# INTRODUCTION

This Air Quality, Heath Risk, Greenhouse Gas (GHG), and Energy Impact Report has been prepared to evaluate the potential air quality, health risk, energy and GHG emissions impacts associated with the proposed John S. Gibson Trailer Lot Project (Project) in the Port of Los Angeles, within the City of Los Angles (City), County of Los Angeles (County), California. This report follows the guidelines identified by the South Coast Air Quality Management District (SCAQMD) in its *California Environmental Quality Act (CEQA) Air Quality Handbook*,[1] and associated updates. In keeping with these guidelines, this analysis describes existing air quality, including air quality and GHG emissions generated from Project-related sources, regional air pollution, and global climate change. In addition, this analysis discusses energy use resulting from implementation of the proposed Project and evaluates whether the proposed Project would result in the wasteful, inefficient, or unnecessary consumption of energy resources or conflict with any applicable plans for renewable energy and energy efficiency.

## PROJECT LOCATION AND DESCRIPTION

The 18.635-acre Project site is located at 1599 John S. Gibson Boulevard in the community of San Pedro in the southwestern portion of the City of Los Angeles within the Port of Los Angeles Master Plan planning community in Los Angeles County. The Project site is currently undeveloped and consists of Assessor's Parcel Numbers (APNs) 7440-016-001, 7440-016-002, 7440-016-003, and 7412-024-007. The Project site is bounded by Interstate 110 (I-110) to the north and west, John S. Gibson Boulevard to the east, and existing container terminals to the south. A portion of the Project site is in the western portion of the Port of Los Angeles Master Plan Planning Area 2, which encompasses the West Basin and Wilmington areas. See Figure 1, Regional Project Location, and Figure 2, Site Plan, below.

The proposed Project would construct a short-term trailer parking facility and related site improvements. The Project would include paving of the site and striping of 393 trailer stalls. The 393 trailer stalls would be 11 feet by 40 feet and would occupy approximately 405,602 square feet (sq ft). In addition, the proposed Project would include installation of a prefabricated guard booth and restroom for use by truck drivers and Project employees.

The proposed Project would also include approximately 316,373 sq ft of drought tolerant ornamental landscaping that would cover approximately 38.97 percent of the Project site. The proposed Project would use a water-efficient automatic irrigation controller and would utilize reclaimed rainwater to irrigate the landscape area. In addition, the proposed Project would construct a traffic signal and a 40-foot-wide access driveway off John S. Gibson Boulevard to allow vehicles to access the proposed Project site.

Site Plan

Operations of the proposed Project involve a to-be-determined company that would operate the site as a truck trailer parking lot. Typical operational characteristics include trucks traveling to and from the Project site to pick up or drop off chassis and shipping containers. Shipping containers would be parked on top of the trailer chassis. Truck trailer operations are conservatively assumed to occur year-round, 24 hours per day, 7 days per week. Operations would require a maximum of 2 employees onsite at any given time in order to provide security and operate onsite machinery. In addition, onsite equipment needed for the parking of truck trailers would include one yard goat and two small forklifts. Onsite equipment would be zero-emission, all-electric, and necessary charging equipment would be provided onsite, which would connect to existing electric infrastructure in John S. Gibson Boulevard. The Project would result in approximately 1,808 average daily trips, including 1,794 one-way truck trips, 4 one-way delivery/vendor trips, and 10 passenger vehicle trips[2]. The parking lot is intended to support ship offloading and loading activities occurring at Port of Los Angeles container yards.

Construction of the proposed Project would occur for approximately 8 months and includes site preparation, grading, paving, and signage and striping. The proposed Project would require the export of approximately 500 cubic yards of total petroleum hydrocarbons (TPH) and volatile organic compounds (VOC) impacted soils which would be disposed at either Chiquita Canyon Landfill, Simi Valley Landfill, or Soil Safe Adelanto. The proposed Project would also require the import of approximately 3,433 cubic yards of soil. In addition, construction equipment would utilize Tier 3 engines.

## EXISTING LAND USES IN THE PROJECT AREA

For the purposes of this analysis, sensitive receptors are areas of population that have an increased sensitivity to air pollution or environmental contaminants. Sensitive receptor locations include residences, schools, daycare centers, hospitals, parks, and similar uses which are sensitive to air quality. Impacts on sensitive receptors are of particular concern because they are the population most vulnerable to the effects of air pollution. The Project site is surrounded by the I-110 and industrial uses to the north, John S. Gibson Boulevard and a container and terminal storage to the south and southeast, and a shipping company and the Harbor Community Police Station to the west.

There are no nearby sensitive receptors within a 1,000-foot radius of the Project site. The closest sensitive receptors to the Project site are single-family homes located southwest of the Project site at approximately 1,366 feet from the western Project site boundary line to the residences. The closest worker receptor to the project site is the Ports of America insurance company located immediately west at approximately 25 feet.

# BACKGROUND

This section provides current background information on air pollutants and their health effects. It also provides current regulatory background information, including information from the California Air Resources Board's (CARB) Air Quality and Land Use Handbook[3] (CARB Handbook); a description of the general health risks of toxics, and the significance criteria for Project evaluation.

## AIR POLLUTANTS AND HEALTH EFFECTS

Both State and federal governments have established health-based ambient air quality standards (California Ambient Air Quality Standards [CAAQS] and National Ambient Air Quality Standards [NAAQS], respectively) for six criteria air pollutants:[4] carbon monoxide (CO), ozone ($O_3$), nitrogen dioxide ($NO_2$), sulfur dioxide ($SO_2$), lead (Pb), and suspended particulate matter (PM). In addition, the State has set standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. These standards are designed to protect the health and welfare of the populace with a reasonable margin of safety. Long-term exposure to elevated levels of criteria pollutants may result in adverse health effects. However, emission thresholds established by an air district are used to manage total regional emissions within an air basin based on the air basin's attainment status for criteria pollutants. These emission thresholds were established for individual projects that would contribute to regional emissions and pollutant concentrations and could adversely affect or delay the projected attainment target year for certain criteria pollutants.

Because of the conservative nature of the thresholds and the basin-wide context of individual project emissions, there is no known direct correlation between a single project and localized air quality-related health effects. One individual project that generates emissions exceeding a threshold does not necessarily result in adverse health effects for residents in the Project vicinity. This condition is especially true when the criteria pollutants exceeding thresholds are those with regional effects, such as ozone precursors like nitrogen oxides ($NO_X$) and VOCs.

Occupants of facilities such as schools, daycare centers, parks and playgrounds, hospitals, and nursing and convalescent homes are considered to be more sensitive than the general public to air pollutants because these population groups have increased susceptibility to respiratory disease. Persons engaged in strenuous outdoor work or exercise also have increased sensitivity to poor air quality. Residential areas are considered more sensitive to air quality conditions, compared to commercial and industrial areas, because people generally spend longer periods of time at their residences, with greater associated exposure to ambient air quality conditions. Recreational uses are also considered sensitive compared to commercial and industrial uses due to greater exposure to ambient air quality conditions associated with exercise.

4 Criteria pollutants are defined as those pollutants for which the federal and State governments have established ambient air quality standards, or criteria, for outdoor concentrations in order to protect public health.

### Ozone

Rather than being directly emitted, ozone ($O_3$ or smog) is formed by photochemical reactions between $NO_X$ and VOCs. Ozone is a pungent, colorless gas. Elevated ozone concentrations result in reduced lung function, particularly during vigorous physical activity. This health problem is particularly acute in sensitive receptors such as the sick, elderly, and young children. Ozone levels peak during the summer and early fall months.

### Carbon Monoxide

Carbon monoxide (CO) is formed by the incomplete combustion of fossil fuels, almost entirely from automobiles. It is a colorless, odorless gas that can cause dizziness, fatigue, and impairments to central nervous system functions. CO passes through the lungs into the bloodstream, where it interferes with the transfer of oxygen to body tissues.

### Particulate Matter

Particulate matter (PM) is the term used for a mixture of solid particles and liquid droplets found in the air. Coarse particles are those that are 10 microns or less in diameter, or $PM_{10}$. Fine, suspended particulate matter with an aerodynamic diameter of 2.5 microns or less, or $PM_{2.5}$, is not readily filtered out by the lungs. Nitrates, sulfates, dust, and combustion particulates are major components of $PM_{10}$ and $PM_{2.5}$. These small particles can be directly emitted into the atmosphere as byproducts of fuel combustion; through abrasion, such as tire or brake lining wear; or through fugitive dust (wind or mechanical erosion of soil). They can also be formed in the atmosphere through chemical reactions. Particulates may transport carcinogens and other toxic compounds that adhere to the particle surfaces and can enter the human body through the lungs.

### Nitrogen Dioxide

Nitrogen dioxide ($NO_2$) is a reddish brown gas that is a byproduct of combustion processes. Automobiles and industrial operations are the main sources of $NO_2$. Aside from its contribution to ozone formation, $NO_2$ also contributes to other pollution problems, including a high concentration of fine particulate matter, poor visibility, and acid deposition. $NO_2$ may be visible as a coloring component on high pollution days, especially in conjunction with high ozone levels. $NO_2$ decreases lung function and may reduce resistance to infection.

### Sulfur Dioxide

Sulfur dioxide ($SO_2$) is a colorless, irritating gas formed primarily from incomplete combustion of fuels containing sulfur. Industrial facilities also contribute to gaseous $SO_2$ levels in the region. $SO_2$ irritates the respiratory tract, can injure lung tissue when combined with fine particulate matter, and reduces visibility and the level of sunlight.

### Lead

Leaded gasoline (phased out in the United States beginning in 1973), paint (on older houses and cars), smelters (metal refineries), and the manufacture of lead storage batteries have been the primary sources of lead (Pb) released into the atmosphere. Lead has multiple adverse neurotoxic health effects, and children are at special risk. Some lead-containing chemicals cause cancer in

animals. Lead levels in the air have decreased substantially since leaded gasoline was eliminated. Ambient lead concentrations are only monitored on an as-warranted, site-specific basis in California. On October 15, 2008, the United States Environmental Protection Agency (USEPA) strengthened the NAAQS for lead by lowering it from 1.5 to 0.15 micrograms per cubic meter ($\mu g/m^3$). The USEPA revised the monitoring requirements for lead in December 2010. These requirements focus on airports and large urban areas, resulting in an increase in 76 monitors nationally.

### Volatile Organic Compounds

Volatile organic compounds (VOCs, also known as reactive organic gases [ROGs] and reactive organic compounds [ROCs]) are formed from the combustion of fuels and the evaporation of organic solvents. VOCs are not defined as criteria pollutants, however, because VOCs accumulate in the atmosphere more quickly during the winter, when sunlight is limited and photochemical reactions are slower, they are a prime component of the photochemical smog reaction. There are no attainment designations for VOCs.

### Toxic Air Contaminants

In addition to the criteria pollutants discussed above, toxic air contaminants (TACs) are another group of pollutants of concern. TACs are injurious in small quantities and are regulated by the USEPA and the CARB. Some examples of TACs include benzene, butadiene, formaldehyde, and hydrogen sulfide. The identification, regulation, and monitoring of TACs is relatively recent compared to that for criteria pollutants.

TACs do not have ambient air quality standards (AAQS), but are regulated by the USEPA, CARB, and the SCAQMD. In 1998, the CARB identified particulate matter from diesel-fueled engines as a TAC. The CARB has completed a risk management process that identified potential cancer risks for a range of activities using diesel-fueled engines.[5] High-volume freeways, stationary diesel engines, and facilities attracting heavy and constant diesel vehicle traffic (e.g., distribution centers and truck stops) were identified as posing the highest risk to adjacent receptors. Other facilities associated with increased risk include warehouse distribution centers, large retail or industrial facilities, high-volume transit centers, and schools with a high volume of bus traffic. Health risks from TACs are a function of both concentration and duration of exposure.

Unlike TACs emitted from industrial and other stationary sources noted above, most diesel particulate matter (DPM) is emitted from mobile sources—primarily "off-road" sources such as construction and mining equipment, agricultural equipment, and truck-mounted refrigeration units, as well as "on-road" sources such as trucks and buses traveling on freeways and local roadways.

Although not specifically monitored, recent studies indicate that exposure to DPM may contribute significantly to a cancer risk (a risk of approximately 500 to 700 in 1,000,000) that is greater than all other measured TACs combined.[6] The technology for reducing DPM emissions from heavy-duty trucks is well established, and both State and federal agencies are moving aggressively to regulate engines

[5] CARB. 2000. Stationary Source Division and Mobile Source Control Division. *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles.* October.

[6] Ibid.

and emission control systems to reduce and remediate diesel emissions. The CARB anticipated that by 2020, average statewide DPM concentrations will decrease by 85 percent from levels in 2000 with full implementation of the CARB's Diesel Risk Reduction Plan,[7] meaning that the statewide health risk from DPM is expected to decrease from 540 cancer cases in 1,000,000 to 21.5 cancer cases in 1,000,000. The CARB 2000 Diesel Risk Reduction Plan is still the most recent version and has not been updated.

Table A summarizes the sources and health effects of air pollutants discussed in this section. Table B presents a summary of CAAQS and NAAQS.

*Table notes are provided on the following page.*

[a] California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1- and 24-hour), nitrogen dioxide, and particulate matter ($PM_{10}$, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California Ambient Air Quality Standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[b] National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For $PM_{10}$, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m$^3$ is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact USEPA for further clarification and current national policies.

[c] Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[d] Any equivalent measurement method which can be shown to the satisfaction of the CARB to give equivalent results at or near the level of the air quality standard may be used.

[e] National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

[f] National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[g] Reference method as described by the USEPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the USEPA.

[h] On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

[i] On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 µg/m$^3$ to 12.0 µg/m$^3$. The existing national 24- hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m$^3$, as was the annual secondary standard of 15 µg/m$^3$. The existing 24-hour $PM_{10}$ standards (primary and secondary) of 150 µg/m$^3$ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

[j] To attain the 1-hour national standard, the 3-year average of the annual 98$^{th}$ percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

[k] On June 2, 2010, a new 1-hour $SO_2$ standard was established, and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99$^{th}$ percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 $SO_2$ national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

[l] The CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[m] The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 µg/m$^3$ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

[n] In 1989, the CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

# ENERGY

## Electricity

Electricity is a manmade resource. The production of electricity requires the consumption or conversion of energy resources (including water, wind, oil, gas, coal, solar, geothermal, and nuclear resources) into energy. Electricity is used for a variety of purposes (e.g., lighting, heating, cooling, and refrigeration, and for operating appliances, computers, electronics, machinery, and public transportation systems).

According to the most recent data available, in 2021, California's electricity was generated primarily by natural gas (37.9 percent), renewable sources (33.6 percent), large hydroelectric (9.2 percent), nuclear (9.3 percent), coal (3.0 percent), and other and unspecified sources. Total electric generation in California in 2021 was 277,764 gigawatt-hours (GWh), up 2 percent from the 2020 total generation of 272,576 GWh.[8]

The Project site is within the service territory of the Los Angeles Department of Water and Power (LADWP). LADWP provides electricity to more than 1.4 million people in Los Angeles.[9] According to the California Energy Commission (CEC), total electricity consumption in the LADWP service area in 2021 was 22,852 GWh (7,954 GWh for the residential sector and 14,898 GWh for the non-residential sector). Total electricity consumption in Los Angeles County in 2021 was 65,374.7 GWh (65,374,721,369 kilowatt-hours (kWh).[10]

## Natural Gas

Natural gas is a non-renewable fossil fuel. Fossil fuels are formed when layers of decomposing plant and animal matter are exposed to intense heat and pressure under the surface of the Earth over millions of years. Natural gas is a combustible mixture of hydrocarbon compounds (primarily methane) that is used as a fuel source. Natural gas is found in naturally occurring reservoirs in deep underground rock formations. Natural gas is used for a variety of uses (e.g., heating buildings, generating electricity, and powering appliances such as stoves, washing machines and dryers, gas fireplaces, and gas grills).

Natural gas consumed in California is used for electricity generation (45 percent), residential uses (21 percent), industrial uses (25 percent), and commercial uses (9 percent). California continues to depend on out-of-state imports for nearly 90 percent of its natural gas supply.[11]

The Southern California Gas Company (SoCalGas) is the natural gas service provider for the Project site. SoCalGas provides natural gas to approximately 21.8 million people in a 24,000 sq mi service area throughout Central and Southern California, from Visalia to the Mexican border.[12] According to the CEC, total natural gas consumption in the SoCalGas service area in 2021 was 6,755 million therms (2,308 million therms for the residential sector). Total natural gas consumption in Los Angeles County in 2021 was 2,880 million therms (2,880,994,891 therms).[13]

### Fuel

Petroleum is also a non-renewable fossil fuel. Petroleum is a thick, flammable, yellow-to-black mixture of gaseous, liquid, and solid hydrocarbons that occurs naturally beneath the earth's surface. Petroleum is primarily recovered by oil drilling. It is refined into a large number of consumer products, primarily fuel oil, gasoline, and diesel.

The average fuel economy for light-duty vehicles (autos, pickups, vans, and SUVs) in the United States has steadily increased from about 14.9 miles per gallon (mpg) in 1980 to 22.9 mpg in 2020.[14] Federal fuel economy standards have changed substantially since the Energy Independence and Security Act was passed in 2007. The Act, which originally mandated a national fuel economy standard of 35 mpg by year 2020[15], applies to cars and light trucks of Model Years 2011 through 2020. In March 2020, the United States Environmental Protection Agency (USEPA) and National Highway Traffic Safety Administration (NHTSA) finalized the Corporate Average Fuel Economy (CAFE) standards for Model Years 2024–2026 Passenger Cars and Light Trucks, further detailed below.

Gasoline is the most used transportation fuel in California, with 97 percent of all gasoline being consumed by light-duty cars, pickup trucks, and sport utility vehicles. According to the most recent data available, total gasoline consumption in California was 319,514 thousand barrels or 1,613.5 trillion British Thermal Units (BTU) in 2021.[16] Of the total gasoline consumption, 302,881 thousand

barrels or 1,529.5 trillion BTU were consumed for transportation.[17] Based on fuel consumption obtained from CARB's California Emissions Factor Model, Version 2021 (EMFAC2021), approximately 3,921.8 million gallons of gasoline and approximately 608.6 million gallons of diesel were consumed from vehicle trips in Los Angeles County in 2023.

## GREENHOUSE GASES

Global climate change is the observed increase in the average temperature of the Earth's atmosphere and oceans in recent decades. The Earth's average near-surface atmospheric temperature rose 0.6 ± 0.2° Celsius (°C) or 1.1 ± 0.4° Fahrenheit (°F) in the 20th century. The prevailing scientific opinion on climate change is that most of the warming observed over the last 50 years is attributable to human activities. The increased amounts of carbon dioxide ($CO_2$) and other GHGs are the primary causes of the human-induced component of warming. GHGs are released by the burning of fossil fuels, land clearing, agriculture, and other activities, and lead to an increase in the greenhouse effect.[18]

GHGs are present in the atmosphere naturally, are released by natural sources, or are formed from secondary reactions taking place in the atmosphere. The gases that are widely seen as the principal contributors to human-induced global climate change are:

- $CO_2$
- Methane ($CH_4$)
- Nitrous oxide ($N_2O$)
- Hydrofluorocarbons (HFCs)
- Perfluorocarbons (PFCs)
- Sulfur hexafluoride ($SF_6$)

Over the last 200 years, humans have caused substantial quantities of GHGs to be released into the atmosphere. These extra emissions are increasing GHG concentrations in the atmosphere, and enhancing the natural greenhouse effect, which is believed to be causing global warming. While manmade GHGs include naturally-occurring GHGs such as $CO_2$, methane, and $N_2O$, some gases, like HFCs, PFCs, and $SF_6$ are completely new to the atmosphere.

Certain gases, such as water vapor, are short-lived in the atmosphere. Others remain in the atmosphere for significant periods of time, contributing to climate change in the long term. Water vapor is excluded from the list of GHGs above because it is short-lived in the atmosphere and its atmospheric

18 The temperature on Earth is regulated by a system commonly known as the "greenhouse effect." Just as the glass in a greenhouse lets heat from sunlight in and reduces the heat escaping, greenhouse gases like carbon dioxide, methane, and nitrous oxide in the atmosphere keep the Earth at a relatively even temperature. Without the greenhouse effect, the Earth would be a frozen globe; thus, although an excess of greenhouse gas results in global warming, the naturally occurring greenhouse effect is necessary to keep our planet at a comfortable temperature.

concentrations are largely determined by natural processes, such as oceanic evaporation. For the purposes of this air quality analysis, the term "GHGs" will refer collectively to the six gases listed above.

These gases vary considerably in terms of Global Warming Potential (GWP), which is a concept developed to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The global warming potential is based on several factors, including the relative effectiveness of a gas to absorb infrared radiation and length of time that the gas remains in the atmosphere ("atmospheric lifetime"). The GWP of each gas is measured relative to carbon dioxide, the most abundant GHG; the definition of GWP for a particular GHG is the ratio of heat trapped by one unit mass of the GHG to the ratio of heat trapped by one unit mass of $CO_2$ over a specified time period. GHG emissions are typically measured in terms of pounds or tons of "$CO_2$ equivalents" ($CO_2e$). Table C shows the GWP for each type of GHG. For example, $SF_6$ is 23,900 times more potent at contributing to global warming than $CO_2$.

### Table C: Global Warming Potential of Greenhouse Gases

| Gas | Atmospheric Lifetime (Years) | Global Warming Potential (100-Year Time Horizon) |

| Carbon Dioxide | 50-200 | 1 |

The following discussion summarizes the characteristics of the six GHGs and black carbon.

## Carbon Dioxide

In the atmosphere, carbon generally exists in its oxidized form, as carbon dioxide ($CO_2$). Natural sources of $CO_2$ include the respiration (breathing) of humans, animals and plants, volcanic out gassing, decomposition of organic matter and evaporation from the oceans. Human caused sources of $CO_2$ include the combustion of fossil fuels and wood, waste incineration, mineral production, and deforestation. Natural sources release approximately 150 billion tons of $CO_2$ each year, far outweighing the 7 billion tons of man-made emissions of $CO_2$ each year. Nevertheless, natural removal processes, such as photosynthesis by land- and ocean-dwelling plant species, cannot keep pace with this extra input of man-made $CO_2$, and consequently, the gas is building up in the atmosphere.

In 2020, total annual $CO_2$ accounted for approximately 80.2 percent of California's overall GHG emissions.[19] Transportation is the single largest source of $CO_2$ in California, which is primarily comprised of on-road travel. Electricity production, industrial and residential sources also make important contributions to $CO_2$ emissions in California.

### Methane

Methane ($CH_4$) is produced when organic matter decomposes in environments lacking sufficient oxygen. Natural sources include wetlands, termites, and oceans. Decomposition occurring in landfills accounts for the majority of human-generated $CH_4$ emissions in California and in the United States as a whole. Agricultural processes such as intestinal fermentation, manure management, and rice cultivation are also significant sources of $CH_4$ in California. Total annual emissions of $CH_4$ accounted for approximately 10.5 percent of GHG emissions in California in 2020.[20]

### Nitrous Oxide

Nitrous oxide ($N_2O$) is produced naturally by a wide variety of biological sources, particularly microbial action in soils and water. Tropical soils and oceans account for the majority of natural source emissions. Nitrous oxide is a product of the reaction that occurs between nitrogen and oxygen during fuel combustion. Both mobile and stationary combustion emit $N_2O$, and the quantity emitted varies according to the type of fuel, technology, and pollution control device used, as well as maintenance and operating practices. Agricultural soil management and fossil fuel combustion are the primary sources of human-generated $N_2O$ emissions in California. Nitrous oxide emissions accounted for approximately 3.5 percent of GHG emissions in California in 2020.[21]

### Hydrofluorocarbons, Perfluorocarbons, and Sulfur Hexafluoride

HFCs are primarily used as substitutes for ozone-depleting substances regulated under the Montreal Protocol.[22] PFCs and $SF_6$ are emitted from various industrial processes, including aluminum smelting, semiconductor manufacturing, electric power transmission and distribution, and magnesium casting. There is no aluminum or magnesium production in California; however, the rapid growth in the semiconductor industry leads to greater use of PFCs. HFCs, PFCs, and $SF_6$ accounted for about 5.5 percent of GHG emissions in California in 2020.[23]

### Black Carbon

Black carbon is the most strongly light-absorbing component of PM formed by burning fossil fuels such as coal, diesel, and biomass. Black carbon is emitted directly into the atmosphere in the form of

$PM_{2.5}$ and is the most effective form of PM, by mass, at absorbing solar energy. Per unit of mass in the atmosphere, black carbon can absorb one million times more energy than $CO_2$.[24] Black carbon contributes to climate change both directly, such as absorbing sunlight, and indirectly, such as affecting cloud formation. However, because black carbon is short-lived in the atmosphere, it can be difficult to quantify its effect on global warming.

Most U.S. emissions of black carbon come from mobile sources (52 percent), particularly from diesel-fueled vehicles. The other major source of black carbon is open biomass burning, including wildfires, although residential heating and industry also contribute. The CARB estimates that the annual black carbon emissions in California will be reduced approximately 50 percent below 2013 levels by 2030.[25]

# REGULATORY SETTING

## AIR QUALITY REGULATIONS

The USEPA and the CARB regulate direct emissions from motor vehicles. The SCAQMD is the regional agency primarily responsible for regulating air pollution emissions from stationary sources (e.g., factories) and indirect sources (e.g., traffic associated with new development), as well as monitoring ambient pollutant concentrations.

### Federal Regulations

#### *Federal Clean Air Act*

The 1970 federal Clean Air Act (CAA) authorized the establishment of national health-based air quality standards and also set deadlines for their attainment. The federal Clean Air Act Amendments of 1990 changed deadlines for attaining national standards as well as the remedial actions required of areas of the nation that exceed the standards. Under the Clean Air Act, State and local agencies in areas that exceed the national standards are required to develop State Implementation Plans to demonstrate how they will achieve the national standards by specified dates.

### State Regulations

#### *California Clean Air Act*

In 1988, the California Clean Air Act (CCAA) required that all air districts in the State endeavor to achieve and maintain CAAQS for CO, $O_3$, $SO_2$, and $NO_2$ by the earliest practical date. The California Clean Air Act provides districts with authority to regulate indirect sources and mandates that air quality districts focus particular attention on reducing emissions from transportation and area-wide emission sources. Each nonattainment district is required to adopt a plan to achieve a 5 percent annual reduction, averaged over consecutive 3-year periods, in district-wide emissions of each nonattainment pollutant or its precursors. A Clean Air Plan shows how a district would reduce emissions to achieve air quality standards. Generally, the State standards for these pollutants are more stringent than the national standards.

#### *California Advanced Clean Fleet*

The Advanced Clean Fleets (ACF) regulation[26] is part of the California Air Resources Board's (CARB) overall approach to accelerate a large-scale transition to zero emissions medium-and heady-duty vehicles. This regulation works in conjunction with the Advanced Clean Trucks (ACT) regulation, approved March 2021, which helps ensure that zero-emission vehicles (ZEV) are brought to market. As such, the primary goal of the ACF regulation is to accelerate the market for zero-emission trucks, vans, and buses by requiring fleets that are well suited for electrification, to transition to ZEVs where feasible. The ACF regulation will apply to fleets performing drayage operations, those owned by State, local, and federal government agencies, and high priority fleets. The regulation will affect

medium- and heavy-duty on-road vehicles with a gross vehicle weight rating greater than 8,500 pounds, off-road yard tractors, and light-duty mail and package delivery vehicles.

### *California Air Resources Board*

The CARB is the State's "clean air agency." The CARB's goals are to attain and maintain healthy air quality, protect the public from exposure to toxic air contaminants, and oversee compliance with air pollution rules and regulations.

**Assembly Bill 2588 Air Toxics "Hot Spots" Information and Assessment Act.** Under Assembly Bill (AB) 2588, stationary sources of air pollutants are required to report the types and quantities of certain substances their facilities routinely released into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, identify facilities having localized impacts, determine health risks, and notify nearby residents of significant risks.

**The California Air Resources Board Handbook.** The CARB has developed an Air Quality and Land Use Handbook[27] which is intended to serve as a general reference guide for evaluating and reducing air pollution impacts associated with new Projects that go through the land use decision-making process. According to the CARB Handbook, air pollution studies have shown an association between respiratory and other non-cancer health effects and proximity to high traffic roadways. Other studies have shown that diesel exhaust and other cancer-causing chemicals emitted from cars and trucks are responsible for much of the overall cancer risk from airborne toxics in California. The CARB Handbook recommends that county and city planning agencies strongly consider proximity to these sources when finding new locations for "sensitive" land uses such as homes, medical facilities, daycare centers, schools, and playgrounds.

Land uses that can produce air pollution sources of concern include freeways, rail yards, ports, refineries, distribution centers, chrome plating facilities, dry cleaners, and large gasoline service stations. Key recommendations in the CARB Handbook include taking steps to avoid siting new, sensitive land uses:

- Within 500 feet of a freeway, urban roads with 100,000 vehicles/day or rural roads with 50,000 vehicles/day;
- Within 1,000 feet of a major service and maintenance rail yard;
- Immediately downwind of ports (in the most heavily impacted zones) and petroleum refineries;
- Within 300 feet of any dry cleaning operation (for operations with two or more machines, provide 500 feet); and
- Within 300 feet of a large gas station (defined as a facility with a throughput of 3.6 million gallons per year or greater).

[27] CARB. 2005. *Air Quality and Land Use Handbook: A Community Health Perspective.* April.

The CARB Handbook specifically states that its recommendations are advisory and acknowledges land use agencies have to balance other considerations, including housing and transportation needs, economic development priorities, and other quality of life issues.

The recommendations are generalized and do not consider site-specific meteorology, freeway truck percentages, or other factors that influence risk for a particular Project site. The purpose of this guidance is to help land use agencies determine when to further examine Project sites for actual health risk associated with the location of new sensitive land uses.

### *Assembly Bill 617*

AB 617 was approved by the Governor in July 26, 2017 (C. Garcia, Chapter 136, Statutes of 2017), and it requires the state board to develop a uniform statewide system of annual reporting of emissions of criteria air pollutants and toxic contaminants for use by certain categories of stationary sources. AB 617 would require those stationary sources to report their annual emissions of criteria pollutants and toxic contaminants and it would also require the state board to select, based on the monitoring plan, the highest priority locations in the state for the deployment of community air monitoring systems.

In response to AB 617, CARB established the Community Air Protection Program (CAPP) which focuses on reducing exposure in communities most impacted by air pollution. Communities around the State are working together to develop and implement new strategies to measure air pollution and reduce health impacts.

## Regional Regulations

### *South Coast Air Quality Management District*

The SCAQMD has jurisdiction over most air quality matters in the South Coast Air Basin (Basin). This area includes all of Orange County, Los Angeles County except for the Antelope Valley, the non-desert portion of western San Bernardino County, and the western and Coachella Valley portions of Riverside County. The SCAQMD is the agency principally responsible for comprehensive air pollution control in the Basin and is tasked with implementing certain programs and regulations required by the CAA and the CCAA. The SCAQMD prepares plans to attain CAAQS and NAAQS. SCAQMD is directly responsible for reducing emissions from stationary (area and point) sources. The SCAQMD develops rules and regulations, establishes permitting requirements, inspects emissions sources, and enforces such measures though educational programs or fines, when necessary.

The proposed Project could be subject to the following SCAQMD rules and regulations:

- **Regulation IV - Prohibitions:** This regulation sets forth the restrictions for visible emissions, odor nuisance, fugitive dust, various air pollutant emissions, fuel contaminants, start-up/shutdown exemptions, and breakdown events.
    - **Rule 402 - Nuisance:** This rule restricts the discharge of any contaminant in quantities that cause or have a natural ability to cause injury, damage, nuisance, or annoyance to businesses, property, or the public.

- **Rule 403 - Fugitive Dust:** This rule requires the prevention, reduction, or mitigation of fugitive dust emissions from a project site. Rule 403 restricts visible fugitive dust to a project property line, restricts the net $PM_{10}$ emissions to less than 50 µg/$m^3$ and restricts the tracking out of bulk materials onto public roads. Additionally, Rule 403 requires an applicant to utilize one or more of the best available control measures (identified in the tables within the rule). Control measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering, using chemical stabilizers, and/or ceasing all activities. Finally, Rule 403 requires that a contingency plan be prepared if so determined by the USEPA. In addition, SCAQMD Rule 403(e), Additional Requirements for Large Operations, includes requirements to provide Large Operation Notification Form 403 N, appropriate signage, additional dust control measures, and employment of a dust control supervisor that has successfully completed the Dust Control training class in the South Coast Air Basin.

- **Regulation XI - Source Specific Standards:** Regulation XI sets emissions standards for different sources.

  - **Rule 1113 - Architectural Coatings:** This rule limits the amount of VOCs from architectural coatings and solvents, which lowers the emissions of odorous compounds.

The SCAQMD is responsible for demonstrating regional compliance with AAQS but has limited indirect involvement in reducing emissions from fugitive, mobile, and natural sources. To that end, the SCAQMD works cooperatively with the CARB, the Southern California Association of Governments (SCAG), county transportation commissions, local governments, and other federal and State government agencies. It has responded to this requirement by preparing a series of Air Quality Management Plans (AQMPs) to meet CAAQS and NAAQS. SCAQMD and the SCAG are responsible for formulating and implementing the AQMP for the Basin. The main purpose of an AQMP is to bring the area into compliance with federal and State air quality standards. Every 3 years, SCAQMD prepares a new AQMP, updating the previous plan and 20-year horizon.[28]

The Final 2022 Air Quality Management Plan is the currently adopted AQMP. Key elements of the Final 2022 AQMP include the following:

- Calculating and taking credit for co-benefits from other planning efforts (e.g., climate, energy, and transportation)

- A strategy with fair-share emission reductions at the federal, State, and local levels

- Investment in strategies and technologies meeting multiple air quality objectives

- Seeking new partnerships and significant funding for incentives to accelerate deployment of zero-emission and near-zero emission technologies

- Enhanced socioeconomic assessment, including an expanded environmental justice analysis

[28] SCAQMD. 2022. *Final 2022 Air Quality Management Plan*. December 2.

- Attainment of the 24-hour $PM_{2.5}$ standard in 2019 with no additional measures
- Attainment of the annual $PM_{2.5}$ standard by 2025 with implementation of a portion of the $O_3$ strategy
- Attainment of the 1-hour $O_3$ standard by 2022 with no reliance on "black box" future technology (CAA Section 182(e)(5) measures)

The 2022 AQMP builds upon measures already in place from previous AQMPs. It also includes a variety of additional strategies such as regulation, accelerated deployment of available cleaner technologies (e.g., zero emissions technologies, when cost-effective and feasible, and low $NO_x$ technologies in other applications), best management practices, co-benefits from existing programs (e.g., climate and energy efficiency), incentives, and other CAA measures to achieve the 2015 8-hour ozone standard.

### *Southern California Association of Governments*

Southern California Association of Governments (SCAG) is a council of governments for Los Angeles, Orange, Riverside, San Bernardino, Imperial, and Ventura Counties. It is a regional planning agency and serves as a forum for regional issues relating to transportation, the economy and community development, and the environment. SCAG is the federally designated Metropolitan Planning Organization (MPO) for the majority of the southern California region and is the largest MPO in the nation. With regard to air quality planning, SCAG prepares the Regional Transportation Plan (RTP) and Regional Transportation Improvement Program (RTIP), which address regional development and growth forecasts and form the basis for the land use and transportation control portions of the Air Quality Management Plan (AQMP) and are utilized in the preparation of the air quality forecasts and consistency analysis included in the AQMP. The RTP, RTIP, and AQMP are based on Projections originating within local jurisdictions.

Although SCAG is not an air quality management agency, it is responsible for developing transportation, land use, and energy conservation measures that affect air quality. SCAG's Regional Comprehensive Plan (RCP) provides growth forecasts that are used in the development of air quality-related land use and transportation control strategies by the SCAQMD. The RCP is a framework for decision-making for local governments, assisting them in meeting federal and State mandates for growth management, mobility, and environmental standards, while maintaining consistency with regional goals regarding growth and changes. Policies within the RCP include consideration of air quality, land use, transportation, and economic relationships by all levels of government.

SCAG adopted the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) (Connect SoCal) on September 3, 2020. Connect SoCal is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. Connect SoCal is an important planning document for the region, allowing Project sponsors to qualify for federal funding and takes into account operations and maintenance costs, to ensure reliability, longevity, and cost effectiveness. The forecasted development pattern, when integrated with the financially constrained transportation investments identified in Connect SoCal, would reach

the regional target of reducing GHG emissions from autos and light-duty trucks by 19 percent by 2035 (compared to 2005 levels).

## Local Regulations

### *City of Los Angeles General Plan*

The City of Los Angeles addresses Air Quality in the Air Quality Element of the City's General Plan.[29] The Air Quality Element sets forth the goals, objectives, and policies which will guide the City in the implementation of it's air quality improvement programs and strategies. The following policies from the Air Quality Element are applicable to the proposed project:

- Policy 1.3.1: Minimize particulate emissions from construction sites.
- Policy 1.3.2: Minimize particulate emissions from unpaved roads and parking lots which are associated with vehicular traffic.
- Policy 3.3.1: Implement the best available system management techniques, and transportation management and mobility action plans to improve the efficiency of existing transportation facilities, subject to availability of funding.
- Policy 4.3.2: Revise the City's General Plan/Community Plans to ensure that new or relocated major air pollution sources are located to minimize significant health risks to sensitive receptors.
- Policy 5.1.1: Make improvements in Harbor and airport operations and facilities in order to reduce air emissions.
- Policy 5.3.1: Support the development and use of equipment powered by electric or low emitting fuels.

### *Port of Los Angeles Clean Air Action Plan Update*

The POLA addresses air quality in the Clean Air Action Plan Update (CAAP).[30] The CAAP is a plan that provides guidance to help the region achieve its clean air goals and to support the statewide vision for more sustainable freight movement. As articulated in the Sustainable Freight Action Plan, to become greener – and to support the ultimate goal of zero-emissions goods movement – the Ports must develop strategies that include the introduction of clean vehicles and equipment, infrastructure, freight efficiency and energy planning. As a result, parallel strategies are proposed in the CAAP. In addition, the CAAP strategies are aligned to broad State Agency Actions identified in Appendix C of the Sustainable Freight Action Plan, which include the following:

### *Assembly Bill 617 – South Los Angeles: Community Emissions Reduction Plan (CERP)*

The South Los Angeles (SLA) Community Emissions Reduction Plan (CERP) is a critical part of implementing AB 617, a California law that addresses the disproportionate impacts of air pollution in environmental justice communities. Based on the sources of air pollution impacting the community, the SLA Community Steering Committee (CSC) identified the following air quality priorities to be addressed in the CERP: Mobile Sources; Auto Body Shops; General Industrial Facilities; Metal Processing Facilities; and Oil and Gas Industry. At its core, this CERP seeks to address these air quality priorities with actions that reduce air pollution emissions from sources within the community and reduce air pollution exposure for the people in the community. The following actions related to air quality from the CERP would be applicable to the proposed project:

- Reduce emissions at construction sites.
- Reduce exposure from truck traffic through collaboration with agencies responsible for designating truck routes.

## ENERGY REGULATORY SETTING

Federal and State agencies regulate energy use and consumption through various means and programs. On the federal level, the U.S. Department of Transportation (USDOT), the United States Department of Energy, and the USEPA are three federal agencies with substantial influence over energy policies and programs. Generally, federal agencies influence and regulate transportation energy consumption through establishment and enforcement of fuel economy standards for automobiles and light trucks, through funding of energy-related research and development Projects, and through funding for transportation infrastructure improvements. On the State level, the California Public Utilities Commission (CPUC) and the CEC are two agencies with authority over different aspects of energy.

The CPUC regulates privately owned electric, natural gas, telecommunications, water, railroad, rail transit, and passenger transportation companies and serves the public interest by protecting consumers and ensuring the provision of safe, reliable utility service and infrastructure at reasonable rates, with a commitment to environmental enhancement and a healthy California economy.

The CEC is the State's primary energy policy and planning agency. The CEC forecasts future energy needs, promotes energy efficiency, supports energy research, develops renewable energy resources, and plans for/directs state response to energy emergencies. The applicable federal, State, regional, and local regulatory framework is discussed below.

## Federal Regulations

### *Energy Policy Act of 2005*

The Energy Policy Act of 2005 seeks to reduce reliance on non-renewable energy resources and provide incentives to reduce current demand on these resources. For example, under this Act, consumers and businesses can obtain federal tax credits for purchasing fuel-efficient appliances and products (including hybrid vehicles), building energy-efficient buildings, and improving the energy efficiency of commercial buildings. Additionally, tax credits are available for the installation of qualified fuel cells, stationary microturbine power plants, and solar power equipment.

### *Corporate Average Fuel Economy Standards*

On March 31, 2022, the National Highway Traffic Safety Administration (NHTSA) finalized the Corporate Average Fuel Economy (CAFE) standards for Model Years 2024–2026 Passenger Cars and Light Trucks. The amended CAFE standards would require an industry wide fleet average of approximately 49 mpg for passenger cars and light trucks in model year 2026, by increasing fuel efficiency by 8 percent annually for model years 2024–2025, and 10 percent annually for model year 2026. The final standards are estimated to save about 234 billion gallons of gas between model years 2030 to 2050.

## State Regulations

### *Assembly Bill 1575, Warren-Alquist Act*

In 1975, largely in response to the oil crisis of the 1970s, the State Legislature adopted AB 1575 (also known as the Warren-Alquist Act), which created the CEC. The statutory mission of the CEC is to forecast future energy needs; license power plants of 50 megawatts (MW) or larger; develop energy technologies and renewable energy resources; plan for and direct State responses to energy emergencies; and, perhaps most importantly, promote energy efficiency through the adoption and enforcement of appliance and building energy efficiency standards. AB 1575 also amended Public Resources Code (PRC) Section 21100(b)(3) and *State CEQA Guidelines* Section 15126.4 to require Environmental Impact Reports (EIRs) to include, where relevant, mitigation measures proposed to minimize the wasteful, inefficient, and unnecessary consumption of energy caused by a project. Thereafter, the State Resources Agency created Appendix F to the *State CEQA Guidelines*. Appendix F assists EIR preparers in determining whether a project will result in the inefficient, wasteful, and unnecessary consumption of energy. Appendix F of the *State CEQA Guidelines* also states that the goal of conserving energy implies the wise and efficient use of energy and the means of achieving this goal, including (1) decreasing overall per capita energy consumption; (2) decreasing reliance on fossil fuels such as coal, natural gas, and oil; and (3) increasing reliance on renewable energy sources.

### *Senate Bill 1389, Energy: Planning and Forecasting*

In 2002, the State Legislature passed Senate Bill (SB) 1389, which required the CEC to develop an integrated energy plan every 2 years for electricity, natural gas, and transportation fuels for the California Energy Policy Report. The plan calls for the State to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the least environmental and energy costs. To further this policy, the plan identifies

a number of strategies, including assistance to public agencies and fleet operators in implementing incentive programs for zero emission vehicles (ZEVs) and their infrastructure needs, and encouragement of urban designs that reduce vehicle miles traveled (VMT) and accommodate pedestrian and bicycle access.

In compliance with the requirements of SB 1389, the CEC adopts an Integrated Energy Policy Report every 2 years and an update every other year. The most recently adopted report includes the 2023 Integrated Energy Policy Report.31 The Integrated Energy Policy Report covers a broad range of topics, including decarbonizing buildings, integrating renewables, energy efficiency, energy equity, integrating renewable energy, updates on Southern California electricity reliability, climate adaptation activities for the energy sector, natural gas assessment, transportation energy demand forecast, and the California Energy Demand Forecast. The Integrated Energy Policy Report provides the results of the CEC's assessments of a variety of energy issues facing California. Many of these issues will require action if the State is to meet its climate, energy, air quality, and other environmental goals while maintaining energy reliability and controlling costs.

### *Renewable Portfolio Standard*

SB 1078 established the California Renewable Portfolio Standards program in 2002. SB 1078 initially required that 20 percent of electricity retail sales be served by renewable resources by 2017; however, this standard has become more stringent over time. In 2006, SB 107 accelerated the standard by requiring that the 20 percent mandate be met by 2010. In April 2011, SB 2 required that 33 percent of electricity retail sales be served by renewable resources by 2020. In 2015, SB 350 established tiered increases to the Renewable Portfolio Standards of 40 percent by 2024, 45 percent by 2027, and 50 percent by 2030. In 2018, SB 100 increased the requirement to 60 percent by 2030 and required that all the State's electricity come from carbon-free resources by 2045. SB 100 took effect on January 1, 2019.[32]

### *Title 24, California Building Code*

Energy consumption by new buildings in California is regulated by the Building Energy Efficiency Standards, embodied in Title 24 of the California Code of Regulations (CCR), known as the California Building Code (CBC). The CEC first adopted the Building Energy Efficiency Standards for Residential and Non-residential Buildings in 1978 in response to a legislative mandate to reduce energy consumption in the State. The CBC is updated every 3 years, with the most recent update consisting of the 2022 CBC that became effective January 1, 2023. The efficiency standards apply to both new construction and rehabilitation of both residential and non-residential buildings, and regulate energy consumed for heating, cooling, ventilation, water heating, and lighting. The building efficiency standards are enforced through the local building permit process. Local government agencies may adopt and enforce energy standards for new buildings, provided these standards meet or exceed those provided in CCR Title 24.

### *California Green Building Standards Code*

In 2010, the California Building Standards Commission (CBSC) adopted Part 11 of the Title 24 Building Energy Efficiency Standards, referred to as the California Green Building Standards Code (CALGreen Code). The CALGreen Code took effect on January 1, 2011. The CALGreen Code is updated on a regular basis, with the most recent update consisting of the 2022 CALGreen Code standards that became effective January 1, 2023. The CALGreen Code established mandatory measures for residential and non-residential building construction and encouraged sustainable construction practices in the following five categories: (1) planning and design, (2) energy efficiency, (3) water efficiency and conservation, (4) material conservation and resource efficiency, and (5) indoor environmental quality. Although the CALGreen Code was adopted as part of the State's efforts to reduce greenhouse gas (GHG) emissions, the CALGreen Code standards have co-benefits of reducing energy consumption from residential and non-residential buildings subject to the standard.

### *California Energy Efficiency Strategic Plan*

On September 18, 2008, the CPUC adopted California's first Long-Term Energy Efficiency Strategic Plan, presenting a roadmap for energy efficiency in California. The Plan articulates a long-term vision and goals for each economic sector and identifies specific near-term, mid-term, and long-term strategies to assist in achieving those goals. The plan also reiterates the following four specific programmatic goals known as the "Big Bold Energy Efficiency Strategies" that were established by the CPUC in Decisions D.07-10-032 and D.07-12-051:

- All new residential construction will be zero net energy (ZNE) by 2020.
- All new commercial construction will be ZNE by 2030.
- 50 percent of commercial buildings will be retrofitted to ZNE by 2030.
- 50 percent of new major renovations of State buildings will be ZNE by 2025.

## Regional Regulations

There are no regional regulations that apply to the proposed Project.

## Local Regulations

### *City of Los Angeles Sustainable City pLAn.*

The POLA has adopted the Sustainable City pLAn[33] for the City of Los Angeles. The Sustainability City pLAn addresses energy in the Renewable Energy Chapter. The Renewable Energy Chapter contains goals that work towards helping the City transition to 100 percent renewable energy and achieve carbon neutrality. As such, the Renewable Energy Chapter established the following targets:

- LADWP will supply 55 percent renewable energy by 2025; 80 percent by 2036; and 100 percent by 2045.

[33] Los Angeles, City of. 2019. *LA's Green New Deal – Sustainable City pLAn*. Website: https://plan.lamayor.org/sites/default/files/pLAn_2019_final.pdf (accessed June 2023)

- Increase cumulative MW by 2025; 2035; and 2050 of:
    - Local solar to 900-1,500 MW; 1,500-1,800 MW; and 1,950 MW
    - Energy storage capacity to 1,654-1,750 MW; 3,000 MW; and 4,000 MW
    - Demand response (DR) programs to 234 MW (2025) and 600 MW (2035)

These targets would help the City move towards a path to zero carbon emissions by continuing to ramp up renewable energy.

## GREENHOUSE GAS REGULATORY SETTING

This section describes regulations related to Global Climate Change at the federal, State, and local level.

### Federal Regulations

The United States has historically had a voluntary approach to reducing GHG emissions. However, on April 2, 2007, the United States Supreme Court ruled that the USEPA has the authority to regulate $CO_2$ emissions under the CAA. While there currently are no adopted federal regulations for the control or reduction of GHG emissions, the USEPA commenced several actions in 2009 to implement a regulatory approach to global climate change.

This includes the 2009 USEPA final rule for mandatory reporting of GHGs from large GHG emission sources in the United States. Additionally, the USEPA Administrator signed an endangerment finding action in 2009 under the Clean Air Act, finding that six GHGs ($CO_2$, $CH_4$, $N_2O$, HFCs, PFCs, $SF_6$) constitute a threat to public health and welfare, and that the combined emissions from motor vehicles cause and contribute to global climate change, leading to national GHG emission standards.

In October 2012, the USEPA and the NHTSA, on behalf of the USDOT, issued final rules to further reduce GHG emissions and improve CAFE standards for light-duty vehicles for model years 2017 and beyond (77 *Federal Register* 62624). The NHTSA's CAFE standards have been enacted under the Energy Policy and Conservation Act since 1978. This national program requires automobile manufacturers to build a single light-duty national fleet that meets all requirements under both federal programs and the standards of California and other states. This program would increase fuel economy to the equivalent of 54.5 miles per gallon, limiting vehicle emissions to 163 grams of $CO_2$ per mile for the fleet of cars and light-duty trucks by model year 2025 (77 *Federal Register* 62630).

On March 31, 2022, the NHTSA finalized the CAFE standards for Model Years 2024–2026 Passenger Cars and Light Trucks. The amended CAFE standards would require an industry-wide fleet average of approximately 49 mpg for passenger cars and light trucks in model year 2026, by increasing fuel efficiency by 8 percent annually for model years 2024–2025, and 10 percent annually for model year 2026. The final standards are estimated to save about 234 billion gallons of gas between model years 2030 to 2050.

## State Regulations

The CARB is the lead agency for implementing climate change regulations in the State. Since its formation, the CARB has worked with the public, the business sector, and local governments to find solutions to California's air pollution problems. Key efforts by the State are described below.

### *Assembly Bill 1493 (2002)*

In a response to the transportation sector's significant contribution to California's $CO_2$ emissions, AB 1493 was enacted on July 22, 2002. AB 1493 requires the CARB to set GHG emission standards for passenger vehicles and light duty trucks (and other vehicles whose primary use is noncommercial personal transportation in the State) manufactured in 2009 and all subsequent model years. These standards (starting in model years 2009 to 2016) were approved by the CARB in 2004, but the needed waiver of CCAA Preemption was not granted by the USEPA until June 30, 2009. The CARB responded by amending its original regulation, now referred to as Low Emission Vehicle III, to take effect for model years starting in 2017 to 2025. The Trump administration revoked California's waiver in 2019; however, the Biden administration restored California's waiver in 2021.

### *Executive Order S-3-05 (2005)*

Governor Arnold Schwarzenegger signed Executive Order (EO) S-3-05 on June 1, 2005, which proclaimed that California is vulnerable to the impacts of climate change. To combat those concerns, the executive order established California's GHG emissions reduction targets, which established the following goals:

- GHG emissions should be reduced to 2000 levels by 2010;
- GHG emissions should be reduced to 1990 levels by 2020; and
- GHG emissions should be reduced to 80 percent below 1990 levels by 2050.

The Secretary of the California Environmental Protection Agency (CalEPA) is required to coordinate efforts of various State agencies in order to collectively and efficiently reduce GHGs. A biannual progress report must be submitted to the Governor and State Legislature disclosing the progress made toward GHG emission reduction targets. In addition, another biannual report must be submitted illustrating the impacts of global warming on California's water supply, public health, agriculture, the coastline, and forestry, and report possible mitigation and adaptation plans to address these impacts.

The Secretary of CalEPA leads the Climate Action Team (CAT) made up of representatives from State agencies as well as numerous other boards and departments. The CAT members work to coordinate statewide efforts to implement global warming emission reduction programs and the State's Climate Adaptation Strategy. The CAT is also responsible for reporting on the progress made toward meeting the statewide GHG targets that were established in the executive order and further defined under AB 32, the "Global Warming Solutions Act of 2006." The first CAT Report to the Governor and the Legislature was released in March 2006, which it laid out 46 specific emission reduction strategies for reducing GHG emissions and reaching the targets established in the executive order. The most recent report was released in December 2020.

### *Assembly Bill 32 (2006), California Global Warming Solutions Act*

California's major initiative for reducing GHG emissions is AB 32, passed by the State legislature on August 31, 2006. This effort aims at reducing GHG emissions to 1990 levels by 2020. The CARB has established the level of GHG emissions in 1990 at 427 million metric tons (MMT) of $CO_2e$. The emissions target of 427 MMT requires the reduction of 169 MMT from the State's Projected business-as-usual (BAU) 2020 emissions of 596 MMT. AB 32 requires the CARB to prepare a Scoping Plan that outlines the main State strategies for meeting the 2020 deadline and to reduce GHGs that contribute to global climate change. The Scoping Plan was approved by the CARB on December 11, 2008, and contains the main strategies California will implement to achieve the reduction of approximately 169 MMT $CO_2e$, or approximately 30 percent, from the State's Projected 2020 emissions level of 596 MMT $CO_2e$ under a BAU scenario (this is a reduction of 42 MMT $CO_2e$, or almost 10 percent from 2002–2004 average emissions). The Scoping Plan also includes CARB-recommended GHG reductions for each emissions sector of the State's GHG inventory. The Scoping Plan calls for the largest reductions in GHG emissions to be achieved by implementing the following measures and standards:

- Improved emissions standards for light-duty vehicles (estimated reductions of 31.7 MMT $CO_2e$);
- The Low-Carbon Fuel Standard (15.0 MMT $CO_2e$);
- Energy efficiency measures in buildings and appliances and the widespread development of combined heat and power systems (26.3 MMT $CO_2e$); and
- A renewable portfolio standard for electricity production (21.3 MMT $CO_2e$).

The Scoping Plan identifies 18 emission reduction measures that address cap-and-trade programs, vehicle gas standards, energy efficiency, low carbon fuel standards, renewable energy, regional transportation-related GHG targets, vehicle efficiency measures, goods movement, solar roof programs, industrial emissions, high speed rail, green building strategies, recycling, sustainable forests, water, and air. The measures would result in a total reduction of 174 MMT $CO_2e$ by 2020.

On August 24, 2011, the CARB unanimously approved both the new supplemental assessment and reapproved its Scoping Plan, which provides the overall roadmap and rule measures to carry out AB 32. The CARB also approved a more robust CEQA equivalent document supporting the supplemental analysis of the cap-and-trade program. The cap-and-trade took effect on January 1, 2012, with an enforceable compliance obligation that began January 1, 2013.

CARB has not yet determined what amount of GHG reductions it recommends from local government operations and local land use decisions; however, the Scoping Plan states that land use planning and urban growth decisions will play an important role in the State's GHG reductions because local governments have primary authority to plan, zone, approve, and permit how land is developed to accommodate population growth and the changing needs of their jurisdictions (meanwhile, CARB is also developing an additional protocol for community emissions). CARB further acknowledges that decisions on how land is used will have large impacts on the GHG emissions that would result from the transportation, housing, industry, forestry, water, agriculture, electricity, and natural gas emission sectors. The Scoping Plan states that the ultimate GHG reduction assignment to

local government operations is to be determined. With regard to land use planning, the Scoping Plan expects an approximately 5.0 MMT $CO_2e$ reduction due to implementation of SB 375.

In addition to reducing GHG emissions to 1990 levels by 2020, AB 32 directed the CARB and the CAT to identify a list of "discrete early action GHG reduction measures" that could be adopted and made enforceable by January 1, 2010. On January 18, 2007, Governor Schwarzenegger signed EO S-1-07, further solidifying California's dedication to reducing GHGs by setting a new Low Carbon Fuel Standard (LCFS). This executive order sets a target to reduce the carbon intensity of California transportation fuels by at least 10 percent by 2020 and directs the CARB to consider the LCFS as a discrete early action measure. In 2011, U.S. District Court Judge Lawrence O'Neil issued an injunction preventing implementation of the LCFS, ruling that it is unconstitutional. In 2012, the Ninth Circuit Court of Appeal stayed the District Court's injunction, allowing implementation of the LCFS. The Ninth Circuit decided to uphold the LCFS.

In June 2007, the CARB approved a list of 37 early action measures, including three discrete early action measures (LCFS, Restrictions on GWP Refrigerants, and Landfill $CH_4$ Capture).[34] Discrete early action measures are measures that were required to be adopted as regulations and made effective no later than January 1, 2010, the date established by Health and Safety Code Section 38560.5. The CARB adopted additional early action measures in October 2007 that tripled the number of discrete early action measures. These measures relate to truck efficiency, port electrification, reduction of PFCs from the semiconductor industry, reduction of propellants in consumer products, proper tire inflation, and $SF_6$ reductions from the non-electricity sector. The combination of early action measures is estimated to reduce statewide GHG emissions by nearly 16 MMT.[35]

The CARB approved the First Update to the Climate Change Scoping Plan on May 22, 2014. The First Update identifies opportunities to leverage existing and new funds to further drive GHG emission reductions through strategic planning and targeted low carbon investments. The First Update defines CARB climate change priorities until 2020, and also sets the groundwork to reach long-term goals set forth in EOs S-3-05 and B-16-2012. The Update highlights California's progress toward meeting the "near-term" 2020 GHG emission reduction goals as defined in the initial Scoping Plan. It also evaluates how to align the State's "longer-term" GHG reduction strategies with other State policy priorities for water, waste, natural resources, clean energy, transportation, and land use. CARB released a second update to the Scoping Plan, the 2017 Scoping Plan,[36] to reflect the 2030 target set by EO B-30-15 and codified by SB 32.

The 2022 Scoping Plan[37] was approved in December 2022 and assesses progress towards achieving the SB 32 2030 target and lay out a path to achieve carbon neutrality no later than 2045. The 2022 Scoping Plan focuses on outcomes needed to achieve carbon neutrality by assessing paths for clean

technology, energy deployment, natural and working lands, and others, and is designed to meet the State's long-term climate objectives and support a range of economic, environmental, energy security, environmental justice, and public health priorities.

### *Senate Bill 97 (2007)*

SB 97, signed by the Governor in August 2007 (Chapter 185, Statutes of 2007; Public Resources Code [PRC], Sections 21083.05 and 21097), acknowledges climate change is a prominent environmental issue that requires analysis under CEQA. This bill directed the Governor's Office of Planning and Research (OPR) to prepare, develop, and transmit to the California Resources Agency guidelines for mitigating GHG emissions or the effects of GHG emissions, as required by CEQA.

The California Natural Resources Agency adopted the amendments to the *State CEQA Guidelines* in November 2018, which went into effect in December 2018. The amendments do not identify a threshold of significance for GHG emissions, nor do they prescribe assessment methodologies or specific mitigation measures. The amendments encourage lead agencies to consider many factors in performing a CEQA analysis, but preserve the discretion granted by CEQA to lead agencies in making their own determinations based on substantial evidence. The amendments also encourage public agencies to make use of programmatic mitigation plans and programs when they perform individual Project analyses.

### *Senate Bill 375 (2008)*

SB 375, the Sustainable Communities and Climate Protection Act, which establishes mechanisms for the development of regional targets for reducing passenger vehicle GHG emissions, was adopted by the State on September 30, 2008. On September 23, 2010, the CARB adopted the vehicular GHG emissions reduction targets that had been developed in consultation with the Metropolitan Planning Organization (MPOs); the targets require a 6 to 15 percent reduction by 2020 and between 13 to 19 percent reduction by 2035 for each MPO. SB 375 recognizes the importance of achieving significant GHG reductions by working with cities and counties to change land use patterns and improve transportation alternatives. Through the SB 375 process, MPOs such as the Fresno Council of Governments will work with local jurisdictions in the development of Sustainable Communities Strategy (SCS) designed to integrate development patterns and the transportation network in a way that reduces GHG emissions while meeting housing needs and other regional planning objectives. Pursuant to SB 375, the Los Angeles/Southern California reduction targets for per capita vehicular emissions were 8 percent by 2020 and are 19 percent by 2035 as shown in Table D.

### *Executive Order B-30-15 (2015)*

Governor Jerry Brown signed EO B-30-15 on April 29, 2015, which added the immediate target of:

- GHG emissions should be reduced to 40 percent below 1990 levels by 2030.

All State agencies with jurisdiction over sources of GHG emissions were directed to implement measures to achieve reductions of GHG emissions to meet the 2030 and 2050 targets. CARB was directed to update the AB 32 Scoping Plan to reflect the 2030 target, and therefore, is moving forward with the update process. The mid-term target is critical to help frame the suite of policy measures, regulations, planning efforts, and investments in clean technologies and infrastructure needed to continue reducing emissions.

### *Senate Bill 350 (2015) Clean Energy and Pollution Reduction Act*

SB 350, signed by Governor Jerry Brown on October 7, 2015, updates and enhances AB 32 by introducing the following set of objectives in clean energy, clean air, and pollution reduction for 2030:

- Raise California's renewable portfolio standard from 33 percent to 50 percent; and
- Increasing energy efficiency in buildings by 50 percent by the year 2030.

The 50 percent renewable energy standard will be implemented by the CPUC for the private utilities and by the CEC for municipal utilities. Each utility must submit a procurement plan showing it will purchase clean energy to displace other non-renewable resources. The 50 percent increase in energy efficiency in buildings must be achieved through the use of existing energy efficiency retrofit funding and regulatory tools already available to State energy agencies under existing law. The addition made by this legislation requires state energy agencies to plan for, and implement those programs in a manner that achieves the energy efficiency target.

### *Senate Bill 32, California Global Warming Solutions Act of 2016, and Assembly Bill 197*

In summer 2016 the Legislature passed, and the Governor signed, SB 32, and AB 197. SB 32 affirms the importance of addressing climate change by codifying into statute the GHG emissions reductions target of at least 40 percent below 1990 levels by 2030 contained in Governor Brown's April 2015 EO B-30-15. SB 32 builds on AB 32 and keeps us on the path toward achieving the State's 2050

objective of reducing emissions to 80 percent below 1990 levels, consistent with an Intergovernmental Panel on Climate Change (IPCC) analysis of the emissions trajectory that would stabilize atmospheric GHG concentrations at 450 parts per million $CO_2e$ and reduce the likelihood of catastrophic impacts from climate change.

The companion bill to SB 32, AB 197, provides additional direction to CARB related to the adoption of strategies to reduce GHG emissions. Additional direction in AB 197 meant to provide easier public access to air emissions data that are collected by CARB was posted in December 2016.

### *Senate Bill 100*

On September 10, 2018, Governor Brown signed SB 100, which raises California's Renewables Portfolio Standard (RPS) requirements to 60 percent by 2030, with interim targets, and 100 percent by 2045. The bill also establishes a State policy that eligible renewable energy resources and zero-carbon resources supply 100 percent of all retail sales of electricity to California end-use customers and 100 percent of electricity procured to serve all State agencies by December 31, 2045. Under the bill, the State cannot increase carbon emissions elsewhere in the western grid or allow resource shuffling to achieve the 100 percent carbon-free electricity target.

### *Executive Order B-55-18*

EO B-55-18, signed September 10, 2018, sets a goal "to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter." EO B-55-18 directs CARB to work with relevant State agencies to ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal. The goal of carbon neutrality by 2045 is in addition to other statewide goals, meaning not only should emissions be reduced to 80 percent below 1990 levels by 2050, but that, by no later than 2045, the remaining emissions be offset by equivalent net removals of $CO_2e$ from the atmosphere, including through sequestration in forests, soils, and other natural landscapes.

### *Title 24, Part 11, Building Standards Code and CALGreen Code*

The California Building Standards Code, or Title 24 of the California Code of Regulations (CCR) contains the regulations that govern the construction of buildings in California. Within the Building Standards Code, two parts pertain to the incorporation of both energy efficient and green building elements into land use development. Part 6 is California's Energy Efficiency Standards for Residential and Non-Residential Buildings. These standards were first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption and are updated on an approximately 3-year cycle to allow consideration and possible incorporation of new energy efficient technologies and methods.

In November 2008, the California Building Standards Commission established the California Green Building Standards Code (CALGreen Code), which sets performance standards for residential and non-residential development to reduce environmental impacts and encourage sustainable construction practices. The CALGreen Code addresses energy efficiency, water conservation, material conservation, planning and design, and overall environmental quality. The CALGreen Code is updated every 3 years and was most recently updated in 2022 to include new mandatory

measures for residential as well as non-residential uses; the new measures took effect on January 1, 2023. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions.

### *Cap and Trade*

The development of a cap-and-trade program was included as a key reduction measure of the CARB AB 32 Climate Change Scoping Plan. The cap-and-trade program will help put California on the path to meet its goal of reducing GHG emissions to 1990 levels by 2020 and ultimately achieving an 80 percent reduction from 1990 levels by 2050. The cap-and-trade emissions trading program developed by the CARB took effect on January 1, 2012, with enforceable compliance obligations beginning January 1, 2013. The cap-and-trade program aims to regulate GHG emissions from the largest producers in the State by setting a statewide firm limit, or cap, on allowable annual GHG emissions. The cap was set in 2013 at approximately 2 percent below the emissions forecast for 2020. In 2014, the cap declined approximately 2 percent. Beginning in 2015 and continuing through 2020, the cap has been declining approximately 3 percent annually. The CARB administered the first auction on November 14, 2012, with many of the qualified bidders representing corporations or organizations that produce large amounts of GHG emissions, including energy companies, agriculture and food industries, steel mills, cement companies, and universities. On January 1, 2015, compliance obligation began for distributors of transportation fuels, natural gas, and other fuels. The cap-and-trade program was initially slated to sunset in 2020 but the passage of SB 398 in 2017 extended the program through 2030.

### *Executive Order N-79-20*

EO N-79-20, which was signed by the Governor on September 23, 2020, sets the following goals for the State: 100 percent of in-state sales of new passenger cars and trucks shall be zero-emission by 2035; 100 percent of medium- and heavy-duty vehicles in the State shall be zero-emission by 2045 for all operations where feasible and by 2035 for drayage trucks; and 100 percent of off-road vehicles and equipment in the State shall be zero-emission by 2035, where feasible.

### *California Integrated Waste Management Act*

To minimize the amount of solid waste that must be disposed of in landfills, the State Legislature passed the California Integrated Waste Management Act of 1989 (AB 939), effective January 1990. According to AB 939, all cities and counties were required to divert 25 percent of all solid waste from landfill facilities by January 1, 1995, and 50 percent by January 1, 2000. Through other statutes and regulations, this 50 percent diversion rate also applies to State agencies. In order of priority, waste reduction efforts must promote source reduction, recycling and composting, and environmentally safe transformation and land disposal. In 2011, AB 341 modified the California Integrated Waste Management Act and directed the California Department of Resources Recycling and Recovery (CalRecycle) to develop and adopt regulations for mandatory commercial recycling. The resulting 2012 Mandatory Commercial Recycling Regulation requires that on and after July 1, 2012, certain businesses that generate four cubic yards or more of commercial solid waste per week shall arrange recycling services. To comply with this requirement, businesses may either separate recyclables and self-haul them or subscribe to a recycling service that includes mixed waste processing. AB 341 also established a statewide recycling goal of 75 percent; the 50 percent disposal

reduction mandate still applies for cities and counties under AB 939, the Integrated Waste Management Act. In April 2016, AB 1826 further modified the California Integrated Waste Management Act, requiring businesses that generate a specified amount of organic waste per week to arrange for recycling services for that organic waste in a specified manner. If CalRecycle determines that statewide disposal of organic waste has not been reduced by 50 percent below 2014 levels by 2020, businesses generating more than two cubic yards of organic waste per week would be subject to these waste collection requirements. CalRecycle plans to make this assessment in the fall of 2020. Diverting organic waste from landfills reduces emissions of $CH_4$. This is equivalent to reducing anaerobic decomposition of organic waste that would have otherwise occurred in landfills where organic waste is often buried with other inorganic waste.

### *Low Carbon Fuel Standard*

In January 2007, EO S-01-07 established an LCFS. This executive order calls for a statewide goal to be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020, and that an LCFS for transportation fuels be established for California. The LCFS applies to all refiners, blenders, producers, or importers ("Providers") of transportation fuels in California, including fuels used by off-road construction equipment. In June 2007, CARB adopted the LCFS under AB 32 pursuant to Health and Safety Code Section 38560.5, and, in April 2009, CARB approved the new rules and carbon intensity reference values with new regulatory requirements taking effect in January 2011. The standards require providers of transportation fuels to report on the mix of fuels they provide and demonstrate they meet the LCFS intensity standards annually. This is accomplished by ensuring that the number of "credits" earned by providing fuels with a lower carbon intensity than the established baseline (or obtained from another party) is equal to or greater than the "deficits" earned from selling higher intensity fuels. In response to certain court rulings, CARB re-adopted the LCFS regulation in September 2015, and the LCFS went into effect on January 1, 2016. In 2018, CARB approved amendments to the regulation to readjust carbon intensity benchmarks to meet California's 2030 GHG reductions targets under SB 32. These amendments include opportunities to promote zero emission vehicle (ZEV) adoption, carbon capture and sequestration, and advanced technologies for decarbonization of the transportation sector.

### *Advanced Clean Cars Program*

In January 2012, CARB approved the Advanced Clean Cars program, which combines the control of GHG emissions and criteria air pollutants, as well as requirements for greater numbers of ZEVs, into a single package of regulatory standards for vehicle model years 2017 through 2025. The new regulations strengthen the GHG standard for 2017 models and beyond. This will be achieved through existing technologies, the use of stronger and lighter materials, and more efficient drivetrains and engines. The program's ZEVs regulation requires battery, fuel cell, and/or plug-in hybrid electric vehicles to account for up to 15 percent of California's new vehicle sales by 2025. The program also includes a clean fuels outlet regulation designed to support the commercialization of zero-emission hydrogen fuel cell vehicles planned by vehicle manufacturers by 2015 by requiring increased numbers of hydrogen fueling stations throughout the State. The number of stations will grow as vehicle manufacturers sell more fuel cell vehicles. By 2025, when the rules will be fully implemented, the statewide fleet of new cars and light trucks will emit 40 percent fewer GHGs and 75 percent fewer smog-forming emissions than 2012 model year vehicles.

### *Executive Order B-48-18*

In January 2018, Governor Brown signed EO B-48-18 requiring all State entities to work with the private sector to have at least 5 million ZEVs on the road by 2030, as well as install 200 hydrogen fueling stations and 250,000 electric vehicle charging stations by 2025. It specifies that 10,000 of the electric vehicle charging stations should be direct current fast chargers. This order also requires all State entities to continue to partner with local and regional governments to streamline the installation of ZEV infrastructure. The Governor's Office of Business and Economic Development is required to publish a Plug-in Charging Station Design Guidebook and update the 2015 Hydrogen Station Permitting Guidebook to aid in these efforts. All State entities are required to participate in updating the 2016 Zero-Emissions Vehicle Action Plan to help expand private investment in ZEV infrastructure with a focus on serving low-income and disadvantaged communities. Additionally, all State entities are to support and recommend policies and actions to expand ZEV infrastructure at residential land uses, through the LCFS Program, and recommend how to ensure affordability and accessibility for all drivers.

## Regional Regulations

### *South Coast Air Quality Management District*

In 2008, the SCAQMD formed a Working Group to identify GHG emissions thresholds for land use Projects that could be used by local lead agencies in the Basin. The Working Group developed several different options that are contained in the SCAQMD 2008 draft guidance document titled Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans[38] that could be applied by lead agencies. On September 28, 2010, SCAQMD Working Group Meeting No. 15 provided further guidance, including a tiered approach for evaluating GHG emissions for development projects where the SCAQMD is not the lead agency. The SCAQMD has not presented a finalized version of these thresholds to the governing board.

The SCAQMD identifies the emissions level for which a project would not be expected to substantially conflict with any State legislation adopted to reduce statewide GHG emissions. As such, the utilization of a service population represents the rates of emissions needed to achieve a fair share of the State's mandated emissions reductions. Overall, the SCAQMD identifies a GHG efficiency level that, when applied statewide or to a defined geographic area, would meet the year 2020 and post-2020 emissions targets as required by AB 32 and SB 32. If projects are able to achieve targeted rates of emissions per the service population, the State will be able to accommodate expected population growth and achieve economic development objectives, while also abiding by AB 32's emissions target and future post-2020 targets.

### *Southern California Association of Governments*

On September 3, 2020, SCAG adopted Connect SoCal–The 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy (2020–2045 RTP/SCS).[39] In general, the SCS outlines a

development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, would reduce VMT from automobiles and light-duty trucks and thereby reduce GHG emissions from these sources. For the SCAG region, CARB has set GHG reduction targets at 8 percent below 2005 per capita emissions levels by 2020, and 19 percent below 2005 per capita emissions levels by 2035. The RTP/SCS lays out a strategy for the region to meet these targets. Overall, the SCS is meant to provide growth strategies that will achieve the regional GHG emissions reduction targets. Land use strategies to achieve the region's targets include planning for new growth around high-quality transit areas and livable corridors, and creating neighborhood mobility areas to integrate land use and transportation and plan for more active lifestyles.[40] However, the SCS does not require that local General Plans, Specific Plans, or zoning be consistent with the SCS; SCAG is required to consider local land use controls when drafting the SCS.

## Local Regulations

### *City of Los Angeles Sustainable City pLAn.*

The POLA is committed to responsible growth through the implementation of the three tenets of sustainability: environment, economy, and equity. As such, the POLA has adopted the Sustainable City pLAn[41] of the City of Los Angeles. The pLAn contains goals for the City, especially in areas of local solar, energy efficient buildings, carbon and climate leadership, green jobs, preparedness and resiliency, air quality, and environmental justice. In addition, the pLAn advances the City's environment, economy, and social equity in 14 various categories with short term, near term (2025), and long-term (2035) targets. The following municipal targets from the pLAn would be applicable to the proposed Project:

- Recycle 100 percent of all wastewater for beneficial reuse by 2035.
- Reduce potable water use per capita by 22.5 percent by 2025; and 25 percent by 2035; and maintain or reduce 2035 per capita water use through 2050.
- Reduce VMT per capita by at least 13% by 2025; 39% by 2035; and 45% by 2050.
- Reduce port-related GHG emissions by 80% by 2050.
- Reduce industrial emissions by 38% by 2035; and 82% by 2050.

# SETTING

This section provides the current SCAQMD attainment status, climate and air quality, ambient air quality monitoring results, and GHG emissions inventory.

## ATTAINMENT STATUS

The CARB is required to designate areas of the state as attainment, nonattainment, or unclassified for all State standards. An *attainment* designation for an area signifies that pollutant concentrations did not violate the standard for that pollutant in that area. A *nonattainment* designation indicates that a pollutant concentration violated the standard at least once, excluding those occasions when a violation was caused by an exceptional event, as defined in the criteria. An *unclassified* designation signifies that data do not support either an attainment or nonattainment status. The CCAA divides districts into moderate, serious, and severe air pollution categories, with increasingly stringent control requirements mandated for each category.

The USEPA designates areas for $O_3$, CO, and $NO_2$ as either does not meet the primary standards, or cannot be classified, or better than national standards. For $SO_2$, areas are designated as does not meet the primary standards, does not meet the secondary standards, cannot be classified, or better than national standards.

Table E provides a summary of the attainment status for the Basin with respect to NAAQS and CAAQS.

### Table E: Attainment Status of Criteria Pollutants in the South Coast Air Basin

## EXISTING CLIMATE AND AIR QUALITY

Air quality in the planning area is not only affected by various emission sources (e.g., mobile and industry), but also by atmospheric conditions (e.g., wind speed, wind direction, temperature, and rainfall). The combination of topography, low mixing height, abundant sunshine, and emissions from

the second-largest urban area in the United States gives the South Coast Air Basin some of the worst air pollution in the nation.

The annual average temperature varies little throughout the Basin, ranging from the low to middle 60s°F. With a more pronounced oceanic influence, coastal areas show less variability in annual minimum and maximum temperatures than inland areas. The climatological station closest to the site is the San Pedro Station.[42] The monthly average maximum temperature recorded at this station ranged from 66.9°F in January to 74.4°F in September, with an annual average maximum of 68.7°F. The monthly average minimum temperature recorded at this station ranged from 47.2°F in January to 61.8°F In August, with an annual average minimum of 54.4°F. These levels are representative of the Project area.

The majority of annual rainfall in the Basin occurs between November and February. Summer rainfall is minimal and is generally limited to scattered thundershowers in coastal regions and slightly heavier showers in the eastern portion of the Basin and along the coastal side of the mountains. Average monthly rainfall at the San Pedro station varied from 0.02 inch in July to 2.37 inches in February, with an annual total of 10.69 inches. Patterns in monthly and yearly rainfall totals are unpredictable due to fluctuations in the weather.

The Basin experiences a persistent temperature inversion (increasing temperature with increasing altitude) as a result of the Pacific high. This inversion limits the vertical dispersion of air contaminants, holding them relatively near the ground. As the sun warms the ground and the lower air layer, the temperature of the lower air layer approaches the temperature of the base of the inversion (upper) layer until the inversion layer finally breaks, allowing vertical mixing with the lower layer. This phenomenon is observed in mid-afternoon to late afternoon on hot summer days when the air appears to clear up suddenly. Winter inversions frequently break by midmorning.

Winds in the Project area blow predominantly from the south-southwest, with relatively low velocities. Wind speeds in the Project area average about 5 miles per hour (mph). Summer wind speeds average slightly higher than winter wind speeds. Low average wind speeds, together with a persistent temperature inversion, limit the vertical dispersion of air pollutants throughout the Basin. Strong, dry, north or northeasterly winds, known as Santa Ana winds, occur during the fall and winter months, dispersing air contaminants. The Santa Ana conditions tend to last for several days at a time.

The combination of stagnant wind conditions and low inversions produces the greatest pollutant concentrations. On days of no inversion or high wind speeds, ambient air pollutant concentrations are the lowest. During periods of low inversions and low wind speeds, air pollutants generated in urbanized areas are transported predominantly on shore into Riverside and San Bernardino Counties. In the winter, the greatest pollution problems are CO and $NO_X$ because of extremely low inversions and air stagnation during the night and early morning hours. In the summer, the longer daylight hours and brighter sunshine combine to cause a reaction between hydrocarbons and $NO_x$ to form photochemical smog. Smog is a general term that is naturally occurring fog that has become mixed with smoke or pollution. In this context it is better described as a form of air pollution

produced by the photochemical reaction of sunlight with pollutants that have been released into the atmosphere, especially by automotive emissions.

## AIR QUALITY MONITORING RESULTS

Air quality monitoring stations are located throughout the nation and are maintained by the local air pollution control district and State air quality regulating agencies. The SCAQMD, together with the CARB, maintains regional ambient air quality monitoring stations in the Basin. However, the POLA also maintains their own monitoring stations. The POLA air quality monitoring station closest to the Project site is the San Pedro Community station.

Pollutant monitoring results for years 2020 to 2022 at the San Pedro Community air quality monitoring station, shown in Table F, indicate that air quality in the area has generally been good. As indicated in the monitoring results, the federal $PM_{10}$ standard an unknown number of exceedances in 2020 and no exceedances in 2021 and 2022. The State $PM_{10}$ standard had an unknown number of exceedances during the 3-year period. The $PM_{2.5}$ federal and State standard had an unknown number of exceedances in the 3—year period. The 1-hour ozone State standard also had an unknown number of exceedances in the 3-year period. The 8-hour ozone State and federal standards had no exceedances for 2020 and 2021 and had an unknown number of times in 2022. The State and federal $SO_2$ standards had an unknown number of exceedances in 2021 and no exceedances in 2020 and 2022. In addition, the CO and $NO_2$ standards were not exceeded in this area during the 3-year period.

## GREENHOUSE GAS EMISSIONS INVENTORY

An emissions inventory that identifies and quantifies the primary human-generated sources and sinks of GHGs is a well-recognized and useful tool for addressing climate change. This section summarizes the latest information on global, United States, and California GHG emission inventories.

### Global Emissions

Worldwide emissions of GHGs in 2020 totaled 22.9 billion metric tons (MT) of $CO_2e$. Global estimates are based on country inventories developed as part of the programs of the United Nations Framework Convention on Climate Change.[43]

### United States Emissions

In 2020, the year for which the most recent data are available, the United States emitted about 5,222 million metric tons of $CO_2e$ (MMT $CO_2e$). Overall, emissions in 2020 decreased by 11 percent since 2019 and were 21 percent lower than 2005 levels. The primary driver for the decrease was an 11 percent decrease in $CO_2$ emissions from fossil fuel combustion. This decrease was primarily due to a 13 percent decrease in transportation emissions driven by decreased demand due to the ongoing COVID-19 pandemic. Electric power sector emissions also decreased 10 percent, reflecting both a slight decrease in demand from the COVID-19 pandemic and a continued shift from coal to less carbon intensive natural gas and renewables. Of the five major sectors – residential and commercial, agricultural, industry, transportation, and electricity generation – transportation accounted for the highest amount of GHG emissions in 2020 (approximately 27 percent), with electricity generation second at 27 percent and emissions from industry third at 24 percent.[44]

### State of California Emissions

The State emitted approximately 369.2 MMT $CO_2e$ emissions in 2020, 35.3 MMT $CO_2e$ lower than 2019 levels and 61.8 MMT $CO_2e$ below the 2020 GHG limit of 431 MMT $CO_2e$.[45] The California Air Resources Board (CARB) estimates that transportation was the source of approximately 37 percent of the State's GHG emissions in 2020, which is a smaller share than recent years, as the transportation sector saw a significant decrease of 26.6 MMT $CO_2e$ in 2020, likely due in large part to the impact of the COVID-19 pandemic. The next largest sources included industrial sources at approximately 20 percent and electricity generation at 16 percent. The remaining sources of GHG emissions were commercial and residential activities at 10 percent, agriculture at 9 percent, high GWP at 6 percent, and waste at 2 percent.[46]

### City of Los Angeles Emissions

The City of Angeles' most recent GHG inventory for baseline year 2008 and 2017–2020 is shown in Table G. Overall emissions have been decreasing, and in 2020, there was a 54 percent decrease in emissions from the 2008 baseline. Table G summarizes the total annual municipal GHG emissions from 2008 and 2017–2020 by sector. The power generation related emissions are the largest contributor to GHG emissions in the City. The second largest contributor of emissions are buildings and other facilities, followed by vehicle fleet emissions and water reclamation emissions.

### Port of Los Angeles GHG Emissions

The POLA's air emissions from 2021, 2020, and 2005 are shown in Table H. Emissions from 2021 more than doubled when compared to the previous year of 2020. However, emissions in 2021 are still lower than those in the baseline year of 2005. Therefore, even with the increase in emissions in 2021, the POLA would still be on track to meet the CAAP goal of reducing air emissions.

# METHODOLOGY

The methodology used to estimate air quality, health risk, GHG, and energy impacts is described below.

## CONSTRUCTION EMISSIONS

Construction activities can generate a substantial amount of air pollution. Construction activities are considered temporary; however, short-term impacts can contribute to exceedances of air quality standards. Construction activities include demolition, site preparation, earthmoving, and general construction. The emissions generated from these common construction activities include fugitive dust from soil disturbance, fuel combustion from mobile heavy-duty diesel and gasoline powered equipment, portable auxiliary equipment, and worker commute trips.

The California Emissions Estimator Model version 2022.1.1.20 (CalEEMod) computer program was used to calculate emissions from on-site construction equipment and emissions from worker and vehicle trips to the site. As discussed previously in the Project Location and Description section, construction is anticipated to being in the second quarter of 2025 and be completed in 8 months, which was included in CalEEMod. The proposed Project would require the export of approximately 500 cubic yards of TPH and VOC impacted soils which would be disposed at either Chiquita Canyon Landfill, Simi Valley Landfill, or Soil Safe Adelanto, which was included in CalEEMod. To be conservative, this analysis assumes the impacted soils would be hauled to Soil Safe Adelanto, which is the furthest from the Project site (117 miles). The proposed Project would require the import of approximately 3,433 cubic yards of soil, which was also included in CalEEMod. In addition, this analysis assumes the use of Tier 3 construction equipment. This analysis also assumes that the proposed Project would comply with SCAQMD Rule 403 measures as required by existing regulations. All other construction details are not yet known; therefore, default assumptions (e.g., construction worker and truck trips and fleet activities) from CalEEMod were used.

## OPERATIONAL EMISSIONS

The air quality analysis includes estimating emissions associated with long-term operation of the proposed Project. Consistent with the SCAQMD guidance for estimating emissions associated with land use development Projects, the CalEEMod computer program was used to calculate the long-term operational emissions associated with the Project. As discussed in the Project Location and Description section, the proposed Project would include the construction of a trailer parking lot, consisting of 393 trailer stalls and associated site improvements. The proposed Project would also include installation of a traffic signal, a prefabricated guard booth and restroom for use by truck drivers and Project employees; however, emissions associated with the traffic signal, guard booth and restroom are expected to be minimal. Therefore, this analysis focuses on the trailer parking lot and associated truck trips.

The proposed Project analysis was conducted using land use code *Parking Lot*. In order to provide a conservative analysis, horizon year trips for the Project were modeled. Trip generation rates used in

CalEEMod for the proposed Project were based on the Project's VMT Screening Memo[47], which identifies that the proposed Project would generate approximately 1,808 average daily trips, including 1,794 one-way truck trips, 4 one-way delivery/vendor trips, and 10 passenger vehicle trips during the horizon year condition. Based on the VMT Screening Memo, the total increase in VMT per day would be 6,809 over baseline POLA VMT, which is an average VMT per truck of 3.8 miles; therefore, this analysis would assume that each truck trip would travel 3.8 miles over baseline POLA conditions. CalEEMod assumes that all trucks would be diesel-fueled and heavy heavy duty trucks (HHDT), which is a conservative estimate of potential emissions as POLA requirements would result in a phase out of diesel trucks in favor of zero-emission and near-zero-emissions trucks. In addition, the Project would need onsite operational equipment which would involve the use of a yard goat and two forklifts. Onsite operational equipment would be zero-emission and all-electric.

## HEALTH RISK ASSESSMENT

For the purposes of a health risk assessment (HRA), emissions are analyzed for acute health impacts, chronic, and carcinogenic health impacts. A multi-pathway assessment has been conducted to evaluate the Project's emissions during construction and operation following the modeling techniques recommended in the CalEPA's Office of Environmental Health Hazard Assessment (OEHHA) *Air Toxic Hot Spots Program Risk Assessment Guidelines*.[48] The analysis herein has been conducted in accordance with SCAQMD requirements for HRAs.

The HRA analysis was conducted using three models: (1) EMFAC2021 for on-road vehicle emissions factors and percentages of fuel type within the overall vehicle fleet; (2) the USEPA AERMOD air dispersion model to determine how the TACs would move through the atmosphere after release from sources both on site and on surrounding roadways; and (3) CARB's HARP2 model to translate the pollutant concentrations from AERMOD into individual health risks at any sensitive receptor locations surrounding the Project site.

The OEHHA has determined that long-term exposure to diesel exhaust particulates poses the highest cancer risk of any TAC it has evaluated. Exposure to diesel exhaust can also have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, DPM made people with allergies more susceptible to the materials to which they were allergic, such as dust and pollen. Exposure to DPM also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. For risk assessment procedures, the OEHHA specifies that the surrogate for whole diesel exhaust is DPM. The HRA analyses used $PM_{10}$ emissions to represent DPM emissions, consistent with OEHHA guidance.

The conservative nature of this analysis is due primarily to the following three factors:

47 EPD Solutions, Inc. 2023. *John S. Gibson Trailer Lot Project Vehicles Miles Traveled (VMT) Screening Memo.* May 26.

48 California Environmental Protection Agency (CalEPA) Office of Environmental Health Hazard Assessment (OEHHA). 2015. *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*. March. Website: https://oehha.ca.gov/air/air-toxics-hot-spots (accessed June 2023).

- The CARB-adopted diesel exhaust unit risk factor (URF) of 300 in 1 million per microgram per cubic meter ($\mu g/m^3$) is based on the upper 95$^{th}$ percentile of estimated risk for each of the epidemiological studies used to develop the URF. Therefore, the risk factor is already representative of the conservative risk posed by DPM.

- The risk estimates assume sensitive receptors would be subject to DPM 24 hours per day, 350 days per year. As a conservative measure, SCAQMD does not recognize indoor adjustments for residents. However, typical people spend the majority of their time indoors versus remaining outdoors 24 hours per day, 350 days per year.

- The exposure to DPM is assumed to be constant for the given period analyzed (i.e., 30 years for the residential receptors and 25 years for the worker receptors). However, emissions from DPM are expected to substantially decrease in the future with the implementation of standard regulatory requirements and technological advancement to reduce DPM.

## Emission Sources

### *Construction Health Risk Assessment*

A construction HRA, which evaluates construction-period health risk to off-site receptors, was performed for the proposed Project. To estimate the potential cancer risk associated with construction of the proposed Project from equipment exhaust (including DPM), a dispersion model was used to translate an emission rate from the source location to a concentration at the receptor location of interest (i.e., a nearby residence and worksites). The HRA analyses used $PM_{1o}$ emissions to represent DPM emissions, consistent with OEHHA guidance.[49] Dispersion modeling varies from a simpler, more conservative screening-level analysis to a more complex and refined detailed analysis. This refined assessment was conducted using the CARB exposure methodology with the air dispersion modeling performed using the USEPA dispersion model AERMOD. The model provides a detailed estimate of exhaust concentrations based on site and source geometry, source emissions strength, distance from the source to the receptor, and meteorological data.

### *Operational Health Risk Assessment*

To determine the potential health risk to people living near the proposed Project associated with the exhaust of diesel-powered trucks and equipment, an operational HRA was conducted for the proposed Project.

The first step of an HRA is to characterize the Project-related emissions of TACs. The proposed Project would generate approximately 1,808 average daily trips, including 1,794 one-way truck trips, 4 one-way delivery/vendor trips, and 10 passenger vehicle trips. This analysis assumes that all trucks would be HHDT. The trucks would access the site via one onsite driveway, which would be located in John S. Gibson Boulevard. The proposed Project would provide 393 trailer stalls; as the Project would contain multiple trailer stalls, offsite queuing of trucks is not anticipated. While the TAC emissions from gasoline-powered vehicles have a small health effect compared to DPM, this HRA includes both gasoline- and diesel-powered vehicle emissions. For the diesel exhaust emissions, it is

[49] CalEPA OEHHA. 2015. op cit.

sufficient to only consider the DPM ($PM_{10}$ and $PM_{2.5}$) portions of the exhaust; all the TACs for the gasoline exhaust emissions are contained in the ROG emissions. Using speciation data from CARB, the emission rates of the TAC components are derived from the total ROG emissions. These data are attached.

Project trucks would operate in two modes: stationary idling and moving on and off the site. The emissions from trucks while idling result in a much higher concentration of TACs at nearby sensitive receptors compared to the emissions from moving trucks. This is due to the dispersion of emissions that occurs with distance and with travel of the vehicle. For this HRA, the truck travel emissions were modeled as a series of volume sources along the onsite driveway, along surrounding roadways, as shown in Figure 3 below. LSA assumed vehicles traveling on site would maneuver slowly, averaging approximately 5–15 mph, and that vehicles traveling on roadways would average 5–55 mph. On-site VMT assumptions are shown in the operational HRA data outputs, which are included in Appendix B.

Receptors were placed at the nearest sensitive receptor locations, as depicted in green in Figure 3 below.

**Figure 3: Project Sources and Receptors**

The idling emissions of trucks operating on the Project site were modeled as point sources within the area sources representing the planned loading docks. EMFAC2021 was used to determine the emissions factors of idling and operating diesel trucks to determine the total emissions of DPM. While it is expected that the truck emissions rate will continue to reduce over time, an HRA only allows for a single emission rate to represent the entire 30-year exposure period. The use of

emissions factors for the year 2025, was used as a conservative estimate of emissions, although, the Project is not expected to be fully operational until 2026.

### American Meteorological Society/Environmental Protection Agency Regulatory Model Dispersion Modeling

In order to assess the dispersion of emissions associated with the Project, air dispersion modeling was performed using AERMOD. The model is approved by the USEPA when estimating the air quality impacts associated with point and fugitive sources in simple and complex terrain. The model was used to calculate the annual average pollutant concentrations associated with each emitting source. Inputs for each emitting source were based on the characterizations described above. Details of these inputs are attached.

For the volume sources used to represent on-road mobile source activity, vertical (sigma z) dispersion parameters were developed as described in the SCAQMD's modeling guidance for trucks. For the truck parking locations, individual point sources represent the trucks idling at each space. For all the idling sources, the release parameters were set to the SCAQMD default parameters.

The model requires additional input parameters, including local meteorology. Due to the model's sensitivity to individual parameters (e.g., wind speed, temperature, and direction), the USEPA recommends meteorological data used as input into dispersion models be selected on the basis of relative spatial and temporal conditions that exist in the area of concern. As such, 5 years of meteorological data from SCAQMD's Long Beach Airport Monitoring Station (the nearest available station) was used to represent local weather conditions and prevailing winds. Figure 4 shows the graphical representation of the wind patterns.

Receptors were placed at the nearest sensitive receptor locations, as shown in Figure 3 above.

## Hotspots Analysis and Reporting Program Modeling

CARB's HARP2 model is a tool that assists with the programmatic requirements of the Air Toxics "Hot Spots" Program (AB 2588). HARP2 was used to translate the TAC concentrations from AERMOD into long-term carcinogenic and chronic, and short-term acute health risk levels following the guidance in the SCAQMD and OEHHA risk assessment guidelines. These guidelines specify a minimum set of TAC pathways and HARP2 modeling options for the carcinogenic assessment. To estimate chronic noncancer risks at residential receptors, the "RMP-(Risk Management Policy) Derived Method" risk-calculation option was used. Following the OEHHA guidance, an 8-hour chronic noncancer risk was calculated for residential receptors because the Project would operate more than 8 hours per day and 5 days per week.

The dose-response relationship for a specific pollutant describes the association between exposure and the observed response (health effect). In other words, the relationship estimates how different levels of exposure to a pollutant change the likelihood and severity of health effects. The dose-response relationship (the response occurring with increasing doses) varies with each pollutant, individual sensitivity, and type of health effect. Combining the results of the emission characterization and dispersion modeling described above with the dose-response assessment gives an estimate of the increased health risk for an individual exposed to the maximum predicted long-term concentrations of TACs.

Discrete variants for daily breathing rates, exposure frequency, and exposure duration were default rates as presented in the OEHHA guidance document entitled *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*[50] and guidance from SCAQMD.

## POPULATION-WIDE RISKS (CANCER BURDEN)

If incremental individual cancer risk from the proposed Project would exceed the SCAQMD regulatory threshold of an incremental increase of 1 in one million, then an estimated determination of population level risks is required.[51] This is distinct from the cancer risk, which is the risk probability for an exposed individual. The burden calculations are conservative estimates of the number of cancer cases that could occur in the exposed populations. The impacts are considered significant if more than 0.5 cases are calculated for the proposed Project.

For the cancer burden analysis, the proposed Project risk is evaluated for a 30-year residential scenario in order to determine population-wide risks. The zone of impact is the area surrounding the Project site that encompasses cancer risk values greater than or equal to 1 in one million and would be determined by modeling. The population-wide risks would be estimated for persons living within the zone of impact.

A census block group is a statistical area within a census tract that is assigned a population number. The cancer burden analysis utilized census data from HARP2 and then is cross-referenced with the calculated cancer risks. The total cancer burden for the proposed Project was determined as the sum of the individual census block group cancer burdens.

## ENERGY USE

The analysis of electricity/natural gas usage is based on the CalEEMod modeling conducted by LSA, which quantifies energy use for Project operations. CalEEMod quantifies direct emissions from construction and operations (including vehicle use), as well as indirect emissions, such as greenhouse gas (GHG) emissions from energy use, solid waste disposal, vegetation planting and/or removal, and water use. CalEEMod utilizes widely accepted methodologies for estimating emissions combined with default data that can be used when site-specific information is not available, including data from the California Energy Commission (CEC). CalEEMod contains default values for estimating utility consumption (e.g., water, electricity, natural gas) that may be used in preparation of energy analyses. Additionally, it should also be noted that the energy use factors included in CalEEMod, which was used to estimate energy for the Project, are based on the CEC-sponsored California Commercial End Use Survey (CEUS) and Residential Appliance Saturation Survey (RASS) studies, which provide a more conservative assumption based on actual use surveys and are the best available information for purposes of this assessment. As such, CalEEMod is appropriate for use in energy analyses. In addition, fuel consumption (diesel fuel and gasoline) from vehicle trips during operation was estimated for the opening year (2025) of the proposed Project based on trip estimates from the CalEEMod model and fuel efficiencies from the CARB EMission FACtor Model

(EMFAC2021) model. Estimates of fuel consumption (diesel fuel and gasoline) from construction trucks and construction worker vehicles were based on trip estimates from the CalEEMod model and fuel efficiencies from the CARB EMFAC2021 model.

The analysis focuses on the sources of energy that are relevant to the proposed Project: electricity, the equipment fuel necessary for Project construction, and vehicle fuel necessary for Project operations. For the purposes of this analysis, the amount of electricity, construction fuel, and fuel use from operations are quantified and compared to that consumed in Los Angeles County. The electricity use of the proposed Project is analyzed as a whole on an annual basis. Electricity use was estimated for the Project using default energy intensities by land use type in CalEEMod.

## GREENHOUSE GAS ANALYSIS

Recognizing that the field of global climate change analysis is rapidly evolving, the approaches advocated most recently indicate that for determining a Project's contribution to GHG emissions, lead agencies should calculate, or estimate, emissions from vehicular traffic, energy consumption, water conveyance and treatment, waste generation, construction activities, and any other significant source of emissions within the Project area. The CalEEMod results were used to quantify GHG emissions generated by the Project.

# THRESHOLDS OF SIGNIFICANCE

The *State CEQA Guidelines* indicate that a project would normally have a significant adverse air quality impact if Project-generated pollutant emissions would:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project is nonattainment under applicable federal or State ambient air quality standards;
- Expose sensitive receptors to substantial pollutant concentrations; or
- Result in other emissions (such as those leading to odors) affecting a substantial number of people.

The *State CEQA Guidelines* indicate that a project would normally have a significant adverse energy impact if the Project would:

- Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation; or
- Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

The *State CEQA Guidelines* indicate that a project would normally have a significant adverse greenhouse gas emission impact if the project would:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reduction the emissions of greenhouse gases.

Certain air districts (e.g., SCAQMD) have created guidelines and requirements to conduct air quality analysis. The SCAQMD's current guidelines, the CEQA Air Quality Handbook with associated updates, were followed in this assessment of air quality and GHG impacts for the proposed Project.

## AIR QUALITY

SCAQMD has established daily emissions thresholds for construction and operation of a proposed project in the Basin. The emissions thresholds were established based on the attainment status of the Basin with regard to air quality standards for specific criteria pollutants. Because the concentration standards were set at a level that protects public health with an adequate margin of safety, these emissions thresholds are regarded as conservative and would overstate an individual project's contribution to health risks.

## Criteria Pollutant Thresholds

The L.A. CEQA Thresholds Guide[52] references the SCAQMD CEQA Air Quality Handbook and EPA AP-42[53] for calculating and determining the significance of construction emissions. SCAQMD's current guidelines, the *CEQA Air Quality Handbook* with associated updates, were followed in this assessment of air quality and climate impacts for the Proposed Project. Table I lists the CEQA significance thresholds for construction and operational emissions established for the Basin. Projects in the Basin with construction- or operation-related emissions that exceed any of their respective emission thresholds would be considered significant under SCAQMD guidelines. These thresholds, which SCAQMD developed and that apply throughout the Basin, apply as both project and cumulative thresholds. If a project exceeds these standards, it is considered to have a project-specific and cumulative impact.

### Table I: Regional Thresholds for Construction and Operational Emissions

$NO_x$ = nitrogen oxides
$PM_{10}$ = particulate matter less than 10 microns in size
$PM_{2.5}$ = particulate matter less than 2.5 microns in size

$SO_X$ = sulfur oxides
VOCs = volatile organic compounds

## Health Risk Thresholds

The following limits for maximum individual cancer risk (MICR) and noncancer acute and chronic Hazard Index (HI) from project emissions of TACs are considered appropriate for use in determining the health risk for projects in the Basin:

- **MICR:** MICR is the estimated probability of a maximally exposed individual (MEI) contracting cancer as a result of exposure to TACs over a period of 30 years for adults and 9 years for children in residential locations and over a period of 25 years for workers. The MICR calculations include multipathway consideration, when applicable.

  The cumulative increase in MICR that is the sum of the calculated MICR values for all TACs would be considered significant if it would result in an increased MICR greater than 10 in 1 million ($1 \times 10^{-5}$) at any receptor location.

[52] City of Los Angeles. 2006. L.A. CEQA Thresholds Guide. Website: https://planning.lacity.org/eir/CrossroadsHwd/deir/files/references/A07.pdf (accessed July 2023)

[53] United States Environmental Protection Agency (EPA). 2011. AP-42: Compilation of Air Pollutant Emissions Factors.

- **Chronic HI:** Chronic HI is the ratio of the estimated long-term level of exposure to a TAC for a potential MEI to its chronic reference exposure level. The chronic HI calculations include multipathway consideration, when applicable.

  The Project would be considered significant if the cumulative increase in total chronic HI for any target organ system would exceed 1.0 at any receptor location.

- **Acute HI:** Acute HI is the ratio of the estimated maximum 1-hour concentration of a TAC for a potential MEI to its acute reference exposure level.

  The Project would be considered significant if the cumulative increase in total acute HI for any target organ system would exceed 1.0 at any receptor location.

The SCAQMD's *CEQA Air Quality Handbook*[54] states that emissions of TACs are considered significant if an HRA shows an increased risk of greater than 10 in 1 million. Based on guidance from SCAQMD in the document *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*[55], for the purposes of this analysis, the threshold of 10 in 1 million was used as the cancer risk threshold for the proposed Project.

If incremental individual cancer risk from the proposed Project would exceed the SCAQMD regulatory threshold of an incremental increase of 1 in one million, then an estimated determination of population level risks is required.[56] This is distinct from the cancer risk, which is the risk probability for an exposed individual. The burden calculations are conservative estimates of the number of cancer cases that could occur in the exposed populations. The impacts are considered significant if more than 0.5 cases are calculated for the proposed Project.

### Localized Impacts Analysis

The SCAQMD published its *Final Localized Significance Threshold Methodology* in July 2008, recommending that all air quality analyses include an assessment of air quality impacts to nearby sensitive receptors.[57] This guidance was used to analyze potential localized air quality impacts associated with construction of the proposed Project. Localized significance thresholds (LST) are developed based on the size or total area of the emission source, the ambient air quality in the source receptor area, and the distance to the Project. Sensitive receptors include residences, schools, hospitals, and similar uses that are sensitive to adverse air quality.

LSTs are based on the ambient concentrations of that pollutant within the Project Source Receptor Area (SRA) and the distance to the nearest sensitive receptor. For the proposed Project, the appropriate SRA for the LST is the nearby South Coastal LA County (SRA 4). SCAQMD provides LST screening tables for 25-, 50-, 100-, 200-, and 500-meter source-receptor distances. As identified above, the closest sensitive receptors to the Project site are single-family homes located southwest

of the Project site at approximately 1,366 feet (416 meters) from the western Project site boundary line to the residences. As such, LST thresholds were derived by interpolation using the distance to the nearest sensitive receptor per lookup table. Based on the anticipated construction equipment and the SCAQMD methodology for applying CalEEMod to LST Thresholds document, it is assumed that the maximum daily disturbed acreage for the proposed Project would be 3.5 acres for construction.[58] Operational LST thresholds are based on a 5.0-acre disturbance area. Table J lists the emissions thresholds that apply during Project construction and operation.

#### Local Microscale Concentration Standards

The significance of localized Project impacts under CEQA depends on whether ambient CO levels in the vicinity of the Project are above or below State and federal CO standards. Because ambient CO levels are below the standards throughout the Basin, a Project would be considered to have a significant CO impact if Project emissions result in an exceedance of one or more of the 1-hour or 8-hour standards. The following are applicable local emission concentration standards for CO:

- California State 1-hour CO standard of 20 parts per million (ppm)
- California State 8-hour CO standard of 9 ppm

## GREENHOUSE GAS THRESHOLDS

To provide guidance to local lead agencies on determining significance for GHG emissions in their CEQA documents, SCAQMD convened a GHG CEQA Significance Threshold Working Group (Working Group). Based on the last Working Group meeting held in September 2010 (Meeting No. 15), SCAQMD proposed to adopt a tiered approach for evaluating GHG emissions for development Projects where SCAQMD is not the lead agency:

- **Tier 1. Exemptions:** If a Project is exempt from CEQA, Project-level and cumulative GHG emissions are less than significant.

- **Tier 2. Consistency with a locally adopted GHG Reduction Plan:** If the Project complies with a GHG emissions reduction plan or mitigation program that avoids or substantially reduces GHG

[58] SCAQMD. n.d. *Fact Sheet for Applying CalEEMod to Localized Significance Thresholds*. Website: http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/caleemod-guidance.pdf (accessed May 2023).

emissions in the Project's geographic area (i.e., city or county), Project-level and cumulative GHG emissions are less than significant.

- **Tier 3. Numerical Screening Threshold:** If GHG emissions are less than the numerical screening-level threshold, Project-level and cumulative GHG emissions are less than significant.

  For Projects that are not exempt or where no qualifying GHG reduction plans are directly applicable, SCAQMD requires an assessment of GHG emissions. The 10,000 MT of $CO_2e$ per year (MT $CO_2e$/yr) threshold for industrial uses would be recommended for use by all lead agencies. Under Option 1, separate screening thresholds are proposed for residential Projects (3,500 MT $CO_2e$/yr), commercial Projects (1,400 MT $CO_2e$/yr), and mixed-use Projects (3,000 MT $CO_2e$/yr). Under Option 2, a single numerical screening-level threshold of 3,000 MT $CO_2e$/yr would be used for all non-industrial Projects.

- **Tier 4. Performance Standards:** If emissions exceed the numerical screening threshold, a more detailed review of the Project's GHG emissions is warranted. SCAQMD has proposed an efficiency target for Projects that exceed the bright-line threshold. The current recommended approach is per capita efficiency targets. SCAQMD is not recommending use of a percent emissions reduction target. Instead, SCAQMD proposes a 2020 efficiency target of 4.8 MT $CO_2e$/yr per service population (for Project-level analyses and 6.6 MT $CO_2e$/yr per service population for plan-level Projects (e.g., program-level Projects such as general plans). The GHG efficiency metric divides annualized GHG emissions by the service population, which is the sum of residents and employees, per the following equation:

  *Rate of Emission: GHG Emissions (MT $CO_2e$/yr) ÷ Service Population*

- The efficiency evaluation consists of comparing the Project's efficiency metric to efficiency targets. Efficiency targets represent the maximum quantity of emissions each resident and employee in the State of California could emit in various years based on emissions levels necessary to achieve the statewide GHG emissions reduction goals. A Project that results in a lower rate of emissions would be more efficient than a Project with a higher rate of emissions, based on the same service population. The metric considers GHG reduction measures integrated into a Project's design and operation (or through mitigation). The per capita efficiency targets are based on the AB 32 GHG reduction target and 2020 GHG emissions inventory prepared for the CARB's 2008 Scoping Plan.

For the purpose of this analysis, the proposed Project will be compared to the threshold of 10,000 MT $CO_2e$/year for industrial uses. The Project is also evaluated for compliance with the 2022 Scoping Plan and SCAG's RTP/SCS.

# IMPACTS ANALYSIS

This section identifies the air quality, energy, and GHG emissions impacts associated with implementation of the proposed Project.

## AIR QUALITY IMPACTS

Air pollutant emissions associated with the Project would occur over the short term from construction activities and over the long term from operational activities associated with the proposed Project.

### Consistency with Applicable Air Quality Plans

A consistency determination plays an essential role in local agency Project review by linking local planning and unique individual Projects to the air quality plans. A consistency determination fulfills the CEQA goal of fully informing local agency decision-makers of the environmental costs of the Project under consideration at a stage early enough to ensure that air quality concerns are addressed. Only new or amended General Plan elements, Specific Plans, and significantly unique Projects need to undergo a consistency review due to the air quality plan strategy being based on Projections from local General Plans.

The AQMP is based on regional growth Projections developed by SCAG. The proposed Project would include the construction of a trailer lot consisting of 393 trailer stalls. The proposed Project would not house more than 1,000 persons, occupy more than 40 acres of land, or encompass more than 650,000 sq ft of floor area. Thus, the proposed Project would not be defined as a regionally significant Project under CEQA; therefore, it does not meet SCAG's Intergovernmental Review criteria.

The City's General Plan and Port of Los Angeles Master Plan is consistent with the SCAG Regional Comprehensive Plan Guidelines and the SCAQMD AQMP. Pursuant to the methodology provided in the SCAQMD's *CEQA Air Quality Handbook*, consistency with the Basin 2022 AQMP is affirmed when a Project (1) would not increase the frequency or severity of an air quality standards violation or cause a new violation and (2) is consistent with the growth assumptions in the AQMP. Consistency review is presented as follows:

1. The Project would result in short-term construction and long-term operational pollutant emissions that are all less than the CEQA significance emissions thresholds established by SCAQMD, as demonstrated below; therefore, the Project would not result in an increase in the frequency or severity of an air quality standards violation or cause a new air quality standards violation.

2. The *CEQA Air Quality Handbook* indicates that consistency with AQMP growth assumptions must be analyzed for new or amended General Plan elements, Specific Plans, and significant Projects. Significant Projects include airports, electrical generating facilities, petroleum and gas refineries, designation of oil drilling districts, water ports, solid waste disposal sites, and offshore drilling

facilities. As mentioned above, the proposed Project would construct a trailer parking lot consisting of 393 trailer spaces; therefore, the proposed Project is not defined as significant.

A portion of the Project site is within the Port of Los Angeles Mater Plan land use designation of Open Space. The Project would require a Port of Los Angeles Master Plan amendment to Maritime Support for APNs 7440-016-002, 7440-016-003, and 7440-016-007. The Maritime Support designation provides for water-dependent and non-water-dependent operations necessary to support cargo handling and other maritime activities. The remaining APNs (7440-016-001, 7440-016-002, 7440-016-003, and 7412-024-) have a General Plan land use designation of General/Bulk Cargo – Non-Hazardous Industrial and Commercial and are zoned Heavy Industrial [Q] M3-1VL and Light Industrial [Q] M2-1VL. The Project would be consistent with the City's land use designation and zoning for these APNs.

With respect to determining the proposed Project consistency with the air quality plan growth assumptions, the Projections in the AQMP for achieving air quality goals are based on assumptions in SCAG's RTP/SCS regarding population, housing, and growth trends. According to SCAG's 2020–2045 RTP/SCS, the City's population, households, and employment are forecast to increase by approximately 837,500 residents, 426,000 households, and 287,600 jobs, respectively, between 2016 and 2045.[59] The proposed Project would construct a trailer parking lot consisting of 393 trailer stalls. The proposed Project would have a total of 4 employees. The additional 4 employees would fall within the 287,600 jobs projected for the City. Therefore, it is assumed that it the Project's labor demand would not substantially increase population, households, or employment in the City. As such, the Project would be consistent with SCAG's goals for new job growth in the region.

In addition, since the proposed Project would not include airports, electrical generating facilities, petroleum and gas refineries, designation of oil drilling districts, water ports, solid waste disposal sites, and offshore drilling facilities, the proposed Project is not defined as a significant Project as defined by the SCAQMD's *CEQA Air Quality Handbook*. Therefore, it is unlikely that the proposed Project would interfere with SCAQMD's goals for improving air quality in the region. The proposed Project would not conflict with the 2022 AQMP and, as such, would not jeopardize attainment of the CAAQS and NAAQS in the area under the jurisdiction of the SCAQMD.

Furthermore, the proposed Project would be required to comply with CARB's Off-Road Diesel Regulation and SCAQMD Rule 403: Fugitive Dust, which would help reduce particulate matter emissions. The proposed Project would also follow construction best practices to minimize construction emissions consistent with the General Plan policies from the Air Quality Element and actions from CERP. Therefore, the proposed Project would not conflict with applicable air quality plans.

[59] Southern California Association of Governments (SCAG). 2020. *Connect SoCal 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy.* Website: https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal-plan_0.pdf?1606001176 (accessed March 2023).

Based on the consistency analysis presented above, the proposed Project would be consistent with the regional AQMP, the General Plan, and CERP.

## Criteria Pollutant Analysis

The Basin is designated as non-attainment for $O_3$ and $PM_{2.5}$ for federal standards and non-attainment for $O_3$, $PM_{10}$, and $PM_{2.5}$ for State standards. The SCAQMD's nonattainment status is attributed to the region's development history. Past, present, and future development Projects contribute to the region's adverse air quality impacts on a cumulative basis. By its very nature, air pollution is largely a cumulative impact. No single Project is sufficient in size to, by itself, result in nonattainment of AAQS. Instead, a Project's individual emissions contribute to existing cumulatively significant adverse air quality impacts. If a Project's contribution to the cumulative impact is considerable, then the Project's impact on air quality would be considered significant.

In developing thresholds of significance for air pollutants, the SCAQMD considered the emission levels for which a Project's individual emissions would be cumulatively considerable. If a Project exceeds the identified significance thresholds, its emissions would be cumulatively considerable, resulting in significant adverse air quality impacts to the region's existing air quality conditions. Therefore, additional analysis to assess cumulative impacts is unnecessary. The following analysis assesses the potential Project-level construction- and operation-related air quality impacts.

### *Construction Emissions*

During construction, short-term degradation of air quality may occur due to the release of particulate emissions generated by grading, paving, building, and other activities. Emissions from construction equipment are also anticipated and would include CO, $NO_x$, ROG, directly emitted particulate matter ($PM_{2.5}$ and $PM_{10}$), and TACs such as diesel exhaust particulate matter.

Project construction activities would include site preparation, grading, paving, and architectural coating activities. Construction-related effects on air quality from the proposed Project would be greatest during the site preparation phase due to the disturbance of soils. If not properly controlled, these activities would temporarily generate particulate emissions. Sources of fugitive dust would include disturbed soils at the construction site. Unless properly controlled, vehicles leaving the site would deposit dirt and mud on local streets, which could be an additional source of airborne dust after it dries. $PM_{10}$ emissions would vary from day to day, depending on the nature and magnitude of construction activity and local weather conditions. $PM_{10}$ emissions would depend on soil moisture, silt content of soil, wind speed, and the amount of operating equipment. Larger dust particles would settle near the source, while fine particles would be dispersed over greater distances from the construction site.

Water or other soil stabilizers can be used to control dust, resulting in emission reductions of 50 percent or more. The SCAQMD has established Rule 403: Fugitive Dust, which would require the applicant to implement measures that would reduce the amount of particulate matter generated during the construction period.

In addition to dust related $PM_{10}$ emissions, heavy trucks and construction equipment powered by gasoline and diesel engines would generate CO, $SO_2$, $NO_x$, VOCs and some soot particulate ($PM_{2.5}$

and $PM_{10}$) in exhaust emissions. If construction activities were to increase traffic congestion in the area, CO and other emissions from traffic would increase slightly while those vehicles idle in traffic. These emissions would be temporary in nature and limited to the immediate area surrounding the construction site.

Construction emissions were estimated for the Project using CalEEMod. Table K lists the tentative Project construction schedule based on an 8-month construction duration. Table L lists the potential construction equipment to be used during Project construction under each phase of construction. Construction-related emissions are presented in Table M. CalEEMod output sheets are included in Appendix A.

$PM_{10}$ = particulate matter less than 10 microns in size
SCAQMD = South Coast Air Quality Management District
$SO_X$ = sulfur oxides
VOCs = volatile organic compounds

As shown in Table M, construction emissions associated with the Project would not exceed the SCAQMD thresholds for ROGs, $NO_x$, CO, sulfur oxides ($SO_X$), $PM_{2.5}$, or $PM_{10}$ emissions. In addition to the construction period thresholds of significance, the Project is required to comply with regional rules that assist in reducing short-term air pollutant emissions. SCAQMD Rule 403 requires that fugitive dust be controlled with best available control measures so that the presence of such dust does not remain visible in the atmosphere beyond the property line of the emission source. In addition, SCAQMD Rule 403 requires implementation of dust suppression techniques to prevent fugitive dust from creating a nuisance off site. Even though the Project's construction would not exceed any of the emissions thresholds as noted in Table M, compliance with Rule 403 dust suppression techniques can further reduce the fugitive dust generation (and thus, the $PM_{10}$ component). With compliance with Rule 403, construction of the proposed Project would not result in emissions that would result in a cumulatively considerable net increase of any criteria pollutant for which the Project is nonattainment under an applicable federal or State ambient air quality standard.

### *Operational Air Quality Impacts*

Long-term air pollutant emission impacts are those typically associated with mobile sources (e.g., vehicle and truck trips), energy sources (e.g., natural gas), area sources (e.g., architectural coatings and the use of landscape maintenance equipment), and operational equipment (off-Road equipment) related to the proposed Project.

$PM_{10}$ emissions result from running exhaust, tire and brake wear, and the entrainment of dust into the atmosphere from vehicles traveling on paved roadways. Entrainment of $PM_{10}$ occurs when vehicle tires pulverize small rocks and pavement and the vehicle wakes generate airborne dust. The contribution of tire and brake wear is small compared to the other PM emission processes. Gasoline-powered engines have small rates of PM emissions compared with diesel-powered vehicles.

Energy source emissions result from activities in buildings for which natural gas is used. The quantity of emissions is the product of usage intensity (i.e., the amount of natural gas) and the emission factor of the fuel source. Greater building or appliance efficiency reduces the amount of energy for a given activity and thus lowers the resultant emissions. As mentioned above, the proposed Project would construct a trailer parking lot consisting of 393 trailer stalls. The proposed Project would include installation of a prefabricated guard booth and restroom for use by truck drivers and Project employees; however, any energy source emissions associated with the guard booth and restroom are expected to be minimal.

Typically, area source emissions consist of direct sources of air emissions located at the Project site, including architectural coatings and the use of landscape maintenance equipment. The proposed Project would also include off-road operational equipment consisting of one yard goat and two small forklifts; however, on-site equipment would be zero-emission and all-electric.

Long-term operation emissions associated with the proposed Project were calculated using CalEEMod. Model results are shown in Table N below. CalEEMod output sheets are included in Appendix A.

## Table N: Project Operational Emissions

The results shown in Table N indicate the Project would not exceed the significance criteria for VOCs, $NO_x$, CO, $SO_x$, $PM_{10}$, or $PM_{2.5}$ emissions; thus, the proposed Project would not have a significant effect on regional air quality. Therefore, operation of the Project would not result in a cumulatively considerable net increase of any criteria pollutant for which the Project is nonattainment under an applicable federal or State ambient air quality standard.

### *Long-Term Microscale (CO Hot Spot) Analysis*

Vehicular trips associated with the proposed Project would contribute to congestion at intersections and along roadway segments in the Project vicinity. Localized air quality impacts would occur when emissions from vehicular traffic increase as a result of the proposed Project. The primary mobile-source pollutant of local concern is CO, a direct function of vehicle idling time and, thus, of traffic

flow conditions. CO transport is extremely limited; under normal meteorological conditions, CO disperses rapidly with distance from the source. However, under certain extreme meteorological conditions, CO concentrations near a congested roadway or intersection may reach unhealthful levels, affecting local sensitive receptors (e.g., residents, schoolchildren, the elderly, and hospital patients). Typically, high CO concentrations are associated with roadways or intersections operating at unacceptable levels of service or with extremely high traffic volumes. In areas with high ambient background CO concentrations, modeling is recommended to determine a Project's effect on local CO levels.

An assessment of Project-related impacts on localized ambient air quality requires that future ambient air quality levels be Projected. Existing CO concentrations in the immediate Project vicinity are not available. Ambient CO levels monitored at the POLA San Pedro Community station, the closest station to the Project site, showed a highest recorded 1-hour concentration of 6.9 ppm (the State standard is 20 ppm) and a highest 8-hour concentration of 2.2 ppm (the State standard is 9 ppm) during the past 3 years (Table G). The highest CO concentrations would normally occur during peak traffic hours; hence, CO impacts calculated under peak traffic conditions represent a worst-case analysis.

As described in the VMT Screening Memo[60], the proposed Project would generate 225 AM peak hour trips and 100 PM peak-hour trips. Given the extremely low level of CO concentrations in the Project area, and lack of traffic impacts at any intersections, Project-related vehicles are not expected to contribute significantly to result in the CO concentrations exceeding the State or federal CO standards.

### Health Risk on Nearby Sensitive Receptors

Sensitive receptors are defined as people that have an increased sensitivity to air pollution or environmental contaminants. Sensitive receptor locations include schools, parks and playgrounds, daycare centers, nursing homes, hospitals, and residential dwelling units. The closest sensitive receptors to the Project site are single-family homes located southwest of the Project site at approximately 1,366 feet from the western Project site boundary line to the residences. The closest worker receptor to the project site is the Ports of America insurance company located immediately west at a distance of approximately 25 feet.

The following section describes the potential impacts on sensitive receptors from construction and operation of the proposed Project. Health risk impacts associated with Project construction and operation are evaluated separately to correctly estimate the risk for each type of receptor (i.e., sensitive vs. worker locations, since sensitive receptors start at the third trimester and workers start at age 16.) The risk is calculated starting at the third trimester going to 30.25 years, which is broken down into three bins: third trimester to under 2 years; 2 years to under 16 years; and 16 years to 30 years. This is consistent with OEHHA's standard method of calculating a 30-year risk (i.e., the sum of all three bins).

The HRA analysis and results are presented below; data outputs are included in Appendix B.

### *Construction Health Risk*

A construction HRA, which evaluates construction-period health risk to off-site receptors, was performed for the proposed Project. Table O, below, identifies the results of the analysis assuming the use of Tier 3 construction equipment as proposed by the Project. Model snapshots of the sources are shown in Appendix B.

**Table O: Health Risks from Project Construction to Off-Site Receptors**

| Location | Carcinogenic Inhalation Health Risk in One Million | Chronic Inhalation Hazard Index | Acute Inhalation Hazard Index |

| **Significant?** | **No** | **No** | **No** |

Source: LSA (June 2024).
SCAQMD = South Coast Air Quality Management District

As shown in Table O, the maximum cancer risk for the residential MEI would be 0.13 in one million, which would not exceed the SCAQMD cancer risk threshold of 10 in one million. The worker receptor risk would be lower at 0.06 in one million, which would also not exceed the SCAQMD cancer risk thresholds. The total chronic hazard index would be 0.004 for the worker receptor MEI and less than 0.001 for the residential receptor MEI, which is below the threshold of 1.0. In addition, the total acute hazard index would be nominal (0.000), which would also not exceed the threshold of 1.0. Therefore, construction of the proposed Project would not exceed SCAQMD thresholds and would not expose nearby sensitive receptors to substantial pollutant concentrations. No significant health risk would occur from Project construction emissions.

### *Operational Health Risk*

To determine the potential health risk to people living near the proposed Project associated with the exhaust of diesel-powered trucks and equipment, an operational HRA was conducted for the proposed Project. The carcinogenic and chronic health risks from the proposed Project are shown in Table P. The residential risk incorporates both the risk for a child living in a nearby residence for 9 years (the standard period of time for child risk) and an adult living in a nearby residence for 30 years (considered a conservative period of time for an individual to live in any one residence). As indicated above, the closest sensitive receptors to the Project site are single-family homes located approximately 1,366 feet southwest of the Project site. However, as shown in the risk contours included in Appendix B, the residential MEI is a single-family home located south of the project site along I-110. The closest worker receptor and the worker MEI is the Ports of America insurance company located immediately west of the project site, at a distance of approximately 25 feet. The HRA model snapshots, outputs, and risk contours are included in Appendix B.

SCAQMD = South Coast Air Quality Management District

As shown in Table P, the maximum cancer risk for the residential MEI would be 7.84 in one million and the cancer risk for the worker MEI would be 5.08 in one million, which are less than the threshold of 10 in one million. The chronic hazard index would be 0.003 for the residential receptor MEI and 0.002 for the worker receptor MEI, which are below the threshold of 1.0. In addition. The acute hazard index would be less than 0.001, which would also not exceed the threshold of 1.0. As these results show, all health risk levels to nearby sensitive receptors from operation-related emissions of TACs would be well below the SCAQMD's HRA thresholds. No significant health risk would occur from Project operation emissions.

#### *Population-Wide Risks (Cancer Burden)*

If incremental individual cancer risk from the proposed Project would exceed the SCAQMD regulatory threshold of an incremental increase of 1 in one million, then an estimated determination of population level risks is required. For the cancer burden analysis, the proposed Project risk is evaluated for a 30-year residential scenario. Cancer risk was estimated at the geographical center (centroid) of census tracts that are within the study area of the HRA and multiplied by the corresponding population number. A cancer burden greater than 0.5 is considered a significant cancer burden. As presented in Table Q, the cancer burden is estimated to be 0.025 individuals that were estimated to have a cancer risk of 1 in a million or more. Therefore, the proposed Project would not exceed the SCAQMD's cancer burden significance threshold.

## Localized Significance Analysis

Project construction and operation emissions were compared to the LST screening tables in SRA 4, based on a 416-meter source-receptor distance and a disturbed acreage of 3.5 acres for construction and 5.0 acres for operation.

Table R indicates the on-site construction emissions would not exceed the LSTs for the nearby residences. Therefore, construction of the proposed Project would not result in a locally significant air quality impact.

By design, the localized impacts analysis only includes on-site sources; however, the CalEEMod outputs do not separate on-site and off-site emissions for mobile sources. For a worst-case scenario assessment, the emissions detailed in Table S assume all area and energy source emissions would occur on site, and 5 percent of the Project-related new mobile sources, which is an estimate of the amount of Project-related on-site vehicle and truck travel, would occur on site. Considering the total trip length included in CalEEMod and that the majority of vehicle and truck travel would occur off-site, resulting in emissions that would also be released off-site, the 5 percent assumption is conservative. Table S indicates the localized operational emissions would not exceed the LSTs at nearby residences. Therefore, the proposed operational activity would not result in a locally significant air quality impact.

The results of the LST analysis, summarized in Tables R and S, indicate that the Project would not result in an exceedance of the SCAQMD LSTs during Project construction or operation.

## Odors

During Project construction, some odors may be present due to diesel exhaust. However, these odors would be temporary and limited to the construction period. The proposed Project would not

include any activities or operations that would generate objectionable odors and once operational, the Project would not be a source of odors. Therefore, the proposed Project would not result in other emissions (such as those leading to odors) affecting a substantial number of people.

## ENERGY IMPACTS

The following describes the potential impacts regarding energy resources that could result from implementation of the proposed Project.

### Energy Consumption

The proposed Project would increase the demand for energy through day-to-day operations and fuel consumption associated with Project construction. This section discusses energy use resulting from implementation of the proposed Project and evaluates whether the proposed Project would result in the wasteful, inefficient, or unnecessary consumption of energy resources or conflict with any applicable plans for renewable energy and energy efficiency.

#### *Construction Energy Use*

Construction of the proposed Project would occur for approximately 8-months. The Project would require energy for activities such as the manufacture and transportation of construction materials, grading activities, and building construction. Construction of the proposed Project would require electricity to power construction-related equipment. Construction of the proposed Project would not involve the consumption of natural gas. The construction-related equipment would not be powered by natural gas, and no natural gas demand is anticipated during construction.

Transportation energy represents the largest energy use during construction and would occur from the transport and use of construction equipment, delivery vehicles and haul trucks, and construction worker vehicles that would use petroleum fuels (e.g., diesel fuel and/or gasoline). Therefore, the analysis of energy use during construction focuses on fuel consumption. Construction trucks and vendor trucks hauling materials to and from the Project site would be anticipated to use diesel fuel, whereas construction workers traveling to and from the Project site would be anticipated to use gasoline-powered vehicles. Fuel consumption from transportation uses depends on the type and number of trips, VMT, the fuel efficiency of the vehicles, and the travel mode.

Estimates of fuel consumption (diesel fuel and gasoline) from construction equipment, construction trucks, and construction worker vehicles were based on default construction equipment assumptions and trip estimates from CalEEMod and fuel efficiencies from EMFAC2021. Fuel consumption estimates are presented in Table T. CalEEMod output sheets are included in Appendix A, and detailed energy calculations are included in Appendix C.

**Table T: Proposed Project Energy Consumption Estimates during Construction**

| Energy Type | Total Energy Consumption | Percentage of Increase Countywide |
|---|---|---|
| Diesel Fuel (total gallons) | 37,841.6 | 0.01 |
| Gasoline (total gallons) | 3,561.6 | <0.01 |

Source: Compiled by LSA (January 2024).

As indicated in Table T, the Project would consume approximately 37,841.6 gallons of diesel fuel and approximately 3,561.6 gallons of gasoline during construction. Based on fuel consumption obtained from EMFAC2021, approximately 3,921.8 million gallons of gasoline and approximately 608.6 million gallons of diesel were consumed from vehicle trips in Los Angeles County in 2023. Therefore, construction of the proposed Project would increase the annual construction generated fuel use in Los Angeles County by approximately 0.01 percent for diesel fuel usage and by approximately less than 0.01 percent for gasoline fuel usage. As such, Project construction would have a negligible effect on local and regional energy supplies. Furthermore, impacts related to energy use during construction would be temporary and relatively small in comparison to Los Angeles County's overall use of the State's available energy resources. No unusual Project characteristics would necessitate the use of construction equipment that would be less energy efficient than at comparable construction sites in the region or the State. In addition, construction activities are not anticipated to result in an inefficient use of energy as gasoline and diesel fuel would be supplied by construction contractors who would conserve the use of their supplies to minimize their costs on the Project. The Project would not cause or result in the need for additional energy facilities or an additional or expanded delivery system. For these reasons, fuel consumption during construction would not be inefficient, wasteful, or unnecessary.

### *Operational Energy Use*

Operational energy use is typically associated with electricity, and fuel used for vehicle trips associated with a Project. Energy consumption was estimated for the proposed Project using default energy intensities by land use type in CalEEMod. As discussed in the Project Location and Description section, the proposed Project would include the construction of a trailer parking lot, consisting of 393 trailer stalls and associated site improvements. The proposed Project would also include installation of a prefabricated guard booth and restroom for use by truck drivers and Project employees; however, energy consumption associated with the guard booth and restroom is expected to be minimal. In addition, onsite equipment needed for the parking of truck trailers would include one yard goat and two small forklifts. Onsite equipment would be zero-emission and all-electric; therefore, energy consumption associated with the operational equipment is included in the overall annual estimate for electricity consumption. Therefore, this analysis focuses on the trailer parking lot and associated truck trips.

The proposed Project would also result in energy usage associated with gasoline and diesel fuel consumed by Project-related vehicle and truck trips. Fuel use associated with vehicle and truck trips generated by the proposed Project was calculated based on the Project's VMT Screening Memo[61],

[61] EPD Solutions, Inc. 2023. *John S. Gibson Trailer Lot Project Vehicles Miles Traveled (VMT) Screening Memo.* May 26.

which identifies that the proposed Project would generate approximately 1,808 average daily trips, including 1,794 one-way truck trips, 4 one-way delivery/vendor trips, and 10 passenger vehicle trips. The amount of operational fuel use was estimated using CARB's EMFAC2021 model, which provided projections for typical daily fuel usage in Los Angeles County.

Electricity and fuel usage estimates associated with the proposed Project are shown in Table U.

### Table U: Proposed Project Energy Consumption Estimates during Operation

| Energy Type | Annual Energy Consumption |
|---|---|
| Electricity Consumption (kWh/year) | 711,085.0 |
| Gasoline (gallons/year) | 721.6 |
| Diesel Fuel (gallons/year) | 407,596.2 |

Source: Compiled by LSA (January 2024).
kWh = kilowatt-hours

As shown in Table U, the estimated electricity demand associated with the operation of the proposed Project is 711,085.0 kWh per year. Total electricity consumption in Los Angeles County in 2021 was 65,374.7 GWh (65,374,721,369 kWh). Therefore, operation of the proposed Project would increase the annual electricity consumption in Los Angeles County by approximately less than 0.01 percent.

Electrical demand associated with Project operations would not be considered inefficient, wasteful, or unnecessary in comparison to other similar developments in the region. Furthermore, the proposed Project would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency. The Project would be required to adhere to all federal, State, and local requirements for energy efficiency, including the Title 24 standards.

As shown in Table U, fuel use associated with the vehicle trips generated by the proposed Project is estimated at 721.6 gallons of gasoline and 407,596.2 gallons of diesel fuel per year. This analysis conservatively assumes that all vehicle trips generated as a result of Project operation would be new to Los Angeles County. Based on fuel consumption obtained from EMFAC2021, approximately 3,921.8 million gallons of gasoline and approximately 608.6 million gallons of diesel were consumed from vehicle trips in Los Angeles County in 2023. Therefore, vehicle and truck trips associated with the proposed Project would increase the annual fuel use in Los Angeles County by approximately less than 0.01 percent for gasoline fuel usage and approximately 0.07 percent for diesel fuel usage. Fuel consumption associated with vehicle trips generated by Project operations would not be considered inefficient, wasteful, or unnecessary in comparison to other similar developments in the region.

### Conflict with Renewable Energy or Energy Efficiency Plans

In 2002, the Legislature passed SB 1389, which required the CEC to develop an integrated energy plan every two years for electricity, natural gas, and transportation fuels for the Integrated Energy Policy Report. The plan calls for the State to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with

the least environmental and energy costs. To further this policy, the plan identifies a number of strategies, including assistance to public agencies and fleet operators in implementing incentive programs for ZEVs and their infrastructure needs, and encouragement of urban designs that reduce VMT and accommodate pedestrian and bicycle access.

The CEC's *2023 Integrated Energy Policy Report* provide the results of the CEC's assessments of a variety of energy issues facing California. As indicated above, energy usage on the Project site during construction would be temporary in nature and would be relatively small in comparison to the overall use in the County. In addition, energy usage associated with operation of the proposed Project would be relatively small in comparison to the overall use in Los Angeles County, and the State's available energy resources. Therefore, energy impacts at the regional level would be negligible. Because California's energy conservation planning actions are conducted at a regional level, and because the proposed Project's total impact on regional energy supplies would be minor, the proposed Project would not conflict with or obstruct California's energy conservation plans as described in the CEC's Integrated Energy Policy Report. Additionally, as demonstrated above, the proposed Project would not result in the inefficient, wasteful, and unnecessary consumption of energy.

## GREENHOUSE GAS IMPACTS

This section describes the potential GHG impacts associated with implementation the proposed Project.

### Generation of Greenhouse Gas Emissions

This section describes the proposed Project's construction- and operational-related GHG emissions and contribution to global climate change. Neither the SCAQMD nor SCAQMD has addressed emission thresholds for construction; however, the SCAQMD requires quantification and disclosure. Thus, an evaluation of the Project's impacts related to the release of GHG emissions for both construction and operational phases of the Project is described below.

#### *Short-Term Greenhouse Gas Emissions*

Construction activities associated with the proposed Project would produce combustion emissions from various sources. During construction, GHGs would be emitted through the operation of construction equipment and from worker and builder supply vendor vehicles, each of which typically use fossil-based fuels to operate. The combustion of fossil-based fuels creates GHGs such as $CO_2$, $CH_4$, and $N_2O$. Furthermore, $CH_4$ is emitted during the fueling of heavy equipment. Exhaust emissions from on-site construction activities would vary daily as construction activity levels change.

As indicated above, the SCAQMD does not have an adopted threshold of significance for construction-related GHG emissions. However, lead agencies are required to quantify and disclose GHG emissions that would occur during construction. As described above, for the purpose of this analysis, the proposed Project will be compared to the GHG threshold of 10,000 MT/year $CO_2e$. The SCAQMD then requires the construction GHG emissions to be amortized over the life of the Project, defined by the SCAQMD as 30 years, added to the operational emissions, and compared to the applicable interim GHG significance threshold tier.

Using CalEEMod, it is estimated that the Project would generate approximately 383.4 MT $CO_2e$ during construction of the Project. When annualized over the 30-year life of the Project, annual emissions would be 12.8 MT $CO_2e$.

### *Long-Term Greenhouse Gas Emissions*

Long-term GHG emissions are typically generated from mobile sources (e.g., vehicle and truck trips), area sources (e.g., maintenance activities and landscaping), indirect emissions from sources associated with energy consumption, waste sources (land filling and waste disposal), and water sources (water supply and conveyance, treatment, and distribution). Mobile-source GHG emissions would include Project-generated vehicle trips to and from the Project. Area-source emissions would be associated with activities such as landscaping and maintenance on the Project site. Energy source emissions would be generated at off-site utility providers because of increased electricity demand generated by the Project. Waste source emissions generated by the proposed Project include energy generated by land filling and other methods of disposal related to transporting and managing Project-generated waste. In addition, water source emissions associated with the proposed Project are generated by water supply and conveyance, water treatment, water distribution, and wastewater treatment.

Following guidance from the SCAQMD, GHG emissions were estimated for the operational year of 2025 using CalEEMod. Table V shows the calculated GHG emissions for the proposed Project.

**Table V: Greenhouse Gas Emissions**

| Emissions Source | Operational Emissions (MT/yr) | | | | |
|---|---|---|---|---|---|
| | $CO_2$ | $CH_4$ | $N_2O$ | $CO_2e$ | Percentage of Total |
| Mobile Sources | 4,363.1 | 0.4 | 0.7 | 4,584.6 | 92 |
| Area Sources | <0.1 | <0.1 | <0.1 | <0.1 | <1 |
| Energy Sources | 308.0 | <0.1 | <0.1 | 309.5 | 8 |
| Water Sources | 7.4 | <0.1 | <0.1 | 7.4 | <1 |
| Waste Sources | 0.0 | 0.0 | 0.0 | 0.0 | 0 |
| Off -Road Sources | 0.0 | 0.0 | 0.0 | 0.0 | 0 |
| **Total Project Operational Emissions** | | | | **4,901.5** | **100** |
| Amortized Construction Emissions | | | | 12.8 | - |
| **Total Annual Emissions** | | | | **4,914.3** | **-** |
| Threshold | | | | 10,000 | - |
| **Exceed?** | | | | **No** | **-** |

Source: Compiled by LSA (January 2024)
$CH_4$ = methane
$CO_2$ = carbon dioxide
$CO_2e$ = carbon dioxide equivalent
MT/yr = metric tons per year
$N_2O$ = nitrous oxide
SCAQMD = South Coast Air Quality Management District

As discussed above, a project would have less than significant GHG emissions if it would result in operational-related GHG emissions of less than 10,000 MT $CO_2e$/yr. Based on the analysis results, the proposed Project would result in approximately 4,914.3 MT $CO_2e$/yr, which would be below the SCAQMD Threshold of 10,000 MT $CO_2e$/yr. Therefore, operation of the proposed Project would not generate significant GHG emissions that would have a significant effect on the environment.

Therefore, the proposed Project would not lead to new or substantially more severe significant impacts associated with operational GHG emissions.

## Consistency with Greenhouse Gas Emissions Reduction Plans

An evaluation of the proposed Project's consistency with the City of Los Angeles Sustainability City pLAn, the 2022 Scoping Plan, and the 2020–2045 RTP/SCS is provided below.

### *City of Los Angeles Sustainable City pLAn*

As described above, the POLA has adopted the Sustainable City pLAn[62] of the City of Los Angeles. The pLAn contains goals for the City, especially in areas of local solar, energy efficient buildings, carbon and climate leadership, green jobs, preparedness and resiliency, air quality, and environmental justice. In addition, the pLAn advances the City's environment, economy, and social equity in 14 various categories with short term, near term (2025), and long-term (2035) targets. The following municipal targets from the pLAn would be applicable to the proposed Project:

- Recycle 100 percent of all wastewater for beneficial reuse by 2035.
- Reduce potable water use per capita by 22.5 percent by 2025; and 25 percent by 2035; and maintain or reduce 2035 per capita water use through 2050.
- Reduce VMT per capita by at least 13% by 2025; 39% by 2035; and 45% by 2050.
- Reduce port-related GHG emissions by 80% by 2050.
    - 100 percent zero emission cargo handling equipment
    - 100 percent zero emission on-road drayage trucks
- Reduce industrial emissions by 38% by 2035; and 82% by 2050.
- Increase tree canopy in areas of greatest need by at least 50% by 2028.

The proposed Project would include drought tolerant ornamental landscaping that would cover approximately 38.97 percent of the Project site. The proposed Project would also use a water-efficient automatic irrigation controller and would utilize reclaimed rainwater to irrigate the landscape areas. As such, the proposed project would be on track to achieving the water, wastewater, and canopy municipal targets for the City of Los Angeles. In addition, the proposed Project would not be powered by natural gas, and no natural gas demand is anticipated during construction or operation of the proposed Project. The elimination of natural gas in new development would help Projects implement their "fair share" of achieving long-term 2045 carbon neutrality consistent State goals. The proposed Project would also include all electric on-site equipment consistent with the goal of zero emission cargo handling equipment. As such, the

[62] Los Angeles, City of. 2019. *LA's Green New Deal – Sustainable City pLAn*. Website: https://plan.lamayor.org/sites/default/files/pLAn_2019_final.pdf (accessed June 2023).

proposed Project would be consistent with the goal of zero emission on-road drayage trucks. Therefore, the proposed Project would also be on track with the municipal goal of reducing 80 percent of the POLA GHG-related emissions by 2050. The proposed Project would include a trailer parking lot that would consist of 393 trailer stalls; therefore, the proposed Project would not increase VMT in the area and would be in consistent with the VMT municipal goal for the City. Therefore, the proposed Project would be consistent with the Sustainability City pLAn municipal targets.

### *2022 Scoping Plan*

The following discussion evaluates the proposed Project according to the goals of the 2022 Scoping Plan, EO B-30-15, SB 32, and AB 197.

EO B-30-15 added the immediate target of reducing GHG emissions to 40 percent below 1990 levels by 2030. CARB released a second update to the Scoping Plan, the 2017 Scoping Plan,[63] to reflect the 2030 target set by EO B-30-15 and codified by SB 32. SB 32 affirms the importance of addressing climate change by codifying into statute the GHG emissions reductions target of at least 40 percent below 1990 levels by 2030 contained in EO B-30-15. SB 32 builds on AB 32 and keeps us on the path toward achieving the State's 2050 objective of reducing emissions to 80 percent below 1990 levels. The companion bill to SB 32, AB 197, provides additional direction to the CARB related to the adoption of strategies to reduce GHG emissions. Additional direction in AB 197 intended to provide easier public access to air emissions data that are collected by CARB was posted in December 2016.

In addition, the 2022 Scoping Plan assesses progress toward the statutory 2030 target, while laying out a path to achieving carbon neutrality no later than 2045. The 2022 Scoping Plan focuses on outcomes needed to achieve carbon neutrality by assessing paths for clean technology, energy deployment, natural and working lands, and others, and is designed to meet the State's long-term climate objectives and support a range of economic, environmental, energy security, environmental justice, and public health priorities.

The 2022 Scoping Plan focuses on building clean energy production and distribution infrastructure for a carbon-neutral future, including transitioning existing energy production and transmission infrastructure to produce zero-carbon electricity and hydrogen, and utilizing biogas resulting from wildfire management or landfill and dairy operations, among other substitutes. The 2022 Scoping Plan states that in almost all sectors, electrification will play an important role. The 2022 Scoping Plan evaluates clean energy and technology options and the transition away from fossil fuels, including adding four times the solar and wind capacity by 2045 and about 1,700 times the amount of current hydrogen supply. As discussed in the 2022 Scoping Plan, EO N-79-20 requires that all new passenger vehicles sold in California will be zero-emission by 2035, and all other fleets will have transitioned to zero-emission as fully possible by 2045, which will reduce the percentage of fossil fuel combustion vehicles.

Energy efficient measures are intended to maximize energy efficiency building and appliance standards, pursue additional efficiency efforts including new technologies and new policy and

63 CARB. 2017a. *California's 2017 Climate Change Scoping Plan*. November.

implementation mechanisms, and pursue comparable investment in energy efficiency from all retail providers of electricity in California. In addition, these measures are designed to expand the use of green building practices to reduce the carbon footprint of California's new and existing inventory of buildings. As mentioned above, the proposed Project would not be powered by natural gas, and no natural gas demand is anticipated during construction or operation of the proposed Project. The elimination of natural gas in new development would help Projects implement their "fair share" of achieving long-term 2045 carbon neutrality consistent State goals. As such, if a Project does not utilize natural gas, a lead agency can conclude that it would be consistent with achieving the 2045 neutrality goal and will not have a cumulative considerable impact on climate change.[64] In addition, the proposed Project would comply with the CALGreen Code, regarding energy conservation and green building standards. Therefore, the proposed Project would comply with applicable energy measures.

Water conservation and efficiency measures are intended to continue efficiency programs and use cleaner energy sources to move and treat water. Increasing the efficiency of water transport and reducing water use would reduce GHG emissions. As noted above, the Project would comply with the CALGreen Code, which includes a variety of different measures, including the reduction of wastewater and water use. The proposed Project would also be required to comply with the California Model Water Efficient Landscape Ordinance. In addition, the proposed Project would include drought tolerant ornamental landscaping that would cover approximately 38.97 percent of the Project site. The proposed Project would also use a water-efficient automatic irrigation controller and would utilize reclaimed rainwater to irrigate the landscape area. Therefore, the proposed Project would not conflict with any of the water conservation and efficiency measures.

The goal of transportation and motor vehicle measures is to develop regional GHG emissions reduction targets for passenger vehicles. Specific regional emission targets for transportation emissions would not directly apply to the proposed Project. The second phase of Pavley standards will reduce GHG emissions from new cars by 34 percent from 2016 levels by 2025, resulting in a 3 percent decrease in average vehicle emissions for all vehicles by 2020. Vehicles traveling to the Project site would comply with the Pavley II (LEV III) Advanced Clean Cars Program. Therefore, the proposed Project would not conflict with the identified transportation and motor vehicle measures.

### *2020-2045 Regional Transportation Plan/Sustainable Communities Strategy*

SCAG's Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) identifies that land use strategies that focus on new housing and job growth in areas served by high quality transit and other opportunity areas would be consistent with a land use development pattern that supports and complements the proposed transportation network. The core vision in the 2020–2045 RTP/SCS is to better manage the existing transportation system through design management strategies, integrate land use decisions and technological advancements, create complete streets that are safe to all roadway users, preserve the transportation system, and expand transit and foster

[64] April. Bay Area Air Quality Management District (BAAQMD). 2022. *Justification Report: CEQA Thresholds for Evaluating the Significance of Climate Impacts From Land Use Projects and Plans.* Website: Microsoft Word - FINAL CEQA Thresholds Report for Climate Impacts 03_30_22 revisions with tracked changes (baaqmd.gov) (accessed June 2023).

development in transit oriented communities. The 2020–2045 RTP/SCS contains transportation Projects to help more efficiently distribute population, housing, and employment growth, as well as forecast development that is generally consistent with regional-level general plan data. The forecasted development pattern, when integrated with the financially constrained transportation investments identified in the 2020–2045 RTP/SCS, would reach the regional target of reducing GHG emissions from autos and light-duty trucks by 19 percent by 2035 (compared to 2005 levels). The 2020–2045 RTP/SCS does not require that local General Plans, Specific Plans, or zoning be consistent with the 2020–2045 RTP/SCS, but provides incentives for consistency for governments and developers.

Implementing SCAG's RTP/SCS will greatly reduce the regional GHG emissions from transportation, helping to achieve statewide emissions reduction targets. The proposed Project would not interfere with SCAG's ability to achieve the region's GHG reduction target of 19 percent below 2005 per capita emissions levels by 2035. Furthermore, the proposed Project is not regionally significant per *State CEQA Guidelines* Section 15206 and as such, it would not conflict with the SCAG RTP/SCS targets since those targets were established and are applicable on a regional level.

The proposed Project would include a trailer parking lot that would consist of 393 trailer stalls, it is anticipated that implementation of the proposed Project would not interfere with SCAG's ability to implement the regional strategies outlined in the RTP/SCS.

# CONCLUSIONS

Based on the analysis presented above, construction and operation of the proposed Project would not result in the generation of criteria air pollutants that would exceed SCAQMD thresholds of significance. Compliance with SCAQMD Rule 403: Fugitive Dust would further reduce construction dust impacts. The proposed Project is not expected to produce significant emissions that would affect nearby sensitive receptors. The Project would also not result in other emissions (such as those leading to odors) affecting a substantial number of people. GHG emissions released during construction and operation of the Project would not exceed the significance thresholds and thus would not be cumulatively considerable. In addition, the Project would be consistent with the State's GHG emissions reductions objectives embodied in the 2022 Scoping Plan and the 2020–2045 RTP/SCS. In addition, the proposed Project would not result in the wasteful, inefficient, or unnecessary consumption of energy resources or conflict with any applicable plans for renewable energy and energy efficiency.

# 8. User Changes to Default Data

| Screen | Justification |
|---|---|
| Land Use | Total project site is 18.635 acres. The proposed project would develop a trailer parking lot with a total of 393 trailer stalls, proposed project would also include 316,373 sq ft of landscaping |
| Construction: Construction Phases | Construction is assumed to start in the second quarter of 2025 and would occur for 8 months |
| Construction: Off-Road Equipment | Default construction equipment with Tier 3 engines |
| Operations: Off-Road Equipment | Project would utilize two small forklifts and a yard goat (off-highway truck). Equipment would be zero-emission and all-electric |
| Operations: Vehicle Data | Based on 1,808 average daily trip, including 1,794 |
| Operations: Fleet Mix | Fleet mix adjust to match trip generation, assuming that all truck trips will be HHDT |
| Construction: Trips and VMT | The Phase II Consultant identified a few potential sites for disposal of the exported soil: Chiquita Canyon Landfill (68 miles), Simi Valley Landfill (65 miles), Soil Safe Adelanto (117 miles). Assuming the Soil Safe Adelanto site to be conservative. |
