site review, access analysis, parking, and truck analysis. The analysis may include the following:

- Site access and site circulation review
- Driveway access review
- Number, time & frequency of trucks per day
- Truck turning templates using WB-67 showing truck turning from parking lane
- Review of signing and striping (onsite and offsite) (if available)
- Parking supply analysis
- Bicycle, pedestrian, and transit evaluation

Task 4 – Traffic Report

Kittelson will document the results of all tasks in a draft traffic report be submitted to the Applicant and City of San Leandro. Following two (2) rounds of review, the first by the project team and the second by City staff, Kittelson will finalize the traffic report. One (1) phone meeting with City staff is assumed to discuss the findings.

Note:

This scope does not include preparatory time (graphics and handouts) or attendance time for any public hearings or meetings beyond those scoped above. All client requests for additional presentations and meetings of this nature will be accommodated on a time-and-materials (T&M) basis and will be considered additional services.

SCHEDULE

Kittelson will deliver the draft traffic report to the Applicant within 8 weeks of receiving the executed contract and notice to proceed. The schedule may be equitably adjusted due to unforeseen events related to the development program or City of San Leandro requirements.

BUDGET

Kittelson has estimated the cost at $33,000 based on our staff hourly billing rates (attached) and time and materials. Kittelson will invoice monthly based on time and materials showing progress for that period until the project is completed. The maximum authorized budget will not be exceeded without a written signed amendment.

Should the project description or City requirements change once the study has commenced that require a revision to the scope, then this will be addressed as a separate amendment to the project based on time and materials cost.

Task 4 – Traffic Report

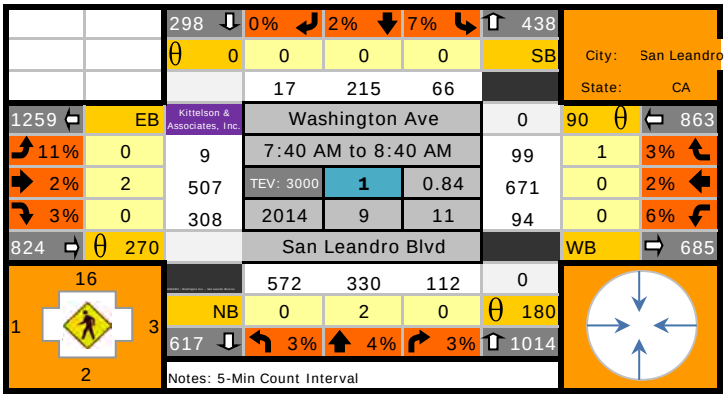
Kittelson will document the results of all tasks in a draft traffic report be submitted to the Applicant and City of San Leandro. Following two (2) rounds of review, the first by the project team and the second by City staff, Kittelson will finalize the traffic report. One (1) phone meeting with City staff is assumed to discuss the findings.

Note:

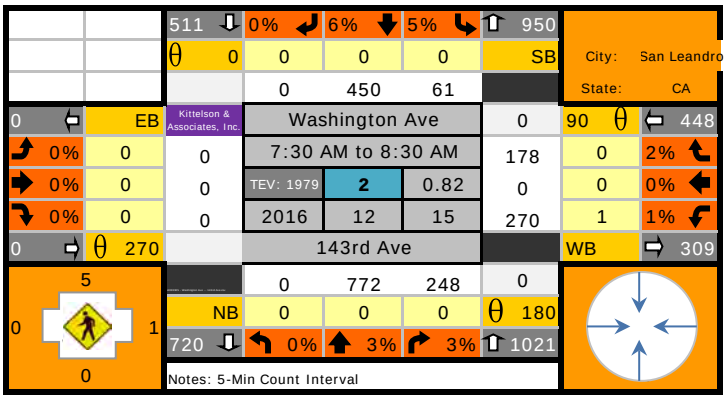
This scope does not include preparatory time (graphics and handouts) or attendance time for any public hearings or meetings beyond those scoped above. All client requests for additional presentations and meetings of this nature will be accommodated on a time-and-materials (T&M) basis and will be considered additional services.

SCHEDULE

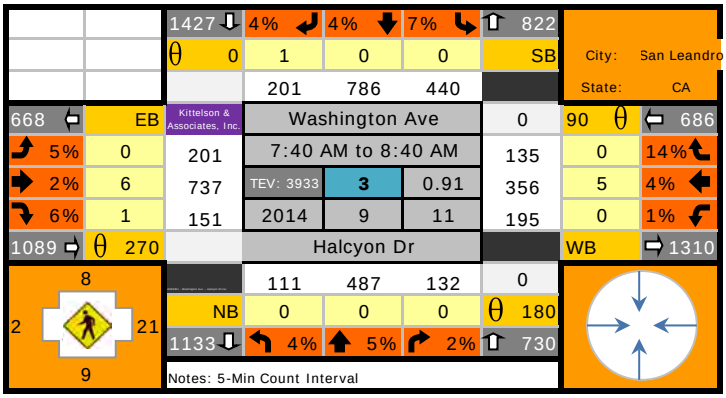
Kittelson will deliver the draft traffic report to the Applicant within 8 weeks of receiving the executed contract and notice to proceed. The schedule may be equitably adjusted due to unforeseen events related to the development program or City of San Leandro requirements.



BUDGET



Kittelson has estimated the cost at $33,000 based on our staff hourly billing rates (attached) and time and materials. Kittelson will invoice monthly based on time and materials showing progress for that period until the project is completed. The maximum authorized budget will not be exceeded without a written signed amendment.



Should the project description or City requirements change once the study has commenced that require a revision to the scope, then this will be addressed as a separate amendment to the project based on time and materials cost.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary	
HCM 6th Ctrl Delay	51.4
HCM 6th LOS	D

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary	
HCM 6th Ctrl Delay	10.4
HCM 6th LOS	B

Notes

User approved pedestrian interval to be less than phase max green.
User approved volume balancing among the lanes for turning movement.
* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary	
HCM 6th Ctrl Delay	80.4
HCM 6th LOS	F

Notes

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary	
HCM 6th Ctrl Delay	52.7
HCM 6th LOS	D

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary	
HCM 6th Ctrl Delay	10.6
HCM 6th LOS	B

Notes

User approved pedestrian interval to be less than phase max green.
User approved volume balancing among the lanes for turning movement.
* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary	
HCM 6th Ctrl Delay	79.9
HCM 6th LOS	E

Notes

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary	
HCM 6th Ctrl Delay	41.7
HCM 6th LOS	D

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary	
HCM 6th Ctrl Delay	103.0
HCM 6th LOS	F

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary	
HCM 6th Ctrl Delay	76.0
HCM 6th LOS	E

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary	
HCM 6th Ctrl Delay	7.3
HCM 6th LOS	A

Notes

User approved pedestrian interval to be less than phase max green.
User approved volume balancing among the lanes for turning movement.
* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary	
HCM 6th Ctrl Delay	45.4
HCM 6th LOS	D

Notes

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary	
HCM 6th Ctrl Delay	75.6
HCM 6th LOS	E

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary	
HCM 6th Ctrl Delay	7.3
HCM 6th LOS	A

Notes

User approved pedestrian interval to be less than phase max green.
User approved volume balancing among the lanes for turning movement.
* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

NOTES

1. THIS SURVEY WAS PREPARED FROM INFORMATION FURNISHED IN A COMMITMENT FOR TITLE INSURANCE, PREPARED BY FIRST AMERICAN TITLE INSURANCE COMPANY DATED AS OF JANUARY 22, 2021, ORDER NUMBER NCS–1049046–CHI2, FURNISHED TO KIER & WRIGHT CIVIL ENGINEERS & SURVEYORS, INC BY FIRST INDUSTRIAL REALTY TRUST, INC. ON FEBRUARY 10, 2021. NO LIABILITY IS ASSUMED FOR MATTERS OF RECORD NOT STATED IN SAID REPORT THAT MAY AFFECT THE TITLE LINES, OR EXCEPTIONS, OR EASEMENTS OF THE PROPERTY.
2. ALL DISTANCES AND ELEVATIONS SHOWN HEREON ARE IN FEET AND DECIMALS THEREOF.
3. THE TYPES, LOCATIONS, SIZES AND/OR DEPTHS OF EXISTING UNDERGROUND UTILITIES AS SHOWN ON THIS TOPOGRAPHIC SURVEY WERE OBTAINED FROM SOURCES OF VARYING RELIABILITY. THE CONTRACTOR IS CAUTIONED THAT ONLY ACTUAL EXCAVATION WILL REVEAL THE TYPES, EXTENT, SIZES, LOCATIONS AND DEPTHS OF SUCH UNDERGROUND UTILITIES. (A REASONABLE EFFORT HAS BEEN MADE TO LOCATE AND DELINEATE ALL KNOWN UNDERGROUND UTILITIES). HOWEVER, THE ENGINEER CAN ASSUME NO RESPONSIBILITY FOR THE COMPLETENESS OR ACCURACY OF ITS DELINEATION OF SUCH UNDERGROUND UTILITIES WHICH MAY BE ENCOUNTERED, BUT WHICH ARE NOT SHOWN ON THESE DRAWINGS.
4. THIS SURVEY DOES NOT SHOW THE LOCATIONS OF THE FOLLOWING UNDERGROUND UTILITY LINES DUE TO THE FACT THAT THE CLIENT HAS NOT FURNISHED KIER & WRIGHT CIVIL ENGINEERS & SURVEYORS, INC. WITH ANY PLANS THAT DELINEATE THEIR LOCATIONS: ELECTRIC LINES, GAS LINES, WATER LINES, TELEPHONE LINES, CABLE TELEVISION LINES, NITROGEN LINES, (IF ANY) FIBER OPTIC LINES (IF ANY). ALL PARTIES SHOULD CONSIDER THIS SURVEY AS PRELIMINARY WITH REGARDS TO THE LOCATION OF THE UTILITY FACILITIES. UPON RECEIPT OF THIS INFORMATION KIER & WRIGHT WILL UPDATE THIS SURVEY AND REISSUE IT.
5. PHYSICAL ITEMS SHOWN ON THIS SURVEY ARE LIMITED TO THOSE ITEMS VISIBLE AS OF THE DATE OF THIS SURVEY. SUBSURFACE STRUCTURES, IF ANY, ARE NOT SHOWN. SAID SUBSURFACE OBJECTS MAY INCLUDE, BUT ARE NOT LIMITED TO, CONCRETE FOOTINGS, SLABS, SHORING, STRUCTURAL PILES, UTILITY VAULTS, PIPING, UNDERGROUND TANKS, AND ANY OTHER SUBSURFACE STRUCTURES NOT REVEALED BY A SURFACE INSPECTION.
6. THE SUBJECT PROPERTY IS SHOWN ON THE FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) FLOOD INSURANCE RATE MAP (FIRM) FOR ALAMEDA COUNTY, CALIFORNIA, MAP NUMBER 06001C0259G FOR COMMUNITY NUMBER 060013 (CITY OF SAN LEANDRO), WITH AN EFFECTIVE DATE OF AUGUST 3, 2009, AS BEING LOCATED IN FLOOD ZONE "X–UNSHADED". ACCORDING TO FEMA THE DEFINITION OF ZONE "X–UNSHADED" IS: AREAS DETERMINED TO BE OUTSIDE THE 0.2% ANNUAL CHANCE FLOODPLAIN.

   INFORMATION WAS OBTAINED FROM THE CITY OF SAN LEANDRO, PUBLIC WORKS DEPARTMENT ON FEBRUARY 18, 2021.
7. BENCHMARK:
   CITY OF SAN LEANDRO 2.5" DISK WITH PUNCH IN WELL AT THE CENTERLINE OF WASHINGTON AVE AND 143RD AVENUE. ELEVATION= 36.456.
8. BASIS OF BEARINGS:
   THE BEARING OF NORTH 27° 43' 23" WEST TAKEN ON THE MONUMENT LINE OF WASHINGTON AVENUE AS SHOWN ON THAT CERTAIN RECORD OF SURVEY NUMBER 1558, FILED FOR RECORD ON OCTOBER 8, 1998, IN BOOK 22 OF MAPS AT PAGES 59–60, OFFICIAL RECORDS OF ALAMEDA COUNTY WAS TAKEN AS THE BASIS FOR ALL BEARINGS SHOWN HEREON.
9. CORNER RECORD NOTE:
   THE DEVELOPER AND/OR CONTRACTOR SHALL BE RESPONSIBLE FOR THE PREPARATION AND FILING OF PRE–CONSTRUCTION AND POST–CONSTRUCTION CORNER RECORDS FOR ANY MONUMENTS OR PROPERTY CORNERS SHOWN HEREON THAT MAY BE DESTROYED DURING IMPROVEMENTS TO THE SUBJECT PROPERTY AS DEFINED IN SECTION 8771(B) OF THE PROFESSIONAL LAND SURVEYORS ACT.

Biological Resources Analysis

Memorandum

Date: February 15, 2023

To: Binh Nguyen, Associate Planner, City of Leandro, Planning Division

From: Bernhard Warzecha, FirstCarbon Solutions, Senior Biologist

Subject: Revised Biological Resources Analysis for the 14143 Washington Avenue Project, San Leandro, CA

This memorandum summarizes the findings of a Biological Resources Analysis (BRA) for the proposed 14143 Washington Avenue Project (proposed project), in San Leandro, California (Exhibit 1). Recommended measures to avoid or minimize potential project-related impacts on sensitive biological resources on-site are included as appropriate.

PROJECT LOCATION AND PROJECT DESCRIPTION

The project site consists of approximately 3.45 acres located at 14143 Washington Avenue, between Washington Avenue to the east, commercial/industrial land uses to the north and south, and a railway corridor to the west. The proposed project would develop a warehouse and office building with auxiliary facilities including parking and landscaping (Exhibit 2).

REGULATORY BACKGROUND

Federal

Endangered Species Act of 1973

The United States Fish and Wildlife Service (USFWS) has jurisdiction over species listed as threatened or endangered under the federal Endangered Species Act of 1973. Section 9 of the Endangered Species Act protects listed species from "take," which is broadly defined as actions taken to "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct." The Endangered Species Act protects threatened and endangered plants and animals and their habitats. Additionally, the USFWS designates specific areas as "Critical Habitat" for Endangered Species Act-listed species.

Candidate species are those proposed for listing; these species are usually treated by resource agencies as if they were actually listed during the environmental review process.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) implements international treaties between the United States and other nations devised to protect migratory birds, their parts, eggs, and nests from activities such as hunting, pursuing, capturing, killing, selling, and shipping, unless expressly authorized in the regulations or by permit. All migratory birds and their nests are protected from take and other impacts under the MBTA (16 United States Code [USC] § 703, *et seq*.).

Bald and Golden Eagle Protection Act

The golden eagle (*Aquila chrysaetos*) and bald eagle (*Haliaeetus leucocephalus*) are afforded additional protection under the Eagle Protection Act, amended in 1973 (16 USC § 669, *et seq*.) and the Bald and Golden Eagle Protection Act (16 USC §§ 668–668d).

Clean Water Act

Section 404

The United States Army Corps of Engineers (USACE) administers Section 404 of the federal Clean Water Act (CWA), which regulates the discharge of dredge and fill material into waters of the United States.

As of the date of this report, the United States Environmental Protection Agency (EPA) and USACE (hereafter the agencies) are in receipt of the U.S. District Court for the District of Arizona's August 30, 2021, order vacating and remanding the Navigable Waters Protection Rule in the case of *Pascua Yaqui Tribe v. U.S. Environmental Protection Agency*. In light of this order, these agencies have halted implementation of the Navigable Waters Protection Rule and are interpreting "waters of the United States" consistent with the pre-2015 regulatory regime until further notice.[1]

Therefore, since the agencies are interpreting "waters of the United States" consistent with the pre-2015 regulatory regime until further notice, our analysis follows 40 Code of Federal Regulations 230.3(s) in effect under the pre-2015 regulatory regime, which defines "waters of the United States" as follows:

1. All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide.
2. All interstate waters including interstate wetlands.
3. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation, or destruction of which could affect interstate or foreign commerce including any such waters:

[1] United States Environmental Protection Agency (EPA). 2021. Website: https://www.epa.gov/wotus/current-implementation-waters-united-states. Accessed April 22, 2022.

a) Which are or could be used by interstate or foreign travelers for recreational or other purposes; or
b) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
c) Which are used or could be used for industrial purposes by industries in interstate commerce.

4. All impoundments of waters otherwise defined as waters of the United States under this definition.
5. Tributaries of waters identified in paragraphs (s)(1) through (4) of this section.
6. The territorial sea.
7. Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (s)(1) through (6) of this section; waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of the CWA (other than cooling ponds as defined in 40 Code of Federal Regulations 423.11(m) which also meet the criteria of this definition) are not waters of the United States.

Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the CWA, the final authority regarding CWA jurisdiction remains with the EPA and/or USACE.

"Wetland" refers to areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and seasonal wetlands. Wetlands are considered jurisdictional if they fall under one of the categories of waters of the United States defined above. The USACE jurisdiction typically extends up to the ordinary high water mark (OHWM).

In general, a USACE permit must be obtained before placing fill in wetlands or other waters of the United States. The type of permit depends on the impacted acreage, the purpose of the proposed fill, and other factors.

Section 401

As stated in Section 401 of the CWA, "any applicant for a federal permit for activities that involve a discharge to waters of the State, shall provide the federal permitting agency a certification from the State in which the discharge is proposed that states that the discharge will comply with the applicable provisions under the federal Clean Water Act." Therefore, before the USACE will issue a Section 404 permit in California, applicants must apply for and receive a Section 401 Water Quality Certification from the State or Regional Water Quality Control Board (RWQCB).

State

CEQA Guidelines

The California Environmental Quality Act (CEQA) requires public agencies to evaluate potential impacts to special-status species and their habitat. The following CEQA Guidelines Appendix G checklist questions serve as thresholds of significance when evaluating the potential impacts of a proposed project on biological resources. Impacts are considered significant if a project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as being a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife (CDFW) or USFWS.
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the CDFW or USFWS.
- Have a substantial adverse effect on federally and State-protected wetlands as defined by Section 404 of the CWA (including but not limited to marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.
- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State Habitat Conservation Plan.

California Endangered Species Act

The State of California enacted the California Endangered Species Act (CESA) in 1984. CESA pertains to State listed endangered and threatened species. CESA requires State agencies to consult with the CDFW when preparing CEQA documents to ensure that the State lead agency actions do not jeopardize the continued existence of a listed species or result in the destruction or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available (Fish and Game Code [FGC] § 2080). CESA directs agencies to consult with the CDFW on projects or actions that could affect listed species, directs the CDFW to determine whether jeopardy would occur, and allows the CDFW to identify “reasonable and prudent alternatives” to the project consistent with conserving the species. CESA allows the CDFW to authorize exceptions to the State’s prohibition against take of a listed species if the “take” of a listed species is incidental to carrying out an otherwise lawful project that has been approved under CEQA (FGC § 2081).

California Fish and Game Code

Under CESA, the CDFW has the responsibility for maintaining a list of endangered and threatened species (FGC § 2070). Fish and Game Code Sections 2050–2098 outline the protection provided to California's rare, endangered, and threatened species. Fish and Game Code Section 2080 prohibits the taking of plants and animals listed under the CESA. Fish and Game Code Section 2081 established an incidental take permit program for State listed species. The CDFW maintains a list of "candidate species," which it formally notices as being under review for addition to the list of endangered or threatened species.

In addition, the Native Plant Protection Act of 1977 (NPPA) (FGC § 1900, *et seq*.) prohibits the taking, possessing, or sale within the State of any plants with a State designation of rare, threatened, or endangered (as defined by the CDFW). An exception to this prohibition in the NPPA allows landowners, under specified circumstances, to take listed plant species, provided that the owners first notify the CDFW and give the agency at least 10 days to come and retrieve (and presumably replant) the plants before they are plowed under or otherwise destroyed. Fish and Game Code Section 1913 exempts from "take" prohibition "the removal of endangered or rare native plants from a canal, lateral ditch, building site, or road, or other right of way." Project impacts to these species are not considered significant unless the species are known to have a high potential to occur within the area of disturbance associated with construction of the proposed project.

In addition to formal listing under the Endangered Species Act and CESA, some species receive additional consideration by the CDFW and local lead agencies during the CEQA process. Species that may be considered for review are those listed as a "Species of Special Concern." The CDFW maintains lists of "Species of Special Concern" that serve as species "watch lists." Species with this status may have limited distributions or limited populations and/or the extent of their habitats has been reduced substantially, such that their populations may be threatened. Thus, their populations are monitored, and they may receive special attention during environmental review. While they do not have statutory protection, they may be considered rare under CEQA Guidelines and specific protection measures may be warranted. In addition to Species of Special Concern, the CDFW Special Animals List identifies animals that are tracked by the California Natural Diversity Database (CNDDB) and may be potentially vulnerable but warrant no federal interest and no legal protection.

Sensitive species that would qualify for listing but are not currently listed are afforded protection under CEQA. CEQA Guidelines Section 15065 (Mandatory Findings of Significance) requires that a substantial reduction in numbers of a rare or endangered species be considered a significant effect. CEQA Guidelines Section 15380 (Rare or Endangered Species) provides for the assessment of unlisted species as rare or endangered under CEQA if the species can be shown to meet the criteria for listing. Unlisted plant species on the California Native Plant Society (CNPS) List ranked 1A, 1B, and 2 would typically require evaluation under CEQA.

Fish and Game Code Sections 3500 to 5500 outline protection for fully protected species of mammals, birds, reptiles, amphibians, and fish. Species that are fully protected by these sections may not be taken or possessed at any time. The CDFW cannot issue permits or licenses that authorize the take of any fully protected species, except under certain circumstances such as scientific research and live capture and relocation of such species pursuant to a permit for the protection of livestock.

Under Fish and Game Code Section 3503.5, it is unlawful to take, possess, or destroy any birds in the orders of *Falconiformes* or *Strigiformes* (birds of prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto. To comply with the requirements of CESA, an agency reviewing a proposed project within its jurisdiction must determine whether any State listed endangered or threatened species may be present in the project Study Area and determine whether the proposed project will have a potentially significant impact on such species. In addition, the CDFW encourages informal consultation on any proposed project that may impact a candidate species.

California Fish and Game Code continues to protect non-listed bat species and their roosting habitat, including individual roosts and maternity colonies. Relevant regulations include California Fish and Game Code Sections 86; 2000; 2014; 3007; and 4150, along with Title 14 of California Code of Regulations.

Fish and Game Code Section 1602 requires any entity to notify the CDFW before beginning any activity that "may substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of any river, stream, or lake" or "deposit debris, waste, or other materials that could pass into any river, stream, or lake." "River, stream, or lake" includes waters that are episodic and perennial and ephemeral streams, desert washes, and watercourses with a subsurface flow. A Lake or Streambed Alteration Agreement will be required if the CDFW determines that project activities may substantially adversely affect fish or wildlife resources through alterations to a covered body of water. CDFW jurisdiction typically extends to the edge or "drip line" of the riparian habitat or top of bank.

California Native Plant Society

The CNPS maintains a rank of plant species that are native to California and that have low population numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the Inventory of Rare and Endangered Vascular Plants of California. Following are the definitions of the CNPS ranks:

- **Rank 1A:** Plants presumed extirpated in California and either rare or extinct elsewhere
- **Rank 1B:** Plants rare, threatened, or endangered in California and elsewhere
- **Rank 2A:** Plants presumed extirpated in California but common elsewhere
- **Rank 2B:** Plants rare, threatened, or endangered in California but more common elsewhere
- **Rank 3:** Plants about which more information is needed, a review list
- **Rank 4:** Watch List: Plants of limited distribution

Potential impacts to populations of CNPS-ranked plants receive consideration under CEQA review. All plants appearing on the CNPS List ranked 1 or 2 are considered to meet the CEQA Guidelines Section 15380 criteria. Rank 3 and 4 plants do not automatically meet this definition. Rank 4 plants do not clearly meet CEQA standards and thresholds for impact considerations. Nevertheless, some level of CEQA review is justified for California Rare Plant Rank (CRPR) 4 taxa, and under some circumstances, a full impact analysis is warranted. Taxa that can be shown to meet the criteria for endangered, rare, or threatened status under CEQA Section 15380(d) or that can be shown to be regionally rare or unique as defined in CEQA Section 15125(c) must be fully analyzed in a CEQA document. Some circumstances, such as local rarity, having occurrences peripheral to the taxon's distribution, or having occurrences on unusual substrates or rare and declining habitats, provide justification for treating some CRPR 4 taxa occurrences as regionally rare or unique. One limitation to fully analyzing impacts on CRPR 4 taxa is the difficulty in obtaining current data on the number and condition of the occurrences.[2]

City of San Leandro 2035 General Plan

The following General Plan Policies relate to biological resources:

Policy OSC-6.2 Mitigation of Development Impacts

Require measures to mitigate the impacts of development or public improvements on fish and wildlife habitat, plant resources, and other valuable natural resources in the City.

Action OSC-6.4.A Biological Assessments

Require biological assessments for development in areas where special-status species may be present. Require mitigation in accordance with State and federal regulations where potential adverse impacts exist.

San Leandro Municipal Code

San Leandro Municipal Code (SLMC) Chapter 5.2 outlines the City's Tree Ordinance. It establishes the City's role in protecting, maintaining, removing, or otherwise altering street trees and also identifies the procedures necessary to make any alterations and to prevent damage to street trees.

San Leandro Zoning Code

San Leandro Zoning Code (SLZC) Section 4.16.112 outlines procedures for the treatment of existing trees on development sites. Procedures include identifying all existing trees equal or greater than 6 inches in

[2] California Native Plant Society (CNPS). 2020. Considerations for Including CRPR 4 Plant Taxa in CEQA Biological Resource Impact Analysis. Sacramento, CA. January 21, 2020.

diameter on plans submitted for "Site Plan Approval" and, if necessary, preparing a tree report. SLZC Section 4.16.112 additionally provides guidance regarding the preservation or replacement of trees.

METHODS

Analysis of the biological resources associated with the project site entailed a thorough review of relevant literature followed by a reconnaissance-level field survey to document existing site conditions and identify biological resource constraints, including the potential for special-status species to occur on-site. The survey area included the entire project site as well as the immediate vicinity where access was possible.

Literature Review

A literature review included topographic maps and recent and historic aerial imagery, the Natural Resources Conservation Service (NRCS) soil survey database, special-status species observation databases, hydrology databases, and others, as detailed below.

Topographic Maps and Aerial Photographs

A FirstCarbon Solutions (FCS) Biologist reviewed current topographic maps and aerial photographs as a preliminary analysis of the existing conditions within the project site and immediate vicinity. Information obtained from the review of the topographic maps included elevation range, general watershed information, and potential drainage feature locations.[3] Aerial photographs provide a perspective of site conditions relative to on-site and off-site land uses, preliminary plant community locations, and potential locations of wildlife movement corridors.

Soil Surveys

An FCS Biologist reviewed the NRCS Web Soil Survey to determine soil series (i.e., group of soils with similar profiles) and soil mapping units occurring at the project site.[4] An FCS Biologist reviewed habitat requirements pertaining to soils and substrates for special-status species to establish whether on-site conditions are suitable for occurrence of special-status plant and wildlife species.

Special-status Species Database Search

An FCS Biologist reviewed the CDFW CNDDB, a special-status species and plant community account database, the USFWS Information for Planning and Consultation (IPaC) system and the CNPS Electronic Inventory (CNPSEI) of Rare and Endangered Vascular Plants of California database for the *San Leandro,*

[3] United States Environmental Protection Agency (EPA). 2022. Watershed Assessment, Tracking and Environmental Results System (WATERS). Website: https://www.epa.gov/waterdata/waters-watershed-assessment-tracking-environmental-results-system. Accessed March 2022.

California, United States Geological Survey (USGS) 7.5-minute Topographic Quadrangle Map and the eight surrounding quadrangles.[5,6,7]

State or Federally Protected Waters and Wetlands

An FCS Biologist reviewed the EPA Watershed Assessment, Tracing and Environmental Results System (WATERS) and aerial photography to identify potential natural drainage features and water bodies.[8] In general, all surface drainage features identified as blue-line streams on USGS maps and linear water or wetland features that exhibit evidence of concentrated flow are considered potentially subject to State and federal regulatory authority as waters of the United States and/or State. A preliminary assessment in the field was conducted to determine the location of any existing drainages and the limits of project-related grading activities, to aid in determining whether a formal delineation of waters of the United States or State is necessary.

Protected Trees

Prior to conducting the reconnaissance-level survey, an FCS Biologist reviewed applicable City and County ordinances pertaining to tree preservation and protective measures and their tree replacement conditions or permits required. Additionally, the Revised Arborist Report (Attachment B) was reviewed and used as the basis for the tree-related analysis included here.

Habitat Conservation Plan

As part of the literature review, FCS also took into consideration whether the proposed project lies within the boundaries of any adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional, or State HCP and whether any such plan would be applicable to the proposed project.

City of San Leandro General Plan

The City of San Leandro General Plan (General Plan) was reviewed to identify applicable policies, goals, and actions related to biological resources.

Reconnaissance-Level Field Survey

On March 30, 2022, an FCS Biologist conducted a reconnaissance-level field survey of the project site and its immediate vicinity, where accessible. The object of the survey was to assess and characterize the biological conditions on and adjacent to the site, including an evaluation on whether sensitive biological resources, including suitable habitat for special-status plant and wildlife species are present.

Exhibit 2
Site Plan

RESULTS

The following section summarizes the results of the literature review and biological resources survey, including existing conditions, special-status species, State or federally protected waters or wetlands, wildlife movement corridors and nursery sites, protected trees, and others, as detailed below.

Existing Conditions

Topography and Climate

The project site is flat and does not contain fluctuations in topography as it consists of a graded, developed site. Runoff would drain to the municipal stormwater system. Climate consists of mild coastal temperatures with minimal fluctuations (33°/84°F [degrees Fahrenheit]) and low (13-30 inches) yearly precipitation levels.

Soils

The NRCS Web Soil Survey maps the site as consisting of Clear Lake clay, drained, 0 to 2 percent slopes, MLRA 14.[9] However, the site is almost entirely covered with hardscape (pavement and buildings) and only small areas of exposed soil is present in form of backyards of the former residents located on the northern portion of the site, and along the site boundaries.

Vegetation Communities or Land Cover Types

Vegetation Communities and Land Cover Types are depicted on Exhibit 3 and described below.

Urban/Developed

The entire site (approximately 3.28 acres) can be classified as Urban/Developed. The approximately 0.22-acres of mixed ornamental tree cover are a part of the Urban/Developed land cover type but are evaluated and mapped separately in this report because of the potential value of tree cover in regard to biological resources (Exhibit 3).

Hardscaped and Landscaped

Developed land is characterized by permanent or semi-permanent structures, pavement, or hardscape and landscaped areas that often require irrigation. The Urban/Developed land cover type includes land that has been developed or otherwise covered with a permanent man-made surface. Areas where no natural land is evident, or because large amounts of debris or other materials have been placed upon it, may also be included. The project site contains large, paved areas, seven structures, a large former RV parking lot, and associated landscaped and hardscaped areas.

[9] Natural Resources Conservation Service (NRCS). 2020. United States Department of Agriculture (USDA). Soil Survey Official Soil Series Descriptions. Website: http://www.nrcs.usda.gov/. Accessed March 2022.

Because the structures on-site are now vacant, the site now includes small patches of ruderal vegetation interspersed throughout and primarily on the parcel boundaries. Therefore, these areas are not mapped and quantified separately, but are included in the Developed category, below.

The former backyards of the residences on the northern portion of the project site have converted to ruderal areas following the abandonment of these structures. Additionally, invasive plants ("weeds") have started to colonize the boundaries of the former RV business site at the southern portion of the site.

Vegetation observed included shortpod mustard (*Hirschfeldia incana*), ripgut brome (*Bromus diandrus*), fennel (*Foeniculum vulgare*), wild oat (*Avena fatua*), dandelion (*Taraxacum* sp.), bristly ox tongue (*Helminthotheca echioides*), burclover (*Medicago polymorpha*), cheeseweed (*Malva parviflora*), bamboo (subfamily Bambusoideae), stinkwort (*Dittrichia graveolens*), English ivy (*Helix hedera*), prickly lettuce (*Lactuca serriola*), and others.

Mixed Ornamental Tree Cover

The project site contains multiple clusters of ornamental trees. All trees are identified, mapped and evaluated in the Preliminary Tree Report (Attachment B). Because of the small and disjunct canopy cover, landscaped or hardscaped understory, and the species composition, these clusters of trees do not meet the characteristics of a woodland. However, individual trees may be protected (see Impact Analysis).

Wildlife

The site may provide habitat for generalist and opportunistic wildlife species that are able to tolerate high levels of habitat disturbance, including skunk (*Mephitis mephitis*), raccoon (*Procyon lotor*), mourning dove (*Zenaida macroura*), American crow (*Corvus brachyrhynchos*), and others. Wildlife observed during the field survey included crow (*Corvus brachyrhynchos*), Ana's hummingbird (*Calypte anna*), house finch (*Haemorhous mexicanus*), black phoebe (*Sayornis nigricans*), and California gull (*Larus californicus*).

The trees located on-site and the immediate vicinity could provide suitable habitat for migratory or resident nesting birds. No signs of bat roosts were observed during the field survey; however, many small openings in the existing structures on-site could provide roosting habitat for bats. However, the lack of natural foraging habitat and nearby human disturbance reduces the likelihood of bat use of this area.

Special-status Species

A review of the CNDDB, CNPS, and IPaC Inventories determined that 35 special-status plant species and 28 special-status animal species have been recorded within the regional vicinity of the project site (Attachment A). The parameters of these search queries included an area consisting of the *San Leandro, California*, USGS 7.5-minute Topographic Quadrangle Map and the eight surrounding quadrangles (regional vicinity). The likelihood and rationale for these species to occur are discussed in the paragraphs below. No special-status plants or animal species were observed during the field survey.

Special-status Plant Species

The project site includes only previously landscaped areas including heavily managed backyards and now small patches of ruderal vegetation consisting of non-native invasive species. The site does not contain suitable habitat for rare plant species, which would require valley grasslands, cismontane woodlands, chaparral, swamps, marshes, serpentine-derived substrate, or outcrops. Additionally, the site is cut-off from dispersal opportunities from regionally occurring special-status plant species populations by large swaths of surrounding development on all sides. No special-status plant species or vegetation communities or other conditions supporting sensitive plant species were observed during the spring 2022 survey conducted by a qualified Biologist. Therefore, it is reasonable to conclude that no special-status plant species occur on the project site.

Special-status Wildlife

The presence of 28 special-status wildlife species, as recorded within the regional area surrounding the project site (Appendix A; covering an area of about 450 square miles) require specific habitat conditions and dispersal opportunities. The required habitat types for these species include sufficiently large and suitable woodland, grassland, shrubland, rock outcroppings, serpentine-derived soils, specific native host-plants, saltmarsh/estuarine, or suitable freshwater aquatic habitats, or a combination thereof. None of these habitat types and conditions are present on the project site or adjacent areas. Additionally, the project site lacks dispersal opportunities from regionally occurring special-status wildlife species populations by large swaths of surrounding development on all sides. No special-status wildlife species or habitats supporting special-status wildlife species were observed during the 2022 survey conducted by a qualified Biologist. Therefore, it is reasonable to conclude that no special-status wildlife species occur on the project site or within disturbance distance.

Protected Functional Groups

Nesting birds and roosting bats include groups of species that are not listed as endangered, rare, or threatened but are protected under federal and State law under certain conditions, as described below.

Nesting Birds

The active nests of most bird species are protected by federal and/or State law (MBTA and Fish and Game Code). Species that are protected pursuant to MBTA are listed by the USFWS.[10] Nests are generally defined as being “active” if they contain eggs or altricial young. The project site contains trees, shrubs, and structures that provide suitable habitat for protected migratory or native resident nesting bird species relatively tolerant of human disturbance.

Roosting Bats

Trees and/or structures on-site are potentially capable of supporting protected bat roosts (e.g., maternity roosts) of bat species tolerant to urban settings, if structures remain unoccupied and

[10] United States Fish and Wildlife Service (USFWS). 2022. Website: https://www.federalregister.gov/documents/2020/04/16/2020-06779/general-provisions-revised-list-of-migratory-birds.

vegetation unmanaged for more than approximately one month before demolition. Protection of bats is defined in the Regulatory Settings section above.

State or Federally Protected Waters and Wetlands

No wetlands or other aquatic features that meet criteria as waters of the United States or State were observed within the proposed project site during the reconnaissance-level survey.

Wildlife Movement Corridors

Wildlife movement corridors link areas of suitable wildlife habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. Urbanization and the resulting fragmentation of open space areas create isolated "islands" of wildlife habitat, forming separated populations. Corridors act as an effective link between populations.

The project site was evaluated for evidence of wildlife movement corridors during the field survey. The project site is developed and is surrounded in all directions by extensive urban development, roadways and other man-made structures that serve as barriers to wildlife movement. The site does not provide value as a wildlife movement corridor.

Nursery Sites

The only potential wildlife nursery opportunities on-site could include nesting birds and maternity bat roosts, as discussed in the section Protected Functional Groups, above.

Protected Trees

Per the Revised Arborist Report (Attachment B), 23 trees representing six species with a diameter equal to or more than 6 inches diameter are present on the site. These trees are subject to Site Plan Approval and therefore potentially protected through SLMC Chapter 5.2 or SLZC Section 4.16.112.

Applicable Habitat Conservation Plans

The proposed project does not lie within the boundaries of any adopted HCP, NCCP, or other approved local, regional, or State HCP.[11]

[11] California Department of Fish and Wildlife (CDFW). 2022. NCCP Plan Summaries. Website: https://wildlife.ca.gov/conservation/planning/nccp/plans. Accessed March 2022.

Exhibit 3
Land Cover Types and Vegetation Communities

IMPACT ANALYSIS

The following section analyzes potential project-related impacts on special-status species and protected functional groups such as nesting birds or roosting bats, as identified as present or potentially present in Section 4.3 above. Sensitive communities, special-status plant or wildlife species, and wildlife movement corridors were determined to have no potential to occur on the project site (see Results section for details); therefore, no impacts would occur, and no further impact analysis is warranted.

The impact analysis for the remaining protected nesting birds and roosting bats is based on the project plans and assumes demolition of all current structures and subsequent construction of new residential structures and infrastructure.

Impact Analysis Related to Protected Functional Groups

Nesting Birds

If active bird nests of any federally or State-protected species are present on the project site or within disturbance distance, the proposed project has the potential to disturb/disrupt protected bird nesting by removal of trees, shrubs, or structures and, in the immediate vicinity of construction activity, potentially leading to direct destruction or premature nest abandonment and therefore take of protected nests (i.e., eggs or altricial young). With implementation of Avoidance and Minimization Measure (AMM)-1 (see below), this potential impact can be reduced to a less than significant level.

Roosting Bats

If bat roosts are present on the project site or within disturbance distance, demolition activities have the potential to disturb/disrupt protected bat roosts, potentially leading to direct destruction or premature roost abandonment and loss of bats (including young or rare/sensitive bat species). With implementation of AMM-2 (see below), this potential impact can be reduced to a less than significant level.

Impact Analysis Related to Protected Trees

The Revised Arborist Report (Attachment B) includes an impact analysis based on the site plan and recommendations for preservation of specific trees, including the mature redwood trees along Washington Avenue suitable for preservation. Additionally, impact avoidance and minimization measures are recommended. Adherence to additional tree protection guidelines specified in an updated Arborist Report is also recommended to minimize impacts. With implementation of the preservation measures listed in the Revised Arborist Report, and adherence to any additional tree preservation requirements following site plan approval, no significant impacts to protected trees are anticipated.

Consistency with General Plan Policies Related to Biological Resources

Applicable General Plan Policies related to biological resources are summarized in the Regulatory Background Section, above. With preparation and submittal of this BRA, and implementation of the

avoidance and minimization measures below, the proposed project would be consistent with General Plan Policies.

AVOIDANCE AND MINIMIZATION RECOMMENDATIONS

The following section includes recommended avoidance and minimization measures to reduce the above identified potential impacts on nesting birds, roosting bats, and potentially protected trees to a less than significant level.

AMM-1 Nesting Birds

If the project is implemented during the nesting season (generally February 15 to August 31), a qualified Biologist shall conduct a nesting bird survey no more than 7 days prior to start of construction to determine whether or not protected active bird nests are present within the disturbance zone of the project site.

If a protected active nest is located during the pre-construction surveys, a qualified Biologist shall determine a nest protection buffer based on species and anticipated disturbance level. The buffer shall be physically marked on-site, e.g., using fencing, pin flags, and or yellow caution tape. The buffer zone will be maintained around the active nest site(s) until the young have fledged and are foraging independently.

AMM-2 Roosting Bats

If tree removal, heavy vegetation modifications, or demolition of existing structures is proposed, trees and/or structures with features capable of supporting roosting bats (both maternity and wintering or hibernation roosts) shall be surveyed by a qualified Biologist for bat roosts or evidence of bat roosting (guano, urine staining and scent, dead bats) not more than 14 days before the start of disturbance, including vegetation removal. If active roosts are discovered, a protection zone of no less than 50 feet around the active roost shall be established by the qualified Biologist. Disturbance may occur within the once active roosting ceases, as determined by the qualified Biologist.

AMM-3 Protected Trees

The project applicant shall submit the Preliminary Arborist Report and the Revised Arborist Report to the City of San Leandro for Site Plan Approval pursuant SLMC Chapter 5.2 or SLZC Section 4.16.112. The project applicant shall obtain approval from the City of San Leandro for tree removal based on the Arborist Report and shall follow all conditions of the approval.

Tree Assessment Form

Introduction and Overview

First Industrial Realty Trust, Inc. is planning the redevelopment of 14143-14273 Washington Avenue in San Leandro, CA. The site is currently a mix of commercial and residential buildings with associated parking lots and landscapes. HortScience | Bartlett Consulting was asked to prepare a **Preliminary Arborist Report** was asked to revise a **Preliminary Arborist Report** produced in February 2022 for the site as part of the application to the City of San Leandro, this report responds to that request.

This report provides the following information:

1. Assessment of the health and structural condition of the trees within the proposed project area based on a visual inspection from the ground.
2. Evaluation of the impacts to trees based on development plans.
3. Guidelines for tree preservation during the design, construction and maintenance phases of development.

Tree Assessment Methods

Trees were assessed on January 10, 2022. The assessment included all trees 6" and greater, located within and adjacent to the project area. There were no offsite trees. The assessment procedure consisted of the following steps:

1. Identifying the tree species.
2. Verifying or tagging trees and recording locations on a map.
3. Measuring the trunk diameter at a point 54 inches above grade.
4. Evaluating the health and structural condition using a scale of 1 – 5:
   - ***5*** - A healthy, vigorous tree, reasonably free of signs and symptoms of disease, with good structure and form typical of the species.
   - ***4*** - Tree with slight decline in vigor, small amount of twig dieback, minor structural defects that could be corrected.
   - ***3*** - Tree with moderate vigor, moderate twig and small branch dieback, thinning of crown, poor leaf color, moderate structural defects that might be mitigated with regular care.
   - ***2*** - Tree in decline, epicormic growth, extensive dieback of medium to large branches, significant structural defects that cannot be abated.
   - ***1*** - Tree in severe decline, dieback of scaffold branches and/or trunk; most of foliage from epicormics; extensive structural defects that cannot be abated.
5. Rating the suitability for preservation as "high", "moderate" or "low". Suitability for preservation considers the health, age and structural condition of the tree, and its potential to remain an asset to the site for years to come.
   - ***High***: Trees with good health and structural stability that have the potential for longevity at the site.
   - ***Moderate***: Trees with somewhat declining health and/or structural defects than can be abated with treatment. The tree will require more intense management, monitoring, and may have shorter life span than those in 'high' category.
   - ***Low***: Trees in poor health or with significant structural defects that cannot be mitigated. Tree is expected to continue to decline, regardless of treatment. The species or individual may have characteristics that are undesirable for landscapes, and generally are unsuited for use areas.

Description of Trees

Twenty-three (23) trees representing six species were evaluated (Table 1). Coast redwoods and valley oaks are native to the Alameda County area, trees of these two species, however, are unlikely indigenous to the site. The remaining five trees were ornamental species. All of the trees were located on the eastern half of the property with the majority located along the edge of Washington Avenue. Overall, 16 trees (70%) were in good condition, four (17%) were in fair condition, and three (13%) were in poor condition (Table 1). Descriptions of each tree are found in the ***Tree Assessment Form***, and approximate locations are plotted on the ***Tree Assessment Map*** (see Exhibits).

Table 1. Condition ratings and frequency of occurrence of trees.
14143-14273 Washington Avenue, San Leandro, CA

Common Name	Scientific Name	Condition			Total
		Poor (1-2)	Fair (3)	Good (4-5)	
Norfolk island pine	*Araucaria heterophylla*	-	-	2	**2**
Loquat	*Eriobotrya japonica*	1	-	-	**1**
Ginkgo	*Ginkgo biloba*	-	1	-	**1**
Victorian box	*Pittosporum undulatum*	1	-	-	**1**
Valley oak	*Quercus lobata*	1	1	-	**2**
Coast redwood	*Sequoia sempervirens*	-	2	14	**16**
Total		**3**	**4**	**16**	**23**

Among the 16 coast redwoods, 14 were in good condition, trees #111 and #120 were fair, and none were in poor condition. Trees ranged in development from young to mature with trunk diameters from 9 to 45 inches (Photo 1).

Photo 1 (right): Looking southeast along Washington Avenue at trees #101-104 (back to front). Trees #101 and 102 were close to average size for coast redwoods at the site, while #103 and 104 were two of the smallest.

The remaining species were represented by two or fewer individuals:

- Female ginkgo #118 was growing along the south edge of the driveway for 14143 Washington Avenue. Fruit covered the driveway below its canopy. It was semi-mature in development and 14 inches in trunk diameter. The ginkgo was in fair condition with multiple attachments throughout the canopy.

- Loquat #119 was growing adjacent to the north of the building at 14173. It was semi-mature in development with two stems (7 and 4 inches in diameter). It was in poor condition.

- Norfolk Island pines #113 and #122 were growing along Washington Avenue on the northern half of the property. Both trees were mature in development with trunk diameters of 23 and 26 inches respectively. Both trees were in good condition and had been pruned for utilities (Photo 2).

Photo 2: Norfolk Island pine #113 was growing along Washington Avenue with a vigorous crown.

- Valley oaks #114 and #123 were located on the north half of the property. Both trees were semi-mature in development and had trunk diameters of 8 and 13 inches respectively. Tree #114 was in poor condition while #123 was fair. Both trees had multiple attachments along their trunks.

- Victorian box #121 was located at the northern corner of the property. It was mature in development with multiple stems. It was almost dead with very poor structure.

San Leandro's Municipal Code only protects *Street Trees* growing within the public right-of-way. Although the extent of the ROW was not marked in the field, no trees appeared to be *Street Trees*. It appears that none of the trees included in this assessment require a permit to be removed.

Suitability for Preservation

Before evaluating the impacts that will occur during development, it is important to consider the quality of the tree resource itself, and the potential for individual trees to function well over an extended length of time. Trees that are preserved on development sites must be carefully selected to make sure that they may survive development impacts, adapt to a new environment and perform well in the landscape.

Our goal is to identify trees that have the potential for long-term health, structural stability and longevity. For trees growing in open fields, away from areas where people and property are present, structural defects and/or poor health present a low risk of damage or injury if they fail. However, we must be concerned about safety in use areas. Therefore, where development encroaches into existing plantings, we must consider their structural stability as well as their potential to grow and thrive in a new environment. Where development will not occur, the normal life cycles of decline, structural failure and death should be allowed to continue.
Evaluation of suitability for preservation considers several factors:

- **Tree health**
  Healthy, vigorous trees are better able to tolerate impacts such as root injury, demolition of existing structures, changes in soil grade and moisture, and soil compaction than are non-vigorous trees. For example, valley oak #114 was in poor condition and should be removed regardless of construction impact.

- **Structural integrity**
  Trees with significant amounts of wood decay and other structural defects that cannot be corrected are likely to fail. Such trees should not be preserved in areas where damage to people or property is likely. For example, Victorian box #121 had a decayed trunk and multiple attachments.

- **Species response**
  There is a wide variation in the response of individual species to construction impacts and changes in the environment. For instance, loquats and ginkgoes have good tolerance to root pruning under more general conditions while coast redwoods are more tolerant of root pruning when soil is adequately moist.

- **Tree age and longevity**
  Mature trees, while having significant emotional and aesthetic appeal, have limited physiological capacity to adjust to an altered environment. Young trees are better able to generate new tissue and respond to change. The coast redwoods were generally young and are expected to have a high degree of adaptability to site changes. Meanwhile, Victorian box #121 is overly mature and expected to decline or die with any adjacent construction activity.

- **Species invasiveness**
  Species that spread across a site and displace desired vegetation are not always appropriate for retention. This is particularly true when indigenous species are displaced. The California Invasive Plant Inventory Database http://www.cal-ipc.org/plants/inventory/ lists species identified as being invasive. San Leandro is part of the Central West Floristic Province. No invasive trees were growing on the site.

Each tree was rated for suitability for preservation based upon its age, health, structural condition and ability to safely coexist within a development environment (see ***Tree Assessment*** in Exhibits and Table 2). We consider trees with "high" suitability for preservation to be the best candidates for preservation. We do not recommend retention of trees with "low" suitability for preservation in areas where people or property will be present. Retention of trees with "moderate" suitability for preservation depends upon the intensity of proposed site changes.

Table 2. Tree suitability for preservation
14143-14273 Washington Avenue, San Leandro, CA

High	These are trees with good health and structural stability that have the potential for longevity at the site. Sixteen (16) trees, including 14 coast redwoods and both Norfolk Island pines, had "high" suitability for preservation.
Moderate	Trees in this category have fair health and/or structural defects that may be abated with treatment. These trees require more intense management and monitoring, and may have shorter life-spans than those in the "high" category. Coast redwoods #111 and #120, ginkgo #118, and valley oak #123 had "moderate" suitability for preservation.
Low	Trees in this category are in poor health or have significant defects in structure that cannot be abated with treatment. These trees can be expected to decline regardless of management. The species or individual tree may possess either characteristics that are undesirable in landscape settings or be unsuited for use areas. Valley oak #114, loquat #119, and Victorian box #121 had "low" suitability for preservation.

Preliminary Evaluations of Impacts and Recommendations

Appropriate tree retention develops a practical match between the location and intensity of construction activities with the quality and health of trees. The ***Tree Assessment*** was the reference point for tree condition and quality. Impacts from construction were estimated given the project information available to date. I referred to the Preliminary Site Improvement Plans Washington Avenue by Kier + Wright (dated April 2022) to evaluate impacts.

All plans were preliminary. As such, the assessment of impacts to trees is preliminary. The development proposes to demolish an existing set of commercial buildings and construct a new building with parking spaces and associated sidewalks and landscaping. Development will encompass the entire site, limiting opportunity for preservation of on-site trees.

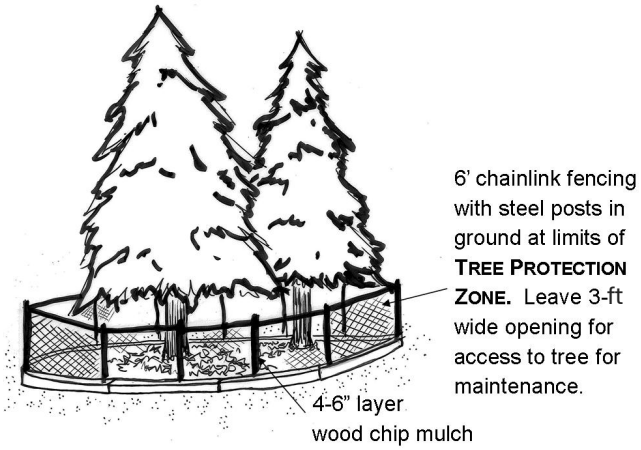
Based on the proposed plan, I recommend preservation of 8 trees and removal of 15 (Table 3, page 7). The 9 trees recommended for preservation had high suitability for preservation. The trees recommended for preservation include coast redwoods #101 – 105 and 108, and Norfolk Island pine #113 which are expected to have tolerable levels of construction and relandscaping within their driplines. Coast redwood #109 is within an area to be relandscaped. Foundation construction appears to be within 7’ of the trunk. Tree #109 will not tolerate root severances within 6’ of the trunk. If roots will be severed within 6’ of the trunk of tree #109, the tree will be removed.

Retention of these trees is predicated on strict adherence to the ***Preliminary Tree Preservation Guidelines***. For the coast redwoods, some amount of canopy and root pruning may be required. Although the driplines of these trees are within the proposed construction area, coast redwoods are tolerant of root pruning and can be retained even with activity in the root zone. Additionally, these trees provide significant benefits to the site in their current location. They provide good screening of surrounding infrastructure and property boundaries as well as shading of adjacent asphalt.

The 15 trees which are to be removed are either within the proposed building footprint, the proposed parking and driveway construction, or the bioretention beds and associated drainage. This includes eight coast redwoods, valley oaks #114 and #123, ginkgo #118, loquat #119, and Victorian box #121. Six coast redwoods had a high suitability for preservation while the remaining trees had low to moderate suitability.

Table 3. Tree disposition.
14143 – 14273 Washington Avenue. San Leandro, CA

Tree No.	Species	Trunk Diameter (in.)	Condition 1=poor 5=excellent	Suitability for Preservation	Disposition	Comments
101	Coast redwood	21	5	High	Preserve	W/in relandscaped area; 11' to building
102	Coast redwood	16	5	High	Preserve	W/in relandscaped area; 10' to building
103	Coast redwood	11	5	High	Preserve	W/in relandscaped area; 9' to building
104	Coast redwood	9	5	High	Preserve	W/in relandscaped area; 8' to building
105	Coast redwood	15	4	High	Preserve	W/in relandscaped area; 10' to building
106	Coast redwood	19	4	High	Remove	W/in relandscaped area; 3' to trenching
107	Coast redwood	20	5	High	Remove	W/in bioretention bed
108	Coast redwood	21	5	High	Preserve	W/in relandscaped area; 11' to building
109	Coast redwood	25	5	High	Preserve	W/in relandscaped area; 7' to building; do not root prune <6’
110	Coast redwood	15	4	High	Remove	W/in 4' of building exit
111	Coast redwood	13	3	Moderate	Remove	W/in building footprint
112	Coast redwood	17	4	High	Remove	W/in bioretention bed
113	Norfolk island pine	23	4	High	Preserve	W/in relandscaped area
114	Valley oak	8	1	Low	Remove	W/in building footprint
115	Coast redwood	11	5	High	Remove	W/in building footprint
116	Coast redwood	11	5	High	Remove	W/in building footprint
117	Coast redwood	11	5	High	Remove	W/in building footprint
118	Ginkgo	14	3	Moderate	Remove	W/in building footprint
119	Loquat	7,4	2	Low	Remove	W/in building footprint
120	Coast redwood	45	3	Moderate	Remove	W/in parking area
121	Victorian box	18,12,12, 12,8	1	Low	Remove	W/in parking area
122	Norfolk island pine	26	4	High	Remove	2' to driveway
123	Valley oak	13	3	Moderate	Remove	W/in building footprint



Preliminary Tree Preservation Guidelines

The following recommendations will help reduce impacts to trees from development as well as maintain and improve their health and vitality through the clearing, grading and construction phases. The key elements of a tree preservation plan for the Washington Avenue site would include:

- Retaining select trees with high or moderate suitability for preservation and apparently tolerable conflicts with construction impacts.
- Establishing **Tree Protection Zones** for each tree to be preserved. **Tree Protection Zones** are identified by the Consulting Arborist based on species tolerances, tree condition, trunk diameters and the nature and proximity of the proposed disturbance.
- Providing supplemental irrigation prior to and during the demolition and construction phases.

Design recommendations

1. All plans affecting trees shall be reviewed by the Consulting Arborist with regard to tree impacts. These include, but are not limited to, demolition plans, grading and utility plans, landscape and irrigation plans.
2. For trees identified for preservation, designate a **Tree Protection Zone** in which no construction, grading and underground services including utilities, sub-drains, water or sewer will be located (Figure 1, next page). For design purposes, the **Tree Protection Zone** should be either the dripline or edge of proposed construction. The **TPZ** will be determined once final plans have been reviewed. Depending on the tree to be preserved, additional space beyond the dripline may be required.
3. No grading, excavation, construction or storage of materials shall occur within the **Tree Protection Zone**.
4. No underground services including utilities, sub-drains, water or sewer shall be placed in the **Tree Protection Zone**.
5. Irrigation systems must be designed so that no trenching will occur within the **Tree Protection Zone**.

Detail A: Redwood Tree Protection Fencing

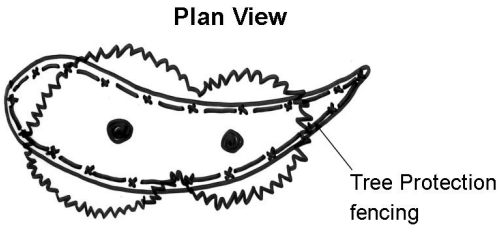


Figure 1: An example of a **Tree Protection Zone** which encroaches slightly on the dripline of the trees but designates the edge of proposed construction.

6. As trees withdraw water from the soil, expansive soils may shrink within the root area. Therefore, foundations, footings and pavements on expansive soils near trees should be designed to withstand differential displacement.

7. Consider having a temporary irrigation system installed (using soaker hoses or PVC pipes laid on the ground and covered with mulch) as soon as possible to supply the trees with water and help them recover and prepare them for impacts associated with the demolition and construction process.

Pre-construction treatments and recommendations

1. The demolition contractor shall meet with the Consulting Arborist before beginning work to discuss work procedures and tree protection.

2. Where possible, cap and abandon all existing underground utilities within the **TPZ** in place. Removal of utility boxes by hand is acceptable but no trenching should be performed within the **TPZ** in an effort to remove utilities, irrigation lines, etc.

3. Fence all trees to be retained to completely enclose the **Tree Protection Zone** prior to demolition, grubbing or grading. Fences shall be 6 ft. chain link or equivalent as approved by the Consulting Arborist. Fences are to remain until all grading and construction is completed.

4. Prune trees to be preserved to clean the crown of dead branches 1 inch and larger in diameter and raise canopies as needed for construction activities. All pruning shall be done by a State of California Licensed Tree Contractor (C61/D49). All pruning shall be done by Certified Arborist or Certified Tree Worker in accordance with the Best Management Practices for Pruning (International Society of Arboriculture, 2002) and adhere to the most recent editions of the American National Standard for Tree Care Operations (Z133.1) and Pruning (A300). The Consulting Arborist will provide pruning specifications prior to site demolition. Branches extending into the work area that can remain following demolition shall be tied back and protected from damage.

5. All tree work shall comply with the Migratory Bird Treaty Act as well as California Fish and Wildlife code 3503-3513 to not disturb nesting birds. Tree pruning and removal should be scheduled outside of the breeding season to avoid scheduling delays. Breeding bird surveys should be conducted prior to tree work. Qualified biologists should be involved in establishing work buffers for active nests.

6. Tree(s) to be removed that have branches extending into the canopy of tree(s) to remain must be removed by a qualified arborist and not by construction contractors. The qualified arborist shall remove the tree in a manner that causes no damage to the tree(s) and understory to remain. Tree stumps shall be ground 12 inches below ground surface.

7. Trees to be removed, specifically trees #110 and 111, shall be felled so as to fall away from **Tree Protection Zone** and avoid pulling and breaking of roots of trees to remain. If roots are entwined, the consultant may require first severing the major woody root mass before extracting the trees, or grinding the stump below ground.

8. Apply and maintain 4-6 inches of wood chip mulch within the **Tree Protection Zone.**

Recommendations for tree protection during construction

1. Prior to beginning work, the contractors working in the vicinity of trees to be preserved are required to meet with the Consulting Arborist at the site to review all work procedures, access routes, storage areas and tree protection measures.

2. All contractors shall conduct operations in a manner that will prevent damage to trees to be preserved.

3. Any grading, construction, demolition or other work that is expected to encounter tree roots should be monitored by the Consulting Arborist.

4. Tree protection fences are to remain until all site work has been completed. Fences may not be relocated or removed without permission of the Consulting Arborist.

5. Construction trailers, traffic and storage areas must remain outside fenced areas at all times.

6. Prior to grading, pad preparation, excavation for foundations/footings/walls, trenching, trees may require root pruning outside the **Tree Protection Zone** by cutting all roots cleanly to the depth of the excavation. Roots shall be cut by manually digging a trench and cutting exposed roots with a saw, with a vibrating knife, rock saw, narrow trencher with sharp blades, or other approved root pruning equipment. The Consulting Arborist will identify where root pruning is required and monitor all root pruning activities.

7. If injury should occur to any tree during construction, it should be evaluated as soon as possible by the Consulting Arborist so that appropriate treatments can be applied.

8. No excess soil, chemicals, debris, equipment or other materials shall be dumped or stored within the **Tree Protection Zone**.

9. Any additional tree pruning needed for clearance during construction must be performed by a Certified Arborist and not by construction personnel.

10. All trees shall be irrigated on a schedule to be determined by the Consulting Arborist (every 3 to 6 weeks April through October is typical). Each irrigation shall wet the soil within the **Tree Protection Zone** to a depth of 24 inches.

Maintenance of impacted trees
Our procedures included assessing trees for observable defects in structure. This is not to say that trees without significant defects will not fail. Failure of apparently defect-free trees does occur, especially during storm events. Wind forces, for example, can exceed the strength of defect-free wood causing branches and trunks to break. Wind forces coupled with rain can saturate soils, reducing their ability to hold roots, and blow over defect-free trees. Although we cannot predict all failures, identifying those trees with observable defects is a critical component of enhancing public safety.

Furthermore, trees change over time. Our inspections represent the condition of the tree at the time of inspection. As trees age, the likelihood of failure of branches or entire trees increases. Annual tree inspections are recommended to identify changes to tree health and structure. In addition, trees should be inspected after storms of unusual severity to evaluate damage and structural changes. Initiating these inspections is the responsibility of the client and/or tree owner.

Preserved trees will experience a physical environment different from that of pre-development. As a result, tree health and structural stability should be monitored. Occasional pruning, fertilization, mulch, pest management, replanting and irrigation may be required. In addition, provisions for monitoring both tree health and structural stability following construction must be made a priority.

If you have any questions about my observations or recommendations, please contact me.

MANAGEMENT SUMMARY

At the request of First Industrial Realty Trust, Inc., FirstCarbon Solutions (FCS) conducted a Phase I Cultural Resources Assessment for the proposed San Leandro Washington Avenue Warehouse Project (proposed project) located in San Leandro, California, in Alameda County. The purpose of this assessment is to identify the presence or absence of potentially significant cultural resources within the project site, and if present, propose recommendations for mitigation. Completion of this investigation fulfills the requirements associated with the California Environmental Quality Act (CEQA) Guidelines. This report follows the California Office of Historic Preservation (OHP) procedures for cultural resource surveys and the OHP Archaeological Resource Management Report (ARMR) format for archaeological reports.

On May 4, 2022, a records search was conducted at the Northwest Information Center (NWIC) located at Sonoma State University located in Rohnert Park, California, for the project site and a 0.5-mile radius beyond the project boundaries. The current inventories of the National Register of Historic Places (NRHP), the California Register of Historical Resources (CRHR), the California Historical Landmarks (CHL) list, the California Points of Historical Interest (CPHI) list, and the California Built Environment Resource Directory (BERD) for Alameda County were also reviewed to determine the existence of previously documented local historical resources. The results of the records search indicate that one historical resource has been recorded within the 0.5-mile search radius, which is not located within the project site boundaries. Fourteen survey reports are on file within the 0.5-mile radius of the project site, none of which address the proposed project site, indicating that it has not been previously surveyed for cultural resources.

On April 27, 2022, FCS sent a request to the Native American Heritage Commission (NAHC) in an effort to determine whether any sacred sites are listed on its Sacred Lands File for the project site. A response was received on May 29, 2022, indicating that the Sacred Lands File search produced a negative result for Native American cultural resources in the project area. The NAHC included a list of 11 tribal representatives available for consultation. To ensure that all Native American knowledge and concerns over potential Tribal Cultural Resources (TCRs) that may be affected by implementation of the proposed project are addressed, FCS sent letters to all 11 tribal representatives on June 7, 2022. A response was received by the Confederated Villages of Lisjan Nation on June 25, 2022, indicating that the tribe has no further information or comment regarding the proposed project. No additional responses have been received to date.

On May 13, 2022, FCS Senior Archaeologist Dr. Dana DePietro and FCS Archaeologist and Historian, Ti Ngo, surveyed the project site to identify any unrecorded cultural resources within the project boundary. The survey began in the northwest corner of the project site and moved south and east, using north–south transects spaced at 15-meter intervals whenever possible. The site was completely hardscaped with associated imported soil for landscaping elements. As a result, visibility of native soils was extremely poor, ranging between 1 to 5 percent. All areas of the project site were closely inspected for culturally modified soils or other indicators of potential historic or prehistoric resources. Native soils were visible in the northeastern portion of the project site. Visible soils were

largely composed of medium brown (7.5 YR 4/3) sandy clay, interspersed with small granite stones ranging between 1 to 3 centimeters.

Dr. DePietro and Mr. Ngo initially encountered six structures that appeared to be over 45 years in age and had not previously been evaluated for their historical significance or potential for inclusion in the CRHR or NRHP. An earlier version of this report called out the need to have the structures evaluated for full CEQA compliance, however all six were subsequently damaged by fire and demolished before the recommended evaluations could be completed. Dr. DePietro conducted an updated pedestrian survey on January 18, 2022, and confirmed that all six buildings are no longer present at the site. As such, the properties are determined ineligible for inclusion in the CRHR or NRHP as they are no longer able to convey any historic integrity. No additional prehistoric or historic resources or raw materials commonly used in the manufacture of tools (e.g., obsidian, Franciscan chert, etc.) were found within the project site.

Based on the results of the records searches, archival research, and pedestrian survey, FCS considers the probability of the project to have an adverse impact on historic or archaeological resources to be moderate. There are no recorded cultural resources within project site, however the foundations of six historic era-buildings increase the probability that subsurface archaeological resources may be encountered during project construction.

FCS therefore recommends that an archaeologist who meets the Secretary of the Interior's Professional Qualification Standards for archaeology inspect the project site following the removal of all rubble, asphalt, and ground cover, and prior to any grading or trenching into previously undisturbed soils. This may be followed by regular periodic or "spot-check" archaeological monitoring as determined by the Archaeologist, but full-time construction monitoring is not warranted at this time. Additional procedures for the inadvertent discovery of human remains and cultural resources are provided below.

SECTION 1: INTRODUCTION

1.1 - Project Location

The 3.45-acre project site is located in the City of San Leandro, in Alameda County, California. The project site is bounded by Washington Avenue to the east, 139th Avenue to the north, and railroad tracks to the south and west. As part of the project, the existing three buildings at the site would be demolished and the existing debris would be removed from the site

1.2 - Project Description

The project scope will include combining six parcels into one lot with a total area of 3.45 acres. The project applicant, First Industrial Realty Trust, Inc., proposes to develop a 52,269-square-foot building which includes 5,000 square feet of office uses and 47,269 square feet of warehouse use on the proposed project site. The proposed project would include 64 automobile parking stalls, five truck parking stalls, as well as 15 dock-high doors and two drive-in doors in the rear of the building. The site shall be fully landscaped and irrigated. The site will accommodate the required automobile and bike parking, trash enclosure, and off-street loading spaces in the truck court, which will be located on the south side of the property and secured with a fence and gate to allow for truck ingress/egress. The building shall be constructed with concrete tilt walls and a hybrid roof deck for a Type III-B construction and fully sprinklered. Access to the project consists of a proposed curb-cut at the northwest corner of the site to allow for automobile and fire truck ingress/egress, while truck access is located on the northeast corner of the property.

1.3 - Assessment Team

FCS Archaeologist and Historian, Ti Ngo, MA, authored this report. FCS Senior Archaeologist, Dr. Dana DePietro, RPA, and Mr. Ngo conducted the pedestrian survey. Professional qualifications for Dr. DePietro and Mr. Ngo can be found in Appendix A.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 2: CULTURAL SETTING

The following is a brief overview of the prehistoric and historic background of the general area, which provides context to understand the relevance of resources found in the general project area. This section is not intended to be a comprehensive review of the current resources available; rather, it serves as a general overview.

Further details of the Bay Area can be found in the ethnographic studies, mission records, and major published sources, including Beardsley (1948), Bennyhoff (1950), Fredrickson (1973), Kroeber (1925), Moratto (1984), Chartkoff and Chartkoff (1984), Heizer (ed. 1978), and Jones and Klar (2007).

2.1 - Prehistoric and Ethnographic Background

In general, archaeological research in the greater San Francisco Bay Area has focused on coastal areas, where large shellmounds were relatively easily identified on the landscape. This research and its chronological framework, however, is relevant to and has a bearing on our understanding of prehistory in areas adjacent to the San Francisco Bay, including modern Santa Clara County.

The San Francisco Bay Area supported a dense population of hunter-gatherers over thousands of years, leaving a rich a varied archaeological record. The Bay Area was a place of incredible language diversity, with seven languages spoken at the time of Spanish settlement in 1776. The diverse ecosystem of the San Francisco Bay and surrounding lands supported an average of three to five persons per square mile but reached 11 persons per square mile in the North Bay. At the time of Spanish contact, the people of the Bay Area were organized into local tribelets that defended fixed territories under independent leaders. Typically, individual Bay Area tribelets included 200 to 400 people distributed among three to five semi-permanent villages, within territories measuring approximately 10 to 12 miles in diameter (Milliken et.al. 2007).

Native American occupation and use of the greater Bay Area including the regions comprising Concord and Oakley, extends over 5000-7000 years and may be longer. Early archaeological investigations in Central California were conducted at sites located in the Sacramento-San Joaquin Delta region. The first published account documents investigations in the Lodi and Stockton area. The initial archaeological reports typically contained descriptive narratives with more systematic approaches sponsored by Sacramento Junior College in the 1930s. At the same time, University of California at Berkeley excavated several sites in the lower Sacramento Valley and Delta region, which resulted in recognizing archaeological site patterns based on a variation of intersite assemblages. Research during the 1930s identified temporal periods in Central California prehistory and provided an initial chronological sequence. In 1939, researcher Jeremiah Lillard of Sacramento Junior College noted that each cultural period led directly to the next and that influences spread from the Delta region to their regions in Central California (Lillard and Purves 1936). In the late 1940s and early 1950s, researcher Richard Beardsley of the University of California Berkeley documented similarities in artifacts among sites in the San Francisco Bay region and the Delta and refined his findings into a

cultural model that ultimately became known as the Central California Taxonomic System (CCTS). This system proposed a uniform, linear sequence of cultural succession (Beardsley 1948).

To address some of the flaws in the CCTS system, D.A. Fredrickson (1973) introduced a revision that incorporated a system of spatial and cultural integrative units. Fredrickson separated cultural, temporal, and spatial units from each other and assigned them to six chronological periods: Paleo-Indian (12,000 to 8000 years Before Present [BP]; Lower, Middle, and Upper Archaic [8000 to 1500 BP], and Emergent [Upper and Lower, 1500 to 250 BP]). The suggested temporal ranges are similar to earlier horizons, which are broad cultural units that can be arranged in a temporal sequence. In addition, Fredrickson defined several patterns—a general way of life shared within a specific geographical region. These patterns include:

- Windmiller Pattern or Early Horizon (4500 to 3500 BP)
- Berkeley Pattern or Middle Horizon (3500 to 1500 BP)
- Augustine Pattern or Late Horizon (1500 to 250 BP)

Brief descriptions of these temporal ranges and their unique characteristics follow.

2.1.1 - Windmiller Pattern or Early Horizon (4500 to 3500 BP)

Characterized by the Windmiller Pattern, the Early Horizon was centered in the Cosumnes District of the Delta and emphasized hunting rather than gathering, as evidenced by the abundance of projectile points in relation to plant processing tools. Additionally, atlatl, dart, and spear technologies typically included stemmed projectile points of slate and chert but minimal obsidian. The large variety of projectile point types and faunal remains suggests exploitation of numerous types of terrestrial and aquatic species (Bennyhoff 1950). Burials occurred in cemeteries and intra-village graves. These burials typically were ventrally extended, although some dorsal extensions are known with a westerly orientation and a high number of grave goods. Trade networks focused on acquisition of ornamental and ceremonial objects in finished form rather than on raw material. The presence of artifacts made of exotic materials such as quartz, obsidian, and shell, indicates an extensive trade network that may represent the arrival of Utian populations into Central California. Also indicative of this period, are rectangular Haliotis and Olivella shell beads and charmstones that usually were perforated (Ragir 1972).

2.1.2 - Berkeley Pattern or Middle Horizon (3500 to 1500 BP)

The Middle Horizon is characterized by the Berkeley Pattern, which displays considerable changes from the Early Horizon. This period exhibited a strong milling technology represented by minimally shaped cobble mortars and pestles, although metates and manos were still used. Dart and atlatl technologies during this period were characterized by non-stemmed projectile points made primarily of obsidian. Fredrickson suggests that the Berkeley Pattern marked the eastward expansion of Miwok groups from the San Francisco Bay Area. Compared with the Early Horizon, there is a higher proportion of grinding implements at this time, implying an emphasis on plant resources rather than on hunting. Typical burials occurred within the village with flexed positions, variable cardinal orientation, and some cremations. As noted by Lillard, the practice of spreading ground ochre over

the burial was common at this time (Lillard et al. 1939). Grave goods during this period are generally sparse and typically include only utilitarian items and a few ornamental objects. However, objects such as charmstones, quartz crystals, and bone whistles occasionally were present, which suggest the religious or ceremonial significance of the individual (Lillard et.al. 1939). During this period, larger populations are suggested by the number and depth of sites compared with the Windmiller Pattern. According to Fredrickson (1973), the Berkeley Pattern reflects gradual expansion or assimilation of different populations rather than sudden population replacement and a gradual shift in economic emphasis.

2.1.3 - Augustine Pattern or Late Horizon (1500 to 250 BP)

The Late Horizon is characterized by the Augustine Pattern, which represents a shift in the general subsistence pattern. Changes include the introduction of bow and arrow technology; and most importantly, acorns became the predominant food resource. Trade systems expanded to include raw resources as well as finished products. There are more baked clay artifacts and extensive use of Haliotis ornaments of many elaborate shapes and forms. According to Moratto, burial patterns retained the use of flexed burials with variable orientation, but there was a reduction in the use of ochre and widespread evidence of cremation (Moratto 1984). Judging from the number and types of grave goods associated with the two types of burials, cremation seems to have been reserved for individuals of higher status, whereas other individuals were buried in flexed positions. Johnson (1976) suggests that the Augustine Pattern represents expansion of the Wintuan population from the north, which resulted in combining new traits with those established during the Berkeley Pattern.

Central California research has expanded from an emphasis on defining chronological and cultural units to a more comprehensive look at settlement and subsistence systems. This shift is illustrated by the early use of burials to identify mortuary assemblages and more recent research using osteological data to determine the health of prehistoric populations (Dickel et al. 1984). Although debate continues over a single model or sequence for California, the general framework consisting of three temporal/cultural units is generally accepted, although the identification of regional and local variation is a major goal of current archaeological research.

2.1.4 - The Ohlone

At the time of European contact in the 18th Century, the San Ramon area was occupied by the Ohlone tribe of California Native Americans. The Ohlone group designates a linguistic family consisting of eight different yet related languages. The eight Ohlone languages were quite different from one another, with each language being related to its geographically contiguous neighbors.

The arrival of Ohlone groups into the Bay Area appears to be temporally consistent with the appearance of the Late Period artifact assemblage in the archaeological record, as documented at sites such as the Emeryville Shellmound or the Ellis Landing Shellmound. It is probable that the Ohlone moved south and west from the Delta region of the San Joaquin-Sacramento River region into the Bay Area. The tribal group that most likely occupied the Master Plan area is the Chochenyo language group, whose territory extended from the southern end of the Carquinez Strait south to Mission San José (present-day Fremont), east to present-day Livermore and west to the San Francisco Bay.

The various Ohlone tribes subsisted as hunter-gatherers and relied on local terrestrial and marine flora and fauna for subsistence. The predominant plant food source was the acorn, but they also exploited a wide range of other plants, including various seeds, buckeye, berries, and roots. Protein sources included grizzly bear, elk, sea lions, antelope, and black-tailed deer as well as smaller mammals such as raccoon, brush rabbit, ground squirrels, and wood rats. Waterfowl, including Canadian geese, mallards, green-winged teal, and American widgeon, were captured in nets using decoys to attract them. Fish also played an important role in the Chochenyo diet and included steelhead, salmon, and sturgeon.

The Ohlone constructed watercraft from tule reeds and possessed bow and arrow technology. They fashioned blankets from sea otter pelts, fabricated basketry from twined reeds of various types, and assembled a variety of stone and bone tools in their assemblages. Ohlone villages typically consisted of domed dwelling structures, communal sweathouses, dance enclosures, and assembly houses constructed from thatched tule reeds and a combination of wild grasses, wild alfalfa, and ferns.

The Ohlone were politically organized into autonomous tribelets that had distinct cultural territories. Individual tribelets contained one or more villages with a number of seasonal camps for resource procurement within the tribelet territory. The tribelet chief could be either male or female, and the position was inherited patrilineally, but approval of the community was required. The tribelet chief and council were essentially advisors to the community and were responsible for feeding visitors, directing hunting and fishing expeditions, ceremonial activities, and warfare on neighboring tribelets.

The first European contact with the Ohlone was probably in 1602, when Sebastian Vizcaíno's expedition moored in Monterey. The estimated Ohlone population in 1770—when the first mission was established in Ohlone territory—was approximately 10,000. By 1832, the population had declined to fewer than 2,000, mainly due to diseases introduced by the European explorers and settlers. When the Spanish mission system rapidly expanded across California, the Ohlone traditional way of life was irreversibly altered. The pre-contact hunter-gatherer subsistence economy was replaced by an agricultural economy, and the Spanish missionaries prohibited traditional social activities. After secularization of the missions between 1834 and 1836, some Native Americans returned to traditional religious and subsistence practices while others labored on Mexican ranchos. Thus, multi-ethnic Indian communities grew up in and around the area and provided informant testimony to ethnologists from 1878 to 1933 (Hart 1987).

The California Gold Rush brought further disease to the native inhabitants, and by the 1850s, nearly all of the Ohlone had adapted in some way or another to economies based on cash income. Hunting and gathering activities continued to decline and were rapidly replaced with economies based on ranching and farming.

2.2 - Regional Historic Background

2.2.1 - Spanish and Mexican Exploration and Settlement

The first European to enter the area was Captain José Francisco de Ortega, who was a scout for the Portola Expedition; however, it was not officially explored until the De Anza Expedition, where Father Junípero Serra consecrated the Mission Santa Clara de Asís. Named after Italian Saint Santa Chiara di Assisi. Mission Santa Clara de Asís, the mission was founded on January 12, 1777, was the 8th mission in the chain of 21 Franciscan missions established by Padre Junípero Serra (Mission Santa Clara de Asís 2020; Hall 1871). The mission would eventually be moved or rebuilt five times due to architectural faults or natural disasters. The final location is adjacent to the where current chapel now stands.

The pueblo of San José de Guadalupe was established on November 29, 1777, in an effort by the Spanish government to provide a permanent and secure settlement to the religious and military personal that were passing through the area; it was the first town to be established in California. On June 11, 1797, Mission San José was consecrated, making it the 14th of the 21 Franciscan Missions. Santa Clara Valley grew and expanded rapidly chiefly due to fertile land surrounding Mission San José, excellent water supply, large numbers of Native American laborers, and its proximity to San Francisco Bay. However, Spanish mission records indicate that local Native American inhabitants were being taken to Mission San José until secularization of the missions in 1833. Many Native Americans were not willing converts, and there are numerous accounts of neophytes fleeing the missions and a series of "Indian Wars" broke out when the Spanish tried to return them to the missions. During this period, Native American populations were declining rapidly from an influx of Euro-American diseases. In 1832, a party of trappers from the Hudson's Bay Company, led by John Work, traveled down the Sacramento River unintentionally spreading a malaria epidemic to Native Californians.

2.2.2 - The Mexican Period (1821-1848)

With the declaration of Mexican independence in 1821, Spanish control of Alta California ended, although little change actually occurred. Political change did not take place until mission secularization in 1834, when Native Americans were released from missionary control and the mission lands were granted to private individuals. Shoup and Milliken (1999) state that mission secularization removed the social protection and support on which Native Americans had come to rely. It exposed them to further exploitation by outside interests, often forcing them into a marginal existence as laborers for large ranchos. Following mission secularization, the Mexican population grew as the native population continued to decline. Anglo-American settlers began to arrive in Alta California during this period and often married into Mexican families, becoming Mexican citizens, which made them eligible to receive land grants. In 1846, on the eve of the U.S.-Mexican War (1846 to 1848), the estimated population of Alta California was 8,000 non-natives and 10,000 natives. However, these estimates have been debated. Cook (1976) suggests the Native American population was 100,000 in 1850; the U.S. Census of 1880 reports the Native American population as 20,385 during the Gold Rush and American Expansion.

During this period, and prior, Native American populations were declining rapidly because of an influx of Euro-American diseases. In 1832, a party of trappers from the Hudson's Bay Company, led by John Work, traveled down the Sacramento River, unintentionally spreading a malaria epidemic to Native Californians. Four years later, a smallpox epidemic decimated local population, and it is estimated that up to 75 percent of the native population died (Cook 1955).

After the upheaval of the Bear Flag Revolt in 1846, and the result of the Treaty of Guadalupe Hidalgo in 1848, California became a United States territory. In 1848, James W. Marshall discovered gold at Coloma in modern-day El Dorado County, which started the Gold Rush into the region that forever altered the course of California's history. The arrival of thousands of gold seekers in the territory contributed to the exploration and settlement of the entire State. By late 1848, approximately four out of five men in California were gold miners.

The Gold Rush originated along the reaches of the American River and other tributaries to the Sacramento River, and Hangtown, present-day Placerville, became the closest town offering mining supplies and other necessities for the miners in El Dorado County. Gold subsequently was found in the tributaries to the San Joaquin River, which flowed north to join the Sacramento River in the Great Delta east of San Francisco Bay.

By 1864, California's Gold Rush had essentially ended. The rich surface and river placers were largely exhausted and the miners either returned to their homelands or stayed to start new lives in California. After the Gold Rush, people in towns such as Jackson, Placerville, and Sonora turned to other means of commerce, such as ranching, agriculture, and timber production. With the decline of gold mining, agriculture and ranching came to the forefront in the State's economy. California's natural resources and moderate climate proved well suited for cultivation of a variety of fruits, nuts, vegetables, and grains.

2.2.3 - Euro-American Expansion

In 1848, James W. Marshall discovered gold at Coloma in modern-day El Dorado County, which started the Gold Rush into the region that forever altered the course of California's history. The arrival of thousands of gold seekers in the territory contributed to the exploration and settlement of the entire State. By late 1848, approximately four out of five men in California were gold miners. The Gold Rush originated along the reaches of the American River and other tributaries to the Sacramento River, and Hangtown, present-day Placerville, became the closest town offering mining supplies and other necessities for the miners in El Dorado County. Gold subsequently was found in the tributaries to the San Joaquin River, which flowed north to join the Sacramento River in the Great Delta east of San Francisco Bay (Robinson 1948).

By 1864, the California Gold Rush had essentially ended. The rich surface and river placers were largely exhausted and the miners either returned to their homelands or stayed to start new lives in California. After the Gold Rush, people in towns such as Jackson, Placerville, and Sonora turned to other means of commerce, such as ranching, agriculture, and timber production. With the decline of gold mining, agriculture and ranching came to the forefront in the State's economy. California's

natural resources and moderate climate proved well suited for cultivation of a variety of fruits, nuts, vegetables, and grains (Beck and Hasse 1974).

2.2.4 - Alameda County

Alameda County occupies the eastern portion of the East Bay region of the San Francisco Bay Area region. The County was formed in March of 1853 from portions of Contra Costa and Santa Clara counties. Alameda County, like much of California, was seen as a land of economic opportunity, not just for its mining resources but also for its productive land where farmers could cultivate a variety of crops. Agriculture became important in the California economy in the late 1850s and through the 1860s, homesteading became a means by which people could own and operate a family farm. The decidedly agricultural focus also underpins the historical significance of the Spanish colonial and Mexican era of land grants. The variety of cultural traditions, technological developments, and ideological views further underwrite the County's agricultural history. The County's rural setting continues to support farming and ranching operations (Baker 2017).

As early as 1887, special interests advertised the County's virtues as a place to cultivate. Early settlers began to speak of beneficial soils that support a range of crops—oranges, lemons, olives, pomegranates, figs, and grapes flourished—with seasonal rainfall, and suitable climates. In addition, the welcoming character of towns, regional accessibility, and schools further encouraged westward migration (Calderwood, 2011).

A variety of crops flourished in the County because of favorable sub-climate conditions. Cultivated lands expanded with changes and advancements in the agricultural industry that encouraged farmers to adapt operations and remain relevant. More generally, stable crops such as wheat and specialty crop agriculture were an important component of California's agricultural history. Between 1880 and 1900, for example, farmers shifted from apples to such fruits as peaches, plums, prunes, apricots, and pears. The shift boosted California's orchard industries, coinciding with accelerated growth in local drying and canning industries. The development of these specialized crops gave California an economic buffer when wheat prices declined in the early 20th Century (Meritt, 1928).

Large-scale commercial operations began to capitalize on mechanical innovations just as irrigation developed in the early 1880s. Consequently, competing economic interests caused land prices to increase and make family farming a less profitable enterprise. Following the World Wars, large companies followed their employees to suburban areas east of San Francisco. The establishment of large population centers fostered the development of equally large shopping centers. To meet demand on infrastructure, the State modernized highways and roadways. With the establishment of the Bay Area Rapid Transit system, the central county cities in turn spawned their own suburbs (Nolte 2012). The once outlying rural areas of Antioch, Oakley, and Brentwood continue to grow.

2.2.5 - The City of San Leandro

The area that would become the City of San Leandro was originally a 9,000 acre land grant, Rancho San Leandro, given to José Joaquin Estudillo for his services for the Spanish army in 1842. Two of Estudillo's sons-in-law, John B. Ward and William Heath Davis, established the perimeter of the townsite that would become San Leandro, bounded by the San Leandro Creek on the north, Watkins

Street on the east, Castro Street on the south, and Alvarado Street on the west. Similar to many land grants, the Rancho of San Leandro consisted of cattle farms and small-scale agriculture in its early days (Freeman 1940).

After the Mexican-American War, San Leandro became the county seat for Alameda County in 1856 until the downtown area and courthouse were destroyed by the earthquake of 1868 along the Hayward fault. The town recovered and was officially incorporated in 1872 with a population of 426 persons. Agriculture continued to be the main economic hub of the City with cattle farms surrounded by orchards of fruit, asparagus, and vegetable farms (Viralkas 2008).

Warehouses and small-scale industry entered the area is the 1920s and 1930s. Because of the enactment of laws that forbade property owners to sell land to African Americans or other minorities, San Leandro had a 99.3 percent Caucasian demographic in 1960 in comparison to its neighbor, Oakland, which housed a large African American community. After the landmark Supreme Court Case, *Shelley vs. Kraemer* in 1948 which outlawed such practices, demographic change slowly came to San Leandro. By the 1980s, Asian Americans and other minorities had moved to the area creating a more plural and diverse community. Today, San Leandro is home to over 90,000 people with large corporations such as JanSport, The North Face, Ghirardelli Chocolates, 21st Amendment Brewery, and Coca-Cola having factories in the City (Census.gov 2022).

SECTION 3: RESULTS

3.1 - Records Search

3.1.1 - Northwest Information Center Records Search

On May 4, 2022, a records search for the project site and a 0.5-mile radius beyond the project site boundary was conducted at the NWIC located at Sonoma State University in Rohnert Park, California. The current inventories of the NRHP, the CRHR, the CHL list, the CPHI list, and the California BERD for the County of Alameda were also reviewed to determine the existence of previously documented local historical resources.

The results of the records search indicate that one historical cultural resource has been recorded within 0.5-mile search radius, which is not located within the project boundaries (Table 1). The Kraft Foods Plant and associated office buildings have been evaluated for their historical significance and found not to qualify for the CRHR or NRHP. Fourteen survey reports are on file within a 0.5-mile radius, none of which address the proposed project site, indicating the project site has not been previously surveyed for cultural resources (Table 2). No buildings on the project site were listed for inclusion in the BERD for Alameda County. A copy of the NWIC record searches can be found in Appendix B.

Table 1: Cultural Resources Within 0.5-mile Radius of the Project Site

Resource No.	Resource Description	Date Recorded
P-01-010665	Resource Name–Kraft Foods Plant; Other–General Foods Corporation Plant; OHP Property Number–154689; OHP PRN–FCC080425A; OHP PRN–FCC050527D	2004

Historic Aerials

A review of 16 historic aerials from 1946 to 2018 indicate that from the earliest aerial in 1946, the site was not developed. (Historic Aerials 2021). The garage and repair facility for cars at 14273 Washington Avenue was built between 1968 and 1980. The houses at 14123, 14173, and 14193 Washington Avenue were built between 1958 and 1968. The building at 14251 Washington Avenue was constructed after 1980.

3.1.2 - Native American Heritage Commission Record Search

On April 27, 2022, FCS sent a request to the NAHC in an effort to determine whether any sacred sites are listed on its Sacred Lands File for the project site. A response was received on May 29, 2022, indicating that the Sacred Lands File search produced a negative result for Native American cultural resources in the project area. The NAHC included a list of 11 tribal representatives available for consultation. To ensure that all Native American knowledge and concerns over potential TCRs that may be affected by implementation of the proposed project are addressed, FCS sent letters to all 11 tribal representatives on June 7, 2022. A response was received by the Confederated Villages of Lisjan Nation on June 25, 2022, indicating that the tribe has no further information or comment regarding the proposed project. No additional responses have been received to date. A copy of the NAHC record searches and Native American tribal correspondences can be found in Appendix C.

3.2 - Pedestrian Survey

3.2.1 - Pedestrian Survey

On May 13, 2022, FCS Senior Archaeologist Dr. Dana DePietro and FCS Archaeologist and Historian, Ti Ngo, surveyed the project site to identify any unrecorded cultural resources within the project boundary. The survey began in the northwest corner of the project site and moved south and east, using north–south transects spaced at 15-meter intervals whenever possible. The site was completely hardscaped with associated imported soil for landscaping elements. As a result, visibility of native soils was extremely poor, ranging between 1 to 5 percent. All areas of the project site were closely inspected for culturally modified soils or other indicators of potential historic or prehistoric resources. Native soils were visible in the northeastern portion of the project site. Visible soils were largely composed of medium brown (7.5 YR 4/3) sandy clay, interspersed with small granite stones ranging between 1 to 3 centimeters. No additional prehistoric or historic resources or raw materials commonly used in the manufacture of tools (e.g., obsidian, Franciscan chert, etc.) were found within the project site.

Survey conditions were documented using digital photographs and field notes. During the survey, Dr. DePietro and Mr. Ngo examined all areas of the exposed ground surface for prehistoric artifacts (e.g., fire-affected rock, milling tools, flaked stone tools, toolmaking debris, ceramics), soil discoloration and depressions that might indicate the presence of a cultural midden, faunal and human osteological remains, and features indicative of the former presence of structures or buildings (e.g., postholes, standing exterior walls, foundations) or historic debris (e.g., glass, metal, ceramics).

Dr. DePietro and Mr. Ngo initially encountered six structures within the project boundary that appeared to be over 45 years in age and had not previously been evaluated for their historical significance or potential for inclusion in the CRHR or NRHP. These structures included a wooden, yellow-painted single residence family residence and a collapsed house at 14143 Washington Avenue. To the rear of the residence at 14143 Washington Avenue (northwestern portion of the project site) is Zermeno's Custom Ironworks located at 14143-A Washington Avenue. This consists of an office building with associated workshop and storage containers. In the central eastern portion of the project site, there is large family residence and garage located at 14173 Washington Avenue. The southeastern portion of the project site is taken up by Star RVs. This 2-story building consists of a garage with four roll-up doors for vehicular storage and maintenance on its eastern half as well as an office space and reception area in its western half. An earlier version of this report called out the need to have the structures evaluated for full CEQA compliance, however all six were subsequently damaged by fire and demolished before the recommended evaluations could be completed (demolition permit numbers B22-1442, B22-1449, and B22-1453). Dr. DePietro conducted an updated pedestrian survey on January 18, 2022, and confirmed that all six buildings are no longer present at the site. As such, the properties are determined ineligible for inclusion in the CRHR or NRHP as they are no longer able to convey any historic integrity. No additional prehistoric or historic resources or raw materials commonly used in the manufacture of tools (e.g., obsidian, Franciscan chert, etc.) were found within the project site. Pedestrian survey photos can be found in Appendix D.

SECTION 4: SUMMARY AND RECOMMENDATIONS

4.1 - Summary

In accordance with CEQA Guidelines, FCS assessed the potential for the proposed project to have an adverse impact on known and potential cultural resources at the project site. Results from the NWIC indicate one historical cultural resource is recorded within a 0.5-mile search radius of the project site, which is not located within the project boundaries. Fourteen survey reports are on file within the 0.5-mile radius, none of which address the project site indicating that it has not been previously surveyed for unrecorded cultural resources. The pedestrian survey encountered six buildings on-site that appear to be over 45 years in age, but were destroyed in a fire before they could be evaluated for CRHR or NRHP eligibility.

The NAHC Sacred Lands File search reported a negative result for Native American cultural resources in the immediate project area. FCS contacted Native American representatives and to date, only the Confederated Villages of Lisjan Nation have responded, indicating that they have no further information or comment on the project.

4.2 - Recommendations

4.2.1 - Cultural Resources Recommendations

Based on the results of the records searches, archival research, tribal correspondence, and the pedestrian survey, FCS considers the potential for the proposed project to have an adverse effect on historic or prehistoric cultural resources to be moderate. There are no recorded cultural resources within project site, however the foundations of six historic era-buildings increase the probability that subsurface archaeological resources may be encountered during project construction.

FCS therefore recommends that an archaeologist who meets the Secretary of the Interior's Professional Qualification Standards for archaeology inspect the project site following the removal of all rubble, asphalt, and ground cover, and prior to any grading or trenching into previously undisturbed soils. This may be followed by regular periodic or "spot-check" archaeological monitoring as determined by the Archaeologist, but full-time construction monitoring is not warranted at this time. Additional procedures for the inadvertent discovery of human remains and cultural resources are provided below.

4.2.2 - Inadvertent Discovery of Human Remains

There is always the possibility that ground-disturbing activities during construction may uncover previously unknown buried human remains. Should this occur, Section 7050.5 of the California Health and Safety Code applies, and the following procedures shall be followed.

In the event of an accidental discovery or recognition of any human remains, Public Resources Code Section 5097.98 must be followed. In this instance, once project-related earthmoving begins and if there is accidental discovery or recognition of any human remains, the following steps shall be taken:

1. There shall be no further excavation or disturbance of the site, or any nearby area reasonably suspected to overlie adjacent human remains until the County Coroner is contacted to determine whether the remains are Native American and if an investigation of the cause of death is required. If the coroner determines the remains to be Native American, the coroner shall contact the NAHC within 24 hours, and the NAHC shall identify the person or persons it believes to be the "most likely descendant" of the deceased Native American. The most likely descendant may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains, and any associated grave goods as provided in Public Resources Code Section 5097.98, or
2. Where the following conditions occur, the landowner or his/her authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity either in accordance with the recommendations of the most likely descendant or on the project area in a location not subject to further subsurface disturbance:
    - The NAHC is unable to identify a most likely descendant, or the most likely descendant failed to make a recommendation within 48 hours after being notified by the Commission;
    - The descendant identified fails to make a recommendation; or
    - The landowner or his authorized representative rejects the recommendation of the descendant, and the mediation by the NAHC fails to provide measures acceptable to the landowner.

4.2.3 - Inadvertent Discovery of Cultural Resources

It is always possible that ground-disturbing activities during construction may uncover previously unknown, buried cultural resources. In the event that buried cultural resources are discovered during construction, operations shall stop in the immediate vicinity of the find and a qualified Archaeologist shall be consulted to determine whether the resource requires further study. The qualified Archaeologist shall make recommendations to the lead agency on the measures that shall be implemented to protect the discovered resources, including but not limited to excavation of the finds and evaluation of the finds in accordance with Section 15064.5 of the CEQA Guidelines. Potentially significant cultural resources consist of, but are not limited to, stone, bone, fossils, wood, or shell artifacts or features, including hearths, structural remains, or historic dumpsites. Any previously undiscovered resources found during construction within the Master Plan area should be recorded on appropriate California Department of Parks and Recreation (DPR) forms and evaluated for significance in terms of CEQA Guidelines.

If the resources are determined to be unique historic resources as defined under Section 15064.5 of the CEQA Guidelines, mitigation measures shall be identified by the monitor and recommended to the lead agency. Appropriate mitigation measures for significant resources could include avoidance or capping, incorporation of the site in green space, parks, or open space, or data recovery excavations of the finds.

No further grading shall occur in the area of the discovery until the lead agency approves the measures to protect these resources. Any archaeological artifacts recovered as a result of mitigation shall be donated to a qualified scientific institution approved by the lead agency where they would be afforded long-term preservation to allow future scientific study.

Type of Services	**Geotechnical Investigation**
Project Name	**Washington Industrial Facility**
Location	**14273 Washington Avenue** **San Leandro, California**

SECTION 1: INTRODUCTION

This geotechnical report was prepared for the sole use of First Industrial Realty Trust, Inc. for the Washington Industrial Facility in San Leandro, California. The location of the site is shown on the Vicinity Map, Figure 1. For our use, we were provided with the following documents:

- A preliminary site plan titled, "Scheme 2, Conceptual Site Plan, Washington Avenue, San Leandro, CA," prepared by HPA Architects, dated December 25, 2020.

1.1 PROJECT DESCRIPTION

The project will include redeveloping an approximately 3½-acre site for a new warehouse. Based on the provided conceptual site plan, the project will include constructing an approximately 52,500 square foot warehouse building. The building will likely be single story with interior clear height of 36 to 38 feet and consist of concrete tilt-up construction. Dock doors and two drive-thru doors will be located along the west side of the building. At-grade auto and trailer parking and drive aisles will occupy the reminder of the site. Appurtenant utilities, landscaping, storm water management areas, and other improvements necessary for overall site development will also be constructed.

Building loads are expected to be typical to this type of construction. Site grading with cuts and fills on the order of 1 to 3 feet are estimated.

1.2 SCOPE OF SERVICES

Our scope of services was presented in our proposal dated January 22, 2021 and consisted of field and laboratory programs to evaluate physical and engineering properties of the subsurface soils, engineering analysis to prepare recommendations for site work and grading, building foundations, flatwork, retaining walls, and pavements, and preparation of this report. Brief descriptions of our exploration and laboratory programs are presented below.

1.3 EXPLORATION PROGRAM

Field exploration consisted of three borings drilled on March 1, 2021 with truck-mounted hollow-stem auger drilling equipment and four Cone Penetration Tests (CPTs) advanced on February 19, 2021. The borings were drilled to depths of approximately 30 to 40 feet; the CPTs were advanced to depths of approximately 50 to 100 feet. Seismic shear wave velocity measurements were collected from CPT-2. Three of the borings (Borings EB-1, EB-2, and EB-3) were advanced adjacent to CPT-1, CPT-2, and CPT-4 for direct evaluation of physical samples to correlated soil behavior, respectively.

The borings and CPTs were backfilled with cement grout in accordance with local requirements; exploration permits were obtained as required by local jurisdictions.

The approximate locations of our exploratory borings are shown on the Site Plan, Figure 2. Details regarding our field program are included in Appendix A.

1.4 LABORATORY TESTING PROGRAM

In addition to visual classification of samples, the laboratory program focused on obtaining data for foundation design and seismic ground deformation estimates. Testing included moisture contents, dry densities, grain size analyses, Plasticity Index tests, corrosivity, and a consolidation test. Details regarding our laboratory program are included in Appendix B.

1.5 CORROSION EVALUATION

Three samples from our borings at depths ranging from approximately 2 to 6 feet were tested for saturated resistivity, pH, and soluble sulfates and chlorides. In general, the on-site soils can be characterized as severely to severely corrosive to buried metal, and non-corrosive to buried concrete.

1.6 ENVIRONMENTAL SERVICES

Environmental services were not requested for this project. If environmental concerns are determined to be present during future evaluations, the project environmental consultant should review our geotechnical recommendations for compatibility with the environmental concerns.

SECTION 2: REGIONAL SETTING

2.1 REGIONAL SEISMICITY

The San Francisco Bay area region is one of the most seismically active areas in the Country. While seismologists cannot predict earthquake events, geologists from the U.S. Geological Survey have recently updated earlier estimates from their 2015 Uniform California Earthquake Rupture Forecast (Version 3) publication. The estimated probability of one or more magnitude 6.7 earthquakes (the size of the destructive 1994 Northridge earthquake) expected to occur somewhere in the San Francisco Bay Area has been revised (increased) to 72 percent for the

period 2014 to 2043 (Aagaard et al., 2016). The faults in the region with the highest estimated probability of generating damaging earthquakes between 2014 and 2043 are the Hayward (33%), Rodgers Creek (33%), Calaveras (26%), and San Andreas Faults (22%). In this 30-year period, the probability of an earthquake of magnitude 6.7 or larger occurring is 22 percent along the San Andreas Fault and 33 percent for the Hayward or Rodgers Creek Faults.

The faults considered capable of generating significant earthquakes are generally associated with the well-defined areas of crustal movement, which trend northwesterly. The table below presents the State-considered active faults within 25 kilometers of the site.

Table 1: Approximate Fault Distances

Fault Name	Distance	
	(miles)	(kilometers)
Hayward (Total Length)	1.6	2.5
Calaveras	10.1	16.3
Concord-Green Valley	15.5	25.0

A regional fault map is presented as Figure 3, illustrating the relative distances of the site to significant fault zones.

SECTION 3: SITE CONDITIONS

3.1 SITE BACKGROUND

We reviewed historical aerial imagery provided online by Historical Aerials (http://www.historicaerials.com) and Google Earth Pro (2021). A summary of pertinent surface changes at and in the near vicinity of the site is as follows:

- 1958: The northern section of project site appears to be occupied by multiple residential homes and the southern section of the site consists of agricultural fields.
- 1980: A few of the residentials homes to the north are still present. The agricultural field and two of the residential homes appear to have been demolished and this portion of the site was developed into a staging lot with concrete and asphalt pavements. The current one-story commercial building at the southern edge is observed.
- 1993: Additional residential homes appear to have been demolished and additional concrete pavement is added to the lot.
- 2005: Remaining residential homes in the northern section of the site appear to have pavement placed adjacent to the structures.

- 2020: A high bay metal structure is constructed near the center of the site. No other major changes were observed and the site appears to be similar to its current state.

Based on our research of the California GeoTracker website, a case history was present at the 14273 Washington Avenue address. A tank closure report dated April 23, 1992 and a case closure letter and summary from the Regional Water Quality Control Board dated June 17, 1997 states that three underground storage tanks (USTs) were previously removed in 1991 and 1992. Based on the summary, the removal consisted of one 5,000-gallon and two 1,000-gallon USTs located on the 14273 Washington Avenue address. The discovery of the presence of diesel and gasoline in the underlying soil prompted remedial work. The remedial excavation to over-excavate the impacted soil produced approximately 2,400 cubic yards of soil. This soil was removed from the site in 1992 and 1995. An accompanying site plan roughly indicates the location of the over-excavation and denotes it on the site plan as “Former Tank Excavation”. Based on our review, the precise depth and extent of the “Former Tank Excavation” are not clearly defined but are estimated based on various hand drawn site maps. Based on sampling depths on the “Former Tank Excavation”, the excavation was potentially taken to a depth of 18 to 20 feet below site grades. The summary states that once contamination was no longer observed, the excavation was backfilled and paved over. Records of compaction were not present.

3.2 SURFACE DESCRIPTION

The project site is situated in an industrial area with adjacent commercial and industrial buildings. The site is bound by Washington Avenue to the northeast, commercial and industrial use properties to the southeast and northwest, and railroad tracks to the west. The project site can be identified as a previous recreational vehicle (RV) rental lot at the center and southern portion and residential lots to the north. The RV lot is mainly covered with concrete pavement with a few asphalt pavement locations. The one-story masonry commercial building is situated near the southeastern margin of the site. Landscaping areas are present along Washington Avenue.

The residential lots on the northern portion of the project site contain multiple one-story residential buildings and storage sheds. The lots appear to be paved with asphalt, concrete, and pavers along the driveways and backyards. Multiple landscaping areas are present with several large trees observed.

The project site is relatively level, but graded to drain to storm drainage facilities with elevations ranging from about 40 feet to 43 feet (Google Earth Pro, WGS84).

Surface pavements measured from our borings generally consisted of 6 to 8 inches of concrete over 4 to 6 inches of aggregate base. Based on visual observations, the existing pavements are in poor shape with moderate to significant alligator cracking.

3.3 SUBSURFACE CONDITIONS

Below the surface pavements, our explorations generally encountered undocumented fill underlain by native alluvial soils. Undocumented fill was encountered in our three borings to a depth of 3 feet below existing site grades and consisted of lean clay with gravel. Below the fills, our borings generally encountered alluvial soils consisting of medium stiff to very stiff lean clay

with variable amounts of sand interbedded with loose to medium dense silty sand to a depth of 40 feet, the maximum boring depth explored. High plasticity clay was observed in Boring EB-2 from a depth of approximately 27 to 32 feet. Below our maximum boring depth, CPT correlations indicate fine-grained soil consisting of clayey silt, silty clay, and sandy silt with interbedded layers of silty sand to a depth of approximately 50 feet. Below a depth of 50 feet, CPT-2 correlations indicate additional fine grain soil to a depth of approximately 57 feet. A large layer of sand, gravelly sand, and silty sand was indicated between approximately 57 to 72 feet below existing ground surface. Below this granular layer, additional fine-grained soils consisting of clay, silty clay, clayey silt and sandy silt were indicated to a depth of 100 feet with interbedded layers of sand and gravelly sand at approximately 88 feet and 95 feet below the existing ground surface. Our CPT data generally correlates to our borings and subsurface conditions to the maximum depths explored.

3.3.1 Plasticity/Expansion Potential

We performed two Plasticity Index (PI) tests on representative samples. Test results were used to evaluate expansion potential of surficial soils. The results of the surficial PI tests indicated PIs ranging from 22 to 24, indicating moderate expansion potential to wetting and drying cycles.

3.3.2 In-Situ Moisture Contents

Laboratory testing indicated that the in-situ moisture contents within the upper 10 feet range from 15 to 26 percent moisture. In our opinion, we estimated this corresponds to about 3 to 8 percent above the estimated laboratory optimum moisture content.

3.4 GROUNDWATER

Groundwater was encountered in some of our explorations. Pore pressure measurements from CPT-2 and CPT-4 inferred groundwater at depths ranging from 17½ to 18 feet below current grades. Groundwater was encountered in Borings EB-1 to EB-3 at depths ranging from 17 to 20 feet below current grades. All measurements were taken at the time of drilling and may not represent the stabilized levels that can be higher than the initial levels encountered.

Published data (CGS, San Leandro 7.5-minute Quadrangle, 2003) indicated that seasonal and/or historical high groundwater levels in the vicinity of the site are on the order of 15 feet below the ground surface. Based on our review of monitoring well data from the California GeoTracker website, monitoring wells on a site located at 14336 Washington Avenue, approximately 600 feet southeast along Washington Avenue, recorded groundwater depths between 12 to 17 feet below current grades.

In general, fluctuations in groundwater levels occur due to many factors including seasonal fluctuation, underground drainage patterns, regional fluctuations, and other factors.
Based on the above information, we recommend a design groundwater depth of 12 feet below current grades.

3.5 PRELIMINARY CORROSION SCREENING

We tested three samples collected at depths ranging from approximately 2 to 6 feet for resistivity, pH, soluble sulfates, and chlorides. The laboratory test results are summarized in Table 2.

Table 2: Summary of Corrosion Test Results

Test Location Number	Depth (feet)	Soil pH[(1)]	Minimum Resistivity[(2)] (ohm-cm)	Chloride[(3)] (mg/kg)	Sulfate[(3)(4)] (mg/kg)
EB-1	6	6.3	1,080	9	112
EB-2	3½	6.9	1,488	11	28
EB-3	2	7.6	1,328	25	124

Notes: (1) ASTM G51
(2) ASTM G57 - 100% saturation
(3) ASTM D4327
(4) 1 mg/kg = 0.0001 % by dry weight

Many factors can affect the corrosion potential of soil including moisture content, resistivity, permeability, and pH, as well as chloride and sulfate concentration. Typically, soil resistivity, which is a measurement of how easily electrical current flows through a medium (soil and/or water), is the most influential factor. In addition to soil resistivity, chloride and sulfate ion concentrations, and pH also contribute in affecting corrosion potential.

3.5.1 Preliminary Soil Corrosion Screening

Based on the laboratory test results summarized in Table 2 and published correlations between resistivity and corrosion potential, the soils may be considered severely corrosive to buried metallic improvements (Chaker and Palmer, 1989).

In accordance with the 2019 CBC Section 1904.1, alternative cementitious materials for different exposure categories and classes shall be determined in accordance with ACI 318-19 Table 19.3.1.1, Table R19.3.1, and Table 19.3.2.1. Based on the laboratory sulfate test results, no cement type restriction is required, although, in our opinion, it is generally a good idea to include some sulfate resistance and to maintain a relatively low water-cement ratio. We have summarized applicable exposure categories and classes from ACI 318-19, Table 19.3.1.1 below in Table 3A.

Table 3A: ACI 318-19 Table 19.3.1.1 Exposure Categories and Classes

Freezing and Thawing (F)	Sulfate (S, soil)	In Contact with Water (W)	Corrosion Protection of Reinforcement (C)
F0[1]	S0[2]	W1[3]	C1[4]

1 (F0) “Concrete not exposed to freezing-and-thawing cycles” (ACI 318-19)
2 (S0) “Water soluble sulfate in soil, percent by mass” is less than 0.10 (ACI 318-19)
3 (W1) “Concrete in contact with water and low permeability is not required” (ACI 318-19)
4 (C1) “Concrete exposed to moisture but not to an external source of chlorides” (ACI 318-19)

In addition, ACI 318-19, Table 19.3.2.1 provides requirements for concrete by exposure class. Table 3B below indicates different requirements that we recommend be followed for the concrete design.

Table 3B: ACI 318-19 Table 19.3.2.1 Requirements for Concrete by Exposure Class

Exposure Class	Maximum water:cement ratio	Minimum Compressive Strength (psi)	Maximum Water-Soluble Chloride Ion Content (% wt)
F0	N/A	2,500	N/A
S0 (soil)	N/A	2,500	N/A
W1[1]	N/A	2,500	None
C1	N/A	2,500	0.30 (0.06)[2]

1 Per section 26.4.2.2(d), For concrete identified as being exposed to water in service, evidence shall be submitted that the concrete mixture complies with (1) and (2):
(1) Aggregates are not alkali-silica reactive or measures to mitigate alkali-silica reactivity have been established.
(2) Aggregates are not alkali-carbonate reactive
2 Maximum water-soluble chloride ion content for non-prestressed concrete (value for prestressed concrete).

We recommend the structural engineer and a corrosion engineer be retained to confirm the information provided and for additional recommendations, as required.

SECTION 4: GEOLOGIC HAZARDS

4.1 FAULT RUPTURE

As discussed above several significant faults are located within 25 kilometers of the site. The site is not located within a State-designated Alquist Priolo Earthquake Fault Zone. As shown in Figure 3, no known surface expression of fault traces is thought to cross the site; therefore, fault rupture hazard is not a significant geologic hazard at the site.

4.2 ESTIMATED GROUND SHAKING

Moderate to severe (design-level) earthquakes can cause strong ground shaking, which is the case for most sites within the Bay Area. A peak ground acceleration (PGA_M) was estimated following the ground motion hazard analysis procedure presented in Chapter 16 and 18 and Appendix J of the 2019 California Building Code (CBC) and Chapter 21, Section 21.2 of ASCE 7-16 and Supplement No. 1. For our analysis we used a PGA_M of 1.00g, which was determined in accordance with Section 21.5 of ASCE 7-16.

4.3 LIQUEFACTION POTENTIAL

The site is within a State-designated Liquefaction Hazard Zone (CGS, San Leandro Quadrangle, 2003). Our field and laboratory programs addressed this issue by testing and sampling potentially liquefiable layers to depths of at least 50 feet, performing visual classification on sampled materials, evaluating CPT data, and performing various tests to further classify soil properties.

4.3.1 Background

During strong seismic shaking, cyclically induced stresses can cause increased pore pressures within the soil matrix that can result in liquefaction triggering, soil softening due to shear stress loss, potentially significant ground deformation due to settlement within sandy liquefiable layers as pore pressures dissipate, and/or flow failures in sloping ground or where open faces are present (lateral spreading) (NCEER 1998). Limited field and laboratory data is available regarding ground deformation due to settlement; however, in clean sand layers settlement on the order of 2 to 4 percent of the liquefied layer thickness can occur. Soils most susceptible to liquefaction are loose, non-cohesive soils that are saturated and are bedded with poor drainage, such as sand and silt layers bedded with a cohesive cap.

4.3.2 Analysis

As discussed in the "Subsurface" section above, several sand layers were encountered below the design ground water depth of 12 feet. Following the liquefaction analysis framework in the 2008 monograph, *Soil Liquefaction During Earthquakes* (Idriss and Boulanger, 2008), incorporating updates in *CPT and SPT Based Liquefaction Triggering Procedures* (Boulanger and Idriss, 2014), and in accordance with CDMG Special Publication 117A guidelines (CDMG, 2008) for quantitative analysis, these layers were analyzed for liquefaction triggering and potential post-liquefaction settlement. These methods compare the ratio of the estimated cyclic shaking (Cyclic Stress Ratio - CSR) to the soil's estimated resistance to cyclic shaking (Cyclic Resistance Ratio - CRR), providing a factor of safety against liquefaction triggering. Factors of safety less than or equal to 1.3 are considered to be potentially liquefiable and capable of post-liquefaction re-consolidation (i.e. settlement).

The CSR for each layer quantifies the stresses anticipated to be generated due to a design-level seismic event, is based on the peak horizontal acceleration generated at the ground surface discussed in the "Estimated Ground Shaking" section above, and is corrected for overburden and stress reduction factors as discussed in the procedure developed by Seed and Idriss (1971) and updated in the 2008 Idriss and Boulanger monograph.

The soil's CRR is estimated from the in-situ measurements from CPTs and laboratory testing on samples retrieved from our borings. SPT "N" values obtained from hollow-stem auger borings were not used in our analyses, as the "N" values obtained are less reliable in sands below ground water. The tip pressures are corrected for effective overburden stresses, taking into consideration both the ground water level at the time of exploration and the design ground water level, and stress reduction versus depth factors. The CPT method utilizes the soil behavior type index (I_C) to estimate the plasticity of the layers. Selected soil samples collected from advancing the CPT equipment adjacent to CPT-1, CPT-2, and CPT-4 were tested to evaluate grain size, as well as visually observed for confirmation of CPT soil behavior types.

The results of our CPT analyses (CPT-1 to CPT-4) are presented on Figures 4A to 4D of this report. Calculations for these CPTs are attached as Appendix C.

4.3.3 Summary

Our analyses indicate that several layers could potentially experience liquefaction triggering that could result in post-liquefaction total settlement at the ground surface ranging from ¼- to ⅓-inches based on the Yoshimine (2006) method. As discussed in SP 117A, differential movement for level ground sites over deep soil sites will be up to about two-thirds of the total settlement between independent foundation elements. In our opinion, differential settlements are anticipated to be on the order of ¼-inch between independent foundation elements.

4.3.4 Ground Rupture Potential

The methods used to estimate liquefaction settlements assume that there is a sufficient cap of non-liquefiable material to prevent ground rupture or sand boils. For ground rupture to occur, the pore water pressure within the liquefiable soil layer will need to be great enough to break through the overlying non-liquefiable layer, which could cause significant ground deformation and settlement. The work of Youd and Garris (1995) indicates that the 12-foot thick layer of non-liquefiable cap is sufficient to prevent ground rupture; therefore the above total settlement estimates are reasonable.

4.4 LATERAL SPREADING

Lateral spreading is horizontal/lateral ground movement of relatively flat-lying soil deposits towards a free face such as an excavation, channel, or open body of water; typically lateral spreading is associated with liquefaction of one or more subsurface layers near the bottom of the exposed slope. As failure tends to propagate as block failures, it is difficult to analyze and estimate where the first tension crack will form.

There are no open faces within a distance considered susceptible to lateral spreading; therefore, in our opinion, the potential for lateral spreading to affect the site is low.

4.5 SEISMIC SETTLEMENT/UNSATURATED SAND SHAKING

Loose unsaturated sandy soils can settle during strong seismic shaking. As the soils encountered at the site were predominantly very stiff to hard clays, in our opinion, the potential for significant differential seismic settlement affecting the proposed improvements is low.

4.6 TSUNAMI/SEICHE

The terms tsunami or seiche are described as ocean waves or similar waves usually created by undersea fault movement or by a coastal or submerged landslide. Tsunamis may be generated at great distance from shore (far field events) or nearby (near field events). Waves are formed, as the displaced water moves to regain equilibrium, and radiates across the open water, similar to ripples from a rock being thrown into a pond. When the waveform reaches the coastline, it quickly raises the water level, with water velocities as high as 15 to 20 knots. The water mass, as well as vessels, vehicles, or other objects in its path create tremendous forces as they impact coastal structures.

Tsunamis have affected the coastline along the Pacific Northwest during historic times. The Fort Point tide gauge in San Francisco recorded approximately 21 tsunamis between 1854 and 1964. The 1964 Alaska earthquake generated a recorded wave height of 7.4 feet and drowned eleven people in Crescent City, California. For the case of a far-field event, the Bay area would have hours of warning; for a near field event, there may be only a few minutes of warning, if any.

A tsunami or seiche originating in the Pacific Ocean would lose much of its energy passing through San Francisco Bay. Based on the study of tsunami inundation potential for the San Francisco Bay Area (Ritter and Dupre, 1972), areas most likely to be inundated are marshlands, tidal flats, and former bay margin lands that are now artificially filled, but are still at or below sea level, and are generally within 1½ miles of the shoreline. The site is approximately 2¼ miles inland from the San Francisco Bay shoreline, and is approximately 40 to 43 feet above mean sea level. Therefore, the potential for inundation due to tsunami or seiche is considered low.

4.7 FLOODING

Based on our internet search of the Federal Emergency Management Agency (FEMA) flood map public database, the site is located within Zone X, an area of minimal flood hazard. We recommend the project civil engineer be retained to confirm this information.

SECTION 5: CONCLUSIONS

5.1 SUMMARY

From a geotechnical viewpoint, the project is feasible provided the concerns listed below are addressed in the project design. Descriptions of each concern with brief outlines of our recommendations follow the listed concerns.

- Potential for Liquefaction-Induced Settlements
- Presence of Undocumented Fills and Redevelopment Considerations
- Presence of Moderately Expansive Soils
- Soil Corrosion Potential

5.1.1 Potential for Liquefaction-Induced Settlements

As discussed, our liquefaction analysis indicates that there is a potential for liquefaction of localized sand layers during a significant seismic event. Although the potential for liquefied sands to vent to the ground surface through cracks in the surficial soils is low, our analysis indicates that liquefaction-induced settlement on the order of ¼- to ⅓-inches could occur, resulting in differential settlement up to ¼ inch. Foundations should be designed to tolerate the anticipated total and differential settlements. Detailed foundation recommendations are presented in the “Foundations” section.

5.1.2 Presence of Undocumented Fill and Redevelopment Considerations

Undocumented fills consisting of lean clay with gravel were encountered in our borings to a depth of 3 feet below existing ground surface. Additionally, we anticipate additional surficial fills from previous development to be present throughout the site. Also, former USTs were removed from the 14273 Washington Avenue site in 1991 and 1992 and subsequent remedial over-excavation likely generated an excavation on the order or 18 to 20 feet deep. The remedial over-excavation was backfilled and paved over, however; we do not have compaction documentation of the backfill.

Undocumented fills are expected to be variable in thickness, density, and consistency across the site. We recommend any fill be completely removed from within the building areas and replaced as engineered fill. As discussed, the site is currently developed and had previously been developed and previous improvements have been demolished. Potential issues that are often associated with redeveloping sites include demolition of existing improvements, abandonment of existing utilities, and undocumented fills. Please refer to the "Earthwork" section below for further recommendations.

5.1.3 Expansive Soils

Moderately expansive surficial soils generally blanket the site. Expansive soils can undergo significant volume change with changes in moisture content. They shrink and harden when dried and expand and soften when wetted. To reduce the potential for damage to the planned structures, slabs-on-grade should have sufficient reinforcement and be supported on a layer of non-expansive fill; footings should extend below the zone of seasonal moisture fluctuation. In addition, it is important to limit moisture changes in the surficial soils by using positive drainage away from buildings as well as limiting landscaping watering. Detailed grading and foundation recommendations addressing this concern are presented in the following sections.

5.1.4 Soil Corrosion Potential

A preliminary soil corrosion screening was performed based on the results of analytical tests on samples at depths ranging from 2 to 6 feet below existing ground surface. Testing on the samples indicate sulfate exposure is low and therefore sulfate resistant concrete is not required per published ACI guidelines. However, the corrosion potential for buried metallic structures, such as metal pipes, is considered severely corrosive based on comparisons to published standards. We recommend that special requirements for corrosion control be made to protect metal pipes. We recommend that a corrosion engineer be retained to review this information, provide additional recommendations as needed, and perform additional testing as deemed necessary for the proposed site development.

5.2 PLANS AND SPECIFICATIONS REVIEW

We recommend that we be retained to review the geotechnical aspects of the project structural, civil, and landscape plans and specifications, allowing sufficient time to provide the design team with any comments prior to issuing the plans for construction.

5.3 CONSTRUCTION OBSERVATION AND TESTING

As site conditions may vary significantly between the small-diameter borings performed during this investigation, we also recommend that a Cornerstone representative be present to provide geotechnical observation and testing during earthwork and foundation construction. This will allow us to form an opinion and prepare a letter at the end of construction regarding contractor compliance with project plans and specifications, and with the recommendations in our report. We will also be allowed to evaluate any conditions differing from those encountered during our investigation, and provide supplemental recommendations as necessary. For these reasons, the recommendations in this report are contingent of Cornerstone providing observation and testing during construction. Contractors should provide at least a 48-hour notice when scheduling our field personnel.

SECTION 6: EARTHWORK

6.1 SITE DEMOLITION

All existing improvements not to be reused for the current development, including all foundations, flatwork, pavements, utilities, and other improvements should be demolished and removed from the site. Recommendations in this section apply to the removal of these improvements, which are currently present on the site, prior to the start of mass grading or the construction of new improvements for the project.

Cornerstone should be notified prior to the start of demolition, and should be present on at least a part-time basis during all backfill and mass grading as a result of demolition. Occasionally, other types of buried structures (wells, cisterns, debris pits, etc.) can be found on sites with prior development. If encountered, Cornerstone should be contacted to address these types of structures on a case-by-case basis.

6.1.1 Demolition of Existing Slabs, Foundations and Pavements

All slabs, foundations, and pavements should be completely removed from within planned building areas.

Existing foundations are typically mat-slabs, shallow footings, or piers/piles. If slab or shallow footings are encountered, they should be completely removed. If drilled piers are encountered, they should be cut off at an elevation at least 60-inches below proposed footings or the final subgrade elevation, whichever is deeper. The remainder of the drilled pier could remain in place. Foundation elements to remain in place should be surveyed and superimposed on the proposed development plans to determine the potential for conflicts or detrimental impacts to the planned construction. Following review, additional mitigation or planned foundation elements may need to be modified.

6.1.2 Abandonment of Existing Utilities

All utilities should be completely removed from within planned building areas. For any utility line to be considered acceptable to remain within building areas, the utility line must be completely backfilled with grout or sand-cement slurry (sand slurry is not acceptable), the ends outside the building area capped with concrete, and the trench fills either removed and replaced as engineered fill with the trench side slopes flattened to at least 1:1, or the trench fills are determined not to be a risk to the structure. The assessment of the level of risk posed by the particular utility line will determine whether the utility may be abandoned in place or needs to be completely removed. The contractor should assume that all utilities will be removed from within building areas unless provided written confirmation from both the owner and the geotechnical engineer.

Utilities extending beyond the building area may be abandoned in place provided the ends are plugged with concrete, they do not conflict with planned improvements, and that the trench fills do not pose significant risk to the planned surface improvements.

The risk for owners associated with abandoning utilities in place include the potential for future differential settlement of existing trench fills, and/or partial collapse and potential ground loss into utility lines that are not completely filled with grout.

6.2 SITE CLEARING AND PREPARATION

6.2.1 Site Stripping

The site should be stripped of all surface vegetation, and surface and subsurface improvements to be removed within the proposed development area. Demolition of existing improvements is discussed in the prior paragraphs. A detailed discussion of removal of existing fills is provided later in this report. Surface vegetation and topsoil should be stripped to a sufficient depth to remove all material greater than 3 percent organic content by weight. Surficial stripping should extend about 4 to 6 inches below existing grade in vegetated areas and isolated planters.

6.2.2 Tree and Shrub Removal

Trees and shrubs designated for removal should have the root balls and any roots greater than ½-inch diameter removed completely. Mature trees are estimated to have root balls extending to depths of 2 to 4 feet, depending on the tree size. Significant root zones are anticipated to extend to the diameter of the tree canopy. Grade depressions resulting from root ball removal should be cleaned of loose material and backfilled in accordance with the recommendations in the “Compaction” section of this report.

6.3 REMOVAL OF EXISTING FILLS

As discussed earlier, undocumented fills were encountered in our borings ranging up to 3 feet in depth. Additionally, up to 20 feet of undocumented fill may be present at the “Former Tank Excavation” mentioned above. All fills should be completely removed from within building areas

and to a lateral distance of at least 5 feet beyond the building footprint or to a lateral distance equal to fill depth below the perimeter footing, whichever is greater. Provided the fills meet the "Material for Fill" requirements below, the fills may be reused when backfilling the excavations. Based on review of the samples collected from our borings, it appears that the fill may be reused. If materials are encountered that do not meet the requirements, such as debris, wood, trash, those materials should screened out of the remaining material and be removed from the site. Backfill of excavations should be placed in lifts and compacted in accordance with the "Compaction" section below.

Fills extending into planned pavement and flatwork areas may be left in place provided they are determined to be a low risk for future differential settlement and that the upper 12 to 18 inches of fill below pavement subgrade is re-worked and compacted as discussed in the "Compaction" section below.

6.3.1 Exploration Test Pits

As previously mentioned, undocumented fill can be variable in thickness, density, and consistency across the site. We recommend exploration test pits be performed to determine the depth of fills within the building footprint prior to grading. This additional information can be used to better define the limits of fill and provided to earthwork contractors for estimating.

6.4 TEMPORARY CUT AND FILL SLOPES

The contractor is responsible for maintaining all temporary slopes and providing temporary shoring where required. Temporary shoring, bracing, and cuts/fills should be performed in accordance with the strictest government safety standards. On a preliminary basis, the upper 10 feet at the site may be classified as OSHA Site C materials.

Excavations performed during site demolition and fill removal should be sloped at 3:1 (horizontal:vertical) within the upper 5 feet below building subgrade. Excavations extending more than 5 feet below building subgrade and excavations in pavement and flatwork areas should be slope at a 1:1 inclination unless the OSHA soil classification indicates that slope should not exceed 1.5:1.

6.5 SUBGRADE PREPARATION

After site clearing and demolition is complete, and prior to backfilling any excavations resulting from fill removal or demolition, the excavation subgrade and subgrade within areas to receive additional site fills, slabs-on-grade and/or pavements should be scarified to a depth of 6 inches, moisture conditioned, and compacted in accordance with the "Compaction" section below.

6.6 SUBGRADE STABILIZATION MEASURES

Soil subgrade and fill materials, especially soils with high fines contents such as clays and silty soils, can become unstable due to high moisture content, whether from high in-situ moisture contents or from winter rains. As the moisture content increases over the laboratory optimum, it

becomes more likely the materials will be subject to softening and yielding (pumping) from construction loading or become unworkable during placement and compaction.

As discussed in the “Subsurface” section in this report, the in-situ moisture contents are about 3 to 8 percent over the estimated laboratory optimum in the upper 10 feet of the soil profile. The contractor should anticipate drying the soils prior to reusing them as fill. In addition, repetitive rubber-tire loading will likely de-stabilize the soils.

There are several methods to address potential unstable soil conditions and facilitate fill placement and trench backfill. Some of the methods are briefly discussed below. Implementation of the appropriate stabilization measures should be evaluated on a case-by-case basis according to the project construction goals and the particular site conditions.

6.6.1 Scarification and Drying

The subgrade may be scarified to a depth of 12 to 18 inches and allowed to dry to near optimum conditions if sufficient dry weather is anticipated to allow sufficient drying. More than one round of scarification may be needed to break up the soil clods.

6.6.2 Removal and Replacement

As an alternative to scarification, the contractor may choose to over-excavate the unstable soils and replace them with dry on-site or import materials. A Cornerstone representative should be present to provide recommendations regarding the appropriate depth of over-excavation, whether a geosynthethic (stabilization fabric or geogrid) is recommended, and what materials are recommended for backfill.

6.6.3 Chemical Treatment

Where the unstable area exceeds about 5,000 to 10,000 square feet and/or site winterization is desired, chemical treatment with quicklime (CaO), kiln-dust, or cement may be more cost-effective than removal and replacement. Recommended chemical treatment depths will typically range from 12 to 18 inches depending on the magnitude of the instability.

6.7 MATERIAL FOR FILL

6.7.1 Re-Use of On-site Soils

On-site soils with an organic content less than 3 percent by weight may be reused as general fill. General fill should not have lumps, clods or cobble pieces larger than 6 inches in diameter; 85 percent of the fill should be smaller than 2½ inches in diameter. Minor amounts of oversize material (smaller than 12 inches in diameter) may be allowed provided the oversized pieces are not allowed to nest together and the compaction method will allow for loosely placed lifts not exceeding 12 inches.

6.7.2 Re-Use of On-Site Site Improvements

We anticipate that significant quantities of asphalt concrete (AC) grindings and aggregate base (AB) and Portland Cement Concrete (PCC) will be generated during site demolition. If the AC grindings are mixed with the underlying AB to meet Class 2 AB specifications, they may be reused within the new pavement and flatwork structural sections. AC/AB grindings may not be reused within the habitable building areas. Laboratory testing will be required to confirm the grindings meet project specifications. Due to the existing alligator cracking of the AC pavements, it is likely that the grinding operation will leave significant oversize chunks and won't meet the Class 2 AB gradation requirements but may meet Caltrans subbase requirements. Depending on the quantities of oversized material, the grindings may still be used within the structural section; however, the pavement design will need to be modified to account for the difference, typically resulting in the addition of about 1 inch to the structural section.

If the site area allows for on-site pulverization of PCC and provided the PCC is pulverized to meet the "Material for Fill" requirements of this report, it may be used as select fill within the hospitable building areas, excluding the capillary break layer; as typically pulverized PCC comes close to or meets Class 2 AB specifications, the recycled PCC may likely be used within the pavement structural sections. PCC grindings also make good winter construction access roads, similar to a cement-treated base (CTB) section.

6.7.3 Potential Import Sources

Imported and non-expansive material should be inorganic with a Plasticity Index (PI) of 15 or less, and not contain recycled asphalt concrete where it will be used within the habitable building areas. To prevent significant caving during trenching or foundation construction, imported material should have sufficient fines. Samples of potential import sources should be delivered to our office at least 10 days prior to the desired import start date. Information regarding the import source should be provided, such as any site geotechnical reports. If the material will be derived from an excavation rather than a stockpile, potholes will likely be required to collect samples from throughout the depth of the planned cut that will be imported. At a minimum, laboratory testing will include PI tests. Material data sheets for select fill materials (Class 2 aggregate base, ¾-inch crushed rock, quarry fines, etc.) listing current laboratory testing data (not older than 6 months from the import date) may be provided for our review without providing a sample. If current data is not available, specification testing will need to be completed prior to approval.

Environmental and soil corrosion characterization should also be considered by the project team prior to acceptance. Suitable environmental laboratory data to the planned import quantity should be provided to the project environmental consultant; additional laboratory testing may be required based on the project environmental consultant's review. The potential import source should also not be more corrosive than the on-site soils, based on pH, saturated resistivity, and soluble sulfate and chloride testing.

6.7.4 Non-Expansive Fill Using Lime Treatment

As discussed above, non-expansive fill should have a Plasticity Index (PI) of 15 or less. Due to the high clay content and PI of the on-site soil materials, it is not likely that sufficient quantities of non-expansive fill would be generated from cut materials. As an alternative to importing non-expansive fill, chemical treatment can be considered to create non-expansive fill. If this option is considered, additional laboratory tests should be performed during initial site grading to further evaluate the optimum percentage of chemical treatment required.

6.8 COMPACTION REQUIREMENTS

All fills, and subgrade areas where fill, slabs-on-grade, and pavements are planned, should be placed in loose lifts 8 inches thick or less and compacted in accordance with ASTM D1557 (latest version) requirements as shown in the table below. In general, clayey soils should be compacted with sheepsfoot equipment and sandy/gravelly soils with vibratory equipment; open-graded materials such as crushed rock should be placed in lifts no thicker than 18 inches consolidated in place with vibratory equipment. Each lift of fill and all subgrade should be firm and unyielding under construction equipment loading in addition to meeting the compaction requirements to be approved. The contractor (with input from a Cornerstone representative) should evaluate the in-situ moisture conditions, as the use of vibratory equipment on soils with high moistures can cause unstable conditions. General recommendations for soil stabilization are provided in the “Subgrade Stabilization Measures” section of this report. Where the soil’s PI is 20 or greater, the expansive soil criteria should be used.

Table 4: Compaction Requirements

Description	Material Description	Minimum Relative[1] Compaction (percent)	Moisture[2] Content (percent)
General Fill (within upper 5 feet)	On-Site Expansive Soils	87 – 92	>3
	Low Expansion Soils	90	>1
General Fill (below a depth of 5 feet)	On-Site Expansive Soils	95	>3
	Low Expansion Soils	95	>1
Basement Wall Backfill	Without Surface Improvements	90	>1
Basement Wall Backfill	With Surface Improvements	95[4]	>1
Trench Backfill	On-Site Expansive Soils	87 – 92	>3
Trench Backfill	Low Expansion Soils	90	>1
Trench Backfill (upper 6 inches of subgrade)	On-Site Low Expansion Soils	95	>1
Crushed Rock Fill	¾-inch Clean Crushed Rock	Consolidate In-Place	NA
Non-Expansive Fill	Imported Non-Expansive Fill	90	Optimum
Flatwork Subgrade	On-Site Expansive Soils	87 - 92	>3
Flatwork Subgrade	Low Expansion Soils	90	>1
Flatwork Aggregate Base	Class 2 Aggregate Base[3]	90	Optimum
Pavement Subgrade	On-Site Expansive Soils	87 - 92	>3
Pavement Subgrade	Low Expansion Soils	95	>1
Pavement Aggregate Base	Class 2 Aggregate Base[3]	95	Optimum
Asphalt Concrete	Asphalt Concrete	95 (Marshall)	NA

1 – Relative compaction based on maximum density determined by ASTM D1557 (latest version)
2 – Moisture content based on optimum moisture content determined by ASTM D1557 (latest version)
3 – Class 2 aggregate base shall conform to Caltrans Standard Specifications, latest edition, except that the relative compaction should be determined by ASTM D1557 (latest version)
4 – Using light-weight compaction or walls should be braced

6.8.1 Construction Moisture Conditioning

Expansive soils can undergo significant volume change when dried then wetted. The contractor should keep all exposed expansive soil subgrade (and also trench excavation side walls) moist until protected by overlying improvements (or trenches are backfilled). If expansive soils are allowed to dry out significantly, re-moisture conditioning may require several days of re-wetting (flooding is not recommended), or deep scarification, moisture conditioning, and re-compaction.

6.9 TRENCH BACKFILL

Utility lines constructed within public right-of-way should be trenched, bedded and shaded, and backfilled in accordance with the local or governing jurisdictional requirements. Utility lines in

private improvement areas should be constructed in accordance with the following requirements unless superseded by other governing requirements.

All utility lines should be bedded and shaded to at least 6 inches over the top of the lines with crushed rock (⅜-inch-diameter or greater) or well-graded sand and gravel materials conforming to the pipe manufacturer's requirements. Open-graded shading materials should be consolidated in place with vibratory equipment and well-graded materials should be compacted to at least 90 percent relative compaction with vibratory equipment prior to placing subsequent backfill materials.

General backfill over shading materials may consist of on-site native materials provided they meet the requirements in the "Material for Fill" section, and are moisture conditioned and compacted in accordance with the requirements in the "Compaction" section.

Where utility lines will cross perpendicular to strip footings, the footing should be deepened to encase the utility line, providing sleeves or flexible cushions to protect the pipes from anticipated foundation settlement, or the utility lines should be backfilled to the bottom of footing with sand-cement slurry or lean concrete. Where utility lines will parallel footings and will extend below the "foundation plane of influence," an imaginary 1:1 plane projected down from the bottom edge of the footing, either the footing will need to be deepened so that the pipe is above the foundation plane of influence or the utility trench will need to be backfilled with sand-cement slurry or lean concrete within the influence zone. Sand-cement slurry used within foundation influence zones should have a minimum compressive strength of 75 psi.

On expansive soils sites it is desirable to reduce the potential for water migration into building and pavement areas through the granular shading materials. We recommend that a plug of low-permeability clay soil, sand-cement slurry, or lean concrete be placed within trenches just outside where the trenches pass into building and pavement areas.

6.10 SITE DRAINAGE

Ponding should not be allowed adjacent to building foundations, slabs-on-grade, or pavements. Hardscape surfaces should slope at least 2 percent towards suitable discharge facilities; landscape areas should slope at least 3 percent towards suitable discharge facilities. Roof runoff should be directed away from building areas in closed conduits, to approved infiltration facilities, or on to hardscaped surfaces that drain to suitable facilities. Retention, detention or infiltration facilities should be spaced at least 10 feet from buildings, and preferably at least 5 feet from slabs-on-grade or pavements. However, if retention, detention or infiltration facilities are located within these zones, we recommend that these treatment facilities meet the requirements in the Storm Water Treatment Design Considerations section of this report.

6.11 LOW-IMPACT DEVELOPMENT (LID) IMPROVEMENTS

The Municipal Regional Permit (MRP) requires regulated projects to treat 100 percent of the amount of runoff identified in Provision C.3.d from a regulated project's drainage area with low impact development (LID) treatment measures onsite or at a joint stormwater treatment facility.

LID treatment measures are defined as rainwater harvesting and use, infiltration, evapotranspiration, or biotreatment. A biotreatment system may only be used if it is infeasible to implement harvesting and use, infiltration, or evapotranspiration at a project site.

Technical infeasibility of infiltration may result from site conditions that restrict the operability of infiltration measures and devices. Various factors affecting the feasibility of infiltration treatment may create an environmental risk, structural stability risk, or physically restrict infiltration. The presence of any of these limiting factors may render infiltration technically infeasible for a proposed project. To aid in determining if infiltration may be feasible at the site, we provide the following site information regarding factors that may aid in determining the feasibility of infiltration facilities at the site.

- The near-surface soils at the site are clayey, and categorized as Hydrologic Soil Group D, and is expected to have infiltration rates of less than 0.2 inches per hour. In our opinion, these clayey soils will significantly limit the infiltration of stormwater.

- Locally, seasonal high ground water was observed in the area at a depth of 12 feet, and therefore is expected to be within 10 feet of the base of the infiltration measure.

- In our opinion, infiltration locations within 10 feet of the buildings would create a geotechnical hazard.

6.11.1 Storm Water Treatment Design Considerations

If storm water treatment improvements, such as shallow bio-retention swales, basins or pervious pavements, are required as part of the site improvements to satisfy Storm Water Quality (C.3) requirements, we recommend the following items be considered for design and construction.

6.11.1.1 General Bioswale Design Guidelines

- If possible, avoid placing bioswales or basins within 10 feet of the building perimeter or within 5 feet of exterior flatwork or pavements. If bioswales must be constructed within these setbacks, the side(s) and bottom of the trench excavation should be lined with 10-mil visqueen to reduce water infiltration into the surrounding expansive clay.

- Bioswales constructed within 3 feet of proposed buildings may be within the foundation zone of influence for perimeter wall loads. Therefore, where bioswales will parallel foundations and will extend below the “foundation plane of influence,” an imaginary 1:1 plane projected down from the bottom edge of the foundation, the foundation will need to be deepened so that the bottom edge of the bioswale filter material is above the foundation plane of influence.

- The bottom of bioswale or detention areas should include a perforated drain placed at a low point, such as a shallow trench or sloped bottom, to reduce water infiltration into the

surrounding soils near structural improvements, and to address the low infiltration capacity of the on-site clay soils.

6.11.1.2 Bioswale Infiltration Material

- Gradation specifications for bioswale filter material, if required, should be specified on the grading and improvement plans.

- Compaction requirements for bioswale filter material in non-landscaped areas or in pervious pavement areas, if any, should be indicated on the plans and specifications to satisfy the anticipated use of the infiltration area.

- If required, infiltration (percolation) testing should be performed on representative samples of potential bioswale materials prior to construction to check for general conformance with the specified infiltration rates.

- It should be noted that multiple laboratory tests may be required to evaluate the properties of the bioswale materials, including percolation, landscape suitability and possibly environmental analytical testing depending on the source of the material. We recommend that the landscape architect provide input on the required landscape suitability tests if bioswales are to be planted.

- If bioswales are to be vegetated, the landscape architect should select planting materials that do not reduce or inhibit the water infiltration rate, such as covering the bioswale with grass sod containing a clayey soil base.

- If required by governing agencies, field infiltration testing should be specified on the grading and improvement plans. The appropriate infiltration test method, duration and frequency of testing should be specified in accordance with local requirements.

- Due to the relatively loose consistency and/or high organic content of many bioswale filter materials, long-term settlement of the bioswale medium should be anticipated. To reduce initial volume loss, bioswale filter material should be wetted in 12 inch lifts during placement to pre-consolidate the material. Mechanical compaction should not be allowed, unless specified on the grading and improvement plans, since this could significantly decrease the infiltration rate of the bioswale materials.

- It should be noted that the volume of bioswale filter material may decrease over time depending on the organic content of the material. Additional filter material may need to be added to bioswales after the initial exposure to winter rains and periodically over the life of the bioswale areas, as needed.

6.11.1.3 Bioswale Construction Adjacent to Pavements

If bio-infiltration swales or basins are considered adjacent to proposed parking lots or exterior flatwork, we recommend that mitigative measures be considered in the design and construction

of these facilities to reduce potential impacts to flatwork or pavements. Exterior flatwork, concrete curbs, and pavements located directly adjacent to bio-swales may be susceptible to settlement or lateral movement, depending on the configuration of the bioswale and the setback between the improvements and edge of the swale. To reduce the potential for distress to these improvements due to vertical or lateral movement, the following options should be considered by the project civil engineer:

- Improvements should be setback from the vertical edge of a bioswale such that there is at least 1 foot of horizontal distance between the edge of improvements and the top edge of the bioswale excavation for every 1 foot of vertical bioswale depth, or

- Concrete curbs for pavements, or lateral restraint for exterior flatwork, located directly adjacent to a vertical bioswale cut should be designed to resist lateral earth pressures in accordance with the recommendations in the "Retaining Walls" section of this report, or concrete curbs or edge restraint should be adequately keyed into the native soil or engineered to reduce the potential for rotation or lateral movement of the curbs.

6.12 LANDSCAPE CONSIDERATIONS

Since the near-surface soils are moderately expansive, we recommend reducing the amount of surface water infiltrating these soils near foundations and exterior slabs-on-grade. This can typically be achieved by:

- Using drip irrigation

- Avoiding open planting within 3 feet of the building perimeter or near the top of existing slopes

- Regulating the amount of water distributed to lawns or planter areas by using irrigation timers

- Selecting landscaping that requires little or no watering, especially near foundations.

We recommend that the landscape architect consider these items when developing landscaping plans.

SECTION 7: 2019 CBC SEISMIC DESIGN CRITERIA

We developed site-specific seismic design parameters in accordance with Chapter 16, Chapter 18 and Appendix J of the 2019 California Building Code (CBC) and Chapters 11, 12, 20, and 21 and Supplement No. 1 of ASCE 7-16.

7.1 SITE LOCATION AND PROVIDED DATA FOR 2019 CBC SEISMIC DESIGN

The project is located at latitude 37.706563° and longitude -122.144755°, which is based on Google Earth (WGS84) coordinates of the site at 14273 Washington Avenue in San Leandro,

California. We have assumed that a Seismic Importance Factor (I_e) of 1.00 has been assigned to the structure in accordance with Table 1.5-2 of ASCE 7-16 for structures classified as Risk Category II. The building period has not been provided by the project structural engineer.

7.2 SITE CLASSIFICATION – CHAPTER 20 OF ASCE 7-16

Code-based site classification and ground motion attenuation relationships are based on the time-weighted average shear wave velocity of the top approximately 100 feet (30 meters) of the soil profile (V_{S30}).

Our explorations generally encountered medium stiff to very stiff clays with varying amounts sand and interbedded layers of loose to medium dense silty sands to a depth of 100 feet, the maximum depth explored. Shear wave velocity (V_S) measurements were performed while advancing CPT-2, resulting in a time-averaged shear wave velocity for the top 30 meters (V_{S30}) of 241 meters per second. In accordance with Table 20.3-1 of ASCE 7-16, we recommend the site be classified as Soil Classification D, which is described as a "stiff soil" profile. Because we used site specific data from our explorations and laboratory testing, the site class should be considered as "determined" for the purposes of estimating the seismic design parameters from the code outlined below. Our site-specific ground motion hazard analysis considered a V_{S30} of 241 m/s (791ft/s).

7.3 CODE-BASED SEISMIC DESIGN PARAMETERS

Code-based spectral acceleration parameters were determined based on mapped acceleration response parameters adjusted for the specific site conditions. Mapped Risk-Adjusted Maximum Considered Earthquake (MCE_R) spectral acceleration parameters (S_S and S_1) were determined using the ATC Hazards by Location website (https://hazards.atcouncil.org).

The mapped acceleration parameters were adjusted for local site conditions based on the average soil conditions for the upper 100 feet (30 meters) of the soil profile. Code-based MCE_R spectral response acceleration parameters adjusted for site effects (S_{MS} and S_{M1}) and design spectral response acceleration parameters (S_{DS} and S_{D1}) are presented in Table 5.

In accordance with Section 11.4.8 of ASCE 7-16, structures on Site Class D sites with mapped 1-second period spectral acceleration (S_1) values greater than or equal to 0.2 require a site-specific ground motion hazard analysis be performed in accordance with Section 21.2 of ASCE 7-16. ***Design seismic parameters determined by performing a Ground Motion Hazard Analysis per Section 21.2 of ASCE 7-16 are presented in Table 8. Recommended values in Table 5 should not be used for design unless in the judgement of the structural engineer an exception can be taken in accordance with Section 11.4.8 of ASCE 7-16.*** Values summarized in Table 5 are only used to determine Seismic Design Category and comparison with minimum code requirements for further use in our ground motion hazard analysis (GMHA).

Table 5: 2019 CBC Site Categorization and Site Coefficients

Classification/Coefficient	Design Value
Site Class	D
Site Latitude	37.706563°
Site Longitude	-122.144755°
Risk Category	II**
Short Period Mapped Spectral Acceleration – S_S	2.094
1-second Period Mapped Spectral Acceleration – S_1	0.806
Short-Period Site Coefficient – F_a	1
Long-Period Site Coefficient – F_v	*null
Short Period MCE Spectral Response Acceleration Adjusted for Site Effects – S_{MS}	2.094
1-second Period MCE Spectral Response Acceleration Adjusted for Site Effects – S_{M1}	*null
Short Period, Design Earthquake Spectral Response Acceleration – S_{DS}	1.396
1-second Period, Design Earthquake Spectral Response Acceleration – S_{D1}	*null
Long-Period Transition – T_L	8
Site Coefficient – F_{PGA}	1.1
Site Modified Peak Ground Acceleration – PGA_M	0.968

*null – per section 11.4.8 of ASCE 7-16
**Assumed, to be confirmed by Structural Engineer

7.4 SITE-SPECIFIC GROUND MOTION HAZARD ANALYSIS

Following Section 11.4.8 of ASCE 7-16, we performed a ground motion hazards analysis (GMHA) in accordance with Chapter 21, Section 21.2 of ASCE 7. We evaluated both Probabilistic MCE_R Ground Motions in accordance with Method 1 and Deterministic MCE_R Ground Motions to generate our recommended design response spectrum for the project. Our analyses were performed using the USGS interface Unified Hazard Tool (UHT) based on the UCERF 3 Data Set, Building Seismic Safety Council (BSSC) Scenario Catalog 2014 event set (BSSC 2014), and the 2014 National Seismic Hazard Maps – Source Parameters (NSHMP deterministic event set). Additionally, we utilized the USGS program Response Spectra Plotter with combined models (Combined: WUS 2014 (4.1)).

Our analysis utilized the mean ground motions predicted by four of the Next Generation Attenuation West 2 (NGA-West 2) relationships: Boore-Atkinson (2013), Campbell-Bozorgnia (2013), Chiou-Youngs (2013), and Abrahamson-Silva (2013). Rotation factors (scale factors) were determined as specified in ASCE 7-16 Chapter 21, Section 21.2, to calculate the maximum rotated component of ground motions (ASCE, 2016).

7.4.1 Probabilistic MCE_R

We performed a probabilistic seismic hazard analysis (PSHA) in accordance with ASCE 7-16 Section 21.2.1. The probabilistic MCE acceleration response spectrum is defined as the 5 percent damped acceleration response spectrum having a 2 percent probability of exceedance in a 50-year period (2,475-year return period). The probabilistic MCE spectrum was multiplied by Risk Coefficients (C_R) to determine the probabilistic MCE_R. We used Risk Coefficients (C_{RS} and C_{R1}) of 0.917 and 0.905, respectively, based on ASCE 7-16 Section 21.2.1.1 - Method 1 and the ATC website. Risk coefficients for the various periods are presented in Table 6, Column 3.

The resulting probabilistic MCE_R for site class D are presented on Figure 5 (red line). Spectral ordinates are tabulated in Table 6, Column 6.

7.4.2 Deterministic MCE_R

We performed deterministic seismic hazard analyses in accordance with ASCE 7-16 Section 21.2.2 and ASCE 7-16 Supplement No. 1. The deterministic MCE_R acceleration response spectrum is calculated as the largest 84th percentile ground motion in the direction of maximum horizontal response for each period for characteristic earthquakes on all known active faults within the region. The largest deterministic ground motion resulted from a M_w 7.58 earthquake on the Hayward Fault (RC+HN+HS+HE segments), located at a distance of approximately 3.97 km from the site.

In accordance with Supplement No.1 of ASCE 7-16, when the largest spectral response acceleration of the resulting deterministic ground motion response spectrum is less than $1.5F_a$ then the largest 84th percentile rotated response spectrum (Table 6, Column 4) shall be scaled by a single factor such that the maximum response spectral acceleration equals $1.5F_a$. For Site Classes A, B, C and D, F_a is determined using Table 11.4.1 with the value of S_s taken as 1.5; for Site Class E, F_a shall be taken as 1.0. When the largest spectral response acceleration of the probabilistic ground motion response of 21.2.1 is less than $1.2F_a$, the deterministic ground motion response spectrum does not need to be calculated.

As the largest probabilistic spectral response acceleration was determined to be 2.881 which is greater than $1.2F_a$, where F_a is taken as 1.000 from Table 11.4-1 in ASCE 7-16 Supplement No.1, the 84th percentile rotated response spectrum was calculated as part of the deterministic analyses. The maximum spectral acceleration from the 84th percentile rotated response spectrum was then compared to $1.5F_a$ to determine if a scale factor needed to be applied. The deterministic MCE spectrum are tabulated in Table 6, Column 5. The deterministic MCE_R is presented graphically on Figure 5 (blue line).

7.4.3 Site-Specific MCE_R

The site-specific MCE_R is defined by ASCE 7-16 Section 21.2.3 as the lesser of the deterministic and probabilistic MCE_R's at each period. Spectral ordinates for the site-specific

MCE_R are tabulated in Table 6, Column 7 and shown graphically on Figure 5 (dashed black line).

Table 6: Site Class D: Development of Site-Specific MCE_R Spectrum

Period (seconds)	CBC General Spectrum (g)	Risk Coefficient	Det. 84th Percentile Rotated	Deterministic MCE_R (g)	Probabilistic MCE_R (g)	Site-Specific MCE_R (g)

5.000	0.269	0.905	0.412	0.412	0.473	0.412

7.4.4 Design Response Spectrum

The Design Response Spectrum (DRS) is defined in ASCE 7-16 Section 21.3 as:

- two-thirds of the site-specific MCE_R, but
- not less than 80% of the general design response spectrum

Spectral accelerations corresponding to two-thirds of the MCE_R are tabulated in Table 7, Column 2. Ordinates corresponding to 80% of the general Site Class D response spectrum are tabulated below in Table 7, Column 3. Ordinates of the site-specific DRS are tabulated in Table 7, Column 4. Development of the site-specific DRS is presented graphically on Figure 6 (dashed black line).

Table 7: Site Class D: Development of Site-Specific Design Response Spectrum

Period (seconds)	2/3 Site-Specific MCE_R (g)	80% CBC Site Class C Spectrum (g)	Design Response Spectrum (g)
0.000	0.710	0.447	0.710
0.050	0.753	0.621	0.753
0.080	0.898	0.708	0.898

7.5 DESIGN ACCELERATION PARAMETERS

Design acceleration parameters (S_{DS} and S_{D1}) were determined in accordance with Section 21.4 of ASCE 7-16. S_{DS} is defined as the design spectral acceleration at 90% of the maximum spectral acceleration, S_a, obtained from the site-specific spectrum, at any period within the range from 0.2 to 5 seconds, inclusive. S_{D1} is defined as the maximum value of the product, TS_a, for periods from 1 to 2 seconds for sites with vs,30 > 1,200 ft/s ($v_{s,30}$ > 365.76 m/s) and for periods from 1 to 5 seconds for sites with vs,30 ≤ 1,200 ft/s ($v_{s,30}$ ≤365.76 m/s).
Site-specific MCE_R spectral response acceleration parameters (S_{MS} and S_{M1}) are calculated as:

- 1.5 times the S_{DS} and S_{D1} values, respectively, but
- not less than 80% of the code-based values presented in Table 5

Recommended design acceleration parameters are summarized in Table 8.

When using the Equivalent Lateral Force Procedure, ASCE 7-16 Section 21.4 allows using the spectral acceleration at any period (T) in lieu of S_{D1}/T in Eq. 12.8-3 and $S_{D1}T_L/T_2$ in Eq. 12.8-4.

The site-specific spectral acceleration at any period may be calculated by interpolation of the spectral ordinates in Table 7, Column 4.

Table 8: Site Class D: Site-Specific Design Acceleration Parameters

Parameter	Value
S_{DS}	1.546
S_{D1}	1.537
S_{MS}	2.318
S_{M1}	2.306

7.6 SITE-SPECIFIC MCE_G PEAK GROUND ACCELERATION

7.6.1 Site Class D: Site-Specific MCE_G Peak Ground Acceleration

We calculated the Site-Specific MCE_G Peak Ground Acceleration (PGA_M) in accordance with ASCE 7-16 Section 21.5. The Site-Specific PGA_M is calculated as the lesser of probabilistic and deterministic geometric mean PGA. The 2% in 50-year probabilistic geometric mean PGA is 1.055g. The deterministic PGA is considered the greater of the largest 84th percentile deterministic geometric mean PGA (1.004) or one-half of the tabulated F_{PGA} value from ASCE 7-16 Table 11.8.1 with the value of PGA taken as 0.5g. For the site, F_{PGA} is 1.100 and one-half of the F_{PGA} is 0.55g; therefore, the deterministic PGA is 1.004g. Additionally, the Site-Specific PGA_M may not be less than 80% of the mapped PGA_M determined from ASCE 7-16 Equation 11.8-1. The mapped PGA_M for the site is 0.968g; 80% of PGA_M is 0.774g.

Based on the above, the recommended Site-Specific PGA_M for the site is 1.004g.

SECTION 8: FOUNDATIONS

8.1 SUMMARY OF RECOMMENDATIONS

In our opinion, the proposed structures may be supported on shallow foundations provided the recommendations in the “Earthwork” section and the sections below are followed.

8.2 SHALLOW FOUNDATIONS

8.2.1 Spread Footings

Spread footings should bear on natural, undisturbed soil or engineered fill, be at least 15 inches wide, and extend at least 18 inches below the lowest adjacent grade. Lowest adjacent grade is defined as the deeper of the following: 1) bottom of the adjacent interior slab-on-grade, or 2) finished exterior grade, excluding landscaping topsoil. The deeper footing embedment is due to

the presence of highly expansive soils and is intended to embed the footing below the zone of significant seasonal moisture fluctuation, reducing the potential for differential movement.

Footings constructed to the above dimensions and in accordance with the "Earthwork" recommendations of this report are capable of supporting maximum allowable bearing pressures of 2,000 psf for dead loads, 3,000 psf for combined dead plus live loads, and 4,000 psf for all loads including wind and seismic. These pressures are based on factors of safety of 3.0, 2.0, and 1.5 applied to the ultimate bearing pressure for dead, dead plus live, and all loads, respectively. These pressures are net values; the weight of the footing may be neglected for the portion of the footing extending below grade (typically, the full footing depth). Top and bottom mats of reinforcing steel should be included in continuous footings to help span irregularities and differential settlement.

8.2.2 Footing Settlement

Structural loads were not provided to us at the time this report was prepared; therefore, we assumed the typical loading in the following table.

Table 9: Assumed Structural Loading

Foundation Area	Range of Assumed Loads
Interior Isolated Column Footing	100 to 150 kips
Exterior Isolated Column Footing	50 to 75 kips
Perimeter Strip Footing	5 to 10 kips per lineal foot

Based on the above loading and the allowable bearing pressures presented above, we estimate that the total static footing settlement will be on the order of ½ inch, with ⅓ inch of post-construction differential settlement between adjacent foundation elements. In addition, total seismic settlements are estimated to range up to about ⅓ inch. We estimate total static and seismic footing settlement will be on the order of ¾ inch, resulting in total estimated differential settlement up to ½ inch between foundation elements, assumed to be on the order of 50 to 60 feet. As our footing loads were assumed, we recommend we be retained to review the final footing layout and loading, and verify the settlement estimates above.

8.2.3 Lateral Loading

Lateral loads may be resisted by friction between the bottom of footing and the supporting subgrade, and also by passive pressures generated against footing sidewalls. An ultimate frictional resistance of 0.40 applied to the footing dead load, and an ultimate passive pressure based on an equivalent fluid pressure of 400 pcf may be used in design. The structural engineer should apply an appropriate factor of safety (such as 1.5) to the ultimate values above. Where footings are adjacent to landscape areas without hardscape, the upper 18 inches of soil should be neglected when determining passive pressure capacity.

8.2.4 Spread Footing Construction Considerations

Where utility lines will cross perpendicular to strip footings, the footing should be deepened to encase the utility line, providing sleeves or flexible cushions to protect the pipes from anticipated foundation settlement, or the utility lines should be backfilled to the bottom of footing with sand-cement slurry or lean concrete. Where utility lines will parallel footings and will extend below the "foundation plane of influence," an imaginary 1:1 plane projected down from the bottom edge of the footing, either the footing will need to be deepened so that the pipe is above the foundation plane of influence or the utility trench will need to be backfilled with sand-cement slurry or lean concrete within the influence zone. Sand-cement slurry used within foundation influence zones should have a minimum compressive strength of 75 psi.

Footing excavations should be filled as soon as possible or be kept moist until concrete placement by regular sprinkling to prevent desiccation. A Cornerstone representative should observe all footing excavations prior to placing reinforcing steel and concrete. If there is a significant schedule delay between our initial observation and concrete placement, we may need to re-observe the excavations.

SECTION 9: CONCRETE SLABS AND PEDESTRIAN PAVEMENTS

9.1 OFFICE SLABS-ON-GRADE

As the Plasticity Index (PI) of the surficial soils ranges up to 24, the proposed slabs-on-grade should be supported on at least 12 inches of non-expansive fill (NEF) to reduce the potential for slab damage due to soil heave. The NEF layer should be constructed over subgrade prepared in accordance with the recommendations in the "Earthwork" section of this report. If moisture-sensitive floor coverings are planned, the recommendations in the "Interior Slabs Moisture Protection Considerations" section below may be incorporated in the project design if desired. If significant time elapses between initial subgrade preparation and NEF construction, the subgrade should be proof rolled to confirm subgrade stability, and if the soil has been allowed to dry out, the subgrade should be re-moisture conditioned in accordance with the "Compaction" section of this report.

The structural engineer should determine the appropriate slab reinforcement for the loading requirements and considering the expansion potential of the underlying soils. Consideration should be given to limiting the control joint spacing to a maximum of about 2 feet in each direction for each inch of concrete thickness.

9.2 WAREHOUSE SLABS-ON-GRADE

Warehouse slabs-on-grade should be at least 6 inches thick, should have a minimum compressive strength of 3,500 psi, and should be designed for the specific warehouse loading (i.e. Forklifts, rack loads, etc.). At this time, rack loading information, etc. was not available. The slab should also be designed to accommodate potential slab settlement beneath heavily loaded slab areas. We recommend we be retained to review the final heavily loaded (i.e. rack loading) layout and loading, and provide estimated settlements.

The warehouse slab should be supported on at least 6 inches of non-expansive, crushed granular base having an R-value of at least 50 and no more than 10 percent passing the No. 200 sieve, such as Class 2 aggregate base. Due to the high plasticity of the surficial soils, an additional 6 inches of non-expansive fill (NEF) should underlie the upper granular base. At your option, the recommended crushed granular base material can also be increased for the full non-expansive fill depth of 12 inches. All base and sub-base materials should be placed and compacted in accordance with the "Compaction" section of this report. If there will be areas within the warehouse that are moisture sensitive, such as equipment and elevator rooms, a vapor barrier may be placed over the upper granular base prior to slab construction. Please refer to the recommendations in the "Interior Slabs Moisture Protection Considerations" section for vapor barrier construction. Consideration should be given to limiting the control joint spacing to a maximum of about 2 feet in each direction for each inch of concrete thickness.

9.3 INTERIOR SLABS MOISTURE PROTECTION CONSIDERATIONS

The following general guidelines for concrete slab-on-grade construction where floor coverings are planned are presented for the consideration by the developer, design team, and contractor. These guidelines are based on information obtained from a variety of sources, including the American Concrete Institute (ACI) and are intended to reduce the potential for moisture-related problems causing floor covering failures, and may be supplemented as necessary based on project-specific requirements. The application of these guidelines or not will not affect the geotechnical aspects of the slab-on-grade performance.

- Place a minimum 10-mil vapor retarder conforming to ASTM E 1745, Class C requirements or better directly below the concrete slab; the vapor retarder should extend to the slab edges and be sealed at all seams and penetrations in accordance with manufacturer's recommendations and ASTM E 1643 requirements. A 4-inch-thick capillary break, consisting of crushed rock should be placed below the vapor retarder and consolidated in place with vibratory equipment. The mineral aggregate shall be of such size that the percentage composition by dry weight as determined by laboratory sieves will conform to the following gradation:

Sieve Size	Percentage Passing Sieve
1"	100
¾"	90 – 100
No. 4	0 - 10

  The capillary break rock may be considered as the upper 4 inches of the non-expansive fill previously recommended.

- The concrete water:cement ratio should be 0.45 or less. Mid-range plasticizers may be used to increase concrete workability and facilitate pumping and placement.

- Water should not be added after initial batching unless the slump is less than specified and/or the resulting water:cement ratio will not exceed 0.45.

- Polishing the concrete surface with metal trowels is not recommended.
- Where floor coverings are planned, all concrete surfaces should be properly cured.
- Water vapor emission levels and concrete pH should be determined in accordance with ASTM F1869-98 and F710-98 requirements and evaluated against the floor covering manufacturer's requirements prior to installation.

9.4 EXTERIOR FLATWORK

Exterior concrete flatwork subject to pedestrian loading only should be at least 4 inches thick and supported on at least 4 inches of Class 2 aggregate base overlying 4 inches of non-expansive fill overlying subgrade prepared in accordance with the "Earthwork" recommendations of this report. Flatwork that will be subject to heavier or frequent vehicular loading should be designed in accordance with the recommendations in the "Vehicular Pavements" section below. To help reduce the potential for uncontrolled shrinkage cracking, adequate expansion and control joints should be included. Consideration should be given to limiting the control joint spacing to a maximum of about 2 feet in each direction for each inch of concrete thickness. Flatwork should be isolated from adjacent foundations or retaining walls.

SECTION 10: VEHICULAR PAVEMENTS

10.1 ASPHALT CONCRETE

The following asphalt concrete pavement recommendations tabulated below are based on the Procedure 608 of the Caltrans Highway Design Manual, estimated traffic indices for various pavement-loading conditions, and a design R-value of 5. The design R-value was chosen based on engineering judgement considering the proposed pavement areas and potential variable surface conditions following site grading. We have also included pavement structural section alternatives for chemical-treated (lime/cement) subgrade soil with an estimated design R-value of 50 for your consideration. If it is desired to chemical treat, we recommend that the upper 12 inches of subgrade soil be treated. Additional testing will need to be performed to determine the appropriate lime/cement percentage to be mixed with the subgrade soil.

Table 10: Asphalt Concrete Pavement Recommendations (Untreated Subgrade)

Design Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base* (inches)	Total Pavement Section Thickness (inches)
4.0	2.5	7.5	10.0
4.5	2.5	9.5	12.0
5.0	3.0	10.0	13.0
5.5	3.0	12.0	15.0
6.0	3.5	13.0	16.5
6.5	4.0	14.0	18.0
7.0	4.0	16.0	20.0
7.5	4.5	17.0	21.5
8.0	5.0	18.0	23.0
8.5	5.0	20.0	25.0
9.0	5.5	21.0	26.5
9.5	6.0	22.0	28.0
10.0	6.5	23.0	29.5
10.5	6.5	25.0	31.5
11.0	7.0	26.0	33.0

*Caltrans Class 2 aggregate base; minimum R-value of 78.

Table 11: Asphalt Concrete Pavement Recommendations (Chemical-Treated Subgrade)

Design Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base* (inches)	Total Pavement Section Thickness (inches)
4.0/4.5	2.5	4.0	6.5
5.0/5.5	3.0	4.0	7.0
6.0	3.5	4.0	7.5
6.5	4.0	4.0	8.0
7.0	4.0	4.5	8.5
7.5	4.5	5.0	9.5
8.0	5.0	5.0	10.0
8.5	5.0	6.5	11.5
9.0	5.5	6.5	12.0
9.5	6.0	7.0	13.0
10.0	6.5	7.5	14.0
10.5	6.5	8.5	15.0
11.0	7.0	8.5	15.5

*Caltrans Class 2 aggregate base with minimum R-value of 78; minimum chemical-treated subgrade R-value assumed to be 5.

Frequently, the full asphalt concrete section is not constructed prior to construction traffic loading. This can result in significant loss of asphalt concrete layer life, rutting, or other pavement failures. To improve the pavement life and reduce the potential for pavement distress through construction, we recommend the full design asphalt concrete section be constructed prior to construction traffic loading. Alternatively, a higher traffic index may be chosen for the areas where construction traffic will be using the pavements.

Asphalt concrete pavements constructed on expansive subgrade where the adjacent areas will not be irrigated for several months after the pavements are constructed may experience longitudinal cracking parallel to the pavement edge. These cracks typically form within a few feet of the pavement edge and are due to seasonal wetting and drying of the adjacent soil. The cracking may also occur during construction where the adjacent grade is allowed to significantly dry during the summer, pulling moisture out of the pavement subgrade. Any cracks that form should be sealed with bituminous sealant prior to the start of winter rains. One alternative to reduce the potential for this type of cracking is to install a moisture barrier at least 24 inches deep behind the pavement curb.

10.2 PORTLAND CEMENT CONCRETE

The exterior Portland Cement Concrete (PCC) pavement recommendations tabulated below are based on methods presented in the Portland Cement Association (PCA) design manual (PCA, 1984). We have provided a few pavement alternatives as an anticipated Average Daily Truck

Traffic (ADTT) was not provided. An allowable ADTT should be chosen that is greater than what is expected for the development. PCC alternatives for chemical-treated (lime/cement) subgrade are also provided in the tables below.

Table 12: PCC Pavement Recommendations (Untreated Subgrade)

Allowable ADTT	Minimum PCC Thickness (inches)
13	5.5
130	6.0

Table 13: PCC Pavement Recommendations (Chemical-Treated Subgrade)

Allowable ADTT	Minimum PCC Thickness (inches)
13	5.0
150	5.5

The PCC thicknesses above are based on a concrete compressive strength of at least 3,500 psi, supporting the PCC on at least 6 inches of Class 2 aggregate base compacted as recommended in the "Earthwork" section, and laterally restraining the PCC with curbs or concrete shoulders. Adequate expansion and control joints should be included. Consideration should be given to limiting the control joint spacing to a maximum of about 2 feet in each direction for each inch of concrete thickness. Due to the expansive surficial soils present, we recommend that the construction and expansion joints be dowelled.

10.2.1 Stress Pads for Trash Enclosures

Pads where trash containers will be stored, and where garbage trucks will park while emptying trash containers, should be constructed on Portland Cement Concrete. We recommend that the trash enclosure pads and stress (landing) pads where garbage trucks will store, pick up, and empty trash be increased to a minimum PCC thickness of 7 inches. The compressive strength, underlayment, and construction details should be consistent with the above recommendations for PCC pavements.

10.3 PAVEMENT CUTOFF

Surface water penetration into the pavement section can significantly reduce the pavement life, due to the native expansive clays. While quantifying the life reduction is difficult, a normal 20-year pavement design could be reduced to less than 10 years; therefore, increased long-term maintenance may be required.

It would be beneficial to include a pavement cut-off, such as deepened curbs, redwood-headers, or “Deep-Root Moisture Barriers” that are keyed at least 4 inches into the pavement subgrade. This will help limit the additional long-term maintenance.

SECTION 11: RETAINING WALLS

11.1 STATIC LATERAL EARTH PRESSURES

The structural design of any site retaining wall should include resistance to lateral earth pressures that develop from the soil behind the wall, any undrained water pressure, and surcharge loads acting behind the wall. Provided a drainage system is constructed behind the wall to prevent the build-up of hydrostatic pressures as discussed in the section below, we recommend that the walls with level backfill be designed for the following pressures in the table below. Due to the presence of expansive soils, cantilever retaining walls backfilled with native soil should be designed as restrained. If granular backfill materials are used, then the unrestrained values in the table can be used.

Table 14: Recommended Lateral Earth Pressures

Wall Condition	Lateral Earth Pressure*	Additional Surcharge Loads
Unrestrained – Cantilever Wall	45 pcf	⅓ of vertical loads at top of wall
Restrained – Braced Wall	45 pcf + 8H** psf	½ of vertical loads at top of wall

* Lateral earth pressures are based on an equivalent fluid pressure for level backfill conditions
** H is the distance in feet between the bottom of footing and top of retained soil

If adequate drainage cannot be provided behind the wall, an additional equivalent fluid pressure of 40 pcf should be added to the values above for both restrained and unrestrained walls for the portion of the wall that will not have drainage. Damp proofing or waterproofing of the walls may be considered where moisture penetration and/or efflorescence are not desired.

11.2 SEISMIC LATERAL EARTH PRESSURES

The 2019 CBC states that lateral pressures from earthquakes should be considered in the design of basements and retaining walls. At this time, we are not aware of any retaining walls 6 feet or greater in height and have not provided seismic earth pressures with this report. If retaining walls greater than 6 feet in height are proposed, we should be retained to provide seismic earth pressures, if warranted. In our opinion, seismic earth pressures are not warranted for design of minor landscaping and loading dock walls (i.e. walls 6 feet or less in height).

11.3 WALL DRAINAGE

Adequate drainage should be provided by a subdrain system behind all walls. This system should consist of a 4-inch minimum diameter perforated pipe placed near the base of the wall (perforations placed downward). The pipe should be bedded and backfilled with Class 2 Permeable Material per Caltrans Standard Specifications, latest edition. The permeable backfill

should extend at least 12 inches out from the wall and to within 2 feet of outside finished grade. Alternatively, ½-inch to ¾-inch crushed rock may be used in place of the Class 2 Permeable Material provided the crushed rock and pipe are enclosed in filter fabric, such as Mirafi 140N or approved equivalent. The upper 2 feet of wall backfill should consist of compacted on-site soil. The subdrain outlet should be connected to a free-draining outlet or sump.

Miradrain, Geotech Drainage Panels, or equivalent drainage matting can be used for wall drainage as an alternative to the Class 2 Permeable Material or drain rock backfill. Horizontal strip drains connecting to the vertical drainage matting may be used in lieu of the perforated pipe and crushed rock section. The vertical drainage panel should be connected to the perforated pipe or horizontal drainage strip at the base of the wall, or to some other closed or through-wall system such as the TotalDrain system from AmerDrain. Sections of horizontal drainage strips should be connected with either the manufacturer's connector pieces or by pulling back the filter fabric, overlapping the panel dimples, and replacing the filter fabric over the connection. At corners, a corner guard, corner connection insert, or a section of crushed rock covered with filter fabric must be used to maintain the drainage path.

Drainage panels should terminate 18 to 24 inches from final exterior grade. The Miradrain panel filter fabric should be extended over the top of and behind the panel to protect it from intrusion of the adjacent soil.

11.4 BACKFILL

Where surface improvements will be located over the retaining wall backfill, backfill placed behind the walls with a PI less than 20 should be compacted to at least 95 percent relative compaction using light compaction equipment. If the soil's PI is 20 or greater, expansive soil criteria should be used as discussed in the "Compaction" section of this report. Where no surface improvements are planned, backfill should be compacted to at least 90 percent for soils with a PI less than 20. Expansive soil criteria should be followed for soils with a PI of 20 or greater. If heavy compaction equipment is used, the walls should be temporarily braced.

11.5 FOUNDATIONS

Retaining walls may be supported on a continuous spread footing designed in accordance with the recommendations presented in the "Foundations" section of this report.

SECTION 12: LIMITATIONS

This report, an instrument of professional service, has been prepared for the sole use of First Industrial Realty Trust, Inc. specifically to support the design of the Washington Industrial Facility project in San Leandro, California. The opinions, conclusions, and recommendations presented in this report have been formulated in accordance with accepted geotechnical engineering practices that exist in Northern California at the time this report was prepared. No warranty, expressed or implied, is made or should be inferred.

Recommendations in this report are based upon the soil and ground water conditions encountered during our subsurface exploration. If variations or unsuitable conditions are encountered during construction, Cornerstone must be contacted to provide supplemental recommendations, as needed.

First Industrial Realty Trust, Inc. may have provided Cornerstone with plans, reports and other documents prepared by others. First Industrial Realty Trust, Inc. understands that Cornerstone reviewed and relied on the information presented in these documents and cannot be responsible for their accuracy.

Cornerstone prepared this report with the understanding that it is the responsibility of the owner or his representatives to see that the recommendations contained in this report are presented to other members of the design team and incorporated into the project plans and specifications, and that appropriate actions are taken to implement the geotechnical recommendations during construction.

Conclusions and recommendations presented in this report are valid as of the present time for the development as currently planned. Changes in the condition of the property or adjacent properties may occur with the passage of time, whether by natural processes or the acts of other persons. In addition, changes in applicable or appropriate standards may occur through legislation or the broadening of knowledge. Therefore, the conclusions and recommendations presented in this report may be invalidated, wholly or in part, by changes beyond Cornerstone's control. This report should be reviewed by Cornerstone after a period of three (3) years has elapsed from the date of this report. In addition, if the current project design is changed, then Cornerstone must review the proposed changes and provide supplemental recommendations, as needed.

An electronic transmission of this report may also have been issued. While Cornerstone has taken precautions to produce a complete and secure electronic transmission, please check the electronic transmission against the hard copy version for conformity.

Recommendations provided in this report are based on the assumption that Cornerstone will be retained to provide observation and testing services during construction to confirm that conditions are similar to that assumed for design, and to form an opinion as to whether the work has been performed in accordance with the project plans and specifications. If we are not retained for these services, Cornerstone cannot assume any responsibility for any potential claims that may arise during or after construction as a result of misuse or misinterpretation of Cornerstone's report by others. Furthermore, Cornerstone will cease to be the Geotechnical-Engineer-of-Record if we are not retained for these services.

PROJECT NO. 1262-2-1

March 17, 2021 | RSM

APPENDIX A: FIELD INVESTIGATION

The field investigation consisted of a surface reconnaissance and a subsurface exploration program using truck-mounted, hollow-stem auger drilling equipment and 20-ton truck-mounted Cone Penetration Test equipment. Three 8-inch-diameter exploratory borings were drilled on March 1, 2021 to depths of 30 to 40 feet. Four CPT soundings were also performed in accordance with ASTM D 5778-95 (revised, 2002) on February 19, 2021, to depths ranging from 50 to 100 feet. The approximate locations of exploratory borings and CPTs are shown on the Site Plan, Figure 2. The soils encountered were continuously logged in the field by our representative and described in accordance with the Unified Soil Classification System (ASTM D2488). Boring logs, as well as a key to the classification of the soil and bedrock, are included as part of this appendix.

Boring and CPT locations were approximated using existing site boundaries and other site features as references. Boring and CPT elevations were not determined. The locations of the borings and CPTs should be considered accurate only to the degree implied by the method used.

Representative soil samples were obtained from the borings at selected depths. All samples were returned to our laboratory for evaluation and appropriate testing. The standard penetration resistance blow counts were obtained by dropping a 140-pound hammer through a 30-inch free fall. The 2-inch O.D. split-spoon sampler was driven 18 inches and the number of blows was recorded for each 6 inches of penetration (ASTM D1586). 2.5-inch I.D. samples were obtained using a Modified California Sampler driven into the soil with the 140-pound hammer previously described. Relatively undisturbed samples were also obtained with 2.875-inch I.D. Shelby Tube sampler which were hydraulically pushed. Unless otherwise indicated, the blows per foot recorded on the boring log represent the accumulated number of blows required to drive the last 12 inches. The various samplers are denoted at the appropriate depth on the boring logs.

The CPT involved advancing an instrumented cone-tipped probe into the ground while simultaneously recording the resistance at the cone tip (q_c) and along the friction sleeve (f_s) at approximately 5-centimeter intervals. Based on the tip resistance and tip to sleeve ratio (R_f), the CPT classified the soil behavior type and estimated engineering properties of the soil, such as equivalent Standard Penetration Test (SPT) blow count, internal friction angle within sand layers, and undrained shear strength in silts and clays. A pressure transducer behind the tip of the CPT cone measured pore water pressure (u_2). Graphical logs of the CPT data is included as part of this appendix.

Field tests included an evaluation of the unconfined compressive strength of the soil samples using a pocket penetrometer device. The results of these tests are presented on the individual boring logs at the appropriate sample depths.

Attached boring and CPT logs and related information depict subsurface conditions at the locations indicated and on the date designated on the logs. Subsurface conditions at other locations may differ from conditions occurring at these boring and CPT locations. The passage of time may result in altered subsurface conditions due to environmental changes. In addition,

any stratification lines on the logs represent the approximate boundary between soil types and the transition may be gradual.

UNIFIED SOIL CLASSIFICATION (ASTM D-2487-10)

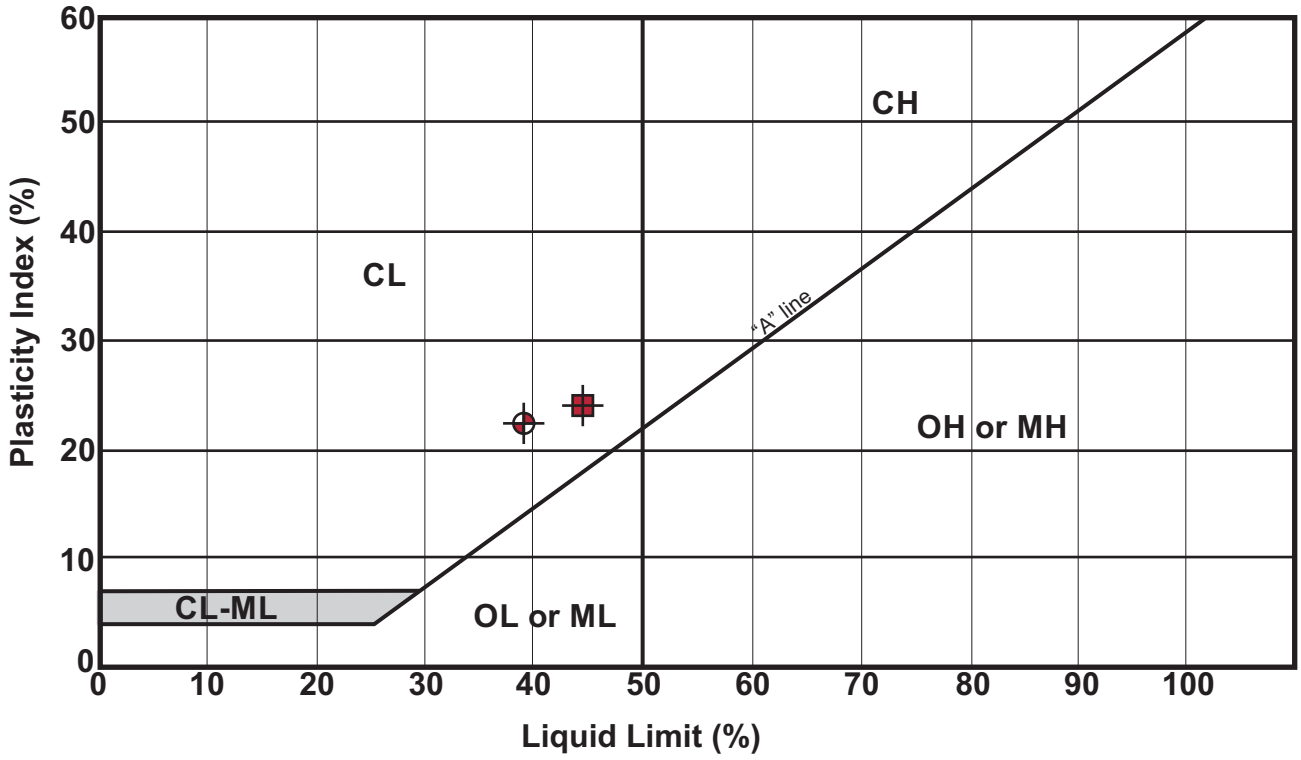
APPENDIX B: LABORATORY TEST PROGRAM

The laboratory testing program was performed to evaluate the physical and mechanical properties of the soils retrieved from the site to aid in verifying soil classification.

Moisture Content: The natural water content was determined (ASTM D2216) on 29 samples of the materials recovered from the borings. These water contents are recorded on the boring logs at the appropriate sample depths.



Dry Densities: In place dry density determinations (ASTM D2937) were performed on 29 samples to measure the unit weight of the subsurface soils. Results of these tests are shown on the boring logs at the appropriate sample depths.

Plasticity Index: Two Plasticity Index determinations (ASTM D4318) were performed on samples of the subsurface soils to measure the range of water contents over which this material exhibits plasticity. The Plasticity Index was used to classify the soil in accordance with the Unified Soil Classification System and to evaluate the soil expansion potential. Results of these tests are shown on the boring logs at the appropriate sample depths.

Consolidation: One consolidation test (ASTM D2435) was performed on a relatively undisturbed sample of the subsurface clayey soils to assist in evaluating the compressibility property of this soil. Results of the consolidation test are presented graphically in this appendix.

Corrosivity Testing: Three samples of the subsurface soils were tested for water soluble sulfate content (ASTM D4327), chloride content (ASTM D4327), pH (ASTM G51), and saturated resistivity (ASTM G57). Results of these tests are attached in this appendix.

Plasticity Index (ASTM D4318) Testing Summary

Symbol	Boring No.	Depth (ft)	Natural Water Content (%)	Liquid Limit (%)	Plastic Limit (%)	Plasticity Index	Passing No. 200 (%)	Group Name (USCS - ASTM D2487)

Executive Summary

First Industrial Realty Trust, Inc. (FIRT, the User) retained Roux Associates, Inc. (Roux) to perform a Phase I Environmental Site Assessment (ESA) of the property located at 14143-14273 Washington Avenue, San Leandro, California 94578, Assessor's Parcel Numbers (APNs) 77B-1222-3-3; 77B-1222-4-3; 77B-1222-5-3; 77B-1222-6-18; 77B-1222-6-17; 77B-1222-6-15; and 77B-1222-6-19 (the Site). Roux performed this Phase I ESA in general accordance with the American Society for Testing Materials (ASTM) *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM E1527-13) in an effort to identify, to the extent feasible, the presence of recognized environmental conditions (RECs) with respect to the Site as defined in ASTM E1527-13. Exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

The Site consists of seven separate and adjoining parcels, provided above, totaling approximately 3.48 acres, located on the west side of Washington Avenue in a predominately commercial/industrial area with a few single-family residences of San Leandro, California. At the time of the Site reconnaissance, the majority of the Site, 14273 Washington Avenue, was vacant. Site improvements include one approximately 6,000 square-foot building (Building A) that contains garage and office space, one approximately 1,000 square-foot building (Building B) formerly used as a recreational vehicle (RV) washing area, two residential structures (addresses 14143 and 14173 Washington Avenue) and several simple metal roof structures located behind 14143 Washington Avenue and utilized for a custom ironworks operation. The elevation of the Site is approximately 39 feet above mean sea level (msl) and is graded to drain at a gentle slope, oriented southeast. Prior to current improvements, the Site was historically developed for residential and possibly limited agricultural use and was then occupied by an equipment rental service and bar/lounge.

On February 9, February 12, and August 11, 2021, Roux visually assessed the Site during the site reconnaissance for potential RECs, including, but not limited to, potential underground storage tanks (USTs), aboveground storage tanks (ASTs), polychlorinated biphenyl (PCB)-containing equipment, hazardous materials storage or handling areas, containerized or bulk wastes, and visual indications of impacted soil.

Roux also performed a records review in an effort to identify RECs in connection with the Site. This records review addressed the Site and surrounding properties. Roux reviewed commercially available records associated with the Site and nearby properties to assess potential concerns associated with the migration of hazardous substances. The records review also included reasonably ascertainable historical data, which can be helpful in identifying the past uses of the Site and surrounding areas, as it may relate to the environmental condition of the Site.

Roux performed interviews and/or file reviews with various government agencies and other parties with possible knowledge of the Site and surrounding properties in an effort to identify current and past uses of the Site and surrounding areas, as they may relate to the environmental condition of the Site.

ASTM E 1527-13 defines a Recognized Environmental Condition (REC) as:

> "The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions."

A Controlled Recognized Environmental Condition (cREC) as:

> "A recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls)."

And a Historical Recognized Environmental Condition (hREC) as:

> "A past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). Before calling the past release a historical recognized environmental condition, the environmental professional must determine whether the past release is a *recognized* environmental condition at the time the Phase I Environmental Site Assessment is conducted (for example, if there has been a change in the regulatory criteria). If the EP considers the past release to be a recognized environmental condition at the time the Phase I ESA is conducted, the condition shall be included in the conclusions section of the report as a recognized environmental condition."

The term recognized environmental condition is not intended to include de minimis conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

This Executive Summary provides a brief overview of the findings of this Phase I ESA. Although the Executive Summary is an integral part of a report, it does not substitute for reading the entire report or the appended or referenced documents in order to fully understand the findings and potential environmental concerns associated with the Site.

Roux did not identify known or suspected RECs or cRECs in connection with the current and historical operations at the Site.

Based on the information obtained through the performance of this ESA, as well as March 2021 Limited Phase II Subsurface Investigation (Appendix H) activities, Roux identified the following hRECs in connection with the current and historical operations at the Site or adjacent properties. To the extent possible, the locations of the hRECs are shown in Figure 2. To avoid confusion, all RECs, and hRECs are numbered sequentially.

hREC 1 – Custom Ironwork Facility. Located in the western half of Parcel 1, at the address 14143-A Washington Avenue, is the facility Zermeno's Custom Ironworks (Building E on Figure 2). Consisting of several simple metal structures, this facility primarily produces iron gates and fences. According to Mr. Al Zermano, owner and resident at 14143 Washington Avenue, he has been conducting ironwork at the Site for over 20 years. The flooring, both inside and outside the buildings, consisted of a combination of concrete flooring and bare soil. Roux observed miscellaneous paints, cleaners, and lubricating/cutting

oils, all in consumer commodity sized containers throughout the facility. Housekeeping was observed to be generally poor in regard to secondary containment and proper storage of chemicals. Also observed were multiple saws, compressed air cylinders of various sizes, cables, multiple inactive compressors, stock metal, and other miscellaneous tools and equipment. Considering the long term (20+ years) operation that has likely included the storage and use of lubricants, oils, paints and potential solvents, in addition to the relatively poor housekeeping, bare soil, drum storage, vehicle storage and maintenance, this facility was determined to pose a potential concern in relation to the Site. The March 2021 Limited Phase II Subsurface Investigation addressed this area and the data did not indicate subsurface contamination resulting from this item; therefore, this facility is considered an hREC in the context of this Phase I ESA

hREC 2 – Oil-water Separator. Roux observed a below-ground oil-water separator located south of Building B. It is estimated that this feature was installed along with Building B around 2007. Wastewater from the former wash station in Building B likely entered a floor drain in the wash bay and was discharged into the oil-water separator prior to being discharged into the municipal sewer system. The oil-water separator was not opened for inspection at the time of the Site reconnaissance and no significant staining was observed around the feature. Historical waste fluids including motor vehicle fuels, new and used engine oil, hydraulic oil, coolant, battery acid, power steering fluid, and other fluids may have been discharged into the oil-water separator during washing activities. Wastewater processed in the oil-water separator would potentially be impacted with petroleum-related products and volatile organic compounds (VOCs), and therefore there is a reasonable likelihood that a release could have occurred. The March 2021 Limited Phase II Subsurface Investigation addressed this area and did not indicate subsurface contamination resulting from this item; therefore, this facility is considered an hREC in the context of this Phase I ESA

hREC 3 – Former UST without Regulatory Closure. Of the four former USTs known to have existed on Site, reviewed records indicated that three of the four USTs received regulatory closure. One UST, a reported 550-gallon waste oil tank located along the southern boundary behind Building A, was removed in 1998 under the oversight of the San Leandro Fire Department (SLFD). Confirmation soil samples from this excavation were non-detect for TPH, BTEX, MTBE and halogenated VOCs and below applicable screening levels for metals. Roux did not review a formal closure letter from the SLFD or the San Francisco Bay Regional Water Quality Control Board (SFB RWQCB) for this tank; however, the Underground Tank Removal letter prepared by Quarle stated that the confirmation soil results were faxed to Mr. Carl Buche of the SLFD and, “Mr. Buche gave verbal authorization for the excavation to be backfilled” (Quarle, 1998). The March 2021 Limited Phase II Subsurface Investigation addressed this area and did not indicate subsurface contamination resulting from this item; therefore, this facility is considered an hREC in the context of this Phase I ESA

hREC 4 – Former USTs with Regulatory Closure. Three USTs, including two 1,000-gallon diesel tanks and one 5,000-gallon gasoline tank, were removed from the Site in 1991 and 1992. These USTs were utilized by the former San Leandro and United Rentals operations, likely to fill rental equipment and fleet vehicles. Historical records reviewed showed that these three USTs, referred to as Tanks #1, #2 and #3 in this Report, were removed under the oversight of the SLFD, and subsequently received regulatory closure from the SLFD and the SFB RWQCB in 1997. Upon removal of Tank #1 in 1991, contaminated soil was excavated to a depth of about 20 feet bgs and confirmation soil samples from the floor of this excavation detected TPH-d at concentrations up to 1,000 ppm. Following removal of Tanks #2 and #3 and a former pipeline trench in 1992, confirmation soil samples were generally non-detectable, with the

exception of TPH-d at 460 ppm from a location in the pipeline trench adjacent to former location of Tank #1. As a result of this detection, additional excavation activities were conducted around the former Tank #1 area in 1992. The excavation reached the size of approximately 50 by 70 feet. The depth of this excavation is unknown. Final soil samples from this excavation sidewall detected TPH-g and TPH-d at concentrations up to 100 ppm and 1,300 ppm, respectively. The excavation was then backfilled. A soil and groundwater investigation conducted by ALLCAL in 1997 around the areas of these former USTs concluded that, "the results of this investigation suggest there are no significant soil or groundwater BTEX plumes at the subject site, if any". This report noted that there were residual concentrations of TPH-g and TPH-d of 100 ppm and 1,300 ppm, respectively, and TPH-d was detected in groundwater at a maximum concentration of 2,800 ppb (ALLCAL, 1997). This investigation resulted in Site closure by the City of San Leandro and then the SFB RWQCB. Additionally, the March 2021 Limited Phase II Subsurface Investigation did not indicate subsurface contamination resulting from these facilities; therefore, this facility is considered an hREC in the context of this Phase I ESA.

The term recognized environmental condition is not intended to include de minimis conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

Roux conducted a Limited Phase II Subsurface Investigation for FIRT in March 2021 to investigate concerns identified in the initial Site walk and document review related to this Phase I ESA. The results of the Limited Phase II Subsurface Investigation did not identify conditions directly related to the concerns that indicate significant subsurface contamination resulting from these facilities. The ACM and other regulated materials survey identified building materials in all structures on Site that should be properly addressed by appropriately qualified professionals prior to renovation or demolition activities. The Limited Phase II Subsurface Investigation Report is included in Appendix H.

1. Introduction

Roux Associates, Inc. (Roux) completed this Phase I Environmental Site Assessment (ESA) of the commercial property located at 14143-14273 Washington Avenue, San Leandro, California 94578 (the Site). The Site location is shown in Figure 1 and the Site and vicinity is shown in Figure 2. Roux performed this Phase I ESA in compliance with the scope and limitations of American Society for Testing Materials (ASTM) E1527-13 and the terms and conditions of Roux' proposal dated January 29, 2021. Roux conducted this Phase I ESA for the benefit of First Industrial Realty Trust, Inc. (FIRT, the User).

The following sections of this report present our Phase I ESA findings and conclusions. A glossary containing terms and definitions presented in ASTM E1527-13 is included in Appendix A – Glossary of Terms. Other appendices presented at the end of the report include historical topographic maps, historical aerial photographs, regulatory records review documentation, applicable historical records, and personnel qualifications.

1.1 Purpose

The purpose of this Phase I ESA is to identify and report, to the extent feasible, recognized environmental conditions (RECs) with respect to the Site. Performing a Phase I ESA in general compliance with ASTM E 1527-13 may enable a User to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) liability. That is, the practice that constitutes one of the requirements for "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined in 42 USC Section 9601(35) (B).

1.2 Scope of Services

The scope of services for this Phase I ESA included, but was not limited to, the activities listed below.

- A review of reasonably ascertainable and practicably reviewable topographic maps, historical aerial photographs, and city directories, if available, to investigate past Site conditions;
- A review of specific government lists pursuant to ASTM Standard E 1527-13 regarding environmental activities for the Site and local area properties;
- A review of recorded land title records, building, assessors, and fire department records, for permits, citations, and reports connected to the Site that were reasonably ascertainable, practicably reviewable, and publicly available within reasonable time and cost;
- An inspection by an environmental professional to investigate the current use of the Site and to identify environmental concerns including but not limited to, the presence of hazardous substances or petroleum products, wastes, underground storage tanks (USTs), aboveground storage tanks (ASTs), or other environmental concerns;
- Interviews with available representatives of the owner of the Site, occupants, and local government officials by an environmental professional; and
- Preparation of this Phase I ESA report.

Roux initiated this Phase I ESA pursuant to receipt of written authorization to proceed on February 1, 2021 and authorization to complete the Phase I ESA update on August 4, 2021.

1.3 Standard of Care

Roux conducted this Phase I ESA using a defined scope of services considered appropriate and agreed upon by all parties on the date the service was authorized, unless the scope of services or the methods used were later modified, in writing, and accepted by all parties prior to performance. Roux conducted this Phase I ESA in accordance with generally accepted practices in a manner consistent with that level of care exercised by other members of our profession in the same locality and under similar conditions of time and accessibility of improvements and information. No other representations, expressed or implied, and no warranty or guarantee is included or intended to be part of this Phase I ESA.

Please note that the scope of services performed in execution of this assessment may not be appropriate to satisfy the needs of other parties. We, therefore, are not responsible for independent conclusions, opinions, or recommendations of others based on our assessment. Furthermore, this Phase I ESA relates to the environmental conditions of the Site and does not address issues raised in transactions such as business risk, purchase of business entities, or interests therein, or of their assets, that may well involve environmental liabilities pertaining to properties previously owned or operated or other offsite liabilities.

Additionally, the findings of this Phase I ESA are based on Roux' observations, inquiries, and historical research using reasonably ascertainable and practically reviewable information obtained within reasonable time and cost constraints. Roux does not represent that this Phase I ESA is an exhaustive investigation that reflects the findings of all of the information available for the Site, nor is it representative of future Site conditions. If additional information is generated from the Site, it should be provided to Roux so that we may evaluate its impact on our conclusions. As such, activities or episodes that transpire subsequent to this Phase I ESA are not considered in this assessment. It is not intended that a Phase I ESA in accordance with ASTM E1527-13 be an exhaustive assessment of a property nor can it wholly eliminate uncertainty regarding the potential for *recognized environmental conditions* in connection with a property.

1.4 Assumptions

This Phase I ESA Report, including the exhibits attached hereto, describes the results of Roux' investigation to identify the presence of *recognized environmental conditions* connected with the Site in accordance with ASTM E1527-13, as allowed by and consistent with the regulatory requirements of the All Appropriate Inquiry Rule, 40 CFR Part 312, Amendment to Standards and Practices for All Appropriate Inquires Under CERCLA, Final Rule, published December 30, 2013 (AAI Rule). Specifically, the preamble to the amended AAI Rule states:

> *The Environmental Protection Agency (EPA) today is taking final action to amend the standards and practices for conducting all appropriate inquiries under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) to reference a standard practice recently made available by ASTM International, a widely recognized standards development organization. Specifically, this final rule amends the ''All Appropriate Inquiries Rule'' at 40 CFR Part 312 to reference ASTM International's E1527–13 ''Standard Practice for Environmental Site Assessments: Phase I Environmental Site*

Assessment Process'' and make clear that persons conducting all appropriate inquiries may use the procedures included in this standard to comply with the All Appropriate Inquiries Rule[1].

One of the requirements that a person acquiring real property must meet in order to qualify for either the innocent landowner, contiguous owner, or bona fide prospective purchaser (collectively hereinafter "Prospective Purchaser") defense to liability under the federal Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended by the Superfund Amendments and Reauthorization Act of 1986, and the Small Business Liability Relief and Brownfields' Revitalization Act of 2002, 42 U.S.C. 9601-9675 (collectively referred to hereafter as "CERCLA") is that person must conduct all appropriate inquiries into the previous ownership and uses of the property in conformance with the AAI Rule (or the ASTM E1527-13) prior to acquisition of the property. The User has acknowledged that, under the AAI Rule, Roux' performance of this Phase I ESA in accordance with ASTM E1527-13 will not alone result in the User satisfying all requirements of the AAI Rule and will not in itself provide a defense to CERCLA liability. The User has acknowledged that the AAI Rule also requires that the Prospective Purchaser undertake certain additional inquiries and post-acquisition activities to satisfy the CERCLA AAI requirements. Accordingly, Roux makes no guarantees or warranties, expressed or implied, regarding this Phase I ESA, including without limitation, that this Phase I ESA will qualify the User for a defense to CERCLA liability.

Roux has performed this Phase I ESA in a professional manner using that degree of skill and care exercised for similar projects under similar conditions by reputable and competent environmental consultants. Professional judgments expressed herein are based on the facts currently available to Roux.

The AAI Rule requires, and the conclusions and recommendations stated herein represent, the application of a variety of engineering and technical disciplines to material facts and conditions associated with the Site. As such, these conclusions and recommendations are based on subjective interpretations and the exercise of discretion based on the facts available to Roux and conditions at the time of the performance of this Phase I ESA. Many of these facts and conditions are subject to change over time. Accordingly, the conclusions and recommendations must be considered within this context.

The User has agreed that Roux shall not be responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time this Phase I ESA was performed. To the extent practicable, Roux has identified data gaps, and has evaluated the potential significance of such data gaps. Recommendations to address those data gaps are presented herein and are based on the data available at the time of the performance of this Phase I ESA. Implementation of the recommendations may not fully address the data gaps, and the information obtained from execution of those recommendations may alter and/or modify the interpretation of the Site conditions and conclusions, herein. This Phase I ESA does not include consideration of matters specifically excluded by ASTM E1527-13, including but not limited to, asbestos-containing building materials, radon, lead-based paint, lead in drinking water, wetlands, regulatory compliance, and mold unless specifically identified herein.

Roux has not collected any soil and/or groundwater samples on the Site for Phase I purposes, and is relying on information presented by others, often in preliminary, draft, or verbal form. By referencing this information, Roux does not accept responsibility for the accuracy of the underlying data, sampling methods, laboratory analysis, or documentation.

This Phase I ESA Report should not be considered a legal interpretation of existing environmental laws and regulations. This Phase I ESA was conducted with a reasonable degree of inquiry to identify *recognized environmental conditions*, but uncertainty is not eliminated. No Phase I ESA can wholly eliminate uncertainty regarding the potential for *recognized environmental conditions* in connection with a property. The Phase I ESA process is intended to reduce, but not eliminate, the uncertainty involved with identifying *recognized environmental conditions*.

This Phase I ESA Report is not an appraisal or value judgment of the Site. The User has agreed that Roux shall not be liable for any use of this Phase I ESA Report as an appraisal or value judgment of the Site.

This Phase I ESA Report has been prepared for the exclusive use of the User for specific application to the Site covered by this Phase I ESA Report. The User has agreed that any third-party use of this Phase I ESA Report, upon disclosure by the User, is the sole responsibility and at the sole liability of the User.

1.5 User Reliance
