The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-100086-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Revision
The report being provided is a revision of the original report sent on 6/30/2022. The report (revision 1) is being revised due to: Per the clients request sample ID for sample #9 was upated, see COC section of the report for details..

Receipt
The samples were received on 6/17/2022 11:46 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.7° C.

GC Semi VOA
Method 8082: The following sample required a dilution due to the nature of the sample matrix: Unit-2-SST_SO-W-SW-5A (570-100086-7). Because of this dilution, the surrogate spike concentration in the sample was reduced to a level where the recovery calculation does not provide useful information.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3540C: Due to the matrix, the following samples could not be concentrated to the final method required volume: Unit-2-LT-5B (570-100086-2) and Unit-2-LT-5C (570-100086-3). The reporting limits (RLs) are elevated proportionately. The final volume was changed from 10mL to 20ml.
8082

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Detection Summary

Client: Roux Associates, Inc.
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Accreditation/Certification Summary

Client: Roux Associates, Inc. Job ID: 570-100086-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	2944	09-30-22

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
Moisture		Solid	Percent Moisture

Method Summary

Client: Roux Associates, Inc. Job ID: 570-100086-1

EXTERNAL EMAIL*

Hi Virendra,

Will you please correct the sample ID for sample #570-100086-9. The correct sample ID should be:

- Unit-2-SST_SO-W-SW-5C

Please let me know if you have any questions.

Thanks,
Mark

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-100089-1
Project/Site: Etiwanda Commerce Center / 3653.0001L0000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Narrative

Job Narrative
570-100089-1

Comments
No additional comments.

Receipt
The samples were received on 6/17/2022 11:46 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.7° C.

GC Semi VOA
Method 8082: Due to the high concentration of Aroclor-1260, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 570-242496 and analytical batch 570-243065 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3540C: Due to the matrix, the following samples could not be concentrated to the final method required volume: Unit-2-LT-5D (570-100089-8), Unit-2-LT-5D-DUP (570-100089-9) and Unit-2-LT-5E (570-100089-10). The reporting limits (RLs) are elevated proportionately. The final volume was changed from 10mL to 20ml.
8082

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Accreditation/Certification Summary

Client: Roux Associates, Inc. Job ID: 570-100089-1
Project/Site: Etiwanda Commerce Center / 3653.0001L0000

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	2944	09-30-22

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
Moisture		Solid	Percent Moisture

Method Summary

Client: Roux Associates, Inc. Job ID: 570-100089-1
Project/Site: Etiwanda Commerce Center / 3653.0001L0000

Method	Method Description	Protocol	Laboratory
8082	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	ECL 4
Moisture	Percent Moisture	EPA	ECL 4
3540C	Soxhlet Extraction	SW846	ECL 4

Protocol References:

Login Sample Receipt Checklist

Client: Roux Associates, Inc.

Job Number: 570-100089-1

Login Number: 100089
List Number: 1
Creator: Ovalle, Erick

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-100091-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 570-100091-1

Laboratory: Eurofins Calscience

Narrative

Job Narrative
570-100091-1

Comments
No additional comments.

Receipt
The samples were received on 6/17/2022 11:46 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.7° C.

GC Semi VOA
Method 8082: Due to the high concentration of Aroclor-1260, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 570-242496 and analytical batch 570-243065 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Method 8082: The native sample, matrix spike, and matrix spike duplicate (MS/MSD) associated with preparation batch 570-242496 and analytical batch 570-243065 were performed at the same dilution. Due to the additional level of analyte present in the spiked samples, the concentration of < Aroclor-1260> in the MS/MSD was above the instrument calibration range. The data have been reported and qualified.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Accreditation/Certification Summary

Client: Roux Associates, Inc. Job ID: 570-100091-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	2944	09-30-22

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
Moisture		Solid	Percent Moisture

Method Summary

Client: Roux Associates, Inc. Job ID: 570-100091-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Method	Method Description	Protocol	Laboratory
8082	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	ECL 4
Moisture	Percent Moisture	EPA	ECL 4
3540C	Soxhlet Extraction	SW846	ECL 4

Login Number: 100091
List Number: 1
Creator: Ovalle, Erick

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-109835-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Client: Roux Associates, Inc. Job ID: 570-109835-1

Comments
No additional comments.

Receipt
The samples were received on 9/15/2022 4:25 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 4.6° C.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3540C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 570-264592. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.
Method 8082.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Detection Summary

Client: Roux Associates, Inc. Job ID: 570-109835-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Client Sample ID: WIPE_1_T Lab Sample ID: 570-109835-1

No Detections.

Client Sample ID: WIPE_2_B Lab Sample ID: 570-109835-2

No Detections.

This Detection Summary does not include radiochemical test results.

Login Number: 109835
List Number: 1
Creator: Patel, Virendra

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Virendra Patel, Project Manager I
(714)895-5494
Virendra.Patel@et.eurofinsus.com

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-109842-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Narrative

Job Narrative
570-109842-1

Comments
No additional comments.

Receipt
The samples were received on 9/15/2022 4:25 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 4.6º C.

GC Semi VOA
Method 8082: Due to the high concentration of Aroclor-1260, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 570-264591 and analytical batch 570-265194 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Method 8082: Surrogate recovery for the following samples were outside control limits: Unit-2-SST-SO-W-SW-15C (570-109842-3), Unit-2-SST-SO-W-SW-15D (570-109842-4) and Unit-2-SST-SO-W-SW-15E (570-109842-5). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8082: Surrogate recovery for the following sample was outside control limits: Unit-2-SST-SO-W-SW-15H (570-109842-8). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3540C: The following sample(s) contains excessive acidity after performing sulfuric acid clean up. The following sample was transfered directly to G.C vial.
8082

Unit-2-SST-SO-W-SW-15D (570-109842-4), Unit-2-SST-SO-W-SW-15E (570-109842-5), Unit-2-SST-SO-W-SW-15I (570-109842-9) and Unit-2-SST-SO-W-SW-15J (570-109842-10)

Method 3540C: Due to the matrix, the following samples could not be concentrated to the final method required volume: UNIT-2-LT-15A (570-109842-13), UNIT-2-LT-15D (570-109842-16), GNIT-2-LT-10G (570-109842-19) and GNIT-2-LT-10G-DUP (570-109842-20). The reporting limits (RLs) are elevated proportionately. The final volume was changed from 10mL to 20ml
8082

Method 3540C: Due to the matrix, the following samples could not be concentrated to the final method required volume: UNIT-2-LT-15B (570-109842-14), UNIT-2-LT-15C (570-109842-15), UNIT-2-LT-15E (570-109842-17) and UNIT-2-LT-10F (570-109842-18). The reporting limits (RLs) are elevated proportionately. the final volume was changed from 10mL to 40mL
8082

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Accreditation/Certification Summary

Client: Roux Associates, Inc. Job ID: 570-109842-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	3082	07-31-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8082	3540C	Solid	Aroclor-1262
8082	3540C	Solid	Aroclor-1268
Moisture		Solid	Percent Moisture

Method Summary

Client: Roux Associates, Inc. Job ID: 570-109842-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Method	Method Description	Protocol	Laboratory
8082	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	EET CAL 4
Moisture	Percent Moisture	EPA	EET CAL 4
3540C	Soxhlet Extraction	SW846	EET CAL 4

Login Number: 109842
List Number: 1
Creator: Patel, Virendra

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-110053-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
E	Result exceeded calibration range.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Client: Roux Associates, Inc. Job ID: 570-110053-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Job ID: 570-110053-1

Laboratory: Eurofins Calscience

Narrative

Job Narrative
570-110053-1

Comments
No additional comments.

Receipt
The samples were received on 9/16/2022 6:20 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.0º C.

Receipt Exceptions

The Chain-of-Custody (COC) was incomplete as received. No total numer of conatners listed for sample 21.

GC Semi VOA
Method 8082: Surrogate recovery for the following sample was outside control limits: (570-110053-A-21-B MSD). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8082: Due to the high concentration of Aroclor-1260, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 570-265019 and analytical batch 570-265607 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Method 8082: Surrogate recovery for the following samples were outside control limits: Unit-2-SST-SO-W-SW-20B (570-110053-2), Unit-2-SST-SO-W-SW-20C (570-110053-3) and Unit-2-SST-SO-W-SW-20D (570-110053-4). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3540C: Due to the matrix, the following samples could not be concentrated to the final method required volume: Unit-2-LT-20E (570-110053-21), (570-110053-A-21 MS) and (570-110053-A-21 MSD). The reporting limits (RLs) are elevated proportionately. The final volume was changed from 10mL to 20mL. Method 8082.

Method 3540C: Due to the matrix, the following samples could not be concentrated to the final method required volume: Unit-2-LT-20B (570-110053-18), Unit-2-LT-20C (570-110053-19) and Unit-2-LT-20D (570-110053-20). The reporting limits (RLs) are elevated proportionately. The

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Accreditation/Certification Summary

Client: Roux Associates, Inc. Job ID: 570-110053-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	3082	07-31-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8082	3540C	Solid	Aroclor-1262
8082	3540C	Solid	Aroclor-1268
Moisture		Solid	Percent Moisture

Method Summary

Client: Roux Associates, Inc. Job ID: 570-110053-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Method	Method Description	Protocol	Laboratory
8082	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	EET CAL 4
Moisture	Percent Moisture	EPA	EET CAL 4
3540C	Soxhlet Extraction	SW846	EET CAL 4

Protocol References:

EPA = US Environmental Protection Agency

SW846 = "Test Methods For Evaluating Solid Waste, Physical/Chemical Methods", Third Edition, November 1986 And Its Updates.

List Source: Eurofins Calscience

List Number: 1

Creator: Patel, Virendra

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	Refer to Job Narrative for details.
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
S1-	Surrogate recovery exceeds control limits, low biased.
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 570-110054-1

Laboratory: Eurofins Calscience

Narrative

Job Narrative
570-110054-1

Comments
No additional comments.

Receipt
The samples were received on 9/16/2022 6:20 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.0º C.

Receipt Exceptions

The Chain-of-Custody (COC) was incomplete as received. No total number of containers listed for any of the samples.

Insufficient sample volume was provided for the following sample for the Percent Moisture analysis: Unit-1/2-RT-A (570-110054-1).

The clients office was notified on 09/19/2022 via e-mail, see COC section of the report for details.

GC Semi VOA
Method 8082: Surrogate recovery for the following sample was outside control limits: Unit-1/2-RT-D (570-110054-4). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8082: Surrogate recovery for the following sample was outside control limits: (570-110053-A-21-B MSD). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8082: Surrogate recovery for the following sample was outside control limits: Unit-2-SST-F (570-110054-15). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8082: Due to the high concentration of Aroclor-1260, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 570-265020 and analytical batch 570-265181 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Method 8082: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-265020 and analytical batch 570-265181 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Patel, Virendra

From: Patel, Virendra
Sent: Monday, September 19, 2022 3:00 PM
To: Mark Nishibayashi; Matthew Nelson; 'Daniel Zaragoza'
Subject: Etiwanda Commerce Center --- 570-110054 -- Insufficient sample mass remaining.
Attachments: COC 570-110054 (202209162034).pdf

Importance: High

All -

For sample #1, Unit-1/2-RT-A – we have run out of sample to complete the Moisture Content. PCBs/Soxhlet will have to be reported as 'wet" weight as a result.

We will include narrative comment and a copy of this email in the final report.

Please advise of any questions/concerns. Thank you!

Best Regards,

Virendra Patel

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	Refer to Job Narrative for details.
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-110061-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Client: Roux Associates, Inc. Job ID: 570-110061-1

Narrative

Job Narrative
570-110061-1

Comments
No additional comments.

Receipt
The samples were received on 9/16/2022 6:20 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 4.8º C.

Receipt Exceptions

The Chain-of-Custody (COC) was incomplete as received. No total number of containers listed for any of the samples.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3540C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 570-265022. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.
Method 8082.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	Refer to Job Narrative for details.
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Laboratory: Eurofins Calscience

Narrative

Job Narrative
570-110333-1

Comments
No additional comments.

Receipt
The samples were received on 9/20/2022 1:30 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.1° C.

GC Semi VOA
Method 8082: Due to the high concentration of Aroclor-1260, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 570-265774 and analytical batch 570-266477 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Method 8082: The following samples required a dilution due to the nature of the sample matrix: Unit-2-SST-SO-W-S1-A (570-110333-1), Unit-2-SST-SO-W-S1-C (570-110333-3) and Unit-2-LT-SO-N-A (570-110333-11). Because of this dilution, the surrogate spike concentration in the sample was reduced to a level where the recovery calculation does not provide useful information.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Aroclor-1260 - DL	1400		260		ug/Kg	5	☼	8082	Total/NA

Client Sample ID: Unit-2-LT-SO-N-A — Lab Sample ID: 570-110333-11

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1260 - DL	11000		2500		ug/Kg	50	☼	8082	Total/NA

Client Sample ID: Unit-2-LT-SO-S-A — Lab Sample ID: 570-110333-12

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1260	470		50		ug/Kg	1	☼	8082	Total/NA

This Detection Summary does not include radiochemical test results.

Detection Summary

Client: Roux Associates, Inc.
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Job ID: 570-110333-1

Client Sample ID: Unit-2-LT-SO-S-B

Lab Sample ID: 570-110333-13

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1260 - DL	1400		500		ug/Kg	10	☼	8082	Total/NA

Client Sample ID: Unit-1-SST-(S)-SO-A

Lab Sample ID: 570-110333-17

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1260	80		52		ug/Kg	1	☼	8082	Total/NA

This Detection Summary does not include radiochemical test results.

Method: 8082 - Polychlorinated Biphenyls (PCBs) by Gas Chromatography

Client Sample ID: Unit-2-SST-SO-W-S1-A **Lab Sample ID: 570-110333-1**
Date Collected: 09/20/22 08:08 **Matrix: Solid**
Date Received: 09/20/22 15:00

Login Number: 110333
List Number: 1
Creator: Patel, Virendra

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-110925-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
S1-	Surrogate recovery exceeds control limits, low biased.
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Narrative

Job Narrative
570-110925-1

Comments
No additional comments.

Receipt
The samples were received on 9/23/2022 4:21 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.1° C.

GC Semi VOA
Method 8082: Surrogate recovery for the following samples were outside control limits: Unit-2-SST-SO-W-SW-25H (570-110925-21) and Unit-2-SST-SO-W-SW-25K (570-110925-24). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8082: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-266961 and analytical batch 570-267368 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8082: Surrogate recovery for the following sample was outside control limits: Unit-2-LT-25A (570-110925-1). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8082: Surrogate recovery for the following sample was outside control limits: Unit-2-SST-SO-W-SW-25C (570-110925-15). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3540C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 570-266962 and 570-266962.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.
8082

Method 3540C: Due to the matrix, the following samples could not be concentrated to the final method required volume: Unit-2-LT-25A (570-110925-1), Unit-2-LT-25B (570-110925-2), Unit-2-LT-20I (570-110925-3), Unit-2-LT-15F (570-110925-4), Unit-2-LT-15G (570-110925-5), Unit-2-LT-15H (570-110925-6), Unit-2-LT-15I (570-110925-7), (570-110925-A-7 MS) and (570-110925-A-7 MSD). The reporting limits (RLs) are elevated proportionately. The final volume was changed from 10ml to 20ml.
8082

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Accreditation/Certification Summary

Client: Roux Associates, Inc. Job ID: 570-110925-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	3082	07-31-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8082	3540C	Solid	Aroclor-1262
8082	3540C	Solid	Aroclor-1268
Moisture		Solid	Percent Moisture

Method Summary

Client: Roux Associates, Inc. Job ID: 570-110925-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Method	Method Description	Protocol	Laboratory
8082	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	EET CAL 4
Moisture	Percent Moisture	EPA	EET CAL 4
3540C	Soxhlet Extraction	SW846	EET CAL 4

Login Number: 110925
List Number: 1
Creator: Patel, Virendra

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-111535-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Narrative

Job Narrative
570-111535-1

Comments
No additional comments.

Receipt
The samples were received on 9/29/2022 5:13 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.6º C.

GC Semi VOA
Method 8082: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-268601 and analytical batch 570-268700 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8082: The following sample required a dilution due to the nature of the sample matrix: Unit-2-LT-30A (570-111535-2). Because of this dilution, the surrogate spike concentration in the sample was reduced to a level where the recovery calculation does not provide useful information.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3540C: Due to the matrix, the following samples could not be concentrated to the final method required volume: Unit-2-LT-25C (570-111535-1), Unit-2-LT-30A (570-111535-2), Unit-2-LT-30B (570-111535-3), Unit-2-LT-25D (570-111535-4), Unit-2-LT-20J (570-111535-5), (570-111535-A-1 MS) and (570-111535-A-1 MSD). The reporting limits (RLs) are elevated proportionately. The final volume was changed from 10ml to 20mL.
8082

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

This Detection Summary does not include radiochemical test results.

Detection Summary

Client: Roux Associates, Inc.
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Job ID: 570-111535-1

Client Sample ID: Unit-2-SST-SO-W-SW-30D — Lab Sample ID: 570-111535-13

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1260 - DL	990		100		ug/Kg	2	☼	8082	Total/NA

Client Sample ID: Unit-2-SST-SO-W-SW-30E — Lab Sample ID: 570-111535-14

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1260	610		51		ug/Kg	1	☼	8082	Total/NA

Client Sample ID: Unit-2-SST-SO-W-SW-30F — Lab Sample ID: 570-111535-15

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1260	960		51		ug/Kg	1	☼	8082	Total/NA

Client Sample ID: Unit-2-SST-SO-W-SW-30G — Lab Sample ID: 570-111535-16

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1260	800		50		ug/Kg	1	☼	8082	Total/NA

Client Sample ID: Unit-2-SST-SO-W-SW-30G-DUP — Lab Sample ID: 570-111535-17

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1260	600		50		ug/Kg	1	☼	8082	Total/NA

Client Sample ID: Unit-2-SST-SO-W-SW-30H — Lab Sample ID: 570-111535-18

No Detections.

This Detection Summary does not include radiochemical test results.

Method: 8082 - Polychlorinated Biphenyls (PCBs) by Gas Chromatography

Client Sample ID: Unit-2-LT-25C **Lab Sample ID: 570-111535-1**
Date Collected: 09/29/22 12:22 **Matrix: Solid**

Accreditation/Certification Summary

Client: Roux Associates, Inc. Job ID: 570-111535-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	3082	07-31-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8082	3540C	Solid	Aroclor-1262
8082	3540C	Solid	Aroclor-1268
Moisture		Solid	Percent Moisture

Method Summary

Client: Roux Associates, Inc. Job ID: 570-111535-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Method	Method Description	Protocol	Laboratory
8082	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	EET CAL 4
Moisture	Percent Moisture	EPA	EET CAL 4
3540C	Soxhlet Extraction	SW846	EET CAL 4

Login Sample Receipt Checklist

Client: Roux Associates, Inc.

Job Number: 570-111535-1

Login Number: 111535
List Number: 1
Creator: Patel, Virendra

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-111681-1
Project/Site: Etiwanda Commerce Center / 3653.0001L00

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Comments
No additional comments.

Receipt
The samples were received on 9/30/2022 5:07 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.9º C.

GC Semi VOA
Method 8082: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-268970 and analytical batch 570-269213 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Client: Roux Associates, Inc.
Project/Site: Etiwanda Commerce Center / 3653.0001L00

Job ID: 570-111681-1

Client Sample ID: Unit-2-SST-SO-W-SW-35B — Lab Sample ID: 570-111681-13

No Detections.

Accreditation/Certification Summary

Client: Roux Associates, Inc.
Job ID: 570-111681-1
Project/Site: Etiwanda Commerce Center / 3653.0001L00

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	3082	07-31-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8082	3540C	Solid	Aroclor-1262
8082	3540C	Solid	Aroclor-1268
Moisture		Solid	Percent Moisture

Method Summary

Client: Roux Associates, Inc.
Project/Site: Etiwanda Commerce Center / 3653.0001L00

Job ID: 570-111681-1

Method	Method Description	Protocol	Laboratory
8082	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	EET CAL 4
Moisture	Percent Moisture	EPA	EET CAL 4
3540C	Soxhlet Extraction	SW846	EET CAL 4

Login Sample Receipt Checklist

Client: Roux Associates, Inc.

Job Number: 570-111681-1

Login Number: 111681
List Number: 1
Creator: Patel, Virendra

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Client: Roux Associates, Inc. Job ID: 570-111681-2
Project/Site: Etiwanda Commerce Center / 3653.0001L00

Job ID: 570-111681-2

Laboratory: Eurofins Calscience

Narrative

Job Narrative
570-111681-2

Comments
No additional comments.

Receipt
The samples were received on 9/30/2022 5:07 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.9º C.

GC Semi VOA
Method 8082: The following sample required a dilution due to the nature of the sample matrix: Unit-2-SST-SO-W-SW-35E (570-111681-16). Because of this dilution, the surrogate spike concentration in the sample was reduced to a level where the recovery calculation does not provide useful information.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3540C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 570-269579, 570-269579 and 570-269579. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.
8082

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Detection Summary

Client: Roux Associates, Inc.
Project/Site: Etiwanda Commerce Center / 3653.0001L00

Job ID: 570-111681-2

Client Sample ID: Unit-2-LT-25E — Lab Sample ID: 570-111681-1

EXTERNAL EMAIL*

Hi Virendra,

Will you please have the lab analyze the following samples that were previously put on HOLD:

- Unit-2-LT-25E
- Unit-2-LT-30C
- Unit-2-LT-35A
- Unit-2-LT-35B
- Unit-2-LT-30D
- Unit-2-LT-30E
- Unit-2-LT-30E-DUP
- Unit-2-SST_SO-W-SW-35E
- Unit-2-SST_SO-W-SW-35J
- Unit-2-SST_SO-W-SW-35K
- Unit-2-SST_SO-W-SW-35L

Please have the lab run the analysis on RUSH TAT. Let me know if you have any questions.

Thanks,
Mark

Job Number: 570-111681-2

Login Number: 111681
List Number: 1
Creator: Patel, Virendra

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-112149-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Comments
No additional comments.

Receipt
The samples were received on 10/5/2022 5:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.4° C.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Client: Roux Associates, Inc.
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Accreditation/Certification Summary

Client: Roux Associates, Inc. Job ID: 570-112149-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	3082	07-31-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8082	3540C	Solid	Aroclor-1262
8082	3540C	Solid	Aroclor-1268
Moisture		Solid	Percent Moisture

Job Number: 570-112149-1

Login Number: 112149
List Number: 1
Creator: Patel, Virendra

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-112149-2
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Receipt
The samples were received on 10/5/2022 5:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.4° C.

GC Semi VOA
Method 8082: Surrogate recovery for the following sample was outside control limits: (570-112402-A-17-A MS). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

EXTERNAL EMAIL*

Hi Virendra,

Will you please have the lab analyze the following samples that were previously put on HOLD:

- Unit-2-LT-30G
- Unit-2-LT-40A
- Unit-2-LT-35C

Please have the lab run the analysis on RUSH TAT. Let me know if you have any questions.

Thanks,
Mark

Login Sample Receipt Checklist

Client: Roux Associates, Inc.

Job Number: 570-112149-2

Login Number: 112149
List Number: 1
Creator: Patel, Virendra

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.
F1	MS and/or MSD recovery exceeds control limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Narrative

Job Narrative
570-112940-1

Comments
No additional comments.

Receipt
The samples were received on 10/12/2022 2:18 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.7° C.

GC Semi VOA
Method 8082: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-272288 and analytical batch 570-273104 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3540C: Due to the matrix, the following samples could not be concentrated to the final method required volume: Unit-2-SST-SO-W-SW-35W (570-112940-1), Unit-2-SST-SO-W-SW-35X (570-112940-2), Unit-2-SST-SO-W-SW-35Y (570-112940-3), Unit-2-SST-SO-W-SW-35Z (570-112940-4), (570-112940-A-1 MS) and (570-112940-A-1 MSD). The reporting limits (RLs) are elevated proportionately. The final volume was changed from 10mL
to 20mL
8082

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Client: Roux Associates, Inc.

Job Number: 570-112940-1

Login Number: 112940
List Number: 1
Creator: Patel, Virendra

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Virendra Patel, Project Manager I
(714)895-5494
Virendra.Patel@et.eurofinsus.com

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-112940-2
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Laboratory: Eurofins Calscience

Narrative

Job Narrative
570-112940-2

Comments
No additional comments.

Receipt
The samples were received on 10/12/2022 2:18 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.7° C.

GC Semi VOA
Method 8082: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-273299 and analytical batch 570-273870 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

EXTERNAL EMAIL*

Hi Virendra,

Thank you for sending over these results. Based on these results we'd like to have a couple of additional samples released for analysis. Of the samples collected/submitted on 10/12 last week (see attached COC), please have the laboratory analyze the following samples:

- Unit-2-LT-40D
- Unit-2-LT-45B

Thanks,
Mark

Login Sample Receipt Checklist

Client: Roux Associates, Inc.

Job Number: 570-112940-2

Login Number: 112940
List Number: 1
Creator: Patel, Virendra

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

For:
Roux Associates, Inc.
5150 E Pacific Coast Highway
Suite 450
Long Beach, California 90804

Attn: Matthew Nelson

Virendra R Patel

Authorized for release by:
10/23/2022 4:38:01 PM

Virendra Patel, Project Manager I
(714)895-5494
Virendra.Patel@et.eurofinsus.com

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-112940-3
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Receipt
The samples were received on 10/12/2022 2:18 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.7° C.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3540C: Due to the matrix, the following samples could not be concentrated to the final method required volume: Unit-2-SST-SO-W-SW-40H (570-112940-8), Unit-2-SST-SO-W-SW-40G (570-112940-9) and Unit-2-SST-SO-W-SW-40I (570-112940-10). The reporting limits (RLs) are elevated proportionately. The final volume was changed from 10mL to 20mL.
8082

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Accreditation/Certification Summary

Client: Roux Associates, Inc.
Job ID: 570-112940-3
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	3082	07-31-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8082	3540C	Solid	Aroclor-1262
8082	3540C	Solid	Aroclor-1268
Moisture		Solid	Percent Moisture

Method Summary

Client: Roux Associates, Inc.
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Job ID: 570-112940-3

Method	Method Description	Protocol	Laboratory
8082	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	EET CAL 4
Moisture	Percent Moisture	EPA	EET CAL 4
3540C	Soxhlet Extraction	SW846	EET CAL 4

EXTERNAL EMAIL*

Thanks, Virendra.

Will you please direct the lab to release and analyze the following samples:

- Unit-2-SST-SO-W-SW-40D
- Unit-2-SST-SO-W-SW-40E
- Unit-2-SST-SO-W-SW-40G
- Unit-2-SST-SO-W-SW-40H
- Unit-2-SST-SO-W-SW-40I
- Unit-2-LT-35E
- Unit-2-LT-40C
- Unit-2-LT-40C-D

Please let us know if you have any questions.

Thanks,
Mark

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.

General Chemistry

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 570-112940-4

Laboratory: Eurofins Calscience

Narrative

Job Narrative
570-112940-4

Comments
No additional comments.

Receipt
The samples were received on 10/12/2022 2:18 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.7° C.

GC Semi VOA
Method 8082: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-275274 and analytical batch 570-275875 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
Method Moisture: The following sample was login outside of holding time: Unit-2-LT-45A (570-112940-13).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Receipt
The samples were received on 10/21/2022 3:03 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.3º C.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Accreditation/Certification Summary

Client: Roux Associates, Inc.
Project/Site: Etiwanda / 3653.0001L000

Job ID: 570-114304-1

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	3082	07-31-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8082	3540C	Solid	Aroclor-1262
8082	3540C	Solid	Aroclor-1268
Moisture		Solid	Percent Moisture

Method Summary

Client: Roux Associates, Inc.
Project/Site: Etiwanda / 3653.0001L000

Job ID: 570-114304-1

Method	Method Description	Protocol	Laboratory
8082	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	EET CAL 4
Moisture	Percent Moisture	EPA	EET CAL 4
3540C	Soxhlet Extraction	SW846	EET CAL 4

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Job ID: 570-114304-2

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Detection Summary

Client: Roux Associates, Inc.
Project/Site: Etiwanda / 3653.0001L000

Job ID: 570-114304-2

Client Sample ID: Unit-2-SST-SD-W-SW-45F — Lab Sample ID: 570-114304-6

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1260	320		100		ug/Kg	1	☼	8082	Total/NA

Client Sample ID: Unit-2-SST-SD-W-SW-45G — Lab Sample ID: 570-114304-7

EXTERNAL EMAIL*

Hi Virendra,

Will you please direct the lab to release and analyze the following samples:

- Unit-2-SST-SO-W-SW-45F
- Unit-2-SST-SO-W-SW-45G
- Unit-2-LT-40E

Thanks,
Mark

This message originated outside your organization. Please use caution!

Hello,

Attached please find the sample confirmation files for job 570-114304-1; Etiwanda / 3653.0001L000

Please feel free to contact me if you have any questions.

Thank you.

Virendra Patel

Login Number: 114304
List Number: 1
Creator: Cortez Diaz, Antonio

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Job ID: 570-114304-3

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Receipt
The samples were received on 10/21/2022 3:03 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.3º C.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Hi Virendra,

Please have the lab release and analyze the following samples:

- Unit-2-LT-50A
- Unit-2-LT-40E
- SS-Soil-4

Thank you,
Mark

Hello,

Attached please find the report and EDD files for job 570-114304-1; Etiwanda / 3653.0001L000

72 HR RUSH was not met, results are being sent on 96 HR RUSH (10% mark-up), rush surcharges have been adjusted accordingly. Our apologies for the delay.

Please feel free to contact me if you have any questions.

Thank you.

Virendra Patel

EXTERNAL EMAIL*

Hi Virendra,

I'm sorry, I made a mistake. We had already directed the lab to release and analyze sample Unit-2-LT-40E, and the results were received today.

Thanks,
Mark

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Qualifiers

General Chemistry

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Receipt
The samples were received on 10/21/2022 3:03 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.3º C.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
Method Moisture: The following sample was received outside of holding time: Unit-2-LT-45C (570-114304-12).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Hi Virendra,

Rush TAT (24-hr, if available). Yes, please release for moisture analysis as well.

Thanks,
Mark

Login Sample Receipt Checklist

Client: Roux Associates, Inc.

Job Number: 570-114304-4

Login Number: 114304
List Number: 1
Creator: Cortez Diaz, Antonio

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Receipt
The samples were received on 10/27/2022 6:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 4.5º C.

GC Semi VOA
Method 8082: Batch preparation batch 570-276588 and analytical batch 570-277703 is reported without a matrix spike/matrix spike duplicate (MS/MSD). The batch MS/MSD was originally performed on another client's sample, and this test was on HOLD at client request. This MS/MSD result does not have immediate bearing on any samples except for the actual sample spiked. The associated laboratory control sample (LCS) met acceptance criteria and provides long-term precision and accuracy for this batch.

Method 8082: Surrogate recovery for the following samples were outside control limits: Unit-2-LT-35H (570-114921-1), Unit-2-LT-40G (570-114921-2) and Unit-2-LT-45F (570-114921-3). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Accreditation/Certification Summary

Client: Roux Associates, Inc.
Job ID: 570-114921-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	3082	07-31-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8082	3540C	Solid	Aroclor-1262
8082	3540C	Solid	Aroclor-1268
Moisture		Solid	Percent Moisture

Method Summary

Client: Roux Associates, Inc. Job ID: 570-114921-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Method	Method Description	Protocol	Laboratory
8082	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	EET CAL 4
Moisture	Percent Moisture	EPA	EET CAL 4
3540C	Soxhlet Extraction	SW846	EET CAL 4

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-114922-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Receipt
The samples were received on 10/27/2022 6:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 4.5º C.

GC Semi VOA
Method 8082: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-276588 and analytical batch 570-277703 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8082: Surrogate recovery for the following samples were outside control limits: (570-114922-A-1-A MS) and (570-114922-A-1-B MSD). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Hi Virendra,

Rush TAT (24-hr, if available). Yes, please release for moisture analysis as well.

Thanks,
Mark

This message originated outside your organization. Please use caution!

What TAT? Release moisture as well, correct?

Best Regards,

Virendra Patel

EXTERNAL EMAIL*

Hi Virendra,

Will you please have the lab release and analyze the extracts for the following samples:

- Unit-2-LT-30I
- Unit-2-LT-35G
- Unit-2-LT-40F
- Unit-2-LT-45E
- Unit-2-LT-50C

Thanks,
Mark

Hello,

Attached please find the sample confirmation files for job 570-114922-1; Etiwanda Commerce Center / 3653.0001L000

Please feel free to contact me if you have any questions.

Thank you.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Virendra Patel, Project Manager I
(714)895-5494
Virendra.Patel@et.eurofinsus.com

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-114923-1
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
S1-	Surrogate recovery exceeds control limits, low biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Receipt
The samples were received on 10/27/2022 6:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 4.5º C.

GC Semi VOA
Method 8082: The following samples appears to contain polychlorinated biphenyls (PCBs); however, due to weathering or other environmental processes, the PCBs in the sample do not closely match any of the laboratory's Aroclor standards used for instrument calibration: Unit-2-LT-25F (570-114923-1), Unit-2-LT-30H (570-114923-2) and Unit-2-LT-35F (570-114923-3). The sample(s) has been quantified and reported as Aroclor 1268. Due to the poor match with the Aroclor standard(s), there is increased qualitative and quantitative uncertainty associated with this result.

Method 8082: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-278151 and analytical batch 570-278644 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8082: Surrogate recovery for the following sample was outside control limits: Unit-2-LT-25F (570-114923-1). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3540C: Due to the matrix, the following samples could not be concentrated to the final method required volume: Unit-2-LT-25F (570-114923-1), (570-114923-A-1 MS) and (570-114923-A-1 MSD). The reporting limits (RLs) are elevated proportionately. The final volume was changed from 10mL to 20mL.
8082

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Subject: Etiwanda Commerce Center: 10/27/22 Samples on Hold
Attachments: 2022-1027-COC-Etiwanda.pdf

EXTERNAL EMAIL*

Hi Virendra,

For the samples that were submitted to the lab on Thursday (10/27), there were 3 samples placed on HOLD (COC attached – I don't think I received a sample confirmation for these samples). Will you please direct the lab to release the samples from HOLD and have them perform the Soxhlet extraction and HOLD the extract? Please perform the extraction on a 3-day TAT. Hold moisture analysis as well.

Please let me know if you have any questions.

Thanks,
Mark

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the {0} Project Manager.

Definitions/Glossary

Client: Roux Associates, Inc. Job ID: 570-115680-2
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
*1	LCS/LCSD RPD exceeds control limits.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Client: Roux Associates, Inc. Job ID: 570-115680-2
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Job ID: 570-115680-2

Comments
No additional comments.

Receipt
The samples were received on 11/3/2022 4:17 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.5º C.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Client: Roux Associates, Inc.
Project/Site: Etiwanda Commerce Center / 3653.0001L000

Job ID: 570-115680-2

Client Sample ID: Unit-2-LT-20N — Lab Sample ID: 570-115680-1

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1260	380		55		ug/Kg	1	☼	8082	Total/NA

Client Sample ID: Unit-2-LT-25G — Lab Sample ID: 570-115680-2

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1254 - DL	1300		600		ug/Kg	10	☼	8082	Total/NA
Aroclor-1260 - DL	1900		600		ug/Kg	10	☼	8082	Total/NA

Client Sample ID: Unit-2-LT-30J — Lab Sample ID: 570-115680-3

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1254 - DL	710		610		ug/Kg	10	☼	8082	Total/NA
Aroclor-1260 - DL	1600		610		ug/Kg	10	☼	8082	Total/NA

Client Sample ID: Unit-2-LT-35I — Lab Sample ID: 570-115680-4

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Aroclor-1254 - DL	670		610		ug/Kg	10	☼	8082	Total/NA
Aroclor-1260 - DL	1500		610		ug/Kg	10	☼	8082	Total/NA

This Detection Summary does not include radiochemical test results.

EXTERNAL EMAIL*

Hi Virendra,

Please have the lab perform the Soxhlet extraction (and HOLD extract) on 3-day TAT for the following samples:

- Unit-2-LT-20N
- Unit-2-LT-25G
- Unit-2-LT-30J
- Unit-2-LT-35I
- Unit-2-LT-40H
- Unit-2-LT-45G
- Unit-2-LT-50G
- Unit-2-LT-55D

Thank you,
Mark

EXTERNAL EMAIL*

Hi Virendra,

I would like to revise the analytical instructions for the email that was sent on Friday 11/4. Please have the following samples analyzed for PCBs (+ moisture) on 3-Day TAT from today:

- Unit-2-LT-20N
- Unit-2-LT-25G
- Unit-2-LT-30J
- Unit-2-LT-35I

The remaining samples listed in the email below should continue to be extracted and held.

Please let me know if you have any questions.

Thanks,
Mark

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
S1-	Surrogate recovery exceeds control limits, low biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

EXTERNAL EMAIL*

Hi Virendra,

Please have the lab proceed with the analysis (plus moisture) on a 3-day TAT for the following samples:

- Unit-2-LT-40I
- Unit-2-LT-45H
- Unit-2-LT-50H

Thank you,
Mark

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

ENTHALPY ANALYTICAL

Case Narrative

Roux Associates, Inc. 5150 E. Pacific Coast Hwy. Suite 450 Long Beach, CA 90804 Matthew Nelson	Lab Job Number: 464519 Location: Etiwanda Commerce Center / 3653.0001L000 Date Received: 06/17/22

This data package contains sample and QC results for fifteen soil samples, requested for the above referenced project on 06/17/22. The samples were received cold and intact.

PCBs (EPA 8082):

- Low recoveries were observed for Aroclor-1260 in the MS/MSD of UNIT-2-LT-10E (lab # 464526-001); the LCS was within limits, and the associated RPD was within limits.
- High RPD was observed for Aroclor-1016 in the BS/BSD for batch 291934; this analyte was not detected at or above the RL in the associated samples.
- UNIT-2-LT-10C (lab # 464519-001) and UNIT-2-LT-10D (lab # 464519-014) were diluted due to high non-target analytes.
- No other analytical problems were encountered.

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: ROUX ASSOCIATES

Project: ETIWANDA COMMERCE CENTER

Date Received: 6/17/22

Sampler's Name Present: ☑ Yes ☐ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? 1 ☐ No (skip section 2)

Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 20.1 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☑ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 5.8 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			✓
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____

☐ Email (email sent to/on): _____ / _____

Project Manager's response:

Completed By: _____ Date: 6/17/22

Diane Galvan <diane.galvan@enthalpy.com>

[EXTERNAL] Etiwanda: Concrete Samples for PCB Analysis

1 message

Mark Nishibayashi <mnishibayashi@rouxinc.com> Wed, Jul 6, 2022 at 8:58 AM
To: "diane.galvan@enthalpy.com" <diane.galvan@enthalpy.com>
Cc: Matthew Nelson <mnelson@rouxinc.com>, Daniel Zaragoza <dzaragoza@rouxinc.com>

Hi Diane,

Will you please run the PCB analysis (8082) on the extracts that were previously held? Please have the following samples analyzed:

-Unit-2-LT-10C

-Unit-2-LT-10D

-Unit-2-LT-10E

-Unit-2-SST_SO-W-W-10A

-Unit-2-SST_SO-W-SW-10A

-Unit-2-SST_SO-W-SW-10B

-Unit-2-SST_SO-W-SW-10C

-Unit-2-SST_SO-W-SW-10D

-Unit-2-SST_SO-W-SW-10E

-Unit-2-SST_SO-W-SW-10F

Samples selected for analysis are also highlighted in the attached copies of the original COCs.

Please let us know if you have any questions.

Thanks,
Mark

Analysis Results for 464519

Matthew Nelson
Roux Associates, Inc.
5150 E. Pacific Coast Hwy.
Suite 450
Long Beach, CA 90804

Lab Job #: 464519
Location: Etiwanda Commerce Center / 3653.0001L000
Date Received: 06/17/22

Perform SOXHLET extraction only and hold.

Sample ID: UNIT-2-LT-10C **Lab ID: 464519-001** **Collected: 06/15/22 13:25**
Matrix: Soil

Case Narrative

Roux Associates, Inc. 5150 E. Pacific Coast Hwy. Suite 450 Long Beach, CA 90804 Matthew Nelson	Lab Job Number: 464526 Location: Etiwanda Commerce Center / 3653.0001L000 Date Received: 06/17/22

This data package contains sample and QC results for one soil sample, requested for the above referenced project on 06/17/22. The sample was received cold and intact.

PCBs (EPA 8082):

- Low recoveries were observed for Aroclor-1260 in the MS/MSD of UNIT-2-LT-10E (lab # 464526-001); the LCS was within limits, and the associated RPD was within limits.
- UNIT-2-LT-10E (lab # 464526-001) was diluted due to high non-target analytes.
- No other analytical problems were encountered.

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: ROUX ASSOCIATES Project: ETIWANDA COMMERCE CENTER

Date Received: 6/17/22 Sampler's Name Present: ☑ Yes ☐ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? 1 ☐ No (skip section 2) Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 20.1 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☑ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 5.8 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			✓
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____

☐ Email (email sent to/on): _____ / _____

Project Manager's response:

Completed By: _____ Date: 6/17/22

[EXTERNAL] Etiwanda: Concrete Samples for PCB Analysis

1 message

Mark Nishibayashi <mnishibayashi@rouxinc.com> Wed, Jul 6, 2022 at 8:58 AM
To: "diane.galvan@enthalpy.com" <diane.galvan@enthalpy.com>
Cc: Matthew Nelson <mnelson@rouxinc.com>, Daniel Zaragoza <dzaragoza@rouxinc.com>

Hi Diane,

Will you please run the PCB analysis (8082) on the extracts that were previously held? Please have the following samples analyzed:

-Unit-2-LT-10C

-Unit-2-LT-10D

-Unit-2-LT-10E

-Unit-2-SST_SO-W-W-10A

-Unit-2-SST_SO-W-SW-10A

-Unit-2-SST_SO-W-SW-10B

-Unit-2-SST_SO-W-SW-10C

-Unit-2-SST_SO-W-SW-10D

-Unit-2-SST_SO-W-SW-10E

-Unit-2-SST_SO-W-SW-10F

Samples selected for analysis are also highlighted in the attached copies of the original COCs.

Please let us know if you have any questions.

Thanks,
Mark

APPENDIX C

Certification

CERTIFICATION

Certification of Self-Implementing PCB Cleanup and Disposal PCB Remediation Waste, 8996 Etiwanda Avenue, Rancho Cucamonga, California

This Certification is being submitted in connection with the Self-Implementing PCB Cleanup and Disposal PCB Notification Plan (the "Plan") for the site located at 8996 Etiwanda Avenue, Rancho Cucamonga, California (the Property).

The party conducting the cleanup described in the Plan, hereby certifies, and has advised the owner of the Property where cleanup is located, that all sampling plans, sample collection procedures, sample preparation procedures, extraction procedures, and instrumental/chemical analysis procedures used to assess or characterize the PCB contamination at the Property, are on file at the following location(s) and are available for USEPA inspection:

- 8996 Etiwanda Avenue, Rancho Cucamonga, California

To access these files, please contact Matthew Nelson with Roux Associates, Inc., at mnelson@rouxinc.com to arrange an appointment and identify the specific records to be inspected. BTC III Etiwanda Commerce Center will compile the information requested and make the information available for review in their office or transmit electronic copies directly to the USEPA representative requesting the information.

MEMORANDUM

Date: February 2, 2023

To: Carmen Santos – PCB Coordinator, U.S. EPA Region 9

From: Mark Nishibayashi – Roux Associates, Inc.
Matthew Nelson, PE – Roux Associates, Inc.

Subject: **Response to U.S. Environmental Protection Agency Conditions of Approval for Self-Implementing PCB Cleanup/Disposal Notification Plan – Etiwanda Commerce Center, 8996 Etiwanda Avenue, Rancho Cucamonga, California – PCB Site ID: CAR000038158**

On November 28, 2022, Roux Associates, Inc. (Roux) submitted a revised Self-Implementing Polychlorinated Biphenyl (PCB) Cleanup and Disposal Notification Plan (SICP), on behalf BTC III Etiwanda Commerce Center LP (BTC III), to the United Stated Environmental Protection Agency (USEPA) for the remediation of PCB impacted materials for Former Generating Units 1 and 2 (Site) located at 8996 Etiwanda Avenue, Rancho Cucamonga, California (Property).[1] On December 15, 2022, USEPA issued an approval ("Approval") of the SICP which included certain conditions outlined in Section B.3.

Conditions of approval for which responses were requested within 30 days are summarized in the sections below along with their corresponding responses/clarifications. The following enclosures are also provided:

- Enclosure A Revised SICP Figures
- Enclosure B Revised SICP Tables
- Enclosure C Unit 1-2 Protected Area
- Enclosure D Equipment/Transformer List

1. Cover Letter Comment: Disposal Facilities

Comment: *USEPA requests "the name and address of the disposal facilities that you have selected for disposal of PCB waste at any concentration" "to ensure that use of routes to transport PCB waste from the Etiwanda Site to the offsite disposal facility will not increase the burden of potentially vulnerable communities that may be present near or along those routes."*

BTC III Response: Below are the selected disposal facilities for PCB remediation waste.

PCB Concentrations <50 Parts Per Million (PPM)

La Paz County Landfill
26999 AZ-95
Parker, Arizona 85344

PCB Concentrations 50 to 1,000 PPM

US Ecology Landfill
Hwy 95, 11 Miles S. of,
Beatty, Nevada 89003

[1] An initial SICP, dated August 5, 2022, was submitted to Ms. Carmen Santos, USEPA PCB Coordinator, on August 8, 2022. The USEPA provided comments to Roux during meetings on August 8, 2022, August 23, 2022, and November 18, 2022. Based on direction received from USEPA during these meetings, Roux made revisions to the SICP which were incorporated into the revised SICP, dated November 28, 2022.

Alternate disposal facilities may be selected during implementation of the SICP based on availability and costs.

2. **Section B(3)(f) – Excavation Area Cleanup Verification Sampling Grid Figure**

Condition of Approval: *USEPA requests "a figure showing the cleanup verification sampling grid for that excavation area," referring to "the excavation area related to sample Unit-2-LT-30A (670 mg/kg total PCBs), the excavation area includes sampling locations Unit-2-LT-35A, -35D, -30C, and -25C."*

BTC III Response: The proposed verification sampling grid for the excavation area is shown on Figure 8 (Enclosure A). Verification samples will be collected as composite samples in accordance with 40 CFR §761.289(b)(1)(i) (non-point source cleanup), using a maximum of four discrete samples per composite sample. Table 4 of the SICP has been revised to summarize the verification samples to be collected (Enclosure B).

3. **Section B(3)(f) – Sub-Slab Characterization Sampling Grid Figure and Table**

Condition of Approval: *USEPA requests "a revision of [SICP] Figure 7 depicting the discrete soil samples that it will collect beneath the concrete and asphalt that it will remove. The Owner must also correct Note 4 in Figure 7 by changing 'verification samples' to 'characterization samples.' The Owner must also email to EPA a revised [SICP] Table 4 showing each sample listed in that table as a discrete sample (not as composite samples)."*

BTC III Response: The proposed characterization sampling grid for the soil beneath the PCB-impacted concrete and asphalt areas is shown on the revised Figure 7 (Enclosure A). Characterization samples will be collected as discrete samples on a 10-foot by 10-foot grid in accordance with 40 CFR §761.265(a). Table 6 (Enclosure B) has been prepared for the SICP to identify the discrete characterization samples to be collected following removal of the PCB-impacted concrete and asphalt. Table 5 (Enclosure B) of the SICP has been revised to indicate the discrete soil characterization samples to be collected to delineate the extent of PCB impacts in the northwest part of the cleanup area.

4. **Section B(3)(h) – Figure Depicting Soil to Be Protected in Place**

Condition of Approval: *USEPA requests "a figure depicting all the soil areas that it will protect in place."*

BTC III Response: Figure A (Enclosure C) depicts the current soil protection area. Final protection areas cannot be established until soil characterization is complete. Therefore, Roux requests an extension for submittal of a figure depicting the final soil protection areas to 30 days following the receipt of soil characterization sample results.

5. **Section B(3)(k) – Clarification to Composite Sample Reference**

Condition of Approval: *USEPA requests clarification "of the reference to 40 CFR §761.289(b)(i) in Section 5.3 of the SICP in reference to composite sample preparation."*

BTC III Response: The reference to 40 CFR §761.289(b)(i) in Section 5.3 of the SICP is a typo. The text in Section 5.3 should refer to 40 CFR §761.289(b)**(1)**(i).

6. **Section B(3)(m) – Confirmation of Decontamination Standard for Water with PCBs**

Condition of Approval: *USEPA requests confirmation of "the decontamination standard that [BTC III] will apply to water that has PCBs, if it generates such water during decontamination*

activities and/or during implementation of the soil protection measures covered in the above condition B.3."

BTC III Response: Water potentially generated during decontamination activities will be drummed, sampled, profiled, and disposed of offsite by an appropriate disposal contractor.

Water potentially generated during implementation of the soil protection measures, identified in Section 4.3.2 of the SICP, will be handled using the decontamination standard of <3 micrograms per liter (µg/l) or a PCB discharge limit included in a permit issued under section 307(b) or 402 of the Clean Water Act, as stated in 40 CFR §761.79(b)(1)(ii), for any water discharged to a treatment works or to navigable waters. Water intended for unrestricted use will meet the ≤0.5 µg/l standard for unrestricted use, as stated in 40 CFR §761.79(b)(1)(iii).

7. Section B(3)(n) – Decontamination Procedures

Condition of Approval: *USEPA requests "the risk-based alternative decontamination application for EPA approval that follows the requirements in 40 CFR 761.79(h)(2)."*

BTC III Response: A risk-based alternative decontamination procedure is no longer requested. Equipment decontamination will be conducted following self-implementing decontamination procedures in accordance with 40 CFR §761.79(c)(2).

8. Section F - Responses to USEPA E-Mail Comments and Clarifications

The USEPA provided initial comments and inquiries in response to the SICP via e-mail correspondence dated November 28 and 30, and December 1, 2022. Section F of the Approval requests that responses to the comments and inquires in the e-mails referenced above be provided to USEPA within 30 days after the date of the Approval. Comments provided by USEPA in each e-mail are summarized below along with corresponding responses/clarifications.

November 28, 2022, Email Sent at 11:53 A.M.

Comment: *Regarding the below text from the revised notification, please note that changes to equipment decontamination self-implementing procedures are done under 761.79(h).*

"This SICP is a hybrid plan including aspects from the Self-Implementing requirements of 40 CFR §761.61(a) and Risk-Based Approval requirements of 40 CFR §761.61(c). Risk-Based Approval is requested in the following sections, as noted in the Section title ["Risk-Based Approval §761.61(c)"]:

- ***Section 4.3.7****: Equipment Decontamination*
- ***Section 5.1****: Grid Size; and*
- ***Section 5.6****: Decontamination Procedures."*

BTC III Response: Noted. As described in our response to USEPA's condition of approval outlined in Section B(3)(n) above, a risk-based decontamination process is no longer being requested.

November 28, 2022, Email Sent at 12:36 P.M.

Comment: *I was not able to find Appendix C to the notification. If not included please send the written certification signed by the property owner and the cleanup party right away. Without that information, the notification is incomplete.*

BTC III Response: Roux provided the signed certification for the Etiwanda SICP to USEPA in an e-mail dated November 28, 2022, at 12:51 P.M.

November 30, 2022, Email Sent at 11:01 A.M.

Comment: *Regarding the revised notification, is section 3.4 (Decontamination procedures) a request for an approval under 761.79(h)? Please clarify the 40 CFR 761.79(h) paragraph that Section 3.4 refers to as it is not mentioned in that Section. Please note that prior to its use, EPA has to approve the proposed decontamination procedure. Based on the text in Section 3.4 the decontamination procedure was used before EPA approval under 761.79(h).*

BTC III Response: As described in the response to USEPA's condition of approval outlined in Section B(3)(n) above, a risk-based decontamination process is no longer being requested.

December 1, 2022, Email Sent at 5:55 A.M.

Comment #1: *Regarding 79(h), please note that concurrence with the sampling plan did not mean approval of the plan or any other matter associated with the plan. A 79(h) pilot study should be approved by EPA (Division Director level) before it is conducted and the proposed procedure for decontamination is approved by EPA (at same management level as the pilot study) based on whether the pilot study results showed the procedure was effective in decontaminating the material to a PCB level adequate for unrestricted use or other level specified in the PCB regulations and applicable to the material being decontaminated.*

BTC III Response #1: Noted.

Comment #2: *Regarding the initial characterization, please confirm the number of discrete samples of concrete that were combined into one composite sample and extraction method used.*

BTC III Response #2: Individual coring locations that make up each composite sample area are depicted on Figure 4 of the revised SICP and described below.

Composite Sample ID	Number of Discrete Samples Combined into the Composite Sample	Extraction Method
Sample Unit-1-SST(S)	12	3546
Sample Unit-2-LT	13	3546
Sample Unit-2-SST_SO-W-W	7	3546
Sample Unit-2-SST_SO-W-S	12	3546

Subsequent discrete sampling/characterization was performed using Soxhlet extraction method (3540C) and results were reported on a dry-weight basis.

Comment #3: *Regarding known soils with PCB contamination that will remain in place temporarily until Phase 2 or Phase 3, please clarify how the soils will be covered to prevent stormwater runoff. Also, please clarify if stormwater runoff is generated during a rainfall event, how will the runoff be collected? If collected, the stormwater runoff and any "sediments" would need to be tested for PCBs.*

BTC III Response #3: As described in Section 4.3.2 of the revised SICP, soils temporarily remaining in place will be protected from precipitation and/or stormwater

runoff by placing a nonwoven geotextile on the ground surface, covered by 6-mil polyethylene plastic sheeting. The geotextile and plastic sheeting will be held in place by hay bales and stakes (as recommended by USEPA in Section B(3)(h) of the Approval) or gravel bags placed at a minimum of every 10 feet.

As requested in Section B(3)(h) of the Approval, an earthen berm will be constructed surrounding the area protected in place to prevent flow of stormwater onto the protected area.

The surrounding area will generally consist of exposed ground surface, where stormwater is expected to infiltrate directly.

December 1, 2022, Email Sent at 7:10 A.M.

Comment #1: *"A combination of the above-listed options [Section 4 of the SICP] (removal or capping) for Phase 3 may be used, depending on final characterization results and redevelopment plans. Additional details and rationale of the recommended cleanup approach are presented in the sections that follow."*

The parenthetical through me off. Please confirm if this means a combination of removal and capping may be implemented at the cleanup site under one specific phase.

BTC III Response #1: Phase 3 will be the subject of a separate submittal to USEPA as requested in condition B(3)(a) of the Approval.

Comment #2: *Also, a schedule for implementation of the three phases should be provided given that it will take until or after Phase 3 to remove soils contaminated with PCBs or to cap such soils.*

BTC III Response #2: Commencement of SICP implementation is on hold pending USEPA approval of reuse of concrete and asphalt outside of the delineated areas at Former Generating Units 1 and 2. Therefore, Roux requests an extension for providing an implementation schedule until 30 days following the receipt of USEPA approval.

Comment #3: *"It is proposed to not shift the grid as required by 40 CFR §761.283 (b)(1)(ii) where resampling is needed in order to simplify and streamline the sampling process and data management. The proposed grid is shown on Figure 7."*

"The reasons not to shift the grid as required in Subpart O are not technical reasons. Please give me a justifiable technical reason for deviating from the Subpart O verification sampling grid requirements when recleaning is necessary.

BTC III Response #3: Approval to deviate from the requirements of Subpart O is no longer being requested.

December 1, 2022, Email Sent at 10:32 A.M.

Comment #1: *The PCB regulations do not have a 761.286(d) provision. Are you referring to 40 CFR 761.283(d)? In addition, please note that 40 CFR 761.298 describes the procedure that must be followed to evaluate the results of composite samples. Please clarify Section 5.2.*

BTC III Response #1: The regulatory reference in Section 5.2 included a typo; Section 5.2 should have referred to 40 CFR §761.283(d). Sample results will be evaluated in accordance with the requirements specified in 40 CFR §761.298:

- For grid samples which are chemically analyzed individually, the PCB concentration will apply to the area of inference as described in 40 CFR §761.283(d); and
- For grid samples analyzed as part of a composite sample, the PCB concentration will apply to the area of inference of the composite sample as described in 40 CFR §761.283(d) (i.e., the area of inference is the total of the areas of the individual samples included in the composite).

Comment #2: *40 CFR 761.289(b)(i) is not a regulatory provision in the regulations. Are you referring to 761.289(b)(1)(i)? Please clarify and also explain why 761.289(b)(2) would not be applicable.*

BTC III Response #2: The regulatory reference in Section 5.3 included a typo; Section 5.3 should have referred to 40 CFR §761.289(b)(1)(i).

40 CFR §761.289(b)(2) is not applicable, as it describes procedures for compositing samples collected at small cleanup sites in accordance with 40 CFR §761.283(c). As noted above, sample collection will be performed in accordance with 40 CFR §761.283(b).

Comment #3: *EPA considers for approval proposed changes to self-implementing decontamination procedures under 761.79(h) not 761.61(c). It is not clear what Section 5.6 is conveying or trying to achieve. Are you asking EPA to approve the use of a non-phosphate detergent for decontamination? If so, you need to tell us what is the detergent that you want EPA to approve instead of giving an example. A specific detergent was used in the quasi pilot study conducted without EPA approval. The detergent that was used in that study must be included in the request for an EPA approval under 761.79(h). Also, please verify if the wipe samples that you collected as part of the study were collected from the tools or equipment that was exposed to the highest PCB concentrations found in concrete and soil.*

BTC III Response #3: A risk-based decontamination process is no longer being requested. Self-implementing decontamination will be conducted in accordance with 40 CFR §761.79(c)(2).

9. Section F – Summary of Soil Removals

Comment: *USEPA requests a summary of all soil removals conducted at Former Units 1 and 2 including whether PCBs were a constituent of concern, and related PCB analytical results.*

BTC III Response: There have been no soil removals in the area of Former Generating Units 1 and 2 to date.

10. Section F – Summary of PCB Analytical Results and Equipment Removed

Comment: *USEPA requests a list of equipment removed from the Etiwanda Site such as compressors. Please send that information also for Units 3 and 4.*

BTC III Response: Attached in Enclosure D is a list of the transformers that were removed from the Property by BTC III and its contractors. Equipment that previous property owners/operators had removed prior to BTC III's ownership of the Property is documented in the December 2018 Closure Report for GenOn Etiwanda Generating Station, prepared by ERM-West, Inc. on behalf of GenOn (the previous owner of the Property).

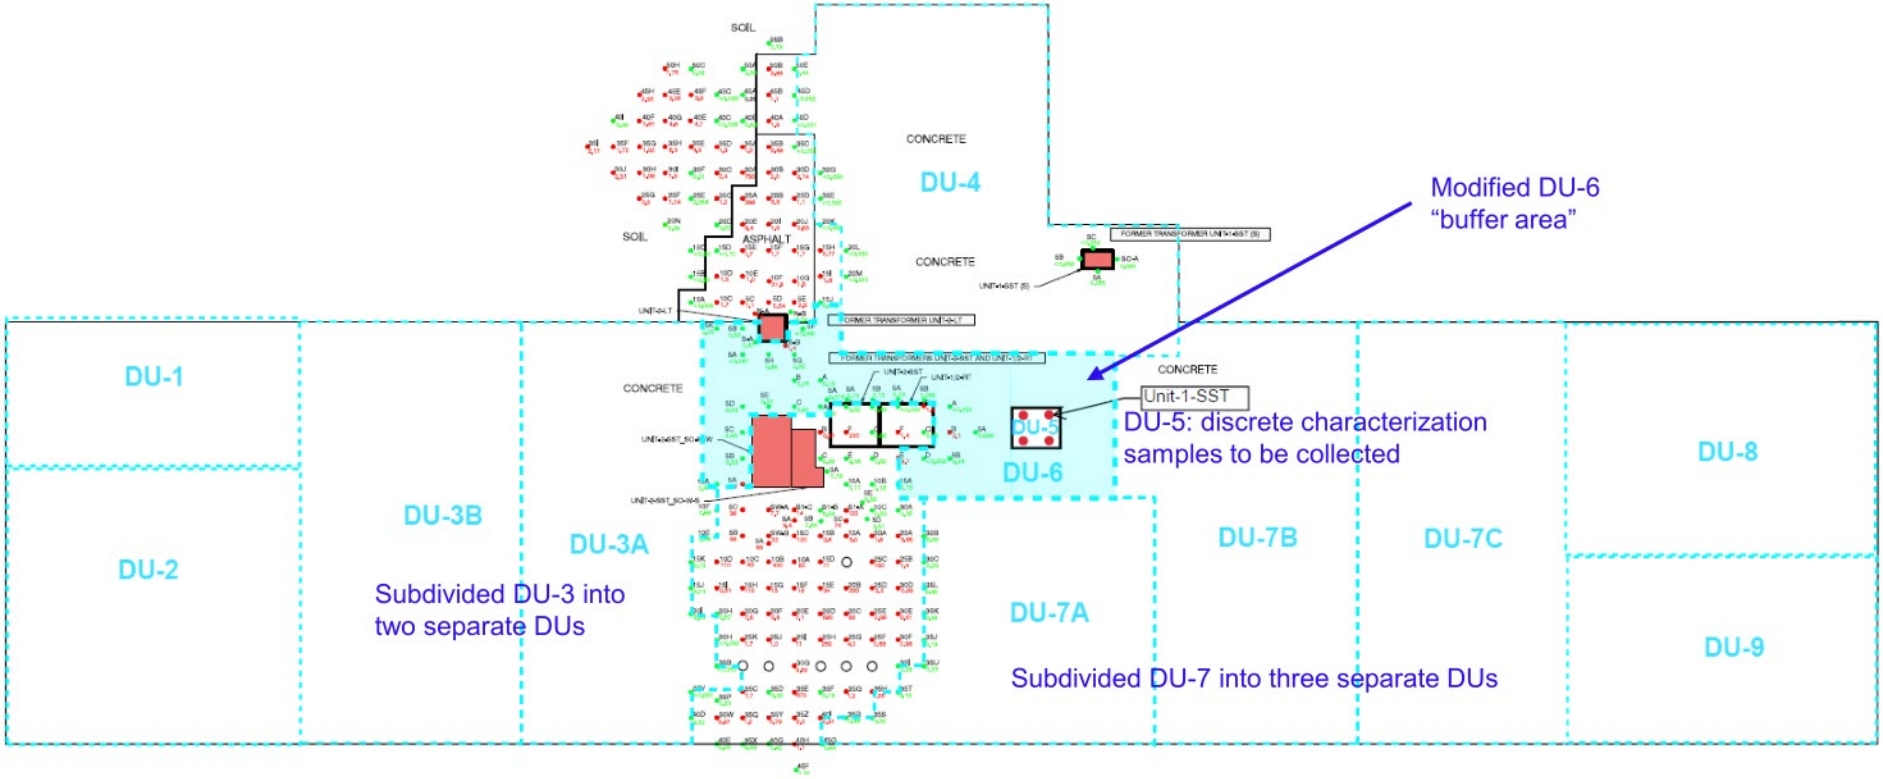
PCB CLEAN-UP PLAN UPDATE

May 3, 2023



Agenda

1. Updated conceptual characterization plan
2. Response to USEPA comments dated April 25, 2023

Conceptual Characterization Plan: Original Proposed Decision Units

Conceptual Characterization Plan: Revised Proposed Decision Units

Response to USEPA Comments

Comment 3: Increment Design: The plan should describe the rationale for using 30 increments to characterize PCBs in concrete. This design is consistent with ITRC's ISM-2 sampling protocol. However, as observed by several practitioners (such as Hawaii Department of Health), PCB-contaminant distribution is more heterogenous in soils than metals and recommend 75 increments or more. We recommend that:

a. If the consultant is proposing 30 increments based on scientific literature, they should cite the publication in the plan.
b. If no literature is available, the consultant should prove 30 increments can consistently meet the data quality objectives by performing a pilot test (also called demonstration of methods applicability). This pilot should be performed prior to site characterization implementation and should be targeted in an area of significant uncertainty (DU-6 seems ideal).

Response:

- No pilot test is proposed.
- Per ITRC ISM guidance, Visual Sample Plan (VSP) software was used to establish a statistical rationale for the number of increments necessary to accurately characterize each DU using ISM.

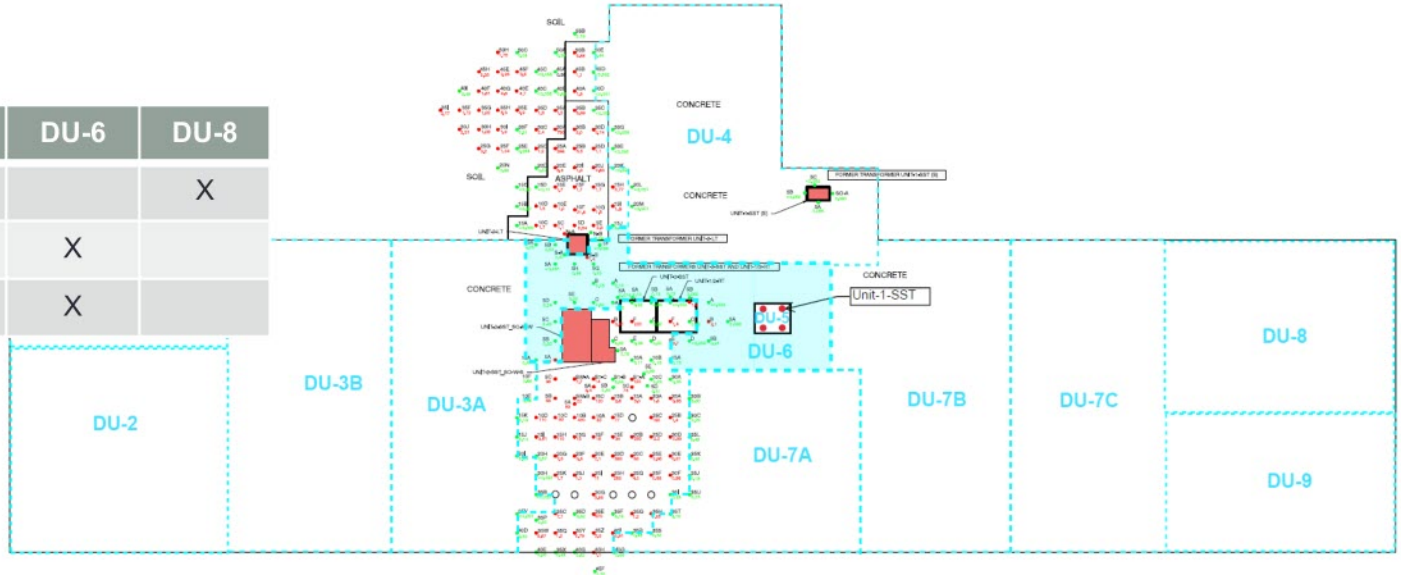
→→ **VSP recommends minimum of 42 samples per DU based on site-specific inputs and specifications.**

- Concrete characterization plan will include an attachment describing statistical rationale for increment design.

Response to USEPA Comments

Comment 1: Replicates/Triplicates: The Decision Units (DUs) should include replicates/triplicates. Triplicates should be used to verify uncertainties in the ISM design. Therefore, at a minimum, we recommend:

a. One triplicate for a likely low to no PCB concentration DU (based on draft plan, DU-8 and DU-9 appear to be good candidates)



b. One triplicate for a high PCB concentration DU (DU-5 seems ideal)

c. Triplicates for all 'boundary' DUs (DU-3, DU-4, DU-6, and DU-7 appear to be good candidates)

Response:

- Proposed triplicates:

	DU-6	DU-8
Likely low PCB concentration		X
Likely high concentration	X	
Buffer area DUs	X	

Response to USEPA Comments

Comment 5: Field and Laboratory Quality Control Samples: During the March 17 meeting with Etiwanda, EPA mentioned among other things that Etiwanda needs to add to its plan field quality control (e.g., triplicates) and laboratory quality control samples (e.g., triplicates) for PCB analysis. The plan should also include the statistics to evaluate the results of field and laboratory triplicates.

Response:

- Field and laboratory triplicates will be included in the plan.
  - Field triplicates as described on previous slide
  - 1 laboratory triplicate
- Evaluation of results will be conducted in accordance with ITRC ISM guidance
  - Single sample DUs: Compare ISM sample result to action levels.
  - Triplicate sample DUs: Compare 95% UCL (using ITRC-generated spreadsheet) to action levels.
- Action levels

Response to USEPA Comments

Comment 2b: DU Boundary Design:

b. All DUs should be verified and modified with a walkthrough or survey of the concrete surface. During the walkthrough, cracks, slopes in the concrete, and stains should be noted, photographed, and the DU design should be adjusted.

Response:

- Discussion

Response to USEPA Comments

Comment 2c: DU Boundary Design:

c. The plan should describe the rationale for the 10-foot buffer area. The buffer area should be consistent with the likely spill zone and verified with employees that have observed leaks and spills.

Response:

- Discussion

Response to USEPA Comments

Comment 2a: DU Boundary Design:

a. DU-3, DU-4 and DU-7 are large for making decisions about disposal, which the contractor acknowledges in that they propose splitting these into smaller DUs if they fail. We suggest dividing DU-3, DU-4, and DU-7 into smaller DUs to include a buffer area, similar to the DU-5 and DU-6 approach.

Response:

- DU-3 and DU-7 will be subdivided, with subdivision lines oriented north-south.

Response to USEPA Comments

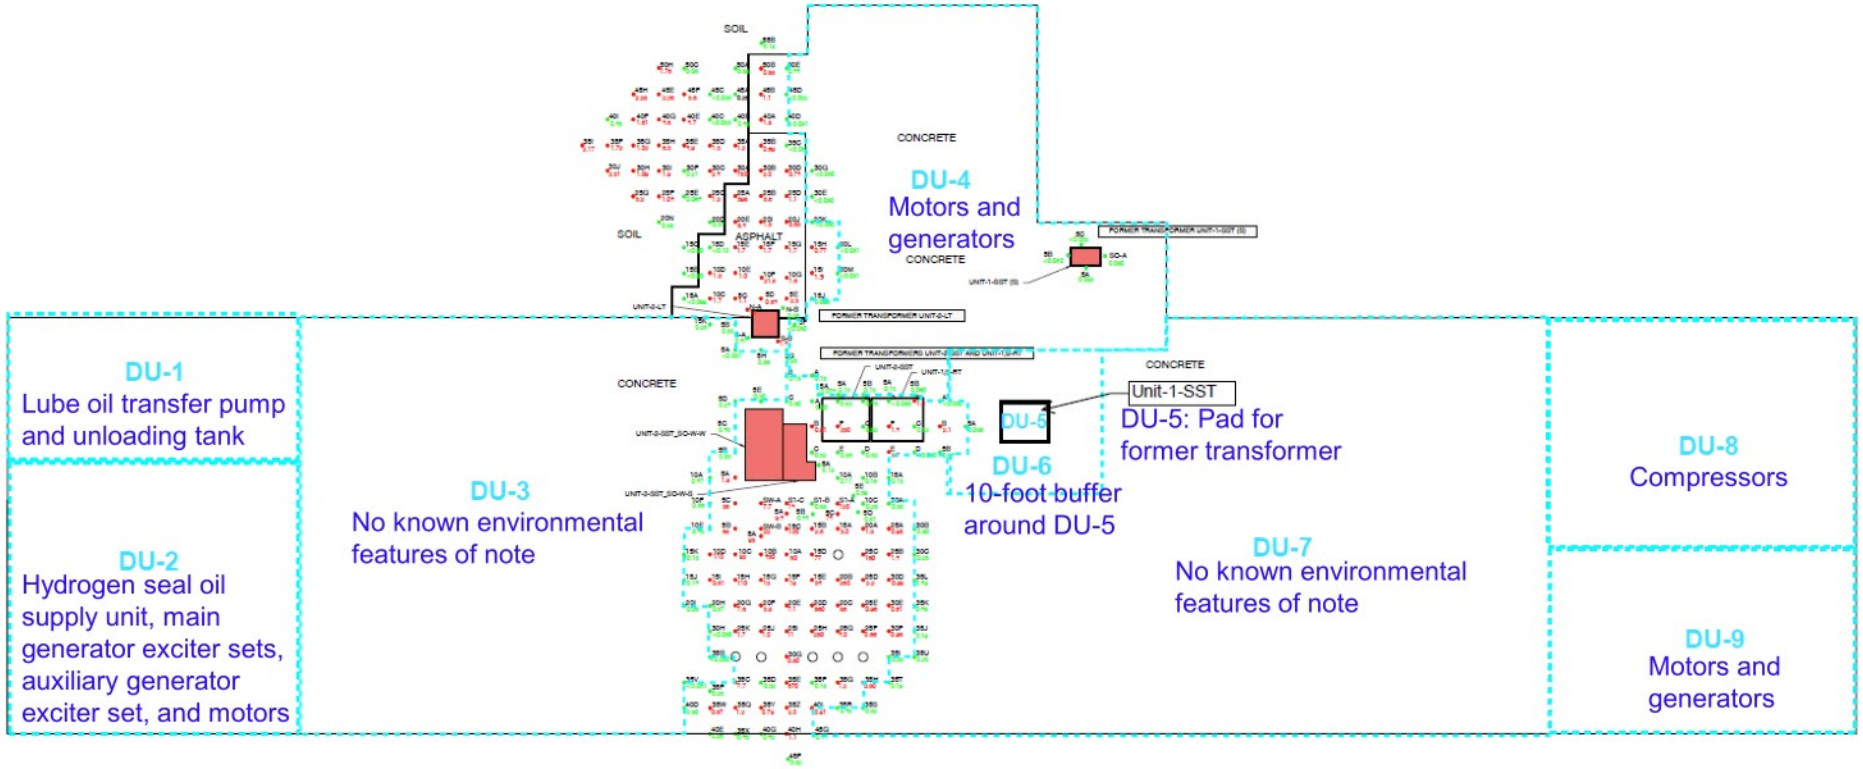
Comment 4: DU Failure: Under subsection 5d of the Proposed ISM Procedure, clarification is needed for the statement "Owner may elect to subdivide existing DUs into smaller areas and resample in accordance with above-listed procedure in order to limit the volume of materials to be disposed of offsite." We recommend:

a. Outlining a procedure on how an area will be subdivided.
b. A regulatory approval process for the redesign.

Response:

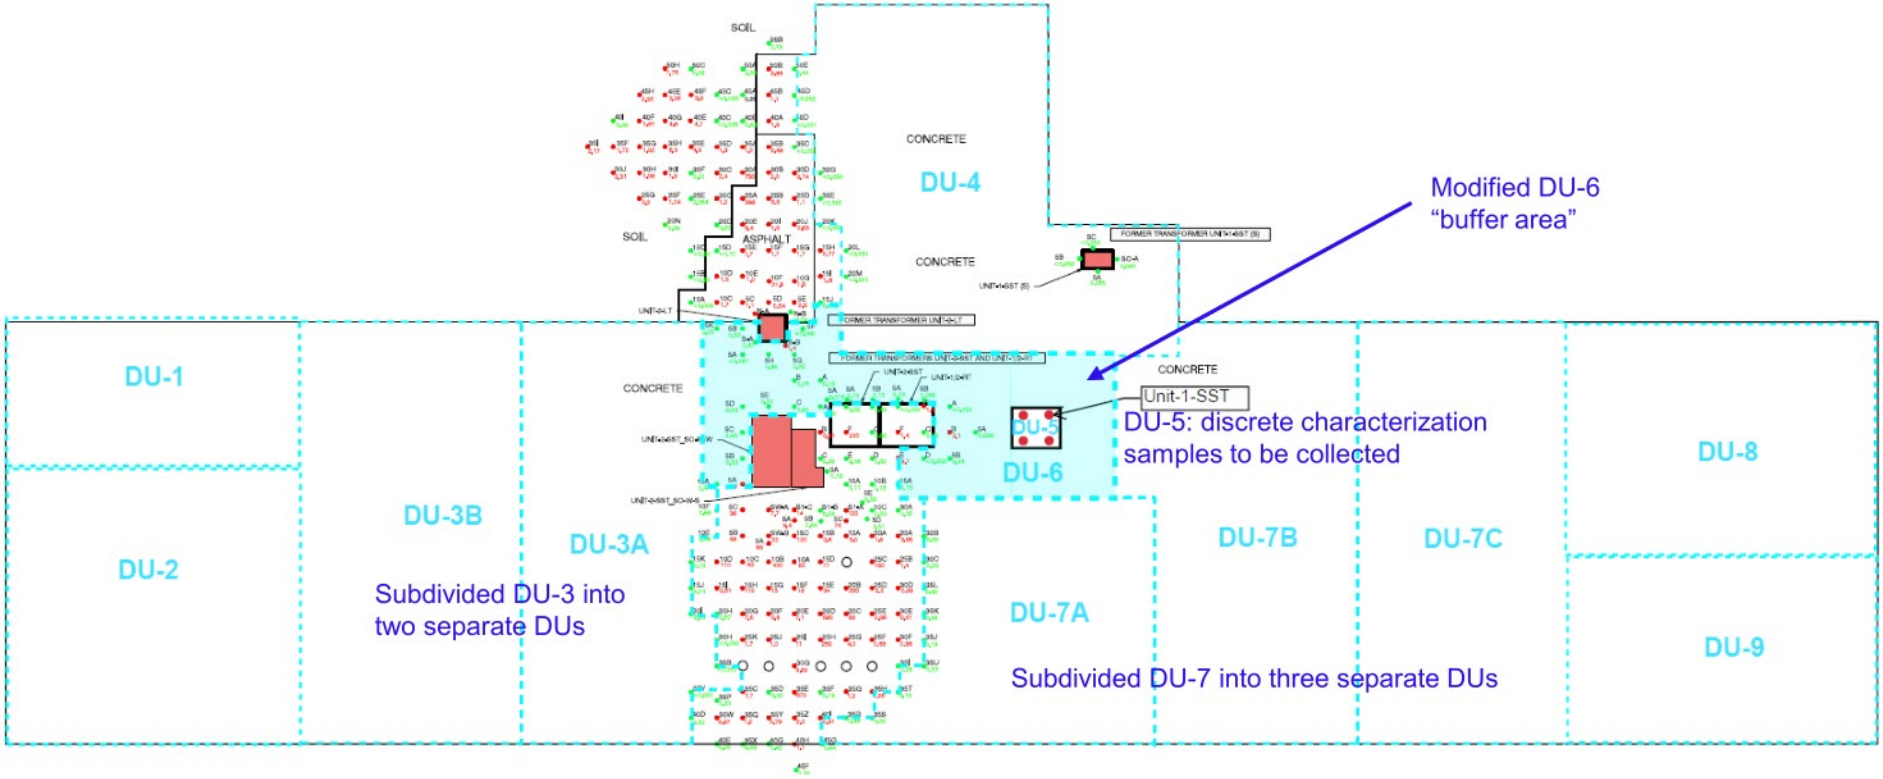
- Discussion

ETIWANDA COMMERCE CENTER



PCB CLEAN-UP PLAN UPDATE

May 5, 2023



Agenda

1. Revisit updated conceptual characterization plan
2. Response to USEPA comments dated April 25, 2023 (continuation of May 3, 2023 discussion)

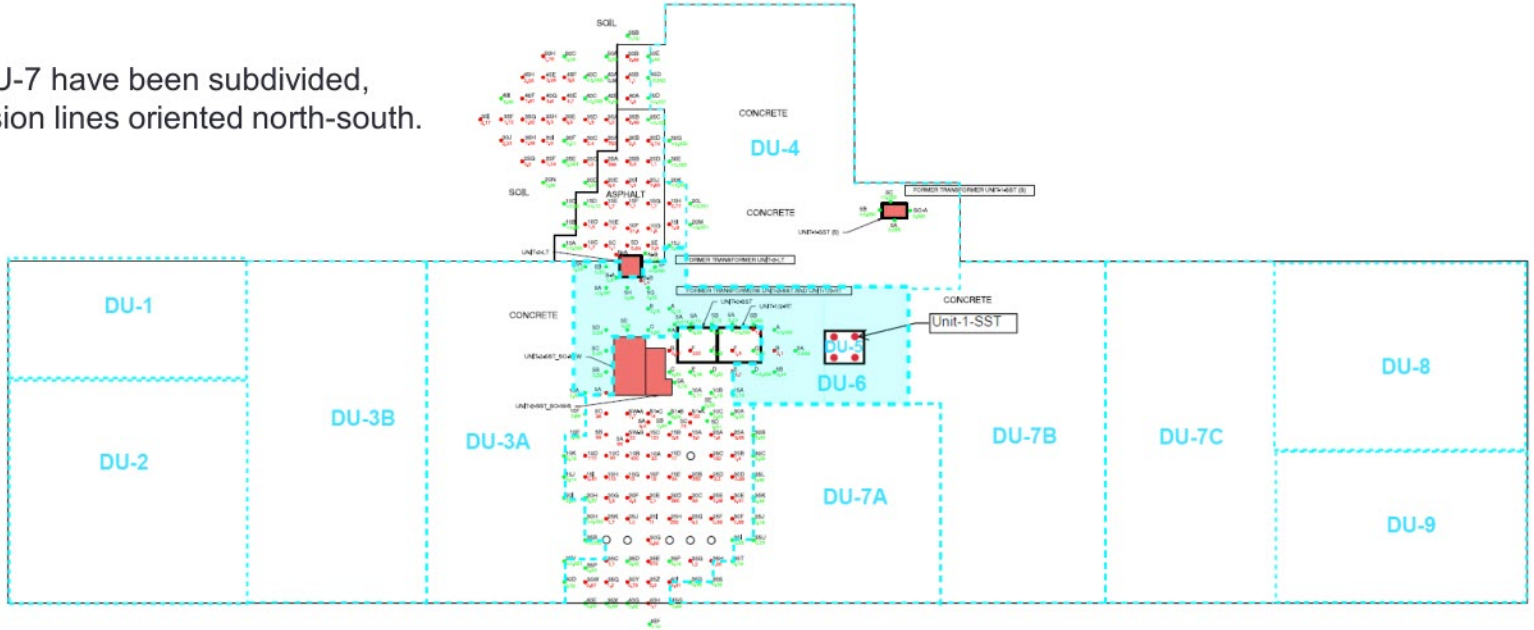
Conceptual Characterization Plan: Original Proposed Decision Units

Conceptual Characterization Plan: Revised Proposed Decision Units

Conceptual Characterization Plan: Revised Proposed Decision Units

- Figure shows conceptual layout only, and does not include triplicate sample locations
- DU size ranges from 1,590 to 3,460 SF (excluding DU-5)
  - Smallest: DU-1
  - Largest: DU-4
- Number of increments: 42-46 (42 minimum)
- Increment spacing: 7-9 feet

DU	Approx. Area	# Increments	DU	Approx. Area	# Increments
DU-1	1,590 SF	45	DU-6	1,780 SF	44
DU-2	2,910 SF	42	DU-7A	2,130 SF	46
DU-3A	2,760 SF	45	DU-7B	3,210 SF	43
DU-3B	2,910 SF	44	DU-7C	3,240 SF	45
DU-4	3,460 SF	43	DU-8	2,650 SF	42
DU-5	90 SF	4 discrete samples	DU-9	2,090 SF	45



Response to USEPA Comments

Comment 2a: DU Boundary Design:

a. DU-3, DU-4 and DU-7 are large for making decisions about disposal, which the contractor acknowledges in that they propose splitting these into smaller DUs if they fail. We suggest dividing DU-3, DU-4, and DU-7 into smaller DUs to include a buffer area, similar to the DU-5 and DU-6 approach.

Response:

- DU-3 and DU-7 have been subdivided, with subdivision lines oriented north-south.

Response to USEPA Comments

Comment 2b: DU Boundary Design:

b. All DUs should be verified and modified with a walkthrough or survey of the concrete surface. During the walkthrough, cracks, slopes in the concrete, and stains should be noted, photographed, and the DU design should be adjusted.

Response:

- Discussion

Response to USEPA Comments

Comment 2c: DU Boundary Design:

c. The plan should describe the rationale for the 10-foot buffer area. The buffer area should be consistent with the likely spill zone and verified with employees that have observed leaks and spills.

Response:

- Discussion

Response to USEPA Comments

Comment 4: DU Failure: Under subsection 5d of the Proposed ISM Procedure, clarification is needed for the statement "Owner may elect to subdivide existing DUs into smaller areas and resample in accordance with above-listed procedure in order to limit the volume of materials to be disposed of offsite." We recommend:

a. Outlining a procedure on how an area will be subdivided.
b. A regulatory approval process for the redesign.

Response:

- Discussion

Discussion/Questions

Response to USEPA Comments – UPDATED

Comment 5: Field and Laboratory Quality Control Samples: During the March 17 meeting with Etiwanda, EPA mentioned among other things that Etiwanda needs to add to its plan field quality control (e.g., triplicates) and laboratory quality control samples (e.g., triplicates) for PCB analysis. The plan should also include the statistics to evaluate the results of field and laboratory triplicates.

Response:

- Field and laboratory triplicates will be included in the plan.
  - Field triplicates as discussed elsewhere
  - 2 laboratory triplicates (approximately 10% of samples submitted for laboratory analysis)
- Data precision evaluation will be conducted in general accordance with HIDOH DU-MIS Guidance
  - Relative standard deviation (RSD) will be calculated for each replicate data set.
  - RSD < 50% → Data is useable for its intended purpose.
  - RSD > 50% → Further evaluation is required (see caveats below)
  - Caveats:
    - High RSDs can become unavoidable as contaminant concentrations approach the laboratory method reporting and detection limits.
    - Similarly, RSDs typically increase as the magnitude of contamination increases. Sample data that significantly exceed target action levels is generally acceptable for decision making even though the RSD of the replicate data indicate very poor precision.

Response to USEPA Comments – UPDATED

Comment 5: Field and Laboratory Quality Control Samples

Response (continued):

- Evaluation of results will be conducted in accordance with ITRC ISM guidance
  - Single sample DUs: Compare ISM sample result to action levels
  - Triplicate sample DUs:
    - Compare 95% UCL (using ITRC-generated spreadsheet) to action levels?
    - 2020 draft updates to HIDOH DU-MIS Guidance discourages the use of 95% UCL
    - Discussion

CERTIFICATION

Certification of Self-Implementing PCB Cleanup and Disposal PCB Remediation Waste, 8996 Etiwanda Avenue, Rancho Cucamonga, California

This Certification is being submitted in connection with the Self-Implementing PCB Cleanup and Disposal PCB Notification Plan (the "Plan") for the site located at 8996 Etiwanda Avenue, Rancho Cucamonga, California (the Property).

The party conducting the cleanup described in the Plan, hereby certifies, and has advised the owner of the Property where cleanup is located, that all sampling plans, sample collection procedures, sample preparation procedures, extraction procedures, and instrumental/chemical analysis procedures used to assess or characterize the PCB contamination at the Property, are on file at the following location(s) and are available for USEPA inspection:

- 8996 Etiwanda Avenue, Rancho Cucamonga, California

To access these files, please contact Matthew Nelson with Roux Associates, Inc., at mnelson@rouxinc.com to arrange an appointment and identify the specific records to be inspected. BTC III Etiwanda Commerce Center will compile the information requested and make the information available for review in their office or transmit electronic copies directly to the USEPA representative requesting the information.

Annotated Agenda from Etiwanda All Hands Meeting, 30 August 2023

Attendees:

Margaret Alkon (EPA), Carmen Santos (EPA), Dina Kourda (DTSC)

Jim Murray (Owner), Mark Foley (Owner), Jess Hinchliffe (Owner)

Pam Andes (Counsel), Deepa Gandhi (EKI), Matthew Nelson (Roux), Andrew Shapero (Roux), Travis Clow (Roux)

Proposed Agenda to Discuss Next Steps for Etiwanda (for continuity, phrasing is similar to Carmen's 11 July 2023 next steps email):

Goal: Provide a Plan in the next submittal that is implementable by the Owner and approvable by EPA

1. Increments:
   Presentation by Roux with description of approach and rationale
   a. Appropriate VSP inputs for calculation of minimum number of increments
      i. Owner has selected VSP inputs based on the historical use and expected concentration of PCBs in the areas to be sampled, to determine the minimum number of increments for each DU, which is a VSP output.
      ii. Additional discussion of EPA technical rationale for changing the VSP inputs is requested.

➔ EPA was interested in the standard deviation estimate of 0.15 units input into VSP. It was agreed that more information would be provided by Roux in the revised plan regarding the description of and rationale for the data used as a basis for that estimate, including the PCB analysis method, sample locations, etc. for the dataset. A more robust discussion of how this dataset is consistent with the conceptual site model for the sampling area will also be added.

   b. Standardization of the number of increments
      i. Owner has proposed 42 minimum increments per DU, but actual number of increments varies from 42 to 46 based on the geometry of the DU, averaging 44.5 increments with a standard deviation of 1.4.
      ii. Additional discussion about EPA's technical rationale for standardization of increments is requested.

➔ The main issue for revision in the plan that EPA identified on this topic was variability amongst number of increments for replicate samples within a given DU, particularly for DU-7A. DU-4 may also warrant a revisit with respect to this comment. The number of increments will be reassessed for the DU-7A replicates, and if possible, modified so that each DU-7A replicate has the same number of increments. If possible, the same modification will be made for DU-4.

c. Field observations and their relationship with locations of increments/increment grid layout: "How will field observations be considered when laying the grid for collection of increments?"
    i. Owner has proposed systematic random sampling (with fixed increment spacing)
    ii. Clarification is requested about EPA's comment, to understand how to be responsive to this comment.

➔ After discussion, it was agreed that the Applicant will elaborate on the location of the grid and explicitly indicate that the grid will cover the entirety of the concrete area identified for disposal based on ISM data, including areas where field observations indicate cracks, stains, and the like. It was acknowledged that small shifts in increment location (6" or so) may be needed based on field conditions and no agency notifications will be needed for this.

2. Plan for DU failure and the scope of this and future amendments
    a. Clarification on the term "DU failure" is requested, for better understanding of the issue EPA is looking to resolve.
    b. Owner has provided a preliminary plan for these items and would like to defer further development of related decision-making flow charts until the sampling results are available.
    c. Discussion about how deferring these decisions will impact EPA's process is requested, to better understand the rationale for these requests at this time.

➔ EPA explained why this discussion is required in the plan and approval, why it cannot be deferred, and what will and won't be included in this current approval.
    - Re DU failure, after discussion, a solution was floated that was acceptable to EPA: if a RSD>35% was calculated from a set of triplicate samples, the highest triplicate analytical result for that DU would be used for comparison to action levels and disposal decision-making.
    - The EPA approval, including proposed action levels, will be limited to the concrete area investigated by ISM plus DU-5 (the small discrete sampling area). Soil/future areas will be discussed separately.

3. Other non-concrete media
    a. EPA comments have been received regarding the following media, that, based on site conditions, are not intended by the Owner to be part of the "Site" or application. These media are: (1) water in condensate pits; and (2) dust and debris from demolition of overhead structures currently overlying the concrete surfaces to be sampled. We would like to discuss and understand EPA's rationale/approach to these media in the plan.

➔ For water that may accumulate in condensate pits in the future, the appropriate number of samples (based on professional judgement), analytical method (EPA 8082), and detection limit will be consistent with EPA's comments. For clearing of concrete surfaces to prepare them for sampling, large debris/material will be handled consistent with the site demolition plan; for smaller material of the size that can be vacuumed (e.g., dust) that may be present on the surface to be sampled, EPA indicated a preference to use a HEPA vacuum to containerize the material, with subsequent sampling and analysis for PCBs (EPA Method 8082/3540C). The Owner will take

EPA's recommendations into consideration in the development of the revised concrete characterization plan.

Subject: **Revised Site Characterization Plan, BTC III Etiwanda Commerce Center**
PCB Site ID: CATSCA111184 / CAR000038158

Dear Ms. Santos:

Please find enclosed the revised Site Characterization Plan ("Plan") for concrete ground surfaces at former Generating Units 1 and 2 ("Site") of the facility located at 8996 Etiwanda Avenue, Rancho Cucamonga, California. The Environmental Protection Agency (EPA) comments received on April 25, May 25, June 1, and June 27-29, 2023, have been addressed in the enclosed Plan. Responses to EPA's comments from June 27-29, 2023, are also provided as a separate enclosure.

With EPA approval of the enclosed Plan, we plan on conducting fieldwork in December. If you have any questions regarding this submittal or need additional information, please contact me at (732) 742-0764.

Sincerely,

Jessica Hinchliffe
BTC III Etiwanda Commerce Center LP

Site Characterization Plan

BTC III Etiwanda Commerce Center
8996 Etiwanda Avenue, Rancho Cucamonga, California

PCB Site ID: CATSCA111184 / CAR000038158

Prepared by: BTC III Etiwanda Commerce Center LP
Date: October 10, 2023

1. Introduction

BTC III Etiwanda Commerce Center LP ("Owner") prepared this site characterization plan for concrete ground surfaces at former Generating Units 1 and 2 ("Site"; Figure 1) of the facility located at 8996 Etiwanda Avenue, Rancho Cucamonga, California.

Polychlorinated biphenyl (PCB) impacts at the Site have been assessed via a stepwise investigation process based on historical operations and land uses started in 1995 under the oversight of the California Department of Toxic Substances Control ("DTSC"). Ground surfaces in the vicinity of former oil-containing equipment at the Site have been delineated using discrete samples collected on a 5-foot grid as described in the *Self-Implementing PCB Cleanup and Disposal Notification Plan* ("SICP") for the Site (Roux Associates, Inc., revised November 28, 2022; Roux, 2022). Step-out samples were collected and analyzed until concentrations in concrete and/or asphalt samples were less than DTSC Human Ecological Risk Office ("HERO") Human Health Risk Assessment ("HHRA") Note Number 3 (DTSC, 2022) commercial/industrial soil screening level ("DTSC SL") of 0.58 milligrams per kilogram (mg/kg) for total PCBs. Previous sampling results are shown on Figure 1.

In order to assess whether remaining concrete at the Site is suitable to remain on-Site, the Environmental Protection Agency (EPA) has requested a characterization plan for areas of concrete that remain to be characterized. This Plan has been prepared in response to EPA's conditional approval of the SICP (Condition B.3.b), dated December 15, 2022. In addition to satisfying EPA's request to characterize remaining concrete areas, this Plan has been developed as the Owner's initiated request to modify the approval EPA issued on December 15, 2022, under 40 CFR 761.61(a) and 40 CFR 761.61(c).

Due to the size of the remaining areas to be characterized (approximately 28,300 square feet ["SF"]) and prioritization of greener cleanup procedures, a sampling approach based on incremental sampling methodology (ISM) concepts is proposed as a Site-specific risk-based alternative under 40 CFR 761.61(c) for evaluation of remaining concrete ground surfaces for PCBs at the Site. Use of ISM for characterization of PCBs in soil is discussed in the PCB Facility Approval Streamlining Toolbox ("FAST") and EPA's August 8, 2019 document entitled ISM at PCB Cleanup Sites. Based on discussions with EPA, EPA is allowing the use of ISM at the Site for characterization of PCBs in concrete.

This plan has been developed in coordination with EPA and DTSC via meetings on March 17, May 3, May 5, and August 30, 2023, draft submittals and responses to EPA inquiries provided by Owner on March 14, March 17, May 5, May 11, May 19, and June 8, 2023, and written comments received from EPA on April 25, May 25, June 1, June 29, and July 11, 2023.

Details of the investigation design, field sampling procedures, and laboratory processing steps are provided below and in the attached documents:

- Attachment 2: Standard Operating Procedure: Incremental Sampling Methodology for Collection of Concrete Samples for Polychlorinated Biphenyl (PCB) Analysis
- Attachment 3: Laboratory Standard Operating Procedure for Multi-Incremental Sampling (MIS)

2. ISM Investigation Design

2.1. Decision Units ("DUs")

The ISM characterization program is designed to determine if PCBs are present in concrete at the Site outside of those areas previously characterized and, if so, at what concentrations. Decision Units ("DUs") were established based on historical uses at the Site, including the location of known former oil-containing equipment, process areas, rooms and/or other building features. Proposed DUs are presented on Figure 1, and summarized below:

Table 1: Proposed Decision Units

Decision Unit ID	Approximate Area	Description and Rationale
DU-1	1,590 SF	Northwest corner of the building slab. Previously contained lube oil transfer pump; trench and lube oil unloading tank; dirty oil sump based on historical information.
DU-2	2,900 SF	Southwest portion of the building slab. Previously contained hydrogen seal oil supply unit; main generator exciter sets; auxiliary generator exciter set, and motors based on historical information.
DU-3A (1)	2,970 SF	Area west of the delineated area extending to DUs 1 and 2. No oil-containing equipment was observed in this area based on historical information. DU-3A and DU-3B include the western condensate pit, the square footage and increment grids of which include the pit walls. Historically, the pit was installed as secondary containment below the closed loop circulation systems for condensers for each of the generating units. The purpose of the pit was to collect any condensate (water) that came out of the condensers. No oils or equipment known or suspected to have contained PCBs are known to have been staged in this pit.
DU-3B	4,090 SF	
DU-4 (1)	2,960 SF	Area to the north of former transformers Unit-2-SST and Unit-1/2-RT and the east of the delineated area. Previously contained motor and generator based on historical information. This area surrounds former transformer Unit-1-SST(s) but does not include it as this transformer pad was previously characterized and delineated, and will be disposed of following the self-implementing PCB cleanup notification that EPA approved on December 15, 2022 as modified by that approval.

[1] Because of its small size, DU-5 included in this submittal will be characterized using a discrete sampling approach.

Decision Unit ID	Approximate Area	Description and Rationale
DU-5 (2)	90 SF	Pad for former transformer Unit-1-SST located to the east of former transformer Unit-1/2-RT.
DU-6 (1)	1,410 SF	Area surrounding the pad for former transformer Unit-1-SST and including other nearby areas adjacent to previously-characterized and delineated former transformer pads. This area represents a reasonable work area around the former locations of equipment known or suspected to have contained PCBs.
DU-7A (1)	1,480 SF	Area east of the delineated area extending to DUs 8 and 9. No oil-containing equipment was observed in this area based on historical information. DU-7B and DU-7C include the eastern condensate pit, the square footages and increment grids of which include the pit walls. Historically, the pit was installed as secondary containment below the closed loop circulation systems for condensers for each of the generating units. The purpose of the pit was to collect any condensate (water) that came out of the condensers. No oils or equipment known or suspected to have contained PCBs are known to have been staged in this pit.
DU-7B	3,740 SF	
DU-7C	4,000 SF	
DU-8 (1)	2,650 SF	Northeast corner of the building slab. Previously contained compressors based on historical information.
DU-9	2,100 SF	Southeast corner of the building slab. Previously contained motors and generators based on historical information.

Notes: (1) Triplicate field samples to be collected. DUs designated for field replicate collection were determined in consultation with EPA and in response to EPA's April 25 comment #1:
a. One triplicate for a likely low to no PCB concentration DU: DU-8
b. One triplicate for a likely high PCB concentration DU: DU-6
c. Triplicates for all 'boundary' DUs: DU-3A, DU-4, DU-7A
(2) DU to be characterized using discrete sampling methodology on a 5-foot grid.

2.2. Increments and Field Bulk Samples

The field and laboratory protocols described herein are designed to improve reliability and defensibility of sampling data by reducing data variability and providing a reasonable estimate of a chemical's mean concentration for the volume of material being sampled.

A minimum of 42 increments (single points of collection that are combined to create field bulk sample for each DU) will be collected from each DU (except for DU-5 described above). The rationale for the number of increments to be collected is provided in Attachment 1, and field sampling procedures are provided in Attachment 2.

Increment locations were determined through systematic random sampling using Visual Sample Plan (VSP) software, by dividing each DU into a grid and selecting a random increment location within the first grid cell. Remaining increment locations were then assigned to the remaining grid cells at the same relative location. The DU boundaries and increment grids cover the entirety of the concrete to be characterized and disposed under this submittal. Proposed increment locations for each DU are presented on Figures 2 through 6. Minor adjustments (shifts of approximately 6" or less) may be made to the increment locations based on field conditions and the geometry of the DU prior to the initiation of sample collection. These minor adjustments made will be documented by the field personnel conducting the sampling.

Field bulk samples (or "ISM samples") will be prepared for each DU by combining the increments collected into a single container as they are collected in the field, which is then further processed and subsampled by the analytical laboratory according to specific protocols described in Attachment 3.

2.3. Data Quality Objectives

The following data quality objectives ("DQOs") have been established for this effort:

- Assess remaining areas of concrete known to be the location of former oil-containing equipment and process areas;
- Assess areas of concrete immediately adjacent to previously-characterized concrete and asphalt ground surfaces ("boundary DUs")
- Screen remaining areas of concrete with no known environmental features of note;
- Assess the representativeness of the ISM program by calculating the relative standard deviation (RSD) of field and laboratory replicate samples; and
- Use sampling results, including RSDs, to determine the disposal approach for characterized concrete;
- Waste management in accordance with TSCA requirements for characterization and disposal of PCB remediation waste and personal protective equipment (PPE)..

3. ISM Investigation Implementation

3.1. Field Preparation

- Debris from the previous demolition of aboveground structures (pieces of concrete and other building materials such as rebar) will be removed from the concrete surfaces to facilitate a visual survey of the sampling area.
    - Large building debris will be managed in accordance with the site demolition plan.
    - If needed prior to sampling, sampling areas on the concrete surfaces will be cleaned with a HEPA equipped vacuum to collect and containerize surficial dust for future characterization and offsite disposal (see Section 5.2).
- Standing water within Site boundaries (if any[2]) will be sampled in situ in accordance with 40 CFR 761.269. Following receipt of analytical results, standing water will be removed, containerized, and disposed of pending appropriate characterization. If any, previously submerged concrete surfaces in the condensate pits will be inspected and documented following water removal.
- A surveyor will be retained to mark out the corners of DUs and reference points to be used to lay out the increment locations within each DU.
- Increment locations will be marked out using tape and a marker or paint circles. No paint will be placed where the increment sample is to be collected. Different colors will be used to distinguish between replicate samples within a DU.
- DUs will be verified with a walkthrough and visual survey of the concrete surface. Cracks, slopes in the concrete, and stains will be noted and photographed, including their location(s) relative to nearby marked increment locations.

3.2. Sample Collection

- Sampling procedures are summarized below, and standard operating procedures for field sampling are provided in Attachment 2.
- Samples will be collected using a rotary hammer drill with a 1 1/8-inch diameter drill bit using methods in general accordance with EPA Region 1 Standard Operating Procedures for Sampling Porous Surfaces for PCBs. Maximum sample depth will be approximately 0.5 inches. Multiple closely spaced holes may be required to generate sufficient sample mass. Each increment will be 30 grams as weighed in the field.
- All the increments will be combined in a phthalate-free zip top bag or laboratory supplied container in the field to prepare the field bulk sample.

---

[2] Standing water in the condensate pits was observed in the spring of 2023. The water has since evaporated, and no water is anticipated to be present during upcoming Site characterization activities described herein.

- Samples will be transported under strict chain-of-custody to the analytical laboratory for processing and analysis, as described in Section 3.4. The following will be included on the chain-of-custody form accompanying the samples to the laboratory:
    - Sample extraction method: EPA method 3540C (manual Soxhlet)
    - Analytical method: EPA method 8082A.
    - All laboratory analytical results are to be reported on a dry weight basis.
    - Detection and quantitation limits must be at least 50% lower than the action level of 0.58 mg/kg total PCBs.
- Sampling tool decontamination is not required between increments. Sampling tools will be decontaminated between DUs and between triplicate samples. Decontamination procedures are provided in Attachment 2.
- Discrete samples collected from DU-5 will be collected following procedures described in the SICP.

3.3. Field Quality Control

- In consultation with EPA and DTSC, triplicate bulk samples will be collected from the following DUs: DU-3A, DU-4, DU-6, DU-7A, and DU-8.
- To prepare each triplicate, individual increments will be collected following a systematic random approach from different areas. The increments to prepare each of the triplicates (each of the three bulk samples) will not be collected side by side.
- Increment locations presented on Figures 3 through 6 include the proposed triplicate samples.
- Sampling tools will be decontaminated between triplicate samples.

3.4. Laboratory Processing of Bulk Samples

- Laboratory processing of bulk samples will be conducted by Eurofins Calscience LLC (“Eurofins”), of Garden Grove, California, in accordance with their Standard Operating Procedure for Multi-Incremental Sampling (MIS; Attachment 3) and as described below. Sample extraction and analysis will also be performed by Eurofins.
- The processing laboratory will be instructed to spread the ground sample in a thin layer (slab cake) and prepare a representative 30-gram subsample for testing by collecting 30 x 1-gram increments from the slab cake in a systematic random manner and combining each of the small increments. A flat bottom sampling tool with sides and a minimum 16-millimeter (mm) width should be used by the laboratory to collect the subsamples.
- A 30-gram subsample will also be collected to determine percent moisture as PCB analytical results must be reported as dry weight. Percent moisture will be determined following EPA’s extraction method 3540C procedures.
- The 30-gram subsample will be extracted following EPA’s extraction method 3540C (manual Soxhlet; including use of a 1-mm sieve size) and analyzed for PCBs following EPA method 8082A.
- The laboratory will be instructed on the chain-of-custody form to use EPA Method 3665A to clean up the sample extracts to achieve and consistently maintain detection and quantitation limits at least 50% lower than the action level of 0.58 mg/kg total PCBs.

3.5. Laboratory Quality Control

- To evaluate the accuracy of the laboratory subsampling procedures, the processing laboratory will collect three sets of triplicate samples from the bulk samples submitted for processing and analysis.
- Laboratory triplicate samples will be collected from bulk samples collected from DU-6 and DU-3A, which are boundary DUs adjacent to areas with previously characterized PCB impacts, and from DU-8, which is not a boundary DU.
- Laboratory results will be reported on a dry weight basis.

4. Evaluation of analytical results

4.1. Data Precision Evaluation

All laboratory packages will be reviewed for completeness and conformance with project goals. A data precision evaluation will be conducted by calculating the RSD for each replicate data set, including both field and laboratory replicates. As recommended by EPA, the following thresholds will be utilized when evaluating data precision of replicate samples:

- RSD ≤ 35%: Data will be considered useable for its intended purpose.
- RSD > 35%: Further evaluation will be conducted in consultation with EPA and DTSC (see caveats below).

When evaluating results of replicate samples with RSD > 35%, the following caveats should be considered:

- High RSDs can become unavoidable as contaminant concentrations approach the laboratory method reporting and detection limits. Sample data that indicate low concentrations well below the action levels may be considered acceptable for decision making even though the RSD of the replicate data indicate poor precision.
- Similarly, RSDs typically increase as the magnitude of contamination increases. Sample data that significantly exceed target action levels are generally acceptable for decision making even though the RSD of the replicate data indicate poor precision.

4.2. Evaluation of Analytical Results

Proposed action levels for total PCB concentrations are as follows:

- DTSC SL = 0.58 mg/kg
- Risk-based action level for on-Site management/capping = 25 mg/kg
- Action level for disposal at an approved PCB disposal facility or RCRA landfill = 50 mg/kg

For DUs where a single ISM sample was collected, the ISM sample result will be compared directly to action levels.

For DUs where replicate field samples were collected and the RSD is equal to or less than 35%, the mean concentration of the replicates will be calculated and compared to the action levels.

For DUs where replicate field samples were collected and the RSD exceeds 35%, the highest concentration will be compared to the action levels.

Discrete samples collected from DU-5 will be directly compared to the action levels above.

5. Management of Characterized Materials and Waste

5.1. Risk-Based Management of Characterized Ground Surfaces

Characterized ground surfaces may remain on Site (with or without capping) or be disposed of off Site as described in Table 2 below.

Table 2: Proposed risk-based management strategy for characterized materials

PCB concentration range	Management strategy
Total PCBs ≤ 0.58 mg/kg	Material will be crushed for use during the redevelopment of the subject property.
0.58 mg/kg < total PCBs ≤ 25 mg/kg	Material will be segregated, crushed, and placed under a new concrete or asphalt cap at least 6 inches thick on the same parcel from which the materials were generated. New building slab or pavement installed as part of the development will serve as the proposed protective cap. After cleanup and capping, procedures will be provided under a separate cover for: (1) regular inspection and maintenance of the cap; and (2) future breach of the cap.
25 mg/kg < total PCBs < 50 mg/kg	Material will be disposed of in a permitted nonhazardous landfill.
50 mg/kg ≤ total PCBs	Material will be disposed of in a hazardous waste landfill permitted by EPA or an authorized State, or in an approved PCB disposal facility.

Discrete in situ sample data, where available, will be used for waste profiling purposes for media requiring off-Site disposal. Where discrete sample data is not available, concrete requiring off-Site disposal will be profiled using ISM data collected as described herein. Additional disposal sampling may be conducted as required by the selected disposal facility.

5.2. Waste Management

The following waste streams may be generated during implementation of this Site Characterization Plan:

- **Water**: Standing water within the areas to be characterized (if any) will be sampled for PCBs in situ prior to removal in accordance with 40 CFR 761.269. Following receipt of analytical results, standing water will be removed, containerized, and disposed of offsite at an appropriately licensed disposal facility. Additional disposal sampling may be conducted as required by the selected disposal facility.
- **Dust**: Dust removal for preparation of concrete surfaces for sampling, if present and deemed warranted by the Site health & safety officer, will be performed using a HEPA-equipped vacuum. Dust will be containerized, and a sample collected for PCBs in accordance with 40 CFR 761.265(b) or (c), as applicable. The containerized dust will be disposed of offsite at an appropriately licensed disposal facility. Additional disposal sampling may be conducted as required by the selected disposal facility.
- **Decontamination liquids**: Decontamination liquids will be containerized during the decontamination process. Following implementation of this Site Characterization Plan, decontamination liquids will be sampled in accordance with 40 CFR 761.269. Following receipt of analytical results, decontamination liquids will be profiled and disposed of offsite at an appropriately licensed disposal facility. Additional disposal sampling may be conducted as required by the selected disposal facility.

6. Schedule and Reporting

Fieldwork is anticipated to begin at the beginning of December or 2 weeks after EPA and DTSC approval of this plan, and take 4-6 weeks to complete. Laboratory analysis is expected to have a turnaround time of 20 business days, after which RSDs will be calculated. Unexpected conditions or proposed deviations from the approved plan will be communicated to EPA and DTSC by email.

Results of the Site characterization activities are anticipated to be reported to EPA and DTSC in March or April 2024.

Attachment 1
Statistical Rationale Supporting ISM Approach

MEMORANDUM

Date: October 9, 2023

To: Jessica Hinchliffe – Senior Associate, BTC III Etiwanda Commerce Center LP

From: Matthew Nelson, PE – Roux
Travis Clow, PhD – Roux
Mauricio H. Escobar, PG - Roux

Subject: **Statistical Rationale of Incremental Sampling Methodology for Collection of Samples for Polychlorinated Biphenyl (PCB) Analysis**

Roux has prepared this memorandum providing the statistical rationale for the incremental sampling plan to be conducted as part of the Site Characterization Plan (the Plan) for concrete ground surfaces at former Generating Units 1 and 2 (Site) of the facility located at 8996 Etiwanda Avenue, Rancho Cucamonga, California. Incremental Sampling Methodology (ISM) is used to evaluate the mean contaminant concentration in environmental media (i.e., soil, sediment, concrete) using statistically supported techniques. The Interstate Technology Regulatory Council (ITRC) developed a guidance document describing ISM and how it is used; Incremental Sampling Methodology Update, October 2020 (ITRC, 2020). The ITRC ISM guidance was followed when establishing the rationale described below.

Approach

When sampling an area using ISM, the area must first be broken up into decision units (DUs) based on either known or assumed source areas, or on human and/or ecological receptors. DUs identified in the Plan were selected by evaluating historical uses at the Site. Once the DUs are established, the number and placement of increments (single points of collection that are combined to create an incremental sample for each DU) are evaluated for each DU. The ITRC ISM guidance recommends a range of 30 to 100 increments per DU as well as the use of Visual Sample Plan (VSP) software to best determine the appropriate minimum increment size for a given Site (ITRC, 2020). VSP provides a statistically sound tool for quantifying and defining a sampling scheme for any two-dimensional contamination problem in surface soil, building surfaces, water bodies, and other similar applications (VSP, 2014). VSP version 7.19 (VSP Development Team, 2023) software was used to establish a statistical rationale for the number of increments necessary to accurately characterize each DU using an incremental sampling plan. The implicit understanding in evaluating increments for each DU was that the number of increments will be greater than 30. PCB data from concrete samples collected surrounding former transformer pads at the Site (shown on Figure 1 of the Plan and Enclosure 1 of this memorandum) were used as an input into VSP. The Department of Toxic Substances Control (DTSC) Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA) Note Number 3 (DTSC, 2022) commercial/industrial soil screening level (SL) for total PCBs of 0.58 milligrams per kilogram (mg/kg) was also used as an action level input into VSP.

VSP provides multiple approaches for determining an appropriate sampling plan for a given DU. Two approaches to achieve data quality objectives (DQOs) stated in the Plan were considered for this incremental sampling plan: (1) Estimate the Mean using Stratified Sampling and (2) Compare Average to a Fixed Threshold. The VSP User Guide describes the first option, Estimate the Mean using Stratified Sampling, as being best suited for situations where there is an assumption of homogeneous contamination conditions in DUs and a fixed budget that needs to be met, rather than a specific cleanup goal (VSP, 2014). In this case, neither of these assumptions best reflect the Site and the DQOs. The second option, Compare Average to a Reference Average, allows for the comparison of the true average concentration of a DU (if one were to sample 100% of the DU) against a fixed threshold concentration (i.e., 0.58 mg/kg) to determine the number of increments needed to obtain a sufficient spatial density within a DU while simultaneously incorporating previously gathered data. The VSP User Guide states

that comparing the average to a fixed threshold is the most common issue confronted in environmental remediation (VSP, 2014). The Compare Average to a Fixed Threshold approach was chosen for all DUs at the Site, except for DU-5, because it allows for the most information to be utilized in determining an appropriate sampling plan. DU-5 is the location of a former transformer pad and the discrete sampling approach adopted for the other former transformer pads at the Site as described in the Self-Implementing PCB Cleanup and Disposal Notification Plan will be used for this DU (Roux, 2022).

Inputs and Assumptions

The baseline assumption used in VSP with the Compare Average to a Fixed Threshold sampling plan is that the data is normally distributed (i.e., follows a bell curve). This sampling plan requires a null hypothesis, which allows for a confidence level to be specified to ensure that the anticipated results accurately reflect real conditions at the Site. The null hypothesis in this sampling plan is that PCB concentrations are below the DTSC SL (0.58 mg/kg; action level) in all DUs until proven otherwise. This is consistent with the conceptual site model (CSM) for the DUs, which is that there are no known sources of PCB-containing equipment or materials storage located within the concrete pad being investigated as part of the Plan based on available historical information. There are two possibilities that can lead to erroneous results: (1) falsely rejecting the null hypothesis, meaning that the sample results indicate that the Site is not clean, when it is clean, or (2) falsely accepting the null hypothesis, meaning that the sampling results indicate that the Site is clean, when it is not clean. A confidence level of **at least** 95% is specified to ensure a less than a 5% chance of incorrectly characterizing the Site by either falsely rejecting or falsely accepting the null hypothesis (false rejection rate and false acceptance rate, respectively) that the Site is clean if the true average concentration in the DU is roughly 15% higher than the DTSC SL (0.658 mg/kg; hypothetical true average concentration). A 95% confidence level is the most commonly implemented confidence level and is routinely used across virtually all branches of science (Dekking et al., 2005). A 95% confidence level is also used in an example of the Compare Average to a Fixed Threshold sampling plan in the VSP User Guide (VSP, 2014).

Discrete sampling data collected during previous investigations surrounding the former transformer pads were used to calculate the estimated standard deviation observed in real data due to sampling and analytical variability. PCB detections from these investigations that are equal to or less than the DTSC SL were used for the calculation and are shown on Figure 1 of the Plan (green sample locations) and in the table in Enclosure 1 of this memorandum. These data were used to determine an estimated standard deviation as they are the closest approximation to expected conditions in the DUs as informed by the CSM. An estimated standard deviation of 0.15 mg/kg was calculated and input into VSP as an expected standard deviation based on real world data. The estimated standard deviation influences the number of increments recommended by VSP (VSP, 2014). All VSP inputs used to generate the minimum number of increments per DU are shown on a screenshot from VSP included as Enclosure 2 and in Table 1 below.

Table 1. VSP parameter inputs.

Parameter	Input
False Rejection Rate	**At Least** 95.0%
Action Level (DTSC SL)	0.58 mg/kg
Hypothetical True Average Concentration	0.658 mg/kg
False Acceptance Rate	No Greater Than 5%
Estimated Standard Deviation	0.15 mg/kg

Results

Using a confidence level of **at least** 95%, PCB SL of 0.58 mg/kg, and an estimated standard deviation of 0.15 mg/kg, VSP provided the following outputs:

1. The **minimum** number of increments in a DU is **42** (Enclosure 1)[1].
2. Increment placement within each DU was determined via systematic grid sampling (with fixed spacing) using a random start across the DU (also referred to as systematic random sampling; Figures 2 through 6 of the Plan). In other words, there is equal spacing between increments in each DU, but the starting location of the increment grid is randomly generated for each DU.

Condensate pit walls (approximately 5.1 feet deep) were considered for DU-3A, DU-3B, DU-7B, and DU-7C when laying out increment locations in VSP (Figures 3 and 5 of the Plan). The number of increments per DU, the spacing among increments, and the DUs that will be sampled in triplicate (as well as the number of duplicate/triplicate increments) are summarized in Table 2 below.

Table 2. DU Increments, Spacing, and Triplicates

DU[(a)]	Square Footage[(b)]	Number of Increments[(c)]	Measured Spacing Between Increments (to nearest inch)	Duplicates/ Triplicates?[(d)]
DU-1	1,590	45	6 feet 4 inches	No
DU-2	2,900	42	8 feet 2 inches	No
DU-3A	2,970	43	8 feet 6 inches	Yes
DU-3B	4,090	45	10 feet	No
DU-4	2,960	46	7 feet 9 inches	Yes
DU-6	1,410	46	5 feet 8 inches	Yes
DU-7A	1,480	46	6 feet	Yes
DU-7B	3,740	46	8 feet 8 inches	No
DU-7C	4,000	45	10 feet	No
DU-8	2,650	42	7 feet 9 inches	Yes
DU-9	2,100	45	6 feet 6 inches	No

(a) Discrete samples will be collected from DU-5. Therefore, DU-5 is not included in this table.
(b) Square footage includes condensate pit walls for DU-3A, DU-3B, DU-7B, DU-7C.
(c) Primary, duplicate, and triplicate ISM samples will be collected with the same number of increments.
(d) Duplicate/triplicate increments have the same spacing as the primary increments.

Enclosures

1 Summary of PCB Results Detected in Concrete <0.58 mg/kg
2 VSP Screenshot of Inputs and Output

[1] Due to the geometry of the DUs (i.e., they are not all rectangles of the same size and shape), it is not possible for all DUs to have the exact same number of increments using systematic grid sampling with fixed spacing. As a result, many DUs have more than the minimum of 42 increments (e.g., DU-1 has 45 increments), but no DU has fewer than 42 increments. ITRC guidance acknowledges that for square or rectangular DUs, conversions for spacing between increments is straightforward to calculate. However, in situations where DUs are not square or rectangular the number of increments for a DU may be plus or minus the target number (ITRC, 2020).

Standard Operating Procedure: Incremental Sampling Methodology for Collection of Concrete Samples for Polychlorinated Biphenyl (PCB) Analysis

MEMORANDUM

Date: October 9, 2023

To: Jessica Hinchliffe – Senior Associate, BTC III Etiwanda Commerce Center LP

From: Matthew Nelson, PE – Roux
Mauricio H. Escobar, PG – Roux

Subject: **Standard Operating Procedure: Incremental Sampling Methodology for Collection of Concrete Samples for Polychlorinated Biphenyl (PCB) Analysis**

Roux has prepared this Standard Operating Procedure (SOP) for inclusion in the Site Characterization Plan (the Plan) for concrete ground surfaces at former Generating Units 1 and 2 (Site; Figure 1) of the facility located at 8996 Etiwanda Avenue, Rancho Cucamonga, California. The purpose of this SOP is to establish guidelines and procedures for the collection of concrete samples for laboratory analysis of polychlorinated biphenyls (PCBs) in accordance with the incremental sampling methodology (ISM) proposed in the Plan. ISM is used to evaluate the mean contaminant concentration in environmental media (i.e. soil, sediment, concrete) using statistically supported techniques. The Interstate Technology Regulatory Council (ITRC) developed a guidance document describing ISM and how it is used; Incremental Sampling Methodology Update, October 2020 (ITRC, 2020). This SOP describes the procedures and equipment needed to prepare, collect, and preserve field samples before laboratory analysis, and is largely based on the ITRC ISM guidance document and the US Environmental Protection Agency (USEPA) Region 1 Standard Operating Procedure for Sampling Porous Surfaces for Polychlorinated Biphenyls (PCBs; USEPA Region 1 SOP; USEPA, 2011).

Considerations

ISM is a structured composite sampling protocol that was developed to address the variability present in environmental samples/media, which yields more consistent and reproducible results than traditional, discrete sampling approaches. ISM reduces potential biases in the sampling methodology by collecting several "increments" of the material being analyzed that are then combined, processed, and subsampled to reliably estimate the mean concentration of a particular sampling area. The ISM approach requires attention to quality assurance/quality control (QA/QC) measures throughout the sampling process.

When sampling an area using ISM, the area must first be broken up into decision units (DUs) based on either known or assumed source areas, or on human and/or ecological receptors. Before sampling begins, DUs will be marked out in the field along with each of the individual increment locations. The layouts and extents of DUs have been determined in consultation with USEPA and DTSC and are based on Site-specific features and historical knowledge. The number of increments and their locations have been generated using Visual Sample Plan (VSP) software and Site-specific information. Increment placement within each DU was determined via systematic grid sampling (with fixed spacing) using a random start across the DU.

Wind speeds are not expected to be above 15 miles per hour (mph). However, wind speeds will be monitored before and during sampling in real time via a weather application (i.e., WeatherBug or similar) and sampling will not be conducted when wind speeds exceed 15 mph. Also, sampling will not be conducted during a rain event. If a rain event occurs during sampling, the concrete will be given 24 hours to dry before sampling resumes.

Equipment and Materials

Equipment and materials needed to perform the sampling described in this SOP are as follows.

1. General field supplies and personal protective equipment (PPE):
    a. Job Safety Analysis (JSA) and PPE, as specified in the Site-specific Health and Safety Plan (HASP). Minimum PPE includes:
        i. Safety glasses;
        ii. Hearing protection;
        iii. Respiratory protection (N95 mask);
        iv. Nitrile gloves; and
        v. Safety-toe (e.g., steel toe, composite toe) boots.
    b. The Plan, which outlines sampling requirements including the Site-specific data quality objectives (DQOs); and
    c. Field notebook, field form(s), maps, chain-of-custody (COC) forms.
2. DU and Increment Layout Equipment:
    a. Spray paint to mark DU extents;
    b. String and stakes;
    c. Measuring tape; and
    d. Handheld global positioning system (GPS).
3. Decontamination Equipment:
    a. Deionized water;
    b. Two small buckets;
    c. Squirt bottle;
    d. Paper towels and cloths;
    e. Hexane; and
    f. Wire brushes for removing particulates.
4. Sampling Equipment:
    a. Clean brush/cloth and a vacuum with a high efficiency particulate air (HEPA) filter to clear increment area;
    b. Single use aluminum foil sheets to collect increment powder;
    c. Stainless steel scoopula;
    d. Rotary hammer drill with 1 1/8-inch diameter drill bit;
    e. Drill bit shroud;
    f. Stainless steel bowls for covering increment locations between drilling and increment collection;
    g. Digital scale for measurement of increments;
    h. Large resealable phthalate-free zip top bags (Ziploc™ or equivalent) for collecting increments for each DU sample (an additional bag will be needed for each duplicate and triplicate sample collected);

i. Additional large resealable phthalate-free zip top bags to double bag each DU sample (an additional bag will be needed for each duplicate and triplicate sample collected); and

j. Ice and coolers/ice chests.

Field Sampling Procedure

1. DUs and increments within each DU will be cleared, inspected, and marked out before sampling, as described in the Plan.
2. Collect increments starting in the corner or end of the DU. Two field personnel will be at the Site working together to collect increments. One sampler will follow the pre-determined sampling path drilling each increment. The second sampler will follow behind collecting and weighing each increment. The travel path approach as well as the number of replicate samples to be collected in each DU are presented in Figures 1 through 6 and Table 1. Spacing between the primary increments and the duplicate and triplicate increment spacing are shown on Table 1. For DUs that include condensate pit floor and condensate pit wall samples, increments will be collected in the following order: (1) ground level increments, (2) condensate pit floor increments, (3) condensate pit wall increments.
3. Remove any debris with a clean brush or cloth before drilling. Set up the rotary hammer for use. Secure the drill bit and drill bit shroud in the rotary hammer before connecting to a generator/power source.
4. Drill each increment approximately 0.5 inch into the concrete using a rotary hammer and a 1 1/8-inch diameter drill bit to generate a fine powder of the material. Multiple closely spaced holes may be needed to generate sufficient sample mass. Field personnel drilling each increment location will cover the increment location with a stainless-steel bowl to prevent losing any of the concrete dust following the drilling of each location.
5. Collect the powdered concrete increment onto aluminum foil by scooping it up with the foil or using a stainless-steel scoopula from the bottom of the hole. Each increment should consist of approximately 30 grams of material and will be measured in the field using a digital scale.

   Condensate pit sidewall increments will be collected by the first sampler drilling the holes and the second sampler collecting the powdered concrete in either a stainless-steel bowl or an aluminum foil sheet held below the drill bit.
6. Add each increment collected to a large new resealable phthalate-free zip top bag by carefully pouring the powdered concrete from the aluminum foil directly into the bag. The resealable phthalate-free zip top bag will be specific for each DU (one bag each for primary, duplicate, and triplicate samples) and large enough to contain all increments for the DU, which are expected to be 1,200 to 1,400 grams each, and a minimum of 1,000 grams.
7. Following collection of all increments for the DU, the resealable phthalate-free zip top bag containing the sample should be placed in an additional sealed phthalate-free zip top bag, and then into an ice chest/cooler with ice surrounding the sampling bags. Double bagging the sample will help ensure that water will not enter the bags that contain the increments. Cooler temperature will be maintained at or below 6 degrees Celsius and will be confirmed by the laboratory upon receipt.
8. Record the samples on a chain-of-custody (COC; see Table 1 for the sample naming convention). Ensure that the laboratory project number and “ISM” is noted for each analytical method on the COC. The following will be included on the chain-of-custody form accompanying the samples to the laboratory:

   a. Sample extraction method: USEPA Method 3540C (manual Soxhlet);

   b. Sample extract cleanup method: USEPA Method 3665A;

   c. Analytical method: USEPA Method 8082A;

d. All laboratory analytical results are to be reported on a dry weight basis; and

e. Detection and quantitation limits must be at least 50% lower than the action level of 0.58 milligrams per kilogram (mg/kg) total PCBs.

9. Decontaminate sampling equipment in accordance with the Decontamination section below.

10. Repeat the incremental sampling process within the DU to collect second and third replicate samples, or advance to the next DU, as appropriate. Consult Table 1 for the number of replicate samples to be collected from each DU, the spacing between increments, and the sample naming convention for each DU. Additional details regarding replicate samples are provided in the Quality Control Field Sample Collection section below.

Decontamination

Decontamination of reusable sampling equipment is not required between increments, but shall be performed between each DU and between replicate samples within a DU. Decontamination shall be performed in a dedicated decontamination area with measures in place to protect against direct release of PCBs to the environment from the decontamination area. Persons performing decontamination activities shall wear or use appropriate PPE to protect against dermal contact or inhalation of PCBs or materials containing PCBs, in accordance with the Site-specific HASP.

Decontamination shall be performed by swabbing with a solvent (hexane), consistent with self-implementing decontamination procedures in accordance with 40 CFR 761.79(c)(2) and the USEPA Region 1 SOP (USEPA, 2011). A brush may be used before swabbing to remove any particulates from the sampling equipment to facilitate thorough decontamination. All parts of the reusable sampling equipment that may come in contact with sample media shall be decontaminated.

Decontamination waste[1] will be disposed of consistent with the requirements in 40 CFR 761.79(g). Any non-liquid cleaning materials such as paper towels, rags, or PPE used as part of decontamination activities shall be containerized and disposed of at an appropriate facility following 40 CFR 761.61(a)(5)(v). Cleaning solvent (hexane) used as part of decontamination activities shall be collected, containerized, and incinerated at an appropriate facility following 40 CFR 761.79(g)(3) and 40 CFR 761.60(a). Decontamination waste will be stored in approved containers on Site at a location greater than 100 feet from all property boundaries and disposed of off Site within 90 days.

A written record of the decontamination procedures, including photos and video, will be taken and saved in the project file for 3 years after completion of the decontamination procedures in accordance with 40 CFR 761.79(f)(2), and will be included in the report to USEPA.

Quality Control Field Sample Collection

Field replicate samples are an integral part of the ISM approach and are used to assess potential bias in the sample collection process to evaluate the mean PCB concentration of each DU and evaluate field and laboratory precision. Replicate samples are independently collected incremental samples that are collected following the same procedures described above for the original sample. The increment layout for replicate samples was determined via systematic grid sampling (with fixed spacing) using a random start across the DU using VSP in the same manner as the original increments. Replicate samples will consist of the same number of increments for each DU (Table 1). All samples shall be handled the same throughout the field and laboratory procedures.

[1] Decontamination waste is expected to be used solvent, non-liquid cleaning materials and PPE waste at any concentration, including non-porous surfaces and other non-liquid materials such as rags, gloves, other disposable PPE, and similar materials resulting from decontamination (40 CFR 761.79[g]).

Table 1 summarizes the quantity and type of quality control samples to be collected for the sampling event.

Sample Submission to Laboratory for Preparation/Analysis

Implementation of the ISM sampling protocol requires close communication and coordination with the analytical laboratory. Before sampling activities begin, plans should already be in place with the laboratory to ensure that the laboratory understands the specific handling and processing requirements. Specifically, requirements listed in item 8 of the Field Sampling Procedure above must be discussed with the laboratory before sampling begins.

APPROVED FOR RELEASE BY: _____ 4/20/2018
MANAGEMENT **DATE**

_____ 4/20/18
QA DEPARTMENT **DATE**

1. METHOD IDENTIFICATION

1.1. Multi-Incremental Sampling of Solid Matrices.

2. APPLICABLE MATRICES

2.1. Solid, soil, sludge and sediment samples.

3. ►DETECTION / QUANTITATION LIMITS

3.1. Not Applicable to this preparation procedure. Please refer to the determinative procedures that are specific to the target analytes being analyzed for.

4. SCOPE AND APPLICATION

4.1. Multi-Incremental Sampling is the process of taking multiple soil increments, across a defined decision unit in the field, and then again in the laboratory to produce a fully representative sample for preparation and analysis.

4.2. The procedure outlined in this SOP is not to be used for the preparation of VOC samples nor for samples requiring analysis for Explosives via EPA 8330B.

4.2.1. The procedures presented in this SOP are limited to samples that require nonvolatile analysis only. Volatile analyses (8260, 8015 GRO and DRO, Mercury and certain PAH's) are adversely impacted by the drying and sieving procedure due to volatilization of target analytes and is therefore not recommended.

4.2.1.1. Samples for 8260 or 8015 GRO should be collected using method 5035 (encore or terracore) kits.

4.2.1.1.1. Additionally, MIS aliquotting in the field, following the HEER guidance is preferred: use a collection device such as an easy-draw syringe and 500ml or 1 liter amber containers with methanol in a 1:1 ratio.

4.2.1.2. Samples for percent moisture, 8015 DRO/TPHD, mercury and the volatile PAH's should be taken immediately from the field sample, prior to drying and sieving.

4.2.2. Refer to Appendix A and Appendix B, for a listing of analytes and preferred treatment processes.

4.2.3. Samples for Explosives by EPA 8330B must undergo a grinding procedure prior to analysis. The grinding procedure is not outlined in this SOP.

4.3. Sub-sampling, homogenization, drying and sieving practices have an important effect on the reported results. Improper incremental sampling procedures can lead to results that have significant biases and large imprecision.

UNCONTROLLED

4.4. This is a time intensive procedure and great care must be taken to assure the samples are handled properly throughout all steps of this process. EPA recommended holding times start when the sample is initially collected. As the MIS procedure takes 1 to 5 days, monitoring holding times is critical.

5. ►METHOD SUMMARY

5.1. A solid/soil sample (50g to 2000g) is received directly from the field, often in large resealable bags. The sample is 'homogenized', large 'clumps' broken down to a consistent size, spread out on a tray and ***MI subsamples are taken "wet" for the more volatile analytes, (ie. mercury, some PAHs, cyanide, TPH-D. etc).***

5.2. ***The "dry" samples are*** allowed to air dry for a minimum of one to five days.

5.3. Once dry, the entire sample is passed through a #10 sieve to reduce the particle size of the sample to less than 2mm. The sample is then incrementally sampled to produce an aliquot for preparation and analysis for any one of many nonvolatile analyses.

5.4. Comments

5.4.1. Collect samples to be tested for VOCs (including TPHg) separately from samples to be tested for SVOCs and non-volatile chemicals;

5.4.2. MI samples to be tested for VOCs:

5.4.2.1. Consider field preservation of increments in methanol using the procedure outlined in the HEER document. A summary is included below:

5.4.2.1.1. Please note that the 150 mL methanol composite should not be shipped to the lab, but instead should be allowed to equilibrate (sit) for 24 to 48 hours, under proper conditions (0−6°C).

5.4.2.1.2. Following this period of rest, a 20−40 mL aliquot of the methanol should be subsampled and that aliquot should be sent to the lab for analysis. This helps with any potential shipping issues.

5.4.2.1.3. We will need the tare weights of the methanol and container both pre and post sample collection in order to determine exact sample weight.

5.4.2.2. Hazardous materials shipping regulations restrict the volume of methanol to no more than 30 milliliters per container and a maximum of one liter per cooler;

5.4.2.2.1. If shipping methanol-preserved samples is not practical then consider freezing individual 5035 increments for shipment and having the increments combined in methanol at the lab;

5.4.2.3. Include naphthalene as a VOC;

UNCONTROLLED

5.4.3. MI samples to be tested for semi-volatile chemicals (see Appendix A, Table 1):

5.4.3.1. Collect samples to be tested for SVOCs separately from samples to be tested for VOCs;

5.4.3.2. Samples do not have to be field-preserved, but should be cooled and immediately subsampled for testing upon receipt at the laboratory;

5.4.4. At the lab:

5.4.4.1. Subsample MI samples to be tested for SVOCs (see Table 1; including % Moisture, TPHd, some PAHs and mercury), immediately after the sample is homogenized and spread out and prior to drying and sieving.

5.4.4.1.1. ***The wet material is tested*** for percent moisture in order to convert analytical results to dry-weight basis;

5.4.4.1.2. All other analyses are already in a dry weight form and will not be further corrected for moisture.

5.4.4.2. Follow standard drying and sieving methods if additional tests are required for non-volatile chemicals using a different lab analysis.

5.4.5. If both SVOC and non-volatile PAHs are targeted as contaminants of potential concern, then include testing for both in laboratory subsamples collected from the MI sample prior to drying and sieving.

6. DEFINITIONS

6.1. Blank: A sample that has not been exposed to the analyzed sample stream in order to monitor contamination during sampling, transport, storage, preparation or analysis. The blank is subjected to the usual analytical and measurement process to establish a background value.

6.2. Composite: A sample that is an aggregate of separate discrete samples.

6.3. Corrective Action: The action taken to eliminate the causes of an existing nonconformity, defect or other undesirable situation in order to prevent recurrence.

6.4. Holding Times: The maximum times that samples may be held prior to analysis and still be considered valid or not compromised. The holding time for SVOC analyses is 14 days from collection.

6.5. Homogenize: To make uniform in consistency.

6.6. Increment: One of a series of regular additions or contributions:

6.7. Multi-Increment®: a comprehensive sampling methodology used to represent a specific population (decision unit) and provide a foundation for defensible decision making.

UNCONTROLLED

6.8. Multi-layered Sample: A sample consisting of two or more clearly differentiated components (visually distinct layers of material). The layers may be a result of density difference such as liquid/liquid layers, liquid/solid layers, solid/solid layers (small rocks and large rocks), or a combination of these layers.

6.9. Particle Size: The controlling lineal dimension of individual particles, or, the physical dimension of an object's pieces or parts.

6.10. Sieve: A tool to separate materials of one characteristic or size from another.

6.11. Sieving: A simple technique of separating particles of different sizes by passing the material through a sieve of predetermined mesh size.

6.12. Sub-sample: A portion of a sample taken for the purpose of estimating properties or composition of the whole sample.

6.13. VOC: Volatile Organic Compounds - have a low boiling point, and a high vapor pressure at room temperature which causes large numbers of molecules to evaporate or sublimate from the liquid or solid form of the compound and enter the surrounding air.

7. INTERFERENCES

7.1. The equipment used in this procedure will be used for multiple samples. Proper cleaning of all related equipment between samples is essential for the success of this preparation procedure.

7.2. Multi-incremental sampling must be conducted in an area free from contamination that is easily decontaminated and is vented to control dust and fumes.

7.3. All materials, benches, racks, etc. must be kept clean and free from dust and particulates that can contaminate the samples while being dried. Ensure that all preparation areas are wiped clean of dust and debris prior to beginning this procedure.

8. SAFETY

8.1. Solids, soils and sediments may contain chemically or biologically active toxicants. Exposure to these agents and associated reagent chemicals should be minimized through the use of proper protective equipment and safe laboratory practices as referenced in the current Eurofins Calscience Health & Safety Manual.

8.1.1. At a minimum, Personal Protective Equipment (PPE) includes safety glasses, nitrile or latex gloves and lab coats. Additional safety equipment should be used as needed.

8.2. Cracked or broken glassware should be immediately discarded into a broken glassware receptacle. Broken glassware shall never be used.

8.3. Material Safety Data Sheets (MSDSs) are available for each laboratory reagent and chemical. Employees should review and be familiar with the hazards and precautions outlined in the MSDS for all chemicals to be used prior to handling.

UNCONTROLLED

8.4. To ensure the safety of the technician, this procedure should not be performed alone. Another technician or chemist should be in the vicinity and must check in on the technician.

9. EQUIPMENT AND SUPPLIES

9.1. 2-mm Sieves (#10).

9.2. Aluminum foils and paper liners, large width.

9.3. Bakers racks, various sizes.

9.4. Certified clean sampling jars, 2oz, 4oz, 8oz and 16oz.

9.5. Cookie sheets/baking pans (3/4"-1" deep), plastic and stainless steel, various sizes.

9.6. Dispensers, plastic squeezable, for solvent, 1/2 liter.

9.7. Sample labels and indelible pens/markers.

9.8. Stainless steel spatulas, wooden tongue depressors, Teflon-coated or other plastic spatulas or spoons.

9.9. Stainless steel, Teflon-coated, or other plastic forceps and/or tweezers, large.

9.10. Stainless steel, square-bottomed scoops for IS aliquotting.

9.11. Stainless steel, Teflon coated and plastic bowls, medium and large.

9.12. Top–loading balance, capable of weighing to 0.1 grams.

9.13. Washing brushes, various types and sizes.

10. REAGENTS AND STANDARDS

10.1. Reagents are used only for the cleaning and drying of related incremental sampling equipment used in this procedure.

10.1.1. Reagent grade chemicals are used. Other grades may be used, provided it is first ascertained that the reagent is of sufficiently high purity to permit its use without lessening the accuracy of the determination.

10.1.2. Alconox detergent solution or equivalent.

10.1.3. Nitric Acid Solution 0.5 Normal, employed as a decontamination / cleaning solution.

10.1.4. Acetone or Methanol, reagent grade, used as a cleaning/drying solvent.

11. ►SAMPLE COLLECTION, PRESERVATION, CONTAINERS AND HOLDING TIMES

11.1. Please refer to the specific determinative extractive/digestive and analytical procedures for the target analytes of concern.

UNCONTROLLED

12. ►QUALITY CONTROL

12.1. ***Refer to the appropriate analytical method for guidance on quality control procedures.***

13. CALIBRATION AND STANDARDIZATION

13.1. Calibration and standardization protocols are defined by the determinative extractive and analytical procedures that are specific to the target analytes.

14. ►PROCEDURE

14.1. Drying Tray and Equipment Preparation:

14.1.1. The baking sheets used for drying the samples will be stainless steel or plastic. There are medium (13" x 18") and large (18" x 26") sheets. Choose the appropriate size based upon the volume of sample received. Too big is better than too small.

14.1.2. Prior to use, and between samples, the trays, sieves bowls and other sample related equipment must be washed thoroughly with Alconox ***or Liquinox*** detergent solution, rinsed and thoroughly dried. Use a brush for cleaning as needed.

14.1.3. After cleaning with ***detergent,*** rinse the equipment with copious amounts of tap water until the detergent residue is removed and then do a final rinse with DI water.

14.1.3.1. After rinsing, stainless steel and Teflon coated equipment may be further rinsed with a dilute (0.5N) solution of Nitric Acid using a dispenser bottle.

14.1.4. Dry the equipment with clean paper towels, Kimwipe® type tissues and/or allow it to air dry on racks.

14.1.4.1. Stainless steel or Teflon coated equipment may be dried with the use of a solvent such as methanol or acetone. If solvent is used the equipment must be allowed to "dry" under the hood until the solvent has fully evaporated from the surface. And, the solvent rinses must be collected in an appropriate satellite waste container for flammable solvents.

14.1.5. Once dried, the equipment is now ready for use.

14.1.5.1. This cleaning process must be followed between each sample. Multiple sets of sieves and bowls are suggested to expedite the process.

14.1.6. Prior to use for sample drying, the working surface of the trays are to be covered with aluminum foil or a clean paper liner.

UNCONTROLLED

14.1.7. It is suggested that two opposite sides of the baker's rack be covered with paper or aluminum foil, leaving the two ends open to air, to limit the amount of sample disturbance while still allowing air to access and pass over the samples.

14.2. ►Sample Preparation:

14.2.1. Take a single aluminum foil or paper covered medium or large tray (depending on the sample volume received), and label it by writing the Work Order number, sample number and container ID on a corner of the paper, or on a label which is then affixed to the tray.

14.2.2. Apply the label to the edge of the tray so it is visible when the tray is placed in the baker's rack.

14.2.3. Samples will be received in bulk form and contained in one of many sample collection devices: brass, stainless or acetate sleeves, glass jars, resealable bags.

14.2.3.1. The entire sample (anywhere from 100g to 2000g) will be used in the procedure and care must be taken to ensure that the entire sample is removed from the collection device.

14.2.4. Decant water or Homogenize as follows:

14.2.4.1. Decantable water (a separate distinct water layer on top of the soil) will be poured off of the sample prior to drying unless otherwise dictated by the client or project-specific requirements.

14.2.4.1.1. Collect the decanted fluid in an appropriate waste collection device. Do not pour down the drain. If the project requires the aqueous aliquot be maintained, pour off into a clean sample jar and label.

14.2.4.2. Moisture, or water that is a part of the sample such as sludge, will be fully incorporated into the sample by stirring or mixing prior to drying.

14.2.4.2.1. If there is sufficient space in the sample container to homogenize the sample directly within it, use a clean, Teflon spoon or stainless spatula to mix thoroughly.

14.2.4.2.2. If there is not sufficient room to homogenize without the risk of losing material from the container, transfer the entire sample to a clean stainless steel bowl and mix thoroughly using a clean Teflon spoon or stainless steel spatula.

14.2.5. Once the tray is labeled, empty the <u>entire</u> contents of the sample container onto the tray. Break up any large sample clumps using the spatula and/or Teflon spoon but do not grind the sample. (A clean mortar and pestle may

UNCONTROLLED

be used if absolutely needed, but do not grind the sample to a fine dust, only break up the clumps to a size consistent with the rest of the sample.)

14.2.5.1. Samples received in sleeves may be difficult to remove. Use a clean stainless steel spatula or Teflon spoon to help loosen the contents to ensure complete transfer.

14.2.6. Using a stainless steel spatula or Teflon spoon, spread out the sample evenly over the entire aluminum foil covered tray. The material should be approximately ¼ to ½ of an inch thick.

14.2.6.1. Extraneous material such as leaves, twigs, rocks or stones, etc. may be removed from the sample at this time, although this is not always necessary as they will be removed via the sieving process. Only remove if their presence may prevent proper drying (a layer of leaves, etc) of the sample. If removed, the extraneous objects are to be returned to the original sample container.

14.2.6.1.1. Use forceps or tweezers to remove these objects, and not fingers.

14.3. ***The sample is now ready for incremental sub-sampling.***

14.3.1. ***Incremental Sub-Sampling Protocol:***

14.3.1.1. Now that the sample has been spread out on the tray, it can be sub-sampled using an incremental approach. To do this, visually divide up the sample into 30 approximately equal 'sampling areas' – 6 rows and 5 columns.

14.3.1.2. It is suggested that you use a ruler to approximate the sampling areas. (Do not touch the sample with the ruler.) Instead, mark the outside of the tray with colored tape to designate the boundaries and then use the stem end of a clean Teflon or steel spatula to 'score' the sample into 30 sections.

14.3.1.3. Another approach is to use a template suitable for the size tray being used to demarcate the areas for sampling (if this is done, the template shall be made of suitable material such as Teflon).

14.3.1.4.

14.4. ***"Wet Samples":***

14.4.1. ***If mercury, volatile PAH's and/or TPH D is required, remove sufficient sample volume from the tray with a stainless steel or Teflon spatula or square bottom scoop to remove the soil from each of the sampling areas and transfer into jars of suitable size. Be sure to collect a sample for percent moisture determination and try to limit the amount of headspace present.***

14.4.2.

14.4.2.1. Depending on the number of analyses and related QC required, the aliquots that will be removed from each

UNCONTROLLED

sampling area will vary in weight from about 0.33 grams to as much as 1 or 2 grams of sample.

14.4.2.2. The aliquots for each analysis shall be collected separate from other analyses.

14.4.2.3. As an example: the testing needed involves mercury and TPH Diesel, collect the first thirty aliquots for the metals analysis and place in a 2-oz jar or a metals digestion tube. Each aliquot collected is approximately 0.33 grams for a total of ~10 grams.

14.4.2.4. Each aliquot will be combined together with the others and placed in a 2oz, 4oz, or other size jar, as needed.

14.4.2.5. As much as possible, remove aliquots with small particle size (~2mm) from the tray.

14.4.3. ***Label the jars with the work order and the next available sample numbers from that of the original samples and a container ID, i.e., if the original samples are numbered 1 through 4, the "wet " samples created are labeled numbers 5 (A, B, C… for each analytical method) through 8 (A, B, C…). Attach labels with the appropriate analytical method.***

14.4.4. ***Place the labeled container (jar or digestion tube) on a calibrated balance and tare. Place each of the thirty aliquots into the container. Once all thirty are combined, remove the container from the balance and record the weight to the nearest decimal place on the sample label.***

14.4.5. ***Record the applicable information in the MIS logbook:***

14.4.6. ***Date, Workorder Number, Sample ID, Container ID***

14.4.7. ***Circle the container type (jar, sleeve, bag, etc)***

14.4.8. Once completed, the sample jars are returned to sample control. Be sure to notify ***sample log-in or*** the PM so they can initiate log-in for the required analyses.

14.4.9. Following this, place the sample tray in the baker's rack with the label showing.

14.4.9.1. Follow the same procedure (14.2-14.4) for all other samples.

14.4.9.2. Record all pertinent information in the MIS logbook.

14.5. ***Drying:***

14.5.1. After the blank and all field samples have been properly spread out on the trays, ***the "wet" sample aliquots have been harvested,*** and the trays have been placed in the racks, roll the racks over to the hood and place in front to facilitate air flow over the samples. Be sure that one of the open ends of the rack faces the hood (is perpendicular to the hood sash).

UNCONTROLLED

14.5.2. Pull the hood sash down to ***the "SASH POSITION"*** to maintain a constant flow of air in the lab without creating pockets of air that swirl and potentially disrupt the samples.

14.5.3. The samples must undergo a minimum of 24 hours of drying time and may be dried for up to five (5) days.

14.5.3.1. During the drying process, check each of the samples and if needed, gently "stir" the samples using a steel or Teflon spatula to expedite the release of moisture. Once you have stirred the samples about on the tray, re-spread out the soil to a standard depth of ¼ to ½ of an inch and continue the drying process.

14.5.3.2. If sample stirring is needed, remove the trays from the rack so as not to knock sample from one tray onto another and be careful not to lose any of the sample during the process.

14.5.4. When the samples appear to be dry, a minimum of 24 hours has passed and there are no obvious signs of moisture, the samples are now ready for sieving. ('Dry' samples should display a fairly consistent color, texture and appearance.)

14.5.4.1. It is advised that a small, representative aliquot (~10g) of each sample be weighed when assumed to have reached the point of 'dryness', and then again in a sequential manner to confirm that the change in mass has not varied by more than 0.5g. Sequential weighings should be at least one hour apart.

14.6. Sample Sieving Protocol:

14.6.1. The entire dried sample will be sieved prior to continuing with the incremental sampling procedure.

14.6.2. Retrieve a clean tray of suitable size and place ***in a hood*** and cover with a layer of paper or foil.

14.6.3. Retrieve a #10 (2mm) sieve and a dried-sample tray from the rack. Do not remove the sample label from the tray.

14.6.4. Hold the sieve over tray and begin adding sample to the sieve with a Teflon or other stainless steel spatula or spoon. (The soil can be formed into a mound on the tray to assist with the transfer process.)

14.6.4.1. At the start of the transfer process, do not attempt to lift the foil/paper off of the tray to pour the sample into the sieve as the foil may tear and subsequent loss of sample will occur. This can be done when there is a little sample left to aid in complete transfer of the sample to the sieve.

14.6.5. Shake the sieve gently from side to side allowing the sample to pass through the sieve onto the tray. (Move the sieve all over the tray; don't just allow the sample to form a mound in the middle of the tray.) Continue the process until the entire sample has passed through the sieve. Set the sieve aside for cleaning prior to further use.

UNCONTROLLED

14.6.5.1. Any large items left in the sieve should be returned to the original sample container.

14.6.5.2. During the sieving process the sample should have been allowed to deposit over all areas of the tray, if there are larger mounds, distribute the sample to a fairly even level, ¼ to ½ of an inch, using a clean Teflon or stainless steel spatula. Gently 'shaking' the tray from side to side may also help to evenly distribute the sample across the tray.

14.6.6. The sample is now ready for incremental sub-sampling ***of "dry" samples***.

14.7. ***"Dry" Samples:***

14.7.1.1. Repeat the Incremental Sub-Sampling Protocol (14.3). Harvest incremental samples for each "dry" analysis (Metals (non-mercury), TPH motor oil, PCBs, etc.) in separate containers.

14.7.1.2. Label the jars with the work order and the next available sample numbers from that of the original samples and a container ID, i.e., if the original samples are numbers 1 through 4, the "dry " samples created are labeled numbers 9 (A, B, C...for each analytical method) through 12 (A, B, C...). Attach labels with the appropriate analytical method.

14.7.1.3. Place the labeled container (jar or digestion tube) on a calibrated balance and tare. Place each of the thirty aliquots into the container. Once all thirty are combined, remove the container from the balance and record the weight to the nearest decimal place on the sample label.

14.7.1.4. Record the applicable information in the MIS logbook:

14.7.1.4.1. Date, Workorder and ***Sample IDs.***

14.7.1.4.2. Enter date and time drying started

14.7.1.4.3. When complete, enter date and time drying finished

14.7.1.4.4. Include any needed comments

14.7.1.5. Make a copy of the logbook page(s) and provide to the PM.

14.7.1.6. The following table lists the minimum sample mass needed for samples and QC for the standard analyses.

Minimum Sample Mass Required for Analysis			
Analytical Method	**Environmental Sample Mass (g)**	**Prep Blank Mass (g)**	**MS/MSD Mass (g)**
EPA 8015 - ext	10	10	10/10

UNCONTROLLED

Uncontrolled Copy (Hard)

EPA 8081A	20	20	20/20
EPA 8082	20	20	20/20

*Specifically required for Hawaii projects, may also be performed by client or project requirement. Clients may also request an increase of the sample size for the organic analyses.

14.7.2. The sub-sample is now ready for further preparation and/or digestion.

14.7.3. ***Take the sample jars to sample control. Be sure to notify sample log-in or the PM so they can initiate log-in for the required analyses.***

14.7.4. Return any sample that would not pass through the sieve to the original sample container ***or new plastic bag with ID "Y".***

14.7.5. Return any additional MIS sample (after sieving) to a clean jar and label with the workorder ***number*** and sample ID "Z".

14.7.6. Return all containers to sample control.

14.7.7. ***Attach a "USDA Restricted Sample" label to samples from outside of mainland USA .***

14.8. Clean all utensils and equipment. After cleaning place in clean plastic bags or wrap with fresh aluminum foil and place in a secure area.

UNCONTROLLED

15. CALCULATIONS

15.1. Calculation protocols are defined by the determinative extractive and analytical procedures that are specific to the target analytes.

16. METHOD PERFORMANCE

16.1. Method Performance is defined by the determinative extractive and analytical procedures that are specific to the target analytes.

17. POLLUTION PREVENTION

17.1. None.

18. DATA ASSESSMENT AND ACCEPTANCE CRITERIA

18.1. Data acceptance and acceptance criteria are defined by the determinative extractive and analytical procedures that are specific to the target analytes.

19. CORRECTIVE ACTIONS

19.1. If on the basis of internal or external systems or performance audits, routine monitoring of laboratory support equipment, or QC sample analysis results, analytical systems fail to meet the established criteria, an appropriate corrective action must be implemented.

19.2. The Operations Manager, Project Manager, QA Manager, Group Leader and analyst may be involved in identifying the most appropriate corrective action. If previously reported data are affected or if corrective action will impact the project, the action may directly involve the Laboratory Director.

19.3. Corrective actions are generally of two types, immediate and long-term actions.

19.3.1. An **immediate action** is designed to correct or repair nonconforming instruments and measurement systems. The analyst or Group Leader as a result of calibration checks and other QC sample analyses most frequently will identify the need for such an action.

19.3.2. A **long-term action** is designed to eliminate causes of nonconformance. The need for such actions is identified by systems and performance audits. The systematic nonconformances identified during the data generation process and the appropriate corrective measures taken are thoroughly documented in the Corrective Action Record. Examples of this type of action include:

19.3.2.1. Remedial training of staff in technical skills, technique or implementation of operating procedures.

19.3.2.2. Rescheduling of analytical laboratory routine to ensure analysis within holding times.

19.3.2.3. Revision of standard operating procedures.

19.3.2.4. Replacing personnel, as necessary.

19.4. For either type of corrective action, the sequential steps that compose a close-loop corrective action system are as follows:

Uncontrolled (watermark)
UNCONTROLLED

19.4.1. Define the problem.

19.4.2. Assign responsibility for investigating the problem.

19.4.3. Investigate and determine the cause of the problem.

19.4.4. Assign and accept responsibility for implementing the corrective action.

19.4.5. Determine effectiveness of the corrective action and implement.

19.4.6. Verify that the corrective action has eliminated the problem.

19.5. Depending on the nature of the problem, the corrective action employed may be formal or informal. In either case, occurrence of the problem, the corrective action employed, and verification that the problem has been eliminated must be properly documented on a Corrective / Preventive Action Record.

20. CONTINGENCIES FOR OUT-OF-CONTROL OR UNACCEPTABLE DATA

20.1. Out-of-Control and unacceptable data protocols are defined by the determinative extractive and analytical procedures that are specific to the target analytes.

21. WASTE MANAGEMENT

21.1. The proper disposal of analytical samples and laboratory wastes is not only good laboratory practice, but also regulated by a variety of local, state, and federal laws. In order to remain compliant with these laws, the samples and wastes are identified, segregated, and either returned to the client (preferable) or placed into the proper laboratory waste stream.

21.2. Each specific laboratory area shall maintain clearly labeled waste containers for small quantity waste collection. These satellite waste containers shall be used for temporary collection of residual sample from aliquotting procedures, contaminated consumables, sample extracts, purged aqueous samples, and other wastes that require disposal as hazardous waste.

21.3. Unused or remaining soil or liquid samples and all other solid or liquid wastes resulting from our laboratory operations are considered hazardous for disposal purposes.

21.4. Waste management procedures shall adhere to the current revision of SOP-T005, "Disposal of Laboratory Samples and Wastes."

21.5. To ensure compliance with Federal RCRA regulations, the Hazardous Waste Coordinator collects and disposes of the hazardous waste at each satellite collection point no less than monthly.

21.6. In order to maintain accountability for all samples received by Eurofins Calscience, when a sample is used in its entirety for analysis, the empty container(s) are returned to Sample Control for placement in analytical storage.

21.7. The toxicity, carcinogenicity and other health hazards associated with the use of biological specimens and most laboratory chemicals have not been precisely

UNCONTROLLED

defined. Each specimen and chemical should be handled assuming it is a potential health hazard. Exposure to these specimens and chemicals should be minimized through the use of proper protective equipment and safe laboratory practices as referenced in the current revision of Eurofins Calscience's Health, Safety, and Respiratory Protection Manual.

21.8. Processes that promote vaporization of volatile chemicals should be performed in an area well ventilated to the exterior of the laboratory to prevent contamination to other areas in the laboratory.

Uncontrolled (watermark)

UNCONTROLLED

APPENDIX A, Cont'd

Uncontrolled (watermark)

Reference: Appendix 1, Table H in HEER office Environmental Hazard Evaluation guidance (HDOH 2008).

1. Physical state of chemical at ambient conditions (V - volatile, SV - Semi-Volatile, NV - nonvolatile, S - solid, L - liquid, G - gas). *SV: Meets criteria for potential consideration as a "volatile" chemical and inclusion in soil gas investigations for evaluation of potential vapor intrusion hazards (H >0.00001 and MW <200, see Footnote 3).

2. Vapor Pressures from National Library of Medicine TOXNET or ChemID databases.

3. Volatile Chemicals defined by vapor pressure >1 mm Hg at 25C. Collect soil gas samples in additional to soil samples at sites with significant releases of volatile chemicals for evaluation of vapor intrusion hazards.

4. Semi-Volatile and Semi-Stable Chemicals defined as: VP 0.1 to <1.0 OR (H >0.00001 and MW <200) OR Liquid at 25C OR Low Persistence OR Otherwise Semi-Stable. See also Footnote 1 (*SV). TPHd overlaps volatile and semi-volatile categories.

5. Non-Volatile Stable Chemicals defined as: VP <0.1 AND H <0.00001 (or H >0.00001 but MW >200) AND Solid at 25C OR Otherwise Stable.

6. Check with lab to determine feasibility of wet sieving sample to remove <2mm particles prior to subsampling.

7. Soil or sediment samples that consist entirely of <2mm material do *not* require drying and sieving to address fundamental error concerns, although some degree of drying and sieving may be desirable by the laboratory for testing purposes.

8. Nonvolatile and published half-life less than thirty days or less. Refer to Table 9-A in Section 9 of the HEER TGM.

9. Mercury stability depends on targeted species. Assumed liquid and semi-stable as default.

10. PAHS - See Table 2.

11. TPH diesel may not be adequately extractable from soil or sediment when placed in methanol, subsamples should be collected and extracted at the laboratory (e.g., using methylene chloride).

12. The stability of a targeted metal depends in part on the species present and can be highly variable. Testing for a specific species of a metal may require alternate collection and preservation methods and should be evaluated on a site-by-site basis with respect to the site investigation objectives.

UNCONTROLLED

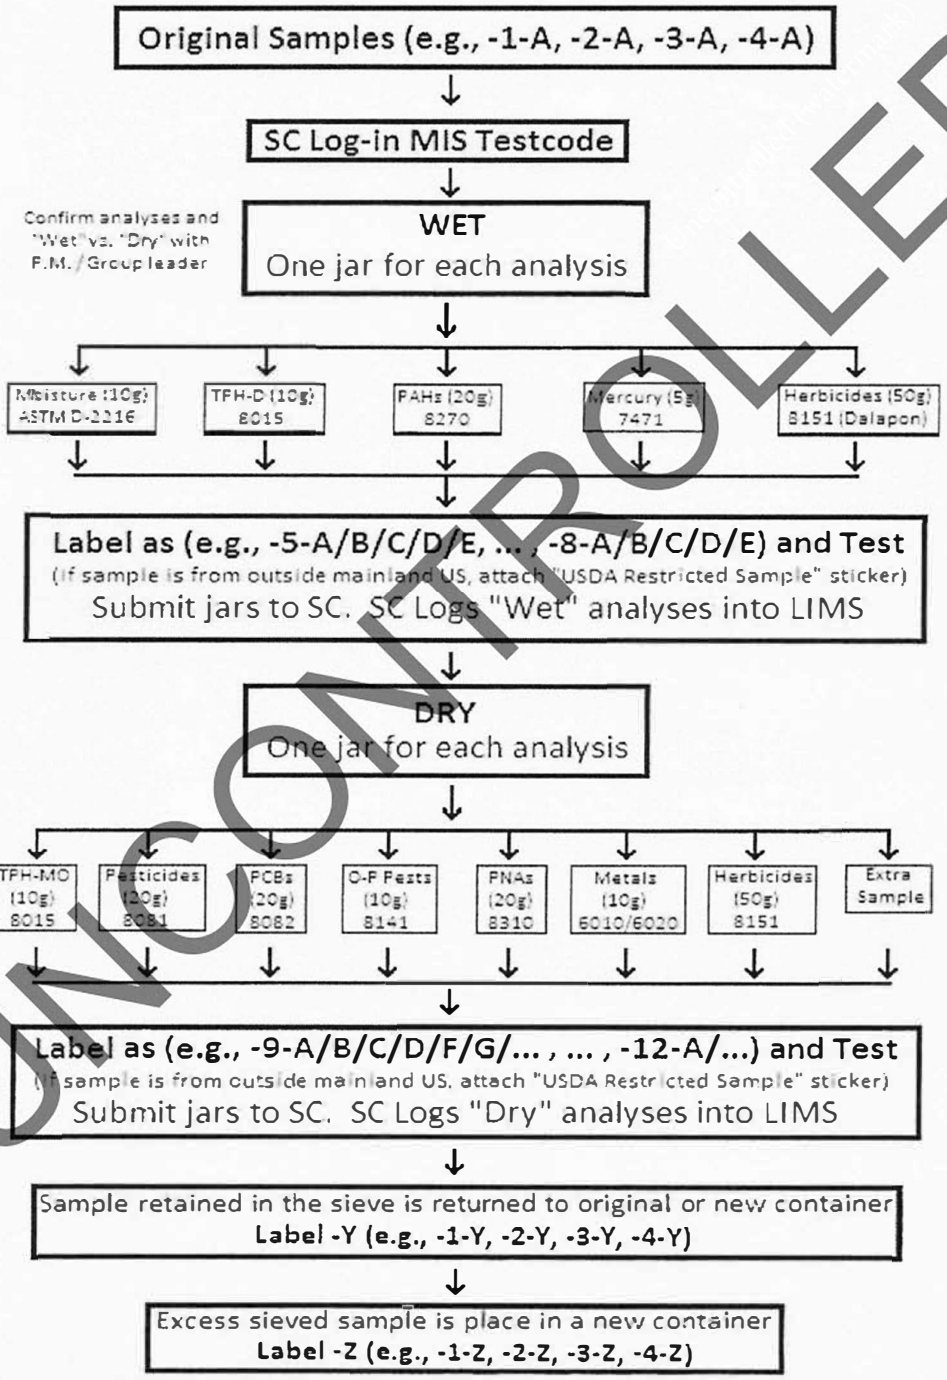
Reference: Appendix 1, Table H in HEER office Environmental Hazard Evaluation guidance (HDOH 2008).

1. PAHS - Eighteen targeted PAHs listed in Section 9 of the HEER TGM (HDOH 2009). Pyrene considered semi-volatile due to Henry's Law Constant >0.00001 even though MW marginally exceeds 200.



2. Physical state of chemical at ambient conditions (V - volatile, SV - Semi-Volatile, NV - nonvolatile, S - solid, L - liquid, G - gas).

3. Vapor Pressures from National Library of Medicine TOXNET or ChemID databases.

4. If target PAHs include both semi-volatile *and* non-volatile PAHs then subsample upon receipt at lab without drying and test for full suite of PAHs. If only non-volatile PAHs are targeted then sieve and dry samples before testing

5. Include naphthalene as a "volatile" chemical of concern in soil gas investigations at sites with significant releases of petroleum fuels (see TGM Section 9). Other petroleum-related SVOCs do not need to be included in soil gas investigations due to minimal presence in fuels and focus on TPH (and/or specific carbon ranges), BTEX and naphthalene as the main risk drivers for vapor intrusion hazards. Inclusion of additional SVOCs may be required for former manufactured gas plants, however, on a case-by-case basis.

Re: Freedom of Information Act Request No. 2024-R09-02242
Final Response

Dear Lindsey Dandridge-Perry:

This letter concerns the above-referenced Freedom of Information Act (FOIA) request, received by the U.S. Environmental Protection Agency (EPA) on October 20, 2023, in which you requested the following records:

> I would like to review any environmental records (hazardous material or site mitigation) for 8996 Etiwanda Avenue or 8998 Etiwanda Avenue, Rancho Cucamonga, CA. (Date Range for Record Search: From 01/01/1900 To 10/19/2023).

In a Microsoft Teams call with Grace Elam and Claudia Guerra on November 8, 2023, you clarified that you are interested in EPA's environmental records related to the referenced address, with the exception of air permitting documents.

Final Response

EPA has concluded its search for records responsive to your request and is providing the requested records in full. Responsive, releasable records have been uploaded to EPA's FOIAXpress system found at: https://foiapublicaccessportal.epa.gov/app/Home.aspx. To access the records, reference your FOIA request as 2023-R09-02242.

If EPA is assessing fees related to the processing of your FOIA request, an invoice with billing and payment instructions will be attached.

Final Appeal Rights and Contact Information

This letter concludes our response to your request. You may appeal this determination by email at hq.foia@epa.gov, or by mail to the EPA's National FOIA Office, U.S. EPA, 1200 Pennsylvania Avenue,

N.W. (2310A), Washington, DC 20460 or through FOIAXpress if you are an account holder. If you are submitting your appeal by hand delivery, courier service, or overnight delivery, you must address your correspondence to 1200 Pennsylvania Avenue, N.W., WJC-N Building, Room 7309C, Washington, DC 20460.

Your appeal must be in writing, and it must be received no later than 90 calendar days from the date of this letter. The Agency will not consider appeals received after the 90-calendar-day limit. Appeals received after 5:00 p.m. EST will be considered received the next business day. The appeal letter should include the FOIA tracking number listed above. For quickest possible handling, the subject line of your email, the appeal letter, and its envelope, if applicable, should be marked "Freedom of Information Act Appeal."

If you need any further assistance or would like to discuss any aspect of your request, you may seek assistance from EPA's FOIA Public Liaison at hq.foia@epa.gov or call (202) 566-1667. You may also seek assistance from the Office of Government Information Services (OGIS). You may contact OGIS in any of the following ways: by mail, Office of Government Information Services, National Archives and Records Administration, 8601 Adelphi Road, College Park, MD 20740-6001; email: ogis@nara.gov; telephone: (202) 741-5770 or (877) 684-6448; or fax: (202) 741-5769. For all media inquiries, please contact press@epa.gov.

Please contact Grace Elam at elam.grace@epa.gov, or (415) 972-3574 should you have any questions concerning this matter.

Sincerely,

Claire Trombadore, Director
Land, Chemicals, and Redevelopment Division

Attention: Mr. Christopher Sanford
Senior Vice President, Development

Project No.: 20G207-1

Subject: Geotechnical Investigation
Proposed Commercial/Industrial Development
NWC Etiwanda Avenue and Napa Street
Rancho Cucamonga, California

Gentlemen:

In accordance with your request, we have conducted a geotechnical investigation at the subject site. We are pleased to present this report summarizing the conclusions and recommendations developed from our investigation.

We sincerely appreciate the opportunity to be of service on this project. We look forward to providing additional consulting services during the course of the project. If we may be of further assistance in any manner, please contact our office.

Respectfully Submitted,

SOUTHERN CALIFORNIA GEOTECHNICAL, INC.

1.0 EXECUTIVE SUMMARY

Presented below is a brief summary of the conclusions and recommendations of this investigation. Since this summary is not all inclusive, it should be read in complete context with the entire report.

Geotechnical Design Considerations

- Artificial fill soils were encountered most of the boring and trench locations, extending from the ground surface to depths of 1½ to 8½± feet.
- The fill soils and near-surface alluvial soils possess varying strengths and densities. In addition, some of the existing fill soils possess a potential for hydrocollapse. The existing fill soils are considered to represent undocumented fill. These soils, in their present condition, are not considered suitable for support of the foundation loads of the new structures.
- The fill soils encountered at Boring No. B-1 are compressible and possess relatively high organic contents, are severely corrosive to metallic improvements, and possess a sulfate concentration that constitutes a severe sulfate exposure (sulfate exposure class S2) to concrete. Based on these considerations, the existing fill soils in the area of Boring No. B-1 should not be reused as structural fill and should be removed from the site in their entirety.
- Remedial grading will be necessary to remove the existing fill soils and a portion of the near-surface alluvial soils and replace them as compacted structural fill. Generally, the existing fill soils may be reused as structural fill, with the exception of the fill soils encountered at Boring No. B-1.
- We recommend that additional exploration be performed in the area of Boring B-1 to determine the extent of the highly organic and severely corrosive soils.

Site Preparation Recommendations

- Initial site stripping should include removal of any surficial vegetation from the site. Stripping should include any weeds, grasses, and any organic top soils.
- Demolition of the existing structures, pavements and any associated improvements will be necessary to facilitate the construction of the proposed development. Debris resultant from demolition should be disposed of off-site. Alternatively, asphalt debris may be pulverized to a maximum 2-inch particle size, well mixed with the on-site soils, and incorporated into new structural fills. It may also be crushed and made into crushed miscellaneous base (CMB), if desired.
- We recommend that remedial grading be performed within the proposed building areas in order to remove all of the artificial fill soils and a portion of the near-surface alluvium. The soils present within the proposed building areas should be overexcavated to a depth of 5 feet below existing grade and to a depth of at least 3 feet below proposed building pad subgrade elevation. The proposed foundation influence zones should also be overexcavated to a depth of at least 2 feet below proposed foundation bearing grade. Additional overexcavation may be necessary in areas where loose or otherwise unsuitable soils are encountered at the base off the overexcavation.
- After overexcavation has been completed, the resulting subgrade soils should be evaluated by the geotechnical engineer to identify any additional soils that should be overexcavated. The resulting soils should be scarified and moisture conditioned to 0 to 4 percent above the optimum moisture content, to a depth of at least 12 inches. The overexcavation subgrade

soils should then be recompacted under the observation of the geotechnical engineer. The previously excavated soils may then be replaced as compacted structural fill.
- The new pavement and flatwork subgrade soils are recommended to be scarified to a depth of 12± inches, thoroughly moisture conditioned and recompacted to at least 90 percent of the ASTM D-1557 maximum dry density.

Foundation Design Recommendations

- Conventional shallow foundations, supported in newly placed compacted fill.
- 2,500 lbs/ft^2 maximum allowable soil bearing pressure.
- Reinforcement consisting of at least two (2) No. 5 rebars (1 top and 1 bottom) in strip footings. Additional reinforcement may be necessary for structural considerations.

Building Floor Slab Design Recommendations

- Conventional Slabs-on-Grade: minimum 6-inch thickness.
- Modulus of Subgrade Reaction: k = 150 psi/in.
- Reinforcement is not expected to be necessary for geotechnical considerations.
- The actual thickness and reinforcement of the floor slab should be determined by the structural engineer.

Pavement Design Recommendations

ASPHALT PAVEMENTS (R=50)					
Materials	Thickness (inches)				
	Auto Parking and Auto Drive Lanes (TI = 4.0 to 5.0)	Truck Traffic			
		TI = 6.0	TI = 7.0	TI = 8.0	TI = 9.0
Asphalt Concrete	3	3½	4	5	5½
Aggregate Base	3	4	5	5	7
Compacted Subgrade	12	12	12	12	12

PORTLAND CEMENT CONCRETE PAVEMENTS (R=50)				
Materials	Thickness (inches)			
	Autos and Light Truck Traffic (TI = 6.0)	Truck Traffic		
		TI = 7.0	TI = 8.0	TI = 9.0
PCC	5	5½	6½	8
Compacted Subgrade (95% minimum compaction)	12	12	12	12

2.0 SCOPE OF SERVICES

The scope of services performed for this project was in accordance with our Proposal No. 20P325R, dated September 30, 2020. The scope of services included a visual site reconnaissance, subsurface exploration, field and laboratory testing, and geotechnical engineering analysis to provide criteria for preparing the design of the building foundations, building floor slabs, and parking lot pavements along with site preparation recommendations and construction considerations for the proposed development. The evaluation of the environmental aspects of this site was beyond the scope of services for this geotechnical investigation.

3.0 SITE AND PROJECT DESCRIPTION

3.1 Site Conditions

The subject site is located at the street address of 8996 Etiwanda Avenue in Rancho Cucamonga, California. The site is bounded to the north by a railroad easement, to the west by a commercial/industrial building and a vacant lot, to the south by a Southern California Edison electrical substation and an Inland Empire Utilities Agency, and to the east by Etiwanda Avenue. The general location of the site is illustrated on the Site Location Map, enclosed as Plate 1 in Appendix A of this report.

The site consists of an irregular-shaped parcel, 61.59± acres in size. The site is currently developed as a natural gas power plant, operated by NRG, which was decommissioned in 2018. The site is developed with numerous structures associated with the former power plant. Two (2) large cooling towers are present in the northern portion of the center of the site and four (4) cooling towers are located in the northwestern portion of the site. Two (2) multi-story generating plants and associated equipment (piping, above ground storage tanks (ASTs), and towers) are located in the central area of the site. A pump station is present in the east-central area of the site. One single-story office building is located in the south-central area of the site. Retention ponds are present in the northeastern and southeastern areas of the site. Numerous small support structures are located throughout the site. The ground surface cover surrounding the power plant and support structures generally consists of asphaltic concrete (AC) pavements. The existing pavements are generally in poor condition with moderate to severe cracking throughout. Landscaping consisting of turf grass and several large trees are present around the office building and pump station. Additionally, a 1 to 2± inch layer of open-graded gravel is located in the southeastern region of the site, between the retention pond and guard shack, and in the northwestern region, surrounding the cooling towers. A dense grove of evergreen trees is present in the northwestern area of the site. The ground surface cover throughout the remainder of the northwestern portion of the site and other unpaved areas of the site consists of exposed soil with sparse native grass and weed growth. An existing drainage course, draining from north to south, is present in the center of the site.

Detailed topographic information was not available at the time of this report. Based on elevations obtained from Google Earth, and visual observations made at the time of the subsurface investigation, a 260,000± ft² berm is present in the northwestern portion of the site. The existing berm is about 5 to 10± feet higher than the surrounding site topography. A 15,000± ft² pit is also present in the northwestern corner of the site. The existing pit appears to extend 2 to 7± feet below the adjacent site grades. The excavation within the pit appears to have been made to remove highly organic soils from the pit area. With the exception of the berm and pit, the site topography generally slopes downward to the south and toward the existing drainage course in the center of the site at a gradient of 1 to 2± percent.

3.2 Proposed Development

A conceptual site plan identified as Scheme 5, prepared by RGA, has been provided to our office by the client. Based on this plan, the subject site will be developed with a 1,024,565± ft^2 commercial/industrial building, identified as Building Area 1. Dock-high doors will be constructed in a cross-dock configuration on the north and south sides of the building. An alternative site plan identified as Scheme 6.8, prepared by RGA, has also been provided to our office. Based on this plan, the subject site will be developed with two (2) commercial/industrial buildings, identified as Building Areas 1 and 2. Building 1 will be located in the eastern region of the site and will be 688,111± ft² in size. Building 2 will be located in the western region of the site and will be 376,365± ft² in size. Both of these buildings will be constructed with dock-high doors along a portion of at least 1 building wall. The proposed buildings are expected to be surrounded by AC pavements in the parking and drive areas, Portland cement concrete (PCC) pavements in the loading dock areas, and concrete flatwork and landscaped planters throughout the site. Scheme 5 and Scheme 6.8 are indicated on the Boring and Trench Location Plans, included as Plate 2A and Plate 2B, respectively, in Appendix A of this report.

Detailed structural information has not been provided. It is assumed that the new buildings will be single-story structures of tilt-up concrete construction, typically supported on conventional shallow foundations with concrete slab-on-grade floors. Based on the assumed construction, maximum column and wall loads are expected to be on the order of 100 kips and 4 to 6 kips per linear foot, respectively.

No significant amounts of below-grade construction, such as basements or crawl spaces, are expected to be included in the proposed development. Based on the assumed topography, cuts and fills of up to 6± feet are expected to be necessary to achieve the proposed site grades.

3.3 Previous Study

Southern California Geotechnical, Inc. (SCG) previously performed a geotechnical investigation for a previously proposed commercial/industrial development at the subject site. The results of this investigation are presented in the report referenced as follows:

> Geotechnical Investigation, Proposed Commercial/Industrial Development, NWC Etiwanda Avenue and Napa Street, Rancho Cucamonga, California, prepared by SCG, prepared for Bridge Development Partners, SCG Project No. 19G174-1, dated August 27, 2019.

As part of this investigation sixteen (16) borings (identified as Boring Nos. B-1 through B-16) were advanced to depths of 15 to 30± feet below the existing site grades. Additionally, four (4) trenches (identified as Trench Nos. T-1 through T-4) were excavated to depths of 11 to 14± feet below the existing site grades. The approximate locations of the previous borings and trenches are indicated on the Boring and Trench Location Plans, included as Plate 2A and Plate 2B in Appendix A of this report. AC pavements were encountered at the ground surface at most boring locations, occasionally underlain by aggregate base. The pavements generally consisted of 3 to 5± inches of AC, underlain by 0 to 5± inches of aggregate base. The remaining boring locations encountered a surficial layer of open-graded gravel approximately 1 to 2 inches thick. Artificial fill soils were encountered at the ground surface at most of the boring and trench locations,

extending to depths of 2 to 8½± feet. The fill soils generally consisted of loose to dense silty fine sands with varying medium to coarse sand and fine to coarse gravel content. Native alluvial soils were encountered at the ground surface and beneath the fill soils at all of the boring and trench locations, extending to at least the maximum depth explored of 30± feet. The alluvium generally consisted of loose to medium dense fine sandy silts, silty fine sands, and loose to very dense fine to coarse sands. Free water was not encountered during the drilling of any of the borings or excavation of any of the trenches. Based on the lack of water within the borings, the groundwater was considered to have existed at a depth in excess of 30± feet at the time of the previous subsurface exploration.

Based upon the identified subsurface conditions, remedial grading was recommended to be performed within the previously proposed building pad area in order to remove the existing undocumented fill soils. The previously proposed building area was recommended to be overexcavated to a depth of at least 5 feet below existing grade and to a depth of at least 3 feet below proposed pad grade. It was also recommended to extend the overexcavation to a depth of at least 2 feet below foundation bearing grade within the foundation influence zones. The foundations were recommended to be designed for a maximum allowable soil bearing pressure of 2,500 lbs/ft^2. Excerpts from the previous study, including the boring and trench logs, along with the results of laboratory testing, are included in Appendix F of this report.

4.0 SUBSURFACE EXPLORATION

4.1 Scope of Exploration/Sampling Methods

The subsurface exploration conducted for this project consisted of eight (8) borings (identified as Boring Nos. B-17 through B-24), advanced to a depth of 10 to 30± feet below the existing site grades. All of the borings were logged during drilling by a member of our staff.

The borings were advanced with hollow-stem augers, by a conventional truck-mounted drilling rig. Representative bulk and relatively undisturbed soil samples were taken during drilling. Relatively undisturbed soil samples were taken with a split barrel "California Sampler" containing a series of one inch long, 2.416± inch diameter brass rings. This sampling method is described in ASTM Test Method D-3550. In-situ samples were also taken using a 1.4± inch inside diameter split spoon sampler, in general accordance with ASTM D-1586. Both of these samplers are driven into the ground with successive blows of a 140-pound weight falling 30 inches. The blow counts obtained during driving are recorded for further analysis. Bulk samples were collected in plastic bags to retain their original moisture content. The relatively undisturbed ring samples were placed in molded plastic sleeves that were then sealed and transported to our laboratory.

The approximate locations of the borings from this investigation are indicated on the Boring and Trench Location Plans, included as Plate 2A and Plate 2B in Appendix A of this report. The Boring Logs, which illustrate the conditions encountered at the boring locations, as well as the results of some of the laboratory testing, are included in Appendix B.

4.2 Geotechnical Conditions

Pavements

AC pavements were encountered at the ground surface at Boring Nos. 18, B-20 and B-21. The pavements at these locations consist of 2½ to 6± inches of AC, underlain by 0 to 6± inches of aggregate base. Boring Nos. B-23 and B-24 were drilled through a surficial layer of 2± inches of open-graded gravel.

Artificial Fill

Artificial fill soils were encountered at the ground surface at Boring Nos. B-19 and B-22, and beneath the existing pavements at Boring Nos. B-20, B-21, B-23 and B-24, extending to depths of 1½ to 5½± feet below the existing site grades. The fill soils generally consist of medium dense to dense fine sands with little silt, and silty fine sands with varying medium to coarse sand and fine gravel content. The fill soils possess a disturbed mottled appearance with occasional horizontal laminations and minor debris, such as AC and concrete fragments, resulting in their classification as artificial fill.

Alluvium

Native alluvial soils were encountered beneath the fill soils and/or the existing pavements, and at the ground surface at all of the boring locations, extending to at least the maximum depth explored of 30± feet below the existing site grades. The near-surface alluvium generally consists of loose to medium dense sands, silty sands and sandy silts with varying clay and fine gravel content, extending to depths of 17 to 27± feet, with the exception of Boring No. B-22. At greater depths and extending to the maximum depth explore of 30± feet, the alluvium generally consists of medium dense to dense sands and silty sands with varying fine gravel content. Boring No.B-22 encountered soil strata generally consisting of medium dense to dense sands and silty sands with varying fine gravel content at depths of 5½ to 25± feet. Boring No. B-19 encountered a soil stratum consisting of very stiff clayey silt at depths of 17 to 22± feet.

Groundwater

Free water was not encountered during the drilling of any of the borings. Based on the lack of any water within the borings, and the moisture contents of the recovered soil samples, the static groundwater is considered to have existed at a depth in excess of 30± feet at the time of the subsurface exploration.

As part of our research, we reviewed available groundwater data in the vicinity of the subject site. The primary reference used to determine the groundwater depths in this area is the California Department of Water Resources website, http://www.water.ca.gov/geotracker/. The nearest monitoring well is located approximately 2± miles east of the site. Water level readings within these monitoring wells indicate high groundwater levels of 467± feet below site grades (April 2017).

5.0 LABORATORY TESTING

The soil samples recovered from the subsurface exploration were returned to our laboratory for further testing to determine selected physical and engineering properties of the soils. The tests are briefly discussed below. It should be noted that the test results are specific to the actual samples tested, and variations could be expected at other locations and depths. Test results from the previous study are denoted using the project number (19G174-1). The test results from the previous study are included in Appendix F.

Classification

All recovered soil samples were classified using the Unified Soil Classification System (USCS), in accordance with ASTM D-2488. Field identifications were then supplemented with additional visual classifications and/or by laboratory testing. The USCS classifications are shown on the Boring Logs and are periodically referenced throughout this report.

Density and Moisture Content

The density has been determined for selected relatively undisturbed ring samples. These densities were determined in general accordance with the method presented in ASTM D-2937. The results are recorded as dry unit weight in pounds per cubic foot. The moisture contents are determined in accordance with ASTM D-2216, and are expressed as a percentage of the dry weight. These test results are presented on the Boring Logs. The results of additional testing performed during the previous study are included in Appendix F of this report.

Consolidation

Selected soil samples have been tested to determine their consolidation potential, in accordance with ASTM D-2435. The testing apparatus is designed to accept either natural or remolded samples in a one-inch high ring, approximately 2.416 inches in diameter. Each sample is then loaded incrementally in a geometric progression and the resulting deflection is recorded at selected time intervals. Porous stones are in contact with the top and bottom of the sample to permit the addition or release of pore water. The samples are typically inundated with water at an intermediate load to determine their potential for collapse or heave. The results of the consolidation testing are plotted on Plates C-1 through C-8 in Appendix C of this report. Additional consolidation test results performed during the previous study are included in Appendix F.

Maximum Dry Density and Optimum Moisture Content

A representative bulk sample has been tested for its maximum dry density and optimum moisture content. The results have been obtained using the Modified Proctor procedure, per ASTM D-1557 and are presented on Plate C-9 in Appendix C of this report. This test is generally used to compare the in-situ densities of undisturbed field samples, and for later compaction testing. Additional testing of other soil types or soil mixes may be necessary at a later date. The results of additional testing performed during the previous study are included in Appendix F of this report.

Expansion Index (EI)

The expansion potential of the on-site soils was determined in general accordance with ASTM D-4829. The testing apparatus is designed to accept a 4-inch diameter, 1-in high, remolded sample. The sample is initially remolded to 50± 1 percent saturation and then loaded with a surcharge equivalent to 144 pounds per square foot. The sample is then inundated with water, and allowed to swell against the surcharge. The resultant swell or consolidation is recorded after a 24-hour period. The result of the EI testing is as follows:

Sample Identification	Expansion Index	Expansive Potential
B-15 @ 0 to 5 feet (19G174-1)	15	Very Low

Soluble Sulfates

Representative samples of the near-surface soils have been submitted to a subcontracted analytical laboratory for determination of soluble sulfate content. Soluble sulfates are naturally present in soils, and if the concentration is high enough, can result in degradation of concrete which comes into contact with these soils. The results of the soluble sulfate testing are presented below, and are discussed further in a subsequent section of this report.

Sample Identification	Soluble Sulfates (%)	ACI Classification
B-1 @ 0 to 5 feet (19G174-1)	1.230	Severe (S2)
B-12 @ 0 to 5 feet (19G174-1)	0.034	Not Applicable (S0)
B-15 @ 0 to 5 feet (19G174-1)	0.006	Not Applicable (S0)
B-17 @ 1 to 5 feet	0.001	Not Applicable (S0)
B-22 @ 1 to 5 feet	0.003	Not Applicable (S0)

Corrosivity Testing

Representative samples of the near-surface soils have been submitted to a subcontracted corrosion engineering laboratory to identify potentially corrosive characteristics with respect to common construction materials. The corrosivity testing included a determination of the electrical resistivity, pH, and chloride and nitrate concentrations of the soils, as well as other tests. The results of some of these tests are presented below.

Sample Identification	Saturated Resistivity (ohm-cm)	pH	Chlorides (mg/kg)	Nitrates (mg/kg)
B-1 @ 0 to 5 feet (19G174-1)	800	5.7	75	432
B-12 @ 0 to 5 feet (19G174-1)	15,200	7.7	<0.1	7.1
B-15 @ 0 to 5 feet (19G174-1)	4,400	6.8	20	38
B-17 @ 1 to 5 feet	18,800	7.9	4.9	10
B-22 @ 1 to 5 feet	7,600	7.2	4.9	16

6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of our review, field exploration, laboratory testing and geotechnical analysis, the proposed development is considered feasible from a geotechnical standpoint. The recommendations contained in this report should be taken into the design, construction, and grading considerations.

The recommendations are contingent upon all grading and foundation construction activities being monitored by the geotechnical engineer of record. The recommendations are provided with the assumption that an adequate program of client consultation, construction monitoring, and testing will be performed during the final design and construction phases to verify compliance with these recommendations. Maintaining SCG as the geotechnical consultant from the beginning to the end of the project will provide continuity of services. The geotechnical engineering firm providing testing and observation services shall assume the responsibility of Geotechnical Engineer of Record.

The Grading Guide Specifications, included as Appendix D, should be considered part of this report, and should be incorporated into the project specifications. The contractor and/or owner of the development should bring to the attention of the geotechnical engineer any conditions that differ from those stated in this report, or which may be detrimental for the development.

6.1 Seismic Design Considerations

The subject site is located in an area which is subject to strong ground motions due to earthquakes. The performance of a site specific seismic hazards analysis was beyond the scope of this investigation. However, numerous faults capable of producing significant ground motions are located near the subject site. Due to economic considerations, it is not generally considered reasonable to design a structure that is not susceptible to earthquake damage. Therefore, significant damage to structures may be unavoidable during large earthquakes. The proposed structures should, however, be designed to resist structural collapse and thereby provide reasonable protection from serious injury, catastrophic property damage and loss of life.

Faulting and Seismicity

Research of available maps indicates that the subject site is not located within an Alquist-Priolo Earthquake Fault Zone. Furthermore, SCG did not identify any evidence of faulting during the previous and current geotechnical investigations. Therefore, the possibility of significant fault rupture on the site is considered to be low.

The potential for other geologic hazards such as seismically induced settlement, lateral spreading, tsunamis, inundation, seiches, flooding, and subsidence affecting the site is considered low.

Seismic Design Parameters

The 2019 California Building Code (CBC) provides procedures for earthquake resistant structural design that include considerations for on-site soil conditions, occupancy, and the configuration of

the structure including the structural system and height. The seismic design parameters presented below are based on the soil profile and the proximity of known faults with respect to the subject site.

Based on standards in place at the time of this report, the proposed development is expected to be designed in accordance with the requirements of the 2019 edition of the California Building Code (CBC), which was adopted on January 1, 2020.

The 2019 CBC Seismic Design Parameters have been generated using the SEAOC/OSHPD Seismic Design Maps Tool, a web-based software application available at the website www.seismicmaps.org. This software application calculates seismic design parameters in accordance with several building code reference documents, including ASCE 7-16, upon which the 2019 CBC is based. The application utilizes a database of risk-targeted maximum considered earthquake (MCE_R) site accelerations at 0.01-degree intervals for each of the code documents. The table below was created using data obtained from the application. The output generated from this program is included as Plate E-1 in Appendix E of this report.

The 2019 CBC requires that a site-specific ground motion study be performed in accordance with Section 11.4.8 of ASCE 7-16 for Site Class D sites with a mapped S_1 value greater than 0.2. However, Section 11.4.8 of ASCE 7-16 also indicates an exception to the requirement for a site-specific ground motion hazard analysis for certain structures on Site Class D sites. The commentary for Section 11 of ASCE 7-16 (Page 534 of Section C11 of ASCE 7-16) indicates that "In general, this exception effectively limits the requirements for site-specific hazard analysis to very tall and or flexible structures at Site Class D sites." Based on our understanding of the proposed development, the seismic design parameters presented below were calculated assuming that the exception in Section 11.4.8 applies to the proposed structures at this site. However, the structural engineer should verify that this exception is applicable to the proposed structures. Based on the exception, the spectral response accelerations presented below were calculated using the site coefficients (F_a and F_v) from Tables 1613.2.3(1) and 1613.2.3(2) presented in Section 16.4.4 of the 2019 CBC.

2019 CBC SEISMIC DESIGN PARAMETERS

Parameter		Value
Mapped Spectral Acceleration at 0.2 sec Period	S_S	1.762
Mapped Spectral Acceleration at 1.0 sec Period	S_1	0.655
Site Class	---	D
Site Modified Spectral Acceleration at 0.2 sec Period	S_{MS}	1.762
Site Modified Spectral Acceleration at 1.0 sec Period	S_{M1}	1.114
Design Spectral Acceleration at 0.2 sec Period	S_{DS}	1.175
Design Spectral Acceleration at 1.0 sec Period	S_{D1}	0.742

It should be noted that the site coefficient F_v and the parameters S_{M1} and S_{D1} were not included in the SEAOC/OSHPD Seismic Design Maps Tool output for the 2019 CBC. We calculated these parameters-based on Table 1613.2.3(2) in Section 16.4.4 of the 2019 CBC using the value of S_1

obtained from the Seismic Design Maps Tool, assuming that a site-specific ground motion hazards analysis is not required for the proposed buildings at this site.

Liquefaction

Liquefaction is the loss of strength in generally cohesionless, saturated soils when the pore-water pressure induced in the soil by a seismic event becomes equal to or exceeds the overburden pressure. The primary factors which influence the potential for liquefaction include groundwater table elevation, soil type and grain size characteristics, relative density of the soil, initial confining pressure, and intensity and duration of ground shaking. The depth within which the occurrence of liquefaction may impact surface improvements is generally identified as the upper 50 feet below the existing ground surface. Liquefaction potential is greater in saturated, loose, poorly graded fine sands with a mean (d_{50}) grain size in the range of 0.075 to 0.2 mm (Seed and Idriss, 1971). Clayey (cohesive) soils or soils which possess clay particles (d<0.005mm) in excess of 20 percent (Seed and Idriss, 1982) are generally not considered to be susceptible to liquefaction, nor are those soils which are above the historic static groundwater table.

The California Geological Survey (CGS) has not yet conducted detailed seismic hazards mapping in the area of the subject site. The general liquefaction susceptibility of the site was determined by research of the San Bernardino County Land Use Plan, General Plan, Geologic Hazard Overlays. Map FH28 for the Guasti 7.5-Minute Quadrangle indicates that the subject site is not located within an area of liquefaction susceptibility. Based on the mapping performed by the county of San Bernardino and the subsurface conditions encountered at the boring locations, liquefaction is not considered to be a design concern for this project.

6.2 Geotechnical Design Considerations

General

The near-surface soils encountered at the boring and trench locations from the previous and current studies consist of artificial fill soils and native alluvium. The artificial fill soils, where encountered, extend to depths of 1½ to 8½± feet below the existing site grades. The fill soils possess variable strengths and densities and based on the results of consolidation/collapse testing, some of the fill materials possess a significant potential for hydrocollapse when inundated with water. Based on these considerations, and a lack of documentation of the placement and compaction of these soils, the existing fill materials are considered to consist of undocumented fill, unsuitable for the support of the proposed structures. The near-surface alluvium also possesses variable strengths, densities, and composition. Additionally, it is anticipated that demolition of the existing structures and associated improvements will cause disturbance of the upper 3 to 5± feet of soil. Therefore, remedial grading is considered warranted within the proposed building areas in order to remove all of the undocumented fill soils in their entirety, the upper portion of the near-surface native alluvial soils, and any soils disturbed during the demolition process, and replace these materials as compacted structural fill soils.

In general, the on-site soils may be reused as structural fill to support the foundations and floor slabs of the new buildings as well as other site improvements including new pavements. However, the fill soils encountered at Boring No. B-1 possess relatively high organic contents of 17.0 to

23.6 percent, are severely corrosive to metallic improvements, and possess a concentration of soluble sulfates that constitutes a severe sulfate exposure to concrete (Sulfate Class S2), as discussed below. The fill soils at Boring No. B-1 should not be reused in any improvement areas including new building and pavement areas. These materials should be disposed of off-site. Alternatively, it may be feasible to reuse these materials in landscaped planters, but the properties of these soils should be evaluated by the landscape architect or another qualified person as the evaluation of these soils for use in landscape areas is outside of our purview as the geotechnical engineer.

Based on our review of the previous study, we understand that the existing organic soils may have been placed as a part of an agricultural research project performed by a local university. The extent of these organic and corrosive soils around Boring No. B-1 is not presently known to SCG. We understand that some of these soils may also be present in the area planted with evergreen trees in the northwestern portion of the site. However, these soils were not observed in any appreciable quantities in the samples taken at Boring Nos. B-2, B-3, B-4, B-5, B-6, B-17, B-18, B-19 or B-24, nor were they observed during the excavation and logging of Trench Nos T-1 and T-2. We recommend that additional exploration be performed prior to rough grading in order to determine the actual extent of these organic soils which are considered unsuitable to support the new structures and site improvements.

Settlement

The recommended remedial grading will remove the existing undocumented fill soils, as well as the potentially compressible/collapsible near-surface native alluvium, and replace these materials as compacted structural fill. The native soils that will remain in place below the recommended depth of overexcavation will not be subject to significant stress increases from the foundations of the new structures. Therefore, following completion of the recommended grading, post-construction settlements are expected to be within tolerable limits.

Expansion

The near-surface soils encountered at the boring locations consist of silty sands, sandy silts and sands with varying clay content. The results of expansion index testing performed on soils from the upper 5± feet at Boring No. B-15 indicate that these soils possess a very low expansion potential (EI = 15). These materials have been visually classified as very low to non-expansive. Therefore, no design considerations related to expansive soils are considered warranted for this site.

Soluble Sulfates

The results of soluble sulfate testing indicate that the organic fill soils present in the location of Boring No. B-1 possess a soluble sulfate concentration that corresponds with Sulfate Exposure Class S2 (or a severe sulfate exposure) to concrete with respect to the American Concrete Institute (ACI) Publication 318-14 Building Code Requirements for Structural Concrete and Commentary, Section 4.3. However, the grading recommendations provided in this report recommend the removal of any of the existing fill soils resembling those encountered at Boring No. B-1. These soils should not be reused in new building areas, nor in any new improvement areas.

The results of the soluble sulfate testing on samples from other boring locations indicate that the selected samples of the on-site soils to correspond to Class S0 with respect to ACI Publication 318-14, Section 4.3. Therefore, specialized concrete mix designs are not considered to be necessary, with regard to sulfate protection purposes, provided that no soils resembling those encountered in the upper 4½ feet at Boring No. B-1 are reused in the proposed building and improvement areas. We recommend that additional soluble sulfate testing be conducted at the completion of rough grading to verify the soluble sulfate concentrations of the soils which are present at pad grade within the building areas.

Corrosion Potential

The results of the electrical resistivity and pH testing indicate that the bulk sample of soils taken from Boring No. B-1 possesses a relatively low resistivity value of 800 ohm-cm and a pH value of 5.7. These test results have been evaluated in accordance with guidelines published by the Ductile Iron Pipe Research Association (DIPRA). The DIPRA guidelines consist of a point system by which characteristics of the soils are used to quantify the corrosivity characteristics of the site. Resistivity and pH are two of the five factors evaluated in the DIPRA procedure. Redox potential, relative soil moisture content and sulfides are also included. Although sulfide testing was not part of the scope of services for this project, we have evaluated the corrosivity characteristics of the on-site soils using resistivity, pH and moisture content. Based on these factors, and utilizing the DIPRA procedure, the existing fill soils at Boring No. B-1 are considered to be severely corrosive to ductile iron pipe. However, based on their organic content and corrosion potential, we recommend that the fill soils represented by those encountered at Boring No. B-1 be excluded from any fill soils at this site.

The results of the electrical resistivity and pH testing performed on the near surface soils taken from Boring Nos. B-12, B-15, B-17 and B-22 indicate that the tested soils possess saturated resistivity values ranging from 4,400 and 18,800 ohm-cm, and pH values of 6.8 and 7.9. These test results have also been evaluated in accordance with the DIPRA guidelines. Based on these factors, and utilizing the DIPRA procedure, the on-site soils are generally considered to be noncorrosive to ductile iron pipe, with the exception of those encountered at Boring No. B-1, as discussed above. However, as noted above, SCG does not practice in the field of corrosion engineering, and therefore, the client may also wish to contact a corrosion engineer to provide a more thorough evaluation.

Relatively low concentration (ranging from 0.1 to 75 mg/kg) of chlorides was detected in the samples submitted for corrosivity testing. In general, soils possessing chloride concentrations in excess of 500 parts per million (ppm) are considered to be corrosive with respect to steel reinforcement within reinforced concrete. Based on the lack of any significant chlorides in the tested samples, the site is considered to have a C1 chloride exposure in accordance with the American Concrete Institute (ACI) Publication 318 Building Code Requirements for Structural Concrete and Commentary. Therefore, a specialized concrete mix design for reinforced concrete for protection against chloride exposure is not considered warranted.

Nitrates

Nitrates present in soil can be corrosive to copper tubing at concentrations greater than 50 mg/kg. The existing fill soils encountered at Boring No. B-1 also possess a nitrate concentration of 432 mg/kg. Based on this test result, the existing fill soils at Boring No. B-1 are considered

to be corrosive to copper pipe. Since SCG does not practice in the area of corrosion engineering, we recommend that the client contact a corrosion engineer to provide recommendations for the protection of copper tubing/pipe in contact with the on-site soils. However, based on their organic content and corrosion potential, we recommend that the fill soils represented by those encountered at Boring No. B-1 be excluded from any fill soils at this site. The remaining tested samples of the near-surface soils are considered to be noncorrosive to copper tubing.

Shrinkage/Subsidence

Based on the results of the laboratory testing, removal and recompaction of the loose to medium dense near-surface fill and alluvial soils, extending to depths of 5± feet, is estimated to result in an average shrinkage of 6 to 15 percent. However, the estimated shrinkage of the individual soil layers at the site is highly variable, locally ranging from a minimum shrinkage value of 0 percent to a maximum shrinkage of 23 percent at varying sample depths and locations. It should be noted that this shrinkage estimate is based on the results of dry density testing performed on small-diameter samples of the existing soils taken at the boring locations. If a more accurate and precise shrinkage estimate is desired, SCG can perform a shrinkage study involving several excavated test-pits where in-place densities are determined using in-situ testing methods instead of laboratory density testing on small-diameter samples. Please contact SCG for details and a cost estimate regarding a shrinkage study, if desired.

Minor ground subsidence is expected to occur in the soils below the zone of removal, due to settlement and machinery working. The subsidence is estimated to be 0.1 feet.

These estimates are based on previous experience and the subsurface conditions encountered at the boring locations. The actual amount of subsidence is expected to be variable and will be dependent on the type of machinery used, repetitions of use, and dynamic effects, all of which are difficult to assess precisely.

Grading and Foundation Plan Review

No grading or foundation plans were available at the time of this report. It is therefore recommended that we be provided with copies of the preliminary plans, when they become available, for review with regard to the conclusions, recommendations, and assumptions contained within this report.

6.3 Site Grading Recommendations

The grading recommendations presented below are based on the subsurface conditions encountered at the boring locations and our understanding of the proposed development. We recommend that all grading activities be completed in accordance with the Grading Guide Specifications included as Appendix D of this report, unless superseded by site-specific recommendations presented below.

Site Stripping and Demolition

Demolition of the existing structures, pavements and any associated improvements will be necessary to facilitate the construction of the proposed development. Demolition of the existing structures should include all foundations, floor slabs, and any associated utilities. Any septic systems encountered during demolition and/or grading (if present) should be removed in their entirety. Any associated leach fields or other existing underground improvements should also be removed in their entirety. Debris resultant from demolition should be disposed of off-site in accordance with local regulations. Alternatively, concrete and asphalt debris may be pulverized to a maximum 2-inch particle size, well mixed with the on-site soils, and incorporated into new structural fills or it may be crushed and made into crushed miscellaneous base (CMB), if desired.

Initial site stripping should also include removal of any surficial vegetation from the unpaved areas of the site. This should include any weeds, grasses, shrubs, and trees. Root systems associated with the trees should be removed in their entirety, and the resultant excavations should be backfilled with compacted structural fill soils. Stripping should also include the organic soils present in the area of Boring No. B-1. The soils encountered at this boring location possess organic contents of 17.0 to 23.6 percent, and are compressible, corrosive and possess sulfate concentrations that constitute a severe sulfate exposure to concrete. These highly organic soils should be removed from the site in their entirety. Alternatively, it may be feasible to reuse these organic soils in landscape areas, provided that their properties are evaluated by the landscape architect or other qualified person. However, these materials should not be used in any areas supporting any structure or site improvement. The actual extent of site stripping should be determined in the field by the geotechnical engineer, based on the organic content and stability of the materials encountered.

Treatment of Existing Soils: Building Pads

Remedial grading should be performed within the proposed building pad areas in order to remove any soils disturbed during demolition, the existing undocumented fill soils, and the upper portion of the near-surface native alluvium. Based on conditions encountered at the boring and trench locations, we recommend that the existing soils within the proposed building areas be overexcavated to a depth of at least 5 feet below existing grade and to a depth of at least 3 feet below proposed building pad subgrade elevations, whichever is greater. The depth of the overexcavation should also extend to a depth sufficient to remove all undocumented fill soils. The undocumented fills extend to depths of 1½ to 8½± feet at most of the boring and trench locations. Additional overexcavation should be performed within the influence zones of the new foundations, to provide for a new layer of compacted structural fill extending to a depth of at least 2 feet below proposed bearing grades.

The overexcavation areas should extend at least 5 feet beyond the building and foundation perimeters, and to an extent equal to the depth of fill placed below the foundation bearing grade, whichever is greater. If the proposed structure incorporates any exterior columns (such as for a canopy or overhang) the area of overexcavation should also encompass these areas.

Following completion of the overexcavation, the subgrade soils within the overexcavation areas should be evaluated by the geotechnical engineer to verify their suitability to serve as the structural fill subgrade, as well as to support the foundation loads of the new structures. This evaluation should include proofrolling and probing to identify any soft, loose or otherwise unstable

soils that must be removed. Some localized areas of deeper excavation may be required if additional fill materials or loose, porous, or low-density native soils are encountered at the base of the overexcavation. It should be noted that some of the borings, including Boring Nos. B-4, B-5, B-6, B-12, B-13, B-16, B-18 and B-21 encountered loose soils extending to depths of 7½ to 12± feet, and Boring No. B-11 encountered loose soils to a depth of 17± feet.

After a suitable overexcavation subgrade has been achieved, the exposed soils should be scarified to a depth of at least 12 inches and moisture treated to 0 to 4 percent above optimum moisture content. The subgrade soils should then be recompacted to at least 90 percent of the ASTM D-1557 maximum dry density. The previously excavated soils may then be replaced as compacted structural fill.

Treatment of Existing Soils: Retaining Walls and Site Walls

The existing soils within the areas of any proposed retaining walls and site walls should be overexcavated to a depth of 2 feet below foundation bearing grade and replaced as compacted structural fill as discussed above for the proposed building pad. Any undocumented fill soils or disturbed native alluvium within any of these foundation areas should be removed in their entirety. The overexcavation areas should extend at least 5 feet beyond the foundation perimeters, and to an extent equal to the depth of fill below the new foundations. Any erection pads for tilt-up concrete walls are considered to be part of the foundation system. Therefore, these overexcavation recommendations are applicable to erection pads. The overexcavation subgrade soils should be evaluated by the geotechnical engineer prior to scarifying, moisture conditioning to within 0 to 4 percent above the optimum moisture content, and recompacting the upper 12 inches of exposed subgrade soils. The previously excavated soils may then be replaced as compacted structural fill.

If the full lateral recommended remedial grading cannot be completed for the proposed retaining walls and site walls located along property lines, the foundations for those walls should be designed using a reduced allowable bearing pressure. Furthermore, the contractor should take necessary precautions to protect the adjacent improvements during rough grading. Specialized grading techniques, such as A-B-C slot cuts, will likely be required during remedial grading. The geotechnical engineer of record should be contacted if additional recommendations, such as shoring design recommendations, are required during grading.

Treatment of Existing Soils: Flatwork, Parking and Drive Areas

Based on economic considerations, overexcavation of the existing near-surface existing soils in the new flatwork, parking and drive areas is not considered warranted, with the exception of areas where lower strength or unstable soils are identified by the geotechnical engineer during grading. The existing fill soils encountered at Boring No. B-1 are compressible and corrosive. These soils should be removed from the proposed pavement areas in their entirety. These organic soils should not be reused as structural fill in any pavement areas. Subgrade preparation in the new flatwork, parking and drive areas should initially consist of removal of all soils disturbed during stripping and demolition operations

The geotechnical engineer should then evaluate the subgrade to identify any areas of additional unsuitable soils. Any such materials should be removed to a level of firm and unyielding soil. The exposed subgrade soils should then be scarified to a depth of 12± inches, moisture conditioned

to 0 to 4 percent above the optimum moisture content, and recompacted to at least 90 percent of the ASTM D-1557 maximum dry density. Based on the presence of variable strength surficial soils throughout the site, it is expected that some isolated areas of additional overexcavation may be required to remove zones of lower strength, unsuitable soils.

The grading recommendations presented above for the proposed flatwork, parking and drive areas assume that the owner and/or developer can tolerate minor amounts of settlement within the proposed flatwork, parking and drive areas. The grading recommendations presented above do not completely mitigate the extent of existing fill soils that may be present in the flatwork, parking and drive areas. As such, some settlement and associated pavement distress could occur. Typically, repair of such distressed areas involves significantly lower costs than completely mitigating these soils at the time of construction. If the owner cannot tolerate the risk of such settlements, the flatwork, parking and drive areas should be overexcavated to a depth of 2 feet below proposed pavement subgrade elevation, with the resulting soils replaced as compacted structural fill.

Fill Placement

- Fill soils should be placed in thin (6± inches), near-horizontal lifts, moisture conditioned to 0 to 4 percent above the optimum moisture content, and compacted.
- On-site soils may be used for fill provided they are cleaned of any debris to the satisfaction of the geotechnical engineer.
- All grading and fill placement activities should be completed in accordance with the requirements of the 2019 CBC and the grading code of the city of Rancho Cucamonga.
- All fill soils should be compacted to at least 90 percent of the ASTM D-1557 maximum dry density. Fill soils should be well mixed.
- Compaction tests should be performed periodically by the geotechnical engineer as random verification of compaction and moisture content. These tests are intended to aid the contractor. Since the tests are taken at discrete locations and depths, they may not be indicative of the entire fill and therefore should not relieve the contractor of his responsibility to meet the job specifications.

Imported Structural Fill

All imported structural fill should consist of very low expansive (EI < 20), well graded soils possessing at least 10 percent fines (that portion of the sample passing the No. 200 sieve). Additional specifications for structural fill are presented in the Grading Guide Specifications, included as Appendix D.

Utility Trench Backfill

In general, all utility trench backfill should be compacted to at least 90 percent of the ASTM D-1557 maximum dry density. As an alternative, a clean sand (minimum Sand Equivalent of 30) may be placed within trenches and compacted in place (jetting or flooding is not recommended). Compacted trench backfill should conform to the requirements of the local grading code, and more restrictive requirements may be indicated by the city of Rancho Cucamonga. All utility trench backfills should be witnessed by the geotechnical engineer. The trench backfill soils should be compaction tested where possible; probed and visually evaluated elsewhere.

Utility trenches which parallel a footing, and extending below a 1h:1v (horizontal to vertical) plane projected from the outside edge of the footing should be backfilled with structural fill soils, compacted to at least 90 percent of the ASTM D-1557 standard. Pea gravel backfill should not be used for these trenches.

Any soils used to backfill voids around subsurface utility structures, such as manholes or vaults, should be placed as compacted structural fill. If it is not practical to place compacted fill in these areas, then such void spaces may be backfilled with lean concrete slurry. Uncompacted pea gravel or sand is not recommended for backfilling these voids since these materials have a potential to settle and thereby cause distress of pavements placed around these subterranean structures.

6.4 Construction Considerations

Excavation Considerations

The near-surface soils generally consist of loose to medium dense sands, silty sands and sandy silts. These materials will likely be subject to moderate caving within shallow excavations. Where caving does occur, flattened excavation slopes may be sufficient to provide excavation stability. On a preliminary basis, the inclination of temporary slopes should not exceed 2h:1v. Deeper excavations may require some form of external stabilization such as shoring or bracing. Maintaining adequate moisture content within the near-surface soils will improve excavation stability. All excavation activities on this site should be conducted in accordance with Cal-OSHA regulations.

Moisture Sensitive Subgrade Soils

Some of the near-surface soils possess appreciable silt content. These soils may become unstable if exposed to significant moisture infiltration or disturbance by construction traffic. In addition, based on their granular content, some of the on-site soils will also be susceptible to erosion. The site should, therefore, be graded to prevent ponding of surface water and to prevent water from running into excavations.

If grading occurs during a period of relatively wet weather, subgrade instability should also be expected. The site should, therefore, be graded to prevent ponding of surface water and to prevent water from running into excavations. Consideration should be given to using only tracked vehicles once subgrade instability develops. The use of rubber-tired equipment could result in significant pumping and further deterioration of the exposed subgrade.

If the construction schedule dictates that site grading will occur during a period of wet weather, allowances should be made for costs and delays associated with drying the on-site soils or import of a drier, less moisture-sensitive fill material. Grading during wet or cool weather may also increase the depth of overexcavation in the pad area.

Groundwater

The static groundwater table is considered to have existed at a depth in excess of 30± feet at the time of the subsurface exploration. Therefore, groundwater is not expected to impact the grading or foundation construction activities.

6.5 Foundation Design and Construction

Based on the preceding grading recommendations, it is assumed that the new building pads will be underlain by structural fill soils used to replace the existing fill soils and a portion of the near-surface alluvial soils. These new structural fill soils are expected to extend to depths of at least 2 feet below proposed foundation bearing grade, underlain by 1± foot of additional soil that has been scarified, moisture conditioned, and recompacted. Based on this subsurface profile, the proposed structures may be supported on conventional shallow foundations.

Foundation Design Parameters

New square and rectangular footings may be designed as follows:

- Maximum, net allowable soil bearing pressure: 2,500 lbs/ft^2.
- Minimum wall/column footing width: 14 inches/24 inches.
- Minimum longitudinal steel reinforcement within strip footings: Two (2) No. 5 rebars (1 top and 1 bottom).
- Minimum foundation embedment: 12 inches into suitable structural fill soils, and at least 18 inches below adjacent exterior grade. Interior column footings may be placed immediately beneath the floor slab.
- It is recommended that the perimeter building foundations be continuous across all exterior doorways. Any flatwork adjacent to the exterior doors should be doweled into the perimeter foundations in a manner determined by the structural engineer.

The allowable bearing pressures presented above may be increased by 1/3 when considering short duration wind or seismic loads. The minimum steel reinforcement recommended above is based on geotechnical considerations; additional reinforcement may be necessary for structural considerations. The actual design of the foundations should be determined by the structural engineer.

Foundation Construction

The foundation subgrade soils should be evaluated at the time of overexcavation, as discussed in Section 6.3 of this report. It is further recommended that the foundation subgrade soils be evaluated by the geotechnical engineer immediately prior to steel or concrete placement. Soils suitable for direct foundation support should consist of newly placed structural fill, compacted to at least 90 percent of the ASTM D-1557 maximum dry density. Any unsuitable materials should be removed to a depth of suitable bearing compacted structural fill or suitable native alluvium

(where reduced bearing pressures are utilized), with the resulting excavations backfilled with compacted fill soils. As an alternative, lean concrete slurry (500 to 1,500 psi) may be used to backfill such isolated overexcavations.

The foundation subgrade soils should also be properly moisture conditioned to 0 to 4 percent above the Modified Proctor optimum, to a depth of at least 12 inches below bearing grade. Since it is typically not feasible to increase the moisture content of the floor slab and foundation subgrade soils once rough grading has been completed, care should be taken to maintain the moisture content of the building pad subgrade soils throughout the construction process.

Estimated Foundation Settlements

Post-construction total and differential settlements of shallow foundations designed and constructed in accordance with the previously presented recommendations are estimated to be less than 1.0 and 0.5 inches, respectively. Differential movements are expected to occur over a 30-foot span, thereby resulting in an angular distortion of less than 0.002 inches per inch.

Lateral Load Resistance

Lateral load resistance will be developed by a combination of friction acting at the base of foundations and slabs and the passive earth pressure developed by footings below grade. The following friction and passive pressure may be used to resist lateral forces:

- Passive Earth Pressure: 300 lbs/ft^3
- Friction Coefficient: 0.30

These are allowable values, and include a factor of safety. When combining friction and passive resistance, the passive pressure component should be reduced by one-third. These values assume that footings will be poured directly against compacted structural fill soils. The maximum allowable passive pressure is 3,000 lbs/ft^2.

6.6 Floor Slab Design and Construction

Subgrades which will support the new floor slabs should be prepared in accordance with the recommendations contained in the *Site Grading Recommendations* section of this report. Based on the anticipated grading which will occur at this site, the floors of the proposed structures may be constructed as conventional slabs-on-grade supported on newly placed structural fill (or densified existing soils), extending to a depth of at least 3 feet below finished pad grades. Based on geotechnical considerations, the floor slabs may be designed as follows:

- Minimum slab thickness: 6 inches.

- Modulus of Subgrade Reaction: k = 150 psi/in.

- Minimum slab reinforcement: Reinforcement is not considered necessary from a geotechnical standpoint. The actual floor slab reinforcement should be determined by the structural engineer, based on the imposed slab loading.

- Slab underlayment: If moisture sensitive floor coverings will be used then minimum slab underlayment should consist of a moisture vapor barrier constructed below the entire area of the proposed slab where such moisture sensitive floor coverings are anticipated. The moisture vapor barrier should meet or exceed the Class A rating as defined by ASTM E 1745-97 and have a permeance rating less than 0.01 perms as described in ASTM E 96-95 and ASTM E 154-88. A polyolefin material such as Stego® Wrap Vapor Barrier or equivalent will meet these specifications. The moisture vapor barrier should be properly constructed in accordance with all applicable manufacturer specifications. Given that a rock free subgrade is anticipated and that a capillary break is not required, sand below the barrier is not required. The need for sand and/or the amount of sand above the moisture vapor barrier should be specified by the structural engineer or concrete contractor. The selection of sand above the barrier is not a geotechnical engineering issue and hence outside our purview. Where moisture sensitive floor coverings are not anticipated, the vapor barrier may be eliminated.

- Moisture condition the floor slab subgrade soils to 0 to 4 percent above the Modified Proctor optimum moisture content, to a depth of 12 inches. The moisture content of the floor slab subgrade soils should be verified by the geotechnical engineer within 24 hours prior to concrete placement.

- Proper concrete curing techniques should be utilized to reduce the potential for slab curling or the formation of excessive shrinkage cracks.

The actual design of the floor slabs should be completed by the structural engineer to verify adequate thickness and reinforcement.

6.7 Retaining Wall Design and Construction

Although not indicated on the site plans, some small (less than 6 feet in height) retaining walls may be required to facilitate the new site grades. The parameters recommended for use in the design of these walls are presented below.

Retaining Wall Design Parameters

Based on the soil conditions encountered at the boring locations, the following parameters may be used in the design of new retaining walls for this site. We have provided parameters assuming the use of on-site soils for retaining wall backfill. The on-site soils generally consist of silty sands, sands, and sandy silts. Based on their classification, these materials are expected to possess a friction angle of at least 30 degrees when compacted to at least 90 percent of the ASTM D-1557 maximum dry density.

If desired, SCG could provide design parameters for an alternative select backfill material behind the retaining walls. The use of select backfill material could result in lower lateral earth pressures. In order to use the design parameters for the imported select fill, this material must be placed within the entire active failure wedge. This wedge is defined as extending from the heel of the retaining wall upwards at an angle of approximately 60° from horizontal. If select backfill material behind the retaining wall is desired, SCG should be contacted for supplementary recommendations.

RETAINING WALL DESIGN PARAMETERS

Design Parameter		Soil Type On-site Silty Sands and Sandy Silts
Internal Friction Angle (ϕ)		30°
Unit Weight		130 lbs/ft^3
Equivalent Fluid Pressure:	Active Condition (level backfill)	43 lbs/ft^3
	Active Condition (2h:1v backfill)	70 lbs/ft^3
	At-Rest Condition (level backfill)	65 lbs/ft^3

The walls should be designed using a soil-footing coefficient of friction of 0.30 and an equivalent passive pressure of 300 lbs/ft^3. The structural engineer should incorporate appropriate factors of safety in the design of the retaining walls.

The active earth pressure may be used for the design of retaining walls that do not directly support structures or support soils that in turn support structures and which will be allowed to deflect. The at-rest earth pressure should be used for walls that will not be allowed to deflect such as those which will support foundation bearing soils, or which will support foundation loads directly.

Where the soils on the toe side of the retaining wall are not covered by a "hard" surface such as a structure or pavement, the upper 1 foot of soil should be neglected when calculating passive resistance due to the potential for the material to become disturbed or degraded during the life of the structure.

Seismic Lateral Earth Pressures

In accordance with the 2019 CBC, any retaining walls more than 6 feet in height must be designed for seismic lateral earth pressures. If walls 6 feet or more are required for this site, the geotechnical engineer should be contacted for supplementary seismic lateral earth pressure recommendations.

Retaining Wall Foundation Design

The retaining wall foundations should be underlain by at least 2 feet of newly placed structural fill. Foundations to support new retaining walls should be designed in accordance with the general Foundation Design Parameters presented in a previous section of this report.

Backfill Material

On-site soils may be used to backfill the retaining walls. However, all backfill material placed within 3 feet of the back wall face should have a particle size no greater than 3 inches. The retaining wall backfill materials should be well graded.

It is recommended that a properly installed prefabricated drainage composite such as the MiraDRAIN 6000XL (or approved equivalent), which is specifically designed for use behind retaining walls be used. If the drainage composite material is not covered by an impermeable surface, such as a structure or pavement, a 12-inch thick layer of a low permeability soil should be placed over the backfill to reduce surface water migration to the underlying soils. The drainage composite should be separated from the backfill soils by a suitable geotextile, approved by the geotechnical engineer.

All retaining wall backfill should be placed and compacted under engineering controlled conditions in the necessary layer thicknesses to ensure an in-place density between 90 and 93 percent of the maximum dry density as determined by the Modified Proctor test (ASTM D1557). Care should be taken to avoid over-compaction of the soils behind the retaining walls, and the use of heavy compaction equipment should be avoided.

Subsurface Drainage

As previously indicated, the retaining wall design parameters are based upon drained backfill conditions. Consequently, some form of permanent drainage system will be necessary in conjunction with the appropriate backfill material. Subsurface drainage may consist of either:

- A weep hole drainage system typically consisting of a series of 4-inch diameter holes in the wall situated slightly above the ground surface elevation on the exposed side of the wall and at an approximate 8-foot on-center spacing. The weep holes should include a 2 cubic foot pocket of open graded gravel, surrounded by an approved geotextile fabric, at each weep hole location.

- A 4-inch diameter perforated pipe surrounded by 2 cubic feet of gravel per linear foot of drain placed behind the wall, above the retaining wall footing. The gravel layer should be wrapped in a suitable geotextile fabric to reduce the potential for migration of fines. The footing drain should be extended to daylight or tied into a storm drainage system.

6.8 Pavement Design Parameters

Site preparation in the pavement area should be completed as previously recommended in the *Site Grading Recommendations* section of this report. The subsequent pavement recommendations assume proper drainage and construction monitoring, and are based on either PCA or CALTRANS design parameters for a twenty (20) year design period. However, these designs also assume a routine pavement maintenance program to obtain the anticipated 20-year pavement service life.

Pavement Subgrades

It is anticipated that the new pavements will be primarily supported on a layer of compacted structural fill, consisting of scarified, thoroughly moisture conditioned and recompacted existing soils. The near-surface soils generally consist of silty sands and sands with occasional interbedded sandy silt, sandy clay, and silty clay strata. These soils are generally considered to possess good pavement support characteristics, with R-values in the range of 50 to 60. The subsequent

pavement design is therefore based upon an assumed R-value of 50. Any fill material imported to the site should have support characteristics equal to or greater than that of the on-site soils and be placed and compacted under engineering controlled conditions. It is recommended that R-value testing be performed after completion of rough grading to verify that the pavement design recommendations presented herein are valid.

Asphaltic Concrete

Presented below are the recommended thicknesses for new flexible pavement structures consisting of asphaltic concrete over a granular base. The pavement designs are based on the traffic indices (TI's) indicated. The client and/or civil engineer should verify that these TI's are representative of the anticipated traffic volumes. If the client and/or civil engineer determine that the expected traffic volume will exceed the applicable traffic index, we should be contacted for supplementary recommendations. The design traffic indices equate to the following approximate daily traffic volumes over a 20-year design life, assuming six operational traffic days per week.

Traffic Index	No. of Heavy Trucks per Day
4.0	0
5.0	1
6.0	3
7.0	11
8.0	35
9.0	93

For the purpose of the traffic volumes indicated above, a truck is defined as a 5-axle tractor trailer unit with one 8-kip axle and two 32-kip tandem axles. All of the traffic indices allow for 1,000 automobiles per day.

ASPHALT PAVEMENTS (R=50)					
Materials	Thickness (inches)				
	Auto Parking and Auto Drive Lanes (TI = 4.0 to 5.0)	Truck Traffic			
		TI = 6.0	TI = 7.0	TI = 8.0	TI = 9.0
Asphalt Concrete	3	3½	4	5	5½
Aggregate Base	3	4	5	5	7
Compacted Subgrade	12	12	12	12	12

The aggregate base course should be compacted to at least 95 percent of the ASTM D-1557 maximum dry density. The asphaltic concrete should be compacted to at least 95 percent of the Marshall maximum density, as determined by ASTM D-2726. The aggregate base course may consist of crushed aggregate base (CAB) or crushed miscellaneous base (CMB), which is a recycled gravel, asphalt and concrete material. The gradation, R-Value, Sand Equivalent, and Percentage Wear of the CAB or CMB should comply with appropriate specifications contained in the current edition of the "Greenbook" Standard Specifications for Public Works Construction.

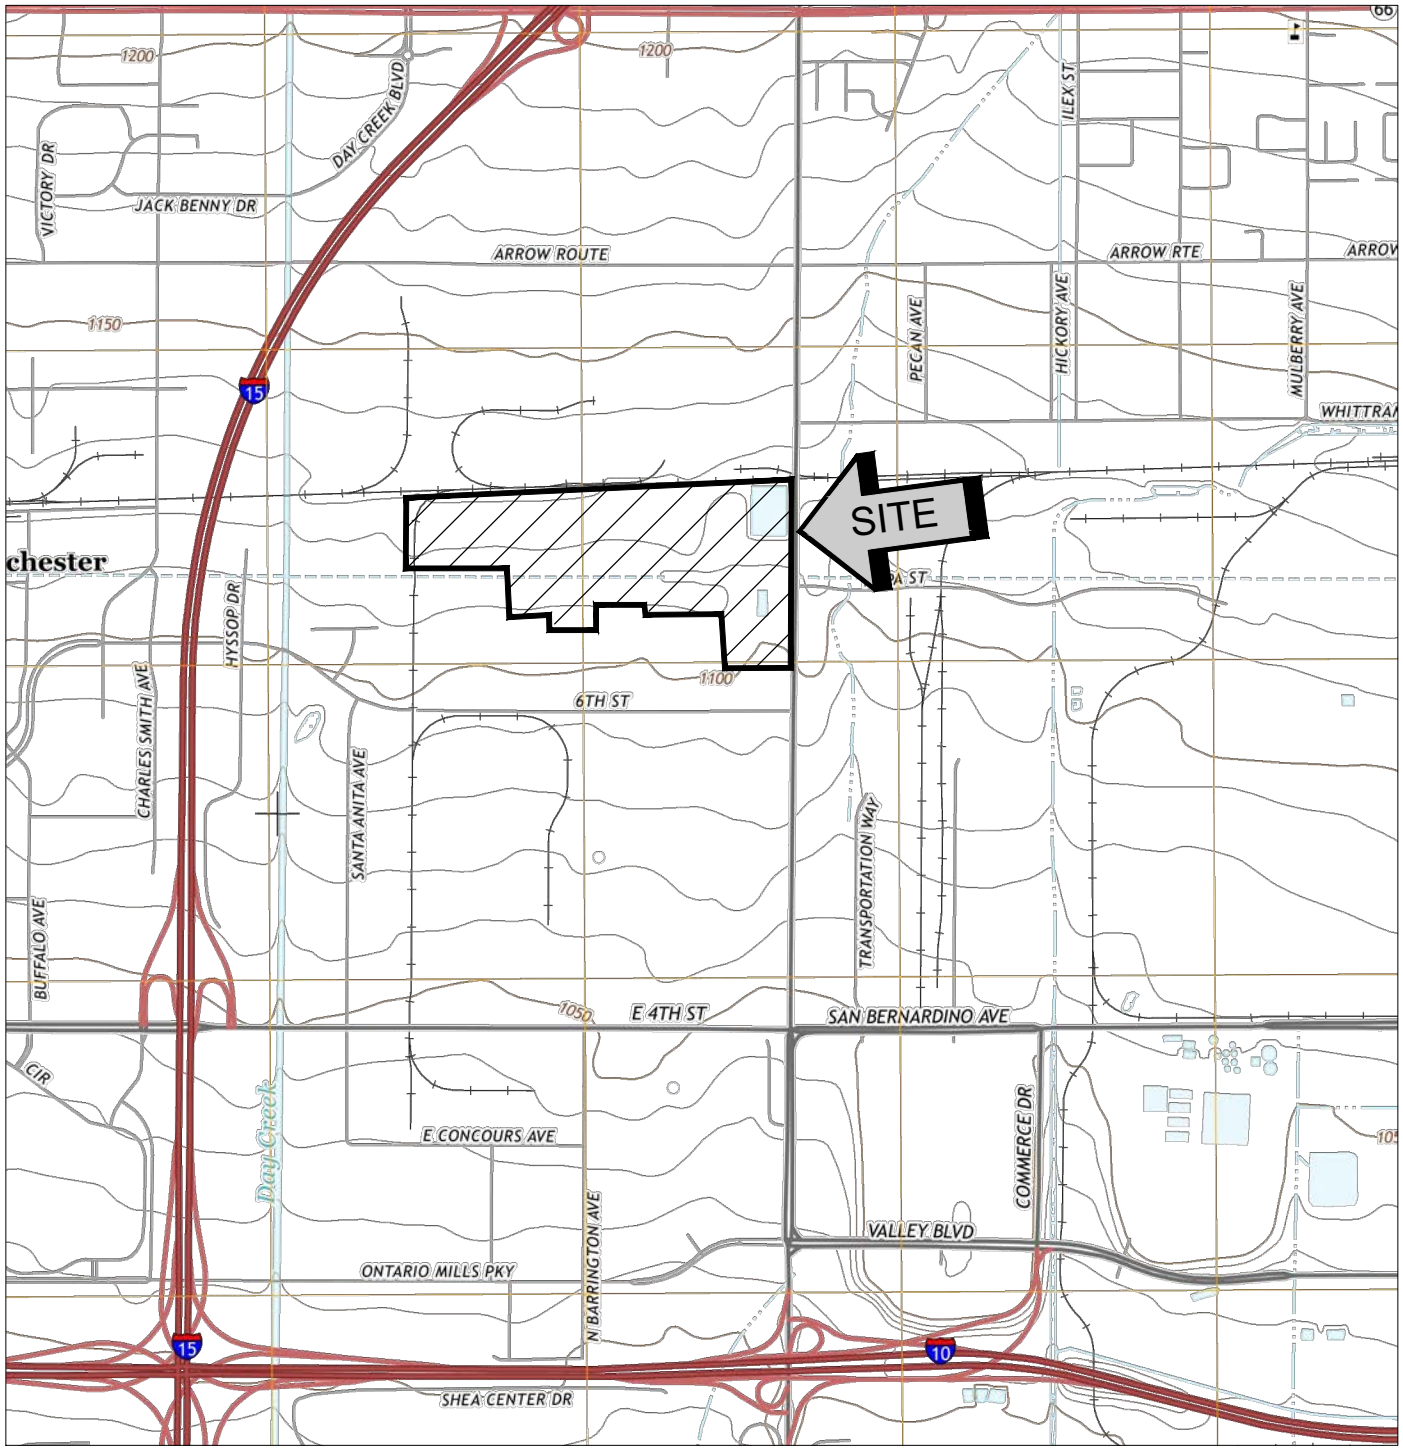
Portland Cement Concrete

The preparation of the subgrade soils within concrete pavement areas should be performed as previously described for proposed asphalt pavement areas. The minimum recommended thicknesses for the Portland Cement Concrete pavement sections are as follows:

PORTLAND CEMENT CONCRETE PAVEMENTS (R=50)				
Materials	Thickness (inches)			
	Autos and Light Truck Traffic (TI = 6.0)	Truck Traffic		
		TI = 7.0	TI = 8.0	TI = 9.0
PCC	5	5½	6½	8
Compacted Subgrade (95% minimum compaction)	12	12	12	12

The concrete should have a 28-day compressive strength of at least 3,000 psi. Any reinforcement within the PCC pavements should be determined by the project structural engineer. The maximum joint spacing within all of the PCC pavements is recommended to be equal to or less than 30 times the pavement thickness.

7.0 GENERAL COMMENTS



This report has been prepared as an instrument of service for use by the client, in order to aid in the evaluation of this property and to assist the architects and engineers in the design and preparation of the project plans and specifications. This report may be provided to the contractor(s) and other design consultants to disclose information relative to the project. However, this report is not intended to be utilized as a specification in and of itself, without appropriate interpretation by the project architect, civil engineer, and/or structural engineer. The reproduction and distribution of this report must be authorized by the client and Southern California Geotechnical, Inc. Furthermore, any reliance on this report by an unauthorized third party is at such party's sole risk, and we accept no responsibility for damage or loss which may occur. The client(s)' reliance upon this report is subject to the Engineering Services Agreement, incorporated into our proposal for this project.

The analysis of this site was based on a subsurface profile interpolated from limited discrete soil samples. While the materials encountered in the project area are considered to be representative of the total area, some variations should be expected between boring locations and sample depths. If the conditions encountered during construction vary significantly from those detailed herein, we should be contacted immediately to determine if the conditions alter the recommendations contained herein.

This report has been based on assumed or provided characteristics of the proposed development. It is recommended that the owner, client, architect, structural engineer, and civil engineer carefully review these assumptions to ensure that they are consistent with the characteristics of the proposed development. If discrepancies exist, they should be brought to our attention to verify that they do not affect the conclusions and recommendations contained herein. We also recommend that the project plans and specifications be submitted to our office for review to verify that our recommendations have been correctly interpreted.

The analysis, conclusions, and recommendations contained within this report have been promulgated in accordance with generally accepted professional geotechnical engineering practice. No other warranty is implied or expressed.

APPENDIX B

BORING LOG LEGEND

SAMPLE TYPE	GRAPHICAL SYMBOL	SAMPLE DESCRIPTION
AUGER		SAMPLE COLLECTED FROM AUGER CUTTINGS, NO FIELD MEASUREMENT OF SOIL STRENGTH. (DISTURBED)
CORE		ROCK CORE SAMPLE: TYPICALLY TAKEN WITH A DIAMOND-TIPPED CORE BARREL. TYPICALLY USED ONLY IN HIGHLY CONSOLIDATED BEDROCK.
GRAB		SOIL SAMPLE TAKEN WITH NO SPECIALIZED EQUIPMENT, SUCH AS FROM A STOCKPILE OR THE GROUND SURFACE. (DISTURBED)
CS		CALIFORNIA SAMPLER: 2-1/2 INCH I.D. SPLIT BARREL SAMPLER, LINED WITH 1-INCH HIGH BRASS RINGS. DRIVEN WITH SPT HAMMER. (RELATIVELY UNDISTURBED)
NSR		NO RECOVERY: THE SAMPLING ATTEMPT DID NOT RESULT IN RECOVERY OF ANY SIGNIFICANT SOIL OR ROCK MATERIAL.
SPT		STANDARD PENETRATION TEST: SAMPLER IS A 1.4 INCH INSIDE DIAMETER SPLIT BARREL, DRIVEN 18 INCHES WITH THE SPT HAMMER. (DISTURBED)
SH		SHELBY TUBE: TAKEN WITH A THIN WALL SAMPLE TUBE, PUSHED INTO THE SOIL AND THEN EXTRACTED. (UNDISTURBED)
VANE		VANE SHEAR TEST: SOIL STRENGTH OBTAINED USING A 4 BLADED SHEAR DEVICE. TYPICALLY USED IN SOFT CLAYS-NO SAMPLE RECOVERED.

COLUMN DESCRIPTIONS

DEPTH: Distance in feet below the ground surface.

SAMPLE: Sample Type as depicted above.

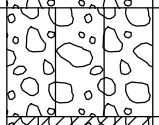
BLOW COUNT: Number of blows required to advance the sampler 12 inches using a 140 lb hammer with a 30-inch drop. 50/3" indicates penetration refusal (>50 blows) at 3 inches. WH indicates that the weight of the hammer was sufficient to push the sampler 6 inches or more.

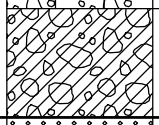
POCKET PEN.: Approximate shear strength of a cohesive soil sample as measured by pocket penetrometer.

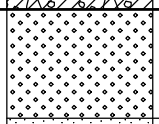
GRAPHIC LOG: Graphic Soil Symbol as depicted on the following page.

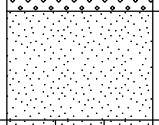
DRY DENSITY: Dry density of an undisturbed or relatively undisturbed sample in lbs/ft^3.

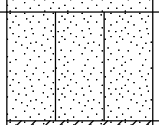
MOISTURE CONTENT: Moisture content of a soil sample, expressed as a percentage of the dry weight.

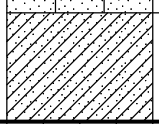


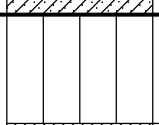


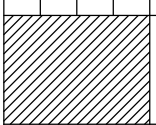


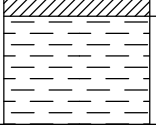


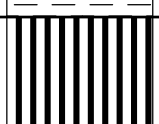


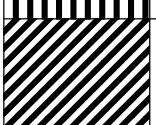


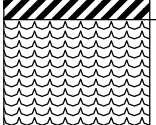


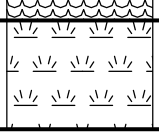












LIQUID LIMIT: The moisture content above which a soil behaves as a liquid.

PLASTIC LIMIT: The moisture content above which a soil behaves as a plastic.

PASSING #200 SIEVE: The percentage of the sample finer than the #200 standard sieve.

UNCONFINED SHEAR: The shear strength of a cohesive soil sample, as measured in the unconfined state.

SOIL CLASSIFICATION CHART

MAJOR DIVISIONS			SYMBOLS		TYPICAL DESCRIPTIONS

APPENDIX D

GRADING GUIDE SPECIFICATIONS

These grading guide specifications are intended to provide typical procedures for grading operations. They are intended to supplement the recommendations contained in the geotechnical investigation report for this project. Should the recommendations in the geotechnical investigation report conflict with the grading guide specifications, the more site specific recommendations in the geotechnical investigation report will govern.

General

- The Earthwork Contractor is responsible for the satisfactory completion of all earthwork in accordance with the plans and geotechnical reports, and in accordance with city, county, and applicable building codes.

- The Geotechnical Engineer is the representative of the Owner/Builder for the purpose of implementing the report recommendations and guidelines. These duties are not intended to relieve the Earthwork Contractor of any responsibility to perform in a workman-like manner, nor is the Geotechnical Engineer to direct the grading equipment or personnel employed by the Contractor.

- The Earthwork Contractor is required to notify the Geotechnical Engineer of the anticipated work and schedule so that testing and inspections can be provided. If necessary, work may be stopped and redone if personnel have not been scheduled in advance.

- The Earthwork Contractor is required to have suitable and sufficient equipment on the job-site to process, moisture condition, mix and compact the amount of fill being placed to the approved compaction. In addition, suitable support equipment should be available to conform with recommendations and guidelines in this report.

- Canyon cleanouts, overexcavation areas, processed ground to receive fill, key excavations, subdrains and benches should be observed by the Geotechnical Engineer prior to placement of any fill. It is the Earthwork Contractor's responsibility to notify the Geotechnical Engineer of areas that are ready for inspection.

- Excavation, filling, and subgrade preparation should be performed in a manner and sequence that will provide drainage at all times and proper control of erosion. Precipitation, springs, and seepage water encountered shall be pumped or drained to provide a suitable working surface. The Geotechnical Engineer must be informed of springs or water seepage encountered during grading or foundation construction for possible revision to the recommended construction procedures and/or installation of subdrains.

Site Preparation

- The Earthwork Contractor is responsible for all clearing, grubbing, stripping and site preparation for the project in accordance with the recommendations of the Geotechnical Engineer.

- If any materials or areas are encountered by the Earthwork Contractor which are suspected of having toxic or environmentally sensitive contamination, the Geotechnical Engineer and Owner/Builder should be notified immediately.

- Major vegetation should be stripped and disposed of off-site. This includes trees, brush, heavy grasses and any materials considered unsuitable by the Geotechnical Engineer.

- Underground structures such as basements, cesspools or septic disposal systems, mining shafts, tunnels, wells and pipelines should be removed under the inspection of the Geotechnical Engineer and recommendations provided by the Geotechnical Engineer and/or city, county or state agencies. If such structures are known or found, the Geotechnical Engineer should be notified as soon as possible so that recommendations can be formulated.

- Any topsoil, slopewash, colluvium, alluvium and rock materials which are considered unsuitable by the Geotechnical Engineer should be removed prior to fill placement.

- Remaining voids created during site clearing caused by removal of trees, foundations basements, irrigation facilities, etc., should be excavated and filled with compacted fill.

- Subsequent to clearing and removals, areas to receive fill should be scarified to a depth of 10 to 12 inches, moisture conditioned and compacted

- The moisture condition of the processed ground should be at or slightly above the optimum moisture content as determined by the Geotechnical Engineer. Depending upon field conditions, this may require air drying or watering together with mixing and/or discing.

Compacted Fills

- Soil materials imported to or excavated on the property may be utilized in the fill, provided each material has been determined to be suitable in the opinion of the Geotechnical Engineer. Unless otherwise approved by the Geotechnical Engineer, all fill materials shall be free of deleterious, organic, or frozen matter, shall contain no chemicals that may result in the material being classified as “contaminated,” and shall be very low to non-expansive with a maximum expansion index (EI) of 50. The top 12 inches of the compacted fill should have a maximum particle size of 3 inches, and all underlying compacted fill material a maximum 6-inch particle size, except as noted below.

- All soils should be evaluated and tested by the Geotechnical Engineer. Materials with high expansion potential, low strength, poor gradation or containing organic materials may require removal from the site or selective placement and/or mixing to the satisfaction of the Geotechnical Engineer.

- Rock fragments or rocks less than 6 inches in their largest dimensions, or as otherwise determined by the Geotechnical Engineer, may be used in compacted fill, provided the distribution and placement is satisfactory in the opinion of the Geotechnical Engineer.

- Rock fragments or rocks greater than 12 inches should be taken off-site or placed in accordance with recommendations and in areas designated as suitable by the Geotechnical Engineer. These materials should be placed in accordance with Plate D-8 of these Grading Guide Specifications and in accordance with the following recommendations:

    - Rocks 12 inches or more in diameter should be placed in rows at least 15 feet apart, 15 feet from the edge of the fill, and 10 feet or more below subgrade. Spaces should be left between each rock fragment to provide for placement and compaction of soil around the fragments.

    - Fill materials consisting of soil meeting the minimum moisture content requirements and free of oversize material should be placed between and over the rows of rock or

concrete. Ample water and compactive effort should be applied to the fill materials as they are placed in order that all of the voids between each of the fragments are filled and compacted to the specified density.

- Subsequent rows of rocks should be placed such that they are not directly above a row placed in the previous lift of fill. A minimum 5-foot offset between rows is recommended.

- To facilitate future trenching, oversized material should not be placed within the range of foundation excavations, future utilities or other underground construction unless specifically approved by the soil engineer and the developer/owner representative.

- Fill materials approved by the Geotechnical Engineer should be placed in areas previously prepared to receive fill and in evenly placed, near horizontal layers at about 6 to 8 inches in loose thickness, or as otherwise determined by the Geotechnical Engineer for the project.

- Each layer should be moisture conditioned to optimum moisture content, or slightly above, as directed by the Geotechnical Engineer. After proper mixing and/or drying, to evenly distribute the moisture, the layers should be compacted to at least 90 percent of the maximum dry density in compliance with ASTM D-1557-78 unless otherwise indicated.

- Density and moisture content testing should be performed by the Geotechnical Engineer at random intervals and locations as determined by the Geotechnical Engineer. These tests are intended as an aid to the Earthwork Contractor, so he can evaluate his workmanship, equipment effectiveness and site conditions. The Earthwork Contractor is responsible for compaction as required by the Geotechnical Report(s) and governmental agencies.

- Fill areas unused for a period of time may require moisture conditioning, processing and recompaction prior to the start of additional filling. The Earthwork Contractor should notify the Geotechnical Engineer of his intent so that an evaluation can be made.

- Fill placed on ground sloping at a 5-to-1 inclination (horizontal-to-vertical) or steeper should be benched into bedrock or other suitable materials, as directed by the Geotechnical Engineer. Typical details of benching are illustrated on Plates D-2, D-4, and D-5.

- Cut/fill transition lots should have the cut portion overexcavated to a depth of at least 3 feet and rebuilt with fill (see Plate D-1), as determined by the Geotechnical Engineer.

- All cut lots should be inspected by the Geotechnical Engineer for fracturing and other bedrock conditions. If necessary, the pads should be overexcavated to a depth of 3 feet and rebuilt with a uniform, more cohesive soil type to impede moisture penetration.

- Cut portions of pad areas above buttresses or stabilizations should be overexcavated to a depth of 3 feet and rebuilt with uniform, more cohesive compacted fill to impede moisture penetration.

- Non-structural fill adjacent to structural fill should typically be placed in unison to provide lateral support. Backfill along walls must be placed and compacted with care to ensure that excessive unbalanced lateral pressures do not develop. The type of fill material placed adjacent to below grade walls must be properly tested and approved by the Geotechnical Engineer with consideration of the lateral earth pressure used in the design.

Foundations

- The foundation influence zone is defined as extending one foot horizontally from the outside edge of a footing, and proceeding downward at a ½ horizontal to 1 vertical (0.5:1) inclination.

- Where overexcavation beneath a footing subgrade is necessary, it should be conducted so as to encompass the entire foundation influence zone, as described above.

- Compacted fill adjacent to exterior footings should extend at least 12 inches above foundation bearing grade. Compacted fill within the interior of structures should extend to the floor subgrade elevation.

Fill Slopes

- The placement and compaction of fill described above applies to all fill slopes. Slope compaction should be accomplished by overfilling the slope, adequately compacting the fill in even layers, including the overfilled zone and cutting the slope back to expose the compacted core

- Slope compaction may also be achieved by backrolling the slope adequately every 2 to 4 vertical feet during the filling process as well as requiring the earth moving and compaction equipment to work close to the top of the slope. Upon completion of slope construction, the slope face should be compacted with a sheepsfoot connected to a sideboom and then grid rolled. This method of slope compaction should only be used if approved by the Geotechnical Engineer.

- Sandy soils lacking in adequate cohesion may be unstable for a finished slope condition and therefore should not be placed within 15 horizontal feet of the slope face.

- All fill slopes should be keyed into bedrock or other suitable material. Fill keys should be at least 15 feet wide and inclined at 2 percent into the slope. For slopes higher than 30 feet, the fill key width should be equal to one-half the height of the slope (see Plate D-5).

- All fill keys should be cleared of loose slough material prior to geotechnical inspection and should be approved by the Geotechnical Engineer and governmental agencies prior to filling.

- The cut portion of fill over cut slopes should be made first and inspected by the Geotechnical Engineer for possible stabilization requirements. The fill portion should be adequately keyed through all surficial soils and into bedrock or suitable material. Soils should be removed from the transition zone between the cut and fill portions (see Plate D-2).

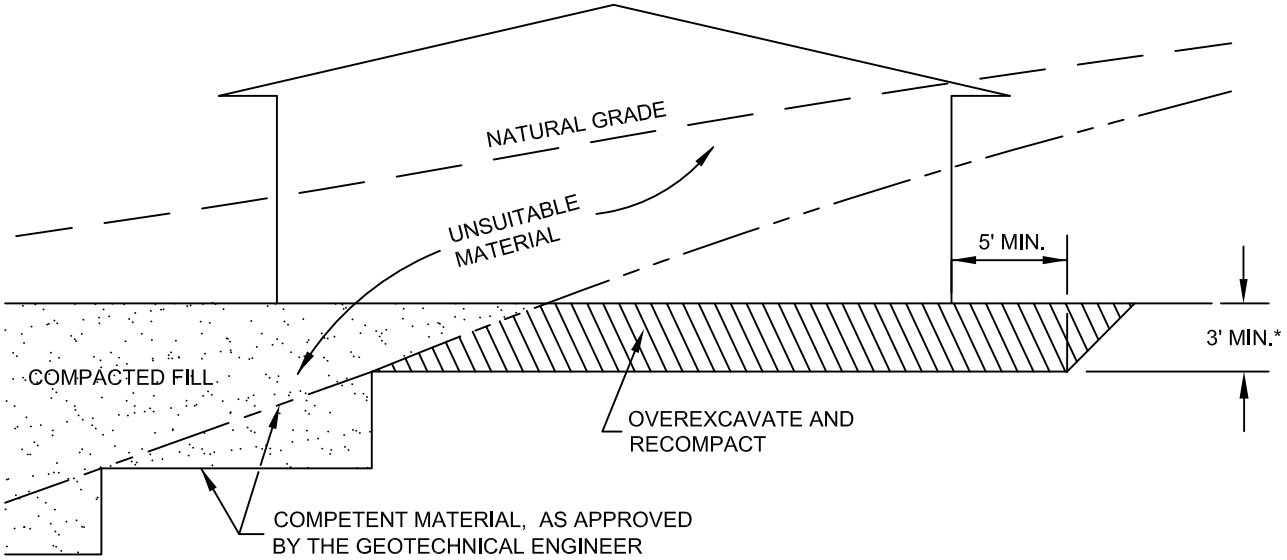
Cut Slopes

- All cut slopes should be inspected by the Geotechnical Engineer to determine the need for stabilization. The Earthwork Contractor should notify the Geotechnical Engineer when slope cutting is in progress at intervals of 10 vertical feet. Failure to notify may result in a delay in recommendations.

- Cut slopes exposing loose, cohesionless sands should be reported to the Geotechnical Engineer for possible stabilization recommendations.

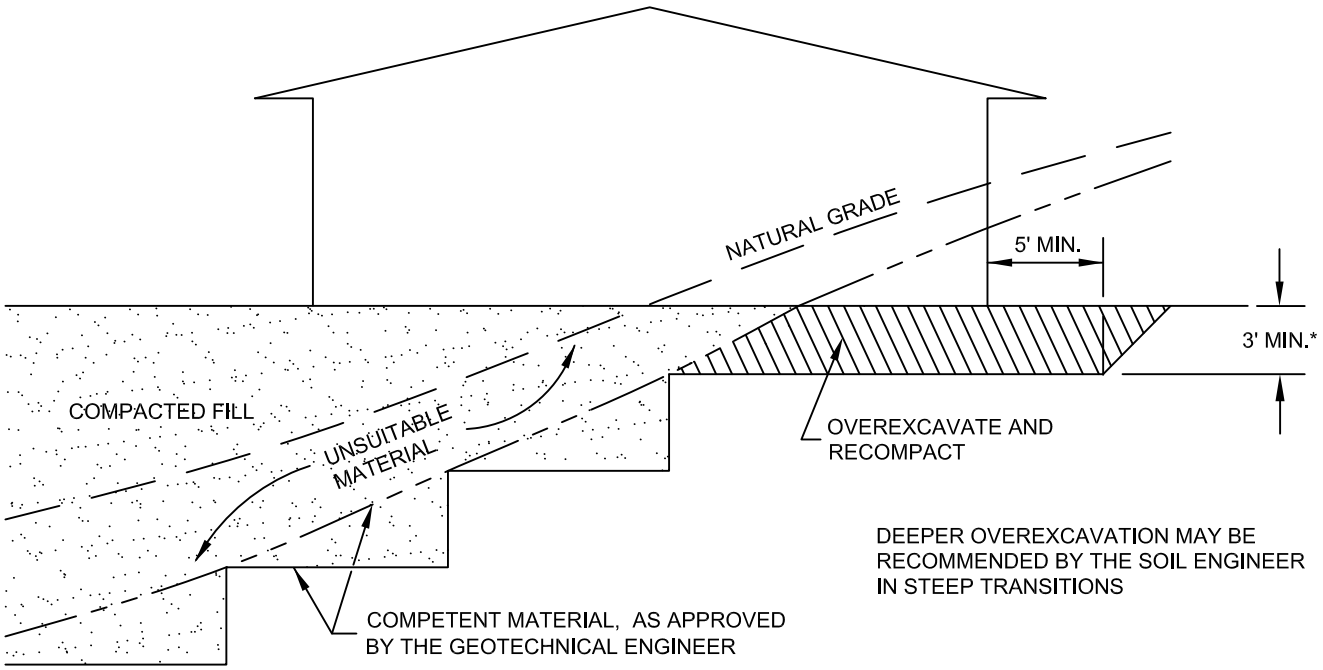
- All stabilization excavations should be cleared of loose slough material prior to geotechnical inspection. Stakes should be provided by the Civil Engineer to verify the location and dimensions of the key. A typical stabilization fill detail is shown on Plate D-5.

- Stabilization key excavations should be provided with subdrains. Typical subdrain details are shown on Plates D-6.



Subdrains

- Subdrains may be required in canyons and swales where fill placement is proposed. Typical subdrain details for canyons are shown on Plate D-3. Subdrains should be installed after approval of removals and before filling, as determined by the Soils Engineer.



- Plastic pipe may be used for subdrains provided it is Schedule 40 or SDR 35 or equivalent. Pipe should be protected against breakage, typically by placement in a square-cut (backhoe) trench or as recommended by the manufacturer.

- Filter material for subdrains should conform to CALTRANS Specification 68-1.025 or as approved by the Geotechnical Engineer for the specific site conditions. Clean ¾-inch crushed rock may be used provided it is wrapped in an acceptable filter cloth and approved by the Geotechnical Engineer. Pipe diameters should be 6 inches for runs up to 500 feet and 8 inches for the downstream continuations of longer runs. Four-inch diameter pipe may be used in buttress and stabilization fills.

Project No.: 124-108-100

EXECUTIVE SUMMARY

Black Creek Industrial Acquisitions LLC retained Path Forward Partners, Inc. (Path Forward) to conduct a Phase I Environmental Site Assessment (ESA) in conjunction with a prospective acquisition of the property located at 8996 Etiwanda Avenue, San Bernardino County, Rancho Cucamonga, California (subject property or Site). The subject property is identified by Assessor's Parcel Number 0229-283-79-0000.

Path Forward conducted this ESA in conformance with *ASTM Designation: E1527-13 Standard Practice for ESAs: Phase I ESA Process*. The scope of work and the terms and conditions are described in our Proposal No. 124-108-100 dated August 27, 2020. Exceptions and limitations encountered during this ESA are identified in the report.

Approximately 80 percent of the 62-acre property is paved, covered with gravel, and/or covered by Site structures that are part of a decommissioned electric power generating facility, known as the Etiwanda Generating Station, including buildings, power generating units, cooling towers, and retention basins/ponds. The remaining 20 percent of the Site is open space or vegetated.

Path Forward identified obvious subject property uses from the present back to 1938, at which time the subject property used for agricultural purposes. The electric power generating facility was constructed by Southern California Edison (SCE) on the subject property in 1951. Additional equipment and retention basins were added to the facility through 1979. The power generating facility operated on-Site until 2018. In 2003, some of the facility equipment was decommissioned. By 2018, the owner, GenOn, had ceased facility operations and the remaining equipment was decommissioned.

This ESA has revealed evidence of recognized environmental conditions (RECs), as defined in Section 1.1, in connection with the subject property, as follows:

- Pending RCRA Facility Investigation: The Superior Court of Los Angeles issued a Final Judgment pursuant to Stipulation on February 1, 1995. The Stipulation alleged that SCE had stored hazardous wastes in unpermitted surface impoundments at the company's power generating stations in Southern California, including the Etiwanda Generating Station. As part of the Stipulation, SCE was required to conduct Resource Conservation and Recovery Act (RCRA) closure of three surface impoundments (two wastewater retention basins and one boiler chemical cleaning basin) and the associated pipelines and appurtenances that connect the basins to the power generating units at the subject property according to Chapter 15 of Title 22, California Code of Regulations. The basins were granted case closure in 2011, as discussed below in the HREC section. The remainder of the subject property was ordered to be evaluated under RCRA corrective action. A Site-wide RCRA Facility Investigation (RFI) is required to evaluate soil beneath

inaccessible areas of the subject property (e.g., beneath the powerblock and cooling towers) and to determine if additional areas of the subject property require further assessment. The potential for impacts beneath Site features due to the historical operation of the power generating facility is considered a REC.

- Pending Data Gap Investigation: SCE submitted a workplan for the data gap soil sampling event to Department of Toxic Substances Control (DTSC) on October 15, 2020. The workplan indicates that soil samples will be collected at one hypochlorite tank/sump, three sulfuric acid aboveground storage tanks (ASTs) and two auxiliary transformers located on the subject property (SCE 2020). SCE stated that the data from the soil sampling event would be included in the RFI workplan along with other data previously collected at the subject property. SCE does not plan to conduct additional sampling in other inaccessible areas of the subject property, such as beneath the generating units and peaker unit. SCE stated that impacts identified in these areas during Site redevelopment will be managed in accordance with a Soil Management Plan that will be proposed in the RFI. The potential for impacts beneath Site features proposed for investigation is considered a REC.

- Arsenic in Soil: A Phase II investigation conducted in 1997 identified five areas on the subject property containing arsenic concentrations in soil above screening criteria identified in 1997. The identified areas are generally defined as surface water discharge, pipelines, cooling towers 3 and 4, sulfuric acid storage tanks, and the former water softener and brine pit. The maximum concentrations detected in 1997 were compared to the current DTSC approved background concentration of 12 milligrams per kilogram (mg/kg). Maximum arsenic concentrations detected at three of the areas, cooling towers 3 and 4 (17 mg/kg), sulfuric acid storage tanks (22 mg/kg), and former water softener and brine pit (17 mg/kg), exceeded the background concentration. The maximum concentrations detected at the surface water discharge (5.3 mg/kg) and pipelines (2.6 mg/kg) were below the background concentration.

  An additional investigation conducted in the vicinity of the Units 1 and 2 cooling towers conducted in March through May 2005 detected arsenic in shallow soils at concentrations ranging from 160 to 390 mg/kg. In August 2005, additional shallow soil sampling in the vicinity of the Units 1 and 2 cooling towers found arsenic at concentrations between 1.89 and 70.2 mg/kg. URS concluded that elevated arsenic concentrations "do not extend much past the base of the cooling tower units." In September 2019, SCE's consultant, Northgate Environmental, prepared a Cooling Towers Removal Activities Memorandum that outlines the excavation activities planned in the immediate vicinity of the Units 1 and 2 cooling towers (Northgate 2019).

  The elevated arsenic concentrations remaining in on-Site soils in the vicinity of cooling towers 1 and 2, cooling towers 3 and 4, sulfuric acid storage tanks, and former water softener and brine pit is considered a REC.

- 2019 Investigation Results: In October 2019, Ardent Environmental Group (Ardent) conducted a site investigation on behalf of a prospective buyer. Figures and tables from this investigation were provided to Path Forward but an accompanying report was not available. Based on a review of the figures and tables, soil and soil gas samples collected in several locations on the subject property contained concentrations of chemicals above human health and/or disposal criteria. Chemicals detected in soil above human health and/or disposal criteria include total petroleum hydrocarbons (TPH) as diesel in Chadwick Channel, arsenic and lead near the Unit 3 cooling tower, arsenic, copper, and lead in Landfill I (see 2020 Soil Excavation below), and thallium in the Unit 3 cooling tower flume. Chemicals detected in soil gas above human health and/or disposal criteria include bromodichloromethane, chloroform, 1,1-dichloroethane (1,1-DCA), tetrachloroethylene (PCE), and vinyl chloride in the maintenance shop area and 1,1-DCA, PCE, and vinyl chloride in the septic system associated with the maintenance shop. Given that the areas where elevated concentrations of chemicals were detected have not been further investigated, the extent of impacts in these areas has not been defined. The results of the 2019 Investigation indicating the presence of impacts above human health and/or disposal criteria is a REC.

- 2020 Soil Excavation: Metals-impacted soil in the northwest portion of the property (identified as Landfill I) was identified during a 2019 subsurface investigation conducted by Ardent. Between May and July 2020, approximately 6,445 tons of metals-impacted soil was identified and excavated from this area of the subject property. The soil was profiled as non-RCRA hazardous waste and disposed off-Site. The Soil Removal Memorandum prepared by ERM and dated September 22, 2020 states that, based on the results of field screening, visual observations and analytical results of the confirmation samples, all impacted soil containing elevated metals concentrations in the northwest portion of the subject property has been removed. ERM recommended no further action to mitigate this area.

  During the site visit performed by Path Forward, additional “black sand” was identified in northwest portion of the property (identified as Landfill II). In September 2020, ERM collected one additional soil sample of “black sand” that appeared similar to the area of excavation in Landfill I. The metals concentrations detected were similar to those detected in the Landfill I area; however, were below human health risk based levels. Given that only one sample was collected in this area, the extent of soil with elevated metals concentrations is not known. The presence of Black Sand in Landfill II is considered a REC.

- Spills and Releases: Numerous spills and releases from the cooling towers, tanks, and equipment have occurred since Site operations began in 1953. SCE records, San Bernardino County Fire Department records and records in the CHMIRS database indicate that releases to Chadwick Channel and other areas on the subject property have occurred throughout the history of Site operations. For example, records indicate

that transformer leakage in 1991 generated approximately 80 tons of transformer oil-containing soil and that an approximately 45-gallon release of non-PCB mineral oil was recovered by removal of soil in 1995. In addition, oil staining was noted in the powerblock and near various equipment at the Site during the Site reconnaissance conducted by Path Forward and others. Previous investigations conducted at the subject property have not included sampling in areas of subsurface and aboveground piping that conveys fuel oil from oil tanks to the powerblock. Given the long history of industrial operations including significant quantities of petroleum and other products and known release events, it is possible that impacts are present beneath inaccessible areas, such as the powerblocks and cooling towers, and near other equipment at the subject property, such as pipelines. This long industrial history and documented releases is considered a REC.

This ESA has revealed evidence of historical recognized environmental conditions (HRECs), as defined in Section 1.1, in connection with the subject property, as follows:

- Retention Basin RCRA Investigation and Closure: As discussed above in the REC section, the Superior Court of Los Angeles issued a Final Judgment pursuant to Stipulation on February 1, 1995. The Stipulation alleged that SCE had stored hazardous wastes in unpermitted surface impoundments at the company's power generating stations in Southern California, including the Etiwanda Generating Station. As part of the Stipulation, SCE was required to conduct RCRA closure of three surface impoundments (two wastewater retention basins and one boiler chemical cleaning basin) and the associated pipelines and appurtenances (the "Retention Basin Site") that connect the basins to the power generating units at the subject property according to Chapter 15 of Title 22, California Code of Regulations.

  SCE conducted investigations to determine whether the basins or associated conveyance systems had released wastewater to the underlying soil. The investigations concluded that leakage had occurred through the basin liners causing limited changes in the native soil chemistry. A DTSC-approved Water Quality Monitoring Program (WQMP) was subsequently conducted. A Closure Documentation Report (CDR) submitted to the DTSC in 2011 summarizes the data collected for the RCRA closure project. The CDR concluded that the extensive sampling and resultant analytical data illustrates a complete characterization of the soil beneath the retention basins and associated pipeline system. The CDR also concluded that there is no direct pathway for leakage to impact the groundwater and that there is no evidence of a continuous leak of wastewater to the sediments. The retention basins were found to meet closure requirements for the soil and groundwater chemicals of potential concern (COPCs) based on the results of a human health risk assessment that concluded that human health risks are within acceptable limits for future unrestricted industrial or residential use and that groundwater use is also acceptable for unrestricted use. The

environmental and ecological scoping-level risk assessment determined that ecological exposure pathways are incomplete.

The DTSC reviewed the CDR and issued a Closure Certification Acknowledgment letter on December 29, 2011 (DTSC 2011). The letter states that the DTSC considers the Retention Basin Site as being officially closed on December 20, 2011 and confirms that the Retention Basin Site has been investigated. The RCRA closure of the retention basins at the subject property is considered an HREC.

- 1985 Underground Storage Tank (UST) No Further Action Letter: An October 13, 1985 report provided the results of a soil investigation for three USTs (120-gallon naphtha, 550-gallon kerosene, and 550-gallon unleaded gasoline) that were removed in 1986. Five soil borings were advanced to 49 feet below ground surface (bgs) each, and a total of 24 soil samples were collected. All samples were analyzed for total recoverable petroleum hydrocarbons (TRPH). The highest TRPH result was 11 mg/kg from a sample collected at a depth of 10 feet bgs. The investigation results were submitted to the County of San Bernardino Department of Environmental Health Services on December 11, 1985. The DEHS reviewed the results and issued a letter dated December 27, 1985 that states "this Department concurs that the levels of contamination found do not present an environmental or public health threat." The no further action letter for the UST closure is considered an HREC.

- 1998 Tank Area No Further Action Letter: A May 26, 1998 letter, the Regional Water Quality Control Board (RWQCB) stated that their review of a April 9, 1998 Baseline Tank Study Report, which was not available in the records reviewed, indicates that additional investigation was required in borings where TPH concentrations were increasing with depth. The Baseline Tank Study Report included soil data collected in the "west and east tank areas" at the subject property. The location of these areas was not identified in records reviewed. The RWQCB letter states that further characterization of these areas could be conducted during remedial activities in these areas. A December 9, 1998 letter from the RWQCB to SCE indicated that, based on a review of the results of sampling contained in an August 21, 1998 report, which was also not available in the records reviewed, no further action was required. The no further action letter for the Tank Area is considered an HREC.

- Chadwick Channel Excavation Activity: The 1997 Phase II ESA indicates former occupants of properties to the north of the Site (TAMCO and Ameron) were responsible for several releases to the Chadwick Channel and other areas located to the north of the Site in the 1980s and 1990s. An investigation conducted in 1985 reportedly detected concentrations of arsenic in Chadwick Channel above screening criteria, and concentrations of lead and chromium above hazardous waste criteria. Results of the 1985 investigation were reportedly presented in a Site Characterization Study for the Etiwanda Generating Station; however, this report was not available for Path Forward's

review. On July 22, 1987, SCE received a letter from the RWQCB that states, based on review of the "Site Characterization study" that addressed the chemical composition and extent of impact to soil in the drainage channel and spreading basin, which is located south of the subject property, no further remedial action will be required.

Path Forward also reviewed a 1997 Chadwick Channel Site Investigation and Cleanup report that indicates that soil containing nickel at concentrations above the California Total Threshold Limiting Concentration (TTLC) were delineated near the former Unit 4 drain line discharge in Chadwick Channel. Beryllium was also detected at concentrations above its Preliminary Remediation Goal (PRG). The soil was excavated and sidewall and bottom samples confirmed that all impacted soil was removed. Agency closure of the 1997 excavation activities was not found during this assessment. The no further action letter and remediation of the area of Chadwick Channel near the former Unit 4 drainage line discharge are considered an HREC.

This ESA has revealed no evidence of controlled recognized environmental conditions (CRECs), as defined in Section 1.1, in connection with the subject property.

This ESA has revealed the following de minimis conditions, as defined in Section 1.1, in connection with the subject property:

- Former Agricultural Uses: The subject property was used for agricultural purposes sometime prior to 1938 until the early 1950s. Although not documented at the subject property, activities commonly associated with agricultural uses may include the use and storage of hazardous materials and petroleum products (*e.g.*, agricultural chemicals). Information was not available as to the potential historical usage of pesticides, fertilizers or insecticides. Based on our experience, these residual concentrations, if present, are not typically at concentrations that would require cleanup by a regulatory agency or pose a significant human health risk to commercial or industrial site users. There is potential that the near surface soils may contain residual agricultural chemicals that may affect disposal costs in the event redevelopment is planned and such soils are removed from the property. The historical agricultural use is considered a de minimis condition.

- Closed in place UST(s): A 550-gallon UST was installed at the subject property in 1986 or 1996. The 2007 Phase I ESA indicates that a construction inspection record dated January 13, 2000 and prepared by the Rancho Cucamonga Fire Department (RCFD) indicates that a 500-gallon fiberglass UST was removed from the Etiwanda facility. No noncompliance was observed. The inspection report indicated the UST was removed and transported offsite. Although a copy of the closure report was requested, the report was not contained in the file. However, the 2019 Phase I ESA indicates that the 550-gallon UST was closed in place at the Site in 2000 although closure and removal documentation was not available for review. Based on Path Forward's review of San

Bernardino County Fire Department (SBCFD) records, an Underground Storage Tanks form for permanent on-site closure of a 2,000-gallon UST was filed with the CUPA on January 3, 2000. The form indicates that the UST was filled with inert material and closed in place. No information regarding UST contents or location was found in the records reviewed. Based on the conflicting information provided in the previous Phase Is and records reviewed by Path Forward, it is possible that one or two USTs may have been closed in place at the subject property; one 550-gallon UST may be located south of the warehouse and the location of one 2,000-gallon UST is unknown.

- Potential UST: The 1997 Phase II ESA indicates that Edison Drawing 5625202 identifies a UST near a carport area, as shown on Figure 3. Geraghty & Miller conducted a geophysical survey in the area identified and did not identify a UST in this area but concluded that a UST may be found in this area during Site redevelopment.

1.0 INTRODUCTION

Black Creek Industrial Acquisitions LLC (User) retained Path Forward Partners Inc. (Path Forward) to conduct a Phase I Environmental Site Assessment (ESA) in conjunction with a prospective acquisition of the property located at 8996 Etiwanda Avenue, San Bernardino County, Rancho Cucamonga, California (subject property or Site). The subject property is identified by Assessor's Parcel Number 0229-283-79-0000. Figure 1 shows the approximate subject property location.

1.1 Purpose

One purpose of this Phase I ESA is to permit a user to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on CERCLA liability. A Phase I ESA is performed to identify recognized environmental conditions (RECs), historical recognized environmental conditions (HRECs), and controlled recognized environmental conditions (CRECs) in connection with the subject property by performing all appropriate inquiry into subject property ownership and use as well as into uses of adjoining properties and surrounding areas within approximate minimum search distances from the subject property.

ASTM Designation: E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessments Process (ASTM E1527) defines the terms REC, CREC, HREC and de minimis as follows (emphasis in original to indicate formally defined terms):

> **REC** – "The presence or likely presence of any *hazardous substances* or *petroleum products* in, on, or at a *property*: (1) due to any *release* to the environment; (2) under conditions indicative of a *release* to the *environment*; or (3) under conditions that pose a *material threat* of a future *release* to the *environment. De minimis* conditions are not *recognized environmental conditions*."
>
> **CREC** – "A *recognized environmental condition* resulting from a past *release* of *hazardous substances* or *petroleum products* that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with *hazardous substances* or *petroleum products* allowed to remain in place subject to the implementation of required controls (for example, *property* use restrictions, *activity and use limitations, institutional controls*, or *engineering controls*). A condition considered by the *environmental professional* to be a *controlled recognized environmental condition* shall be listed in the findings section of the *Phase I Environmental Site Assessment report*, and as a recognized environmental condition in the conclusions section of the *Phase I Environmental Site Assessment report*."

HREC – "A past *release* of any *hazardous substances* or *petroleum products* that has occurred in connection with the *property* and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, *property* use restrictions, *activity and use limitations*, *institutional controls*, or *engineering controls*). Before calling the past release a *historical recognized environmental condition*, the *environmental professional* must determine whether the past *release* is a *recognized environmental condition* at the time the *Phase I Environmental Site Assessment* is conducted (for example, if there has been a change in the regulatory criteria). If the EP considers the past *release* to be a *recognized environmental condition* at the time the Phase I ESA is conducted, the condition shall be included in the conclusions section of the report as a *recognized environmental condition*."

De Minimis Condition – "A condition that generally does not present a threat to human health or the *environment* and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be *de minimis* conditions are not *recognized environmental conditions* nor *controlled recognized environmental conditions*.

1.2 Methodology

Path Forward conducted the Phase I ESA in conformance with ASTM E1527. The scope of work and the terms and conditions are described in our Proposal No. 124-108-100 dated August 27, 2020.

1.3 Limitations

Path Forward obtained information for this ESA from various sources including historical sources, public records, the User, interviews and an environmental database report. For purposes of performing this Phase I ESA, this information is assumed to be correct and complete. Path Forward is not responsible for the quality or content of information from these sources.

Path Forward encountered the following data gaps or limitations in performing this ESA:

- Path Forward was not able to access the interior of two of shipping containers. No staining was noted in the vicinity of the shipping containers.

The information and opinions rendered in this report are exclusively for use by Black Creek Industrial Acquisitions LLC, its successors and/or assigns. Path Forward will not distribute or publish this report without consent except as required by law or court order. The information and opinions expressed in this report are given in response to a limited assignment and should be considered and implemented only in light of that assignment. The services provided by Path

Forward in completing this project were consistent with normal standards of the profession. No other warranty, expressed or implied, is made.

2.0 RECONNAISSANCE

Date of Site Visit:	September 17, 2020
Path Forward Person(s):	David A. Grunat, P.G. C.H.G. and Karen T. Smith
Property Escort:	Jon Sacks of GenOn and Steve Williams of ERM
Inaccessible Areas:	Interior of two shipping containers

The subject property reconnaissance was performed by vehicle and on foot. Adjoining properties were observed from the subject property and from public thoroughfares. Photographs are presented in Appendix A. Figure 2 depicts a site plan.

2.1 Subject Property Use

Approximately 80 percent of the 62-acre subject property is paved, covered with gravel, and/or covered by Site structures that are part of a decommissioned electric power generating facility, known as the Etiwanda Generating Station, including buildings, power generating units, cooling towers, and retention basins/ponds. The structures and basins/ponds located on the subject property are shown on Figure 2 and include the following:

- Guard shack;
- Administrative office building;
- Former maintenance shop;
- Former warehouse building;
- Former welding shop;
- Control room;
- Capped natural gas piping easement;
- The Chadwick Channel drainage ditch;
- Four decommissioned natural gas/oil/distillate- fueled electric generating units (Units 1, 2, 3, and 4)
- Decommissioned peaker unit (Unit 5);

- Cooling towers for Units 1-4;
- Cooling tower make-up water pond;
- Former hazardous waste accumulation area;
- Decommissioned reverse osmosis equipment and retention basin;
- Former laydown area;
- Fueling station;
- North and South retention basins;
- Former boiler chemical cleaning basin;
- Electrical transformers;
- Aboveground storage tanks; and
- Several auxiliary storage sheds/trailers.

The remaining 20 percent of the Site is open space or vegetated. The subject property is surrounded by chain-link fencing. Access to the subject property is through a gate on the eastern side of the subject property on Etiwanda Avenue. A manned guard shack monitors access to the subject property. Paved and dirt roads are located throughout the subject property. Paved parking areas are located north, south, and west of the administrative office building.

GenOn ceased operating the Etiwanda Generating Station on June 28, 2018. A facility caretaker employed by GenOn currently works at the subject property. The caretaker is responsible for facility maintenance and upkeep, operation of sumps, and keeping required permits and records up to date. The caretaker uses a gasoline-powered golf cart to travel on the Site. A third-party contractor staffs and operates the guard shack 24 hours a day, seven days a week.

Utilities are provided to the subject property as follows:

Electricity:	Southern California Edison
Gas:	Natural gas connections at the Site are currently capped and not in use.
Sewer:	On-Site septic tanks; no city sewer connection.
Water:	Bottled water for drinking purposes. Former on- and off-Site groundwater production wells were formerly utilized for non-potable use.

An underground pipeline aqueduct owned by the Metropolitan Water District (MWD) runs east-to-west along the southern portion of the subject property from the guard shack area to the western property boundary.

2.1.1 Hazardous Substances and Petroleum Products

Path Forward assessed the subject property for indications of the use, storage, or disposal of hazardous substances and petroleum products (e.g., manufacturing activities, drums, containers, stressed vegetation, stains, sheens, and heating/cooling systems). Path Forward observed no such indications, except for the following:

- Southeastern portion of the Site: 250-gallon gasoline AST in the fueling station.
- Unit 4: Several labeled and unlabeled drums and smaller containers were observed including a 30-gallon drum of trisodium phosphate, a 5-gallon container of unfiltered oil, and an approximately 2-gallon container of oil.
- Maintenance building: Several labeled and unlabeled smaller containers were observed including retail-sized containers of cleaners and aerosols.
- Warehouse building: Several labeled and unlabeled smaller containers were observed including 5-gallon pails on wooden pallets and several small containers of oil.
- Hazardous waste accumulation area: Two 8-gallon oily waste containers and five empty 55-gallon drums.
- Throughout the Site: Oil-filled transformers.

Since ceasing operations in June 2018, GenOn has removed bulk chemicals formerly stored at the subject property. Most of the tanks and reservoirs of oils and chemicals have been drained and properly closed as documented in the 2018 Closure Report (ERM 2018). The Closure Report states that oil-filled equipment serving Units 1, 2, and 5 was previously drained of oil and decommissioned when the units were taken out of service in 2003. In June 2018, GenOn prepared a Closure Plan that was approved by the City of Rancho Cucamonga. Between June and September 2018, additional closure activities were completed and documented in the Closure Report. The closure activities included draining, cleaning, and certifying the tanks and equipment in Units 3 and 4. Empty tanks and equipment from Units 1, 2, and 5 were cleaned and inspected and equipment that was in service in these units was emptied, cleaned and closed, with the exception of some equipment that remains in use, such as transformers.

Table 1 from the Closure Report, which is included in Appendix C, summarizes the completed closure activities, which include the following:

- Petroleum was drained from ASTs, transformers, and other oil-bearing equipment and the equipment was cleaned.
- The three retention basins were emptied of waste materials and cleaned.
- Chemicals stored in ASTs were cleaned using a combination of manual scraping of bottom sludge and pressure washing tank interiors with hot water.
- Portable containers (totes, 55-galllon drums, 5-gallon and smaller containers) of petroleum and other chemicals were removed from the Site for disposal.

Figure 2 through 10 of the Closure Report show the locations of the tanks and equipment that were addressed during the closure activities documented in the Closure Report. These figures are included in Appendix C.

2.1.2 Underground Storage Tanks (USTs)

Path Forward assessed the subject property for indications of USTs (*e.g.*, vent piping, dispensing equipment, pavement variations, and fill ports). Path Forward observed no such indications. Records reviewed during this assessment indicate several USTs containing petroleum products, wastewater, and other constituents have historically been in use at the Site, as discussed below.

Based on a review of previous reports, three USTs were historically located between Units 2 and 3, south of the warehouse building, as shown on Figure 3. Soil samples collected in this area in 1985 identified TRPH was detected at a maximum concentration of 11 mg/kg at a depth of 10 feet bgs and was not detected in samples collected at 40 feet bgs. The tanks were removed in 1986 and replaced by a 550-gallon double-walled fiberglass tank used to store unleaded fuel. The 550-gallon UST was reportedly installed with leak and integrity testing devices. No leaks or tank failures were reported. Based on the presence of the leak detection system, samples were not collected in this area in 1997 (URS 1997). The 2019 Phase I ESA indicates that the 550-gallon UST was closed in place at the Site in 2000 although closure and removal documentation was not available for review by ERM.

The 1997 Phase II ESA indicates that Edison Drawing 5625202 identifies a UST near a carport area, as shown on Figure 3. Geraghty & Miller conducted a geophysical survey in the area identified and did not identify a UST in this area but concluded that a UST may be found in this area during Site redevelopment.

In addition to the USTs, a distillate line runs beneath the ground from the distillate AST in the southern portion of the Site to peaker Unit 5, as shown on Figure 3.

The Subject Property was identified in the historical UST (HIST UST) and the Statewide Environmental Evaluation and Planning System (SWEEPS) UST databases of the EDR report. The

EDR report HIST and SWEEPS UST databases include 53 UST listings at the subject property address, some of which appear to be duplicate listings.

2.1.3 Aboveground Storage Tanks (ASTs)

Path Forward assessed the subject property for indications of ASTs (*e.g.*, pavement bolts, containers, reservoirs, and generators). Path Forward observed one AST that is currently in use for fueling Site vehicles: a 250-gallon AST used to store gasoline in the southeastern portion of the Site, as shown on Figure 2. The AST appeared to be in good condition, absent of leaks and staining. Other ASTs observed on the Site have been drained and properly closed as documented in the Closure Report discussed in Section 2.1.1. The ASTs were observed to be in fair to good condition and many were marked with spray paint indicating the tanks were "closed." ASTs that were formerly used to contain hazardous materials were equipped with secondary containment or were located in the power blocks which are equipped with floor drains that discharge to oil-water separators, as discussed in Section 2.1.4.

2.1.4 Liquid Waste

Path Forward assessed the subject property for indications of liquid waste discharge sources (*e.g.*, sumps, drains, clarifiers, pools of liquid, pits, ponds, lagoons, septic systems, wastewater, and storm water). Path Forward observed the following liquid waste discharge sources.

Sanitary wastewater generated at the subject property discharges to four on-Site septic tanks. The location of the septic systems is shown on Figure 3. Records reviewed indicate that the septic system located east of the maintenance shop consists of a 7,000-gallon tank with five inline 3,000-gallon seepage pits located downstream in the parking area of the shop building. Records indicate that this system backed up in 1996.

Process wastewater is not currently generated at the subject property. Floor drains and catch basins are located throughout the subject property. The drains and catch basins discharge to sumps and retention basins located on the subject property. The basins that are located on the subject property are shown on Figure 3 and discussed below.

- Two retention basins, identified as the north and south retention basins, are located in the southeast portion of the subject property. The basins have a gunite base and are lined with a poly liner. The basins formerly received water from an oil-water sump located north of Unit 4. An oil-water separator in the south basin removed oil remaining in the water and discharged water to the basins. Wastewater from the basins was periodically discharged to two lines that lead to the off-Site La Verne or Chino Wastewater Treatment facilities. The basins were cleaned as a part of the closure activities discussed in Section 2.1.1.

- The boiler water washdown basin, which is also identified as the chemical cleaning basin, is in the southeasternmost corner of the subject property and is lined with a

combination of gunite, geo-netting, and poly liner. The basin was previously used to retain wash down from on-Site boilers. By 2006, facility personnel stated that boiler water washdown instead was directed to Baker tanks (URS 2007).

- A retention basin located adjacent to the reverse osmosis facility in the south-central portion of the subject property was used to contain mineralized water that was a by-product of the reverse osmosis process. Water from the basin was used in the cooling towers. The basin was cleaned as a part of the closure activities discussed in Section 2.1.1.

- The cooling tower makeup water basin is located in the northeast corner of the subject property. Currently, the basin is used to store stormwater. Previously, water from three water production wells, Colorado River water, and reclaimed water was stored in the basin. The water was pumped through the cooling towers and made five loops before being discharged to the off-Site wastewater treatment facilities in La Verne and Chino. The 2007 Phase I ESA indicates that 17,395,000 gallons of wastewater was discharged in December 2006 (URS 2007).

- One former cooling tower sludge basin is located adjacent to the south side of the Units 1 and 2 cooling towers, as shown on Figure 3. The cooling tower sludge basin was not in use in 2007. Instead, sludge generated during cooling tower cleaning was placed in 20-yard roll-off containers that allowed water to be leached from the bins (URS 2007).

Three sumps are present around Generating Units 3 and 4. One sump on the north side of the units discharges to the north and south retention basins. One sump located in the powerblock discharges to an oil-water sump. An oil sump is located just south of the oil-water sump. Sumps in Generating Units 1 and 2 are reportedly similar in layout to those in Units 3 and 4. According to Site personnel, the sumps are not active. Storm water that collects in the sumps is manually discharged to the retention basins when necessary. During the Site visit an oily sheen was noted on accumulated stormwater within these sumps.

The 2019 Phase I ESA indicates that the Etiwanda Generating Station received a Notice of Significant Noncompliance (Enforcement Action Number 0192569) from the County of Sanitation Districts of Los Angeles on February 27, 2019. According to the violation, GenOn was found to be in violation of the Site's wastewater discharge permit requirements on at least one occasion in 2018. As a result, GenOn was included in the list of dischargers in Significant Noncompliance for 2018. Chronic and Technical Review Criteria (TRC) violations were determined for soluble sulfide on December 31, 2018 (ERM 2019).

Stormwater runoff at the subject property is directed through two main north-south conveyances, Chadwick Channel and a 30-inch storm drainpipe.

- Chadwick Channel is a unvegetated channel constructed of native soils that enters the subject property from the north between the cooling towers for Units 3 and 4. The

channel is six feet deep and 60 feet wide at the channel bottom. The surface channel trends west on the south side of the Unit 4 cooling tower and then trends south exiting the subject property to the southwest of the reverse osmosis retention basin, as shown on Figure 3. The channel terminates at an off-Site retention/energy dissipation basin south of the subject property. The surface of the channel was dry at the time of the Site reconnaissance.

- A 30-inch storm drainpipe enters the subject property at the east end of the cooling tower for Unit 3. The drain runs south and exits the subject property near the former distillate AST.

According to facility personnel, stormwater runoff from facilities to the north of the subject property commingles with runoff from the subject property. GenOn tests the storm drain influent and effluent twice per rainy season.

GenOn formerly maintained coverage under the General Permit for Storm Water Discharges Associated with Industrial Activity. The Central Valley Regional Water Quality Board approved the Notice of Termination (NOT) for the Subject Property on September 13, 2018 and the permit was terminated. ERM conducted a review of historical sampling results related to the former storm water permit maintained at the Site and found that exceedances of metals have been detected in surface water samples originating from off-Site sources (ERM 2019).

2.1.5 Solid Waste

Path Forward assessed the subject property for indications of solid waste disposal (*e.g.*, mounding, depressions, fill material, bins, debris, and active human use). Path Forward observed no such indications with the exception of municipal trash and recyclables generated in the administration building.

During operation of the power generating facility, SCE was registered as a large quantity generator (>2,200 pounds/month) and was issued Generator ID No. CAD008302903 on April 7, 1998. URS provided the following hazardous waste generation information based on review of a 2006 business plan and information from facility personnel (URS 2007):

Name of Waste	**Size of Largest Container**	**Approximate Quantity**
Asbestos	10,000 pounds	50,000 pounds/annual
Grit/Duct Sweep	6,400 pounds	1,000 pounds/annual
Cooling Tower Sludge	48,000 pounds	750,000 pounds/every 5-10 years
Cooling Tower Wood	80,000 pounds	750,000 pounds/annual
Grease, Fuel Oil, Tar	55 gallons	8,000 gallons/annual
Mercury Debris	50 pounds	5 pounds/annual

Name of Waste	Size of Largest Container	Approximate Quantity
Mercury	50 pounds	0 pounds in 2006
Oil, Debris, Soil	500 pounds	20,000 pounds/annual
Oil/Water Separator Sludge, Solid	5,000 gallons	250,000 pounds/every 8-10 years
Oil with Solvent	55 gallons	100 gallons/annual
Paint Chips/Debris with Lead	300 pounds	200 pounds/annual
Paint Solids/Sludge	55 gallons	25 gallons/annual

Records reviewed during this assessment indicate that two areas of the former SCE property, which includes the subject property, may have formerly been used as construction debris landfills. One area in the northwest portion of the subject property is identified in previous reports as Landfill 1 and is located on the subject property. The second landfill area was located southeast of the southeast fuel tank in a location that is not on the subject property. Investigations conducted in the on-Site landfill area are discussed in Section 5.5.

2.1.6 Polychlorinated Biphenyls (PCBs)

Path Forward assessed the subject property for indications of PCBs (*e.g.*, transformers, capacitors, elevators, and lifts). Transformers are located throughout the subject property including adjacent to the four power generating units and cooling towers. The 1997 Phase I ESA indicates that the transformers present in 1997 contained oil with less than 50 ppm PCBs. The transformers were reported to have contained oil with higher concentrations of PCBs prior to 1976. The Closure Report documents transformers that were drained during the 2018 closure activities and prior to 2018. The Closure Report also documents the transformers that continued to remain in service post-closure. Figures and tables showing the locations of the transformers are included in Appendix C.

SCE records reviewed during the 1997 Phase I ESA indicate that transformer leakage had generated approximately 80 tons of transformer oil-containing soil in 1991. The records indicate that off-Site thermal treatment was recommended for the soil. No records of off-Site disposal was found in the records reviewed.

2.1.7 Wells

Path Forward assessed the subject property for indications of supply, irrigation, monitor, injection, dry, abandoned, or other wells (*e.g.*, protruding pipes, cover plates, pumps, small sheds, large water storage containers, and mounded grout). Path Forward observed one well in the northern portion of the subject property. The well is identified as a stilling well in records reviewed for this assessment. According to facility personnel, the well is not currently in use.

Two production wells identified as the East Well and Central Well that were located south of the subject property, as shown on Figure 4, formerly provided process water to the subject

property. An additional production well was installed on the subject property in 2006, on the southern portion of the subject property southwest of the reverse osmosis basin. The well, which was identified as the West Well (see Figure 4), was decommissioned in 2019 as documented in the West Well Closure Memorandum prepared by ERM and dated February 3, 2020 (ERM 2020).

As discussed in Section 5.5., groundwater monitoring wells historically were installed on and south of the subject property to investigate impacts from the retention basins. The locations of these wells are shown on Figure 4.

2.2 Adjoining Property and Surrounding Area Use

Adjoining property and surrounding area use are primarily commercial/industrial.

- North: Railroad tracks, beyond which are industrial properties occupied by CMC Steel California (12459 Arrow Route), Central Transport (8822 Etiwanda Avenue), and Bernell Hydraulics (8810 Etiwanda Avenue).
- South: SCE Switchyard and Inland Empire Utilities Authority ASTs, which are used to store reclaimed water.
- East: Etiwanda Avenue, beyond which is a vacant building that was formerly occupied by All State Recycling (8889 Etiwanda Avenue), a bail bonds office (12951 Napa Street), and vacant land.
- West: Undeveloped, vacant land.

Photographs of the adjoining properties are presented in Appendix A.

3.0 USER PROVIDED INFORMATION

ASTM E 1527 defines “user” as the party seeking to use Practice E 1527 to complete an environmental site assessment of the subject property, and in this case, the user is Black Creek Industrial Acquisitions, LLC. Andrea Karp, on behalf of the user, is unaware of any environmental liens, AULs, or any other environmental issues associated with the subject property. During this ESA, the property owner provided information to the User for review by Path Forward, as noted in Section 5.5.

4.0 INTERVIEWS

4.1 Current Owner, Operators, Occupants

On September 17, 2020, David Grunat and Karen Smith of Path Forward interviewed Jon Sacks of GenOn and Steve Williams of ERM, representatives of the subject property owner. According to Mr. Sacks, he has no environmental information regarding the subject property beyond the records that were provided during this ESA (as discussed in Section 5.5).

4.2 Past Owners, Operators, and Occupants

Path Forward did not identify past subject property owners, operators, and occupants for interviews except for a phone interview with the DTSC in which representatives from past owner, SCE, participated, as discussed in Section 4.4 below.

4.3 Nearby Property Owners and Occupants

The subject property is not abandoned. Therefore, Path Forward did not interview nearby property owners and occupants.

4.4 Government Officials

Path Forward participated in a call with representatives from DTSC, GenOn (current subject property owner), and SCE (former subject property owner) on October 14, 2020. DTSC confirmed that SCE is required to prepare a RFI for the subject property. SCE confirmed they are in the process of preparing an RFI workplan.

Prior to submitting the RFI workplan to the DTSC, SCE plans to conduct a data gap soil sampling event to provide analytical data for selected areas of the Etiwanda Generating Station. SCE submitted a workplan for the data gap soil sampling event to DTSC on October 15, 2020. The workplan indicates that soil samples will be collected at one hypochlorite tank/sump, three sulfuric acid ASTs and two auxiliary transformers located on the subject property (SCE 2020). SCE stated that the data from the soil sampling event would be included in the RFI workplan along with other data previously collected at the subject property. SCE does not plan to conduct additional sampling in other inaccessible areas of the subject property, such as beneath the generating units and peaker unit. SCE stated that impacts identified in these areas during Site redevelopment will be managed in accordance with a Soil Management Plan that will be proposed in the RFI.

During the call, SCE representatives noted that the 1998 PSA limits SCE's liability for environmental impacts at the subject property until the fifteenth anniversary of the closing of the sale of the subject property. The environmental impacts are defined in the PSA in Article I, Section 1.1.(e) as follows:

"Existing Soils Contamination" shall mean the actual presence prior to the closing of hazardous materials in the soil or groundwater of the real properties included in the assets , as well as migration through soil or groundwater of hazardous materials actually present prior to the closing in the soil or groundwater of the real properties included in the assets, if (i) the seller, as of the date hereof and the closing date, has knowledge of such presence of such hazardous materials, it being agreed that seller has knowledge of matters disclosed in the Phase I and Phase II environmental assessments referred to in Section 3.7 and of matters otherwise disclosed in Schedule 3.7, (ii) such presence of such hazardous materials prior to the closing is demonstrated through the tests that buyer is entitled to make under Section 6.4, or (iii) such

hazardous material are proven by clean and convincing evidence on or before the fifteenth anniversary of the closing to have been present in such soil or groundwater prior to the closing."

As discussed during the phone call, SCE maintains that they are only responsible for arsenic impacts identified in soil near the Units 1 and 2 cooling towers and that GenOn is responsible for other impacts that have been identified since 2013 and that may be discovered during Site redevelopment. SCE's consultant, Northgate Environmental, prepared a Cooling Towers Removal Activities Memorandum dated September 23, 2019 that outlines the excavation activities planned in the immediate vicinity of the Units 1 and 2 cooling towers (Northgate 2019).

5.0 RECORDS REVIEW

Path Forward reviewed records pertaining to the subject property. In addition, where warranted and practical, Path Forward reviewed records pertaining to adjoining and nearby properties.

5.1 Physical Setting Sources

5.1.1 Physiography

Path Forward reviewed the United States Geological Survey's (USGS) 2012 7.5-minute Series Guasti Quadrangle Topographic Map. The ground surface elevation at the subject property is approximately 1,090 to 1,130 feet above mean sea level (msl) with a slight downward slope to the south. Surface water at the subject property drains via overland flow towards the southern boundary of the subject property. Surface water from northern surrounding properties enters the subject property via the Chadwick Channel, a drainage ditch, which transects the subject property from the north to the south, as shown on Figure 2. The channel originates off-Site to the north and extends beneath the northern adjoining railroad tracks prior to entering the subject property. This channel is six feet deep and 60 feet wide at the channel bottom and terminates at an off-Site retention/energy dissipation basin north of 6th Avenue before entering the regional municipal storm collection system.

5.1.2 Geology

The subject property is located near the junction of the Transverse Ranges and Peninsular Ranges physiographic provinces. The subject property is in a basin on the Pacific side of the San Gabriel Mountains and is on a broad, gently sloping inland alluvial fan. The basin is predominantly an urbanized landscape situated on gently sloping Late Quaternary (Pleistocene and Holocene) alluvial deposits from the Santa Ana River that drains this area of the Transverse Ranges and northern Peninsular Ranges southeastward toward the Pacific Ocean.

The geology of the subject property is composed of igneous and metamorphic Mesozoic crystalline basement to the north and Late Quaternary basin fill deposits. Most of the sediments in the area of the subject property are alluvial and colluvial deposits composed of interbedded clays, silts, sands, and gravels up to 1,000 feet thick. Investigations conducted at the subject property indicate that the upper 450 feet of sediments beneath the subject property is comprised of layered sands and clays with localized gravel (Jamison 2011).

5.1.3 Hydrology

The subject property is located within the Baja Sub Area of the Mojave River groundwater basin. There are two aquifers located in the vicinity of subject property: the Floodplain Aquifer and the Regional Aquifer. The Floodplain Aquifer is made up of the modern Mojave River alluvium, which consists of unconsolidated permeable, coarse sands and gravel extended to a depth of approximately 200 feet bgs. The Floodplain Aquifer is the principal aquifer system in the area and overlies the Regional Aquifer, which is approximately 500 feet bgs below the subject property and much deeper in other areas to the east and west. The Floodplain Aquifer consists of less permeable alluvial fan deposits and older Mojave River alluvial deposits.

Records reviewed indicate that depth to groundwater in wells formerly located on the subject property is approximately 420 feet bgs. The groundwater flow direction is to the southwest.

5.2 Historical Use Information

The following table summarizes historical uses and occupancies of the subject property as identified by the ESA. Details of reviewed records are discussed below.

Years	Development/Use
1938 to 1951	Agricultural use.
1951 to present	The subject property was developed with an electric power generating facility which utilized four oil/gas fired boilers for steam generation and a single gas/distillate fired peaker unit with various storage tanks, equipment, and structures designed to contain petroleum products including, but not limited to, natural gas, No. 6 fuel oil, distillate (jet propellants [JP-5]), lubricating oil, displacement oil, gear oil, mineral oil, gasoline fuel, and waste oil. The predominant structures located on the subject property included large cooling towers aboveground steel tanks used to store petroleum products, process units that included boilers, tanks and various mechanical equipment and vessels, retention basins, and buildings used for offices and control and maintenance operations. The north and south retention basins were constructed in 1952. The boiler chemical cleaning basin was constructed in 1979. The process units are also referred to as powerblocks. The powerblock equipment converts energy from a fuel (fuel oil, distillate, or natural gas) to electricity. Contained within the powerblocks are various structures (such as battery rooms, lube oil rooms, elevators, various sumps, and control rooms) and equipment (such as boilers, pre-heaters, blowers, and turbines). Powerblock Units 1 and 2 began operations in 1953; Units 3 and 4 began operations in 1963. Peaker Unit 5 began operation in 1970. Unit 5 was used to generate

Years	Development/Use
	additional electricity during high demand hours. Units 1, 2, and 5 were decommissioned in 2003. Power generating operations were discontinued at the subject property when Units 3 and 4 were decommissioned in June 2018. Commercial and residential development in the subject property vicinity occurred during this time period as well. Additional power generating equipment including ASTs and an electric substation were developed on the properties to the south beginning in the 1950s. Development of the CMC Steel facility located north of the subject property also began in the 1950s. A recycling facility located near the northeast corner of the subject property began operations in the 1970s.

SCE owned and operated the Etiwanda Generating Station from 1953 to 1998 when it sold the subject property portion of the generating station to Alta Power Generation LLC, an early predecessor of GenOn. SCE retained the areas to the west and south of the current subject property boundary, including a former tank farm with several fuel oil ASTs, a switchyard, and undeveloped land.

5.2.1 Fire Insurance Maps

Path Forward requested a search of historical Sanborn Fire Insurance Maps from the Environmental Data Resources, Inc. (EDR) collection. According to EDR, such maps are not available.

5.2.2 Aerial Photographs

Path Forward reviewed aerial photographs of the subject property, adjoining properties, and surrounding area obtained from EDR. Photograph summaries follow:

Years Listed	Subject Property and Adjoining Property Uses
1938, 1949	The subject property is a vacant parcel that appears to be used for agricultural purposes.
1953	The subject property appears to have been developed with the power generating facility. Many of the structures that are currently located on the subject property are evident except for Units 3 and 4 and their associated cooling towers and Unit 5. An unlined drainage channel is present in the middle of the property between the north and south property boundaries. Railroad tracks are evident along the northern property boundary. Development south of the subject property includes an electric substation and four ASTs adjacent to the southwest portion of the subject property.
1959	The subject property is generally unchanged except for the northwestern portion of the subject property which appears to be used for agricultural purposes. In addition, the cooling tower sludge basin is evident on the south side of the cooling towers for Units 1 and 2. An industrial operation has been developed on the property to the north of the subject property.

Years Listed	Subject Property and Adjoining Property Uses
1966	Units 3 and 4 and their associated cooling towers are evident on the 1966 aerial photograph. Four additional ASTs are evident on the property to the southwest of the subject property.
1975	The peaker unit (Unit 5) and the distillate AST in the southeast corner of the subject property are evident on the subject property. Additional industrial development is evident on the property to the north of the subject property. The property located across Etiwanda Avenue near the northeast corner of the subject property has been developed with a commercial operation.
1985	Two additional retention basins are evident on the subject property: the reverse osmosis basin to the south of Units 3 and 4 and the boiler water washdown basin in the southeast corner of the subject property. Additional commercial and industrial development is evident north and south of the subject property.
1990, 1994	The subject property is generally unchanged. Additional industrial development is evident north of the subject property.
2005	The subject property is generally unchanged. Four ASTs located south of the subject property have been removed.
2009, 2012, 2016	The subject property is generally unchanged. Additional commercial and industrial development and redevelopment is evident north of the subject property.

5.2.3 Topographic Maps

Path Forward reviewed USGS topographic maps of the subject property, adjoining properties, and surrounding area from the EDR collection. Map summaries follow.

Years	Scale	Subject Property and Adjoining Property Uses
1897, 1900, 1903, 1944	1:62,500	The subject property and surrounding properties appear to be unused. A railroad track is located along the northern subject property boundary.
1941	1:24,000	The subject property appears to be unused.
1953, 1954	1:24,000	The subject property has been developed with a power plant. Five oil ASTs are located southwest of the subject property. The Kaiser Steel Plant is located southeast of the subject property beyond land used for agriculture.
1966, 1973, 1976, 1981	1:24,000	The subject property appears similar to earlier maps. Additional ASTs are located southwest of the subject property. Development of the property located north of the subject property is evident.
2012	1:24,000	The subject property and surrounding area are not depicted with features or uses except for the pond and one retention basin on the subject property.

5.2.4 Local Street Directories

Path Forward reviewed local street directory entries for the subject property and adjoining/nearby properties that EDR researched in approximately five-year intervals between the years 1922 and 2017. The subject property address is listed as follows:

Address	Year(s)	Tenants
8996 Etiwanda Avenue	1985	Etiwanda Av Fon (sic), Sephton Wtr Technlgy (sic)
	2004, 2009	Reliant Energy
	2014	GenOn
	2017	NRG Energy

5.3 Regulatory Agencies

Path Forward requested records of the following agencies to obtain information regarding the subject property.

5.3.1 Tax Assessor

Path Forward reviewed records on the website of the San Bernardino County Assessor. According to the Assessor's website, the assessor's parcel number (APN) assigned to the subject property is 0229-283-79-0000. The current Assessor's Parcel Map indicates the subject property consists of 65.71 acres.

The subject property owner is currently identified as RRI Energy Etiwanda, Inc. (EDR 2020). The subject property has historically been owned by SCE and various other entities, as discussed in the 2019 Phase I ESA:

"Alta Power Generation LLC., a subsidiary of Houston Industries Inc. and early predecessor of GenOn, acquired the subject property from SCE in 1998. In 1999, Houston Industries Inc. changed its name to Reliant Energy and subsequently to RRI Energy. In 2010, RRI Energy and Mirant Energy merged to form GenOn Energy, Inc. In 2012, NRG Energy Inc. (NRG) merged with GenOn, doing business under NRG's name. GenOn officially separated from NRG in December 2018 and GenOn facilities are no longer associated with NRG. According to information provided by GenOn, the current Site owner is GenOn California South, LP, a subsidiary of GenOn Holdings, Inc."

5.3.2 Building Department

Path Forward accessed Rancho Cucamonga's Online Permit Center on September 21, 2020. Building permit applications dated 2001 and 2013 were available for review and included applications, plans, and permits for tenant improvements related to electrical, mechanical, plumbing, roofing, air conditioning, and fire systems at the subject property.

5.3.3 Fire Department

Path Forward reviewed records available from both the Rancho Cucamonga Fire Department and San Bernardino County Fire Department. These records are discussed in the following sections.

5.3.3.1 Rancho Cucamonga Fire Department

Path Forward submitted a written request for records pertaining to the subject property parcel to the RCFD on September 15, 2020. The RCFD responded in an email dated September 15, 2020 that records requests should be submitted to the SBCFD, which is the CUPA for Rancho Cucamonga.

Based on a review of the 2007 Phase I ESA, the following records were previously filed at the RCFD (URS 2007). Path Forward was not provided with these RCFD files during this assessment.

- A partially completed application for a permit to store and use 2,000 pounds of hydrogen gas and 300,000 gallons of JP5 fuel was included in the RCFD file. The permit was not dated or signed.
- A permit application dated November 11, 1999 to remove a UST at the Etiwanda facility was filed with the RCFD.
- A construction inspection record dated January 13, 2000, was prepared by the RCFD. The inspection covered the removal of a 500-gallon fiberglass UST from the Etiwanda facility. No noncompliance was observed. The inspection report indicated the UST was removed and transported offsite. Although a copy of the closure report was requested, the report was not contained in the file.

5.3.3.2 San Bernardino County Fire Department

Path Forward submitted a written request for any records pertaining to the subject property parcel to the SBCFD, which is the Certified Unified Program Agency (CUPA) for Rancho Cucamonga, on September 15, 2020. The SBCFD responded via email on September 21, 2020 that records are available for the subject property address and Path Forward Partners reviewed available records at the SBCFD on October 9, 2020. Available records are discussed below.

5.3.3.2.1 UST Records

An October 13, 1985 report provided the results of a soil investigation for three USTs (120-gallon naphtha, 550-gallon kerosene, and 550-gallon unleaded gasoline) that were removed in 1986. Five soil borings were advanced to 49 feet bgs each, and a total of 24 soil samples were collected. All samples were analyzed for TRPH. The highest TRPH result was 11 mg/kg from a sample collected at a depth of 10 feet bgs. The investigation results were submitted to the

County of San Bernardino Department of Environmental Health Services on December 11, 1985. The DEHS reviewed the results and issued a letter dated December 27, 1985 that states "this Department concurs that the levels of contamination found do not present an environmental or public health threat" (SBCDEHS 1985; see Appendix D). After removal of the three USTs, a new 550-gallon UST with secondary containment and continuous monitoring was installed in the same location. Records on file at the SBCFD indicate that the UST was installed in either April 1986 or April 1996.

A UST inspection report dated October 14, 1998 indicates that a UST was installed in April 1996 and contained diesel fuel. The inspection report noted violations for no leak detection monitoring plan, no certification of financial responsibility, and failure to develop a response plan. There was no information in the file regarding a response from Mountain View Generating, which was the Site owner in 1998.

An Underground Storage Tanks form for permanent on-site closure of a 2,000-gallon UST was filed with the CUPA on January 3, 2000. The form indicates that the UST was filled with inert material and closed in place. No information regarding UST contents or location was found in the records reviewed.

5.3.3.2.2. Hazardous Materials Release Records

In a letter dated July 20, 1995, SCE notified the San Bernardino County Environmental Health that a release of non-PCB mineral oil took place on July 14, 1995. Approximately 45 gallons of oil was released and was recovered by removal of soil. SCE reported that the hydrocarbon-affected soil was sent for reclamation and that SCE believed the area affected was fully addressed. No follow-up was in the file.

From June 1999 to May 2011, there were nine reported releases of cooling tower water. The releases ranged in size from 20 to 5,000 gallons of cooling tower water. Releases of oil, mineral oil, and lube oil (50 gallons or less) were also reported. A release of cement/hazardous waste to a stream/river/soil from a pipe on the adjacent Ameron property was recorded in April 2012. Water samples were collected and levels of metals and pH were reportedly below hazardous waste levels. Remediated soil was kept off-Site on the Ameron property and the pipe was repaired to prevent further releases.

5.3.4 Regional Water Quality Control Board

Path Forward submitted a written request for records pertaining to the subject property parcel to the Santa Ana RWQCB on September 8, 2020. The Santa Ana RWQCB responded in an email dated September 23, 2020 that records are available for the subject parcel address. Path Forward reviewed available records at the RWQCB on October 15, 2020. Available records are discussed below.

5.3.4.1 Waste Discharge Order

A Waste Discharge Order (WDO) No. 94-21 Waste Discharge Requirements including an Exemption from Requirements of the Toxic Pits Cleanup Act (TPCA) dated January 28, 1994 was included in the records. WDO 94-21 was transferred to Mountain Vista Power Generation LLC effective January 1, 1998. The WDO exempted the boiler chemical cleaning basin from the requirements of the TPCA. The WDO was rescinded by Order No. 01-67 dated July 20, 2001, because discharges to surface impoundments had ceased.

An inspection report dated September 18, 1996 included inspection of the boiler chemical cleaning basin. According to the report, the basin had not been used for six years. The report concluded that the basin was in good condition with no violations.

5.3.4.2 Tank Study Report

A May 26, 1998 letter, the RWQCB stated that their review of a April 9, 1998 Baseline Tank Study Report, which was not available in the records reviewed, indicates that additional investigation was required in borings where TPH concentrations were increasing with depth. The Baseline Tank Study Report included soil data collected in the "west and east tank areas" at the subject property. The RWQCB letter states that further characterization of these areas could be conducted during remedial activities in these areas. A December 9, 1998 letter from the RWQCB to SCE indicated that, based on a review of the results of sampling contained in an August 21, 1998 report, which was also not available in the records reviewed, no further action was required. A copy of the letter is included in Appendix D.

5.3.5 Department of Toxic Substances Control

Path Forward submitted a written request for records pertaining to the subject property parcel to the DTSC Cypress office on September 9, 2020. DTSC responded in an email dated September 9, 2020 that records are available for the subject property address. Path Forward reviewed available records at the DTSC on October 6, 2020. Available records are discussed below.

DTSC issued a Notice of Violation (NOV) to the SCE Etiwanda facility in a letter dated July 3, 1992. The letter states that SCE stored hazardous waste in the acid retention basin without a hazardous waste storage facility permit.

The Superior Court of the State of California, County of Los Angeles issued a Judgment to SCE on February 1, 1995 requiring SCE to investigate the retention basins at the subject property and other SCE-owned properties. If the investigations determined that releases had occurred, DTSC would issue a Cleanup and Abatement Order. Investigations conducted in response to the Judgment are discussed in Section 5.5.1.

5.3.6 Other Agencies

Path Forward submitted a written request for records pertaining to the subject property parcel to the San Bernardino County Public Health Environmental Health Services (EHS) on September 15, 2020. The EHS responded in an email dated September 15, 2020 that records requests should be submitted to the SBCFD, which is the CUPA for Rancho Cucamonga.

Path Forward searched the South Coast Air Quality Management District (SCAQMD) Facility Information Detail (FIND) database on September 15, 2020. The facility address is not listed in the FIND database.

Path Forward submitted a written request for records pertaining to the subject property parcel to the California Department of Resources Recycling and Recovery (CalRecycle) on September 29, 2020. CalRecycle responded in an email dated October 9, 2020 that they do not have records for the subject property address.

5.4 Activity & Use Limitations (AULs)

Path Forward reviewed a report of title and judicial records prepared by EDR for indications of environmental liens and AULs recorded against the subject property. No environmental liens or AULs were identified.

5.5 Prior Reports

Path Forward reviewed several reports provided by the client or available from regulatory agencies.

5.5.1 1995 Judgment

The Superior Court of Los Angeles issued a Final Judgment pursuant to Stipulation on February 1, 1995 (No. BC121219). The Stipulation alleged that SCE had stored hazardous wastes in unpermitted surface impoundments at 11 of their power generating stations in California, including the Etiwanda Generating Station, in violation of the Hazardous Waste Control Law. In response, SCE agreed to conduct RCRA closure of three surface impoundments (two wastewater retention basins and one boiler chemical cleaning basin) and the associated pipelines and appurtenances that connect the basins to the power generating units at the subject property according to Chapter 15 of Title 22, California Code of Regulations. The remainder of the subject property was ordered to be evaluated under RCRA corrective action.

Eight hazardous waste management units (HWMUs) were identified at the subject property:

- North Wastewater Retention Basin
- South Wastewater Retention Basin

- Boiler Chemical Cleaning Basin
- Units 1 and 2 Fireside Wash Drain System
- Units 3 and 4 Fireside Wash Drain System
- Units 3 and 4 Fireside Wash System Sediment Trap
- Units 1 and 2 Boiler Acid Wash Drain System
- Units 3 and 4 Boiler Acid Wash Drain System

SCE conducted investigations to determine whether the basins or associated conveyance systems (pipelines), which together are identified as the "Retention Basin Site" in investigation documents. In 1996, a soil and soil vapor investigation was conducted to determine whether the Retention Basin Site had released wastewater to the underlying soil. If a leak was detected, the nature and extent of the impacts were to be investigated. The results of the investigation indicated that leakage had occurred beneath the surface impoundments as a result of elevated metal concentrations, low pH values, and the presence of volatile organic compounds (VOCs) in some soil samples. Based on these results, SCE conducted additional investigation activities in three phases of investigation between 1997 and 1998. The investigations concluded that leakage had occurred through the basin liners causing limited changes in the native soil chemistry. Based on these findings, SCE submitted a Water Quality Monitoring Program (WQMP) to the DTSC in June 2001.

After DTSC approval of the WQMP, SCE installed four groundwater monitoring wells (EW-1, EW-2, EW-3, and EW-4) in April 2002. The initial groundwater sampling event took place in the second quarter of 2002. The results of the sampling event showed that the flow direction was more westerly than expected and that no wells were downgradient of the north and south retention basins. Thus, two additional wells (EW-5 and EW-6) were installed downgradient of the retention basins. The locations of the wells are shown on Figure 4. The wells were sampled between 2002 and 2009. Monitoring results are summarized in the 2009 Annual Groundwater Monitoring Report (Hamilton 2010).

A Closure Documentation Report (CDR) submitted to the DTSC in 2011 summarizes the data collected for the Retention Basin Site closure project (Jamison and Associates 2011). The CDR concluded that the extensive sampling and resultant analytical data illustrates a complete characterization of the soil beneath the retention basins and associated pipeline system. The CDR also concluded that there is no direct pathway for leakage to impact the groundwater, that there is no evidence of a continuous leak of wastewater to the sediments, and that groundwater samples collected from EW-3 and EW-4 are from a different water source than those collected from the other four wells.

The metal chemicals of potential concern (COPCs) identified for soils under the retention basins are arsenic, antimony, mercury molybdenum, nickel, silver, and thallium based on the data collected and analyzed. Other COPCs identified for soil include six VOCs (chloroform, chloromethane, styrene, tetrachloroethene, toluene, vinyl chloride), one semivolatile organic compound (SVOC) (butyl benzyl phthalate) and dioxin/furans (evaluated as 2,3,7,8-TCDD-equivalents). No COPCs were identified for groundwater. The CDR indicates that the investigations did not detect metal or VOC parameters that would indicate a change in the groundwater between the background and compliance wells.

The retention basins were found to meet closure requirements for the soil and groundwater COPCs based on the results of a human health risk assessment that concluded that human health risks are within acceptable limits for future unrestricted industrial or residential use and that groundwater use is also acceptable for unrestricted use. The environmental and ecological scoping-level risk assessment determined that ecological exposure pathways are incomplete.

The DTSC reviewed the CDR and issued a Closure Certification Acknowledgment letter on December 29, 2011 (DTSC 2011). The letter states that the DTSC considers the Retention Basin Site as being officially closed on December 20, 2011 and confirms that the Retention Basin Site has been investigated. A copy of the letter is included in Appendix E.

5.5.2 Phase I ESA (CH2MHill 1997)

CH2MHill prepared a Phase I ESA in 1997 and identified three RECs and ten areas of concern (AOCs).

RECs identified in the 1997 Phase I ESA:

- CH2M HILL personnel observed what appeared to be an oily substance and staining in the unlined Chadwick Channel and considered Chadwick Channel to be a REC.
- As a result of visual evidence of a small spill or leak inside the secondary containment area of the northwest fuel oil tank, the area was identified as a REC.
- The presence of petroleum hydrocarbon-affected soil in the AST areas was identified as a REC.

AOCs identified in the 1997 Phase I ESA:

- Past use of the retention basins made them subject to an investigation under an order by the DTSC; based on the ongoing investigation, CH2M HILL designated the retention basins an AOC.
- As a result of the presence of a white powdery substance near the sulfuric acid tank near the cooling towers, CH2M HILL designated the white powdery area an AOC.

- As a result of the former practice of placing cooling tower sludge (possibly containing chrome and arsenic from treated wood) in an unlined leaching basin, CH2M HILL designated the former leaching basin an AOC.

- As a result of the possible presence of a landfill area near the west end of the subject Property, CH2M HILL designated the possible landfill an AOC.

- As a result of the presence of oil in a recessed sump valve box near the fuel oil pumping system in the tank farm, CH2M HILL designated the sump box an AOC.

- SCE reported that the primary fuel oil pump area and the truck loading area were the locations of possibly contaminated soil. As a result of the potential for subsurface contamination, CH2M HILL designated these areas AOCs.

- As a result of the presence of a transformer that contained PCB-bearing oil and the possibility of a PCB release, CH2M HILL designated the transformers AOCs.

- As a result of oil staining in the powerblock areas near equipment that contained oil, CH2M HILL designated the oil stained area an AOC.

- As a result of the presence of untested subsurface and aboveground piping that conveys fuel oil from oil tanks to the powerblock, CH2M HILL designated the piping an AOC.

- As a result of the presence of arsenic and chrome-treated wood in the cooling towers and the possibly that soil beneath the cooling towers may be impacted by contaminants that leached from the treated wood, CH2M HILL designated the cooling tower areas AOCs.

5.5.3 Phase II ESA (Geraghty & Miller 1997)

Geraghty & Miller (G&M) conducted a Phase II ESA to evaluate the environmental condition of the subject property by investigating RECs and AOCs identified in the 1997 Phase I ESA. Geraghty & Miller investigated 31 areas with the potential for historical or current releases of hazardous substances or petroleum products at the subject property and off-Site areas that were also owned by SCE in 1997. The Phase II report indicates that three retention basins (two general and one reverse osmosis) and the adjacent acid and caustic tanks and the boiler chemical cleaning basin were not addressed by G&M because of the ongoing investigation by SCE that was being conducted under the order of DTSC. Geraghty & Miller's conclusions and recommendations for the remaining areas are summarized below.

At four of the site features, no further action was recommended at this time; however, agency negotiation and additional sampling may be required as part of decommissioning at the following features. URS expects that any work associated with these site features will remain the responsibility of SCE (URS 1997):

- ASTs: Soil investigation around ASTs was limited and additional sampling may be required.

- Transformers: TPH and PCBs detected below screening criteria. Investigation around the transformers was limited due to restricted access.

- Powerblock: Sampling around the powerblock found in TPH, metals, and PCBs below the screening criteria; however, the investigation was limited due to restricted access.

- Possible UST: The Phase II geophysical survey and soil sampling did not identify the location of the UST identified in SCE files. The UST may be discovered during Site redevelopment.

Of the thirty-one features identified, six were noted as needing further action although one of the features was an off-Site landfill located southeast of the subject property:

- Surface water discharge: Arsenic was detected at concentrations above screening criteria in soil samples collected at points of surface water discharge.

- Pipelines: TPH was detected in soil at concentrations below screening criteria and arsenic was detected above screening criteria. Some excavation activities were conducted and a portion of the pipeline was removed. The report notes that the pipeline was determined to be lined with lead and a portion of the pipeline remained on the subject property.

- Units 3 and 4 cooling towers: Arsenic was detected at concentrations above screening criteria in soil samples collected near the cooling towers. In addition, due to restricted access, no samples were collected to evaluate the former incinerator located near Cooling Unit 3.

- Sulfuric acid storage tanks: Arsenic was detected at concentrations above screening criteria in soil samples collected near the storage tank located at Cooling Tower 3.

- Former water softener and brine pit: Arsenic was detected at concentrations above screening criteria in soil samples collected near the former water softener and brine pit.

Based on the Phase II investigation, the following site features were identified as requiring no further actions: waste discharges (from off-Site sources), underground storage tanks, AST containment structures, hazardous waste storage area, solid waste disposal area (landfill), scrap metal yard, septic systems, site of 1995 reported transformer oil spill, peaker unit floor drain and sumps, switchyard perimeter, boiler wash water storage tank area, and Units 1 and 2 cooling tower sludge dewatering basin. Four off-Site areas were also identified in the Phase II report: vineyard water tank, bone yard (laydown area), utility pole storage, and agricultural research area.

Regulatory agency records indicated that the Ameron and TAMCO facilities immediately north of the subject property reported contaminated soil near the Etiwanda Generating Station that may have not been delineated. Based on a review of available investigative data, G&M concluded that it did not appear that releases associated with Ameron and TAMCO had impacted soil on the subject property. Based on the data reviewed, G&M recommended no further action for soil. Groundwater data was not available for review by G&M and was not included in its conclusions and recommendations.

5.5.3 Chadwick Channel Remedial Activities (1997)

The 1997 Phase II ESA indicates former occupants of properties to the north of the Site (TAMCO and Ameron) were responsible for several releases to the Chadwick Channel and other areas located to the north of the Site in the 1980s and 1990s. An investigation conducted in 1985 detected concentrations of arsenic in Chadwick Channel above screening criteria, and concentrations of lead and chromium above hazardous waste criteria. Results of the 1985 investigation were reportedly presented in a Site Characterization Study; however, this report was not readily available for review. SCE received a letter from the RWQCB dated July 22, 1987 that states that, based on review of the "Site Characterization study" that addressed the chemical composition and extent of impact to soil in the drainage channel and spreading basin, which is located south of the subject property, no further remedial action will be required. A copy of the letter is included as Appendix D.

Path Forward reviewed a 1997 Chadwick Channel Site Investigation and Cleanup report that indicates that soil containing nickel at concentrations above the California Total Threshold Limiting Concentration (TTLC) were delineated near the former Unit 4 drain line discharge in Chadwick Channel. Beryllium was also detected at concentrations above its Preliminary Remediation Goal (PRG). The soil was excavated and sidewall and bottom samples confirmed that all impacted soil was removed (SCE 1997).

5.5.4 Arsenic Investigations (2005-2007)

Several investigations have been conducted to determine the extent of arsenic impacts in soil at the subject property. An investigation conducted by Earth Tech in March through May 2005 detected arsenic in shallow soils at concentrations ranging from 160 to 390 mg/kg in the shallow soil in the vicinity of the Units 1 and 2 cooling towers. In August 2005, URS collected additional shallow soil samples in 23 locations in the vicinity of the Units 1 and 2 cooling towers. Arsenic was detected at concentrations between 1.89 and 70.2 mg/kg. URS concluded that elevated arsenic concentrations "do not extend much past the base of the cooling tower units."

The 2010 Soil Characterization Report (SCR) summarizes additional arsenic investigation results and evaluation of arsenic background concentrations. The 2010 SCR was not available for review by Path Forward but is discussed in the 2019 Phase I ESA, as follows:

"Evaluations were completed in 1985, 2005 and 2007 to determine Site-specific background levels for several constituents, including arsenic. The maximum background level for the Site was determined to be 7.4 mg/kg in 1985 and 2 mg/kg in 2005/2007. However, the DTSC approved regional background level for arsenic is 12 mg/kg. Review of analytical data from the 1997 Phase II indicates arsenic levels for three of these areas (surface water discharge, pipelines, and the second solid waste disposal area (Landfill 2) were below the regional background level of 12 mg/kg but above 2 mg/kg. The remaining three areas had a detection above the regional background level of 12 mg/kg (cooling towers 3 and 4 - 17 mg/kg, sulfuric acid storage tanks - 22 mg/kg, and the former water softener and brine pit - 17 mg/kg). To date, limited arsenic impacted soils remain in place at the Site and no further investigations have been completed. These areas will be further evaluated during the RFI for the remainder of the facility." As discussed in Section 4.4, SCE submitted a workplan for excavation of the impacted soils in the vicinity of cooling towers 1 and 2 to the DTSC on September 23, 2019 (Northgate 2019).

5.5.5 Subject Property Investigation (Ardent 2019)

In October 2019, Ardent Environmental Group (Ardent) conducted a site investigation on behalf of a prospective buyer. Ardent provided figures showing soil boring and soil gas sampling locations as well as tables showing analytical results of the soil and soil gas sample analyses. The figures and tables are provided in Appendix F. A report detailing the investigation was not provided by Ardent. The following is information summarized from review of the figures and tables provided.

Soil and soil gas samples were collected from several locations on the subject property, as shown in the following table. The table below also details the chemicals analyzed by the laboratory and the general results of those analyses.

Table 1: Ardent Investigation Summary	**Ardent Table Number**	**Analytes**				
		TPH	Metals	VOCs	OCPs	PCBs
Soil Sample Locations						
Cooling Tower 1 and 2	1		x			
Sludge Drainage Area	2		x			
Cooling Tower 3	3		** (arsenic, lead)			
Cooling Tower 4	4		X			
Chadwick Channel	5	**	x			

Table 1: Ardent Investigation Summary	Ardent Table Number	Analytes				
		TPH	Metals	VOCs	OCPs	PCBs
		(TPH-d)				
Railroad Spur	6		x		x	
Landfill I (a)	7	x	** (arsenic, copper, lead)	x		
Landfill II (a)	8	x	x	x		
Flumes	13		** (thallium)			
Tributary	14	x	x			x
Soil Gas Sample Locations						
Former Hazardous Waste Storage Area	9			x		
Existing Hazardous Waste Storage Area	10			x		
Maintenance Shop	11			** (bromodichloromethane, chloroform, 1,1-DCA, PCE, VC)		
Septic System associated with the Maintenance Shop	12			** (1,1-DCA, PCE, VC)		

Notes:

a = note that Ardent identified two adjacent landfill areas, Landfill I and Landfill II, in the northwestern portion of the subject property (as shown on Figure 2 in Appendix F). The northwestern portion of the subject property has been identified as Landfill 1 in previous reports. It appears that Ardent used the Landfill I and II identifiers to differentiate between two separate areas within the area formerly identified as Landfill 1.

X = samples analyzed for this group of compounds; no chemicals detected above human health and/or disposal criteria

** = samples analyzed for this group of compounds; chemicals listed in parentheses were detected at concentrations above human health and/or disposal criteria (see Ardent tables for details)

OCPs = organochlorine pesticides

PCBs = polychlorinated biphenyls

TPH = total petroleum hydrocarbons

VOCs = volatile organic compounds

1,1-DCA = 1,1-dichloroethane

PCE = tetrachloroethene

TPH-d = TPH as diesel

VC = vinyl chloride

As noted above, a report containing investigation details and a discussion of findings and conclusions was not provided by Ardent. As shown in the table above, soil and soil gas samples in several locations on the subject property contained concentrations of chemicals above human health and/or disposal criteria.

Between May and July 2020, ERM conducted excavation activities in the Landfill I area to address the elevated metal concentrations detected in soil samples in this area during Ardent's investigation, as discussed in Section 5.5.6. below. In September 2020, ERM collected one additional soil sample in an area of "black sand" in the Landfill II area that appeared similar to the area of excavation in Landfill I. The metals concentrations detected were similar to those detected in the Landfill I area. Given that only one sample was collected in this area, the extent of soil with elevated metals concentrations is not known.

No records of additional investigation or remedial activities in the other areas where chemicals were detected at concentrations above screening criteria was provided or found during this assessment.

5.5.6 Excavation Activities in the Northwest Portion of the Subject Property (ERM 2020)

Based on the findings of Ardent's investigation described above, GenOn elected to proactively remove the metals-impacted soil from the northwest portion of the property in the area Ardent identified as Landfill I. Between May and July 2020, ERM and their subcontractor conducted soil removal activities. Soil excavation began at the LFI-1 and LFI-3 test pit locations and were extended based on visual observations, X-ray fluorescence (XRF) analyzer field-screening data, and soil sample analytical results. Approximately 6,445 tons of waste soil was generated during excavation activities. The soil was profiled as non-RCRA hazardous waste and disposed off-Site. The Soil Removal Memorandum prepared by ERM and dated September 22, 2020 states that, based on the results of field screening, visual observations and analytical results of the confirmation samples, all impacted soil containing elevated metals concentrations in the northwest portion of the subject property has been removed. ERM recommended no further action to mitigate this area (ERM 2020). A copy of the Soil Removal Memorandum is included in Appendix G.

6.0 REGULATORY DATABASE REVIEW

Path Forward reviewed a regulatory agency database search report prepared by EDR for the subject property. EDR conducted a search of publicly available information from federal, state, tribal, and local databases for information pertinent to the subject property associated with plotted addresses located within ASTM-specified search distances from the subject property. The database report identifies about 84 facilities as well as the accessed databases.

The subject property address of 8996 Etiwanda Avenue was identified in the following databases searched by EDR:

Site Name:	Southern California, NRG Energy Inc., NRG California South, Etiwanda Generating, EPTC Etiwanda, Etiwanda Launcher Facility, Etiwanda Substation, Inland Empire Utility, 8996 Etiwanda Avenue, North Star Recycling
Databases:	RCRA-SQG, HAZNET, CERS HAZ WASTE, HIST UST, SWEEPS UST, AST, CHMIRS, HWTS, NPDES, CIWQS, LDS, WDS, WMUDS/SWAT, ICIS, EMI, US AIRS, TSCA, ECHO, COAL ASH DOE
Southern California Edison/EPTC/Reliant Etiwanda was registered as a small or large quantity generator of hazardous waste between 1990 and 2016 that has received violations. Over 300 records of hazardous waste manifests for off-Site disposal for various hazardous wastes were filed between 2004 and 2019. The UST listings include details on 53 UST listings at the subject property address; many of these listings are missing information or appear to be duplicate listings. The AST listing indicates that the facility was registered to store a total of 210,850 gallons in ASTs. The CHMIRS listings indicate that releases of cooling tower water (10 to 10,000 gallons) to Chadwick Channel occurred in 1989 through 2015. The CHMIRS listings also include information on releases of lube oil (35 gallons due to broken oil lines on equipment in 2010 and 42 gallons due to rupture of a pressure gauge in 2016). The COAL ASH DOE database indicates that the following byproducts were reported by Etiwanda Generating Station in 2018: fly ash from units with dry FGD, bottom ash from standard boiler units, bottom (bed) ash from FBC units, FGD gypsum, ash from coal gasification (IGCC) units, fly ash from standard boiler/PCD units, and fly ash from FBC units. The remaining listings are related to historical hazardous materials use and storage, wastewater discharges, and air emission registrations and do not indicate that releases have occurred.	

No adjoining properties or nearby properties located up to cross gradient were identified with cases involving releases to groundwater, with the exception of the following:

Site Name:	SA Recycling		
Address:	8822 Etiwanda Avenue		
Distance: 0.047 miles		**Direction:** Northeast	**Relative Elevation:** Higher
Databases:	VCP, Envirostor, CHMIRS, HAZNET, NPDES, San Bern Co Permit, CIWQS, CERS, HWTS		
The Envirostor listing indicates that the facility entered into a voluntary cleanup agreement with DTSC in 2018. Automobile and scrap metal recycling operations were conducted at this facility between 1975 and 2017. Investigations identified metals, TPH, and PCBs in soil samples. Groundwater samples were not collected. DTSC determined that additional action is necessary to assess environmental conditions at the facility. Redevelopment of the property is currently underway. The facility is located upgradient of the subject property; however, given the depth to groundwater in the subject property vicinity (approximately 400 feet bgs), this facility is unlikely to have impacted the groundwater beneath the subject property. As discussed in Section 5.5.3., the 1997 Phase II ESA indicates former occupants of properties to the north of the Site were responsible for several releases to the Chadwick Channel and other areas located to the north of the Site in the 1980s and 1990s. Investigation and remediation of Chadwick Channel was conducted in 1997. It is possible that additional releases from properties located north of the Site, including the SA Recycling property, have impacted the Site via surface runoff to Chadwick Channel.			

Site Name:	TAMCO/Ameron Steel and Wire (Ameron)		
Address:	12459 and 12459 B Arrow Route		
Distance: 0.443 miles		**Direction:** North-northwest	**Relative Elevation:** Higher
Databases:	SEMS-ARCHIVE, RCRA-LQG, Envirostor, LUST, SLIC, UST, VCP, CERS HAZ WASTE, SWEEPS UST, HIST UST, EPA WATCH LIST, HIST Cortese, San Bern Co Permit		
The Envirostor listing indicates the EDR report, various USTs were present on the property from the 1970s through at least the 1990s. The facility was also entered into the Cleanup Program (CPS-SLIC) and the case was closed in 1990. A LUST incident was reported in 1993 and was closed in 1994. The facility was determined to be a non-NPL (SEMS ARCHIVE) site in 1994 and was then entered into the VCP in 1995. The historic use of the facility was reportedly a recycling, scrap metal, and vehicle maintenance facility, and the contaminants of concern include hydrocarbon solvents, metals, and other inorganic solvent wastes. The facility was granted No Further Action status in 1996. The facility is located upgradient of the subject property; however, given the depth to groundwater in the subject property vicinity (approximately 400 feet bgs), this facility is unlikely to have impacted the groundwater beneath the subject property. As discussed in Section 5.5.3., the 1997 Phase II ESA indicates former occupants of properties to the north of the Site were responsible for several releases to the Chadwick Channel and other areas located to the north of the Site in the 1980s and 1990s. Investigation and remediation of Chadwick Channel was conducted in 1997. It is possible that additional releases from properties located north of the Site, including the TAMCO/Ameron property which is currently occupied by CMC Steel California, have impacted the Site via surface runoff to Chadwick Channel.			

7.0 FINDINGS AND OPINIONS

Path Forward identified obvious subject property uses from the present back to 1938, at which time the subject property used for agricultural purposes. The electric power generating facility was constructed by Southern California Edison on the subject property in 1951. Additional equipment and retention basins were added to the facility through 1979. The power generating facility operated on-Site until 2018. In 2003, some of the facility equipment was decommissioned. By 2018, the owner, GenOn, had ceased facility operations and the remaining equipment was decommissioned.

This ESA identified the following findings with respect to RECs, CRECs, HRECs and de minimis conditions, as defined in Section 1.1 of this report:

- Pending RCRA Facility Investigation: The Superior Court of Los Angeles issued a Final Judgment pursuant to Stipulation on February 1, 1995. The Stipulation alleged that SCE had stored hazardous wastes in unpermitted surface impoundments at the company's power generating stations in Southern California, including the Etiwanda Generating Station. As part of the Stipulation, SCE was required to conduct Resource Conservation and Recovery Act (RCRA) closure of three surface impoundments (two wastewater retention basins and one boiler chemical cleaning basin) and the associated pipelines and appurtenances that connect the basins to the power generating units at the subject property according to Chapter 15 of Title 22, California Code of Regulations. The basins

were granted case closure in 2011, as discussed below in the HREC section. The remainder of the subject property was ordered to be evaluated under RCRA corrective action. A Site-wide RCRA Facility Investigation (RFI) is required to evaluate soil beneath inaccessible areas of the subject property (e.g., beneath the powerblock and cooling towers) and to determine if additional areas of the subject property require further assessment. The potential for impacts beneath Site features due to the historical operation of the power generating facility is considered a REC.

- Pending Data Gap Investigation: SCE submitted a workplan for the data gap soil sampling event to Department of Toxic Substances Control (DTSC) on October 15, 2020. The workplan indicates that soil samples will be collected at one hypochlorite tank/sump, three sulfuric acid aboveground storage tanks (ASTs) and two auxiliary transformers located on the subject property (SCE 2020). SCE stated that the data from the soil sampling event would be included in the RFI workplan along with other data previously collected at the subject property. SCE does not plan to conduct additional sampling in other inaccessible areas of the subject property, such as beneath the generating units and peaker unit. SCE stated that impacts identified in these areas during Site redevelopment will be managed in accordance with a Soil Management Plan that will be proposed in the RFI. The potential for impacts beneath Site features proposed for investigation is considered a REC.

- Arsenic in Soil: A Phase II investigation conducted in 1997 identified five areas on the subject property containing arsenic concentrations in soil above screening criteria identified in 1997. The identified areas are generally defined as surface water discharge, pipelines, cooling towers 3 and 4, sulfuric acid storage tanks, and the former water softener and brine pit. The maximum concentrations detected in 1997 were compared to the current DTSC approved background concentration of 12 milligrams per kilogram (mg/kg). Maximum arsenic concentrations detected at three of the areas, cooling towers 3 and 4 (17 mg/kg), sulfuric acid storage tanks (22 mg/kg), and former water softener and brine pit (17 mg/kg), exceeded the background concentration. The maximum concentrations detected at the surface water discharge (5.3 mg/kg) and pipelines (2.6 mg/kg) were below the background concentration.

  An additional investigation conducted in the vicinity of the Units 1 and 2 cooling towers conducted in March through May 2005 detected arsenic in shallow soils at concentrations ranging from 160 to 390 mg/kg. In August 2005, additional shallow soil sampling in the vicinity of the Units 1 and 2 cooling towers found arsenic at concentrations between 1.89 and 70.2 mg/kg. URS concluded that elevated arsenic concentrations “do not extend much past the base of the cooling tower units.” In September 2019, SCE’s consultant, Northgate Environmental, prepared a Cooling Towers Removal Activities Memorandum that outlines the excavation activities planned in the immediate vicinity of the Units 1 and 2 cooling towers (Northgate 2019).

The elevated arsenic concentrations remaining in on-Site soils in the vicinity of cooling towers 1 and 2, cooling towers 3 and 4, sulfuric acid storage tanks, and former water softener and brine pit is considered a REC.

- 2019 Investigation Results: In October 2019, Ardent Environmental Group (Ardent) conducted a site investigation on behalf of a prospective buyer. Figures and tables from this investigation were provided to Path Forward but an accompanying report was not available. Based on a review of the figures and tables, soil and soil gas samples collected in several locations on the subject property contained concentrations of chemicals above human health and/or disposal criteria. Chemicals detected in soil above human health and/or disposal criteria include total petroleum hydrocarbons (TPH) as diesel in Chadwick Channel, arsenic and lead near the Unit 3 cooling tower, arsenic, copper, and lead in Landfill I (see 2020 Soil Excavation below), and thallium in the Unit 3 cooling tower flume. Chemicals detected in soil gas above human health and/or disposal criteria include bromodichloromethane, chloroform, 1,1-dichloroethane (1,1-DCA), tetrachloroethylene (PCE), and vinyl chloride in the maintenance shop area and 1,1-DCA, PCE, and vinyl chloride in the septic system associated with the maintenance shop. Given that the areas where elevated concentrations of chemicals were detected have not been further investigated, the extent of impacts in these areas has not been defined. The results of the 2019 Investigation indicating the presence of impacts above human health and/or disposal criteria is a REC.

- 2020 Soil Excavation: Metals-impacted soil in the northwest portion of the property (identified as Landfill I) was identified during a 2019 subsurface investigation conducted by Ardent. Between May and July 2020, approximately 6,445 tons of metals-impacted soil was identified and excavated from this area of the subject property. The soil was profiled as non-RCRA hazardous waste and disposed off-Site. The Soil Removal Memorandum prepared by ERM and dated September 22, 2020 states that, based on the results of field screening, visual observations and analytical results of the confirmation samples, all impacted soil containing elevated metals concentrations in the northwest portion of the subject property has been removed. ERM recommended no further action to mitigate this area.

  During the site visit performed by Path Forward, additional “black sand” was identified in northwest portion of the property (identified as Landfill II). In September 2020, ERM collected one additional soil sample of “black sand” that appeared similar to the area of excavation in Landfill I. The metals concentrations detected were similar to those detected in the Landfill I area; however, were below human health risk based levels. Given that only one sample was collected in this area, the extent of soil with elevated metals concentrations is not known. The presence of Black Sand in Landfill II is considered a REC.

- Spills and Releases: Numerous spills and releases from the cooling towers, tanks, and equipment have occurred since Site operations began in 1953. SCE records, San Bernardino County Fire Department records and records in the CHMIRS database indicate that releases to Chadwick Channel and other areas on the subject property have occurred throughout the history of Site operations. For example, records indicate that transformer leakage in 1991 generated approximately 80 tons of transformer oil-containing soil and that an approximately 45-gallon release of non-PCB mineral oil was recovered by removal of soil in 1995. In addition, oil staining was noted in the powerblock and near various equipment at the Site during the Site reconnaissance conducted by Path Forward and others. Previous investigations conducted at the subject property have not included sampling in areas of subsurface and aboveground piping that conveys fuel oil from oil tanks to the powerblock. Given the long history of industrial operations including significant quantities of petroleum and other products and known release events, it is possible that impacts are present beneath inaccessible areas, such as the powerblocks and cooling towers, and near other equipment at the subject property, such as pipelines. This long industrial history and documented releases is considered a REC.

- Retention Basin RCRA Investigation and Closure: As discussed above in the REC section, the Superior Court of Los Angeles issued a Final Judgment pursuant to Stipulation on February 1, 1995. The Stipulation alleged that SCE had stored hazardous wastes in unpermitted surface impoundments at the company's power generating stations in Southern California, including the Etiwanda Generating Station. As part of the Stipulation, SCE was required to conduct RCRA closure of three surface impoundments (two wastewater retention basins and one boiler chemical cleaning basin) and the associated pipelines and appurtenances (the "Retention Basin Site") that connect the basins to the power generating units at the subject property according to Chapter 15 of Title 22, California Code of Regulations.

  SCE conducted investigations to determine whether the basins or associated conveyance systems had released wastewater to the underlying soil. The investigations concluded that leakage had occurred through the basin liners causing limited changes in the native soil chemistry. A DTSC-approved Water Quality Monitoring Program (WQMP) was subsequently conducted. A Closure Documentation Report (CDR) submitted to the DTSC in 2011 summarizes the data collected for the RCRA closure project. The CDR concluded that the extensive sampling and resultant analytical data illustrates a complete characterization of the soil beneath the retention basins and associated pipeline system. The CDR also concluded that there is no direct pathway for leakage to impact the groundwater and that there is no evidence of a continuous leak of wastewater to the sediments. The retention basins were found to meet closure requirements for the soil and groundwater chemicals of potential concern (COPCs) based on the results of a human health risk assessment that concluded that human health risks are within acceptable limits for future unrestricted industrial or residential

use and that groundwater use is also acceptable for unrestricted use. The environmental and ecological scoping-level risk assessment determined that ecological exposure pathways are incomplete.

The DTSC reviewed the CDR and issued a Closure Certification Acknowledgment letter on December 29, 2011 (DTSC 2011). The letter states that the DTSC considers the Retention Basin Site as being officially closed on December 20, 2011 and confirms that the Retention Basin Site has been investigated. The RCRA closure of the retention basins at the subject property is considered an HREC.

- 1985 Underground Storage Tank (UST) No Further Action Letter: An October 13, 1985 report provided the results of a soil investigation for three USTs (120-gallon naphtha, 550-gallon kerosene, and 550-gallon unleaded gasoline) that were removed in 1986. Five soil borings were advanced to 49 feet below ground surface (bgs) each, and a total of 24 soil samples were collected. All samples were analyzed for total recoverable petroleum hydrocarbons (TRPH). The highest TRPH result was 11 mg/kg from a sample collected at a depth of 10 feet bgs. The investigation results were submitted to the County of San Bernardino Department of Environmental Health Services on December 11, 1985. The DEHS reviewed the results and issued a letter dated December 27, 1985 that states “this Department concurs that the levels of contamination found do not present an environmental or public health threat.” The no further action letter for the UST closure is considered an HREC.

- 1998 Tank Area No Further Action Letter: A May 26, 1998 letter, the Regional Water Quality Control Board (RWQCB) stated that their review of a April 9, 1998 Baseline Tank Study Report, which was not available in the records reviewed, indicates that additional investigation was required in borings where TPH concentrations were increasing with depth. The Baseline Tank Study Report included soil data collected in the “west and east tank areas” at the subject property. The location of these areas was not identified in records reviewed. The RWQCB letter states that further characterization of these areas could be conducted during remedial activities in these areas. A December 9, 1998 letter from the RWQCB to SCE indicated that, based on a review of the results of sampling contained in an August 21, 1998 report, which was also not available in the records reviewed, no further action was required. The no further action letter for the Tank Area is considered an HREC.

- Chadwick Channel Excavation Activity: The 1997 Phase II ESA indicates former occupants of properties to the north of the Site (TAMCO and Ameron) were responsible for several releases to the Chadwick Channel and other areas located to the north of the Site in the 1980s and 1990s. An investigation conducted in 1985 reportedly detected concentrations of arsenic in Chadwick Channel above screening criteria, and concentrations of lead and chromium above hazardous waste criteria. Results of the 1985 investigation were reportedly presented in a Site Characterization Study for the

Etiwanda Generating Station; however, this report was not available for Path Forward's review. On July 22, 1987, SCE received a letter from the RWQCB that states, based on review of the "Site Characterization study" that addressed the chemical composition and extent of impact to soil in the drainage channel and spreading basin, which is located south of the subject property, no further remedial action will be required.

Path Forward also reviewed a 1997 Chadwick Channel Site Investigation and Cleanup report that indicates that soil containing nickel at concentrations above the California Total Threshold Limiting Concentration (TTLC) were delineated near the former Unit 4 drain line discharge in Chadwick Channel. Beryllium was also detected at concentrations above its Preliminary Remediation Goal (PRG). The soil was excavated and sidewall and bottom samples confirmed that all impacted soil was removed. Agency closure of the 1997 excavation activities was not found during this assessment. The no further action letter and remediation of the area of Chadwick Channel near the former Unit 4 drainage line discharge are considered an HREC.

- Former Agricultural Uses: The subject property was used for agricultural purposes sometime prior to 1938 until the early 1950s. Although not documented at the subject property, activities commonly associated with agricultural uses may include the use and storage of hazardous materials and petroleum products (*e.g.*, agricultural chemicals). Information was not available as to the potential historical usage of pesticides, fertilizers or insecticides. Based on our experience, these residual concentrations, if present, are not typically at concentrations that would require cleanup by a regulatory agency or pose a significant human health risk to commercial or industrial site users. There is potential that the near surface soils may contain residual agricultural chemicals that may affect disposal costs in the event redevelopment is planned and such soils are removed from the property. The historical agricultural use is considered a de minimis condition.

- Closed in place UST(s): A 550-gallon UST was installed at the subject property in 1986 or 1996. The 2007 Phase I ESA indicates that a construction inspection record dated January 13, 2000 and prepared by the Rancho Cucamonga Fire Department (RCFD) indicates that a 500-gallon fiberglass UST was removed from the Etiwanda facility. No noncompliance was observed. The inspection report indicated the UST was removed and transported offsite. Although a copy of the closure report was requested, the report was not contained in the file. However, the 2019 Phase I ESA indicates that the 550-gallon UST was closed in place at the Site in 2000 although closure and removal documentation was not available for review. Based on Path Forward's review of San Bernardino County Fire Department (SBCFD) records, an Underground Storage Tanks form for permanent on-site closure of a 2,000-gallon UST was filed with the CUPA on January 3, 2000. The form indicates that the UST was filled with inert material and closed in place. No information regarding UST contents or location was found in the records reviewed. Based on the conflicting information provided in the previous Phase Is

and records reviewed by Path Forward, it is possible that one or two USTs may have been closed in place at the subject property; one 550-gallon UST may be located south of the warehouse and the location of one 2,000-gallon UST is unknown. The presence of potential closed in place USTs is considered a de minimis condition.

- Potential UST: The 1997 Phase II ESA indicates that Edison Drawing 5625202 identifies a UST near a carport area, as shown on Figure 3. Geraghty & Miller conducted a geophysical survey in the area identified and did not identify a UST in this area but concluded that a UST may be found in this area during Site redevelopment. The presence of a potential UST is considered a de minimis condition.

8.0 CONCLUSIONS

Path Forward conducted a Phase I ESA in conformance with ASTM Designation: E1527 of the subject property located at 8996 Etiwanda Avenue, San Bernardino County, Rancho Cucamonga, California. This ESA has revealed evidence of RECs in connection with the subject property, as discussed in Section 7.0.

We declare that, to the best of our professional knowledge and belief, we meet the definition of environmental professional as defined in §312.10 of 40 CFR 312. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Notes:
1. The table above includes all items listed in the Hazardous Materials and Waste Inventory Matrix Report (NRG, 5/13/2016
2. The table above includes all items listed in Table 2-1 of Spill Prevention, Control and Countermeasure (SPCC) Plan (Sage Environmental Consulting, October 201
= Capacities are based on information presented in Table 2-1 of the SPCC Plan (Sage Environmental Consulting, October 2012); and on information included in Hazardous Materials Inventory Summary Form (NRG, December 2012).

SUBJECT: SITE INVESTIGATION AT THE ETIWANDA GENERATING STATION, 8996 ETIWANDA AVENUE, ETIWANDA, CA

After reviewing the investigation and remedial action reports concerning soil contamination in the vicinity of the underground storage tanks at the Etiwanda Generating Station, this Department concurs that the levels of contamination found do not present an environmental or public health threat.

It was indicated in the report that you intend to close the kerosene and naptha tanks and replace the unleaded gasoline tanks. Please find enclosed copies of the applications, and standards the County of San Bernardino requires when performing these modifications.

If you have any questions, please call at (714) 383-7170 or (714) 383-1856.

Attention: Mr. Bob Goodson

REMEDIAL ACTION AT ETIWANDA GENERATING STATION

Dear Mr. Faeder:

Board staff has reviewed your Site Characterization study for the Etiwanda Generating Station (EGS). The study addressed the chemical composition and extent of contamination of the soil in the drainage channel and spreading basin on EGS property. Based on the site characterization you submitted, water quality has not been deleteriously affected or threatened at the Etiwanda Generating Station. Therefore, further remedial action at the site will not be required.

If you should have any questions, please contact either me or Myron Eng of our Industrial Surveillance Section.

Sincerely,

Gary M. Litton, Chief
Industrial Surveillance Section

PETROLEUM HYDROCARBON (PHC)-IMPACTED SOIL REMEDIATION AT SOUTHERN CALIFORNIA EDISON (SCE), ETIWANDA GENERATING STATION

Mountain Vista Power

Dear Ms. Chupa:

We have reviewed your August 21, 1998 final report on the PHC-impacted soil remedial activities at SCE's Etiwanda Generating Station. This report indicates that the soil remedial activities were performed at this site in accordance with a previously approved workplan.

After careful review of your report and the results of the confirmation sampling, we believe that no further action will be necessary at this site. Please be advised that this letter does not relieve you of your responsibility to comply with rules and regulations set forth by other agencies.

If you have any questions, please contact me at (909) 320-2024.

Sincerely,

Ray Akhtarshad

December 29, 2011

Mr. Randal Weidner
Project Manager
Southern California Edison
2244 Walnut Grove Avenue
Rosemead, California 91770

CLOSURE CERTIFICATION ACKNOWLEDGMENT: SOUTHERN CALIFORNIA EDISON, ETIWANDA GENERATING STATION RETENTION BASIN SITE, 8996 ETIWANDA AVENUE, RANCHO CUCAMONGA, CALIFORNIA 91739, SAN BERNARDINO COUNTY, EPA ID NUMBER CAD 079 548 574

Dear Mr. Weidner:

On December 21, 2011 the Department of Toxic Substances Control (DTSC) received a report titled "Final Closure Demonstration Report Etiwanda Generating Station Retention Basin Site, San Bernardino County, California" (Report) dated December 20, 2011 for the Southern California Edison Etiwanda Generating Station, 8996 Etiwanda Avenue, Rancho Cucamonga, CA 91739. The Report was prepared by Southern California Edison's consultant, Jamison and Associates, Inc., and included a Closure Demonstration Report Certification signed by both the land owner and an independent California registered Professional Engineer, certifying that all the hazardous waste management units at the facility were closed in accordance with the Final Judgment Pursuant To Stipulation No. BC121219, filed in The Superior Court of the State of California for the County Of Los Angeles (Order). In addition, the Report provided the results of additional site investigation and groundwater investigation at the site. This Report shows that the site has been investigated. All Hazardous Waste Management Units at this facility have been investigated, remediated and/or demolished and closed.

These are the hazardous waste management units that were closed:

North Wastewater Retention Basin (North Basin)
South Wastewater Retention Basin (South Basin)
Boiler Chemical Cleaning Basin (BCCB)
Units 1 and 2 Fireside Wash Drain System
Units 3 and 4 Fireside Wash Drain System
Units 3 and 4 Fireside Wash System Sediment Trap
Units 1 and 2 Boiler Acid Wash Drain System

Printed on Recycled Paper

Units 3 and 4 Boiler Acid Wash Drain System

Groundwater was found not to be contaminated. Groundwater occurs at about 420-feet below ground surface (bgs), and is not used as a drinking water source on-site. The site has been remediated and is approved for unrestricted use.

This letter is to inform you that DTSC now considers the above referenced hazardous waste storage and treatment facility as being officially closed on December 20, 2011. This letter also confirms that the site has been investigated.

This acknowledgment is based on the assumption that the information submitted in the certification, as well as any other information provided to DTSC, and used as a basis for this decision is true and accurate. The owner/operator must inform DTSC of any deviations from or changes in the information provided, which would affect the closure certification acknowledgement.

Should you have any questions, please contact me at (818) 717-6602.

Sincerely,

Mr. Steve Rounds, P.E.
Hazardous Substances Engineer

Notes:

ID - identification

feet bgs - feet below the ground surface

ppm - parts per million

mg/kg - milligrams per kilogram

ug/L - micrograms per liter

ND - no detectable concentrations above the laboratory reporting limit

NA - not available/not applicable

-- - not analyzed

PID - Photoionization Detector

TPHcc - total petroleum hydrocarbons carbon chain C4-C35 analyzed in general accordance with EPA Method No. 8015 (modified)

TPHg - total petroleum hydrocarbons as gasoline

TPHd - total petroleum hydrocarbons as diesel fuel

TPHo - total petroleum hydrocarbons as oil

VOCs - volatile organic compounds analyzed in general accordance with EPA Method No. 8260B

Title 22 Metals analyzed in general accordance with EPA Method No. 6010/7000

Chromium VI - hexavalent chromium analyzed in general accordance with EPA Method No. 7179

EPA-RSLi - EPA Regional Screening Levels for industrial/commercial land use, dated April 2019

DTSC-SLi - Department of Toxic Substances Control, Human and Ecological Risk Office Note 3, screening levels for industrial/commercial land use, dated April 2019

LARWQCD - Los Angeles Regional Water District Control Board, Interim Site Assessment and Cleanup Guidebook, March 1996

Background for Arsenic - DTSC, Final Report Background Metals at Los Angeles Unified School Sites; Arsenic: Suppliment to the DTSC Preliminary Endangerment Assessment (PEA) for evaluating background concentrations of arsenic at Los Angeles Unified School District (LAUSD) school sites, dated June 6, 2005.

SCAQMD - South Coast Air Quality Management District Rule 1166 guidelines

TTLC - Total Threshold Limit Concentration

STLC - Soluble Threshold Limit Concentration

TCLP - Toxicity Characteristic Leeching Procedure

Yellow highlighted cell indicates a concentration that exceeds a regulatory screening level for protection of human health

Green highlighted cell indicates a concentration that exceeds a regulatory screening level for disposal criteria

Blue highlighted cell indicates a concentration that exceeds a regulatory screening level for protection of human health and for disposal criteria

Memorandum

To	Steven Rounds, Department of Toxic Substance Control
From	Steve Williams, P.G., CHG, ERM
Date	22 September 2020
Subject	Etiwanda Generating Station – Soil Removal Memorandum

On behalf of GenOn, LLC. (GenOn), ERM-West, Inc. (ERM) has prepared this Soil Removal Memorandum (memo) for the Etiwanda Generating Station located at 8996 Etiwanda Avenue in Rancho Cucamonga, California (the Site; Figure 1). In October 2019, Ardent Environmental Group Inc. (Ardent) conducted a Site-wide investigation, which included excavating test pits in select areas of the Site and collecting soil samples for laboratory analysis. Two of the test pits (LFI-1 and LFI-3) located in the northwest corner of the property indicated lead and/or arsenic concentrations that exceeded applicable commercial/industrial soil screening levels. GenOn contracted ERM to remove the Arsenic and Lead impacted soil. ERM prepared and submitted to the DTSC a *Soil Excavation Work Pla*n, dated 4 March 2020. This memo documents the removal of the soils containing elevated metals concentrations in the northwest portion of the Site.

Between May and July 2020, ERM and their subcontractor, American Integrated Services, Inc. (AIS), conducted soil removal activities in general accordance with ERM's *Soil Excavation Work Pla*n. Soil excavation began at the LFI-1 and LFI-3 test pit locations and were extended based on visual observations, X-ray fluorescence (XRF) analyzer field-screening data, and soil sample analytical results. The following sections further detail the completed soil removal activities.

SOIL EXCAVATION AND SAMPLING

Prior to conducting any ground disturbance activities, Underground Service Alert was notified to obtain clearance for the work area. ERM also utilized a private geophysical utility locator to clear the excavation location for subsurface utilities and structures.

XRF soil screening was used to field test soil samples, based on the XRF results the excavation was either expanded or soil samples collected for confirmation laboratory analyses. Once XRF field screening results indicated impacted soils were removed to concentrations below applicable screening levels, confirmation samples were collected. A total of 87 confirmation soil samples (43 base samples [BS or BSS] and 44 sidewall samples [ESS, NSS, SSS, and WSS]) were collected to verify the remaining soil beneath and around the excavation did not contain arsenic and lead concentrations above applicable screening levels. The final excavation area was approximately 190 feet long and 105 feet wide with a depth ranging from 2 to 8 feet below ground surface. Prior to demobilizing, the sidewalls of the excavation were sloped to allow safe entry and egress to the excavation. The excavation area and final confirmation sample locations are presented on Figure 2. Photographs of the excavation are included in Attachment A.

© Copyright 2020 by ERM Worldwide Group Limited and/or its affiliates ('ERM'). All Rights Reserved. No part of this work may be reproduced or transmitted in any form or by any means, without prior written permission of ERM.

Soil samples collected during the excavation activities were submitted to Eurofins Calscience LLC in Garden Grove, a California State-Certified Laboratory (ID Number 2944). All confirmation samples were analyzed for metals by United States Environmental Protection Agency (USEPA) Method 6010B. Since lead and arsenic were the only samples exceeding regulatory levels, the majority of the samples were analyzed for those two constituents. However, 21 of the 87 confirmation samples were also analyzed for the other 14 metal constituents as part of USEPA 6010B, as well as mercury by USEPA 7471A. In addition, two confirmation samples were also analyzed for volatile organic compounds (VOCs) by USEPA 8260B and total petroleum hydrocarbon (TPH) by USEPA 8015B. Results from these other analyses were also compared to applicable soil screening levels and no other exceedances were observed. Summaries of metals, VOCs, and TPH in soils are provided in Tables 1, 2, and 3 respectively.

All laboratory analytical reports are included in Attachment B.

WASTE MANAGEMENT

Excavated soil was profiled as non-Resource Conservation and Recovery Act (RCRA) hazardous waste following waste characterization sampling and analytical testing. Excavated soils were stockpiled on plastic and covered each day, left in the excavation, or directly loaded into trucks for transportation and disposal. Approximately 6,445 tons of waste soil was generated during excavation activities; waste soil was then loaded into 256 trucks and transported to the Yuma County Landfill in Yuma, Arizona for proper disposal by AIS and/or their contractors. Copies of the non-RCRA hazardous waste manifests are included in Attachment C.

CONCLUSION AND RECOMMENDATIONS

Based on the results of field screening, visual observations and analytical results of the confirmation samples, all impacted soil containing elevated metals concentrations in the northwest portion of the Site has been removed and no further action to mitigate this area is required.

Please contact Mr. Steve Williams at 949-294-0835 or steve.williams@erm.com with any questions.

Notes:
Results in mg/kg.
< = Compound not detected. Reportable detection limit shown.
Bolded values indicate concentrations above the reportable detection limit.
Shaded values indicate concentrations above the standard.
** = Southern California background concentration of 12 mg/kg used.*
^ = Industrial RSL for Chromium III used in absence of Total Chromium Industrial RSL.
~~Strikethrough~~ indicates sample was over-excavated due to a screening level exceedance.
Samples with two sets of results are the same sample analyzed on separate dates.

Qualifiers - Inorganic:
B = Compound was found in the blank and sample.
J = Result is less than the reporting limit, but greater than or equal to the method detection limit; concentration is an approximate value.
L = A negative instrument reading had an absolute value greater than the reporting limit.
H = Sample was prepped or analyzed beyond the specified holding time.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Path Forward Partners were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # C77B-4585-9455

PO # 124-108-100

Project 8996 Etiwanda Avenue

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: C77B-4585-9455

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through 2017. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

SUBJECT: CERTIFIED RECORD SEARCH FINDINGS
8996 ETIWANDA AVENUE, RANCHO CUCAMONGA, CALIFORNIA

This is to confirm that the San Bernardino County Hazardous Materials Division has identified records that may pertain to the subject site, as described in your request for records search.

The file(s) shown below have been retrieved for review. If you wish to view the original documents, please e-mail this office at mmolina@sbcfire.org or call the number at the end of this letter to arrange an appointment.

ACTIVE PERMIT FACILITIES: (Regulatory files for facilities with annual operating permits to maintain underground storage tanks, handle hazardous materials, and/or generate hazardous waste. Files include permits, inspections, reports, test results, correspondence, and related materials. Files will also include any underground tank removal/construction activity records and site remediation/contamination records for facilities still in operation).

Etiwanda Generating Station 8996 Etiwanda Ave. Rancho Cucamonga	FA0002943~ CERS ID. 10038976 Small Quantity Generator Permit Hazardous Materials 11-30 Chemicals Handler Permit (Last CERS Submission: 08/24/2020)

INACTIVE PERMIT AND/OR NON-PERMIT FACILITIES: (Inactive regulatory files for formerly permitted facilities that maintained underground storage tanks, stored hazardous materials, and/or generated hazardous waste and/or facilities with underground storage tanks removed and/or materials and waste removed.
Files will also include any underground tank removal/construction activity records and site remediation/ contamination records for facilities no longer operating underground tanks).

Etiwanda Generating Station 8996 Etiwanda Ave. Rancho Cucamonga	FA0002943 ~ Est. # 86008879 Underground Storage Tank Permit

PERMITS TO REMOVE/INSTALL/MODIFY TANKS UNDERGROUND:

Etiwanda Generating Station 8996 Etiwanda Ave. Rancho Cucamonga	Issued 01/03/2000 Removal (1) – Removed on 01/13/2000 Log # 010300-02 ~ Job Card # 6319

BOARD OF DIRECTORS

Robert A. Lovingood, First District | Janice Rutherford, Second District | Dawn Rowe, Third District | Curt Hagman, Chairman, Fourth District | Josie Gonzales, Vice Chair, Fifth District

Gary McBride, Chief Executive Officer

HAZARDOUS MATERIAL INCIDENT AND/OR COMPLAINT RESPONSE ACTIVITY: (other records of spill notifications and/or complaints not listed below may also exist in facility permit files).

Etiwanda Generating Station 8996 Etiwanda Ave. Rancho Cucamonga	CO0032644 06/16/2016 Release of approximately 42 gallons of lube oil
Etiwanda Generating Station 8996 Etiwanda Ave. Rancho Cucamonga	CO0031131 07/25/2014 Release of less than 3 gallons of sodium hypochlorite
Etiwanda Generating Station 8996 Etiwanda Ave. Rancho Cucamonga	CO0029229 04/05/2012 Cement/hazardous waste release to stream/river/soil from pipe from Ameron. Fish and Game and Water Board cleaned up stream. Ameron fixed the pipe of release. Samples of water were sent to lab. Results of lab tests were all levels of metals and pH were below hazardous waste levels. Remediated soil was kept onsite at Ameron. Case closed.
Genonwest, LP 8996 Etiwanda Ave. Rancho Cucamonga	CO0028479 05/09/2011 Release of 150 gallons of cooling water (reclaimed water with well mixture)
RRI Energy Etiwanda 8996 Etiwanda Ave. Rancho Cucamonga	CO0027236 03/03/2010 Release of 35 gallons of oil
Etiwanda Generating Station 8996 Etiwanda Ave. Rancho Cucamonga	CO0025739 10/10/2008 Release of 50 gallons of mineral oil
Reliant Energy 8996 Etiwanda Ave. Rancho Cucamonga	CO0002935 07/15/2002 5000 gallons of cooling tower water
Reliant Energy 8996 Etiwanda Ave. Rancho Cucamonga	CO0002860 02/09/2002 Release of 1000 gallons of cooling water (w/Chlorine)
Reliant Energy 8996 Etiwanda Ave. Rancho Cucamonga	CO0002554 09/13/2001 Release of 80 gallons of cooling tower water
Reliant Energy 8996 Etiwanda Ave. Rancho Cucamonga	CO0002525 08/28/2001 Release of 100 gallons of cooling tower water

Reliant Energy 8996 Etiwanda Rancho Cucamonga	CO0002430 07/16/2001 Release of 150 Gallons of coolant tower water
Reliant Energy 8996 Etiwanda Rancho Cucamonga	CO0002320 05/21/2001 Release of 20 gallons of cooling tower water
Reliant Energy 8996 Etiwanda Rancho Cucamonga	CO0002773 01/17/2001 Release of 100 gallons of cooling tower water
Reliant Generator Station 8996 Etiwanda Rancho Cucamonga	CO0003575 06/30/1999 Release of 500 gallons of process tower water

SITE REMEDIATION: (Underground Storage Tank Clean-Up under Local Oversight Program or Voluntary Hazardous Waste Clean-Up activity under Local Jurisdiction) (documents may be included in regular active or inactive permit files listed above).

No record of site remediation identified in this search.

Records searched include permit database systems for facilities with permits as hazardous waste generators, hazardous materials handlers, and/or underground storage tanks, including inactive and/or out of business records; logs of permits issued for the removal and/or installation of underground storage tanks; records and databases pertaining to illicit dumping and releases; records of non-permitted facilities; sites undergoing remediation for contaminated soil and/or groundwater; and incidents responded to by the hazardous materials emergency response team. Records date back to mid- 1980's. Please note if a facility has completed a submission in CERS, the most recent submission can be made available for review upon request.

Records consist of 11 file(s), 13 volumes, approximately 13 ½" thick. To request a file review appointment or request further clarification, please contact this office at (909) 386-8468 or by email to mmolina@sbcfire.org.

Dear Requestor:

On September 8, 2020 the Department of Toxic Substances Control (DTSC) received your email of September 8, 2020 requesting records under the Public Records Act. (DTSC) Department of Toxics Substances Control has identified site records responsive to your request and is in the process of gathering the requested records.

Please contact us to schedule an appointment to review these records. DTSC will notify you if any of the records will be withheld from disclosure under the Act. We recommend you bring a copier or arrange for a bonded copying service to make copies of the records.

DTSC's Hazardous Waste Tracking System (HWTS) may have records that pertain to this request. This unit tracks toxic waste generators, transporters 9manifests) and disposal facilities. If you are interested in this type of information, it can be identified by accessing the HWTS database at http://hwts.dtsc.ca.gov/report_search.cfm?id=5. If you are interested in retrieving detailed reports additional charges may apply. Please contact the HWTS unit by email at hwtsreports@dtsc.ca.gov or by phone at 800-6186942 for further information. For copies of manifests, please send an email to mcr@dtsc.ca.gov.

A large number of records are available on EnviroStor an online database that provides non-confidential, public access to DTSCs data management system. It tracks our cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities

Printed on Recycled Paper

and sites with known or suspected contamination issues. EnviroStor is available 24/7, 365 days a year. The data reflects the latest updates as they are entered in the system. Access it from your computer or smartphone the local library - anywhere Internet access is available. Just go to www.envirostor@dtsc.ca.gov. You'll find a step-by-step of EnviroStor under the "How to Use EnviroStor" menu on the website.

If you have any questions, would like further information regarding your request please contact me at (714) 484-5337.

Sincerely

Julie Johnson
Regional Records Coordinator

User Questionnaire

PATH FORWARD
Environmental Engineering & Geology

PHASE I ENVIRONMENTAL SITE ASSESSMENT
USER QUESTIONNAIRE

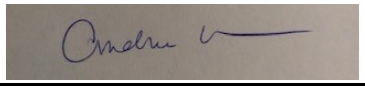
In order to qualify for one of the Landowner Liability Protections (LLPs)[1] offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "Brownfields Amendments"),188 the user must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. These inquiries must also be conducted by EPA Brownfield Assessment and Characterization grantees. The user should provide the following information to the environmental professional. Failure to conduct these inquiries could result in a determination that "all appropriate inquiries" is not complete.

1. **Environmental liens that are filed or recorded against the property (40 CFR 312.25).** Did a search of recorded land title records (or judicial records where appropriate, see Note 1 below) identify any environmental liens filed or recorded against the property under federal, tribal, state or local law? NO

   NOTE 1—In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

2. **Activity and use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.26(a)(1)(v) and vi)).** Did a search of recorded land title records (or judicial records where appropriate, see Note 1 above) identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law? NO

3. **Specialized knowledge or experience of the person seeking to qualify for the LLP** (40 CFR 312.28).
   Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?



[1] Landowner Liability Protections, or LLPs, is the term used to describe the three types of potential defenses to Superfund liability in EPA's Interim Guidance Regarding Criteria Landowners Must Meet in Order to Qualify for Bona Fide Prospective Purchaser, Contiguous Property Owner, or Innocent Landowner Limitations on CERCLA Liability ("Common Elements" Guide) issued on March 6, 2003.

4. **Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29).**
   Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property? YES

5. **Commonly known or reasonably ascertainable information about the property (40 CFR 312.30).**
   Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example,
   (a.) Do you know the past uses of the property? - see Seller's Phase I
   (b.) Do you know of specific chemicals that are present or once were present at the property? (c.) Do you know of spills or other chemical releases that have taken place at the property? (d.) Do you know of any environmental cleanups that have taken place at the property? See Seller's Phase I

6. The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by ap- propriate investigation (40 CFR 312.31).
   Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?
   See Seller's Phase I

THE ABOVE REFERENCED INFORMATION IS TRUE TO THE BEST OF MY KNOWLEDGE:

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 07/29/2020 has revealed that there are 3 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/23/2020 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/23/2020 has revealed that there are 5 RCRA-SQG sites within approximately 0.25 miles of the target property.

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 04/27/2020 has revealed that there are 11 ENVIROSTOR sites within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

State and tribal leaking storage tank lists

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there are 5 LUST sites within approximately 0.5 miles of the target property.

CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CPS-SLIC list, as provided by EDR, has revealed that there are 4 CPS-SLIC sites within approximately 0.5 miles of the target property.

Environmental Interest/Information System:
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.
