1 EXECUTIVE SUMMARY

A Phase I Environmental Site Assessment (ESA) was performed by Kleinfelder for Ascent Environmental, Inc (Ascent) (Client), on behalf of the City of Rancho Cucamonga and BTC III Arrow Route CC, LP (Applicant/Owner/User), for property located south and southwest of the intersection of Arrow Route and Yellow Wood Road/Juneberry Drive in the City of Rancho Cucamonga (the City), San Bernardino County, California (Subject Property) (Figure 1). The Subject Property includes four parcels of land identified by the San Bernardino Assessor's Office as Assessor's Parcel Numbers (APNs) 0229-121-33-0000, 0229-121-34-0000, 0229-121-35-0000, and 0229-131-19-0000 (Figures 1 and 2).

BTC III Arrow Route CC, LP (applicant) is proposing to re-develop the Subject Property. Re-development would include the demolition and clearing of surface-paved areas and construction of five two-story (single story with mezzanine) buildings for general warehouse space, associated office space, and loading docks for truck trailers. The buildings are proposed to be surrounded by asphaltic concrete pavements in the parking and drive lanes, including 922 automobile parking spaces and 424 truck-trailer parking spaces. The proposed project would also include the creation of a new vehicle circulation system, water quality basins, utility infrastructure, exterior lighting and signage, and provide roughly 10 percent landscape coverage. In total, the proposed project would introduce approximately 1,830,729-gross-square feet of new building floor area. Vehicle access to the Subject Property would be provided by public roadways connecting the Subject Property to Arrow Route and Etiwanda Avenue.

DRAFT

Information gathered and activities performed for this Phase I ESA were consistent with the guidelines in ASTM International Designation E1527-21, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (the "ASTM Standard"), the All Appropriate Inquiry (AAI) section of the Small Business Liability Relief and Brownfields Revitalization Act (the Federal Brownfields Law).

A summary of findings is provided below:

- The Subject Property is located at 12451 Arrow Route, south and southwest of the intersection of Arrow Route and Yellow Wood Road/Juneberry Drive in the City of Rancho Cucamonga, San Bernardino County, California and consists of approximately 94.247 acres of land which is identified by the following San Bernardino County APNs and associated historical addresses (Figures 3 through 6):

Copyright 2024 Kleinfelder

- APN 0229-121-33 (Parcel 2/South Parcel; Figure 4), located in the southwestern-central portion of the Subject Property, associated with addresses of 12459 Arrow Route and 12353 Arrow Route, Etiwanda CA 91739;
- APN 0229-121-34 (Parcel 1/West Parcel; Figure 3), located in the western portion of the Subject Property, associated with addresses of 12459 Arrow Route and 12343 Arrow Route, Etiwanda CA 91739;
- APN 0229-121-35 (Parcel 4/North Parcel; Figure 6), located in the north-central portion of the Subject Property adjoining Arrow Route, associated with an address of 12451 Arrow Route, Etiwanda CA 91739; and
- APN 0229-131-19 (Parcel 3/East Parcel; Figure 5), located in the southeastern portion of the Subject Property, assigned addresses of 12455 Arrow Route and 12459 Arrow Route, Etiwanda CA 91739.

- Historically, the Subject Property was developed for agricultural use from at least 1938 until 1954. A small structure was added to the southeast corner of the Subject Property in 1953, which was later identified as a water tower in the historical records. Steel mill development began circa 1959 in the southeastern portion of the Subject Property (APN 0229-131-19). By 1966, the southeastern Subject Property parcel (east parcel) had been fully developed with stockpiles associated with the industrial activities covering the parcel. Between 1975 and 1990, the melt shop, parking lots, material storage areas, and railroad spurs were developed in the western half of the Subject Property (APN 0229-121-33 and APN 0229-121-35). A thin strip of vacant land (APN 0229-121-34) remained along the western boundary of the Subject Property. By 1990, the north parcel of the Subject Property had been developed with a large commercial building (Fontana Steel) and by 2002, the vacant strip of land along the western boundary of the Subject Property had been covered with material storage. The industrial use of the property continued through 2020. Past occupants of the Subject Property APNs 0229-121-33, 0229-121-34, and 0229-131-19 included American Pipe and Construction, United Slag Processing, Ameron Steel (Ameron), Ameron Steel and Wire, TAMCO, Tervita, Tube City, Phoenix Services LLC, Olympic Mills, and Gerdau Ameristeel. Past occupants of Parcel 0229-121-35 included Ameron Pipe, Fontana Steel, Commercial Metals Company (CMC) Fabricators, and CMC Rebar. TAMCO was formed by Ameron (formerly American Pipe and Construction), Tokyo Steel, and Mitsui Corporation in 1974. TAMCO operated the melt shop, which was constructed in 1976, and later took over operating the Rolling Mill in the southeast portion of the Subject Property in 1983. TAMCO was bought by Gerdau

DRAFT

Copyright 2024 Kleinfelder

Ameristeel in October 2010. Tervita, Tube City, Olympic Mills, and Phoenix Services LLC appear to have been slag management/processing businesses that operated at the TAMCO facility. The north parcel (APN 0229-121-35) had been occupied by Fontana Steel and then CMC Rebar Etiwanda between 1988 and 2022. Fontana Steel obtained the property in 1987 after Ameron, Inc sold it to Kaiser Steel, who then traded it to Fontana Steel. Fontana Steel and later CMC Rebar performed rebar manufacturing on this north parcel. BTC III Arrow Route CC LLC obtained the deed for APNs 0229-121-33, 0229-131-19, 0229-121-34 from TAMCO and the deed for APN 0229-121-35 from CMC Steel Fabricators Inc in 2021. The former structures on the Subject Property were demolished in 2022.

- Fontana Steel and later CMC Rebar were listed as small quantity generators (SQG). Oils and lubricants associated with equipment maintenance were used and stored on site. Wash water drained to a clarifier where the water was allowed to evaporate. Sludge was removed periodically. A 12,000-gallon diesel underground storage tank (UST) and fuel dispensers were installed at the Fontana Steel facility in 1989, one fuel dispenser was abandoned in 1999, and the UST and remaining fuel dispenser were removed in 2014.
- As part of the property transaction between Ameron and Fontana Steel in 1987, Ameron was to remove all hazardous materials from the property. Ameron had buried baghouse dust in three trenches on the parcel. These trenches were excavated, the baghouse dust removed, and confirmation samples were collected in 1987. Subsequent investigations were performed between 1998 and 2001 to assess if residual contamination remained. Slag material was present up to 10 feet below ground surface (bgs), no baghouse dust was observed, and soluble lead and chromium concentrations above California Code of Regulations (CCR) Title 22 soluble threshold limit concentrations (STLC) were not detected in the samples analyzed. In addition to the assessment of the former baghouse trenches, during a 1999 Phase II ESA investigation, soil samples were collected near the oil/water separator/wash area and the diesel UST. Total petroleum hydrocarbons (TPH) were not detected in these areas. The associated cleanup case was issued a No Further Action (NFA) determination on December 20, 2001.
- Based on review of regulatory database listings, TAMCO was listed as a large quantity hazardous waste generator (LQG) between 1974 and 2022. TAMCO was listed as generating aggregate slag, baghouse dust, mill scale (ferrous metal), and steel manufacture chemicals associated with steelmaking. The Facility and Manifest Data (HAZNET) database listing indicates that the following wastes were generated by TAMCO: baghouse waste, waste oil and mixed oil, oxygenated solvents, hydrocarbon solvents,

DRAFT

Copyright 2024 Kleinfelder

oil/water separator sludge, detergent waste chemicals, gas scrubber waste, paint sludge, and latex waste between 1989 and 2021; contaminated soil waste from site cleanup activities between 1990 and 2021; asbestos-containing waste in 2000, 2005, 2011, 2018 and 2021; polychlorinated biphenyls (PCBs) and material containing PCBs in 1990, 1993, 2011 and 2013; hydrocarbon solvent waste between 1995 and 2015; and halogenated solvents/liquids with halogenated compounds between 1991 and 2012. Multiple USTs and aboveground storage tanks (ASTs) had historically been present at the TAMCO facility. Four 50,000-gallon fuel oil USTs (associated with a former furnace used at the Rolling Mill) had been installed in 1975 and removed in 1993; four 12,000-gallon diesel/fuel oil USTs were found by TAMCO near the southern boundary of APN 0229-131-19 and removed in 2006; one 300-gallon diesel UST was removed from near the cooling towers and generators north of the Melt Shop in 2010; a split UST consisting of a 10,000-gallon diesel compartment and a 2,000-gallon gasoline compartment and associated fuel dispensers and piping were removed in 2022; and a 10,000-gallon diesel UST was discovered during demolition of the former Melt Shop and was removed in 2023. For the 50,000-gallon USTs, approximately 474-cubic yards of impacted soil were excavated and removed. Confirmation samples were collected and areas with detected TPH were excavated and resampled until hydrocarbon concentrations were not detected. Confirmation soil samples from the 300-gallon diesel UST were reported to contain TPH-d at a concentration of 1,720 milligrams per kilogram (mg/kg); ethylbenzene at a concentration of 57 micrograms per kilogram (µg/kg); and total xylenes at 423 µg/kg. TPH-d and ethylbenzene remain in soil above commercial/industrial screening levels. For the remaining tanks, constituents in confirmation samples were either not detected or detected concentrations did not exceed commercial/industrial screening levels and cases were issued closure by the SBCFD. ASTs were reported to contain oxygen, nitrogen, propane, oil, gear oil, sodium hypochlorite, lubricating fluids, waste oil, diesel, and lime.

- Various cleanup cases were associated with the TAMCO facility. In 1986, water runoff containing baghouse dust from TAMCO had flowed into the property adjoining TAMCO to the southwest. TAMCO constructed a concrete dam to contain the runoff in 1986; however, approximately 21 acres of the adjoining property had been impacted with metals from the baghouse dust (primarily lead). Assessment and then remedial excavation were performed under direction of the Santa Ana Regional Water Quality Control Board (RWQCB) to remove the lead-impacted soil with cleanup goals of 50 mg/kg for solids and 5 milligrams per liter (mg/L) for STLC. The RWQCB closed the case November 7, 1990, after confirmation samples confirmed that the contaminated soil had been removed.

DRAFT

Copyright 2024 Kleinfelder

Approximately 3,300-cubic yards of impacted soils were excavated and stabilized under a variance from the Department of Toxic Substances Control (DTSC). After stabilization, the treated soil was stockpiled and then a portion was used to backfill UST excavations in 1993.

- The United States Environmental Protection Agency (USEPA) performed a preliminary assessment of the TAMCO facility in 1994. The report indicated that some baghouse waste was irradiated when a canister containing cesium went into the furnace. A portion of this irradiated waste was sent off site for disposal at Kettleman Hills hazardous waste landfill in May 1985. The California Department of Health Services determined the irradiated load would be left in place at Kettleman Hills. The remaining waste identified as radioactive waste was sent for disposal at U.S. Ecology. TAMCO subsequently has performed radioactive screening of scrap metal brought to the facility. In 1988, soils southwest of the TAMCO facility had been impacted by runoff containing baghouse waste. Lead concentrations up to 135 mg/L, zinc up to 1,860 mg/L, and cadmium up to 5.7 mg/L were reported in soil samples from the property southwest of TAMCO. Approximately 3,300-cubic yards of impacted soils were excavated and stabilized under a variance from the DTSC. After stabilization, the treated soil was stockpiled and then a portion was used to backfill UST excavations in 1993. This report identified that the baghouse waste generated at the facility was identified as a Resource Conservation and Recovery Act (RCRA) waste, which was generally transported off site by railcar to a disposal facility. The report identified that baghouse waste was present in a 250-feet long by 100-feet wide and 25-feet tall slag pile in the northwest portion of the TAMCO facility. This slag pile was reported to have been sampled in 1993 and elevated concentrations of cadmium, chromium, lead, nickel, and zinc were present. The report identified the stabilized soil, the slag pile, and the radioactive baghouse waste as areas where hazardous wastes are present on the TAMCO facility. Stormwater runoff was reported to flow southeast and southwest. A retention basin captures the runoff to the southwest, and the runoff to the southeast flows into the Chadwick Channel. Wastewater from the cooling tower was reported to have been piped to the Chino Basin Publicly Owned Treatment Works. Waste from the maintenance shops included waste solvents, degreasers, and oils, which were stored in drums and disposed of off site. Before removal, the drummed waste was stored in a bermed concrete hazardous materials storage area. Stained concrete was observed in the maintenance areas. The USEPA preliminary assessment concluded that, based on the depth to groundwater, it is unlikely that TAMCO's operations would impact groundwater, therefore, the facility does not qualify for further remedial assessment under

DRAFT

Copyright 2024 Kleinfelder

the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA).

- Remediation of the 41,000-cubic-yard stockpile mixed slag and baghouse dust stockpile identified in the USEPA report was performed under the oversight of the San Bernardino County Fire Department in 2000. Non-slag (baghouse dust) was separated from the slag material using a rotary drum separation method. The clean slag was tested and then sold by Olympic Mills or crushed and reused in cement. A couple of depressions filled with slag and baghouse dust were found beneath the stockpile after its remediation. These depressions were excavated, and confirmation samples collected. The slag remediation case was closed in 2002 with residual contamination remaining in soil. The closure letter indicated that the residual concentrations were below hazardous waste thresholds, and no further action was required.
- During a field inspection performed in 2005, the DTSC identified that TAMCO receives large quantities of scrap metal for smelting and producing rebar and that the scrap metal was stored in piles without containment. Scrap metal contains lead, chromium, copper, nickel, and zinc. The DTSC performed shallow soil sampling around the stockpiles and the sample analytical results indicated the presence of high lead concentrations in soil around the stockpile located at Pad 16. TAMCO completed additional sampling in 2006 and then excavated and disposed of the impacted soils. Confirmation sampling was performed to verify the removal of impacted soil. Areas were paved to the north and south of the scrap piles and barriers were installed to separate piles, and a stormwater treatment system was constructed to prevent contamination from leaving the paved areas. A State of California Environmental Protection Agency (CalEPA) DTSC, Docket No. HWCA 2005 0964, Consent Order, was signed April 26, 2007 by TAMCO and May 2, 2007 by DTSC summarizing the sampling, cleanup, and actions taken to control runoff and infiltration of metals into the soils around the piles. The Consent Order directed that TAMCO will minimize the release of contaminants by using barriers or wind breaks to prevent the powder from being carried by wind, and required routine cleanup of residual dust from scrap piles and installation of track-out controls to prevent the dust from being tracked out by trucks.
- The Subject Property was listed under BTC III Arrow Route, as an active voluntary cleanup site on Envirostor as of August 24, 2022. The application indicated that the Subject Property was vacant and the previous structures had been demolished in preparation for redevelopment. Previous occupants of the Subject Property were listed as Etiwanda Steel Producers in 1956, Ameron Steel / Ameron Pipe Products in 1970, Tamco Steel in 1974,

DRAFT

Copyright 2024 Kleinfelder

Fontana Steel in 1988, Gerdau Steel in 2013, and CMC Steel in 2018. Soil and soil vapor have been impacted by historic operations at the Subject Property. Constituents of concern included pesticides/herbicides, metals, petroleum hydrocarbons, and volatile organic compounds (VOCs). Multiple closed cleanup cases were listed in association with the Subject Property, including a NFA status for lead remediation issued by the RWQCB in 1990, a NFA for UST removal issued in 1994 by San Bernardino County Department of Environmental Health (SBCDEH), excavation oversight performed by the DTSC in 2001, NFA for slag stockpile remediation in 2002 by San Bernardino County Fire Department (SBCFD), NFAs for UST removal in 2006, 2011, and 2014 by SBCFD, and a Consent Order in 2007 by the DTSC. Two Phase II ESA investigations, one by Ramboll US Consulting, Inc. (Ramboll) and one by Roux Associates, Inc. (Roux) were reported to have been performed in 2021. The Voluntary Cleanup Agreement between BTC III Arrow Route CC LP and the DTSC for the Subject Property was signed October 6, 2022 and executed on October 26, 2022.

- Ramboll advanced 99 soil bores (including 33 step-out bores) across the Subject Property in 2020 and 2021 as part of a Phase II subsurface investigation. Bores were advanced in areas of previous cleanup cases, and in a grid pattern across the Subject Property. Of these bores, 26 were converted to soil vapor probes. Slag material was encountered at depths up to 10 feet bgs in 33 of the 99 bores. In summary, soil analytical results indicated gasoline-range TPH (TPH-g) was only detected in one soil sample collected at a depth of 3 feet bgs. The TPH-g concentration detected (0.00034 mg/kg) did not exceed commercial screening levels. Diesel-range TPH (TPH-d) was present in 15 of the initial soil samples and 11 of the step-out soil samples. TPH-d concentrations ranged from 11.8 mg/kg to 9,230 mg/kg (collected at 1 foot bgs). Two of the initial soil samples (RSB-03 and RSB-05) contained TPH-d concentrations that exceeded commercial screening levels and both samples were collected at 1 foot bgs. The concentrations in the step-out bores in these areas also exceeded commercial screening levels. The TPH-d concentrations exceeding commercial screening levels were located south of the Bundling Station and near the west boundary of APN 0229-121-33. Oil-range TPH (TPH-o) was present in 19 of the initial samples and seven of the step-out samples. TPH-o concentrations ranged up to 11,000 mg/kg. TPH-o concentrations did not exceed the TPH-o commercial screening levels. VOCs including 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, benzene, ethylbenzene, m,p-xylene, o-xylene, p-cymene, and tetrachloroethylene (PCE) were present in soil samples at concentrations below their respective commercial screening levels. Lead concentrations were, however, present in samples collected up to 3 feet bgs

DRAFT

Copyright 2024 Kleinfelder

that were above their respective commercial screening levels, at concentrations ranging up to 2,910 mg/kg. Lead concentrations exceeding commercial screening levels were present north of the Warehouse Maintenance building, and east part of the Mobile Maintenance building. Cadmium, lead, and zinc were detected at concentrations above their respective CCR Title 22 hazardous waste thresholds (total threshold limit concentrations [TTLCs]) in three soil samples, and one soil sample had soluble lead that exceeded the RCRA toxicity characteristic leaching potential (TCLP) limit. Six samples were analyzed for PCBs and PCBs were not detected. VOCs including PCE and chloroform were detected in soil vapor samples above commercial screening levels with an attenuation factor of 0.001 applied. Chloroform was detected at concentrations ranging from 0.06 microgram per liter (µg/L) to 1 µg/L, and PCE was detected at concentrations ranging from 0.08 µg/L to 100 µg/L. PCE concentrations appeared to decrease in a second sampling event. Ramboll recommended a Site-Specific Soil Management Plan (SMP) be prepared for future construction at the Subject Property to manage the slag material present in the subsurface and the areas with TPH-d, lead, zinc, and cadmium concentrations. Ramboll concluded that the TPH-d in shallow soils above commercial screening levels appeared to be limited laterally and vertically. Ramboll recommended that soil in the areas containing elevated lead, zinc, and cadmium concentrations be removed off site for disposal. Ramboll also indicated that the PCE-impacted soil vapor appeared to be localized in the eastern portion of the Parts Warehouse building and appeared to be limited to the upper 15 feet bgs.

- Roux performed subsequent environmental investigations in 2021, 2022 and 2023, including sampling along the railroad spurs present on the Subject Property, sampling in a former chemical storage area northwest of the former Melt Shop, sampling at a wash rack located in the northern portion of APN 0229-121-33, sampling in the location of a former subsurface clarifier and aboveground oil recovery system on APN 0229-121-35, and sampling in the vicinity of former USTs. Roux's investigations identified PCB concentrations greater than screening levels in soil samples collected along the railroad spurs on APNs 0229-121-33 and 0229-131-19, and in concrete samples from an area of pink concrete in the vicinity of the Rolling Mill. Soil and soil vapor samples collected from the former chemical storage area, wash rack, and former UST areas did not contain concentrations exceeding commercial screening levels. Pesticide and herbicide concentrations in samples collected across the Subject Property do not exceed commercial screening levels. TPH-d and metals exceeding commercial screening levels are present in soil at depths less than 5 feet bgs in the southern portions of APNs 0229-

DRAFT

Copyright 2024 Kleinfelder

121-33 and 0229-131-19. VOCs were not detected in soil samples greater than screening levels. Soil vapor investigations identified that PCE, trichloroethylene (TCE), benzene, and chloroform were present in soil vapor beneath APN 0229-131-19 at concentrations exceeding commercial screening levels. Roux indicated in their most recent Subsurface Investigation Report that lateral and vertical delineation of soil vapor is still required, and recommended soil vapor extraction (SVE) as a remedial method for the soil vapor impact. Roux indicated that SVE wells and a pilot test had been performed in 2022. Roux also recommended further delineation of TPH-d, metals, and semi-volatile organic compounds (SVOCs) in shallow soils, and further delineation of PCB impacted soils near the railroad spurs. Finally, Roux recommended evaluation of the physical distribution and chemical composition of the slag material present in the western portion of the Subject Property. In their Current Conditions Report, prepared in October 2023, Roux indicated that remediation was not required on APNs 0229-121-34 and 0229-121-35, and that the additional delineation activities for TPH-d and metals in soil, PCBs in soil and concrete, and VOCs in soil vapor were all present on APNs 0229-121-33 and 0229-131-19. Roux's Current Conditions Report included a workplan to perform delineation activities.

- During the Subject Property reconnaissance, the Subject Property was observed to be mostly vacant. A guard shack was present at the entrance to the Subject Property off Juneberry Drive and a paved driveway extended south into the Subject Property with a small parking lot adjoining the guard house. Three Southern California Edison (SCE) electrical substation enclosures were present in the southern portion of the Subject Property. One empty enclosure was present in the southern portion of APN 0299-131-35; and two enclosures with SCE equipment were present in the southern portion of APN 0229-131-19. Foundations of the previous steel mill operation structures (including the Melt Shop and the Rolling Mill) remained present in the south-central and southeastern portions of the Subject Property. Railroad spurs were still present extending throughout the southern Subject Property parcels. Evidence of excavation activity and multiple stockpiles were present across the Subject Property. Soil stockpiles were present on APN 0229-121-35 (address 12451 Arrow Route) and stockpiles of slag, broken concrete, and broken asphalt from the facility's previous operations and from facility demolition activities were present on the western portion of the Subject Property. The slag stockpiles appeared to be on concrete pads. Areas with dark staining were observed in the southern and western portions of the Subject Property. Utility main lines, including water, power, sewer, and storm drains, remained present on the Subject Property. A pad-mounted transformer was present in the northern portion of APN 0229-131-19 and a second pad-mounted

DRAFT

Copyright 2024 Kleinfelder

transformer was present in one of the SCE enclosures on APN 0229-131-19. Two storm water detention ponds were present on the Subject Property: one in the southeast corner of APN 0229-131-19, and one in the southwest corner of APN 0229-121-33. A non-potable production well and a former three-stage catch basin were also located in the southeastern corner of the Subject Property. SVE wells associated with the site assessment activities are located in the southeast portion of the Subject Property. A former sump/clarifier was present in the southwest corner of APN 0229-131-19. During the Subject Property reconnaissance site assessment drilling activities were occurring on APN 0229-131-19. Based on the Subject Property owner representative and their consultant, Roux, ongoing site assessment activities (soil vapor assessment on APN 0229-131-19 and diesel assessment on the southern portion of APN 0229-121-33) and an active PCB investigation on APN 0229-131-19 are being conducted at the Subject Property under DTSC oversight. Some of the former structure foundations and former equipment pads remain in place as a result of the ongoing investigation.

- At the time of the Subject Property reconnaissance, the adjoining properties were observed to be commercial/industrial. A Goodman distribution center was present west of the northern portion of the Subject Property and east-northeast of the southeastern portion of the Subject Property. An unoccupied former industrial building (formerly occupied by Tree Island Wire – a steel wire manufacturer) was located west of the central portion of the Subject Property and north of the southeastern portion of the Subject Property. A trucking facility (Central Transport) was located east of the southeastern portion of the Subject Property. The properties west of the Subject Property were occupied by Parallel Products (a facility that recycles alcohol to produce ethanol), and a car auction yard (Copart Rancho Cucamonga). Railroad tracks were present adjoining the Subject Property to the south, and properties south of the railroad tracks included a vacant property with multiple stockpiles (former Etiwanda Generating station) and a SCE Battery, Energy, Storage Systems (BESS) Separator Facility. Multiple kegs, totes, ASTs, and pooling liquid were observed on the Parallel Products property; however, these likely contain alcoholic beverages that will be recycled. Additionally, there is the potential for hazardous materials to be present at the SCE facility south of the Subject Property. Hazardous materials and petroleum products were not observed to be stored on the properties adjoining the Subject Property at the time of the Subject Property reconnaissance. No other indications of obvious or suspect recognized environmental conditions (RECs) were apparent on the adjoining properties at the time of Kleinfelder's Subject Property reconnaissance.

DRAFT

Copyright 2024 Kleinfelder

- According to previous environmental investigations at the former generating station property to the south and the adjoining property to the east, groundwater ranges from 300 to 400 feet and primarily flows to the southwest.
- Multiple cleanup cases are associated with the adjoining properties; however, based on the depth to groundwater it is unlikely that these releases will have impacted the Subject Property, with the exception of the following:
    - DP Etiwanda, located at 8822 Etiwanda Avenue, is located east and adjoining the southeastern Subject Property parcel (east parcel), APN 0229-131-19. This facility was listed as a voluntary cleanup case with land use restrictions. The facility was used for automobile and scrap metal recycling from 1975 through 2017 and has since been redeveloped as a transportation facility. Prior to redevelopment, a soil and soil vapor investigation of the property was performed by Ramboll in July 2018, and concentrations of metals, TPH, and PCBs were reported to be present in soil samples. Subsequently, remedial excavation was performed to remove contaminated soil. Confirmation soil samples indicated that residual metal and PCB concentrations at the property were below commercial/industrial screening levels, except for areas along the western, northern, and southern property boundaries. A Land Use Covenant between DP Etiwanda and DTSC was executed on August 19, 2020, restricting the property to commercial/industrial use. A subsequent investigation to delineate residual soil impact along the property boundaries was performed in August 2020. Refusal between 1 and 2.5 feet bgs was encountered in many of the bores along the western property boundary (adjoining the Subject Property). Based on Kleinfelder's review of the investigation results, lead was reported to present at a maximum concentration of 379 mg/kg in a 0.5-foot soil sample in the west-northwest boundary of the property in 2018. Samples from the step-out bore advanced to the west of the location of the maximum result in 2020 indicated that lead was present at 0.5 foot at 83 mg/kg, and at 6.9 mg/kg at 2 feet. PCB concentrations were present above commercial screening levels in soil samples collected from the 2018 excavation on the west-southwest boundary of the property. The maximum concentration of Aroclor-1248 was 11.7 mg/kg at 0.5 feet and the maximum concentration of Aroclor-1254 was 2.47 mg/kg, also in a 0.5-foot sample, though PCB concentrations were reported at depths down to 3 feet bgs at some locations. Only a 0.5-foot sample was collected at the step-out location to the west of the highest Aroclor-1248 concentration, but the analytical results indicated an Aroclor-1248 concentration of

DRAFT

Copyright 2024 Kleinfelder

0.39 mg/kg. Samples from the other two step-out bore locations contained PCB concentrations and did not further delineate the impacted soil. The southeast corner of the Subject Property adjoins this PCB-impacted area. A concrete cinder block wall was reported to be present on the Subject Property boundary preventing any further step-out bore assessments. Ramboll indicated that the residual concentrations of lead present along the south and northwest boundaries were localized and slightly above the commercial/industrial screening levels. Ramboll indicated that the step-out sample results did not exceed the previously maximum-detected PCB result and that the concrete cinder block wall along the western boundary acts as a barrier to limit the PCB impact. Ramboll also indicated that the lead and PCB concentrations were adequately characterized and do not present a human health risk since the property has a land use covenant limiting it to industrial use.

Based on the results of the Phase I ESA, no RECs, controlled RECs (CRECs), historical RECs (HRECs), or *de minimis* conditions were identified for the Subject Property, except for the following:

DRAFT

RECs

- The long history of industrial use of the Subject Property and ongoing site assessment and cleanup activities at the Subject Property are considered a REC. This includes the presence of PCB concentration along the rail spurs and in areas around the former rolling mill on APN 0229-131-19; the presence of TPH-d, SVOCs, and metals in shallow soil on APNs 0229-121-33 and 0229-131-19; and the presence of PCE, TCE, benzene, and chloroform in soil vapor on APN 0229-131-19.
- The active Land Use Covenant (LUC), residual concentrations of metals, TPH, and PCBs, and active soil management plan at the east adjoining DP Etiwanda facility is considered a REC.
- One 300-gallon diesel fuel UST was removed from APN 0229-121-33 in November 2010. Based on confirmation soil sampling, this UST was closed with residual contamination of TPH-d and ethylbenzene present above commercial/industrial screening levels.

CRECs

- Baghouse dust waste and slag was historically stockpiled on APNs 0229-121-33 and APN 0229-121-34. The stockpile was remediated, and depressions beneath the stockpile full of baghouse dust and slag were excavated and confirmation soil samples were collected.

Copyright 2024 Kleinfelder

The remediation case was closed by the SBCFD with residual concentrations remaining in soil and a NFA determination was issued July 2, 2002, provided land use of the Subject property didn't change. Ramboll performed limited soil sampling in the footprint of the former slag stockpile. Soil analytical results did not exceed commercial/industrial screening levels; however, there remains the potential for pockets of lead impacted soil to remain.

- A lead-impacted area north of Pad16 was excavated in 2006. Confirmation samples were collected and overexcavation performed wherever lead exceeded hazardous waste thresholds. DTSC and TAMCO signed a Consent Order in 2007 concerning actions taken to control runoff and infiltration of metals into the soils around the piles. Ramboll collected soil samples from a bore advanced in the approximate center of the Pad 16 remedial excavation. Analytical results did not exceed commercial screening levels.

HRECs

- Soil contaminated by metal impacted runoff water on the adjoining property southwest of APN 0229-121-33 was excavated, stockpiled, and stabilized between 1989 and 1990. The stabilized soil was stockpiled on the former TAMCO facility for use in future construction projects. SARWQCB issued a NFA on November 7, 1990.
- Four 50,000-gallon fuel oil USTs were removed from APN 0229-131-19 in November 1993, and approximately 474-cubic yards of impacted soil were excavated and removed. Confirmation samples were collected and areas with detected TPH were excavated and resampled until hydrocarbon concentrations were not detected. The San Bernardino County Department of Environmental Health Services determined NFA on April 28, 1994.
- Stabilized soil from the 1990 cleanup case summarized above was used as backfill for excavation of the four fuel oil USTs removed in 1993. Roux collected soil samples from the backfill material in this former UST excavation area. Soil analytical results do not exceed commercial screening levels.
- Baghouse dust waste and slag was excavated from trenches in APN 0229-121-35 in 1988 under oversight by the DTSC. Between 1998 and 2001, samples were collected from within and adjoining the trenches. Sample analytical results indicated that the remaining metals concentrations met health-based criteria for unrestricted land use in a letter dated December 20, 2001.

DRAFT

Copyright 2024 Kleinfelder

- Four 12,000-gallon diesel USTs were removed from the southwest portion of APN 0229-131-19 in 2006. Confirmation samples indicated that analyzed constituents were not detected.
- One 12,000-gallon diesel UST was removed from APN 0229-121-35 in June 2014. Based on confirmation samples, no significant release had occurred and the case was closed.
- A dual-compartment UST (one compartment 10,000-gallon diesel and one compartment 2,000-gallon gasoline) and associated equipment was removed from the northwest portion of APN 0229-131-19 in December 2022. Constituents in confirmation samples were either not detected or detected concentrations did not exceed commercial/industrial screening levels. The case was issued closure by the SBCFD.
- A 10,000-gallon UST was discovered during demolition of the Melt Shop. This UST was removed in 2023. Constituents in confirmation samples were either not detected or detected concentrations did not exceed screening levels. Closure was issued by the SBCFD.

De minimis conditions

- Dark-stained soil was observed in the southern and western portions of the Subject Property. Given the depth of groundwater, it is unlikely that potentially impacted soil has affected groundwater, and removal by excavation, confirmation sampling, and disposal is recommended.

BER

Although not considered a REC pursuant to ASTM Standard E 1527-21, the following BER has been identified:

- Buried slag material is generally not hazardous, and was historically encountered during previous investigations, therefore the presence of slag is considered a BER.

Recommendations

Based on the findings and conclusions of this Phase I ESA, Kleinfelder has the following recommendations for further assessment.

  - Continue to manage soil under a soil management plan.
  - Sampling of soil along the Subject Property boundary for organochlorine pesticides (OCPs), metals, TPH, VOCs, PCBs, and polycyclic aromatic hydrocarbons (PAHs) to assess impacts due to historical agricultural, railway right-of-way, and current

DRAFT

Copyright 2024 Kleinfelder

soil management and land-use covenants in place in some of the adjacent properties.

- Kleinfelder agrees with Roux's recommendation for SVE remediation.
- Sampling of soil vapor in the proposed building footprints to assess potential impact to indoor air quality.

Deviations from the Phase I ESA Standard (if any) are discussed in Section 8 of this report. This report is subject to the limitations in Section 2.5.

DRAFT

Copyright 2024 Kleinfelder

2 INTRODUCTION

This report is a summary of work performed using the guidelines set forth in ASTM Designation E1527-21, *"Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process"* and AAI standards of the Small Business Liability and Brownfields Revitalization Act (the "Brownfields Law"). This report also generally conforms to the ASTM Standard's suggested table of contents. Minor format modifications have been made to the ASTM Standard's suggested table of contents to assist in better reading and understanding the report findings.

The purpose of this Phase I ESA is to identify potential or known hazardous materials, hazardous waste, and contamination, which may be present in the Subject Project vicinity. Information gathered and activities performed for this Phase I ESA were consistent with applicable guidelines set forth in ASTM Designation E1527-21, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*. Pursuant to the ASTM Standard and limitations discussed in this report, RECs, and other environmental issues related to the Subject Property will be evaluated:

2.1 PURPOSE

The purpose of this Phase I ESA is to identify RECs, to the extent feasible pursuant to the scope of services defined in our Proposal No. MW232277.001P/LH22P146237 dated June 28, 2023 and limitations discussed in this report. As defined in the ASTM Standard, a REC is:

> *The presence of hazardous substances or petroleum products due to a release to the environment; (2) likely presence of hazardous substances or petroleum products due to a release or likely release to the environment; or (3) presence of hazardous materials or petroleum products under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions.*
>
> *Note: "Likely" is that which is neither certain nor proved, but can be expected or believed by a reasonable observer based on the logic and/or experience of the environmental professional, and/or available evidence, as stated in the report to support the opinion given therein.*

DRAFT

Copyright 2024 Kleinfelder

As defined in the ASTM Standard, a *de minimis* condition is:

> *A condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.*

ASTM Standard E1527-21 definition of a CREC is:

> *… a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use limitations, activity and use limitations, institutional controls, or engineering controls).*

Additionally, the ASTM Standard defines HRECs, as:

> *… a past release of any hazardous substances or petroleum products that has affected the Subject Property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to environmental controls.*

DRAFT

The final decision on whether a past release is an HREC rests with the Environmental Professional (EP), and will be influenced by the current impact (if any) of the past release to the Subject Property.

Finally, the ASTM Standard defines a BER as:

> *"…a risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of a parcel of commercial real estate, not necessarily limited to those environmental issues required to be investigated in this practice. Consideration of business environmental risk issues may involve addressing one or more non-scope considerations..."*

This report describes Kleinfelder's assessment methodology and documents our findings, subject to the limitations presented in Section 2.5 of this report.

Copyright 2024 Kleinfelder

Kleinfelder professionals conducting this site assessment included Ms. Lindsey Dandridge-Perry and Mr. Alan Rodriguez, who performed the Subject Property reconnaissance, and Ms. Lindsey Dandridge-Perry, who was the primary author of this report. Ms. Lizanne Simmons provided project oversight. Resumes of Environmental Professionals are available from Kleinfelder upon request.

2.2 DETAILED SCOPE OF SERVICES

The following sections describe Kleinfelder's work scope:

Section 2, **Introduction**, includes a discussion of the purpose/reason for performing the Phase I ESA, additional services requested by the Client (e.g., an evaluation of business environmental risk factors associated with the Subject Property), significant assumptions (e.g., property boundaries if not marked in the field), limitations, exceptions, special terms and conditions (e.g., contractual), and user reliance parameters.

Section 3, **Subject Property Description**, is a compilation of information concerning the Subject Property location, legal description (if provided by the Client), current and proposed use of the Subject Property, a description of structures and improvements on the Subject Property at the time of Kleinfelder's assessment, and adjoining property use.

Section 4, **Records Review**, is a compilation of Kleinfelder's review of several databases available from Federal, State, and local regulatory agencies regarding hazardous substance use, storage, or disposal at the Subject Property and off-Subject Property facilities within the search distances specified by the ASTM Standard. Records provided by the Client are summarized, and copies of relevant documents are included in the appendices of this report. Physical setting sources (including topography and soil and groundwater conditions) and typical Client-provided information (e.g., title records, environmental liens, specialized knowledge, valuation reduction for environmental issues, and owner, property manager, and occupant information) are also summarized. Other interviews with people knowledgeable about the Subject Property (including the Client) are included in Section 7.

Section 5, **History of the Subject Property**, summarizes the history of the Subject Property and adjoining properties. This Subject Property history is based on various sources, which may include a review of historical aerial photographs, Sanborn Fire Insurance Maps, city or suburban directories, historical topographic maps, building department records, and results of previous Subject Property assessments (if any and reasonably ascertainable).

DRAFT

Copyright 2024 Kleinfelder

Section 6, **Subject Property Reconnaissance**, describes Kleinfelder's observations during the Subject Property reconnaissance. The methodology used and limiting conditions are also described.

Section 7, **Interviews**, is a summary of telephone and in-person interviews performed with "Key Site Managers" that may include the Subject Property owner/manager, occupants/tenants, local government officials, and the Client. Additional interview sources may be contacted if Key Site Managers were not available prior to production of this report, and may include adjoining landowners and people with historical knowledge of the area.

Section 8, **Evaluation**, is a presentation of findings and opinions regarding the information provided in Sections 3 through 7, and presents the conclusions regarding the presence of RECs connected with the Subject Property, and Kleinfelder's recommendations.

Section 9, **References**, is a summary listing of the resources used to compile this report.

A statement of qualifications of the signatories of this report is provided in Appendix A, and pertinent documentation regarding the Subject Property is included in Appendices B through E.

DRAFT

2.3 ADDITIONAL SERVICES

An evaluation of business environmental risk associated with the Subject Property was not included in Kleinfelder's scope of services. The scope of this Phase I ESA does not incorporate ASTM Standard non-scope considerations such as asbestos-containing materials (ACMs), radon, lead-based paint (LBP), lead in drinking water, wetlands, regulatory compliance, cultural and historical resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, and high-voltage power lines.

2.4 SIGNIFICANT ASSUMPTIONS

Kleinfelder does not guarantee the accuracy of information supplied by its sources, but reserves the right to rely on the information in forming a professional opinion regarding the potential for contamination at the Subject Property. It is assumed the Client provided Kleinfelder all applicable and available environmental records and specialized knowledge in its possession regarding the Subject Property. Kleinfelder assumes that any potential historical agrichemical/pesticide application which may be associated with the identified historical agricultural land use was performed in a customary manner in strict accordance with the agrichemical/pesticide manufacturer labels; and this assumption does not apply to any potentially identified areas

Copyright 2024 Kleinfelder

associated with agrichemical storage, mixing, transportation, spills, and/or disposal. If specific information was not available, Kleinfelder also made assumptions for this Phase I ESA regarding the groundwater flow direction beneath the Subject Property based on observed conditions and a review of United States Geological Survey (USGS) Topographic Maps and online USGS StreamStats drainage basin delineation tool. Kleinfelder assumed that historical aerial photographs, topographic maps, and other information was representative of conditions during periods between coverage.

Kleinfelder has not made other significant assumptions during the performance of this Phase I ESA.

2.5 LIMITATIONS AND EXCEPTIONS

Environmental assessments are non-comprehensive by nature and are unlikely to identify all environmental problems or eliminate all risk. This report is a qualitative assessment. Kleinfelder offers a range of investigative and engineering services to suit the needs of our clients, including more quantitative investigations. Although risk can never be eliminated, more detailed and extensive investigations yield more information, which may help the Client understand and better manage risks. Since such detailed services involve greater expense, we ask our clients to participate in identifying the level of service, which will provide them with an acceptable level of risk. Please contact the signatories of this report if you would like to discuss this issue of risk further.

DRAFT

Kleinfelder performed this Phase I ESA in general accordance with the guidelines set forth in the ASTM Standard, and the proposed scope subsequently approved by the Client. No warranty, either express or implied, is made. Environmental issues not specifically addressed in this report were beyond the scope of our services and not included in our evaluation.

Land use, Subject Property conditions (both on-site and off-site), and other factors will change over time (e.g., EDR, *The EDR Radius Map™ Report with GeoCheck®*). Since Subject Property activities and regulations beyond our control could change at any time after the completion of this report, our observations, findings, and opinions can be considered valid only as of the date of *The EDR Radius Map™ Report with GeoCheck®* (September 5, 2023), which was used in the preparation of this report. Additionally, Subject Property conditions observed were limited to readily apparent environmental conditions observed at the Subject Property.

This report may be used only by the Client and the registered design professional in responsible charge, only for the purposes stated, but in no event later than one year from the date of the

Copyright 2024 Kleinfelder

report. Pursuant to Section 4.6 of the ASTM Standard, this report should not be relied upon after 180 days from the date of its oldest component. Land or facility use, on and off-site conditions, regulations, or other factors may change over time, and additional work may be required with the passage of time. Any party other than the Client who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of the report, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the Client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party, and Client agrees to defend, indemnify, and hold Kleinfelder harmless from any claim or liability associated with such unauthorized use or non-compliance.

During the course of the performance of Kleinfelder's services, hazardous materials may have been discovered. Kleinfelder assumes no responsibility or liability whatsoever for any claim, loss of property value, damage, or injury that results from pre-existing hazardous materials being encountered or present on the Subject Project, or from the discovery of such hazardous materials. Nothing contained in this report should be construed or interpreted as requiring Kleinfelder to assume the status of an owner, operator, or generator, or person who arranges for disposal, transport, storage, or treatment of hazardous materials within the meaning of any governmental statute, regulation, or order. Client is solely responsible for directing notification of all governmental agencies, and the public at large, of the existence, release, treatment, or disposal of any hazardous materials observed at the Subject Property, either before or during performance of Kleinfelder's services. Client is responsible for directing all arrangements to lawfully store, treat, recycle, dispose of, or otherwise handle hazardous materials, including cuttings and samples resulting from Kleinfelder's services.

DRAFT

2.6 SPECIAL TERMS AND CONDITIONS

No special terms and conditions were agreed to by the Client and Kleinfelder.

Copyright 2024 Kleinfelder

3 SUBJECT PROPERTY DESCRIPTION

The Subject Property description is presented in this section and addresses the condition of the Subject Property at the time of the Phase I ESA. The Subject Property location is shown on Figure 1. Tables 3-1 through 3-4 summarize the physical characteristics of the Subject Property and adjoining properties.

3.1 LOCATION AND LEGAL DESCRIPTION

The information presented in Table 3-1 denotes the physical location and legal description of the Subject Property. This information was obtained from review of various maps (such as topographic maps and tax assessor maps), aerial photographs, public records at City and/or County offices, interviews, and/or information provided by the Client.

Table 3-1
Location and Legal Description

PARAMETER	INFORMATION/COMMENTS
LOCATION	The Subject Property is located south of Arrow Route, south and southwest of the intersection of Arrow Route and Yellow Wood Road/Juneberry Drive in the City of Rancho Cucamonga, San Bernardino County, California (see Figure 1, Subject Property Location Map).
ASSESSOR'S PARCEL NUMBER	The Subject Property is associated with APN 0229-121-33-0000, 0229-121-34-0000, 0229-121-35-0000, and 0229-131-19-0000.
LEGAL DESCRIPTION	A legal description for the Subject Property parcel is presented in the *EDR Environmental Lien and AUL Search* reports (EDR, 2023a) provided in Appendix C.
ADDRESS(ES)	Main addresses associated with the Subject Property: 12451 Arrow Route and 12459 Arrow Route, Rancho Cucamonga, San Bernardino County, California. Additional Addresses associated with the Subject Property: 12343, 12353, and 12455 Arrow Route, Rancho Cucamonga, San Bernardino County, California.
SECTION, TOWNSHIP, AND RANGE	The Subject Property is located in Township 1 South, Range 6 West, Section 8, San Bernardino Meridian and Baseline.
ZONING	Based on information available via the City of Rancho Cucamonga's Zoning Planner Viewer website at Zoning Plan Viewer (arcgis.com), the General Plan 2020 Zoning Information indicates that the western half of the Subject Property (APNs 0229-121-33-0000, 0229-121-34-0000, 0229-121-35-0000) is zoned "NI Neo Industrial", and the east parcel, APN 0229-131-19-0000, is zoned "IE Industrial Employment".

DRAFT

Copyright 2024 Kleinfelder

3.2 CURRENT / PROPOSED USE OF THE SUBJECT PROPERTY

At the time of Kleinfelder's assessment, land use in the immediate Subject Property vicinity appeared to be used for commercial and industrial purposes. Current and proposed uses are described in Table 3-2.

Table 3-2
Current / Proposed Uses

PARAMETER	GENERAL OBSERVATIONS
CURRENT USE	The Subject Property is presently unoccupied.
PROPOSED USE	Kleinfelder understands the Subject Property is being considered for redevelopment. BTC III Arrow Route CC, LP (applicant) is proposing to re-develop the Subject Property. Re-development would include the demolition and clearing of surface-paved areas and construction of five two-story (single story with mezzanine) buildings for general warehouse space, associated office space, and loading docks for truck trailers. The buildings are proposed to be surrounded by asphaltic concrete pavements in the parking and drive lanes, including 922 automobile parking spaces and 424 truck-trailer parking spaces. The proposed project would also include the creation of a new vehicle circulation system, water quality basins, utility infrastructure, exterior lighting and signage, and provide roughly 10 percent landscape coverage. In total, the proposed project would introduce approximately 1,830,729-gross-square feet of new building floor area. Vehicle access to the Subject Property would be provided by public roadways connecting the Subject Property to Arrow Route and Etiwanda Avenue.

DRAFT

3.3 DESCRIPTION OF STRUCTURES / IMPROVEMENTS

Structures and/or improvements observed on the Subject Property at the time of Kleinfelder's Subject Property reconnaissance are described in Table 3-3.

Table 3-3
Structures / Improvements

PARAMETER	GENERAL OBSERVATIONS
STRUCTURES	A guard shack is present at the entrance to the Subject Property off Juneberry Drive. Three SCE electrical substation enclosures (one empty enclosure in the southern portion of Parcel 2, and two enclosures with SCE equipment in the southern portion of Parcel 3) are present on the Subject Property. No other structures remain on the Subject Property.

Copyright 2024 Kleinfelder

Table 3-3 (Cont'd.)
Structures / Improvements

PARAMETER	GENERAL OBSERVATIONS
IMPROVEMENTS	Utility main lines, including water, power, sewer, and storm drains, are present on the Subject Property. A pad-mounted transformer is present in the northern portion of APN 0229-121-19 and a second pad-mounted transformer was present in the SCE enclosure on APN 0229-121-19. Two storm water detention ponds were present: one in the southeast corner of APN 0229-121-19, and one in the southwest corner of APN 0229-121-33 the Subject Property. One non-production water well was present in the southeast corner of the Subject Property. Three soil vapor wells were located in the southeast portion of the Subject Property. A former sump/clarifier was present in the southwest corner of APN 0229-121-19.

3.4 CURRENT USES OF ADJOINING PROPERTIES

Kleinfelder performed a brief drive-by survey of the properties adjoining the Subject Property on September 25, 2023. A summary of the surrounding properties is presented in Table 3-4 and shown on Figure 2, Subject Property Vicinity Map.

DRAFT

Table 3-4
Adjoining Properties

DIRECTION	LAND USE DESCRIPTION
NORTH	APN 0229-121-35 and APN 0229-121-34 (the northern portion of the Subject Property) are adjoined by Arrow Route. Planet Storage Center (a storage rental facility) and AMQ Solutions (an office furniture manufacturer) are present north of the Subject Property, across Arrow Route. The eastern portion of the Subject Property (APN 0229-121-19) is adjoined to the north by the former Tree Island Wire facility located at address 12459 Arrow Route, Rancho Cucamonga.
EAST	The Subject Property APN 0229-121-19 is adjoined to the east by Goodman Logistics Center Rancho Cucamonga and Central Transport; APN 0229-121-35 is adjoined to the east by Juneberry Drive and then Goodman Products (GP) Distribution Center.
SOUTH	The Subject Property is adjoined to the south by railroad right-of-way. The former Etiwanda Generating Station is present south of the eastern portion of the Subject Property (APN 0229-121-19), across the railroad right-of-way. SCE BESS is present south of the western portion of the Subject Property (APNs 0229-121-33 and APN 0229-121-34), across the railroad right-of-way.
WEST	The northwestern portion of the Subject Property (APN 0229-121-34) is adjoined to the west by Parallel Products, a recycling facility for distressed alcoholic or non-alcoholic beverage products. The remainder of the Subject Property is adjoined to the west by Copart – Rancho Cucamonga, a car auction facility.

Copyright 2024 Kleinfelder

The adjoining properties were observed to be commercial/industrial. Hazardous materials and petroleum products were not directly observed to be stored on the properties adjoining the Subject Property at the time of the Subject Property reconnaissance. Multiple kegs, totes, and ASTs were observed on the Parallel Products property; however, these likely contain alcoholic beverages that will be recycled. However, there is the potential for hazardous materials to be present at the SCE facility south of the Subject Property and at the other commercial/industrial facilities. No other indications of obvious or suspect RECs were apparent on the adjoining properties at the time of Kleinfelder's Subject Property reconnaissance.

DRAFT

Copyright 2024 Kleinfelder

4 RECORDS REVIEW

4.1 STANDARD ENVIRONMENTAL RECORD SOURCES

The purpose of the records review was to obtain and review records that would help to evaluate RECs of potential concern in connection with the Subject Property and bordering properties. Federal, state and local regulatory agencies publish databases or "lists" of businesses and properties that handle hazardous materials or hazardous waste, or are the known location of a release of hazardous substances to soil and/or groundwater. These databases are available for review and/or purchase at the regulatory agencies, or the information may be obtained through a commercial database service. Kleinfelder contracted a commercial database service, EDR of Shelton, Connecticut to perform the government database search for listings within the appropriate ASTM Standard minimum search distance of the Subject Property. Kleinfelder provided EDR with a Subject Property map to incorporate the search distances from the Subject Property boundary. Included in *The EDR Radius Map™ Report with GeoCheck®* is a listing of specific databases outlined by the ASTM Standard. A listing of the search distances, databases evaluated, dates the databases were last updated, and types of information contained in each database are included in the regulatory database search provided as Appendix B to this report.

EDR utilizes a geographical information system to plot the locations of reported spills, leaks, incidents, etc. Kleinfelder reviews this information to help establish if the Subject Property, or nearby properties, have been included in the noted databases and lists. Each of the listings was reviewed to assess whether the corresponding property details included in the EDR report revealed a potential environmental impact to the Subject Property. A number of listings in the EDR database report were found not to have the potential to impact the Subject Property based on the following, or a combination thereof:

- The listed property was located at a distance where the facility would be unlikely to impact the Subject Property based on Kleinfelder's evaluation of the relevant data in the EDR report and knowledge of the Subject Property vicinity.
- The listed property was located in a down-gradient or cross-gradient direction from the Subject Property, based on the anticipated direction of groundwater flow at the property being evaluated, and is located at a distance that would be unlikely to impact the Subject Property. Note that groundwater flow direction may be variable in the vicinity of the Subject Property and determinations as to down- or cross-gradient direction were made only when groundwater flow direction was available for a specific property.

DRAFT

Copyright 2024 Kleinfelder

- The listed property was identified in the UST or SQG databases and was not on or immediately adjoining the Subject Property. The property was not listed in other databases that reported a release of a hazardous substance or petroleum product and/or was not listed as having environmental violations. The listing of a facility on these databases alone is not indicative of an unauthorized release.
- The listing for the facility suggested a short-term release had occurred (i.e., from incidental traffic accidents, or chemicals from illegal drug labs found at residences) with associated response actions completed.
- The quantity of the hazardous substances or petroleum product released from an off-site facility was not considered to have resulted in contamination above the most stringent criteria that would require regulatory action. Therefore, no impact to the Subject Property is anticipated.
- The listed property record indicates that the property was characterized, the reported release affected soil only, the listed property was not on or adjacent to the Subject Property, and the release was not recognized as indicative of area-wide conditions or was characterized as a soil removal action only.
- The listed property record indicates that contamination on the property is limited to relatively non-mobile contaminants, including PAHs and metals, in soil only, on a non-adjacent property.
- The listed property record indicates that the case has been closed to the satisfaction of the designated lead regulatory agency and residual contamination, if present, is not considered likely to affect the Subject Property based on one or more of the criteria mentioned in the bulleted items above (referred in the ASTM Standard as an HREC).

DRAFT

Based on these criteria indicating no material threat of a release that affected the Subject Property and/or no release that could require future regulatory agency oversight, these listings were not evaluated further and are not discussed in the following sections.

4.2 RESULTS OF DATABASE SEARCH

The remaining property listings were reviewed to assess whether these properties had environmental releases, which may have resulted in RECs in relation to the Subject Property. The listed properties for which a reported release may have resulted in a REC were further assessed by performing a review of agency files available through the RWQCB / State Water Resources Control Board (SWRCB's) GeoTracker™ website (https://geotracker.waterboards.ca.gov/) and

Copyright 2024 Kleinfelder

other relevant regulatory agency websites, to evaluate whether the listed release represents a potential impact to the Subject Property.

4.2.1 Subject Property Listings

No listings were available for Subject Property addresses 12353 Arrow Route and 12343 Arrow Route. The following listings were available for the Subject Property addresses 12451 Arrow Route and 12459 Arrow Route. The listings for address 12455 Arrow Route appeared to be associated with the Goodman property, adjoining to the east.

<u>12451 Arrow Route (associated with APN 0229-121-35, the northern Subject Property parcel)</u>

- Fontana Steel Inc was listed in the Facility Index System/Facility Registry System (FINDS), Enforcement & Compliance History Information (ECHO), California Hazardous Waste Tracking System (HWTS), HAZNET, and UST databases. This facility was listed in the FINDS database due to its listing in the DTSC-Envirostor database. Fontana Steel was listed in the HWTS database from September 17, 1998 through June 30, 2002. The North American Industry Classification System (NAICS) description for Fontana Steel was “forging and stamping”. Waste generated included aqueous solution with less than 10 percent total organic residue.
- BTC III Arrow Route / BTC III Arrow Route CC LP was listed in the EnviroStor, Voluntary Cleanup Program (VCP), National Pollutant Discharge Elimination System (NPDES), San Bernardino Co. Permit, California Integrated Water Quality System (CIWQS), and California Environmental Reporting System (CERS), databases. The past use of this property was identified as metal manufacturing under the name Fontana Steel, Inc. Fontana Steel has a voluntary cleanup case open December 22, 2000. No contaminants were reported to have been identified. A preliminary endangerment assessment report was completed on December 20, 2001 and indicated that no further action was determined. This facility is listed in Envirostor as an active voluntary cleanup site as of August 24, 2022 under BTC III Arrow Route. This is further discussed in Section 4.3.4. The NPDES database listing was under the names Fontana Steel and CMC Rebar Etiwanda and was listed as effective December 31, 1997 and terminated January 27, 2022. A NPDES storm water construction-industrial permit was listed in the NPDES, California Integrated Water Quality System (CIWQS), and CERS databases for BTC III Arrow Route CC LLP as active effective June 10, 2022. CMC Rebar Etiwanda was listed in the San Bernardino Co. Permit database as having inactive hazardous chemical handler and SQG permits as of October 31, 2022. Other permits indicate that CMC Rebar

DRAFT

Copyright 2024 Kleinfelder

maintained ASTs (Aboveground Petroleum Storage Act [APSA] 1,320-10,000-gallon facility capacity, permit listed as inactive October 31, 2017) and USTs (Regular UST Annual Inspection per tank permit listed as inactive October 31, 2017). This facility was also listed as having a Emergency Planning and Community Right-To-Know Act (EPCRA) facility permit which was inactive as of October 31, 2013. The CIWQS database indicated that a storm water industrial permit had been associated with Fontana Steel and CMC Rebar Etiwanda from December 31, 1997 through January 27, 2022.

- CMC Rebar Etiwanda (Commercial Metals Co) was listed in the Toxic Release Inventory System (TRIS), FINDS, and ECHO databases. CMC Rebar Etiwanda was indicated to report to the TRIS database from 2000 to 2021 for nickel compounds.
- CMC Steel Fabricators – DBA, CMC Rebar was listed in the HWTS, HAZNET, FINDS, ECHO, and RCRA Non-Generator/No Longer Regulated (Nongen / NLR) databases. CMC Steel Fabricators – DBA was listed in the HWTS database in 1994 under EPA ID CAL000120760. The NAICS descriptions for this facility included custom roll forming, fabricated structural metal manufacturing, metal window and door manufacturing, and ornamental and architectural metal work manufacturing. A 12,000-gallon diesel UST was listed as having been present at CMC Rebar Etiwanda from June 1, 1989 to August 14, 2014. The RCRA Listings for CMC Steel Fabricators-DBA indicated that this facility was not a generator in 1994 and 2022. No violations were listed.

DRAFT

<u>12459 Arrow Route / 12459 Arrow Route, Suite B (associated with Subject Property APNs 0229-121-19, 0229-121-33, 0229-121-34, and the east adjoining APN 0229-131-24)</u>

- TAMCO / TAMCO Inc / TAMCO Steel / TAMCO Rancho Cucamonga is listed in the Emissions Inventory (EMI), Toxic Substance Control Act (TSCA), Integrated Compliance Information system (ICIS), US Airs, Potential Responsible Parties (PRP), AST, UST, leaking underground storage tank (LUST), Recovered Government Archive LUST (RGA LUST), HWTS, HAZNET, Superfund Enterprise Management System Archive (SEMS-Archive), RCRA-SQG, Envirostor, Cleanup Program Sites (CPS-SLIC), VCP, Statewide Environmental Evaluation and Planning System (SWEEPS) UST, Hazardous Substance Storage Container Database (HIST UST), EPA Watch List, Cortese, Hist Cortese, San Bernardino Co. Permit, CERS, CERS Haz Waste, FINDS, ECHO, NPDES, CIWQS, and Waste Discharge System (WDS) databases.

  The TSCA listing for TAMCO indicated that 1-billion-pounds per year or greater aggregate slag, dust, mill scale (ferrous metal), and steel manufacture chemicals associated with

Copyright 2024 Kleinfelder

steelmaking was generated in 2006, 2012 to 2015 (with parent Company Gerdau Ameristeel, Inc / Gerdau USA, Inc) and in 2016 to 2019 (with domestic parent company Commercial Metals Co). TAMCO was listed in the ICIS database as having enforcement actions including notices of violation and administrative orders from the Air Program. TAMCO was listed in the US AIRS database as having Title V permits in 1978 through 2016 with enforcement actions issued in 1997, 1998, 1999, 2000, 2003, 2004, 2006, 2008, and 2009. TAMCO was listed in the EMI database as generating emissions of total organic hydrocarbon gases, reactive organic gases, carbon monoxide, nitrous oxides, and sulfuric oxide gases, as well as particulate matter between 1987 and 2021. A construction NPDES permit was listed for TAMCO as active as of December 7, 2016 and terminated December 5, 2017. TAMCO was listed in the PRP database with general notice given on January 9, 1986 in relation to superfund site Micronutrient Intrenal Inc (located in Utah). This database listing indicated that the facility was not on the National Priorities List (NPL / Superfund) based on available information and a settlement date was listed as March 28, 1991. TAMCO was also listed as PRP for the Palmerton Zinc Pile (located in Pennsylvania) which is on its Final NPL stage. Based on the information available in the SEMS-Archive database listing, TAMCO was investigated by the United States Environmental Protection Agency (USEPA) in 1993 and then indicated to not be an NPL in 1994. The HWTS database indicates that TAMCO was listed as a generator from June 29, 1990 through 2021 under USEPA ID CAD982361404, with NAICS description of being an iron and steel mill and ferro-alloy manufacturer. The HAZNET database listing indicates that the following wastes were generated by TAMCO: baghouse waste, other inorganic solid waste, unspecified oil-containing waste, aqueous solution with total organic residues less than 10 percent, unspecified organic liquid mixture, other organic solid, liquids with pH less 2, and off-specification, aged, or surplus organics, alkaline solution without metals pH greater than 12.5, waste oil and mixed oil, oxygenated solvents, hydrocarbon solvents, oil/water separator sludge, detergent waste chemicals, gas scrubber waste, paint sludge, and latex waste were generated between 1989 and 2021. Contaminated soil waste from site cleanup activities were generated between 1990 and 2021. Asbestos-containing waste was generated in 2000, 2005, 2011, 2018 and 2021. PCBs and material containing PCBs were generated in 1990, 1993, 2011 and 2013. Hydrocarbon solvent waste was generated between 1995 and 2015. Halogenated solvents/liquids with halogenated compounds were generated between 1991 and 2012. TAMCO was listed as a hazardous waste generator between 1974 and 2022. RCRA listings from 2022 indicate that BTC III Arrow Route CC LP is a SQG. NAICS descriptions include Iron and Steel Mills, Ferroalloy manufacturing, rolled steel shape manufacturing, and real estate activities. RCRA

DRAFT

Copyright 2024 Kleinfelder

violations included generator-general violations in 2003, 2005, and 2006. Evaluation notes from 2007, 2012, and 2013 indicate that the facility was “no longer a significant non-complier”. TAMCO was listed in the CERS database as being listed in the Toxic Release inventory (TRI) under Commercial Metals Co, with parent company Gerdau USA, Inc. San Bernardino Co Permit database indicated that TAMCO, owned by BTC III Arrow Route CC LP, had permits for being a large quantity generator (two permits), APSA 100,001-1,000,000-gallon facility capacity (one permit), regular UST annual inspection (per tank) (seven permits), universal waste (UW) handler with another Certified Unified Program Agency (CUPA) permit (one permit), and hazardous materials 71+ chemicals (one permit), listed as inactive March 31, 2023.

TAMCO was listed in the AST database for the SCE-Francis Substation owned by SCE. The AST capacity was reported to be approximately 14,116 gallons. TAMCO was listed a second time in the AST database as being owned by Gerdau Long Steel North America. No information on AST capacity was provided.

Two USTs were listed at TAMCO: one compartmentalized 2,000-gallon regular unleaded UST with a 10,000-gallon diesel UST was installed March 17, 1987. The SWEEPS UST database listed one 10,000-gallon diesel UST, one 2,000-gallon petroleum UST (listed separately but was the compartmentalized UST listed above), two 50,000-gallon fuel oil USTs, and two 50,000-gallon diesel USTs. The 10,000-gallon/2,000-gallon USTs were reported to be active as of August 29, 1988. Based on the HIST UST database listing, the four 50,000-gallon USTs were originally all diesel USTs and were installed in 1975.

A CPS-SLIC case was listed as closed November 7, 1990. A case closure letter was provided on Geotracker™ and indicated that lead-contaminated soil on a property adjoining TAMCO to the southwest had been excavated until confirmation samples verified that the lead contamination had been removed. No further information was provided.

A LUST case (T0607100309) was listed as closed May 11, 1994. Based on Kleinfelder’s review of the case closure documentation, dated February 28, 1994, four 50,000-gallon diesel USTs were removed November 4, 1993. The USTs and piping were decontaminated and scrapped to be processed into rebar at TAMCO. Remedial excavation was performed up to 23 feet, and approximately 633-cubic yards of soil was removed and disposed off site. Diesel was not detected in soil after remedial excavation.

TAMCO was listed in the EnviroStor database for a historical case dated August 31, 1995. A potential release of baghouse waste containing lead, cadmium, chromium compounds,

DRAFT

Copyright 2024 Kleinfelder

and nickel was investigated by the USEPA and DTSC, and has a status of “No further action was required”.

A California Hazardous Material Incident Report System (CHMIRS) listing from 2007 indicated that a radioactive object was present in a truck that pulled up to the TAMCO Scrap metal facility on March 26, 2007.

TAMCO was listed in the CIWQS database as having a storm water construction permit from December 7, 2016 through November 20, 2017. TAMCO was listed in the NPDES database as having an industrial storm water permit from March 3, 1992 through February 7, 2022.

- Tenco Steel was listed in the Haulers Database. This listing was associated with address 12459 Arrow Route – B. The status was listed as active with the last regulatory update on May 14, 2018.
- Phoenix Services LLC / Phoenix Metal Services was listed in the San Bernardino Co. Permit, HWTS, HAZNET, RCRA Nongen / NLR, FINDS, ECHO, Haulers databases. This facility was listed at 12459-B Arrow Route. The San Bernardino Co. Permit indicated that a permit for 1,320- to 10,000-gallon AST was listed as inactive August 31, 2022 and a permit for being a SQG was also listed as inactive August 31, 2022. Phoenix was listed in the HAZNET database as generating waste between 2018 and 2021. Waste listed as generated included other organic solids and waste oil and mixed oil. No violations were listed under the RCRA listings.
- 12459 Arrow Route / 12459 Arrow Route, Suite B was listed in the CHMIRS database. TAMCO was listed as having an incident on March 26, 2018 when 50 gallons of diesel fuel was spilled. The cause of the spill was reported to have been a truck fuel tank being punctured from running into a piece of equipment. The spill was cleaned up and no waterways were impacted. A truck loaded with scrap metal was reported to have a radioactive reading at TAMCO on July 27, 2005. A release of 0.5% iron sulfate occurred on August 21, 2008. The release was caused by an operator error while loading a truck. The release was reported to have been contained. A CHMIRS incident was reported on February 17, 1989. No other information was available. The address of 12459 Arrow Route was listed in the CHMIRS database as having an incident July 10, 2003 at TAMCO Steel. Scrap pipe with radioactive residue was delivered. TAMCO declined delivery and requested to return the scrap to its source. A CHMIRS listing for incident reported February 9, 2017 involved the Chadwick Channel. A dust suppressant, “Road Pro NT”, was reported to have been released in 2017 from the Gerdau facility due to stormwater runoff from rain.

DRAFT

Copyright 2024 Kleinfelder

The Chadwick Channel extended offsite to the NRG Power plant which identified the release in their water samples.

- SCE Ameron Substation / Ameron Substation was listed in the San Bernardino Co. Permit, AST, HWTS, HAZNET, FINDS, ECHO, RCRA Nongen / NLR database. The AST database listing indicated that a total of 24,908 gallons were stored in ASTs at SCE-Ameron Substation. The San Bernardino Co. Permit listing indicated that an inactive permit for hazardous materials and an inactive “APSA Exempt” permit were listed for this facility as expired on February 28, 2023. SCE Ameron Substation was listed in the HWTS database in 2007. Based on information available in the HAZNET database, waste generated in 2007 included PCBs and material containing PCBs. Ameron Substation was listed in the RCRA listings as not a generator in 2022. The owner was listed as SCE. No violations were listed.
- SCE-Pipe Substation / Pipe Station was listed in the San Bernardino Co. Permit, CERS, AST and RCRA Nongen / NLR databases. A 2,852-gallon AST was reported to be present at this substation. The SCE Pipe Substation was listed in the RCRA listing as not a generator in 2020. No violations were listed. This facility was listed in the San Bernardino Co. Permit database as having active permits “hazardous materials 1-3-chemicals special” and “APSA exempt”. The SCE pipe Substation was listed in CERS as a chemical storage facility.
- SCE was listed in the HWTS database as generating hazardous waste between July 16, 2001 and January 11, 2002, March 27 through September 24, 2007, and September 28, 2007 through March 27, 2008.
- Gerdau / Gerdau Steel was listed in the FINDS, ECHO, and CIWQS databases. The FINDS database indicated that Gerdau had a storm water industrial permit from August 7, 2017 through August 19, 2020, and was a hazardous waste generator between May 7, 2019 and April 14, 2021. The NAICS indicated that the establishment was a wire product manufacturing facility. This facility was also listed as TI Wire or Tree Island Wire. Gerdau Steel was listed in the CIWQS database for a storm water construction permit related to construction activities associated with a railroad spur. This permit was effective October 26, 2012 and terminated May 7, 2013.
- Tervita US Operations LLC / Tervita LLC was listed in the EMI, ICIS, CERS, FINDS, ECHO, RCRA Nongen / NLR databases. Tervita was listed in the EMI database in 2014 and 2015 and the CERS database indicated Tervita was also listed in the US EPA Air Emission Inventory System. Tervita was listed in the FINDS database as being listed in

DRAFT

Copyright 2024 Kleinfelder

the TRIS from September 2, 2007 through 2017. The ECHO database indicated that the facility was a nonmetallic mineral product manufacturing industry. The NAICS information in the FINDS and ECHO databases indicated that the Tervita facility was “Materials Recovery Facilities” and “Ground or treated mineral and Earth Manufacturing”. Lead and manganese were listed as released at this facility with 5 to 10 pounds released onsite annually between 2015 and 2017, and 9 to 26 pounds transferred off site annually between 2015 and 2017. Tervita LLC was listed in the AST database under USEPA ID CA1000385141. San Bernardino Co. Permit database listings for Tervita indicate that an APSA 1,320-10,000-gallon facility capacity, hazardous materials, and small quantity generator permits were inactive. This facility was also listed in the ICIS database as having an administrative informal notice of violation from San Bernardino County for the air program. Tervita was listed in the RCRA listings as not a generator in 2013. No violations were identified.

- Olympic Mill Service was listed in the HWTS from March 13, 2002 through June 30, 2008 when it was listed as inactive. The NAICS for this facility indicated it performed nonmetallic mineral mining. The HAZNET database listing indicates that this facility generated aqueous solution waste with total organic residue less than 10 percent in 2003 under USEPA ID CAL000235068.
- Logistics Express Inc was listed in the HWTS in 2006. Based on the information provided in the HAZNET database, this facility generated unspecified oil-containing waste.
- Tube City IMS LLC was listed in the HWTS in 2010 to 2013 under EPA ID CAL000349774 and in 2020 under EPA ID CAC003082971. The NAICS description for this facility indicated it was an electric bulk power transmission and control facility (Pipe Substation). Hazardous waste generated at this facility listed in the HAZNET database included waste and mixed oil, liquids with pH less than 2 with metals, unspecified solvent mixture, unspecified sludge waste, unspecified organic liquid mixture, other organic solids, and unspecified oil-containing waste. and CERS databases. Tube City was listed in the San Bernardino Co Permit database as having HAZMAT handler, APSA, and special generator permits in 2012.
- I.W.P.A.D., Inc was listed in the EMI in 1996 and WDS database. No other information was available. Kleinfelder determined this listing is for the adjoining parcel to the east.
- United Slag Processing Co was listed in the EMI from 1997 through 2000 as generating particulate matter. This facility was listed in the HWTS database from August 31, 1994 through June 20, 1998 under USEPA ID CAL000122753.

DRAFT

Copyright 2024 Kleinfelder

- CMC California Steel Baghouse was listed in the NPDES and CIWQS databases. A NPDES construction permit was indicated to be effective May 30, 2017 and terminated as of July 1, 2019. The operator on the NPDES permit was listed as TAMCO. The CIWQS database listed a stormwater construction permit was issued to TAMCO on May 30, 2017 and was terminated June 7, 2019.

4.2.2 Non-Subject Property Listings

The following non-Subject Property facilities were assessed as potential concerns to the Subject Property. A summary of the information is included in Table 4-1.

DRAFT

Copyright 2024 Kleinfelder

Table 4-1
Non-Subject Property Facilities of Potential Concern

FACILITY OR SITE NAME	FACILITY OR SITE ADDRESS	PROXIMITY TO SUBJECT PROPERTY (FEET)	COMMENTS
Goodman Rancho SPE LLC / Goodman Logistics Center / Ameron Pipe Corp / Ameron Pipe Arrow Plant / Arrow Plant / Ameron International / Ameron International Concrete & Steel Pipe Group / Ameron So CA Div	12455 Arrow Route	Adjoins Subject Property to east	Goodman Logistics Center was listed in the Waste Management Unit Database (WMUDS/SWAT), Hist UST, Deed, CHMIRS, Land Disposal Site (LDS), Enforcement (ENF), San Bernardino Co. Permit, WDS, CIWQS, and CERS databases. Goodman Rancho SPE LLC was listed in the HWTS and HAZNET databases in 2014 for generating asbestos containing waste. Most of the database listings under Goodman were for Ameron Pipe Corp, Ameron International – Water Transmission Group, or Ameron Concrete & Steel Pipe Group. The DEED database listing related to the former Ameron International Corp., Brine Facility. This facility was listed on Geotracker as a land disposal site that was closed as of July 21, 2016. Based on the summary provided on Geotracker, Goodman purchased the property from Ameron in 2013 and redeveloped the property with the existing Goodman Logistic Center. A wastewater pond had been present on this property since 1966/1967 and had been used to accumulate industrial wastewater. This pond was expanded in 1970 and was used to hold wastewater until 1994. The pond had been installed with a polyvinyl chloride (PVC) liner but no leak detection system. The liner was removed and excavation of approximately 555 tons of soil from beneath the liner was performed in 1994. Soil sampling was performed in 1995. Total dissolved solids (TDS) concentrations were reported to be present in soil indicating that the liner had leaked. By 2005, the impacted soil had been delineated and the pond backfilled with compacted fill material, and an engineered cap was constructed over the former brine pond location. A closure report and a land use restriction were approved by the RWQCB in 2007. The 2007 “Declaration of Restrictions” was executed by Ameron International Corporation. The current “Amended and Restated Declaration of Restrictions” was executed by Goodman Rancho SPE LLC on April 22, 2015. The restrictions included not installing irrigation or landscaping on the area, not installing any water infiltration systems in the vicinity or upstream of the capped area, any future liquid-bearing piping would need to be double-walled and installed with a leak detection system, and the remedial cap must not be modified or altered without written approval of the RWQCB.

Table 4-1 (Cont'd)
Non-Subject Property Facilities of Potential Concern

FACILITY OR SITE NAME	FACILITY OR SITE ADDRESS	PROXIMITY TO SUBJECT PROPERTY (FEET)	COMMENTS
Goodman Rancho SPE LLC / Goodman Logistics Center / Ameron Pipe Corp / Ameron Pipe Arrow Plant / Arrow Plant / Ameron International / Ameron International Concrete & Steel Pipe Group / Ameron So CA Div	12455 Arrow Route	Adjoins Subject Property to east	(Continued) The former brine pond is currently used as parking lot. Based on figures available in the cap installation report prepared by Encon in 2003, and the figures included in the land use restriction documents, the brine pond was located on the southern boundary of the Ameron Pipe Arrow Plant (current Goodman Logistic Center), which was shown to be present adjoining Arrow Route, and extend southward to the east of the Subject Property along Etiwanda Avenue. The LDS database indicates that the land disposal site case was closed July 21, 2016. The WMUDS/SWAT database listing under Goodman was for Ameron Pipe Corp and indicated that it was a facility that treats and/or disposes of liquid or semisolid waste from a servicing, producing, manufacturing, or processing operation. Ameron International – Water Transmission Group Etiwanda facility, a concrete manufacturing facility, was listed in the CIWQS database as having waste discharge requirements effective May 14, 1982 and terminated October 28, 2011. Arrow Plant was listed in the NPDES database. This listing was associated with a construction waste discharge permit for Ameron International that expired in 2011. Ameron Concrete & Steel Pipe Group was listed CIWQS as having an industrial storm water permit effective June 27, 1992 and terminated June 5, 2014. Goodman Rancho SPE LLC was listed as having a commercial construction waste discharge permit from January 31, 2014 until December 29, 2015. An enforcement letter was issued for Ameron International on January 30, 2003. A second enforcement letter was issued June 20, 2007 and required Ameron International to inspect and maintain the remedial cap on the closed brine pond.

Table 4-1 (Cont'd)
Non-Subject Property Facilities of Potential Concern

FACILITY OR SITE NAME	FACILITY OR SITE ADDRESS	PROXIMITY TO SUBJECT PROPERTY (FEET)	COMMENTS
Goodman Rancho SPE LLC / Goodman Logistics Center / Ameron Pipe Corp / Ameron Pipe Arrow Plant / Arrow Plant / Ameron International / Ameron International Concrete & Steel Pipe Group / Ameron So CA Div	12455 Arrow Route	Adjoins Subject Property to east	(Continued) Ameron International was listed in the FINDS, ECHO, HWTS, HAZNET, CERS database. This facility was listed in the FINDS database as a concrete pipe manufacturing facility. This facility was listed as generating asbestos-containing waste in 2005 and 2006 under USEPA ID CAC002598872. The CERS database listing for Ameron International indicated that the facility was in the toxic release inventory. The Ameron International Concrete & Steel Pipe Group was listed in the HWTS database from July 23, 1982 through June 30, 2014. The NAICS listing indicated that this facility was a cement and concrete product manufacturing company. The HAZNET database listed waste generated between 1987 and 2014. Generated waste included liquids with halogenated organic compounds greater than 1,000 mg/L, hydrocarbon solvents (benzene, hexane, Stoddard, etc), unspecified aqueous solution, halogenated solvents (chloroform, methyl chloride, perchloroethylene, etc), unspecified solvent mixture, waste oil and mixed oil, aqueous solution with less than 10 percent total organic residue, unspecified oil-containing waste, other organic solids, unspecified organic liquid mixture, empty containers less than 30 gallons, paint sludge, off-specification, ages, or surplus organics, contaminated soil from site clean-ups (1990, 2007), oil/water separation sludge, laboratory waste chemicals 561 detergent and soap, liquids with pH less than 2 with metals, alkaline solution without metals/pH greater than 12.5, PCBs and materials containing PCBs (1994, 2007, 2009, 2010, 2011), and asbestos containing waste (2001). Ameron International – Water Transmission Group was listed in the San Bernardino County Permit database as maintaining ASTs of up to 10,000-gallon capacity, as handling hazardous materials, as being a small quantity generator, and as being a EPCRA Facility. These permits were listed as inactive as of August 31, 2014.

Non-Subject Property Facilities of Potential Concern

FACILITY OR SITE NAME	FACILITY OR SITE ADDRESS	PROXIMITY TO SUBJECT PROPERTY (FEET)	COMMENTS
Goodman Rancho SPE LLC / Goodman Logistics Center / Ameron Pipe Corp / Ameron Pipe Arrow Plant / Arrow Plant / Ameron International / Ameron International Concrete & Steel Pipe Group / Ameron So CA Div	12455 Arrow Route	Adjoins Subject Property to east	(Continued) Ameron Concrete & Steel Pipe Sys, So Div / Ameron International Concrete & Steel Pipe Group was listed in the EMI, HWTS, and HAZNET databases. The Ameron Concrete Pipe Group SO was listed in the EMI database from 1990 through 2013. Etiwanda Facility was listed in the FINDS database. This facility was listed in the FINDS database as being a facility that manufactures "concrete products, except block and brick". Waste discharge requirements were initiated May 14, 1982, and ended October 28, 2011. The Hist UST listing was for Ameron Pipe Arrow Plant and indicated three 10,000-gallon diesel USTs (two installed in 1966 and one in 1980), one 12,000-gallon product UST (installation dated unknown), two 3,000-gallon product USTs (installed in 1980), one 1,000-gallon product UST (installed in 1972), two 550-galllon product USTs (installed in 1972) were present at this facility. Ameron Pipe Arrow Plant / Ameron Pipe Div, Arrow Plant was listed in the SWEEPS UST and AST databases. The database listing for three USTs, two 10,000-gallon diesel USTs and one 12,000-gallon unknown use UST, was created February 29, 1988. Ameron Pipe Div, Arrow Plant was listed in the AST database as maintaining 4,720 total gallons in ASTs. The owner was listed as Ameron International Water Transmission. Ameron So CA Div was listed in the RCRA-SQG in 1996 and 2002 and was listed as a large quantity generator in 1981. No violations were listed in the RCRA listings. The HIST UST database listing was under the name Ameron Pipe Arrow Plant and nine USTs were listed at this facility (one 12,000-gallon product UST, two 10,000-gallon diesel UST, two 3,000-gallon product USTs, one 1,000-gallon product UST, one 550-gallon product UST, and one 550-gallon waste oil UST). The CHMIRS database listing indicated that 50 gallons of diesel were spilled on March 14, 2007 at the Ameron International facility. The spill was caused by overfilling a truck during fueling. On April 6, 2012, approximately 500 to 1,000 gallons of pH water was released to a storm drain when a valve was stuck open. Though multiple USTs and releases have been reported at this facility, based on the depth to groundwater, the presence of Juneberry Drive between the Subject Property's northern parcel and this facility, and the recent redevelopment of the facility as a Goodman distribution center, in Kleinfelder's opinion it is unlikely that impact from the previous industrial activities has impacted the Subject Property.

Non-Subject Property Facilities of Potential Concern

FACILITY OR SITE NAME	FACILITY OR SITE ADDRESS	PROXIMITY TO SUBJECT PROPERTY (FEET)	COMMENTS
TI Wire / Tree Island Wire	12459 Arrow Route 12459 Etiwanda	Adjoins Subject Property to east and north	Kleinfelder determined that the TI Wire facility shared the same address as the TAMCO facility. TI Wire / Tree Island Wire was listed in the RCRA-LGQ, LUST, AST, CHMIRS, NPDES, San Bernardino Co. Permit, CIWQS, CERS, HWTS, HAZNET, FINDS databases. TI Wire was listed in the HWTS as a hazardous waste generator as of July 23, 1982. The NAICS description indicated that TI Wire performed steel product manufacturing from purchased steel. The RCRA listings indicate that TI Wire was a large quantity generator from 2004 to 2022. Historic LQGs at this facility were indicated to be Ameron Steel Wire division in 1994 and 1996, I.W.P.A.D., Inc in 2000, and Industrial Wire Products in 2004. General-generator and generators reporting violations were listed for TI Wire in 2006 and 2017. The HAZNET database indicates that this facility generated aqueous solution with total organic residues less than 10 percent, other organic solids, other inorganic solids, waste oil and mixed oil, liquids with pH less than 2 with metals, latex waste, unspecified organic liquid mixture, unspecified oil-containing waste, organic solids with halogens, oil/water separation sludge, off-specification, aged, or surplus organics, alkaline solution (pH greater than 12.5) with metals, unspecified alkaline solution, detergent waste chemicals, unspecified sludge waste, tank bottom waste, and sulfur sludge between 1986 and 2021. Hydrocarbon solvents were generated in 1995; PCBs and material containing PCBs were generated in 1983, 1986, 1987, 1988 and 1994; and liquids with PCBs greater than 50 mg/l were generated in 1986, 1987 and 1988. Contaminated soil from site cleanup was listed as generated in 1985, 1986, 1987, 1989, 1991 and 1997. Baghouse waste was listed as generated in 1984, 1985, 1986, 1987, 1988 and 1989. TI Wire was listed in the CERS Haz Waste and San Bernardino Co Permit databases as a large quantity generator, hazardous materials handler, EPCRA facility in 2014, 2018, and 2023. TI Wire was listed as having an AST permit in 2008. TI Wire was listed as a chemical storage facility in CERS. A violation for failure to conduct a source reduction evaluation in 2017 was listed. (Continued)

FACILITY OR SITE NAME	FACILITY OR SITE ADDRESS	PROXIMITY TO SUBJECT PROPERTY (FEET)	COMMENTS
TI Wire / Tree Island Wire	12459 Arrow Route 12459 Etiwanda	Adjoins Subject Property to east and north	(Continued) The LUST case listed under TI Wire is associated with TAMCO. The San Bernardino Co. Permit and AST database listings were for Tervita LLC. The CHMIRS listing was for TAMCO. The CERS, NPDES and CIWQS database listings indicated that Tree Island Wire USA Inc had an industrial facility storm water permit since April 3, 1992. A termination date was not listed, but TI Wire was still listed in the NPDES 2018 database as active. Operations at the facility were described as steel wire drawing and steel nail and spike manufacturing. A case development inspection performed on May 19, 2009 indicated that the water board met with four companies regarding the stormwater treatment system on the TAMCO property. A meeting on September 9, 2009 indicated that TI Wire met with the RWQCB to discuss options for new best management plans (BMPs) to prevent runoff onto the TAMCO property (located south and southwest of TI Wire). The CHMIRS listing indicated a spill of 50 gallons of sulfuric acid/water mixture occurred February 10, 2014 at Tree Island Wire after valve malfunctioned and the secondary containment overflowed onto concrete floor. The spill was neutralized and cleaned up. I.W.P.A.D., Inc was listed in the EMI in 1996 and WDS database. No other information was available. Ameron Steel and Wire / Ameron Steel and Wire Division addressed as 12459 Etiwanda was listed in the EMI, LUST, SWEEPS UST, HIST UST, Cortese, Hist Cortese, HWTS, HAZNET, and CERS databases. Ameron Steel & Wire was listed in the EMI database in 1987 as generating nitrogen oxide gas. This facility was listed in the HIST UST database as having a 10,000-gallon product UST installed in 1976. This facility was listed in the LUST and Cortese databases as having a closed LUST case for soil having been impacted with diesel in 1989. The case was closed December 4, 1990. No further information was provided. Ameron Steel and Wire was listed in the HWTS database from May 20, 1993 through October 25, 2000, and July through October, 2022. Contaminated soil from site cleanup activities was reported in the HAZNET database as generated at Ameron Steel and Wire in 1993. (Continued)

Table 4-1 (Cont'd)
Non-Subject Property Facilities of Potential Concern

FACILITY OR SITE NAME	FACILITY OR SITE ADDRESS	PROXIMITY TO SUBJECT PROPERTY (FEET)	COMMENTS
TI Wire / Tree Island Wire	12459 Arrow Route 12459 Etiwanda	Adjoins Subject Property to east and north	(Continued) Ameron Steel & Wire Property was listed in the EnviroStor and VCP databases as having a voluntary cleanup case closed as of April 23, 1996. Past use of the property was identified as recycling scrap metal and vehicle maintenance. Constituents of Concern (COCs) included hydrocarbon solvents, metals, unspecified solvent mixtures, and inorganic solid waste, however, confirmed COCs were not specified. A Preliminary Endangerment Assessment (PEA) was performed in 1997 and a no further action" status was issued by the DTSC. Based on review of the voluntary cleanup agreement (VCA) dated June 9, 1995, the Ameron Steel & Wire Property was described as a portion of the property identified as 14549 Arrow Route, on APN 229-131-18. A site plan attached to the agreement shows the site layout with a wire mill building in the western portion of the site, a "EVG" building in the center of the site, a settling pond near the northern boundary of the site (this is the brine pond discussed in the previous listing), and railroad spurs along southern boundary and in the eastern portion of the Subject Property. The background information provided in the voluntary agreement indicated that Ameron, Inc planned to sell the property to Industrial Wire Products (the operator at the facility). The property was described as being used to manufacture and store steel wire and related products since 1962 when the mill building (the western building) was constructed. The eastern quarter of the property was historically used to store scrap metal feed stock from the 1960s through 1970s. This stock would be transferred by rail to the adjoining steel mill facility. At the time of the VCA, the eastern portion of the property was being used by TAMCO (located south and southwest of this property) to store rebar and truck trailers. The Ameron Arrow Division Concrete and Steel Pipe Manufacturing facility and Fontana Steel were identified as being located in the vicinity of this property. The VCA indicated that heavy metals including lead had been identified in soil during soil investigations since 1989. Based on the depth to groundwater, in Kleinfelder's opinion, it is unlikely that impact from the previous industrial activities, closed LUST case, and closed VCP case, has impacted the Subject Property.

Parallel Products / USL Parallel Products of California / DBA Brookside Vineyard Company	12281 Arrow Route	Adjoins Subject Property to the west	Parallel Products was listed in the per- and polyfluoroalkyl substances (PFAS) ECHO, CPS-SLIC, HIST UST, ICIS, US AIRS, EMI, SWEEPS UST, CA FID UST, RCRA-LQG, FUELS PROGRAM, AST, CERS HAZ WASTE, ENF, San Bernardino CO Permit, CIWQS, CERS, FTTS, and Hist Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA)/TSCA Tracking System Inspection & Enforcement Case Listing (FTTS) databases. DBA Brookside Vineyard Company was listed in the HIST UST database. This HIST UST database listing indicates that a 500-gallon unleaded product UST was historically associated with a winery at this facility. Parallel Products was listed in the FUELS Program as a gas/ethanol producer. The AST database information indicates 4,000-gallons are stored in ASTs at this property. This facility was listed in the CERS Haz Waste database as a generator of hazardous waste. Parallel Products was listed as a LQG in 2002. No violations were listed. This facility was indicated to be a manufacturer of industrial organic chemicals. A cleanup and abatement order was issued according to the ENF database, to Parallel Products Recycling facility by the WDR program on December 28, 1988 and terminated January 14, 1991 for groundwater cleanup. Other enforcement actions included an admin civil liability action effective April 21, 1989 and terminated January 7, 1992. This facility was listed in the NPDES database as active as of February 22, 2002 and in the CIWQS database as having an active waste discharge permit effective July 19, 2002. This facility was listed in the CERS database as an industrial storm water facility. Multiple administrative violations were listed for this facility including a late report July 1, 2013, failure to update hazard review and document employee training on February 21, 2023, failure to update site map and emergency response plan on April 12, 2017, a general operations/maintenance violation and failure to update hazardous material inventory on June 10, 2014, failure to update Risk Management Plan on March 6, 2020. Parallel Products / USL Parallel Products of California / DBA Brookside Vineyard Company	12281 Arrow Route	Adjoins Subject Property to the west	(Continued) Parallel Products was listed in the San Bernardino Co Permit database as having active permits for hazardous Materials 11-30 chemicals, RMP Inspection – Program 2, and being a small quantity generator. A permit for risk management plan Level 2 was listed as inactive September 30, 2015. A California Accidental Release Prevention Program (CalARP) facility permit was listed as inactive September 30, 2013. An AST permit, an EPCRA Facility permit, and a waste-generating recycler (onsite) permit was listed as inactive September 30, 2013. A CA Annual fee permit was listed as inactive September 30, 2009. The CPS-SLIC case for Parallel Products was listed as closed with soil and groundwater having been impacted. No other information was available. Parallel Products was listed in the ICIS database as having Air program administrative orders. This facility was listed in the EMI database from 1995 through 2021. The SWEEPS UST database lists a 550-gallon fuel UST and a 10,000-gallon diesel UST were installed in February 29, 1988. Based on the closed case status, the depth to groundwater, cross-gradient location of this facility in relation to the Subject Property, and industrial history of this facility as a gas/ethanol producer, this facility is not considered a REC.

TRAC DIV TANNER CO / Soil Treatment, Rancho Cucamonga / Copart (97), Tanner Company TPAC Division	12167 Arrow Highway	Adjoins Subject Property to the west	This facility was listed in the CERS, CERS HAZ WASTE, SWEEPS UST, HIST UST, LDS, San Bernardino Co Permit, CIWQS, WMUDS/SWAT, and RCRA NonGen / NLR databases. The SWEEPS UST and HIST UST databases listed two 10,000-gallon diesel USTs active July 1, 1985. This facility was listed as a land disposal site under the name "Soil Treatment, Rancho Cucamonga", with the case closed November 11, 1998. No further information was available, and no cleanup activities were listed on the associated Geotracker™ case file. This facility was listed in the San Bernardino Co Permit database under the name Copart (YD 97) as have an active conditionally exempt small quantity generator permit and hazardous materials 1-3 chemicals permit. The CIQWS database listing was under Soil Treatment, Rancho Cucamonga and was for a land treatment project. The CIWQS permit was listed as effective November 22, 1995 through November 18, 1997. Copart was listed in the CERS database as a chemical storage facility with violations including failure to state the accumulation start date on labels, and failure to complete hazardous waste labels. The WMUDS/SWAT listing indicated that the primary waste for this facility was CNSOIL. Copart was listed as not a generator in the RCRA listings in 2012. The NAICS code description for Copart was "all other waste management services". No violations were listed under the RCRA listings. Based on the depth to groundwater, location of this facility cross-gradient to the Subject Property, and closed case status, in Kleinfelder's opinion it is unlikely that impact from the previous industrial activities has impacted the Subject Property.
DP Etiwanda / SA Recycling / SIMS Metals America	8822 Etiwanda Avenue	Adjoins Subject Property to the east	This facility was listed in the HWTS, ENVIROSTOR, VCP, DEED, CHMIRS, EMI, HAZNET, NPDES, SAN BERN. CO. PERMIT, CIWQS, CERS, RCRA-LQG, HWTS, AST, HAZNET, CIWQS, HWTS, RCRA-SQG, SWEEPS UST, HIST UST, FINDS, ECHO, EMI, HAZNET, RCRA NONGEN / NLR, and RCRA-SQG databases. (Continued)

DP Etiwanda / SA Recycling / SIMS Metals America	8822 Etiwanda Avenue	Adjoins Subject Property to the east	This facility was listed in Envirostor, VCP, and DEED databases as having a land-use restriction as of October 22, 2020. Past use of the property was indicated to include railroad right-of-way, USTs, and recycling scrap metal. Soil and soil vapor were reported to have been impacted with lead, PCBs, and TPH. The Envirostor listing and land use restriction are further discussed in Section 4.3.4. A CHMIRS incident dated May 21, 2003, was listed for a call regarding metal dust originating from the recycling plant. Pacific Coast Recycling, LLC was listed at this property address in the EMI database from 2008 through 2010. SA Recycling was listed at this address in the HAZNET database as generating asbestos-containing waste in 2017. Etiwanda Rancho Cucamonga (operator DP Etiwanda LLC) was listed in the NPDES database as having a construction stormwater permit effective February 26, 2018 and terminated November 20, 2020. SA recycling was listed in the NPDES database as having a scrap metal permit effective May 10, 2012 and terminated September 26, 2017. The San Bernardino Co Permit database indicated SIMSMetal America had a hazardous waste generator 0-10 employees permit and a hazmat handler 0-10 employees permit inactive July 31, 2004. SA Recycling was listed as having a APSA 1,320-10,000-gal Fac Capacity permit, LQG permit, and hazardous materials 11-30 chemicals permit inactive November 30, 2018, and an appliance recycler permit inactive November 30, 2017. The CIWQS database lists the occupant as Central Transport, an industrial trucking facility, as having an active industrial storm water permit effective April 1, 2021. Central Transport was listed in the CERS database as having a storm water industrial permit. Pacific Coast Recycling, LLC was listed in the CERS database as being listed in the US AIRS database. DP Etiwanda was listed in the HWTS database under USEPA ID CAP000332783 between January 6, 2022 and April 7, 2022. SA Recycling, a recycling material wholesale facility, was listed as not a generator in 2010, but was then listed in the HWTS database under USEPA ID CAC002925489 between August 28, 2017 and November 29, 2017 and under USEPA ID CAL000359034 between November 29, 2010 and June 30, 2018. DP Etiwanda / SA Recycling / SIMS Metals America	8822 Etiwanda Avenue	Adjoins Subject Property to the east	(Continued) DP Etiwanda was listed in the RCRA listings as a LQG in 2018 and a SQG in 2022. Generated waste included cadmium and lead in 2018 and lead in 2022. The NAICS code description for DP Etiwanda was "process, physical distribution, and logistics consulting services" in 2018 and "Freight Transportation Arrangement" in 2022. SA Recycling was listed in the AST database and the HAZNET database. Generated waste included unspecified solvent mixture, waste oil and mixed oil, halogenated solvents (chloroforms, methyl chloride, and perchloroethylene), unspecified organic liquid mixture, contaminated soil from site cleanup, PCB and material containing PCBs, aqueous solution with total organic residues less than 10 percent, other organic solids, unspecified aqueous solution, and unspecified oil-containing waste between 2010 and 2017. The contaminated soil from site cleanup waste was generated in 2017. SIMSMetal America was listed in the RCRA listings as a SQG in 1996 and 1998. No violations were listed. SIMSMetal America/Etiwanda Division was listed in the HWTS database from April 10, 1987 through June 30, 2004. Waste listed as generated at this facility in the HAZNET database includes unspecified aqueous solution, unspecified oil-containing waste, oil/water separation sludge, PCBs and material containing PCBs, other empty containers 30 gallons or more, and tank bottom waste between 1989 and 2003. Ferromet, Inc was listed in the SWEEPS UST database as having a 9,940-gallon diesel UST and a 1,009-gallon unleaded fuel UST. The HIST UST database lists Ferromet, Inc as having a 9,940-gallon diesel UST installed in 1980, a 555-gallon regular product UST/sump and a 1,009-gallon unleaded product UST installed in 1972. Ferromet, Inc was described as a recycling wholesaler that was listed in the EMI database in 1987 and 1990. Kleinfelder determined that this adjoining facility is considered a REC due to the residual concentrations of metals, TPH, and PCBs in soil and active Land Use Covenant (LUC), which require an active soil management plan to be in place annually along the property boundary.

Generating Station, Etiwanda / Southern California Edison – Etiwanda Generating Station / Etiwanda Pumping Station & Tank Farm / EPTC Etiwanda	8996 and 8998 Etiwanda Avenue	Adjoins Subject Property to the south (noncontiguous)	The SCE Etiwanda Generating Station was listed in the WMUDS/SWAT, CHMIRS, Envirostor, and San Bernardino Co. Permit databases. This facility was listed in the CHMIRS database for an incident at the Etiwanda Generating Station on June 30, 1999. Approximately 500 gallons of cooling tower water was released into the Chadwick Channel. Vacuum trucks were used to recover the water. The SCE Etiwanda Generating Station was listed in the Envirostor database as an active corrective action case as of February 2, 1995. ASTs were historically present on site and PCBs, vanadium and compounds were listed as potentially in soil. Groundwater monitoring was performed in 2010. A Consent Agreement was completed June 3, 2021 for an Inland Empire Utilities Agency (IEUA) parcel. The San Bernardino Co Permit database listed the Etiwanda Facility as having a hazardous waste generator -10 employees permit, a Hazmat Handler 0-10 employees permit, and an AST Permit inactive August 31, 2004. EPTC Etiwanda was listed in the HWTS, HWP, HAZNET, CORRACTS, RCRA Nongen / NLR databases. The HWP database listing indicated that EPTC Etiwanda had a closed cleanup case. The facility history summarized in this listing indicated that SCE generated and stored hazardous waste in two surface impoundments in the 1980s. SCE was exempted from Hazardous Waste RCRA permit fee requirements. A variance was granted January 29, 1987 allowing SCE facilities to perform on-site treatment, and a Final Judgement was passed on February 1, 1995 to close SCE facilities (including the Etiwanda facility). Two wastewater retention basins at the Etiwanda generating facility received closure certification on December 21, 2011. The units that received closure included the Boiler Chemical Cleaning Basin, North Wastewater retention basin, south wastewater retention basin, Unit 1 Fireside wash drain system, Unit 1: boiler acid wash drain system, Unit 2: boiler acid wash drain system, Unit 2: fireside wash drain system, Unit 3: boiler acid wash drain system, Unit 3: fireside wash system sediment trap, Unit 4: acid wash drain system, and Unit 4: fireside wash system sediment trap. Closure verification was issued December 21, 2015. (Continued)

Generating Station, Etiwanda / Southern California Edison – Etiwanda Generating Station / Etiwanda Pumping Station & Tank Farm / EPTC Etiwanda	8996 and 8998 Etiwanda Avenue	Adjoins Subject Property to the south (noncontiguous)	(Continued) The Etiwanda Pumping Station & Tank farm was listed in the HWTS database between August 29, 2003 and August 29, 2007, and in the HAZNET database as generating tank bottom waste and tank bottom waste with halogenated organics in 2005. The NAICS description was "pipeline transportation of crude oil". EPTC Etiwanda was listed in the USEPA Corrective Action Sites (CORRACTS) database as having a sitewide investigation workplan received in 2021. Investigative reports were received March 10, 2023. EPTC Etiwanda was listed in the RCRA listings as not a generator in 2023. The facility was listed as owned by SCE and was listed in the RCRA database since 1960. Historical generators for this facility include SCE in 1990 through 1996 (LQG), Etiwanda Generating Station in 1999 (LQG), EPTC Etiwanda in 1998 (SQG) and the not a generator in 2023. Generated wastes included ignitable waste, lead, benzene, spent halogenated solvents used for degreasing and spent solvent mixtures, containing PCE, TCE, methylene chloride, 1,1,1-trichloroethane, carbon tetrachloride and chlorinate fluorocarbons, spent nonhalogenated solvents including xylenes, acetone, ethyl acetate, ethylbenzene, ethyl ether, methyl isobutyl ketone, n-butyl alcohol, cyclohexanone, and methanol. The south adjacent Etiwanda Generating Station is not considered a REC due to the site being located downgradient, is noncontiguous, and unlikely to affect the Subject Property.
Big Three Industries / Air Liquide Corp / Air Liquide America Corp / Air Liquide Industrial U.S. LP / Air Liquide / AirGas USA, LLC / SCE Reduction Substation	12550 Arrow Route	Approximately 273-feet north-northeast	Air Liquide was listed in the RCRA-SQG, ICIS, US AIRS, FINDS, ECHO, HIST UST, WDS, RCRA Nongen / NLR, LUST, Cortese, AST, NPDES, San Bernardino Co. Permit, CIWQS, CERS, HWTS, and HAZNET databases. Big Three Industries was listed in the SWEEPS UST. The RCRA listing indicated that Big Three Industries was listed as a SQG in 1996 and as a LQG generator in 1980. (Continued)

Big Three Industries / Air Liquide Corp / Air Liquide America Corp / Air Liquide Industrial U.S. LP / Air Liquide / AirGas USA, LLC / SCE Reduction Substation	12550 Arrow Route	Approximately 273-feet north-northeast	(Continued) Big Three Industries was listed under NAICS code description "industrial machinery and equipment wholesaler". No violations were listed. Air Liquide Industrial U.S. LP was listed as not a generator in 2012. Air Liquide Industrial U.S. LP was listed in the HWTS database from 2000 through 2008. Waste listed as generated in the HAZNET database included off-specification, ages, or surplus inorganics, other inorganic solid waste, unspecified organic liquid mixture, other organic solids, unspecified aqueous solution, liquids with pH less than 2, laboratory waste chemicals, unspecified sludge waste, waste oil and mixed oil, aqueous solution with 10 percent or more organic residue, and aqueous solution with metals between 2003 and 2016. Air Liquide was listed in the US AIRS database as being in the Stratospheric Ozone Protection Air program. In 2001 and 2014. Air Liquide was listed in the PFAS ECHO database as being an industrial gas facility. Air Liquide Corporation was listed as under Civil Judicial action in the ICIS database. The NPDES database indicated that an industrial wastewater discharge permit for Air Liquide America Corp was processed November 8, 1992 and terminated October 10, 2016 and the CIWQS database listed a storm water permit effective November 8, 1992 through September 23, 2016. A construction permit was listed in the CIWQS database as effective June 17, 2010 through July 1, 2013. Air Liquide America Corp was listed in the San Bernardino Co Permit database as having inactive hazmat handler 11-25 employee permits, dated October 31, 2002 and March 31, 2009. Big Three Industries was listed in the SWEEPS UST database has having one 12,000-gallon diesel UST, one 9950-gallon unleaded UST, and one waste oil UST (capacity not reported) active July 1, 1985. The Hist UST database indicates that one 12,000-gallon diesel UST was installed in 1977, one 9950-gallon unleaded UST was installed in 1978, and one waste oil UST was installed in 1977. Air Liquide was listed as having a closed LUST case for diesel having impacted soil. (Continued)

Big Three Industries / Air Liquide Corp / Air Liquide America Corp / Air Liquide Industrial U.S. LP / Air Liquide / AirGas USA, LLC / SCE Reduction Substation	12550 Arrow Route	Approximately 273-feet north-northeast	(Continued) The leak was discovered during tank closure in 1991. The impacted soil was reported to have been excavated and disposed of at an approved soil recycling facility in 1995 and the case was closed February 27, 1996. The AST database listing was actually for an AST operated by SCE at the SCE-Reduction Substation. The AST capacity was reported to be 18,155 gallons. Air Gas USA, LLC, an industrial gas manufacturing facility, was listed in the RCRA Nongen / NLR as not a generator in 2019. This facility was also listed in the CERS Haz waste as a hazardous waste generator. The San Bernardino Co. Permit database indicates this facility has an active Hazardous Materials 31-50 chemicals permit, an RMP Inspection-Program 3 permit, and an active SQG. An EPCRA Facility permit was listed as inactive as of October 31, 2013, and a CalARP Facility Permit was listed as inactive October 31, 2004. The CERS database listing for Airgas USA, LLC indicated that the facility had a violation for failure to submit hazardous waste inventory. SCE Reduction Substation was listed in the San Bernardino Co. Permit and CERS databases. The San Bernardino Co Permit database lists active hazardous Materials 1-3 Chemicals Special permit and APSA Exempt permit. Based on the distance of this facility from the Subject Property, soil-only impact, the closed case status, and no significant violations, this facility is not considered a REC.

DRAFT

Table 4-1 (Cont'd)
Non-Subject Property Facilities of Potential Concern

FACILITY OR SITE NAME	FACILITY OR SITE ADDRESS	PROXIMITY TO SUBJECT PROPERTY (FEET)	COMMENTS
Bernell Hydraulics Inc	8810 Etiwanda Avenue	Approximately 1,117-feet east	This facility was listed in the RCRA NonGen / NLR, RCRA – SQG, FINDS, ECHO, Envirostor, AST, VCP, CERS HAZ WASTE, CERS TANKS, NPDES, SAN BERN. CO. PERMIT, WDS, CIWQS, and CERS databases. Bernell Hydraulics was listed in CERS HAZ WASTE as a hazardous waste generator that maintained ASTs. This facility was listed as a SQG of hazardous waste in 2000. Generated waste included PCE. Bernell Hydraulics was listed in the RCRA listings as not a generator in 2011 and 2021. The NAICS code description was "industrial machinery and equipment wholesalers" in 2011 and "leather and hide tanning and finishing in 2021". No violations were listed under the RCRA listings. The San Bernardino Co Permit database listed Bernell Hydraulics Inc as having an active SQG permit, hazardous materials 4-10 chemicals permit, and APSA 1,320-10,000-gallon facility capacity permit. An inactive AST permit was listed as expired September 30, 2010. The CERS database listing indicates this facility is a chemical storage facility with violations for failure to prepare a spill prevention control and countermeasure plan, failure to label hazardous waste accumulation tanks correctly, failure to submit annual stormwater reports on time, failure to submit complete hazardous material inventory, failure to review and certify business plan annually, failure to send hazardous waste offsite for disposal within 180 days, failure to obtain USEPA ID, failure to maintain used oil receipts and waste manifests for three years, failure to submit tank facility statement, and failure to submit accurate APSA information on CERS. A CHMIRS listing for this facility listed an incident dated February 20, 2001 for the release of approximately 500-gallons of used oil. The incident description indicated that Bernell Hydraulics employees were possibly disposing of used oil over the wall into a dry drainage channel. This was reported to be under investigation. Bernell Hydraulics was listed the Envirostor and VCP databases as an active voluntary cleanup case as of September 17, 2021. The Standard Voluntary agreement was completed February 2, 2022. Supplemental site assessment activities were listed to be performed in 2023. (Continued)

DRAFT

Table 4-1 (Cont'd)
Non-Subject Property Facilities of Potential Concern

FACILITY OR SITE NAME	FACILITY OR SITE ADDRESS	PROXIMITY TO SUBJECT PROPERTY (FEET)	COMMENTS
Bernell Hydraulics Inc	8810 Etiwanda Avenue	Approximately 1,117-feet east	(Continued) Bernell Hydraulics Inc was listed in the WDS, NPDES, and CIWQS databases as active since April 26, 1995. The NPDES listing described Bernell Hydraulics as an industrial machinery and equipment facility including fluid power cylinders and actuators. Although the facility is as an active cleanup site, the potential for vapor encroachment and various impacts from hazardous materials to the Subject Property is minimal as this site is not directly adjoining, as at a distance, and as the site is at a lower elevation, therefore, this facility is not considered a REC.

In summary, the Subject Property and adjoining properties have a long history of industrial use with multiple releases, cleanup cases, and land use restrictions reported on adjoining properties. The long history of industrial use of the Subject Property vicinity is considered a REC.

4.2.3 Orphan List

Facilities not plotted by EDR due to poor or inadequate address information are referred to as orphan facilities. Five orphan summary/unmapped facilities were listed in the EDR Radius Map Report. These orphan facilities were reviewed by Kleinfelder to assess the potential for the remaining listed facilities to pose a REC to the Subject Property. Based on the review, these listings were judged not to pose an environmental concern to the Subject Property.

4.3 OTHER RECORDS REVIEWED / AGENCIES CONTACTED

The following additional sources of environmental records were reviewed during this Phase I ESA for the purposes of meeting the ASTM Standard. Local regulatory agencies were contacted for reasonably ascertainable and practically reviewable documentation regarding RECs present at the Subject Property and adjoining facilities. Summaries of interviews with local regulatory agency representatives are included in Section 7 of this report (with interview documentation included in Appendix C). Figures associated with historical site investigations are presented in Appendix E. The following agencies (if marked with an "X") were contacted for documentation:

☒ ..... Pipeline and Hazardous Materials Safety Administration (PHMSA), National Pipeline Mapping System (NPMS).
☒ ..... State of California, California Geologic Energy Management Division (CalGEM).
☒ ..... State Water Resources Control Board, GeoTracker™ Database.
☒ ..... State of California, Department of Toxic Substances Control, EnviroStor Database.
☒ ..... South Coast Air Quality Management District (SCAQMD).
☒ ..... San Bernardino County Fire Protection District – Hazardous Materials Division (HMD).
☒ ..... San Bernardino County Building Services.
..... City of Rancho Cucamonga Building and Safety Department.
☒ ..... City of Rancho Cucamonga Fire District.

Information from these agencies is presented below.

4.3.1 Pipeline and Hazardous Materials Safety Administration, National Pipeline Mapping System

Pipeline information is available at the PHMSA's online NPMS website (https://www.npms.phmsa.dot.gov). Kleinfelder researched the website's pipeline information for the Subject Property and its vicinity on September 12, 2023. Based on Kleinfelder's review, an

DRAFT

Copyright 2024 Kleinfelder

active Southern California Gas Co transmission pipeline is present in Arrow Route, north and adjoining to the Subject Property. No hazardous liquid pipelines were present on or adjoining to the Subject Property. Copies of the NPMS map and pipeline information is included in Appendix C.

4.3.2 California Geologic Environmental Management (CalGEM)

Kleinfelder searched for information concerning oil and gas fields for the Subject Property on CalGEM's Well Finder database (DOC CalGEM WellFinder) on September 12, 2023. No oil or gas wells are depicted to be on the Subject Property or on the adjoining properties. A copy of CalGEM's map is included in Appendix C.

4.3.3 State Water Resources Control Board, GeoTracker™ / Los Angeles Regional Water Quality Control Board

Kleinfelder reviewed the SWRCB's GeoTracker™ Database (http://geotracker.waterboards.ca.gov/) on September 5, 2023 for information pertaining to the Subject Property and adjoining properties. The following two listings were associated with one of the Subject Property addresses:

TAMCO (T0607100309), located at 12459 Arrow Highway, was listed as having a closed LUST case as of May 11, 1994. Based on the case closure information, a release was discovered during removal of four 50,000-gallon diesel USTs on November 4, 1993. Approximately 633-cubic yards of soil was excavated from up to 23 feet bgs and removed to the Gibson Oil & Refining Facility in Bakersfield. A diesel concentration of 12,360-parts per million (ppm) was detected in soil before cleanup and diesel was not detected in soil after cleanup. The USTs were reported to have been "decontaminated & sectioned at Erickson, sent back to TAMCO as scrap to be processed into rebar."

The following listing was associated with an adjoining property:

Ameron Steel and Wire, located east at 12459 Arrow Highway was listed as having a closed LUST case as of December 4, 1990. Soil had reportedly been impacted with diesel. No further information was available.

Air Liquide, located at 12550 Arrow Route, north of the Subject Property, was listed as having a closed LUST case as of February 27, 1996. Soil had reportedly been impacted with diesel.

DRAFT

Copyright 2024 Kleinfelder

Remedial excavation had been performed October 8, 1995, and the excavated soil had been recycled at “GDE Soil Recycling” in Devore, California. No further information was available.

Copies of the Geotracker™ map and findings are included in Appendix C.

4.3.4 State Department of Toxic Substances Control

Kleinfelder reviewed the DTSC’s EnviroStor website (https://www.envirostor.dtsc.ca.gov/public/) for available files pertaining to the Subject Property and adjoining properties on September 5, 2023. Kleinfelder also reviewed the available files at the DTSC Cypress office on October 25, 2023 and files at the DSTC Chatsworth office on November 16, 2023.

Based on review of the Envirostor database, BTC III Arrow Route, located at 12451 Arrow Route, was listed as an active voluntary cleanup site as of August 24, 2022. BTC III Arrow Route CC LP submitted a voluntary cleanup agreement application on August 24, 2022 for 94.247 acres of land located at the address of 12451 Arrow Route and identified as APNs 0229-121-34, 0229-121-33, 0229-131-19, and 0229-121-35 (the Subject Property). The application indicated that the Subject Property was vacant and the previous structures had been demolished in preparation for redevelopment. Previous occupants of the Subject Property were listed as Etiwanda Steel Producers in 1956, Ameron Steel / Ameron Pipe Products in 1970, Tamco Steel in 1974, Fontana Steel in 1988, Gerdau Steel in 2013, and CMC Steel in 2018. Soil and soil vapor samples indicated there has been impact by historic operations at the Subject Property. Constituents of concern included pesticides/herbicides, metals, petroleum hydrocarbons, and VOCs. Multiple closed cleanup cases were listed in association with the Subject Property including a NFA status for lead remediation issued by the RWQCB in 1990, a NFA for UST removal issued in 1994 by SBCDEH, excavation oversight performed by the DTSC in 2001, NFA for slag stockpile remediation in 2002 by SBCFD, NFAs for UST removal in 2006, 2011, and 2014 by SBCFD, and a Consent Order in 2007 by the DTSC. Two Phase II ESA investigations, one by Ramboll and one by Roux were reported to have been performed in 2021. The VCA between BTC III Arrow Route CC LP and the DTSC for the Subject Property was signed October 6, 2022 and executed on October 26, 2022. The figures attached to this agreement show the Subject Property and the former structures, UST locations, and remediation areas. The Site Diagram prepared by Roux, dated December 3, 2021, identified the Subject Property parcels as Parcel 1 through 4. Parcel 1 corresponded to APN 0229-121-34 (west parcel); Parcel 2 corresponded to APN 0229-121-33 (south parcel); Parcel 3 corresponded to APN 0229-131-19 (east parcel); and Parcel 4 corresponded to APN -229-121-35 (north parcel). Features identified on Parcel 1 included an equipment boneyard (north portion), slag processing (central portion), and Phoenix Industries

DRAFT

Copyright 2024 Kleinfelder

maintenance and Processing (southcentral portion). A lead remediation area was drawn extending over the southern portion of Parcel 1 and the southwest portion of Parcel 2, and into the adjoining property to the south. Railroad spurs formed a circuit through the southern portion of Parcel 2 and around Parcel 3. A Slag Remediation Area was drawn in the northwestern portion of Parcel 2. A wash rack and "Pad 16 Remediation Area" was identified in the northeastern portion of Parcel 2. A Melt Shop, electric arc furnace, and Warehouse and Maintenance building were present in the south-southeastern portion of Parcel 2. A former 300-gallon diesel UST and chemical storage area were identified north-northwest of the Melt Shop. The Main Office, Roll Mill, Parts Warehouse, and Bundling Station were located on Parcel 3. Former oil USTs were located south of the Main Office and west of the Roll Mill. Former 12,000-gallon diesel USTs were located southwest of the Roll Mill. A 12,000-gallon compartmented gasoline and diesel UST (10,000-gallon diesel/2,000-gallon gasoline) was identified as present in the northwest corner of Parcel 3. A stormwater infiltration basin was drawn in the southeast portion of Parcel 3. Adjoining properties were identified as industrial and vehicle auction storage to the west; self-storage, warehouse, and industrial to the north; warehouse, Tree Island Wire, and vacant (DP Etiwanda) to the east; and railroad tracks and Etiwanda Generating Station to the south.

The following historical documents were also available for the Subject Property:

Fontana Steel, 12451 Arrow Route

A Phase I ESA report was prepared by Pacific Environmental Group, Inc. (PEG) on Fontana Steel, Inc. in 1998 (PEG, 1998). This Phase I ESA identified Fontana Steel as operating at 12451 Arrow Route. The property was reported to be owned by Fontana Steel. Ameron Inc had sold the property to Kaiser Foundation Hospitals in 1988 and Kaiser traded it to Fontana Steel for some parcels in Fontana. An easement for an IEUA concrete pipe was identified to be present along the western side of the property. This pipe was reported to be carrying brine waste from Air Liquide (northeast of the property) to the East Edison line south of the property. Arrow Route was reported to be located adjoining the property to the north, TAMCO Steel to the south, Ameron Concrete & Steel Pipe to the east, and Industrial Wire Products to the southeast. Historically, the property was reported to have been developed as vineyards until 1955, and then vacant until 1988 when the Fontana Steel structure was constructed. The property had been owned by Ameron, Inc. (the parent company of TAMCO) until 1988 and had been used for the material storage and disposal of baghouse dust. As part of the sales agreement between Ameron and Kaiser, Ameron agreed to remove hazardous materials from the property. Baghouse dust had been buried in three 170-feet long, 14- to 20-feet wide, and 12-feet deep trenches in the southern portion of the property in the 1970s. Ameron excavated and removed approximately 4,000-cubic yards of baghouse dust

DRAFT

Copyright 2024 Kleinfelder

from these trenches in 1987. The cleanup goals were reported to be TTLC and STLC for cadmium, copper, lead, and zinc. Excavation soil sample results indicated maximum lead concentrations of 440 mg/kg from the bottom of the west trench; 1,590 mg/kg from the north end of the center trench; and 326 mg/kg from the bottom of the east trench. Maximum zinc concentrations were 3,550 mg/kg from the bottom of the west trench; 12,500 mg/kg from the north end of the center trench, and 2,860 mg/kg from the bottom of the east trench. Over excavation was reported to have been performed until confirmation soil sample results met the TTLC and STLC limits. The trenches were subsequently backfilled with slag. The excavated baghouse dust was removed to the TAMCO property. Based on PEG's review, TTLC limits were reported to not have been exceeded, but STLC limits were exceeded for zinc and a few lead concentrations. The closure of the trenches was reported in a "Clean Closure Verification Report, TAMCO Rolling Mill Site" prepared by ERT, Inc, dated March 1988.

At the time of this 1998 Phase I ESA, the property had been developed with a fabrication shop, office building, and maintenance shop which had been constructed in 1989 and 1992. The areas adjoining the structures were concrete paved and the southern portion of the property was covered in gravel. This report indicated that none of the operations at the property included wet chemical processing. The operations in the fabrication shop included sorting, bending, shearing, welding, storage and transport. Rebar was being constructed at the property. Maintenance of trucks, forklifts, and cranes was performed at the maintenance shop. Fontana Steel was reported to be a limited quantity hazardous waste generator, with small quantities of hydraulic and lubricating oils, oil filters, absorbent, rags, paint, ethylene glycol and solvent generated the property. Waste oil was accumulated in a 200-gallon AST and other wastes were reported to be stored in 55-gallon drums. A wash rack was indicated to have been present and drained to a below ground clarifier which was equipped with an aboveground oil water separator. One 12,000-gallon diesel UST and one 15,000-gallon propane AST were present on the property.

Multiple cleanup cases were reported for adjoining properties including cleanup of waste discharge from TAMCO into the adjoining property southwest of TAMCO in 1986. Metals from baghouse dust impacted soil and TAMCO excavated 3,000-cubic yards of soil and stored it at the TAMCO site for treatment. At the time of this Phase I ESA, TAMCO was reported to be in the process of separating baghouse dust from slag in a large stockpile in the northwest portion of the TAMCO property. Air Liquide had a diesel release in 1996 which was closed by San Bernardino County, and Industrial Wire Products (formerly Ameron Steel and Wire) had a sulfuric acid spill in 1989, and a voluntary cleanup case for metal contamination. A *Risk Assessment For Steel and Wire Facility, Property Owned by Ameron, Inc., Etiwanda, California*, dated January 12, 1996,

DRAFT

Copyright 2024 Kleinfelder

was prepared by PSM International, Inc for the Ameron Steel and Wire facility. This report indicated that cadmium, copper, lead, and zinc concentrations were present in soil in its storage yard. Investigation activities were performed between 1990 and 1993. Impacted material was sorted into asphalt aggregate, oversize materials, and fines. Approximately 400-cubic yards of impacted material with concentrations greater than their respective TTLCs were disposed off site. Approximately 1,200-cubic yards of impacted material containing concentrations greater than their STLC, but less than their TCLP were used in cold-mix asphalt. Metals remained present at concentrations above human health screening levels in the confirmation samples from the remedial excavation side walls. Metal concentrations above STLC were present in the asphalt. The risk assessment concluded that there were no potential pathways of exposure and the asphalt was proposed to be used on unused portions of the property to suppress fugitive dust. The voluntary cleanup case received closure from the DTSC in 1997. The contaminated soil from Ameron was reported to have been transported off site in 1993. Ameron Concrete & Pipe, located east of the Fontana Property, was identified as being an industrial waste discharger since 1966. In 1967, a polyethylene lined pond was constructed to collect wastewater from the facility containing brine. The RWQCB ordered Ameron Concrete & Pipe to cease discharge into the pond in 1994. Subsurface investigation for removal of the pond began in 1995. PEG recommended assessment of the IEUA pipeline, assessment of the former baghouse trenches, and soil sampling near the wash rack.

PEG prepared a *Summary of Findings, Additional Site Assessment Activities, Fontana Steel, Inc., 12451 Arrow Route, Rancho Cucamonga, California*, dated June 10, 1999. This report documented the advancement and sampling of eleven soil bores around the former baghouse trenches, two bores in the vicinity of the washrack and clarifier, and one bore adjoining the 12,000-gallon diesel UST at the Fontana Steel property. The trenches were not located where the closure report indicated and no backfill slag material was encountered in five bores. Three bores were advanced in the former trenches. No baghouse dust was reported to have been observed. TPH diesel concentrations were not reported in the soil samples collected near the clarifier and washrack or near the UST. Soil samples from the bores adjoining and in the former trenches did not contain metal concentrations exceeding their TTLC. Maximum chromium and lead concentrations were 900 mg/kg chromium collected from the east trench at 16.5 feet bgs, and 170 mg/kg lead collected from the center trench at 10 feet bgs, respectively. Samples from two bores were analyzed for soluble chromium and lead using TCLP (USEPA Method 1311). The results indicated that soluble lead was not detected.

DRAFT

Copyright 2024 Kleinfelder

A Voluntary Cleanup Agreement was signed between Fontana Steel, Inc. and the DTSC on December 22, 2000, for remediation of historical slag trenches on the northern Subject Property parcel (Parcel 1 – 12451 Arrow Route). At the time of this agreement, the property was indicated to be owned by CMC Steel Fabricators Inc., dba Fontana Steel. Three trenches located adjacent to a steel mill had been used for the disposal of baghouse dust which was generated at the mill. The trenches were located approximately 300 feet east of the western property boundary and 100 feet north of the southern property boundary. Arsenic, cadmium chromium, lead, and zinc were reported to be present in soil. The Voluntary Agreement indicated that a Preliminary Endangerment Assessment would be performed.

A correspondence letter from the DTSC on September 13, 2000 transmitted two sets of comments in response to the PEA draft for Fontana Steel.

A memorandum dated September 5, 2001 provided additional comments on the PEA report for Fontana Steel dated July 31, 2001.

A *Final Preliminary Endangerment Assessment Work Plan* for the historical electric arc furnace dust trenches at Fontana Steel Inc. and CMC Steel Group was prepared by IT Corporation in September 2001 and revised in November 2001. Various drafts were also available.

IT Corporation prepared a *Final Preliminary Endangerment Assessment Report, Historical Electric Arc Furnace Dust Trenches, Fontana Steel, Inc., Rancho Cucamonga, California* report dated September 2001, and revised November 2001. As part of IT's PEA, seven bores were advanced and sampled for CCR Title 22 metals and hexavalent chromium; four background samples were also collected from the perimeter of the property and analyzed. The slag was present between 6 and 10 feet bgs and extended to depths of 16 to 18 feet bgs based on the 1999 and 2001 investigations. The results from the 2001 PEA bore samples indicated the presence of a maximum chromium concentration of 1,200 mg/kg in the center trench sample from 11.5 feet bgs, a maximum hexavalent chromium of 2.0 mg/kg in the east trench sample from 1.5 feet, a maximum lead concentration of 480 mg/kg in the east trench sample from 1.5 feet bgs, and maximum zinc concentration of 2,200 mg/kg from the center trench sample from 11.5 feet bgs. The PEA findings indicated that the metal concentrations present in soil and backfill are within commercial exposure limits and no further action was recommended. The DTSC agreed with these findings and indicated no further action was required in a letter dated December 20, 2001.

DRAFT

Copyright 2024 Kleinfelder

TAMCO - 12459 Arrow Route

RWQCB letter dated April 28, 2005, entitled “Notice of Violation: Failure to Comply with the General Permit for Storm Water Discharges Associated with Industrial Activities, Order No. 97-03-DWQ, NPDES No. CA0000001 (General Permit). An inspection performed on December 15, 2004 noted violations. A re-inspection was performed on March 22, 2005 indicated that the Stormwater Pollution Prevention Plan (SWPP) had been updated, annual sampling required the iron and copper, housekeeping continues to need improvement, BMPs need to be implemented on the west side of the property to prevent runoff, unauthorized discharge was occurring with sediment runoff and oil sheen observed, and process water being discharged to storm drains.

RWQCB letter dated September 16, 2005, entitled “Notice of Violation: Failure to Comply with the General Permit for Storm Water Discharges Associated with Industrial Activities, Order No. 97-03-DWQ, NPDES No. CA0000001 (General Permit). This letter indicated that the SWPP did not comply with requirements and does not identify all the potential pollutants. This letter noted that spills of oil and grease were observed on the ground in the maintenance area. Scrap waste from Pacific Coast Recycling, including foam from car seats, was observed in the scrap piles. This foam contained PCBs. The RWQCB directed that this waste be contained so it doesn’t migrate. Scrap metal was observed to be sprayed using sprinklers. The water was allowed to drain into unpaved areas and percolate into the ground. A silo north of the furnace was observed to store soda ash. This was observed on the ground. A fine black dust was accumulated in the bundling area, and it was observed that water from a leaking pipe was carrying this powder to a storm drain. A pit was present across from the roll mill. The pit was observed to be full of oily water. A concrete pit was observed to contain wastewater from the mill scale. Mill scale waste was piled near the roll mill. The RQQCB requested that the wastewater in the pit and the mill scale be analyzed.

DTSC letter dated October 7, 2005 documented review of TAMCO’s proposal to remove contaminated soil. The contaminated soil extent was based off the DTSC’s samples collected in 2005. TAMCO indicated that the only sample that failed hazardous waste criteria that was not located on a concrete pad was Sample 5, which was collected just north of the concrete pad with scrap pile COMP P16. Excavation will include the area around Sample 5. Excavated soil that passed the soil criteria (TTLC or STLC or the Preliminary Remediation Goals [PRGs]) would be used as backfill along with slag. DTSC noted that the 10-inch concrete pads did not have secondary containment and the contamination is likely to migrate to the adjoining unpaved areas.

DRAFT

Copyright 2024 Kleinfelder

The maximum concentrations listed in the September 2005 health and safety plan prepared by the Leu Group for TAMCO listed cadmium at 24.6 mg/kg, chromium at 477 mg/kg, copper at 868 mg/kg, lead at 1,010 mg/kg, nickel at 101 mg/kg, zinc at 1,650 mg/kg, and mercury at 0.88 mg/kg.

The Leu Group, 2006, *Remediation Completion Report for Surface Soils Impacted by Heavy Metals Located North of Pad 16, TAMCO Steel, Rancho Cucamonga, CA*. This report indicates that the DTSC collected soil samples from north of Piles 12 and 16 on January 20, 2005 and identified heavy metals in soils. Clean up levels were identified as TTLCs, STLCs, and California PRGs. An x-ray fluorescence (XRF) analyzer was used to screen soils during remedial excavation. Laboratory results indicated that concentrations did not exceed their respective TTLCs; however, two shallow samples failed STLC. These areas were excavated deeper until subsequent samples passed the cleanup criteria. Crushed slag and the excavated soil that passed the cleanup criteria were used as backfill and the area was subsequently paved with asphalt. Based on review of the attached figure, the excavated area was approximately 20 feet to 35 feet by 120 feet. The depth of the excavation was indicated to be a couple feet.

State of California Environmental Protection Agency Department of Toxic Substances Control, Docket No. HWCA 2005 0964, Consent Order, signed April 26, 2007 by TAMCO and May 2, 2007 by DTSC. This document indicates that TAMCO receives large quantities of scrap metal for smelting and producing rebar. Scrap metal has been stored in piles without containment. Scrap metal contains lead, chromium, copper, nickel, and zinc. During an inspection on January 20, 2005, it was noted that a release of powder containing metal concentrations that exceed their respective TTLCs had occurred. TAMCO completed sampling in 2006 and then removed and disposed of the impacted soils. Areas were paved to the north and south of the scrap piles and barriers were installed to separate piles, and a stormwater treatment system was constructed to prevent contamination from leaving the paved areas. The Consent Order directed that TAMCO will minimize the release of contaminants by using barriers or wind breaks to prevent the powder from being carried by wind, routine cleanup of residual dust from scrap piles, installation of track-out controls to prevent the dust from being tracked out by trucks. Laboratory reports for samples collected November 30, 2005 were attached for 23 soil samples.

Ramboll Environ, 2017*, Phase I Environmental Site Assessment, Gerdau Ameristeel US Inc. DBA TAMCO, 12459-B Arrow Route, Rancho Cucamonga, California*, July. This Phase I ESA was prepared on behalf of Commercial Metals Company. The Subject Property was identified as formerly orchards until the southeastern portion was developed as a steel mill in 1956. Past occupants of the property included American Pipe and Construction, United Slag Processing, Ameron Steel and Wire (Ameron), and TAMCO. TAMCO was formed by a Ameron (formerly

DRAFT

Copyright 2024 Kleinfelder

American Pipe and Construction), Tokyo Steel, and Mitsui Corporation in 1974. The current Melt Shop was constructed in 1976. The Rolling Mill and Melt Shop became part of TAMCO operations in 1983. TAMCO was bought by Gerdau Ameristeel in October 2010. This Phase I ESA identified the former industrial use of the property as a steel mill since 1956 as a REC. Concerns included potential buried hazardous materials and waste, potential historical septic and drain field, former presence of an “oil cellar” and abandoned 10,000-gallon oil tank in the Rolling Mill area, a waste sludge or ink disposal area near a cooling tower, area of significant staining noted in 1998 near ASTs, oil and staining observed in waste storage areas in 2012, staining on paved surfaces, aging waste water collection systems, active diesel and gasoline USTs, closure of one or more USTs without regulatory oversight, and a former sludge pit. Four CRECs were identified for the Subject Property. An area southwest of TAMCO had been contaminated with lead, zinc, and cadmium, by runoff water from the TAMCO facility was remediated by TAMCO. Soil was excavated, stabilized, and stockpiled on the TAMCO facility, and then used to backfill a UST excavation. The case was closed on November 7, 1990 by the RWQCB. Cleanup closure levels were California hazardous waste thresholds (50 mg/kg lead and 5 mg/L soluble lead). Ramboll identified that the DTSC used 80 mg/kg lead as the screening criteria for unrestricted use and identified this cleanup case as a CREC. The second CREC identified was the remediation of a stockpile of approximately 62,500 tons of baghouse dust and slag in 2000. The baghouse dust was disposed of off site, and verification samples were collected after remedial excavation. The slag was reused on site. The San Bernardino County Fire Department issued case closure on July 2, 2002, with residual contaminants remaining in soil. The third CREC was the excavation and remediation of lead, chromium, copper, nickel, and zinc in soil north of the scrap metal yard in 2005 and 2006. The excavations were backfilled with slag. Metal concentrations may remain present in soil. TAMCO entered into a Consent Agreement with the DTSC. The fourth CREC listed was the closure of a 300-gallon diesel UST in 2011 (this is for the UST removed in November 2010). Diesel was reported at a concentration of 1,720 mg/kg, ethylbenzene was reported at a concentration of 57 µg/kg, and total xylenes were reported at a concentration of 423 µg/kg in the sampled collected from the bottom of the UST excavation. Closure was issued March 7, 2011 with the residual contamination remaining. This report indicated that a comprehensive asbestos survey had been completed in 2015. Asbestos had been identified in various joint compounds, tiles, mastics, linoleum, stucco, window putty, and roofing materials across the property. No abatement was indicated to have been performed. One production well, approximately 709 feet deep, was reported to be present on the property and used for non-potable purposes (dust suppression). Groundwater was reported to be present at 443 feet bgs based on videologging performed on the non-potable well on the Subject Property in 2006. Personnel interviewed as part of Ramboll’s Phase I ESA indicated that the facility was connected to municipal sewer in 1980s but formerly

DRAFT

Copyright 2024 Kleinfelder

had a least one septic system and leachfield. This report reviewed multiple previous Phase I ESA reports, 2006 and 2011 UST closure reports, remediation reports for slag and non-slag stockpiled material, and pre-renovation survey.

Ramboll Environ, 2018, *Phase I Environmental Site Assessment, Gerdau Ameristeel US Inc. DBA TAMCO, 12459-B Arrow Route, Rancho Cucamonga, California*, August 6. This Phase I ESA was performed as an update to the 2017 Phase I ESA summarized above. The findings from this Phase I ESA were generally the same as the 2017 Phase I ESA.

Ramboll Environ, 2020, *Phase I Environmental Site Assessment, 12459-B Arrow Route, Rancho Cucamonga, California*, August 6. This Phase I ESA identified the staining observed around the ASTs in a 1998 Phase I ESA prepared by Arcadis as a REC. The ASTs were described as located south of the maintenance building on Parcel 3. The ASTs had been used to store oil, grease, antifreeze, and diesel fuel. This area was upgraded with secondary containment in 2010. The remediation of the impacted soil near Pad 16 and the remediation of the slag stockpile were identified as CRECs. Identified HRECs included the impacted shallows soils southwest of the Subject Property which was closed November 7, 1990, the removal and closure of four 12,000-gallon USTs in 1993/1994, and the slag trench remediation and closure in 2001. No structures were present on Parcel 1 at the time of this Phase I ESA. Instead, it was used to store spare parts and equipment for the CMC rebar facility, slag piles, and steel billets. The former steel mill structures remained present on Parcel 2, including the electric arc furnace (EAF) building, lime silos, cooling tower, warehouse and maintenance building. Slab and scrap metal piles were stored on the northern portion of Parcel 2. Phoenix Industries was present on Parcel 2 and operated a slag processing business. Phoenix operated a maintenance building in Parcel 2. Parcel 3 was occupied by a baghouse and cooling towers, two maintenance structures, the roll shop and roll mill, and a bundling station. Rebar was stored in the northeast portion of Parcel 3. Parcel 4 was occupied by a rebar fabrication shop, maintenance structure, and office building. Rebar was also stored on Parcel 4. The Subject Property is described as mostly paved with asphalt and concrete. Unpaved areas were indicated to be present in the west and used to store steel billets. Active railspurs were present on the Subject Property. A stormwater infiltration pond was reported to be present in the southeastern portion of the Subject Property, concrete-lined wastewater treatment ponds were located near the cooling towers, and a concrete-lined evaporation pond was reported to be located west of the rolling mill. A well was located in the southeastern corner of the Subject Property. One split UST was reported to be present on site. Various oils, greases, lubricants, degreasers, welding gases, cooling tower treatment chemicals, refrigerant chemicals, and detergents were used by CMC during its operations. A parts cleaner

DRAFT

Copyright 2024 Kleinfelder

was reported to be present in a maintenance building but was reported to use non-chlorinated cleaner.

Ramboll, 2021, *Phase II Subsurface Investigation Report, 12459-B Arrow Route, Rancho Cucamonga, California*, April 28. As part of this subsurface investigation, Ramboll advanced 99 soil bores (including 33 step-out bores) across the Subject Property in 2020 and 2021. Of these bores, 26 were converted to soil vapor probes. Bores were advanced in a grid pattern or in areas of concern to depths ranging between 5 and 35 feet bgs. Areas of concern included clarifier locations, near the hydraulic lift in the maintenance shop, the slag remediation, near drains, in the Pad 16 remediation area, in the slag trench remediation area, near the stormwater channel, in the lead remediation area, in the approximate location of the former 500-gallon diesel UST, in the vicinity of a cooling water channel, near cooling towers, near reheat oven, near the dual-compartment UST, at the approximate location of the former four fuel oil USTs and the four diesel USTs, near wash stations, near former oil cellar in the production/roll mill building, in the former roll shop, near transformers, in the lubricant storage area, in the mobile maintenance building, near ASTs in the mobile maintenance building, near the stormwater infiltration channel, in the hazardous waste storage, and near the former septic system. Soil vapor probes were installed at 5 feet and 15 feet bgs in nine of the 26 bores; 5 feet and 30 feet bgs in three of the 26 bores; and at 5 feet bgs in the remaining bores. Of the step out bores, 8 were advanced to 3 feet bgs, 8 were advanced to 5 feet bgs, four (4) were advanced to 15 feet bgs, four (4) were advanced to 36 feet bgs. Soil vapor probes were installed at 5 feet, 15 feet, and 35 feet bgs in the step-out bore locations. Slag material was encountered at depths up to 10 feet bgs in 33 of the 99 bores. Soil samples were analyzed for metals, VOCs, and TPH. Select samples were also analyzed for hexavalent chromium and PCBs. In summary, soil analytical results indicated TPH-g was only detected in one soil sample collected at a depth of 3 feet bgs. This TPH-g concentration (0.00034 mg/kg) did not exceed commercial screening levels. TPH-d was present in 15 of the initial soil samples and 11 of the step-out soil samples. Concentrations ranged from 11.8 mg/kg to 9,230 mg/kg (collected at 1-foot bgs). Only two soil of the initial samples (RSB-03 and RSB-05) contained TPH-d concentrations that exceeded commercial screening levels and both samples were collected at 1-foot bgs. The concentrations in the step-out bores in these areas also exceeded commercial screening levels. The elevated TPH-d areas were located in the western portion of APN 0229-121-33 and in the southeast portion of APN 0229-131-19. TPH-o was present in 19 of the initial samples and seven of the step-out samples. TPH-o concentrations ranged up to 11,000 mg/kg. TPH-o concentrations did not exceed the TPH-o commercial screening levels. VOCs including 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, benzene, ethylbenzene, m,p-xylene, o-xylene, p-cymene, and PCE were present in soil samples at

DRAFT

Copyright 2024 Kleinfelder

concentrations below their respective commercial screening levels. Lead concentrations were, however, present above their respective commercial screening levels, at concentrations ranging up to 2,910 mg/kg. Cadmium, lead, and zinc were detected at concentrations above their respective hazardous waste thresholds (TTLCs) in three soil samples, and one soil sample had soluble lead that exceeded the TCLP limit. Elevated lead was present in two areas: one near the eastern portion of the Mobile Maintenance building on APN 0229-131-19 and one north of the Warehouse and Maintenance building on APN 0229-121-33. One area with elevated cadmium was present near the old Baghouse on APN 0229-121-33. Six samples were analyzed for PCBs and PCBs were not detected. VOCs including PCE and chloroform were detected in soil vapor samples above commercial screening levels with an attenuation factor of 0.001 applied. Chloroform was detected at concentrations ranging from 0.06 µg/L to 1 µg/L, and PCE was detected at concentrations ranging from 0.08 µg/L to 100 µg/L. PCE concentrations appeared to decrease during a second sampling event. Ramboll recommended a Site-Specific SMP be prepared for future construction at the Subject Property to manage the slag material present in the subsurface and the areas with TPH-d, lead, zinc, and cadmium concentrations. Ramboll concluded that the TPH-d in shallow soils above commercial screening levels appeared to be limited laterally and vertically. Ramboll recommended that soil in the areas containing elevated lead, zinc, and cadmium concentrations be removed off site for disposal. Ramboll indicated that the PCE-impacted soil vapor appeared to be localized in the eastern portion of the Parts Warehouse building and appeared to be limited to the upper 15 feet bgs.

Ramboll Environ, 2021, *Phase I Environmental Site Assessment, 12459-B Arrow Route, Rancho Cucamonga, California*, June. At the time of this Phase I ESA the steel mill, including the Rolling Mill and Bundling Station, was no longer in operation. Rebar fabrication and slag processing operations continued. The equipment and structures from the steel mill operations remained in place. This Phase I ESA identified areas of impacted soil and soil vapor found in Ramboll's 2021 Phase II investigation as a REC. The remediation of the area north of Pad 16 and the remediation of the baghouse dust/slag stockpile were identified as CRECs. Historical remediation at the Subject Property including remediation of the property adjoining to the southwest in 1990, removal of fuel oil USTs in 1994, and remediation of baghouse dust trenches in 2001 were identified as HRECs. This report indicated that Ramboll collected soil samples at each of the previous areas of concern and did not identify any concentrations above screening levels for unrestricted use.

Roux Associates, Inc (Roux), 2021, *Phase I Environmental Site* Assessment, 12451 Arrow Route, Rancho Cucamonga, California, December 27. This Phase I ESA was provided by the User and is summarized in Section 4.5.4.

Roux, *Technical Memorandum, Targeted Shallow Soil Investigation for Polychlorinated Biphenyls, Southeastern Corner of Parcel 3, Former Commercial Metals Company Facility, 12451 Arrow Route, Rancho Cucamonga, California,* dated April 7, 2023. This report documents a shallow soil sampling investigation performed on November 10, 2022 at the location where PCBs had been identified in the southeast portion of Parcel 3. The background information included in this report indicated that shallow soil sampling had been performed by Roux in November 2021 along the railroad spurs on the Subject Property. Results of this 2021 investigation were reported in a *Subsurface Investigation Report* prepared by Roux dated April 6, 2023. During this 2021 investigation, soil samples from 19 locations (RR-1 through RR-19) were analyzed for TPH, PCBs, OCPs, and SVOCs. The PCBs Aroclor-1260 and Aroclor-1242 were identified at three locations, with Aroclor-1242 present above commercial screening levels at one sampling location, at concentrations of 130 mg/kg and 170 mg/kg in the 0.5 foot and 1.5-foot samples, respectively. On November 10, 2022, additional soil samples were collected from 11 locations around the location where Aroclor-1242 was above screening levels. Samples were collected from 0.5-, 1.5-, and 3-feet bgs, and one additional sample was collected at 4-feet bgs adjoining the original location. Aroclor-1242 was not detected in the step-out samples. Aroclor-1254 was present in one of the 11 soil samples at a concentration of 0.39 mg/kg, which did not exceed screening levels. Aroclor-1260 was present in four of the 11 samples at concentrations ranging up to 1.90 mg/kg. Only the maximum concentration exceeded screening levels. Roux concluded that the PCB impact did not appear to be widespread, and recommended removal pursuant to the Site's SMP.

Roux, *Technical Memorandum, Targeted Shallow Soil Investigation for Polychlorinated Biphenyls near RR-3 and Recommended Additional Sampling, Former Rail Spur, Southeastern Corner of Parcel 3, Former Commercial Metals Company Facility, 12451 Arrow Route, Rancho Cucamonga, California,* dated August 25, 2023. This memorandum summarized the results of soil samples collected in May and June 2023 from six additional bores around RR-3. The previous 11 step-outs bores from November 2022 had been located 20 feet south, and 40 feet north, west, and east of RR-3. These May and June step-out bores were located and 5 and 10 feet from RR-3. PCBs were not detected in samples to the east or west, but concentrations of the PCB Aroclor-1248 were present in the 0.5-foot and 1.5-foot samples collected 5 feet to the south of RR-3. PCBs were not detected in the 3-foot soil sample collected at this location, or in the soil samples from the step-out location 10 feet south of RR-3. Aroclor-1260 was present in the 0.5-foot soil sample collected 5 feet north of RR-3 and concentrations of both Aroclor-1254 and Aroclor-1260 were present in the 0.5-foot soil sample from the step out location 10 feet north of RR-3. Roux concluded that PCB impact was not delineated to the north, but was delineated to the east, west,

DRAFT

Copyright 2024 Kleinfelder

and south. PCBs were delineated vertically at each sampling location, with the exception of the step out location 10 feet north of RR-3.

Roux, *Technical Memorandum, Characterization of Polychlorinated Impacted Concrete, Parcel 3, Former Commercial Metals Company Facility, 12451 Arrow Route, Rancho Cucamonga, California,* dated August 25, 2023. This report summarizes concrete and soil sampling activities performed in the vicinity of an approximately 60-feet by 20-feet "pink-stained" concrete area discovered during demolition of the Rolling Mill in January 2023. An active electrical transformer and switchboard were located adjoining the concrete area to the east. After discovery, the stained concrete was left in place and sampled for waste characterization. Concentrations of the PCB Aroclor-1242 up to 200 mg/kg were detected within the stained concrete area. This area was indicated to be at the approximate former location of the "FAB" room, adjacent to the Roll Mill. The sampling discussed in this memorandum included sampling in a 10-foot by 10-foot grid across the concrete pad and into the adjoining soil. The PCBs Aroclor-1242 (up to 91 mg/kg in concrete, not detected in soil), Aroclor-1248 (up to 1,900 mg/kg in concrete, up to 0.90 mg/kg in soil), Aroclor-1254 (up to 2.8 mg/kg in concrete, not detected in soil), and Aroclor-1260 (not detected in concrete, up to 0.069 mg/kg in soil) were present in samples. PCB concentrations greater than the DTSC commercial screening levels were present in the northern portion of the concrete slab. PCBs were only detected in soil above screening levels in one area. Vertical profiling of the concrete slab showed that the higher PCB concentrations were present near the concrete surface. Roux concluded that, based on the thickness of the concrete slab (approximately 12-inches thick) and the results of the vertical assessment, it is unlikely that soil beneath the slab was impacted.

DRAFT

DTSC letter dated October 25, 2023, entitled "Concurrence with Slag Investigation Technical Memorandum, BTC III Arrow Route, 12451 Arrow Route, Rancho Cucamonga, San Bernardino County (Site Code: 4000885). This letter indicated that the DTSC reviewed a *Slag Investigation Technical Memorandum* prepared by Roux, dated April 7, 2023, and revised August 25, 2023. The letter indicated that groundwater has historically been measured at 378 feet and previous investigations do not indicate that groundwater has been impacted. The technical memorandum was indicated to include information from a *Subsurface Investigation Report*, dated March 24, 2023, which discussed the extent and characteristics of the slag material at the Subject Property. Slag samples were indicated to have been collected between September and October 2022 from pothole and trench investigations and analyzed for metals and pH. The slag material was reported to extend up to 13 feet bgs. The report indicated that analytical results identified thallium and

Copyright 2024 Kleinfelder

arsenic concentrations were above commercial/industrial screening levels. This letter indicated that a “site-specific leaching model will be considered”.

Roux, 2023, *Subsurface Investigation Report, 12451 Arrow Route, Rancho Cucamonga, California,* April 6, revised September 12, revised October 24. Roux performed subsequent environmental investigations in 2021 and 2022 including sampling along the railroad spurs present on the Subject Property, sampling in a former chemical storage area northwest of the former Melt Shop, sampling at a wash rack located in the northern portion of APN 0229-121-33, sampling in the location of a former subsurface clarifier and aboveground oil recovery system on APN 0229-121-35, and sampling around the dual-compartment UST and associated fuel dispensers in the northwest corner of APN 0229-131-19.

Roux performed two subsurface investigation mobilizations. Roux’s first subsurface investigation in 2021 included the advancement of 95 soil bores to 15 feet bgs. Thirty-four (34) bores were advanced to investigate the extent of lead and TPH-d in shallow soil based on the findings from Ramboll’s 2021 investigation. Nineteen (19) soil bores were advanced along the rail spurs and analyzed for TPH, VOCs, PCBs, OCPs, SVOCs, and chlorinated herbicides. Forty (40) bores were advanced around the area where Ramboll detected benzene and PCE in soil vapor and soil vapor probes were installed at depths of 5-, 10-, and 15-feet bgs. One shallow bore (3 feet bgs) was advanced in the vicinity of the dual-compartment UST and dispenser and soil samples were analyzed for TPH. Two shallow bores (3 feet bgs) were advanced at the location of the four former USTs which had been removed in 1993 and soil samples were analyzed for TPH, VOCs, and metals. One shallow bore (3 feet bgs) was advanced at the approximate area of a former drum storage area near the former 300-gallon diesel UST and soil samples were analyzed for TPH, VOCs, and metals. Two bores were advanced to 5 feet bgs in the vicinity of a vehicle wash rack on APN 0229-121-33 and soil samples were analyzed for TPH, VOCs, and metals. Two bores were advanced to 5 feet bgs in the vicinity of a former clarifier and aboveground recovery system on APN 0229-121-34 and soil samples were analyzed for TPH, VOCs, and metals. Roux’s second mobilization in 2022 was performed to further delineate soil and soil vapor impact on APN 0229-131-19 and included the advancement of 34 soil bores and the installation of soil vapor probes at depths ranging between 15 and 35 feet bgs.

Roux’s investigations identified concentrations of PCB, TPH-d, arsenic, and one concentration of the SVOC benzo(a)pyrene greater than screening levels in soil samples collected along the railroad spurs on APNs 0229-121-33 and 0229-131-19. Further delineation of the PCB concentrations was preformed and discussed in Roux’s memorandums (previously summarized). The report indicated that TPH-d, metals, and SVOC concentrations required further delineation.

DRAFT

Copyright 2024 Kleinfelder

TPH-d and metals exceeding commercial screening levels are present in soil at depths less than 5 feet bgs in the southern portions of APNs 0229-121-33 and 0229-131-19. TPH-d concentrations were identified to be mainly in the 1-foot soil samples and vertically delineated by the 3-foot soil samples, with one location delineated by the 5-foot soil sample. Lateral delineation was still required. One of the areas identified by Ramboll as having elevated lead concentrations (the area near the former Mobile Maintenance building) was similarly vertically assessed in samples collected at 5 feet bgs. Lateral delineation was still required for this location's impacted areas. Vertical and lateral delineation was required for the second area (near the former Warehouse and Maintenance building). The area with the elevated cadmium concentration was delineated vertically, but remains to be delineated laterally. VOCs were not detected in soil samples greater than screening levels.

Soil samples from bores advanced near the open-top clarifier (near Ramboll's bores where PCE and benzene were detected in soil vapor) indicated that metal, VOC, and TPH concentrations were not detected or did not exceed screening levels. Soil vapor samples indicated that benzene was present in soil vapor at 5 feet bgs at concentrations exceeding commercial screening levels. VOCs did not exceed screening levels in the 30-foot soil vapor sample. Nineteen (19) step out bores were advanced and soil vapor probes were installed in this vicinity. VOCs were not detected in soil samples and only benzene and PCE were present in soil vapor samples at concentrations greater than their respective screening levels.

Roux advanced 24 bores and installed soil vapor probes in the vicinity of the Mobile Maintenance building. Only tertiary butyl alcohol (tBA) was detected in the soil samples collected. Benzene (maximum concentration of 29 micrograms per cubic meter [µg/m^3]), PCE (maximum concentration of 680 µg/m^3), TCE (maximum concentration of 550 µg/m^3), and chloroform (maximum concentration of 86 µg/m^3) were present above their respective commercial screening levels in soil vapor samples. The maximum PCE and benzene concentrations were present in soil vapor samples collected from 5 feet bgs and the maximum TCE and chloroform concentrations were detected from soil vapor samples collected from 35 feet bgs. Roux also advanced 26 bores around the area Ramboll identified as having PCE in soil vapor near the Parts Warehouse. Only tBA was detected in the soil samples collected. PCE and TCE were present in soil vapor samples at maximum concentrations of 2,500 µg/m^3 (15 feet bgs) and 520 µg/m^3 (35 feet bgs).

Soil samples were collected from the former 1993 UST excavation area to assess the backfill material for the presence of metals, TPH, and VOCs. Samples were collected from 1 foot and 3 feet bgs. Metal concentrations did not exceed either commercial screening levels or background levels. Low concentrations of tBA and benzene were detected, and TPH-d and TPH-o were not

DRAFT

Copyright 2024 Kleinfelder

detected at concentrations that did not exceed their respective San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) commercial screening levels.

Roux advanced a soil bore in the tank pit adjacent to the dual-compartment UST tank pit. The UST and dispenser (which had been located on top of the UST) was removed December 2022. TPH-d and TPH-o concentrations were not detected in the soil samples above their respective SFBRWQCB commercial screening levels. The SBCFD issued case closure July 18, 2023.

Ramboll had sampled next to an inactive clarifier and aboveground oil recovery system on APN 0229-121-34. Sample analytical results indicated that VOCs were present in soil and soil vapor. Metals did not exceed their screening criteria and TPH was not detected. Roux advanced step-out bores. Sample analytical results from the step out bores indicated that metals did not exceed their criteria, VOCs were not detected, and TPH-d and TPH-o were present in the 1-foot soil samples at concentrations that did not exceed their respective SFBRWQCB commercial screening levels.

In summary, soil vapor investigations identified that PCE, TCE, benzene, and chloroform were present in soil vapor beneath the western portions of the former roll mill and beneath the parts warehouse on APN 0229-131-19 at concentrations exceeding commercial screening levels. Roux indicated that lateral and vertical delineation of soil vapor is still required, and recommended SVE as a remedial method for the soil vapor impact. Roux installed SVE wells and performed a SVE pilot test in 2022. The pilot test was confirmed to be effective for soil vapor remediation. Roux also recommended further delineation of TPH-d, metals, and SVOCs which are present in shallow soils in localized areas, and further delineation of PCB-impacted soils near the railroad spurs. VOC concentrations were either not detected or did not exceed their respective screening levels and pesticide and herbicide concentrations in samples collected across the Subject Property did not exceed commercial screening levels. Finally, Roux recommended evaluation of the physical distribution and chemical composition of the slag material present in the western portion of the Subject Property. Both Ramboll and Roux had performed leachabilty analysis of slag samples. Results indicated that only one location had metal concentrations that exceeded STLC and/or TCLP.

EnviroStor listings were also available for adjoining properties. These listings are summarized below:

Ameron/Steel & Wire Property, located at 12459 Arrow Route, was listed as a voluntary agreement cleanup site with a status of “No Further Action” as of April 23, 1996. This facility was

DRAFT

Copyright 2024 Kleinfelder

listed as a wire manufacturing facility that was owned by Ameron from 1962 through 1990, after which it was sold to Industrial Wire Products, Inc., who continued to manufacture wire at the facility. Wire was manufactured in the Wire Mill building located on the western side of the facility. Steel rod was obtained from the steel mill located on the property south of the facility. The Wire Mill building was constructed in the early 1960s. The eastern portion of the facility was used for storage/processing/staging of scrap metal feed stock between the mid-1960s and late-1970s. The Voluntary Cleanup Agreement document, dated June 9, 1995, indicated that previous investigations identified heavy metals including lead in soil from scrap metal storage. Based on review of the Site Layout Map included in the Voluntary Cleanup Agreement, this facility appears to be associated with the adjoining property identified as current APN 0229-121-24.

DP Etiwanda, located at 8822 Etiwanda Avenue, is located east and adjoining the east Subject Property parcel, APN 0229-131-19. This facility was listed as a voluntary cleanup case with land-use restrictions. This property was historically agricultural with a single-family residence and a railroad spur on the property between 1938 and 1966. The facility was then used for automobile and scrap metal recycling from 1975 through 2017. This facility was proposed to be redeveloped with as a transportation facility with office, storage, freight, shipping, and trucking operations. As part of proposed redevelopment activities, the DTSC reviewed the *Initial Study/Mitigated Declaration for Design Review* and required a soil and soil vapor investigation of the property in their comments, dated February 14, 2018. A Voluntary Cleanup Agreement was signed on May 3, 2018. A site assessment was performed by Ramboll in July 2018, and concentrations of metals, TPH, and PCBs were reported to be present in soil samples. Subsequently, remedial excavation was performed to remove contaminated soil. Confirmation soil samples indicated that residual metal and PCB concentrations at the property were below commercial/industrial screening levels, except for areas along the western, northern, and southern property boundaries. A Land Use Covenant between DP Etiwanda and DTSC was executed on August 19, 2020, restricting the property to commercial/industrial use. A subsequent investigation to delineate residual soil impact along the property boundaries was performed in August 2020. Refusal between 1 and 2.5 feet bgs was encountered in many of the bores along the western property boundary (adjoining the Subject Property). Based on Kleinfelder's review of the investigation results, lead was reported to present at a maximum concentration of 379 mg/kg in a 0.5-foot soil sample in the west-northwest boundary of the property in 2018. Samples from the step-out bore advanced to the west of the location of the maximum result in 2020 indicated that lead was present at 0.5 foot at 83 mg/kg, and at 6.9 mg/kg at 2 feet. PCB concentrations were present above commercial screening levels in soil samples collected from the 2018 excavation on the west-southwest boundary of the property. The maximum concentration of Aroclor-1248 was 11.7 mg/kg at 0.5 foot and the

DRAFT

Copyright 2024 Kleinfelder

maximum concentration of Aroclor-1254 was 2.47 mg/kg, also in a 0.5-foot sample, though PCB concentrations were reported at depths down to 3 feet bgs at some locations. Only a 0.5-foot sample was collected at the step-out location to the west of the highest Aroclor-1248 concentration, but the analytical results indicated an Aroclor-1248 concentration of 0.39 mg/kg. Samples from the other two step-out bore locations contained PCB concentrations and did not further delineate the impacted soil. The southeast corner of the Subject Property adjoins this PCB-impacted area. A concrete cinder block wall was reported to be present on the Subject Property boundary preventing any further step-out bore assessments. Ramboll indicated that the residual concentrations of lead present along the south and northwest boundaries were localized and slightly above the commercial/industrial screening levels. Ramboll indicated that the step-out sample results did not exceed the previously maximum detected PCB result and that the concrete cinder block wall along the western boundary acts as a barrier to limit the PCB impact. Ramboll also indicated that the lead and PCB concentrations were adequately characterized and do not present a human health risk since the property has a land use covenant limiting it to industrial use.

Southern California Edison – Etiwanda Generating Station, located at 8998 Etiwanda Avenue (south of the Subject Property across the railroad tracks). This facility was listed as a "corrective action" type facility as of February 2, 1995. This facility was indicated that have maintained ASTs, and contaminants of concern were listed as PCBs and vanadium and compounds. A Stipulation from the Superior Court of California, LA County, Number 121219, dated February 1, 1995, indicated that SCE had stored hazardous waste in non-permitted wastewater retention basins in southern California. SCE was ordered to clean and close the basins. This facility was one of the facilities that this corrective action applied to. The retention basins were cleaned and closed as of 2011. An ongoing RCRA facility investigation is taking place for IEUA, which is located on the parcel southwest and adjoining the former SCE-Etiwanda generating facility.

Copies of the EnviroStor map and findings are provided in Appendix C.

4.3.5 South Coast Air Quality Management District (SCAQMD)

Kleinfelder search the SCAQMD's Facility Information Detail (FIND) website (http://www.aqmd.gov/nav/FIND/facility-information-detail) for air quality records on September 13, 2023. Based on Kleinfelder's review of the SCAQMD FIND website, Fontana Steel Inc. was located at the address of 12451 Arrow Route, on the northern Subject Property parcel. Ameron Concrete & Steel Pipe Sys, So Div was listed at the Subject Property address of 12455 Arrow Route. TI Wire, Tamco, Tube City, Ims, Inc., Industrial Wire Products – Arrow Division, and

DRAFT

Copyright 2024 Kleinfelder

Phoenix Services, LLC were listed at the address of 12459 Arrow Route. No other listings were identified on the FIND map on the Subject Property. Parallel Products (12281 Arrow Route) was shown adjoining the Subject Property to the west and SA Recycling (8822 Etiwanda Avenue) was shown adjoining the southeastern portion of the Subject Property to the east. A cluster of facilities, which included Ameron Concrete & Steel Pipe Sys, So Div, TI Wire, TAMCO, Tube City, IMS, Inc., Industrial Wire Products – Arrow Division, and Phoenix Services, LLC, was shown adjoining the Subject Property to the east and north. Kleinfelder also submitted records requests to the SCAQMD on September 13 and September 14, 2023 for each of the Subject Property addresses. The SCAQMD responded in emails dated September 15, 2023, that no records were available for Subject Property addresses 12343 Arrow Route and 12353 Arrow Route. The SCAQMD responded in an email dated September 19, 2023, that records were available for the address of 12451 Arrow Route, and in emails dated September 21, 2023 that records were available for addresses 12455 and 12459 Arrow Route. Links to the available records were included in accompanying SCAQMD emails. These records are summarized below:

12451 Arrow Route

The following records were available for Subject Property address 12451 Arrow Route:

- A permit to operate a service station and dispense gasoline, Permit M92118, was listed as inactive for Fontana Steel, Inc. It had been issued July 27, 1989. A copy of this permit was available and indicated it was a permit to operate a 10,000-gallon diesel UST and two dispensers.
- Violations were issued on May 26, 2023 for failure to provide proof of manufacturer calibration for an organic vapor analyzer (OVA), to provide VOC monitoring data from February 15, 2023 to the present, and failure to keep a signed copy of the approved plan on site.
- Violations were issued on September 12, 2023 for failure to notify the SCAQMD 24 hours prior to excavation and for failure to calibrate the monitoring equipment every three months. The violation occurred on May 25, 2023.

12459 Arrow Route

The following records were available for Subject Property address 12459 Arrow Route:

TAMCO, located at 12459-B Arrow Route. Permits to operate were listed as inactive and included the following:

Copyright 2024 Kleinfelder

- Permit for storage tank lime & limestone, dated October 12, 1977.
- Baghouse permits dated July 6, 1977, July 8, 1977, October 12, 1977, February 9, 1990, April 15, 1998, October 9, 2008, September 1, 2010, December 4, 2013, and September 25, 2020.
- Permit for Amine Treating dated May 28, 1987.
- Permit for CFC-12 Recovery/Recycling (Rule 1411) dated May 7, 1996.
- Permits for Cooling Tower or Pond / Cooling Tower, Rule 222, dated October 12, 1977, December 27, 2018, and March 6, 2020.
- Permits for Furnace Arc Iron-Steel dated July 6, 1977, July 8, 1977, October 12, 1977, February 9, 1990, November 21, 1991, January 22, 2002, and October 1, 2013.
- Permits for Furnace for Other Metal Operations dated May 25, 1988, July 4, 1994, October 14, 1996, October 1, 1997, December 3, 2013, May 5, 2017, and December 27, 2018.
- Permits for Heaters/Furnace dated August 30, 1977, October 18, 1984, November 30, 1992, October 15, 1996, October 1, 1997, November 27, 2013, and May 5, 2017.
- Permits for storage tank minerals dated July 15, 1983.
- Permits for storage tank petroleum light distillate dated February 11, 1992.
- Permits for storage tank LPG dated April 12, 1996.
- Permits for ICE (50-500) EM Elec Gen-Diesel dated May 29, 1996 and January 29, 1997.
- Permits for ICE (500 HP) EM Elec Gen-Nat gas dated January 29, 1997.
- Permits for ICE (50-500 HP) EM Elec Gen-Nat gas dated October 26, 2005.
- Permit for ICE (50-500 HP) N-EM Port N-rent diesel dated January 28, 2014.
- Permits for storage silo minerals misc dated October 6, 2006 and September 25, 2020.
- Permit for service station storage & dispensing gasoline dated March 3, 2009.
- Permit for storage tank other misc org material dated December 4, 2013.
- Permit for storage silo lime & limestone dated December 4, 2013.
- Multiple (34) violations including emission exceedances, visible emissions of dust, failure to obtain a permit to construct for modification and operation of a billet reheat furnace, failure to report daily emissions and conduct daily calibration, failure to clean equipment

DRAFT

Copyright 2024 Kleinfelder

so as not to accumulate lead-containing dust, and failure to perform reverification testing by January 1, 1998 for gas storage tank were listed for TAMCO between 1991 and 2020.

Tervita (US Operations) LLC, located at 12459-B Arrow Route:

- Inactive permit for bulk load/unload other aggregate dated April 14, 2017.
- Inactive permit for dust collector cartridge type dated April 14, 2017.
- Active permit for aggregate production/crushing dated April 14, 2017.
- Notice of compliance was issued August 26, 2015 to Tervita to submit semi0annual reports by due dates.
- Phoenix Services LLC, located at 12459-B Arrow Route:
- Inactive permit for bulk load/unload other aggregate dated January 12, 2018.
- Inactive permit for dust collector cartridge type dated January 12, 2018.
- Inactive permit for aggregate production/crushing dated January 12, 2018.
- Notice of violations included: failure to provide records for trained persons in a reasonable time issued November 2, 2022; failure to pay annual operating permit fee issued August 24, 2021; provide monthly diesel fuel usage, monthly tons of lead processed, weekly soil_O2 applications, monthly tons of slag processed and loaded and annual Visual Emissions Evaluation (VEE) of emissions issued October 4, 2018; and failure to submit report with flame ionization detector (FID) readings for 2017, issued November 29, 2018. The Notice of Violation (NOV) from March 18, 2022 indicated that the facility was closed as of December 31, 2022. The violation required records of compliance for 2021.

Tube City, located at 12459 Arrow Route:

- Inactive permits for aggregate production/crushing dated September 30, 2011 and May 27, 1998.
- A notice of violation was issued November 19, 2010 for exceedance of monthly limits, operation of replaced crusher without a permit to operate, and replacement crusher without prior approval.
- The following records were available for the address of 12459 Arrow Route and appear to be associated with the adjoining property to the east of the north Subject Property parcel, and north of the east Subject Property parcel:

DRAFT

- Industrial Wire Products, located at 12459 Arrow Route (adjoining the Subject Property to the east and north):
- Permit application for a Boiler dated February 9, 2001.

Phoenix Services LLC, located at 12459 B Arrow Route listed the following permits:

- A permit to operate a slag/aggregate processing system, Permit G50133, was listed as inactive. It had been issued January 12, 2018.
- A permit to operate a dust collector – cartridge type, Permit G50134, was listed as inactive. It had been issued January 12, 2018.
- A permit to operate a slag/aggregate loading system, Permit G50135, was listed as inactive. It had been issued January 12, 2018.
- A Title V administrative permit, Application 597945, had been issued October 19, 2017.
- A Rule 1420, Lead Compliance Plan, Application 603029, was last assigned on May 11, 2018.
- A Title V Permit Renewal Application, Application 605853, was last assigned on April 29, 2019.
- An Aggregate Crushing (<5000 tpd), Application 626580, was rejected on January 26, 2021.

DRAFT

TI Wire, located at 12459 Arrow Route (adjoining the Subject Property to the east and north):

- Permit for a furnace, other metal operations iron-steel dated March 9, 1977.
- Permit application for a boiler methanol dated October 17, 1979. This permit was issued to Ameron Steel-Wire Division.
- Permits for storage tank ammonia dated July 11, 1986. There permits were issued to Ameron Steel-Wire Division.
- Permit for service station storage & dispensing, dated July 4, 1990. This permit was issued to Industrial Wire Products. Permit was for one 10,000-gallon diesel UST and one dispenser.
- Permits for tank, surface preparation – other acids, dated August 8, 1989. These permits were issued to Ameron Steel and Wire Division. One permit was for sulphuric acid and the other was for hydrochloric acid treating tanks.

Copyright 2024 Kleinfelder

- Permit for heat treating furnace dated August 8, 1990. This permit was issued to I.W.P.A.D., Inc
- Permit for acid fume scrubber, other venting M.S. dated March 29, 1998. This permit was issued to I.W.P.A.D., Inc
- Permit for boiler, natural gas only, dated June 8, 2000. This permit was issued to I.W.P.A.D., Inc.

The following records were available for address 12455 Arrow Route and appear to be associated with the adjoining property to the east:

SCAQMD Facility Equipment List Report - Ameron Concrete & Steel Pipe Sys, So Div was listed as having a last inspection date of April 7, 2023, at which time it was listed as “out of business”.

The following permits were listed for this address:

- Permits for Ser Stat Storage & Dispensing Gasoline had been issued July 1, 1982, February 24, 1984, May 7, 1990, and September 8, 1999.
- Permits for an ICE (50-500 HP) N-EM Port N-Rent Diesel / ICE (50-500 HP) N-EM Stat Diesel issued November 27, 1989, December 6, 1989, and February 12, 1999.
- Permit for an ICE (50-500 HP) N-EM Stat Gasoline issued April 4, 1990.
- Permits for Abrasive Blasting (Open) issued October 26, 1976, January 13, 1990, January 17, 1990, and April 16, 1997.
- Permits for Abrasive Blasting (Cabinet/Machine/Room) issued October 26, 1976, January 17, 1990, January 13, 1990, May 16, 1991, and December 30, 1992.
- Permits for Baghouses dated October 26, 1976, November 30, 1977, June 13, 1980, May 5, 1983, May 16, 1991, August 14, 1992, December 30, 1992, and May 5, 1994.
- Permits for Concrete Batch Equipment dated October 26, 1976, June 13, 1980, August 14, 1992, and May 4, 1994.
- Permits for Boiler (>20-50 million British thermal units per hour [MMBTU/Hr]) Comb Gas-Distil dated October 26, 1976.
- Permits for Boiler (>20-50 MMBTU/Hr) Natural Gas only dated December 30, 1992.
- Permits for Storage Tank Cement dated November 30, 1977, June 13, 1980, and May 5, 1983.

DRAFT

Copyright 2024 Kleinfelder

- Permits for Amine (or diethanolamine [DEA]) regeneration dated July 1, 1982 and February 24, 1984.
- Permit for Amine Treating dated May 7, 1990.
- Permits for Spray Equipment Open Architectural/Spray Equipment Open dated July 3, 1986, June 29, 1990, July 18, 1990, April 8, 1992, and October 11, 1993.
- Permits for Storage Silo Cement dated August 14, 1992 and May 4, 1994.
- Permits for Low NOx Burner dated December 30, 1992.
- Permit for Plasma Arc Cutting dated June 16, 1993.
- Permit for Tar Pot dated April 13, 1994.

The following violations were listed:

- A violation was issued to Ameron Concrete Pipe Group on September 24, 1985. No information was provided.
- A violation was issued to Ameron Concrete & Steel Pipe Sys, So Div on March 17, 2009 for an Intrafacility Portable internal compustion engine (ICE). An application was required for administrative change of the equipment description.
- A violation was issued March 25, 2014 to American Wrecking Inc to provide revised demo notification. Equipment was described as asbestos.
- A violation was issued February 17, 1998 to Ameron Concrete & Steel Pipe Sys, So Div with the requirement to keep adequate records of all VOC-containing materials, closed lids of degreasers, dispose of solvent rags in metal containers with lids.
- A violation was issued February 20, 1998 to Ameron Concrete & Steel Pipe Sys, So Div with the requirement to post updated district required signs on gasoline pumps.
- A violation was issued to Ameron Concrete Pipe on May 16, 1989 for a diesel tank. No further information was provided.
- A violation was issued to Ameron Concrete Pipe Group So Cal Div on July 30, 1993 for an IC Engine. The listed requirement was a 1110.2 Compliance Plan.
- A violation was issued to Ameron Concrete & Steel Pipe Sys, So Div on February 11, 1998. The listed requirement was to “stabilize ASB in contaminated area by 2/27/98”.

DRAFT

Copyright 2024 Kleinfelder

- A violation was issued to Ameron Concrete & Steel Pipe Sys, So Div on February 5, 2003. The listed requirement was to implement dust control measures for the “hickory yard”.
- A violation was issued Ameron Concrete & Steel Pipe Sys, So Div on January 22, 2009 for open spray equipment, abrasive blasters, tar pot, and gasoline storage and dispensing. The listed requirement was to provide daily production records for the cement batch plant, the monthly usage log for propane for the tar pot, and daily VOC emission records from the coatings from 2007 to the time of the violation.

Copies of the FINDS search results, SCAQMD’s response, and available records are included in Appendix C.

4.3.6 San Bernardino County Fire Protection District – Hazardous Materials Division

Kleinfelder submitted a written request to the San Bernardino County Fire Protection District Hazardous Material Division for available records for the Subject Property addresses. The San Bernardino County Fire Protection District Hazardous Material Division responded with a letter dated September 14, 2023. The letter indicated that the following records were available:

Active permit facilities

- SCE Pipe Station located at 12459 Arrow Highway. This facility was listed as having an active Hazardous Materials 1-3 Chemicals Special Handler permit and an inactive APSA Conditionally Exempt Permit.

Inactive permits and/or non-permit facilities:

- Tamco (formerly CMC) located at 12459, Suite B. This facility was listed as having an APSA 10,001-100,000 Gal. Fac. Capacity Permit, UST permit, Hazardous Materials 71+ Chemicals Handler Permit, RCRA LQG Permit, and UW Handler with Another CUPA permit.
- TI Wire (formerly I.W.P.A.D. Inc.), located at 12459-B Arrow Route. This facility was listed as having a Hazardous Materials 11-30 Chemicals Handler Permit and a RCRA LQG permit.
- Phoenix Services LLC, located at 12459-B Arrow Route. This facility was listed as having a Hazardous Materials 4-10 Chemicals Handler Permit, an APSA 1,320-10,000 Gal. Fac. Capacity Permit, and a SQG permit.

DRAFT

Copyright 2024 Kleinfelder

- CMC Rebar Etiwanda (formerly Fontana Steel Inc), located at 12451 Arrow Route. This facility was listed as having a Hazardous Materials 11-30 Chemicals Handler Permit, and a SQG permit.
- Ameron Steel and Wire Division, located at 12459 Arrow Route. This facility was listed as a UST permit.
- Tervita LLC, located at 12459 Arrow Route. This facility was listed as having a Hazardous Materials 4-10 Chemicals Handler Permit, an APSA 1,320-10,000 Gal. Fac. Capacity Permit, and a SQG permit.
- Tube City IMS, located at 12459 Arrow Route. This facility was listed as having a Hazmat Handler Permit, an APSA 1,320-10,000 Gal. Fac. Capacity Permit, and a Special Generator permit.
- SCE Ameron Substation, located at 12459 Arrow Route. This facility was listed as having a Hazardous Materials 1-3 Chemicals Special Handler Permit, and an APSA Conditionally Exempt Permit.

Permits to remove/install/modify USTs:

- Ameron Steel and Wire Division, located at 12459 Arrow Route.
    - A permit was issued November 9, 1989 to remove one UST.
    - A permit was issued August 27, 1987 for removal.
- Tamco, located at 12459 Arrow Route, suite B.
    - A permit was issued May 4, 2021 for modification/repair.
    - A permit was issued August 2, 2018 for minor modification. This permit was indicated to be expired.
    - A permit was issued March 9, 2018 for modification.
    - A permit was issued February 8, 2016 for modification.
    - A permit was issued April 9, 2012 for modification.
    - A permit was issued November 19, 2010 for removal of one 330-gallon UST.
    - A permit was issued February 2, 2009 for modification.
    - A permit was issued March 24 2006 for removal of four 12,000-gallon USTs.
    - A permit was issued November 4, 1998 for modification.

DRAFT

Copyright 2024 Kleinfelder

  - A permit was issued September 7, 1993 for removal of four 50,000 gallon USTs.
  - A permit was issued December 2, 1986 for installation.
- CMC/Tamco, located at 12459 Arrow Route, suite B.
  - A permit was issued March 13, 2020 for modification.
- CMC Rebar - Etiwanda, located at 12451 Arrow Route.
  - A permit was issued July 9, 2014 for removal.
  - A permit was issued May 12, 2014 for modification. This permit was then cancelled.
- CMC Fontana Steel, located at 12451 Arrow Route, suite B.
  - A permit was issued May 21, 2010 for modification.
  - A permit was issued July 15, 2009 for modification.
- Fontana Steel, located at 12451 Arrow Route.
  - A permit was issued March 3, 2003 for modification.
  - A permit was issued February 9, 1999 for modification.
  - A permit was issued April 19, 1989 for installation.

Hazardous material incident and/or complaint response activity:

- Ameron Steel & Wire Division, located at 12459 Arrow Highway. A line break and spill of sulfuric acid occurred February 17, 1989.
- Ameron Steel, located at 12459 Arrow Route. A complaint for radioactive steel and employee exposure was filed May 29, 1985.
- Bulk Transportation/DTI Associates, located at 12459 Arrow Route. A release of sulfuric acid occurred August 31, 2007.
- Tamco, located at 12459 Arrow Route, Suite B. A release of 30 gallons of water contaminated with baghouse dust occurred on June 8, 2017. The spill was reported to have been contained and cleaned up.
- Tamco located at 12459 Arrow Route, Suite B. A release of sulfuric acid occurred October 15, 2013.

DRAFT

Copyright 2024 Kleinfelder

- Tamco, located at 12459 Arrow Route, Suite B. On March 27, 2007 a load of heavy metal delivered to Tamco from Main Street Fibers set off radiation alarms. The load was returned to its source.
- Tamco, located at 12459 Arrow Route, Suite B. A notification for radioactive material was filed July 27, 2005. The material was returned to its source.
- Tamco, located at 12459 Arrow Route, Suite B. A cylinder in the scrap pile was investigated by the bomb squad on March 4, 2005.
- Tamco, located at 12459 Arrow Route, Suite B. A load of scrap metal set off the radiation alarms. The load was returned to its source.
- Tamco, located at 12459 Arrow Route, Suite B. Hazmat was call for a fire on October 21, 1999.
- Tamco, located at 12459 Arrow Route, Suite B. Cooling tower water mixed with waste oil and solvents was alleged to have been used as dust control on June 13, 1996.
- Tamco, located at 12459 Arrow Route, Suite B. A complaint reported that waste oil and solvents were disposed of in cooling tower and then used as dust suppression. Investigation did not uncover any evidence and the case was closed June 13, 1996.
- Tamco, located at 12459 Arrow Route. A complaint was filed for dumping and covering slag. Investigation did not uncover any evidence and the case was closed July 28, 1992.
- Tamco, located at 12459 Arrow Route. Soils were reported to have been contaminated with metal oxides on August 1, 1986.
- Tamco, located at 12459-B Arrow Route. A live 20-millimeter round was reported to be present in a scrap metal pile and hazmat was called to verify.
- TI Wire, located at 12459 Arrow Route. A release of hydraulic oil was reported on November 6, 2009. The release occurred due to an accident with rebar carried by a Tamco forklift.
- TI Wire, located at 12459-B Arrow Route. A release of sulfuric acid occurred on August 21, 2008.

Site Remediation:

- Ameron Steel (Geotracker™ Global ID T0607100046) - reported September 25, 1989 and closed December 4, 1990.

DRAFT

Copyright 2024 Kleinfelder

- Tamco – closed May 11, 1994.
- Ameron, Inc – reported December 6, 1991.
- Tamco – LUST reported November 22, 1993 and closed May 11, 1994.
- Tamco – reported November 17, 1997 and closed July 2, 2002.

Kleinfelder also reviewed the records available at San Bernardino County Fire Protection District on September 27 and 28, 2023. A summary of pertinent information is provided below. Copies of pertinent information are included in Appendix C.

12451 Arrow Route:

CMC Fontana / Fontana Steel

- A permit to install a 10,000-gallon diesel UST was dated April 19, 1989 (*note: most of the inspections refer to this UST as a 12,000-gallon UST*).
- Business plans had been accepted by San Bernardino County for Fontana Steel from 1994 through 1999. Hazardous material and waste chemical inventories were requested in 1994. Propane was listed at the Fontana Steel facility in 1999. Oxygen, acetylene, propane, waste oil, and waste ethylene glycol were listed in 2000. Diesel was listed on site in 2001. Fontana Steel was listed as owned by CMC Steel Fabricators in 2001.
- Business Emergency Plans and Chemical Inventory lists from 2002 through 2014 indicate that motor oil, diesel fuel (approximately 11,627 gallons), oxygen, propane, acetylene, waste oil, waste ethylene glycol, and waste sludge from the oil water separator.
- A lab report from Chemical & Environmental Laboratories, Inc, dated March 19, 1999, entitled “Fontana Steel” included results for four soil samples. A note on the report indicated that these samples were collected from underneath old fuel dispensers during upgrade activities. Results indicate diesel concentrations in three samples up to 3,298 mg/kg. The samples appeared to be collected at different depths (2.5 feet, 3 feet, and 4 feet) from one location and the maximum concentration was present at 2.5 feet. Diesel was present in the 4-foot sample at 1,263 mg/kg. Benzene, toluene, ethylbenzene, and methyl tertiary-butyl ether (MtBE) were not detected. Xylenes were detected up to 0.217 mg/kg.
- Special Handler, Limited Quantity, and facility permits were available for Fontana Steel from 1994 through 2002. UST permits were available for Fontana Steel from 1990 through

DRAFT

Copyright 2024 Kleinfelder

2002. Special Handler, Limited Quantity, and UST permits were available for CMC Fontana / Fontana Steel from 2002 through 2007.

- From 2009 through 2011, the following permits were issued to CMC Fontana: HAZMAT handler 11-25 employees, limited quantity generator, and UST ownership/operating permit (per UST).
- In November 2012 annual CUPA permits for the following; UST ownership/operating permit (per UST), EPCRA facility, conditionally exempt small quantity generator were issued to CMC Rebar-Etiwanda. A temporary UST permit was issued in December 2013.
- Annual CUPA permits for UST ownership/operating permit (per UST), Hazardous Materials 11-30 chemicals, SQG, and CUPA annual admin permit program fee-level 2 were issued in November 2013.
- In November 2014, annual CUPA permits for hazardous materials and SQG were issued to CMC Rebar-Etiwanda.
- Inspection reports were also available for Fontana Steel from 1994 through 1998, after which CMC-Rebar was listed as the facility name from 2010 through 2020. Inspection reports list a 12,000-gallon diesel UST and 150-gallon oil UST on the facility, and that the water from on site is captured in a clarifier system and the water is evaporated. Sludge from the clarifier was reported to be hauled off site.
- In July 2005 and December 2010 and 2012, a UST Facility Information Sheet lists the following product types; aviation gas, diesel, ethanol, jet fuel, midgrade unleaded, other, other non-petroleum, petroleum blend fuel, premium unleaded, regular unleaded, and used oil. One 12,000-gallon diesel UST was listed as installed June 1989.
- A Hazardous Material Field Services form (5050 Form), states that one UST was removed, along with soil sampling which was witnessed August 14, 2014.
- A Construction and/or Removal of Underground Storage Facility permit was issued for the removal of one 12,000-gallon diesel UST on August 14, 2014. Three soil samples (two from beneath the UST and one from beneath the dispenser) were collected and analyzed for VOCs and diesel. Diesel analytical results were 1.52 mg/kg from beneath the dispenser, 1.02 mg/kg from beneath the north end of the UST, and 1.26 mg/kg from beneath the south end of the UST. VOCs were not detected.
- San Bernardino Fire Department letter dated October 29, 2014 to CMS Steel Fabricators, Inc, with Subject: Removal of Underground Storage Tank(s) located at CMC Rebar-Etiwanda, 12451 Arrow Rte, Rancho Cucamonga, CA 91739. This letter indicated that the

DRAFT

Copyright 2024 Kleinfelder

fire department had received soil sample analytical results following the removal of a 12,000-gallon UST. The letter indicated that the soil samples had been collected from approximately 16 feet bgs from the bottom of the UST cavity and from approximately 6 feet bgs from beneath the former dispenser. The letter indicated that no further action was required.

- Pursuant to a San Bernardino County CUPA Facility Information sheet submitted July 2017, the following violations were noted from an inspection performed in June 2017; failure to properly label hazardous waste accumulation containers, failure to ensure the following information is present and legible on a hazardous waste label; “hazardous waste”, name and address of the generator, physical and chemical characteristics of the hazardous waste and starting accumulation date, failure to note accumulation date, failure to accurately complete and electronically submit the Business Activities Page and/or Business Owner Operator identification, failure to properly manage used oil filters in accordance with the requirements. Comments in the San Bernardino County CUPA Facility form states that a 500-gallon diesel AST has been obtained to replace 55-gallon drums at the facility. An attached email from July 2017 conveyed the new inventory which included the 500-gallon diesel AST, three 55-gallon hydraulic oil drums, two motor oil drums, one transmission oil drum, one 20-gallon drum of gear oil, two 5-gallon buckets gear oil, and one 250-galon tank of used oil.

12459 Arrow Route:

Bulk Transportation/ DTI Associates

- A San Bernardino County Fire Department Source Envision E/R Report indicated that a release of sulfuric acid occurred at 12459 Arrow Highway, Etiwanda on August 31, 2007. Status was indicated to be closed. A Spill Center letter dated September 7, 2007 indicated approximately 60 gallons of sulfuric acid was released when a hose failed during unloading.

TAMCO

Lead Contamination Cleanup Case – 1990

- Preliminary samples were collected July and August 1986.
- A TAMCO letter dated August 18, 1986 with subject “Remedial Action Plan” indicted that TAMCO was focusing on intercepting any water runoff from the facility and performing the

DRAFT

Copyright 2024 Kleinfelder

soil sampling and testing and cleanup of the contaminated soil. TAMCO indicated it was constructing a concrete dam near the railroad spurs culvert in the southwestern portion of the facility to capture process water. TAMCO indicated that they plan to limit the use of water to cool the slag. TAMCO indicated that the sewer line was cleaned to remove obstruction.

- RWQCB notes dated August 19, 1986 indicate that the contaminated area is approximately 21 acres, with contamination limited to 1 to 2 feet except near the railroad. Remediation will include the upper 6-inches over 10-13 acres. The notes indicated that zinc, copper, chromium, and nickel were detected, but did not exceed STLC, and only five samples contained lead concentrations that exceeded STLC.
- A sampling plan was proposed by Chemical Consultants to TAMCO in a cost proposal dated October 27, 1986. The RWQCB approved a proposed sampling plan in a letter dated June 3, 1987. Handwritten notes on a Hazardous Waste Generator Production Process Flow Chart dated October 9, 1986, indicated that the contaminated land began at the end of the asphalt swale, extended through the railroad trestle, and into a field south of the railroad owned by Atchison, Topeka and Santa Fe (ATSF), SCE, and a Mr. Kagarian. Sources of the contamination were identified in meeting notes between TAMCO and RWQCB from August 18, 1986 as cooling tower and clarifier discharge line overflows. Additional care was indicated to be taken to prevent baghouse dust from entering drainage areas and limit cooling slag with water and having runoff.
- A transmittal letter dated May 16, 1988 to “File-Tamco-Hazardous Waste Cleanup (Non-Gasoline)”, with subject “Meeting with TAMCO regarding Site Investigation”. This transmittal documented meeting with TAMCO and Chemical Consultants. Five bores were drilled on April 25, 1988 to 7 to 20 feet bgs in the vicinity of the railroad bridge. Results indicated that lead concentrations increased at 5 feet bgs and then decreased at deeper depths. Lead was deeper in one area where a pit had been eroded in 1969 during flooding. Additional bores to depths of 8 to 10 feet bgs were proposed to be advanced in a 25-foot grid pattern in the brush and mud area, and hand-auger bores to 18 inches were proposed in a 25-foot grid pattern in the bamboo area. Attached was laboratory data from Chemical Consultants for the five preliminary bores.
- Department of Health Services letter dated September 15, 1988, entitled “The Trezek Group, Inc. – Polysilicate Treatment of Heavy Metal Contaminated Soil, at the TAMCO Steel Plant, Rancho Cucamonga”. This letter was in regard to a variance request from the Hazardous Waste facility permit requirements for application of polysilicate to excavated

DRAFT

Copyright 2024 Kleinfelder

soils containing heavy metals as part of a demonstration of heavy metal stabilization process. Approximately 4,000-cubic yards of soil was proposed to be treated as part of a demonstration. The soil was reported to contain lead, zinc, and cadmium. This letter approved the variance.

- Clean-up Technology Inc letter dated August 23, 1990, entitled TAMCO Off Site Contamination, Etiwanda, CA. This letter conveys the remedial workplan for the contaminated soils on the property southwest and adjacent to TAMCO. The soil had been contaminated by runoff from TAMCO. Contaminated soils were proposed to be placed in stockpiles. The contaminated soils will then be treated and reused as foundation for future construction projects (scrap yards operations area) at TAMCO. RWQCB set the cleanup goals as 50 mg/kg lead for soil and 5 mg/l for soluble lead. Verification samples would be collected after excavation. Treatment of the contaminated soils included blending the soils with reagents to stabilize the soluble lead contamination.
- RWQCB Letter dated November 7, 1990, entitled "Remediation of Lead Contaminated Soil at Site Southwest of TAMCO in Etiwanda". This letter indicated that Cleanup Technology excavated and removed lead contaminated soil from an adjoining property southwest of TAMCO. The remedial excavation activities were performed until all contamination had been removed.

USEPA Reports

- USEPA letter dated September 13, 1994 transmitted a Site Assessment Report prepared by URS on the TAMCO facility. This report documents a preliminary assessment of TAMCO and identified that the baghouse waste generated at the facility was identified as a RCRA hazardous waste. The report indicated that this waste was generally disposed of at a disposal facility, but baghouse waste was identified as present in a 250-feet long by 100-feet wide and 25-feet tall slag pile in the northwest portion of the TAMCO facility. The report indicated that some baghouse waste was irradiated when a canister containing cesium went into the furnace. A portion of this irradiated waste was sent off site for disposal at Kettleman Hills landfill in May 1985. The California Department of Health Services determined the irradiated load would be left in place at Kettleman Hills. The remaining waste identified as radioactive waste was sent for disposal at U.S. Ecology. TAMCO subsequently has performed radioactive screening of scrap metal brought to the facility. In 1988, soils southwest of the TAMCO facility had been impacted by runoff containing baghouse waste. Baghouse waste was spilled on the ground surface during transfer from the baghouse to the trucks or roll-off bins. Lead concentrations up to 135

DRAFT

Copyright 2024 Kleinfelder

mg/L, zinc up to 1,860 mg/L, and cadmium up to 5.7 mg/L were reported in soil samples from the property southwest of TAMCO. Approximately 3,300-cubic yards of impacted soils were excavated and stabilized under a variance from the DTSC. After stabilization, the treated soil was stockpiled and then a portion was used to backfill UST excavations. Four USTs were removed November 15, 1993. The Site Assessment Report identified the stabilized soil, the slag pile, and the radioactive baghouse waste as areas where hazardous waste were present. The slag pile was reported to have been sampled in 1993 and elevated concentrations of cadmium, chromium, lead, nickel, and zinc were present. The site history obtained from TAMCO indicated that American Pipe and Construction Company built a Melt Shop in 1956, prior to which the property was used for agricultural purposes. American Pipe and Construction leased the property until August 25, 1968 when American Pipe and Construction purchased the property from Illinois-California Express, Inc. TAMCO was formed in 1974 with ownership divided between Ameron Steel and Wire, Tokyo Steel, and Mitsui. A Rolling Mill was constructed in 1982. Baghouse waste had been transported off site via railroad car for disposal since 1991. Stormwater runoff flows southeast and southwest. A retention basin captured the runoff to the southwest, and the runoff to the southeast flows into the Chadwick Channel. Baghouse dust had impacted stormwater runoff leading to the contamination off site to the southwest. Wastewater from the cooling tower was piped to the Chino Basin Publicly Owned Treatment Works. Waste from the maintenance shops included waste solvents, degreasers, and oils. These wastes were stored in drums and disposed off site. Before removal, the drummed waste was stored in a bermed concrete hazardous materials storage area. Stained concrete was observed in the maintenance areas. At the time of this report, four USTs were being removed. These USTs had stored fuel oil for the Rolling Mill furnace. During URS' site walk, the slag pile mentioned above was observed to be not lined or covered. The Furnace building was observed to have metal strewn about the floor and significant dust was observed in the air. URS concluded that it is unlikely to impact groundwater, therefore the facility does not qualify for further remedial assessment under CERCLA.

- USEPA 1995 Hazardous Waste Report Waste Generation and Management, TAMCO. Listed waste included "emission control dust from electric arc furnace", contaminated baghouse filter bags, oily water from secondary containment and skimmers from hot wells, parts cleaning solvent from parts cleaning machines, ignitable tank bottom waste from fuel tank cleanup, corrosive liquid, sodium hydroxide, sodium hypochlorite from cooling tower treatment, waste oil from mobile equipment, waste sulfuric acid from cooling water

DRAFT

Copyright 2024 Kleinfelder

treatment, 55-gallon empty poly drums from cooling water treatment, potassium carbonate (soda ash) from cooling water treatment, hydrocarbon contaminated soil from site cleanup, and waste lube grease contaminated with dirt during servicing of equipment.

Slag Stockpile Remediation Case – 2000

- Clayton Environmental Consultants (Clayton), *Workplan for Field Pilot Plant Operations to Separate Slag/Non-Slag Materials at Tamco* dated May 28, 1998. This document presented a workplan to evaluate a sorting process to separate slag from non-slag materials using a rotary drum separation system. Background information presented in this report indicated that stormwater flowed southwest to a concrete-lined retention pond and then was directed to Chadwick Channel. Groundwater is reported to be at approximately 420 feet bgs. TAMCO was described as an active steel mill facility that utilizes scrap metal to produce rebar. Facility structures included an Office building, Furnace building, Baghouse, Rolling Mill, Maintenance shops, and cooling towers. The facility also included railroad spurs and storage yards. This facility was historically operated as Etiwanda Steel Producers in 1956. The plant was later named Ameron Steel & Wire. Ameron, Tokyo Steel and Mitsui Corporation formed a consortium to operate the Melt Shop in 1976. This consortium was called TAMCO. The Melt Shop and Roll Mill became TAMCO in 1983. TAMCO provided steel billets to Ameron Steel & Wire to be manufactured into rebar. Scrap metal consisting of shredded automobiles would be delivered to TAMCO, screened for radioactivity, and then placed in piles on a concrete pad. The scrap metal was spread out and anomalous objects removed prior to the metal being recycled. Recycling consisted of melting the scrap and reforming it as steel billers, which then would be heated and pressed and formed into rebar at the Rolling Mill. Slag (iron and silica) and baghouse waste were generated through the steel milling process. At the time of this report, the baghouse waste was shipped off site by rail car to a disposal facility in Tennessee for zinc recycling. Approximately 700 tons of baghouse waste was reported to have been produced monthly. Waste was stored in the northwest corner of the facility in the later 1970s through early 1980s. The USEPA performed a field assessment of the stockpiled slag material in November 1993 and, in a report dated September 13, 1994 and titled *CERCLA Preliminary Assessment Report*, had indicated that no release or exposure pathways to groundwater were identified. The County of San Bernardino requested assessment or remedial action of the slag stockpile in a letter dated April 14, 1998. An investigation of the slag stockpile was performed January 1993. This investigation included digging three trenches into the pile to the soil underneath. Soil, slag,

DRAFT

Copyright 2024 Kleinfelder

and non-slag samples were collected. Non-slag material was identified as having lead (20,000 mg/kg), zinc (140,000 mg/kg), and cadmium (380 mg/kg and 420 mg/kg) concentrations orders of magnitude above the soil or slag samples. The investigation concluded that the constituents of concern had not migrated into soil. Soil samples did not contain cadmium concentrations above reporting limits (less than 0.7 mg/kg), lead concentrations ranged up to 18 mg/kg, and zinc concentrations ranged up to 110 mg/kg. This document proposed using the rotary drum separation (RDSS) method to sort the slag from the non-slag. Negative pressure applied to the drum would remove the baghouse fines. Samples of the slag and baghouse waste were proposed to be tested to show that the non-slag with the heavy metals was removed.

- Delta Air Quality Services, Inc. June 1999, *Source Test report for the Portable Slag Pile Treatment System*. This report documented tests for particulate matter in relation to the operation of the portable slag pile treatment system.
- Clayton, *Demonstration Report on: Field Pilot Plant Operations to Separate Slag/Non Slag Materials located at Tamco, Rancho Cucamonga, CA*, dated August 11, 1999. This report summarized the pilot test results for a treatment system to separate slag from non slag to remediate an approximately 41,137-cubic yard stockpile of mixed layers of clean slag, dirty slag, and baghouse dust. This report identified clean slag as slag free from baghouse dust and having low concentrations of heavy metals. Dirty slag was identified as slag impacted by baghouse fines that have high concentrations of heavy metals. In summary, the pilot test was performed on 250 tons of material removed from the slag pile in the northwest portion of the facility. Material was run through the rotary drum separator six times. Five runs were performed using dirty slag and one run using clean slag. No heat was used during the first runs, and it was observed that fines were still present on the slag material. Laboratory results of the slag from the first few runs also indicated that the slag qualified as hazardous waste. Subsequent runs were performed with heat. Slag samples greater than 4-inches in diameter were reported to be able to be separated by vibrational screening so long as no moisture was applied to bind the dust. One larger sample was reported to have hazardous chromium levels even after screening, but this sample was considered to be an outlier. Samples of the less than 4-inch diameter slag collected after the heated runs were reported to pass hazardous waste criteria. Samples of the baghouse dust failed California (but not RCRA) hazardous waste criteria for cadmium, lead, and zinc.
- The Leu Group and Clayton Environmental Consultants conveyed the quarterly report for the remediation of the 41,000-cubic yard stockpile of slag and non-slag material on August 29, 2000. After being run through the RDSS the clean slag was tested and then Olympic

DRAFT

Copyright 2024 Kleinfelder

Mills would sell the slag. Remediation began Apil 3, 2000. Approximately 24,900 tons of baghouse dust was disposed of at US Ecology. Approximately 37,600 tons of slag was identified as clean. The clean slag was stockpiled and processed by Olympic Mills or crushed and reused as cement. After the stockpile was treated, baghouse dust and slag were found beneath the stockpile in a couple depressions. Trenches were excavated in the north to south and east to west directions in the former stockpile footprint. The baghouse dust/slag was found to extend to depths ranging between 1 foot and 4 feet below grade, with a couple depression extending up to 12 feet bgs. The depressions were excavated and an additional 15,000 tons of material was remediated. This letter indicated that the remediation would require another six to eight weeks to complete.

- Clayton Environmental Consultants letter dated March 17, 2000 to San Bernardino County Fire Department entitled “SCAQMD Permits and Start Up Date for Implementation of RAP for Treatment of Slag/Non Slag Stockpile for TAMCO Facility in Rancho Cucamonga, California.” This letter conveyed the SCAQMD permits. The RDSS was indicated to be powered using natural gas.
- San Bernardino County Fire Department letter dated January 10, 2000, entitled “Remedial Action Plan for the Treatment of the Slag/Non-Slag Stockpile at TAMCO, located at 12459 Arrow Highway, Rancho Cucamonga, California.” This letter approved the remedial action plan (RAP) for the stockpile.
- The Leu Group sent a letter dated November 22, 2000, to the San Bernardino County Fire Department, requesting to reuse the clean slag generated by the Rotary Drum Separation System as cover material. The slag was reported to have been sampled and met the cleanup criteria identified in the 1999 Remedial Action Plan (cadmium 100 mg/kg, chromium 2500 mg/kg, lead 1,000 mg/kg, zinc 5000 mg/kg, soluble cadmium 1 mg/L, soluble chromium 560 mg/L, soluble lead 5 mg/L, and soluble zinc 250 mg/L). Attached was a table showing the sample results listing maximum values of 35 mg/kg cadmium, 2,040 mg/L chromium, 447 mg/kg lead, and 1,260 mg/kg zinc. The soluble metal results did not exceed cleanup criteria.
- Notes from October 20, 2000 regarding post-excavation verification sampling. The notes indicate that the stockpile has been treated and that native soil is exposed. Pits containing baghouse dust and slag were being excavated. Thirty-two (32) verification samples were collected from the western stockpile footprint from approximately 6 inches into native soil.
- Notes from November 14, 2000 for post-excavation sampling from the footprint of the eastern footprint of the stockpile. Several pits were discovered, one of which was 20 feet

DRAFT

Copyright 2024 Kleinfelder

deep. Seventeen (17) samples were collected and analyzed for lead, chromium, cadmium, and zinc. An attached table showed confirmation sampling results. Areas with high lead concentrations were overexcavated and another verification sample collected. Sometimes multiple passes were performed to obtain clean soil. With the exception of areas identified as C9 which had five passes performed, the excavation achieved non-hazardous levels.

- San Bernardino County Fire Department letter dated July 2, 2002 with subject "Remediation of Slag and Non-Slag Stockpiled Soil for TAMCO, located at 12459 Arrow Highway, Rancho Cucamonga, California," dated July 2, 2002. This letter confirmed completion of remedial action but indicated that residual contamination remains in soil, but as concentrations are below hazardous waste thresholds, no further action is required.

Miscellaneous (facility forms, permits, inspection reports, complaints)

- TAMCO Hazardous Waste Source Reduction and Source Review Plan, undated. This report presents changes TAMCO plans to reduce baghouse dust generation. Changes included using lime pellets instead of lime powder to reduce the mixing of the lime powder and baghouse dust and thus the volume of dust and TAMCO constructed two 100-foot by 300-foot concrete pads to store scrap on in order to avoid having dirt mixed with the scrap and go into the EAF.
- Complaint and Investigation report dated July 28, 1992. A complaint was filed for dumping and covering slag. An employee reported that slag was dumped and covered east of the doorway of the north baghouse. The case was closed after no evidence was uncovered during investigation.
- An incident report dated October 21, 1999 was for a fire at the TAMCO scrap yard. A pile containing steel turnings and steel-belted tire cords caught fire when hot slag was spilled by a loader operated by Olympic Mill. The load was transporting the hot slag from the Rolling Mill to the scrap yard. The pile was spread and the fire extinguished. Approximately 35,000-gallons of contaminated water was removed for off-site disposal. Waste manifests were attached to the incident report. The waste was described on the manifests as water contaminated with oil and as "oil contaminated suppression water" on the San Bernardino County Fire Department Hazardous Materials Response Report.
- Multiple hazardous waste generator permits were listed for TAMCO from 1984 to 2002, and hazardous waste handler permits were listed for TAMCO from 1990 to 2002. A hazardous waste generator permit application from 1984 lists baghouse dust as the waste generated.

DRAFT

Copyright 2024 Kleinfelder

- A letter from TAMCO to the Department of Environmental Health Services, dated October 17, 1991, regarding processing drained and crushed oil filters. This letter was regarding the SCAQMD changing TAMCO's permit to operate requirements because of the oil filter recycling plan. Attached were documents that included an introduction and summary of TAMCOs operations and history, a description of baghouse waste, and requirements for used oil filter acceptance for recycling. The used oil filters were to be stored on pads in the scrap yard and to be free of any dripping oil. Based on an interoffice memo, used oil filter recycling was set to begin June 1, 1992.
- A letter from TAMCO to the Department of Environmental Health Services, dated August 8, 1992, responded to a complaint that TAMCO buried drums in the slag area of the Melt Shop. The letter indicated that the largest waste stream was baghouse dust which is transported by railcar to metal recyclers in Illinois and Tennessee, and the baghouse dust is not contained in drums.
- Complaint dated June 17, 1996. The complaint indicated that waste oil and solvents were in the cooling tower water which was used as dust suppression. An inspection had been made on May 29, 1996. The inspector indicated that the cooling tower is a closed loop with no outlet valve. The May 29, 1996 inspection was attached. The inspection notes that the cooling tower is not discharged and evaporation rates are high. Oily water is skimmed from the "hot wells" and removed off site for disposal. No violations were reported.
- San Bernardino County Fire Department letter dated December 4, 1997, titled "Regulatory Oversight of the Investigation and Remedial Actions at TAMCO, located at 12459 Arrow Highway, Etiwanda, California, Site # 97067". This letter indicated that the San Bernardino County Fire Department would perform oversight of the characterization and cleanup activities at TAMCO. Attached was parcel owner information which listed TAMCO as the owner of 0229-121-34 and 0229-121-33, TAMCO Steel Subsidiary Inc was listed as the owner of 0229-121-19 (addresses 12343 Arrow Highway, 12353 Arrow Highway, 12459 Arrow Highway). TAMCO was the lessee and Imaging Financial Services Inc. was the lessor of 0229-131-117 (12459 Arrow Highway). Ameron, Inc. was listed as the owner of 12455 Arrow Highway, 0229-131-17. Cargill Leasing Corp lessor and Industrial Wire Products lessee were listed for 12559 Arrow Highway, 0229-131-17.
- TAMCO letter dated April 16, 1999, entitled "04/14/99 Explosion at TAMCO". An explosion and fire were reported southwest of the melt shop. Molten steel and slag was dropped into mud and water accidentally resulting in an explosion which caused the nearby vegetation and a railroad flat car to ignite.

DRAFT

Copyright 2024 Kleinfelder

- Business Activity forms and Inventory summary forms were provided for TAMCO from 2000 through 2012. Business plan update correspondence for TAMCO was also available from 1996 through 1999. The inventory lists included the following hazardous materials/wastes having been present at the TAMCO facility: bleach, casting oil, cooling water additives (3D Trasar, Nalco 8338), diesel, liquid nitrogen, Metsafe 200 Glycol, motor oil, gear oil, hydraulic fluid, oxygen, propane, waste oil, oil contaminated debris, unleaded gasoline, Dia Carb Carbon/Coke, quick lime, baghouse dust, nitrogen, acetylene, propylene, helium, paint waste, compressor oil, hydrous sodium silicate, nitrous oxide, sulfuric acid, glass impact beads, silica manganese (Si Mn), argon, diesel, sodium hypochlorite, junk lead batteries, oil-contaminated soil from site cleanups, oil-containing waste, calcined petroleum coke, grease, calcium carbide, hydrogen peroxide, Kleen Weed, antifreeze, natural gas, Safety-Kleen Aqueous Parts Cleaner, sodium molybdate, among other materials/chemicals associated with the steel mill process.
- TAMCO letter dated June 21, 2001 indicated that a fire occurred in the scrap yard.
- Source – Hazardous Materials Release Report (HMRR) (1994-2004), on February 13, 2003 the Fire department was called to identify an unknown cylinder in a pile of scrap metal. The cylinder was identified as containing chlorine gas.
- Hazardous Materials Spill Report dated April 12, 2004. The radiation alarm was going off due to welding being performed at Fontana Steel.
- Facility Release Report, dated August 23, 2005. Status was listed as closed. The bomb squad responded to a report of 20 mm ammunition suspected to be present in scrap metal. The 20 mm round was removed.
- Hazardous Material Field Services Computer Database Update Authorization, dated April 28, 2006, indicated facility is processing waste aerosol cans using a puncture device.
- Inspection report dated April 18, 2006. Report indicated that TAMCO inspected all incoming scrap metal for radiation before the scarp went to the electric arc furnace. Waste included slag which was sold to Olympic Mill Services who manufactured the slag into road base. The baghouse dust was disposed of at a recycling facility in Mexico. Other waste included waste oil, oil-containing waste, junk lead batteries, oil-contaminated soil from cleanup activities, and used-oil filters. Aerosol waste was stored in 55-gallon drums. Site USTs included a 2,000-gallon gasoline UST and a 10,000-gallon diesel UST; multiple ASTs containing oxygen, nitrogen, propane, oil, gear oil, sodium hypochlorite, and lubricating fluids; 55-gallon drums containing sodium hydroxide, hydrochloric acid, hydrogen peroxide, oil-based lubricating fluids, and Algacite 500; and cylinders of argon.

DRAFT

Copyright 2024 Kleinfelder

Waste included waste oil, baghouse dust, lead batteries, waste material from aerosol cans, and contaminated soil and debris. Violations included liquid observed in the secondary containment for the sodium hypochlorite AST and the containment containing 55-gallon drums of hydrogen peroxide stored on wood pallets. A violation for failure to label hazardous waste containers. Violations were listed for failure to store the used oil filters in a covered container and failure to updated business plan. Based on photos attached to the inspection report, the 500-gallon sodium hypochlorite AST was used to treat the cooling tower water and was located south of the scrap metal yard, in the western portion of the facility near the electrode storage area.

- Hazardous Material Field Services Computer Database Update Authorization, dated March 27, 2007. Written notes indicated to active two UST permits as the facility has a "98" and diesel fuel UST. Two USTs were removed on October 6, 2006.
- San Bernardino County CUPA annual permits were issued to TAMCO for being a LQG (or super large quantity) generator and handling hazardous waste in 2007 to 2015. Two UST Ownership/Operating Permit (per UST) were listed for TAMCO in 2002 to 2015. An invoice for the removal of four USTs was included for 2006.
- The 2009 inspection report required that a Business Emergency Contingency Plan be updated and hazardous waste containers must be properly labeled.
- California Emergency Management Agency Hazardous Materials Spill Report, dated November 6, 2009. Approximately 5 gallons of hydraulic oil was spilled due to a collision at the TAMCO Steel facility. Clean up was reported to be complete.
- Hazardous Material Field Services Computer Database Update Authorization, dated November 20, 2009. Listed two active USTs.
- Gerdau Notice to the Market, Gerdau Announces Agreement to Acquire Tamco, dated September 15, 2010. TAMCO was reported to have been incorporated August 2, 1974.
- Hazardous Material Field Services Computer Database Update Authorization, dated November 20, 2010. Listed two active USTs and indicated one 300-gallon diesel UST had been removed.
- Facility Information forms dated March 1, 2010, October 12, 2011, April 26, 2012, March 25, 2013, April 4, 2014, and March 17, 2015 listed two active permits for USTs. The USTs were the spilt compartment UST.
- The 2012 inspection form indicated that TAMCO also included production operations for Ameron, TI Wire, Tube City Slag processors and Fontana Steel, and that TAMCO had

DRAFT

Copyright 2024 Kleinfelder

been acquired by Gerdau long Steel North America. Approximately 600,000 pounds of baghouse waste was reported to be produced per year and disposed of via railroad car to Mexico. Violations listed included the requirement that waste be characterized prior to disposal. A 55-gallon drum in the spray weld area required characterization. A notification for the operation of aerosol puncture equipment was required. ASTs required daily inspection records. Training records must be maintained. Complete the Spill Prevention, Control, and Countermeasure (SPCC) plan.

- Hazardous waste daily inspection checklists were available for 2012. Records indicated labels need to be updated, rainwater pumped out, and the pump removed.
- Gerdau letter dated March 6, 2012 entitled “Notification of the Processing of Aerosol Cans”. This letter indicated that the aerosol cans were discharged into a 55-gallon drum, which was marked as hazardous waste and stored on a containment pallet. TAMCO has 5 aerosol processing units. Approximately 150 gallons of waste aerosol were generated each year.
- Gerdau letter dated November 20, 2013 entitled "TAMCO FA0006582 Certificate of Compliance”. This letter was regarding compliance from the April 26, 2012 inspection, including implementation of a SPCC plan, a training program, hazardous waste testing for the street sweeper dirt for disposal, and characterization of a drum of arc-welder baghouse dust.
- Gerdau letter dated September 9, 2013, entitled "Notification of Changes in the Processing of Aerosol Cans”. Used aerosol containers were stored until they could be processed.
- Source-Facility Release Report dated October 15, 2013. A release of 5 gallons of sulfuric acid from a tank feed line for a cooling was reported to have occurred on October 9, 2013 at TAMCO.
- Gerdau letter dated August 5, 2014, entitled “Notification of an Additional Aerosol Can Processing Unit”. TAMCO was listed as having five aerosol processing units, and this letter indicated that a new unit was installed.
- Facility Information dated February 13, 2016 indicated that ownership was transferred from TAMCO to Gerdau. Two active permits for USTs were listed.
- CUPA Compliance Inspection Report dated February 8, 2016. Baghouse waste was disposed of off site as RCRA hazardous waste. Street sweeping waste was disposed off site as either non-hazardous waste, non-RCRA hazardous waste, or RCRA hazardous waste. An oil-water separator was reported to be present on site and the oil water/oily

DRAFT

Copyright 2024 Kleinfelder

sludge waste was disposed of off site. Other wastes include used oil, oily solid waste, used oil filters, and universal waste. Violations included an illegible gauge of the 100-gallon diesel AST near Cooling Tower Number 4 and no sensors for liquid levels, failure to update business plan, two 55-gallon drums of unknown waste, observed pooling of oil in secondary containment for 275-gallon AST and oily residue on totes, and incomplete hazardous waste labels.

- Kleinfelder *Waste Oil Tank, Professional Engineer Hazardous Waste Tank System Assessment/Certifications, Gerdau Long Steel North America, Rancho Cucamonga, California,* dated February 23, 2016. This document described a waste tank certification. The waste oil tank was indicated to have been a shop-fabricated tank purchased in 2008. The tank was reported to be manually filled by placing oil filters and other equipment on the steel grate over the tank or using a pump to transport oil into the AST. The tank was located within concrete secondary containment with other ASTs, including three 500-gallon oil and hydraulic fluid, one 250-gallon gear oil tank, and 55-gallon drums. No cracks were observed in the welds, paint was worn away in some areas, minor surface corrosion, but no structural damage was observed on the tank. A sump was present in the southeast corner of the containment. Cracks were observed in the floor of the secondary containment. Residual oil in the secondary containment was identified. Recommendations included proper housekeeping, and that the paint on the AST should be maintained.
- A Certificate of Compliance dated March 9, 2016 for violations observed on February 8, 2016. This indicated that oily water was pooling in the secondary containment for the 275-gallon AST near Cooling Tower Number 1 and oil residue was observed on the two 275-gallon totes outside the maintenance shop. Level sensors were not observed and an illegible gauge was present on the 100-gallon diesel AST next to Cooling Tower Number 4. The CERS emergency plan appeared to be incomplete.
- San Bernardino Fire Department Source – Envision E/R dated June 8, 2017 for contaminated water/baghouse dust. Gerdau Steel reported that 30-gallons of industrial water contaminated with baghouse dust was released on concrete.
- San Bernardino County Fire Department Source – Envision E/R dated February 9, 2017. This document listed the property owner as Gerdau Long Steel North America. Active permits for TAMCO included Hazardous Materials 71+ Chemicals, Super Large Quantity Generator, two UST Ownership/Operating Permit (per UST), UW Handler W/Another Haz Waste Generator, and APSA 10,001-100,000-Gallon Facility Capacity. Inactive permits listed included Hazardous Waste Generator RCRA LQG, and five UST

DRAFT

Copyright 2024 Kleinfelder

Ownership/Operating Permit (per UST). A complaint for release of approximately 2,300-gallons of chemical dust suppressant “Road Pro NT” into an adjoining property, the NRG Power Plant, through the Chadwick Channel was reported on February 10, 2017. The release was discovered when the power plant noticed a change in their stormwater samples. The release was vacuumed up from the storm drain system.

- Facility Information Form dated February 21, 2019. Facility CUPA permits, including two UST permits, were listed as active. The facility owner was listed as Commercial Metals Company. A change of ownership was listed as of November 5, 2018. Previous owner listed was Gerdau.
- A couple corrective action letters from San Bernardino County Fire District were addressed to TAMCO on February 10, 2020 and August 14, 2019 for administrative violations. A Certificate of Compliance was available for the 2019 violation for updating the business plan. The 2019 inspection indicated that TAMCO operated a mini mill which manufactured concrete rebar out of scrap metal. Wastes generated included baghouse dust, mill scale, slag, clarifier wastewater, used oil, waste oily water, waste antifreeze, used oil filters, and waste paint. Hazardous materials stored on site included one roll-off bin of oil-contaminated debris, four drums insulating oil, drums of motor oil, twelve containers of Tower Brom 991, six drums of waste paint, two 275-gallon totes of oily water, one drum antifreeze, five 275-gallon totes of hydraulic oil, one drum of aerosol can waste, an AST of liquid oxygen, and parts washers. Photos from the 2019 inspection also showed a 750-gallon AST of sodium hypochlorite and a 1,500-gallon AST of 3D Trazar. The facility was listed as a LQG. Wastes were transported off site for disposal.
- Facility Information Form dated February 1, 2022. This form indicated that the facility CUPA permits, including two UST permits, were still active.
- Facility Information Form dated December 21, 2022 indicated that the split UST was removed December 12, 2022. This form indicated the facility was closed.
- Facility Information Form dated June 30, 2022. Comments indicated that pursuant to an inspection performed on June 30, 2022, the facility is no longer in operation and all hazardous materials/wastes have been removed. Notes indicated that there had been a change of ownership. Owner was listed as BTC III Arrow Route CC LP.
- Facility Information Form dated July 17, 2023. CUPA permits, including seven UST permits, were listed as inactive. Comments indicated that pursuant to an inspection performed on June 28, 2023, a 10,000-gallon UST was found and removed.

DRAFT

Copyright 2024 Kleinfelder

- Closure form issued to BTC III Arrow Route CC LP dated June 30, 2022. Notes indicate that TAMCO was no longer in operation. All hazardous wastes were reported to have been removed. A demolition crew was indicated to be on site and demolishing the structures. The UST was reported to be emptied and in the process of being removed.

UST Records

- UST Facility Information Sheet listed two UST permits: one for 10,000-gallon diesel UST and one 2,000-gallon regular unleaded UST installed March 17, 1987. Four inactive UST permits were listed. The facility owner was listed as Gerdau Long Steel North America.
- A permit for six USTs was listed for TAMCO in 1989 and 1992. A permit application lists TAMCO as having four USTs in 1985.
- Removal of four 50,000-gallon Underground Storage Tanks at TAMCO, stamped by the Department of Environmental Health Services on January 14, 1994. This report indicates that TAMCO installed four 50,000-gallon fuel oil USTs in 1975. The fuel oil was to fuel the Brickmont Re-Heat furnace. TAMCO replaced the Brickmont furnace in 1990 with an ITAM furnace that does not require fuel oil. The fuel oil from the USTs was donated to Orange Empire Railway Museum. After being emptied, the USTs were removed on November 4, 1993, and sent Erickson, Inc. in Fontana, where they were decontaminated and sectioned. The sectioned scrap was sent back to TAMCO to be recycled. Four soil samples were collected from beneath the northeast and southeast USTs and three composite soil samples were collected from the stockpiles of excavated material. Petroleum hydrocarbon concentrations in the diesel range were reported in the soil samples collected from beneath the west side of the southeast UST and west side of the northeast UST at concentrations of 1,533 ppm and 12,360 ppm, respectively. Petroleum hydrocarbons were present in the stockpile composite sample from the south end of the excavation at a concentration of 77 ppm. No significant metal concentrations were reported. Soil was excavated and disposed of offsite. Prior to removing the northwest and southwest USTs, the eastern tank cavity was backfilled with soil. This was to allow access to the western USTs. Four soil samples were collected from beneath the western USTs and four stockpile samples were collected from the excavation material. Petroleum hydrocarbons were not detected in the western UST samples. The western UST excavation was backfilled with the excavated soil. The two areas at the western edge of the eastern USTs where petroleum hydrocarbons had been detected were resampled after being excavated. The northeast samples indicated that diesel was not detected. The second sampling of the southeast UST area indicated the presence of diesel at 3,500 ppm and 2,200 ppm. The

DRAFT

Copyright 2024 Kleinfelder

areas with hydrocarbon contamination were indicated to have been excavated and retested with the results indicating that hydrocarbons were not detected.

- ENCON Environmental & Engineering Services, dated November 4, 1998, UST Double Wall Split Tank-Compliance Upgrade, TAMCO Steel, Rancho Cucamonga, California.
- ENCON Environmental & Engineering Services, dated January 25, 1999, *Final Report 12,000-Gallon Split Compartment Tank Compliance Upgrade, TAMCO Steel, 12459 Arrow Highway, Rancho Cucamonga, California*. This document documents the fuel facility upgrade activities. Six soil samples were collected from beneath the dispensers and from the north and south ends of the tank excavation. Gasoline range TPH, benzene, toluene, ethylbenzene and xylenes (BTEX), and MtBE were not detected. TPH-d was reported in one dispenser sample at a concentration of 353 mg/kg. TPH-d was not detected in a deeper sample at the same location. Total recoverable petroleum hydrocarbons (TRPH) was detected at 127 mg/kg in one of the tank excavation samples. No further action was performed as the concentrations were below screening levels. Upgrades included dispenser spill containment units, overfill spill containment for bottom tank protection, double wall product piping, sensor sump, flex pipe fittings and manways, and leak detection monitoring system.
- Periodic Secondary Containment Testing Form dated October 22, 2002 for two tanks. The sketch attached to the form shows a fueling island with gasoline and diesel tanks located east of the guard shack and south of the wire facility, and north of railroad tracks.
- A UST inspection report dated November 21, 2002 lists a split UST with 10,000-gallon diesel and 2,000-gallon gasoline compartments. Violations included updating leak detection sensor, having the leak detection and monitoring response plan available, and having the dispenser shut down when sensor alarm goes off. Monitoring reports were available from 2000 and 2001 for the split UST.
- A permit application to remove four 12,000-gallon diesel USTs was dated December 9, 2006. Attached UST permits were available from 2000, 2001, 2002. Also attached was a sensor test report.
- Sharp Environmental Technologies, Inc., *Underground Storage Tank Closure report, TAMCO, 12459-B Arrow Highway, Rancho Cucamonga, California 91739*, dated September 27, 2006. This report documents the removal of four 12,000-gallon diesel/fuel oil USTs from the TAMCO Steel facility on May 5, 2006. The excavation was backfilled with soil. TAMCO recycled the USTs at their facility. Eight soil samples were collected from beneath the USTs. TPH-carbon-chain distinction (TPH-cc) and VOCs were not

DRAFT

Copyright 2024 Kleinfelder

detected above laboratory practical quantitation limits. Field notes from the UST removal showed the USTs near the southern boundary of the Subject Property near the cement culvert. Notes indicated that TAMCO found the USTs just north of the railroad tracks and south-southeast of a building and cooling tower. The USTs had been full of slurry.

- Construction and/or Removal of Underground Storage Facility, dated November 30, 2010 to remove one 300-gallon diesel UST.
- UST form for UST permanent closure on site dated July 1, 2010. This form was to remove a 300-gallon diesel UST.
- A San Bernardino County Fire Department Letter, dated March 7, 2011, entitled "removal of (2) Underground Storage Tank at 12459 Arrow Route, Rancho Cucamonga, CA 91739" documented the removal of a 300-gallon diesel UST. A workplan prepared by Environmental Logistics, Inc, entitled "Site Specific Work Plan for Removal and Disposal of One 300-Gallon Underground Storage Tanks, San Bernardino County Fire, City of Rancho Cucamonga, CA," dated October 6, 2010, was included.
- Sharp Environmental Technologies, Inc., *Underground Storage Tank Closure Report, TAMCO, 12459 Arrow Route B, Rancho Cucamonga, California 91739*, dated January 7, 2011. This report documents the removal of one 300-gallon diesel UST from the TAMCO facility on November 30, 2010. One soil sample was collected from beneath the UST from approximately 6.5 feet bgs. The excavation was backfilled with concrete slurry. The UST was transported to American Metal Recycling in Fontana for recycling. The soil sample analytical result indicated that TPH-d was present at a concentration of 1,720 mg/kg; ethylbenzene was present at a concentration of 57 µg/kg; and total xylenes were present at 423 µg/kg. Based on the attached figures, this UST was formerly located north of Cooling Tower #4 and south of a generator.
- Multiple inspections, upgrades, leak detection test reports were available for the split UST and fuel dispensers which was installed in 1987 until its removal in 2022.
- Underground Storage Tank Cleanup Site dated December 18, 1998.
- Construction and/or Removal of UST Job Card for CMC dated June 17, 2020. This was for secondary containment repair.
- UST Plan Check Permit for UST closure and removal of a 10,000- gallon and 2,000-gallon UST and associated piping/equipment dated February 18, 2022.

DRAFT

Copyright 2024 Kleinfelder

- The UST removal inspections and manifests were included and indicated CMC as the owner. The manifest identified the split UST as having a 2,000-gallon gasoline compartment and an 8,000-gallon diesel compartment.
- San Bernardino County Fire District Letter dated July 18, 2023, titled “Closure of Underground Storage Tank(s) (USTs) located at 12459 Arrow Route B, Rancho Cucamonga, CA 91739 (FA0006582, SR0202355, CERS ID 10152245)”. This letter documented that the removal of one 10,000-gallon diesel UST and one 2,000-gallon regular unleaded UST was witnessed on December 13, 2022, and no other USTs remain at the site. The closure report had been received and approved by the CUPA.
- Roux Associates, Inc. Underground Storage Tank Closure Report, 12451 Arrow Route, Rancho Cucamonga, California, dated June 23, 2023. This report documents the removal of a split UST consisting of a 10,000-gallon diesel compartment and a 2,000-gallon gasoline compartment. The UST was shown as located in the northwest portion of parcel 0229-131-19. The UST and associated equipment were removed between December 5, 2022 and December 12, 2022. The UST was cleaned prior to removal and then transported to SA Recycling for disposal. Soil samples were collected from beneath each end of the UST, and composite soil samples were collected from the stockpiles generated during removal. Samples were analyzed for TPH-g, TPH-d, BTEX, fuel oxygenates, and naphthalene. With the exception tBA, the analyzed constituents were not detected above laboratory reporting limits in the samples collected from beneath the UST. The detected tBA concentrations, 0.013 mg/kg and 0.012 mg/kg, did not exceed commercial/industrial screening levels. Concentrations of TPH-d (39 mg/kg), tBA (0.0083 mg/kg), toluene (0.010 mg/kg), ethylbenzene (0.0084 mg/kg), total xylenes (0.069 mg/kg), and naphthalene (0.022 mg/kg) were detected in one stockpile sample. No constituents were detected in the second stockpile sample. The detected concentrations did not exceed commercial/industrial screening levels. Case closure was requested.
- San Bernardino County Fire District Letter dated August 29, 2023, entitled “Closure of Underground Storage Tank(s) (USTs) located at 12459 Arrow Route B, Rancho Cucamonga, CA 91739 (FA0006582, SR0202355, CERS ID 10152245)”. This letter documented that the removal of one 10,000-gallon UST was witnessed on June 28, 2023, and no other USTs remain at the site. The closure report had been received and approved by the CUPA.
- Roux, 2023, *Underground Storage Tank Removal Report, 12451 Arrow Route, Rancho Cucamonga, California*, August 25. This report describes the removal of a 10,000-gallon

DRAFT

Copyright 2024 Kleinfelder

UST which was discovered on April 5, 2023 during demolition of the former Melt Shop. The contents of the UST at the time of discovery consisted of approximately 15-inches of oily water. This fluid was sampled and identified as diesel fuel. Approximately 1,400-gallons of liquid was removed from the UST. The UST was removed on June 28, 2023 after being rinsed and inerted. Confirmation sampling consisted of the collection of one composited soil sample from the stockpile generated during removal and two soil samples from beneath the former UST. Diesel concentrations were detected in one UST confirmation soil sample at 170 mg/kg and in the stockpile sample at 5,100 mg/kg. With the exception of one detection of tBA at a concentration of 0.014 mg/kg in the UST confirmation sample, gasoline and VOCs were not detected. The stockpile was planned to be removed for off-site disposal.

SCE Ameron

- Annual Permits dated March 1, 2014 and March 1, 2015 for APSA Conditionally Exempt, Hazardous Materials 1-3 Chemicals Special.
- Annual Permits dated March 1, 2011, March 1, 2012, March 1, 2013 for APSA Exempt Tanks, hazmat handler 0-10 employees.
- Annual permits dated February 28, 2002, February 28, 2003, March 1, 2003, February 29, 2004, March 1, 2005, March 1, 2007, February 29, 2008, March 1, 2010 for hazmat handler 0-10 employees.
- Annual permit dated March 1, 2009 for hazmat handler 0-10 employees and AST (SPCC).
- Facility Information for Closure dated August 31, 2022. The owner was listed as SCE. Inactive permits for APSA Exempt and hazardous materials 1-3 chemicals were dated as expired February 28, 2018. Notes indicated that the site has been decommissioned and hazardous waste has been removed.
- Facility information documents dated October 27, 2008 through April 5, 2016.
- Facility Information form dated November 9, 2009. A note on this form indicates that the facility equipment is APSA exempt. It also notes that the capacity of each piece of equipment is less than 10,000 gallons of dielectric fluid and the “aggregate petroleum capacity in exempt equipment is 13,483” gallons.
- Note on invoice from December 15, 2000 indicates that a new estimate for the permit was required as a new facility was added (3rd at the 12459 Arrow Route address).

DRAFT

Copyright 2024 Kleinfelder

- Business Emergency/Contingency Plans and inventory summaries were available from 2000 through 2012. The substation was listed as having ASTs. The hazardous material inventory included mineral-insulating oil through 2009 and included batteries after 2010. The maximum container of mineral oil was listed as 2,733 or 3,450 gallons in the inventory depending on the year. The 2012 plan indicated the sensation is an unmanned facility with a remote switching center monitoring system. Hazardous materials are stored within sealed operating equipment. The facility was indicated to not generally generate hazardous waste.
- CUPA Compliance Inspection Report dated February 9, 2022. The facility was indicated to be an electrical substation with mineral oil stored onsite. No violations were observed.
- CUPA Compliance Inspection Report dated April 22, 2019. No violations were observed.
- Hazardous Waste Generator and Hazardous Materials Handler Inspection Report, dated March 17, 2016. No violations were observed.
- Hazardous Waste Generator and Hazardous Materials Handler Inspection Report, dated November 3, 2009. This inspection report indicated that the substation was located on the Tamco forge building. The substation had oil-filled equipment with Units 1 through 3 containing approximately 2,974-gallons each, Unit 4 containing approximately 3,450 gallons, and circuit breakers containing 363-gallons each. Lead acid batteries were also reported to be present at the substation. Comments indicated that the maps in the business plan did not have enough detail.

DRAFT

Phoenix Services LLC

- A Cupa Compliance Inspection report dated September 7, 2018 indicated that Phoenix was a slag-recovery facility that received slag from Gerdau. Heavy metals are removed from the slag by using a hopper conveyor belt and a magnet. The removed metal was indicated to be sold back to Gerdau and the slag was then sold to Phoenix's customers. Used oil and used oil filters were generated from maintenance of the equipment gear boxes and the facility's trucks. Violations included failure to submit a tank facility statement, failure to prepare a SPCC plan, failure to establish a business plan and failure to submit a business plan, failure to obtain a CUPA hazardous Waste generator permit, and failure to provide facility information to CUPA.
- Facility Information dated September 20, 2018. This document indicated the facility was active and the inspection notes indicate that the permit status needed to be updated as 4-

Copyright 2024 Kleinfelder

10 chemicals above threshold amounts were stored at the facility, and the facility generates hazardous waste.

- San Bernardino County Fire District letter dated November 20, 2018, subject “Inspection Compliance Requirements”. This letter was regarding outstanding violations. The violations listed were administrative including failure to provide facility information, list hazardous waste generated, submit tank statement, prepare a contingency plan, and submit and implement a business plan.
- Certificate of Compliance dated June 17, 2021. This document required that the permit fees be paid, hazardous waste containers properly labeled, CUPA documentation submitted, and SPCC plan amended. Attached were email correspondence and a CUPA Compliance Inspection Form dated June 17, 2021. This form indicated that Phoenix manufactures slag which is then sold to use as a cement additive. Hazardous materials stored by this facility include diesel to fuel the trucks and oils for the trucks. Oxygen and acetylene were also stored for use in cutting metal. Truck maintenance was reported to be performed by a third party and used oil was reported to be disposed of off site. Wastes include used oil and used-metal filters. The hazardous material inventory included 240-gallon tanks of hydraulic oil, transmission oil, and engine oil; a 275-gallon tote of hydraulic oil, 1,000-gallon tank of diesel, a 180-gallon tank of used oil, and 55-gallon drums of hydraulic oil, antifreeze, solid grease, diesel, and used-metal filters. Photos were attached pursuant to the compliance requirements.
- Facility Information – Closure, dated January 19, 2022. Form indicated that the facility was closed and no hazardous materials or waste remain at the facility. All permits were indicated to be inactive.

Tervita LLC (Tervita Environmental Services)

- On an inspection report dated May 24, 2012, a consultation appointment was held to discuss the regulatory requirements and documentation filing for Tervita to assume responsibility for the slag management operations at the Gerdau/TAMCO mill facility. The current slag management company, Tube City IMS, is planning to cease operation by the end of June 2012. The slag operations began when hot slag was brought from the Gerdau/TAMCO mill to the Tervita site and consisted of a metallic and non-metallic portion. The non-metallic portion is processed for use as roadbed, dust control, and lead line fill. The metallic portion is brough back to Gerdau/Tamco for further mill processing.

DRAFT

Copyright 2024 Kleinfelder

- A Site-Specific Safety Plan (SSSP) was compiled for the Tervita project to remove the processed slag from the Gerdau melt shop, tear out various equipment, and various other management activities.
- The SBCFD determined that several violations were outstanding from the inspection conducted on August 31, 2015 which were associated with storage and handling of hazardous materials.
- An inspection was conducted on September 7, 2018 and it was determined that Tervita LLC was no longer in operation at the site, and a new tenant, Phoenix Services LLC was now operating the site. Tervita reportedly vacated on September 1, 2017, and Phoenix Services LLC assumed responsibility of the management of hazardous materials and wastes generated by Tervita LLC.
- The remaining files are associated with permit renewals, facility information documentation, and records requests.

Tube City IMS

- Contained a Business Owner/Operator Identification Form, Emergency Response Plans and Procedures Form, a Hazardous Waste Inventory Summary Form, chemical descriptions, and Material Safety Data Sheets (MSDS) since 2006. Olympic Mill Services was historically listed on a Business Plan sent to the County Fire Department on June 24, 1999. A request for research and review of records was submitted for the TAMCO facility on November 22, 1996. A Business Plan submission to the San Bernardino County Department of Environmental Health Emergency Management Program was dated November 22, 1994 for the United Slag Processing Co facility.
- A Certificate of Compliance was issued to United Slag Processing Co on August 21, 1994.
- A Hazardous Materials Fire Services Data input sheet to the United Slag Processing Company was dated August 31, 1994.
- A Hazardous Waste Generator and Hazardous Material Handler Inspection Report at the United Slag Processing Co was dated August 31, 1994.
- A delinquent permit fee invoice was forwarded to United Slag Processing Co on December 12, 1995 and corrected on January 22, 1996.
- A Hazardous Waste Generator and Hazardous Material Hander Inspection correspondence dated May 14, 1999 depicts that Olympic Mill Services, the former site for United Slag, was situated on the TAMCO property to the northwest of the furnace.

DRAFT

Copyright 2024 Kleinfelder

Olympic Mill processed the slag from the rebar manufacturer at TAMCO. Slag was a byproduct of TAMCO's milling process, was non-hazardous. The slag was brought from the furnace area to TAMCO to the processing area at OMS. The material was sorted and any metallic portions were sold back to TAMCO for reprocessing, the non-metallic portions were sized and sold as road base and railroad base material. Materials and wastes stored onsite was primarily used for maintenance of the heavy equipment. A request for business name change for the former Olympic Mill Services, Tube City LLC at the TAMCO Steel site to IMS Division, Tube City IMS was dated August 15, 2006. Various business plan deficiencies were recorded since 2006 at the Tube City IMS facility; however, they were mostly administrative in nature. Tube City LLC and International Mill Services Inc merged effectively on January 1, 2008 and renamed Tube City IMS, LLC. A letter notifying the cease of operations on June 30, 2012 for the Tube City IMS facility and its associated permits was sent to the SBCFD. The remaining hazardous materials and containment areas were to be cleaned and removed on July 2 and 3, 2012. Tervita were depicted to be the new operators on a database authorization form dated July 3, 2012. The remaining files were Hazardous Waste Generator and Hazardous Materials Handler Inspection Reports, and annual permits.

Unknown Radiological Source

- At the TAMCO facility, a folder contained a subpoena to produce documents, information, or objects or to permit inspection of premises in a civil action case No. 5:21-cv-01238-SSS-SP dated March 3, 2020 to Sims Group USA Corporation, et al.
- A facility release report dated March 27, 2007 depicts a load of heavy melt was brought in to TAMCO by Main Street Fibers and had set off a radiation alarm. The source was not able to be located in the load and was 2-3 times background. The load was returned to origin under Department of Transportation (DOT) exempt shipment. The Department of Energy (DOE) investigated on March 28, 2007 and also could not determine the source.

Adjoining Properties:

Ameron Steel and Wire Division

- Permits for USTs (one UST was indicated) were dated February 28, 1986, January 24, 1987, February 28, 1990, February 28, 1992.

DRAFT

Copyright 2024 Kleinfelder

- RWQCB Letter dated October 29, 2002, entitled “Underground Storage Tank Cleanup Fund (Fund), Notice of Intended Removal from Priority List, Claim Number 000630, Site Address: 12459 Arrow Route, Etiwanda.” This letter denies reimbursement.
- A figure provided in a records request from 2000 showed Ameron Pipe located along Arrow Route, east of the Subject Property; Fontana Steel was shown in the northern portion of the Subject Property; Industrial Wire Products was shown south of Ameron Pipe; Tamco Steel was shown west, south, and east of Industrial Wire Products (Tamco Steel covered the remainder of the Subject Property).
- Ameron Concrete and Steel Pipe Group Southern California Division, letter dated April 25, 1994. This letter transmitted a Certificate of Financial Responsibility for USTs located at 12455 Arrow Route, Etiwanda.
- PSM International, Inc., letter dated February 14, 1991, titled “Biodegrade Project Closure and Analytical Results for Ameron Steel and Wire Division Located at 12459 Arrow Highway, Etiwanda, California; Your Letter, 27 September 1990, Disposal of Biodegraded Soil from 12459 Etiwanda to Class III Landfill, Solid Waste Management Department Letter, 4 December 1990”. This letter indicated that approximately 601-tons treated soil was transported to Colton Landfill in January and February 1991. Attached to this letter was the Solid Waste Management letter and a letter from A Geological Systems Evaluation Company, dated September 11, 1990, titled “Biodegrade Project Closure Analytical Results”. This letter indicated that contaminated soil had been spread on the Ameron facility to biodegrade and was subsequently sampled on August 17, 1990. The biodegrade concentration of 1,000 mg/kg or less TPH was achieved, and the soil was transported off site to the approved disposal facility. Figures showing the sampling cells and results were attached. It is unclear where on the property this biodegradation treatment occurred. Samples had been analyzed for TPH-d, nitrogen as NO3, and total bacteria. A Clean-Up Technology, Inc letter dated August 21, 1990, and titled “Permit by Rule Site Specific Notification, Soil Remediation, Etiwanda, CA, CUT Project No. 90-018” provided notification of the treatment operations. Attached was the PSM International, Inc report dated September 24, 1990 conveying the closure sampling results. This report indicated that soil excavated at the former Ameron Steel and Wire facility was biodegraded to contain TPH concentrations less than 1,000 mg/kg, with the maximum TPH concentration in the last sampling event reported to be 334 mg/kg. A letter from PSM International, Inc, dated September 25, 1990 requested permission to transport approximately 315 yards of soil to a landfill. The soil was reported to have been excavated in November 1989 from beneath a 10,000-gallon diesel UST at the former Ameron Steel

DRAFT

Copyright 2024 Kleinfelder

and Wire Division facility. The soil was treated using biodegradation to contain less than 1,000 mg/kg. To biodegrade the soil, it was spread on a paved and bermed area. A letter from San Bernardino County Environmental Health Services, dated September 27, 1990, with subject “Biodegrade Project Closure and Analytical Results for Ameron Steel and Wire Division, located at 12459 Arrow Highway, Etiwanda, California” documented that no further investigation was required and that the treated soil would be disposed of off site.

- A hazardous waste generator inspection report for Industrial Wire Products, dated April 9, 1990 noted violations including: hazardous waste must not be stored over 90 days, all drums must be labeled and managed to prevent leaks, oil was observed on ground beneath machine D-4 and sampling must be performed, and soil removed from D-6 must be removed as hazardous waste. The inspection notes indicated that sodium soaps and lube were disposed of off site. Drums that had been left on site by Ameron had been disposed of, and waste discharge to the sewer system was regulated by Chino Water district and effluent was sampled monthly. The inspection notes indicated that machine D-4 discharged to a “can in ground” and was attached to a sump. Notes indicated that a tank was pulled in October and the release form reviewed. Soil from new tank excavation was indicated to have high copper concentrations. A note on the record indicated that the Industrial Wire Products facility is located where Ameron Pipe used to be and that it is not part of the Tamco facility, though it has the same address.
- A complaint from March 2, 1990, was investigated with an inspection performed April 3, 1990. The complaint indicated that the facility has plating solutions and chemicals in soil, which went into the drain when it rained. The inspector noted that the area in question had the “faucets of the drums outside of berm area”. The drums contained oils and hydraulic fluid.
- Handwritten notes dated January 18, 1990 regarding Ameron Steel and Wire Workplan for Soil Remediation dated December 15, 1989. Approximately 315-cubic yards of diesel-impacted soil was spread 1.5-feet thick over an asphalt-paved and bermed area and then covered in plastic. Soil was proposed to be disked monthly until TPH is less than 1,000 mg/kg.
- SBC Environmental Health Services letter dated January 18, 1990, with subject “Soil Remediation and Biodegradation for Ameron Steel and Wire, 12459 Arrow Highway, California.” This letter approved the biodegradation treatment for the diesel-impacted soil.
- PSM International, Inc, December 29, 1988. This letter transmitted the technical plan for biodegradation treatment of the diesel-impacted soil. The technical plan, entitled “Soil

DRAFT

Copyright 2024 Kleinfelder

Remediation Biodegradation, 315 y3 Ameron, 12459 Arrow Highway, Etiwanda, CA" dated December 15, 1989 described the proposed treatment of spreading out the diesel-contaminated soil on asphalt and bermed area so that the soil was 1.5-feet deep. Plastic would be placed over the soil to maintain its moisture. Soil samples would be collected from 20-foot by 20-foot cells. Best-Pro Balance 15-15-15 containing NO3, PO4, and O2 was proposed to be used to initiate biodegradation. Soil will be scarified/disked monthly.

- SBC Environmental Health Services letter dated November 22, 1989, with subject "Underground Tank Closure for Ameron Steel and Wire Division located at 12459 Arrow Highway, Etiwanda, California." This letter indicated that no further investigation is required for the contamination remaining in the excavation.
- Construction and/or Abandonment of Underground Storage Facility permit for removal of one 10,000-gallon diesel UST. Application was dated November 9, 1989. A figure attached to the application forms showed the former UST located north of the building and east of the fire hydrant and pump. The inspection notes indicated that no samples were collected after removal of the 10,000-gallon diesel UST as soil samples had already been collected from borings. Excavation was performed after removal. Gray soil was noted halfway down the north side of the tank excavation. Additional excavation was performed on the southwest side of the UST excavation. With the exception of the north sidewall sample (PSM Sample 6 where TPH was reported at 4,290 mg/kg), TPH concentrations were less than 1,000-mg/kg. Samples 9 and 10 and C-1 through C-5 were collected from stockpiles and had TPH concentrations ranging up to 5,400 mg/kg.
- Letter dated November 6, 1989, Subject "Soil Quality Assessment Borings, Ameron Steel and Wire, 12459 Arrow Highway, Etiwanda, CA 91739". This report summarized the results of soils samples collected from nine soil bores advanced around the 10,000-gallon diesel UST on October 30 and 31, 1989. Soil bores were advanced up to 40 feet bgs. Hydrocarbon concentrations were present in soil samples collected up to 35 feet bgs with the maximum detected concentrations in the 15-foot soil sample from the bore advanced south of the center of the UST. The maximum detected diesel concentration was 24,800 mg/kg. This sample was also analyzed for VOCs: benzene was not detected, toluene was reported at a concentration of 3.9 mg/kg, ethylbenzene was reported at a concentration of 7.7 mg/kg, and total xylenes were reported at a concentration of 30 mg/kg.
- Letter dated October 20, 1989, regarding "Soil Quality Assessment Borings, Ameron Steel and Wire, 12459 Arrow Highway, Etiwanda, CA 91739". This letter indicated that Geo-Sec, Inc would advance four soil borings around the UST to 40 feet bgs. Previous soil

DRAFT

Copyright 2024 Kleinfelder

bores, BH4 and BH5 (indicated to be slanted bores) and BH6 (vertical bore) were shown on map attached to the letter.

- PSM International, Inc, letter dated October 20, 1989. This report indicated that PSM collected soil samples from beneath the diesel UST on September 14, 1989 on behalf of Ameron, Inc. Three bores had been advanced around the UST: to the east, west, and south. Two slanted bores and one vertical bore had been advanced. TPH concentrations were present in two soil samples (approximately 11.2 to 12.6 feet and 14.6 to 16 feet) and an Unauthorized Release report was submitted for the UST. Groundwater was reported to be approximately 300 feet in the vicinity of the property. This report proposed to advance four new 40-foot soil bores. The site history summary attached to the letter indicated that the UST had been installed in 1976 and the system had been testing tight. The figure attached to the letter showed the UST northwest of the building.
- SBC Environmental Health Services letter dated May 5, 1987, regarding subject "Underground Storage Tank Monitoring Proposal for 12459 Arrow Hwy, Etiwanda, California." This letter required a written leak detection plan.
- Med-Tox Associates, Inc, responded with a letter dated May 30, 1986 indicating a precision tank test would be performed. Attached to this letter was documentation for the 10,000-gallon carbon-steel diesel UST installed in 1976 at the Ameron Steel and Wire Division facility, owned by Ameron, Inc.
- Ameron Pipe application for removal of UST, dated August 28, 1987, was available for a 12,000-gallon diesel, a 10,000-gallon diesel, a 550-gallon waste oil, and a 1,000-gallon waste oil UST. The locations of these USTs were not clear from the map attached to the application.
- A complaint and investigation report dated February 17, 1989 for Ameron Steel & Wire Division indicated 5-gallons of sulfuric acid diluted with water was released after a 2-inch line broke and went into the bermed drainage. The bermed drainage area was indicated to drain to a water treatment system.

Tree Island Wire

- A hazardous Materials Spill Report dated November 6, 2009 indicated 5 gallons of hydraulic oil was spilled. The entity was reported to be Tree Island Wire and the responsible party was indicated to be Tamco. The Source-Facility Release Report indicated that TI Wire and Tamco share a yard and Tamco hit TI Wire's heavy equipment while moving 65 feet of rebar. This resulted in a release of hydraulic fluid from the heavy equipment. The release was to soil and was cleaned up with absorbent. The impacted soil and absorbent were indicated to have been removed and put in a waste container.
- Source – Envision Complaint for TI Wire dated August 21, 2008. A release of sulfuric acid occurred at TI Wire due to truck driver error during transfer and approximately 55 gallons was released onto cement. The release was cleaned up using absorbent and sodium bicarbonate slurry.
- Hazardous Materials Response Report, dated June 18, 1996, for a release of cooling tower water, oil, and solvent mix. A complaint was called in on June 13, 1996. The caller indicated that TAMCO was using a cooling tower water, oil, and solvent mix for dust control. A recent inspection of the TAMCO facility had been performed and the inspector consulted regarding the call. The inspector did not think that Tamco was mixing the waste oils and solvents with the cooling tower water. Cooling tower water is an acceptable dust suppressant.

Copies of the database search results and available records are presented in Appendix C.

4.3.7 City of Rancho Cucamonga Building and Safety

Kleinfelder submitted a written request to the City of Rancho Cucamonga's Building and Safety's Department for available building records for the Subject Property addresses. A summary of pertinent information from the online database is provided below. Copies of pertinent information are included in Appendix C.

12353 Arrow Route

Tamco Steel

- A permit dated March 2009 was issued for an addition of Enhanced Vapor Recovery to existing underground storage tanks “Tamco Steel.” The permit was finalized in April of 2009.

12451 Arrow Highway/Route

CMC Steel Fabricators, Inc / Fontana Steel

- An electrical/mechanical permit was issued to Fontana Steel on January 14, 1989.
- An electrical/mechanical/plumbing permit was issued to Fontana Steel on May 25, 1989 for eight boiler/compressor and ten air handlers.
- A permit was issued to CMC Steel Fabricators Inc on May 18, 2006 for an 8,800-square-foot steel canopy.
- In permit was issued to CMC Steel Fabricators Inc on November 26, 2007 for a 2,760-square-foot tenant improvement.
- A building permit was issued to CMC Steel Fabricators Inc on December 10, 2007 for the installation of overhead sprinklers.
- A permit record describes a project for a 200-feet underground conduit for a 1,150-gallon Liquid Petroleum Gas (LPG) tank. The owner and permit date are unknown.
- A permit record describes a project for a removal of an existing 15,000-gallon LPG tank at CMC-Fabricators – Fontana Steel and replacing it with a freestanding 1,150-gallon LPG tank with foundation. The date of issuance is unknown.
- A permit record describes a project for a foundation and electrical for a 1,150-gallon LPG tank. The owner and date of issue are unknown.

Tamco Steel

- A permit was issued to Tamco Steel on January 23, 2008 for electricity for a construction trailer.

Ameron Pipe Division/Ameron Pipe Plant/Ameron Concrete and Steel Pipe/Ameron Pipe Products/Ameron International Corporation

- A permit was issued to Ameron Pipe Division on May 19, 1980 for a motor truck scale pit.
- A permit was issued to Ameron Pipe Plant on April 9, 1980 a for a 60-amperage (amp) subpanel.
- A permit was issued to Ameron Pipe on April 28, 1981 for five water closets and three lavatories.
- A building permit was issued to Ameron Pipe Division on July 9, 1981 for a 75-feet by 300-feet fabrication building and a 25-feet by 75-feet two-story service and office building.
- A permit was issued to Ameron Pipe on September 1, 1981 for water and gas plumbing.
- A permit was issued to Ameron Pipe on March 15, 1995 for fire sprinklers and underground.
- A permit was issued to Ameron Concrete and Steel Pipe Systems on April 3, 1995 for a "pipe coating plant with exposed steel structural frame and steel walls (grading only)".
- A building permit was issued to Ameron, Inc on April 19, 1995 for a prefabricated steel building on a concrete foundation (a special coating plant).
- A permit was issued to Ameron Concrete Steel and Pipe Systems on April 24, 1995 for electrical work including four transformers.
- A permit was issued to Ameron Pipe Products on June 7, 1995 for gas and water line plumbing.
- A permit was issued to Ameron Pipe Products on December 5, 1998 for a bridge crane.
- A permit was issued to Ameron Concrete and Steel Pipe Systems on February 26, 1998 for an underground conduit and a 1,500-kilo-volt amps (KVA) transformer.
- A permit was issued to Ameron Pipe Products on March 3, 1998 for two transformers.
- A permit was issued to Ameron Pipe Products on March 12, 1998 for five transformers. With this permit, four pages of correction notices were attached dated from April 1998 to January 1999. The correction notices pertain to failure to have permits and use of proper electrical components. The correction notice also states an enclosure for hydraulic expander controller required to be rated 3R and 4R.

Ameron / Ameron Steel & Wire

- A permit to construct wire storage building was issued to Ameron Steel and Wire and the first inspection was dated November 29, 1978.
- A permit for construction of a 28 x 74 feet bundling building was issued to Ameron Steel and Wire and the first inspection was dated February 20, 1979.
- A permit to add a boiler room structure, add a bay to the straighten and cut department, and install a 100-horsepower boiler was issued to Ameron Steel and Wire, and the building was finalized April 16, 1979.
- A permit was issued January 14, 1980 to Ameron Steel for electrical for new wire mill storage building.
- A re-roof permit was issued to Ameron Steel and Wire on April 21, 1980.
- A permit was issued on May 15, 1980 to Ameron Steel and Wire for a foreman's office.
- A permit was issued to Ameron on July 7, 1980 for electrical work.
- A permit was issued on October 2, 1980 to Ameron Steel and Wire for a roll mill maintenance west end enclosure.
- A permit was issued on October 2, 1980 to Ameron Steel and Wire for a wind break lean-to.
- A permit was issued to Ameron Steel Corporation on August 15, 1980 for electrical work.
- A permit was issued to Ameron on September 10, 1981 for electrical work.
- A permit was issued to Ameron Pipe on April 29, 1981 for an under slab, underground conduit. A sketch on the permit showed a septic tank on the south side of a building.
- A permit was issued to Ameron Steel and Wire Division dated June 2, 1982 for two 8-foot by 12-foot electrical control buildings.
- A permit was issued to Ameron Steel and Wire Division on June 29, 1981 for a coil collector station personnel shelter.
- A permit was issued to Ameron Steel and Wire for a hot well on March 10, 1982.
- A permit was issued to Ameron Steel and Wire on April 16, 1982 for a cooling tower foundation.

DRAFT

Copyright 2024 Kleinfelder

- A permit was issued to Ameron Steel and Wire on June 29, 1982 for a preheater equipment foundation.
- A permit was issued to Ameron Steel and Wire Division on June 2, 1982 for two 8- by 12-foot electrical control buildings.
- A permit was issued to Ameron Steel and Wire on July 20, 1982 for electrical work.
- A permit was issued to Ameron on September 10, 1981 for electrical work/underground conduit.
- A permit was issued to Ameron on July 30, 1987 for electrical/plumbing for new boiler.
- A permit was issued to Ameron on September 9, 1987 for electrical work.
- A permit was issued to Ameron Steel and Wire Division on February 26, 1988 for one storage tank foundation and one equipment pad.
- A permit was issued to Ameron on March 9, 1988 for electrical work.
- A permit was issued October 4, 1989 to Ameron Wire and Steel for a personal platform for air system on roof.
- A permit was issued to Ameron, Inc on February 13, 2014 for concrete basins for the addition of new cooling towers - Gerdau.

Tamco

- A permit was issued to TAMCO on December 9, 1977, to construct a compressor roof cover.
- A permit to construct an observation platform in casting machine area was issued to Tamco, and the building was finalized on April 5, 1979.
- A permit was issued April 19, 1979 to construct a 30-foot by 75-foot maintenance building and additional weld shop.
- Permits were issued to TAMCO on May 7, 1980 for plumbing, a cooling tower storage basin and hot well, and a motor control center room.
- A permit was issued to TAMCO on June 26, 1980 for an 8-feet-high and 2,400-feet-long fence.
- A permit was issued to TAMCO on November 24, 1980 to construct landing platforms.

DRAFT

- A permit was issued to Tree Island Wire (USA) Inc on November 3, 2014, for a private fire underground service line - Gerdau.
- A permit was issued to Tree Island Wire (USA) Inc on November 3, 2014 for on-site sewer and water.
- A permit was issued to Tree Island Wire on February 19, 2015, for pallet storage racks.
- A permit was issued to Tree Island Wire (USA), Inc. on January 25, 2016 for precise grading.
- A permit was issued to Tree Island Wire on June 6, 2019 for EDR fire service upgrades as required in the previously approved fire protection plan for CMC metals.

Copies of the provided records are included in Appendix C.

4.3.8 City of Rancho Cucamonga Fire District

Kleinfelder submitted a written request to the City of Rancho Cucamonga's Fire District for available for the Subject Property addresses. A summary of pertinent information from the online database is provided below. Copies of pertinent information are included in Appendix C.

DRAFT

12451 Arrow Route

Fontana Steel

- A permit application dated June 23, 1989 was to install a 12,000-gallon diesel UST.
- Permit applications dated April 27, 1989 and June 15, 1989 were to operate a 15,000-gallon LPG tank.
- Plans for a 12,000-gallon UST and dispenser system were dated June 9, 1989.
- An underground storage tank inspection for a 12,000-gallon diesel UST at Fontana Steel was conducted on June 18, 1990. The form states that no discrepancies were noted during the inspection.
- Permits for storage, use, and handling of oxygen and acetylene, were issued May 27, 1998.
- Permits were issued to Fontana Steel on May 27, 1998 and then September 22, 1998 for the storage, use and handling of flammable and combustible liquids. The first permit was for 11,000 gallons from a fuel dispenser and the second permit was for a 12,000-gallon UST.

Copyright 2024 Kleinfelder

- A Construction and Inspection Report dated September 15, 1998 indicated that permits for the following were issued: 12,000-gallon diesel UST, oxygen, and acetylene.
- Encon Engineering Services prepared plans entitled *Underground Storage Tank Upgrades* dated January 8, 1999 for Fontana Steel. These plans show two fuel dispensers east of the 12,000-gallon diesel UST, and a propane tank east of the dispensers. The southern fuel dispenser and piping to the fuel dispenser were proposed to be flushed, cleaned, slurried and abandoned in place. A new "Bravo Box" was proposed to be installed under the northern dispenser and a new overfill drop tube valve and tank bottom protector were proposed o the diesel fill.

TAMCO

- A permit was issued to TAMCO for the removal of four 12,000-gallon fuel oil USTs on May 4, 2006.

CMC Rebar Etiwanda

- A permit was issued to CMC Fabricators on February 24, 2009 to install a 1,150-gallon propane storage tank and remove a 15,000-gallon propane storage tank.
- A Notice to Correct/Inspection Report for CMC Americas dated February 14, 2012, states that an LPG tank had been relocated and to provide permits, plans, and documents for the relocation. The document also states to secure all compressed gas cylinders and to store outside of SEA containers and to replace signage for diesel pumps.
- A permit was issued August 5, 2013 to operate a motor vehicle fuel-dispensing station dispensing flammable and/or combustible liquids, liquified petroleum gases, compressed natural gases, or similar substances intended for use as a motor vehicle fuel in accordance with Chapter 22 of the 2010 California Fire Code. Unattended self-serve diesel 8,000-gallon UST. A second permit was issued August 5, 2013 to store, handle, and/or dispense LPG in accordance with Chapters 27 and 38 of the 2010 California Fire Code, propane 1,500-gallon tank.
- A permit was issued to CMC Rebar Etiwanda on August 7, 2014 for removal of a 12,000-gallon diesel UST.
- The CERS UST-Facility Information form from 2020 indicated that the UST at CMC Rebar Etiwanda was closed 2014 by the San Bernardino County Fire Department.

DRAFT

Copyright 2024 Kleinfelder

- Based on a Hazardous Materials and Wastes Inventory Matrix report submitted on April 2020, the facility's (CMC Rebar Etiwanda) inventory is described as; oxygen, acetylene, propane, waste sludge, diesel fuel, ethylene glycol, used oil, and motor oil. In May and October 2021, the inventory consists of; oxygen, acetylene, propane, waste sludge, diesel fuel, ethylene glycol, oil filters, rags, used oil, waste aerosols liquid, and motor oil.

12455 Arrow Route (adjoining property to east)

Ameron

- A permit was issued to Ameron Pipe for two 3,000-gallon gasoline tanks, and one 10,000-gallon diesel tank (unknown date though the form was indicated to have been revised in 1977).
- A permit application dated April 3, 1980 was approved to install at the Ameron (pipe plant) one 10,000-gallon diesel UST, and two, 3,000-gallon gasoline USTs.
- An inspection report for Ameron Pipe, dated April 1980, lists two 3,000-gallon gasoline tanks, and a diesel tank.
- Based on a sketch for the Ameron Pipe Plant dated April 2, 1980, a fuel station including new 3,000-gallon USTs, and a 10,000-gallon UST which was noted as being relocated southeast of the shop building.
- A permit was issued to Ameron Concrete Steel Pipe Systems on September 30, 1998 to remove three USTs; one, 10,000-gallon diesel, two 3,000-gallon gasoline, and underground piping.
- A permit was issued to Ameron Concrete and Steel Pipe on January 26, 1999 for a 2,000-gallon AST. Another permit dated the same date, was issued for a 2,000-gallon diesel and gasoline AST. A third permit dated the same date was issued for fuel dispensing.
- A UST permit was issued to Ameron Pipe Division, Arrow Plant on April 30, 1999.
- A permit was issued to Ameron on October 16, 2012 for a fuel-dispensing station including a 1,500-gallon diesel tank and a 500-gallon gasoline tank. Other permits were issued the same date to store or use four propane cylinders and oxygen/acetylene.
- Based on a Hazardous Materials and Wastes Inventory Matrix report submitted on February 19, 2014, the facility's (Ameron International Water Transmission Group) inventory included: waste oil, diesel, gasoline, gear oil, transmission fluid, motor oil,

DRAFT

grease, paints and epoxys, acetylene, concrete add mix, LPG, oxygen, waste paint and thinner, primer, resin and cure/epoxy amercoat.

12459 Arrow Route / 12459 Arrow Route Suite B

Ameron (there permits appear to be associated with adjoining property to the east)

- A permit was issued to Ameron Steel Wire Division (illegible date) for a 10,000-gallon diesel UST for a boiler. The application was dated December 14, 1977.
- A permit was issued to Ameron Pipe on September 8, 1987 to remove three waste oil USTs. Another permit was issued at the same time to remove three diesel USTs.
- A permit application dated November 13, 1989 was to remove a 10,000-gallon diesel UST from Ameron Steel and Wire Division.
- A sketch for Ameron Steel and Wire Division listed J.D. Brodine and Sons as the contractor and showed the 10,000-gallon UST northwest of the building, east of the access road, and northeast of the guard shack. Arrow Route employee parking was noted to the north. A fire hydrant was located northeast and adjoining the UST and a barrel storage and containment area was drawn east of the UST. The fuel pump was south of the southwest corner of the UST. Based on the drawing, this UST appears to be on the property adjoining the Subject Property to the east.

J.D. Brodine & Son, Inc. (this permit appears to be associated with the adjoining property to the east)

- A permit (undated) was issued for the removal of a 10,000-gallon diesel UST.

TAMCO

- A permit application dated April 30, 1979 was approved for the use and storage of two 8,000-gallon diesel fuel tanks, and one 4,000-gallon gasoline tank at the Tamco facility. The application was stamped by the Ameron Steel and Wire Division.
- A permit application dated July 14, 1980 was approved for the installation of one 280-gallon diesel fuel UST to fuel a diesel engine (generator set) at TAMCO.
- A permit was issued to Tamco on November 23, 1992, to conduct storage of LPG tanks 2-30 gallon.

DRAFT

Copyright 2024 Kleinfelder

- A permit dated November 9, 1993, was issued for the removal of two 50,000-gallon tanks which formerly held fuel oil. The permit application was for the removal of four 50,000-gallon USTs. A Construction Inspection Report dated November 18, 1993, describes the removal of two 50,000-gallon USTs.
- A permit application dated April 27, 2006, calls for the removal of four 12,000-gallon fuel oil USTs at Tamco Steel. An inspection ticket associated with the work indicated that the USTs were removed between May 3 and May 31, 2006.
- A permit was issued to TAMCO Steel Inc on November 22, 2010, for the removal of a 300-gallon diesel UST.
- In February 2021, Tamco listed the following in their CERS chemical inventory: propane with compressed gases and in melt shop; bleach (sodium hypchlorite and sodium hydroxide) and sulfuric acid in the cooling towers; waste paint in the finishing end; diesel in AST and UST and gasoline in UST; lead acid batteries, waste paint, hydraulic oil, and lubricating oil in Mobile Maintenance Shop; Americlase HC, Arco 50 HS, Basic 187 GM-93, ISOTAP/TAP-332, NC-Cast Maxima PC, NC-Cast Optima PC, and Nozzle Set 90P in refractory; waste hydrocarbon contaminated soil and debris and waste paint in Rolling Mill, oxygen, propylene, waste paint in Rolling Mill Maintenance; Mobilegrease HTR and waste oil in south oil storage.
- Based on a Hazardous Materials and Wastes Inventory Matrix report submitted on October 13, 2021, BTC III Arrow Route CC LP's (TAMCO's) inventory included; propane in gas rack and ambient; diesel and gasoline fuel storage tanks; surplus dirt in the northwest yard; Envirotemp FR3 transformer oil, mineral oil (light), and silicone oil in transformers.

Phoenix Services LLC

- Based on a Hazardous Materials and Wastes Inventory Matrix report submitted on May 2020 and February 2021, Phoenix Services LLC's inventory includes three 500-gallon motor oil ASTs, one 1,000-gallon diesel AST, acetylene, oxygen, Ecosafe (polyether polypol phenothiazine), hydraulic oil, used lubricating oils, diesel, gasoline, drained used oil filters, grease, DEF (water urea), ethylene glycol, motor oil, and miscellaneous aerosols. Phoenix stored most of its chemicals west of the maintenance shop. The aerosols were reported to have been stored in a bin inside the maintenance shop.

DRAFT

Copyright 2024 Kleinfelder

Southern California Edison, Transmission and Distribution

- Based on a Hazardous Materials and Wastes Inventory Matrix report submitted on February 2017, 2018, 2021, 2022, and 2023 and March 2021, Southern California Edison, Transmission and Distribution's inventory included mineral oil inside the electrical equipment.

Tervita LLC

- Based on a Hazardous Materials and Wastes Inventory Matrix report submitted on July 27, 2017, Tervita LLC's inventory included: acetylene, antifreeze, fire resistant hydraulic oil, general purpose grease, oxygen, drained used oil filters, diesel fuel, Mobil fleet 15W-40, Mobil hydraulic 10W, and waste oil. Chemicals were reported to be stored in an outdoor storage area.

Tree Island Wire USA, Inc. (adjoining property to the east)

- A permit application dated February 26, 2013, listed the following permit categories: corrosive, cryogenic fluid (nitrogen), flammable/combustible liquids, oxidizers, hot work (oxy acetylene), and propane would be used.
- An operating permit was issued on May 12, 2015 to Tree Island Wire for operation or use of the following: cryogenic fluids, hot work, industrial ovens, and LPG.
- Operating permits were issued on June 21, 2016, August 23, 2018, April 22, 2021, October 26, 2022, for use of corrosive liquids, cryogenic fluids (6,000-gallon nitrogen), flammable and combustible liquids (385 gallons), oxygen liquid, and solid, oxygen and acetylene, and LPG (499-gallon tank and 8-gallon cylinders for forklifts).
- Based on a Hazardous Materials and Wastes Inventory Matrix report submitted on April 21, 2020 and November 3, 2022, Tree Island Wire's inventory included: acetylene, argon, LPG, oxygen, nitrogen, calcium hydroxide solution and sulfuric acid (west side of main building), lime additive and Bulk Draw 416MX/Bulk Draw 417RX (phosphoric acid, zinc and nickel compounds), Bulk Phos NO. 1 (phosphoric acid), and L1011-NC Inhibitor (diethyltheiurea, polyethylenepolyamine, coco amine), Misti Emulsi Plus (mineral spirits and monocyclic terpene), rust preventative oil, sodium nitrate and waste lubricating oil (inside building in chemical storage area); calcium hydroxide, sodium hydroxide, and spent wire draw lube-calcium and sodium based (inside main building); soap, disodium borate (borax), potassium permanganate, ridoline XP (sodium hydroxide and sodium

DRAFT

Copyright 2024 Kleinfelder

metasilicate), sodium tripolyphosphate, vicafil salvia 2 (nitric acid sodium salt, calcium hydroxide and sodium tetraborate pentahydrate), and vicafil TF 120 G (calcium stearate and hydrated lime), vicafil TN 135 (calcium soap), Vicafil TN 19T2, Vicafil TN 411, Vicafil TN 6264 X, Vicafil TS 350, Vicafil TS 7112, wire drawing compound (inside main building dry chemical storage area); hydraulic oil (inside main building maintenance department).

Copies of the provided records are included in Appendix C.

4.4 PHYSICAL SETTING SOURCE(S)

Table 4-2 presents information concerning the physical setting of the Subject Property. This information was obtained from published maps.

Table 4-2
Physical Setting

DATA	GENERAL INFORMATION
USGS TOPOGRAPHIC QUADRANGLE	Kleinfelder's review of the United States Geological Survey (USGS) Guasti Quadrangle 7.5-Minute Series (Topographic) Map dated 2018 indicated the elevation of the Subject Property's ground surface is approximately 1,150-feet above MSL and slopes southward.
SOIL TYPE	Based on information for the Subject Property from the EDR GeoCheck Physical Setting (EDR, 2023), the soil components at the Subject Property were listed as Tujunga gravelly loamy sand. Based on subsurface investigations performed at the Subject Property by Ramboll and Roux in 2021, sand and gravel is present in the upper 5 feet bgs, overlying interbedded sand and silts (Ramboll, 2021; Roux, 2021).
OIL AND GAS WELLS	On September 12, 2023, Kleinfelder searched CalGEM's Well Finder website (DOC CalGEM WellFinder) for information regarding oil and gas fields located in the immediate vicinity of the Subject Property. No oil or gas wells are depicted to be on the Subject Property or on the adjoining properties. A copy of the Well Finder search results is presented in Appendix C.

Table 4-3 presents information concerning regional geology and hydrogeology. The information was obtained from published maps and other sources.

Table 4-3
Regional Geology and Hydrogeology

PHYSICAL PARAMETER	INFORMATION/COMMENTS
REGIONAL PHYSIOGRAPHY AND GEOLOGY	The Subject Property is situated within the Chino Valley at the northern end of the Perris block along the northern boundary of the Peninsular Ranges geomorphic province of California (Norris and Webb, 1990). The Subject Property is underlain by late-Holocene age alluvial-fan deposits (Qyf1, Qf2) (Morton and Miller, 2006). Alluvial soils are estimated to be 1,000- to 1,100-feet thick beneath the site (Fife, 1976).

DRAFT

Copyright 2024 Kleinfelder

Table 4-3 (Cont'd.)
Regional Geology and Hydrogeology

PHYSICAL PARAMETER	INFORMATION/COMMENTS
REGIONAL HYDROGEOLOGY	The Subject Property is situated in the northern part of the Upper Santa Ana Valley Groundwater Basin in the Chino Subbasin. The Subbasin is bounded on the north by the San Gabriel Mountains and the Cucamonga fault, on east by the Rialto-Colton fault, on the southeast by the Jurupa Mountains, on the south by the Puente Hills and the Chino fault, and on the northwest by the San Jose fault (DWR, 2006). Groundwater is present in the alluvial deposits of the Subbasin. The Pleistocene alluvium is composed of interfingering finer, alluvial-fan deposits and coarser, fluvial deposits (DWR, 2006).
DEPTH TO GROUNDWATER DIRECTION OF ANTICIPATED FLOW [1]	Groundwater flow was reported to the southwest. An annual Groundwater Monitoring Report (P. Hamilton, 2010) was performed at the former Etiwanda Generating Station located at 8996 Etiwanda Avenue (south of the Subject Property) in the fourth quarter of 2009 and indicated depths to groundwater ranged from 369 feet to 434 feet bgs and a groundwater flow direction primarily toward the southwest. Groundwater in the area is considered to be of beneficial use.
REGIONAL GROUNDWATER QUALITY PROBLEMS	Groundwater in the Chino Subbasin is predominantly calcium-sodium bicarbonate. According to the Department of Health Services, the Total Dissolved Solids (TDS) concentration from Title 22 wells ranges between 149 to 1,710 mg/L and averages 359 mg/L. The most adverse impact to groundwater is high concentrations of dissolved solids and nitrate-nitrogen (DWR, 2006).
WATER SUPPLY	The Subject Property is connected to the local municipal water system. A non-production water well is located in the southeast portion of the Subject Property.
FLOOD ZONE DESIGNATION	According to EDR's *The EDR Radius Map™ Report with GeoCheck®*, the Subject Property is not located in a special 1% flood hazard area or in a 0.2% annual chance flood hazard zone.

[1] Groundwater flow direction is based on regional information sources. Site-specific conditions may vary due to a variety of factors including geologic anomalies, utilities, nearby pumping wells (if present), and others.

DRAFT

4.5 USER PROVIDED INFORMATION

Information regarding the current owners/occupants of the Subject Property is summarized in Table 4-4.

Table 4-4
Owner / Occupant Information

ENTITY	NAME
OWNER	According to the *EDR Environmental Lien and AUL Search* report (EDR, 2023a), the current owner of the Subject Property APNs 0229-121-33-0000, 0229-131-19-000, 0229-121-34-0000, and 0229-121-35-0000 is "BTC III Arrow Route CC LLC."
OCCUPANT(S)	The Subject Property is currently unoccupied.

Copyright 2024 Kleinfelder

Summaries of interviews of key individuals with knowledge of the Subject Property ("Key Site Managers") are provided in Section 7. The following sections present information provided to Kleinfelder by EDR.

4.5.1 Title Records

Chain-of-title information for the Subject Proper was not provided by the Client. Therefore, a review of a chain-of-title report was not performed as part of the scope of this Phase I ESA. However, based on the deed information available for the Subject Property, TAMCO transferred the deed for APNs 0229-121-33-0000, 0229-131-19-000, 0229-121-34-0000 to BTC III Arrow Route CC LLC in 2021 and the deed for APN 0229-121-35-0000 was transferred from CMC Steel Fabricators Inc in 2021.

4.5.2 Environmental Liens and Usage Limitations

According to information provided in EDR's regulatory agency database search report (EDR, 2023b), no known recorded land-use environmental deed restrictions pertaining to the Subject Property are listed in the State Liens Database; however, there is a deed restriction for the former brine area on the east adjacent Goodman Rancho SPE, LLC property and a Land Use Covenant (LUC) for the east adjoining DP Etiwanda property. Kleinfelder's review of EDR's *EDR Environmental Lien and AUL Search* report (EDR, 2023a) indicated no environmental liens or activity and use limitations (AULs) are associated with the Subject Property. A copy of EDR's report is provided in Appendix C.

DRAFT

4.5.3 Value Reduction

As part of the ASTM Designation E1527-21 process, information is to be gathered regarding the prospective purchase price of the Subject Property relative to its fair market value. If there appears to be a value reduction, that reduction must be identified with respect to whether the difference could be attributed to environmental degradation of the property. As the Subject Property is not for sale, this is not applicable.

4.5.4 Other Information/Documents Provided

The following reports and other documents were provided to Kleinfelder:

A December 27, 2021 report prepared by Roux Associates, Inc. and entitled *Phase I Environmental Site Assessment Report, 12451 Arrow Route, Rancho Cucamonga, California*, was performed on the Subject Property and was prepared for BTC III Acquisitions LLC. This report

Copyright 2024 Kleinfelder

indicated that the Subject Property consisted of approximately 94.247 acres of land identified as APNs 0229-121-34 (the west parcel of the Subject Property), 0229-121-33 (the south parcel of the Subject Property), 0229-131-19 (the east parcel of the Subject Property), and 0229-121-35 (the north parcel of the Subject Property). Addresses listed for the Subject Property included 12451 Arrow Route, 12343 Arrow Route, 12353 Arrow Route, 12455 Arrow Route, and 12459-B Arrow Route, with the 12451 Arrow Route address identified as the main address. At the time of the Roux Phase I ESA, the Subject Property was occupied by CMC (an inactive steel mill), CMC Rebar (a rebar manufacturing facility), and Phoenix Industries (a slag processing facility). The northern portion of APN 0229-121-34 was used by CMC for equipment storage and the southern portion of APN 0229-121-34 was used for steel billet and processed slag storage. No permanent structures were present on this parcel. The northern portion of APN 0229-121-33 was partially occupied by Phoenix Industries. Phoenix Industries performed mechanical crushing and sorting of steel slag for use as aggregate material. No permanent structures were present in this area. The remainder of the northern portion of APN 0229-121-33 was used for storage of scrap metal and processed steel slag. The southern portion of APN 0229-121-33 was developed with the inactive CMC steel mill. The steel mill consisted of a Melt Shop, the primary Processing Building, Warehouse and Maintenance Building, old baghouse, and guard shack. An EAF was reported to have previously operated in the Melt Shop. The northern portion of APN 0229-131-19 was developed with the CMC office building and fueling station. Rebar was also stored in this area. The southern portion of APN 0229-131-19 was developed with a Milling and Rolling Building, new baghouse, Main Office, Warehouse, and Bundling Station associated with the inactive steel mill operations. APN 0229-121-35 was developed with CMC Rebar. An Office and Fabrication Shop were reported to be present on this parcel. The steel mill development began circa 1959 with the construction of the Milling and Rolling Building. By 1975, the Subject Property, except for the northern portion, was graded and used for storage. By 1985, the northern portion of the Subject Property had also been developed for industrial use. The Melt Shop was developed by 1985 and the Office building and Fabrication Building were developed by 1990.

DRAFT

This Phase I ESA identified the following RECs:

- The presence of TPH and metal concentrations in soil, and VOC concentrations in soil vapor across the Subject Property;
- The presence of railroad spurs on APN 0229-121-33 (the central and southern portion of the Subject Property), APN 0229-131-19 (the eastern portion of the Subject Property) since at least 1959. Historical use of oils, pesticides, herbicides, PCBs, and arsenic is known to be associated with the maintenance of railroad tracks and spurs. Additionally,

Copyright 2024 Kleinfelder

there is the potential for spills of hazardous materials during loading or unloading of railroad cars;

- The presence of a fueling station equipped with dual-compartment diesel and gasoline UST. This UST was reported to consist of a 10,000-gallon diesel compartment and a 2,000-gallon gasoline compartment. At the time of this Phase I ESA report, the UST had been drained and inactive. Based on an investigation performed in 2021, no petroleum hydrocarbons were identified above regulatory screening levels in soil or soil vapor in the vicinity of this UST. Roux concluded that, due to the long history of industrial operations, and unknown age of this UST, there is potential that a release to have occurred. Roux recommended further investigation after removal of the UST;
- A former chemical storage area was located northwest of the Melt Shop on APN 0229-121-33. Roux indicated that, during their reconnaissance, signage was observed indicating the storage of new and used oils. The area was reported to be asphalt and concrete paved and bermed, though moderate staining and cracks were observed. Roux indicated that this area was not investigated in 2021;
- A wash rack equipped with a sump on the northern portion of APN 0229-121-33. The wastewater may have been impacted with automotive oils (petroleum hydrocarbons and VOCs) and metals from processed slag. There is potential for a release of impacted wastewater from the wash rack area; and
- At least 24 USTs used to store gasoline, diesel, fuel oil, or waste oil were reported to have been present at the Subject Property. Removal of some of the USTs is documented. Roux indicated that inactive USTs may be present on the Subject Property and may have released petroleum hydrocarbons.

This Phase I ESA identified the following HRECs:

- Soil impacted with lead was remediated in the southwestern portion of APN 0229-121-34 between 1989 and 1990. The RWQCB issued a letter stating no further action was required on November 7, 1990.
- Four 50,000-gallon fuel oil USTs were removed in November 1993 from APN 0229-131-19. Impacted soil was excavated and removed for off-site disposal. The SBCDEHS issued a letter stating no further action was required on April 28, 1994.

DRAFT

Copyright 2024 Kleinfelder

- Metal-impacted soil, which was stabilized under DTSC oversight between 1989 and 1990, was used to backfill the UST cavities for the four USTs removed in 1993. The presence of the stabilized metal-impacted fill soil is considered a HREC.
- Steel-mill furnace wastes (baghouse dust waste and slag) were buried in trenches on APN 0229-121-35. These wastes were excavated, and confirmation sampling was performed under DTSC oversight and the DTSC issued a letter indicating that the residual concentrations were below human health screening levels for unrestricted use in 2001.
- Baghouse dust waste and slag were stockpiled on APNs 0229-121-34 and 0229-121-33. Remediation was performed under the oversight of SBCFD and a no further action determination was issued July 2, 2002.
- Four diesel USTs were removed from APN 0229-131-19 in 2006. Based on confirmation sampling results, no further action was indicated in a SBCFD letter dated October 6, 2006.
- A 12,000-gallon diesel UST and associated fuel dispenser was removed in June 2014 from APN 0229-121-35. Residual diesel was detected in confirmation soil samples; however, the SBCFD indicated that no further action was required in a letter dated October 29, 2014.

This Phase I ESA identified the following CRECs:

- Soil samples collected by the DTSC in 2005 identified an area of soil impacted by heavy metals north of Scrap Piles 12 and 16 on APN 0229-121-33. Remedial excavation was performed in November 2005. The excavation was backfilled with excavation soil that did not exceed the cleanup criteria and crushed slag, and then the area was capped with asphalt. TAMCO, the property owner at the time of this remedial activity, and the DTSC signed a Consent Order dated April 26, 2007 documenting the remedial completion.

This Phase I ESA identified the following environmental concerns:

- The potential for pesticides to be present in shallow soils due to former agricultural use of the Subject Property.
- Adjoining property DP Etiwanda, located at 8822 Etiwanda Avenue was listed in the EnviroStor database as having Land Use Restrictions as of October 22, 2020. Metals, TPH, and PCBs were reported to be present in soil at this facility. Land use is restricted to commercial and industrial use. This property was considered an environmental concern

DRAFT

Copyright 2024 Kleinfelder

due to the documented presence of contamination and its proximity to the Subject Property.

- Buried slag was present in the northern, western, and southwestern portions of the Subject Property during Ramboll's Phase II investigation in 2021. Roux indicated that the slag material does not typically contain hazardous or petroleum constituents.

A *Geotechnical Investigation Report* for a proposed warehouse development prepared by Southern California Geotechnical for the Subject Property on October 15, 2021.

A *Preliminary Water Quality Management Plan* was prepared by Thienes Engineering, Inc. on May 18, 2023 for the proposed warehouse development.

A *Biological Due Diligence Investigation* for the proposed Arrow Route and Juneberry Drive Project was prepared by ELMT Consulting on November 29, 2021.

A *Site Plan* for the proposed warehouse developments was prepared by HPA Architecture.

A *Conceptual Grading and Drainage Map Plan* was prepared by Thienes Engineering, Inc.

A *Hazardous Waste Site Statement* was signed by BTC Arrow Route CC LP (Ares Industrial Management) on May 11, 2023. "Exhibit B" depicts the location of existing overhead utilities, and was prepared by Thienes Engineering, Inc.

A *Preliminary Hydrology Calculations Report* was prepared by Thienes Engineering, Inc. on May 8, 2023.

Roux, 2023, *Current Conditions Report, 12451 Arrow Route, Rancho Cucamonga, California.* October 25. This report summarizes the history of the Subject Property, the environmental assessments performed to date, the current conceptual model for the Subject Property, ongoing investigations and data gaps. The Subject Property was indicated to have been purchased by BTC III in December 2021 for industrial development. The previous steel-mill structures were demolished in 2021 and 2022. Recent subsurface investigations were performed by Ramboll in 2020 and 2021 on behalf of CMC (the owner of the Subject Property prior to its purchase by BTC), and by Roux on behalf of BTC in 2021 prior to purchase, and in 2022 and 2023. In summary, TPH-d has been identified in shallow soil in limited areas on APNs 0229-121-33 and 0229-121-19. Additional delineation of these soils is required. PCE, benzene, and chloroform are present in soil vapor on APN 0229-131-19. Roux recommended SVE remediation; however, the DTSC has requested further delineation, which has yet to be performed. PCB concentrations have been

DRAFT

Copyright 2024 Kleinfelder

identified in the southern portions of APNs 0229-121-33 and 0229-131-19. Though, the impacted appears to be limited, further delineation of these areas is required. Slag material has been identified as present in the subsurface at the Subject Property. Previous investigations indicate that the slag does not pose a human health risk. The DTSC has recommended a site-specific leaching model be prepared to evaluate the slag material for potential leaching of metals. APN 0220-121-34 was reported to have previously been a SCE easement and was historically vacant until it was purchased by TAMCO in the later 1990s. The southern portion of this parcel was impacted by lead from water runoff from TAMCO in the 1980s. The lead-contaminated soil was remediated, and the case closed by the RWQCB in 1990. The *Current Conditions Report* indicates that slag material was used on the southern portion of APN 0229-121-34 by SCE to level the parcel. Roux indicates that no additional investigation is required of this parcel. APN 0229-121-35 was also identified as requiring no further evaluation. This parcel had been the former Fontana Steel rebar fabrication facility. Prior to use by Fontana Steel, Ameron had buried baghouse dust and slag in three trenches on this parcel. These trenches were excavated as part of the property transaction in the late 1980s. These trenches were investigated again in 1998 through 2001, and based on the results, the case was closed by the DTSC. Both Ramboll and Roux collected recent samples in the vicinity of these trenches and no impacted soil was identified. The *Current Conditions Report* identified multiple USTs having been present on the Subject Property, most of which had records of having been removed. One 1,000-gallon gasoline UST was reported to have been located southwest of the maintenance building on APN 0229-131-19; however, Roux indicated that it was unknown when this UST had been removed.

The *Current Conditions Report* summarized two Phase I ESA reports not previously summarized in this Phase I ESA report. A Phase I ESA had been prepared by Kinworthy/Patton Environmental, Inc, on December 2, 1996 for TAMCO regarding APN 0229-121-34. This parcel was described as vacant and having never been developed. A graded area had been present near the center of parcel. Liquid was observed to be flowing onto the property from the adjoining Parallel Products facility to the west. A 30-inch concrete pipe drainage channel and a 5-foot by 5-foot vault was noted on the parcel. The southern portion of the parcel appeared to have been raised using fill material (including slag). A second Phase I ESA had been performed on APNs 0229-121-34, 0229-121-33, and 0229-131-19 by Arcadis Geraghty & Miller dated October 7, 1998. This Phase I ESA identified an active UST in the northern portion of APN 0229-131-19, the slag stockpile in the northern portion of APN 0229-121-33, and poor housekeeping and staining the vicinity of an AST south of the maintenance area on APN 0229-131-19 as RECs. Other Phase I ESAs, subsurface investigations, and UST closure documentation were also summarized.

DRAFT

Copyright 2024 Kleinfelder

In preparation for redevelopment, Roux prepared a *Soil Management Plan*, dated October 3, 2022. This plan was prepared prior to demolition of the structures at the Subject Property.

In July 2022, Roux performed a SVE pilot test at the Subject Property. The SVE radius of influence was reported to be from 71 to 82 feet at screens set at 5 feet bgs, and from 125 to 158 feet at screens set at 15 feet bgs.

In September and October 2022, Roux performed an assessment of the slag distribution across the Subject Property. Findings indicated that slag material was mainly present on APN 0229-121-34, the western and southern portions of APN 0229-121-33, and the southeastern portion of APN 0229-131-19 at depths up to 13 feet bgs. With the exception of thallium in soil samples collected at 11 feet bgs from two adjoining locations, and arsenic in one location at 3 feet bgs, metal concentrations in the slag material did not exceed industrial screening levels or hazardous waste criteria. Roux's site conceptual model identified that the former steel mill operations had impacted soil and soil vapor. Exposure to soil during construction activities was identified as a pathway. Roux indicated that once construction is complete and the soil surfaces capped by the buildings or parking areas, this exposure pathway will be closed. Vapor intrusion to indoor area was identified as another potential exposure pathway. Data gaps included the complete delineation of the TPH-d, metals (including lead, arsenic, cadmium, chromium, and hexavalent chromium), and SVOCs (benzo(a)pyrene) in soil, PCBs in soil and concrete, and VOCs in soil vapor. Included in the *Current Conditions Report* was a workplan to address these data gaps.

5 HISTORY OF THE SUBJECT PROPERTY

The history of the Subject Property was researched to identify obvious uses. Historical land use was researched to the first developed use, or back to 1940, whichever was earlier or readily available. Table 5-1 summarizes the availability of information reviewed during this assessment.

Table 5-1
Historical Information Sources

SOURCE	YEARS REVIEWED	SOURCE / AVAILABILITY

DRAFT

5.1 SANBORN FIRE INSURANCE MAPS

Sanborn Fire Insurance Maps provide historical land use information for some metropolitan areas and small, established towns. Kleinfelder requested EDR to search its library of Sanborn Fire Insurance Maps for maps of the Subject Property. EDR responded that Sanborn Fire Insurance Maps were not available for the Subject Property (EDR, 2023d). A copy of EDR's response is provided in Appendix D.

5.2 AERIAL PHOTOGRAPHS

A review of historical aerial photography may indicate past activities at a property that may not be documented by other means or observed during a reconnaissance visit. The effectiveness of this technique depends on the scale and quality of the photographs and the available coverage. Aerial photographs were obtained from several historical photograph collections through EDR (2023d) and span a period of 82 years. A tabulation of the aerial photographs reviewed by Kleinfelder is

Copyright 2024 Kleinfelder

presented in Table 5-2. Copies of the aerial photographs provided by EDR are included in Appendix D.

Table 5-2
Historical Aerial Photographs Reviewed

YEAR	APPROXIMATE SCALE	SUMMARY
1938	1" = 500'	**Subject Property:** The Subject Property appeared to be developed as agricultural row crops. A small structure appeared to be present in the northwest corner of the Subject Property and a possible small pond appeared to be present in the northeast corner of the northern portion of the Subject Property. A small structure was located at the southeast corner of the Subject Property. A dirt road extended northward from this structure, through the fields. Another structure (possible shed) was located just west of this road, just south of the center of the eastern Subject Property boundary. **Surrounding Area:** The adjoining properties to the appeared to also be developed as agricultural land. Arrow Route appeared to be present north of the Subject Property. A natural drainage channel appeared to be present along the western boundary of the Subject Property. Another drainage channel and then a railroad were present along the southern boundary of the Subject Property. A residence with a possible small orchard adjoining it was present west of the northwest corner of the Subject Property. A dirt road and a railroad spur appear to extend east-northeast from the railroad south of the Subject Property, adjoining the southeast corner of the Subject Property.
1949	1" = 500'	**Subject Property:** The Subject Property appeared to be generally the same. **Surrounding Area:** The adjoining properties appeared to be generally the same, except that a detached garage appeared to be present south of the residence northwest of the Subject Property, and the orchard that appeared to be adjoining the residence was no long present. Additionally, a small structure appeared to be present southeast of the Subject Property, near where the railroad spurs leave the main railroad.
1953	1" = 500'	**Subject Property:** The Subject Property appeared to be generally the same. **Surrounding Area:** The adjoining properties to the west, north, and east also appeared to be generally unchanged. The railroad remained present to the south and the railroad spur remained present east-southeast. An industrial facility was present south and southeast of the Subject Property. Multiple structures were present in the portion of the industrial facility to the southeast. A drainage channel appeared to extend from the railroad near the southeast corner of the Subject Property, south-southwestward into the industrial facility. Four structures, and then four large ASTs and one small AST were present on the property south of the Subject Property. The ASTs were present in bermed secondary containment.

DRAFT

Copyright 2024 Kleinfelder

Table 5-2 (Cont'd.)
Historical Aerial Photographs Reviewed

YEAR	APPROXIMATE SCALE	SUMMARY
1959	1" = 500'	**Subject Property:** The western and northern portions of the Subject Property appeared to remain developed for agricultural use. The small structure noted previously in the northwest portion and the small pond noted in the northeast portion of the Subject Property were no longer present. The northern portion of the eastern portion of the Subject Property also remained agricultural. A road extended down the eastern portion of the northern portion of the Subject Property, to an asphalt-paved parking lot and commercial structure in the northeastern quadrant of the eastern portion of the Subject Property. A dirt storage yard was present adjoining the parking lot to the east, and then an apparent residual agricultural field, with stockpiled material present in the north-central portion of the field. A dirt road also extended easterly through this agricultural field. The area east of the field appeared to be graded dirt and used as storage. An industrial warehouse facility was present in the southwest-central portion of the eastern portion of the Subject Property. The areas around this industrial structure were used for material storage. Stockpiles were present southeast of the industrial structure. A water tower appeared to be present in the southeast corner of the Subject Property. Railroad spurs were present in the eastern portion of the Subject Property: one spur extending off the railroad south of the Subject Property northward along the eastern boundary of the Subject Property. A second railroad spur appeared to extend from the eastern boundary and other railroad spur back towards the location of the stockpiles. **Surrounding Area:** The adjoining properties appeared generally the same as on the 1953 aerial photograph, except that there is an additional structure present west of the farm/residential structures west of the northwest corner of the Subject Property. The property east of the northeast portion of the northern portion of the Subject Property appeared to have been graded and developed as either parking lot or storage yard, with a structure in the northeast central portion of the property.

DRAFT

Copyright 2024 Kleinfelder

Table 5-2 (Cont'd.)
Historical Aerial Photographs Reviewed

YEAR	APPROXIMATE SCALE	SUMMARY
1966	1" = 500'	**Subject Property:** The northern and western portions of the Subject Property appeared generally the same. The eastern portion of the Subject Property appeared to have been fully developed for industrial use with the northern portion used for stockpile and material storage. The parking lot and commercial structure remained present in the northwestern portion of this section, and the industrial building remained present. A new commercial building was present north-northeast of the industrial building. Stockpiles appeared to be present along the south, east, and southeast boundaries of the Subject Property. A small structure was present in the southeast corner of the Subject Property. A new railroad spur appeared to extend from the southwest corner of the eastern portion of the Subject Property, northward to the west of the industrial building, into the stockpile and storage area north of the new commercial building. The previously noted railroad spurs are not as apparent. **Surrounding Area:** Agricultural fields remained on much of the adjoining properties. The property west of the northwest portion of the northern half of the Subject Property appeared to have been redeveloped with at least two structures and eight ASTs. A railroad spur extended from this facility southward to the railroad south of the Subject Property. A large commercial building was present north of the northwest portion of the eastern portion of the Subject Property. The area west of this building was being used for storage and the area east of this building appeared to be covered in stockpiles. The industrial facility to the south and southeast of the Subject Property appears to have been further developed with near equipment along the south side of the railroad, south of the southeast corner of the Subject Property.

Table 5-2 (Cont'd.)
Historical Aerial Photographs Reviewed

YEAR	APPROXIMATE SCALE	SUMMARY
1975	1" = 500'	**Subject Property:** The 1975 aerial photograph was poor quality; however, the eastern portion of the Subject Property appeared to remain generally the same. The northern and western portions of the Subject Property appeared to be most vacant. A series of man-made ponds appeared to be present along the western boundary of the Subject Property, though most appeared to be just outside the Subject Property boundary. A dirt lot was present in the central and southern portions of the western side of the Subject Property. A parking lot was present on the east-central portion of the western side of the Subject Property, adjoining the commercial facility to the east of the northern portion of the Subject Property. Possible stockpiles were present in the southwest corner of the Subject Property, and some earthwork or development was occurring in the portion of the Subject Property west of the industrial development in the eastern portion of the Subject Property. **Surrounding Area:** The adjoining properties to the north and south appeared generally the same. As previously mentioned, a series of manmade ponds were present along the western boundary of the Subject Property. The land west of these ponds appeared to be under development. The industrial facility with the ASTs remained present west of the northwest portion of the Subject Property, though two additional ASTs appeared to be present. The property east of the northern portion of the Subject Property and north of the eastern portion of the Subject Property was further developed. The commercial building and material storage yard remained present on the southern half of this property; however, the northern half appeared to have been developed with multiple commercial buildings. The area along Arrow Route appeared to be in use as storage. The property east of the southeastern portion of the Subject Property also appeared to be under development, with one possible structure already present.

Table 5-2 (Cont'd.)
Historical Aerial Photographs Reviewed

YEAR	APPROXIMATE SCALE	SUMMARY
1985	1" = 500'	**Subject Property:** The northwestern and western portions of the Subject Property appear to be vacant, though the southwestern portion appears to be a dirt lot. The northeastern and central portions of the Subject Property appear to be paved and in use for stockpile/material storage. A small structure was present on the west-central edge of this storage yard. Two structures were present on the south-central portion of the Subject Property. A possible AST appeared to be present north of these structures. The eastern portion of the Subject Property appears to be generally the same. **Surrounding Area:** The property north of the northern portion of the Subject Property remains vacant/agricultural land. The property northeast of the Subject Property, across Arrow Route, appears to have been developed with four commercial structures. The property east of the northern portion of the Subject Property appears generally the same except that a new warehouse-type building was present east of the large commercial building in the southern half of the property. The property northeast of the eastern portion of the Subject Property appears to be bare earth and in use for storing stockpiled material. The property east of the southeast portion of the Subject Property appears to have two or three structures and be in use as a storage yard. The properties to the south and southeast appeared generally the same. The property west of the northwest portion of the Subject Property appeared generally the same. The ponds appeared to be dry, and the property farther to the west appeared to be in use for storage or trailer trucks or material pallets.

Table 5-2 (Cont'd.)
Historical Aerial Photographs Reviewed

YEAR	APPROXIMATE SCALE	SUMMARY
1990	1" = 500'	**Subject Property:** The western portion of the Subject Property remained vacant. Two commercial buildings were present in the northern portion of the Subject Property with parking lots and storage yards present adjoining the buildings. Parking lots were also present along the eastern boundary of the north-central portion of the Subject Property. Stockpiles and stored material were present on the west-central portion of the Subject Property. A railroad spur appeared to be present extending from this stockpile area, down the western side of the stockpile/material storage yard, to connect with the railroad south of the Subject Property. The commercial and industrial structures remain present in the south-central and eastern portions of the Subject Property. A new structure was present west and adjoining the industrial structure in the eastern portion of the Subject Property. The areas around these structures were used for material storage. **Surrounding Area:** The adjoining properties to the north, south, and southeast of the Subject Property, to the east of the northern portion of the Subject Property, and to the west of the northwest portion of the Subject Property appear generally the same. The property to the west no longer has the "ponds" along the Subject Property boundary, and the property farther to the west appears to be in use for material storage with some scattered structures present throughout. Stockpiles were present on the southern portion of this property. The railroad spur remained present extending up to the property with the ASTs west of the northwest portion of the Subject Property. The property east-northeast of the eastern portion of the Subject Property appears to be in use as a storage yard. The property east of the southeast portion of the Subject Property appears generally the same.
1994	1" = 500'	**Subject Property:** The Subject Property appeared to be generally the same. **Surrounding Area:** The adjoining properties appear generally the same, except that two commercial buildings were now present on the property west of the Subject Property.
2002	1" = 500'	**Subject Property:** The Subject Property appeared generally unchanged, except that the western side of the Subject Property was now being used for material storage. Additionally, a new structure appeared to be present in the southeast portion of the Subject Property. **Surrounding Area:** The adjoining properties appeared to be generally the same, except that the area northeast of the southeastern portion of the Subject Property appeared to be in use for material storage and new commercial building was present northwest of the Subject Property across Arrow Route.
2005	1" = 500'	**Subject Property:** The Subject Property appeared generally the same. **Surrounding Area:** The adjoining properties appeared to be generally the same, except that the property to the west was now a large parking lot.

YEAR	APPROXIMATE SCALE	SUMMARY
2009	1" = 500'	**Subject Property:** The Subject Property appeared generally the same. **Surrounding Area:** The adjoining properties appeared to be generally the same, except that a new commercial building was present north of the northwest portion of the Subject Property across Arrow Route.
2012	1" = 500'	**Subject Property:** The Subject Property appeared generally the same. **Surrounding Area:** The adjoining properties appeared to be generally the same, except that the property south of the western half of the Subject Property (south of the railroad) appears to have been developed as a storage yard.
2016	1" = 500'	**Subject Property:** The Subject Property remained generally the same. **Surrounding Area:** The adjoining properties to the north, west, and south appeared generally the same. The properties east of the northern Subject Property parcel and northeast of the southeastern Subject Property parcel had been redeveloped with the existing large commercial warehouse buildings. The property south of the western half of the Subject Property, south of the railroad, appears to have been completely paved or covered in gravel.
2020	1" = 500'	**Subject Property:** The Subject Property remained generally the same. **Surrounding Area:** The adjoining properties appeared generally the same, except that a new commercial building was present north of the northern Subject Property parcel, and the property east of the southeastern Subject Property parcel appeared to have been redeveloped as a truck parking lot and small warehouse type building.
Note: Aerial photographs only provide information concerning indications of land use, and no conclusions regarding the release of hazardous substances or petroleum products can be drawn from the review of photographs alone.		

DRAFT

The aerial photograph review indicated the Subject Property was developed for agricultural use from approximately 1938 through 1949, and the northern and western portions of the Subject Property continued to be used for agricultural purposes through 1966. An industrial warehouse facility, railroad spurs, and stockpiles of material were present in the southern portion of the southeastern Subject Property parcel by 1959. By 1966, stockpiles associated with the industrial activities covered the southeastern parcel. In 1975, the western portions of the Subject Property appeared vacant with a railroad spur extending through the southern half of the western portion of the Subject Property. Additionally, parking lots and material storage areas appeared to be

Copyright 2024 Kleinfelder

extending into the western half of the Subject Property from the southeastern portion of the Subject Property. By 1985, new industrial buildings were present in the southeastern portion of the western half of the Subject Property, and a large portion of the western half and northern portion of the Subject Property was being used for stockpiled material. A thin strip of vacant land remained along the western boundary of the Subject Property. By 1990, the northern parcel of the Subject Property had been developed with a large commercial building. By 2002, the vacant strip of land along the western boundary of the Subject Property had been covered with material storage. The industrial use of the property continued through 2020. The long industrial use of the Subject Property is considered a REC.

5.3 CITY DIRECTORIES

City directories provide information regarding property occupants by address. EDR provided a city directory abstract (EDR, 2023d) that summarized a review of city directories for properties along Arrow Route and Etiwanda Avenue between 1922 and 2020. It was determined that 12455 and 12459 Arrow Route shared common addresses with the adjacent T.I Wire and Ameron facility to the east. The available directory listings for the Subject Property addresses mentioned in EDR's report are summarized below:

- 12343 Arrow Route – No listings.
- 12353 Arrow Route – No listings.
- 12451 Arrow Route – This address was occupied by Fontana Crane Service in 1992; Fontana Steel from 1995 to 2017; Commercial Metals Co in 2017; Wood Keith, Tracy Porter, Ryan Harris , Nancy Koehler, Mike Moreno, Maricel Ortega , Malcolm McDowel, Lilian Rodriguez, Kevin Soli, Joy Fontes, John Ware, Greg Andstadt, David Hansen, Dave Otey, Daniel Smith, Christian McCain, Carvajal Chrostopher, Bob McRoberts, Bill Harry, and CMC Steel Alabama in 2020.
- 12455 Arrow Route – This address was listed as occupied by Ameron Pipe Products from 1985 through 2014; Ameron Concrete & Steel in 1995 and 2005; Ameron Water Trans Group in 2010; Ameron International in 2014; Nancy Woods, Maria Usciou, Kim Spencer, Jorge Gutierrez, Gene Cuesta, and Cheryl Humphrey in 2020.
- 12459 Arrow Route - This address was listed as occupied by Steel Producing Division in 1975, Pipe Products in 1975, Ameron in 1975, Ameron Pipe Coating Division in 1975, Ameron Pipe Products in 1980, United Slag Processing in 1985 through 2000, Ameron Steel & Wire in 1985 and 1990, Arrow FOE in 1985, Tamco in 1990 through 2017, Tamco

DRAFT

Copyright 2024 Kleinfelder

Steel in 2008, RBC Contractors in 1995, IWP AD INC in 1995 through 2014, Golden State Nail in 2000 through 2003, Olympic Mill Services in 2003 through 2008, Industrial Wire Products Corp in 2005, GSN in 2005, Tree Island Wire / TI Wire in 2014 through 2020, Tervita Corp / Tervita in 2014 through 2017, Phoenix Services LLC in 2020, and Gerdau SA/Gerdau Ameristeel in 2020.

The available directory listings for the adjoining properties are summarized below:

- 12330 Arrow Route (north of the Subject Property across Arrow Route) – This address was occupied by American Coatings Inc, Alon Planet Storage LP, and U-Haul Neighborhood Dealer in 2020.
- No other adjoining property addresses were listed in the City directories.

The long industrial use of the Subject Property is considered a REC.

5.4 HISTORICAL TOPOGRAPHIC MAP REVIEW

Kleinfelder obtained information regarding historical topographic maps of the Subject Property vicinity from EDR (2023g). The topographic maps reviewed for this assessment are listed in Table 5-3 and copies of the maps are included in Appendix D.

Table 5-3
Historical Topographic Maps Reviewed

YEAR	SCALE	SUMMARY
1897 1900 1903	1:62,500 1:62,500 1:62,500	**Subject Property:** The Subject Property appeared to be vacant. Natural drainage channels appeared to be present along the western and eastern boundaries of the Subject Property. **Surrounding Area:** The adjoining properties appeared to be vacant, except for railroad tracks present south and adjoining the Subject Property.
1941	1:31,680	**Subject Property:** The Subject Property appeared to remain vacant. **Surrounding Area:** Most of the adjoining properties remain vacant. Arrow Highway was shown north and adjoining the Subject Property. Two structures were drawn west of the northwest corner of the Subject Property, and one structure was drawn across Arrow Highway to the northwest. An unimproved road was drawn extending northward from an intersection northeast of the northeast corner of the northern portion of the Subject Property. The railroad remains present south and adjoining the Subject Property. A railroad spur appears to extend off the railroad into the property east of the southeastern portion of the Subject Property. An aqueduct is drawn farther to the south and Etiwanda Avenue is drawn farther to the east.

DRAFT

Copyright 2024 Kleinfelder

Table 5-3 (Cont'd.)
Historical Topographic Maps Reviewed

YEAR	SCALE	SUMMARY
1944	1:50,000	**Subject Property:** The Subject Property appeared to remain vacant with the two drainage channels present along its western and eastern boundaries. **Surrounding Area:** The adjoining properties appeared generally the same, except that a structure was shown on the property east of the southeastern portion of the Subject Property. Additionally, an unimproved road is shown on the south side of the railroad, south of the Subject Property, and the aqueduct noted on the 1941 topographic map is no longer shown. The buildings west of the northwest corner of the Subject Property appeared to have changed from two residential type buildings to include three commercial/industrial buildings.
1953 1954	1:24,000 1:62,500	**Subject Property:** The Subject Property appeared to be developed as orchards. A small structure was present in the northwest portion of the Subject Property, adjoining Arrow Route and a structure was shown in the southeast corner of the Subject Property. An unimproved road extended north to south through the center of the Subject Property, separating the southeast portion from the western and northern portions of the Subject Property. **Surrounding Area:** The adjoining properties to the north, west, and east appeared to have been developed as orchards. Arrow Route was shown north and adjoining the Subject Property. The unimproved road noted extending through the Subject Property, extended northward adjoining the northern portion of the Subject Property to the east, and then continued to extend north across Arrow Route. Another unimproved road extended north to south along the eastern boundary of the southeastern portion of the Subject Property to Arrow Route. A railroad spur was present adjoining the Subject Property to the west. This spur extended from the buildings located west of the northwest corner of the Subject Property, adjoining Arrow Route, southward to the railroad south of the Subject Property. The property to the south and southeast of the Subject Property appeared to have been developed with as a power plant. A railroad spur extended south and then east into this facility. Five oil tanks were identified south of the railroad spur, and two reservoirs were drawn on the eastern side of this facility. A water line labeled as "MWD Upper Feeder" was also shown extending east to west through this power plant.

Table 5-3 (Cont'd.)
Historical Topographic Maps Reviewed

YEAR	SCALE	SUMMARY
1966	1:24,000	**Subject Property:** The western half of the Subject Property appeared to remain developed as orchards. The southeast portion of the Subject Property appeared to have been developed for commercial/industrial use with four new commercial/industrial structures and multiple railroad spurs present. The railroad spurs extended around the commercial/industrial structures and up the eastern boundary of the Subject Property. The small structure previously mentioned on the 1953 and 1954 topographic maps remains present in the southeast corner of the Subject Property and was labeled as a water tower. A road extended southward into the central portion of the Subject Property and then looped east and back northward around one of the commercial structures. The structure previously mentioned on the 1953 and 1954 topographic maps in the northwest corner of the Subject Property was no longer shown. **Surrounding Area:** The adjoining properties appeared generally the same, except that a new commercial warehouse-type building was present on the property north of the southeastern portion of the Subject Property. The railroad spurs on the southeastern portion of the Subject Property also extended into this property and to this new commercial building. Additionally, five ASTs appeared to be present at the industrial facility located west of the northwest corner of the Subject Property. The railroad and the power plant remained present south and southeast of the Subject Property.
1973 1976	1:24,000 1:50,000	**Subject Property:** The Subject Property appeared generally the same. **Surrounding Area:** The adjoining properties appear generally the same, except that there appeared to be additional commercial/industrial structures east of the northern portion of the Subject Property, and additional structures on the power plant adjoining the railroad south of the Subject Property.
1981	1:24,000	**Subject Property:** The Subject Property appeared generally the same, except that three new structures were present: two in the south-central portion of the Subject Property west of the industrial southeastern portion of the Subject Property, and one small structure in the west central portion of the western half of the Subject Property. The northern portion and a portion of the western portion of the Subject Property remained developed as orchards. **Surrounding Area:** The adjoining properties appear generally the same, except that the property east of the northern portion of the Subject Property appeared to have railroad spurs extending from the east of the Subject Property northward and then westward along the northside of its commercial buildings. A commercial structure was also present on the property northeast of the northern portion of the Subject Property, across Arrow Route.

Table 5-3 (Cont'd.)
Historical Topographic Maps Reviewed

YEAR	SCALE	SUMMARY
2012 2015 2018	1:24,000 1:24,000 1:24,000	**Subject Property:** This map shows physical features (i.e., surface topographic contours) but no structures. Juneberry Drive is shown extending southward into the Subject Property. A railroad spur is shown on the 2015 and 2018 topographic maps looping through the southern portion of the Subject Property. **Surrounding Area:** Arrow Route is shown along the northern Subject Property boundary and Juneberry Drive is shown along the eastern boundary of the northern portion of the Subject Property. The railroad is not shown south of the Subject Property on the 2012 topographic map but is shown on the 2015 and 2018 topographic maps.

The Subject Property was depicted as vacant/orchards since at least 1944. By 1953, a small structure was depicted on the northwest and southeast corner of the Subject Property with an unimproved road extended north to south through the center of the Subject Property, separating the southeast portion from the western and northern portions of the Subject Property. The western portion of the property remained as orchards until 1976. Industrial development continued from 1966 with new structures, water tower, and rail spurs.

The surrounding area was mostly vacant since 1897, except for railroad tracks to the south. Improved roads were depicted since 1941. Commercial development in the area continued from 1944. By 1953, the facility to the south was depicted as a power plant with five large oil tanks, and developments to the west and northwest continued from 1966. Additional industrial properties were depicted to the east since 1973, and to the northeast since 1981. The remaining topographic maps did not depict site features or structures. The long industrial use of the Subject Property is considered a REC.

DRAFT

5.5 BUILDING DEPARTMENT

EDR provided Kleinfelder a report summarizing its Subject Property building permit search (EDR, 2023e), a copy of which is included in Appendix D. No building permits were identified in the EDR Building Permit Report. Additional permit search information is summarized in Section 4.3.3.

5.6 PREVIOUS ASSESSMENTS

Previous assessments were summarized in Sections 4.3 and 4.5.4.

Copyright 2024 Kleinfelder

6 SUBJECT PROPERTY RECONNAISSANCE

Kleinfelder's Phase I ESA activities included a Subject Property reconnaissance. This section summarizes the findings from the Subject Property reconnaissance.

6.1 METHODOLOGY AND LIMITING CONDITIONS

Ms. Lindsey Dandridge-Perry and Mr. Alan Rodriguez of Kleinfelder performed a Subject Property reconnaissance on September 25, 2023. The Subject Property reconnaissance included a visual inspection of the Subject Property to assist in identifying the presence or likely presence of hazardous substances or petroleum hydrocarbons under conditions that indicate an existing release, a past release, or threat of release into structures, soil, groundwater, or surface water at the Subject Property (i.e., RECs). Observations of readily apparent environmental conditions are summarized in Table 6-1, and color photographs of the Subject Property are presented in Figures 7 through 46. The approximate Subject Property boundaries are shown on Figure 2, and site-specific features of each of the four parcels are presented as Figures 3 through 6.

6.2 GENERAL PROPERTY SETTING

The Subject Property is located south of Arrow Route, south and southwest of the intersection of Arrow Route and Yellow Wood Road/Juneberry Drive in Rancho Cucamonga, San Bernardino County, California. The Subject Property consists of the four parcels of land, bound by Arrow Route to the north, industrial properties farther to the north across Arrow Route, and adjoining to the northeast, east, and west, railroad right-of-way to the south, and a former Etiwanda generating plant farther to the south. The Subject Property vicinity is generally surrounded by industrial properties.

6.3 PROPERTY OBSERVATIONS

Kleinfelder's Subject Property observations are summarized in Table 6-1.

DRAFT

Copyright 2024 Kleinfelder

Table 6-1
Subject Property Observations

GENERAL OBSERVATIONS	REMARKS	OBSERVED	NOT OBSERVED
Current use	Vacant.	X	
Current use likely to indicate RECs	Stockpiles of slag, pulverized concrete, and asphalt remain on Subject Property.	X	
Past use	The northern portion of the property (adjoining Arrow Route) was a former rebar manufacturing facility. Baghouse dust had been buried on this parcel and then excavated and remediated. The case had then been closed under DTSC oversight. The southern and southeastern portions of the Subject Property had been occupied by a former steel mill that operated from the 1950s through 2017. Multiple USTs had historically been present on the Subject Property.		X
Past use likely to indicate RECs	Stockpiles of slag, pulverized concrete, and asphalt remain on the western side of Subject Property. Railroad spurs remain present, extending up the eastern boundary of the Subject Property and looping through the southern portions of the Subject Property. Foundations for the furnace and steel-mill structures remain present in the south-central and southeastern portions of the Subject Property. Pursuant to the Subject Property representatives, these features were not demolished as there are continuing environmental investigations in these areas. The Subject Property is under active voluntary cleanup under the oversight of the DTSC. Based on the property owner representatives, ongoing investigations include assessment of soil vapor impacts in the subsurface in the southeastern portion of the property and investigation of PCB impacts in localized areas.	X	
Structures	Foundations of previous structures remain present in south-central and southeastern portions of the Subject Property. Two SCE substation enclosures containing electrical equipment are present in the southeastern portion of the Subject Property and one empty SCE compound was present in the southern portion of the western half of the Subject Property.	X

Subject Property Observations

Interior and exterior observations or environmental conditions that may involve the use, storage, disposal or generation of hazardous substances or petroleum products.		Observed	Not Observed
Heating and cooling system and fuel source	Not observed.		X
Industrial waste treatment equipment	Not observed.		X
Loading and unloading areas	Not observed.		X
Odors	Yeast odor was observed in the area next to Parallel Products, in the northwest portion of the Subject Property.	X	
Pits, ponds, or lagoons	Two stormwater detention basins.	X	
Pools of liquid	Not observed.		X
Process wastewater	Not observed.		X
Sanitary sewer system	Municipal supply. Multiple manholes were observed on the Subject Property.	X	
Septic system (e.g., tank and leach fields)	Not observed.		X
Soil piles	Various stockpiles of slag, pulverized asphalt and concrete are located on the central, north, east, and west inner portions of APN 0229-121-34, on the central and northern portions of APN 0229-121-33, and the central and western portions of APN 022-121-35.		X
Solid waste/evidence of unauthorized dumping	A dumpster was observed on the west portion of APN 0229-131-19. A trash bin was observed on the north portion of APN 0229-121-34. Trash debris was observed along the northern Subject Property boundaries.	X	
Stained pavement, soil or concrete	APN 0229-131-19: Dark surface staining was observed in the northwest corner of former fueling station/UST area (removed Dec 2022). APN 0229-121-34: Surface soil appeared dark and stained in areas around the stockpiles. APN 0229-121-33: Localized areas appear dark and stained.	X	
Stains or corrosion (interior, non-water)	Not observed.		X

Subject Property Observations

Interior and exterior observations or environmental conditions that may involve the use, storage, disposal or generation of hazardous substances or petroleum products.		Observed	Not Observed
Storm drains/catch basins	Various scattered storm drain covers were observed eastern and southern Subject Property boundaries, along north side of APN 0229-131-19, east of the end of Juneberry Drive, and on the west end of APN 0229-121-34.	X	
Stressed vegetation	Not observed.		X
Sumps and clarifiers	A former sump with clarifier on southwest corner of APN 0229-131-19 was observed. A three-stage open sump appeared to be present adjoining the infiltration basin in the southeast corner of the Subject Property.	X	
Surface water	Not observed.		X
UST(s) (including heating oil tanks)	Not observed.		X
Unidentified substance containers	Not observed.		X
Wastewater discharge	Not observed.		X
Water supplies (potable and process)	Municipal supply. Multiple fire hydrants were observed on the Subject Property.	X	
Wells (irrigation, monitoring, or domestic)	A non-production water well was present in the southeast corner of the Subject Property. Two SVE wells were observed on the southeast portion of Parcel 3 (0229-131-119), west of PCB area 2 and 3. An additional SVE well was observed in the central portion of Parcel 3.	X	
Wells (dry)	Not observed.		X
Wells (oil and gas)	Not observed.		X

DRAFT

6.3 RESULTS OF SUBJECT PROPERTY RECONNAISSANCE

The Subject Property consists of a large L-shaped piece of land that includes four parcels: APN 0229-121-34-0000 (the west parcel), APN 0229-121-33-0000 (the south parcel), APN 0229-131-19-0000 (the south parcel), and APN 0229-121-35-0000 (the north parcel).

Ms. Lindsey Dandridge-Perry and Mr. Alan Rodriguez of Kleinfelder were accompanied by Mr. Carlos Palafox, Ares Industrial Management, and their environmental consultant, Mr. Peter Shimer, Roux, Inc. on September 25, 2023 during the site reconnaissance. Mr. Shimer provided figures showing the Subject Property's previous features, former remediation areas, and site

Copyright 2024 Kleinfelder

investigation areas. At the time of the reconnaissance, the Subject Property was vacant with most above-grade structures and paved areas having been demolished. Utility infrastructure remained present on the Subject Property, including stormwater conveyance systems, fire hydrants, and transformers. Various vaults, rail spurs, equipment enclosures, a clarifier, a former cooling bed concrete area, and concrete foundations of former structures remained present. Three SCE substations (two containing electrical equipment and one empty compound) were also present on the Subject Property.

During the reconnaissance of APN 0229-121-35, the Mr. Shimer pointed out the location of a former 12,000-gallon UST, the former slag trench remediation area, the former Fontana Steel / CMC Rebar Fabrication Shop, and the former wash area. APN 0229-121-35 was observed to be mostly graded with no features remaining present and all pavement removed. Elevated soil stockpiles were present covering the central and western portions of the parcel. Trees and utility infrastructure remained present along the adjoining roads, including two pad-mounted transformers on the southwest corner of Juneberry Drive and Arrow Route. A fire post, retaining wall, two vaults, and a trash bin were also observed in the north portion of the parcel. Trash debris was observed along Juneberry Drive and Arrow Route. Trees were also present along the western and southern boundaries of APN 0229-121-35. PVC irrigation pipes line the perimeter of the trees. A water spigot was identified on the southwest corner of the parcel. A gravel road was present separating the western portion of APN 0229-121-35 from APN 0229-121-34. An electric gate provided access to the parcel from the east side adjoining Juneberry Drive.

During the reconnaissance of APN 0229-121-33, the Mr. Shimer identified the former wash rack, former Pad 16 remediation area, former scrap metal storage area, and former slag remediation areas. Large stockpiles of slag and scrap metal (from the former steel mill operations) and pulverized asphalt and concrete from the demolition activities were present on the northern portion of the parcel. The slag/scrap metal stockpile appeared to be on a concrete pad. Various water valves and a surface drain were present in the east portion of APN 0229-121-33, where Juneberry Drive intersects the Subject Property. A rail spur spans from the south portion of the parcel and curves north and then east towards APN 0229-131-19. Along the eastern portion of the parcel traveling south from the rail spur, there are various stormwater pipes, scattered manhole covers, and a fire hydrant. The ground surface is uneven from previous excavations. A former SCE enclosure was observed on the southeast portion of the parcel. A stormwater channel and stormwater detention pond were present in the southwestern corner of the parcel. The foundations of the Melt Shop remained present in the southeastern portion of this parcel.

DRAFT

Copyright 2024 Kleinfelder

During the reconnaissance of APN 0229-131-19, the Mr. Shimer identified various PCB investigation areas near the former Roll Mill and rail spur in the southeast portion of the parcel. Additionally, ongoing drilling activities were being performed in the center of the parcel as part of the soil vapor assessment activities. A clarifier and sewer manholes were identified in the southwest corner of the parcel. Further east, along the southern parcel boundary, was a switchboard enclosure with a pad-mounted transformer. Another switchboard enclosure was observed directly north of this in an area where building foundations remained present. The site contact indicated that the concrete area west of the switchboard enclosure was part of an ongoing PCB investigation. Two PCB investigation areas along the former railroad spurs were identified in the southeast portion of the parcel. Well vaults (likely for SVE wells or soil vapor probes) were observed scattered on the east and west sides of the investigation area. Further north, there was an area marked as a “cooling bed area” that consisted of concrete pads with large below-grade open pits. Two railroad spurs were observed on the southeast corner of the parcel that extend north and eventually meet further north on the adjoining parcel. Scattered stormwater manhole covers were present in the southeastern portion of the parcel and along the eastern boundary. A pad-mounted transformer and nearby manhole cover was identified on the north central portion of the parcel. A dumpster was observed on the central eastern portion of the parcel. The site contact indicated that a former UST and dispenser (removed in 2022) had been located in the northwest portion of the parcel. Dark-stained soil was observed in this area. A stormwater channel was observed on the north perimeter of the parcel and separates the Subject Property from the north adjoining TI Wire facility. A non-production water well was observed in the southeastern corner of the Subject Property. A concrete pad was present on the eastern property boundary with an adjoining vault with multiple manholes. A three-stage sump was present south of the well and a stormwater channel was present at the southeast corner of the Subject Property and is redirected westward along the Subject Property. A detention basin was also present along the southern boundary of the parcel, and is enclosed in a chain-link fence

During the reconnaissance of APN 0229-121-34, the southern portion of the parcel was observed to be graded with asphalt and gravel stockpiles present on the central, western, eastern, and northern inner portions of the parcel. Dark staining was observed across the whole parcel. The southcentral portion of the parcel was reportedly a former Phoenix Industries maintenance and processing area. Stormwater channels and storm drains were observed on the south and west perimeter of the parcel. An equipment pad or remnant foundation of a former structure was located on the eastern central portion of the parcel. Several large metal bolts were observed in the central northern portion. A distinct yeast-odor was present in the northern portion of the parcel, and it was determined to be sourced from the adjoining property to the west (Parallel Products). Numerous

DRAFT

Copyright 2024 Kleinfelder

totes and barrels and pooling liquid were observed on this property. Roux reported that this facility recycled waste alcohol to manufacture ethanol.

7 INTERVIEWS

Key Site Managers were contacted to obtain current and historical environmental information concerning the Subject Property. The following sections highlight information revealed during the interviews.

7.1 INTERVIEW WITH CLIENT

A User Questionnaire was provided to Ascent on July 27, 2023 to provide to the applicant. Mr. Carlos Palafox Vice President of Development for Ares Management completed the questionnaire on January 10, 2024.

- He indicated that he was not aware of environmental liens and AULs, and a search performed did not find environmental liens and AULs associated with the Subject Property.
- He is not in the same line of business as the former Subject Property occupants and has no specialized knowledge or experience related to the Subject Property or nearby properties.
- He indicated that the Subject Property was purchased December 2021.
- He indicated that the Subject Property was a former steel-fabrication facility and referred to the recent *Current Conditions Report* for information about the Subject Property. This report is summarized in Section 4.5.4.

The completed questionnaire is included in Appendix C.

7.2 INTERVIEW WITH OWNER/MANAGER/OCCUPANTS

An Interview Questionnaire was provided to Ascent on July 27, 2023 to provide to the applicant. Mr. Carlos Palafox Vice President of Development for Ares Management completed the questionnaire on January 10, 2024. The responses to this questionnaire are summarized below:

- The Subject Property was occupied by a former steel-fabrication facility for at least the past three decades. The former occupant was Commercial Metals Corporation.
- Mr. Palafox referred to the recent *Current Conditions Report* for information about the Subject Property. This report is summarized in Section 4.5.4.
- He indicated there are monitoring wells used by Cucamonga Valley Water District.
- He was not aware of any septic system.

The documents provided by the applicant were summarized in Section 4.5.4.

DRAFT

Copyright 2024 Kleinfelder

During the Subject Property reconnaissance, the site contact provided copies of figures showing the former Subject Property features, site investigation areas, sample areas, and closed remediation areas.

7.3 INTERVIEWS WITH LOCAL GOVERNMENT OFFICIALS

Information obtained from regulatory agencies contacted by Kleinfelder is discussed in Section 4.3.

DRAFT

Copyright 2024 Kleinfelder

8 EVALUATION

Kleinfelder performed this Phase I ESA of the Subject Property consistent with the scope and limitations of ASTM Designation E1527-21. The following sections describe Kleinfelder's findings and provide general background information about the Subject Property. Findings address RECs, HRECs, CRECs, and notation of *de minimis* quantities, as applicable to the Subject Property. In summary, Kleinfelder's assessment revealed the following information concerning the Subject Property:

- The Subject Property is located at 12451 Arrow Route, south and southwest of the intersection of Arrow Route and Yellow Wood Road/Juneberry Drive in the City of Rancho Cucamonga, San Bernardino County, California and consists of approximately 94.247 acres of land which is identified by the following San Bernardino County APNs and associated historical addresses:
    - APN 0229-121-33 (Parcel 2/South Parcel; Figure 4), located in the southwestern-central portion of the Subject Property, associated with addresses of 12459 Arrow Route and 12353 Arrow Route, Etiwanda CA 91739;
    - APN 0229-121-34 (Parcel 1/West Parcel; Figure 3), located in the western portion of the Subject Property, associated with addresses of 12459 Arrow Route and 12343 Arrow Route, Etiwanda CA 91739;
    - APN 0229-121-35 (Parcel 4/North Parcel; Figure 6), located in the north-central portion of the Subject Property adjoining Arrow Route, associated with an address of 12451 Arrow Route, Etiwanda CA 91739; and
    - APN 0229-131-19 (Parcel 3/East Parcel; Figure 5), located in the southeastern portion of the Subject Property, assigned addresses of 12455 Arrow Route and 12459 Arrow Route, Etiwanda CA 91739.

  BTC III Arrow Route CC, LP (applicant) is proposing to re-develop the Subject Property. Re-development would include the demolition and clearing of surface-paved areas and construction of five two-story (single story with mezzanine) buildings for general warehouse space, associated office space, and loading docks for truck trailers. The buildings are proposed to be surrounded by asphaltic concrete pavements in the parking and drive lanes, including 922 automobile parking spaces and 424 truck-trailer parking spaces. The proposed project would also include the creation of a new vehicle circulation system, water quality basins, utility infrastructure, exterior lighting and signage, and provide roughly 10 percent landscape coverage. In total, the

DRAFT

Copyright 2024 Kleinfelder

proposed project would introduce approximately 1,830,729-gross-square feet of new building floor area. Vehicle access to the Subject Property would be provided by public roadways connecting the Subject Property to Arrow Route and Etiwanda Avenue.

- Historically, the Subject Property was developed for agricultural use from at least 1938 until 1954. A small structure was added to the southeast corner of the Subject Property in 1953, which was later identified as a water tower in the historical records. Steel mill development began circa 1959 in the southeastern portion of the Subject Property (APN 0229-131-19). Steel mill development include construction of a milling and rolling building, outdoor storage yards, office building, and multiple rail spurs. By 1966, the southeastern Subject Property parcel (east parcel) had been fully developed with stockpiles associated with the industrial activities covering the parcel. Between 1975 and 1990, the melt shop, parking lots, material storage areas, and railroad spurs were developed in the western half of the Subject Property (APN 0229-121-33 and APN 0229-121-35). A thin strip of vacant land (APN 0229-121-34) remained along the western boundary of the Subject Property. By 1990, the north parcel of the Subject Property had been developed with a large commercial building (Fontana Steel) and by 2002, the vacant strip of land along the western boundary of the Subject Property had been covered with material storage. The industrial use of the property continued through 2020. Past occupants of the Subject Property APNs 0229-121-33, 0229-121-34, and 0229-131-19 included American Pipe and Construction, United Slag Processing, Ameron Steel (Ameron), TAMCO, Tervita, Tube City, Phoenix Services LLC, Olympic Mills, CMC and Gerdau Ameristeel. Past occupants of Parcel 0229-121-35 included Ameron Pipe, Fontana Steel, CMC Fabricators, and CMC Rebar. TAMCO was formed by Ameron (formerly American Pipe and Construction), Tokyo Steel, and Mitsui Corporation in 1974. TAMCO operated the melt shop, which was constructed in 1976, and later took over operating the rolling mill in 1983. TAMCO was bought by Gerdau Ameristeel in October 2010. Tervita, Tube City, Olympic Mills, and Phoenix Services LLC appear to have been slag management/processing businesses that operated at the TAMCO facility. The north parcel (APN 0229-121-35) had been occupied by Fontana Steel and then CMC Rebar Etiwanda between 1988 and 2022. Fontana Steel obtained the property in 1987 after Ameron, Inc sold it to Kaiser Steel, who then traded it to Fontana Steel. Fontana Steel and later CMC Rebar performed rebar manufacturing on this north parcel. BTC III Arrow Route CC LLC obtained the deed for APNs 0229-121-33, 0229-131-19, 0229-121-34 from TAMCO and the deed for APN 0229-121-35 from CMC Steel Fabricators Inc in 2021. The former structures on the Subject Property were demolished in 2022.

DRAFT

Copyright 2024 Kleinfelder

- Fontana Steel and later CMC Rebar were listed as SQGs. Oils and lubricants associated with equipment maintenance were used and stored on site. Wash water drained to a clarifier where the water was allowed to evaporate. Sludge was removed periodically. A 12,000-gallon diesel UST and fuel dispensers were installed at the Fontana Steel facility in 1989 and were removed in 2014.
- As part of the property transaction between Ameron and Fontana Steel in 1987, Ameron was to remove all hazardous materials from the property. Ameron had buried baghouse dust in three trenches on the parcel. These trenches were excavated, the baghouse dust removed, and confirmation samples were collected in 1987. Subsequent investigations were performed between 1998 and 2001 to assess if residual contamination remained. Slag material was present up to 10 feet bgs, no baghouse dust was observed, and soluble lead and chromium concentrations above STLC were not detected in the samples analyzed. In addition to assessment of the former baghouse trenches, soil samples were collected during the 1999 Phase II ESA near the oil/water separator/wash area, and the diesel UST. TPH was not detected in these areas. The associated cleanup case was issued a NFA determination on December 20, 2001.
- Based on review of regulatory database listings, TAMCO was listed as a large quantity (or super large quantity) hazardous waste generator between 1974 and 2022. TAMCO was listed as generating aggregate slag, baghouse dust, mill scale (ferrous metal), and steel manufacture chemicals associated with steelmaking. The HAZNET database listing indicates that the following wastes were generated by TAMCO: baghouse waste, waste oil and mixed oil, oxygenated solvents, hydrocarbon solvents, oil/water separator sludge, detergent waste chemicals, gas scrubber waste, paint sludge, and latex waste between 1989 and 2021; contaminated soil waste from site cleanup activities between 1990 and 2021; asbestos containing waste in 2000, 2005, 2011, 2018 and 2021; PCBs and material containing PCBs in 1990, 1993, 2011 and 2013; hydrocarbon solvent waste between 1995 and 2015; and halogenated solvents/liquids with halogenated compounds between 1991 and 2012. Multiple USTs and ASTs had historically been present at the TAMCO facility. Four 50,000-gallon fuel oil USTs (associated with a former furnace used at the rolling mill) had been installed in 1975 and removed in 1993; four 12,000-gallon diesel/fuel oil USTs were found by TAMCO near the southern boundary of APN 0229-131-19 and removed in 2006; one 300-gallon diesel UST was removed from near the cooling towers and generators north of the Melt Shop in 2011; a split UST consisting of a 10,000-gallon diesel compartment and a 2,000-gallon gasoline compartment and associated fuel dispensers and piping were removed in 2022; and a 10,000-gallon diesel UST was discovered during

DRAFT

Copyright 2024 Kleinfelder

demolition of the former Melt Shop and was removed in 2023. Confirmation soil samples from the 300-gallon diesel UST were reported to contain TPH-d at a concentration of 1,720 mg/kg; ethylbenzene at a concentration of 57 µg/kg; and total xylenes at 423 µg/kg. TPH-d and ethylbenzene remain in soil above commercial/industrial screening levels. For the remaining tanks, constituents in confirmation samples were either not detected or detected concentrations did not exceed commercial/industrial screening levels and cases were issued closure by the SBCFD. ASTs were reported to contain oxygen, nitrogen, propane, oil, gear oil, sodium hypochlorite, lubricating fluids, waste oil, and diesel.

- Various cleanup cases were associated with the TAMCO facility. In 1986, water runoff containing baghouse dust from TAMCO had flowed into the property adjoining TAMCO to the southwest. TAMCO constructed a concrete dam to contain the runoff in 1986, however, approximately 21 acres of the adjoining property had been impacted with metals from the baghouse dust (primarily lead). Assessment and then remedial excavation were performed under the direction of the RWQCB to remove the lead-impacted soil with cleanup goals of 50 mg/kg for solids and 5 mg/L for STLC. The RWQCB closed the case November 7, 1990, after confirmation samples confirmed that the contaminated soil had been removed. Approximately 3,300-cubic yards of impacted soils were excavated and stabilized under a variance from the DTSC. After stabilization, the treated soil was stockpiled and then a portion was used to backfill UST excavations in 1993.
- The USEPA performed a preliminary assessment of the TAMCO facility in 1994. The report indicated that some baghouse waste was irradiated when a canister containing cesium went into the furnace. A portion of this irradiated waste was sent off-site for disposal at Kettleman Hills hazardous waste landfill in May 1985. The California Department of Health Services determined the irradiated load would be left in place at Kettleman City. The remaining waste identified as radioactive waste was sent for disposal at U.S. Ecology. TAMCO subsequently has performed radioactive screening of scrap metal brought to the facility. In 1988, soils southwest of the TAMCO facility had been impacted by runoff containing baghouse waste. Lead concentrations up to 135 mg/L, zinc up to 1,860 mg/L, and cadmium up to 5.7 mg/L were reported in soil samples from the property southwest of TAMCO. Approximately 3,300-cubic yards of impacted soils were excavated and stabilized under a variance from the DTSC. After stabilization, the treated soil was stockpiled and then a portion was used to backfill UST excavations in 1993. This report identified that the baghouse waste generated at the facility was identified as a RCRA waste, which was generally transported off site by railcar to a disposal facility. The report identified that baghouse waste was present in a 250-feet long by 100-feet wide and

DRAFT

Copyright 2024 Kleinfelder

25-feet tall slag pile in the northwest portion of the TAMCO facility. This slag pile was reported to have been sampled in 1993 and elevated concentrations of cadmium, chromium, lead, nickel, and zinc were present. The report identified the stabilized soil, the slag pile, and the radioactive baghouse waste as areas where hazardous wastes are present on the TAMCO facility. Stormwater runoff was reported to flow southeast and southwest. A retention basin captures the runoff to the southwest, and the runoff to the southeast flows into the Chadwick Channel. Wastewater from the cooling tower was reported to have been piped to the Chino Basin Publicly Owned Treatment Works. Waste from the maintenance shops included waste solvents, degreasers, and oils, which were stored in drums and disposed of off site. Before removal, the drummed waste was stored in a bermed concrete hazardous materials storage area. Stained concrete was observed in the maintenance areas. The USEPA preliminary assessment concluded that, based on the depth to groundwater, it is unlikely that TAMCO's operations would impact groundwater, therefore, the facility does not qualify for further remedial assessment under CERCLA.

- Remediation of the 41,000-cubic-yard stockpile mixed slag and baghouse dust stockpile identified in the USEPA report was performed under the oversight of the San Bernardino County Fire Department in 2000. Non-slag (baghouse dust) was separated from the slag material using a rotary drum separation method. The clean slag was tested and then sold by Olympic Mills or crushed and reused in cement. A couple of depressions filled with slag and baghouse dust were found beneath the stockpile after its remediation. These depressions were excavated, and confirmation samples collected. The slag remediation case was closed in 2002 with residual contamination remaining in soil. The closure letter indicated that the residual concentrations were below hazardous waste thresholds, and no further action was required.
- During a field inspection performed in 2005, the DTSC identified that TAMCO receives large quantities of scrap metal for smelting and producing rebar and that the scrap metal was stored in piles without containment. Scrap metal contains lead, chromium, copper, nickel, and zinc. The DTSC performed shallow soil sampling around the stockpiles and the sample analytical results indicated the presence of high lead concentrations in soil around the stockpile located at Pad 16. TAMCO completed additional sampling in 2006 and then excavated and disposed of the impacted soils. Confirmation sampling was performed to verify the removal of impacted soil. Areas were paved to the north and south of the scrap piles and barriers were installed to separate piles, and a stormwater treatment system was constructed to prevent contamination from leaving the paved areas. A CalEPA

DRAFT

Copyright 2024 Kleinfelder

DTSC, Docket No. HWCA 2005 0964, Consent Order, was signed April 26, 2007 by TAMCO and May 2, 2007 by DTSC summarizing the sampling, cleanup, and actions taken to control runoff and infiltration of metals into the soils around the piles. The Consent Order directed that TAMCO will minimize the release of contaminants by using barriers or wind breaks to prevent the powder from being carried by wind, and required routine cleanup of residual dust from scrap piles and installation of track-out controls to prevent the dust from being tracked out by trucks.

- The Subject Property was listed under BTC III Arrow Route, as an active voluntary cleanup site on Envirostor as of August 24, 2022. The application indicated that the Subject Property was vacant and the previous structures had been demolished in preparation for redevelopment. Previous occupants of the Subject Property were listed as Etiwanda Steel Producers in 1956, Ameron Steel / Ameron Pipe Products in 1970, Tamco Steel in 1974, Fontana Steel in 1988, Gerdau Steel in 2013, and CMC Steel in 2018. Soil and soil vapor have been impacted by historic operations at the Subject Property. Constituents of concern included pesticides/herbicides, metals, petroleum hydrocarbons, and VOCs. Multiple closed cleanup cases were listed in association with the Subject Property, including a NFA status for lead remediation issued by the RWQCB in 1990, a NFA for UST removal issued in 1994 by SBCDEH, excavation oversight performed by the DTSC in 2001, NFA for slag stockpile remediation in 2002 by SBCFD, NFAs for UST removal in 2006, 2011, and 2014 by SBCFD, and a Consent Order in 2007 by the DTSC. Two Phase II ESA investigations, one by Ramboll US Consulting, Inc. and one by Roux Associates, Inc. were reported to have been performed in 2021. The Voluntary Cleanup Agreement between BTC III Arrow Route CC LP and the DTSC for the Subject Property was signed October 6, 2022 and executed on October 26, 2022.
- Ramboll advanced 99 soil bores (including 33 step-out bores) across the Subject Property in 2020 and 2021 as part of a Phase II subsurface investigation. Bores were advanced in areas of previous cleanup cases, and in a grid pattern across the Subject Property. Of these bores, 26 were converted to soil vapor probes. Slag material was encountered at depths up to 10 feet bgs in 33 of the 99 bores. In summary, soil analytical results indicated TPH-g was only detected in one soil sample collected at a depth of 3 feet bgs. This TPH-g concentration (0.00034 mg/kg) did not exceed commercial screening levels. TPH-d was present in 15 of the initial soil samples and 11 of the step-out soil samples. TPH-d concentrations ranged from 11.8 mg/kg to 9,230 mg/kg (collected at 1 foot bgs). Two of the initial soil samples (RSB-03 and RSB-05) contained TPH-d concentrations that exceeded commercial screening levels and both samples were collected at 1 foot bgs.

DRAFT

Copyright 2024 Kleinfelder

TPH-d concentrations in the step-out bores in these areas also exceeded commercial screening levels. The TPH-d concentrations exceeding commercial screening levels were located south of the Bundling Station and near the west boundary of APN 0229-121-33. TPH-o was present in 19 of the initial samples and seven of the step-out samples. TPH-o concentrations ranged up to 11,000 mg/kg. TPH-o concentrations did not exceed the TPH-o commercial screening levels. VOCs including 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, benzene, ethylbenzene, m,p-xylene, o-xylene, p-cymene, and PCE were present in soil samples at concentrations below their respective commercial screening levels. Lead concentrations were, however, present in samples collected up to 3 feet bgs above their respective commercial screening levels, at concentrations ranging up to 2,910 mg/kg. Lead concentrations exceeding commercial screening levels were present north of the Warehouse Maintenance building, and east part of the Mobile Maintenance building. Cadmium, lead, and zinc were detected at concentrations above their respective CCR Title 22 hazardous waste thresholds (TTLCs) in three soil samples, and one soil sample had soluble lead that exceeded the RCRA TCLP limit. Six samples were analyzed for PCBs and PCBs were not detected. VOCs including PCE and chloroform were detected in soil vapor samples above commercial screening levels with an attenuation factor of 0.001 applied. Chloroform was detected at concentrations ranging from 0.06 µg/L to 1 µg/L, and PCE was detected at concentrations ranging from 0.08 µg/L to 100 µg/L. PCE concentrations appeared to decrease in a second sampling event. Ramboll recommended a Site-Specific SMP be prepared for future construction at the Subject Property to manage the slag material present in the subsurface and the areas with TPH-d, lead, zinc, and cadmium concentrations. Ramboll concluded that the TPH-d in shallow soils above commercial screening levels appeared to be limited laterally and vertically. Ramboll recommended that soil in the areas containing elevated lead, zinc, and cadmium concentrations be removed off site for disposal. Ramboll also indicated that the PCE-impacted soil vapor appeared to be localized in the eastern portion of the Parts Warehouse building and appeared to be limited to the upper 15 feet bgs.

- Roux performed subsequent environmental investigations in 2021 and 2022 including sampling along the railroad spurs present on the Subject Property, sampling in a former chemical storage area northwest of the former Melt Shop, sampling at a wash rack located in the northern portion of APN 0229-121-33, sampling in the location of a former subsurface clarifier and aboveground oil recovery system on APN 0229-121-35, and sampling in the vicinity of former USTs. Roux's investigations identified PCB concentrations greater than screening levels in soil samples collected along the railroad

DRAFT

Copyright 2024 Kleinfelder

spurs on APNs 0229-121-33 and 0229-131-19, and in concrete samples from an area of pink concrete in the vicinity of the Rolling Mill. Soil and soil vapor samples collected from the former chemical storage area, wash rack, and former UST areas did not contain concentrations exceeding commercial screening levels. Pesticide and herbicide concentrations in samples collected across the Subject Property do not exceed commercial screening levels. TPH-d and metals exceeding commercial screening levels are present in soil at depths less than 5 feet bgs in the southern portions of APNs 0229-121-33 and 0229-131-19. VOCs were not detected in soil samples greater than screening levels. Soil vapor investigations identified that PCE, TCE, benzene, and chloroform were present in soil vapor beneath APN 0229-131-19 at concentrations exceeding commercial screening levels. Roux indicated in their most recent Subsurface Investigation Report that lateral and vertical delineation of soil vapor is still required, and recommended SVE as a remedial method for the soil vapor impact. Roux indicated that SVE wells and a pilot test had been performed in 2022. Roux also recommended further delineation of TPH-d, metals, and SVOCs in shallow soils, and further delineation of PCB-impacted soils near the railroad spurs. Finally, Roux recommended evaluation of the physical distribution and chemical composition of the slag material present in the western portion of the Subject Property.

- During the Subject Property reconnaissance, the Subject Property was observed to be mostly vacant. A guard shack was present at the entrance to the Subject Property off Juneberry Drive and a paved driveway extended south into the Subject Property with a small parking lot adjoining the guard house. Three SCE electrical substations were present in the southern portion of the Subject Property. One empty enclosure was present in the southern portion of APN 0299-131-35; and two enclosures with SCE equipment were present in the southern portion of APN 0229-131-19. Foundations of the previous steel mill operation structures (including the Melt Shop and the Rolling Mill) remained present in the south-central and southeastern portions of the Subject Property. Railroad spurs were still present extending throughout the southern Subject Property parcels. Evidence of excavation activity and multiple stockpiles were present across the Subject Property. Soil stockpiles were present on APN 0229-121-35 (address 12451 Arrow Route) and stockpiles of slag, broken concrete, and broken asphalt from the facility's previous operations and from facility demolition activities were present on the western portion of the Subject Property. The slag stockpiles appeared to be on concrete pads. Areas with dark staining were observed in the southern and western portions of the Subject Property. Utility main lines, including water, power, sewer, and storm drains, remained present on

DRAFT

Copyright 2024 Kleinfelder

the Subject Property. A pad-mounted transformer was present in the northern portion of APN 0229-131-19 and a second pad-mounted transformer was present in one of the SCE enclosures on APN 0229-131-19. Two storm water detention ponds were present on the Subject Property: one in the southeast corner of APN 0229-131-19, and one in the southwest corner of APN 0229-121-33. A non-potable production well and a former three-stage catch basin were also located in the southeastern corner of the Subject Property. Three SVE wells associated with the site assessment activities are located in the southeast portion of the Subject Property. A former sump/clarifier was present in the southwest corner of APN 0229-131-19. During the Subject Property reconnaissance site assessment drilling activities were occurring on APN 0229-131-19. Based on the Subject Property owner representative and their consultant, Roux, ongoing site assessment activities (soil vapor assessment on APN 0229-131-19 and diesel assessment on the southern portion of APN 0229-121-33) and an active PCB investigation on APN 0229-131-19 are being conducted at the Subject Property under DTSC oversight. Some of the former structure foundations and former equipment pads remain in place as a result of the ongoing investigation.

- At the time of the Subject Property reconnaissance, the adjoining properties were observed to be commercial/industrial. A Goodman distribution center was present west of the northern portion of the Subject Property and east-northeast of the southeastern portion of the Subject Property. An unoccupied former industrial building (formerly occupied by Tree Island Wire – a steel wire manufacturer) was located west of the central portion of the Subject Property and north of the southeastern portion of the Subject Property. A trucking facility (Central Transport) was located east of the southeastern portion of the Subject Property. The properties west of the Subject Property were occupied by Parallel Products (a facility that recycles alcohol to produce ethanol), and a car auction yard (Copart Rancho Cucamonga). Railroad tracks were present adjoining the Subject Property to the south, and properties south of the railroad tracks included a vacant property with multiple stockpiles (former Etiwanda Generating station) and a SCE BESS Separator Facility. Multiple kegs, totes, ASTs, and pooling liquid were observed on the Parallel Products property; however, these likely contain alcoholic beverages that will be recycled. Additionally, there is the potential for hazardous materials to be present at the SCE facility south of the Subject Property. Hazardous materials and petroleum products were not observed to be stored on the properties adjoining the Subject Property at the time of the Subject Property reconnaissance. No other indications of obvious or suspect RECs were

DRAFT

Copyright 2024 Kleinfelder

apparent on the adjoining properties at the time of Kleinfelder's Subject Property reconnaissance.

- According to previous environmental investigations at the former generating station property to the south and the adjoining property to the east, groundwater ranges from 300 to 400 feet and primarily flows to the southwest.
- Multiple cleanup cases are associated with the adjoining properties, however, based on the depth to groundwater it is unlikely that these releases will have impacted the Subject Property, with the exception of the following:
    - DP Etiwanda, located at 8822 Etiwanda Avenue, is located east and adjoining the southeastern Subject Property parcel, APN 0229-131-19 (east parcel). This facility was listed as a voluntary cleanup case with land use restrictions. The facility was used for automobile and scrap metal recycling from 1975 through 2017 and has since been redeveloped as a transportation facility. Prior to redevelopment, a soil and soil vapor investigation of the property was performed by Ramboll in July 2018, and concentrations of metals, TPH, and PCBs were reported to be present in soil samples. Subsequently, remedial excavation was performed to remove contaminated soil. Confirmation soil samples indicated that residual metal and PCB concentrations at the property were below commercial/industrial screening levels, except for areas along the western, northern, and southern property boundaries. A Land Use Covenant between DP Etiwanda and DTSC was executed on August 19, 2020, restricting the property to commercial/industrial use. A subsequent investigation to delineate residual soil impact along the property boundaries was performed in August 2020. Refusal between 1 and 2.5 feet bgs was encountered in many of the bores along the western property boundary (adjoining the Subject Property). Based on Kleinfelder's review of the investigation results, lead was reported to present at a maximum concentration of 379 mg/kg in a 0.5-foot soil sample in the west-northwest boundary of the property in 2018. Samples from the step-out bore advanced to the west of the location of the maximum result in 2020 indicated that lead was present at 0.5 foot at 83 mg/kg, and at 6.9 mg/kg at 2 feet. PCB concentrations were present above commercial screening levels in soil samples collected from the 2018 excavation on the west-southwest boundary of the property. The maximum concentration of Aroclor-1248 was 11.7 mg/kg at 0.5 feet and the maximum concentration of Aroclor-1254 was 2.47 mg/kg, also in a 0.5-foot sample, though PCB concentrations were reported at depths down to 3 feet bgs at some locations. Only a 0.5-foot sample was

DRAFT

Copyright 2024 Kleinfelder

collected at the step-out location to the west of the highest Aroclor-1248 concentration, but the analytical results indicated an Aroclor-1248 concentration of 0.39 mg/kg. Samples from the other two step-out bore locations also contained PCB concentrations and did not further delineate the impacted soil. The southeast corner of the Subject Property adjoins this PCB-impacted area. A concrete cinder block wall was reported to be present on the Subject Property boundary preventing any further step-out bore assessments. Ramboll indicated that the residual concentrations of lead present along the south and northwest boundaries were localized and slightly above the commercial/industrial screening levels. Ramboll indicated that the step-out sample results did not exceed the previously maximum-detected PCB result and that the concrete cinder block wall along the western boundary acts as a barrier to limit the PCB impact. Ramboll also indicated that the lead and PCB concentrations were adequately characterized and do not present a human health risk since the property has a land use covenant limiting it to industrial use.

8.1 DEVIATIONS AND ADDITIONAL SERVICES

The scope of this Phase I ESA does not incorporate ASTM Standard non-scope considerations, such as ACMs, radon, LBP, lead in drinking water, wetlands, regulatory compliance, cultural and historical resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality/vapor intrusion, and high-voltage power lines.

8.2 CONCLUSIONS AND RECOMMENDATIONS

Kleinfelder has performed a Phase I ESA, in conformance with the scope of services required by ASTM Designation E1527-21, our Proposal No. Proposal No. MT200213.001P dated November 16, 2022, and limitations discussed in this report. Exceptions to and deviations from this practice are described in Section 8.1 of this report.

Based on the results of the Phase I ESA, no RECs, CRECs, HRECs, or *de minimis* conditions were identified for the Subject Property, except for the following:

RECs

- The long history of industrial use of the Subject Property and ongoing site assessment and cleanup activities at the Subject Property are considered a REC. This includes the presence of PCB concentration along the rail spurs and in areas around the former rolling mill on APN 0229-131-19; the presence of TPH-d, SVOCs, and metals in shallow soil on

DRAFT

Copyright 2024 Kleinfelder

APNs 0229-121-33 and 0229-131-19; and the presence of PCE, TCE, benzene, and chloroform in soil vapor on APN 0229-131-19.

- The active LUC, residual concentrations of metals, TPH, and PCBs, and active soil management plan at the east adjoining DP Etiwanda facility is considered a REC.

CRECs

- Baghouse dust waste and slag was historically stockpiled on APNs 0229-121-33 and APN 0229-121-34. The stockpile was remediated, and depressions beneath the stockpile full of baghouse dust and slag were excavated and confirmation soil samples were collected. The remediation case was closed by the San Bernardino County Fire Department with residual concentrations remaining in soil and A NFA was issued July 2, 2002. Ramboll performed limited soil sampling in the footprint of the former slag stockpile. Soil analytical results did not exceed commercial/industrial screening levels; however, there remains the potential for pockets of lead impacted soil to remain.
- A lead impacted area north of Pad16 was excavated in 2006. Confirmation samples were collected and overexcavation performed wherever lead exceeded hazardous waste thresholds. DTSC and TAMCO signed a Consent Order in 2007 concerning actions taken to control runoff and infiltration of metals into the soils around the piles. Ramboll collected soil samples from a bore advanced in the approximate center of the Pad 16 remedial excavation. Analytical results did not exceed commercial screening levels.
- One 300-gallon diesel fuel UST was removed from APN 0229-121-33 in November 2010. The confirmation soil sample analytical result indicated that TPH-d was present at a concentration of 1,720 mg/kg; ethylbenzene was present at a concentration of 57 µg/kg; and total xylenes were present at 423 µg/kg. This UST was closed with residual contamination present.

HRECs

- Soil contaminated by metal impacted runoff water on the adjoining property southwest of APN 0229-121-33 was excavated, stockpiled, and stabilized between 1989 and 1990. The stabilized soil was stockpiled on the former TAMCO facility for use in future construction projects. SARWQCB issued a NFA on November 7, 1990.
- Four 50,000-gallon fuel oil USTs were removed from APN 0229-131-19 in November 1993, and approximately 474-cubic yards of impacted soil were excavated and removed. Confirmation samples were collected and areas with detected TPH were excavated and resampled until hydrocarbon concentrations were not detected. The San Bernardino County Department of Environmental Health Services determined NFA on April 28, 1994.

DRAFT

Copyright 2024 Kleinfelder

- Stabilized soil from the 1990 cleanup case summarized above was used as backfill for excavation of the four fuel oil USTs removed in 1993. Roux collected soil samples from the backfill material in this former UST excavation area. Soil analytical results do not exceed commercial screening levels.
- Baghouse dust waste and slag was excavated from trenches in APN 0229-121-35 in 1988 under oversight by the DTSC. Between 1998 and 2001, samples were collected from within and adjoining the trenches. Sample analytical results indicated that the remaining metals concentrations met health-based criteria for unrestricted land use in a letter dated December 20, 2001.
- Four 12,000-gallon diesel USTs were removed from the southwest portion of APN 0229-131-19 in 2006. Confirmation samples indicated that TPH-cc and VOCs were not detected.
- One 12,000-gallon diesel UST was removed from APN 0229-121-35 in June 2014. Confirmation samples indicated no significant release had occurred and the case was closed.
- A dual-compartment UST (one compartment 10,000-gallon diesel and one compartment 2,000-gallon gasoline) and associated equipment was removed from the northwest portion of APN 0229-131-19 in December 2022. Constituents in confirmation samples were either not detected or detected concentrations did not exceed commercial/industrial screening levels. The case was issued closure by the SBCFD.
- A 10,000-gallon UST was discovered during demolition of the Melt Shop. This UST was removed in 2023. Constituents in confirmation samples were either not detected or detected concentrations did not exceed screening levels. Closure was issued by the SBCFD.

DRAFT

De minimis conditions

- Dark-stained soil was observed in the southern and western portions of the Subject Property. Given the depth of groundwater, it is unlikely that potentially impacted soil has affected groundwater, and removal by excavation, confirmation sampling, and disposal is recommended.

Copyright 2024 Kleinfelder

BER

Although not considered a REC pursuant to ASTM Standard E 1527-21, the following BER has been identified:

- Buried slag material is generally not hazardous, and was historically encountered during previous investigations, therefore the presence of slag is considered a BER.

Recommendations

Based on the findings and conclusions of this Phase I ESA, Kleinfelder has the following recommendations for further assessment.

- Continue to manage soil under a soil management plan.
- Sampling of soil along the Subject Property boundary for OCPs, metals, TPH, VOCs, PCBs, and PAHs to assess impacts due to historical agricultural, railway right-of-way, and current soil management and land-use covenants in place in some of the adjacent properties.
- Kleinfelder agrees with Roux's recommendation for SVE remediation.
- Perform soil vapor sampling in the proposed building footprints to assess potential impact to indoor air quality. Prepare a human health risk assessment based on the soil vapor sample results.

DRAFT

8.3 DATA GAPS

Kleinfelder attempted to obtain reasonably ascertainable information regarding the Subject Property consistent with ASTM Standard E1527-21. Despite good faith efforts by the environmental professional(s) to gather the necessary information, data gaps, a lack of information, or inability to obtain information as required by the ASTM Standard, were encountered during the completion of this Phase I ESA. No significant data gaps were identified.

STATEMENT OF QUALIFICATIONS

We declare that to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in Section 312.10 of 40 CFR 312. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all-appropriate inquiries in conformance with the standards and practices set forth in CFR Part 312.

_____
Lindsey Dandridge-Perry
Senior Professional

_____
Lizanne Simmons, PG 7431
Senior Principal Geologist

The resumes of above-listed environmental professionals performing this Phase I ESA are on file at the Kleinfelder office and are available on request.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 06/22/2023 has revealed that there are 2 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Lists of Federal RCRA facilities undergoing Corrective Action

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 07/24/2023 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Lists of Federal RCRA generators

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 07/24/2023 has revealed that there are 2

RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 07/24/2023 has revealed that there are 5 RCRA-SQG sites within approximately 0.25 miles of the target property.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 04/24/2023 has revealed that there are

6 ENVIROSTOR sites within approximately 1 mile of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 07/24/2023 has revealed that there are 10 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

Environmental Interest/Information System:
California's Hazardous Waste Tracking System Data Mart (HWTS-DATAMART) provides information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
Registry ID: 110070845289

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
The Toxic Release Inventory System (TRIS) is a publicly available EPA database reported annually by certain covered industry groups, as well as federal facilities. It contains information about more than 650 toxic chemicals that are being used, manufactured, treated, transported, or released into the environment, and includes information about waste management and pollution prevention activities.
California's Hazardous Waste Tracking System Data Mart (HWTS-DATAMART) provides information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES
The Department of Labor, Occupational Safety and Health Administration information system consists of inspection case detail for approximately 100,000 OSHA inspections conducted annually. The FRS dataset includes facilities that had inspections within the last 7 years within the mining, oil and gas, utilities, and manufacturing sectors.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many

Environmental Interest/Information System:
The National Pollutant Discharge Elimination System (NPDES) module of the Integrated Compliance Information System (ICIS). Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.
The Department of Labor, Occupational Safety and Health Administration information system consists of inspection case detail for approximately 100,000 OSHA inspections conducted annually. The FRS dataset includes facilities that had inspections within the last 7 years within the mining, oil and gas, utilities, and manufacturing sectors.
All generators and treatment, storage, and disposal (TSD) facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years. The data collected is used to create the National Biennial Resource Conservation and Recovery Act (RCRA) Hazardous Waste Report. This data is processed within the RCRA Information (RCRAInfo) database

Environmental Interest/Information System:
The Toxic Release Inventory System (TRIS) is a publicly available EPA database reported annually by certain covered industry groups, as well as federal facilities. It contains information about more than 650 toxic chemicals that are being used, manufactured, treated, transported, or released into the environment, and includes information about waste management and pollution prevention activities.

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).

Military DOD Site: No
Facility Project Subtype: Title 27 - Surface Impoundment
RWQCB Region: SANTA ANA RWQCB (REGION 8)
Site History: Pond Construction - The SARWQCB records indicate that a wastewater pond was installed at the site in September 1966. The pond was used to hold industrial wastewater on-site. Brine Pond Permitting - The SARWQCB approved the operation of the pond under Resolution 66-26, which required testing of the effluent every two months. In 1967, site operations arranged for the construction of a small saline discharge pond to hold the waste segregated from the water softening process. Brine Pond Expansion - A larger brine pond was constructed on-site in 1970. The expanded pond was reportedly lined with polyethylene. The SARWQCB updated the site s waste discharge requirements in Resolution 70-22 in 1970. Permitting - The SARWQCB updated the 1976 Resolution with a Monitoring and Reporting Program Order (No. 82-142) in 1982 for industrial wastewater discharge monitoring at the site. The order No. 82-142 outlines ongoing monitoring and reporting of recycled cure yard water. Request for Soil Investigation - In 1994, the SARWQCB noted the brine pond had a liner fabricated with polyvinylchloride (PVC); however, the barrier was not equipped with a leak detection system. The SARWQCB requested soil sampling around the brine pond to evaluate soil impacts associated with the liner leakage. The memo also stated that use of the pond had to cease while pond retrofitting was implemented. If contamination was found to exist below the pond, which could not be removed by soil excavation, then a surface cap would have to be constructed to prevent water infiltration. Discharges to the brine pond ceased in March 1994. Brine Pond Abandonment Work Plan - On August 18, 1994, a brine pond abandonment work plan was prepared and submitted to the SARWQCB to conduct the following: (1) evaporate the water in the soil; (2) remove the soil above the pond liner; (3) remove the pond liner; (4) conduct field analytical tests, and; (5) submit samples to the laboratory for testing. Liner Removal, Excavation, and Soil Disposal - A report prepared by Hemphill Green and Associates indicates that the liner from the brine pond was removed in October of 1994 and 555 tons of soil were removed from the site. Soil Investigation - On June 29, 1995, subsurface soil samples were collected and a soil investigation report was prepared. Based on a subsurface investigation, subsurface soil had been impacted above SARWQCB limits by the pond wastewater which had leaked through the liner material. Lateral Delineation - It was determined that the lateral extent of total dissolved solids (TDS) impacts was delineated. In 2005, all the liquid had been removed from the pond, material above the liner was removed, and the pond was backfilled with approximately 6.5 feet of compacted fill from the site. An engineered brine pond cap had been placed on the former pond in accordance with the technical specifications approved by the SARWQCB. Closure Report - The Final Cap Closure Report was approved by the SARWQCB in 2007. A Declaration of Restrictions was signed during the same year. An annual cap monitoring and maintenance plan is in effect at the site. Cap and Liner Design - Encon installed a cap that incorporated a reinforced block retaining wall, backfill material, and a 30-mil polyvinyl liner over the brine pond area for leak detection (Figure 6). The brine pond area abandonment and cap

GOODMAN LOGISTICS CENTER (Continued) **S104156558**

construction were performed based on the Encon Brine Pond Permanent Cap Work Plan (ENCON, 2003). The 30-mil liner was installed between a 6-inch layer of sand below the liner, and a 12- inch layer of sand above the liner. An 8-inch thick concrete rebar-reinforced cap was installed above the liner with a 6-inch gravel base. The purpose of the cap is to prevent infiltration of water through the TDS-impacted soil and to prevent migration of TDS mass into the aquifer. The purpose of the liner is to act as a secondary barrier; combined with a monitoring well, it is designed to detect and contain cap leaks. Goodman Birtcher acquired the Ameron site property in late 2013, and redeveloped the site into a warehouse distribution center, Goodman Logistic Center. The existing brine pond cap has been modified and the former brine pond area has been used as a parking lot. Board files for this case has been renamed from "Ameron Pipe Division, Southern California (Arrow Plant), Etiwanda" to "Goodman Logistic Center, Rancho Cucamonga"

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
The Toxic Release Inventory System (TRIS) is a publicly available EPA database reported annually by certain covered industry groups, as well as federal facilities. It contains information about more than 650 toxic chemicals that are being used, manufactured, treated, transported, or released into the environment, and includes information about waste management and pollution prevention activities.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
California's Department of Toxic Substances Control's (DTSC's)-EnviroStor database is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Eval Source: SMARTS,

Eval General Type: Case Development Inspection
Eval Date: 05-19-2009
Violations Found: No
Eval Type: Industrial Storm Water Enforcement Follow-up
Eval Notes: Meeting of four companies to address pollutant loads issues. Staff met with four companies to address the undersized stormwater treatment system on Tamco's property, due to the high stormwater run-offs draining towards it from the adjacent properties to the north, north-east, and eastern borders. At least two representatives from each company are present at the meeting to discuss Tamco's treatment system expansion, or each company will establish its own treatment system its property stormwater run-off. Stormwater samples analysis report from annual reports submitted to the Board by the four companies for 2004-2005 to 2007-2008 were presented by RB staff for discussion. Based on the analytical results, each company confirmed the need for corrective action and and acknowledged that the issues will be dealt with swifty.

Eval Program: INDSTW
Eval Source: SMARTS,

Eval General Type: Compliance Evaluation Inspection
Eval Date: 09-09-2009
Violations Found: No
Eval Type: Industrial Storm Water Compliance Evaluation
Eval Notes: Staff arrived at 1300: At the request of Mr. Peter Maitland, the technical services manager engineer from main headquarter in Canada (pmaitland@treeisland.com), staff visited the site to discuss options in retrofitting new structural BMPs for the site. With him is Harold Manifold, the director of operations from HQ

TI WIRE (Continued) **S109035898**

(hmanifold@treeisland.com), and the various colleges from the past meetings during the four companies gathering to discuss about the Tamco's undersized treatment systems for all four companies. Tree Island had contacted various consultants and engineers to pre-calculate the required structural upgrades, as well as the treatment systems' options for retrofitting, in order to meet the EPA multi-sector benchmarks for their exceeding stormwater samples parameters. In addition, Tree Island also would like to prevent any discharge of stormwater run-off, treated or untreated, onto Tamco's property, located south and southwest of its property. Tree Island's preliminary conclusion is to perform an aerial and land survey of its property, including property borders assessment, a possibility of a structural trench line for diverting all stormwater run-offs to the eastern culvert/ditch, which ultimately discharges directly to the energy company about 2000 feet downstream, by-passing Tamco s treatment systems completely. Due to the economy, Tree Island is unable to perform drastic structural modification. However, the company is doing everything it could within its meager budget for stormwater improvement project without causing the company to file for bankruptcy. The company will provide Board staff with updates within a month or two. Awaiting updates from company.

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
ICIS-Air (AIR) AIR is the modernization of the Air Facility System (AFS) into the Integrated Compliance Information System (ICIS). AIR contains enforcement, compliance, and permit data for stationary sources of air pollution regulated by the EPA, State, and Local air pollution agencies.
THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES
The Toxic Release Inventory System (TRIS) is a publicly available EPA database reported annually by certain covered industry groups, as well as federal facilities. It contains information about more than 650 toxic chemicals that are being used, manufactured, treated, transported, or released into the environment, and includes information about waste management and pollution prevention activities.
California's Hazardous Waste Tracking System Data Mart (HWTS-DATAMART) provides information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
The database that supports the Toxic Substances Control Act (TSCA) of 1976, which provides EPA with authority to require reporting, record-keeping and testing requirements, and restrictions relating to chemical substances and/or mixtures. Certain substances are generally excluded from TSCA, including, among others, food, drugs, cosmetics and pesticides. TSCA addresses the production, importation, use, and disposal of specific chemicals including polychlorinated biphenyls (PCBs), asbestos, radon and lead-based paint.
The Air Facility System (AFS) contains compliance and permit data for stationary sources of air pollution regulated by the EPA, state, and local air pollution agencies.

TAMCO INCORPORATED (Continued) **1010374011**

THE ELECTRONIC GREENHOUSE GAS REPORTING TOOL (E-GGRT) IS ACCESSIBLE THROUGH AN EPA WEB PAGE AND USED TO SUBMIT ANNUAL REPORTS IN SUPPORT OF THE EPA RULE FOR MANDATORY REPORTING OF GREENHOUSE GASES (GHG) FROM LARGE GHG EMISSIONS SOURCES. IMPLEMENTATION OF 40 CFR PART 98 IS REFERRED TO AS THE GREENHOUSE GAS REPORTING PROGRAM (GHGRP). THIS COMPREHENSIVE, NATIONWIDE EMISSIONS DATA WILL PROVIDE A BETTER UNDERSTANDING OF THE SOURCES OF GHGS AND WILL GUIDE DEVELOPMENT OF THE POLICIES AND PROGRAMS TO REDUCE EMISSIONS. THE PUBLICALLY AVAILABLE DATA WILL ALLOW REPORTERS TO TRACK THEIR OWN EMISSIONS, COMPARE THEM TO SIMILAR FACILITIES, AND AID IN IDENTIFYING COST EFFECTIVE OPPORTUNITIES TO REDUCE EMISSIONS IN THE FUTURE.
The Integrated Compliance Information System (ICIS) provides a database that, when complete, will contain integrated enforcement and compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions and a subset of the Permit Compliance System (PCS), which supports the National Pollutant Discharge Elimination System (NPDES). This information is maintained in ICIS by EPA in the Regional offices and it at Headquarters. A future release of ICIS will completely replace PCS and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities that support compliance and enforcement programs, including incident tracking, compliance assistance, and compliance monitoring.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
The Integrated Compliance Information System (ICIS) provides a database that, when complete, will contain integrated enforcement and compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions and a subset of the Permit Compliance System (PCS), which supports the National Pollutant Discharge Elimination System (NPDES). This information is maintained in ICIS by EPA in the Regional offices and it at Headquarters. A future release of ICIS will completely replace PCS and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities that support compliance and enforcement programs, including incident tracking, compliance assistance, and compliance monitoring.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.
Registry ID: 110066066991

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).

FINDS:
Registry ID: 110070089499

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
The National Pollutant Discharge Elimination System (NPDES) module of the Integrated Compliance Information System (ICIS). Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.
Registry ID: 110070344634

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
The Department of Labor, Occupational Safety and Health Administration information system consists of inspection case detail for approximately 100,000 OSHA inspections conducted annually. The FRS dataset includes facilities that had inspections within the last 7 years within the mining, oil and gas, utilities, and manufacturing sectors.

Hazardous Waste Summary:

Waste Code:	D001
Waste Description:	Ignitable Waste
Waste Code:	D002
Waste Description:	Corrosive Waste
Waste Code:	D004
Waste Description:	Arsenic
Waste Code:	D006
Waste Description:	Cadmium
Waste Code:	D007
Waste Description:	Chromium
Waste Code:	F003
Waste Description:	The Following Spent Nonhalogenated Solvents: Xylene, Acetone, Ethyl Acetate, Ethyl Benzene, Ethyl Ether, Methyl Isobutyl Ketone, N-Butyl Alcohol, Cyclohexanone, And Methanol; All Spent Solvent Mixtures/Blends Containing, Before Use, Only The Above Spent Nonhalogenated Solvents; And All Spent Solvent Mixtures/Blends Containing, Before Use, One Or More Of The Above Nonhalogenated Solvents, And A Total Of Ten Percent Or More (By Volume) Of One Or More Of Those Solvents Listed In F001, F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Description:	RP states: Chemical dust supressant Road Pro NT runoff due to rains onto neighboring facility. 2300 gallons was applied to the entire facility (40 acres) over the weekend of 2/4 & 2/5 and a smaller unknown amount has released to a storm capture/discharge system which eventually leads to the Chadwick Channel that runs through the NRG Power Plant. The NRG Power Plant contacted the RP after noticing a change in water samples at their

(Continued) **S120832984**

facility. A contractor is currently cleaning up release and vacuuming storm system.

Environmental Interest/Information System:

The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
ICIS-Air (AIR) AIR is the modernization of the Air Facility System (AFS) into the Integrated Compliance Information System (ICIS). AIR contains enforcement, compliance, and permit data for stationary sources of air pollution regulated by the EPA, State, and Local air pollution agencies.
The Toxic Release Inventory System (TRIS) is a publicly available EPA database reported annually by certain covered industry groups, as well as federal facilities. It contains information about more than 650

TERVITA LLC (Continued) **1016696702**

toxic chemicals that are being used, manufactured, treated, transported, or released into the environment, and includes information about waste management and pollution prevention activities.
THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES
The Air Facility System (AFS) contains compliance and permit data for stationary sources of air pollution regulated by the EPA, state, and local air pollution agencies.
The Integrated Compliance Information System (ICIS) provides a database that, when complete, will contain integrated enforcement and compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions and a subset of the Permit Compliance System (PCS), which supports the National Pollutant Discharge Elimination System (NPDES). This information is maintained in ICIS by EPA in the Regional offices and it at Headquarters. A future release of ICIS will completely replace PCS and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities that support compliance and enforcement programs, including incident tracking, compliance assistance, and compliance monitoring.
ALLOWS PERMITTING AUTHORITIES TO SUBMIT NEW SOURCE REVIEW (NSR) AND TITLE V PERMIT ACTIONS TO EPA FOR REVIEW.
All generators and treatment, storage, and disposal (TSD) facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years. The data collected is used to create the National Biennial Resource Conservation and Recovery Act (RCRA) Hazardous Waste Report. This data is processed within the RCRA Information (RCRAInfo) database
The Department of Labor, Occupational Safety and Health Administration information system consists of inspection case detail for approximately 100,000 OSHA inspections conducted annually. The FRS dataset includes facilities that had inspections within the last 7 years within the mining, oil and gas, utilities, and manufacturing sectors.

Environmental Interest/Information System:
The National Pollutant Discharge Elimination System (NPDES) module of the Integrated Compliance Information System (ICIS). Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

IWPAD INC (Continued) **S104767080**

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.

Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

TSD EPA ID:	AZD081705402
CA Waste Code:	331 - Off-specification, aged or surplus organics
Disposal Method:	H141 - Storage, Bulking, And/Or Transfer Off Site--No Treatment/Reovery (H010-H129) Or (H131-H135)

AMERON INTL CONCRETE & STEEL PIPE GRP (Continued) **S113180252**

Tons: 0.4

Year: 2014
Gepaid: CAT080033202
TSD EPA ID: CAT000613927
CA Waste Code: 134 - Aqueous solution with total organic residues less than 10 percent
Disposal Method: H141 - Storage, Bulking, And/Or Transfer Off Site--No Treatment/Reovery (H010-H129) Or (H131-H135)
Tons: 0.336

Year: 2014
Gepaid: CAT080033202
TSD EPA ID: ARD981057870
CA Waste Code: 343 - Unspecified organic liquid mixture
Disposal Method: H061 - Fuel Blending Prior To Energy Recovery At Another Site
Tons: 0.79

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

CERS Description: Chemical Storage Facilities

Violations:
Site ID: 384359
Site Name: AIRGAS USA, LLC
Violation Date: 07-31-2018
Citation: HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Description: Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.
Violation Notes: Returned to compliance on 08/17/2018. OBSERVATION: The reported inventory in CERS was not consistent with the observed at the time of the inspection. CORRECTIVE ACTION: Submit an accurate and complete hazardous materials inventory into the California Environmental Reporting System (CERS).

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The National Pollutant Discharge Elimination System (NPDES) module of the Integrated Compliance Information System (ICIS). Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
The National Compliance Database (NCDB) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA).
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

POTW: Not reported
Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

BERNELL HYDRAULICS (Continued) **S104764254**

Violation Description:	Failure to prepare and implement a Spill Prevention Control and Countermeasure (SPCC) Plan .
Violation Notes:	Returned to compliance on 05/19/2016. SPCC not prepared or unavailable for review.
Violation Division:	San Bernardino County Fire Department
Violation Program:	APSA
Violation Source:	CERS,
Site ID:	11877
Site Name:	BERNELL HYDRAULICS, INC.
Violation Date:	07-08-2021
Citation:	22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Description:	Failure to properly label hazardous waste accumulation containers and portable tanks with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.
Violation Notes:	Returned to compliance on 08/05/2021. OBSERVATION: (1) 55 gallon drum of aerosol cans was observed without a hazardous waste label. CORRECTIVE ACTION: Properly label all hazardous waste containers and submit a photo to the CUPA demonstrating that the container listed above has been properly labeled.

Violation Date:	01-28-2016
Citation:	HSC 6.95 25508.2 - California Health and Safety Code, Chapter 6.95, Section(s) 25508.2
Violation Description:	Failure to annually review and electronically certify that the business plan is complete, accurate, and up-to-date.
Violation Notes:	Returned to compliance on 05/19/2016.
Violation Division:	San Bernardino County Fire Department
Violation Program:	HMRRP
Violation Source:	CERS,
Site ID:	11877
Site Name:	BERNELL HYDRAULICS, INC.
Violation Date:	07-08-2021
Citation:	HSC 6.5 25123.3(h)(1) - California Health and Safety Code, Chapter 6.5, Section(s) 25123.3(h)(1)
Violation Description:	Failure to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles) for a generator who generates less than 1000 kilogram per month if all of the following conditions are met: (1) The quantity of hazardous waste accumulated onsite never exceeds 6,000 kilograms. (2) The generator complies with the requirements of 40 Code of Federal Regulations section 262.34(d), (e) and (f). (3) The generator does not hold acutely hazardous waste or extremely hazardous waste in an amount greater than one kilogram for more than 90 days.
Violation Notes:	Returned to compliance on 08/05/2021. OBSERVATION: (1) 1,000 gallon tank of used oil has an accumulation start date of 10/16/2020, exceeding the amount of time hazardous waste can be stored onsite prior to being properly disposed of. CORRECTIVE ACTION: Dispose of hazardous waste that has been stored over the applicable time limit and provide documentation that the violation has been corrected.

BERNELL HYDRAULICS (Continued) **S104764254**

Violation Description:	Failure to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles) for a generator who generates less than 1000 kilogram per month if all of the following conditions are met: (1) The quantity of hazardous waste accumulated onsite never exceeds 6,000 kilograms. (2) The generator complies with the requirements of 40 Code of Federal Regulations section 262.34(d), (e) and (f). (3) The generator does not hold acutely hazardous waste or extremely hazardous waste in an amount greater than one kilogram for more than 90 days.
Violation Notes:	Returned to compliance on 08/05/2021. OBSERVATION: (1) 1,000 gallon tank of used oil has an accumulation start date of 10/16/2020, exceeding the amount of time hazardous waste can be stored onsite prior to being properly disposed of. CORRECTIVE ACTION: Dispose of hazardous waste that has been stored over the applicable time limit and provide documentation that the violation has been corrected.

Eval General Type: Compliance Evaluation Inspection
Eval Date: 02-15-2012
Violations Found: No
Eval Type: Industrial Storm Water Compliance Evaluation
Eval Notes: Staff performed inspection of the facility's south side perimeter during a light rain event to observe any run-off from the site. Site did not generate run-off during a 0.20in storm event for the area on this day (reported by the San Bernardino Flood Control District for this area). Staff would contact site's representative to notify the need for housekeeping along the south perimeter.

Environmental Interest/Information System:
California's Hazardous Waste Tracking System Data Mart (HWTS-DATAMART) provides information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Quarterly Update:	Facility Description / History: Southern California Edison facilities are located in Los Angeles County. In the 1980s, the facilities generated and then stored hazardous waste in two surface impoundments. Permitting Regulatory Description / History: Southern California Edison facilities applied for a RCRA Permit. However, DTSC did not issue the facilities a permit and were exempted from Hazardous Waste RCRA Permit fee requirements. The facilities were then granted an Interim Status documented on March 30, 1981. Then granted a Variance Status on January 29, 1987, valid for 180 days, allowing the facility to perform on-site treatment for their liquid hazardous waste. On February 1, 1995, a Final Judgement Pursuant to Stipulation, court order No. BC121219, was issued to close the Southern California Edison facilities: Alamitos, Cool Water, El Segundo, Etiwanda, Huntington Beach, Highgrove, Long Beach, Mandalay, Ormond Beach, Redondo Beach, and San Bernardino. The facilities had violated Hazardous Waste Laws and received cost penalties. In response to the court order, the Southern California Edison (SCE) performed the investigation and activities to close two wastewater retention basins that had operated without a permit or other form of authorization from the DTSC. The facilities were passed onto Corrective Action for closure. On December 21, 2011, EPTC-Etiwanda received a closure certification for their closed units.

Hazardous Waste Summary:

Waste Code:	D001
Waste Description:	Ignitable Waste
Waste Code:	D008
Waste Description:	Lead
Waste Code:	D018
Waste Description:	Benzene
Waste Code:	F001
Waste Description:	The Following Spent Halogenated Solvents Used In Degreasing: Tetrachloroethylene, Trichlorethylene, Methylene Chloride, 1,1,1-Trichloroethane, Carbon Tetrachloride And Chlorinated

EPTC ETIWANDA (Continued) **1000167575**

Fluorocarbons; All Spent Solvent Mixtures/Blends Used In Degreasing Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F002
Waste Description: The Following Spent Halogenated Solvents: Tetrachloroethylene, Methylene Chloride, Trichloroethylene, 1,1,1-Trichloroethane, Chlorobenzene, 1,1,2-Trichloro-1,2,2-Trifluoroethane, Ortho-Dichlorobenzene, Trichlorofluoromethane, And 1,1,2, Trichloroethane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F001, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F003
Waste Description: The Following Spent Nonhalogenated Solvents: Xylene, Acetone, Ethyl Acetate, Ethyl Benzene, Ethyl Ether, Methyl Isobutyl Ketone, N-Butyl Alcohol, Cyclohexanone, And Methanol; All Spent Solvent Mixtures/Blends Containing, Before Use, Only The Above Spent Nonhalogenated Solvents; And All Spent Solvent Mixtures/Blends Containing, Before Use, One Or More Of The Above Nonhalogenated Solvents, And A Total Of Ten Percent Or More (By Volume) Of One Or More Of Those Solvents Listed In F001, F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F005
Waste Description: The Following Spent Nonhalogenated Solvents: Toluene, Methyl Ethyl Ketone, Carbon Disulfide, Isobutanol, Pyridine, Benzene, 2-Ethoxyethanol, And 2-Nitropropane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Nonhalogenated Solvents Or Those Solvents Listed In F001, F002, Or F004; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Total amount transferred offsite for disposal:	5
Total amount transferred offsite for recycling:	0
Total amount transferred offsite for energy recovery:	0
Total amount transferred offsite for treatment:	0
FRS ID - Transfer Location:	110012625132
TRI ID:	92335VSTMT13425
Cas number:	0007439965
Chemical name: Manganese	
Classification:	TRI
Unit of measure:	Pounds
Metal ind:	YES
Revision code 1:	Not reported
Revision code 2:	Not reported
Maximum amount on site:	04
Fugitive air emissions - total release pounds:	0
Fugitive air emissions - total release range code:	Not reported
Total fugitive air emissions:	0
Fugitive air emissions - basis of estimate:	Published Emission Factors
Stack air emissions - release pounds:	Not reported
Stack air emissions - release range code:	A
Total stack air emissions:	5
Stack air emissions - basis of estimate:	On-Site-Specific Emission Factors
Total air emissions:	5
Discharges to stream a - stream name:	NA
Total discharges to stream a:	0
Discharges to stream a - basis of estimate:	Not reported
Discharges to stream a - % from stormwater:	Not reported
Discharges to stream b - stream name:	Not reported
Total discharges to stream b:	Not reported
Discharges to stream b - basis of estimate:	Not reported
Discharges to stream b - % from stormwater:	Not reported
Discharges to stream c - stream name:	Not reported
Total discharges to stream c:	Not reported
Discharges to stream c - basis of estimate:	Not reported
Discharges to stream c - % from stormwater:	Not reported
Discharges to stream d - stream name:	Not reported
Total discharges to stream d:	Not reported
Discharges to stream d - basis of estimate:	Not reported
Discharges to stream d - % from stormwater:	Not reported
Discharges to stream e - stream name:	Not reported

VISTA METALS CORP. (Continued) **1000395229**

Total discharges to stream e:	Not reported
Discharges to stream e - basis of estimate:	Not reported
Discharges to stream e - % from stormwater:	Not reported
Discharges to stream f - stream name:	Not reported
Total discharges to stream f:	Not reported
Discharges to stream f - basis of estimate:	Not reported
Discharges to stream f - % from stormwater:	Not reported
Discharges to stream g - stream name:	Not reported
Total discharges to stream g:	Not reported
Discharges to stream g - basis of estimate:	Not reported
Discharges to stream g - % from stormwater:	Not reported
Discharges to stream h - stream name:	Not reported
Discharges to stream h - release pounds:	Not reported
Discharges to stream h - release range code:	Not reported
Total discharges to stream h:	Not reported
Discharges to stream h - basis for estimate:	Not reported
Discharges to stream h - % from stormwater:	Not reported
Total number of receiving streams:	0
Total surface water discharge:	0
Total on-site underground inj - pounds:	Not reported
On-site underground inj - basis of estimate:	Not reported
Total on-site ugrnd inj to cl i wells - pounds:	0
On-site underground inj to c1 i wells - basis of estimate:	Not reported
Total on-site ugrnd inj to cl ii-v wells - pounds:	0
On-site ungrnd inj to cl ii-v wells - basis of estimate:	Not reported
Total on-site underground injection:	0
Total on-site landfills:	Not reported
On-site landfills - basis of estimate:	Not reported
Total on-site RCRA subtitle c landfills:	0
On-site RCRA subtitle c landfills - basis of estimate:	Not reported
Total other on-site landfills:	0
Other landfills - basis of estimate:	Not reported
Total on-site land treatment:	0
Land trtmt/appl farming - basis of estimate:	Not reported
Total surface impoundments:	Not reported
Surface impoundment - basis of estimate:	Not reported
Total RCRA c surface impoundments:	0
RCRA c Surface impoundment - basis of estimate:	Not reported
Total other surface impoundments:	0
Other surface impoundment - basis of estimate:	Not reported
Total other disposal:	0
Other disposal - basis of estimate:	Not reported
Total on-site land releases:	0
Total on-site releases:	5
Off-site - POTW releases:	0
Off-site - storage only:	0
Off-site - solid/stab - metals:	0
Off-site - wastewater treatment release - metals:	0
Off-site - solid/stab - release - metals:	0
Off-site - wastewater treatment - metals:	0
Off-site - underground injection:	0
Off-site - underground injection - class 1 wells:	0
Off-site - underground injection - class ii-v wells:	0
Off-site - landfills/disposal surface impoundments:	0
Off-site - surface impoundment:	0
Off-site - RCRA subtitle c surface impoundments:	0
Off-site - other surface impoundments:	0

Document control number:		1321219754886
Chemical name:	Manganese	
Classification:		TRI
Unit of measure:		Pounds
Produce the chemical:		Yes
Import the chemical:		No
On-site use of the chemical:		No
Sale or distribution of the chemical:		No
As a byproduct:		Yes
As a manufactured impurity:		No
Used as a reactant:		No
P101 feedstocks:		No
P102 raw materials:		No
P103 intermediates:		No
P104 initiators:		No
P199 other:		No
Added as a formulation component:		No
P201 additives:		No
P202 dyes:		No
P203 reaction diluents:		No
P204 initiators:		No
P205 solvents:		No
P206 inhibitors:		No
P207 emulsifiers:		No
P208 surfactants:		No
P209 lubricants:		No
P210 flame retardants:		No
P211 rheological modifiers:		No
P299 other:		No
Used as an article component:		Yes
Repackaging:		No
As a process impurity:		No
Processed / recycling:		No
Used as a chemical processing aid:		No
Z101 process solvents:		No
Z102 catalysts:		No
Z103 inhibitors:		No
Z104 initiators:		No
Z105 reaction terminators:		No
Z106 solution buffers:		No
Z199 other:		No
Used as a manufacturing aid:		No
Z201 process lubricants:		No
Z202 metalworking fluids:		No
Z203 coolants:		No
Z204 refrigerants:		No
Z205 hydraulic fluids:		No
Z299 other:		No
Ancillary or other use:		No
Z301 cleaner:		No
Z302 degreaser:		No
Z303 lubricant:		No
Z304 fuel:		No
Z305 flame retardant:		No
Z306 waste treatment:		No
Z307 water treatment:		No
Z308 construction materials:		No
