# K.2 - Transportation Evaluation

THIS PAGE INTENTIONALLY LEFT BLANK

KITTELSON & ASSOCIATES
155 Grand Avenue, Suite 505
Oakland, CA 94612
P 510.839.1742

# TECHNICAL MEMORANDUM

June 27, 2024 Project# 28949

To: Mr. Sean Smith, Supervising Civil Engineer
City of Clovis
1033 Fifth Street
Clovis, CA 93612

From: Aaron Elias, T.E., Lee Miller, Qiming Sun, Mike Aronson, P.E.

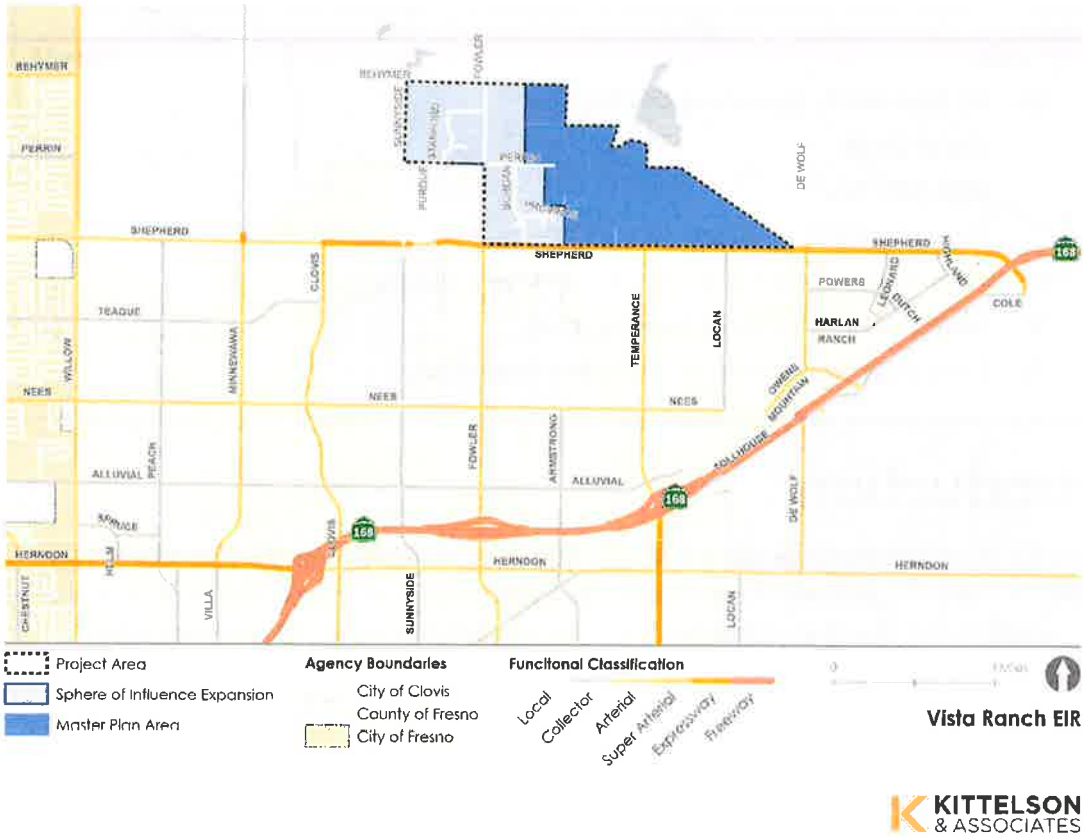
CC: Steve McMurtry, De Novo Planning Group

RE: Clovis Vista Ranch CEQA Transportation Evaluation

# Introduction

The California Environmental Quality Act (CEQA) transportation analysis for the Vista Ranch Project (Project) in Clovis, CA, evaluates the transportation impact areas that may be considered in environmental documentation for the project. A separate Local Transportation Analysis (LTA) evaluates other transportation issues such as roadway and intersection capacity which are not part of the environmental evaluation under CEQA.

The CEQA checklist for transportation includes four questions that this memo will evaluate. These four questions include:



a. Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?
b. Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)? (vehicle miles of travel (VMT) assessment)
c. Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?
d. Would the project result in inadequate emergency access?

The following sections include a brief description of the Project, existing transportation conditions in the Project area, regulations and policies which apply to the CEQA evaluation, and an assessment of each of the four CEQA transportation questions.

## PROJECT DESCRIPTION

The Project includes approximately 952 acres located within the city's planning area and is bounded on the north by Behymer Avenue, on the east by the Big Dry Creek Reservoir, on the south by Shepherd and Perrin Avenues, and on the west by North Fowler and North Sunnyside Avenues. The project contains both a master plan area and a non-development sphere of influence expansion. Figure 1 shows the Project and study area.

## Figure 1: Vista Ranch Project and Study Area

KITTELSON & ASSOCIATES

The Master Plan area is approximately 507 acres and proposes the construction of up to 3,286 residential units, approximately 48 acres of commercial/mixed uses, approximately 19 acres for an elementary school, and approximately 57 acres of parks, trails, and open space. The non-development area is approximately 445 acres and will not receive any entitlements other than to be included in the Sphere of Influence (SOI) expansion.

The Project's planning area is separated into three distinct areas which include:

- MPArea1, approximately 368 acres including:
  - Up to 1,268 medium density residential dwelling units (Zoned R-1-MD)
  - Up to 1,039 medium high density residential dwelling units (Zoned R-2)
  - Up to 500 very high density residential dwelling units (Zoned R-4)
  - Up to 85,000 square feet of gateway commercial (Zoned C-1)
  - An accessible public park of 2.74 acres
- MPArea2, approximately 139 acres including:
  - Up to 137 low density residential dwelling units (Zoned R-1)
  - Up to 224 medium density residential dwelling units (Zoned R-1-MD)
  - Up to 115,000 square feet of gateway commercial (Zoned C-1)
  - Mini self-storage facility with up to 421,356 square feet of building (Zoned M-1)
  - Elementary school with up to 750 students or an additional 118 medium density residential units (Zoned R-1-MD)
- Non-Development Area, approximately 445 acres that have not requested any entitlements at this time other than to be included in the proposed SOI expansion.

# Existing Conditions

This section provides a description of the existing roadway, transit, bicycle, and pedestrian components of the transportation system within the Project study area shown in Figure 1.

## ROADWAY NETWORK

The existing roadway network in the Project study area is composed of freeways, super arterials, arterials, and collector roads. Roadway classifications listed are from Fresno County to account for roadways currently outside the city of Clovis.

### Freeways

**State Route 168 (SR 168)** is a divided four-lane highway running northeast to southwest through the study area. It provides connection from the intercity Fresno area to the Sierra Nevada Mountain range. Access points to SR 168 are located at Herndon Avenue, Fowler Avenue, Temperance Avenue, Owens Mountain Parkway and Shepherd Avenue. Most sections in the study area have limited access but sections near Owens Mountain Parkway and Shepherd Avenue have at-grade intersections. The speed limit is generally set at 65 miles per hour (mph) within the study area.

## Expressway

**Shepherd Avenue** is an east to west running roadway that ranges from a two lane road to a four lane divided by a median roadway near the Project where it provides the southern boundary for the Project. Newer sections of the road are the four lane divided sections while the older unimproved sections are the two lane areas. Sidewalks are along the developed south side of the roadway, and conventional bike lanes on each side. Shepherd Avenue connects SR 168 to Willow Avenue at the western edge of the study area. A half mile segment of Shepherd Avenue between Fowler Avenue and Sunnyside Avenue is not improved and classified as an arterial. The speed limit ranges from 50 mph on the divided sections to 40 mph in the two-lane highway section.

## Super Arterials

**Willow Avenue** runs north to south along the western edge of the study area from Behymer Avenue to Herdon Avenue. Willow Avenue has six lanes divided by a center median. From Shepherd Avenue south, the majority of Willow Avenue has bike lanes and sidewalks on both sides. The Clovis Old Town Trail runs along the Willow Avenue right-of-way (ROW) from Behymer Avenue to just south of Teague Avenue where it crosses under Willow Avenue heading southeast. Willow Avenue provides access to central Clovis to the south and the Clovis Community College campus to the north. The speed limit in the vicinity of the Project (near Shepherd) is 50 mph.

## Arterials

### NORTH-SOUTH

**Clovis Avenue** is located west of the Master Plan Area, beginning north of Shepherd Avenue, and connecting south to Herndon Avenue. Clovis Avenue is four lanes with a center median with sidewalk and bike lanes on each side. Between Teague Avenue and Alluvial Avenue, the Dry Creek Trail shared use path shares the ROW along the east side of the corridor. The speed limit is approximately 45 mph.

**Fowler Avenue** runs through the study area classified as a local street, changing to an arterial from Shepherd Avenue south to SR 168. The roadway configuration on Fowler Avenue is mixed due to fronting land uses and undeveloped parcels.

- From Shepherd Avenue to Teague Avenue there are two lanes in the southbound direction and one lane northbound. A bike lane and sidewalk are located along the majority of this section. The Enterprise shared use path crosses Fowler Avenue south of Shepherd Avenue and connects with a shared use path on the west side of Fowler Avenue from the Enterprise trail crossing to Teague Avenue. The speed limit in this section is 45 mph.
- From Teague Avenue to Nees Avenue the ROW narrows and includes one lane in each direction with no sidewalk and bike facilities. The speed limit remains 45 mph.
- From Nees Avenue to SR 168, the cross-section includes four lanes with a center median, and includes bike lanes and sidewalks on each side. The speed limit in this section is 45 mph.

**Temperance Avenue** begins in the center of the Master Plan Area and runs south to SR 168 and a collection of commercial land uses. The roadway is a four lane divided road with bike lanes and sidewalks on each side. The speed limit is 50 mph.

**De Wolf Avenue** runs from Shepherd Avenue south to Owens Mountain Parkway on the eastern edge of the Master Plan Area. The roadway cross section generally has a single lane in each direction with a center median allowing for turn lanes. Bicycle lanes and sidewalks are provided on each side. De Wolf Avenue provides access from the Master Plan Area to the SR 168 freeway via Owens Mountain Parkway. The posted speed limit is 40 mph.

### EAST-WEST

**Shepherd Avenue** has a small section from Fowler Avenue to Sunnyside Avenue that is classified as an arterial rather than an expressway. The roadway narrows to two lanes without a median and no bike or walking facilities. Future development in this area will improve this segment of Shepherd Avenue to be consistent with the rest of the roadway. The speed limit in this section is 40 mph.

**Owens Mountain Parkway** connects to SR 168 and terminates prior to Nees Avenue without providing a connection under existing conditions. Future plans would extend this roadway to connect to Temperance Avenue at Alluvial Avenue. Owens Mountain Parkway is one lane in each direction with a center median and bike lanes on each side. Sidewalks are intermittent where existing development is located on the western section. The roadway pairs with De Wolf Avenue to provide access from the Master Plan Area to SR 168. There are currently no observed posted speed limit signs.

**Nees Avenue** runs through the center of the study area, cutting through suburban neighborhoods where the land use shifts east of Clovis Avenue to a more rural and undeveloped landscape. From Willow Avenue to Minnewawa Avenue the corridor has four lanes with a center turn lane and sidewalk on the majority of both sides. East of Minnewawa Avenue, the corridor is varied with some two lane undivided sections, divided two lane sections, and divided three lane sections. Posted speed limits range from 40 mph to 45 mph.

**Herndon Avenue** is at the southern edge of the study area and connects SR 168 and the northern parts of Fresno to the west. Herndon Avenue is six lanes with a center turn lane. The corridor has sporadic sidewalks adjacent to areas of newer development. The posted speed limit is 45 mph.

## Collectors

The collector streets vary greatly in their configuration and character, as many traverse through developed neighborhoods and undeveloped land. Collector roadways within the study area are listed in Table 1. Each street condition is listed as one of the following:

- **Improved –** The majority of the street cross section has been brought up to current stands and includes sidewalk and bicycle facilities based on context.
- **Unimproved –** The majority of the street cross section has not been brought to current standards and may not include curbs, sidewalk, or bicycle facilities.

- **Mixed –** The street cross section is mixed between improved and unimproved condition, based primarily on frontage of a developed neighborhood or commercial tract.

- **Table 1: Collector Streets**

| | Street Name | Condition |
|---|---|---|
| North/South | Sunnyside Avenue | Mixed |
| | Locan Avenue | Mixed |
| | Peach Avenue | Improved |
| | Armstrong Avenue | Mixed |
| | Leonard Avenue | Improved |
| | Minnewawa Avenue | Improved |
| | Teaque Avenue | Mixed |
| East/West | Powers Avenue / Dutch Avenue | Improved |
| | Harlan Ranch Avenue | Improved |
| | Highland Avenue | Improved |
| | Tollhouse Rd. | Unimproved |
| | Alluvial Avenue | Mixed |

## Local Streets

Within the study area, there are many local streets providing access to residential single family housing. Many of the local streets within neighborhood developments do have sidewalks on both sides of the street, however streets in less dense residential or undeveloped areas do not.

### MASTER PLAN AREA

Within the Master Plan Area, which is currently outside of the city of Clovis, there are several local streets serving residents. The major local streets within the Master Plan Area are described below.

**Behymer Avenue** connects the north edge of the Master Plan Area west to Willow Avenue. It has two lanes and no sidewalk or bike facilities. Behymer Avenue is in a rural residential context and is posted at 45 mph.

**Fowler Avenue** changes character significantly north of Shepherd Avenue. It runs through the center of the Master Plan Area and provides rural residential access. Fowler Avenue is two lanes without sidewalk or bike facilities and is posted at 45 mph. It connects the city of Clovis to the south with Behymer Avenue to the north.

**Perrin Avenue** is a short east to west connecting street providing rural residential access. It is two lanes, without a center stripe, and does not have sidewalk or bike facilities. It is also split into two sections, divided by parcels in the center. It connects to Sunnyside Avenue and Fowler Avenue. There are no posted speed limit signs.

**Sunnyside Avenue** north of Shepherd Avenue maintains a rural residential context, but does not have a center stripe, nor does it have sidewalk or bike facilities. It connects north to Perrin Avenue. There are no posted speed limit signs but there is an "end 45 speed limit" sign indicating the speed limit is 55 mph per its roadway classification.

**Burgan Avenue** connects Perrin Avenue south to Shepherd Avenue. It provides rural residential access, with two lanes, no center stripe and does not have sidewalk or bike facilities. No speed limit is posted.

# TRANSIT

The following section describes existing transit services near the study area. These routes are shown graphically in Figure 2. Detailed information on served areas and hours of operation are found in Table 2.

## Fresno Area Express (FAX)

FAX provides fixed route transit services serving the city of Fresno and a portion of the City of Clovis and is the largest transit service provider in the region with almost seven million annual boardings. Handy Ride is the paratransit service provider for the FAX system.

**Route 3** serves the western edge of the study area along Willow Avenue terminating at Clovis Community College. Service runs every 30 minutes each day of the week.

## Clovis Transit

Clovis Transit is the principal transit service in the city of Clovis and provides fixed route and paratransit services. Clovis Transit connects with Fresno Area Express (FAX). Round Up is the paratransit service for the Clovis Transit system.

**Route 10** is a circulator route that provides service to the western portion of Clovis and connects to the Clovis Civic Center.

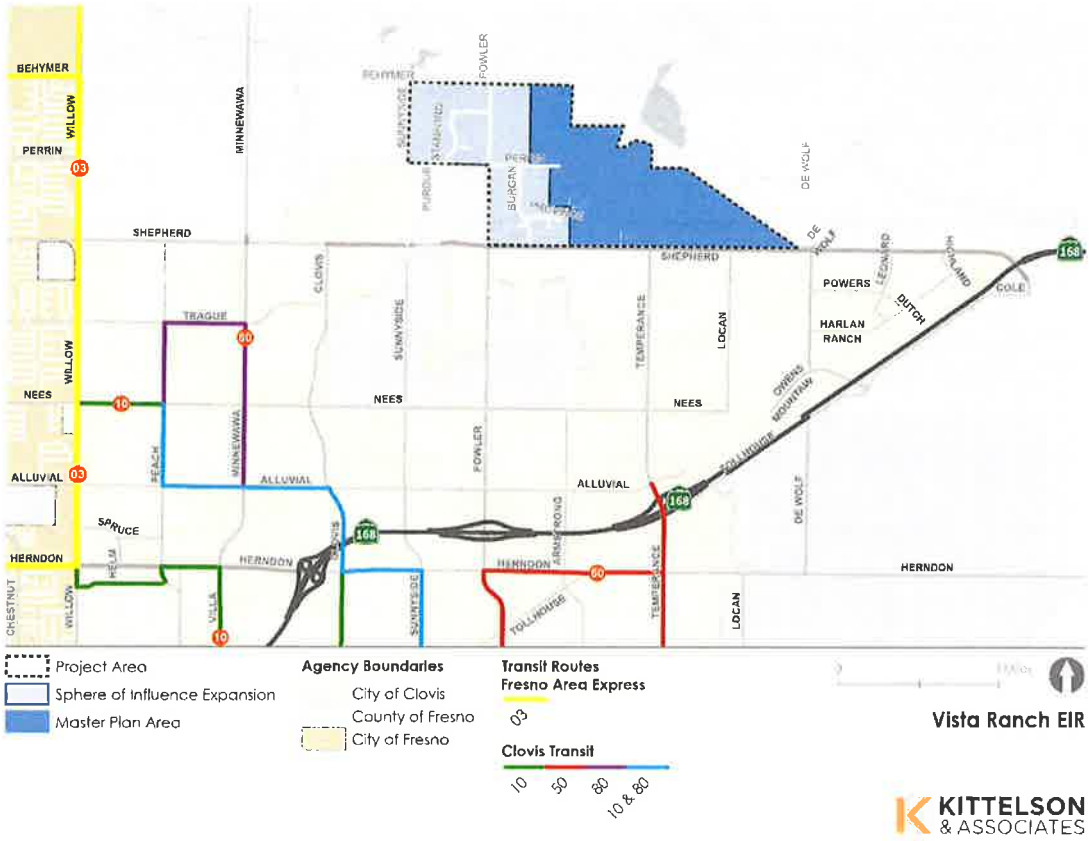
**Route 50** is a circulator route serving the northeast and southeast section of Clovis.

**Route 80** provides local services from central Clovis to the Buchanan education complex.

## Fresno County Rural Transit Agency (FCRTA)

FCRTA provides general public transit service to rural communities throughout Fresno County. FCRTA provides both scheduled, fixed route services with designated bus stops along specific routes, as well as reservation-based, demand responsive service that offers curb-to-curb transportation.

## Auberry Route



The Auberry transit route provides connection from Clovis to the Auberry area foothill communities northeast of Clovis. The service is demand responsive and operates one day per week with 24-hr advanced notice.

**Table 2: Bus Routes Serving the Study Area**

| | Route | Serving | Day | Times | | Frequency |
|---|---|---|---|---|---|---|
| | | **Fresno Area Express** | | | | |
| Existing | 3 | Route 3 connects Clovis Community College to Herdon. The route provides access to several shopping centers and medical facilities along the route. | Mon – Fri | 5:45am | 8:45am | 30min |
| | | | Sat – Sun | 6:45am | 6:15pm | 30min |
| | | **Clovis Transit** | | | | |
| | 10 | Route 10 connects north Clovis to Fresno State University, serving Clovis Civic Center, and Peachwood Medical Center. | Mon – Fri | 6:15am | 6:30pm | 30min |
| | | | Sat | 7:30am | 3:30pm | 30min |
| | 50 | Route 50 connects medial facilities near Herdon Avenue to Clovis Civic Center, and south to several schools and shopping centers. | Mon – Fri | 6:05am | 5:35pm | 30min |
| | | | Sat | 7:35am | 2:05pm | 60min |
| | 80 | Route 80 serves the Buchanan Education complex and connects to Clovis Civic Center, passing several parks and shopping centers including Bicentennial Park and Walmart, respectively. | Mon – Fri | 6:15am | 6:30pm | 30min |
| | | | Sat | 7:30am | 3:30pm | 30min |
| | | **Fresno County Rural Transit Agency** | | | | |
| | Auberry | The Auberry transit route provides connection between the foothill communities in Northeast Fresno County and the intercity area of Clovis and Fresno. | Tues | 8am | 5pm | On demand |

**Figure 2: Existing Transit Service in the Study Area**

# BICYCLE AND PEDESTRIAN FACILITIES

Bicycle and pedestrian facilities are important components of the transportation network in the study area. They not only offer non-vehicular opportunities for both commute and recreational trips but also provide connections to the Clovis transit network and opportunities to shop, dine, and accomplish other daily needs without using a car.

## Existing Bicycle Facilities

Bicycle facilities are defined by the following four classes[1]:

- Class I – Provides a completely separated facility designed for the exclusive use of bicyclists and pedestrians with crossing points minimized.
- Class II – Provides a restricted right-of-way designated lane for the exclusive or semi-exclusive use of bicycles with through travel by motor vehicles or pedestrians prohibited, but with vehicle parking and crossflows by pedestrians and motorists permitted.
- Class III – Provides a right-of-way designated by signs or permanent markings and shared with pedestrians and motorists.
- Class IV – Provides a restricted right-of-way designated lane for the exclusive use of bicyclists that is separated by a vertical element to provide further separation from motor vehicle traffic.

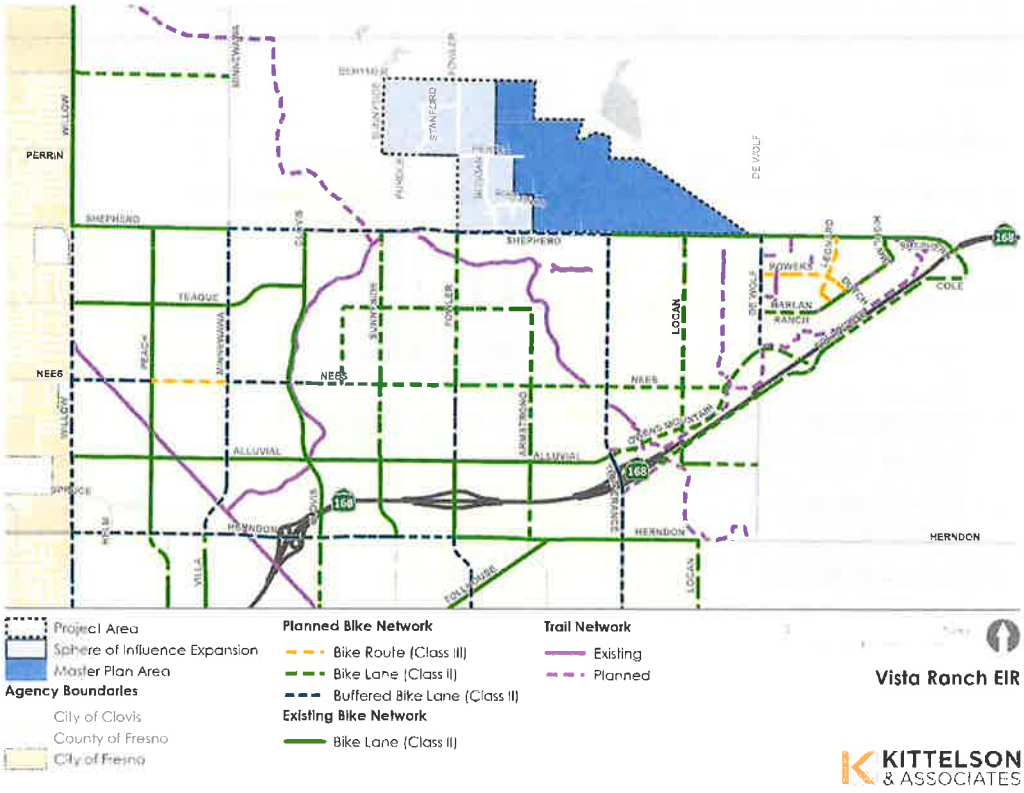
In Fall 2023, the City of Clovis adopted their Active Transportation Plan (ATP), which provides a clear vision for the active transportation network and provides strategies to implement the planned network. The following bikeways are currently present within the study area, but many are at intermittent locations on the listed roads. They are shown graphically in Figure 3.

- Class I Bike Paths
  - Dry Creek Trail (Clovis Avenue)
  - Enterprise Trail
  - Multiple Neighborhood trails on east end of Study Area
- Class II Bike Lanes
  - Shepherd Avenue
  - Teague Avenue
  - Alluvial Avenue
  - Herndon Avenue
  - Willow Avenue
  - Peach Avenue
  - Clovis Avenue
  - Sunnyside Avenue
  - Fowler Avenue
  - Temperance Avenue
  - Locan Avenue
  - DeWolf Avenue

[1] As detailed in Chapter 1000 of the Highway Design Manual (Caltrans, 2020).

## Planned and Proposed Bicycle Facilities

The Clovis ATP includes proposed bike facilities in the study area. They are listed below and shown in Figure 3. The planned alignments aim to fill gaps in the existing network and enhance safety and comfort for people biking.



- Class I Bike Paths
  - Various connections that fill gaps in the existing Class I network are proposed.
- Class II Bike Lanes

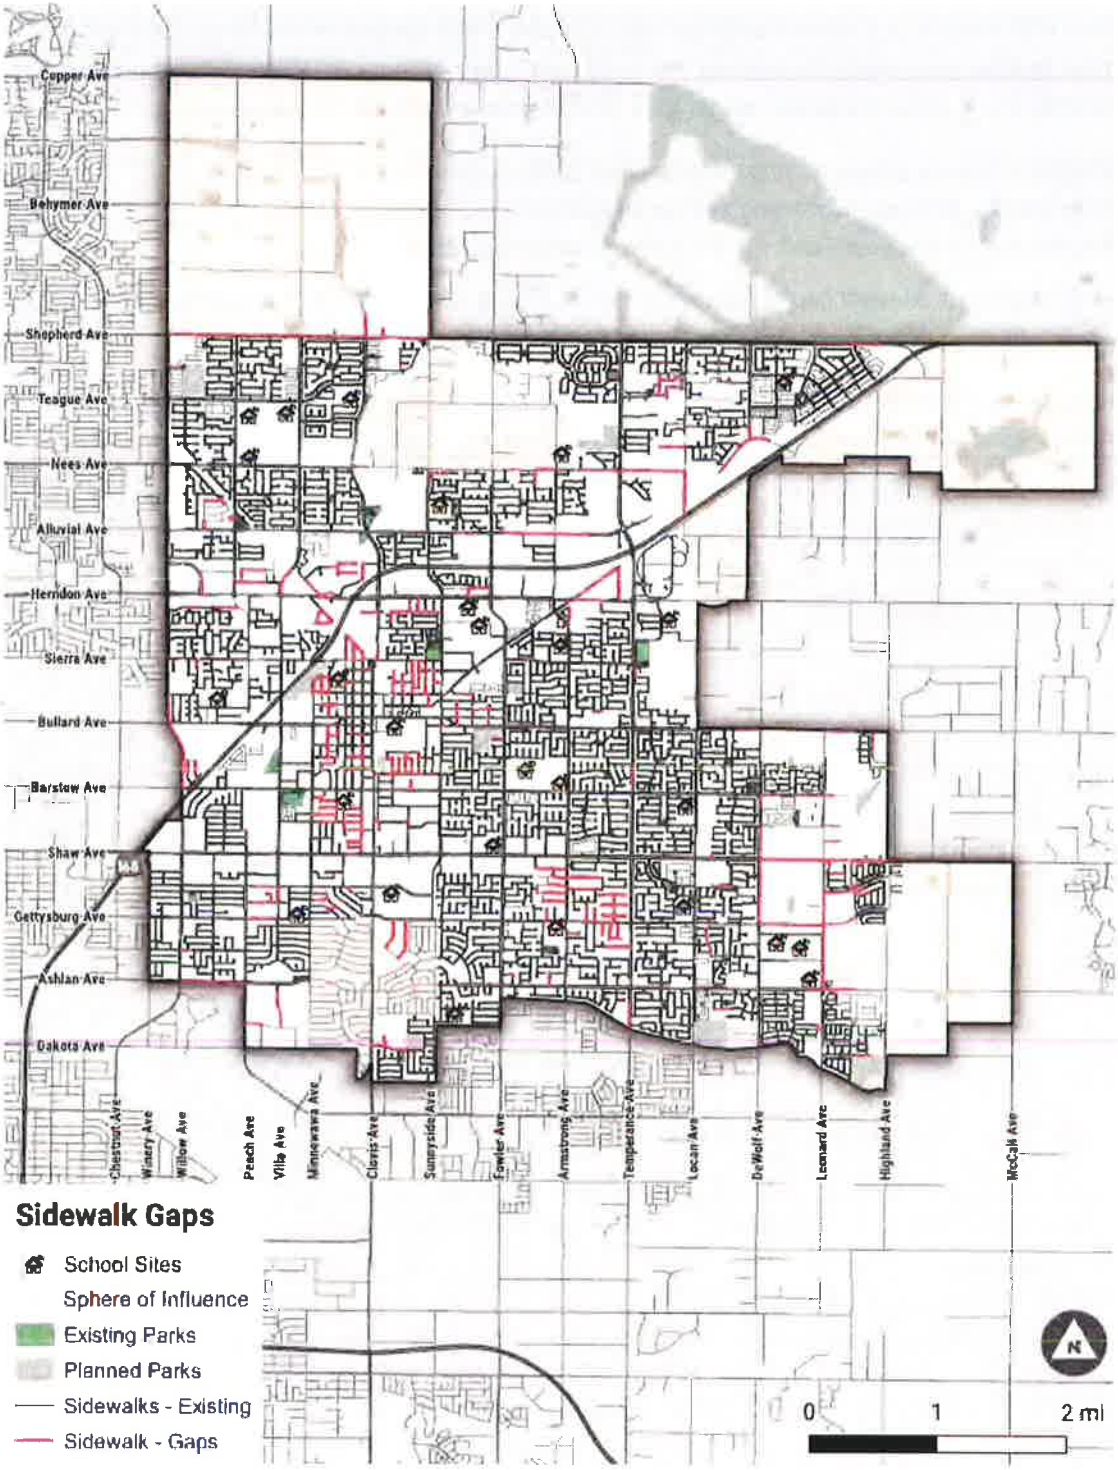
  Conventional Bike Lane (No Buffer)
  - Behymer Avenue
  - Teague Avenue
  - Nees Avenue
  - Alluvial Avenue
  - Clovis Avenue
  - Marion Avenue
  - Sunnyside Avenue
  - Fowler Avenue
  - Armstrong Avenue
  - Locan Avenue
  - Owens Mountain Pkwy.
  - Harlan Ranch Blvd.

  Buffered Bike Lane
  - Shepherd Avenue
  - Nees Avenue
  - Herndon Avenue
  - Willow Avenue
  - Minnewawa Avenue
  - Fowler Avenue
  - Temperance Avenue
  - DeWolf Avenue

- Class III Bike Routes
  - Nees Avenue
  - Powers/Dutch Avenue
  - Leonard Avenue

## Figure 3: Existing and Proposed Bike Facilities in the Study Area

## Pedestrian Facilities



The Clovis ATP assesses and recommends pedestrian facility enhancements as well as bicycle facilities. Pedestrian facilities are present throughout the study area, however there are sidewalk gaps present intermittently along some roadways. Longer gaps on collector and arterial roadways include:

- Shepherd Avenue between Willow Avenue and Sunnyside Avenue
- Nees Avenue between Armstrong and Locan Avenue
- Alluvial Avenue between Fowler Avenue and Armstrong Avenue

Existing sidewalk and sidewalk gaps are shown below in Figure 4. The Clovis ATP provides a prioritized list of sidewalk infill segments. Those within the Study Area are listed below:

- Nees Avenue from Whittier Avenue to Armstrong Avenue (0.25 miles)
- Alluvial Avenue from Fordham Avenue to West of Renn Avenue (0.14 miles)

**Figure 4: Existing and Missing Sidewalks in the Study Area**

# Regulatory Setting

This section summarizes applicable federal, state, regional, and local plans, laws, and regulations that are relevant to this analysis. This information provides a context for the discussion related to the Project's consistency with applicable policies, plans, laws, and regulations.

## FEDERAL

No federal plans, policies, regulations, or laws pertaining to transportation have been determined to be applicable to this Project.

## STATE

Senate Bill 743 (SB 743) was signed into law in September 2013. SB 743 (Steinberg, 2013) required changes to the CEQA Guidelines regarding the analysis of transportation impacts. Historically, CEQA transportation analyses of individual projects determined impacts in the circulation system in terms of roadway delay and/or capacity at specific locations. SB 743 changes include the elimination of auto delay, level of service (LOS), and other similar measures of vehicular capacity or traffic congestion as a basis for determining significant impacts. Those proposed changes identify vehicle miles traveled (VMT) as the most appropriate metric to evaluate a project's transportation impacts. Since the bill has gone into effect, automobile delay, as measured by "level of service" and other similar metrics, no longer constitutes a significant environmental effect under CEQA. Auto-mobility (often expressed as "LOS") may continue to be a measure for planning purposes.[2]

In December 2018, the California Governor's Office of Planning and Research (OPR) and the State Natural Resources Agency submitted updated CEQA Guidelines to the Office of Administrative Law for final approval to implement SB 743. The Office of Administrative Law approved the updated CEQA Guidelines, thus implementing SB 743 and making VMT the primary metric used to analyze transportation impacts. The final text, final statement of reasons, and related materials are posted at http://resources.ca.gov/ceqa. The changes have been approved by the Office of Administrative Law and are now in effect. For land use and transportation projects, SB 743-compliant CEQA analysis became mandatory on July 1, 2020.

## REGIONAL

### Fresno Council of Governments Regional Transportation Plan

The Fresno COG is a voluntary association of local governments and a regional planning agency comprised of 16 member jurisdictions, including the city of Clovis. The members are represented by a Policy Board consisting of mayors of each incorporated city, and the Chairperson of the County Board of

[2] Governor's Office of Planning and Research, "Technical Advisory on Evaluating Transportation Impacts in CEQA," December, 2018.

Supervisors, or their designated elected official. The Fresno COG's purpose is to establish a consensus on the needs of the Fresno County area and further action plans for issues related to the Fresno County region. The current regional transportation plan, known as the Regional Transportation Plan & Sustainable Communities Strategy (RTP), was adopted in 2022. The RTP addresses GHG emissions reductions and other air emissions related to transportation, with the goal of preparing for future growth in a sustainable way. The plan specifies how funding will be sourced and financed for the region's planned transportation investments, ongoing operations, and maintenance. The goals, objectives, and policies of the RTP are established to direct the courses of action that will provide efficient, integrated multimodal transportation systems to serve the mobility needs of people, including accessible pedestrian and bicycle facilities, and freight, while fostering economic prosperity and development, and minimizing mobile sources of air pollution. The five main goals of the RTP include:

- GOAL 1: Improved mobility and accessibility for all
- GOAL 2: Vibrant communities that are accessible by sustainable transportation options.
- GOAL 3: A safe, well-maintained, efficient, and climate-resilient multimodal transportation network
- GOAL 4: A transportation network that supports a sustainable and vibrant economy.
- GOAL 5: A region embracing clean transportation, technology, and innovation.

## Fresno Council of Governments Multijurisdictional Local Road Safety Plan (MLRSP)

The MLRSP was completed in 2022 and provides an in depth look at areas of safety concern within the city of Clovis and other cities within the planning area. The report identifies priority segments and intersections in the city of Clovis and potential crash reduction treatments to apply. The plan also provides strategies for education, enforcement, engineering, and emergency services to improve safety outcomes. Intersections near the Master Plan Area which were identified in the 95$^{th}$ percentile of Crash Severity Scores include:

- Shepherd Avenue at Minnewawa Avenue
- Shepherd Avenue at De Wolf Avenue (western intersection)

## Fresno County Congestion Management Process

In June 1990, California voters approved legislation that required Congestion Management Plans be developed in urbanized counties to address congestion on California's highways and roads.
The Fresno County Congestion Management Process (CMP) implements this requirement, and its responsibilities include providing information on transportation system performance and assessing alternative strategies for alleviating congestion and improving mobility for people and goods to levels that meet State and local needs. The Fresno County CMP identifies four general objectives:

1. Optimize the transportation facilities through efficient system management;
2. Invest in strategies that reduce travel demand, improve system performance, increase safety, and provide effective incident management;
3. Reduce VMT by encouraging alternative modes of transportation and promotion of sustainable land use development; and

4. improve public transit, extend bicycle and pedestrian systems, and promote car-sharing and bike-sharing programs to facilitate the development of an integrated multimodal transportation system in the Fresno region.

# LOCAL

## City of Clovis General Plan – Circulation Element

The City of Clovis adopted the General Plan[3] in August 2014 as an update to the previous General Plan approved in 1993. It serves as the City's guide for the continued development, enhancement, and revitalization of the City of Clovis. The following policies related to transportation and circulation are applicable to the Project:

- **Policy 1.1: Multimodal network.** The city shall plan, design, operate, and maintain the transportation network to promote safe and convenient travel for all users: pedestrians, bicyclists, transit riders, freight, and motorists.
- **Policy 1.2: Transportation decisions.** Decisions should balance the comfort, convenience, and safety of pedestrians, bicyclists, and motorists.
- **Policy 1.3: Age and mobility.** The design of roadways shall consider all potential users, including children, seniors, and persons with disabilities.
- **Policy 1.4: Jobs and housing.** Encourage infill development that would provide jobs and services closer to housing, and vice versa, to reduce citywide vehicle miles travelled and effectively utilize the existing transportation infrastructure.
- **Policy 1.5: Neighborhood connectivity.** The transportation network shall provide multimodal access between neighborhoods and neighborhood-serving uses (educational, recreational, or neighborhood commercial uses).
- **Policy 1.6: Internal circulation.** New development shall utilize a grid or modified-grid street pattern. Areas designated for residential and mixed-use village developments should feature short block lengths of 200 to 600 feet.
- **Policy 1.7: Narrow streets.** The city may permit curb-to-curb dimensions that are narrower than current standards on local streets to promote pedestrian and bicycle connectivity and enhance safety.
- **Policy 2.2: Multimodal LOS.** Monitor the evolution of multimodal level of service (MMLOS) standards. The city may adopt MMLOS standards when appropriate.
- **Policy 2.3: Fair share costs.** New development shall pay its fair share of the cost for circulation improvements in accordance with the city's traffic fee mitigation program.
- **Policy 2.4: Right-of-way dedication.** The city may require right-of-way dedication essential to the circulation system in conjunction with any development or annexation. The City shall request the County of Fresno to apply the same requirements in the Clovis planning area.
- **Policy 3.1**: **Traffic calming**. Employ traffic-calming measures in new developments and existing neighborhoods to control traffic speeds and maintain safety.

[3] City of Clovis General Plan, August 25, 2014.

- **Policy 3.4: Road diets.** Minimize roadway width as feasible to serve adjacent neighborhoods while maintaining sufficient space for public safety services.
- **Policy 3.5: Roadway widening.** Only consider street widening or intersection expansions after considering multimodal alternative improvements to non-automotive facilities.
- **Policy 3.6: Soundwalls.** Design roadway networks to disperse traffic to minimize traffic levels. Discourage soundwalls along new collector and local streets when feasible.
- **Policy 3.7: Conflict points.** Minimize the number of and enhance safety at vehicular, pedestrian, and bicycle conflict points.
- **Policy 3.8: Access management.** Minimize access points and curb cuts along arterials and prohibit them within 200 feet of an intersection where possible. Eliminate and/or consolidate driveways when new development occurs or when traffic operation or safety warrants.
- **Policy 3.9: Park-once.** Encourage "park-once" designs where convenient, centralized public parking areas are accompanied by safe, visible, and well-marked access to sidewalks and businesses.
- **Policy 3.10: Pedestrian access and circulation.** Entrances at signalized intersections should provide sidewalks on both sides of the entrance that connect to an internal pedestrian pathway to businesses and throughout nonresidential parking lots larger than 50 spaces.
- **Policy 3.11: Right-of-way design.** Design landscaped parkways, medians, and rights-of-way as aesthetic buffers to improve the community's appearance and encourage non-motorized transportation.
- **Policy 3.12: Residential orientation.** Where feasible, residential development should face local and collector streets to increase visibility and safety of travelers along the streets and encourage pedestrian and bicycle access.
- **Policy 5.2: Development-funded facilities.** Require development to fund and construct facilities as shown in the Bicycle Transportation Plan when facilities are in or adjacent to the development.
- **Policy 5.3: Pathways.** Encourage pathways and other pedestrian amenities in Urban Centers and new developments of 10 acres or larger.
- **Policy 5.4: Homeowner associations.** The city may require homeowner associations to maintain pathways and other bicycle and pedestrian facilities within the homeowner association area.
- **Policy 5.5: Pedestrian access.** Require sidewalks, paths, and crosswalks to provide access to schools, parks, and other activity centers and to provide general pedestrian connectivity throughout the city.

The General Plan has policies related to maintaining acceptable Levels of Service (LOS) outside of some permitted exceptions. However, LOS can no longer be used for CEQA evaluations and is therefore not relevant to this memorandum focusing on CEQA impacts. Additional analyses of the Master Plan Area will be documented in another report that will detail LOS.

## City of Clovis Active Transportation Plan (ATP)

The Clovis ATP was adopted in fall of 2023 and provides a vision for Clovis to complete a network of walking, biking and shared use trail facilities that are convenient, safe, and easy to use. The network should support and encourage travel between and within neighborhoods. The plan developed recommended bicycle, pedestrian and trail networks, and prioritized projects to meet the most need, more quickly. These prioritized projects were guided by the goals of the plan, which are listed below:

- Safety and Comfort – Improve the safety of people walking and biking.

- Connectivity – Develop a well-connected network of trails, walkways, and bikeways.
- Mode Shift – Increase the share of people who walk or ride a bike to get to work, school, shopping, and other activities.
- Equity – Create a network that allows people of all physical abilities and socioeconomic circumstances the ability to travel safely throughout the city without a car.
- Recreation – Increase access to recreation by providing access to trails, walkways, and bikeways.

# CEQA Transportation Analysis

The transportation analysis assesses how the study area's transportation system would operate with the implementation of the proposed Master Plan. This analysis includes effects that would result in significant impacts under the California Environmental Quality Act (CEQA) guidelines.

## CEQA Significance Criteria

The Project's impact is not considered to be significant unless it would:

a. Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.
b. Conflict or be inconsistent with CEQA Guideline section 15064.3, subdivision (b).
c. Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).
d. Result in inadequate emergency access.

Significance criteria "b" is related to the implementation of vehicle miles traveled (VMT) as the primary performance metric. The following criteria are used to assess a significant impact related to VMT consistent with the city of Clovis "Transportation Impact Analysis Guidelines" dated September 15, 2022:

- **Residential** – A proposed project exceeding a level of 13 percent below existing average VMT per capita in Fresno County.
    - Regional Average: 16.1 VMT/capita
    - Impact Threshold: 14.1 VMT/capita
- **Office** – A proposed project exceeding a level of 13 percent below existing average VMT per employee in Fresno County.
    - Regional Average: 25.6 VMT/employee
    - Impact Threshold: 22.3 VMT/employee
- **Retail** – A net increase in total VMT. The total VMT for the region without and with the project is calculated. The difference between the two scenarios is the net change in total VMT that is attributable to the project.

# CEQA PROJECT IMPACTS AND PROPOSED MITIGATIONS

**TRAF-1** **The proposed project would not conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities. This would be considered a less than significant impact.**

The Proposed Project and its effects were compared against local, regional, and state programs, plans, ordinances, and policies addressing the circulation system, as described previously. The documents governing the plans and policies addressing the circulation system in the area and a discussion of whether the Proposed Project would conflict with them include:

- Fresno Council of Governments Regional Transportation Plan (RTP)
    - The goals, objectives, and policies of the RTP are established to direct the courses of action that will provide efficient, integrated multimodal transportation systems to serve the mobility needs of people, including accessible pedestrian and bicycle facilities, and freight, while fostering economic prosperity and development, and minimizing mobile sources of air pollution.

      The Project objectives include providing infrastructure that meets City standards and is integrated with existing and planned facilities while also providing a strong pedestrian network to link local commercial and neighborhood together. This is consistent with the RTP since it would be accessible, provide a safe multimodal transportation network, and support a sustainable and vibrant economy by providing housing types, sizes, and densities that provide for local and regional housing needs.

- Fresno Council of Governments Multijurisdictional Local Road Safety Plan (MLRSP)
    - This plan identifies priority intersections and segments and potential reduction treatments to improve the safety of transportation infrastructure with the highest crash severity scores. Two of the intersections identified are within the study area for the transportation analysis. Since the Project is not proposing modification at the two identified intersections, the Project would not interfere with the implementation of the MLRSP.

- Fresno County Congestion Management Plan (CMP)
    - The CMP is responsible for monitoring the transportation infrastructure and developing deficiency plans to improve the transportation infrastructure that is not meeting standards. The Project is proposing development in a master plan area and is not anticipated to affect intersections and roadway segments that are not internal or abutting the Project. There are no anticipated design features that would prevent the normal analysis and deficiency reporting for the CMP.

- City of Clovis General Plan

- The overarching goal of the General Plan circulation element is to create a comprehensive and well-maintained multimodal circulation system that provides for the safe and efficient movement of people and goods. This includes goals for "complete streets," making bicycle and transit networks a functional alternative, and a complete system of trails and pathways assessable to all. This aligns with the Project objectives which call for a Project that integrates and supports active and public transportation, encourage walkability and safe pedestrian/bicycle routes to all land uses, and a system of trails, parks, and open spaces that connect logically with greater Clovis.

- City of Clovis Active Transportation Plan (ATP)
  - The ATP identifies roadways where planned bicycle and pedestrian infrastructure will be implemented. In addition to providing internal roadways that provide multimodal streets per the General Plan, the Project would be required to improve its frontage which would help the ATP in filling in gaps in the bicycle and pedestrian network such as along Shepherd Avenue. The Project is not anticipated to affect transportation infrastructure away from the boundaries in a way that would prevent the proposed network in the ATP from being completed.

Based on this assessment, the Project is not anticipated to conflict with policies, plans, and programs addressing the circulation system for alternative modes. Therefore, the impact would be **less than significant,** and no mitigation measures would be required.

**TRAF-2** **The proposed project would conflict with or be inconsistent with CEQA Guideline section 15064.3, subdivision (b). This would be considered a significant and unavoidable impact.**

The Fresno COG activity-based travel demand model was used to estimate base year (2019) VMT for the transportation analysis zones (TAZs) that comprise the Project. Table 3 presents VMT per capita and VMT per employee findings for base year conditions in Fresno County and for the Project at buildout. The Project is considered to have a significant impact if the VMT per capita or VMT per employee of the Project exceeds a threshold based on 13 percent below the regional averages for Fresno County.

**Table 3: VMT Per Capita and Per Employee**

| | VMT per Capita | VMT per Employee |
|---|---|---|
| Fresno County | 16.1 | 25.6 |
| Impact Threshold (13% below regional average) | 14.1 | 22.3 |
| Project Area | 30.4 | 44.3 |
| Percent Compared to Impact Threshold | +116% | +99% |
| Significant Impact | **Yes** | **Yes** |

Source: Kittelson & Associates, 2024, based on Fresno COG travel model and VMT calculation tool

Table 4 lists the total regional daily VMT for the base year with the Project, without the retail commercial component and with the retail commercial component. The total regional VMT is projected to decrease with the addition of retail commercial uses within the Project. This indicates that the proposed retail uses would provide services close to residents and reduce the need to make longer trips to access services.

The Project would exceed the impact thresholds for both residential and employment land uses. This would have a **significant impact** for residential and employment uses. The Project retail uses would decrease total regional VMT. This would have a **less than significant impact** for retail uses.

**Table 4: Regional VMT Without and With Retail**

| | Total Regional Daily VMT |
|---|---|
| With Project Without Retail | 22,029,977 |
| With Project With Retail | 22,026,474 |
| Difference | -3,503 |
| Significant Impact | **No** |

Source: Kittelson & Associates, 2024, based on Fresno COG travel model

## Mitigation

Mitigation for VMT impacts for residential and employment uses would include mitigation measures TRAF-2-1 through TRAF-2-5. The potential effectiveness of mitigation measures for VMT has been estimated using the CAPCOA *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity*[4].

**Mitigation Measure TRAF-2-1:** Future employers within the Project shall implement a commute trip reduction program, consistent with other trip reduction programs in the City of Clovis. The program would include the following components:

- trip reduction targets
- measures to discourage single occupancy vehicles while encouraging alternative modes of transportation such as carpooling, ridesharing, vanpooling, subsidized transit passes and other benefits,
- include a guaranteed ride home for eligible employers,
- establish applicable fees and funding mechanisms,
- define monitoring measures and frequency, and strategies for non-compliance.

The CAPCOA Handbook Measure T-5 estimates that a voluntary commute trip reduction program can reduce commute VMT by up to 4.0 percent with full participation of all eligible employees. Commute VMT to and from employers within Vista Ranch is projected to account for a maximum of 7.5 percent of total VMT. Therefore, the maximum VMT reduction from a commute trip reduction program would be 4.0 percent times 7.5 percent or 0.3 percent VMT reduction.

**Mitigation Measure TRAF-2-2:** Provide bicycle facilities that include bike parking and bike lockers. The CAPCOA Handbook Measure T-10 estimates that provision of end-of-trip bicycle facilities can reduce commute VMT by up to 4.4 percent depending on the existing propensity for commuters to use bicycles. The potential VMT reduction for employers in Clovis is estimated at 0.61 percent. Commute VMT to and from employers within Vista Ranch is projected to account for a maximum of 7.5 percent of total VMT. Therefore, the maximum VMT reduction from bicycle end-of-trip facilities would be 0.61 percent times 7.5 percent or 0.05 percent VMT reduction.

**Mitigation Measure TRAF-2-3:** Provide a well-connected street network, particularly for non-motorized connections. Characteristics of street network connectivity include short block lengths, numerous three and four-way intersections, and minimal dead-ends (cul-de-sacs). Street connectivity helps to facilitate shorter vehicle trips and greater numbers of walk and bike trips and thus a reduction in VMT. CAPCOA Handbook Measure T-17 uses increased vehicle intersection density as a proxy for street connectivity improvements. The CAPCOA Handbook estimates that VMT can be reduced up to 30 percent if a development provides a street grid that has much greater density (up to about three times) of streets and

[4] California Air Pollution Control Officers Association (CAPCOA), *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity*, December, 2021, https://www.airquality.org/ClimateChange/Documents/Final%20Handbook_AB434.pdf

street intersections than the average American street grid density of 36 street intersections per square mile.

Based on the Vista Ranch Illustrative Plan in the September 15, 2023 Draft of the Vista Ranch Master Development Plan, there would be approximately 53 intersections within the Master Plan area that would provide direct network connectivity connecting clusters of housing with other clusters and the main street network. The total Master Plan area is approximately 507 acres (0.79 square miles), resulting in an average intersection density of about 67 street intersections per square mile providing street network connectivity for all modes of travel. The proposed intersection density would be 86 percent higher than the American average. Therefore, the proposed street grid would be expected to provide up to a 12 percent reduction in VMT compared to typical development areas.

The proposed site plan shows that many of the local streets and residences would be separated from the collectors and arterials within the site by walls or fencing except at a relatively small number of vehicle access intersections. Adding additional bicycle and pedestrian access points through these walls or fences to facilitate more direct pedestrian and bicycle connections has the potential to reduce VMT by providing more direct paths of travel between the various neighborhoods for non-auto modes.

**Mitigation Measure TRAF-2-4:** Increase the length of the area bicycle network, including separated trails available to bicycles as well as on-street bike lanes. The Project proposes to add 4.5 miles of Class I separated trails. This would increase the mileage of bicycle facilities in Clovis from the existing 21.2 miles to 25.7 miles, an increase of 21 percent. The CAPCOA Handbook Measure T-20 estimates that a 21 percent increase in bike network mileage could reduce citywide VMT by 0.01 percent. The total daily VMT generated in Clovis is approximately 4,285,900, so the Project bike network would reduce daily VMT by approximately 350. This would represent a 0.2 percent reduction from the unmitigated Project total daily VMT of 188,900. Note that these VMT reductions would occur citywide and would not exclusively affect Project trips.

**Mitigation Measure TRAF-2-5:** Contribute to implementation of expanded transit service in Clovis, including potentially service to the Project area. Implementation of expanded transit service would require both capital expenditures for support facilities, including construction of transit stops and facilitating extensions of future transit routes. The CAPCOA Handbook Measure T-25 estimates that a 25 percent increase in transit service hours could reduce citywide VMT by 0.3 percent. The total daily VMT generated in Clovis is approximately 4,285,900, so the expanded transit network would reduce daily VMT by approximately 12,600. This would represent a 6.7 percent reduction from the unmitigated Project total daily VMT of 188,900. Note that these VMT reductions would occur citywide and would not exclusively affect Project trips.

## SIGNIFICANCE AFTER MITIGATION

VMT reduction depends on factors such as actual implementation of planned land use development, demographic change, household preferences for housing types and locations, the cost of fuel, and the competitiveness of transit relative to driving, which relates to congestion along vehicular commute routes that are not under the Project's jurisdiction, as well as transit provided by parties other than the Project or the city of Clovis. The feasibility and effectiveness of the mitigation measures is either insufficient or unknown at this time. The Project cannot demonstrate definitively that implementation of these policies

would achieve VMT reductions to meet the VMT per capita or VMT per employee thresholds. With implementation of the Project and the recommended mitigation measures, this impact would remain **significant and unavoidable.**

**TRAF-3 The proposed project would not substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment). This would be considered a less than significant impact.**

The Master Plan Area implements a desire for a mixed use planned community as depicted in the city of Clovis General Plan and proposed an amended Focus Area 13a. The proposed Master Plan will be a designated land use of Mixed Use Village, with multiple zoned districts, within focus area 13a. The Master Plan Area includes the following guiding principles related to transportation and hazards:

- Provide infrastructure that meets City standards and is integrated with existing and planned facilities and connections.
- Develop a strong pedestrian network that links activities, recreational amenities, local commercial and neighborhoods together.
- Establish a logical phasing plan designed to ensure that each phase of development would include necessary public improvements required to meet City standards.

Buildout of the proposed Master Plan would result in some changes to the City's circulation network in the vicinity of the project but would not increase hazards or incompatible uses due to design features. All future roadway system improvements associated with development activities under the Master Plan would be designed in accordance with the established roadway design standards, and as depicted in the Circulation Element of the General Plan.

These improvements will be subject to review and future consideration by the city of Clovis. An evaluation of the roadway alignments, intersection geometrics, and traffic control features will be needed during development application. Roadway improvements would have to be made in accordance with the City's Circulation Plan, roadway functional design guidelines, and would have to meet design guidelines such as the accessibility requirements of Title 24 (California Building Code), ADA and PROWAG standards, California Manual of Uniform Traffic Control Devices (MUTCD), and the Caltrans Roadway Design Manual.

Implementation of the Master Plan would not result in hazardous conditions or create conflicting uses. With implementation of policies and ordinance listed in this report, and application of the conditions of approval at the time of review of land development projects, the Master Plan would be designed to ensure that no hazardous circulation conditions are created as a result of implementation of the proposed project. The Master Plan would implement components of the roadway system consistent with the City's standards and guidelines. Therefore, potential impacts related to hazards due to a geometric design feature or incompatible uses would be **less than significant**, and no mitigation measures would be required.

**TRAF-4 The proposed project would result in adequate emergency access. This would be considered a less than significant impact.**

Emergency response requires a balance of emergency response time and evacuation needs with other community concerns, such as urban design, walking and biking needs, and traffic calming. Future roadway improvements associated with buildout of the Master Plan Area would be made in accordance with the city of Clovis General Plan Circulation Element and roadway functional design guidelines.

With the application of the conditions of approval at the time of review of land development projects, the Master Plan Area would be designed to ensure that adequate emergency access is provided. The Master Plan would implement components of the roadway system consistent with the City's General Plan. Therefore, impacts related to inadequate emergency access would be **less than significant**, and no mitigation measures would be required.

Subject: Supplemental Traffic Analyses
Proposed Vista Ranch Project
Clovis, California

Dear Ms. Campion:

## 1.0 INTRODUCTION

This report presents the results of traffic analyses intended to supplement the Vista Ranch Transportation Impact Analysis report dated September 4, 2024 by Kittelson & Associates and updated December 9, 2024 (hereinafter referred to as "the TIA" or "TIA") and the Technical Memorandum dated June 27, 2024 by Kittelson & Associates regarding the Clovis Vista Ranch CEQA Transportation Evaluation.

One of the purposes of the supplemental analyses is to address minor changes in the project description and to confirm whether the TIA (and conclusions regarding vehicle miles traveled) remain applicable and valid in light of those changes. This supplemental analysis also addresses comments made on the Notice of Preparation (NOP) for the project related to transportation. Specifically, additional near-term analyses have been performed to consider conditions that would occur with buildout of the proposed residential portions of the Vista Ranch project in the absence of development of commercial portions of the project. In addition, collision records have been reviewed to identify intersections with potential existing safety concerns. Finally, this report presents a summary of potential mitigation measures to reduce the number of vehicle miles traveled (VMT) to supplement the transportation impact analysis presented in the TIA.

## 2.0 PROJECT DESCRIPTION

The proposed Vista Ranch Project includes phasing for approvals that would facilitate a 368-acre mixed-use development, as well as plan-level approvals and a planning boundary modification that would include a larger area, as follows:

1. Expansion of the City of Clovis Sphere of Influence (SOI) to include approximately 952 acres, to be referred to as the Vista Ranch SOI Expansion (SOI Expansion), to be analyzed at a program level in a Recirculated Draft Environmental Impact Report (RDEIR).
2. Adoption of the Vista Ranch Master Plan (Master Plan) to guide development within approximately 507 acres of the SOI Expansion, including pre-zoning and annexation of the Master Plan area. Adoption of the Master Plan and annexation of the Master Plan area are to be analyzed at a program level in the RDEIR.

3. Approval and implementation of the Vista Ranch Development (Development), consisting of approximately 368 acres of the Master Plan area, with residential and commercial uses over approximately 10 years as the first step in the longer-term implementation of the Master Plan. The Development is to be analyzed at a project level in the RDEIR. The Development is expected to include up to 2,718 residential units, up to approximately 85,000 square feet of "Gateway" neighborhood commercial, community recreation facilities, and approximately 51 acres of parks, trails, and open space.

## 3.0 STUDY AREA AND TIME PERIOD

This report includes analysis of the intersections listed on Page 13 of the TIA and the road segments listed on Page 11 of the TIA.

The study time periods include the weekday a.m. and p.m. peak hours determined between 7:00 and 9:00 a.m. and between 4:00 and 6:00 p.m. The peak hours were analyzed for the following scenarios:

- Near-Term Plus Development (Residential Only);
- Near-Term Plus Master Plan (Residential Only).

## 4.0 LANE CONFIGURATIONS AND INTERSECTION CONTROL

The lane configurations and intersection control at the study intersections for the near-term conditions were obtained from the TIA.

## 5.0 PROJECT TRIP GENERATION

Data provided in the Institute of Transportation Engineers (ITE) *Trip Generation Manual, 11th Edition*, were used to estimate the number of trips anticipated to be generated by the Development and the Master Plan. Table A-1 included in Appendix A of this report presents the trip generation estimates for the Project.

## 6.0 APPLICABILITY OF TIA AND TECHNICAL MEMORANDUM

The TIA has been reviewed in light of the new Project Description and it is our opinion that the findings and conclusions in the TIA remain valid. The trip generation values presented in Table A-1 were compared to the trip generation estimates utilized in the TIA to confirm that the analyses in the TIA remain applicable. The trip generation estimates for the Development and the Master Plan as described in the new Project Description do not exceed the values analyzed in the TIA. Tables A-2 and A-3 indicate that the Project trip generation estimates are very similar to, and slightly less than, the values analyzed in the TIA, indicating that the analyses and conclusions of the TIA remain applicable for each of the following scenarios:

- Existing Conditions
- Near-Term No Project
- Near-Term Plus MPArea 1 (Development)
- Near-Term Plus Project (MPArea 1 + MPArea 2) (Master Plan)
- Cumulative No Project
- Cumulative Plus Project (MPArea 1 + MPArea 2) (Master Plan)

Conversely, there are no scenarios in the TIA to which the analyses and conclusions are inapplicable to the new Project Description.

The Technical Memorandum, which presented the California Environmental Quality Act (CEQA) transportation impact analysis for the Vista Ranch Project, has been reviewed in light of the new Project Description and it is our opinion that the findings and conclusions in the Technical Memorandum remain valid.

## 7.0 RESIDENTIAL PROJECT TRIP DISTRIBUTION AND ASSIGNMENT

The residential Project trips were distributed to the adjacent road network based on the project trip distribution obtained from the TIA. The peak-hour residential project traffic volumes presented in Table A-1 are presented in Figure 1, Development Project Peak-Hour Residential Traffic Volumes, and Figure 2, Master Plan Project Peak-Hour Residential Traffic Volumes.

## 8.0 NEAR-TERM TRAFFIC VOLUMES AND VMT

The near-term no-Project peak-hour traffic volumes at the study intersections were obtained from the TIA and are presented in Figure 3, Near-Term No-Project Peak-Hour Traffic Volumes. It is noted that the values obtained from the TIA and presented in Figure 3 are the greater of either the existing turning movement volume or the near-term no-Project turning movement volume as presented in the TIA.

The near-term traffic volumes with the Development project (residential trips only) are presented in Figure 4, Near-Term Peak-Hour Traffic Volumes With Development Project Residential Only. The near-term traffic volumes with the Master Plan project (residential trips only) are presented in Figure 5, Near-Term Peak-Hour Traffic Volumes With Master Plan Project Residential Only.

Reducing VMT on a regional basis is intended to achieve the State of California's long-term climate goals. As such, near-term VMT conditions during partial completion of the Project were not considered in the Technical Memorandum. However, as this report is intended to address the conditions that would occur with buildout of the proposed residential portions of the Vista Ranch project in the absence of development of commercial portions of the project, the near-term VMT conditions will be addressed.

The Technical Memorandum found that the Project would exceed the impact thresholds for residential land uses by 116 percent and for employment land uses by 99 percent, resulting in a significant impact for residential and employment uses. The Project retail uses would decrease total regional VMT, and therefore, the Project would have a less than significant impact for retail uses.

For the case in which only residential uses have been constructed, the significant impact caused by employees (VMT per employee) would not occur because no employment opportunities would have been constructed. During this interim period, the VMT per capita (based on residential uses) may slightly exceed the calculated 30.4 VMT per capita because the lack of nearby, internal commercial uses will require longer trips for the same purpose.

Data presented in the ITE *Trip Generation Handbook, 3rd Edition* dated September 2017 (TGH) contains information related to internal trips (also referred to as "internally-captured trips"). Estimates of the number of internal trips account for the interaction between the various

individual land uses assumed for the trip generation calculations. Based on information presented in the TGH, it may be estimated 20-percent of the retail trips expected to be generated at the Project site would be captured with the Project residences. Based on the trip generation estimates, the total number of daily commercial trips is expected to be 13,505, and the 20-percent internal capture estimate is 2,701 trips per day. These 2,701 commercial trips will be longer during the interim period in which the retail portion of the Project has not been constructed. It is estimated that these trips will be an average of two miles each (for example, to drive near the intersection of Fowler and Herndon Avenues). The California Department of Finance indicates an average of 2.81 persons per household in Clovis. The total population of the Master Plan, using the worst-case trip generation estimates, may be estimated as 2.81 * 3,168 = 8,902. Based on the calculated VMT of 30.4 per capita, the total VMT would be 8,902 * 30.4 = 270,620. However, if 2,701 trips temporarily drive two miles farther, the total VMT would increase to 270,620 + 2 * 2,701 = 276,022. The temporarily-greater VMT per capita would be 276,022 / 8,902 = 31.0. Therefore, the VMT per capita of 31.0 would be 120 percent compared to the impact threshold in the interim period.

## 9.0 INTERSECTION ANALYSES

### 9.1 Operations and Level of Service

The levels of service at the study intersections for the near-term with-project (residential) scenarios were determined using the computer program Synchro 12. The intersection analysis sheets are presented in Appendix B. The results of the intersection operational analyses are presented in Table 1. Levels of service and delays worse than the target LOS are indicated in bold type and are underlined. Intersections 7, 8, 15, 38 are not included in Table 1 because they are not expected to exist in the near-term condition.

**Table 1**

| | | | PM | 10.3 | B | 10.8 | B |

The analyses identified the following intersections that are expected to operate worse than the target LOS in the near-term condition with construction of the residential portions of the Vista Ranch Development.

4. Minnewawa Avenue and International Avenue
5. Minnewawa Avenue and Behymer Avenue
17. Sunnyside Avenue and Nees Avenue
18. Sunnyside Avenue and Alluvial Avenue
20. Fowler Avenue and Behymer Avenue
21. Fowler Avenue and Perrin Avenue
25. Fowler Avenue and Alluvial Avenue
30. Armstrong Avenue and Shepherd Avenue
31. Temperance Avenue and Shepherd Avenue
35. Temperance Avenue and SR 168 Eastbound Ramps
36. Locan Avenue and Shepherd Avenue
40. DeWolf Avenue and Owens Mountain Parkway
41. Owens Mountain Parkway and SR 168

The analyses indicate that, with the construction of all residences in the Vista Ranch Master Plan, the same intersections listed above would operate worse than the target LOS in the near-term condition, with the following additional intersection also operating worse than the target LOS:

12. Clovis Avenue and Herndon Avenue

## 9.2 Queuing

The results of the intersection operational analyses include an estimate of the 95$^{th}$-percentile queue lengths at the study intersection. The calculated 95$^{th}$-percentile queue lengths are presented in Table B-1 at the end of Appendix B. Calculated 95$^{th}$-percentile queue lengths that exceed the storage capacity by the length of at least one vehicle (25 feet) or that are judged to be excessive are indicated in bold type and are underlined.

In addition to excessive queues associated with levels of service below the target LOS that would be expected at the intersections listed above, the following intersections also exhibit queueing issues in the near-term conditions:

2. Willow Avenue and Behymer Avenue (westbound left-turn lane, which is only approximately 75 feet long; calculated 95$^{th}$-percentile queue exceeds storage capacity by approximately 100 feet).
6. Minnewawa Avenue and Shepherd Avenue (right-turn lane on the eastbound approach; calculated 95$^{th}$-percentile queues exceed storage capacity by approximately one car length, which is not considered a substantial issue considering the adjacent through lane operates on the same signal phase).
9. Clovis Avenue and Shepherd Avenue (left turn lane on the northbound approach; calculated 95$^{th}$-percentile queue exceeds storage capacity by approximately 100 feet, and right-turn lane on the eastbound approach; queues exceed storage capacity by

approximately 130 feet, which is not considered a substantial issue considering the adjacent through lane operates on the same signal phase). Project trips do not utilize these movements.

11. Clovis Avenue and Alluvial Avenue (left turn lane on the southbound approach; calculated 95th-percentile queue exceeds storage capacity by approximately 40 feet.) Project trips do not utilize this movement.

13. SR 168 Eastbound Ramps and Herndon Avenue (right-turn from the off ramp; calculated 95th-percentile queue exceeds storage capacity by approximately 140 feet.) Project trips do not utilize this movement.

16. Sunnyside Avenue and Shepherd Avenue (left turn lane on the northbound approach; calculated 95th-percentile queue exceeds storage capacity by approximately 40 feet.) Project trips do not utilize this movement.

19. Sunnyside Avenue and Herndon Avenue (left turn lane on the northbound approach; calculated 95th-percentile queue exceeds storage capacity by approximately 171 feet. Project trips do not utilize this movement. Right-turn lane on the eastbound approach; calculated 95th-percentile queue exceeds storage capacity by approximately 235 feet, which is not considered a substantial issue considering the adjacent through lane operates on the same signal phase).

22. Fowler Avenue and Shepherd Avenue (left-turn lanes on the southbound and eastbound approaches; calculated 95th-percentile queues exceed storage capacities by approximately two to three vehicle lengths, and the right-turn lane on the westbound approach; calculated 95th-percentile queues exceeds storage capacity by approximately 192 feet, which is not considered a substantial issue considering the adjacent through lane operates on the same signal phase).

24. Fowler Avenue and Nees Avenue (left turn lane on the northbound approach; calculated 95th-percentile queue exceeds storage capacity by approximately 90 feet.) Project trips do not utilize this movement.

32. Nees Avenue and Temperance Avenue (left turn lane on the westbound approach, which is only approximately 100 feet long; calculated 95th-percentile queue exceeds storage capacity by approximately 185 feet.) Project trips do not utilize this movement.

## 9.3 Recommended Intersection Improvements

The recommended improvements for each scenario are presented below.

### *9.3.1 Near-Term Plus Development (Residential Only) Recommended Improvements*

- 2. Willow and Behymer Avenues: Increase the length of the left-turn lane on the westbound approach to at least 175 feet.

- 4. Minnewawa and International Avenues: Installation of all-way stop control would cause the intersection to operate at acceptable LOS during the peak hours. It is noted that eight-hour all-way stop control warrants as presented in the *California Manual on Uniform Traffic Control Devices* (CMUTCD) are not expected to be satisfied at the intersection in the near-term conditions; however, based on collision history (as discussed below) it is suggested that all-way stop control may be considered. It should be noted that the LOS and delays at the

overall intersection with all-way stop control are expected to be acceptable; however, the LOS on the northbound approach during the p.m. peak hour is expected to be E with a calculated 95$^{th}$-percentile queue of 12 to 13 vehicles.

The agency with jurisdiction over the intersection may defer installation of all-way stop control until such time as observed traffic volumes indicate that warrants are satisfied. If it is determined that warrants for all-way stop control are not yet satisfied, other safety improvements may be implemented, such as enhancing the visibility of stop signs and warning signs (potentially with flashing beacons), installing street lighting, and ensuring adequate sight distance.

- 5. Minnewawa and Behymer Avenues: In order to operate at acceptable LOS, the intersection would require signalization with the following minimum lane configurations:

  Eastbound: one shared left-turn/through/right-turn lane with permissive left turns

  Westbound: one shared left-turn/through/right-turn lane with permissive left turns

  Northbound: one left-turn lane and one shared through/right-turn lane

  Southbound: one left-turn lane and one shared through/right-turn lane

  It should be noted that the lane configurations suggested above represent the minimum expected to provide acceptable LOS; however, it is more common to construct new traffic signals with dedicated left-turn lanes and protected left-turn phasing, as permissive phasing is generally not considered as safe as protected phasing in the Fresno/Clovis region. Therefore, it is at the discretion of the agency having jurisdiction over the intersection to potentially require protected left-turn phasing with dedicated left-turn lanes. The agency with jurisdiction over the intersection may defer installation of traffic signals until such time as observed traffic volumes indicate that traffic signal warrants are satisfied.

- 17. Sunnyside and Nees Avenues: In order to operate at acceptable LOS, the intersection would require signalization with the following minimum lane configurations:

  Eastbound: one left-turn lane and two through lanes with a shared right turn

  Westbound: one left-turn lane and two through lanes with a shared right turn

  Northbound: one left-turn lane, one through lane, and one right-turn lane

  Southbound: one left-turn lane and one shared through/right-turn lane

  The agency with jurisdiction over the intersection may defer installation of traffic signals until such time as observed traffic volumes indicate that traffic signal warrants are satisfied.

- 18. Sunnyside and Alluvial Avenues: The intersection of Sunnyside and Alluvial is signalized and constructed to its full planned width. The TIA presents a discussion indicating no feasible improvements were identified. It should be noted that intersection is affected primarily during the a.m. peak hour and the intersection is near an elementary school. An acceptable LOS is expected to continue to occur during the p.m. peak hour.

- 20. Fowler and Behymer Avenues: In order to operate at acceptable LOS, the intersection would require signalization with the following minimum lane configurations:

  Eastbound: one left-turn lane, one through lane, and one right-turn lane

  Westbound: one left-turn lane and one shared through/right-turn lane

  Northbound: one left-turn lane and one shared through/right-turn lane

  Southbound: one left-turn lane and one shared through/right-turn lane

  It should be noted that the road segment analyses presented below may recommend additional road widening on Fowler and Behymer Avenues that could require additional lanes at the intersection. In addition, a substantial number of northbound-to-westbound left-turns are expected during the peak hours, resulting in long queues and the potential need for two left-turn lanes on the northbound approach to the intersection.

  The agency with jurisdiction over the intersection may defer installation of traffic signals until such time as observed traffic volumes indicate that traffic signal warrants are satisfied.

- 21. Fowler and Perrin Avenues: In order to operate at acceptable LOS, the intersection would require signalization with the following minimum lane configurations:

  Eastbound: does not exist

  Westbound: one shared left-turn/right-turn lane

  Northbound: one shared through/right-turn lane

  Southbound: one left-turn lane and one through lane

  It should be noted that the road segment analyses presented below may recommend additional road widening on Fowler Avenue that could require additional lanes at the intersection. The agency with jurisdiction over the intersection may defer installation of traffic signals until such time as observed traffic volumes indicate that traffic signal warrants are satisfied.

- 22. Fowler and Shepherd Avenues: Increase the length of the left-turn lane on the eastbound approach to 225 feet by modifying the existing striping and increase the length of the left-turn lane on the southbound approach to 275 feet.

- 25. Fowler and Alluvial Avenues: The intersection of Fowler and Alluvial is signalized and constructed to its full planned width. However, a minor modification to add a right-turn lane on the southbound approach, potentially limited to restriping, would slightly reduce the delays associated with LOS E during the a.m. peak hour. It should be noted that the intersection is expected to operate at acceptable LOS during the p.m. peak hour without any improvements.

- 30. Armstrong and Shepherd Avenues: In order to operate at acceptable LOS, the intersection would require signalization with the following minimum lane configurations:

  Eastbound: one U-turn lane and two through lanes with a shared right turn

  Westbound: one left-turn lane and one through lane

  Northbound: one shared left-turn/right-turn lane

  Southbound: does not exist

  The agency with jurisdiction over the intersection may defer installation of traffic signals until such time as observed traffic volumes indicate that traffic signal warrants are satisfied.

- 31. Temperance and Shepherd Avenues: The intersection is signalized. In order to operate at acceptable LOS, the intersection would require modification to the following minimum lane configurations:

  - Eastbound: one left-turn lane, two through lanes, and one right-turn lane
  - Westbound: one left-turn lane, two through lanes, and one right-turn lane
  - Northbound: one left-turn lane, one through lane, and one right-turn lane
  - Southbound: one left-turn lane, one through lane, and one right-turn lane

- 35. Temperance and SR 168 Eastbound Ramps: The intersection is signalized. In order to operate at acceptable LOS, the intersection would likely require widening of the off ramp to provide one left-turn lane and two right-turn lanes and widening of the northbound approach to provide a third through lane dedicated to the westbound loop on ramp. The resulting intersection lane configurations would be as follows:

  - Eastbound: one shared left-turn/through lane and two dedicated right-turn lanes
  - Northbound: three through lanes with a shared right turn
  - Southbound: one left-turn lane and two through lanes

  In order to optimize lane utilization on the northbound approach, it is suggested that the northbound receiving lanes north of the eastbound ramps be restriped to create two lanes accessing the westbound freeway on ramp. The configuration of the northbound lanes departing the intersection would include one dedicated through lane, one shared through lane/westbound on-ramp lane, and one dedicated westbound on-ramp lane. This configuration is expected to be feasible because there are two existing westbound loop on-ramp lanes. A similar configuration exists on westbound Herndon Avenue to the westbound on ramp at the SR 168 interchange.

- 36. Locan and Shepherd Avenues: In order to operate at acceptable LOS, the intersection would require signalization with the following minimum lane configurations:

  Eastbound: one left-turn lane, two through lanes, and one right-turn lane

  Westbound: one left-turn lane, two through lanes, and one right-turn lane

  Northbound: one shared left-turn/through/right-turn lane

  Southbound: one shared left-turn/through and one right-turn lane

It should be noted that the lane configurations suggested above represent the minimum expected to provide acceptable LOS, and would require permissive phasing (or split phasing) to accommodate the shared lane already existing on the northbound approach. The agency with jurisdiction over the intersection may defer installation of traffic signals until such time as observed traffic volumes indicate that traffic signal warrants are satisfied.

- 40. DeWolf Avenue and Owens Mountain Parkway: The City plans to convert the intersection to a roundabout. The intersection is expected to operate at acceptable LOS as a single-lane roundabout in the near-term condition with the Development.
- 41. Owens Mountain Parkway and SR 168: The intersection is signalized. In order to operate at acceptable LOS, the intersection would require modification of the Owens Mountain Parkway southbound approach to add a second right-turn lane on (a condition that existed when the intersection was originally constructed), with the following resulting lane configurations:
  - Eastbound: two left-turn lanes, two through lanes, and one right-turn lane
  - Westbound: one left-turn lane, two through lanes, and one right-turn lane
  - Northbound: one left-turn lane, two through lanes, and one right-turn lane
  - Southbound: one left-turn lane, one through lane, and two right-turn lanes

### *9.3.2 Near-Term Plus Master Plan (Residential Only)*

The improvements discussed above for the Development project are applicable to the Master Plan as well. In addition, the intersection of Clovis and Herndon Avenue requires a discussion of potential improvements in the Master Plan scenario.

- 12. Clovis and Herndon Avenues: The intersection of Clovis and Herndon Avenues is signalized and constructed to its full planned width. The TIA presents a discussion considering right-turn overlaps. Given the substantial demand for U-turns at the intersection, the only feasible overlap location is likely the southbound-to-westbound right turn, which would require preventing eastbound-to-westbound U-turns. Before considering traffic signal modifications to install an overlapping right-turn phase, consideration could be given to restriping the northbound approach to change the three through lanes with a shared right turn to two through lanes and a dedicated right-lane. This modification is expected to result in LOS D or better during the peak hours.

### *9.3.3 Summary of Near-Term Conditions with Vista Ranch Residential*

Table 2 presents the results of the analysis of the improved conditions. The intersection analysis sheets for the improved conditions are presented in Appendix C. The calculated 95$^{th}$-percentile queue lengths for the improved conditions are presented in Table C-1 at the end of Appendix C.

**Table 2**

The recommended improvements would provide LOS D or better operations at 11 of the 13 intersections that are projected to have deficient operations with near term development plus the Vista Ranch Development residential only and at 12 of the 14 intersections that are projected to have deficient operations with near term development plus the Vista Ranch Master Plan residential only. The following two intersections would still have deficient LOS E or F operations.

18. Sunnyside Avenue and Alluvial Avenue: No feasible improvements were identified within the available street right-of-way. As shown in Table 15 of the TIA, however, this intersection is projected to operate at acceptable LOS under 2046 cumulative conditions without additional improvements. The TIA indicates that this is because planned citywide

street improvements are expected to allow diversion of traffic away from Sunnyside Avenue and Alluvial Avenue.

25. Fowler Avenue and Alluvial Avenue: No feasible improvements were identified within the available street right-of-way. As shown in Table 15 of the TIA, however, this intersection is projected to operate at acceptable LOS under 2046 cumulative conditions without additional improvements. The TIA indicates that this is because planned citywide street improvements are expected to allow diversion of traffic away from Fowler Avenue and Alluvial Avenue.

## 10.0 ROAD SEGMENT ANALYSES

The levels of service at the study road segments for the near-term with-project (residential) scenarios are presented in Table 3. Levels of service worse than the target LOS are indicated in bold type and are underlined. Roadway capacities were obtained from the TIA.

The analyses identified the following road segments that are expected to operate worse than the target LOS in the near-term condition with construction of the residential portions of the Vista Ranch Development:

2. Behymer Avenue from Minnewawa Avenue to Sunnyside Avenue
3. Behymer Avenue from Sunnyside Avenue to Fowler Avenue
5. Fowler Avenue from Behymer Avenue to Shepherd Avenue

The analyses indicate that, with the construction of all residences in the Vista Ranch Master Plan, the same road segments listed above would operate worse than the target LOS in the near-term condition. In order to operate at acceptable LOS, the road segments listed above would require widening prior to completion of the Development residences. Due to right-of-way limitations and existing residences, it may not be feasible to build out the affected roadways to the ultimate planned width. Applying the LOS D threshold of 1,680 trips for a two-lane collector street with a two-way left-turn lane as presented in the TIA, each of the roadways listed above would operate at an acceptable LOS D or better during the peak hours in the near-term condition with construction of the residential portions of the Vista Ranch Development and the residential portions of the Master Plan. Therefore, it is recommended that the roadways be widened in an interim configuration to provide a two-way left-turn lane and one lane in each direction.

## Table 3
## Near-Term With-Project Road Segment Operations

| ID | Roadway Segment | Hour | Threshold | | | Near Term With Development Residential | | Near Term with Master Plan Residential | |

## 11.0 CRASH RECORDS

The TIA refers to the Fresno Council of Governments (COG) Multijurisdictional Local Road Safety Plan (MLRSP) dated January 2022. The only study intersection in the 95th-percentile of crash severity scores is the intersection of Shepherd Avenue and Minnewawa Avenue.

An additional search of crash records available from the Statewide Integrated Traffic Records System (SWITRS) database for the years 2019 through 2023 at each of the study intersections was performed and is summarized in Table D-1 in Appendix D.

Table 4 presents a general summary of the crash rates calculated for each intersection. The average daily traffic volumes were roughly estimated by assuming that the combined a.m. and p.m. peak hour traffic volumes represent 20 percent of the daily trips. The values presented are intended to provide a relative comparison of crash rates. Those locations with the greatest crash rates could be investigated to identify issues that potentially contribute to crashes.

**Table 4**
**Crash Rates**

| ID | Intersection | Crash Rate | ID | Intersection | Crash Rate |
|---|---|---|---|---|---|
| 1 | Willow / International | 0.186 | 23 | Fowler / Teague | 0.479 |
| 2 | Willow / Behymer | 0.000 | 24 | Fowler / Nees | 0.222 |
| 3 | Willow / Shepherd | 0.339 | 25 | Fowler / Alluvial | 0.221 |
| 4 | Minnewawa / International | 0.899 | 26 | Fowler / SR 168 WB Ramps | 0.000 |
| 5 | Minnewawa / Behymer | 0.994 | 27 | Fowler / SR 168 EB Ramps | 0.023 |
| 6 | Minnewawa / Shepherd | 0.510 | 28 | Perrin Rd / Burgan | 0.000 |
| 7 | Clovis / International | N/A | 29 | Burgan / Shepherd | 0.000 |
| 8 | Clovis / Behymer | N/A | 30 | Armstrong / Shepherd | 0.133 |
| 9 | Clovis / Shepherd | 0.219 | 31 | Temperance / Shepherd | 0.420 |
| 10 | Clovis / Nees | 0.269 | 32 | Nees / Temperance | 0.239 |
| 11 | Clovis / Alluvial | 0.247 | 33 | Temperance / Alluvial | 0.224 |
| 12 | Clovis / Herndon | 0.508 | 34 | Temperance / SR 168 WB Ramps | 0.000 |
| 13 | SR 168 EB Ramps / Herndon | 0.116 | 35 | Temperance / SR 168 EB Ramps | 0.140 |
| 14 | SR 168 WB Ramps / Herndon | 0.012 | 36 | Locan / Shepherd | 0.099 |
| 15 | Behymer / Sunnyside | 0.598 | 37 | Locan / Nees | 0.255 |
| 16 | Sunnyside / Shepherd | 0.294 | 38 | Locan / Owens Mountain | N/A |
| 17 | Sunnyside / Nees | 0.600 | 39 | De Wolf / Shepherd | 0.340 |
| 18 | Sunnyside / Alluvial | 0.069 | 40 | De Wolf / Owens Mountain | 0.070 |
| 19 | Sunnyside / Herndon | 0.340 | 41 | Owens Mountain Pkwy / SR 168 | 0.031 |
| 20 | Fowler / Behymer | 0.453 | 42 | Shepherd / SR 168 | 0.700 |
| 21 | Fowler / Perrin | 0.269 | 43 | Shepherd / Project Access | N/A |
| 22 | Fowler / Shepherd | 0.445 | 44 | Behymer / Project Access | N/A |

Note: crash rates are reported in crashes per million vehicles entering the intersection (traffic volumes estimated from peak hour counts)

It is noted that there are generally four types of intersections listed in Table 4: 1) signalized, 2) all-way stop, 3) one-way stop, and 4) two-way stop.

**Signalized and All-Way Stop.** In general, the additional trips generated by a proposed Project are not likely to create a safety issue or substantially exacerbate the existing safety conditions at a signalized intersection or an all-way-stop-controlled intersection because the right of way is

assigned by the control, regardless of the length of the queues at the intersection. These systems for determining which vehicles or pedestrians may proceed at any given time reduces the potential for conflicts and driver confusion (provided that the capacity of the intersection is not exceeded).

**One-Way and Two-Way Stop.** The types of intersections at which additional traffic volumes are most likely to have the potential to contribute to safety issues are one-way- and two-way-stop-controlled intersections. At these locations, traffic on the major street is not required to stop, and increased delays resulting from additional traffic on either street may increase the likelihood that drivers become impatient and are willing to take additional risks to avoid queuing, such as pulling out into busy traffic. Where an acceptable LOS exists at a one-way or two-way stop-controlled intersection with adequate visibility and design features, the likelihood that drivers become impatient decreases. Conversely, where a poor LOS occurs, driver impatience tends to increase.

Thus, if mitigation proposed for a one-way or two-way stop results in an acceptable LOS for that intersection, or contemplates improvements such as an all-way stop or signalization, the intersection would not be expected to experience new or exacerbated adverse safety impacts.

Generally speaking, improvements to the intersection control at an intersection are feasible only if warrants for all-way stop control or traffic signals are satisfied; however, where warrants are not satisfied, the installation of all-way stop control or traffic signals would be infeasible.

Of the study intersections, only the following are one-way or two-way stop controlled under the existing conditions:

- Minnewawa Avenue / International Avenue (potential all-way stop to be installed as described previously in this report)
- Fowler Avenue / Perrin Avenue (potential traffic signal to be installed as described previously in this report)
- Fowler Avenue / Teague Avenue (acceptable LOS with Project)
- Burgan Avenue / Perrin Avenue (acceptable LOS with Project)
- Burgan Avenue / Shepherd Avenue (acceptable LOS with Project)
- Armstrong Avenue / Shepherd Avenue (potential traffic signal to be installed as described previously in this report)
- Locan Avenue / Shepherd Avenue (potential traffic signal to be installed as described previously in this report)

Based on the foregoing, following the above mitigation, the Project would not result in any one-way or two-way stops operating at a deficient LOS. As a result, the Project is not expected to create or exacerbate safety concerns at the study intersections.

Below is a more in-depth evaluation of the intersections that experience the greatest crash rates among the study intersections in terms of crashes per million vehicles:

- Minnewawa Avenue / Behymer Avenue (existing all-way stop): 0.994 crashes per million vehicles
- Minnewawa Avenue / International Avenue (existing two-way stop): 0.899 crashes per million vehicles
- Shepherd Avenue / SR 168 (existing signalized): 0.700 crashes per million vehicles
- Sunnyside Avenue / Nees Avenue (existing all-way stop): 0.600 crashes per million vehicles

The predominant type of crash at the intersection of Minnewawa and Behymer Avenues is a rear-end collision, followed by hitting an object and broadside collisions. It is likely that many drivers traveling at unsafe speeds may not anticipate queues associated with delays and congestion. Where advance warning signage already exists, consideration could be given to enhancing the visibility of the signage, potentially including stop beacon to the stop signs in accordance with CMUTCD Section 4L.05. The intersection has been identified as requiring signalization in the near-term condition. With these improvements, the Project would not cause or exacerbate an unsafe traffic condition.

The predominant type of crash at the intersection of Minnewawa and International Avenues is a broadside collision. There was one fatality in 2023. The intersection has been identified as potentially requiring installation of all-way stop control in the near-term condition based on peak-hour operations alone. The CMUTCD indicates that an intersection may be converted to all-way stop control if five crashes susceptible to correction with stop signs occur within a 12-month period. During the five-year period of 2019 through 2023, there were up to four crashes during a 12-month period that would be considered susceptible to correction with stop signs, but there were no 12-month periods identified with five crashes. Considering the increase in traffic volumes expected as a result of development in the region, and the calculated collision rate, it appears likely that the number of collisions at the intersection could increase. Along with installation of all-way stop control, consideration should be given to enhancing the visibility of signage at the intersection, adding flashing beacons, installing street lighting. With these improvements, the Project would not cause or exacerbate an unsafe traffic condition. For the interim period during which two-way stop control remains, it is recommended that W4-4P "CROSS TRAFFIC DOES NOT STOP" plaques be installed beneath the existing stop signs.

The predominant type of crash at the intersection of Shepherd Avenue and SR 168 (which is a signalized intersection under Caltrans jurisdiction) is a broadside collision, followed by hitting an object. The collisions tend to be the result of right-of-way violations and improper turns. It is likely the large size of the intersection contributes to driver willingness to turn in front of other vehicles or misjudge speeds and distances. Considering that the intersection is signalized, the Project would not cause or exacerbate an unsafe traffic condition.

The predominant type of crash at the intersection of Sunnyside and Nees Avenues, which is a four-way stop, is a broadside collision associate with running a stop sign or a right-of-way violation. The intersection has been identified as requiring signalization in the near-term condition, which would reduce potential safety impacts associated with the Project. An interim measure may include installation of stop beacons to the stop signs on Sunnyside Avenue in

accordance with CMUTCD Section 4L.05. Stop beacons already exist on the stop signs on Nees Avenue.

The predominant type of crash at the signalized intersection of Shepherd and Minnewawa Avenues is a broadside collision, followed by rear-end collisions. The intersection has been identified as requiring additional lanes in the near-term condition, which would further reduce potential safety impacts associated with the Project.

None of the intersections affected by the Project are expected to have safety issues exacerbated by the Project in the improved condition.

## 12.0 VMT MITIGATION MEASURES

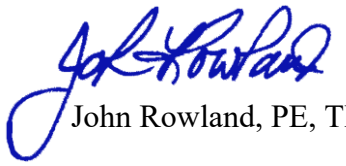
The TIA includes a CEQA transportation impact analysis that quantifies VMT for the project area. The TIA found that the VMT per capita and VMT per employee will cause a significant impact. The significant impact is expected to be the same whether or not the commercial portions of the Project have been constructed. Several mitigation measures are recommended in the TIA to reduce VMT.

The California Air Pollution Control Officers Association (CAPCOA) *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity* dated October 2024 presents several measures that potentially reduce VMT. The potential mitigation measures can generally be grouped as either: 1) managing land use (primarily infill, high-density development, and connectivity), 2) promoting active transportation (primarily walking and biking), 3) promoting transit (primarily buses), and 4) managing commutes and limiting parking supply.

The proposed Project, along with the recommended Project mitigation measures, addresses (either directly or indirectly) at least 17 of the CAPCOA measures as listed in Table 5.

**Table 5**
**Project-Related CAPCOA Measures**

| ID | CAPCOA Measure | ID | Intersection |
|---|---|---|---|
| T-3 | Provide Transit-Oriented Development | T-17 | Improve Street Connectivity |
| T-5 | Implement Commute Trip Reduction Program (Voluntary) | T-18 | Provide Pedestrian Network Improvement |
| T-6 | Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) | T-19-A | Construct or Improve Bike Facility |
| T-7 | Implement Commute Trip Reduction Marketing | T-20 | Expand Bikeway Network |
| T-8 | Provide Ridesharing Program | T-25 | Extend Transit Network Coverage or Hours |
| T-9 | Implement Subsidized or Discounted Transit Program | T-27 | Implement Transit-Supportive Roadway Treatments |
| T-10 | Provide End-of-Trip Bicycle Facilities | T-46 | Provide Transit Shelters |
| T-11 | Provide Employer-Sponsored Vanpool | T-56 | Active Modes of Transportation for Youth |
| T-14 | Provide Electric Vehicle Charging Infrastructure | | |



The TIA presents an estimated quantification of the VMT reduction. However, there are few (if any) feasible mitigation measures that can substantially and measurably reduce VMT for most projects in the Clovis / Fresno region. In general, the geography, development, and climate in the Clovis / Fresno region, and essentially the entirety of central California, are not conducive to residents being able to go to work, perform the required shopping, and other (such as health care or entertainment) via means of transportation such as walking, bicycling, or mass transit. As the Clovis/Fresno region is not a dense city with high-rise residential, office, health care, and shopping all within close proximity, and with high heat in the summer and cold/rain/fog in the winter, simply providing for and promoting active transportation and transit opportunities does not generally result in a noticeable reduction in the number of vehicle miles residents must travel per day. The regional transit system has not been developed to the extent that a majority of residents are willing to utilize it; therefore, on a Project level, providing additional transit facilities, including the measures identified in Table 5, would not be effective in reducing VMT in anything other than de minimis levels. Likewise, carpooling has been promoted for several decades with minimal benefit as many employees tend to work different hours, do not live near each other, are required to attend appointments, or continue to enjoy the independence and opportunity to run other errands during the commute. For these reasons, VMT mitigation measures, including those identified in Table 5, will not be effective in reducing the Project's VMT. As such, the TIA found that the transportation impact based on VMT is likely to remain significant and unavoidable even with the inclusion of VMT mitigation measures such as those identified in Table 5.

## 13.0 CONCLUSIONS

Generally-accepted traffic engineering principles and methods were employed to estimate the number of trips expected to be generated by the Project and to analyze the traffic conditions projected to occur in the near-term condition. This report includes discussion of the study intersections and recommendations for improvements in the near-term condition that are intended to supplement the information presented in the TIA to be utilized in the RDEIR for the project.

Thank you for the opportunity to perform this Supplemental Traffic Analyses. Please feel free to contact our office if you have any questions.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Options tab).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.
LOS F will result if v/c >1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).
Roundabout Capacity Model: SIDRA HCM.
Delay Model: HCM Delay Formula (Stopline Delay: Geometric Delay is not included).
Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.
Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Options tab).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.
LOS F will result if v/c >1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).
Roundabout Capacity Model: SIDRA HCM.
Delay Model: HCM Delay Formula (Stopline Delay: Geometric Delay is not included).
Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.
Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Options tab).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.
LOS F will result if v/c >1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).
Roundabout Capacity Model: SIDRA HCM.
Delay Model: HCM Delay Formula (Stopline Delay: Geometric Delay is not included).
Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.
Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Options tab).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.
LOS F will result if v/c >1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).
Roundabout Capacity Model: SIDRA HCM.
Delay Model: HCM Delay Formula (Stopline Delay: Geometric Delay is not included).
Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.
Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Options tab).
Roundabout LOS Method: Same as Sign Control.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c >1 irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).
Roundabout Capacity Model: SIDRA HCM.
Delay Model: HCM Delay Formula (Stopline Delay: Geometric Delay is not included).
Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.
Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Options tab).
Roundabout LOS Method: Same as Sign Control.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c >1 irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).
Roundabout Capacity Model: SIDRA HCM.
Delay Model: HCM Delay Formula (Stopline Delay: Geometric Delay is not included).
Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.
Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Options tab).
Roundabout LOS Method: Same as Sign Control.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c >1 irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).
Roundabout Capacity Model: SIDRA HCM.
Delay Model: HCM Delay Formula (Stopline Delay: Geometric Delay is not included).
Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.
Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Options tab).
Roundabout LOS Method: Same as Sign Control.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c >1 irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).
Roundabout Capacity Model: SIDRA HCM.
Delay Model: HCM Delay Formula (Stopline Delay: Geometric Delay is not included).
Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.
Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.
