Problem Descriptions:
TEI JOB 3687
BIG BUILDING - SOUTH TRUCK YARD

==========

FLOW-THROUGH DETENTION BASIN MODEL

SPECIFIED BASIN CONDITIONS ARE AS FOLLOWS:
CONSTANT HYDROGRAPH TIME UNIT(MINUTES) = 13.400
DEAD STORAGE(AF) = 0.00
SPECIFIED DEAD STORAGE(AF) FILLED = 0.00
ASSUMED INITIAL DEPTH(FEET) IN STORAGE BASIN = 0.00

DEPTH-VS.-STORAGE AND DEPTH-VS.-DISCHARGE INFORMATION:
TOTAL NUMBER OF BASIN DEPTH INFORMATION ENTRIES = 7

*BASIN-DEPTH (FEET)	STORAGE (ACRE-FEET)	OUTFLOW (CFS)	**	**BASIN-DEPTH (FEET)	STORAGE (ACRE-FEET)	OUTFLOW (CFS)	*
* 0.000	0.000	0.000**		0.230	0.010	47.400	*

WHERE S=STORAGE(AF);O=OUTFLOW(AF/MIN.);DT=UNIT INTERVAL(MIN.)

DETENTION BASIN ROUTING RESULTS:
NOTE: COMPUTED BASIN DEPTH, OUTFLOW, AND STORAGE QUANTITIES OCCUR AT THE GIVEN TIME. BASIN INFLOW VALUES REPRESENT THE AVERAGE INFLOW DURING THE RECENT HYDROGRAPH UNIT INTERVAL.

 Problem Descriptions:
  TEI JOB 3687
  SMALL BUILDING - EASTERLY TRUCK YARD

--------------------------------------------------------------------------

    RATIONAL METHOD CALIBRATION COEFFICIENT = 0.90
    TOTAL CATCHMENT AREA(ACRES) =    5.75
    SOIL-LOSS RATE, Fm,(INCH/HR) =  0.074
    LOW LOSS FRACTION = 0.095
    TIME OF CONCENTRATION(MIN.) =  7.70
    SMALL AREA PEAK Q COMPUTED USING PEAK FLOW RATE FORMULA
    USER SPECIFIED RAINFALL VALUES ARE USED
    RETURN FREQUENCY(YEARS) = 100
       5-MINUTE POINT RAINFALL VALUE(INCHES) =  0.51
      30-MINUTE POINT RAINFALL VALUE(INCHES) =  1.05
       1-HOUR   POINT RAINFALL VALUE(INCHES) =  1.40
       3-HOUR   POINT RAINFALL VALUE(INCHES) =  2.50
       6-HOUR   POINT RAINFALL VALUE(INCHES) =  3.75
      24-HOUR   POINT RAINFALL VALUE(INCHES) =  8.20

--------------------------------------------------------------------------

    TOTAL CATCHMENT   RUNOFF  VOLUME(ACRE-FEET) =     3.21
    TOTAL CATCHMENT SOIL-LOSS VOLUME(ACRE-FEET) =     0.72

Problem Descriptions:
TEI JOB 3687
SMALL BUILDING - EASTERLY TRUCK YARD

==========

FLOW-THROUGH DETENTION BASIN MODEL

SPECIFIED BASIN CONDITIONS ARE AS FOLLOWS:
CONSTANT HYDROGRAPH TIME UNIT(MINUTES) = 7.700
DEAD STORAGE(AF) = 0.00
SPECIFIED DEAD STORAGE(AF) FILLED = 0.00
ASSUMED INITIAL DEPTH(FEET) IN STORAGE BASIN = 0.00

DEPTH-VS.-STORAGE AND DEPTH-VS.-DISCHARGE INFORMATION:
TOTAL NUMBER OF BASIN DEPTH INFORMATION ENTRIES = 7

*BASIN-DEPTH (FEET)	STORAGE (ACRE-FEET)	OUTFLOW (CFS)	**	*BASIN-DEPTH (FEET)	STORAGE (ACRE-FEET)	OUTFLOW (CFS)	*
0.000	0.000	0.000	**	0.110	0.010	9.200	*
0.310	0.010	9.300	**	0.510	0.050	9.500	*
0.710	0.130	9.600	**	0.910	0.250	9.800	*
1.110	0.410	9.900	**				

BASIN STORAGE, OUTFLOW AND DEPTH ROUTING VALUES:

INTERVAL NUMBER	DEPTH (FEET)	{S-O*DT/2} (ACRE-FEET)	{S+O*DT/2} (ACRE-FEET)
1	0.00	0.00000	0.00000
2	0.11	-0.03879	0.05879

7	1.11	0.35750	0.46250

WHERE S=STORAGE(AF);O=OUTFLOW(AF/MIN.);DT=UNIT INTERVAL(MIN.)

DETENTION BASIN ROUTING RESULTS:
NOTE: COMPUTED BASIN DEPTH, OUTFLOW, AND STORAGE QUANTITIES OCCUR AT THE GIVEN TIME. BASIN INFLOW VALUES REPRESENT THE AVERAGE INFLOW DURING THE RECENT HYDROGRAPH UNIT INTERVAL.

TIME (HRS)	DEAD-STORAGE FILLED(AF)	INFLOW (CFS)	EFFECTIVE DEPTH(FT)	OUTFLOW (CFS)	EFFECTIVE VOLUME(AF)

Project Owner's Certification

This Water Quality Management Plan (WQMP) has been prepared for ***BTC III Etiwanda Commerce Center*** by ***Thienes Engineering, Inc***. The WQMP is intended to comply with the requirements of the ***City of Rancho Cucamonga*** and the NPDES Areawide Stormwater Program requiring the preparation of a WQMP.

The undersigned, while it owns the subject property, is responsible for the implementation of the provisions of this plan and will ensure that this plan is amended as appropriate to reflect up-to-date conditions on the site consistent with the San Bernardino County's Municipal Storm Water Management Program and the intent of the NPDES Permit for San Bernardino County and the incorporated cities of San Bernardino County within the Santa Ana Region. Once the undersigned transfers its interest in the property, its successors in interest and the city/county shall be notified of the transfer. The new owner will be informed of its responsibility under this WQMP. A copy of the approved WQMP shall be available on the subject site in perpetuity.

"I certify under a penalty of law that the provisions (implementation, operation, maintenance, and fund) of the WQMP have been accepted and that the plan will be transferred to future successors."

Permit/Application Number(s):	DRC-XXXX-XXXXX PGRXXXX-XXXXX WQMPXXXX-XXXXX		**Tract/Parcel Map Number(s):**		
Additional Information/ Comments:	n/a				
Description of Project:	The project site encompasses approximately 70.85 acres, where 61.60 includes of onsite improvements and 9.25 acres of new public roads (Streets "A" and "B"). Proposed onsite improvements include two industrial buildings of 1,013,815 square feet (Building 1) and 127,343 square feet (Building 2) and a trailer parking lot. There will be truck yards on the north and south sides of Building 1 and along the east side of Building 2. Vehicle parking and landscape will be scattered throughout the site. The southeast lot will be utilized as trailer parking. A proposed 3'H x 8'W reinforced concrete box (RCB) is proposed to carry offsite flows from north to south. A separate storm drain system is proposed to convey project flows towards the east and make two connections to the existing storm drain in Etiwanda Avenue. Runoff from the westerly truck yard and vehicle parking lot west of Building 1 will surface drain to series of catch basins and be added to a private storm drain (Line A). The storm drain will travel southerly then turn easterly through the southern truck yard. A series of low points with catch basins will collect the runoff from the southerly half of the building and the truck yard. The storm drain will continue easterly and connect to the proposed public storm drain in "B" Street. The northerly half of Building 1 and the northerly truck yard will drain to a series of low points with catch basins within the truck yard. A private storm drain (Line B) will convey the runoff easterly then turn southerly through the easterly vehicle parking lot. Runoff from the vehicle parking lot will be collected and added to Line B. Line B will confluence with Line A prior to discharging into the storm drain in "B" Street. Runoff from Building 2, the northerly vehicle parking lot, and the truck yard will drain to a series of low points with catch basins. A private storm drain (Line C) will convey this runoff southerly through the easterly truck yard then turn westerly. The southerly vehicle parking lot will drain to a catch basin then connect to Line C. The storm drain will confluence with the storm drain in "B" Street and continue southerly. The storm drain in "B" Street will collect runoff from the proposed streets prior to turning east in "A" Street and discharging into the existing 42" public storm drain in Etiwanda Avenue. Runoff from the southeasterly truck yard and portions of the street are also tributary to the existing 42" storm drain in Etiwanda Avenue. A private storm drain will collect runoff from a catch basin in the truck yard and the street flows and convey it to the existing drain. Per the Phase I Environmental Site Assessment (ESA) excerpt provided in Attachment K, the site consists of structures that are part of a decommissioned electric power generating facility, known as the Etiwanda Generating Station, including buildings, power generating units, cooling towers and retention basins/ponds. A 2019 investigation revealed that soil and soil gas samples collected in several locations contained concentrations of chemicals above human health and/or disposal criteria. Under these conditions, infiltration is not recommended. Instead, treatment will be provided via underground detention systems, proprietary biofiltration units (volume-based				

	biotreatment BMPs) and hydrodynamic separators/drain inserts for pretreatment. Approximately 5.95 acres (DA 4) from the landscaping throughout the project site will sheet flow offsite without being routed to the LID BMPs. These areas are considered self-treating. Lastly, the project site will also utilize the MEP principle in order to treat disturbed Public Right-of-Way (ROW) impervious areas onsite. This area is approximately 9.25 acres and is included along with the onsite DCV.
Provide summary of Conceptual WQMP conditions (if previously submitted and approved). Attach complete copy.	

Section 2 Project Description

2.1 Project Information

This section of the WQMP should provide the information listed below. The information provided for Conceptual/ Preliminary WQMP should give sufficient detail to identify the major proposed site design and LID BMPs and other anticipated water quality features that impact site planning. Final Project WQMP must specifically identify all BMP incorporated into the final site design and provide other detailed information as described herein.

The purpose of this information is to help determine the applicable development category, pollutants of concern, watershed description, and long term maintenance responsibilities for the project, and any applicable water quality credits. This information will be used in conjunction with the information in Section 3, Site Description, to establish the performance criteria and to select the LID BMP or other BMP for the project or other alternative programs that the project will participate in, which are described in Section 4.

Form 2.1-1 Description of Proposed Project

[1] Development Category (Select all that apply):

☒ Significant re-development involving the addition or replacement of 5,000 ft^2 or more of impervious surface on an already developed site	☐ New development involving the creation of 10,000 ft^2 or more of impervious surface collectively over entire site	☐ Automotive repair shops with standard industrial classification (SIC) codes 5013, 5014, 5541, 7532- 7534, 7536-7539	☐ Restaurants (with SIC code 5812) where the land area of development is 5,000 ft^2 or more
☐ Hillside developments of 5,000 ft^2 or more which are located on areas with known erosive soil conditions or where the natural slope is 25 percent or more	☐ Developments of 2,500 ft^2 of impervious surface or more adjacent to (within 200 ft) or discharging directly into environmentally sensitive areas or waterbodies listed on the CWA Section 303(d) list of impaired waters.	☒ Parking lots of 5,000 ft^2 or more exposed to storm water	☐ Retail gasoline outlets that are either 5,000 ft^2 or more, or have a projected average daily traffic of 100 or more vehicles per day

☐ Non-Priority / Non-Category Project

May require source control LID BMPs and other LIP requirements. Please consult with local jurisdiction on specific requirements.

[2] Project Area (ft^2):	3,086,226 sq-ft 70.85 acres*	**[3] Number of Dwelling Units:**	n/a	**[4] SIC Code:**	4225

[5] Is Project going to be phased? ☐Yes ☒No

If yes, ensure that the WQMP evaluates each phase as a distinct DA, requiring LID BMPs to address runoff at time of completion.

[6] Does Project include roads? ☒Yes ☐No

If yes, ensure that applicable requirements for transportation projects are addressed (see Appendix A of TGD for WQMP)

* This includes approximately 9.25 acres of offsite improvements (Streets “A” and “B”).

2.2 Property Ownership/Management

Describe the ownership/management of all portions of the project and site. State whether any infrastructure will transfer to public agencies (City, County, Caltrans, etc.) after project completion. State if a homeowners or property owners association will be formed and be responsible for the long-term maintenance of project stormwater facilities. Describe any lot-level stormwater features that will be the responsibility of individual property owners.

Form 2.2-1 Property Ownership/Management

Describe property ownership/management responsible for long-term maintenance of WQMP stormwater facilities:

BTC III Etiwanda Commerce Center
4675 Macarthur Court, Suite 625
Newport Beach, CA 92660
Phone: (949) 862-4900
Contact: Chris Sanford

No infrastructure will be transferred to a public agency after project completion.
A property owner's association (POA) will be formed for long-term maintenance of project stormwater facilities.

2.3 Potential Stormwater Pollutants

Determine and describe expected stormwater pollutants of concern based on land uses and site activities (refer to Table 3-3 in the TGD for WQMP).

Form 2.3-1 Pollutants of Concern

Pollutant	Please check: E=Expected, N=Not Expected		Additional Information and Comments
Pathogens (Bacterial / Virus)	E ☒	N ☐	Including petroleum hydrocarbons. Bacterial indicators are routinely detected in pavement runoff.
Nutrients - Phosphorous	E ☒	N ☐	Expected pollutant if landscaping exists on-site.
Nutrients - Nitrogen	E ☒	N ☐	Expected pollutant if landscaping exists on-site.
Noxious Aquatic Plants	E ☒	N ☐	Expected pollutant if landscaping exists on-site.
Sediment / TSS / pH	E ☒	N ☐	Expected pollutant if landscaping exists on-site.
Metals	E ☒	N ☐	Expected pollutant if parking lots exist on-site.
Oil and Grease	E ☒	N ☐	Expected pollutant if parking lots exist on-site.
Trash & Debris	E ☒	N ☐	Expected pollutant if landscaping and parking lots exists on-site.
Pesticides / Herbicides	E ☒	N ☐	Expected pollutant if landscaping exists on-site.
Organic Compounds	E ☒	N ☐	Expected pollutant if landscaping exists on-site. Including solvents. Bacterial indicators are routinely detected in pavement runoff.
Oxygen Demanding Compounds	E ☒	N ☐	Expected pollutant if landscaping exists on-site.
Other:	E ☐	N ☐	
Other:	E ☐	N ☐	

The expected POCs for the project site are ***Pathogens, Nutrients, and Metals***.

2.4 Water Quality Credits

A water quality credit program is applicable for certain types of development projects if it is not feasible to meet the requirements for on-site LID. Proponents for eligible projects, as described below, can apply for water quality credits that would reduce project obligations for selecting and sizing other treatment BMP or participating in other alternative compliance programs. Refer to Section 6.2 in the TGD for WQMP to determine if water quality credits are applicable for the project.

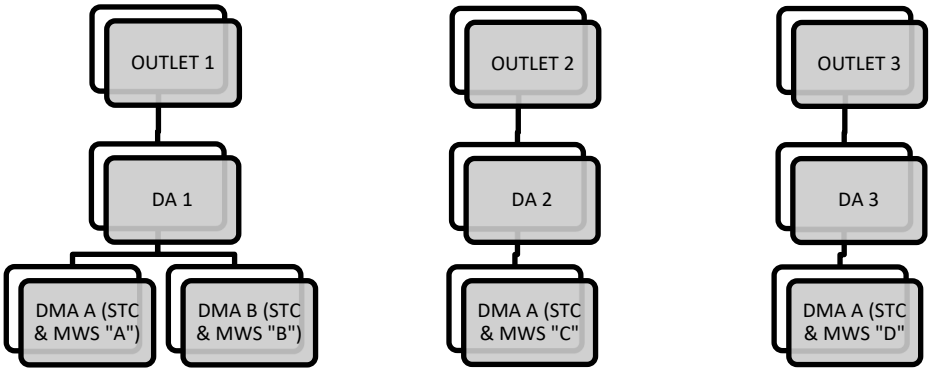
Form 2.4-1 Water Quality Credits

[1] **Project Types that Qualify for Water Quality Credits:** *Select all that apply*			
☐ Redevelopment projects that reduce the overall impervious footprint of the project site. [Credit = % impervious reduced]	Higher density development projects ☐ Vertical density [20%] ☐ 7 units/ acre [5%]	☐ Mixed use development, (combination of residential, commercial, industrial, office, institutional, or other land uses which incorporate design principles that demonstrate environmental benefits not realized through single use projects) [20%]	☐ Brownfield redevelopment (redevelop real property complicated by presence or potential of hazardous contaminants) [25%]
☐ Redevelopment projects in established historic district, historic preservation area, or similar significant core city center areas [10%]	☐ Transit-oriented developments (mixed use residential or commercial area designed to maximize access to public transportation) [20%]	☐ In-fill projects (conversion of empty lots & other underused spaces < 5 acres, substantially surrounded by urban land uses, into more beneficially used spaces, such as residential or commercial areas) [10%]	☐ Live-Work developments (variety of developments designed to support residential and vocational needs) [20%]
[2] **Total Credit %:** n/a *(Total all credit percentages up to a maximum allowable credit of 50 percent)*			
Description of Water Quality Credit Eligibility (if applicable)	n/a		

The proposed project will ***not*** utilize any water quality credits.

Section 3 Site and Watershed Description

Describe the project site conditions that will facilitate the selection of BMP through an analysis of the physical conditions and limitations of the site and its receiving waters. Identify distinct drainage areas (DA) that collect flow from a portion of the site and describe how runoff from each DA (and sub-watershed DMAs) is conveyed to the site outlet(s). Refer to Section 3.2 in the TGD for WQMP. Complete form 3.2 for each DA on the project site.



Form 3-1 Site Location and Hydrologic Features

Site coordinates *Take GPS measurement at approximate center of site*	**Latitude:** 34.091404	**Longitude:** -117.52738	**Thomas Bros Map page:** Page 603

[1] San Bernardino County climatic region: ☒Valley ☐Mountain ☐Desert

[2] Does the site have more than one drainage area (DA): ☒Yes ☐No

If no, proceed to Form 3-2. If yes, then use this form to show a conceptual schematic describing DMAs and hydrologic feature connecting DMAs to the site outlet(s). An example is provided below that can be modified for proposed project or a drawing clearly showing DMA and flow routing may be attached.

Conveyance	*Briefly describe on-site drainage features to convey runoff that is not retained within a DMA*
DA 1 DMA A flows to Outlet 1	Prior to runoff discharging to the existing public storm drain in Etiwanda Avenue, the low flows from DA 1 DMA A will be directed to a set of underground detention chambers and a proprietary biofiltration system for biotreatment (STC & MWS "A"). DA 1 DMA A includes ROW improvements from "B" Street.
DA 1 DMA B flows to Outlet 1	Prior to runoff discharging to the existing public storm drain in Etiwanda Avenue, the low flows from DA 1 DMA B will be directed to a set of underground detention chambers and a proprietary biofiltration system for biotreatment (STC & MWS "B"). DA 1 DMA B includes ROW improvements from "A" Street.
DA 2 DMA A flows to Outlet 2	Prior to runoff discharging to the existing public storm drain in Etiwanda Avenue, the low flows from DA 2 DMA A will be directed to a set of underground detention chambers and a proprietary biofiltration system for biotreatment (STC & MWS "C").
DA 3 DMA A flows to Outlet 3	Prior to runoff discharging to the existing public storm drain in Etiwanda Avenue, the low flows from DA 3 DMA A will be directed to a set of underground detention chambers and a proprietary biofiltration system for biotreatment (STC & MWS "B"). DA 3 DMA A includes ROW improvements from "A" and "B" Street.

Form 3-2 Existing Hydrologic Characteristics for Drainage Area (DA)

For each drainage area's sub-watershed DMA, provide the following characteristics	DMA A Hydrology Nodes (200-202)	DMA B Hydrology Nodes (300-332)	DMA C Hydrology Nodes (400-403)	DMA D Hydrology Nodes (500-502)	DMA E Hydrology Nodes (600-601)
[1] **DMA drainage area (ft^2)**	564,102 (12.95 ac)	971,388 (22.30 ac)	836,352 (19.20 ac)	696,960 (16.00 ac)	17,424 (0.40 ac)
[2] **Existing site impervious area (ft^2)**	81,606	638,056	483,959	3959,806	0
[3] **Antecedent moisture condition** *For desert areas, use http://www.sbcounty.gov/dpw/floodcontrol/pdf/20100412_map.pdf*	AMC II	AMC II	AMC II	AMC II	AMC II
[4] **Hydrologic soil group** *Refer to Watershed Mapping Tool – http://sbcounty.permitrack.com/WAP*	HSG B	HSG A & B	HSG A	HSG A	HSG A
[5] **Longest flowpath length (ft)**	1,085	2,010	1,690	1,785	115
[6] **Longest flowpath slope (ft/ft)**	0.0154	0.0167	0.0134	0.0105	0.5139
[7] **Current land cover type(s)** *Select from Fig C-3 of Hydrology Manual*	Barren Commercial	Barren Commercial	Barren Commercial	Barren Commercial	Barren Commercial
[8] **Pre-developed pervious area condition:** *Based on the extent of wet season vegetated cover good >75%; Fair 50-75%; Poor <50% See Attachment A for photos of site to support rating*	Poor and Paved	Poor and Paved	Poor and Paved	Poor and Paved	Poor and Paved

Form 3-3 Watershed Description

Receiving Waters *Refer to Watershed Mapping Tool - http://sbcounty.permitrack.com/WAP See 'Drainage Facilities" link at this website*	Day Creek Cucamonga Creek, Reach 1 Mill Creek (Prado Area) Chino Creek, Reach 1A Santa Ana River, Reach 3 Prado Dam Santa Ana River, Reach 2 Santa Ana River, Reach 1 Pacific Ocean
Applicable TMDLs *Refer to Local Implementation Plan*	Day Creek: None Cucamonga Creek, Reach 1: High Coliform Count Mill Creek (Prado Area): Pathogens Chino Creek, Reach 1A: Pathogens Santa Ana River, Reach 3: Pathogens and Nitrate Prado Dam: Pathogens Santa Ana River, Reach 2: None Santa Ana River, Reach 1: None Pacific Ocean: None
303(d) listed impairments *Refer to Local Implementation Plan and Watershed Mapping Tool – http://sbcounty.permitrack.com/WAP and State Water Resources Control Board website – http://www.waterboards.ca.gov/santaana/water_iss ues/programs/tmdl/index.shtml*	Day Creek: None Cucamonga Creek, Reach 1: Cadmium, Copper, Lead, and Zinc Mill Creek (Prado Area): Indicator Bacteria, Nutrients and Total Suspended Solids (TSS) Chino Creek, Reach 1A: Indicator Bacteria, and Nutrients Santa Ana River, Reach 3: Copper, Indicator Bacteria and Lead Prado Dam: pH Santa Ana River, Reach 2: None Santa Ana River, Reach 1: None Pacific Ocean: None
Environmentally Sensitive Areas (ESA) *Refer to Watershed Mapping Tool – http://sbcounty.permitrack.com/WAP*	n/a
Unlined Downstream Water Bodies *Refer to Watershed Mapping Tool – http://sbcounty.permitrack.com/WAP*	Santa Ana River
Hydrologic Conditions of Concern	☐ Yes *Complete Hydrologic Conditions of Concern (HCOC) Assessment. Include Forms 4.2-2 through Form 4.2-5 and Hydromodification BMP Form 4.3-10 in submittal* ☒ No
Watershed–based BMP included in a RWQCB approved WAP	☐ Yes *Attach verification of regional BMP evaluation criteria in WAP* • *More Effective than On-site LID* • *Remaining Capacity for Project DCV* • *Upstream of any Water of the US* • *Operational at Project Completion* • *Long-Term Maintenance Plan* ☒ No

Section 4 Best Management Practices (BMP)

4.1 Source Control BMP

4.1.1 Pollution Prevention

Non-structural and structural source control BMP are required to be incorporated into all new development and significant redevelopment projects. Form 4.1-1 and 4.1-2 are used to describe specific source control BMPs used in the WQMP or to explain why a certain BMP is not applicable. Table 7-3 of the TGD for WQMP provides a list of applicable source control BMP for projects with specific types of potential pollutant sources or activities. The source control BMP in this table must be implemented for projects with these specific types of potential pollutant sources or activities.

The preparers of this WQMP have reviewed the source control BMP requirements for new development and significant redevelopment projects. The preparers have also reviewed the specific BMP required for project as specified in Forms 4.1-1 and 4.1-2. All applicable non-structural and structural source control BMP shall be implemented in the project.

Form 4.1-1 Non-Structural Source Control BMPs

Identifier	Name	Check One		Describe BMP Implementation OR, if not applicable, state reason
		Included	Not Applicable	
N1	Education of Property Owners, Tenants and Occupants on Stormwater BMPs	☒	☐	Property owner will familiarize him/herself with the educational materials in Attachment "E" and the contents of the WQMP.
N2	Activity Restrictions	☒	☐	The owner shall develop ongoing activity restrictions that include those that have the potential to create adverse impacts on water quality. Activities include, but are not limited to: handling and disposal of contaminants, fertilizer and pesticide application restrictions, litter control and pick-up, and vehicle or equipment repair as well as any other activities that may potentially contribute to water pollution. Refer to Attachment J.
N3	Landscape Management BMPs	☒	☐	Irrigation must be consistent with City's Water Conservation Ordinance. Fertilizer and pesticide usage will be consistent with County Management Guidelines for Use of Fertilizers and Pesticides.
N4	BMP Maintenance	☒	☐	BMP maintenance, implementation schedules, and responsible parties are included with each specific BMP narrative.
N5	Title 22 CCR Compliance (How development will comply)	☐	☒	No hazardous materials anticipated outdoors. WQMP to be amended if hazardous materials become applicable.
N6	Local Water Quality Ordinances	☒	☐	Owner/tenant will comply with Local Water Ordinances.
N7	Spill Contingency Plan	☒	☐	Owner/tenant will have a spill contingency plan, a separate document, based on specific site needs.
N8	Underground Storage Tank Compliance	☐	☒	No USTs onsite.
N9	Hazardous Materials Disclosure Compliance	☐	☒	No hazardous materials anticipated outdoors. WQMP to be amended if hazardous materials become applicable.
N10	Uniform Fire Code Implementation	☒	☐	If applicable, owner will comply with Article 80 of the California Fire Code enforced by the fire protection agency. The facility operators will be educated annually regarding requirements for handling, storage and proper disposal of hazardous substances.
N11	Litter/Debris Control Program	☒	☐	Contract with their landscape maintenance firm to provide this service during regularly schedule maintenance. They are required to implement trash management and litter control procedures in the common areas aimed at reducing pollution of drainage water.
N12	Employee Training	☒	☐	The owner will ensure that tenants are also familiar with onsite BMPs and necessary maintenance required of the tenants. Owner will check with City and County at least once a year to obtain new or updated educational materials and provide these materials to tenants. Employees shall be trained to clean up spills and participate in ongoing maintenance. The WQMP requires annual employee training and new hires within 2 months.

Form 4.1-1 Non-Structural Source Control BMPs

Identifier	Name	Check One		Describe BMP Implementation OR, if not applicable, state reason
		Included	Not Applicable	
N13	Housekeeping of Loading Docks	☒	☐	Keep all fluids indoors. Clean up spills immediately and keep spills from entering storm drain system. No direct discharges into the storm drain system. Area shall be inspected weekly for proper containment and practices with spills cleaned up immediately and disposed of properly.
N14	Catch Basin Inspection Program	☒	☐	Monthly inspection by property owner's designee. Inspection consists of immediate repair of any deterioration of the structures and maintenance of drain inserts before and after major rain events. Drain insert maintenance shall be per manufacturer's guidelines.
N15	Vacuum Sweeping of Private Streets and Parking Lots	☒	☐	All landscape maintenance contractors will be required to sweep up all landscape cuttings, mowings and fertilizer materials off paved areas weekly and dispose of properly. Parking areas and drive ways will be swept monthly by sweeping contractor.
N16	Other Non-structural Measures for Public Agency Projects	☐	☒	Not a public agency project.
N17	Comply with all other applicable NDPES permits	☒	☐	Will comply with Construction General Permit and Industrial General Permit (may apply for No Exposure Certification/NEC).

Form 4.1-2 Structural Source Control BMPs

Identifier	Name	Check One		Describe BMP Implementation OR, if not applicable, state reason
		Included	Not Applicable	
S1	Provide storm drain system stenciling and signage (CASQA New Development BMP Handbook SD-13)	☒	☐	"No Dumping – Drains to Waterway" stencils will be applied. Legibility of stencil will be maintained on a yearly basis.
S2	Design and construct outdoor material storage areas to reduce pollution introduction (CASQA New Development BMP Handbook SD-34)	☐	☒	No outdoor material storage areas onsite.
S3	Design and construct trash and waste storage areas to reduce pollution introduction (CASQA New Development BMP Handbook SD-32)	☒	☐	Paved with an impervious surface, designed not to allow run-on from adjoining areas, designed to divert drainage from adjoining roofs and pavements diverted around the area, screened or walled to prevent off-site transport of trash. A trash enclosure detail is provided within the Site and Drainage Map.
S4	Use efficient irrigation systems & landscape design, water conservation, smart controllers, and source control (Statewide Model Landscape Ordinance; CASQA New Development BMP Handbook SD-12)	☒	☐	Irrigation systems shall include reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines. Timers will be used to avoid over watering and watering cycles and duration shall be adjusted seasonally by the landscape maintenance contractor. The landscaping areas will be grouped with plants that have similar water requirements. Native or drought tolerant species shall also be used where appropriate to reduce excess irrigation runoff and promote surface filtration.
S5	Finish grade of landscaped areas at a minimum of 1-2 inches below top of curb, sidewalk, or pavement	☐	☒	Stormwater runoff from all impervious areas will drain into the proposed LID BMPs for treatment.
S6	Protect slopes and channels and provide energy dissipation (CASQA New Development BMP Handbook SD-10)	☐	☒	No channels to protect.
S7	Covered dock areas (CASQA New Development BMP Handbook SD-31)	☐	☒	No applicable.
S8	Covered maintenance bays with spill containment plans (CASQA New Development BMP Handbook SD-31)	☐	☒	No maintenance bays onsite.
S9	Vehicle wash areas with spill containment plans (CASQA New Development BMP Handbook SD-33)	☐	☒	No vehicle wash areas onsite.
S10	Covered outdoor processing areas (CASQA New Development BMP Handbook SD-36)	☐	☒	No outdoor processing areas onsite.

Form 4.1-2 Structural Source Control BMPs

Identifier	Name	Check One		Describe BMP Implementation OR, if not applicable, state reason
		Included	Not Applicable	
S11	Equipment wash areas with spill containment plans (CASQA New Development BMP Handbook SD-33)	☐	☒	No equipment wash areas onsite.
S12	Fueling areas (CASQA New Development BMP Handbook SD-30)	☐	☒	No fueling areas onsite.
S13	Hillside landscaping (CASQA New Development BMP Handbook SD-10)	☐	☒	No hillsides onsite.
S14	Wash water control for food preparation areas	☐	☒	No food preparation onsite.
S15	Community car wash racks (CASQA New Development BMP Handbook SD-33)	☐	☒	No community cars wash racks onsite.

4.1.2 Preventive LID Site Design Practices

Site design practices associated with new LID requirements in the MS4 Permit should be considered in the earliest phases of a project. Preventative site design practices can result in smaller DCV for LID BMP and hydromodification control BMP by reducing runoff generation. Describe site design and drainage plan including:

- A narrative of site design practices utilized or rationale for not using practices
- A narrative of how site plan incorporates preventive site design practices
- Include an attached Site Plan layout which shows how preventative site design practices are included in WQMP

Refer to Section 5.2 of the TGD for WQMP for more details.

Form 4.1-3 Preventive LID Site Design Practices Checklist

Site Design Practices *If yes, explain how preventative site design practice is addressed in project site plan. If no, other LID BMPs must be selected to meet targets.*
Minimize impervious areas: ☐ Yes ☒ No Explanation: The project will utilize biotreatment BMPs to collect runoff from impervious areas. Roads and sidewalk widths are reduced to the City standards.
Maximize natural infiltration capacity: ☐ Yes ☒ No Explanation: Due to the environmental conditions of the site, infiltration is not recommended.
Preserve existing drainage patterns and time of concentration: ☒ Yes ☐ No Explanation: Post-development drainage patterns will mimic pre-development conditions. Stormwater will be detained in biotreatment BMPs and mimic the time of concentration compared to existing condition.
Disconnect impervious areas: ☒ Yes ☐ No Explanation: The biotreatment BMPs will disconnect impervious areas before discharging offsite.
Protect existing vegetation and sensitive areas: ☐ Yes ☒ No Explanation: Not applicable, there is no existing vegetation onsite (see Attachment A for recent site photos). The site is being developed into a light industrial facility. There are no sensitive areas to protect. Landscape will be provided throughout the site.
Re-vegetate disturbed areas: ☐ Yes ☒ No Explanation: Not applicable, development consists of two light-industrial warehouses. Most of the disturbed areas will be paved; however, all disturbed areas will be collected by the biotreatment BMPs for treatment. Landscape will be provided throughout the site.
Minimize unnecessary compaction in stormwater retention/infiltration basin/trench areas: ☒ Yes ☐ No Explanation: Heavy construction vehicles will be prohibited from performing unnecessary soil compaction at the locations of the underground detention chambers.
Utilize vegetated drainage swales in place of underground piping or imperviously lined swales: ☐ Yes ☒ No Explanation: Underground piping and imperviously lined swales are located at truck loading areas that could not be substituted with vegetated swales. All Imperviously lined swales will be taken to the biotreatment BMPs for treatment.
Stake off areas that will be used for landscaping to minimize compaction during construction : ☒ Yes ☐ No Explanation: Landscaped areas (not located in the compacted building zone area) will be staked to minimize unnecessary compaction during construction. Material storage areas and stockpiles will be located on areas being developed into a parking lot. Access routes for heavy equipment will be located around BMP locations.

4.2 Project Performance Criteria

The purpose of this section of the Project WQMP is to establish targets for post development hydrology based on performance criteria specified in the MS4 Permit. These targets include runoff volume for water quality control (referred to as LID design capture volume), and runoff volume, time of concentration, and peak runoff for protection of any downstream waterbody segments with a HCOC. ***If the project has more than one outlet for stormwater runoff, then complete additional versions of these forms for each DA / outlet.***

Methods applied in the following forms include:

- For LID BMP Design Capture Volume (DCV), the San Bernardino County Stormwater Program requires use of the P6 method (MS4 Permit Section XI.D.6a.ii) – Form 4.2-1
- For HCOC pre- and post-development hydrologic calculation, the San Bernardino County Stormwater Program requires the use of the Rational Method (San Bernardino County Hydrology Manual Section D). Forms 4.2-2 through Form 4.2-5 calculate hydrologic variables including runoff volume, time of concentration, and peak runoff from the project site pre- and post-development using the Hydrology Manual Rational Method approach. For projects greater than 640 acres (1.0 mi2), the Rational Method and these forms should not be used. For such projects, the Unit Hydrograph Method (San Bernardino County Hydrology Manual Section E) shall be applied for hydrologic calculations for HCOC performance criteria.

Refer to Section 4 in the TGD for WQMP for detailed guidance and instructions.

Form 4.2-1 LID BMP Performance Criteria for Design Capture Volume (DA 1)

[1] **Project area (ft^2):** 916,938 (DMA A – 21.05 ac)	[2] **Imperviousness after applying preventative site design practices (Imp%):** 100%	[3] **Runoff Coefficient (R_c):** 0.892 $R_C = 0.858(Imp\%)^3 - 0.78(Imp\%)^2 + 0.774(Imp\%) + 0.04$
[4] **Determine 1-hour rainfall depth for a 2-year return period $P_{2yr\text{-}1hr}$ (in):** 0.526 http://hdsc.nws.noaa.gov/hdsc/pfds/sa/sca_pfds.html		
[5] **Compute P6, Mean 6-hr Precipitation (inches):** 0.779 *P6 = Item 4 *C_1, where C_1 is a function of site climatic region specified in Form 3-1 Item 1* *(Valley = 1.4807; Mountain = 1.909; Desert = 1.2371)*		
[6] **Drawdown Rate** *Use 48 hours as the default condition. Selection and use of the 24 hour drawdown time condition is subject to approval by the local jurisdiction. The necessary BMP footprint is a function of drawdown time. While shorter drawdown times reduce the performance criteria for LID BMP design capture volume, the depth of water that can be stored is also reduced.*		24-hrs ☐ 48-hrs ☒
[7] **Compute design capture volume, DCV (ft^3):** 104,207 *DCV = 1/12 * [Item 1* Item 3 *Item 5 * C_2], where C_2 is a function of drawdown rate (24-hr = 1.582; 48-hr = 1.963)* *Compute separate DCV for each outlet from the project site per schematic drawn in Form 3-1 Item 2*		
[1] **Project area (ft^2):** 89,298 (DMA A - ROW – 2.05 ac)	[2] **Imperviousness after applying preventative site design practices (Imp%):** 100%	[3] **Runoff Coefficient (R_c):** 0.892 $R_C = 0.858(Imp\%)^3 - 0.78(Imp\%)^2 + 0.774(Imp\%) + 0.04$
[4] **Determine 1-hour rainfall depth for a 2-year return period $P_{2yr\text{-}1hr}$ (in):** 0.526 http://hdsc.nws.noaa.gov/hdsc/pfds/sa/sca_pfds.html		

[5] Compute P6, Mean 6-hr Precipitation (inches): 0.779

*P6 = Item 4 *C_1, where C_1 is a function of site climatic region specified in Form 3-1 Item 1*

(Valley = 1.4807; Mountain = 1.909; Desert = 1.2371)

[6] Drawdown Rate

Use 48 hours as the default condition. Selection and use of the 24 hour drawdown time condition is subject to approval by the local jurisdiction. The necessary BMP footprint is a function of drawdown time. While shorter drawdown times reduce the performance criteria for LID BMP design capture volume, the depth of water that can be stored is also reduced.

15 Peak runoff reduction needed to meet HCOC Requirement (cfs): 0 *$Q_{p\text{-}HCOC}$ = (Item 14 * 0.95) – Item 10*		

4.3 Project Conformance Analysis

Complete the following forms for each project site DA to document that the proposed LID BMPs conform to the project DCV developed to meet performance criteria specified in the MS4 Permit (WQMP Template Section 4.2). For the LID DCV, the forms are ordered according to hierarchy of BMP selection as required by the MS4 Permit (see Section 5.3.1 in the TGD for WQMP). The forms compute the following for on-site LID BMP:

- Site Design and Hydrologic Source Controls (Form 4.3-2)
- Retention and Infiltration (Form 4.3-3)
- Harvested and Use (Form 4.3-4) or
- Biotreatment (Form 4.3-5).

At the end of each form, additional fields facilitate the determination of the extent of mitigation provided by the specific BMP category, allowing for use of the next category of BMP in the hierarchy, if necessary.

The first step in the analysis, using Section 5.3.2.1 of the TGD for WQMP, is to complete Forms 4.3-1 and 4.3-3) to determine if retention and infiltration BMPs are infeasible for the project. For each feasibility criterion in Form 4.3-1, if the answer is "Yes," provide all study findings that includes relevant calculations, maps, data sources, etc. used to make the determination of infeasibility.

Next, complete Forms 4.3-2 and 4.3-4 to determine the feasibility of applicable HSC and harvest and use BMPs, and, if their implementation is feasible, the extent of mitigation of the DCV.

If no site constraints exist that would limit the type of BMP to be implemented in a DA, evaluate the use of combinations of LID BMPs, including all applicable HSC BMPs to maximize on-site retention of the DCV. If no combination of BMP can mitigate the entire DCV, implement the single BMP type, or combination of BMP types, that maximizes on-site retention of the DCV within the minimum effective area.

If the combination of LID HSC, retention and infiltration, and harvest and use BMPs are unable to mitigate the entire DCV, then biotreatment BMPs may be implemented by the project proponent. If biotreatment BMPs are used, then they must be sized to provide sufficient capacity for effective treatment of the remainder of the volume-based performance criteria that cannot be achieved with LID BMPs (TGD for WQMP Section 5.4.4.2). Under no circumstances shall any portion of the DCV be released from the site without effective mitigation and/or treatment.

Form 4.3-1 Infiltration BMP Feasibility (Entire Site)

Feasibility Criterion – Complete evaluation for each DA on the Project Site

1 Would infiltration BMP pose significant risk for groundwater related concerns? ☒ Yes ☐ No

Refer to Section 5.3.2.1 of the TGD for WQMP

If Yes, Provide basis: Per the Phase I Environmental Site Assessment (ESA) excerpt provided in Attachment K, the site consists of structures that are part of a decommissioned electric power generating facility, known as the Etiwanda Generating Station, including buildings, power generating units, cooling towers and retention basins/ponds. A 2019 investigation revealed that soil and soil gas samples collected in several locations contained concentrations of chemicals above human health and/or disposal criteria. Under these conditions, infiltration is not recommended.

2 Would installation of infiltration BMP significantly increase the risk of geotechnical hazards ☐ Yes ☒ No

(Yes, if the answer to any of the following questions is yes, as established by a geotechnical expert):

- The location is less than 50 feet away from slopes steeper than 15 percent
- The location is less than eight feet from building foundations or an alternative setback.
- A study certified by a geotechnical professional or an available watershed study determines that stormwater infiltration would result in significantly increased risks of geotechnical hazards.

If Yes, Provide basis: (attach)

3 Would infiltration of runoff on a Project site violate downstream water rights? ☐ Yes ☒ No

If Yes, Provide basis: (attach)

4 Is proposed infiltration facility located on hydrologic soil group (HSG) D soils or does the site geotechnical investigation indicate presence of soil characteristics, which support categorization as D soils? ☐ Yes ☒ No

If Yes, Provide basis: (attach)

5 Is the design infiltration rate, after accounting for safety factor of 2.0, below proposed facility less than 0.3 in/hr (accounting for soil amendments)? ☐ Yes ☒ No

If Yes, Provide basis: (attach)

6 Would on-site infiltration or reduction of runoff over pre-developed conditions be partially or fully inconsistent with watershed management strategies as defined in the WAP, or impair beneficial uses? ☐ Yes ☒ No

See Section 3.5 of the TGD for WQMP and WAP

If Yes, Provide basis: (attach)

7 Any answer from Item 1 through Item 3 is "Yes": ☒ Yes ☐ No

If yes, infiltration of any volume is not feasible onsite. Proceed to Form 4.3-4, Harvest and Use BMP. If no, then proceed to Item 8 below.

8 Any answer from Item 4 through Item 6 is "Yes": ☐ Yes ☒ No

If yes, infiltration is permissible but is not required to be considered. Proceed to Form 4.3-2, Hydrologic Source Control BMP.
If no, then proceed to Item 9, below.

9 All answers to Item 1 through Item 6 are "No": ☐ Yes ☒ No

Infiltration of the full DCV is potentially feasible, LID infiltration BMP must be designed to infiltrate the full DCV to the MEP.
Proceed to Form 4.3-2, Hydrologic Source Control BMP.

4.3.1 Site Design Hydrologic Source Control BMP

Section XI.E. of the Permit emphasizes the use of LID preventative measures; and the use of LID HSC BMPs reduces the portion of the DCV that must be addressed in downstream BMPs. Therefore, all applicable HSC shall be provided except where they are mutually exclusive with each other, or with other BMPs. Mutual exclusivity may result from overlapping BMP footprints such that either would be potentially feasible by itself, but both could not be implemented. Please note that while there are no numeric standards regarding the use of HSC, if a project cannot feasibly meet BMP sizing requirements or cannot fully address HCOCs, feasibility of all applicable HSC must be part of demonstrating that the BMP system has been designed to retain the maximum feasible portion of the DCV. Complete Form 4.3-2 to identify and calculate estimated retention volume from implementing site design HSC BMP. Refer to Section 5.4.1 in the TGD for more detailed guidance.

Form 4.3-2 Site Design Hydrologic Source Control BMPs (DA)

1 Implementation of Impervious Area Dispersion BMP (i.e. routing runoff from impervious to pervious areas), excluding impervious areas planned for routing to on-lot infiltration BMP: ☐ Yes ☒ No *If yes, complete Items 2-5; If no, proceed to Item 6*	DA DMA BMP Type	DA DMA BMP Type	DA DMA BMP Type *(Use additional forms for more BMPs)*
2 Total impervious area draining to pervious area (ft^2)	0	0	0

4.3.2 Infiltration BMPs

Use Form 4.3-3 to compute on-site retention of runoff from proposed retention and infiltration BMPs. Volume retention estimates are sensitive to the percolation rate used, which determines the amount of runoff that can be infiltrated within the specified drawdown time. The infiltration safety factor reduces field measured percolation to account for potential inaccuracy associated with field measurements, declining BMP performance over time, and compaction during construction. Appendix D of the TGD for WQMP provides guidance on estimating an appropriate safety factor to use in Form 4.3-3.

If site constraints limit the use of BMPs to a single type and implementation of retention and infiltration BMPs mitigate no more than 40% of the DCV, then they are considered infeasible and the Project Proponent may evaluate the effectiveness of BMPs lower in the LID hierarchy of use (Section 5.5.1 of the TGD for WQMP)

If implementation of infiltrations BMPs is feasible as determined using Form 4.3-1, then LID infiltration BMPs shall be implemented to the MEP (section 4.1 of the TGD for WQMP).

Form 4.3-3 Infiltration LID BMP – including underground BMPs (DA 1)

4.3.3 Harvest and Use BMP

Harvest and use BMP may be considered if the full LID DCV cannot be met by maximizing infiltration BMPs. Use Form 4.3-4 to compute on-site retention of runoff from proposed harvest and use BMPs.

Volume retention estimates for harvest and use BMPs are sensitive to the on-site demand for captured stormwater. Since irrigation water demand is low in the wet season, when most rainfall events occur in San Bernardino County, the volume of water that can be used within a specified drawdown period is relatively low. The bottom portion of Form 4.3-4 facilitates the necessary computations to show infeasibility if a minimum incremental benefit of 40 percent of the LID DCV would not be achievable with MEP implementation of on-site harvest and use of stormwater (Section 5.5.4 of the TGD for WQMP).

Form 4.3-5 Harvest and Use BMPs (DA 1)

1 Remaining LID DCV not met by site design HSC or infiltration BMP (ft^3): 250,848 *V_{unmet} = Form 4.2-1 Item 7 - Form 4.3-2 Item 30 – Form 4.3-3 Item 16*

10 Is the full DCV retained with a combination of LID HSC, retention and infiltration, and harvest & use BMPs? ☐ Yes ☒ No
If yes, demonstrate conformance using Form 4.3-10. If no, then re-evaluate combinations of all LID BMP and optimize their implementation such that the maximum portion of the DCV is retained on-site (using a single BMP type or combination of BMP types). If the full DCV cannot be mitigated after this optimization process, proceed to Section 4.3.4.

* This concept was not utilized because it is an industrial facility where the amount of impervious area is much greater than landscape. However, stormwater is detained for biotreatment prior to discharging into the storm drain system.

4.3.4 Biotreatment BMP

Biotreatment BMPs may be considered if the full LID DCV cannot be met by maximizing retention and infiltration, and harvest and use BMPs. A key consideration when using biotreatment BMP is the effectiveness of the proposed BMP in addressing the pollutants of concern for the project (see Table 5-5 of the TGD for WQMP).

Use Form 4.3-5 to summarize the potential for volume based and/or flow based biotreatment options to biotreat the remaining unmet LID DCV. Biotreatment computations are included as follows:

- Use Form 4.3-6 to compute biotreatment in small volume based biotreatment BMP (e.g. bioretention w/underdrains);
- Use Form 4.3-7 to compute biotreatment in large volume based biotreatment BMP (e.g. constructed wetlands);
- Use Form 4.3-8 to compute sizing criteria for flow-based biotreatment BMP (e.g. bioswales)

4.3.5 Conformance Summary

Complete Form 4.3-9 to demonstrate how on-site LID DCV is met with proposed site design hydrologic source control, infiltration, harvest and use, and/or biotreatment BMP. The bottom line of the form is used to describe the basis for infeasibility determination for on-site LID BMP to achieve full LID DCV, and provides methods for computing remaining volume to be addressed in an alternative compliance plan. If the project has more than one outlet, then complete additional versions of this form for each outlet.

Form 4.3-10 Conformance Summary and Alternative Compliance Volume Estimate (DA 1 DMA A)

1 Total LID DCV for the Project DA-1 (ft^3): 114,355
Copy Item 7 in Form 4.2-1

2 On-site retention with site design hydrologic source control LID BMP (ft^3): 0
Copy Item 30 in Form 4.3-2

3 On-site retention with LID infiltration BMP (ft^3): 0
Copy Item 16 in Form 4.3-3

4 On-site retention with LID harvest and use BMP (ft^3): 0
Copy Item 9 in Form 4.3-4

5 On-site biotreatment with volume based biotreatment BMP (ft^3): 114,405
Copy Item 3 in Form 4.3-5

6 Flow capacity provided by flow based biotreatment BMP (cfs): 0
Copy Item 6 in Form 4.3-5

7 LID BMP performance criteria are achieved if answer to any of the following is "Yes":

- Full retention of LID DCV with site design HSC, infiltration, or harvest and use BMP: ☐ Yes ☒ No
  If yes, sum of Items 2, 3, and 4 is greater than Item 1
- Combination of on-site retention BMPs for a portion of the LID DCV and volume-based biotreatment BMP that address all pollutants of concern for the remaining LID DCV: ☐ Yes ☒ No
  If yes, a) sum of Items 2, 3, 4, and 5 is greater than Item 1, and Items 2, 3 and 4 are maximized; or b) Item 6 is greater than Form 4.3--5 Item 6 and Items 2, 3 and 4 are maximized
- On-site retention and infiltration is determined to be infeasible and biotreatment BMP provide biotreatment for all pollutants of concern for full LID DCV: ☒ Yes ☐ No
  If yes, Form 4.3-1 Items 7 and 8 were both checked yes

8 If the LID DCV is not achieved by any of these means, then the project may be allowed to develop an alternative compliance plan. Check box that describes the scenario which caused the need for alternative compliance:

- Combination of HSC, retention and infiltration, harvest and use, and biotreatment BMPs provide less than full LID DCV capture: ☐
  *Checked yes for Form 4.3-5 Item 7, Item 6 is zero, and sum of Items 2, 3, 4, and 5 is less than Item 1. If so, apply water quality credits and calculate volume for alternative compliance, V_{alt} = (Item 1 – Item 2 – Item 3 – Item 4 – Item 5) * (100 - Form 2.4-1 Item 2)%*
- An approved Watershed Action Plan (WAP) demonstrates that water quality and hydrologic impacts of urbanization are more effective when managed in at an off-site facility: ☐
  Attach appropriate WAP section, including technical documentation, showing effectiveness comparisons for the project site and regional watershed

Form 4.3-10 Conformance Summary and Alternative Compliance Volume Estimate (DA 1 DMA B)

1 Total LID DCV for the Project DA-1 (ft^3): 136,493

Copy Item 7 in Form 4.2-1

2 On-site retention with site design hydrologic source control LID BMP (ft^3): 0

Copy Item 30 in Form 4.3-2

3 On-site retention with LID infiltration BMP (ft^3): 0

Copy Item 16 in Form 4.3-3

4 On-site retention with LID harvest and use BMP (ft^3): 0

Copy Item 9 in Form 4.3-4

5 On-site biotreatment with volume based biotreatment BMP (ft^3): 136,657

Copy Item 3 in Form 4.3-5

6 Flow capacity provided by flow based biotreatment BMP (cfs): 0

Copy Item 6 in Form 4.3-5

7 LID BMP performance criteria are achieved if answer to any of the following is "Yes":

- Full retention of LID DCV with site design HSC, infiltration, or harvest and use BMP: ☐ Yes ☒ No
  If yes, sum of Items 2, 3, and 4 is greater than Item 1
- Combination of on-site retention BMPs for a portion of the LID DCV and volume-based biotreatment BMP that address all pollutants of concern for the remaining LID DCV: ☐ Yes ☒ No
  If yes, a) sum of Items 2, 3, 4, and 5 is greater than Item 1, and Items 2, 3 and 4 are maximized; or b) Item 6 is greater than Form 4.3--5 Item 6 and Items 2, 3 and 4 are maximized
- On-site retention and infiltration is determined to be infeasible and biotreatment BMP provide biotreatment for all pollutants of concern for full LID DCV: ☒ Yes ☐ No
  If yes, Form 4.3-1 Items 7 and 8 were both checked yes

8 If the LID DCV is not achieved by any of these means, then the project may be allowed to develop an alternative compliance plan. Check box that describes the scenario which caused the need for alternative compliance:

- Combination of HSC, retention and infiltration, harvest and use, and biotreatment BMPs provide less than full LID DCV capture: ☐
  *Checked yes for Form 4.3-5 Item 7, Item 6 is zero, and sum of Items 2, 3, 4, and 5 is less than Item 1. If so, apply water quality credits and calculate volume for alternative compliance, V_{alt} = (Item 1 – Item 2 – Item 3 – Item 4 – Item 5) * (100 - Form 2.4-1 Item 2)%*
- An approved Watershed Action Plan (WAP) demonstrates that water quality and hydrologic impacts of urbanization are more effective when managed in at an off-site facility: ☐
  Attach appropriate WAP section, including technical documentation, showing effectiveness comparisons for the project site and regional watershed

Form 4.3-10 Conformance Summary and Alternative Compliance Volume Estimate (DA 2)

1 Total LID DCV for the Project DA-1 (ft^3): 28,887

Copy Item 7 in Form 4.2-1

2 On-site retention with site design hydrologic source control LID BMP (ft^3): 0

Copy Item 30 in Form 4.3-2

3 On-site retention with LID infiltration BMP (ft^3): 0

Copy Item 16 in Form 4.3-3

4 On-site retention with LID harvest and use BMP (ft^3): 0

Copy Item 9 in Form 4.3-4

5 On-site biotreatment with volume based biotreatment BMP (ft^3): 28,945

Copy Item 3 in Form 4.3-5

6 Flow capacity provided by flow based biotreatment BMP (cfs): 0

Copy Item 6 in Form 4.3-5

7 LID BMP performance criteria are achieved if answer to any of the following is "Yes":

- Full retention of LID DCV with site design HSC, infiltration, or harvest and use BMP: ☐ Yes ☒ No
  If yes, sum of Items 2, 3, and 4 is greater than Item 1
- Combination of on-site retention BMPs for a portion of the LID DCV and volume-based biotreatment BMP that address all pollutants of concern for the remaining LID DCV: ☐ Yes ☒ No
  If yes, a) sum of Items 2, 3, 4, and 5 is greater than Item 1, and Items 2, 3 and 4 are maximized; or b) Item 6 is greater than Form 4.3--5 Item 6 and Items 2, 3 and 4 are maximized
- On-site retention and infiltration is determined to be infeasible and biotreatment BMP provide biotreatment for all pollutants of concern for full LID DCV: ☒ Yes ☐ No
  If yes, Form 4.3-1 Items 7 and 8 were both checked yes

8 If the LID DCV is not achieved by any of these means, then the project may be allowed to develop an alternative compliance plan. Check box that describes the scenario which caused the need for alternative compliance:

Copy Item 16 in Form 4.3-3

4 On-site retention with LID harvest and use BMP (ft^3): 0

Copy Item 9 in Form 4.3-4

5 On-site biotreatment with volume based biotreatment BMP (ft^3): 25,280

Copy Item 3 in Form 4.3-5

6 Flow capacity provided by flow based biotreatment BMP (cfs): 0

Copy Item 6 in Form 4.3-5

7 LID BMP performance criteria are achieved if answer to any of the following is "Yes":

- Full retention of LID DCV with site design HSC, infiltration, or harvest and use BMP: ☐ Yes ☒ No
  If yes, sum of Items 2, 3, and 4 is greater than Item 1
- Combination of on-site retention BMPs for a portion of the LID DCV and volume-based biotreatment BMP that address all pollutants of concern for the remaining LID DCV: ☐ Yes ☒ No
  If yes, a) sum of Items 2, 3, 4, and 5 is greater than Item 1, and Items 2, 3 and 4 are maximized; or b) Item 6 is greater than Form 4.3--5 Item 6 and Items 2, 3 and 4 are maximized
- On-site retention and infiltration is determined to be infeasible and biotreatment BMP provide biotreatment for all pollutants of concern for full LID DCV: ☒ Yes ☐ No
  If yes, Form 4.3-1 Items 7 and 8 were both checked yes

8 If the LID DCV is not achieved by any of these means, then the project may be allowed to develop an alternative compliance plan. Check box that describes the scenario which caused the need for alternative compliance:

- Combination of HSC, retention and infiltration, harvest and use, and biotreatment BMPs provide less than full LID DCV capture: ☐
  *Checked yes for Form 4.3-5 Item 7, Item 6 is zero, and sum of Items 2, 3, 4, and 5 is less than Item 1. If so, apply water quality credits and calculate volume for alternative compliance, V_{alt} = (Item 1 – Item 2 – Item 3 – Item 4 – Item 5) * (100 - Form 2.4-1 Item 2)%*
- An approved Watershed Action Plan (WAP) demonstrates that water quality and hydrologic impacts of urbanization are more effective when managed in at an off-site facility: ☐
  Attach appropriate WAP section, including technical documentation, showing effectiveness comparisons for the project site and regional watershed

4.3.6 Hydromodification Control BMP

Use Form 4.3-10 to compute the remaining runoff volume retention, after LID BMP are implemented, needed to address HCOC, and the increase in time of concentration and decrease in peak runoff necessary to meet targets for protection of waterbodies with a potential HCOC. Describe hydromodification control BMP that address HCOC, which may include off-site BMP and/or in-stream controls. Section 5.6 of the TGD for WQMP provides additional details on selection and evaluation of hydromodification control BMP.

Form 4.3-11 Hydromodification Control BMPs (DA 1)

1 Volume reduction needed for HCOC performance criteria (ft^3): 0 *(Form 4.2-2 Item 4 * 0.95) – Form 4.2-2 Item 1*	**2 On-site retention with site design hydrologic source control, infiltration, and harvest and use LID BMP (ft^3):** 0 *Sum of Form 4.3-9 Items 2, 3, and 4 Evaluate option to increase implementation of on-site retention in Forms 4.3-2, 4.3-3, and 4.3-4 in excess of LID DCV toward achieving HCOC volume reduction*
3 Remaining volume for HCOC volume capture (ft^3): 0 *Item 1 – Item 2*	**4 Volume capture provided by incorporating additional on-site or off-site retention BMPs (ft^3):** 0 *Existing downstream BMP may be used to demonstrate additional volume capture (if so, attach to this WQMP a hydrologic analysis showing how the additional volume would be retained during a 2-yr storm event for the regional watershed)*

5 If Item 4 is less than Item 3, incorporate in-stream controls on downstream waterbody segment to prevent impacts due to hydromodification ☐
Attach in-stream control BMP selection and evaluation to this WQMP

6 Is Form 4.2-2 Item 11 less than or equal to 5%: ☐ Yes ☐ No

If yes, HCOC performance criteria is achieved. If no, select one or more mitigation options below:

- Demonstrate increase in time of concentration achieved by proposed LID site design, LID BMP, and additional on-site or off-site retention BMP ☐
  BMP upstream of a waterbody segment with a potential HCOC may be used to demonstrate increased time of concentration through hydrograph attenuation (if so, show that the hydraulic residence time provided in BMP for a 2-year storm event is equal or greater than the addition time of concentration requirement in Form 4.2-4 Item 15)
- Increase time of concentration by preserving pre-developed flow path and/or increase travel time by reducing slope and increasing cross-sectional area and roughness for proposed on-site conveyance facilities ☐
- Incorporate appropriate in-stream controls for downstream waterbody segment to prevent impacts due to hydromodification, in a plan approved and signed by a licensed engineer in the State of California ☐

7 Form 4.2-2 Item 12 less than or equal to 5%: ☐ Yes ☐ No

If yes, HCOC performance criteria is achieved. If no, select one or more mitigation options below:

- Demonstrate reduction in peak runoff achieved by proposed LID site design, LID BMPs, and additional on-site or off-site retention BMPs ☐
  BMPs upstream of a waterbody segment with a potential HCOC may be used to demonstrate additional peak runoff reduction through hydrograph attenuation (if so, attach to this WQMP, a hydrograph analysis showing how the peak runoff would be reduced during a 2-yr storm event)
- Incorporate appropriate in-stream controls for downstream waterbody segment to prevent impacts due to hydromodification, in a plan approved and signed by a licensed engineer in the State of California ☐

4.4 Alternative Compliance Plan (if applicable)

Describe an alternative compliance plan (if applicable) for projects not fully able to infiltrate, harvest and use, or biotreat the DCV via on-site LID practices. A project proponent must develop an alternative compliance plan to address the remainder of the LID DCV. Depending on project type some projects may qualify for water quality credits that can be applied to reduce the DCV that must be treated prior to development of an alternative compliance plan (see Form 2.4-1, Water Quality Credits). Form 4.3-9 Item 8 includes instructions on how to apply water quality credits when computing the DCV that must be met through alternative compliance. Alternative compliance plans may include one or more of the following elements:

- On-site structural treatment control BMP - All treatment control BMP should be located as close to possible to the pollutant sources and should not be located within receiving waters;
- Off-site structural treatment control BMP - Pollutant removal should occur prior to discharge of runoff to receiving waters;
- Urban runoff fund or In-lieu program, if available

Depending upon the proposed alternative compliance plan, approval by the executive officer may or may not be required (see Section 6 of the TGD for WQMP).

Section 5 Inspection and Maintenance Responsibility for Post Construction BMP

All BMP included as part of the project WQMP are required to be maintained through regular scheduled inspection and maintenance (refer to Section 8, Post Construction BMP Requirements, in the TGD for WQMP). Fully complete Form 5-1 summarizing all BMP included in the WQMP. Attach additional forms as needed. The WQMP shall also include a detailed Operation and Maintenance Plan for all BMP and may require a Maintenance Agreement (consult the jurisdiction's LIP). If a Maintenance Agreement is required, it must also be attached to the WQMP.

Form 5-1 BMP Inspection and Maintenance

BMP	Responsible Party(ies)	Inspection/Maintenance Activities Required	Minimum Frequency of Activities
Underground Detention Chambers	Owner	The isolator row shall be inspected for debris and sediment accumulations and maintained by a qualified technician and he/she will properly dispose of all wastes and inspect for standing water. A manhole is installed in order to inspect and maintain the inlet row. All entry into the chamber system must be done per OSHA codes to ensure operator and inspector safety. Inspection ports should be checked 48 hours after storm events to see that the water is draining down, at least once each rainy season, following a major storm event. Records shall be maintained by owner to document inspections.	The isolator row shall be inspected semi-annually (by October 1st and February 1st) and cleaned by water-flush and vacuum when solids accumulate to 3" depth. Maintenance to be conducted through service contract with the vendor or equally qualified contractor.
Hydrodynamic Separator	Owner	Visual inspection to quantify the accumulation of hydrocarbons, trash, and sediment in the system. Use vacuum truck to clean and remove pollutants from the system upon reaching 75% capacity. Clean area outside of the screen if pollutant build-up exists.	Visually inspect twice a year (spring and fall) or as frequently as needed. Vacuum frequency as determined by inspection.
Drain Inserts	Owner	Visually inspect for defects and illegal dumping. Notify proper authorities if illegal dumping has occurred. Using an industrial vacuum, the collected materials shall be removed from the filter basket and disposed of properly. Inspect biosorb hydrocarbon boom and replace as necessary.	Two times per year (May and September) or following any rain event that would potentially accumulate a large amount of debris in the system. Replace boom twice per year, at a minimum.
Proprietary Biofiltration Unit	Owner	Remove trash from Screening Device, sediment from Separation Chamber and replace cartridge Filter Media, and Drain Down Filter Media. The owner should keep maintenance/inspection record(s) for a minimum of five years from the date of maintenance. These records should be made available to the governing municipality for inspection upon request at any time. Transport all debris, trash, organics and sediments to approved facility for disposal in accordance with local and state requirements.	Average maintenance interval of 6 to 12 months for removing trash from Screening Device. Average interval of 12 to 24 months for removing sediment, replacing Cartridge Filter Media, replacing Drain Down Filter Media and trimming vegetation.

Form 5-1 BMP Inspection and Maintenance

Storm Drain Stenciled Message	Owner	Visually inspect for legibility and replace or repaint as necessary.	Annually (September)
N1: Education of Property Owners, Tenants and Occupants on Stormwater BMPs	Owner	Property owner will familiarize him/herself with the educational materials in Attachment "E" and the contents of the WQMP.	Annually (January) for all employees and within 2 months for new hires.
N2: Activity Restrictions	Owner	Activities are restricted to only those for which a BMP has been implemented. The owner shall develop ongoing activity restrictions that include those that have the potential to create adverse impacts on water quality. Activities include, but are not limited to: handling and disposal of contaminants, fertilizer and pesticide application restrictions, litter control and pick-up, and vehicle or equipment repair as well as any other activities that may potentially contribute to water pollution.	Ongoing
N3: Landscape Management BMPs	Owner	Irrigation must be consistent with City's Water Conservation Ordinance. Fertilizer and pesticide usage will be consistent with County Management Guidelines for Use of Fertilizers and Pesticides.	Ongoing
N4: BMP Maintenance	Owner	BMP maintenance, implementation schedules, and responsible parties are included with each specific BMP narrative.	As described in each BMP listed within this form.
N7: Spill Contingency Plan	Owner	Owner/tenant will have a spill contingency plan, a separate document, based on specific site needs.	Ongoing
N10: Uniform Fire Code Implementation	Owner	If applicable, owner will comply with Article 80 of the Uniform Fire Code enforced by the fire protection agency. The facility operators will be educated annually regarding requirements for handling, storage and proper disposal of hazardous substances.	Ongoing
N11: Litter/Debris Control Program	Owner	Contract with their landscape maintenance firm to provide this service during regularly schedule maintenance. They are required to implement trash management and litter control procedures in the common areas aimed at reducing pollution of drainage water.	Weekly
N12: Employee Training	Owner	The owner will ensure that tenants are also familiar with onsite BMPs and necessary maintenance required of the tenants. Owner will check with City and County at least once a year to obtain new or updated educational materials and provide these materials to tenants. Employees shall be trained to clean up spills and participate in ongoing maintenance. The WQMP requires annual employee training and new hires within 2 months.	Annually (January) for all employees and within 2 months for new hires.

Form 5-1 BMP Inspection and Maintenance			
N13: Housekeeping of Loading Docks	Owner	Keep all fluids indoors. Clean up spills immediately and keep spills from entering storm drain system. No direct discharges into the storm drain system. Area shall be inspected weekly for proper containment and practices with spills cleaned up immediately and disposed of properly.	Ongoing
N14: Catch Basin Inspection Program	Owner	Monthly inspection by property owner's designee. Inspection consists of immediate repair of any deterioration of the structures and maintenance of drain inserts before and after major rain events. Drain insert maintenance shall be per manufacturer's guidelines.	Monthly inspection and maintain as necessary.
N15: Vacuum Sweeping of Private Streets and Parking Lots	Owner	All landscape maintenance contractors will be required to sweep up all landscape cuttings, mowings and fertilizer materials off paved areas weekly and dispose of properly. Parking areas and drive ways will be swept monthly by sweeping contractor.	Monthly
N17: Comply with all other applicable NPDES permits	Owner	Will comply with Construction General Permit and Industrial General Permit (may apply for No Exposure Certification/NEC).	Ongoing
S1: Provide storm drain system stenciling and signage (CASQA New Development BMP Handbook SD-13)	Owner	"No Dumping – Drains to River" stencils will be applied. Legibility of stencil will be maintained on a yearly basis.	Annually (January)
S3: Design and construct trash and waste storage areas to reduce pollution introduction (CASQA New Development BMP Handbook SD-32)	Owner	Paved with an impervious surface, designed not to allow run-on from adjoining areas, designed to divert drainage from adjoining roofs and pavements diverted around the area, screened or walled to prevent off-site transport of trash. Detail to be provided once available.	Ongoing
S4: Use efficient irrigation systems & landscape design, water conservation, smart controllers, and source control (Statewide Model Landscape Ordinance; CASQA New Development BMP Handbook SD-12)	Owner	Irrigation systems shall include reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines. Timers will be used to avoid over watering and watering cycles and duration shall be adjusted seasonally by the landscape maintenance contractor. The landscaping areas will be grouped with plants that have similar water requirements. Native or drought tolerant species shall also be used where appropriate to reduce excess irrigation runoff and promote surface filtration.	Adjust watering cycles and duration seasonally / quarterly (Oct, Jan, Apr, and Jul).

Section 6 WQMP Attachments

6.1 Site Plan and Drainage Plan

Include a site plan and drainage plan sheet set containing the following minimum information:

- Project location
- Site boundary
- Land uses and land covers, as applicable
- Suitability/feasibility constraints
- Structural Source Control BMP locations
- Site Design Hydrologic Source Control BMP locations
- LID BMP details
- Drainage delineations and flow information
- Drainage connections

See Attachment C for Site and Drainage Plan.

6.2 Electronic Data Submittal

Minimum requirements include submittal of PDF exhibits in addition to hard copies. Format must not require specialized software to open. If the local jurisdiction requires specialized electronic document formats (consult the LIP), this section will describe the contents (e.g., layering, nomenclature, geo-referencing, etc.) of these documents so that they may be interpreted efficiently and accurately.

6.3 Post Construction

Attach all O&M Plans and Memorandum of Agreement for BMP to the WQMP (Attachment D).

6.4 Other Supporting Documentation

- BMP Educational Materials (Attachment E)
- Soil/Infiltration Report (Attachment F) (NA)
- BMP Maintenance Material (Attachment G)
- Conditions of Approval (Attachment H)
- Class V Injection Well Registration (Attachment I)
- Activity Restrictions (Attachment J)
- Phase I ESA (Attachment K)

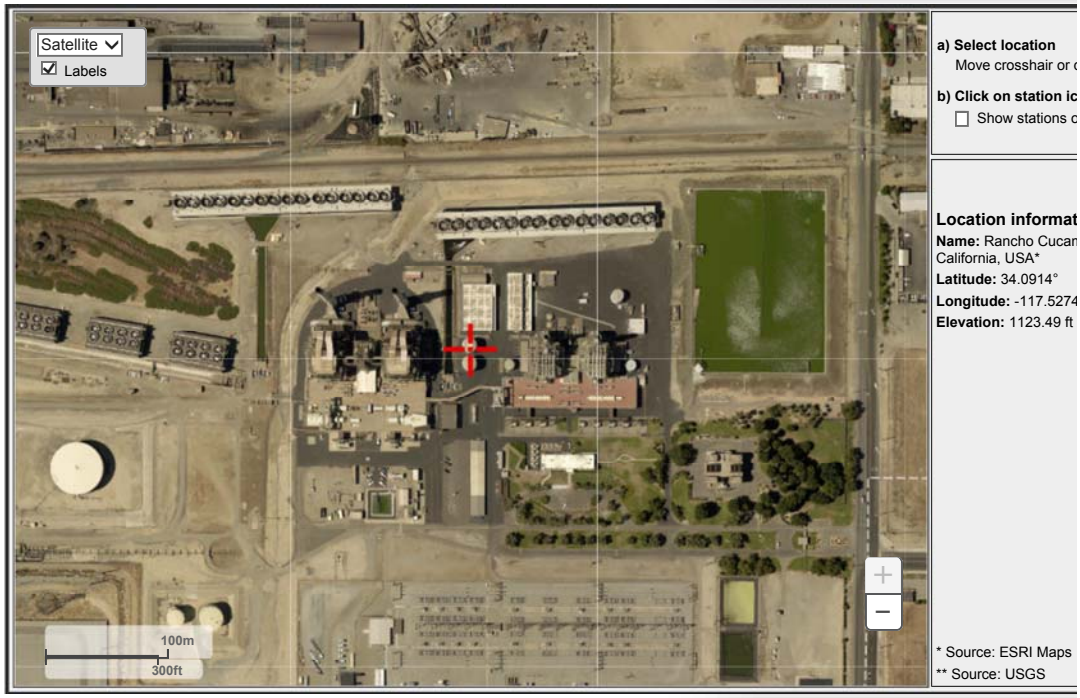
NOAA ATLAS 14 POINT PRECIPITATION FREQUENCY ESTIMATES: CA

Data description

Data type: Precipitation depth | **Units:** English | **Time series type:** Partial duration

Select location



1) Manually:

a) By location (decimal degrees, use "-" for S and W): Latitude: 34.091404 Longitude: -117.52738 Submit

b) By station (list of CA stations): Select station

c) By address Search

2) Use map (if ESRI interactive map is not loading, try adding the host: **https://js.arcgis.com/** to the firewall, or contact us at hdsc.questions@noaa.gov):

POINT PRECIPITATION FREQUENCY (PF) ESTIMATES

WITH 90% CONFIDENCE INTERVALS AND SUPPLEMENTARY INFORMATION

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration a recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitatic estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

Total DCV = 104,207 cu-ft + 10,148 cu-ft = 114,355 cu-ft

WetlandMOD VOLUME BASED SIZING SHEET

Horizontal Flow Biofiltration System

Project Location

Project Name	Etiwanda Distribution Center (DA 1 DMA A)
City/Town	Rancho Cucamonga
State	California
Zip Code	91739

SIZING CALCULATIONS	**Inputs**	**Units**	**Notes/References**
Impervious Area			
BMP Drainage Area (not required - manual entry - not part of formula)	23.1	**Acres**	This includes all areas that will contribute runoff to the proposed BMP, including pervious areas, impervious areas, and off-site areas, whether or not they are directly or indirectly connected to the BMP.
Watershed Impervious Ratio (not required - manual entry - not part of formula)			Watershed Imperviousness Ratio", is equal to the percent of total impervious area in the "BMP Drainage Area" divided by 100
Runoff Coefficient "C" (not required - manual entry - not part of formula)			
Water Quality Volume (required)	114355	cubic feet	Use sizing procedures provided by state or local agencies to determine the appropriate Water Quality Volume. Intensities and design storms vary widely by region and method.
Design Storm Duration	3	hours	Varies depending on geographical region. Set at 0 for pump system set up. LA County 3 hours. Call for details.
MWS - Linear Sizing			
MWS - Linear Model Number (from matrix)	MWS-L-10-20	quantity	Please choose size from "Model Size Matrix" Tab
# Of Units	4	quantity	Select the number of systems required to treat the water quality volume. Will very depending on drain down time regulaitons.
Discharge Rate (from matrix)	78.50	gallons/minute	Rate of 0.26 gpm/sq ft or 25 in/hr. Field Verified.
Volume Treated During Event			
Processed through MWS - Linear	7535.9	cubic feet	**314.00 gals/minute**
Volume Treated Following Event			
MWS - Linear Static Capacity (from matrix)	349	cubic feet	
Volume Needed in *Pre-Storage*	106470	cubic feet	Set at zero to start. Size pre-storage system to hold this volume
			Sizing complete when eqaul to value of zero.
TOTAL STORMWATER TREATED	114355	cubic feet	Note: This amount should be equal to the "Water Quality Volume"
Drain Down Time	42.52	hours	Drain down time must be equal to or less than requirement of local juristiction. Default 48 hours.

Feel free to fax or email proposed sizing calculations to Modular Wetlands Systems, Inc. for assistance with sizing, compliance, and design.

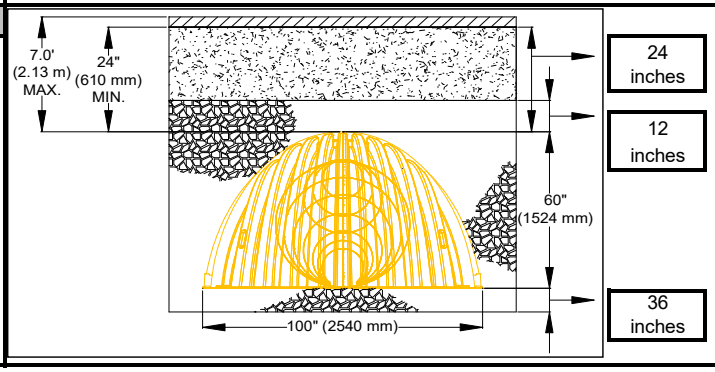
StormTech RPM:	

System Requirements



Units		Imperial	
Required Storage Volume		106470	CF
Stone Porosity (Industry Standard = 40%)		40	%
Stone Above Chambers	(12 inch min.)	12	inches
Stone Foundation Depth	(9 inch min.)	36	inches
Average Cover over Chambers	(24 inch min.)	24	inches
Bed size controlled by WIDTH or LENGTH?		WIDTH	
Limiting WIDTH or LENGTH dimension		70	feet
Storage Volume per Chamber		195.5	CF
Storage Volume per End Cap		137.7	CF

System Sizing

Number of Chambers Required	535	each
Number of End Caps Required	14	each
Bed Size (including perimeter stone)	20,335	square feet
Stone Required (including perimeter stone)	6591	tons
Volume of Excavation	7532	cubic yards
Non-woven Filter Fabric Required (20% Safety Factor)	6339	square yards
Length of Isolator Row	317.0	feet
Woven Isolator Row Fabric (20% Safety Factor)	871	square yards
Installed Storage Volume	106,520	cubic feet

Controlled by Width (Rows)

Maximum Width =	70	feet
3 rows of 77 chambers		
4 row of 76 chambers		
Maximum Length =	317.0	feet
Maximum Width =	64.8	feet

DA 1 DMA B– STORMTECH CHAMBERS & MODULAR WETLANDS "B"

Project Location

Project Name	Etiwanda Distribution Center (DA 2 DMA A)
City/Town	Rancho Cucamonga
State	California
Zip Code	91739

SIZING CALCULATIONS	**Inputs**	**Units**	**Notes/References**
Impervious Area			
BMP Drainage Area (not required - manual entry - not part of formula)	6.45	**Acres**	This includes all areas that will contribute runoff to the proposed BMP, including pervious areas, impervious areas, and off-site areas, whether or not they are directly or indirectly connected to the BMP.
Watershed Impervious Ratio (not required - manual entry - not part of formula)			Watershed Imperviousness Ratio", is equal to the percent of total impervious area in the "BMP Drainage Area" divided by 100
Runoff Coefficient "C" (not required - manual entry - not part of formula)			
Water Quality Volume (required)	28887	cubic feet	Use sizing procedures provided by state or local agencies to determine the appropriate Water Quality Volume. Intensities and design storms vary widely by region and method.
Design Storm Duration	3	hours	Varies depending on geographical region. Set at 0 for pump system set up. LA County 3 hours. Call for details.
MWS - Linear Sizing			
MWS - Linear Model Number (from matrix)	MWS-L-10-20	quantity	Please choose size from "Model Size Matrix" Tab
# Of Units	1	quantity	Select the number of systems required to treat the water quality volume. Will very depending on drain down time regulaitons.
Discharge Rate (from matrix)	78.50	gallons/minute	Rate of 0.26 gpm/sq ft or 25 in/hr. Field Verified.
Volume Treated During Event			
Processed through MWS - Linear	1884.0	cubic feet	**78.50 gals/minute**
Volume Treated Following Event			
MWS - Linear Static Capacity (from matrix)	349	cubic feet	
Volume Needed in *Pre-Storage*	26654	cubic feet	Set at zero to start. Size pre-storage system to hold this volume
			Sizing complete when eqaul to value of zero.
TOTAL STORMWATER TREATED	28887	cubic feet	Note: This amount should be equal to the "Water Quality Volume"
Drain Down Time	43.00	hours	Drain down time must be equal to or less than requirement of local juristiction. Default 48 hours.

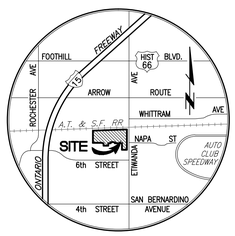
FOR

8996 ETIWANDA AVENUE
RANCHO CUCAMONGA, CA

NTS

Form 5-1 BMP Inspection and Maintenance

BMP	Responsible Party(ies)	Inspection/Maintenance Activities Required	Minimum Frequency of Activities
Underground Detention Systems	Owner	The isolator row shall be inspected for debris and sediment accumulations and maintained by a qualified technician and he/she will properly dispose of all wastes and inspect for standing water. A manhole is installed in order to inspect and maintain the inlet row. All entry into the chamber system must be done per OSHA codes to ensure operator and inspector safety. Inspection ports should be checked 48 hours after storm events to see that the water is draining down, at least once each rainy season, following a major storm event. Records shall be maintained by owner to document inspections.	The isolator row shall be inspected semi-annually (by October 1st and February 1st) and cleaned by water-flush and vacuum when solids accumulate to 3" depth. Maintenance to be conducted through service contract with the vendor or equally qualified contractor.
Hydrodynamic Separator	Owner	Visual inspection to quantify the accumulation of hydrocarbons, trash, and sediment in the system. Use vacuum truck to clean and remove pollutants from the system upon reaching 75% capacity. Clean area outside of the screen if pollutant build-up exists.	Visually inspect twice a year (spring and fall) or as frequently as needed. Vacuum frequency as determined by inspection.
Drain Inserts	Owner	Visually inspect for defects and illegal dumping. Notify proper authorities if illegal dumping has occurred. Using an industrial vacuum, the collected materials shall be removed from the filter basket and disposed of properly. Inspect biosorb hydrocarbon boom and replace as necessary.	Two times per year (May and September) or following any rain event that would potentially accumulate a large amount of debris in the system. Replace boom twice per year, at a minimum.
Proprietary Biofiltration Unit	Owner	Remove trash from Screening Device, sediment from Separation Chamber and replace cartridge Filter Media, and Drain Down Filter Media. The owner should keep maintenance/inspection record(s) for a minimum of five years from the date of maintenance. These records should be made available to the governing municipality for inspection upon request at any time. Transport all debris, trash, organics and sediments to approved facility for disposal in accordance with local and state requirements.	Average maintenance interval of 6 to 12 months for removing trash from Screening Device. Average interval of 12 to 24 months for removing sediment, replacing Cartridge Filter Media, replacing Drain Down Filter Media and trimming vegetation.
Storm Drain Stenciled Message	Owner	Visually inspect for legibility and replace or repaint as necessary.	Annually (September)
N1: Education of Property Owners, Tenants and Occupants on Stormwater BMPs	Owner	Property owner will familiarize him/herself with the educational materials in Attachment "E" and the contents of the WQMP.	Annually (January) for all employees and within 2 months for new hires.
N2: Activity Restrictions	Owner	Activities are restricted to only those for which a BMP has been implemented. The owner shall develop ongoing activity restrictions that include those that have the potential to create adverse impacts on water quality. Activities include, but are not limited to: handling and disposal of contaminants, fertilizer and pesticide application restrictions, litter control and pick-up, and vehicle or equipment repair as well as any other activities that may potentially contribute to water pollution.	Ongoing
N3: Landscape Management BMPs	Owner	Irrigation must be consistent with City's Water Conservation Ordinance. Fertilizer and pesticide usage will be consistent with County Management Guidelines for Use of Fertilizers and Pesticides.	Ongoing
N4: BMP Maintenance	Owner	BMP maintenance, implementation schedules, and responsible parties are included with each specific BMP narrative.	As described in each BMP listed within this form.
N7: Spill Contingency Plan	Owner	Owner/tenant will have a spill contingency plan, a separate document, based on specific site needs.	Ongoing
N10: Uniform Fire Code Implementation	Owner	If applicable, owner will comply with Article 80 of the Uniform Fire Code enforced by the fire protection agency. The facility operators will be educated annually regarding requirements for handling, storage and proper disposal of hazardous substances.	Ongoing
N11: Litter/Debris Control Program	Owner	Contract with their landscape maintenance firm to provide this service during regularly schedule maintenance. They are required to implement trash management and litter control procedures in the common areas aimed at reducing pollution of drainage water.	Weekly



Form 5-1 BMP Inspection and Maintenance

BMP	Responsible Party(ies)	Inspection/Maintenance Activities Required	Minimum Frequency of Activities
N12: Employee Training	Owner	The owner will ensure that tenants are also familiar with onsite BMPs and necessary maintenance required of the tenants. Owner will check with City and County at least once a year to obtain new or updated educational materials and provide these materials to tenants. Employees shall be trained to clean up spills and participate in ongoing maintenance. The WQMP requires annual employee training and new hires within 2 months.	Annually (January) for all employees and within 2 months for new hires.
N13: Housekeeping of Loading Docks	Owner	Keep all fluids indoors. Clean up spills immediately and keep spills from entering storm drain system. No direct discharges into the storm drain system. Area shall be inspected weekly for proper containment and practices with spills cleaned up immediately and disposed of properly.	Ongoing
N14: Catch Basin Inspection Program	Owner	Monthly inspection by property owner's designee. Inspection consists of immediate repair of any deterioration of the structures and maintenance of drain inserts before and after major rain events. Drain insert maintenance shall be per manufacturer's guidelines.	Monthly inspection and maintain as necessary.
N15: Vacuum Sweeping of Private Streets and Parking Lots	Owner	All landscape maintenance contractors will be required to sweep up all landscape cuttings, mowings and fertilizer materials off paved areas weekly and dispose of properly. Parking areas and drive ways will be swept monthly by sweeping contractor.	Monthly
N17: Comply with all other applicable NPDES permits	Owner	Will comply with Construction General Permit and Industrial General Permit (may apply for No Exposure Certification/NEC).	Ongoing
S1: Provide storm drain system stenciling and signage (CASQA New Development BMP Handbook SD-13)	Owner	"No Dumping – Drains to River" stencils will be applied. Legibility of stencil will be maintained on a yearly basis.	Annually (January)
S3: Design and construct trash and waste storage areas to reduce pollution introduction (CASQA New Development BMP Handbook SD-32)	Owner	Paved with an impervious surface, designed not to allow run-on from adjoining areas, designed to divert drainage from adjoining roofs and pavements diverted around the area, screened or walled to prevent off-site transport of trash. Detail to be provided once available.	Ongoing
S4: Use efficient irrigation systems & landscape design, water conservation, smart controllers, and source control (Statewide Model Landscape Ordinance; CASQA New Development BMP Handbook SD-12)	Owner	Irrigation systems shall include reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines. Timers will be used to avoid over watering and watering cycles and duration shall be adjusted seasonally by the landscape maintenance contractor. The landscaping areas will be grouped with plants that have similar water requirements. Native or drought tolerant species shall also be used where appropriate to reduce excess irrigation runoff and promote surface filtration.	Adjust watering cycles and duration seasonally / quarterly (Oct, Jan, Apr, and Jul).

INSTALL ONE 4" ALUMINUM STORM DRAIN PLACARD, PAINTED BLUE WITH A 1/4" SQUARE MOUNTING HOLE (NO DUMPING DRAINS TO WATERWAY) FISH WITH WAVE (PROVIDED BY ENGINEERING SERVICES DEPARTMENT) ON CENTER OF CATCH BASIN BETWEEN SCORING LINE AND CURB LINE. STORM DRAIN PLACARD MUST BE INSTALLED WITH "NO DUMPING DRAINS TO WATERWAY" READING TOWARD THE STREET. MUST INSTALL PLACARD WITH A 1/4"x1" HAMMER SET RIVET (PROVIDED BY ENGINEERING SERVICES DEPARTMENT) AND MASONRY ADHESIVE.

CDS2025-5-C DESIGN NOTES

CDS2025-5-C RATED TREATMENT CAPACITY IS 1.6 CFS [45.3 L/s], OR PER LOCAL REGULATIONS. MAXIMUM HYDRAULIC INTERNAL BYPASS CAPACITY IS 14.0 CFS [396 L/s]. IF THE SITE CONDITIONS EXCEED 14.0 CFS [396 L/s], AN UPSTREAM BYPASS STRUCTURE IS REQUIRED.

THE STANDARD CDS2025-5-C CONFIGURATION IS SHOWN. ALTERNATE CONFIGURATIONS ARE AVAILABLE AND ARE LISTED BELOW. SOME CONFIGURATIONS MAY BE COMBINED TO SUIT SITE REQUIREMENTS.

CONFIGURATION DESCRIPTION

- GRATED INLET ONLY (NO INLET PIPE)
- GRATED INLET WITH INLET PIPE OR PIPES
- CURB INLET ONLY (NO INLET PIPE)
- CURB INLET WITH INLET PIPE OR PIPES
- SEPARATE OIL BAFFLE (SINGLE INLET PIPE REQUIRED FOR THIS CONFIGURATION)
- SEDIMENT WEIR FOR NJDEP / NJCAT CONFORMING UNITS

SITE SPECIFIC DATA REQUIREMENTS

STRUCTURE ID		
WATER QUALITY FLOW RATE (CFS OR L/s)		*
PEAK FLOW RATE (CFS OR L/s)		*
RETURN PERIOD OF PEAK FLOW (YRS)		*
SCREEN APERTURE (2400 OR 4700)		*

PIPE DATA:	I.E.	MATERIAL	DIAMETER
INLET PIPE 1	*	*	*
INLET PIPE 2	*	*	*
OUTLET PIPE	*	*	*

RIM ELEVATION	*

ANTI-FLOTATION BALLAST	WIDTH	HEIGHT

NOTES/SPECIAL REQUIREMENTS:

* PER ENGINEER OF RECORD

GENERAL NOTES
1. CONTECH TO PROVIDE ALL MATERIALS UNLESS NOTED OTHERWISE.
2. DIMENSIONS MARKED WITH ( ) ARE REFERENCE DIMENSIONS. ACTUAL DIMENSIONS MAY VARY.
3. FOR FABRICATION DRAWINGS WITH DETAILED STRUCTURE DIMENSIONS AND WEIGHTS, PLEASE CONTACT YOUR CONTECH ENGINEERED SOLUTIONS LLC REPRESENTATIVE. www.ContechES.com
4. CDS WATER QUALITY STRUCTURE SHALL BE IN ACCORDANCE WITH ALL DESIGN DATA AND INFORMATION CONTAINED IN THIS DRAWING.
5. STRUCTURE SHALL MEET AASHTO HS20 AND CASTINGS SHALL MEET HS20 (AASHTO M 306) LOAD RATING, ASSUMING GROUNDWATER ELEVATION AT, OR BELOW, THE OUTLET PIPE INVERT ELEVATION. ENGINEER OF RECORD TO CONFIRM ACTUAL GROUNDWATER ELEVATION.
6. PVC HYDRAULIC SHEAR PLATE IS PLACED ON SHELF AT BOTTOM OF SCREEN CYLINDER. REMOVE AND REPLACE AS NECESSARY DURING MAINTENANCE CLEANING.

INSTALLATION NOTES
A. ANY SUB-BASE, BACKFILL DEPTH, AND/OR ANTI-FLOTATION PROVISIONS ARE SITE-SPECIFIC DESIGN CONSIDERATIONS AND SHALL BE SPECIFIED BY ENGINEER OF RECORD.
B. CONTRACTOR TO PROVIDE EQUIPMENT WITH SUFFICIENT LIFTING AND REACH CAPACITY TO LIFT AND SET THE CDS MANHOLE STRUCTURE (LIFTING CLUTCHES PROVIDED).
C. CONTRACTOR TO ADD JOINT SEALANT BETWEEN ALL STRUCTURE SECTIONS, AND ASSEMBLE STRUCTURE.
D. CONTRACTOR TO PROVIDE, INSTALL, AND GROUT PIPES. MATCH PIPE INVERTS WITH ELEVATIONS SHOWN.
E. CONTRACTOR TO TAKE APPROPRIATE MEASURES TO ASSURE UNIT IS WATER TIGHT, HOLDING WATER TO FLOWLINE INVERT MINIMUM. IT IS SUGGESTED THAT ALL JOINTS BELOW PIPE INVERTS ARE GROUTED.

3. FOR FABRICATION DRAWINGS WITH DETAILED STRUCTURE DIMENSIONS AND WEIGHTS, PLEASE CONTACT YOUR CONTECH ENGINEERED SOLUTIONS LLC REPRESENTATIVE. www.ContechES.com
4. CDS WATER QUALITY STRUCTURE SHALL BE IN ACCORDANCE WITH ALL DESIGN DATA AND INFORMATION CONTAINED IN THIS DRAWING.
5. STRUCTURE SHALL MEET AASHTO HS20 AND CASTINGS SHALL MEET HS20 (AASHTO M 306) LOAD RATING, ASSUMING GROUNDWATER ELEVATION AT, OR BELOW, THE OUTLET PIPE INVERT ELEVATION. ENGINEER OF RECORD TO CONFIRM ACTUAL GROUNDWATER ELEVATION.
6. PVC HYDRAULIC SHEAR PLATE IS PLACED ON SHELF AT BOTTOM OF SCREEN CYLINDER. REMOVE AND REPLACE AS NECESSARY DURING MAINTENANCE CLEANING.

INSTALLATION NOTES
A. ANY SUB-BASE, BACKFILL DEPTH, AND/OR ANTI-FLOTATION PROVISIONS ARE SITE-SPECIFIC DESIGN CONSIDERATIONS AND SHALL BE SPECIFIED BY ENGINEER OF RECORD.
B. CONTRACTOR TO PROVIDE EQUIPMENT WITH SUFFICIENT LIFTING AND REACH CAPACITY TO LIFT AND SET THE CDS MANHOLE STRUCTURE (LIFTING CLUTCHES PROVIDED).
C. CONTRACTOR TO ADD JOINT SEALANT BETWEEN ALL STRUCTURE SECTIONS, AND ASSEMBLE STRUCTURE.
D. CONTRACTOR TO PROVIDE, INSTALL, AND GROUT PIPES. MATCH PIPE INVERTS WITH ELEVATIONS SHOWN.
E. CONTRACTOR TO TAKE APPROPRIATE MEASURES TO ASSURE UNIT IS WATER TIGHT, HOLDING WATER TO FLOWLINE INVERT MINIMUM. IT IS SUGGESTED THAT ALL JOINTS BELOW PIPE INVERTS ARE GROUTED.

CDS5640-10-C DESIGN NOTES

CDS5640-10-C RATED TREATMENT CAPACITY IS 5.0 CFS [254.9 L/s], OR PER LOCAL REGULATIONS. MAXIMUM HYDRAULIC INTERNAL BYPASS CAPACITY IS 50.0 CFS [1416 L/s]. IF THE SITE CONDITIONS EXCEED 50.0 CFS [1416 L/s], AN UPSTREAM BYPASS STRUCTURE IS REQUIRED.

THE STANDARD CDS5640-10-C CONFIGURATION IS SHOWN. ALTERNATE CONFIGURATIONS ARE AVAILABLE AND ARE LISTED BELOW. SOME CONFIGURATIONS MAY BE COMBINED TO SUIT SITE REQUIREMENTS.

CONFIGURATION DESCRIPTION

- GRATED INLET ONLY (NO INLET PIPE)
- GRATED INLET WITH INLET PIPE OR PIPES
- CURB INLET ONLY (NO INLET PIPE)
- CURB INLET WITH INLET PIPE OR PIPES
- SEPARATE OIL BAFFLE (SINGLE INLET PIPE REQUIRED FOR THIS CONFIGURATION)
- SEDIMENT WEIR FOR NJDEP / NJCAT CONFORMING UNITS

SITE SPECIFIC DATA REQUIREMENTS

STRUCTURE ID		
WATER QUALITY FLOW RATE (CFS OR L/s)		*
PEAK FLOW RATE (CFS OR L/s)		*

MC-4500 CHAMBER

Designed to meet the most stringent industry performance standards for superior structural integrity while providing designers with a cost-effective method to save valuable land and protect water resources. The StormTech system is designed primarily to be used under parking lots, thus maximizing land usage for private (commercial) and public applications. StormTech chambers can also be used in conjunction with Green Infrastructure, thus enhancing the performance and extending the service life of these practices.

STORMTECH MC-4500 CHAMBER
(not to scale)

Nominal Chamber Specifications

Size (L x W x H)
52" x 100" x 60"
1,321 mm x 2,540 mm x 1,524 mm

Chamber Storage
106.5 ft³ (3.01 m³)

Min. Installed Storage*
162.6 ft³ (4.60 m³)

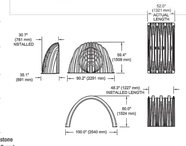
Weight
120 lbs (54.4 kg)

Shipping
7 chambers/pallet
11 pallets/truck

STORMTECH MC-4500 END CAP
(not to scale)

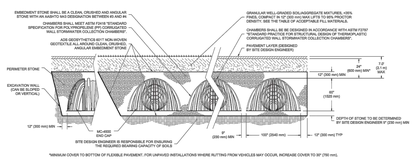
Nominal End Cap Specifications

Size (L x W x H)
35.1" x 90.2" x 59.4"
891 mm x 2,291 mm x 1,509 mm



End Cap Storage
35.7 ft³ (1.01 m³)

Min. Installed Storage*
108.7 ft³ (3.08 m³)



Weight
120 lbs (54.4 kg)

Shipping
7 end caps/pallet
11 pallets/truck

*Assumes a minimum of 12" (300 mm) of stone above, 9" (230 mm) of stone below chambers, 9" (230 mm) of stone between chambers/end caps and 40% stone porosity.

*Assumes a minimum of 12" (300 mm) of stone above, 9" (230 mm) of stone below, 9" (230 mm) of stone between chambers/end caps and 40% stone porosity.

StormTech | ADS

MC-4500 CHAMBER SPECIFICATIONS

STORAGE VOLUME PER CHAMBER FT³ (M³)

	Bare Chamber Storage ft³ (m³)	Chamber and Stone Foundation Depth in. (mm)			
		9" (230 mm)	12" (300 mm)	15" (375 mm)	18" (450 mm)
MC-4500 Chamber	106.5 (3.02)	162.6 (4.60)	166.3 (4.71)	169.6 (4.81)	173.6 (4.91)
MC-4500 End Cap	35.7 (1.0)	108.7 (3.08)	111.9 (3.17)	115.2 (3.26)	118.4 (3.35)

Note: Assumes 9" (230 mm) row spacing, 40% stone porosity, 12" (300 mm) stone above and includes the bare chamber/end cap volume. End cap volume assumes 12" (300 mm) stone perimeter.

AMOUNT OF STONE PER CHAMBER

ENGLISH TONS (yds³)	Stone Foundation Depth			
	9"	12"	15"	18"
MC-4500 Chamber	7.4 (5.2)	7.5 (5.5)	8.3 (5.9)	8.8 (6.2)
MC-4500 End Cap	9.6 (6.8)	10.0 (7.1)	10.4 (7.4)	10.9 (7.7)
METRIC KILOGRAMS (m³)	230 mm	300 mm	375 mm	450 mm
MC-4500 Chamber	6,681 (4.6)	7,117 (4.2)	7,552 (4.5)	7,987 (4.7)
MC-4500 End Cap	8,691 (5.2)	9,073 (5.4)	9,460 (5.6)	9,845 (5.9)

Note: Assumes 12" (300 mm) of stone above and 9" (230 mm) row spacing and 12" (300 mm) of perimeter stone in front of end caps.

VOLUME EXCAVATION PER CHAMBER YD³ (M³)

	Stone Foundation Depth			
	9" (230 mm)	12" (300 mm)	15" (375mm)	18" (450 mm)
MC-4500 Chamber	10.5 (8.0)	10.8 (8.3)	11.2 (8.5)	11.5 (8.8)
MC-4500 End Cap	9.3 (7.1)	9.6 (7.3)	9.9 (7.6)	10.2 (7.8)

Note: Assumes 9" (230 mm) of separation between chamber rows, 12" (300 mm) of perimeter in front of the end caps, and 24" (600 mm) of cover. The volume of excavation will varyas depth of cover increases.

INSTALLATION NOTES

1. CONTRACTOR TO PROVIDE ALL LABOR, EQUIPMENT, MATERIALS AND INCIDENTALS REQUIRED TO OFFLOAD AND INSTALL THE SYSTEM AND APPURTENANCES IN ACCORDANCE WITH THIS DRAWING AND THE MANUFACTURERS SPECIFICATIONS, UNLESS OTHERWISE STATED IN MANUFACTURERS CONTRACT.
2. UNIT MUST BE INSTALLED ON LEVEL BASE. MANUFACTURER RECOMMENDS A MINIMUM 6" LEVEL ROCK BASE UNLESS SPECIFIED BY THE PROJECT ENGINEER. CONTRACTOR IS RESPONSIBLE TO VERIFY PROJECT ENGINEERS RECOMMENDED BASE SPECIFICATIONS.
3. ALL PIPES MUST BE FLUSH WITH INSIDE SURFACE OF CONCRETE. (PIPES CANNOT INTRUDE BEYOND FLUSH). INVERT OF OUTFLOW PIPE MUST BE FLUSH WITH DISCHARGE CHAMBER FLOOR. ALL GAPS AROUND PIPES SHALL BE SEALED WATER TIGHT WITH A NON-SHRINK GROUT PER MANUFACTURERS STANDARD CONNECTION DETAIL AND SHALL MEET OR EXCEED REGIONAL PIPE CONNECTION STANDARDS.
4. CONTRACTOR TO SUPPLY AND INSTALL ALL EXTERNAL CONNECTING PIPES.
5. CONTRACTOR RESPONSIBLE FOR INSTALLATION OF ALL RISERS, MANHOLES, AND HATCHES. CONTRACTOR TO GROUT ALL MANHOLES AND HATCHES TO MATCH FINISHED SURFACE UNLESS SPECIFIED OTHERWISE.
6. DRIP OR SPRAY IRRIGATION REQUIRED ON ALL UNITS WITH VEGETATION.

GENERAL NOTES

1. MANUFACTURER TO PROVIDE ALL MATERIALS UNLESS OTHERWISE NOTED.
2. ALL DIMENSIONS, ELEVATIONS, SPECIFICATIONS AND CAPACITIES ARE SUBJECT TO CHANGE. FOR PROJECT SPECIFIC DRAWINGS DETAILING EXACT DIMENSIONS, WEIGHTS AND ACCESSORIES PLEASE CONTACT MANUFACTURER.

MEMORANDUM OF AGREEMENT OF STORM WATER QUALITY MANAGEMENT PLAN

The undersigned hereby enters into this Memorandum of Storm Water Quality Management Plan (the "Memorandum") on this _____ day of MONTH, 2022 with reference to the following:

A. The undersigned is the owner of certain real property located in the City of Rancho Cucamonga, County of San Bernardino, State of California legally described below and hereto referred to as "Exhibit A" (the "Real Property") and "Exhibit B" (Vicinity Map). Each exhibit is attached hereto and incorporated herein by this reference and also in the Water Quality Management Plan document, on file with the owner or its successors or assigns, and the City and hereinafter is referred to as "WQMP".

B. The undersigned is seeking certain permits and approvals from the City of Rancho Cucamonga ("City") for the development of the Real Property as follows: Precise Grading and Building Permit (the "Approvals").

C. In consideration of the City granting the Approvals, I the undersigned, agree to and accept the terms and conditions of the Storm Water Quality Management Plan (the "Plan") approved by the City's Engineering Services Department on MM/DD/2022, and bind the Real Property with the provisions of the Plan, which is on file with the City of Rancho Cucamonga's Engineering Services Department, File No. DRCXXXX-XXXXX, PGRXXXX-XXXXX, WQMPXXXX-XXXXX.

D. In consideration of the City granting the Approvals, the undersigned has agreed to and accepts the terms and conditions of the Plan as it relates to the Real Property and agrees that the Real Property shall be bound by and subject to the Plan.

E. The owner has chosen to install structures as required by Best Management Practices (BMPs) and to implement non-structural BMPs as described in Exhibit "C" (List of BMP Maintenance Items) and depicted in Exhibit "D" (BMP Site Map). The purpose of the WQMP is to minimize pollutants in urban runoff and to minimize other adverse impacts of urban runoff;

F. Said WQMP has been certified by the Owner and reviewed and approved by the City;

G. Said BMPs, with installation and/or implementation on private property and draining only private property, are part of a private facility with all implementation, maintenance or replacement, therefore, the sole responsibility of the Owner in accordance with the terms of this Agreement;

NOW, THEREFORE, it is hereby agreed by the undersigned as follows:

1. Owner hereby provides the City of Rancho Cucamonga's designee complete inspection access, of any duration, to the areas in which BMPs are applied and their immediate vicinity at any time, upon reasonable notice, or in the event of emergency, as determined by the City's Engineer, no advance notice, for the purpose of inspection, sampling, testing of device(s), and in case of emergency, to undertake all necessary repairs or other preventative measures at owner's expense as provided in paragraph 3 below. City shall make every effort at all times to minimize or avoid interference with Owner's use of the property.

2. The undersigned hereby agrees to the terms and conditions of the Plan, the provisions of which are incorporated by reference as though set out herein in full, and agrees that the Real Property shall be bound by and subject to the terms and conditions of the Plan, subject to minor modifications incorporated during construction, as approved by the City of Rancho Cucamonga Engineering Services Director.

3. The undersigned agrees to conduct the necessary routine maintenance of any structural devices designed into or installed as part of the storm water drainage system on the Real Property to reduce

pollutants in storm water runoff to the maximum extent practicable or to reestablish infiltration through the lifetime of the development which is the subject of Approvals.

4. The undersigned agrees to hold the City, its officials, officers, employees, volunteers, and agents free and harmless from any and all claims, demands, causes of action, costs, expenses, liability, loss, damage, or injury, in law or equity, to property or persons, arising from the imposition of the Plan by the City.

5. The agreements contained herein and the terms and conditions of the Plan are covenants intended to run with the land and shall burden the Real Property and shall be binding upon future owners of all or any portion of the Real Property. Upon a transfer of the Real Property, the transferor (including the undersigned) shall be relieved of any obligations under this Memorandum or the Plan arising from and after the effective date of the transfer.

6. The provisions of this Memorandum are intended to constitute equitable servitudes which shall encumber the Real Property and be binding upon future owners of the Real Property or any portion thereof.

7. The provisions of the Memorandum may be enforced by the City, which, among other remedies, shall have the remedy of injunctive relief and other equitable remedies.

8. This Memorandum shall not be amended, modified or terminated without the prior written consent of the City, which consent to be effective shall be contained in a document executed by the City and recorded against the Real Property.

Non-Stormwater Discharges SC-10

Description

Non-stormwater discharges (NSWDs) are flows that do not consist entirely of stormwater. Some non-stormwater discharges do not include pollutants and may be discharged to the storm drain if local regulations allow. These include uncontaminated groundwater and natural springs. There are also some non-stormwater discharges that typically do not contain pollutants and may be discharged to the storm drain with conditions. These include: potable water sources, fire hydrant flushing, air conditioner condensate, landscape irrigation drainage and landscape watering, emergency firefighting, etc. as discussed in Section 2.

However there are certain non-stormwater discharges that pose an environmental concern. These discharges may originate from illegal dumping of industrial material or wastes and illegal connections such as internal floor drains, appliances, industrial processes, sinks, and toilets that are illegally connected to the nearby storm drainage system through on-site drainage and piping. These unauthorized discharges (examples of which may include: process waste waters, cooling waters, wash waters, and sanitary wastewater) can carry substances such as paint, oil, fuel and other automotive fluids, chemicals and other pollutants into storm drains.

Non-stormwater discharges will need to be addressed through a combination of detection and elimination. The ultimate goal is to effectively eliminate unauthorized non-stormwater discharges to the stormwater drainage system through implementation of measures to detect, correct, and enforce against illicit connections and illegal discharges of

pollutants on streets and into the storm drain system and downstream water bodies.

Approach

Initially the Discharger must make an assessment of non-stormwater discharges to determine which types must be eliminated or addressed through BMPs. The focus of the following approach is the elimination of unauthorized non-stormwater discharges. See other BMP Fact Sheets for activity-specific pollution prevention procedures.

General Pollution Prevention Protocols

- Implement waste management controls described in SC-34 Waste Handling and Disposal.

- Develop clear protocols and lines of communication for effectively prohibiting non-stormwater discharges, especially those that are not classified as hazardous. These are often not responded to as effectively as they need to be.

- Stencil or demarcate storm drains, where applicable, to prevent illegal disposal of pollutants. Storm drain inlets should have messages such as "Dump No Waste Drains to Stream" or similar stenciled or demarcated next to them to warn against ignorant or unintentional dumping of pollutants into the storm drainage system.

- Manage and control sources of water such as hose bibs, faucets, wash racks, irrigation heads, etc. Identify hoses and faucets in the SWPPP, and post signage for appropriate use.

Non-Stormwater Discharge Investigation Protocols

Identifying the sources of non-stormwater discharges requires the Discharger to conduct an investigation of the facility at regular intervals. There are several categories of non-stormwater discharges:

- Visible, easily identifiable discharges, typically generated as surface runoff, such as uncontained surface runoff from vehicle or equipment washing; and

- Non-visible, (e.g., subsurface) discharges into the site drainage system through a variety of pathways that are not obvious.

The approach to detecting and eliminating non-stormwater discharges will vary considerably, as discussed below:

Visible and identifiable discharges

- Conduct routine inspections of the facilities and of each major activity area and identify visible evidence of unauthorized non-stormwater discharges. This may include:

  - ✓ Visual observations of actual discharges occurring;

- ✓ Evidence of surface staining, discoloring etc. that indicates that discharges have occurred;
- ✓ Pools of water in low lying areas when a rain event has not occurred; and
- ✓ Discussions with operations personnel to understand practices that may lead to unauthorized discharges.

- ☐ If evidence of non-stormwater discharges is discovered:
  - ✓ Document the location and circumstances using Worksheets 5 and 6 (Section 2 of the manual), including digital photos;
  - ✓ Identify and implement any quick remedy or corrective action (e.g., moving uncovered containers inside or to a proper location); and
  - ✓ Develop a plan to eliminate the discharge. Consult the appropriate activity-specific BMP Fact Sheet for alternative approaches to manage and eliminate the discharge.
- ☐ Consult the appropriate activity-specific BMP Fact Sheet for alternative approaches to manage and eliminate the discharge. Make sure the facility SWPPP is up-to-date and includes applicable BMPs to address the non-stormwater discharge.

Other Illegal Discharges (Non visible)

Illicit Connections

- ☐ Locate discharges from the industrial storm drainage system to the municipal storm drain system through review of "as-built" piping schematics.
- ☐ Isolate problem areas and plug illicit discharge points.
- ☐ Locate and evaluate discharges to the storm drain system.
- ☐ Visual Inspection and Inventory:
  - ✓ Inventory and inspect each discharge point during dry weather.
  - ✓ Keep in mind that drainage from a storm event can continue for a day or two following the end of a storm and groundwater may infiltrate the underground stormwater collection system.
  - ✓ Non-stormwater discharges are often intermittent and may require periodic inspections.

Review Infield Piping

- ☐ A review of the "as-built" piping schematic is a way to determine if there are any connections to the stormwater collection system.

- Inspect the path of loading/unloading area drain inlets and floor drains in older buildings.

- Never assume storm drains are connected to the sanitary sewer system.

Monitoring for investigation/detection of illegal discharges

- If a suspected illegal or unknown discharge is detected, monitoring of the discharge may help identify the content and/or suggest the source. This may be done with a field screening analysis, flow meter measurements, or by collecting a sample for laboratory analysis. Section 5 and Appendix D describe the necessary field equipment and procedures for field investigations.

- Investigative monitoring may be conducted over time. For example if, a discharge is intermittent, then monitoring might be conducted to determine the timing of the discharge to determine the source.

- Investigative monitoring may be conducted over a spatial area. For example, if a discharge is observed in a pipe, then monitoring might be conducted at accessible upstream locations in order to pinpoint the source of the discharge.

- Generally, investigative monitoring requiring collection of samples and submittal for lab analysis requires proper planning and specially trained staff.

Smoke Testing

Smoke testing of wastewater and stormwater collection systems is used to detect connections between the two piping systems. Smoke testing is generally performed at a downstream location and the smoke is forced upstream using blowers to create positive pressure. The advantage to smoke testing is that it can potentially identify multiple potential discharge sources at once.

- Smoke testing uses a harmless, non-toxic smoke cartridges developed specifically for this purpose.

- Smoke testing requires specialized equipment (e.g., cartridges, blowers) and is generally only appropriate for specially trained staff.

- A Standard Operating Procedure (SOP) for smoke testing is highly desirable. The SOP should address the following elements:

  - ✓ Proper planning and notification of nearby residents and emergency services is necessary since introducing smoke into the system may result in false alarms;

  - ✓ During dry weather, the stormwater collection system is filled with smoke and then traced back to sources;

- ✓ Temporary isolation of segments of pipe using sand bags is often needed to force the smoke into leaking pipes; and
- ✓ The appearance of smoke in a waste vent pipe, at a sewer manhole, or even the base of a toilet indicates that there may be a connection between the sanitary and storm water systems.

- Most municipal wastewater agencies will have necessary staff and equipment to conduct smoke testing and they should be contacted if cross connections with the sanitary sewer are suspected. See SC-44 Drainage System Maintenance for more information.

Dye Testing

- Dye testing is typically performed when there is a suspected specific pollutant source and location (i.e., leaking sanitary sewer) and there is evidence of dry weather flows in the stormwater collection system.
- Dye is released at a probable upstream source location, either the facility's sanitary or process wastewater system. The dye must be released with a sufficient volume of water to flush the system.
- Operators then visually examine the downstream discharge points from the stormwater collection system for the presence of the dye.
- Dye testing can be performed informally using commercially available products in order to conduct an initial investigation for fairly obvious cross-connections.
- More detailed dye testing should be performed by properly trained staff and follow SOPs. Specialized equipment such as fluorometers may be necessary to detect low concentrations of dye.
- Most municipal wastewater agencies will have necessary staff and equipment to conduct dye testing and they should be contacted if cross connections with the sanitary sewer are suspected.

TV Inspection of Drainage System

- Closed Circuit Television (CCTV) can be employed to visually identify illicit connections to the industrial storm drainage system. Two types of CCTV systems are available: (1) a small specially designed camera that can be manually pushed on a stiff cable through storm drains to observe the interior of the piping, or (2) a larger remote operated video camera on treads or wheels that can be guided through storm drains to view the interior of the pipe.
- CCTV systems often include a high-pressure water jet and camera on a flexible cable. The water jet cleans debris and biofilm off the inside of pipes so the camera can take video images of the pipe condition.

- CCTV units can detect large cracks and other defects such as offsets in pipe ends caused by root intrusions or shifting substrate.
- CCTV can also be used to detect dye introduced into the sanitary sewer.
- CCTV inspections require specialized equipment and properly trained staff and are generally best left to specialized contractors or municipal public works staff.

Illegal Dumping

- Substances illegally dumped on streets and into the storm drain systems and creeks may include paints, used oil and other automotive fluids, construction debris, chemicals, fresh concrete, leaves, grass clippings, and pet wastes. These wastes can cause stormwater and receiving water quality problems as well as clog the storm drain system itself.
- Establish a system for tracking incidents. The system should be designed to identify the following:
  - ✓ Illegal dumping hot spots;
  - ✓ Types and quantities (in some cases) of wastes;
  - ✓ Patterns in time of occurrence (time of day/night, month, or year);
  - ✓ Mode of dumping (abandoned containers, "midnight dumping" from moving vehicles, direct dumping of materials, accidents/spills);
  - ✓ An anonymous tip/reporting mechanism; and
  - ✓ Evidence of responsible parties (e.g., tagging, encampments, etc.).
- One of the keys to success of reducing or eliminating illegal dumping is increasing the number of people at the facility who are aware of the problem and who have the tools to at least identify the incident, if not correct it. Therefore, train field staff to recognize and report the incidents.

Once a site has been cleaned:

- Post "No Dumping" signs with a phone number for reporting dumping and disposal.
- Landscaping and beautification efforts of hot spots may also discourage future dumping, as well as provide open space and increase property values.
- Lighting or barriers may also be needed to discourage future dumping.
- See fact sheet SC-11 Spill Prevention, Control, and Cleanup.

Inspection

- Regularly inspect and clean up hot spots and other storm drainage areas where illegal dumping and disposal occurs.
- Conduct field investigations of the industrial storm drain system for potential sources of non-stormwater discharges.
- Pro-actively conduct investigations of high priority areas. Based on historical data, prioritize specific geographic areas and/or incident type for pro-active investigations.

Spill and Leak Prevention and Response

- On paved surfaces, clean up spills with as little water as possible. Use a rag for small spills, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to a certified laundry (rags) or disposed of as hazardous waste.
- Never hose down or bury dry material spills. Sweep up the material and dispose of properly.
- Use adsorbent materials on small spills rather than hosing down the spill. Remove the adsorbent materials promptly and dispose of properly.
- For larger spills, a private spill cleanup company or Hazmat team may be necessary.
- See SC-11 Spill Prevention Control and Cleanup.

Employee Training Program

- Training of technical staff in identifying and documenting illegal dumping incidents is required. The frequency of training must be presented in the SWPPP, and depends on site-specific industrial materials and activities.
- Consider posting a quick reference table near storm drains to reinforce training.
- Train employees to identify non-stormwater discharges and report discharges to the appropriate departments.
- Educate employees about spill prevention and cleanup.
- Well-trained employees can reduce human errors that lead to accidental releases or spills. The employee should have the tools and knowledge to immediately begin cleaning up a spill should one occur. Employees should be familiar with the Spill Prevention Control and Countermeasure Plan. Employees should be able to identify work/jobs with high potential for spills and suggest methods to reduce possibility.
- Determine and implement appropriate outreach efforts to reduce non-permissible non-stormwater discharges.

- Conduct spill response drills annually (if no events occurred) in order to evaluate the effectiveness of the plan.
- When a responsible party is identified, educate the party on the impacts of his or her actions.

Quality Assurance and Record Keeping

Performance Evaluation

- Annually review internal investigation results; assess whether goals were met and what changes or improvements are necessary.
- Obtain feedback from personnel assigned to respond to, or inspect for, illicit connections and illegal dumping incidents.
- Develop document and data management procedures.
- A database is useful for defining and tracking the magnitude and location of the problem.
- Report prohibited non-stormwater discharges observed during the course of normal daily activities so they can be investigated, contained, and cleaned up or eliminated.
- Document that non-stormwater discharges have been eliminated by recording tests performed, methods used, dates of testing, and any on-site drainage points observed.
- Annually document and report the results of the program.
- Maintain documentation of illicit connection and illegal dumping incidents, including significant conditionally exempt discharges that are not properly managed.
- Document training activities.

Potential Limitations and Work-Arounds

Some facilities may have space constraints, limited staffing and time limitations that may preclude implementation of BMPs. Provided below are typical limitations and recommended "work-arounds."

- Many facilities do not have accurate, up-to-date 'as-built' plans or drawings which may be necessary in order to conduct non-stormwater discharge assessments.
  - ✓ Online tools such as Google Earth™ can provide an aerial view of the facility and may be useful in understanding drainage patterns and potential sources of non-stormwater discharges
  - ✓ Local municipal jurisdictions may have useful drainage systems maps.

- Video surveillance cameras are commonly used to secure the perimeter of industrial facilities against break-ins and theft. These surveillance systems may also be useful for capturing illegal dumping activities. Minor, temporary adjustments to the field of view of existing surveillance camera systems to target known or suspected problem areas may be a cost-effective way of capturing illegal dumping activities and identifying the perpetrators.

Potential Capital Facility Costs and Operation & Maintenance Requirements

Facilities

- Capital facility cost requirements may be minimal unless cross-connections to storm drains are detected.
- Indoor floor drains may require re-plumbing if cross-connections are detected.
- Leaky sanitary sewers will require repair or replacement which can have significant costs depending on the size and industrial activity at the facility.

Maintenance (including administrative and staffing)

- The primary effort is for staff time and depends on how aggressively a program is implemented.
- Costs for containment, and disposal of any leak or discharge is borne by the Discharger.
- Illicit connections can be difficult to locate especially if there is groundwater infiltration.
- Illegal dumping and illicit connection violations requires technical staff to detect and investigate them.

Supplemental Information

Permit Requirements

The IGP authorizes certain Non-Storm Water Discharges (NSWDs) provided BMPs are included in the SWPPP and implemented to:

- Reduce or prevent the contact of authorized NSWDs with materials or equipment that are potential sources of pollutants;
- Reduce, to the extent practicable, the flow or volume of authorized NSWDs;
- Ensure that authorized NSWDs do not contain quantities of pollutants that cause or contribute to an exceedance of a water quality standards (WQS); and,

- Reduce or prevent discharges of pollutants in authorized NSWDs in a manner that reflects best industry practice considering technological availability and economic practicability and achievability."

Spill Prevention, Control & Cleanup SC-11

Description

Many activities that occur at an industrial or commercial site have the potential to cause accidental spills. Preparation for accidental spills, with proper training and reporting systems implemented, can minimize the discharge of pollutants to the environment.

Spills and leaks are one of the largest contributors of stormwater pollutants. Spill prevention and control plans are applicable to any site at which hazardous materials are stored or used. An effective plan should have spill prevention and response procedures that identify hazardous material storage areas, specify material handling procedures, describe spill response procedures, and provide locations of spill clean-up equipment and materials. The plan should take steps to identify and characterize potential spills, eliminate and reduce spill potential, respond to spills when they occur in an effort to prevent pollutants from entering the stormwater drainage system, and train personnel to prevent and control future spills. An adequate supply of spill clean-up materials must be maintained onsite.

Approach

General Pollution Prevention Protocols

- ☐ Develop procedures to prevent/mitigate spills to storm drain systems.
- ☐ Develop and standardize reporting procedures, containment, storage, and disposal activities, documentation, and follow-up procedures.
- ☐ Establish procedures and/or controls to minimize spills and leaks. The procedures should address:
  - ✓ Description of the facility, owner and address, activities, chemicals, and quantities present;

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION®

- ✓ Facility map of the locations of industrial materials;
- ✓ Notification and evacuation procedures;
- ✓ Cleanup instructions;
- ✓ Identification of responsible departments; and
- ✓ Identify key spill response personnel.

- ☐ Recycle, reclaim, or reuse materials whenever possible. This will reduce the amount of process materials that are brought into the facility.

Spill and Leak Prevention and Response

Spill Prevention

- ☐ Develop procedures to prevent/mitigate spills to storm drain systems. Develop and standardize reporting procedures, containment, storage, and disposal activities, documentation, and follow-up procedures.

- ☐ If illegal dumping is observed at the facility:

  - ✓ Post "No Dumping" signs with a phone number for reporting illegal dumping and disposal. Signs should also indicate fines and penalties applicable for illegal dumping.
  - ✓ Landscaping and beautification efforts may also discourage illegal dumping.
  - ✓ Bright lighting and/or entrance barriers may also be needed to discourage illegal dumping.

- ☐ Store and contain liquid materials in such a manner that if the container is ruptured, the contents will not discharge, flow, or be washed into the storm drainage system, surface waters, or groundwater.

- ☐ If the liquid is oil, gas, or other material that separates from and floats on water, install a spill control device (such as a tee section) in the catch basins that collects runoff from the storage tank area.

Preventative Maintenance

- ☐ Place drip pans or absorbent materials beneath all mounted taps, and at all potential drip and spill locations during filling and unloading of tanks. Any collected liquids or soiled absorbent materials must be reused/recycled or properly disposed.

- ☐ Store and maintain appropriate spill cleanup materials in a location known to all near the tank storage area; and ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.

- ☐ Sweep and clean the storage area monthly if it is paved, *do not hose down the area to a storm drain.*

- ☐ Check tanks (and any containment sumps) daily for leaks and spills. Replace tanks that are leaking, corroded, or otherwise deteriorating with tanks in good condition. Collect all spilled liquids and properly dispose of them.

- ☐ Label all containers according to their contents (e.g., solvent, gasoline).

- ☐ Label hazardous substances regarding the potential hazard (corrosive, radioactive, flammable, explosive, poisonous).

- ☐ Prominently display required labels on transported hazardous and toxic materials (per US DOT regulations).

- ☐ Identify key spill response personnel.

Spill Response

- ☐ Clean up leaks and spills immediately.

- ☐ Place a stockpile of spill cleanup materials where it will be readily accessible (e.g., near storage and maintenance areas).

- ☐ On paved surfaces, clean up spills with as little water as possible.

  - ✓ Use a rag for small spills, a damp mop for general cleanup, and absorbent material for larger spills.

  - ✓ If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to a certified laundry (rags) or disposed of as hazardous waste.

  - ✓ If possible use physical methods for the cleanup of dry chemicals (e.g., brooms, shovels, sweepers, or vacuums).

- ☐ Never hose down or bury dry material spills. Sweep up the material and dispose of properly.

- ☐ Chemical cleanups of material can be achieved with the use of adsorbents, gels, and foams. Use adsorbent materials on small spills rather than hosing down the spill. Remove the adsorbent materials promptly and dispose of properly.

- ☐ For larger spills, a private spill cleanup company or Hazmat team may be necessary.

Reporting

- Report spills that pose an immediate threat to human health or the environment to the Regional Water Quality Control Board or local authority as location regulations dictate.
- Federal regulations require that any oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center (NRC) at 800-424-8802 (24 hour).
- Report spills to 911 for dispatch and clean-up assistance when needed. Do not contact fire agencies directly.
- Establish a system for tracking incidents. The system should be designed to identify the following:
  - ✓ Types and quantities (in some cases) of wastes;
  - ✓ Patterns in time of occurrence (time of day/night, month, or year);
  - ✓ Mode of dumping (abandoned containers, "midnight dumping" from moving vehicles, direct dumping of materials, accidents/spills);
  - ✓ Clean-up procedures; and
  - ✓ Responsible parties.

Employee Training Program

- Educate employees about spill prevention and cleanup.
- Well-trained employees can reduce human errors that lead to accidental releases or spills:
  - ✓ The employee should have the tools and knowledge to immediately begin cleaning up a spill should one occur; and
  - ✓ Employees should be familiar with the Spill Prevention Control and Countermeasure Plan.
- Employees should be educated about aboveground storage tank requirements. Employees responsible for aboveground storage tanks and liquid transfers should be thoroughly familiar with the Spill Prevention Control and Countermeasure Plan and the plan should be readily available.
- Train employees to recognize and report illegal dumping incidents.

Other Considerations (Limitations and Regulations)

- State regulations exist for facilities with a storage capacity of 10,000 gallons or more of petroleum to prepare a Spill Prevention Control and Countermeasure (SPCC) Plan (Health & Safety Code Chapter 6.67).
- State regulations also exist for storage of hazardous materials (Health & Safety Code Chapter 6.95), including the preparation of area and business plans for emergency response to the releases or threatened releases.
- Consider requiring smaller secondary containment areas (less than 200 sq. ft.) to be connected to the sanitary sewer, prohibiting any hard connections to the storm drain.

Requirements

Costs (including capital and operation & maintenance)

- Will vary depending on the size of the facility and the necessary controls.
- Prevention of leaks and spills is inexpensive. Treatment and/or disposal of contaminated soil or water can be quite expensive.

Maintenance (including administrative and staffing)

- Develop spill prevention and control plan, provide and document training, conduct inspections of material storage areas, and supply spill kits.
- Extra time is needed to properly handle and dispose of spills, which results in increased labor costs.

Supplemental Information

Further Detail of the BMP

Reporting

Record keeping and internal reporting represent good operating practices because they can increase the efficiency of the facility and the effectiveness of BMPs. A good record keeping system helps the facility minimize incident recurrence, correctly respond with appropriate cleanup activities, and comply with legal requirements. A record keeping and reporting system should be set up for documenting spills, leaks, and other discharges, including discharges of hazardous substances in reportable quantities. Incident records describe the quality and quantity of non-stormwater discharges to the storm sewer. These records should contain the following information:

- Date and time of the incident;
- Weather conditions;
- Duration of the spill/leak/discharge;

- Cause of the spill/leak/discharge;
- Response procedures implemented;
- Persons notified; and
- Environmental problems associated with the spill/leak/discharge.

Separate record keeping systems should be established to document housekeeping and preventive maintenance inspections, and training activities. All housekeeping and preventive maintenance inspections should be documented. Inspection documentation should contain the following information:

- Date and time the inspection was performed;
- Name of the inspector;
- Items inspected;
- Problems noted;
- Corrective action required; and
- Date corrective action was taken.

Other means to document and record inspection results are field notes, timed and dated photographs, videotapes, and drawings and maps.

Aboveground Tank Leak and Spill Control

Accidental releases of materials from aboveground liquid storage tanks present the potential for contaminating stormwater with many different pollutants. Materials spilled, leaked, or lost from tanks may accumulate in soils or on impervious surfaces and be carried away by stormwater runoff.

The most common causes of unintentional releases are:

- Installation problems;
- Failure of piping systems (pipes, pumps, flanges, couplings, hoses, and valves);
- External corrosion and structural failure;
- Spills and overfills due to operator error; and
- Leaks during pumping of liquids or gases from truck or rail car to a storage tank or vice versa.

Storage of reactive, ignitable, or flammable liquids should comply with the Uniform Fire Code and the National Electric Code. Practices listed below should be employed to enhance the code requirements:

- Tanks should be placed in a designated area.
- Tanks located in areas where firearms are discharged should be encapsulated in concrete or the equivalent.
- Designated areas should be impervious and paved with Portland cement concrete, free of cracks and gaps, in order to contain leaks and spills.
- Liquid materials should be stored in UL approved double walled tanks or surrounded by a curb or dike to provide the volume to contain 10 percent of the volume of all of the containers or 110 percent of the volume of the largest container, whichever is greater. The area inside the curb should slope to a drain.
- For used oil or dangerous waste, a dead-end sump should be installed in the drain.
- All other liquids should be drained to the sanitary sewer if available. The drain must have a positive control such as a lock, valve, or plug to prevent release of contaminated liquids.
- Accumulated stormwater in petroleum storage areas should be passed through an oil/water separator.

Maintenance is critical to preventing leaks and spills. Conduct routine inspections and:

- Check for external corrosion and structural failure.
- Check for spills and overfills due to operator error.
- Check for failure of piping system (pipes, pumps, flanges, coupling, hoses, and valves).
- Check for leaks or spills during pumping of liquids or gases from truck or rail car to a storage facility or vice versa.
- Visually inspect new tank or container installation for loose fittings, poor welding, and improper or poorly fitted gaskets.
- Inspect tank foundations, connections, coatings, and tank walls and piping system. Look for corrosion, leaks, cracks, scratches, and other physical damage that may weaken the tank or container system.
- Frequently relocate accumulated stormwater during the wet season.

- Periodically conduct integrity testing by a qualified professional.

Vehicle Leak and Spill Control

Major spills on roadways and other public areas are generally handled by highly trained Hazmat teams from local fire departments or environmental health departments. The measures listed below pertain to leaks and smaller spills at vehicle maintenance shops.

In addition to implementing the spill prevention, control, and clean up practices above, use the following measures related to specific activities:

Vehicle and Equipment Maintenance

- Perform all vehicle fluid removal or changing inside or under cover to prevent the run-on of stormwater and the runoff of spills.
- Regularly inspect vehicles and equipment for leaks, and repair immediately.
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment onsite.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Immediately drain all fluids from wrecked vehicles.
- Store wrecked vehicles or damaged equipment under cover.
- Place drip pans or absorbent materials under heavy equipment when not in use.
- Use absorbent materials on small spills rather than hosing down the spill.
- Remove the adsorbent materials promptly and dispose of properly.
- Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around.
- Oil filters disposed of in trashcans or dumpsters can leak oil and contaminate stormwater. Place the oil filter in a funnel over a waste oil recycling drum to drain excess oil before disposal. Oil filters can also be recycled. Ask your oil supplier or recycler about recycling oil filters.
- Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries, even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Vehicle and Equipment Fueling

- Design the fueling area to prevent the run-on of stormwater and the runoff of spills:

  Cover fueling area if possible.

  Use a perimeter drain or slope pavement inward with drainage to a sump.

  Pave fueling area with concrete rather than asphalt.

- If dead-end sump is not used to collect spills, install an oil/water separator.
- Install vapor recovery nozzles to help control drips as well as air pollution.
- Discourage "topping-off' of fuel tanks.
- Use secondary containment when transferring fuel from the tank truck to the fuel tank.
- Use absorbent materials on small spills and general cleaning rather than hosing down the area. Remove the absorbent materials promptly.
- Carry out all Federal and State requirements regarding underground storage tanks, or install above ground tanks.
- Do not use mobile fueling of mobile industrial equipment around the facility; rather, transport the equipment to designated fueling areas.
- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Train employees in proper fueling and cleanup procedures.

Industrial Spill Prevention Response

For the purposes of developing a spill prevention and response program to meet the stormwater regulations, facility managers should use information provided in this fact sheet and the spill prevention/response portions of the fact sheets in this handbook, for specific activities.

The program should:

- Integrate with existing emergency response/hazardous materials programs (e.g., Fire Department).
- Develop procedures to prevent/mitigate spills to storm drain systems.
- Identify responsible departments.

- Develop and standardize reporting procedures, containment, storage, and disposal activities, documentation, and follow-up procedures.
- Address spills at municipal facilities, as well as public areas.
- Provide training concerning spill prevention, response and cleanup to all appropriate personnel.

Outdoor Loading/Unloading SC-30

Description

The loading/unloading of materials usually takes place outside on docks or terminals; therefore, materials spilled, leaked, or lost during loading/unloading may collect in the soil or on other surfaces and have the potential to be carried away by wind, stormwater runoff or when the area is cleaned. Additionally, rainfall may wash pollutants from machinery used to unload or move materials. Implementation of the following protocols will prevent or reduce the discharge of pollutants to stormwater from outdoor loading/unloading of materials.

Approach

Reduce potential for pollutant discharge through source control pollution prevention and BMP implementation. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

General Pollution Prevention Protocols

- Park tank trucks or delivery vehicles in designated areas so that spills or leaks can be contained.
- Limit exposure of material to rainfall whenever possible.
- Prevent stormwater run-on.
- Check equipment regularly for leaks.

Good Housekeeping

- Develop an operations plan that describes procedures for loading and/or unloading.
- Conduct loading and unloading in dry weather if possible.

Objectives
■ *Cover*
■ *Contain*
■ *Educate*
■ *Reduce/Minimize*
■ *Product Substitution*

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION®

- Cover designated loading/unloading areas to reduce exposure of materials to rain.
- Consider placing a seal or door skirt between delivery vehicles and building to prevent exposure to rain.
- Design loading/unloading area to prevent stormwater run-on, which would include grading or berming the area, and position roof downspouts so they direct stormwater away from the loading/unloading areas.
- Have employees load and unload all materials and equipment in covered areas such as building overhangs at loading docks if feasible.
- Load/unload only at designated loading areas.
- Use drip pans underneath hose and pipe connections and other leak-prone spots during liquid transfer operations, and when making and breaking connections. Several drip pans should be stored in a covered location near the liquid transfer area so that they are always available, yet protected from precipitation when not in use. Drip pans can be made specifically for railroad tracks. Drip pans must be cleaned periodically, and drip collected materials must be disposed of properly.
- Pave loading areas with concrete instead of asphalt.
- Avoid placing storm drains inlets in the area.
- Grade and/or berm the loading/unloading area with drainage to sump; regularly remove materials accumulated in sump.

Spill Response and Prevention Procedures

- Keep your spill prevention and control plan up-to-date or have an emergency spill cleanup plan readily available, as applicable.
- Contain leaks during transfer.
- Store and maintain appropriate spill cleanup materials in a location that is readily accessible and known to all employees.
- Ensure that employees are familiar with the site's spill control plan and proper spill cleanup procedures.
- Use drip pans or comparable devices when transferring oils, solvents, and paints.

Material Handling and Waste Management

- Spot clean leaks and drips routinely to prevent runoff of spillage.
- Do not pour liquid wastes into floor drains, sinks, outdoor storm drain inlets, or other storm drains or sewer connections.

- Do not put used or leftover cleaning solutions, solvents, and automotive fluids in the storm drain or sanitary sewer.
- Collect leaking or dripping fluids in drip pans or containers. Fluids are easier to recycle if kept separate.
- Promptly transfer used fluids to the proper waste or recycling drums. Do not leave drip pans or other open containers lying around.
- Minimize the possibility of stormwater pollution from outside waste receptacles by doing at least one of the following:
  - ✓ Use only watertight waste receptacle(s) and keep the lid(s) closed.
  - ✓ Grade and pave the waste receptacle area to prevent run-on of stormwater.
  - ✓ Install a roof over the waste receptacle area.
  - ✓ Install a low containment berm around the waste receptacle area.
  - ✓ Use and maintain drip pans under waste receptacles.
- Post "no littering" signs.
- Perform work area clean-up and dry sweep after daily operations.

Employee Training Program

- Train employees (e.g., fork lift operators) and contractors on proper spill containment and cleanup.
- Have employees trained in spill containment and cleanup present during loading/unloading.
- Train employees in proper handling techniques during liquid transfers to avoid spills.
- Make sure forklift operators are properly trained on loading and unloading procedures.

Quality Assurance and Record Keeping

- Keep accurate maintenance logs that document activities performed, quantities of materials removed, and improvement actions.
- Keep accurate logs of spill response actions that document what was spilled, how it was cleaned up, and how the waste was disposed.
- Establish procedures to complete logs and file them in the central office.
- Keep accurate logs of daily clean-up operations.

Potential Limitations and Work-Arounds

Some facilities may have space constraints, limited staffing and time limitations that may preclude implementation of BMPs. Provided below are typical limitations and recommended "work-arounds."

- Space and time limitations may preclude all transfers from being performed indoors or under cover.
  - ✓ Designate specific areas for outdoor loading and unloading.
  - ✓ Require employees to understand and follow spill and leak prevention BMPs.
- It may not be possible to conduct transfers only during dry weather.
  - ✓ Limit materials and equipment rainfall exposure to all extents practicable.
  - ✓ Require employees to understand and follow spill and leak prevention BMPs.

Potential Capital Facility Costs and Operation & Maintenance Requirements

Facilities

Many facilities will already have indoor or covered areas where loading/unloading takes place and will require no additional capital expenditures.

If outdoor activities are required, construction of berms or other means to retain spills and leaks may require appropriate constructed systems for containment. These containment areas may require significant new capital investment.

Capital investments will likely be required at some sites if adequate cover and containment facilities do not exist and can vary significantly depending upon site conditions.

Maintenance

Most of the operations and maintenance activities associated with implementing this BMP are integrally linked to routine operations as previously described. Therefore additional O&M is not required.

- Conduct regular inspections and make repairs and improvements as necessary.
- Check loading and unloading equipment regularly for leaks.
- Conduct regular broom dry-sweeping of area. Do not wash with water.

Supplemental Information

Loading and Unloading of Liquids

- Loading or unloading of liquids should occur in the manufacturing building so that any spills that are not completely retained can be discharged to the sanitary sewer,

treatment plant, or treated in a manner consistent with local sewer authorities and permit requirements.

- For loading and unloading tank trucks to above and below ground storage tanks, the following procedures should be used:
  - ✓ The area where the transfer takes place should be paved. If the liquid is reactive with the asphalt, Portland cement should be used to pave the area.
  - ✓ The transfer area should be designed to prevent run-on of stormwater from adjacent areas. Sloping the pad and using a curb, like a speed bump, around the uphill side of the transfer area should reduce run-on.
  - ✓ The transfer area should be designed to prevent runoff of spilled liquids from the area. Sloping the area to a drain should prevent runoff. The drain should be connected to a dead-end sump or to the sanitary sewer. A positive control valve should be installed on the drain.
- For transfer from rail cars to storage tanks that must occur outside, use the following procedures:
  - ✓ Drip pans should be placed at locations where spillage may occur, such as hose connections, hose reels, and filler nozzles. Use drip pans when making and breaking connections.
  - ✓ Drip pan systems should be installed between the rails to collect spillage from tank cars.

Outdoor Equipment Operations SC-32

Description

Outside process equipment operations and maintenance can contaminate stormwater runoff. Activities, such as grinding, painting, coating, sanding, degreasing or parts cleaning, landfills and waste piles, and solid waste treatment and disposal are examples of process operations that can lead to contamination of stormwater runoff. The targeted constituents will vary for each site depending on the operation being performed.

Approach

Implement source control BMPs to limit exposure of outdoor equipment to direct precipitation and stormwater run-on. Refer to SC-22 Vehicle and Equipment Repair for additional information.

General Pollution Prevention Protocols

- ☐ Perform the activity during dry periods whenever possible.
- ☐ Install secondary containment measures where leaks and spills may occur.
- ☐ Use non-toxic chemicals for maintenance and minimize or eliminate the use of solvents.
- ☐ Connect process equipment area to public sanitary sewer or facility wastewater treatment system when possible. Some jurisdictions require that secondary containment areas be connected to the sanitary sewer, prohibiting any hard connections to the storm drain.

Good Housekeeping

- ☐ Manage materials and waste properly (see Material Handling and Waste Management) to reduce adverse impacts on stormwater quality.

Objectives
■ *Cover*
■ *Contain*
■ *Educate*
■ *Reduce/Minimize*

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION®

- Cover the work area with a permanent roof if possible.
- Use drop cloths for sanding and painting operations.
- Use a vacuum for fine particle clean-up in pavement cracks and crevices.
- Minimize contact of stormwater with outside process equipment operations through berming and drainage routing (run-on prevention).
- "Spot clean" leaks and drips routinely. Leaks are not cleaned up until the absorbent is picked up and disposed of properly.
- Paint signs on storm drain inlets to indicate that they are not to receive liquid or solid wastes.
- Use roll down or permanent walls when windy/breezy to prevent wind transport of particulates/pollutants.

Preventative Maintenance

- Design outdoor equipment areas to prevent stormwater runoff and spills. Use a perimeter drain or slope pavement inward with drainage to sump.
- Dry clean the work area regularly. Do not wash outdoor equipment with water if there is a direct connection to the storm drain.
- Pave area with concrete rather than asphalt.
- Inspect outdoor equipment regularly for leaks or spills. Also check for structural failure, spills and overfills due to operator error, and/or failure of piping system.
- Inspect and clean, if necessary, storm drain inlets and catch basins within the outdoor equipment area before October 1 each year.

Spill Response and Prevention Procedures

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Have employees trained in emergency spill cleanup procedures present when dangerous waste, liquid chemicals, or other wastes are delivered.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Prevent operator errors by using engineering safe guards and thus reducing accidental releases of pollutant.

Material Handling and Waste Management

- Do not pour liquid wastes into floor drains, sinks, outdoor storm drain inlets, or other storm drain or sewer connections.
- Collect leaking or dripping fluids in drip pans or containers. Fluids are easier to recycle if kept separate.
- Promptly transfer used fluids to the proper waste or recycling drums. Do not leave drip pans or other open containers lying around.
- Minimize the possibility of stormwater pollution from outside waste receptacles by doing at least one of the following:
  - ✓ Use only watertight waste receptacle(s) and keep the lid(s) closed.
  - ✓ Grade and pave the waste receptacle area to prevent run-on of stormwater.
  - ✓ Install a roof over the waste receptacle area.

Employee Training Program

- Educate employees about pollution prevention measures and goals.
- Train employees on proper equipment operation and maintenance procedures.
- Train all employees upon hiring and annually thereafter on proper methods for handling and disposing of waste. Ensure that all employees understand stormwater discharge prohibitions, wastewater discharge requirements, and these best management practices.
- Use a training log or similar method to document training.
- Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.

Quality Assurance and Record Keeping

- Keep accurate maintenance logs that document minimum BMP activities performed for outdoor equipment, types and quantities of materials removed and disposed of, and any improvement actions.
- Keep accurate logs of spill response actions that document what was spilled, how it was cleaned up, and how the waste was disposed.
- Establish procedures to complete logs and file them in the central office.

Potential Limitations and Work-Arounds

Some facilities may have space constraints, limited staffing and time limitations that may preclude implementation of BMPs. Provided below are typical limitations and recommended "work-arounds."

- Providing cover over outdoor equipment may be impractical or cost-prohibitive.
  - ✓ Operate outdoor equipment only during periods of dry weather.
- Regular operations and time limitations may require outdoor activities during wet weather.
  - ✓ Designate specific areas for outdoor activities.
  - ✓ Allow time for work area clean-up after each shift.
  - ✓ Require employees to understand and follow preventive maintenance and spill and leak prevention BMPs.
  - ✓ Design and install secondary containment and good housekeeping BMPs for outdoor equipment area.
- Storage sheds often must meet building and fire code requirements.

Potential Capital Facility Costs and Operation & Maintenance Requirements

Facilities

- Many facilities will already have indoor covered areas where vehicle and equipment repairs take place and will require no additional capital expenditures.
- If outdoor activities are required, construction of berms or other means to retain spills and leaks may require appropriate constructed systems for containment. These containment areas may require significant new capital investment.
- Capital investments will likely be required at some sites if adequate cover and containment facilities do not exist and can vary significantly depending upon site conditions.

Maintenance

- Most of the operations and maintenance activities associated with implementing this BMP are integrally linked to routine operations as previously described. Therefore additional O&M is not required.
- For facilities responsible for pre-treating their wastewater prior to discharging, the proper functioning of structural treatment system is an important maintenance consideration.
- Routine cleanout of oil and grease is required for the devices to maintain their effectiveness, usually at least once a month. During periods of heavy rainfall, cleanout is required more often to ensure pollutants are not washed through the trap. Sediment removal is also required on a regular basis to keep the device working efficiently.

Waste Handling & Disposal SC-34

Description

Improper storage and handling of solid wastes can allow toxic compounds, oils and greases, heavy metals, nutrients, suspended solids, and other pollutants to enter stormwater runoff. The discharge of pollutants to stormwater from waste handling and disposal can be prevented and reduced by tracking waste generation, storage, and disposal; reducing waste generation and disposal through source reduction, reuse, and recycling; and preventing run-on and runoff.

Approach

Reduce potential for pollutant discharge through source control pollution prevention and BMP implementation. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

General Pollution Prevention Protocols

- ☐ Accomplish reduction in the amount of waste generated using the following source controls:
  - ✓ Production planning and sequencing;
  - ✓ Process or equipment modification;
  - ✓ Raw material substitution or elimination;
  - ✓ Loss prevention and housekeeping;
  - ✓ Waste segregation and separation; and
  - ✓ Close loop recycling.
- ☐ Establish a material tracking system to increase awareness about material usage. This may reduce spills and minimize contamination, thus reducing the amount of waste produced.
- ☐ Recycle materials whenever possible.

Objectives
■ *Cover*
■ *Contain*
■ *Educate*
■ *Reduce/Minimize*
■ *Product Substitution*

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION®

- Use the entire product before disposing of the container.
- To the extent possible, store wastes under cover or indoors after ensuring all safety concerns such as fire hazard and ventilation are addressed.
- Provide containers for each waste stream at each work station. Allow time after shift to clean area.

Good Housekeeping

- Cover storage containers with leak proof lids or some other means. If waste is not in containers, cover all waste piles (plastic tarps are acceptable coverage) and prevent stormwater run-on and runoff with a berm. The waste containers or piles must be covered except when in use.
- Use drip pans or absorbent materials whenever grease containers are emptied by vacuum trucks or other means. Grease cannot be left on the ground. Collected grease must be properly disposed of as garbage.
- Dispose of rinse and wash water from cleaning waste containers into a sanitary sewer if allowed by the local sewer authority. Do not discharge wash water to the street or storm drain. Clean in a designated wash area that drains to a clarifier.
- Transfer waste from damaged containers into safe containers.
- Take special care when loading or unloading wastes to minimize losses. Loading systems can be used to minimize spills and fugitive emission losses such as dust or mist. Vacuum transfer systems can minimize waste loss.
- Keep the waste management area clean at all times by sweeping and cleaning up spills immediately.
- Use dry methods when possible (e.g., sweeping, use of absorbents) when cleaning around restaurant/food handling dumpster areas. If water must be used after sweeping/using absorbents, collect water and discharge through grease interceptor to the sewer.
- Stencil or demarcate storm drains on the facility's property with prohibitive message regarding waste disposal.
- Cover waste piles with temporary covering material such as reinforced tarpaulin, polyethylene, polyurethane, polypropylene or hypalon.
- If possible, move the activity indoor after ensuring all safety concerns such as fire hazard and ventilation are addressed.

Preventative Maintenance

- Prevent stormwater run-on from entering the waste management area by enclosing the area or building a berm around the area.
- Prevent waste materials from directly contacting rain.

- Cover waste piles with temporary covering material such as reinforced tarpaulin, polyethylene, polyurethane, polypropylene or hypalon.
- Cover the area with a permanent roof if feasible.
- Cover dumpsters to prevent rain from washing waste out of holes or cracks in the bottom of the dumpster.
- Check waste containers weekly for leaks and to ensure that lids are on tightly. Replace any that are leaking, corroded, or otherwise deteriorating.
- Sweep and clean the waste management area regularly. Use dry methods when possible (e.g., sweeping, vacuuming, use of absorbents) when cleaning around restaurant/food handling dumpster areas. If water must be used after sweeping/using absorbents, collect water and discharge through grease interceptor to the sewer.
- Inspect and replace faulty pumps or hoses regularly to minimize the potential of releases and spills.
- Repair leaking equipment including valves, lines, seals, or pumps promptly.

Spill Response and Prevention Procedures

- Keep your spill prevention and plan up-to-date.
- Have an emergency plan, equipment and trained personnel ready at all times to deal immediately with major spills.
- Collect all spilled liquids and properly dispose of them.
- Store and maintain appropriate spill cleanup materials in a location known to all near the designated wash area.
- Ensure that vehicles transporting waste have spill prevention equipment that can prevent spills during transport. Spill prevention equipment includes:
  - ✓ Vehicles equipped with baffles for liquid waste; and
  - ✓ Trucks with sealed gates and spill guards for solid waste.

Material Handling and Waste Management

Litter Control

- Post "No Littering" signs and enforce anti-litter laws.
- Provide a sufficient number of litter receptacles for the facility.
- Clean out and cover litter receptacles frequently to prevent spillage.

Waste Collection

- Keep waste collection areas clean.

- Inspect solid waste containers for structural damage regularly. Repair or replace damaged containers as necessary.
- Secure solid waste containers; containers must be closed tightly when not in use.
- Do not fill waste containers with washout water or any other liquid.
- Ensure that only appropriate solid wastes are added to the solid waste container. Certain wastes such as hazardous wastes, appliances, fluorescent lamps, pesticides, etc., may not be disposed of in solid waste containers (see chemical/ hazardous waste collection section below).
- Do not mix wastes; this can cause chemical reactions, make recycling impossible, and complicate disposal. Affix labels to all waste containers.

Chemical/Hazardous Wastes

- Select designated hazardous waste collection areas on-site.
- Store hazardous materials and wastes in covered containers and protect them from vandalism.
- Place hazardous waste containers in secondary containment.
- Make sure that hazardous waste is collected, removed, and disposed of only at authorized disposal areas.
- Hazardous waste cannot be reused or recycled; it must be disposed of by a licensed hazardous waste hauler.

Employee Training Program

- Educate employees about pollution prevention measures and goals.
- Train employees how to properly handle and dispose of waste using the source control BMPs described above.
- Train employees and subcontractors in proper hazardous waste management.
- Use a training log or similar method to document training.
- Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.

Quality Assurance and Record Keeping

- Keep accurate maintenance logs that document minimum BMP activities performed for waste handling and disposal, types and quantities of waste disposed of, and any improvement actions.
- Keep accurate logs of spill response actions that document what was spilled, how it was cleaned up, and how the waste was disposed.

- Establish procedures to complete logs and file them in the central office.

Potential Capital Facility Costs and Operation & Maintenance Requirements

Facilities

- Capital costs will vary substantially depending on the size of the facility and the types of waste handled. Significant capital costs may be associated with reducing wastes by modifying processes or implementing closed-loop recycling.
- Many facilities will already have indoor covered areas where waste materials will be stored and will require no additional capital expenditures for providing cover.
- If outdoor storage of wastes is required, construction of berms or other means to prevent stormwater run-on and runoff may require appropriate constructed systems for containment.
- Capital investments will likely be required at some sites if adequate cover and containment facilities do not exist and can vary significantly depending upon site conditions.

Maintenance

- Check waste containers weekly for leaks and to ensure that lids are on tightly. Replace any that are leaking, corroded, or otherwise deteriorating.
- Sweep and clean the waste management area regularly. Use dry methods when possible (e.g., sweeping, use of absorbents) when cleaning around restaurant/food handling dumpster areas. If water must be used after sweeping/using absorbents, collect water and discharge through grease interceptor to the sewer.
- Inspect and replace faulty pumps or hoses regularly to minimize the potential of releases and spills.
- Repair leaking equipment including valves, lines, seals, or pumps promptly.

Safer Alternative Products SC-35

Description

Promote the use of less harmful products and products that contain little or no TMDL and 303(d) list pollutants. Alternatives exist for most product classes including chemical fertilizers, pesticides, cleaning solutions, janitorial chemicals, automotive and paint products, and consumables (batteries, fluorescent lamps).

Approach

Pattern a new program after the many established programs around the state and country. Integrate this best management practice as much as possible with existing programs at your facility.

Develop a comprehensive program based on:

- The "Precautionary Principle," which is an alternative to the "Risk Assessment" model that says it's acceptable to use a potentially harmful product until physical evidence of its harmful effects are established and deemed too costly from an environmental or public health perspective. For instance, a risk assessment approach might say it's acceptable to use a pesticide until there is direct proof of an environmental impact. The Precautionary Principle approach is used to evaluate whether a given product is safe, whether it is really necessary, and whether alternative products would perform just as well.
- Environmentally Preferable Purchasing Program to minimize the purchase of products containing hazardous ingredients used in the facility's custodial services, fleet maintenance, and facility maintenance in favor of using alternate products that pose less risk to employees and to the environment.
- Integrated Pest Management (IPM) or Less-Toxic Pesticide Program, which uses a pest management approach that minimizes the use of toxic chemicals and gets rid of pests

Objectives
■ *Educate*
■ *Reduce/Minimize*
■ *Product Substitution*

by methods that pose a lower risk to employees, the public, and the environment.

- Energy Efficiency Program including no-cost and low-cost energy conservation and efficiency actions that can reduce both energy consumption and electricity bills, along with long-term energy efficiency investments.

Consider the following mechanisms for developing and implementing a comprehensive program:

- Policies
- Procedures
  - ✓ Standard operating procedures (SOPs);
  - ✓ Purchasing guidelines and procedures; and
  - ✓ Bid packages (services and supplies).
- Materials
  - ✓ Preferred or approved product and supplier lists;
  - ✓ Product and supplier evaluation criteria;
  - ✓ Training sessions and manuals; and
  - ✓ Fact sheets for employees.

Implement this BMP in conjunction with the Vehicle and Equipment Management fact sheets (SC-20 – SC-22) and SC-41 Building and Grounds Maintenance.

Employee Training Program

- Employees who handle potentially harmful materials should be trained in the use of safer alternatives.
- Purchasing departments should be trained on safer alternative products and encouraged to procure less hazardous materials and products that contain little or no harmful substances or TMDL pollutants.
- Employees and contractors / service providers can both be educated about safer alternatives by using information developed by a number of organizations including the references and resources provided in this fact sheet.

Potential Limitations and Work-Arounds

Some facilities may have space constraints, limited staffing and time limitations that may preclude implementation of BMPs. Provided below are typical limitations and recommended "work-arounds"

- Alternative products may not be available, suitable, or effective in every case.

- ✓ Minimize use of hazardous/harmful products if no alternative product is available.

Regulatory Considerations

This BMP has no regulatory requirements unless local/municipal ordinance applies. Existing regulations already encourage facilities to reduce the use of hazardous materials through incentives such as reduced:

- Specialized equipment storage and handling requirements;
- Storm water runoff sampling requirements;
- Training and licensing requirements; and
- Record keeping and reporting requirements.

Cost Considerations

- The primary cost is for staff time to: 1) develop new policies and procedures and 2) educate purchasing departments and employees who handle potentially harmful materials about the availability, procurement, and use of safer alternatives.
- Some alternative products may be slightly more expensive than conventional products.

Supplemental Information

The following discussion provides some general information on safer alternatives. More specific information on particular hazardous materials and the available alternatives may be found in the references and resources listed below.

- Automotive products – Less toxic alternatives are not available for many automotive products, especially engine fluids. But there are alternatives to grease lubricants, car polishes, degreasers, and windshield washer solution. Refined motor oil is also available.
- Vehicle/Trailer lubrication – Fifth wheel bearings on trucks require routine lubrication. Adhesive lubricants are available to replace typical chassis grease.
- Cleaners – Vegetables-based or citrus-based soaps are available to replace petroleum-based soaps/detergents.
- Paint products – Water-based paints, wood preservatives, stains, and finishes with low VOC content are available.
- Pesticides – Specific alternative products or methods exist to control most insects, fungi, and weeds.
- Chemical Fertilizers – Compost and soil amendments are natural alternatives.
- Consumables – Manufacturers have either reduced or are in the process of reducing the amount of heavy metals in consumables such as batteries and fluorescent lamps.

All fluorescent lamps contain mercury, however low-mercury containing lamps are now available from most hardware and lighting stores. Fluorescent lamps are also more energy efficient than the average incandescent lamp.

- Janitorial chemicals – Even biodegradable soap can harm fish and wildlife before it biodegrades. Biodegradable does not mean non-toxic. Safer products and procedures are available for floor stripping and cleaning, as well as carpet, glass, metal, and restroom cleaning and disinfecting. Use paper products with post-consumer recycled content and implement electric had dryers.

Examples

There are a number of business and trade associations, and communities with effective programs. Some of the more prominent are listed below in the references and resources section.

References and Resources

Note: Many of these references provide alternative products for materials that typically are used inside and disposed to the sanitary sewer as well as alternatives to products that usually end up in the storm drain.

Building & Grounds Maintenance SC-41

Description

Stormwater runoff from building and grounds maintenance activities can be contaminated with toxic hydrocarbons in solvents, fertilizers and pesticides, suspended solids, heavy metals, abnormal pH, and oils and greases. Utilizing the protocols in this fact sheet will prevent or reduce the discharge of pollutants to stormwater from building and grounds maintenance activities by washing and cleaning up with as little water as possible, following good landscape management practices, preventing and cleaning up spills immediately, keeping debris from entering the storm drains, and maintaining the stormwater collection system.

Approach

Reduce potential for pollutant discharge through source control pollution prevention and BMP implementation. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

General Pollution Prevention Protocols

- ☐ Switch to non-toxic chemicals for maintenance to the maximum extent possible.
- ☐ Choose cleaning agents that can be recycled.
- ☐ Encourage proper lawn management and landscaping, including use of native vegetation.
- ☐ Encourage use of Integrated Pest Management techniques for pest control.
- ☐ Encourage proper onsite recycling of yard trimmings.
- ☐ Recycle residual paints, solvents, lumber, and other material as much as possible.

Objectives
■ *Cover*
■ *Contain*
■ *Educate*
■ *Reduce/Minimize*
■ *Product Substitution*

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION®

- Clean work areas at the end of each work shift using dry cleaning methods such as sweeping and vacuuming.

Good Housekeeping

Pressure Washing of Buildings, Rooftops, and Other Large Objects

- In situations where soaps or detergents are used and the surrounding area is paved, pressure washers must use a water collection device that enables collection of wash water and associated solids. A sump pump, wet vacuum or similarly effective device must be used to collect the runoff and loose materials. The collected runoff and solids must be disposed of properly.

- If soaps or detergents are not used, and the surrounding area is paved, wash runoff does not have to be collected but must be screened. Pressure washers must use filter fabric or some other type of screen on the ground and/or in the catch basin to trap the particles in wash water runoff.

- If you are pressure washing on a grassed area (with or without soap), runoff must be dispersed as sheet flow as much as possible, rather than as a concentrated stream. The wash runoff must remain on the grass and not drain to pavement.

Landscaping Activities

- Dispose of grass clippings, leaves, sticks, or other collected vegetation as garbage, or by composting. Do not dispose of collected vegetation into waterways or storm drainage systems.

- Use mulch or other erosion control measures on exposed soils. See also SC-40, Contaminated and Erodible Areas, for more information.

Building Repair, Remodeling, and Construction

- Do not dump any toxic substance or liquid waste on the pavement, the ground, or toward a storm drain.

- Use ground or drop cloths underneath outdoor painting, scraping, and sandblasting work, and properly dispose of collected material daily.

- Use a ground cloth or oversized tub for activities such as paint mixing and tool cleaning.

- Clean paintbrushes and tools covered with water-based paints in sinks connected to sanitary sewers or in portable containers that can be dumped into a sanitary sewer drain. Brushes and tools covered with non-water-based paints, finishes, or other materials must be cleaned in a manner that enables collection of used solvents (e.g., paint thinner, turpentine, etc.) for recycling or proper disposal.

- Use a storm drain cover, filter fabric, or similarly effective runoff control mechanism if dust, grit, wash water, or other pollutants may escape the work area and enter a catch basin. This is particularly necessary on rainy days. The containment device(s) must be in place at the beginning of the work day, and accumulated dirty runoff and

solids must be collected and disposed of before removing the containment device(s) at the end of the work day.

- If you need to de-water an excavation site, you may need to filter the water before discharging to a catch basin or off-site. If directed off-site, you should direct the water through hay bales and filter fabric or use other sediment filters or traps.
- Store toxic material under cover during precipitation events and when not in use. A cover would include tarps or other temporary cover material.

Mowing, Trimming, and Planting

- Dispose of leaves, sticks, or other collected vegetation as garbage, by composting or at a permitted landfill. Do not dispose of collected vegetation into waterways or storm drainage systems.
- Use mulch or other erosion control measures when soils are exposed.
- Place temporarily stockpiled material away from watercourses and drain inlets, and berm or cover stockpiles to prevent material releases to the storm drain system.
- Consider an alternative approach when bailing out muddy water: do not put it in the storm drain; pour over landscaped areas.
- Use hand weeding where practical.

Fertilizer and Pesticide Management

- Do not use pesticides if rain is expected.
- Do not mix or prepare pesticides for application near storm drains.
- Use the minimum amount needed for the job.
- Calibrate fertilizer distributors to avoid excessive application.
- Employ techniques to minimize off-target application (e.g., spray drift) of pesticides, including consideration of alternative application techniques.
- Apply pesticides only when wind speeds are low.
- Fertilizers should be worked into the soil rather than dumped or broadcast onto the surface.
- Irrigate slowly to prevent runoff and then only as much as is needed.
- Clean pavement and sidewalk if fertilizer is spilled on these surfaces before applying irrigation water.

Inspection

- Inspect irrigation system periodically to ensure that the right amount of water is being applied and that excessive runoff is not occurring. Minimize excess watering and repair leaks in the irrigation system as soon as they are observed.

Building & Grounds Maintenance SC-41

Spill Response and Prevention Procedures

- ☐ Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- ☐ Place a stockpile of spill cleanup materials, such as brooms, dustpans, and vacuum sweepers (if desired) near the storage area where it will be readily accessible.
- ☐ Have employees trained in spill containment and cleanup present during the loading/unloading of dangerous wastes, liquid chemicals, or other materials.
- ☐ Familiarize employees with the Spill Prevention Control and Countermeasure Plan.
- ☐ Clean up spills immediately.

Material Handling and Waste Management

- ☐ Follow all federal, state, and local laws and regulations governing the use, storage, and disposal of fertilizers and pesticides and training of applicators and pest control advisors.
- ☐ Use less toxic pesticides that will do the job when applicable. Avoid use of copper-based pesticides if possible.
- ☐ Dispose of empty pesticide containers according to the instructions on the container label.
- ☐ Use up the pesticides. Rinse containers, and use rinse water as product. Dispose of unused pesticide as hazardous waste.
- ☐ Implement storage requirements for pesticide products with guidance from the local fire department and County Agricultural Commissioner. Provide secondary containment for pesticides.

Employee Training Program

- ☐ Educate and train employees on pesticide use and in pesticide application techniques to prevent pollution.
- ☐ Train employees and contractors in proper techniques for spill containment and cleanup.
- ☐ Be sure the frequency of training takes into account the complexity of the operations and the needs of individual staff.

Quality Assurance and Record Keeping

- ☐ Keep accurate logs that document maintenance activities performed and minimum BMP measures implemented.
- ☐ Keep accurate logs of spill response actions that document what was spilled, how it was cleaned up, and how the waste was disposed.
- ☐ Establish procedures to complete logs and file them in the central office.

Potential Capital Facility Costs and Operation & Maintenance Requirements

Facilities

- Additional capital costs are not anticipated for building and grounds maintenance. Implementation of the minimum BMPs described above should be conducted as part of regular site operations.

Maintenance

- Maintenance activities for the BMPs described above will be minimal, and no additional cost is anticipated.

Supplemental Information

Fire Sprinkler Line Flushing

Site fire sprinkler line flushing may be a source of non-stormwater runoff pollution. The water entering the system is usually potable water, though in some areas it may be non-potable reclaimed wastewater. There are subsequent factors that may drastically reduce the quality of the water in such systems. Black iron pipe is usually used since it is cheaper than potable piping, but it is subject to rusting and results in lower quality water. Initially, the black iron pipe has an oil coating to protect it from rusting between manufacture and installation; this will contaminate the water from the first flush but not from subsequent flushes. Nitrates, poly-phosphates and other corrosion inhibitors, as well as fire suppressants and antifreeze may be added to the sprinkler water system. Water generally remains in the sprinkler system a long time (typically a year) and between flushes may accumulate iron, manganese, lead, copper, nickel, and zinc. The water generally becomes anoxic and contains living and dead bacteria and breakdown products from chlorination. This may result in a significant BOD problem and the water often smells. Consequently dispose fire sprinkler line flush water into the sanitary sewer. Do not allow discharge to storm drain or infiltration due to potential high levels of pollutants in fire sprinkler line water.

Building Repair and Construction SC-42

Description

Site modifications are common, particularly at large industrial sites. The activity may vary from minor and normal building repair to major remodeling, or the construction of new facilities. These activities can generate pollutants including solvents, paints, paint and varnish removers, finishing residues, spent thinners, soap cleaners, kerosene, asphalt and concrete materials, adhesive residues, and old asbestos installation. Protocols in this fact sheet are intended to prevent or reduce the discharge of pollutants to stormwater from building repair, remodeling, and minor construction by using soil erosion controls, enclosing or covering building material storage areas, using good housekeeping practices, using safer alternative products, and training employees.

This fact sheet is intended to be used for minor repairs and construction. If major construction is required, the guidelines in the Construction BMP Handbook should be followed.

Approach

The BMP approach is to reduce potential for pollutant discharges through source control pollution prevention and BMP implementation. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

General Pollution Prevention Protocols

- ☐ Recycle residual paints, solvents, lumber, and other materials to the maximum extent practicable.
- ☐ Avoid outdoor repairs and construction during periods of wet weather.
- ☐ Use safer alternative products to the maximum extent practicable. See also SC-35 Safer Alternative Products for more information.

Objectives
■ *Cover*
■ *Contain*
■ *Educate*
■ *Reduce/Minimize*
■ *Product Substitution*

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION®

- Buy recycled products to the maximum extent practicable.
- Inform on-site contractors of company policy on these matters and include appropriate provisions in their contract to ensure certain proper housekeeping and disposal practices are implemented.
- Make sure that nearby storm drains are well marked to minimize the chance of inadvertent disposal of residual paints and other liquids.

Good Housekeeping

Repair & Remodeling

- Keep the work site clean and orderly. Remove debris in a timely fashion. Sweep and vacuum the area regularly to remove sediments and small debris.
- Cover raw materials of particular concern that must be left outside, particularly during the rainy season. See also SC-33 Outdoor Storage of Raw Materials for more information.
- Use equipment and tools such as bag sanders to reduce accumulation of debris.
- Limit/prohibit work on windy days; implement roll-down walls or other measures to reduce wind transport of pollutants.
- Do not dump waste liquids down the storm drain.
- Dispose of wash water, sweepings, and sediments properly.
- Store liquid materials properly that are normally used in repair and remodeling such as paints and solvents. See also SC-31 Outdoor Liquid Container Storage for more information.
- Sweep out rain gutters or wash the gutter and trap the particles at the outlet of the downspout. A sock or geofabric placed over the outlet may effectively trap the materials. If the downspout is tight lined, place a temporary plug at the first convenient point in the storm drain and pump out the water with a vactor truck, and clean the catch basin sump where you placed the plug.
- Clean the storm drain system in the immediate vicinity of the construction activity after it is completed. See also SC-44 Drainage System Maintenance for more information.

Painting

- Enclose painting operations consistent with local air quality regulations and OSHA.
- Local air pollution regulations may, in many areas of the state, specify painting procedures which if properly carried out are usually sufficient to protect water quality.
- Develop paint handling procedures for proper use, storage, and disposal of paints.

- Transport paint and materials to and from job sites in containers with secure lids and tied down to the transport vehicle.
- Test and inspect spray equipment prior to starting to paint. Tighten all hoses and connections and do not overfill paint containers.
- Mix paint indoors before using so that any spill will not be exposed to rain. Do so even during dry weather because cleanup of a spill will never be 100 percent effective.
- Transfer and load paint and hot thermoplastic away from storm drain inlets.
- Do not transfer or load paint near storm drain inlets.
- Plug nearby storm drain inlets prior to starting painting and remove plugs when job is complete when there is risk of a spill reaching storm drains.
- Cover nearby storm drain inlets prior to starting work if sand blasting is used to remove paint.
- Use a ground cloth to collect the chips if painting requires scraping or sand blasting of the existing surface. Dispose of the residue properly.
- Cover or enclose painting operations properly to avoid drift.
- Clean the application equipment in a sink that is connected to the sanitary sewer if using water based paints.
- Capture all cleanup-water and dispose of properly.
- Dispose of paints containing lead or tributyl tin and considered a hazardous waste properly.
- Store leftover paints if they are to be kept for the next job properly, or dispose properly.
- Recycle paint when possible. Dispose of paint at an appropriate household hazardous waste facility.

Spill Response and Prevention Procedures

- Keep your spill prevention and control plan up-to-date.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Clean up spills immediately.
- Excavate and remove the contaminated (stained) soil if a spill occurs on dirt.

Material Handling and Waste Management

- Post “No Littering” signs and enforce anti-litter laws.

- Provide a sufficient number of litter receptacles for the facility.
- Clean out and cover litter receptacles frequently to prevent spillage.
- Keep waste collection areas clean.
- Inspect solid waste containers for structural damage regularly. Repair or replace damaged containers as necessary.
- Secure solid waste containers; containers must be closed tightly when not in use.
- Do not fill waste containers with washout water or any other liquid.
- Ensure that only appropriate solid wastes are added to the solid waste container. Certain wastes such as hazardous wastes, appliances, fluorescent lamps, pesticides, etc., may not be disposed of in solid waste containers (see chemical/ hazardous waste collection section below).
- Do not mix wastes; this can cause chemical reactions, make recycling impossible, and complicate disposal. Affix labels to all waste containers.
- Make sure that hazardous waste is collected, removed, and disposed of properly. See also SC-34, Waste Handling and Disposal for more information.

Sediment and Erosion Controls

- Limit disturbance to bare soils and preserve natural vegetation whenever possible. See also EC-2, Preservation of Existing Vegetation, in the Construction BMP Handbook.
- Stabilize loose soils by re-vegetating whenever possible. See also EC-4 Hydroseeding, in the Construction BMP Handbook.
- Utilize non-vegetative stabilization methods for areas prone to erosion where vegetative options are not feasible. Examples include:
  - ✓ Areas of vehicular or pedestrian traffic such as roads or paths;
  - ✓ Arid environments where vegetation would not provide timely ground coverage, or would require excessive irrigation;
  - ✓ Rocky substrate, infertile or droughty soils where vegetation would be difficult to establish; and
  - ✓ Areas where vegetation will not grow adequately within the construction time frame.

  There are several non-vegetative stabilization methods and selection should be based on site-specific conditions. See also EC-16 Non-Vegetative Stabilization, in the Construction BMP Handbook.

- Utilize chemical stabilization when needed. See also EC-5 Soil Binders, in the Construction BMP Handbook.
- Use geosynthetic membranes to control erosion if feasible. See also EC-7 Geotextiles and Mats, in the Construction BMP Handbook.
- Stabilize all roadways, entrances, and exits to sufficiently control discharges of erodible materials from discharging or being tracked off the site. See also TC 1-3 Tracking Control, in the Construction BMP Handbook.
- Refer to the supplemental information provided below for projects that involve more extensive soil disturbance activities.

Employee Training Program

- Educate employees about pollution prevention measures and goals.
- Train employees how to properly implement the source control BMPs described above. Detailed information for Sediment and Erosion Control BMPs is provided in the Construction BMP Handbook.
- Proper education of off-site contractors is often overlooked. The conscientious efforts of well trained employees can be lost by unknowing off-site contractors, so make sure they are well informed about pollutant source control responsibilities.
- Use a training log or similar method to document training.

Quality Assurance and Record Keeping

- Keep accurate maintenance logs that document minimum BMP activities performed for building repair and construction, types and quantities of waste disposed of, and any improvement actions.
- Keep accurate logs of spill response actions that document what was spilled, how it was cleaned up, and how the waste was disposed.
- Establish procedures to complete logs and file them in the central office.

Potential Limitations and Work-Arounds

Some facilities may have space constraints, limited staffing and time limitations that may preclude implementation of BMPs. Provided below are typical limitations and recommended "work-arounds."

- This BMP is for minor construction only. The State's General Construction Activity Stormwater Permit has more extensive requirements for larger projects that would disturb one or more acres of surface.
  - ✓ Refer to the companion "Construction Best Management Practice Handbook" which contains specific guidance and best management practices for larger-scale projects.

- Time constraints may require some outdoor repairs and construction during wet weather.
  - ✓ Require employees to understand and follow good housekeeping and spill and leak prevention BMPs.
  - ✓ Inspect sediment and erosion control BMPs daily during periods of wet weather and repair or improve BMP implementation as necessary.
- Hazardous waste that cannot be reused or recycled must be disposed of by a licensed hazardous waste hauler.
  - ✓ Minimize use of hazardous materials to the maximum extent practicable.
- Be certain that actions to help stormwater quality are consistent with Cal- and Fed-OSHA and air quality regulations.
- Prices for recycled/safer alternative materials and fluids may be higher than those of conventional materials.

Potential Capital Facility Costs and Operation & Maintenance Requirements

Facilities

- Limited capital investments may be required at some sites if adequate cover and containment facilities do not exist for construction materials and wastes.
- Purchase and installation of erosion and sediment controls, if needed will require additional capital investments, and this amount will vary depending on site characteristics and the types of BMPs being implemented.
- Minimize costs by maintaining existing vegetation and limiting construction operations on bare soils.

Maintenance

- The erosion and sediment control BMPs described above require periodic inspection and maintenance to remain effective. The cost of these actions will vary depending on site characteristics and the types of BMPs being implemented.
- Irrigation costs may be required to establish and maintain vegetation.

Supplemental Information

Soil/Erosion Control

If the work involves exposing large areas of soil, employ the appropriate soil erosion and control techniques. See the Construction Best Management Practice Handbook. If old buildings are being torn down and not replaced in the near future, stabilize the site using measures described in SC-40 Contaminated or Erodible Areas.

If a building is to be placed over an open area with a storm drainage system, make sure the storm inlets within the building are covered or removed, or the storm line is connected to the sanitary sewer. If because of the remodeling a new drainage system is to be installed or the existing system is to be modified, consider installing catch basins as they serve as effective "in-line" treatment devices. Include in the catch basin a "turn-down" elbow or similar device to trap floatables.

Parking Area Maintenance SC-43

Description

Parking lots can contribute a number of substances, such as trash, suspended solids, hydrocarbons, oil and grease, and heavy metals that can enter receiving waters through stormwater runoff or non-stormwater discharges. The protocols in this fact sheet are intended to prevent or reduce the discharge of pollutants from parking areas and include using good housekeeping practices, following appropriate cleaning BMPs, and training employees.

BMPs for other outdoor areas on site (loading/unloading, material storage, and equipment operations) are described in SC-30 through SC-33.

Approach

The goal of this program is to ensure stormwater pollution prevention practices are considered when conducting activities on or around parking areas to reduce potential for pollutant discharge to receiving waters. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

General Pollution Prevention Protocols

- ☐ Encourage advanced designs and maintenance strategies for impervious parking lots. Refer to the treatment control BMP fact sheets in this manual for additional information.
- ☐ Keep accurate maintenance logs to evaluate BMP implementation.

Good Housekeeping

- ☐ Keep all parking areas clean and orderly. Remove debris, litter, and sediments in a timely fashion.
- ☐ Post "No Littering" signs and enforce anti-litter laws.

Objectives
■ *Cover*
■ *Contain*
■ *Educate*
■ *Reduce/Minimize*
■ *Product Substitution*

Targeted Constituents

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION®

- ☐ Provide an adequate number of litter receptacles.
- ☐ Clean out and cover litter receptacles frequently to prevent spillage.

Preventative Maintenance

Inspection

Have designated personnel conduct inspections of parking facilities and stormwater conveyance systems associated with parking facilities on a regular basis.

- ☐ Inspect cleaning equipment/sweepers for leaks on a regular basis.

Surface Cleaning

- ☐ Use dry cleaning methods (e.g., sweeping, vacuuming) to prevent the discharge of pollutants into the stormwater conveyance system if possible.
- ☐ Establish frequency of public parking lot sweeping based on usage and field observations of waste accumulation.
- ☐ Sweep all parking lots at least once before the onset of the wet season.
- ☐ Dispose of parking lot sweeping debris and dirt at a landfill.
- ☐ Follow the procedures below if water is used to clean surfaces:
  - ✓ Block the storm drain or contain runoff.
  - ✓ Collect and pump wash water to the sanitary sewer or discharge to a pervious surface. Do not allow wash water to enter storm drains.
- ☐ Follow the procedures below when cleaning heavy oily deposits:
  - ✓ Clean oily spots with absorbent materials.
  - ✓ Use a screen or filter fabric over inlet, then wash surfaces.
  - ✓ Do not allow discharges to the storm drain.
  - ✓ Vacuum/pump discharges to a tank or discharge to sanitary sewer.
  - ✓ Dispose of spilled materials and absorbents appropriately.

Surface Repair

- ☐ Check local ordinance for SUSMP/LID ordinance.
- ☐ Preheat, transfer or load hot bituminous material away from storm drain inlets.
- ☐ Apply concrete, asphalt, and seal coat during dry weather to prevent contamination from contacting stormwater runoff.
- ☐ Cover and seal nearby storm drain inlets where applicable (with waterproof material or mesh) and manholes before applying seal coat, slurry seal, etc. Leave covers in

place until job is complete and all water from emulsified oil sealants has drained or evaporated. Clean any debris from these covered manholes and drains for proper disposal.

- Use only as much water as necessary for dust control during sweeping to avoid runoff.
- Catch drips from paving equipment that is not in use with pans or absorbent material placed under the machines. Dispose of collected material and absorbents properly.

Spill Response and Prevention Procedures

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Place a stockpile of spill cleanup materials where it will be readily accessible or at a central location.
- Clean up fluid spills immediately with absorbent rags or material.
- Dispose of spilled material and absorbents properly.

Employee Training Program

- Provide regular training to field employees and/or contractors regarding cleaning of paved areas and proper operation of equipment.
- Train employees and contractors in proper techniques for spill containment and cleanup.
- Use a training log or similar method to document training.

Quality Assurance and Record Keeping

- Keep accurate maintenance logs that document minimum BMP activities performed for parking area maintenance, types and quantities of waste disposed of, and any improvement actions.
- Keep accurate logs of spill response actions that document what was spilled, how it was cleaned up, and how the waste was disposed.
- Establish procedures to complete logs and file them in the central office.

Potential Capital Facility Costs and Operation & Maintenance Requirements

Facilities

- Capital investments may be required at some sites to purchase sweeping equipment, train sweeper operators, install oil/water/sand separators, or implement advanced BMPs. These costs can vary significantly depending upon site conditions and the amount of BMPs required.

Maintenance

- Sweep and clean parking lots regularly to minimize pollutant transport into storm drains from stormwater runoff.
- Clean out oil/water/sand separators regularly, especially after heavy storms.
- Maintain advanced BMPs such as vegetated swales, infiltration trenches, or detention basins as appropriate. Refer to the treatment control fact sheets for more information.

Supplemental Information

Advanced BMPs

Some parking areas may require advanced BMPs to further reduce pollutants in stormwater runoff, and a few examples are listed below. Refer to the Treatment Control Fact Sheets and the New Development and Redevelopment Manual for more information.

- When possible, direct sheet runoff to flow into biofilters (vegetated strip and swale) and/or infiltration devices.
- Utilize sand filters or oleophilic collectors for oily waste in low quantities.
- Arrange rooftop drains to prevent drainage directly onto paved surfaces.
- Design lot to include semi-permeable hardscape.

Drainage System Maintenance SC-44

Description

As a consequence of its function, the stormwater drainage facilities on site convey stormwater that may contain certain pollutants either to the offsite conveyance system that collects and transports urban runoff and stormwater, or directly to receiving waters. The protocols in this fact sheet are intended to reduce pollutants leaving the site to the offsite drainage infrastructure or to receiving waters through proper on-site conveyance system operation and maintenance. The targeted constituents will vary depending on site characteristics and operations.

Approach

Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

General Pollution Prevention Protocols

- ☐ Maintain catch basins, stormwater inlets, and other stormwater conveyance structures on a regular basis to remove pollutants, reduce high pollutant concentrations during the first flush of storms, prevent clogging of the downstream conveyance system, restore catch basins' sediment trapping capacity, and ensure the system functions properly hydraulically to avoid flooding.
- ☐ Develop and follow a site specific drainage system maintenance plan that describes maintenance locations, methods, required equipment, water sources, sediment collection areas, disposal requirements, and any other pertinent information.

Good Housekeeping

Illicit Connections and Discharges

- ☐ Look for evidence of illegal discharges or illicit connections during routine maintenance of conveyance system and drainage structures:

Objectives
■ *Cover*
■ *Contain*
■ *Educate*
■ *Reduce/Minimize*

Quality Assurance Record Keeping	✓

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION®

- ✓ Identify evidence of spills such as paints, discoloring, odors, etc.
- ✓ Record locations of apparent illegal discharges/illicit connections.
- ✓ Track flows back to potential discharges and conduct aboveground inspections. This can be done through visual inspection of upgradient manholes or alternate techniques including zinc chloride smoke testing, fluorometric dye testing, physical inspection testing, or television camera inspection.
- ✓ Eliminate the discharge once the origin of flow is established.

- ☐ Stencil or demarcate storm drains, where applicable, to prevent illegal disposal of pollutants. Storm drain inlets should have messages such as "Dump No Waste Drains to Stream" or similar stenciled next to them to warn against ignorant or intentional dumping of pollutants into the storm drainage system.
- ☐ Refer to fact sheet SC-10 Non-Stormwater Discharges for additional information.

Illegal Dumping

- ☐ Inspect and clean up hot spots and other storm drainage areas regularly where illegal dumping and disposal occurs.
- ☐ Establish a system for tracking incidents. The system should be designed to identify the following:
  - ✓ Illegal dumping hot spots;
  - ✓ Types and quantities (in some cases) of wastes;
  - ✓ Patterns in time of occurrence (time of day/night, month, or year);
  - ✓ Mode of dumping (abandoned containers, "midnight dumping" from moving vehicles, direct dumping of materials, accidents/spills); and
  - ✓ Responsible parties.
- ☐ Post "No Dumping" signs in problem areas with a phone number for reporting dumping and disposal. Signs should also indicate fines and penalties for illegal dumping.
- ☐ Refer to fact sheet SC-10 Non-Stormwater Discharges for additional information.

Preventative Maintenance

Catch Basins/Inlet Structures

- ☐ Staff should regularly inspect facilities to ensure compliance with the following:
  - ✓ Immediate repair of any deterioration threatening structural integrity.
  - ✓ Cleaning before the sump is 40% full. Catch basins should be cleaned as frequently as needed to meet this standard.

- Clean catch basins, storm drain inlets, and other conveyance structures before the wet season to remove sediments and debris accumulated during the summer.
- Conduct inspections more frequently during the wet season for problem areas where sediment or trash accumulates more often. Prioritize storm drain inlets; clean and repair as needed.
- Keep accurate logs of the number of catch basins cleaned.
- Store wastes collected from cleaning activities of the drainage system in appropriate containers or temporary storage sites in a manner that prevents discharge to the storm drain.
- Dewater the wastes if necessary with outflow into the sanitary sewer if permitted. Water should be treated with an appropriate filtering device prior to discharge to the sanitary sewer. If discharge to the sanitary sewer is not allowed, water should be pumped or vacuumed to a tank and properly disposed. Do not dewater near a storm drain or stream.

Storm Drain Conveyance System

- Locate reaches of storm drain with deposit problems and develop a flushing schedule that keeps the pipe clear of excessive buildup.
- Collect and pump flushed effluent to the sanitary sewer for treatment whenever possible.

Pump Stations

- Clean all storm drain pump stations prior to the wet season to remove silt and trash.
- Do not allow discharge to reach the storm drain system when cleaning a storm drain pump station or other facility.
- Conduct routine maintenance at each pump station.
- Inspect, clean, and repair as necessary all outlet structures prior to the wet season.

Open Channel

- Modify storm channel characteristics to improve channel hydraulics, increase pollutant removals, and enhance channel/creek aesthetic and habitat value.
- Conduct channel modification/improvement in accordance with existing laws. Any person, government agency, or public utility proposing an activity that will change the natural state of any river, stream, or lake in California, must enter into a Steam or Lake Alteration Agreement with the Department of Fish and Wildlife. The developer-applicant should also contact local governments (city, county, special districts), other state agencies (SWRCB, RWQCB, Department of Forestry, Department of Water Resources), and Army Corps of Engineers and USFWS.

Spill Response and Prevention Procedures

- Keep your spill prevention control plan up-to-date.

- Investigate all reports of spills, leaks, and/or illegal dumping promptly.
- Place a stockpile of spill cleanup materials where it will be readily accessible or at a central location.
- Clean up all spills and leaks using "dry" methods (with absorbent materials and/or rags) or dig up, remove, and properly dispose of contaminated soil.

Employee Training Program

- Educate employees about pollution prevention measures and goals.
- Train employees how to properly handle and dispose of waste using the source control BMPs described above.
- Train employees and subcontractors in proper hazardous waste management.
- Use a training log or similar method to document training.
- Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
- Have staff involved in detection and removal of illicit connections trained in the following:
  - ✓ OSHA-required Health and Safety Training (29 CFR 1910.120) plus annual refresher training (as needed).
  - ✓ OSHA Confined Space Entry training (Cal-OSHA Confined Space, Title 8 and Federal OSHA 29 CFR 1910.146).
  - ✓ Procedural training (field screening, sampling, smoke/dye testing, TV inspection).

Quality Assurance and Record Keeping

- Keep accurate maintenance logs that document minimum BMP activities performed for drainage system maintenance, types and quantities of waste disposed of, and any improvement actions.
- Keep accurate logs of spill response actions that document what was spilled, how it was cleaned up, and how the waste was disposed.
- Keep accurate logs of illicit connections, illicit discharges, and illegal dumping into the storm drain system including how wastes were cleaned up and disposed.
- Establish procedures to complete logs and file them in the central office.

Potential Limitations and Work-Arounds

Provided below are typical limitations and recommended "work-arounds" for drainage system maintenance:

- Clean-up activities may create a slight disturbance for local aquatic species. Access to items and material on private property may be limited. Trade-offs may exist between channel hydraulics and water quality/riparian habitat. If storm channels or basins are recognized as wetlands, many activities, including maintenance, may be subject to regulation and permitting.

  - ✓ Perform all maintenance onsite and do not flush accumulated material downstream to private property or riparian habitats.

- Storm drain flushing is most effective in small diameter pipes (36-inch diameter pipe or less, depending on water supply and sediment collection capacity). Other considerations associated with storm drain flushing may include the availability of a water source, finding a downstream area to collect sediments, and liquid/sediment disposal.

  - ✓ Develop and follow a site specific drainage system maintenance plan that describes maintenance locations, methods, required equipment, water sources, sediment collection areas, disposal requirements, and any other pertinent information.

- Regulations may include adoption of substantial penalties for illegal dumping and disposal.

  - ✓ Do not dump illegal materials anywhere onsite.

  - ✓ Identify illicit connections, illicit discharge, and illegal dumping.

  - ✓ Cleanup spills immediately and properly dispose of wastes.

- Local municipal codes may include sections prohibiting discharge of soil, debris, refuse, hazardous wastes, and other pollutants into the sanitary sewer system.

  - ✓ Collect all materials and pollutants accumulated in drainage system and dispose of according to local regulations.

  - ✓ Install debris excluders in areas with a trash TMDL.

Potential Capital Facility Costs and Operation & Maintenance Requirements

Facilities

- Capital costs will vary substantially depending on the size of the facility and characteristics of the drainage system. Significant capital costs may be associated with purchasing water trucks, vacuum trucks, and any other necessary cleaning equipment or improving the drainage infrastructure to reduce the potential .

- Developing and implementing a site specific drainage system maintenance plan will require additional capital if a similar program is not already in place.

Maintenance

- Two-person teams may be required to clean catch basins with vactor trucks.
- Teams of at least two people plus administrative personnel are required to identify illicit discharges, depending on the complexity of the storm sewer system.
- Arrangements must be made for proper disposal of collected wastes.
- Technical staff are required to detect and investigate illegal dumping violations.
- Methods used for illicit connection detection (smoke testing, dye testing, visual inspection, and flow monitoring) can be costly and time-consuming. Site-specific factors, such as the level of impervious area, the density and ages of buildings, and type of land use will determine the level of investigation necessary.

Supplemental Information

Storm Drain Flushing

Flushing is a common maintenance activity used to improve pipe hydraulics and to remove pollutants in storm drainage systems. Flushing may be designed to hydraulically convey accumulated material to strategic locations, such as an open channel, another point where flushing will be initiated, or the sanitary sewer and the treatment facilities, thus preventing re-suspension and overflow of a portion of the solids during storm events. Flushing prevents "plug flow" discharges of concentrated pollutant loadings and sediments. Deposits can hinder the designed conveyance capacity of the storm drain system and potentially cause backwater conditions in severe cases of clogging.

Storm drain flushing usually takes place along segments of pipe with grades that are too flat to maintain adequate velocity to keep particles in suspension. An upstream manhole is selected to place an inflatable device that temporarily plugs the pipe. Further upstream, water is pumped into the line to create a flushing wave. When the upstream reach of pipe is sufficiently full to cause a flushing wave, the inflated device is rapidly deflated with the assistance of a vacuum pump, thereby releasing the backed up water and resulting in the cleaning of the storm drain segment.

To further reduce impacts of stormwater pollution, a second inflatable device placed well downstream may be used to recollect the water after the force of the flushing wave has dissipated. A pump may then be used to transfer the water and accumulated material to the sanitary sewer for treatment. In some cases, an interceptor structure may be more practical or required to recollect the flushed waters.

It has been found that cleansing efficiency of periodic flush waves is dependent upon flush volume, flush discharge rate, sewer slope, sewer length, sewer flow rate, sewer diameter, and population density. As a rule of thumb, the length of line to be flushed should not exceed 700 feet. At this maximum recommended length, the percent removal efficiency ranges between 65-75% for organics and 55-65% for dry weather grit/inorganic material. The percent removal efficiency drops rapidly beyond that. Water is commonly supplied by a water truck, but fire hydrants can also supply water. To make the best use of water, it is recommended that reclaimed water be used if allowed or that fire hydrant line flushing coincide with storm sewer flushing.

Efficient Irrigation SD-12

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Irrigation water provided to landscaped areas may result in excess irrigation water being conveyed into stormwater drainage systems.

Approach

Project plan designs for development and redevelopment should include application methods of irrigation water that minimize runoff of excess irrigation water into the stormwater conveyance system.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Designing New Installations

The following methods to reduce excessive irrigation runoff should be considered, and incorporated and implemented where determined applicable and feasible by the Permittee:

- Employ rain-triggered shutoff devices to prevent irrigation after precipitation.
- Design irrigation systems to each landscape area's specific water requirements.
- Include design featuring flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines.
- Implement landscape plans consistent with County or City water conservation resolutions, which may include provision of water sensors, programmable irrigation times (for short cycles), etc.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Design timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the storm water drainage system.
- Group plants with similar water requirements in order to reduce excess irrigation runoff and promote surface filtration. Choose plants with low irrigation requirements (for example, native or drought tolerant species). Consider design features such as:
  - Using mulches (such as wood chips or bar) in planter areas without ground cover to minimize sediment in runoff
  - Installing appropriate plant materials for the location, in accordance with amount of sunlight and climate, and use native plant materials where possible and/or as recommended by the landscape architect
  - Leaving a vegetative barrier along the property boundary and interior watercourses, to act as a pollutant filter, where appropriate and feasible
  - Choosing plants that minimize or eliminate the use of fertilizer or pesticides to sustain growth
- Employ other comparable, equally effective methods to reduce irrigation water runoff.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Storm Drain Signage SD-13

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- ☑ Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Waste materials dumped into storm drain inlets can have severe impacts on receiving and ground waters. Posting notices regarding discharge prohibitions at storm drain inlets can prevent waste dumping. Storm drain signs and stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets.

Approach

The stencil or affixed sign contains a brief statement that prohibits dumping of improper materials into the urban runoff conveyance system. Storm drain messages have become a popular method of alerting the public about the effects of and the prohibitions against waste disposal.

Suitable Applications

Stencils and signs alert the public to the destination of pollutants discharged to the storm drain. Signs are appropriate in residential, commercial, and industrial areas, as well as any other area where contributions or dumping to storm drains is likely.

Design Considerations

Storm drain message markers or placards are recommended at all storm drain inlets within the boundary of a development project. The marker should be placed in clear sight facing toward anyone approaching the inlet from either side. All storm drain inlet locations should be identified on the development site map.

Designing New Installations

The following methods should be considered for inclusion in the project design and show on project plans:

- Provide stenciling or labeling of all storm drain inlets and catch basins, constructed or modified, within the project area with prohibitive language. Examples include “NO DUMPING

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

– DRAINS TO OCEAN" and/or other graphical icons to discourage illegal dumping.

- Post signs with prohibitive language and/or graphical icons, which prohibit illegal dumping at public access points along channels and creeks within the project area.

Note - Some local agencies have approved specific signage and/or storm drain message placards for use. Consult local agency stormwater staff to determine specific requirements for placard types and methods of application.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. If the project meets the definition of "redevelopment", then the requirements stated under " designing new installations" above should be included in all project design plans.

Additional Information

Maintenance Considerations

- Legibility of markers and signs should be maintained. If required by the agency with jurisdiction over the project, the owner/operator or homeowner's association should enter into a maintenance agreement with the agency or record a deed restriction upon the property title to maintain the legibility of placards or signs.

Placement

- Signage on top of curbs tends to weather and fade.

- Signage on face of curbs tends to be worn by contact with vehicle tires and sweeper brooms.

Supplemental Information

Examples

- Most MS4 programs have storm drain signage programs. Some MS4 programs will provide stencils, or arrange for volunteers to stencil storm drains as part of their outreach program.

Other Resources

A Manual for the Standard Urban Stormwater Mitigation Plan (SUSMP), Los Angeles County Department of Public Works, May 2002.

Model Standard Urban Storm Water Mitigation Plan (SUSMP) for San Diego County, Port of San Diego, and Cities in San Diego County, February 14, 2002.

Ventura Countywide Technical Guidance Manual for Stormwater Quality Control Measures, July 2002.

Maintenance Bays & Docks SD-31

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- ☑ Prohibit Dumping of Improper Materials
- ☑ Contain Pollutants
- Collect and Convey

Description

Several measures can be taken to prevent operations at maintenance bays and loading docks from contributing a variety of toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to the stormwater conveyance system.

Approach

In designs for maintenance bays and loading docks, containment is encouraged. Preventative measures include overflow containment structures and dead-end sumps. However, in the case of loading docks from grocery stores and warehouse/distribution centers, engineered infiltration systems may be considered.

Suitable Applications

Appropriate applications include commercial and industrial areas planned for development or redevelopment.

Design Considerations

Design requirements for vehicle maintenance and repair are governed by Building and Fire Codes, and by current local agency ordinances, and zoning requirements. The design criteria described in this fact sheet are meant to enhance and be consistent with these code requirements.

Designing New Installations

Designs of maintenance bays should consider the following:

- Repair/maintenance bays and vehicle parts with fluids should be indoors; or designed to preclude urban run-on and runoff.
- Repair/maintenance floor areas should be paved with Portland cement concrete (or equivalent smooth impervious surface).

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Repair/maintenance bays should be designed to capture all wash water leaks and spills. Provide impermeable berms, drop inlets, trench catch basins, or overflow containment structures around repair bays to prevent spilled materials and wash-down waters form entering the storm drain system. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

- Other features may be comparable and equally effective.

The following designs of loading/unloading dock areas should be considered:

- Loading dock areas should be covered, or drainage should be designed to preclude urban run-on and runoff.

- Direct connections into storm drains from depressed loading docks (truck wells) are prohibited.

- Below-grade loading docks from grocery stores and warehouse/distribution centers of fresh food items should drain through water quality inlets, or to an engineered infiltration system, or an equally effective alternative. Pre-treatment may also be required.

- Other features may be comparable and equally effective.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Additional Information

Stormwater and non-stormwater will accumulate in containment areas and sumps with impervious surfaces. Contaminated accumulated water must be disposed of in accordance with applicable laws and cannot be discharged directly to the storm drain or sanitary sewer system without the appropriate permit.

Other Resources

A Manual for the Standard Urban Stormwater Mitigation Plan (SUSMP), Los Angeles County Department of Public Works, May 2002.

Model Standard Urban Storm Water Mitigation Plan (SUSMP) for San Diego County, Port of San Diego, and Cities in San Diego County, February 14, 2002.

Model Water Quality Management Plan (WQMP) for County of Orange, Orange County Flood Control District, and the Incorporated Cities of Orange County, Draft February 2003.

Ventura Countywide Technical Guidance Manual for Stormwater Quality Control Measures, July 2002.

Trash Storage Areas SD-32

Description

Trash storage areas are areas where a trash receptacle (s) are located for use as a repository for solid wastes. Stormwater runoff from areas where trash is stored or disposed of can be polluted. In addition, loose trash and debris can be easily transported by water or wind into nearby storm drain inlets, channels, and/or creeks. Waste handling operations that may be sources of stormwater pollution include dumpsters, litter control, and waste piles.

Approach

This fact sheet contains details on the specific measures required to prevent or reduce pollutants in stormwater runoff associated with trash storage and handling. Preventative measures including enclosures, containment structures, and impervious pavements to mitigate spills, should be used to reduce the likelihood of contamination.

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- ☑ Contain Pollutants
- Collect and Convey

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Design requirements for waste handling areas are governed by Building and Fire Codes, and by current local agency ordinances and zoning requirements. The design criteria described in this fact sheet are meant to enhance and be consistent with these code and ordinance requirements. Hazardous waste should be handled in accordance with legal requirements established in Title 22, California Code of Regulation.

Wastes from commercial and industrial sites are typically hauled by either public or commercial carriers that may have design or access requirements for waste storage areas. The design criteria in this fact sheet are recommendations and are not intended to be in conflict with requirements established by the waste hauler. The waste hauler should be contacted prior to the design of your site trash collection areas. Conflicts or issues should be discussed with the local agency.

Designing New Installations

Trash storage areas should be designed to consider the following structural or treatment control BMPs:

- Design trash container areas so that drainage from adjoining roofs and pavement is diverted around the area(s) to avoid run-on. This might include berming or grading the waste handling area to prevent run-on of stormwater.
- Make sure trash container areas are screened or walled to prevent off-site transport of trash.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Use lined bins or dumpsters to reduce leaking of liquid waste.
- Provide roofs, awnings, or attached lids on all trash containers to minimize direct precipitation and prevent rainfall from entering containers.
- Pave trash storage areas with an impervious surface to mitigate spills.
- Do not locate storm drains in immediate vicinity of the trash storage area.
- Post signs on all dumpsters informing users that hazardous materials are not to be disposed of therein.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Additional Information

Maintenance Considerations

The integrity of structural elements that are subject to damage (i.e., screens, covers, and signs) must be maintained by the owner/operator. Maintenance agreements between the local agency and the owner/operator may be required. Some agencies will require maintenance deed restrictions to be recorded of the property title. If required by the local agency, maintenance agreements or deed restrictions must be executed by the owner/operator before improvement plans are approved.

Drain Inlet Insert MP-52

General Description

Drain inlet inserts, also known as catch basin, drop inlet or curb inlet inserts, are used to remove pollutants at the point of entry to the storm drain system. There are a multitude of inserts of various shapes and configurations including baffles, baskets, boxes, fabrics, sorbent media, screens, and skimmers. The effectiveness of drain inlet inserts depends on their design, application, loading, and frequency of maintenance to remove accumulated sediment, trash, and debris.

Inspection / Maintenance Considerations

Routine inspection and maintenance is necessary to maintain functionality of drain inlet inserts and to prevent re-suspension and discharge of accumulated pollutants. Maintenance activities vary depending on the type of drain inlet insert being implemented; refer to the manufacturer's recommendations for more information.

Advanced BMPs Covered

Maintenance Concerns

- *Sediment, Trash, and Debris Accumulations*
- *Pollutant Re-suspension and Discharge*

Targeted Constituents*

Sediment	✓
Nutrients	✓
Trash	✓
Metals	✓
Bacteria	
Oil and Grease	✓
Organics	✓

**Removal Effectiveness varies for different manufacturer designs. See New Development and Redevelopment Handbook-Section 5 for more information.*

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION®

Inspection Activities	Suggested Frequency
☐ Verify that stormwater enters the unit and does not leak around the perimeter.	After construction.
☐ Inspect for sediment, trash, and debris buildup and proper functioning.	At the beginning of the wet season and after significant storms
Maintenance Activities	**Suggested Frequency**
☐ Remove accumulated sediment, trash, and debris. ☐ Replace sorbent media.	At the beginning of the wet season and as necessary

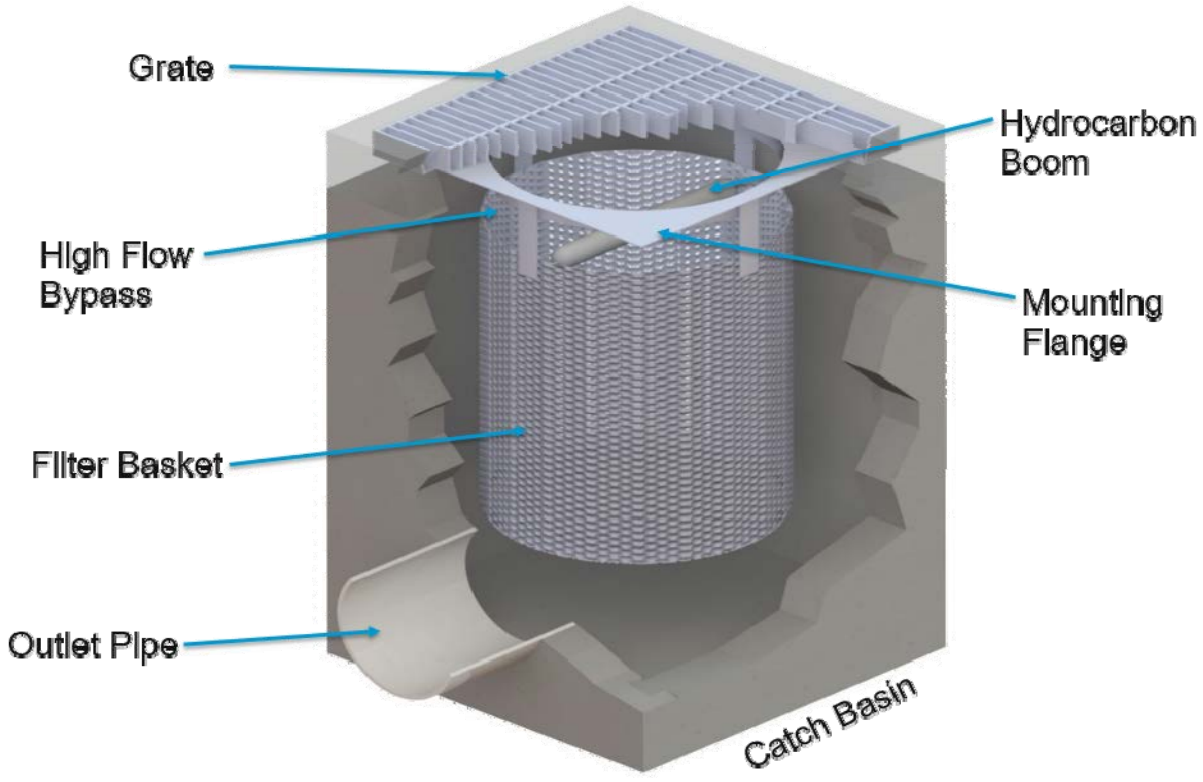
Grate Inlet Filter

Bio Clean
A Forterra Company

OPERATION & MAINTENANCE



Bio Clean Environmental Services, Inc.
398 Via El Centro
Oceanside, CA 92058

www.BioCleanEnvironmental.com
p: 760.433.7640
f: 760.433.3176

OPERATION & MAINTENANCE

The Bio Clean Grate Inlet Filter is a stormwater device designed to remove high levels of trash, debris, sediments and hydrocarbons. The filter is available in several configurations including trash full capture, multi-level screening, Kraken membrane filter and media filter variations. This manual covers maintenance procedures of the trash full capture and multi-level screening configurations. A supplemental manual is available for the Kraken and media filter variations. This filter is made of 100% stainless steel and is available and various sizes and depths allowing it to fit in any grated catch basin inlet. The filters heavy duty construction allows for cleaning with any vacuum truck. The filet can also easily be cleaned by hand.

As with all stormwater BMPs, inspection and maintenance on the Grate Inlet Filter is necessary. Stormwater regulations require BMPs be inspected and maintained to ensure they are operating as designed to allow for effective pollutant removal and provide protection to receiving water bodies. It is recommended that inspections be performed multiple times during the first year to assess site-specific loading conditions. This is recommended because pollutant loading can vary greatly from site to site. Variables such as nearby soil erosion or construction sites, winter sanding of roads, amount of daily traffic and land use can increase pollutant loading on the system. The first year of inspections can be used to set inspection and maintenance intervals for subsequent years. Without appropriate maintenance a BMP can exceed its storage capacity which can negatively affect its continued performance in removing and retaining captured pollutants.

System Diagram:

Inspection Equipment

Following is a list of equipment to allow for simple and effective inspection of the Grate Inlet Filter:

- Bio Clean Environmental Inspection Form (contained within this manual).
- Manhole hook or appropriate tools to remove access hatches and covers.
- Appropriate traffic control signage and procedures.
- Protective clothing and eye protection.
- Note: entering a confined space requires appropriate safety and certification. It is generally not required for routine inspections or maintenance of the system.

Inspection Steps

The core to any successful stormwater BMP maintenance program is routine inspections. The inspection steps required on the Grate Inlet Filter are quick and easy. As mentioned above the first year should be seen as the maintenance interval establishment phase. During the first year more frequent inspections should occur in order to gather loading data and maintenance requirements for that specific site. This information can be used to establish a base for long-term inspection and maintenance interval requirements.

The Grate Inlet Filter can be inspected though visual observation. All necessary pre-inspection steps must be carried out before inspection occurs, such as safety measures to protect the inspector and nearby pedestrians from any dangers associated with an open grated inlet. Once the grate has been safely removed the inspection process can proceed:

- Prepare the inspection form by writing in the necessary information including project name, location, date & time, unit number and other info (see inspection form).
- Observe the filter with the grate removed.
- Look for any out of the ordinary obstructions on the grate or in the filter and its bypass. Write down any observations on the inspection form.
- Through observation and/or digital photographs estimate the amount of trash, foliage and sediment accumulated inside the filter basket. Record this information on the inspection form.
- Observe the condition and color of the hydrocarbon boom. Record this information on the inspection form.
- Finalize inspection report for analysis by the maintenance manager to determine if maintenance is required.

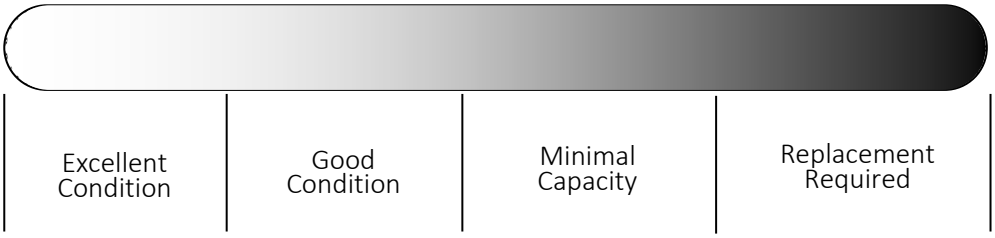
Maintenance Indicators

Based upon observations made during inspection, maintenance of the system may be required based on the following indicators:

- Missing or damaged internal components.
- Obstructions in the filter basket and its bypass.
- Excessive accumulation of trash, foliage and sediment in the filter basket. Maintenance is required when the basket is greater than half-full.
- The following chart shows the 50% and 100% storage capacity of each filter height:

Model	Filter Basket Diameter (in)	Filter Basket Height (in)	50% Storage Capacity (cu ft)	100% Storage Capacity (cu ft)
BC-GRATE-12-12-12	10.00	12.00	0.27	0.55
BC-GRATE-18-18-18	16.00	18.00	1.05	2.09
BC-GRATE-24-24-24	21.00	24.00	2.41	4.81
BC-GRATE-30-30-24	27.00	24.00	3.98	7.95
BC-GRATE-36-36-24	33.00	24.00	5.94	11.88
BC-GRATE-48-48-18	44.00	18.00	7.92	15.84

Maintenance Equipment



It is recommended that a vacuum truck be utilized to minimize the time required to maintain the Curb Inlet Filter, though it can easily cleaned by hand:

- Bio Clean Environmental Maintenance Form (contained in O&M Manual).
- Manhole hook or appropriate tools to remove the grate.
- Appropriate safety signage and procedures.
- Protective clothing and eye protection.
- Note: entering a confined space requires appropriate safety and certification. It is generally not required for routine maintenance of the system. Small or large vacuum truck (with pressure washer attachment preferred).

Maintenance Procedures

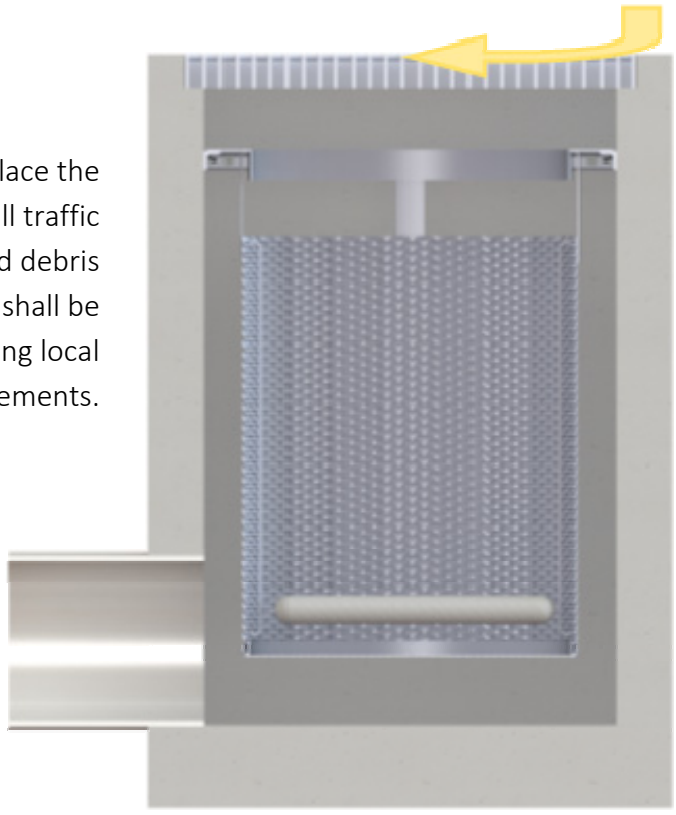
It is recommended that maintenance occurs at least two days after the most recent rain event to allow debris and sediments to dry out. Maintaining the system while flows are still entering it will increase the time and complexity required for maintenance. Cleaning of the Grate Inlet Filter can be performed utilizing a vacuum truck. Once all safety measures have been set up cleaning of the Grate Inlet Filter can proceed as followed:

- Remove grate (traffic control and safety measures to be completed prior).
- Using an extension on a vacuum truck position the hose over the opened catch basin. Insert the vacuum hose down into the filter basket and suck out trash, foliage and sediment. A pressure wash is recommended and will assist in spraying of any debris stuck on the side or bottom of the filter basket. Power wash off the filter basket sides and bottom.
- Next remove the hydrocarbon boom that is attached to the inside of the filter basket. The hydrocarbon boom is fastened to rails on two opposite sides of the basket (vertical rails). Assess the color and condition of the boom using the following information in the next bullet point. If replacement is required install and fasten on a new hydrocarbon boom. Booms can be ordered directly from the manufacturer.
- Follow is a replacement indication color chart for the hydrocarbon booms:

- The last step is to replace the grate and remove all traffic control.
- All removed debris and pollutants shall be disposed of following local and state requirements.
- Disposal requirements for recovered pollutants may vary depending on local guidelines. In most areas the sediment, once dewatered, can be disposed of in a sanitary landfill. It is not anticipated that the sediment would be classified as hazardous waste.
- In the case of damaged components, replacement parts can be ordered from the manufacturer. Hydrocarbon booms can also be ordered directly from the manufacturer as previously noted.

Maintenance Sequence

Remove grate and set up vacuum truck to clean the filter basket.



Insert the vacuum hose down into the filter basket and suck out debris. Use a pressure washer to assist in vacuum removal. Pressure wash off screens.

Remove the hydrocarbon boom that is attached to the inside of the filter basket. The hydrocarbon boom is fastened to rails on two opposite sides of the basket (vertical rails). Assess the color and condition of the boom using the following information in the next bullet point. If replacement is required install and fasten on a new hydrocarbon boom.

Close up and replace the grate and remove all traffic control. All removed debris and pollutants shall be disposed of following local and state requirements.

Gravity Separators MP-51

General Description

Gravity separators: (alternatively, swirl concentrators, swirl or vortex separators, or hydrodynamic separators) are gravity separators, and in principle are essentially wet vaults. The difference from wet vaults, however, is that the gravity separator is round, rather than rectangular, and the water moves in a centrifugal fashion before exiting. By having the water move in a circular fashion, rather than a straight line as is the case with a standard wet vault, it is possible to obtain significant removal of suspended sediments and attached pollutants with less space. They can provide effective pretreatment when paired with filtration devices, such as media filters or bioretention systems.

Gravity separators were originally developed for combined sewer overflows (CSOs), where they are used primarily to remove coarse inorganic solids. Gravity separation has been adapted to stormwater treatment by several manufacturers.

Inspection/Maintenance Considerations

Gravity separators require routine removal of accumulated sediment, trash, and debris. As some of the systems have standing water that remains between storms, gravity separators can become a nuisance due to mosquito breeding. Also, a loss of dissolved pollutants may occur as accumulated organic matter (e.g., leaves) decomposes in the units.

Advanced BMPs Covered

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION®

Inspection Activities	Suggested Frequency
☐ Inspect the unit twice during the first wet season of operation, setting the cleaning frequency accordingly.	Post construction
☐ Inspect for floating debris, sediment buildup, and accumulated petroleum products.	Annual
☐ Contact the local mosquito and vector control agency if mosquito breeding is observed or suspected.	As needed
Maintenance Activities	**Suggested Frequency**
☐ Remove sediment that has accumulated in the vault after construction in the drainage area is complete.	Post construction
☐ The recommended frequency of cleaning differs with the manufacturer, ranging from one to two years. ☐ Maintenance consists of the removal of accumulated material with a vactor truck. It may be necessary to remove and dispose the floatables separately due to the presence of petroleum product. Annual maintenance is typical.	Annual, or per manufacturers recommendations
☐ Remove floating debris and accumulated petroleum products as needed. Floating oil should be removed from wet vaults that are used as oil/water separators when oil accumulation exceeds one inch.	Annual, or more frequent as needed

CDS® Inspection and Maintenance Guide

CDS TECHNOLOGIES

Maintenance

The CDS system should be inspected at regular intervals and maintained when necessary to ensure optimum performance. The rate at which the system collects pollutants will depend more heavily on site activities than the size of the unit. For example, unstable soils or heavy winter sanding will cause the grit chamber to fill more quickly but regular sweeping of paved surfaces will slow accumulation.

Inspection

Inspection is the key to effective maintenance and is easily performed. Pollutant transport and deposition may vary from year to year and regular inspections will help ensure that the system is cleaned out at the appropriate time. At a minimum, inspections should be performed twice per year (e.g. spring and fall) however more frequent inspections may be necessary in climates where winter sanding operations may lead to rapid accumulations, or in equipment washdown areas. Installations should also be inspected more frequently where excessive amounts of trash are expected.

The visual inspection should ascertain that the system components are in working order and that there are no blockages or obstructions in the inlet and separation screen. The inspection should also quantify the accumulation of hydrocarbons, trash, and sediment in the system. Measuring pollutant accumulation can be done with a calibrated dipstick, tape measure or other measuring instrument. If absorbent material is used for enhanced removal of hydrocarbons, the level of discoloration of the sorbent material should also be identified during inspection. It is useful and often required as part of an operating permit to keep a record of each inspection. A simple form for doing so is provided.

Access to the CDS unit is typically achieved through two manhole access covers. One opening allows for inspection and cleanout of the separation chamber (cylinder and screen) and isolated sump. The other allows for inspection and cleanout of sediment captured and retained outside the screen. For deep units, a single manhole access point would allows both sump cleanout and access outside the screen.

The CDS system should be cleaned when the level of sediment has reached 75% of capacity in the isolated sump or when an appreciable level of hydrocarbons and trash has accumulated. If absorbent material is used, it should be replaced when significant discoloration has occurred. Performance will not be impacted until 100% of the sump capacity is exceeded however it is recommended that the system be cleaned prior to that for easier removal of sediment. The level of sediment is easily determined by measuring from finished grade down to the top of the sediment pile. To avoid underestimating the level of sediment in the chamber, the measuring device must be lowered to the top of the sediment pile carefully. Particles at the top of the pile typically offer less resistance to the end of the rod than consolidated particles toward the bottom of the pile. Once this measurement is recorded, it should be compared to the as-built drawing for the unit to determine weather the height of the sediment pile off the bottom of the sump floor exceeds 75% of the total height of isolated sump.

Cleaning

Cleaning of a CDS systems should be done during dry weather conditions when no flow is entering the system. The use of a vacuum truck is generally the most effective and convenient method of removing pollutants from the system. Simply remove the manhole covers and insert the vacuum hose into the sump. The system should be completely drained down and the sump fully evacuated of sediment. The area outside the screen should also be cleaned out if pollutant build-up exists in this area.

In installations where the risk of petroleum spills is small, liquid contaminants may not accumulate as quickly as sediment. However, the system should be cleaned out immediately in the event of an oil or gasoline spill should be cleaned out immediately. Motor oil and other hydrocarbons that accumulate on a more routine basis should be removed when an appreciable layer has been captured. To remove these pollutants, it may be preferable to use absorbent pads since they are usually less expensive to dispose than the oil/water emulsion that may be created by vacuuming the oily layer. Trash and debris can be netted out to separate it from the other pollutants. The screen should be power washed to ensure it is free of trash and debris.

Manhole covers should be securely seated following cleaning activities to prevent leakage of runoff into the system from above and also to ensure that proper safety precautions have been followed. Confined space entry procedures need to be followed if physical access is required. Disposal of all material removed from the CDS system should be done in accordance with local regulations. In many jurisdictions, disposal of the sediments may be handled in the same manner as the disposal of sediments removed from catch basins or deep sump manholes.

CDS Inspection & Maintenance Log

CDS Model: _____ Location: _____

Date	Water depth to sediment[1]	Floatable Layer Thickness[2]	Describe Maintenance Performed	Maintenance Personnel	Comments

1. The water depth to sediment is determined by taking two measurements with a stadia rod: one measurement from the manhole opening to the top of the sediment pile and the other from the manhole opening to the water surface. If the difference between these measurements is less than the values listed in table 1 the system should be cleaned out. **Note: to avoid underestimating the volume of sediment in the chamber, the measuring device must be carefully lowered to the top of the sediment pile.**

2. For optimum performance, the system should be cleaned out when the floating hydrocarbon layer accumulates to an appreciable thickness. In the event of an oil spill, the system should be cleaned immediately.

Infiltration Basin TC-11

General Description

An infiltration basin is a shallow impoundment that is designed to infiltrate stormwater. Infiltration basins store stormwater runoff until it gradually exfiltrates into the underlying soil. Pollutant removal occurs through the infiltration of runoff and the adsorption of pollutants into the soil and vegetation. Additional benefits include:

- Reduced runoff volume and attenuation of peak flows, and
- Facilitated groundwater recharge thus helping to maintain low flows in stream systems.

Inspection / Maintenance Considerations

The use and regular maintenance of pretreatment BMPs will significantly minimize maintenance requirements for the basin. Installing vegetated swales or a sediment forebay upstream from the infiltration basin can provide effective pretreatment and reduce maintenance.

Spill response procedures and controls should be implemented to prevent spills from reaching the infiltration system. This BMP may require groundwater monitoring, and basins cannot be put into operation until the upstream tributary area is stabilized.

Advanced BMPs Covered

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION®

Inspection Activities	Suggested Frequency
☐ Observe drain time for a storm after completion or modification of the facility to confirm that the desired drain time has been obtained. ☐ Newly established vegetation should be inspected several times to determine if any landscape maintenance (reseeding, irrigation, etc.) is necessary. ☐ Inspect for upslope or adjacent contributing sediment sources and ensure that pretreatment systems are in place.	Post construction and semi-annually (beginning and end of rainy season)
☐ Inspect for the following issues: differential accumulation of sediment, signs of wetness or damage to structures, erosion of the basin floor, dead or dying grass on the bottom, condition of riprap, drain time, signs of petroleum hydrocarbon contamination, standing water, trash and debris, sediment accumulation, slope stability, pretreatment device condition	Semi-annually and after extreme events
Maintenance Activities	**Suggested Frequency**
☐ Factors responsible for clogging should be repaired immediately.	Immediately
☐ Remove invasive weeds once monthly during the first two growing seasons.	Monthly during growing season
☐ Stabilize eroded banks with erosion control mat or mulch and revegetate. ☐ Repair undercut and eroded areas at inflow and outflow structures. ☐ Maintain access to the basin for regular maintenance activities. ☐ Mow as appropriate for vegetative cover species. ☐ Monitor health of vegetation and replace as necessary. ☐ Control mosquitoes as necessary. ☐ Remove litter and debris from infiltration basin area as required. ☐ Trim vegetation to prevent establishment of woody vegetation that decreases storage volume.	Standard maintenance (as needed)
☐ Mow and remove grass clippings, litter, and debris. ☐ Replant eroded or barren spots to prevent erosion and accumulation of sediment.	Semi-annual
☐ Scrape bottom and remove sediment when accumulated sediment reduces original infiltration rate by 25-50%. Restore original cross-section and infiltration rate. Properly dispose of sediment. ☐ Seed or sod to restore ground cover. ☐ Disc or otherwise aerate bottom. ☐ Dethatch basin bottom.	3-5 year maintenance

If there are actual signs of clogging or significant loss of infiltrative capacity the following maintenance activities should be considered:

- ☐ Mechanically de-thatching and/or aerating the top soils along the sides and bottom of the basin.
- ☐ Tilling or dicing to scarify the bottom of the basin

These activities should be on an "as-needed" rather than on a routine basis. Always remove deposited sediments before scarification, and use a hand-guided rotary tiller, if possible, or a disc harrow pulled by a light tractor.

Clogged infiltration basins with surface standing water can become a breeding area for mosquitoes and midges. Maintenance efforts associated with infiltration basins should include frequent inspections to ensure that water infiltrates into the subsurface completely (recommended infiltration rate of 96 hours or less) and that vegetation is carefully managed to prevent creating mosquito and other vector habitats.

Additional Information

In most cases, surface sediment removed from an infiltration basin during periodic maintenance to restore capacity does not contain toxic materials (e/g metals, oil and grease, or organics) at levels posing a hazardous concern. Studies to date indicate that pond sediments are generally below toxicity limits and can be safely landfilled or disposed onsite. Onsite sediment disposal is always preferable (if local authorities permit) as long as the sediments are deposited away from the perimeter to prevent their reentry into the basin. Sediments should be tested for toxic materials in compliance with current landfill requirements and disposed of properly.

Maintenance activities should use lightweight equipment (e.g. bobcat), which will not compact the underlying soil to remove the top layer of sediment. The remaining soil should be tilled and revegetated as soon as possible.

Sediment removal within the basin should be performed when the sediment is dry enough so that it is cracked and readily separates from the basin floor. This minimizes intermixing of the finer sediment with underlying coarser material on the basin floor.

Special maintenance considerations are required maintain infiltration basins effectiveness in cold climates. Treating runoff containing salt-based deicers in an infiltration basin may reduce soil fertility cause vegetation to fail. Incorporating mulch into the soil can help to mitigate this problem. Infiltration basins should not be used to store snow plowed from highways or parking lots. The sand in this snow can clog the basin. In addition, the chlorides and other pollutants can contaminate the groundwater.

THE ISOLATOR® ROW

INTRODUCTION

An important component of any Stormwater Pollution Prevention Plan is inspection and maintenance. The StormTech Isolator Row is a technique to inexpensively enhance Total Suspended Solids (TSS) removal and provide easy access for inspection and maintenance.

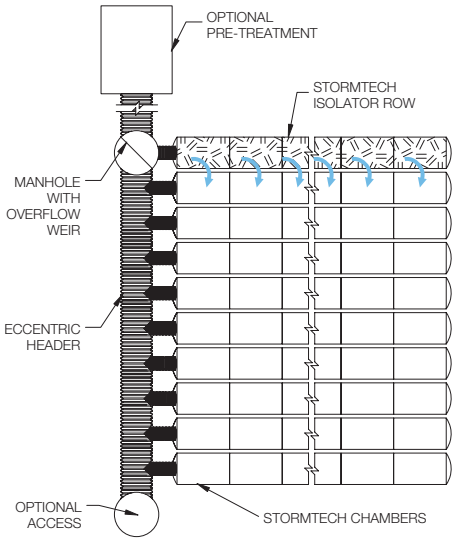
THE ISOLATOR ROW

The Isolator Row is a row of StormTech chambers, either SC-160LP, SC-310, SC-310-3, SC-740, DC-780, MC-3500 or MC-4500 models, that is surrounded with filter fabric and connected to a closely located manhole for easy access. The fabric-wrapped chambers provide for settling and filtration of sediment as storm water rises in the Isolator Row and ultimately passes through the filter fabric. The open bottom chambers and perforated sidewalls (SC-310, SC- 310-3 and SC-740 models) allow storm water to flow both vertically and horizontally out of the chambers. Sediments are captured in the Isolator Row protecting the storage areas of the adjacent stone and chambers from sediment accumulation.

Two different fabrics are used for the Isolator Row. A woven geotextile fabric is placed between the stone and the Isolator Row chambers. The tough geotextile provides a media for storm water filtration and provides a durable surface for maintenance operations. It is also designed to prevent scour of the underlying stone and remain intact during high pressure jetting. A non-woven fabric is placed over the chambers to provide a filter media for flows passing through the perforations in the sidewall of the chamber. The non-woven fabric is not required over the SC-160LP, DC-780, MC-3500 or MC-4500 models as these chambers do not have perforated side walls.

The Isolator Row is typically designed to capture the “first flush” and offers the versatility to be sized on a volume basis or flow rate basis. An upstream manhole not only provides access to the Isolator Row but typically includes a high flow weir such that storm water flowrates or volumes that exceed the capacity of the Isolator Row overtop the over flow weir and discharge through a manifold to the other chambers.

The Isolator Row may also be part of a treatment train. By treating storm water prior to entry into the chamber system, the service life can be extended and pollutants such as hydrocarbons can be captured. Pre-treatment best management practices can be as simple as deep sump catch basins, oil-water separators or can be innovative storm water treatment devices. The design of the treatment train and selection of pretreatment devices by the design engineer is often driven by regulatory requirements. Whether pretreatment is used or not, the Isolator Row is recommended by StormTech as an effective means to minimize maintenance requirements and maintenance costs.



Note: See the StormTech Design Manual for detailed information on designing inlets for a StormTech system, including the Isolator Row.

Looking down the Isolator Row from the manhole opening, woven geotextile is shown between the chamber and stone base.

StormTech Isolator Row with Overflow Spillway (not to scale)

ISOLATOR ROW INSPECTION/MAINTENANCE

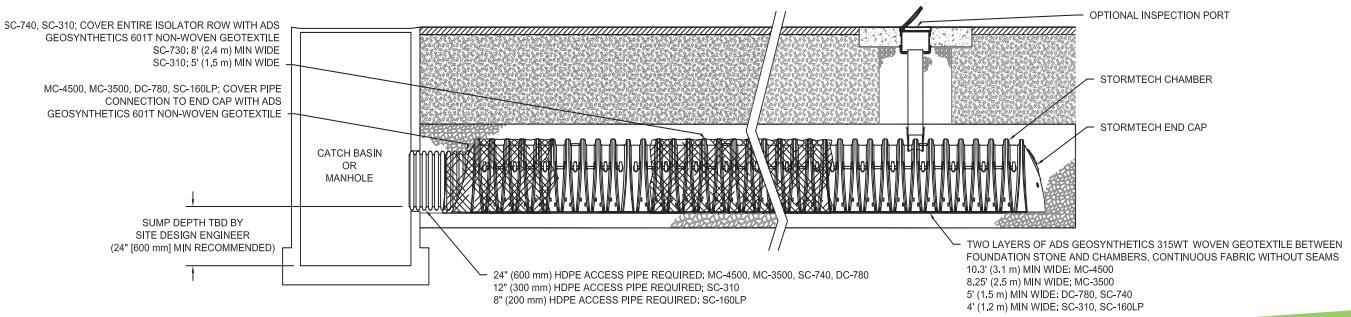
INSPECTION

The frequency of inspection and maintenance varies by location. A routine inspection schedule needs to be established for each individual location based upon site specific variables. The type of land use (i.e. industrial, commercial, residential), anticipated pollutant load, percent imperviousness, climate, etc. all play a critical role in determining the actual frequency of inspection and maintenance practices.

At a minimum, StormTech recommends annual inspections. Initially, the Isolator Row should be inspected every 6 months for the first year of operation. For subsequent years, the inspection should be adjusted based upon previous observation of sediment deposition.

The Isolator Row incorporates a combination of standard manhole(s) and strategically located inspection ports (as needed). The inspection ports allow for easy access to the system from the surface, eliminating the need to perform a confined space entry for inspection purposes.

If upon visual inspection it is found that sediment has accumulated, a stadia rod should be inserted to determine the depth of sediment. When the average depth of sediment exceeds 3 inches throughout the length of the Isolator Row, clean-out should be performed.



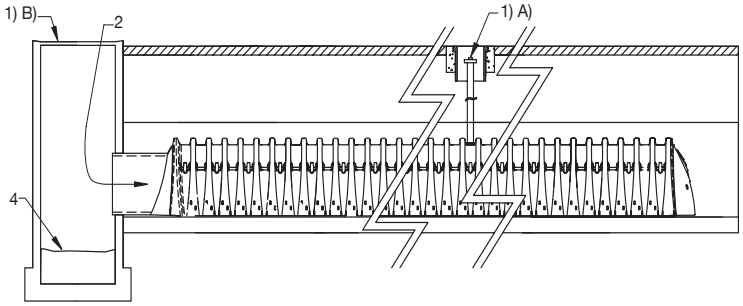
MAINTENANCE

The Isolator Row was designed to reduce the cost of periodic maintenance. By "isolating" sediments to just one row, costs are dramatically reduced by eliminating the need to clean out each row of the entire storage bed. If inspection indicates the potential need for maintenance, access is provided via a manhole(s) located on the end(s) of the row for cleanout. If entry into the manhole is required, please follow local and OSHA rules for a confined space entries.

Maintenance is accomplished with the JetVac process. The JetVac process utilizes a high pressure water nozzle to propel itself down the Isolator Row while scouring and suspending sediments. As the nozzle is retrieved, the captured pollutants are flushed back into the manhole for vacuuming. Most sewer and pipe maintenance companies have vacuum/JetVac combination vehicles. Selection of an appropriate JetVac nozzle will improve maintenance efficiency. Fixed nozzles designed for culverts or large diameter pipe cleaning are preferable. Rear facing jets with an effective spread of at least 45" are best. Most JetVac reels have 400 feet of hose allowing maintenance of an Isolator Row up to 50 chambers long. **The JetVac process shall only be performed on StormTech Isolator Rows that have AASHTO class 1 woven geotextile (as specified by StormTech) over their angular base stone.**

StormTech Isolator Row (not to scale)

Note: Non-woven fabric is only required over the inlet pipe connection into the end cap for SC-160LP, DC-780, MC-3500 and MC-4500 chamber models and is not required over the entire Isolator Row.



ISOLATOR ROW STEP BY STEP MAINTENANCE PROCEDURES

STEP 1
Inspect Isolator Row for sediment.
- A) Inspection ports (if present)
  - i. Remove lid from floor box frame
  - ii. Remove cap from inspection riser
  - iii. Using a flashlight and stadia rod,measure depth of sediment and record results on maintenance log.
  - iv. If sediment is at or above 3 inch depth, proceed to Step 2. If not, proceed to Step 3.
- B) All Isolator Rows
  - i. Remove cover from manhole at upstream end of Isolator Row
  - ii. Using a flashlight, inspect down Isolator Row through outlet pipe
    1. Mirrors on poles or cameras may be used to avoid a confined space entry
    2. Follow OSHA regulations for confined space entry if entering manhole
  - iii. If sediment is at or above the lower row of sidewall holes (approximately 3 inches), proceed to Step 2. If not, proceed to Step 3.

STEP 2
Clean out Isolator Row using the JetVac process.
- A) A fixed floor cleaning nozzle with rear facing nozzle spread of 45 inches or more is preferable
- B) Apply multiple passes of JetVac until backflush water is clean
- C) Vacuum manhole sump as required

STEP 3
Replace all caps, lids and covers, record observations and actions.

STEP 4
Inspect & clean catch basins and manholes upstream of the StormTech system.

SAMPLE MAINTENANCE LOG

1. PROPOSED PAINTED CONCRETE TILT-UP 40' CLEAR INDUSTRIAL BUILDING.

2. TYPICAL PARKING STALL - 9' X 18'. MAY BE REDUCED TO 9' X 17' W/ 1'-0" OVERHANG. STRIPING PER CITY STANDARDS.

3. TYPICAL LOW EMITTING / FUEL EFFICIENT / CARPOOL / VANPOOL PARKING STALL - 9' X 18'. MAY BE REDUCED TO 9' X 17' W/ 1'-0" OVERHANG. STRIPING PER CITY STANDARDS. MINIMUM 8% OF ALL PARKING SPACES PROVIDED PER BUILDING. A MINIMUM OF 6% OF ALL PARKING SPACES PROVIDED PER BUILDING SHALL BE EQUIPPED FOR FUTURE EV CHARGING CAPACITY.

4. 7" THICK CONCRETE YARD W/ GRADE LEVEL TRUCK DOORS AND TRAILER PARKING AREAS.

5. FULLY IRRIGATED LANDSCAPE AREA BOUNDED BY 6" CONCRETE CURB - SEE CONCEPT LANDSCAPE PLAN.

6. PRIMARY BUILDING ENTRANCE W/ DECORATIVE CONCRETE ENTRY WALK.

7. LOCATION OF 8'-0" HIGH TRASH AND RECYCLABLE BINS. SEE SHEET A2-1 FOR ELEVATION AND SECTIONS.

8. NEW 8'-0" HIGH BLACK TUBE STEEL FENCE.

9. PROPERTY LINES.

10. PROPOSED TRANSFORMER LOCATION.

11. 14' X 50' TRUCK TRAILER PARKING AREA.

12. ACCESSIBLE PARKING STALLS 9' X 18'-0" MIN.

13. DASHED LINE INDICATES : NEW 5'-0" WIDE SURFACE WALK ACCESSIBLE PATH OF TRAVEL FROM PUBLIC SIDEWALK & PARKING STALLS TO PRIMARY BUILDING ENTRANCE - CONSTRUCT NEW CONCRETE SIDEWALK. MAX SLOPE OF SURFACE WALK IN THE DIRECTION OF TRAVEL 4.9%. MAX CROSS SLOPE 2%.

14. PROVIDE BREAK AREA / LUNCH PATIO WITH SEATING. SEE PROJECT DATA ON A1-0 FOR MIN SF AREA AND NUMBER OF SEATS.

15. PROPOSED LOCATION FOR FIRE WATER METER AND 2" SUPPLY LINE INTO BUILDING. ABOVE GROUND BACKFLOWS AND DETECTOR CHECK ASSEMBLIES SHALL BE SCREENED BY A 3' MIN. / 4' MAX. CMU WALL ON 3 SIDES, 3' CLEAR TO THE ASSEMBLY. SEE PLAN VIEW.

16. PROPOSED SEWER LATERAL FROM PUBLIC RIGHT OF WAY SERVING BOTH BUILDINGS 1 & 2.

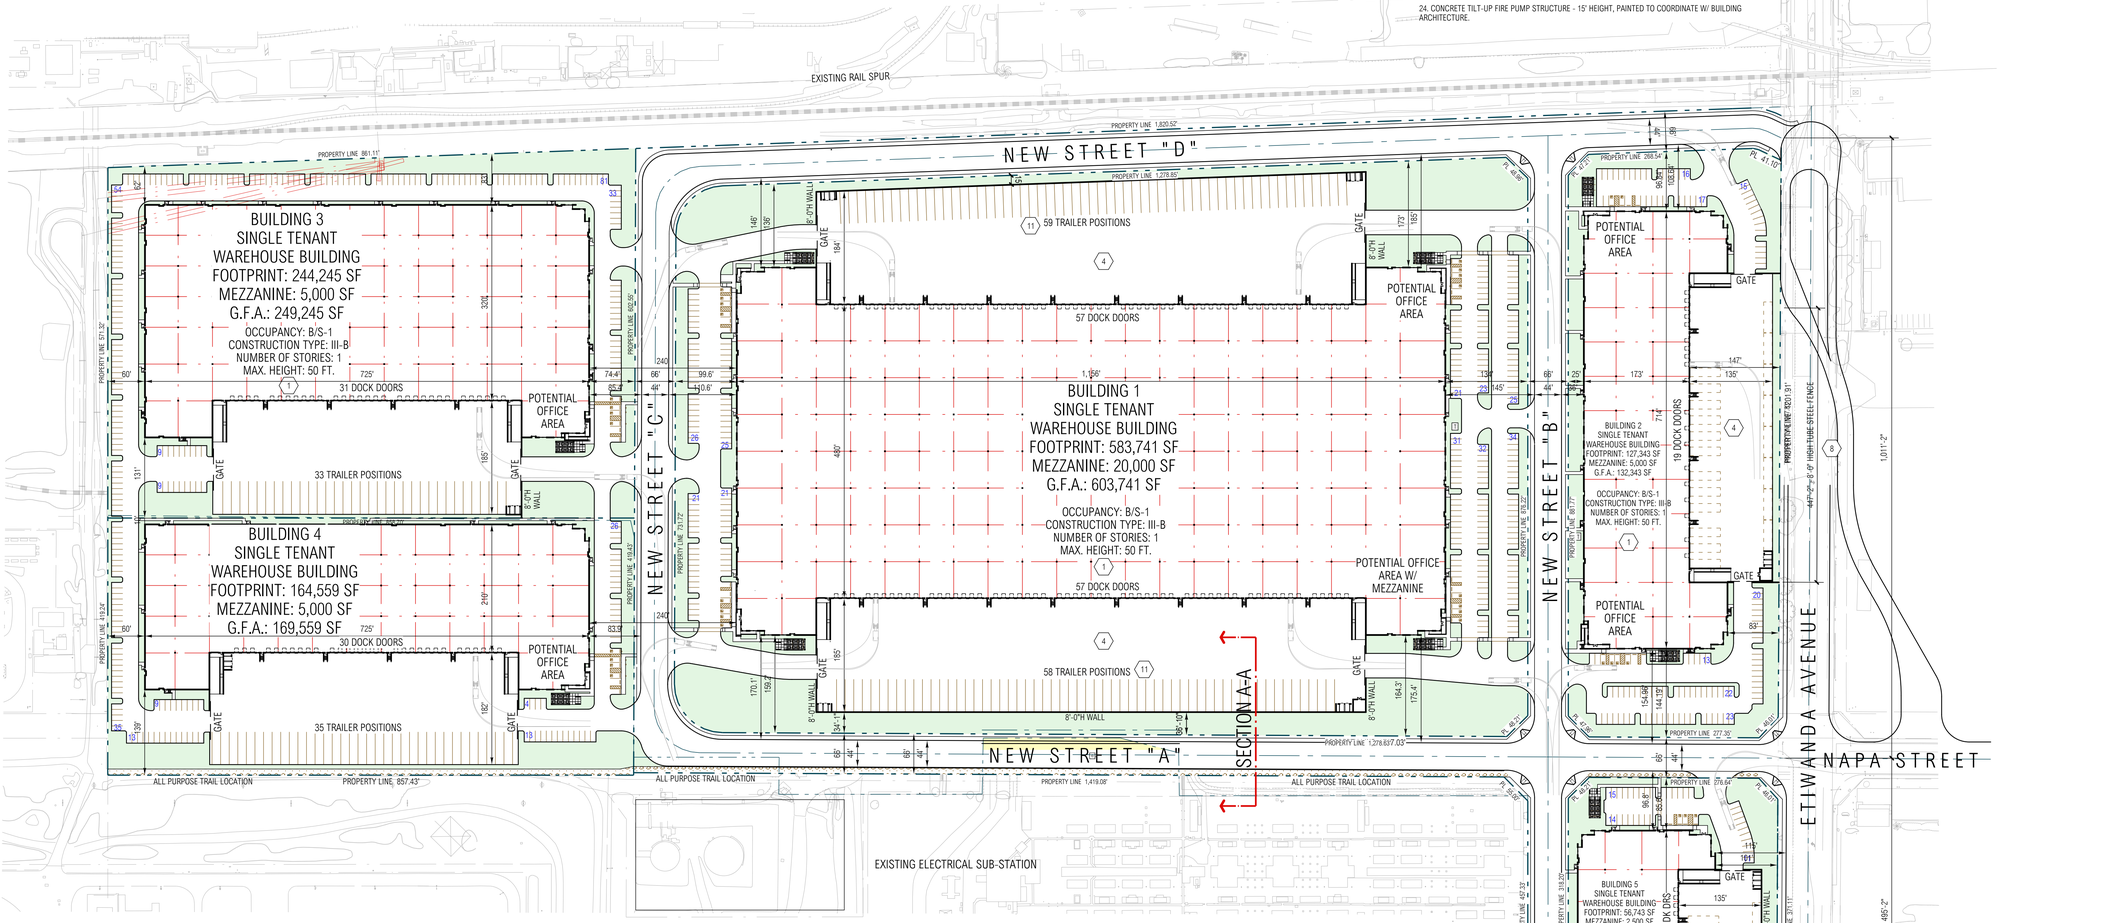
17. NOT USED.

18. NEW CURB AND GUTTER PER CITY STANDARD.

19. PROPOSED ONSITE FIRE HYDRANT LOCATIONS.

20. ALL UTILITY STRUCTURES SUCH AS TRANSFORMERS AND BACK FLOW DEVICES SHALL BE SCREENED BY LANDSCAPE, SEE LANDSCAPE PLAN.

21. CONCRETE LANDING AND BICYCLE RACK FOR BIKES. SEE PROJECT DATA FOR SPACES REQUIRED.



22. LONG TERM MOUNTED BICYCLE RACK. (NOTE LONG TERM RACK TO BE INSTALL ADJACENT TO ELECTRICAL ROOM TO COMPLY WITH CALGREEN). SEE PROJECT DATA FOR SPACES REQUIRED.

23. TYP. 8' HIGH PAINTED CONCRETE SCREEN WALL ELEVATION W/ ACCENT REVEALS AND PAINTED ACCENTS TO MATCH BUILDING ARCHITECTURE.

24. CONCRETE TILT-UP FIRE PUMP STRUCTURE - 15' HEIGHT, PAINTED TO COORDINATE W/ BUILDING ARCHITECTURE.

SUBJECT: Biological Due Diligence Investigation for the Proposed GenOn Powerplant Project Located at 8996 Etiwanda Avenue, Rancho Cucamonga, San Bernardino County, California

Introduction

This report contains the findings of ELMT Consulting's (ELMT) preliminary biological due diligence investigation for proposed GenOn Powerplant Project (project site or site) located at 8996 Etiwanda Avenue, Rancho Cucamonga, California. The biological due diligence investigation was conducted by ELMT biologist Travis J. McGill and Jacob H. Lloyd Davies on September 29, 2020 to document baseline conditions and to determine the potential for special-status plant and wildlife species to occur on the project site that could pose a constraint to implementation of the proposed project.

Project Location

The project site is generally located north of Interstate 10, east of Interstate 15, south of State Route 210 and west of Etiwanda Avenue in the City of Rancho Cucamonga, California. The site is depicted on the Guasti quadrangle of the United States Geological Survey's (USGS) 7.5-minute map series within Sections 17 and 8 of Township 1 South, Range 6 West. Specifically, the project site is located at 8996 Etiwanda, Avenue, Rancho Cucamonga, California.

Existing Site Conditions

The entire project site has been subject to a variety of anthropogenic disturbances associated with historic agricultural activities and onsite development. Due to historical and current land uses, no undisturbed native plant communities or natural communities of special concern were observed on the project site. These disturbances have eliminated the natural plant communities that once occurred on and surrounding the project site. The project site and site-adjacent improvement areas consists of two (2) land cover types that would be classified as disturbed and developed. Developed areas generally encompass all building/structures, and paved/impervious surfaces. The developed areas within the project site are comprised of the existing industrial development, paved and loose gravel parking lots, and landscaped areas. The heavily disturbed areas are primarily found adjacent to Chadwick Channel, near the center of the project site, and on the northwest corner of the site.

Migratory Corridors and Linkages

Habitat linkages provide links between larger habitat areas that are separated by development. Wildlife corridors are similar to linkages but provide specific opportunities for animals to disperse or migrate between areas. A corridor can be defined as a linear landscape feature of sufficient width to allow animal movement between two comparatively undisturbed habitat fragments. Adequate cover is essential for a corridor to function as a wildlife movement area. It is possible for a habitat corridor to be adequate for one species, yet inadequate for others. Wildlife corridors are significant features for dispersal, seasonal migration, breeding, and foraging. Additionally, open space can provide a buffer against both human disturbance and natural fluctuations in resources.

According to the San Bernardino County General Plan, the project site has not been identified as occurring within a Wildlife Corridor or Linkage. As designated by the San Bernardino County General Plan Open Space Element, the nearest wildlife corridors are the Santa Ana River located approximately 7.5 miles south of the project site, and Chino Hills Open Space located approximately 13 miles southwest of the project.

The proposed project will be confined to existing disturbed and developed areas and is surrounded by development, which has removed natural plant communities from the surrounding area. The project site is isolated from regional wildlife corridors and linkages, specifically the Santa Ana River and Chino Hills Open Space, and there are no riparian corridors, creeks, or useful patches of steppingstone habitat (natural areas) within or connecting the project site to any identified wildlife corridors or linkages in the area. As a result, implementation of the proposed project will not disrupt or have any adverse effects on any migratory corridors or linkages in the surrounding area.

Jurisdictional Areas

There are three key agencies that regulate activities within inland streams, wetlands, and riparian areas in California. The United State Army Corps of Engineers (Corps) Regulatory Branch regulates discharge of dredge and/or fill materials into “waters of the United States” pursuant to Section 404 of the Federal Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act. Of the State agencies, the Regional Water Quality Control board (Regional Board) regulates discharges into surface waters pursuant to Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act and the California Department of Fish and Wildlife (CDFW) regulates alterations to streambed and associated plant communities pursuant to Section 1602 of the California Fish and Game Code.

Glen Lukos conducted a jurisdictional delineation in 2020. Based on their findings, it was determined that the project site contains two drainage features: Chadwick Channel and Tributary A. Chadwick Channel is an existing ephemeral drainage in the central portion of the project site that conveys storm flows from the railroad and areas north of the project site, across the middle of the site, to the southern boundary. Chadwick Channel is maintained for flood control purposes and rip rap has been placed at both the northern and southern property boundaries. Tributary A is a small tributary located in the southeastern portion of the project site that conveys storm flows from north to south before leaving the property and continuing to head south. The jurisdictional delineation stated that the onsite drainage features would qualify as waters of the Untied States and fall under the regulatory authority of the Corps, Regional Board and CDFW.

However, Glen Lukos also noted that the jurisdictional delineation was conducted prior to the adoption of

the new Navigable Waters Protection Rule (adopted June 22, 2020) and the new State Wetland Policy, (adopted on May 28, 2020), and recommended that jurisdictional delineation be updated to analyze the onsite drainages under the new regulations.

Prior to site development, and during the processing of CEQA, ELMT recommends that an updated jurisdictional delineation be conducted to verify the extent of aquatic resources onsite and quantify impacts to the onsite drainages under the new regulations. It is ELMT's understanding that the onsite drainage features are ephemeral and only convey water in direct response to precipitation. As a result, under the new Navigable Waters Protection Rule, the Corps will not assert jurisdiction over the onsite drainage features. However, the onsite drainage will likely qualify as waters of the State by the Regional Board, and jurisdictional streambed by CDFW. Impacts to onsite jurisdictional areas will likely require the following regulatory approvals prior to project implementation: Regional Board Report of Waste Discharge permit, and CDFW Section 1602 Lake or Streambed Alteration Agreement.

Special-Status Biological Resources

The literature search identified thirteen (13) special-status plant species and thirty-three (33) special-status wildlife species as having the potential to occur within the Guasti 7.5-minute quadrangle. No special-status plant communities haven been recorded within the Guasti USGS 7.5-minute quadrangle. Special-status plant and wildlife species were evaluated for their potential to occur within the project site based on habitat requirements, availability and quality of suitable habitat, and known distributions. Species determined to have the potential to occur within the general vicinity of the project site is presented in Attachment B*: Potentially Occurring Special-Status Biological Resources*.

Special-Status Plants

According to the CNDDB and CNPS, thirteen (13) special-status plant species have been recorded in the Guasti quadrangle (refer to Attachment B). No special-status plant species were observed onsite during the habitat assessment. The project site has been subject to existing anthropogenic disturbances. These disturbances have reduced the suitability of the habitat to support special-status plant species known to occur in the general vicinity of the project site. Based on habitat requirements for specific special-status plant species and the availability and quality of habitats needed by each species, it was determined that the project site does not provide suitable habitat for any of the special-status plant species known to occur in the area and are presumed to be absent from the project site. A focused survey was conducted during the 2020 blooming season by Glen Lukos and no special-status plant species were observed onsite. No additional studies are recommended.

Special-Status Wildlife

According to the CNDDB, thirty-three (33) special-status wildlife species have been reported in the Guasti quadrangle (refer to Attachment B). San Diego black-tailed jackrabbit (*Lepus californicus bennettii*) and Cooper's hawk (*Accipiter cooperii*) were the only special-status species observed onsite. Disturbances onsite have greatly reduced potential foraging and nesting/denning opportunities for wildlife species onsite. Based on habitat requirements for specific species and the availability and quality of onsite habitats, it was determined that the proposed project site has a moderate potential to support Los Angeles pocket mouse (*Perognathus longimembris brevinasus*; LAPM), and a lot potential to support California horned lark

(*Eremophila alpestris actua*). The undeveloped areas on the western portion of the project site provides marginal foraging and nesting habitat for these species. All remaining special-status wildlife species are presumed to be absent from the project site due to lack of quality habitat.

Focused Surveys

Burrowing Owl

Glen Lukos conducted a focused burrowing owl (*Athene cunicularia*) survey during the 2020 breeding season and no burrowing owls were observed onsite. Out of an abundance of caution, a pre-construction burrowing owl clearance survey should be conducted to ensure burrowing owl remain absent from the project site.

Species Suitability Assessments

Delhi Sands Flower-loving Fly

Ecological Sciences conducted a Delhi Sands flower-loving fly (*Rhaphiomidas terminatus abdominalis*; DSF) suitability assessment in 2020. Based on results of the May 2020 habitat suitability assessment, it was determined that existing conditions are not consistent with those known or expected to support a DSF. As a result of development and disturbances on and surrounding the proposed project site, surface soils have been heavily mixed and compacted. The undeveloped portions of the project site are composed of heavily mixed soils containing alluvial materials (Tujunga Soils and Hilmar loamy sand) from historic agricultural activities, and onsite and surrounding development. The project site is surrounded by existing developments and no longer have connectivity to areas upwind containing Delhi Sands soils, areas subjected to Aeolian processes, or areas supporting DSF populations. Therefore, the soils within the northern portion of the project site were rated as "unsuitable quality" with a habitat quality rating of 1. Therefore, it was determined that the site does not support Delhi Sand soils needed for suitable habitat for DSF and DSF is presumed absent from the project site. No further actions or focused surveys are recommended.

Los Angeles Pocket Mouse

Envira conducted a LAPM habitat suitability assessment in 2020. The suitability assessment focused on two locations, the Chadwick Channel and the northwest corner of the project site. During the assessment, sign of potential LAPM burrows (small mammal burrows) were observed along the north and west boundary of the site. Based on the results of the LAPM suitability assessment, the project site was determined to have the potential to provide suitable habitat for LAPM. A trapping study will need to be conducted in order to determine the presence or absence of LAPM on the project site.

Special-Status Plant Communities

According to the CNDDB, no special-status plant communities are reported to occur in the Guasti USGS 7.5-minute quadrangle. Based on the results of the field investigation, no special-status plant communities were observed onsite. Therefore, no special-status plant communities will be impacted from project implementation.

Critical Habitat

The project site is not located within federally designated Critical Habitat. The nearest designated Critical Habitat is located approximately 3.5 miles north of the project site for San Bernardino kangaroo rat (*Dipodomys merriami parvus*) and approximately 3.7 miles southeast for coastal California gnatcatcher (*Polioptila californica californica*) (refer to Exhibit 6, *Critical Habitat*). Therefore, the loss or adverse modification of Critical Habitat from site development will not occur and consultation with the USFWS for impacts to Critical Habitat will not be required for implementation of the proposed project.

Recommendations

Jurisdictional Areas

ELMT recommends that an updated jurisdictional delineation be conducted to verify the extent of aquatic resources onsite and quantify impacts to the onsite drainages under the new regulations.

Special-Status Species

A LAPM trapping study is recommended to be conducted in order to determine the presence or absence of LAPM on the project site.

Please do not hesitate to contact Tom McGill at (951) 285-6014 or tmcgill@elmtconsulting.com or Travis McGill at (909) 816-1646 or travismcgill@elmtconsulting.com should you have any questions.

Sincerely,

Thomas J. McGill, Ph.D.

Potentially Occurring Special-Status Biological Resources

Potentially Occurring Special-Status Biological Resources

Scientific Name Common Name	**Status**	**Habitat**	**Observed Onsite**	**Potential to Occur**
SPECIAL-STATUS WILDLIFE SPECIES				
Accipiter cooperii Cooper's hawk	Fed: None CA: WL	Common yearlong resident of California. Typically forages in broken woodland and habitat edges with dense stands of coast live oak (*Quercus agrifolia*), riparian deciduous, or other forest habitat near water. Usually nests in dense riparian areas, usually near streams.	Yes	**Present**. There is minimal foraging habitat on the disturbed western portion of the project site. The landscaped trees onsite provide limited nesting opportunities. This species is adapted to urban environments and occurs commonly. Was observed by Glen Lukos during the 2020 surveys.
Agelaius tricolor tricolored blackbird	Fed: None CA: **THR**/SSC	Range is limited to the coastal areas of the Pacific coast of North America, from Northern California to upper Baja California. Can be found in a wide variety of habitat including annual grasslands, wet and dry vernal pools and other seasonal wetlands, agricultural fields, cattle feedlots, and dairies. Occasionally forage in riparian scrub habitats along marsh borders. Basic habitat requirements for breeding include open accessible water, protected nesting substrate (freshwater marsh dominated by cattails, willows, and bulrushes [*Schoenoplectus* sp.]), and either flooded or thorny or spiny vegetation and suitable foraging space providing adequate insect prey.	No	**Presumed absent.** No suitable habitat is present on-site.
Aimophila ruficeps canescens southern California rufous-crowned sparrow	Fed: None CA: WL	Typically found between 3,000 and 6,000 feet in elevation. Breed in sparsely vegetated scrubland on hillsides and canyons. Prefers coastal sage scrub dominated by California sagebrush (*Artemisia californica*), but they can also be found breeding in coastal bluff scrub, low-growing serpentine chaparral, and along the edges of tall chaparral habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Anniella stebbinsi southern California legless lizard	Fed: None CA: SSC	Occurs in sparsely vegetated habitat types including coastal sand dunes, chaparral, pine-oak woodland, desert scrub, open grassland, and riparian areas. Requires sandy or loose loamy substrates conducive to burrowing.	No	**Presumed absent.** No suitable habitat is present on-site.
Ardea alba great egret	Fed: None CA: None	Yearlong resident throughout California, except for the high mountains and deserts. Feeds and rests in fresh, and saline emergent wetlands, along the margins of estuaries, lakes, and slow-moving streams, on mudflats and salt ponds, and in irrigated croplands and pastures.	No	**Presumed absent.** No suitable habitat is present on-site.
Ardea herodias great blue heron	Fed: None CA: None	Fairly common all year throughout most of California, in shallow estuaries and fresh and saline emergent wetlands. Less common along riverine and rocky marine shores, in croplands, pastures, and in mountains about foothills.	No	**Presumed absent.** No suitable habitat is present on-site.
Arizona elegans occidentalis California glossy snake	Fed: None CA: SSC	Occurs in a wide variety of habitat types including open desert, grasslands, shrublands, chaparral, and woodlands. Prefers areas where the soil is loose and sandy which allows for burrowing.	No	**Presumed absent.** No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed Onsite**	**Potential to Occur**
Aspidoscelis tigris stejnegeri coastal whiptail	Fed: None CA: SSC	Found in a variety of ecosystems, primarily hot and dry open areas with sparse foliage - chaparral, woodland, and riparian areas.	No	**Presumed absent.** No suitable habitat is present on-site.
Athene cunicularia burrowing owl	Fed: None CA: SSC	Primarily a grassland species, but it persists and even thrives in some landscapes highly altered by human activity. Occurs in open, annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. The overriding characteristics of suitable habitat appear to be burrows for roosting and nesting and relatively short vegetation with only sparse shrubs and taller vegetation.	No	**Presumed absent.** The undeveloped northern portion of the project site provides minimal foraging opportunities. However, no burrowing owls were observed during the 2020 focused survey.
Bombus crotchii Crotch bumble bee	Fed: None CA: CE	Exclusive to coastal California east towards the Sierra-Cascade Crest; less common in western Nevada.	No	**Presumed absent.** No suitable habitat is present on-site.
Calypte costae Costa's hummingbird	Fed: None CA: None	Desert and semi-desert, arid brushy foothills and chaparral. A desert hummingbird that breeds in the Sonoran and Mojave Deserts. Departs desert heat moving into chaparral, scrub, and woodland habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Chaetodipus fallax fallax northwestern San Diego pocket mouse	Fed: None CA: SSC	Occurs in desert and coastal habitats in southern California, Mexico, and northern Baja California, from sea level to at least 1,400 meters above msl. Found in a variety of temperate habitats ranging from chaparral and grasslands to scrub forests and deserts. Requires low growing vegetation or rocky outcroppings, as well as sandy soils for burrowing.	No	**Presumed absent.** No suitable habitat is present on-site.
Circus hudsonius northern harrier	Fed: None CA: SSC	Frequents meadows, grasslands, open rangelands, desert sinks, fresh and saltwater emergent wetlands; seldom found in wooded areas. Mostly found in flat, or hummocky, open areas of tall, dense grasses moist or dry shrubs, and edges for nesting, cover, and feeding.	No	**Presumed absent.** No suitable habitat is present on-site.
Dipodomys merriami parvus San Bernardino kangaroo rat	Fed: **END** CA: CE/SSC	Primarily found in Riversidean alluvial fan sage scrub (RAFSS) and sandy loam soils, alluvial fans and flood plains, and along washes with nearby sage scrub. May also occur at lower densities in Riversidean upland sage scrub, chaparral and grassland in uplands and tributaries in proximity to RAFSS habitat. Tends to avoid rocky substrates.	No	**Presumed absent.** No suitable habitat is present on-site.
Dipodomys simulans Dulzura kangaroo rat	Fed: None CA: None	Relatively common in chaparral, coastal sage scrub, Riversidean alluvial fan sage scrub, and peninsular juniper woodland habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Dipodomys stephensi Stephens' kangaroo rat	Fed: **END** CA: **THR**	Occur in arid and semi-arid habitats with some grass or brush. Prefer open habitats with less than 50% protective cover. Require soft, well-drained substrate for building burrows and are typically found in areas with sandy soil.	No	**Presumed absent.** No suitable habitat is present on-site.
Egretta thula snowy egret	Fed: None CA: None	Widespread in California along shores of coastal estuaries, fresh and saline emergent wetlands, ponds, slow-moving rivers, irrigation ditches, and wet fields. In southern California, common yearlong in the Imperial Valley and along the Colorado River.	No	**Presumed absent.** No suitable habitat is present on-site.
Elanus leucurus white-tailed kite	Fed: None CA: FP	Widespread in California along shores of coastal estuaries, fresh and saline emergent wetlands, ponds, slow-moving rivers, irrigation ditches, and wet fields. In southern California, common yearlong in the Imperial Valley and along the Colorado River.	No	**Presumed absent.** No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed Onsite**	**Potential to Occur**
Eremophila alpestris actia California horned lark	Fed: None CA: WL	Occurs in meadows, grasslands, open fields, prairie, and alkali flats. This subspecies is typically found in coastal regions.	No	**Low.** There is limited foraging habitat and minimal nesting opportunities within the disturbed northern portion of the project site.
Eumops perotis californicus western mastiff bat	Fed: None CA: SSC	Primarily a cliff-dwelling species, roost generally under exfoliating rock slabs. Roosts are generally high above the ground, usually allowing a clear vertical drop of at least 3 meters below the entrance for flight. In California, it is most frequently encountered in broad open areas including dry desert washes, flood plains, chaparral, oak woodland, open ponderosa pine forest, grassland, and agricultural areas.	No	**Presumed absent.** No suitable habitat is present on-site.
Lanius ludovicianus loggerhead shrike	Fed: None CA: SSC	Common yearlong resident of California. Prefers open habitats with bare ground, scattered shrubs, and areas with low or sparse herbaceous cover. Requires suitable perches including trees, posts, fences, utility lines, or other perches.	No	**Presumed absent.** No suitable habitat is present on-site.
Larus californicus California gull	Fed: None CA: WL	Require isolated islands in rivers, reservoirs and natural lakes for nesting, where predations pressures from terrestrial mammals are diminished. Uses both fresh and saline aquatic habitats at variable elevations and degrees of aridity for nesting and for opportunistic foraging.	No	**Presumed absent.** No suitable habitat is present on-site.
Lasiurus xanthinus western yellow bat	Fed: None CA: SSC	Occurs in valley/foothill riparian, desert riparian, desert wash, and palm oasis habitats. Roosts under palm trees and feeds in, and near, palm oases and riparian habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Laterallus jamaicensis coturniculus California black rail	Fed: None CA: THR/FP	Shallow marshes, and wet meadows; in winter, drier fresh-water and brackish marshes, as well as dense, deep grass.	No	**Presumed absent.** No suitable habitat is present on-site.
Lepus californicus bennettii San Diego black-tailed jackrabbit	Fed: None CA: SSC	Occupies many diverse habitats, but primarily is found in arid regions supporting short-grass habitats, agricultural fields, or sparse coastal scrub.	Yes	**Present.** Observed onsite during the 2020 surveys conducted by Glen Lukos.
Neotoma lepida intermedia San Diego desert woodrat	Fed: None CA: SSC	Occurs in coastal scrub communities between San Luis Obispo and San Diego Counties. Prefers moderate to dense canopies, and especially rocky outcrops.	No	**Presumed absent.** No suitable habitat is present on-site.
Nycticorax nycticorax black-crowned night heron	Fed: None CA: None	Common in wetlands across North America, including saltmarshes, freshwater marshes, swamps, streams, rivers, lakes, ponds, lagoons, tidal mudflats, and wet agricultural fields. They require aquatic habitat for foraging and terrestrial vegetation for cover.	No	**Presumed absent.** No suitable habitat is present on-site.
Perognathus longimembris brevinasus Los Angeles pocket mouse	Fed: None CA: SSC	Occurs in lower elevation grasslands and coastal sage scrub communities in and around the Los Angeles Basin. Prefers open ground with fine sandy soils. May not dig extensive burrows, but instead will seek refuge under weeds and dead leaves instead.	No	**Moderate.** Suitable burrows were observed onsite. This species has been previously documented in the area. A focused survey should be conducted to determine presence/absence.
Perognathus longimembris pacificus Pacific pocket mouse	Fed: **END** CA: SSC	Occurs on loose sandy soils that support sparse coastal sage scrub, grassland, and ruderal habitats.	No	**Presumed absent.** No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed Onsite**	**Potential to Occur**
Phrynosoma blainvillii coast horned lizard	Fed: None CA: SSC	Found in a wide variety of vegetation types including coastal sage scrub, annual grassland, chaparral, oak woodland, riparian woodland and coniferous forest. The key elements of such habitats are loose, fine soils with a high sand fraction; an abundance of native ants or other insects; and open areas with limited overstory for basking and low, but relatively dense shrubs for refuge.	No	**Presumed absent.** No suitable habitat is present on-site.
Polioptila californica californica coastal California gnatcatcher	Fed: **THR** CA: SSC	Common yearlong resident of southern California in sage scrub habitats that are dominated by California sagebrush (*Artemisia californica*). Prefers scrub habitat with more low-growing vegetation. Species generally occurs below 750 feet above mean sea level (msl) along the coast and below 1,500 feet above msl within inland regions.	No	**Presumed absent.** No suitable habitat is present on-site.
Rhaphiomidas terminatus abdominalis Delhi Sands flower-loving fly	Fed: **END** CA: None	DSF habitat is limited to areas that include Delhi fine sand, an aeolian (wind-deposited) soil type. The highest density of DSF have been found in habitat that includes a variety of plants including California buckwheat, California croton, deerweed, and telegraph weed.	No	**Presumed absent.** No suitable habitat is present onsite. Based on the results of the DSF suitability assessment, it was determined that the project site does not support clean/uncontaminated Delhi Sand soils needed to support DSF.
Spizella breweri Brewer's sparrow	Fed: None CA: None	Habitats include sagebrush and brushy plains.	No	**Presumed absent.** No suitable habitat is present on-site.
SPECIAL-STATUS PLANT SPECIES				
Calochortus catalinae Catalina mariposa-lily	Fed: None CA: None CNPS: 4.2	Grows in chaparral, cismontane woodland, coastal scrub, and valley and foothill grassland habitats. Found at elevations ranging from 49 to 2,297 feet. Blooming period is from March to June.	No	**Presumed absent**. No suitable habitat is present.
Calochortus plummerae Plummer's mariposa-lily	Fed: None CA: None CNPS: 4.2	Prefers openings in chaparral, foothill woodland, coastal sage scrub, valley and foothill grasslands, cismontane woodland, lower montane coniferous forest and yellow pine forest. Often found on dry, rocky slopes and soils and brushy areas. Can be very common after a fire. From 328 to 5,577 feet in elevation. Blooming period is from May to July.	No	**Presumed absent**. No suitable habitat is present.
Chorizanthe parryi* var. *parryi Parry's spineflower	Fed: None CA: None CNPS: 1B.1	Occurs on sandy and/or rocky soils in chaparral, coastal sage scrub, and sandy openings within alluvial washes and margins. Found at elevations ranging from 951 to 3,773 feet. Blooming period is from April to June.	No	**Presumed absent**. No suitable habitat is present.
Cladium californicum California saw-grass	Fed: None CA: None CNPS: 2B.2	Found in meadows and seeps, marshes and alkaline swamps or freshwater habitats. Found at elevations ranging from 197 to 5,249 feet. Blooming period is from June to September.	No	**Presumed absent**. No suitable habitat is present.
Deinandra paniculata paniculate tarplant	Fed: None CA: None CNPS: 4.2	Typically found in vernally mesic, sometimes sandy soils in coastal scrub, valley and foothill grasslands, and vernal pools. Found at elevations ranging from 82 to 3,084 feet. Blooming period is from April to November.	No	**Presumed absent**. No suitable habitat is present.
Horkelia cuneata* var. *puberula mesa horkelia	Fed: None CA: None CNPS: 4.2	Occurs on sandy or gravelly soils in chaparral, woodlands, and coastal scrub plant communities. Found at elevations ranging from 230 to 2,657 feet. Blooming period is from February to September.	No	**Presumed absent**. No suitable habitat is present.

Scientific Name Common Name	**Status**	**Habitat**	**Observed Onsite**	**Potential to Occur**
Juglans californica southern California black walnut	Fed: None CA: None CNPS: 4.2	Found in chaparral, cismontane woodland, coastal scrub, and riparian woodland habitats. Found at elevations ranging from 164 to 2,953 feet. Blooming period is from March to August.	No	**Presumed absent**. No suitable habitat is present.
Muhlenbergia californica California muhly	Fed: None CA: None CNPS: 4.3	Found in mesic, seeps, and streambanks within chaparral, coastal scrub, lower montane coniferous forest, and meadows and seeps. Found at elevations ranging from 328 to 6,562 feet. Blooming period is from June to September.	No	**Presumed absent**. No suitable habitat is present.
Muhlenbergia utilis aparego grass	Fed: None CA: None CNPS: 2B.2	Native to north and central America. Grows in wet habitats, including riverbanks and meadows, sometimes alkaline soils. Blooming period is from October to March.	No	**Presumed absent**. No suitable habitat is present.
Navarretia prostrata prostrate vernal pool navarretia	Fed: None CA: None CNPS: 1B.2	Found in mesic soils in coastal scrub, meadows and seeps, valley and foothill grasslands (alkaline), and vernal pools. Found at elevations ranging from 65 to 2,100 feet. Blooming period is from April to July.	No	**Presumed absent**. No suitable habitat is present.
Phacelia stellaris Brand's star phacelia	Fed: None CA: None CNPS: 1B.1	Occurs in coastal dunes and coastal sage scrub habitats. In western Riverside County this species is restricted to sandy benches along the Santa Ana River. Grows in elevations ranging from 3 to 1,312 feet. Blooming period is from March to June.	No	**Presumed absent**. No suitable habitat is present.
Pseudognaphalium leucocephalum white rabbit-tobacco	Fed: None CA: None CNPS: 2B.2	Grows in sandy, gravelly soils within chaparral, cismontane woodland, coastal scrub, and riparian woodland habitats. Found at elevations ranging from 0 to 6,890 feet. Blooming period is from July to December.	No	**Presumed absent**. No suitable habitat is present.
Symphyotrichum defoliatum San Bernardino aster	Fed: None CA: None CNPS: 1B.2	Grows in cismontane woodland, coastal scrub, lower montane coniferous forest, meadows and seeps, marshes and swamps, valley and foothill grassland (vernally mesic). Can be found growing near ditches, streams, and springs within these habitats. Found at elevations ranging from 7 to 6,693 feet. Blooming period is from July to November.	No	**Presumed absent**. No suitable habitat is present.

Resource Area	Request	Responsible Party	Applicant/City Response	Ascent follow-up			
		yellow highlight =	no response provided				
Project Description							
	List of project objectives from the applicant and approved by the City	Applicant/City					
	List of potential discretionary permits and approvals required	City		*Complete (see NOP)*			
	Description of existing buildings/structures on the project site, including: number of stories and height; total building area (square feet); existing uses/operations, and total area of each; status of operations as active or inactive/vacant; historical duration of existing uses/activities (e.g., number of years operating at existing activity levels)	Applicant	All buildings and structures have been demolished. Prior use: site was used as a power generation plant by SCE. There were approximately 330,740 sf of exisitng buildings on the site: offices: 11,92 sf, power generation: 154,645 sf, cooling towers: 131,767 sf, misc. support buildings: 32,404 sf. Buildings very on the site from 1 story to 3 stories in height.	*ok*			
	Description of each proposed land use type: **Unit amount (e.g., square footage) by building type (e.g., warehouse, cold storage, offices)	Applicant	Parcel 1/ Bldg 1: 558,741 SF warehouse; 25,000 SF office Parcel 2/ Bldg 2: 117,343 SF warehouse; 10,000 SF office Parcel 3/ Bldg 3: 234,245 SF warehouse; 10,000 SF office Parcel 4/ Bldg 4: 154,559 SF warehouse; 10,000 SF office Parcel 5/ Bldg 5: 51,743 SF warehouse; 5,000 SF office Buildings are speculative. However, the following assumptions should be made: General warehouse (27%); High-Cube Fullfillment non-sorting (63%); High-Cube Cold Storage (10%)	*Total warehouse area (sf)*	*1,116,631*	*General warehouse (27%)*	*301,490*
	Total acreage to be paved	Applicant	Excluding new public streets, the total paved areas is 21.94 acres.	*Also need paved/impervious acreage for new public streets*		*High-Cube Fulfillment non-sorting (63%)*	*703,478*
	Proposed uses/building functions: whether cold storage provided, NAICS industrial code, number of employees, commodity type, location in supply chain (parts, manufacture/assembly, wholesale/distributor, retailer)	Applicant	Tenant is unknown at this time.	*ok*		*High-Cube Cold Storage (10%)*	*111,663*
	Description of on-site utility improvements	Applicant	All on-site utilities will be new, including but not limited to: storm drain, sewer, domestic water, electrical power, & telecommunication.	*Need details, including capacity and location. Provide plan sheets if available.*			
	Would any off-site improvements (i.e. utilities, roadways, etc) be required? If so, provide details on type, length, size, location, timing.	Applicant	Off-site improvements will be incorporated into the project's scope once applicant and city have coordinated the corresponding needs, requirements and conditions.	*If off-site improvements are required to serve the project, they need to be described and evaluated in the EIR.*			
	Would an amendment to the Circulation Element be required for any of the proposed roadways?	City					
	Operation characteristics (first year of operation, anticipated hours of operation, estimated number of employees onsite per day or per shift)	Applicant	Tenant is unknown at this time. Use standard industry assumptions for a speculative project.	*ok*			
	Description of building design, building materials	Applicant	Contemporary indutrial buildings constructed of concrete walls, glazing system with aluminum mullions, steel columns, roof joists, and wood roof deck.	*need more objective description of details like materials, colors, windows, and so on.*			
	Details of compliance with General Plan Policy RC-5.6 regarding preparation of community benefit plans for projects generating or accommodating more than 100 trucks per days, more than 40 trucks with TRUs per day, or TRU unit operations exceeding 300 hours per week	City/Applicant	Applicant will work with the city to prepare the corresponding community benefit plan to demonstrate an offset to the impacts.	*Need to understand specific elements/project features included in this plan.*			
	Details of compliance with General Plan Policy RC-5.9 regarding installation of electric Truck Hook-ups at New Industrial and Commercial Developments	City/Applicant	Applicant will work with the city to propose a plan for installation of electric truck charging hook-ups.	*Need to understand details such as number, location, type/specifications of charging infrastructure.*			
	Details of compliance with South Coast AQMD Rule 2305 (Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions [WAIRE] Program) – applies to warehouses 100,000 sf or greater	City/Applicant	Tenant is unknown at this time, but will comply.	*Would help to understand project features proposed in anticipation of WAIRE requirements, e.g., infrastructure for charging ZE/NZE trucks; infrastructure for charging ZE yard trucks; kilowatt rating of proposed rooftop solar systems; anticipated kWh generated by proposed solar systems; air filtration systems (MERV 16 or greater)*				
	Any best practices being incorporated into the project in response to California Attorney General. For reference, refer to: Warehouse Best Practice Document September 2022 (ca.gov) https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf	Applicant	Tenant is unknown at this time.	*Discuss with City*			60,000
	Any other sustainability features included in the proposed project, including, but not limited to, features related to charging of cars and/or heavy duty trucks, electric truck hook ups to avoid idling, features to generate solar/renewable electricity on-site, features to minimize water consumption, electrification of on-site equipment/vehicles (e.g., forklifts, yard equipment)	Applicant	LEED certification will be procured for this project. EV car charging, infrastructure for future truck charging, roof top solar for office spaces, low flow plumbing fixtures, drought tolerant landscaping with drip irrigation, LED light fixtures, all concrete site paving	*Describe the specific features included in the project, e.g., number, capacity, type, specification for chargers, solar systems, fixtures*			
	Exterior lighting and signage improvement specifics	Applicant	Exterior lighting will be designed and installed throughout the site via street light posts; parking lot light posts; building lights; and landscape lighting. Primary monument signs will be installed at the two main access points, and building signage to be installed at the visible locations.	*Need more details for exterior lighting, e.g., type of distribution, lumens. Provide lighting plan if available.*			
	Any loading/queueing space, per RCMC Section 17.64.100?	City/Applicant	A total of 200 loading dock spaces are proposed, which corresponds to the 200 loading bays. At least one truck queuing space is provided for each ten loading bays.	*ok*			
	Bicycle parking? Per RCMC Section 17.64.110	City/Applicant	Long-term bicycle parking will be provided at each building at a minimum ratio of 5% of required motorized vehicle spaces.	*ok*			
	Parking Management Plan status or copy, per RCMC Section 17.64.070	City/Applicant	A general Parking Management Plan will be provided by the applicant and will assume the same land-use classifications being utilized for traffic analysis.	*ok*			
	Label each proposed new public street with a unique ID (e.g., new public street A, new public street B)	City/Applicant	Site plan is labeled as indicated.	*Confirm shown on plans we have*			
	Confirm the project would not involve any uses generating "visitor traffic" (e.g., customers separate from employees and truck trailers)	Applicant	Tenants are unknown at this time.	*ok*			
	Copy of landscape plan	Applicant	Provided	*Confirm shown on plans we have*			
Construction	Total amount of acres (or cubic yards of cut/fill) that will be graded	Applicant	Site will be balanced: 217,456 CY	*ok*			
Construction	Maximum amount of the acreage indicated in previous row that will be disturbed on a daily basis	Applicant	8,700 CY	*ok*			
Aesthetics	Existing site photos	Applicant	Provided	*Confirm we have*			
	Visual simulations (if available)	Applicant	Not available at this time	*ok*			
	Confirm extent of any tree/vegetation removal required	Applicant	All trees have been removed under Tree Removal Permit DRC2022-00125	*ok*			
AQ/Noise	Any planned residential uses (or other sensitive receptors like schools) adjacent to or in the vicinity of the project sites.	City	None	*ok*			
AQ/Noise	Please see separate Word file with specific requests for Air Quality, Greenhouse Gas Emissions, and Noise (AQ-GHG-Noise). Please complete the file for each project (one set of complete answers for each project please).	Applicant	Word document completed and provided	*ok*			
Hazards	Please see separate Word file for specific "User Questionnaire" (Completed for Site 3. Sites 1 & 2 are outstanding.)	Applicant	Word document completed and provided	*We don't have this*			
Hazards	Please see separate Word file for specific "Owner Questionnaire" (Completed for Site 3. Sites 1 & 2 are outstanding)	Applicant	Word document completed and provided	*We don't have this*			
Hydro/WQ	Total acres of ground disturbance	Applicant					
	Net change in impervious surface area	Applicant					
	Depth to groundwater	Applicant					
Noise	Please confirm that **no** pile driving would occur for any of the projects; if it would occur please describe	Applicant	Confirmed, no pile driving	*ok*			
Transportation/Traffic							
VMT and LOS	Cumulative projects - Land use (above and beyond the General Plan); and transportation (in particular Etiwanda grade separation)	City					
LOS	Confirmation of scoping approach (re: study intersections, scenarios) w/ the City (Fehr & Peers will reach out to schedule a call to discuss)	City					
LOS	Signal timings at all study intersections (Fehr & Peers will reach out to request)	City					
LOS	Traffic Counts (aiming for mid-sept; Fehr & Peers to follow to schedule specific date and time)	F&P					
Turning Movements	Confirm what movements are allowed at access points and what access control should be assumed (most of these we can infer from the site plan, but will be helpful to confirm)	Applicant/City	Etiwanda/Napa intersection: all turn movements Etiwanda new north access: right in/out only				
Traffic Noise Data	•ADT segment volumes for all roadways in the traffic study area in **EXCEL**: oExisting oExisting + Project oCumulative oCumulative + Project;	F&P					
	Figure showing segments or study intersections;	F&P					
	Vehicle mix [auto, medium-duty (2 axle, 6 tire), heavy-duty (3+ axle)] on the segments for existing and future timeframes	F&P					
	Daytime (7:00 a.m. – 7:00 p.m.)/Evening (7:00 p.m. – 10:00 p.m.)/Nighttime (10:00 p.m. – 7:00 a.m.) percentage splits on the segments for existing timeframes	F&P					
Utilities	electrical use/demand - existing and proposed	Applicant	Information to follow	*What is the timing?*			
	wastewater use/demand - existing and proposed	Applicant	Information to follow	*What is the timing?*			
	natural gas use/demand - existing and proposed	Applicant	Information to follow	*What is the timing?*			
	solid waste generation - existing and proposed	Applicant	Information to follow	*What is the timing?*			
	Will Serve Letters/Service Request letters from utilities	Applicant	Letter to be provided by applicant	*What is the timing?*			
	Water Supply Assessment	Applicant	In progress, to be provided by applicant	*What is the timing?*			
	Type and location of existing wet and dry utilities on the project site	Applicant	Storm drain, sewer, domestic water, electrical power, & telecommunication.	*Need details, including capacity and location. Provide plan sheets if available.*

SUBJECT: RCRA Facility Investigation Report
Former SCE Etiwanda Generating Station (Site Code: 400437)
8996 Etiwanda Avenue, Rancho Cucamonga, California 91739

Dear Mr. Rounds:

A bookmarked digital copy of the Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) Report for the former SCE Etiwanda Generating Station has been uploaded to EnviroStor for review. This RFI Report has been updated in response to comments received from DTSC on September 6, 2023 (comments and SCE responses are attached to this letter).

If you have any questions regarding this submittal, please contact me at 626.756.6403.

Respectfully yours,

John R. Johnsen
Senior Environmental Science Advisor
Operational Services, Environmental
Services Department

Distribution List:

TABULAR SUMMARY OF RESPONSES TO DTSC COMMENTS ON THE
RCRA FACILITY INVESTIGATION (RFI) REPORT
FORMER SCE ETIWANDA GENERATING STATION, RANCHO CUCAMONGA, CALIFORNIA

RCRA Facility Investigation (RFI) Report, Former SCE Etiwanda Generating Station was prepared by Northgate Environmental Management, Inc., dated May 31, 2023	
DTSC Comments from Dina Kourda, Geological Services Branch (GSB) dated July 11, 2023	**Northgate/SCE Response**
1. **Arsenic Ambient Screening Level**: For consistency throughout the text (e.g., Section 4.14.3 on page 38, Section 4.17.3 on page 42, Section 4.24.1 on page 50, Section 4.27.1, on page 53, Section 4.35.1 on page 56, Section 4.36.3 on page 58, etc.), please refer to 12 mg/kg for arsenic as the "Southern California Ambient Arsenic Screening Level," as documented on the in-text table in Section 4.39 on page 60, the notes on Table 5, and in accordance with the DTSC Human Health Risk Assessment (HHRA) Note 11.	The wording in the referenced sections has been updated to identify 12 mg/kg as the Southern California ambient arsenic screening level.

TABULAR SUMMARY OF RESPONSES TO DTSC COMMENTS ON THE RCRA FACILITY INVESTIGATION (RFI) REPORT FORMER SCE ETIWANDA GENERATING STATION, RANCHO CUCAMONGA, CALIFORNIA

RCRA Facility Investigation (RFI) Report, Former SCE Etiwanda Generating Station was prepared by Northgate Environmental Management, Inc., dated May 31, 2023	
DTSC Comments from Chawn Y. (CY) Jeng Human and Ecological Risk Office (HERO) dated August 4, 2023	**Northgate/SCE Response**
1. **Section 1.2.4 Regulatory Screening Comparison Standards**: HERO requests replacing the terms "screening comparison standards" and "screening standards" with "screening levels" to avoid confusion. Specifically, the guidance documents on the screening levels listed in this section are not promulgated by regulatory agencies and thus should not be referred to as regulatory standards.	Section 1.2.4 now includes the header, "Regulatory Screening Levels for Comparison." Text within this section has been updated to refer to the comparison of RFI data against "screening levels" as opposed to "screening standards."
2. **Section 4.3 (AOI 3) & 4.4 (AOI 4)**: The following statement, "*The BCCB was demolished in 2022 as part of Site demolition activities*" does not match AOI 3 (South Retention Basin) and AOI 4 (North Retention Basin) described in these sections. Please rectify these discrepancies.	The text in the referenced sections has been corrected to refer to the appropriate retention basins under investigation at each AOI.
3. **Section 4.38 AOI 38 – Flumes**: HERO recommends presenting a figure to depict thallium concentrations in soil samples collected at F3-1 and its vicinity to show that the lateral and vertical extent of potential thallium impact is limited and not a "hot spot" in support of using the 95% UCL concentration for thallium in the HHSE.	Figure 15 has been added to the revised RFI Report and includes thallium concentrations in soil samples collected within and adjacent to Flume 3. A photograph has also been added as an inset in Figure 15 which depicts typical concrete flume construction at the Etiwanda Generating Station to support the lines of evidence provided in the RFI Report text for the isolated thallium concentration reported below the flume bottom.
4. **Section 4.39 Overall Summary of RFI Soil Results**: HERO recommends identifying arsenic as a chemical of potential concern (COPC) at AOI 10 in the summary table, based on the pre-excavation soil sampling results of the cooling towers for Units 1 and 2 (as noted in Section 2.4.4.3, the soil with arsenic concentrations exceeding the Southern California ambient arsenic screening level was subsequently removed). The sampling was conducted by Northgate on behalf of SCE after the RFI Work Plan was finalized in July 2021, and thus should be included in the summary table for completeness.	Delineation and removal activities involving arsenic-affected soil above the Southern California ambient arsenic screening level at the Units 1 and 2 cooling towers (AOI 10) are now called out in the summary table in Section 4.39 for completeness.

RCRA Facility Investigation (RFI) Report, Former SCE Etiwanda Generating Station was prepared by Northgate Environmental Management, Inc., dated May 31, 2023	
DTSC Comments from Chawn Y. (CY) Jeng Human and Ecological Risk Office (HERO) dated August 4, 2023	**Northgate/SCE Response**
5. **Section 4.40 Overall Summary of RFI Soil Vapor Results**: (a) HERO recommends listing relevant information on the proposed building (e.g., building size/dimension, ventilation system, layout/usage, etc.) under "Site-Specific Factors for Consideration" for completeness. (b) HERO recommends preparing a summary table listing the analytes exceeding the soil vapor screening levels and associated AOCs, and noting additional rounds of soil vapor assessment conducted during the RFI, if applicable.	(a) Available building information that has been shared with SCE by the current Site owner and developer has been added to the bullet list of "Site-Specific Factors for Consideration." (b) A table has been added within the text of Section 4.40 which summarizes the analytes reported above one or more screening levels for the individual AOIs targeted during the RFI. A statement has also been added within Section 4.40 related to the timeframe in which RFI soil vapor sampling was conducted and the soil vapor resampling event which took place in April 2022 (the reader is also directed to Section 5.2.5 for additional information and findings related to the soil vapor temporal variation assessment conducted during the RFI).
6. **Section 5.2.5 Soil Vapor Temporal Variation Assessment**: HERO recommends revising the following statement, "…Figures 11A through 11E were updated to reflect the maximum concentration reported to date (most conservative approach), which resulted in very little change to the overall soil vapor concentration contours." by describing when the original contours were prepared and with which data set(s) and listing a reference containing this information for comparison.	Section 5.2.5 has been updated to clarify that the majority of the RFI soil vapor data were collected in August and September 2021 with some additional delineation sampling conducted between October 2021 and January 2022. An email with supporting table and soil vapor concentration maps was submitted to the DTSC team on May 2, 2022 to demonstrate that temporal variation in soil vapor concentrations was low at the Site (based on results of a soil vapor resampling event conducted in April 2022). A copy of this email and the attached table and figures has been added to Appendix B of the RFI Report. The text in Section 5.2.5 has been updated to reference this email and figures in support of the quoted statement identified in this comment.
7. **Section 6.1 Human Health Risk Summary**: Please update the health risk results and associated discussions in this section, as appropriate, to reflect the changes recommended for the HHSE discussed below *("below" refers to HERO Comment Nos. 10 through 18 related to the HHSE – response to these comments are being prepared separately by the HHSE author, Roux Associates, Inc.).*	Section 6.1 has been updated to reflect changes made to the HHSE.

RCRA Facility Investigation (RFI) Report, Former SCE Etiwanda Generating Station was prepared by Northgate Environmental Management, Inc., dated May 31, 2023	
DTSC Comments from Chawn Y. (CY) Jeng Human and Ecological Risk Office (HERO) dated August 4, 2023	**Northgate/SCE Response**
8. **Section 7.1 RFI Conclusions**: HERO recommends deleting the following sentence, "Furthermore, the hypothetical commercial/industrial exposure scenario…hazard quotient of 1 (Roux, 2023b)" (2nd bullet under "Summary of RFI soil results"). The current discussion is potentially misleading as it does not address the construction worker scenario and associated health risk (note that the findings of the HHSE are summarized in Sections 6.1 and 7.2 of the RFI Report).	The referenced sentence has been deleted from Section 7.1 of the revised RFI Report.
9. **Appendix B Supporting Documents**: HERO notes that a portion (pages 323-349 in the pdf file) of the Revised Soil Removal Completion Report at Cooling Towers for Units 1 and 2 (SCE/Northgate; January 6, 2022) is not legible.	Thank you for bringing this issue to our attention. We believe the illegible text is related to a software error when the final PDF document was compiled which affected some text in Appendix B and text in the Photographic Log in Appendix C. Affected portions of the RFI Report with illegible text have been remedied.

1.0 INTRODUCTION

1.1 Purpose

On behalf of Southern California Edison (SCE), this report was prepared by Northgate Environmental Management, Inc. (Northgate) to document the Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) conducted at the former SCE Etiwanda Generating Station. Field work began in August 2021 and was completed in December 2022. The former SCE Etiwanda Generating Station is located at 8996 Etiwanda Avenue, Rancho Cucamonga, California 91739 (Site). Refer to Figures 1 and 2 for Site location and general configuration.

Investigative work was conducted in accordance with the Department of Toxic Substances Control (DTSC)-approved *Revised Final RCRA Facility Investigation Work Plan* dated July 20, 2021 (Northgate, 2021c; DTSC, 2021c). For ease of reference within this report, the *Revised Final RCRA Facility Investigation Work Plan* will be referred to as the RFI Work Plan. This RFI Report has been updated in response to comments received from DTSC on September 6, 2023 and replaces the previous version of the RFI Report dated May 31, 2023 (DTSC, 2023).

1.2 RFI Work Plan Objective and Background

1.2.1 Objective

The objective of the RFI is to provide environmental data as described in the RFI Work Plan that are representative of subsurface conditions at the Site to be utilized to determine the nature and extent of potential impacts at the Etiwanda Generating Station and assess the need for potential remedial actions.

1.2.2 RFI Work Plan Background

Thirty-eight (38) operational areas/areas of interest (AOIs) have been identified; several of the AOIs refer to multiple locations at the Site. During the initial Site walk on October 31, 2019, conducted by Mr. Jose Marcos of the DTSC, Mr. John Johnsen of SCE, Mr. Steve Williams of ERM, Mr. Sammie Robertson of GenOn, Mr. George Piantka of NRG, and Mr. Frank Hagar of Northgate, 23 AOIs were identified and discussed. Based on the initial Site walk and subsequent discussion, one AOI (guard shack) was removed and 16 additional AOIs were identified (AOIs 1, 22-24, and 27-38). These AOIs are listed in the table below along with the proposed investigation as part of the RFI Work Plan.

OPERATIONAL AREAS OF INTEREST AND PROPOSED SAMPLING PER RFI WORK PLAN		
ID	**Operational Area/Area of Interest (AOI)**	**Proposed Investigation**
1	Distillate Tank for Unit 5 Peaker	Soil and soil vapor
2	Former Boiler Chemical Cleaning Basin	No investigation required
3	South Retention Basin (Closed)	No investigation required
4	North Retention Basin (Closed)	No investigation required
5	Fueling Station	Soil and soil vapor
6	Unit 5 (Peaker)	Soil and soil vapor
7	Administration Building	No investigation required
8	Decommissioned RO Equip and Basin	No investigation required
9	Laydown Area	No investigation required
10	Units 1 and 2 Cooling Towers	No investigation required
11	Chadwick Channel	Soil
12	Units 4 Cooling Towers and Cooling Tower Transformer	No investigation required
13	Generating Units 3 & 4	No investigation required
14	Hazardous Waste Accumulation Area	Soil and soil vapor
15	Generating Units 1 & 2	Soil vapor
16	Warehouse	Soil and soil vapor
17	Maintenance Shop	Soil and soil vapor
18	Welding Shop	Soil and soil vapor
19	Unit 3 Cooling Towers	No investigation required
20	Capped Natural Gas Easement	No investigation required
21	Cooling Tower Makeup Water Pond	Soil and soil vapor
22	Construction and Operations Waste	No investigation required
23	Auxiliary Transformer	No investigation required
24	Sulfuric Acid Tank	Soil
25	Units 3 & 4 Transformers	Soil
26	Units 1 & 2 Transformers	Soil
27	Acid Caustic Tank Area	Soil
28	Well Water Storage Tank	No investigation required
29	Distilled Water Tanks	No investigation required
30	Cooling Water Tank	No investigation required
31	Fire House (foam)	No investigation required
32	Fire Water Pumps	No investigation required
33	Sludge Drainage Area	No investigation required
34	Northern Fill	No investigation required
35	Sodium Hypochlorite Tank	Soil
36	Former Hazardous Waste Area	Soil and soil vapor
37	Septic Pits	Soil and soil vapor
38	Flumes	No investigation required

For ease of reference to historical documents, the AOI numbering system remains consistent throughout this report.

1.2.3 Sampling Conducted During RFI Implementation

Soil samples were collected and analyzed for total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, pH, and polychlorinated biphenyls (PCBs). Soil vapor samples were analyzed for VOCs. One (1) grab groundwater sample was collected and analyzed for VOCs as directed by the DTSC. Refer to Table 1 for sampling and analysis details with deviations from the approved RFI Work Plan and conditional sampling/analyses identified in red. Further details pertaining to implementation of the RFI sampling are included in Section 3.0.

1.2.4 Regulatory Screening Levels for Comparison

The analytical data from the RFI samplings were compared to generic, risk-based screening levels for commercial/industrial use, as discussed in the RFI Work Plan. Generic screening levels are not intended for use as cleanup levels; however, additional evaluation could be warranted to determine whether concentrations exceeding screening levels pose significant health risks. A listing of the published screening levels used in comparison tables is included below:

- DTSC-modified Screening Levels (DTSC-SLs), Human and Ecological Risk Office (HERO) Note Number 3 (DTSC, 2022a).
- Regional Screening Levels (RSLs) from the United States Environmental Protection Agency (USEPA; USEPA, 2023).
- TPH soil screening levels (SSLs) from the Los Angeles Regional Water Quality Control Board (LARWQCB, May 1996) for protection of groundwater. The groundwater below the Site is greater than 150 feet below ground surface (bgs); therefore, the TPH screening levels are 1,000 milligrams per kilogram [mg/kg] for C_4-C_{12} (referred to as TPH-gasoline or TPH-g), 10,000 mg/kg for C_{13}-C_{22} (referred to as TPH-diesel or TPH-d) and 50,000 mg/kg for C_{23}-C_{32} (referred to as TPH-motor oil or TPH-mo). The LARWQCB SSLs will be used for evaluating deep soil data (greater than 10 feet bgs) for groundwater protection.
- TPH Environmental Screening Levels (ESLs) from the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB, revised January 2019), as allowed in the DTSC Preliminary Endangerment Assessment (PEA) Manual (DTSC, 2015b). The SFBRWQCB ESLs will be used for evaluating shallow soil (less than or equal to 10 feet bgs) for direct human exposure pathways to TPH-g, TPH-d, and TPH-mo. It should be

noted that the RFI Work Plan discussed the potential comparison of TPH in soil to USEPA RSLs and/or DTSC-SLs for aromatic low (C_6-C_8), medium (C_9-C_{16}), and high (C_{17}-C_{32}) ranges for samples analyzed by aromatic hydrocarbon fractions. TPH results for RFI soil samples were also reported by the laboratory in accordance with the above aromatic ranges. At DTSC's direction (during a project meeting held on January 24, 2023), RFI TPH soil data is not compared to USEPA RSLs or DTSC-SLs as DTSC is still reviewing significant changes to TPH aromatic carbon ranges, risk-based assumptions, and screening levels published by USEPA in November 2022.

- The arsenic background concentrations in soil in Southern California often exceed the DTSC-SL for commercial/industrial land use. A DTSC study concluded that based on the analysis of regional data, the upper bound for naturally occurring plus anthropogenic arsenic is 12 milligram per kilogram (mg/kg; Chernoff, Bosan, and Oudiz, 2008). This value for arsenic of 12 mg/kg has been adopted as the "Southern California ambient arsenic screening level" by the DTSC (DTSC, 2020).
- Soil vapor sample test results for VOCs were compared to USEPA RSLs and DTSC-SLs for commercial/industrial land use. The RSLs and DTSC-SLs have been developed for indoor air concentrations; therefore, RSLs and DTSC-SLs for soil vapor are modified using a default attenuation factor (AF). The default AFs of 0.001 for current commercial and 0.0005 for future commercial were derived per the DTSC *Final Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air* (Vapor Intrusion Guidance; DTSC, 2011a). The most conservative default AF of 0.03 was also utilized to develop soil vapor screening levels for comparison (DTSC and CWRCB, 2023). Site specific factors and multiple lines of evidence are presented in Section 4.40 to assist stakeholders in navigating the uncertainties associated with vapor intrusion risk management decisions. Soil vapor probes (SVPs) were installed and sampled in accordance with the *Advisory – Active Soil Gas Investigations* (DTSC, 2015a).
- Groundwater sample test results for VOCs were compared to current California Maximum Contaminant Levels (MCLs) for drinking water.

As discussed above, the RFI data are compared to commercial/industrial screening criteria for decision-making purposes.

1.3 Document Organization

The document is organized as follows:

- Section 1: Introduction
- Section 2: Facility Background
- Section 3: RFI Implementation Details

- Section 4: Analytical Results and Screening Comparisons
- Section 5: Quality Assurance/Quality Control (QA/QC)
- Section 6: Human Health and Ecological Risk Assessment Summary
- Section 7: Conclusions and Recommendations
- Section 8: References
- Tables
- Figures
- Appendices
    - A – Tables from the RFI Work Plan
    - B – Supporting Documents
    - C – Photographic Log
    - D – Permits
    - E – Soil Boring Logs and Soil Vapor Probe Construction Details
    - F – Lab-Grade Water Specifications and Analytical Results
    - G – Laboratory Analytical Reports and Chain of Custody Documentation
    - H – Scoping Level Environmental and Ecological Risk Assessment

2.0 FACILITY BACKGROUND

The Site is located at 8996 Etiwanda Avenue, Rancho Cucamonga, California, approximately one mile east of Interstate 15 and 1.5 miles north of I-10 (Figure 1). It encompasses approximately 60 acres and is bordered by Burlington Northern Santa Fe Railroad (BNSF) tracks to the north, Etiwanda Avenue to the east, the SCE-owned switchyard (Parcels 022928382 and 022928381) to the southeast, and the Inland Empire Utility Agency parcel (IEUA, Parcel 133731) to the southwest (Figure 2). Farther to the southwest is the Rancho Vista Substation (Parcels 022928375 and 022928380), which was constructed in 2009 (Figure 2).

The Chadwick Channel originates north of the Site, flowing through upstream industrial areas, extending beneath the northern adjoining railroad tracks prior to entering the Site. The Chadwick Channel transects the Site from the north to the south (Figure 2). This unvegetated channel is constructed of native soils. The channel terminates at a retention/energy dissipation basin north of 6th Avenue before entering the regional municipality storm collection system. Through the generating station, the channel is unvegetated and approximately 6 feet deep and 60 feet wide at the channel bottom (Jamison and Associates 2011).

2.1 Regional and Local Geology

The Site is located within the north-central portion of the Chino Basin on a broad, gently undulating alluvial plain (Hamilton, 2001). This plain is comprised of coalescing alluvial fans, which have expanded southward from the San Gabriel Mountains and the Jurupa Mountains. Surface deposits at the Site have been mapped as Pleistocene alluvial deposits of gravel, sand, silt, and clay (Hamilton, 2001).

Site borehole logs indicate the upper 450 feet of sediments beneath the Site consists of layered sands and clays with localized gravel. Approximately five to six clay layers were encountered that ranged in thickness from five to 40 feet and collectively were over 125 feet thick (Jamison and Associates, 2011). The clay demonstrated plastic characteristics. Two distinctive, red clay layers were encountered below a depth of 385 feet. The red clay was dry and cemented (Jamison and Associates, 2011).

2.2 Regional and Local Hydrogeology

The Site is situated in the northern part of the Upper Santa Ana Valley Groundwater Basin in the Chino Subbasin. The Subbasin is bounded on the north by the San Gabriel

Mountains and the Cucamonga fault, on east by the Rialto-Colton fault, on the southeast by the Jurupa Mountains, on the south by the Puente Hills and the Chino fault, and on the northwest by the San Jose fault (DWR, 2006). Groundwater is present in the alluvial deposits of the Subbasin. The Pleistocene alluvium is composed of interfingering finer, alluvial-fan deposits and coarser, fluvial deposits (DWR, 2006).

Perched groundwater was not encountered while advancing wells EW-1 through EW-6 (Figure 3) and the depth to first groundwater was approximately 420 feet bgs. Groundwater flow was to the southwest. Well EW-4, installed in February 2002, penetrated a sand aquifer with confined conditions between the two red clay layers described in the previous section. Groundwater was noted flowing from the drill stem at well EW-4 while adding drill rods after the red clay/sand interface was crossed. The groundwater elevation measured in well EW-4 was over thirty feet higher than the groundwater elevation for the other monitoring wells. The boreholes for the other five monitoring wells were completed at a greater depth than well EW-4 and penetrated a deeper, second sand aquifer with unconfined conditions (Jamison and Associates, 2011).

2.3 Site Operations and History

Prior to SCE ownership and use as a power generation facility, the Site and surrounding area was used for agricultural purposes from at least 1938 to approximately 1951. Based on the 2008 Interim Guidance for Sampling Agricultural Properties, DTSC found that at sites where agricultural use had ceased prior to 1950, organochlorine pesticides (OCPs) were not identified as chemicals of potential concern and OCPs did not need to be evaluated (DTSC, 2008). Given that agricultural usage at the Site ended in early 1951 and an additional 13 years has passed since the DTSC guidance was updated, it is even less likely that OCPs would be detected at the Site.

However, in 1997, OCPs were evaluated as part of a Phase II that SCE conducted at the Site and surrounding area (Geraghty & Miller, 1997). Soil samples were collected south of the Site, immediately south of the switchyard in a relatively undisturbed area (with similar crops to the Site) and three soil samples were collected at 0.5 and 3 feet bgs (CS-1-0.5, CS-2-0.5, and CS-2-3). Dichlorodiphenyldichloroethylene (DDE) and dichlorodiphenyltrichloroethane (DDT) were detected in one sample at estimated ("J-flag") concentrations of 0.065 and 0.135 mg/kg, respectively, which are an order of magnitude less than commercial screening levels. The laboratory reporting limits (RLs) for the remaining OCPs were less than the commercial screening levels. Three additional soil samples were collected by a utility pole on SCE property located southwest of the Site and analyzed for OCPs. OCPs were not detected above the

laboratory RLs and the laboratory RLs were 1 to 2 orders of magnitude less than the commercial screening levels. The tabulated data and a figure of the sampling locations were presented in Appendix A of the approved RFI Work Plan.

In October 2019, Ardent Environmental Group, Inc. (Ardent) collected four composite soil samples by the railroad spur at 0.5 feet bgs. DDE was the only pesticide detected and it was detected at a maximum concentration of 21 micrograms per kilogram (µg/kg), which is two orders of magnitude less than the commercial screening level. The remaining laboratory RLs were 1 to 2 orders of magnitude less than the commercial screening levels (Ardent report presented in Appendix B of the approved RFI Work Plan).

Based on previous OCP sampling in 1997 and 2019, that indicated non-detect to very low concentrations of OCPs in the area, with maximum concentrations one to two orders of magnitude less than commercial screening levels, and 70 years since the Site has been used for agricultural uses, sampling for OCPs is not warranted and further sampling for OCPs was not conducted as part of this RFI.

2.3.1 Etiwanda Generating Station History

Initial construction at the Site began in 1951. Units 1 and 2 were in full operation in 1953. Units 3 and 4 were built in 1963. All four units were originally oil-fired conventional boilers and were converted to natural gas fired units. Boiler cooling capacity used water from three onsite, deep, high-capacity groundwater wells (properly abandoned in 2019/2020). Cooling water was circulated through the plants and then to cooling towers located on the north side of the Site (Figure 4). In 1969, a 126,000-KW peaker unit (Unit 5) was added to generate electricity during periods of high demand (Jamison and Associates, 2011).

The operations at the Site have historically included two open, aboveground, wastewater retention basins (North Basin and South Basin), a Boiler Chemical Cleaning Basin (BCCB), four power blocks (Units 1 through 4), cooling towers, a peaker unit, and associated appurtenances (Figure 4). In 1979, the BCCB was constructed. Units 1 and 2 were decommissioned in 2003 and have been inactive since then. The Unit 5 Peaker reportedly has not been used since 1998. Units 3 and 4 discontinued operations by June 2018. The Site has been vacant since then with ongoing targeted demolition activities occurring sporadically since then.

In 1995, in response to a Final Judgment pursuant to a Stipulation from the Superior Court of California, Los Angeles County, Number BC 121219, SCE signed an agreement with

DTSC to clean close the surface impoundments (retention basins), where SCE had stored hazardous wastes, at 11 generating stations in Southern California. The Site is one of the 11 stations included in the Final Judgement. This liability for the Site was reported to result from SCE's past practice of temporarily storing boiler chemical cleaning wastes in the retention basins in the late 1980s, which was discontinued in the North and South Basins and BCCB after that time. Historically, the three (3) basins were utilized for the temporary storage (less than 30 days) of acidic cleaning solutions resulting from the removal of corrosion and mineral deposits from the boiler tubes. This waste remained in the basins prior to removal and offsite treatment. SCE agreed to close the retention basins and associated sumps and appurtenances according to Title 22, California Code of Regulations, Chapter 15. Further information regarding the investigation and subsequent closure of the retention basins at the Site is provided in Sections 2.4.1 and 2.4.2, respectively.

SCE operated the generating station from 1953 to 1998. The Site was sold to Reliant Energy Inc. in 1998, but SCE retained responsibility under the contract of sale for environmental liability associated with past operation of the retention basins during the period of SCE's ownership (discussed above). Ownership transferred to NRG in July 2009 when they purchased Reliant Energy. In 2012, NRG merged with GenOn. Through several business changes including a restructuring of GenOn in 2018, ownership of the Site was transferred to GenOn. In December 2020, the Site was sold to BTC III Etiwanda Commerce Center LP (BTC III) for redevelopment as a commercial logistics center. BTC III and its contractors have been engaged in the demolition of the Site features since July 2021 to facilitate grading and construction of the future commercial buildings (currently up to four [4] commercial buildings and associated paved parking areas for vehicles and truck trailers are anticipated).

2.3.2 Stakeholders and Responsibilities

As discussed above, SCE sold the Site in 1998 but retained liability associated with past operation of the retention basins (per 1995 Final Judgment from the Supreme Court of California). The retention basins were investigated and received closure from the DTSC in 2011 (DTSC, 2011b), however, SCE did retain responsibility for implementing a Site-wide RFI to investigate subsurface environmental conditions at the Site.

When SCE sold the property in 1998, the original Purchase and Sales Agreement contained a clause that SCE is not responsible for non-retention basin contaminants identified 15 years or more after the sale of the property. The 15-year time period for extended

environmental liability closed in 2013, and this clause carries forward in newer Purchase and Sales Agreements.

As of December 2020, the Site owner is recognized as BTC III. According to the Facility-Initiated Corrective Action (FICA) Agreement between BTC III and the DTSC, the sole responsibility of SCE is to prepare and submit an RFI Report to the DTSC. Industrial redevelopment activities by BTC III will follow once the RFI Report is finalized and approved by the DTSC. The scope of work included as Exhibit B of the FICA Agreement indicates that BTC III is responsible for preparation of a Soil Management Plan (SMP), a Human Health Screening Evaluation (HHSE), conducting limited excavation and offsite disposal of arsenic impacted soils which were identified during previous Site investigations, and take part in public participation activities with the DTSC as part of the RCRA closure process for the Site (DTSC, 2021).

Other groups and organizations that have an interest in the outcome of the RFI and subsequent RCRA closure process include the State of California, the local community, and potentially public interest groups.

2.4 Previous Pertinent Environmental Investigations

Information regarding pertinent previous investigations and reports associated with the Site are summarized below. Some of these investigations are associated with SCE retention basin investigations. Pertinent reports are summarized below and copies of selected documents for the Site were included in Appendix B of the RFI Work Plan.

2.4.1 Water Quality Monitoring Programs (1996 to 2011)

In 1996, SCE implemented a *Water Quality Monitoring Program* in response to a Final Judgment pursuant to Stipulation, handed down by the Superior Court of California, Los Angeles County, Number BC 121219 on February 1, 1995 (previously discussed in Section 2.3.1).

The purpose of the *Water Quality Monitoring Program* was to demonstrate if environmental contamination had resulted from the operation of the wastewater retention basins at the Site. Because of the basin size and the minor usage, it was proposed that a soil and soil vapor sampling program initially be performed beneath the retention basin liners (Hamilton, 2012). If the soils directly beneath the retention basins did not exhibit abnormal pH or elevated metal concentrations, then a groundwater monitoring program would not be necessary (Hamilton, 2012). Beginning in 1996, three soil and two soil vapor investigations were conducted beneath

the retention basins to a maximum depth of 100 feet bgs. A total of 173 soil samples and 50 soil vapor samples were collected during the investigations (Hamilton, 2005 and Jamison and Associates, 2011). Based on the investigation results of elevated metal concentrations, pH values, and the presence of VOCs in soil, it was concluded that leakage had occurred beneath the retention basins (Hamilton, 2012).

Between January 2002 and April 2002, four groundwater monitoring wells (EW-1 through EW-4) were installed at the Site to measure groundwater gradients and collect groundwater quality samples both upgradient and downgradient of the retention basins (Figure 3). In 2003, two additional groundwater monitoring wells (EW-5 and EW-6) were added to the monitoring well network (Figure 3). Groundwater sampling and analysis was conducted at the Site from 2002 and concluded in 2011 after DTSC closure of the retention basins. Groundwater sample results from the monitoring wells were used in a statistical analysis to identify contaminants of potential concern (COPCs). Based on the results, it was concluded that there were no statistically significantly elevated chemicals in groundwater in the downgradient wells (Jamison and Associates, 2011). Therefore, there were no COPCs for groundwater at the retention basin site (Jamison and Associates, 2011). A copy of the Final Annual 2011 Groundwater Monitoring Report was included in Appendix B of the RFI Work Plan.

2.4.2 Final Closure Demonstration Report (2011) for the Retention Basins

The *Final Closure Demonstration Report* prepared by Jamison and Associates identified 15 COPCs in soil beneath the basin retention site that were carried forward into a Human Health and Environmental Risk Assessment. The seven (7) inorganic COPCs identified in soil included antimony, arsenic, mercury, molybdenum, nickel, silver, and thallium. The eight (8) organic COPCs identified in soil included chloroform, chloromethane, styrene, tetrachloroethene, toluene, vinyl chloride, butyl benzyl phthalate, and dioxin/furans. No COPCs were identified in soil vapor or groundwater (Jamison and Associates, 2011).

The *Final Closure Demonstration Report* indicated that based on the results of the human health and ecological risk assessments, the retention basin site met the closure standards for unrestricted land use. The results indicated that COPCs in soil at the retention basin site were unlikely to represent future human health or ecological impacts of concern. Therefore, the retention basin site met all closure standards for unrestricted land use and no further remedy or land use covenant was required. On December 29, 2011, DTSC approved the *Final Closure Demonstration Report* (DTSC, 2011b), which is also included in Appendix B of the RFI Work Plan.

2.4.3 Recent Pre-RFI Site Investigations (2019 through 2020)

The legacy information was presented in the RFI Work Plan to provide information regarding previous investigations of interest and target data gaps to be addressed as part of the RFI. Figure 5A presents a comprehensive sampling map of all the recent sampling locations that were included in the four recent (dating back to 2019 at the earliest) subsurface investigations (herein collectively referred to as "Pre-RFI" investigations) alongside the RFI sampling conducted in 2021 and 2022 in accordance with the RFI Work Plan and any subsequent Tech Memo Work Plans. Figures 5B through 5F present more detailed maps of the Pre-RFI sampling locations at the various AOIs. The four Pre-RFI subsurface investigations are described in detail in the Data Gap Analysis (DGA) Report (Northgate, 2021b).

The recent Pre-RFI subsurface investigations are summarized below. The investigations are also described in detail per individual AOIs in Section 4.

2.4.3.1 Site Investigation (2019)

Between October 7 and 17, 2019, ERM (on behalf of previous Site owner GenOn) oversaw a site investigation conducted by Ardent. The site investigation was conducted for due diligence purposes and included sampling at the following locations of soil and/or soil vapor:

- Cooling Towers 1, 2, 3, and 4 (AOIs 10, 12, and 19);
- The Chadwick Channel (AOI 11);
- the Railroad Spur;
- Landfills I and II (AOIs 22and 34);
- The Sludge Drainage Area (AOI 33);
- Existing and Former Hazardous Waste Storage Areas (AOIs 14 and 36);
- Maintenance Shop (AOI 17);
- Septic System (AOI 37);
- Cooling Tower Flumes (AOI 38); and
- The Tributary (southeast corner of the site) (ERM, 2021).

Soil samples were collected at various depths between 0.5 and 7 feet bgs and analyzed for one or more of the following: title 22 metals and hexavalent chromium, TPH carbon chain (TPH-cc), PCBs, OCPs, and VOCs. Sub-slab vapor samples and soil vapor samples at 5 feet bgs were collected and analyzed for VOCs (ERM, 2021a). Sample locations are indicated on

Figures 5A through 5E and analytical results were included in Tables 3 through 16 of the RFI Work Plan (RFI Work Plan tables are included in Appendix A for reference).

Soil and/or soil vapor results at the Cooling Towers 1, 2 and 4 (AOIs 10 and 12), the railroad spur, the tributary, the existing and former hazardous waste storage areas (AOIs 14 and 36), the sludge drainage area (AOI 33), and the landfill II (northern fill; AOI 34) were all less than the commercial screening levels. A brief description of the sampling results that were above the screening levels is presented below. At the Cooling Towers, shallow arsenic contamination was detected at two locations by Cooling Tower 3 (AOI 19) but was not fully delineated (later delineated and removed by Roux [on behalf of BTC III] per discussion in Section 2.4.4.3). At the Chadwick Channel (AOI 11), shallow TPH-d contamination was detected and delineated. At landfill I (AOI 22), lead and arsenic were detected in soil in two areas (LFI-1 and LFI-3) above commercial screening levels. At the flumes (AOI 38) associated with Cooling Towers 1 and 2, as well as 3, and 4, one soil sample collected 0.5 feet below the Cooling Tower 3 flume bottom contained a concentration of thallium slightly above the commercial screening level and was delineated vertically (lateral delineation not feasible/warranted because soil sample was collected within an expansion joint within the concrete-lined flume bottom). It should be noted that thallium is not a constituent of potential concern related to the Site usage.

At the maintenance shop and septic system, 12 SVPs were installed at 5 feet bgs as shown on Figure 11. VOCs including tetrachloroethene (PCE), bromodichloromethane (BDCM), chloroform, 1,1-dichloroethane (1,1-DCA), and vinyl chloride were detected in soil vapor at concentrations above the commercial calculated soil vapor screening level using the most conservative default AF 0.03. Additional details for each AOI investigated were presented in Section 5.4 of the RFI Work Plan.

2.4.3.2 Interim Data Gap Soil Sampling (2020)

In October and November 2020, Northgate (on behalf of SCE) conducted soil sampling at the Unit 4 Cooling Tower and Transformer (AOI 12), the former auxiliary transformer locations (AOI 23), the Sulfuric Acid Tanks (AOI 24), and Sodium Hypochlorite Tanks (AOI 35). Twenty-one hand auger borings (HA1 through HA21) were advanced near the four (4) AOIs (Figures 5B through 5D). Soil samples were analyzed for TPH, PCBs, and/or pH (Tables 20 through 22 of the RFI Work Plan; Appendix A). All detected soil results for TPH and PCBs were below commercial/industrial screening levels. The detected soil results were also below residential screening levels. The pH in soil ranged from 5.69 to 10.1 standard units.

Findings of the sampling indicated that AOI 12 and AOI 23 have been adequately characterized and no additional sampling was required. Additional sampling was recommended at AOI 24 and

AOI 35 per DTSC's comments. Additional details for each AOI investigated are presented in Section 5.4 of the RFI Work Plan. A copy of the *Interim Data Gap Soil Sampling Report* (Northgate, 2021a) was included in Appendix B of the RFI Work Plan (within the *DGA Report* [Northgate, 2021b]).

2.4.3.3 Limited Subsurface Site Investigation (2020)

In 2020, Path Forward Partners, Inc. (Path Forward) conducted a Limited Subsurface Site Investigation on behalf of BTC III (Path Forward, 2020b). Path Forward conducted a soil and soil vapor investigation at the Site of Units 1-4 and the Peaker Unit 5, specifically targeting areas of staining, the oil/solvent storage area, the hazardous waste accumulation area, and the lubricant oil aboveground storage tanks (ASTs). Thirteen (13) borings were proposed; however, two (2) borings by Units 1 and 2 were abandoned due to thick concrete on the order of 3 to 4 feet. Eleven (11) borings (PFP-1 through PFP-11) were advanced to 4 feet bgs and 22 soil samples were collected and analyzed for TPH, VOCs, SVOCs, PCBs, metals, and pH (Figures 5C, 5E, and 8 and Table 23 of the RFI Work Plan; Appendix A). All soil results were less than the DTSC SLs and USEPA RSLs for commercial land use. Six (6) SVPs (PFP-1 through PFP-3, PFP-7, PFP-9, and PFP-10) were installed to 5 feet bgs and soil vapor samples were analyzed for VOCs. Soil vapor results were less than the calculated DTSC SLs using an AF of 0.03, with the exception of PCE (Table 24 of the RFI Work Plan; Appendix A). PCE was detected in one sample by the Peaker Unit 5 at a concentration of 130 micrograms per cubic meter ($\mu g/m^3$), which exceeds the calculated DTSC SL of 67 $\mu g/m^3$ when applying the most conservative default AF 0.03 (Figure 8B). Path Forward concluded that it does not appear significant releases have occurred beneath the power blocks or peaker unit based on the low concentrations detected during this investigation (Path Forward, 2020b). Additional details for each AOI investigated are presented in Section 4. A copy of the *Limited Subsurface Site Investigation Report* was included in Appendix B of the RFI Work Plan (within the *DGA Report*).

2.4.4 Removal Action Activities

Information regarding pertinent previous or ongoing removal action activities and associated reports are summarized below.

2.4.4.1 Soil Removal at Construction and Operations Waste Area (2020)

Between May and June 2020, ERM (on behalf of previous Site owner GenOn) removed arsenic and lead-impacted soil from the construction and operations waste area of the Site (AOI 22). The arsenic and lead-impacted soil was discovered in October 2019, in the northwest corner of the Site at two test pits (LFI-1 and LFI-3) by Ardent (ERM, 2020). During excavation activities,

ERM characterized the lateral and vertical extent of impacted soil based on field screening using portable x-ray fluorescence (XRF) analyzer and after excavation performed confirmation soil sampling to evaluate concentrations of soils left in place (Figure 5F). A total of 87 confirmation soil samples (43 base samples and 44 sidewall samples) were collected to verify the remaining soil beneath and around the excavation did not contain arsenic and lead concentrations above applicable commercial screening levels (ERM, 2020). The final excavation area was approximately 190 feet long by 105 feet wide with a depth ranging from 2 to 8 feet bgs (ERM, 2020). Approximately 6,445 tons of soil were removed from the Site and disposed of at the Yuma County Landfill in Yuma, Arizona. Additional details regarding AOI 22 are presented in Section 5.4.22. A copy of the Soil Removal Memorandum by ERM was included in Appendix B of the RFI Work Plan (included in the DGA report) and analytical results were summarized in Tables 17 through 19 of the RFI Work Plan (Appendix A).

2.4.4.2 Transformer Spill and Soil Removal Summary (2021)

On July 22, 2021, during demolition and decommissioning activities at the Site conducted on behalf of BTC III, a Link Belt 750 Excavator inadvertently removed the western transformer from the Cooling Tower 4 pad, resulting in approximately 40 gallons of transformer mineral oil being released to an unpaved surface. When the operator identified that the transformer was leaking fluid, the transformer was immediately placed on the ground to limit the lateral extent of the spill. The transformer was later placed on plastic sheeting and the remaining contents were relocated into a 55-gallon drum.

To remove all oil-impacted soil on the eastern and northern sides of the transformer/substation pad, ERM (on behalf of BTC III) oversaw soil excavation activities on July 22 and 23, 2021. Four soil confirmation samples were collected at the bottom of the "L"-shaped excavation and analyzed for PCBs. PCBs were not detected above the laboratory RL of 0.050 mg/kg. Stockpiled soil was sampled and analyzed for waste characterization purposes. On August 19, 2021, approximately 146.82 tons of non-hazardous, TPH-impacted soil from the transformer spill was transported to Waste Management, Inc. in Antelope Valley, California. The *Transformer Spill and Soil Removal Summary* document prepared by ERM (document included as a supporting document in Appendix B) concluded that no additional actions were warranted in relation to the spill (ERM, 2021b).

2.4.4.3 Soil Removal Completion Report at Cooling Towers for Units 1 and 2 (2021/2022)

Based on the analytical results of previous investigations conducted by Ardent/ERM (ERM, 2021a), URS Corporation (URS; URS, 2005), EarthTech (EarthTech, 2005), and Roux

Associates, Inc. (Roux; Roux, 2021a), elevated arsenic concentrations generally occurred approximately 1.5 feet horizontally from the cooling tower structures associated with Units 1 and 2 and the adjacent water channel at an approximate depth of 4 to 6 inches bgs. In general, a significant reduction in concentrations to below the Southern California ambient arsenic screening level (12 mg/kg) was observed at approximately 3 feet horizontally from the cooling towers at depths of 6 and 12 inches bgs. The previous results and the soil removal action are discussed in further detail in Northgate's *Revised Soil Removal Completion Report* at Cooling Towers for Units 1 and 2 dated January 6, 2022, which is included as a supporting document in Appendix B.

Based on the previous analytical results, removal of surface material (soil and asphalt) from the west, north, and east sides of the cooling towers, and the south side of the water channel was proposed to remove arsenic impacts. In general, the proposed excavation areas were approximately 4 feet wide and 6 inches deep. However, several limited areas were proposed to have slightly wider and/or deeper removals based on previous analytical results.

In August 2021, Northgate (on behalf of SCE) conducted pre-excavation confirmation soil sampling at cooling towers for Units 1 and 2. Either previous soil sample results, pre-excavation confirmation samples collected in August 2021, or post excavation confirmation samples collected at the excavation limits (conducted in October 2021 by Northgate) were used to provide clean limits for the soil excavations. Soil with arsenic concentrations exceeding the Southern California ambient arsenic screening level was removed and disposed offsite at an appropriately permitted and licensed disposal facility. Soil excavation and disposal of arsenic-affected soil adjacent to the cooling tower building pads and the adjacent water channel took place between August 20, 2021 and September 2, 2021 and was conducted by American Integrated Services (on behalf of SCE). All earthmoving and soil loading activities were monitored in accordance with the South Coast Air Quality Management District (SCAQMD) Rule 1466 guidelines by Roux.

Northgate recommended no additional work at the former cooling towers for Units 1 and 2 (AOI 10) with regard to removal of arsenic-impacted soil and requested the issuance of a no further action letter (Northgate, 2022a). On January 6, 2022, DTSC approved the report via email (a copy of the DTSC email approval is included in Appendix B).

2.4.4.4 Soil Removal at Cooling Tower 3 (2021)

Based on the analytical results of previous investigations conducted by Ardent/ERM (ERM, 2021a), arsenic concentrations above the Southern California ambient arsenic screening level (12 mg/kg) were detected at concentrations of 14.3 mg/kg and 26.4 mg/kg at locations

CT3-2 and CT3-6, respectively at depths of 0.5 feet bgs. To delineate the extent of the arsenic impacts near the former cooling tower for Unit 3 (AOI 19), BTC III's environmental consultant, Roux (on behalf of BTC III), advanced four (4) step-out soil borings on September 9, 2021. The soil borings were located 4 feet from the original Ardent sampling locations, CT3-2 and CT3-6, in three (3) cardinal directions. Soil samples were collected at 2 feet bgs in each of the six step-out soil borings. Arsenic concentrations in the step-out samples were all below the Southern California ambient arsenic screening level of 12 mg/kg, according to an analytical table and associated figures submitted by Roux to the DTSC on October 18, 2021 (Roux, 2021b).

According to the email summary provided by Roux to DTSC on October 18, 2021, two (2) small soil excavations were completed on October 6, 2021 to remove arsenic-impacted soil at previous sampling locations CT3-2 and CT3-6. Work was conducted under the SMP prepared for the Site by Roux on behalf of BTC III (Roux, 2021a). Soil excavations at both locations were 8 feet by 4 feet by 2 feet deep and generated approximately 5 cubic yards of soil in total. Soil was transported under non-hazardous waste manifest for disposal at Simi Valley Landfill (Roux, 2021b). A copy of the email and attachments provided by Roux regarding the arsenic-impacted soil removals is included as a supporting document in Appendix B.

2.4.4.5 Demolition of Generating Units 1 through 5 and Related Soil Removals

Unit 5 (Peaker)

Unit 5 (Peaker) was demolished in November 2021 by BTC III and its contractors, following RFI sampling activities conducted by Northgate. RFI soil sampling conducted near one of the two exterior transformers indicated shallow PCB concentrations above commercial/industrial screening levels (Figure 8). Subsequent RFI step-out sampling was successful in vertically and laterally delineating PCB concentrations above commercial/industrial screening levels adjacent to the transformer pad (see Figure 8A and the discussion of RFI sampling results in Section 4.6.1). RFI sampling results, figures, and soil boring location information in the vicinity of the transformer south of Unit 5 were transmitted to BTC III's consultants Roux and ERM on June 1, 2022.

Roux (on behalf of BTC III) collected a composite concrete sample (analyzed for TPH and PCBs in November 2021) of the transformer pad at Unit 5 and additional soil confirmation samples (analyzed for PCBs in March and April 2022) to further support materials handling and waste characterization procedures associated with Site demolition. In August 2022, Roux (on behalf of BTC III) oversaw the demolition of the transformer concrete pad and a soil excavation to address the PCB-affected soil surrounding the former transformer location. The resulting soil

excavation dimensions measured approximately 16 feet by 20 feet by 2.5 feet deep. Concrete debris was transported for disposal at Antelope Valley Landfill. Soil generated from the excavation activities was transported for disposal at Kettleman Hills (Roux, 2023a).

Roux prepared a summary email to DTSC on January 18, 2023, with details regarding the additional sampling and material removal/disposal operations (Roux, 2023a). A copy of the January 18, 2023 email to DTSC along with supporting tables, figures, and laboratory analytical reports is included in Appendix B. According to email correspondence with Roux on May 1, 2023, soil disposed of at off-Site disposal facilities was not subject to USEPA Toxic Substances Control Act (TSCA) regulations.

Units 3 & 4

Units 3 & 4 were demolished in the first half of 2022 by BTC III and its contractors, following RFI sampling activities conducted by Northgate. RFI soil sampling conducted near two transformers located south of Units 3 & 4 indicated shallow TPH and PCB concentrations above commercial/industrial screening levels (Figure 14). Subsequent RFI step-out sampling was successful in vertically and laterally delineating PCB concentrations above commercial/industrial screening levels adjacent to the two (2) transformer pads (see Figures 14A and 14B and the discussion of RFI sampling results in Section 4.6.1). RFI sampling results, figures, and soil boring location information in the vicinity of the transformers located south of Units 3 & 4 were transmitted to BTC III's consultants Roux and ERM on June 22, 2022.

Roux (on behalf of BTC III) collected composite concrete samples of the transformer pads at former Units 3 & 4 to further support materials handling and waste characterization procedures associated with Site demolition. In August 2022, Roux oversaw the demolition of the transformer concrete pads and two (2) soil excavations to address the PCB and TPH-affected soils surrounding the former transformer locations. The soil excavation dimensions measured approximately 35 feet by 20 feet by 2.5 feet deep and 35 feet by 25 feet by 2.5 feet deep. Four (4) sidewall confirmation samples and one (1) bottom confirmation sample were collected from each of the two (2) excavations and analyzed for TPH (C_6-C_{44}) and PCBs. Concrete debris was transported for disposal at Antelope Valley Landfill. Soil generated from the excavation activities was transported for disposal at Kettleman Hills (Roux, 2023a).

Roux prepared a summary email to DTSC on January 18, 2023, with details regarding the additional sampling and material removal/disposal operations (Roux, 2023a). A copy of the January 18, 2023 email to DTSC along with supporting tables, figures, and laboratory analytical reports is included in Appendix B. According to email correspondence with Roux on May 1, 2023, soil disposed of off Site was not subject to USEPA TSCA regulations.

Units 1 & 2

Units 1 & 2 were demolished in the second half of 2022 by BTC III and its contractors, following RFI sampling activities conducted by Northgate. RFI soil sampling was conducted by Northgate at eight (8) former transformer locations located on the south side of Units 1 and 2 (Figure 14). The transformers had been removed prior to RFI sampling activities in September 2021, but their concrete pads were still in place when RFI sampling was conducted. RFI soil results at the transformer locations did not indicate concentrations of TPH, VOCs, or PCBs above commercial/industrial screening levels (see RFI sampling results in Section 4.26).

In November 2021, as part of demolition preparation activities, Roux collected composite samples of concrete at locations where PCBs were suspected to have been present in equipment related to historical operations at the Site. Concrete in certain locations near Units 1 and 2 contained PCBs at concentrations greater than or equal to 50 mg/kg. As a result, Roux and BTC III began coordination with the USEPA TSCA group. Additional composite samples were collected in January and February 2022 to further characterize the extent of PCBs in this area and to support preparation of a Self-Implementing PCB Cleanup and Disposal Notification Plan (SICP). Additional characterization sampling of concrete, asphalt, and soil was conducted between June and November 2022. BTC III is continuing to work with both DTSC and USEPA to characterize and remediate PCB impacts at former Units 1 and 2 in accordance with the TSCA regulations. It should be noted that the continuing investigation of PCB-impacted material under USEPA's TSCA group at former Units 1 & 2 is considered separate from the scope of this RFI.

3.0 RFI IMPLEMENTATION DETAILS

3.1 Timing

Field efforts associated with the RFI took place between August 6, 2021 and December 19, 2022. Field efforts included initial Site walk to mark boring locations, geophysical surveying to clear proposed locations for underground utilities, advancement of soil borings for the collection of soil samples, retrieval of one (1) grab groundwater sample, and installation of SVPs, soil vapor sampling events, and SVP destruction activities. Representative photographs of these activities are included in Appendix C. Details related to field efforts are discussed in the following sections.

3.2 DTSC Notifications and Progress Updates

On August 9, 2021, DTSC was notified via email of scheduled field work to begin at the Site on August 23, 2021. As analytical results were received from the laboratory, multiple meetings were held between DTSC, SCE, and Northgate (also referred to as the RFI Project Team) to discuss preliminary analytical results, review draft figures and tables, propose additional field mobilizations to laterally and/or vertically delineate chemicals identified in soil and soil vapor above commercial/industrial screening criteria, and provide field status/schedule updates. RFI Project Team meetings were held virtually on September 8th, October 28th, November 19th, December 2, 2021, January 28, 2022, February 28, 2022, April 25, 2022, and October 11, 2022.

Based on discussions during Project Team meetings mentioned above, several technical memorandum-style work plans were developed and submitted to DTSC which proposed supplemental RFI sampling activities to adequately delineate the lateral and vertical extent of chemicals identified above commercial/industrial screening criteria. A brief summary of the Technical Memoranda (Tech Memos) submitted to DTSC and DTSC responses is presented below. Copies of the Tech Memos and relevant DTSC correspondence are included in Appendix B.

- *Technical Memorandum: Additional RFI Soil Vapor Sampling* was submitted to DTSC on December 6, 2021. This Tech Memo provided a summary of RFI soil vapor sampling efforts and proposed additional step-down soil vapor sampling up to 250 feet bgs at MS-23C, located in the vicinity of a former sodium hypochlorite tank and north of the former warehouse (AOI 16) and maintenance shop (AOI 17; Northgate, 2021d). DTSC did not issue formal written approval for this document; however, verbal discussions during Project Team meetings indicated DTSC concurrence and Northgate was asked to proceed with the proposed additional RFI sampling.

- *Technical Memorandum: Additional RFI Soil Vapor Sampling* was submitted to DTSC on February 2, 2022. This Tech Memo proposed four (4) additional soil vapor sampling locations (identified as MS-29, MS-30, MS-31, and MS-32) to delineate elevated soil vapor concentrations identified west of the former warehouse (AOI 16) and maintenance shop (AOI 17; Northgate, 2022b). DTSC provided comments via email on February 1, 2022, in response to the initial version of this Tech Memo. DTSC comments were incorporated and addressed in the final Tech Memo dated February 2, 2022 (DTSC email comments are included in Appendix B).
- *Technical Memorandum: Soil Vapor Temporal Variability Assessment* was submitted to DTSC on March 15, 2022. This Tech Memo proposed resampling 18 of the previous RFI soil vapor sampling locations to reduce the uncertainty associated with potential soil vapor variability over time and in different seasons (Northgate, 2022c). The number of proposed soil vapor resampling locations was subsequently increased from 18 to 22 in response to DTSC comments received via email on March 17, 2022 (email correspondence included in Appendix B). Temporal variability results in the form of tables and figures were provided to DTSC on May 2, 2022, via email. DTSC issued an approval letter on July 18, 2022, which confirmed that no further temporal variability sampling was required (a copy of the DTSC approval letter included in Appendix B).
- *Technical Memorandum: Supplemental Soil Vapor and Groundwater Assessment* was submitted to DTSC on March 29, 2022. This Tech Memo proposed advancement of one (1) deep soil boring, identified as MS-23D, to an estimated depth of 425 feet bgs for the collection of deep soil vapor and groundwater samples below the former sodium hypochlorite tank (which was installed after SCE sold the property), located north of the former warehouse (AOI 16). Grab groundwater sampling results at this location would be evaluated to determine if construction of a groundwater monitoring well is warranted and potentially groundwater monitoring (Northgate, 2022d). A letter was issued by DTSC Geological Services Branch with several comments on the Tech Memo, but also recommended conditional approval. Northgate confirmed via email that the sampling program would be updated to be consistent with DTSC comments (DTSC letter and email response are included in Appendix B). Temporary well construction information and preliminary groundwater sampling results were submitted to DTSC on September 16, 2022, via email.

3.3 Underground Utility Clearance

Proposed drilling locations were marked in white paint and Underground Service Alert (a.k.a. DigAlert of Southern California) was notified at least 48 hours prior to the start of drilling activities, as required by law, in order to avoid potential damages to underground utilities in the vicinity of the boring locations.

On August 6, 13 and 19, 2021, October 14, 2021, February 4, 2022, and May 25, 2022, Northgate and its subcontractor, Ground Penetrating Radar Systems, LLC. (GPRS) of Toledo, Ohio performed geophysical surveys at the Site for the proposed boring locations and their vicinity. The surveys consisted of a ground-penetrating radar (GPR) scan, and other geophysical survey methods (e.g., electromagnetic and radio frequency methods) to scan for underground utilities and features at the Site. Maximum effective depth of the GPR survey was estimated by GPRS to be 3-5 feet bgs. However, in numerous locations around the Site, use of the GPR instrument was restricted due to an uneven ground surface surrounding some proposed borings. In addition to clearance of the proposed borings, GPRS scanned for underground utilities within the general vicinity of each boring in case additional step out borings were necessary. The locations of any detected utilities were marked directly at the Site with paint, flags, or stakes.

3.4 Permitting

Well permits were obtained for any soil boring advanced beyond 20 feet deep, in accordance with San Bernardino County Environmental Health Services (EHS) requirements. This applied to six (6) "step-down" sample locations completed at Unit 5 Peaker area (AOI 6; boring P-1B) and the former warehouse and maintenance shop areas (AOIs 16 and 17; borings MS-13B, MS-17B, MS-23B, MS-23C, and MS-23D). Construction of SVPs at sampling location MS-23D included the installation of a polyvinyl chloride (PVC) pipe to approximately 400 feet bgs to more accurately place deep SVPs. Because of the depth of this soil boring and the use of hard casing in close proximity to groundwater (water table identified at 460 feet bgs), a well destruction permit was also obtained from EHS for MS-23D. Copies of the approved permits from EHS are included in Appendix D.

3.5 Soil Boring and Sampling Protocols

Between August 23, 2021 and September 29, 2022, approximately 145 soil borings were advanced at the AOIs indicated in Section 1.2.2 and on Table 1.

3.5.1 Boring Installation and Sampling Protocols

Each boring was advanced using a hand auger to a depth of 5 feet bgs prior to being advanced with mechanized drilling equipment. If the total depth of the boring was less than 5 feet bgs, a hand auger was used exclusively to complete the soil boring. The total depth of the borings ranged from 0.5 feet bgs to 470 feet bgs. In general, soil samples were collected using a hand auger (sample analysis for non-volatiles), slide hammer (sample analysis includes volatiles) or in an acetate sleeve if advanced deeper than 5 feet bgs; however, soil conditions at some locations, particularly AOI 11, Chadwick Channel, were such that samples submitted for

volatile analyses were collected directly from the hand auger bucket (soil samples preserved using USEPA Method 5035) due to loose and dry soil conditions limiting sample recovery within the slide hammer sleeves.

Hand augering, direct-push drilling, and hollow stem auger drilling, and sampling was supervised by a Northgate geologist or other qualified environmental scientist familiar with the Site and the project objectives. Cuttings and core samples were logged in accordance with the Unified Soil Classification System (USCS) to provide a continuous record of subsurface lithology at each boring location. Field boring logs are included in Appendix E. All borings not utilized for temporary soil vapor wells were backfilled to the surface with hydrated bentonite chips. All subsurface generated cuttings other than those collected for laboratory analysis and decontamination rinse water were containerized in 55-gallon steel drums or covered roll-off bins for disposal as non-hazardous waste by an SCE-contracted waste hauler.

After sampling was complete, coordinates for each soil boring were collected using a Trimble Geo 7X handheld global positioning system (GPS) unit or cellular phone equipped with an appropriate geolocation application.

3.5.2 Actual Versus Planned Soil Boring Locations

In general, the borings were installed per the RFI Work Plan; however, a number of boring locations were either deleted, modified, or added due either to DTSC requests, refusal/utility location during boring installation, or the necessity of additional delineation step-out/down borings. A summary of deviations from the RFI Work Plan and conditional analyses completed as part of the RFI is presented in Table 1. Deviations from the DTSC-approved RFI Work Plan are addressed in more detail in Section 5.4.2.

3.5.3 Target Analyses

Soil samples were analyzed for TPH, VOCs, SVOCs, lead, metals, pH, and/or PCBs in accordance with the RFI Work Plan. All soil samples were submitted to Eurofins Calscience LLC (Eurofins) in Garden Grove, California under proper chain-of-custody protocol. A listing of soil analytical methods follows:

- TPH volatiles (gasoline range) by USEPA Method 5035/8015B;
- TPH extractables (diesel and motor oil range) by USEPA Method 8015B;
- VOCs by USEPA Method 5035/8260B;
- SVOCs by USEPA Method 8270C;

- Lead by USEPA Method 6020;
- CAM 17 Metals by USEPA Method 6020/7471A;
- PCBs by USEPA Method 8082; and
- pH by USEPA 9045C.

All soil analytical results were reported to the method detection limit (MDL) and concentrations reported above the MDL, but below the RL were flagged by the laboratory as estimated concentrations ("J-flagged").

3.6 Soil Vapor Probe Installation and Sampling Protocols

3.6.1 Soil Vapor Probe Installation and Sampling Protocols

Between August 23, 2021, and September 29, 2022, approximately 59 soil boring locations were converted into temporary SVPs. The SVPs were generally installed per the RFI Work Plan and in accordance with the DTSC *Advisory for Active Soil Gas Investigations* dated August 2015 (DTSC, 2015a). SVPs consisted of either polyethylene implants or stainless-steel implants (used at several of the deeper soil vapor sampling locations where a hollow stem auger or air rotary-casing hammer drilling rigs were required for installation) were installed at target sampling depths and connected to the surface using ¼-inch Nylaflow® tubing. Generally, a 1- to 1.5-foot-thick sand pack consisting of Number 3 Monterey Sand was placed around each SVP implant and hydrated bentonite was used for annular/surface seals. Individual SVP construction details are included in Appendix E.

Following installation, each SVP was allowed to equilibrate for a minimum of 24 or 48 hours prior to collecting soil vapor samples if advanced with direct-push rig or hand auger, respectively. Between August 27, 2021 and October 7, 2022, available SVPs were purged of three well volumes in accordance with the *DTSC Advisory* (DTSC,2015a). A shut-in test was successfully conducted on each SVP. Tracer gas, consisting of a mixture of n-pentane, n-hexane and n-heptane, was applied to a tissue and placed at the tubing-ground surface interface before sampling each SVP. The three compounds associated with the tracer were analyzed along with the full VOC list to determine if there were surface leaks to the subsurface due to improper construction of the soil vapor sampling train or defects associated with the SVP.

Following the purging process, the majority of the soil vapor samples were collected in a glass syringe and analyzed onsite by a California state-certified mobile laboratory, Jones Environmental, Inc. (Jones). Soil vapor samples collected on September 17, 2021, October 18, 2021, January 12, 2022, and April 4, 2022 were collected in Summa® canisters by Jones

personnel and were submitted to Jones' stationary laboratory in Santa Fe Springs, California under proper chain-of-custody protocol for analysis. All soil vapor samples were analyzed for the full suite of VOCs using USEPA Method 8260B by Jones via mobile lab or stationary lab.

Soil vapor samples which reported concentrations of the tracer gas compounds (n-pentane, n-hexane and n-heptane) were considered potentially affected by ambient air intrusion (samples with reported concentrations of tracer gas are shaded in blue on Table 7). In general, samples with reported concentrations of tracer gas were resampled in an attempt to collect a more representative sample of subsurface vapors without evidence of potential ambient air intrusion. If a resampled SVP still indicated significant concentrations of tracer gas, it was assumed that there was a defect in the SVP construction or that the probe integrity had been compromised due to heavy equipment and demolition activities in the area. To remedy these soil vapor data gaps, several replacement SVPs were installed (replacement probe IDs include the letter "R" to distinguish them from the original SVP at the same location) and sampled. Several examples of replacement SVPs constructed for resampling purposes include P-9-5R at Unit 5 Peaker (AOI 6), MS-21-5R and SS-12-5R at the former maintenance shop (AOI 17).

Following soil vapor sample collection, the temporary SVPs were abandoned by removing Nylaflow® tubing from the ground or cutting the tubing beneath the surface if the entire length of tubing could not be removed. The hydrated bentonite and/or cement grout seals were left in place.

3.7 Field Quality Control Samples Collected

Field quality control samples were collected during the investigation as follows:

- Field duplicates of soil and soil vapor samples were collected to assess the variance of the total process including sampling and analysis. The target duplicate rate was one (1) duplicate for every 10 soil samples (10%) analyzed and one (1) duplicate for every 20 soil vapor samples analyzed (5%). The final average field duplicate rates for soil (across all analyses) and soil vapor samples were 9.6% and 5.9%, respectively.
- Trip blanks supplied by the laboratory, were kept in each ice chest with soil VOC samples and transported to the laboratory for analysis with the samples to identify shipping and laboratory sources of contamination.
- Field blanks were collected to determine if any potential contaminants were present while the VOC soil samples were being collected. Field blanks were collected and analyzed on each day that VOC soil samples were collected.
- Equipment rinsate blanks were collected following equipment decontamination of the slide hammer, hand auger, or direct push rig sampling shoe. The target rate for

equipment rinsate blank collection was one (1) per 20 samples. Equipment rinsate blanks were collected and analyzed per the target rate.

- Additional sample volume was collected at a rate of approximately one per 20 samples or one per analytical batch for the laboratory analysis of matrix spike (MS) and matrix spike duplicate (MSD) samples to evaluate accuracy of analytical procedures conducted at the laboratory.

Honeywell brand, lab-grade water specifically designed for high-performance liquid chromatography (HPLC) and spectrophotometry was primarily used in generating the field blanks and equipment rinsate blanks during the RFI. Two samples of the lab-grade water from different batches (batch IDs DZ609 and EA182) were decanted in an office setting and analyzed as part of ongoing SCE projects for metals by drinking water method USEPA Method 200.8 and for VOCs by USEPA Method 8260B. Analytical results indicate that trace and minor[1] concentrations of various metals and chloroform are present in the lab-grade water. Lab-grade water chemical specifications and relevant excerpts from the laboratory analytical reports with lab-grade water test results are included in Appendix F.

Sparkletts brand distilled water was later utilized as the preferred lab-grade water used in QA/QC samples associated with collection of groundwater samples in September 2022 (at sample location MS-23D) because chloroform was confirmed present in Honeywell brand water and was a target analyte in the subsurface based on soil vapor concentrations detected in and around the former maintenance shop area (AOI 17). A representative sample of Sparkletts distilled water (sample identified as SDW-1) was collected in an office setting and analyzed for VOCs by USEPA 8260B at Eurofins. Chloroform was not detected in the distilled water sample above the laboratory detection limits and was considered suitable for equipment decontamination purposes, equipment rinsate blanks, field blanks, etc. A copy of the VOC results for sample SDW-1 are also included in Appendix F.

Further QA/QC details are included in Section 5.0.

[1] Trace concentrations refer to estimated or J flagged results reported above the MDL but below the RL. Minor concentrations refer to concentrations that are slightly above the RL.

4.0 ANALYTICAL RESULTS AND SCREENING COMPARISONS

Soil, soil vapor, and groundwater analytical results are presented in Tables 2 through 8 and briefly summarized with respect to each individual AOI in the following sections. AOIs and boring locations are shown in Figures 4 and 5. Laboratory analytical reports and chain of custody documentation associated with RFI sampling are included in Appendix G.

4.1 AOI 1 – Distillate Tank for Unit 5 Peaker

Background: A retired and empty distillate tank for Unit 5 Peaker was previously staged in the southeastern part of the Site (Figure 7). The distillate tank was removed as part of the demolition activities taking place between August and September 2021 (generally concurrent with RFI sampling activities).

Additional Assessment Conducted: Four (4) borings were advanced by Northgate around the base of the former distillate tank (DT-1 through DT-4; Figure 7). Soil samples were collected at depths of 2.5, 5, and 10 feet bgs and analyzed for TPH (Table 1). Additional sample material was retained at the laboratory on hold as contingency for possible analysis of VOCs, SVOCs, and polycyclic aromatic hydrocarbons (PAHs) if TPH concentrations exceeded 100 mg/kg, per the RFI Work Plan. TPH results in soil are discussed below. Contingency soil sample analyses were not warranted.

Multi-depth SVPs were also installed at 5 and 10 feet bgs in each boring, and soil vapor samples were collected and analyzed for VOCs. Soil vapor results are discussed in Section 4.2.1.

4.1.1 TPH in Soil

TPH results from the soil samples analyzed between 2.5 and 10 feet bgs were all less than 100 mg/kg (threshold for contingency analyses) and less than the applicable commercial/industrial screening levels as presented in Table 2.

4.1.2 VOCs in Soil Vapor

VOC results from the eight (8) soil vapor samples analyzed were all less than applicable commercial/industrial screening levels for soil vapor using the default AFs 0.03, 0.001, and 0.0005 (Table 7). The SVP installed at 5 feet bgs at location DT-1 was resampled on September 1, 2021, due to detection of tracer gas compounds in the sample collected on August 31, 2021 (see general protocol for tracer gas detections in Section 3.6.1). The resampling effort at DT-1-5 also reported tracer gas concentrations, therefore, the SVP may be compromised or damaged and soil vapor data at this location may be affected by ambient air

intrusion. Because soil vapor results for the other seven SVPs at AOI 1 did not indicate concentrations of VOCs above commercial/industrial screening levels, installation and sampling of a replacement probe for DT-1-5, per the general protocol for tracer gas detections described in Section 3.6.1, was not considered necessary or likely to change the conclusions or recommendations for this AOI.

4.2 AOI 2 – Former Boiler Chemical Cleaning Basin (Closed)

Background: The former BCCB was located in the southeastern part of the Site (Figure 4). The former BCCB was previously investigated and obtained regulatory closure in December 2011 (Jamison and Associates, 2011; DTSC, 2011b). The BCCB was demolished in 2022 as part of Site demolition activities.

Assessment Completed: Since the former BCCB has received regulatory closure, no additional RFI sampling was proposed in the RFI Work Plan.

4.3 AOI 3 – South Retentions Basin (Closed)

Background: The closed South Retention Basin was located in the southeastern part of the Site (Figure 4). The South Retention Basin was previously investigated and obtained regulatory closure in December 2011 (Jamison and Associates, 2011; DTSC, 2011b). The Southern Retention Basin was demolished in 2022 as part of Site demolition activities.

Assessment Completed: Since the former South Retention Basin has received regulatory closure, no sampling was proposed in this area as part of the RFI Work Plan.

4.4 AOI 4 – North Retentions Basin (Closed)

Background: The closed North Retention Basin was located in the southeastern part of the Site (Figure 4). The North Retention Basin was previously investigated and obtained regulatory closure in December 2011 (Jamison and Associates, 2011; DTSC, 2011b). The Northern Retention Basin was demolished in 2022 as part of Site demolition activities.

Assessment Completed: Since the former North Retention Basin has received regulatory closure, no sampling was proposed in this area as part of the RFI Work Plan.

4.5 AOI 5 – Fueling Station

Background: The former fueling station was located in the southeastern part of the Site and was used for vehicle fueling (Figure 7). A fuel underground storage tank (UST) was

historically located in the southern part of this area, east of the southern part of the North Basin as noted on Figure 7. In 2020, Path Forward noted that there was a 250-gallon gasoline aboveground storage tank (AST) in use at the fueling station (Path Forward, 2020a). The last remnants of the fueling station including the asphalt pavement and concrete pads were removed in the second half of 2021 (generally concurrent with RFI sampling activities).

Additional Assessment Conducted: Two borings (F5-1 and F5-2) were completed by Northgate, one adjacent to the fuel pump/AST and one adjacent to the UST to approximately 10 feet bgs. Soil samples were collected at depths of 2.5, 5, and 10 feet bgs. All soil samples were analyzed for TPH. Soil samples at 2.5 and 5 feet bgs were analyzed for VOCs and lead with the deeper sample on hold pending the results of shallow samples. Any concentration of TPH carbon ranges above 100 mg/kg, would trigger analysis of VOCs in soil (if not already scheduled for analysis).

Multi-depth SVPs were set at 5 and 10 feet bgs in both borings, and soil vapor samples were collected and analyzed for VOCs.

4.5.1 TPH in Soil

TPH results from the soil samples analyzed between 2.5 and 10 feet bgs were all less than 100 mg/kg (threshold for contingency analyses) and less than the applicable commercial/industrial screening levels as presented in Table 2.

4.5.2 VOCs in Soil

VOC results from the soil samples analyzed at 2.5 and 5 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 3.

4.5.3 Lead in Soil

Lead results from the soil samples analyzed at 2.5 and 5 feet bgs from both borings were less than the applicable commercial/industrial screening levels as presented in Table 5.

4.5.4 VOCs in Soil Vapor

VOCs results from the four (4) soil vapor samples analyzed were all less than applicable commercial/industrial screening levels using the default AFs 0.001 and 0.0005 (Table 7). The 5-foot soil vapor sample at F5-1 reported a PCE concentration of 88.7 µg/m^3 and is slightly above the DTSC-SL of 67 µg/m^3 using the most conservative default AF 0.03. The slightly

elevated PCE concentration at 5 feet in F5-1 was observed to decrease rapidly with depth. A PCE concentration of 14.9 µg/m^3 was reported in the deeper 10-foot sample at F5-1. PCE concentrations were below the screening level in the adjacent soil boring F5-2 in both the 5 and 10-foot samples. In addition, PCE was not reported above the RL in the 2.5 and 5-foot soil samples collected at F5-1 and F5-2. PCE is not known to have been stored or used at the former fueling station and all improvements, piping, and pavement have been removed from this area. Based on these observations, the source strength of PCE in soil vapor was considered to be weak and likely the result of an incidental and insignificant surface release; therefore, further soil vapor sampling was not proposed. All other VOCs reported in soil vapor samples collected at F5-1 and F5-2 were below commercial/industrial screening levels using the most conservative default AF 0.03.

4.6 AOI 6 – Unit 5 Peaker

Background: The former Unit 5 Peaker was located in the eastern part of the Site, northwest of the guard shack (Figure 4). Two transformers were identified adjacent to the southern wall of Unit 5 Peaker. It should be noted that the RFI Work Plan mentions only one transformer; however, a second small transformer was identified near the southwestern corner of the former Unit 5 Peaker (Figure 8) during the Site Walk on August 6, 2021 and additional RFI sampling was conducted to assess both transformers (see Table 1 for additional details regarding RFI Work Plan deviations). In November 2020, during Path Forward's limited site investigation, PCE was detected in soil vapor at 5 feet bgs at two borings at the Unit 5 Peaker at concentrations of 40 µg/m^3 at PFP-01 and 130 µg/m^3 at PFP-02 (Figure 8B). PCE at PFP-02 exceeded the commercial/industrial screening level for soil vapor using the most conservative default AF 0.03. The remaining VOC detections were less than the calculated commercial screening levels for soil vapor. Unit 5 Peaker was demolished in November 2021, following the RFI sampling discussed below.

Additional Assessment Conducted: Initially, eight (8) soil borings (PT1-1 through PT1-4 and PT2-1 through PT2-4) were completed by Northgate within the gravel area around the two transformers located immediately south of Unit 5 Peaker (Figure 8). The borings were installed in the gravel area immediately adjacent to the transformer concrete pads. Soil samples were collected at ground surface and at depths of 0.5, 1, and 2.5 feet bgs. Samples from surface, 0.5, and 1 feet bgs were analyzed for PCBs with the deeper samples on hold pending shallower results. Samples from 0.5 and 2.5 feet were collected for TPH analysis. If TPH was detected in any of the carbon ranges above 100 mg/kg, the sample from the corresponding depths were analyzed for VOCs (Table 1). PCB concentrations reported in two soil borings (PT1-3 and PT1-4) exceeded the commercial/industrial screening levels

and prompted the advancement of four additional step-out soil borings, discussed below in Section 4.6.1 (Figure 8A).

One soil/soil vapor boring (P-1) was advanced to 10 feet bgs, directly west of historical sample location PFP-02 (Figure 8). Soil samples were collected from the boring at 2.5, 5, and 10 feet bgs and analyzed for VOCs. Four nested SVPs were also installed west of the Unit 5 Peaker (P-1 through P-4). Multi-depth SVPs were installed and sampled at 5 and 10 feet bgs in each boring. Concentrations of PCE in SVPs P-1 through P-4 exceeded commercial/industrial screening levels only when using the most conservative default AF 0.03 and prompted the advancement of six (6) additional step-out and step-down SVPs by Northgate, discussed below in Section 4.6.4.

4.6.1 PCBs in Soil

PCB concentrations were identified above commercial/industrial screening levels in soil at PT1-3 and PT1-4 at depths of up to 1 feet bgs (Table 6). Concentrations of Aroclor-1254 (maximum concentration of 6.9 mg/kg) were identified above commercial/industrial screening level in the surface, 0.5, and 1.0-foot soil samples collected at PT1-3. In addition, concentrations of Aroclor-1260 (maximum concentration of 1.5 mg/kg) were identified above the commercial/industrial screening level in the 0.5 and 1.0-foot soil samples collected at PT1-3. The 1-foot soil sample at PT1-4 also contained an Aroclor-1254 concentration of 0.93 mg/kg which exceeds the DTSC-SL. Step-out soil borings PT1-3N, PT1-3E, PT1-4S, and PT1-4E were positioned approximately 5 feet away from PT1-3 and PT1-4 and advanced to a total depth of 2.5 feet bgs with soil samples collected at ground surface, 0.5, 1, and 2.5 to delineate the lateral extent of PCBs in shallow soil to the east of the former transformer pad (Figure 8A; Table 6). PCB concentrations in the step-out soil samples and the remaining soil samples collected around the transformer pads were below commercial/industrial screening levels. Adequate lateral and vertical delineation of PCBs in shallow soil above commercial/industrial screening levels has been achieved at the Unit 5 Peaker AOI (Figure 8A).

Northgate provided soil analytical information, associated figures, and soil boring location information to BTC III's consultants (Roux and ERM) and noted that concentrations of PCBs in soil above 1 mg/kg may require special handling and disposal in accordance with USEPA regulations. As described in Section 2.4.4.5, soil impacted by PCBs above commercial/industrial screening levels was subsequently removed by BTC III's consultants, Roux and ERM, under the SMP for the Site. Additional information regarding the subsequent removal of PCB-impacted soils at Unit 5 Peaker (AOI 6) is included in Section 2.4.4.5.

4.6.2 TPH in Soil

TPH carbon range concentrations exceeded the established threshold of 100 mg/kg in soil samples PT1-2-0.5, PT1-3-0.5, and PT2-1-0.5 prompting the analysis of VOCs at these locations (VOCs results are discussed in Section 4.6.3). TPH results from the soil samples collected between 0.5 and 2.5 feet bgs from each boring were all less than the applicable commercial/industrial screening levels as presented in Table 2.

4.6.3 VOCs in Soil

VOC analysis of soil samples was conducted at sample locations P-1, PT1-2, PT1-3, PT2-1 per the conditions stated in the RFI Work Plan (Table 1). In addition, SCE elected to analyze soil for VOCs at locations where collocated soil vapor concentrations exceeded commercial/industrial screening levels utilizing the most conservative default AF 0.03 (includes soil collected from step-down and step-out boring locations P-1B and P-5 through P-9). VOC results from the soil samples analyzed were all less than the applicable commercial/industrial screening levels as presented in Table 3.

4.6.4 VOCs in Soil Vapor

Based on the soil vapor results from SVPs P-1 through P-4 that exceeded commercial/industrial screening levels only for default AF 0.03 and delineation conditions described in the RFI Work Plan, additional step-down and step-out borings P-1B and P-5 through P-9 were advanced with single and nested SVPs installed to assess the nature and extent of VOC concentrations in soil vapor near the Unit 5 Peaker area (Table 1; Figure 8). VOCs results from the 22 soil vapor samples analyzed were all less than applicable commercial/industrial screening levels using the default AFs 0.001 and 0.0005 (Table 7).

PCE concentrations were reported in 21 of 22 soil vapor samples collected and ranged from 10.1 to 317 µg/m^3. PCE concentrations in 14 samples exceeded the DTSC-SL of 67 µg/m^3 using the most conservative default AF 0.03 (Table 7). PCE concentrations above the DTSC-SL were laterally delineated at 5 feet bgs and displayed consistent declining concentrations with depth beyond 20 feet bgs in the observed “hot spot” centered around sample location P-1/P-1B (Figure 8B).

Benzene concentrations were reported in 10 of 22 soil vapor samples collected and ranged from 1.0 to 16.4 µg/m^3. Only the benzene concentration reported in the 5-foot step-out sample at P-6 (16.4 µg/m^3) slightly exceeded the DTSC-SL of 14 µg/m^3 using the most conservative default AF 0.03. The benzene concentration declined to 1.0 µg/m^3 in the 20-foot sample at P-6 and was

not detected in any other soil vapor sample above commercial/industrial screening levels at the Unit 5 Peaker area (Table 7). Benzene was not reported above the laboratory RL in the soil samples collected from P-6 at 5 and 20 feet bgs. Based on these observations the source strength of benzene in soil vapor was considered to be weak and likely the result of an incidental and insignificant surface release; therefore, further soil vapor sampling was not proposed. Tracer gas compounds were reported in the 5-foot soil vapor sample at P-9 on September 17, 2021, prompting the installation and sampling of a replacement SVP identified as P-9-5R on October 18, 2021. Replacement probe P-9-5R soil vapor results did not identify tracer gas compounds above laboratory detection limits (Table 7).

4.7 AOI 7 – Administration Building

Background: The administration building was located in the east central portion of the Site, west of Unit 5 Peaker and south of Units 1 and 2 (Figure 4). The administration building was removed in 2022 as part of Site demolition activities.

Assessment Completed: No historic use of hazardous substances in this area; therefore, sampling was not proposed in the RFI Work Plan.

4.8 AOI 8 – Decommissioned Reverse Osmosis (RO) Equipment and Basin

Background: The decommissioned RO equipment and basin was located south of Units 3 and 4 (Figure 4). RO was previously used to treat groundwater so that it could be used as cooling water at the Site.

Assessment Completed: No historic use of hazardous substances in this area; therefore, sampling was not proposed in the RFI Work Plan.

4.9 AOI 9 – Laydown Area

Background: The laydown area was located in the southwestern section of the Site, west of the decommissioned RO equipment and basin (Figure 4). The laydown area was used for temporary equipment storage.

Assessment Completed: No historic use of hazardous substances in this area; therefore, sampling was not proposed in the RFI Work Plan.

4.10 AOI 10 – Units 1 and 2 Cooling Towers

Background: The former cooling towers for Units 1 and 2 were located in the western portion of the Site (Figure 4). As previously summarized in Section 2.4.4.2 and as reported in further detail in Northgate's *Revised Soil Removal Completion Report at Cooling Towers for Units 1 and 2* dated January 6, 2022 (Appendix B), arsenic concentrations greater than the Southern California ambient arsenic screening level (12 mg/kg) were detected in shallow soil in the vicinity of the cooling towers. Arsenic generally occurred approximately 1.5 feet horizontally from the cooling tower structures and the adjacent water channel at an approximate depth of 4 to 6 inches bgs. In general, a significant reduction in concentrations to below the arsenic Southern California ambient arsenic screening level was observed at approximately 3 feet horizontally from the cooling towers at depths of 6 and 12 inches bgs. Cooling towers associated with Units 1 and 2 were demolished in the first half of 2021, prior to the RFI sampling activities.

Assessment Completed: As described in Section 2.4.4.3, between August and September 2021, confirmation sampling was conducted and soil with arsenic concentrations exceeding the Southern California ambient arsenic screening level was removed and disposed offsite at an appropriately permitted and licensed disposal facility. These activities were coordinated by Northgate on behalf of SCE. Northgate recommended no additional work at the cooling towers for Units 1 and 2 with regard to removal of arsenic-impacted soil and requested the issuance of a no further action letter (Northgate, 2022a). On January 6, 2022, DTSC approved of Northgate's report via email (Appendix B).

4.11 AOI 11 – Chadwick Channel

Background: The Chadwick Channel is oriented north-south and transects the central portion of the Site, east of Units 1 and 2 cooling towers and west of Units 1 and 2. The Chadwick Channel originates north of the Site and flows through industrial upstream facilities, prior to entering the Site. Previous upstream releases to the Chadwick Channel were documented in the 1980s and 1990s (Geraghty & Miller, 1997).

In October 2019, Ardent collected ten composite (CC-1 through CC-10) soil samples (composed of 4 discrete samples) within the Chadwick Channel at 0.5 feet bgs (Figures 5C and 5D) as part of a due diligence investigation. The end-to-end distance of the lines that the four discrete samples were collected along varied from 131 feet for the CC-2 sample to 47 feet for the CC-9 sample. The four individual samples were provided to the laboratory who composited the individual samples and then analyzed them for TPH-g, TPH-d, TPH-mo, PCBs, and CAM17 metals plus hexavalent chromium.

Compositing soil samples for TPH-g analyses is not normally a recommended sampling procedure due to the high volume of VOCs in the TPH-g range. However, the shallow sampling depth within the Chadwick Channel is considered to have a greater impact on the volatilization of the VOCs in any TPH-g present in the soil compared to the compositing effects. Moreover, TPH is not a consistent entity, making the assessment of health effects and development of toxicity values for mixtures of hydrocarbons problematic.

TPH-g, TPH-mo, metals, and PCB soil results were all less than the commercial/industrial screening levels (presented in Table 7 of the RFI Work Plan; Appendix A). TPH-d was detected in one composite sample (CC-2, which consists of samples CC-2-A, CC-2-B, CC-2-C, and CC-2-D) at concentrations greater than the USEPA RSL (published for the aromatic high carbon range) but less than the LARWQCB SSL. In addition, the laboratory RLs were less than the commercial/industrial screening levels.

Additional Assessment Conducted: Considering the comments from DTSC regarding the previous samples collected by Ardent and with additional review, 11 additional soil borings (F11-1, F11-2A, F11-2B, F11-3 through F11-10) were advanced by Northgate along the channel to supplement the previous data collected by Ardent in 2019 and to delineate the TPH-d detected by historical sample location CC-2 (Figure 9). Soil samples were collected at depths of 0.5, 2.5, and 5 feet bgs at each sample location with the exception of F11-9 where hand auger refusal prevented the collection of the 2.5 and 5-foot soil samples (Table 1). The samples from 0.5 and 2.5 feet bgs were analyzed for TPH-d, TPH-o, VOCs, SVOCs and PCBs with the deeper 5-foot samples on hold pending results of the shallower samples. The VOC and SVOC analyses were conducted to provide speciation to replace the TPH-g analysis and supplement the TPH-d analyses.

4.11.1 TPH in Soil

TPH results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 2.

4.11.2 VOCs in Soil

VOC results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 3.

4.11.3 SVOCs in Soil

SVOC results from the soil samples analyzed at 0.5 and 2.5 feet bgs were not detected above the applicable laboratory reporting limits and were less than commercial/industrial screening levels as presented in Table 4.

4.11.4 PCBs in Soil

PCB results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 6.

4.12 AOI 12 – Unit 4 Cooling Towers and Cooling Tower Transformer

Background: The former Unit 4 cooling towers were located in the northern section of the Site (Figure 4). In October 2019, Ardent advanced eight soil borings (CT4-1 through CT4-8) adjacent to the cooling tower (Figures 5B and 5C). Soil samples were collected at 0.5 feet bgs from each of the eight borings and analyzed for metals. All the soil results were less than the commercial screening levels or less than background concentration for arsenic (presented in Table 6 of the RFI Work Plan). In addition, all the laboratory RLs were less than the commercial/industrial screening levels. The cooling towers associated with Unit 4 were demolished in the first half of 2021, prior to RFI sampling activities.

The cooling tower transformer was located directly south of the Unit 4 cooling towers (Figure 4). Between October 28, 2020 and November 2, 2020, Northgate advanced two borings (HA16 and HA17) to 2.5 feet bgs adjacent to the transformer drains (Figure 13). At both borings, soil samples from 0.5 and 2.5 feet bgs were analyzed for TPH and soil samples from 0 (ground surface or first soil encountered), 0.5, and 1 feet bgs were analyzed for PCBs. TPH and PCB soil results were all less than the applicable commercial screening levels (presented in Tables 20 and 21 of the RFI Work Plan; Appendix A). In addition, all the laboratory RLs were less than the commercial screening levels.

Assessment Completed: Based on previous sampling conducted by Ardent and Northgate, no immediate concerns were noted in this area and additional sampling as part of the RFI was not conducted. The SMP prepared by Roux, BTC III's environmental consultant, is in place to investigate and address any unknown or unexpected contamination encountered during demolition and grading operations.

4.13 AOI 13 – Generating Units 3 and 4

Background: Units 3 and 4 were located in the central part of the Site and were demolished in 2022 (Figure 4). Historically, SCE has considered that the former generating stations would remain generating stations into the foreseeable future and therefore the RFI focusses on accessible areas on Site with only minimal investigation of sub-slab and foundation areas on Site. Moreover, the power blocks were constructed with multiple drains and sumps throughout the plants that collected any generated liquids, piped those wastes to oil-water separators and then to the basins included in the original court stipulation. The sumps, drains, piping, pumps, and oil-water separators are appurtenances to the basins, which were closed in 2011 after being adequately characterized. Furthermore, Path Forward investigated Units 3 and 4 (as noted in Section 4.4.4 of the RFI Work Plan). TPH, VOCs, SVOCs, PCBs, and metal soil (PFP-8 through PFP-11) and VOC soil vapor (PFP-9 and PFP-10) results were less than commercial/industrial screening levels using the most conservative default AF 0.03 (Figure 5C). The tabulated soil and soil vapor results were presented in Tables 23 and 24 of the RFI Work Plan (Appendix A). In addition, the soil laboratory RLs were less than the commercial screening levels, with the exception of n-nitrosodimethylamine (NDMA). The commercial/industrial screening level of NDMA is 0.034 mg/kg and the laboratory RLs were slightly higher and ranged between 0.081 and 0.094 mg/kg. However, NDMA is not a COPC for the Site.

Assessment Completed: Additional sampling was not proposed as part of the RFI Work Plan.

4.14 AOI 14 – Hazardous Waste Accumulation Area

Background: The hazardous waste accumulation area was located in the southern section of the Site, immediately east of the laydown area (Figure 4). Drums and cans of oily waste were stored in this area. Historically, AOI 14 included some infrastructure for the former tank farm area located west of this area. In October 2019, Ardent collected and analyzed two soil vapor samples (EHW-1 and EHW-2) for VOCs in this area (Figure 10). Soil vapor results were less than the commercial/industrial screening levels (presented in Table 12 of the RFI Work Plan; Appendix A).

Additional Assessment Conducted: One soil boring (F14-1) was completed by Northgate in this area to approximately 10 feet bgs (Figure 10; Table 1). Soil samples were collected from ground surface and at depths of 0.5, 1, 2.5, 5, and 10 feet bgs. Soil samples from ground surface, 0.5 and 1 feet bgs were analyzed for PCBs. The deeper samples were held pending results of the shallower samples. Soil samples from 0.5 and 2.5 feet bgs were

analyzed for TPH, VOCs and metals. The 5 and 10-foot samples were held pending results from the shallower samples.

Nested SVPs were installed at 5 and 10 feet bgs in boring F14-1, and soil vapor samples were collected and analyzed for VOCs.

4.14.1 TPH in Soil

TPH results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 2.

4.14.2 VOCs in Soil

VOC results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 3.

4.14.3 Metals in Soil

Metals results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels or the Southern California ambient arsenic screening level of 12 mg/kg as presented in Table 5.

4.14.4 PCBs in Soil

PCB results from the soil samples analyzed at 0 (ground surface), 0.5 and 1 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 6.

4.14.5 VOCs in Soil Vapor

VOC results for the 5 and 10-foot soil vapor samples at F14-1 were all below laboratory RLs and commercial/industrial screening levels using the default AFs 0.03, 0.001, and 0.0005 as presented in Table 7.

4.15 AOI 15 – Generating Units 1 and 2

Background: Units 1 and 2 were located in the northeastern half of the Site, east of Units 3 and 4, and were demolished in 2022 (Figure 4). Historically, SCE has considered that the former generating stations would remain generating stations into the foreseeable future and therefore the RFI focusses on accessible areas on Site with only minimal investigation of sub-slab and foundation areas on Site. The power blocks were constructed with multiple drains and sumps throughout the plants that collected any generated liquids or waste, piped those wastes to

oil-water separators and then to the basins included in the original court Stipulation. The sumps, drains, piping, pumps, and oil-water separators are appurtenances to the basins, which were closed in 2011 after being adequately characterized. Furthermore, Path Forward investigated Units 1 and 2 as noted in Section 2.4.3.3. Five borings (PFP-3 through PFP-7) were advanced to 4 feet bgs and 10 soil samples were collected and analyzed for TPH, VOCs, SVOCs/PAHs, PCBs, metals, and pH (Figure 5E). All soil results were less than the DTSC SLs and USEPA RSLs for commercial land use. In addition, the soil laboratory RLs were less than the commercial screening levels, with the exception of NDMA (presented in Table 23 of the RFI Work Plan; Appendix A). The commercial screening level for NDMA is 0.034 mg/kg and the laboratory RLs were slightly higher and ranged between 0.081 and 0.094 mg/kg. However, NDMA is not a COPC for the Site.

Two soil gas probes (PFP-3 and PFP-7) were installed by Path Forward to 5 feet bgs and soil vapor samples were analyzed for VOCs. VOC soil vapor (PFP-3 and PFP-7) results were less than the DTSC SLs and USEPA RSLs (presented in Table 24 of the RFI Work Plan; Appendix A). However, at PFP-07 the tracer gas compound (1,1-difluroethane [1,1-DFA]) was detected at a concentration of 200 µg/m^3, indicating a surface leak into the soil vapor sample. PCE was detected at a concentration of 46 µg/m^3. The remaining analytes were reported as not detected at varying reporting limits. The only analyte that had a reporting limit less than 20 µg/m^3 was vinyl chloride which had a reporting limit of 10 µg/m^3.

Additional Assessment Conducted: One 5-foot SVP (F15-1) was installed by Northgate and sampled for VOCs adjacent to former probe PFP-07 due to the detection of the tracer gas compound at a concentration of 200 ug/m^3 in PFP-07 (Figure 14).

As discussed in Section 2.4.4.5, Roux (on behalf of BTC III) collected composite samples of concrete in 2021 as part of demolition preparation activities at Units 1 and 2. Concrete in certain locations at Units 1 and 2 contained PCBs at concentrations greater than or equal to 50 mg/kg. As a result, Roux and BTC III began coordination with the USEPA TSCA group. Additional composite samples were collected in January and February 2022 to further characterize the extent of PCBs in this area and to support preparation of a (SICP). BTC III is continuing to work with both DTSC and USEPA to characterize and remediate PCB impacts at former Units 1 and 2 in accordance with the TSCA regulations. It should be noted that the continuing investigation of PCB-impacted material under USEPA's TSCA group at former Units 1 & 2 is considered separate from the scope of this RFI.

4.15.1 VOCs in Soil Vapor

VOC results for the 5-foot soil vapor sample at F15-1 were all below commercial/industrial screening levels using the default AFs 0.03, 0.001, and 0.005 as presented in Table 7.

4.16 AOI 16 – Warehouse

Background: The former warehouse was in the north central section of the Site, northeast of Units 3 and 4 (Figure 4). The following materials were historically stored in the warehouse: 50-pound drums of drierite (drying agent), air compressor, buckets of concrete repair, cans of aircraft hydraulic oil, 5-gallon pails and small containers of oil (Path Forward, 2020a). VOCs in soil vapor were detected above applicable commercial/industrial soil vapor screening levels east of the warehouse, adjacent to the maintenance shop (as presented in the Tables 13 and 14 of the RFI Work Plan [Appendix A] and discussed in Section 2.4.3.1 of this document). The warehouse building was demolished between August and October 2021, at the time when RFI sampling was being conducted.

Additional Assessment Conducted: Additional soil and soil vapor samples were collected in this area by Northgate and results are presented under the maintenance shop AOI 17 discussion in Section 4.17.

4.17 AOI 17 – Maintenance Shop

Background: The maintenance shop is directly east of the warehouse (Figure 11). Small containers of oil were stored in the maintenance shop. In October 2019, Ardent installed 12 SVPs (SS-1 through SS-3, MS-1 through MS-7, MS-8SS, and MS-9SS) at 5 feet bgs in the vicinity of the maintenance shop (AOI 17), the warehouse (AOI 16), the welding shop (AOI 18), and the septic pits (AOI 37) as shown on Figure 11. VOCs including PCE, BDCM, chloroform, 1,1-DCA, and vinyl chloride were detected in soil vapor at concentrations above the commercial/industrial screening levels when using the most conservative AF 0.03 (presented in Tables 13 and 14 of the RFI Work Plan; Appendix A). The maximum vinyl chloride concentration of 160 µg/m^3 reported from sample location SS-1 at 5 feet is equal to the DTSC-SL, assuming default AF 0.001, but was less than screening level at all other sampled locations. The remaining VOC detections were less than the soil vapor screening levels. The maintenance shop building was demolished between September and October 2021, at the time when RFI sampling was being conducted.

Additional Assessment Conducted: Nineteen (19) soil borings were originally proposed (SS-1B, MS-10 through MS-18 and SS-4 through SS-12) by Northgate in the vicinity of the maintenance shop, the warehouse, the welding shop, and the septic pits as part of the RFI Work Plan (Figure 11). Soil samples were collected from these borings at 0.5, 2.5, 5, 10, 15, and 20 feet bgs. Soil samples at 0.5, 2.5, and 5 feet bgs were analyzed for TPH and VOCs and selectively analyzed for metals. The deeper samples were held pending results of the shallower soil samples and soil vapor results. Soil samples at 0.5, 2.5, and 5 feet bgs from MS-10, MS-12, MS-14, MS-16, MS-17, SS-4, SS-5, and SS-10 through SS-12 were analyzed for metals.

The original 19 borings were converted into multi-depth SVPs. SVPs were set at 5, 10, and 20 feet bgs at each location. The "inner" SVPs (located closer to the maintenance shop) were sampled first for analysis of VOCs in soil vapor. "Outer" SVPs (located further from the maintenance shop) were sampled if inner soil vapor samples identified VOC concentrations exceeding commercial/industrial screening levels using the most conservative default AF 0.03. Based on initial soil vapor sampling results, 19 additional step-down and step-out borings with nested SVPs were installed to assess the nature and extent of VOCs in soil vapor generally identified below the maintenance shop, warehouse, and welding shop (Table 1). Increasing soil vapor concentrations with depth prompted investigation of deep soil vapor and groundwater in the area below the highest reported soil vapor concentrations. Additional RFI soil vapor sampling and collection of a grab groundwater sample were proposed by Northgate in a series of Tech Memos submitted to the DTSC (discussed in Section 3.2). SCE also elected to analyze collocated soil samples for VOCs where soil vapor results indicated VOCs above commercial/industrial screening levels using the most conservative default AF 0.03 (Table 1).

4.17.1 TPH in Soil

TPH results from the 62 soil samples analyzed at 0.5, 2.5, and 5 feet bgs from the original 19 soil borings (installed per the RFI Work Plan) were all less than the applicable commercial/industrial screening levels as presented in Table 2.

4.17.2 VOCs in Soil

VOC results from the 123 soil samples analyzed at various depths between 0.5 and 200 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 3.

4.17.3 Metals in Soil

Metals results from the 33 soil samples analyzed at 0.5, 2.5, and 5 feet bgs from select RFI borings (MS-10, MS-12, MS-14, MS-16, MS-17, SS-4, SS-5, SS-10, SS-11, and SS-12 per Table 1) were all less than the applicable commercial/industrial screening levels or the Southern California ambient arsenic screening level of 12 mg/kg as presented in Table 5.

4.17.4 VOCs in Soil Vapor

Based on the soil vapor results from the 19 original RFI sampling locations, 19 additional step-own and step-out borings were advanced with single and nested SVPs installed to assess the nature and extent of VOC concentrations in soil vapor generally located below the maintenance shop (AOI 17), warehouse (AOI 16), welding shop (AOI 18) and the septic pits (AOI 37; Table 1; Figure 11). Ultimately, 129 soil vapor samples were collected to characterize and delineate soil vapor concentrations identified in this general area of the Site. Two (2) VOCs, chloroform and carbon tetrachloride were detected in soil vapor exceeding commercial/industrial screening levels using the default AFs 0.001 and 0.0005. Screening level exceedances using the default AF 0.001 were identified at or below 20 feet bgs for chloroform and at or below 150 feet bgs for carbon tetrachloride (i.e., no exceedances reported in 5-foot SVPs when using default AF 0.001; Table 7). Chloroform and carbon tetrachloride concentration trends are discussed in the following paragraphs.

Chloroform concentrations were reported in 115 of 129 soil vapor samples collected and ranged from 1.1 to 1,900 µg/m^3. Concentrations of chloroform exceeded the RSL of 530 µg/m^3 using default AF 0.001 in soil vapor samples collected from soil boring locations MS-13/13B/13R, MS-21, MS-23, MS23B, and MS-23C between depths of 20 feet to 200 feet bgs. The maximum chloroform concentration of 1,900 µg/m^3 was identified in two soil vapor samples, MS-23B at 100 feet bgs and MS-23C at 150 feet bgs (Table 7). Chloroform concentrations were generally identified to increase with depth to 200 feet bgs, but then decreased between 200 and 400 feet bgs. As shown in Figures 11A and 11B, step-out and step-down soil vapor sampling was successful in laterally and vertically delineating chloroform concentrations in soil vapor. Chloroform concentration contouring at 5 feet and 20 feet bgs (Figures 11A and 11B) indicates the highest concentrations of chloroform are located near the former sodium hypochlorite tank (installed in 2007), south of the former Unit 3 Cooling Tower and were generally identified near areas with elevated carbon tetrachloride concentrations (Figure 11C and discussed below).

Carbon tetrachloride concentrations were reported in 96 of 129 soil vapor samples collected and ranged from 1.1 to 4,920 µg/m^3. Concentrations of carbon tetrachloride exceeded the RSL of 2,000 µg/m^3 using default AF 0.001 in four (4) soil vapor samples collected from soil boring

location MS-23C between 150 and 200 feet bgs. The maximum carbon tetrachloride concentration of 4,920 µg/m^3 was identified in MS-23C at 200 feet bgs (Table 7). Carbon tetrachloride concentrations were generally observed to increase with depth up to 200 feet bgs. In step-down sampling location MS-23D, carbon tetrachloride concentrations decreased significantly from 200 to 400 feet bgs. As shown in Figure 11C, step-out and step-down soil vapor sampling was successful in laterally and vertically delineating carbon tetrachloride concentrations in soil vapor. Carbon tetrachloride concentration contouring at 20 feet indicates the highest concentrations in the upper vadose zone are located northwest and west of the warehouse (Figure 11C) and were generally identified near areas with elevated chloroform concentrations (Figures 11A and 11B).

When utilizing the most conservative default AF 0.03, an additional 10 VOCs were identified to exceed a commercial/industrial screening level in at least one or more soil vapor sample. With the exception of PCE and 1,1-DCA, concentrations above screening levels (using default AF 0.03) for the remaining eight (8) VOCs were sporadic and did not display any consistent spatial distribution for contouring purposes. 1,1-DCA and PCE soil vapor concentrations are contoured in Figures 11D and E, respectively. The additional VOCs reported above commercial/industrial screening levels when using the most conservative default AF 0.03 are discussed in the following paragraphs.

Benzene concentrations were reported in 95 of 129 soil vapor samples and ranged from 0.6 to 19 µg/m^3 (Table 7). Two (2) samples, the 5-foot soil vapor sample at MS-13R (16.2 µg/m^3) and the 20-foot soil vapor sample at MS-29 (19 µg/m^3), slightly exceeded the DTSC-SL of 14 µg/m^3 using the most conservative default AF 0.03. All other reported benzene concentrations were below commercial/industrial screening levels. Based on the low number of soil vapor samples which only slightly exceed the commercial/screening level using the most conservative default AF 0.03 and the high density of soil vapor sampling conducted in this area of the Site, additional soil vapor sampling to further assess benzene concentrations was not proposed.

BDCM concentrations were reported in 40 of 129 soil vapor samples collected and ranged from 1.2 to 77.4 µg/m^3. Soil boring locations MS-10/10R, MS-23B, MS-23C, MS-28, and MS-32 contained one or more soil vapor samples exceeding the RSL of 11 µg/m^3 using the most conservative default AF 0.03. The maximum BDCM concentration of 77.4 µg/m^3 was identified in MS-23C at 150 feet bgs (Table 7). Elevated concentrations of BDCM were often observed alongside high concentrations of chloroform. According to the vertical profile presented by soil borings MS-23/23B/23C/23D, concentrations of BDCM were generally observed to increase with increasing depth up to approximately 200 feet bgs. A significant decrease in BDCM concentrations was observed between 200 and 250 feet bgs and BDCM was not detected above

the laboratory RL in samples collected from 250 to 400 feet bgs in soil boring MS-23D (Table 7).

Dibromochloromethane concentrations were reported in 18 of 129 soil vapor samples collected and ranged from 1.1 to 26.9 µg/m^3. Two (2) samples, the 60-foot and 80-foot soil vapor samples at MS-23B (26.9 and 22.4 µg/m^3, respectively) and the 5-foot soil vapor sample at MS-28 (24.3 µg/m^3), slightly exceeded the DTSC-SL of 19 µg/m^3 using the most conservative default AF 0.03. All other reported dibromochloromethane concentrations were below commercial/industrial screening levels (Table 7). Based on the low number of soil vapor samples which only slightly exceed the commercial/screening level using the most conservative default AF 0.03 and the high density of soil vapor sampling conducted in this area of the Site, additional soil vapor sampling to further assess dibromochloromethane concentrations was not proposed.

1,2-DCA concentrations were reported in 26 of 129 soil vapor samples collected and ranged from 1.5 to 23.4 µg/m^3. Concentrations of 1,2-DCA slightly exceeded the RSL of 16 µg/m^3 using the most conservative default AF 0.03 in one or more soil vapor samples from five (5) soil boring locations including MS-11, MS-12, MS-13B/13R, MS-17B, and MS-23C (Table 7). All other reported 1,2-DCA concentrations were below commercial/industrial screening levels. Based on the low number of soil vapor samples which only slightly exceed the commercial/screening level using the most conservative default AF 0.03 and the high density of soil vapor sampling conducted in this area of the Site, additional soil vapor sampling to further assess dibromochloromethane concentrations was not proposed.

Ethylbenzene concentrations were reported in 52 of 129 soil vapor samples and ranged from 2.1 to 319 µg/m^3. The 20-foot soil vapor sample at SS-10 (319 µg/m^3) was the only sample to exceed the RSL of 163 µg/m^3 using the most conservative default AF 0.03 (Table 7). All other reported ethylbenzene concentrations were below commercial/industrial screening levels. Based on the low number of soil vapor samples which exceed the commercial/screening level using the most conservative default AF 0.03 and the high density of soil vapor sampling conducted in this area of the Site, additional soil vapor sampling to further assess ethylbenzene concentrations was not proposed.

Naphthalene concentrations were reported in 3 of 129 soil vapor samples and ranged from 2.2 to 17 µg/m^3. The 10-foot soil vapor sample at SS-10 (17.3 µg/m^3) slightly exceeded the RSL of 12 µg/m^3 using the most conservative default AF 0.03 (Table 7). All other reported naphthalene concentrations were below commercial/industrial screening levels. Based on the low number of soil vapor samples which only slightly exceed the commercial/screening level using the most

conservative default AF 0.03 and the high density of soil vapor sampling conducted in this area of the Site, additional soil vapor sampling to further assess naphthalene concentrations was not proposed.

1,1,2-Trichloroethane concentrations were reported in 7 of 129 soil vapor samples and ranged from 3.5 to 34.6 µg/m^3. The 5-foot soil vapor sample at MS-17R (34.6 µg/m^3) slightly exceeded the RSL of 26 µg/m^3 using the most conservative default AF 0.03 (Table 7). All other reported 1,1,2-trichloroethane concentrations were below commercial/industrial screening levels. Based on the low number of soil vapor samples which only slightly exceed the commercial/screening level using the most conservative default AF 0.03 and the high density of soil vapor sampling conducted in this area of the Site, additional soil vapor sampling to further assess 1,1,2-trichloroethane concentrations was not proposed.

TCE concentrations were reported in 56 of 129 soil vapor samples and ranged from 1.1 to 194 µg/m^3. Two (2) samples, the collocated 20-foot soil vapor samples at MS-17/17R (194 and 139 µg/m^3), slightly exceeded the RSL of 100 µg/m^3 using the most conservative default AF 0.03 (Table 7). All other reported TCE concentrations were below commercial/industrial screening levels. Based on the low number of soil vapor samples which only slightly exceed the commercial/screening level using the most conservative default AF 0.03 and the high density of soil vapor sampling conducted in this area of the Site, additional soil vapor sampling to further assess TCE concentrations was not proposed.

PCE concentrations were reported in 119 of 129 soil vapor samples collected and ranged from 1.8 to 1,900 µg/m^3. One or more soil vapor samples from 16 soil borings contained PCE concentrations exceeding the DTSC-SL of 67 µg/m^3 using the most conservative default AF 0.03. The maximum PCE concentration of 1,900 µg/m^3 was identified in MS-17 at 10 feet bgs (Table 7). As shown in Figure 11D, step-out and step-down soil vapor sampling was successful in laterally and vertically delineating PCE concentrations in soil vapor. PCE concentration contouring at 5 bgs (Figure 11D) indicates the highest concentrations of shallow PCE are located below the maintenance shop and welding shop (AOI 18) and were generally identified near areas with elevated 1,1-DCA concentrations (Figure 11E). The spatial distribution of PCE shown in Figure 11D indicates the area below the maintenance shop and welding shop (AOI 18) as a “hot spot” and indicates that releases of PCE-based products likely occurred in this area. The vertical profile of soil vapor concentrations at soil borings MS-17/17B/17R (the center of the soil vapor “hot spot” for PCE) illustrates a general increasing trend in 1,1-DCA concentrations with increasing depth until approximately 10 feet bgs. From 10 to 60 feet bgs, 1,1-DCA concentrations were observed to consistently decline with depth (Figure 11E).

1,1-DCA concentrations were reported in 102 of 129 soil vapor samples collected and ranged from 1.1 to 3,290 µg/m^3. One or more soil vapor samples from 10 soil borings contained 1,1-DCA concentrations exceeding the RSL of 257 µg/m^3 using the most conservative default AF 0.03. The maximum 1,1-DCA concentration of 3,290 µg/m^3 was identified in MS-17 at 20 feet bgs (Table 7). As shown in Figure 11E, step-out and step-down soil vapor sampling was successful in laterally and vertically delineating 1,1-DCA concentrations in soil vapor. 1,1-DCA concentration contouring at 5 bgs (Figure 11E) indicates the highest concentrations of shallow 1,1-DCA are located by the maintenance shop and welding shop (AOI 18) and were generally identified near areas with elevated PCE concentrations (Figure 11D). The spatial distribution of 1,1-DCA shown in Figure 11D indicates the area below the maintenance shop and welding shop (AOI 18) as a "hot spot" and indicates that releases of 1,1-DCA-based products likely occurred in this area. The vertical profile of soil vapor concentrations at soil borings MS-17/17B/17R (the center of the soil vapor "hot spot" for 1,1-DCA) illustrates a general increasing trend in 1,1-DCA concentrations with increasing depth until approximately 20 feet bgs. From 20 to 60 feet bgs, 1,1-DCA concentrations were observed to consistently decline with increasing depth (Figure 11E). At the request of the DTSC, a soil vapor temporal variation assessment was conducted at select SVPs which defined various areas of the chloroform, carbon tetrachloride, PCE, and 1,1-DCA soil vapor plumes. Results of seasonal soil vapor sampling indicate temporal variability in soil vapor is considered low at the Site (see Section 5.2.5 for additional details regarding the soil vapor temporal variation assessment).

Tracer gas compounds were reported in three of the 5-foot soil vapor samples from locations MS-21, SS-7, and SS-12, prompting resampling or the installation and sampling of replacement SVPs. Resampling and/or replacement probe soil vapor sampling results did not identify tracer gas compounds above laboratory detection limits. Soil vapor samples where tracer gas was detected may not be representative of subsurface conditions due to ambient air intrusion in the sample.

4.17.5 VOCs in Groundwater

Based on the observation that some VOC concentrations were increasing with depth up to 200 feet bgs (namely chloroform and carbon tetrachloride), DTSC recommended that groundwater conditions in the vicinity of the warehouse, maintenance shop, welding shop, and septic pits be assessed. Step-down boring MS-23D was advanced in the area identified where the highest chloroform concentrations in soil vapor were observed (below the former sodium hypochlorite tank, north of the warehouse and maintenance shop [Figure 11]). The deep soil boring MS-23D was advanced in general accordance with the DTSC-approved Tech Memo-style work plan (Northgate, 2022d). Groundwater was encountered at approximately 453 feet

bgs during drilling. Collection of a grab groundwater sample via the proposed SimulProbe sampler was unsuccessful after multiple attempts. DTSC was notified of the challenges encountered during groundwater sample collection and DTSC approved the installation of a temporary well and collection of a grab groundwater sample via bladder pump (email correspondence included in Appendix B). A schematic of the temporary well construction is included with the soil boring log for MS-23D in Appendix E.

Collection of groundwater was successful using the bladder pump. VOC results from the grab groundwater sample collected at approximately 460 feet bgs were all less than the applicable California MCLs as presented in Table 8. Based on the results of grab groundwater sampling, in accordance with the DTSC-approved Tech Memo, a permanent groundwater monitoring well was not installed in soil boring MS-23D.

4.18 AOI 18 – Welding Shop

Background: The welding shop was located directly east of the maintenance shop (Figure 10). As noted under the maintenance shop, twelve SVPs were previously installed at 5 feet bgs in the vicinity of the maintenance shop, the warehouse, the welding shop, and the septic pits as shown on Figure 11. VOCs were detected in soil vapor at concentrations above the commercial soil vapor screening level using the most conservative default AF 0.03. The welding shop was demolished between September and October 2021, at the time when RFI sampling was being conducted.

Additional Assessment Conducted: Additional soil and soil vapor samples were collected in this area and results are presented under the maintenance shop AOI 17 discussion in Section 4.17.

4.19 AOI 19 – Unit 3 Cooling Towers

Background: The former cooling towers associated with Unit 3 were located adjacent to the northern property boundary in the north central section of the Site, directly north of the warehouse (Figure 4). In October 2019, Ardent advanced eight soil borings (CT3-1 through CT3-8) adjacent to the cooling tower (Figure 5E). Soil samples were collected at 0.5 feet bgs from each of the eight borings and analyzed for metals (presented in Table 5 of the RFI Work Plan; Appendix A). Arsenic was detected in soil from two borings (CT3-2 and CT3-6) at concentrations above the Southern California ambient arsenic screening level of 12 mg/kg. Additional soil samples from CT3-2 and CT3-6 were collected at 1.5 and 3 feet bgs and analyzed for arsenic. Arsenic concentrations in all the deeper soil samples were less than the Southern California ambient arsenic screening level of 12 mg/kg. In addition,

all the laboratory RLs for the remaining metals were less than the commercial screening levels. The Unit 3 cooling towers were demolished in the first half of 2021, prior to commencement of RFI sampling activities.

Assessment Completed: Shallow arsenic soil contamination has been identified and delineated and additional sampling as part of the RFI was not conducted. On October 6, 2021, removal of arsenic-impacted soil above 12 mg/kg in the vicinity of Cooling Tower 3 was conducted under a DTSC-approved SMP by BTC III's environmental consultants at two (2) locations (CT3-2 and CTS-6, Roux, 2021b). Additional details regarding arsenic delineation and subsequent soil excavation activities are included in Section 2.4.4.4.

4.20 AOI 20 – Capped Natural Gas Easement

Background: The capped natural gas easement is in the eastern section of the Site, directly south of the cooling tower makeup water pond (Figure 4).

Assessment Completed: There is no historic use of hazardous substances in this area; therefore, sampling was not proposed as part of the RFI Work Plan.

4.21 AOI 21 – Cooling Tower Makeup Water Pond

Background: The cooling tower makeup water pond was located in the far northeastern area of the Site (Figure 12). It is currently used to store stormwater. Previously, it was used to store water from three groundwater production wells, Colorado River water, and reclaimed water. In the southwest corner of the pond there was a 570-gallon diesel fuel AST. The cooling tower makeup water pond was demolished in 2022.

A soil boring, F21-1, was proposed as part of the RFI Work Plan to investigate the AST, but this boring and associated samples were removed from the scope of the RFI with email approval from DTSC on August 16, 2021 (DTSC, 2021b). In the email DTSC noted that the former diesel AST would be addressed by the current property owner through their existing SMP since the installation date of the diesel AST was 2011, which is after SCE's sale of the property in 1998 (Table 1; Figure 12).

Additional Assessment Conducted: During Northgate's Site walk conducted on August 6, 2021, to mark out the proposed RFI soil borings, two additional small transformers were identified just west of the cooling tower makeup water pond (Figure 12). SCE elected to advance two borings adjacent to each small transformer (F21-T1-1, F21-T1-2, F21-T2-1, and F21-T2-2) and analyze soil samples in accordance with the typical transformer assessment proposed in the RFI Work Plan (Table 1). Soil samples were collected at

ground surface and at depths of 0.5, 1, and 2.5 feet bgs. Samples from surface, 0.5, and 1 feet bgs were analyzed for PCBs with the deeper samples on hold pending shallower results. Samples from 0.5 and 2.5 feet were collected for TPH analysis. Per the RFI Work Plan, any concentration of TPH carbon ranges above 100 mg/kg, would trigger analysis of VOCs in soil.

4.21.1 PCBs in Soil

PCB results from the soil samples analyzed at 0 (ground surface), 0.5 and 1 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 6.

4.21.2 TPH in Soil

TPH results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than 100 mg/kg (threshold for contingency VOC analysis) and less than the applicable commercial/industrial screening levels as presented in Table 2. Based on the results, soil samples were not analyzed for VOCs per the RFI Work Plan.

4.22 AOI 22 – Construction and Operations Waste

Background: Construction and operations waste is located in the northwestern section of the Site (Figure 4). This area is also referred to as Landfill I. In October 2019, seven test pits (LFI-1 through LFI-7) and eight soil samples were collected by Ardent from Landfill I between the depths of 3 and 7 feet bgs (Figure 5B). Soil samples were analyzed for TPH, VOCs, and metals (presented in Table 9 of the RFI Work Plan; Appendix A). TPH and VOC soil results were less than commercial screening levels. Arsenic (LFI-1 and LFI-3) and lead (LFI-3) soil results exceeded commercial/industrial screening levels. The remaining metals soil results were less than commercial/industrial screening levels. ERM removed approximately 6,445 tons of arsenic and lead-impacted soil by sample locations LFI-1 and LFI-3 (as previously described in Section 4.4.3 of the RFI Work Plan) and as shown on Figure 5E. A total of 87 confirmation soil samples (43 base samples and 44 sidewall samples) were collected to verify the remaining soil beneath and around the excavation did not contain arsenic and lead concentrations above applicable commercial screening levels (Tables 17 through 19 of the RFI Work Plan; Appendix A). In addition, all the laboratory RLs were less than the commercial/industrial screening levels.

Assessment Completed: This area has been adequately investigated and remediated; therefore, sampling was not proposed in the RFI Work Plan.

4.23 AOI 23 – Auxiliary Transformers

Background: There were two auxiliary transformers located onsite, one was located directly south of Units 1 and 2 cooling towers and the second one was located south of Units 3 and 4 (Figure 4). Between October 28, 2020, and November 2, 2020, Northgate advanced eight (8) soil borings adjacent to these transformers (HA12 through HA15 and HA18 through HA21 as shown on Figures 5B and 5D, respectively). Soil samples were analyzed for TPH (at depths of 0.5 and 2.5 feet bgs) and PCBs (at ground surface, 0.5- and 1-foot bgs) and all soil results were less than the applicable commercial/industrial screening levels (Tables 20 and 21 of the RFI Work Plan in Appendix A). In addition, the laboratory RLs were all less than the commercial/industrial screening levels.

Assessment Completed: Previous sampling indicated no concerns in this area; therefore, sampling was not proposed in the RFI Work Plan.

4.24 AOI 24 – Sulfuric Acid Tanks

Background: There were two sulfuric acid tanks on Site, one was located directly south of cooling towers for Unit 3 and the second tank was located directly south of the cooling towers for Unit 4 (Figure 4). Between October 28, 2020, and November 2, 2020, Northgate advanced eight (8) soil borings adjacent to these tanks (HA1 through HA4 and HA5 through HA7, Figure 13). Soil samples from 0.5 and 2.5 feet bgs were analyzed for pH, which ranged from 5.69 to 9.65 (Table 22 of the RFI Work Plan; Appendix A). Soil samples were not analyzed for metals.

Additional Assessment Conducted: One boring adjacent to each tank (F24-1 and F24-2) was advanced to 5 feet bgs by Northgate (Figure 13). Soil samples were collected at depths of 0.5, 2.5, and 5 feet bgs. Soil samples from 0.5 and 2.5 feet bgs were analyzed for metals. The deeper samples were held pending results of the shallower samples.

4.24.1 Metals in Soil

Metals results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels or the Southern California ambient arsenic screening level of 12 mg/kg as presented in Table 5.

4.25 AOI 25 – Units 3 and 4 Transformers

Background: Two main transformers and one smaller transformer were located on the south side of Units 3 and 4 (Figure 4). The transformers were originally constructed on concrete

containment pads, but the two main transformers were removed prior to conducting the RFI sampling in September 2021.

Additional Assessment Conducted: Four soil borings were advanced by Northgate at each of the three transformer locations (T3-4-1 through T3-4-12) within the concrete pad, adjacent to the transformer fill port and any areas of staining, if observed (Figure 14). During the Site walk conducted on August 6, 2021, to mark out the proposed RFI soil borings, two additional small transformers were identified in the area between Units 3 and 4 (Figure 14). SCE elected to advance two borings adjacent to each small transformer (four additional soil borings total) and analyze soil samples in accordance with the typical transformer assessment proposed in the RFI Work Plan (Table 1). Soil samples at all transformer locations were collected at ground surface and at depths of 0.5, 1, and 2.5 feet bgs. Samples from surface, 0.5, and 1 feet bgs were analyzed for PCBs with the deeper samples on hold pending shallower results. Samples from 0.5 and 2.5 feet were collected for TPH analysis. Per the RFI Work Plan, any concentration of TPH carbon ranges above 100 mg/kg, would trigger analysis of VOCs in soil.

Additional step-out soil sampling was required based on concentrations of TPH and PCB concentrations in soil. Details regarding the step-out sampling are discussed in the following sections.

4.25.1 TPH in Soil

TPH concentrations exceeding the TPH-d (C_{13}-C_{22}) commercial/industrial screening levels were identified in the 0.5-foot samples at T3-4-4 and T3-4-5 (Table 2). Step-out borings and samples were successfully conducted to laterally delineate TPH to the southwest and southeast of T3-4-4 (Figure 14A) and northwest and southwest of T3-4-5 (Figure 14B). Remaining TPH results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 2.

TPH carbon range concentrations exceeded the established threshold of 100 mg/kg in seven (7) soil samples collected from T3-4-2, T3-4-4, T3-4-5, T3-4-14, and T3-4-15 prompting the analysis of VOCs at these locations (VOCs results are discussed in Section 4.25.2).

Northgate provided soil analytical information, associated figures, and soil boring location information to BTC III's consultants (Roux and ERM) and noted that concentrations of TPH were identified above commercial/industrial screening levels in this area of the Site. As described in Section 2.4.4.5, soil impacted by TPH above commercial/industrial screening levels was subsequently removed by Roux and ERM, under the SMP for the Site. Additional

information regarding the removal of TPH-impacted soils at Unit 3 and 4 transformers (AOI 25) is included in Section 2.4.4.5.

4.25.2 VOCs in Soil

VOC results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 3.

4.25.3 PCBs in Soil

PCB concentrations were identified above commercial/industrial screening levels in soil boring T3-4-2 at a depth of up to 1 feet bgs with a maximum Aroclor-1254 concentration of 1.7 mg/kg reported in surface sample at this location (Table 6 and Figure 14A). The deeper 2.5-foot sample at T3-4-2 was analyzed for PCBs and two (2) step-out soil borings were advanced to the northwest and northeast of T3-4-2 to delineate concentrations of Aroclor-1254 above commercial industrial screening levels (Figure 14A). PCB concentrations in the step-out soil samples and the remaining soil samples collected around the transformer pads were below commercial/industrial screening levels.

Northgate provided soil analytical information, associated figures, and soil boring location information to BTC III's consultants (Roux and ERM) and noted that concentrations of PCBs in soil above 1 mg/kg may require special handling and disposal in accordance with USEPA regulations. As described in Section 2.4.4.5, soil impacted by PCBs above commercial/industrial screening levels was subsequently removed by Roux and ERM, under the SMP for the Site. Additional information regarding the removal of PCB-impacted soils at Unit 3 and 4 transformers (AOI 25) is included in Section 2.4.4.5.

4.26 AOI 26 – Units 1 and 2 Transformers

Background: Eight (8) transformers were located on the south side of Units 1 and 2 (Figure 4). The transformers had been removed prior to RFI sampling activities in September 2021, but their concrete pads were still in place when RFI sampling for this AOI took place.

Additional Assessment Conducted: Four (4) soil borings were advanced by Northgate at each of the eight (8) transformers (T1-2-1 through T1-2-32) within the concrete pad, adjacent to the fill port and any areas of staining, if observed (Figure 14). Soil samples were collected at ground surface and at depths of 0.5, 1, and 2.5 feet bgs. The samples from surface, 0.5, and 1 feet bgs were analyzed for PCBs and the deeper sample was held pending results of the shallower samples. Samples from 0.5 and 2.5 feet were collected for TPH analysis. If TPH was detected in

any of the carbon ranges above 100 mg/kg, the sample from the corresponding depth were analyzed for VOCs.

4.26.1 TPH in Soil

TPH results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 2.

TPH carbon range concentrations (including results for the aromatic carbon ranges not shown in Table 2) exceeded the established threshold of 100 mg/kg in nine (9) soil samples collected from T1-2-13, T1-2-14, T1-2-15, T1-2-16, T1-2-19, T1-2-22, T1-2-26, and T1-2-32 prompting the analysis of VOCs at these locations (VOCs results are discussed in Section 4.26.2).

4.26.2 VOCs in Soil

VOC results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 3.

4.26.3 PCBs in Soil

PCB results from the soil samples analyzed at 0 (first soil encountered), 0.5 and 1 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 6.

4.27 AOI 27 – Acid Caustic Tank Area

Background: The acid caustic tank area was in the southern area of the Site, directly south of the decommissioned RO equipment and basin (Figure 10). The acid caustic tank was present during the time of RFI sampling but was later removed in 2022.

Additional Investigation Conducted: One soil boring was advanced by Northgate in the acid caustic tank area (FS-3, Figure 10). Soil samples were collected at 0.5, 2.5, and 5 feet bgs. Soil samples collected at 0.5 and 2.5 feet bgs were analyzed for metals and pH. An additional sample collected at 5 feet bgs was held for additional analyses pending the results of the shallower samples.

4.27.1 Metals in Soil

Metals results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels or the Southern California ambient arsenic screening level of 12 mg/kg as presented in Table 5.

4.27.2 pH in Soil

Results for pH in soil samples ranged from 9.7 to 10.3 standard units (Table 5). There are no applicable soil screening levels for pH.

4.28 AOI 28 – Well Water Storage Tank

Background: The well water storage tank was located in the eastern section of the Site, north of Units 1 and 2 (Figure 4).

Assessment Completed: No historic use of hazardous substances in this area; therefore, sampling was not proposed.

4.29 AOI 29 – Distilled Water Tanks

Background: There were four distilled water tanks located in the eastern section of the Site; three were located west of Units 1 and 2 and one is located east of Units 1 and 2 (Figure 4).

Assessment Completed: No historic use of hazardous substances in this area; therefore, sampling was not proposed.

4.30 AOI 30 – Cooling Water Tank

Background: The cooling water tower was located in the central section of the Site, directly north of Units 3 and 4 (Figure 4).

Assessment Completed: No historic use of hazardous substances in this area; therefore, sampling was not proposed.

4.31 AOI 31 – Fire House (foam)

Background: The fire house was located in the southern area of the Site, directly north of the decommissioned RO equipment and basin (Figure 4). At the fire house, foam made from animal byproducts, specifically animal blood, was used and not chemical foam. Therefore, the fire house should not be a source of per- and polyfluoroalkyl substances.

Assessment Completed: No historic use of hazardous substances in this area; therefore, sampling was not proposed.

4.32 AOI 32 – Fire Water Pumps

Background: The fire water pumps were located immediately north of the administration building (Figure 4).

Assessment Completed: No historic use of hazardous substances in this area; therefore, sampling was not proposed.

4.33 AOI 33 – Sludge Drainage Area

Background: The sludge drainage area was in the western portion of the Site immediately south of the Units 1 and 2 cooling towers and immediately north of the former railroad spur (Figure 5B). Historically, when the cooling towers were cleaned the sludge was deposited in this area. In October 2019, ten borings (SDA-1 through SDA-10) were advanced in this area (Figure 5B). Soil samples were collected at 0.5 feet bgs and analyzed for metals. All metal soil results were less than the commercial/industrial screening levels or less than background concentrations for arsenic (Table 4 of the RFI Work Plan; Appendix A). In addition, all the laboratory RLs were less than the commercial/industrial screening levels.

Assessment Completed: No concerns were noted in this area; therefore, additional sampling was not proposed.

4.34 AOI 34 – Northern Fill

Background: The northern fill is in the northwestern area of the Site north of Cooling Towers 1 and 2 (Figure 5B). Excavated soil during Site construction was deposited here. Ardent also referred to this area as Landfill II. In October 2019, 10 test pits (LFII-1 through LFII-10) and 10 soil samples were collected by Ardent from this area between the depths of 2 and 7 feet bgs (Figure 5B). Soil samples were analyzed for TPH, VOCs, and metals. TPH, VOCs, and metals soil results were all less than commercial/industrial screening levels (Table 10 of the RFI Work Plan; Appendix A). In addition, all the laboratory RLs were less than the commercial/industrial screening levels.

Assessment Completed: The northern fill has been adequately investigated and there were no concerns noted in this area; therefore, additional sampling was not proposed.

4.35 AOI 35 – Sodium Hypochlorite Tanks

Background: There were three sodium hypochlorite tanks onsite, one was in the northern central area of the Site, directly south of the cooling towers for Unit 4, the second tank was

located in the northeastern area of the Site, directly west of the cooling tower makeup water pond, and the third tank was in the western area of the Site, directly south of the cooling towers for Units 1 and 2 (Figure 12 and 13). Between October 28, 2020 and November 2, 2020, Northgate investigated the north central and western sodium hypochlorite tanks. One boring (HA8) was advanced southeast of the north central sodium hypochlorite tank, and three borings (HA9 through HA11) were advanced adjacent to the western tank (Figure 12). Soil samples at 0.5 and 2.5 feet bgs were analyzed for pH, which ranged from 9.42 to 10.1 (Table 22 of the RFI Work Plan; Appendix A). Soil samples were not analyzed for metals.

Additional Assessment Conducted: During the initial stages of the RFI sampling activities in August 2021, a fourth sodium hypochlorite tank was identified south of the Unit 3 cooling tower (Figure 11). Based on a review of historical aerial imagery, this fourth sodium hypochlorite tank was estimated to have been installed in 2007, after SCE sold the property (The Site was sold to Reliant Energy, Inc. in 1998). SCE elected to collect soil samples near this tank to be consistent with the investigation being conducted at other onsite sodium hypochlorite tanks despite this feature having been installed and used by other parties after the sale of the property. Soil samples at the fourth sodium hypochlorite tank were accommodated during hand auger clearance at soil vapor step-down location MS-23C (part of the soil vapor investigation at the maintenance shop area including AOIs 16, 17, and 18; Figure 11).

One boring adjacent to each tank (F35-1, F35-2, F35-3, and MS-23C) was advanced to 5 feet bgs by Northgate (Figure 12 and 13). Soil samples were collected at depths of 0.5, 2.5, and 5 feet bgs. Soil samples from 0.5 and 2.5 feet bgs were analyzed for metals and pH at F35-1 and MS-23C, which were located at tanks not previously investigated. Soil samples from 0.5 and 2.5 feet bgs were analyzed for metals at F35-2 and F35-3. The deeper samples were held pending results of the shallower samples.

4.35.1 Metals in Soil

Metals results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels or the Southern California ambient arsenic screening level of 12 mg/kg as presented in Table 5.

4.35.2 pH in Soil

Results for pH in soil samples collected at F35-1 ranged from 7.3 to 7.4 standard units and pH results in soil samples collected at MS-23C ranged from 9.3 to 11.6 standard units (Table 5). There are no applicable soil screening levels for pH.

4.36 AOI 36 – Former Hazardous Waste Area

Background: The former hazardous waste area was located in the southwestern section of the Site, southwest of Units 3 and 4 (Figure 10). Drums and cans of oily waste were stored in this area. In October 2019, Ardent collected and analyzed four soil vapor samples (FHW-1 through FHW-4) for VOCs in this area (Figure 10). Soil vapor results were less than the commercial/industrial screening levels (Table 11 of the RFI Work Plan; Appendix A).

Additional Investigation Conducted: Three (3) soil borings (F36-1 through F36-3) were advanced by Northgate in this area to approximately 10 feet bgs (Figure 10). Soil samples were collected from ground surface and at depths of 0.5, 1, 2.5, 5, and 10 feet bgs in each boring. Soil samples from ground surface, 0.5 and 1 feet bgs were analyzed for PCBs. The deeper samples were held pending results of the shallower samples. Soil samples from 0.5 and 2.5 feet bgs were analyzed for TPH, VOCs and metals. The 5 and 10-foot samples were held pending results from the shallower samples.

SVPs were installed at 5 and 10 feet bgs in each boring, and soil vapor samples were collected and analyzed for VOCs.

4.36.1 TPH in Soil

TPH results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 2.

4.36.2 VOCs in Soil

VOC results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 3.

4.36.3 Metals in Soil

Metals results from the soil samples analyzed at 0.5 and 2.5 feet bgs were all less than the applicable commercial/industrial screening levels or the Southern California ambient arsenic screening level of 12 mg/kg as presented in Table 5.

4.36.4 PCBs in Soil

PCB results from the soil samples analyzed at 0 (first soil encountered), 0.5 and 1 feet bgs were all less than the applicable commercial/industrial screening levels as presented in Table 6.

4.36.5 VOCs in Soil Vapor

VOC results for the 5 and 10-foot soil vapor samples at F36-1, F36-2, and F36-3 were all below commercial/industrial screening levels using default AFs 0.03, 0.001, and 0.0005 as presented in Table 7. It should be noted that tracer gas was identified in the 10-foot sample from F36-3 on both occasions when the SVP was sampled. Soil vapor results at F36-3 at 10 feet may not be representative of subsurface conditions due to the presence of ambient air in the samples. Given that VOC concentrations were not reported above commercial/industrial screening levels or laboratory RLs in the 5-foot probe at this location nor within the four (4) other soil vapor samples collected at this AOI, the qualified data from F36-3-10 due to tracer gas detection is not considered a significant data gap. Additional soil vapor sample collection at this AOI is not warranted.

4.37 AOI 37 – Septic Pits

Background: The septic pits are in the eastern section of the Site, east of the maintenance shop (Figure 11). The septic pits consist of five inline 3,000-gallon seepage pits. As described in Section 4.17 for the maintenance shop, 12 SVPs were previously installed at 5 feet bgs in the vicinity of the maintenance shop, the warehouse, the welding shop, and the septic pits as shown on Figure 11. VOCs were detected in soil vapor at concentrations above the commercial/industrial screening levels when using default AF 0.03 (Tables 13 and 14 of the RFI Work Plan; Appendix A).

Additional Assessment Conducted: Additional soil and soil vapor samples were collected by Northgate in this area and results are presented under the maintenance shop AOI 17 discussion in Section 4.17.

4.38 AOI 38 – Flumes

Background: The former flumes correspond to three (3) concrete-lined, channel features used to recirculate the water from the cooling towers to the generating units (Figure 4). The flumes were demolished and the general area regraded in 2022. For ease of reference, Flume 1/2 was located south of the Units 1 and 2 cooling towers, Flume 3 was located south of the Unit 3 cooling tower, and Flume 4 was located south of the Unit 4 cooling tower (Figure 4). In October 2019 and prior to demolition operations, Ardent advanced five (5) soil borings (F1/2-1 through F1/2-5) within Flume 1/2, four (4) soil borings (F4-1 through F4-4) within Flume 4 (Figures 5B and 5C), and four (4) soil borings (F3-1 through F3-4) within Flume 3 (Figures 5E and 15). According to Ardent's written scope of services documented in October 2019, soil samples within the concrete-lined flumes were collected at the concrete bottom of each flume (note that flume bottom was located approximately 8 feet lower than surrounding grade) by advancing borings within the "visual expansion joints" and collecting soil at 0.5 and 1.5 below the flume bottom (Figure 15; Ardent, 2019). Soil samples were collected from each boring at 0.5 and 1.5 feet below the concrete flume bottom and select samples were analyzed for metals.

Metals results in all the soil samples were less than the commercial screening levels with the exception of a thallium concentration of 14.9 mg/kg in the 0.5-foot sample at F3-1 which slightly exceeded the commercial RSL of 12 mg/kg (Table 15 of the RFI Work Plan; Appendix A). The thallium concentration for the 1.5-foot sample at F3-1 was less than the commercial RSL and was reported as 2.43 mg/kg. Given that the thallium concentration at sample location F3-1 dropped below the commercial/industrial screening level at 1.5 feet bgs and the linear nature of the concrete-lined channel with expansion joints, the lateral and vertical migration potential thallium is significantly limited. As shown in Figure 15, thallium concentrations in shallow soil in the general vicinity of Flume 3 were not reported above commercial/industrial screening levels.

Assessment Completed: The flumes have been adequately characterized and there were no other concerns noted in this area; therefore, additional sampling was not proposed. Furthermore, this area has been disturbed as a result of demolition activities and additional undisturbed sampling beneath the former flumes is not feasible.

4.39 Overall Summary of RFI Soil Results

An overall summary of the RFI soil results is provided below.

SUMMARY OF RFI SOIL RESULTS TO SCREENING COMPARISON DATA			
Analysis	**All Detected Results Below Commercial/ Industrial Screening Levels**	**All Non-Detected Results Below Commercial/ Industrial Screening Levels**	**Comment**
TPH-g C_4-C_{12}	Yes	Yes	
TPH-d C_{13}-C_{22}	**All but two (2) shallow samples, which were delineated and removed at AOI 25**	Yes	
TPH-mo C_{23}-C_{32}	Yes	Yes	
VOCs	Yes	Yes	
SVOCs	Yes	All RLs below screening levels except for 3,3'-Dichlorobenzidine, Benzidine, bis(2-Chloroethyl)ether, Dibenz(a,h)anthracene, N-Nitroso-di-N-propylamine, and Pentachlorophenol which are not expected at the Site	Per email communication on 9/21/21 with DTSC, reporting to RLs was acceptable as long as detections above MDLs are reported with "J" flags
Metals	**All except arsenic which was delineated at the Cooling Towers for Units 1 and 2 (AOI 10) and removed (see Section 4.10)**	Yes	Southern California ambient arsenic screening level of 12 mg/kg used in RFI for comparison
pH	No screening levels established	All were detected – pH ranged from 7.3 to 11.6 standard units	
PCBs	**All but six (6) shallow samples which were delineated and removed at AOI 6 and AOI 25**	Yes	

4.40 Overall Summary of RFI Soil Vapor Analytical Results

Soil vapor analytical results for AOIs 1, 5, 6, 14, 17, and 36 are discussed in the representative Sections above. A majority of the RFI soil vapor data were collected in August and September 2021 with some additional delineation sampling conducted between October 2021 and January 2022. In April 2022, select soil vapor locations were resampled to assess potential seasonal and temporal variation in soil vapor concentrations at the Site (see Section 5.2.5 for additional details). The RSLs and DTSC-SLs, used for comparison to soil vapor sample results, have been developed for indoor air concentrations; therefore, RSLs and DTSC-SLs for soil vapor are calculated using a default AF. As discussed in Section 1.2.4, default AFs 0.0005 (future commercial; DTSC, 2011), 0.001 (current commercial; DTSC, 2011), and 0.03 (initial site screening purposes; DTSC and CWRCB, 2023) were utilized in the preparation of this RFI to compare soil vapor data to commercial/industrial screening levels in indoor air (Table 7).

As illustrated in Table 7, the application of different default AFs results in a wide range of commercial/industrial screening levels. It is important for stakeholders to examine multiple lines of evidence to support risk management decisions where considerable uncertainty exists. Site-specific factors along with information relating to the derivation and strengths/weaknesses of the default AFs are considered below to support the decision-making process for the Site.

Site-Specific Factors for Consideration:

- Currently there are no buildings constructed at the Site.
- The Site is located in a commercial/industrial area and is planned for grading and redevelopment as a commercial/industrial facility with four (4) buildings and associated parking for vehicles and truck trailers.
- According to the Draft Master Site Plan included in the HHSE, the four (4) proposed onsite buildings will range in size from approximately 133,500 to 658,000 square feet (Roux, 2023b).
- Slab-on-grade construction with average slab thicknesses ranging from 8 to 10 inches is anticipated for the proposed buildings at the Site.
- Each of the proposed buildings includes planned warehouse and office spaces.
- According to Site owner representatives, ventilation plans are not finalized for the proposed buildings at this time; however, areas designated for office spaces will likely include roof-top heating, ventilation, and air conditioning (HVAC) units and warehouse spaces will likely be equipped with exhaust fans and air intake vents.
- Depth to groundwater at the Site is greater than 400 feet bgs.

- Based on groundwater samples collected at the Site, groundwater off-gassing does not appear to be a significant source of the vapors identified in the vadose zone below the Site.
- Significant concentrations of VOCs have not been identified in soil samples at the Site.
- Potential sources of continuing contamination (e.g., chemical storage tanks, pipelines, hazardous waste storage areas, transformers, retention basins, etc.) have all been removed from the Site.

Default AF Information for Consideration:

- The most conservative default AF 0.03 represents the 95th percentile value for observed AFs reported at sites contained in EPA's vapor intrusion database up to 2010 (EPA, 2012). The default AF 0.03 was developed utilizing chlorinated solvent sub-slab vapor and indoor air data. The RFI data set represents subsurface soil vapor collected between 5 feet and 400 feet bgs and application of an attenuation based on sub-slab to indoor air data may represent an overconservative assumption.
- The most conservative default AF 0.03 has nationwide acceptance, but very few California sites were included in the USEPA database which utilized to derive this AF. Many of the states included in the 2012 EPA study (including Colorado, New York, Montana, and Connecticut) do not exhibit the typical climatic conditions or building types commonly found in California. Sites in California may exhibit higher soil gas attenuation between subsurface vapor and indoor air because buildings in California generally do not include basements and are not as insulated as buildings constructed for colder climates. For reference, 75 percent of residential homes in the USEPA database have basements, but only 5 percent of homes in California have basements.
- One recent, peer-reviewed study assessed pairs of indoor air with sub-slab and soil vapor data collected from sites in California and found that the California dataset yielded a 95th percentile sub-slab AF of 0.005 and a 95th percentile soil vapor AF of 0.0009 (Abbasi et al., 2022). The empirically derived soil vapor AF discussed this study are significantly higher than the default AF 0.03 developed by USEPA, but more consistent with the two other default AFs 0.001 and 0.0005 considered in this RFI Report. It should be noted that the *Supplemental Vapor Intrusion Guidance Document* also indicates that California-specific AFs "may be incorporated into a future version of this Supplemental Guidance" (DTSC and CRWCB, 2023).
- The most conservative default AF 0.03 was developed using sub-slab and indoor air paired data collected within 48-hours which address temporal and spatial variability.

Only two (2) VOCs, carbon tetrachloride and chloroform, were identified during the RFI above commercial/industrial screening levels using the default AFs 0.001 and 0.0005, as discussed in

Section 4.17.4 for the area located below the maintenance shop (AOI 17), warehouse (AOI 16), and welding shop (AOI 18) areas (Table 7; Figures 11A through 11C). When utilizing the most conservative AF 0.03, an additional 10 VOCs (including benzene, BDCM, dibromochloromethane, 1,1-DCA, 1,2-DCA, ethylbenzene, naphthalene, PCE, 1,1,2-trichloroethane, and TCE) were identified in RFI soil vapor results above commercial/industrial screening levels, as summarized in the table below. The results for these additional VOCs are examined in previous "VOCs in Soil Vapor" subsections under the respective AOIs. However, based on the lines of evidence presented above concerning Site-specific factors and default AF considerations, the most conservative default AF 0.03 may overestimate vapor intrusion risk for this Site. That being said, the most conservative default AF 0.03 was used as a conservative tool to screen the Site and assess the nature and extent of soil vapor COPCs in the subsurface.

SUMMARY OF SOIL VAPOR ANALYTES REPORTED ABOVE A SCREENING LEVEL		
ID	**Operational Area/Area of Interest (AOI)**	**Analytes (Soil Vapor AF Utilized)**
1	Distillate Tank for Unit 5 Peaker	No analytes reported above a screening level
5	Fueling Station	PCE (0.03)
6	Unit 5 Peaker	Benzene (0.03) PCE (0.03)
14	Hazardous Waste Accumulation Area	No analytes reported above a screening level
15	Generating Units 1 & 2	No analytes reported above a screening level
17	Maintenance Shop (overlaps with Warehouse [AOI 16], Welding Shop [AOI 18], and Septic Pits [AOI 37])	Benzene (0.03) Bromodichloromethane (0.03) Carbon Tetrachloride (0.03, 0.001, and 0.0005) Chloroform (0.03, 0.001, and 0.0005) Dibromochloromethane (0.03) 1,1-Dichloroethane (0.03) 1,2-Dichloroethane (0.03) Ethylbenzene (0.03) Naphthalene (0.03) PCE (0.03) 1,1,2-Trichloroethane (0.03) TCE (0.03)
36	Former Hazardous Waste Area	No analytes reported above a screening level

Soil vapor at the Site is considered adequately characterized based on the results presented in the above sections. The successful execution of the comprehensive sampling plan proposed in the RFI Work Plan in combination with the multiple rounds of additional soil vapor assessment conducted in accordance with four (4) DTSC-approved Tech Memos has led to a robust data set that is available to support risk management decisions moving forward.

4.40.1 Summary of Non-Detect Screening Level Exceedances in Soil Vapor Samples

There are three (3) analytes that were not detected in any soil vapor sample above the RL; however, the RL exceeds the calculated screening levels after applying one or more of the default AFs. A summary and discussion of the non-detected screening level exceedance is included below.

SUMMARY OF NON-DETECT SCREENING LEVEL EXCEEDANCES FOR SOIL VAPOR				
Analyte	**RL µg/m³**	**Screening Level Exceedance**		
		Calculated Level µg/m³	**AF**	**Source**
1,2-Dibromo-3-chloropropane (DBCP)	5	4.0 2.0 0.067	0.0005 0.001 0.03	USEPA RSL USEPA RSL USEPA RSL
1,2-Dibromoethane (EDB)	0.5 to 2	0.67	0.03	USEPA RSL
1,2,3-Trichloropropane (TCP)	1 to 2	0.53	0.03	USEPA RSL

The VOCs, DBCP, EDB, and TCP were not detected in any of the RFI soil samples and the RLs in soil were below soil screening levels. DBCP, EDB, and TCP are not expected to be used or present at the generating station. DBCP was historically used as a fumigant and nematicide for crops and was banned in 1977 (USEPA, 2000a). EDB was previously used as an additive in leaded gasoline and a fumigant and nematicide. Currently, EDB is used in the treatment of logs for bark beetles and termites and as an intermediate for dyes, resins, waxes, and gums (USEPA, 2000b). TCP was used as an industrial solvent and as an impurity in fumigants and nematicides for crops (USEPA, 2017).

Based on the above, the risk of DBCP, EDB, and TCP in soil vapor at the Site appears to be negligible.

4.41 Overall Summary of RFI Groundwater Analytical Results

As discussed in Section 4.17.5, a grab groundwater sample was collected at MS-23D to assess if constituents identified in soil vapor near the warehouse (AOI 16) and maintenance shop (AOI 17) have affected groundwater quality at the Site. VOC results from the grab groundwater sample collected at approximately 460 feet bgs were all less than the applicable California MCLs as presented in Table 8.

5.0 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

5.1 Analysis of the High Purity Water Used for Field and Equipment Blanks

Honeywell lab-grade water, designed for high-purity liquid chromatography, was used in generating field and equipment blank samples. As introduced in Section 3.7, sample analytical for two batch samples (SSB-DZ609 and SSB-EA182) collected of the Honeywell lab-grade water were reviewed. Based on frequent concentrations of chloroform being reported in project blank samples and the batch analytical results, Sparkletts brand distilled water was later tested (sample ID SDW-1) as a potential substitute for the Honeywell lab-grade water. The following table summarizes the detected parameters in the lab-grade and distilled water used during the RFI. Batch certificates from Honeywell and copies of the analytical reports for blank water sampling of Honeywell lab-grade water and Sparkletts distilled water are included in Appendix F.

HIGH PURITY WATER ANALYTICAL DETECTION SUMMARY			
Parameter	**SSB-DZ609 Results (Honeywell Lab Water)**	**SSB-EA182 Results (Honeywell Lab Water)**	**SDW-1 Results (Sparkletts Distilled Water)**
Chloroform	**3.05** µg/L	**3.38** µg/L	<1.0 µg/L
Arsenic	**0.233 J** µg/L	<0.100 µg/L	Not Analyzed
Barium	**0.638** µg/L	<0.200 µg/L	Not Analyzed
Chromium	**0.198 J** µg/L	<1.0 µg/L	Not Analyzed
Copper	**1.21** µg/L	<0.200 µg/L	Not Analyzed
Lead	**0.159** µg/L	<0.100 µg/L	Not Analyzed
Molybdenum	**0.211** µg/L	<0.100 µg/L	Not Analyzed
Nickel	**0.171 J** µg/L	<0.200 µg/L	Not Analyzed
Silver	**0.932** µg/L	<0.600 µg/L	Not Analyzed
Vanadium	**0.602** µg/L	<0.500 µg/L	Not Analyzed
Zinc	**30.2** µg/L	**9.70** µg/L	Not Analyzed

Low-level concentrations of the VOC chloroform (likely a disinfectant biproduct) and trace and minor concentrations of metals including arsenic, barium, chromium, copper, lead, molybdenum, nickel, silver, vanadium, and zinc were detected in the Honeywell lab-grade water.

VOCs were not reported above laboratory reporting limits in the Sparkletts distilled water sample.

5.2 Field Quality Control Samples

The following field quality control samples were collected during the event:

- Field Duplicates;
- Trip Blanks;
- Field Blanks; and
- Equipment Rinsate Blanks.

Northgate conducted limited validation as indicated in the sections below which generally follow USEPA functional guidelines for data validation.

5.2.1 Field Duplicates

Field duplicates of soil were collected between August 18 and September 2, 2021 and analyzed for TPH, VOCs, SVOCs, metals, pH, and PCBs. As discussed previously in Section 3.7, the target of one (1) duplicate per 10 samples (10%) analyzed was generally met with an overall soil duplicate rate (across all analyses) of 9.6%. Table 9 contains the TPH duplicate results, Table 10 includes the VOC duplicate results, Table 11 contains the SVOC duplicate results, Table 12 includes metals and pH duplicate results, and Table 13 contains the PCB duplicate results.

In general, a relative percent difference (RPD) below 50% for soil samples represent good agreement. It is common practice to only calculate RPDs for sample results that are greater than five times the laboratory RL. RPDs between the duplicate and original sample results were calculated for all detected analytes that were greater than five (5) times the RL. The calculated RPDs are shown on the tables. The calculated RPDs were generally below 50% indicating good agreement with the exception shown in the table below.

Analyte (Table #)	Primary / Duplicate Sample IDs	Calculated RPD	Comment
TPH-mo C_{23}-C_{32} (Table 9)	MS-16-0.5 / MS-116-0.5	55%	Neither concentration exceeds the commercial/industrial screening level
	SS-5-0.5 / SS-105-0.5	73%	Neither concentration exceeds the commercial/industrial screening level
Acetone (Table 10)	F11-10-0.5 / F11-110-0.5	53%	Neither concentration exceeds the commercial/industrial screening level
Barium (Table 12)	FS-3-2.5 / FS-103-2.5	79%	Neither concentration exceeds the commercial/industrial screening level
	SS-11-5 / SS-111-5	60%	Neither concentration exceeds the commercial/industrial screening level

Analyte (Table #)	Primary / Duplicate Sample IDs	Calculated RPD	Comment
Aroclor-1254 (Table 13)	PT1-4-1 / PT1-104-1	95%	Primary sample concentration exceeds the commercial/industrial screening level, but the duplicate sample concentration is below the commercial/industrial screening level

It is common in soil to have higher RPD values due to soil heterogeneities. In an effort to address concentration discrepancies and act in a conservative manner with respect to potential contamination identified during RFI sampling, the higher concentration reported for each duplicate sample pair was considered when determining if additional delineation sampling was necessary.

Field duplicates of soil vapor were collected between August 31, 2021, and October 7, 2022 and analyzed for VOCs. As discussed previously in Section 3.7, the target of one duplicate per 20 samples (5% target) analyzed was met with an overall soil duplicate rate (across all analyses) of 5.6%.

In general, a relative RPD below 50% for soil vapor samples represents good agreement. It is common practice to only calculate RPDs for sample results that are greater than five times the laboratory RL. RPDs between the duplicate and original sample results were calculated for all detected analytes that were greater than five (5) times the RL. The calculated RPDs for soil vapor duplicate sample pairs are shown on Table 14. All calculated RPDs for soil vapor duplicate sample pairs were below 50%, indicating good agreement between soil vapor samples collected during the RFI.

5.2.2 Trip Blanks

Per the RFI Work Plan, a trip blank was placed in each cooler containing the samples to be analyzed for VOCs. The trip blank samples were analyzed for VOCs only. Trip blanks were obtained from the analytical laboratory in closed 40 milliliter glass vials. The vials provided by the laboratory were maintained in the cooler with the samples to be analyzed for VOCs. The trip blank results are included below the VOC analytical results for RFI soil samples on the lower section of Table 3. A single 1,4-dichlorobenzene concentration of 0.24 J micrograms per liter (µg/L) was reported in trip blank TB-A-082521 which accompanied samples collected on August 25, 2021. Due to 1,4-dichlorobenzene method blank contamination, the trip blank result was hand-validated to non-detect with a "B" qualifier (<0.24 J B µg/L) for blank contamination. 1,4-dichlorobenzene was not detected in any soil samples collected as part of the RFI; therefore, no data qualifiers were necessary. Acetone was detected at trace concentrations in two trip blank samples for February 8 and 11, 2022. Acetone is a common laboratory contaminant and the

acetone concentrations detected in soil samples collected during the RFI were all well below the commercial/industrial RSLs. Therefore, the presence of acetone concentrations in the trip blank samples does not negatively impact the results of the report. No other VOCs were detected above the laboratory reporting limits in any of the trip blank samples.

5.2.3 Field Blanks

A total of 20 field blank samples were collected between August 23, 2021, and February 11, 2022 and analyzed for VOCs. The field blank samples are made in the field by decanting the selected lab-grade water into the sampling container on days when VOC samples are being collected. The field blank sample results for VOCs are shown on the lower section of Table 3, respectively. Minor and trace concentrations of VOCs including chloroform, acetone, and n-butylbenzene were reported in a few of the field blank samples. As noted above, minor concentrations of chloroform were also detected in the Honeywell lab-grade water; therefore, their presence in the field blank samples is not indicative of airborne contamination introduced in the field. Furthermore, chloroform was not detected in any of the soil samples analyzed for the RFI.

Low-level concentrations of acetone were commonly detected in soil samples collected during the RFI; however, acetone concentrations in soil were all well below the commercial/industrial RSL. Therefore, the presence of minor and trace acetone concentrations in the field blank samples does not negatively impact the soil results. A trace concentration of n-butylbenzene 0.30 J µg/L was reported in the field blank FB-DZ609-083021. Due to n-butylbenzene method blank contamination, the field blank result was hand-validated to non-detect with a “B” qualifier (<0.30 J B µg/L) for blank contamination. N-Butylbenzene was not reported in any of the RFI soil samples; therefore, data qualifiers of the soil data were not necessary. The trace concentration of n-butylbenzene in the single field blank does not negatively impact the results of the report.

5.2.4 Equipment Rinsate Blanks

Between August 23, 2021 and February 11, 2022, equipment rinsate blank samples were collected at a frequency of approximately one (1) in 20 samples and were analyzed for all constituents analyzed in samples during that field day or sampling group. The equipment rinsate samples were collected by pouring lab-grade water over the decontaminated hand auger, slide hammer, or direct push rig’s sample shoe and collecting the contact water in laboratory-supplied containers.

The equipment rinsate blank sample results are included at the bottom of analytical Tables 2 through 8.

Trace concentrations of TPH-mo were reported in the equipment rinsate blank EB-B-090121, collected on September 1, 2021 (Table 2). Concentrations of TPH were reported in soil samples collected on September 1, 2021, were all below commercial/industrial screening levels; therefore, trace TPH concentrations in the equipment rinsate blank sample do not negatively impact the results of the report.

One (1) trace concentration of carbon disulfide was reported in the equipment rinsate blank EB-B-082721 collected on August 27, 2021 (Table 3). Carbon disulfide reported in RFI soil samples were all below commercial/industrial screening levels; therefore, the trace carbon disulfide concentration in the equipment rinsate blank sample does not negatively impact the results of the report.

Trace and minor concentrations of chloroform were reported in equipment rinsate blank samples collected using Honeywell lab-grade water between August 23, 2021, and February 11, 2022 (Table 3). In addition, chloroform was reported in the Honeywell lab-grade water analytical testing (see Section 5.1). However, chloroform was not reported in any RFI soil samples. Therefore, chloroform concentrations reported in the equipment rinsate blanks do not negatively impact the results of the report.

A trace concentration of 2-butanone was reported in the equipment rinsate blank sample EB-091522 collected using Sparkletts distilled water after rinsing the bladder pump utilized to collect the grab groundwater sample at MS-23D-GW on September 15, 2022 (Table 8). 2-Butanone was not detected in the corresponding groundwater sample; therefore, the 2-butanone concentration reported in the equipment rinsate blank does not negatively impact the results of the report.

A trace concentration of barium was reported in the equipment rinsate blank sample EB-B-082521 collected using Honeywell lab-grade water on August 25, 2021 (Table 5). In addition, Barium was reported in the Honeywell lab-grade water analytical testing (see Section 5.1). However, barium was not reported in any RFI soil samples above commercial/industrial screening levels. Therefore, the barium concentration reported in the equipment rinsate blank does not negatively impact the results of the report.

A trace concentration of copper was reported in the equipment rinsate blank sample EB-B-082321 collected using Honeywell lab-grade water on August 23, 2021 (Table 5). In addition, copper was reported in the Honeywell lab-grade water analytical testing (see Section

5.1). Copper was not reported in any RFI soil samples above commercial/industrial screening levels. Therefore, the copper concentration reported in the equipment rinsate blank does not negatively impact the results of the report.

Trace and minor concentrations of zinc were reported in three (3) equipment rinsate blank samples collected using Honeywell lab-grade water (Table 5). In addition, zinc was reported in the Honeywell lab-grade water analytical testing (see Section 5.1). However, zinc was not reported in any RFI soil samples above commercial/industrial screening levels. Therefore, the zinc concentrations reported in the equipment rinsate blanks do not negatively impact the results of the report.

SVOCs and PCBs were not detected in any of the equipment blank samples submitted as part of the RFI sampling.

5.2.5 Soil Vapor Temporal Variation Assessment

Soil vapor migration through the subsurface can be complex and influenced by climatic factors including temperature, pressure, and precipitation. A majority of the RFI soil vapor data were collected in August and September 2021 with some additional delineation sampling conducted between October 2021 and January 2022. During a project meeting held on January 18, 2022, DTSC recommended that soil vapor temporal variability for the Site be assessed as part of the RFI. High variability in soil vapor concentrations may result in potential underestimation of vapor intrusion risk. To reduce the uncertainty associated with potential variability in soil vapor concentrations, a soil vapor resampling event was conducted in accordance with the prepared Tech Memo-style work plan (Northgate, 2022c). The DTSC approved the Tech Memo on March 17, 2022, with recommendations to adjust the proposed SVP resampling list, which was updated accordingly (DTSC email comments on the Tech Memo are included in Appendix B).

Soil vapor resampling took place on April 4, 2022, and included collecting samples from 22 SVP locations generally installed near AOI 17 (maintenance shop). Findings of the temporal variation study were transmitted to DTSC in the form of an email on May 2, 2022 with supporting soil vapor concentration maps showing soil vapor contours using data from before and after the April 2022 sampling event (a copy of the email with the study findings and supporting table and figures is included in Appendix B). To quantify the amount of variation in soil vapor concentrations across different sampling events and/or seasons, the RPD was calculated for analytes that were detected at least five (5) times higher than their respective laboratory RLs (Table 7A). An RPD of 50% or lower was considered to indicate good agreement (low variability) in soil vapor concentrations between sampling events. According to Table 7A, samples containing significant concentrations of the main risk-driver chemicals for

the Site including chloroform, carbon tetrachloride, PCE, and 1,1-DCA generally indicated good agreement between sampling events. In addition, soil vapor concentration Figures 11A through 11E were updated to reflect the maximum concentration reported to date (most conservative approach), which resulted in very little change to the overall soil vapor concentration contours (the soil vapor contours from before and after the April 2022 resampling event are presented in the May 2, 2022 email to DTSC in Appendix B).

Analytes that consistently indicated higher variability (RPD > 50%) included benzene, Freon-12, ethylbenzene, Freon-11, and xylenes. These analytes are not widely detected at the Site and were also not detected at concentrations above commercial/industrial screening levels using default AF 0.001; therefore, these results are not considered to significantly alter the findings of the report. Overall, temporal variability in soil vapor is considered low at the Site. Soil vapor data including initial temporal variability comparison tables and figures were transmitted to DTSC on May 2, 2022. DTSC responded via email on June 20, 2022, and agreed that no further sampling at the subject sampling points was recommended to assess temporal variability.

5.3 Preservation and Holding Times

Preservation and hold times for soil samples are as follows for the constituents analyzed:

- TPH– preserve to 4 degrees Centigrade, 14 days for samples preserved with sodium biosulfate and methanol;
- VOCs – preserve to 4 degrees Centigrade, 14 days for samples preserved with sodium biosulfate and methanol;
- SVOCs – preserve to 4 degrees Centigrade, 14 days hold time;
- Metals – preserve to 4 degrees Centigrade, 180 days hold time;
- pH – preserve to 4 degrees Centigrade, 24 hours hold time; and.
- PCBs – preserve to 4 degrees Centigrade, 14 days hold time.

Preservation was conducted as required. All analyses for were performed within the hold times listed above.

Preservation and hold times for soil vapor samples included collection of samples in clean, gas-tight, glass syringes and immediately injected into mobile laboratory equipment or stored in individually certified passivated stainless steel (Summa) cannisters for stationary laboratory analysis within 14 days. Preservation was conducted as required. All analyses for VOCs in soil vapor were performed within the hold times mentioned above.

Preservation and hold times for groundwater samples included collection of samples in clean glass vials, preserved to 4 degrees Centigrade with hydrochloric acid (no headspace) and analyzed within 14 days. Preservation was conducted as required. All analyses for VOCs in groundwater were performed within the hold times mentioned above.

5.4 Laboratory QA/QC

The laboratory reports and laboratory QA/QC data are included in Appendix G. As discussed previously, results that were detected above the MDL but below the RL were reported and J flagged by the laboratory as estimated results. These J flags have been included in the tabulated results.

5.4.1 Method Blank Contamination

According to laboratory analytical reports, trace amounts of metals (mercury and barium) and VOCs (chloroform, n-butylbenzene, 1,4-dichlorobenzene, p-isopropyltoluene, 1,2,4-trichlorobenzene, 1,3,5-trimethylbenzene, and styrene) were detected in the method blank samples. The laboratory appropriately flagged all positive results for these parameters in their respective laboratory packages with a B qualifier indicating contamination was detected in the method blank. USEPA guidance for validating data with blank contamination is generally to qualify data that is less than five times the concentration found in the blank as non-detected. A summary of the constituents detected by laboratory package and the associated hand-validation of results that were less than five times the amount found in the blank are listed in the table below.

Method Blank Contaminant Validation Summary

Lab Package	Blank Contaminant	Conc. Detected in Method Blank	Five Times Conc. In Method Blank	Sample ID with Result Less Than Five Times the Method Blank	Original Result	Validated Result
570-68447-1	1,4-Dichlorobenzene	0.3099 J µg/L	1.5495 µg/L	TB-A-082521	0.24 J B	<0.24 J B
570-68779-1	n-Butylbenzene	0.3190 J µg/L	1.595 µg/L	FB-D2609-083021	0.30 J B	<0.30 J B

One (1) trip blank sample (TB-A-082521) and one (1) field blank sample (FB-D2609-083021) with trace concentrations of 1,4-dichlorobenzene and n-butylbenzene were hand-validated as

non-detected due to laboratory method blank contamination. Based on the review of method blank results as part of the data validation process, method blank contamination reported was minimal and not considered to significantly affect the findings of this report.

5.4.2 Deviations from the RFI Work Plan

Deviations from the Work Plan that took place are recorded in Table 1 and summarized below:

- Additional step-out and step-down soil samples were collected at the Unit 5 Peaker (AOI 6) and Units 3 and 4 transformers (AOI 25) for the delineation of PCBs and/or TPH above commercial/industrial screening levels.
- Additional step-out and step-down soil vapor samples were collected in the vicinity of the warehouse (AOI 16), maintenance shop (AOI 17), welding shop (AOI 18), and septic pits (AOI 37). Additionally, a grab groundwater sample was collected from one step-down sampling location (MS-23D) to assess potential for VOCs in groundwater as requested by the DTSC.
- A number of additional soil borings were added to the RFI scope of work to assess soil conditions around additional transformers identified during the Site walk to mark the proposed borings at AOIs 6, 21, and 25.
- Additional shallow samples were collected at step-down boring location MS-23D to assess the former sodium hypochlorite tank located south of former Unit 3 Cooling Tower and north of the former Warehouse, which was not identified in the RFI Work Plan. SCE elected to collect these samples even though the sodium hypochlorite tank was estimated to be installed circa 2007 and installed well after SCE sold the property in 1998.
- One (1) soil boring, F-21, was cancelled at the cooling tower makeup water pond (AOI 21) with DTSC approval because the diesel tank targeted for investigation was determined to postdate SCE's sale of the property in 1998.
- Several instances of hand auger boring refusal which prevented some deeper soil samples per the RFI Work Plan. Based on review of shallow and nearby soil samples, the locations with hand auger refusal are not considered to represent a significant data gap.

As described above, the majority of the deviations or changes to the DTSC-approved RFI Work Plan involved the addition of soil borings and subsurface samples for the purposes of further Site characterization. The remaining deviations from the RFI Work Plan scope are not considered to materially affect the findings of this RFI.

5.4.3 Overall Assessment of Data

The RFI was conducted according to the RFI Work Plan except for the deviations noted in the sections above. A brief summary of QA/QC findings is presented below.

- In general, a RPD below 50% for soil samples represent good agreement; however, six (6) duplicate soil results were identified with an RPD greater than 50%. In an effort to address concentration discrepancies and act in a conservative manner with respect to potential contamination identified during RFI sampling, the higher concentration reported for each duplicate sample pair was considered when determining if additional delineation sampling was necessary. RPDs calculated for soil vapor duplicate samples were all below 50%, indicating good agreement indicating good agreement between soil vapor samples collected during the RFI.

- Trace and minor concentrations of analytes were found in the trip blanks, field blank, and equipment blank samples; however, concentrations of these constituents in corresponding RFI soil samples were either well below commercial/industrial screening levels or below laboratory RLs. In addition, several of the blank contaminants were identified as trace or minor concentrations in lab-grade water used in the collection of field and equipment rinsate blanks. Identified contaminants in trip blanks, field blanks, and equipment rinsate blank samples are not considered to significantly affect the findings of this report.

- Method blank contamination reported was minimal and not considered to significantly affect the findings of this report.

- Temporal variation in soil vapor concentrations is low at the Site for the most prevalent chemicals at the Site and therefore are not considered to significantly affect the findings of this report. It should be noted that maximum soil vapor concentrations are posted on figures wherever multiple or duplicate samples were collected.

- RFI soil, soil vapor, and groundwater samples were collected and handled according to the RFI Work Plan and analyzed within the recommended holding times.

No significant concerns were identified for the data set based on field and laboratory standard QA/QC procedural reviews. The data set is considered acceptable for the purposes of assessing human health risks and supporting stakeholder decisions for future Site use.

6.0 HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT SUMMARY

6.1 Human Health Risk Summary

According to the FICA Agreement between BTC III and the DTSC, the sole responsibility of SCE is to prepare and submit an RFI Report to the DTSC. The current Site owner, BTC III, is responsible for the preparation of a HHSE for the Site (see additional discussion in Section 2.3.2). The HHSE was prepared by Roux on behalf of BTC III with the objective of providing a conservative evaluation of the potential risk from exposure to chemicals detected in the subsurface at the Site for known current and future planned uses (Roux, 2023b). The HHSE is designed to assess whether residual COPCs present in the subsurface at the Site pose an unacceptable level of risk to the following receptors:

- Current and future construction worker,
- Future indoor commercial/industrial worker, and
- Future outdoor commercial/industrial worker.

According to the conceptual site model presented in the HHSE, direct exposure to soil (exposure routes of ingestion, dermal contact, or inhalation of particles) was considered a complete pathway for the current and future construction worker and future outdoor commercial/industrial worker. Exposure to chemicals in indoor air (exposure route of inhalation via vapor intrusion from chemicals present in soil vapor) was considered complete for the future indoor commercial/industrial worker. Direct exposure to groundwater was not considered a complete exposure pathway at the Site.

As discussed in Section 2.4.4.5, an ongoing investigation is being conducted by Roux and BTC III under the USEPA TSCA group based on PCBs concentrations reported above 50 mg/kg in concrete samples at former Units 1 & 2. This investigation is being conducted as part of a SICP prepared by Roux (on behalf of current owner BTC III) under the direct oversight of the USEPA TSCA group. The ongoing USEPA-led investigation is considered separate from the Site RFI, conducted by Northgate (on behalf of former owner SCE). This distinction is significant because although the HHSE prepared by Roux includes the full Pre-RFI and RFI data sets (samples collected between 2019 and 2022; Figure 5), the HHSE also includes elevated concentrations of PCBs identified during the ongoing USEPA-led PCB investigation at former Units 1 & 2 (not included in the aforementioned Pre-RFI and RFI data sets).

The risks for a potential construction worker and outdoor commercial/industrial worker exposure to soil were estimated based on a review of Site-wide soil data. Potential exposure to indoor receptors was qualitatively evaluated for two exposure units (EUs) defined by future

redevelopment plans and distribution of contaminants in the subsurface. Maximum and 95% upper confidence limit (95% UCL) concentrations for soil vapor and soil were selected as exposure point concentrations (EPCs). The cancer and non-cancer risks estimated for the identified receptors and given exposure scenarios included in Roux's HHSE for the Site are summarized in the table below (see complete HHSE for further details on selected risk estimation methods and assumptions).

Cumulative Cancer and Non-Cancer Risks

Receptor	Estimated Cancer Risk	Exceed Risk Threshold of 1E-06 to 1E-04?	Estimated Non-Cancer Risk	Exceed Risk Threshold of 1?
Construction Worker	2E-04	Yes	4E+02	Yes
Future Outdoor Commercial/Industrial (0-2')	1E-03	Yes	9E+01	Yes
Future Outdoor Commercial/Industrial (0-10')	1E-03	Yes	9E+01	Yes
Future Indoor Commercial/Industrial (EU1) - 0.0005 AF	1E-07	No	1E-02	No
Future Indoor Commercial/Industrial (EU2) - 0.0005 AF	1E-06	No	7E-02	No
Future Indoor Commercial/Industrial (EU1) - 0.03 AF	7E-06	Risk Management Range	9E-01	No
Future Indoor Commercial/Industrial (EU2) - 0.03 AF	9E-05	Risk Management Range	4E+00	Yes

The construction worker and future outdoor commercial/industrial worker cancer and non-cancer risks are driven by PCBs (maximum PCB concentration in soil of 750 mg/kg from ongoing USEPA-led investigation used as the EPC).

According to Roux's HHSE, excavation of PCB-impacted soil is planned, and the following post excavation "virtual" scenario was presented for consideration.

"Virtual" Cumulative Cancer and Non-Cancer Risks

Receptor	Estimated Cancer Risk	Exceed Risk Threshold of 1E-06 to 1E-04?	Estimated Non-Cancer Risk	Exceed Risk Threshold of 1?
Construction Worker	4E-07	No	5E+00	Yes
Future Outdoor Commercial/Industrial (0-2')	3E-06	Risk Management Range	1E+00	No
Future Outdoor Commercial/Industrial (0-10')	3E-06	Risk Management Range	1E+00	No

The construction worker scenario, exceedance of the non-cancer hazard target threshold of 1 is driven by the maximum concentration of thallium. Roux considers the maximum thallium concentration an outlier. If the thallium outlier concentration is removed from the dataset for the construction worker scenario, use of the 95% UCL concentration for thallium (2.6 mg/kg) yields an estimated cumulative HI that exceeds 1, but a target analysis identified that no individual target organ exceeds a threshold of 1.

Arsenic and lead concentrations in soil at the Site were evaluated separately from the quantitative risk evaluation presented above. Arsenic in Site soil was considered to be consistent with naturally occurring arsenic in soil and not included in the quantitative risk assessment. Lead in Site soil was evaluated using the DTSC Lead Risk Assessment Spreadsheet. Results of the lead assessment suggest that levels of lead at the Site do not pose unacceptable risk.

6.2 Ecological Risk Summary

In response to a recommendation from DTSC to examine potential risks to ecological receptors at the Site as part of the RFI, a Scoping Level Environmental and Ecological Risk Assessment (SLEERA) was prepared by Tetra Tech, Inc. (Tetra Tech) on behalf of SCE. A copy of the SLEERA is included in Appendix H and briefly summarized below.

The objective of the SLEERA is to provide an evaluation of potential ecological hazards by chemicals of potential ecological concern (COPECs). To accomplish this objective, the SLEERA addresses the following three questions:

- •Are there any potentially affected habitats or receptors of concern present at or near the Site?
- Are potentially harmful chemicals released or present at the Site?

- Are there potentially complete pathways through which biological resources of concern may be exposed to released chemicals?

According to the SLEERA, a negative response to any one of the above questions indicates the absence of potential ecological impacts. If an affirmative answer is given to all three questions, further evaluation potentially including a quantitative predictive ecological risk evaluation may be conducted. By definition, there is no ecological risk if no biological receptors of concern are present that are exposed to chemicals released from the Site.

Potentially affected habitats and receptors of concern were assessed in the SLEERA. Based on available data presented in the SLEERA, it was determined that there exists a moderate potential for the northwest portion of the Site (generally defined as the Construction and Operations Waste Area or AOI 22 in the RFI) to support the Los Angeles pocket mouse (*Perognathus longimembris brevinasus*) and a low potential to support the California horned lark (*Eremophila alpestris actua*). The undeveloped, heavily disturbed areas on the north-western portion of the Site provide marginal foraging and nesting habitat for these species. All remaining special-status wildlife species are presumed to be absent from the Site due to lack of quality habitat.

Although AOI 22 was determined to have the potential to provide suitable habitat for Los Angeles pocket mouse, the Los Angeles pocket mouse has not been observed nor its presence confirmed at the time of the SLEERA preparation. In addition, the population size of the Los Angeles pocket mouse is likely to be limited due to the sparse low-quality nature of the habitat that is currently present at AOI 22.

A formal assessment of COPECs was conducted using detected metals and VOC concentrations in soil samples collected by Ardent and ERM in 2019 and 2020 in the vicinity of AOI 22. Maximum detected concentrations in soil were compared to available background (ambient) soil concentrations and SFBRWQCB ESLs for minimally vegetated terrestrial (commercial/industrial) habitats (Table 2 of the SLEERA).

The SLEERA concluded that it is unlikely that COPECs are present in surface soils at AOI 22 (area identified at the Site as potential habitat for sensitive ecological receptors). The presence of sensitive receptors (i.e., the Los Angeles pocket mouse, a California Species of Special Concern) at the Site is currently undetermined. Accordingly, since it is unlikely that there are COPECs in soil, sensitive receptors, if present, may not be exposed to COPECs.

7.0 CONCLUSIONS AND RECOMMENDATIONS

7.1 RFI Conclusions

The following conclusions can be formed from the data derived from the RFI sampling:

- The RFI was conducted according to the RFI Work Plan except for the deviations noted in Table 1. As described in Section 5.4.2, the majority of the deviations or changes to the DTSC-approved RFI Work Plan involved the addition of soil borings and subsurface samples for the purposes of further Site characterization. The remaining deviations from the RFI Work Plan scope are not considered to materially affect the findings of this RFI.

- Summary of RFI soil results:
  - Reported soil concentrations for TPH and PCBs above commercial/industrial screening levels were appropriately delineated as part of the RFI. Concentrations above commercial/industrial screening levels at Unit 5 Peaker (AOI 6) and Units 3 and 4 transformers (AOI 25) were subsequently removed by Roux (on behalf of BTC III) under the Site's SMP in 2022 (additional details are provided in Section 2.4.4.5). All other reported RFI soil concentrations for TPH, VOCs, SVOCs, metals, and PCBs were below commercial/industrial screening levels.
  - A single historical (Pre-RFI) soil sample, Ardent's (2019) flume investigation boring F3 at the labeled depth of 0.5 feet, reported a thallium concentration of 14.9 mg/kg, which slightly exceeds the commercial/industrial RSL of 12 mg/kg (Table 15 in Appendix A). The thallium concentration for the 1.5-foot sample at F3-1 was less than the commercial RSL and was reported as 2.43 mg/kg. According to Ardent's written scope of services documented in October 2019, soil samples within the concrete-lined flumes were collected at the bottom of the flume immediately beneath the concrete by advancing borings within the "visual expansion joints" and collecting soil at 0.5 and 1.5 below the flume bottom (note that flume bottom was located approximately 8 feet lower than surrounding grade, so the two [2] soil samples discussed herein were collected at approximately 8.5 and 10 feet below current grade, respectively). Given that the thallium concentration at sample location F3-1 (located in the flume south of Cooling Tower 3 [Figure 15]) decreased below commercial/industrial screening level within 1 foot of the flume bottom and the linear nature of the concrete-lined channel with expansion joints, the lateral and vertical migration potential for elevated thallium concentrations in soil is significantly limited. Finally, removal of soil within the expansion joint at sample location F3-1 is not feasible because the flumes have been demolished and the area re-graded.
  - pH in soil samples collected for the RFI ranged from 7.3 to 11.6 standard units.

- All non-detected results for TPH, VOCs, metals, and PCBs in soil included laboratory RLs that were below the commercial/industrial screening levels or the Southern California ambient arsenic screening level of 12 mg/kg.
- SVOCs were not detected in the RFI soil samples. Data was J-flagged down to the MDL and all laboratory RLs were below commercial/industrial screening levels, except for 3,3'-dichlorobenzidine, benzidine, bis(2-chloroethyl)ether, dibenz(a,h)anthracene, N-nitroso-di-n-propylamine, and pentachlorophenol which are not expected at the Site.

- Summary of RFI soil vapor results:
  - Only two (2) VOCs including carbon tetrachloride and chloroform, were identified during the RFI above commercial/industrial screening levels using default AFs 0.001 and 0.0005 as discussed in Section 4.17.4 as part of the soil vapor generally located below the maintenance shop (AOI 17), warehouse (AOI 16), and welding shop (AOI 18) areas (Table 7; Figures 11A through 11C).
  - When utilizing the most conservative AF 0.03, an additional 10 VOCs were identified in RFI soil vapor results above commercial/screening (including benzene, BDCM, dibromochloromethane, 1,1-DCA, 1,2-DCA, ethylbenzene, naphthalene, PCE, 1,1,2-trichloroethane, and TCE). The results for these additional VOCs are examined in Section 4.0 under the respective AOI subsections. However, based on the lines of evidence presented in Section 4.40 concerning Site-specific factors and default AF considerations, the most conservative default AF 0.03 may overestimate vapor intrusion risk for this Site. That being said, the most conservative default AF 0.03 was used as a conservative tool to screen the Site and assess the nature and extent of soil vapor COPCs in the subsurface.
  - Soil vapor at the Site is considered adequately characterized based on the results presented in Section 4.0. The successful execution of the comprehensive sampling plan proposed in the RFI Work Plan in combination with the multiple rounds of additional soil vapor assessment conducted in accordance with four (4) DTSC-approved Tech Memos has led to a robust data set that is available to support risk management decisions moving forward.
  - All non-detected results for VOCs in soil vapor included RLs that were below the calculated commercial screening levels after applying default AFs 0.03, 0.001, and 0.0005 with the exception of DBCP, EDB, and TCP. DBCP, EDB, and TCP are not expected to have been used or present at the former generating station and concentrations have not been detected in the Site soil or groundwater; therefore, the potential risks associated with DBCP, EDB, and TCP in soil vapor appears to be negligible.

- Trace and minor concentrations of analytes were found in the trip blanks, field blank, and equipment blank samples; however, concentrations of these constituents in corresponding RFI soil samples were either well below commercial/industrial screening levels or below laboratory RLs. In addition, several of the blank contaminants were identified as trace or minor concentrations in lab-grade water used in the collection of field and equipment rinsate blanks. Identified contaminants in trip blanks, field blanks, and equipment rinsate blank samples are not considered to significantly affect the findings of this report.

- Method blank contamination resulted in two (2) trace concentrations of VOCs in QA/QC samples being hand-validated as not detected. Method blank contamination reported was minimal and not considered to significantly affect the findings of this report.
- No significant concerns were identified for the RFI data set based on field and laboratory standard QA/QC procedural reviews. The data set is considered acceptable for purposes of assessing risks to human and ecological receptors and supporting stakeholder decisions for future Site use.
- The Site AOIs have been adequately characterized based on the RFI results.

7.2 Other Considerations for Stakeholders

- A separate investigation related to PCBs in concrete and soil at former Units 1 & 2 is currently being conducted at the Site by Roux (on behalf of current owner BTC III) under the oversight of the USEPA TSCA group. Results of this ongoing, USEPA-led investigation are not included in this RFI Report, but initial soil data are included in an HHSE prepared by Roux, on behalf of BTC III. Once PCB impacts at former Units 1 & 2 have been fully characterized, it is anticipated that a cleanup program will be implemented that is compliant with USEPA TSCA and DTSC requirements to address residual PCBs at former Units 1 & 2 that present unacceptable risk to human health and the environment.
- Findings of the HHSE prepared by Roux on behalf of BTC III indicate that PCBs in soil at former Units 1 & 2 represent unacceptable cancer and non-cancer risks to construction workers and future commercial/industrial workers. The HHSE indicates that the PCB-impacted soil is anticipated to be addressed via soil excavation under USEPA and DTSC oversight and will result in acceptable cancer risks for current and future receptors at the Site. An outlier thallium concentration in soil remaining after remediation activities will result in unacceptable non-cancer risk for the construction worker scenario only. However, as described further in Section 6.1, no individual target organ exceeds the non-cancer threshold of 1 when utilizing the 95% UCL concentration for thallium.

- A SLEERA was prepared for the Site and is included in Appendix H. The objective of the SLEERA is to provide an evaluation of potential ecological hazards by COPECs. The SLEERA concluded that it is unlikely that COPECs are present in surface soils at AOI 22 (area identified at the Site as potential habitat for sensitive ecological receptors). The presence of sensitive receptors (i.e., the Los Angeles pocket mouse, a California Species of Special Concern) at the Site is currently undetermined. Accordingly, since it is unlikely that there are COPECs in soil, sensitive receptors, if present, may not be exposed to COPECs.

7.3 Recommendations

Results of the RFI indicate that the Site has been adequately characterized. Further sampling is not recommended at the identified AOIs as part of the RFI. With the exception of the ongoing USEPA-led investigation and anticipated remediation of PCBs at the former Units 1 & 2 (to be completed by BTC III), the Site meets general criteria for the proposed commercial/industrial land use.

Notes:

Red	Red font indicates a deviation from the RFI Work Plan scope or a conditional course of action taken based on analytical results
(1)	Total petroleum hydrocarbon full carbon chain (including C4-C12, C13-C22, C23-C32, C6-C8, C9-C16, and C17-C32 ranges)
(2)	Total petroleum hydrocarbons in diesel and motor oil ranges (including C13-C22, C23-C32, C9-C16, and C17-C32 ranges)
A	Analyze
H	Hold pending results of shallower samples or nearby samples
P	Potential soil analysis if TPH in any of the ranges above 100 mg/kg will be further analyzed for VOCs and/or SVOCs (including PAHs)
bgs	Below ground surface
EPA	Environmental Protection Agency
PAHs	Polycyclic aromatic hydrocarbons
PCBs	Polychlorinated biphenyls
mg/kg	Milligram per kilogram
SVOC	Semi-volatile organic compounds
TPH	Total petroleum hydrocarbons
VOCs	Volatile organic compounds

NOTES:

	Concentration exceeds a regulatory screening level
792	**Bold** value is reported concentration above the laboratory Method Detection Limit (MDL).
<0.050	Denotes analyte not detected above the posted Reporting Limit (RL)
J	Concentration is below the RL but above the MDL so the result represents an estimated value
--	Not analyzed or No Published Value
mg/kg	Milligrams per kilogram
Dup	Field duplicate samples are identified in this column with an "X"
SFBRWQCB ESLs	San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels (Updated July 2019)
LARWQCB SSLs	Los Angeles Regional Water Quality Control Board soil screening levels for protection of groundwater (May 1996)

NOTES:

17	**Bold** value is reported concentration above the laboratory Method Detection Limit (MDL).
<0.84	Denotes analyte not detected above the posted Reporting Limit (RL)
J	Concentration is below the RL but above the MDL so the result represents an estimated value
B	Compound was detected in the laboratory method blank and the sample
NA	Not analyzed or No Published Value
µg/kg	Micrograms per kilogram
µg/L	Micrograms per liter
Dup	Field duplicate samples are identified in this column with an "X"
EPA RSL	United States Environmental Protection Agency (EPA) Regional Screening Levels (RSL) for commercial/industrial land use (Updated May 2023)
DTSC-SLs	Department of Toxic Substances Control (DTSC)-modified screening levels for commercial/industrial land use (Updated May 2022)

NOTES:

17	**Bold** value is reported concentration above the laboratory Method Detection Limit (MDL).
<0.84	Denotes analyte not detected above the posted Reporting Limit (RL)
J	Concentration is below the RL but above the MDL so the result represents an estimated value
B	Compound was detected in the laboratory method blank and the sample
NA	Not analyzed or No Published Value
µg/kg	Micrograms per kilogram
µg/L	Micrograms per liter
Dup	Field duplicate samples are identified in this column with an "X"
EPA RSL	United States Environmental Protection Agency (EPA) Regional Screening Levels (RSL) for commercial/industrial land use (Updated May 2023)
DTSC-SLs	Department of Toxic Substances Control (DTSC)-modified screening levels for commercial/industrial land use (Updated May 2022)

NOTES:

17	**Bold** value is reported concentration above the laboratory Method Detection Limit (MDL).
<0.84	Denotes analyte not detected above the posted Reporting Limit (RL)
J	Concentration is below the RL but above the MDL so the result represents an estimated value
B	Compound was detected in the laboratory method blank and the sample
NA	Not analyzed or No Published Value
µg/kg	Micrograms per kilogram
µg/L	Micrograms per liter
Dup	Field duplicate samples are identified in this column with an "X"
EPA RSL	United States Environmental Protection Agency (EPA) Regional Screening Levels (RSL) for commercial/industrial land use (Updated May 2023)
DTSC-SLs	Department of Toxic Substances Control (DTSC)-modified screening levels for commercial/industrial land use (Updated May 2022)

NOTES:

17	**Bold** value is reported concentration above the laboratory Method Detection Limit (MDL).
<0.84	Denotes analyte not detected above the posted Reporting Limit (RL)
J	Concentration is below the RL but above the MDL so the result represents an estimated value
B	Compound was detected in the laboratory method blank and the sample
NA	Not analyzed or No Published Value
µg/kg	Micrograms per kilogram
µg/L	Micrograms per liter
Dup	Field duplicate samples are identified in this column with an "X"

NOTES:

	Concentration exceeds a regulatory screening level
1.23	**Bold** value is reported concentration above the laboratory Method Detection Limit (MDL).
<1.90	Denotes analyte not detected above the posted Reporting Limit (RL)
J	Concentration is below the RL but above the MDL so the result represents an estimated value
B	Analyte was detected in the method blank and sample
Deg C	Degrees Centigrade
--	Not analyzed or No Published Value
mg/kg	Milligrams per kilogram
mg/L	Milligrams per liter
s.u.	Standard units
Dup	Field duplicate samples are identified in this column with an "X"
EPA RSL	United States Environmental Protection Agency (EPA) Regional Screening Levels (RSL) for commercial/industrial land use (Updated May 2023)
DTSC-SLs	Department of Toxic Substances Control (DTSC)-modified screening levels for commercial/industrial land use (Updated May 2022)
(1)	Selected screening level for arsenic in soil (DTSC Human Health Risk Assessment Note Number 11)

NOTES:

	Concentration exceeds a regulatory screening level
792	**Bold** value is reported concentration above the laboratory Method Detection Limit (MDL).
<0.050	Denotes analyte not detected above the posted Reporting Limit (RL)
J	Concentration is below the RL but above the MDL so the result represents an estimated value
--	Not analyzed or No Published Value
mg/kg	Milligrams per kilogram
µg/L	Micrograms per liter
Dup	Field duplicate samples are identified in this column with an "X"
EPA RSL	United States Environmental Protection Agency (EPA) Regional Screening Levels (RSL) for commercial/industrial land use (Updated May 2023)
DTSC-SLs	Department of Toxic Substances Control (DTSC)-modified screening levels for commercial/industrial land use (Updated June 2020)

Notes:

Bold: Reported chemical concentration in micrograms per cubic meter (µg/m^3)

<: Not detected at or above the indicated Reporting Limit (RL)

-- : No published value or not analyzed

* : Dilution required for this compound

NS: Not sampled

DTSC-SL: Department of Toxic Substances Control-modified screening level (May 2022)

EPA RSL: United States Environmental Protection Agency Regional Screening Level (May 2023)

AF: Attenuation Factor (see Notes 1 and 2 for additional information)

8260B: VOC Analytical Method

Calculated commercial screening values for soil vapor using the default AFs listed (for DTSC SL, the lower of the cancer or non-cancer level was used)

Concentration exceeds the commercial soil vapor screening level after application of the most conservative default soil vapor AF 0.03

Concentration exceeds the commercial soil vapor screening level after application of default soil vapor AF 0.001

Tracer gas concentration was detected in soil vapor sample (results may not be representative of subsurface conditions due to ambient air intrusion in sample)

1 : Default AF of 0.0005 for soil vapor in future commercial settings is in accordance with the DTSC Final Vapor Intrusion Guidance document (October 2011)

2 : Default AF of 0.001 for soil vapor in existing commercial settings is in accordance with the DTSC Final Vapor Intrusion Guidance document (October 2011)

3 : Default AF of 0.03 for soil vapor in accordance with the Final Draft Supplemental Guidance: Screening and Evaluating Vapor Intrusion from DTSC and California Water Resources Control Board (February 2023)

Notes:

Bold: Reported chemical concentration in micrograms per cubic meter (µg/m^3)

<: Not detected at or above the indicated Reporting Limit (RL)

-- : No published value or not analyzed

* : Dilution required for this compound

NS: Not sampled

DTSC-SL: Department of Toxic Substances Control-modified screening level (May 2022)

EPA RSL: United States Environmental Protection Agency Regional Screening Level (May 2023)

AF: Attenuation Factor (see Notes 1 and 2 for additional information)

8260B: VOC Analytical Method

Calculated commercial screening values for soil vapor using the default AFs listed (for DTSC SL, the lower of the cancer or non-cancer level was used)

Concentration exceeds the commercial soil vapor screening level after application of the most conservative default soil vapor AF 0.03

Concentration exceeds the commercial soil vapor screening level after application of default soil vapor AF 0.001

Tracer gas concentration was detected in soil vapor sample (results may not be representative of subsurface conditions due to ambient air intrusion in sample)

1 : Default AF of 0.001 for soil vapor in future commercial settings is in accordance with the DTSC Final Vapor Intrusion Guidance document (October 2011)

2 : Default AF of 0.001 for soil vapor in existing commercial settings is in accordance with the DTSC Final Vapor Intrusion Guidance document (October 2011)

3 : Default AF of 0.03 for soil vapor in accordance with the Final Draft Supplemental Guidance: Screening and Evaluating Vapor Intrusion from DTSC and California Water Resources Control Board (February 2023)

Table 7A
Summary of Temporal Variation Assessment in Soil Vapor

Location or Boring ID	Field Sample ID	Sample Depth in feet below ground surface	Sample Date	Units	Average RPD (Per Sample Set)	Benzene	Bromobenzene	Bromodichloromethane	Bromoform	Carbon tetrachloride	Chloroform	Dibromochloromethane	Dichlorodifluoromethane (Freon-12)	1,1-Dichloroethane	1,2-Dichloroethane	1,1-Dichloroethene	cis-1,2-Dichloroethene	Ethylbenzene	Freon-113	Isopropylbenzene	4-Isopropyltoluene	Methylene chloride	Naphthalene	n-Propylbenzene	Styrene	Tetrachloroethene (PCE)	Toluene	1,1,1-Trichloroethane	1,1,2-Trichloroethane	Trichloroethene (TCE)	Trichlorofluoromethane (Freon-11)	1,2,4-Trimethylbenzene	1,3,5-Trimethylbenzene	Vinyl chloride	m,p-Xylene	o-Xylene	tert-Butyl alcohol

Notes:

Bold: Reported chemical concentration in micrograms per cubic meter ($\mu g/m^3$)

<: Not detected at or above the indicated Reporting Limit (RL)

-- : No published value or not applicable

* : Dilution required for this compound

DTSC-SL: Department of Toxic Substances Control-modified screening level (May 2022)

EPA RSL: United States Environmental Protection Agency Regional Screening Level (May 2023)

AF: Attenuation Factor (see Notes 1 and 2 for additional information)

RPD: Realtive Percent Difference between sample results were calculated for all detected analytes that were greater than five times (5x) the laboratory RL:

$$RPD = \frac{|D_1 - D_2|}{(D_1 + D_2)/2} \times 100$$

where D_1 = Original sample result and D_2 = Resample result in different season

Calculated commercial screening values for soil vapor using the default attenuation factors listed (for DTSC SL, the lower of the cancer or non-cancer level was used)

Typical Reporting Limit (RL) published by analytical laboratory (assuming no dilution necessary)

Concentration exceeds a commercial soil vapor screening level after application of a default AF 0.001

RPD (averaged over a sample pair or for a specific analyte) exceeds 50%

1 : Default AF of 0.001 for soil vapor in existing commercial settings is in accordance with the DTSC Final Vapor Intrusion Guidance document (October 2011)

2 : Default AF of 0.03 for soil vapor in accordance with the Draft Supplemental Guidance: Screening and Evaluating Vapor Intrusion from DTSC and California Water Resources Control Board (February 2020)

Notes:

RPD for duplicate sample pair exceeds 50%

VOCs: Volatile organic compounds

RPD: Relative Percent Difference are calculated for positive results greater than five times the Reporting Limit (RL)

--: Not analyzed or not applicable

<: Not detected above RL

ug/kg: micrograms per kilogram

J: The reported value was obtained from a measurement that was less than the RL but greater than or equal to the MDL (Method Detection Limit)

Notes:

RPD for duplicate sample pair exceeds 50%

VOCs: Volatile organic compounds

RPD: Relative Percent Difference are calculated for positive results greater than five times the Reporting Limit (RL)

--: Not analyzed or not applicable

<: Not detected above RL

ug/kg: micrograms per kilogram

J: The reported value was obtained from a measurement that was less than the RL but greater than or equal to the MDL (Method Detection Limit)

Notes:

RPD: Relative Percent Difference are calculated for positive results greater than five times the Reporting Limit (RL)

--: Not analyzed or not applicable

<: Not detected above PQL

RPD for duplicate sample pair exceeds 50%

mg/kg: milligrams per kilogram

mg/l: milligrams per liter

s.u.: standard units

J: The reported value was obtained from a measurement that was less than the RL but greater than or qual to the MDL (Method Detection Limit)

B: Compound was detected in the laboratory method blank and the sample

RLs noted when results were detected above the RL in the primary and/or duplicate sample

Notes:

SVOCs: Semi-volatile organic compounds

RPD: Relative Percent Difference are calculated for positive results greater than five times the Reporting Limit (RL)

<: Not detected above RL

--: Not analyzed or not applicable

mg/kg: milligrams per kilogram

µg/l - micrograms per liter

J: The reported value was obtained from a measurement that was less than the PQL but greater than or qual to the MDL (Method Detection Limit)

RPD for duplicate sample pair exceeds 50%

TPH-diesel soil results from composite CC-2 (CC-2-A, CC-2-B, CC-2-C, and CC-2-D) exceeded the EPA RSL but not the RWQCB SSL.

Arsenic results at CT3-2 and CT3-6 exceeded background concentrations.

All remaining soil results were less than the commercial screening levels.

Laboratory soil reporting limits were all less than the commercial screening levels, with the exception of NDMA for PFP-5 through PFP-11. The commercial screening level of NDMA is 0.034 mg/kg and the laboratory RLs were slightly higher and ranged between 0.081 and 0.094 mg/kg. However, NDMA is not a COPC for the Site.

Notes:

ID - identification

feet bgs - feet below the ground surface

ppm - parts per million

mg/kg - milligrams per kilogram

ND - no detectable concentrations above the laboratory reporting limit

NA - not available/not applicable

-- - not analyzed

PID - Photoionization Detector

Title 22 Metals analyzed in general accordance with EPA Method No. 6010/7000

Table source is from Ardent

Chromium VI - hexavalent chromium analyzed in general accordance with EPA Method No. 7179

EPA-RSLi - EPA Regional Screening Levels for industrial/commercial land use, dated April 2019

DTSC-SLi - Department of Toxic Substances Control, Human and Ecological Risk Office Note 3, screening levels for industrial/commercial land use, dated April 2019

Background for Arsenic - DTSC, Final Report Background Metals at Los Angeles Unified School Sites; Arsenic: Suppliment to the DTSC Preliminary Endangerment Assessment (PEA) for evaluating background concentrations of arsenic at Los Angeles Unfied School District (LAUSD) school sites, dated June 6, 2005.

SCAQMD - South Coast Air Quality Management District Rule 1166 guidelines

TTLC - Total Threshold Limit Concentration

STLC - Soluble Threshold Limit Concentration

TABLE 4- - ARDENT LABORATORY RESULTS OF SOIL SAMPLES, SLUDGE DRAINAGE AREA ASSOCIATED WITH COOLING TOWERS 1 AND 2, AOI 33

TPHd - total petroleum hydrocarbons as diesel fuel

TPHo - total petroleum hydrocarbons as oil

EPA-RSLi - Environmental Protection Agency, Region 9, Regional Screening Levels for industrial abient air modified for soil gas using the approved EPA attenuation factor of 0.03 for residential land , dated April 2019. The EPA does not have attenuation factors for industrial/commercial land use.

DTSC-SLi - California Department of Toxic Substances Control, Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA), Note 3, Screening Levels for industrial ambient air modified for soil gas using the EPA approved attenuation factor of 0.03 for residential land use, dated April 2019. The EPA does not have attenuation factors for industrial/commercial land use.

TTLC - Total Threshold Limit Concentration

STLC - Soluble Threshold Limit Concentration

Notes:
Results in mg/kg.
< = Compound not detected. Reportable detection limit shown.
Bolded values indicate concentrations above the reportable detection limit.
Shaded values indicate concentrations above the standard.
** = Southern California background concentration of 12 mg/kg used.*
^ = Industrial RSL for Chromium III used in absence of Total Chromium Industrial RSL.
~~Strikethrough~~ indicates sample was over-excavated due to a screening level exceedance (refer to Table 4 for sample ID of resample).
Samples with two sets of results are the same sample analyzed on separate dates.

Qualifiers - Inorganic:
B = Compound was found in the blank and sample.
J = Result is less than the reporting limit, but greater than or equal to the method detection limit; concentration is an approximate value.
L = A negative instrument reading had an absolute value greater than the reporting limit.
H = Sample was prepped or analyzed beyond the specified holding time.

Table 23. PathForward Soil Sampling Results vs. Risk-Based Screening Levels, Unit 5 (Peaker), Generating Units 3 and 4, and Generating Units 1 and 2, AOIs 6, 13 and 15

Notes:

(1) Less-than sign (<) indicates analyte was not detected above indicated laboratory reporting limit. En-dash (–) indicates sample was not analyzed for compound.

(2) Abbreviations:
- ft bgs – feet below ground surface
- mg/kg – milligrams per kilogram
- °C – degrees Celsius
- TPH-g – total petroleum hydrocarbons in the gasoline range
- TPH-jf – total petroleum hydrocarbons in the Jet A range
- TPH-d – total petroleum hydrocarbons in the diesel range
- TPH-mo – total petroleum hydrocarbons in the motor oil range

(3) Data qualifiers:
- B – Compound was found in the blank and sample.
- F1 – MS and/or MSD recovery exceeds control limits.
- J – Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
- L – A negative instrument reading had an absolute value greater than the reporting limit.
- * – LCS or LCSD is outside acceptance limits.

(4) Sampling results are compared to Department of Toxic Substances Control (DTSC)-recommended human health risk-based screening levels for commercial/industrial soil (DTSC 2020, USEPA 2020).

(5) Highlighting key:
- – Detected concentration exceeds one or more screening levels.
- – Detected concentration exceeds one or more screening levels, but is consistent with background/ambient conditions.

(6) Background/ambient concentrations are from:
- Bradford, G.R., Chang, A.C., Page, A.L., Bakhtar, D., Frampton, J.A., and Wright, H. 1996. Background Concentrations of Trace and Major Elements in California Soils. Kearney Foundation of Soil Science, Division of Agriculture and Natural Resources, University of California. March.
- DTSC. 2018.Determination of a Southern California Regional Background Arsenic Concentration in Soil. January 31.

Table 24. PathForward Soil Gas Sampling Results vs. Risk-Based Screening Levels, Unit 5 (Peaker), Generating Units 3 and 4, and Generating Units 1 and 2, AOIs 6, 13, and 15

Notes:

(1) Soil gas sampling results for VOCs reported in micrograms per cubic meter (µg/m³). Less-than sign (<) indicates analyte was not detected above indicated laboratory reporting limit.

(2) Soil gas sampling results are compared to DTSC-recommended soil gas risk-based screening levels which incorporate the following components.
- DTSC-recommended indoor air risk-based screening levels for commercial/industrial land use (DTSC 2020, USEPA 2020); and
- DTSC-recommended sub-slab soil gas-to-indoor air attenuation factor of 0.03 (DTSC and SWRCB 2020).

The attenuation factor does not account for bioattenuation of petroleum compounds.

Screening levels are based on cancer (CA) or noncancer (NC) health effects.

Detected concentrations that exceed screening levels are highlighted.

38	Flumes	W part of Site	Service	0	None	None	None	No

Table 25
Summary of Site Areas of Interest
Etiwanda Generating Station

Area Number	Area of Interest	Location	Purpose	Number of Proposed Borings	Proposed Locations	Proposed Sample Depths	Proposed Analytes	Soil Vapor

Notes:

TPH	Total petroleum hydrocarbons (including C4-C12, C13-C22, C23-C32, C6-C8, C9-C16, and C17-C32 ranges)
VOCs	Volatile organic compounds
PCBs	Polychlorinated biphenyls
(1)	Soil samples with TPH in any of the ranges above 100 mg/kg will be further analyzed for VOCs, SVOCs, and PAHs
(2)	Deeper sample(s) held pending the results of the shallower samples.

				10	H	H			H	H		Yes	A
37	Septic Pits	E part of Site			Sampling in this area is summarized under maintenance shop								
38	Flumes	W part of Site	None	None	No Sampling Proposed								

Notes:

(1) Total petroleum hydrocarbons (including C4-C12, C13-C22, C23-C32, C6-C8, C9-C16, and C17-C32 ranges)

(2) At locations where soil vapor sampling is not planned and TPH-gas or VOCs are detected in the soil, DTSC will be consulted to discuss the potential need for soil vapor sampling at that location.

A Analyze

H Hold pending results of shallower samples or nearby samples

P Potential soil analysis if TPH in any of the ranges above 100 mg/kg will be further analyzed for VOCs, SVOCs (including PAHs)

Table 27
Soil Sample Container, Preservation, and Holding Time Requirements
Etiwanda Generating Station

Parameter	Methodology	Container [1,2]	Minimum Sample Amount	Preservation	Holding Time [3]
Lead/Metals	EPA 6020/7471A	Glass Jar or parafilm/capped stainless steel sleeve	5 grams	Cool at 4 degrees Centigrade	180 days
Polychlorinated Biphenyls (PCB)	EPA 8082	Glass Jar or parafilm/capped stainless steel sleeve	20 grams	Cool at 4 degrees Centigrade	14 days (a)
pH	EPA 9045C	Glass Jar or parafilm/capped stainless steel sleeve	20 grams	Cool at 4 degrees Centigrade	14 days (a)
Semi-Volatile Organic Compounds (SVOCs) (including polyaromatic hydrocarbons [PAHs])	EPA 8270C	Glass Jar or parafilm/capped stainless steel sleeve	20 grams	Cool at 4 degrees Centigrade	14 days (a)
Total Petroleum Hyrocarbons (TPH) C4 to C12 (b)	EPA 8015M/5035	3 VOAs (TerraCore Kit or equivalent)	15 grams	Sodium bisulfate, methanol, cool at 4 degrees Centigrade	14 days (a)
TPH C13 to C34 (b)	EPA 8015M	Glass Jar or parafilm/capped stainless steel sleeve	10 grams	Cool at 4 degrees Centigrade	14 days
Volatile Organic Compounds (VOCs)	EPA 8260B/5035	3 VOAs (TerraCore Kit or equivalent)	15 grams	Sodium bisulfate, methanol, cool at 4 degrees Centigrade	14 days (a)

Notes:

[1] Additional volume will be collected for MS/MSD samples.

[2] Laboratory may provide alternate containers as long as the containers meet the requirements of the method and allow the collection of sufficient volume to perform the analyses.

[3] Holding time begins from date of sample collection.

(a) for extraction, 40 days after extraction

(b) TPH results will be reported over the C4-C12, C13-C22, C23-C32, C6-C8, C9-C16, and C17-C32 ranges.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Kleinfelder, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at approximately five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through current. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

Summary information obtained is provided in the text of this report.

RECORD SOURCES

The EDR City Directory Report accesses a variety of business directory sources, including Haines, InfoUSA, Polk, Cole, Bresser, and Stewart. Listings marked as EDR Digital Archive access Cole and InfoUSA records. The various directory sources enhance and complement each other to provide a more thorough and accurate report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer.

Rancho Cucamonga, CA 9173
EDR Inquiry # 7435504.4

Client Name:

Kleinfelder, Inc.
24411 Ridge Rte Dr Suite 225
Laguna Hills, CA 92653
Contact: Lindsey Dandridge-Perry

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Kleinfelder, Inc. were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Search Results:

EDR BUILDING PERMIT REPORT

About This Report

The EDR Building Permit Report provides a practical and efficient method to search building department records for indications of environmental conditions. Generated via a search of municipal building permit records gathered from more than 1,600 cities nationwide, this report will assist you in meeting the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

Building permit data can be used to identify current and/or former operations and structures/features of environmental concern. The data can provide information on a target property and adjoining properties such as the presence of underground storage tanks, pump islands, sumps, drywells, etc., as well as information regarding water, sewer, natural gas, electrical connection dates, and current/former septic tanks.

ASTM and EPA Requirements

ASTM E1527 - 21 lists building department records as a "standard historical source," as detailed in § 8.3.4.7: "Building Department Records - The term building department records means those records of the local government in which the property is located indicating permission of the local government to construct, alter, or demolish improvements on the property." ASTM also states that "Uses in the area surrounding the property shall be identified in the report, but this task is required only to the extent that this information is revealed in the course of researching the property itself."

EPA's Standards and Practices for All Appropriate Inquires (AAI) states: "§312.24: Reviews of historical sources of information. (a) Historical documents and records must be reviewed for the purposes of achieving the objectives and performance factors of §312.20(e) and (f). Historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps, building department records, chain of title documents, and land use records."

Methodology

EDR has developed the EDR Building Permit Report through our partnership with BuildFax, the nation's largest repository of building department records. BuildFax collects, updates, and manages building department records from local municipal governments. The database now includes 30 million permits, on more than 10 million properties across 1,600 cities in the United States.

The EDR Building Permit Report comprises local municipal building permit records, gathered directly from local jurisdictions, including both target property and adjoining properties. Years of coverage vary by municipality. Data reported includes (where available): date of permit, permit type, permit number, status, valuation, contractor company, contractor name, and description.

Incoming permit data is checked at seven stages in a regimented quality control process, from initial data source interview, to data preparation, through final auditing. To ensure the building department is accurate, each of the seven quality control stages contains, on average, 15 additional quality checks, resulting in a process of approximately 105 quality control "touch points."

For more information about the EDR Building Permit Report, please contact your EDR Account Executive at (800) 352-0050.

EDR® Environmental Data Resources Inc

BUILD FAX PROPERTY HISTORY

EXECUTIVE SUMMARY: SEARCH DOCUMENTATION

A search of building department records was conducted by Environmental Data Resources, Inc (EDR) on behalf of Kleinfelder, Inc. on Sep 05, 2023.

TARGET PROPERTY

APN 22928379
Rancho Cucamonga, CA 91739

SEARCH METHODS

EDR searches available lists for both the Target Property and Surrounding Properties.

RESEARCH SUMMARY

Building permits identified: **NO PERMITS IDENTIFIED**

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

No Permits Found

GLOSSARY

General Building Department concepts

- **ICC:** The International Code Council. The governing body for the building/development codes used by all jurisdictions who've adopted the ICC guidelines. MOST of the US has done this. Canada, Mexico, and other countries use ICC codes books and guides as well. There are a few states who have added guidelines to the ICC codes to better fit their needs. For example, California has added seismic retrofit requirements for most commercial structures.
- **Building Department (Permitting Authority, Building Codes, Inspections Department, Building and Inspections):** This is the department in a jurisdiction where an owner or contractor goes to obtain permits and inspections for building, tearing down, remodeling, adding to, re-roofing, moving or otherwise making changes to any structure, Residential or Commercial.
- **Jurisdiction:** This is the geographic area representing the properties over which a Permitting Authority has responsibility.
- **GC:** General Contractor. Usually the primary contractor hired for any Residential or Commercial construction work.
- **Sub:** Subordinate contracting companies or subcontractors. Usually a "trades" contractor working for the GC. These contractors generally have an area of expertise in which they are licensed like Plumbing, Electrical, Heating and Air systems, Gas Systems, Pools etc. (called "trades").
- **Journeymen:** Sub contractors who have their own personal licenses in one or more trades and work for different contracting companies, wherever they are needed or there is work.
- **HVAC (Mechanical, Heating & Air companies):** HVAC = Heating, Ventilation, and Air Conditioning.
- **ELEC (Electrical, TempPole, TPole, TPower, Temporary Power, Panel, AMP Change, Power Release):** Electrical permits can be pulled for many reasons. The most common reason is to increase the AMPs of power in an electrical power panel. This requires a permit in almost every jurisdiction. Other commons reason for Electrical permits is to insert a temporary power pole at a new construction site. Construction requires electricity, and in a new development, power has yet to be run to the lot. The temporary power pole is usually the very first permit pulled for new development. The power is released to the home owner when construction is complete and this sometimes takes the form of a Power Release permit or inspection.
- **"Pull" a permit:** To obtain and pay for a building permit.
- **CBO:** Chief Building Official
- **Planning Department:** The department in the development process where the building /structural plans are reviewed for their completeness and compliance with building codes
- **Zoning Department:** The department in the development process where the site plans are reviewed for their compliance with the regulations associated with the zoning district in which they are situated.
- **Zoning District:** A pre-determined geographic boundary within a jurisdiction where certain types of structures are permitted / prohibited. Examples are Residential structure, Commercial/Retail structures, Industrial/Manufacturing structures etc. Each zoning district has regulations associated with it like the sizes of the lots, the density of the structures on the lots, the number of parking spaces required for certain types of structures on the lots etc.
- **PIN (TMS, GIS ID, Parcel#):** Property Identification Number and Tax Map System number.
- **State Card (Business license):** A license card issued to a contractor to conduct business.
- **Building Inspector (Inspector):** The inspector is a building department employee that inspects building construction for compliance to codes.
- **C.O.:** Certificate of Occupancy. This is the end of the construction process and designates that the owners now have permission to occupy a structure after its building is complete. Sometimes also referred to as a Certificate of Compliance.

GLOSSARY

Permit Content Definitions

- Permit Number: The alphanumerical designation assigned to a permit for tracking within the building department system. Sometimes the permit number gives clues to its role, e.g. a "PL" prefix may designate a plumbing permit.
- Description: A field on the permit form that allows the building department to give a brief description of the work being done. More often than not, this is the most important field for EP's to find clues to the prior use (s) of the property.
- Permit Type: Generally a brief designation of the type of job being done. For example BLDG-RES, BLDG-COM, ELEC, MECH etc.

Sample Building Permit Data

Date: Nov 09, 2000
Permit Type: Bldg -
New Permit Number: 101000000405
Status: Valuation: $1,000,000.00
Contractor Company: OWNER-BUILDER
Contractor Name:

Description: New one store retail (SAV-ON) with drive-thru pharmacy. Certificate of Occupancy.

- Soil Vapor Borings SCE RFI Work Plan (2021)
- Proposed Step-Out/Down Scil Vapor Sample Location
- 18 — Chloroform Isocontour at 5 Feet Below Ground Surface

Notes:
Chloroform concentrations are reported in micrograms per cubic meter (ug/m³) at various sampling depths (feet below ground surface). Concentrations of chloroform exceeding the EPA Regional Screening Level (RSL) of 18 ug/m³ for commercial/ industrial land use are identified in **Red** font (RSL assumes default soil vapor attenuation factor 0.03).

Chloroform RSL when using default attenuation factor 0.001 is 530 ug/m³.

Posted chloroform concentrations represent maximum concentrations where multiple or duplicate samples were collected.

ND: Chloroform was not detected above the laboratory reporting limit of 2 ug/m³.

- 800 Chloroform Isocontour at 20 Feet Below Ground Surface
- Line of Cross-Section

Notes:

Chloroform concentrations are reported in micrograms per cubic meter (ug/m³) at various sampling depths (feet below ground surface). Concentrations of chloroform exceeding the EPA Regional Screening Level (RSL) of 18 ug/m³ for commercial/industrial land use are identified in **Red** font (RSL assumes default soil vapor attenuation factor 0.03).

Chloroform RSL when using default attenuation factor 0.001 is 530 ug/m³.

Posted chloroform concentrations represent maximum concentrations where multiple or duplicate samples were collected.

ND: Chloroform was not detected above the laboratory reporting limit (generally 2 ug/m³).

NOTE 2:
Property/Parcel boundaries from County of San Bernardino Geographic Information Services.

Samples BSS-6-31, BSS-6-4, ESS-3-1, SSS-1-8, LFI-1-ESS-4, LFI-1-SSS-3, and LFI-3-WSS-2 exceeded soil screening levels for arsenic and/or lead and were removed.

The remaining soil results were less than the commercial screening levels.

Laboratory soil reporting limits were all less than the commercial screening levels.

Generating station buildings and features were demolished in 2021-2022. Google aerial image shown is from August 2018 and was selected to provide historical reference for the locations of former generating station buildings and features targeted for environmental investigation.
