Public Records Request Number: 5-051823-01
Location(s): 2909 Houghton Road, Bakersfield, California 93313

Dear Requestor:

On May 18, 2023 the Department of Toxic Substances Control (DTSC) received your email of May 18, 2023 requesting records under the Public Records Act. After a thorough review of our files, no site records were found pertaining to the sites/facilities referenced above.

A large number of our records are available on EnviroStor, an online database that provides non-confidential, public access to DTSCs data management system. It tracks our cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities and sites with known or suspected contamination issues. EnviroStor is available 24/7, 365 days a year. The data reflects the latest updates as they are entered in the system. Access it from your computer or smartphone, the local library – anywhere Internet access is available. Just go to www.envirostor.dtsc.ca.gov. You'll find a step-by-step tour of EnviroStor under the "How to Use EnviroStor" menu on the website.

If you have any questions or would like further information regarding your request, please contact me at 559-578-8175 or via email at ClovisFileRoom@dtsc.ca.gov.

Sincerely,
Shelly Combs

Subject: 2909 Houghton Rd., Bakersfield

Good Afternoon Shannon,

We've located records for 2909 Houghton Rd, however, the only records we have are an inspection report and a liquid petroleum gas tank permit. The fee to obtain these records is $70.00. We accept check or money order. If you would like a copy of these records please make your payment out to the Kern County Fire Department and mail it to:

Kern County Fire Department
ATTN: Records
5642 Victor St.
Bakersfield, CA 93308

Once the payment has been received the records can be emailed and your receipt will be mailed back.

Please let me know if you have any questions.

Thank you,

Sylvia Ahumada

From: CALFIRE PRA Records Center <calfire@govqa.us>
Sent: Thursday, May 18, 2023 1:29 PM
To: shannon environmentalsupportservices.com
Subject: Public Records Request :: R008117-051823

RE: PUBLIC RECORDS REQUEST of 5/18/2023, Reference # R008117-051823

Dear Shannon Castagno,
Thank you for your interest in public records of CAL FIRE. Your request has been received and is being processed in accordance with the California Public Records Act, Government Code section 6250 et seq. Your request was received on May 18, 2023 and given the reference number R008117-051823 for tracking purposes.

Records Requested: Site: 2909 Houghton Road, Bakersfield, CA 93313, APN 18439108. ESS requests the following information concerning the subject site which your agency may have on file: 1. utilization, manufacture, storage, or discharge of hazardous materials/waste. 2. previous or on-going site investigations/remediations pertaining to hazardous materials/waste. 3. hazardous materials disclosures concerning the site. 4. pipelines. 5. information regarding underground storage tank present or previously found at the site. 6. Reportable Spills, Releases, Notices of Violations (NOVs) and any Environmental Reportable Issues.

Your request will be forwarded to the relevant CAL FIRE department(s) to locate the information you seek and to determine the volume and any costs that may be associated with satisfying your request. You will be contacted about the availability and/or provided with copies of the records in question. PLEASE NOTE: The California Public Records Act does not require a governmental body to create new information, to do legal research, or to answer questions.

You can monitor the progress of your request at the link below and you'll receive an email when your request has been completed.

--- Please respond above this line ---

RE: PUBLIC RECORDS REQUEST of May 18, 2023, Reference # R008117-051823.

Dear Shannon Castagno,

CAL FIRE received a California Public Records Act (CPRA) request from you on May 18, 2023. Your request mentioned:

"Site: 2909 Houghton Road, Bakersfield, CA 93313, APN 18439108. ESS requests the following information concerning the subject site which your agency may have on file: 1. utilization, manufacture, storage, or discharge of hazardous materials/waste. 2. previous or on-going site investigations/remediations pertaining to hazardous materials/waste. 3. hazardous materials disclosures concerning the site. 4. pipelines. 5. information regarding underground storage tank present or previously found at the site. 6. Reportable Spills, Releases, Notices of Violations (NOVs) and any Environmental Reportable Issues."

CAL FIRE has reviewed its files and has located responsive records to your request. Please log in to the CAL FIRE PRA Records Center at the following link to retrieve the appropriate responsive documents.

Public Records Request - R008117-051823

Please note some information has been redacted pursuant to Government Code sections 7927.700 and 7927.705, which incorporates an individual's right to privacy under the California Constitution (Cal. Const., art. I, 1) and the Information Practices Act of 1977 (Civ Code 1798 et seq.).

We recommend that you visit the California Regulated Site Portal at https://siteportal.calepa.ca.gov/nsite/map/help.

Information on facilities or locations/areas that have been reported to the State Warning Center for hazardous materials spills or releases may be found on the Governor' s Office of Emergency Services (Cal OES) HazMat Spill Release Reporting Database (https://w3.calema.ca.gov/operational/malhaz.nsf/$defaultview).

To search for nearby pipelines please visit: https://www.npms.phmsa.dot.gov/.

To search for open fire code violations please submit a records request with your local jurisdiction.

If you have any questions or need additional information, you can manage your request through the CAL FIRE PRA Records Center.

Sincerely,
Ashley Bradley
PRA Analyst
Sacramento - HQ - Legal Office

Subject: PRA Request #697
Attachments: Outlook-vrzlcfxj; RR#697_5-18-2023_ESS (1).pdf; PRA_697_ILRP_Data.xlsx

In regard to your request for information for the parcels listed below:

Site: 2909 Houghton Road
Bakersfield, CA 93313
APN 18439108

This property is farmed commercially and is subject to regulation under the Central Valley Water Board's Irrigated Lands Regulatory Program (ILRP) General Order R5-2013-0120-09. The property is currently enrolled (Member ID# 10653) with the Kern River Watershed Coalition Authority which is an intermediary between commercial farmers and the Central Valley Water Board.

Central Valley Water Board staff have identified the following information which may be responsive:

(1) Member enrollment information from the referenced Coalition's annual Membership List submittal (see attached).

Groundwater quality data, if available, can be accessed via the GeoTracker portal (https://geotracker.waterboards.ca.gov/). In the GeoTracker Map, select "choose more sites" from the map legend, and then choose permitted facilities, then select Irrigated Lands Regulatory Program Sites. For assistance please contact Ryan West (contact information below).

Thank you,

1 INTRODUCTION

1.1 PROJECT DESCRIPTION

Kimley-Horn has been retained to prepare a Drainage Study for the proposed Project Ware Malcomb ("Project"). The report was prepared for the proposed ±629,186 square-foot warehouse and distribution facility, comprised of loading docks, truck courtyard, associate parking, landscape and stormwater Best Management Practices (BMPs) over the ±93.74-acre onsite project site area (overall project is 99.28 acres which consists of 5.54 acres of right-of-way dedication) .

1.2 PROJECT LOCATION

The Project site is located southeast of the intersection of Houghton Road and Wible Road in an unincorporated area of Kern County, California (APN 184-391-08). The site is currently agricultural farmland and is bordered on the northwest by a neighboring agricultural property, on the north by Houghton Road, on the east and south by private unpaved roads, and on the west by Wible Road.

See the vicinity map in **Appendix A.**

2 DESIGN CRITERIA

2.1 METHODOLOGY

The purpose of the report is to demonstrate the Project's compliance with the *Kern County Hydrology Manual* and *Kern County Public Works Division Four: Standards for Drainage*. Hydrologic analysis will be used to determine if the development's stormwater generation will have any impact on downstream properties, and appropriate stormwater facilities for mitigation.

A rational method analysis for the 100-year storm event will be used to calculate peak discharges for the existing and proposed conditions. Multiday rainfall mass ratios for this storm event will factor into the onsite underground and surface basins designed to mitigate peak flows and infiltrate design volumes per County guidance.

The following subsections, include but are not limited to, the referenced design standards for the basis of design calculations:

a) Rational Method (Peak Flow)

a. Q = CiA

Q = Peak Discharge in cfs
C = Runoff Coefficient
i = Precipitation Intensity for the 100-year, 5-min rainfall in in/hr.
A = Drainage Area in acres

b) 407-1.01 Closed Conduit Design Storm

a. 10-year storm

c) 407-1.06 Closed Conduit Minimum Cover

a. 24-inches onsite
b. 30-inches within street right-of-way

d) 407-1.09 Closed Conduit Minimum Slope

a. 0.001 (0.1%) unless otherwise approved by the Director

e) 407-4.01 Manhole Spacing

a. 300-feet for conduit 30-inches or less in diameter
b. 400-feet for conduit 30 to 48-inch in diameter
c. 500-feet for conduit 48-inch or more in diameter

f) 408-1 Basin Design Volume

a. $V = 0.12 \times D_{10} \times a_i \times A$

V = Runoff Volume
D_{10} = 10-year, 24-hr depth of rainfall in inches
a_i = Average percentage of impervious area
A = Drainage area of total development
0.12 = 1.44 x 1/12
1.44 = 5-day mass ratio (Kern County Hydrology Manual, Table B-1)
1/12 = Conversion from rainfall depth in inches to feet

g) 408-2 Hydraulic Design

a. Storm drain HGL line calculations shall assume that 50% of the design storm volume and 100% of the nuisance volume is in the basin when peak flows occur.

h) 408-3 Basin Freeboard

a. Freeboard required for design water depths exceeding 18-inches
b. 6-inch of freeboard required for design depth of 4-feet or less
c. 12-inches of freeboard required for design depth of 4-feet or more

i) 408-5 Basin Access

a. Access ramps required for design depths exceeding 18-inches
b. 12-foot-wide minimum ramp
c. 15% maximum slope. Exception – 20% maximum slope increase for ponding depth 4-feet or less

Hydrology and Hydraulic calculations were performed using Microsoft Excel and Bentley StormCAD. StormCAD is a program that utilizes the Rational Method to calculate peak flows and volumes based on a variety of parameters such as drainage area, flow length, flow slope, time of concentration, rainfall depth and design storm intensities.

2.2 PRECIPITATION

According to the *Kern County Hydrology Manual*, drainage reports shall use NOAA Atlas 2 data for hydrologic calculations. Kern County released Engineering Bulletins 11-01 and 11-02 to amend the hydrology manual to reference precipitation data from NOAA Atlas 14. The current data for site-specific point-precipitation depths and intensities will be taken from NOAA Atlas 14.

See additional tabular output precipitation data in **Appendix B.**

2.3 SOIL TYPES

The type of soil and soil conditions are major factors affecting infiltration and resultant storm water runoff. The Natural Resources Conservation Service (NRCS) has classified soils into four general hydrologic soil groups for comparing infiltration and runoff rates. The groups are based on properties that influence runoff, such as water infiltration rate, texture, natural discharge and moisture condition. The runoff potential is

based on the amount of runoff at the end of a long duration storm that occurs after wetting and swelling of the soil not protected by vegetation. Using the NRCS Web Soil Survey online tool, this site was identified as 73.0% Bakersfield fine sandy loam and 27.0% Vineland loamy sand. These soils are classified as Hydrologic Soil Group B, soils that have a moderate infiltration rate when thoroughly wet and have a moderate rate of water transmission.

See **Appendix D** for NRCS soil type classifications.

Additional site-specific soil characteristics have been outlined in the *Geotechnical Evaluation Warehouse Facility Project*, performed by Ninyo & Moore, dated September 15, 2021. Infiltration testing will be performed to identify accurate infiltration characteristics and will be provided during final design.

See **Appendix E** for Geotechnical Report and Infiltration Study.

2.4 GROUNDWATER

According the geotechnical investigation, borings ranging from 11.5 to 51.5 feet deep did not encounter any groundwater during the time of drilling. Data from the State of California Water Resources Board's GeoTracker website indicates that groundwater monitoring wells located 2.2 miles and 3.2 miles from the site show groundwater levels at 22.5 to 34-feet and 141 to 145-feet below ground, respectively. It is assumed that groundwater will not be a concern.

2.5 FEMA MAPPING

Research into the Federal Emergency Management Agency (FEMA) show the project site is covered by Map Number 06029C2725E of the FEMA Flood Insurance Rate Map (FIRM) for Kern County, California and Incorporated Areas. The project is within Zone X as defined by FEMA as area determined to be outside the 100-year flood. No portion of the site is located within the Special Flood Hazard Area (SFHA) inundated by the 100-year flood.

See **Appendix F** for the effective FEMA map is dated September 26, 2008.

3 EXISTING ONSITE DRAINAGE CONDITIONS

The Project site is a maintained agricultural area that is used to grow and harvest crops. At an elevation around 335-feet, the topography of the site generally flows from northeast to southwest with an average slope of 0.3%. Surface runoff flows toward dirt ditches bordering the site along the unpaved private roads, and along public Houghton Road and Wible Road. There is no municipal drainage infrastructure within the public right-of-way for the project area to discharge. Irrigation channels between the lot and bordering dirt roads are used to capture and reuse irrigation water from agricultural wells outside the Project boundary.

See **Appendix B** for Existing Drainage Exhibit.

4 PROPOSED ONSITE DRAINAGE CONDITIONS

The proposed Project conditions will divide the site into three (3) drainage management areas (DMAs). The three DMAs will outfall into respective surface retention basins (Basins A, B, and C). Stormwater runoff will sheet flow across pavement and landscape into various inlets and storm drain networks throughout the site.

The building roof is divided specific to plumbing conduits. Roof runoff is captured via roof drains/downspouts and conveyed underground to connect to the overall storm drainage system.

See **Appendix B** for Proposed Drainage Exhibit.

Hydrologic Analysis

The Rational Method is used to calculate conservative peak flow rates. Runoff coefficient values for pervious and impervious surfaces are 0.3 and 0.9, respectively. Precipitation intensity of 2.89-inches per hour is used for the 100-year, 5-minute storm event.

Design volumes are calculated using the runoff volume equation in the *Kern County Standards for Drainage* based on the multiday Intermediate Storm Design Discharge (ISDD). Although, the ISDD is a function of the 10-year storm event, the 100-year storm depth will be used for redundancy. See **Table 1** for a summary of the design volume results.

Table 1 Summary of Hydrologic Analysis

Drainage Management Areas	Area, A (ac)	*Peak Discharge, Q (cfs) 100 Year	Design Volume, V (ac-ft) 100 Year
BASIN A	26.78	69.64	8.80
BASIN B	49.16	127.86	16.80
BASIN C	17.80	46.29	5.85
TOTAL	**93.73**	**243.79**	**31.45**

(*) denotes peak flows that were calculated via Rational Method. Intensity of 2.89 in/hr for the 100-year, 5-minute storm event, C=0.3 for pervious surfaces, and C=0.9 for impervious surfaces. Refer to **Appendix B** for individual subbasin peak flows.

Hydraulic design

The hydraulic calculations will utilize rational method calculations to determine peak flows for the 100-year storm event. StormCAD will be used to model the Hydraulic Grade Line (HGL) based on Section 408-2 outlined above. Inlet sizing, pipe sizing, and pipe hydraulics will be provided during final design. It is anticipated that storm drain laterals will be sized with 4 to 18-inch pipe, while mains will range from 18 to 48-inches in diameter. The schematic horizontal configuration is provided in the attached storm drain plans.

See **Appendix G** for Storm Drain Plans.

5 MAINTENANCE

Seefried Industrial Properties, Inc. will be responsible for operation and maintenance of all proposed storm drain pipes and inlets, surface basins, and dry wells, until such time that the buildings are sold or leased.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Kern County, California, Southwest Part
Survey Area Data: Version 13, Sep 1, 2022

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Mar 12, 2022—Oct 25, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
101	Bakersfield fine sandy loam, drained, 0 to 1 percent slopes	B	68.5	73.0%
310	Vineland loamy sand, drained, 0 to 1 percent slopes	B	25.4	27.0%
Totals for Area of Interest			**93.9**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Kern County, California, Southwest Part
Survey Area Data: Version 13, Sep 1, 2022

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Mar 12, 2022—Oct 25, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Saturated Hydraulic Conductivity (Ksat), Standard Classes

Map unit symbol	Map unit name	Rating (micrometers per second)	Acres in AOI	Percent of AOI
101	Bakersfield fine sandy loam, drained, 0 to 1 percent slopes	24.9098	68.5	73.0%
310	Vineland loamy sand, drained, 0 to 1 percent slopes	154.6516	25.4	27.0%
Totals for Area of Interest			**93.9**	**100.0%**

Description

Saturated hydraulic conductivity (Ksat) refers to the ease with which pores in a saturated soil transmit water. The estimates are expressed in terms of micrometers per second. They are based on soil characteristics observed in the field, particularly structure, porosity, and texture. Saturated hydraulic conductivity is considered in the design of soil drainage systems and septic tank absorption fields.

For each soil layer, this attribute is actually recorded as three separate values in the database. A low value and a high value indicate the range of this attribute for the soil component. A "representative" value indicates the expected value of this attribute for the component. For this soil property, only the representative value is used.

The numeric Ksat values have been grouped according to standard Ksat class limits. The classes are:

Very low: 0.00 to 0.01

Low: 0.01 to 0.1

Moderately low: 0.1 to 1.0

Moderately high: 1 to 10

High: 10 to 100

Very high: 100 to 705

1 INTRODUCTION

In accordance with your request and authorization, we have performed a geotechnical evaluation for the proposed warehouse facility to be located at Wible Road and Houghton Road in Kern County, California (Figure 1). The purpose of our study was to evaluate the soil and geologic conditions at the project site in order to provide geotechnical recommendations for the design and construction of the project. This report presents our findings, conclusions, and recommendations for design and construction of the proposed improvements.

2 SCOPE OF SERVICES

Our scope of services included the following:

- Project coordination, planning, and scheduling of the subsurface exploration.
- Review of readily available background materials, including published geologic maps and literature, in-house information, aerial photographs, and plans provided by the client.
- Site reconnaissance to observe the general site conditions, mark the proposed boring locations, and coordinate with Underground Service Alert for utility clearance.
- Acquisition of an encroachment permit from the County of Kern Public Works Department, Building and Development Division, for drilling borings within the County Right-of-Way on Houghton Road and Wible Road.
- Subsurface exploration consisting of drilling, logging, and sampling of eighteen small-diameter, hollow-stem auger borings to depths of up to approximately 51.5 feet below the existing ground surface. The borings were logged by a representative of our firm and relatively undisturbed and bulk soil samples were collected at selected intervals for laboratory testing.
- Laboratory testing of representative soil samples. Laboratory tests included evaluation of in-situ moisture content and dry density, percentage of particles finer than the No. 200 sieve, consolidation characteristics, direct shear strength, Proctor density and optimum moisture content, R-value, and soil corrosivity.
- Data compilation and engineering analysis of the information obtained from our background review, subsurface exploration, and laboratory testing.
- Preparation of this report presenting our findings, conclusions, and geotechnical recommendations pertaining to the geotechnical aspects of the design and construction of the proposed improvements.

3 SITE DESCRIPTION

The site is located southeast of the intersection of Houghton Road and Wible Road in an unincorporated area of Kern County, approximately 1.5 miles south of the city limits of Bakersfield, California (Figure 1). The site consists of an approximately 66 acres of currently undeveloped

land formerly used for agricultural purposes. The site is bounded on the northwest corner by another agricultural property, on the north by Houghton Road, on the west by Wible Road, and on the south and east by unpaved roads and agricultural properties. The existing ground surface at the site is tilled and covered with scattered dry grasses, hay, and/or old crop. Topographically, the project site is relatively flat with a ground surface elevation of approximately 330 feet above mean sea level (United States Geological Survey [USGS], 2018a).

4 PROPOSED CONSTRUCTION

The project consists of the design and construction of a new warehouse facility and includes upgraded pavement sections for approximately 0.6 miles of Wible Road and approximately 1.3 miles of Houghton Road (Figures 2 and 3). The new facility will include a single-story tilt-up warehouse building with a footprint area of approximately 601,795 square feet and office space with an area of approximately 33,017 square feet. Large asphalt concrete-paved loading and parking areas will be located around the perimeter of the building (Ware Malcomb, 2021). The new warehouse will also include approximately 53 loading dock spaces on the north and east sides of the building. The paved parking areas will include approximately 292 trailer parking stalls on the north and east sides of the facility and approximately 1,797 associate parking stalls on the west and south sides of the facility. Additional site improvements include a relatively large storm water detention basin, proposed to be located on the northeast corner of the site and new roads on the south and east side of the facility (Ware Malcomb, 2021). Grading for the project will generally include remedial grading, relatively shallow excavations for foundation and floor slab preparation, and utility installation via cut-and-cover trenching.

5 SUBSURFACE EVALUATION AND LABORATORY TESTING

Our subsurface exploration was performed on July 14, July 15, August 10, and August 11, 2021, and consisted of drilling, logging, and sampling of eighteen small-diameter borings using a truck-mounted drill rig with 8-inch-diameter hollow-stem augers to depths ranging from approximately 11.5 to 51.5 feet below the ground surface. The approximate locations of the exploratory borings are shown on Figures 2 and 3. The borings were logged by a representative from our firm. Bulk and relatively undisturbed soil samples were obtained at selected depths for laboratory testing. The borings within the site boundary were backfilled with onsite soil, the borings within County streets were backfilled and patched per the encroachment permit from the County of Kern Public Works Department, Building and Development Division requirements. The logs of the exploratory borings are presented in Appendix A.

Laboratory testing was performed on representative samples to evaluate in-situ moisture content and dry density, percentage of particles finer than the No. 200 sieve, consolidation characteristics, direct shear strength, Proctor density, R-value, and corrosivity. The results of the in-situ moisture content and dry density tests are presented on the boring logs in Appendix A. The remaining laboratory test results are presented in Appendix B.

6 GEOLOGY AND SUBSURFACE CONDITIONS

6.1 Regional Geology

The project site is located on a broad, relatively flat southern portion of the Great Valley Geomorphic Province (Norris and Webb, 1990). The Great Valley extends nearly 500 miles north and south, separating the Sierra Nevada from the Coast Ranges by an average of 40 miles. The Great Valley surficial deposits generally consists of alluvial, flood, and delta plains of the Sacramento and San Joaquin Rivers and their tributaries. The Great Valley is divided into a northern segment, the Sacramento Valley, and a southern segment, the San Joaquin Valley. The project site, located within southern portion of the San Joaquin Valley, is underlain by silt, sand, and gravel alluvial fan deposits which are in turn underlain by a thick sedimentary sequence (Norris and Webb, 1990). Geologic mapping by Smith (1964) indicates that the site is underlain by Quaternary-aged alluvial fan deposits (Figure 4).

6.2 Subsurface Conditions

Materials encountered during our subsurface exploration consisted of asphalt concrete (AC) pavement sections underlain by shallow fill soils and alluvium. Pavement was encountered at borings B-1 through B-5 and B-14. Borings B-6 through B-13 and B-15 through B-18 were located on unpaved surfaces. The AC ranged in thickness from approximately 5 to 7 inches. The AC was underlain by approximately 2 inches of aggregate base (AB) in boring B-14 and generally consisted of moist, dense, silty sand with gravel.

Fill was encountered below the pavement sections in borings B-1 through B-5 and B-14 and at the ground surface in borings B-6 through B-13 and B-15 through B-18, to depths of approximately 1 to 2 feet below the ground surface. The fill material generally consisted of disturbed/tilled, moist, loose to medium dense, sandy silt, silty sand, and poorly graded sand.

Alluvium/alluvial fan deposits were encountered in our borings below the fill to the total depths explored of approximately 51.5 feet. The alluvium generally consisted of interbedded, moist, loose to very dense, sandy silt, clayey sand, silty sand, poorly graded sand with silt, and poorly graded

sand, and moist, firm to very stiff, lean clay. Detailed descriptions of the materials encountered in our borings are presented on the boring logs in Appendix A.

7 GROUNDWATER

Groundwater was not encountered in our borings at the time of drilling. Groundwater monitoring well data from the State of California Water Resources Control Board's GeoTracker website (2021) indicates that the depth to groundwater at a monitoring well located approximately 2.2 miles southeast of the site ranges from approximately 22.5 to 34 feet below the ground surface. An additional groundwater monitoring well, located approximately 3.2 miles northeast of the site, indicates that the depth to groundwater ranges from approximately 141 to 145 feet below the ground surface. Fluctuations in groundwater levels may occur due to variations in precipitation, ground surface topography, subsurface stratification, irrigation, groundwater pumping, and other factors that may not have been evident at the time of our field evaluation.

8 FLOOD HAZARDS

Based on review of the Kern Master Environmental Assessment Resource's Flood Plain and Dam Inundation Areas Map (Kern Council of Governments, 2004b), the site is located within a mapped dam inundation area for the Lake Isabella reservoir. Areas in the Lake Isabella inundation area would be subject to approximately 1 to 2 feet of sheet flooding. Based on our review of flood insurance rate maps for the project area (Federal Emergency Management Agency [FEMA], 2009), the project site is located within FEMA's designated Other Areas - Zone X, which includes areas assigned to be outside the 500-year floodplain.

9 FAULTING, SEISMICITY, AND GEOLOGIC HAZARDS

The project site is located in a seismically active area, as is the majority of central and southern California. The numerous faults in California include active, potentially active, and inactive faults. As defined by the California Geological Survey (CGS), active faults are faults that have ruptured within Holocene time, or within approximately the last 11,000 years. Potentially active faults are those that show evidence of movement during Quaternary time (approximately the last 1.6 million years) but for which evidence of Holocene movement has not been established. Inactive faults have not ruptured in the last approximately 1.6 million years. The approximate locations of major active faults in the region and their geographic relationship to the project sites are shown on Figure 5.

Based on our review of seismic hazard maps, geologic literature, and geologic maps, the site is not located within a State of California Earthquake Fault Zone (formerly known as Alquist-Priolo

Special Studies Zone), and no active faults are known to cross the subject site. The principal seismic and geologic hazards evaluated at the subject site are surface ground rupture, ground motion, liquefaction, and regional subsidence. A brief description of these hazards and the potential for their occurrences on site are discussed in the following sections.

9.1 Surface Ground Rupture

Based on our review of the referenced literature and our site reconnaissance, no active faults are known to cross the project site. Therefore, the probability of damage from surface fault rupture is considered to be low. However, lurching or cracking of the ground surface as a result of nearby seismic events is possible.

9.2 Site-Specific Seismic Ground Motion

Considering the proximity of the site to active faults capable of producing a maximum moment magnitude of 6.0 or more, the project area has a high potential for experiencing strong ground motion. The 2019 California Building Code (CBC) specifies that the risk-targeted maximum considered earthquake (MCE_R) ground motion response accelerations be used to evaluate seismic loads for design of buildings and other structures. Per the 2019 CBC, a site-specific ground motion hazard analysis shall be performed for structures on Site Class D with a mapped MCE_R, 5 percent damped, spectral response acceleration parameter at a period of 1 second (S_1) greater than or equal to 0.2g in accordance with Sections 21.2 and 21.3 of the American Society of Civil Engineers (ASCE) Publication 7-16 (2016) for the Minimum Design Loads and Associated Criteria for Building and Other Structures. We calculated that the S_1 for the site is equal to 0.392g using the 2021 Applied Technology Council (ATC) seismic design tool (web-based); therefore, a site-specific ground motion hazard analysis was performed for the project area.

The site-specific ground motion hazard analysis consisted of the review of available seismologic information for nearby faults and performance of probabilistic seismic hazard analysis (PSHA) and deterministic seismic hazard analysis (DSHA) to develop acceleration response spectrum curves corresponding to the MCE_R for 5 percent damping. Prior to the site-specific ground motion hazard analysis, we obtained the mapped seismic ground motion values and developed the general MCE_R response spectrum for 5 percent damping in accordance with Section 11.4 of ASCE 7-16 (ATC, 2021). The average shear wave velocity (V_S) for the upper 30 meters of soil (V_{S30}) is assumed to be 228 meters per second (m/s) (CGS/Wills et al., 2017) and the depths to V_S = 1,000 m/s and V_S = 2,500 m/s are assumed to be 90 meters and 5,800 meters, respectively (Southern California Earthquake Center Community Velocity Model).

The 2014 new generation attenuation (NGA) West-2 relationships were used to evaluate the site-specific ground motions. The NGA relationships that we used for developing the probabilistic and deterministic response spectra are by Chiou and Youngs (2014), Campbell and Bozorgnia (2014), Boore, Stewart, Seyhan, and Atkinson (2014), and Abrahamson, Silva, and Kamai (2014). The Open Seismic Hazard Analysis software developed by USGS (USGS, 2020) was used for performing the PSHA. The Calculation of Weighted Average 2014 NGA Models spreadsheet by the Pacific Earthquake Engineering Research Center was used for performing the DSHA (Seyhan, 2014).

PSHA was performed for earthquake hazards having a 2 percent chance of being exceeded in 50 years multiplied by the risk coefficients per ASCE 7-16. The maximum rotated components of ground motions were considered in PSHA with 5 percent damping. For the DSHA, we analyzed accelerations from characteristic earthquakes on active faults within the region using the hazard curves and deaggregation plots at the site obtained from the USGS Unified Hazard Tool application (USGS, 2021). A magnitude 8.1 event on the San Andreas Fault with a rupture distance of 43.4 kilometers from the site was evaluated to be the controlling earthquake. Hence, the deterministic seismic hazard analysis was performed for the site using this event and corrections were made to the spectral accelerations for the 84th percentile of the maximum rotated component of ground motion with 5 percent damping.

The site-specific MCE_R response spectrum was taken as the lesser of the spectral response acceleration at any period from the PSHA and DSHA, and the site-specific general response spectrum was determined by taking two-thirds of the MCE_R response spectrum with some conditions in accordance with Section 21.3 of ASCE 7-16. Figure 6 presents the site-specific MCE_R response spectrum and the site-specific design response spectrum. The general mapped design response spectrum calculated in accordance with Section 11.4 of ASCE 7-16 is also presented on Figure 6 for comparison. The site-specific spectral response acceleration parameters, consistent with the 2019 CBC, are provided in Section 11.2 for the evaluation of seismic loads on buildings and other structures. The site-specific maximum considered earthquake geometric mean (MCE_G) peak ground acceleration, PGA_M, was calculated as 0.550g.

9.3 Liquefaction Potential

Liquefaction is the phenomenon in which loosely deposited granular soils and non-plastic silts located below the water table undergo rapid loss of shear strength when subjected to strong earthquake-induced ground shaking. Ground shaking of sufficient duration results in the loss of grain-to-grain contact due to a rapid rise in pore water pressure, and causes the soil to behave

as a fluid for a short period of time. Liquefaction is known generally to occur in saturated or near-saturated cohesionless soils at depths shallower than 50 feet below the ground surface. Liquefaction is also known to occur in relatively fine-grained soils (i.e., sandy silt and clayey silt) with a plasticity index (PI) of less than 12 and an in-place moisture content more than 85 percent of the liquid limit (LL) and sensitive silts and clays with a PI more than 18. Factors known to influence liquefaction potential include composition and thickness of soil layers, grain size, relative density, groundwater level, degree of saturation, and both intensity and duration of ground shaking.

The project site is not located in an area mapped as a liquefaction hazard (CalOES, 2021). In addition, groundwater was not encountered in our borings to the depths explored of 51.5 feet. Accordingly, it is our opinion that liquefaction and liquefaction-related seismic hazards (e.g., dynamic settlement and/or lateral spreading) are not design considerations for the project.

9.4 Regional Subsidence

Subsidence is characterized as a sinking of the ground surface relative to surrounding areas, and can generally occur where deep, unconsolidated soil deposits are present. Regional land subsidence is typically associated with regional groundwater withdrawal, oil and/or natural gas withdrawal, hydro-compaction, or oxidation and compaction of peat soils following drainage of marshland (Faunt, 2009). Subsidence can result in the development of ground surface cracks, larger scale ground failures, such as surface faulting and/or earth fissuring, ground surface drainage problems due to permanent subsurface aquifer compaction, increased incidences of flooding, and sinkholes, differential settlement, and damaged wells in the vicinity of the groundwater removal equipment areas (Baum et al., 2008).

According to the USGS, the San Joaquin Valley where the project site is located, has been subject to historical subsidence due to groundwater pumping with some areas experiencing as much as 28 feet of historical ground subsidence (USGS, 2018b). In general, current groundwater practices have improved over the years to help reduce land subsidence due to groundwater pumping. Management strategies are used by governing agencies to store water for future use in an effort to meet water demands reliably. However, periods of drought and/or reduced surface water availability have the potential to cause renewed groundwater pumping and subsidence in the San Joaquin Valley.

10 CONCLUSIONS

Based on the results of our evaluation, it is our opinion that construction of the proposed project improvements is feasible from a geotechnical perspective, provided that the following recommendations are incorporated into the design and construction of the project. In general, the following conclusions were made:

- The site is generally underlain by moist, loose to very dense, sandy silts, clayey sands, silty sands, poorly graded sand with silt and poorly graded sand with some scattered inter-beds of moist, stiff to very stiff, lean clay. Excavations during site grading should be feasible with earthmoving equipment in good working order.

- The on-site sandy soils should be suitable for re-use as compacted fill once moisture-conditioned to near the optimum moisture content. Oversize materials with a diameter of 4 inches or more are not considered to be suitable for use as fill.

- Granular alluvial soils encountered at the site may be subject to caving. These soils should be considered as Type C soils in accordance with Occupational Safety and Health Administration (OSHA) regulations.

- Groundwater was not encountered during our subsurface exploration. Groundwater levels in the vicinity of the site range from approximately 22.5 to 145 feet below the ground surface. Fluctuations in groundwater levels may occur due to variations in precipitation, ground surface topography, subsurface stratification, irrigation, groundwater pumping, and other factors which may not have been evident at the time of our field evaluation.

- The site soils are not considered susceptible to significant dynamic settlements due to earthquake-induced liquefaction.

- The subject site is not located within a State of California Earthquake Fault Zone. Based on our review of published geologic maps and aerial photographs, there are no known active faults that underlie the site. The potential for surface fault rupture at the site is considered to be low.

- The design PGA_M was calculated as 0.550g for the site.

- Our limited laboratory corrosivity testing indicates that the on-site materials can be classified as corrosive based on the California Department of Transportation (Caltrans, 2021) corrosion guidelines.

11 RECOMMENDATIONS

The following sections provide our geotechnical recommendations for the design and construction of the proposed warehouse building and associated improvements. These recommendations are based on our evaluation of the site geotechnical conditions and our understanding of the planned construction, including anticipated foundation loads. The proposed work should be performed in conformance with the recommendations presented in this report, project specifications, and appropriate agency standards.

11.1 Earthwork

Earthwork at the site is anticipated to consist of remedial grading of the near-surface soils, fill placement, foundation excavations, trenching and backfilling for new utilities, pavement construction, and finish grading for establishment of site drainage. Earthwork operations should be performed in accordance with the requirements of the applicable governing agencies and the recommendations presented in the following sections of this report.

11.1.1 Pre-Construction Conference

We recommend that a pre-construction conference be held. The owner and/or their representative, the governing agencies' representatives, the civil engineer, Ninyo & Moore, and the contractor should be in attendance to discuss the work plan and project schedule and earthwork requirements.

11.1.2 Site Preparation

Prior to performing excavations or other earthwork, the site should be cleared of surface obstructions, deleterious materials, and vegetation, as well as surface soils containing organic materials. Existing utilities within the project limits (if any) should be re-routed or protected from damage by construction activities. Obstructions that extend below the finished grade should be removed and the resulting holes filled with compacted soil. Materials generated from the clearing operations should be removed from the project site and disposed of at a legal dump site.

11.1.3 Excavation Characteristics

Based on our field exploration, we anticipate that excavations within alluvial materials at the site may be accomplished with conventional earthmoving equipment in good working condition. Based on our site reconnaissance and review of geologic literature, we anticipate that the materials encountered will be comprised predominantly of sandy silts, clayey sand, silty sands, poorly graded sand with silt, and poorly graded sand with some scattered inter-beds of lean clay. Oversize materials including cobbles and boulders, if encountered during excavation operations, may not be suitable for backfill and should be disposed of off-site. Contractors should make their own independent evaluation of the excavatability of the on-site materials prior to submitting their bids.

Temporary near-vertical excavations not exceeding a depth of approximately 4 feet should be feasible. Excavations that are unstable or deeper than 4 feet should be laid back to slope inclinations of approximately 1½:1 (horizontal to vertical) or flatter. Where temporary slopes

are not possible, shoring will be needed. Excavations should be performed in accordance with OSHA's regulations. On-site soils should be considered as Type C soils in accordance with OSHA guidelines.

11.1.4 Treatment of Near-Surface Soils

In order to provide suitable support for the proposed building we recommend that the building pad be overexcavated to a depth of approximately 7 feet below the existing ground surface or 5 feet beneath the bottom of the footings, whichever is deeper. The over-excavation should remove existing loose surficial soils and should expose relatively dense alluvial deposits. Additional overexcavation of loose, soft, and/or wet areas, and/or undocumented fill may be appropriate. The limits of the excavation should extend laterally so that the overexcavation is approximately 10 feet beyond the perimeter of the building or a distance equal to the depth of the overexcavation, whichever is greater. The excavation bottom should be evaluated by our representative during the excavation work. The exposed subgrade should be scarified to a depth of approximately 8 inches, moisture-conditioned, and compacted prior to the placement of fill.

In areas of pavements subject to vehicle traffic and exterior flatwork, the near-surface soils should be removed to a depth of approximately 2 feet below the pavement or flatwork subgrade. The actual depths of overexcavation should be evaluated by our representative based on the materials exposed at the time of construction. The limits of overexcavation should extend laterally beyond the improvements to a distance equal to the depth of over-excavation. The subgrade at the bottoms of the overexcavation should be scarified to a depth of 8 inches, moisture-conditioned to slightly above the laboratory optimum moisture content, and compacted to a relative compaction of 90 percent or more. The overexcavated areas should be backfilled to the finished grade with the on-site soils with very low to low expansion potential and compacted to a relative compaction of 90 percent or more.

11.1.5 Fill Material

In general, the on-site granular soils should be suitable for re-use as fill, structural fill, and trench backfill provided they are free of trash, debris, roots, vegetation, or other deleterious materials. Fill should generally be free of rocks or solid lumps of material in excess of 4 inches in diameter. Rocks or solid lumps larger than approximately 4 inches in diameter should be broken into smaller pieces or should be removed from the site. On-site soils used as fill will involve moisture-conditioning to achieve appropriate moisture content for compaction.

Imported materials, if used, should consist of clean, non-expansive, granular material that conforms to the latest edition of "Greenbook" Standard Specifications for Public Works Construction for structure backfill in accordance with ASTM International (ASTM) D 4829 (CBC, 2019). Soil should also be tested for corrosive properties prior to importing. We recommend that the imported materials comply with the Caltrans (2021) criteria for non-corrosive soils (i.e., soils having a chloride concentration of 500 parts per million (ppm) or less, a soluble sulfate content of approximately 0.15 percent (1,500 ppm) or less, a pH value of 5.5 or higher, or an electrical resistivity of 1,500 ohm-centimeters [ohm-cm] or more). Materials for use as fill should be evaluated by the geotechnical consultant prior to importing. The contractor should be responsible for the uniformity of import material brought to the site.

11.1.6 Fill Placement and Compaction

Fill placed for support of the new warehouse building or other miscellaneous improvements should be compacted in horizontal lifts to a relative compaction of 90 percent or more as evaluated by ASTM D 1557. Fill soils should be placed at slightly above the optimum moisture content as evaluated by ASTM D 1557. The optimum lift thickness of fill will depend on the type of compaction equipment used but generally should not exceed 8 inches in loose thickness. Placement and compaction of the fill soils should be in general accordance with appropriate governing agency grading ordinances and good construction practice.

11.2 Site-Specific Seismic Design Considerations

Design of the proposed improvements should be performed in accordance with the requirements of the governing jurisdictions and applicable building codes. Table 1 presents the site-specific spectral response acceleration parameters in accordance with the CBC (2019) guidelines.

Table 1 – 2019 California Building Code Seismic Design Criteria

Site Coefficients and Spectral Response Acceleration Parameters	Values
Site Class	D
Mapped Spectral Response Acceleration at 0.2-second Period, S_S	1.080g
Mapped Spectral Response Acceleration at 1.0-second Period, S_1	0.392g
Site-Specific Spectral Response Acceleration at 0.2-second Period, S_{MS}	1.350g
Site-Specific Spectral Response Acceleration at 1.0-second Period, S_{M1}	0.982
Site-Specific Design Spectral Response Acceleration at 0.2-second Period, S_{DS}	0.900
Site-Specific Design Spectral Response Acceleration at 1.0-second Period, S_{D1}	0.655
Site-Specific Maximum Considered Earthquake Geometric Mean (MCE_G) Peak Ground Acceleration, PGA_M	0.550g

11.3 Foundations

The proposed warehouse facility may be supported on shallow, spread footings bearing on engineered fill compacted in accordance with the recommendations presented in Section 11.1 of

this report. Foundations should be designed in accordance with structural considerations and the following recommendations. In addition, requirements of the appropriate governing jurisdictions and applicable building codes should be considered in the design of the structures.

11.3.1 Footings

Footings should extend 24 inches or more below the lowest adjacent finished grade. Continuous footings should have a width of 24 inches or more. Isolated pad footings should have a width of 36 inches or more and extend 24 inches or more below the lowest adjacent finish grade. Spread footings should be reinforced with a minimum of two No. 4 steel reinforcing bars, one placed near the top and one placed near the bottom of the footings, and further detailed in accordance with the recommendations of the structural engineer.

Footings, as described above and bearing on compacted fill soils with very low to low expansion potential, may be designed using a net allowable bearing capacity of 2,500 pounds per square foot (psf). The bearing capacity may be increased by 250 psf and 500 psf for every additional foot of increase in width and depth, respectively, up to a value of 3,500 psf.

Total and differential settlements for footings designed and constructed in accordance with the above recommendations are estimated to be less than approximately 1 inch and ½ inch over a horizontal span of 40 feet, respectively.

Footings bearing on compacted fill may be designed using a coefficient of friction of 0.35, where the total frictional resistance equals the coefficient of friction times the dead load. Footings may be designed using a passive resistance of 350 psf per foot of depth for level ground condition up to a value of 3,500 psf. The allowable lateral resistance can be taken as the sum of the frictional resistance and passive resistance provided the passive resistance does not exceed one-half of the total allowable resistance. The passive resistance may be increased by one-third when considering loads of short duration such as wind or seismic forces.

11.3.2 Building Floor Slabs

Building floor slabs should be designed by the project structural engineer based on the anticipated loading conditions. Building floor slabs should be underlain by compacted soil prepared in accordance with the recommendations presented in this report. We recommend that slabs be, at a minimum, 5 inches thick and reinforced with No. 3 steel reinforcing bars placed 18 inches on-center (each way) placed near the mid-height of the slab. The placement

of the reinforcement in the slab is vital for satisfactory performance. The floor slab and foundations should be tied together by extending the slab reinforcement into the foundations. The slab should be underlain by a 4-inch-thick capillary break (consisting of either sand or crushed rock) overlain by a polyethylene vapor retarder (with a thickness of 10 mils or more). The steel reinforcements for the floor slab shall be placed on the vapor retarder using chairs, as appropriate. The vapor retarder is recommended in areas where moisture-sensitive floor coverings are anticipated. Soils underlying the slabs should be moisture-conditioned and compacted in accordance with the recommendations presented in this report prior to concrete placement. Joints should be constructed at intervals designed by the structural engineer to help reduce random cracking of the slab.

11.4 Exterior Flatwork

Exterior flatwork should be supported on subgrade soils prepared in accordance with the remedial recommendations presented in Section 11.1 of this report. Exterior flatwork should have a thickness of 4 inches or more. The flatwork should be reinforced with No. 3 steel reinforcing bars placed 24 inches on-center (each way) near the mid-height of the slab.

To reduce the potential for distress to exterior concrete flatwork due to movement of the underlying soil, we recommend that flatwork be installed with crack-control joints at appropriate spacing as designed by the structural engineer. Exterior flatwork should be underlain by 4 inches of clean sand. Positive drainage should be established and maintained adjacent to flatwork.

11.5 Underground Utilities

We anticipate that utility pipelines will be supported on compacted fill or native alluvium. The depths of the pipelines are not known; however, we anticipate that the pipe invert depths will not exceed 10 feet.

11.5.1 Pipe Bedding

We recommend that pipelines be supported on 6 inches or more of granular bedding material such as sand with a sand equivalent (SE) value of 30 or more. Bedding material should be placed and compacted around the pipe, and 12 inches or more above the top of the pipe in accordance with the current “Greenbook” Standard Specifications for Public Works. We do not recommend the use of crushed rock for bedding material. It has been our experience that the voids within a crushed rock material are sufficiently large enough to allow fines to migrate into the voids, thereby creating the potential for sinkholes and depressions to develop at the ground surface.

Special care should be taken not to allow voids beneath and around the pipe. Bedding material and compaction requirements should be in accordance with the recommendations of this report, the project specifications, and applicable requirements of the appropriate agencies. Compaction of the bedding material and backfill should proceed along both sides of the pipe concurrently and be compacted to 90 percent or more relative compaction as evaluated by ASTM D 1557.

11.5.2 Modulus of Soil Reaction

The modulus of soil reaction is used to characterize the stiffness of soil backfill placed on the sides of buried flexible pipelines for the purpose of evaluating lateral deflection caused by the weight of the backfill above the pipe. We recommend that a modulus of soil reaction of 1,200 pounds per square inch (psi) be used for design, provided that granular bedding material is placed adjacent to the pipe, as recommended in this report.

11.6 Pavement Recommendations

Installing pavements for Wible Road and Houghton Road, paved access roads, and parking stalls will be part of the proposed improvements for this project. Accordingly, the pavement sections were designed based on the subgrade soil conditions and our laboratory testing. Laboratory testing of a representative soil sample was performed and indicated an R-value of approximately 61 for the on-site subgrade soils. However, considering the variability in density and strength of near-surface soils across the site and in accordance with the Caltrans criteria, an R-value of 50 was used for the pavement design. We have evaluated pavement structural sections for Traffic Indices (TI) of 4.0, 6.0, 8.0, and 10.0. Our pavement analysis was performed using the methodology outlined in the Caltrans Highway Design Manual (Caltrans, 2019b). The analysis assumes a 20-year design life for the new pavements. Based on the design R-value and TI, our preliminary estimates of pavement structural sections are provided below in Table 2.

Table 2 – Preliminary Structural Pavement Sections

Traffic Index	AC over CAB or AC over CMB (inches)	Full Depth AC (inches)	Full Depth PCC (inches)
≤4	2.5 over 4.5	4.5	5.0
6	3.0 over 4.5	6.0	6.5
8	5.0 over 5.5	8.0	9.5
10	6.0 over 8.0	10.0	12.5

Notes:
AC – Asphalt Concrete
CAB – Crushed Aggregate Base
CMB – Crushed Miscellaneous Base
PCC – Portland Cement Concrete with a 28-day compressive strength of 2,500 psi

Pavements should be supported on subgrade soils prepared in accordance with the remedial recommendations presented in Section 11.1 of this report. Base material should be placed at a relative compaction of 95 percent or more as evaluated by ASTM D 1557. If a full depth AC pavement is selected, the subgrade soil should be compacted to 95 percent relative compaction.

Aggregate base material should conform to the latest specifications in Section 200 2.2 for crushed aggregate base or Section 200 2.4 for crushed miscellaneous base of the Greenbook and should be compacted to a relative compaction of 95 percent in accordance with ASTM D 1557. AC should conform to Section 203.6 of the Greenbook and should be compacted to a relative compaction of 95 percent in accordance with ASTM D 1557.

11.7 Soil Corrosivity and Concrete

Limited testing for corrosion potential of the site soils was performed by Ninyo & Moore using the results of a selected, representative near-surface sample obtained from boring B-5. Laboratory testing was performed to evaluate pH, minimum electrical resistivity, soluble sulfate, and chloride content. Soluble sulfate content is addressed in the following section of this report. The soil pH and minimum resistivity tests were performed in accordance with California Test Method (CT) 643. The test for chloride content of the soils was performed using CT 422. Sulfate testing was performed in general accordance with CT 417. The laboratory test results are presented in Appendix B.

The chloride content of the sample tested was approximately 110 ppm. The sulfate content was approximately 170 ppm. The soil pH of the sample was approximately 7.1, and the electrical resistivity measured in the laboratory was approximately 762 ohm-cm. Based on the laboratory test results and Caltrans (2021) criteria, the project site can be classified as a corrosive site, which is defined as having earth materials with more than 500 ppm chlorides, more than 1,500 ppm of sulfates, a pH of 5.5 or less, or an electrical resistivity of less than 1,500 ohm-cm. The results of the corrosivity tests are presented in Appendix B.

11.8 Concrete

Concrete in contact with soil or water that contains high concentrations of water-soluble sulfates can be subject to premature chemical and/or physical deterioration. Based on the American Concrete Institute (ACI) criteria (2016), the potential for sulfate attack is negligible for water-soluble sulfate contents in soil ranging from 0.00 to 0.10 percent by weight and moderate for water-soluble sulfate contents ranging from 0.10 to 0.20 percent by weight. The potential for sulfate attack is severe for water-soluble sulfate contents ranging from 0.20 to 2.00 percent by

weight and very severe for water-soluble sulfate contents over 2.00 percent by weight. The sample tested during this evaluation indicated water-soluble sulfate contents of approximately 0.017 percent by weight (i.e., about 170 ppm). Accordingly, the on-site soils are considered to have a negligible potential for sulfate attack. Per ACI (2016), Type II cement is appropriate for the site improvements. However, due to the potential variability of soils on site, consideration should be given to using Type II/V cement for the project.

In order to reduce the potential for shrinkage cracks in the concrete during curing, we recommend that the concrete for the proposed structures be placed with a slump of 4 inches based on ASTM C 143. The slump should be checked periodically at the site prior to concrete placement. We further recommend that concrete cover over reinforcing steel for foundations be provided in accordance with CBC (2019). The structural engineer should be consulted for additional concrete specifications.

11.9 Drainage

Positive surface drainage is imperative for satisfactory performance of the site. Positive drainage should be provided and maintained to direct surface water away from foundations and offsite. Positive drainage is defined as a slope of 2 percent or more for a distance of 5 feet or more away from foundations and other site improvements. Runoff should then be directed by the use of swales or pipes into a collective drainage system. Surface waters should not be allowed to pond adjacent to footings or on pavements. Concentrated runoff should not be allowed to flow over pavement as this can result in early deterioration of the pavement. We recommend that the top level of the structures have roof drains and downspouts installed to collect runoff. Area drains for landscaped and paved areas are recommended.

12 CONSTRUCTION OBSERVATION

The recommendations provided in this report are based on our understanding of the proposed project and our evaluation of the data collected based on subsurface conditions observed in our exploratory borings. It is imperative that the geotechnical consultant checks the subsurface conditions during construction.

During construction, we recommend that the duties of the geotechnical consultant include, but not be limited to:

- Observing clearing, grubbing, and removals.
- Observing excavation, placement, and compaction of fill, including trench backfill.

- Evaluating on-site soil for suitability of its use as engineered fill/structural backfill prior to placement.
- Evaluating imported materials prior to their use as fill, if any.
- Performing field tests to evaluate fill compaction.
- Observing foundation excavations for bearing material prior to placement of reinforcing steel or concrete.

The recommendations provided in this report are based on the assumption that Ninyo & Moore will provide geotechnical observation and testing services during construction. In the event that the services of Ninyo & Moore are not used during construction, we request that the selected consultant provide the owner with a letter (with a copy to Ninyo & Moore) indicating that they fully understand Ninyo & Moore's recommendations and that they are in full agreement with the design parameters and recommendations contained in this report.

13 LIMITATIONS

The field evaluation, laboratory testing, and geotechnical analyses presented in this geotechnical report have been conducted in general accordance with current practice and the standard of care exercised by geotechnical consultants performing similar tasks in the project area. No warranty, expressed or implied, is made regarding the conclusions, recommendations, and opinions presented in this report. There is no evaluation detailed enough to reveal every subsurface condition. Variations may exist and conditions not observed or described in this report may be encountered during construction. Uncertainties relative to subsurface conditions can be reduced through additional subsurface exploration. Additional subsurface evaluation will be performed upon request.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires additional information or has questions regarding the content, interpretations presented, or completeness of this document.

This report is intended for design purposes only. It does not provide sufficient data to prepare an accurate bid by contractors. It is suggested that the bidders and their geotechnical consultant perform an independent evaluation of the subsurface conditions in the project areas. The independent evaluations may include, but not be limited to, review of other geotechnical reports prepared for the adjacent areas, site reconnaissance, and additional exploration and laboratory testing.

Our conclusions, recommendations, and opinions are based on an analysis of the observed site conditions. If geotechnical conditions different from those described in this report are encountered, our office should be notified, and additional recommendations, if warranted, will be provided upon request. It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control.

This report is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than the client is undertaken at said parties' sole risk.

NOTES:

1 The probabilistic ground motion spectral response accelerations are based on the risk-targeted Maximum Considered Earthquake (MCE_R) having a 2% probability of exceedance in 50 years in the maximum direction using the Chiou & Youngs (2014), Campbell & Bozorgnia (2014), Boore et al. (2014), and Abrahamson et al. (2014) attenuation relationships and the risk coefficients.

2 The deterministic ground motion spectral response accelerations are for the 84th percentile of the geometric mean values in the maximum direction using the Chiou & Youngs (2014), Campbell & Bozorgnia (2014), Boore et al. (2014), and Abrahamson et al. (2014) attenuation relationships for deep soil sites considering a Mw 8.1 event on the San Andreas fault zone located 43.4 kilometers from the site. It conforms with the lower bound limit per ASCE 7-16 Section 21.2.2.

3 The Site-Specific MCE_R Response Spectrum is the lesser of spectral ordinates of deterministic and probabilistic accelerations at each period per ASCE 7-16 Section 21.2.3. The Site-Specific Design Response Spectrum conforms with lower bound limit per ASCE 7-16 Section 21.3.

4 The Mapped Design MCE_R Response Spectrum is computed from mapped spectral ordinates modified for Site Class D (stiff soil profile) per ASCE 7-16 Section 11.4. It is presented for the sake of comparison.

APPENDIX A

Boring Logs

APPENDIX A

BORING LOGS

Field Procedure for the Collection of Disturbed Samples
Disturbed soil samples were obtained in the field using the following method.

Bulk Samples
Bulk samples of representative earth materials were obtained from the exploratory borings. The samples were bagged and transported to the laboratory for testing.

The Standard Penetration Test (SPT) Sampler
Disturbed drive samples of earth materials were obtained by means of a Standard Penetration Test sampler. The sampler is composed of a split barrel with an external diameter of 2 inches and an unlined internal diameter of 13/8 inches. The sampler was driven into the ground 12 to 18 inches with a 140-pound hammer falling freely from a height of 30 inches in general accordance with ASTM D 1586. The blow counts were recorded for every 6 inches of penetration; the blow counts reported on the logs are those for the last 12 inches of penetration. Soil samples were observed and removed from the sampler, bagged, sealed and transported to the laboratory for testing.

Undisturbed Samples
Relatively undisturbed soil samples were obtained in the field using the following method.

The Modified Split-Barrel Drive Sampler
The sampler, with an external diameter of 3 inches, was lined with 1-inch-long, thin brass rings with inside diameters of approximately 2.4 inches. The sample barrel was driven into the ground with the weight of a hammer in general accordance with ASTM D 3550. The driving weight was permitted to fall freely. The approximate length of the fall, the weight of the hammer, and the number of blows per foot of driving are presented on the boring logs as an index to the relative resistance of the materials sampled. The samples were removed from the sample barrel in the brass rings, sealed, and transported to the laboratory for testing.

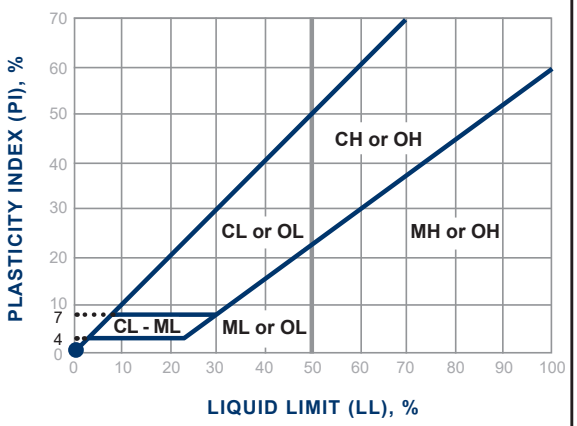
Soil Classification Chart Per ASTM D 2488

Primary Divisions			Secondary Divisions	
			Group Symbol	Group Name
COARSE-GRAINED SOILS more than 50% retained on No. 4 sieve	**GRAVEL** more than 50% of coarse fraction retained on No. 4 sieve	CLEAN GRAVEL less than 5% fines	GW	well-graded GRAVEL
			GP	poorly graded GRAVEL
		GRAVEL with DUAL CLASSIFICATIONS 5% to 12% fines	GW-GM	well-graded GRAVEL with silt
			GP-GM	poorly graded GRAVEL with silt
			GW-GC	well-graded GRAVEL with clay
			GP-GC	poorly graded GRAVEL with clay
		GRAVEL with FINES more than 12% fines	GM	silty GRAVEL
			GC	clayey GRAVEL
			GC-GM	silty, clayey GRAVEL
	SAND 50% or more of coarse fraction passes No. 4 sieve	CLEAN SAND less than 5% fines	SW	well-graded SAND
			SP	poorly graded SAND
		SAND with DUAL CLASSIFICATIONS 5% to 12% fines	SW-SM	well-graded SAND with silt
			SP-SM	poorly graded SAND with silt
			SW-SC	well-graded SAND with clay
			SP-SC	poorly graded SAND with clay
		SAND with FINES more than 12% fines	SM	silty SAND
			SC	clayey SAND
			SC-SM	silty, clayey SAND
FINE-GRAINED SOILS 50% or more passes No. 200 sieve	**SILT and CLAY** liquid limit less than 50%	INORGANIC	CL	lean CLAY
			ML	SILT
			CL-ML	silty CLAY
		ORGANIC	OL (PI > 4)	organic CLAY
			OL (PI < 4)	organic SILT
	SILT and CLAY liquid limit 50% or more	INORGANIC	CH	fat CLAY
			MH	elastic SILT
		ORGANIC	OH (plots on or above "A"-line)	organic CLAY
			OH (plots below "A"-line)	organic SILT
	Highly Organic Soils		PT	Peat

Grain Size

Description		Sieve Size	Grain Size	Approximate Size
Boulders		> 12"	> 12"	Larger than basketball-sized
Cobbles		3 - 12"	3 - 12"	Fist-sized to basketball-sized
Gravel	Coarse	3/4 - 3"	3/4 - 3"	Thumb-sized to fist-sized
	Fine	#4 - 3/4"	0.19 - 0.75"	Pea-sized to thumb-sized
Sand	Coarse	#10 - #4	0.079 - 0.19"	Rock-salt-sized to pea-sized
	Medium	#40 - #10	0.017 - 0.079"	Sugar-sized to rock-salt-sized
	Fine	#200 - #40	0.0029 - 0.017"	Flour-sized to sugar-sized
Fines		Passing #200	< 0.0029"	Flour-sized and smaller

Plasticity Chart



Apparent Density - Coarse-Grained Soil

Apparent Density	Spooling Cable or Cathead		Automatic Trip Hammer	
	SPT (blows/foot)	Modified Split Barrel (blows/foot)	SPT (blows/foot)	Modified Split Barrel (blows/foot)
Very Loose	≤ 4	≤ 8	≤ 3	≤ 5
Loose	5 - 10	9 - 21	4 - 7	6 - 14

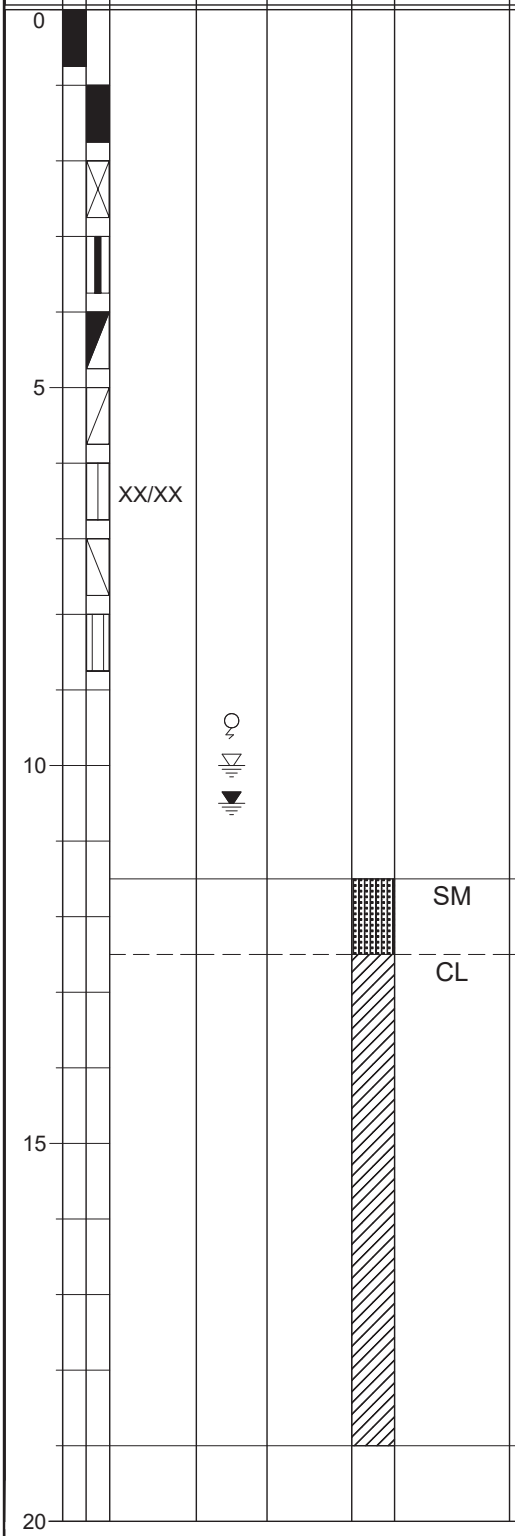
BORING LOG EXPLANATION SHEET



Bulk sample.

Modified split-barrel drive sampler.

No recovery with modified split-barrel drive sampler.

Sample retained by others.

Standard Penetration Test (SPT).

No recovery with a SPT.

Shelby tube sample. Distance pushed in inches/length of sample recovered in inches.

No recovery with Shelby tube sampler.

Continuous Push Sample.

Seepage.

Groundwater encountered during drilling.

Groundwater measured after drilling.

SM

MAJOR MATERIAL TYPE (SOIL):

Solid line denotes unit change.

CL

Dashed line denotes material change.

Attitudes: Strike/Dip
b: Bedding
c: Contact
j: Joint
f: Fracture
F: Fault
cs: Clay Seam
s: Shear
bss: Basal Slide Surface
sf: Shear Fracture
sz: Shear Zone
sbs: Shear Bedding Surface

The total depth line is a solid line that is drawn at the bottom of the boring.

APPENDIX B

Laboratory Testing

APPENDIX B

LABORATORY TESTING

Classification
Soils were visually and texturally classified in accordance with the Unified Soil Classification System (USCS) in general accordance with ASTM D 2488. Soil classifications are indicated on the logs of the exploratory borings in Appendix A.

In-Place Moisture and Density Tests
The moisture content and dry density of relatively undisturbed samples obtained from the exploratory borings were evaluated in general accordance with ASTM D 2937. The test results are presented on the logs of the exploratory borings in Appendix A.

200 Wash
An evaluation of the percentage of particles passing the No. 200 sieve in selected soil samples was performed in general accordance with ASTM D 1140. The results of the tests are summarized on Figures B-1 and B-2.

Consolidation Tests
A consolidation test was performed on a selected relatively undisturbed soil sample in general accordance with ASTM D 2435. The sample was inundated during testing to represent adverse field conditions. The percent of consolidation for each load cycle was recorded as a ratio of the amount of vertical compression to the original height of the sample. The results of the test are summarized on Figure B-3.

Direct Shear Tests
Direct shear tests were performed on remolded and relatively undisturbed samples in general accordance with ASTM D 3080 to evaluate the shear strength characteristics of the selected materials. The samples were inundated during shearing to represent adverse field conditions. The results are shown on Figures B-4 through B-6.

Proctor Density Tests
The maximum dry density and optimum moisture content of a selected representative soil sample was evaluated using the Modified Proctor method in general accordance with ASTM D 1557. The results of this test are summarized on Figure B-7.

R-Value
The resistance value, or R-value, for site soils was evaluated in general accordance with California Test (CT) 301. A sample was prepared and evaluated for exudation pressure and expansion pressure. The equilibrium R-value is reported as the lesser or more conservative of the two calculated results. The test results are shown on Figure B-8.

Soil Corrosivity Tests
Soil pH and minimum resistivity tests were performed on a representative sample in general accordance with CT 643. The chloride content of the selected sample was evaluated in general accordance with CT 422. The sulfate content of the selected sample was evaluated in general accordance with CT 417. The test results are presented on Figure B-9.

- Hydrographic Feature

MAP PANELS
- Digital Data Available
- No Digital Data Available
- Unmapped

N

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 1/18/2022 at 4:37 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 11. The **horizontal datum** was NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, MD 20910-3282

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit its website at http://www.ngs.noaa.gov/.

Base map information shown on this FIRM was derived from USDA –Farm Service Agency –Aerial Photography Field Office dated 2005 and from U.S. Geological Survey Digital Orthophoto Quadrangles produced at a scale of 1:12,000 from photography dated 1992 or later.

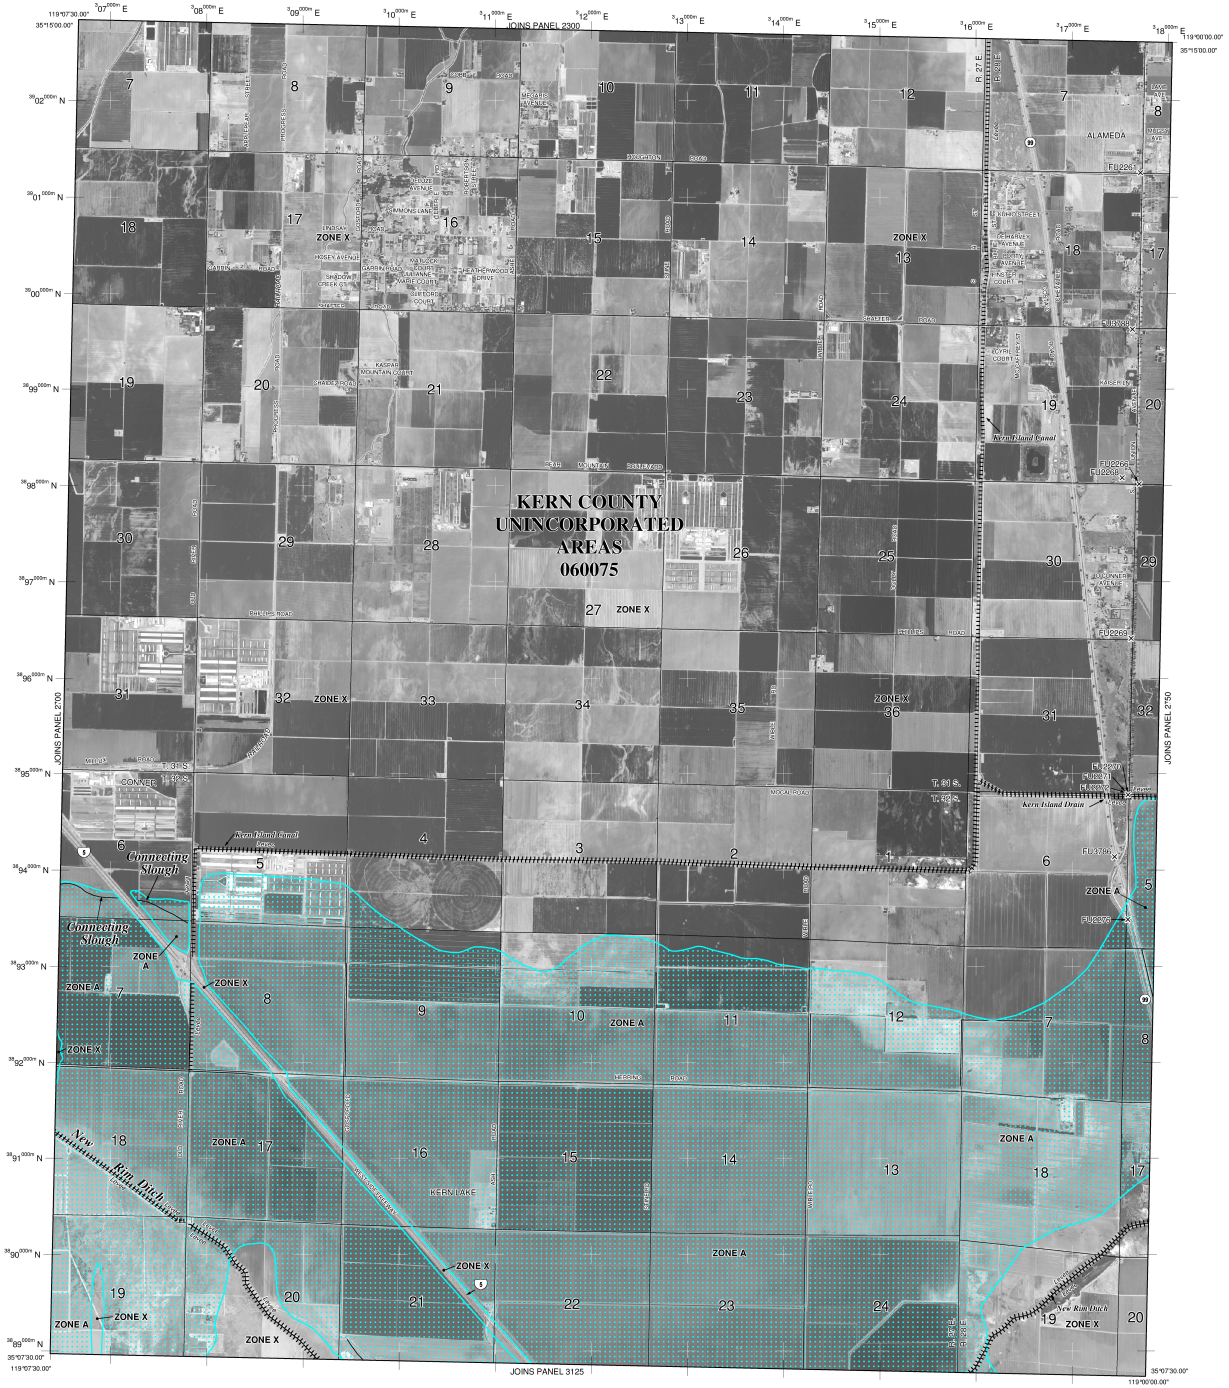
This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables *in the Flood Insurance Study report (which contains authoritative hydraulic data)* may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, *a Flood Insurance Study report*, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://www.msc.fema.gov/.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/.



LEGEND

SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A No Base Flood Elevations determined.

ZONE AE Base Flood Elevations determined.

ZONE AH Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.

ZONE AO Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.

ZONE AR Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.

ZONE A99 Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.

ZONE V Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.

ZONE VE Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X Areas determined to be outside the 0.2% annual chance floodplain.

ZONE D Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

- 1% annual chance floodplain boundary
- 0.2% annual chance floodplain boundary
- Floodway boundary
- Zone D boundary
- CBRS and OPA boundary
- Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.
- 513 — Base Flood Elevation line and value; elevation in feet*
- (EL 987) — Base Flood Elevation value where uniform within zone; elevation in feet*

* Referenced to the North American Vertical Datum of 1988 (NAVD 88)

- A — A — Cross section line
- 23 — 23 — Transect line
- 97°07'30", 32°22'30" — Geographic coordinates referenced to the North American Datum of 1983 (NAD 83)
- 4275000 mN — 1000-meter Universal Transverse Mercator grid ticks, zone 11
- 6000000 M — 5000-foot grid ticks: California State Plane coordinate system, V zone (FIPSZONE 0405), Lambert Conformal Conic
- DX5510 — Bench mark (see explanation in Notes to Users section of this FIRM panel)
- M1.6 — River Mile

INTRODUCTION

Project Description

Kimley-Horn has been retained to prepare a storm water quality assessment for the proposed Project Ware Malcomb ("Project"). The report was prepared for the proposed ±629,186 square-foot warehouse and distribution facility, comprised of loading docks, truck courtyard, associate parking, landscape and stormwater Best Management Practices (BMPs) over the ±93.74-acre onsite project site area (overall project is 99.28 acres which consists of 5.54 acres of right-of-way dedication) .

Project Location

The Project site is located southeast of the intersection of Houghton Road and Wible Road in an unincorporated area of Kern County, California (APN 184-391-08). The site is currently agricultural farmland and is bordered on the northwest by a neighboring agricultural property, on the north by Houghton Road, on the east and south by private unpaved roads, and on the west by Wible Road.

See the vicinity map in the figure below.

Figure 1: Vicinity Map

BMP SUMMARY

Source Control BMPs

Source control BMPs are required to be incorporated in all new development and redevelopment projects unless not applicable. The table below indicates all BMPs to be incorporated in the project. For those designated as not applicable (N/A), a brief explanation why is provided.

The specific source control BMPs for the tenant improvement project include:

Table 1: Source Control BMPs

INCORPORATED SOURCE CONTROL BMP:	YES	N/A	DESCRIPTION
Peak Stormwater Runoff Discharge Rates	☐	☒	The proposed retention basin retains the peak 100-year flow, therefore there is no discharge less than the 100-year peak flow.
Conserve Natural Areas	☒	☐	Existing landscaping will be preserved as much as possible.
Minimize Stormwater Pollutants of Concern	☒	☐	The retention basins will provide treatment of stormwater runoff through infiltration. Additional source control BMPs will further minimize pollutants of concern.
Protect Slopes & Channels	☐	☒	The existing site does not currently have slopes or on-site channels, therefore no damage by surface runoff will occur.
Provide Storm Drain System Stenciling & Signage	☒	☐	The phrase “No Dumping – Drains to Ocean” or equally effective phrase will be stenciled on catch basins and/or area drains to alert the public as to the destination of pollutants discharged into the stormwater.
Properly Design Outdoor Material Storage Areas	☐	☒	There are no outdoor storage areas proposed for the project site.
Properly Design Trash Storage Areas	☐	☒	There are no proposed trash storage areas on this project site.
Provide Proof of Ongoing BMP Maintenance	☒	☐	The property owner will be responsible for the maintenance of the BMPs onsite and ensure that they are in good working order.
Properly Design Loading/Unloading Dock Areas	☒	☐	Proposed loading docks will be properly maintained.

INCORPORATED SOURCE CONTROL BMP:	YES	N/A	DESCRIPTION
Properly Design Repair/Maintenance Bays	☐	☒	There are no repair/maintenance bays proposed for the project site.
Properly Design Vehicle/ Equipment/ Accessory Wash Areas	☐	☒	There are no vehicle or equipment wash areas proposed for the project site.
Design Standards for Treatment Control BMPs	☒	☐	Post-construction structural BMP design will accommodate the 85th percentile rainfall requirement by retaining the entire peak 100 year storm event.

The following source control BMP fact sheets taken from the 2019 California BMP Handbook and shall be used as a reference to the design plans and/or specifications for new commercial improvements:

- SC-41 Building & Grounds Maintenance
- SC-43 Parking/Storage Area Maintenance
- SC-44 Drainage System Maintenance
- SD-13 Storm Drainage Signage

INSPECTION/MAINTENANCE RESPONSIBILITY

It has been determined that the property owner shall assume all BMP inspection and maintenance responsibilities for the new tenant improvements. The Owner will be responsible for maintenance of all storm drain inlets, collectors, v-ditches, basins, or any other related flood control or stormwater control devices. Furthermore, all interior streets and/or roadways, landscape, recreation areas, facilities and/or open space within the project limits will be maintained by the Owner.

Long-term Funding for BMP Maintenance

Long-term funding for BMP maintenance shall be funded by Owner.

Responsible Party Contact Information

Seefried Industrial Properties, Inc.

Phoenix, AZ 85016

OPERATION & MAINTENANCE PLAN

Proper O&M is an important element of a stormwater mitigation plan to ensure BMPs remove pollution effectively. Routine maintenance or service also contributes to the efficiency and continuous operation of a system. The post development BMP maintenance responsibility and frequency matrix provided in this section detail the specific party to perform the inspection and maintenance of each BMP for the tenant Improvements and details the maintenance and inspection activities to be performed, and the frequency with which each shall be performed.

Table 2: Structural BMP Maintenance Responsibility / Frequency Matrix

BMP		RESPONSIBILITY	MAINTENANCE FREQUENCY
SD-13	Storm Drainage Signage	Seefried Properties	Storm drain stencils shall be inspected for legibility, at minimum, once prior to the storm season, no later than October 1st each year. Those determined to be illegible should be re-stenciled as soon as possible. Frequency: ANNUALLY
SD-32	Trash Storage Areas	Seefried Properties	Sweep trash area at least once per week and before October 1st each year. Maintain area clean of trash and debris at all times. Frequency: WEEKLY
SC-34	Waste Handling & Disposal	Seefried Properties	Train employees to clean regularly to remove potential sources of pollutants. Sweep area to be performed at least once per month and before October 1st of each year. Frequency: MONTHLY
SD-41	Building and Grounds Maintenance	Seefried Properties	Sweep paved areas regularly to collect loose particles, and wipe up spills with rags and other absorbent material immediately, DO NOT hose down the area to a storm drain. Frequency: WEEKLY

BMP		RESPONSIBILITY	MAINTENANCE FREQUENCY
SC-43	Parking/Storage Area Maintenance	Seefried Properties	Parking lots must be swept at least quarterly (every 3 months), including prior to the start of the rainy season (October 1st). Frequency: QUARTERLY
Retention Basin		Seefried Properties	Identify and remediate clogging issues at inlets. Trim and weed regularly. Inspect and remove litter and debris. Every 6 to 12 months Every 12 to 25 months Frequency: TWICE MONTHLY AND AFTER STORM EVENTS

SECTION 1: INTRODUCTION

1.1 - Purpose of Analysis and Study Objectives

This Noise Impact Analysis Report has been prepared by FirstCarbon Solutions (FCS) to determine and document the off-site and on-site noise impacts associated with the proposed Westside Industrial Project (proposed project). The following is provided in this report:

- A description of the study area, project site, and proposed project.
- Information regarding the fundamentals of noise and vibration.
- A description of the local noise guidelines and standards.
- A description of the existing noise environment.
- An analysis of the potential short-term, construction-related noise and vibration impacts from the proposed project.
- An analysis of long-term, operations-related noise and vibration impacts from the proposed project.

1.2 - Project Summary

1.2.1 - Site Location

The approximately 93.74-acre project site is located in the southern San Joaquin Valley in unincorporated Kern County, California (Exhibit 1). The site is bounded by Wible Road (west), Houghton Road (north), and agricultural land (south and east) (Exhibit 2).

1.2.2 - Project Description

The project applicant, Seefried Industrial Properties, Inc., proposes to develop an approximately 653,442-square-foot single-story warehouse and distribution facility and related improvements. The proposed facility would have a footprint of approximately 629,186 square feet (including approximately 44, 424 square feet of office space) that would primarily facilitate material handling equipment and warehouse uses (Exhibit 3). The remaining square footage is made up of a 24,256 square foot mezzanine, which would contain only material handling equipment conveyors with occasional maintenance and no storage. Additionally, the proposed project would include two guardhouses and one pumphouse.

1.2.3 - Phasing and Construction

For the purposes of this environmental analysis, the following construction schedule was assumed. Grading of the proposed project would start in July 2024 and would last approximately 20 days. Construction would be completed in one phase, beginning in September 2024, and concluding in September 2025. The proposed project is expected to be operational in 2025.

SECTION 2: NOISE AND VIBRATION FUNDAMENTALS

2.1 - Characteristics of Noise

Noise is generally defined as unwanted or objectionable sound. Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm, or when it has adverse effects on health. The effects of noise on people can include general annoyance, interference with speech communication, sleep disturbance, and in the extreme, hearing impairment. Noise effects can be caused by pitch or loudness. *Pitch* is the number of complete vibrations or cycles per second of a wave that result in the range of tone from high to low; higher-pitched sounds are louder to humans than lower-pitched sounds. *Loudness* is the intensity or amplitude of sound.

Sound is produced by the vibration of sound pressure waves in the air. Sound pressure levels are used to measure the intensity of sound and are described in terms of decibels. The decibel (dB) is a logarithmic unit, which expresses the ratio of the sound pressure level being measured to a standard reference level. The 0 point on the dB scale is based on the lowest sound level that the healthy, unimpaired human ear can detect. Changes of 3 dB or less are only perceptible in laboratory environments. Audible increases in noise levels generally refer to a change of 3 dB or more, as this level has been found to be barely perceptible to the human ear in outdoor environments. Only audible changes in existing ambient or background noise levels are considered potentially significant.

The human ear is not equally sensitive to all frequencies within the audible sound spectrum, so sound pressure level measurements can be weighted to better represent frequency-based sensitivity of average healthy human hearing. One such specific “filtering” of sound is called “A-weighting.” A-weighted decibels (dBA) approximate the subjective response of the human ear to a broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies that are audible to the human ear. Because decibels are logarithmic units, they cannot be added or subtracted by ordinary arithmetic means. For example, if one noise source produces a noise level of 70 dB, the addition of another noise source with the same noise level would not produce 140 dB; rather, they would combine to produce a noise level of 73 dB.

As noise spreads from a source, it loses energy so that the farther away the noise receiver is from the noise source, the lower the perceived noise level. Noise levels diminish or attenuate as distance from the source increases based on an inverse square rule, depending on how the noise source is physically configured. Noise levels from a single-point source, such as a single piece of construction equipment at ground level, attenuate at a rate of 6 dB for each doubling of distance (between the single-point source of noise and the noise-sensitive receptor of concern). Heavily traveled roads with few gaps in traffic behave as continuous line sources and attenuate roughly at a rate of 3 dB per doubling of distance.

2.1.1 - Noise Descriptors

There are many ways to rate noise for various time periods, but an appropriate rating of ambient noise affecting humans also accounts for the annoying effects of sound. Equivalent continuous sound level (L_{eq}) is the total sound energy of time-varying noise over a sample period. However, the predominant rating scales for human communities in the State of California are the L_{eq} and Community Noise Equivalent Level (CNEL) or the day-night average level (L_{dn}) based on dBA. CNEL is the time-varying noise over a 24-hour period, with a 5 dBA weighting factor applied to the hourly L_{eq} for noises occurring from 7:00 p.m. to 10:00 p.m. (defined as relaxation hours) and a 10 dBA weighting factor applied to noise occurring from 10:00 p.m. to 7:00 a.m. (defined as sleeping hours). L_{dn} is similar to the CNEL scale but without the adjustment for events occurring during the evening hours. CNEL and L_{dn} are within 1 dBA of each other and are normally exchangeable. The noise adjustments are added to the noise events occurring during the more sensitive hours.

Other noise rating scales of importance when assessing the annoyance factor include the maximum noise level (L_{max}), which is the highest exponential time-averaged sound level that occurs during a stated time period. The noise environments discussed in this analysis are specified in terms of maximum levels denoted by L_{max} for short-term noise impacts. L_{max} reflects peak operating conditions and addresses the annoying aspects of intermittent noise.

2.1.2 - Noise Propagation

From the noise source to the receiver, noise changes both in level and frequency spectrum. The most obvious is the decrease in noise as the distance from the source increases. The manner in which noise reduces with distance depends on whether the source is a point or line source, as well as ground absorption, atmospheric conditions (wind, temperature gradients, and humidity) and refraction, and shielding by natural and manmade features. Sound from point sources, such as an air conditioning condenser, a piece of construction equipment, or an idling truck, radiates uniformly outward as it travels away from the source in a spherical pattern.

The attenuation or sound drop-off rate is dependent on the conditions of the land between the noise source and receiver. To account for this ground-effect attenuation (absorption), two types of site conditions are commonly used in noise models: soft-site and hard-site conditions. Soft-site conditions account for the sound propagation loss over natural surfaces such as normal earth and ground vegetation. For point sources, a drop-off rate of 7.5 dBA per each doubling of the distance (dBA/DD) is typically observed over soft ground with landscaping, as compared with a 6 dBA/DD drop-off rate over hard ground such as asphalt, concrete, stone, and very hard packed earth. For line sources, such as traffic noise on a roadway, a 4.5 dBA/DD is typically observed for soft-site conditions compared to the 3 dBA/DD drop-off rate for hard-site conditions. Table 1 briefly defines these measurement descriptors and other sound terminology used in this section.

Table 1: Sound Terminology

Term	Definition
Sound	A vibratory disturbance created by a vibrating object which, when transmitted by pressure waves through a medium such as air, can be detected by a receiving mechanism such as the human ear or a microphone.
Noise	Sound that is loud, unpleasant, unexpected, or otherwise undesirable.
Ambient Noise	The composite of noise from all sources near and far in a given environment.
Decibel (dB)	A unitless measure of sound on a logarithmic scale, which represents the squared ratio of sound pressure amplitude to a reference sound pressure. The reference pressure is 20 micropascals, representing the threshold of human hearing (0 dB).
A-Weighted Decibel (dBA)	An overall frequency-weighted sound level that approximates the frequency response of the human ear.
Equivalent Noise Level (L_{eq})	The average sound energy occurring over a specified time period. In effect, L_{eq} is the steady-state sound level that in a stated period would contain the same acoustical energy as the time-varying sound that actually occurs during the same period.
Maximum and Minimum Noise Levels (L_{max} and L_{min})	The maximum or minimum instantaneous sound level measured during a measurement period.
Day-Night Level (DNL or L_{dn})	The energy average of the A-weighted sound levels occurring during a 24-hour period, with 10 dB added to the A-weighted sound levels occurring between 10:00 p.m. and 7:00 a.m. (nighttime).
Community Noise Equivalent Level (CNEL)	The energy average of the A-weighted sound levels occurring during a 24-hour period, with 5 dB added to the A-weighted sound levels occurring between 7:00 p.m. and 10:00 p.m. and 10 dB added to the A-weighted sound levels occurring between 10:00 p.m. and 7:00 a.m.
Source: Data compiled by FirstCarbon Solutions (FCS) 2021.	

2.1.3 - Traffic Noise

The level of traffic noise depends on the three primary factors: (1) the volume of the traffic, (2) the speed of the traffic, and (3) the number of trucks in the flow of traffic. Generally, the loudness of traffic noise is increased by heavier traffic volumes, higher speeds, and greater number of trucks. Vehicle noise is a combination of the noise produced by the engine, exhaust, and tires. Because of the logarithmic nature of noise levels, a doubling of the traffic volume (assuming that the speed and truck mix do not change) results in a noise level increase of 3 dBA. Based on the Federal Highway

Administration (FHWA) community noise assessment criteria, this change is "barely perceptible." For reference, a doubling of perceived noise levels would require an increase of approximately 10 dBA. The truck mix on a given roadway also has an effect on community noise levels. As the number of heavy trucks increases and becomes a larger percentage of the vehicle mix, adjacent noise levels increase.

2.1.4 - Stationary Noise

A stationary noise producer is any entity in a fixed location that emits noise. Examples of stationary noise sources include machinery, engines, energy production, and other mechanical or powered equipment and activities such as loading and unloading or public assembly that may occur at commercial, industrial, manufacturing, or institutional facilities. Furthermore, while noise generated by the use of motor vehicles over public roads is preempted from local regulation, the use of these vehicles is considered a stationary noise source when operated on private property such as at a construction-site, a truck terminal, or warehousing facility.

The effects of stationary noise depend on factors such as characteristics of the equipment and operations, distance and pathway between the generator and receptor, and weather. Stationary noise sources may be regulated at the point of manufacture (e.g., equipment or engines), with limitations on the hours of operation, or with provision of intervening structures, barriers, or topography.

Construction activities are a common source of stationary noise. Construction-period noise levels are higher than background ambient noise levels but eventually cease once construction is complete. Construction is performed in discrete steps, each of which has its own mix of equipment and, consequently, its own noise characteristics. These various sequential phases would change the character of the noise generated on each construction-site and, therefore, would change the noise levels as construction progresses. Despite the variety in the type and size of construction equipment, similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase. Table 2 shows typical noise levels of construction equipment as measured at a distance of 50 feet from the operating equipment.

Table 2: Typical Construction Equipment Maximum Noise Levels, L_{max}

Type of Equipment	Impact Device? (Yes/No)	Specification Maximum Sound Levels for Analysis (dBA at 50 feet)
Impact Pile Driver	Yes	95
Auger Drill Rig	No	85
Vibratory Pile Driver	No	95

dBA = A-weighted decibel
Source: Federal Highway Administration (FHWA). 2006. Highway Construction Noise Handbook. August.

2.1.5 - Noise from Multiple Sources

Because sound pressure levels in decibels are based on a logarithmic scale, they cannot be added or subtracted in the usual arithmetical way. Therefore, sound pressure levels in decibels are logarithmically added on an energy summation basis. In other words, adding a new noise source to an existing noise source, both producing noise at the same level, will not double the noise level. Instead, if the difference between two noise sources is 10 dBA or more, the louder noise source will dominate, and the resultant noise level will be equal to the noise level of the louder source. In general, if the difference between two noise sources is 0–1 dBA, the resultant noise level will be 3 dBA higher than the louder noise source, or both sources if they are equal. If the difference between two noise sources is 2–3 dBA, the resultant noise level will be 2 dBA above the louder noise source. If the difference between two noise sources is 4–10 dBA, the resultant noise level will be 1 dBA higher than the louder noise source.

2.2 - Characteristics of Groundborne Vibration and Noise

Groundborne vibration consists of rapidly fluctuating motion through a solid medium, specifically the ground, that has an average motion of zero and in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. The effects of groundborne vibration typically only causes a nuisance to people, but in extreme cases, excessive groundborne vibration has the potential to cause structural damage to buildings. Although groundborne vibration can be felt outdoors, it is typically only an annoyance to people indoors where the associated effects of the shaking of a building can be notable. Groundborne noise is an effect of groundborne vibration and only exists indoors, since it is produced from noise radiated from the motion of the walls and floors of a room and may also consist of the rattling of windows or dishes on shelves.

Several different methods are used to quantify vibration amplitude such as the maximum instantaneous peak in the vibrations velocity, which is known as the peak particle velocity (PPV) or the root mean square (rms) amplitude of the vibration velocity. Because of the typically small amplitudes of vibrations, vibration velocity is often expressed in decibels–denoted as LV–and is based on the reference quantity of 1 microinch per second. To distinguish these vibration levels referenced in decibels from noise levels referenced in decibels, the unit is written as "VdB."

Although groundborne vibration can be felt outdoors, it is typically only an annoyance to people indoors where the associated effects of the shaking of a building can be notable. When assessing annoyance from groundborne vibration, vibration is typically expressed as rms velocity in units of decibels of 1 microinch per second, with the unit written in VdB. Typically, developed areas are continuously affected by vibration velocities of 50 VdB or lower. Human perception to vibration starts at levels as low as 67 VdB. Annoyance due to vibration in residential settings starts at approximately 70 VdB.

Off-site sources that may produce perceptible vibrations are usually caused by construction equipment, steel-wheeled trains, and traffic on rough roads, while smooth roads rarely produce perceptible groundborne noise or vibration. Construction activities, such as blasting, pile driving and operating heavy earthmoving equipment, are common sources of groundborne vibration. Construction vibration impacts on building structures are generally assessed in terms of PPV. Typical vibration source levels from construction equipment are shown in Table 3.

Table 3: Vibration Levels of Construction Equipment

Construction Equipment	PPV at 25 Feet (inches/second)	rms VdB at 25 Feet
Water Trucks	0.001	57
Scraper	0.002	58
Bulldozer—Small	0.003	58
Jackhammer	0.035	79
Concrete Mixer	0.046	81
Concrete Pump	0.046	81
Paver	0.046	81
Pickup Truck	0.046	81
Auger Drill Rig	0.051	82
Backhoe	0.051	82
Crane (Mobile)	0.051	82
Excavator	0.051	82
Grader	0.051	82
Loader	0.051	82
Loaded Trucks	0.076	86

Construction Equipment	PPV at 25 Feet (inches/second)	rms VdB at 25 Feet

Caisson drilling	0.089	87
Vibratory Roller—Small	0.101	88
Compactor	0.138	90
Clam shovel drop	0.202	94
Vibratory Roller—Large	0.210	94
Pile Driver (impact-typical)	0.644	104
Pile Driver (impact-upper range)	1.518	112

Notes:
PPV = peak particle velocity
rms = root mean square
VdB = vibration in decibels
Source: Compilation of scientific and academic literature, generated by the Federal Transit Administration (FTA) and Federal Highway Administration (FHWA).

The propagation of groundborne vibration is not as simple to model as airborne noise. This is because noise in the air travels through a relatively uniform medium, while groundborne vibrations travel through the earth, which may contain significant geological differences. Factors that influence groundborne vibration include:

- **Vibration source:** Type of activity or equipment, such as impact or mobile, and depth of vibration source.
- **Vibration path:** Soil type, rock layers, soil layering, depth to water table, and frost depth.
- **Vibration receiver:** Foundation type, building construction, and acoustical absorption.

Among these factors that influence groundborne vibration, there are significant differences in the vibration characteristics when the source is underground compared to at the ground surface. In addition, soil conditions are known to have a strong influence on the levels of groundborne vibration. Among the most important factors are the stiffness and internal damping of the soil and the depth to bedrock. Vibration propagation is more efficient in stiff clay soils than in loose sandy soils, and shallow rock seems to concentrate the vibration energy close to the surface and can result in groundborne vibration problems at large distance from the source. Factors such as layering of the soil and depth to the water table can have significant effects on the propagation of groundborne vibration. Soft, loose, sandy soils tend to attenuate more vibration energy than hard, rocky materials. Vibration propagation through groundwater is more efficient than through sandy soils. There are three main types of vibration propagation: surface, compression, and shear waves. Surface waves, or Rayleigh waves, travel along the ground's surface. These waves carry most of their energy along an expanding circular wave front, similar to ripples produced by throwing a rock into a pool of water. P-waves, or compression waves, are body waves that carry their energy along an expanding spherical wave front. The particle motion in these waves is longitudinal (i.e., in a "push-pull" fashion). P-waves

are analogous to airborne sound waves. S-waves, or shear waves, are also body waves that carry energy along an expanding spherical wave front. However, unlike P-waves, the particle motion is transverse, or side-to-side and perpendicular to the direction of propagation.

As vibration waves propagate from a source, the vibration energy decreases in a logarithmic nature and the vibration levels typically decrease by 6 VdB per doubling of the distance from the vibration source. As stated above, this drop-off rate can vary greatly depending on the soil type, but it has been shown to be effective enough for screening purposes, in order to identify potential vibration impacts that may need to be studied through actual field tests. The vibration level (calculated below as PPV) at a distance from a point source can generally be calculated using the vibration reference equation:

$$PPV = PPV_{ref} * (25/D)^n \text{ (in/sec)}$$

Where:

PPV_{ref} = reference measurement at 25 feet from vibration source
D = distance from equipment to property line
n = vibration attenuation rate through ground

According to Section 7 of the Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual, an "n" value of 1.5 is recommended to calculate vibration propagation through typical soil conditions.[1]

[1] Federal Transit Administration (FTA). 2018. Transit Noise and Vibration Impact Assessment Manual. September.

SECTION 3: REGULATORY SETTING

3.1 - Federal Regulations

Currently, no federal noise standards regulate environmental noise associated with temporary construction activities or the long-term operations of development projects. As such, both temporary and long-term noise impacts resulting from the proposed project would be largely regulated or otherwise evaluated by State and local agency standards designed to protect public well-being and health.

3.1.1 - Federal Transit Administration

Though not regulatory in nature, vibration impact criteria for buildings and other structures have been established by the FTA, as building and structural damages are generally the foremost concern when evaluating the impacts of construction-related vibrations. For the evaluation of the proposed project's construction-related vibration impacts, the following FTA vibration impact criteria, shown in Table 4 are used given the absence of applicable federal, State, and City standards specific to temporary construction activities and their potential to result in building and structural damages.

Table 4: Federal Transit Administration Construction Vibration Impact Criteria

Building Category	PPV (in/sec)	Approximate VdB
I. Reinforced—Concrete, Steel or Timber (no plaster)	0.5	102
II. Engineered Concrete and Masonry (no plaster)	0.3	98
III. Non-engineered Timber and Masonry Buildings	0.2	94
IV. Buildings Extremely Susceptible to Vibration Damage	0.12	90

Notes:
VdB = velocity in decibels
PPV = peak particle velocity
in/sec = inch per second
Source: Federal Transit Administration (FTA). 2018. Transit Noise and Vibration Impact Assessment Manual. September.

3.2 - State Regulations

The State of California's General Plan Guidelines propose county and city standards for acceptable exterior noise levels based on land use. These standards are incorporated into land use planning processes to prevent or reduce noise and land use incompatibilities. The State's suggested compatibility considerations between various land uses and exterior noise levels are not regulatory in nature but are recommendations intended to aid communities in determining their own noise-acceptability standards.

3.3 - Local Regulations

The project site is located within unincorporated Kern County. Kern County and City of Bakersfield have separately adopted a coordinated general plan for the unincorporated metropolitan area the

Metropolitan Bakersfield General Plan, in 2002. Therefore, this analysis evaluates noise impacts compared to the policies and standards of the Metropolitan Bakersfield General Plan and in the County Municipal Code.

The applicable regulations are summarized below.

Metropolitan Bakersfield General Plan

Chapter VII: Noise Element

Policies

Policy 1 Identify noise impact areas exposed to existing or projected noise levels exceeding 65 dB CNEL (exterior) or the performance standards described in Table VII-2 [of the General Plan]. The noise exposure contour maps on file at the City of Bakersfield and County of Kern indicate areas where existing and projected noise exposures exceed 65 dB CNEL (exterior) for the major noise sources identified.

Policy 3 Review discretionary industrial, commercial or other noise-generating land use projects for compatibility with nearby noise-sensitive land uses.

Additionally, the development of new noise-generating land uses which are not preempted from local noise regulation will be reviewed if resulting noise levels will exceed the performance standards contained within Table VII-2 [of the General Plan] in areas containing residential or other noise-sensitive land uses.

Implementation Measures

Measure 4 Require proposed commercial and industrial uses or operations to be designed or arranged so that they will not subject residential or other noise-sensitive land uses to exterior noise levels in excess of 65 dB CNEL and interior noise levels in excess of 45 dB CNEL and so that impacts on noise-sensitive uses shall not exceed the performance standards in Table VII-2 [of the General Plan].

At time of any discretionary approval, such as a request for zone change or subdivision, the developer may be required to submit an acoustical report indicating the means by which the developer proposes to comply with the noise standards. The acoustical report shall:

a) Be the responsibility of the applicant.
b) Be prepared by a qualified acoustical consultant experienced in the fields of environmental noise assessment and architectural acoustics.
c) Include representative noise level measurements with sufficient sampling periods and locations to adequately describe local conditions.
d) Include estimated noise levels in terms of CNEL and the standards of Table VII-2 (if applicable) for existing and projected future (10-20 years hence) conditions, with a comparison made to the adopted policies of the Noise Element.
e) Include recommendations for appropriate mitigation to achieve compliance with the adopted policies and standards of the Noise Element.

f) Include estimates of noise exposure after the prescribed mitigation measures have been implemented. If compliance with the adopted standards and policies of the Noise Element will not be achieved, a rationale for acceptance of the project must be provided.

Measure 5 Develop implementation procedures to ensure that requirements imposed pursuant to the findings of an acoustical analysis are conducted as part of the project permitting process.

Measure 10 The following standards shall be used to determine the existence of significant cumulative noise impacts expected to result from proposed construction or development projects. The projected occurrence of such significant cumulative impacts shall require the adoption of practical and feasible mitigation measures to be identified in an Environmental Impact Report or Negative Declaration, whichever is applicable.

Standards for Cumulative Noise Impacts
A significant increase in ambient noise level affective existing noise-sensitive land uses (receptors), requiring the adoption of practical and feasible mitigation measures, is deemed to occur where a project will cause:

- An increase in ambient noise level of 1dB or more over 65dB CNEL, where the existing ambient level is 65dB CNEL or less;
- The ambient noise level is less than 60 dB CNEL and the project increases noise levels by 5 dB or more;
- The ambient noise level is 60 to 65 dB CNEL and the project increases noise levels by 3 dB or more; or
- The ambient noise level is greater than 65 dB CNEL and the project increases noise levels by 1.5 dB or more.

Kern County Municipal Code

The County Municipal Code[2] has established limits on permissible hours of construction. Permissible construction hours are from 6:00 a.m. to 9:00 p.m. on weekdays and from 8:00 a.m. and 9:00 p.m. on weekends. Any exemption to these hours must be granted by a County approved permit. The purpose is to limit loud construction noise which disturbs the peace and quiet of any neighborhood or which causes discomfort or annoyance to any reasonable person of normal sensitiveness sleeping or residing in the area. Therefore, the County has established that these standards do not apply to any construction performed 1,000 feet or more from the nearest residential dwelling.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 4: EXISTING NOISE CONDITIONS

The proposed project site is located within unincorporated Kern County. Surrounding the project site are agricultural land to the south and east, an agricultural processing facility and Houghton Road to the north, and Wible Road and the same agricultural processing facility to the west. The dominant noise source in the project vicinity is noise from traffic on local roadways adjacent to the project site.

Existing traffic noise levels along selected roadway segments in the project vicinity were modeled using the FHWA Traffic Noise Prediction Model (FHWA-RD-77-108). The average daily traffic volumes were obtained from the traffic analysis prepared for the proposed project by Kimley-Horn.[3] The traffic volumes described here correspond to the existing without project conditions traffic scenario as described in the transportation analysis. The model inputs and outputs—including the 60 dBA, 65 dBA, and 70 dBA CNEL noise contour distances—are provided in Appendix A of this document. A summary of the modeling results is shown in Table 5.

Table 5: Existing Traffic Noise Levels

Roadway Segment	Approximate ADT	Centerline to 70 CNEL (feet)	Centerline to 65 CNEL (feet)	Centerline to 60 CNEL (feet)	CNEL (dBA) 50 feet from Centerline of Outermost Lane
Houghton Road–Highway 99 ramps to H Street	2,900	< 50	< 50	84	62.7
Houghton Road–H Street to Wible Road	2,200	< 50	< 50	70	61.5
Wible Road–Houghton Road to Project South Road	860	< 50	< 50	< 50	57.4

Notes:
ADT = Average Daily Traffic
CNEL = Community Noise Equivalent Level
dBA = A-weighted decibel
[1] Modeling results do not take into account mitigating features such as topography, vegetative screening, fencing, building design, or structure screening. Rather, they assume a worst-case scenario of having a direct line of site on flat terrain.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 5: THRESHOLDS OF SIGNIFICANCE AND IMPACT ANALYSIS

5.1 - Thresholds of Significance

According to the California Environmental Quality Act (CEQA) Guidelines Appendix G, to determine whether impacts related to noise and vibration are significant environmental effects, the following questions are analyzed and evaluated.

Would the proposed plan:

a) Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

b) Generate excessive groundborne vibration or groundborne noise levels?

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

5.2 - Substantial Noise Increase in Excess of Standards

5.2.1 - Construction Noise Impacts

For purposes of this analysis, a significant impact would occur if construction activities would result in a substantial temporary increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. The County Municipal Code has established limits on permissible hours of construction from 6:00 a.m. to 9:00 p.m. on weekdays and from 8:00 a.m. and 9:00 p.m. on weekends. The purpose is to limit loud construction noise which disturbs the peace and quiet of any neighborhood or which causes discomfort or annoyance to any reasonable person of normal sensitiveness sleeping or residing in the area.

Construction-related Traffic Noise

Noise impacts from construction activities associated with the project would be a function of the noise generated by construction equipment, equipment location, sensitivity of nearby land uses, and the timing and duration of the construction activities. One type of short-term noise impact that could occur during project construction would result from the increase in traffic flow on local streets, associated with the transport of workers, equipment, and materials to and from the project site. The transport of workers and construction equipment and materials to the project site would incrementally increase noise levels on access roads leading to the site. Because workers and construction equipment would use existing routes, noise from passing trucks would be similar to existing vehicle-generated noise on these local roadways. Typically, a doubling of the Average Daily Traffic (ADT) hourly volumes on a roadway segment is required in order to result in an increase of 3

dBA in traffic noise levels, which as discussed in the characteristics of nose discussion above, is the lowest change that can be perceptible to the human ear in outdoor environments. Project-related construction trips would not be expected to double the hourly or daily traffic volumes along any roadway segment in the project vicinity. For this reason, short-term intermittent noise from construction trips would not be expected to result in a perceptible increase in hourly or daily average traffic noise levels in the project vicinity. Therefore, short-term construction-related noise impacts associated with the transportation of workers and equipment to the project site would be less than significant.

Construction Equipment Operational Noise

The second type of short-term noise impact is related to noise generated during construction on the project site. Construction is completed in discrete steps, each of which has its own mix of equipment and, consequently, its own noise characteristics. These various sequential phases would change the character of the noise generated on the site and, therefore, the noise levels surrounding the site as construction progresses. Despite the variety in the type and size of construction equipment, similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase. Table 1 lists typical construction equipment noise levels, based on a distance of 50 feet between the equipment and a noise receptor. Typical operating cycles for these types of construction equipment may involve 1 or 2 minutes of full power operation followed by 3 or 4 minutes at lower power settings. Impact equipment such as pile drivers are not expected to be used during construction of this project.

The site preparation phase, which includes excavation and grading of the site, tends to generate the highest noise levels because the noisiest construction equipment is earthmoving equipment. Earthmoving equipment includes excavating machinery and compacting equipment, such as bulldozers, draglines, backhoes, front loaders, roller compactors, scrapers, and graders. Typical operating cycles for these types of construction equipment may involve 1 or 2 minutes of full power operation followed by 3 or 4 minutes at lower power settings.

Construction of the project is expected to require the use of scrapers, bulldozers, water trucks, haul trucks, and pickup trucks. Based on the information provided in Table 2, the maximum noise level generated by each scraper is assumed to be 85 dBA L_{max} at 50 feet from this equipment. Each bulldozer would also generate 85 dBA L_{max} at 50 feet. The maximum noise level generated by graders is approximately 85 dBA L_{max} at 50 feet. A characteristic of sound is that each doubling of sound sources with equal strength increases a sound level by 3 dBA. Assuming that each piece of construction equipment operates at some distance from the other equipment, a reasonable worst-case combined noise level during this phase of construction would be 90 dBA L_{max} at a distance of 50 feet from the acoustic center of a construction area. This would result in a reasonable worst-case hourly average of 86 dBA L_{eq}. The acoustic center reference is used, because construction equipment must operate at some distance from one another on a project site, and the combined noise level as measured at a point equidistant from the sources would (acoustic center) be the worst-case maximum noise level. The effect on sensitive receptors is evaluated below.

The closest noise-sensitive receptor to the project site is the single-family residential dwelling located approximately 400 feet southwest of the project site, west of Wible Road. The next closest receptors are a neighborhood along Billie Way located approximately 3,685 feet east of the project site, and General Shafter School located approximately 4,120 feet southeast of the project site. Because of distance attenuation, project noise levels at these other sensitive land uses would attenuate by more than 19 dBA compared to the noise levels that would be experienced at the nearest sensitive receptor. Therefore, the following analysis focuses on potential noise impacts to the closest sensitive receptor land use.

The nearest sensitive receptor, the residence southwest of the project site, would be located approximately 400 feet from the acoustic center of construction activity where multiple pieces of heavy construction equipment would operate simultaneously during construction of the off-site roadway improvements along Wible Road. At this distance, relative worst-case maximum construction noise levels would attenuate to below 67 dBA L_{max}, and relative worst-case hourly average construction noise levels would attenuate to below 59 L_{eq}. Assuming these activities occurred every hour during the County's permissible hours for construction activities, the resulting 24-hour noise measurement would be 57 dBA CNEL, as measured at this nearest sensitive receptor.

Noise levels in the vicinity of this sensitive receptor are documented in Table 6, to be 57.4 dBA CNEL. Therefore, these reasonable worst-case construction noise levels would exceed existing ambient noise levels by less than 3 dBA. Such a change would not be considered a perceptible change. In addition, based on the EPA's Protective Noise Levels,[4] standard construction for residential structures built in Northern California built in accordance with California Building Standard Code (CBC) requirements, would provide a minimum of 25 dBA in exterior-to-interior noise reduction with windows closed. Therefore, these reasonable worst-case construction noise levels would attenuate to below 32 dBA CNEL as measured at the interior of the nearest residential receptor. These noise levels are well below the applicable interior noise performance standard of 45 dB CNEL. Therefore, project construction noise levels would not result in a substantial temporary increase in ambient noise levels in excess of established standards, and the impact would be less than significant.

5.2.2 - Mobile Source Operational Noise Impacts

A significant impact would occur if implementation of the proposed project would result in a substantial increase in traffic noise levels in excess of normally acceptable noise levels for adjoining land uses. According to the applicable General Plan standards, operational noise levels should not exceed 65 dBA CNEL as measured at any residential land use adjacent to roadway segments used for project access. However, the County does not define what would be a significant increase for mobile source operational noise levels. According to Caltrans Traffic Noise Protocol,[5] in California a substantial noise increase is considered to occur when the project's predicted design-year noise level exceeds the existing noise level by 12 dBA or more. Therefore, for the purposes of this analysis, an increase of 12 dBA or greater above existing noise levels would be a substantial permanent increase in traffic noise levels.

[4] United States Environmental Protection Agency (EPA). Protective Noise Levels. EPA 550/9-79-100, November 1978. Website: https://www.nonoise.org/library/levels/levels.htm.
[5] California Department of Transportation (Caltrans). 2020. Traffic Noise Analysis Protocol. April.

Traffic noise levels along selected roadway segments in the project vicinity were modeled using the FHWA Traffic Noise Prediction Model (FHWA-RD-77-108). Site-specific information is entered, such as roadway traffic volumes, roadway active width, source-to-receiver distances, travel speed, noise source and receiver heights, and the percentages of automobiles, medium trucks, and heavy trucks that the traffic is made up of throughout the day, among other variables. The ADT volumes were obtained from the traffic analysis prepared for the project by Kimley-Horn.[6] The traffic volumes described here, which correspond to the traffic scenarios analyzed in the traffic study. The model inputs and outputs—including the 60 dBA, 65 dBA, and 70 dBA CNEL noise contour distances—are provided in the Appendix A of this document. Table 6, shows the traffic noise levels as measured at 50 feet from the centerline of the outermost travel lane.

Table 6: Traffic Noise Increase Summary

Roadway Segment	Existing (2023) No Project (dBA) CNEL	Opening Year (2026) Plus Project (dBA) CNEL	Increase over Existing (dBA)	Horizon Year (2046) Plus Project (dBA) CNEL	Increase over Existing (dBA)
Houghton Road–Highway 99 ramps to H Street	62.7	66.1	3.4	66.4	3.7
Houghton Road–H Street to Wible Road	61.5	63.6	2.1	64.2	2.7
Wible Road–Houghton Road to Project South Road	57.4	63.2	5.8	63.8	6.4

Notes:
CNEL = Community Noise Equivalent Level
dBA = A-weighted decibel
Source: FirstCarbon Solutions (FCS) 2021.

As shown in Table 6, the highest traffic noise level increase with implementation of the project would be 66.4 dBA compared to existing traffic noise levels. This is well below the 12 dBA increase that would be considered a substantial increase in traffic noise.

In addition, due to distance attenuation, the resulting traffic noise levels would not exceed 65 dBA CNEL as measured at any residential land use adjacent to these roadway segments. For example, the closest residence adjacent to the modeled segments of Houghton Road is located over 140 feet from the roadway centerline. At this distance, traffic noise levels even under horizon year (2046) plus project conditions would attenuate to below 63 dBA CNEL. The closest residence adjacent to the modeled segments of Wible Road is located over 230 feet from the roadway centerline. At this distance, traffic noise levels even under horizon year (2046) plus project conditions would attenuate to below 58 dBA CNEL.

This analysis demonstrates that project-related traffic would not result in a substantial permanent increase of 12 dBA or greater above existing traffic noise levels and would not exceed the County's operational noise standard of 65 dBA CNEL as measured at any residential land use adjacent to

[6] Kimley-Horn. 2023. Traffic Study Westside Industrial Project. October.

roadway segments used for project access. Therefore, impacts from project-related traffic noise levels would be less than significant.

5.2.3 - Stationary Source Operational Noise Impacts

A significant impact would occur if operational noise levels generated by stationary noise sources at the proposed project site would result in a substantial permanent increase in ambient noise levels in excess of the applicable noise performance thresholds. The Metropolitan Bakersfield General Plan Noise Element establishes an exterior noise threshold of 65 dBA CNEL, and an interior noise limit of 45 dBA CNEL for stationary noise sources as measured at receiving noise-sensitive land uses.

Existing noise levels adjacent to the project site in the vicinity of the nearest sensitive receptor are documented in Table 6, to be 57.4 dBA CNEL. Therefore, according to the Noise Element, the applicable significance criteria for a substantial noise increase would be a 5 dB or greater increase in ambient noise levels as a result of project operations as measured at the nearest noise-sensitive receptor land use.

The proposed project would generate noise from truck delivery, loading and unloading activities at commercial loading areas; parking lot activities, which includes people conversing, doors shutting, engine startup, and slow-moving vehicles; and from new exterior mechanical equipment sources, such as rooftop ventilation systems on proposed commercial uses. Potential impacts from these noise sources are discussed below.

Truck Loading Activities

Noise would be also generated by truck loading and unloading activities at the loading docks along the southern, western, and northern sides of the proposed building. Typical noise levels from truck loading and unloading activity range from 70 dBA to 80 dBA L_{max} as measured at 50 feet. These maximum noise level range includes noise from associated truck loading/unloading activity, including trucks maneuvering, truck trailer loading, truck trailer unloading, backup alarms or beepers, and truck docking noise.

The nearest noise-sensitive receptor is the single-family residential land use located southwest of the project site on Wible Road, approximately 1,360 feet from the nearest proposed loading dock. Because of distance attenuation, reasonable worst-case maximum noise levels from truck loading and unloading activities would attenuate to below 51 dBA L_{max} and 28 dBA L_{eq} at the receiving residential property line. Assuming these hourly average noise levels occurred every hour for a 24-hour period, they would result in a reasonable worst-case noise level of 35dBA CNEL as measured at the property line of this nearest receptor. The calculation spreadsheet with the detailed modeling assumptions is included in Appendix A. These noise levels would not exceed the exterior noise limit of 65 dBA CNEL and would not exceed the interior noise limit of 45 dBA CNEL for stationary noise sources as measured at the nearest receiving noise-sensitive land use. In addition, these noise levels would not exceed existing ambient noise levels of 57 dBA CNEL.

Therefore, noise levels from truck loading and unloading activities would not generate a substantial temporary or permanent increase in ambient noise levels in the project vicinity in excess of

standards established in the local general plan or noise ordinance, and the impact would be less than significant.

Parking Lot Activities

Typical parking lot activities include people conversing, doors shutting, and vehicles idling which generate noise levels ranging from approximately 60 dBA to 70 dBA L_{max} at 50 feet. These activities are expected to occur sporadically throughout the day, as visitors and staff arrive and leave parking lot areas at the project site.

The nearest noise-sensitive receptor to proposed parking areas is the single-family residential dwelling located southwest of the project site, west of Wible Road. Proposed parking areas could be located approximately 750 feet from this closest sensitive receptor. At this distance, noise generated by typical parking lot activity would attenuate to below 46 dBA L_{max} and 28 dBA L_{eq}. Assuming these hourly average noise levels occurred every hour for a 24-hour period, they would result in a reasonable worst-case noise level of 34 dBA CNEL as measured at the property line of this nearest receptor. The calculation spreadsheet with the detailed modeling assumptions is included in Appendix A. These noise levels would not exceed the exterior noise limit of 65 dBA CNEL and would not exceed the interior noise limit of 45 dBA CNEL for stationary noise sources as measured at the nearest receiving noise-sensitive land use. In addition, these noise levels would not exceed existing ambient noise levels of 57 dBA CNEL.

Therefore, noise levels from parking lot activity would not generate a substantial temporary or permanent increase in ambient noise levels in the project vicinity in excess of standards established in the local general plan or noise ordinance, and the impact would be less than significant.

Mechanical Equipment Operations

At the time of preparation of this analysis, details were not available pertaining to the proposed rooftop mechanical ventilation systems for the project; therefore, a reference noise level for typical rooftop mechanical ventilation systems was used. Noise levels from commercially available rooftop mechanical ventilation equipment range from 50 dBA to 60 dBA L_{eq} at a distance of 25 feet.

The nearest noise-sensitive receptor to proposed rooftop mechanical ventilation equipment is the single-family residential dwelling located southwest of the project site, west of Wible Road. Rooftop mechanical ventilation equipment could be located approximately 1,285 feet from this closest sensitive receptor. At this distance, noise generated by typical rooftop mechanical ventilation equipment would attenuate to below 23 dBA L_{max} and 23 dBA L_{eq}. Assuming these hourly average noise levels occurred every hour for a 24-hour period, they would result in a reasonable worst-case noise level of 29 dBA CNEL as measured at the property line of this nearest receptor. The calculation spreadsheet with the detailed modeling assumptions is included in Appendix A. These noise levels would not exceed the exterior noise limit of 65 dBA CNEL and would not exceed the interior noise limit of 45 dBA CNEL for stationary noise sources as measured at the nearest receiving noise-sensitive land use. In addition, these noise levels would not exceed existing ambient noise levels of 57 dBA CNEL.

The proposed project would also include an emergency backup generator to power the sewer lift station pumps. The pumps would be submerged in the holding basin and therefore would not produce

noise levels that would be audible at the project property line. However, the type of generator that would be used for this project are documented to produce noise levels of 55 dBA to 60 dBA as measured at a distance of 25 feet from the equipment skid. The generator would be located in the northeast corner of the project site, near the water supply pumphouse. The nearest noise-sensitive receptor is the single-family residential dwelling located southwest of the project site, west of Wible Road. The generator would be located more than 1,275 feet from this receptor. Therefore, at this distance, operational noise levels from the emergency backup generator would attenuate to below 17 dBA as measured at the nearest residential receptor. These noise levels would not exceed the exterior noise limit of 65 dBA CNEL and would not exceed the interior noise limit of 45 dBA CNEL for stationary noise sources as measured at the nearest receiving noise-sensitive land use. In addition, these noise levels would not exceed existing ambient noise levels of 57 dBA CNEL.

Therefore, noise levels from on-site mechanical equipment operations would not generate a substantial temporary or permanent increase in ambient noise levels in the project vicinity in excess of standards established in the local general plan or noise ordinance, and the impact would be less than significant.

5.3 - Groundborne Vibration/Noise Levels

This section analyzes both construction and operational groundborne vibration and noise impacts. Groundborne vibrations consist of rapidly fluctuating motions within the ground that have an average motion of zero. Vibrating objects in contact with the ground radiate vibration waves through various soil and rock strata to the foundations of nearby buildings. Groundborne noise is generated when vibrating building components radiate sound, or noise generated by groundborne vibration. In general, if groundborne vibration levels do not exceed levels considered to be perceptible, then groundborne noise levels would not be perceptible in most interior environments. Therefore, this analysis focuses on determining exceedances of groundborne vibration levels.

A significant impact would occur if the project would generate groundborne vibration or groundborne noise levels in excess of established standards. Kern County has not adopted criteria for groundborne vibration impacts. Therefore, for the purposes of this analysis, the FTA's vibration impact criteria are utilized. The FTA has established industry accepted standards for vibration impact criteria and impact assessment. These guidelines are published in its Transit Noise and Vibration Impact Assessment Manual.[7] These guidelines are summarized in Table 4.

5.3.1 - Short-term Construction Vibration Impacts

A significant impact would occur if existing structures at the project site or in the project vicinity would be exposed to groundborne vibration levels in excess of levels established by the FTA's Construction Vibration Impact Criteria for the listed type of structure, as shown in Table 4.

Of the variety of equipment used during construction, the large vibratory rollers that could be used in the site preparation and roadway improvement phases of construction would produce the

[7] Federal Transit Administration (FTA). 2018. Transit Noise and Vibration Impact Assessment Manual. September.

greatest groundborne vibration levels. Large vibratory rollers produce groundborne vibration levels ranging up to 0.210 inch per second (in/sec) PPV at 25 feet from the operating equipment.

The nearest off-site structure to the project construction footprint where the heaviest construction equipment would operate is the agricultural shed for Martin Feed Inc., located north of the project site on Houghton Road. The façade of this structure would be located approximately 235 feet from the nearest point on the project site where the heaviest construction equipment would potentially operate. At this distance, groundborne vibration levels would attenuate to below 0.002 in/sec PPV from operation of the types of equipment that would produce the highest vibration levels. This is well below the FTA's Construction Vibration Impact Criteria of 0.2 in/sec PPV for commercial structures of normal construction. Therefore, the impact of short-term groundborne vibration associated with construction to off-site receptors would be less than significant.

5.3.2 - Operational Vibration Impacts

Operation of the proposed project would involve operational traffic, including regular trips by delivery trucks (generating approximately 0.076 in/sec PPV as measured at 25-feet). The closest residential receptor adjacent to the access roadways in the project vicinity are located over 160 feet from the nearest travel lane. At this distance vibration levels would attenuate to below .005 in/sec PPV. This is well below levels that would be perceptible without instruments. Additionally, there are no active sources of groundborne vibration in the project vicinity that would produce vibration levels that would be perceptible without instruments within the project site. Therefore, the proposed project would not generate groundborne vibration or groundborne noise levels in excess of established standards and there would be no impact related to operational groundborne vibration.

5.4 - Excessive Noise Levels from Airport Activity

A significant impact would occur if the proposed project would expose people residing or working in the project area to excessive noise levels for a project located in the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport.

The nearest public airport to the project site is the Bakersfield Municipal Airport, located approximately 6 miles northeast of the project site. At this distance, the project site is located outside of the 60 dBA CNEL airport noise contours. While aircraft noise is occasionally audible on the project site from aircraft flyovers, aircraft noise associated with nearby airport activity would not expose people residing or working near the project site to excessive noise levels. Therefore, implementation of the project would not expose persons residing or working in the project vicinity to noise levels from airport activity that would be in excess of normally acceptable standards for the proposed land use development, and no impact would occur.

Kern County Parks Department
1115 Truxtun Ave, 3rd Floor
Bakersfield, CA 93301

Sent via email to:

Subject: Westside Industrial Project Environmental Impact Report: Parks and Recreation Services

To whom it may concern:

On behalf of Kern County, FirstCarbon Solutions (FCS) is preparing an Environmental Impact Report (EIR) for the proposed Westside Industrial Project. As part of the environmental review process, we are consulting with service providers to determine whether the project would impact their ability to deliver public services. We are contacting you to request information related to the provision of park and recreation services.

The proposed 93.74 acres project is located 1.3 miles south of the City of Bakersfield, in unincorporated Kern County, but within the City of Bakersfield's Sphere of Influence. The project site is bound by Houghton Road to the north and Wible Road to the west and is situated approximately 1 mile west of State Route 99 and 8.75 miles east of Interstate 5.

Regional access to the project site is available from SR-99 via the Houghton Road exit. Local access to the project site is available from Houghton Road and Wible Road. The proposed project would include the development of a 653,442 square foot single-story cubic warehouse distribution facility~~,~~ that would receive and consolidate products from vendors and then ship these products to other fulfillment centers within the network. This also includes 44,424 square feet of office space, a 24,256 square foot mezzanine, two guardhouses, and a pumphouse.

The project also includes the construction of a new private road along the eastern and southern perimeter of the project site to connect Houghton Road and Wible Road. The road would be two lanes to accommodate heavy trucks. Both the intersection of Houghton Road and the eastern perimeter road, as well as the intersection of Wible Road and Houghton Road, would be signalized. Existing roads would be improved with new pavement, raised median, curb and gutter, and sidewalk.

Potential impacts to park and recreation services are an important element of our study. Our analysis strongly relies on your assistance in identifying potentially significant impacts to park and recreation services that may occur as a result of the project, as well as any mitigation measure(s) that may reduce or eliminate these impacts. Any assistance that you can provide with addressing the following questions would be greatly appreciated.

Service Questions

1. Please identify the park(s) and recreation center(s) that would provide services to the project site. Please describe the existing conditions of these park(s) and center(s).

2. Please provide an estimate of the park acres/1,000 residents and the target ratio that the department would like to achieve.

3. Please provide information about the residential and nonresidential development fee schedule. What are the current rates? What is the estimate rate for the proposed project?

4. Please identify the ability of the park service provider to accommodate the demand of the proposed project as part of the existing facilities.

5. Please define any potential challenges that the proposed project may present to the department. Please describe any measures that you would recommend to reduce potential concerns/challenges

Thank you for your assistance in responding to these questions. Your responses will help us ensure that our analysis is accurate and complete. To ensure a timely completion of our analysis, please provide your response via e-mail no later than Friday, November 10, 2023. If you have any questions, please contact me by email at schurchill@fcs-intl.com.

Sincerely,

Aaron Duncan, Fire Chief
308 Taft Highway
Bakersfield, CA 93307

Sent via e-mail to fireprevention@kerncountryfire.org

Subject: Westside Industrial Project Environmental Impact Report: Fire Protection Services

Dear Chief Duncan:

On behalf of Kern County, FirstCarbon Solutions (FCS) is preparing an Environmental Impact Report (EIR) for the proposed Westside Industrial Project. As part of the environmental review process, we are consulting with service providers to determine whether the project would impact their ability to deliver public services. We are contacting you to request information related to the provision of fire and emergency services.

The proposed 93.74 acres project is located 1.3 miles south of the City of Bakersfield, in unincorporated Kern County, but within the City of Bakersfield's Sphere of Influence. The project site is bound by Houghton Road to the north and Wible Road to the west and is situated approximately 1 mile west of State Route 99 and 8.75 miles east of Interstate 5. Regional access to the project site is available from SR-99 via the Houghton Road exit. Local access to the project site is available from Houghton Road and Wible Road. The proposed project would include the development of a 635,442 square foot single-story cubic warehouse distribution facility that would receive and consolidate products from vendors and then ship these products to other fulfillment centers within the network. This also includes 44,424 square feet of office space, a 24,256 square foot mezzanine, two guardhouses, and a pumphouse.

The project also includes the construction of a new private road along the eastern and southern perimeter of the project site to connect Houghton Road and Wible Road. The road would be two lanes to accommodate heavy trucks. Both the intersection of Houghton Road and the eastern perimeter road, as well as the intersection of Wible Road and Houghton Road, would be signalized. Existing roads would be improved with new pavement, raised median, curb and gutter, and sidewalk.

Potential impacts to fire services are an important element of our study. Our analysis strongly relies on your assistance in identifying potentially significant impacts to fire services that may occur as a result of the project, as well as any mitigation measure(s) that may reduce or eliminate these impacts. Any assistance that you can provide with addressing the following questions would be greatly appreciated.

Service Questions

1. Which station(s) would provide services to the project site?

2. What are the existing staffing levels, by type (department-wide and at the station(s) that would serve the project site)? What is the current number of firefighters, EMT personnel, engines, hook and ladder trucks, etc.?

3. Please provide the current average response times for emergency calls for service as a whole and for the station(s) located nearest to the project site.

4. Please provide an estimate of the annual number of service calls the proposed project would be expected to generate. If possible, please provide an estimate by type of call (e.g., EMS, fire, etc.)

5. What is the ability of the fire department to accommodate the demand of the proposed project as part of the existing facilities?

6. Are there any existing or planned mutual aid agreements with other agencies?

7. Please provide information about the residential and non-residential development fee schedule. What are the current rates? What is the estimate rate for the proposed project?

8. Do you foresee any potential challenges that the project may present to the department? This includes concerns related to response times, staffing, apparatus, fire stations, etc. Please describe any measures that you would recommend to reduce potential concerns/challenges.

9. Would the development of the proposed project impair the fire department's ability to maintain established response time standards with current staff and equipment levels?
10. Would the fire department need to construct new facilities or expand existing ones in order to serve the proposed project and the fire protection needs of the surrounding community?

11. Do you have any other comments about the potential impacts of this project on the fire department? Please provide any recommendations or special concerns that may assist us in avoiding or reducing the occurrence of potential impacts to fire services associated with the project.

Thank you for your assistance in responding to these questions. Your responses will help us ensure that our analysis is accurate and complete. To ensure a timely completion of our analysis, please provide your response via e-mail no later than Friday, November 10, 2023. If you have any questions, please contact me by email at schurchill@fcs-intl.com.

Subject: Westside Industrial Project Environmental Impact Report: School Services

Dear Superintendent Salyards:

On behalf of Kern County, FirstCarbon Solutions (FCS) is preparing an Environmental Impact Report (EIR) for the proposed Westside Industrial Project. As part of the environmental review process, we are consulting with service providers to determine whether the project would impact their ability to deliver public services. We are contacting you to request information related to the provision of school services.

The proposed 93.74 acres project is located 1.3 miles south of the City of Bakersfield, in unincorporated Kern County, but within the City of Bakersfield's Sphere of Influence. The project site is bound by Houghton Road to the north and Wible Road to the west and is situated approximately 1 mile west of State Route 99 and 8.75 miles east of Interstate 5.

Regional access to the project site is available from SR-99 via the Houghton Road exit. Local access to the project site is available from Houghton Road and Wible Road. The proposed project would include the development of a 653,442 square foot single-story cubic warehouse distribution facility, that would receive and consolidate products from vendors and then ship these products to other fulfillment centers within the network. This also includes 44,424 square feet of office space, a 24,256 square foot mezzanine, two guardhouses, and a pumphouse.

The project also includes the construction of a new private road along the eastern and southern perimeter of the project site to connect Houghton Road and Wible Road. The road would be two lanes to accommodate heavy trucks. Both the intersection of Houghton Road and the eastern perimeter road, as well as the intersection of Wible Road and Houghton Road, would be signalized. Existing roads would be improved with new pavement, raised median, curb and gutter, and sidewalk.

Potential impacts to school services are an important element of our study. Our analysis strongly relies on your assistance in identifying potentially significant impacts to school services that may occur as a result of the project, as well as any mitigation measure(s) that may reduce or eliminate these impacts. Any assistance that you can provide with addressing the following questions would be greatly appreciated.

Service Questions

1. We have prepared the following description of the General Shafter School District based on information available online. We would appreciate it if you could review and edit (as needed) for completeness and accuracy.

   According to the California School Dashboard and the District website, the district serves over 190 students grade K-8. The district includes one elementary school, with construction of a multipurpose facility scheduled to have been completed in 2019.

2. Based on the residential/commercial development potential of the proposed project, please provide an estimated number of students generated by the proposed project.

3. Please list the school(s) that may be affected by the proposed project and their current capacity/enrolment ratio.

4. Please provide information about the residential and non-residential development fee schedule currently assessed by/on behalf of the District.

5. Please define any potential challenges that the proposed project may present to the District. Please describe any measures that you would recommend to reduce potential concerns/challenges.

6. Please provide any additional information that you believe to be relevant to the proposed project.

Thank you for your assistance in responding to these questions. Your responses will help us ensure that our analysis is accurate and complete. To ensure a timely completion of our analysis, please provide your response via e-mail no later than Friday, November 10, 2023. If you have any questions, please contact me by email at schurchill@fcs-intl.com.

Existing roads would be improved with new pavement, raised median, curb and gutter, and sidewalk.

Potential impacts to school services are an important element of our study. Our analysis strongly relies on your assistance in identifying potentially significant impacts to school services that may occur as a result of the project, as well as any mitigation measure(s) that may reduce or eliminate these impacts. Any assistance that you can provide with addressing the following questions would be greatly appreciated.

Service Questions

1. We have prepared the following description of the Kern High School District based on information available online. We would appreciate it if you could review and edit (as needed) for completeness and accuracy.

   According to the 2023-2024 Local Control and Accountability Plan (LCAP) and the District website, the District serves 42,451 students grades 9-12 and encompasses approximately 3,500 square miles. The District includes 19 comprehensive high schools, five alternative education schools, three Special Education Career Centers, three Special Education Programs, two Career and Technical education sites, one blended learning program, the Bakersfield Adult School, and one charter school. and one adult education center.

2. Based on the residential/commercial development potential of the proposed project, please provide an estimated number of students generated by the proposed project.

3. Please list the school(s) that may be affected by the proposed project and their current capacity/enrolment ratio.

4. Please provide information about the residential and non-residential development fee schedule currently assessed by/on behalf of the District.

5. Please define any potential challenges that the proposed project may present to the District. Please describe any measures that you would recommend to reduce potential concerns/challenges.

6. Please provide any additional information that you believe to be relevant to the proposed project.

Thank you for your assistance in responding to these questions. Your responses will help us ensure that our analysis is accurate and complete. To ensure a timely completion of our analysis, please provide your response via e-mail no later than Friday, November 10, 2023. If you have any questions, please contact me by email at schurchill@fcs-intl.com.

Sincerely,

Spencer Churchill, Environmental Services Analyst

EXECUTIVE SUMMARY

The following Traffic Study (TS) has been prepared to analyze potential Vehicle Miles Traveled (VMT) impacts pursuant to the requirements of the California Environmental Quality Act (Public Resources Code [PRC] § 21000 *et seq*. and the CEQA Guidelines § 15000 *et seq*.) (collectively, CEQA) as well as to evaluate any non-CEQA Level of Service (LOS) deficiencies associated with the Westside Industrial Project ("proposed project"), a warehouse and distribution facility proposed in unincorporated Kern County (County). The proposed 93.74-acre project site is approximately 1.3 miles south of the City of Bakersfield, and located within the City of Bakersfield Sphere of Influence (SOI). The project site is located approximately 1 mile west of State Route 99 (SR 99), and bounded by Wible Road (west), Houghton Road (north), and agricultural land (south and east).

The project's applicant is proposing to develop a warehouse and distribution facility with a building footprint of approximately 629,186-square-feet, which includes approximately 44,424 square feet of interior office space, breakrooms, and other ancillary space. Approximately 1,000 passenger vehicle parking stalls, 726 truck trailer stalls, and 16 motorcycle parking stalls are proposed. The proposed facility would primarily facilitate material handling equipment and warehouse uses, and will feature approximately 132 loading docks along the north, west, and east sides of building. The building also contains approximately 24,256-square-foot mezzanine space, which would contain material handling equipment. The proposed operations incorporate a high-level of on-site automation and logistics management, enabling efficient processing of goods, and will run 24-hours a day, 365 days per year.

PROPOSED ROADWAY AND ACCESS IMPROVEMENTS

Off-site roadway improvements would be constructed by the proposed project along Houghton Road and Wible Road. The proposed project would also construct a private access road adjacent to the east and south sides of the site, referred to as East Private Road and South Private Road. Four (4) access driveways are proposed on the private access road along the south side of the site. It should be noted that the proposed frontage improvements are pending approval of County staff, therefore, design details included in concept are subject to revision.

HOUGHTON ROAD

With the construction of the proposed project, the southern half of Houghton Road would be widened along the property frontage to provide ½ width improvements for a County standard Type "A" Arterial Highway (Lot Size > 3 < 20 acres) with a half right-of-way width of 55-feet and a half-improved width of 35-feet. The cross-section would provide a single westbound travel lane and two travel lanes in the eastbound direction along the frontage that would become a drop right-turn lane at the East Private Road. The south 7-feet of the raised median would be constructed with the north half striped as a median. For purposes of intersection lane alignments and shift tapers, the proposed improvements would extend west of Wible Road and east of the East Private Road. These improvements would be interim conditions, where half of the roadway is built to its ultimate roadway cross-section, and expected to be in place until future development of the adjacent parcels occurs.

WIBLE ROAD

With the construction of the proposed project, the eastern portion of Wible Road would be widened along the property frontage to provide ½ width improvements for a County standard Type "A" Arterial Highway (Lot Size > 3 < 20 acres) with a half right-of-way width of 55-feet and a half-improved width of 35-feet. The cross-section would provide a single southbound travel lane, painted median, and one travel lane in the northbound direction along the frontage. For purposes of intersection lane alignments and shift tapers, the proposed improvements would extend north of Houghton Road and south of the South Private Road. These improvements would be interim conditions, where half of the roadway is built to its ultimate roadway cross-section, and expected to be in place until future development of the adjacent parcels occurs.

SITE ACCESS

Access to the proposed project would be established through the proposed construction of a private access road adjacent to the east and south sides of the site, East Private Road / South Private Road, and four (4) access driveways on the private access road along the south side of the site. The following summarizes the proposed access improvements:

- East Private Road
  - Construct a 50-foot-wide roadway along the eastern limits of the proposed project site, intersecting Houghton Road;
  - Construct limited-access (outbound left-turn restricted) intersection along the easter limits of the proposed project site, approximately 1,650-feet east of Wible Road;
  - Design intersection to accommodate inbound/outbound truck turning paths; and
  - Provide stop-control for northbound approach.
- South Private Road
  - Construct a 50-foot-wide roadway along the southern limits of the proposed project site, intersecting Wible Road;
  - Construct full-access intersection along the southern limits of the proposed project site, approximately 2,650-feet south of Houghton Road;
  - Design intersection to accommodate inbound/outbound truck turning paths; and
  - Provide stop-control for westbound approach.
- Outbound Truck Driveway
  - Construct driveway approximately 250-feet east of Wible Road, along the South Private Road;
  - Provide separate left-turn and right-turn lanes for the southbound approach;
  - Stripe two-way left-turn lane along South Private Road;
  - Provide a stop control at the southbound approach; and
  - Restrict inbound vehicles with signage.
- Passenger Vehicle Driveway 1
  - Construct full-access driveway approximately 375-feet east of Wible Road, along the South Private Road;
  - Provide separate left-turn and right-turn lanes for the southbound approach;
  - Stripe two-way left-turn lane along South Private Road; and
  - Provide a stop control at the southbound approach.
- Passenger Vehicle Driveway 2
  - Construct full-access driveway approximately 925-feet east of Wible Road, along the South Private Road;

    - Provide separate left-turn and right-turn lanes for the southbound approach;
    - Stripe two-way left-turn lane along South Private Road; and
    - Provide a stop control at the southbound approach.
- Inbound Truck Driveway
    - Construct driveway approximately 1,150-feet east of Wible Road, along the South Private Road;
    - Provide two inbound travel lanes;
    - Stripe two-way left-turn lane along South Private Road; and
    - Restrict outbound vehicles with signage.

TRIP GENERATION

It is estimated that the proposed project would generate 4,052 daily trips, with 547 trips (443 inbound / 104 outbound) during the a.m. peak hour and 755 trips (294 inbound / 461 outbound) during the p.m. peak hour. A Passenger Car Equivalent (PCE) of 3.0 was applied to truck trips to account for additional intersection delay and turn-pocket queue caused by truck trips. The resulting total of 4,341 daily PCE trips, with 573 PCE trips (455 inbound / 118 outbound) during the a.m. peak hour and 767 PCE trips (300 inbound / 467 outbound) during the p.m. peak hour are analyzed.

PROJECT IMPACTS / RECOMMENDATIONS (CEQA)

Based on the quantitative VMT analysis and thresholds applied, the proposed project would result in a significant impact, requiring mitigation. Prior to occupancy, the proposed project shall develop a TDM program to reduce VMTs associated with employee trips. The following TDM measures would be implemented by the proposed project as part of the TDM program:

1. Alternative-Mode Subsidies and Incentives: Provide subsidization of transit fares, carpool, or electric vanpool for employees of the project site. Provide monetary incentives for alternative-modes of transportation.
2. Travel Behavior Change Program: Provide a web site that allows employees to research alternate modes of transportation for commuting to the site.
3. Promotions & Marketing: Provide marketing and promotional tools to educate and inform travelers about site-specific transportation options and the effects of their travel choices with passive educational and promotional materials.
4. Commute Assistance Center: Provide a computer kiosk that allows employees to research other modes of transportation for commuting.
5. Preferential Carpool / Vanpool Parking Spaces: Provide reserved carpool/vanpool spaces closer to the building entrance.
6. Passenger Loading Zones: Provide passenger loading zones for easy access to carpools or vanpools.
7. Bike Share: Implement bike share to allow people to have on-demand access to a bicycle, as-needed.
8. Bike Parking and Facilities: Include dedicated bike route into facility and secure bike lockers/parking to support safe and comfortable bicycle travel. Provide on-site bicycle repair tools.

Combining the above-mentioned mitigation measures would reduce the proposed project's VMT per employee by 5.4 percent. However, since the proposed mitigations are not expected to reduce the proposed project's VMT per employee by more than 24.5 percent, the proposed project's VMT impact would be significant and unavoidable.

PROJECT DEFICIENCIES / RECOMMENDATIONS (NON-CEQA)

Level Of Service (LOS) operations were evaluated for the following five (5) scenarios:

- Existing (2023) Conditions – Represents the traffic conditions of the existing street network when traffic data was collected in May 2023.
- Opening Year (2026) Conditions – Represents the expected traffic conditions in 2026, the proposed project's anticipated opening year.
- Opening Year (2026) Plus Project Conditions – Represents the traffic conditions for the Opening Year (2026) with the addition of the proposed project's improvements and trip generation.
- Horizon Year (2046) Conditions – Represents the traffic conditions in 2046, the Kern COG travel demand model 2046 horizon year.
- Horizon Year (2046) Plus Project Conditions – Represents the traffic conditions for the Horizon Year (2046) Plus Project Conditions with the addition of the proposed project's improvements and trip generation.

Under the Opening Year (2026) Plus Project and Horizon Year (2046) Plus Project scenarios, the proposed project's traffic is expected to cause a LOS deficiency at Houghton Road & Union Avenue.

Under the Opening Year (2026) Plus Project and Horizon Year (2046) Plus Project scenarios, the intersection of Houghton Road & Union Avenue (Intersection #6) would not satisfy CA MUTCD Warrant 1 (8-hour) and Warrant 2 (4-hour). However, Warrant 3 (peak hour) would be satisfied for a single hour of the day (3 PM – 4 PM).

The CA MUTCD states the following:

> The Peak Hour signal warrant is intended for use at a location where traffic conditions are such that for a minimum of 1 hour of an average day, the minor-street traffic suffers undue delay when entering or crossing the major street. This signal warrant shall be applied only in unusual cases, such as office complexes, manufacturing plants, industrial complexes, or high-occupancy vehicle facilities that attract or discharge large numbers of vehicles over a short time.

It should be noted that the CA MUTCD suggests this warrant only be considered at intersections that provide direct access to proposed project site. However, the County has elected to consider the Peak Hour signal warrant at Houghton Road & Union Avenue. Therefore, a traffic signal would be warranted.

To alleviate the intersection LOS deficiency, it is recommended that the proposed project signalize the intersection and modify the raised median on Union Avenue to provide a northbound left-turn pocket (150-feet minimum). The following summarizes the recommended improvements and resulting lane geometry and control:

- Northbound: Modify raised median to provide left-turn pocket, thru lane and thru/right-turn lane;
- Southbound: Existing left-turn pocket (140-feet), thru lane and thru/right-turn lane;
- Eastbound: Existing shared left-turn/thru/right-turn lane;
- Westbound: Existing shared left-turn/thru lane and right-turn pocket (100-feet); and
- Signalize intersection, providing NB/SB protected left-turn phasing and EB/WB permissive phasing.

This improvement would enable the intersection to operate at LOS B for the AM and PM peak hours under both the Opening Year (2026) Plus Project and Horizon Year (2046) Plus Project conditions.

As stated above, the intersection satisfies only the CA MUTCD traffic signal Warrants 3 (peak hour) for a single hour of the day. Therefore, the recommendation for signalization is subject to the approval of the County, and acceptance of the Peak Hour Warrant as the basis for recommendation. These improvements would be constructed as an Opening Day (2026) feature, prior to occupancy since the proposed project traffic is expected to trigger the LOS deficiency.

1. INTRODUCTION

The following Traffic Study (TS) has been prepared to analyze potential Vehicle Miles Traveled (VMT) impacts pursuant to the requirements of the California Environmental Quality Act (Public Resources Code [PRC] § 21000 *et seq*. and the CEQA Guidelines § 15000 *et seq*.) (collectively, CEQA) as well as to evaluate any non-CEQA Level of Service (LOS) deficiencies associated with the Westside Industrial Project ("proposed project"), a warehouse and distribution facility proposed near the southern end of the San Joaquin Valley in unincorporated Kern County (County). The proposed project would include the construction of an approximately 629,186-square-foot single-story warehouse distribution facility and associated improvements on approximately 93.74-acres of privately owned land. The project site is bounded by Wible Road (west), Houghton Road (north), and agricultural land (south and east). The Assessor's Parcel Number (APN) is 184-391-08.

The proposed project site is approximately 1.3 miles south of the City of Bakersfield, and located within the City of Bakersfield Sphere of Influence (SOI). The City of Arvin lies approximately 11 miles east of the site, and the unincorporated community of Lamont is approximately 6 miles northeast. The proposed project site is situated approximately 1 mile west of State Route 99 (SR 99) and 8.75 miles east of Interstate 5 (I-5). Regional access to the project site is available from SR-99 via the Houghton Road exit. Local access to the project site is available from Houghton Road and Wible Road. Unpaved roads provide existing access within the project site. The project vicinity is characterized by cultivated agricultural uses (row crops and orchards) as well as agricultural processing facilities. The General Shafter Elementary School is located approximately 1 mile southeast of the project site at South H Street and Shafter Road. In addition, Kern High School District has identified a future school site at Wible Road and Engle Road approximately 0.5 mile north of the project site. **Figure 1-1** depicts the proposed project's location within the region.

The project's applicant is proposing to develop a warehouse and distribution facility with a building footprint of approximately 629,186-square-feet, which includes approximately 44,424 square feet of interior office space, breakrooms, and other ancillary space. Approximately 1,000 passenger vehicle parking stalls, 726 truck trailer stalls, and 16 motorcycle parking stalls are proposed. The proposed facility would primarily facilitate material handling equipment and warehouse uses, and will feature approximately 132 loading docks along the north, west, and east sides of building. The building also contains approximately 24,256-square-foot mezzanine space, which would contain material handling equipment. The proposed operations incorporate a high-level of on-site automation and logistics management, enabling efficient processing of goods, and will run 24-hours a day, 365 days per year. Off-site roadway improvements would be constructed by the proposed project along Houghton Road and Wible Road. The proposed project would also construct a private access road adjacent to the east and south sides of the site, referred to as East Private Road and South Private Road. Four (4) access driveways are proposed on the private access road along the south side of the site. **Figure 1-2** shows the proposed site plan.

Kern County and City of Bakersfield have jointly adopted a general plan for the metropolitan area (Metropolitan Bakersfield General Plan 2002). The project site is within the jurisdictional boundaries of the Metropolitan Bakersfield General Plan and is designated Intensive Agricultural (R-IA). The R-IA designation is applied to areas devoted to the production of irrigated crops, or areas that have the potential for such use. The proposed project includes a request to amend the Metropolitan Bakersfield General Plan, which would change the existing Kern County General Plan map code for the project site from R-IA to Light Industrial (LI). The project site is zoned Exclusive Agriculture (A) by the Kern County Zoning Code. The proposed project includes a request for a Zone Classification Change (ZCC) from Exclusive Agriculture (A) to Light Industrial/Precise Development Plan (M-1 PD).

Proposed Site Plan

STUDY AREA

The proposed project is expected to generate new vehicular trips that will increase traffic volumes on the surrounding street network, primarily along Houghton Road, between Wible Road and Union Avenue. To assess changes in traffic conditions associated with the proposed project, the intersections in **Table 1** and roadway segments in **Table 2** were evaluated. **Figure 1-3** illustrates the location of each intersection and roadway segment relative to the proposed project site. The four (4) access driveways proposed are also analyzed.

METHODOLOGY

This Traffic Study adheres to the Kern County guidelines, *Kern County Public Works Division Nine – Standards for Traffic Engineering, Chapter II. Traffic Studies*. This TS, similarly, adheres to the foregoing.

VEHICLE MILES TRAVELED (CEQA)

Senate Bill 743 (SB 743) was approved by the California legislature in September 2013. SB 743 requires changes to California Environmental Quality Act (CEQA), specifically directing the Governor's Office of Planning and Research (OPR) to develop alternative metrics to the use of vehicular LOS for evaluating transportation impacts of projects. OPR updated guidelines for CEQA and wrote a technical advisory for evaluating transportation impacts in CEQA in December 2018 (OPR Technical Advisory). OPR recommended that Vehicle Miles Travelled (VMT) replace LOS as the primary measure of transportation impacts.

The OPR Technical Advisory included transportation impact thresholds to adhere to the updated CEQA requirements, and helps with answering important implementation questions about the methodology, thresholds, and mitigation approaches for VMT impact analysis. Since Kern County has not adopted a VMT methodology or significant criteria, the VMT analysis for the proposed project was conducted following guidance outlined by OPR Technical Advisory on Evaluation Transportation Impacts in CEQA.[1]

Impact Criteria

Table 3 summarizes the VMT thresholds of significance for typical land uses, as recommended by OPR Technical Advisory.

Table 3: VMT Threshold of Significance

Land Use	Threshold of Significance
Residential	Project VMT per capita exceeds 85% of County Average VMT per capita
Office	Project VMT per employee exceeds 85% of County Average VMT per employee
Retail	Project generates a net increase in total regional VMT

While OPR's guidelines related to SB 743 is useful for evaluating typical residential, office and retail land use projects, it does not provide solutions to more complex, non-standard land uses like the proposed project's industrial land use. There are several practical issues that are not addressed by OPR's guidance. However, the guidance provides latitude for the reviewing agency to implement elements of VMT standards, such as thresholds.

[1] OPR. April 2018. Technical Advisory on Evaluating Transportation Impacts in CEQA. Website: https://opr.ca.gov/docs/20180416-743_Technical_Advisory_4.16.18.pdf

LOCAL TRANSPORTATION ANALYSIS (NON-CEQA)

A non-CEQA Local Transportation Analysis (LTA) was conducted to evaluate the proposed project's effect on traffic operations within the study area. This analysis evaluates intersection LOS analysis, roadway segment LOS analysis, queueing analysis and signal warrant evaluation. A traffic LOS analysis was conducted to identify the proposed project's access and circulation needs per guidelines outlined in the *Kern County Public Works Division Nine – Standards for Traffic Engineering, Chapter II. Traffic Studies.*

Analysis Scenarios

Five (5) scenarios were analyzed as part of the traffic operations analysis, listed below:

- **Existing (2023) Conditions** – Represents the traffic conditions of the existing street network when traffic data was collected in May 2023. This scenario does not include the proposed project's traffic.
- **Opening Year (2026) Conditions** – Represents the expected traffic conditions in 2026, the proposed project's anticipated opening year. Traffic volumes were developed from growth rates calculated using the Kern Council of Governments (COG) travel demand model. No cumulative project improvements or volumes were assumed. This scenario does not include traffic generated by the proposed project.
- **Opening Year (2026) Plus Project Conditions** – Represents the traffic conditions for the Opening Year (2026) with the addition of the proposed project's improvements and trip generation. Comparison of this scenario to the Opening Year (2026) Conditions scenario determines whether deficiencies are a direct result of the proposed project.
- **Horizon Year (2046) Conditions** – Represents the traffic conditions in 2046, the Kern COG travel demand model 2046 horizon year. Traffic volumes were developed from growth rates calculated using the Kern Council of Governments (COG) travel demand model. No cumulative project improvements or volumes were assumed. This scenario does not include traffic generated by the proposed project.
- **Horizon Year (2046) Plus Project Conditions** – Represents the traffic conditions for the Horizon Year (2046) Plus Project Conditions with the addition of the proposed project's improvements and trip generation. Comparison of this scenario to the Horizon Year (2046) Conditions scenario determines whether future deficiencies are expected to result from the proposed project.

Level of Service

Although CEQA now recognizes VMT as the primary analysis methodology for transportation impacts for purposes of CEQA, intersection and roadway segment LOS also analyzed as part of a non-CEQA evaluation to determine the operational effects of nearby study intersections due to the proposed project.

Intersection

The intersection analysis utilizes LOS methodologies for intersections published in the *Highway Capacity Manual (HCM)*, *6th Edition* (Transportation Research Board, 2016). LOS is a measure of congestion from a driver's perspective. LOS ranges from A (best), which represents free flow conditions with minimal delay, to F (worst), which represents heavy delay and a facility that is operating at or near its functional capacity. LOS methodologies and thresholds for this study were determined using HCM methods using the *Synchro 11* traffic analysis software.

The HCM includes procedures for analyzing side street stop controlled (SSSC), all-way stop controlled (AWSC), and signalized intersections. The SSSC procedure defines LOS as the highest delay of each

minor street movements or major street left turns. For AWSC and signalized intersection procedures define LOS as a function of average control delay for the entire intersection. **Table 4** presents the operational characteristics associated with each LOS category for signalized and unsignalized intersections.

Table 4: Intersection Level of Service Definitions

Level of Service	Description	Signalized (Avg. control delay per vehicle sec/veh.)	Unsignalized (Avg. control delay per vehicle sec/veh.)
A	Free flow with no delays. Users are virtually unaffected by others in the traffic stream	≤ 10	≤ 10
B	Stable traffic. Traffic flows smoothly with few delays.	> 10 – 20	> 10 – 15
C	Stable flow but the operation of individual users becomes affected by other vehicles. Modest delays.	> 20 – 35	> 15 – 25
D	Approaching unstable flow. Operation of individual users becomes significantly affected by other vehicles. Delays may be more than one cycle during peak hours.	> 35 – 55	> 25 – 35
E	Unstable flow with operating conditions at or near the capacity level. Long delays and vehicle queuing.	> 55 – 80	> 35 – 50
F	Forced or breakdown flow that causes reduced capacity. Stop and go traffic conditions. Excessive long delays and vehicle queuing.	> 80	> 50

Source: Transportation Research Board, Highway Capacity Manual 2016, National Research Council, 2016.

The following assumptions were included in the analysis:

- Peak-hour factor (PHF) based on the existing traffic data was used for the Existing and Opening Year scenarios. 0.92 PHF used for the Horizon Year scenarios.
- A Heavy Vehicle (HV) percentage of 12-percent based on the existing traffic data was used for all analysis scenarios and intersection movements.

Roadway Segment

Roadway segment LOS is analyzed using calculated volume-to-capacity (V/C) ratios based on roadway capacities in the Metropolitan Bakersfield General Plan, shown below.

Roadway Capacities

- 6-lane arterial 40,000 vehicles
- 4-lane arterial 30,000 vehicles
- 4-lane collector 30,000 vehicles
- 2-lane collector 15,000 vehicles

A V/C of 0.80 or less corresponds to a LOS of C or better.

Queuing

Vehicle queueing that exceeds a turn pocket length can create potentially hazardous conditions by blocking or disrupting through traffic in adjacent travel lanes. Vehicle queuing at interchange locations has the potential safety hazard of causing backup onto the freeway's mainlines or within the exit ramps deceleration zones. The effects of vehicle queuing for all exclusive turn lanes and the Caltrans exit ramps were analyzed for the Opening Year (2026) Plus Project and Horizon Year (2042) Plus Project scenarios using *Synchro 11* software and *HCM* methodology. The 95th percentile is defined as the queue length that has only a 5-percent probability of being exceeded during the analysis time period.

Signal Warrants

Traffic signals may be justified when traffic operations fall below acceptable LOS standards and when one or more signal warrants are satisfied. Traffic volumes at the unsignalized study intersections, where deficiencies are identified, were compared against the 8-hour, 4-hour and peak hour warrants in the 2014 California Manual on Uniform Traffic Control Devices (CA MUTCD)[2].

Deficiency Criteria

Potential deficiencies were determined by comparing conditions with the proposed project to those without the proposed project.

Intersection LOS (County) – Criteria for LOS deficiencies for the County intersections in this study are based on Kern County's *General Plan Circulation Element* (2009). The County standard for the minimum LOS for intersections is LOS D or better. However, since the study area is located within the Metropolitan Bakersfield General Plan Sphere Of Influence, the minimum LOS for intersections under the County's jurisdiction is LOS C or better. Therefore, a project-related deficiency is assumed if the addition of project traffic would cause a County intersection that is operating acceptably (LOS A, B or C) to begin to operate unacceptably (LOS D, E or F). For County intersections already operating unacceptably (LOS D, E or F), a project-related deficiency is assumed if the addition of project traffic would increase the delay by more than 2.0 seconds at LOS D/E or more than 1.0 second at LOS F. If project-related deficiency is found, improvements would be required.

Intersection LOS (Caltrans) – Criteria for LOS deficiencies for the Caltrans intersections in this study are based on Caltrans' *Guide for the Preparation of Traffic Impact Studies* dated December 2002, which states that "Caltrans endeavors to maintain a target LOS at the transition between LOS "C" and LOS "D" (see Appendix "C-3") on State highway facilities, however, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS. If an existing State highway facility is operating at less than the appropriate target LOS, the existing MOE should be maintained." Therefore, a project-related deficiency is assumed if the addition of project traffic would cause a Caltrans intersection that is operating acceptably (LOS A, B, C or D) to begin to operate unacceptably (LOS E or F). For Caltrans intersections already operating unacceptably (LOS E or F), a project-related deficiency is assumed if the addition of project traffic would increase the delay by more than 2.0 seconds at LOS E or more than 1.0 second at LOS F. If project-related deficiency is found, improvements may be required.

[2] *California Manual on Uniform Traffic Control Devices,* (FHWA's MUTCD 2009 Edition, including Revisions 1 & 2 as amended for use in California), 2014 Edition, Revision 6 (March 30, 2021)

Roadway Segment LOS – Criteria for LOS deficiency for the roadway segments in this study are based on Kern County's *General Plan Circulation Element* (2009). The County standard for the minimum LOS for roadway segments is LOS D or better. However, since the study area is located within the Metropolitan Bakersfield General Plan Sphere Of Influence, the minimum LOS for roadway segments is LOS C or better. Therefore, a project-related deficiency is assumed if the addition of project traffic would cause a roadway segment that is operating acceptably (LOS A, B or C) to begin to operate unacceptably (LOS D, E or F). For roadway segments already operating unacceptably (LOS D, E or F), a project-related deficiency is assumed if the addition of project traffic would increase the V/C ratio more than 0.02 at LOS D/E or more than 0.01 at LOS F. If project-related deficiency is found, improvements would be required.

Vehicle Queueing – Unacceptable or extended queuing is defined as spill over from turn pockets into through lanes and/or spill over into adjacent intersections. The County and Caltrans do not have specific thresholds for identifying project-related queueing deficiencies. This study assumes spill over to mean that the estimated 95th percentile queue for a turn pocket or Caltrans exit ramp where project trips are added, exceeds available storage by more than one car length, or 25-feet. If a turn pocket is anticipated to exceed available storage under no-project conditions, the proposed project would be expected to cause constrained access for that movement if it increases the deficient queue by more than 25-feet.

REPORT ORGANIZATION

The remainder of this TS is divided into the following chapters:

- Chapter 2 – Existing (2023) Conditions: describes the existing conditions of transportation network and summarizes existing traffic data collected.
- Chapter 3 – Project Description: proposed roadway/access improvements adjacent to the proposed project's site and project-related trip generation/distribution/assignment.
- Chapter 4 – Vehicle Miles Traveled (VMT) analysis: summarizes methodology, inputs, assumptions, results and conclusion of the VMT analysis. (CEQA)
- Chapter 5 – Local Transportation Analysis (Non-CEQA): describes the supplemental traffic operation analysis which includes an analysis of intersection LOS, roadway segment LOS, queueing and signal warrant analysis. (non-CEQA)
- Chapter 6 – Access and Circulation: describes site access and internal circulation for the proposed project. (non-CEQA)
- Chapter 7 – Conclusion and Recommendations: summarizes potential impacts (CEQA) and deficiencies (non-CEQA) of the proposed project and recommended feasible mitigations and improvements.

2. EXISTING (2023) CONDITIONS

This chapter describes the existing conditions of the roadway network within the vicinity of the proposed project site.

EXISTING MULTI-MODAL FACILITIES

Currently, there are no sidewalks, bicycle facilities or transit service in the proposed project's study area. The nearest transit service consists of Kern Transit's Route 130 (Santa Clarita-Bakersfield) and Route 145 (Lamont-Bakersfield South). Both routes stop at the McKee Road Park & Ride lot, which is 4 miles north of the site on the east side of SR 99. Both routes start at the GET Downtown Transit Center in downtown Bakersfield and make several stops before reaching the McKee Road stop. However, the McKee Road stop is too far to provide a practical transit solution for the proposed project site.

EXISTING ROADWAY NETWORK

The roadway network within the study area is within Kern County and Caltrans jurisdictions. This section provides a description of the relevant roadways included in this study.

State Route 99 (SR 99) is a north-south divided freeway that connects to Interstate 5 approximately 16-miles south of the study area up to Sacramento. As of 2023, the freeway adjacent to the study area was under construction to widen from three lanes in each direction to four lanes in each direction. There is one (1) interchange within the study area at Houghton Road. The freeway exit ramps are stop-controlled.

Houghton Road is an east-west roadway providing access from rural areas in the west to the SR 99 in the east. Within the study area, Houghton Road is constructed as a two-lane undivided roadway and classified as a future arterial roadway in the Metropolitan Bakersfield General Plan.

Wible Road is a north-south roadway providing access from rural areas in the south to Brundage Lane in Bakersfield to the north. Within the study area, Wible Road is constructed as a two-lane undivided roadway and classified as a future arterial roadway in the Metropolitan Bakersfield General Plan. The intersection with Houghton Road is all-way stop-controlled.

H Street is a north-south roadway providing local access between Curnow Road and Bear Mountain Road. Within the study area, H Street is constructed as a two-lane undivided roadway. The intersection with Houghton Road is all-way stop-controlled.

Chevalier Road is a north-south roadway providing local access between Houghton Road and Shafter Road. Within the study area, Chevalier Road is constructed as a two-lane undivided roadway. The intersection with Houghton Road is two-way stop-controlled.

Union Avenue (Business SR 99) is a north-south roadway providing a roadway connection between agricultural areas east of SR 99 with downtown Bakersfield. Within the study area, Union Avenue is constructed as a major four-lane arterial. The intersection with Houghton Road is all-way stop-controlled.

The existing intersection/roadway lane configurations and traffic controls, as of June 2023, are illustrated in **Figure 2-1**.

Existing (2023) Transportation Conditions

TRAFFIC VOLUMES

Intersection turning movement and roadway segment volumes for the study area were collected on Tuesday, May 2nd, 2023, when local schools were in session and when weather was fair. Intersection turning movement volumes were collected for 14 hours, between 6 AM and 8 PM, at four (4) intersections identified for potential future signalization. At the two (2) intersections of Houghton Road/H Street and Houghton Road/Chevalier Road, intersection turning movements were collected for 4 hours during the typical commuter peak hours (7-9 AM and 4-6 PM). Roadway segment data was collected for a 24-hour period at five (5) locations. Vehicular classification data was obtained from the roadway segment data on Houghton Road, between H Street and SR 99 SB Ramps. A HV percentage was determined from the classification data for purposes of the intersection LOS analysis calculations. Existing (2023) peak hour turning movement and Average Daily Traffic (ADT) volumes are illustrated in **Figure 2-2**. **Appendix A** contains the intersection and roadway segment/classification data sheets.

3. PROJECT CONDITIONS

This chapter presents a description of the proposed roadway and site access improvements adjacent to the proposed project and project-related trip generation, trip distribution, and trip assignment.

PROPOSED ROADWAY AND ACCESS IMPROVEMENTS

Off-site roadway improvements would be constructed by the proposed project along Houghton Road and Wible Road. The proposed project would also construct a private access road adjacent to the east and south sides of the site, referred to as East Private Road and South Private Road. Four (4) access driveways are proposed on the private access road along the south side of the site. **Appendix B** contains concept drawings of the proposed frontage. It should be noted that the proposed frontage improvements are pending approval of County staff, therefore, design details included in concept are subject to revision.

HOUGHTON ROAD

With the construction of the proposed project, the southern half of Houghton Road would be widened along the property frontage to provide ½ width improvements for a County standard Type "A" Arterial Highway (Lot Size > 3 < 20 acres) with a half right-of-way width of 55-feet and a half-improved width of 35-feet. The cross-section would provide a single westbound travel lane and two travel lanes in the eastbound direction along the frontage that would become a drop right-turn lane at the East Private Road. The south 7-feet of the raised median would be constructed with the north half striped as a median. For purposes of intersection lane alignments and shift tapers, the proposed improvements would extend west of Wible Road and east of the East Private Road. These improvements would be interim conditions, where half of the roadway is built to its ultimate roadway cross-section, and expected to be in place until future development of the adjacent parcels occurs.

WIBLE ROAD

With the construction of the proposed project, the eastern portion of Wible Road would be widened along the property frontage to provide ½ width improvements for a County standard Type "A" Arterial Highway (Lot Size > 3 < 20 acres) with a half right-of-way width of 55-feet and a half-improved width of 35-feet. The cross-section would provide a single southbound travel lane, painted median, and one travel lane in the northbound direction along the frontage. For purposes of intersection lane alignments and shift tapers, the proposed improvements would extend north of Houghton Road and south of the South Private Road. These improvements would be interim conditions, where half of the roadway is built to its ultimate roadway cross-section, and expected to be in place until future development of the adjacent parcels occurs.

PRIVATE ROAD

With the construction of the proposed project, a private access road is proposed along the east and south sides of the site. This private roadway would be constructed with a 50-foot curb-to-curb width and striped with a 12-foot two-way left-turn lane, single 12-foot travel lanes in each direction and 8-foot shoulders.

ACCESS DRIVEWAYS

With the construction of the proposed project, four (4) access driveways would be constructed along the south side: one (1) outbound-only driveway for delivery trucks, two (2) full-access stop-controlled driveways for passenger vehicles, and one (1) inbound-only driveway for delivery trucks. Guard stations are proposed

at the delivery truck driveways.

TRIP GENERATION

Trip generation estimates are based on the *Institute of Transportation Engineers (ITE) Trip Generation Manual, 11th Edition*.[3] A trip is defined as a single or one-directional vehicle movement with either the origin or destination at the project site. In other words, a trip can be either "to" or "from" the site and therefore, a single visitor to a site is counted as two. Trips generated by the proposed project are estimated for a typical weekday, and for a typical weekday's AM and PM commuter peak hours, which are between 7-9 AM and 4-6 PM. **Table 5** presents ITE trip rates for Industrial land uses that were considered for estimating trip generation.

Table 5: ITE Trip Rates Considered

ITE Land Use	Daily Trip Rate	AM Peak Hour Trip Rate	PM Peak Hour Trip Rate
110 – General Light Industrial	4.87 / ksf	0.74 / ksf	0.65 / ksf
130 – Industrial Park	3.37 / ksf	0.34 / ksf	0.34 / ksf
150 – Warehousing	1.71 / ksf	0.17 / ksf	0.18 / ksf
154 – High-Cube Transload and Short-Term Warehouse	1.40 / ksf	0.08 / ksf	0.10 / ksf
155 – High-Cube Fulfillment Center Warehouse (Non-Sort)	1.81 / ksf	0.15 / ksf	0.16 / ksf
155 – High-Cube Fulfillment Center Warehouse (Sort)	**6.44 / ksf**	**0.87 / ksf**	**1.20 / ksf**
156 – High-Cube Parcel Hub Warehouse	4.63 / ksf	0.70 / ksf	0.64 / ksf

Source: Trip Generation Manual, 11th Edition, Institute of Transportation Engineers, 2022.

Based on the building size and operations expected to occur, the proposed project is expected to operate most similar to the ITE land use descriptions outlined under Land Use 154 (High-Cube Transload and Short-Term Warehouse), Land Use 155 (High-Cube Fulfillment Center Warehouse) and Land Use 156 (High-Cube Parcel Hub Warehouse). Of the three warehouse uses, ITE Land Use 155 generates higher Daily, AM peak hour, and PM peak hour trips. Based on the tenant's estimated number of employees and shift structure, trip generation for the proposed project is expected to be most similar to the average rates for ITE Land Use 155 (High-Cube Fulfillment Center Warehouse - Sort). Therefore, the volume of traffic is expected to be most accurately represented by selecting these rates.

Table 6 contains a summary of the proposed project's trip generation. It is estimated that the proposed project would generate 4,052 daily trips, with 547 trips (443 inbound / 104 outbound) during the a.m. peak hour and 755 trips (294 inbound / 461 outbound) during the p.m. peak hour. A Passenger Car Equivalent (PCE) of 3.0 was applied to truck trips to account for additional intersection delay and turn-pocket queue caused by truck trips. The resulting total of 4,341 daily PCE trips, with 573 PCE trips (455 inbound / 118 outbound) during the a.m. peak hour and 767 PCE trips (300 inbound / 467 outbound) during the p.m. peak hour are analyzed.

[3] *Trip Generation Manual, 11th Edition*, Institute of Transportation Engineers, 2022.

TABLE 6: TRIP GENERATION SUMMARY

Land Use as listed in ITE		Units[1]	Trip Rate[2]	Daily Trips	AM Peak-Hour					PM Peak-Hour

PROJECT TRIP DISTRIBUTION AND ASSIGNMENT

The proposed project's employee trip distribution was developed using select zone model runs from the Kern Council of Governments (Kern COG) travel demand model. The Kern COG Model compiles a wide variety of data and forecasts future transportation demands that are currently known and planned for. The model-based distribution was refined based on the existing roadway/freeway configurations and expected travel patterns from the most populated areas in Bakersfield and surrounding communities.

The following is the trip distribution patterns for the passenger vehicles assumed for the proposed project:

- 5% to/from the west along Houghton Road, west of Wible Road;
- 15% to/from the north along Wible Road, north of Houghton Road;
- 5% to/from the south along Wible Road, south of South Private Road;
- 45% to/from the north along SR 99, using Houghton Road interchange;
- 10% to/from the south along SR 99, using Houghton Road interchange;
- 7% to/from the north along Union Avenue, north Houghton Road;
- 10% to/from the east along Houghton Road, east of Union Avenue; and
- 3% to/from the south along Union Avenue, south of Houghton Road.

Since delivery trucks would not originate locally and would travel to/from the site via designated truck routes from the SR 99 freeway, these vehicles are assumed to be distributed to the study area as follows:

- 60% to/from the north along SR 99, using the Houghton Road interchange; and
- 40% to/from the south along SR 99, using the Houghton Road interchange.

Figure 3-1 shows the passenger vehicle trip distribution and **Figure 3-2** shows the delivery truck trip distribution for the proposed project's traffic. Based on this assumed trip distribution, the passenger vehicle and truck volumes generated by the proposed project were assigned to the street network. **Figure 3-3** illustrates the trip assignment for passenger vehicles and **Figure 3-4** illustrates the trip assignment for delivery trucks, normalized with a PCE. **Figure 3-5** shows the total trip assignment for the proposed project, normalized with a PCE.

Appendix C contains the Kern COG Model Plots and distribution calculations.

4. VEHICLE MILES TRAVELED ANALYSIS (CEQA)

This chapter discussed the VMT screening and analysis conducted for the proposed project.

SCREENING

The OPR guidelines provides details on appropriate screening thresholds that can be used to identify when a proposed land use project is presumed to result in a less than significant impact such that a more detailed level analysis is not warranted. Screening thresholds related to the proposed land use is broken into the following three steps:

1. Transit Priority Area (TPA) Screening
   As described in the OPR Technical Advisory, projects located within a half-mile from an existing major transit stop or within half of a mile from an existing stop along a high-quality transit corridor can be screened out.
2. Low VMT Area Screening
   Projects that are located within low VMT efficient areas can be screened out.
3. Low Project Type Screening
   Projects that generate less than 110 daily trips could be considered not to lead to a significant impact and can be screened out.

A land use project must only meet one of the above screening thresholds to be presumed to not result in a significant impact under CEQA pursuant to SB 743. However, the proposed project does not meet any of the criteria that would allow the proposed project to be presumed to have less than significant impacts and thus screened out from further evaluation. Therefore, a complete VMT analysis is required to further evaluate the potential VMT impacts of the proposed project.

PROJECT VMT

The OPR guidance related to SB 743 is a helpful introduction to using VMT to evaluate projects. OPR has established that a broad range of analysis tools may be acceptable for the purposes of VMT analysis including:

Travel demand models, sketch models, spreadsheet models, research and data can all be used to calculate and estimate VMT. To the extent possible, lead agencies should choose models that have sensitivity to features of the project that affect VMT. Those tools and resources can also assist in establishing thresholds of significance and estimating VMT reduction attributable to mitigation measures and project alternatives. When using models and tools for those various purposes, agencies should use comparable data and methods, in order to set up an "apples-to-apples" comparison between thresholds, VMT estimates, and VMT mitigation estimates[4].

Kimley-Horn had developed a VMT efficiency matrices using Replica Big Data platform for the proposed project as well as covering most of the California. Replica provides travel and demographic data similar to a travel demand model with various trip attributes such as trip mode, trip purpose, trip distance, origin, and destination. Replica provides trip data for the year 2023 using different data points including cell phone data. Vehicle trips by purpose and trip distances for Kern County and surrounding areas were compiled at block-group level from the Replica big data platform. Population data from the Census Bureau's American

[4] OPR Guidelines, page 30

Community Survey (ACS) was compiled for the year 2019 as well. VMT per Capita for the Los Angeles County as well as for the Project area separately was calculated at block-group level, using the existing big data trips, trip purpose, trip distance and population. The proposed project area VMT was compared against the threshold considered for this project to assess potential significant VMT impacts.

POTENTIAL IMPACTS

Table 7 shows the proposed project's VMT results based on the Replica Big Data.

Table 7: VMT per Employee – Replica Big Data

Efficiency Metric	Existing County Average VMT	VMT Threshold	Project Area VMT	Potentially Significant?
VMT per Employee	23.29	19.80	26.23	**Yes**

The proposed project would result in a significant impact, and requires mitigation that would be expected to reduce the average miles traveled to the project site by 6.43 VMT per employee, or approximately 24.5 percent of the total VMT.

Appendix H contains VMT calculations and support information.

5. LOCAL TRANSPORTATION ANALYSIS (NON-CEQA)

This chapter will discuss non-CEQA traffic operation analysis prepared to determine the effect of the proposed project on the transportation system. This operational traffic analysis includes an evaluation of intersection LOS, roadway segment LOS, queuing, and signal warrant analysis.

LEVEL OF SERVICE

LOS analysis was conducted to evaluate the proposed project's effect on the operations of the study intersections and roadway segments.

EXISTING (2023) CONDITIONS

Existing (2023) Conditions represents the on-the-ground conditions present in May 2023, when traffic data was collected. This scenario does not include the proposed project's traffic.

Existing (2023) Transportation Conditions

Existing (2023) Transportation Conditions were discussed in Chapter 2 and illustrated in Figure 2-1.

Existing (2023) Traffic Volumes

Existing (2023) Traffic Volumes were discussed in Chapter 2 and illustrated in Figure 2-2.

Existing (2023) Intersection Level of Service

Table 9 displays the intersection LOS analysis results under Existing (2023) Conditions, showing all intersections operate at LOS C or better during the AM and PM commuter peak hours. **Appendix D** contains the intersection LOS calculation worksheets.

Existing (2023) Roadway Segment Level of Service

Table 8 displays the roadway segment LOS analysis results under Existing (2023) Conditions, showing all roadway segments operate at LOS C or better.

Table 8: Existing (2023) Conditions Roadway Segment LOS Summary

#	Roadway Segment	Functional Classification (a)	ADT (b)	V/C (c)	LOS C or Better?
1	Houghton Road: Wible Road to H Street	2-Lane Collector	2,111	0.14	Yes
2	Houghton Road: H Street to SR 99 SB Ramps	2-Lane Collector	2,872	0.19	Yes
3	Houghton Road: SR 99 SB Ramps to NB Ramps	2-Lane Collector	4,064	0.27	Yes
4	Houghton Road: SR 99 NB Ramps to Union Avenue	2-Lane Collector	3,891	0.26	Yes
5	Wible Road: Houghton Road to South Private Road	2-Lane Collector	859	0.06	Yes

Notes:
(a) Functional roadway classification per Metropolitan Bakersfield General Plan
(b) ADT = Average Daily Traffic (two-way total)
(c) V/C = Volume to capacity ratio

TABLE 9: EXISTING (2023) CONDITIONS INTERSECTION LOS SUMMARY

#	Intersection	Jurisdiction	Traffic Control	Peak Hour	Existing (2023) Conditions

Notes:

Bold values indicate intersections operating at unacceptable LOS. **Bold and shaded** values indicate project significant impact.

ECL = Exceeds Calculable Limit. Reported when delay exceeds 180 seconds.

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a one- or two-way stop-controlled intersection, delay refers to the worst movement. At intersections 3 and 4, delay refers to the worst approach to account for slip right-turn lanes.

(b) LOS calculations are based on the methodology outlined in the *Highway Capacity Manual 6th Edition* and performed using Synchro 11.0

OPENING YEAR (2026) CONDITIONS

Opening Year (2026) Conditions represent the expected conditions when the proposed project is constructed, which is assumed to occur in 2026.

Opening Year (2026) Transportation Conditions

The transportation conditions for Opening Year (2026) Conditions are assumed to be the same as Existing (2023) Conditions, illustrated on Figure 2-2, since no improvements are expected within the study area before the proposed project is expected to open.

Opening Year (2026) Traffic Volumes

To account for background growth within the study area, the Opening Year (2026) traffic volumes were developed by calculating the total traffic growth from the Kern COG model between the base year (2022) and the horizon year (2046) and applying a four-year growth increment to account for growth from the base year to opening year (2026). This growth increment was calculated for each intersection approach and applied to Existing (2023) Peak Hour Turning Movement and ADT Volumes, shown on Figure 2-2, using the existing turning movement and roadway segment proportions. The resulting Opening Year (2026) Peak Hour Turning Movement and ADT Volumes are presented in **Figure 5-1. Appendix E** contains the methodology used for traffic forecasting of future baseline volumes, model plots and future volume development calculation worksheets.

Opening Year (2026) Intersection Level of Service

Table 11 displays the intersection LOS analysis results under Opening Year (2026) Conditions, showing all intersections are expected to operate at LOS C or better during the AM and PM commuter peak hours. **Appendix D** contains the intersection LOS calculation worksheets.

Opening Year (2026) Roadway Segment Level of Service

Table 10 presents the roadway segment LOS analysis under Opening Year (2026) Conditions, showing all segments are expected to operate at LOS C or better.

Table 10: Opening Year (2026) Conditions Roadway Segment LOS Summary

#	Intersection	Functional Class (a)	ADT (b)	V/C (c)	LOS C or Better?
1	Houghton Road: Wible Road to H Street	2-Lane Collector	2,276	0.15	Yes
2	Houghton Road: H Street to SR 99 SB Ramps	2-Lane Collector	2,997	0.20	Yes

OPENING YEAR (2026) PLUS PROJECT CONDITIONS

Opening Year Plus Project Conditions represent the expected conditions in 2026, when the Project is expected to be complete, with the addition of the proposed project's roadway and access improvements and traffic generated.

Opening Year (2026) Plus Project Transportation Conditions

The Opening Year (2026) Plus Project Conditions are the same as Existing (2023) Conditions with the addition of the Project's frontage improvements as described in Section 3, and illustrated in the drawings contained in **Appendix B**. The transportation conditions within the study area with the construction of the Project are illustrated in **Figure 5-2**.

Opening Year (2026) Plus Project Traffic Volumes

Opening Year (2026) Plus Project traffic volumes were developed by adding the proposed project's trip assignments, shown in Figure 3-5, to the Opening Year (2026) Peak Hour Turning Movement and ADT Volumes, Figure 5-1. **Figure 5-3** presents the Opening Year (2026) Plus Project Peak Hour Turning Movement and ADT Volumes**.**

Opening Year (2026) Plus Project Intersection Level of Service

Table 11 displays the intersection LOS analysis results under Opening Year (2026) Plus Project Conditions, showing all intersections are expected to operate at LOS C or better during the AM and PM commuter peak hours with the addition of the proposed project's traffic, except for the intersection at Houghton Road & Union Avenue (Intersection #6), which operates at LOS B in the AM peak hour and LOS D in the PM peak hour. **Appendix D** contains the intersection LOS calculation worksheets.

Opening Year (2026) Plus Project Roadway Segment Level of Service

Table 12 presents the roadway segment LOS analysis results under Opening Year (2026) Conditions and Opening Year (2026) Plus Project Conditions, showing all segments are expected to continue to operate at LOS C or better with the addition of proposed the project's traffic.

HORIZON YEAR (2046) CONDITIONS

Horizon Year conditions represent the expected background conditions in 2046, which is the Kern COG model's future forecast horizon year.

Horizon Year (2046) Transportation Conditions

The transportation conditions for the Horizon Year (2046) Conditions are assumed to be the same as Existing (2023) Conditions and Opening Year (2026) Conditions, illustrated on Figure 2-2, since no improvements are expected within the study area at this time.

Horizon Year (2046) Traffic Volumes

To account for background growth within the study area, the Horizon Year (2046) traffic volumes were developed by calculating the total traffic growth from the Kern COG model between the base year (2022) and the horizon year (2046). The 2046 model scenario accounts for all planned projects and ambient growth in Countywide population and employment at this time. The entire growth increment was calculated for each intersection approach and applied to the Existing (2022) Peak Hour Turning Movement and ADT Volumes, shown on Figure 2-2, using the existing turning movement and roadway segment proportions. The resulting Horizon Year (2046) Peak Hour Turning Movement and ADT Volumes are presented in **Figure 5-4**. **Appendix E** contains the methodology used for traffic forecasting of future baseline volumes, model plots and future volume development calculation worksheets.

Horizon Year (2046) Intersection Level of Service

Table 14 displays the intersection LOS analysis results under Horizon Year (2046) Conditions, showing all intersections are expected to operate at LOS C or better during the AM and PM commuter peak hours. **Appendix D** contains the intersection LOS calculation worksheets.

Horizon Year (2046) Roadway Segment Level of Service

Table 13 presents the roadway segment LOS analysis under Horizon Year (2046) Conditions, showing all segments are expected to operate at LOS C or better.

Table 13: Horizon Year (2046) Conditions Roadway Segment LOS Summary

SIGNAL WARRANT

Traffic signals may be justified when one or more signal warrants is satisfied. Signal warrant analysis was performed at the deficient intersection (Houghton Road & Union Avenue) identified in the LTA per the *2014 California Manual on Uniform Traffic Control Devices (CA MUTCD)*. Traffic volumes for the Opening Year (2026), Horizon Year (2046), Opening Year (2026) Plus Project, and Horizon Year (2046) Plus Project scenarios were evaluated for the hours of 6 AM – 8PM.

The following traffic signal warrants were applicable to the project location:

> Traffic Signal Warrant #1 – Eight Hour Vehicular Volume is satisfied when traffic volumes on the major and minor approaches exceed thresholds for eight hours of the day. This warrant typically applies at locations where a large volume of intersection traffic is the principal reason to consider installing a traffic control signal or when traffic volumes on a major street are so heavy that traffic on the minor street suffers excessive delay or conflict in entering or crossing the major street.
>
> Traffic Signal Warrant #2 – Four Hour Vehicular Volume is satisfied when traffic volumes on the major and minor approaches exceed thresholds for four hours of the day. This warrant typically applies at locations where a large volume of intersection traffic is the principal reason to consider installing a traffic control signal or when traffic volumes on a major street are so heavy that traffic on the minor street suffers excessive delay or conflict in entering or crossing the major street.
>
> Traffic Signal Warrant #3 – Peak Hour Vehicular Volume is satisfied when traffic volumes on the major and minor approaches exceed thresholds for one hour of the day. This warrant applies to unusual cases, such as office complex, manufacturing plants, industrial complexes, or high-occupancy vehicle facilities that attract or discharge large numbers of vehicles over a short time. Therefore, this warrant is recommended to only be considered at intersections that provide direct access to proposed project site (Intersections 7 and 8).

Opening Year (2026) Plus Project

The intersection of Houghton Road & Union Avenue (Intersection #6) would operate at LOS D during the PM peak hour under Opening Year (2026) Plus Project conditions. Under these conditions, the intersection would not satisfy CA MUTCD Warrant 1 (8-hour) and Warrant 2 (4-hour). However, Warrant 3 (peak hour) is expected to be satisfied for a single hour of the day (3 PM – 4 PM). It should be noted that the intersection would not meet any CA MUTCD signal warrant under the Opening Year (2026) baseline conditions. CA MUTCD signal warrant methodology summary and calculations are included in **Appendix G**.

Horizon Year (2046) Plus Project

The intersection of Houghton Road & Union Avenue (Intersection #6) would operate at LOS D during the PM peak hour under Horizon Year (2046) Plus Project conditions. Under these conditions, the intersection would not satisfy CA MUTCD Warrant 1 (8-hour) and Warrant 2 (4-hour). However, Warrant 3 (peak hour) is expected to be satisfied for a single hour of the day (3 PM – 4 PM). It should be noted that the intersection would meet the CA MUTCD Warrant 1 signal warrant under the Horizon Year (2046) baseline conditions. CA MUTCD signal warrant methodology summary and calculations are included in **Appendix G**.

QUEUING

Vehicle queuing that exceeds a turn pocket length can create potentially hazardous conditions by blocking or disrupting through traffic in adjacent travel lanes. Vehicle queuing at interchange locations has the potential safety hazard of causing backup onto the freeway's mainlines or within the exit ramps deceleration zones. The effects of vehicle queuing for all exclusive turn lanes and the Caltrans exit ramps were analyzed for the Opening Year (2026) Plus Project and Horizon Year (2042) Plus Project scenarios using *Synchro 11* software and *HCM* methodology. The 95th percentile is defined as the queue length that has only a 5-percent probability of being exceeded during the analysis time period. **Table 16** summarizes the queueing analysis results for each intersection turning movement and Caltrans ramp evaluated. The results show that all calculated 95th percentile queue lengths are less than available storage. Therefore, the proposed project is not expected to cause queueing deficiencies that would block adjacent through movements at intersections, or queues that would extend into ramp's deceleration areas or block the mainline traffic. Simtraffic queue length calculation sheets are provided in **Appendix F**.

TABLE 16: QUEUEING SUMMARY

#	Intersection	Movement	Available Storage (ft)	95th Percentile Queue Length[1]			
				Opening Year (2026) Plus Project Conditions		Horizon Year (2046) Plus Project Conditions

6. ACCESS AND CIRCULATION (NON-CEQA)

This section discusses site access and the internal site circulation recommendations for the proposed project.

SITE ACCESS

Access to the proposed project would be established through the proposed construction of a private access road adjacent to the east and south sides of the site, East Private Road / South Private Road, and four (4) access driveways on the private access road along the south side of the site. The following summarizes the proposed access improvements:

- East Private Road
  - Construct a 50-foot-wide roadway along the eastern limits of the proposed project site, intersecting Houghton Road;
  - Construct limited-access (outbound left-turn restricted) intersection along the easter limits of the proposed project site, approximately 1,650-feet east of Wible Road;
  - Design intersection to accommodate inbound/outbound truck turning paths; and
  - Provide stop-control for northbound approach.
- South Private Road
  - Construct a 50-foot-wide roadway along the southern limits of the proposed project site, intersecting Wible Road;
  - Construct full-access intersection along the southern limits of the proposed project site, approximately 2,650-feet south of Houghton Road;
  - Design intersection to accommodate inbound/outbound truck turning paths; and
  - Provide stop-control for westbound approach.
- Outbound Truck Driveway
  - Construct driveway approximately 250-feet east of Wible Road, along the South Private Road;
  - Provide separate left-turn and right-turn lanes for the southbound approach;
  - Stripe two-way left-turn lane along South Private Road;
  - Provide a stop control at the southbound approach; and
  - Restrict inbound vehicles with signage.
- Passenger Vehicle Driveway 1
  - Construct full-access driveway approximately 375-feet east of Wible Road, along the South Private Road;
  - Provide separate left-turn and right-turn lanes for the southbound approach;
  - Stripe two-way left-turn lane along South Private Road; and
  - Provide a stop control at the southbound approach.
- Passenger Vehicle Driveway 2
  - Construct full-access driveway approximately 925-feet east of Wible Road, along the South Private Road;
  - Provide separate left-turn and right-turn lanes for the southbound approach;
  - Stripe two-way left-turn lane along South Private Road; and
  - Provide a stop control at the southbound approach.
- Inbound Truck Driveway
  - Construct driveway approximately 1,150-feet east of Wible Road, along the South Private Road;

- Provide two inbound travel lanes;
- Stripe two-way left-turn lane along South Private Road; and
- Restrict outbound vehicles with signage.

INTERNAL SITE CIRCULATION

The internal circulation would consist of delivery trucks entering the eastmost driveway, circulating around the permitter of site in counterclockwise direction while unloading and loading product, and exiting the site via the westernmost driveway. Guard station are present near the truck entrances and exits for logistics and security purposes. Any queuing of trucks due to the guard station would be contained within the site. Employees commuting in passenger vehicles would enter and exit the site via the two (2) middle driveways. Sufficient parking would be present within the proposed project site. Employees would not park within the County's right-of-way.

7. SUMMARY OF IMPACTS, DEFICIENCIES AND RECOMMENDATIONS

Based on the results of the traffic VMT and the non-CEQA LOS operational analysis of the proposed project, potential significant impacts and deficiencies were identified, as defined in TS Methodology (Section 1). This chapter summarizes these potential impacts and/or deficiencies caused by the expected trips generated by the proposed project and recommended mitigation and/or improvements.

PROJECT IMPACTS / RECOMMENDATIONS (CEQA)

Based on the quantitative VMT analysis and thresholds applied, the proposed project would result in a significant impact, requiring mitigation. Since a significant CEQA VMT transportation impact has been identified, feasible mitigation measures to avoid or reduce the impact have been identified. CEQA requires that the mitigation measures be included in the proposed project's environmental assessment. OPR provides a list of potential measures to reduce VMT but gives the lead agency full discretion in the selection of mitigation measures.

For an individual development project, VMT mitigations typically require the development of a Transportation Demand Management (TDM) program. A TDM program is a combination of strategies to reduce VMT. The program is created by an applicant for their land use project based on a list of strategies agreed to with the County. Prior to occupancy, the proposed project shall develop a TDM program to reduce VMTs associated with employee trips. The following TDM measures would be implemented by the proposed project as part of the TDM program:

9. Alternative-Mode Subsidies and Incentives: Provide subsidization of transit fares, carpool, or electric vanpool for employees of the project site. Provide monetary incentives for alternative-modes of transportation.
10. Travel Behavior Change Program: Provide a web site that allows employees to research alternate modes of transportation for commuting to the site.
11. Promotions & Marketing: Provide marketing and promotional tools to educate and inform travelers about site-specific transportation options and the effects of their travel choices with passive educational and promotional materials.
12. Commute Assistance Center: Provide a computer kiosk that allows employees to research other modes of transportation for commuting.
13. Preferential Carpool / Vanpool Parking Spaces: Provide reserved carpool/vanpool spaces closer to the building entrance.
14. Passenger Loading Zones: Provide passenger loading zones for easy access to carpools or vanpools.
15. Bike Share: Implement bike share to allow people to have on-demand access to a bicycle, as-needed.
16. Bike Parking and Facilities: Include dedicated bike route into facility and secure bike lockers/parking to support safe and comfortable bicycle travel. Provide on-site bicycle repair tools.

Combining the above-mentioned mitigation measures would reduce the proposed project's VMT per employee by 5.4 percent. However, since the proposed mitigations are not expected to reduce the proposed project's VMT per employee by more than 24.5 percent, the proposed project's VMT impact would be significant and unavoidable. **Appendix H** contains VMT calculations and information related to TDM measures selected.

PROJECT DEFICIENCIES / RECOMMENDATIONS (NON-CEQA)

Project-related deficiencies were determined based on criteria established in TS Methodology (Section 1).

INTERSECTION LEVEL OF SERVICE

Under the Opening Year (2026) Plus Project and Horizon Year (2046) Plus Project scenarios, the proposed project's traffic is expected to cause a LOS deficiency at Houghton Road & Union Avenue (Intersection #6).

ROADWAY SEGMENT LEVEL OF SERVICE

Under the Opening Year (2026) Plus Project and Horizon Year (2046) Plus Project scenarios, the proposed project's traffic is not expected to cause roadway segment LOS deficiencies.

SIGNAL WARRANT ANALYSIS

Under the Opening Year (2026) Plus Project and Horizon Year (2046) Plus Project scenarios, the intersection of Houghton Road & Union Avenue (Intersection #6) would not satisfy CA MUTCD Warrant 1 (8-hour) and Warrant 2 (4-hour). However, Warrant 3 (peak hour) would be satisfied for a single hour of the day (3 PM – 4 PM).

The CA MUTCD states the following:

> The Peak Hour signal warrant is intended for use at a location where traffic conditions are such that for a minimum of 1 hour of an average day, the minor-street traffic suffers undue delay when entering or crossing the major street. This signal warrant shall be applied only in unusual cases, such as office complexes, manufacturing plants, industrial complexes, or high-occupancy vehicle facilities that attract or discharge large numbers of vehicles over a short time.

It should be noted that the CA MUTCD suggests this warrant only be considered at intersections that provide direct access to proposed project site (Intersections 7 and 8). However, the County has elected to consider the Peak Hour signal warrant at Houghton Road & Union Avenue. Therefore, a traffic signal would be warranted.

QUEUEING ANALYSIS

Under the Opening Year (2026) Plus Project and Horizon Year (2046) Plus Project scenarios, the proposed project's traffic is not expected to cause queueing deficiencies that would block adjacent through movements at intersections, or queues that would extend into ramp's deceleration areas or block the mainline traffic.

RECOMMENDED OFFSITE IMPROVEMENTS

The LOS analysis indicates that the proposed project's traffic is expected to cause a LOS deficiency at Houghton Road & Union Avenue (Intersection #6) since the addition of traffic would cause the intersection to begin operating at LOS D for the Opening Year (2026) Plus Project and Horizon Year (2026) Plus Project conditions. To alleviate the intersection LOS deficiency, it is recommended that the proposed project signalize the intersection and modify the raised median on Union Avenue to provide a northbound left-turn pocket (150-feet minimum). The following summarizes the recommended improvements and resulting lane geometry and control:

- Northbound: Modify raised median to provide left-turn pocket, thru lane and thru/right-turn lane;
- Southbound: Existing left-turn pocket (140-feet), thru lane and thru/right-turn lane;
- Eastbound: Existing shared left-turn/thru/right-turn lane;
- Westbound: Existing shared left-turn/thru lane and right-turn pocket (100-feet); and
- Signalize intersection, providing NB/SB protected left-turn phasing and EB/WB permissive phasing.

Figure 7-1 illustrates the proposed transportation improvements and resulting intersection conditions, detailed above. This improvement would enable the intersection to operate at LOS B for the AM and PM peak hours under both the Opening Year (2026) Plus Project and Horizon Year (2046) Plus Project conditions. **Tables 17** and **18** display the LOS analysis results with the recommended improvements at Houghton Road & Union Avenue (Intersection #6), under Opening Year (2026) Plus Project and Horizon Year (2046) Plus Project scenarios. **Appendix D** contains the intersection LOS calculation worksheets.

As stated above, the intersection satisfies only the CA MUTCD traffic signal Warrants 3 (peak hour) for a single hour of the day. Therefore, the recommendation for signalization is subject to the approval of the County, and acceptance of the Peak Hour Warrant as the basis for recommendation. These improvements would be constructed as an Opening Day (2026) feature, prior to occupancy since the proposed project traffic is expected to trigger the LOS deficiency.

Mitigation Transportation Conditions

TABLE 17: OPENING YEAR (2026) INTERSECTION IMPROVEMENTS LOS SUMMARY

#	Intersection	Jurisdiction	Peak Hour	Improvement	After Opening Year Improvement	
					Delay (a)	LOS (b)
6	Houghton Rd & Union Ave	County	AM	Addition of NB LT pocket of 150 feet minimum. Signalize intersection control.	11.0	B
			PM		14.7	B

Notes:

Bold values indicate intersections operating at unacceptable LOS. **Bold and shaded** values indicate project significant impact.

ECL = Exceeds Calculable Limit. Reported when delay exceeds 180 seconds.

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a one- or two-way stop-controlled intersection, delay refers to the worst movement.

(b) LOS calculations are based on the methodology outlined in the *Highway Capacity Manual 6th Edition* and performed using Synchro 11.0

County - Kern County

E – Future Volume Methodology & Calculation Sheets

Ware Malcomb Industrial Building
Traffic Volume Development Methodology

The traffic volumes included in the Traffic Analysis (TA) were developed using the following process:

Step 1: Existing (2023) Traffic Volumes

Existing (2023) intersection turning movement counts were collected on May 2, 2023 at the six study area intersections. These counts were collected after the COVID-19 pandemic and during the school year. There are two schools in the vicinity of the project site: the General Shafter Elementary, which is two miles from the site, and Lakeside Union Elementary, which is five miles from the site.

Caltrans *Traffic Operations Policy Directive, 20-04* (December 7, 2020) provides guidance on how to adjust traffic counts given the impact of COVID-19 on travel demand. The Caltrans' Directive states:

> *"Historical traffic data gathered from past projects and partner agencies may be used to supplement and/or replace "existing" COVID-19 pandemic period traffic counts, subject to sound engineering justification and source documentation of historical traffic data."*

Since the turning movement counts were performed after the COVID-19 pandemic and during school, the traffic volumes collected in May 2023 were not adjusted.

Step 2: Develop Future Year Forecasts

The Kern COG regional travel demand forecasting model was used to develop traffic forecasts for the study area intersections. The forecasting process included the following:

1. AM and PM peak hour loaded networks for the base year (2022) and future year (2046) from the Kern COG model were exported and loaded into an Excel table. The model development report can be found at this URL: https://www.kerncog.org/wp-content/uploads/2017/11/VMIP-2-Model-Development-Report-KernCOG.pdf The model was calibrated to 2015 conditions and serves as the model's base year for forecasting purposes. Screenshots from the 2022 and 2046 model runs around the Houghton Road interchange are shown below.

Figure 1: 2022 AM Peak Loaded Networks

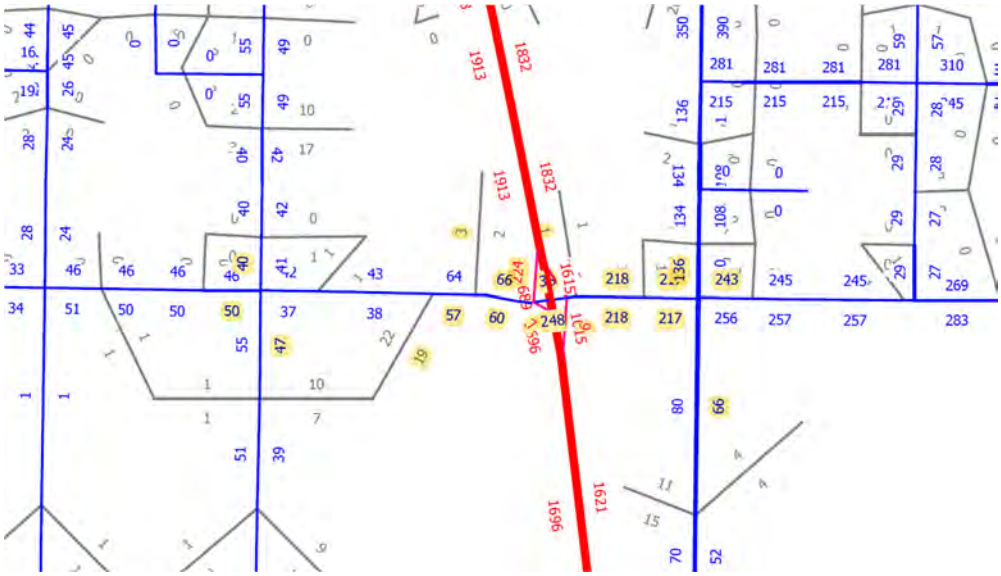

Figure 2: 2022 PM Peak Loaded Networks

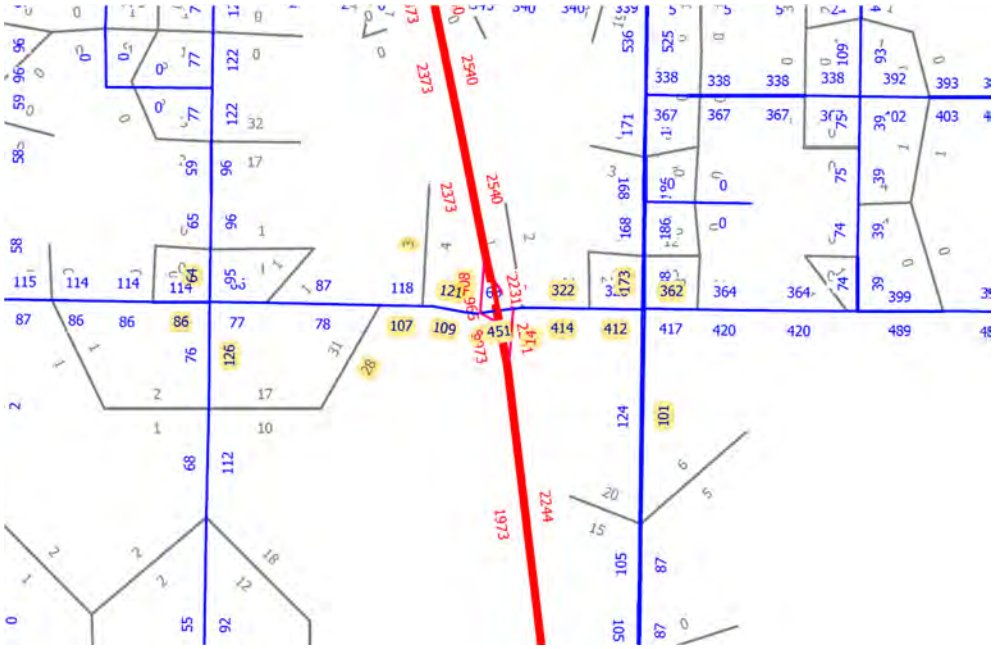

Figure 3: 2046 AM Peak Loaded Networks

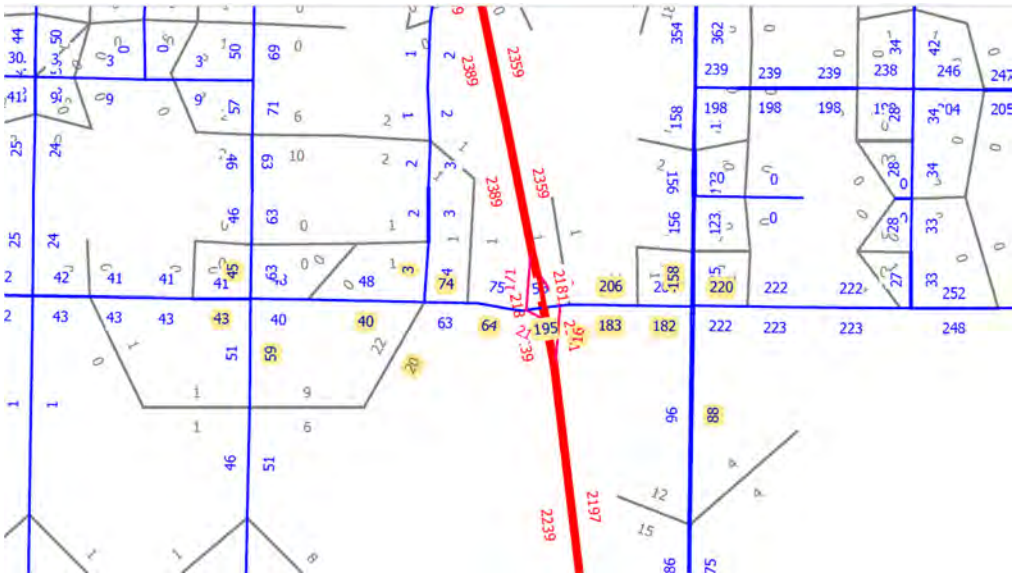

Figure 4: 2046 PM Peak Loaded Networks

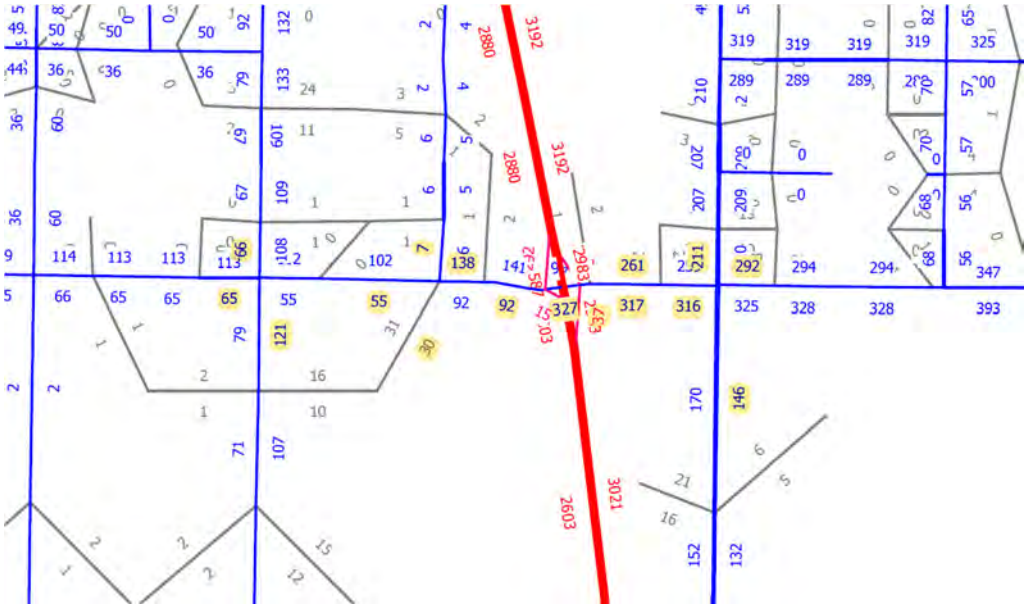

2. The 2022 and 2046 directional AM/PM assigned segment volumes were used to calculate the traffic growth between 2022 and 2046 for each intersection approach. This forecasting process accounts for all planned/proposed land use and transportation projects within Kern County.

   The full growth increment from 2022 to 2046 (24 years) was added to the Existing volumes on each segment to develop the Horizon Year (2046) traffic volumes for the TA. The growth in segment volumes were applied to individual turning movements at intersections using the existing turning proportions. Assigning the full increment of growth to the Horizon Year (2046) is a conservative assumption as it accounts for countywide population and employment projections.

For segments that experienced a decrease in traffic between the 2022 and 2046 Kern COG model runs, the turning movement volume was set to the adjusted Existing volume.

The Project volumes used in the TA were assigned on top of these Cumulative Year (2042) forecasts.

3. Opening Year (2026) No Project volumes were developed for each intersection turning movement and roadway segment by assuming 24 years of linear growth between 2022 and 2046 and applying it to the adjusted Existing volumes. The Project volumes were assigned on top of these Opening Year (2026) volumes in the TA.

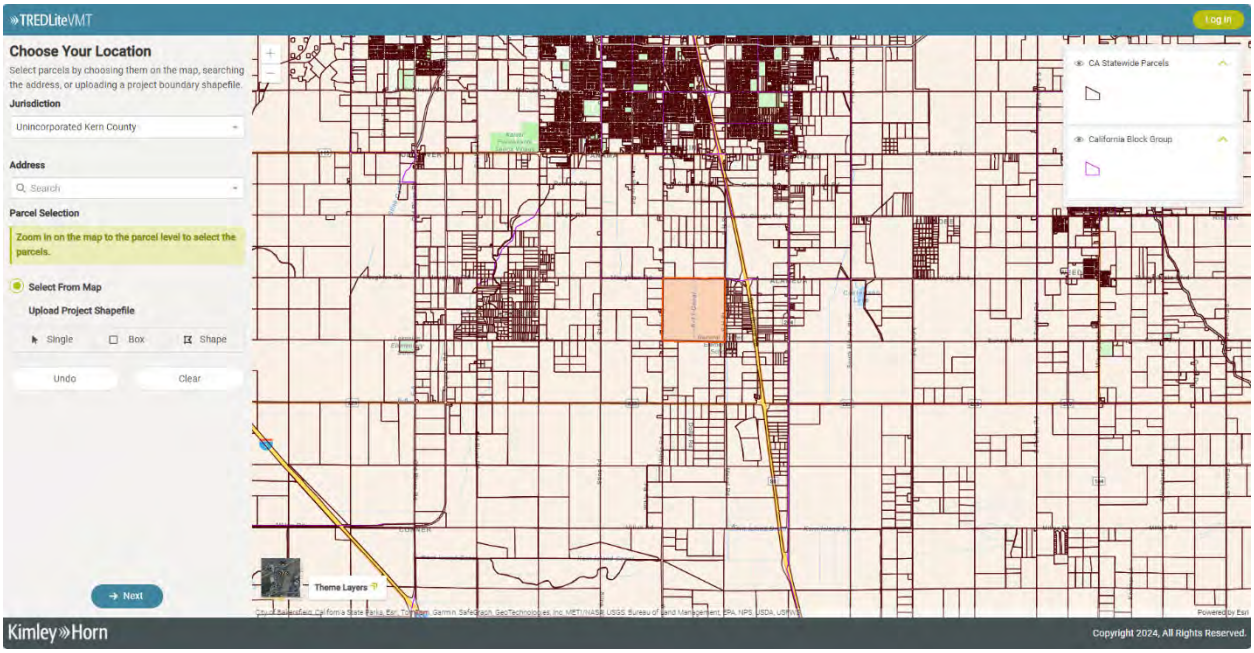
Model Network and Project TAZ



TREDLiteVMT | A Kimley-Horn Environmental Solution

Project Name: Westside Industrial Project

Location: Unincorporated Kern County

Analysis Year: 2023

Project Land Uses & Intensities

Code	Intensity	Unit	Per Capita/ Employee VMT	VMT With Mitigation	Total VMT	Threshold	Significant Impact
155	630	1,000 Sq Ft	26.37		35242.1	20.83	Yes
		Totals	26.37		35242.1		

Transportation Demand Management

Implement Commute Trip Reduction Program (Voluntary) (T-5)	This measure will implement a voluntary commute trip reduction (CTR) program with employers. CTR programs discourage single occupancy vehicle trips and encourage alternative modes of transportation such as carpooling, taking transit, walking, and biking, thereby reducing VMT and GHG emissions.	4.00%	50	percent of employees eligible	2.00%
Implement Commute Trip Reduction Marketing (T-7)	This measure will implement a marketing strategy to promote the project site employer's CTR program. Information sharing and marketing promote and educate employees about their travel choices to the employment location beyond driving such as carpooling, taking transit, walking, and biking, thereby reducing VMT and GHG emissions.	4.00%	50	percent of employees eligible	2.00%
Provide End-of-Trip Bicycle Facilities (T-10)	This measure will install and maintain end-of-trip facilities for employee use. End-of-trip facilities include bike parking, bike lockers, showers, and personal lockers.	0.75%	Without	bicycle facility with/without locker & shower	0.06%
Employer-Sponsored Vanpool (T-11)	This measure will implement an employer-sponsored vanpool service. Vanpooling is a flexible form of public transportation that provides groups of 5 to 15 people with a cost-effective and convenient rideshare option for commuting.	20.00%	1	percent of employees eligible (2.7% default)	1.34%

Mitigation

Appendix A: Bakersfield District Purchase Agreements

1 INTRODUCTION

Included herein is a Senate Bill (SB) 610-compliant water supply assessment (WSA) in support of the proposed Ware Malcomb Industrial Project (Proposed Project). The Proposed Project is located within the City of Bakersfield, California (Bakersfield or City; **Figure 1**) and the project site is a 94-acre parcel located at the southeast corner of Wible Road and Houghton Road (**Figure 2**). Per the project description provided by Kimley-Horn and Associates, Inc. (Project Proponent; Kimley-Horn, 2023b; 2023c), the Proposed Project includes an approximately 653,442 square foot (sq ft) single-story warehouse and distribution facility and related improvements.

The Proposed Project is located adjacent to the California Water Service (Cal Water) Bakersfield District service area along an existing water main located on Wible Road (**Figure 1**). Providing services to the Proposed Project will necessitate an expansion of the Bakersfield District service area (Cal Water, 2023c).

The information provided in this WSA is consistent with California Water Code (CWC or Water Code) §10910-10912 requirements and the California Department of Water Resources' (DWR's) *Guidebook for Implementation of SB 610 and SB 221 of 2001: To Assist Water Suppliers, Cities, and Counties in Integrating Water and Land Use Planning*, dated 8 October 2003. The text of specific sub-sections of the Water Code is included in greyed boxes and italicized font at the beginning of specific sections of this WSA. The information presented in those respective sections, and the associated tables and figures, respond directly to Water Code requirements.

The purpose of this WSA is to evaluate whether sufficient water supplies are available to meet future demands within the Bakersfield District service area, including demands associated with the Proposed Project, during normal, single dry, and multiple dry hydrologic years for a 20-year time horizon.[1] More specifically, this WSA includes:

- A summary of the WSA requirements articulated in CWC §10910-10912 and a description of how they apply to the Proposed Project;
- A description and analysis of the current and projected future water demands of the Proposed Project through the year 2045;
- A description and analysis of the historical, current, and projected future water demands for the Bakersfield District service area through the year 2045;
- A description and analysis of the current and projected future water supplies for the Bakersfield District service area through the year 2045; and
- A comparison of the water supplies and demands for the Bakersfield District service area, including the projected water demands associated with the Proposed Project.

[1] The Water Code specifies that a WSA must look at supplies and demand on a 20-year horizon (i.e., to 2043), but given the available data, this WSA looks beyond that to 2045.

The information contained in this WSA is based on the Bakersfield District 2020 Urban Water Management Plan (2020 UWMP) prepared for the Bakersfield District, except where augmented by additional relevant water demand and supply reliability and other information from sources including Cal Water, Groundwater Sustainability Agencies (GSAs), DWR, and others.

This WSA concludes that, based on the currently available information, sufficient water supply is available to Cal Water to meet future demands anticipated within the Bakersfield District service area, including those associated with the Proposed Project.

2 GENERAL REQUIREMENTS FOR THE PREPARATION OF A WATER SUPPLY ASSESSMENT

The purpose of this section is to outline what types of projects require the preparation of a WSA, who is responsible for its preparation, and the necessary components of a WSA.

2.1 Applicability of Senate Bill 610 to the Project

☑ ***CWC § 10910 (a)***

Any city or county that determines that a project, as defined in Section 10912, is subject to the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) under Section 21080 of the Public Resources Code shall comply with this part.

☑ ***CWC § 10912***

For the purposes of this part, the following terms have the following meanings:

(a) "Project" means any of the following:

(1) A proposed residential development of more than 500 dwelling units.

(2) A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space.

(3) A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space.

(4) A proposed hotel or motel, or both, having more than 500 rooms.

(5) A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area.

(6) A mixed-use project that includes one or more of the projects specified in this subdivision.

(7) A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project.

(b) If a public water system has fewer than 5,000 service connections, then "project" means any proposed residential, business, commercial, hotel or motel, or industrial development that would account for an increase of 10 percent or more in the number of the public water system's existing service connections, or a mixed-use project that would demand an amount of water equivalent to, or greater than, the amount of water required by residential development that would represent an increase of 10 percent or more in the number of the public water system's existing service connections.

The Proposed Project includes 653,442 sq ft of floor area (i.e., over 650,000 sq ft) and therefore satisfies the definition of a "project" requiring a WSA pursuant to SB 610 (CWC §10912(a)(5)).

2.2 Responsibility for Preparation of the Water Supply Assessment

☑ ***CWC § 10910 (b)***

The city or county, at the time that it determines whether an environmental impact report, a negative declaration, or a mitigated negative declaration is required for any project subject to the California Environmental Quality Act pursuant to Section 21080.1 of the Public Resources Code, shall identify any water system that is, or may become as a result of supplying water to the project identified pursuant to this subdivision, a public water system, as defined in Section 10912, that may supply water for the project. If the city or county is not able to identify any public water system that may supply water for the project, the city or county shall prepare the water assessment required by this part after consulting with any entity serving domestic water supplies whose service area includes the project site, the local agency formation commission, and any public water system adjacent to the project site.

The Proposed Project is located adjacent to the Cal Water Bakersfield District service area along an existing water main located on Wible Road (**Figure 1**). Providing services to the Proposed Project will necessitate an expansion of the Bakersfield District service area (Cal Water, 2023c). Therefore, in accordance with CWC §10910(b), Cal Water is the entity responsible for developing the WSA for the Proposed Project, assuming successful annexation of the Proposed Project into the Bakersfield District service area.

2.3 Components of a Water Supply Assessment

☑ ***CWC § 10910 (c) (4)***

If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.

☑ ***CWC § 10911***

(b) The city or county shall include the water supply assessment provided pursuant to Section 10910, and any information provided pursuant to subdivision (a), in any environmental document prepared for the project pursuant to Division 13 (commencing with Section 21000) of the Public Resources Code.

(c) The city or county may include in any environmental document an evaluation of any information included in that environmental document provided pursuant to subdivision (b). The city or county shall determine, based on the entire record, whether projected water supplies will be sufficient to satisfy the demands of the project, in addition to existing and planned future uses. If the city or county determines that water supplies will not be sufficient, the city or county shall include that determination in its findings for the project.

As listed above in CWC §10910(c)(4), the primary purpose of a WSA is to evaluate whether sufficient water supply is available to meet future demands within the water supplier's service area, including those associated with the Proposed Project, during normal and dry hydrologic years for a 20-year time horizon.[1] Therefore, the following information is included in this WSA:

- A description and analysis of the current and projected future water demands of the Proposed Project through the year 2045;

- A description and analysis of the historical, current, and projected future water demands for the Bakersfield District service area through the year 2045;
- A description and analysis of the current and projected future water supplies for the Bakersfield District service area through the year 2045; and
- A comparison of the water supplies and demands for the Bakersfield District service area, including the projected water demands and supplies associated with the Proposed Project.

3 PROJECT DESCRIPTION

The Proposed Project includes an approximately 653,442 sq ft single-story warehouse and distribution facility located within the City of Bakersfield Sphere of Influence at the southeast corner of Wible Road and Houghton Road (see **Figure 2**).

Per the project description in the *Draft Environmental Impact Report (EIR) for the Westside Industrial Project* provided by the Project Proponent, the total occupiable space in the proposed facility would be roughly 653,442 sq ft (Kimley-Horn, 2023b). The proposed facility has a floor footprint of approximately 629,186 sq ft, including approximately 44,424 sq ft of office space, that would primarily facilitate material handling equipment and warehouse uses. The remaining area is made up of a 24,256-sq ft mezzanine, which contains only material handling equipment conveyors with occasional maintenance and no storage. The proposed facility would operate 24 hours a day, 365 days a year, and typically consist of both day and night shifts. It is anticipated that the facility would employ approximately 915 employees per shift (two shifts, for a total of 1,830 employees) in peak season from June to August and November to January, and approximately 732 employees per shift (two shifts for a total of 1,464 employees) in non-peak season from February to May and September to October. In addition to the warehouse and distribution facility, the Proposed Project will include 217,529 sq ft of landscaped area, which would consist primarily of drought tolerant and low maintenance plants (Kimley-Horn, 2023b; 2023c). In addition, the Proposed Project includes approximately 543,000 sq ft of parking lot (Cal Water, 2023b).

The Assessor's Parcel Number (APN) for the Proposed Project site is 184-391-08. As shown in **Figure 2**, this parcel includes a feed store in the northwest corner of the parcel and agricultural land. The feed store is currently supplied by Cal Water, and the agricultural land is supplied by local groundwater from the Kern County Subbasin (Subbasin). The parcel will be subdivided so that the feed store is its own individual parcel. The feed store will remain in operation and will continue to be served by Cal Water (Kimley-Horn, 2023a). The Proposed Project site is within the existing agricultural land use, which has historically been covered by row crop varietals including corn, wheat, beets, turnips, and cotton. Historical water use at the site ranged between 117 and 173 acre-feet per year (AFY) from 2018 to 2022, and averaged 151 AFY (Kimley-Horn, 2022). Since the Proposed Project's total annual water demand is projected to be less than the site's historical agricultural water use (see Section 4.5 below), it is anticipated that the Proposed Project will constitute a net reduction in demand on the underlying Subbasin.

For the purposes of this WSA, it is assumed that full buildout of the facility will be complete by 2025 (Kimley-Horn, 2023c). The Proposed Project buildout schedule is shown in **Table 1**, along with additional land use details.

Table 1
Project Land Use Assumptions
Ware Malcomb Industrial Project, City of Bakersfield, California

Land Use	Total Land Use (a)	Land Use Units	Cumulative Buildout (a)					Description
			2025	2030	2035	2040	2045	
Industrial	653,442	sq ft	653,442	653,442	653,442	653,442	653,442	Warehouse and distribution facility; includes approximately 44,424 sq ft of office space
Landscaped Area	217,529	sq ft	217,529	217,529	217,529	217,529	217,529	--
Total	**870,971**	**sq ft**	**870,971**	**870,971**	**870,971**	**870,971**	**870,971**	

Abbreviations:
"sq ft" = square feet

Notes:
(a) Land use and buildout estimates are based on information per Reference 1.

4 PROJECT WATER DEMAND

The City of Bakersfield has adopted green building standards and water efficient landscaping ordinances consistent with previous versions of the CalGreen building standards and the California Model Water Efficient Landscape Ordinance (MWELO). As part of state requirements, all new developments must comply with these efficiency standards. As such, the Proposed Project development is expected to include a number of water-efficient features, including, but not limited to:

- Use of low-flow lavatory faucets, kitchen faucets, toilets, and urinals in accordance with CalGreen Code; and
- Inclusion of low-water use landscaping and high-efficiency irrigation systems to minimize outdoor water use in accordance with MWELO.

As described below, the average annual water demand for the Proposed Project was estimated based on: (1) literature values for industrial and commercial water use (USEIA, 2017); and (2) information provided by the Project Proponent in coordination with Cal Water (Kimley-Horn, 2023b; 2023c). Total water demands include water used by the Proposed Project for industrial uses, landscaping, and water that is lost during distribution (i.e., "distribution system losses" or "unaccounted for water").

Table 2 includes a summary of the water demand projections associated with the proposed land uses at the project completion, including assumed distribution system losses. As described in Section 3, for the purpose of this WSA, it is conservatively assumed that full buildout will be complete by 2025 (Kimley-Horn, 2023c).

4.1 Indoor Water Use

Based on the project description provided, it is anticipated that sinks, toilet-flushing, and other non-industrial, non-process-oriented operations will comprise the majority of indoor water use for the Proposed Project. As such, an employee-based demand factor of 30 gallons per day (gpd) per employee was selected to project indoor water demands. The selected demand factor is based on literature values included in the United States Energy Information Administration 2012 Large Commercial Buildings Energy Consumption Survey (USEIA, 2017). Applying the selected demand factor, the indoor water use of the Proposed Project is estimated to be approximately 55 AFY at full buildout.

It is noted that Cal Water typically uses their *WSA Water Factor Tool* to calculate water use factors based on building area and customer-level metered water use records for 2016 through 2018 within each district (e.g., existing service area building stock). However, the demand factors within this tool are not appropriate for application to the Proposed Project because the average building size for non-residential buildings in the Bakersfield District, on which the demand factors are based, is only 12,712 sq ft, or 1.9% of the size of the Proposed Project building. Additionally, the non-residential demand factor for the Bakersfield District from the *WSA Water Factor Tool* is 0.16 gpd/sq ft, which is almost two times higher than the demand factor used in this WSA (0.075

gpd/sq ft). Therefore, applying the *WSA Water Factor Tool* to calculate the non-residential water demand would significantly overestimate the water demands associated with the Proposed Project.

4.2 Landscaping Water Use

The projected water demand for the landscaped area included as part of the Proposed Project was estimated based on the Maximum Applied Water Allowance (MAWA; DWR, 2015). The Model Water Efficient Landscape Ordinance (MWELO) requires that the annual landscape irrigation water use not exceed the MAWA (DWR, 2015). As shown below, the MAWA is calculated based on the regional reference evapotranspiration rate, an evaporation adjustment factor, the total landscaped area, and the area of "special landscaped area."[2] Water use for the Proposed Project landscaping irrigation has been conservatively assumed to be equal to the MAWA, which is the upper limit of annual applied water for established landscaped areas.

The MAWA is calculated using the following equation:

$$MAWA = ETo \times [(ETAF \times LA) + (1\text{-}ETAF) \times SLA]$$

where:

ETo	=	The regional reference evapotranspiration rate
ETAF	=	Evapotranspiration Adjustment Factor For parks (SLAs) = 1.0 For landscape corridors = 0.45
LA	=	Total landscape area (including SLA)
SLA	=	Special Landscape Area

Based on the above methodology, the total annual water use for landscaping is estimated to be 11 AFY at full buildout as shown in **Table 3a** and encompasses all irrigated areas (excluding the distribution system losses discussed in Section 4.5).

As shown in **Table 3b**, based on the monthly average reference evapotranspiration for the San Joaquin Valley, the maximum monthly landscape irrigation demand associated with the Proposed Project is estimated to be 1.6 AF per month. All landscape irrigation demands will be met with potable water.

4.3 Distribution System Losses

Water distribution systems experience a degree of water loss over the course of transmission from the source to the customer. Although losses from the newly-constructed portion of the system's infrastructure associated with the Proposed Project would initially be expected to be minimal, it is conservatively assumed that distribution system losses associated with delivering water to the Proposed Project will ultimately be consistent with the proportion of real and

[2] Special Landscaped Area includes landscaping dedicated solely to edible plants, recreational areas, areas irrigated with recycled water, or water features using recycled water.

apparent losses per the validated 2021 water loss audit that Cal Water has submitted to DWR for the Bakersfield Public Water System (PWS; i.e., 8.7%; DWR, 2022). It should be noted that while these losses represent a demand on the system, water lost through the distribution system returns to the underlying groundwater basins and thus is not a true demand on the groundwater supply. However, for purposes of this WSA, all water loss is conservatively considered a demand. **Table 2** shows the distribution system water loss associated with the Proposed Project, estimated to be 6.3 AFY at buildout.

4.4 Existing Current Water Demand on the Proposed Project Site

The Proposed Project site has historically been used for agricultural production and irrigated using local groundwater from the Subbasin. Within the past five years, crop varietals including corn, wheat, beets, turnips, and cotton have been cultivated at the site. Current and historical groundwater demands at the site were calculated by multiplying the planted acreage by the corresponding water demand factor for each crop type provided by the Project Proponent (Kimley-Horn, 2022). Based on this information, it is estimated that historical water use for irrigation at the site ranged from 117 and 173 AFY between 2018 and 2022, and averaged 151 AFY (Kimley-Horn, 2022). The demands for the Proposed Project will be served by Cal Water, whereas historical and existing onsite demands were met directly with local groundwater supplies. Therefore, for the purposes of this WSA, the projected demands do not account for existing demands as shown in **Table 2**.

4.5 Total Project Water Demand

Based on the above methodologies and assumptions, the total annual water demand for the Proposed Project at full buildout and occupancy is conservatively estimated to be 72 AFY, as shown in **Table 2**. Since the Proposed Project's total annual water demand is projected to be less than the site's historical water use, it is anticipated that the Proposed Project will constitute a net reduction in demand on the underlying Subbasin. It is noted that, while not quantified herein, after consideration of irrigation return flows to groundwater, the actual demand on the supply system will be less than 72 AFY.

Table 2

Estimated Project Water Demand

Ware Malcomb Industrial Project, City of Bakersfield, California

Land Use	Season (a)	Employees/ Shift	Shift/Day (a)	Water Use Factor (b)	Water Use Factor Units	Estimated Water Use (AFY)				
						2025	2030	2035	2040	2045
Industrial	non-peak	732	2	30	gpd/employee	24	24	24	24	24
	peak	915				31	31	31	31	31
Landscaping	--	--	--	(c)	--	11	11	11	11	11
System Water Losses (d)	--	--	--	8.7%	--	6.3	6.3	6.3	6.3	6.3
					Total (e)	**72**	**72**	**72**	**72**	**72**

Abbreviations:

"AFY" = acre-feet per year

"Cal Water" = California Water Service

"gpd/employee" = gallons per day per employee

"MAWA" = Maximum Applied Water Allowance

"MWELO" = Model Water Efficient Landscaping Ordinance

"Proposed Project" = Ware Malcomb Industrial Project

Notes:

(a) Water demand calculations are based on a 7-day work week with a peak season lasting from June to August and November to January per Reference 1.

(b) Industrial water use factor per Reference 2.

(c) Estimates of landscape irrigation are based on MWELO MAWA calculations provided by Cal Water, per Reference 3. See Table 3 for MWELO MAWA calculations.

(d) Estimated distribution system water loss associated with delivery of water to the Proposed Project is based on a rate of 8.7% per Reference 4 and includes both real and apparent losses.

(e) Totals may not sum due to rounding.

5 CAL WATER BAKERSFIELD DISTRICT WATER DEMAND

☑ ***CWC § 10910 (c)***

(1) The city or county, at the time it makes the determination required under Section 21080.1 of the Public Resources Code, shall request each public water system identified pursuant to subdivision (b) to determine whether the projected water demand associated with a proposed project was included as part of the most recently adopted urban water management plan adopted pursuant to Part 2.6 (commencing with Section 10610).

(2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).

(3) If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

Consistent with the UWMP Act (CWC §10610-10656), the 2020 UWMP presents estimates of projected future water demand for the Bakersfield District service area in five-year increments, between the years 2025 and 2045 (Cal Water, 2021b). Projected water demand is subdivided between the following seven customer sectors or use types: (1) residential single family, (2) residential multi-family, (3) commercial, (4) industrial, (5) institutional/ governmental, (6) other, and (7) system losses. As discussed further below, the 2020 UWMP demand projections account for: (1) demands for the existing service area and accounts, (2) projected growth based on population and employment estimates, and (3) all anticipated new development based on information currently available to Cal Water.

The number of commercial, industrial, and institutional (CII) sector service connections are projected to increase by approximately 23% between 2020 and 2045 (Cal Water, 2021a).[3] This corresponds to an estimated net increase of 1,635 service connections and a net increase of 1,522 AFY of demand in the CII sector within the Bakersfield District. When conservatively considering the total water demand of the Proposed Project at 72 AFY, the projected Proposed Project demand would account for 4.7% of the projected net CII growth for the Bakersfield District. Therefore, while the Proposed Project is not explicitly included in the 2020 UWMP water demand growth projections, the Proposed Project's demands are considered to be within the projected growth anticipated by the 2020 UWMP. Total water demands for the Bakersfield District are therefore inclusive of the demands associated with the Proposed Project.

[3] Service growth projections projected in the 2020 UWMP are tied to county-level population, housing, and employment projections developed by Caltrans.

5.1 Current and Historical Water Demand Within the Bakersfield District Service Area

Historical water demand within the Bakersfield District from 2000 through 2022 is summarized in **Table 4**. Based on water use from 2018 to 2022, the majority of the water demand within the Bakersfield District is from the single-family residential (SFR) sector, which represented 58% of the demand. The remainder of the demand was split between commercial and industrial (18% of overall demand), government (8.7% of overall demand), multi-family residential (MFR) (5.8% of overall demand), and other (0.37% of overall demand; Cal Water, 2023a).

Water use from 2000 to 2008 remained fairly consistent within the Bakersfield District, at an average of approximately 77,752 AFY. A decrease in water use occurred from 2008 to 2011, which generally corresponds with the 2007 to 2009 drought and the economic downturn. Then, a significant drop in water demand occurred in 2014 through 2016, corresponding with the recent historic drought and mandatory state-wide water use restrictions and water conservation targets. Total water demand within the Bakersfield District was 54,905 AFY in 2022 (Cal Water, 2023a).

5.2 Planned Development Projects within the Bakersfield District

The 2020 UWMP water demand projections incorporate current and historical water usage within the Bakersfield District service area through 2045 and estimates population growth based on population and employment forecasts for Kern County generated by the California Department of Transportation's (Caltrans) long-term socio-economic forecast model for the existing Bakersfield District service area (Cal Water, 2021b). As discussed above, Cal Water has determined that the water demand associated with the Proposed Project is within the growth anticipated within the Bakersfield District and is accounted for in the 2020 UWMP demand projections. The 2020 UWMP water demand projections do not include any other major developments which would necessitate a WSA. Thus, the demand projections presented in Section 6 are inclusive of all identified and anticipated development, including the water demand associated with the Proposed Project.

5.3 Water Demand Projections

As discussed above, the 2020 UWMP demand projections include projections of growth within the existing service area based on Caltrans forecasts, including demands associated with the Proposed Project (Cal Water, 2021b). The 2020 UMMP demand projections for the Bakersfield District are presented in Section 6 in five-year increments. It is estimated that, inclusive of the Proposed Project, the total annual water demand for the Bakersfield District will be approximately 70,314 AFY in 2045.

6 CAL WATER BAKERSFIELD DISTRICT WATER SUPPLY

This section identifies the water supplies for the Bakersfield District and discusses the variability of the different supplies based on drought and other factors affecting water supply reliability. Unless otherwise noted, the source of the information included in this section is the Bakersfield District's 2020 UWMP. The water supply for the Bakersfield District is a combination of the following sources:

- Untreated Kern River water purchased from the City of Bakersfield,
- Treated Kern River water and imported water purchased from the Kern County Water Agency-Improvement District 4 (ID-4), and
- Groundwater pumped from the Subbasin of the San Joaquin Valley Groundwater Basin (DWR Basin No. 5-022.14).

Demand associated with the Proposed Project will be met by potable water, which would be expected to be a combination of purchased water via ID-4 and groundwater.

6.1 Identification of Water Supply Rights

☑ ***CWC § 10910 (d)(1)***

The assessment required by this section shall include an identification of any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project, and a description of the quantities of water received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts.

Pursuant to CWC §10910(d)(1), a WSA is required to include identification of all water supply entitlements, water rights, and water service contracts relevant to the identified water supply for the Proposed Project. In accordance with these requirements, this WSA includes a summary of each of Cal Water's supply sources in the Bakersfield District service area. All relevant purchase agreements are included as **Appendix A**.

6.2 Purchased Water

Cal Water currently purchases water from two sources to meet demands in its Bakersfield District: (1) untreated Kern River water purchased from City of Bakersfield, and (2) treated Kern River water and imported water purchased from ID-4. Historical water supply purchases are shown in **Table 5** and projected supplies are shown in **Table 6**.

6.2.1 Purchases from City of Bakersfield

The City of Bakersfield holds pre-1914 appropriative rights to Kern River water. Cal Water has a signed long-term supply agreement with the City for up to 67,200 AFY of this water supply (Cal Water, 2003; **Appendix A**). Cal Water purchases untreated Kern River surface water from the City of Bakersfield and treats the water at the Northeast Bakersfield Water Treatment Plant (NEBWTP) and the North Garden Water Treatment Plant (NGWTP). The NEBWTP currently has a

base load treatment capacity of 20 million gallons per day (MGD; or 22,400 AFY) and peaking capacity of 23 MGD. The NEBWTP has a planned phase 2 expansion that would add another 22,400 AFY of base load capacity to bring the total to 44,800 AFY. This expansion is projected to be online by 2030 (Cal Water, 2021b). However, there is the possibility that the treatment capacity expansion at the NEBWTP could be delayed and come online at a later date. The NGWTP has a base load treatment capacity of 8.0 MGD (8,960 AFY) and a 10.4 MGD peaking capacity (Cal Water, 2021b). Cal Water's long-term supply agreement with the City of Bakersfield stipulates that Kern River water shall not be delivered to customers outside City limits. Thus, the Proposed Project will not receive purchased water from the City of Bakersfield.

6.2.2 Purchases from Kern County Water Agency Improvement District 4

Cal Water also purchases imported water from ID-4 (Cal Water, 2013; **Appendix A**). The Kern County Water Agency (KCWA) is a contractor of the State Water Project (SWP) and imports water for municipal and industrial (M&I) and agricultural use through the California Aqueduct. The KCWA also holds water rights to, and diverts water from, the Kern River.

The ID-4 built and operates a surface water treatment plant, the Henry C. Garnett Water Treatment Plant (HGWTP), that serves Cal Water, the East Niles Community Services District, and the North of the River Water District. The ID-4 obtains its water supply from KCWA entitlements to SWP supplies and Kern River flows and uses the water to recharge groundwater aquifers and to supply its conventional multi-media high-rate filtration plant (i.e., the HGWTP). The total treatment plant capacity of the HGWTP is about 47 MGD (53,000 AFY).

Rapid growth is occurring in the northwest Bakersfield area. To provide a reliable supply for this area, Cal Water entered into an agreement with KCWA for expansion of the HGWTP and construction of the Northwest feeder pipeline to convey water from the expanded plant (Cal Water, 2005; **Appendix A**). The Northwest feeder pipeline has been constructed and Cal Water has a contract with ID-4 to purchase 20,500 AFY of treated water from the HGWTP during normal hydrologic conditions, as well as access to a peaking capacity of 15.5 MGD. Further, depending on the needs of other water suppliers and the production capabilities of the plant, Cal Water can purchase up to 15% more than its contracted amount.

Every year Cal Water prepares a monthly demand schedule for this water and submits it to ID-4. The schedule is weighted so that the greatest volume of deliveries occurs during the peak summer demand period. The water acquired from ID-4 is obtained through five service connections (Cal Water, 2021b).

6.3 Groundwater Supply

☑ ***CWC § 10910 (f)***

If a water supply for a proposed project includes groundwater, the following additional information shall be included in the water supply assessment:

(1) A review of any information contained in the urban water management plan relevant to the identified water supply for the proposed project.

(2)(A) A description of any groundwater basin or basins from which the proposed project will be supplied.

(B) For those basins for which a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has the legal right to pump under the order or decree.

(C) For a basin that has not been adjudicated that is a basin designated as high- or medium-priority pursuant to Section 10722.4, information regarding the following:

(i) Whether the department has identified the basin as being subject to critical conditions of overdraft pursuant to Section 12924.

(ii) If a groundwater sustainability agency has adopted a groundwater sustainability plan or has an approved alternative, a copy of that alternative or plan.

(D) For a basin that has not been adjudicated that is a basin designated as low- or very low priority pursuant to Section 10722.4, information as to whether the department has identified the basin or basins as overdrafted or has projected that the basin will become overdrafted if present management conditions continue, in the most current bulletin of the department that characterizes the condition of the groundwater basin, and a detailed description by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), of the efforts being undertaken in the basin or basins to eliminate the long-term overdraft condition.

(3) A detailed description and analysis of the amount and location of groundwater pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), for the past five years from any groundwater basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(4) A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), from any basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(5) An analysis of the sufficiency of the groundwater from the basin or basins from which the proposed project will be supplied to meet the projected water demand associated with the proposed project. A water supply assessment shall not be required to include the information required by this paragraph if the public water system determines, as part of the review required by paragraph (1), that the sufficiency of groundwater necessary to meet the initial and projected water demand associated with the project was addressed in the description and analysis required by paragraph (4) of subdivision (b) of Section 10631.

As shown on **Figure 3,** the Bakersfield District overlies the Subbasin of the San Joaquin Valley Groundwater Basin (DWR Basin No. 5-022.14). Between 2018 and 2022, the Bakersfield District relied on groundwater for approximately 49% to 56% of its total supply, as shown in **Table 5**.

Additional details regarding the Subbasin description, groundwater management, and historical groundwater use are included below.

6.3.1 Subbasin Description and Status

The Subbasin covers an area of approximately 1,813,800 acres (2,834 square miles) and is located at the southern end of the San Joaquin Valley and underlies the City of Bakersfield. The Subbasin is bounded on the west, southwest, and east by the bedrock formations of the coast range, San Emigdio Mountains, and Sierra Nevada, respectively. It is separated from the White Wolf Subbasin on the southeast by the White Wolf Fault. The northern boundary is generally coincident with the Kern County line (DWR, 2018).

The Subbasin is not adjudicated. In its evaluation of California groundwater basins, DWR determined that the Subbasin is in a condition of critical overdraft (DWR, 2019). The Subbasin is further designated as a high priority basin under DWR's 2019 Phase 2 Basin Prioritization. Under this prioritization process, basins are ranked on eight components, and if a basin is assigned more than 21 total points, it is defined as "high priority." The main factors driving the Subbasin's designation include population growth (5 out of 5 possible points), irrigated acreage per square mile (4 out of 5 possible points), groundwater reliance (4.5 out of 5 possible points), and documented impacts including declining groundwater levels and subsidence (4 out of 5 possible points). However, because the Subbasin is critically overdrafted, the Subbasin is assigned 40 priority points, which is the maximum total points under DWR's ranking system.

6.3.2 Groundwater Management

6.3.2.1 Non-SGMA Groundwater Management

Prior to the passage of SGMA, water agencies in the Subbasin cooperated in water supply and groundwater management efforts. The Subbasin was included in the Kern Integrated Regional Water Management Plan (IRWMP) within the Greater Bakersfield Subregion. Section 3 of the Kern IRWMP describes the physical, environmental, social, and demographic characteristics of the Greater Bakersfield Subregion, the hydrologic features and overall water reliability, major water related infrastructure, and the identified subregional issues, needs, challenges and priorities (Provost & Pritchard Consulting Group, 2020).

The most recent update to the Kern IRWMP was adopted in March 2020. The five regional goals stated in the IRWMP include: (1) increase water supply, (2) improve operational efficiency, (3) improve water quality, (4) promote land use planning and resource stewardship, and (5) improve regional flood management (Provost & Pritchard Consulting Group, 2020). These regional goals were used to inform the measurable objectives and potential project proposals to accomplish the goals of the region. The Groundwater Sustainability Plans (GSPs; discussed below) supersede the IRWMP as the groundwater management plan for the Bakersfield District portion of the Subbasin.

6.3.2.2 SGMA Groundwater Management

In 2014, the California State Legislature enacted the Sustainable Groundwater Management Act (SGMA) with subsequent amendments in 2015. Among other things, SGMA requires the formation of GSAs and the development and implementation of GSPs for groundwater basins that are designated by DWR as medium or high priority. As a high priority, critically overdrafted and non-adjudicated basin, the Subbasin is subject to the requirements of SGMA.

Seventeen GSAs were formed to collectively assume responsibility for sustainable groundwater management of the Subbasin. The Proposed Project falls within the jurisdiction of the Kern River Groundwater Sustainability Agency (KRGSA).

The seventeen GSAs coordinated to prepare five GSPs within the Subbasin (i.e., Kern Groundwater Authority [KGA] GSP, KRGSA GSP, Olcese GSA GSP, Henry Miller Water District GSA GSP, and Buena Vista Water Storage District GSA GSP), but certain technical efforts (e.g., development of the Subbasin-level Water Budget) were cooperatively developed through a Coordination Agreement. The majority of the Bakersfield District, including the Proposed Project, falls within the jurisdiction of the KRGSA GSP, which covers an area of 230,830 acres in the southeast-central portion of the Subbasin, including most of the City of Bakersfield. Small portions of the Bakersfield District also fall within the jurisdiction of the Olcese GSA GSP. All of the Subbasin GSPs were submitted to DWR on or before the January 30, 2020 deadline, and re-submitted these, along with a new additional GSP, to address DWR recommendations in July 2022 (see additional discussion below).

As defined under SGMA, sustainable yield means "the maximum quantity of water, calculated over a base period representative of long-term conditions in a basin and including any temporary surplus, that can be withdrawn annually from a groundwater supply without causing undesirable results."[4] Based on development and application of a numerical groundwater flow model for the Subbasin (C2VSimFG-Kern), the sustainable yield of the Subbasin is estimated to be approximately 1,313,000 AFY, plus or minus 10%, but has not been further allocated (KGA GSA, 2022). The Subbasin-level estimate was supplemented by local water budget information presented in each GSP, but again, the local sustainable yield was not formally allocated. For example, the KRGSA GSP estimated an initial sustainable yield of about 290,000 AFY to 320,000 AFY for its portion of the Subbasin and the Olcese GSA GSP estimated a sustainable yield of 890 AFY to 1,840 AFY for its portion of the Subbasin (KRGSA, 2022; Olcese GSA, 2022).

Projects and management actions to support achievement of the Subbasin's sustainability goal under SGMA are proposed by the GSAs and documented in their respective GSPs. Projects and management actions for the GSPs that include the Bakersfield District are briefly summarized below, but it should be noted that this summary is not exhaustive.

- The "Phase One" projects described in the KRGSA GSP include: a water allocation plan, Kern River optimized conjunctive use, expanded recycled water use, conversion of

[4] CWC §10721(w).

agricultural lands to urban use, water system consolidation, and possible water exchange. These six projects will begin implementation prior to 2025 but will require adjustment and possible re-direction over time to optimize project performance and avoid undesirable results. In addition, the KRGSA proposed ten management actions to provide a framework for overall groundwater management including establishing GSP policies and filling data gaps (KRGSA, 2022).

- The projects and management actions described in the Olcese GSA GSP include: installation of a shallow monitoring well to evaluate the degree of hydraulic connection between the Olcese Sand Aquifer Unit and the Shallow Alluvium and conducting a study of the potential hydraulic connection between the Olcese Sand Aquifer Unit and the Shallow Alluvium (Olcese GSA, 2022).

As reported in the Kern County Subbasin Groundwater Sustainability Plans Fourth Annual Report Water Year 2022, all GSAs that include the Bakersfield District have made progress towards implementing projects and management actions since the release of their respective GSPs (Todd Groundwater, 2023). For example, the KRGSA obtained additional transfer water, recharged along the Kern River, used recycled water, continued funding of the Delta Conveyance Project, and started efforts towards lining the Cross Valley Canal. Additional detail regarding implementation of projects and management actions for the KRGSA and all other GSAs within the Subbasin are included in the Kern County Subbasin Groundwater Sustainability Plans Fourth Annual Report Water Year 2022 (Todd Groundwater, 2023).

In late January 2022, DWR announced that the five GSPs and coordination agreement developed for the Subbasin were collectively determined to be "incomplete" pursuant to SGMA (23 CCR §355.2(e)(2)). The deficiencies identified by DWR are provided verbatim below.

A. The GSPs do not establish undesirable results that are consistent for the entire Subbasin.

1. While the Coordination Agreement presents Subbasin-wide undesirable results, the Subbasin's fragmented approach towards establishing management criteria that define undesirable conditions in various parts of the Subbasin does not satisfy SGMA's requirement to use same data and methodologies.

B. The Subbasin's chronic lowering of groundwater levels sustainable management criteria do not satisfy the requirements of SGMA and the GSP Regulations.

1. The GSPs relied on disparate methods to develop groundwater level minimum thresholds across the numerous GSPs and management areas.

2. The GSPs do not consistently and sufficiently document the effects of their selected minimum thresholds on beneficial uses and users in the Subbasin, nor explain how the minimum thresholds and measurable objectives that are set below historical lows will impact other applicable sustainability indicators specifically water quality, land subsidence, and reduction of groundwater storage.

C. The Subbasin's land subsidence sustainable management criteria do not satisfy the requirements of SGMA and the GSP Regulations.

1. *The Plan lacks a Subbasin-wide, coordinated approach to establishing land subsidence sustainable management criteria.*
2. *The GSPs and management areas that use their minimum thresholds for the chronic lowering of groundwater levels as proxy criteria for subsidence do not sufficiently demonstrate that groundwater levels (specifically groundwater levels below historical lows) are a reasonable proxy to avoid land subsidence that would substantially interfere with surface land uses.*

Pursuant to 23 CCR §355.2(e)(2), the GSAs had 180 days from the date of the determination (until 27 July 2022) to correct the identified deficiencies. Subsequently, the GSAs reorganized to amend the five GSPs and prepare one additional GSP to address DWR recommendations. The six amended GSPs were submitted to DWR on 27 July 2022, to correct deficiencies identified by DWR (Todd Groundwater, 2023). However, on 2 March 2023, DWR determined that the six revised GSPs were inadequate to fully address the previous corrective actions. The findings regarding the sufficiency of the actions taken by the GSAs to correct the deficiencies are provided verbatim below.

Deficiency 1: involved how the Plan established and justified undesirable results that represent effects caused by groundwater conditions occurring throughout the Subbasin. The corrective action advised the Agencies to evaluate the groundwater conditions that would be occurring throughout the Subbasin at the defined quantitative criteria described in the Plan. The corrective action also advised the Plan to explain how the Subbasin has utilized the same data and methodologies to define the Subbasin-wide undesirable results and how the Plan has considered the interests of beneficial uses and users of groundwater. The corrective actions included developing clear and consistent terminology and reporting processes for the Subbasin. The Staff Report indicates that the Agencies did not take sufficient actions to correct this deficiency, which materially affects the ability of the Agencies to achieve sustainability and the ability of the Department to evaluate the likelihood of the Plan to achieve sustainability.

Deficiency 2: involved the establishment of minimum thresholds for the chronic lowering of groundwater levels. The corrective action advised the Agencies to describe the various methods used to establish minimum thresholds and the potential effects on beneficial uses and users. The corrective action also advised the Plan to explain how the lowering of groundwater levels minimum thresholds and measurable objectives that are set below historical lows will impact other applicable sustainability indicators. The Staff Report indicates that the Agencies made progress toward describing the specific minimum thresholds at the management area plan scale but still did not take sufficient action to explain how the various minimum thresholds will collectively achieve the sustainability goals and avoid undesirable results for the Subbasin, which materially affects the ability of the Agencies to achieve sustainability and the ability of the Department to evaluate the likelihood of the Plan to achieve sustainability.

> *Deficiency 3: involved the establishment of sustainable management criteria for land subsidence. The corrective action advised the Plan to establish a Subbasin-wide approach to land subsidence, including Subbasin-wide subsidence sustainable management criteria and assessment of critical infrastructure that would be susceptible to substantial interference from future subsidence. The Staff Report indicates that the Agencies did not take sufficient actions to correct this deficiency, which materially affects the ability of the Agencies to achieve sustainability and the ability of the Department to evaluate the likelihood of the Plan to achieve sustainability.*

Since DWR determined that the GSPs are inadequate, primary jurisdiction has shifted from DWR to the State Water Resources Control Board (SWRCB). The SWRCB may designate the Subbasin as *probationary*, pursuant to CWC § 10735.2(a). A probationary hearing for the Subbasin is anticipated to occur in April 2024.[5] If the deficiencies identified in the probationary designation are not remedied within one year, the SWRCB may develop and adopt its own interim plan to manage groundwater use in the Subbasin, which could potentially result in allocations and fees imposed on the Subbasin. Given this, the long-term impacts of SGMA implementation in the Subbasin are still uncertain. The GSAs are currently consulting with the SWRCB and DWR while continuing coordinated implementation of the six GSPs to stabilize water levels and provide for sustainable management of the groundwater resource.

6.3.3 Groundwater Use

The Bakersfield District has a total of 130 wells located within the Bakersfield District service area boundaries, all of which overlie the Subbasin (Cal Water, 2021b). Pursuant to Water Code §10910(f)(3), the amount of groundwater pumped by Cal Water within the Bakersfield District for the past five years and prior years is provided in **Table 5**. The groundwater pumping data shown in **Table 5** extends beyond the required period and includes data from 2000 through 2022 (Cal Water, 2023a). The available groundwater supplies (supplemented by its other supplies described in Section 6.2) have been sufficient to meet all of the Bakersfield District's demands in all prior years. **Table 6** shows the Bakersfield District's projected groundwater use through 2045, per the 2020 UWMP projections.[1] The 2020 UWMP assumes that surface water will be utilized at a higher rate in the future as a result of infrastructure improvements and the remaining demands will be met with groundwater. Notably, the 2020 UWMP assumes an additional 14,500 AFY of water purchased from the City of Bakersfield will be available once increased treatment capacity becomes available at the NEBWTP in 2030. Thus, the Bakersfield District is projected to use less groundwater than it has historically. However, as noted in Section 6.2.1, there is a possibility that the treatment capacity expansion at the NEBWTP may experience delays and come online at a later date. If that is the case, Bakersfield District will continue to use groundwater to meet the remaining demands.[6]

[5] A probationary hearing timeline was presented in the SWRCB Board meeting on June 21, 2023.

[6] Note that the Proposed Project's total annual water demand is projected to be less than the site's historical agricultural water use (see Section 4.5). Therefore, it is anticipated that the Proposed Project will constitute a net reduction in demand on the underlying Subbasin.

6.3.4 Analysis of Sufficiency of Groundwater Supply

Historically, the groundwater supplies available to the Bakersfield District from the underlying Subbasin (supplemented by other supplies) have always been sufficient to meet Bakersfield District demands and the Cal Water supply wells have not dewatered, even during historical drought periods. As shown in **Table 5**, the groundwater pumping volumes within the Bakersfield District in recent years (an average of 30,591 AFY from 2018 through 2022) are lower than they were in previous years (an average of 48,328 AFY from 2000 through 2017), reflecting Cal Water's successful implementation of water conservation measures in response to the drought and continued efficiency due to passive conservation and demand hardening (Cal Water, 2023a).

Despite these efficiency achievements, the Kern County Subbasin Groundwater Sustainability Plans Fourth Annual Report Water Year 2022 reported 11 groundwater levels in the KRGSA GSP area exceeded the Minimum Thresholds (MTs) set as part of the Sustainability Management Criteria for the Subbasin, four of which were within the Bakersfield District boundaries (Todd Groundwater, 2023). While there are no pumping restrictions currently in place for the Subbasin, the KRGSA GSP includes a management action that entails a five-step action plan to address MT exceedances. One step of the action plan is to consider the development of programs to curtail pumping or allocate groundwater (KRGSA, 2022). Assuming a Proposed Project area of 90 acres and that groundwater will only provide 28% of Bakersfield District's groundwater supplies in 2045, groundwater demand will be equivalent to approximately 0.22 AFY/acre. The Subbasin has a native safe yield of 0.15 AF/acre in undeveloped lands and a safe yield of 0.35 AF/acre in currently irrigated lands (KRGSA, 2022). Therefore, it is assumed the groundwater demand will be between this range. This is deemed reasonably conservative, even considering SGMA uncertainty.

It is also important to note that from a regional and Subbasin-wide standpoint, the Cal Water Bakersfield District pumping is only a small fraction of total groundwater pumping. Based on Figure 2-58 presented in the KGA GSP, also shown on **Figure 4** below, average annual groundwater pumping from water year 1995 to 2014 within the Subbasin was approximately 1,590,373 AFY. Approximately 78% of that pumping was for irrigated agriculture, while total M&I pumping (inclusive of the Bakersfield District, the areas served by the City of Bakersfield, City of Shafter, and others) only accounted for approximately 11% of total pumping (KGA GSA, 2022). In water year 2022, irrigated agriculture accounted for approximately 71% of total pumping within the Subbasin, while total M&I pumping only accounted for approximately 6.2% of total pumping within the Subbasin (Todd Groundwater, 2023). While the long-term impacts of SGMA implementation in the Subbasin are still uncertain, it is likely that management of agricultural groundwater use, rather than M&I use, will be a much larger determining factor in maintaining groundwater sustainability in the Subbasin in the future.

Figure 4. Groundwater Pumping by Type for Kern County Subbasin Figure from the KGA GSP

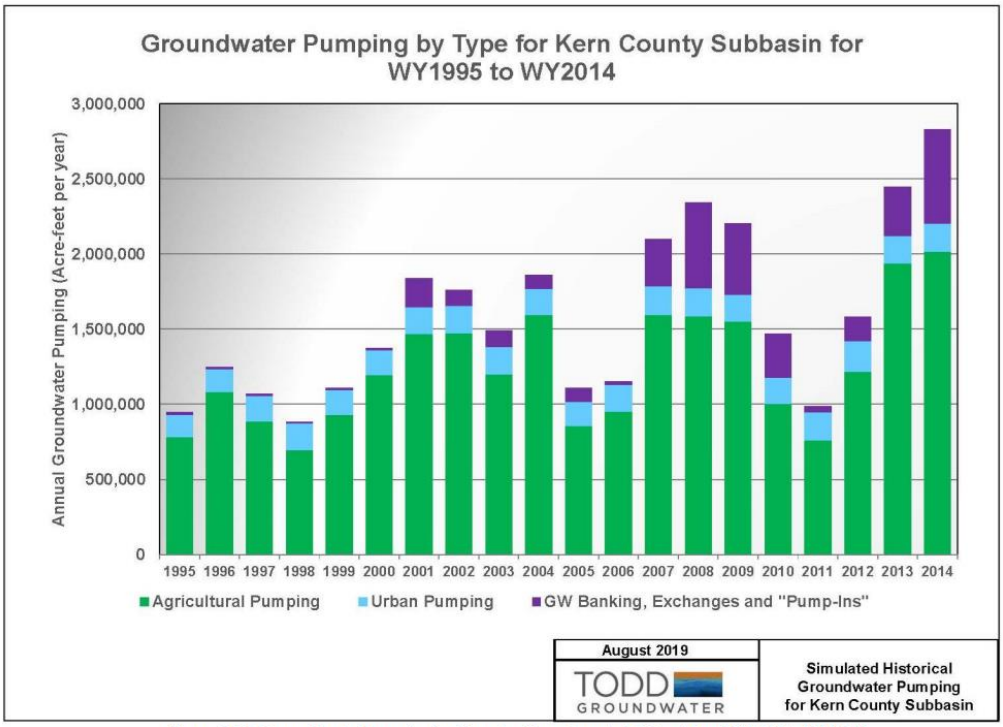

Figure 2-58. Groundwater Pumping by Type for Kern County Subbasin for WY1995 to WY2014

Further, although a significant amount of growth is projected in the Bakersfield District over the planning horizon (i.e., a projected population increase of approximately 24% over the next 25 years), it is anticipated that some land currently used for agricultural production will be converted to residential and non-residential urban uses to accommodate future growth. Irrigated agriculture typically uses more water on a per-acre basis than urban uses; thus, some future growth within the Bakersfield District will likely result in a net decrease in water use within the Subbasin. Based on the Kern River GSA GSP, which covers the majority of the Bakersfield District, approximately 10,000 acres of current KRGSA agricultural lands are expected to be urbanized representing a projected demand reduction of 27,000 AFY (KRGSA, 2022).

Cal Water holds certain water rights to groundwater it has pumped and used as an overlying owner and appropriator. Cal Water's water rights have been dedicated to a public use, and Cal Water is required by the CPUC to provide water to all customers within its designated service area under reasonable rules and regulations. Further, under California law municipal water rights and uses have a higher priority and are entitled to more protection than other uses of water, including in connection with SGMA. Use of water for domestic purposes is recognized as the "highest use" of water in the State of California pursuant to CWC §106, and the rights of urban water purveyors should be protected to the fullest extent necessary for existing and future uses, pursuant to CWC §106.5.

SGMA was intended to preserve the security of water rights in the state to the greatest extent possible, and was not intended to determine, modify or alter any surface water or groundwater

rights or priorities (CWC §10720.1(b), 10720.5(a) and (b)). SGMA should therefore not reduce, adversely impact or limit Cal Water's present or future exercise of its domestic water rights or its obligation to serve its municipal customers, and Cal Water's rights should be subject to less restrictions and limitations than any other types of water rights or uses.

Because of the demonstrated ability of the Bakersfield District to meet historical demands through the combination of purchased water and groundwater supplies, the 2020 UWMP concludes that the available supplies are sufficient to meet the projected Bakersfield District demands under all conditions (i.e., current and projected, and for normal, single dry, and multiple dry years including a five-year drought period).

6.4 Total Projected Potable Supply in Normal, Single Dry, and Multiple Dry Years

As discussed above, the water supply for the Bakersfield District is a combination of: (1) untreated Kern River water purchased from City of Bakersfield, (2) treated Kern River water and imported water purchased from ID-4, and (3) groundwater pumped from the Subbasin.

The agreement with the City of Bakersfield allows the Bakersfield District to receive untreated Kern River surface water at a rate of up to 67,200 acre-feet per year (AFY) regardless of water year type (i.e., 100% reliable). The City holds pre-1914 appropriative rights to the Kern River surface water.

The agreement with ID-4 allows the Bakersfield District to receive up to 20,500 AFY of treated Kern River surface water and imported SWP water during normal hydrologic conditions. Cal Water can purchase up to 15% more than this amount depending on the needs of other water suppliers and the production capabilities of the ID-4 treatment plant (which has a total capacity of about 53,000 AFY). Based on the information provided by ID-4,[7] ID-4's supplies are adequate to meet its projected demands on average in normal year, single dry year, and multiple dry years.

Historically, the groundwater supplies available to the Bakersfield District from the Subbasin (supplemented by other supplies) have always been sufficient to meet Bakersfield District demands and the Cal Water supply wells have not dewatered, even during historical drought periods. While the long-term impacts of SGMA implementation in the Subbasin are still uncertain, development of programs to curtail pumping or allocate groundwater could occur in the future as described in Section 6.3.4. The total groundwater demand for the Proposed Project will largely be met with the safe yield.

In the event of purchased water supply shortages, groundwater supply will be used to serve any remaining projected demand that is not met with purchased water supplies. Given that Cal Water's agreements with the City of Bakersfield and ID-4, purchased water supplies in combination with groundwater supply are expected to be sufficient to meet projected water demands of the Bakersfield District under all hydrologic conditions, including in normal, single

[7] Table 7-2 to 7-4 of the ID-4 UWMP provided by KCWA ID-4 on 27 April 2021.

dry, and multiple dry years (Cal Water, 2021b). The total projected potable supplies for normal, single dry, and multiple dry years are presented in **Tables 7**, **8**, and **9**, respectively.

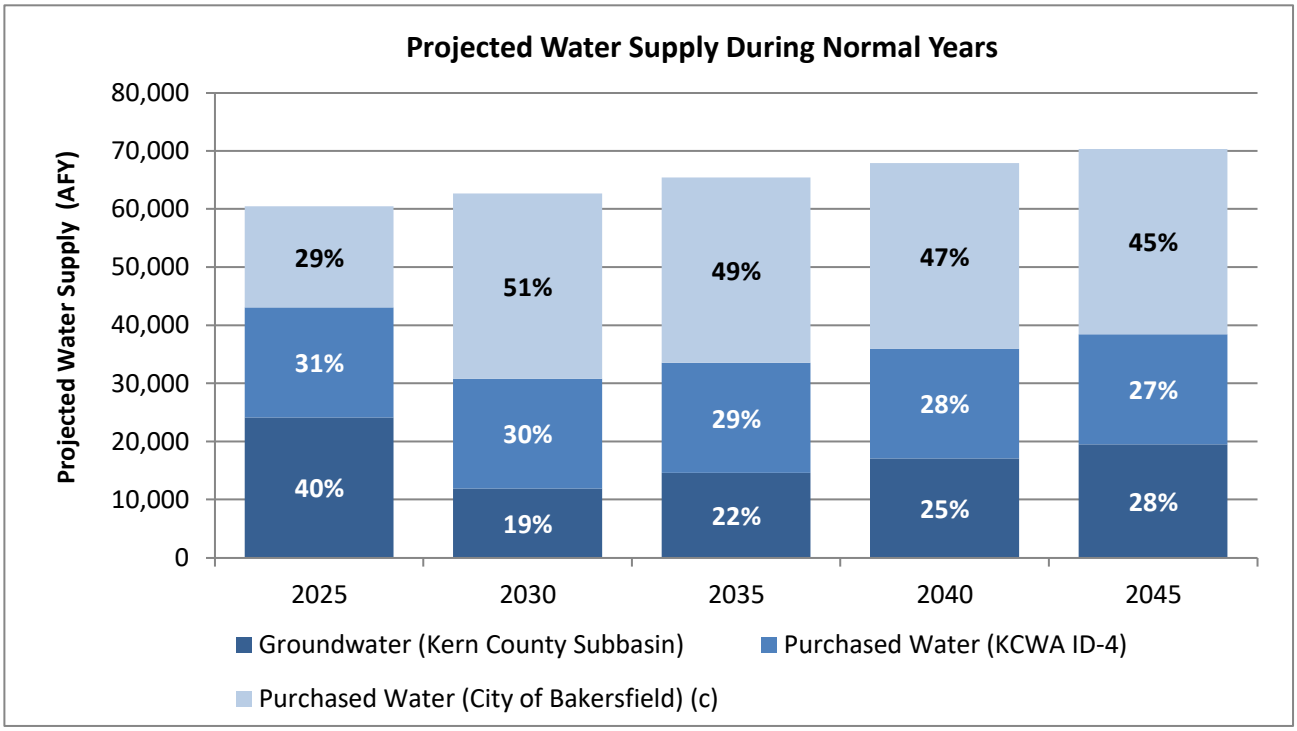
Table 6

Projected Normal Year Water Supply Sources for the Bakersfield District

Ware Malcomb Industrial Project, City of Bakersfield, California

Water Supply Source (a)	Projected Water Supply (b) (AFY)				
	2025	2030	2035	2040	2045
Groundwater (Kern County Subbasin)	24,139	11,881	14,608	17,071	19,514
Purchased Water (KCWA ID-4)	18,900	18,900	18,900	18,900	18,900
Purchased Water (City of Bakersfield) (c)	17,400	31,900	31,900	31,900	31,900
Total Projected Supply	**60,439**	**62,681**	**65,408**	**67,871**	**70,314**



Abbreviations:

"AFY" = acre-feet per year
"Cal Water" = California Water Service
"District" = Cal Water - Bakersfield District
"KCWA ID-4" = Kern County Water Agency Irrigation District No. 4
"NBWTP" = Northeast Bakersfield Water Treatment Plant
"UWMP" = Urban Water Management Plan

Notes:

(a) The District's 2020 UWMP assumes that surface water will be utilized at a higher rate in the future as a result of infrastructure improvements and the remaining demands will be met with groundwater.

(b) Projected supplies for the District per Reference 1.

(c) The District's 2020 UWMP assumes an additional 14,500 AFY of water purchased from the City of Bakersfield will be available once increased treatment capacity becomes available at the NEBWTP in 2030. Should the treatment capacity expansion at the NEBWTP experience delays and come online at a later date, the District will continue to use groundwater to meet the remaining demands.

7 COMPARISON OF SUPPLY AND DEMAND

☑ ***CWC § 10910 (c)(3)***

If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

☑ ***CWC § 10911 (a)***

If, as a result of its assessment, the public water system concludes that its water supplies are, or will be, insufficient, the public water system shall provide to the city or county its plans for acquiring additional water supplies, setting forth the measures that are being undertaken to acquire and develop those water supplies. If the city or county, if either is required to comply with this part pursuant to subdivision (b), concludes as a result of its assessment, that water supplies are, or will be, insufficient, the city or county shall include in its water supply assessment its plans for acquiring additional water supplies, setting forth the measures that are being undertaken to acquire and develop those water supplies. Those plans may include, but are not limited to, information concerning all of the following:

(1) The estimated total costs, and the proposed method of financing the costs, associated with acquiring the additional water supplies.

(2) All federal, state, and local permits, approvals, or entitlements that are anticipated to be required in order to acquire and develop the additional water supplies.

(3) Based on the considerations set forth in paragraphs (1) and (2), the estimated timeframes within which the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), expects to be able to acquire additional water supplies.

☑ ***CWC § 10911 (c)***

The city or county may include in any environmental document an evaluation of any information included in that environmental document provided pursuant to subdivision (b). The city or county shall determine, based on the entire record, whether projected water supplies will be sufficient to satisfy the demands of the project, in addition to existing and planned future uses. If the city or county determines that water supplies will not be sufficient, the city or county shall include that determination in its findings for the project.

As discussed further in Section 5, based on a review of the projected Bakersfield District growth assumptions, Cal Water has determined that the Proposed Project is within the growth anticipated within the Bakersfield District and thus is accounted for in the 2020 UWMP demand projections. Therefore, pursuant to CWC §10910(c)(3), the WSA may rely upon the 2020 UWMP for its analysis of normal, single dry, and multiple dry water years.

This WSA includes an estimate of the projected water supplies available to the Bakersfield District under normal, single dry, and multiple dry years, and a discussion of whether those supplies will meet the projected demand associated with the Proposed Project, in addition to the water system's existing and planned future uses. This assessment is parallel to the multiple-dry year supply reliability analysis required for UWMPs under CWC §10635. In 2018, CWC §10635 was revised to require UWMPs to extend this analysis to consider "a drought lasting five consecutive

water years." Although CWC §10910(c)(3) has not yet been updated to require this for WSAs, a five-year drought scenario is also evaluated herein.

Tables 7, **8**, and **9** provide a comparison of the demands and supplies, inclusive of the Proposed Project, in normal year, single-dry year, and multiple-dry year hydrologic scenarios respectively for the Bakersfield District. As discussed above, because all water sources are considered reliable, the 2020 UWMP assumes that the total projected supplies are equal to the projected demands under all conditions (i.e., current and projected, and for normal, single dry, and multiple dry years).

While supply shortfalls are not projected, shortfalls resulting from any cause (e.g., droughts, impacted distribution system infrastructure, regulatory-imposed shortage restrictions, etc.) that could occur in the future would be managed through the implementation of the Bakersfield District's Water Shortage Contingency Plan (WSCP). The overall reduction goals in the WSCP are established for six drought stages ranging from 10% to greater than 50% shortfalls.

In 2016, Governor Brown signed Executive Order (EO) B-37-16 *Making Water Conservation a California Way of Life* and subsequently SB 606 and Assembly Bill (AB) 1668 were passed. SB 606/AB 1688 set new requirements for urban water agencies to continue to increase water efficiency beyond the 2020 water use targets developed under the Water Conservation Act of 2009 (SB X7-7). Beginning in 2024, agencies are required to report on "annual water use objectives." The urban water use objective is based on an aggregate estimate of efficient urban water use for the previous year and local service area characteristics for that year. In addition, SB 606/AB 1668 added new requirements related to drought planning and WSCPs, including requirements for agencies to: (1) conduct a drought risk assessments part of their future UWMPs to assess water supply reliability for a period of drought lasting five consecutive water years (CWC §10635(b)), and (2) conduct annual water supply and demand assessments to determine its water supply reliability for the current year and one dry year (CWC §10632(a)). These elements are included in the Bakersfield District's 2020 WSCP.

With implementation of its WSCP during the historic five-year 2013-2017 drought, the Bakersfield District achieved a demand reduction of 19% (2017 water demand compared to 2013 water demand; Cal Water, 2021b). As a customer within the Bakersfield District, the Proposed Project would be obligated to comply with the demand reduction efforts imposed by Cal Water through implementation of the WSCP in any future water shortage condition. Therefore, the Proposed Project would contribute a proportionate share of the reduction in water demands during dry years.

On 8 July 2021, in response to the recent drought conditions, Governor Newsom signed EO N-10-21 calling Californians to voluntarily reduce water use by 15% compared to 2020 levels. The Bakersfield District enacted Stage 2 of its WSCP on 14 December 2021 and implemented numerous drought response actions, including, but not limited to, irrigation day restrictions, obligations to fix leaks, community outreach, rebates, and penalties (Cal Water, 2021c; 2021d). The Bakersfield District demands decreased by 8.2% in 2022 compared to its 2020 demands.

Therefore, based on: (1) the projected reliability of the supply sources available to the Bakersfield District, (2) the demonstrated effectiveness of the Bakersfield District's WSCP in the case of supply shortages, and (3) the increasing efficiency and drought planning requirements from the State, sufficient water supply is estimated to be available to Cal Water to meet future demands within the Bakersfield District service area including those associated with the Proposed Project.

8 CONCLUSIONS

As listed in CWC §10910(c)(4), the primary purpose of this WSA is to evaluate whether sufficient water supply is available to meet future water demands within the water supplier's service area, including those associated with the Proposed Project, during normal and multiple dry hydrologic years for a 20-year time horizon.

As described in Section 4, the water demand of the Proposed Project (i.e., 72 AFY at buildout) has been conservatively estimated. As discussed in Section 5, these demands are within the projected water demand growth that form the basis of Cal Water's updated demand projections in the adopted 2020 UWMP.

As discussed in Section 6, all supply sources to the Bakersfield District are considered reliable based on the findings of the 2020 UWMP. Therefore, sufficient water supply is estimated to be available to Cal Water to meet future demands within the Bakersfield District service area from 2020 through 2045 under all hydrologic conditions (i.e., current and projected, and for normal, single dry, and multiple dry years including a five-year drought period).

Therefore, this WSA concludes that sufficient water supply is available to Cal Water to meet future demands anticipated within the Bakersfield District service area, including those associated with the Proposed Project.

Appendix A

Bakersfield District Purchase Agreements

AGREEMENT FOR A DRY YEAR WATER SUPPLY FROM
IMPROVEMENT DISTRICT No. 4

This agreement entered this 24th day of May, 2013, between the Kern County Water Agency ("Agency"), individually and on behalf of Improvement District No. 4 ("ID4"), and CALIFORNIA WATER SERVICE COMPANY ("Customer").

RECITALS

WHEREAS, the Agency has previously entered into long term water supply agreements with the Customer dated September 21, 2005 ("Water Supply Agreement"), a model of which is attached hereto as Exhibit A;

WHEREAS, the Water Supply Agreement provides, pursuant to Article 12(A), that the Agency may use ID4 groundwater banking projects or in-district wells for reducing shortages subject to a separate agreement between the Agency and the Customer;

WHEREAS, ID4 staff has investigated the recovery capacity of the ID4 groundwater banking projects and in-district wells to provide dry year supplies to reduce shortages to the Customer in years when treated water requests of the Customer for New Entitlement cannot be met by ID4's surface water supplies;

WHEREAS, ID4 staff has provided the Customer with analyses showing the estimated costs of utilizing the recharge and recovery capacity of the ID4 groundwater banking projects and in-district wells to provide such dry year supplies;

WHEREAS, the Customer desires to utilize the recovery capacity of the ID4 groundwater banking projects and in-district wells to receive a dry year water supply from ID4 to reduce shortages as provided for in the Water Supply Agreement.

NOW, THEREFORE, for good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the Agency and Customer agree as follows:

1. Incorporation of Water Supply Agreement.

   The provisions of the Water Supply Agreement, including but not limited to those that define the terms used in this agreement and those that describe the obligation and method of payments, are hereby incorporated by reference into this agreement.

2. Schedule for Dry Year Supplies.

   (a) By December 1 of each year, the Agency will provide the Customer with a preliminary estimate of ID4's recovery capacity for dry year supplies for the succeeding year.

   (b) By March 1 of each year, the Customer will provide the Agency with its preliminary dry year water supply request and delivery schedule for that year.

(c) By May 1 of each year, the Customer will provide ID4 with its final dry year water supply request and delivery schedule for that year.

(d) After May 1, the Customer may propose to amend its dry year water supply request and delivery schedule for that year. The Agency shall review any proposed amendments and provide an updated delivery schedule within two weeks of the request.

(e) Agency shall endeavor to at all times keep the Customer apprised of State Water Supply anticipated allocations so that the Customer may make informed decisions about dry year supply needs.

3. Costs and Payments for Dry Year Supplies.

(a) By December 1 of each year, the Agency will provide the Customer with a preliminary estimate and detailed breakdown of the costs for dry year supplies, including any ID4 administrative costs, for the succeeding year.

(b) By March 1 of each year, the Customer shall pay 25% of the dry year water supply charges due to ID4 for that year that are attributable to such Customer's preliminary dry year water supply request and delivery schedule. The remaining 75% of the dry year water supply charges due to ID4 for that year will be collected in equal installments on a monthly basis in those months for which the Customer has requested delivery of any dry year water supplies.

(c) ID4 will reconcile all dry year water supply costs when final costs for the recovery of such supplies are available and by substituting actual deliveries for the requested deliveries made pursuant to 2(c) and 2(d). The Customer will be charged a melded rate for recovery over all ID4 groundwater banking projects and in-district wells used to meet dry year water supply requests.

(d) The Customer may, upon reasonable notice, reduce its dry year water supply request and delivery schedule, and shall not be obligated to make payments for dry year water supplies that are not delivered to Customer pursuant to such reduction.

4. 2013 Schedule and Costs for Dry Year Supplies.

(a) By June 1, 2013, the Customer will provide the Agency with a final dry year water supply request, delivery schedule for the year and shall pay 25% of the dry year water supply charges due to ID4 for 2013.

(b) In 2013, the Customer shall be charged $75 per acre-foot for dry year water supplies.

Executed on the day(s) specified below by the following duly authorized representatives of the contracting parties.

AND

CALIFORNIA WATER SERVICE COMPANY

FOR A WATER SUPPLY

SEPTEMBER 2005

PAGE LEFT BLANK INTENTIONALLY

AMENDMENT NO. 2
TO THE
CONTRACT BETWEEN THE KERN COUNTY WATER AGENCY
AND CALIFORNIA WATER SERVICE COMPANY
FOR A WATER SUPPLY

This agreement made this 23rd day of June, 1994, is by and between the Kern County Water Agency, established by Chapter 1003 of the 1961 Statutes of the State of California (hereinafter "Agency"), and the California Water Service Company (hereinafter "Company"). This agreement is an amendment to the water supply contract entered into between Agency and Company on June 13, 1974 (hereinafter "Water Supply Contract").

RECITALS:

WHEREAS, the Agency and Company have previously entered into the Water Supply Contract dated June 13, 1974 governing the terms and conditions under which the Agency will provide a designated water supply to Company;

WHEREAS, Article 15 of the Water Supply Contract contains pricing provisions, and provides for a surcharge and renegotiation in the event of specified financial conditions leading to the potential insolvency of Improvement District Number 4 of the Agency;

WHEREAS, the conditions specified have occurred and a surcharge under subdivision (d) of Article 15 of the Water Supply Contract has been imposed; and

WHEREAS, the Agency and the Company have engaged in renegotiation pursuant to Article 15 of the Water Supply Contract and have reached the agreement set forth herein which shall constituted an amendment to the Water Supply Contract.

AGREEMENT:

NOW, THEREFORE, IT IS HEREBY MUTUALLY AGREED by the parties hereto as follows:

1. This agreement between the Agency and Company shall constitute an amendment to the terms of the Water Supply Contract between the parties, attached hereto as Exhibit A and incorporated herein

by reference as though fully set forth at length.

2. Subdivision (a) of Article 15 of the Water Supply Contract shall be amended to read as follows:

"Until the date of this amendment the charge for each acre-foot of water delivered to the Company, and all other customers shall be five dollars ($5.00) more per acre-foot than the highest groundwater charge levied in Improvement District No. 4 for that year in accordance with the Agency's resolution 17-71, as amended. After the date of this amendment the charge for each acre-foot of water delivered to the Company, and all other customers, shall be thirty-eight dollars ($38.00) (hereinafter "Water Treatment Charge") more per acre-foot than the highest groundwater charge levied in Improvement District No. 4 for that year in accordance with the Agency's Resolution No. 17-71, as amended."

3. Subdivision (b) of Article 15 of the Water Supply contract shall be amended to read as follows:

"Beginning in the 1980-81 year and each year thereafter the Company and all other customers, shall pay the rate per acre-foot provided for in paragraph (a) of this article times either the water delivered to them or their annual entitlement, whichever is greater. Commencing with the first full year that water is made available and each year thereafter prior to 1980-81 if the Company or any other customer, fails to take its annual entitlement, the customer failing to take its annual entitlement shall pay the Water Treatment Charge for each acre-foot of annual entitlement not taken by it; provided, however, if other customers have paid for the delivery of 25,000 acre-feet of water and the Agency determines on the basis of its estimates that the proceeds from the charges for water delivered and any groundwater charges and taxes levied in Improvement District No. 4 will be sufficient to meet the expenses for the Improvement District for that year, customers failing to take their annual entitlement shall not be required to pay said Water Treatment Charge; provided further, if the Agency has levied the maximum permitted groundwater charge for Improvement District No. 4 and anticipates levying a tax in Improvement District No. 4 for the same year of not less than twenty cents ($.20) per one hundred dollars ($100.00) of assesssed valuation or the maximum tax rate permitted by law without an election, if such maximum is less than twenty cents, and determines on the basis of its estimates that the proceeds from all charges and taxes levied in the Improvement District will be insufficient to meet the estimated expenses for the Improvement District for that year, the Company and all other customers, shall pay, at a uniform rate for each acre-foot of annual entitlement not taken by them, the amount necessary to meet such expenses; provided, that said uniform rate shall be not less than the Water Treatment Charge nor more than the Water Treatment Charge plus the maximum groundwater charge permissible in Improvement District No. 4.

4. Subdivision (j) of Article 1 shall be amended by changing the the title of the last column of figures contained therein from "Max. Capacity" to "Maximum Instantaneous Flow Capacity".

5. Except as specifically amended herein all other provisions of the Water Supply Contract

shall remain in force and effect.

IN WITNESS WHEREOF, the parties hereto have executed this amendment on the date first above written.

CONTRACT BETWEEN KERN COUNTY WATER AGENCY AND
CALIFORNIA WATER SERVICE COMPANY
FOR A WATER SUPPLY

This agreement made this 13th day of June, 1974 is by and between the Kern County Water Agency, established by Chapter 1003 of the 1961 Statutes of the State of California, hereinafter referred to as the "Agency" and California Water Service Company, a California corporation, hereinafter referred to as the "Company".

W I T N E S S E T H:

WHEREAS, the Agency and the State of California entered into an agreement entitled "Water Supply Contract Between the State of California Department of Water Resources and Kern County Water Agency" dated November 15, 1963, whereby the State of California will furnish a water supply to the Agency; and

WHEREAS, the Agency has allocated an ultimate annual supply of 77,000 acre-feet of the water it will obtain from the State to the Urban Bakersfield Area; and

WHEREAS, by Resolution No. 17-71 adopted December 21, 1971, the Agency formed Improvement District No. 4 of the Kern County Water Agency to undertake the financing, construction, operation and maintenance of works to provide a supplemental water supply for the Urban Bakersfield Area; and

WHEREAS, the Company, which is a public utility serving customers in said Improvement District No. 4, is in need of additional water to serve such customers; and

WHEREAS, the Agency desires to sell water to distribution agencies within said Improvement District No. 4, including the Company, under terms and conditions which shall be fair and equitable to all such water distributors and the inhabitants of said Improvement District No. 4; and

WHEREAS, the Company desires to contract with the Agency for a water supply for the benefit and use of the lands and inhabitants served by the Company and for which the Company will make payments to the Agency upon the terms and conditions hereinafter set forth;

NOW, THEREFORE, IT IS HEREBY MUTUALLY AGREED by the parties hereto as follows:

Article 1. Definitions.

When used in this contract the following terms shall have the meanings hereinafter set forth:

(a) "Master Contract" shall mean that contract between the Agency and the State of California entitled "Water Supply Contract Between the State of California Department of Water Resources and the Kern County Water Agency" dated November 15, 1963, as amended to date and any revisions or amendments hereafter made.

(b) "State Project Water" shall mean water made available to the Agency from the California Aqueduct, a portion of the State Water Resources Development system.

(c) "Year" shall mean the 12-month period from July 1 of any calendar year to June 30 of the following calendar year.

(d) "Cross Valley Canal" shall mean the concrete lined canal approximately 17 miles in length extending from the California Aqueduct near Tupman easterly to the Arvin-Edison Canal, together with the turnout from the California Aqueduct, the pumping plants necessary to lift water through a static head of approximately 84 feet and such road crossings, utility relocations, fences, and other facilities necessary for its construction and operation.

(e) "Extension" shall mean the unlined canal beginning at the eastern terminus of the Cross Valley Canal and extending easterly approximately 4.5 miles to a point near the Calloway Weir, together with the pumping plants necessary to lift water through a static head of approximately 30 feet and such road crossings, utility relocations, fences and other facilities necessary for its construction and operation.

(f) "Improvement District No. 4" shall mean Improvement District No. 4 of the Kern County Water Agency created by Resolution No. 17-71 of the Board of Directors of the Kern County Water Agency adopted December 21, 1971.

(g) "Project" shall mean the project to be undertaken by the Agency for the benefit of Improvement District No. 4 and others as described in said Resolution No. 17-71, including the features more particularly described in Article 5 hereof.

(h) "Agency Act" shall mean the Kern County Water Agency Act, being Chapter 1003 of the 1961 Statutes of the State of California, as amended.

(i) "Customers" shall mean each of the following water purveyors that contracts to buy treated water from the project: the Company, East Niles Community Services District, and North of the River Municipal Water District.

(j) "Annual entitlement" shall mean the following amounts of treated water, in acre-feet, to be made available to each customer each year, and the maximum instantaneous flow capacities to be provided for each customer in the transmission facilities are the following amounts:

Customer	Annual Entitlement	Max. Capacity
North of the River Municipal Water District	8,500 acre-feet	17.6 CFS
East Niles Community Services District	5,000 acre-feet	10.4 CFS
Company	11,500 acre-feet	24.0 CFS

(k) "Capital costs" shall mean all costs incurred by the Agency which are properly chargeable, in accordance with generally accepted accounting practices, to the construction of and the furnishing of equipment for the various

project facilities, including the costs of surveys, engineering studies, exploratory work, designs, preparation of construction plans and specifications, acquisitions, acquisition of lands, easements and rights-of-way, relocation work, and essential legal, administrative and financial work in connection therewith.

(l) "Operating costs" shall mean all necessary costs, other than pumping costs, for the operation, maintenance, repair, replacement and administration of the various project facilities.

(m) "Pumping costs" shall mean all necessary power costs incurred for pumping water.

Article 2. Term.

This contract shall become effective when the Agency has executed contracts with customers for an aggregate of 25,000 acre-feet of annual entitlements from a treatment plant or plants to be constructed as part of the project and, except as provided for in Article 15(d), shall remain in effect for the repayment period of any bonds authorized for the project by the electorate of Improvement District No. 4 at the election held on September 12, 1972; provided, however, that if the construction of the water treatment plant described in subdivision (c) of Article 5 is not commenced by December 31, 1975 either party may terminate this contract by giving the other party written notice of its election to do so by January 31, 1976.

Article 3. Option for Continued Service.

After the expiration of the term of this contract, the Company shall be entitled to continued service under the following conditions unless otherwise agreed to:

(a) Service of water in annual amounts equal to the Company's annual entitlement.

(b) Service of water under the same physical conditions of service, including time, place, amount and rate of delivery, as are provided for hereunder.

(c) Service of water at prices to be mutually agreed upon.

Other terms and conditions of the continued service shall be reasonable and equitable and shall be mutually agreed upon. In the event that said terms and conditions provide for continued service for a limited number of years only, the Company shall have the same option to receive continued service here provided for upon the expiration of that and each succeeding period of continued service.

Article 4. Relationship to Master Contract.

This contract is subject to the obligations and limitations imposed by the Master Contract and is intended to be in conformance and harmony with it. The Master Contract is hereby incorporated herein by this reference in all respects as though set forth in full at this point. The Company hereby expressly agrees to the provisions of the Master Contract imposing obligations and limitations upon it and further ex-

presssly agrees that nothing in this contract shall be deemed to require the Agency to perform any obligation in conflict with the Master Contract.

The Agency agrees it will not, without the prior approval of the Company, consent to any amendments to the Master Contract which would increase the price of water to the Company under this contract or substantially adversely affect the Agency's ability to deliver the water provided for herein.

Article 5. Agency to Construct Project.

Upon obtaining sufficient financing, the Agency shall construct the following:

(a) A Cross Valley Canal which shall consist of the following three reaches:

(1) Reach 1 shall begin with a turnout on the California Aqueduct near Tupman and extend northeasterly for approximately 5 miles to a turnout to be constructed near the NW 1/4 of the SW 1/4 of Section 2, T30S, R25E. This reach will include a pumping plant or plants and a major crossing under Interstate Highway 5 and shall be designed and constructed to have a minimum instantaneous flow capacity of 736 cubic feet per second.

(2) Reach 2 shall begin at the terminus of Reach 1 and extend easterly approximately 9 miles to a turnout to be constructed near the crossing of Jerry Slough, Section 36, T29S, R26E. This reach will include a pumping plant or plants and a pipe siphon under the Southern Pacific Railway and shall be designed and constructed to have a minimum instantaneous flow capacity of 706 cubic feet per second.

(3) Reach 3 shall begin at the terminus of Reach 2 and extend approximately 2 3/4 miles to the terminus of the Cross Valley Canal located near the southern terminus of the Friant-Kern Canal. This reach will include a pumping plant or plants and will be designed and constructed to have a minimum instantaneous flow capacity of 646 cubic feet per second.

(b) The Extension which shall have a minimum instantaneous flow capacity of 280 cubic feet per second throughout its length and be constructed to allow future installation of pumps to increase the instantaneous flow capacity to 306 cubic feet per second. It will include a pumping plant or plants, crossings under the Friant-Kern and/or Arvin-Edison Canals, the Southern Pacific and Santa Fe railroads, State Highway 99 and other roads, and a terminal structure to divide the water and deliver it to the water treatment plant for Improvement District No. 4 and to Cawelo Water District.

(c) A water treatment plant with sufficient capacity to provide for the treatment to commonly accepted standards of potability of at least 25,000 acre-feet of water annually from the Extension.

(d) The North pipeline and associated pumping plant or plants and delivery structures for the conveyance and delivery of water from the treatment plant to the North of the River Municipal Water District as described in Exhibit A attached hereto and incorporated herein by reference.

(e) The East pipeline and associated pumping plant or plants and delivery structures for the conveyance and delivery of water from the treatment plant to East Niles Community Services District and the Company as described in said Exhibit A.

(f) Facilities for spreading and percolating water for recharging the underground in Improvement District No. 4.

(g) In addition to constructing the above-mentioned facilities, the Agency may determine that in order to meet its commitment pursuant to Resolution No. 16-71, adopted by the Board of Directors of Kern County Water Agency on December 21, 1971, it will construct additional capacity in the treatment plant and treated water conveyance facilities to be constructed in Improvement District No. 4 sufficient to provide for the delivery of 3,000 acre-feet of treated water annually to East Niles Community Services District, in addition to that District's annual entitlement.

Article 6. Allocation of Capital and Operating Costs of Project Features.

Several of the project features will be joint use facilities to be financed by the following six participants: Improvement District No. 4, Arvin-Edison Water Storage District (Arvin-Edison), Cawelo Water District (Cawelo), Rag Gulch Water District (Rag Gulch), Rosedale-Rio Bravo Water Storage District (Rosedale) and Kern-Tulare Water District (Kern-Tulare). The capital and operating costs of the various project facilities described in Article 5 shall be allocated among these participants as hereinafter set forth. For the purpose of these

allocations the maximum annual entitlement and the capacity to be provided for each participant in each reach of the Cross Valley Canal and the Extension shall be deemed to be:

Maximum Annual Entitlement

	Reach 1	Reach 2	Reach 3	Extension
Rosedale	35,000 AF	23,300 AF	0	0
Cawelo	45,000 AF	45,000 AF	45,000 AF	55,000 AF
Rag Gulch	13,300 AF	13,300 AF	13,300 AF	0
I.D. No. 4	77,000 AF	77,000 AF	77,000 AF	77,000 AF
Kern-Tulare	40,000 AF	40,000 AF	40,000 AF	0
Arvin-Edison A	10,000 AF	10,000 AF	10,000 AF	0
Arvin-Edison B	60,000 AF	60,000 AF	60,000 AF	0

Capacity (cubic feet per second)

	Reach 1	Reach 2	Reach 3	Extension
Rosedale	90	60	0	0
Cawelo	135	135	135	165
Rag Gulch	40	40	40	0
I.D. No. 4	141	141	141	141
Kern-Tulare	120	120	120	0
Arvin-Edison A	30	30	30	0
Arvin-Edison B	180	180	180	0

The terms "Arvin-Edison A," "Arvin-Edison B," and "A" and "B" capacity refer to the various priorities of use and cost responsibilities allocated to Arvin-Edison. "Arvin-Edison A" and "A" capacity refer to the portion of the Cross Valley Canal use and costs allocated to Arvin-Edison on a full proportionate use basis from the inception of the contract between Arvin-Edison and the Agency. "Arvin-Edison B" and "B" capacity refer to the portion of the Cross Valley Canal use and costs allocated to Arvin-Edison initially on an incremental basis.

As of the date of this contract, Arvin-Edison does not have a firm supply of water to be delivered through the

Cross Valley Canal. Because of this fact, the share of the capital and operating costs of the Cross Valley Canal for Arvin-Edison's "B" capacity shall be determined on an incremental basis, as provided for in subdivision (a) of this article, until such costs are reallocated on the proportionate use basis, as provided for in subdivisions (b) and (c) of this article, or Arvin-Edison's right to use "B" capacity is terminated pursuant to subdivision (d) of Article 2 of Arvin-Edison's contract.

(a) Cross Valley Canal - Allocation on Incremental Basis

Until the capital and operating costs of the Cross Valley Canal for Arvin-Edison's "B" capacity are reallocated pursuant to subdivisions (b) and (c) of this article, the capital and operating costs for each reach of the Cross Valley Canal, not recovered from any entities that have withdrawn as participants, shall be determined by the Agency and then allocated among the remaining participants as follows:

(1) The incremental capital costs of providing the last 180 cubic feet per second capacity (Arvin-Edison's "B" capacity) in each reach, as determined by the Agency, shall be allocated to Arvin-Edison.

(2) The remaining capital costs of each reach shall be allocated among the participants, including Arvin-Edison, in proportion to the average of the following two ratios: (i) The ratio of the participant's maximum annual entitlement to be delivered from or through the reach to the total of the maximum annual entitlements of all participants to be

delivered from or through the reach, and (ii) the ratio of the capacity provided in the reach for the transport and delivery of water to the participant to the total capacity provided in the reach for the transport and delivery of water to all participants served from or through the reach. In making this allocation, Arvin-Edison's "A" capacity and entitlement shall be included in determining each participant's share, but not its "B" capacity or entitlement.

(3) The operating costs of each reach shall be allocated among all the participants in proportion to their respective shares of the capital costs.

Incremental costs shall mean the costs which would not be incurred by the Agency if it constructed the Cross Valley Canal without capacity for Arvin-Edison and shall be determined by the Agency on the basis of the difference between the lowest responsible bids received for a Canal with a maximum capacity of 556 cubic feet per second and for a Canal with a maximum capacity of 736 cubic feet per second. The Agency will install pumping equipment for Arvin-Edison's "B" capacity only if, as and when Arvin-Edison deposits funds, in addition to the deposits required by Article 12 of Arvin-Edison's contract to cover the costs of installing such equipment.

(b) Conversion of "B" Capacity Costs from Incremental to Proportionate Use Basis

Whenever Arvin-Edison enters into a long-term contract for the exchange of water to be delivered through Arvin-Edison's "B" capacity, the capital and operating costs for that portion of Arvin-Edison's "B" capacity to be used

pursuant to that contract shall be converted from an incremental basis to a proportionate use basis of allocation. For the purpose of these reallocations, 3 cubic feet per second of "B" capacity and 1,000 acre-feet of "B" entitlement shall be converted from the incremental to the proportionate use basis for each 1,000 acre-feet of water to be exchanged on an average annual basis pursuant to such contracts. Any such reallocations shall become effective on the January 1 next following the date of the contract causing the reallocation.

(c) Cross Valley Canal - Allocation on Proportionate Use Basis

Whenever a reallocation is required pursuant to subdivision (b) of this article, the Agency shall reallocate the capital costs of each reach of the Cross Valley Canal among all the participants, including Arvin-Edison, in the following manner:

(1) The capital cost of all pumping equipment required to provide for the pumping of Arvin-Edison's "B" capacity which Arvin-Edison requests to have installed after the initial installation of pumping equipment in the Canal and all the costs required to be paid by Arvin-Edison pursuant to Article 29 of Arvin-Edison's contract shall be borne by Arvin-Edison.

(2) The prorated portion of the incremental costs, as determined by subdivision (a) of this article, that are not to be reallocated shall continue to be allocated to Arvin-Edison.

(3) All other capital costs of the Cross Valley Canal as determined by the Agency shall be reallocated among the participants, including Arvin-Edison, in proportion to the average of the two ratios set forth in subdivision (a) of this article, namely the ratio of the maximum annual entitlements and the ratio of the capacities provided in the reach for each participant. In making this allocation, Arvin-Edison's "A" capacity and entitlement and that portion of its "B" capacity and entitlement to be reallocated shall be included.

(4) All operating costs incurred after the effective date of a reallocation, shall be allocated among all the participants in proportion to that reallocation of the capital shares.

(d) Extension

(1) The capital and operating costs of the Extension, other than (1) the incremental capital costs of increasing the capacity for Cawelo from 135 cubic feet per second to 165 cubic feet per second, and (2) the incremental capital costs of providing the added capacity described in subdivision (g) of Article 5, shall be determined by the Agency and fifty percent (50%) shall be allocated to Cawelo and the remaining fifty percent (50%) to Improvement District No. 4; provided that Cawelo shall not be responsible for the capital and operating costs of pumping units installed to provide an instantaneous flow capacity in excess of 280 cubic feet per second, as provided for in subdivision (b) of Article 5.

(2) In addition to all other payments required under its Cross Valley Canal contract with the Agency, Cawelo shall pay the incremental capital costs incurred by the Agency in increasing the capacity in the Extension for Cawelo from 135 cubic feet per second to 165 cubic feet per second, as determined by the Agency.

(e) Article 5(g) Incremental Costs

In addition to all other payments required under this contract, if the Agency determines to perform the construction described in subdivision (g) of Article 5, the Agency shall allocate the incremental capital costs of providing such added capacity to the above named six participants in proportion to each participant's share of the total capital costs of all three reaches of the Cross Valley Canal; provided, that the following participants shall not be required to pay in excess of the amounts designated below, if all the participants remain in the project:

Arvin-Edison	$ 68,000
Cawelo	$ 61,000
Kern-Tulare	$ 54,000
Rag-Gulch	$ 18,000
Rosedale	$ 29,000

provided, further, that if Kern-Tulare ceases to be a participant the following participants shall not be required to pay in excess of the amounts designated below for such costs:

Arvin-Edison	$ 82,229
Cawelo	$ 73,766
Rag-Gulch	$ 22,000
Rosedale	$ 33,000

Article 7. Completion of Project.

The first year in which water will be made available to the Company is presently estimated to be 1976. Subject to the availability of funds, the Agency shall make all reasonable efforts consistent with sound fiscal policies, reasonable construction schedules, and proper operating procedures to complete the project in such a manner and in such time that water will be available to the Company in or before this year. To the extent practicable, the Agency shall notify the Company of any change in this estimate.

Article 8. Contract Entitlement.

Each year after the project is completed, the Agency shall make available for delivery to the Company the Company's annual entitlement to water. During the year in which the project is completed the Agency shall make available for delivery to the Company that percentage of the Company's annual entitlement that is equal to the percentage of the year remaining after the date of completion.

Article 9. Delivery Structures, Conveyance Facilities, Measuring Devices and Cost Thereof.

(a) Capital Costs of Delivery Structures

All water to be furnished pursuant to this contract will be delivered to the Company through pipelines from the treatment plant at turnouts to be constructed with funds provided by the Company at the time of initial construction. The turnouts to be constructed with Company funds shall include the T, the gate valve and any other facilities requested and

paid for by the Company. If the Company desires to change its point or points of delivery or install additional points of delivery, it may do so either by furnishing all funds to cover any Agency expenses involved, or by undertaking the construction at its own expense; provided, the Company shall not undertake any such construction until it has first obtained Agency approval of the plans and specifications for such work. Upon the receipt of a request for such a change in place of delivery or installation of additional places and the deposit of the required funds, the Agency shall diligently proceed to make such a change or installation. Upon completion of the construction of any delivery structures, the Agency shall refund any monies deposited by the Company not expended for such construction.

(b) Operating Costs of Conveyance Facilities

The annual operating costs, other than pumping costs, of each pipeline, pumping plant and delivery structure used in delivering water from the treatment plant to the Company shall be borne by the Company and any other customers taking water through such conveyance facilities in proportion to the annual quantities of water delivered to each customer through each such facility. On or before April 1 of each year the Agency shall notify the Company in writing of the estimated amount of operating costs it must pay for the next succeeding year for each conveyance facility to be used by it. The Company shall pay one-fourth of such estimated costs on or before each of the following dates during the succeeding

year: July 1, October 1, January 1 and April 1. At the end of each year each customer's share of operating costs for that year shall be recalculated as soon as possible by substituting the actual costs incurred by the Agency and the actual quantities of water delivered to each customer. Any adjustments in the Company's payments required to reflect this recalculation shall be made in the Company's next quarterly operating cost payment due after the recalculation.

(c) Pumping Costs for Delivering Water

The monthly and annual pumping costs for each pumping plant used in delivering water from the treatment plant shall be borne by the Company and any other customers taking water through the pumping plant in proportion to the quantities of water delivered to each customer through the pumping plant during the month and the year, as the case may be. As soon as possible after the close of each month the Agency shall notify the Company in writing of the amount of pumping costs it must pay for the preceding month. The Company shall pay this amount within ten days after receiving such a statement of charges from the Agency.

(d) Recalculation and Adjustment of Pumping Costs

As soon as possible after the end of each year the pumping costs for each pumping plant shall be recalculated by dividing the actual pumping costs incurred by the Agency

for that year for all water delivered through that pumping plant by the actual quantities of water delivered through the pumping plant and multiplying the resulting acre-foot rate by the total quantity of water delivered during the year through that pumping plant to each customer. Any adjustments in the Company's payments required to reflect this recalculation shall be made in the Company's first monthly pumping cost payment due after the recalculation.

(e) Measuring Devices

All water furnished pursuant to this contract shall be measured by the Agency at mutually agreed upon points with equipment satisfactory to the Agency and the Company. All such equipment shall be installed and maintained by the Agency. The Agency shall pay for the installation and maintenance of such equipment. All determinations relative to the measuring of water shall be made by the Agency, and upon request by the Company, the accuracy of such measurements shall be investigated by the Agency. Any errors appearing thereon will be adjusted. The Company may inspect such measuring equipment for the purpose of determining the accuracy thereof.

Article 10. Delivery Schedules.

The amounts, times, and rates of delivery of water to the Company during any year shall be in accordance

with a water delivery schedule determined in the following manner:

(a) On or before August 1 of each year, the Company shall submit in writing to the Agency a preliminary water delivery schedule indicating the amounts of water desired by the Company during each month of the succeeding six years.

(b) Upon receipt of a preliminary schedule, the Agency shall review it and after consultation with the Company shall make such modifications in it as are necessary to ensure that the amounts, times, and rates of delivery to the Company will be consistent with the available supply of water from the treatment facilities, considering each customer's annual entitlement and the then current delivery schedules of all other customers. On or before December 31, of each year, the Agency shall determine and furnish to the Company a water delivery schedule for the next succeeding calendar year which shall show the amounts of water to be delivered to the Company during each month of that calendar year. If the Agency determines it has water available, such schedules may provide for the delivery of water in excess of the Company's annual entitlement.

(c) A water delivery schedule may be amended by the Agency upon the Company's written request. Proposed amendments shall be submitted by the Company within a

reasonable time before the desired change is to become effective, and it shall be subject to review and modification by the Agency in like manner as the schedule itself.

(d) In no event shall the Agency be obligated to deliver water to the Company in any month in excess of the Company's demand for that month as set forth in the approved delivery schedule, or twelve and one-half percent (12.5%) of its annual entitlement, whichever is the lesser.

(e) In no event shall the Agency be obligated to deliver water to the Company in excess of 24.0 cfs which is the maximum instantaneous flow capacity to be provided for the Company in the pipeline and associated pumping plant or plants.

Article 11. Responsibilities for Delivery and Distribution of Water.

Neither the Agency nor its officers, agents, or employees shall be liable for the control, carriage, handling, use, disposal, or distribution of water supplied to the Company pursuant to this contract after such water has passed the points of delivery established in accordance with Article 9; nor for claim of damages of any nature whatsoever, including but not limited to property damage, personal injury, or death, arising out of or connected with the control, carriage, handling, use, disposal, or distribution of such water beyond

said delivery structures; and the Company shall indemnify and hold harmless the Agency and its officers, agents, and employees, from any such damages or claims of damages.

Article 12. Water Shortage.

At times there may occur a shortage during any year in the quantity of water available for delivery to the Company by the Agency pursuant to this contract. However, if the Agency can prevent or diminish a shortage in treated water by temporarily halting or curtailing its spreading of water for recharging the underground in Improvement District No. 4, it shall do so.

No liability shall accrue against the Agency or any of its officers, agents or employees for any damage, direct or indirect, arising from a shortage on account of drought, or unavoidable causes. In any year in which such a shortage may occur for any cause so that the total quantity of water available to the Agency for distribution to the Company and other customers taking water from the treatment facilities is less than the total of all quantities contracted for by the Company and other customers, the Agency shall apportion the available treated water among the Company and other customers in proportion to their monthly entitlements as set forth in the approved delivery schedules.

The Agency shall give the Company written notice as far in advance as possible of any such reduction in delivery to it.

Article 13. Curtailment of Delivery for Maintenance Purposes.

The State of California or the Agency may temporarily discontinue or reduce the amount of water to be furnished the Company for the purposes of maintaining, repairing, replacing, investigating or inspecting any of the facilities necessary for furnishing of water to the Company. Insofar as it is feasible, the Agency will give the Company due notice in advance of any such temporary discontinuance or reductions, except in the case of emergency, in which case no notice need be given. In the event of such discontinuance or reduction, the Agency will upon resumption of service, deliver, as nearly as may be feasible after consultation with the Company, and to the extent water is furnished to it by the State of California, or other sources, the quantity of water which would have been furnished to the Company in the absence of such discontinuance or reduction. The Agency shall schedule its routine maintenance of project facilities so that whenever possible any such discontinuances or reductions in delivery will occur during the months of December or January each year.

Article 14. Water Quality.

All water delivered to the Company under this contract shall meet all applicable Federal, State of California and Kern County minimum water quality requirements for water for domestic use.

Article 15. Cost of Water.

The Company and all other customers, shall pay the following charges to be determined and set annually by the Agency.

(a) Charges for Water Delivered

Each year after the project is completed, the charge for each acre-foot of water delivered to the Company, and all other customers, shall be five dollars ($5.00) more per acre-foot than the highest groundwater charge levied in Improvement District No. 4 for that year in accordance with the Agency's Resolution No. 17-71. In the year in which the project is completed the charge for each acre-foot of water delivered to the Company during that year shall be twenty-five dollars ($25.00).

(b) Charges for Failure to Take Annual Entitlements

Beginning in the 1980-81 year and each year thereafter the Company and all other customers, shall pay the rate per acre-foot provided for in paragraph (a) of this article times either the water delivered to them or their annual entitlement, whichever is greater.

Commencing with the first full year that water is made available and each year thereafter prior to 1980-81 if the Company or any other customer, fails to take its annual entitlement, the customer failing to take its annual entitlement shall pay five dollars ($5.00) for each acre-foot of annual entitlement not taken by it; provided, however, if other customers have paid for the delivery of 25,000 acre-feet of water and the Agency determines on the basis of its estimates that the proceeds from the charges for water de-

livered and any groundwater charges and taxes levied in Improvement District No. 4 will be sufficient to meet the expenses for the Improvement District for that year, customers failing to take their annual entitlement shall not be required to pay said five dollars ($5.00) charge; provided further, however, if the Agency has levied a twenty dollar ($20.00) per acre-foot groundwater charge for Improvement District No. 4 and anticipates levying a tax in Improvement District No. 4 for the same year of not less than twenty cents ($.20) per one hundred dollars ($100.00) of assessed valuation or the maximum tax rate permitted by law without an election, if such maximum is less than twenty cents, and determines on the basis of its estimates that the proceeds from all charges and taxes levied in the Improvement District will be insufficient to meet the estimated expenses for the Improvement District for that year, the Company and all other customers, shall pay, at a uniform rate for each acre-foot of annual entitlement not taken by them, the amount necessary to meet such expenses; provided, that said uniform rate shall be not less than five dollars ($5.00) nor more than twenty-five dollars ($25.00) per acre-foot.

(c) Credit for Annual Entitlement Not Taken

Beginning in the 1980-81 year and each year thereafter, if any customer pays for the delivery of more than its

annual entitlement in any year, any other customer which took delivery of less than its annual entitlement shall be entitled to a credit. The total amount of such credits to be given to all customers entitled thereto shall equal the rate per acre-foot provided for in paragraph (a) of this article times either the total number of acre-feet of water delivered to all customers in excess of their annual entitlements or the total number of acre-feet of annual entitlements not taken by customers, whichever is the lesser. The total amount of such credits shall be allocated among those customers entitled thereto in proportion to the number of acre-feet of annual entitlement each such customer failed to take.

(d) Surcharges

If the Agency has levied a twenty dollar ($20.00) per acre-foot groundwater charge for Improvement District No. 4 and anticipates levying a tax in Improvement District No. 4 for that same year of not less than twenty cents ($.20) per one hundred dollars ($100.00) of assessed valuation or the maximum tax rate permitted by law without an election, if such maximum is less than twenty cents, and the proceeds from these and the other charges provided for in this article are estimated by the Agency to be insufficient to meet the estimated expenses for Improvement District No. 4 for that year, the Agency shall charge the Company, and all other customers, a surcharge. The total amount of the sur-

charges to the Company and all other customers shall be one-fourth of the estimated deficit. The amount of the Company's and each customer's surcharge shall be determined by the Agency by dividing one-fourth of the estimated deficit by 25,000 acre-feet and multiplying the result by the Company's or the other customer's annual entitlement for that year.

To the extent it may legally do so without an election, the Agency will raise funds for the remaining three-fourths of the deficit by levying an ad valorem tax in Improvement District No. 4. If the Agency is legally prevented from raising that amount by ad valorem taxes, it shall immediately enter into negotiations with the Company and all other customers in an effort to find a way to raise the remaining three-fourths of the deficit that is acceptable to all parties. If no mutually satisfactory way to raise that amount can be agreed upon, either the Agency or the Company may terminate this contract upon six months written notice.

Article 16. Time of Payment.

(a) Payment of Charges for Year in Which Project Is Completed

On or before the tenth day of each month during the year in which the project is completed, the Agency shall send the Company a statement of charges for all water delivered to the Company during the preceding month. The Company shall pay such statements within twenty (20) days after they are received.

(b) Payment of Charges for Annual Entitlement for Each Year after the Year in Which Project Is Completed

On or before June 1 of the year in which the project is completed and June 1 of each year thereafter, the Agency shall notify the Company of its estimated charges for annual entitlement water for the ensuing year. These estimates shall be prepared by the Agency on the basis of the delivery schedules provided for in Article 10, the Agency's estimates of the revenues and expenses for Improvement District No. 4 and the Agency's estimates of any credits due as provided for in Article 15 and shall provide for both the payments to be made for water to be delivered and for that portion of the annual entitlement not requested for delivery. The Company shall pay sixty percent (60%) of these charges on or before July 1 of each year and the remainder on or before January 1 of that year.

(c) Payment of Charges for Deliveries in Excess of Annual Entitlement

On or before the tenth day of each month the Agency shall send the Company a statement of charges for all water delivered to the Company during the preceding month in excess of the Company's annual entitlement for that year. The Company shall pay such statements within twenty (20) days after they are received.

Article 17. Recalculation and Adjustment of Cost of Water.

At the end of each year, the charges for water

for that year required by Article 15 shall be recalculated by the Agency by substituting as soon as possible actual figures for the estimates made pursuant to Article 16. Also, if the Agency charged the Company a surcharge and did not, as anticipated, levy a tax in Improvement District No. 4 for that year of at least twenty cents ($.20) per one hundred dollars ($100.00) of assessed valuation or the maximum tax rate permitted by law without an election, if such maximum is less than twenty cents, such surcharge shall be refunded to the Company. Any adjustments in the Company's payments required to reflect these recalculations shall be made in the Company's first semiannual payment due after the recalculations.

Article 18. Default.

The Company shall cause to be levied and collected all necessary fees and charges and will use all the authority and resources of the Company to meet its obligations hereunder, to make in full all payments to be made pursuant to this contract on or before the date such payments become due and to meet its other obligations under this contract. In the event of any default by the Company in the payment of any money required to be paid to the Agency hereunder, the Agency in its discretion may suspend delivery of water during the period when the Company is delinquent in its payments or obligations due to the Agency under the terms of this contract; provided that during any such

period of delinquency or suspension the Company shall remain obligated to make all payments required under this contract. Action taken pursuant to this article shall not deprive the Agency of or limit any remedy provided by this contract or by law for the recovery of money due or which may become due under this contract.

Article 19. Obligation to Make Payments.

(a) Character of Obligation

The obligation of the Company arising out of or pursuant or incidental to this contract including, without limiting the generality of the foregoing, the obligations of the Company to pay to the Agency the sums becoming due the Agency for water furnished hereunder, shall constitute a general obligation of the Company and the Company shall use all the powers and resources available to it under the law to collect the funds necessary for and to pay its obligations to the Agency under this contract. The Company is obligated to pay to the Agency the payments becoming due under this contract, notwithstanding any individual default by its water users, constituents or others in the payment to the Company of charges levied by the Company.

(b) Refusal of Water Does Not Affect Obligation

Except as provided in Article 15(b) and except in the year in which the project is completed, the Company's failure or refusal to accept delivery of water to which it is entitled under this contract shall in no way relieve the Company of its obligation to make payments to the Agency as provided for herein.

Article 20. Penalty for Late Payment.

Upon each charge to be paid by the Company to the Agency pursuant to this contract which shall remain unpaid after the same shall have become due and payable, interest shall accrue at the rate of one-half (1/2) of one (1) percent per month of the amount of such delinquent payment from and after the date when the same becomes due until paid, and the Company hereby agrees to pay such interest.

Article 21. Remedies Not Exclusive.

The use by either party of any remedy specified herein for the enforcement of this contract is not exclusive and shall not deprive the party using such remedy of, or limit the application of, any other remedy provided by law.

Article 22. Amendments.

This contract may be amended at any time by mutual agreement of the parties, except insofar as any proposed amendments may adversely affect other customers or be in any way contrary to applicable law or inconsistent with the provisions of the Master Contract. The Agency shall make available to the Company at all times during the normal hours of business at the Agency offices for the Company's inspection copies of all contracts now or hereafter executed by the Agency with all other customers and the participants referred to in Article 6 and of any amendments thereto. The Agency agrees that each contract for the supply of treated water now or hereafter executed with all other customers in Improvement District No. 4 shall contain provisions substantially similar to those herein set forth and shall not contain any

provisions of a material nature more favorable to any other customer than the provisions herein applicable to the Company.

Article 23. Opinions and Determinations.

Where the terms of this contract provide for action to be based upon opinion, judgment, approval, review or determination of either party hereto, such terms are not intended to be and shall never be construed as permitting such opinion, judgment, approval, review or determination to be arbitrary, capricious, or unreasonable.

Article 24. Waiver of Rights.

Any waiver at any time by either party hereto of its rights with respect to a default or any other matter arising in connection with this contract, shall not be deemed to be a waiver with respect to any other default or matter.

Article 25. Notices.

All notices that are required either expressly or by implication to be given by either party to the other under this contract shall be signed for the Agency and for the Company by such officers as they may, from time to time, authorize in writing to so act. All such notices shall be deemed to have been given and delivered if delivered personally or if enclosed in a properly addressed envelope and deposited in a United States Post Office for delivery by registered or certified mail. Unless and until formally notified otherwise, all notices shall be addressed to the parties at their addresses as shown on the signature page of this contract.

Article 26. Assignment.

The provisions of this contract shall apply to and bind the successors and assigns of the respective parties, but no assignment or transfer of this contract, or any part hereof or interest herein, shall be valid until and unless approved by the Agency. The Agency shall not approve any such assignment or transfer to any person or entity that is not a customer unless and until the proposed assignment or transfer has been first offered to and refused in writing by all customers. The offer of any such assignment or transfer shall be on the same basis to all customers and if more than one customer desires to accept the offer, the contract or portion thereof to be assigned shall be prorated among them in proportion to the flow capacities provided for each of them in the facilities involved in the assignment or transfer. Notwithstanding any other provisions of this article to the contrary, the Agency's approval shall not be required for an assignment by the Company of all or part of this contract to a public agency with the power of eminent domain, if such public agency expressly assumes all or part of the obligations of this contract. If such public agency assumes only a portion of the obligations of the Company under this contract, the Company shall remain obligated for the remainder of such obligations.

Article 27. Inspection of Books and Records.

The proper officers or agents of the Company shall have full and free access at all reasonable times to the

account books and official records of the Agency insofar as the same pertain to the matters and things provided for in this contract, with the right at any time during office hours to make copies thereof, and the proper representatives of the Agency shall have similar rights in respect to the account books and records of the Company.

Article 28. Validation.

After the execution and delivery of this contract the Agency may file a proceeding in mandamus or other appropriate proceeding or action for the judicial examination, approval, and confirmation of this contract and the validity of the provisions thereof.

Article 29. Areas Served by the Company.

Water delivered to the Company pursuant to this contract shall not be sold or otherwise disposed of by the Company for use outside the boundaries of Improvement District No. 4 without the prior written consent of the Agency.

Article 30. Changes in the Company's Service Area.

The Company will furnish the Agency with maps showing the service area or areas of its water distribution system. Throughout the term of this contract, the Company will properly notify the Agency of any changes, either by inclusion or exclusion, in said service area or areas.

Article 31. Sale of Water to Others.

The Agency shall not sell any water from the treatment plant provided for in this contract to other than the customers unless and until it has first offered

to sell such water to the customers at the prices provided for herein. If the customers do not elect to take all the water available from the treatment plant, the unused water may be sold to others at not less than the prices provided for herein; provided, that such sale shall not interfere with the ability of the Agency to make deliveries to the Company and other customers; and further provided, that such sales shall be made only to others who will use the water within Improvement District No. 4.

Article 32. Advisory Committee.

An Advisory Committee shall be created which shall consist of seven members. One member shall be recommended by each of the three customers and appointed by the Agency, one member shall be recommended by the City of Bakersfield and appointed by the Agency, and three members shall be recommended and appointed by the Agency. Each member shall serve at the pleasure of the party responsible for his or her appointment and alternates may be appointed who may serve in the absence of a member.

The Advisory Committee shall be charged with the responsibility of making recommendations to the Agency on such things as plans and specifications for project facilities, construction and operating budgets, operating criteria and use of the project facilities. To the extent reasonably possible the Advisory Committee shall be informed of the details of such matters in a timely manner and,

except in emergencies, the Agency will seek and consider the advice of the Advisory Committee on all such matters. Final decisions concerning the project shall be made by the Agency.

IN WITNESS WHEREOF, the parties hereto have executed this contract on the date first above written.

AGREEMENT BETWEEN KERN COUNTY WATER AGENCY
AND THE CALIFORNIA WATER SERVICE COMPANY
FOR A WATER SUPPLY

This agreement made this 21st day of September, 2005 (hereinafter Agreement), is by and between the Kern County Water Agency, established by chapter 1003 of the 1961 Statutes of the State of California, hereinafter referred to as the "Agency" and the California Water Service Company, a California corporation, duly organized and existing under and by virtue of the laws of the State of California, hereinafter referred to as "Purveyor":

W I T N E S S E T H :

WHEREAS, the Agency and the State of California entered into an agreement entitled "Water Supply Contract Between the State of California Department of Water Resources and Kern County Water Agency" dated November 15, 1963, whereby the State of California has and will furnish a water supply to the Agency; and

WHEREAS, the Agency has obtained an annual State Water Project Table A Supply of 82,946 acre-feet per year, which is within the yield authorized for Improvement District No. 4, which it will allocate to the Urban Bakersfield Area; and

WHEREAS, by Resolution No. 17-71 adopted December 21, 1971, as amended, the Agency formed Improvement District No. 4 of the Kern County Water Agency to undertake the financing, construction, operation and maintenance of works to provide a supplemental water supply for the Urban Bakersfield Area; and

WHEREAS, the lands and inhabitants of the Purveyor to be served by the water provided hereby, all of which will be located in said Improvement District No. 4 prior to service, are in need of surface water for beneficial uses; and

WHEREAS, the Agency has sold water to certain distribution agencies, and desires to continue to sell water to distribution agencies as a method of achieving the purposes of Improvement District No. 4; and

WHEREAS, in order to continue to meet the increasing demands of the distribution agencies within Improvement District No. 4 which will exercise all reasonable efforts to comply with federal, state and local laws regarding water conservation, the Agency plans to expand its treated water supply to meet those increased demands by expanding its facilities as illustrated on attached Exhibit A, under terms and conditions which shall be fair and equitable to all such water distributors and the inhabitants of Improvement District No. 4; and

WHEREAS, Purveyor desires to enter this Agreement with the Agency for a water supply, and increase the amount of the supply, for the benefit of the lands and inhabitants served by the Purveyor within the confines of Agency Improvement District No. 4 and for which the Purveyor will make payments to the Agency upon the terms and conditions hereinafter set forth, and Purveyor accepts this Agreement as meeting the terms of its option for continued service under its existing contract;

NOW THEREFORE, IT IS HEREBY MUTUALLY AGREED by the parties hereto as follows:

Article 1. Definitions.

When used in this Agreement, the following terms shall have the meanings hereinafter set forth:

(A) "Agency Act " shall mean the Kern County Water Agency Act, being Chapter 1003 of the 1961 Statutes of the State of California, as amended.

(B) "Annual Entitlement" shall mean the amounts of treated water, in acre-feet, to be made available to each Customer each Year as shown on Exhibit D, and in accordance with the option arrangement set forth in Article 8. The maximum instantaneous flow capacities to be provided for each Customer in the transmission facilities are shown on Exhibit C.

(C) "Capacity" shall mean the measurement of the capability of a pipeline, canal, Purification Plant, or other facility as measured over a short period utilizing the full operational capability of the facility, and where referencing the Purveyor's or other Customer's share of Capacity shall mean that share allocated by this Agreement either textually or as specified in the incorporated Exhibits.

(D) "Capital Costs" shall mean all costs incurred by the Agency which are properly chargeable, in accordance with generally accepted accounting practices, to the development of, construction of and the furnishing of equipment for the various project facilities, including the costs of surveys, engineering studies, exploratory work, designs, preparation of construction plans and specifications, acquisitions, acquisition of lands, easements and rights-of-way, relocation work, and essential legal, administrative and financial work in connection therewith.

(E) "Capital Facilities Charge" shall mean that charge to Purveyor and other

Customers which repays the Expanded Capital Costs, including the interest on financing of such costs, trustee fees, remarketing fees, credit enhancement costs, arbitrage rebate, any amount required to replenish a debt service reserve fund to its required amount, costs for financing or refunding, other ongoing financing or re-financing costs, any payments required pursuant to Article 19 hereof, any amount necessary to comply with a debt service coverage covenant for a financing, and other capital costs including, but not limited to, payments on obligations issued on the Expanded Capital Costs.

(F) "Capital Facilities Account" shall mean a restricted account within the ID4 Enterprise Fund to receive payments of Capital Facilities Charges and to disburse payments to service the debt incurred for the Expanded Capital Costs and other Capital Costs, including but not limited to, payments on Certificates of Participation issued in 2000 and 2005, and in subsequent years as required to finance the Expansion Project.

(G) "Cross Valley Canal" shall mean the concrete lined canal approximately 17 miles in length extending from the California Aqueduct near Tupman easterly to the Arvin-Edison Canal, together with the turnout from the California Aqueduct, the pumping plants necessary to lift water through a static head of approximately 84 feet and such road crossings, utility relocations, fences and other facilities necessary for its construction and operation.

(H) "Customers" shall mean each of the following water distributors that contract to buy treated water from the project including: North of the River Municipal Water District, East Niles Community Services District, California Water Service Company and the City of Bakersfield.

(I) "Distribution Component" means that portion of the Expansion Project which is set forth in Article 5(B)(2).

(J) "Enterprise" means the Purveyor's Bakersfield District water system, including all facilities, works, properties and structures of the Purveyor's Bakersfield District for the treatment, transmission and distribution of water, excluding wastewater and all facilities for the collection and treating of wastewater, but including all contractual rights to water supplies, transmission capacity, supply, easements, rights-of-way and other works, property or structures necessary or convenient for such facilities, together with all additions, betterments, extensions and improvements to such facilities or any part thereof hereafter acquired or constructed.

(K) "Expanded Capital Costs" shall mean that subset of Capital Costs which are due to the Expansion Project, exclusive of Cross Valley Canal expansion capital costs and other capital costs.

(L) "Expansion Project" shall mean the project to be undertaken by the Agency to increase treated water capacity and delivery capability more particularly described in Article 5(B).

(M) "Extension" shall mean the lined and unlined canal reaches beginning at the eastern terminus of the Cross Valley Canal at the afterbay of Pumping Plant No. 6 and extending easterly approximately 4.5 miles to a point near the Henry C. Garnett Water Purification Plant, which point is approximately 1240 feet upstream from the Cawelo Water District's Pump Station "A," together with a pumping plant necessary to lift water through a static head of approximately 30 feet and such road crossings, utility relocations, fences and other facilities necessary for its construction and operation.

(N) "Groundwater Charge" is the governmental exaction levied in Improvement District No. 4 under the authority of the Kern County Water Agency Act (Uncodified Act 99, West's Annotated California Water Code) and resolutions of the Kern County Water Agency Board.

(O) "Improvement District No. 4" or "ID4" shall mean Improvement District No. 4 of the Kern County Water Agency created by Resolution No. 17-71 of the Board of Directors of the Kern County Water Agency adopted December 21, 1971, as amended.

(P) "ID4 Enterprise Fund" is that fund created within the Agency for accounting of revenues and expenses of the Improvement District No. 4 enterprise, including restricted accounts for the payment of the Expanded Capital Costs.

(Q) "Maintenance and Operation Costs" of the Enterprise means the reasonable and necessary costs and expenses paid by the Purveyor for maintaining and operating the Enterprise, as determined in accordance with generally accepted accounting principles (GAAP), including but not limited to (a) the reasonable expenses of management and repair and other costs and expenses necessary to maintain and preserve the Enterprise in good repair and working order, (b) administrative costs of the Purveyor attributable to the Enterprise and the financing thereof, and (c) amounts due Improvement District No. 4 under the Agreement including, but not limited to, the Treated Water Charge and Capital Facilities Charge; but excluding (x) depreciation, replacement and obsolescence charges or reserves therefore, (y) in any Fiscal Year prior to setting aside an amount equal to the Capital Facilities Charge for such Fiscal Year, capital expenditures other than as set forth in subsection (A) above, and (z) amortization of intangibles or other bookkeeping entries or a similar nature.

(R) "Master Contract" shall mean that contract between the Agency and the State of California entitled "Water Supply Contract Between the State of California Department of Water Resources and the Kern County Water Agency" dated November 15, 1963, as amended to date and any revisions or amendments hereafter made.

(S) "New Customer" shall mean the City of Bakersfield.

(T) "New Entitlement" is that portion of the Annual Entitlement which Customers have acquired through the execution of this Agreement and the Expansion Project.

(U) "Operating Costs" shall mean all necessary costs, other than pumping costs, for the operation, maintenance, repair, replacement and administration of the various project facilities, including Expansion Project facilities.

(V) "Original Customers" shall mean Customers other than the City of Bakersfield.

(W) "Original Entitlement" is that portion of the Annual Entitlement which Customers held by pre-existing contract.

(X) "Original Project" shall mean the project previously undertaken by the Agency for the benefit of Improvement District No. 4 and others as described in said Resolution No. 17-71, including the features more particularly described in Article 5(A) hereof.

(Y) "Point of Delivery" means the physical location at which delivery of the water from the Agency to Purveyor is deemed to occur which is the geometric plane intersecting the lumen of the delivery structure as water moves from the Agency pipeline to the delivery structure.

(Z) "Pumping Costs" shall mean all necessary energy and standby costs incurred by the Agency for pumping water for the Original Project and Expansion Project with the exception of such costs necessary to move water to the treated water pump station.

(AA) "Purification Plant" shall mean the Henry C. Garnett Water Purification Plant.

(BB) "Purification Plant Expansion Component" means that portion of the Expansion Project defined at Article 5(B)(1).

(CC) "Purveyor Revenues" means all gross income and revenue received or receivable by the Purveyor from the ownership and operation of the Enterprise, calculated in accordance with GAAP, including all rates, fees and charges (including connection fees to the degree permissible under Article XIII C and XIII D of the California Constitution) received by the Purveyor for Water Service and all other income and revenue howsoever derived by the Purveyor from the Enterprise or arising from the Enterprise, together with all other legally available funds from the Enterprise; provided, however, that (i) any specific charges levied for the express purpose of reimbursing others for all or a portion of the cost of the acquisition or construction of specific facilities, or (ii) customers' deposits or any other deposits subject to refund until such deposits have become the property of the Purveyor, are not Purveyor Revenues.

(DD) "State Project Water" shall mean water made available to the Agency from the California Aqueduct, a portion of the State Water Resources Development system.

(EE) "Treated Water Charge" is that charge established by Article 15 of the Agreement, including any surcharges thereon established pursuant to Article 15.

(FF) "Water Service" means the service made available or provided by the Enterprise.

(GG) "Year" shall mean the twelve (12) month period from July 1 of any year to June 30 of the following year.

Article 2. Term.

This Agreement shall become effective when all Customers have executed this Agreement with the Agency and, except as provided for in Article 15(D), shall remain in effect through January 1, 2035, or until the repayment in full of any bonds or similar instruments issued for financing of the Expansion Project, whichever is later. This Agreement supersedes the contract of June 13, 1974, between the Agency and Purveyor.

Article 3. Option for Continued Service.

After the expiration of the term of this Agreement, Purveyor shall be entitled to continued service under the following conditions unless otherwise agreed to:

(A) Service of water in annual amounts equal to the Purveyor's total Annual Entitlement.

(B) Service of water under the same physical conditions of service, including time, place, amount and rate of delivery, as are provided hereunder.

(C) Service of water at prices to be mutually agreed upon.

Other terms and conditions of the continued service shall be reasonable and equitable and shall be mutually agreed upon. In the event that said terms and conditions provide for continued service for a limited number of years only, the Purveyor shall have the same option to receive continued service as provided here upon the expiration of that and each succeeding period of continued service.

Article 4. Relationship to Master Contract.

This Agreement is subject to the obligations and limitations imposed by the Master Contract and is intended to be in conformance and harmony with it. The Master Contract is hereby incorporated herein by this reference in all respects as though set forth in full at this point. The Purveyor hereby expressly agrees to the provisions of the Master Contract imposing obligations and limitations upon it and further expressly agrees that nothing in this Agreement shall be deemed to require the Agency to perform any obligation in conflict with the Master Contract.

The Agency agrees it will not, without the prior approval of the Purveyor, consent to any amendments to the Master Contract which would increase the price of water to the Purveyor under this Agreement or substantially adversely affect the Agency's ability to deliver the water provided for herein.

Article 5. Integration of Original Project and Expansion Project.

(A) The following are the components of the Original Project:

(1) Cross Valley Canal Reach 1 which begins with a turnout on the California Aqueduct near Tupman and extends northeasterly for approximately five (5) miles to a turnout constructed near the NW 1/4 of the SW 1/4 of Section 2, T30S, R25E, MDB&M. This reach includes two (2) pumping plants and a major crossing under Interstate Highway 5 and is designed and constructed to have a minimum instantaneous flow capacity of 922 cubic feet per second, of which Improvement District No. 4 has a capacity of 184.36 cubic feet per second, with a scheduled expansion not related to this Agreement to 1422 cubic feet per second.

(2) Cross Valley Canal Reach 2 which begins at the terminus of Reach 1 and extends easterly approximately nine (9) miles to a point east of Pumping Plant No. 5 (at the Rosedale-Rio Bravo Water Storage District Turnout No. 2). This reach includes three (3) pumping plants and five (5) pipe siphons under the Sunset Railway, two (2) gas pipelines, Stockdale Highway and Jerry Slough, and is designed and constructed to have a minimum instantaneous flow capacity of 843 cubic feet per second, which Improvement District No. 4 has a capacity of 174.33 cubic feet per second, with a scheduled expansion unrelated to this Agreement to 1343 cubic feet per second.

(3) Cross Valley Canal Reach 3 which begins at the terminus of Reach 2 and extends approximately two and three-quarters (2 ¾) miles to the terminus of the Cross Valley Canal located near the southern terminus of the Friant-Kern Canal. This reach includes one (1) pumping plant, designed and constructed to have a minimum instantaneous flow capacity of 812 cubic feet per second, of which Improvement District No. 4 has a capacity of 185.17 cubic feet per second, with a scheduled expansion unrelated to this Agreement to 1312 cubic feet per second.

(4) Cross Valley Canal Extension which has a minimum instantaneous flow capacity of 342 cubic feet per second, of which Improvement District No. 4 has a capacity of approximately 168.74 cubic feet per second. It includes a pumping plant and pipe siphons under the Friant-Kern and Arvin-Edison Canals, the Southern Pacific and Santa Fe railroads, State Highway 99 and other roads, and turnouts into the Kern River and Calloway Canal. The Extension ends near the Henry C. Garnett Water Purification Plant approximately 860 feet upstream of Cawelo Water District's Pump Station "A."

(5) The original water Purification Plant with sufficient Capacity to provide for the treatment to commonly accepted standards of potability of at least 25,000 acre-feet of water annually from the Extension, and any existing rights in other canal conveyance facilities that feed the Henry C. Garnett Water Purification Plant.

(6) The North Pipeline and associated pumping plant and delivery structures for the conveyance and delivery of water as described in Exhibit C attached hereto and incorporated herein by reference.

(7) The East Pipeline and associated pumping plants and delivery structures for the conveyance and delivery of water as described in said Exhibit C.

(8) Facilities for spreading and percolating water for recharging the underground in Improvement District No. 4, including three (3) Cross Valley Canal turnouts to the Kern River and one (1) Calloway Canal turnout.

(9) The Improvement District No. 4 share of Pioneer Project facilities and rights as shown and described on attached Exhibit B attached hereto and incorporated herein by reference.

(10) The Improvement District No. 4 share of Kern Water Bank Authority facilities and rights as shown and described on attached Exhibit B.

(11) Other district facilities as specified on Exhibit B, including but not limited to rights in the City of Bakersfield 2800-Acre Recharge Facility.

(B) The following are the components of the Expansion Project:

(1) Expansion of the Henry C. Garnett Water Purification Plant from a maximum instantaneous flow Capacity of 38 MGD to 71.9 MGD (the "Purification Plant Expansion Component"). Such expansion shall also incorporate modifications,

replacements and repairs to original facilities to ensure continued reliability and operation.

(2) The "Distribution Component" of the Expansion Project consists of the following:

(a) Construction of a Northwest Pump Station and Pipeline designed to convey up to 32.0 MGD to the northwest portion of Improvement District No. 4.

(b) Expansion of the East Pipeline which will include improvements to the existing pipeline necessary to increase the delivery Capacity from 21.7 MGD to 28.8 MGD.

(c) Expansion of the North Pipeline which will include improvements to the existing pipeline necessary to increase the delivery Capacity from 11.4 MGD to 22.1 MGD.

(C) The facilities described in subdivisions (A) and (B) of this Article are intended to operate as an integrated project except as specifically set forth herein in other Articles. When reference is made herein to costs or revenues that are not specifically identified as belonging to the Original Project or Expansion Project, then the reference shall be presumed to be to the integrated composite of the two.

Article 6. Allocation of Capital and Operating Costs of Project Features.

(A) The Cross Valley Canal reaches and Extension are joint use facilities financed in respective part by the following Cross Valley Canal participants, including Improvement District No. 4, as identified for each reach and the Extension. The Improvement District No. 4 share of such costs is specified in Agency policy on allocation of costs to Improvement District No. 4 and Purveyor's Agreement:

(1) Reach 1: Improvement District No. 4, Arvin-Edison Water Storage District (Arvin-Edison), Cawelo Water District (Cawelo), Rag Gulch Water District (Rag Gulch), Rosedale-Rio Bravo Water Storage District (Rosedale), Kern-Tulare Water District (Kern-Tulare), Kern County Water Agency (KCWA), Kern Delta Water District (Kern Delta) and the Fresno-Tulare Group, which consists of the Hills Valley Irrigation District, Tri-Valley Irrigation District, Pixley Irrigation District, Lower-Tule River Irrigation District, County of Tulare, and the County of Fresno.

(2) Reach 2: Improvement District No. 4, Arvin-Edison, Cawelo, Rag Gulch, Rosedale, Kern-Tulare, KCWA, Kern Delta and the Fresno-Tulare Group.

(3) Reach 3: Improvement District No. 4, Arvin-Edison, Cawelo, Rag Gulch, Rosedale, Kern-Tulare, KCWA, Kern Delta and the Fresno-Tulare Group.

(4) Extension: Improvement District No. 4 and Cawelo.

(5) The Improvement District No. 4 share of the capital, operating and other costs of the Cross Valley Canal facilities specified in subdivision (A) of this Article shall be paid from the ID4 Enterprise Fund.

(B) A summary of the allocation of estimated Capital Costs among the Customers for the Expansion Project, exclusive of CVC and Extension expansion costs, is shown on attached Exhibit E. Exhibit A, attached hereto and incorporated herein by reference, reflects the resulting percentage allocations and Capacities. Exhibit F, attached hereto and incorporated herein by reference, sets forth the description and an initial estimate of the amount of each fee and cost that Purveyor will be required to pay under this Agreement and a reference to the Article and section of this Agreement that provides for such cost or fee. Exhibits A, E and F shall be adjusted to reflect actual costs and

Capacities when known. Expanded Capital Costs, other than those paid directly or financed by Improvement District No. 4 for its reserved Capacity, shall be financed by the Customers, including Purveyor, by payment of a Capital Facilities Charge which shall be accounted for in the Capital Facilities Account designated for payment of the Expanded Capital Costs. Capital costs allocated to Improvement District No. 4 for Cross Valley Canal and Extension facilities, including but not limited to costs related to Improvement District No. 4's share of the expansion of Cross Valley Canal facilities, are to be paid for out of the ID4 Enterprise Fund described herein.

(C) The Capital Costs, Operating and other costs of the Improvement District No. 4 share of the Pioneer Project (as set forth in the Pioneer Project Participation Agreement) and Kern Water Bank Authority (as set forth in the Joint Powers Agreement for the Kern Water Bank Authority) are to be paid for out of the ID4 Enterprise Fund described herein.

(D) Improvement District No. 4, through the ID4 Enterprise Fund, will pay for the following costs incurred by Agency prior to execution of this Agreement in developing the Expansion Project, and the following additional costs associated with design of conveyance facilities:

(1) Costs associated with financing of the Expansion Project as estimated, subject to revision to actuals, as identified in Exhibit E.

(2) Costs associated with the engineering and design of the Northwest Feeder Project as identified in Exhibit E.

(3) Costs associated with the engineering and design of the North Pipeline expansion as identified in Exhibit E.

(4) Costs associated with the engineering and design of the East Pipeline expansion as identified in Exhibit E.

(E) Charges for capital costs of delivery structures, operating and other costs of conveyance are set forth in Article 9.

(F) Charges for the cost of water, including treatment costs.

(G) Prior to the acceptance of bids on contracts for construction or the issuance of financing instruments for the Distribution Component, of the Expansion Project, as defined in Article 5 (whichever shall occur first) and prior to the acceptance of bids on construction contracts or the issuance of financing instruments for the Purification Plant Expansion Component of the Expansion Project, if the projected costs are more than one hundred and twenty-five percent (125%) of those estimated herein, Purveyor shall have the option of withdrawing from either component of the Expansion Project by providing written notice hand-delivered to the Agency General Manager and to each other Customer within twenty (20) days of the opening of construction bids, for the specified component of the Expansion Project. In the event of withdrawal, Purveyor shall pay all fees and other payments specified herein based upon the allocation formulas specified herein utilizing Purveyor's currently existing Capacity and entitlement, if any, for the component from which Purveyor has withdrawn, and shall be entitled only to benefits and rights based upon Purveyor's currently existing Capacity and entitlement, if any, for the component from which Purveyor has withdrawn. In the event of the withdrawal hereunder of any other Customer, Purveyor shall pay based upon the recalculated amounts after the withdrawal of Customers electing not to participate in an Expansion Project component and shall be entitled to a share, based on such recalculation, of the

withdrawing Customer's Capacity, entitlement and other rights and privileges under the Agreement from which such Customer is withdrawing. Agency and Purveyor shall take all actions and execute all documents reasonably required to evidence the foregoing changes in Purveyor's entitlement, rights and obligations. If a withdrawal occurs, the Agency shall require a renegotiation of contract terms, and may reject all bids or delay financing.

Article 7. Completion of Expansion Project.

Water and distribution conveyance Capacity are currently available to Original Customers from the Original Project. The estimated completion and start-up date for the Expansion Project is July 1, 2008. Subject to the availability of funds, the Agency shall make all reasonable efforts consistent with sound fiscal policies, reasonable construction schedules and proper operating procedures to complete the Expansion Project in such a manner and in such a time that some water from a component of the Expansion Project will be available to Purveyor by July 31, 2007. To the extent practicable, the Agency shall notify the Purveyor of any change in this estimate.

Article 8. Contract Entitlement.

(A) Each Year after the Expansion Project is completed, the Agency shall make available for delivery to the Purveyor the Purveyor's Annual Entitlement to water as shown on Exhibit D, as provided in Article 10, and as described by the terms and conditions of this Agreement. During the Year in which the Expansion Project is completed, the Agency shall make available for delivery to the Purveyor that percentage of New Entitlement of the Purveyor that is equal to the percentage of the Year remaining

after the date of completion (in addition to the Original Entitlement as provided in paragraph (B) below).

(B) Each Year of this Agreement through the Year of completion of the Expansion Project, the Agency shall make available for delivery to the Purveyor, the Purveyors' Original Entitlement to water. Each year of this Agreement through the Year of completion of the Expansion Project or if the Expansion Project is not substantially completed, the Agency shall make available for delivery to the Customers that water that may be available in the judgment of the Agency in addition to that which is contracted for by Original Customers from the Original Project. Allocation of this additional available water is in proportion to the Customers' Annual Entitlement. The additional water from the Original Project may be transported through Capacity available in the Original Project available to Purveyor, or such share of new Capacity as may be constructed at the time, subject to proration among other Customers with the need for transportation Capacity.

(C) During the Year following the Year in which the Expansion Project is completed, and each Year thereafter for the term of this Agreement, the Agency shall make available, for delivery to the Purveyor, the Purveyors' Annual Entitlement as defined by the terms and conditions of this Agreement.

(D) If an option for increased service is specified for Purveyor in Exhibit D, Purveyor shall provide to Agency in writing a commitment to add the specified option amount to its Annual Entitlement within six (6) months of the execution date of this Agreement, and subsequently all amounts specified herein shall be determined based on Purveyor's Annual Entitlement as increased by the option amount. If Purveyor has not provided the commitment in writing within the six (6) month period, Purveyor shall be

deemed to have rejected the offer for additional entitlement and all determinations shall be made upon the Annual Entitlement specified without including the option amount. All Exhibits, cost allocations, and other formulas may be adjusted by the Agency to match the final amounts of increased service accepted by Purveyor and other Customers.

Article 9. District Facilities and the Costs Thereof.

(A) Delivery Structures, Conveyance Facilities, Measuring Devices and Cost Thereof:

All water to be furnished pursuant to this Agreement will be delivered to the Purveyor through facilities of the Original Project and Expansion Project, and delivery structures to be provided by Purveyor as follows:

(1) Capital Costs of Distribution Component. All necessary connections to these facilities are to be constructed with funds provided by the Purveyor proportional to Purveyor's Capacity in the facility. The turnouts to be constructed with Purveyor funds shall include the tee, the gate valve and any other facilities requested and needed by Purveyor for delivery of the Purveyor's water from Improvement District No. 4 facilities. If the Purveyor desires to change its point or points of delivery or install additional points of delivery, it may do so either by furnishing all funds to cover any Agency expenses involved, or by undertaking the construction at its own expense; provided, the Purveyor shall not undertake any such construction until it has first obtained Agency approval of the plans and specifications for such work. Upon receipt of a request for such a change in place of delivery or installation of additional places and the deposit of the required funds, the Agency shall diligently proceed to make such a change or installation. Upon

completion of the construction of any delivery structures, the Agency shall refund any monies deposited by the Purveyor not expended for such construction.

(2) Capital Costs of Distribution Component Facilities. The Purveyor has requested that the Northwest Feeder Pipeline described in Exhibit C hereof be constructed with Capacity for the Purveyor of 23.2 cubic feet per second requiring a diameter of approximately 42 inches, the size being based on Purveyor's estimates of required Capacity. Purveyor shall be responsible for its proportionate share of the pipeline Capital Costs (prorated according to Purveyor's Capacity stated herein in relation to total Purveyor requested Capacity of 32.5 cubic feet per second) regardless of whether the Capacity therein is actually required for delivery of Purveyor's water. Such proportionate share shall be included in Purveyor's Capital Facilities Charge. Such amounts shall be paid at the time set forth in Article 16 hereof. Capacity shall be for use within Improvement District No. 4, including areas which have been annexed to Improvement District No. 4 in accordance with Article 25, during the term of the Agreement. The Purveyor shall also pay its proportionate share of improvements to the Oswell Reservoir and Booster Pumping Facility, based upon its current contracted capacity, as shown on Exhibit E. The Agency shall have the right to construct incremental Capacity and future connections to any of the facilities described herein for use within Improvement District No. 4.

(3) Operating Costs of Conveyance Facilities. The annual Operating Costs, other than pumping costs, of each pipeline, pumping plant and delivery structure used in delivering water from the Purification Plant to the Purveyor shall be borne by the Purveyor and any other Customers taking water through such conveyance facilities in

proportion to the annual quantities of water delivered to each Customer through each such facility. On or before June 1 of each Year, the Agency shall notify the Purveyor in writing of the estimated amount of operating costs it must pay for the next succeeding Year for each conveyance facility to be used by it. The Purveyor shall pay one-fourth (1/4) of such estimated costs on or before each of the following dates during the succeeding Year: July 1, October 1, January 1 and April 1.

(4) Recalculation and Adjustment of Operating Costs of Conveyance Facilities. At the end of each Year, each Customer's share of Operating Costs for that Year shall be recalculated as soon as possible by substituting the actual costs incurred by the Agency and the actual quantities of water delivered to each Customer. Any adjustments in the Purveyor's payments required to reflect this recalculation shall be made in Purveyor's next quarterly operating cost payment due after the recalculation.

(5) Pumping Costs for Delivering Water. The monthly and annual pumping costs for each pumping plant used in delivering water from the Purification Plant shall be borne by the Purveyor and any other Customers taking water through the pumping plant in proportion to the quantities of water delivered to each Customer through the pumping plant during the month and the Year, as the case may be. As soon as possible after the close of each month, the Agency shall notify the Purveyor in writing of the amount of pumping costs it must pay for the preceding month. The Purveyor shall pay this amount within thirty (30) days after receiving such statement of charges from the Agency.

(6) Recalculation and Adjustment of Pumping Costs. As soon as possible after the end of each Year, the pumping costs for each pumping plant shall be recalculated by dividing the actual pumping costs incurred by the Agency for that Year

for all water delivered through that pumping plant by the actual quantities of water delivered through the pumping plant and multiplying the resulting acre-foot rate by the total quantity of water delivered during the Year through that pumping plant to each Customer. Any adjustments in the Purveyor's payments required to reflect this recalculation shall be made in the Purveyor's first monthly pumping cost payment due after the recalculation.

(7) Measuring Devices. All water furnished pursuant to this Agreement shall be measured by the Agency at mutually agreed upon points with equipment satisfactory to the Agency and the Purveyor. All such equipment shall be installed and maintained by the Agency at the expense of Purveyor. All new meters shall conform to American Water Works Association standards (or the standards of the successor organization) for meter design and accuracy and shall be equipped with a digital readout, which records flow in Million Gallons per Day (MGD) and totals in MG. All determinations relative to the measuring of water shall be made by the Agency, and upon request by the Purveyor, the accuracy of such measurements shall be investigated by the Agency. Any errors appearing thereon will be adjusted. The Purveyor may inspect such measuring equipment for the purpose of determining the accuracy thereof.

(B) Purification Plant Expansion Component and other Facilities and the Costs Thereof.

(1) Purification Plant Expansion Component Capital. The Capital Costs of the Purification Plant Expansion Component, and other costs attributable to the Capital Facilities Account, shall be paid by Purveyor through the Capital Facilities Charge as set forth in Article 16, and through other provisions set forth herein.

(2) Improvement District No. 4 Banking Facilities. All costs of Improvement District No. 4 water banking facilities including, but not limited to the Pioneer Project, shall be paid by Improvement District No. 4 with costs to be paid by the ID4 Enterprise Fund when used for the general benefit to Improvement District No. 4. Customers benefiting from such facilities shall pay for costs related to the provision of specific benefits for a Customer, subject to mutual agreement between participating Customers and the Agency.

(3) Purification Plant Operation and Maintenance and Costs of Other Facilities. All costs of Improvement District No. 4 other than as specified above shall be payable from the ID4 Enterprise Fund, as set forth in Article 15.

Article 10. Delivery Schedules.

The amounts, times, and rates of delivery of water to the Purveyor during any Year shall be in accordance with a water delivery schedule determined in the following manner:

(A) On or before August 1 of each Year, the Purveyor shall submit in writing to the Agency a preliminary water delivery schedule indicating the amounts of water, in acre-feet, desired by the Purveyor during each month of the succeeding six (6) years.

(B) On or before December 1 of each Year, the Purveyor shall submit in writing to the Agency a water balance demonstrating, subject to the approval of the Agency which shall not be unreasonably withheld, that the current demand for Purveyor's contracted entitlement within its service area in Improvement District No. 4 is greater than or equal to Purveyor's current contracted entitlement deliveries.

(C) Upon receipt of a preliminary schedule, the Agency shall review it and after consulting with the Purveyor, shall make such modifications as are necessary to ensure that the amounts, times and rates of delivery to the Purveyor will be consistent with the available supply of water from the treatment facilities, considering each Customer's Annual Entitlement and Capacity, and the then current delivery schedules of all other Customers. On or before December 31 of each Year, the Agency shall determine and furnish to the Purveyor a water delivery schedule for the next succeeding year which shall show the amounts of water to be delivered to the Purveyor during each month of that year.

(D) A water delivery schedule may be amended by the Agency upon the Purveyor's written request. Proposed amendments shall be submitted by the Purveyor within sixty (60) days before the desired change is to become effective, and shall be subject to review and modification by the Agency in like manner as the schedule itself, provided that, Purveyor shall provide the Agency one (1) year's notice for any increase in deliveries above the previous level of Annual Entitlement and peaking stated herein to reach its available Annual Entitlement and peaking Capacity subject to associated increases in operations and maintenance and pumping costs through the charges specified herein.

(E) In no event shall the Agency be obligated to deliver water to the Purveyor in any month in excess of the Purveyor's demand for that month as set forth in the approved delivery schedule, as specified in Exhibit D, or the amount of water that can be delivered within the Purveyor's contracted peaking Capacity, as specified in Exhibit C, during the

month, whichever is the lesser. Agency, at its sole discretion, may deliver water in excess of the obligation specified herein.

(F) In no event shall the Agency be obligated to deliver water to the Purveyor in excess of Purveyor's Capacities for facilities and Annual Entitlement as specified herein.

(G) If the Agency determines there is excess or unused Capacity and the Customers request such Capacity, the Agency may allocate any excess or unused Capacity to the Customers based upon their percentage of the then contracted Capacity through the Purification Plant.

Article 11. Responsibilities for Delivery and Distribution of Water.

Neither the Agency nor its officers, agents, or employees shall be liable for the control, carriage, handling, use, disposal, or distribution of water supplied to the Purveyor pursuant to this Agreement after such water has passed the points of delivery established in accordance with Article 9; nor for claim of damages of any nature whatsoever including but not limited to property damage, personal injury, or death, arising out of or connected with the treatment, control, carriage, handling, use, disposal, or distribution of such water beyond said delivery structures; and the Purveyor shall indemnify and hold harmless the Agency and its officers, agents, and employees, from any such damages or claims of damages. The foregoing shall not apply to any claims, damages, or liabilities to the extent arising out of the failure of water delivered by the Agency to the Point of Delivery to meet applicable federal, State of California and Kern County minimum drinking standards.

Neither the Purveyor nor its officers, agents, or employees shall be liable for the control, carriage, handling, use, treatment, disposal, or distribution of water supplied to

the Purveyor by the Agency pursuant to this Agreement before such water has passed the Points of Delivery established in accordance with Article 9; nor for claim of damages of any nature whatsoever including but not limited to property damage, personal injury, or death, arising out of or connected with the control, carriage, handling, use, treatment, disposal, or distribution of such water before said delivery structures or the failure of such water to meet applicable federal, State of California and Kern County minimum drinking water standards before it reaches the Point of Delivery; and the Agency shall indemnify and hold harmless the Purveyor and its officers, agents and employees, from any such damages or claims of damages. The amounts to satisfy any of the foregoing liabilities of the Agency set forth in this Article 11 shall first be paid from proceeds of the insurance described below and thereafter, or to the extent the claim is not covered by such insurance, from the ID4 Enterprise Fund and Purveyor shall remain responsible for its allotted share of payments for such fund. The Agency shall obtain insurance from an insurer or insurers having a Best's rating of A or higher, or participate in the Association of California Water Agencies Joint Powers Indemnity Association, or similar joint self-insurance entity, to protect Purveyor, other Customers and the ID4 Enterprise Fund with commercially reasonable coverage limits, and the cost of such insurance or joint indemnification agreements shall be reimbursable as an Operations and Maintenance expense for each facility

Article 12. Water Shortage.

(A) At times there may occur a shortage during any year in the quantity of water available for delivery to the Purveyor by the Agency pursuant to this Agreement. However, if the Agency can prevent or diminish a shortage in treated water by

temporarily halting or curtailing its spreading of water for recharging the underground in Improvement District No. 4, it may do so at its discretion. The Agency may use Improvement District No. 4 groundwater banking projects or in-district wells for reducing shortages subject to a separate agreement with the Purveyor.

(B) To eliminate or reduce shortages, Customers may secure and deliver non-Improvement District No. 4 surface water to the Henry C. Garnett Water Purification Plant for treatment under the following terms:

(1) A request for delivery and subsequent treatment of any non-Improvement District No. 4 surface water shall require Agency approval.

(2) A request to deliver non-Improvement District No. 4 water shall be submitted in writing to the Agency for review ninety (90) days prior to the expected date of delivery. Such request shall include information as to the quantity, quality and origin of the source water. Requesting Customer shall provide all information pertaining to the source as requested by Agency.

(3) Improvement District No. 4 shall be responsible for the scheduling of all non-Improvement District No. 4 surface water and shall coordinate the delivery of non-Improvement District No. 4 surface water with Customer. The point of delivery for any non-Improvement District No. 4 surface water shall be the headworks of the Henry C. Garnett Water Purification Plant or any other point of delivery available to Customer and Improvement District No. 4 which is mutually agreeable.

(C) No liability shall accrue against the Agency or any of its officers, agents, or employees for any damage, direct or indirect, arising from a shortage on account of drought or other unavoidable causes. In any year in which such a shortage may occur for

any cause so that the total quantity of water available to the Agency for distribution to the Purveyor and other Customers taking water from the treatment facilities is less than the total of all quantities contracted for by the Purveyor and other Customers, the Agency shall apportion the available treated water among the Customers in proportion to their Total Annual Entitlements, for the current year, as set forth in Exhibit D and pursuant to Articles 8 and 10.

(D) The Agency shall give the Purveyor written notice as far in advance as reasonably possible of any such reduction in delivery to it.

Article 13. Curtailment of Delivery for Maintenance Purposes.

The State of California or the Agency may temporarily discontinue or reduce the amount of water to be furnished the Purveyor for the purposes of maintaining, repairing, replacing, investigating or inspecting any of the facilities necessary for furnishing of water to the Purveyor. Insofar as it is feasible, the Agency will give the Purveyor due notice in advance of any such temporary discontinuance or reductions, except in the case of emergency, in which case no notice need be given. In the event of such discontinuance or reduction, the Agency will, upon resumption of service, deliver, as nearly as may be feasible after consultation with the Purveyor, and to the extent water is furnished to it by the State of California, or other sources, the quantity of water which would have been furnished to the Purveyor in the absence of such discontinuance or reduction. The Agency shall attempt to schedule its routine maintenance on Project Facilities so that whenever possible, any such discontinuance or reductions in delivery will occur during periods of reduced demand.

Article 14. Water Quality.

(A) The Agency shall use all reasonable efforts to ensure that all water delivered by the Agency from the Purification Plant into the distribution pipelines described in Exhibit C hereof shall meet all applicable federal, State of California and Kern County minimum drinking water quality requirements.

(B) In the future, the Purveyor may use the distribution pipelines to deliver water from its wells, as well as for delivering water from the Purification Plant. Any request by the Purveyor for the use of the distribution pipelines for conveyance of water, other than that originating from the Henry C. Garnett Water Purification Plant, shall be made by providing written notice ninety (90) days prior to the requested date of use, provided that such notice period may be shortened upon a finding of an emergency by the Agency. The Agency reserves the right to approve or deny any request received, provided that all costs and risks associated with, or arising from, the delivery of such water shall be borne by Purveyor in accord with a supplementary written agreement between Agency and Purveyor.

(C) When the Purveyor puts water from any source other than the Henry C. Garnett Water Purification Plant in the distribution pipelines, the Agency will be absolved of responsibility for the quality and quantity of any water delivered to the Purveyor after it leaves the Purification Plant, unless the liability results from the quality of water leaving the Purification Plant failing to meet federal, State of California or Kern County minimum drinking water quality requirements. The burden of proof that such water fails to meet such requirements shall rest with Purveyor, provided that Agency shall permit all reasonable testing and review of the Agency's records reasonably

necessary to meet such burden of proof. When the Purveyor ceases to put water from another source in the distribution pipeline, the Agency will resume responsibility for the quality and quantity of water delivered to the Purveyor through the Agency's distribution pipelines when and if the conditions set forth in subdivisions (1) and (2) are met: (1) Purveyor advances sufficient funds to the Agency to cover the cost of inspection and testing, and (2) such inspection and testing shows to the satisfaction of the Agency that other waters are either no longer co-mingled in the distribution pipelines with the water supply from the Purification Plant or if co-mingled, the combined waters meet all applicable requirements.

(D) Such assumption of responsibility shall become effective only if and when the Agency notifies the Purveyor in writing that the results of such inspection and testing demonstrate to the satisfaction of the Agency that all applicable water quality requirements have been met.

(E) During any period(s) between the time the Purveyor commences to introduce water into the distribution pipelines and the time the Agency resumes responsibility for the quality of water in those pipelines, neither the Agency nor its officers, agents, or employees shall be liable for the impacts from the introduction of such water by Purveyor on the quality or quantity of water supplied to the Purveyor through the distribution pipelines, nor for claim of damages of any nature whatsoever arising out of or connected in any way with the quality or quantity of such water introduced by the Purveyor or the impacts thereof, and the Purveyor shall indemnify and hold harmless the Agency, its officers, agents, and employees from any such damages or claims of damages. The foregoing shall not limit the Agency's liability under paragraph (C) of this Article 14.

The burden of proof that such Agency water fails to meet such requirements shall rest with Purveyor, provided that Agency shall cooperate to permit all testing and review of Agency records reasonably necessary to meet such burden of proof. If Agency voluntarily permits other Customers to introduce water into a pipeline serving Purveyor after the execution of this Agreement, Agency will require such Customer to accept responsibility for any loss resulting thereby, and obtain a commitment to hold the Agency, Improvement District No. 4, and Purveyor harmless from any loss thereby.

(F) Existing agreements, attached as Exhibit G and incorporated herein by reference, with North of the River and California Water Service Co. and East Niles Community Services District for introduction of water into the North and East Pipelines shall remain in effect, and the term of each is amended to be consistent with the term of this Agreement.

Article 15. Cost of Water.

The Purveyor, and all other Customers, shall pay the following charges to be determined and set annually by the Agency:

(A) Treated Water Charge.

The amount of the charge for each acre-foot of water ("Treated Water Charge") payable by the Purveyor, and all other Customers, shall be One Hundred and Thirty-Six Dollars ($136), subject to the surcharges specified in this Article. The revenues received from payment of the Treated Water Charge shall be accounted for utilizing a separate Agency fund identified as the ID4 Enterprise Fund. The amount of the Treated Water Charge shall be subject to modification by mutual agreement of the parties in a periodic

ten (10) year review, provided that this provision does not alter the ability of the Agency to impose surcharges pursuant to subdivision (D) of this Article.

(B) Payment of the Treated Water Charge.

The Purveyor, and all other Customers, shall pay the amount of the Treated Water Charge provided for in paragraph (A) times either the quantity of water delivered to them or their Annual Entitlement for the Year as set forth in Article 8 and Exhibit D, whichever is greater.

(C) Credit for Annual Entitlement Not Taken.

If Purveyor complies with Article 10, regarding scheduling of Annual Entitlement, the Agency shall use reasonable efforts to sell any of Purveyor's Annual Entitlement not taken to other Customers at the Treated Water Charge rate, including surcharges, or such other rate as may be paid by Customers, for delivery during the Year the Annual Entitlement was not taken by Purveyor. Funds received from other Customers for the Annual Entitlement of the Purveyor, less administrative charges of the Agency, shall offset Purveyor's obligation.

(D) Surcharges.

Notwithstanding any other provision of this Agreement, if the Agency reasonably determines that the ID4 Enterprise Fund is insufficiently funded to meet the estimated expenses for Improvement District No. 4 for that year, including any amount necessary to pay debt service or comply with a debt service coverage covenant not met by the Capital Facilities Charge, the Agency shall notify Purveyor and make an effort to reduce its estimated expenses to be consistent with its estimated revenues. If, after thirty (30) days from notice to Purveyor of its estimate, the Agency has reviewed and where appropriate

reduced expenses, it still projects a deficit with respect to estimated revenues, it shall provide the relevant financial information to the Purveyor and all other Customers along with all other information supporting a specified short-term surcharge to Purveyor, and all other Customers. The total amount of the short-term surcharges to the Purveyor and all other Customers shall be sufficient to eliminate the estimated deficit through the Year in which the estimate is made and the following Year. The amount of the Purveyor's and each Customer's short-term surcharge shall be determined by the Agency by dividing the estimated deficit by the current year contracted Annual Entitlement for all Customers and multiplying the result by the Purveyor's or the other Customers' Annual Entitlement for that year. The Agency shall use its best efforts to provide warning of such necessity one Year in advance; however, the failure to provide such advance warning shall not relieve Purveyor of the responsibility to pay such surcharge, nor excuse nor affect in any way the obligation to make such payment in the manner set forth in this Agreement.

Upon implementation of a short-term surcharge, in consultation with the Purveyor and other Customers, the Agency may develop a financial plan considering future long-term revenues and costs of Improvement District No. 4 and establishing an annual long-term surcharge on the Treated Water Charge paid by Purveyors to provide sufficient funding for the five (5) Years following the period of a short-term surcharge. The Agency shall provide at least ninety (90) days notice of the intent to impose a long-term surcharge including the provision of a draft financial plan. In consultation with Customers, Agency shall adopt the financial plan, as modified, no sooner than thirty (30) days after the date set for consultation.

Such charges shall be billable to and payable by Purveyor in the same manner as the Treated Water Charge.

Article 16. Payment of the Capital Facilities Charge.

The Purveyor agrees hereby to pay the Capital Facilities Charge from Purveyor Revenues. The obligation of the Purveyor to pay the Capital Facilities Charge and to pay the included interest thereon and other costs is absolute and unconditional, whether or not the Expansion Project shall be completed, and until such time as all of the Capital Facilities Charges shall have been fully paid, the Purveyor will not, under any circumstances, discontinue, abate or suspend any Capital Facilities Charge payment required to be made by it under Article 19 when due, whether or not the Enterprise or any part thereof is operating or operable or has been completed, or whether or not the Enterprise is condemned, damaged, destroyed or seized or its use is suspended, interfered with, reduced or curtailed or terminated in whole or in part, and such payments shall not be subject to reduction whether by offset, counterclaim, defense, recoupment, abatement, suspension, deferment or otherwise and shall not be conditional upon the performance or nonperformance by any party of any agreement or covenant contained herein for any cause whatsoever. If the Agency is able to reduce Capital Costs, or obtains funds that can be applied to reduce Capital Costs, it may, at its discretion, provide credits to Customers and, if credits are made, it shall credit the Purveyor a proportionate share of the reduction in the same percentage that the Purveyor's share of the Capital Costs bears to total Capital Costs unless it determines that the funds available for credit are uniquely attributable to specific portions of the Capital Facilities. If the Agency refinances the debt for Capital Costs, then any savings from refinancing shall be used to reduce the

Capital Facilities Charge. All condemnation proceeds, all casualty insurance recoveries, and all funds derived from the Enterprise Fund for the purpose of repair, restoration or modification of the Henry C. Garnett Water Purification Plant or any distribution lines or other facilities or equipment that provide a water supply pursuant to this Agreement, shall be applied to repair and reconstruct the Henry C. Garnett Water Purification Plant and distribution or other facilities to which they relate and if such repair or reconstruction is not reasonably feasible, or excess funds become available, all such condemnation proceeds, insurance proceeds and other funds shall be applied to reduce the Capital Facilities Charge of each Customer in the ratio of such Customer's Cost Allocation set forth in Exhibit E. All repair and reconstruction shall be conducted with diligence in order to assure restoration of services at the earliest reasonable date.

Article 17. Time of Payment.

(A) Payment of Charges for Annual Entitlement/Treated Water Charge.

On or before June 1 of each Year, the Agency shall notify the Purveyor of its estimated charges for Annual Entitlement water for the ensuing Year. These estimates shall be prepared by the Agency on the basis of the delivery schedules provided for in Article 10, the Agency's estimates of the revenues and expenses for Improvement District No. 4 and the Agency's estimates of any credits due as provided for in Article 15, and the estimate shall provide for both the payments to be made for water to be delivered and for that portion of the Annual Entitlement for that Year not requested for delivery. The Purveyor shall pay sixty percent (60%) of these charges on or before July 10 of each year, and the remainder on or before January 10 of the following year. If the Expansion Project is completed after bills have been issued, a supplementary bill shall be issued by

the Agency, and is payable by Purveyor within thirty (30) days of mailing of the supplementary bill, for estimated charges for the proportion of New Entitlement provided by the Expansion Project before the year covered by the next regular annual billing.

(B) Payment of Charges for Deliveries in Excess of Annual Entitlement.

As soon as possible after the end of each Year, the Agency shall send to the Purveyor a statement of charges for all water delivered to the Purveyor in the preceding Year in excess of the Purveyor's Annual Entitlement for that Year. The Purveyor shall pay such statements within thirty (30) days after they are received.

(C) Payment of Capital Facilities Charge.

On or before June 1 of each Year, the Agency shall send the Purveyor a statement of Capital Facilities Charges for all costs of Capital Facilities, and payment of principal and interest due on financing for Capital Facilities which shall be due during the ensuing year as allocated pursuant to Article 6, Exhibit A, and other provisions herein. To the extent necessary in any given year, Purveyor's and each other Customer's yearly charge shall be increased by one-fifth (1/5) to augment the Capital Facilities Account to prevent a default on financing payments. The Purveyor shall pay sixty percent (60%) of these charges on or before July 10 of each Year and the remainder on or before January 10 of each Year.

Article 18. Recalculation and Adjustment of Treated Water Charge.

As soon as possible after the end of each Year, the charges for water for that Year required by Article 15(B) shall be recalculated by the Agency by substituting actual deliveries for the estimated deliveries made pursuant to Article 16. Any adjustments in

the Purveyor's payments required to reflect these recalculations shall be made in the Purveyors first semiannual payment due after the recalculations.

Article 19. Default.

(A) The Purveyor shall cause to be levied and collected all necessary fees and charges and will use all the authority and resources of the Purveyor to meet its obligations hereunder, to make in full all payments to be made pursuant to this Agreement on or before the date such payments become due and to meet its other obligations under this Agreement. In the event of any default by the Purveyor in the payment of any money required to be paid to the Agency hereunder, the Agency in its discretion may suspend delivery of water during the period when the Purveyor is delinquent in its payments or obligation due to the Agency under the terms of this Agreement; provided, that during any such period of delinquency or suspension the Purveyor shall remain obligated to make all payments required under this Agreement. Action taken pursuant to this article shall not deprive the Agency of or limit any remedy provided by this Agreement or by law for the recovery of money due or which may become due under this Agreement.

(B) In the event of default continuing ninety (90) days beyond written notice to Purveyor to the address specified herein, the Agency may, without abandoning any other remedy provided by this Agreement or California law, transfer Purveyor's Annual Entitlement, Capacity, other rights and obligations hereunder to any other Customer, and if no other Customer accepts an offer of such transfer within thirty (30) days of mailing, then Agency may transfer such Annual Entitlement, Capacity, rights and obligations to any water distributor in Kern County; provided, that priority shall be given to distributors

within Improvement District No. 4. In the event of such transfer, all financial obligations of Purveyor under this Agreement shall continue except to the extent they are offset by amounts received from the transferee.

(C) In the event of default by another Customer, as provided in Article 19 hereof, and if the Capacity of that defaulting Customer in facilities, constructed as part of the Expansion Project, has not been acquired by another Customer (including the Purveyor) or entity, Purveyor agrees to purchase its pro rata portion (based on its Capacity in each facility) of said defaulting Customer's Capacity in each facility on the following terms:

(1) Payment for the additional Capacity provided to Purveyor shall be made by assumption by Purveyor of the pro-rata portion of the Capital Facilities Charge due from the defaulting Customer.

(2) The purchase price for said Capacity shall not be less than the payment of the balance of the Capital Facilities Charge of the defaulting Customer attributable to the Capacity being purchased.

(3) The aggregate amount of the defaulting Customer's Capacity in each facility to be purchased does not exceed twenty-five percent (25%) of the then existing Capacity of Purveyor in each facility.

(D) In the event of default by other Customers, Agency shall use all reasonable efforts to recover from such defaulting Customers all delinquent Capital Facilities Charge, Maintenance and Operations Costs, Treated Water Charge, other amounts due under this Agreement, attorney's fees and other costs. To the extent not recovered from the defaulting Customer, Capital Facilities Charge due from such Customer will be paid

from the Capital Facilities Fund and attorney's fees and costs will be paid from the Enterprise Fund.

(E) In the event of a default under this Agreement by the Agency, Purveyor and each other Customer, acting singly or jointly, may exercise any and all rights available under their respective Agreements with the Agency or under applicable laws.

Article 20. Obligation to Make Payments.

(A) Character of Obligation.

The obligation of the Purveyor arising out of or pursuant or incidental to this Agreement including, without limiting the generality of the foregoing, the obligations of the Purveyor to pay to the Agency the sums becoming due the Agency for water furnished hereunder, including but not limited to the Capital Facilities Charge, shall constitute a general obligation of the Purveyor and the Purveyor shall use all the powers and resources available to it under the law to collect the funds necessary for and to pay its obligations to the Agency under this Agreement which meets the terms of its option for continued service under prior contract for a water supply entered on June 13, 1974. The Purveyor as a whole is obligated to pay to the Agency the payments becoming due under this Agreement, notwithstanding any individual default by its water users, constituents or others in the payment to the Purveyor of tolls, or other charges levied by the Purveyor.

(B) Refusal of Water Does Not Affect Obligation.

Failure of the Agency to deliver water, or the Purveyor's failure or refusal to accept delivery of Annual Entitlement for each Year under this Agreement shall in no way relieve the Purveyor of its obligation to make payments to the Agency as provided for herein, provided that failure to deliver water due to Improvement District No. 4

negligence or misconduct in the operations of its facilities which would constitute a breach of contract shall excuse payment of the Treated Water Charge and shall excuse the Agency's obligation to deliver that portion of the Annual Entitlement not delivered, but in such instances Agency shall use good faith efforts to make delivery of any Annual Entitlement not delivered within the Year of the failure for which Purveyor shall pay all costs.

Article 21. Against Encumbrances.

The Purveyor hereby covenants that there is no pledge of or lien on Purveyor Revenues senior to the payment of Maintenance and Operation Costs other than those disclosed to Agency.

Article 22. Maintenance and Operation of the Enterprise; Budgets.

The Purveyor will maintain and preserve the Enterprise in good repair and working order at all times and will operate the Enterprise in an efficient and economical manner and will pay all Maintenance and Operation Costs of the Enterprise as they become due and payable.

Article 23. Amount of Rates and Charges.

(A) Purveyor shall seek, with all due diligence under its customary practice, the approval by the Public Utilities Commission of its Bakersfield District rates for the amounts required to be paid by Purveyor under this Agreement. Subject to the approval of the PUC, the Purveyor will fix, prescribe and collect rates, fees and charges in connection with the Enterprise's Bakersfield District so as to yield Purveyor Revenues at least sufficient, after making reasonable allowances for contingencies and errors in the estimates, to pay one hundred and twenty-five percent (125%) of the following amounts

in the order below set forth, provided that rates, fees and charges each year to Customers of the Enterprise need not be set at levels sufficient to return the foregoing one hundred and twenty-five percent (125%) if reserves and other legally available revenues of Purveyor, together with those rates, fees and charges which are set, provide the specified funding level as follows:

(1) All Maintenance and Operation Costs of the Enterprise;

(2) All amounts due on obligations payable from the Purveyor Revenues on a basis subordinate to payment of Maintenance and Operation Costs; and

(3) All payments required to meet any other obligations of the Purveyor which are charges, liens, reserves, encumbrances upon, or which are otherwise payable from the Purveyor Revenues during such Fiscal Year.

(B) If the rate structure provided in subdivision (A) is not approved by the PUC, then Purveyor shall charge those rates approved by the PUC.

Article 24. Operation of Enterprise; Collection of Rates and Charges.

The Purveyor will continue to operate the Enterprise and shall have in effect at all times rules and regulations requiring all users of the Enterprise to pay the rates, fees and charges applicable to the Enterprise provided or made available to such users, and providing for the billing thereof and for a due date and a delinquency date for each bill. In each case where such bill remains unpaid in whole or in part after such bill becomes delinquent, the Purveyor, in accordance with law, may refuse to provide or make available the services provided by the Enterprise to such premises until all delinquent rates, fees, charges and penalties have been paid in full.

Article 25. Improvement District No. 4 Boundary Expansion.

(A) Water delivered to the Purveyor pursuant to this Agreement shall not be sold or otherwise disposed of by the Purveyor for use outside the boundaries of Improvement District No. 4 without the prior written consent of the Agency.

(B) The Purveyor may request a boundary expansion to allow it to deliver additional treated water supplies outside the boundaries of Improvement District No. 4 existing at the time of the request. The Agency shall cooperate with Purveyor in taking steps necessary to annex new areas to Improvement District No. 4, but Purveyor shall be responsible for all costs incurred in attempting such boundary expansion as specified below. The Agency retains the right to approve or disapprove the adequacy of measures taken to achieve expansion. If the Purveyor provides a proportional amount of additional new (non-Improvement District No. 4 State Water Project) surface water supply to Improvement District No. 4 for use in the expanded areas, the zone of benefit boundary may not need to be expanded if the Purveyor enters an agreement satisfactory to the Agency to be responsible for all costs for such supply; provided, however, that such supply must be acquired by Purveyor and the agreement with the Agency entered within six (6) months of the date of this Agreement. If, however, the Purveyor is unable to secure a new surface supply for the expansion, the Purveyor may request that Improvement District No. 4 purchase additional State Water Project entitlement at the current market cost, if available, provided that Purveyor shall be responsible for the full cost of such entitlement if such cost is not legally charged to a Zone of Benefit. The area to be annexed must also be subject to the Groundwater Charge existing through other portions of Improvement District No. 4, and shall take all steps necessary to ensure the applicability of the Groundwater Charge to the annexed area. Purveyor shall be

responsible for the amount of such Groundwater Charge which would otherwise be levied if the charge is invalidated. The Customer requesting a boundary expansion will assist Improvement District No. 4 with any administrative proceedings, environmental compliance, or any other approvals or processes that may be necessary to comply with a boundary expansion. All costs incurred complying with, or attempting to comply with, the request for a boundary expansion shall be paid for by the requesting Customer. Any request for boundary expansion may also result in the assessment of an annexation fee by the Agency to the Purveyor. The Agency does not guarantee the success of any boundary expansion efforts, or the success of implementation of a zone of benefit levy or expansion of the Groundwater Charge to an annexed area, and the parties acknowledge that pursuit of an expansion of Improvement District No. 4's service and supply are subject to the discretion of the Kern County Water Agency's Board.

Article 26. Covenants Relating to Bond Issuance.

(A) INTENTIONALLY BLANK

(B) INTENTIONALLY BLANK

(C) In order to assist with the issuance of the debt obligations , the Purveyor hereby covenants to execute an agreement to provide annual reports, as required by Rule 15c2-12 of the Securities and Exchange Commission, in a form to be mutually agreed upon between the Purveyor and the Agency, agreement not to be unreasonably withheld.

(D) In connection with the issuance of the debt obligations, the Purveyor hereby covenants to provide, in a form acceptable to the Agency, (i) an opinion of counsel as to the validity and enforceability of this Agreement, and (ii) certifications customarily delivered in connection with financings such as the debt obligations.

Article 27. Penalty for Late Payment.

Upon each charge to be paid by the Purveyor to the Agency pursuant to this Agreement, which shall remain unpaid after the same shall have become due and payable, shall accrue interest at the rate of one-half of one percent (.5%) per month of the amount of such delinquent payment from and after the date when the same becomes due until paid. The Purveyor hereby agrees to pay such interest, provided that such late charge shall not apply until thirty (30) days after the Agency invoices Purveyor for the underlying charge.

Article 28. Remedies Not Exclusive.

The use by either party of any remedy specified herein for the enforcement of this Agreement is not exclusive and shall not deprive the party using such remedy of, or limit the application of, any other remedy provided by law.

Article 29. Amendments.

This Agreement may be amended at any time by mutual agreement of the parties, except insofar as any proposed amendments may adversely affect other Customers or be in any way contrary to applicable law or inconsistent with the provisions of the Master Contract. The Agency shall make available to the Purveyor at all times during the normal hours of business at the Agency offices for the Purveyor's inspection copies of all contracts now or hereafter executed by the Agency with all other Customers and the participants referred to in Article 6 and of any amendments thereto. The Agency agrees that each contract for the supply of treated water now or hereafter executed with all other Customers in Improvement District No. 4 shall contain provisions substantially similar to

those herein set forth and shall not contain any provisions of a material nature more favorable to any other Customer than the provisions herein applicable to the Purveyor.

Article 30. Opinions and Determinations.

Where the terms of this Agreement provide for action to be based upon opinion, judgment, approval, review or determination of either party hereto, such terms are not intended to be and shall never be construed as permitting such opinion, judgment, approval, review or determination to be arbitrary, capricious, or unreasonably delayed or conditioned.

Article 31. Waiver of Rights.

Any waiver at any time by either party hereto of its rights with respect to a default or any other matter arising in connection with this Agreement, shall not be deemed to be a waiver with respect to any other default or matter.

Article 32. Notices.

All notices that are required to either expressly or by implication to be given by either party to the other under this Agreement shall be signed for the Agency and for the Purveyor by such officers as they may, from time to time, authorize in writing to so act. All such notices shall be deemed to have been given and delivered if delivered personally or if enclosed in a properly addressed envelope and deposited in a United States Post Office for delivery by registered or certified mail, or by confirmed delivery by recognized national delivery service. Unless and until formally notified otherwise, all notices shall be addressed to the parties at their addresses as shown on the signature page of this Agreement.

Article 33. Assignment.

The provisions of this Agreement shall apply to and bind the successors and assigns of the respective parties, but no assignment or transfer of this Agreement, or any part hereof or interest herein, shall be valid until and unless approved by the Agency as to all lawful factors within its discretion, including but not limited to the satisfaction of all covenants and conditions for all bonds or other financing for the Expanded Capital Costs, provided that such approval shall not be unreasonably withheld. The Agency shall act upon a requested approval of a proposed assignment within sixty (60) days of receiving all relevant requested information. Upon Agency approval of assignment, the assignee shall assume all rights and obligations of this Agreement and the assignor shall be relieved of all rights and obligations. The Agency shall not approve any such assignment or transfer to any person or entity that is not a Customer unless and until the proposed assignment or transfer has been first offered to and refused in writing by all Customers. The offer of any such assignment or transfer shall be on the same basis to all Customers and if more than one Customer desires to accept the offer, the Agreement or portion thereof to be assigned shall be prorated among them in proportion to the flow capacities provided for each of them in the facilities involved in the assignment or transfer. Notwithstanding any other provisions of this article to the contrary, the Agency's approval shall not be required for an assignment by the Purveyor of all or part of this Agreement to a public agency with the power of eminent domain, if such public agency expressly assumes all or part of the obligation of this Agreement. If such public agency assumes only a portion of the obligations of the Purveyor under this Agreement, the Purveyor shall remain obligated for the remainder of such obligations.

Article 34. Inspection of Books and Records.

The proper officers or agents of the Purveyor shall have full and free access at all reasonable times to the account books and official records of the Agency insofar as the same pertain to the matters and things provided for in this Agreement, with the right at any time during office hours to make copies thereof, and the proper representatives of the Agency shall have similar rights in respect to the account books and records of the Purveyor.

Article 35. Negotiation or Mediation of Disputes.

(A) The parties will attempt in good faith to resolve controversies or claims arising out of or relating to this Agreement by prompt negotiations between the senior executives of the parties subject to subdivision (B) of this Article. A party may invoke this Article by providing written notice of the dispute to the chief executive of the other party specifying the nature of the dispute and the position of the invoking party, whereupon the chief executive of the responding party shall provide written notice of the responding party's position within twenty (20) days of receipt of the invoking party's notice. Within thirty (30) days of the notice invoking this Article, the chief executive officers or responsible Vice-President of the parties shall meet in Bakersfield, California, for the purpose of negotiating a resolution of the dispute. If no resolution can be negotiated, the parties may agree upon a mediator and mediation process to further attempt resolution of the dispute.

(B) Provided, however, that this Article shall not limit any party's ability to proceed at any time with other remedies available to it, including but not limited to the initiation of litigation.

Article 36. Changes in the Purveyor's Service Area.

The Purveyor will furnish the Agency with maps showing their entire water distribution service area. Throughout the term of this Agreement, the Purveyor will properly notify the Agency of any changes, either by inclusion or exclusion, and in said service area or areas.

Article 37. Sale of Water to Others.

The Agency shall not sell any water from the Purification Plant provided for in this Agreement to other than the Customers unless and until it has first offered to sell such water to the Customers at the prices provided for herein. If the Customers do not elect to take all the water available from the Purification Plant, the unused water may be sold to others at not less than the prices provided for herein; provided, that such sale shall not interfere with the ability of the Agency to make deliveries to the Purveyor and other Customers; and further provided, that such sales shall be made only to others who will use the water within Improvement District No. 4 except as provided for in Article 19.

Article 38. Advisory Committee.

An Advisory Committee shall be created which shall consist of nine (9) members who shall serve terms of one (1) year. One (1) member shall be recommended by each of the Customers; one (1) member shall be recommended by sub-contractors to Customers; one (1) member shall be recommended by the City of Bakersfield; and three (3) members shall be recommended by Agency staff. Recommendations shall be made prior to the final Agency Board meeting of each calendar year, or by the relevant recommending party upon the existence of a vacancy, and the Agency Board of Directors shall consider the recommendations and make appointments during the final Agency Board meeting of each calendar year. During his or her term, each member of the Advisory Committee

shall serve at the pleasure of the party responsible for his or her appointment and alternates may be appointed who may serve in the absence of a member.

The Advisory Committee shall be charged with the responsibility of making recommendations to the Agency on those portions of the Agency's annual budget pertaining to the Purveyor and other Customers, Agency water supply and water quality plans, programs, actions and issues pertaining to the Purveyor and other Customers' plans and specifications for project facilities, construction and operating budgets, operating criteria and use of the project facilities. Voting on the Advisory Committee is on the basis of one (1) person, one (1) vote. To the extent reasonably possible, the Advisory Committee shall be informed of the details of such matters in a timely manner and, except in emergencies, the Agency will seek and consider the advice of the Advisory Committee on all such matters. Four (4) members of the Advisory Committee shall be considered a quorum for the committee acting in its advisory capacity. Final decisions concerning the project, including but not limited to, matters reviewed by the Advisory Committee, shall be made by the Agency.

A member of the Urban Bakersfield Advisory Committee shall be elected by the Advisory Committee, and appointed by the Agency Board, to sit on the Cross Valley Canal Advisory Committee to represent the interests of Improvement District No. 4 on the Cross Valley Canal. An alternate will be selected by the Advisory Committee from the Advisory Committee at the first meeting of each year, provided that if the alternate is not available for any meeting, the alternate position for the meeting will be filled by the Improvement District No. 4 Manager.

Article 39. Review by California Public Utilities Commission.

The rights and obligations of Purveyor under this Agreement are subject to review by the California Public Utilities Commission ("CPUC") in the course of rate review proceedings. In the event CPUC fails to approve rates established for the Enterprise, or finds such charges imprudent, as a result of this Agreement, then Agency and Purveyor shall immediately begin negotiations to amend the Agreement in a mutually satisfactory manner in an attempt to resolve issues resulting in such CPUC action, provided that neither party shall be excused from performance of the Agreement.

Article 40. Integration.

This Agreement represents the entire understanding of Agency and Purveyor as to those matters contained herein. No prior oral or written understanding shall be of any force or effect with respect to those matters covered hereunder. This Agreement may not be modified or altered except by an amendment to this Agreement evidenced in writing and executed by the parties hereto.

Article 41. Governing Law.

This Agreement is entered into in the State of California. The law governing the Agreement is agreed to be that of the State of California and such federal law as may apply.

Article 42. Time.

Time is of the essence with respect to the performance of each of the covenants and agreements contained in this Agreement.

IN WITNESS WHEREOF, the parties hereto have executed this Agreement on the date first above written.

AGREEMENT

BETWEEN NORTH OF THE RIVER MUNICIPAL WATER DISTRICT

AND

THE KERN COUNTY WATER AGENCY

This agreement entered this 22 day of November, 1996, between the Kern County Water Agency ("Agency"), and the North of the River Municipal Water District ("NORMWD") regarding construction and operation of NORMWD Well #3 discharge pipeline connection to the Agency 27 inch north pipeline.

RECITALS

WHEREAS, the Agency, on behalf of its improvement district number 4, owns and operates a 27" diameter water pipeline from its treatment plant to portions of its service area within Improvement District No. 4 (the "North Pipeline");

WHEREAS, NORMWD previously provided additional funding to Agency for enlargement of the capacity of the North Pipeline to allow for potential utilization for well water;

WHEREAS, NORMWD has a proposed potable water well, known as "NORMWD Well #3", located within its service area and Agency Improvement District No. 4 which will be capable of providing potable water of suitable quality for use within NORMWD and Improvement District No. 4; and

WHEREAS, it is in the best interest of the parties to this agreement that a connection be constructed from the proposed NORMWD Well #3 to the 27 inch Agency North Pipeline near 601 Willow Dr., Oildale, so as to allow for the augmentation of NORMWD's water supply and therefore help relieve the peak load on the Agency Improvement District No. 4 water treatment plant.

NOW THEREFORE, for the mutual consideration set forth herein, it is agreed as follows:

1. Agency, for the consideration herein set forth, grants permission to the NORMWD to construct a pipeline connection from its proposed NORMWD Well #3 to the Agency North Pipeline (hereinafter referred to as "Connection) within the Agency's accompanying easement or right-of-way near 601 Willow Dr., Oildale, as shown on Exhibit "A"; consisting of a fabricated flanged outlet attached to the 27" Agency line, valving (including check valve), and appropriate metering equipment; connecting to 10" ductile iron discharge pipe from the well.

2. This contract shall become effective on the date signed below, and shall remain in effect throughout the term provided by Article 2 of the Treated Water Contract dated June 13, 1974, between the Agency and NORMWD, and any extensions, amendments or renegotiations thereto.

3. Detailed plans and specifications shall be prepared by NORMWD for the Connection and related structures subject to approval of the Agency, and shall be subject to the Agency's right-of-way. Record drawings and specifications will be on permanent file at NORMWD.

4. Metering will be by in-line propeller meters, or other AWWA approved device. Provisions will be made for accommodation of transducers, telemetry equipment and the treatment plant SCADA monitoring and control system. Records of the daily and accumulated flows will be maintained by NORMWD. Costs incurred for meeting the requirements of this provision shall be the responsibility of NORMWD.

5. The Connection shall be constructed by NORMWD through force account, and/or licensed contractors, at NORMWD's sole expense. Construction shall be subject to the inspection and approval of the Agency at each stage. NORMWD shall keep Agency fully apprised of the schedule of construction. An encroachment permit issued by the Agency will be obtained by NORMWD prior to the commencement of construction.

6. The Connection shall be operated by NORMWD so as to not interfere with the Agency's treatment plant operations and water deliveries . All produced water from Well #3 will meet all State of California potable water quality requirements.

7. Agency shall have access to the Connection for inspection purposes at any time. Agency will endeavor to provide NORMWD with advance notice of such inspections to the extent practical. The Agency will maintain ownership of the Connection up to, but not including, the isolation valve attached to the flanged outlet. NORMWD will maintain ownership from, and including the isolation valve to the well.

8. Unless operation is requested by the Agency, NORMWD will provide one hour notice to the Agency of its intent to use the Connection to deliver produced water from its Well #3 into the Agency line. In the event of an emergency, notice will be given as soon as practical. Upon notice the Agency may deny permission in accordance with paragraph 9. If conditions require the Agency to shut down Well #3, one hour notice shall be given unless an emergency exists, in which case notice shall be given as soon as practical.

9. The Connection will not be operated under any conditions which are adverse to the operations, finances, and water supply of the Agency and its Treated Water Contractors.

10. NOR shall defend, indemnify, and hold harmless the Agency, its employees, directors, contractors and agents, with respect to any claims or liabilities of all kinds arising out of, or related to the construction or operation of the Connection, including but not limited to all reasonable attorney and consultant fees.

11. In the event of disputes relating to this agreement, the parties shall first submit to mediation in an attempt to resolve such disputes, then such disputes shall be subject to a non-binding arbitration before a mutually agreeable neutral arbitrator, or if no agreement can be reached, before a neutral arbitrator selected by the Kern County Superior Court. In the event of an action after arbitration, the party obtaining a result less favorable than the result obtained in arbitration shall bear the attorneys fees of both parties.

IN WITNESS WHERE OF, the parties hereto have executed this contract on the 2nd day of December, 1996.

AGREEMENT AMONG
CALIFORNIA WATER SERVICE COMPANY
AND
EAST NILES COMMUNITY SERVICES DISTRICT
AND
KERN COUNTY WATER AGENCY/IMPROVEMENT DISTRICT NO. 4

For Construction and Operation of a California Water Service Company (hereinafter referred to as "CWS") "T" Connection and Related Facilities (hereinafter referred to as the "Connection") to the Kern County Water Agency/Improvement District No. 4 (hereinafter referred to as the "Agency") East Pipeline near or at the 23 Corner Tank Facility site

WHEREAS, it is in the best interests of the parties to this Agreement that this Connection be constructed to enable CWS to use the Agency's east transmission pipeline at or near the 23 Corner Tank Facility, for conveying treated water from CWS' new North East Bakersfield Water Treatment Plant (NEBWTP) to customers within the service areas of CWS and East Niles Community Services District (hereinafter referred to as "ENCSD")

WHEREAS, the following benefits expect to be realized as the result of the Connection being constructed and operated in the manner set forth in this Agreement:

(1) ENCSD will receive an excellent quality of treated Kern River water from the NEBWTP;

(2) There will be an increase in treated water supply reliability for all three parties due to the direct connection of the NEBWTP and the Agency's Henry C. Garnett water treatment plant (HCGWTP) to the east pipeline;

(3) ENCSD will experience a significant reduction in costs for electric power consumption due to the elimination or reduction under normal circumstances of pumping water from the HCGWTP to the 23 Corner Tank Facility;

(4) If the Agency is required and able to deliver an additional 3,000 acre-feet per of treated water to ENCSD consistent with the terms and conditions of the existing Treated Water Contract dated June 13, 1974, including the provisions of Agency Resolution No. 16-71 and the Agreement dated August 25, 1983 that implemented this Resolution, CWS will provide ENCSD the additional amount in exchange for the treated water that would have been delivered by the Agency to ENCSD.

(5) ENCSD has the opportunity to participate in and therefore increase the amount of treated water it receives from future expansions of the NEBWTP if it contracts with CWS to pay for its proportional share of capital, operational and maintenance costs of such expansions

WHEREAS, it is recognized by all parties that this Agreement does not amend, change, limit, alter or invalidate any of the terms and conditions of the existing Treated Water Contract dated June 13, 1974, among the Agency, CWS, ENCSD, and other Treated Water Contractors. The duties and obligations of each party and respective assignments of treated water as set forth in the Treated Water Contract and any amendments thereto remain in effect after this Agreement is executed and the Connection is constructed and put into operation

NOW THEREFORE, it is agreed as follows:

1. The Parties agree that the statements set forth in the preceding "Whereas" clauses are true and correct to the best of their knowledge and are being relied upon by the Parties in entering into this Agreement

2. The Agency grants permission to CWS to construct the Connection from its piping system to a tie-in with the Agency's piping system and make use of the Agency's existing easement or right-of-way near 8401 Auburn Ave, as shown and described in Exhibits "A-1, A-2, B-1 and B-2", attached hereto, subject to the conditions set forth in the following sections of this Agreement

3. This Agreement shall become effective on the date signed below, and shall remain in effect throughout the term provided by Article 2 of the Treated Water Contract dated June 13, 1974, between the Agency, CWS, and ENCSD and any extensions, amendments, or renegotiations thereto unless all parties mutually agree to earlier termination

4. Detailed plans and specifications shall be prepared by CWS for the Connection for review and approval by the Agency and ENCSD, and shall be subject to the Agency's right-of-way. Record as built drawings and specifications will be on permanent file at CWS and copies provided to the Agency and ENCSD

5. Metering will be by an AWWA approved device. Provisions will be made for telemetering, transducers, telemetry equipment, and the HCGWTP SCADA monitoring and control system. Records of the daily and accumulated flows will be maintained by both the Agency and CWS. Copies of all flow records will be provided to ENCSD. Costs incurred for meeting the requirements of this provision shall be the responsibility of CWS.

6. The Connection shall be constructed by CWS through force account, and/or licensed contractors, at the sole expense of CWS. Construction shall be subject to the inspection and approval of the Agency at each stage. CWS shall provide the Agency and ENCSD with the schedule of construction and timely updates of construction progress. CWS will obtain an encroachment permit from the Agency prior to commencement of construction. Any shutdowns of the Agency's east transmission pipeline for purposes of construction or disinfection of the Connection will be performed only after prior consent has been obtained from ENCSD and in a manner and under conditions that doe not result in negative or harmful effects on the operations, finances and water supply of ENCSD.

7. The Connection shall be operated by CWS in a manner and under conditions that do not result in negative or harmful effects on the operations, finances, and water supply of the Agency's Improvement District No.4, ENCSD and other Treated Water Contractors. Responsibilities for operations and maintenance of the Connection by CWS and related administrative procedures shall be in accordance with the provisions of the Treated Water Contract dated June 13, 1974. All water delivered to the Connection by CWS from the NEBWTP shall meet all State of California Department of Health Services potable water quality requirements.

8. Agency shall have access to the Connection for inspection purposes at any time. Agency shall provide CWS with advance notice of such inspections to the extent practical. Agency will maintain ownership of the Connection which subject to final design changes will generally consist of the following: _____

9. CWS shall defend, indemnify, and hold harmless the Agency and ENCSD, their employees, directors, contractors and agents, from damages and losses including reasonable attorney fees and consultant fees to the extent caused by the negligence or willful misconduct of CWS, its employees and agents, including without limitation, negligence or misconduct in the design of, construction of, or operation and maintenance of the Connection, or design of the CWS system, and from the day to day management and operations of flow through the Connection to ENCSD.

10. Agency shall defend, indemnify and hold harmless CWS and ENCSD, their employees, directors, contractors and agents from damages and losses including reasonable attorney fees and consultant fees, to the extent caused by the negligence or willful misconduct of the Agency or its employees, directors, contractors or agents, including without limitation, negligence or misconduct in operational control of the Connection.

11. Dispute Resolution

(1) Intent. Agency, ENCSD, and CWS desire and intend to resolve all disputes or other matters arising out of or in connection with this Agreement through reasonable, business like dispute resolution procedures without resort to litigation. Accordingly, any disputes among the parties shall be resolved in accordance with this section, excepting those construction disputes resolved according to the requirements of Public Contract Code sections 20104 et seq., and excepting those disputes where an imminent threat to public health or safety requires immediate judicial action.

(2) Initial Meeting. As a first step, any party may call a special meeting to initially resolve a dispute. The initial meeting shall be held within three (3) working days after delivery of a written request for such a meeting. The written request shall contain a statement of the nature of the dispute. The meeting shall be attended by the authorized representatives of the Agency, ENCSD and CWS. Disclosures made by the parties during such meetings shall be protected as discussions for the resolution of a disputed claim under the California Evidence Code.

(3) Mediation. If the dispute has not been resolved within five (5) working days after the conclusion of the initial meeting, any party may initiate mediation by written notice to the others. All parties shall attend and participate in the mediation that shall be non-binding and without prejudice. The parties shall first attempt to agree upon a mediator. If agreement cannot be reached on selection of a mediator, the parties shall attempt to agree upon a mediation entity, e.g. AAA, JAMS, etc., to appoint a mediator. If agreement cannot be reached, the parties shall petition the Kern County Superior Court for appointment of a mediator. Costs of mediation shall be borne equally by each party.

(4) Failure of Mediation. If mediation fails to resolve the dispute within 30days the parties are free to pursue other legal remedies.

IN WITNESS WHERE OF, the parties hereto have executed this contract on the _____ day of 2001

AGREEMENT NO. 03-316

CUSTOMER SERVICE AGREEMENT

NOV 05 2003

KERN DELTA WATER DISTRICT, CALIFORNIA WATER SERVICE COMPANY, AND CITY OF BAKERSFIELD

RECITALS:

A. Kern Delta owns and operates certain canal systems diverting and delivering Kern River water. The canal systems are generally described as the Eastside Canal, Kern Island Canal System, Stine Canal, Farmers Canal, and Buena Vista Canal (collectively serving the "Kern Island Service Area"). These canal systems are unlined and seepage losses ("losses") are incurred in the delivery of diverted water. Kern Delta claims the benefit of such losses in its water balance calculations.

B. The City of Bakersfield ("City") and the California Water Service Company ("Cal Water") (the City and Cal Water are collectively referred to herein as "Customers") provide water service to lands overlying the area traversed by the subject canal systems and, in doing so, produce water from the groundwater basin overlying such lands. The City and Cal Water benefit from the losses since the losses maintain the water quality and levels in the local groundwater aquifer.

C. All parties have determined it would be mutually beneficial for the City and Cal Water to enter into a pilot program with Kern Delta whereby they will become customers of Kern Delta and thereafter purchase losses from Kern Delta to insure the continued availability of such water for the uses and purposes of Customers.

D. All parties have determined that a non-precedent setting pilot program of limited duration would be appropriate to allow the parties to better assess their respective needs with respect to a long-term program.

E. This agreement shall not constitute a precedent for any future agreements respecting the subject matter hereof, nor shall this agreement be used or usable in support of any claims that water rights of any party have been gained or lost as a result of the making or performance of this agreement.

AGREEMENT:

1. On behalf of urbanized lands situated within the historic Kern Island Service Area, Customers will submit an application for utility water service to be provided by Kern Delta. Customers will comply with rules and regulations applicable generally to utility customers of Kern Delta.

2. During the term of this agreement, Kern Delta agrees to make available to Customers, and Customers agree to buy from Kern Delta, seepage losses attributable to the diversion and delivery of Kern River water (other than Kern River water acquired by exchange) through the canal systems from the headgate thereof to a point agreed upon by the parties, which generally will be the southern boundary of the urbanized area of the City.

3. The purchase price of water made available to Customers pursuant to this agreement shall be the utility rate established annually for each canal system by Kern Delta, plus an administrative charge of $2.50 per acre foot of water sold. The administrative charge shall be subject to escalation annually using the same index as is applicable to charges imposed by the City for transportation of water from the Carrier Canal into the Arvin-Edison Canal.

4. The term of this agreement is five (5) years commencing January 1, 2004 and ending December 31, 2008; provided, however, if this agreement is not terminated by written notice given by one of the parties prior to the expiration of the initial term, this agreement shall continue in successive one-year terms thereafter until such notice is given and then it shall terminate on December 31 of the year in which the notice is given.

5. The amount of Kern River water to be purchased by Customers will be the actual amount of canal losses occurring in the urban area during each year of operation. In a given year the amount of water diverted into a canal system will be measured at the headgate and at the agreed urban boundary point and the difference (less upstream agricultural deliveries, if any) will be the amount purchased by Customers. In any year in which there is Kern River entitlement for a given canal system, including years in which the system may not operate for some reason, deliveries to Customers for that year will be based on historic activities representing a pro rata share of the annual canal entitlement. Deliveries to Customers can be made at any time during the **same** calendar year. It is intended that Kern Delta will have maximum flexibility in delivering water to Customers.

6. The delivery point of Kern River water made available to Customers is the point of percolation of such water into the groundwater aquifer via the unlined canals of Kern Delta. Kern Delta will not be required to deliver any water pursuant to this agreement to Customers as a surface supply, but this agreement does not preclude such deliveries in the future subject to separate arrangements.

7. It is understood that Kern Delta has and will continue to claim credit for losses in calculating its water balance and diversion right. The sale of water to Customers shall not diminish or defeat such claim.

8. This agreement does not, nor is it intended to, affect, alter or impair in any manner the water rights of the parties hereto, and this agreement will not and shall not act as a waiver, release, acknowledgment, confirmation or compromise of any rights or interests of the parties. This agreement is temporary in nature and is not precedent setting. In the future, the parties may not defend or assert that any claims, rights or causes of action are time barred or otherwise compromised, waived, released or prejudiced as a result of this agreement. This agreement is made and entered into pursuant to Evidence Code §1152 and may not be introduced in evidence in any legal proceeding, except a proceeding to enforce this agreement.

9. The parties agree that this agreement, and any actions taken pursuant to the agreement, are exempt from environmental review pursuant to the requirements of the California Environmental Quality Act ("CEQA"), under applicable exemptions.

10. The validity of this agreement is subject to and dependent upon the approval of the governing boards or bodies of the parties, and, Cal Water's obligations under this agreement may be further conditioned upon the approval by the California Public Utilities Commission of the terms and conditions of this agreement. The parties hereto may rescind this agreement if they are not able to obtain appropriate governmental approvals for the terms and conditions of the agreement.

Subject: Project Ware Malcomb Wastewater Treatment Plant (WWTP)
Preliminary Design Report

---

1. PROJECT BACKGROUND AND UNDERSTANDING

Kimley-Horn has been retained by Seefried Industrial Properties to perform planning and due diligence for the Project Ware Malcomb 2 (Project). The Project will be located in Kern County, south of Bakersfield and approximately 2 miles northwest of the SR-99 and SR-223 intersection (**Figure 1**). The Project will be a sorting facility supporting e-commerce order fulfilment. The Project will on average support two shifts with 732 employees per shift, or 1,464 employees per day, and operate 24-hours a day. During peak e-commerce fulfillment season, the Project will support two shifts with 915 employees per shift, for a total of 1830 employees per day, and operate 24-hours a day. The City of Bakersfield and Kern County do not plan to construct a wastewater treatment facility nearby and the Project will be located over 1 mile from the closest municipal sewer system. An onsite wastewater treatment plant (WWTP) has been proposed to serve this facility in perpetuity. The objective of this report is to investigate proposed WWTP alternatives, design sizing, initial requirements, and other planning level details.

2. PERMITTING REQUIREMENTS

The WWTP will solely serve the Project Ware Malcomb 2 and will not be sized for any future facilities in the vicinity. The Project will employ a maximum of 1830 employees a day based on coordination with the end user. It is estimated that each employee will generate 30 gallons per capita per day (gpcpd). As a result, the expected wastewater

generation rate is 54,900, gallons per day (GPD). The wastewater generation rates and calculations are provided in **Attachment 1**.

Figure 1: Project Vicinity Map

The WWTP will be permitted and regulated by the California Regional Water Quality Control Board (RWQCB) – Central Valley Region 5 (the Region). Since the WWTP will be sized for 54,900 GPD, it can enroll under the Small Domestic Permit (2014-0153) which regulates wastewater facilities that discharge a monthly average of 100,000 GPD of domestic wastewater or less, included in **Attachment 6**.

A Report of Waste Discharge (ROWD) will be prepared for review and approval by the RWQCB to enroll under the Small Domestic Permit. The ROWD will discuss project background, as well as describe treatment and disposal methods method to ensure the plant will meet Federal and State requirements. The regulations are intended to protect

the water quality of surface water and groundwater by regulating the treated wastewater (effluent).

Enrollment in the Small Domestic Permit will require an application fee as well as an annual fee. The 2022-23 Fee Schedule is included in **Attachment 7.** Fees are issued based on the Threat to Water Quality as well as Complexity of the system. During an initial discussion with the RWQCB, it was indicated that the proposed WWTP process and location appear similar to a Category 2B classification. A Category 2B discharger has physical, chemical, or biological treatment systems and could impair the designated uses of the receiving water or violate water quality objectives. This categorization, however, cannot be confirmed until the ROWD process is completed.

If the effluent is treated for re-use such as recycled water for irrigation, rapid injection, or recharge basin, Title 22 requirements under "Regulations Related to Recycled Water" would be applied to the WWTP. At this time, the Project is not proposing to treat the effluent for re-use. If it were, a Title 22 report would need to be submitted in addition to the ROWD for review. Title 22 reports are currently reviewed by the California Department of Health and Safety (DHS) and enforced by the RWQCB. The Title 22 report is intended to discuss additional redundant features for the treatment system, application methods of the effluent, public safety methods, and monitoring and sampling requirements. Re-use of treated wastewater typically requires more frequent monitoring and sampling, as well as operators with higher classification requirements. As a result, recycled water operations and maintenance (O&M) costs can be significant and should be compared to the cost savings of recycled water use.

The WWTP is located within RWQCB Region 5 – the Central Valley Region – which has additional salt and nitrate requirements as part of Resolution R5-2018-0034. These requirements are part of the Region's Nitrate and Salt Control Programs, which are programmatic efforts to improve salts and nitrates in the Region's groundwater basins. Each discharger in the Region must submit a Notice of Intent (NOI) for the discharge of both salts and nitrates respectively, as well as select a compliance pathway for each constituent. The pathways for each nutrient are discussed below:

Salts: The two compliance pathways include: Pathway 1 – the Conservative Salinity Permitting Approach and Pathway 2 – the Alternative Salinity Permitting Approach. Pathway 1 typically requires additional studies for a specific site to demonstrate that there will not be any degradation of the groundwater from the discharger's effluent. The studies will take additional effort and coordination, as well as increase the review and permitting timeline. Pathway 2 requires participation in a Prioritization and Optimization Study as well as a financial contribution to the study. In general, **Pathway 2 is recommended** because the Prioritization and Optimization Study primarily requires an annual fee and is typically a less lengthy permit process.

Nitrates: The two compliance pathways include: Pathway A – Individual Permitting Approach and Pathway B - Management Zone Permitting Approach. Pathway A typically requires additional studies to demonstrate that there will not be any degradation of the groundwater from the discharger's effluent. The studies will take additional effort and coordination, as well as increase the review and permitting timeline. Pathway B requires participation in a Management Zone Permitting Approach Group, a collaborative approach between permittees to address nitrate impacts in their local areas. In general, **Pathway B is recommended** because the Nitrate Management Zone Permitting Approach Group primarily requires an annual fee and is typically a less lengthy permit process.

Attachment 8 includes guidance for the NOI of both programs and detailed descriptions of the pathways summarized above.

3. WWTP ELEMENTS AND SIZING

The WWTP will solely serve the Project. While the expected wastewater generation rate is 54,900 GPD, a peaking factor of 2 is assumed to adhere to the Kern County Standards Division Three – Standards for Sanitary Sewers, as well as provide a safety factor. No future growth is anticipated that would impact the influent volumes to this Project. Should the tenant/owner expand employee counts, the WWTP would need to be re-evaluated for sizing capacity and potentially re-permitted. Various wastewater treatment and disposal methods were investigated and discussed below.

Treatment:

1) Conventional Treatment Plant:

A pre-package conventional wastewater treatment system will typically consist of a flow equalization tank, aeration tank, clarifier tank, disinfection system, and sludge holding tank. The footprint for the pre-package system will be approximately 74 feet x 24 feet. An example is provided in **Attachment 2**. Resultant sludge will then be routed to a sludge processing and dewatering system that will produce concentrated sludge and effluent wastewater. The site will require chemical truck access, waste truck access, and maintenance access. An odor control facility is also recommended. The yard footprint is expected to be approximately 2.4 acres and is shown in **Figure 2**. It is recommended that screen walls be provided for security and aesthetic purposes.

Operations & Maintenance:

A conventional activated sludge WWTP requires a staff of knowledgeable, trained, and certified WWTP operators to learn the required operations to maintain a functioning treatment plant and troubleshoot any issues as they arise.

FIGURE 2 - CONVENTIONAL WWTP FOOTPRINT
PROJECT WARE MALCOMB
KERN COUNTY, CA

Operators and supervisors should be able to check the viability of efficiency of all components in the activated sludge process to prevent system upsets. Maintenance of the treatment plant would be the responsibility of the owner.

2) Membrane Bioreactor Plant:

A pre-package Membrane Bioreactor (MBR) wastewater treatment system will typically consist of a flow equalization storage tank, aeration and anaerobic tanks, a Membrane Bioreactor, and disinfection system. The footprint for the flow equalization tank, the pre-package MBR treatment system, and the disinfection system will be approximately 40 feet by 10 feet, 65 feet by 20 feet, and 42 feet by 8 feet in area, respectively. An example is provided in **Attachment 3**. Resultant sludge will then be routed to a sludge processing and dewatering system that will produce concentrated sludge and effluent wastewater. An odor control facility is also recommended. The site will require chemical truck access, waste truck access, and maintenance access. The yard footprint is expected to be approximately 2.4 acres and is shown in **Figure 3**. It is recommended that screen walls be provided for security and aesthetic purposes.

Operations & Maintenance:

A staff of knowledgeable, trained, and certified operators and supervisors are required to maintain successful operation of the package WWTP. Operations for package MBR WWTPs can be straightforward for operators, as the manufacturer can provide maintenance and support remotely. The manufacturer of the package MBR WWTP can offer the fabrication, assembly, and wet testing of the plant and equipment prior to shipping to the project site.

Power Requirements:

The proposed treatment systems will require power to be provided by the future adjacent substation. At this stage of the design process, the total power requirements for the WWTP and sewer lift station are preliminary. The power requirements will vary based on the selected treatment method and associated mixers, blowers, pumps, generator selection, and other equipment. At this stage, Kimley-Horn would expect a 400 Amp, 480 Volt 3-phase service for the future WWTP and associated lift station. This will need to be verified as part of the final design process.

Disposal Methods:

Wastewater by-products will include sludge and effluent. Sludge will be processed to further concentrate the solids for final disposal. Solids will be collected and stored, and regularly hauled offsite by a licensed handler.
The treated wastewater can be disposed through a variety of methods, as follows:

FIGURE 3 - MBR WWTP FOOTPRINT
PROJECT WARE MALCOMB
KERN COUNTY, CA

1) Percolation Pond:

A percolation pond collects treated wastewater effluent, and the effluent is disposed of by infiltration into the local soils. The percolation ponds are sized to infiltrate one day's worth of effluent for normal operations, as well as rainfall accumulated during a 100-year 24-hour storm event, within 48 hours to avoid standing water conditions per the RWQCB's Small Domestic Permit in **Attachment 6**. Additionally, two percolation ponds are typically installed to rotate between ponds and maintain pond efficiency as well as to mitigate breeding of mosquitos. Installing two percolation ponds also provides redundancy for long term maintenance.

At the time of this report, a geotechnical report with infiltration data had not been prepared. The soil is expected to be Type B soil based on United States Geological Survey (U.S.G.S.) Soils data (see **Attachment 4**). As a conservative sizing measure, the lowest infiltration rate for Type B soils of 0.57 inches per hour was used to size the percolation pond footprint. A safety factor of 2 was applied in the case that the soil could not infiltrate at 0.57 inches per hour, which results in an effective infiltration rate of 0.285 inches per hour. Once the geotechnical report is complete, the percolation pond size will be refined based on the site soil conditions. *Equation 1* was used to determine the area of the percolation ponds.

(Equation 1): $$A = \frac{V}{t * effective\ infiltration\ rate}$$

A=Area of Percolation Pond
V=Volume of Effluent in a Day plus Rainfall Volume from a 100-Year 24-hour Storm Event
t=time of infiltration
Effective Infiltration Rate

The calculated percolation pond area to treat the desired volume is 0.3 acres. The percolation ponds would require a depth of 1 foot in order to meet drawdown time requirements and 2 feet of freeboard per the Small Domestic Permit, for a total of 3 feet of depth. To account for side slopes and freeboard, the total estimated area for each percolation pond will be 0.36 acres. Detailed calculations are provided in **Attachment 5**. A fence or screen wall is required around the perimeter of the site that contains the percolation ponds. Site access for the percolation must be limited to only trained operators and not the general public to avoid potential contact.

Since percolation ponds are solely intended for disposal, Title 22 regulations are not applicable. Only a ROWD and review by the RWQCB would be required for the Small Domestic Permit. Groundwater monitoring may not be required depending on the groundwater basin's sensitivity to various constituents that could degrade the water quality as well as WWTP location.

Percolation ponds are designed to store ancillary stormwater in order to mitigate the likelihood of overflow and provide a factor of safety during a large storm event. However, they are not designed to be designated stormwater detention facilities. Overall, stormwater and treated wastewater facilities must be kept separate per State Requirements.

2) Recharge Basin:

Recharge basins, similar to percolation ponds, collect effluent for deliberate infiltration into the native soils and recharge groundwater basins. Recharge basins are sized in the same manner as percolation ponds. The calculated percolation pond area to treat the desired volume is 0.3 acres. To account for side slopes and freeboard, the total estimated area for each percolation pond will be 0.36 acres with a depth of 3 feet. See *Equation 1* and **Attachment 5** for detailed calculations. A fence or screen wall is required around the perimeter of the yard that contains the recharge basins.

Unlike percolation ponds, recharge basins are intended to recharge the existing groundwater quality basins. Due to the intended re-use, recharge basins are considered a recycled water application and would require compliance with all Title 22 regulations and review of Title 22 reports. The DHS and RWQCB would have to review the ROWD and Title 22 reports before the WWTP could be enrolled under the Small Domestic Permit. The Title 22 requirements include additional redundant features for the treatment system, application methods of the effluent, public safety methods, and monitoring requirements. Additionally, groundwater monitoring would be required.

3) Irrigation:

The treated wastewater effluent could be used as a source of irrigation water for either onsite landscaping or other offsite uses. Since the effluent would have an intended re-use purpose, this approach would require compliance with all Title 22 regulations and review of Title 22 reports. The DHS and RWQCB would have to review the ROWD and Title 22 reports before the WWTP could be enrolled under the Small Domestic Permit. Title 22 requirements include additional redundancy in the treatment system and other facilities, additional sampling and analysis, additional signage requirements, and compliance with regulations on how the recycled water can be applied by the end-user. Additionally, groundwater monitoring will be required. Irrigation onsite or offsite will also require additional piping, a pump station, and potentially a recycled water storage tank.

Percolation ponds are the recommended method of treated effluent disposal. This method does not require compliance with Title 22 regulations and submittal of Title 22 reports.

It is not recommended to permit the effluent under Title 22 at this time because Title 22 standards include further redundancy, higher standards of effluent quality, groundwater

monitoring, stricter sampling and analyses, and more. The Title 22 review process would increase the permitting timeline for the Project and may require public hearings and notification processes as well.

It shall be noted that designing to Title 22 requirements does allow flexibility for the owner to obtain a Title 22 permit in the future without major upgrades to the system, if a need for irrigation arises.

4. OPERATIONS AND MAINTENANCE AND LIFE CYCLE COSTS

Kimley-Horn has prepared conceptual opinions of probable cost to evaluate Capital Costs, Operations & Maintenance (O&M) Costs, and overall life cycle analysis costs for both Conventional and MBR WWTPs.

Attachment 9 includes estimates for the anticipated construction and operation and maintenance costs associated with both treatment alternatives, assuming percolation ponds as the method of treated effluent disposal.

Operation and maintenance costs include but are not limited to:

- Equipment required for routine maintenance or replacement of damaged parts of all facilities.
- Consumables and chemicals to operate the treatment plant, disinfection system, sludge processing facility, and odor control facility.
- Labor for routine operations, required sampling/analysis, maintenance, and compliance and reporting.
- Electrical power to operate all facilities.
- Hauling and disposal of sludge waste to a licensed handler.

A summary of the costs for Capital Costs, O&M and Total Life Cycle Cost Analyses are provided *Table 1* below:

	Capital Costs	Annual O&M Costs (no escalation)	20-Year Life Cycle Analysis
Conventional WWTP	$5,670,000	$650,000	$18,670,000
MBR WWTP	$6,370,000	$500,000	$16,370,000

Table 1 – Summary of Capital Costs, O&M and Life Cycle Analysis

In general, conventional treatment facilities require more skilled operators and significantly more sampling and monitoring, increasing long-term operation and

maintenance costs. Although pre-package MBR systems have higher upfront costs, it is estimated that the cost difference will be recovered within 5 years of operations.

Kimley-Horn has no control over the cost of labor, materials, equipment, or over the contractor's methods of determining prices or over competitive bidding or market conditions. The opinions of probable costs provided in **Attachment 9** are based on the information known to Kimley-Horn at this time and represent only Kimley-Horn's judgment as a design professional familiar with the construction industry.

Kimley-Horn cannot and does not guarantee that proposals, bids, or actual construction costs will not vary from its opinions of probable costs.

5. RECOMMENDATIONS AND CONCLUSIONS

The proposed WWTP will be sized to treat a monthly average of 54,900 GPD of wastewater generated by the Project. It is recommended to install a pre-package MBR system. Compared to a pre-package conventional wastewater treatment system, a pre-package MBR system has a smaller footprint, requires less maintenance and sampling/monitoring, and has more efficient sludge production resulting in decreased frequency of hauling solid waste offsite; overall decreasing long-term operation and maintenance costs.

The site shall also include an influent pump station, a sludge processing and storage area, an odor control facility, and a small building for electrical and operations and maintenance equipment. It important the site has lighting as well as drive aisles suitable for maintenance vehicles, chemical trucks, and waste hauling trucks to maneuver comfortably around the percolation ponds and all other onsite treatment facilities.

Percolation ponds are sized for a monthly average of 54,900 GPD and rainfall resulting from 24 hours of a 100-year storm event. They are recommended to eliminate Title 22 requirements and additional DHS review that could extend the permitting process and to potentially avoid groundwater monitoring requirements. Two percolation ponds are recommended to maintain infiltration efficiency, prevent standing water, and provide redundancy in the case of maintenance or shutdowns. Finally, an emergency overflow storage basin with a liner is recommended in the case of an emergency event; the basin will be sized to match the percolation ponds but is not intended for infiltration.

It is anticipated that this approach would incur $6,370,00 in construction costs and $500,000 of annual operation and maintenance costs, per **Attachment 9**.

1 PROJECT INFORMATION

The project is designed as a single treatment train.

1.1 PROCESS FLOW DESCRIPTON

The following describes the process flow of the MEMPAC-M unit:

Headworks

The influent flow will pass through an influent flow meter prior to discharge into an influent screen. The influent screen is a 2MM fine screw screen compactor. Screened solids will be discharged into an endless bagger unit to be dumped into a client provided receptacle. Screened influent will discharge into the anoxic chamber.

Biological Nutrient Removal

Screened influent will mix with return activated sludge (RAS) which has gravity-returned from the pre-anoxic chamber to form “mixed liquor.” Nitrates conveyed by RAS flow from the aeration basin to the oxygen-lean anoxic chamber serve to oxidize some of the influent biological oxygen demand (BOD) by which process these nitrates are converted to nitrogen gas, ultimately lowering effluent total nitrogen (TN).

Secondary Treatment

Mixed liquor proceeds from the anoxic process to the aeration process where nitrification occurs by which process BOD is oxidized and ammonia is converted to nitrates, ultimately lowering their respective effluent concentrations. This is achieved by introducing compressed air through fine bubble diffusers on a carefully designed aeration network.

Membrane Clarification

At the end of the activated sludge process, wastewater is pumped from the aeration process to the individual membranes cassette chambers using forward activated sludge (FAS) pumps. These membrane cassettes have a vacuum applied across them by permeate pumps, pulling clear water “permeate” through the membranes and leaving solids behind, outside of the membranes. The permeate pumps convey their permeate to a “clear well” reservoir of water used for periodic membrane cleaning, i.e. “backpulsing,” and clean-in-place (CIP) procedures which are fully automated.

Waste Sludge

Solids concentration will be monitored by an on-line suspended solids meter located in the FAS Chamber. A sludge wasting pump will remove a calibrated portion of activated sludge to an exterior sludge storage (by others).

2 PROJECT DESIGN

The following are the design parameters of the supplied Cloacina equipment:

2.1 Influent Parameters

Daily Flow (Q)	Average Annual (AAF)	Maximum Daily (MDF)	Peak Daily (PDF)	Peak Hour (PHF)
Peaking Factor	1.0	1.5	2.0	4.0
Gallons per Day	55,333	83,000	110,667	
Gallons per Minute	38	58	77	154

Organic Concentration	BOD5	TSS	TKN	NH3	P
Influent (mg/l)	360	350	58	37	10
Screen Removal %	4%	9%	0%	0%	2%
Screened Influent (mg/l)	346	319	57	37	10

TOTAL ORGANIC LOADING (lbs/day)	BOD_5	TSS	TKN	NH3	P
AAF	159	147	27	17	5
MDF	239	220	41	26	7

Effluent Limitations	BOD5	TSS	TKN	NH3	P
Effluent (mg/l)	<10	<10	<10	<5	N/A

*Engineering to verify once under contract. During due diligence Cloacina may find the need to modify processes and/or scope to achieve effluent requirements.

2.1.1 Flow Definitions

Wastewater flow can be described in a multitude of ways, related to varied time periods, wet and dry weather, seasonal populations, and permit definitions. To ensure that the estimated package meets the project needs, the following terms **shall** be used to define the capacity of the proposed system:

Term	Definition
Average Annual Flow (AAF)	The average flow of a one-day period which is the influent volume in one year divided by the number of days in that year. AAF is typically the nominal capacity of a plant.
Maximum Daily Flow (MDF)	The maximum daily flow occurring over a 24-hour period. Cloacina utilizes MDF for maximum biological design and the maximum sizing of the treatment equipment.
Peak Daily Flow (PDF)	The single greatest flow of a one-day (24hr) period in a year. PDF serves for design of plant hydraulic capacity. Flow rates greater than PDF, including Peak Hour Flow (defined below), are to be equalized to PDF by influent storage (by others) that augments the treatment plant.
Peak Hour Flow (PHF)	The flow over a 60-minute period which is the influent flow of the highest flow hour in the Peak Day. For applications in which influent is screened prior to equalization, screens shall be sized for PHF. In the absence of a PHF specified by the Client, PHF will be calculated as a function of the plant's service population per "Metcalf & Eddy".

2.1.2 Influent Loading

The following outlines the organic loading used to develop this estimate.

Term	Definition
Maximum Daily Flow (MDF) Loading	It is assumed that the influent concentrations outlined below are applied 100% to the Maximum Day Flow (MDF), unless otherwise indicated.
PEAK Daily Flow (PDF)	It is assumed that no additional influent constituent loading is contributed by flows more than MDF. Loading defined for MDF is assumed to be diluted at PDF such that PDF loading shall equal MDF loading multiplied by the ratio of MDF to PDF.
PDF Equation	• $BOD_{PD} = BOD_{MMDF} \times \frac{MDF}{PDF}$ • $TSS_{PD} = TSS_{MMDF} \times \frac{MDF}{PDF}$ • $TKN_{PD} = TKN_{MMDF} \times \frac{MDF}{PDF}$

2.2 PROCESS DESIGN PARAMETERS

Activated Sludge	Design Value (MMF)
Volume Under Aeration (gal)	20,368
Hydraulic Residence Time (hrs)	7.7
Design MLSS (mg/L)	9,000
Design MLSS (lbs)	2,277
MLSS/MLVSS Ratio	0.69
Design MLVSS (lbs)	1,571
Design F/M Ratio	0.15
Design SRT (days)	14.2
Return Activated Sludge Factor (x Q)	4.0
Return Activated Sludge Rate (gpm)	231

Aeration	Design Value (MMF)
Project Altitude (ft)	400
lb O_2 / lb BOD	1.25
lb O_2 / lb NH_3-N	4.60
Design Air Requirement (SCFM)	127
Design Aeration Residence Time (hrs)	5.4

Nutrient Reduction	Design Value (MMF)
Design Anoxic Residence Time (hrs)	2.22

Waste Activated Sludge (WAS)	Design Value (MMF)
lbs WAS / lbs Influent BOD	0.67
Design lbs WAS / day	160.4
Design WAS Concentration (mg/L)	11,250
Design WAS Production Rate (gpd)	1,708

Membrane Clarification	Each Cassette	N	N+1
Cassettes Supplied	1	1	2
Membrane Area (ft^2)	6,880	6,880	13,760
Flux at AAF ($gal/ft^2/day$)	8.0	8.0	4.0
Flux at MMF ($gal/ft^2/day$)	12.1	12.1	6.0
Flux at PDF ($gal/ft^2/day$)	16.1	16.1	8.0
PEAK Permeation per Cassette (gpm)	83	83	42
Design Air Flow (DCFM)*	65	65	130
Estimated Production Time (min/day)	1,329		
Membrane Cassette Type	ZW500D-16/16		
Total Cassettes Supplied	2		

*Design air flow based on LEAP Aeration Protocol

Chemical Usage	Sodium Hypochlorite	Citric Acid
Gallons per CIP Cycle	3.21	2.29
Gallons per Recovery Clean	1.01	0.84
Estimated Gallons per Year	336	120

2.3 Package Parameters

Package Dimensions	Length	Width	Height
Outside Dimensions of Package Tanks and Skids (ft)	60	10	14

Electrical Requirements	Voltage	Phase	Amperage
The FLA's are approximate and subject to change based on actual options/upgrades chosen.	480	3	200

3 SCOPE OF SUPPLY

3.1 Headworks

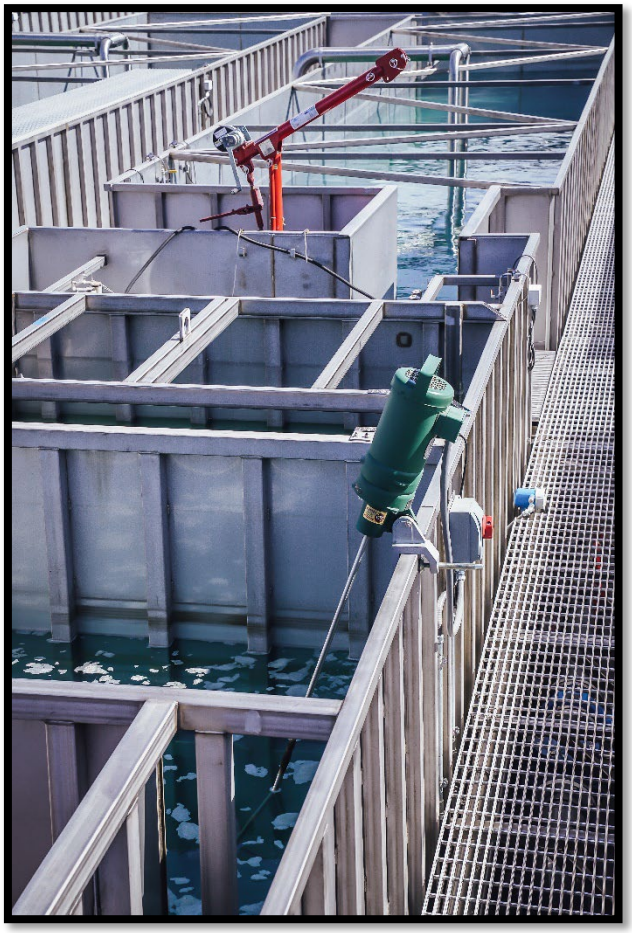
Equipment	Description	Quantity
Influent Flowmeter	Endress+Hauser, electromagnetic flowmeter	1
Influent Screen	2 mm fine bar screen with washer compactor rated at 100 GPM	1

3.2 Anoxic Process

Equipment	Description	Quantity
Level Sensor	Endress+Hauser hydrostatic level transducer	1
ORP Probe	Endress+Hauser, ORP probe	1
Anoxic Mixer	Lightening, top mount mixer	1

3.3 Aeration Process

Equipment	Description	Quantity
Level Sensor	Endress+Hauser, level transducer	1
Dissolved Oxygen Sensor	Endress+Hauser, DO Sensor	1
Aeration Blower	FPZ regenerative blower	2
Blower Pressure Sensor	Endress+Hauser, pressure sensor	4
Aeration Diffusers	OTT, Magnum 2000 Flexsil fine bubble	18



3.4 Membrane Process

3.4.1 Forward Activated Sludge (FAS) Process

Equipment	Description	Quantity
Level Sensor	Endress+Hauser hydrostatic level transducer	1
FAS Pump	Submersible pump with slide rail and base	2
FAS Flowmeter	Endress+Hauser, electromagnetic flowmeter	2

3.4.2 Membrane Equipment

Equipment	Description	Quantity
Level Sensor	Endress+Hauser hydrostatic level transducer	2
Membrane Cassette	SUEZ ZW500S	2
Permeate Pump	Positive Displacement Rotary Lobe Pump	2
Permeate Flowmeter	Endress+Hauser, electromagnetic flowmeter	2
Permeate Pressure Sensor	Endress+Hauser, pressure sensor	2
Air Scour Blower	FPZ regenerative blower	2
Blower Pressure Sensor	Endress+Hauser, pressure sensor	4
Mass Air Flowmeter	Endress+Hauser, thermal mass flowmeter	2

3.4.3 Clean in Place (CIP) Equipment

Equipment	Description	Quantity
Clear Well Level Sensor	Endress+Hauser hydrostatic level transducer	1
Chemical Pump	Peristaltic Metering Pump	4
Injector Solenoid	Hayward SV, True union solenoid valve	4

3.4.4 Waste Activated Sludge (WAS) Process

Equipment	Description	Quantity
MLSS Sensor	Endress+Hauser, TSS Sensor	1
WAS Pumps	Progressive cavity pump	1
WAS Flowmeter	Endress+Hauser, electromagnetic flowmeter	1

3.5 Effluent Equipment

Equipment	Description	Quantity
Effluent Flow Meter	Endress+Hauser, electromagnetic flowmeter	1
Effluent Turbidity	Endress+Hauser, Turbidity Sensor	1

3.6 Utility Equipment

Equipment	Description	Quantity
Probe Wash Solenoid	ASCO Solenoid valve	1
Water Regulator	ZURN Water pressure regulator	1
Water Y-Strainer	HIPCO Y-Strainer	1

3.7 Electrical and Control Equipment

Equipment	Description	Quantity
Control Panel	U.L. Listed 480V, 3-Phase, NEMA 4X, Stainless Steel Panel	1
HMI	Integrated touch screen interface	1
Control Transmitter	Endress+Hauser Liquiline, digital transmitter	1

4 Project Support

4.1 Documents

Document	Description	Quantity
Electrical Control Panel	Equipment drawings	1
Project Submittals	Detailed information for all supplied equipment	1
Factory Acceptance Testing Documents	Detail of all equipment tests prior to shipping	1
Equipment Manual	Detailed Operations and Maintenance Manual	1

4.2 Labor

Scope	Description	Hrs
On-site Startup	On-site startup and commissioning	32
Operator Training	On-site Operator training	8
Remote Support	Phone and web support after completion of startup	20

5 Optional Equipment

5.1 Package Lift Station

Cloacina will provide a packaged lift pump station. The fiberglass pump station will be supplied complete with pumps, slide rails, attached valve vault and controls.

EQUIPMENT	DESCRIPTION	Quantity
Fiberglass Vessel	96” Diameter X 144” Deep pump well	1
Valve Vault	48” X 48” attached valve vault	1
Attached Pipe and Valves	6” PVC piping, check valves and isolation valves	2
Hardware	316 SS studs, hardware, rails and brackets	2
Connection	6” inlet hub (link seal)	1
Non-Traffic Rate Lid(s)	Attached aluminum lid with access hatches	2
Lift Pump	Non-clog pump rated at 250 gpm @ 35’ TDH	2
Pump Base	Attached pump base	2
Controls	Level transducer	1
Controls	Redundant/Alarm Floats	3
Control Panel	Simple duplex control panel with no remote monitoring	1

Note: Assumes lift station will be installed within 200ft of screen inlet.

5.1.1 Lift Station Panel Upgrade

Cloacina can upgrade the Remote-Control Panel to the following and the Lift station controls will be integrated into the MCC supplied with the Cloacina package, utilizing remote I/O:

EQUIPMENT	DESCRIPTION	Quantity
Remote Control Panel	NEMA-4X Control Panel with remote I/O	1

Note: This option is recommended for visibility if there is no equalization storage

5.2 Equalization Storage

Cloacina can provide Equalization tanks integrated and controlled by the Cloacina control panel. *See Figure*

Equipment	Description	Quantity
Equalization Tank	Stainless Steel Equalization Tank (10'W X 10'H X 40'L) for about 32,000 gallons of storage each tank. See *Figure.*	1
Aeration Equipment	Aeration Blower and diffusers Factory installed necessary to keep stored influent fresh.	2 Lot
Submersible Transfer Pumps	Transfer pumps necessary to return stored influent to Phase 1 anoxic process factory mounted on slide rail systems and pre-plumbed with tank interconnects to influent line for metering	2
Controls	All necessary electrical components, sensory, controls and programming necessary to operate Phase 1 EQ equipment in panel expansion of MCC	1 lot
Fittings	3" SS flanges for odor scrubber ducting	2

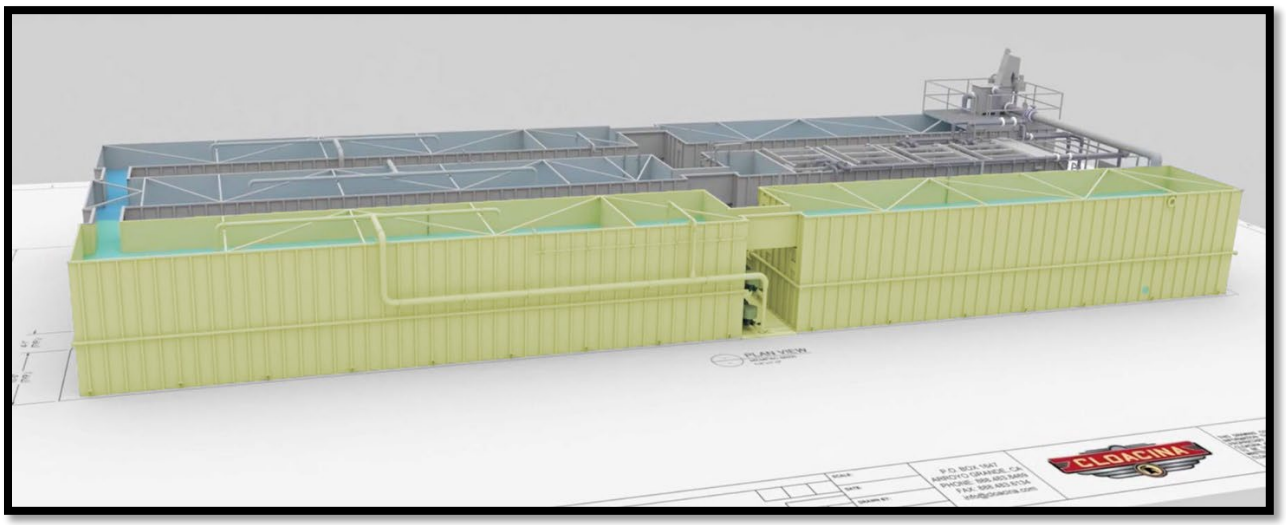


Figure. Example stainless steel equalization tanks provided by Cloacina.

5.3 Duplex Screen on Single Platform

5.3.1 Cloacina will provide a factory installed, completely redundant influent screen. *See Figure*

Equipment	Description	Quantity
Redundant Screen	Self-Cleaning 2MM perforated screen with auger, compaction zone, chute extension, spray wash system and endless bagger system.	1
Installation/Integration	Includes all hardware necessary for mounting on the Cloacina primary screen platform, platform extension, additional grating and handrail, electrical disconnect, integration, controls and Factory Acceptance Testing of equipment.	(1) Lot

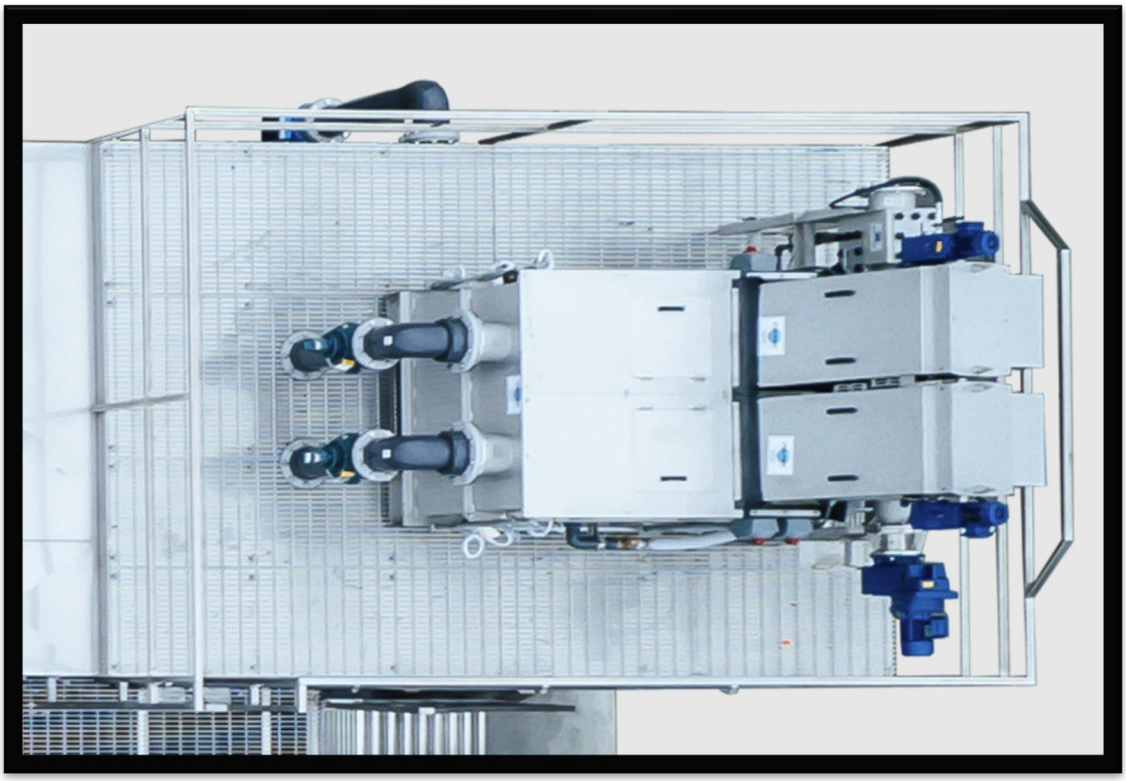

Figure. This is an example Duplex Screen arrangement and is not project specific.

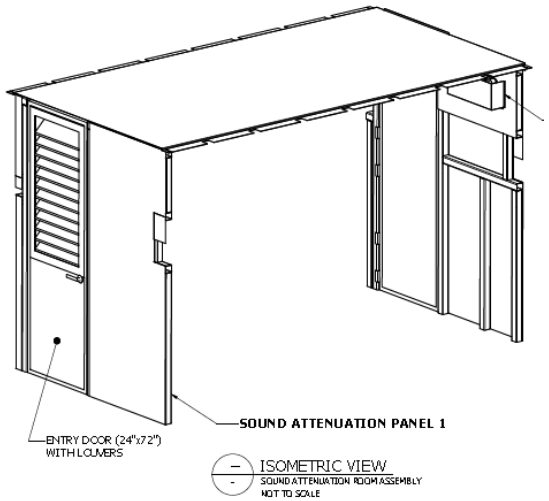
5.4 Sound Attenuated Blower Room

Cloacina will enclose the area between the Anoxic and Aeration Tanks to create an equipment room.

Equipment	Description	Quantity
Enclosures	(1) wall panel with louver, (1) wall panel with man door and lockset, (1) roof panel to go under catwalk/grating.	(1) Lots
Door(s)	30” steel access door	1
Insulation	Sound board mounted on all interior wall/surfaces between verts of the blower corridor walls	(1) Lots
Ventilation	ventilation fan with shutters, louvers and thermal calculations	(1) Lots

5.4.1 ISO View of Sound Enclosure Room



5.5 Effluent Disposal Pump

Effluent Disposal Pump Skid

In addition to the treatment package outlined in this estimate, Cloacina can provide integrated equipment necessary to pump treated effluent to downstream disposal.

Effluent Pump Design

Equipment	Description	Quantity
Effluent Pumps	Multi-Stage Centrifugal Vertical Pumps (TBD)	2
Instrumentation	Effluent Flow Meter	1
Instrumentation	Level Transducer	1
Effluent Pressure Sensor	Endress+Hauser Cerabar, pressure sensor	1
Associated Valves	Isolation Valves, Check Valves, and piping	1
Control Panel	U.L Listed 508A NEMA4X Stainless Steel Control Panel	1

5.5.1 If you cannot flow by gravity out of the clear well downhill to your discharge location, then you have the option to select one of the below effluent pumping skids with associated pricing:
Pricing valid for specific duty point below. Change in duty point will result in additional engineering to finalize scope.

Flow (GPM):	Qty of Pumps	Duty Point	Inlet Size:	Outlet Size:	Price:
0-50	2	60’	2	2	$66,670.00
25-100	2	60’	3	3	$68,150.00
75-150	2	60’	3	3	$70,820.00
100-200	2	60’	4	4	$73,740.00
150-300	2	60’	4	4	$73,740.00
250-750	2	60’	6	6	$82,520.00

5.6 Low-Flow Configuration

Cloacina can provide a low-flow solution which allows the system to operate as low as 15% of the average daily flow. Any typical flow rate less than 20% of the average daily flow will require additional evaluation from engineering. The Low Flow package includes the following:

- Extended Mixer Shaft(s)
- Process modeling/simulations
- Low level interconnect lines
- TEBC motors for permeate systems for maximal turn-down

5.7 UV Disinfection

Cloacina can provide a separate package UV Disinfection system installed on a stainless-steel skid. The skid includes a break tank and cooling loop system in addition to the necessary valves, piping, and instrumentation integrated into the MEMPAC Controls system for alarming, graphing and trending of the UV Disinfection components.

Design Parameters:

Parameter	Value	Unit
PEAK Daily Flow Rate	37	gpm
%UVT	65	%
Dose	80	mj/cm2
Reactor Redundancy	100	%

Equipment	Description	Quantity
Skid	304SS skid with pipe supports, (12'L x 8'W)	1
Cooling loop system	Cooling pump with piping and valves necessary to return flows during low flow periods to reduce bulb striking.	(1) system
Break Tank	Effluent will flow by gravity to and from the break tank sized appropriately for the UV cooling loop system.	1
UV Reactor	Medium Pressure Reactor	2
Instrumentation	Turbidity Probe and Transmitter	1
Instrumentation	UV Transmittance Analyzer	1
Instrumentation	Effluent Flow Meter	1
Control Panels	Vendor supplied control panel(s). Independent NEMA 12* UV Control Panel with all electrical/controls pre-wired	1 per Reactor
Cloacina Control Panel	Cloacina NEMA4X Control Panel provided for integration	1
Spares	Includes: Extra lot of spares; UV Lamp, Quartz thimble, wiper ring, electronic ballast	1 (lot)

*For indoor installation only.

6 Pricing Summary

Section	Equipment/Service	Description	Price
1-4	Base MEMPAC-M	MEMPAC-M50	**$1,535,654.67**
5.1	Package Lift Station	Per Scope	**$74,680.00**
5.1.1	NEMA 4X 304SS Wall Mount panel	Per Scope	**$4,800.00**
5.2	Equalization Storage	Per Scope	**$308,558.20**
5.3	Duplex Influent Screen	Per Scope	**$98,177.45**
5.4	Sound Attenuated Blower Room	Per Scope	**$29,198.70**
5.5	Effluent Disposal Pump	Per Scope	**$68,150.00**
5.6	Low-Flow Configuration	Per Scope	**$62,904.00**
5.7	UV Disinfection System	Per Scope	**$331,062.70**

PRICING VALID FOR 30 DAYS

NOTE: Shipping is not included in the budgetary estimate. You can learn more about Cloacina's shipping process Here!

7 Standard Assumptions

7.1 Domestic Facility

The system will be designed to receive only domestic wastewater, as outlined in Section 2, above.

7.2 Unnecessary Waste

All unnecessary process waste will be diverted from entering the treatment system. Examples of unnecessary process waste are:

- Rainwater, excess flow during rain events should be prevented by identifying areas with potential for Infiltration and Intrusion (I & I).
- Industrial Dischargers, high strength dischargers should be identified, and associated waste streams should be evaluated for impact on the treatment facility. Industrial waste can increase the loading on the treatment facility and result in poor performance or reduction in hydraulic capacity.
- Inorganic Solids, efforts should be made to keep excess dirt and grit from entering the treatment facility.
- Fats, Oils and Greases (FOG) should be prevented from entering the facility by ensuring all restaurants have properly installed and maintained grease traps.

7.3 Effluent Disposal

Effluent will flow by gravity from Clear Well, the final disposal location is to be determined. Effluent pumps can be provided in addition to this package.

7.4 Installation Location

The package will be installed outdoors on an engineered concrete slab. The site will have enough access to allow the delivery of the individual treatment tanks fully assembled.

8 Exclusions

8.1 Taxes are not included in the above pricing

8.2 Equalization

Any diurnal flows needing to be attenuated are by others.

8.3 Installation

Treatment package quoted does not include installation costs.

8.4 Civil Engineering

Site civil engineering is not provided as part of this budgetary estimate.

8.5 Slab

Equipment slab design and construction is not included as part of this budgetary estimate.

8.6 Permitting

Permit costs of any kind are not included as part of this budgetary estimate

8.7 Secondary Containment

Secondary containment is not included in this budgetary estimate.

8.8 Thermal Protection

Thermal protection of hydraulic piping is not included in this budgetary estimate.

8.9 Painting

No surface preparation and/or painting of any surfaces is included in above pricing unless specifically mentioned.

8.10 Security

Safety and security items such as fencing, locking ladders, lighting etc. are not included in this budgetary estimate.

8.11 Shipping

Shipping and crane costs are not included in this budgetary estimate unless otherwise stated.

8.12 Dissolved Solids (TDS)

The unit will not address dissolved solids through biological treatment. Dissolved Solids should be managed through source control.

8.13 Initial Seed Sludge

Adequate and acceptable seed sludge is the responsibility of the Client.

8.14 Bonding

No bonding is included in the estimate.

8.15 Disinfection

Disinfection is not included in the base pricing unless specifically stated or offered as an option.

Cloacina Terms and Conditions

1 Invoicing and Payment Schedule

The pricing quoted in this proposal is based on the following terms of payment:

1.1 30% due upon receipt of executed contract or issuance of Purchase Order

A payment for 30% of the total contract amount, including all upgrades and/or options, must accompany the executed contract or PO in order for any work on the project to commence. Failure to accompany the PO with the deposit check may cause project delays.

1.2 30% due upon approval of submittals and release for fabrication

A payment for 30% of the total contract amount, including all upgrades and/or options, must accompany the approved submittals and release for fabrication. Production of the system will not begin until this payment has been received.

1.3 35% due prior to shipping

A payment for 35% of the total contract amount, including all upgrades and/or options, must be received 7 calendar days prior to scheduled ship date to allow for checks to clear. Cloacina will not allow any equipment to be loaded for shipment to the jobsite or contractor's facility without the 95% payment being received and processed.

1.4 5% due Net 30 days from the date of ready to ship.

A payment for 5% of the total contract amount, including all upgrades and/or options, must be received by Cloacina 30 days from the date of being ready to ship. Retention is not to be held for longer than 30 days for any reason. Should the client/contractor delay payment past 30 days, late fees and penalties will apply as detailed below. Ready to ship is the date in which Cloacina has completed the project such that the FAT, QA/QC process is complete and it's ready to leave the Factory. This does not take into consideration the Client's readiness or ability to receive the unit

1.5 Payment Delay

Any delays in meeting the above payment milestones will cause delays in and/or stoppage of the project and production schedules until the payment has been received. Additionally, any Client delays during the project may result in the Client being charged for items such as: increased materials costs, storage fees, placement of the system in/out of production and/or increased project management costs.

2 Pricing and Payment Terms

2.1 Pricing is valid for 30 calendar days

Pricing is valid for 30 calendar days from the date listed on the coversheet of this document. Cloacina reserves the right to cancel or withdraw this quotation at any time with or without notice or cause prior to acceptance by the Client.

2.2 Bonding

No bonds of any kind are included in the above price. Any required bonds can be provided by Cloacina upon request, but will result in additional charges to the Client.

2.3 Currency

All prices quoted are in United States Dollars (USD).

2.4 Taxes

The above pricing does not include any taxes. Any applicable sales tax, value added tax, local, state/provincial, federal or international taxes, duties and/or tariffs are the sole responsibility of the Client.
Additionally, any future amendments or change orders do not include sales tax, value added tax, local, state/provincial, federal or international taxes, duties and/or tariffs unless specifically stated in the change order or amendment.

2.5 Credit Application

Cloacina may, at its discretion, require the Client to complete a credit application. Cloacina reserves the right to require payment in advance and otherwise modify credit terms should the Client's credit standing not meet Cloacina's acceptance.

2.6 Finance Charge

In the event payment is not made when due, or retention is held longer than 30 days from the date of start-up, the Client agrees to pay Cloacina a service or finance charge of the lesser of 1.5% per month/18% per annum or the highest rate permitted by applicable law on the unpaid balance of the invoice from and after the invoice due date. The Client is responsible for all costs and expenses associated with any checks returned due to insufficient funds. Export shipments will require payment prior to loading for shipment or an appropriate Letter of Credit.

2.7 Changes in Client Status and/or Financial Security

If, during the performance of the contract with the Client, the financial responsibility or condition of Client is such that Cloacina in good faith deems itself insecure or if the Client becomes insolvent, a material change in the ownership of the Client occurs, the Client fails to make any payments in accordance with the terms of this document, then Cloacina is not obligated to continue performance under the contract and may stop equipment in transit and defer or decline to make delivery of equipment, except upon receipt of satisfactory security or cash payments in advance, or Cloacina may terminate the order upon written notice to the Client without further obligation to Client whatsoever.

2.8 Insurance

Cloacina pricing is based on standard insurance coverage being suitable for the project. Any additional riders or policies necessary to meet Contractor/Client requirements will be at the cost of the Client/Contractor.

2.9 Failure to Make Payments

If the Client fails to make payments or fails to furnish security satisfactory to Cloacina, then Cloacina shall also have the right to enforce payment of the full contract price of the work completed and in process. Acceptance by Cloacina of less than full payment shall not be a waiver of any of its rights hereunder. The Client shall not assign or transfer this agreement or any interest in it, or monies payable under it, without the written consent of Cloacina. Any assignment made without such consent shall be null and void.

In the event that the Client has failed to make payments in accordance with the terms and conditions set out herein Cloacina reserves the right to do any or all of the following after 30 days' notice; remove the project from the Cloacina design/production schedule, charge handling and storage fees, charge financing fees, resell the product to another Client, put the product into a rental/leasing fleet. Should the latter of these occur, Cloacina will reimburse the Client for the actual labor (burden rate) and materials for the build portion of the product/project only. Mark-up and overhead will not be reimbursed, nor the project specific design/project management labor. In the event that the Client settles the outstanding balance, but any of the actions have already been taken, the costs to perform the above tasks will be added to the Client's outstanding balance.

2.10 Price Escalations

Material prices are volatile in nature, especially those associated with Steel/Stainless Steel. As such, we do not cover pricing escalations from the time the project is bid to when the PO's are issued and raw materials are released for purchasing. As such, Cloacina will utilize the following major cost indexes for the purposes of determining delta increase/decreases from the date of proposal to purchase order/contract execution. The following CI's shall be the determining indexes;

2.10.1 Stainless Steel:

https://www.atimetals.com/specialtyrolledproducts/Pages/stainless-steels-surcharge-report.aspx

2.10.2 Material Sub-Vendors

In the event that sub-vendors have passed along material escalations, Cloacina will provide proof of these escalations for factoring into escalations.

2.11 Engineering and Design Deposit

If an engineering and design deposit is made part of the project, then the above payment schedule will only be applied after the point in which the system is released. Engineering and Design Deposits will either be lump sum or progress billed and will be spelled out in the contract documents. In the event they are not specified, they will be lump sum due at the time of signing the contract.

2.11.1 If the project design parameters change, require re-engineering of work already performed, additional equipment is requested by the Client, or additional unanticipated equipment is required to meet the project goals then the re-design and engineering required to make these changes will be billed as either a lump sum or time and materials change order.

2.11.2 If the engineering and design deposit option is provided and selected and the Client wishes to hold back the release of equipment once the engineering and design is complete, then the Client will be responsible for any material escalations between the time the project was ready to release by Cloacina's engineering and design team and when it is released for fabrication. If there were project/Client related reasons that stopped Cloacina from progressing on the engineering and design portion of the work then it will be assumed that 30 days is the reasonable time frame that it would have been completed within for the purposes of comparing material/labor escalation CPI's.

3 Conditional Offering and Client's Warranty

The Client understands that this proposal has been issued based upon the information provided by the Client, and made available to Cloacina, as of the date on the cover sheet of this document. Any changes or discrepancies in site conditions (Including but not limited to system influent characteristics, changes in Environmental Health and Safety (EH&S) conditions and/or newly discovered EH&S concerns, the Client's financial standing, Client's requirements and/or any other relevant change or discrepancy in the factual basis upon which this proposal was created, may lead to changes in the offering, including but not limited to changes in pricing, warranties, quoted specifications and/or terms and conditions.

Client warrants the accuracy of any and all information relating to the details of its operating conditions and project understanding and that Cloacina can justifiably rely upon the accuracy of the Client's information in its performance. Should the Client's information prove inaccurate, the Client agrees to reimburse Cloacina for any losses, liabilities, damages and expenses that Cloacina may have incurred as a result of any inaccurate information provided by the Client to Cloacina.

4 Loading, Packing, Shipping, Delivery, and Inspection

4.1 Loading

4.1.1 Factory Pick-Up

Equipment craning and loading onto the trailer of the shipping agent at the Cloacina factory is included in the above pricing. Cloacina will only lift and set the equipment on the trailer – no assistance will be provided with strapping, securing and/or tarping the load. Any damage as a result of improper strapping, securing and/or tarping will be the responsibility of the shipping agent and Cloacina shall not be liable. Title and ownership transfers to the Client immediately upon Cloacina setting the equipment on the trailer of the third party shipping agent and Cloacina is not liable for any damage to the equipment or caused by the equipment from that time forward.

4.1.2 Cloacina as the Shipping Agent

Should Cloacina act as the shipping agent, title, ownership, liability for damage to the equipment or caused by the equipment, the risk of loss of the material and repair/replacement costs shall pass to the Client upon commencement of third-party rigging or removal/lifting of the equipment from Cloacina's trailer by the crane/forklift operator. Cloacina or agent will unstrap and/or un-tarp the load upon arrival but will not provide the crane/forklift operator with assistance and/or direction in removal of the unit from the trailer. Cloacina is not liable for any damage sustained during rigging, forklift positioning and/or removal/lifting. Damage to the unit during rigging, removal and/or lifting may void the Equipment Warranty and/or Process Guarantee, and the client will be responsible for making repairs according to written instruction by Cloacina.

4.2 Packing

The above price includes standard packing and preparation for shipping according to Cloacina's specifications. Standard packing does not include provisions for inclement weather. Should the Client require weather-resistant packing, Cloacina can provide it for an additional cost at the explicit request by the Client. It is the Clients responsibility to notify Cloacina of any special shipping requirements for transit to the jobsite. All costs and taxes associated with special packing requested by the Client, including packing for international exports, shall be paid by the Client as an additional charge. Shipping and packing prices are subject to change without notice.

4.3 Shipping

4.4 Freight on Board (FOB)

Unless otherwise noted in the Cloacina proposal and a specific price is given for shipping, all projects are FOB Cloacina's factory located at:

2385 Precision Drive
Arroyo Grande, CA 93420

4.5 Schedule

Due to the volatility in project schedules, vendor delays, materials availability and logistics issues, Cloacina and the Client will arrange a kick-off meeting after contract acceptance to develop a project schedule. Expedited project completion and shipping may be available for an additional cost to the Client.

4.6 Delays for Shipping

If Cloacina completes production of the equipment prior to the Client being ready on the site and the Client cannot yet receive the equipment, Cloacina may at its option choose to move the equipment into long-term/short-term storage in one of the Cloacina storage yards/areas. The minimum charge for moving a tank is $1,000.00 for single tank systems. Multiple tank systems will be billed at a rate of $1,000.00 per tank. Long-term and short-term storage fees will be billed at $250/month per equivalent 400 square foot tank.

5 Delivery

5.1 Production Schedule

The delivery schedule presented is based on current workload backlogs and production capacity. This estimated delivery schedule assumes no more than two weeks for Client review of the Equipment Submittal Package. Any delays in Client approval or requested changes may result in additional charges to the Client and/or a delay to the production schedule and delivery date.

5.2 Client Acceptance

Cloacina's price and delivery schedule assume that the Client will take delivery as and when foreseen by the schedule. When this is not the case, Cloacina and the Client must agree in advance on an alternative place of delivery, failing which Cloacina will be entitled to move the equipment to storage. In such cases, the Client shall be liable for all moving, storage and relocation fees.

5.3 Delivery Date

Delivery dates are estimates, and time is not of the essence. Cloacina shall not be responsible to the Client for any loss, whether direct, indirect, incidental, or consequential in nature, including without limitation loss of profits arising out of or relating to any failure of the goods to be delivered by the specified delivery date. In the absence of specific instructions, Cloacina has the option to select the shipping agent, the equipment will be shipped COD and the shipping charges will be due and payable by the Client upon delivery.

5.4 Additional Costs

The Client shall be responsible for any additional costs resulting from inaccurate delivery information, lack of delivery or equipment placement instructions and/or omission of special or unique delivery details such as dirt roads, steep grades, etc. Additional costs may include, but are not limited to, storage, insurance, protection, re-inspection, and redelivery expenses. Client further agrees that any payment due on delivery shall be made on delivery into storage as though the equipment had been delivered in accordance with the order. Claims for loss of or damage to equipment in transit must be made to the shipping agent, not to Cloacina. Cloacina requires that the Client and/or the Client's agent, contractor or engineer meets the shipping agent at the time of delivery to inspect the condition of all Cloacina-provided equipment.

5.5 American Iron and Steel Requirements

If a project manager/engineer provides a subjective opinion that the Cloacina plant is subject to AIS requirements, either an adder for this will be applied to the project costs or a justification letter for exemption based on specific exclusions allowed for in AIS. Cloacina does not as a standard provide AIS stainless steel due to the limited domestically available SS sources. Additionally, packaged membrane bioreactors are specifically excluded in the AIS.

5.6 Damage

Any visible damage to equipment or components during shipping must be declared to Cloacina and the shipping company prior to unloading. In the event of damage to equipment, authorization to unload must be received by Cloacina in writing only. Unloading equipment that may have been damaged during shipment, without express written permission from Cloacina may void the Equipment Warranty and Process Guarantee, and the Client takes responsibility for remedying any necessary repairs. The Client shall have the right to inspect all Cloacina-provided equipment upon their receipt and shall notify Cloacina in writing of any nonconformity of the equipment with this agreement within seventy-two hours of delivery by the shipping agent at the client's job-site, other agreed upon location or to storage, regardless of whether the Client and/or their agent, contractor or engineer is there to receive the equipment in person. Failure to give such notice shall constitute a waiver of the Client's right to inspect and/or reject the equipment for nonconformity and shall be equivalent to an irrevocable acceptance of the equipment by the Client.

6 Installation, Start-up and Commissioning

6.1 Installation

6.1.1 Responsibility

Installation is the sole responsibility of the Client and costs to install the Cloacina-provided equipment are not included in the above pricing. The Client may have installation performed by a contractor, engineer or their own mechanical staff. Cloacina can provide contact information for factory-authorized installers, upon request. Cloacina assumes no liability for the quality of workmanship in any installation, regardless of who installs the equipment.

6.1.2 Guidelines

Should the Client and/or their agent, contractor, engineer or staff install the equipment contrary to Cloacina's installation guidelines or direct a factory-authorized representative to do so, the Equipment Warranty and Process Guarantee may become void.

6.2 Start-up and Commissioning

6.2.1 General Provisions

Equipment start-up and commissioning may be included in the above pricing. Additional eight-hour days are available for $1,600.00 per day plus travel costs and per diem.

6.2.2 Procedures

Cloacina requires that all factory-supplied equipment be installed and started-up in strict accordance with Cloacina's installation and start-up procedures and/or in accordance with local/state/federal building codes (Whichever is more stringent) to maintain the validity of Cloacina's Equipment Warranty. Start-up must be performed by a Factory Service Technician or authorized Cloacina representative. Should start-up occur outside the presence of an authorized Cloacina representative and without the prior written consent of Cloacina, Cloacina's Equipment Warranty and Process Guarantee are void.

6.2.3 Engineering Oversight

If the Client hires an engineer for start-up supervision, such engineer will function in a supervisory capacity only. Cloacina's start-up technician shall not follow start-up directions from engineers that are contrary to Cloacina's Standard Start-Up Procedures, SOP's or industry standards. Cloacina requires the Client to have a licensed electrician on-site at all times during start-up, the cost of which will be paid by the Client.

6.2.4 Start-up and Commissioning Scheduling

To schedule a start-up/commissioning date, the Client must notify Cloacina at least four weeks prior to the date they desire start-up/commissioning services. Should the Client need to cancel and/or reschedule a start-up date once a date has been scheduled, the Client must notify Cloacina in writing and will be responsible for any costs Cloacina incurs to cancel and/or reschedule, including, but not limited to: airline ticket cancelation/change fees, rental car cancelation/change fees, hotel cancelation/change fees, etc.

6.3 Delays

Should a Cloacina start-up technician arrive at the Client's job-site on the agreed upon start-up date and find the site, Cloacina-provided equipment, equipment provided by others and/or the Client not ready to start-up the equipment, upon arrival, for any reason, Cloacina will count that day as day 1 of the included start-up days, regardless of whether Cloacina directs the start-up technician to remain on-site or return to the Cloacina office, which shall be at Cloacina's discretion. Cloacina will count every day until the start-up technician arrives at the office as a day of commissioning. Should the Client then require more start-up days than the balance remaining, it will be at the additional per day/travel/per Diem costs outlined above.

7 Equipment Warranty

7.1 Overview

Cloacina expects and plans for a successful project with each client. Each system is designed and built using only the highest quality components that have a proven track record in the wastewater industry. As a result, each treatment plant comes standard with one year warranty on all Cloacina-provided equipment.

7.2 Warranty Period

Cloacina warrants its materials and workmanship for a period of twelve (12) months from the date of start-up/beneficial occupancy of the plant, or fifteen (15) months from the date of equipment shipment, or fifteen months from the date of notice of production completion, whichever occurs first. Extended warranties are available for an additional cost to the Client. Extended warranties must be purchased 1 month prior to the unit leaving the Cloacina facility.

Beneficial occupancy is defined as: the date in which the plant is turned on and can produce any benefit. Whether that's for permitting purposes, regulatory purposes, funding purposes, fiscal purposes, any benefit to the Client is the start of the date of beneficial occupancy, whether or not the plant or appurtenances are fully on-line.

7.3 Warranty Changes

No additional warranty, either expressed or implied, is to be construed as binding. Any changes to this warranty must be issued in writing by Cloacina and will be issued as an addendum to this document.

7.4 Damage

Cloacina's Equipment Warranty expressly excludes any liability for damage to equipment caused during shipping or under any other circumstances once title for the equipment has passed to the Client.

7.5 Equipment Storage

All materials, once delivered to the jobsite, are required to be stored in a protected area and tarped during times of inclement weather. In severe weather, climate control may be necessary.

7.6 Consumables

Cloacina does not warranty consumables.

7.7 Communication of Warranty Related Issues

Client will be required to communicate any warranty related issues by submitting a ticket through the Cloacina portal. Instructions will be given to the Client during the commissioning/training period. A warranty related ticket will be assigned to the issue, and tracked for the life of the problem. Verbal expressions and/or letters/email will not be accepted nor addressed.

7.8 Cloacina Portal

The Client may be provided with a Cloacina or 3rd party portal. In that event the Client will be required to communicate any requested data through a Cloacina provided portal. Failure to fully fill out the data at the requested interval will violate the Cloacina warranty.

7.9 Equipment Repair or Replacement

Cloacina shall, at its option and at no cost to the Client, either repair or replace any product which fails to conform to the Equipment Warranty; provided, however, that under either option, Cloacina shall not be obligated to remove the defective product or install the replaced or repaired product. The Client shall be responsible for all other costs, including, but not limited to, service costs, shipping fees and expenses. Cloacina shall have complete discretion as to the method or means of repair or replacement. Client's failure to comply with Cloacina's repair or replacement directions shall constitute a waiver of its rights and render the Equipment Warranty void. Any parts repaired or replaced under the Equipment Warranty are warranted only for the balance of the warranty period on the parts that were repaired or replaced. The Equipment Warranty is conditioned on the Client giving written notice to Cloacina of any defects in material or workmanship of warranted equipment immediately after any defects are first manifest.

7.10 Change of Ownership

The Equipment Warranty is extended to the original Client/end-user only and is not transferrable to new owners and/or other third parties.

8 Exclusions:

Cloacina shall have no warranty obligations to the Client with respect to any product or parts of a product where one or more of the following applies:

8.1 De-rating of Equipment

In the event that one of the following conditions exist, there will be a commensurate de-rating of all effected downstream equipment;

8.1.1 Influent Screening

-In the event the TSS exceeds the stated influent assumptions, then a commensurate de-rating of the screens stated flows will occur.
-In the event that the influent is ground, chopped, macerated, cut, or materially changed beyond that of raw influent, then a de-rating of the screen will occur and the Client will be responsible for putting in a finer screen to increase the removal rate due to finer material having a propensity to pass through at a higher rate, otherwise an increased burden associated with more frequent membrane cleaning will be required.

8.2 Strength of Influent

If the influent materially differs from the assumed influent characteristics using composited samples as the basis for the differentiation then a re-rating of the plant may be necessary for the purposes of determining total loading of the plant. Contaminant variances may have one or all of the following unintended consequences which will be part of the re-rating in order to meet effluent targets;

- Process setpoints
- Re-rating of flows as a function of the loading
- Chemical addition for alkalinity and/or load balancing/supplementation for proper BNR
- Programming changes to effect the above
- Expansion of the plant to meet build-out goals
- Re-screening
- More frequent cleaning of membranes/sensory/equipment

8.3 Standards Compliance

If an inspector requests changes due to their interpretation of State, Federal, internal, trade standards or 3rd Party regulations which are different than how Cloacina builds as a standard, the Client will be responsible for any delta costs to comply with this requirement/request. Cloacina reserves the right to consult with a trade specific Engineer/Expert regarding the request. The direction received from that Engineer/Expert will determine any course of action, if required. If a 3rd party or the Client requires changes which deviate from that Engineers direction to be made due to subjective interpretation on the part of the 3rd party or Client, these costs will be borne solely by the Client and not Cloacina.

8.4 Third Party Repairs

The equipment has been repaired by third parties other than Cloacina and/or without Cloacina's written approval.

8.5 Misuse or Damage

The equipment has been subject to intentional or unintentional misuse, misapplication, neglect, alteration, accident or physical damage.

8.6 Use Contrary to Instructions

The equipment has been used in a manner contrary to Cloacina's instructions for installation, operation and/or maintenance.

8.7 Wear, Tear and Corrosion

The equipment has been damaged from ordinary wear and tear, corrosion, biological or chemical attack.

8.8 Abnormal Conditions

The equipment has been damaged due to abnormal conditions, vibration, failure to properly prime or operation without flow.

8.9 Improper Electrical Conditions

The equipment has been damaged due to a defective power supply or improper electrical protection.

8.10 Non-Cloacina Ancillary Equipment

The equipment has been damaged from the use of ancillary equipment not sold by Cloacina or not approved by Cloacina in connection with products supplied by Cloacina. **Cloacina strongly recommends that, prior to installation of any ancillary equipment, the Client contacts their Cloacina representative to ensure that the desired ancillary equipment is compatible with the Cloacina-provided equipment and treatment process.**

8.11 Liability Limitations

The foregoing warranty is exclusive and in lieu of any and all other express or implied warranties, guarantees, conditions or terms of whatever nature relating to the equipment provided hereunder, including without limitation any implied warranties of merchantability and fitness for a particular purpose, which are hereby expressly disclaimed and excluded. Client's exclusive remedy and Cloacina's aggregate liability for breach of any of the foregoing warranties are limited to repairing or replacing the product and shall in all cases be limited to the amount paid by the client as outlined above. In no event is Cloacina liable for any other form of damages, whether direct, indirect, liquidated, incidental, consequential, punitive, exemplary or special damages, including but not limited to loss of profit, loss of anticipated savings or revenue, loss of income, loss of business, loss of production, loss of opportunity or loss of reputation.

9 Process Guarantee

Cloacina's treatment systems are guaranteed to function properly and to meet the Design Criteria specified in the contract documents for a period of twelve months from the date of initial start-up performed by an authorized Cloacina representative. For the Process Guarantee to remain in full effect, the Client must never exceed the Design Criteria and comply with all the following subcategories:

9.1 Reports

The Client and/or their agent must provide operational and lab reports as required in the warranty compliance sampling schedule or any other written documentation provided to the Client. These samples and their results are to be provided to Cloacina monthly during the first 12 months of operation for the Process Guarantee to remain in full effect. Emailed reports or raw files uploaded to the Cloacina portal/server are acceptable.

9.2 Operations

The Client and/or their agent must operate the treatment system in accordance with the Design Specifications outlined in the contract documents and within all Cloacina OMMs and equipment manuals.

9.3 Operations and Maintenance Manual

The Client and/or their agent must adhere to the operations and maintenance procedures as set forth in the OMM and/or provided with the treatment plant upon start-up.

9.4 Internet

The Client and/or their agent must provide and maintain a reliable high-speed Internet connection (Minimum speed of 400Kbps) to the Cloacina-supplied SCADA Controls Computer. It is the Client's responsibility to provide the necessary network security clearances for Cloacina to access the system remotely using GoToMyPC or Teamviewer or other third-party remote desktop software. In addition, the Client and/or their agent shall maintain Port 25 for SCADA's use for alarm text/email notification of alarm conditions.

9.5 Maintenance

The Client and/or their agent shall perform all routine equipment maintenance in accordance with the SCADA System Maintenance Module, the OMM, and/or the respective equipment manufacturers' recommendations, whichever is the most stringent.

9.6 Lab Work

The Client and/or their agent shall perform all process control lab work applicable and enter all data into SCADA History, portal or if those are unavailable emailing them to the Cloacina PM. The Client must also include lab results in the weekly/monthly reports. Cloacina will provide the required sampling constituents and schedule as part of the submittal package.

9.7 Non-Identified Constituents

If a constituent or combination of constituents that Cloacina did not explicitly identify as being managed in the influent compounds causes unintended consequences, the Client shall be solely responsible for mitigating these constituent(s) such that they are within acceptable range(s) for the process warranty to be in full force. Examples of such unintended constituent side effects may be;

- Precipitation
- Mineralization
- Deposition
- Scaling
- Fouling

9.8 Compliance

Should the client fail to comply with any of the above criteria, the Process Guarantee will be void from the date of the Client's non-compliance. From that date forward, Cloacina will not be responsible for any system upsets, effluent violations, the Client's inability to reuse effluent and/or any fines or other costs, including lost revenue or ancillary costs that may be incurred, including costs to repair or cure any damage to the system because of noncompliance.

9.9 Pretreatment Program

For domestic systems, the Client must implement a pretreatment program and submit it to Cloacina for approval. In the absence of a Client provided pretreatment program, the Client must implement the Cloacina standard pretreatment program to ensure compliance with influent criteria.

10 General Terms and Conditions

This document is an offer by Cloacina to sell the equipment and/or services set forth herein and is conditional on Client's assent to these terms and conditions. This document is to be included, in its entirety, in any issued POs or subcontracts. Acceptance by the Client is expressly limited to these terms and conditions. Any additional or different terms and conditions contained in Client's PO or other communication shall not be effective or binding upon Cloacina unless specifically agreed to in writing by Cloacina; Cloacina hereby objects to any such conditions. The failure of Cloacina to object to specific provisions contained in any PO or other communication from Cloacina shall not be construed as a waiver of these terms and conditions nor an acceptance of any such provisions. Neither Cloacina's commencement of performance nor delivery shall be deemed or construed as acceptance of Client's additional or different terms and conditions. Client acknowledges that this document is the complete and final agreement between the parties and this document supersedes all prior negotiations, representations, or agreements, either written or oral, between the parties and, further, can only be altered, modified or amended with the express written consent of Cloacina.

10.1 Release

The Client gives Cloacina permission to use project information, including but not limited to: project name, client name, location, design criteria, photographs, video, drawings, images, renderings, etc., for the purposes of marketing/promotional materials that may be printed, broadcast or used in digital formats on-line. The Client acknowledges that Cloacina may elect to hire/employ aerial photographers, photographers, artists, etc. for the purpose of documenting project progress and the final product. Cloacina shall, upon request, share any photographs or images of the project with the Client for their exclusive use. Photographs, images, likenesses and project information shall be used at the discretion of Cloacina and the Client is not entitled to editorial control or compensation.

10.2 Limited Liability

In no event shall Cloacina's liability under this agreement exceed the amount paid by the Client under this agreement. Cloacina shall have no liability for loss of profit, loss of anticipated savings or revenue, loss of income, loss of business, loss of production, loss of opportunity, loss of reputation, indirect, consequential, incidental, punitive or exemplary damages.

10.3 Cloacina Cancellation

Cloacina may cancel or suspend this agreement and Cloacina shall have no liability for any failure to deliver or perform, or for any delay in delivering or performing any obligations, due to acts or omissions of the Client and/or its agent, engineer, contractors or third party representatives or due to circumstances beyond its reasonable control, including but not limited to acts of God, fire, flood or other natural disasters, war and civil disturbance, riots, acts of governments, terrorism, disease, currency restrictions, labor shortages or disputes, unavailability of materials, fuel, power, energy or transportation facilities, failures of suppliers or subcontractors to effect deliveries, in which case the time for performance shall be extended in an amount equal to the excused period, provided that Cloacina shall have, as soon as reasonably practicable after it has actual knowledge of the beginning of any excusable delay, notified the Client of such delay, of the reason therefore and of the probable duration and consequence thereof. Cloacina shall use its best efforts to eliminate the cause of the delay, interruption or cessation and to resume performance of its obligations hereunder with the least possible delay.

10.4 Client Cancellation

Except as otherwise provided in this agreement, no order may be cancelled unless requested in writing by one party and accepted in writing by the other. In the event of a cancellation by the Client, the Client shall, within thirty days of such cancellation, pay Cloacina a cancellation fee, which shall include all costs and expenses incurred by Cloacina prior to the receipt of the request for cancellation including, but not limited to: Estimating costs, engineering (Process/mechanical/civil/electrical/controls), drawing costs, copies, lost profits, project management, all commitments to its suppliers, subcontractors and others, all labor and overhead expended by Cloacina, plus a reasonable charge for profit. Cloacina may charge a restocking fee and may reassign equipment initially assigned to the Client's project to another client.

10.5 Default

Notwithstanding anything to the contrary herein, in the event of the commencement by or against Client of any voluntary or involuntary proceedings in bankruptcy or insolvency or in the event Client shall be adjusted bankrupt, make a general assignment for the benefit of its creditors, or if a receiver shall be appointed on account of Client's insolvency, or if Client fails to make payment when due under this agreement, or in the event Client does not correct or, if immediate correction is not possible, commence and diligently continue action to correct any default of Client to comply with any of the provisions or requirements of this agreement within ten calendar days after being notified in writing of such default by Cloacina, Cloacina may, by written notice to Client, without prejudice to any other rights or remedies which Cloacina may have, terminate its further performance of this agreement. In the event of such termination, Cloacina shall be entitled to receive payment as if Client has cancelled the agreement as per the preceding paragraphs. Cloacina may nevertheless elect to complete its performance of this agreement by any means it chooses. Client agrees to be responsible for any additional costs incurred by Cloacina in so doing.

10.6 Termination

Upon termination of this agreement, the rights, obligations and liabilities of the parties which shall have arisen or been incurred under this agreement prior to its termination shall survive such termination.

10.7 Failure to Insist

Cloacina's failure to insist, in any one or more instances, upon Client's performance of any term of this proposal, or to exercise any rights conferred, shall not constitute a waiver or relinquishment of any such right or right to insist upon Client's performance in any other regard.

10.8 Severability

If any term, covenant, condition or provision of these Terms and Conditions is held by a court of competent jurisdiction to be invalid, void or unenforceable, the remainder of the provisions hereof shall remain in full force and effect and shall in no way be affected, impaired or invalidated.

10.9 Governing Laws and Venue

The terms of this agreement and all rights and obligations hereunder shall be governed by the laws of The State of California. Any petitions filed against Cloacina shall be filed, heard, tried and decided in The San Luis Obispo County Superior Court. In international transactions, the rights and obligations of the parties hereunder shall not be governed by the 1980 United Nations Convention on Contracts for the International Sale of Goods.

Should changes in laws, regulations, tariffs, taxes or any governing regulatory agency stipulations effecting the project occur after the time in which Cloacina was placed under contract, the entire costs for the compliance with the same will be borne by the Client, and not Cloacina.

10.10 Indemnification

To the fullest extent permitted by law, the Client agrees to indemnify, defend and hold harmless Cloacina and any of its respective officers, agents, employees, affiliates, parents and subsidiaries from and against any and all liability claims, loss, damage or costs (Including but not limited to attorney's fees, loss of profit, business interruption or other special or consequential damages, damages relating to property damage, bodily injury or damages relating to wrongful death) arising out of or relating to the installation, operation, maintenance, use or possession of any Cloacina-provided equipment. This indemnity provision also applies to any claims asserted against Cloacina based upon strict or product liability causes of action. The Client shall not be obligated to indemnify Cloacina for that part of any loss, damage or liability caused solely by the intentional misconduct or sole negligence of Cloacina. In furtherance of, but not in limitation to the indemnity provisions in this document, the Client expressly and specifically agrees that the foregoing obligation to indemnify shall not be in any way affected or diminished by any statutory or constitutional imitation of liability or immunity Client enjoys from suits by its own employees. The duty to indemnify will continue in full force indefinitely from the date of execution of this document and is not diminished by cancelation or early termination of the agreement if Cloacina provides any equipment to the Client.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Kern County, California, Southwest Part
Survey Area Data: Version 13, Sep 1, 2022

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Mar 12, 2022—Oct 25, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
101	Bakersfield fine sandy loam, drained, 0 to 1 percent slopes	B	68.5	73.0%
310	Vineland loamy sand, drained, 0 to 1 percent slopes	B	25.4	27.0%
Totals for Area of Interest			**93.9**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

STATE WATER RESOURCES CONTROL BOARD
ORDER WQ 2014-0153-DWQ
GENERAL WASTE DISCHARGE REQUIREMENTS
FOR SMALL DOMESTIC WASTEWATER TREATMENT SYSTEMS

BACKGROUND INFORMATION

Findings:
The State Water Resources Control Board (State Water Board) finds that:

1. Water Code section 13260(a) requires that any person discharging waste or proposing to discharge waste within any region, other than to a community sewer system, that could affect the quality of the waters of the state, file a Report of Waste Discharge (ROWD) to obtain coverage under Waste Discharge Requirements (WDRs) or a waiver of WDRs. "Waste" is defined in Water Code section 13050(d).
2. Discharges to land from Small Domestic Wastewater Treatment Systems (hereafter Small Domestic Systems) have certain common characteristics, such as similar constituents, concentrations of constituents, disposal techniques, flow ranges, and they require the same or similar treatment standards. These types of discharges are appropriately regulated under a General Waste Discharge Requirements Order (General Order). State Water Board Water Quality Order 97-10-DWQ (WQO 97-10-DWQ) is a 1997 General Order addressing Small Domestic Systems. Once effective, this General Order will supersede WQO 97-10-DWQ which will no longer be available for additional enrollees.
3. For the purposes of this General Order, the term "wastewater system" shall mean the collection system, treatment equipment, pumping stations, treatment ponds, clarifiers, sand/media filters, disinfection systems, recycled water systems (including distribution systems), storage ponds, land application areas, and other systems associated with the collection, treatment, storage, and disposal of wastewater.
4. Only Small Domestic Systems, with a monthly average flow rate of 100,000 gallons per day (gpd) or less, that discharge to land are eligible for coverage under this General Order. Small Domestic Systems are typically located at individual residences, rural parks, schools, campgrounds, mobile home parks, roadside rest stops, small commercial or residential subdivisions, restaurants, resort hotels/lodges, small correctional facilities, temporary fire-fighting camps, and recreational vehicle (RV) dump locations, including RV parks. An owner and/or operator of such a wastewater system is hereafter referred to as Discharger in this General Order. A Small Domestic System that uses subsurface disposal may be regulated by a local agency rather than a Regional Water Board, consistent with the Water Quality Control Policy for Siting, Design, Operation, and Maintenance of Onsite Wastewater Treatment Systems Policy (OWTS Policy). Wastewater systems regulated by local agencies may continue that coverage unless directed by the local agency or the Regional Water Board Executive Officer to seek WDRs from the Regional Water Board.
5. Wastewater treatment technologies evolve over time. Septic tanks and gravity fed leach fields provide the lowest level of acceptable treatment. Other treatment may include aerobic treatment systems, sand/media filters, package treatment plants, constructed wetlands, activated sludge, membrane biological reactors, and disinfection systems. Similarly, other dispersal options for the treated effluent may include pressure dosing, drip irrigation, land application, mound/at grade systems, or

evapotranspiration systems. The level of treatment shall be based upon the wastewater quality and the receiving water quality at the wastewater disposal location. For flow rates that exceed 20,000 gallons per day (gpd), Attachment 1, *Nitrogen Effluent Limit Evaluation*, provides direction in evaluating a discharge and determining when nitrogen control is required. Seepage pits may be considered part of the disposal system if inadequate land exists for a leach field dispersal system, other site conditions require the use of seepage pits, and site conditions are favorable for the use of seepage pits (groundwater quality shall be maintained consistent with this General Order). The discussion of treatment and disposal alternatives is not intended to limit the selection of alternatives available to the wastewater system designer.

6. All WDRs must implement the applicable Regional Water Quality Control Board's (Regional Water Board's) Water Quality Control Plan (Basin Plan) for the region in which the discharge occurs; therefore this General Order requires Dischargers to comply with all applicable Basin Plan requirements, including any prohibitions and/or water quality objectives, governing the discharge. The Discharger must comply with any more stringent standards in the applicable Basin Plan. In the event of a conflict between the requirements of this General Order and the Basin Plan, the more stringent requirement prevails.

7. This General Order allows the production and use of recycled water (as defined in Water Code section 13050(n)) and requires all recycled water use to comply with the applicable requirements described in California Code of Regulations, title 22, division 4, chapter 3, (hereafter title 22). Compliance with title 22 water recycling criteria and title 17 sanitation requirements shall be determined by the State Water Board Division of Drinking Water (DDW) (formerly California Department of Public Health), which reviews title 22 Engineering Reports. This General Order also allows for the application of treated wastewater to land that does not meet the definition of beneficial use, and is therefore not subject to the title 22 requirements.

8. Wastewater and treated wastewater quality vary depending upon source water quality, the activities generating the wastewater, water conservation efforts, inflow and infiltration (I/I), and treatment technology. Typical domestic wastewater and treated wastewater characteristics are presented in Table 1. Published wastewater textbooks and/or United States Environmental Protection Agency (USEPA) wastewater publications may also be used to characterize wastewater characteristics.

Table 1: Summary of Domestic Wastewater Characteristics

Constituent	Units[a]	Typical Domestic Wastewater	Septic Tank Influent	Septic Tank Effluent	Secondary Treatment Effluent	Equivalent to Secondary Treatment Effluent
Biochemical Oxygen Demand	mg/L	200-290 [b]	155-286 [c]	140-200 [d]	30-45 [e]	65 percent reduction [f]
Total Suspended Solids	mg/L	200-290 [b]	155-330 [c]	50-100 [d]	30-45 [e]	[p]
Ammonia (as N)	mg/L	6-18 [b]	4-13 [c]	--[g,o]	-- [g,h]	-- [g,h,i]
Total Nitrogen	mg/L	35-100 [b]	26-75 [c]	40-100 [d]	50% [m]	43-80% [k,h,i]

Constituent	Units[a]	Typical Domestic Wastewater	Septic Tank Influent	Septic Tank Effluent	Secondary Treatment Effluent	Equivalent to Secondary Treatment Effluent
Nitrite and Nitrate (as N)	mg/L	<1 [b]	<1 [c]	--[g,o]	--[g,h]	-- [g,h,i]
Total Phosphorus (as P)	mg/L	6-12 [b]	6-12 [c]	5-15 [d]	51% [m]	50% [k,h,i]

a. mg/L denotes milligrams per liter.
b. Data from Table 4-3, USEPA Wastewater Treatment/Disposal for Small Communities, Manual, September 1992, EPA/625/R-92/005.
c. Data from Table 3-7, USEPA Onsite Wastewater Treatment System Manual, June 2005, EPA/625/R-00/008.
d. Data from Table 3-19, USEPA Onsite Wastewater Treatment Systems Manual, June 2005, EPA/625/R-00/008.
e. Data from Exhibit 5-6, USEPA NPDES Permit Writers' Manual, December 1996, EPA-833-B-96-003.
f. Data from Section 5.2.2, USEPA NPDES Permit Writers' Manual, December 1996, EPA-833-B-96-003.
g. "--" denotes data not available.
h. Value highly variable depending upon treatment technology.
i. No technology based limit established by USEPA.
k. Percent reduction from influent, wastewater pond treatment. USEPA webpage <http://www.epa.gov/ caddis/ssr_urb_ww1.html>, accessed August 29, 2014.
m. Percent reduction from influent wastewater, activated sludge treatment. USEPA webpage <http://www.epa.gov/ caddis/ssr_urb_ww1.html>, accessed August 29, 2014.
o. Insignificant change expected in treatment.
p. TSS limit not appropriate for land discharge.

9. Discharges from RV holding tanks or portable toilets may contain chemicals that can pollute groundwater quality. Some commercially available products used to control holding tank/portable toilet odors may contain harmful chemicals such as formaldehyde, zinc, or phenol. The harmful chemicals can kill the bacteria in the wastewater treatment system and cause wastewater to be inadequately treated. Inadequately treated wastewater may cause additional problems such as leachfield/ seepage pit failure, surfacing wastewater, and potential exposure and health risks. Discharge of the harmful chemicals to groundwater that creates pollution may result in enforcement activities requiring groundwater remediation. The best and least expensive method to prevent groundwater pollution is to not use harmful chemicals by educating RV owners about the pollution hazard.

10. Total dissolved solids (TDS) consists of both volatile (organic) and fixed (inorganic) fractions. A varying concentration of volatile dissolved solids will exist in wastewater effluent depending upon the wastewater source and treatment technology. In a properly operated land application system, volatile dissolved solids in percolate are generally reduced to negligible concentrations (less than 2 mg/L) by filtration and biological degradation following percolation through five feet of soil.[1] However, fixed

[1] USEPA, Process Design Manual, Land Treatment of Municipal Wastewater, Section 4.2.1, 1981.

dissolved solids (FDS) do not degrade biologically. Elevated concentrations of FDS in land applied effluent can change soil chemistry and degrade groundwater quality.

11. Wastewater discharged to land in close proximity to a surface water body may impact surface water quality. Additional monitoring may be required by a Regional Water Board's Executive Officer to determine if the discharge has degraded surface water quality. The USEPA recommends *Escherichia coli* (E. coli) and enterococci bacteria, which exist in fecal material from humans and other warm-blooded animals, as the best indicators of health risk from water contact.[2] Because both bacteria are present in domestic wastewater, there is no need to monitor separately for them in wastewater effluent. The effectiveness of disinfection procedures are similar for bacteria, therefore total coliform organisms, which is a less expensive analysis, is appropriate to determine if wastewater effluent is effectively disinfected. Total coliform monitoring is required for recycled water use consistent with title 22.

12. Use of recycled water in lieu of potable water is encouraged by the State Water Board as described below:

    a. The State Water Board's Strategic Plan Update 2008-2012 includes a priority to increase sustainable local water supplies available for meeting existing and future beneficial uses by 1,725,000 acre-feet per year (afy) in excess of 2002 levels by 2015.

    b. The State Water Board's Policy for Water Quality Control for Recycled Water states the following goals (in part): 1) Increase the use of recycled water over the 2002 level by at least 1 million afy by 2020 and by at least 2 million afy by 2030. 2) Increase the amount of water conserved in urban and industrial uses by 20 percent compared to 2007. 3) Substitute as much recycled water for potable water as possible by 2030.

13. The Recycled Water Policy calls on local water and wastewater entities together with other stakeholders who contribute salt and nutrients to a groundwater basin or sub-basin, to fund and develop Salt and Nutrient Management Plans (SNMPs) to comprehensively address all sources of salts and nutrients. The State Water Board herein reasserts the need for comprehensive salt and nutrient management planning and directs that salinity and nutrient increases should be managed in a manner consistent with the Recycled Water Policy. It is the intent of the Recycled Water Policy that every groundwater basin/sub-basin in California ultimately has a consistent Salt and Nutrient Management Plan. The appropriate way to address salt and nutrient issues is through the development of regional or subregional SNMPs. Dischargers may be directed to perform or participate in SNMP planning activities as described in the Provisions of this General Order.

[2] USEPA Internet page accessed June 10, 2014 <http://water.epa.gov/type/rsl/monitoring/vms511.cfm>.

14. The Recycled Water Policy includes monitoring requirements for Constituents of Emerging Concern[3] for the use of recycled water for groundwater recharge by surface and subsurface application methods. The monitoring requirements and criteria for evaluating monitoring results in the Recycled Water Policy are based on recommendations from a Science Advisory Panel.[4] Because this General Order is limited to non-potable uses and does not authorize groundwater replenishment activities, monitoring for Constituents of Emerging Concern is not required.

15. The Recycled Water Policy requires permits for landscape irrigation with recycled water to include priority pollutant monitoring at the recycled water production facility. Annual monitoring is required for design production flows greater than one million gallons per day; a five year monitoring frequency is required for flows less than one million gallons per day. Priority pollutants are listed in Appendix A of 40 Code of Federal Regulations (C.F.R.) Part 423.

16. Beneficial uses for groundwater are determined by each Regional Water Board and are listed in their respective Basin Plans. Beneficial uses for groundwater are: municipal supply (MUN), industrial service supply (IND), industrial process supply (PROC), fresh water replenishment (FRESH), aquaculture (AQUA), wildlife habitat (WILD), water contact recreation (REC-1), agricultural supply (AGR), and groundwater recharge (GWR). Some beneficial uses only apply to certain geographic areas within regions.

17. Basin Plans establish groundwater quality objectives to protect beneficial uses. The objectives may be narrative, numerical, or both. This General Order requires the Discharger to comply with those objectives in receiving groundwater.

WASTEWATER DISPERSAL

18. Wastewater dispersal will occur by different methods. It may be percolated from ponds; applied to the surface by spray, flood, or drip methods; or discharged to a subsurface dispersal area such as a leachfield or seepage pit. The choice of disposal method will depend upon the amount of wastewater generated, the value of the wastewater for irrigation, and the receiving environment.

    a. Wastewater discharged to a pond for treatment and/or storage can result in groundwater degradation or nuisance odors. Ponds can also be vulnerable to damage caused by burrowing animals.

---

[3] For this order, Constituents of Emerging Concern are defined to be chemicals in personal care products, pharmaceuticals including antibiotics, antimicrobials; industrial, agricultural, and household chemicals; hormones; food additives; transformation products, inorganic constituents; and nanomaterials.

[4] The Science Advisory Panel was convened in accordance with provision 10.b of the Recycled Water Policy. The panel's recommendations were presented in the report; *Monitoring Strategies for Chemicals of Emerging Concern in Recycled Water - Recommendations of a Science Advisory Panel*, dated June 25, 2010.

Wastewater percolated from a pond to the subsurface has the potential to degrade groundwater quality to an unacceptable extent. Reducing the amount of wastewater percolated by lining a pond with a synthetic or low permeability liner can control the percolation rate, but an alternative method of wastewater disposal may be required. Land application (discussed below) is often selected as the method to dispose of the wastewater from lined ponds.

Overloading a wastewater pond with Biochemical Oxygen Demand (BOD) constituents can result in nuisance odor generation. Source control of BOD constituents, additional pretreatment prior to discharge to the pond, or mechanical aeration of wastewater in the pond are typically used to prevent a pond from generating nuisance odors.

Burrowing animals can result in rapid failure of a containment berm. The population of such animals should be promptly controlled and repairs to the containment completed as soon as possible.

b. When land application of wastewater is selected as a disposal method, adequate acreage must be available to allow application rates that will not create nuisance conditions (e.g. vectors, nuisance odors, off-site discharge) or degrade groundwater quality to an unacceptable extent.

   Crops are often grown and harvested from a land application area (LAA) to take up wastewater constituents such as nitrogen and dissolved solids, as well as maintain roots which promote wastewater infiltration rates. When climatic conditions are favorable, double cropping an LAA can increase the uptake of wastewater constituents.

   Hydraulic loading of an LAA must be controlled to prevent off-site wastewater discharge; if wastewater is not disinfected prior to land application, storm water that falls on the LAA must be contained to prevent the potential migration off-site of pathogenic organisms. LAAs are sometimes equipped with a tailwater control system that allows for reapplication of wastewater to the LAA or returning tailwater to a wastewater pond.

c. Subsurface disposal areas may be constructed as leachfields or when conditions allow, seepage pits. If seepage pits are employed, they are often located at the end of a leachfield distribution pipe to maximize shallow distribution of wastewater.

   If conditions are not favorable for traditional leachfield construction, an at-grade, or an above grade (mound) system may be used. Typically, at-grade and above grade systems are dosed using a dosing pump and pump controller. Dosed systems use relatively small diameter pipe to distribute the wastewater to zones within the dispersal area. Even in well operated systems, some suspended solids will be pumped into the distribution piping. Cleanouts or a flushing system on the distribution piping are required to remove the solids that will accumulate if the emitters are small enough diameter to prevent suspended solids from passing through the distribution equipment. Gravelless trench systems which do not use gravel, typically use distribution piping and a dosing

system, and should be constructed with cleanouts or a flushing system similar to at-grade and/or above grade systems when needed.

Subsurface disposal areas should be planted with shallow rooted plants to prevent erosion and provide for uptake of wastewater nutrients; trees and shrubs should be removed to prevent roots from damaging the leachfield. Similarly, burrowing animals can damage an at-grade or above grade (mound) disposal system and result in leakage. Burrowing animals should be promptly controlled and repairs to the disposal system completed as soon as possible.

19. Setbacks from wastewater treatment areas, dispersal areas, and/or LAAs from domestic wells, flowing and/or ephemeral streams, lakes/reservoirs, and property lines are provided in this General Order. Setbacks are included as a means of reducing pathogenic risks by coupling pathogen inactivation rates with groundwater travel time to a well or other potential exposure route (e.g. water contact activities). In general, a substantial unsaturated zone reduces pathogen survival compared to saturated soil conditions. Fine grained (silt or clay) soil particles reduce the rate of groundwater transport and therefore are generally less likely to transport pathogens; coarse grained soil particles or fracture flow groundwater conditions may be more likely to transport pathogens. Setbacks also provide attenuation of other wastewater constituents through physical, chemical, and biological processes. The setbacks provided in this General Order are based on the title 22 water recycling criteria, the California Well Standards, the OWTS Policy, the California Plumbing Code, and commonly imposed setbacks by regulatory agencies.

20. The OWTS Policy identified wastewater disposal as a potential contributing source of pathogens or nitrogen to an impaired surface water body.[5] OWTS Policy Tier 3 addresses impaired surface water bodies and describes an Advanced Protection Management Program (APMP) as the minimum management program for wastewater systems subject to the OWTS Policy. In general, wastewater systems located within the geographic area[6] of an APMP are not eligible for coverage under this General Order unless the Regional Water Board's Executive Officer determines the discharge is acceptable based on site-specific conditions, the level of wastewater treatment, and/or total maximum daily load (TMDL) implementation plan requirements.

[5] Impaired surface water bodies are those identified on a list approved first by the State Water Board and then approved by USEPA pursuant to Section 303(d) of the Federal Clean Water Act.

[6] The geographic area of an APMP is established (in order of hierarchy) by an approved TMDL, an approved local agency defined APMP, or 600 feet from the water body.

APPLICATION PROCESS

21. Dischargers seeking coverage under this General Order shall file an ROWD with the appropriate Regional Water Board. The application process is summarized in Attachment A. Some Regional Water Boards may provide procedures for electronic submittal of application documents. An ROWD consists of:

    a. A completed Form 200, which is available at: http://www.waterboards.ca.gov/publications_forms/forms/docs/form200.pdf .

    b. An application fee that serves as the first annual fee. Fees are based on threat and complexity ratings, and the treatment technology employed. Threat and complexity ratings are defined in the fee schedule listed in California Code of Regulations, title 23, section 2200 and also available at: <http://www.waterboards.ca.gov/resources/fees/docs/ fy1112fee_schdl_wdr.pdf>.

    c. A technical report that describes the wastewater generation, treatment, storage, and disposal. Submittal of the report in the recommended format provided in Attachment B1 will allow for an expedited review by Regional Water Board staff. (Some Regional Water Boards' staff may have different or additional technical report requirements in addition to Attachment B1. An applicant is advised to inquire with the Regional Water Board staff before performing investigations and/or preparing the technical report.)

    Upon review of the ROWD, Regional Water Board staff will determine if coverage under this General Order is appropriate. The Regional Water Board's Executive Officer will issue a Notice of Applicability (NOA) when coverage under this General Order has been authorized. The NOA will contain the necessary site-specific monitoring and reporting requirements.

22. Dischargers covered by WQO 97-10-DWQ or another administrative mechanism may continue discharging under that authority until notified of the need to update their coverage by the State Water Board or Regional Water Board.

23. Although a Discharger may be eligible for coverage under this General Order, the appropriate Regional Water Board Executive Officer may determine that the discharge would be better regulated by a waiver of WDRs, individual WDRs, a different general order, an enforcement order, or a National Pollutant Discharge Elimination System (NPDES) Permit.

ANTIDEGRADATION ANALYSIS

24. State Water Board Resolution 68-16, the *Statement of Policy with Respect to Maintaining High Quality of Waters in California* (hereafter the Antidegradation Policy) requires that disposal of waste into the waters of the state be regulated to achieve the highest water quality consistent with the maximum benefit to the people of the state. The quality of some waters is higher than established by adopted policies and that higher quality water shall be maintained to the maximum extent possible consistent with the Antidegradation Policy. The Antidegradation Policy requires the following:

a. Higher quality water will be maintained until it has been demonstrated to the state that any change will be consistent with the maximum benefit to the people of the state, will not unreasonably affect present and anticipated beneficial use of the water, and will not result in water quality less than that prescribed in the policies.

b. Any activity that produces a waste and discharges to existing high quality waters will be required to meet WDRs that will result in the Best Practicable Treatment or Control (BPTC) of the discharge necessary to assure pollution or nuisance will not occur, and the highest water quality consistent with the maximum benefit to the people of the state will be maintained.

25. The Antidegradation Policy requires maintenance of high quality of waters of the state unless limited degradation is consistent with the maximum benefit to the people of the state. When issuing NOAs under this General Order, Executive Officers must assure that Dischargers implement BPTC as necessary to maintain the highest water quality consistent with the maximum benefit to the people of the state.

26. This General Order allows discharges to numerous groundwater bodies, each with its own chemical characteristics. There are not sufficient data to determine which receiving waters are high quality waters. To the extent a discharge covered under this General Order may be to high quality waters, this General Order authorizes limited degradation consistent with the Antidegradation Policy as described in the findings below.

27. This General Order limits a discharge flow rate to 100,000 gpd; therefore, only small Dischargers will be eligible for coverage. Wastewater systems with a flow rate greater than 20,000 gpd must evaluate the discharge with the method presented in Attachment 1 to determine if nitrogen effluent limits are appropriate. Discharge of domestic wastewater at lower flow rates inherently has less potential to significantly degrade water quality.

28. Limited degradation of groundwater by some waste constituents associated with domestic wastewater effluent, after effective source control, treatment, and control measures are implemented, is consistent with the maximum benefit to the people of the state. The technology, energy, water recycling, and waste management advantages of centralized wastewater treatment systems far exceed any benefits derived from reliance on numerous, concentrated individual wastewater systems, and the cumulative impact on water quality will be substantially less. The economic prosperity of communities and associated industry is of maximum benefit to the people of the state and provides sufficient justification for allowing the limited groundwater degradation that may occur pursuant to this General Order provided the terms of the applicable Basin Plan, and other applicable State Water Board and Regional Water Board policies are consistently met. The State Water Board recognizes variability in a small community's ability to construct wastewater treatment systems based on financial resources.

29. Constituents of concern that have the potential to degrade groundwater include salinity, nutrients, and pathogens (represented by coliform bacteria). In addition, excessive BOD loading of ponds or LAAs may result in nuisance odors or anaerobic

conditions, which are not favorable biological treatment conditions. This General Order includes effluent limits for nitrogen and BOD, and a process to determine how to apply the limits. Implementation of the process to determine the effluent limit that applies will result in the BPTC for the wastewater constituents. In addition, this General Order provides guidance on preparing a monitoring program that ensures the treatment is effective. Each of the wastewater constituents of concern are discussed below:

a. Salinity is a measure of dissolved solids in water. Excessive salinity can reduce the beneficial uses of water. Salinity can be affected by the discharge of wastewater with elevated concentrations of TDS. TDS consists of both volatile (organic) and fixed (inorganic) fractions. In a well-operated land application system, volatile dissolved solids in percolate will be reduced to negligible concentrations. The best approach for addressing salinity is through source control activities. This General Order allows an Executive Officer to require participation in salt and nutrient management planning processes.

b. Nitrogen is a nutrient normally present in domestic wastewater at a concentration that can degrade groundwater quality. The potential for degradation depends upon the wastewater treatment method and the environment into which the wastewater effluent is discharged. Nitrogen concentration reduction is not required in every situation, such as when wastewater treatment and application is performed in a way that is protective of the beneficial uses of water.

   When needed, nitrogen concentrations can be reduced in a number of ways, such as nitrification, denitrification, and/or crop uptake and removal. However, the General Order requires that the effluent limit for nitrogen be determined based on procedures in Attachment 1, which provides additional criteria to determine when and how much nitrogen control is required. Effluent limits are determined based on the threat to groundwater quality. If nitrogen control is needed, a minimum of 50-percent reduction is required. In cases where a higher threat to groundwater exists, a total nitrogen concentration limit of 10 mg/L is required. By imposing the total nitrogen limit of 10 mg/L, the wastewater derived nitrogen cannot exceed the maximum contaminant level (MCL) for groundwater. Because natural systems are rarely 100-percent efficient, the nitrogen concentration limit will be protective of the existing and/or potential beneficial use of groundwater. Effluent limitations for nitrogen are contained in this General Order. To ensure the nitrogen control is effective, the model Monitoring and Reporting Program (MRP) provided as Information Sheet Attachment C includes monitoring that can be implemented to verify compliance with effluent limits.

c. Pathogens and other microorganisms are present in domestic wastewater. Wastewater treatment processes will reduce the concentration of pathogens but disinfection is required to significantly reduce their presence. Coliform bacteria are used as a surrogate (indicator) because they are excreted by warm-blooded animals, are present in high numbers, survive in the environment similar to

pathogenic bacteria, and are easy to detect and quantify. Disinfection of wastewater is not required in every situation, such as when the wastewater application is performed in such a way that public contact is minimized through physical controls and/or notification.

When needed, disinfection can be performed in a number of ways. The title 22 water recycling criteria lists disinfection requirements for specific activities. To ensure the disinfection is effective, the model MRP provided as Information Sheet Attachment C includes monitoring that can be implemented to verify compliance with effluent limits.

30. Compliance with the General Order, the NOA, DDW requirements, and any mitigation measures will ensure compliance with the applicable Basin Plan.

TITLE 27 EXEMPTION

31. The wastewater treatment, storage, and disposal activities described in this General Order are exempt from the requirements of *Consolidated Regulations for Treatment, Storage, Processing, or Disposal of Solid Waste* in California Code of Regulations, title 27, division 2, Subdivision 1, section 20005, et seq. The activities are exempt from the requirements of title 27 so long as the activity meets, and continues to meet, all preconditions listed below. (Cal. Code Regs., tit. 27, § 20090.)

    a. Sewage—Discharges of domestic sewage or treated effluent which are regulated by WDRs issued pursuant to California Code of Regulations, title 23, division 3, chapter 9, or for which WDRs have been waived, and which are consistent with applicable water quality objectives, and treatment or storage facilities associated with municipal wastewater treatment plants, provided that residual sludge or solid waste from wastewater treatment facilities shall be discharged only in accordance with the applicable State Water Board promulgated provisions of this division. (Cal. Code Regs., tit. 27, § 20090(a).)

    b. Wastewater—Discharges of wastewater to land, including but not limited to evaporation ponds, percolation ponds, or subsurface leach fields if the following conditions are met:

        (1) the applicable Regional Water Board has issued WDRs, reclamation requirements, or waived such issuance;

        (2) the discharge is in compliance with the applicable water quality control plan; and

        (3) the wastewater does not need to be managed according to, California Code of Regulations, title 22, division 4.5, chapter 11, as a hazardous waste. (Cal. Code Regs., tit. 27, § 20090(b).)

    c. Underground Injection—Discharges of waste to wells by injection pursuant to the Underground Injection Control Program established by the USEPA under the Safe Drinking Water Act, 42 US Code section 300(h), see Code of Federal Regulations title 40, Parts 144 to 146. (Cal. Code Regs., tit. 27, § 20090(c).)

d. Soil Amendments—Use of nonhazardous decomposable waste as a soil amendment pursuant to applicable best management practices, provided that Regional Water Boards may issue waste discharge or reclamation requirements for such use. (Cal. Code Regs., tit. 27, § 20090(f).)

e. Fully Enclosed Units—Waste treatment in fully enclosed facilities, such as tanks, or in concrete lined facilities of limited areal extent, such as oil water separators designed, constructed, and operated according to American Petroleum Institute specifications. (Cal. Code Regs., tit. 27, § 20090(i).)

Table 2: Summary of Wastewater System and California Code of Regulations, Title 27 Exemptions

Example of Wastewater System Element/ Activity	Potentially Applicable Exemption(s)
Wastewater collection, treatment, storage, and disposal systems.	Section 20090 (a) Sewage, domestic wastewater, and treated effluent
Applying wastewater to evaporation ponds, storage ponds, percolation ponds, rapid infiltration basins, leach fields, seepage pits, land application areas, spray fields, etc.	Section 20090 (b) Wastewater discharges to land
Disposal of wastewater in injection wells or seepage pits.	Section 20090 (c) Underground injection
Application of treated wastewater containing suspended solids to a land application area.	Section 20090 (f) Soil amendments, nonhazardous decomposable waste
Wastewater collection, flow equalization, and treatment in a septic tank, Imhoff tank, sand/media filter, package treatment tank, aeration basin, clarifier, sludge holding/thickening tank, pumping sumps, lined sludge drying beds, etc.	Section 20090 (i) Waste treatment in fully enclosed facilities.

CALIFORNIA ENVIRONMENTAL QUALITY ACT

32. This General Order is intended to cover both new and existing Small Domestic Systems.

    a. The adoption of this General Order for existing Small Domestic Systems is categorically exempt from the California Environmental Quality Act (CEQA) pursuant to California Code of Regulations, title 14, section 15301 (ongoing or existing projects), section 15302 (replacement or reconstruction of existing utility systems), and section 15303 (new construction or conversion of small structures).

b. For new or expanding Small Domestic Systems, the State Water Board considered the environmental impacts associated with the adoption of this General Order and prepared an Initial Study in accordance with California Code of Regulations, title 14 section 15063. Analysis in the Initial Study and early consultation with responsible and trustee agencies did not identify any significant impacts on the environment. Therefore, a Negative Declaration was prepared. The State Water Board adopted the Negative Declaration (Resolution 2014-0054) on September 23, 2014.

c. New or expanding systems are subject to further CEQA evaluation on a site-specific basis by local agencies performing CEQA evaluations of proposed projects. The potential significant environmental impacts from discharges of domestic wastewater can be mitigated to less than significant impacts by compliance with this General Order, the NOA, and any mitigation measures adopted by local agencies.

OTHER REGULATORY ISSUES

33. Dischargers that meet the criteria for coverage under State Water Board Order No. 2006-0003-DWQ, *Statewide General Waste Discharge Requirements for Sanitary Sewer Systems,* or updated order, are required to obtain coverage.

34. Consistent with Water Code section 13241, the State Water Board, in establishing the requirements contained herein, considered factors including, but not limited to, the following:

    a. Past, present, and probable future beneficial uses of water.

    b. Environmental characteristics of the hydrographic unit under consideration, including the quality of water available thereto.

    c. Water quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area.

    d. Economic considerations.

    e. The need for developing housing within the region(s).

    f. The need to develop and use recycled water.

35. Water Code section 13263(i) states, The State Water Board or a Regional Water Board may prescribe general WDRs for a category of discharges if the State Water Board or that Regional Water Board finds or determines that all of the following criteria apply to the discharges in that category:

    1) The discharges are produced by the same or similar operations.

    2) The discharges involve the same or similar types of waste.

    3) The discharges require the same or similar treatment standards.

    4) The discharges are more appropriately regulated under general WDRs than individual WDRs.

Small Domestic Systems that will be regulated under this General Order are consistent with the criteria listed above and therefore a general order is appropriate. All discharges regulated under this order will be from similar operations and will be consistent with the description of domestic wastewater as defined in Finding 8. The discharges will use similar treatment methods (e.g. screening, settling, biological treatment, clarification, and application to land). Individual WDRs are not necessary because the discharges are similar and discharge requirements would be similar if individual WDRs were issued.

36. Technical and monitoring reports specified in this General Order are required. (Wat. Code, § 13267.) Failing to furnish the reports by the due date or falsifying information in the reports, are misdemeanors that may result in assessment of civil liabilities against the Discharger. Water Code section 13267 states, in part:

> "In conducting an investigation specified in subdivision (a), the regional board may require that any person who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge waste within its region, or any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge, waste outside of its region that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the regional board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports. In requiring those reports, the regional board shall provide the person with a written explanation with regard to the need for the reports, and shall identify the evidence that supports requiring that person to provide the reports."

The technical reports required by this General Order, the NOA, and the MRP are necessary to assure compliance with this General Order. The burden and cost of preparing the reports is reasonable and consistent with the interest of the state in maintaining water quality.

37. The BOD and Total Suspended Solids (TSS) effluent limitations contained in this General Order are technology based. USEPA has developed technology based effluent limits for secondary treatment for use in NPDES permits. However, pond treatment systems often cannot comply with the limits that apply to activated sludge treatment systems due to algae growth in the pond. In response, USEPA developed an equivalent to secondary treatment definition for alternative biological treatment technologies such as a trickling filter or waste stabilization pond. (40 C.F.R. §133.05). Although this General Order only authorizes discharges to land, some of the secondary treatment standards are appropriate to demonstrate that wastewater is adequately treated. For pond and/or trickling filter wastewater systems, the total suspended solids limit is not appropriate because application of algal solids to land is not a concern.

38. This General Order does not preempt or supersede the authority of municipalities, flood control agencies, or other local agencies to prohibit, restrict, or control discharges of waste subject to their jurisdiction.
39. The State Water Board has notified potential Dischargers and all other known interested parties of the intent to prescribe WDRs as described in this General Order.
40. The State Water Board, in a public meeting, has heard and considered all comments pertaining to the proposed discharge.

IT IS HEREBY ORDERED

IT IS HEREBY ORDERED that upon adoption of this General Order, WQO 97-10-DWQ is classified as in effect, but inactive for future Discharger enrollment.

Pursuant to Water Code section 13263 and 13267, the Discharger, its agents, successors, and assigns, in order to meet the provisions contained in division 7 of the Water Code and regulations adopted hereunder, shall comply with the following:

A. Prohibitions

1. The direct or indirect discharge of any wastewater to surface waters or surface water drainage courses is prohibited.
2. The use of cesspools, an excavation or device that allows wastewater infiltration into the soil without treatment, is prohibited.
3. The treatment, storage, and/or disposal of waste in or at the wastewater system shall not cause or contribute to a condition of pollution, contamination, or nuisance as defined in Water Code section 13050.
4. The discharge of wastewater other than domestic wastewater is prohibited.
5. Bypass or overflow of treated or untreated waste is prohibited.
6. The discharge of waste to land not owned, operated, or controlled by the Discharger is prohibited. An exception to this prohibition is when recycled water is used as described in a title 22 Engineering Report approved by DDW.
7. The discharge of waste classified as hazardous (Cal. Code Regs., tit. 23, § 2521(a)), or designated (Wat. Code, § 13173) is prohibited.
8. The discharge of waste in violation of, or not consistent with, the applicable Regional Water Board's Basin Plan is prohibited.
9. A physical connection between a recycled water system and a potable water system is prohibited.
10. The use of recycled water in a manner different than described in the DDW approved title 22 engineering report is prohibited.
11. Use of equipment used to convey recycled water (e.g. tanks, piping, valves,) also used for potable water supply, is prohibited.

B. Requirements by Wastewater System Type

1. All Wastewater Systems

a. The Discharger shall not discharge wastewater in excess of the flow limit(s) specified in the NOA. In no case shall the flow rate of wastewater discharged to the headworks exceed 100,000 gpd as a monthly average. Headworks are defined as the facilities where wastewater enters a wastewater treatment plant. Headworks may include bar screens, comminutors, a wet well, and pumps. Dischargers that store wastewater and apply it to an LAA during irrigation season may land apply more than 100,000 gallons per day of treated wastewater to an LAA during the irrigation season as allowed by the NOA.

b. Treatment and disposal of wastewater must demonstrate BPTC for domestic wastewater. BPTC shall be demonstrated by compliance with all of the following:

   i. Compliance with this General Order.

   ii. Compliance with effluent limitations included in this General Order.

   iii. Compliance with the NOA, which will specify the following (at a minimum):

      1. Site-specific flow limit(s).

      2. Site-specific wastewater system treatment and disposal methods provided in Section B.2 through B.8 of this General Order.

      3. Applicable Basin Plan groundwater and/or surface water limitations in addition to those provided in Section C of this General Order.

      4. Applicable effluent limitations from Section D of this General Order. For flow rates greater than 20,000 gpd, the discharge must be evaluated as described in Attachment 1 to determine if nitrogen effluent limits are required.

      5. Requirements for operation of the wastewater treatment system and disinfection requirements provided by the DDW approved title 22 Engineering Report.

      6. Water quality related mitigation measures from an approved site-specific CEQA document (if one is prepared).

c. Wastewater systems located within the geographic area[7] of an APMP are not eligible for coverage under this General Order unless the Regional Water Board's Executive Officer determines the discharge is acceptable based on site-specific conditions, the level of wastewater treatment, and/or TMDL implementation plan requirements.

[7] The geographic area of an APMP is established (in order of hierarchy) by an approved TMDL, an approved local agency defined APMP, or 600 feet from the water bodies listed on Table 5 or Table 6 of OWTS Policy Attachment 2.

d. The siting, design, construction, operation, maintenance, and monitoring of the wastewater system shall comply with the requirements of the applicable Regional Water Board's Basin Plan.

e. Nuisance odors shall not be perceivable beyond the property line of the wastewater treatment facility.

f. Public contact with wastewater shall be deterred through such means as fences, signs, and other acceptable alternatives.

g. For systems with a design flow rate greater than 3,500 gpd, the technical report required as part of the ROWD shall be prepared by a California licensed professional civil engineer. For systems with a design flow rate less than 3,500 gpd, the technical report shall be prepared by a California licensed professional engineer or other appropriately licensed professional (e.g., a California licensed professional geologist or California registered environmental health specialist).

h. For new or expanding Small Domestic Systems within or nearby the boundaries of a centralized wastewater district or regional service area, the Discharger must demonstrate a good faith effort to connect to the centralized system when feasible and practicable, and provide evidence that connection to the system was not approved.

i. A Regional Water Board Executive Officer may require additional investigations or monitoring to demonstrate beneficial uses of water are protected and antidegradation requirements are satisfied. Acceptable methods may include, but not be limited to, evaluation of the wastewater system's treatment performance, groundwater monitoring, or additional sampling to characterize the wastewater discharge.

j. The Discharger shall comply with any water quality related mitigation measures adopted in a CEQA document addressing the facility.

k. When producing or using recycled water, the Discharger shall comply with the provisions of the DDW approved title 22 Engineering Report.

l. The Discharger shall comply with the setbacks described in Table 3. However, some existing sites may not comply with the setbacks provided herein. Such noncomplying sites may be permitted under this General Order if nuisance conditions do not result from the noncompliance. Expansion of a noncomplying wastewater system shall trigger further evaluation of the setbacks. In some cases, more than one setback standard exists. The following procedure shall be implemented when determining the appropriate setback:

    i. When the setback requirement comes from title 22, approval of a variance must be obtained from DDW.

ii. When the setback comes from the California Well Standards, a reduced setback may be allowed based on site-specific conditions; review the California Well Standards for clarification.

iii. When the setback comes from the OWTS Policy, the Regional Water Board Executive Officer may allow a reduced setback based upon site-specific conditions (e.g. annular seal in a well, groundwater flow direction near water bodies, treatment/disinfection level of wastewater, etc.).

iv. When the setback comes from the California Plumbing Code, the Regional Water Board Executive Officer may not reduce the setback.

v. Setbacks that are not referenced to a requirement listed above are based on professional judgment and may be revised by the Regional Water Board Executive Officer based on site-specific conditions.

Table 3: Summary of Wastewater System Setbacks

Equipment or Activity	Domestic Well	Flowing Stream [a]	Ephemeral Stream Drainage [b]	Property Line	Lake or Reservoir [d]
Septic Tank, Aerobic Treatment Unit, Treatment System, or Collection System [e]	150 ft.[y] 100 ft.[o] 50 ft.[c]	50 ft.[c]	50 ft.	5 ft.[c]	200 ft.[w] 50 ft.[c]
Leach Field [f]	100 ft.[o,c]	100 ft.[c]	50 ft.	5 ft.[c]	200 ft.[w] 100 ft.[c]
Seepage Pit	150 ft.[o,c]	150 ft.[c]	50 ft.	8 ft.[c]	200 ft.[w] 150 ft.[c]
LAND APPLICATION AREA REQUIREMENTS					
LAA (disinfected tertiary recycled water) [g]	50 ft.[m]	25 ft.	50 ft.	25 ft.	200 ft.
LAA (disinfected sec-2.2 or sec-23 recycled water) [h]	100 ft.[r]	50 ft.	50 ft.	100 ft.[x] 50 ft.[p]	200 ft.
LAA (undisinfected secondary recycled water) [i]	150 ft.[s]	100 ft.	100 ft.	100 ft.[x] 50 ft.[p]	200 ft.
Spray Irrigation (disinfected tertiary recycled water) [k]	No spray irrigation of any recycled water, other than disinfected tertiary recycled water, shall take place within 100 feet of a residence or a place where public exposure could be similar to that of a park, playground, or school yard.				
WASTEWATER STORAGE AND/OR TREATMENT PONDS					
Impoundment (disinfected tertiary recycled water) [g]	100 ft.[t]	100 ft.	100 ft.	50 ft.	200 ft.
Impoundment (disinfected sec-2.2 or sec-23 recycled water) [h]	100 ft.[r]	100 ft.	100 ft.	50 ft.	200 ft.
Impoundment (undisinfected secondary recycled water) [i]	150 ft.[s]	150 ft.	150 ft.	50 ft.	200 ft.

LAA denotes Land Application Area. Sec denotes secondary.

[a] A flowing stream shall be measured from the ordinary high water mark established by fluctuations of water elevation and indicated by characteristics such as shelving, changes in soil character, vegetation type, presence of litter or debris, or other appropriate means.

[b] Ephemeral Stream Drainage denotes a surface water drainage feature that flows only after rain or snow-melt and does not have sufficient groundwater seepage (baseflow) to maintain a condition of flowing surface water. The drainage shall be measured from a line that defines the limit of the ordinary high water mark (described in "a" above). Irrigation canals are not considered ephemeral streams drainage

features. The ephemeral stream shall be a "losing stream" (discharging surface water to groundwater) at the proposed wastewater system site.

[c] Setback established by California Plumbing Code, Table K-1.

[d] Lake or reservoir boundary measured from the high water line.

[e] Septic Tank, Aerobic Treatment Unit, Treatment System, or Collection System addresses equipment located below ground or that impedes leak detection by routine visual inspection.

[f] Leach Field includes all subsurface dispersal systems, including mound systems except seepage pits.

[g] Disinfected tertiary recycled water is defined in California Code of Regulations, title 22, section 60301.230.

[h] Disinfected secondary-2.2 recycled water is defined in California Code of Regulations, title 22, section 60301.220. Disinfected secondary-23 recycled water is defined in California Code of Regulations, title 22, section 60301.225.

[i] Undisinfected secondary recycled water is defined in California Code of Regulations, title 22, section 60301.900.

[k] Additional restrictions for spray irrigation of recycled water are contained in California Code of Regulations, title 22, section 60310(f)

[m] Setback established by California Code of Regulations, title 22, section 60310(a). A reduced setback is allowed as described in California Code of Regulations, title 22, section 60310(a) if all the conditions in the section are met and compliance is documented in the ROWD and NOA.

[o] California Well Standards, part II, section 8. Site-specific conditions may allow reduced setback or require an increased setback. See discussion in Well Standards.

[p] Setback for drip or flood application methods. Spray irrigation is subject to additional setbacks and restrictions. (See footnote k.)

[r] Setback established by California Code of Regulations, title 22, section 60310(c).

[s] Setback established by California Code of Regulations, title 22, section 60310(d).

[t] Setback established by California Code of Regulations, title 22, section 60310(b).

[w] Setback established by the Onsite Wastewater Treatment System Policy, section 7.5.5.

[x] Setback established by California Code of Regulations, title 22, section 60310(f).

[y] Setback established by Onsite Wastewater Treatment System Policy, section 7.5.6.

2. Septic Systems

a. Gauging and limited repairs may be performed by homeowners or contractors as allowed by the Business and Professions Code (Bus. & Prof. Code, section 7044 and/or section 7048). With certain exceptions, anyone performing construction work in California must be licensed by the California Contractors' State License Board. Septic tank and/or leach field service (repairs, pumping, etc.) shall be performed only by a California licensed General Engineering (A), Plumbing (C-36), or Sanitation System (C-42) contractor. The Discharger shall maintain a record of all septic service activities for a minimum of five years. At a minimum, the record shall include the date, nature of service, service company name, and service company state contractor license number.

   Health and Safety Code sections 117400 - 117450 require septic tank pumping to be registered by the jurisdiction where work is performed. Such service providers may be exempt from the state contractor's licensing requirements if meeting the exceptions described in the Business & Professions Code section 7044 and/or 7048.

b. Owners and/or operators of wastewater systems that accept wastes from RVs or other mobile waste systems must ensure that such wastes do not deleteriously affect the wastewater system or adversely affect beneficial uses of groundwater

with holding tank additives that may contain, among other chemicals, formaldehyde, zinc, and/or phenol.

Use of holding tank chemicals shall be discouraged by the wastewater system owner/operator. Education of visitors can be accomplished by providing an information sheet upon check-in. Information on holding tank chemicals is provided in Attachment B2. The sale or provision of such additives by the Discharger to operators of RVs served by the Discharger's wastewater facility may be determined to be evidence of noncompliance with this section.

c. To the maximum extent possible, RV, portable toilet, or similar wastes shall not be discharged to a septic tank or functionally equivalent system (e.g. Imhoff tank) without subsequent additional treatment (e.g., aerated pond, recirculating sand filter, etc.) prior to disposal.

d. Septic tanks shall be pumped when any one of the following conditions exists:

   i. The combined thickness of sludge and scum exceeds one-third of the tank depth of the first compartment.

   ii. The scum layer is within 3 inches of the outlet device.

   iii. The sludge layer is within 8 inches of the outlet device.

e. Septage is the liquid, solid, and semisolid material that results from wastewater treatment in a septic tank, which must be pumped, hauled, treated, and disposed of properly. (40 C.F.R. § 503.) Septage disposal shall only be to a legal disposal site that has been issued WDRs by a Regional Water Board allowing septage disposal. Septage shall be handled in such a manner as to prevent its reaching surface waters or watercourses.

3. Aerobic Treatment Units

a. Within **90 days** of the issuance of an NOA, the Discharger shall submit a Sludge Management Plan consistent with the requirements of Provision E.1.c of this General Order. The Discharger must obtain written approval from the Regional Water Board's Executive Officer prior to any disposal of sludge. The Executive Officer shall be notified of any changes in an approved Sludge Management Plan at least **90 days** in advance of the proposed change.

b. Modifications to a Sludge Management Plan deemed part of an emergency action shall be noticed to the Regional Water Board Executive Officer within **five days** of disposal with a rationale for the emergency modification.

c. Gauging and limited repairs may be performed by homeowners or contractors as allowed by the Business and Professions Code (Bus. & Prof. Code, §§ 7044, 7048). With certain exceptions, anyone performing construction work in California must be licensed by the California Contractors' State License Board. Septic tank, aerobic treatment unit, and/or leach field service (repairs, pumping, etc.) shall be performed only by a California licensed General Engineering (A), Plumbing (C-36), or Sanitation System (C-42) contractor. The Discharger shall maintain a record of all service activities for a minimum of five years. At a minimum, the record shall

include the date, nature of service, service company name, and service company state contractor license number.

Health and Safety Code sections 117400 - 117450 require septic tank pumping to be registered by the jurisdiction where work is performed. Such service providers may be exempt from the state contractor's licensing requirements if meeting the exceptions described in the Business & Professions Code section 7044 and/or 7048.

d. Owners and/or operators of wastewater systems that accept wastes from RVs or other mobile waste systems must ensure that such wastes do not deleteriously affect the wastewater system or adversely affect beneficial uses of groundwater with holding tank additives that may contain, among other chemicals, formaldehyde, zinc, and/or phenol.

   Use of holding tank chemicals shall be discouraged by the wastewater system owner/operator. Education of visitors can be accomplished by providing an information sheet upon check-in. Information on holding tank chemicals is provided in Attachment B2. The sale or provision of such additives by the Discharger to operators of RVs served by the Discharger's wastewater facility may be determined to be evidence of noncompliance with this section.

e. Aerobic treatment units shall be pumped when any one of the following conditions exists :

   i. The combined thickness of sludge and scum exceeds one-third of the tank depth of the final settling tank or interferes with the operation of the system (mixed liquor[8] aerator solids shall not exceed the manufacturer's recommendation).

   ii. The scum layer is within 3 inches of the outlet device.

   iii. The sludge layer is within 8 inches of the outlet device.

f. Septic tanks (a septic tank may be used as a pretreatment step to minimize the amount of solids discharged to an aerobic treatment unit) shall be pumped when any one of the following conditions exists:

   i. The combined thickness of sludge and scum exceeds one-third of the tank depth of the first compartment.

   ii. The scum layer is within 3 inches of the outlet device.

   iii. The sludge layer is within 8 inches of the outlet device.

g. Septage is the liquid, solid, and semisolid material that results from wastewater treatment in a septic tank, which must be pumped, hauled, treated, and disposed

[8] When the activated sludge in an aeration tank is mixed with primary effluent or raw wastewater and return sludge, this mixture is referred to as mixed liquor when it is in the aeration tank.

of properly. (40 C.F.R. § 503.) Septage disposal shall only be to a legal disposal site that has been issued WDRs by a Regional Water Board allowing septage disposal. Septage shall be handled in such a manner as to prevent its reaching surface waters or watercourses.

4. Activated Sludge Systems

a. Within **90 days** of the issuance of an NOA, the Discharger shall submit a Sludge Management Plan consistent with the requirements of Provision E.1.c of this General Order. The Discharger must obtain written approval from the Regional Water Board's Executive Officer prior to any disposal of sludge. The Executive Officer shall be notified of any changes in an approved Sludge Management Plan at least **90 days** in advance of the proposed change.

b. Modifications to a Sludge Management Plan deemed part of an emergency action shall be noticed to the Regional Water Board's Executive Officer within **five days** of disposal with a rationale for the emergency modification.

5. Pond Systems

a. Sufficient freeboard shall be maintained at all times in ponds to provide adequate storage capacity and prevent wastewater spills. Freeboard shall be measured vertically from the lowest elevation of the pond berm to the pond water surface. If freeboard is less than one foot, the discharger shall immediately implement the contingency plan contained in the *Spill Prevention and Emergency Response Plan* (Provision E.1.a).

b. Pond systems shall have sufficient capacity to accommodate wastewater, design seasonal precipitation, ancillary I/I, and wind driven waves. Design seasonal precipitation shall be based on the following precipitation criteria:

   i. If wastewater spills do not occur, existing pond systems may continue to operate at their present size if they are covered under individual WDRs, a general order issued by a Regional Water Board, or by WQO 97-10-DWQ. If wastewater spills do occur, the Executive Officer may require the pond size requirement to be consistent with the specification defined in Pond Systems 5.b.ii (below).

   ii. For new or expanding pond systems covered under this General Order, seasonal precipitation used in the pond sizing water balance calculations shall be based on the following:

      a. The 100-year return annual total precipitation value distributed monthly in accordance with average (mean) precipitation values. The calculations shall demonstrate adequate capacity to maintain two feet of freeboard in the pond(s).

      b. The Executive Officer may allow a lower standard for the return annual total precipitation value, with approval of a technical report describing how operation of the wastewater system will not result in wastewater spills. In no case shall the Executive Officer allow less than a 50-year

return annual total precipitation value. If the Discharger seeks relief from the 100-year return annual total precipitation value, the Discharger shall certify that the *Spill Prevention and Emergency Response Plan* (Provision E.1.a) has been prepared, and is adequate to respond to forecast conditions using the 100-year return annual total precipitation value distributed monthly in accordance with average (mean) precipitation values. The calculations shall demonstrate adequate capacity to maintain two feet of freeboard in the pond(s).

c. All ponds shall be managed to mitigate breeding of mosquitoes including, but not limited to the following:

   i. An erosion control program shall be implemented to ensure that small coves and irregularities are not created around the perimeter of the water surface.

   ii. Weeds shall be minimized through control of water depth, a shoreline synthetic liner, harvesting, or herbicides.

   iii. Dead algae, vegetation, and debris shall be removed from the water surface.

   iv. Coordination with the local mosquito abatement or vector control district to supplement the measures described above in cases where other methods are infeasible.

d. Objectionable odors shall not create nuisance conditions beyond the limits of the wastewater treatment facility. A dissolved oxygen concentration less than 1.0 mg/L in the upper one foot of any wastewater pond shall be evidence of the potential to generate objectionable odors.

e. Burrowing animals active in areas that may compromise the integrity of a pond containment shall be promptly controlled and repairs to the containment completed as soon as possible.

f. Prior to any removal, drying, treatment, or disposal of sludge for pond maintenance, the Discharger shall submit a Sludge Management Plan consistent with the requirements of Provision E.1.c and obtain written approval from the Regional Water Board's Executive Officer. The Executive Officer shall be notified of any changes in an approved Sludge Management Plan at least **90 days** in advance of the proposed change.

6. Subsurface Disposal Systems

a. Wastewater shall not surface in any location of the disposal area.

b. Subsurface disposal systems shall hold in reserve sufficient land area for possible future 100-percent replacement of the subsurface disposal system, or establish an equivalent contingency that is approved by the Regional Water Board's Executive Officer and described in the NOA. If less than 100-percent replacement area was previously permitted under existing individual WDRs, WQO 97-10-DWQ, or a local agency permit, the minimum reserve area previously permitted shall be maintained.

c. No part of the disposal system(s) shall extend to a depth where waste may pollute groundwater.

d. All new or rehabilitated disposal areas associated with effluent pressure distribution systems (pressure-dosed systems) shall be equipped with cleanouts or a flushing system to allow solids to be removed from distribution pipes and orifices when needed.

e. Deep rooted plants such as trees or shrubs shall be removed as needed from a subsurface disposal system area to prevent damage to the dispersal system by roots.

f. Burrowing animals active in areas that may result in wastewater leakage from an at-grade or above grade (mound) disposal system shall be promptly controlled and repairs to the disposal system completed as soon as possible.

g. Subsurface disposal systems including leach fields and seepage pits, must comply with USEPA Underground Injection Control requirements when classified as a Class V well. Subsurface disposal systems with at least one of the following characteristics are classified as Class V wells:

   i. The system has the capacity to serve 20 or more persons per day.

   ii. The system receives wastewater other than domestic wastewater such as that generated by manufacturing, chemical processing, industrial fluid disposal, automotive repair, or recycling.

   iii. The system receives sewage containing biological agents (such as wastewater from recreational vehicles or portable toilets).

   Disposal systems that are classified as Class V wells must be registered with USEPA either by completing the online form at: http://www.epa.gov/region09/water/groundwater/injection-wells-register.html , or by completing and submitting Form 7520-16: Inventory of Injection Wells. Form 7520-16 is available at: http://epa.gov/region09/water/groundwater/uic-pdfs/7520-16.pdf .

h. Limited repairs may be performed by homeowners or contractors as allowed by the Business and Professions Code (Bus. & Prof. Code, §§ 7044, 7048). With certain exceptions, anyone performing construction work in California must be licensed by the California Contractors' State License Board. Leach field repairs shall be performed only by a California licensed General Engineering (A), Plumbing (C-36), or Sanitation System (C-42) contractor. The Discharger shall maintain a record of all repair activities for a minimum of five years. At a minimum, the record shall include the date, nature of repair, service company name, and service company state contractor license number.

7. Land Application and/or Recycled Water Systems

a. Wastewater shall not be applied to an LAA within 24 hours of forecasted precipitation with a greater than 50-percent probability of occurring, during precipitation events, or when the LAA surface soil is saturated.

b. Spray irrigation with treated wastewater is prohibited when wind speed (including gusts) exceeds 30 miles per hour. Wind speed may be measured onsite or at a nearby weather station operated by a governmental organization.

c. Discharge of wastewater from an LAA is prohibited.

d. If undisinfected wastewater is applied to an LAA, storm water runoff from the LAA is prohibited.

e. If storm water is allowed to runoff from an LAA (during the time of year wastewater is not applied), all applied wastewater shall meet disinfection requirements at a level equivalent to disinfected secondary-23 recycled water. (Cal. Code Regs., title 22, § 60301.225.) Land application of more highly treated water is acceptable. Alternatively, a Discharger may submit a technical report, for Executive Officer approval, describing how the LAA will be operated to prevent pathogens from migrating off the LAA with stormwater.

f. If recycled water is applied, it shall comply with the title 22 water recycling criteria, this General Order, the NOA, a title 22 Engineering Report, and any DDW approval conditions.

g. Public contact with wastewater/recycled water shall be precluded through use of fences, signs, and/or other appropriate means. All public use areas where recycled water is used shall be posted with signs that are visible, in a size no less than 4 inches by 8 inches and include the following wording, “Recycled Water – Do Not Drink.” (Cal. Code Regs., tit. 22, § 60310(g).)

h. Land application areas shall be managed to mitigate breeding of mosquitoes including, but not limited to the following:

   i. There shall be no standing water 48 hours after application of wastewater.

   ii. Tailwater ditches must be maintained essentially free of emergent, marginal, or floating vegetation.

   iii. Low-pressure and unpressurized pipelines and ditches accessible to mosquitoes shall not be used to store wastewater or recycled water.

   iv. Coordination with the local mosquito abatement or vector control district to supplement the measures described above in cases where other methods are infeasible.

8. Sludge/Solids/Biosolids Disposal

a. Sludge means the solid, semisolid, and liquid residues removed during primary, secondary, or other wastewater treatment processes. Solid waste refers to grit and screenings generated during preliminary treatment. Residual sludge means

sludge that will not be subject to further treatment at the wastewater system. Biosolids refers to sludge that has undergone sufficient treatment and testing to qualify for reuse pursuant to the USEPA Part 503 Biosolids Rule. (40 C.F.R. § 503.)

b. Sludge and solid waste shall be removed from screens, sumps, tanks, and ponds as needed to ensure optimal plant operation.

c. Treatment and storage of sludge shall be confined to the wastewater system property, and shall be conducted in a manner that precludes infiltration of waste constituents into soil in a mass or at concentrations that will violate the groundwater limitations of this General Order.

d. Any storage of residual sludge, solid waste, or biosolids at the wastewater system shall be temporary, and the waste shall be controlled and contained in a manner that minimizes leachate formation and precludes infiltration of waste constituents into soils in a mass or at concentrations that will violate the groundwater limitations of this General Order.

e. Residual sludge, and solid waste shall be disposed of in a manner approved by the appropriate Regional Water Board's Executive Officer and consistent with the Consolidated Requirements for Treatment, Storage, Processing, or Disposal of Solid Waste. (Cal. Code Regs., tit. 27 div. 2.) Removal for further treatment, disposal, or reuse at disposal sites operated in accordance with valid WDRs issued by the State Water Board or Regional Water Board will satisfy this specification.

f. Use and disposal of biosolids shall comply with the USEPA Part 503 Biosolids Rule. (40 C.F.R. § 503.)

C. Groundwater and Surface Water Limitations

1. The discharge shall not

a. Pollute groundwater or surface waters.

b. Adversely affect beneficial uses of groundwater or cause an exceedance of any applicable Basin Plan water quality objectives for groundwater or surface water.

D. Effluent Limitations

1. The discharge shall not:

a. Exceed any of the applicable effluent limitations presented in Table 4. Effluent limitation selection is a two-step process. Step one is based upon the treatment technology employed; step two applies only to systems with a flow rate greater than 20,000 gpd and is based upon an evaluation of the need for a nitrogen effluent limit (as described in Attachment 1). Low and high threat are defined in Attachment 1. The limits presented below are average monthly limits unless otherwise specified.

Table 4: Effluent Limitations for Wastewater Treatment Systems

Step 1 - Effluent Limitations Based on Technology Performance		
Activated Sludge, MBR, or similar (not including residential aerobic treatment units)		
Constituent	Units	Limit
BOD	mg/L	30 (monthly average), 45 (7-day average)
TSS	mg/L	30 (monthly average), 45 (7-day average)
Wastewater Pond or Trickling Filter [1] (not including residential recirculating sand filters)		
Constituent	Units	Limit
BOD	mg/L	90 [2]
TSS	--	Not Applicable

Step 2 - Effluent Limits Based on Low/High Threat Situation (flow rate >20,000 gpd)		
Constituent	Units	Limit
Total N	mg/L	--
Low Threat	mg/L	50 % [3]
High Threat	mg/L	10

BOD denotes biochemical oxygen demand; TSS denotes total suspended solids; MBR denotes membrane biological reactor. Residential denotes a single family home, property caretaker's home, a home with an associated residence (e.g. mother in law unit), or similar, with a flow rate less than 400 gpd. "—" denotes not applicable.

1. Limit applies when treated wastewater is applied to an LAA or to a subsurface disposal system.
2. The limit is based on a 65-percent reduction of incoming BOD. An incoming BOD of 250 mg/L was used to calculate the value.
3. The value represents the minimum percent reduction compared to the untreated wastewater value. Reduction shall be calculated on an annual basis. In no case shall the reduction result in an effluent limit lower than 10 mg/L total nitrogen.

E. Provisions

1. Technical Report Preparation Requirements

a. **Within 90 days** of the issuance of an NOA, aside from residential septic tanks serving four or fewer residences, the Discharger shall prepare and implement a *Spill Prevention and Emergency Response Plan* (Response Plan) that describes operation and maintenance activities to prevent accidental releases of wastewater, and to effectively respond to such releases, minimizing the environmental impact. At a minimum, the Response Plan shall address the following:

i. Operation and Control of Wastewater Treatment - A description of the wastewater treatment equipment, operational controls, flow measurement and calibration procedures, and treatment system schematic including valve/gate locations.

ii. Sludge Handling - A description of the sludge handling equipment, operational controls, and disposal procedures.

iii. Collection System Maintenance - A description of collection system cleaning and maintenance, equipment tests, and alarm functionality tests to minimize the potential for wastewater spills originating in the collection system or headworks. For collection systems subject to State Water Board Order No. 2006-0003-DWQ, reports prepared to comply with the State Water Board Order No. 2006-0003-DWQ satisfy this requirement.

iv. Emergency Response - A description of emergency response procedures including for emergencies such as power outage, severe weather, flooding, or inadequate freeboard (for systems with wastewater or recycled water ponds). An equipment and telephone list for contractors/consultants, emergency personnel, and equipment vendors.

v. Notification Procedures - Coordination procedures with fire, police, Governor's Office of Emergency Services (CalOES), Regional Water Board, and local county health department personnel.

The Response Plan shall be maintained at the treatment facility and shall be presented to the Regional Water Board staff upon request.

b. **Within 90 days** of the issuance of an NOA containing an MRP, the Discharger shall prepare and implement a written sampling and analysis plan (SAP) sufficient to assure compliance with the terms of this General Order and the NOA. Anyone performing sampling on behalf of the Discharger shall be familiar with the SAP. SAPs shall address the need for sample filtration and how filtration will be accomplished. When sampling groundwater or liquid waste, the chemical constituents available to migrate shall be considered. In general, dissolved waste constituents can migrate through soil to groundwater or surface water. In cases where the waste only threatens groundwater, samples shall be filtered prior to chemical preservation, digestion, or analysis for some analytes. If overland flow of liquid waste to surface water is possible, the total constituent concentrations may be available for movement and analyses shall be conducted on unfiltered samples.

At a minimum, the SAP shall describe the following:

i. Sample chain-of-custody procedures and documentation.

ii. Sampling locations.

iii. Sampling frequencies.

iv. Sample handling/preservation procedures.

v. Analytical methods.

vi. Sample containers, preservatives, and holding times.

vii. For groundwater monitoring, well purging and field methods.

The SAP shall be maintained at the treatment facility and shall be presented to the Regional Water Board staff upon request or as required by the NOA.

c. **Within 90 days** of the issuance of an NOA directing preparation, the Discharger shall submit and implement a Sludge Management Plan. At a minimum, the plan shall describe the following:

   i. Estimate the amount of sludge and scum that will be generated.

   ii. Describe how sludge, scum, and supernatant will be stored and disposed of to protect groundwater quality.

   iii. If sludge will be subject to further treatment, describe the treatment and storage requirements.

   iv. Describe cleaning of digesters or storage vessels and the treatment and disposal of the residuals. If drying of residuals is planned, describe how that will be performed to prevent nuisance odors, prevent vectors, and protect groundwater quality.

   The Sludge Management Plan shall be maintained at the treatment facility and shall be presented to the Regional Water Board staff upon request or as required by the NOA.

d. If directed by the Regional Water Board Executive Officer pursuant to Water Code section 13267, a discharger shall prepare and submit a Salt and Nutrient Management Plan, to ensure that the overall impact of treated wastewater and/or water recycling projects does not degrade groundwater resources. Unless otherwise directed by the Regional Water Board Executive Officer, in lieu of developing an individual Salt and Nutrient Management Plan the discharger shall participate in a Regional Water Board's existing salt and nutrient management planning effort to meet the requirements of this provision.

2. For All Wastewater Systems:

a. Bypass (the intentional diversion of waste streams from any portion of a treatment facility) is prohibited. The Regional Water Board and/or the Executive Officer may take enforcement action against the Discharger for bypass unless:

   i. Unavoidable and/or Unscheduled Bypass

      1. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage. (Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production), and

2. There were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities or retention of untreated waste. This condition is not satisfied if adequate backup equipment or wastewater storage facilities should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that would otherwise occur during normal periods of equipment downtime or preventive maintenance; or

ii. Scheduled Bypass

1. Bypass is required for essential maintenance to assure efficient operation,
2. Neither effluent nor groundwater limitations are exceeded,
3. The Discharger notifies the Regional Water Board's Executive Officer **10 days** in advance, and
4. The prohibition against discharge to surface water is not violated.

b. A Discharger that wishes to establish the affirmative defense of an upset (see definition in Provision E.5.a) in an action brought for noncompliance shall demonstrate, through properly signed, contemporaneous operating logs, or other evidence, that all of the following is true:

i. An upset occurred and the cause(s) can be identified.

ii. The permitted facility was being properly operated at the time of the upset.

iii. The Discharger submitted notice of the upset as required in Provision E.3.a.

iv. The Discharger complied with any remedial measures required by this General Order, the NOA, or direction from the Regional Water Board's Executive Officer. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof.

c. A Discharger whose wastewater flow rate has been increasing, or is projected to increase, shall estimate when the flow rate will reach hydraulic and treatment capacities of its treatment, collection, and disposal facilities. The projections shall be made in January, based on the last 3 years average dry weather flow rates, peak wet weather flow rates, and total annual flow rates, as appropriate. When any projection shows that capacity of any part of the facilities may be exceeded in 4 years, the Discharger shall notify the Regional Water Board's Executive Officer by March 1st. Providing the notification in an annual report is acceptable.

d. The requirements prescribed herein do not authorize the commission of any act causing damage to the property of another, or protect the Discharger from liabilities under federal, state, or local laws. This General Order does not convey any property rights or exclusive privileges and does not create a vested right to continue to discharge wastewater.

e. This General Order does not relieve the Discharger from responsibility to obtain other necessary local, state, or federal permits to construct facilities necessary for compliance with this General Order, nor does this General Order prevent imposition of additional standards, requirements, or conditions by any other agency.

f. The prohibitions, requirements, limitations, and provisions of this General Order are severable. If any provision of this General Order is held invalid, the remainder of this General Order shall not be affected.

g. To the maximum extent possible, the wastewater system shall be sited and/or designed to prevent flood or surface water from inundating wastewater ponds or otherwise render the wastewater system inoperable. For design purposes, the most recent Federal Emergency Management Agency (FEMA) approved 100-year base flood elevations shall be used.

h. The Discharger shall ensure that all site operating personnel are familiar with the contents of the wastewater system NOA, this General Order, and the title 22 Engineering Report (for recycled water uses when applicable). A copy of this General Order, the NOA, and technical reports required by this General Order (not including previously submitted monitoring reports) shall be kept at the wastewater treatment facility for reference by operating personnel.

i. Access to the wastewater system shall be limited to authorized persons.

j. The Discharger shall comply with all of the conditions of this General Order. Any noncompliance with this General Order constitutes a violation of the Porter-Cologne Water Quality Control Act and/or appropriate Regional Water Board's Basin Plan and may be grounds for an enforcement action.

k. Wastewater facilities shall be supervised and operated by persons possessing a wastewater treatment operator certificate of the appropriate grade. (Cal. Code Regs., tit. 23, div. 3, ch. 26.) The definition of wastewater treatment plant in the wastewater treatment plant classification, operator certification, and contract operator registration regulations excludes treatment systems that use subsurface disposal.

l. The State Water Board will review this General Order periodically and will revise requirements when necessary.

m. After notice and opportunity for a hearing, coverage of this General Order may be terminated or modified for cause including, but not limited to, any of the following:

    i. Violation of any of the terms or conditions contained in this General Order.

    ii. Obtaining this General Order by misrepresentation, or failure to disclose fully all relevant facts.

    iii. A change in any condition that results in either a temporary or permanent need to reduce or eliminate the authorized discharge.

iv. A material change in the character, location, or volume of discharge.

n. Before making a material change in the character, location, or volume of discharge, the Discharger shall notify the Regional Water Board Executive Officer. A material change includes, but is not limited to, any of the following:

i. An increase in area or depth used for waste disposal beyond that specified in the NOA.

ii. A significant change in disposal method, location, or volume (e.g., change from land application to percolation pond).

The Regional Water Board's Executive Officer may require that an ROWD be submitted.

o. At least **90 days** prior to termination or expiration of any lease, contract, or agreement involving disposal or recycling areas or off-site reuse of effluent, used to justify the capacity authorized herein and assure compliance with this General Order, the Discharger shall notify the Regional Water Board's Executive Officer in writing of the situation and of what measures have been taken or are being taken to assure full compliance with this General Order and the NOA.

p. Except for material determined to be confidential in accordance with California law, all reports prepared in accordance with terms of this General Order shall be available for public inspection at the offices of the Regional Water Board. Data on waste discharges, water quality, geology, and hydrogeology are not confidential.

q. The Discharger shall take all reasonable steps to minimize any adverse impact to waters of the state resulting from noncompliance with this General Order. Such steps shall include accelerated or additional monitoring as necessary to determine the nature and impact of the noncompliance.

r. The Discharger shall maintain in good working order, and operate as efficiently as possible any facility, control system, or monitoring device installed to achieve compliance with this General Order and the NOA.

s. The Discharger shall permit representatives of the Regional Water Board and/or the State Water Board, upon presentation of credentials, to:

i. Enter premises where wastes are treated, stored, or disposed of, and facilities in which any records are kept.

ii. Copy any records required under terms and conditions of this General Order.

iii. Inspect at reasonable hours, monitoring equipment required by this General Order.

iv. Sample, photograph, and/or video record any discharge, waste material, waste treatment system, or monitoring device.

t. For any electrically operated equipment at the site, the failure of which would cause loss of control or containment of waste materials, or violation of this General Order, the Discharger shall employ safeguards to prevent loss of control over wastes. Such safeguards may include alternate power sources, standby generators, retention capacity, operating procedures, or other means.

u. The fact that it would have been necessary to halt or reduce the permitted activity to maintain compliance with this General Order shall not be a defense for the Discharger's violations of the General Order.

v. The discharge shall remain within the disposal area designated in the NOA at all times. (With the exception of activities allowed in an approved title 22 Engineering Report.)

w. In the event of any change in control or ownership of the facility or wastewater disposal areas, the Discharger must notify the succeeding owner or operator of the existence of this General Order by letter, a copy of which shall be immediately forwarded to the Regional Water Board's Executive Officer.

x. The Discharger shall pay an annual fee to the State Water Board in accordance with the fee schedule for each fiscal year. (Cal. Code Regs., tit. 23, § 2200.) Fees are based on threat to water quality and complexity ratings, will be determined based on information in the ROWD, and are subject to revision by the State Water Board. Annual invoices are issued by the State Water Board for the state fiscal year (July 1 to June 30).

3. General Reporting Requirements:

a. If the Discharger does not comply, or will be unable to comply, with a limit related to effluent quality, pond freeboard, flow rate, the title 22 engineering report requirements, or bypass or overflow issues, the Discharger shall notify the Regional Water Board staff by telephone. Current phone numbers for Regional Water Board offices may be found on the NOA or on the Internet at:

http://www.waterboards.ca.gov/about_us/contact_us/docs/rwqcbs_directory.pdf

Notification shall occur as soon as the Discharger or its agents have knowledge of such noncompliance or potential for noncompliance, and the Discharger shall confirm this notification in writing within **10 days**. The written notification shall state the date, time, nature, cause of noncompliance, immediate response action, and a schedule for corrective actions.

b. In the event of a wastewater containment failure, the Discharger shall immediately notify CalOES. Notification shall be provided as soon as possible and when the notice can be provided without substantially impeding cleanup or other emergency measures. (Wat. Code, § 13271.) A written report to the Regional Water Board's Executive Officer shall be submitted within **10 days** of the failure describing the cause of the failure and how a recurrence will be prevented. Such a failure shall be promptly corrected in accordance with the requirements of this General Order.

c. All reports submitted in response to this General Order, including monitoring reports, shall be signed by a person identified below:

   i. For a private residence: by the property owner of the residence.

   ii. For a corporation: by a principal executive officer of at least the level of senior vice-president.

   iii. For a partnership or sole proprietorship: by a general partner or the proprietor.

   iv. For a municipality, state, federal, or other public agency: by either a principal executive officer or ranking elected or appointed official.

   v. A duly authorized representative of a person described above if all of the following are completed:

      1) The authorization is made in writing by a person described above.

      2) The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of plant manager, operator of a waste management unit, superintendent, or position of equivalent responsibility. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.)

      3) The written authorization is submitted to the Regional Water Board.

   Any person signing a document under this section shall make the following certification:

   > "I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."

d. The Discharger shall mail a copy of each monitoring report and any other reports required by this General Order to the appropriate Regional Water Board or provide electronic submittals of reports or data as specified by the Regional Water Board. Contact and mail address information is available on the NOA or at:

   http://www.waterboards.ca.gov/about_us/contact_us/docs/rwqcbs_directory.pdf

4. Monitoring Requirements

a. The Discharger shall comply with the MRP issued with the NOA, and any future revisions, as specified by the appropriate Regional Water Board's Executive Officer. A model MRP is provided as Attachment C. However, the Executive Officer may modify or replace the MRP for site-specific treatment and disposal conditions when issuing the NOA, or revise the MRP when deemed necessary.

b. Unless otherwise approved by the Regional Water Board's Executive Officer, all analyses shall be conducted at a laboratory certified for the analyses by the DDW Environmental Laboratory Accreditation Program. If a certified laboratory is not available to the Discharger, analyses performed by a noncertified laboratory will be accepted provided an acceptable Quality Assurance/Quality Control Program is instituted by the laboratory. A manual containing the steps followed in this program must be kept in the laboratory and shall be available for inspection by Regional Water Board staff. The Quality Assurance/Quality Control Program must conform to USEPA guidelines or to procedures approved by the Regional Water Board.

c. The results of any monitoring done more frequently than required by an MRP shall be reported in the next regularly scheduled monitoring report. Values obtained through additional monitoring shall be used in calculations as appropriate.

d. Treated wastewater samples shall be collected downstream of all treatment works where a sample representative of the discharge can be obtained prior to disposal. In some cases, it may be necessary to collect samples for different analyses from different sampling locations (e.g. immediately downstream of a disinfection system for pathogens).

e. The Discharger shall furnish, within a reasonable time, any information the Regional Water Board's staff may request to determine whether cause exists for modifying, revoking, reissuing, or terminating the Discharger's coverage under this General Order. The Discharger shall also furnish to the Regional Water Board's staff upon request, copies of records required to be kept by this General Order.

f. All noncompliance issues shall be reported with the next regularly scheduled monitoring report in addition to any other reporting requirements.

g. The Discharger shall retain records of all monitoring information, including all calibration and maintenance records, all original strip chart recordings of continuous monitoring instrumentation, copies of all reports required by this General Order, and records of all data used to complete the application for this General Order. Records shall be maintained for a minimum of **3 years** from the date of the sample, measurement, report, or application. This period may be extended during the course of any unresolved litigation regarding this discharge or when requested by the Regional Water Board's Executive Officer.

h. All monitoring and analysis instruments and devices used by the Discharger to fulfill the prescribed MRP shall be properly maintained and calibrated as recommended by the manufacturer to ensure their continued accuracy.

i. The Discharger shall construct all groundwater monitoring wells to meet or exceed the standards stated in Department of Water Resources' Bulletins 74-81, 74-90, and subsequent revisions unless deviation is approved by the Regional Water Board's staff or local well construction enforcing agency, and shall comply with the reporting provisions for wells. (Wat. Code, § 13751.)

5. Definitions

a. Upset means an exceptional incident in which there is unintentional and temporary noncompliance with effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper action.

b. The monthly average flow rate is the total discharge by volume during a calendar month divided by the number of days in the month that the facility was discharging. This number shall be reported in gpd or million gallons per day.

c. The monthly average concentration is the arithmetic mean of measurements recorded during a calendar month. If only one sample is collected in a calendar month, then that sample measurement is the monthly average concentration.

d. The daily maximum concentration is the highest measurement recorded for any grab or composite sample collected during a day in a calendar month.

e. The 7-day median total coliform organism value shall be calculated as the median concentration of the results for the last 7 calendar days. If only one sample is collected within a 7-day period, then that one sample becomes the 7-day median value.

f. A grab sample is an individual sample collected in less than 15 minutes.

g. Unless otherwise specified, a composite sample is a combination of individual samples collected over the specified sampling period. The method of compositing shall be reported with the results.

h. A time-weighted sample is collected at equal time intervals, with a maximum interval of one hour.

i. A flow-weighted sample is collected at varying time intervals (average interval one hour or less) so that each sample represents an equal portion of the cumulative flow. The duration of the sampling period shall be specified in the MRP.

j. A day is the mean solar day of 24 hours beginning at mean midnight. All references to day in this General Order are calendar days.

CERTIFICATION

I, Jeanine Townsend, Clerk to the Board, do hereby certify that this General Order with all attachments is a full, true, and correct copy of a General Order adopted by the State Water Board, on September 23, 2014.

AYE:	Chair Felicia Marcus Vice Chair Frances Spivy-Weber Board Member Tam M. Doduc Board Member Steven Moore Board Member Dorene D'Adamo

ATTACHMENT 1
NITROGEN EFFLUENT LIMIT EVALUATION
ORDER WQ 2014-0153-DWQ
GENERAL WASTE DISCHARGE REQUIREMENTS
FOR SMALL DOMESTIC WASTEWATER TREATMENT SYSTEMS

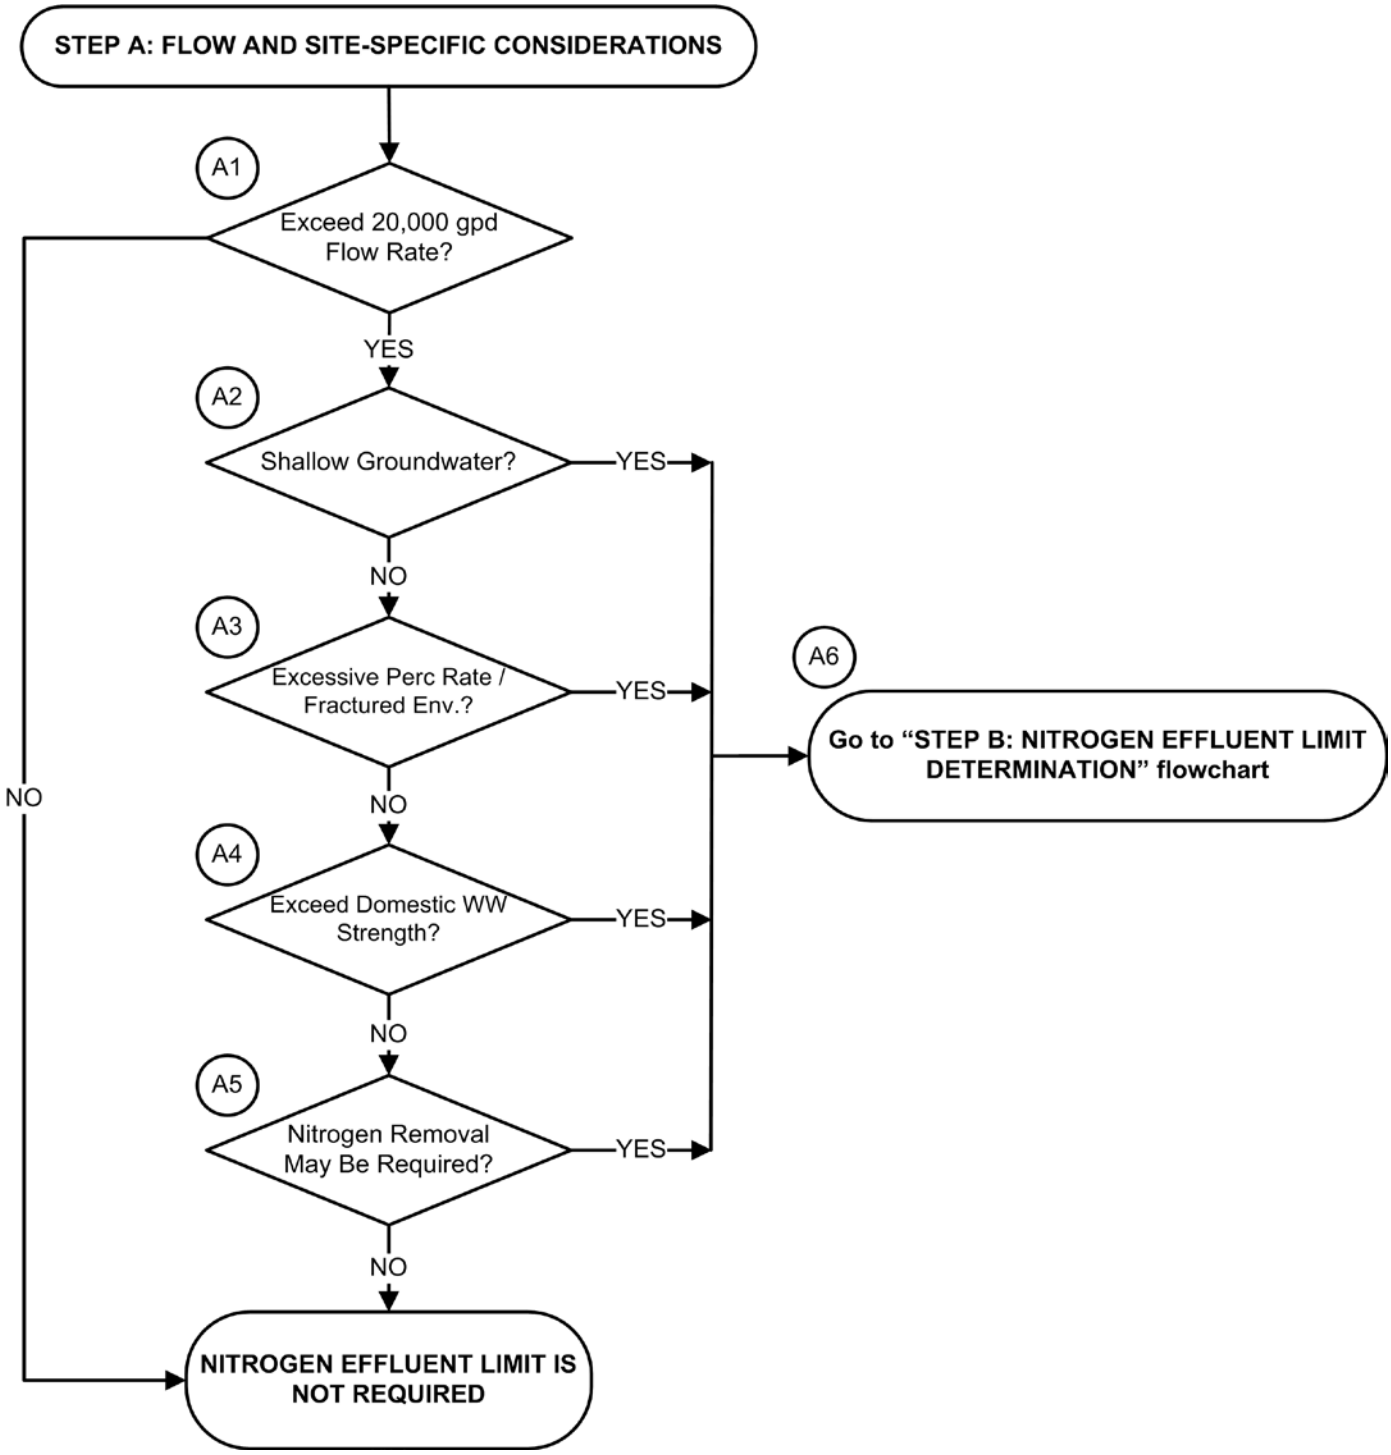
Introduction

The nitrogen effluent limit will only be imposed where required to protect beneficial uses of groundwater and surface water and shall not be selected as a default to add water quality protection where the added expense of nitrogen control is not required. It is the discharger's responsibility to provide adequate information to allow the evaluation of the need for additional treatment.

Each of the five site-specific considerations listed below shall be considered when evaluating a discharge and the need for nitrogen control. The site-specific conditions are further discussed on the explanation sheets. If each of the site-specific considerations is favorable (as discussed individually below), the facility is not required to meet an effluent limit for nitrogen.

The attached flow charts provide a method to evaluate the discharge and the receiving environment to determine the applicability of a nitrogen effluent limit. Evaluation of the need for a nitrogen effluent limit is a two-step process. In the first step, applicability of a nitrogen effluent limit is determined based on the flow rate and site-specific characteristics of the receiving environment; in the second step effluent limits are selected based on further evaluation of level of threat related to the site-specific characteristics of the discharge and the receiving environment.

To begin the evaluation start at "Step A: Flow and Site-Specific Considerations," on the following page.



STEP A: FLOW AND SITE-SPECIFIC CONSIDERATIONS
A1
Exceed 20,000 gpd Flow Rate?
YES
A2
Shallow Groundwater?
YES
NO
A3
Excessive Perc Rate / Fractured Env.?
YES
NO
A4
Exceed Domestic WW Strength?
YES
NO
A5
Nitrogen Removal May Be Required?
YES
NO
NO
A6
Go to "STEP B: NITROGEN EFFLUENT LIMIT DETERMINATION" flowchart
NITROGEN EFFLUENT LIMIT IS NOT REQUIRED

Step A – Flow and Site-Specific Considerations

The following considerations shall be evaluated to determine if a nitrogen effluent limit is appropriate.

A1 *Exceed 20,000 gpd Flow Rate?* The General Order allows a flow rate up to 100,000 gpd. However, discharges with flow rates less than 20,000 gpd are not required to meet a nitrogen effluent limit.

A2 Shallow Groundwater? Shallow groundwater conditions are defined by the OWTS Policy Table 2, *Minimum Depth to Groundwater and Minimum Soil Depth from the Bottom of the Dispersal System* (reproduced as Table 5 below).

Table 5: Minimum Depth to Groundwater and Minimum Soil Depth from the Bottom of Dispersal System

Percolation Rate [a]	Depth to Groundwater [b]
Perc Rate ≤ 1 MPI	Additional Treatment Required
1 MPI ≤ Perc Rate ≤ 5 MPI	20 Feet
5 MPI ≤ Perc Rate ≤ 30 MPI	8 Feet
30 MPI ≤ Perc Rate ≤ 120 MPI	5 Feet
Perc Rate ≥ 120 MPI	Engineered Disposal Required

a. Perc Rate denotes percolation rate. MPI denotes minutes per inch.

b. The minimum depth to groundwater is measured from the base of the infiltration surface to the seasonally high groundwater table or first saturated interval.

A3 *Excessive Percolation Rate / Fractured Environment?* An excessive percolation rate is defined as a combination of percolation rate and depth to groundwater that does not comply with the conditions presented in Table 5.

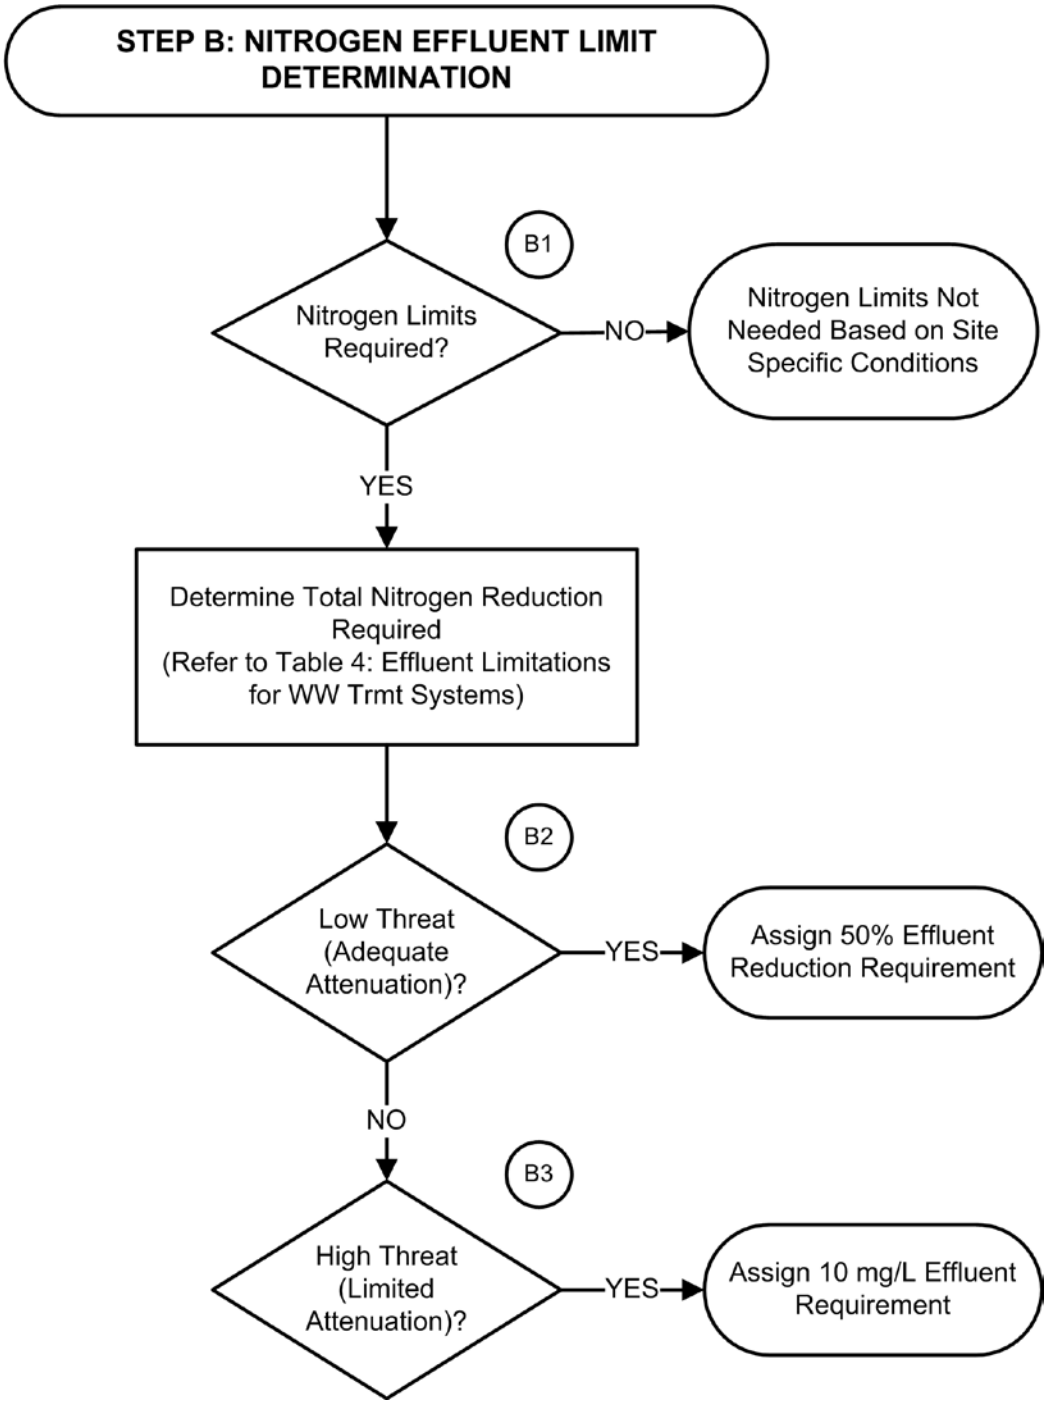
A fractured environment is defined as less permeable rock with porosity resulting from fractures that allows groundwater to flow through the fractures and has either of the following: a) No unconsolidated soil cover, or b) Unconsolidated soil cover that possesses an excessive percolation rate (that does not comply with the conditions defined in Table 5.

A4 *Exceed Domestic Wastewater Strength?* Typical domestic wastewater strength is presented in Finding 8 of the General Order. Alternative domestic wastewater strengths may be based upon other per capita flow rate assumptions. The data presented in the General Order may be used; alternative characterizations from textbook and/or governmental organizations (e.g. U.S. Environmental Protection Agency) may be acceptable at the discretion of Regional Water Quality Control Board (Regional Water Board) staff.

Some domestic wastewater streams (domestic wastewater originating in factory or warehouse situations) may exceed the typical municipal wastewater strengths due to a lack of diluting flows from showers, dishwashers, etc. Such flows are not excluded from coverage by the General Order; however, the discharge shall be evaluated to determine if nitrogen effluent limits are appropriate.

A5 *Nitrogen Removal May Be Required?* If the Regional Water Board Basin Plan or groundwater studies indicate that nitrogen is a constituent of concern, then nitrogen reduction may be required. The appropriate limit shall be based on site conditions as evaluated in Step B.

A6 *Go to "NITROGEN EFFLUENT LIMIT DETERMINATION" flowchart:* If the preliminary evaluation (Step A) indicates a nitrogen effluent limit may be required, proceed to the Nitrogen Effluent Limit Determination flowchart to determine if an effluent limit for nitrogen is required.



STEP B: NITROGEN EFFLUENT LIMIT DETERMINATION
B1
Nitrogen Limits Required?
NO
Nitrogen Limits Not Needed Based on Site Specific Conditions
YES
Determine Total Nitrogen Reduction Required (Refer to Table 4: Effluent Limitations for WW Trmt Systems)
B2
Low Threat (Adequate Attenuation)?
YES
Assign 50% Effluent Reduction Requirement
NO
B3
High Threat (Limited Attenuation)?
YES
Assign 10 mg/L Effluent Requirement

Step B – Nitrogen Effluent Limit Evaluation

If a Regional Water Board's Basin Plan addresses the area where the site is located, the nitrogen control measures shall be consistent with the Basin Plan.

If the Step A evaluation indicated additional treatment for nitrogen control may be necessary, continue the evaluation at "Step B, Nitrogen Effluent Limit Determination."

B1 *Nitrogen Limits Required?* The initial evaluation of the need for nitrogen control (discussed in Item A5) shall include comparison of the wastewater effluent quality to groundwater quality and the potential for the wastewater discharge to cause or contribute to a condition of pollution or nuisance. The benefits of nitrogen control should be balanced with the cost of implementing nitrogen control.

Measures implemented to protect groundwater quality (e.g. equipping a pond with a synthetic or low permeability liner to reduce infiltration, using supplemental water to reduce LAA loading rates, or agronomic application of nitrogen) should be considered when determining the need for nitrogen effluent limits.

B2 *Low-Threat (Adequate Attenuation)?* In low-threat situations, the 50 percent nitrogen removal (in effluent prior to discharge) is appropriate. Low-threat situations are those where additional nitrogen removal will occur in the dispersal area (e.g. land application crop uptake, denitrification, shallow dispersal area, etc.) or where adequate attenuation exists based on other conditions such as depth to groundwater.

B3 *High-Threat (Limited Attenuation)?* In high-threat situations, the 10 milligrams per liter (mg/L) effluent limit is appropriate. High-threat situations are those where limited nitrogen removal will occur in the dispersal area or in limited attenuation situations (e.g. shallow depth to groundwater, fractured aquifer, potential for groundwater to migrate to surface water bodies with limited attenuation, etc.).

INFORMATION SHEET SUMMARY
STATE WATER RESOURCES CONTROL BOARD
ORDER WQ 2014-0153-DWQ
GENERAL WASTE DISCHARGE REQUIREMENTS
FOR SMALL DOMESTIC WASTEWATER TREATMENT SYSTEMS

The attachments to this Information Sheet will help Dischargers understand the process of obtaining coverage under these *General Waste Discharge Requirements for Discharges to Land by Small Domestic Systems* (General Order). The attachments describe the permitting process and the information needed by Regional Water Quality Control Board (Regional Water Board) staff to prepare a Notice of Applicability (NOA), which provides the Discharger coverage under the General Order. Although not required, organization of the technical report described in Attachment B1 in the format presented in the attachment will allow streamlined review of the facility information and may reduce the time required to prepare an NOA. Some Regional Water Boards have implemented procedures for electronic submittal of technical reports and monitoring data. The Dischargers shall comply with those submittal requirements when applicable.

The Discharger is encouraged to contact the Regional Water Board staff early in the process to discuss their conceptual wastewater plan. Attachment A shows the generalized permitting process; it is recommended each of the items in the box labeled “Contact Regional Water Board to Discuss” be listed on a meeting agenda so that they are adequately discussed.

The *Conceptual Wastewater Plan* listed on Attachment A shall be complete enough for a meaningful discussion with the Regional Water Board staff so that any significant issues can be identified early in the process. However, the details of the *Conceptual Wastewater Plan* are unlikely to be finalized at this stage of the process. Determinations regarding the *Conceptual Wastewater Plan* may require additional investigation by the Discharger before the Regional Water Board staff can provide definitive answers to questions about the *Conceptual Wastewater Plan*.

Questions the Discharger may have regarding any of the attachments (such as the report requirements described in Attachment B1) should also be discussed at the meeting. At the conclusion of the meeting, the Discharger should understand how their system will be evaluated using the General Order Attachment 1, *Nitrogen Effluent Limit Evaluation*, and if any additional investigations are required to provide a complete Report of Waste Discharge.

The attachments included in this Information Sheet consist of the following:

Name	Title
Attachment A	Generalized Permit Application Process Summary
Attachment B1	Recommended Report of Waste Discharge Format
Attachment B2	Safe Wastewater Disposal for Recreational Vehicles
Attachment C	Model Monitoring and Reporting Program

ATTACHMENT A - INFORMATION SHEET

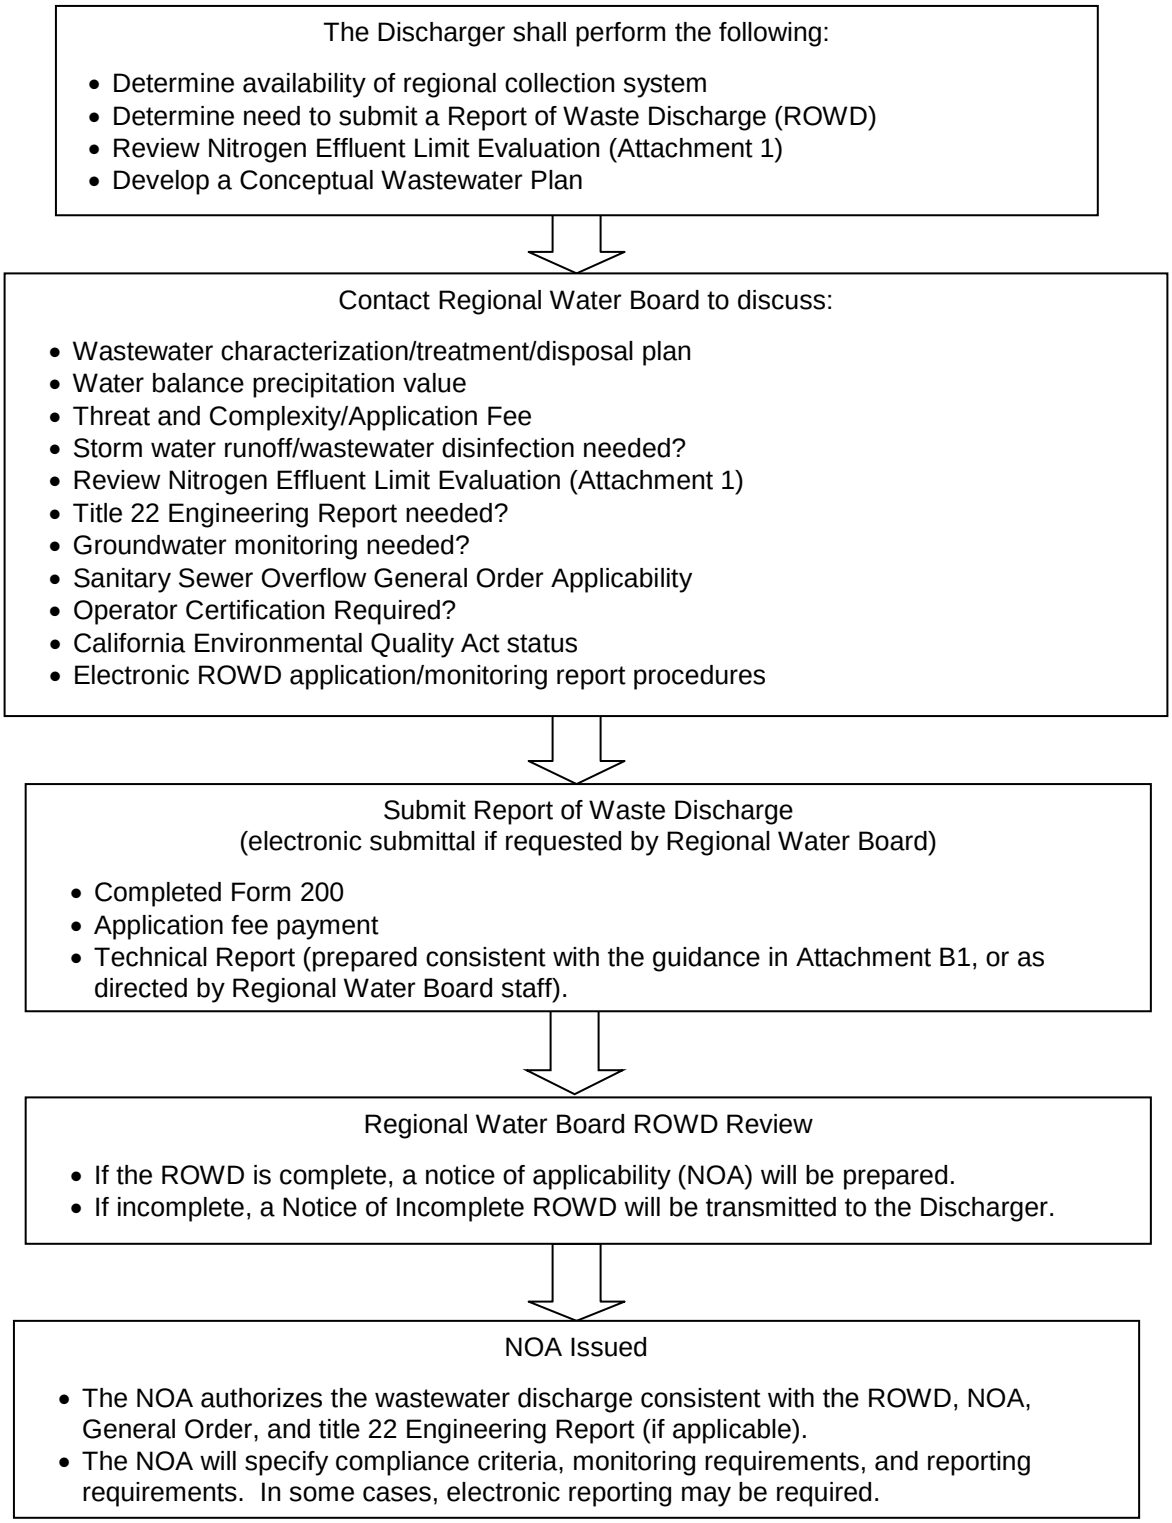
ORDER WQ 2014-0153-DWQ
GENERAL WASTE DISCHARGE REQUIREMENTS
FOR SMALL DOMESTIC WASTEWATER TREATMENT SYSTEMS



ATTACHMENT B1 – INFORMATION SHEET
RECOMMENDED REPORT OF WASTE DISCHARGE FORMAT
STATE WATER RESOURCES CONTROL BOARD
ORDER WQ 2014-0153-DWQ
GENERAL WASTE DISCHARGE REQUIREMENTS FOR SMALL DOMESTIC WASTEWATER TREATMENT SYSTEMS
GENERAL INFORMATION FOR DISCHARGER

The information presented in the Report of Waste Discharge (ROWD) is relied upon by staff to prepare the Notice of Applicability (NOA) for coverage by this General Waste Discharge Requirements for Order (General Order). The Discharger shall ensure that the information presented in the ROWD is accurate. Misstatements, errors, or omissions that exist in the ROWD may be included in the NOA and become enforceable.

Waste Discharge Requirements (WDRs) are generally updated at 10 or 15 year intervals depending on the waste's potential to impact water quality. The ROWD shall state realistic growth projections. Underestimating growth may result in additional or more frequent permitting requirements. Overestimating growth will result in the need for the Discharger to prepare more treatment, storage, and disposal capacity than might otherwise be immediately required.

The ROWD outline presented below is intended to provide general guidance for Dischargers and consultants. Submitting an ROWD consistent with the format will help the Discharger include all of the information that Regional Water Quality Control Board (Regional Water Board) staff need and will expedite review of the document and speed the permitting process. Contacting your Regional Water Board representative to discuss the project before preparing the ROWD is recommended.

1. BACKGROUND

   1.1. Wastewater system description

      1.1.1. Briefly, describe what the wastewater system is and how wastewater is generated.

      1.1.2. Provide a site location map and a site plan.

      1.1.3. Provide information on the location of wastewater system buildings, wastewater treatment system components, groundwater wells, and surface water bodies.

      1.1.4. Provide the Assessor's Parcel Number(s), section number(s), and Township and Range.

      1.1.5. Describe the water supply to the residence(s), business(es), and/or other facilities being served by the wastewater system.

   1.2. Service area description

      1.2.1. Describe the proximity of the wastewater system to an existing regional collection system; if nearby, discuss why connection to the regional system cannot be accomplished. If located within a regional system service area, or in close proximity to a collection system, provide written documentation that a good faith effort to connect to the regional system was made and that the request was not approved.

1.2.2. Wastewater collection system (describe the following). For collection systems subject to State Water Board Order No. 2006-0003-DWQ, reports prepared to comply with the State Water Board Order No. 2006-0003-DWQ satisfies this requirement and may be submitted as part of the ROWD technical report.

1.2.2.1. Age and condition of collection system.

1.2.2.2. Piping construction and layout (show on map).

1.2.2.3. Lift stations and backup pumping systems.

1.2.2.4. Failure warning system.

1.2.2.5. Inflow and infiltration (I/I) estimates (and any control that is necessary).

1.2.2.6. Maintenance of collection system and spill response.

1.2.3. Storm water collection system

1.2.3.1. Storm water collection area (show on map).

1.2.3.2. Storm water disposal area in relation to wastewater disposal area.

1.2.3.3. Storm water disposal permit (if needed).

2. WASTEWATER CHARACTERIZATION AND TREATMENT

2.1. Domestic wastewater characterization (untreated wastewater).

2.1.1. Describe the generation of wastewater (retirees, families, recreational vehicle [RV], institution, etc.).[9] If RV waste is allowed, describe educational and institutional controls in place to minimize the potential for deleterious RV waste constituents to be discharged to the wastewater system.

2.1.2. Domestic wastewater flow rate (describe how determined). Describe any special events or seasonal variations that cause high wastewater flow rates or other sources of wastewater (e.g. swimming pool filter, potable water treatment backwash water, well attended festivals, etc.).

2.1.3. Characterize domestic wastewater for Biochemical Oxygen Demand (BOD), Total Suspended Solids (TSS), electrical conductivity, nitrogen, sodium, chloride, and specific constituents of concern as needed based on site activities. Characterize wastewater for holding tank chemicals identified in the General Order (and others as appropriate) if RV waste is discharged to the system.

2.2. Wastewater treatment system

2.2.1. Provide a wastewater treatment schematic.

[9] Recreational vehicle (RV) holding tank connections, RV waste dump stations, etc. create special conditions for treatment and monitoring. Please refer to the General Order for more information.

2.2.2. Describe wastewater pretreatment components.

2.2.2.1. Domestic wastewater pretreatment systems (e.g. septic tank effluent pump system, grease traps, etc.).

2.2.2.2. Describe storage, treatment, and disposal of pretreatment residuals.

2.2.3. Describe preliminary treatment activities (e.g., screening, comminution, grit removal).

2.2.3.1. Describe storage, treatment, and disposal of preliminary treatment residuals.

2.2.4. Describe primary treatment activities (remove settleable/flotable matter)

2.2.4.1. Describe storage, treatment, and disposal of primary treatment residuals.

2.2.5. Describe treatment technology (e.g., activated sludge, membrane biological reactor, aerated lagoon, oxidation ditch, Imhoff tank, septic tank, etc.) include engineered design capacity in description.

2.2.5.1. Describe storage, treatment, and disposal of treatment residuals (e.g. sludge, septage, etc.).

2.2.6. Size and location of treatment equipment (e.g. septic tank volume, package treatment plant, membrane biological reactor, pond size include acreage and storage capacity, pond liners, and number and horsepower of aerators, etc.).

2.2.7. Disinfection system equipment

2.2.8. Storage facilities

2.2.8.1. If wastewater will be stored prior to disposal, describe the size and location of wastewater storage ponds, include a map showing all the ponds and describe them as lined or not. Describe the materials, age, and condition of any liners.

2.2.9. Predicted wastewater effluent quality

2.2.9.1. Characterize the wastewater for TSS, BOD, total coliform organisms (if needed), and specific constituents of concern as needed. If RV waste is discharged to the system, characterize for holding tank chemicals identified in the General Order (and others as appropriate).

2.2.10. Treated effluent disposal method

2.2.10.1. Describe how treated wastewater will be dispersed (land application area, leach field, percolation pond).

2.2.10.2. Describe the proposed disposal area (and the 100-percent replacement area when needed, such as for a leach field disposal system) include acreage, surrounding land use, depth to groundwater, and the proximity of drainage ways, surface waters, and municipal, industrial, or agricultural wells.

2.2.10.2.1. If land application is proposed, describe how storm water that falls on the land application area (LAA) is handled. If storm water is allowed to run off the LAA, contact your Regional Water Board representative to discuss wastewater disinfection requirements.

2.2.10.2.2. Provide a water balance that demonstrates adequate storage/disposal capacity. Identify the safety factors used in the calculations. Please contact your Regional Water Board representative to determine the precipitation values to be included in the water balance. Typically, the 100-year return annual total precipitation value, distributed monthly in accordance with average (mean) precipitation values monthly is required. Some exemptions for existing ponds or sites that develop an acceptable *Spill Prevention and Emergency Response Plan* may apply. Rainfall depth duration frequency data is available on the Department of Water Resources Internet web page at:

<http://www.water.ca.gov/floodmgmt/hafoo/hb/csm/engineering/>

2.2.10.2.3. Support the assumptions and calculations in the water balance with adequate information. Information may include published infiltration values, site-specific percolation tests, application rates, or other sources. Cite the information source used; if a site-specific investigation, provide a copy of the report.

2.2.10.2.4. The use of subsurface disposal including leach fields and/or seepage pits serving more than 20 people, or systems that accept non-sanitary waste (generated by manufacturing, contains biocidal agents such as RV or portable toilets, etc.) must comply with the United States Environmental Protection Agency Underground Injection Control requirements. Please refer to General Order Requirement B.6.g and http://www.epa.gov/region9/ water/groundwater/uic.html to determine if federal requirements apply to the proposed project. If registration is required, documentation of registration shall be provided in the ROWD.

2.3. Recycled Water Projects

2.3.1. If treated wastewater will be applied for beneficial uses (such as those described in title 22 water recycling criteria), provide a title 22 Engineering Report and the State Water Board Division of Drinking Water (DDW) (formerly the California Department of Public Health (CDPH) review/approval letter. Guidance for preparation of a title 22 Engineering Report is available on the Internet at: http://www.cdph.ca.gov/certlic/drinkingwater/Documents/Recharge/ERGUIDE2001.PDF

2.3.1.1. Describe how any DDW requirements will be implemented in the project.

2.3.1.2. If needed, describe the disinfection requirements for the planned reuse.

2.4. Operation and Maintenance

2.4.1. Describe routine operation and maintenance procedures

2.4.2. Treatment operator training and qualifications requirements

2.4.3. Contingency plans for repairs/spills/treatment issues

3. GROUNDWATER QUALITY

3.1. Depending upon the threat to groundwater quality, groundwater monitoring may be required. Please contact your Regional Water Board representative to determine if groundwater monitoring is required.

4. CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)

4.1. Some existing Small Domestic Systems will be determined to be categorically exempt from the California Environmental Quality Act (CEQA) under Title 14, section 15301 (ongoing or existing projects), section 15302 (replacement or reconstruction of existing utility systems), and section 15303 (new construction or conversion of small structures). The potential for categorical exemptions shall be examined and discussed with the Regional Water Board representative prior to submitting an ROWD.

4.2. New or expanding Small Domestic Systems will likely require CEQA evaluation that should be performed by local agencies. The CEQA evaluation shall be submitted with the ROWD. At a minimum, the evaluation shall include the Initial Study, a list of any adopted mitigation measures related to water quality, and the Notice of Determination.

4.2.1. The ROWD must include a description of how any water quality related mitigation measures will be implemented.

5. ADDITIONAL TECHNICAL REPORTS

5.1. If required by the General Order, a *Sludge Management Plan* shall be submitted with the ROWD.

5.1.1. Estimate the amount of sludge and scum that will be generated.

5.1.1.1. Describe how sludge, scum, and supernatant will be stored and disposed of to protect groundwater quality.

5.1.1.2. If sludge will be subject to further treatment, describe the treatment and storage requirements.

5.1.1.3. Describe cleaning of digesters or storage vessels and the treatment and disposal of the residuals. If drying of residuals is planned, describe how that will be performed to prevent nuisance odors, prevent vectors, and protect groundwater quality.

ATTACHMENT B2 – INFORMATION SHEET
SAFE WASTEWATER DISPOSAL FOR RECREATIONAL VEHICLES
STATE WATER RESOURCES CONTROL BOARD
ORDER WQ 2014-0153-DWQ
GENERAL WASTE DISCHARGE REQUIREMENTS
FOR SMALL DOMESTIC WASTEWATER TREATMENT SYSTEMS

EPA

United States Environmental Protection Agency | Region 9 Ground Water Office (WTR-9) | EPA 909-F-99-002 JULY 1999

ALERT FOR RV, BOAT AND MOBILE HOME OWNERS AND PARK OPERATORS
ABOUT SAFE WASTEWATER DISPOSAL

If you spend any time in a recreational vehicle (RV) or boat, you probably know of the problem of odors from sewage holding tanks. There are a number of commercial products available to control those odors. Some of those products contain chemicals which may pollute water resources. If you use those chemicals and then empty your holding tank into a septic system (or other onsite wastewater treatment system) or dispose of holding tank waste illegally, you may be creating health and environmental hazards. These chemicals and their by-products may pass through onsite wastewater treatment systems, flowing to soil, ground water, and possibly nearby surface waters. They may also corrode treatment system parts, creating a safety hazard.

How septic systems work. A typical septic system contains two major components: a septic tank and an absorption field, also known as a drainfield or leachfield. These systems use natural processes to treat wastewater onsite, as opposed to offsite at a municipal wastewater treatment plant. The purpose of the septic tank is to separate solids from the liquid waste, and to promote partial breakdown of contaminants by microorganisms (bacteria) naturally present in wastewater. The leachfield also treats the wastewater through physical, biological and chemical processes in the soil.

Mixing chemicals with waste in sewage holding tanks or septic systems may produce toxic fumes, corrode pipelines and tanks, and pollute soil and ground water when discharged.

When chemicals, such as formaldehyde, are added to septic systems, they can cause bacteria in the system to die. When this happens, the septic system cannot treat waste adequately. Solids that are allowed to pass from the septic tank, due to inadequate or incomplete treatment, may clog the leachfield. Furthermore, clogged systems may send inadequately or incompletely treated sewage to the surface, threatening the health of people or pets who come into contact with it. Or it may percolate to ground water, where the chemicals and untreated wastewater could contaminate nearby drinking water wells, rivers and streams. Please ***read labels carefully*** to identify any hazardous ingredients.

The restoration of contaminated ground water is extremely costly and can take years. To prevent problems, RV and mobile home parks, as well as dump station operators, may take measures to control hazardous chemical disposal into their waste treatment systems. If they do not, and their system causes contamination, they may be forced to **close the dump station or the park** until the problem can be corrected.

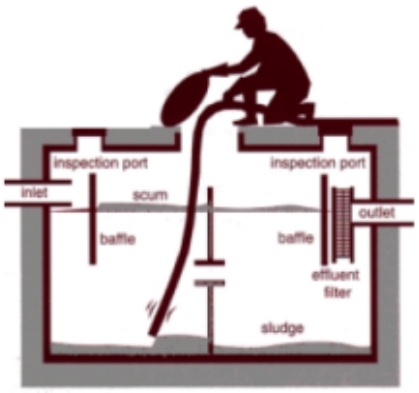
DO NOT USE CHEMICALS WHICH HARM SEPTIC SYSTEMS

Formaldehyde: active ingredient in some deodorizers, also called Formalin. Formaldehyde is an EPA-recognized probable carcinogen (i.e., causes cancer).

Para-dichlorobenzene: Known carcinogen and drinking water contaminant. Common ingredient in mothballs, urinal cakes and bowl fresheners.

OTHER CHEMICALS TO BEWARE OF INCLUDE heavy metals (such as Zinc), benzene, toluene, xylene, ethylene glycol (anti-freeze), methylene chloride, 1,1,1-trichloroethane (TCA), trichlorethylene (TCE) and perchloroethylene (PCE). Strong acids and bases, such as sulfuric acid or caustic soda, can destroy biological activity and damage tanks and pipes.

$ A healthy, well-maintained and appropriately sized septic tank will generally require less pumping over its service life, saving time and money.



NATIONAL SMALL FLOWS CLEARINGHOUSE

REPORT SEWAGE SPILLS and other health hazards to the local health department. Keep People and Pets Away!

PARK OPERATORS:

The United States Department of Health, Education and Welfare said in 1957 that "... there are no known chemicals, yeasts, bacteria, enzymes or other substances capable of eliminating or reducing the solids and scum in a septic tank" and according to EPA, this is still true. No products have been verified by EPA to eliminate the need for routine maintenance, and some may actually accelerate system failure by allowing solids to clog the dispersal system; while the products may claim to "remove" sludge, they may just "move" sludge. Tanks should be checked routinely (see photo) for solids and scum buildup. Sludge Removal (pumpouts) may be needed more often for RV, Mobile Home and Boat waste systems than for single-family septic systems, especially if your tanks are undersized and/or your residents are conservative with water. Oversizing your tanks, or adding additional tanks, may allow greater waste stabilization. Consult a wastewater professional.

X Cloggers
diapers, cat litter, cigarette filters, coffee grounds, grease, etc.

X Killers
household chemicals, gasoline, motor oil, pesticides, antifreeze, paint, etc.

RVers CAN HELP... Here's How:

- Minimize your need of holding tank deodorizers by using rest stop facilities when you can.

- If you must use a holding tank deodorizer, read the label carefully. **Biodegradable** (enzyme and citrus-based) products are available. Whichever product you choose, **follow label directions** and add no more than recommended amounts.

- Some products that claim to be flushable, such as some types of cat litter, may clog hoses and septic tanks; use toilets for waste and toilet paper only.

- Ask questions of your park manager about drinking water and wastewater management. Sanitation costs can be minimal, but not free.

- Educate other RVers. Don't be shy about health.

ATTACHMENT C – INFORMATION SHEET
MODEL MONITORING AND REPORTING PROGRAM
STATE WATER RESOURCES CONTROL BOARD
ORDER WQ 2014-0153-DWQ
GENERAL WASTE DISCHARGE REQUIREMENTS
FOR SMALL DOMESTIC WASTEWATER SYSTEMS

This Monitoring and Reporting Program (MRP) describes requirements for monitoring a wastewater treatment system. This MRP is issued pursuant to Water Code section 13267. The Discharger shall not implement any changes to this MRP unless and until a revised MRP is issued by the Regional Water Quality Control Board (Regional Water Board) Executive Officer.

The State Water Resources Control Board (State Water Board) and Regional Water Boards are transitioning to the paperless office system. In some regions, Dischargers will be directed to submit reports (both technical and monitoring reports) to the State Water Board's GeoTracker database over the Internet in portable document format (pdf). In addition, analytical data shall be uploaded to the GeoTracker database under a site-specific global identification number. Information on the GeoTracker database is provided on the Internet at:

<http://www.waterboards.ca.gov/ust/electronic_submittal/index.shtml>

Water Code section 13267 states, in part:

> "In conducting an investigation specified in subdivision (a), the regional board may require that any person who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge waste within its region, or any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge, waste outside of its region that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the regional board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports. In requiring those reports, the regional board shall provide the person with a written explanation with regard to the need for the reports, and shall identify the evidence that supports requiring that person to provide the reports."

Water Code section 13268 states, in part:

> "(a) Any person failing or refusing to furnish technical or monitoring program reports as required by subdivision (b) of section 13267, or failing or refusing to furnish a statement of compliance as required by subdivision (b) of section 13399.2, or falsifying any information provided therein, is guilty of a misdemeanor and may be liable civilly in accordance with subdivision (b).
>
> (b)(1) Civil liability may be administratively imposed by a regional board in accordance with article 2.5 (commencing with section 13323) of chapter 5 for a violation of subdivision (a) in an amount which shall not exceed one thousand dollars ($1,000) for each day in which the violation occurs."

The Discharger owns and operates the wastewater system that is subject to the Notice of Applicability (NOA) of Water Quality Order 2014-0153-DWQ. The reports are necessary to ensure that the Discharger complies with the NOA and General Order. Pursuant to Water Code section 13267, the Discharger shall implement this MRP and shall submit the monitoring reports described herein.

All samples shall be representative of the volume and nature of the discharge or matrix of material sampled. The name of the sampler, sample type (grab or composite), time, date, location, bottle type, and any preservative used for each sample shall be recorded on the sample chain of custody form. The chain of custody form must also contain all custody information including date, time, and to whom samples were relinquished. If composite samples are collected, the basis for sampling (time or flow weighted) shall be approved by Regional Water Board staff.

Field test instruments (such as those used to test pH, dissolved oxygen, and electrical conductivity) may be used provided that they are used by a State Water Board California Environmental Laboratory Accreditation Program certified laboratory, or:

1. The user is trained in proper use and maintenance of the instruments;
2. The instruments are field calibrated prior to monitoring events at the frequency recommended by the manufacturer;
3. Instruments are serviced and/or calibrated by the manufacturer at the recommended frequency; and
4. Field calibration reports are maintained and available for at least three years.

SEPTIC TANK MONITORING

Monitoring of septic tank shall include the following:

Parameter	Units	Sample Type	Sampling Frequency	Reporting Frequency
Flow Rate	gpd	Metered [a]	Continuous	Annually

gpd denotes gallons per day.

a. Flow rate may be metered or estimated based on potable water supply meter readings or other approved method.

Septic tanks shall be inspected and/or pumped at least as frequently as described below. Inspections of sludge and scum depth are not required if the tanks are pumped at least annually.

Parameter	Units	Measurement Type	Inspection/Reporting Frequency
Sludge depth and scum thickness in each compartment of each tank	Feet	Staff Gauge	Annually
Distance between bottom of scum layer and bottom of outlet device	Inches	Staff Gauge	Annually
Distance between top of sludge layer and bottom of outlet device	Inches	Staff Gauge	Annually
Effluent filter condition (if equipped, clean as needed)	NA	NA	Annually

NA denotes not applicable.

Septic tanks shall be pumped when any one of the following conditions exists:

1. The combined thickness of sludge and scum exceeds one-third of the tank depth of the first compartment.
2. The scum layer is within 3 inches of the outlet device.
3. The sludge layer is within 8 inches of the outlet device.

If a septic tank is pumped during the year, the pumping report shall be submitted with the annual report. All pumping reports shall be submitted with the next regularly scheduled monitoring report. At a minimum, the record shall include the date, nature of service, service company name, and service company license number.

AEROBIC TREATMENT UNIT MONITORING [10]

Influent Monitoring

Influent samples shall be taken from a location that provides representative samples of the wastewater quality. At a minimum, influent monitoring shall consist of the following:

Constituent	Units	Sample Type	Sample Frequency	Reporting Frequency
Total Nitrogen [a]	mg/L	Grab	Monthly	Quarterly

mg/L denotes milligrams per liter.

a. When needed for 50% reduction effluent limit calculations. .

[10] Determine the need for monitoring based on the flow rate and Attachment 1. Biochemical oxygen demand limits apply with flow rates above 400 gpd; nitrogen limits may apply at flow rates above 20,000 gpd. (See General Order Section D, Effluent Limits and Attachment 1, Nitrogen Effluent Limit Evaluation.)

Effluent Monitoring

Samples of effluent shall be taken at an area that represents the effluent quality distributed to the disposal area. At a minimum, effluent monitoring shall consist of the following:

Parameter	Units	Sample Type	Sampling Frequency	Reporting Frequency
Flow Rate	gpd	Metered [a]	Continuous	Quarterly
Biochemical Oxygen Demand	mg/L	Grab	Monthly	Quarterly
Total Nitrogen [b]	mg/L	Grab	Monthly	Quarterly

gpd denotes gallons per day. mg/L denotes milligrams per liter.

a. Flow rate may be metered or estimated based on potable water supply meter readings or other approved method. Flow rates may be measured as influent or effluent flow.

b. Include nitrogen monitoring when a nitrogen effluent limit is imposed.

Aerobic treatment units may be integrated in a treatment train and all components shall be inspected to verify operational status. It is highly recommended that a service agreement with a qualified service provider/vendor be required by the Regional Water Board's Executive Officer. Because aerobic treatment units generate more biosolids than septic systems (similar to the activated sludge process), systems shall be inspected and/or pumped at least as frequently as described below. Depending upon the amount of solids removed from the aerobic treatment unit, less frequent inspections may be allowed by the Regional Water Board's Executive Officer. Inspections of sludge and scum depth are not required if the tanks are pumped at least annually.

Parameter	Units	Measurement Type	Inspection/Reporting Frequency
Sludge depth and scum thickness in each compartment of each tank	Feet	Staff Gauge	Quarterly
Distance between bottom of scum layer and bottom of outlet device	Inches	Staff Gauge	Quarterly
Distance between top of sludge layer and bottom of outlet device	Inches	Staff Gauge	Quarterly
Effluent filter condition (if equipped, clean as needed)	NA	NA	Quarterly

NA denotes not applicable.

Aerobic treatment units shall be pumped when any one of the following conditions exists:

1. The combined thickness of sludge and scum exceeds one-third of the tank depth of the final settling tank or interferes with the operation of the system (mixed liquor aerator solids shall not exceed the manufacturer's recommendation).
2. The scum layer is within 3 inches of the outlet device.
3. The sludge layer is within 8 inches of the outlet device.

All pumping reports shall be submitted with the next regularly scheduled monitoring report. At a minimum, the record shall include the date, nature of service, service company name, and service company license number.

ACTIVATED SLUDGE MONITORING [11]

Influent Monitoring

Influent samples shall be taken from a location that provides representative samples of the wastewater quality. At a minimum, influent monitoring shall consist of the following:

Constituent	Units	Sample Type	Sample Frequency	Reporting Frequency
Total Nitrogen [a]	mg/L	Grab	Monthly	Quarterly

mg/L denotes milligrams per liter.

a. When needed for 50% reduction effluent limit calculation.

Effluent Monitoring

Samples of effluent shall be taken at an area that represents the effluent quality distributed to the disposal area. At a minimum, effluent monitoring shall consist of the following:

Constituent	Units	Sample Type	Sample Frequency	Reporting Frequency
Flow Rate [a]	gpd	Meter	Continuous	Quarterly
Biochemical Oxygen Demand	mg/L	Grab	Monthly	Quarterly
Total Suspended Solids	mg/L	Grab	Monthly	Quarterly
Total Nitrogen [b]	mg/L	Grab	Monthly	Quarterly

gpd denotes gallons per day.

a. At a minimum, the total flow shall be measured monthly to calculate the average daily flow for the month. Flow rates may be measured on influent or effluent flow.

b. Include nitrogen monitoring when a nitrogen effluent limit is imposed.

[11] Determine the need for monitoring based on the flow rate and Attachment 1. Biochemical oxygen demand limits apply with flow rates above 400 gpd; nitrogen limits may apply at flow rates above 20,000 gpd. (See General Order Section D, Effluent Limits and Attachment 1, Nitrogen Effluent Limit Evaluation.)

POND SYSTEM MONITORING [12]

Influent Monitoring

Influent samples shall be taken from a location that provides representative samples of the wastewater and flow rate. At a minimum, influent monitoring shall consist of the following:

Constituent	Units	Sample Type	Sample Frequency	Reporting Frequency
Flow Rate [a]	gpd	Meter	Continuous	Quarterly
Total Nitrogen [b]	mg/L	Grab	Monthly	Quarterly

gpd denotes gallons per day. mg/L denotes milligrams per liter.

a. At a minimum, the total flow shall be measured monthly to calculate the average daily flow for the month. If wastewater is stored and applied to land, flow rate measurement may also be needed on the effluent flow.

b. When needed for 50% reduction effluent limit calculation.

Wastewater Pond Monitoring

All wastewater and treated wastewater storage ponds (lined and unlined) shall be monitored as specified below:

Constituent	Units	Sample Type	Sample Frequency	Reporting Frequency
Dissolved Oxygen	mg/L	Grab	Monthly	Quarterly
Freeboard	0.1 feet	Measurement	Monthly	Quarterly
Odors	--	Observation	Monthly	Quarterly
Berm condition	--	Observation	Monthly	Quarterly

mg/L denotes milligrams per liter.

Effluent Monitoring

Effluent samples shall be taken from a location that provides representative samples of the wastewater. At a minimum, effluent monitoring shall consist of the following:

Constituent	Units	Sample Type	Sample Frequency	Reporting Frequency
Biochemical Oxygen Demand	mg/L	Grab	Monthly	Quarterly

[12] Determine the need for monitoring based on the flow rate and Attachment 1. Biochemical oxygen demand limits apply with flow rates above 400 gpd; nitrogen limits may apply at flow rates above 20,000 gpd. (See General Order Section D, Effluent Limits and Attachment 1, Nitrogen Effluent Limit Evaluation.)

Constituent	Units	Sample Type	Sample Frequency	Reporting Frequency
Total Nitrogen [a]	mg/L	Grab	Monthly	Quarterly

mg/L denotes milligrams per liter.

a. Include nitrogen monitoring when a nitrogen effluent limit is imposed.

DISINFECTION SYSTEM MONITORING

If disinfection is performed, samples shall be collected from immediately downstream of the disinfection system. Depending upon the level of disinfection and wastewater disposal, monitoring requirements vary. Disinfection monitoring shall be customized to the site-specific conditions from the following:

Constituent	Units	Sample Type	Sample Frequency	Reporting Frequency
Total Coliform Organisms	MPN/100 mL	Grab	TBD [a]	Quarterly
Turbidity	NTU	Grab/Meter	TBD [a]	Quarterly

MPN/100 mL denotes most probable number per 100 mL sample. NTU denotes nephelometric turbidity unit.

a. TBD (to be determined) shall be specified in the NOA or as required by California Code of Regulations, title 22 section 60321.

RECREATIONAL VEHICLE DISCHARGE MONITORING

Any wastewater system that has accepted recreational vehicle, portable toilet, or similar waste in the previous 12 months shall perform the following additional monitoring. Samples shall be collected to characterize effluent that is stored in wastewater ponds or that will be applied to a disposal area. Wastewater shall be monitored as specified below:

Constituent	Units	Sample Type	Sample Frequency	Reporting Frequency
Zinc	mg/L	Grab	Quarterly	Quarterly
Phenol	mg/L	Grab	Quarterly	Quarterly
Formaldehyde	mg/L	Grab	Quarterly	Quarterly

mg/L denotes milligrams per liter.

SUBSURFACE DISPOSAL AREA

Subsurface disposal areas may be configured many different ways (e.g. traditional leach field, pressure-dosed, drip system, mound/at grade, gravel less, etc.). In general, monitoring shall be sufficient to determine if wastewater is evenly applied, the disposal area is not saturated, burrowing animals and/or deep rooted plants are not present, and odors are not present. Inspection of dosing pump controllers, automatic distribution valves, etc. is required to maintain optimum treatment in the disposal area (and any sand or media filter if present). Monitoring shall include, at a minimum, the following:

Constituent	Inspection Frequency	Reporting Frequency
Pump Controllers, Automatic Valves, etc. [a]	Quarterly	Quarterly
Nuisance Odor Condition	Quarterly	Quarterly
Saturated Soil Conditions [b]	Quarterly	Quarterly
Plant Growth [c]	Quarterly	Quarterly
Vectors or Animal Burrowing [d]	Quarterly	Quarterly
Seepage Pit Condition [e]	Quarterly	Quarterly

a. All pump controllers and automatic distribution valves shall be inspected for proper operation as recommended by the manufacturer.

b. Inspect a disposal area for saturated conditions. If a mound system is used, inspect perimeter base for signs of wastewater seepage or saturated soil conditions.

c. Shallow-rooted plants are generally desirable, deep-rooted plants such as trees shall be removed as necessary.

d. Evidence of animals burrowing shall be immediately investigated and burrowing animal populations controlled as necessary.

e. Seepage pits shall be inspected to ensure they are allowing wastewater to infiltrate as designed. Visual inspection of the water level in the seepage pit is adequate.

RECYCLED WATER MONITORING

If recycled water is used for irrigation of landscape areas,[13] priority pollutant monitoring is required at the production facility. Sampling shall be consistent with the following:

Constituent	Sampling Frequency	Reporting Frequency
Priority Pollutants	5 years	The next annual report.

mgd denotes million gallons per day.

LAND APPLICATION AREA MONITORING

The Discharger shall monitor LAAs when wastewater and/or supplemental irrigation water is applied. If wastewater/supplemental irrigation water is not applied during a reporting period, the monitoring report shall so state. LAA monitoring shall include the following:

[13] Landscape areas are defined as parks; greenbelts, playgrounds; school yards; athletic fields; golf courses; cemeteries; residential landscaping; common areas; commercial landscaping (except eating areas); industrial landscaping (except eating areas); freeway, highway, and street landscaping

Constituent	Units	Sample Type	Sampling Frequency	Reporting Frequency
Supplemental Irrigation	gpd	Meter [a]	Monthly	Quarterly
Wastewater Flow [a]	gpd	Meter [a]	Monthly	Quarterly
Local Rainfall	Inches	Weather Station [b]	Monthly	Quarterly
Acreage Applied [c]	Acres	Calculated	Monthly	Quarterly
Application Rate	gal/acre/mo	Calculated	Monthly	Quarterly
Soil Erosion Evidence	--	observation	Monthly	Quarterly
Containment Berm Condition	--	observation	Monthly	Quarterly
Soil Saturation/Ponding	--	observation	Monthly	Quarterly
Nuisance Odors/Vectors	--	observation	Monthly	Quarterly
Discharge Off-Site	--	observation	Monthly	Quarterly

gpd denotes gallons per day.

a. Meter requires meter reading, a pump run time meter, or other approved method.
b. Weather station may be site-specific station or nearby governmental weather reporting station.
c. Acreage applied denotes the acreage to which wastewater is applied.
d. Application rate may also be reported as inch/acre/month.

SOLIDS DISPOSAL MONITORING

The Discharger shall report the handling and disposal of all solids (e.g., screenings, grit, sludge, biosolids, etc.) generated at the wastewater system. Records shall include the name/contact information for the hauling company, the type and amount of waste transported, the date removed from the wastewater system, the disposal facility name and address, and copies of analytical data required by the entity accepting the waste. These records shall be submitted as part of the annual monitoring report.

GROUNDWATER MONITORING

The Discharger shall monitor groundwater quality if required by the NOA. Consistent with the Business and Professions Code, groundwater monitoring reports, well construction workplans, etc. shall be prepared under the supervision of a California licensed civil engineer or geologist. Prior to construction of any groundwater monitoring wells, the Discharger shall submit plans and specifications to the Regional Water Board's staff for review and approval. Once installed, all monitoring wells designated as part of the monitoring network shall be sampled and analyzed according to the schedule below.

The data from routine groundwater monitoring events shall be submitted quarterly. Analysis of the data and groundwater flow directions shall be performed at least annually and shall be performed under the supervision of a California licensed professional (as described above). The Discharger may request a reduced monitoring and reporting schedule once adequate data has been collected to characterize the site. (Typically two years of quarterly sampling is required for adequate characterization.)

Prior to sampling, groundwater elevations shall be measured and the wells shall be purged of at least three well volumes and until pH and electrical conductivity have stabilized. No-purge, low-flow, or other sampling techniques are acceptable if they are described in an approved Sampling and Analysis Plan. Depth to groundwater shall be measured to the nearest 0.01 feet. Groundwater elevations shall be calculated. Samples shall be collected using approved USEPA methods. Groundwater monitoring shall include, at a minimum, the following:

Constituent	Units	Sample Type	Sampling/Reporting Frequency [c,d]
Groundwater Elevation [a]	0.01 Feet	Calculated	Quarterly
Depth to Groundwater	0.01 Feet	Measurement	Quarterly
Gradient	Feet/Feet	Calculated	Quarterly
Gradient Direction	degrees	Calculated	Quarterly
pH	Std. Units	Grab	Quarterly
Total Dissolved Solids	mg/L	Grab	Quarterly
Nitrate as Nitrogen	mg/L	Grab	Quarterly
Sodium	mg/L	Grab	Quarterly
Chloride	mg/L	Grab	Quarterly
Total Coliform Organisms [b]	MPN/100 mL	Grab	Quarterly
Zinc [c]	mg/L	Grab	Quarterly
Phenol [c]	mg/L	Grab	Quarterly
Formaldehyde [c]	mg/L	Grab	Quarterly

MPN/100 mL denotes most probable number per 100 mL sample. Std. Units denotes standard units. mg/L denotes milligrams per liter.

a. Groundwater elevation shall be based on depth to water using a surveyed measuring point elevation on the well and a surveyed reference elevation.

b. Using a minimum of 15 tubes or three dilutions.

c. Monitoring of the constituents zinc, phenol, and formaldehyde are required only when recreational vehicles were allowed to discharge to the wastewater system in the previous 12 months.

d. Analysis of data by a California licensed professional is required at least annually,

SURFACE WATER MONITORING

Because of the difficulty in monitoring bacteria in surface water, sample collection procedures must be described in a *Sampling and Analysis Plan*. Natural bacteria levels can vary significantly, and may be correlated with rainfall. When possible, surface water bacteria samples should be collected under dry weather conditions. It is critical when monitoring bacteria that all containers and surfaces a sample contacts are sterile. Sample containers must be autoclaved or manufactured to maintain sterility; use of screw top bottles, Whirl-pak® bags, or similar containers is acceptable. The sample hold time for bacteria samples is typically no more than six hours. Monitoring shall include, at a minimum, the following:

Constituent	Units	Weather (Rain/Dry)	Sampling Frequency	Reporting Frequency
Escherichia coli (E. coli)[a]	MPN/100 mL	Observation	Quarterly	Quarterly
Enterococci [b]	MPN/100 mL	Observation	Quarterly	Quarterly

MPN/100 mL denotes most probable number per 100 mL sample

a. Analysis by USEPA Method 1603 or equivalent.

b. Analysis by USEPA Method 1600 or equivalent.

REPORTING

In reporting monitoring data, the Discharger shall arrange the data in tabular form so that the date, sample type (e.g., effluent, solids, etc.), and reported analytical or visual inspection results are readily discernible. The data shall be summarized to clearly illustrate compliance with the General Order and NOA as applicable. The results of any monitoring done more frequently than required at the locations specified in the MRP shall be reported in the next regularly scheduled monitoring report and shall be included in calculations as appropriate.

During the life of this General Order, the State Water Board or Regional Water Board may require the Discharger to electronically submit monitoring reports using the State Water Board's California Integrated Water Quality System (CIWQS) program Internet web site or alternative database. Electronic submittal procedures will be provided when directed to begin electronic submittals. Until directed to electronically submit monitoring reports, the Discharger shall submit hard copy monitoring reports.

A. Quarterly Monitoring Reports

Quarterly reports shall be submitted to the Regional Water Board on the **first day of the second month after the quarter ends** (e.g. the January-March Quarterly Report is due by May 1st). The reports shall bear the certification and signature of the Discharger's authorized representative. At a minimum, the quarterly reports shall include:

1. Results of all required monitoring.
2. A comparison of monitoring data to the discharge specifications, applicable effluent limits, disclosure of any violations of the NOA and/or General Order, and an explanation of any violation of those requirements. (Data shall be presented in tabular format.)
3. If requested by staff, copies of laboratory analytical report(s) and chain of custody form(s).

B. Annual Report

Annual Reports shall be submitted to the Regional Water Board by **March 1st following the monitoring year**. The Annual Report shall include the following:

1. Tabular and graphical summaries of all monitoring data collected during the year.

2. An evaluation of the performance of the wastewater treatment facility, including discussion of capacity issues, nuisance conditions, system problems, and a forecast of the flows anticipated in the next year. A flow rate evaluation as described in the General Order (Provision E.2.c) shall also be submitted.
3. If disinfection with ultraviolet light is performed, describe disinfection system maintenance activities performed in the calendar year. The description shall address inspections performed, lamp bulb replacement, lamp sleeve cleaning, and manufacturer recommended maintenance activities.
4. A discussion of compliance and the corrective action taken, as well as any planned or proposed actions needed to bring the discharge into compliance with the NOA and/or General Order.
5. A discussion of any data gaps and potential deficiencies/redundancies in the monitoring system or reporting program.
6. The name and contact information for the wastewater operator responsible for operation, maintenance, and system monitoring.
7. A groundwater monitoring report prepared by a California licensed professional. This report may be prepared separately from the rest of the Annual Report. The report shall contain an analysis of groundwater data collected during the year. The analysis shall include a description of the sample events, copies of the field logs, purge method and volume, groundwater elevation and trend, a groundwater elevation map for each sample event, summary tables showing results for parameters measured, comparison of groundwater quality parameters to standards in the NOA, chain-of-custody forms, calibration logs for field equipment used, and a general evaluation of any impacts the wastewater discharge is having on groundwater quality.

A letter transmitting the monitoring reports shall accompany each report. The letter shall report violations found during the reporting period, and actions taken or planned to correct the violations and prevent future violations. The transmittal letter shall contain the following penalty of perjury statement and shall be signed by the Discharger or the Discharger's authorized agent:

> "I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of the those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."

The Discharger shall implement the above monitoring program as of the date of this MRP.

Ordered by:

NAME, Executive Officer

DATE

ATTACHMENT 7: 2022-23 RWQCB FEE SCHEDULE

CALIFORNIA CODE OF REGULATIONS
TITLE 23. Division 3. Chapter 9. Waste Discharge Reports and Requirements
Article 1. Fees

Section 2200. Annual Fee Schedules.

Each person for whom waste discharge requirements have been prescribed pursuant to Section 13263 of the Water Code shall submit, to the state board, an annual fee in accordance with the following schedules. The fee shall be submitted for each waste discharge requirement order issued to that person.[1]

(a) The annual fees for persons issued waste discharge requirements (WDRs), except as provided in subdivisions (a)(3), (a)(4), (b), and (c), shall be based on the discharge's threat to water quality (TTWQ) and complexity (CPLX) rating according to the following fee schedule, plus applicable surcharge(s).

[1] Federal facilities will generally not be invoiced for the portion of the annual fee that is attributable to the state board's ambient water monitoring programs. See *Massachusetts v. United States* (1978) 435 U.S. 444.

Threat to Water Quality (TTWQ)	Complexity (CPLX)	Discharge to Land or Surface Waters[2]	Land Disposal[3] – Not Paying a Tipping Fee[4]	Land Disposal[3] – Paying a Tipping Fee[5]
1	A	$180,398	$76,703[6]	$64,210[6]
1	B	$113,934	$61,951	$51,860
1	C	$61,476	$39,826	$33,340
2	A	$41,063	$33,187	$27,783
2	B	$24,687	$26,552	$22,226
2	C	$18,512	$19,914	$16,670
3	A	$14,590	$13,275	$11,114
3	B	$7,770	$9,957	$8,333
3	C	$3,453	$4,424	$3,705

[2] For this table, discharges to land or surface waters are those discharges of waste to land or surface waters not covered by NPDES permits that are regulated pursuant to Water Code Section 13263 that do not implement the requirements of Title 27 of the California Code of Regulations (CCR). Examples include, but are not limited to, wastewater treatment plants, erosion control projects, and septic tank systems. It does not include discharge of dredge or fill material, discharges from agricultural lands, including irrigated lands, or discharge from animal feeding operations. Dischargers covered by a WDR for municipal and domestic discharges with permitted flows of less than 50,000 gallons per day in categories 2-B, 2-C, 3-B and 3-C will receive a 50 percent fee discount. The design flow shall be used where no permitted flow is present. Municipal and domestic discharges receiving the discount are defined as discharges from facilities that treat domestic wastewater or a mixture of wastewater that is predominately domestic wastewater. Domestic wastewater consists of wastes from bathroom toilets, showers, and sinks from residential kitchens and residential clothes washing. It does not include discharges from food preparation and dish washing in restaurants or from commercial laundromats. Dischargers covered by a Landscape Irrigation General Permit issued by the state board will be assessed a fee associated with TTWQ/CPLX rating of 3B.

[3] For this table, land disposal discharges are those discharges of waste to land that are regulated pursuant to Water Code Section 13263 that implement the requirements of CCR Title 27, Division 2, except Chapter 7, Subchapter 2, §22560-22565 (confined animal facilities). Examples include, but are not limited to, discharges associated with active and closed landfills, waste piles, surface impoundments, and mines.

[4] For this table, Not Paying a Tipping Fee are those land disposal dischargers not subject to Public Resources Code (PRC) § 48000 et seq.

[5] For this table, Paying a Tipping Fee are those land disposal dischargers subject to PRC § 48000 et seq.

[6] A surcharge of $12,000 will be added for Class I landfills. Class I landfills are those that, during the time they are, or were, in operation, are so classified by the regional board under 23 CCR Chapter 15, have WDRs that allow (or, for closed units, allowed) them to receive hazardous waste, and have a permit issued by the Department of Toxic Substances Control under 22 CCR Chapter 10, § 66270.1 et seq.

Oil and gas produced water storage and disposal facilities regulated by waste discharge requirements are subject to a surcharge per barrels of waste water discharged in the prior 12 months according to the following schedule:

TTWQ & CPLX Rating	No Barrels	1 to 999,999 Barrels	1,000,000 or more Barrels
1A	$600	$1,000	$50,000
1B	$600	$1,000	$50,000
1C	$600	$1,000	$50,000
2A	$600	$1,000	$40,000
2B	$600	$1,000	$30,000
2C	$600	$1,000	$10,000
3A	$600	$1,000	$4,000
3B	$600	$1,000	$2,000
3C	$600	$600	$600

(1) Threat to water quality (TTWQ)[7] and complexity (CPLX) of the discharge is assigned by the regional board in accordance with the following definitions:

THREAT TO WATER QUALITY

Category "1" – Those discharges of waste that could cause the long-term loss of a designated beneficial use of the receiving water. Examples of long-term loss of a beneficial use include the loss of drinking water supply, the closure of an area used for water contact recreation, or the posting of an area used for spawning or growth of aquatic resources, including shellfish and migratory fish.

Category "2" – Those discharges of waste that could impair the designated beneficial uses of the receiving water, cause short-term violations of water quality objectives, cause secondary drinking water standards to be violated, or cause a nuisance.

Category "3" – Those discharges of waste that could degrade water quality without violating water quality objectives, or could cause a minor impairment of designated beneficial uses as compared with Category 1 and Category 2.

COMPLEXITY

Category "A" – Any discharge of toxic wastes; any small volume discharge containing toxic waste; any facility having numerous discharge points and groundwater monitoring; or any Class 1 waste management unit.

[7] In assigning a category for TTWQ, a regional board should consider duration, frequency, seasonality, and other factors that might limit the impact of the discharge.

Category “B” – Any discharger not included in Category A that has physical, chemical, or biological treatment systems (except for septic systems with subsurface disposal), or any Class 2 or Class 3 waste management units.

Category “C” – Any discharger for which waste discharge requirements have been prescribed pursuant to Section 13263 of the Water Code not included in Category A or Category B as described above. Included are dischargers having no waste treatment systems or that must comply with best management practices, dischargers having passive treatment and disposal systems, or dischargers having waste storage systems with land disposal.

(2) For dischargers covered under Statewide General WDRs for Sanitary Sewer Systems, the TTWQ and CPLX designations are assigned based on the population served by the sanitary sewer system. The table below describes the correlation between population served and TTWQ and CPLX designations to determine the appropriate annual fee:

Population Served[8]	**Threat and Complexity Designation**
Less than 50,000	3C
50,000 or more	2C

[8] Assumes 2.5 persons per equivalent dwelling unit (EDU).

(a)(3)(A) For dischargers covered under Statewide General WDRs for discharges of winery process water, the annual fees shall be based on the following schedule:

Facility Process Water Flow (gal/yr)	Fee
10,000 to 30,000	$779
>30,000 to 100,000	$1,038
>100,000 to 300,000	$1,246
>300,000 to 600,000	$2,076
>600,000 to 1 million	$3,114
>1 million to 3 million	$7,266
>3 million to 7 million	$13,494
>7 million to 15 million	$19,722

(B) Dischargers enrolled in an approved Local Agency Oversight program will receive a 50 percent fee reduction.

(C) Dischargers enrolled in an approved sustainability program will receive a 10 percent fee reduction.

(D) Dischargers enrolled in an approved Local Agency Oversight program and an approved sustainability program will receive a 50 percent reduction of the annual fee that results from the application of a 10 percent fee reduction.

(E) Dischargers with facility process water flows of less than 10,000 gallons per year that are directed by the state board or a regional board to enroll under the Statewide General WDRs for discharges of winery process water shall pay the fee applicable to dischargers with 10,000 to 30,000 gallons per year.

(F) Dischargers with facility process water flows of 10,000 to 30,000 gallons per year that are directed by the state board or a regional board to enroll as a Tier 2 facility under the Statewide General WDRs for discharges of winery process water shall pay the fee applicable to dischargers with >30,000 to 100,000 gallons per year.

(4) The fees for discharges of dredge and fill material shall be as follows.[9]

Standard Fee:[10]

Discharge Category	Application Fee[11]	Project Fee	Annual Fee[12]
(A) Fill and Excavation[13] Discharges Discharge area expressed in acres rounded to two decimal places (0.01 acre)	$2,734	Impact area in acres x $24,366, minus application fee, up to a maximum of $237,190. If this amount is $0 or less, then no project fee is required.	$2,297 for first five fiscal years following the effective date of the order, then $365 beginning with the sixth fiscal year until the Notice of Completion is issued to discharger.

[9] Fees shall be based on the sum of temporary and permanent impact amounts to be authorized by the order. Impacts include both the excavation and fill area and the dredging area. If water quality certification is issued in conjunction with dredge or fill WDRs or issued for a discharge regulated under preexisting WDRs for the same project, the project will be assessed a single fee derived from this dredge and fill fee schedule. Discharges requiring certification and regulated under a federal permit or license other than a US Army Corp of Engineers Clean Water Act Section 404 permit or a Federal Energy Regulatory Commission License shall be assessed a fee determined from Section 2200(a).

[10] Fees shall be based on the sum of project impacts. Projects that include both category (A) and category (B) discharges shall be subject to the category (A) application and project fees. A single annual fee shall be assessed based on the higher of the applicable annual fee categories.

[11] Dischargers shall pay a one-time application fee and the project fee, if a project fee is required, for each project at the time that the application or report of waste discharge is submitted. Application and project fees shall be determined according to the fee schedule in effect on the date of application submittal.

[12] Consistent with Section 2200.2, the sum of the application fee and the project fee shall serve as the first annual fee. If the submittal of this first annual fee does not coincide with the current fiscal year billing cycle, then the next, and only the next, fiscal year billing shall be adjusted to account for the payment of the application fee. The annual fee for category (B) dredging discharges will be calculated using the annual dredge volume authorized in the applicable Order. Annual fee invoices are based on the fee schedule in effect for the fiscal year in which the invoice is issued.

[13] "Excavation" refers to removing sediment or soil in shallow waters or under no-flow conditions, typically for purposes other than navigation. Examples include, but are not limited to, trenching for utility lines; other earthwork preliminary to discharge; removing sediment to increase channel capacity; and other flood control and drainage maintenance activities (e.g., debris removal, vegetation management and removal, detention basin maintenance and erosion control of slopes along open channels and other drainage facilities).

Discharge Category	Application Fee[11]	Project Fee	Annual Fee[12]
(B) Dredging[14] Discharges (except Category C activities see (C) below) Dredge volume expressed in cubic yards.	$2,734	N/A	Annual dredge volume in cubic yards x $0.60, up to a project maximum of $237,190. The minimum annual fee is $2,734.

Special/Flat Fee:[15]

Discharge Category	Application Fee	Annual Fee
(C) Sand Mining, In-Stream Gravel Mining and Beach Nourishment Discharges Aggregate extraction in surface waters where source material is free of pollutants and the dredging operation will not violate any basin plan provisions and beach nourishment projects.	$2,734	$912
(D) Ecological Restoration and Enhancement Projects The project meets the definition of an "Ecological Restoration and Enhancement Project" set forth in the State Wetland Definition and Procedures for Discharges of Dredged or Fill Materials to Waters of the State, adopted by the State Water Board on April 2, 2019. [16]	$729	$365

[14] "Dredging" refers to removing sediment or aquatic vegetation, typically in deeper water for navigation purposes. For fee purposes, this fee category includes aggregate extraction within stream channels, where the substrate is composed of coarse sediment (e.g., gravel) and is replenished by normal winter flows (e.g., point bars).

[15] To qualify for a special/flat fee category, the whole of a project must meet the fee category description (i.e., all project discharges are limited to those defined by the fee category).

[16] Ecological Restoration and Enhancement Project means the project is voluntarily undertaken for the purpose of assisting or controlling the recovery of an aquatic ecosystem that has been degraded, damaged or destroyed to restore some measure of its natural condition and to enhance the beneficial uses, including potential beneficial uses of water. Such projects are undertaken:

1) in accordance with the terms and conditions of a binding stream or wetland enhancement or restoration agreement, or a wetland establishment agreement, between the real property interest owner or the entity conducting the habitat restoration or enhancement work and:

a. a federal or state resource agency, including, but not limited to, the U.S. Fish and Wildlife Service, Natural Resources Conservation Service, Farm Service Agency, National Marine Fisheries Service, National Oceanic and Atmospheric Administration, U.S. Forest Service, U.S.

(E) Low Impact Discharges Projects may be classified as low impact discharges if the project meets all of the following criteria: 1. The discharge size is less than all of the following: (a) for fill, 0.1 acre, and 300 linear feet, and (b) for dredging, 25 cubic yards. 2. The discharger demonstrates that: (a) all practicable measures will be taken to avoid impacts; (b) where unavoidable temporary impacts take place, waters and vegetation will be restored to pre-project conditions as quickly as practicable; and (c) where unavoidable permanent impacts take place, there will be no net loss of wetland, riparian area, or headwater functions, including onsite habitat, habitat connectivity, floodwater retention, and pollutant removal. 3. The discharge will not do any of the following: (a) directly or indirectly destabilize a bed of a receiving water; (b) contribute to significant cumulative effects; (c) cause pollution, contamination, or nuisance; (d) adversely affect candidate, threatened, or endangered species; (e) degrade water quality or beneficial uses; (f) be toxic; or (g) include “hazardous” or “designated” material.	$2,734	$365
(F) Emergency Projects Authorized by a Water Board General Order	$2,734	$365

Bureau of Land Management, California Department of Fish and Wildlife, California Wildlife Conservation Board, California Coastal Conservancy or the Delta Conservancy;

b. a local agency with the primary function of managing land or water for wetland habitat purposes; or

c. a non-governmental conservation organization; or

2) by a state or federal agency that is statutorily tasked with natural resource management.

These projects do not include the conversion of a stream or natural wetland to uplands or stream channelization. It is recognized that Ecological Restoration and Enhancement Projects may require ongoing maintenance or management to maximize fish, wildlife, habitat, or other ecological benefits, or filling gullied stream channels and similar rehabilitative activities to re-establish stream and meadow hydrology. Changes in wetland plant communities that occur when wetland hydrology is more fully restored during rehabilitation activities are not considered a conversion to another aquatic habitat type. These projects also do not include actions required under a Water Board Order for mitigation, actions to service required mitigation, or actions undertaken for the primary purpose of land development.

(G) Amended Orders[17] Amendments of WDRs or water quality certifications previously issued. (1) All category (D) Ecological Restoration and Enhancement Projects, regardless of amendment type. (2) Administrative amendments including, but not limited to, ownership changes, typographic edits, or time extensions that do not result in a temporal loss of resource function. Amendments in this category require no technical analysis or additional compensatory mitigation. (3) Amendment results in changes(s) in impact character, location, or volume of the discharge; or a time extension that results in a temporal loss of resource function, according to the following criteria: • Amendment increases the active certification's impact quantity by less than 50 percent, and • Amendment does not require a change to the mitigated aquatic resource type. (4) Amendment requires a supplemental CEQA analysis, or Amendment results in a change(s) in impact character, location, or volume of the discharge, or a time extension that results in a temporal loss of resource function, according to the following criteria: • Amendment increases the active certification's impact quantity by more than 50 percent, or • Amendment requires a change to the mitigated aquatic resource type.	(1) No fee required (2) No fee required (3) Additional standard fee assessed per increased amount of discharge(s). The minimum fee is $2,734. (4) New standard fee assessed per new project discharge total. The minimum fee is $2,734.	Annual fee applicable per discharge category
(H) Wildfire Mitigation by Electrical Corporations, Electrical Utilities, and Electrical Cooperatives Dredge or fill activities conducted by electrical corporations, electrical utilities, and electrical cooperatives pursuant to a wildfire mitigation plan prepared in accordance with Public Utilities Code, section 8386(b) or section 8387(b)(1). This annual fee covers all dredge or fill activities conducted by the electrical corporations, electrical utilities, and electrical cooperatives pursuant to a wildfire mitigation plan, and is in lieu of the project-specific dredge or fill fees in section 2200(a)(3)(A)-(G) for dredge or fill activities conducted pursuant to a wildfire mitigation plan.	N/A	$40.00 per mile of overhead electrical lines identified as high risk or high threat in the wildfire mitigation plan.

[17] Dischargers that have met the project fee cap will be assessed the minimum fee for each amendment of previously-issued WDR or water quality certification.

(b) The annual fees for persons issued NPDES permits shall be based on the following schedules, plus any applicable surcharge(s).

(1)(A) Each public entity that owns and/or operates a storm water conveyance system, or pare of such a system, that is subject to a NPDES permit for storm water dischargers from a municipal separate storm sewer system (MS4) shall pay an annual fee according to the following schedule. The fee shall be based on the population of the public entity according to the most recently published United States Census. Public entities other than cities or counties (Non-Traditional Small MS4s[18]), shall pay an annual fee according to the following schedule, based on the average daily population[19] using the entities' facilities, unless otherwise provided in the schedule. Flood control districts or other special districts named as co-permittees to MS4 permits and school districts, serving students between kindergarten and fourteenth grade, shall not pay an annual fee if the city or county within whose jurisdiction the district lies oversees the district's storm water compliance and pays an annual fee.

ANNUAL FEE SCHEDULE FOR AREAWIDE MUNICIPAL STORM WATER SEWER SYSTEM PERMITS AND CO-PERMITEES

Population	Fee
Equal to or greater than 250,000	$70,667
200,000 to 249,999	$61,833
150,000 to 199,999	$53,352
100,000 to 149,999	$44,169
75,000 to 99,999	$35,333
50,000 to 74,999	$26,498
25,000 to 49,999	$17,666
10,000 to 24,999	$10,602
1,000 to 9,999	$7,067
Less than 1,000 population	$3,535
Statewide Permit Holders	$282,664
High Speed Rail Authority	$165,739

(B) Dischargers applying for the Small MS4 Waiver of a General Permit to Discharge Storm Water Associated with Small Municipal Activity issued by the state board shall pay an application fee of $200.

[18] Non-Traditional Small MS4s are facilities that have systems similar to separate storm sewer systems in municipalities, such as systems at military bases, large hospital or prison complexes, and highways and other thoroughfares. (40 C.F.R. § 122.26(b)(16)(iii)).

[19] Total daily population must include resident and commuter populations. For public entities other than cities or counties, total daily population must include resident population and non-residents regularly employed in the areas served by the public entity.

(2) Any entity or entities submitting a watershed improvement plan to the regional board for review pursuant to Section 16102 of the Water Code shall reimburse the regional board for its costs[20] to review and oversee the implementation of the plan, which shall be calculated using a rate of $185.00 per hour.

(3) Facilities that discharge storm water associated with industrial activities that are regulated by a state board or regional board general NPDES storm water permit shall pay an annual fee of $1,738. An amount equal to the fee prescribed shall be submitted with the discharger's Notice of Intent (NOI) to be regulated under a general NPDES permit and will serve as the first annual fee. For the purposes of this section, an NOI is considered to be a report of waste discharge.

(4)(A) Storm water discharges associated with construction activities that are regulated by a general NPDES storm water permit other than those covered under (b)(5), including those issued by a regional board, shall pay an annual fee of $496 plus $52 per acre (rounded to the nearest whole acre and dollar amount), to a maximum fee of $10,896, based on the total acreage to be disturbed during the life of the project as listed on the NOI. An amount equal to the fee prescribed shall be submitted with the discharger's NOI to be regulated under a general NPDES permit and will serve as the first annual fee. For the purposes of this section, an NOI is considered to be a report of waste discharge.

(B) Stormwater discharges associated with Executive Order N-73-20 requesting statewide programmatic General Permit coverage for multiple non-contiguous linear underground and overhead broadband projects, shall pay an annual fee of $10,000 plus $52 per acre (rounded to the nearest whole acre and dollar amount) based on the total acreage to be disturbed during the life of the project as listed on the NOI. An amount equal to the fee prescribed shall be submitted with the discharger's NOI to be regulated under a general NPDES permit and will serve as the first annual fee. For the purposes of this section, an NOI is considered to be a report of waste discharge.

(C) Stormwater discharges requesting programmatic General Permit coverage for multiple non-contiguous linear underground and overhead projects within a single Regional Water Board jurisdiction, shall pay an annual fee of $10,896.00 per NOI. An amount equal to the fee prescribed shall be submitted with the discharger's NOI to be regulated under a general NPDES permit and will serve as the first annual fee. For the purposes of this section, an NOI is considered to be a report of waste discharge.

(D) Dischargers applying for the Small Construction Rainfall Erosivity Waiver of a General Permit to Discharge Storm Water Associated with Construction Activity issued by the state board shall pay an application fee of $200.

[20] These costs include labor, state board and regional board administrative costs, and overhead costs.

(5) Discharges associated with mosquito and vector control activities[21] that are regulated by an individual or general NPDES permit adopted specifically for these purposes, including those issued by a regional board, shall pay a fee of $250. Dischargers filing an application for a mosquito and vector control permit shall pay a fee of $250. The fee shall be paid each time an application for initial certification or renewal of certification is submitted. Mosquito and vector control fees are not subject to ambient water monitoring surcharges.

(6) Planned and emergency discharges from community water systems that are regulated by a general NPDES permit adopted specifically for this purpose shall pay an application fee and subsequent annual fees (if applicable) based on the number of service connections for the public water system in accordance with the following schedule. The application fee shall be submitted with the discharger's NOI to be regulated by the general NPDES permit. For purposes of this section, an NOI is considered to be a report of waste discharge.

Dischargers with a Single System

Service Connections	Application Fee	Annual Fee
15 – 999	$158	No Annual Fee
1,000 – 9,999	$794	$794
10,000+	$3,274	$3,274
Transmission System or Water Wholesaler	$3,274	$3,274

[21] A mosquito and vector control activity involves discharge of pesticides into a designated area for the maintenance and control of mosquito larva for the protection of public health from the outbreak of lethal diseases. A mosquito and vector control agency discharges pesticides into surface waters for the control of mosquito larva.

Dischargers with Multiple Systems

Total Number of Service Connections	Application Fee	Annual Fee[22]
15 – 999	$158	No Annual Fee
1,000 – 9,999	$794	$794 per Primary System fee plus $158 per Secondary System
10,000+	$3,274	$3,274 per Primary System fee plus $158 per Secondary System
Transmission System or Water Wholesaler System	$3,274	$3,274 per Primary System fee plus $158 per Secondary System

(7) Seawater desalination facilities that have submitted a request for a determination of consistency with California Water Code section 13142.5(b) are subject to an annual fee according to the following fee schedule until a determination is made, with a maximum annual fee of $254,643:

Fee Basis[23]	Base Fee	Proposed Intake Volume Multiplier
Subsurface Only	$76,393	$1,283 per mgd
Surface, Combined Surface and Subsurface, or Alternative Intake Technology	$152,786	$1,283 per mgd

(8) Discharges from public wastewater treatment facilities that are regulated by a general NPDES permit adopted specifically for this purpose and all other NPDES permitted discharges, except as provided in (b)(9), (b)(10), and (c), shall pay a fee according to the following formula:

Fee equals $3,274 plus 5,791 multiplied by the permitted flow, in mgd, with a maximum fee of $818,779 plus any applicable surcharge(s).

If there is no permitted effluent flow specified, the fee shall be based on the design flow of the facility.

[22] All Transmission Systems and Water Wholesaler Systems are Primary Systems. If the Discharger does not have a Transmission System or a Water Wholesaler System, the Discharger's individual water system with the highest number of service connections will be designated as the Primary System. All systems that are not Primary Systems are designated as Secondary Systems.

[23] Fee shall be based on the intake type as defined in the Water Quality Control Plan for Ocean Waters of California Chapter III.M.2.d.(1)(a).

NPDES permitted industrial discharges[24] with a threat/complexity[25] rating of 1A, 1B, or 1C are subject to a surcharge as follows:

Threat/Complexity Rating 1A - $15,000
Threat/Complexity Rating 1B - $10,000
Threat/Complexity Rating 1C - $5,000

Public wastewater treatment facilities with approved pretreatment programs are subject to a surcharge of $10,000. Agencies with multiple facilities under one approved pretreatment program shall pay a $10,000 surcharge per program.

(9)(A) Flow for wet weather municipal facilities[26] will be based on the previous five years' actual monthly average flow,[27] as of the date the permit is issued.

(B) Notwithstanding (9)(A), the minimum annual fee for wet weather municipal facilities shall be $20,000.

[24] NPDES permitted industrial discharger(s) means those industries identified in the Standard Industrial Classification Manual, Bureau of Budget, 1967, as amended and supplemented, under the category "Division D-Manufacturing" and such other classes of significant waste producers as, by regulation, the U.S. EPA Administrator deems appropriate. (33 USC Sec. 1362).

[25] Threat/complexity categories are listed under (a)(1) of this document.

[26] Wet weather municipal facilities are intermittently operated facilities that are designated specifically to handle flows during wet weather conditions.

[27] The actual monthly average flow is defined as the average of the flows during each of the months that the discharge occurred during the previous five-year period.

(10) All other general NPDES permits and de minimis discharges[28] that are regulated by an individual or general NPDES permit, including those issued by a regional board, shall pay a fee as follows:

Category 1 – Discharges that require treatment systems to meet priority toxic pollutant limits and that could impair beneficial uses if limits are violated: $18,863

Category 2 – Discharges that require treatment systems to meet non-priority pollutant limits, but are not expected to impair beneficial uses if limits are violated. Examples of non-priority pollutants include, but are not limited to, nutrients, inorganic compounds, pH, and temperature: $11,400

Category 3 – Discharges that require minimal or no treatment systems to meet limits and pose no significant threat to water quality: $3,274

Category 4 – Discharges that require minimal or no treatment systems to meet limits and are authorized by the Regional Water Board to augment ambient streamflow conditions to support aquatic organisms during times of low streamflows where conditions threaten survival of aquatic organisms: $250

[28] De minimis discharge activities include, but are not limited to, the following: aquaculture activities (as defined in Chapter 40, Section 122.25(b) of the Code of Federal Regulations) defined as managed water areas that use discharges of pollutants into that designated area for maintenance or reproduction of harvestable freshwater, estuarine, or marine plants or animals including fish hatcheries; geothermal facilities that utilize, extract, or produce energy from geothermal fluids for heating, generating power, or other beneficial uses, and discharge geothermal fluids to surface waters; aquatic pesticide applications; evaporative condensate; swimming and landscape pool drainage; discharges from fire hydrant testing or flushing; discharges resulting from construction dewatering; discharges associated with supply well installation, development, test pumping, and purging; discharges resulting from the maintenance of uncontaminated water supply wells, pipelines, tanks, etc.; discharges resulting from hydrostatic testing of water supply vessels, pipelines, tanks, etc.; discharges resulting from the disinfection of water supply pipelines, tanks, reservoirs, etc.; discharges from water supply systems resulting from system failures, pressure releases, etc.; discharges of non-contact cooling water, not including steam/electric power plants; discharges resulting from diverted stream flows; water treatment plant discharges; and other similar types of wastes that have low pollutant concentrations and are not likely to cause or have a reasonable potential to cause or contribute to an adverse impact on the beneficial uses of receiving waters yet technically must be regulated under an NPDES permit.

(c) The annual fees for waste discharge requirements and waivers of waste discharge requirements for discharges from confined animal facilities shall be based on the following schedules. If a facility contains animals that fit multiple fee categories, the fee will be based on the number of animals in the category that results in the highest fee.

Dairies – Mature Dairy Cattle or Water Buffalo

Number of Animals	Fee
3,000 or more	$18,767
1,500 to 2,999	$11,728
700 to 1,499	$5,629
300 to 699	$2,815
150 to 299	$1,408
50 to 149	$704
0 to 49	$0

Feedlots – Cattle or Cow/Calf Pairs

Number of Animals	Fee
100,000 or more	$14,077
10,000 to 99,999	$7,037
5,000 to 9,999	$3,752
1,000 to 4,999	$1,876
100 to 999	$939
0 to 99	$0

Feedlots – Calves

Number of Animals	Fee
10,000 or more	$7,037
5,000 to 9,999	$3,752
1,000 to 4,999	$1,876
300 to 999	$939
0 to 299	$0

Feedlots – Heifers

Number of Animals	Fee
10,000 or more	$14,077
5,000 to 9,999	$7,037
1,000 to 4,999	$3,752
300 to 999	$1,876
137 to 299	$939
0 to 136	$0

Feedlots – Auction Yards

Number of Animals	Fee
1,000 or more	$3,752
300 to 999	$1,876
100 to 299	$939
0 to 99	$0

Dairies – Goat Dairies

Number of Animals	Fee
1,000 or more	$1,876
550 to 999	$939
0 to 549	$0

Hogs – Swine (≥ 55 Pounds)

Number of Animals	Fee
5,000 or more	$7,037
2,500 to 4,999	$3,752
750 to 2,499	$1,876
150 to 749	$939
0 to 149	$0

Hogs – Swine (< 55 Pounds)

Number of Animals	Fee
20,000 or more	$7,037
10,000 to 19,999	$3,752
3,000 to 9,999	$1,876
300 to 2,999	$939
0 to 299	$0

Horses

Number of Animals	Fee
500 or more	$3,752
150 to 499	$1,876
75 to 149	$939
0 to 74	$0

Sheep or Lambs

Number of Animals	Fee
10,000 or more	$3,752

(1) Facilities that are certified under a Quality Assurance Program approved by the state board or under a County regulatory program approved by the appropriate regional board, will receive a 50 percent fee reduction. Any facility that is issued a notice of violation by a regional board for an off-property discharge shall not be eligible to receive this fee reduction for a minimum of one billing cycle, and for all subsequent billing cycles until recertification and all corrective actions are complete as determined by the regional board.

(2) Facilities that pose no potential to discharge, as determined by a regional board, shall pay a fee of $200. The fee shall be paid each time an application for initial certification or renewal of certification is submitted.

[29] These fees apply to discharges from poultry operations that are identified as posing a "low threat to water quality" in the applicable waste discharge requirements or waiver of waste discharge requirements.

[30] Rounded to the nearest whole number

(3) Facilities that are required to submit a report of waste discharge (ROWD) while the facility is under construction and remains so subsequent to the billing cycle will have the annual fee waived until the facility is in operation and animals are present at the facility.

(4) Facility closures that are required to maintain a permit until all requirements are met shall continue to be assessed a fee based at the same rate as when the facility was in operation.

(5) Facilities covered under a waste discharge requirement or waiver of waste discharge requirement that do not pay annual fees shall pay an application fee for initial coverage and renewals of coverage of $200. The fee shall be paid each time an application for coverage or report of waste discharge is submitted.

Note: Authority cited: Sections 185, 1058 and 13260 Water Code. Reference: Section 13260, Water Code.

Section 2200.1.

The state board shall notify each discharger annually of the fee to be submitted, the basis upon which the fee was calculated, and the date upon which the fee is due.

Note: Authority cited: Sections 185, 1058 and 13260, Water Code. Reference: Section 13260, Water Code.

Section 2200.2.

Persons proposing a new discharge shall submit to the state board or regional board a report of waste discharge. Unless Section 2200 provides otherwise, or the discharger is specifically instructed otherwise by the state board, a fee equal in amount to the annual fee based on the fee schedules in Section 2200 shall be submitted with the discharger's report of waste discharge. Except as otherwise provided in Section 2200, this fee shall serve as the first annual fee. If the submittal of this first annual fee does not coincide with the current fiscal year billing cycle, then the next, and only the next, fiscal year billing shall be adjusted to account for the payment of a full annual fee that accompanied the discharger's report of waste discharge. Persons proposing a material change in an existing discharge are not required to submit a fee with the report of waste discharge.

Note: Authority cited: Sections 185, 1058 and 13260, Water Code. Reference: Section 13260, Water Code.

Section 2200.3.

Failure to pay the annual fee is a misdemeanor and will result in the state board or regional board seeking the collection of fees through the enforcement provisions provided pursuant to Water Code Section 13261.

Note: Authority cited: Sections 185 and 1058, Water Code. Reference: Section 13261, Water Code.

Section 2200.4.

Any refund made pursuant to Water Code Section 13260(e) or for any other reason, shall withhold sufficient funds to cover actual staff time spent in reviewing the report of waste discharge, which shall be calculated using a rate of $185.00 per hour.

Note: Authority cited: Sections 185, 1058 and 13260, Water Code. Reference: Section 13260, Water Code.

Section 2200.5. No Exposure Certification.

Dischargers filing an application for a No Exposure Certification (NEC) shall pay a fee of $200 for each facility for which an application is submitted, as prescribed in a general industrial storm water permit. The fee shall be paid each time an application for initial certification is submitted. Dischargers shall pay a fee of $75 each time a renewal of certification is submitted. NEC fees are not subject to any surcharges.

Note: Authority cited: Sections 185, 1058 and 13260 Water Code. Reference: Sections 13260 and 13260.2, Water Code.

Section 2200.6. Annual Agricultural and Irrigated Lands Fee Schedule.

(a) Annual fees for waste discharge requirements and waivers of waste discharge requirements for discharges from agricultural lands,[1] including irrigated lands, shall be as follows:

(1) If a discharger is a member of a group that has been approved by the Regional Board or Regional Board Executive Officer to manage fee collection and payment, then the annual fee shall be based on agricultural activity according to the following fee schedule:

Agricultural Activity Tier for Group Enrollment	Per Acre Fee
Tier A – All agricultural activity except those identified in Tier B.	$1.35
Tier B – Discharger or group of dischargers whose agricultural activities are managed wetlands, irrigated pastures with no external nitrogen input, those belonging to the California Rice Commission third party group, or are determined by the Regional Water Board or the Executive Officer to be exempt from the precedential requirement to develop an Irrigation and Nitrogen Management Plan.[2]	$1.08

(2) If a discharger is not a member of a group that has been approved by the Regional Board or Regional Board Executive Officer to manage fee collection and payment, then the annual fee shall be based on agricultural activity according to the following fee schedule:

Agricultural Activity Tier for Individual Enrollment	Per Acre Fee
Tier A – All agricultural activity except those identified in Tier B.	$33.51 per acre up to 300 acres plus $16.76 per acre over 300 acres with a minimum fee of $668
Tier B – Discharger or group of dischargers whose agricultural activities are managed wetlands, irrigated pastures with no external nitrogen input or are determined by the Regional Water Board or the Executive Officer to be exempt from the precedential requirement to develop an Irrigation and Nitrogen Management Plan.[2]	$26.81 per acre up to 300 acres plus $13.40 per acre over 300 acres with a minimum fee of $668

[1] As used in this section, the acreage on which the fee is based refers to the area that has been irrigated or cultivated by the farmer or discharger at any time in the previous five years.

[2] Per State Water Board Order No. WQ 2018-0002, In the Matter of Review of Waste Discharge Requirements General Order No. R5-2012-0116 for Growers Within the Eastern San Joaquin River Watershed that are Members of the Third-Party Group.

(b) Upon approval by the regional board to join a group subject to waste discharge requirements or waivers of waste discharge requirements for discharges from agricultural lands, including irrigated lands, the discharger shall submit to the state board an application fee, unless such fee is not required by the regional board. The application fee is a one-time fee of $200 for dischargers that have received a written request to submit an application or report of waste discharge, and $50 for all other dischargers. This application fee shall not apply to dischargers who were members of a group on or before June 30, 2008.

(c) For purposes of this section, the words “agricultural lands,” “irrigated lands,” “farm,” and “discharger” have the meaning contained in the applicable regional board or state board waste discharge requirements or waiver of waste discharge requirements for discharges from agricultural lands, including irrigated lands. These fees shall apply whether or not a regional board or the state board has previously waived the payment of fees for the discharge of waste.

Note: Authority cited: Sections 185, 1058, 13260 and 13269 Water Code. Reference: Sections 13260 and 13269, Water Code.

2200.7. Annual Fee Schedule for Cannabis Cultivation.

(a) Annual fees for dischargers covered under Statewide General Waste Discharge Requirements for Discharges of Waste Associated with Cannabis Cultivation shall be as follows:

(1) Tier 1 – Dischargers that have a disturbed area greater than 2,000 square feet and less than one acre:

Risk Designation	Annual Fee
Low Risk	$725
Moderate Risk	$1,985
High Risk	$5,135

(2) Tier 2 – Dischargers that have a disturbed area equal to or greater than one acre:

Risk Designation	Annual Fee
Low Risk	$1,145
Moderate Risk	$3,245
High Risk	$8,495

Dischargers that have a disturbed area equal to or greater than two acres shall pay the applicable surcharge below to a maximum surcharge fee of $21,646:

Acres	Per Acre Surcharge
2-50	$194
51-100	$105
101+	$53

(3) Waiver of Waste Discharge Requirements – Dischargers with indoor cultivation sites that meet the requirements for a waiver of waste discharge requirements or conditionally exempt outdoor sites:

Discharge Type	Application Fee	Annual Fee
Waste Hauler	$725	$725
Municipal Sewer	$725	$194
Conditionally Exempt Outdoor Site	$725	$194
Other Permitted Discharges[1]	$725	$725

Note: Authority cited: Sections 185, 1058 and 13260 Water Code. Reference: Sections 13260 and 13269, Water Code.

[1] Includes discharges to Onsite Waste Treatment Systems.

2200.8. General Requirements for the Use of Recycled Water.

Any person who serves as an Administrator under a General Order authorizing the use of recycled water shall pay an annual fee in accordance with the threat/complexity ratings in Section 2200(a)(1) for each recycled water program that the person administers. The first annual fee shall be submitted with the Notice of Intent to be covered by the General Order.

Note: Authority cited: Sections 185, 1058 and 13260, Water Code. Reference: Section 13260, Water Code.

2200.9. Annual Fee Schedule for Waivers of Waste Discharge Requirements.

(a) Any person for whom waste discharge requirements have been waived pursuant to Section 13269 of the Water Code shall submit an annual fee to the state board if a fee is specified for the waiver in this section. These fees shall apply whether or not a regional board or the state board has previously waived the payment of fees for the discharge of waste.

(b) [reserved]

Note: Authority cited: Sections 1852, and 1058 and 13260, Water Code. Reference: Section 13260 and 13269, Water Code.

ATTACHMENT 8: SALT AND NITRATE CONTROL PROGRAMS NOTICE OF INTENT AND GUIDANCE

NOTICE OF INTENT GUIDANCE TO COMPLY WITH THE SALT CONTROL PROGRAM

PURPOSE

The Central Valley Regional Water Quality Control Board (Central Valley Water Board or Board) has established a Salt Control Program (Program) to regulate salinity impacts throughout the Central Valley. The Program requires all dischargers with permits issued by the Board (permittees) that include permit terms to limit salinity impacts to decide on one of two compliance pathways within 6 months of receiving a Notice to Comply (NTC):

Pathway 1: Conservative Salinity Permitting Approach

Pathway 2: Alternative Salinity Permitting Approach

The purpose of this document is to provide guidance to permittees on the two pathways.

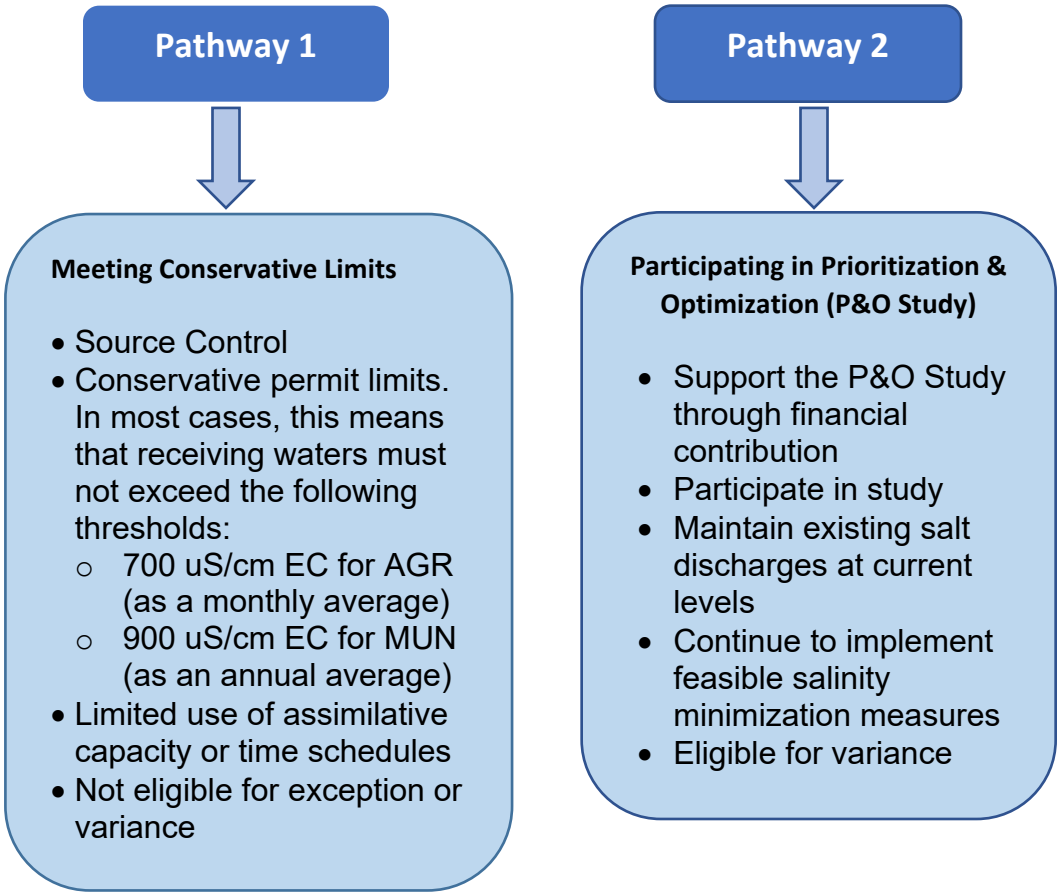
TIMELINE

Within **6 months** of receiving the NTC (please refer to the specific date listed in your letter), permittees must submit a Notice of Intent (NOI) to the Board. The NOI tells the Board which compliance pathway the permittee has chosen. The Board will then update the permittee's permit to reflect that choice. The NOI must include all necessary technical documentation that supports the decision.

BEFORE CHOOSING A PATHWAY

Before permittees decide which pathway to choose, the Board recommends visiting the website cvsalts.info (cvsalinity.org/public-info) for information. Pathway 1 is solely designed for permittees whose discharges have very low salinity concentrations, such as stormwater. To qualify for Pathway 1, a characterization study is required and must demonstrate that the permittee's discharges meet low numeric thresholds and do not threaten to further degrade groundwater or surface water. Most permittees in the Central Valley do not meet these thresholds, and therefore must choose Pathway 2. Since salts are conservative constituents (salts will continue to accumulate in water as water is reused), the Board may require all of these permittees to both limit salinity in their discharge through performance-based limits and through the implementation of salinity management planning, and will require these permittees to participate in a valley-wide study to better understand long-term salinity solutions. Figure 1, below, presents an overview of the two pathways.

Figure 1. Overview Comparison Between Pathway 1 and 2



IF YOU CHOOSE PATHWAY 1

Submit a Salinity Characterization Report that includes or considers all of the following:

1. General Information (can be found on the cover page of your NTC)

- CV-SALTS ID(s)
- Facility ID(s)
- Facility Name(s)

2. Characterization of Discharge

You must provide a characterization of discharge to surface water or groundwater.

- *Constituent(s) to Analyze* – Characterize the discharge by using electrical conductivity (EC) data. If EC data is not available, total dissolved solids (TDS) data may be used, but prior to analysis, the TDS results should be transformed to EC values using the following standard conversion:

  TDS/0.64 = EC

  If you want to use a site-specific conversion method for converting TDS data to EC, the technical justification for the alternative conversion factor should be attached to the end of the report as an appendix.

- *Locations of Permitted Discharge* – List all discharge points and include a map with labels indicating locations of discharge points. Describe and indicate on the map the predominate direction of water flow through the area. For discharge to groundwater, indicate on the map the basin/sub-basin name and boundary.

- *Period of Record for Discharge Data Analysis* – Data from at least two years prior to the date of the NTC should be utilized for the analysis (additional data is needed by water-year type for irrigated agriculture – see below). Historical data (within the past 5-10 years) and/or regional data may be used if local or current data is not available. If historical data is used, explain how historical data is representative of current discharge.

  The frequency of water quality analysis used should be sufficient to characterize any variability or trends in the discharge quality. There should be no significant gaps within the data. You should also be able to calculate monthly and annual averages from the data. Include or consider the following:

  - Provide a table summarizing monthly and annual average calculations.
  - Provide justification for any historical data used.
  - Provide sources of data.

- Include all data utilized at the end of the report as an appendix. Data should include name of discharge point, constituent analyzed, unit, and date.

Additional information needed to characterize discharges from large-scale, regional operations (e.g., agriculture) includes:

- Characterization of irrigation source waters throughout the discharge area by water year type (e.g., critical, dry, wet) to include EC, irrigation water application rates, evapotranspiration rates, rainfall averages, and leaching fraction estimates within the sub-basin.

3. Characterization of Receiving Water

Surface Water Characterization

If your receiving water is surface water, you must characterize ambient water quality around discharge locations.

- *Constituent(s) to Analyze* – Characterize the receiving surface water by using electrical conductivity (EC) data. If EC data is not available, total dissolved solids (TDS) data may be used, but prior to analysis, the TDS results should be transformed to EC using the following standard conversion:

  TDS/0.64 = EC

  If you want to use a site-specific conversion method for converting TDS data to EC, the technical justification for the alternative conversion factor should be attached to the end of the report as an appendix.

  The surface water characterization should provide a justification for the selection of the surface water locations used to characterize the receiving water.

- *Locations of Receiving Surface Water Stations* – For each discharge point to receiving water, data must be provided from three locations that are representative of ambient water quality:

  - Upstream of discharge point(s);
  - Downstream of the facility but relatively close to discharge point(s); and
  - Downstream of the facility at a location where discharge is fully mixed with receiving water.

  The characterization should provide a justification for the selection of the surface water monitoring stations used to characterize the receiving water.

  List all receiving water bodies and water monitoring stations where data was collected. Include a map with labels identifying locations of receiving water bodies

and the monitoring stations. Describe and indicate on the map the predominate direction of surface water flow through the area.

For permits that regulate discharges across a watershed, representative monitoring sites must be selected that sufficiently characterize the conditions throughout the watershed.

- *Period of Record for Receiving Surface Water Data Analysis* – Data from at least two years prior to the date of the NTC should be utilized for the analysis. Historical data (within the past 5-10 years) and/or regional data may be used if local or current data is not available. If historical data is used, explain how historical data is representative of current ambient water quality.

  The frequency of water quality analysis used should be sufficient to characterize any variability or trends in the receiving water such as flow conditions that may be affected by water year type. There should be no significant gaps within the data. You should also be able to calculate monthly and annual averages from the data. Include or consider the following:

  - Provide a table summarizing monthly and annual average calculations.
  - Provide justification for any historical data used.
  - Provide sources of data.
  - Include all data utilized at the end of the report as an appendix. Data should include name of monitoring station, constituent analyzed, unit, and date.

<u>Groundwater Characterization</u>

If your receiving water is groundwater (e.g., you discharge to ponds, spray fields, crops, and/or and application areas), you must characterize quality of groundwater within your area of contribution to the underlying basin/sub-basin groundwater quality.

- *Constituent(s) to Analyze* – Characterize the receiving groundwater by using electrical conductivity (EC) data. If EC data is not available, total dissolved solids (TDS) data may be used, but prior to analysis, the TDS results should be transformed to EC values using the following standard conversion:

  TDS/0.64 = EC

  If you want to use a site-specific conversion method for converting TDS data to EC, the technical justification for the alternative conversion factor should be attached to the end of the report as an appendix.

- *Locations of Receiving Groundwater Wells* – Characterize groundwater within and around area of contribution. This characterization should be conducted at first encountered groundwater without any volume-weighted averaging. For the purpose of the Salinity Characterization Report, first encountered groundwater is defined as

water that is first encountered when drilling underground whether it is sufficient to supply a well or not.

To determine first encountered groundwater depth, you should use drilling methods or tools such as Piezometers or Direct Push Drilling. Alternative types of drilling methods and/or tools may be necessary if depth of first encountered groundwater is beyond too deep. To ensure certainty in determining direction of groundwater flow, these tools should be installed, at a minimum, in a set of three in a triangular manner in each of the following locations:

- Upgradient of the area of contribution;
- Within the area of contribution; and
- Downgradient of the area of contribution.

Provide method and sources used to determine first-encountered groundwater depth. Include graphs of depth measurements and meter readings along with a geologic log. A California Licensed Professional Geologist should perform these analyses as appropriate.

Once first encountered groundwater depth has been determined, data that is representative of groundwater quality must be provided for each location. If there is existing data available, the characterization should provide a justification for the selection of the existing sampling locations used to characterize groundwater within and around the area of contribution. Well data should represent the depth of first encountered groundwater. Data from drinking water wells may not be representative because they are often screened lower in the aquifer system. If there is no existing data available, refer to Section 7.

List all basin/sub-basin(s) and monitoring well stations where data was collected. Include a map with labels identifying name and boundary of basin/sub-basins and location of monitoring well stations. Describe and indicate on the map the predominate direction of groundwater flow through the area.

- For permits that regulate discharges across an entire groundwater sub-basin, representative monitoring sites must be selected that sufficiently characterize the conditions throughout the entire sub-basin to include upgradient and downgradient conditions with adequate well density to capture variations in source water quality and geologic conditions. Characterization must include data for all water-year types (e.g., critical, dry, wet).

- *Period of Record for Receiving Groundwater Data Analysis* – If there is existing data available, data from at least two years prior to the date of the NTC should be utilized for the analysis. Historical data (within the past 5-10 years) and/or regional data may be used if local or current data is not available. If historical data is used, explain how

historical data is representative of current underlying groundwater quality within and around area of contribution.

The frequency of water quality analysis used should be sufficient to characterize any variability or trends in groundwater quality such as during drier and wetter than normal rainfall periods. The analysis should make best efforts to project the area of contribution over a 20-year horizon. There should be no significant gaps within the data. You should also be able to calculate monthly and annual averages from the data. Include or consider the following:

- Provide a table summarizing monthly and annual average calculations.
- Provide justification for any historical data used.
- Provide sources of data.
- Include all data utilized at the end of the report as an appendix. Data should include name of groundwater monitoring well, well location, well type, well depth, constituent analyzed, unit, and date.

4. Evaluation of Applicable Beneficial Uses and Appropriate Numeric Threshold(s)

Eligibility for Pathway 1 requires a finding that your discharge will not cause an exceedance of conservative numeric thresholds AND that your discharge will not further degrade groundwater or surface water. The appliable numeric threshold(s) apply based on whether the Board's Basin Plan designates the groundwater or surface water that receives your discharge as supporting the Agricultural Supply beneficial use (AGR) and/or the Municipal or Domestic Supply beneficial use (MUN). Note that your receiving water defaults to supporting the MUN use unless it is specifically de-designated in the Basin Plan.[1] Unless the Board's Basin Plans designate a site-specific numeric water quality objective, a permittee seeking to be regulated under Pathway 1 must meet the following thresholds:

AGR – 700 uS/cm EC, as a monthly average

MUN – 900 uS/cm EC, as an annual average

If the receiving water has a site-specific numeric water quality objective, that objective will be used for determining whether the permittee may be regulated under Pathway 1. Otherwise, the evaluation should rely on the above values. Fill out the table in III.A.2. of the Notice of Intent (NOI).

[1] State Water Resources Control Board Resolution No. 88- 63 (Sources of Drinking Water Policy) designates all surface and ground waters in California with the MUN use unless they have been specifically de-designated of the MUN use in the Basin Plan.

5. Evaluation of Whether Discharge Results in Exceedances of Numeric Thresholds or Threatens to Cause Additional Degradation of Groundwater or Surface Water[2]

Using findings from 2 through 4, you must both determine if your discharge will result in an exceedance of the MUN and/or AGR numeric thresholds in the receiving water and if your discharge will cause additional salinity degradation.

Surface Water

Compare discharge and receiving water data. Provide a table summarizing the results and indicate whether the discharge will result in an exceedance of the MUN and/or AGR numeric thresholds in the receiving water or if your discharge will cause additional salinity degradation. Consider the following:

- If the monthly or annual discharge averages exceed applicable thresholds, the discharge cannot be permitted under Pathway 1.

- If monthly or annual discharge averages do not exceed applicable thresholds but are above the receiving water average concentrations, and if that degradation has not been authorized by the Board in a Board-issued permit, this degradation precludes the discharge from being permitted under Pathway 1.

Groundwater

Compare discharge and receiving water data while making best effort to project the area of contribution over a 20-year horizon considering all water year types. Provide a table summarizing the results and indicate whether the discharge is degrading receiving water quality. The technical basis for a finding of no degradation now or in the future (e.g., findings from application of numerical models) must be attached to the end of the report as an appendix. Consider the following:

- If monthly or annual discharge averages, as they are calculated based on when they reach groundwater, exceed applicable thresholds, the discharge cannot be permitted under Pathway 1.

- If monthly or annual discharge averages, as they are calculated based on when they reach groundwater, do not exceed applicable thresholds, but if the discharge is anticipated to contribute to degradation that has not been authorized by the Board in

[2] For irrigated agriculture, biosolids, percolation ponds, manure application, and other discharges associated with soil amendments, the point of compliance would be defined as leachate below any existing root zone as it leaches downward to impact groundwater.

a Board-issued permit over a 20-year horizon, the discharge cannot be permitted under Pathway 1.

EXAMPLES

Surface Water

The City of Big Hills is the owner/operator of a municipal wastewater treatment plant subject to an individual NPDES Permit. Upon receipt of the Notice to Comply, the municipality will need to conduct an evaluation to determine if its discharges cause an exceedance of the conservative EC-based salinity values to protect AGR or MUN beneficial uses. The City conducts an evaluation as described above and the analysis of water quality data shows that the EC of the discharge has never exceeded 300 µS/cm, which is well below the conservative threshold values for protection of the AGR and MUN beneficial uses and of higher quality than the receiving water, which ranges from 450-650 µS/cm. The City is able to be permitted under the Conservative Permitting Approach and must provide its Notice of Intent within six months of receiving the Notice to Comply.

In contrast, when the City of Small Hills (which has a similar NPDES permit) conducted its analyses, the monthly average EC of the discharge ranged from 400 uS/cm to 700 uS/cm which was above the background receiving water quality of 150 to 350 uS/cm. Although the City of Small Hills discharges into a river that dilutes its discharge, the City of Small Hills had never conducted a thorough analysis of other salinity sources to support a site-specific objective. The City of Small Hills will need to either request that the Board allow the river's dilution to be used to help determine compliance (using "assimilative capacity," or the capacity of the river to absorb and dilute salinity) or pursue compliance under the Alternative Permitting Approach. Since the Amendments strongly discourage the use of assimilative capacity, preferring instead to conduct a larger analyses through the P&O Study, the City of Small Hills will likely find it more cost-effective to select compliance under the Alternative Permitting Approach, which will require the City to contact the lead entity managing the P&O Study and complete requirements necessary to be documented as fully participating. The City's permit would be amended to incorporate provisions related to the P&O Study and identify that the permittee is in compliance with salinity effluent limits as long as they continue to fully participate in the P&O Study.

Groundwater

Ripe Tomatoes, Inc. is a food processor in Merced County and has a WDR that authorizes the facility to discharge treated effluent to a nearby pasture owned and operated by Ripe Tomatoes. The facility assesses the quality of the groundwater within its area of contribution to the underlying groundwater sub-basin to determine background EC levels. The assessment must make best efforts to project the area of contribution over a 20-year horizon. The assessment finds that the monthly and annual average EC varies closely around 500 µS/cm. The land-applied effluent has a monthly average EC of 575 µS/cm. Through various processes, the EC increases as it percolates to the underlying groundwater and is typically around 800 µS/cm when it

enters the groundwater. The treated effluent that enters the groundwater is above the AGR threshold of 700 µS/cm and the facility cannot be permitted under the Conservative Permitting Approach unless Ripe Tomatoes can demonstrate that other cleaner water sources will interact with its wastewater in the aquifer, which would be considered using assimilative capacity to help determine compliance. However, the Basin Plan Amendments limit new salinity-related allocations of assimilative capacity and the Board will not likely authorize an allocation of assimilative capacity to determine whether the facility complies with the Salt Control Program. While the facility could potentially upgrade its treatment capabilities to reduce the EC of its treated effluent, it will likely be more cost-effective for Ripe Tomatoes to seek compliance under the Alternative Permitting Approach. The permittee's selected permitting approach and the required supporting documentation must be submitted to the Central Valley Water Board within six months of receiving the Notice to Comply.

6. Assessment of Compliance

Using findings from Section 5 above, you must determine your ability to comply with the requirements of Pathway 1.

The compliance assessment must be based solely on existing treatment controls and not include any planned changes in the facilities treatment controls or source of water. If planned modifications to the facility will allow the facility to comply with the Pathway 1 requirements in the future, see Section 7 ("Ability to Comply with Pathway 1 Requirements in the Future") below.

Note that Pathway 1 limits the availability of the use of compliance tools to achieve compliance over the long term, including:

- A time schedule order to meet a salinity–related effluent limit or waste discharge requirement; or

- A new or expanded allocation of assimilative capacity or mixing zone (if it exists).

Approval of either of these compliance tools is very limited and subject to the discretion of the Board. If the findings from Section 5 indicate that the facility cannot comply with Pathway 1 except through the use of one of these compliance tools, you must contact the Board regarding the potential to receive approval of a request for allocation of any available assimilative capacity, mixing zone, or a time schedule order. A request for the Board to consider one of these compliance tools may require you to complete additional technical analyses and documentation as needed. Alternatively, you can consider selecting Pathway 2 to comply with the Program and evaluate the potential to change your permitting approach at a later date (see Section 7 below).

If your existing permit already has an approved allocation of assimilative capacity or mixing zone, supported by a previously accepted antidegradation study or analysis, the Board may consider continuing previously-approved assimilative capacity.

A modification to the facility's current operation that improves effluent quality through changes in blending of source waters may be considered, if it can be demonstrated that the facility has the authority and capability to implement that change at the time this assessment is submitted to the Central Valley Water Board.

7. Ability to Comply with Pathway 1 Requirements in the Future

You may find that it is not possible to demonstrate an ability to comply with the Pathway 1 requirements within the time frame allowed to submit the NOI. Reasons may include:

- Lack of sufficient data to adequately characterize a receiving water or facility's effluent (which could be remedied with additional data collection in the future).

- Planned facility modifications that will result in compliance with Pathway 1 requirements that will not be completed in time to meet the Program's timeline for submitting an NOI.

Under these scenarios or others, you should consider selecting Pathway 2 when submitting an NOI. At a later date, you have the option to revisit the selected permitting approach. Specifically, the Program states:

> *Permittees may switch from one approach to another by submitting a written request to the Executive Officer of the Central Valley Water Board to change its selected compliance pathway. This request must include documentation regarding how the permittee will comply with the requirements applicable to the compliance pathway it is now requesting to be permitted under and the basis for the change. If the permittee requests to change from the Alternative to the Conservative Permitting Approach, the permittee must demonstrate to the Board that it has complied with all provisions associated with the Alternative Permitting Approach, including financial support to the P&O study, up through the time of permit revision to incorporate requirements for the Conservative Permitting Approach.*

Permittees that decide to implement this provision of the Program will need to submit the information that is required in the assessment, as described in Sections 1 through 6. At the time of submittal of a request to change the permitting approach and until the Board approves the change, you must continue to comply with the Pathway 2 requirements.

IF YOU CHOOSE PATHWAY 2

You must contact the lead entity of the P&O Study which is Central Valley Salinity Coalition (CVSC) through cvsalts.info (cvsalinity.org/public-info) or contacting the CVSC Executive Director, Daniel Cozad, at dcozad@cvsalinity.org to determine the annual fee required to participate in the P&O Study. Annual fees are set by CVSC and vary by permit type or industry category. For general fee breakdown, see the P&O Fee Summary by Industry/Permit Type Tables

(https://www.cvsalinity.org/images/P&O%20Fees.pdf). Once you provide the appropriate level of financial support, CVSC will provide you with documentation to submit with the NOI.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

NOTICE OF INTENT (NOI) TO COMPLY WITH SALT CONTROL PROGRAM
RESOLUTION R5-2018-0034

You must complete this entire form. Please send the completed, signed form and all necessary attachments to the Central Valley Water Board by the date indicated on the Notice to Comply (NTC). Permittees that do not provide a NOI are subject to enforcement actions.

I. CONTACT INFORMATION
(if there are multiple facility, owner, and operator, please submit information as attachment)

A. Facility

Name:			Phone Number:
Address:			
City:	County:	State:	Zip Code:
Email Address:			
CIWQS Facility ID (can be found in the NTC):			

B. Owner

Name:			Phone Number:
Mailing Address:			
City:	County:	State:	Zip Code:
Email Address:			

C. Operator

Name:			Phone Number:
Mailing Address:			
City:	County:	State:	Zip Code:
Email Address:			

D. CV-SALTS ID(s) (can be found in the NTC)

II. COMPLIANCE PATHWAY

You must select from one of the two compliance pathways to comply with the Salt Control Program.

☐ **Pathway 1** - Conservative Salinity Permitting Approach (**PLEASE COMPLETE SECTIONS III.A.**)

☐ **Pathway 2 -** Alternative Salinity Permitting Approach (**PLEASE COMPLETE SECTION III.B.**)

III. DOCUMENTATION TO SUPPORT COMPLIANCE PATHWAYS

A. Documentation needed to support selection of Conservative Salinity Permitting Approach (Pathway 1).

If you are an existing permittee, you must submit the following items by the date indicated on the Notice to Comply. If you are a new or expanding permittee, you must submit the following items with a Report of Waste Discharge. Attachments are to be submitted along with this NOI. Please refer to the **Salt NOI Guidance document** (www.waterboards.ca.gov/cvsalts/forms_temps_guide/salt_guidance) for how to comply with the following requirements for Pathway 1.

You must submit a Salinity Characterization Report which is an assessment of how your discharge to groundwater or surface water will comply with the requirements of this permitting approach. The report includes all of the following:

1) Characterization of Discharge and Receiving Water using Electrical Conductivity (EC) (measured as uS/cm)

You must provide a characterization of discharge to surface water or groundwater. If your receiving water is surface water, you must characterize ambient water quality around discharge locations. And if your receiving water is groundwater, you must characterize quality of groundwater within your area of contribution to the underlying basin/sub-basin groundwater quality. Your characterization should include constituents analyzed, location of discharge or receiving monitoring sites/wells, and period of record for data analysis.

2) Evaluation of Applicable Beneficial Uses and Appropriate Numeric Threshold(s)

The applicable conservative numeric threshold(s), apply based on whether the Board's Basin Plan designated the groundwater or surface water that receives your discharge as supporting the Agricultural Supply beneficial use (AGR) and/or the Municipal or Domestic Supply beneficial use (MUN). Unless the Board's Basin Plans designated a site-specific numeric water quality objective, a permittee seeking to be regulated under Pathway 1 must meet the following thresholds:

AGR Beneficial Use - 700 uS/cm EC, as a monthly average
MUN Beneficial Use - 900 uS/cm EC, as an annual average

For surface water discharges, list S for surface water. List all receiving water(s) Water Body names and check the beneficial use(s) or site specific objective (SSO) that apply.

For groundwater discharges, list G for groundwater. List all DWR groundwater basin names and check the beneficial use(s) or (SSO) that apply to the underlying groundwater.

Receiving water information can be found in your permit.

Surface Water Body Name / Groundwater Basin Name	S or G?	AGR	MUN	SSO
		☐	☐	☐
		☐	☐	☐
		☐	☐	☐
		☐	☐	☐
		☐	☐	☐
		☐	☐	☐
		☐	☐	☐
		☐	☐	☐

3) Evaluation of Whether Discharge Results in Exceedances of Numeric Thresholds or Threatens to Cause Additional Degradation of Groundwater or Surface Water

You must both determine if your discharge will result in an exceedance of the MUN and/or AGR numeric thresholds in the receiving water and if your discharge will cause additional salinity degradation.

4) Assessment of Compliance

Using findings from sections above, you must determine your ability to comply with the requirements of Pathway 1. Compliance assessment must be based solely on existing treatment controls.

B. Documentation needed to support selection of Alternative Salinity Permitting Approach. (Pathway 2). Attachments are to be submitted along with this NOI.

Participation in the P&O Study requires you to meet the requirements of the lead entity including any minimum level of financial support. Needed level of participation as well as governance procedures and stakeholder participation elements will be established by the lead entity. The level of participation may vary based on salinity in the discharge, local conditions or other factors.

You must contact the lead entity, Central Valley Salinity Coalition (CVSC), through cvsalts.info (cvsalinity.org/public-info) or contacting the CVSC Executive Director, Daniel Cozad, at dcozad@cvsalinity.org to determine the annual fee required to participate in the P&O Study. Annual fees are set by CVSC and vary by permit type or industry category. For general fee breakdown, see the P&O Fee Summary by Industry/Permit Type Tables (https://www.cvsalinity.org/images/P&O%20Fees.pdf). Once you provide the appropriate level of financial support, CVSC will provide you with documentation to submit with the NOI.

IV. CERTIFICATION

I certify under penalty of law that this document, including all attachments and supplemental information, were prepared under my direction and supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including possibility of fine and imprisonment.

Signature:	Date:

NOTICE OF INTENT GUIDANCE FOR THE NITRATE CONTROL PROGRAM'S INDIVIDUAL PERMITTING APPROACH (PATH A)

PURPOSE

In 2019, the Central Valley Water Board (Board) established new regulations that will affect all Board-issued permits that regulate nitrate discharges. These new regulations are called the "Nitrate Control Program." The Nitrate Control Program requires permittees to choose between an individual permitting approach (Path A) or an approach that allows permittees to work together to reduce nitrate impacts in local areas (Path B).

As the Board begins to implement the Nitrate Control Program, the Board is issuing Notices to Comply (NTC). A Notice to Comply legally requires a permittee to tell the Board which approach they will choose.

The purpose of this document is to help permittees understand the requirements of the individual approach (Path A), which is expected to be technically challenging and expensive for many permittees in the Central Valley Region.

TIMELINE

Within **330 days** of receiving the NTC (please refer to the specific date listed in your letter), permittees must submit a Notice of Intent and all necessary documents to the Board.

BEFORE CHOOSING A PATHWAY

Before deciding which compliance approach, or pathway, to choose, the Board recommends that you visit the website cvsalts.info for information. Please note that if your discharge is causing nitrate impacts to groundwater, Path A may require you to undertake some or all of the following:

- You to significantly upgrade your facility
- You to conduct extensive regular monitoring of your discharge and of local groundwater
- You to provide replacement drinking water to local residents [1]
- You to provide the Board with a rigorous technical hydrogeologic justification of what groundwater will look like in your area in 20 years

Path B, the collaborative approach, was developed so that individual permittees could cooperatively marshal resources to address nitrate impacts. Path B was developed collaboratively with many industries and stakeholders that saw advantages to this approach. However, the Board retained Path A as an option for those permittees that have high-quality discharges that meet nitrate drinking water standards or who have the resources to tackle localized nitrate issues on their own. The cvsalts.info website has

[1] Both Path A and Path B dischargers must provide replacement drinking water to affected residents.

more information on the Path B approach and how you can get involved with other permittees in your area that are developing “Management Zones” to work together to meet the requirements of the Nitrate Control Program.

BY CHOOSING PATH A, YOU WILL BE REQUIRED TO SUBMIT AN INITIAL ASSESSMENT NITRATE REPORT THAT INCLUDES AND/OR CONSIDERS THE FOLLOWING:

1. **General Information (can be found in the NTC)**
    - Facility ID(s)
    - Facility Name(s)
    - CV-SALTS ID

2. **Characterizing Your Area of Contribution and Assessing Ambient Water Quality Conditions in the Groundwater Shallow Zone**

You must characterize your area of contribution to determine the locations where your discharge and groundwater meet and where the presence of the discharge can be detected. The characterization should be conducted in the groundwater Shallow Zone, which is the depth of the shallowest 10% of the domestic wells in an area.

The Shallow Zone can be determined by using available sources such as:

- Domestic well completion records from the Department of Water Resources or County sources,
- The Irrigated Lands Regulatory Program (ILRP) trend monitoring program, or
- High-resolution data developed by the Central Valley Salinity Coalition.

Facility-specific investigations can also be used. You will be required to provide methods and sources used to determine the Shallow Zone, groundwater flow direction, and the area of contribution. The Board highly recommends that a California-licensed Professional Geologist perform these analyses.

Once the Shallow Zone, groundwater flow direction, and the area of contribution have been determined, you must determine the ambient nitrate concentrations in the Shallow Zone. Estimate the impact of nitrate in your discharge on groundwater in the Shallow Zone over a 20-year planning horizon using one of several available options:

- Use readily-available data and information to calculate ambient nitrate concentrations for the shallowest ten percent (10%) of the domestic water supply wells in the Upper Zone of a groundwater basin/sub-basin as defined and established in *Region 5: Updated Groundwater Quality Analysis and High Resolution mapping for Central Valley Salt and Nitrate Management Plan* (June 2016),
- Conduct a site-specific or area-specific evaluation based on various types of available data and information, including but not limited to, depth and age of

domestic wells in the area of contribution, groundwater table, well completion report data, and other available and relevant information, or

- An equivalent alternative approved by the Central Valley Water Board's Executive Officer.

Period of Record for Data Analysis – It is recommended that data from the past 5-10 years should be utilized for the analysis. The frequency of water quality analysis used should be sufficient to characterize trends in groundwater quality in the Shallow Zone and there should be no significant data gaps. Include or consider the following:

- Provide a table summarizing the data. The table should include basic statistical analysis, including monthly and annual minimum, maximum, mean, and median values for nitrate in mg/L-N.
- Provide a table summarizing the nitrate concentration trends and whether nitrate concentrations are decreasing/increasing, and information to support the trend analysis.
- Provide a map with labels identifying name and boundaries of basin/sub-basins and the locations of domestic wells.
- Provide a map that shows the area of contribution now and over a 20-year planning horizon.
- Provide sources for the data used.
- Include all data utilized with the report as an appendix. Data should include name of domestic well, DWR Bulletin 118 groundwater basins/sub-basins the wells are located in, date, and any other pertinent information.

3. Determine if your nitrate discharge is causing or contributing to nitrate impacts in any public water supply well or domestic well

You must conduct a survey of the area where your discharge occurs to identify if water from any public water supply or domestic wells has nitrate levels that exceed the drinking water standard (10 mg/L-N), and determine if your discharge is causing or contributing to the nitrate exceedance(s).

- To identify drinking water wells that may exceed the nitrate drinking water standard, you may use Google Earth to identify locations of domestic wells, the State Water Board's GeoTracker database, State Water Board Division of Drinking Water information, local County Public Health Department information, and other data sources.
- Provide a table summarizing the number of drinking water wells exceeding the nitrate drinking water standard, including the name of the drinking water well, DWR Bulletin 118 groundwater basins/sub-basins the wells are located in, sampling dates, and any other pertinent information. The table should include basic statistical analysis, including monthly and annual minimum, maximum, mean, and median values for nitrate in mg/L-N.

- Provide a map with labels identifying name and boundaries of basin/sub-basins and the locations of domestic wells.
- Provide sources for the data used.

4. Develop an Early Action Plan (EAP) if applicable

If your discharge is causing or contributing to an exceedance of a drinking water standard in a public water supply well or domestic well, then you must prepare and submit an EAP with your initial assessment and a NOI to the Central Valley Water Board. The EAP must include the following:

- A process to identify affected residents and the outreach utilized to ensure that impacted groundwater users are informed of and given the opportunity to participate in the development of proposed solutions,
- A process for coordinating with others that are not dischargers to address drinking water issues, which must include consideration of coordinating with affected communities, domestic well users and their representatives, the State Water Board Division of Drinking Water, local planning departments, local county health officials, sustainable groundwater management agencies, and others, as appropriate,
- Specific actions and a schedule of implementation to address the immediate drinking water needs of those initially identified within the area of contribution for an individual permittee that are drinking groundwater that exceeds nitrate standards and that do not otherwise have interim replacement water that meets drinking water standards, and
- A funding mechanism for implementing the EAP, which may include seeking funding from local, state, and federal funds that are available for such purposes.

Implementation of the EAP should begin as soon as reasonably feasible, but no later than 60 days after submittal, unless an objection is received from the Central Valley Water Board. Guidance on EAP development and implementation was developed as part of an Early Implementation Grant for two Priority 1 Management Zones. The document is available at the cvsalinity.org website.

5. Categorize the Discharge

Based on the impact of your discharge in the Shallow Zone and the quality of the discharge, you are required to categorize your nitrate discharge into one of the five categories described below.

If your discharge is categorized as Category 4 or 5, you must identify and propose an Alternative Compliance Project (ACP) as outlined in Step 6 of this guidance.
Explanation of each category:

- Category 1 (Your wastewater discharge is high-quality and is not causing any nitrate degradation): Nitrate concentration of your discharge as it reaches the Shallow Zone must be lower than the applicable nitrate water quality objective (<10 mg/L-N) and must be lower than the average nitrate concentration in the

Shallow Zone. The average nitrate concentration in the Shallow Zone may be less than, equal to, or greater than the applicable water quality objective, but because your discharge itself is less than the objective, and less than the average concentration in the Shallow Zone, it will improve water quality conditions. Nitrate discharges in this category are considered to not increase nitrate levels in the Shallow Zone, thus an ACP is not required.

- Category 2 (Your discharge may be slightly above the drinking water standard, but because it is so minor and/or because high-quality groundwater recharge is abundant, your discharge is only causing *de minimis* impacts, and groundwater already meets drinking water standards): Your nitrate discharge in combination with other nitrate discharges to the same Shallow Zone will not cause the average concentration of nitrate in the Shallow Zone to exceed a nitrate trigger of 75% of the applicable water quality objective. Your discharge may be above the applicable water quality objective (>10 mg/L-N) but your discharge will use less than 10% of available assimilative capacity, and your discharge along with other discharges of nitrate to the Shallow Zone (over a 20-year planning horizon) will not cause the Shallow Zone to exceed 75% of the applicable water quality objective.

  Any degradation that will occur due to your discharges must be supported with an antidegradation analysis. Such analysis needs to be part of the initial assessment, unless the Central Valley Water Board previously granted the use of assimilative capacity was supported with an antidegradation analysis.

  Nitrate discharges in this category have little adverse impact on groundwater quality in the Shallow Zone, thus an ACP is not required. However, some form of groundwater monitoring may be required to continue to monitor nitrate impacts on the Shallow Zone.

- Category 3 (Your discharge is above the drinking water standard, but because high-quality groundwater recharge is abundant, you are able to demonstrate that the most sensitive portion of the aquifer will remain below 75% of the drinking water standard decades into the future): Concentrations of nitrate in your discharge may be greater than the applicable water quality objective (>10 mg/L-N) and the impact of your discharge of nitrate is more than *de minimis* (i.e., use more than 10% of available assimilative capacity). Further, your discharges cannot cause the average nitrate concentration in the Shallow Zone to exceed 75% of the applicable water quality objective over a 20-year planning horizon.

  Like Category 2, use of assimilative capacity must be supported with an antidegradation analysis and must be part of the initial assessment.

  Nitrate discharges in Category 3 will generally be determined by the Central Valley Water Board to be consistent with the Nitrate Control Program, and an ACP will not be required. However, you will likely be required to conduct additional monitoring to ensure that the trigger level of 75% of the applicable water quality objective is not being exceeded.

- Category 4 (Your discharge is above the drinking water standard, but because high-quality groundwater recharge is abundant, you are able to demonstrate that the most sensitive portion of the aquifer will remain between 75% of the drinking water standard and the drinking water standard decades into the future – extensive monitoring may be required to ensure that assumptions are accurate, and an alternate compliance project is also needed): Your discharge will cause the average nitrate concentration in the Shallow Zone to exceed the 75% trigger, but not the applicable water quality objective over the 20-year planning horizon (e.g., Shallow Zone will be between 7.5 mg/L and 10 mg/L in 20 years).

  The request for use of assimilative capacity must be supported with an antidegradation analysis and must be part of the initial assessment. An ACP is required when requesting the use of assimilative capacity because your discharge will cause the average nitrate concentration in the Shallow Zone to exceed the 75% trigger.

- Category 5 (Your discharge is above the nitrate drinking water standard and will continue to impact groundwater, but instead of collaborating with other permittees in your area to set up a Management Zone that will provide nearby residents with a source of replacement drinking water, monitor groundwater quality, and upgrade facilities, you are choosing to assume all of these obligations on your own): Nitrate concentrations in your discharge exceed the applicable water quality objective (10 mg/L-N) as it reaches the Shallow Zone and the Shallow Zone has no assimilative capacity, or your discharge causes the Shallow Zone to exceed 10 mg/L-N. In this case, you must submit an application that meets the requirements set forth in the Exceptions Policy in order to be granted an Exception to permit the discharge. The granting of an exception is an alternative permitting approach that must be accompanied with an ACP.

6. Proposing an Alternative Compliance Project

Required for Category 4 and Category 5 Permittees

The Central Valley Water Board requires permittees that develop and implement an ACP to support the request of an allocation of assimilative capacity, above a trigger level, or to authorize an exception to meeting nitrate limitations. The request for Alternative Compliance must be accompanied by sufficient documentation to verify that the proposed approach meets the goals of the Nitrate Control Program.

An ACP is a project proposed by a permittee that must assure short and long-term safe drinking water supplies while moving toward long-term managed restoration by reducing nitrate discharge within the basin or sub-basin. ACPs may include both emergency actions (e.g., bottled water) in the short-term, permanent solutions in the intermediate term (such as reliable well-head treatment or connection to or integration with nearby municipal water providers), and efforts to re-attain the water quality objective over the long-term.

For more information and guidelines for proposing an acceptable ACP, please refer to Appendix H of the 2018 Staff Report. To request a copy, please email cvsalts@waterboards.ca.gov.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

NOTICE OF INTENT (NOI) TO COMPLY WITH NITRATE CONTROL PROGRAM
RESOLUTION R5-2018-0034

You must complete this entire form. Please send the completed, signed form and all necessary attachments to the Central Valley Water Board by the dates indicated on the Notice to Comply. Permittees that do not provide a NOI are subject to enforcement actions.

I. CONTACT INFORMATION
(if there are multiple facility, owner, and operator, please submit information as attachment)

A. Facility

Name:			Phone Number:
Mailing Address:			
City:	County:	State	Zip Code:
Email Address:			
CIWQS Facility ID (can be found in the NTC):			

B. Owner

Name:			Phone Number:
Address:			
City:	County:	State	Zip Code:
Email Address:			

C. Operator

Name:			Phone Number:
Address:			
City:	County:	State	Zip Code:
Email Address:			

D. CV-SALTS ID(s) (can be found in the NTC)

II. COMPLIANCE PATHWAY

You must select from one of the two compliance pathways to comply with the Nitrate Control Program. *Please note - Permittees that are identified as an Initial Participant in a Management Zone's Preliminary Management Zone Proposal shall be assumed to be electing Pathway B for complying with the Nitrate Control Program, unless they otherwise notify the Central Valley Water Board of their intent to withdraw from Pathway B.*

☐ **Pathway A** - Individual Permitting Approach (**PLEASE COMPLETE SECTIONS III.A.**)

☐ **Pathway B** - Management Zone Permitting Approach (**PLEASE COMPLETE SECTION III.B.**)

III. DOCUMENTATION TO SUPPORT COMPLIANCE PATHWAYS

A. Documentation needed to support selection of Individual Permitting Approach (Pathway A).

If you are an existing permittee, you must submit the following items by the date indicated on the Notice to Comply for Priority 1 Basins/Sub-basins. If you are a new or expanding permittee, you must submit the following items with a Report of Waste Discharge. Attachments are to be submitted along with this NOI. Please refer to the Nitrate NOI guidance document for how to comply with the following requirements for Pathway A.

1) Assess Water Quality Conditions in the Shallow Zone

You must estimate the impact of nitrate in your discharge(s) on groundwater in the Shallow Zone over a 20-year planning horizon. The Shallow Zone is defined as the vertical extent of the aquifer representing the shallowest 10% of the domestic water supply wells in a given area. Use of an equivalent alternative to this definition of the Shallow Zone must first be approved by the Central Valley Water Board's Executive Officer.

When evaluating such impacts, you should be looking to determine the impact of your nitrate discharge(s) on average nitrate concentrations in the Shallow Zone.

You may conduct such assessments by using simple mass balance calculations that assume 20 years of nitrate loading as it reaches the water table, and by using readily available information. Alternatively, you may collect data and information, to model your nitrate discharge impacts on groundwater in the applicable Shallow Zone. You are not required to develop expensive, high resolution models. However, you have the option to conduct a more sophisticated analysis should you desire. Further, you are encouraged to use existing assessments that may already exist.

2) Determine if Nitrate is Causing Any Public Water Supply Well or Domestic Well to Exceed Nitrate Drinking Water Standard

You must conduct a survey of the area where the discharge(s) occurs to identify if there are public water supply or domestic wells that have nitrate levels in exceedance of the drinking water standard, and determine if your discharge(s) are the cause of the nitrate exceedance in drinking water well in question.

If it is determined that your discharge(s) will cause exceedance in nitrate levels, you will be required to develop an Early Action Plan (**PLEASE COMPLETE SECTION III.A.3**)

3) Develop Early Action Plan *(If Applicable)*

If you have determined that you have caused a public water supply well or domestic well to exceed the nitrate drinking water standard of 10 parts per million (ppm), then you must prepare and submit an Early Action Plan. You are required to implement the Early Action Plan as soon as reasonably feasible, but no later than **60 days** after submittal.

The Early Action Plan must include the following items:

- ☐ A process to identify affected residents and the outreach utilized the ensure that impacted groundwater users are informed and given the opportunity to participate in the development of proposed solutions;

- ☐ A process for coordinating with others that are not dischargers to address drinking water issues, which must include consideration of coordinating with affected communities, domestic well users and their representatives, the State Water Board's Division of Drinking Water, Local Planning Departments, Local County Health Officials, Sustainable Groundwater Management Agencies and others;

- ☐ Specific actions and a schedule of implementation that is as short as practicable to address the immediate drinking water needs of those initially identified within the management zone, or area of contribution for a Pathway A discharger, that are drinking groundwater that exceeds nitrate standards; and

- ☐ A funding mechanism for implementing the Early Action Plan, which may include seeking funding from Management Zone participants, and/or local, state and federal funds that are available for such purposes.

4) Categorize the Discharge

You are required to categorize your impact for nitrate in the Shallow Zone. Please see the five categories below to make your determination. If your discharge is categorized as **4 or 5**, you may need to submit an Alternative Compliance Project (**PLEASE COMPLETE SECTION III.A.5**).

What is your nitrate discharge category? Select a Category

Category	Discharge Quality and Impact to Groundwater
Category 1 No Degradation	Discharge quality, as it reaches the Shallow Zone, is better than the applicable water quality objective and is better than the average nitrate concentration in the Shallow Zone.
Category 2 *De Minimis* Impacts	The average nitrate concentration in the Shallow Zone is better than the applicable water quality objective, and, over a 20-year planning horizon: 1) The effect of the discharge on the average nitrate concentration in the Shallow Zone is expected to use less than 10% of the available assimilative capacity in the Shallow Zone; and 2) The discharge, in combination with other nitrate inputs to the Shallow Zone, is not expected to cause average nitrate concentrations in the Shallow Zone to exceed a nitrate trigger of 75% of the applicable water quality objective.
Category 3 Degradation Below Trigger	The average nitrate concentration in the Shallow Zone is better than the applicable water quality objective. Estimated that discharge is more than de minimus,but will not cause the average nitrate concentration in the Shallow Zone to exceed a trigger of 75% of the applicable water quality objective over a 20-year planning horizon.
Category 4 Degradation Above Trigger	The average nitrate concentration in the Shallow Zone is better than the water quality objective. Though the discharge is reasonably expected to cause the average nitrate concentration in the Shallow Zone to exceed a trigger of 75% of the applicable water quality objective over a 20-year planning horizon, the average nitrate concentration in the Shallow Zone is expected to remain at or below the applicable water quality objective over the same 20-year planning horizon.
Category 5 Discharge Above Objective	Either: 1) The average nitrate concentration in the Shallow Zone is better than the applicable water quality objective, but the discharge may cause the average nitrate concentration in the Shallow Zone to exceed the water quality objective over a 20-year planning horizon; or 2) The average nitrate concentration in the Shallow Zone exceeds the applicable water quality objective and the discharge quality, as it reaches the Shallow Zone, also exceeds the applicable water quality objective.

5) Propose an Alternative Compliance Project *(If Applicable)*

If you seek the use of assimilative capacity above the trigger level of need an Exception, you must submit an Alternative Compliance Project. It must include the following:

- ☐ Identification of public water supply and domestic wells that exceed nitrate water quality objectives and that are within the discharge areas zone of contribution;
- ☐ A schedule, with identified milestones, for addressing those nitrate-related drinking water issues; and
- ☐ Identification of steps to be taken to meet the management goals of the Nitrate Control Program, which may be phased in over time.

B. Documentation needed to support selection of Management Zone Permitting Approach (Pathway B).

If you choose Pathway B, you need to participate in a Management Zone to ensure that all program deliverables and timelines are met. Please refer to cvsalts.info website for how to comply with requirements for Pathway B.

1) If you are participating in a Management Zone, submitting a NOI is optional since the Preliminary Management Zone Proposal (PMZP) will serve as the NOI.

Please provide the following information if you are listed in a Preliminary Management Zone Proposal (PMZP) (if available):

A. Name of Management Zone

B. Primary Contact

Name:			Phone Number:
Address:			
City:	County:	State	Zip Code:
Email Address:			

2) If you are not already listed in a PMZP and wishes to join one, you may check out the CV-SALTS Program website for Management Zone being proposed for your area and contact to join.

IV. CERTIFICATION

I certify under penalty of law that this document, including all attachments and supplemental information, were prepared under my direction and supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including possibility of fine and imprisonment.

Title: **Conventional Wastewater Treatment Facility and Percolation Basins (55,000 GPM Design Flow)**
Opinion of Probable Annual Operation and Maintenance Costs

Item #	Item	Quantity	Unit	Unit Price	Annual Cost
	Pre-Packaged Membrane Bioreactor Plant Equipment				
1	Consumables (Oil, Grease, Belts, Filters, etc.)	1	Annual Cost	$2,000.00	$2,000
2	Spare Parts (Seals, Bearings, Brushes, etc.)	1	Annual Cost	$2,500.00	$2,500
3	Replacement of Parts	1	Annual Cost	$35,000.00	$35,000
	Pre-Packaged Conventional Treatment Plant Labor				
4	Routine Operations	22	Hours per Week	$100.00	$114,400
5	Required Sampling/Analysis	2	Hours per Month	$100.00	$2,400
6	Preventative Maintenance	8	Hours per Week	$100.00	$41,600
7	Compliance and Reporting	3	Hours per Month	$100.00	$3,600
	Pre-Packaged Conventional Treatment Plant				
8	Power	365	Daily Cost	$55.00	$20,075
9	Chemical: Hypochlorite or Equal	25	Gallons per Month	$4.00	$1,200
10	Chemical: Citric Acid or Equal	20	Gallons per Month	$12.00	$2,880
	UV Disinfection System (2 units)				
11	Replacement of Parts	1	Annual Cost	$8,000.00	$8,000
12	Maintenance	1	Hours per Week	$100.00	$5,200
13	Power (assumes only 1 unit in service, daily)	365	Daily Cost	$25.00	$9,125
	Sludge Processing, Storage, and Disposal				
14	Power	365	Daily Cost	$60.00	$21,900
15	Maintenance	4	Hours per Month	$100.00	$4,800
16	Hauling	52	Weekly Cost	$3,500.00	$182,000
17	Chemical: Polymer	1	Annual Cost	$4,000.00	$4,000
	Percolation Ponds				
18	Maintenance	4	Hours per Month	$100.00	$4,800
	Emergency Overflow Storage System				
19	Maintenance	4	Hours per Quarter	$100.00	$1,600
	Odor Control				
20	Power	12	Cost per Month	$15.00	$180
21	Maintenance	2	Hours per Month	$100.00	$2,400
22	Chemicals	1	Annual Cost	$5,000.00	$5,000
	Lift Station				
23	Power	365	Daily Cost	$50.00	$18,250
24	Maintenace	4	Hours per Quarter	$100.00	$1,600

	Subtotal:		$494,510
☑ Conceptual Design	Conting. (%,+/-)	30	$148,353
☐ Preliminary Design			
☐ Final Design			
	Total		**$650,000**
