Site ID: 136904
Site Name: MUROC JOINT USD-MAINT AND TRANSPTN
Violation Date: 09-09-2014
Citation: HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Description: Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.
Violation Notes: Returned to compliance on 07/08/2016. The hazardous materials inventory is not accurate. Add the following items: 165 gallons of Anti-freeze and 530 cubic feet of Argon. Once these items have been added to the hazardous materials inventory, please submit the revised inventory in the California Environmental Reporting System (CERS).
Violation Division: Kern County Env Health Services Department
Violation Program: HMRRP
Violation Source: CERS

Site ID: 136904
Site Name: MUROC JOINT USD-MAINT AND TRANSPTN
Violation Date: 08-08-2017
Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Description: Failure to comply with one or more of the following requirements: 1. Have record of inspections and integrity tests signed by the appropriate supervisor or inspector. 2. Keep written procedures and records of inspections and integrity tests for at least three years. 3. Keep comparison records.
Violation Notes: Returned to compliance on 10/03/2017. Facility lacking inspection logs for all petroleum products (fresh and waste) as per SPCC plan. Please provide routine inspection logs for all fuel, fresh oil, and waste oil areas for the past 3 years. If no inspection logs have been kept please immediately start conducting inspections of these areas and keeping a written log. Please send one months worth of logs along with a written statement as to how often your facility will be conducting inspections, how long inspection logs will be kept and where those inspection logs will be kept. Send all evidence of compliance to trulovej@kerncounty.com

Site ID: 136904
Site Name: MUROC JOINT USD-MAINT AND TRANSPTN
Violation Date: 09-09-2014
Citation: HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Description: Failure to establish and electronically submit an adequate training program in safety procedures in the event of a release or threatened release of a hazardous material.
Violation Notes: Returned to compliance on 07/08/2016. The Employee Training Plan

MUROC JOINT USD-MAINT AND TRANSPTN (Continued) **S113175719**

submitted in CERS is not adequate. The plan should describe specific training related to the handling of hazardous materials and hazardous waste, spill response procedures and familiarity with the facility's emergency response plan and procedures. Please prepare a more detailed training plan and submit in CERS. There is a template available at www.co.kern.ca.us/eh

Citation:	22 CCR 12 66262.34(d) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(d)
Violation Description:	Failure to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles) for a generator who generates less than 1000 kilogram per month if all of the following conditions are met: (1) The quantity of hazardous waste accumulated onsite never exceeds 6,000 kilograms. (2) The generator complies with the requirements of 40 Code of Federal Regulations section 262.34(d), (e) and (f). (3) The generator does not hold acutely hazardous waste or extremely hazardous waste in an amount greater than one kilogram for more than 90 days.
Violation Notes:	Returned to compliance on 10/03/2017. Observed used absorbents, used coolant, and used dexcool to be held on-site for longer than 180 days. (used absorbents observed to be dated 1-1-16, used coolant observed to be dated 2-1-16 and used dexcool observed to be dated 6-1-16). Please have all hazardous wastes removed immediately and send a copy of the hazardous waste manifest to trulovej@kerncounty.com. Please ensure that all hazardous wastes are only kept on-site for a period of 180 days or less.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

CERS Description:	Construction Storm Water

Violations:

Site ID:	527731
Site Name:	Boron Junior Senior High School
Violation Date:	09-20-2018
Citation:	2009-0009-DWQ - Construction General Permit
Violation Description:	SW - No SWPPP
Violation Notes:	No SWPPP on site; SWPPP was written and submitted to SMARTS. No vehicle track in and out stabilization, concrete washout was not maintained properly (spill evident), hazardous materials were on pallet and not on secondary containment, hydrocarbon spill evident on site.
Violation Division:	Water Boards
Violation Program:	CONSTW
Violation Source:	SMARTS

Evaluation:

Eval General Type:	Compliance Evaluation Inspection
Eval Date:	09-20-2018
Violations Found:	Yes
Eval Type:	Industrial Storm Water Compliance Evaluation
Eval Notes:	Tom Browne of the Lahontan Regional Water Board, Victorville, inspected construction at the Boron middle school in Boron on 20 September 2018. Tom met Kevin Cordes, Muroc Joint Unified School District Superintendent, Chase Cooper of CPM construction management company, and 3 other gentlemen without business cards who work for CPM or the school district. There was no SWPPP on site (violation); Mr. Cooper claimed the total area disturbed was less than one acre. Water Board staff paced off a disturbed area of approximately 82,000 square feet or approximately 1.7 acres. The SWPPP says 3.0 acres of land would be disturbed. The SWPPP risk calculation is acceptable (R x K x LS = 2.65, Risk level 1). The following violations were noted: sloppy concrete wash out, no stabilization at entrance (rumble plates or rock), hazardous materials without secondary containment, a spill of about 15 square feet that smelled of oil, and wind blown litter.
Eval Division:	Water Boards
Eval Program:	CONSTW

CERS Description:	Chemical Storage Facilities

Violations:

Site ID:	91
Site Name:	#7701 FASTRIP #45
Violation Date:	01-23-2020
Citation:	HSC 6.7 25284.2 - California Health and Safety Code, Chapter 6.7, Section(s) 25284.2
Violation Description:	"Failure to meet one or more of the following requirements: Install or maintain a liquid-tight spill container. Have a minimum capacity of five gallons. Have a functional drain valve or other method for the removal of liquid from the spill container. Be resistant to galvanic corrosion. Perform a tightness test at installation, every 12 months thereafter, or within 30 days after a repair to the spill container. Tested using applicable manufacturer guidelines, industry codes, engineering standards, or a method approved by a professional engineer. Tested by a certified UST service technician. Maintain records of spill containment testing for 36 months. "
Violation Notes:	Returned to compliance on 01/23/2020. Observed liquid in diesel and 91. Liquid was removed by the service tech prior to testing spill buckets. Corrected on-site.
Violation Division:	Kern County Env Health Services Department
Violation Program:	UST
Violation Source:	CERS

Site ID:	91
Site Name:	#7701 FASTRIP #45
Violation Date:	01-23-2020
Citation:	22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Description:	Failure to properly label hazardous waste accumulation containers and portable tanks with the following requirements: "Hazardous Waste",

#7701 FASTRIP #45 (Continued) **S112918746**

	name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.
Violation Notes:	Returned to compliance on 03/02/2020. Observed the hazardous waste drum to be lacking the accumulation start date. Waste observed to be in drum but no accumulation start date was indicated. The management was unsure as to how long the waste had been in the drum. Please ensure that the hazardous waste label is properly and thoroughly completed and that the accumulation start date is clearly indicated. Please send a photo of the properly completed label to trulovej@kerncounty.com or text a photo to 661-703-2534 with the name and CERS number of the facility.

Citation:	HSC 6.5 25123.3(h)(1) - California Health and Safety Code, Chapter 6.5, Section(s) 25123.3(h)(1)
Violation Description:	Failure to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles) for a generator who generates less than 1000 kilogram per month if all of the following conditions are met: (1) The quantity of hazardous waste accumulated onsite never exceeds 6,000 kilograms. (2) The generator complies with the requirements of 40 Code of Federal Regulations section 262.34(d), (e) and (f). (3) The generator does not hold acutely hazardous waste or extremely hazardous waste in an amount greater than one kilogram for more than 90 days.
Violation Notes:	Returned to compliance on 02/26/2020. Observed the hazardous waste drum to be lacking the accumulation start date. Waste observed to be in drum but no accumulation start date was indicated. The management was unsure as to how long the waste had been in the drum. The last hazardous waste pick up observed to be May 20, 2019. Please have the hazardous waste drum picked up by a licensed contractor immediately and then send a copy of the hazardous waste manifest to trulovej@kerncounty.com

Violation Date: 01-23-2020
Citation: HSC 6.95 25505(a)(4) - California Health and Safety Code, Chapter 6.95, Section(s) 25505(a)(4)

#7701 FASTRIP #45 (Continued) **S112918746**

Violation Description: Failure to provide initial and annual training to all employees in safety procedures in the event of a release or threatened release of a hazardous material or failure to document and maintain training records for a minimum of three years.
Violation Notes: Returned to compliance on 07/09/2020. As per the facility manger, the facility has had no training on propane or CO2. Please ensure that all applicable employees have been properly trained and please revise training plan to include propane and CO2. Please send a copy of the CO2 and propane training logs for the last 3 years to trulovej@kerncounty.com

Completed Sub Area Name:	Not reported
Completed Document Type:	Technical Report
Completed Date:	02/22/2021
Comments:	This Data Usability Assessmrnt was prepared and discussed with DTSC to verify that DTSC agrees with the recommendations within the DUA: namely, that the data is usable and sufficient for making conclusions about the surface clearance activities. USACE is not asking for it to be approved by DTSC at this time, because it will be incorporated

MOJAVE GUNNERY RANGE - (J09CA7281) MMRP (Continued) **S109034297**

into the Remedial Action Completion Report. Thus this activity is being closed out and the document left as draft.

Completed Area Name: PROJECT WIDE

Completed Document Type: Correspondence
Completed Date: 01/14/2018
Comments: This letter identifies the purpose, date, time, and location of the second public meeting for the proposed plan for the MGRC site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Inspections/Visit (Non LUR)
Completed Date: 10/24/2019
Comments: DTSC attending the Systematic Project Planning Meetings 1 for Munitions Response Site (MRS)-04, -06, and -07 and for MRS-01 and -05, and the site visits to all these MRSs

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Inspections/Visit (Non LUR)
Completed Date: 11/09/2020
Comments: Due to COVID-19, this activity can be replaced by video meetings/conference calls, as needed.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Pre-HARP Form
Completed Date: 10/11/2019
Comments: The pre-HARP identifies the probably and possible hazards that may be encountered during the trip to MGRC.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Project Management
Completed Date: 06/30/2021
Comments: This event was prepared to encompass all activities that were needed to track the work on this site associated with USACE, but not attributable to a specific document, but rather general activities (such as project tracking, updating historical records in Envirostor, and the like).

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Correspondence
Completed Date: 02/25/2021
Comments: USACE's contractor Bristol has completed all the surface clearance activities for Munitions Response Sites (MRSs) -04, -06, -07 at the Mojave Gunnery Range C. The surface clearance activities removed 3024 lbs, 1687 lbs. and 1226 lbs. from MRSs-04, -06 and -07, respectively, of material documented as safe from the surface of these areas. The next step in the remediation of these areas is to document these activities in remedial/removal action completion reports, and to identify the institutional controls for each of these areas to protect future receptors from potential subsurfrace unexploded ordnance, or munitions or explosives of concern that was not part of these remedies.

MOJAVE GUNNERY RANGE - (J09CA7281) MMRP (Continued) **S109034297**

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	CEQA - Initial Study/ Neg. Declaration

Completed Date:	06/22/2010
Comments:	Corp provided as information for our files.
Completed Area Name:	Munitions Response Site 07 fka Area of Interest 05 aka Project 07 aka Arial Photo Analysis Areas E, E1 and E2
Completed Sub Area Name:	Not reported
Completed Document Type:	Record of Decision
Completed Date:	06/25/2018
Comments:	DTSC concurred with the proposed remedy for Areas E, E1, and E2, affecting 163 acres of the Mojave Gunnery Range C property. The proposed remedy is surface clearance and institutional controls to both clean up the property and reduce the chance that residents of California City and travelers to California City will be affected in the future. It is anticipated that it will take 3.5 to 4 years from DTSC's concurrence to get funding and perform the cleanup activities.

Completed Document Type:	Record of Decision
Completed Date:	06/25/2018
Comments:	DTSC concurred with the proposed remedy for Areas 5 & 6, affecting 41 acres of the Mojave Gunnery Range C property. The proposed remedy is surface clearance and institutional controls to both clean up the property and reduce the chance that residents of California City and travelers to California City will be affected in the future. It is anticipated that it will take 3.5 to 4 years from DTSC's concurrence to get funding and perform the cleanup activities.

Completed Document Type: Pre-HARP Form
Completed Date: 10/11/2019

MOJAVE GUNNERY RANGE - (J09CA7281) MMRP (Continued) **S109034297**

Comments:	The pre-HARP identifies the probably and possible hazards that may be encountered during the trip to MGRC.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Project Management
Completed Date:	06/30/2021
Comments:	This event was prepared to encompass all activities that were needed to track the work on this site associated with USACE, but not attributable to a specific document, but rather general activities (such as project tracking, updating historical records in Envirostor, and the like).
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Correspondence
Completed Date:	02/25/2021
Comments:	USACE's contractor Bristol has completed all the surface clearance activities for Munitions Response Sites (MRSs) -04, -06, -07 at the Mojave Gunnery Range C. The surface clearance activities removed 3024 lbs, 1687 lbs. and 1226 lbs. from MRSs-04, -06 and -07, respectively, of material documented as safe from the surface of these areas. The next step in the remediation of these areas is to document these activities in remedial/removal action completion reports, and to identify the institutional controls for each of these areas to protect future receptors from potential subsurfrace unexploded ordnance, or munitions or explosives of concern that was not part of these remedies.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	CEQA - Initial Study/ Neg. Declaration
Completed Date:	04/23/2008
Comments:	Complete the environmental review for the proposed action
Completed Area Name:	Munitions Response Site 04 fka Munitions Response Site 05 aka Project 04 aka Areas H and I aka Rocket Range 101
Completed Sub Area Name:	Not reported
Completed Document Type:	Correspondence
Completed Date:	01/15/2021
Comments:	This event and the resulting actions of USACE and Bristol identified that the issues resulting from these scavengers was resolved. Documentation of this event will occur in the appropriate Completion Report(s) for the site.
Completed Area Name:	Munitions Response Site 04 fka Munitions Response Site 05 aka Project 04 aka Areas H and I aka Rocket Range 101
Completed Sub Area Name:	Not reported
Completed Document Type:	Correspondence
Completed Date:	01/12/2021
Comments:	The email documentation DTSC has been given indicates that the items for demolition were consolidated and then detonated with explosives. However, DTSC has determined in subsequent conversations with USACE that the items were mechanically perforated rather than detonated.

Quarterly Update: US Borax Inc submitted a Part A on 11/10/1980. They were later found to be exempt from RCRA permit requirements, as described in their 11/08/1983 letter, due to an amendment for ores and minerals. They requested the withdrawal of their permit application which the Environmental Protection Agency approved on 08/22/1983. They now operate as a Hazardous Waste Generator.

Quarterly Update: NASA - Dryden Flight Research Center (NASA) is a research facility located at Edwards Air Force Base. A hazardous waste facility permit application for the Space Shuttle Fuel Farm Storage Area was submitted April 15, 1983. A hazardous waste storage facility permit was issued July 15, 1984, and renewed effective June 1995 through June 2005. Since Shuttle operations had been fewer than originally planned, the unit had not been used as anticipated. When the permit was to expire NASA began closure rather than to renew the permit. Prior to closure, the facility permit was modified on June 27, 2005 to reduce the sampling and analysis requirements in the Closure Plan section. The Closure Certification Report was submitted to DTSC and approved on June 30, 2006. Additional clarifying language, regarding the disclaimer statement, was added and forwarded to NASA on August 28, 2006. Corrective action for NASA is linked to Edwards Air Force Base by the Federal Facility Agreement (FFA) and RCRA Facility Assessment (RFA). The FFA applies jointly to Edwards Air Force Base and its

NASA ARMSTRONG FLIGHT RESEARCH CENTER (Continued) **S109467253**

tenant properties, including NASA. For purposes of the RFA, Edwards Air Force Base was divided into ten Operable Units (OU), which define separate land areas. NASA was designated in the RFA as OU 6.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 07/29/2021

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Date of Government Version: 06/10/2021

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

SCRD DRYCLEANERS: State Coalition for Remediation of Drycleaners Listing

The State Coalition for Remediation of Drycleaners was established in 1998, with support from the U.S. EPA Office of Superfund Remediation and Technology Innovation. It is comprised of representatives of states with established drycleaner remediation programs. Currently the member states are Alabama, Connecticut, Florida, Illinois, Kansas, Minnesota, Missouri, North Carolina, Oregon, South Carolina, Tennessee, Texas, and Wisconsin.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

Date of Government Version: 12/31/2019
Date Data Arrived at EDR: 04/15/2020

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.
Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527-21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SUBJECT PROPERTY INFORMATION

ADDRESS

CALIFORNIA CITY
EDWARDS, CA 93523

TARGET PROPERTY SEARCH RESULTS

The Target Property was identified in the following databases.

Page Numbers and Map Identifcations refer to the EDR Area/Corridor Report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Page Numbers and Map Identifcations refer to the EDR Area/Corridor Report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

CUPA Listings: CUPA Resources List

A review of the CUPA Listings list, as provided by EDR, has revealed that there is 1 CUPA Listings site within approximately 0.25 miles of the requested target property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 10/20/2021

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 10/20/2021

Next Scheduled EDR Contact: 01/10/2022
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 10/20/2021

Lists of Federal sites subject to CERCLA removals and CERCLA orders

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 05/25/2021

Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 09/13/2021

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 09/13/2021

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 09/13/2021
Date Data Arrived at EDR: 09/15/2021

Data Release Frequency: Quarterly

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing
In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

LOS ANGELES CO LF METHANE: Methane Producing Landfills

This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Parker, AZ 85344

Re: Resources Code section 21080.3, subd.(b) California Assembly Bill 52, Formal Notification of CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project

Tribal Secretary Amanda Barrera,

Pursuant to California Assembly Bill (AB) 52, the California Public Utilities Commission (CPUC) is providing you with formal notification of the Cal City Substation 115 kV Upgrade Project (proposed project), located in unincorporated Kern and San Bernardino Counties, the City of California City, and Edwards Air Force Base (EAFB) in the Mojave Desert region of California on federal, state, private, and municipal land. The CPUC, as lead agency, is reaching out to all groups listed on the California Native American Heritage Commission (NAHC) Sacred Lands File Contact List in a good faith effort to provide notification of the proposed project to groups that are traditionally or culturally affiliated with the geographic area of the proposed project. The present notice includes:

- A description of the proposed project and location;
- A summary of cultural resources work to date, and summary of associated information that can be made available upon request;
- A clear and definitive statement that the tribe has 30 days to request consultation; and
- The lead agency contact information.

Project Description and Location

Southern California Edison (SCE) has filed an application with the California Public Utilities Commission (CPUC) for a Permit to Construct the Cal City Substation 115-kilovolt (kV) Upgrade Project (proposed project). The application was filed March 14, 2023, and includes the Proponent's

Subject: Resources Code section 21080.3, subd.(b) California Assembly Bill 52, Formal Notification of CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project

Environmental Assessment (PEA) prepared by Rincon Consultants. The application and PEA describe the proposed project.

The Project would consist of upgrading transformers at the existing Cal City Substation from 33/12 kV to 115/33 kV and 115/12 kV; construction of two new 115 kV subtransmission lines, the Kramer-Cal City Subtransmission Line, from Kramer Substation to Cal City Substation, and the Cal City-Edwards-Holgate Subtransmission Line, from Cal City Substation to Holgate Switchyard. The proposed Cal City-Edwards-Holgate 115 kV Subtransmission Line would also include a tap line to serve Edwards Substation located on EAFB. Fourteen new underground 12 kV distribution getaways and two new underground 33 kV distribution getaways from Cal City Substation are also proposed along with installation of telecommunication cable on both new 115 kV subtransmission lines and telecommunication improvements at the existing Holgate Switchyard and Cal City, Kramer, and Edwards Substations. The Project Area is identified in the image below (**Image 1**) and the attached figure.

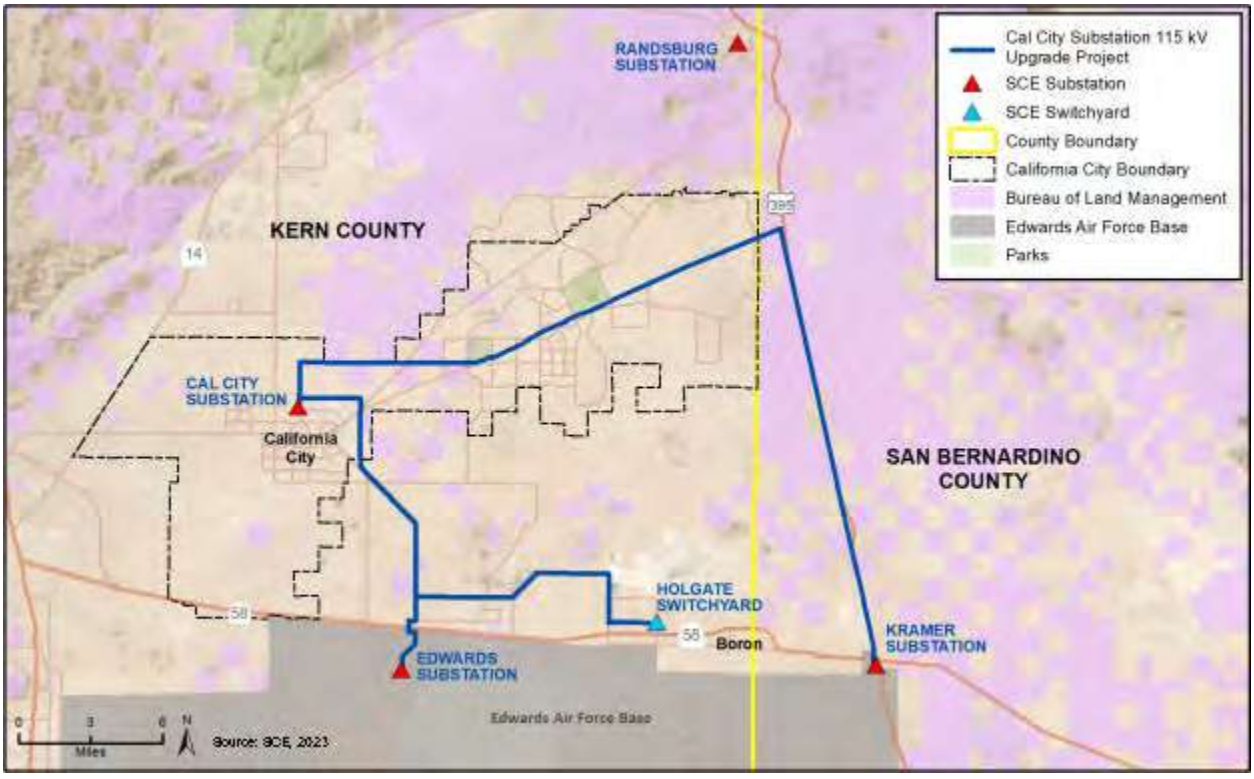

Image 1. California City Project Map (SCE, 2023)

Summary of Cultural Resources Work and Documentation

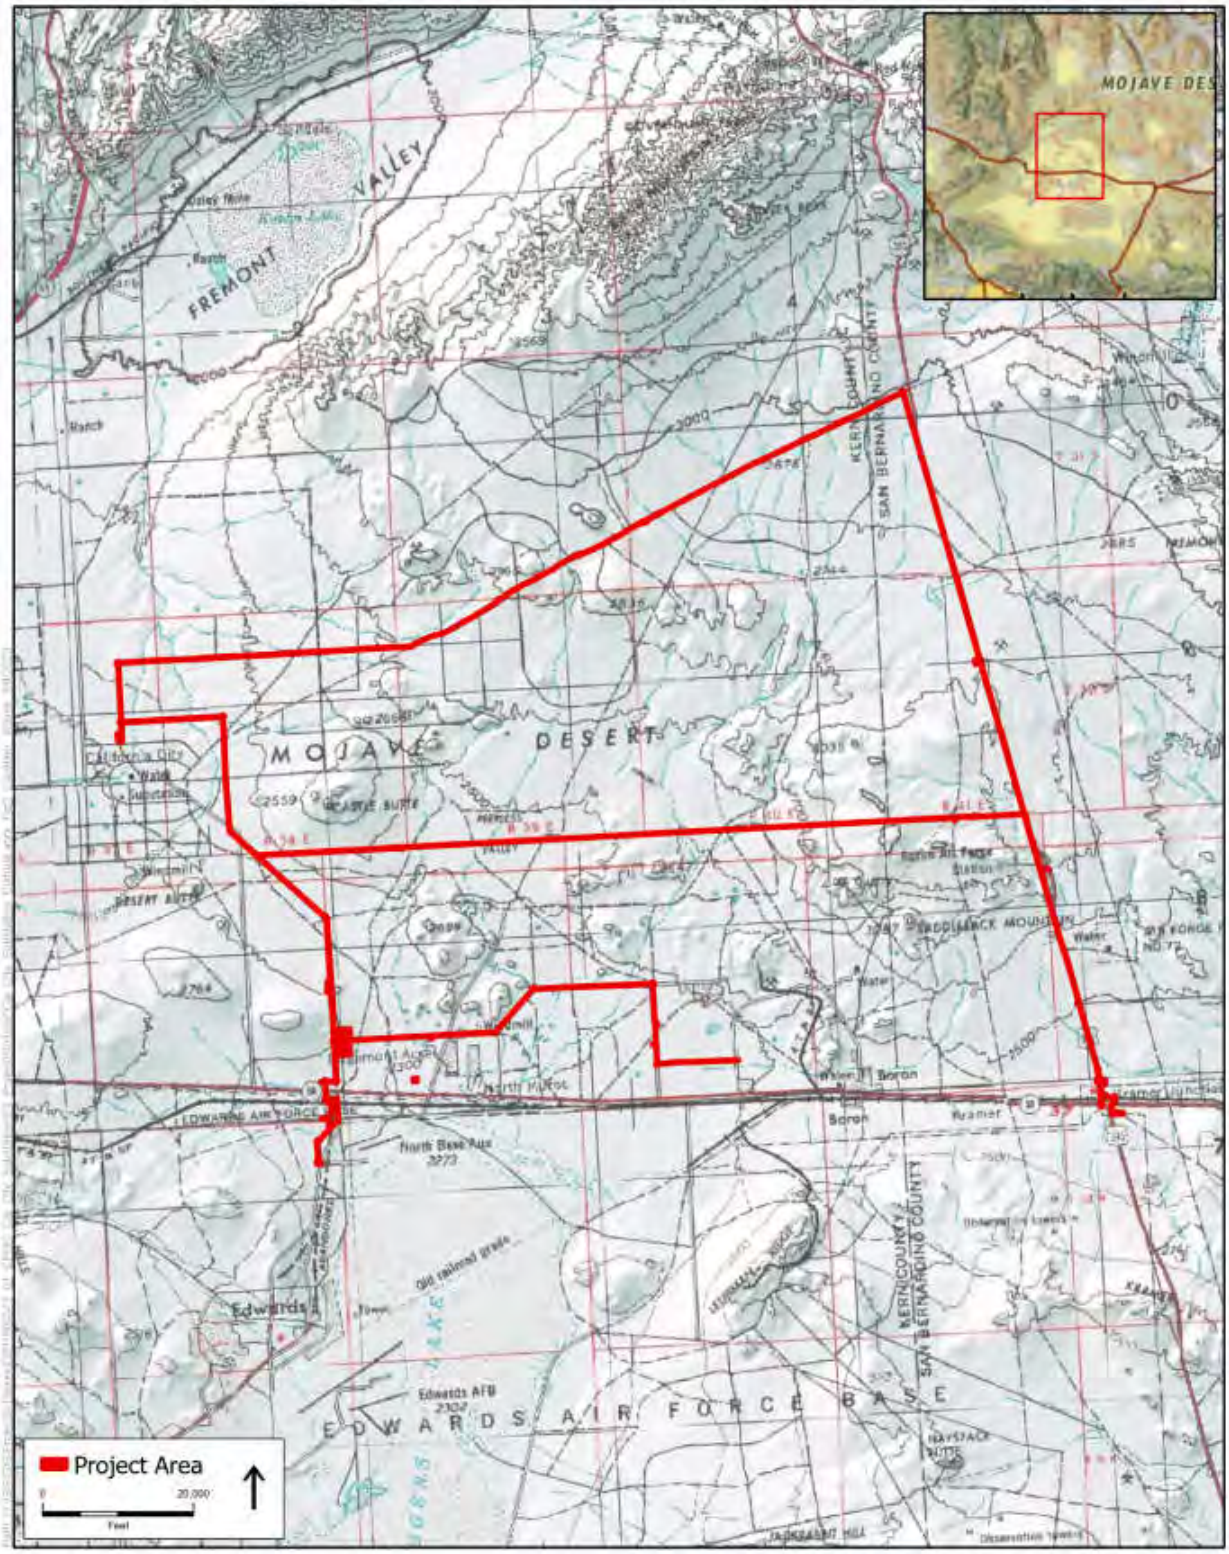
This project is also subject to Section 106 of the National Historic Preservation Act. A cultural resources records search, tribal consultation, and pedestrian survey has been undertaken to identify

cultural resources within the Project Area by Rincon Consultants. The documents prepared for this project are still under review with the Bureau of Land Management (BLM) and the Department of Defense (DOD). Preliminarily, 128 resources with a prehistoric component and 136 prehistoric isolates have been identified in the Project's Area of Potential Effects (APE). Inventory and evaluation of cultural resources within the APE is ongoing.

Cultural resources documentation can be provided upon request. Please note, this information should be considered confidential and is not to be redistributed to individuals without traditional or cultural affiliation.

Consultation Request

If you have any comments or concerns regarding potential impacts to tribal cultural resources (as defined in Public Resources Code § 21074) in relation to the proposed project, or would like to request any additional information, please contact the CPUC Project Manager for this project at address below or via email to Boris Sanchez (Boris.Sanchez@cpuc.ca.gov). Please include the name of a designated lead contact person with any response.



Sincerely,

Boris Sanchez

Re: Resources Code section 21080.3, subd.(b) California Assembly Bill 52, Formal Notification of CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project

Director of the Cultural Resources Management ,

Pursuant to California Assembly Bill (AB) 52, the California Public Utilities Commission (CPUC) is providing you with formal notification of the Cal City Substation 115 kV Upgrade Project (proposed project), located in unincorporated Kern and San Bernardino Counties, the City of California City, and Edwards Air Force Base (EAFB) in the Mojave Desert region of California on federal, state, private, and municipal land. The CPUC, as lead agency, is reaching out to all groups listed on the California Native American Heritage Commission (NAHC) Sacred Lands File Contact List in a good faith effort to provide notification of the proposed project to groups that are traditionally or culturally affiliated with the geographic area of the proposed project. The present notice includes:

- A description of the proposed project and location;
- A summary of cultural resources work to date, and summary of associated information that can be made available upon request;
- A clear and definitive statement that the tribe has 30 days to request consultation; and
- The lead agency contact information.

Project Description and Location

Southern California Edison (SCE) has filed an application with the California Public Utilities Commission (CPUC) for a Permit to Construct the Cal City Substation 115-kilovolt (kV) Upgrade Project (proposed project). The application was filed March 14, 2023, and includes the Proponent's

Subject: Resources Code section 21080.3, subd.(b) California Assembly Bill 52, Formal Notification of CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project

Environmental Assessment (PEA) prepared by Rincon Consultants. The application and PEA describe the proposed project.

The Project would consist of upgrading transformers at the existing Cal City Substation from 33/12 kV to 115/33 kV and 115/12 kV; construction of two new 115 kV subtransmission lines, the Kramer-Cal City Subtransmission Line, from Kramer Substation to Cal City Substation, and the Cal City-Edwards-Holgate Subtransmission Line, from Cal City Substation to Holgate Switchyard. The proposed Cal City-Edwards-Holgate 115 kV Subtransmission Line would also include a tap line to serve Edwards Substation located on EAFB. Fourteen new underground 12 kV distribution getaways and two new underground 33 kV distribution getaways from Cal City Substation are also proposed along with installation of telecommunication cable on both new 115 kV subtransmission lines and telecommunication improvements at the existing Holgate Switchyard and Cal City, Kramer, and Edwards Substations. The Project Area is identified in the image below (**Image 1**) and the attached figure.

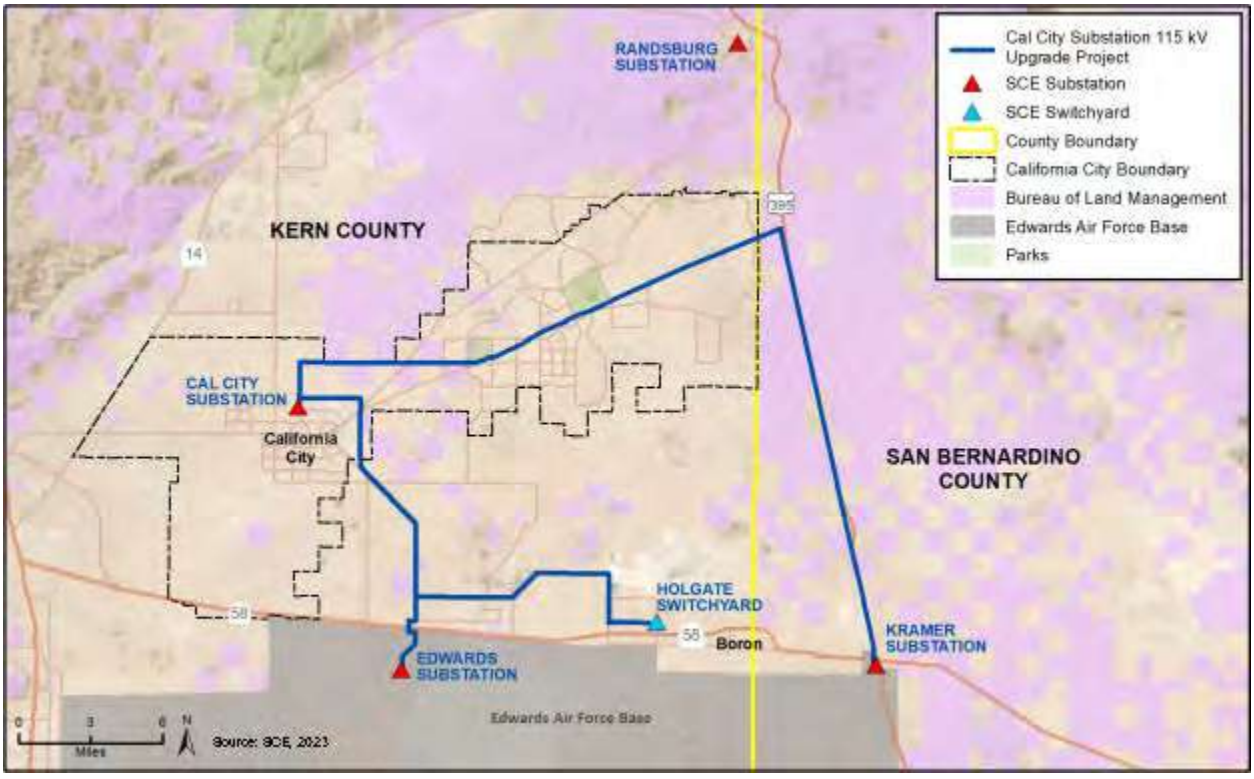

Image 1. California City Project Map (SCE, 2023)

Summary of Cultural Resources Work and Documentation

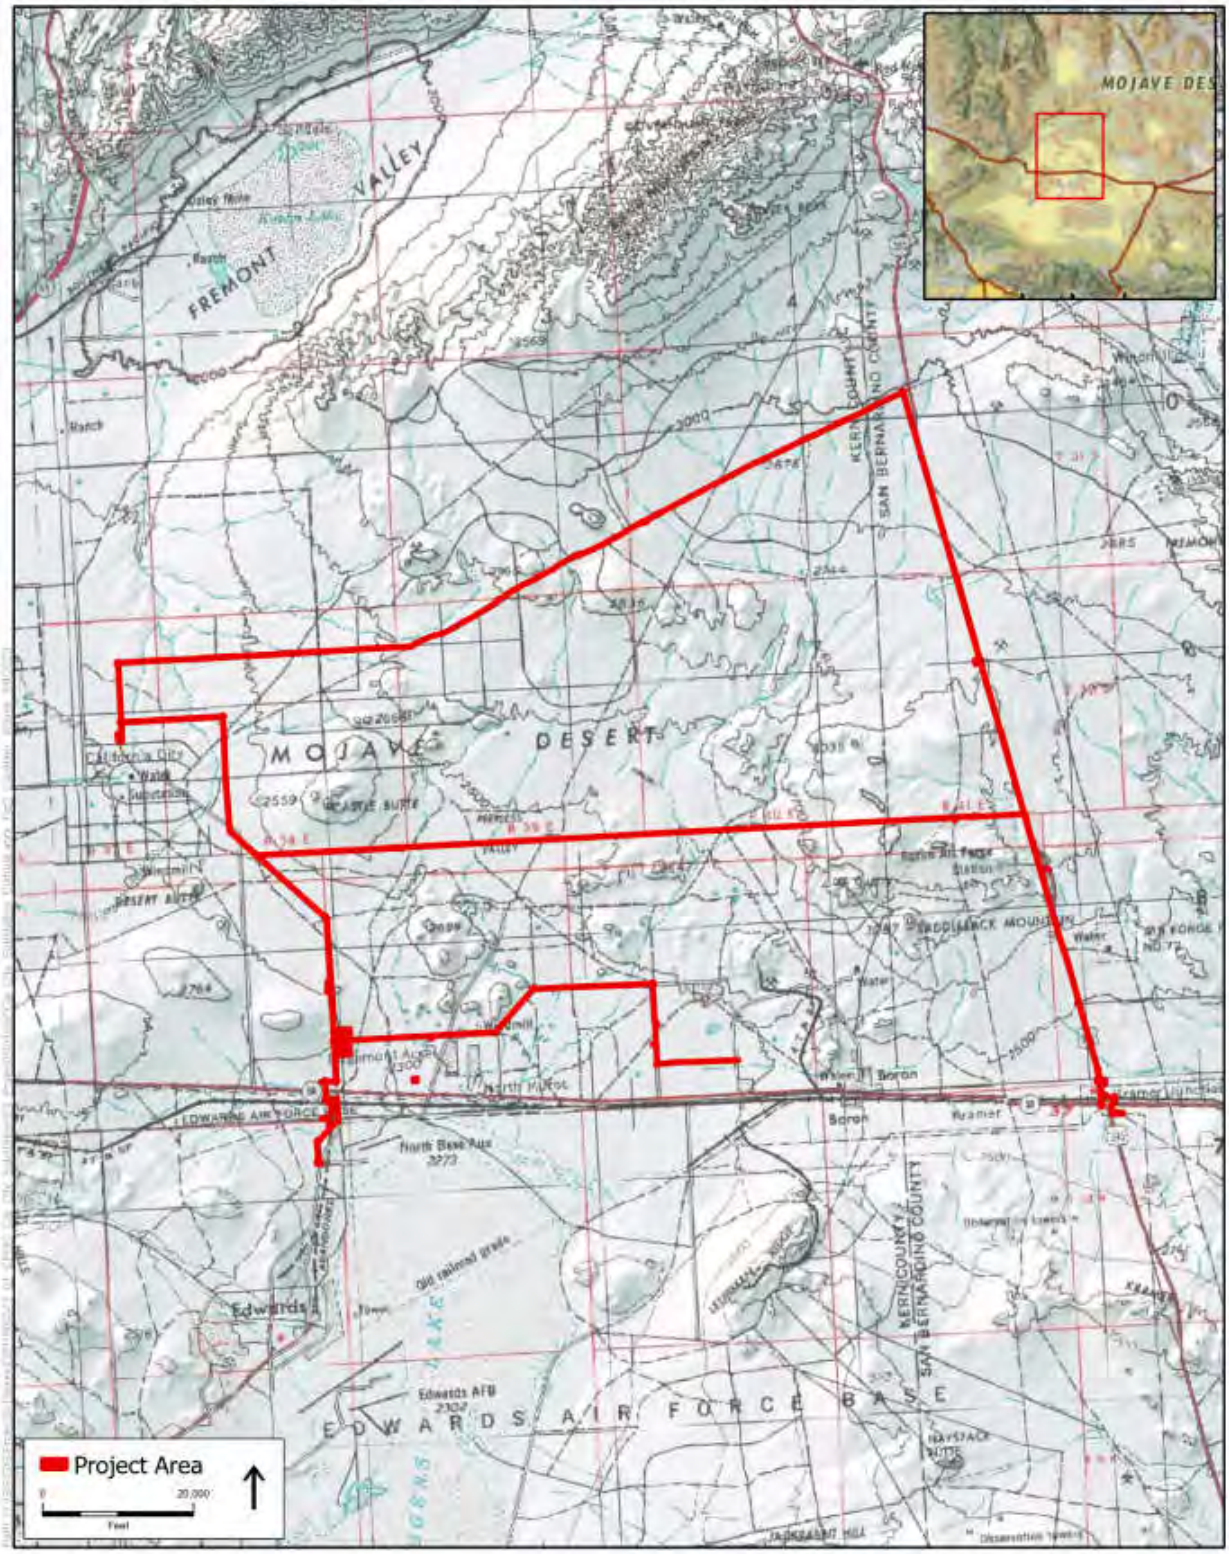
This project is also subject to Section 106 of the National Historic Preservation Act. A cultural resources records search, tribal consultation, and pedestrian survey has been undertaken to identify

cultural resources within the Project Area by Rincon Consultants. The documents prepared for this project are still under review with the Bureau of Land Management (BLM) and the Department of Defense (DOD). Preliminarily, 128 resources with a prehistoric component and 136 prehistoric isolates have been identified in the Project's Area of Potential Effects (APE). Inventory and evaluation of cultural resources within the APE is ongoing.

Cultural resources documentation can be provided upon request. Please note, this information should be considered confidential and is not to be redistributed to individuals without traditional or cultural affiliation.

Consultation Request

If you have any comments or concerns regarding potential impacts to tribal cultural resources (as defined in Public Resources Code § 21074) in relation to the proposed project, or would like to request any additional information, please contact the CPUC Project Manager for this project at address below or via email to Boris Sanchez (Boris.Sanchez@cpuc.ca.gov). Please include the name of a designated lead contact person with any response.



Sincerely,

Boris Sanchez

- A summary of cultural resources work to date, and summary of associated information that can be made available upon request;
- A clear and definitive statement that the tribe has 30 days to request consultation; and
- The lead agency contact information.

Project Description and Location

Southern California Edison (SCE) has filed an application with the California Public Utilities Commission (CPUC) for a Permit to Construct the Cal City Substation 115-kilovolt (kV) Upgrade Project (proposed project). The application was filed March 14, 2023, and includes the Proponent's

Subject: Resources Code section 21080.3, subd.(b) California Assembly Bill 52, Formal Notification of CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project

Environmental Assessment (PEA) prepared by Rincon Consultants. The application and PEA describe the proposed project.

The Project would consist of upgrading transformers at the existing Cal City Substation from 33/12 kV to 115/33 kV and 115/12 kV; construction of two new 115 kV subtransmission lines, the Kramer-Cal City Subtransmission Line, from Kramer Substation to Cal City Substation, and the Cal City-Edwards-Holgate Subtransmission Line, from Cal City Substation to Holgate Switchyard. The proposed Cal City-Edwards-Holgate 115 kV Subtransmission Line would also include a tap line to serve Edwards Substation located on EAFB. Fourteen new underground 12 kV distribution getaways and two new underground 33 kV distribution getaways from Cal City Substation are also proposed along with installation of telecommunication cable on both new 115 kV subtransmission lines and telecommunication improvements at the existing Holgate Switchyard and Cal City, Kramer, and Edwards Substations. The Project Area is identified in the image below (**Image 1**) and the attached figure.

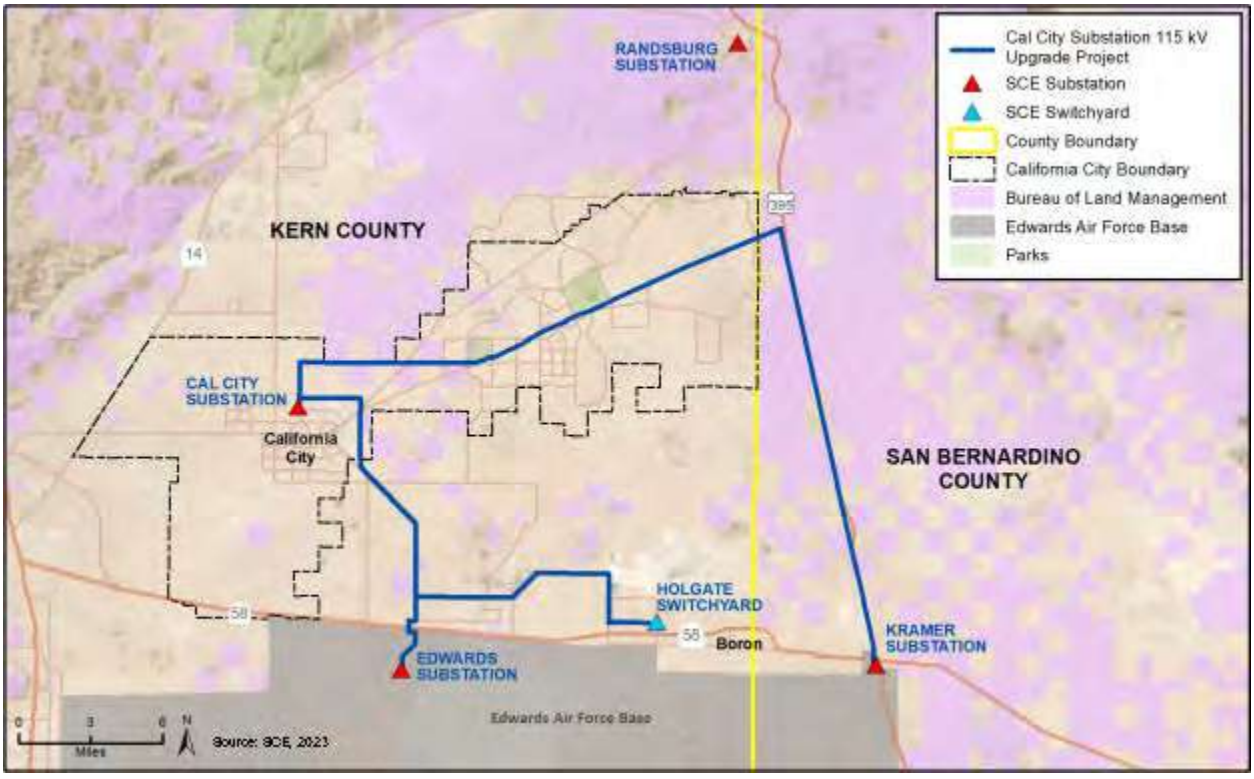

Image 1. California City Project Map (SCE, 2023)

Summary of Cultural Resources Work and Documentation

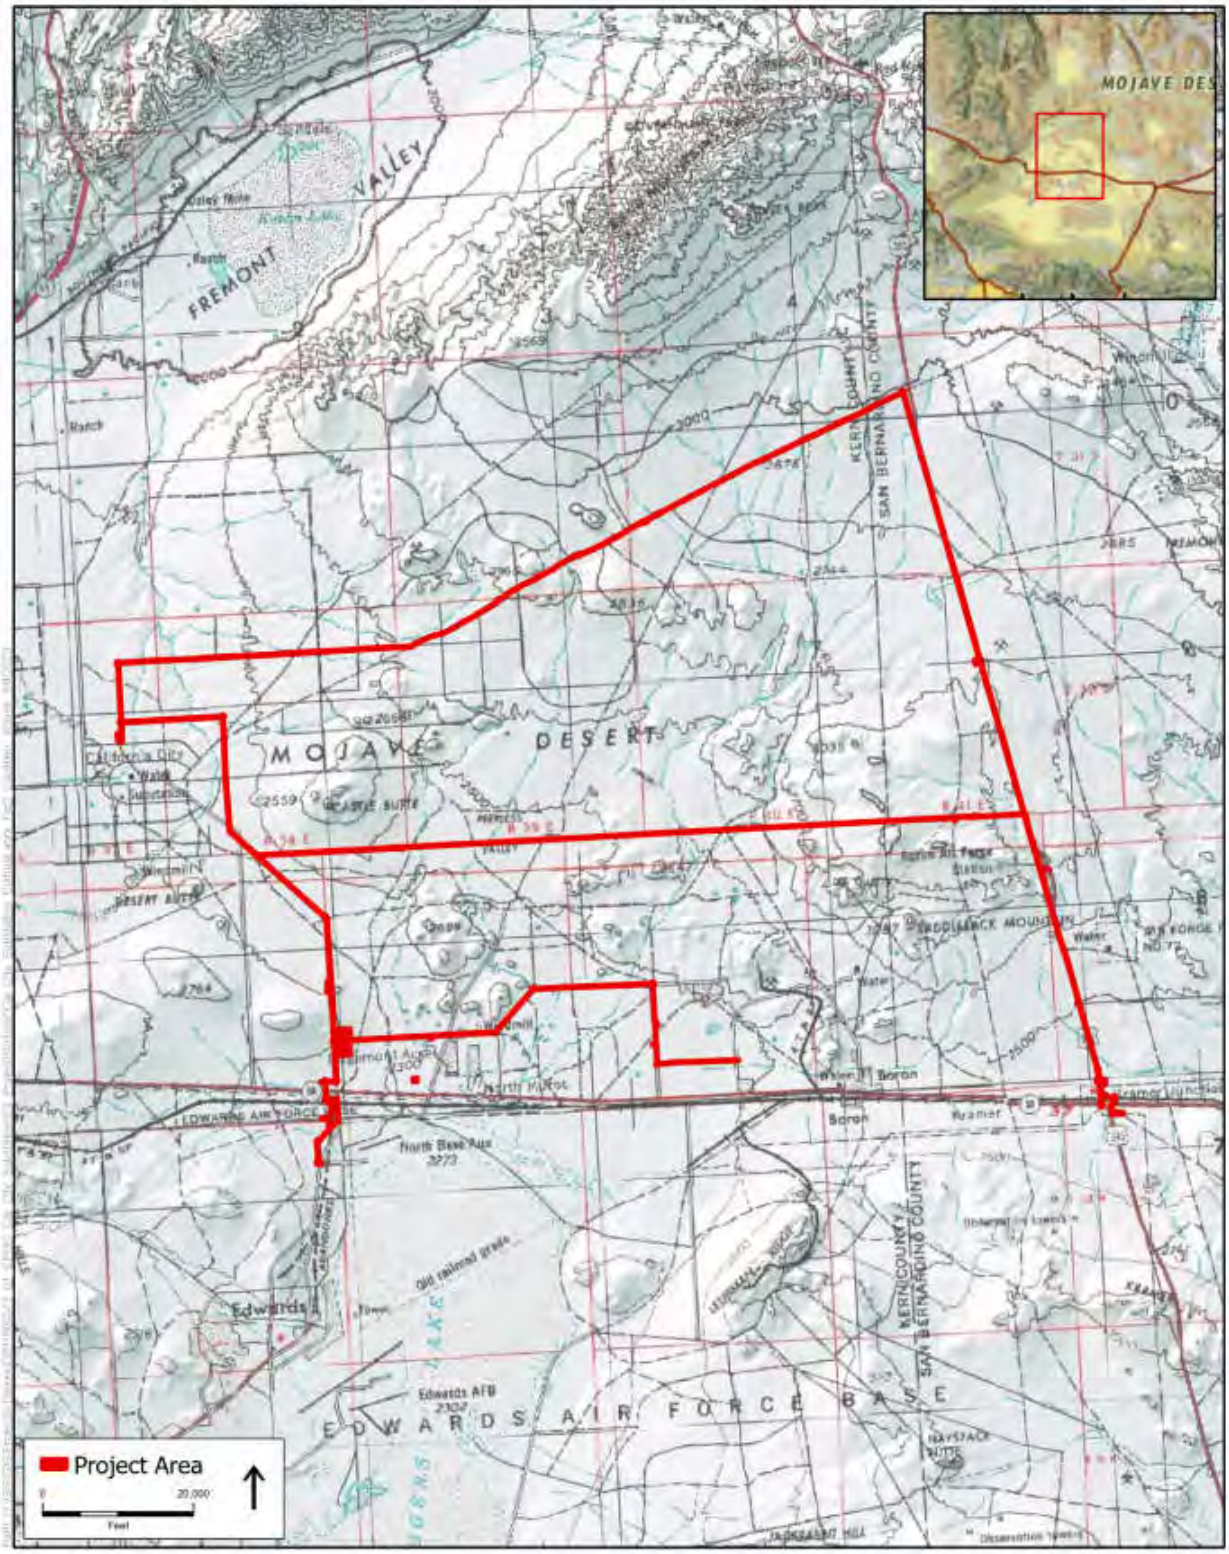
This project is also subject to Section 106 of the National Historic Preservation Act. A cultural resources records search, tribal consultation, and pedestrian survey has been undertaken to identify

cultural resources within the Project Area by Rincon Consultants. The documents prepared for this project are still under review with the Bureau of Land Management (BLM) and the Department of Defense (DOD). Preliminarily, 128 resources with a prehistoric component and 136 prehistoric isolates have been identified in the Project's Area of Potential Effects (APE). Inventory and evaluation of cultural resources within the APE is ongoing.

Cultural resources documentation can be provided upon request. Please note, this information should be considered confidential and is not to be redistributed to individuals without traditional or cultural affiliation.

Consultation Request

If you have any comments or concerns regarding potential impacts to tribal cultural resources (as defined in Public Resources Code § 21074) in relation to the proposed project, or would like to request any additional information, please contact the CPUC Project Manager for this project at address below or via email to Boris Sanchez (Boris.Sanchez@cpuc.ca.gov). Please include the name of a designated lead contact person with any response.



Sincerely,

Boris Sanchez

Re: Resources Code section 21080.3, subd.(b) California Assembly Bill 52, Formal Notification of CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project

Cultural Lands Manager Alexandra McCleary,

Pursuant to California Assembly Bill (AB) 52, the California Public Utilities Commission (CPUC) is providing you with formal notification of the Cal City Substation 115 kV Upgrade Project (proposed project), located in unincorporated Kern and San Bernardino Counties, the City of California City, and Edwards Air Force Base (EAFB) in the Mojave Desert region of California on federal, state, private, and municipal land. The CPUC, as lead agency, is reaching out to all groups listed on the California Native American Heritage Commission (NAHC) Sacred Lands File Contact List in a good faith effort to provide notification of the proposed project to groups that are traditionally or culturally affiliated with the geographic area of the proposed project. The present notice includes:

- A description of the proposed project and location;
- A summary of cultural resources work to date, and summary of associated information that can be made available upon request;
- A clear and definitive statement that the tribe has 30 days to request consultation; and
- The lead agency contact information.

Project Description and Location

Southern California Edison (SCE) has filed an application with the California Public Utilities Commission (CPUC) for a Permit to Construct the Cal City Substation 115-kilovolt (kV) Upgrade Project (proposed project). The application was filed March 14, 2023, and includes the Proponent's

Subject: Resources Code section 21080.3, subd.(b) California Assembly Bill 52, Formal Notification of CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project

Environmental Assessment (PEA) prepared by Rincon Consultants. The application and PEA describe the proposed project.

The Project would consist of upgrading transformers at the existing Cal City Substation from 33/12 kV to 115/33 kV and 115/12 kV; construction of two new 115 kV subtransmission lines, the Kramer-Cal City Subtransmission Line, from Kramer Substation to Cal City Substation, and the Cal City-Edwards-Holgate Subtransmission Line, from Cal City Substation to Holgate Switchyard. The proposed Cal City-Edwards-Holgate 115 kV Subtransmission Line would also include a tap line to serve Edwards Substation located on EAFB. Fourteen new underground 12 kV distribution getaways and two new underground 33 kV distribution getaways from Cal City Substation are also proposed along with installation of telecommunication cable on both new 115 kV subtransmission lines and telecommunication improvements at the existing Holgate Switchyard and Cal City, Kramer, and Edwards Substations. The Project Area is identified in the image below (**Image 1**) and the attached figure.

- A summary of cultural resources work to date, and summary of associated information that can be made available upon request;
- A clear and definitive statement that the tribe has 30 days to request consultation; and
- The lead agency contact information.

Project Description and Location

Southern California Edison (SCE) has filed an application with the California Public Utilities Commission (CPUC) for a Permit to Construct the Cal City Substation 115-kilovolt (kV) Upgrade Project (proposed project). The application was filed March 14, 2023, and includes the Proponent's

Subject: Resources Code section 21080.3, subd.(b) California Assembly Bill 52, Formal Notification of CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project

Environmental Assessment (PEA) prepared by Rincon Consultants. The application and PEA describe the proposed project.

The Project would consist of upgrading transformers at the existing Cal City Substation from 33/12 kV to 115/33 kV and 115/12 kV; construction of two new 115 kV subtransmission lines, the Kramer-Cal City Subtransmission Line, from Kramer Substation to Cal City Substation, and the Cal City-Edwards-Holgate Subtransmission Line, from Cal City Substation to Holgate Switchyard. The proposed Cal City-Edwards-Holgate 115 kV Subtransmission Line would also include a tap line to serve Edwards Substation located on EAFB. Fourteen new underground 12 kV distribution getaways and two new underground 33 kV distribution getaways from Cal City Substation are also proposed along with installation of telecommunication cable on both new 115 kV subtransmission lines and telecommunication improvements at the existing Holgate Switchyard and Cal City, Kramer, and Edwards Substations. The Project Area is identified in the image below (**Image 1**) and the attached figure.

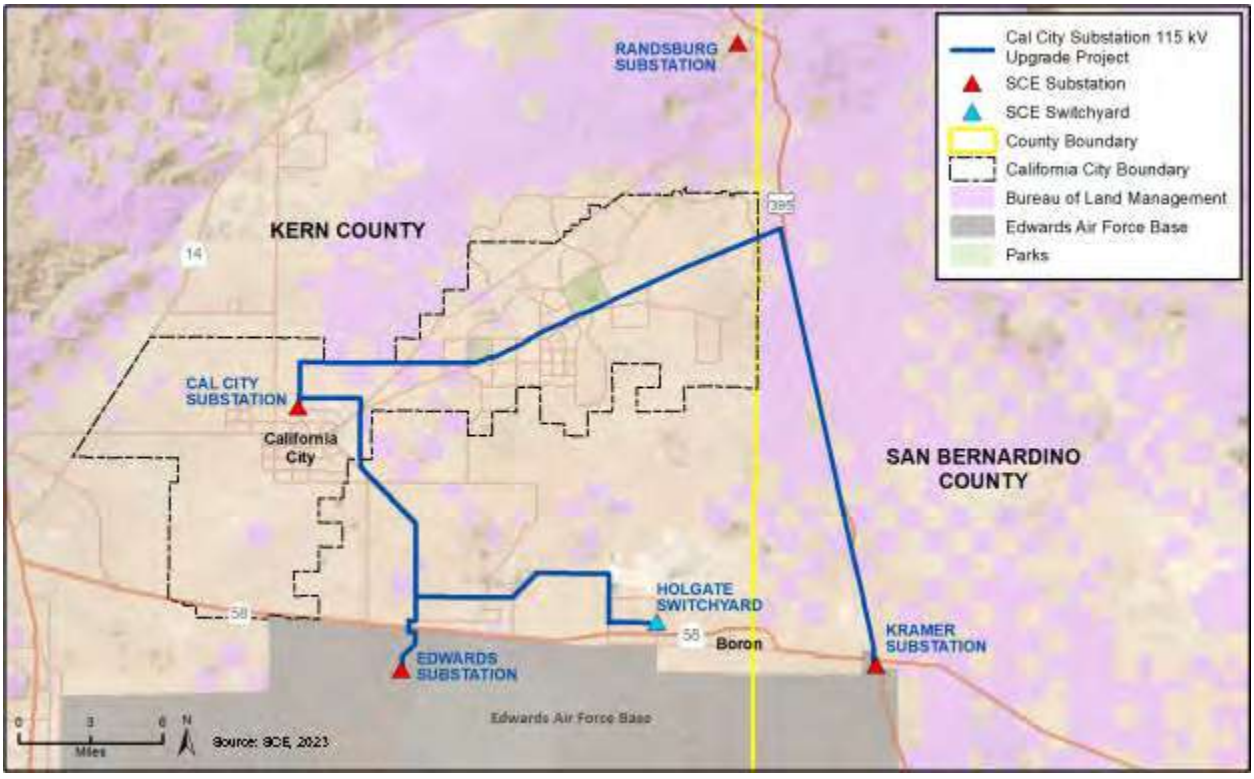

Image 1. California City Project Map (SCE, 2023)

Summary of Cultural Resources Work and Documentation

This project is also subject to Section 106 of the National Historic Preservation Act. A cultural resources records search, tribal consultation, and pedestrian survey has been undertaken to identify

cultural resources within the Project Area by Rincon Consultants. The documents prepared for this project are still under review with the Bureau of Land Management (BLM) and the Department of Defense (DOD). Preliminarily, 128 resources with a prehistoric component and 136 prehistoric isolates have been identified in the Project's Area of Potential Effects (APE). Inventory and evaluation of cultural resources within the APE is ongoing.

Cultural resources documentation can be provided upon request. Please note, this information should be considered confidential and is not to be redistributed to individuals without traditional or cultural affiliation.

Consultation Request

If you have any comments or concerns regarding potential impacts to tribal cultural resources (as defined in Public Resources Code § 21074) in relation to the proposed project, or would like to request any additional information, please contact the CPUC Project Manager for this project at address below or via email to Boris Sanchez (Boris.Sanchez@cpuc.ca.gov). Please include the name of a designated lead contact person with any response.

Re: Request for Cultural Resources Information Related to CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project

Co-Chairperson Mark Cochrane,

The State of California Public Utilities Commission (CPUC) is undertaking a review of Southern California Edison's (SCE) proposed Cal City Substation 115 kV Upgrade Project (proposed project), located in unincorporated Kern and San Bernardino Counties, the City of California City, and Edwards Air Force Base (EAFB) in the Mojave Desert region of California on federal, state, private, and municipal land.

The Native American Heritage Commission has provided a list of tribal organizations, which included your organization that may have information about cultural resources that may be affected by the proposed project. As a courtesy, the CPUC is providing proposed project information and requests your assistance in identifying potential cultural resources as part of its environmental analysis and review required under the California Environmental Quality Act (CEQA) for the proposed project.

Southern California Edison (SCE) filed an application on March 14, 2023, with the California Public Utilities Commission (CPUC) for a Permit to Construct the Cal City Substation 115-kilovolt (kV) Upgrade Project (proposed project).

The Project would consist of upgrading transformers at the existing Cal City Substation from 33/12 kV to 115/33 kV and 115/12 kV; construction of two new 115 kV subtransmission lines, the Kramer-Cal City Subtransmission Line, from Kramer Substation to Cal City Substation, and the Cal City-Edwards-Holgate Subtransmission Line, from Cal City Substation to Holgate Switchyard. The proposed Cal City-Edwards-Holgate 115 kV Subtransmission Line would also include a tap line to serve Edwards Substation located on EAFB. Fourteen new underground 12

Subject: *Request for Cultural Resources Information Related to CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project*

kV distribution getaways and two new underground 33 kV distribution getaways from Cal City Substation are also proposed along with installation of telecommunication cable on both new 115 kV subtransmission lines and telecommunication improvements at the existing Holgate Switchyard and Cal City, Kramer, and Edwards Substations. The Project Area is identified in the image below (**Image 1)** and the attached figure.

A cultural resources records search, tribal consultation, and pedestrian survey has been undertaken to identify cultural resources within the Project Area by Rincon Consultants on behalf of SCE.

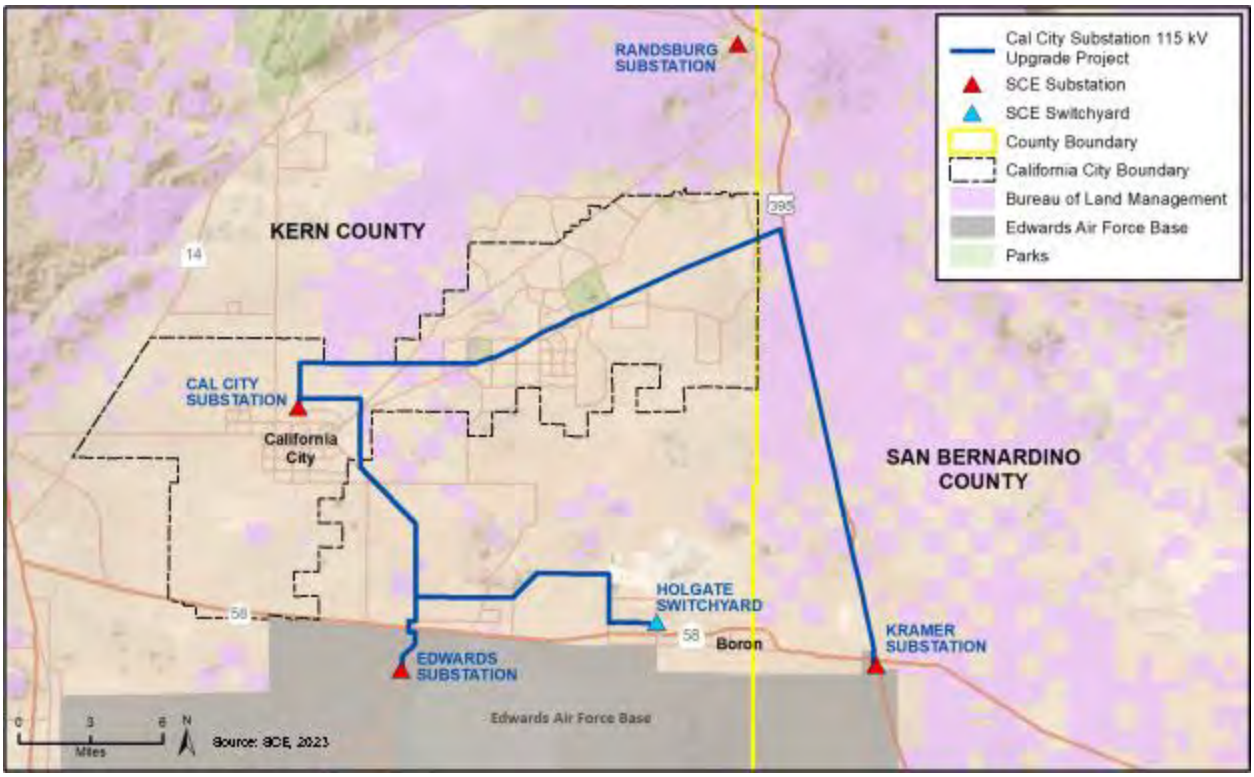

Image 1. California City Project Map (SCE, 2023)

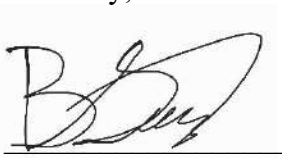
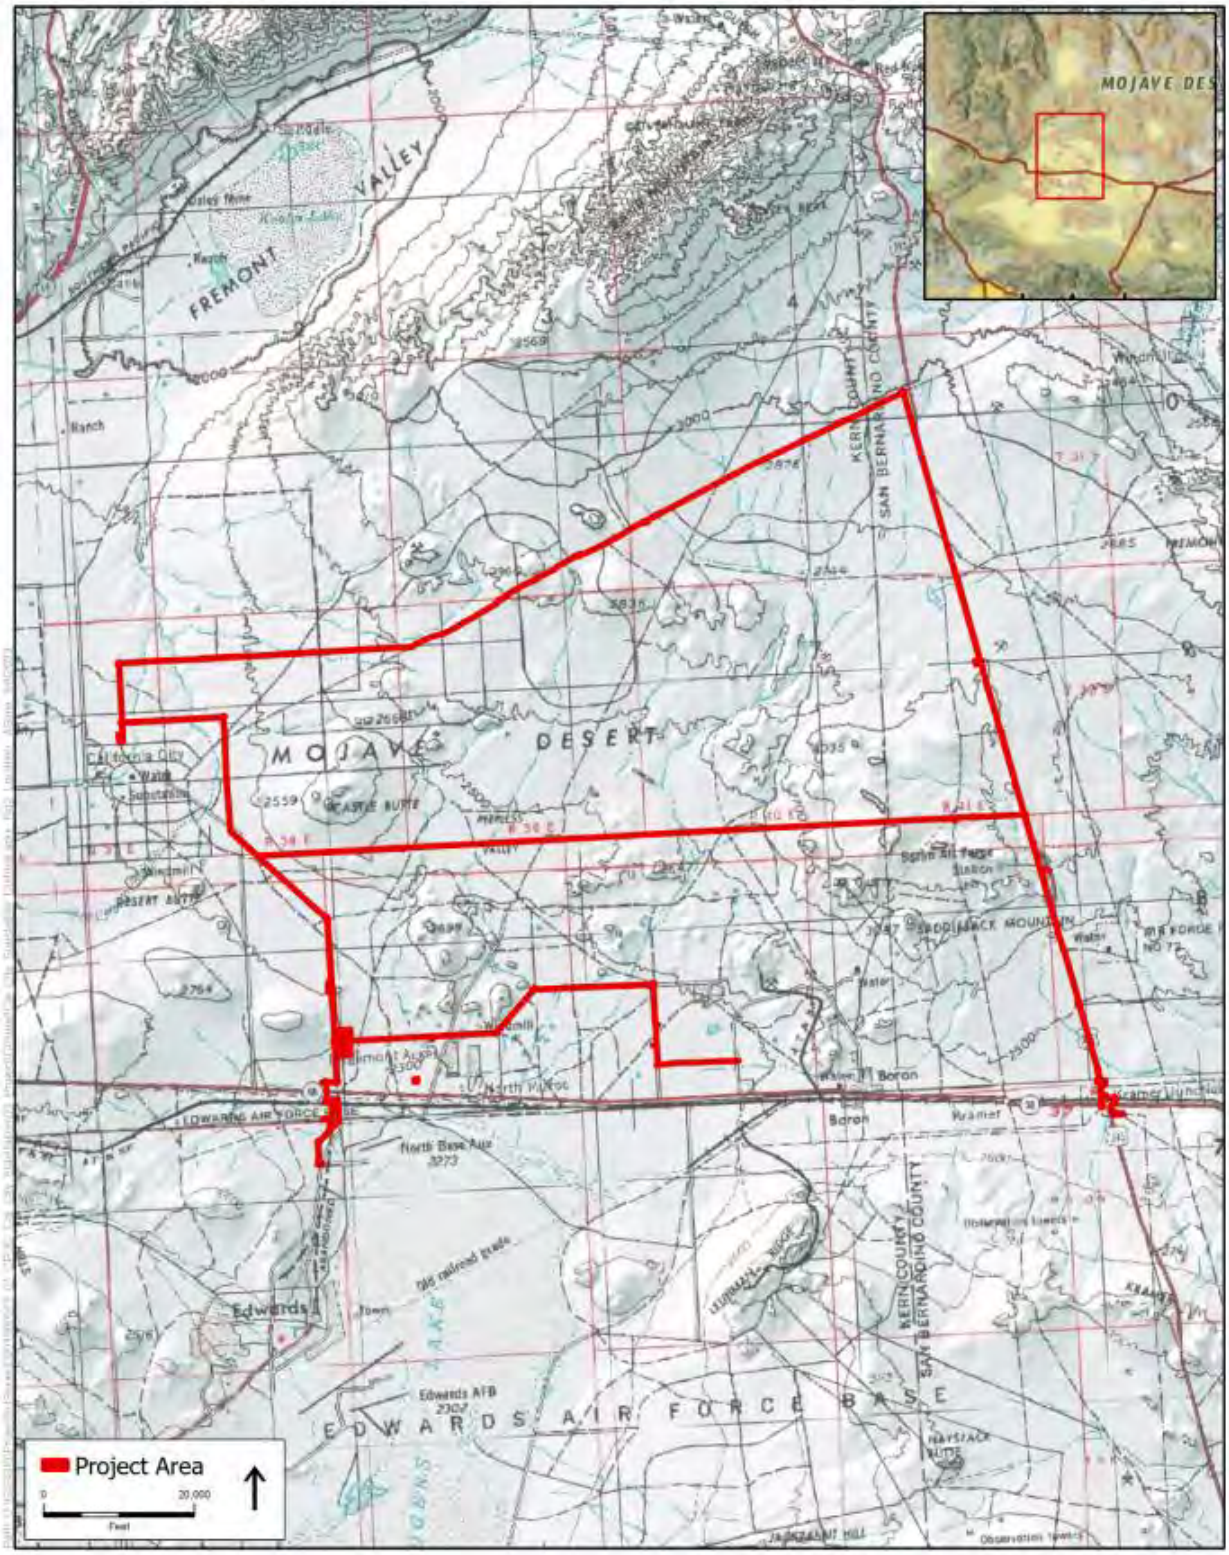


Preliminarily, 128 resources with a prehistoric component and 136 prehistoric isolates have been identified in the projects area. Inventory and evaluation of cultural resources within the project area is ongoing. The documents prepared for this project are still under review by the Bureau of Land Management and EAFB, who are the federal lead agencies that will be responsible for compliance with Section 106 of the National Historic Preservation Act separately from the CPUC's analysis.

The CPUC understands that other resources can be found in the proposed project area. A Native American tribe or individual may be the only source for the presence of traditional cultural places

or sites. Therefore, we request any additional information that you would like to provide related to any sacred or traditional cultural places, tribal cultural resources, tribal landscapes, or other cultural resources with regard to the proposed project area shown on the accompanying map, or regarding any other environmental concerns. The CPUC requests that you provide any comments or concerns within 30 days of receipt of this notice. The CPUC will also invite your comments on CEQA document for the proposed project during the public comment period. Please note that existing state laws protect the confidentiality of sensitive cultural resources information.

If you have any comments or concerns regarding potential impacts to cultural resources in relation to the proposed project, or would like to request any additional information, please contact the CPUC Project Manager for this project at address below or via email to Boris Sanchez (Boris.Sanchez@cpuc.ca.gov). Please include the name of a designated lead contact person with any response.



Sincerely,

Boris Sanchez

Re: Request for Cultural Resources Information Related to CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project

Chairperson Julio Quair,

The State of California Public Utilities Commission (CPUC) is undertaking a review of Southern California Edison's (SCE) proposed Cal City Substation 115 kV Upgrade Project (proposed project), located in unincorporated Kern and San Bernardino Counties, the City of California City, and Edwards Air Force Base (EAFB) in the Mojave Desert region of California on federal, state, private, and municipal land.

The Native American Heritage Commission has provided a list of tribal organizations, which included your organization that may have information about cultural resources that may be affected by the proposed project. As a courtesy, the CPUC is providing proposed project information and requests your assistance in identifying potential cultural resources as part of its environmental analysis and review required under the California Environmental Quality Act (CEQA) for the proposed project.

Southern California Edison (SCE) filed an application on March 14, 2023, with the California Public Utilities Commission (CPUC) for a Permit to Construct the Cal City Substation 115-kilovolt (kV) Upgrade Project (proposed project).

The Project would consist of upgrading transformers at the existing Cal City Substation from 33/12 kV to 115/33 kV and 115/12 kV; construction of two new 115 kV subtransmission lines, the Kramer-Cal City Subtransmission Line, from Kramer Substation to Cal City Substation, and the Cal City-Edwards-Holgate Subtransmission Line, from Cal City Substation to Holgate Switchyard. The proposed Cal City-Edwards-Holgate 115 kV Subtransmission Line would also include a tap line to serve Edwards Substation located on EAFB. Fourteen new underground 12

Subject: *Request for Cultural Resources Information Related to CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project*

kV distribution getaways and two new underground 33 kV distribution getaways from Cal City Substation are also proposed along with installation of telecommunication cable on both new 115 kV subtransmission lines and telecommunication improvements at the existing Holgate Switchyard and Cal City, Kramer, and Edwards Substations. The Project Area is identified in the image below (**Image 1)** and the attached figure.

A cultural resources records search, tribal consultation, and pedestrian survey has been undertaken to identify cultural resources within the Project Area by Rincon Consultants on behalf of SCE.

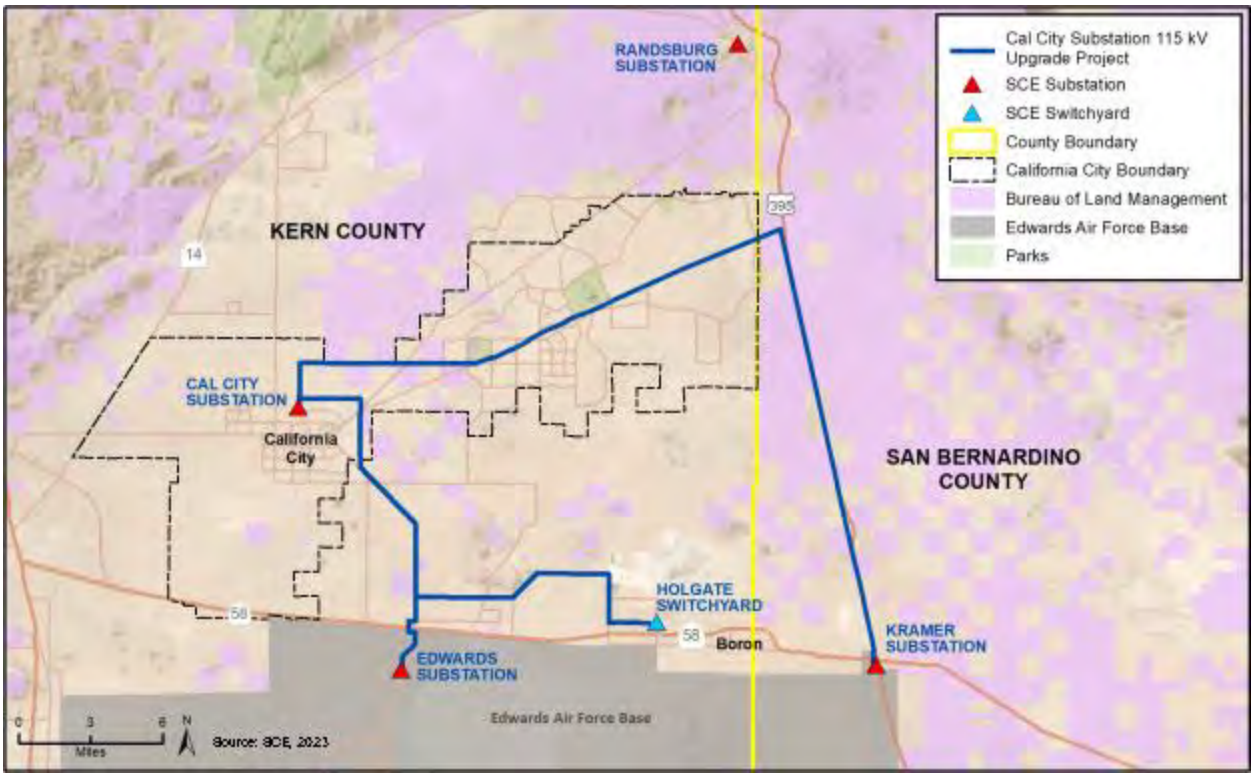

Image 1. California City Project Map (SCE, 2023)

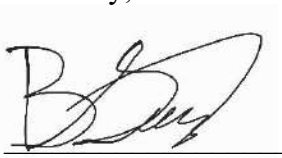

Preliminarily, 128 resources with a prehistoric component and 136 prehistoric isolates have been identified in the projects area. Inventory and evaluation of cultural resources within the project area is ongoing. The documents prepared for this project are still under review by the Bureau of Land Management and EAFB, who are the federal lead agencies that will be responsible for compliance with Section 106 of the National Historic Preservation Act separately from the CPUC's analysis.

The CPUC understands that other resources can be found in the proposed project area. A Native American tribe or individual may be the only source for the presence of traditional cultural places

or sites. Therefore, we request any additional information that you would like to provide related to any sacred or traditional cultural places, tribal cultural resources, tribal landscapes, or other cultural resources with regard to the proposed project area shown on the accompanying map, or regarding any other environmental concerns. The CPUC requests that you provide any comments or concerns within 30 days of receipt of this notice. The CPUC will also invite your comments on CEQA document for the proposed project during the public comment period. Please note that existing state laws protect the confidentiality of sensitive cultural resources information.

If you have any comments or concerns regarding potential impacts to cultural resources in relation to the proposed project, or would like to request any additional information, please contact the CPUC Project Manager for this project at address below or via email to Boris Sanchez (Boris.Sanchez@cpuc.ca.gov). Please include the name of a designated lead contact person with any response.

Re: Request for Cultural Resources Information Related to CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project

Chairperson James Rambeau,

The State of California Public Utilities Commission (CPUC) is undertaking a review of Southern California Edison's (SCE) proposed Cal City Substation 115 kV Upgrade Project (proposed project), located in unincorporated Kern and San Bernardino Counties, the City of California City, and Edwards Air Force Base (EAFB) in the Mojave Desert region of California on federal, state, private, and municipal land.

The Native American Heritage Commission has provided a list of tribal organizations, which included your organization that may have information about cultural resources that may be affected by the proposed project. As a courtesy, the CPUC is providing proposed project information and requests your assistance in identifying potential cultural resources as part of its environmental analysis and review required under the California Environmental Quality Act (CEQA) for the proposed project.

Southern California Edison (SCE) filed an application on March 14, 2023, with the California Public Utilities Commission (CPUC) for a Permit to Construct the Cal City Substation 115-kilovolt (kV) Upgrade Project (proposed project).

The Project would consist of upgrading transformers at the existing Cal City Substation from 33/12 kV to 115/33 kV and 115/12 kV; construction of two new 115 kV subtransmission lines, the Kramer-Cal City Subtransmission Line, from Kramer Substation to Cal City Substation, and the Cal City-Edwards-Holgate Subtransmission Line, from Cal City Substation to Holgate Switchyard. The proposed Cal City-Edwards-Holgate 115 kV Subtransmission Line would also include a tap line to serve Edwards Substation located on EAFB. Fourteen new underground 12

kV distribution getaways and two new underground 33 kV distribution getaways from Cal City Substation are also proposed along with installation of telecommunication cable on both new 115 kV subtransmission lines and telecommunication improvements at the existing Holgate Switchyard and Cal City, Kramer, and Edwards Substations. The Project Area is identified in the image below (**Image 1)** and the attached figure.

A cultural resources records search, tribal consultation, and pedestrian survey has been undertaken to identify cultural resources within the Project Area by Rincon Consultants on behalf of SCE.

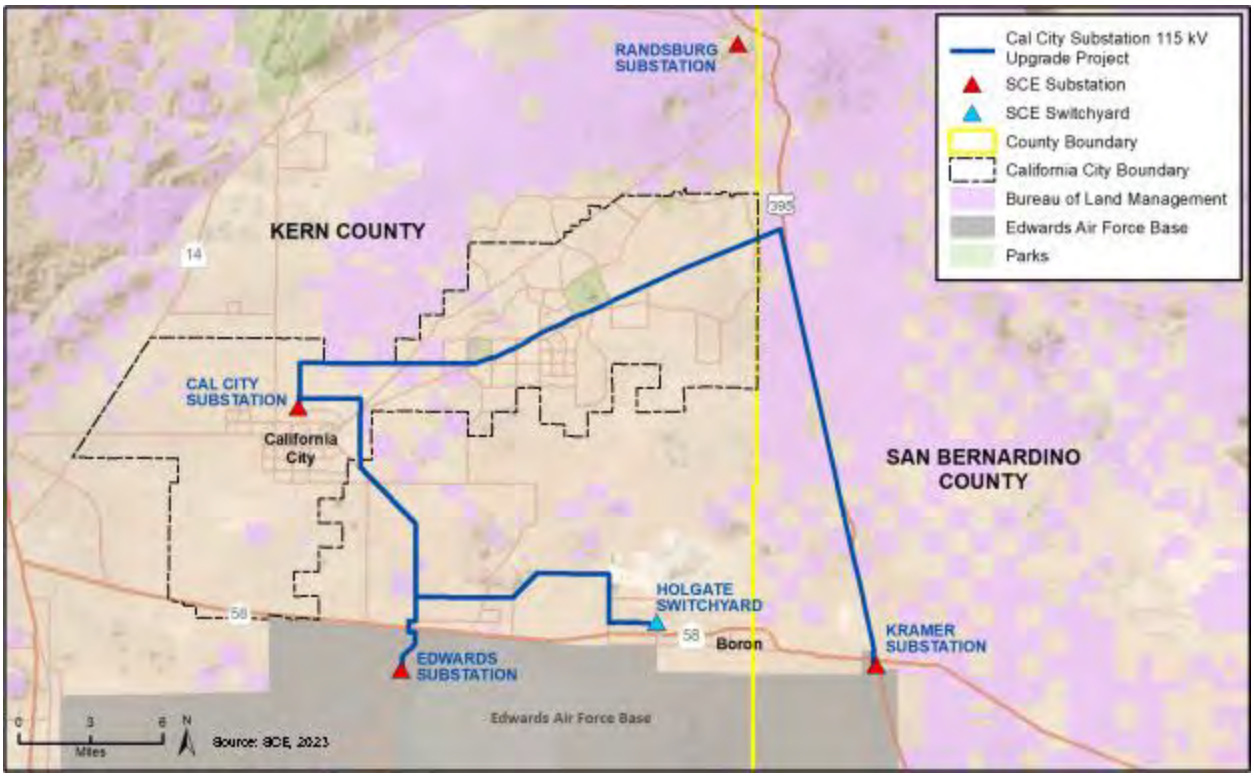

Image 1. California City Project Map (SCE, 2023)

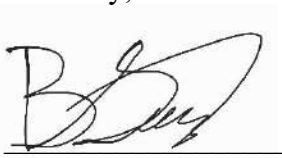
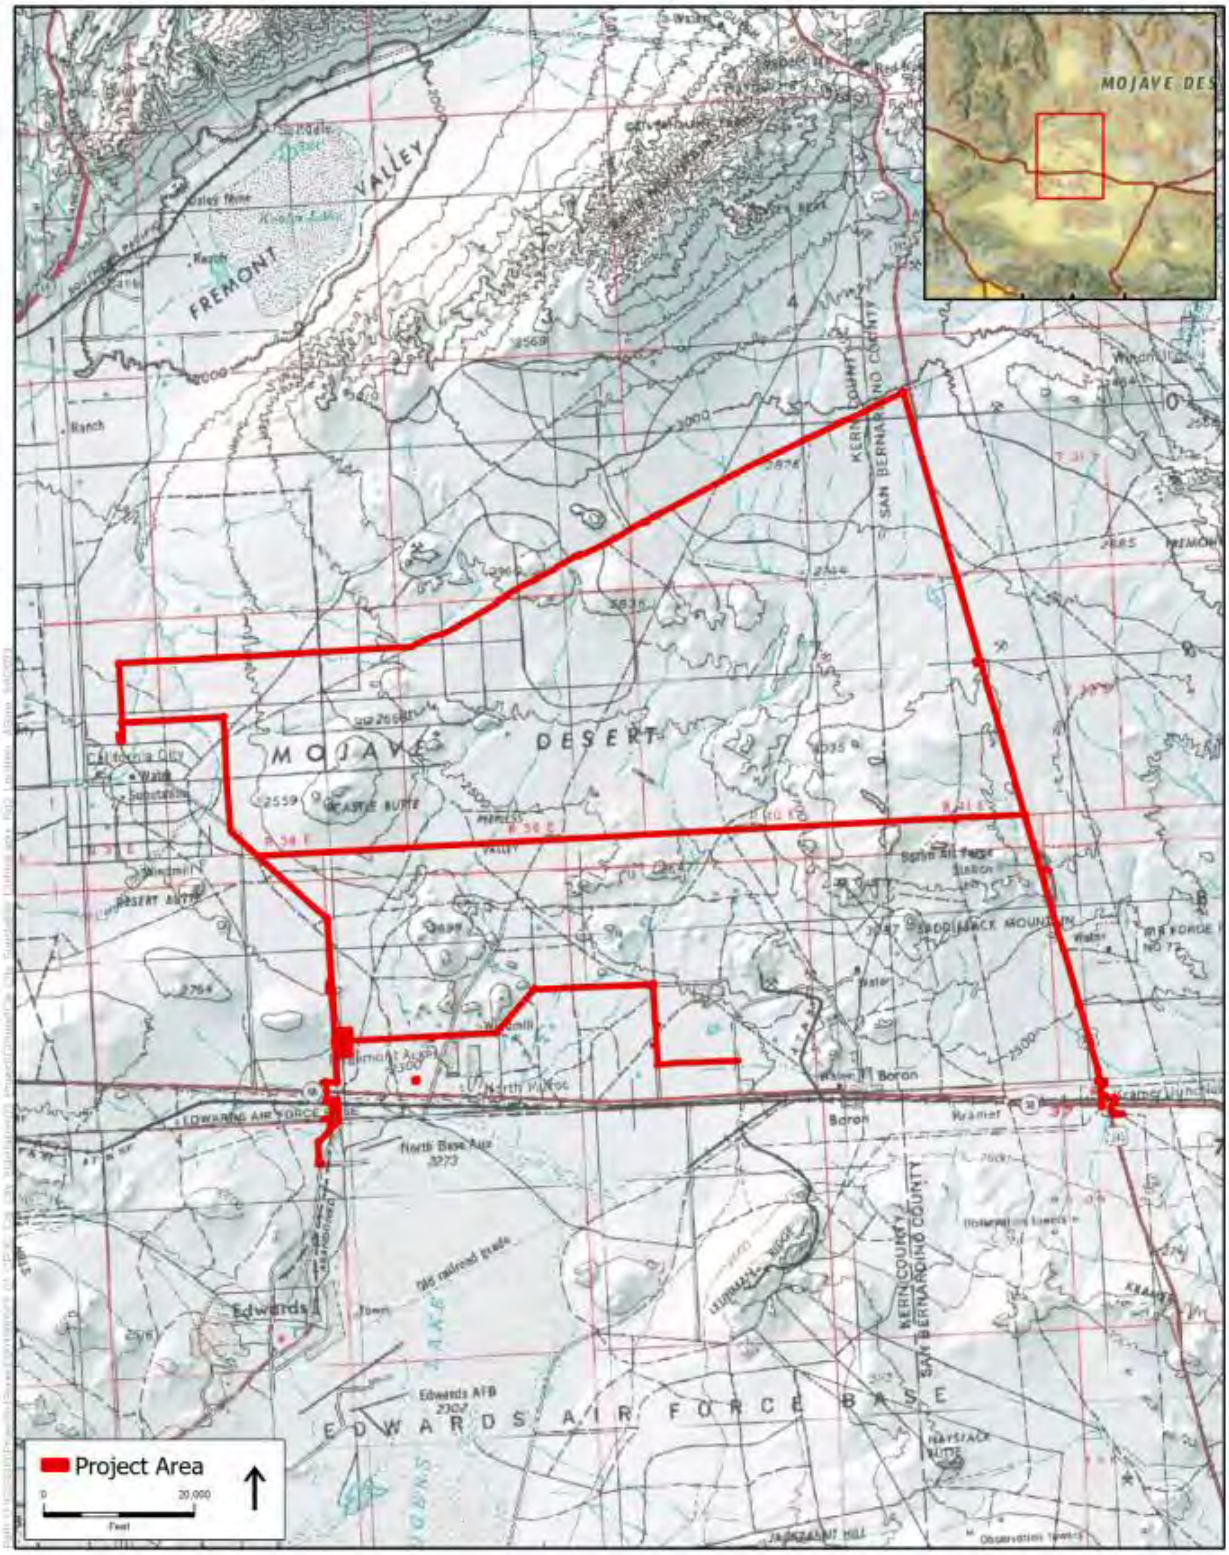


Preliminarily, 128 resources with a prehistoric component and 136 prehistoric isolates have been identified in the projects area. Inventory and evaluation of cultural resources within the project area is ongoing. The documents prepared for this project are still under review by the Bureau of Land Management and EAFB, who are the federal lead agencies that will be responsible for compliance with Section 106 of the National Historic Preservation Act separately from the CPUC's analysis.

The CPUC understands that other resources can be found in the proposed project area. A Native American tribe or individual may be the only source for the presence of traditional cultural places

or sites. Therefore, we request any additional information that you would like to provide related to any sacred or traditional cultural places, tribal cultural resources, tribal landscapes, or other cultural resources with regard to the proposed project area shown on the accompanying map, or regarding any other environmental concerns. The CPUC requests that you provide any comments or concerns within 30 days of receipt of this notice. The CPUC will also invite your comments on CEQA document for the proposed project during the public comment period. Please note that existing state laws protect the confidentiality of sensitive cultural resources information.

If you have any comments or concerns regarding potential impacts to cultural resources in relation to the proposed project, or would like to request any additional information, please contact the CPUC Project Manager for this project at address below or via email to Boris Sanchez (Boris.Sanchez@cpuc.ca.gov). Please include the name of a designated lead contact person with any response.



Sincerely,

Boris Sanchez

Re: Request for Cultural Resources Information Related to CPUC's CEQA Review of Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project

Chairperson Robert Robinson,

The State of California Public Utilities Commission (CPUC) is undertaking a review of Southern California Edison's (SCE) proposed Cal City Substation 115 kV Upgrade Project (proposed project), located in unincorporated Kern and San Bernardino Counties, the City of California City, and Edwards Air Force Base (EAFB) in the Mojave Desert region of California on federal, state, private, and municipal land.

The Native American Heritage Commission has provided a list of tribal organizations, which included your organization that may have information about cultural resources that may be affected by the proposed project. As a courtesy, the CPUC is providing proposed project information and requests your assistance in identifying potential cultural resources as part of its environmental analysis and review required under the California Environmental Quality Act (CEQA) for the proposed project.

Southern California Edison (SCE) filed an application on March 14, 2023, with the California Public Utilities Commission (CPUC) for a Permit to Construct the Cal City Substation 115-kilovolt (kV) Upgrade Project (proposed project).

The Project would consist of upgrading transformers at the existing Cal City Substation from 33/12 kV to 115/33 kV and 115/12 kV; construction of two new 115 kV subtransmission lines, the Kramer-Cal City Subtransmission Line, from Kramer Substation to Cal City Substation, and the Cal City-Edwards-Holgate Subtransmission Line, from Cal City Substation to Holgate Switchyard. The proposed Cal City-Edwards-Holgate 115 kV Subtransmission Line would also include a tap line to serve Edwards Substation located on EAFB. Fourteen new underground 12

kV distribution getaways and two new underground 33 kV distribution getaways from Cal City Substation are also proposed along with installation of telecommunication cable on both new 115 kV subtransmission lines and telecommunication improvements at the existing Holgate Switchyard and Cal City, Kramer, and Edwards Substations. The Project Area is identified in the image below (**Image 1)** and the attached figure.

A cultural resources records search, tribal consultation, and pedestrian survey has been undertaken to identify cultural resources within the Project Area by Rincon Consultants on behalf of SCE.

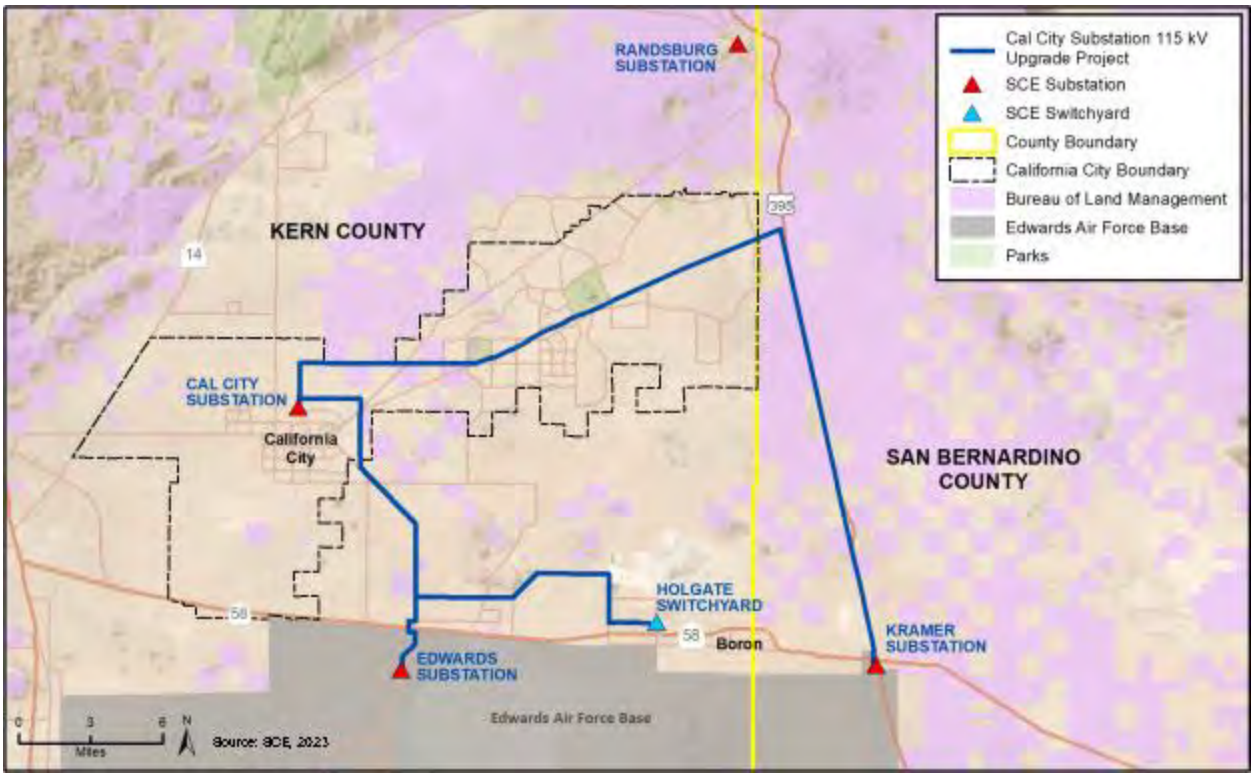

Image 1. California City Project Map (SCE, 2023)

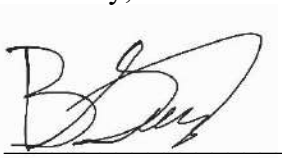

Preliminarily, 128 resources with a prehistoric component and 136 prehistoric isolates have been identified in the projects area. Inventory and evaluation of cultural resources within the project area is ongoing. The documents prepared for this project are still under review by the Bureau of Land Management and EAFB, who are the federal lead agencies that will be responsible for compliance with Section 106 of the National Historic Preservation Act separately from the CPUC's analysis.

The CPUC understands that other resources can be found in the proposed project area. A Native American tribe or individual may be the only source for the presence of traditional cultural places

or sites. Therefore, we request any additional information that you would like to provide related to any sacred or traditional cultural places, tribal cultural resources, tribal landscapes, or other cultural resources with regard to the proposed project area shown on the accompanying map, or regarding any other environmental concerns. The CPUC requests that you provide any comments or concerns within 30 days of receipt of this notice. The CPUC will also invite your comments on CEQA document for the proposed project during the public comment period. Please note that existing state laws protect the confidentiality of sensitive cultural resources information.

If you have any comments or concerns regarding potential impacts to cultural resources in relation to the proposed project, or would like to request any additional information, please contact the CPUC Project Manager for this project at address below or via email to Boris Sanchez (Boris.Sanchez@cpuc.ca.gov). Please include the name of a designated lead contact person with any response.

Dear Historic Preservation Officer Jill McCormick,

ESA, on behalf of the California Public Utilities Commission (CPUC), recently sent a certified letter to you regarding Southern California Edison's proposed Cal City Substation 115 kV Upgrade Project. We are following up via email to ensure that you have been notified of the project and offered the opportunity to respond. A copy of the letter is attached.

If you have any comments or concerns regarding potential impacts to tribal cultural resources (as defined in Public Resources Code § 21074) in relation to the proposed project, or would like to request any additional information, please contact the CPUC Project Manager for this project at address below or via email to Boris Sanchez (Boris.Sanchez@cpuc.ca.gov). Please include the name of a designated lead contact person with any response.

Boris Sanchez
CPUC Project Manager
California Public Utilities Commission
505 Van Ness Avenue
San Francisco, CA, 94102-3298
Boris.Sanchez@cpuc.ca.gov

Thank you,
Ashleigh

SECTION 1

TRANSMISSION LINE PROJECT FIRE PLAN

1.1 INTENT

A. This Specification has been developed for use by Edison and/or Contractor crews to ensure uniform guidelines for prevention, control, and extinguishment of fires are followed during transmission line construction projects. Frequent reference to and compliance with this Specification shall result in more consistency and greater fire control during transmission line construction.

B. The intent of this Specification is to provide an overall technical reference for the Work as defined in the Project Specification. However, not all sections of this Specification may be applicable to every Project. The Project Specification shall define the specific Project Job requirements and shall be the master document in regards to this Specification. In all cases where this Specification is in conflict with the Project Specification, the Project Specification shall apply.

C. Deviation from this Specification shall not be permitted unless so described in the Project Specifications or approved by Edison's Construction Representative.

D. All Working areas shall be maintained in an orderly, safe, clean and neat manner. As Work is completed in any one area, the area shall be promptly cleaned of all trash and surplus material and left in as good or better condition than initially encountered.

1.2 CONFORMANCE TO APPLICABLE CODES AND SAFETY REGULATIONS

A. Construction shall be performed in accordance with all sanitary, safety and building codes; Rules for Overhead Electric Line Construction G.O. 95, Public Utilities Commission, the National Electric Safety Code; and orders, ordinances and regulations that may apply. All Work shall be performed in accordance with the Constructor's Safety Policy, OSHA or any other applicable provisions of Federal, State or local safety regulations. All regulations of the Division of Industrial Safety of the applicable state, any other public agency, or insurance policies shall also be complied with.

B. All Work shall be accomplished by compliance to United States Forest Service Fire Plan, California Public Resource Code, Project Specification, this Specification, referenced specifications and standards, permitting constraints and conditions, and governing regulations using proper tools and equipment

that are in good Working condition.

C. The Work shall be performed in compliance with the latest version of the following codes and standards as amended to the date of the Project Specification, which are by reference, incorporated herein and made a part of the Project Specification. However, where the Drawings and/or this Specification calls for apparatus, workmanship, construction, etc., in excess of the referenced code requirements, Constructor shall take steps such that the Work shall be provided.

California Public Resource Code (Division 4. Forests, Forestry and Range and Forage Lands) (CPRC)

United States Forest Service Handbook (FSH)

Storm Water Pollution Prevention Plan (SWPPP)

1.3 RESPONSIBILITES

This Specification describes Constructor and Construction Representative's responsibilities. Edison or Constructor's crew may assume these responsibilities as follows:

A. Edison crew that are assigned to construct transmission lines will assume the responsibilities of "Constructor", as described in this Specification, or

B. Contractors who are contracted and authorized by Edison to construct transmission lines shall take on the responsibility of "Constructor", as delineated in this Specification.

C. A Construction Representative will be assigned by Southern California Edison.

1.4 SCOPE OF WORK

Constructor shall furnish all supervision, labor, tools, equipment and material necessary to prevent starting any fire, control spread of fires if started, and provide assistance for extinguishing fires started as a result of transmission line construction activities; as specified herein, the Project Specification, and Jobwalk Minutes.

1.5 SAFEGUARDS AND CONTROL OF FIRES

A. Constructor shall provide temporary safeguards, walks, rails, guards, construction fences, and suchlike, as required by any ordinances, as directed by the Construction Representative, or as necessary to protect workers, Edison employees, and the public from the time when the Work is begun until it is

accepted by Edison. Constructor shall ensure reasonable safeguards have been implemented to prevent any fires from starting.

B. Constructor shall incorporate Best Management Practices (BMS) to prevent starting any uncontrolled fire, control spread of fires if started, and provide assistance for extinguishing fires started as a result of transmission line construction. Constructor shall be solely responsible to owners or occupants of land for damage of every kind and nature resulting from the Work and activities of Constructor and its crews.

C. In the event of unforeseen damage to any improvement, Constructor shall promptly notify the Construction Representative and the owner of such improvements. Any damaged improvements shall immediately be repaired by Constructor as approved by the owner of such damaged facility. Other damaged property shall be repaired within a reasonable time.

1.6 PRECAUTIONS IN AREAS OF FIRE HAZARDS

A. Constructor shall use every reasonable precaution against starting fires where the Work is performed, in whole or in part, in an area covered with flammable dry grass, brush, and trees. Such precautions shall include, but not be limited to, prohibiting smoking on the Jobsite, use of spark arresters on equipment exhaust, and if necessary assigning a Fire Patrolperson whose responsibility shall be solely to monitor the Constructor's fire-prevention activities. The Fire Patrolperson shall be equipped with radio or cell phone communication capability.

B. Constructor shall provide required portable fire fighting equipment, shovels, axes, and other necessary fire fighting equipment at all sites where Work is in progress, and with all crews in transit.

C. Constructor shall observe all other precautionary measures that may be ordered by the United States Forest Service (USFS), Division of Forestry of the State where the worksite is located, County Fire Departments, and their authorized representative.

D. Constructor is further advised that during periods of extreme fire hazard due to critical weather conditions, United States Forest Service, Division of Forestry of the State where the worksite is located, and County Fire Departments may order Work to be suspended at any time in designated areas.

E. In the event of any uncontrolled fire near the Work, and as requested by the Construction Representative, Constructor shall furnish any and all of its forces and equipment to extinguish such fire as directed by the United States Forest Service, Division of Forestry of the State where the worksite is located, and

County Fire Departments. Under these conditions, Constructor's forces shall operate under the sole jurisdiction of the United States Forest Service, Division of Forestry of the State where the worksite is located, and County Fire Departments. Payment for labor and equipment shall be negotiated between the Constructor and the United States Forest Service.

1.7 FIRE PLAN REQUIREMENTS FOR US NATIONAL FOREST AREAS

1.7.1 Constructors Responsibilities

A. The provisions set forth in this section of the Project Fire Plan outline the Constructor's responsibility for fire prevention and suppression activities, along with the establishment of a fire attack procedure during transmission line construction projects which take place within U.S. National Forest areas. The "Project Vicinity" is defined as the area which is within and adjacent to the project rights-of-way and work areas, along with all roads used in connection with the construction activities. The provisions set forth in this section of the Project Fire Plan also specify conditions under which construction activities may be curtailed or shut down while within National Forest areas.

B. The terms and conditions of this Project Fire Plan are designed to be in compliance, or exceed the provisions of the U.S. Forest Service "Fire Plan for Construction and Service Contracts" dated 04-26-04 and is incorporated in it's entirety herein.

C. The Forest Service may conduct one or more inspections for compliance with this fire plan. The number, timing, and scope of such inspections will be committed at the discretion of the agency employees responsible for contract administration. Such inspections do not relieve the Constructor of responsibility for correcting violations of this fire plan or for fire safety in general.

Constructor (or his designated representative) shall:

1. Abide by the requirements of this Fire Plan,

2. Take all steps necessary to prevent his/her employees, subcontractors and their employees from setting fires,

3. Be responsible for preventing the escape of fires set accidentally as a result of construction activity,

4. Participate in the extinguishing of all fires in the event that they cannot be immediately contained until relieved by a representative of the U.S.

Forest Service,

5. Assure that all project fire prevention methods, tools, equipment and fire suppression activities are in accordance with any U.S. Forest Service, State, or local codes, the Project Specification requirements, and as stated herein,

6. Complete the Contractor's Plan Regarding Personnel, Equipment and Organization (See last page of this document), and furnish the U.S. Forest Service representative with a copy prior to commencing work in the National Forest Project Vicinity,

7. Advise the responsible U.S Forest Service representative of any changes in personnel, equipment and organization as the changes occur, and

8. Assign a fire patrolperson whose responsibility shall be solely to monitor the Constructor's fire-prevention activities. The fire patrolperson shall be equipped with radio or cell phone communication capability. The fire patrolperson shall perform the project fire patrolperson duties as described herein and any other duties as necessary to ensure that the Constructor is abiding by this Specification.

1.7.2 Operating and Construction Guidelines

Prior to commencement of Work each day, the Constructor shall obtain the Project Activity Level (PAL) and plan the work accordingly. Constructor shall then, as part of a morning safety tailboard meeting:

A. Review fire plan with employees, fire patrolperson, and the Construction Representative;

B. Review smoking policy;

C. Remind employees to not leave idling vehicles with hot exhaust manifolds on dirt roads with dead combustible vegetation under the vehicle;

D. Inspect vehicles and fire fighting equipment daily to ensure equipment is operable and that Fire Plan inspection sheet is still with vehicles;

E. Inspect any new vehicles and construction equipment to ensure it is properly equipped with minimum required fire fighting tools and equipment; and

F. Keep a detailed daily log which documents locations of all crew and equipment as part of placement in case a fire occurs.

1.7.3 Fire Prevention Measures

1.7.3.1 Permits Required

The Constructor shall secure a special written permit from the District Ranger or designated representative before engaging in any of the activities listed below:

A. Blasting and Storage of Explosives and Detonators. Explosives Permit is required by California Health & Safety Code, Section 12101,

B. Burning,

C. Air Pollution (Issued by local State or County Air Pollution Control Districts, as applicable.)

D. Camp, Lunch and Warming Fires.

E. Welding and Cutting.

1.7.3.2 Regulations for Burning

Before setting any fires whatsoever, the Constructor shall notify the Contracting Officer (CO) of his/her intentions. Special care shall be taken to prevent scorching or causing any damage to adjacent structures, trees, and shrubbery. Piles of material to be burned shall be of such size and so placed that during burning no damage shall result to adjacent objects.

1.7.3.3 Smoking and Fire Rules

Smoking shall not be permitted, except in a barren area or in an area cleared to mineral soil at least 3-feet in diameter. Designated smoking areas shall be assigned by the Constructor. Constructor shall provide closeable airtight and fireproof container designed to contain cigarette butts for designated smoking areas. Constructor shall post signs regarding smoking and fire rules in conspicuous places for all employees to see. Constructor's supervisory personnel shall require compliance with these rules. Under no circumstances shall smoking be permitted while Constructor’s employees are operating light or heavy equipment, while commuting to the Jobsite from highways, or walking or working in grass and woodlands.

1.7.3.4 Storage and Parking Areas

Equipment service areas, parking areas, and gas and oil storage areas shall be cleared of all flammable material for a radius of at least 50-feet. Small mobile or stationary engine sites shall be cleared of flammable material for a radius of at least 15-feet from such engine. The USFS Contracting Officer (CO) shall approve such sites in writing.

1.7.3.5 Welding

Constructor shall confine welding activity to cleared areas having a minimum radius of 10-feet measured from place of welding. If welding occurs on the line right-of-way, a fire patrolperson shall observe the operation.

1.7.3.6 Blasting

Constructor shall use electric caps only. When blasting is necessary in slash areas, a watchperson equipped with shovel and a water-filled backpack can (5 gallon), with hand pump, shall remain in the immediate area for an hour after blasting has been completed.

1.7.3.7 Oil Filter and Glass Jugs

Constructor shall remove from National Forest land all oily rags and used oil filters. Constructor shall prohibit his/her employees using glass bottles and jugs in National Forests.

1.7.4 Fire Fighting and Reporting Tools and Equipment

Constructor shall provide the Fire Fighting tools and equipment as listed below. All tools and equipment shall be in good workable condition and shall meet the following principle Forest Service specifications for fire tools:

A. Shovels shall be size "O" or larger and be not less than 46-inches in overall length.

B. Axes (or pulaskis) shall have 2-1/2 pound or larger heads and be not less than 28-inches in overall length.

1.7.4.1 For Diesel and Gasoline Operated Engines

For Project Activity Level A or higher, Constructor shall equip all diesel and/or gasoline-operated engines, both stationary and

mobile, and all flues used in any contract and camp operations with spark arresters that meet Forest Service standards set forth in the National Wildfire Coordinating Group publication for Multi-position Small Engines, #430-1, or General Purpose and Locomotive, #430-2.

Spark arresters are not required on equipment powered by exhaust- driven turbo-charged engines or motor vehicles equipped with a maintained muffler as defined in California Public Resources Code (CPRC), Section 4442 and 4443.

1.7.4.2 For Vehicles and Construction Operating Equipment

For Project Activity Level A or higher, Constructor shall furnish and have available for emergency use on each vehicle used in conjunction with performance of the work (i.e., truck, pickup trucks, crew vehicle, tractor, grader and other construction equipment) hand tools and/or equipment as follows:

A. One shovel,

B. One axe (or pulaski), and

C. A fully charged 2-A:10-B:C fire extinguisher, or larger.

1.7.4.3 For Machines with Hydraulic Systems

For Project Activity Level A or higher, Constructor shall equip each mechanized harvesting machine with hydraulic systems, powered by an internal combustion engine (e.g., chipper, feller/buncher, harvester, forwarder, stroke delimber, etc), except tractors and skidders, with at least two 4-A:80-B:C fire extinguishers, or equivalent. In addition, concentrations of wood dust and debris shall be removed from such equipment daily.

1.7.4.4 For Welders

For Project Activity Level A or higher, Constructor shall furnish one (1) shovel and one (1) backpack 5 gallon water-filled tank with pump with each welder.

1.7.4.5 For Non-Self-Propelling Gasoline or Diesel Powered Tools

For Project Activity Level A or higher, Constructor shall furnish one shovel and one pressurized chemical fire extinguisher for each gasoline- powered tool, including but not restricted to

compressors, hydraulic accumulators, gardening tools (such as chain saws and weed trimmers), soil augers, rock drills, etc. Fire extinguishers shall be of the type and size necessary to provide assurance of controlling fire caused by use of portable power tools under various climatic and fuel conditions. Shovel must be kept within 100-feet from each chain saw when used off cleared landing areas.

1.7.4.6 Communication Capability

A. For Project Activity Level A or higher, Constructor shall furnish communication capability (e.g., a serviceable telephone, radio-telephone, or radio system) connecting each operation with the designated Forest Service Dispatch Center. A radio-equipped fire patrolperson vehicle will satisfy this requirement if in operation during the time required.

B. The communication system shall provide prompt and reliable communications between the Constructor's operations and the Forest Service Dispatch Center.

C. The communications system shall be operable during Constructor's operation in the fire precautionary period and at the time fire patrolperson service is required.

D. The communications system shall be capable of contacting the designated Forest Service Dispatch Center within five (5) minutes of discovery of a fire in the Constructor’s operating area.

1.7.4.7 For Project Work Area

A. A project work area is an area where Work is concentrated, including a zone extending 500-feet radially from the center of a work area.

B. For Project Activity Level B or higher, the following personnel and equipment shall be provided:

1.7.4.7.1 Fire Patrolperson

Constructor shall provide and stage the following personnel and equipment at each project work area:

A. One dedicated fire patrolperson who shall be responsible for patrol of the activities for prevention, detection, control, and extinguishing of fires;

B. One water filled five (5) gallons backpack pump dedicated to the fire patrolperson;

C. One water filled five (5) gallons backpack pump dedicated to the crew at the project work area; and

D. Proven working and reliable communication equipment, radio or cell phone, which guarantees communication path to 911 operator in case of emergency. This communication equipment can be vehicle equipment but must be portable if remote operation away from the vehicle is commenced.

1.7.4.7.2 Water Tank or Trailer

A. Constructor shall furnish a water tank truck or trailer. The truck may serve a dual purpose. The truck may be used to spray water on roads and work area to suppress dust as per Storm Water Pollution Prevention Plan (SWPPP) requirements. The main purpose shall be to assist in the fire prevention and fire fighting activities. The truck shall never have less than 300 gallons of water aboard, even when en-route to refill.

B. The water tank truck or trailer shall be located on or adjacent to the project work area and meet the following minimum specifications:

1. Contain at least 300 gallons of water;

2. A combination straight stream-fog nozzle with 300-feet of 1-inch fire hose, with no segment longer than 50-feet;

3. Fire hose with nozzle closed shall be capable of withstanding 200 psi pump pressure without leaking, slipping of couplings, distortions, or other failures;

4. Nozzle discharge rating of six to 20 gallons per minute;

5. A pump capable of delivering 23 gallons per minute at 175 pounds psi at sea level;

6. Power unit for pump shall have fuel for at least 2-hours operation, with ample transport available for

DRAFT

immediate and safe movement of tank over roads serving the contract area; and

7. Pump outlet shall be equipped with 1-1/2 inch National Standard Fire Hose thread.

DRAFT

1.7.4.7.3 Support Truck

Constructor shall provide one support truck for each heavy piece of equipment operating solo while mobile. The support truck shall follow the heavy equipment as it operates. As an example, as a grader grades a road, a support truck shall follow. This does not apply to a water truck.

1.7.4.8 For Heavy Construction Operating Equipment

For Project Activity Level C or higher, Constructor shall furnish and have available for emergency use on each heavy construction operating equipment used in conjunction with performance of the work additional firefighting capabilities as follows:

A. An onboard self-extinguishing fire suppression system capable of extinguishing any equipment caused fire, or

B. A portable Class A fire suppression system capable of extinguishing a 20-foot by 20-foot wild land fire within 5 minutes of discovery. The Class A system shall meet the following specifications:

1. 100-feet of 1-inch hose,
2. Minimum discharge distance of 50-feet,
3. Minimum pressure of 100 psi at discharge orifice, and
4. Sustainable for minimum of 5 minutes.

1.7.4.9 For Central Mobilization Area

For Project Activity Level C or higher, Constructor shall equip a centrally designated mobilization area, or at a concentrated long term project work area one sealed box of firefighting tools. The box shall be sealed with a Forest Service seal to be broken for emergency use only. The box shall be unlocked during transmission line project construction activities.

The box shall contain:

1. Three (3) five gallons backpack pump-type fire extinguishers filled with water;
2. Five (5) shovels;

DRAFT

3. Five (5) axes;

4. Five (5) McCleod fire tools;

5. One (1) serviceable chain saw of 3-1/2 or more horsepower with a cutting bar 20-inches in length or longer.

1.7.4.10 For Tractor Dozer

For Project Activity Level C or higher, Constructor shall furnish two (2) tractor headlights for each tractor dozer. Tractor headlights shall be attachable to each tractor and served by an adequate power source.

1.7.5 EMERGENCY MEASURES

A. The table set forth below establishes work restrictions and fire precautions that the Constructor shall observe at each project activity level. The restrictions are cumulative at each level.

B. Constructor shall conform to the limitations or requirements of Project Activity Level (PAL) obtained from Forest Service before starting Work each day. If practicable, Forest Service will determine the following day's activity level by 4:00 p.m. each afternoon. Activity level may be changed at any time if, in the judgment of the Forest Service, fire danger is higher or lower than predicted and such change is consistent with forest management objectives. The decision to change the activity level, and when, and how to take weather observations for that purpose, are within the discretion of Forest Service.

C. Project Activity Level applicable to this project shall be for Fuel Model G, National Fire Danger Rating System, and Remote Automated Weather Station (RAWS) or fire danger rating area stated in the legend of Project Area Map.

DRAFT

PROJECT ACTIVITY LEVELS

Project Activity Requirements

Level

A 1. As required by Sections 1.7.4.1 through 1.7.4.6 above.

B 1. As required by Sections 1.7.4.1 through 1.7.4.7 above.

2. Furnish fire patrolperson. A fire patrolperson is required for mechanical operations, including equipment with high speed rotary heads (i.e., > 1,100 RPM) from cessation of operations until 2-hours after operations cease or sunset, whichever occurs first.

C 1. As required by Sections 1.7.4.1 through 1.7.4.10 above.

2. Fire patrolperson is required until sunset local time.

3. The following operations are prohibited from 1:00 PM until 8:00 PM local time:

a) Blasting

b) Dead tree felling (with high speed rotary head), limbing, or bucking except recently dead trees.

c) Operating high speed rotary head equipment.

D 1. As required by Sections 1.7.4.1 through 1.7.4.10 above

2. The following operations are prohibited between hours of 10:00 AM and 8:00 PM local time:

a) Blasting;

b) Mechanized operations for felling (with high speed rotary head), bucking, and limbing; and

c) Felling dead material.

DRAFT

(Cont'd)

Project Activity Requirements

Level

D 3. The following activities may not operate between hours of 1:00 PM and 8:00 PM local time except by special permit:

a) Rubber Tired Skidding
b) Chipping on Roads or Landings
c) Cable Yarding
d) Welding or Cutting of Metal
e) Road Maintenance
f) Culvert Installation
g) Dirt Moving
h) Helicopter Yarding
i) Hand Slash Disposal
j) Chainsaw Operations on Landings and Roadbeds

4. Other operations may continue after 1:00 PM local time, if they meet the following requirements:

A fire patrolperson is required to walk all areas treated that day once per hour, until sunset local time. This includes chainsaw felling, metal track skidding, machines with chainsaw cutting heads and mastication equipment.

Ev 1. As required by Sections 1.7.4.1 through 1.7.4.10 above

2. The following activities may operate:

a) Loading of trucks at landing and hauling
b) Equipment at approved sites may be serviced
c) Roads: Dust abatement or rock aggregate installation (does not include pit development)

3. Other operations may continue until 1:00 PM local time when Constructor and Forest Service agree to variance.

DRAFT

E 1. As required by Sections 1.7.4.1 through 1.7.4.10 above.

2. he following activities may operate:
   a) Loading of trucks at landing and Hauling
   b) Equipment at approved sites may be serviced
   c) Roads: dust abatement or rock aggregate installation (does not include pit development)

1.7.6 REPORTING FIRES

Constructor shall report all fires to any of the following Forest Service facilities and/or personnel listed below, but not necessarily in the order shown:

	Name	Address and/or Telephone Number
Dispatch Center		
Nearest FS Station		
Inspector		
COR		
District Ranger		
D.R. Designated Rep		

When reporting a fire, provide the following information:

A. Your Name
B. Call back Telephone Number
C. Project Name
D. Location
E. Legal Description (Township, Range, Section); and Descriptive location (Reference point)

DRAFT

Fire Information:

F. Acres;
G. Rate of Spread; and
H. Wind Conditions

DRAFT

Constructor's Plan Regarding Personnel, Equipment and Organization

The Constructor shall, prior to commencing work, furnish the following information relating to key personnel, tools and equipment available for the purpose of fighting wild fires within and adjacent to the Contract Area:

KEY PERSONNEL: (In order of call preferences)

	Name	Address and/or Telephone Number
Fire Supervisor		
Fire Patrolperson		

PERSONNEL AND EQUIPMENT:

	Number	Classification, Type, Make & Model
Fire Fighters		
Fallers		
Power Saws		
Other Equipment		

Contractor's Signature

Docket#: 2023-2025 WMPs

April 2, 2024

Shannon O'Rourke
Deputy Director
Office of Energy Infrastructure Safety
715 P Street, 20th Floor
Sacramento, CA 95814

SUBJECT: Version Update to SCE's 2023-2025 Wildfire Mitigation Plan

Dear Deputy Director O'Rourke:

Pursuant the 2025 Wildfire Mitigation Plan Update Guidelines, SCE is submitting an updated version of its 2023-2025 Wildfire Mitigation Plan.

This version reflects the following:

- SCE's errata submitted to OEIS on April 6, 2023
- SCE's errata submitted to OEIS on April 26, 2023
- SCE's errata submitted to OEIS on August 14, 2023
- Additional corrections requested by OEIS on September 28, 2023
- Changes due to reportable updates in the 2025 WMP Update submitted on April 2, 2024

SCE's WMP and associated materials, including the submissions noted above, are available at: https://www.sce.com/safety/wild-fire-mitigation.

Sincerely,

//s//
Gary Chen
Director, Safety & Infrastructure Policy

WILDFIRE MITIGATION PLAN

Docket: 2023 to 2025 Electrical Corporation Wildfire Mitigation Plans Docket#: 2023-2025-WMPs

April 2nd, 2024

SOUTHERN CALIFORNIA EDISON®

Table of Contents

1 Executive Summary 1

1.1 Summary of the 2020-2022 WMP Cycle 1

1.2 Summary of the 2023-2025 Base WMP 4

1.2.1 Risk Methodology and Assessment: Advancements in Risk Modeling Capabilities Will Allow for More Robust Evaluation of Mitigations at Specific Locations of the Grid 5

1.2.2 Grid Design, Operations and Maintenance: Expanded Measures Are Expected to Further Reduce Wildfire Risk from Overhead Electric Systems 6

1.2.3 Vegetation Management and Inspections: An Improved Risk-Informed Vegetation Management Framework to Increase Efficiency and Enable Advanced Analytics 7

1.2.4 Situational Awareness and Forecasting: Additional High-Definition Wildfire Cameras, Weather Stations, Satellite Imagery and Advanced Technology Will Boost Capabilities 7

1.2.5 Emergency Preparedness: Trained Workforce Is Ready to Restore Power and Assist Customers; Aerial Suppression Resources Continue to Support Fire Agencies 7

1.2.6 Community Outreach and Engagement: Strong Partnerships Increase Outreach to Access and Functional Needs (AFN) Customer Groups 8

1.2.7 Public Safety Power Shutoff: SCE Continues Its Goal to Reduce PSPS Impacts with Urgency 8

1.2.8 SCE Continues to Advance Its Wildfire Capability Maturity 9

1.2.9 Conclusion 9

2 Responsible Persons 10

3 Statutory Requirements Checklist 13

1 EXECUTIVE SUMMARY

SCE is dedicated to the safety of our customers and the communities we serve. Our 2020-2022 Wildfire Mitigation Plan (WMP) was a comprehensive blueprint to address wildfire risk and Public Safety Power Shutoff (PSPS) impacts in SCE's service area and was developed with the input of our regulators, public safety partners, local governments, community groups, fellow electrical corporations, and other stakeholders. The execution of our 2020-2022 WMP helped make meaningful progress in reducing a large portion of wildfire risk and PSPS impacts on our system. Our 2023-2025 WMP builds upon our accomplishments and lessons learned from the 2020-2022 WMP to maintain the risk reduction achieved to date and is intended to further reduce the significant wildfire risk and PSPS impacts that remain. Below, SCE describes our past successes and path forward.

1.1 Summary of the 2020-2022 WMP Cycle

California has experienced extreme drought conditions during the past three years, which have — along with exceedingly low fuel moisture, high temperatures and very strong wind gusts — increased the unmitigated risk for ignition and spread of wildfires.[1] The California Department of Forestry and Fire Protection's (CAL FIRE) data indicates that nearly half of the 20 largest wildfires since 1932 have occurred in the past three years, including the single- largest fire.[2] In October 2021, Governor Gavin Newsom declared a drought emergency across California, stating that August 2021 was the driest and hottest August on record since the state began reporting data.[3] In August 2022, Governor Newsom declared a state of emergency for an extreme heat event, where temperatures exceeded 110 degrees in some areas.[4]

SCE's 2020-2022 WMP set forth a comprehensive set of initiatives designed specifically to mitigate wildfire and PSPS risk in the face of these dire circumstances. While we were already implementing myriad wildfire mitigation initiatives in the years before 2020, over the 2020-2022 WMP period we made even more progress in hardening our system and improving our capabilities in risk and weather modeling, asset inspections, vegetation management, situational awareness and community outreach.

We achieved 136 of the 147 (~93%) annual goals in the years they were established and completed nearly all the remaining goals within the 2020-2022 WMP period, resulting in significant reductions to wildfire and PSPS risk. Table SCE 1-01 below highlights the progress made in deploying wildfire and PSPS mitigation activities in the 2020-2022 WMP timeframe.

[1] Despite the recent precipitation, much of California remains in moderate, and in some areas, severe drought conditions. The concentrated rainfall is also expected to increase brush growth which may lead to a heightened fire risk later in the year.

[2] https://www.fire.ca.gov/media/4jandlhh/top20_acres.pdf Nine of the 20 largest wildfires happened in 2020-2021.

Table SCE 1-01 - Summary of 2020-2022 WMP Achievements

Initiative	Achievements in 2020-2022
Covered Conductor	Installed more than 3,880 circuit miles, bringing total covered conductor miles installed to nearly 4,400, or over 44% of SCE's HFRA
Undergrounding	Completed more than 19 miles
High Fire Risk Inspections and Remediations	Completed approximately 541,400 distribution and 73,600 transmission structure inspections in High Fire Risk Area (HFRA), including areas of concern, using an approach that now inspects transmission and distribution structures that represent up to 99% of risk each year; performed repairs and replacements
Vegetation Management	Maintained line clearances; completed hazard tree assessments on more than 1,325 circuits and performed 21,000 hazard tree mitigations — and marked the substantial completion of one full pass of SCE's service area for conducting hazard assessments; cleared brush at the base of more than 502,400 poles
Public Safety Power Shutoff	Developed circuit-specific mitigation plans including deploying grid hardening measures on over 140 circuits, further advanced risk modeling to inform FPI thresholds, enhanced customer notification processes and developed a portfolio of customer care offerings
Weather Stations	Installed more than 1,150 weather stations, resulting in more than 1,620 weather stations installed across our HFRA; expanded artificial intelligence/machine learning (AI/ML) capabilities for improved forecasting
High-Definition Cameras	Installed 21 HD cameras, resulting in a total of more than 180 HD cameras installed across our service area since inception; this represents approximately 90% coverage of our HFRA
Sectionalizing Devices	Installed more than 80 devices, resulting in a total of more than 150 devices installed since this wildfire program's inception, adding to SCE existing portfolio of remote sectionalization devices.
Fast-Acting, Current-Limiting Fuses	Installed/replaced fusing at more than 3,740 fuse locations, resulting in fusing installed/replaced at more than 13,700 fuse locations on the grid since program inception
Customer Resiliency Programs	Delivered more than 10,200 Critical Care Backup Batteries to medical baseline customers and introduced in-event battery loan pilot; developed targeted programs to support critical care Medical Baseline customers, Access & Functional Needs (AFN) customers and communities frequently impacted by PSPS

Because of these efforts, SCE has reduced wildfire risk significantly. SCE has used the performance of these and associated metrics to help inform the development of this 2023-2025 plan. When compared to the 2017-2018 period, the number of acres burned and structures destroyed in 2021-2022 were 92%

and 98% lower, respectively, despite continued extreme drought and wind conditions.[5] Further, there have not been any fires associated with covered conductor caused by risk drivers that covered conductor was designed to directly address. We have also seen approximately 53% less tree-caused electrical faults[6] and a decrease of 61% in asset conditions found from inspections that require remediation, even with updating the inspection form to include additional items and conditions to inspect for.[7] However, a significant portion of our HFRA still remains unhardened where ignitions can endanger communities due to limited egress or where fires can spread rapidly and widely.

PSPS has proven to be an effective measure of last resort to reduce the risk of wildfires. Our post-event patrols from 2018-2022 found approximately 90 incidents of wind-related damage on lines de-energized during PSPS events that potentially could have caused ignitions. There were likely many more potential incidents prevented that could not be observed after the events (e.g., objects hitting the line and falling to the ground). And although SCE uses PSPS judiciously, we recognize the impact de-energizations have on our customers. As such, we have made substantial progress in our PSPS risk mitigation, with customer minutes of interruption (CMI), customer outages and circuit de-energizations dropping by over 70% from 2020-2022.[8]

Each year, we incorporated lessons learned from our fire investigations into our Wildfire Mitigation Plan. For example, when we learned that asset deterioration is not always fully observable from the ground, we supplemented our ground inspections with aerial inspections. As another example, analysis showed that one risk factor is long spans in between poles where wires could clash with each other. As such, we implemented our long span initiative to install components that reduce the chances of wire clash. Finally, when detailed analysis of ignition events showed an increase in fires started by secondary wires, we enhanced our inspections process to look specifically for those issues.

Each year, we also continuously improved our existing wildfire mitigation capabilities and strategy. For example, we refined our risk analysis to pay special attention to specific areas where traditional fire science did not fully capture risk, such as areas with heightened chances of fires driven by dry fuel and areas where limited egress or certain terrain conditions would exacerbate the consequences of a wildfire. Similarly, we refined our prioritization of grid hardening, asset inspections and vegetation management activities in alignment with our refined risk analysis. We also revisited and refreshed our protection device settings during elevated fire conditions to further reduce wildfire risk while balancing customer reliability impacts. As we scaled out our deployment of covered conductor, our cornerstone mitigation to buy down the most risk in the shortest amount of time, we also started to execute limited, targeted undergrounding to minimize to the extent practicable the risk of wildfire from those facilities. And to pave the way for the future of wildfire mitigations, we tested new technologies like Early Fault Detection (EFD) and Rapid Earth Fault Current Limiter (REFCL). We established innovative partnerships with local fire agencies to provide aerial suppression resources to limit consequences from ignitions. To limit the impacts of PSPS when it must be used, we upgraded our grid to minimize the number of customers affected and the length of each event and designed new programs to reduce the impacts to

[5] Even when using a conservative three-year rolling average, there has been a 66% and 92% reduction in acres burned and structures damaged, respectively, since 2018 despite continued extreme drought and wind conditions.

[6] Measured by three-year moving average in HFTD.

[7] Measured as Total Defect Find Rate of Top Ignition Drivers (percentage of inspections) in 2022 as compared to 2019 (inception of program) for structures inspected every year.

[8] Non-weather-normalized outcomes.

customers. Finally, we expanded our partnerships with local, state and federal agencies to enhance emergency preparedness, community engagement and the execution of our wildfire mitigation plan.

1.2 Summary of the 2023-2025 Base WMP

Goal: The primary goal of our WMP is to reduce the risk of wildfires associated with utility equipment and to reduce the scope, scale, frequency and impacts of PSPS events.

Objectives: To accomplish this goal, we have established three- and 10-year objectives for our 2023-2025 WMP that are summarized as follows:

- Reduce the likelihood that objects will contact power lines and lead to an ignition by hardening the majority of the overhead distribution system in our high fire risk area with either covered conductor (and other mitigations) or targeted undergrounding, developing an expanded transmission grid hardening strategy and continuing to maintain vegetation clearance distances for trees and vegetation that could potentially contact power lines.
- Reduce the likelihood that equipment will fail and lead to an ignition by continuing to perform asset inspection initiatives that inspect over 99% of wildfire risk in our HFRA each year and by deploying new technologies that can detect when issues on the system may arise.
- Prioritize the deployment of our mitigation initiatives to the areas that have the greatest potential to lead to the most consequential wildfire and PSPS impacts.
- Improve the efficiency and effectiveness of our vegetation management activities to reduce the risk of vegetation-caused ignitions.
- Improve the operational efficiency and effectiveness of our wildfire mitigation initiatives by enhancing program deployment strategies, leveraging information technology solutions and incorporating new technologies where possible.
- Continue to improve our situational awareness capabilities by enhancing weather and fire potential modeling and forecasting, which will aid PSPS decisions and wildfire mitigation deployment.
- Reduce the impacts of PSPS to customers, particularly those with Access and Functional Needs, through expanded customer offerings, communications and circuit-specific strategies to minimize the need for PSPS altogether.
- Maintain a comprehensive, all-hazards planning and preparedness program to: provide effective emergency response; safely and expeditiously restore service during and after a major event; and communicate effectively with customers, stakeholders and agency partners.
- Deploy new technologies and updated protection device settings to improve wildfire mitigation effectiveness while balancing reliability impacts to customers.

Framework: This WMP represents the continuous refinement, expansion and improvement in our wildfire and PSPS mitigation efforts. While many of the foundational initiatives SCE deployed over the

2020-2022 period continue into this WMP cycle, we are incorporating improvements and lessons learned into our 2023-2025 plan. Importantly, we'll continue to execute on our Integrated Wildfire Mitigation Strategy (IWMS), which further aligns grid hardening, inspections and vegetation management activities. This will reduce the risk of catastrophic wildfire by targeting locations that have historically experienced a high frequency of fires and have limited road availability for quick evacuation, are expected to experience wind and fuel conditions that exceed PSPS thresholds even after covered conductor deployment and where fire spread can be rapid and large.[9] IWMS stratifies our HFRA based on potential customer and community impacts into three tranches of risk areas: (1) Severe Risk Areas, which represent locations with the highest risks; (2) High Consequence Areas; and (3) Other HFRA, which represent areas of lower relative risk than the first two tranches.

Based on IWMS and detailed engineering reviews, we will continue to deploy covered conductor to expeditiously reduce risk across HFRA while also increasing the scope of targeted undergrounding of overhead distribution facilities in the Severe Risk Areas. In Severe Risk Areas, factors such as limited egress, terrain or fuel can create conditions that are difficult for most mitigations, except for undergrounding, to address without leaving a substantial amount of residual public safety risk. Therefore, SCE believes that undergrounding should be the primary mitigation deployed in these areas, where feasible.

In concert with continuing to harden the grid, SCE will achieve the objectives identified above by deploying a suite of complementary mitigations to achieve the greatest risk reduction most expediently while balancing affordability and reliability impacts. This suite of mitigations will include enhancements to our successful asset inspections and maintenance, vegetation management, situational awareness and customer-focused initiatives, as well as new technologies and mitigation strategies to address the residual risk drivers and consequences that have not yet been sufficiently addressed. Our 2023-2025 WMP includes 40 activities with program targets that underscore our commitment to reduce the risk of wildfires and support our communities. We highlight some of the key activities for each wildfire mitigation category below.

1.2.1 Risk Methodology and Assessment: Advancements in Risk Modeling Capabilities Will Allow for More Robust Evaluation of Mitigations at Specific Locations of the Grid

SCE's risk-informed approach is granular, data-driven and uses a multifactor risk assessment framework that informs what mitigations are implemented where and how deployment is prioritized. This level of targeted risk analysis and mitigation selection helps drive efficient allocation of resources to mitigate risk effectively. We also evaluate operational considerations such as planning, permitting and execution lead times, resource constraints, work management efficiencies, risk-reduction potential of mitigations on targeted risk drivers and regulatory compliance requirements to determine the type and volume of work to undertake.

Over the 2023-2025 period, we will update our risk models with improved machine learning (ML) models, weather and fuels information, forward-looking climate scenarios, risk reduction from completed grid hardening projects and lessons learned in collaboration with Energy Safety, stakeholders

[9] SCE targets locations where fires can grow to 300 acres in eight hours. Our analysis shows that fires of that size have the potential to grow to 10,000 acres, twice the threshold defined by Energy Safety for a catastrophic fire.

and utilities through the risk-modeling working groups. SCE will further evaluate incorporating other quantitative factors such as potential acres burned, locations with egress concerns and/or locations subject to frequent high wind and dry fuel conditions into our risk modeling. We will also incorporate the judgment of experts from areas such as fire science, risk management and system design to consider additional qualitative factors not fully captured by ignition modeling alone such as features of the terrain and direction of the wind that could influence the spread of a fire. All these factors and models are used to determine the portfolio of wildfire mitigation work to execute each year, including the type, volume and prioritization of mitigations.

1.2.2 Grid Design, Operations and Maintenance: Expanded Measures Are Expected to Further Reduce Wildfire Risk from Overhead Electric Systems

SCE has continued to refine its grid hardening approach through its IWMS, which guides our mitigation selection and deployment strategy. A key component of this approach is a segment-by-segment risk analysis of the remaining unmitigated overhead distribution lines in HFRA, with the results used to prioritize mitigation deployment across our HFRA.

SCE plans to install more than 2,850 additional circuit miles of covered conductor over this WMP period. By the end of 2025, we expect to have replaced more than 7,200 circuit miles, or approximately 75%, of distribution primary overhead conductors in HFRA with covered conductor. Covered conductor deployment is prioritized, not only by wildfire risk, but also by the probability of PSPS de-energizations for historically impacted circuits.

In Severe Risk Areas where covered conductor has not yet been deployed, SCE is undergrounding 100 miles of lines from 2023-2025 to address the high risk presented by limited egress, extreme potential consequences and other factors.

Furthermore, in this WMP period SCE will perform additional review and analysis of potential incremental mitigations to address remaining wildfire risk on the transmission system.

SCE will also be implementing, more widely, REFCL and EFD technologies, especially in locations where covered conductor has already been deployed to further reduce the risk of ignitions. REFCL helps detect and reduce energy release from a certain common class of faults while EFD facilitates locating abnormalities so that faults can be prevented proactively.

SCE also uses sensitive protection settings for over 900 circuits during elevated fire conditions for a quicker reduction in fault energy and thus lowering of ignition risk. We will upgrade relay hardware to expand the number of circuits with these protection settings. We will also continue refining our approach to balance the wildfire risk reduction benefits and potential customer outage impacts.

SCE will continue High Fire Risk Informed (HFRI) inspections and remediations in HFRA that go beyond minimum compliance requirements in scope, frequency and approach. Asset conditions and location-specific fire risks can often change between multiyear compliance intervals. Higher- frequency inspections are helping identify potential ignition risks every cycle, underscoring our program's efficacy. Detailed ground and aerial inspections are conducted to obtain 360-degree views of overhead structures and equipment. In 2023, SCE will inspect the portion of transmission and distribution structures that

comprise approximately 99% of risk. To further target risk reduction, we will also continue to perform additional inspections of assets in areas where observed risk factors associated with prevailing weather and fire conditions, such as dry fuel buildup and high winds, reach established criteria.

1.2.3 Vegetation Management and Inspections: An Improved Risk-Informed Vegetation Management Framework to Increase Efficiency and Enable Advanced Analytics

We continue to reduce the risks of vegetation contact with energized equipment by maintaining the required or recommended distance between trees and our lines, remediating trees that can fall into lines, removing dead or dying trees and clearing vegetation from around our poles. We are transitioning to an improved risk-informed inspection framework to better inform planning and prioritization of work for routine line clearing and hazard tree programs. This will allow resources to inspect vegetation grow-in risk and imminent fall-in risk at the same time to increase risk reduction and operational efficiencies. We have also implemented new software that will advance our operational and resource efficiency by streamlining scheduling and processing of the large volume of work and facilitating advanced analytics. Over this WMP period, we will also evaluate remote sensing technologies such as LiDAR and satellite imagery to assist with vegetation inspections.

1.2.4 Situational Awareness and Forecasting: Additional High-Definition Wildfire Cameras, Weather Stations, Satellite Imagery and Advanced Technology Will Boost Capabilities

SCE has made substantial progress in developing robust situational awareness and forecasting capabilities. In this WMP cycle, we will continue to advance our fire spread modeling, weather modeling and situational awareness capabilities to better predict fire weather and increase our ability to respond before and after fire and PSPS events. These advancements will allow us to more precisely target PSPS de-energization events, thereby minimizing the impact to customers while still addressing dangerous fire-threat conditions. We will deploy an additional 150 weather stations over the 2023-2025 period that will provide more granular weather data to inform our situational awareness and forecasting of potentially dangerous winds and elevated fire potential. We will also deploy additional high-definition wildfire cameras to monitor ignitions and fire progress in areas with limited coverage to expand visibility from approximately 90% today to expand coverage.

1.2.5 Emergency Preparedness: Trained Workforce Is Ready to Restore Power and Assist Customers; Aerial Suppression Resources Continue to Support Fire Agencies

SCE remains prepared to serve our customers and help them face emergencies that disrupt their electrical service. Our protocols and efforts include increased community engagement on how to prepare for such disruptions. In the event of a major emergency, we have a dedicated customer support team to assist impacted customers via customer communications before, during and after events and enhanced customer care programs. We also have a dedicated and trained Incident Management Team (IMT) to manage the emergency response. Our highly qualified workforce is trained on protocols to restore power safely and quickly after events. And after each event, we have a process in place to learn and improve on our response.

Finally, in 2023, we are expanding our partnership with fire agencies in our service area by maintaining a quick reaction force (QRF) of aerial firefighting resources year-round. These include helitankers, a reconnaissance aircraft and equipment to bolster firefighting capabilities to reduce a fire's consequence, provide service resilience to our customers and protect electrical infrastructure during fires. SCE will continue to reevaluate its funding agreement with Los Angeles, Orange and Ventura fire agencies annually.

1.2.6 Community Outreach and Engagement: Strong Partnerships Increase Outreach to Access and Functional Needs (AFN) Customer Groups

We are continuing to work closely with our customers, local and tribal government agencies, fire agencies, community-based organizations (CBOs) and other utilities for emergency planning, incident management and outreach. Over this WMP period, we will continue to focus much of our engagement efforts on vulnerable communities and communities heavily impacted by PSPS and will evaluate and refine our stakeholder coordination and customer outreach approaches based on feedback received from these stakeholders. We will also partner with telecommunications providers to help minimize the potential for service disruption to communities impacted by PSPS. In addition, we are actively collaborating with state, national and global utilities, industry groups and research organizations to benchmark and share best practices and information.

1.2.7 Public Safety Power Shutoff: SCE Continues Its Goal to Reduce PSPS Impacts with Urgency

PSPS is a necessary mitigation to protect public safety under extreme conditions. Though the frequency and scope of PSPS events are lessening as we execute our WMP activities, PSPS remains available as a tool of last resort when dry fuel levels and windspeeds pose significant threat of fire spread in case of any ignition. However, we recognize the impact that such events can have on our customers and communities. Keeping the lights on, and everything else electricity powers, is in our DNA, and we do not take lightly any decision to proactively de-energize portions of the grid. We have taken to heart the lessons from past PSPS events, and the feedback received from customers, cities, regulators, legislators and other partners, and we are working persistently to make several modifications to the process.

Our highly trained PSPS IMT plans and executes protocols designed to maximize a de-energization event's effectiveness while reducing the impact to customers by removing specific circuit-segments from scope through sectionalizing where possible and facilitating the swift and safe restoration of power.

Over 2023-2025, SCE will continue targeted grid hardening to reduce impacts to customers who have historically experienced PSPS and continue improvements to send timely external communication notifications. We are implementing end-to-end automation solutions to streamline PSPS event management and improve accuracy and speed of customer and public safety partner notifications.

We will also continue to make available temporary backup generators to select customers, not only during PSPS events, but also during maintenance outages required to implement our WMP. We will

expand on successful customer program offerings, with a special focus on AFN customers who rely on a medical device or assistive technology for independence, health or safety during a PSPS de-energization. We will continue to refine our grid protocols and customer-notifications processes to address specific concerns and feedback from county partners. We are also collaborating with heavily impacted communities for education, outreach and critical infrastructure planning support to help other entities providing critical services to be more resilient.

1.2.8 SCE Continues to Advance Its Wildfire Capability Maturity

As described above, SCE has and will continue to make progress in developing our wildfire mitigation capabilities. We continue to support the refinement and utilization of a wildfire mitigation capability maturity model to measure this progress. This will also help us identify and share best practices and continually improve to combat the risk of utility-caused wildfires. However, we note that this year's model survey is completely different from the previous three years, and thus the scores from this year cannot be compared to prior year scores. Further, due to this year's maturity model utilizing questions that are not always relevant to utility operations, some expectations that are operationally impractical, and a minimum scoring methodology, our scores do not accurately capture our actual and expected maturity levels, especially regarding our actual and expected progress in reducing wildfire risks. We have made significant advancements since 2018 in executing our wildfire mitigation plans and are observing the benefits as described above. The scope included in this WMP will further reduce the remaining risks that can potentially have significant consequences for our customers and communities.

1.2.9 Conclusion

SCE has implemented critical mitigations to protect our customers and communities from the threat of wildfires. At the same time, SCE is aware that there are still areas for improvement and more work that needs to be done. Our 2023-2025 WMP builds upon our significant progress made and lessons learned regarding wildfire mitigation since 2018. This plan demonstrates the significant increase in maturity of our wildfire mitigation program over the past four years and provides an integrated risk-informed approach to continue to reduce the remaining wildfire risk and PSPS impacts in our service area. Finally, our wildfire mitigation efforts will add resiliency to the electric system as we navigate a changing climate and a move toward increased electrification in the economy.

We appreciate the opportunity to provide our 2023-2025 WMP for Energy Safety's consideration and look forward to continuing our work with state and federal policymakers, local and tribal government officials, public safety partners, community-based organizations and other stakeholders to help build a safer and more resilient California.

2 RESPONSIBLE PERSONS

The electrical corporation must list those responsible for executing the WMP, including:

- *Executive-level owner with overall responsibility*
- *Program owners with responsibility for each of the main components of the plan*
- *As applicable, general ownership for questions related to or activities described in the WMP*

Titles, credentials, and components of responsible person(s) must be released publicly. Electrical corporations can reference the WMP Process and Evaluation Guidelines and California Code of Regulations Title 14 section 29200 for the submission process of any confidential information.

Jill Anderson, Executive Vice President of Operations at SCE, has overall responsibility for this Wildfire Mitigation Plan. The table below details the program owners with responsibility for each of the main components of the plan. Questions related to activities described in this plan can be submitted to SCE through the following email address: wildfires@sce.com.

Table SCE 2-01 – Responsible Persons

Section	Title	Program Owner
1	Executive Summary	Rajdeep Roy, Director, Wildfire Safety
2	Responsible Persons	Jill C. Anderson, Executive VP, Operations
3	Statutory Requirement Checklist	Gary Chen, Director, Safety & Infrastructure Policy
4	Overview of WMP	Rajdeep Roy, Director, Wildfire Safety
5	Overview of the Service Territory	Don Daigler, Managing Director, Business Resiliency (Weather and Climate components) Robert LeMoine, Director, Enterprise Risk Management & Public Safety (Risk-Related components)
6	Risk Methodology and Assessment	Robert LeMoine, Director, Enterprise Risk Management & Public Safety
7	Wildfire Mitigation Strategy Development	Rajdeep Roy, Director, Wildfire Safety
8	Wildfire Mitigations	Rajdeep Roy, Director, Wildfire Safety
8.1	Grid Design, Operations, and Maintenance	Ray Fugere, Principal Manager, Wildfire Mitigation Strategy
8.2	Vegetation Management and Inspection	Terry Ohanian, Director, Vegetation and Land Management

3 STATUTORY REQUIREMENTS CHECKLIST

This section provides a checklist of the statutory requirements for a WMP as detailed in Public Utilities Code section 8386(c). By completing the checklist, the electrical corporation affirms that its WMP addresses each requirement.

For each statutory requirement, the checklist must include a reference and hyperlink to the relevant section and page number in the WMP. Where multiple WMP sections provide the information for a specific requirement, the electrical corporation must provide references and hyperlinks to all relevant sections. Unique references must be separated by semicolons, and each must include a brief summary of the contents of the referenced section (e.g., Section 5, pp. 30–32 [workforce]; Section 7, p. 43 [mutual assistance]).

SCE provides a checklist of the statutory requirements for its WMP in Table 3-1 below.

Table 3-1 - Statutory Requirements Checklist

PUC Section 8386	Description	WMP Section/ Page
(c)(1)	An accounting of the responsibilities of persons responsible for executing the plan	Section 2 (Responsible Persons), pp. 10-12
(c)(2)	The objectives of the WMP	Section 1 (Executive Summary), pp. 4 Section 4 (Overview of WMP), pp. 20-21 Section 7 (Wildfire Mitigation Strategy Development), Table 7-3, pp. 219-220
(c)(3)	A description of the preventive strategies and programs to be adopted by the electrical corporation to minimize the risk of its electrical lines and equipment causing catastrophic wildfires, including consideration of dynamic climate change risks	Section 5.3.4.2 Climate Change Phenomena and Trends (5.3.4.2 Climate Change Phenomena and Trends), pp. 56-66; Section 6.2.1 (Risk and Risk Component Identification), pp. 95-122; Section 6.3.2 (Extreme-Event/High Uncertainty Scenarios), pp. 154-157; Section 7.2.1, pp. 215-220 (Overview of Mitigation Initiatives and Activities); Section 8.1.2 (Grid Design and System Hardening), pp. 250-342; Section 8.2 (Vegetation Management and Inspections), pp. 374-438; Section 8.3 (Situational Awareness and Forecasting), pp. 445-520; Section 9 (Public Safety Power Shutoff (PSPS)), pp. 610-636

PUC Section 8386	Description	WMP Section/ Page
(c)(4)	A description of the metrics the electrical corporation plans to use to evaluate the plan's performance and the assumptions that underlie the use of those metrics	Targets: Section 8.1 (Grid Design, Operations, and Maintenance), pp.237-244; Section 8.2 (Vegetation Management and Inspections), pp. 377-383; Section 8.3 (Situational Awareness and Forecasting), pp. 448-452; Section 8.4 (Emergency Preparedness), pp. 522-528; Section 8.5 (Community Outreach and Engagement), pp. 578-582; Section 9 (Public Safety Power Shutoff (PSPS), pp. 617 -621 Performance Metrics: Section 8.1 (Grid Design, Operations, and Maintenance), pp. 246-248; Section 8.2 (Vegetation Management and Inspections), pp. 382-386; Section 8.3 (Situational Awareness and Forecasting), pp. 451-454; Section 8.4 (Emergency Preparedness), pp. 527-531; Section 8.5 (Community Outreach and Engagement), pp. 581-584; Section 9 (Public Safety Power Shutoff (PSPS), pp. 620-624
(c)(5)	A discussion of how the application of previously identified metrics to previous plan performances has informed the plan	Section 1 (Executive Summary), pp. 1-4; Section 4 (Overview of WMP), pp. 23-29; Section 10 (Lessons Learned), pp. 635-640 Section 11 (Corrective Action Plan), pp. 650-659
(c)(6)	A description of the electric corporation's protocols] for disabling reclosers and deenergizing portions of the electrical distribution system that consider the associated impacts on public safety. As part of these protocols, each electrical corporation shall include protocols related to mitigating the public safety impacts of disabling reclosers and deenergizing portions of the electrical distribution system that consider the impacts on all of the aspects listed in PU Code 8386[(c)(6)(A)-(D)].	Section 8.3.3 (Grid Monitoring Systems– Existing Systems, Technologies, and Procedures), pp. 467-480; Section 9.2 (Protocols on PSPS), pp. 623-635

	corporation's transmission infrastructure, for instances when the deenergization may impact customers who, or entities that, are dependent upon the infrastructure. The protocols shall comply with any order of the commission regarding deenergization events.	
(c)(12)	A list that identifies, describes, and prioritizes all wildfire risks, and drivers for those risks, throughout the electrical corporation's service territory, including all relevant wildfire risk and risk mitigation information that is part of the Safety Model Assessment Proceeding [(A.15-05-002, et al.)] and the Risk Assessment Mitigation Phase filings. [The list shall include, but not be limited to, both of the following: (A) Risk and risk drivers associated with design, construction, operations, and maintenance of the electrical corporation's equipment and facilities and (B) Particular risks and risk drivers associated with topographic and climatological risk factors throughout the different parts of the electrical corporation's service territory.	Section 6 (Risk Methodology and Assessment), pp. 89-180; Section 7 (Wildfire Mitigation Strategy Development), pp. 181-229; Appendix F: Supplemental Information (F2: Continuation of Section 7 Wildfire Mitigation Strategy Development) pp. 824-850
(c)(13)	A description of how the plan accounts for the wildfire risk identified in the electrical corporation's Risk Assessment Mitigation Phase filing	Section 6 (Risk Methodology and Assessment), pp. 89-180; Section 7 (Wildfire Mitigation Strategy Development), pp. 181-229
(c)(14)	A description of the actions the electrical corporation will take to ensure its system will achieve the highest level of safety, reliability, and resiliency, and to ensure that its system is prepared for a major event, including hardening and modernizing its infrastructure with improved engineering, system design, standards,	Section 7 (Wildfire Mitigation Strategy Development), pp. 181-229; Section 8.1.2 (Grid Design, Operations, and Maintenance), pp. 250-277; Section 8.1.3 (Asset Inspections), pp. 279-313; Section 8.1.4 (Equipment, Maintenance and Repair), pp. 313-319; Section 8.4 (Emergency Preparedness), pp. 518-576

PUC Section 8386	Description	WMP Section/ Page
	equipment, and facilities, such as undergrounding, insulation of distribution wires, and pole replacement	
(c)(15)	A description of where and how the electrical corporation considered undergrounding electrical distribution lines within those areas of its service territory identified to have the highest wildfire risk in a commission fire threat map	Section 8.1.2.2 (Undergrounding of Electric Lines and/or Equipment), pp. 256-257
(c)(16)	A showing that the electrical corporation has an adequately sized and trained workforce to promptly restore service after a major event, taking into account employees of other utilities pursuant to mutual aid agreements and employees of entities that have entered into contracts with the electrical corporation	Section 8.4 (Emergency Preparedness), pp. 539-548, 552-557, 558-560; Section 8.1.9 (Workforce Planning), pp. 341-374
(c)(17)	An identification of any geographic area in the electrical corporation's service territory that is a higher wildfire threat than is currently identified in a commission fire threat map, and where the commission must consider expanding the high fire threat district based on new information or changes in the environment	Section 5.3.3 High Fire Threat Districts, pp. 51-53; Section 6.4.1.2 (Proposed Updates to the HFTD), pp. 159-162.
(c)(18)	A methodology for identifying and presenting enterprise-wide safety risk and wildfire-related risk that is consistent with the methodology used by other electrical corporations unless the commission determines otherwise	Section 4.4.1 (SCE's Risk-Informed Framework), pp. 23-29; Section 6 (Risk Methodology and Assessment), pp. 89-180 Section 7 (Wildfire Mitigation Strategy Development), pp. 181-229
(c)(19)	A description of how the plan is consistent with the electrical corporation's disaster and emergency preparedness plan prepared pursuant	Section 8.4 (Emergency Preparedness), pp 518-576; Section 8.4.3 (External Collaboration and Coordination), pp. 550-559; Section 8.4.5 (Preparedness and

PUC Section 8386	Description	WMP Section/ Page
	to Section 768.6, including [both of the following: (A) Plans to prepare for, and to restore service after, a wildfire, including workforce mobilization and prepositioning equipment and employees and (B) Plans for community outreach and public awareness before, during, and after a wildfire, including language notification in English, Spanish, and the top three primary languages used in the state other than English or Spanish, as determined by the commission based on the United States Census data.]	Planning for Service Restoration), pp. 564-571; Section 8.5.2 (Public Outreach and Education Awareness Program), pp. 583-602
(c)(20)	A statement of how the electrical corporation will restore service after a wildfire	Section 8.4.5.1 (Overview of Service Restoration Plan), pp. 564-568
(c)(21)	Protocols for compliance with requirements adopted by the commission regarding activities to support customers during and after a wildfire, outage reporting, support for low-income customers, billing adjustments, deposit waivers, extended payment plans, suspension of disconnection and nonpayment fees, repair processing and timing, access to electrical corporation representatives, and emergency communications	Section 8.4.6 (Customer Support in Wildfire and PSPS Emergencies), pp. 570-576
(c)(22)	A description of the processes and procedures the electrical corporation will use to do the following: (A) Monitor and audit the implementation of the plan. (B) Identify any deficiencies in the plan or the plan's implementation and correct those deficiencies. (C) Monitor and audit the effectiveness of electrical line and equipment inspections, including inspections performed by contractors,	Section 8.1.6 (Quality Assurance and Quality Control) pp. 325-327; Section 8.2.5 (Vegetation Management) pp. 428-434 ; Section 11 (Corrective Action Program) pp. 650-659

PUC Section 8386	Description	WMP Section/ Page
	carried out under the plan and other applicable statutes and commission rules.	

4 Overview of WMP

4.1 Primary Goal

Each electrical corporation must state the primary goal of its WMP. At a minimum, the electrical corporation must affirm its compliance with California Public Utilities Code section 8386(a):

> *Each electrical corporation shall construct, maintain, and operate its electrical lines and equipment in a manner that will minimize the risk of catastrophic wildfire posed by those electrical lines and equipment.*

In accordance with Section 8386(a) of the California Public Utilities Code, SCE constructs, maintains, and operates its electrical lines and equipment in a manner that will minimize the risk of catastrophic wildfire posed by those electrical lines and equipment. SCE's WMP represents a holistic approach to continue to maintain this compliance, while also balancing customer affordability, reliability, and the impacts to customers from the deployment of wildfire risk mitigation activities, including PSPS. Further, SCE's wildfire mitigation portfolio also considers the impacts associated with fires that may not be categorized as catastrophic but still can present serious impacts to our customers and communities.

4.2 Plan Objectives

In this section, the electrical corporation must summarize its plan objectives over the 2023- 2025 WMP cycle. Plan objectives are determined by the portfolio of mitigation initiatives proposed in the WMP.

The primary objective of our 2023-2025 WMP is to reduce the risk of wildfires associated with utility equipment and to reduce the scope, scale, frequency, and impacts of PSPS events. Our 2023-2025 WMP includes 40 mitigation initiatives designed to help achieve this objective. SCE will strive to meet or exceed our projected targets for these initiatives over this three-year period.[10]

SCE has established 3- and 10-year objectives for each WMP initiative category. Table SCE 7-03 provides an aggregated list of these objectives grouped by each WMP initiative category. Further detail on each objective is provided within Sections 8 and 9 for each respective WMP category.[11] In Section 1, SCE summarized these plan objectives as follows:

- Reduce the likelihood that objects will contact power lines and lead to an ignition by hardening most of the overhead distribution system in our high fire risk area with either covered conductor or targeted undergrounding, developing an expanded transmission grid hardening strategy, and continuing to maintain vegetation clearance distances for trees and vegetation that could potentially contact power lines.
- Reduce the likelihood that equipment will fail and lead to an ignition, by continuing to perform asset inspection initiatives that inspect over 99% of wildfire risk in our HFRA each year and by deploying new technologies that can detect when issues on the system may arise.

[10] Annual targets for these initiatives can be found in the respective Targets tables contained in Sections 8 and 9, and within Table 1 of SCE's Quarterly Data Report – Wildfire Mitigation Data Tables.

[11] See Table 8-1 and Table 8-02(Grid Design, Operations, and Maintenance objectives), Table 8-12 and Table 8-13 (Vegetation Management and Inspections objectives), Table 8-21and Table 8-22 (Situational Awareness and Forecasting objectives), Table 8-33 and Table 8-34 (Emergency Preparedness objectives), Table 8-53 and Table 8-54 (Community Outreach and Engagement objectives), and Table 9-3 and Table 9-4 (PSPS objectives).

- Prioritize the deployment of our mitigation initiatives to the areas that have the greatest potential to lead to the most consequential wildfire and PSPS impacts.
- Improve the efficiency and effectiveness of our vegetation management activities to reduce the risk of vegetation-caused ignitions.
- Improve the operational efficiency and effectiveness of our wildfire mitigation initiatives by enhancing program deployment strategies, leveraging information technology solutions, and incorporating new technologies where possible.
- Continue to improve our situational awareness capabilities by enhancing weather and fire potential modeling and forecasting, which will aid PSPS decisions and wildfire mitigation deployment.
- Reduce the impacts of PSPS to customers, particularly those with Access and Functional Needs, through expanded customer offerings, communications, and circuit-specific strategies to minimize the need for PSPS altogether.
- Maintain a comprehensive, all-hazards planning and preparedness program to: provide effective emergency response; safely and expeditiously restore service during and after a major event; and communicate effectively with customers, stakeholders, and agency partners.
- Deploy new technologies and updated protection device settings to improve wildfire mitigation effectiveness while balancing reliability impacts to customers.

4.3 Proposed Expenditures

Each electrical corporation must summarize its projected expenditures in thousands of U.S. dollars per year for the next three-year WMP cycle, as well as the planned and actual expenditures from the previous three-year WMP cycle (e.g., 2020–2022), in both tabular and graph form.

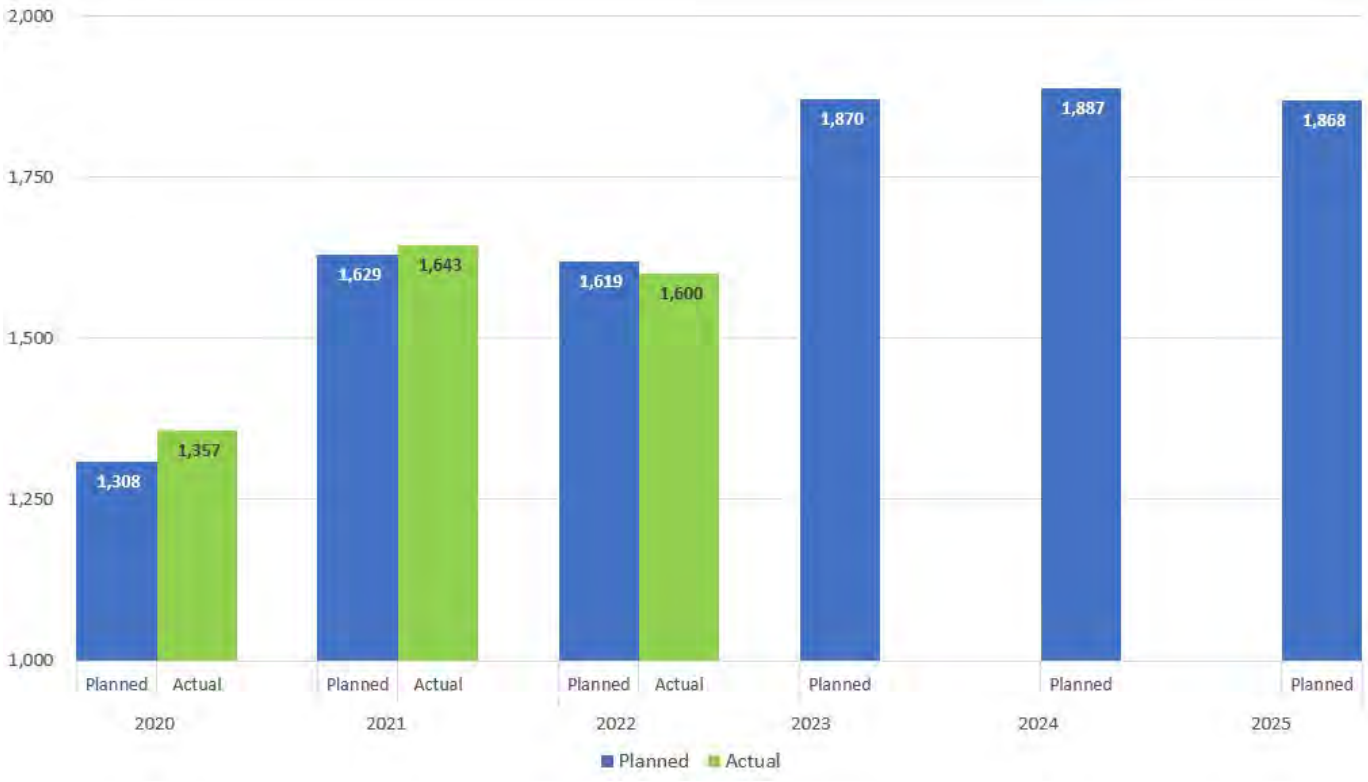

Table 4-1 provides an example of the minimum acceptable level of information summarizing an electrical corporation's WMP expenditures. The financials represented in the summary table equal the aggregate spending listed in the financial tables of the QDR (see the Energy Safety Data Guidelines). Energy Safety's WMP evaluation, including approval or denial, must not be construed as approval of, or agreement with, costs listed in the WMP.

Table 4-1 and Figure SCE 4-01 provide a summary of expenditures for SCE's 2020-2022 and 2023-2025 WMP cycles.

Table 4-1 - Summary of WMP Expenditures[12]

Year	Spend (thousands $USD)
2020	Planned (as reported in 2020 WMP update) = $1,308,269 Actual = $1,356,923 ±△ = $48,654
2021	Planned (as reported in 2021 WMP Update) = $1,629,377 Actual = $1,642,980 ±△ = $13,603
2022	Planned (as reported in 2022 WMP Update) = $1,619,252 Actual = $1,599,912 ±△ = $19,340
2023	Planned = $1,869,997
2024	Planned = $1,887,446
2025	Planned = $1,867,889

Figure SCE 4-01 - Graph of WMP Expenditures

[12] The summary of WMP Expenditures reflects direct capital and O&M costs for wildfire activities which correspond to the HFTD spend as shown in Table 11 of the QDR. The dollars are nominal.

4.4 Risk-Informed Framework

The electrical corporation must adopt a risk-informed approach to developing its WMP. The purposes of adopting this approach are as follows:

- *To develop a WMP that achieves an optimal level of life safety, property protection, and environmental protection, while also being in balance with other performance objectives (e.g., reliability and affordability)*
- *To integrate risk modeling outcomes with a range of other performance objectives, methods, and subject matter expertise to inform decision-making processes and the spatiotemporal prioritization of mitigations*
- *To target mitigation efforts that prioritize the highest-risk equipment, wildfire environmental settings, and assets-at-risk (e.g., people, communities, critical infrastructure), while still satisfying other performance objectives defined by the California Public Utilities Commission (CPUC) (e.g., reliability and affordability)*
- *To provide a decision-making process that is clear and transparent to internal and external stakeholders, including clear evaluation criteria and visual aids (such as flow charts or decision trees)*

The risk-informed approach adopted by the electrical corporation must, at a minimum, incorporate several key components, described below. In addition, the evaluation and management of risk must include consideration of a broad range of performance objectives (e.g., life safety, property protection, reduction of social vulnerability, reliability, resiliency, affordability, health, environmental protection, public perception, etc.), integrate cross- disciplinary expertise, and engage various stakeholder groups as part of the decision-making process.

The risk-informed approach must have seven minimum components, as described in Table 4-2.

Table 4-2 - Risk-Informed Approach Components

Risk-Informed Approach Component	***Brief Description***
1. Goals and plan objectives	*The first step in the risk-informed approach is to identify the primary goal(s) and plan objectives of the electrical corporation's WMP. These goals and objectives are electrical corporation-specific and must be defined and described in Sections 4.1 and 4.2.*
2. Scope of application (i.e., electrical corporation service territory)	*The second step is to define the physical characteristics of the system in terms of its major elements: electrical corporation service territory characteristics, electrical infrastructure, wildfire environmental settings, and various assets-at-risk (e.g., communities and people, property, critical infrastructure, cultural/historical resources, environmental services). Knowledge and understanding of how individual system elements interface are essential to this step. Sections 5–5.4 provide instructions on what electrical corporations must present regarding physical traits, environmental characteristics, and potential assets at risk in their service territory.*

Risk-Informed Approach Component	***Brief Description***
3. Hazard identification	*The third step is to identify hazards and determine their likelihoods. Section 6.2.1 provides instructions on hazard identification.*
4. Risk scenario identification	*The fourth step, based on the context and desired values, is to develop risk scenarios that could lead to an undesirable event. Risk scenario techniques that may be employed include event tree analysis, fault tree analysis, preliminary hazard analysis, and failure modes and effects analysis. Section 6.3 provides instructions on risk scenario identification.*
5. Risk analysis (i.e., likelihood and consequences)	*The fifth step is to evaluate the likelihood and consequences of the identified risk scenarios to understand the potential impact on the desired goal(s) and plan objectives. The consequences are based on an array of risk components that are fundamental to overall utility risk, wildfire risk, and PSPS risk given the electrical corporation's scope of application and portfolio of wildfire mitigation initiatives. Section 6.2.2 provides instructions on risk analysis.*
6. Risk presentation	*The sixth step is to consider how the risk analysis is presented to the various stakeholders involved. Section 6.4 provides instructions on risk presentation.*
7. Risk evaluation	*After the risk analysis is complete, hazards can be resolved by either assuming the risk associated with the hazards or eliminating or controlling the hazards.* *Risk evaluation includes identification of criteria and procedures for identifying critical risk both spatially and temporally. Risk evaluation must also include, as a minimum, evaluating the seriousness, manageability, urgency, and growth potential of the wildfire hazard/risk. Risk evaluation should be used to determine whether the individual hazard/risk should be mitigated. Risk evaluation and risk-informed decision making should be done using a consensus approach involving a range of key stakeholder groups. Section 7 provides instructions for risk evaluation or risk-informed decision making.*
8. Risk mitigation and management	*In the final step, the electrical corporation must identify which risk management strategies are appropriate given practical constraints such as limited resources, costs, and time. The electrical corporation must indicate the high-level risk management approach, as determined in Step 7. The electrical corporation must identify risk mitigation initiatives (or a portfolio of initiatives) and prioritize their spatial and temporal implementation. This step includes consideration of what risk mitigation strategies are appropriate and most effectively meet the intent of the WMP goal(s) and plan objectives, while still in balance with other performance objectives. It also includes the procedures and strategies to develop, review, and execute schedules for implementation of mitigation initiatives and activities (as well as interim mitigation initiatives). Section 8*

Risk-Informed Approach Component	*Brief Description*
	provides instructions for reporting on initiatives to mitigate identified risks.

4.4.1 SCE's Risk-Informed Framework

SCE's risk-informed planning framework is anchored in SCE's Enterprise Risk Management (ERM) process. ERM annually identifies and evaluates the key risks that SCE and its customers face, with a focus on safety, such as wildfire risk. SCE uses a multi-step process that includes both a top-down and bottoms-up approach, as described below.

- Top-down review of enterprise-level risks: This effort assesses the breadth of activities ongoing at SCE, in California, and in the utility industry to identify key risks. It includes a review of utility benchmarking, industry trends and research, public policy efforts, legislative activities, CPUC, Energy Safety and other regulatory proceedings, major SCE initiatives, and critical business functions. The team also compiles and assesses feedback on current and emerging enterprise-level risks through company-wide surveys and direct discussions with SCE leadership.
- Bottom-up review of SCE's Enterprise Risk Register: SCE's ERM function maintains an enterprise risk register that captures and assesses risks from across the enterprise, based on interviews and feedback from working groups throughout the organization, including from engineering analyses and field observations.[13] New risks are also identified based on benchmarking and emerging trends in the industry.
- Consolidation and aggregation: SCE aggregates the risks identified through the above processes to evaluate which risks have potential major safety consequences, includingconsolidation of duplicate and similar risks.
- Review and refinement with senior leadership: Through leadership review and assessment, further refinements are made as appropriate.

SCE's risk-informed approach builds upon past practices, lessons learned, and stakeholder input. In our 2021[14] and 2022 WMP Updates,[15] SCE detailed our risk-informed decision-making process to select and deploy SCE initiatives that mitigate wildfire and PSPS risks. We included a diagram that illustrates SCE's approach to risk-informed decision-making when assessing and selecting wildfire and PSPS mitigations

[13] For example, SCE's Fire Investigation Preliminary Analysis (FIPA) and Repair Order Review processes provide cause analysis and engineering reviews of risk events on the system. These are detailed in SCE's Corrective Action Program in Section 11.

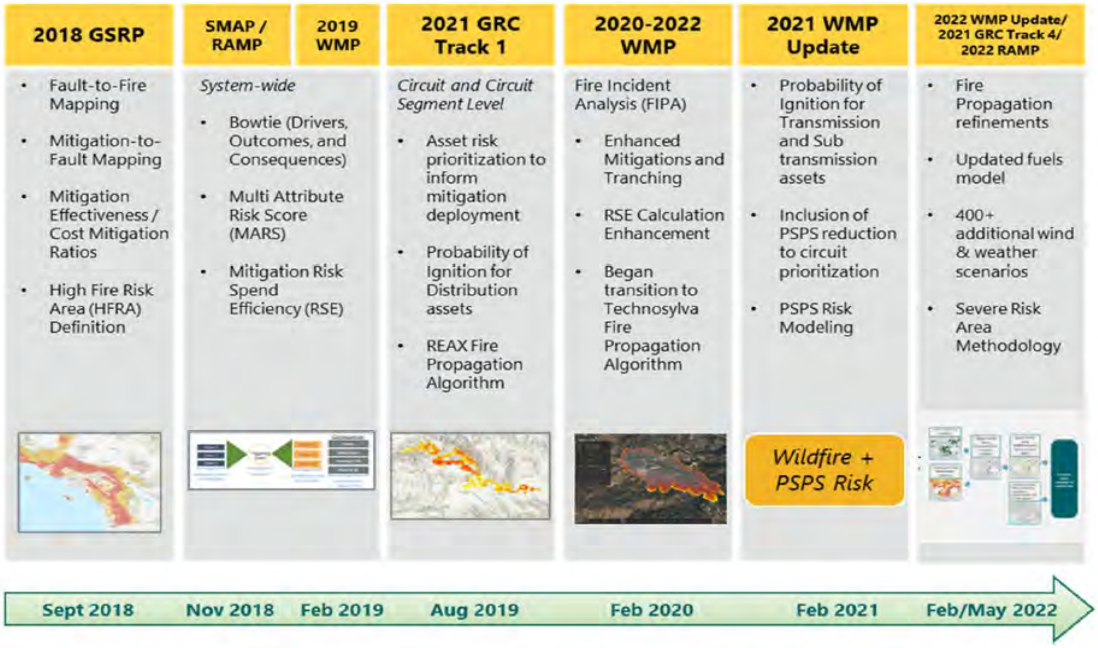
[14] This was initially provided as part of response with regard to Critical Issue SCE-02 in SCE's Revised 2021 WMP Update, which can be retrieved from SCE's WMP webpage (https://www.sce.com/safety/wild-fire-mitigation). Within the document, please refer to SCE's response to Critical Issue SCE-02. In its Final Action Statement, OEIS found that SCE's response for Critical Issue SCE-02 "adequately addressed all parts of this critical issue" and that SCE's work product "brings clarity to the decision-making process by illustrating factors such as 'risk reduced' and 'RSE' are weighted more heavily than 'operational feasibility' and 'compliance requirement.'" (See OEIS Final Action Statement, pp. 87, 89).

[15] See Section 7.1.2 of SCE's 2022 WMP Update.

and prioritizing deployment for selected activities.

Broadly speaking, the process includes four major stages: First, we evaluate or reassess, and then prioritize, wildfire and PSPS risks. Second, we identify the various mitigation alternatives for mitigating the risk. Third, we evaluate the mitigations and then select the appropriate mitigation(s) from the alternatives using decision-making factors. Fourth, we prioritize, scope and deploy the chosen mitigation(s). We then continue to monitor deployments in light of relevant conditions or circumstances, and we strive to improve through lessons learned, data analysis, performance reviews, and feedback from our customers, regulators, and other stakeholders. SCE provides further detail on this process in Section 7.

Application of this process for each wildfire mitigation activity may vary depending on the unique characteristics of the mitigation activities. While specific processes and steps continue to evolve as we build out our asset management capabilities, the planning framework generally captures the key elements of the process. With each WMP cycle, SCE's overall risk-informed decision-making process is maturing in the level of quantitative analysis performed, granularity of analysis, and consistent application across the enterprise.



In this WMP, SCE details its Integrated Wildfire Mitigation Strategy Risk Framework (IWMS Risk Framework or IWMS), which further aligns our wildfire mitigation activities in a risk-informed framework. IWMS reduces the risk of catastrophic wildfire by targeting locations that have historically experienced a high frequency of fires and have limited road availability for quick evacuation, are expected to experience wind and fuel conditions that exceed PSPS thresholds even after covered conductor deployment, and where fire spread can be rapid and large. Section 6 and Section 7 detail how SCE has built upon the foundational risk modeling advancements made in the past five years, to include these new risk factors and to prioritize mitigations to those areas that present the most consequential risk.

SCE's IWMS Risk Framework is granular, data-driven, and uses a multi-factor risk assessment approach that combines quantitative risk analysis with expert human judgment to inform how mitigations are identified, evaluated, prioritized, and implemented. This level of targeted risk analysis and mitigation selection helps drive efficient allocation of resources to mitigate risk in an effective manner. As part of this framework, we evaluate operational considerations such as planning, permitting and execution lead times, resource constraints, work management efficiencies, risk-reduction potential of mitigations on targeted risk drivers, and regulatory compliance requirements to determine the type and volume of work to undertake.

4.4.2 Evolution of SCE's Wildfire and PSPS Risk Modeling

A risk-informed framework has been a cornerstone in the development and execution of our WMPs and has matured over time. This framework is rooted in an evolving set of risk modeling capabilities which inform our evaluation of risk and selection of mitigations. Figure SCE 4-02 traces the key advancements in our wildfire and PSPS risk modeling over the past few years.

Figure SCE 4-02 - Evolution of SCE's Wildfire (and PSPS) Risk Modeling[16]

In 2018, we used a multi-step process to develop our Risk Assessment Mitigation Phase (RAMP) report, which contained nine top safety risks, including wildfire. SCE developed a Multi-Attribute Risk Score (MARS) framework (SCE's version of a Multi Attribute Value Function (MAVF)) to quantify our enterprise-level risks and evaluate mitigation options).

SCE's MARS framework aligns with the methodology approved in the California Public Utilities Commission's (CPUC) Safety Model and Assessment Proceeding (S-MAP). This analysis informed SCE's 2018 Grid Safety and Resiliency Plan (GSRP), which presented an initial set of wildfire mitigations to address the growing threat of wildfires, and 2019 WMP. In parallel, we developed the Wildfire Risk Model (WRM) which was used to determine probability and consequence of ignitions at the asset level. SCE used this granular risk analysis to risk rank circuit segments and prioritize mitigation installations, in conjunction with other operational considerations (e.g., permitting and resource constraints). The results of these analyses were included in SCE's Test Year 2021 GRC and 2020 WMP.

In 2020, SCE achieved several key milestones in enhancing our wildfire risk analytics. We developed asset-specific POI models for transmission and sub-transmission assets to add to our previously built distribution asset models. SCE also transitioned to a new fire consequence modeling tool developed by Technosylva. We developed a method to translate the risk scores produced by our Probability of Ignition (POI) and consequence models into unitless risk scores using the MARS framework at the structure (pole or tower) level. SCE also developed a PSPS risk calculation to more comprehensively account for PSPS risk reduction benefits, as well as risks associated with use of PSPS for individual circuit segments.

In 2021, SCE updated its asset-specific POI model by using the latest asset and weather data and algorithms. At the same time, SCE updated the Technosylva fire consequence model by including

[16] GSRP: Grid Safety and Resiliency Plan; SMAP: Safety Model and Assessment Proceeding; RAMP: Risk Assessment Mitigation Phase .

additional historical weather scenarios and most up-to-date fuel conditions including recent burn scars to better capture the potential fire consequences. In 2021 and through 2022, SCE also participated in several Energy Safety-led joint utility workshops to further inform how individual utilities perform risk modeling. SCE details its risk modeling capabilities and further advancements made in Section 6.

4.4.3 Adherence to Risk-Informed Framework

SCE's risk-informed planning framework is aligned with the eight-step risk-informed framework defined in the guidelines. SCE addresses each component of that framework and describes our approach for each in this WMP. Table SCE 4-01 summarizes where further detail on each component can be found in this WMP.

Table SCE 4-01 - Risk-Informed Framework

Risk-Informed Approach Component	Pertinent Section(s) of SCE's 2023-2025 WMP
1. Goals and plan objectives	Sections 4.1 and 4.2, where SCE identifies primary goal(s) and plan objectives of its WMP.
2. Scope of application	Sections 5– 5.4, where SCE defines the physical characteristics of its system in terms of its major elements: service territory characteristics, electrical infrastructure, wildfire environmental settings, and various assets at risk (e.g., communities and people, property, critical infrastructure, cultural/historical resources, environmental services).
3. Hazard identification	Section 6.2, where SCE identifies hazards and determines their likelihoods.
4. Risk scenario identification	Section 6.3, where SCE describes the risk scenarios used in its analysis.
5. Risk analysis	Section 6.2 and 6.3, where SCE calculates the likelihood and consequences under the identified risk scenarios to develop a risk-informed basis for its approach to the WMP goal and objectives.
6. Risk presentation	Section 6.4, where SCE presents the results of the risk analysis.
7. Risk evaluation	Section 7, where SCE evaluates the identified risk and details its risk-informed decision-making framework.

Risk-Informed Approach Component	Pertinent Section(s) of SCE's 2023-2025 WMP
8. Risk mitigation and management	Sections 7, 8, 9, where SCE identifies which risk management strategies are appropriate given practical constraints such as limited resources, costs, and time. SCE also identifies risk mitigation initiatives (and a portfolio of initiatives) and prioritizes their spatial and temporal implementation. This includes consideration of which risk mitigation strategies are appropriate and most effectively meet the intent of the WMP goal and plan objectives, while still balancing other performance objectives.

5 Overview of the Service Territory

In this section of the WMP, the electrical corporation must provide a high-level overview of its service territory and key characteristics of its electrical infrastructure. This information is intended to provide the reader with an understanding of the physical and technical scope of the electrical corporation's WMP. Sections 5.1 - 5.4 below provide detailed instructions.

5.1 Service Territory

The electrical corporation must provide a high-level description of its service territory, addressing the following components:[17]

- *Area served (in square miles)*
- *Number of customers served*

The electrical corporation must provide a geospatial map that shows its service territory (polygons) and distribution of customers served (raster or polygons). This map should appear in the main body of the report.

Table 5-1 provides a template for presenting the required high-level service territory statistics.

Southern California Edison (SCE) is one of the nation's largest electric utilities. It serves approximately 15.6[18] million people (5.2 million customer accounts) across 193 cities[19] and 16 counties.[19] SCE's service area spans approximately 52,000 square miles of central, coastal, and Southern California.

SCE provides high level statistics for its service area in Table 5-1 below.

Table 5-1 - Service Territory High-Level Statistics

Characteristic	Value
Area served (sq. mi.)[20]	52,256 Square Miles
Number of customers served[19]	5.2 Million Customer Accounts

Further, Figure SCE 5-01 shows SCE's service area (polygons), distribution of customers served (raster or polygons), and county and city administrative boundaries (polygons or polylines).

[17] Annual information included in this section must align with Table 7 of the QDR.
[18] Data as of 12/13/22 and assuming 3 per household and 5.2 million customer account (household), therefore, 5.2 million customer * 3 per household = 15.6 million customers served.
[19] Data as of 12/13/22.
[20] Data as of 12/16/22.

Figure SCE 5-01 - SCE Service Area [21]

[21] Map as of 12/8/22. SCE has provided a spatial data for SCE service territory. Please see https://www.sce.com/safety/wild-fire-mitigation.

5.2 Electrical Infrastructure

The electrical corporation must provide a high-level description of its infrastructure, including all power generation facilities, transmission lines and associated equipment, distribution lines and associated equipment, substations, and any other major equipment.[22]

Table 5-2 provides a template for presenting the required information.

SCE transmits and distributes electricity across 186 transmission and 634 distribution substations. SCE maintains more than 82,000 circuit miles of overhead and underground for distribution and transmission lines. SCE produces approximately 9 million[23] MWh of power annually at 74 generation facilities, predominantly from the Big Creek Hydroelectric Project and Mountainview Generating Station. Approximately 13,925 circuit miles of SCE's transmission and distribution of overhead conductor are in High Fire Risk Areas (HFRA).

SCE provides an overview of key electrical equipment for its service area in Table 5-2 below. The metrics provided in Table 5-2 are based on SCE HFRAs.

Table 5-2 - Overview of Key Electrical Equipment

Type of Equipment	HFRA	Non-HFRA	Total
Substations (#)[24]	131	689	820
Power generation facilities (#)[25]	38	36	74
Overhead transmission lines (circuit miles)[26]	4,366	7,957	12,323
Overhead distribution lines (circuit miles)[27]	9,559	28,709	38,268
Hardened overhead distribution lines (circuit miles)[28]	3,810	183	3,993
Hardened overhead transmission lines (circuit miles)[28]	0	0	0
Underground transmission and distribution lines (circuit miles)[27]	7,233	24,255	31,488
Distribution transformers (#)[29]	81,132	373,028	454,160

[22] Annual information included in this section must align with Table 7 of the QDR.
[23] Data as of 2/26/21. Data source is CAISO meters at the generation facilities.
[24] Data as of 10/28/22. The type of substation includes distribution and transmission.
[25] Data as of 10/28/22. The type of generation includes solar sites, gas sites, hydro sites, fuel cells and battery storage.
[26] Data as of 12/16/22. The overhead Transmission circuit miles include bulk and sub transmission.
[27] Data as of 12/16/22.
[28] Data as of 12/16/22. For purposes of this chart, "hardened overhead distribution and transmission lines" are considered to be circuit miles of covered conductor installed, either through WCCP or other programs (e.g., storm), as well as overhead miles undergrounded through SCE's targeted undergrounding program. Covered conductor being evaluated for feasibility on Transmission lines. As of now, it is not yet approved for use.
[29] Data as of 1/31/2023. The data includes only overhead transformers.

Type of Equipment	HFRA	Non-HFRA	Total
Reclosers (#)[30]	878	1,829	2,707
Poles (#)[31]	300,880	1,039,025	1,339,905
Towers (#)[32]	10,199	16,820	27,019
Microgrids (#)[33]	0	0	0

5.3 Environmental Settings

The electrical corporation must provide a high-level overview of the wildfire environmental settings within its service territory.

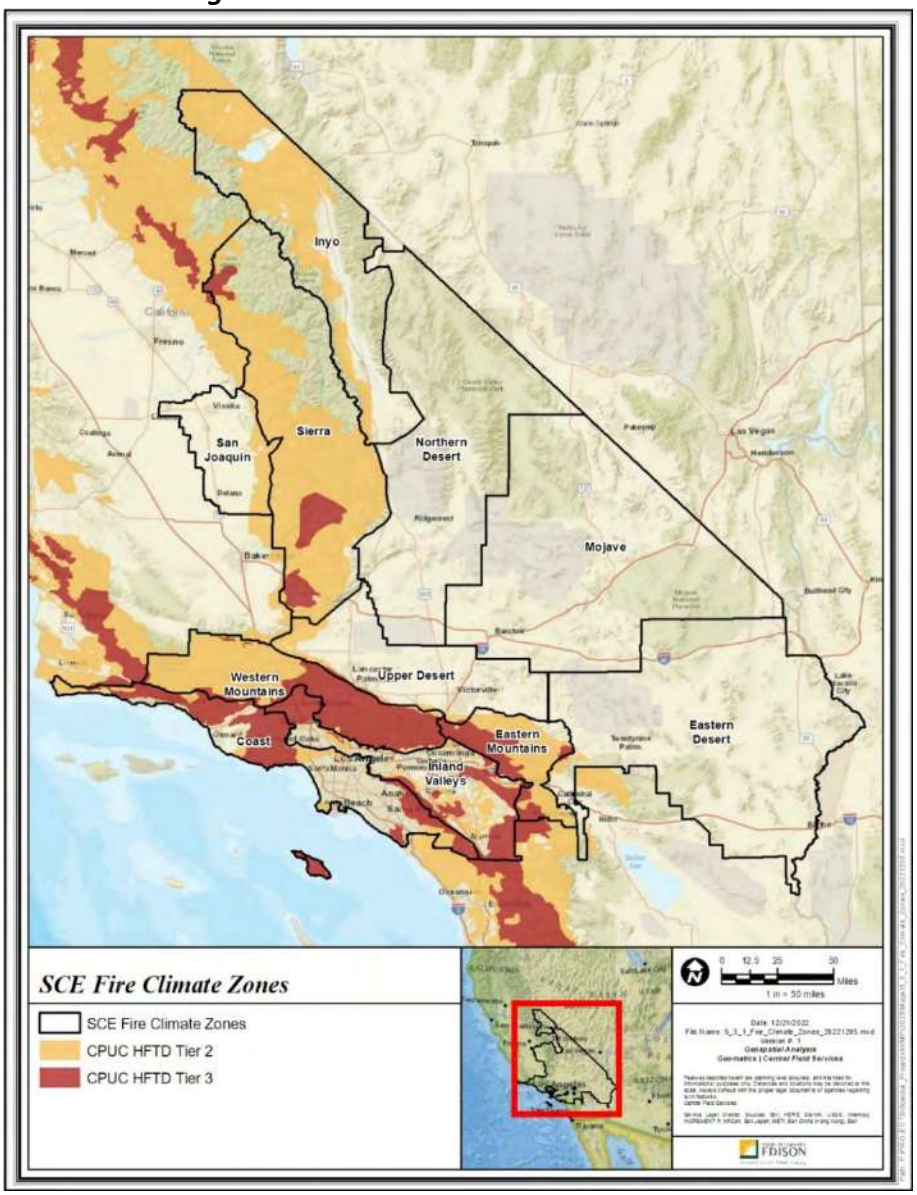
In Section 5.3, SCE describes the environmental settings associated with fire regimes throughout its service territory. In Section 5.3.1, SCE provides an overview of the fire ecology for each of its Fire Climate Zones (FCZ)s including a description of the prevailing vegetation types in each location. In Section 5.3.2, SCE describes catastrophic fires (as defined by Energy Safety) where an investigating agency opined that utility equipment was likely involved or was reported to the CPUC by SCE that utility equipment was potentially involved. Section 5.3.3 and Section 5.3.1, depicts SCE's High Fire Threat District (HFTD), which the CPUC has determined to have elevated or extreme risk of wildfires. Finally, Section 5.3.4 and lays the foundation for prevailing and future climatic conditions, as well as topographic features in each location in Section 5.3.5.

5.3.1 Fire Ecology

The electrical corporation must provide a brief narrative describing the fire ecology or ecologies across its service territory. This includes a brief description of how ecological features, such as the following, influence the propensity of the electrical corporation's service territory to experience wildfires: generalized climate and weather conditions, ecological regions and associated vegetation types, and fire return intervals.

The electrical corporation must provide tabulated statistics of the vegetative coverage across its service territory. The tabulated data must include a breakdown of the vegetation types, total acres per type, and percentage of service territory per type. The electrical corporation must identify the vegetative database used to characterize the vegetation (e.g., CALVEG). Table 5-3 provide an example of the minimum level of content and detail required.

Fire ecology varies greatly across SCE's service territory. The diversity of microclimates, topographic features, and vegetation types produce unique fire ecologies ("pyromes") in each of SCE's Fire Climate Zones (FCZ).



[30] Data as of 1/31/2023. The data includes only overhead reclosers.
[31] Data as of 1/31/2023. Poles include Distribution, Transmission and Combo.
[32] Data as of 1/31/2023.
[33] Currently, there are no operating front of the meter microgrids, but there are multiple projects in development.

SCE designated FCZs for operational analysis of the fire ecology of SCE's service territory. These FCZs represent areas of homogenous climate, wind, vegetation, and topography, all of which play a significant role in the initiation, spread, and intensity of wildfires.

SCE has calibrated its Fire Potential Index (FPI) metrics to the historical presence of significant wind driven fires in each climate zone. A more detailed discussion of this calibration can be found in Section 6.4.3.

In this section, SCE presents the data associated for each prompt based on its FCZ designation. For reference, see FCZ map in Figure SCE 5-02 below.

Figure SCE 5-02 - SCE Fire Climate Zones[34]

[34] Map as of 12/05/2022 and data source is from CPUC's Fire Threat Maps and Fire-Safety Rulemaking https://www.cpuc.ca.gov/industries-and-topics/wildfires/fire-threat-maps-and-fire-safety-rulemaking

- Fire Climate Zone 1 is located along the Southern California Coast from Ventura Santa Barbara

  County south through Orange County.

- Temperatures in the region approach 100 degrees or more in the late spring and occasionally reach 100 degrees in the early fall, but annual average temperatures are around 70 degrees. This zone is strongly influenced by a layer of moist marine air and year-round mild temperatures. Moderate sea breezes are common through most of the year. Precipitation varies from 15 inches along the coastal plain to over 30 inches in the mountain areas.
- Change in average summer temperatures for this region are projected to increase by 3-5 degrees and a slight decrease in summer fuel moisture by the 2050s based on a Representative Concentration Pathway (RCP) 8.5 high emissions scenarios.[35]
- Sundowner winds tend to increase in frequency across the Santa Ynez Mountain range in Santa Barbara County during the late spring and early summer months. Santa Ana winds periodically impact a much larger portion of this zone, particularly the Santa Monica Mountain range from October to May. These winds can result in periods of extreme fire weather if they occur coincident with dry fuels.
- Vegetation in the region consists primarily of grasses, coastal chaparral, and isolated timber.
- Wildfires in this region, though infrequent, can result in significant safety and financial consequences.

- Fire Climate Zone 2 is between mountain ranges from Santa Clarita, San Fernando, and San Gabriel Valleys and east to the Inland Empire.
- Sea breeze influences generally moderate summer heat in all portions of Zone 2, but on summer days when the sea breeze is weaker, temperatures often exceed 100 degrees. Winters are generally mild in this zone with daytime temperatures typically averaging around 60-70 degrees. Precipitation in this region ranges from 15-20 inches with locally higher amounts on the coastal slopes.
- Change in average summer temperatures for this region are projected to increase by 3-5 degrees and a slight decrease in summer fuel moisture by the 2050s based on RCP 8.5 high emissions scenarios.
- Moderate sea breezes are common in the western part of the zone, while Santa Ana winds are common on the mountain passes of the Angeles and San Bernardino National Forest, the Inland Empire, and the San Fernando and Santa Clarita Valleys.
- Vegetation in the region consists primary of grasses, coastal chaparral, and isolated timber.

[35] Pierce, D. W., J. F. Kalansky, and D. R. Cayan, (Scripps Institution of Oceanography). 2018. Climate, Drought, and Sea Level Rise Scenarios for the Fourth California Climate Assessment. California's Fourth Climate Change Assessment, California Energy Commission. Publication Number: CNRA-CEC-2018-006.

- Wildfires in this region are generally driven by dry fuels during the summer and Santa Ana wind driven fires in the fall, or winter, if precipitation is scarce. Wind driven fires in this region can consume vegetation over a large area in a short period of time with the potential for significant safety and financial consequences.

- Fire Climate Zone 3 is comprised of the complex topography (e.g., steep mountains and passes) of the Angeles and Los Padres National Forests north of the Santa Clarita, San Fernando, and San Gabriel Valleys terminating at the Cajon Pass.
- Temperatures in this zone vary drastically daily and seasonally due to both the elevation and seasonal solar angle across the east-west mountain range. Between 4,500- and 7,000-foot elevation, average highs can range from the 80s to low 90s in the summer and are generally in the 40s to low 50s in the winter. Average precipitation is between 15 to 30 inches and up to 45 inches at higher elevations along the windward slopes
- Change in average summer temperatures for this region are projected to increase by 3-5 degrees and a slight decrease in summer fuel moisture by the 2050s based on RCP 8.5 high emissions scenarios.
- Storm systems in the winter produce a mixture of rain and snow with snow common at higher elevations. Breezy conditions are common in this area. Santa Ana conditions and winter storms can each bring wind gusts in excess of 70 mph.
- Vegetation in this region is a mixture of grassland, chaparral, and small amounts of desert sagebrush.
- Fuel driven wildfires in this region are common in the summer months. A small percentage of fires in this location have been induced by lightning in the late summer. When wind driven fires occur in this region, they usually occur in the fall and are difficult to suppress given the complex topography.

- Fire Climate Zone 4 is comprised of the complex topography (e.g., steep mountains and passes) of the San Bernardino and San Jacinto Mountains and the adjacent desert areas east of the Cajon Pass.
- Temperatures vary considerably across this zone both daily and seasonally due to the elevation. Highs are generally in the 80-90s in the summer and 40-50s in the winter. Strong winter storm systems often produce rain and snow at higher elevations. Average precipitation is between 15 to 30 inches and up to 45 inches at higher elevations along the windward slopes.
- Change in average summer temperatures for this region are projected to increase by 3-5 degrees and a slight decrease in summer fuel moisture by the 2050s based on RCP 8.5 high emissions scenarios.

- Breezy wind conditions are common in this area with some of the strongest and most frequent winds occurring in the Banning Pass. During times of strong onshore flow and during Santa Ana

wind conditions, gusts can exceed 60 mph.

- Vegetation in this zone include a wide variety of desert sagebrush, timber, coastal chapparal, and grasslands.
- Wildfires in the region are primarily fuel driven and occur during the summer months. A small percentage of fires in this location are induced by lightning in the late summer. When wind driven fires occur in this region, they usually occur in the fall.

- Fire Climate Zone 5 is located east of the Banning pass. It is primarily comprised of flat desert land with few major geographic features.
- Summer high temperatures in this region are generally in the 100-110 range but can exceed 115 degrees. Winter temperatures average in the 60s. This zone is dry and typically only receives 5 to 10 inches of precipitation a year, with a significant portion of the annual precipitation occurring during the summer monsoons.
- Change in average summer temperatures for this region are projected to increase by 3-5 degrees and a slight decrease in summer fuel moisture by the 2050s based on RCP 8.5 high emissions scenarios.
- This area is subject to mild to moderate Santa Ana winds, though much of the geostrophic energy is dispersed over the broad plains. The strongest winds in this region occur along the Colorado River and near the Banning Pass.
- Vegetation in this zone is comprised of sparse desert sagebrush.
- Although this area experiences hot, dry, and sometimes windy conditions during the summer months, large fires in this region are infrequent given the sparsity of vegetation. Wildfires that do occur in this region generally occur along major transportation corridors during the summer months due to hot and dry conditions, as well as dry lightning during monsoons.

- Fire Climate Zone 6 is in the flat, high desert plain, including the base of the north slopes of the Angeles and San Bernardino Forests east of Tehachapi.
- Summer high temperatures in the region regularly reach 100 and occasionally exceed 110 degrees. Winter high temperatures typical range from the mid-50s to around 60 degrees. This region is a major rain shadow and averages only 5 to 10 inches of precipitation a year, with higher amounts along the Antelope Valley. Light snow can occur in some instances in this area.
- Change in average summer temperatures for this region are projected to increase by 3-5 degrees and a slight decrease in summer fuel moisture by the 2050s based on RCP 8.5 high emissions scenarios.
- This region is extremely windy, with southwest to northwest winds of 15-30 mph during the afternoon and evenings in the spring and summer. During pacific storms, during the late fall, winter, and early spring, wind gusts can easily exceed 60 mph.
- Vegetation in this region is mostly desert sagebrush with grassland, chaparral and timber along

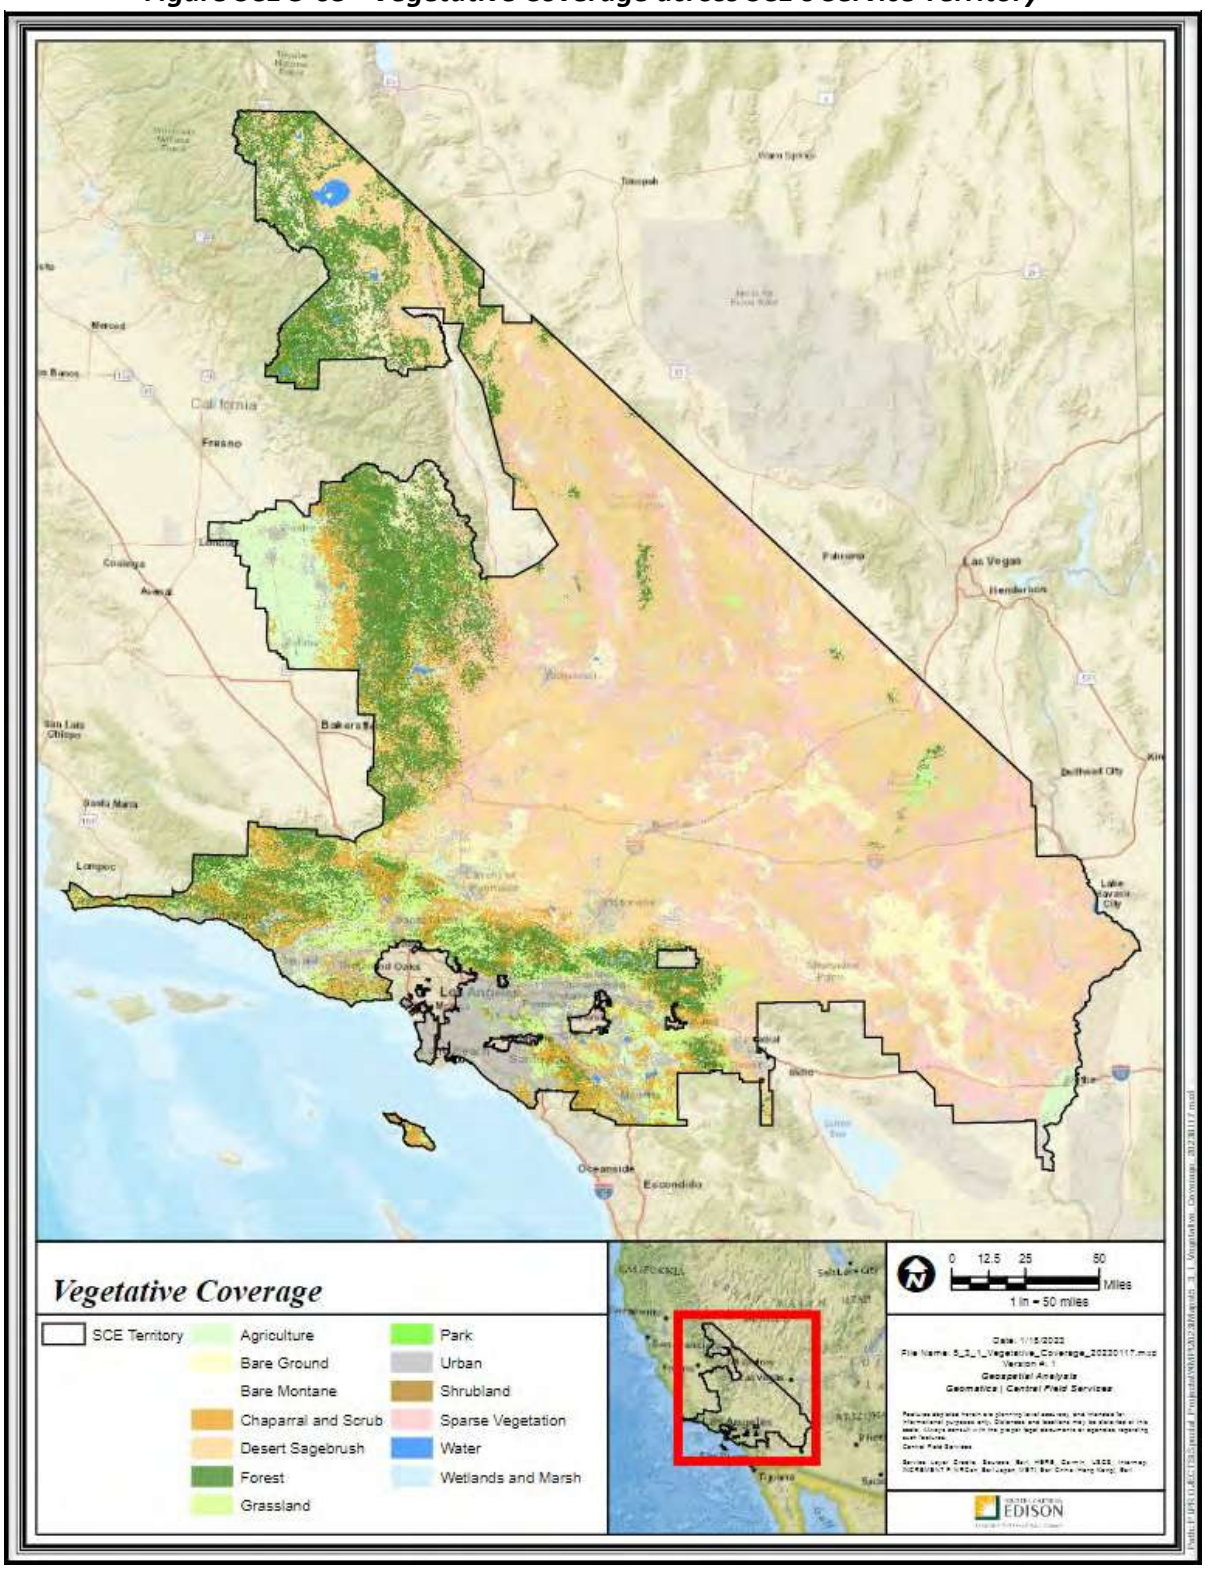
the foothills.

- Wildfires in this region are wind driven and relatively small (e.g., 100-300 acres), though larger fires are frequent in the foothills around Antelope Valley.

- Fire Climate Zone 7 is in the eastern high desert region along the California-Nevada border. This area includes the Mojave Preserve and the Mesquite Wilderness Area and is comprised of large, broad valleys with mountains at the higher elevation.
- Temperatures in this area are generally 100-110 degrees but can occasionally exceed 115. Winter temperatures are in mostly in the 60s. This region is dry (less than 10 inches) but is impacted by monsoonal conditions with summer thunderstorms and occasional light snow in the winter.
- Change in average summer temperatures for this region are projected to increase by 3-5 degrees and a slight decrease in summer fuel moisture by the 2050s based on RCP 8.5 high emissions scenarios.
- This is a windy region, though the broad plains tend to dissipate the geostrophic energy associated with winter and spring wind conditions.
- Vegetation in this region is primarily desert sagebrush with small patches of grassland and isolated timber at higher elevations.
- Wildfires in this region occur primarily in the summer due to persistent hot and dry conditions. Fires ignited by dry lighting related to monsoonal activities can be common in the area, though these fires tend to be contained to local areas due to the lack of widespread vegetation.
- Fire Climate Zone 8 is comprised of broad flat desert regions, such as Death Valley, which is below sea level, as well as the Panamint Range with elevations exceeding ten thousand feet.
- Temperatures are generally in the 105-115 range, but can exceed 120 in Death Valley, Winter temperatures are mostly in the 60-70 range. Though the region is dry (less than 10 inches annually), it can become humid during summer monsoonal conditions. Precipitation is slightly higher along the Panamint Range and some snow can occur in this area in the winter along the higher peaks.
- Change in average summer temperatures for this region are projected to increase by 3-5 degrees and a slight decrease in summer fuel moisture by the 2050s based on RCP 8.5 high emissions scenarios.
- This region is extremely windy throughout the year, with the strongest winds in the winter and spring.

- Desert sagebrush is the most common vegetation in the region, with scattered timber at higher elevations.
- Wildfires in this region occur primarily in the summary due to the prevailing hot and dry conditions. Fires ignited by dry lighting related to monsoonal activities can be quite common in the area. Although fire weather conditions are quite common in this region, due to the lack of vegetation wildfire tend to be infrequent.

- Fire Climate Zone 9 consists of the Eastern Sierras to the east and the White Mountains to the east with the Owens Valley oriented north-south in between.
- Annual average temperatures in this region can range from 30-40s in the mountain slopes to 70-80s in the valley regions. Summertime high temperatures average around 100 degrees in the Owens Valley. Most of the region is in a rain shadow and therefore generally dry, though the northwest portion of the region can receive 30-50" of precipitation, mostly in the form of snow.
- Change in average summer temperatures for this region are projected to increase by 3-5 degrees and a slight decrease in fuel moisture by the 2050s based on RCP 8.5 high emissions scenarios.
- This region can experience strong westerly down sloping winds, along the eastern slopes of the Sierras, which can reach into the Owens Valley. Typical winds are strong southerly winds during the day and light northly winds at night. During the winter, strong northerly "Mono" winds can occur.
- This zone contains a desert sagebrush with areas of mixed timber and interspersed grasslands.
- Wildfires in this region can occur at any time of the year but are most frequent during the summer and fall. Large fires are infrequent, but most fires are wind driven and confined to the valley areas where sagebrush is more prevalent.



- Fire Climate Zone 10 is comprised of complex terrain, including the Sierra and Sequoia National Forests.
- Summer high temperatures range from the mid-70s to low 90s, with milder temperatures at higher elevations. Winter high temperatures can vary from the 30s at higher elevations to 60s in the southern valleys. Precipitation averages from 25-50 inches for a large portion of the northern part of the region where terrain is most complex. The southern portion of the region receives much less precipitation, ranging from 10-25 inches.

- Change in average summer temperatures for this region are projected to increase by 3-5 degrees and a slight decrease in fuel moisture by the 2050s based on RCP 8.5 high emissions scenarios.
- This is a windy area with southerly winds ranging from 15-25 mph during most afternoons in the summer. Winds can be much stronger from the west and northwest associated with storm systems the later fall, winter, and early spring.
- Vegetation in this region is mostly timber with some areas of mixed chapparal grassland and interspersed desert sage.
- Most of the wildfires in this region occurs during the summer months. Fuel driven fires are most frequent, but occasional, wind driven fires can occur in the far southern portion near Lake Isabella. This region experiences lighting ignitions more often than any other region in SCE's service territory.

- Fire Climate Zone 11 is comprised on the San Joaquin Valley inclusive of the agricultural communities. The eastern portion of this zone include the western foothills of the Sierra Mountain range.
- This region is often hot and dry in the summer with daily highs in the 90s to 100s. Winter temperatures vary from 40s-50s in the higher elevations and 50-60s in the San Joaquin Valley. The zone receives 5-10 inches of precipitation in the western portion of the zone while the eastern slopes receive and average of 20-25 inches.
- Change in average summer temperatures for this region are projected to increase by 3-5 degrees and a slight decrease in fuel moisture by the 2050s based on RCP 8.5 high emissions scenarios.
- This is one of the least windy portions of SCE's service territory with southwest to northwest winds reaching 5-15 mph most days in the summer.
- The dominant vegetation in this region is agricultural land, with grassland, chapparal and mixed timber on the eastern slopes.
- Wildfires in this region are primarily fuel driven and mainly occur along the eastern slopes of the Sierra foothills.

Figure SCE 5-03 below shows the vegetative coverage (raster or polygon) across SCE's service territory. The source data for this map is publicly available from the North American Wildland Fuels Database and the spatial data can be downloaded at https://fuels.mtri.org/map. Further, SCE provides tabulated statistics of the vegetative coverage across its service territory in Table 5-3 below.

Figure SCE 5-03 - Vegetative Coverage across SCE's Service Territory[36]

[36] Data as of 11/10/2022 and data source is from North American Wildland Fuels Database. Michigan Tech Research Institute, United States Forest Service, and University of Washington. https://fuels.mtri.org/map

Table 5-3 - Existing Vegetation Types in the SCE Service Territory[37]

Vegetation Type	Acres	Percentage of Service Territory
Creosote Bush Desert Scrub	6,249,404.31	18.69%
Sparse Vegetation	6,161,530.43	18.43%
Desert Scrub	4,471,176.06	13.37%

5.3.2 Catastrophic Wildfire History

The electrical corporation must provide a brief narrative summarizing its wildfire history for the past 20 years (2002-2022) as recorded by the electrical corporation, CAL FIRE, or another authoritative sources. For this section, wildfire history must be limited to electrical corporation ignited catastrophic fires (i.e., fires that caused at least one death, damaged over 500 structures, or burned over 5,000 acres). This includes catastrophic wildfire ignitions reported to the CPUC that may be attributable to facilities or equipment owned by the electrical corporation and where the cause of the ignition is still under investigation.[38] Electrical corporations must clearly denote those ignitions as still under investigation. In

[38] CPUC emergency reporting instructions: https://www.cpuc.ca.gov/regulatory-services/safety/emergency-reporting.

addition, the electrical corporation must provide catastrophic wildfire statistics in tabular form, including the following key metrics:

- *Ignition date*
- *Fire name*
- *Official cause (if known)*
- *Size (acres)*
- *Number of fatalities*
- *Number of structures damaged*
- *Estimated financial loss (U.S. dollars)*

Table 5-4 provides an example of the content and level of detail required for the tabulated historical catastrophic utility-related wildfire statistics.[39] The electrical corporation must provide an authoritative government source (e.g., CPUC, CAL FIRE, U.S. Forest Service, or local fire authority) for its reporting of wildfire history data and loss/damage estimates, to the extent this information is available.

SCE provides the requested information in Table 5-4 below. For purposes of this table, SCE has listed wildfires which meet the definition of "catastrophic" as provided by Energy Safety, and where an investigating agency opined that SCE utility infrastructure was the likely cause or SCE reported to the CPUC as potentially involving utility infrastructure but where the cause is still under investigation. For those listed which are still under investigation, an official cause has not been provided. The information provided below should not be construed as an admission of any wrongdoing or liability by SCE. SCE further notes that the damages metrics provided may be tracked by other agencies and thus, SCE does not guarantee the accuracy of such information. Additionally, in many instances the cause of wildfires are still under investigation and even where an Authority Having Jurisdiction (AHJ) has issued a report on the cause, SCE may dispute the conclusions of such report.

[39] Annual information included in this section must align with Table 2 of the QDR.

Table 5-4 - Catastrophic Electrical Corporation Wildfires

Ignition Date[40]	Fire Name[40]	Official Cause[41]	Fire Size (Acres)[40]	# of Fatalities[40]	# of Structures Destroyed and Damaged[40]	Financial Loss (US$)[42]
10/20/2007	RANCH	USFS opined fire caused by SCE equipment	> 58,000	0	9 Structures Damaged or Destroyed	Data not available
11/14/2008	SAYRE	USFS opined fire caused by SCE equipment	11,262	0	604 Structures Destroyed / 147 Structures Damaged	Data not available
02/06/2015	ROUND	CAL FIRE opined fire caused by SCE equipment	7,000	0	43 Structures Destroyed / 5 Structures Damaged	Data not available
08/18/2016	REY	USFS opined fire caused by SCE equipment	32,606	0	5 Structures Destroyed	Data not available
12/04/2017	THOMAS/ KOENIGSTEIN	CAL FIRE & VCFD opined that fires caused by SCE equipment	281,893	2	1,060 Structures Destroyed / 274 Structures Damaged	Data not available
12/05/2017	CREEK	USFS opined that fire caused by LADWP equipment	15,619	0	123 Structures Destroyed / 81 Structures Damaged	Data not available
12/05/2017	RYE	CAL FIRE opined fire caused by SCE equipment	6,049	0	6 Structures Destroyed / 3 Structures Damaged	Data not available

[40] Wildfire history data is derived from various sources including SCE incident reports and related communications, CAL FIRE (https://www.fire.ca.gov/stats-events/), and U.S Forest Service (https://nap.nwcg.gov/NAP/).

[41] Where an Official Cause is stated, the source of the Official Cause was obtained from the identified agency's Fire Investigation Cause and Origin Report.

[42] In some instances, an agency may provide data related to one component of financial loss such as costs associated with suppression efforts, however, SCE is not aware of an authoritative government source that provides all-inclusive data regarding financial loss.

Ignition Date[40]	Fire Name[40]	Official Cause[41]	Fire Size (Acres)[40]	# of Fatalities[40]	# of Structures Destroyed and Damaged[40]	Financial Loss (US$)[42]
11/08/2018	WOOLSEY	CAL FIRE opined fire caused by SCE equipment and unidentified communication line	96,949	3	1,643 Structures Destroyed / 364 Structures Damaged	Data not available
10/10/2019	SADDLE RIDGE	Los Angeles City Fire Dept opined that the cause of the fire is undetermined	8,799	1	24 Structures Destroyed / 91 Structures Damaged	Data not available
09/06/2020	BOBCAT	No official cause. Under investigation	115,997	0	169 Structures Destroyed / 47 Structures Damaged	Data not available
10/26/2020	SILVERADO	No official cause. Under investigation	12,466	0	5 Structures Destroyed / 11 Structures Damaged	Data not available
09/05/2022	FAIRVIEW	No official cause. Under investigation	28,307	2	36 Structures Destroyed / 8 Structures Damaged	Data not available

SCE identifies the following wildfires which meet the definition of "catastrophic" over the past 20 years wherein SCE, CAL FIRE, or another authoritative source opined that the fire was likely ignited by electrical equipment, or the cause of the fire is still under investigation. The information provided below should not be construed as an admission of any wrongdoing or liability by SCE.

i The **Ranch Fire** ignited on 10/20/2007 wherein the United States Department of Agriculture (USDA) United States Forest Services (USFS) opined that during extreme Santa Ana Wind conditions, a preform attached to a bell-type insulator on a distribution circuit broke, causing the insulator to pull away from the steel tower and suspending it while still attached to the tap line. The winds caused the conductor to swing back and forth allowing the bell insulator to make contact with a section of the tower and ignited the fire.

ii The **Sayre Fire** ignited on 11/14/2008 wherein the USDA (USFS) opined that phase-to-phase conductor contact during windy conditions ignited the fire. However, SCE disputed this opinion insofar as human activity, including the possibility of an intentionally lit fire, could not be ruled out as a cause of the ignition.

iii The **Round Fire** ignited on 2/6/2015 wherein CAL FIRE opined that a decayed tree fell into an overhead line and ignited the fire.

iv The **Rey Fire** ignited on 8/18/2016 wherein the USDA (USFS) opined that a large portion of an oak tree split and landed on underbuilt communication lines which pulled down the poles causing an electric line to separate and ignited the fire.

v The **Thomas Fire/Koenigstein Fire** ignited on 12/4/2017 wherein CAL FIRE and Ventura County Fire Department opined that the Thomas Fire ignited from phase-to-phase conductor contact in a wind event and the Koenigstein Fire ignited from downed energized conductor during the same wind event. These fires are still under investigation by SCE and in active litigation.

vi The **Rye Fire** ignited on 12/5/2017 wherein CAL FIRE opined that a strand-vise device which connected a transmission down-guy to the guy anchor failed, causing the guy wire to whip through the air and make contact with a jumper on an underbuilt distribution circuit and ignited the fire.

vii The **Creek Fire** ignited on 12/5/2017 wherein the USDA (USFS) opined that powerlines on an LADWP-owned transmission circuit ignited the fire. This fire is still under investigation by SCE and in active litigation.

viii The **Woolsey Fire** ignited on 11/8/2018 wherein CAL FIRE opined that a slack transmission down-guy made contact in high winds with a jumper on an underbuilt distribution circuit energizing distribution guy wires and energizing SCE and unidentified communications lines resulting in two ignition sites. This fire is still under investigation by SCE and in active litigation.

ix The **Saddle Ridge Fire** ignited on 10/10/2019 wherein Los Angeles City Fire Department opined that the cause of the fire was undetermined. This fire is still under investigation by SCE and in active litigation.

x The **Bobcat Fire** ignited on 9/6/2020 wherein the cause is still under investigation by SCE and the USDA (USFS).

xi The **Silverado Fire** ignited on 10/26/2020 wherein the cause is still under investigation by SCE and the Orange County Fire Authority.

xii **The Fairview Fire** ignited on 9/5/2022 wherein the cause of the fire is still under investigation by SCE and CAL FIRE.

*[Related Requirement from Sec*tion 10]:

In addition to the above potential sources of lessons learned, the electric corporation must detail lessons learned from any and each catastrophic wildfire ignited by its facilities or equipment in the past 20 years, as listed in Section 5.3.2. The electric corporation must also detail specific mitigation measures implemented as a result of these lessons learned and demonstrate how the mitigation measures are being integrated into the electric corporation's wildfire mitigation strategy.

As discussed in Section 11, SCE has a formal process to investigate ignitions of all sizes (catastrophic and non-catastrophic) and SCE uses this process to evaluate risk events. This can lead to changes to SCE's inspection practices, vegetation management practices, modifications to SCE's engineering standards, or the introduction of new mitigation strategies. Section 11 provides further detail on SCE's risk event evaluation process and how that effort can translate into these changes.

In terms of lessons learned and resulting mitigations from these evaluations, SCE provides a few examples below. For example, SCE had seen an increase in ignitions associated with secondary conductors, and as a result, SCE modified its inspection form with new questions to capture and remediate these issues. In another example, a small fire (<1 acre) occurred in 2019 associated with SCE equipment, due to degradation occurring at the top of a crossarm. In response to this evaluation, SCE began inspecting transmission and distribution structures both from the ground and aerially, to develop a 360-degree inspection of the structure. This has served as the basis for SCE's asset inspection programs which are detailed in Section 8.

Several wildfires are still under investigation. There are some for which SCE filed an Electrical Safety Incident Report in an abundance of caution, even though SCE affirmatively disputes that its equipment was associated with ignition based on current information. Once these ongoing investigations are complete SCE will evaluate opportunities to incorporate any lessons learned into its construction and maintenance practices or future mitigation strategies. Separately, SCE is in the process of implementing system enhancements to strengthen SCE's electric system, support community engagement activities, and make investments in safety studies, pursuant to an agreement between SCE and the CPUC's Safety Enforcement Division, as adopted by the CPUC in Resolution SED-5 and SED-5A.[43] Further information can be found through the CPUC's website.[44]

The electrical corporation must also provide a map or set of maps illustrating the catastrophic wildfires. One representative map must appear in the main body of the WMP, with supplemental or detailed maps provided in Appendix C as needed. The maps must include the following:

- *Fire perimeters*
- *Legend and text labeling each fire perimeter*
- *County lines*

Figure 5-1 below maps the catastrophic wildfires identified in Table 5-4 above. An additional 12 maps reflecting individual catastrophic wildfire are provided in Appendix C: Additional Maps.

[43] RESOLUTION SED-5 APPROVING ADMINISTRATIVE CONSENT ORDER AND AGREEMENT OF THE SAFETY AND ENFORCEMENT DIVISION AND SOUTHERN CALIFORNIA EDISON COMPANY (U338-E) REGARDING THE 2017/2018 SOUTHERN CALIFORNIA FIRES PURSUANT TO RESOLUTION M-4846.

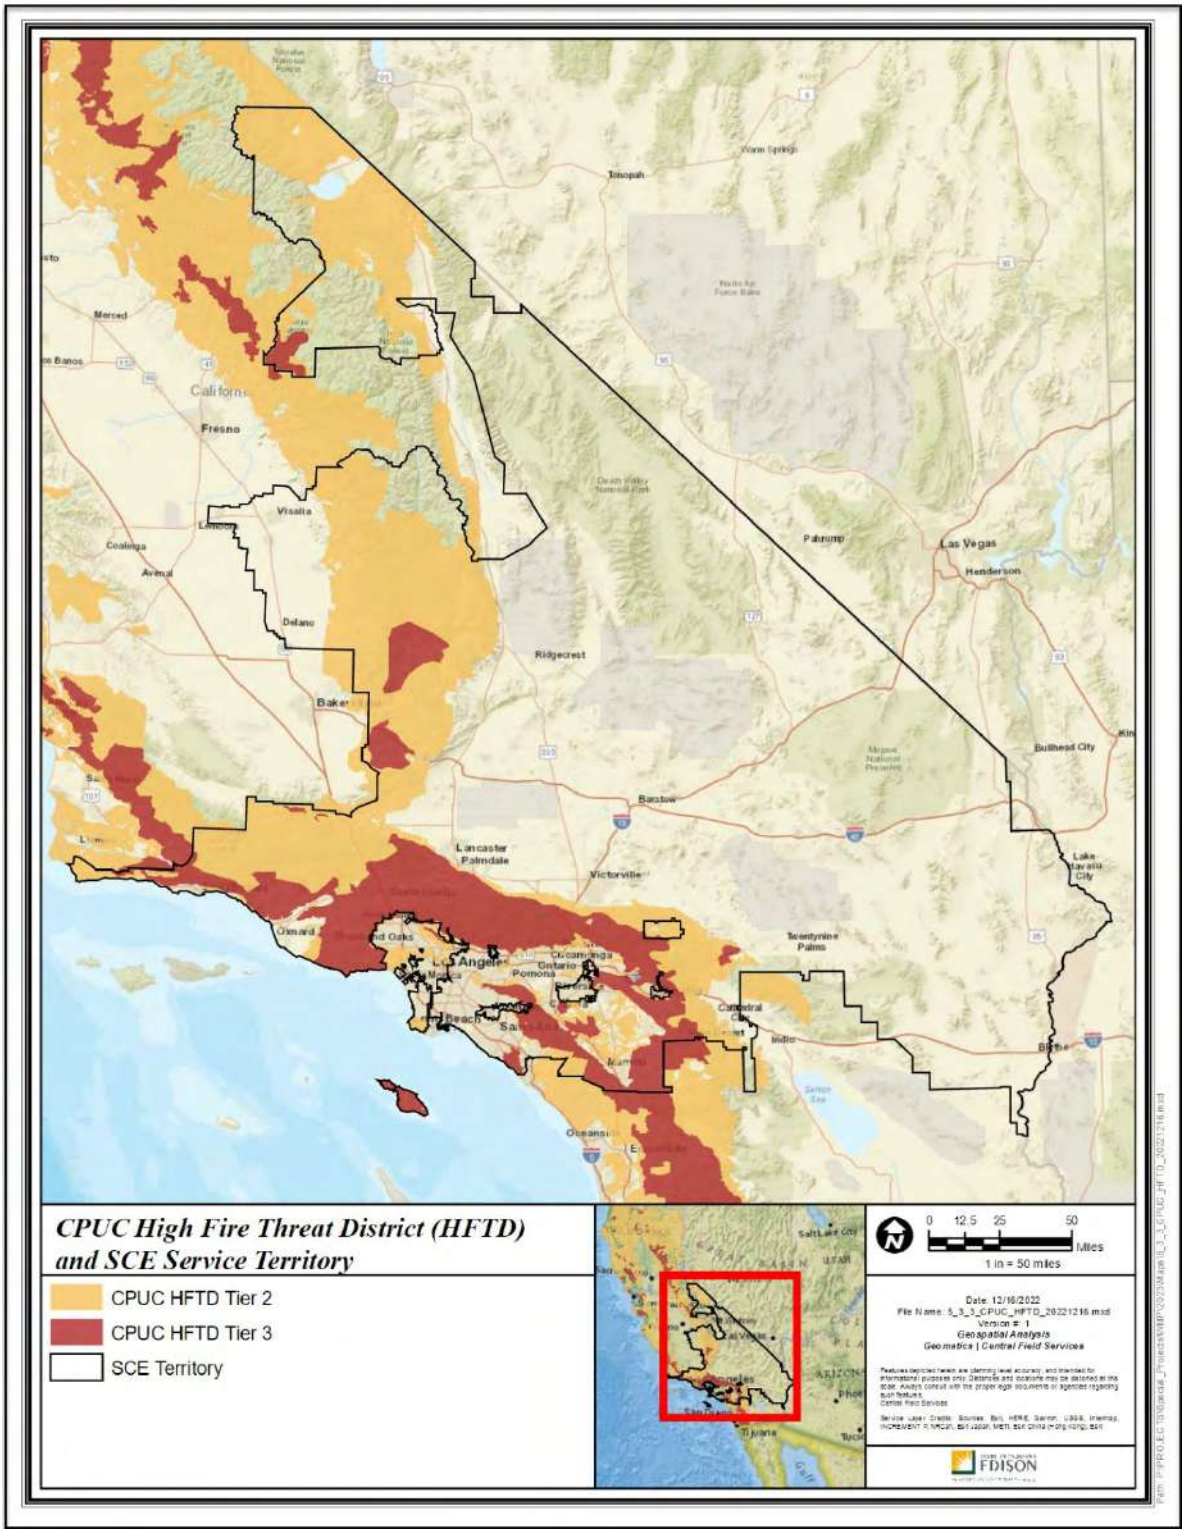
Figure 5-1 - Catastrophic Wildfire History Map [45]

[45] Map as of 1/5/2023 and data source is from CalFire Fire and Resource Assessment Program (FRAP) GIS Database. https://frap.fire.ca.gov/mapping/gis-data/

5.3.3 High Fire Threat Districts

The electrical corporation must provide a brief narrative identifying the CPUC-defined HFTD across its territory. The electrical corporation must also provide a map of its service territory overlaid with the HFTD. The map must be accompanied by tabulated statistics on the CPUC- defined HFTD including the following minimum information:



- *Total area of the electrical corporation's service territory in the HFTD (sq. mi.)*
- *The electrical corporation's service territory in the HFTD as a percentage of its total service territory (%)*

For the HFTD map, the HFTD layer(s) (raster or polygon) must cover the electrical corporation's service territory and the HFTD layer must match the latest boundaries as published by the CPUC. Table 5-5 provides an example of the content and level of detail required.

SCE's High Fire Risk Areas generally follow the historical wildfire patterns described in the previous section. Approximately one third of SCE's service territory is comprised of areas designated as either elevated or extreme by the Commission's High Fire Threat District (HFTD). In response to 2007 wildfires, the Commission adopted Decisions (D) 12-01-032 and D.14-01-010 in Rulemaking 08-11-005 to develop statewide fire hazard maps that depict the locations with environmental conditions in which there is potential for the ignition and spread of utility involved ignition events. These HFTD maps identify locations for enhanced mitigation activities such as inspections and vegetation management adopted in Decision 17-12-024. Decision 15-05-006 modified the HFTD boundaries within SCE's service territory to include areas that were not previously designated.

Figure SCE 5-04 below shows HFTD (raster or polygon) in SCE's service area. The source data for this map is publicly available from the CPUC website, and the spatial data can be downloaded at https://www.cpuc.ca.gov/industries-and-topics/wildfires/fire-threat-maps-and-fire-safety-rulemaking. Further, SCE provides HFTD statistics for its service area in Table 5-5 below.

Figure SCE 5-05 - HFTD For SCE Territory[46]

[46] Map as of 11/3/22 and data source is from CPUC's Fire Threat Maps and Fire-Safety Rulemaking https://www.cpuc.ca.gov/industries-and-topics/wildfires/fire-threat-maps-and-fire-safety-rulemaking

***Table 5-5 - CPUC's HFTD Statistics*[47]**

High Fire Threat District	Total Area of Individual District (sq. mi.)	% of Total Service Territory
Non-HFTD	38,065	73%
Tier 2	9,544	18%
Tier 3	4,662	9%
Total	52,270	100%

5.3.4 Climate Change

It is critical for the electrical corporation to understand general climate conditions and how climate change impacts the frequency and the intensity of extreme weather events and the vegetation that fuels fires.

The risk of significant[48] wildfire events continue to grow due to a range of changing climatic conditions that foster the initiation, spread, and intensity of wildfires. These developments, in turn, have the potential to increase associated wildfire consequences (e.g., average acres burned, facilities impacted). Extreme multi-year droughts (i.e., increased temperatures and decreased precipitation) continue to lead to increases in dead vegetation, while increases in the frequency and/or magnitude of wind events can compound any resulting fires. Projections by Westerling (2018) point to a future defined by intensifying and, at times, expanding areas of elevated wildfire risk, strongly driven by changes to underlying climate conditions.

5.3.4.1 General Climate Conditions

The electrical corporation must provide an overview of the general weather conditions and climate across its service territory in the past 30- to 40-year period.[49] The narrative must include, at a minimum, the following:

- *Average temperatures throughout the year*
- *Extreme temperatures that may occur and when and where they may occur*
- *Precipitation throughout the year*

The electrical corporation must also provide a graph of the average precipitation and maximum and minimum temperatures for each distinct climatic region of its service territory. At a minimum, it must provide one graph in the main body of the report. Figure 5-2 provides an example of the climate/weather graph.

[47] Data as of 12/14/22.

[48] In its 2022 Risk Assessment and Mitigation Phase (RAMP) filing, SCE defines "significant" fires as: Significant Fires are simulated fires that, at 8 hours after ignition, burned more than 10,000 acres or had at least one fatality or had at least 50 structures impacted.

[49] Annual information included in this section must align with Table 4 of the QDR.

Yearly average maximum and minimum temperatures peak in August with minimum values occurring in December and January for all fire climate zones. Average maximum temperatures in the summer range from near 100 in the deserts to around 80 near the coast. Annual precipitation amounts are greatest in the mountains with most of the annual precipitation occurring between November and April. Seasonal drought conditions occur during the summer months, but monsoon moisture in July and August can provide some relief in the mountains and deserts most years.

Below is the analysis on the Annual Mean Climatology (Temperature and Precipitation) for the 11 Fire Climate Zones (FCZ).

Average maximum temperatures for this zone peak in the low 80s in August while dropping to near 60 degrees in December and January. Average minimum temperatures range from the upper 40s in the winter to the lower 60s in the summer. Precipitation is highest from December through March with only trace amounts occurring during the summer.

Average maximum temperatures for this zone peak in the lower 90s in August while dropping to the lower 60s in December and January. Average minimum temperatures range from the upper 40s in the winter to the upper 60s in summer. Precipitation is highest from December through March with only trace amounts occurring during the summer.

Average maximum temperatures for this zone peak in the lower 80s in August while dropping to near 50 in December and January. Average minimum temperatures range from near 40 in the winter to the mid-60s in summer. Precipitation is highest from December through March with only trace amounts occurring during the summer.

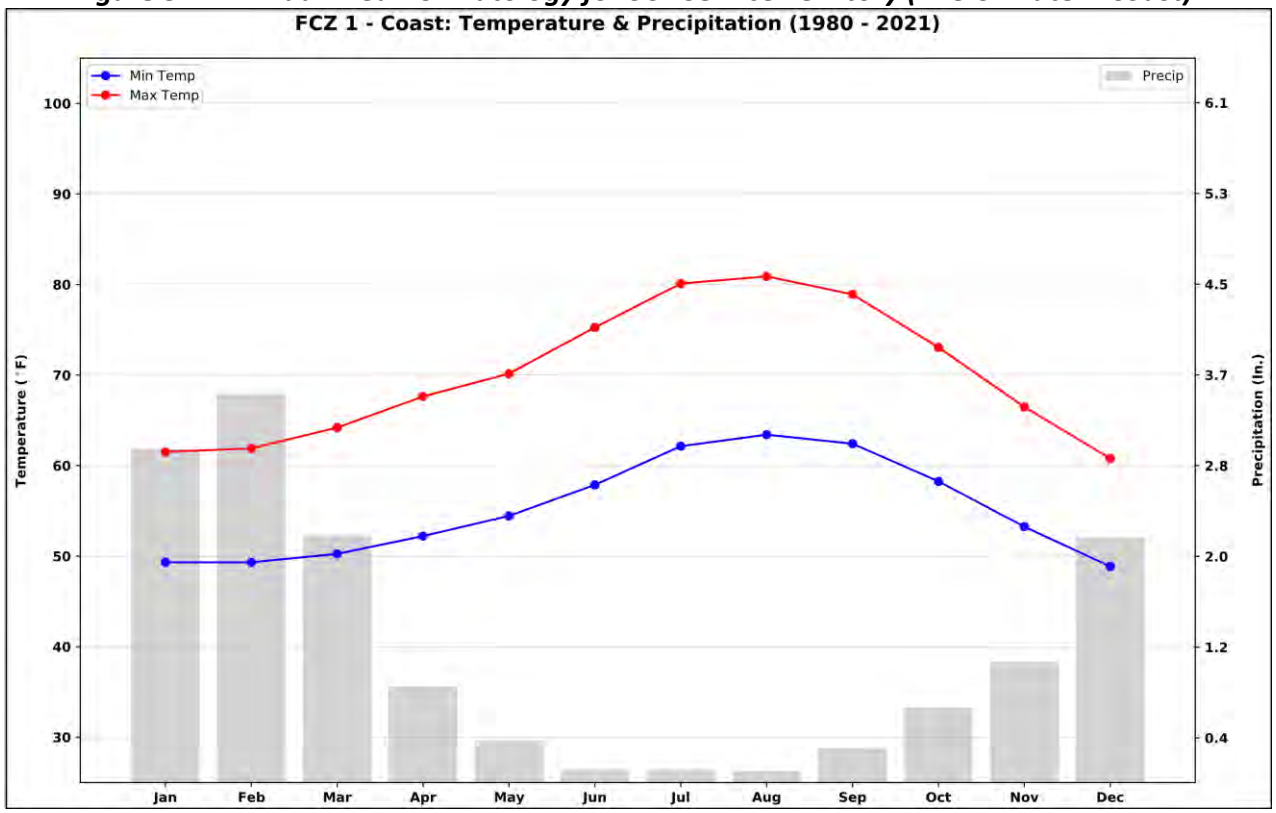
Average maximum temperatures for this zone peak in the lower 80s in August while dropping to the upper 40s in December and January. Average minimum temperatures range from the upper 30s in the winter to the mid-60s in summer. Precipitation is highest from December through March with minimal amounts occurring in the summer.

Average maximum temperatures for this zone peak around 100 in July and August while dropping to near 60 in December and January. Average minimum temperatures range from the mid-40s in the winter to the upper 70s in summer. Precipitation amounts are low throughout the year but are highest from December through February.

Average maximum temperatures for this zone peak in the mid-90s in July and August while dropping to the mid-50s in December and January. Average minimum temperatures range from near 40 in the winter to near 70 in summer. Precipitation amounts are low throughout the year but are highest from December through March.

Average maximum temperatures for this zone peak in the upper 90s in July and August while dropping to the mid-50s in December and January. Average minimum temperatures range from near 40 in the winter to the mid-70s in summer. Precipitation amounts are low throughout the year but are highest from December through February.

Average maximum temperatures for this zone peak in the mid-90s in July and August while dropping to the low 50s in December and January. Average minimum temperatures range from near 40 in the winter to the low 70s in summer. Precipitation amounts are low throughout the year but are highest in January and February.



Average maximum temperatures for this zone peak in the upper 70s in July and August while dropping to the upper 40s in December and January. Average minimum temperatures range from the upper 20s in the winter to near 60 in summer. Precipitation is highest from November through March with lower amounts occurring during the summer.

Average maximum temperatures for this zone peak in the mid-70s in July and August while dropping to the near 40 in December and January. Average minimum temperatures range from near 30 in the winter to near 60 in summer. Precipitation is highest from November through March with lower amounts occurring during the summer.

Average maximum temperatures for this zone peak in the upper 90s in July and August while dropping to the upper 50s in December and January. Average minimum temperatures range from the mid-40s in the winter to the upper 60s in summer. Precipitation is highest from December through March with lower amounts occurring during the summer.

SCE provides graphs of temperature and precipitation for these 11 fire climate zones. Figure 5-2 provides the temperature and precipitation from 1980 to 2021 for fire climate zone 1. Figures for the remaining 10 fire climate zones are provided in Appendix F: Supplemental Information. Data source is from SCE's 40-year internal dataset which was generated by third party vendor, Atmospheric Data Solutions (ADS) by downscaling the Climate Forecast System Reanalysis (CFSR) data which comes from the National Center for Atmospheric Research (NCAR).

Figure 5-2 - Annual Mean Climatology for SCE Service Territory (Fire Climate 1-Coast)[50]

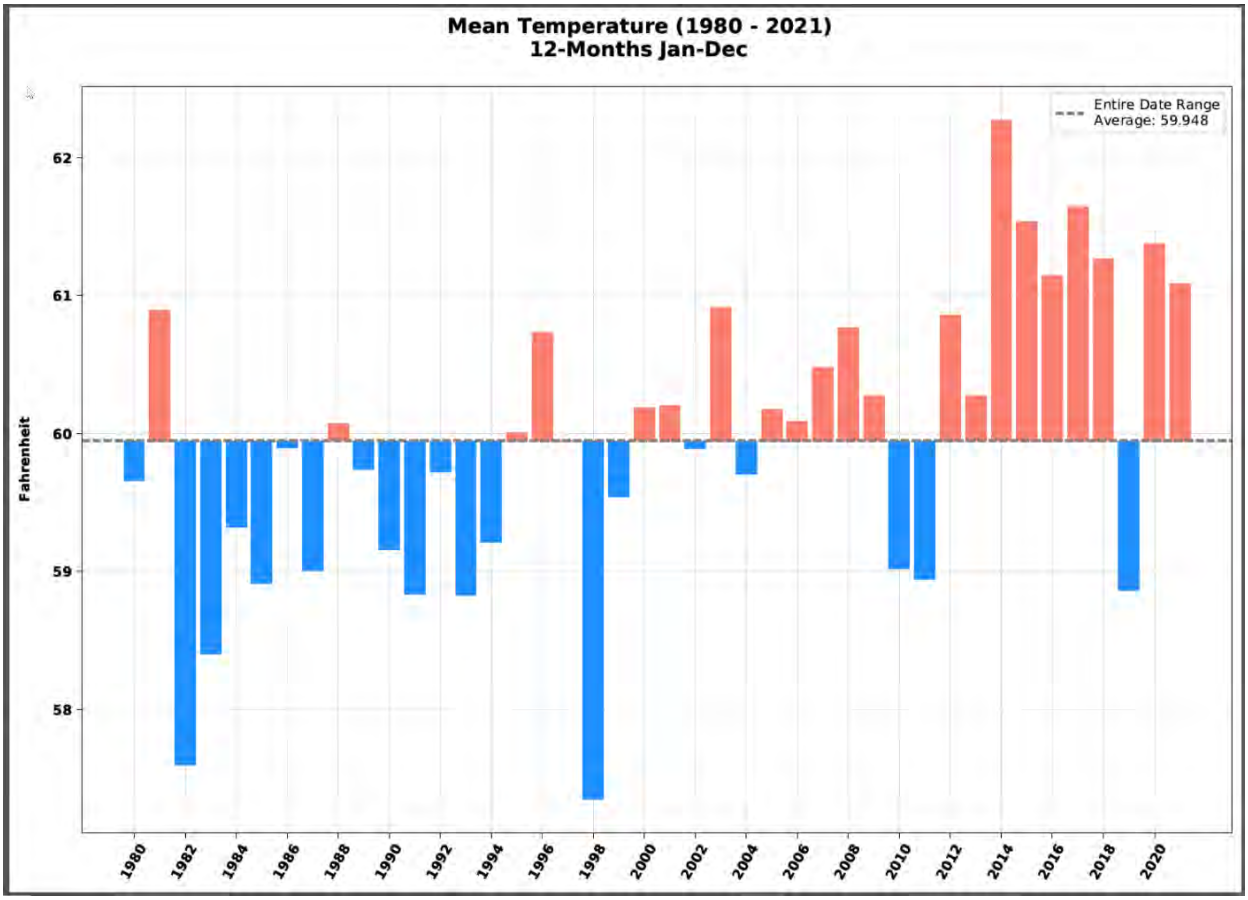
5.3.4.2 Climate Change Phenomena and Trends

The electrical corporation must provide a brief discussion of the local impacts of anticipated climate change phenomena and trends across its service territory. In addition, the electrical corporation must provide graphs/charts illustrating:

- *Mean annual temperature (Figure 5-3)*
- *Mean annual precipitation (Figure 5-4)*
- *Projected changes in minimum and maximum daily temperatures (Figure 5-5)*

The electrical corporation must also indicate the increase in extreme fire danger days (historic 95th-percentile conditions) due to climate change, considering (at a minimum) the combination of warmer temperatures, drier vegetation, and changes in high-wind events (e.g., Santa Ana winds, Diablo winds, Sundowners) for both winter/spring and summer/fall periods throughout the electrical corporation service territory. Figure 5-6 provides an example of the required information on projections of extreme fire dangers.

The electrical corporation must cite all source(s) used to write and illustrate this section.



Mean annual temperatures since 1980 have been steadily increasing across the SCE service area since the early to mid-1990s, while mean annual precipitation has slowly decreased over the last four decades. In addition, there have been periods of severe drought across portions of the SCE service territory since 2000. Data source is from SCE's 40-year internal dataset which was generated by third party vendor, Atmospheric Data Solutions (ADS), by downscaling the Climate Forecast System Reanalysis (CFSR) data from the National

[50] Figure as of 10/26/2022 and data source is from https://psl.noaa.gov/data/gridded/data.narr.html.

Center for Atmospheric Research (NCAR). The data was downscaled to a 2-km horizontal resolution at an hourly temporal resolution going back to 1980.

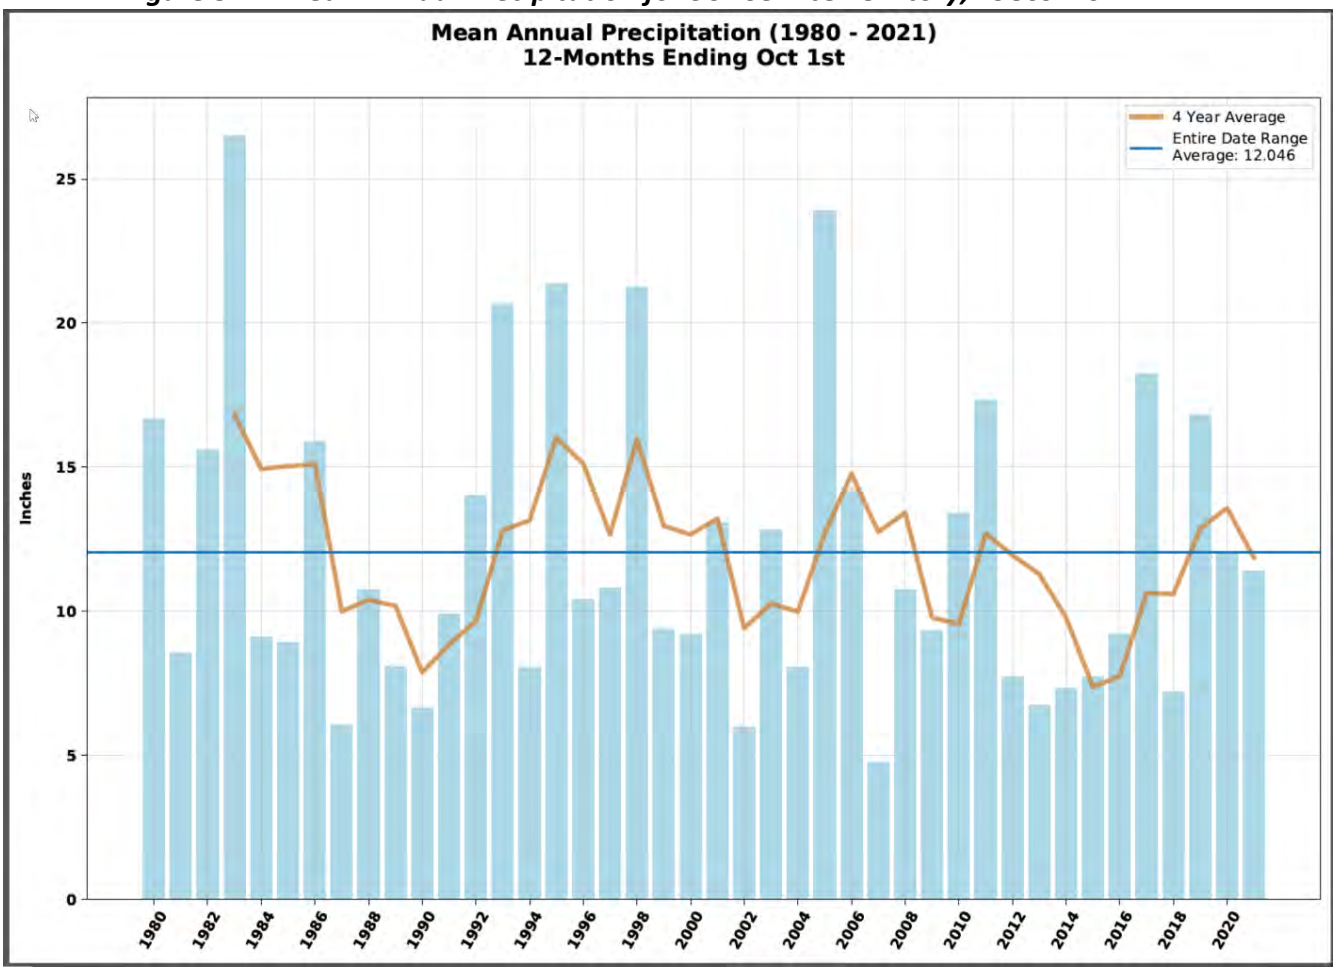


Figure 5-3 below shows annual temperature and Figure 5-4 below shows annual precipitation for SCE's service area.

Figure 5-3 - Mean Annual Temperature for SCE Service Territory, 1980s–2021[51]

[51] Figure as of 11/15/2022 and data source is from https://psl.noaa.gov/data/gridded/data.narr.html.

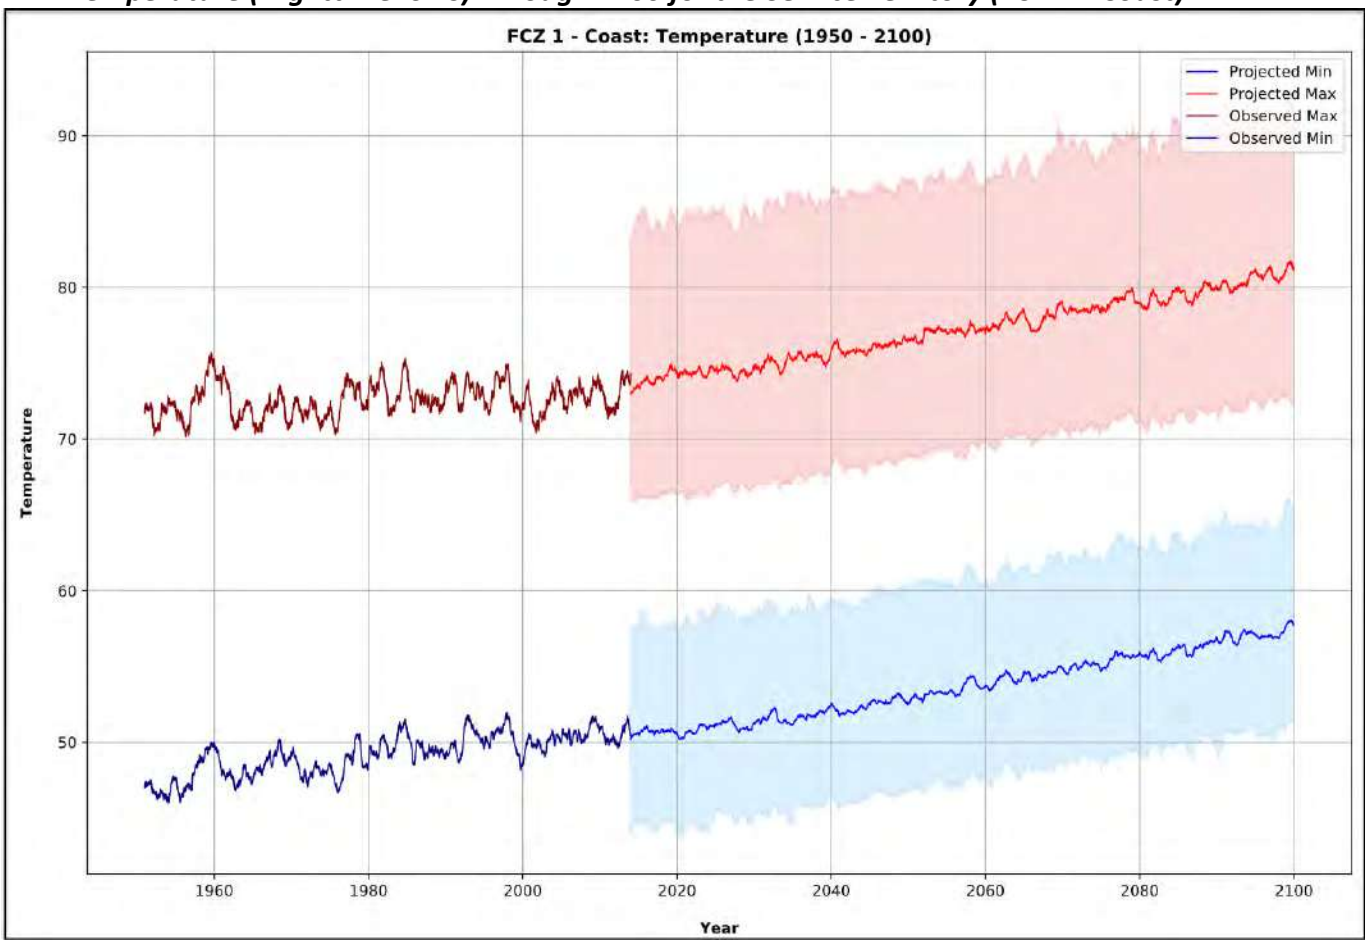

Figure 5-4 - Mean Annual Precipitation for SCE Service Territory, 1980s–2021[52]

[52] Figure as of 11/15/2022 and data source is from https://psl.noaa.gov/data/gridded/data.narr.html.

Figure 5-5 presents average daily maximum and minimum temperature values observed and projected for fire climate zone 1 using data from California's 4th Climate Change Assessment. An additional 10 figures reflecting this information are provided in Appendix F: Supplemental Information. These daily average maximum and minimum values are calculated as 365-day rolling averages. Fire Climate Zones are defined as regions in which SCE observes similar climatic conditions related to fire weather conditions.

Figure 5-5 - Projected Change in Maximum Temperature (Daytime Highs) and Minimum Temperature (Nighttime lows) Through 2100 for the Service Territory (FCZ 1 – Coast)[53]

Below is analysis on the maximum and minimum for the 11 Fire Climate Zones (FCZ).

Fire Climate Zones 1 (Coast) and 2 (Inland Valleys)

Observed maximum temperatures change little through the observed period while an upward trend is noticeable among the minimum temperature observations. Both maximum and minimum temperatures are projected to trend upward across this zone through the end of the century.

Fire Climate Zones 3 (Western Mountains), 4 (Eastern Mountains), 5 (Eastern Mountains), 6 (Upper Desert), and 8 (Northern Desert)

Observed maximum temperatures change little through the observed period while a slight upward trend is

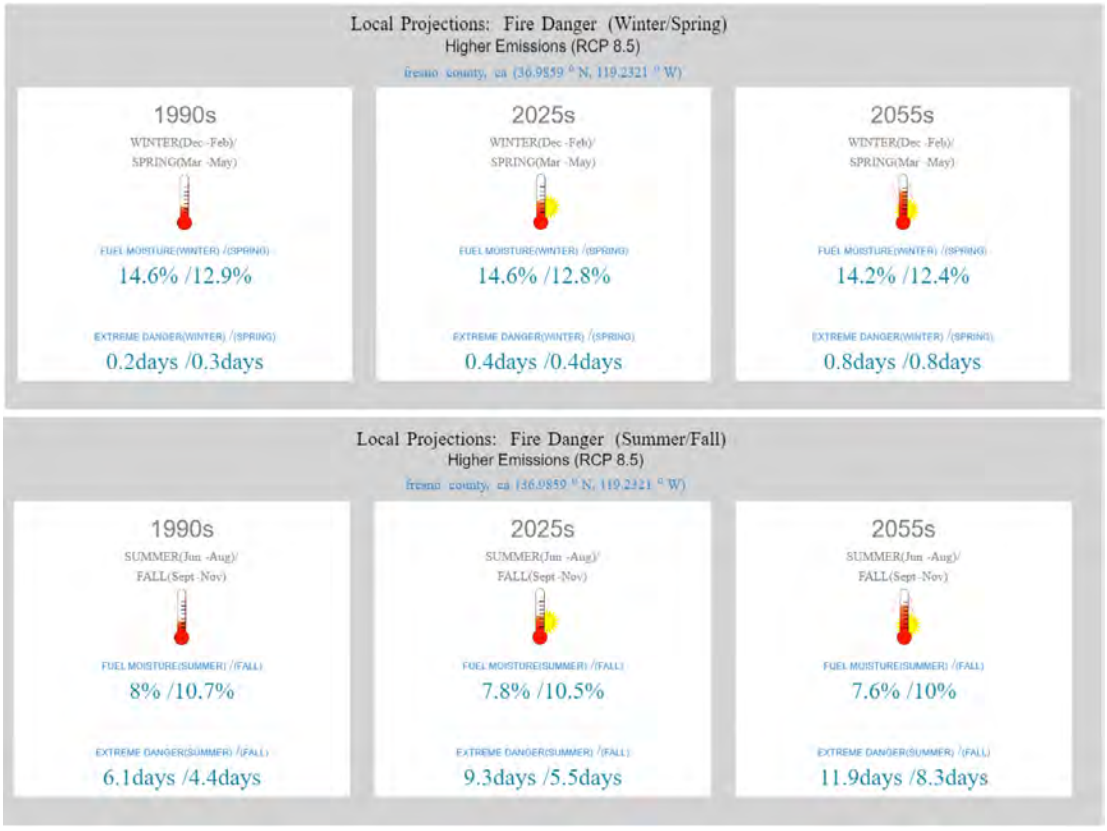
[53] Figure as of 11/4/2022 and data source is from Cal-Adapt https://cal-adapt.org/

noticeable among the minimum temperature observations. Both maximum and minimum temperatures are projected to trend upward across this zone through the end of the century.

Fire Climate Zone 9 (Inyo)

Observed maximum temperatures show a slight upward trend through the observed period while little change was noted among the minimum temperature observations. Both maximum and minimum temperatures are projected to trend upward across this zone through the end of the century.

Fire Climate Zones 7 (Mojave), 10 (Sierra), and 11 (San Joaquin)



Observed maximum and minimum temperatures change little through the observed period, but both are projected to trend upward across this zone through the end of the century.

Projection of Extreme Fire Dangers

Extreme fire weather day frequency is expected to increase across all SCE counties during most seasons and fuel moisture is expected to generally decrease. The largest increases in extreme fire weather days are forecast for Inyo and Mono County during the summer months. Data source is from climatetoolbox.org.[54] below shows the historical and projection of fuel moisture for Fresno County and data for the remaining fifteen counties are provided in Appendix F: Supplemental Information.

[54] Climatetoolbox.org does not allow SCE to apply Fire Climate Zones into the analysis, and therefore SCE has to switch to using counties.

Figure 5-6 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Fresno County)[55]

Below is the analysis on the fire moisture and fire danger observations and projects for the 16 counties.

For summer and fall, little or no change has occurred in fuel moisture since the 1990s, nor is it expected to through 2055. However, the number of fire danger days has increased since the 1990s and will continue to do so through the middle part of the century. For winter and spring, little or no change has occurred in fuel moisture since the 1990s, nor is any significant change expected through 2055. However, a slight increase in the number of fire danger days is projected through mid-century.

For all four seasons, little change is noted in both fuel moisture and the number of fire danger days except for the spring where a slight increase in fire danger days is expected through mid-century.

For summer and fall, fuel moisture values have changed little since the 1990s and are not expected to change significantly through the mid-century period. Meanwhile, the number of fire danger days has been increasing since the 1990s and will continue to increase through 2055. For winter and spring, little or no

[55] Figure as of 11/4/2022 and data source is from https://climatetoolbox.org

change has occurred in both fuel moisture or the number of fire danger days since the 1990s, nor are they expected to through 2055.

For summer and fall, fuel moisture values have changed little since the 1990s and are not expected to change significantly through the mid-century period. Meanwhile, the number of fire danger days has been increasing since the 1990s and will continue to increase through 2055. For winter and spring, little or no change has occurred in both fuel moisture or the number of fire danger days since the 1990s, nor are they expected to through 2055.

During the winter, little change in both fuel moisture and fire danger days is noted through the entire time period. Fuel moisture changes little in the spring but the number of fire danger days increases slightly by mid-century. In the summer, fuel moisture changes little, but there is a notable increase in the number of fire danger days through mid-century. In the fall, fuel moisture changes little through the period, and while the number of fire danger days shows no change from the 1990s to 2025, an increase is expected by the middle of the century.

For summer and fall, little or no change has occurred in fuel moisture since the 1990s, nor is it expected to through 2055. However, the number of fire danger days has increased slightly since the 1990s and will continue to do so through the middle part of the century. For winter and spring, fuel moisture values have changed little since the 1990s and are not expected to change significantly through the mid-century period. Meanwhile, the number of fire danger days has been increasing since the 1990s and will continue to increase through 2055.

While fuel moisture changes little across all four seasons from the 1990s through mid-century, the number of fire danger days increases through mid-century during the summer and fall, with little change or a very slight increase during the winter and spring.

While fuel moisture values during the summer and fall are expected to decrease very slightly through 2055, the number of fire danger days is expected to increase sharply through this same time period. For winter and spring, little or no change has occurred in both fuel moisture or the number of fire danger days since the 1990s, nor are they expected to through 2055.

For summer, little or no change has occurred in both fuel moisture or the number of fire danger days since the 1990s, nor are they expected to through 2055. For winter, little change in fuel moisture has occurred since the 1990s, but it is expected to decrease by mid-century. Meanwhile. Little change was noted in the number of fire danger days from the 1990s to 2055. For spring and fall, fuel moisture changes little through the period while the number of fire danger days steadily increases through the period.

For all four seasons, fuel moisture values have changed little since the 1990s and are not expected to change significantly through the mid-century period. Meanwhile, the number of fire danger days has been increasing since the 1990s and will continue to increase through 2055.

For the summer and winter, little or no change has occurred in fuel moisture since the 1990s, nor is it expected to through 2055. However, while little change was noted in the number of fire danger days from the 1990s, a slight increase is expected to occur by 2055. For the spring and fall, fuel moisture changes little through the period while the number of fire danger days increases slightly through the period.

For the fall and winter, little or no change has occurred in both fuel moisture or the number of fire danger days since the 1990s, nor are they expected to through 2055. For the spring and summer, fuel moisture changes little through the period while the number of fire danger days steadily increases through the period.

While fuel moisture changes little across all four seasons from the 1990s through mid-century, the number of fire danger days increases during the fall and winter, with little change during the spring and summer.

For summer and fall, little or no change has occurred in fuel moisture since the 1990s, nor is it expected to through 2055. However, the number of fire danger days has increased slightly since the 1990s and will continue to do so through the middle part of the century. For winter and spring, little or no change has occurred in both fuel moisture or the number of fire danger days since the 1990s, nor are they expected to through 2055.

For summer and fall, fuel moisture has changed little since the 1990s, but is expected to lower through 2055, while the number of fire danger days will steadily increase through the middle part of the century. For winter and spring, little or no change has occurred in both fuel moisture or the number of fire danger days since the 1990s, with little change expected through 2055.

For all four seasons, fuel moisture changes little through the period however, in the fall and the winter, the number of fire danger days increases through 2055 with little change noted otherwise.

5.3.5 Topography

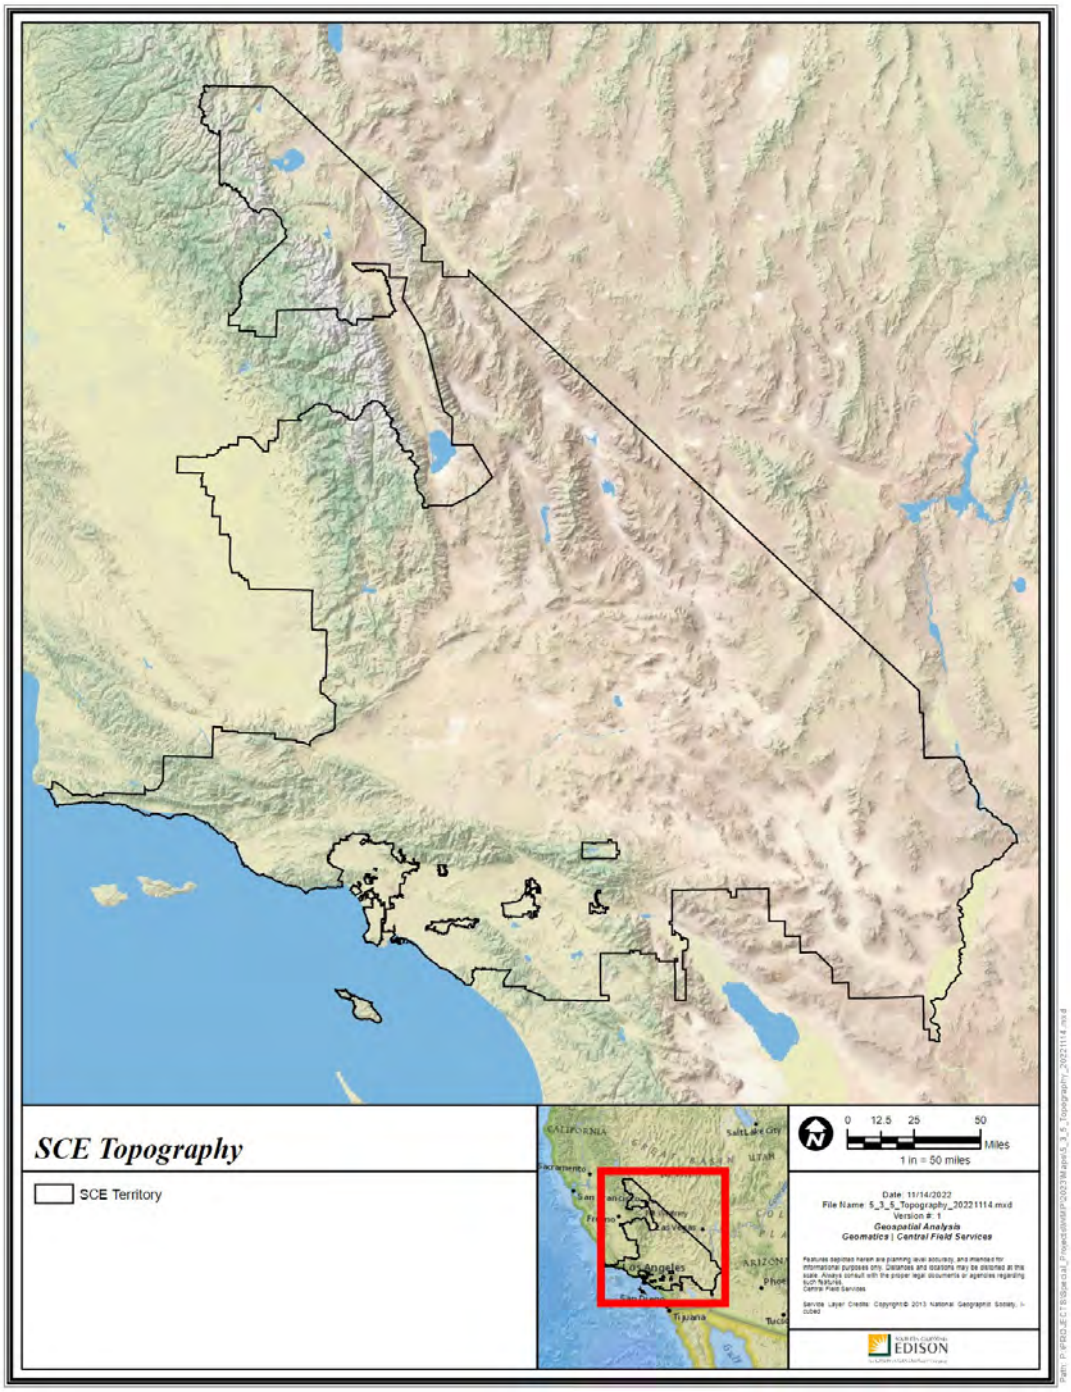
The electrical corporation must provide an overview and brief description of the various topographic conditions across its service territory.

SCE's service territory contains several prominent mountain topographic regions, several of which play a significant role in spatial patterns of fuel and wind driven wildfires activity.

The Sierra Nevada Mountains run north south through the northern portion of SCE's service territory. This mountain range is predominately impacted by winds running parallel to the mountain slopes and is bounded by the San Joaquin Valley to the west.

East of the Sierra Nevada mountains, the upper high desert regions include Owens Valley, which are bounded by the White mountains.

Basin and Range topography, including Death Valley and the Mojave Desert, dominate the high desert regions south of Owens Valley.



Several other mountain ranges traverse SCE's service territory from east to west. These mountain ranges are the (from east to west) Santa Ynez Mountains, Santa Monica Mountains, San Gabriel Mountains, and San Bernardino Mountains. The San Jacinto Mountains taper southeast from the San Bernardino Mountains, dividing the Colorado Desert from the low desert of the Inland Empire.

The spaces between these mountains form passes such as the Tejon, Acton, Cajon, and Banning Passes, which are the locations in which Santa Ana wind driven fire events are prominent in SCE's service territory.

Additionally, some of the coastal mountain ranges, namely the San Ynez and Santa Monica mountains are features which play a major role in the formation of Sundowner winds. Finally, the Peninsular Ranges which separate the Inland Empire from the urbanized coastal plain of Los Angeles and Orange Counties. These mountains are also subject to stronger fuel and wind driven fire events.

Figure SCE 5-06 below shows the illustration of the topography of SCE service territory. The source data for this map is available through ArcMap, ArcGIS Pro, and ArcGIS Online products in form of a base map.

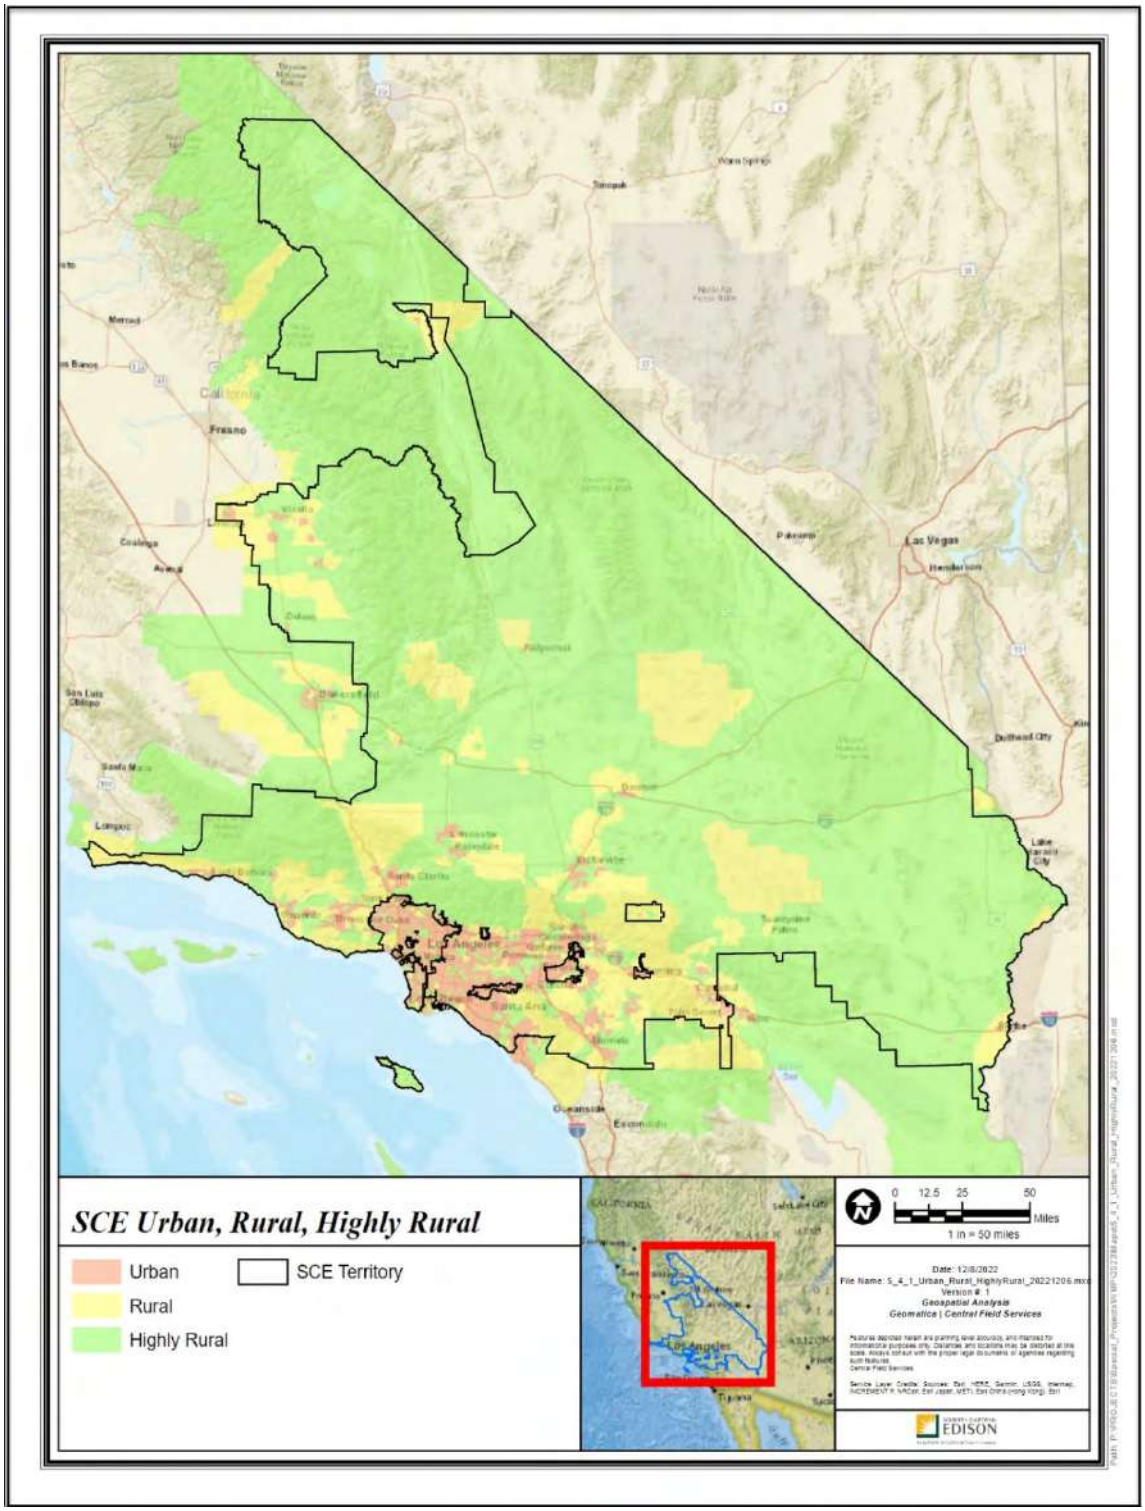
Figure SCE 5-06 - Topography of SCE Service Territory[56]

[56] Map is as of 12/5/2022 and data source is from ESRI base map (USA Topo Map).

5.4 Community Values at Risk

In this section of the WMP, the electrical corporation must identify the community values at risk across its service territory. Sections 5.4.1–5.4.5 provide detailed instructions.[57]

5.4.1 Urban, Rural, and Highly Rural Customers



The electrical corporation must provide a brief narrative describing the distribution of urban, rural, and highly rural areas and customers across its service territory. Refer to Appendix A for definitions.

SCE serves approximately 5.2 million customers, approximately 87% (4.5 million) of which are located in urban areas; 11.6% (0.6 million) in rural areas, and 0.7% (0.04 million) in highly rural areas. Urbanized areas include the North Coast (Ventura and Santa Barbara Counties); the Los Angeles Basin, Orange County, and the Inland Empire (Western San Bernardino and Riverside Counties). Rural and Highly Rural Populations are dispersed across wide swaths of the High Desert and High Sierras, including parts of Tulare, Kern, Mono, Inyo, and the Eastern parts of San Bernardino and Riverside Counties.

Figure SCE 5-06 below shows the urban, rural, and highly rural customer distributions (raster or polygon) across SCE service territory. The source data for this map is publicly available from the United States Census Bureau and the spatial data can be downloaded at https://www.census.gov/geographies/mapping-files/time-series/geo/tiger-geodatabase-file.2020.html.

[57] Annual information included in these sections must align with Table 7 of the QDR.

Figure SCE 5-07 - Urban, Rural, and Highly Rural Customer Distributions across SCE Service Territory[58]

[58] Map as of 12/8/22 and data source is from 2020 Census Tract (https://www.census.gov/geographies/mapping-files/time-series/geo/tiger-geodatabase-file.2020.html).

5.4.2 Wildland-Urban Interfaces

The electrical corporation must provide a brief narrative describing the wildland-urban interfaces (WUIs) across its service territory. Refer to Appendix A for definitions.

The Wildland Urban Interfaces (WUIs) are areas of urbanized developments adjacent to wildland vegetation. Since the late 1970s, the spatial patterns of housing development in most of the United States, and more prominently in Southern California, have largely been characterized by the housing development in these locations. Roughly one-third of SCE customers reside in WUI locations. The primary locations of the WUI in SCE's service territory include the areas adjacent to the urban periphery of the Santa Barbara, Los Angeles, Orange, San Bernardino, and Riverside counties.

New WUI areas are created as new housing development occurs in, or near, wildland vegetation, or when wildland grows near vegetation. However, as development continues into the WUI, additional populations are exposed to potential wildfires.

WUI locations can be classified into two broad categories - WUI interface (WUI) and WUI intermix (WUIx). The WUI Interface is characterized by a clear delineation between the built environment and wildland vegetation. A suburban neighborhood immediately adjacent to wild grasses and shrubs, such as those located south of the Angeles National Forest is a prime example of the WUI Interface. Conversely, in WUI intermix locations, there is not a clear delineation between the urbanized (built) and wildland (unbuilt) environment. WUIx locations are characterized by rural or highly rural structures interspersed with wildland vegetation. Examples of WUIx locations include the rural communities in the San Bernardino National Forest.

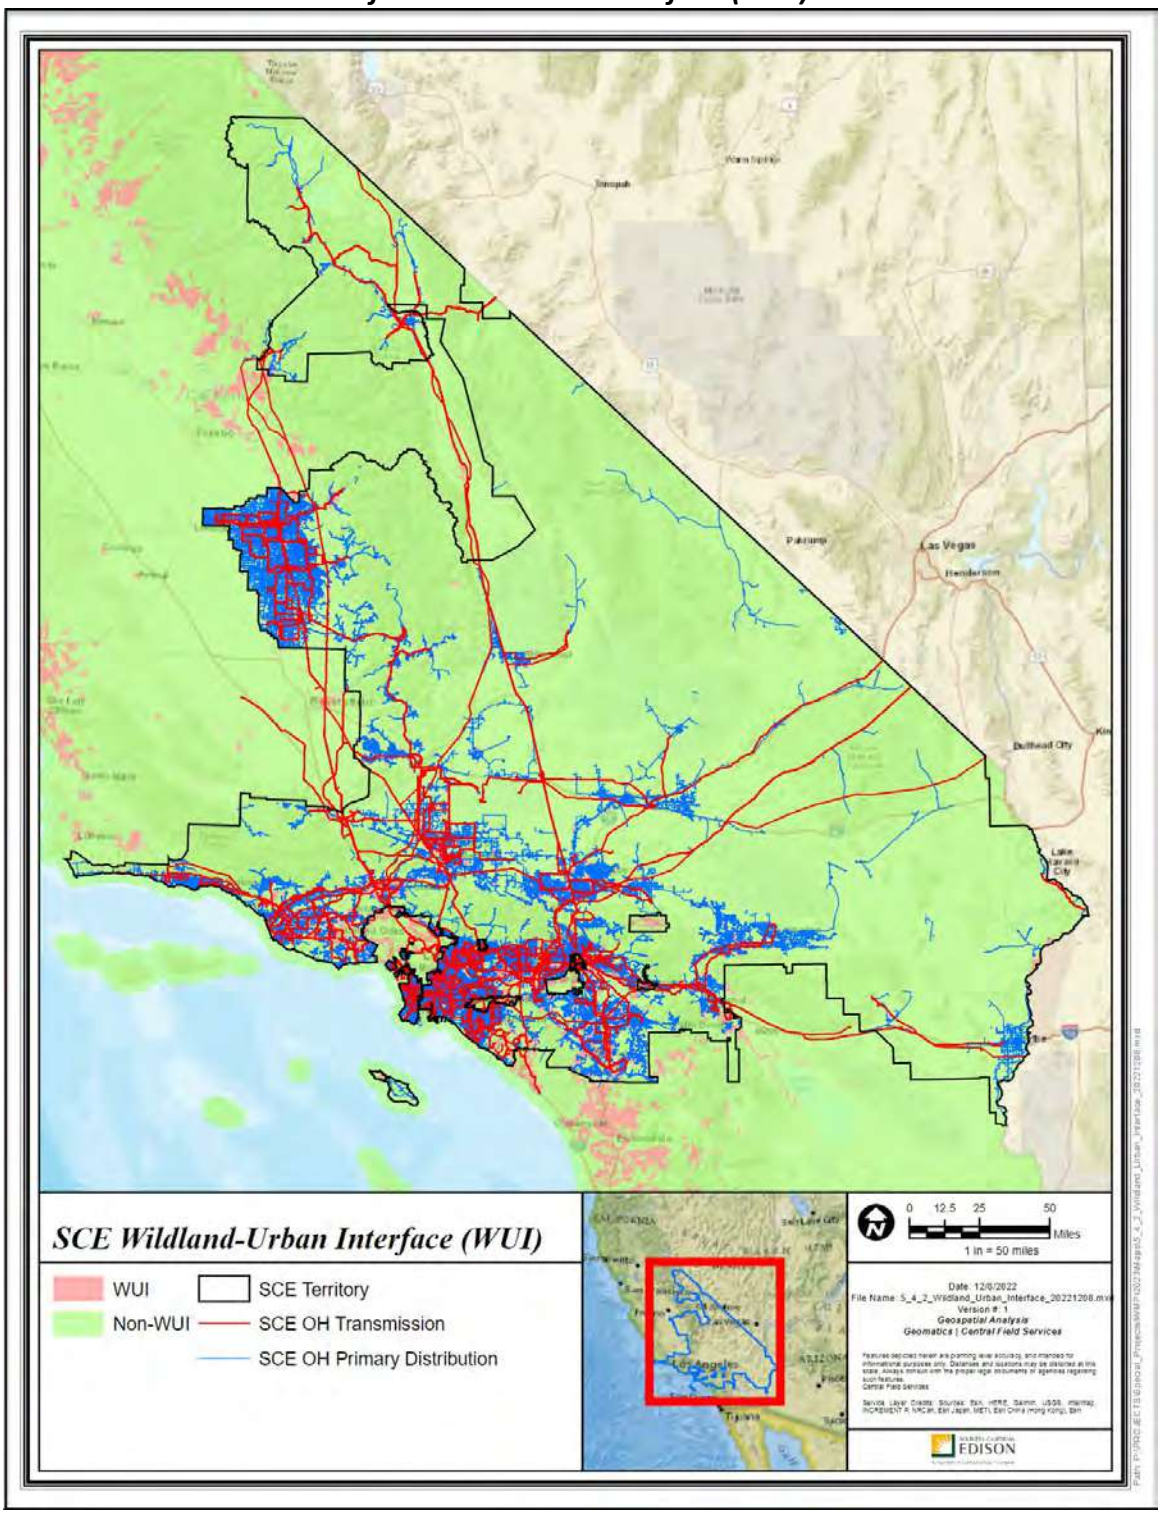


Table SCE 5-01 provides the total area of SCE service territory and number of customers and circuit miles in WUIs.[59] Further, Figure SCE 5-07 below shows the distribution of WUIs (raster or polygon) and overhead transmission and distribution circuit miles across SCE service territory. The source data for this map is publicly available from the University of Wisconsin-Madison (Silvis Lab) and the spatial data can be downloaded at http://silvis.forest.wisc.edu/data/wui-change-2020/.

Table SCE 5-01 - Number of SCE Customers and Circuit Miles in Wildland Urban Interface (WUI)

Wildland-Urban Interfaces (WUIs)	SCE Customers	SCE Circuit Miles
Non-WUIs	3,438,975	54,453
WUIs	1,755,161	27,877
Total	**5,194,136**	**82,330**

[59] The metrics provided include all transmission and primary distribution circuits, including overhead and underground.

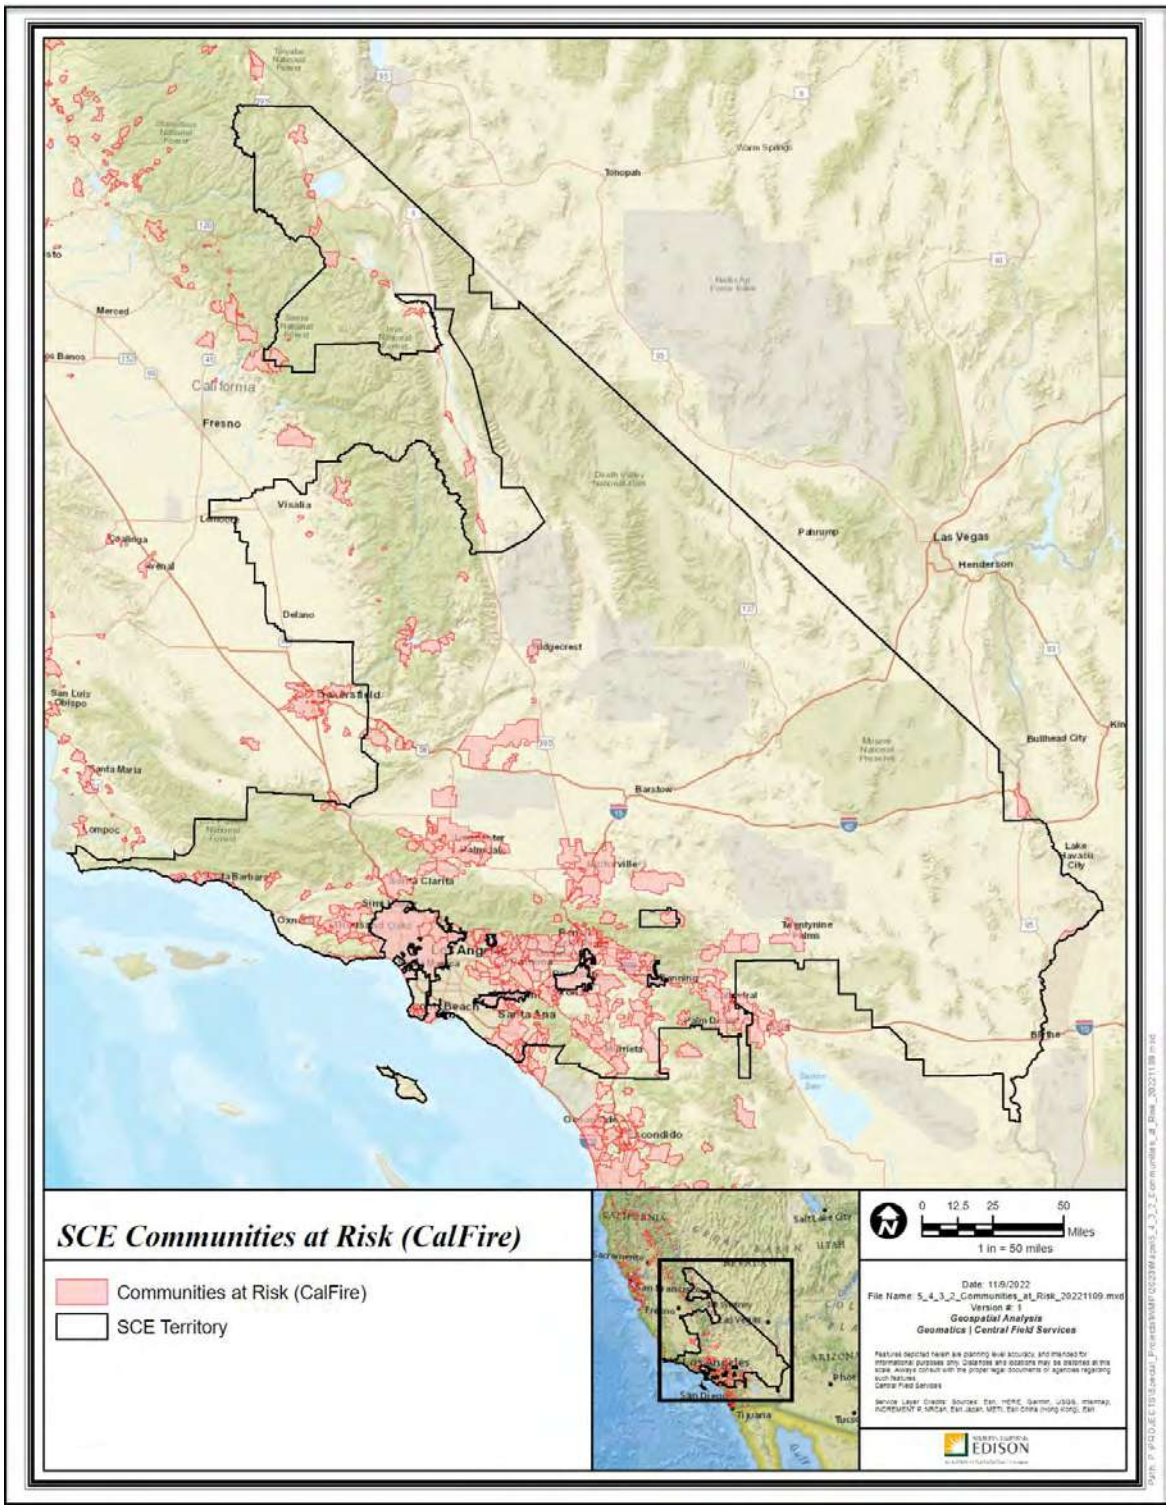
Figure SCE 5-08 - Distribution of Wildland Urban Interface (WUI) across SCE Service Territory[60]

[60] Map as of 12/8/22 and data source is from University of Wisconsin-Madison (Silvis Lab) - 2020 http://silvis.forest.wisc.edu/data/wui-change-2020/.

5.4.3 Communities at Risk from Wildfire

In this section of the WMP, an electrical corporation must provide a high-level overview of communities at risk from wildfire as defined by the electrical corporation (e.g., within the HFTD and HFRA). This includes an overview of individuals at risk, AFN customers, social vulnerability, and communities vulnerable because of single access/egress conditions within its service territory. Detailed instructions are provided below.

5.4.3.1 Individuals at Risk from Wildfire



The electrical corporation must provide a brief narrative (one to two paragraphs) describing the total number of people and distribution of people at risk from wildfire across its service territory.

1. Communities At Risk

Communities at Risk (CARs) are those communities designated by the California Department of Forestry and Fire Prevention (CalFire) that are within, or adjacent, to Wildland Urban Interface (WUI). SCE provides electric service in 193 cities and communities throughout Southern California, the majority of which have been wholly or partially designed as a Community at Risk (CAR). SCE notes that, in many cases, only a portion of these communities intersect with the Commission designated High Fire Threat District (HFTD).

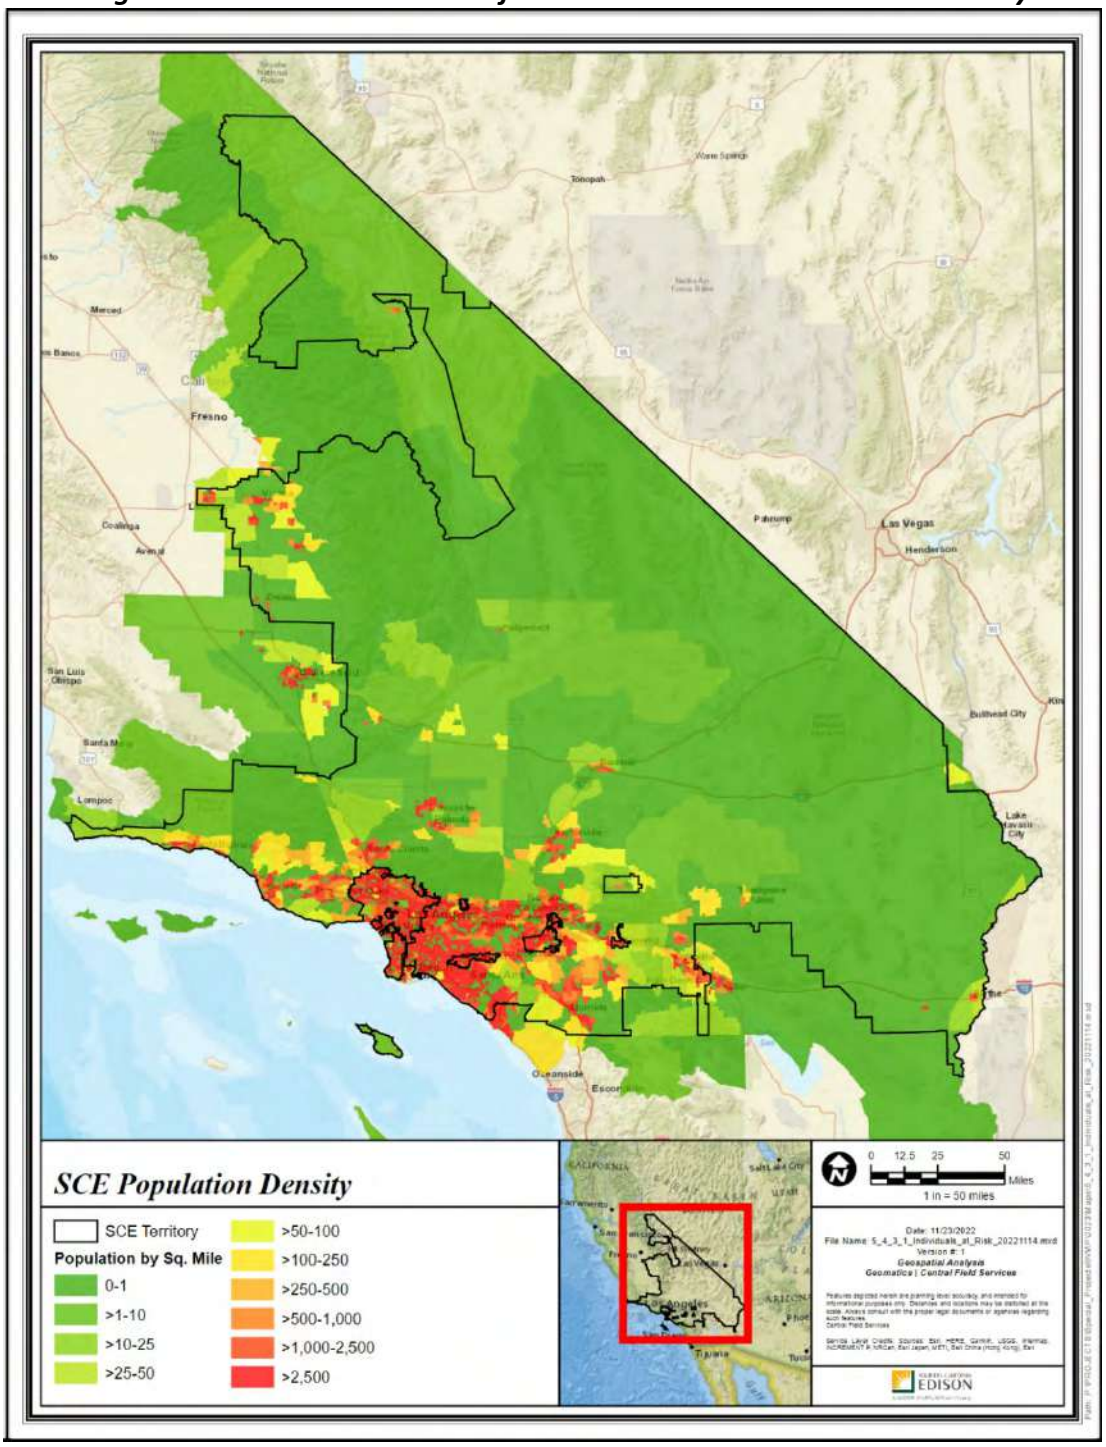
To be considered as a CAR, individual communities must submit an application outlining risk factors specific to their community. These factors include known local fire behavior potential, terrain complexity, and population egress challenges. Once a community is designated as a CAR, they are prioritized for state and federally funded fuel treatments projects. Figure SCE 5-09 below shows the distribution of communities at risk from wildfire across SCE service territory. The source data for this map is publicly available from the CAL FIRE and the spatial data can be downloaded at https://osfm.fire.ca.gov/divisions/community-wildfire-preparedness-and-mitigation/fire-plan/communities-at-risk/.

Figure SCE 5-09 - Distribution of Communities across SCE Service Territory[61]

[61] Map as of 12/8/22 and data source is from CalFire (https://osfm.fire.ca.gov/divisions/community-wildfire-preparedness-and-mitigation/fire-plan/communities-at-risk/).

2. Individuals At Risk

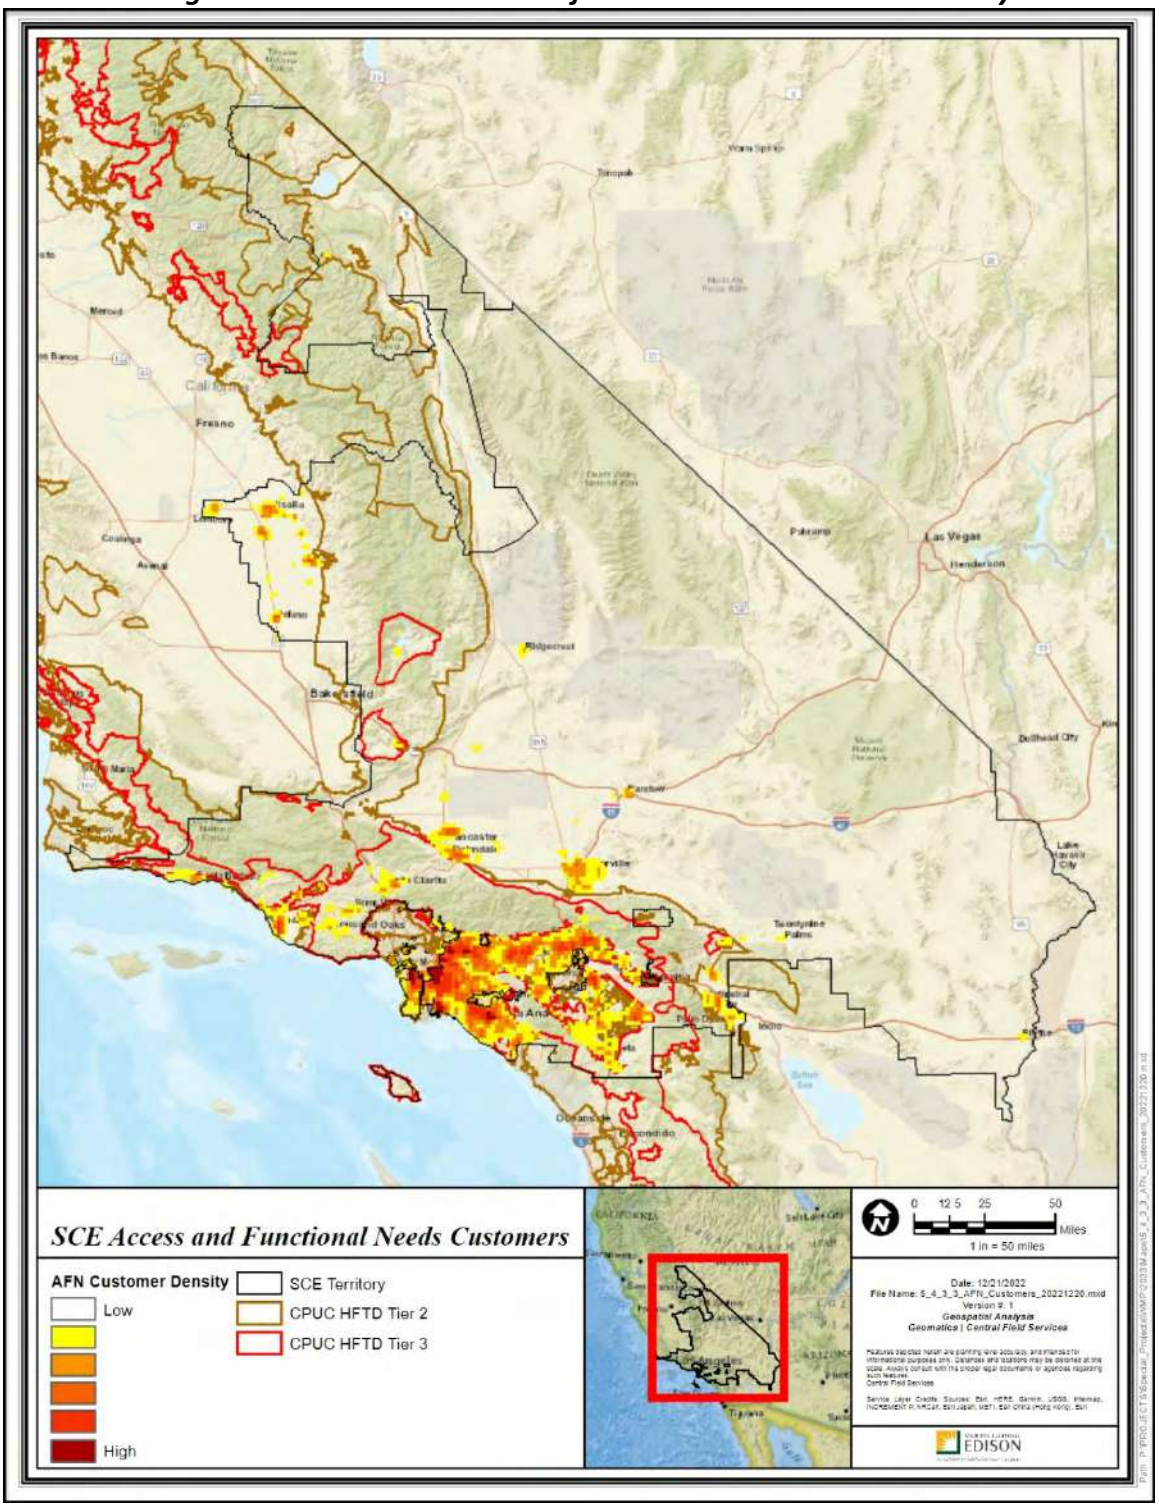
SCE provides service to over approximately 15 million customers through 5.2 million customer accounts. SCE's service area includes densely populated portions of Los Angeles and Orange counties not otherwise served by municipal electric utilities.[62] As stated in the previous section, roughly one third of these customers reside in the WUI. Figure SCE 5-10 below shows the distribution of individuals at risk from wildfire across SCE service territory. The source data for this map is publicly available from the United States Census Bureau and the spatial data can be downloaded at https://www.census.gov/geographies/mapping-files/time-series/geo/tiger-geodatabase-file.2020.html.



3. Access and Functional Needs

SCE leverages internal customer enrollment data from customer programs and services and demographic designations SCE has on record that match the definition of an Access and Function Needs (AFN) customer. See Section 8.5.3 for additional details on AFN data tracked in our systems.[63] In SCE's service territory, the majority of AFN customers are located in more urbanized/non-WUI locations. Figure SCE 5-11 below shows the distribution of AFN at risk from wildfire across SCE service territory.

[62] Source: 2020 U.S. Census https://mtgis-portal.geo.census.gov/arcgis/apps/MapSeries/index.html?appid=2566121a73de463995ed2b2fd7ff6eb7



[63] SCE performed an analysis to identify the percentage of the SCE customer base that meets the definition of AFN per Government Code 8593.3(f)(1). Based on data gathered from SCE's internal systems and programs, SCE estimates that approximately 32% of its customer accounts would identify with at least one AFN category. SCE actively identifies customers as AFN that directly interface with SCE's customer programs and services. SCE launched an AFN Self-Identification pilot in 2022 to help us further identify customers and household members with access and functional needs, above and beyond customers enrolled in the Medical Baseline Allowance Program. See Section 8.5.3 for additional details.

Figure SCE 5-10 - Distribution of Individuals across SCE Service Territory[64]

[64] Map as of 12/8/22 and data source is from data source is from 2020 Census Tract (https://www.census.gov/geographies/mapping-files/time-series/geo/tiger-geodatabase-file.2020.html)

Figure SCE 5-11 - Distribution of AFN across SCE Service Territory[65]

[65] Map as of 12/8/22. SCE has provided a spatial data for AFN in SCE service territory. Please see https://www.sce.com/safety/wild-fire-mitigation.

5.4.3.2 Social Vulnerability and Exposure to Electrical Corporation Wildfire Risk

The electrical corporation must provide a brief narrative describing the intersection of social vulnerability and community exposure to electrical corporation wildfire risk across its service territory. This intersection is defined as census tracts that 1) exceed the 70th percentile according to the Social Vulnerability Index (SVI) or have a median household income of less than 80 percent of the state median, and 2) exceed the 85th percentile in wildfire consequence risk according to the electrical corporation's risk assessment(s).[66]

For SVI, the electrical corporation must use the most up-to-date version of Centers for Disease Control and Prevention/Agency for Toxic Substances and Disease Registry's Social Vulnerability Index dataset (Year = 2018;43F[67] *Geography = California; Geography Type = Census Tracts).*[68]

In addition, the electrical corporation must provide a single geospatial map showing its service territory (polygon) overlaid with the distribution of the SVI and exposure intersection and urban and major roadways. Any additional maps needed to provide clarity and detail should be included in Appendix C.

Based on the census tract level geography used in by Centers for Disease Control (CDC) Social Vulnerability Index (SVI), the majority of the socially vulnerable populations in SCE's service territory are located outside of High Fire Threat Districts (HFTD). Census tract-based geographies are inherently biased toward urbanized areas with higher population density. Therefore, the granularity of spatial data using this geography is not particularly useful in more rural locations, which are prevalent in SCE's High Fire Threat District (HFTD). For this reason, SCE has developed a circuit-based view of social vulnerability. This Access and Functional Needs (AFN)/Non-Residential Critical Infrastructure (NRCI) multiplier methodology is described in additional detail in Section 6.4.

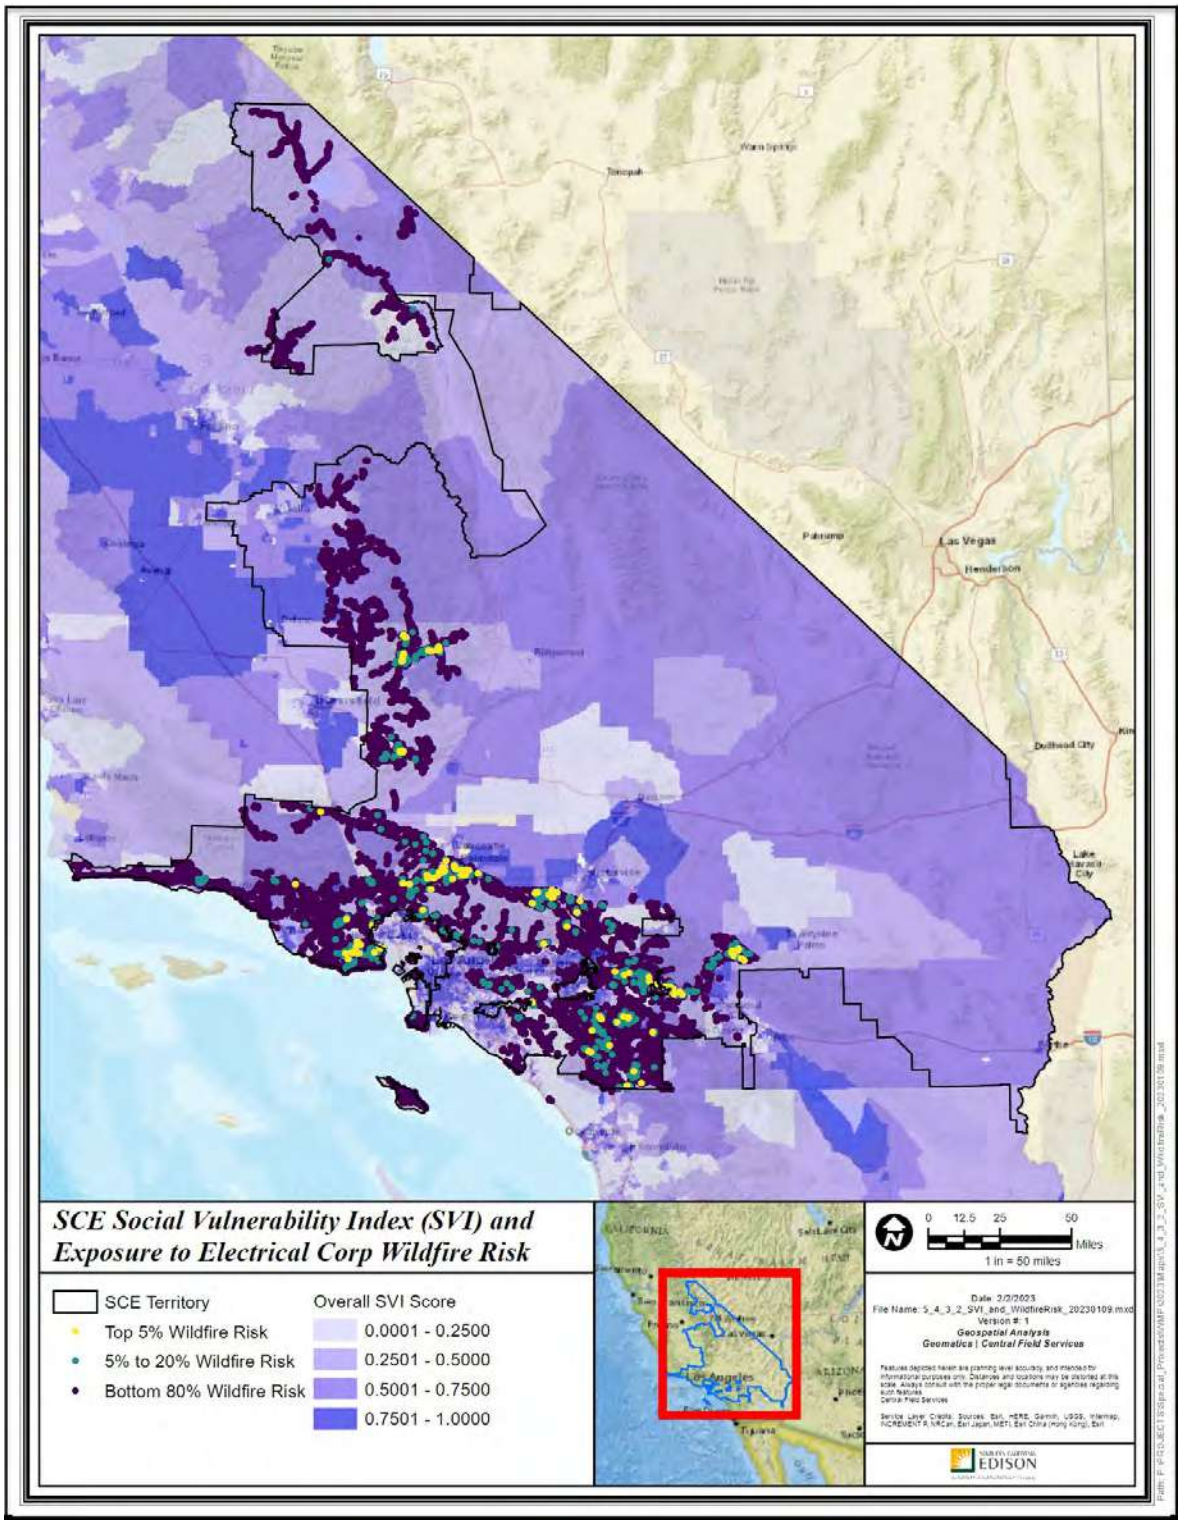


Figure SCE 5-12 below shows the distribution of the SVI and exposure intersection and urban and major roadways across SCE service territory. The source data for this map is publicly available from the Center for Disease Control and Prevention, and the spatial data can be downloaded at https://www.atsdr.cdc.gov/placeandhealth/svi/data_documentation_download.html.

[66] These criteria are derived from Cal OES Recovery Division, Hazard Mitigation Assistance Branch's Multiple Hazards and Social Vulnerability Analysis, dated January 18, 2022: https://www.caloes.ca.gov/wp-content/uploads/Recovery/Documents/Socially-Vulnerable-and-High-Hazard-Risk-Community-Criteria.-Methodology.pdf & https://calema.maps.arcgis.com/apps/dashboards/3c78aea361be4ea8a21b22b30e613d6e

[67] As of the publishing of these Guidelines, 2018 was the most recent version of the dataset. Electrical corporations must use the most up-to-date version of the dataset.

[68] Centers for Disease Control and Prevention / Agency for Toxic Substances and Disease Registry Social Vulnerability Index Data and Documentation Download (https://www.atsdr.cdc.gov/placeandhealth/svi/data_documentation_download.html, accessed Oct. 11, 2022).

Figure SCE 5-12 - Distribution of the SVI and Exposure Intersection and Urban and Major Roadways across SCE Service Territory[69]

[69] Map as of 01/09/23. SVI data is from Center for Disease Control and Prevention

Sub-Divisions with Limited Egress or No Secondary Egress

The electrical corporation must provide a brief narrative overview (one to two paragraphs) describing sub-divisions with limited egress or no secondary egress, per CAL FIRE data,[70] across the electrical corporation's service territory.

AB 2911 (2018) amended the California Public Resource Code 4290.5 that requires CalFire to identify subdivisions with greater than 30 housing units located in the State Responsibility Area (SRA) or a Very High Fire Hazard Severity Zones (VHFSZ) without a secondary means of population egress. Given that this bill only passed a few years ago, many of the neighborhoods in SCE's service territory have not been assessed under this program. Only select portions of Los Angeles, Orange, and Kern counties have complete assessments made available to the public. SCE has developed an alternate methodology to assess population egress with high fire frequency through its Severe Risk Areas (SRA) methodology, which is described in more detail in Section 6. As these AB2911 assessments progress, SCE will continue to review new locations to help ensure any newly identified locations are incorporated into its overall egress methodology.

Figure SCE 5-13 below shows the map of Communities Vulnerable due to Access/Egress Constraints (Polygon) across SCE Service Territory base on CAL FIRE data. The source data for this map is publicly available from the CAL FIRE and the spatial data can be downloaded at https://calfire-forestry.maps.arcgis.com/apps/webappviewer/index.html?id=a045e9e9c01c4dd7abdf14ad30646eaf.

[70] Board of Forestry and Fire Protection Subdivision Review Program (https://bof.fire.ca.gov/projects-and-programs/subdivision-review-program/, accessed Oct. 11, 2022).

Figure SCE 5-13 - Communities Vulnerable due to Access/Egress Constraints (Polygon) and Major Roadways (Polygon) across SCE Service Territory[71]

[71] Map as of 12/8/22 and data source is from CAL FIRE (https://calfire-forestry.maps.arcgis.com/apps/webappviewer/index.html?id=a045e9e9c01c4dd7abdf14ad30646eaf)

[72] Data as of 12/9/22.

5.4.4 Critical Facilities and Infrastructure at Risk from Wildfire

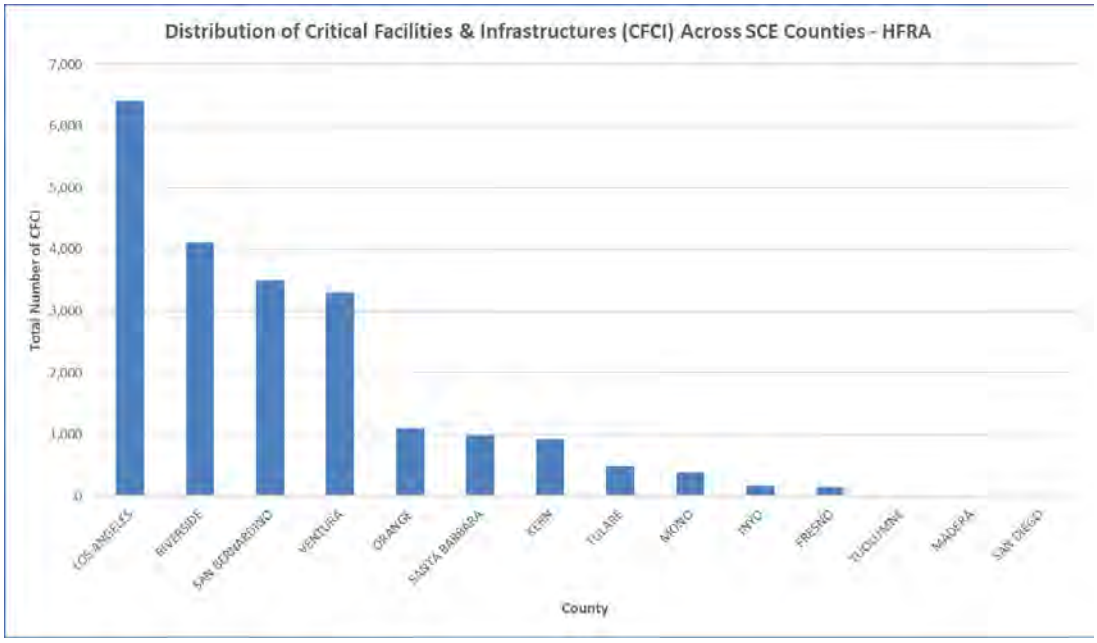
The electrical corporation must provide a brief narrative describing the distribution of critical facilities and infrastructure located in the HFTD/HFRA across its service territory. Critical facilities and infrastructure are defined in Appendix A.

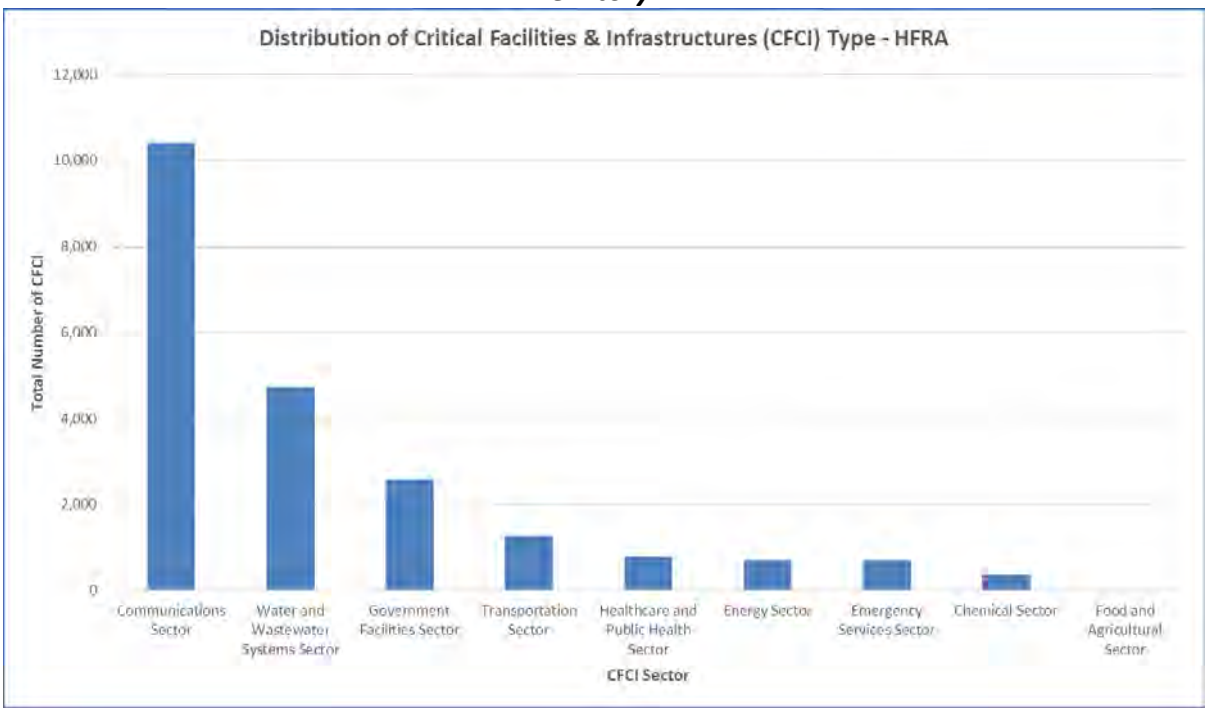
Facilities and infrastructure deemed to be critical are those that perform essential functions to public safety. Some examples include, but are not limited to, police facilities, emergency operation centers (EOCs), fire stations, schools, shelters, telecommunications towers, and numerous other essential facilities. These facilities may require additional assistance and advanced planning to help ensure resiliency and continuity during de-energization events. SCE offers assistance to those facilities with advanced planning efforts toward their functional resiliency during de-energization and re-energization. SCE identifies Critical facilities and Infrastructure customers by utilizing the CPUC's adopted list and the North American Industry Classification System (NAICS) process. NAICS allows us to verify the sectors identified by the CPUC. SCE then verifies customer data against the NAICS.

SCE has approximately 21,000 Critical Facilities in its HFRA. The County of Los Angeles has approximately 6,000 facilities with Riverside and San Bernardino Counties having approximately 4,000 and 3,000 facilities, respectively.

Figure SCE 5-14 shows the distribution of critical facilities and infrastructure by county, and Figure SCE 5-15 hows the distribution of critical facilities and infrastructure by type. Further, Figure SCE 5-15 below shows the critical facilities (point data) and critical infrastructure (points and/or lines, as appropriate) across SCE service territory (polygon).

Figure SCE 5-14 - Distribution of Critical Facilities and Infrastructures across SCE HFRA Territory By Counties[72]





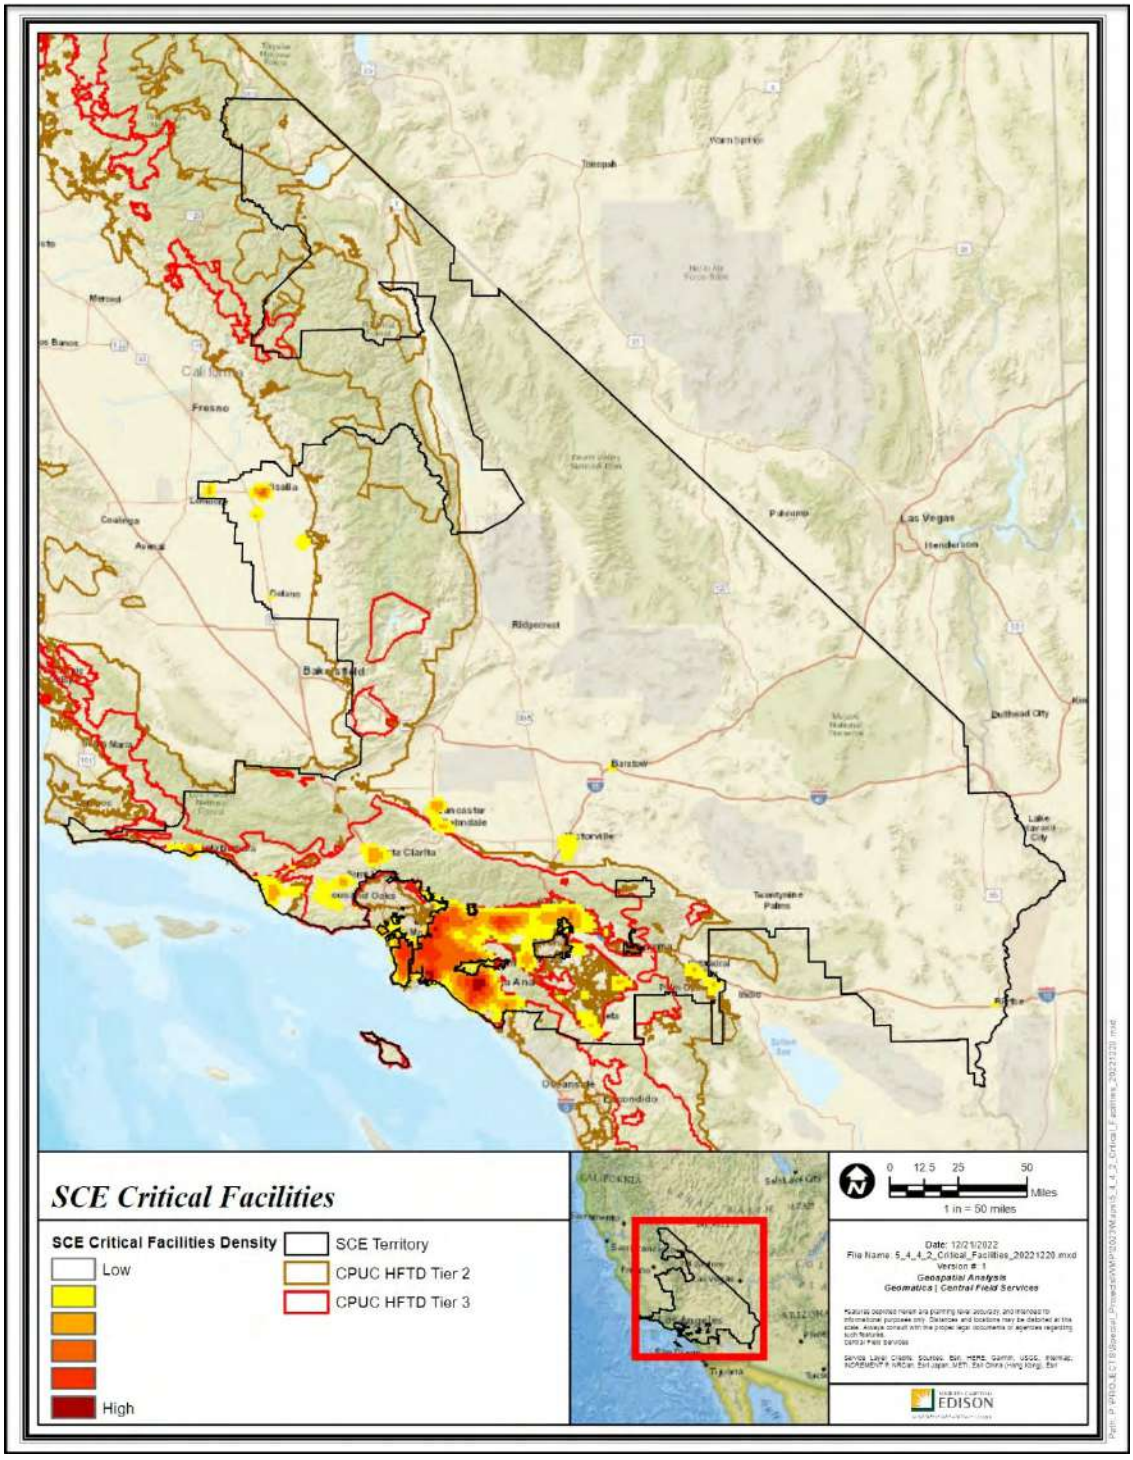


Figure SCE 5-15 Distribution of Critical Facilities and Infrastructures Type across SCE HFRA Territory[72]

[72] Data as of 12/9/22.

Figure SCE 5-16 - Distribution of Critical Facilities and Infrastructures Across SCE Service Territory[73]

[73] Map as of 12/8/22. SCE has provided a spatial data for SCE Critical Facilities. Please see https://www.sce.com/safety/wild-fire-mitigation.

5.4.5 Environmental Compliance and Permitting

In this section, the electrical corporation must provide a summary of how it ensures its compliance with applicable environmental laws, regulations, and permitting related to the implementation of its WMP. This overview must include:

- *A description of the procedures/processes to ensure compliance with relevant environmental laws, regulations, and permitting requirements before and during WMP implementation. The process or procedure should include when consultation with permittees occurs (i.e., at what stage of planning and/or implementation of activities described in the WMP)*
- *Roadblocks the electrical corporation has encountered related to environmental laws, regulations, and permitting related to implementation of its WMP and how the electrical corporation has addressed, is addressing, or plans to address the roadblocks.*
- *Any notable changes to its environmental compliance and permitting procedures and processes since the last WMP submission and a brief explanation as to why those changes were made. Include any planned improvements or updates to the initiative and the timeline for implementation.*

The electrical corporation must also provide a table (Table 5-6 provides an example) of potentially relevant state and federal agencies that may be responsible for discretionary approval of activities described in WMPs and the relevant environmental laws, regulations, and permitting requirements. If this table extends past two pages, provide the required information in an appendix.

Wildfire Environmental Compliance and Permitting Summary

SCE is committed to preserving and protecting the environment and implementing sustainable business practices for the benefit of the customers and communities we serve. SCE complies with applicable local, state, and federal environmental laws and regulations.

SCE Environmental Compliance Procedures and Processes

SCE's Environmental Services Department (ESD) evaluates work activities associated with the WMP to identify the potential for impacts to agency regulated environmental resources (regulated environmental resources) (i.e., archaeological, cultural, biological species, wetlands and waterways, etc.) and any existing agency permit conditions that may be applicable.

The environmental review process is initiated after the work activity has been identified and the scoping for performing the work activity has been completed. After receiving the planned work activity, ESD performs a multi-tiered evaluation, beginning with desktop screening that uses project location information to determine whether the project intersects with known regulated environmental resources identified in publicly available agency databases or past environmental survey data gathered by SCE. If there are no intersects with known regulated environmental resources, the operations team receives approval to proceed with scheduling and implementation following standard environmental requirements designed to ensure work is performed in a way that protects the environment and ensures compliance.

Crews are responsible for reviewing and understanding the requirements prior to implementation, and if they encounter any unforeseen conditions, they are instructed to call for support. If there are intersects with existing agency permits or known regulated environmental resources, the project is further analyzed by ESD to determine the need for environmental impact avoidance/minimization measures and agency review, permitting, and approval. If the project requires agency permitting or review and approval, ESD gathers the required information to initiate such consultation.

After agency review and approval or permitting is complete, ESD sends agency environmental requirements to the operations team for scheduling and execution of the work. Environmental requirements may include pre-activity environmental surveys and/or environmental monitoring during implementation. In these cases, the operations team coordinates with ESD to schedule qualified personnel to perform environmental surveys and monitoring.

SCE also has processes to inspect projects that are on-hold pending environmental or agency review and approval. For example, if an equipment inspection identifies a Priority 1 (P1 - emergency condition), SCE will remediate the P1 condition pursuant to GO95 and will notify the appropriate agency and file any after-the-fact permits that may be necessary.

Roadblocks

Activities to address wildfire risk often occur in locations that require additional environmental review, protection, or permitting. For example, the work can occur in environmentally sensitive areas and on lands administered by State and Federal agencies, requiring coordination with such agencies. Environmental permitting and approval of work in these areas can present significant challenges to the timely execution of work. Reasons for these challenges vary by each agency's rules and available resources. However, some frequently encountered issues include:

- Environmental regulations that do not provide clear guidance on permitting processes and criteria for approval, resulting in different interpretations of a regulation within an agency (e.g., between differing regions, and/or between the regions and headquarters) and delays and/or denials of discretionary permits.
- Agency staffing, resources, and funding shortages to support and prioritize utility permits.
- Long agency processing times given their required administrative/regulatory processes (e.g., 18 months to obtain a temporary right-of-way permit).

Actions to Address Challenges

SCE is continuing to enhance its agency-specific strategies to address permitting challenges. SCE anticipates that the development of broader, long-term permits, streamlined permit processes, and exemption pathways that allow for low environmental risk, high volume utility wildfire and compliance work to proceed in a more efficient manner will be key elements in most agency-specific strategies. In the near-term, when significant issues arise, SCE escalates those issues with the agency and attempts to resolve them as soon as possible. Below, SCE has identified how we are working (or plan to work) in partnership with some key agencies to address permitting.

Forest Service Master Special Use Permit (MSUP)

The Forest Service MSUP continues to be an important tool to facilitate SCE's work. SCE is now focusing on how to improve the efficient use of this permit, including addressing greater consistency in agency execution, expanding the scope of the permitted activities, and obtaining approvals within expected timeframes. SCE is working with agencies to add staff at key forests and at the regional level, through cost recovery agreements, to provide dedicated staff to support review and approval of projects. This should reduce delays due to staffing shortages. SCE is increasing its external engagement with agency leadership to share priorities, signal upcoming changes, discuss concerns and solutions, and gain consensus for a path forward. For example, SCE flagged to the agency's senior leadership that fuel management remains a key challenge and the agency is now working with multiple stakeholders to address this key issue.

Bureau of Land Management (BLM)

SCE worked with the California State Office to obtain a 5-year Instruction Memorandum, which allows utilities to carry-out wildfire mitigation work without waiting for approval (though after-the-fact reporting requirements apply). This has significantly decreased agency permitting time pending the issuance of an Operations and Maintenance Plan, which is currently under development. Specifically, SCE has been working with the BLM in the Bakersfield Office on a pilot for an Operations and Maintenance Plan that can be rolled out more broadly within the agency once completed in 2023. SCE also is increasing its external engagement with agency leadership to share priorities, signal upcoming changes, discuss concerns and solutions, and gain consensus for a path forward.

California Department of Fish and Wildlife (CDFW)

SCE and CDFW share the goals of reducing wildfire risks by completing grid resiliency projects, decreasing turnaround time for permits, protecting California's natural resources, and minimizing the impact of our projects on fish and wildlife. SCE is considering several possible tools and actions that could help and we look forward to continuing our work with CDFW to realize these mutual goals.

Some possible actions include: (1) increasing our portfolio of permits to include broader, long-term permits, additional incidental take permits covering all activities with impact within covered species' habitats and more streamlined permit processes, (2) increasing agency staffing and training to support permit development and more efficient permit processing, and (3) increasing agency leadership participation and input, including through formal agency guidance, definition of key terms and standardization of processes.

As with the Forest Service and BLM, SCE is increasing its engagement with CDFW agency leadership, and will share ideas regarding possible solutions to facilitate processes for both agency and utility staff, while supporting the core mission of the agency.

As mentioned above, across these key agencies, we will continue to evaluate our own internal processes and seek feedback from agencies to help ensure smoother transactions from SCE's part as well.

Notable Changes, Including Planned Improvements

SCE is exploring ways to optimize the work management processes to implement WMP activities outside of seasonal limited operating periods (LOPS) associated with environmental resources (i.e., threatened or endangered species).

SCE has recently obtained incidental take permits for Yosemite Toad and Arroyo Toad and is currently finalizing permits for Pacific Fisher, San Bernardino Kangaroo Rat, and Santa Catalina Island Fox, which will provide greater operational flexibility in key regions. SCE is also applying for a Master Streambed Alteration Agreement for work in CDFW jurisdictional waters (estimated permit approval in 2024).

Relevant Federal Environment Laws, Regulations, and Permitting Requirements

SCE obtains environmental permits and approvals from governmental agencies to comply with environmental laws and regulations. Table 5-6 and Table 5-7 below provide the relevant state and federal environmental laws, regulations and permitting requirements for implementing the WMP.

Table 5-6 - Relevant State Environmental Laws, Regulations, and Permitting Requirements for Implementing the WMP

Environmental Law, Regulation, or Permit	Responsible Permittee/Agency
California Environmental Quality Act (CEQA)	Various: State and local agencies, i.e., California Public Utilities Commission, California Department of Fish and Wildlife, Los Angeles Department of Regional Planning, etc.
Assembly Bill 52 (AB52): California Public Resources Code 21080.3.2	Various: State and local agencies, i.e., California Public Utilities Commission, California Department of Fish and Wildlife, Los Angeles Department of Regional Planning, etc.
California Endangered Species Act (CESA)	California Department of Fish and Wildlife
California Fish and Game Code § 3800 [makes it unlawful to take any nongame bird (i.e., bird that is naturally occurring in California that is not a gamebird, migratory game bird, or fully protected bird)]	California Department of Fish and Wildlife

Environmental Law, Regulation, or Permit	Responsible Permittee/Agency
Native Plant Protection Act	California Department of Fish and Wildlife
California Desert Native Plants Act	California Department of Agriculture, local agencies
Lake or Streambed Alteration (LSA) California Fish and Game Code §§ 5650 - 5652 (prohibit the deposition, passage of, or disposal of deleterious materials into the waters of the state, or within 150 feet of the highwater mark of waters of the state)	California Department of Fish and Wildlife
Air Resources California Health and Safety Code §§ 39000-44474 Portable Equipment Registration Program (PERP) and Portable Engine Airborne Toxic Control Measure	California Air Resources Board and various local air agencies
California Porter-Cologne Water Quality Control Act	California State Water Quality Control Board including multiple Regional Water Quality Control Boards
California Coastal Act	California Coastal Commission including delegation of Local Coastal Programs (LCPs) to cities and counties
Various Encroachment Permits	CA Dept. of Transportation, CA Dept. Water Resources

Table 5-7 - Relevant Federal Environmental Laws, Regulations, and Permitting Requirements for Implementing the WMP

Environmental Law, Regulation, or Permit	Responsible Permittee/Agency
National Environmental Policy Act (NEPA)	Various: Federal Land Management Agencies, i.e., Bureau of Land Management, National Park Service, USFS, etc.
Federal Endangered Species Act of 1973(ESA)	United States Fish and Wildlife Service
Migratory Bird Treaty Act (MBTA)	United States Fish and Wildlife Service

Environmental Law, Regulation, or Permit	Responsible Permittee/Agency
Bald and Golden Eagle Protection Act (BGEPA)	United States Fish and Wildlife Service
Marine Mammal Protection Act (MMPA)	United States Fish and Wildlife Service
National Historic Preservation Act (NHPA)	Advisory Council on Historic Preservation/State Historic Preservation Office/Federal Lead agencies
Archaeological Resources Protection Act (ARPA)	Various: Federal Land Management Agencies, i.e., Bureau of Land Management, National Park Service, USFS, etc.
Native American Graves Repatriation Protection Act (NAGRPA)	Various: Federal Land Management Agencies, i.e., Bureau of Land Management, National Park Service, USFS, etc.
Antiquities Act of 1906	Various: Federal Land Management Agencies, i.e., Bureau of Land Management, National Park Service, USFS, etc.
Paleontological Resources Preservation Act (PRPA)	Various: U.S. Department of the Interior, i.e., Bureau of Land Management, National Park Service, U.S. Fish and Wildlife Service, U.S. Bureau of Reclamation, etc.
Federal Clean Water Act (CWA)	Environmental Protection Agency, Army Corps of Engineers
Federal Coastal Zone Management Act	Bureau of Ocean Energy Management

6 RISK METHODOLOGY AND ASSESSMENT

In this section of the WMP, the electrical corporation must provide an overview of its risk methodology, key input data and assumptions, risk analysis, and risk presentation (i.e., the results of its assessment). This information is intended to provide the reader with a technical understanding of the foundation for the electrical corporation's wildfire mitigation strategy for its Base WMP. Sections 6.1–6.7 below provide detailed instructions.

For the 2023-2025 Base WMP, the electrical corporation does not need to have performed each calculation and analysis indicated in sections 6.2, 6.3, and 6.6. If the electrical corporation is not performing a certain calculation or analysis, it must describe why it does not perform the calculation or analysis, its current alternative to the calculation or analysis (if applicable), and any plans to incorporate those calculations or analyses into its risk methodology and assessment.

In this section, SCE describes its approach to define and analyze wildfire and PSPS risk. These risk assessments inform mitigation strategy, prioritization, selection, and scoping as described in Section 7.

In Section 6.1, SCE provides a summary of the two risk planning frameworks it uses as part of its Integrated Wildfire Mitigation Strategy (IWMS): 1) the Multi-Attribute Risk Score Framework (MARS Framework or MARS), which is used to calculate overall Wildfire and PSPS risk and risk reduction from mitigation activities, and 2) the IWMS Risk Framework, which categorizes SCE's high fire risk area into three risk tranches and is used to inform mitigation selection and scoping.

In Section 6.2, SCE explains its approach to the 17 risk components defined by the WMP guidelines. In the limited cases in which SCE uses a risk component differently than as defined by the WMP guidelines, SCE explains its reasoning.

In Section 6.3, SCE explains its approach to the risk scenarios defined by the WMP guidelines. In the limited cases in which SCE does not use a risk scenario as defined by the WMP guidelines, or uses it differently, SCE explains its reasoning.

In Section 6.4, SCE presents a summary of wildfire and PSPS risk across its service territory, including the highest risk locations and circuits. SCE also describes the HFTD review process with the CPUC and provides details on metrics as requested by the WMP guidelines.

In Section 6.5 and Section 6.6, SCE describes the mechanisms by which SCE accesses, stores, and controls wildfire and PSPS risk related information. This section also summarizes the associated quality control/quality assurance processes for risk data and risk analyses.

In Section 6.7, SCE provides its risk improvement plan, which is informed by internal assessments along with feedback from stakeholders and regulatory agencies.

SCE also notes that additional documentation on risk components and models can be found in Summary Documentation .

6.1 Methodology

In this section, the electrical corporation must present an overview of its risk calculation approach. This includes one or more graphics showing the calculation process, a concise narrative explaining key elements of the approach, and definitions of different risks and risk components.

6.1.1 Overview

The electrical corporation must provide a brief narrative describing its methodology for quantifying its overall utility risk of wildfires and PSPS. This methodology will help inform the development of its wildfire mitigation strategy (see Section 7). The electrical corporation must describe the methodology and underlying intent of this risk assessment in no more than five pages, inclusive of all narratives, bullet point lists, and any graphics.

SCE uses two risk planning frameworks:

The MARS Framework is used to calculate overall utility risk from both wildfire and PSPS. The MARS Framework converts PSPS risk (PSPS Likelihood and PSPS Consequence) and Wildfire risk (Probability of Ignition and Wildfire Consequence) into a unitless risk score based on the principles in the S-MAP Settlement. The MARS Framework allows SCE to define and evaluate overall utility risk, and to compare mitigations and alternatives to each ignition driver and sub-driver on the basis of risk reduction and cost effectiveness.

The IWMS Risk Framework defines three risk tranches within SCE's HFRA based on potential consequences should an ignition occur at a specific utility asset location. This analysis includes elements such as potential egress constraints and Communities of Elevated Fire Concern (CEFC). The IWMS Risk Framework is anchored on wildfire consequence should an ignition occur and does not adjust consequences based on the probability of ignition. SCE takes this approach because probability of ignition changes over time due to many variables such as age, loading, etc. Furthermore, in some locations the consequences of an ignition that leads to a wildfire may be so extreme that it is prudent to mitigate ignition risk regardless of probability.

After mitigations have been evaluated and selected under the MARS Framework, SCE uses this preferred list of mitigations in combination with the IWMS Risk Framework as a key input to determine the location, scale, scope, and frequency for each mitigation based on the three tranches of forecasted wildfire consequence severity. The IWMS Risk Framework supports SCE's strategy to deploy mitigations commensurate with the level of consequence from a safety, financial, and reliability perspective within each location of its high fire risk area.

In Section 6.2.1, SCE further explains these two frameworks, and provides two diagrams that are intended to illustrate how each framework uses the individual risk components defined by the WMP guidelines. Each diagram should be considered as unique to its respective framework.

6.1.2 Summary of Risk Models

In this section, the electrical corporation must summarize the calculation approach for each risk and risk component identified in Section 6.2.1. This documentation is intended to provide a quick summary of the models used. The electrical corporation must provide the following information:

- ***Identification (ID)****: Unique shorthand identifier for the risk or risk component.*
- ***Risk component:*** *Unique full identifier for the risk or risk component.*
- ***Design scenario(s)****: Reference to design scenarios evaluated with the model to calculate the risk or risk component. These must be defined in Section 6.3.*
- ***Key inputs****: List of key inputs used to evaluate the risk or risk component. These can be in summary form (e.g., the electrical corporation may list "equipment properties" rather than listing out equipment age, maintenance history, etc.).*
- ***Sources of inputs****: List of sources for each input parameter. These must include data sources (such as LANDFIRE) and modeling results (such as wind predictions) as relevant to the calculation of the risk or risk component. If the inputs come from multiple sources, each source should be on a new line.*
- ***Key outputs****: List of outputs calculated for the risk or risk component.*
- ***Units****: List of the units associated with the key outputs.*

Table 6-1 provides a template for the required information. The electrical corporation must provide a summary of each model in Appendix B.

Table 6-1 - SCE's Summary of Risk Models

ID[74]	Risk Component	Design Scenario(s)	Key Inputs	Source of Inputs (Data and/or Models)	Key Outputs	Units
R1	Overall Utility Risk	WL1, WL2, WC2, VC1, VC3	Combination of Ignition Risk (R2) and PSPS Risk (R3)	See descriptions for individual risk components	Overall wildfire and PSPS risk	MARS units
R2	Ignition Risk	Same as R1	Product of Ignition Likelihood (IRC1) and Wildfire Consequence (IRC3)	See descriptions for individual risk components	Wildfire risk per asset	MARS units
R3	PSPS Risk	Same as R1	Product of PSPS Likelihood (IRC4) and PSPS Consequence (IRC5)	See descriptions for individual risk components	PSPS risk per circuit	MARS units
IRC1	Ignition Likelihood	Same as R1	Combination of Equipment Ignition Likelihood (FRC1),	POI Model	Ignition likelihood per asset	annualized ignition probability

[74] Naming convention is based on Section 6.2.1 of the WMP Technical Guidelines: R = risk; IRC = intermediate risk component; FRC = fundamental risk component.

ID[74]	Risk Component	Design Scenario(s)	Key Inputs	Source of Inputs (Data and/or Models)	Key Outputs	Units
			Contact from Vegetation Ignition (FRC2), and Contact by Object Ignition Likelihood (FRC3)			per asset
IRC2	Wildfire Likelihood	N/A[75]	N/A	N/A	N/A	N/A
IRC3	Wildfire Consequence	Same as R1	assets, historical climatology, population, fuels, topography, buildings, wildfire vulnerability	Technosylva/Wildfire Consequence Model	Wildfire consequence for each ignition simulation in natural units (acres, buildings, population)	wildfire consequence in either natural units or MARS units
RC4	PSPS Likelihood	Same as R1	Weather and wind data, PSPS post-event reports, current de-energization criteria, existing mitigations	Weather Research and Forecasting (WRF); mitigation deployment	PSPS likelihood per circuit	PSPS likelihood per circuit
IRC5	PSPS Consequence	Same as R1	Number of customers on a circuit, Safety and Financial proxy factors	Customer database, internal claims data (financial proxy) and historical widespread outage data	PSPS consequence in natural units converted to MARS units per circuit	PSPS consequence in MARS units per circuit
FRC1	Equipment Ignition Likelihood	Same as R1	assets, outage database, historical faults/ignitions, pole loading, historical weather, wire down database, work/repair orders	SAP EAM, SAS, GE Small World/Map 3D	Ignition Likelihood	annualized ignition probability of ignition

[75] Please see Section 6.2 for SCE's approach to risk components marked as "N/A".

ID[74]	Risk Component	Design Scenario(s)	Key Inputs	Source of Inputs (Data and/or Models)	Key Outputs	Units
FRC2	Contact from Vegetation Ignition Likelihood	Same as R1	assets, outage database, historical faults/ignitions, pole loading, historical weather, wire down database, work/repair orders	SAP EAM, SAS, GE Small World/Map 3D	Ignition Likelihood	annualized ignition probability of ignition
FRC3	Contact by Object Ignition Likelihood	Same as R1	assets, outage database, historical faults/ignitions, pole loading, historical weather, wire down database, work/repair orders	SAP EAM, SAS, GE Small World/Map 3D	Ignition Likelihood	annualized ignition probability of ignition
FRC4	Burn Probability	N/A	N/A	N/A	N/A	N/A
FRC5	Wildfire Hazard Intensity	N/A	N/A	N/A	N/A	N/A
FRC6	Wildfire Exposure Potential	N/A	N/A	N/A	N/A	N/A
FRC7	Wildfire Vulnerability [76]	Same as R1	Access and Functional Needs (AFN) and Non-Residential Critical Infrastructure (NRCI) customers	Customer database and surveys	AFN and NRCI multipliers on each circuit	unitless multiplier between 1 and 2
FRC8	PSPS Exposure Potential	N/A	N/A	N/A	N/A	N/A
FRC9	PSPS Vulnerability	Same as R1	Access and Functional Needs (AFN) and Non-Residential Critical Infrastructure (NRCI) customers	Customer database and surveys	AFN and NRCI multipliers on each circuit	unitless multiplier between 1 and 2

[76] For the sake of simplicity, SCE has limited the entry for Wildfire Vulnerability in the table above to how the risk component is used in the MARS Framework. Under its IWMS Risk Framework, SCE considers additional elements of vulnerability such as egress constraints and Communities of Elevated Fire Concern. This approach is described in detail in Section 6.2.1.

6.2 Risk Analysis Framework

In this section of the WMP, the electrical corporation must provide a high-level overview of its risk analysis framework. This includes a summary of key modeling assumptions, input data, and modeling tools used.

At a minimum, the electrical corporation must evaluate the impact of the following factors on the quantification of risk:

- ***Equipment / Assets*** *(e.g., type, age, inspection, maintenance procedures, etc.)*
- ***Topography*** *(e.g., elevation, slope, aspect, etc.)*
- ***Weather*** *(at a minimum this must include statistically extreme conditions based on weather history and seasonal weather)*
- ***Vegetation*** *(e.g., type/class/species/fuel model, canopy height/base height/cover, growth rates, moisture content, inspection, clearance procedures, etc.)*
- ***Climate change*** *(e.g., long-term changes in seasonal weather; statistical extreme weather; impact of change on vegetation species, growth, moisture, etc.) at a minimum, this must include adaptations of historical weather data to current and forecasting future climate*
- ***Social vulnerability*** *(e.g., AFN, socioeconomic factors, etc.)*
- ***Physical vulnerability*** *(e.g., people, structures, critical facilities/infrastructure, etc.)*
- ***Coping capacities*** *(e.g., limited access/egress, etc.)*

SCE provides its key modeling assumptions in Section 6.2.3 (Key Assumptions and Limitations).

The factors listed above (e.g., Equipment/Assets, Topography, etc.) are summarized below in Table SCE 6-01.

Table SCE 6-01 - Risk Quantification Factors

	MARS Framework[77]	IWMS Risk Framework[78]
Equipment/Assets	Included in Wildfire POI component	Evaluated during the Review & Revise stage of the IWMS Risk Framework
Topography	Included in Wildfire Consequence Component	Included in Wildfire Consequence Component and in Severe Risk Area Methodology[79]
Weather	Included in POI and Wildfire Components	Included in Wildfire Consequence Component and in Severe Risk Area Methodology
Vegetation	Included in Wildfire Consequence Component	Included in Wildfire Consequence Component and in Severe Risk Area Methodology
Climate change	Not currently factored[80]	Not currently factored
Social vulnerability	Included in Wildfire and PSPS Consequence Components	Not directly factored
Physical vulnerability	Included in Wildfire and PSPS Consequence Components	Included in Severe Risk Area Methodology
Coping capacities	Not directly factored	Included in Severe Risk Area Methodology

6.2.1 Risk and Risk Component Identification

In this section, the electrical corporation must provide a brief narrative and one or more simple graphics describing the framework that defines its overall utility risk. At a minimum, the electrical corporation must define its overall utility risk as the comprehensive risk due to both wildfire and PSPS events across its service territory. This includes several likelihood and consequence risk components that are aggregated based on the framework shown in Figure 6-1 below. The following paragraphs define each risk component.

[77] The MARS Framework was initially described in Section 6.1.1 and is further described in Section 6.2.1.
[78] The IWMS Risk Framework was initially described in Section 6.1.1 and is further described in Section 6.2.1.
[79] See Section 6.2.1 for additional details.
[80] See Section 6.3 for additional details regarding ongoing work to develop forward looking climate change scenarios.

Figure 6-1 - Composition of Overall Utility Risk

[SCE Note: This diagram (i.e., Figure 6-1) is found in Energy Safety's Technical Guidelines (p. 37). SCE's diagrams are found later in this section].

While the overall utility risk framework and associated risk components identified in Section 6.2 are the minimum requirements for determining overall utility risk, the electrical corporation may elect to include additional risk components as needed to better define risk for its service territory. Where the electrical corporation identifies additional terms as part of its risk framework, it must define those terms. The electrical corporation must include a schematic demonstrating its adopted risk framework (similar to Figure 6-1), including any components beyond minimum requirements.

As shown in Figure 6-1 overall utility risk is broken down into two individual hazard risks:

- ***Ignition risk:** The total expected annualized impacts from ignitions at a specific location. This considers the likelihood that an ignition will occur, the likelihood the ignition will transition into a wildfire, and the potential consequences—considering hazard intensity, exposure potential, and vulnerability—the wildfire will have for each community it reaches*
- ***PSPS risk**: The total expected annualized impacts from PSPS at a specific location. This considers two factors: (1) the likelihood a PSPS will be required due to environmental conditions exceeding*

design conditions, and (2) the potential consequences of the PSPS for each affected community, considering exposure potential and vulnerability

The individual hazard risks are further broken down into 14 risk components. These risk components are split into two categories, intermediate and fundamental. Fundamental risk components are the smallest components of risk that the electrical corporation must determine as part of its risk analysis. Intermediate risk components are the likelihood and consequence related to each hazard. Each fundamental or intermediate risk component provides valuable insight in an electrical corporation's wildfire and PSPS risk calculations.

There are a minimum of five intermediate risk components:

- ***Ignition likelihood:*** *The total anticipated annualized number of ignitions resulting from electrical corporation-owned assets at each location in the electrical corporation's service territory. This considers probabilistic weather conditions, type and age of equipment, and potential contact of vegetation and other objects with electrical corporation assets. This should include the use of any method used to reduce the likelihood of ignition. For example, the use of protective equipment and device settings to reduce the likelihood of an ignition upon an initiating event.*
- ***Wildfire likelihood:*** *The total anticipated annualized number of fires reaching each spatial location resulting from utility-related ignitions at each location in the electrical corporation service territory. This considers the ignition likelihood and the likelihood that an ignition will transition into a wildfire based on the probabilistic weather conditions in the area.*
- ***Wildfire consequence:*** *The total anticipated adverse effects from a wildfire on each community it reaches. This considers the wildfire hazard intensity, the wildfire exposure potential, and the inherent wildfire vulnerabilities of communities at risk (see definitions in the following list).*
- ***PSPS likelihood****: The likelihood of an electrical corporation requiring a PSPS given a probabilistic set of environmental conditions.*
- ***PSPS consequence:*** *The total anticipated adverse effects from a PSPS for a community. This considers the PSPS exposure potential and inherent PSPS vulnerabilities of communities at risk (see definitions in the following list).*

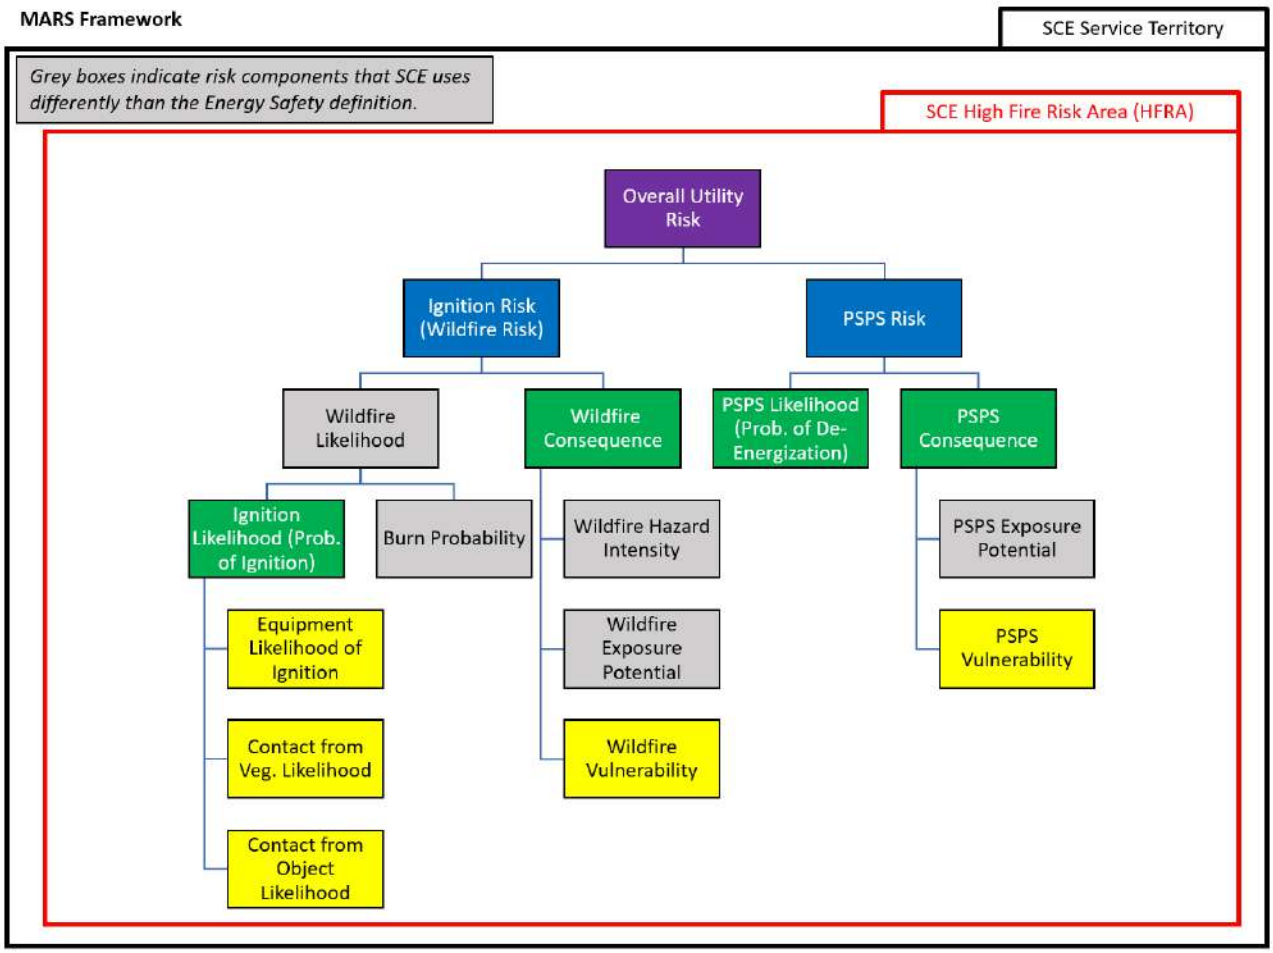
There are a minimum of nine fundamental risk components:

- ***Equipment ignition likelihood:*** *The likelihood that electrical corporation-owned equipment will cause an ignition either through normal operation (such as arcing) or through failure.*
- ***Contact from vegetation ignition likelihood:*** *The likelihood that vegetation will contact electrical corporation-owned equipment and result in an ignition.*
- ***Contact by object ignition likelihood:*** *The likelihood that a non-vegetative object (such as a balloon or vehicle) will contact electrical corporation-owned equipment and result in an ignition.*
- ***Burn probability:*** *The likelihood that a wildfire with a nearby but unknown ignition point will burn a specific location within the service territory based on a probabilistic set of weather profiles, vegetation, and topography.*

- ***Wildfire hazard intensity:*** *The potential intensity of a wildfire at a specific location within the service territory given a probabilistic set of weather profiles, vegetation, and topography.*
- ***Wildfire exposure potential:*** *The potential physical, social, or economic impact of wildfire on people, property, critical infrastructure, livelihoods, health, environmental services, local economies, cultural/historical resources, and other high-value assets. These may include direct or indirect impacts, as well as short- and long-term impacts.*
- ***Wildfire vulnerability:*** *The susceptibility of people or a community to adverse effects of a wildfire, including all characteristics that influence their capacity to anticipate, cope with, resist, and recover from the adverse effects of a wildfire (e.g., access and functional needs customers, Social Vulnerability Index, age of structures, firefighting capacities).*
- ***PSPS exposure potential:*** *The potential physical, social, or economic impact of a PSPS event on people, property, critical infrastructure, livelihoods, health, local economies, and other high-value assets.*
- ***Vulnerability of community to PSPS (PSPS vulnerability):*** *The susceptibility of people or a community to adverse effects of a PSPS event, including all characteristics that influence their capacity to anticipate, cope with, resist, and recover from the adverse effects of a PSPS event (e.g., high AFN population, poor energy resiliency, low socioeconomics).*

The electrical corporation must adopt these definitions in this section of the WMP. If the electrical corporation considers additional intermediate and fundamental risk components, it must define those components in this section as well.

6.2.1.1 MARS Framework



SCE uses its Multi-Attribute Risk Score Framework (MARS Framework or MARS) to quantify Wildfire and PSPS risk. This framework was used in SCE's recent 2022 Risk Assessment and Mitigation Phase (RAMP) application, filed in May 2022, and aligns with the methodology adopted in the CPUC's Safety Model Assessment Proceeding (SMAP).[81]

The diagram below shows how the risk components are used in the MARS Framework. The colors match how Energy Safety has presented the risk components in Figure 6-1.

Risk components and calculation methodologies are further described Section 6.2.1, Section 6.2.2, and Appendix B: Supporting Documentation for Risk Methodology and Assessment.

[81] Please see D.18-12-014 at https://www.publicadvocates.cpuc.ca.gov/general.aspx?id=3345)

Figure SCE 6-01 - SCE's MARS Framework

The MARS framework is constructed by using a risk bowtie methodology, as shown below.

Figure SCE 6-02 - Illustrative Risk Bowtie

The left side of the risk bowtie describes ignition drivers and sub drivers as well as the associated probability of those events. The center of the bowtie describes the risk event itself.

In the case of wildfire ignition risk, the risk event is an ignition associated with SCE overhead electrical equipment in SCE's HFRA. In the case of PSPS, the risk event is a de-energization event during fire weather conditions when current de-energization thresholds are exceeded.

The right side of the bowtie describes the resulting deterministic consequences due to an ignition (in the case of wildfire ignition risk) or a proactive de-energization event (in the case of PSPS risk). These natural units for safety, reliability, and financial consequences are converted to a unitless multi attribute risk score (MARS) through SCE's Multi Attribute Value Function (MAVF). This conversion process is described in additional detail in Section 6.2.2.

To calculate baseline wildfire risk, SCE first estimates a probability of ignition (POI) for each individual ignition driver (e.g., equipment/facility failure (EFF), contact from object (CFO)) and sub-driver (e.g., EFF: conductor failure or CFO: vegetation) for individual distribution and transmission assets. Separately, SCE performs match-drop wildfire simulations along each of these asset locations to estimate consequences in natural units (e.g., acres burned, buildings impacted, population impacted) associated with an ignition emanating from those assets at their specific geographic locations. SCE then combines the POI and the consequences at the asset level to estimate a baseline wildfire risk score.

To calculate a baseline PSPS risk, SCE first estimates the baseline probability of de-energization (POD) of each circuit using a 10-year historical back-cast of weather, wind, fuel dryness conditions using the current Fire Potential Index (FPI), and fuel de-energization thresholds. The consequences of de-energization are derived by estimating the associated frequency and duration of those events and multiplying them by the resulting consequences in natural units (e.g., Customer Minutes of Interruption (CMI)). SCE then combines the POD and the consequences at the circuit level, along with the MARS framework, to estimate a baseline risk score for PSPS.

The key assumptions used to derive pre- and post-mitigation POI and POD include historical ignitions, ignition drivers, historical de-energization events, wind, weather, fuel conditions, mitigation effectiveness assumptions, and fuels or high wind conditions in proximity to SCE overhead distribution and transmission assets in HFRA.

The key assumptions used to estimate wildfire consequences are based on a catalog of 444 historical wind and weather scenarios representing high fire weather conditions. These fire weather scenarios include the 41 weather scenarios originally used by the CPUC to designate HFTD, as well as 403 additional scenarios added by SCE representing both wind-driven and fuel- driven wildfire (dry fuels, but low or no wind) conditions. SCE uses the maximum consequence value (e.g., acres max) across each of these scenarios based on eight-hour simulated wildfire progression without fire suppression at each location to represent the consequence value at each of those individual locations.

The wildfire simulations are conducted for a standard eight-hour unsuppressed burn period to provide a comparable consequence estimate across all locations. If fire simulations were to extend beyond eight hours, or suppression impacts were included (e.g., response timing and complexity), the level of uncertainty associated with the model output can increase to the point where the simulation would not be meaningful.

Therefore, at this time, SCE does not extend the simulation duration beyond 8 hours and does not directly include a probabilistic assessment of suppression based on historical suppression data, as there are inherent risks associated with over-representing the availability of suppression resources. SCE recognizes these are points of interest with stakeholders and looks forward to continuing to engage with Energy Safety and stakeholders through applicable forums and working groups.

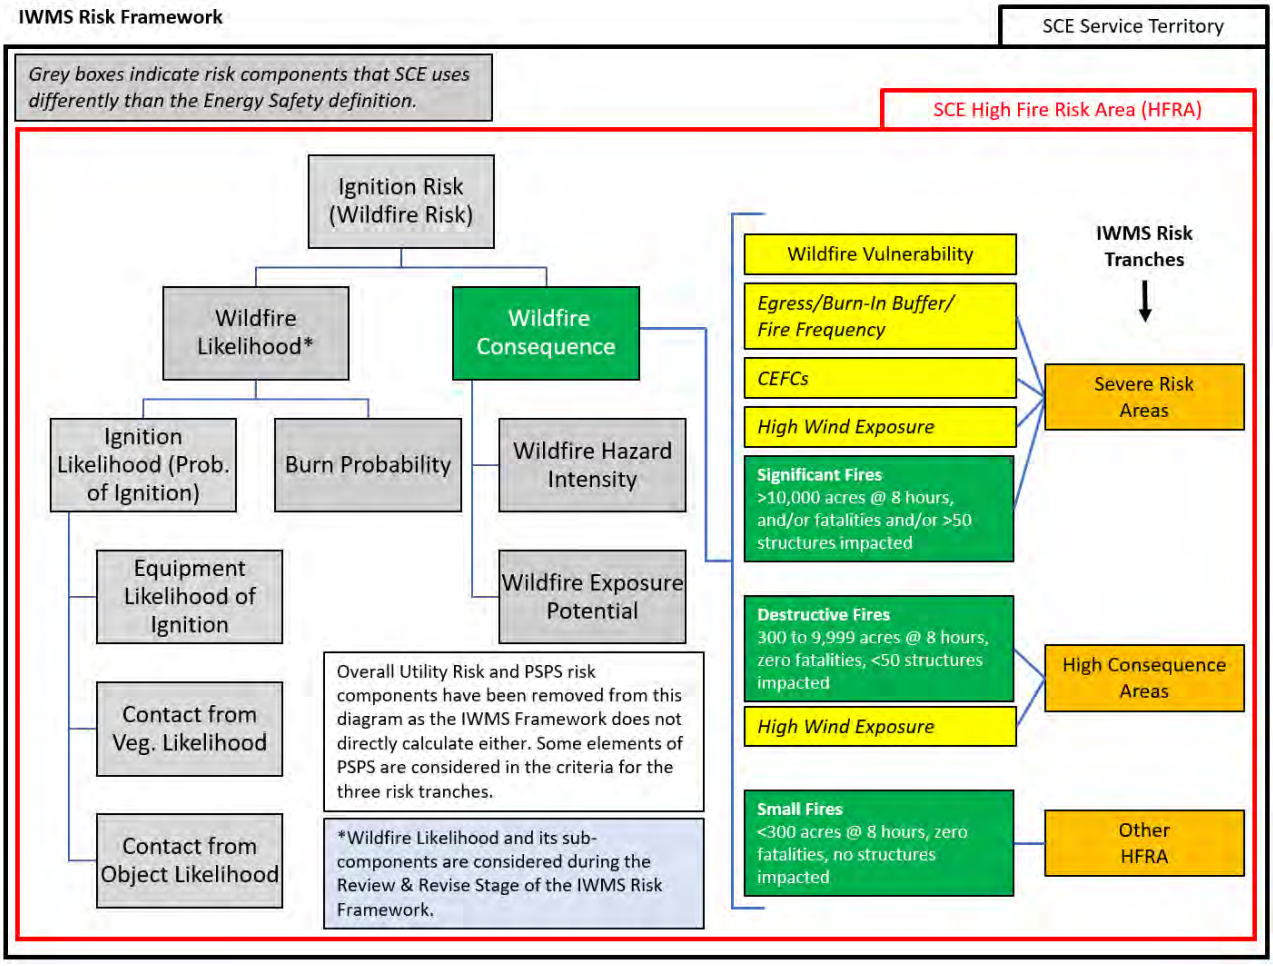
The key input data used for wildfire consequence estimates are fuel models based on Timber fuel layers, with the addition of 19 custom fuel models. SCE updates its fuel model annually. A fuel regrowth algorithm is used to "grow up" fuels in locations with large historical fire scars (greater than 5,000 acres) to project fuel growth out to 2030. Climate change influenced forecast weather conditions are not included at this time. However, as discussed in Energy Safety's risk modeling workshops, SCE is developing a climate change scenario by simulating additional fuel dryness in 2030 fuels for evaluation purposes. See Section 6.3.2 for additional discussion.

SCE also utilizes Access and Functional Need (AFN) and Non-Residential Critical Infrastructure (NRCI) information for each location to account for the relative baseline and post-mitigated risk associated with wildfire and PSPS in vulnerable locations. SCE has considered other census tract-based sources of data such as CalEnviroscreen, Centers for Disease Control (CDC), Social Vulnerability Index (SVI), and the Federal Emergency Management Agency (FEMA) National Risk Index (NRI) data. SCE has determined that these data sources currently lack the granularity required to scale the information down to correspond to other risk data SCE uses at the asset or location level.

The key input data for wildfire POI and PSPS POD estimates are SCE's overhead asset location data, weather and wind data from Atmospheric Data Solutions (ADS) and SCE weather stations, SCE's Outage Database and Reliability Metric (ODRM) system, PSPS event data, SCE's Fire Incident Preliminary Analysis (FIPA) process, vegetation data, and historical de-energization criteria.

In addition to the fuel and weather assumptions described above, SCE uses granular Microsoft building data and the latest available data from U.S. Department of Homeland Security (LandScan 2018) population data to represent individual building footprints and 90m centroid population density, respectively. These data are used to derive associated natural unit consequence impacts from wildfire simulations.

The modeling tools SCE employs are a series of machine learning algorithms (e.g., random forest, gradient boosting) to derive and calibrate POI estimates for each wildfire risk driver. SCE also uses Technosylva Wildfire Analyst to perform match drop simulations to derive wildfire consequences and python-based algorithms to derive both POD and PSPS consequences.



6.2.1.2 IWMS Risk Framework

SCE's IWMS Risk Framework is used to define three risk tranches within SCE's HFRA. These three risk tranches are key elements of how SCE selects, prioritizes, and scopes wildfire and PSPS mitigations.

The figure below shows how the risk components are used in the IWMS Risk Framework. The colors match how Energy Safety has presented the risk components in Figure 6-1.

Risk components and calculation methodologies are further described in Section 6.2.1, Section 6.2.2, and Appendix B: Supporting Documentation for Risk Methodology and Assessment.

Figure SCE 6-03 - SCE's IWMS Risk Framework

SCE started using the IWMS Risk Framework to prioritize mitigation selection and scope for grid hardening activities, inspection programs, and vegetation management activities in 2022. Due to the long lead time for planning and construction for covered conductor and undergrounding, the earliest that mitigations scoped with the IWMS Risk Framework will be placed in-service is 2023.

In early 2022, SCE reviewed in-flight covered conductor scope for 2022 and 2023 that was still in earlier stages for alignment to the IWMS Risk Framework. Based on those reviews, SCE made decisions to either continue the mitigation as-is, target for higher risk mitigation activity, or stop scope completely.

SCE also evaluated the alignment of IWMS with the High-Fire Risk Informed (HFRI) detailed inspection scope strategy and has prioritized structures in Severe Risk Areas and High Consequence Areas to be inspected more frequently starting with 2023 inspections.

Similar alignment was also assessed in 2022 for vegetation management program strategy, such as with the Heavy Tree Mitigation Program (HTMP), where the risk methodology utilized assigned vegetation grids that had higher proportions in Severe Risk Areas to be placed on annual inspection cycles.

The risk assessment portion of the IWMS Risk Framework features two major stages (Initial Risk Categorization and then Review & Revision) which are described below.

Stage 1: Initial Risk Categorization

The first stage of IWMS uses quantitative risk analysis that incorporates several factors to deliver an initial output that categorizes all of SCE's HFRA circuit segments into risk traches defined as Severe Risk Areas, High Consequence Areas, and Other HFRA.

- Severe Risk Areas (SRA) are locations that are characterized by elevated population risk factors such as heightened egress risk, significant wildfire risk, and/or heightened risk of high wind events.
- High Consequence Areas (HCA) are segments where simulated fires exceed 300 acres in eight hours and do not have the same level of population risk as the Severe Risk Areas. These circuit segments are sited in locations where wildfire can propagate over a relatively short period of time.
- Other HFRA encompasses locations within HFRA that do not meet either of the previous criteria.

A detailed description of these three risk tranches, including all factors used, is provided below.

Severe Risk Areas

The CPUC has already defined[82] all areas in HFTD as inherently being at elevated or extreme risk of wildfire. SCE has determined a subset of those regions are "Severe Risk Areas" as they have attributes that further elevate the risk levels to populations residing, working in, or visiting these locations.

SCE uses the following four criteria to determine Severe Risk Areas:

1. Population egress constraints, high fire frequency, and burn-in buffer into egress locations.
2. Significant fire consequence – Acres burned consequence greater than 10,000 over an 8-hour unsuppressed model simulation.
3. High winds – Locations, which if fully covered with covered conductor, would still be subject to high PSPS likelihood.
4. Communities of Elevated Fire Concern (CEFCs) – Smaller geographic areas where terrain, construction, and other factors could lead to smaller, fast-moving fires threatening populated locations under benign (normal) weather conditions.

SCE notes that a circuit mile may meet multiple SRA criteria.

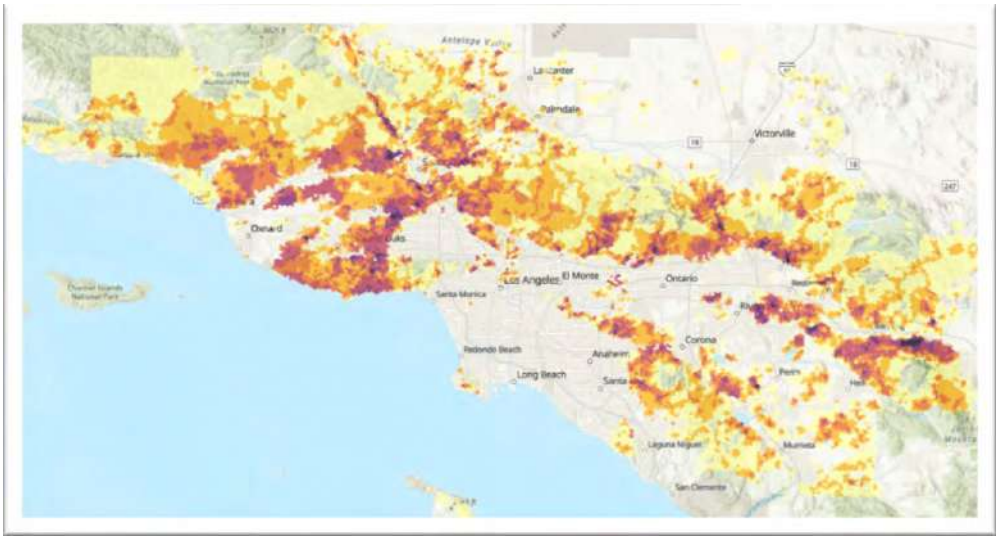
[82] CPUC Decision 17-12-024, Decision Adopting Regulations to Enhance Fire Safety in the High Fire-Threat District, 12/21/2017.

SRA Criteria #1: Egress Constraints, High Fire Frequency & Burn-In Buffer

This criteria includes five steps:

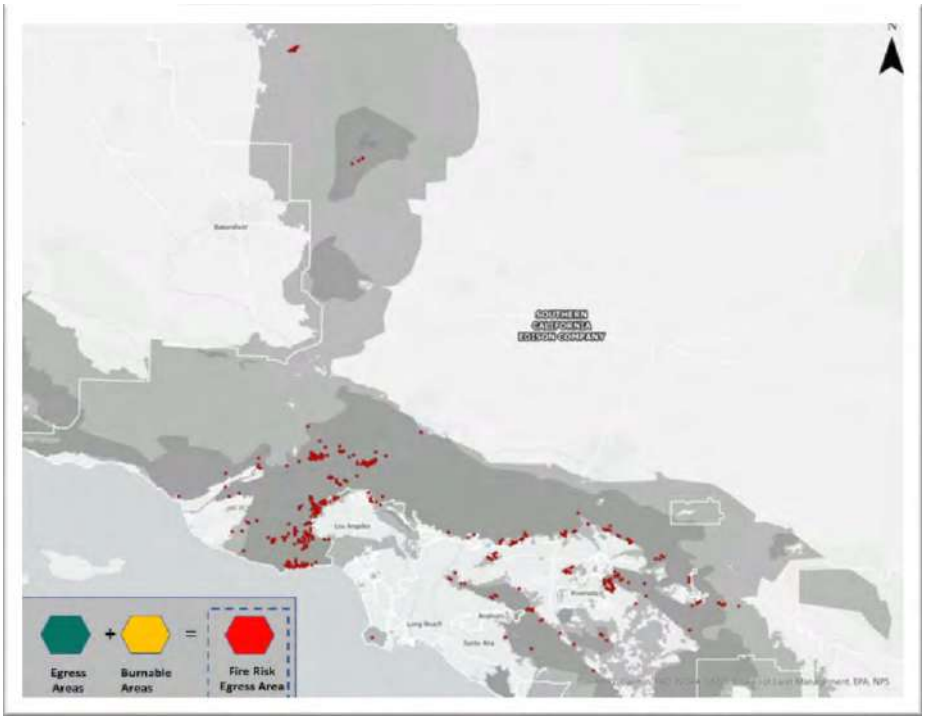
1. Divide SCE's HFRA into equally sized polygons.
2. Identify egress-constrained locations.
3. Determine locations that have experienced high fire frequency historically.
4. Overlay the egress-constrained locations with historical high fire frequency locations to determine Fire Risk Egress Constrained Areas.
5. Add a burn-in buffer to Fire Risk Egress Constrained Areas.

Figure SCE 6-04 - Polygon Assignment



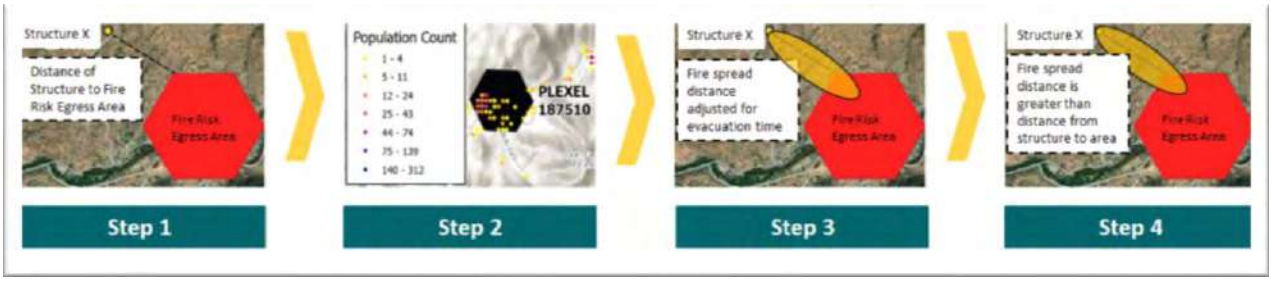
SCE divided its service area into hexagons approximately 214 acres in size. SCE used hexagons because the distance from the center of a hexagon to all adjacent hexagons is the same distance (1,000 meters) and it enabled SCE to compare variables across similar-sized polygons.

Figure SCE 6-05 - Identify Egress-Constrained Areas



SCE determined which hexagons in its HFRA have substantial road availability concerns using a ratio of roads to population in each hexagon. A lower score indicates 0.5 or fewer miles of roads available per person in a given hexagon, creating a potential egress concern should everyone in the polygon need to evacuate the area simultaneously.

Figure SCE 6-06 - Identify Areas with a High Frequency of Fires



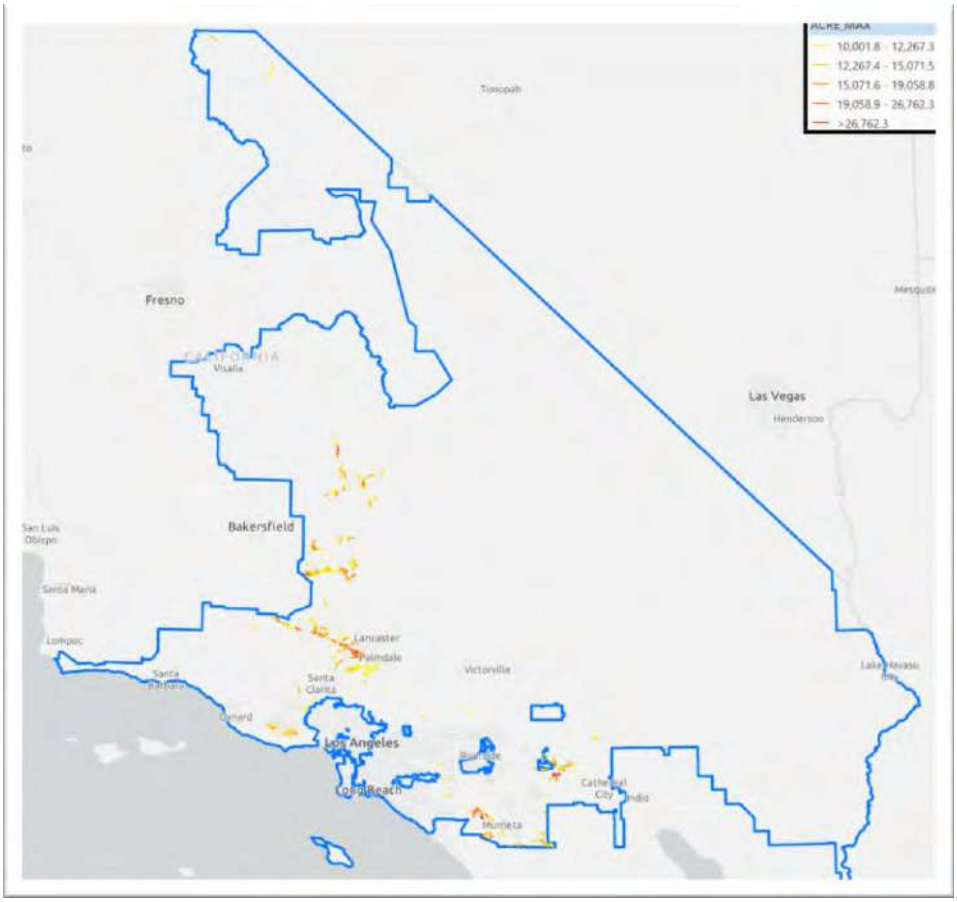
SCE determined which hexagons in its HFRA that have a high frequency of historical fires, using fire scars, from 1970 to 2020.[83] A higher score indicates a higher likelihood that a given hexagon will burn, meaning fires either originated from or travel into these hexagons.

Figure SCE 6-07 - Overlay Areas with a High Frequency of Fires with Egress-Constrained Areas

SCE then overlaid the egress-constrained areas with regions that have a high historical fire frequency. SCE flagged hexagons with both limited road availability and a high burn frequency as potential Fire Risk Egress Constrained Areas.

Figure SCE 6-08 - Delineate Burn in Buffer

Next, utilizing Technosylva ignition simulation data, SCE determined which of SCE's overhead structures could result in fires burning into Fire Risk Egress Constrained Areas. SCE performed a calculation to identify which structures could potentially result in a fire trapping the public.



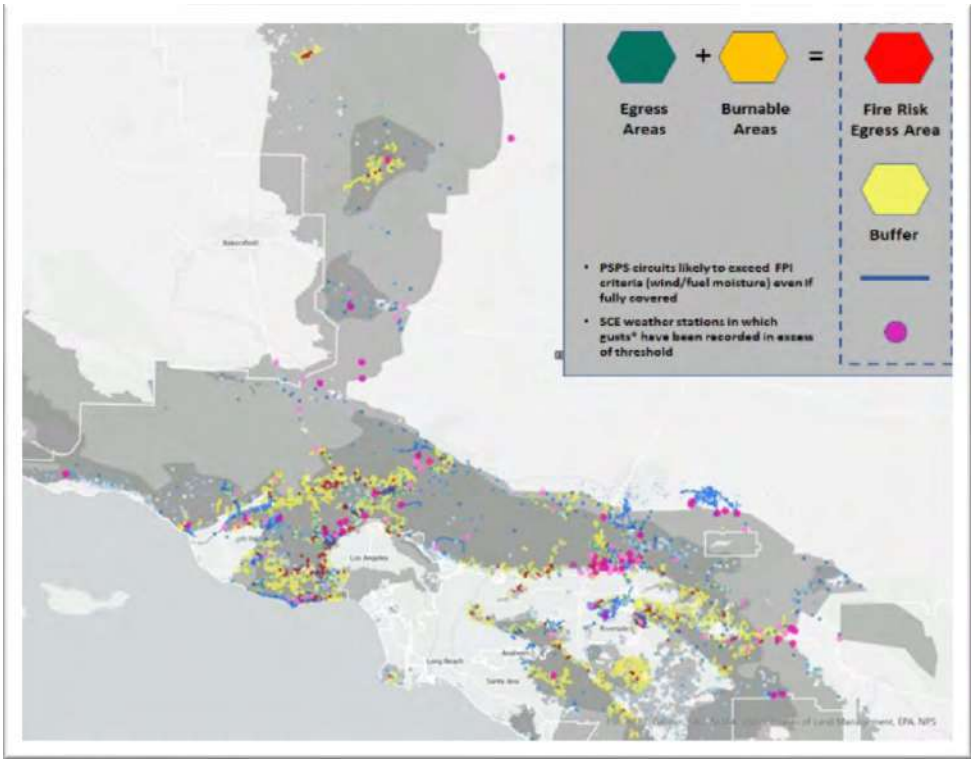
Below are the steps to calculate the "Burn in Buffer".

[83] Data from CalFire FRAP database.

1. Identify all structures within 25 miles of a Fire Risk Egress Constrained Area.
2. Calculate the time needed for the population to exit the polygon using population size, travel speed, and distance to safety.
3. Considering terrain and other factors, calculate the distance the fire could travel from each SCE distribution overhead structure within 25 miles, in the time needed to evacuate the Fire Risk Egress Constrained Area.
4. Flag the structure as a potential burn in buffer structure if the fire originating there could enter the Fire Risk Egress Constrained Area.
5. Assess identified locations to determine if the fire will actually burn into a Fire Risk Egress Constrained Area, when accounting for wind direction, topography, and physical barriers (e.g., lakes).

SRA Criteria #2: Significant Fire Consequence

Figure SCE 6-09 - Identify Areas with Exceptionally High Technosylva Consequence Scores



SCE identified segments in its HFRA that have an exceptionally high Technosylva consequence scores in acres burned at 8 hours based on Technosylva ignition simulations. SCE used the threshold of 10,000 acres or greater burned in the first 8 hours. Fires that burn over 10,000 acres in the first 8 hours on average burn over 100,000 acres. SCE provides further explanation for this threshold below.

SRA Criteria #3: High Wind Locations

SCE examined historical wind data from 2017 to determine which areas have experienced high sustained wind speeds above 40 mph and wind gusts above 58 mph (current PSPS de-energization threshold for fully covered isolatable conductor segments).[84] Even if fully covered, these isolated conductor segments would likely experience some level of PSPS de-energization.

Figure SCE 6-10 - Identify Areas with Extremely High Wind Speeds

[84] This may change as SCE modifies thresholds based on further analyses and data over time.

SRA Criteria #4: Communities of Elevated Fire Concern (CEFC)

Figure SCE 6-11 - Communities of Elevated Fire Concern

Caption for Subdivisions on multiple hilltops surrounded by dense vegetation. Figure SCE 6-11 Fires that start in canyon will burn rapidly uphill towards populated areas. Last major fire in this area was in 2008.

SCE identified Communities of Elevated Fire Concern (CEFCs). CEFCs are smaller geographic areas where terrain and other factors could lead to smaller, fast-moving fires threatening populated locations under benign (normal) weather conditions. Examples of these types of communities are those on the edge of a hill, where if an ignition were to occur downhill from that community, the ignition could immediately impact those population centers, even under low to no wind conditions.

High Consequence Areas

SCE uses the following three criteria to determine High Consequence Areas:

1. Not identified in meeting Severe Risk Area criteria.
2. Destructive fire consequence – Acres burned consequence between 300 and 10,000 after an 8-hour unsuppressed model simulation.
3. Locations subject to PSPS events due to high winds in which covered conductor has not been fully deployed.

Destructive Fire Consequence

SCE has also identified additional locations where a wildfire can propagate over large areas (between 300 and 10,000 acres) in a relatively short period of time and/or have the potential to be frequently impacted by PSPS. SCE has categorized these as “High Consequence Areas.”

SCE determined an ignition that can become a 300-acre-or-greater sized fire within the first eight hours has a high probability of eventually becoming very large, thereby posing significant risks to life, health and property. SCE provides further explanation for this threshold below.

High Winds

SCE also conducts an analysis each year that identified circuits that have experienced or are expected to experience high customer minutes of interruption from PSPS de-energizations due to high wind speeds absent appropriate grid hardening. SCE has included those circuits that meet the criteria described above but were not already identified as Severe Risk Areas.

300 Acres Burned Threshold

SCE selected the 300 acres burned and 10,000 acres burned thresholds at 8-hours as the lower and upper limits for High Consequence Areas based on the following analysis.

As indicated in Table SCE 6-02, number of acres burned is a reasonable and reliable correlated proxy for buildings destroyed:

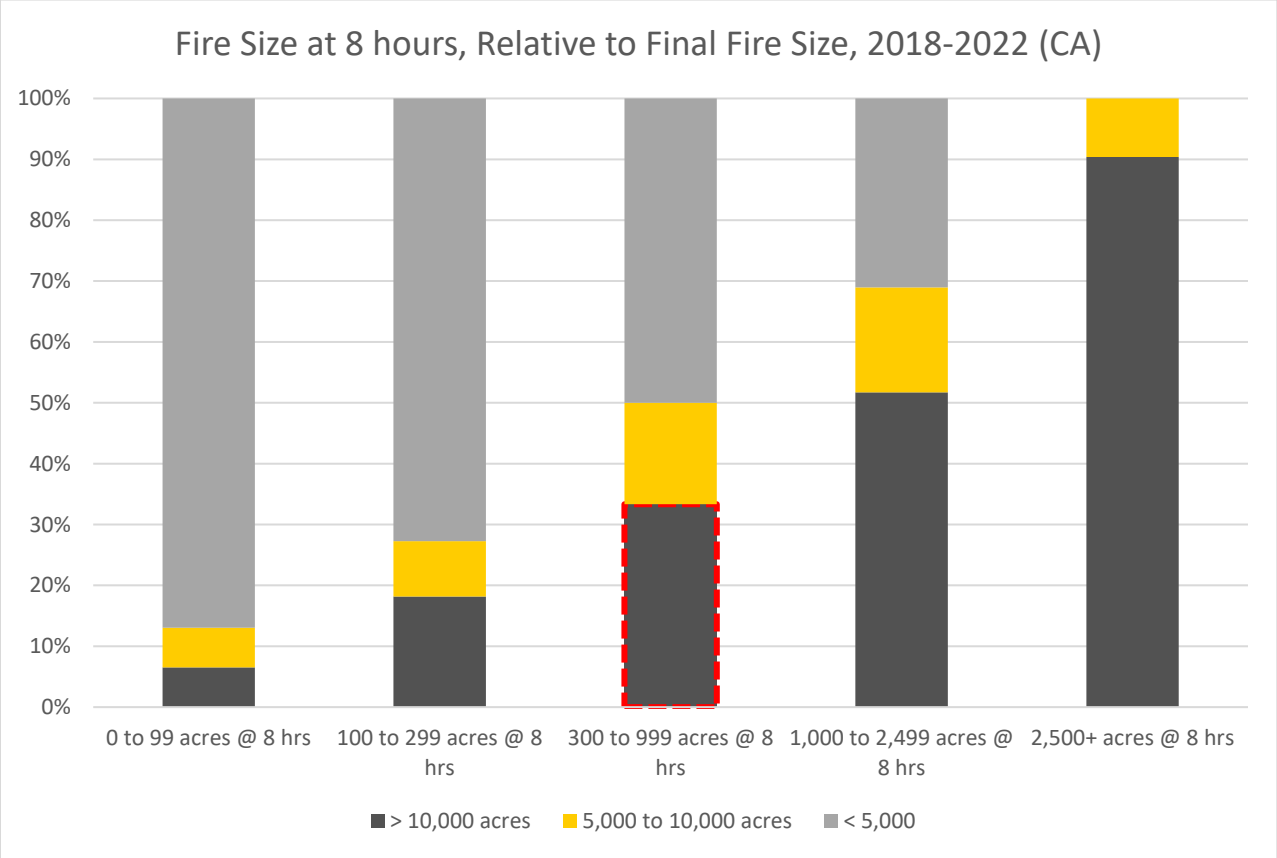


Table SCE 6-02 - 2015-2019 Fire Size and Buildings Destroyed

Final Fire Size (Acres)	Average Buildings Destroyed
300-1k	~2
1k-5k	~7
5k-10k	~15
10k-50k	~200
50k+	~1,250

A fire of 10,000 acres or more destroys approximately 200 buildings, on average.

As indicated in Figure SCE 6-12 below, of the fires that had burned between 300 and 999 acres after 8 hours, 33% eventually burned more than 10,000 acres. In contrast, fires that burned less than 300 acres after 8 hours are much less likely to eventually burn more than 10,000 acres. Of the fires that burned less than 300 acres, only 10% eventually burned more than 10,000 acres. Based on this analysis, SCE selected 300 acres as the lower threshold for modeled fire consequence for High Consequence Areas.

Figure SCE 6-12 - Fire Size at 8 Hours Relative to Final Fire Size

Other HFRA

SCE defines "Other HFRA" as areas that are located in SCE's HFRA that are neither Severe Risk nor High Consequence but are identified by the Commission as areas of "extreme" and "elevated" wildfire risk in the current CPUC Fire Threat Map (See Section 5.3.3 High Fire Threat Districts).

These locations are still subject to regulatory and compliance requirements for enhanced mitigation activity, such as increased inspections and/or vegetation management.

Summary of IWMS Risk Tranches

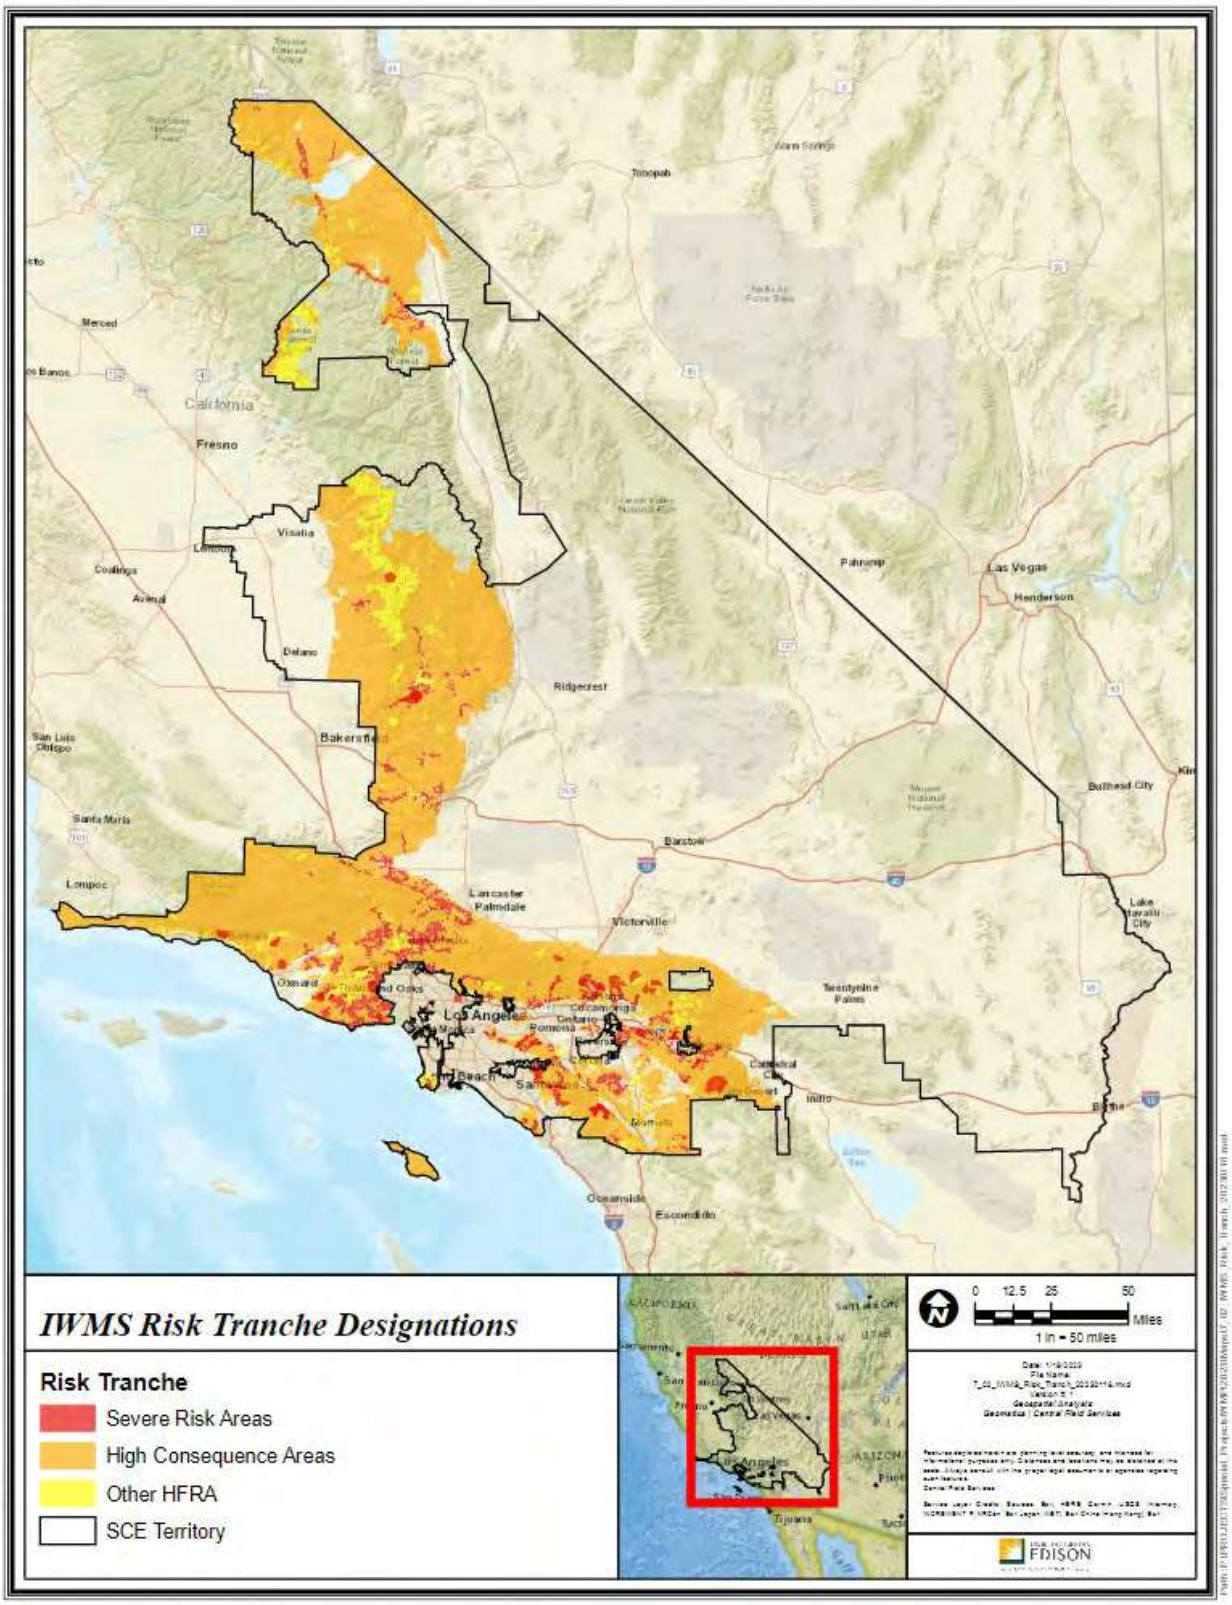

Table SCE 6-03 summarizes the risk characteristics of each risk tranche.

Table SCE 6-03 - IWMS Risk Framework Risk Tranches (Mutually Exclusive)

Severe Risk Area Criteria
o Population egress, high fire frequency location, and burn-in buffer into egress locations. o Significant fire consequence – Acres burned consequence greater than 10,000 over an 8-hour unsuppressed model simulation. o High winds – Locations, which if fully covered with covered conductor, would still be subject to high PSPS likelihood. o Communities of Elevated Fire Concern (CEFCs) – smaller geographic areas where terrain and other factors could lead to smaller, fast-moving fires threatening populated locations under benign (normal) weather conditions.
High Consequence Area Criteria
o Not identified in meeting Severe Risk Area criteria. o Destructive fire consequence – Acres burned consequence between 300 and 10,000 over an 8-hour unsuppressed model simulation. o Locations subject to PSPS events in which covered conductor has not been fully deployed.
Other HFRA Criteria
o Not identified in meeting Severe Risk Area or High Consequence criteria. o Small fire consequence - Acres burned consequence less than 300 over an 8-hour unsuppressed model simulation.

The following map illustrates the locations of the Severe Risk, High Consequence, and Other HFRA areas.

***Figure SCE 6-13 - IWMS Risk Tranche Designations*[85]**

[85] Map as of 01/18/2023

***Table SCE 6-04 - Circuit Miles Per IWMS Risk Tranche*[86]**

IWMS Risk Tranche	Approximate Circuit Miles
Severe Risk Areas	2,950
High Consequence Areas	4,400
Other HFRA	2,250
Total	9,600

Stage 2: Review & Revise

With exception of CEFC identification, the first stage of IWMS is automated and reliant upon the completeness, granularity, and accuracy of data sources. While valuable as a directional starting point, human judgment is needed to evaluate the results of the risk analysis.

Accordingly, SCE performs further due diligence by reviewing the output using SCE's inspection photos, geographic information system (GIS), and Google Maps or Street Views with subject matter experts such as engineers and fire science specialists. These deep dives allow SCE's employees to virtually "walk the line" to determine whether a segment is appropriately categorized.

This stage of the IWMS is time-consuming and labor intensive, as SCE personnel review hundreds of circuit miles of overhead distribution lines. SCE has already started scoping mitigations for areas that have undergone Review & Revise and expects to complete this stage for all HFRA by the second quarter of 2023.

During these reviews, SCE looks for the presence of risk drivers, including but not limited to, heavy trees, long span, local fuel regime, prevailing wind direction and intensity, topography (slope and terrain complexity), local fire ecology, local road accessibility, and existing mitigations (e.g., covered conductor). SCE then makes the determination to either keep the designation as prescribed by the model or recommend an alternate designation as appropriate.

Figure SCE 6-14 below shows an example of a 100% match between the initial output (left picture) and detailed SME review (right picture). This location was identified a Severe Risk Area due to the exceptionally high Technosylva wildfire consequence. A fire starting in this location has the potential to grow larger than 10,000 acres in size in the first eight hours.

SME review confirmed the location of the overhead lines in relation to the dry, heavy vegetation in the area, topography, and potential winds could lead to a fire of this size.

Figure SCE 6-15 shows one of many Google Maps screenshots of the location that SMEs reviewed, confirming the designation as a Severe Risk Area.[87]

[86] Note that the review of unhardened miles for each area/tranche is in progress. Therefore, the total miles provided in the table are not finalized and are subject to change.

[87] Figure SCE 6-15 is a screenshot of the location marked with the teal circle in SCE 6-14.

Figure SCE 6-14 - Example of 100% Match of Risk Model and SME Review

Figure SCE 6-15 - Photo of Location Confirms Severe Risk Area Designation

Figure SCE 6-16 below shows an example of a deviation between the initial output (left picture) and detailed SME review (right picture). The initial output flagged these circuit segments as Severe Risk Areas because they fit the criteria of egress constrained and burn-in buffer.

However, during SME review, it became apparent that the overhead lines mainly run over dirt, roads and light brush and relatively fewer structures in the area would be threatened by a wildfire. The recommendation from the detailed SME review for this location was to convert the designation to High Consequence.

Figure SCE 6-17 shows one of many Google Maps screenshots of the location that SMEs reviewed, confirming the need to convert the designation from Severe Risk Area to High Consequence Area.[88]

Figure SCE 6-16 - Example of a Deviation Between Risk Model and SME Review

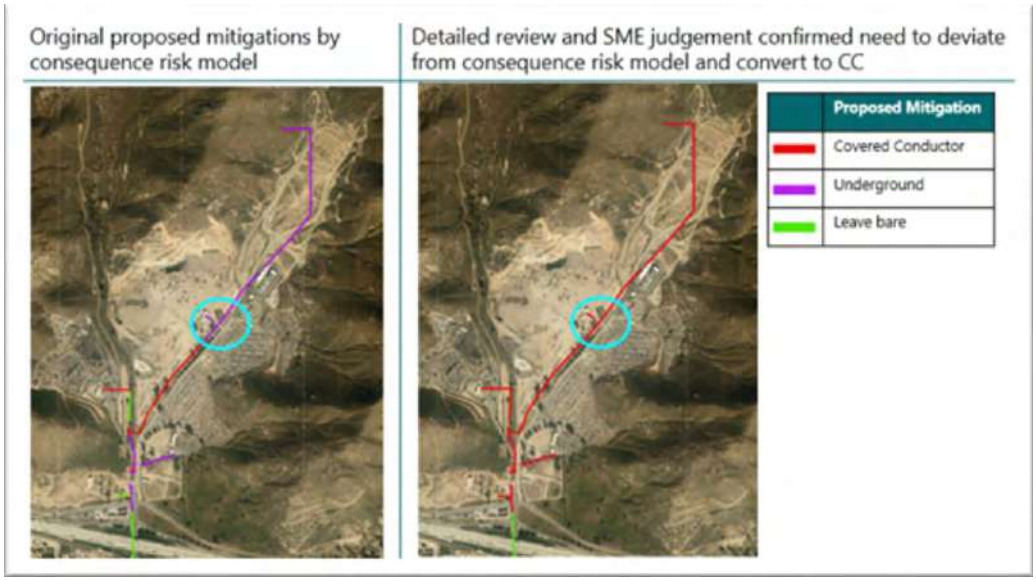

Figure SCE 6-17 - Photo of Location Confirms Need to Convert Designation from Severe Risk to High Consequence

Based on the results of the IWMS Review and Revise stage, SCE selects the appropriate mitigation(s) to deploy to each area. SCE details this aspect of the IWMS in Section 7.1.4.

[88] Figure SCE 6-17 is a screenshot of the location marked with a teal circle in Figure SCE 6-16.

Individual Hazard Risks

R2: Ignition Risk

Ignition risk: The total expected annualized impacts from ignitions at a specific location. This considers the likelihood that an ignition will occur, the likelihood the ignition will transition into a wildfire, and the potential consequences—considering hazard intensity, exposure potential, and vulnerability—the wildfire will have for each community it reaches

SCE considers Ignition Risk as synonymous with Wildfire Risk, which is the product of Ignition Likelihood (IRC1) and Wildfire Consequence (IRC3). SCE calculates Wildfire Risk at the individual asset level. Overall Wildfire Risk is the sum of the individual asset risks over the entire HFRA.

R3: PSPS Risk

PSPS risk: The total expected annualized impacts from PSPS at a specific location. This considers two factors: (1) the likelihood a PSPS will be required due to environmental conditions exceeding design conditions, and (2) the potential consequences of the PSPS for each affected community, considering exposure potential and vulnerability

SCE's overall PSPS risk is the product of Product of PSPS Likelihood (IRC4) and PSPS Consequence (IRC5). SCE calculates PSPS Risk at the circuit level. Overall PSPS risk is the sum of the circuit level risk in HFRA.

SCE calculates PSPS Risk in the MARS Framework. In the IWMS Risk Framework, locations that experience frequent de-energizations and/or potential for PSPS events even when locations are fully covered are considered for mitigation. Please see the description of both frameworks earlier in this section and in Section 6.1.1 for the basis behind this approach.

Intermediate Risk Components

IRC1: Ignition Likelihood

Ignition likelihood: The total anticipated annualized number of ignitions resulting from electrical corporation-owned assets at each location in the electrical corporation's service territory. This considers probabilistic weather conditions, type and age of equipment, and potential contact of vegetation and other objects with electrical corporation assets. This should include the use of any method used to reduce the likelihood of ignition. For example, the use of protective equipment and device settings to reduce the likelihood of an ignition upon an initiating event.

SCE considers Ignition Likelihood to be synonymous with Probability of Ignition (POI). The pre-mitigated POI for every asset is a probabilistic assessment of Ignition Likelihood prior to mitigation deployment. The POI of each asset is further adjusted to account for system hardening activities (e.g., covered conductor) that have taken place.

POI is the sum of the ignition component probabilities at that location (i.e., Equipment Ignition Likelihood (FRC1), Contact from Vegetation Ignition (FRC2), and Contact by Object Ignition Likelihood (FRC3). POI is used to assess overall utility wildfire risk at a given locations.

Please also see the description below regarding Wildfire Likelihood and how SCE considers Wildfire Likelihood sub-components during the Review & Revise stage of the IWMS Risk Framework.

IRC2: Wildfire Likelihood

Wildfire likelihood: The total anticipated annualized number of fires reaching each spatial location resulting from utility-related ignitions at each location in the electrical corporation service territory. This considers the ignition likelihood and the likelihood that an ignition will transition into a wildfire based on the probabilistic weather conditions in the area.

SCE does not differentiate between Ignition Likelihood and Wildfire Likelihood. As described above in the discussion of Ignition Likelihood and earlier in Section 6.1.1, SCE models potential fire behavior and spread from individual utility asset locations.

During the Review & Revise stage of the IWMS Risk Framework, SCE's risk management, fire science, and engineering experts consider Wildfire Likelihood sub-components such as equipment failure likelihood, contact from vegetation likelihood, and contact from other likelihood in determining potential mitigation selection and deployment. SCE notes that not all sub-components may be applicable in each location.

IRC3: Wildfire Consequence

Wildfire consequence: The total anticipated adverse effects from a wildfire on each community it reaches. This considers the wildfire hazard intensity, the wildfire exposure potential, and the inherent wildfire vulnerabilities of communities at risk (see definitions in the following list).

SCE estimates Wildfire Consequences (e.g., acres burned, structures impacted, population impacted) and their associated safety and financial impacts for a given set of deterministic match drop simulations for all overhead assets in SCE's HFRA across 444 weather scenarios using a 2030 fuel projection.

Wildfire Consequence is used, in conjunction with Wildfire Vulnerability, to assess the impact of potential consequences associated with an ignition event in proximity to overhead assets.

In the IWMS Risk Framework, SCE categorizes simulated wildfires based on three definitions:

> **Significant Fires** are simulated fires that, at 8 hours after ignition, burned more than 10,000 acres or had at least one fatality or had at least 50 structures impacted.
>
> **Destructive Fires** are simulated fires that, at 8 hours after ignition, burned between 300 acres and 10,000 acres with zero fatalities and/or had fewer than 50 structures impacted.
>
> **Small Fires** are simulated fires that, at 8 hours after ignition, burned less than 300 acres with zero fatalities and no structures impacted.

These three categories inform the risk tranches that SCE uses to determine mitigation selection, prioritization, and scope deployment. Please see the description of the IWMS methodology earlier in Section 6.2.1 for additional factors considered such as egress and burn-in buffer.

IRC4: PSPS Likelihood

PSPS likelihood: The likelihood of an electrical corporation requiring a PSPS given a probabilistic set of environmental conditions.

SCE considers PSPS Likelihood as synonymous with Probability of De-energization (POD).

The pre-mitigated POD for every asset is based on a deterministic back cast of historical wind and fuel moisture conditions at each location within SCE's HFRA. POD is used to assess PSPS risk at a for each circuit.

SCE calculates PSPS Likelihood in the MARS Framework. In the IWMS Risk Framework, locations that experience frequent de-energizations and/or potential for PSPS events even when locations are fully covered are considered for mitigation. Please see the description of both frameworks earlier in this section and in Section 6.1.1 for the basis behind this approach.

IRC5: PSPS Consequence

PSPS consequence: The total anticipated adverse effects from a PSPS for a community. This considers the PSPS exposure potential and inherent PSPS vulnerabilities of communities at risk (see definitions in the following list).

SCE estimates PSPS Consequences based on an assessment of natural unit consequences (e.g., customer minutes of interruption (CMI)) and associated safety and financial impacts for a given proactive de-energization event.

PSPS Consequence is used, in conjunction with PSPS Vulnerability, to assess the impact of potential consequences associated with a de-energization event in proximity to overhead assets.

SCE calculates PSPS Consequence in the MARS Framework. In the IWMS Risk Framework, locations that experience frequent de-energizations and/or potential for PSPS events even when locations are fully covered are considered for mitigation. Please see the description of both frameworks earlier in this section and in Section 6.1.1 for the basis behind this approach.

Fundamental Risk Components

FRC1: Equipment Ignition Likelihood

Equipment ignition likelihood: The likelihood that electrical corporation-owned equipment will cause an ignition either through normal operation (such as arcing) or through failure.

Equipment Ignition Likelihood, also referred to as Equipment/Facility Failure Probability of Ignition (EFF POI), is the probability associated with equipment causing a fault or arcing event that leads to ignition at a given location.

The pre-mitigated EFF POI for every asset is a probabilistic assessment of ignition likelihood prior to mitigation deployment.

EFF POI is the sum of the ignition component sub models (e.g., conductor POI, transformer POI, switch POI, etc.) probabilities at a given location.

Please also see the description above regarding Wildfire Likelihood and how SCE considers Wildfire Likelihood sub-components during the Review & Revise stage of the IWMS Risk Framework.

FRC2: Contact from Vegetation Ignition Likelihood

Contact from vegetation ignition likelihood: The likelihood that vegetation will contact electrical corporation-owned equipment and result in an ignition.

Contact from Vegetation Ignition Likelihood, also referred to as Contact from Foreign Object - Vegetation Probability of Ignition (CFO-Veg POI), is the probability associated with vegetation coming in contact with utility equipment and causing a fault or arcing event that leads to ignition at a given location.

The pre-mitigated CFO-Veg. POI for every asset is a probabilistic assessment of ignition likelihood prior to mitigation deployment.

Please also see the description above regarding Wildfire Likelihood and how SCE considers Wildfire Likelihood sub-components during the Review & Revise stage of the IWMS Risk Framework.

FRC3: Contact by Object Ignition Likelihood

Contact by object ignition likelihood: The likelihood that a non-vegetative object (such as a balloon or vehicle) will contact electrical corporation-owned equipment and result in an ignition.

Contact from Object Ignition Likelihood, also referred to as Contact from Foreign Object Probability of Ignition (CFO POI), is the probability associated with objects other than vegetation (e.g., vehicles, balloon, animals, other, unknown, etc.) coming in contact with utility equipment and causing a fault or arcing event that leads to an ignition at a given location.

The pre-mitigated CFO POI for every asset is a probabilistic assessment of ignition likelihood prior to mitigation deployment.

Please also see the description above regarding Wildfire Likelihood and how SCE considers Wildfire Likelihood sub-components during the Review & Revise stage of the IWMS Risk Framework.

FRC4: Burn Probability

Burn probability: The likelihood that a wildfire with a nearby but unknown ignition point will burn a specific location within the service territory based on a probabilistic set of weather profiles, vegetation, and topography.

SCE assumes a continuous Burn Probability throughout all of its HFRA. SCE uses a deterministic, rather than probabilistic, modeling approach that identifies the maximum consequences from a range of weather scenarios to represent wildfire consequences for individual locations. The underlying premise of SCE's wildfire consequence model is that fuels are receptive enough to an ignition event to result in a Significant, Destructive, or Small fire (see definitions above in Wildfire Consequence) under the modeled 444 deterministic weather scenarios.

This modeling approach removes the need to separately determine burn probability to assess the relative receptiveness of vegetation to ignition events, given that fuels are already assumed to be fully

cured and highly receptive. Fuel data is updated regularly to reflect updated burn probability based on the current vegetation state across SCE's service territory.

As an additional data point, SCE has compared its wildfire consequence simulations to burn probability analysis performed by the U.S. Forest Service (USFS). See Section 6.4.1.2 for additional information.

FRC5: Wildfire Hazard Intensity

Wildfire hazard intensity: The potential intensity of a wildfire at a specific location within the service territory given a probabilistic set of weather profiles, vegetation, and topography.

Although SCE does not utilize wildfire hazard intensity metrics such as flame length (FL) or rate of spread (RoS) in the MARS or IWMS frameworks, SCE's Technosylva wildfire consequence estimates contain corresponding wildfire hazard intensity metrics.

SCE considers wildfire hazard intensity metrics such as flame length and rate of spread during its HFTD boundary review to model locations that require further analysis. Please see Section 6.4.1.2.

FRC6: Wildfire Exposure Potential

Wildfire exposure potential: The potential physical, social, or economic impact of wildfire on people, property, critical infrastructure, livelihoods, health, environmental services, local economies, cultural/historical resources, and other high-value assets. These may include direct or indirect impacts, as well as short- and long-term impacts.

SCE does not have a separate risk component for Wildfire Exposure Potential, as SCE considers all locations within its HFRA are subject to extreme or elevated wildfire exposure potential. Please see Section 6.4.1.2.

FRC7: Wildfire Vulnerability

Wildfire vulnerability: The susceptibility of people or a community to adverse effects of a wildfire, including all characteristics that influence their capacity to anticipate, cope with, resist, and recover from the adverse effects of a wildfire (e.g., access and functional needs customers, Social Vulnerability Index, age of structures, firefighting capacities).

Wildfire vulnerability in MARS is considered through a relative ranking of circuits based on the composite scoring of Access and Functional Needs (AFN) and Nonresidential Critical Infrastructure (NRCI) customers in comparison to other circuits in its HFRA.

The resulting AFN/NRCI Index is used in conjunction with SCE'S MAVF to amplify the safety component of the wildfire consequence score for a given location.

Wildfire vulnerability in IWMS is incorporated based on the consideration of locational risk factors including known Communities of Elevated Fire Concern (CEFCs), locations with high fire frequency and population egress, as well as locations which could trapped populations in identified egress locations (i.e., "Burn in Buffer"). Please see the explanation of the IWMS Risk Framework in earlier in this section.

FRC8: PSPS Exposure Potential

PSPS exposure potential: The potential physical, social, or economic impact of a PSPS event on people, property, critical infrastructure, livelihoods, health, local economies, and other high-value assets.

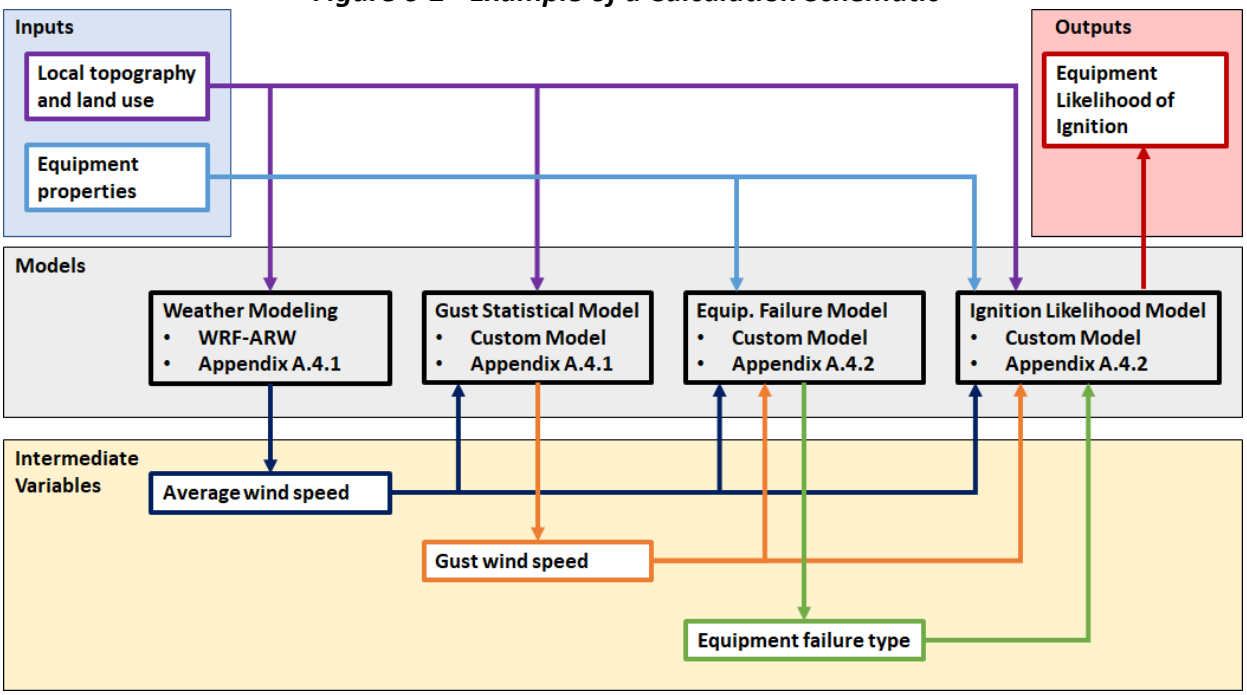
SCE does not have a separate risk component for PSPS Exposure Potential, as SCE considers all locations within its HFRA (and interconnected circuit segments that may be outside HFRA) as subject to PSPS exposure potential.

FRC9: PSPS Vulnerability

Vulnerability of community to PSPS (PSPS vulnerability): The susceptibility of people or a community to adverse effects of a PSPS event, including all characteristics that influence their capacity to anticipate, cope with, resist, and recover from the adverse effects of a PSPS event (e.g., high AFN population, poor energy resiliency, low socioeconomics).

Please see the discussion above regarding how Wildfire vulnerability is determined under the MARS Framework; SCE uses the same approach for PSPS vulnerability.

SCE calculates PSPS Vulnerability in the MARS Framework. In the IWMS Risk Framework, locations that experience frequent de-energizations and/or potential for PSPS events even when locations are fully covered are considered for mitigation. Please see the description of both frameworks earlier in this section and in Section 6.1.1 for the basis behind this approach.



6.2.2 Risk and Risk Components Calculation

The electrical corporation must calculate each risk and risk component defined in Section 6.2.1. Appendix B, "Calculation of Risk and Risk Components," provides additional requirements on these calculations. These are the minimum requirements and are intended to establish the baseline evaluation and reporting of all electrical corporations. If the electrical corporation identifies other key factors as important, it must report them in the WMP in a similar format.

The electrical corporation must provide schematics illustrating the calculation of each risk and risk component as necessary to demonstrate the logical flow from input data to outputs, including separate items for any intermediate calculations.

Figure 6-2 provides an example of a calculation schematic for the equipment likelihood of ignition.

Figure 6-2 - Example of a Calculation Schematic

The electrical corporation must summarize any differences between its calculation of these risk components and the requirements of these Guidelines. These differences may include any of the following:

- ***Additional input parameters** beyond the minimum requirements for a specific risk component*
- ***Calculations of additional outputs** beyond the minimum requirements for a specific risk component*
- ***Calculations of additional risk components** defined by the electrical corporation in Section 6.2.1*

The process used to combine risk components must be summarized for each relevant risk component. This process must align with applicable CPUC decisions regarding the inclusion of Risk Assessment and Mitigation Phase (RAMP) filings. If scaling factors (such as multi-attribute value functions [MAVFs] or representative cost) are used in this combination, the electrical corporation must present a table with all relevant information needed to understand this procedure. The electrical corporation must organize this discussion into the following two subsections focusing on likelihood and consequence.

Diagrams for Risk Components

SCE has developed calculation schematics and input/output diagrams for each risk component, except for the five components that SCE does not calculate directly or are addressed through other risk components (i.e., Wildfire Likelihood, Burn Probability, Wildfire Hazard Intensity, Wildfire Exposure Potential, and PSPS Exposure Potential).

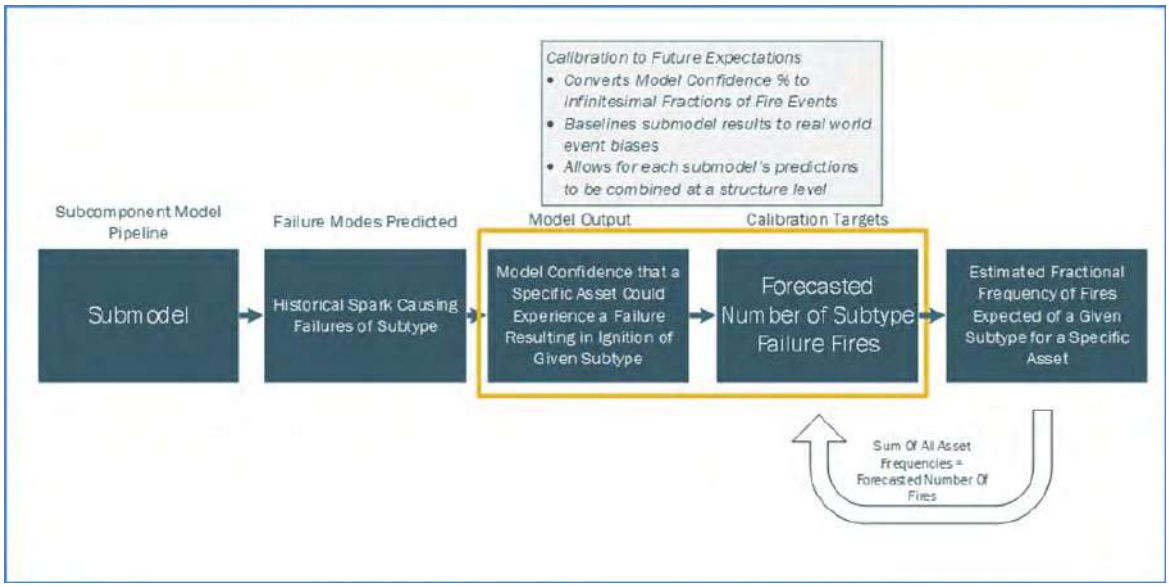
The diagrams are provided in Appendix B: Supporting Documentation for Risk Methodology and Assessment, as well as the additional information for each risk component required by Appendix B: Supporting Documentation for Risk Methodology and Assessment. The diagrams are provided in Appendix B: Supporting Documentation for Risk Methodology and Assessment, as well as the additional information for each risk component required by Appendix B: Supporting Documentation for Risk Methodology and Assessment.

6.2.2.1 Likelihood

The electrical corporation must discuss how it calculates the likelihood that its equipment (through normal operations or failure) will result in a catastrophic wildfire and the resulting likelihood of issuing a PSPS. The risk components discussed in this section must include at least the following:

- *Ignition likelihood*
    - *Equipment failure likelihood of ignition*
    - *Contact from vegetation likelihood of ignition*
    - *Contact from object likelihood of ignition*
- *Burn probability*
- *PSPS likelihood*

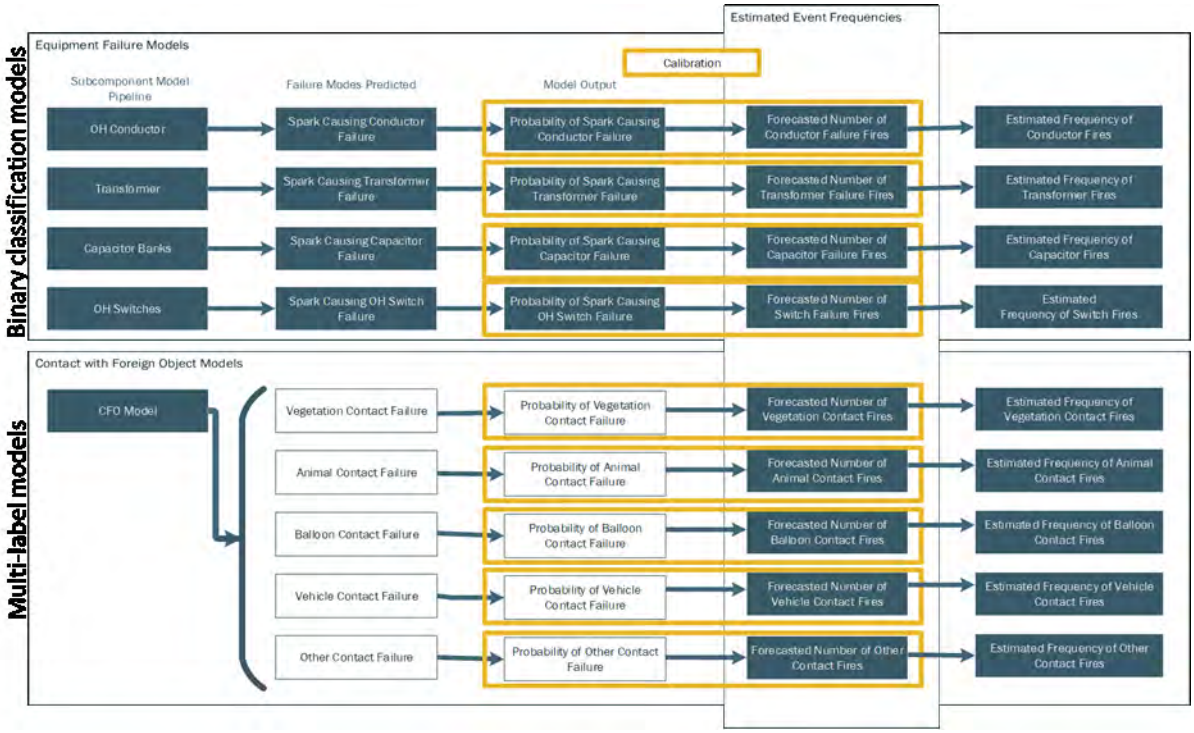
IRC1: Ignition Likelihood



As noted in the previous section, SCE considers Ignition Likelihood to be synonymous with Probability of Ignition (POI). The pre-mitigated POI for every asset is a probabilistic assessment of ignition likelihood prior to mitigation deployment.

Figure SCE - 6-18 Probability of Ignition

$$Probablity\ of\ Ignition\ = POI_{EFF} + POI_{CFOVeg} + \ POI_{CFO} - Other$$



The conditional POI associated with EFF and CFO probabilities are based on the sum of individual component probabilities of individual subcomponent models (e.g., EFF-conductor, CFO- vegetation, etc.). These subcomponent models utilize machine learning (ML) algorithms to assess the relevance of ignition drivers relevant to that subcomponent type. For instance, each EFF related subcomponent model uses historical asset outage data, current asset condition (e.g., age, voltage, inspection results, etc.)., and relevant environmental attributes (e.g., historical wind, asset loading, number of customers, temperature, relative humidity etc.).

Figure SCE 6-19 - Schematic for Individual SCE Probability of Ignition Subcomponent Models

SCE performs data synthesis and quality checks on each of these individual subcomponent models. These models are tested and updated using new observed failures and new inspection, remediation, or replacement information.

Figure SCE 6-20 - Schematic for SCE Probability of Ignition Model

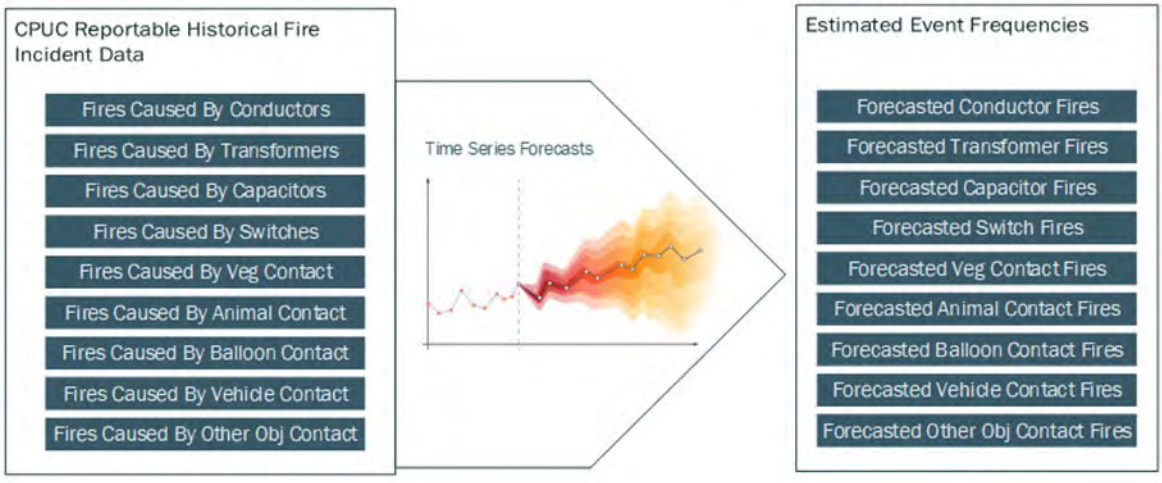
These statistical models are created with the assumption that a given set of explanatory data is what contributes to a failure or non-failure outcome. With this, machine learning models use historical environmental, physical, and electrical variables paired with their actual records of failures to derive statistical insights. The historical data used to derive subcomponent POIs are divided into a training set, a testing set randomly stratified from the same time period as the training set, and a validation set of data held out from a year the model has never seen.

The training set is used to train the model by finding patterns in how independent variables led to dependent variables or outcomes and is the only data that affects the decision thresholds within a model. The test set is not used to train the model, but to measure model accuracy by comparing model predictions to actual outcomes.

The validation set is also not used to train the model. These data are used to measure the accuracy of the model by determining if the model degrades over time. See

Figure SCE 6-21 and Figure SCE 6-22, below.

Figure SCE 6-21 - Schematic of POI Subcomponent Model Calculation



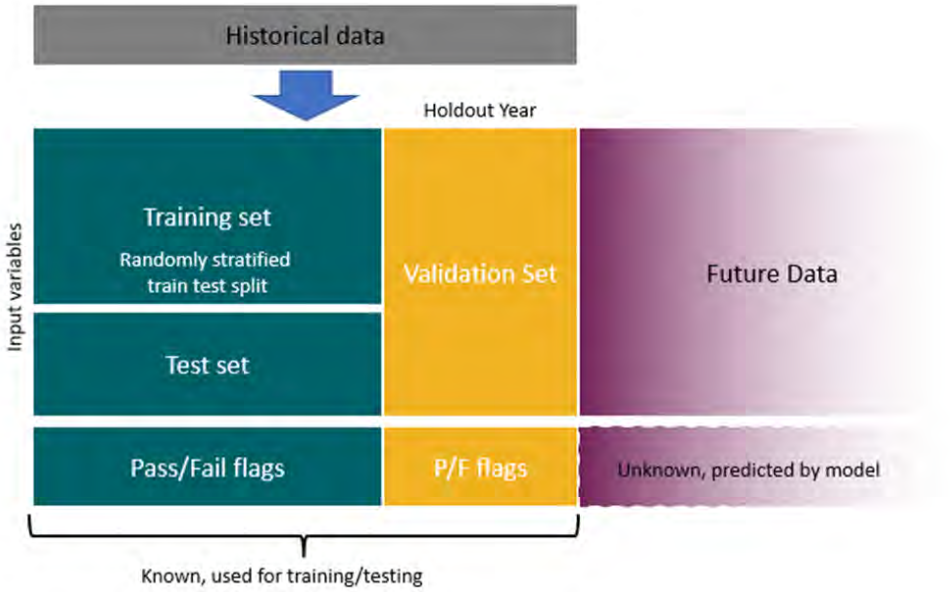


Figure SCE 6-22 - Schematic of POI Subcomponent Testing, Training, and Validation

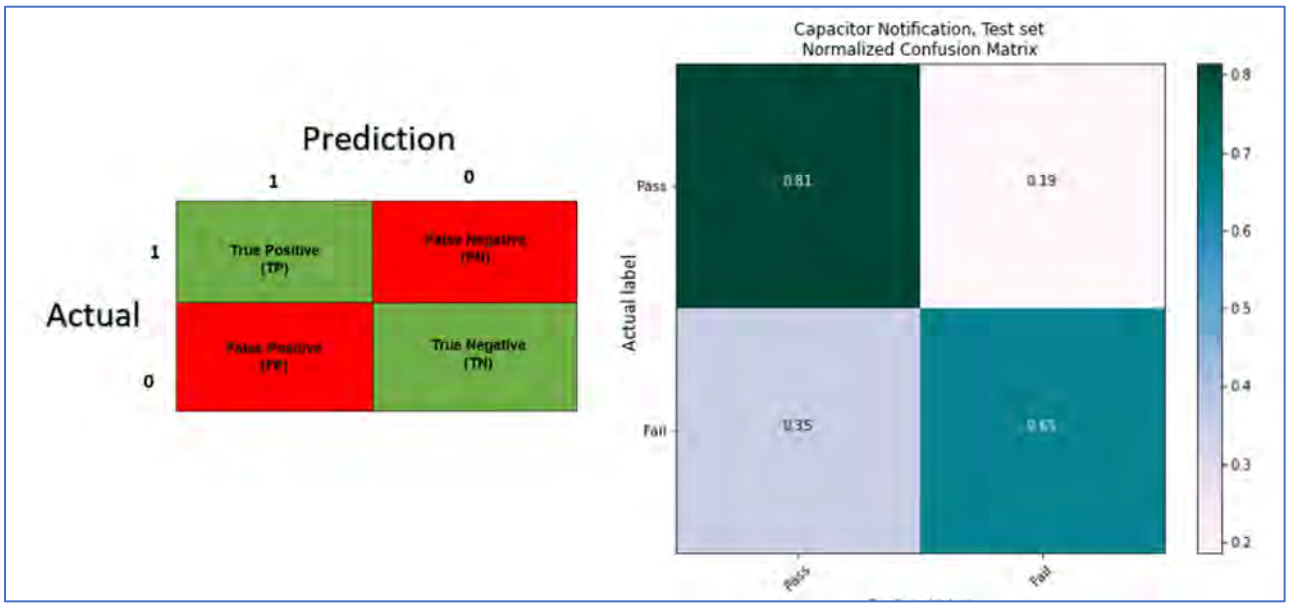
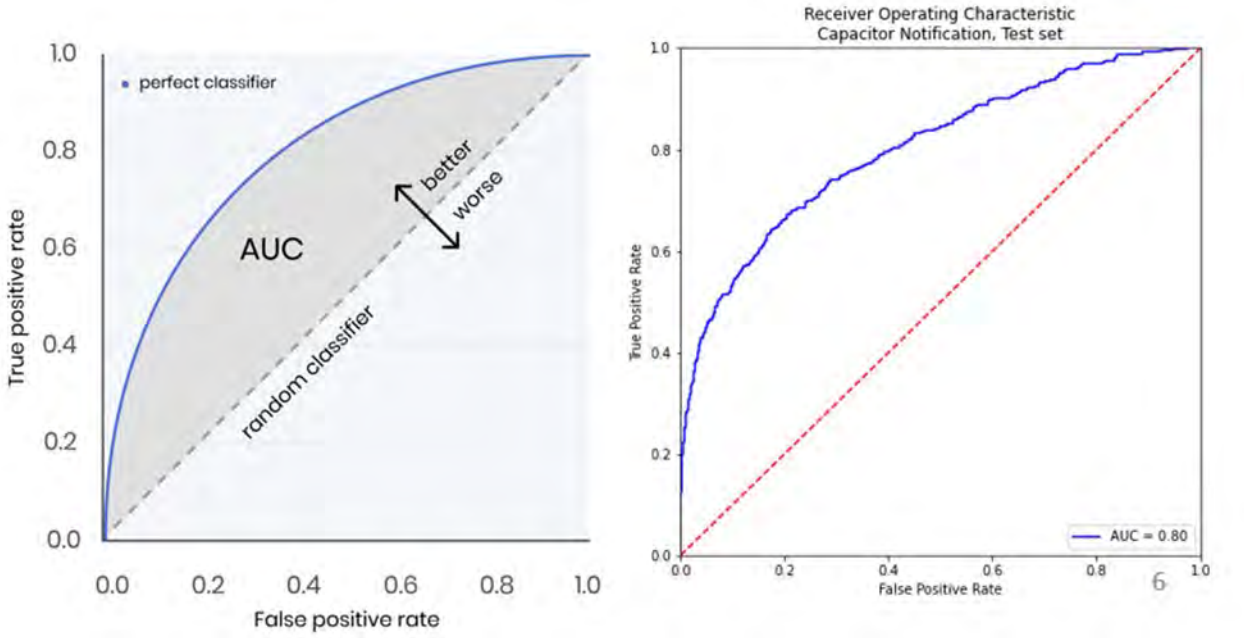
Subcomponent and overall model performance is measured by the statistical significance of model and subcomponent model predictions between the training set and testing set, as well as the training data set and the validation data set. Known historical failures are withheld from model training and the model is "tested" to see if it can predict them. How often the model accurately predicts an ignition event is quantifiable and provides confidence in its future predictions. SCE utilizes two widely accepted methods of quantifying model performance - the Confusion Matrix and the Receiver Operating Characteristic (ROC).



The Confusion Matrix (see Figure SCE 6-23, below) is a metric structure that organizes the predictions of a predictive model into buckets based on whether the predictions are correct. They are used to compare correct and incorrect predictions of the algorithm based on a set of known outcome data (e.g., test set) to determine how often the model predicted failures and non-failures correctly (true positive and true negative rates, respectively), as well as the occurrences when the model predicted incorrectly (false positive and false negative, respectively).

Assuming the convention that a positive prediction is an ignition prediction, and conversely a negative prediction is a non-ignition prediction, a true positive prediction is when the model predicts that an ignition is likely to occur which agrees with what happened. A true negative result occurs when the model correctly predicts that no ignition event occurred in the test set period. A false positive result occurs when the model predicts that an ignition may occur but in the test set, it did not. A false negative result occurs when the model predicts an ignition is unlikely, but the test data shows it did.

The diagonal elements denote how often the model was correct, and the off-diagonal elements measure how often the model is incorrect. The true positive rate is also known as the model "sensitivity" or "recall," the false positive rate is also known as "type 1 error," and the false negative is also known as "type 2 error." The machine learning models calculate probabilities, which are a continuum of values from 0-100%. These confusion matrices are made by picking a decision threshold (often 50%) where, if the probability is greater than this threshold, the event is said to be likely to occur



and vice versa. It is important to note this matrix results in a relative and comparative ranking of model performance.

Figure SCE 6-23 - Schematic of POI Validation Confusion Matrix

In addition to the Confusion Matrix, SCE uses the ROC curve to measure accuracy of each subcomponent model, as the overall model behaves based on different probability thresholds, as represented by the solid blue line in Figure SCE 6-24 As mentioned, the confusion matrix is sensitive to the decision threshold and there is often a tradeoff in discriminating true failures at the expense of increasing the false failure rate. A way to summarize the ROC curve into a single metric is by taking the integral of the true positive rate with respect to the false positive rate or calculating the Area Under the Curve (AUC). If the model were to perfectly classify the train, test, and validation data, the AUC would result in a score of 1.0 (100%) “true positive” result. If the model were to randomly select “true positive” results 50% of the time, the AUC would result in a score of 0.5 (50%), which is no better than a random guess or colloquially a “coin toss”, as represented by the dotted red line in Figure SCE 6-24.

Figure SCE 6-24 - Schematic of POI ROC Curve

IRC2: Wildfire Likelihood

SCE does not differentiate between Ignition Likelihood and Wildfire Likelihood. As described above in the discussion of Ignition Likelihood and earlier in Section 6.1.1, SCE models potential fire behavior and spread from individual utility asset locations.

FRC1: Equipment Failure Likelihood of Ignition

EFF POI (synonymous with Equipment Failure Likelihood of Ignition) is the sum of the EFF ignition component sub models (e.g., conductor POI, switch POI, transformer POI, etc.) probabilities at a given location.

EFF POI utilizes similar algorithms and model performance metrics as described above regarding Ignition Likelihood.

FRC2: Contact from Vegetation Likelihood of Ignition

CFO – Veg. POI utilizes similar algorithms and model performance metrics as described above regarding Ignition Likelihood.

FRC3: Contact from Object Likelihood of Ignition

Contact from Object Ignition POI (e.g., vehicles, balloon, animals, other, unknown, etc.) utilizes similar algorithms and model performance metrics as described above regarding Ignition Likelihood.

FRC4: Burn Probability

Please see Section 6.2.1 for how SCE considers this risk component.

IRC4: PSPS Likelihood

To estimate PSPS Likelihood (also referred to by SCE as POD), SCE derived a 10-year historical climatology of PSPS weather conditions along distribution circuits. This historical climatology was used to determine the extent by which recent years experienced de-energization conditions at above- or below-average frequency, and to what degree mitigations reduce de-energization frequency.

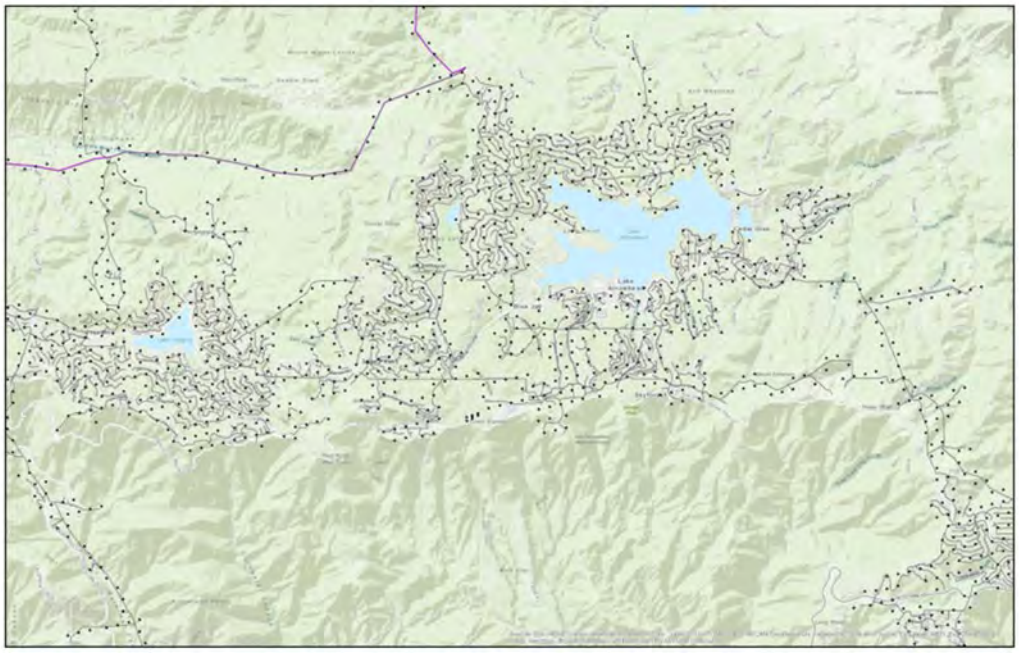
SCE used a gridded historical dataset available at a two-kilometer by two-kilometer spatial resolution over the entire SCE territory to derive this historical climatology. The gridded dataset provided consistent data coverage and a sufficient period of length to derive the average number of hours each circuit would have exceeded PSPS de-energization criteria in the modeled data using specific thresholds. This information was used to derive the historical exceedance of circuit de-energization conditions based on unhardened de-energization thresholds.

SCE then adjusted these de-energization thresholds to simulate a fully hardened forecast exceedance post mitigation deployment. The resulting estimate provided a pre-and post-POD based on the number of hours each circuit might exceed PSPS conditions once hardened, assuming average future conditions are similar to historical climatological conditions.

SCE notes the historical climatology is driven by observed historical atmospheric conditions. Terrain and meteorological resolution are constrained to the same computational limitations. The ability to represent complex terrain is limited, as is representation of small-scale weather features that play important factors in determining local wind speeds. Additionally, climate change literature does not definitely point to a likely increase or decrease in potential future high wind conditions.

6.2.2.2 Consequence

The electrical corporation must discuss how it calculates the consequences of a fire originating from its equipment and the consequence of implementing a PSPS event. The risk components discussed in this section must include at least the following:



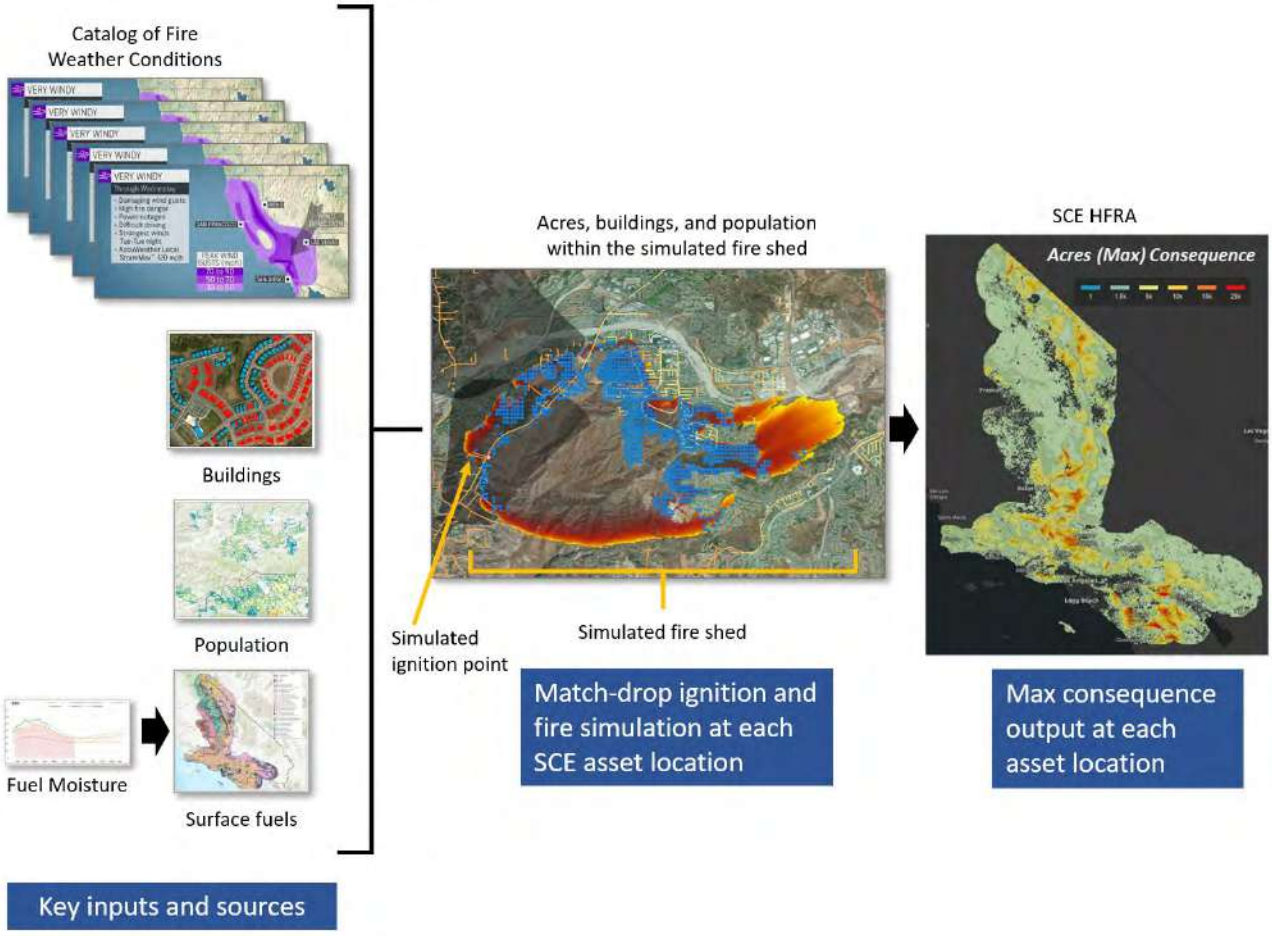
- *Wildfire consequence*
- *Wildfire hazard intensity*
- *Wildfire exposure potential*
- *Wildfire vulnerability*
- *PSPS consequence*
- *PSPS exposure potential*
- *PSPS vulnerability*

IRC3: Wildfire Consequence

SCE utilizes Technosylva-based wildfire modeling tools to assess wildfire consequences based on deterministic match-drop simulations at utility asset location (see Figure SCE 6-25) for a consistent unsuppressed 8 hour burn period. The use of deterministic match drop simulations allows SCE to isolate ignitions associated with wildfire simulations along utility assets and assign the resulting natural unit consequences back to those assets.

The use of a consistent unsuppressed 8 hour burn period allows for direct comparison of the resulting consequences. An eight hour burn period is used to represent the first burn period of which there is certainty in the fuel, wind, and weather conditions at the time of the initial ignition. As evident by CPUC analysis[89] of utility 2019 PSPS events, there is inherent uncertainty in the fuel, wind, weather, as well as suppression, evacuation, and other community response variables beyond the initial burn period.

Figure SCE 6-25 - Example of Ignition Points (Black Dots) in Proximity to Utility Assets (Gray Lines)



SCE uses the maximum model consequence across the 444 modeled weather scenarios simulated along each of the 29 million match drop simulation ignition points. These 444 modeled weather scenarios reflect the 41 weather scenarios used by the CPUC in the development of the utility HFTD map, as well as 403 additional weather scenarios reflective of dry fuel conditions with or without the presence of significant wind (i.e., fuel-driven fires). For longer-term planning purposes, SCE utilizes a 2030 fuel layer reflecting likely fuel regrowth patterns in fire scars greater than 5,000 acres.

[89] https://www.cpuc.ca.gov/consumer-support/psps/technosylva-2019-psps-event-wildfire-risk-analysis-reports

SCE assigns the resulting maximum natural unit consequences (e.g., acres, building, and population) across the 444 simulated weather scenarios to the asset in proximity to those match drop simulation using zonal statistics. The resulting natural unit acres and building consequences are translated into financial values (e.g., suppression and restoration costs per acre, and building replacement value). Natural unit population consequences (e.g., fatalities and series injuries) are translated into a safety index (e.g., one serious injury equals one quarter of a fatality). SCE also assumes eight hours of customer interruption along the circuit in which the ignition propagated. The resulting reliability values – the product of eight hours of interruption and the number of customers on a given circuit – are used as a conservative estimate of the potential reliability impacts of a resulting wildfire. See Figure SCE 6-26.

Figure SCE 6-26 - Schematic of SCE Wildfire Consequence Modeling (8 hours, unsuppressed)

Below SCE provides additional information about how consequences are translated into a MARS score.

Safety Consequences: SCE defines serious injuries and fatalities as those associated with both members of the public and firefighters injured during a wildfire event based on known reported information. To estimate Safety Consequence associated with individual wildfire simulations, SCE uses a ratio of 256 structures impacted to one fatality, and a ratio of 107 structures impacted to one serious injury. These ratios are based on recent historical wildfires in SCE's service territory. These safety consequences are then combined into a Safety Index in which one serious injury is equal in value to one quarter fatality.

$$Safety\ Index = (1 \times Fatalities + \frac{1}{4} \times Serious\ Injuries)\ \times Wildfire\ Vulnerability$$

Reliability Consequences: SCE assumes an eight-hour service interruption for each customer account on the circuit from which that ignition occurred. SCE understands these numbers may be a conservative

estimate given that fire sheds may impact multiple circuits during an actual wildfire event. These impacts are represented by the number of customer minutes of service interruptions (CMI).

$$Reliability = Customers\ \times (8\ hours\ \times 60\ minutes)$$

Financial Consequences: SCE uses average cost information representing costs associated with damage to physical structures, as well as firefighting suppression costs and land restoration costs for each individual wildfire simulation. To model socio-economic equity across SCE's service territory, SCE uses a system-wide average estimated cost of $940,337 per structure impacted.[90] SCE understands these numbers may be a conservative estimate given that insured losses may exceed actual structure values for each wildfire event. SCE also uses a per-acre fire-fighting suppression cost figure of $876; and a per acres land restoration cost of $1,460.[91]

$$Financial = (\#\ of\ Structures)\ \times (\$940{,}337) + (\#\ of\ Acres)\ \times (\$876) + (\#\ of\ Acres)\ \times (\$1{,}460)$$

Overall MARS Risk Score

In Table SCE 6-05, SCE summarizes the associated attributes, units, weights, ranges and scaling functions to convert natural units of consequences (e.g., CMI, dollars, safety) into a unit-less risk score. These components were based on the principles set forth in the S-MAP Settlement and presented in SCE's 2022 RAMP filing.

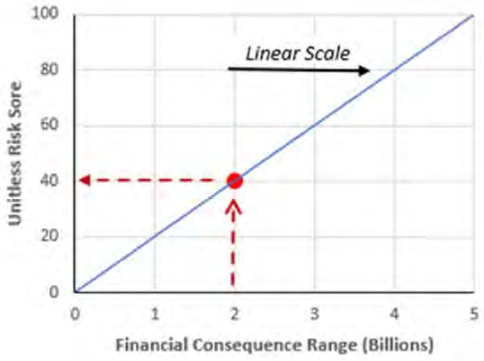


Table SCE 6-05 - MARS Conversion Table

Attribute	Units	Weight	Range	Scaling Factor
Safety	Index	50%	0 - 100	Linear
Reliability	Customer Minutes of Interruption (CMI)	25%	0 - 2 Billion	Linear
Financial	Dollars	25%	0 - 5 Billion	Linear

[90] Estimated average structure value is based on the RMS industry exposure database (IED) for SCE's service area.
[91] Suppression costs are based on a five-year average of California's reported wildfire suppression costs from 2016-2020.

Figure SCE 6-27 provides a step-by-step illustrative example using the weights, ranges and scaling functions to transform consequences (in this example Financial) into a unitless risk score. The same methodology would be used for the safety and reliability consequences.

Figure SCE 6-27 - MARS Conversion Steps

Step	Action	Value
1	Identify Consequence Value	$2 Billion
2	Determine Scaled Score	40
3	Identify Attribute Weight [Financial]	25%
4	Apply Weight to Scaled Score	10 = 25% * 40
5	**Financial Risk Score (MARS)**	**10**

SCE's Use of a Deterministic Approach & Evaluating Wildfire Consequence Results

Given that future weather conditions are not known, match drop simulations (i.e., deterministic) using maximum observed fire weather conditions more appropriately reflect the relative wildfire risk associated with ignitions in proximity to utility assets than probabilistic methods that are based on a range of weather conditions.

Probabilistic methods rely on past historical information to project forward wildfire trends based on an analysis of several partially isolatable variables leading to wildfire ignition (e.g., the susceptibility of fuels to wildfire ignition) and post-ignition decision making (e.g., wildfire suppression decision making and resourcing). These probabilistic methods typically do not properly reflect upward or downward trends in climate change or changes in the amount of availability suppression resources.

While empirical estimations regarding the impact of the dynamic risks of climate change and/or suppression can be added to probabilistic models, it is difficult to discern the relative contribution of each of these variables on the overall model as their impacts would likely vary by location. It is also not clear to what extent probabilistic models would produce a superior result over deterministic models (see Leuenberger et. al 2018).[92]

In the IWMS Risk Framework, SCE categorizes simulated wildfires based on three definitions:

> **Significant Fires** are simulated fires that, at 8 hours after ignition, burned more than 10,000 acres or had at least one fatality or had at least 50 structures impacted.
>
> **Destructive Fires** are simulated fires that, at 8 hours after ignition, burned between 300 acres and 10,000 acres with zero fatalities and/or had fewer than 50 structures impacted.

[92] "Wildfire susceptibility mapping: Deterministic vs. stochastic approaches", *Environmental Modelling & Software*, Volume 101, March 2018, Pages 194-203. https://www.sciencedirect.com/science/article/abs/pii/S1364815217303316?via%3Dihub

Small Fires are simulated fires that, at 8 hours after ignition, burned less than 300 acres with zero fatalities and no structures impacted.

Please see the description of the IWMS methodology in Section 6.2.1 for additional discussion of how these results are used to inform the three risk tranches within IWMS.

FRC5: Wildfire Hazard Intensity

Please see Section 6.2.1 for how SCE considers this risk component.

FRC6: Wildfire Exposure Potential

Please see Section 6.2.1 for how SCE considers this risk component.

FRC7: Wildfire Vulnerability

SCE has developed a multiplier to represent the vulnerability of customers to a wildfire or PSPS event. The purpose of this multiplier is to amplify the safety index based on the relative ranking of those circuits compared to other circuits in HFRA based on the total AFN and NRCI customers on those circuits.

AFN customers include those customers which are subject one or more of the following criteria: Critical Care, disabled, Medical Baseline, Low Income, limited English, pregnant, children. NRCI customers include those customers in the Healthcare and Public Health, Water and Wastewater Systems, Emergency Services, Communication, Transportation, Government Facilities, or Energy sectors.

An AFN multiplier value of "2" represents the highest AFN score compared to other circuits in the HFRA; an AFN multiplier value of "1" represents a circuit with an AFN score of zero. Similarly, a circuit with an NRCI multiplier value of "2" represents the highest NRCI score compared to all of the other circuits in HFRA; an NRCI score of "1" represents a circuit with a NRCI score of zero.

In the case of Wildfire Vulnerability, this multiplier represents the relative level of support that an individual or entity would need in the case of a wildfire event.

$$AFN_{CircuitMultiplier} = 1 + \frac{AFN\ ScoreCircuit}{AFN\ Score_{Max}}$$

$$NRCI_{CircuitMultiplier} = 1 + \frac{NRCI\ ScoreCircuit}{NRCI\ Score_{Max}}$$

$$Wildfire\ Vulnerability_{Circuit} = AFN_{CircuitMultiplier} \times NRCI_{CircuitMultiplier}$$

Wildfire vulnerability in IWMS is incorporated based on the consideration of locational risk factors including known Communities of Elevated Fire Concern (CEFCs), locations with high fire frequency and population egress, as well as locations in which an ignition could cause a wildfire which could spread to and trap populations in identified egress locations (i.e., "Burn in Buffer"). Please see the description of the IWMS Risk Framework in section 6.2.1.

IRC5: PSPS Consequence

SCE estimates PSPS Consequences associated with a proactive de-energization event by using the number of customers impacted along with the potential frequency and duration of those events to estimate potential safety, reliability, and financial impacts.

Safety Consequences: SCE multiplies the total customers in scope by three to estimate the total population impacted. The resulting total population impacted is then multiplied by a safety conversion factor, based epidemiological data from the 2003 Northeast Blackout event as a data point[93], to estimate the number of fatalities. These safety consequences are combined into a Safety Index in which one serious injury is equal in value to one quarter fatality. SCE adjusts the Safety Index by the applicable PSPS Vulnerability multiplier for the circuit in scope.

$$Safety\ Index = (Population\ \times Safety\ Conversion\ Factor)\ \times PSPS\ Vulnerability$$

Reliability Consequences: SCE assumes an 8-hour service interruption for each customer account on the circuit in scope for that event. SCE understands these numbers may be a conservative estimate given that SCE attempts to minimize the number of customers in scope for a given PSPS event. These impacts represent the number of customer minutes of service interruptions (CMI).

$$Reliability = Customers\ \times (8\ hours\ \times 60\ minutes)$$

Financial Consequences: SCE uses the number of customers to estimate the potential financial impact. SCE uses $250 per customer service account, per de-energization event, to approximate potential financial losses, recognizing that some customers may experience no financial impact, while other customer losses may exceed $250[94].

$$Financial = Customers\ \times \$250\ per\ event$$

[93] That blackout lasted for 48 hours, impacted 50 million people, and was recorded to have 100 fatalities, which converts to 4.2 x 10-8 fatalities / people-hrs. Other data points include the 2011 Southwest blackout and the 2019 PSPS outages in SCE service area, though no fatalities were attributed to those events.

[94] This is not an acknowledgment that any given customer has or will incur losses in this amount, and SCE reserves the right to argue otherwise in litigation and other claim resolution contexts, as well as in CPUC regulatory proceedings. This estimate is based on a number of factors including SCE internal Value of Service (VoS) studies, claims information, as well as benchmarking with other utilities.

Overall MARS Risk Score

SCE uses the same weights, ranges, scaling functions as described above in the explanation of Wildfire Consequence.

FRC8: PSPS Exposure Potential

Please see section 6.2.1 for how SCE considers this risk component.

FRC9: PSPS Vulnerability

Please see the discussion above regarding how Wildfire vulnerability is determined under the MARS Framework; SCE uses the same approach for PSPS vulnerability.

$$PSPS\ Vulnerability_{\ Circuit} = AFN_{\ CircuitMultiplier} \times NRCI_{\ CircuitMultiplier}$$

6.2.2.3 Risk

The electrical corporation must discuss how it calculates each risk and the resulting overall utility risk defined in section 6.2.1. The discussion in this section must include at least the following:

- *Ignition risk*
- *PSPS risk*
- *Overall utility risk*

R2: Ignition Risk

Ignition Risk (synonymous with Wildfire Risk) is calculated as the product of the sum of all Ignition Likelihood components and Wildfire Consequence for each asset in SCE's HTFD. The safety score for each segment is the product of the safety subcomponent of Wildfire Consequence and Wildfire Vulnerability.

$$Ignition\ Risk = Ignition\ Likelihood\ x\ Wildfire\ Consequence$$

R3: PSPS Risk

PSPS risk is calculated as the product of PSPS Likelihood (synonymous with Probability of De-energization (POD)) and PSPS Consequence for each asset in SCE's HTFD.

$$PSPS\ Risk = PSPS\ Likelihood\ x\ PSPS\ Consequence$$

R1: Overall Utility Risk

Overall Utility Risk is calculated as the sum of Ignition Risk and PSPS Risk for each asset in SCE's HTFD.

$$Overall\ Utility\ Risk = Ignition\ Risk + PSPS\ Risk$$

6.2.3 Key Assumptions and Limitations

Because the individual elements of risk assessment are interdependent, the interfaces between the various risk models and mitigation initiatives must be internally consistent. In this section of the WMP, the electrical corporation must discuss key assumptions, limitations, and data standards for the individual elements of its risk assessment. This must include the following:

- ***Key modeling assumptions** made specific to each model to represent the physical world and to simplify calculations*
- ***Data standards,** which must be consistently defined (e.g., weather model predictions at a 30-ft [10-m] height must be converted to the correct height for fire behavior predictions, such as mid-flame wind speeds)*
- ***Consistency of assumptions and limitations** in each interconnected model, which must be traced from start to finish, with any discrepancies between models discussed*
- ***Stability of assumptions in the program**, including historical and projected changes*

More mature programs regularly monitor and evaluate the scope and validity of modeling assumptions. Monitoring and evaluation categories may include:

- ***Adaptation of weather history** to current and forecasted climate conditions*
- ***Availability of suppression resources** including type, number of resources, and ease of access to incident location*
- ***Height of wind driving fire spread** / wind adjustment factor calculation*
- ***General equipment failure rates** / wind speed functional dependence for unknown components*
- ***General vegetation contact rates** / wind speed functional dependence for unknown species*
- *Height of electrical equipment in the service territory*
- ***Stability of the atmosphere** and resulting calculation of near-surface winds*
- ***Vegetative fuels** and fuel models including adaptations based on fuel management activities by other Public Safety Partners*
- ***Combination of risk components / weighting of attributes** in alignment with most recent decision issued by the CPUC for inclusion in RAMP filings*
- *Wind load capacity for electrical equipment in the service territory*

- *Number, extent, and type of community assets at risk in the service territory*
- *Proxies for estimating impact on customers and communities in the service territory*
- *Extent, distribution, and characteristics of vulnerable populations in the service territory*

The electrical corporation must document each assumption in Table 6-2. The electrical corporation must summarize detailed assumptions made within models in accordance with the model documentation requirements in Appendix B.

Key Modeling Assumptions

Please see Table 6-2, where SCE provides its key modeling assumptions and approach for the attributes listed above. SCE uses its own historical data, research, and studies relevant to wildfire risk assessment as well as those required in other applicable regulatory forums. SCE looks forward to additional discussion regarding the applicability of these modeling components in forthcoming OEIS risk modeling working groups. Please see Appendix B: Supporting Documentation for Risk Methodology and Assessment for additional information on key modeling assumptions.

Data Standards

The data standards that SCE adopts in its risk modeling is based on the granularity of available data (e.g., segment or functional location level). Where appropriate, SCE has provided the data standard it uses for the key modeling assumption for the attributes listed. Please see Appendix B: Supporting Documentation for Risk Methodology and Assessment for additional information on data standards.

Consistency of Assumptions and Limitations

SCE has provided its assumptions and the limitations it sees it those assumptions in Table 6-2. SCE's key modeling assumptions are used consistently across its risk models. Additional technical information can be found in Appendix B: Supporting Documentation for Risk Methodology and Assessment.

Stability of Assumptions in the program

As provided in Table 6-2, SCE understands there are limitations of these assumptions and consistently updates these assumptions (e.g., fuels, weather scenarios, drivers, etc.) for its risk modeling as necessary and/or as data is available.

Table 6-2 - Risk Modeling Assumptions and Limitations

	Assumption	Justification	Limitation	Applicable Models
Adaptation of Weather History	SCE leverages 2009-2020 weather data generated from its weather research and forecasting (WRF) to identify weather variables associated with fire incidents (see Section 8.3.5).	SCE uses machine learning algorithms to associate applicable weather variables from the WRF model at the time of fault/ignition events.	SCE's WRF has a limited spatial granularity of 2KM x 2KM. These historical weather data may not be reflective of future weather conditions.	POI
	SCE uses 444 weather days from SCE's historical climatology as described above.	These weather days represent fire weather conditions in each of SCE's Fire Climate Zones (FCZs).	In order to increase accuracy and meet the underlying 30m cell size resolution of the fuels data, 2 KM x 2 KM weather data is interpolated spatially using a bilinear interpolation scheme. These historical data may not be reflective of future fire weather conditions.	Wildfire Consequence

	Assumption	Justification	Limitation	Applicable Models
Availability of Suppression Resources	SCE does not account for historical or future fire suppression.	The use of a consistent unsuppressed 8-hour burn period across all fire simulations allows for comparable benchmarking of the resulting consequences across assets	There is inherent uncertainty in agent-based activities, such as fire suppression. The overlapping jurisdiction, availability, and coordination of resourcing decisions as well as the timeliness of those decision-making processes based on the ignition detection time make it challenging to model. SCE also notes that in many cases, fire agencies must respond to multiple concurrent fire events, adding additional complexity to wildfire suppression decision-making. Calibration of historical fires alone does not reflect these decision-making processes. In lieu of artificially	Wildfire Consequence

	Assumption	Justification	Limitation	Applicable Models
			adjusting consequences based on fire suppression, SCE has chosen to not to bias these simulations.	
Height of Wind Driving Fire Spread	Fire simulations require wind speed at midflame to compute surface fire spread and at 20ft to compute crown fire characteristics. To convert the initial 10m wind speeds from WRF to 20ft, we use a wind adjustment factor (WAF) from Andrews (2012).	The model is based on the work of Albini and Baughman (1979) and Baughman and Albini (1980), using some assumptions made by Finney (1998).	The sheltered WAF assumes that the wind speed is approximately constant with height below the top of a uniform forest canopy. Sheltered WAF is based on the fraction of crown space occupied by tree crowns.	Wildfire Consequence
General Equipment Failure Rates	SCE bases its equipment failure rates on its predictive models for Equipment/Facility Failure) EFF) subcomponents using 2015-2020+ equipment failure data for its modelled assets.	SCE uses machine learning algorithms to develop predictive models for equipment failure that are validated and tested for accuracy for inclusion in our probabilistic assessment for risk calculations.	SCE uses historical data which may not be an indicator of future equipment failure rates.	POI

	Assumption	Justification	Limitation	Applicable Models
General Vegetation Contact Rates	SCE bases its vegetation contact rates on its predictive model for Contact from Foreign Object (CFO) subcomponent using 2015-2020+ CFO outages for vegetation sub drivers.	SCE uses machine learning algorithms to develop predictive models for vegetation contact that are validated and tested for accuracy for inclusion in our probabilistic assessment for risk calculations.	SCE uses historical data which may not be an indicator of future vegetation contact rates.	POI
Height of Electrical Equipment in the Service Territory	SCE uses current asset condition attributes (e.g., age, voltage, manufacturer, height of pole, etc.) as variables utilizes in the machine learning algorithms. The height of electrical equipment is governed by the applicable regulations in GO 95.	SCE's machine learning models use historical environmental, physical, and electrical variables paired with their actual records of failures to derive statistical insights.	Height of equipment is based on pole height of associated asset and may not reflect actual installation height.	POI
Stability of the Atmosphere	Atmospheric instability, as it related to wildfire propagation after initial ignition, is not considered in	The wildfire propagation model is a surface model is not directly coupled with	The intent of the model is to capture the fire propagation at the time of the ignition event	Wildfire Consequence

	Assumption	Justification	Limitation	Applicable Models
	the model.	the atmosphere. It assumes that the heat flux generated by the wildfire will not modify local atmospheric conditions and thus create additional fuel moisture dryness (e.g., pre-heating) in any way.	through an 8-hour simulated burn period. The resulting wildfire is assumed to be fully developed with fire acceleration, flashover, or decay not being considered.	
Vegetation Fuels	SCE uses the Live/Dead Fuel Moisture Data from the 444 worst weather days developed by its weather forecasting. These variables include Dead moisture content, (1hr, 10hr, 100hr, 1000hr) herbaceous moisture content, and live woody moisture content. (See Section 8.3.5).	Dead fuel moisture is calculated using the Nelson model which is widely used among fire agencies nationwide. Live fuel moisture is calculated using a machine learning approach that was in part developed by SCE.	Modeling fuel moisture is affected by the same limitations that are common in numerical modeling. In addition to the biases and other forecast errors associated with parameters such as temperature, atmospheric moisture, soil moisture, evaporation rates, etc., needed to calculate fuel moisture, uncertainties within the physical processes of	Wildfire Consequence

	Assumption	Justification	Limitation	Applicable Models
			vegetation phenology compound the errors associated with vegetation moisture outputs	
Vegetation Fuels	Fuels are based on the Timber fuel layers, including an additional 19 custom fuel models. Additional WUI and Non-Forested Land Use are based on customized fuel models representing fire propagation in those locations. (Technosylva, 2020).	These fuel models were developed through daily validation of fuels with fire behavior data from CalFire and California National Guard FireGuard data	These fuel models are static and only represent a snapshot in time at a 30m x 30m resolution. Given limitations in the spatial and temporal granularity of this information (e.g., changes in suburban development between the time the data was captured to present day), this data may not accurately represent details in land/vegetation types at the time of the ignition.	Wildfire Consequence
Combination of Risk Components /Weighting of Attributes	The natural unit consequences resulting from wildfire simulations are translated into	SCE developed its MAVF based on the principles as set forth in the S-MAP	The attributes are based on observable data and may not reflect other qualitative	Wildfire Consequence

	Assumption	Justification	Limitation	Applicable Models
	safety, reliability and consequence scores based on SCE MAVF framework.	settlement. Appendix B provides further discussion and justification for each of the components. SCE is an active participant in the CPUC's Risk Informed Decision-Making Framework Proceeding ("Risk OIR")[95] which governs modifications to this risk assessment process.	factors such as egress or customer satisfaction; factors which may not lend themselves to this type of framework. They may also not reflect of associated risk tolerance standards as set forth in other Commission and/or Legislative guidance.	
Wind Load Capacity for Electrical Equipment	SCE assumes the wind load capacity for its electrical equipment is, at minimum, aligned with applicable GO 95 requirements.	SCE is required to maintain the system based on applicable CPUC operating practices.	Equipment failure can occur in both high wind and low/no wind conditions and can be the result of difficult to predict factors, such as animal and vehicles contact.	POI
Number, extent, and type of community	Not Applicable	Communities at Risk are not spatially granular	Not Applicable, see comment at left.	Wildfire Consequence

[95] R.20-07-013. CPUC Order Instituting Rulemaking to Further Develop a Risk-Based Decision-Making Framework for Electric and Gas Utilities.

	Assumption	Justification	Limitation	Applicable Models
assets at risk		enough to adequately represent wildfire risk. For example, the City of Los Angeles is considered a Community at Risk (CAR), though the vast majority of the city is not exposed to wildland fires. Please also see Section 5.4.		
Proxies for estimating impact on customers and communities	SCE assumes only direct impacts to customers.	SCE uses a ratio of 256 structures impacted to one fatality, and a ratio of 107 structures impacted to one serious injury to determine its safety impact.	These estimates are based on recent historical fire information in Southern California and only include reported data. They do not include any potential indirect or unreported impacts.	Wildfire Consequence
Extent, distribution, and characteristics of vulnerable populations	SCE utilizes an AFN/NRCI multiplier on the safety attribute of MAVF.	The AFN/NRCI multiplier is a relative ranking of vulnerability by populations served on individual	AFN/NRCI weights each population set (AFN customers/NRCI customers) equally and does not	Wildfire Consequence

	Assumption	Justification	Limitation	Applicable Models
		circuits.	differentiate between customer class. Additionally, SCE does not account for customer self-generation capabilities.	

6.3 Risk Scenarios

In this section of the WMP, the electrical corporation must provide a high-level overview of the scenarios to be used in its risk analysis in Section 6.2 These must include at least the following:

- ***Design basis scenarios** that will inform the electrical corporation's long-term wildfire mitigation initiatives and planning*
- ***Extreme-event scenarios** that may inform the electrical corporation's decisions to provide added safety margin and robustness*

The risk scenarios described in Sections 6.3.1 and 6.3.2 below are the minimum scenarios the electrical corporation must assess in its wildfire and PSPS risk analysis. The electrical corporation must also describe and justify any additional scenarios it evaluates.

Each scenario must consider:

- ***Local relevance:** Heterogeneous conditions (e.g., assets, equipment, topography, vegetation, weather) that vary over the landscape of the electrical corporation's service territory at a level sufficiently granular to permit understanding of the risk at a specific location or for a specific circuit segment. For example, statistical wind loads must be calculated based on wind gusts considering the impact of nearby topographic and environmental features, such as hills, canyons, and valleys*
- ***Statistical relevance:** Percentiles used in risk scenario selection must consider the statistical history of occurrence and must be designed to describe a reasonable return interval / probability of occurrence. For example, designing to a wind load with a 10,000- year return interval may not be desirable as most conductors in the service territory would be expected to fail (i.e., the scenario does not help discern which areas are at elevated risk)*

Overview

SCE uses a design basis scenario in its MARS and IWMS Risk Frameworks that reflects wind loading conditions, weather conditions, and vegetation conditions. As described further below, SCE's approach incorporates elements of five of the design scenarios defined by OEIS for the risk assessment analysis that informs mitigation prioritization and selection.

SCE has also developed a scenario called Climate 2030 that represents an Extreme-Event/High Uncertainty scenario. This scenario is not currently used and is still under evaluation. It is intended to help SCE assess if climate change, as well as any resulting changes in wildfire consequence, may influence our existing grid hardening strategy.

SCE provides further detail on both its design basis and extreme event scenarios in the sections immediately following.

6.3.1 Design Basis Scenarios

Fundamental to any risk assessment is the selection of one or more relevant design basis scenarios (design scenarios). These scenarios will inform long-term mitigation initiatives and planning. In this section, the electrical corporation must identify the design scenarios it has prioritized from a comprehensive set of possible scenarios. The scenarios identified must be based on the unique wildfire and PSPS risk characteristics of the electrical corporation's service territory and achieve the primary goal and stated plan objectives of its WMP. At a minimum, the following design scenarios representing

statistically relevant weather and vegetative conditions must be considered throughout the service territory.

***For wind loading on electrical equipment**, the electrical corporation must use at least four statistically relevant design conditions. It must calculate wind loading based on locally relevant 3-second wind gusts over a 30-year wind speed history during fire season in its service territory. The conditions are the following:*

- ***Wind Load Condition 1**: Baseline: The baseline wind load condition the electrical corporation use in design, construction, and maintenance relative to GO 95, Rule 31.1.*
- ***Wind Load Condition 2**: Very High: 95th-percentile wind gusts based on maximum daily values over the 30-year history. This corresponds to a probability of exceedance of 5 percent on an annual basis (i.e., 20-year return interval) and is intended to capture annual high winds observed in the region (e.g., Santa Ana winds).*
- ***Wind Load Condition 3**: Extreme: Wind gusts with a probability of exceedance of 5 percent over the three-year WMP cycle (i.e., 60-year return interval).*
- ***Wind Load Condition 4**: Credible Worst Case: Wind gusts with a probability of exceedance of 1 percent over the three-year WMP cycle (i.e., 300-year return interval).*

The data and/or models the electrical corporation uses to establish locally relevant wind gusts for these design conditions must be documented in accordance with the weather analysis requirements described in Appendix B.

***For weather conditions used in calculating fire behavior**, the electrical corporation must use probabilistic scenarios based on a 30-year history of fire weather. This approach must consider a range of wind speeds, directions, and fuel moistures that are representative of historic conditions. In addition, the electrical corporation must discuss how this weather history is adapted to align with current and forecasted climate conditions. The electrical corporation must consider the following two conditions:*

- ***Weather Condition 1**: Anticipated Conditions: The statistical weather analysis is limited to fire seasons expected to be the most relevant to the next three years of the WMP cycle.*
- ***Weather Condition 2**: Long-Term Conditions: The statistical weather analysis is representative of fire seasons covering the full 30-year history.*

The electrical corporation must state how it defines "fire weather" and "fire season" for the calculations of these probabilistic scenarios.

One possible approach to the statistical weather analysis for fire behavior is Monte- Carlo simulation of synthetic fire seasons in accordance with approaches presented by the United States Forest Service[96] [97]. However, the electrical corporation must justify the selection of locally relevant data for use in this approach (i.e., Remote Automated Weather Systems data or historic weather reanalysis must be locally

[96] M. A. Finney, I. C. Grenfell, C. W. McHugh, R. C. Seli, D. Trethewey, R. D. Stratton, and S. Brittain, 2011, "A Method for Ensemble Wildland Fire Simulation," *Environmental Modeling & Assessment* 16, no. 2: 153–167.

[97] M. A. Finney, C. W. McHugh, I. C. Grenfell, K. L. Riley, and K. C. Short, 2011, "A Simulation of Probabilistic Wildfire Risk Components for the Continental United States," *Stochastic Environmental Research and Risk Assessment* 25: 973–1000.

relevant). The data and/or models the electrical corporation uses to establish locally relevant weather data for these designs must be documented in accordance with the weather analysis requirements described in Appendix B: Supporting Documentation for Risk Methodology and Assessment.

***For vegetative conditions not including short-term moisture content**, the electrical corporation must use design scenarios including the current and forecasted vegetative type and coverage. The conditions it must consider include the following:*

- ***Vegetation Condition 1: Existing Fuel Load:** The wildfire hazard must be evaluated with the existing fuel load within the service territory, including existing burn scars and fuel treatments that reduce the near-term fire hazard.*
- ***Vegetation Condition 2: Short-Term Forecasted Fuel Load:** The wildfire hazard must be evaluated considering the changes in expected fuel load over the three-year Base WMP cycle (2023-2025). At a minimum, this must include regrowth of previously burned and treated areas.*
- ***Vegetation Condition 3: Long-Term Extreme Fuel Load:** The wildfire hazard must be evaluated considering the long-term potential changes in fuels throughout the service territory. This must include, at a minimum, regrowth of previously burned and treated areas and changes in predominant fuel types.*

The data and/or models the electrical corporation uses to establish locally relevant fuel loads for these designs must be documented in accordance with the vegetation requirements described in Appendix B: Supporting Documentation for Risk Methodology and Assessment.

The electrical corporation must provide a brief narrative on the design basis scenarios used in its risk analysis. If the electrical corporation includes additional design scenarios, it must describe these scenarios and their purpose in the analysis. In addition, the electrical corporation must provide a table summarizing the following information:

- *Identification of each design basis scenario (e.g., Scenario 1, Scenario 2)*
- *Components of each scenario (e.g., Weather Condition 1, Vegetation Condition 1)*
- *Purpose of each scenario*

Table 6-3 provides an example.

Overview: Design Basis Scenarios

SCE utilizes a design scenario that most closely reflects Wind Loading Condition 1, Wind Loading Condition 2, Weather Condition 2, Vegetation Condition 1, and Vegetation Condition 3 for mitigation planning purposes in its MARS and IWMS Risk Frameworks.

Table 6-3 - Summary of Design Basis Scenarios

Scenario ID	Design Scenarios (Components)	Purpose
WL1	Wind Loading Condition 1	Used in the MARS and IWMS Risk Frameworks.
WL2	Wind Loading Condition 2	
WC2	Weather Condition 2	
VC1	Vegetation Condition 1	
VC3	Vegetation Condition 3	

SCE notes that it uses scenarios that reflect Wind Loading Condition 2, Weather Condition 1, and Vegetation Condition 1 for the purpose of evaluating potential PSPS de-energization decisions. See Section 9.2 for additional detail.

WL1: Baseline

The baseline wind load condition the electrical corporation use in design, construction, and maintenance relative to GO 95, Rule 31.1.

SCE uses a combination of Wind Loading Condition 1 and Wind Loading Condition 2 in its design scenarios.

Following the 2011 San Gabriel Valley windstorm, SCE was directed by the CPUC to conduct a pole loading study to assess the likely wind conditions to comply with the relevant sections of ASCE/SEI 7-10 "Minimum Design Loads for Buildings and Other Structures" and California General Order (GO) 95 "Overhead Electric Line Construction."[98] These weather and wind conditions reflect the same 41 fire weather scenarios used in the construction of the CPUC HFTD maps.

The result of this study was a composite wind loading map for peak wind speeds, both with and without consideration of relative humidity and temperature, for wind velocities at 20-foot elevations (3 second gusts) based on a 50-year return interval (i.e., a 2% chance of occurrence per year). SCE uses this information in its design scenario.

WL2: Very High

95th-percentile wind gusts based on maximum daily values over the 30-year history. This corresponds to a probability of exceedance of 5 percent on an annual basis (i.e., 20-year return interval) and is intended to capture annual high winds observed in the region (e.g., Santa Ana winds).

[98] See I.14-03-004. Order Instituting Investigation on the Commission's Own Motion into the Operations and Practices of Southern California Edison Company Regarding the Acacia Avenue Triple Electrocution Incident in San Bernardino County and the Windstorm of 2011.

See above regarding Wind Load Condition 1. SCE's approach addresses the conditions outlined in WL2.

SCE notes that it uses scenarios that reflect Wind Loading Condition 2 for the purpose of evaluating potential PSPS de-energization decisions. See Section 9.2 for additional detail.

WL3: Extreme

Wind gusts with a probability of exceedance of 5 percent over the three-year WMP cycle (i.e., 60-year return interval).

SCE does not utilize Wind Loading Condition 3 because the composite wind loading map for peak wind speeds developed following the 2011 San Gabriel Windstorms represent reasonable weather scenarios

for the design, construction, and maintenance of SCE's equipment, as prescribed by GO 95. SCE currently does not see the utility of the WL3 scenario and thus SCE does not anticipate developing or utilizing this design scenario.

WL4: Credible Worst Case

Wind gusts with a probability of exceedance of 1 percent over the three-year WMP cycle (i.e., 300-year return interval).

SCE does not utilize Wind Loading Condition 4 because the composite wind loading map for peak wind speeds developed in 2011 already represents credible weather scenarios as prescribed by GO 95. Because of this, SCE does not anticipate utilizing this design scenario.

WC1: Anticipated Conditions

The statistical weather analysis is limited to fire seasons expected to be the most relevant to the next three years of the WMP cycle.

SCE does not use a short-term forward-looking weather scenario in its MARS and IWMS Risk Frameworks, as short-term weather trends (e.g., three years) are highly variable and contain a significant amount of uncertainty. Additionally, short term weather trends are generally not representative of the ensemble average of longer term (e.g., 10-30 year) climatological conditions. Because of this, SCE does not anticipate utilizing this design scenario.

SCE notes that it uses scenarios that reflect Weather Condition 1 for the purpose of evaluating potential PSPS de-energization decisions. See Section 9.2 for additional detail.

WC2: Long-Term Conditions

The statistical weather analysis is representative of fire seasons covering the full 30-year history.

SCE utilizes the deterministic maximum consequence values resulting from 444 historical weather scenarios reflecting fire weather conditions for SCE's service territory across 20 years of weather history developed by ADS and calibrated to SCE's service territory. These weather scenarios include the 41 weather scenarios used in the creation of the CPUCs HFTD maps, as well as additional locally relevant fuel and wind driven fire weather scenarios. These weather scenarios generally correspond to the definition for WC2.

At this point in time SCE does not plan to extend the weather history data set from 20 to 30 years, however we plan to add fire weather data to the existing data set over time.

VC1: Existing Fuel Load

The wildfire hazard must be evaluated with the existing fuel load within the service territory, including existing burn scars and fuel treatments that reduce the near-term fire hazard.

During the Review & Revise stage of the IWMS Risk Framework, SCE's team of SMEs considers existing fuels through photographs in its analysis. SCE's POI models also use elements of existing fuel load, specifically tree inventory. Vegetation type, density, location information, and burn scars are also considered in the fire simulations used to determine Wildfire Consequence.

Further, SCE's approach to asset inspections and vegetation management considers other shorter-term conditions (e.g., existing fuel conditions) for Areas of Concern (AOCs). See Sections 8.1.3.1, 8.1.3.2, 8.2.2.4, 8.2.1.3, and 8.2.3.8 for details.

SCE also notes that it uses scenarios that reflect Vegetation Condition 1 for the purpose of evaluating potential PSPS de-energization decisions. See Section 9.2 for additional detail.

VC2: Short-Term Forecasted Fuel Load

The wildfire hazard must be evaluated considering the changes in expected fuel load over the three-year Base WMP cycle (2023-2025). At a minimum, this must include regrowth of previously burned and treated areas.

SCE does not use Vegetation Condition 2, as a short-term horizon (i.e., the 2023-2025 WMP period) is typically not informative for mitigation prioritization and scoping. As noted above, SCE uses existing fuel load, and as described below, SCE uses long-term fuel load conditions for mitigation planning purposes.

VC3: Long-Term Extreme Fuel Load

The wildfire hazard must be evaluated considering the long-term potential changes in fuels throughout the service territory. This must include, at a minimum, regrowth of previously burned and treated areas and changes in predominant fuel types.

SCE uses a 2030 fuel layer which aligns with Vegetation Condition 3. The 2030 fuel layer reflects likely fuel conditions in the year 2030. While SCE does not believe these fuel conditions are extreme, per se, SCE does believe this fuel loading is reflective of long-term potential fuel regrowth in major fire scars (e.g., greater than 5,000 acres.).

6.3.2 Extreme-Event/High Uncertainty Scenarios

In this section, the electrical corporation must identify extreme-event/high-uncertainty scenarios that it considers in its risk analysis. These generally include the following types of scenarios:

- *Longer-term scenarios with higher uncertainty (e.g., climate change impacts, population migrations, extended drought)*
- *Multi-hazard scenarios (e.g., ignition from another source during a PSPS)*
- *High-consequence but low-likelihood ("Black Swan") events (e.g., acts of terrorism, 10,000-year weather)*

While the primary risk analysis is intended to be based on the design scenarios discussed in Section 6.3.1, the potential for high consequences from extreme events may provide additional insight into the mitigation prioritization described in Wildfire Mitigation Strategy Development Section 7.

The electrical corporation must provide a brief narrative on the extreme-event scenarios used in its risk analysis. The electrical corporation must describe these scenarios and their purpose in the analysis. In addition, the electrical corporation must provide a table summarizing the following information:

- *Identification of each extreme-event risk scenario (e.g., Scenario 1, Scenario 2)*
- *Components of each scenario (e.g., Weather Condition 1, Vegetation Condition 1)*
- *Purpose of the scenario*

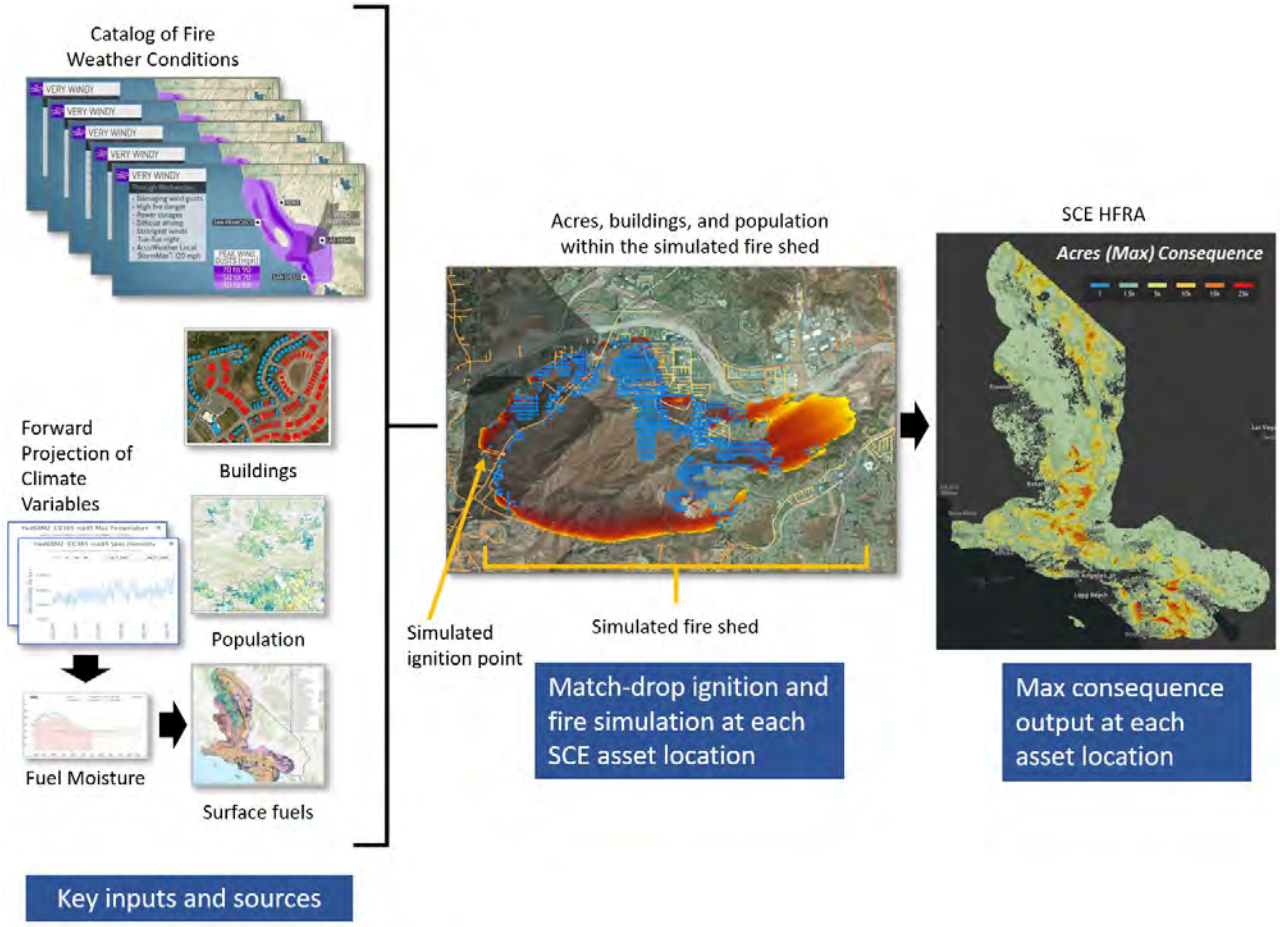
Table 6-4 provides a summary of the extreme-event scenario used by SCE for this purpose.

Overview: Extreme Event Scenarios

SCE has a single extreme event scenario (i.e., "Climate 2030") which is identified in Table 6-4 below and is described further immediately following the table. SCE also provides a diagram for the Climate 2030 scenario, which is discussed within the context of "Longer-Term Scenarios with Higher Uncertainty."

Per the WMP Guidelines, SCE also discusses its approach to "Multi-Hazard Scenarios" and "High-Consequence But Low-Likelihood Events". For reasons described below, at this time SCE does not have wildfire-specific scenarios in either of these two categories, and as such does not have related diagrams.

Table 6-4 - Summary of Extreme-Event Scenarios



Scenario ID	Extreme-Event Scenario/Components	Purpose
Climate 2030	Assess how climate change by 2030 could impact live and dead fuel moisture conditions.	Assess if climate change, as well as any resulting changes in wildfire consequence, may influence our existing grid hardening strategy.

Longer-Term Scenarios with Higher Uncertainty

Longer-term scenarios with higher uncertainty (e.g., climate change impacts, population migrations, extended drought)

SCE has developed, and in the process of performing the analysis, to assess how climate change by 2030 could impact live and dead fuel moisture conditions, which, in turn, may influence the spatial patterns of future wildfire (ignition) consequences.

Figure SCE 6-28 - Schematic for SCE Climate Change (2030) Methodology

The methodology aligns to the prescribed data sources outlined in the CPUC's Climate Change Proceeding (R.18-04-019),[99] including 10 priority CIMP5 Global Climate Models, which are the minimum prescribed by the CPUC in that proceeding. These are also the same data sources used in SCE's 2022 Climate Adaptation and Vulnerability Assessment (CAVA) report.

SCE's climate change methodology utilizes a different downscaling technique (e.g., Localized Constructed Analogs (LOCA)) and Global Climate Model (GCM) selection than that identified in the WMP guidelines. SCE has shared its methodology in Energy Safety wildfire risk modeling workshops. Additionally, SCE has participated in related Energy Safety sponsored workshops, specifically on how to better integrate academic feedback into climate change modeling.

Multi-Hazard Scenarios

Multi-hazard scenarios (e.g., ignition from another source during a PSPS)

SCE acknowledges that consideration of multi-hazard scenarios is appropriate from the perspective of enterprise risk management, emergency preparedness, and disaster planning. However, at this time SCE does not consider multi-hazard scenarios as an element of its wildfire and PSPS risk analysis.

Modeling such multi-hazard scenarios introduces a wide range of hypothetical possibilities that introduces significant uncertainty, can be speculative in nature, and do not provide a sufficient level of

[99] See https://www.cpuc.ca.gov/industries-and-topics/electrical-energy/climate-change

confidence on which to invest the significant financial resources that are needed for wildfire and PSPS mitigations.

For multi-hazard scenarios, as mentioned in Section 8.4.2, SCE maintains and updates an All Hazards plan and maintains an Incident Management Team (IMT) structure that serve as planning and response tools for these types of complex events.

SCE will evaluate whether multi-hazard scenario analysis may be beneficial for wildfire mitigation planning.

High-Consequence/Low-Likelihood Events

High-consequence but low-likelihood ("Black Swan") events (e.g., acts of terrorism, 10,000-year weather)

SCE's wildfire consequence modeling is currently based on 444 weather scenarios that include extreme scenarios representing a 1 in 50 year level of frequency. Furthermore, for the reasons described above in the response to multi-hazard scenarios, these types of scenarios can be an appropriate discussion for a utility's enterprise risk function but SCE does not consider "black swan" events such as 10,000 year weather or acts of terrorism as directly relevant to standard programmatic wildfire mitigation development and scoping.

SCE also notes the above comments about its all-hazards plan and IMT capabilities, which are intended to address scenarios such as extreme weather or hostile actions. Furthermore, SCE discussed both cyber and physical security in its 2022 RAMP filing (chapters 7 and 11, respectively).

6.4 Risk Analysis Results and Presentation

In this section of the WMP, the electrical corporation must present a high-level overview of the risks calculated using the approaches discussed in Section 6.2 for the scenarios discussed in Section 6.3.

The risk presentation must include the following:

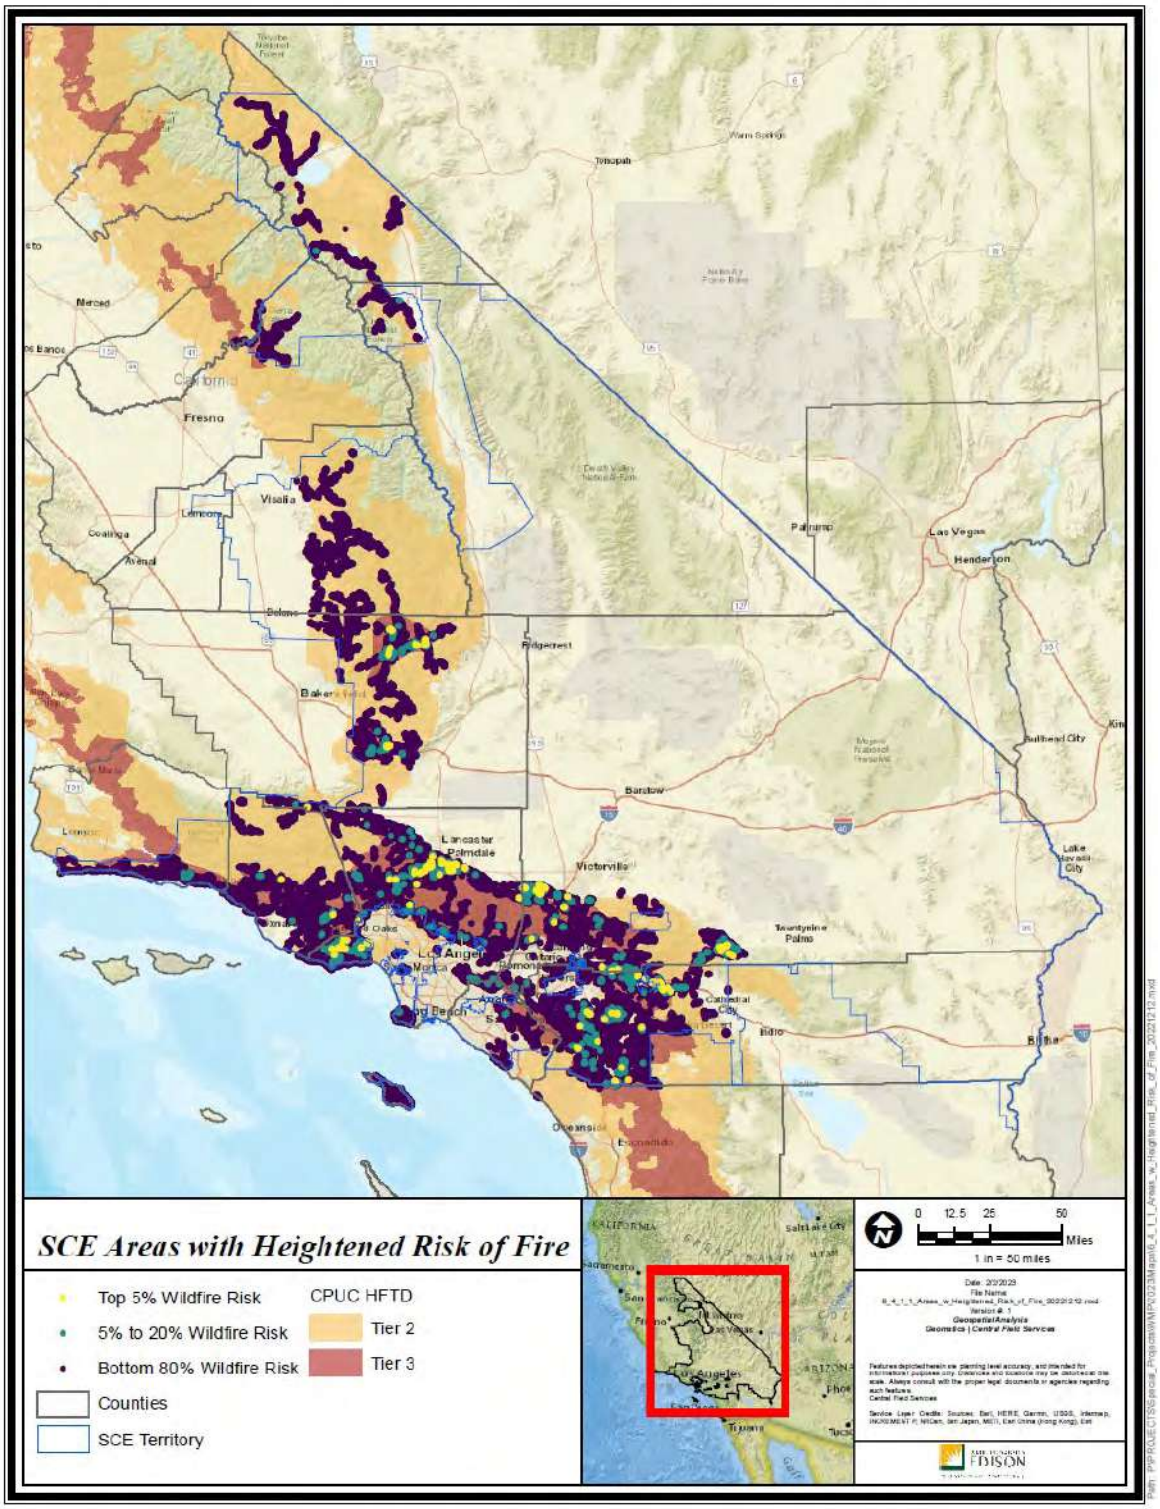
- *Summary of electrical corporation-identified high fire risk areas in the service territory*
- *Geospatial map of the top risk areas within the High Fire Risk Area (HFRA) (i.e., areas that the electrical corporation has deemed at high risk from wildfire independent of HFTD designation)*
- *Narrative discussion of proposed updates to the HFTD*
- *Tabular summary of top risk-contributing circuits across the service territory*
- *Tabular summary of key metrics across the service territory*

The following subsections expand on the requirements for each of these.

6.4.1 Top Risk Areas Within the HFRA

In this section, the electrical corporation must identify top risk areas within its self-identified HFRA, compare these areas to the CPUC's current HFTD, and discuss how it plans to submit its proposed changes to the CPUC for review.

6.4.1.1 Geospatial Maps of Top-Risk Areas within the HFRA



The electrical corporation must evaluate the outputs from its risk modeling to identify top risk areas within its HFRA (independent of where they fall with respect to the HFTD). The electrical corporation must provide geospatial maps of these areas.

The maps must fulfill the following requirements:

- ***Risk levels:** Levels must be selected to show at least three distinct levels, with the values based on the following:*
    - *Top 5 percent of overall utility risk values in the HFRA*
    - *Top 5 to 20 percent of overall utility risk values in the HFRA*
    - *Bottom 80 percent of overall utility risk values in the HFRA*
- ***Colormap:** The colormap of the risk levels must meet accessibility requirements (recommended colormap is Viridis)*
- ***County lines:** The map must include county lines as a geospatial reference*
- ***HFTD tiers:** The map must show a comparison with existing HFTD Tiers 2 and 3 regions.*

Figure SCE 6-29 shows the top-risk areas within HFTD.

Figure SCE 6-29 - Geospatial Maps of Top-Risk Areas within the HFTD[100]

6.4.1.2 Proposed Updates to the HFTD

In this section, the electrical corporation must discuss the differences between the electrical corporation-identified top-risk areas within the HFRA and the existing CPUC-approved HFTD. The electrical

[100] Risk data as of 1/1/23 calculated with the MARS Framework.

corporation must identify areas that its risk analysis indicates are at a higher risk than indicated in the current HFTD. The electrical corporation must also describe its process for submitting proposed changes to the HFTD to the CPUC, if such changes are desired; the electrical corporation need not conclude that the HFTD should be modified. Any proposed changes to the HFTD must be mapped in accordance with the requirements in the previous sub- section.

In 2019, SCE's Petition for Modification (PFM) to the CPUC resulted in a final decision D.20-12-030 (issued 12/21/2020) in Rulemaking 15.05.006 which formally adopted the remaining less than 1% of our non-CPUC HFRA into their Tier 2 and Tier 3 areas. At the time of this filing, all of SCE's HFRA[101] is now consistent with the CPUC HFTD maps. SCE will continue to review the HFTD boundaries each year per the AB 1054 requirements.

SCE has developed advanced analytical techniques using satellite image change detection and other processes to broadly detect and characterize changes in land use and land cover. These technical advances are utilized by a team of subject matter experts in fire science, enterprise risk management, grid operations, vegetation management, and fire management to consider potential removals or additions to HFRA.

- The primary inputs to SCE's HFRA Boundary Assessment process are outlined at a high level below.
- LandFire 2016 updated with additional classifiers from Technosylva to better represent urban fuel, as well as a projection of fuel growth in major fire scars from previous fire seasons with a fuel regrowth projection to 2030. Please see 2025 WMP for current information on fuel models.
- Wildland-Urban Interface (WUI) information from Silvis Labs, which may be further augmented with information from CAL FIRE.
- Historical wildfires from CAL FIRE's Fire Resource Assessment Program (FRAP); U.S. Forest Service Wildfire Burn Probability layer; and SCE internal wildfire consequence simulations, including wildfire hazard intensity metrics (e.g., flame length).

SCE's HFRA Boundary Assessment process is outlined at a high level below.

- Condense land use land cover information to identify locations with moderate to highly burnable fuels based on fuel loading conditions (e.g., grass, grass-shrubs, timber, and slash-blowdown).
- Identify locations with highly urbanized landcover with the assistance of WUI information from Silvis Labs to represent the boundary where highly combustible landcover meets urban landcover (e.g., WUI Interface/Intermix).
- Where overhead assets are present along this WUI boundary, create/add a 600-ft buffer from that interface into urbanized landcover. The 600-foot buffer is used as a conservative measure to address possible ignition fusing and facility failure which may occur along the immediate WUI boundary and could result in a small fire that may, under certain conditions, ignite more

[101] SCE uses a 200-foot buffer extended from the HFTD to account for possible internal mapping discrepancies of assets.

abundant and contiguous fuels nearby. As part of this new boundary assessment methodology, SCE does not prescribe a buffer along the WUI interface boundary when only underground assets are present.

- SCE also uses historical wildfire information from (e.g., CAL FIRE's FRAP data), as well as the U.S. Forest Service (USFS) Wildfire Burn Probability (FRC4) and SCE internal wildfire consequence modeling, including Wildfire Hazard Intensity (FRC5) metrics (e.g., flame length) to assess Wildfire Exposure (see Section 6.2.1).
- SCE pressure tests all recommended locations with internal teams and experts in fire science, wildfire operations, emergency and grid operations, risk management, vegetation management, and others.

Once SCE has completed its analysis and obtained agreement of CAL FIRE, SCE will begin the process to seek approval by the CPUC to modify the HFTD, which is described in general terms below.

1. SCE submits a Petition for Modification (PFM) to the CPUC that includes:
    a. Details and reason for change for all polygons recommended.
    b. ArcGIS file/layer with recommended polygon changes.
    c. High-level analysis focused on possible customer impacts.
2. CPUC reviews the PFM and requests additional information and/or provides approval, rejection, or adjustments to the recommended modifications.
3. SCE will review the CPUC feedback and finalize the PFM to the agreed upon modifications.
4. CPUC will review the final PFM and provide SCE approval of the final modifications.

After SCE receives the CPUC approval, SCE will begin implementation of mapping changes, operational updates, enterprise system updates, and communications to affected stakeholders.

While SCE does not currently plan to propose boundary changes, SCE evaluates its boundary on a regular basis and looks forward to working with stakeholders and agencies including Energy Safety, the CPUC, and CAL FIRE, to formalize any new proposed modifications.

Additionally, SCE continues to collaborate with neighboring Investor-Owned Utilities (IOUs) to share best practices, including remote sensing techniques. If SCE deems it appropriate, we may enact mitigation activities in these identified locations, while those proposed modifications are under review through the CPUC process. SCE notes that it has consulted with CAL FIRE several times and has received positive feedback on our approach.

Applicable fire-safety regulations adopted in R.08-11-005 that rely on the HFTD maps include:

- GO 95, Rule 18A, which requires electric utilities to place a high priority on the correction of significant fire hazards.
- GO 95, Rules 31.2, 80.1A, and 90.1B, which set the minimum frequency for inspections of aerial communication facilities located in close proximity to power lines.

- GO 95, Rule 35, Table 1, Case 14, which requires increased radial clearances between bare-line conductors and vegetation in high fire-threat areas of Southern California.
- GO 95, Appendix E, which authorizes increased time-of-trim clearances between bare-line conductors and vegetation.
- GO 165, Appendix A, Table 1, which requires more frequent patrol inspections of overhead powerline facilities.
- GO 166, Standard 1.E., which requires each electric utility to develop and submit a plan to reduce the risk of fire ignitions by overhead facilities in high fire-threat areas during extreme fire-weather events.

6.4.2 Top Risk-Contributing Circuits/Segments/Spans

The electrical corporation must provide a summary table showing the highest-risk circuits, segments, or spans[102] within its service territory. The table should include the following information about each circuit:

- ***Circuit, Segment, or Span ID:*** *Unique identifier for the circuit, segment, or span*
- ***Overall utility risk scores:*** *Numerical value for each risk*
- ***Top risk contributors:*** *The risk components that lead to the high risk on the circuit*

The electrical corporation must rank its circuits, segments, or spans by circuit-mile-weighted overall utility risk score and identify each circuit, segment, or span that significantly contributes to risk. A circuit/segment/span significantly contributes to risk if it:

1. *Individually contributes more than 1 percent of the total overall utility risk; or*
2. *Is in the top 5 percent of highest risk circuits/segments/spans when all circuits/segments/spans are ranked individually from highest to lowest risk.*

The electrical corporation must include each circuit, segment, or span that significantly contributes to risk in the table below.[103]

[102] For the section, the electrical corporation may use either circuits, segments, or spans, whichever is more appropriate considering the granularity of its risk model(s).

[103] This table is a summary of information provided in the QDR. As such, information included in this table must align with the QDR.

Table 6-5 - Summary of Top-Risk Circuits[104]

Risk Ranking	Circuits	Overall Utility Risk Score	Ignition Risk Score	PSPS Risk Score	Top Risk Contributors
1	CRAWFORD	0.1944	0.1941	0.0003	EFF, CFO Other
2	LOUCKS	0.1773	0.1773	0.0000	CFO Other, EFF

48	BERKSHIRE	0.0638	0.0638	0.0000	CFO Other, EFF

Note: Once populated, if this table is longer than two pages, the electrical corporation must append the table.

6.4.3 Other Key Metrics

The electrical corporation must calculate, track, and present on several other key metrics of risk across its service territory. These include, but are not limited to the frequency of:

- ***High Fire Potential Index (FPI):*** *The electrical corporation must specify whether it calculates its own FPI or uses an external source, such as the United States Geological Survey.*
- ***Red Flag Warning (RFW)***
- ***High Wind Warning (HWW)***

For each metric, the frequency of its occurrence within each HFTD tier and the HFRA must be reported in the table below. The metric must be reported in number of overhead circuit mile (OCM) days of occurrence normalized by circuit miles within that area type. For example, consider an electrical corporation with 1,000 OCM in HFTD Tier 3. If 100 of these OCM are under a RFW for one day, and 10 of those OCM are under a RFW for an additional day, then the average RFW-OCM per OCM would be:

$$\frac{RFW\_OCM}{OCM} = \frac{(100 \times 1 + 10 \times 1)}{1000} = 0.1$$

This metric represents the average RFW-OCM experienced by an OCM within the electrical corporation's service territory within HFTD Tier 3. If the metric is continuous (such as FPI), the report should include a note stating the threshold used to select high values. Table 6-6 provides a template for reporting the required information.

SCE provides the required information in Table 6-6 below.

Table 6-6 - Summary of Key Metrics by Statistical Frequency

Metric	Non-HFTD	HFTD Tier 2	HFTD Tier 3	Non-HFRA	HFRA
FPI-OCM/ OCM	0.21	7.99	2.66	0.21	4.91
RFW-OCM/ OCM	0.41	0.63	1.73	0.41	1.27
HWW-OCM/ OCM	1.57	2.71	4.29	1.57	3.62

Below SCE provides an explanation of how it calculated these values.

High Fire Potential Index (FPI)

The electrical corporation must specify whether it calculates its own FPI or uses an external source, such as the United States Geological Survey.[105]

[105] United States Geological Survey Fire Danger Map and Data Products Web Page (accessed Oct. 27, 2022): https://firedanger.cr.usgs.gov/viewer/index.html.

SCE calculates its Fire Potential Index (FPI) by using weather and fuel (vegetation) conditions which include sustained wind speed, dew point depression (dryness of the air), the state of green-up or curing of the annual grasses, live fuel moisture, and dead fuel moisture. The FPI also considers fuel loading, which is the amount of vegetation on the ground. Calculations were based on circuit-level forecast data of FPI for 2022. For additional detail on SCE's FPI calculation, please see Section 8.3.6.

Red Flag Warning (RFW)

Red Flag Warning (RFW) circuit-mile days are based on all overhead (OH) distribution and transmission circuits that traverse through National Weather Service (NWS) Fire Weather Zones (FWZ) from the historical database of RFW events from the NWS in the Iowa State University archive of NWS watch/warnings.

The OH lengths of distribution and transmission circuits are calculated within each FWZ polygon (the FWZ is divided geospatially into over approximately 1,000 polygons) and are then multiplied by the number of days (or fraction of days) that a particular polygon had an RFW in effect.

The annual circuit mile days are calculated by summing all circuit mile days for all FWZ that occurred within the calendar year. To determine if a circuit mile is under an RFW warning, SCE intersects the OH distribution and transmission circuits with the RFW FWZ polygons to define circuits or portions of circuits within RFW.

High Wind Warning (HWW)

High Wind Warning (HWW) circuit-mile days are based on all OH distribution and transmission circuits that traverse through the NWS Wind Weather Zone (WWZ) from the NWS and a historical database of HWW events from the NWS in the Iowa State University archive of NWS watch/warnings.

The OH lengths of distribution and transmission circuits are calculated within each WWZ polygon (the WWZ is divided geospatially into approximately 200 polygons) and are then multiplied by the number of days (or fraction of days) that a particular polygon had an HWW in effect. The annual circuit mile days are calculated by totaling all circuit mile days for all WWZ that occurred within the calendar year.

To determine if a circuit mile is under an HWW warning, SCE intersects the OH distribution and transmission circuits with the HWW WWZ polygons to define circuits/portions of circuits within HWW.

6.5 Enterprise System for Risk Assessment

In this section, the electrical corporation must provide an overview of inputs to, operation of, and support for a centralized wildfire and PSPS risk assessment enterprise system. This overview must include discussion of:

- *The electrical corporation's database(s) used for storage of risk assessment data.*
- *The electrical corporation's internal documentation of its database(s).*
- *Integration with systems in other lines of business.*
- *The internal procedures for updating the enterprise system including database(s).*
- *Any changes to the initiative since the last WMP submission and a brief explanation as to why those changes were made. Include any planned improvements or updates to the initiative and the timeline for implementation.*

Overview

SCE provides an overview of its enterprise databases in the sections below.

In Section 6.5.1, SCE provides a description of the three primary enterprise databases for input data in its risk models: SAP, SAS, and GE Smallworld (GESW)/Map 3D.

In Section 6.5.2, SCE describes the various documentation it maintains of the systems. Documentation may vary depending on the use of the system.

In Section 6.5.3, SCE explains that SAP, SAS, and GESW/Map 3D are enterprise-wide databases that are used across SCE and integrated with other lines of businesses.

In Section 6.5.4, SCE discusses its procedures for updating its enterprise databases, which aligns SCE needs along with availability and software provider recommendations.

In Section 6.5.5, SCE provides an overview of major changes to its enterprise systems since its last WMP submission.

6.5.1 Database(s) Used for Storage of Its Risk Assessment Data

SCE uses three primary enterprise databases for input data in its risk models:

- SAP Enterprise Asset Management (SAP EAM)
- SAS
- GE Smallworld (GESW)/Map 3D

These databases are used across the enterprise for various system reporting and analytics, in support of both wildfire and non-wildfire activities. Further detail is provided below.

SAP Enterprise Asset Management (SAP EAM)

SAP EAM maintains information about SCE's physical assets, such as Functional Location (FLOC), equipment type, age, manufacturer, and other characteristics utilized in predictive models and other analytical assessments.

SAS

Various dataset and databases are stored and maintained in SAS to enable enterprise usage of data via structured tables and data queries allowing for advanced analytics and visualizations.

SAS datasets and databases include:

- The Wire Down Database (WDD) reports and tracks wire-down events based on wire-down calls and repair orders across the entire SCE service area.
- The Outage Data Reporting Management System (ODRMS) reports information regarding unplanned outages that affect a single line transformer or more on SCE's grid.

SCE stores its machine learning algorithms, including POI information, within SAS and secure GitHub platforms SharePoint Sites.

In addition, SCE's asset risk model prediction results, as well as some Technosylva consequence information, are housed in SAS tables.

GESW/Map 3D

MAP 3D maintains geographically accurate digital mapping of physical assets at structure locations. GESW is a geo-schematically accurate database that maps the connectivity of linear assets, specifically between structures with equipment to another structure with equipment (i.e., segment data).

Additional Information

Other databases provide input data, such as weather and wind data from SCE weather services (see Section 8.3.5.5), ignition events from the Fire Incident Preliminary Analysis (FIPA) database (See Section 11) and vegetation management information from SCE's Arbora platform (see Section 8.2.4).

SCE is in the process of developing a scalable, cloud-based, and geospatially enabled centralized repository for wildfire information. The Wildfire Safety Data Mart and Portal (WiSDM) is intended to consolidate and harmonize information from disparate datasets into a single common platform. Please see Section 8.1.5 for further information, including changes to the WiSDM system since the 2022 WMP, why those changes were made, and SCE's plans and timelines for the next phase of this enterprise system.

Finally, please see Section 8.1.5 for discussion of databases and enterprise systems related to asset inspections management.

6.5.2 Documentation of Its database(s)

SAP EAM, SAS, and GESW/Map 3D are enterprise-wide systems that are used across SCE. Depending on the use of the systems, operational units may develop and maintain documentation and procedures for their specific use of these systems.

SCE also keeps system documentation of these databases. Below is a description of the documentation SCE maintains for the systems discussed.

SAP EAM

SCE maintains operational procedures for SAP EAM, which also includes the scope of this database. In addition, SCE maintains a system source guide, the functional design specifications, technical design specification, and landscape diagram of SAP EAM.

SAS

SCE maintains an internal job aids and runbooks, that are updated monthly to capture changes to the database. In addition, SCE manages internal documentation of any hot fixes, upgrades, or any patches for the SAS platform.

GESW/Map 3D

SCE also maintains a run book for GESW/Map 3D. In addition, SCE maintains documentation of patches applied, release history, record of upgrades and fixes applied to the database.

SCE also maintains procedures on how asset data is inputted into and revised in SAP EAM, SAS and GESW/Map 3D.

6.5.3 Integration with Systems In Other Lines of Business

As indicated above, the databases SCE uses for input data in its risk models is used across SCE for various wildfire and non-wildfire purposes and integrated with other applications based on data needs and work activity needs. For example, SAP EAM is integrated with asset work orders and customer service applications. In addition, Map3D receives structure and FLOC data from SAP that is updated daily, and receives data for conductors, circuits and multiple device types from GESW.

6.5.4 Internal Procedures for Updating the Enterprise System Including Database(s)

The databases SCE uses for its risk models are used across the enterprise for various purposes, both wildfire and non-wildfire. System updates typically based on SCE needs along with availability and software provider recommendations.

SCE maintains internal procedures on how asset data within SAP EAM, SAS, GESW/Map 3D are updated. Asset data is updated when a change is made to the electrical infrastructure system or when a discrepancy is found between the field and SCE's databases.

6.5.5 Any Changes to the Initiative Since the Last WMP Submission

SCE continues to use the three primary enterprise databases for input data in its risk models. Since SCE's last WMP submission, SCE has updated SAS from v7.1 to v8.3. SAS v8.3 was redesigned to include a modern and flexible user interface that provides a more flexible space to write programs, build process flows, as well as access and browse data.

Since the last WMP submission, SCE has enhanced its POI model to include FIPA ignitions into its calibration process. Previously, SCE only used CPUC reportable ignitions as part of its calibration of probability of ignitions to forecast ignition frequencies. Including FIPA ignitions, which captures ignitions beyond just CPUC reportable ignitions, along with separating between primary and secondary ignitions, allows for more granular forecasts and application of POI to specific ignition events.

For changes related to the databases and systems associated with inspections, vegetation management, weather services, and the WiSDM portal, please see Sections 8.1.5, 8.2.4, 8.3.5.5, and 8.1.5 respectively.

6.6 Quality Assurance and Control

The electrical corporation must document the procedures it uses to confirm that the data collected and processed for its risk assessment are accurate and comprehensive. This includes but is not limited to model, sensor, inspection, and risk event data used as part of the electrical corporation's WMP program. In this section of the WMP, the electrical corporation must describe the following:

- ***Independent review:*** *Role of independent third-party review in the data and model quality assurance*
- ***Model controls, design, and review:*** *Overview of the quality controls in place on electrical corporation risk models and sub-models*

6.6.1 Independent Review

The electrical corporation must report on its procedures for independent review of data collected (e.g., through sensors or inspections) and generated (e.g., through risk models and software) to support decision making. In this section of the WMP, the electrical corporation must provide the following:

- ***Independent reviews:*** *The electrical corporation's procedures for conducting independent reviews of data collection and risk models.*
- ***Additional review triggers:*** *The electrical corporation's internal procedures to identify when a third-party review is required beyond the routinely scheduled reviews.*
- ***Results, recommendations, and disposition:*** *The results and recommendations from the electrical corporation's most recent independent review of its data collection and risk models. This includes the electrical corporation's disposition of each comment.*
- ***Routine review schedule:*** *The electrical corporation's routine review schedule.*

The electrical corporation must enter each accepted recommendation from independent review into its action tracking system for resolution (assignment of responsibility, development of technical plan, schedule for development and deployment, etc.) in accordance with the requirements discussed in Section 11.

Independent Reviews

In 2022, SCE engaged a third-party independent evaluator to review its RSE development process for the 2023 WMP and the accuracy of its RSE. In addition, SCE engaged a third-party consultant to review its existing technical documentation of its risk models and develop standardized templates for technical and process documentation of its risk models. Please see Appendix D: Areas for Continued Improvement for further details (Areas for Continued Improvement # SCE-22-22 Third Party Confirmation of RSE Estimates).

Although SCE does not currently conduct external third-party independent reviews of data collected and risk models, SCE has an internal review process for its collected data and risk models.

Data Collection Review Activities

SCE has an extensive inspection program that is described in Section 8.1.3. Results from these inspections are validated and integrated into SCE's risk models in several ways. If the inspection identifies a discrepancy between what is observed in the field and what is recorded in SCE's databases (primarily SAP), SCE will update the information. Repairs and remediations that result from inspections are also integrated into SCE's asset database, and depending on the nature of the data, may be used in calculations such as POI. SCE's QA/QC programs, described in Section 8.1.6, provide assurance on the quality of the inspections themselves.

As discussed in Section 11, SCE analyzes ignitions through its Fire Investigation Preliminary Assessment (FIPA) program. Data and results from these analyses are used as both a data source for modeling and for trend analyses. The FIPA process supports data quality standards through applying consistent methodology and classifications to improve SCE's ability to use ignition data for wildfire risk analysis.

Data Input Review Activities

To prepare and organize its data for its risk models, SCE uses a combination of automated and manual checks of its data. SCE uses automated scripts to validate that unique data are not duplicative, data does not have nonstandard values, and checks for excessive null values. SCE also performs manual validation of the data set by comparing the current data set to previous data sets to check for discrepancies, using a Sankey diagram[106] to display the data flows, and appending data from alternative sources if data is missing.

Validation of Risk Models for Transmission Assets

In 2022, SCE began developing a more formalized validation process of its risk models for transmission using field input. The validation compared assets that SCE risk model identified as risky against assets identified as risky by the Transmission Senior Patrolman. Any variance between the two assessments were further analyzed for the cause of the difference in result and update its data or risk model as needed.

Another avenue to facilitate risk model validation is included in the Transmission survey that is completed during the high-fire risk informed (HFRI) detailed inspection. SCE includes a set of questions to allow the inspector to provide information if they support or disagree with the riskiness of the asset being inspected. This feedback is available to SCE to review and assess if an update to the risk models are needed. Starting in 2023, SCE will include a similar set of risk assessment questions in the Distribution HFRI detailed inspection survey form to allow the inspectors to provide feedback.

Asset Risk Governance Working Team

SCE's Asset Risk Governance Working Team (ARGWT) provides oversight on risk identification, quantification, and mitigation of risk models. As issues requiring asset risk management arise, the working team identifies helps to organize an initiative team which may include subject matter experts from across SCE.

The ARGWT working team is responsible for evaluating issues related to asset risks. This team is expected to study issues, considering all stakeholders internal and external, and to make recommendations to the sponsor team. The recommendations of the working team consider the specific safety, reliability, and financial impacts of each risk model as appropriate to the relevant risk.

Additional Review Triggers

SCE's internal Enterprise Risk Management team provides oversight responsibility for risk modeling more broadly. ERM is responsible for ensuring the ARGWT is providing recommendations to the sponsor team that are consistent and defendable, while using risk-based analysis where appropriate and practical.

ERM, along with SCE's Audit Service Department (ASD), provides recommendations to the ARGWT as to when additional third-party review is warranted. These recommendations may be based on the technical complexity of the subject matter or at the request of SCE management or other external stakeholders. Generally, given that the intent of these third-party reviews is to foster model improvement, the results of these reviews are kept confidential until their recommendations can be

[106] A Sankey diagram is a visualization tool that shows how data or variables flow between sources or databases.

reviewed and implemented.

Results, Recommendations, and Disposition

SCE discusses the results and recommendations of the third-party independent evaluator's review of its RSE results in ACI SCE-22-22 Third Party Confirmation of RSE Estimates in Appendix D: Areas for Continued Improvement.

After SCE's third-party consultant reviewed its technical documentation for its risk models, the third-party consultant provided feedback on compliance with OEIS guidelines and new standardized documentation templates in alignment with OEIS guidelines, which includes model specification, sensitivity testing, benchmarking and data and input quality. These templates are used to support detailed documentation in Appendix B: Supporting Documentation for Risk Methodology and Assessment. Going forward, SCE will use these documentation templates for its risk models, including modelling, validation, and processes.

Routine Review Schedule

SCE currently does not have a routine third-party review schedule. SCE plans to develop criteria for an external third-party review of the Wildfire models. See Section 6.7.2.3 for additional details.

6.6.2 Model Controls, Design, and Review

An electrical corporation's risk modeling approaches are complex, with several layers of interaction between models and sub-models. If these models are designed as a single unit, it can be difficult to evaluate the propagation of small changes in assumptions or inputs through the models. The requirements in this section are designed to facilitate the review of models by the stakeholders and Energy Safety, and to allow for more comprehensive retrospective analysis of failures in the system.

The electrical corporations must report on its risk modeling software's model controls, design, and review in the following areas:

- ***Modularization**: The electrical corporation must report on the degree to which its software architecture is sufficiently modular to track and control changes and enhancements over time. At a minimum, the electrical corporation must report if it has separate modules to evaluate each of the following:*
    - *Weather analysis*
    - *Fire behavior analysis*
    - *Seasonal vegetation analysis*
    - *Equipment failure*
    - *Exposure and vulnerability analysis*
- ***Reanalysis**: The electrical corporation must describe its capability to provide the results of its risk model based on the operational version of the software (including code and data) on a specific historic day.*

- ***Version control****: The electrical corporation must report on how it conforms to industry standard practices in version controlling its risk model and sub-models. At a minimum, the electrical corporation is expected to report on:*
    - *Models and software version controls aligned with industry standard programs, procedures, and protocols*
    - *Version control of model input data, including geospatial data layers*
    - *Procedures for updating technical, verification, and validation documentation.*

Modularization

SCE's models are designed to be modular so that SCE can track and change inputs within the model. Table SCE 6-05 provides a summary of which models contain separate modules for the attributes identified.

Table SCE 6-05 - Risk Models Containing Separate Modules

	Probability of Ignition	**Wildfire Consequence (Technosylva)**
Weather Analysis	No. Weather variables are not contained in a separate module for this model. Weather variables are attributes within the machine learning model.	Yes. Weather scenarios is modular in this model.
Fire Behavior Analysis	Not applicable, this model does not analyze or consider this element.	Yes. Fire Behavior Analysis is modular in this model.
Seasonal Vegetation Analysis	No. Vegetation variables are not contained in a separate module, they are attributes within the model.	Yes. Vegetation (i.e., fuel and fuel moisture) is modular in this model.
Equipment Failure	No. Equipment variables are not contained in a separate module for this model. They are attributes within the machine learning model.	Not applicable, this model does not analyze or consider this element.
Exposure and Vulnerability Analysis	Not applicable, this model does not analyze or consider this element.	Yes. HFRA (exposure) and AFN/NRCI (vulnerability) are separate components of this model

Reanalysis

SCE updates its risk analysis annually and can provide previous yearly scenario runs as needed. Iterations of the risk model are reanalyzed with each refresh of the likelihood or consequence models as data becomes available. Outputs of these models are archived by date but are not intended to produce POI risk estimates for a specific historic date. The Wildfire Consequence model and IWMS analysis is limited to the 444 weather scenarios within the current model.

Version Control

Table SCE 6-06 - Version Control

Models and software version controls aligned with industry standard programs, procedures, and protocols	
Probability of Ignition	Yes. SCE maintains documentation and model information changes as new assets and features are updated in the model. Code commentary is updated as versions are changed.
Wildfire Consequence	Yes. SCE's vendor maintains documentation and model information consistent with Energy Safety's guidelines.
Version control of model input data, including geospatial data layers	
Probability of Ignition	Yes. SCE reassesses and maintains POI models on an annual basis.
Wildfire Consequence	Yes. SCE reassesses and maintains wildfire consequence models on an annual basis.
Procedures for updating technical, verification, and validation documentation	
Probability of Ignition	SCE maintains documentation detailing changes, enhancements, and improvements made to our POI model. SCE is in the process of updating its documentation and is evaluating various standards to utilize to further refine and standardize our documentation.
Wildfire Consequence	Yes. SCE's vendor maintains this information consistent with industry standard practice.

6.7 Risk Assessment Improvement Plan

A key objective of the WMP review process is to drive year-over-year continuous improvement. In this section, the electrical corporation must provide a high-level overview of its plan to improve both programmatic and technical aspects of its risk assessment in at least four key areas:

- ***Risk assessment methodology:*** *Wildfire and PSPS risk assessment methodology and its documentation, including both quantitative and qualitative approaches*
- ***Design basis:*** *Justification of design basis scenarios used to evaluate the risk and its documentation*
- ***Risk presentation:*** *Presentation of risk to stakeholders, including dashboards and statistical assessments*
- ***Risk event tracking:*** *Tracking and reconstruction of risk events and integration of lessons learned*

6.7.1 Overview

SCE discusses how its risk assessment improvement plan will address the four key areas below. SCE provides further details of its risk improvement plan in Section 6.7.2.

Risk Assessment Methodology

SCE has three planned improvements for SCE's risk assessment methodology. SCE plans to further improve its Wildfire Consequence model, POI model, and establish an independent review program for its wildfire risk assessment models.

Design Basis

SCE plans to evaluate potential improvements and approaches to wind scenario modeling based on updated weather data which would be used in the engineering and design of SCE's infrastructure. See Section 6.7.2.4 for SCE's discussion of this planned improvement.

Risk Presentation

SCE plans to increase automation for its process to validate risk assessment data and to develop data visualization dashboard of model outputs so that SCE can further improve its QC methods. This will also include further documentation of datasets and sources. See Section 6.7.2.5 for SCE's discussion of this planned improvement.

Risk Event Tracking

SCE plans to use planned improvements to its FIPA database to improve its risk calculations by reflecting a larger range of historical events in forecasts. See Section 6.7.2.6 for SCE's discussion of this planned improvement.

The overview must consist of the following information, in tabulated format:

- ***Key area:*** *One of the four key areas identified above*
- ***Title of proposed improvement:*** *Brief heading or subject of the improvement*
- ***Type of improvement:*** *Technical or programmatic*
- ***Anticipated benefit:*** *Summary of anticipated benefit and any other impacts of the proposed improvement*
- ***Timeframe and key milestones:*** *Total timeframe for undertaking the proposed improvement and any key milestones*

Table 6-7 provides an example of the minimum acceptable level of information.

Table 6-7 - Utility Risk Assessment Improvement Plan

Key Risk Assessment Area	**Problem Statement**	**Proposed Improvement**	**Type of Improvement** (technical and/or programmatic)	**Expected Value Add/Anticipated Benefit**	**Timeframe and Key Milestones**
Risk Assessment Methodology	SCE seeks continuous improvement in the Wildfire Consequence model.	Transition from version 6.0 to 7.1 risk model	Technical	Updated fuel layer; updated fire propagation algorithm in timber fuel types; updated ignition point spacing.	SCE will incorporate changes in mid-2023.
Risk Assessment Methodology	SCE does not have a predictive model specific to secondary conductor.	Develop and evaluate an additional predictive model for secondary conductor to have more granular data	Technical	Increased granularity in outage and ignition calibration for primary versus secondary	Q2 2023 to evaluate applicability of Secondary Model to mitigation strategies to address secondary ignition subdrivers in POI model.

Key Risk Assessment Area	**Problem Statement**	**Proposed Improvement**	**Type of Improvement** (technical and/or programmatic)	**Expected Value Add/Anticipated Benefit**	**Timeframe and Key Milestones**
		for equipment related failures for secondary conductor that contribute to POI subdrivers.		conductor will improve model prediction and more accurately apply mitigations and risk calculations.	
Risk Assessment Methodology	SCE does not currently have an established independent review program.	Develop a strategy and roadmap to develop a systematic approach for an independent external third-party review.	Technical and Programmatic	Improve confidence in methods and alignment with industry practice.	End of 2023: SCE will develop criteria for an external third-party review of the Wildfire models and initiate a Request for Proposal (RFP) to hire an appropriate party for the validation. End of 2024: Wildfire models validated by an external third-party.
Design Basis	SCE will evaluate potential improvements and approaches to wind scenario modeling based on updated wind data.	Wind data will be used to update pole loading specifications. These pole loading data will be used to inform design scenarios.	Technical	Potential to improve wind modeling and associated downstream design scenarios to up to date information.	Anticipate Q4 2023 to update weather data, and Q4 2025 to process information with selected vendor.
Risk Presentation	Increase automation in QC processes for data used in risk analysis.	To advance its QC methods for data used in risk modelling, SCE's data engineers will streamline data, automate QC processes and develop data visualization dashboards.	Technical	Automated QC'd datasets may enable future automation of model refreshes, and technical documentation of datasets and sources	SCE will incorporate data visualization dashboards of model outputs in Q4 2023. Detailed technical documentation of SCEs risk models will be completed by Q4 2023.
Risk Event Tracking	SCE seeks to use a larger data set of ignitions to further increase robustness of ignition likelihood calculations.	In 2022, SCE began calibrating its ignition frequency forecast with all SCE identified ignitions tracked in its FIPA database, as opposed to just CPUC reportable ignitions. SCE is planning FIPA database improvements in 2023 to improve data collection and	Technical and Programmatic	As SCE's FIPA database becomes more robust, SCE anticipates the distribution of ignition likelihoods will improve in its risk calculations by reflecting a larger number of historical events.	Q1 2023 to transition input data from existing process to incorporating detailed ignition data from the FIPA database.

Key Risk Assessment Area	Problem Statement	Proposed Improvement	Type of Improvement (technical and/or programmatic)	Expected Value Add/Anticipated Benefit	Timeframe and Key Milestones
		processes for root cause analysis.			

6.7.2 Narratives for Individual Improvements

In addition, the electrical corporation must provide a concise narrative of its proposed improvement plan (maximum of five pages per improvement) summarizing:

- ***Problem statement:*** *Description of the current state of the problem to be addressed*
- ***Planned improvement:*** *Discussion of the planned improvement, including any new/novel strategies to be developed and the timeline for their completion*
- ***Anticipated benefit:*** *Detailed description of the anticipated benefit and any other impacts of the proposed improvement*
- ***Region prioritization (where relevant):*** *Reference to risk-informed analysis (e.g., local validation of weather forecasts in the HFTD) demonstrating that high-risk areas are being prioritized for continued improvement*
- *Supporting documentation (as necessary)*

6.7.2.1 Transition SCE's Wildfire Consequence Model from version 6.0 to 7.1

Problem statement: SCE seeks continuous improvement in the Wildfire Consequence model by refreshing underlying assumptions and enhancing modeling techniques.

Planned improvement: A significant improvement of this refreshed model is the expansion of the fuel layer from only including fuels in HFRA, plus a 20-mile buffer, to including fuels across SCE's service territory, plus a small buffer into adjoining jurisdictions. Other minor improvements in this model refresh include improved algorithms to better represent wildfire propagation in timber fuel locations, and better aligned ignition points locations in proximity to overhead utility electrical assets.

Anticipated benefit: 1) Expanding the fuel layer will allow SCE to perform ignition simulations for the entirety of the service territory. This enhancement will assist with HTFD boundary assessment, as well as other anticipated follow-on studies. 2) Fire propagation enhancements will better represent the first burning period associated with timber fuel types. 3) Improving the spacing of ignition points will improvement the granularity of ignition simulation events with respect to locations of complex topography.

Region prioritization: SCE's HFRA.

6.7.2.2 Asset Specific Predictive Models

Problem statement: SCE does not have a predictive model specific to secondary conductor.

Planned improvement: In 2023, SCE will develop and evaluate an additional predictive model for secondary conductor to more accurately identify equipment related failures for secondary conductor that contribute to POI sub-drivers. This will differentiate between primary and secondary conductor failures (both EFF and CFO).

Anticipated benefit: Increased granularity in outage and ignition calibration for primary versus secondary conductor will improve model prediction (separate models for primary vs secondary) and risk calculations.

Region prioritization: SCE's HFRA.

6.7.2.3 Third-Party Independent Review Strategy and Roadmap

Problem statement: SCE does not currently have an established independent third-party review program.

Planned improvement: In 2023, SCE will establish a set of criteria to determine when an external third-party validation is needed and required. After establishing the governance process, SCE will issue an RFP before the end of 2023 to facilitate the selection of the appropriate party to conduct the validation. The wildfire risk models will be validated by the end of 2024.

Anticipated benefit: SCE recognizes that an external review of wildfire risk models will provide additional confidence to external stakeholders on the fidelity and methods deployed in SCE's wildfire risk models. SCE will also consider and incorporate feedback from the external third-party review into its future Wildfire risk modeling roadmap.

Region prioritization: SCE's HFRA.

6.7.2.4 Potential Improvement to Wind Modeling and Associated Scenarios

Problem statement: SCE will evaluate potential improvements and approaches to wind scenario modeling based on updated weather data.

Planned improvement: SCE currently owns a gridded wind and weather historical dataset covering the SCE territory spanning approximately the last 40 years. Since the development of this dataset, SCE has deployed machine learning forecast capabilities to remove biases in gridded wind and weather data leveraging SCE's growing weather station network. This improvement will apply the same machine learning correction techniques to the gridded historical wind and weather data, which will result in more accurate characterization of wind and weather design scenarios.

Anticipated benefit: Weather data will be used to in the analysis of a refreshed pole loading study. This study will inform SCE's design scenarios used in the SCE wildfire modeling.

Region prioritization: SCE's HFRA.

6.7.2.5 Data Validation Methods and Develop Data Visualization Dashboards

Problem statement: In SCE's predictive models, SCE uses data from various sources. To validate the data, SCE QCs the data prior to integrating it into the predictive model.

Planned improvement: By the end of 2023, SCE will develop dashboards for visualization of model outputs and establish procedures for automation of datasets for future integration into automated predictive models.

Anticipated benefit: Streamlining data sources, automating methods to validate data sets and developing data visualization dashboards will enhance SCE modeling capabilities. These enhancements may enable SCE to automate model refreshes more frequently.

In addition, the planned improvements will enable SCE to develop more detailed technical documentation in alignment with OEIS Guidelines for its data sources by establishing defined data marts and data dictionaries associated to the data sources for easier reference and documentation.

Region prioritization: SCE's HFRA.

6.7.2.6 Enhanced Machine Learning Algorithms Application for POI Forecasts

Problem statement: SCE plans to improve its application of the POI model by using FIPA database improvements to enhance distribution of POI for risk calculations.

Planned improvement: SCE's FIPA database tracks the trends of ignitions and ignition drivers. Prior to 2022, SCE calibrated its probability of ignition using CPUC reportable ignitions. In 2022, SCE updated its ignition frequency calculation to use all SCE identified ignitions tracked in its FIPA database, along with separating between primary and secondary ignitions, which allows for more granular forecasts and application of POI to specific ignition events.

Please see Section 11 for further discussion of the FIPA database and planned improvements.

Anticipated benefit: SCE anticipates that the FIPA database planned improvements will improve the distribution of ignition likelihoods in its risk calculations by more reflecting a more extensive record of historical events in its future forecasts.

Region prioritization: SCE's HFRA.

6.7.3 Maturity Advancement

SCE continually seeks alignment with government and industry organizations and practices and continues to look for opportunities to improve risk assessment maturity over time.

The activities discussed in this section could lead to Risk Assessment and Mitigation maturity advancements. Below is a summary of broader anticipated maturity improvements over the WMP period that supplement the objectives outlined at the beginning of Sections 8 and 9.

Table SCE 6-07 - Risk Assessment Maturity Improvements

Capability Name	Projected Maturity Improvements
Statistical Weather, Climate, and Wildfire Modeling	Improvements include evaluating new model inputs and beginning to evaluate impacts of climate change on vegetative species.
Calculation of Wildfire and PSPS Hazard and Exposure to Societal Values	Improvements include new outputs in wildfire and PSPS models.
Calculation of Community Vulnerability to Wildfire and PSPS	Improvements include maintaining version control of community vulnerability to wildfire and PSPS models and new model inputs.
Risk-informed Wildfire Mitigation Strategy	Collaboration with external stakeholders on planned risk reduction efforts.
Calculation of Risk and Combination of Risk Components	Improvements include further documentation of risk models, maintaining version control of models and further developing processes for third-party review.

7 WILDFIRE MITIGATION STRATEGY DEVELOPMENT

In this section of the WMP, the electrical corporation must provide a high-level overview of its risk evaluation and process for deciding on a portfolio of mitigation initiatives to achieve maximum feasible[107] risk reduction and that meet the goal(s) and plan objectives stated in Sections 4.1–4.2, and wildfire mitigation strategy for 2023-2025. Sections 6.1 and 6.2 below provide detailed instructions.

7.1 Risk Evaluation

7.1.1 Approach

In this section of the WMP, the electrical corporation must provide a brief narrative of its risk evaluation approach, based on the risk analysis outcomes presented in Section 6, to help inform the development of a wildfire mitigation strategy that meets the goal(s) and plan objectives stated in Sections 4.1– 4.2.

The electrical corporation must describe the risk evaluation approach in a maximum of two pages, inclusive of all narratives, bullet point lists, and any graphics.

IWMS is SCE's holistic approach to developing portfolios of effective and complementary mitigations and deploying them in a manner that focuses on the areas of greatest risk. IWMS incorporates additional factors not currently present in the MARS Framework (e.g., egress limitations, SME judgment), which help augment SCE's analysis of risk impacts from these factors at local levels. By following its IWMS, SCE has a more complete depiction of the full impacts of a wildfire in certain locations and thus can better prioritize and scope mitigations to areas where ignitions can have the greatest impact.

The first stage (Initial Risk Categorization) of IWMS is to categorize all of SCE's overhead distribution circuit segments in HFRA into one of three tranches utilizing various data sources and fire science: Severe Risk Area, High Consequence Area, and Other HFRA.

The next stage (Review and Revise) involves a team of SMEs from SCE's Wildfire Safety, Fire Science, Enterprise Risk Management, and Engineering groups reviewing, refining, and revising the initial output from the previous step using inspection photographs, satellite imagery, maps, and other data sources to consider local conditions and features that may alter the initial designation.

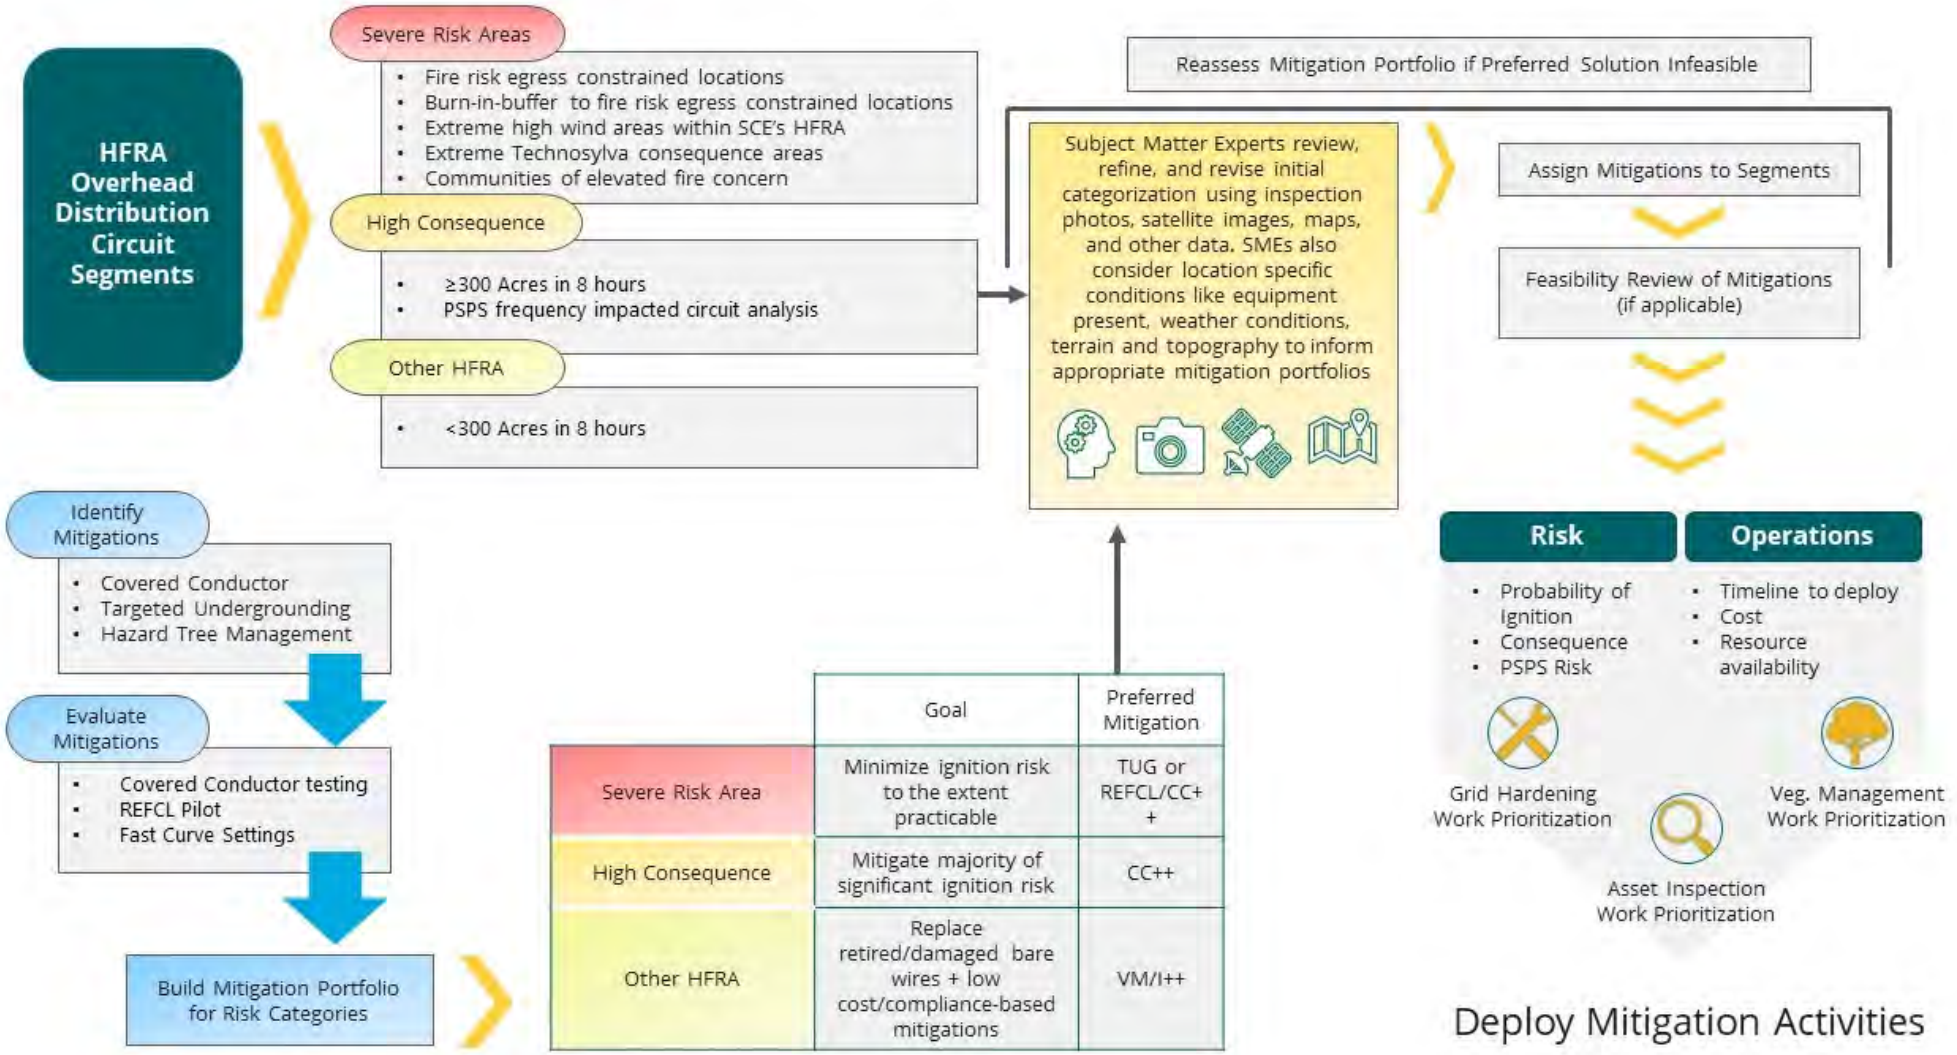
After each overhead distribution circuit segment has a risk tranche designation, SCE assigns to it the corresponding portfolio of mitigations. For each risk tranche, SCE has determined a portfolio of complementary mitigations appropriate for its risk level. In Severe Risk Areas, the threat to lives and property is elevated to such an extent that SCE has determined that for public safety reasons it is prudent to not just significantly reduce ignition risk expeditiously but minimize it in the long term to the extent practicable. In High Consequence Areas, SCE's strategy focuses on mitigating the majority of significant ignition risk drivers. In Other HFRA, SCE will replace retired or damaged bare wires with covered conductor and continue mitigations that have relatively low incremental costs or are dictated by compliance requirements or local conditions. Transmission in SCE's HFRA receives its own separate set of mitigations, and as discussed in Section 8.1.2.12.1, will be evaluated further to determine the potential additional mitigations. During the Review and Revise stage, the team of SMEs will make

[107] "Maximum feasible" means, in accordance with Public Utilities Code section 326(a)(2), capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.

individualized adjustments to portfolios for specific segments if local conditions favor doing so.

Mitigations for each portfolio are selected based on a variety of factors, including effectiveness, risk drivers they mitigate, cost, and time to deploy. SCE uses the MARS Framework to help it compare mitigations and alternatives to each ignition driver and sub-driver on the basis of risk reduction and cost effectiveness.

Some mitigations are deployed only where certain conditions exist, such as tree attachment removals or LSI remediations. Other mitigations, such as undergrounding, require a separate feasibility review, which is conducted by a team of planners and engineers. This feasibility review considers issues impacting constructability, such as local terrain and accessibility. If a mitigation is found to be infeasible, the Review and Revise team will recommend an alternative mitigation taking into account local conditions.



Once segments are assigned a portfolio of mitigations, the deployment of each individual mitigation is prioritized using a combination of risk and operational factors. Generally, mitigations do not have to be prioritized against each other, as they utilize different resources (e.g., hardening uses different resources than inspections, which use different resources than vegetation management) or have different timelines that can run in parallel (e.g., TUG and CC projects have long timelines and SCE can deploy other projects concurrently, such as fast-acting fuses or FC-capable hardware).[108]

Once mitigations are deployed, SCE uses the MARS framework to calculate and quantify remaining overall utility risk from both wildfire and PSPS.

Through the IWMS, SCE identifies the varying levels of wildfire and PSPS risk in its HFRA and then deploys complementary and cost-effective portfolios of mitigations that are prioritized in a risk-informed manner. Please see Figure SCE 7-01 for more information on IWMS.

[108] SCE started using IWMS to prioritize mitigation selection and scope beginning 2021. Due to the long lead time for planning and construction, mitigations scoped with IWMS will generally not be in service until 2023 or later; targeted undergrounding scoped using IWMS will generally not be in service until 2024. However, as noted in Section 6.2.1, SCE performed a review of inflight scope to align to the IWMS as much as possible and practical.

Figure SCE 7-01 - IWMS Schematic

7.1.2 Key Stakeholders for Decision Making

In this section, the electrical corporation must identify all key stakeholder groups that are part of the decision-making process for developing and prioritizing mitigation initiatives. Table 7-1. Example of Stakeholder Roles and Responsibilities in the Decision-Making Process provides an example of the required information. At a minimum, the electrical corporation must do the following:

- *Identify each key stakeholder group (e.g., electrical corporation executive leadership, the public, state/county public safety partners)*
- *Identify the decision-making role of each stakeholder group (e.g., decision maker, consulted, informed)*
- *Identify method of engagement (e.g., meeting, workshop, written comments)*

The electrical corporation must also describe how it communicates decisions to the identified key stakeholders.

Table 7-1 summarizes the various stakeholders that SCE meets with to gather feedback and to communicate wildfire and PSPS decisions.

Table 7-1 - Stakeholder Roles and Responsibilities in the Decision-Making Process

Stakeholder	Stakeholder Point of Contact	Electrical Corporation Point of Contact	Stakeholder Role	Engagement Methods
SCE Executive Leadership	Director of Wildfire Safety	Director of Wildfire Safety	• Provides guidance and decision making on wildfire mitigation near and long-term planning • Informed on wildfire mitigation execution status • Informed and provides guidance on strategy/risk prioritization methodologies	Weekly Internal Meetings

Stakeholder	Stakeholder Point of Contact	Electrical Corporation Point of Contact	Stakeholder Role	Engagement Methods
Office of Energy Infrastructure Safety (OEIS or Energy Safety)	OEIS Deputy Director, Director of OEIS	Managing Director, Regulatory Relations	• Defines WMP requirements • Participates and provides guidance in working groups • Reviews wildfire mitigation plan submissions and provides feedback, areas for continuous improvement, and issues approval or denial of plan	• Weekly meetings following submission of WMP • Biweekly participation in working groups • Written comments • Ad hoc meetings
California Public Utilities Commission (CPUC)	CPUC Staff	Managing Director, Regulatory Relations	• Approves WMP requirements; provides guidance and review of CPUC-mandated risk analysis used to inform wildfire and PSPS mitigations; authorizes cost recovery for wildfire and PSPS mitigations in consideration of risk reduction, cost efficiency, affordability, and other factors.	• Ad hoc meetings • Comments, workshop, CPUC rulings and decisions
Local Governments (including city councils, county boards and tribal governments)	Various local representatives	Director, Local Public Affairs	• Provides feedback on implementation of SCE's wildfire initiatives • Informed on SCE's strategy as	Ad hoc meetings

Stakeholder	Stakeholder Point of Contact	Electrical Corporation Point of Contact	Stakeholder Role	Engagement Methods
			presented in WMP	
Local Fire Agencies (includes Cal FIRE)	Various Southern California Fire Chiefs	Managing Director, Regulatory Relations Managing Director, Business Resiliency	• Provides guidance on wildfire mitigations including Fire Suppression • Informed on SCE's strategy as presented in WMP	Ad hoc meetings
Cal OES	Assistant Director of Response Operations	Managing Director, Regulatory Relations	• Provides statewide guidance on wildfire mitigations including PSPS • Participates on the board of the AFN Council	Ad hoc meetings
Access and Function Needs (AFN) Advisory Council	Various	VP Customer Programs and Services	Raises awareness of the needs of our AFN populations and to collaborate on initiatives that will advance communications, resources and support for AFN populations, all aimed at PSPS impact mitigation	Monthly meetings (or more frequent as necessary)
Public Advocates Office and other stakeholders	Various	Various	Participates in Energy Safety-led working groups and provides input.	Pursuant to working group schedules.

Stakeholder	Stakeholder Point of Contact	Electrical Corporation Point of Contact	Stakeholder Role	Engagement Methods
Wildfire Safety Advisory Board	Board Members	Various	Advises OEIS on requirements for WMPs, holds workshops, provides comments on advisory opinions.	Comments, public meetings.

SCE executive leadership is actively involved in directing all aspects of the WMP process. After SCE's program leads, in conjunction with its Wildfire Strategy and Enterprise Risk Management teams, select mitigations and decide on scope for each one pursuant to the processes described below in Sections 7.1.3 and 7.1.4, they engage with their executive leadership to review and approve their decisions. Then SCE's executive leadership reviews the decisions with the program leads and the Wildfire Strategy team and then either approves or recommends changes.

SCE executive leadership is also regularly briefed on WMP status, including progress of meeting the mitigation goals set in the WMP. SCE's executive team provides guidance and decisions on near- and long-term wildfire and PSPS mitigation strategies, risk analyses, planning activities, resource allocation, and compliance matters. On a monthly basis there is a mandatory report out on the progress of the various wildfire and PSPS mitigations presented in the WMP to senior executives. As new strategy/risk prioritization methodologies are introduced they are also brought forward and reviewed by SCE's senior executives at standing weekly and biweekly wildfire mitigation forums.

Internal wildfire safety meetings are held weekly at a minimum, and more frequently as needed to advance strategic wildfire mitigation and PSPS planning and execution.

SCE meets routinely with key stakeholders to gather feedback and to communicate decisions related to important wildfire-related information, such as short- and long-term wildfire and PSPS mitigation plans as discussed in the WMP filings. SCE engages with various governmental regulatory agencies, including Energy Safety and the California Public Utilities Commission (CPUC).

SCE adheres to guidelines established by Energy Safety in developing the WMP. After the WMP is filed, SCE responds to discovery requests issued by Energy Safety and other Stakeholders. SCE also participates in regular joint-utility working groups meetings mandated by Energy Safety on topics such as risk modeling, grid hardening, and vegetation management.

SCE engages with the CPUC on matters pertaining to wildfire and PSPS policies, cost recovery, and other areas within the CPUC's jurisdiction. The CPUC reviews SCE's requests to recover the costs to implement our WMP and provides funding authorization based on those reviews. The CPUC will also review these requests to ensure adherence with CPUC policies and practices required through various wildfire, risk, and PSPS-related proceedings managed by the CPUC. SCE will hold meetings with the CPUC, largely on an ad hoc basis, with a representative from SCE's Regulatory Affairs department and requisite SMEs.

SCE meets with local governments including city councils, county boards and tribal governments to share strategic decisions made that will impact the local area, and to gather feedback on SCE's wildfire programs

and community needs to understand what is working well and to identify areas of improvement to incorporate into wildfire planning. For example, SCE endeavors to minimize the impacts of outages required to perform wildfire mitigation and other construction work by working with local governments and communities to alleviate outage impacts. SCE also engages with local and state agencies, large commercial and industrial customers, and representatives from critical infrastructure facilities to highlight SCE's wildfire mitigation priorities and PSPS-related work.

Additionally, SCE participates in the AFN Advisory Council, which meets at least monthly to explore wildfire and PSPS risk mitigation strategies, policies, and procedures specific to Access and Functional Needs (AFN) customers. SCE will also relay specific details related to programs or initiatives targeted to further assist AFN customers.[109]

7.1.3 Risk-Informed Prioritization

In making decisions risk mitigation, the electrical corporation must identify and evaluate where it can make investments and take actions to reduce its overall utility risk. The electrical corporation must develop a prioritization list based on overall utility risk.

In this section, the electrical corporation must:

- *Describe how it selects areas of its service territory at risk from wildfire for potential mitigation initiatives, including, at a minimum, the following:*
    - *Geographic scale used in prioritization (i.e., regional, circuit, circuit segment, span, asset)*
    - *Statistical approach used to select prioritized areas (e.g., areas in top 20 percent for risk, areas in top 20 percent for consequences)*
    - *Feasibility constraints (e.g., limitations on data resolution, jurisdictional considerations, accessibility)*

Present a list that identifies, describes, and prioritizes areas of its service territory at risk from wildfire for potential mitigation initiatives based solely on overall utility risk, including the associated risk drivers.

Geographic Scale and Statistical Approach: SCE's definition and selection of areas for prioritization is not defined from the perspective of a "top X" percentage of risk. As described in detail in Section 6.2.1, the IWMS Risk Framework consists of two stages where SCE selects prioritized areas:

Initial Risk Categorization: SCE divides its HFRA into equal-sized polygons about 214 acres in area and then uses several factors such as egress, burn history, and other environmental factors (e.g., high wind locations) to categorize circuit segments within its HFRA into three distinct risk tranches: Severe Risk Areas, High Consequence Areas, and Other HFRA (see Table SCE 7-01 below).

Table SCE 7-01 - IWMS Framework Risk Tranches (Mutually Exclusive)

Severe Risk Area Criteria
o Population egress, high fire frequency location, and burn-in buffer into egress locations. o Significant fire consequence – Acres burned consequence greater than 10,000 over an 8-hour unsuppressed model simulation. o High winds – Locations, which if fully covered with covered conductor, would still be subject to high PSPS likelihood.

[109] Engagement with AFN populations is discussed in more detail Section 8.5.3.

o Communities of Elevated Fire Concern (CEFCs) – smaller geographic areas where terrain and other factors could lead to smaller, fast-moving fires threatening populated locations under benign (normal) weather conditions.
High Consequence Area Criteria
o Not identified in meeting Severe Risk Area criteria. o Destructive fire consequence – Acres burned consequence between 300 and 10,000 over an 8-hour unsuppressed model simulation. o Locations subject to PSPS events in which covered conductor has not been fully deployed.
Other HFRA Criteria
o Not identified in meeting Severe Risk Area or High Consequence criteria. o Small fire consequence - Acres burned consequence less than 300 over an 8-hour unsuppressed model simulation.

Review and Revision: A team of SMEs reviews, refines, and revises the output of the Initial Risk Categorization, by reviewing unhardened circuit segments with additional tools such as inspection photos and maps to determine if local conditions change the initial categorization. This process is ongoing and expected to be complete in Q1 2024.

List of Prioritized Areas: Below is SCE's list that identifies, describes, and prioritizes areas of its service territory at risk from wildfire for potential mitigation initiatives based solely on overall utility risk, including the associated risk drivers.

Table 7-2 - List of Prioritized Areas in SCE's Service Area Based on Overall Utility Risk

Priority	Area/ Tranche	Description[110]	Overall Utility Risk[111]	Associated Risk Drivers
1	Severe Risk Areas	Locations with egress challenges, areas that fires have historically propagated towards (burn-in buffer), CEFCs, areas with extreme high winds, and segments with extreme Technosylva consequence (i.e., greater than 10,000 acres in eight hours with simulated wildfire ignition consequence). ~1,520 of ~2,950 total miles already hardened*	52.41 (0.018 risk per HFRA mile)	• EFF • CFO Other • CFO Veg
2	High Consequence Areas	Segments not identified as a Severe Risk Areas are and in which simulated wildfire ignitions resulted in a wildfire consequence of 300-acres-or greater	64.86 (0.015 risk per HFRA mile)	• EFF • CFO Other • CFO Veg

[110] Hardened miles as of 12/31/2022 for all risk tranches. SCE may revise this data to reflect adjustments based on comparing completed work orders to mapping data, and also pending completion of SCE's Review & Revise stage of IWMS.

[111] MARS units as of January 2023. Reflects mitigations and hardening in place.

Priority	Area/ Tranche	Description[110]	Overall Utility Risk[111]	Associated Risk Drivers
		in eight hours, as well as those circuits which have the potential to be frequently impacted by PSPS events. ~2,285 of ~4,400 total miles already hardened*		
3	Other HFRA	Encompasses SCE overhead distribution lines that are located in HFRA but that are neither High Consequence Areas nor Severe Risk Areas. ~605 of ~2,250 total miles already hardened*	6.03 (0.003 risk per HFRA mile)	• EFF • CFO Other • CFO Veg

* "Hardened miles" refer to the miles of bare overhead lines replaced with covered conductor or underground cable and the associated infrastructure to complete those installation (i.e., FR pole as part of covered conductor installation). In some cases, alternatives such as REFCL, aerial bundled cable, or spacer cable are utilized.

Feasibility Review: After a part of SCE's system is assigned a mitigation, it undergoes a feasibility review. The extent of the review depends on the mitigation, some mitigations require more intensive reviews than others. For example, replacing a vertical switch may not require more than one person to determine feasibility. On the other hand, a group of planners and engineers review TUG scope for feasibility, as there are multiple situations (terrain, ROWs over private property, customer meter locations, etc.) that can influence a TUG project. Further, when planning and scheduling work, SCE considers issues such as engineering and crew resource availability (both internal and external), permitting, logistical viability of potential mitigations, operational needs, local grid configurations, potential for customer outage fatigue, work bundling and other factors.

7.1.4 Mitigation Selection Process

After the electrical corporation creates a list of top-risk contributing circuits/segments/spans (Section 6.4.2) and prioritized areas based on overall utility risk (Section 7.1.3), the electrical corporation must then identify potential mitigation strategies. It must also evaluate the benefits and drawbacks of each strategy at different scales of application (e.g., circuit, circuit segment, system-wide). In this section of the WMP, the electrical corporation must provide the basis for its decisions regarding which mitigation initiatives to pursue. It must also document how it develops, evaluates, and selects mitigation initiatives.

The electrical corporation should consider appropriate mitigation initiatives depending on the local conditions and setting and the risk components that create the high-risk conditions. There may be a wide variety of potential mitigation initiatives, such as:

- *Engineering changes to grid design*
- *Discretionary inspection and/or maintenance of existing assets*
- *Vegetation clearances beyond minimum regulatory requirements*

- *Alternative operational policies, practices, and procedures*
- *Improved emergency planning and coordination*

The electrical corporation may also mitigate risk by combining multiple mitigation initiatives.

The electrical corporation is expected to use its procedures discussed in Section 7 to:

- *Develop potential mitigation* initiative approaches to address each risk
- *Characterize the potential mitigation initiatives to provide decision makers with information required to support decision making (e.g., costs, material availability), including an assessment of uncertainties*
- *Document the results*

The electrical corporation must develop a proposed schedule for implementing each mitigation initiative and proposed metrics to monitor implementation and effectiveness of the mitigation initiative. The following subsections provide specific requirements.[112]

As part of IWMS, SCE's designs portfolios of mitigations that complement each other and mitigate multiple risk drivers. This process begins with the mitigation intake process, where SCE uses MARS to evaluate effectiveness and alternatives to each perspective mitigation. Then SCE considers mitigations from a holistic approach, develop complementary activities that address risk drivers based on risk analysis, historical ignition trends or findings, and expert review. SCE also considers cost effectiveness, how quickly

the mitigations can be deployed, and mitigation deployment feasibility based on terrain. After SCE understands the relative effectiveness of each mitigation as well as the drivers it addresses, SCE designs portfolios of mitigations for each area of its system commensurate with its assigned risk tranche.

7.1.4.1 Identifying and Evaluating Mitigation Initiatives

The electrical corporation must describe how it identifies and evaluates options for mitigating wildfire and PSPS risk at various analytical scales. The current guidelines governing this process are derived from the Risk-Based Decision-Making Framework established in the Safety Model and Assessment Proceeding (S-MAP).[113] *The S-MAP is currently being updated in CPUC proceeding R. 20-07-013.*[114] *In due course, the electrical corporation's risk mitigation identification procedure must align with results from this proceeding.*[115] *The electrical corporation must describe the following:*

[112] Annual information included in this section must align with Tables 11 and 12 of the QDR.

[113] 2018 Safety Model Assessment Proceeding (2018 S-MAP), adopted in D.18-12-014 (see S-MAP, step 3, rows 15–25): https://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M250/K281/250281848.pdf

[114] See the Rulemaking 20-07-013 (Order Instituting Rulemaking to Further Develop a Risk-Based Decision-Making Framework for Electric and Gas Utilities) Proceeding Docket (accessed Oct. 27, 2022): https://apps.cpuc.ca.gov/apex/f?p=401:56:0::NO:RP,57,RIR:P5_PROCEEDING_SELECT:R2007013.
Also see the Risk Assessment Mitigation Phase (RAMP) proceeding (accessed Oct. 27, 2022): https://www.cpuc.ca.gov/about-cpuc/divisions/safety-policy-division/risk-assessment-and-safety-analytics/risk-assessment-mitigation-phase.

[115] Electrical corporations are not required to incorporate changes made as a result of proceeding R. 20-07-013 in the 2023-2025 WMPs submitted in 2023.

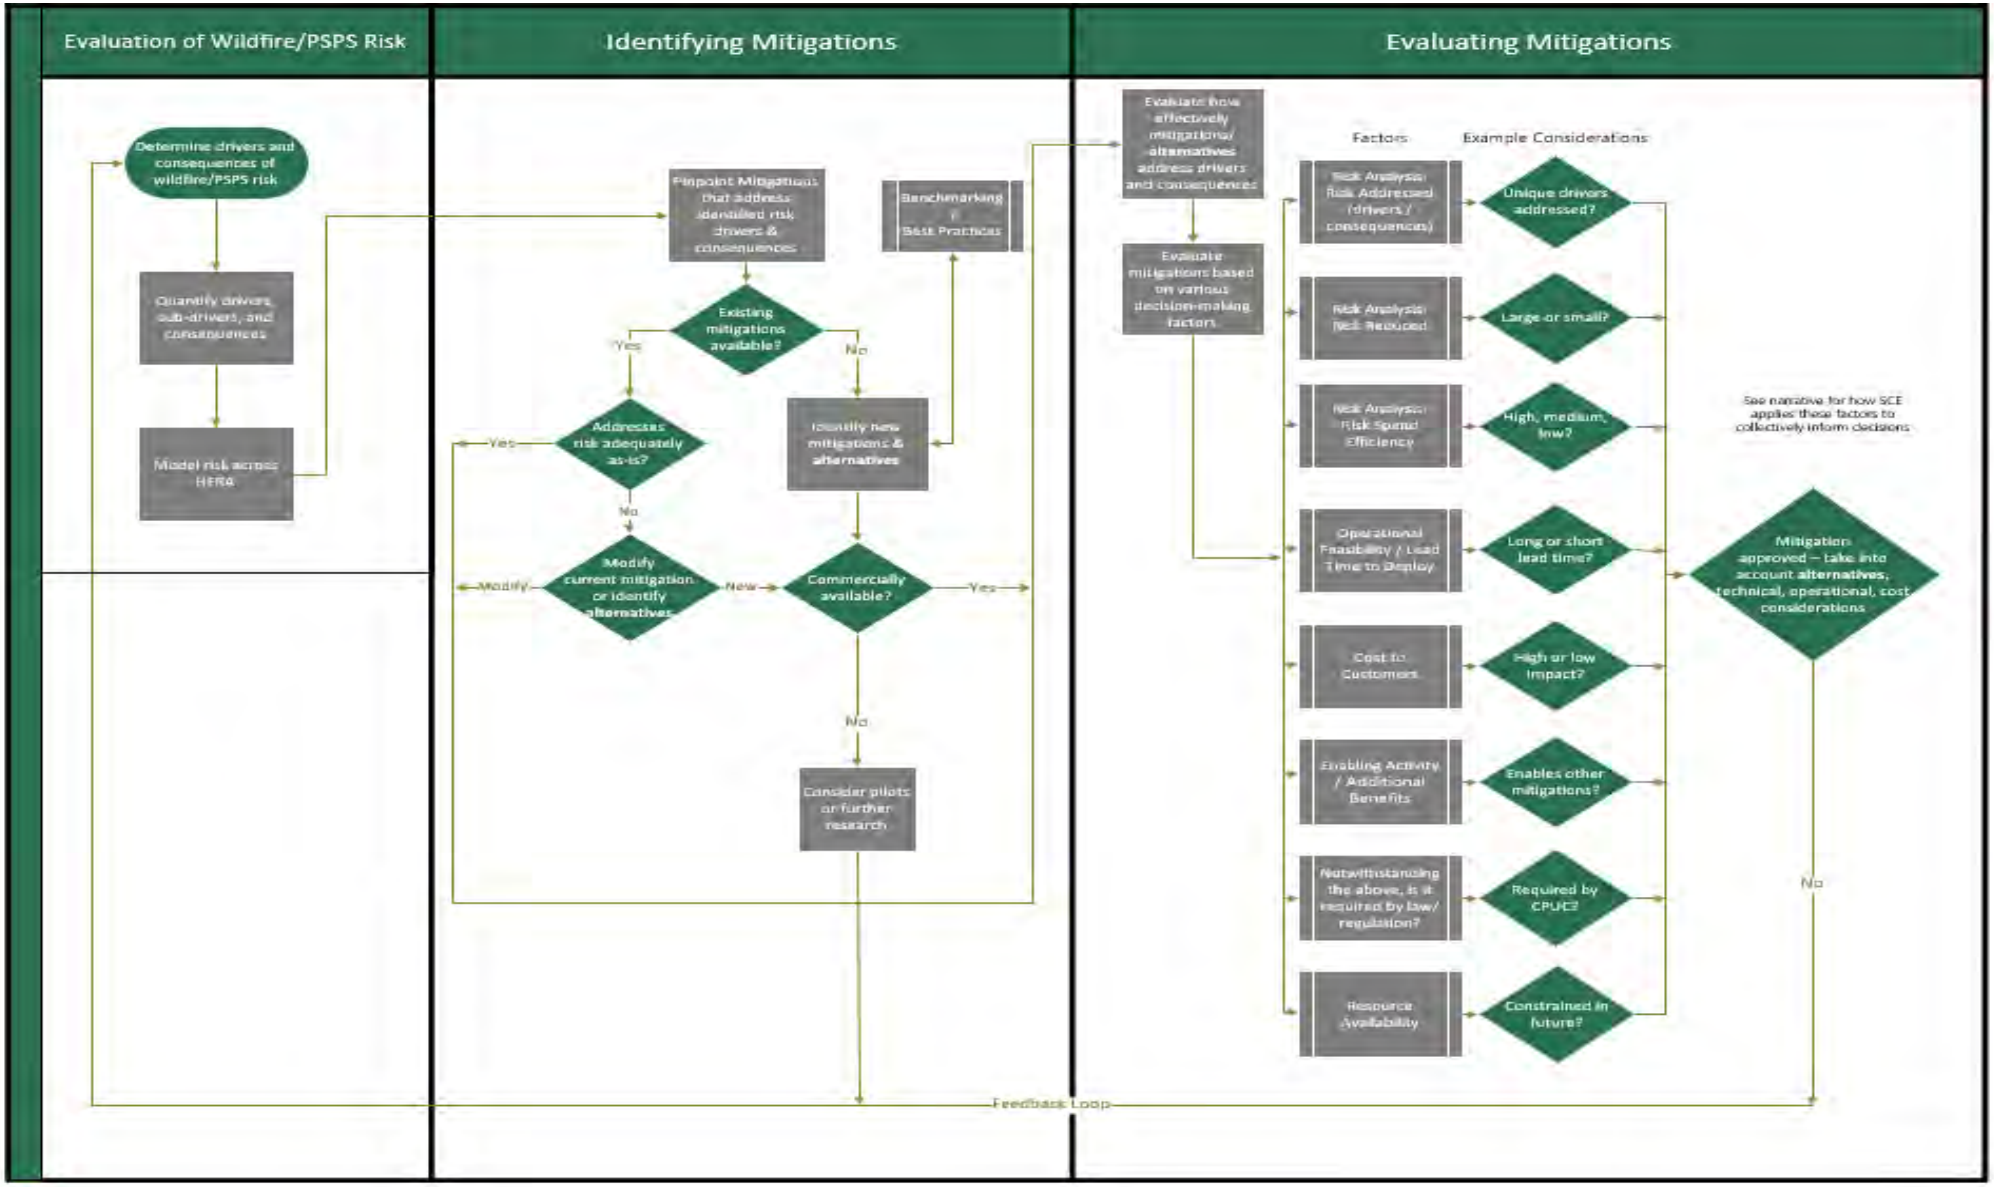
- *The procedures for identifying and evaluating mitigation initiatives (comparable to 2018 S-MAP Settlement Agreement, row 26), including the use of risk buy-down estimates (e.g., risk-spend efficiency) and evaluating the benefits and drawbacks of mitigations*
- *To the extent possible, multiple potential locally* relevant mitigation initiatives to address local wildfire risk drivers (see 2018 S-MAP Settlement Agreement, row 29)
- *The approach the electrica*l corporation uses to characterize uncertainties and how the electrical corporation's evaluation and decision-making process incorporates these uncertainties (see 2018 S-MAP Settlement Agreement, rows 29 and 30)
- *Two or more potential mitigation initiatives* for each risk driver included in the list of prioritized areas (Table 7-2 in Section 7.1.3), including the following information:
    - *The initiativ*es and activities
    - *Expected risk reduction and* impact on individual risk components
    - *Estimated* implementation costs
    - *Relevant uncertainties*
    - *Implementation schedule*
- *How the electrical corporation uses multi-attribute value functions (MAVFs) and/or other specific risk factors (as identified in 2018 S-MAP or subsequent relevant CPUC Decisions) in evaluating different mitigations*

Below, SCE provides a detailed flowchart of our risk-informed decision-making process as generally used to select and evaluate SCE initiatives that mitigate wildfire and PSPS risks. The flowchart illustrates SCE's general approach to risk-informed decision-making when assessing and selecting wildfire and PSPS mitigations. We also provide a detailed narrative explanation of various entries in, and aspects of, the flowchart. For ease of reading and reference, we provide a "zoom in" of the particular portion of the flowchart when we are explaining it in narrative form.

Broadly speaking, the process can be broken down into three major stages, as outlined in the flowchart: First, we evaluate or reassess, and then prioritize, wildfire and PSPS risks. Second, we identify the choice of mitigations to address the risk. In other words, we pinpoint the various mitigation alternatives. Third, we evaluate the mitigations and then select the appropriate one(s) from amongst the alternatives, using decision-making factors.

Application of this process for each wildfire mitigation activity may vary, because SCE is continually in the process of improving how risk-informed decision-making is utilized across the enterprise. Applicability may also vary depending on the unique characteristics of the mitigation activities. While specific processes and steps continue to evolve as we build out our asset management capabilities, the flowchart generally captures the key elements of the process. With each cycle, SCE's overall risk-informed decision-making process generally is maturing in the level of quantitative analysis performed, granularity of analysis, and consistent application across the enterprise.

Figure SCE 7-02 - List of Prioritized Areas in SCE's Service Area Based on Overall Utility Risk



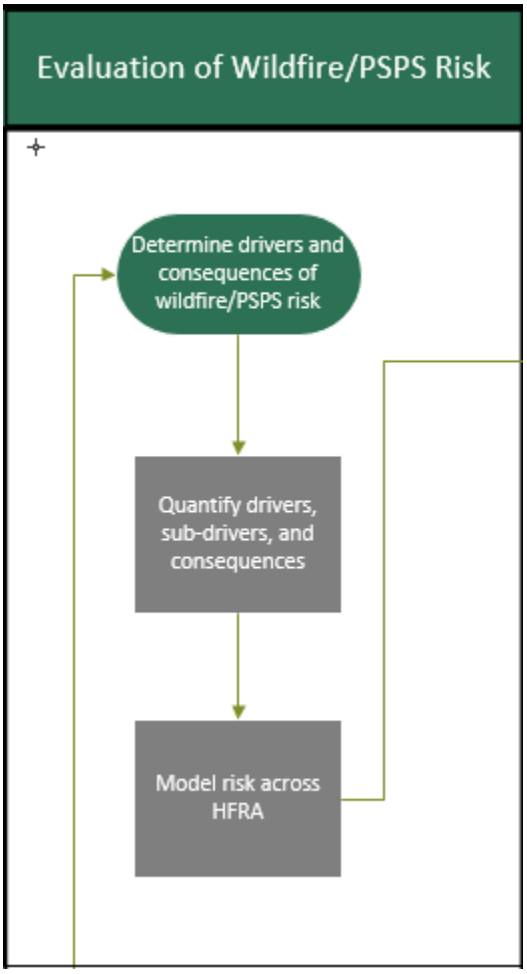


Figure SCE 7-03 - Evaluation of Wildfire and PSPS Risk (excerpt from full version in Figure SCE 7-02):

The selection of wildfire and PSPS risk mitigations starts with evaluating or reassessing the particular issue at hand, and the risks that underpin the issue. SCE has invested considerable resources to build its capabilities for identifying the drivers and consequences of wildfire and PSPS risk and examining how that risk is distributed across SCE's High Fire Risk Area (HFRA). This is discussed in further detail in Section 6.2.1, but is summarized here for context. The general steps embedded in SCE's process for identifying and evaluating wildfire risk are as follows:

- Determining drivers (and sub-drivers) and consequences of wildfire risk;
- Quantifying drivers, sub-drivers, consequences, and overall risk as appropriate; and
- Modeling this risk across SCE's HFRA.

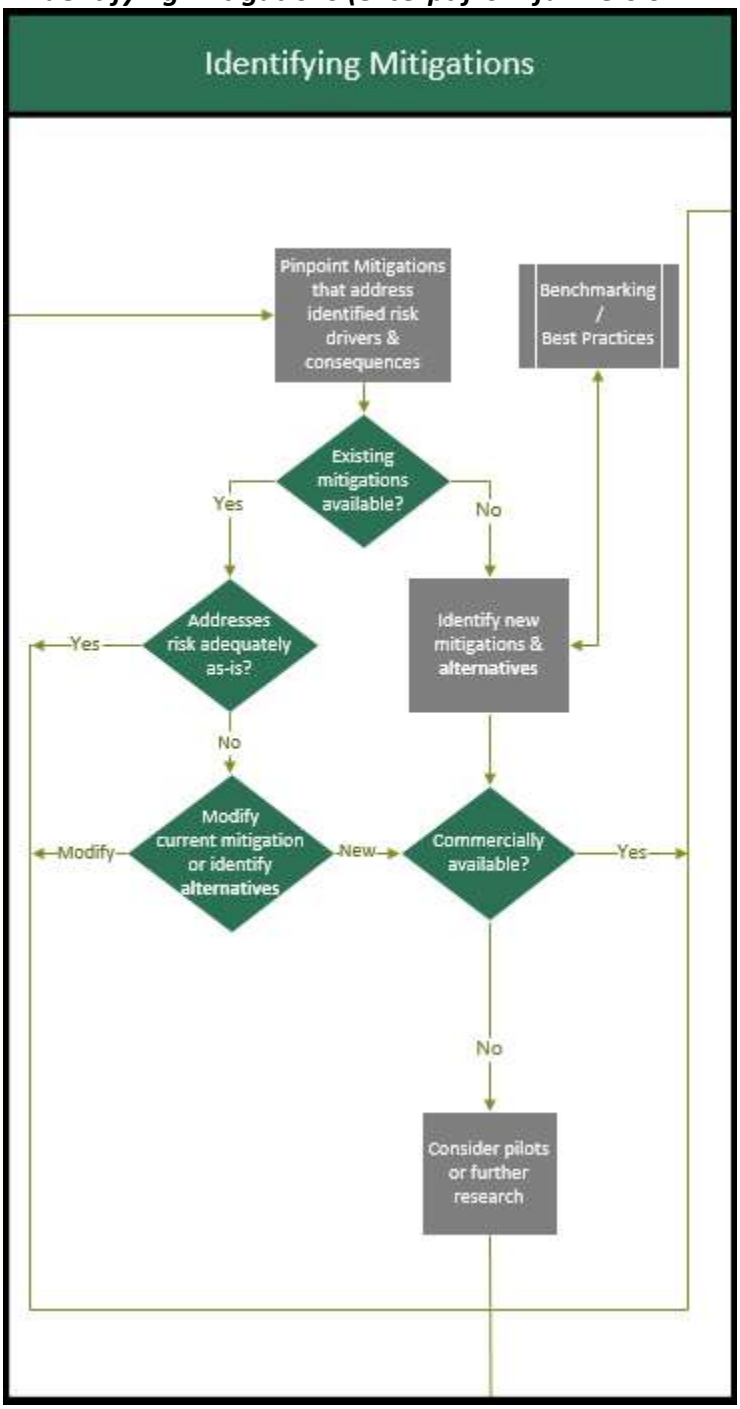
Determine drivers (and sub-drivers) and consequences of wildfire risk

As we discussed in detail in Section 6, SCE applies the risk bowtie approach to enable us to consistently and systematically identify threats and characterize sources of risk.

Quantify drivers, sub-drivers, consequences, and overall risk as appropriate

SCE estimates risk reduction and calculate RSEs in order to help make decisions about wildfire/PSPS mitigation activities and to inform the prioritization of deploying mitigations.

The triggering event at the center of the wildfire bowtie is an ignition in SCE's HFRA. On the left-hand side of the bowtie, historical ignition and fault analysis determined that potential ignitions are primarily driven by equipment failure, contact from objects (such as vegetation or mylar balloons), and wire-to-wire contact (during periods of high winds). SCE leverages machine learning models to estimate the probability of ignition by driver for a given set of assets in HFRA.



The consequences of these ignition events are estimated on the right-hand side of the bowtie, using the Technosylva consequence model (starting in late 2020). The model estimates the potential spread of a fire over a given time, as well as the corresponding impact of a fire in natural units - structures, acres, and population.

The risk bowtie for PSPS risk evaluates the drivers and probabilities of PSPS activations. Here, SCE uses data points such as the historical back-cast of wind and weather conditions in conjunction with PSPS de-energization protocols to estimate the annual frequency and duration of de-energization events. The consequences of these PSPS events are estimated on the right-hand side of the bowtie, based on the potential safety, reliability, and financial impacts to customers.

Model this risk across SCE's HFRA

Wildfire and PSPS consequences are then translated into MARS units to compare the relative risk of wildfire ignitions/PSPS events across SCE HFRA locations. The output of individual models and/or the entirety of the model output can be used to inform risk-related decision-making.

Figure SCE 7-04 - Identifying Mitigations (excerpt from full version in Figure SCE 7-02)

The second step in the process is to identify candidate initiatives to mitigate wildfire/PSPS risk. Here, we focus on potential options to reduce the risks that we evaluated or reassessed, and then prioritized, in the first step. These potential options come in the form of existing, modified, or new initiatives. Mitigation options reduce either the frequency, consequence, or both, of wildfire and/or PSPS risk, resulting in overall risk reduction and fall into one of four general categories, as described below:

- Existing mitigations that already help to reduce risk

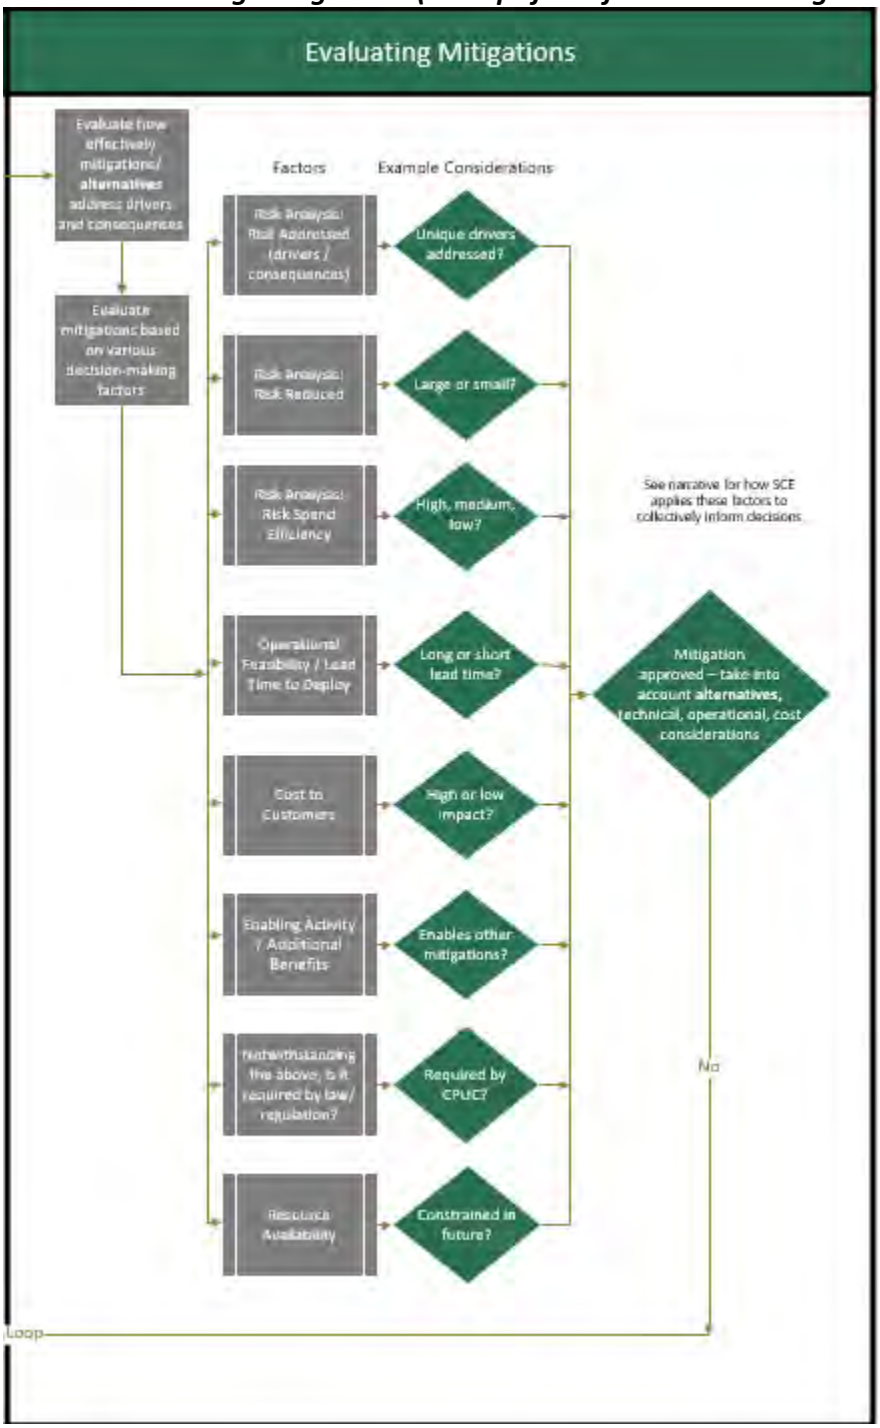
In some cases, the work that SCE performs to maintain and upgrade its overhead systems in HFRA already provides certain risk reduction benefits. In such cases, these activities would be identified for continued implementation as prudent for purposes of reducing wildfire risk. One example is line clearance activities to reduce the probability of faults or ignitions from vegetation making contact with energized equipment.

- Existing mitigations that, when modified, can further reduce risk

In other cases, existing mitigation activities may support wildfire risk reduction, but if appropriately modified, could provide even greater risk reduction benefits. This modification can take several forms:

1. The scope of the activity could be modified. An example is expanding the scope of assets and asset conditions that are evaluated as part of an inspection program.
2. The scale of the activity could be increased to cover a wider area of SCE's HFRA.
3. The frequency of an activity could be modified. An example would be to increase how frequently critical or higher-risk assets or areas are inspected.
4. New technology could be incorporated to make the activity more effective or efficient at identifying and mitigating risk. As an example, incorporating Artificial Intelligence/Machine Learning models to help detect asset defects and identify hazards as part of the Aerial Inspection processes could result in decreased time for problem identification, with increased confidence in risk/issue detection.

- New mitigations that are commercially ready to deploy to reduce risk



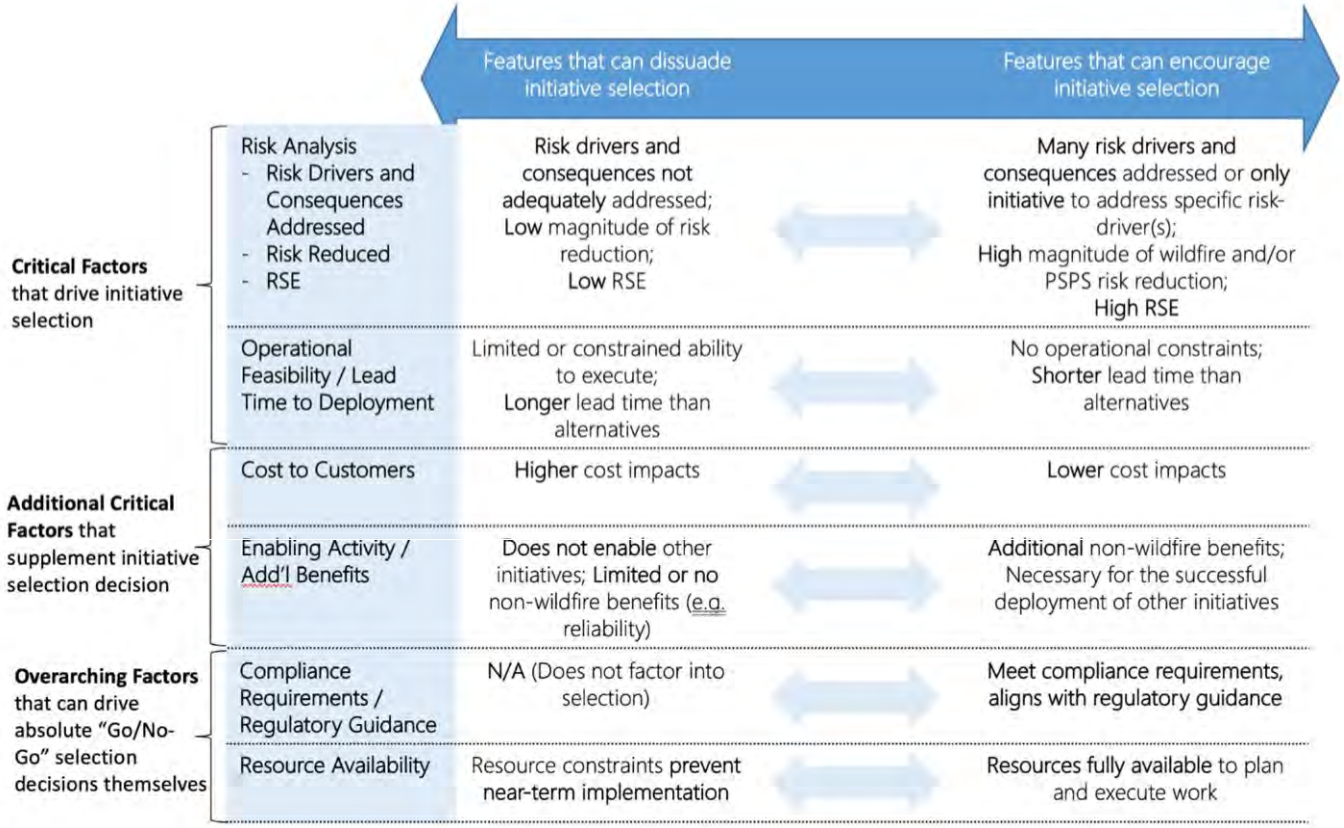
SCE also identifies new risk mitigation options. These new options can be identified through, among other actions, benchmarking with other utilities; studying and adopting emergent best practices; obtaining guidance from engineering and technical industry committees; studying emerging technology demonstrations; and assessing pilot studies that produce successful or otherwise useful results. SCE's portfolio of wildfire mitigation initiatives has benefitted greatly from identifying and adding new initiatives that were not previously deployed in SCE's service area. Our covered conductor program is an example of one such mitigation.

- New mitigations that should be piloted and further evaluated for potential future deployment

In some cases, concepts emerge that have promising wildfire or PSPS risk reduction benefits but have not yet been fully studied or evaluated through a reliable pilot or demonstration. Since these options are not commercially ready to be deployed on SCE's system, SCE will typically engage in further

consideration of these options through a pilot project, demonstration effort, or smaller-scale field testing or pilot deployment. Technological maturity is an important criterion when we are identifying and assessing mitigations.

Figure SCE 7-05 - Evaluating Mitigations (excerpt from full version in Figure SCE 7-02)



After we have identified our options for possible selection, those options must then be prudently evaluated. This usually starts with an estimation of how effective each option can be in reducing the various wildfire and/or PSPS risk drivers and consequences. This analysis is performed by subject matter experts, who utilize engineering data, historical performance data, benchmarking information, research studies, results from demonstrations or field tests, and other sources of information.

SCE is focused on efficiently reducing wildfire and PSPS risk as quickly as reasonably possible, prioritizing

mitigations to areas of our system that present the highest risk and doing so in a manner that appropriately minimizes customer cost and service impacts. Therefore, the selection of wildfire initiatives must necessarily consider several factors in the decision-making process. Such factors include the risk profile for HFRA in SCE's service area, the risk profile of assets that have the potential to cause ignitions, how each activity impacts the frequency and/or impact of wildfires, the potential speed of deployment, costs, RSE scores, resource constraints, material or technology availability and other factors that may relate to a given initiative.

Figure SCE 7-06 provides additional details concerning the key factors shown in the flowchart above that are commonly considered as part of SCE's decision-making process when selecting wildfire mitigation initiatives. The figure also illustrates how SCE generally evaluates each factor when making decisions.

Figure SCE 7-06 - Decision-Making Factors Considered

SCE carefully considers each factor both individually and in the aggregate in order to make sound and informed decisions. A given factor may not have a uniform level of importance or impact in all situations. As an example, if an initiative is required pursuant to a regulation, standard, code, or other authority, then meeting and adhering to compliance requirements would naturally be a decisive factor in SCE's ultimate determination. Similarly, if an initiative is under consideration but SCE would be unable to sufficiently staff it with requisite resources, then the "Resource Availability" factor will more heavily influence our decision-making because it may be infeasible to execute the initiative in a timely manner. The influence of resource constraints in assessing a particular potential mitigation can be very different if the resource constraints would simply lead to a short delay in building out the mitigation, versus if the resource constraints could lead

to a material inability to complete the mitigation in an acceptable time frame, or fully complete it at all.

Below, SCE describes each decision-making factor in greater detail.

- **Risk Analysis/Factors**: Risk is a primary consideration when selecting mitigation initiatives. Decisions incorporate one or more of the following risk factors:

- **Risk Drivers and Consequences Addressed:** There are many drivers to wildfire risk. It is necessary to have a portfolio of initiatives that collectively and sufficiently addresses the breadth of risk drivers. In some cases, an initiative such as covered conductor will address numerous risk drivers. In other cases, initiatives may more narrowly – but importantly – address one risk driver that none of the other initiatives address. For example, SCE's Vertical Switches initiative (SH-15) was included in SCE's WMP to address a very specific potential risk driver associated with a specific switch configuration in HFRA that was previously not addressed in our wildfire mitigation plan. In some cases, a mitigation initiative addresses a key driver that is already addressed to some degree by other initiatives, but the configuration is beneficial because the multiple initiatives work together to address the driver better than any single mitigation initiative. For example, though covered conductor addresses vegetation making contact with wires, line clearance and HTMP activities are also necessary to reduce heavy branches or trees from falling into lines that covered conductor may not be able to withstand. Moreover, vegetation management activities can be deployed more rapidly than covered conductor installation, and therefore can help reduce risk across HFRA in advance of covered conductor being installed. Finally, initiatives are also considered based on their ability to mitigate risk consequences. As an example, SCE deploys Community Resource Centers (CRCs) to enable the charging of portable mobile devices and distribute water and snacks. CRCs also provide access to air-conditioned facilities and restrooms, among other services, during a PSPS event. The CRCs do not prevent PSPS events. Instead, they help alleviate the consequences of a PSPS event.

- **Risk Reduction:** SCE aims to expeditiously reduce as much risk as possible in terms of our electrical lines and equipment being involved in an ignition that can lead to a wildfire. As SCE evaluates wildfire initiatives, the magnitude of risk reduction is a central consideration, with a preference toward those initiatives that can provide higher risk reduction.

Table SCE 7-02 shows the relative effectiveness of wildfire mitigation programs for wildfire risk drivers and PSPS. In the table, a solid white ball indicates no effectiveness (0%) at the driver level, while a solid black ball indicates the highest degree of effectiveness (>75%) at the driver level. The Harvey Balls are based on the weighted average effectiveness values of each ignition subdriver applicable to the driver category and are biased against historical recorded ignition drivers. For example, a mitigation can be effective against an ignition driver, but because there have been zero historical ignitions related to that particular ignition driver, its weighted effectiveness is zero.

Note that the Contact from Object driver was split into two categories: "Contact from Object – Vegetation" which represents effectiveness against vegetation contact and "Contact from Object – Other" which represents effectiveness against the animal contact, balloon contact, vehicle contact, and other.

PSPS effectiveness is categorized as High, Medium, or Low, which are defined as follows:

- High Effectiveness: Will result in a significant reduction or complete elimination of PSPS

- Medium Effectiveness: Will result in a moderate reduction of PSPS

- Low Effectiveness: Will result in a limited reduction of PSPS

Table SCE 7-02 - Mitigation Effectiveness

- **Risk Mitigation Effectiveness Uncertainty**: To the extent possible, SCE bases its assessment of mitigations' risk reduction effectiveness on quantitative data. However, sometimes quantitative data is either unavailable, due to the relative newness of an initiative, or only available in a small size. In such situations, SCE will rely on SME judgment and supplement with quantitative data as it becomes available. SCE takes into account the certainty of an initiative's effectiveness as it determines whether or not to deploy it and, if so, the magnitude of the deployment. Table SCE 7-03 below displays the sources of SCE's estimates of initiatives' risk mitigation effectiveness.

Table SCE 7-03 - Mitigation Effectiveness Sources

Risk Spend Efficiency (RSE): SCE developed its MAVF based on the six principles as set forth in the S-MAP Settlement.[116] The MAVF is a framework to combine different consequences (e.g., safety, reliability and

[116] *See* S-MAP Settlement Agreement, pp. A-5 – A-6.

financial) into a generic unitless risk score, MARS, so that risks and mitigation alternatives can be compared on a uniform scale. SCE uses MARS, as appropriate, to establish baseline risk and to develop RSEs, given that MARS itself has no visible standalone value. RSEs help SCE evaluate the relative cost-effectiveness of potential initiatives; this in turn provides insight concerning prudently allocating resources, funding, and efforts to efficiently mitigate wildfire risk.

That said, it would not be in the best interest of our customers or the communities we serve if SCE were to carry out a comprehensive wildfire risk mitigation plan based solely on RSEs. An RSE does not take into account certain operational realities, such as resource constraints, compliance issues, or service disruptions. Relying solely on RSEs could lead to significant parts of the system and potentially significant risk issues being left unaddressed. Indeed, the Commission's Safety and Enforcement Division (SED) noted that focusing solely on RSEs in selecting mitigations could be "suboptimal from an aggregate risk portfolio standpoint."[117] SED acknowledged that "mitigations are usually selected based on the highest risk spend efficiency score unless there may be some identified resource constraints, compliance constraints, or operational constraints that may favor another candidate measure with a lower RSE."[118] SCE agrees with this characterization. An initiative with a relatively higher RSE is generally favorable to one with a relatively lower RSE. However, when an initiative has a relatively lower RSE, it could still be selected if, for example, it is easier to deploy quickly (e.g., critical care battery backup program to medical baseline customers affected by PSPS), addresses a particular risk driver that other mitigations do not (e.g., C-hook replacement and aerial inspections), or reduces overall risk even if it costs more (e.g., targeted undergrounding).

Operational Feasibility / Lead Time to Deployment: An important feature of the selection process is obtaining an early understanding of the feasibility of implementing an initiative, and the time required to plan, design and ultimately deploy the initiative. Since SCE is focused on reducing wildfire risk as quickly as reasonably possible, our preference leans toward initiatives that can be deployed more quickly in order to protect public safety. However, SCE carefully considers certain initiatives that may have longer lead times but that are necessary to provide substantial long-term risk reduction. SCE provides deployment times for its portfolios in Table SCE 7-07 in Section 7.1.4.2.

Cost to Customers: While the primary focus of our WMP is to reduce wildfire and PSPS risk at an appropriately urgent pace for the safety of our customers, cost is a factor in the decision-making process. In addition to RSEs that assess the risk reduction benefits of each initiative against its costs, the total cost associated with any initiative also needs to be considered to account for customer affordability and funding constraints. SCE notes that implementation costs for selected mitigations as a whole are provided in

Table 4-1 in Section 4, at the portfolio level in Table SCE 7-06 in Section 7.1.4.2 and at the individual level in Table 11 of the QDR.

Enabling Activity / Technology / Additional Benefits: Initiatives can be selected that do not directly reduce wildfire or PSPS risk, but rather *enable* other initiatives to reduce risk, or to do so more efficiently. In our decision-making process, SCE will also consider indirect but worthwhile benefits that initiatives may provide. Such indirect benefits may include improved system reliability, faster service restoration, improved communications with customers, etc. While valuable, these secondary benefits may be less influential in the wildfire risk reduction decision-making process compared to the other factors.

[117] California Public Utilities Commission, Risk and Safety Aspects of Risk Assessment and Mitigation Phase Report of Pacific Gas and Electric Company, Investigation 17-11-003 (March 30, 2018), page 18.
[118] Id.

Compliance Requirement / Regulatory Guidance: In most circumstances, activities necessary to comply with local, state, or federal laws or regulations will be selected irrespective of other factors. In other words, compliance needs may weigh in favor of selecting the initiative even if other factors seem to weigh against selecting the initiative, particularly if the initiative represents the only prudent or feasible way to comply with the applicable law(s) or regulations(s). In addition, SCE takes into account Commission or other regulatory guidance and decisions when we are selecting wildfire mitigation activities and scope.

Resource Availability: With increasing work to maintain and operate the grid while upgrading it to mitigate safety and resiliency risks, there are increasing constraints associated with specialized resources such as planners, designers, engineers, field crews, etc. The scope of such resource constraints can be internal, across the state, and even nationwide at times. If requisite resources are not available, the potential initiative could be temporarily deferred or de-scoped.

7.1.4.2 Mitigation Initiative Prioritization

After identifying and characterizing the mitigation options, the electrical corporation must analyze the options to determine which will reduce risk the most, given limitations and constraints (e.g., resources available for mitigation initiatives). To the greatest extent practicable, the electrical corporation must make these determinations using its existing framework of project prioritization. The electrical corporation must strive to optimize its resources for maximum risk reduction.

The electrical corporation should seek the best integrated portfolio of mitigation initiatives to meet its performance objectives. Objectives may be based on quantified risk assessment results (see Section 6) or other values prioritized by the electrical corporation or broader stakeholder groups (e.g., environmental protection, public perception, resilience, cost). At a minimum, the electrical corporation must do the following:

- *Evaluate its potential mitigation initiatives. This evaluation will yield a prioritized list of initiatives. The objective is for the electrical corporation to identify the preferable initiatives for specific geographical areas. (Comparable to 2018 S-MAP Settlement Agreement, rows 12, 26, and 29.)*
- *Identify the best mitigation initiatives for all geographical areas to create a portfolio of projects expected to provide maximal benefits within known limitations and constraints. (Comparable to 2018 S-MAP Settlement Agreement, rows 12, 26, and 29.)*
- *Explain how the electrical corporation is optimizing its resources to maximize risk reduction. Describe how the proposed initiatives are an efficient use of electrical corporation resources and focus on achieving the greatest risk reduction with the most efficient use of funds and workforce resources.*

This process is expected to be iterative due to the competing nature of performance objectives and their complex interrelationships.

The electrical corporation must describe how it prioritizes mitigation initiatives to reduce both wildfire and PSPS risk. This discussion must include the following:

- *A high-level schematic showing the procedures and evaluation criteria used to evaluate potential mitigation initiatives. At a minimum, the schematic must demonstrate the roles of quantitative risk assessment, resource allocation, evaluation of other performance objectives (e.g., cost, timing) identified by the electrical corporation, and subject matter expert (SME) judgment. Where specific*

local factors, which vary across the service territory, are considered in the decision-making process (e.g., the primary risk driver in a region is legacy equipment), they must be indicated in the schematic. The detail must be sufficiently specific to understand why those local conditions are part of the decision process (i.e., there should not be simply one box in the schematic that is labeled "local conditions," which is then connected to the rest of the process).

- *Summary description (no more than five pages) of the procedures and evaluation criteria for prioritizing mitigation initiatives, including the three minimum requirements listed above in this section.*

Evaluate Mitigations

SCE's process for evaluating mitigations is described in detail in Section 7.1.4.1. High level schematics are provided as Figure SCE 7-01 and Figure SCE 7-02. High level schematics are provided as Figure SCE 7-01 and Figure SCE 7-02.

Optimized Mitigation Portfolios

After the initiatives are identified and evaluated pursuant to the process described above (SCE's evaluation process, criteria and high-level schematic are presented in Section 7.1.4.1), SCE designs portfolios of mitigations tailored to each of the three risk tranches.

Table SCE 7-04 - Preferred Mitigation Portfolio per Risk Tranche

Risk Tranche	Preferred Mitigation Portfolio
Severe Risk Areas	TUG or REFCL/CC++
High Consequence Areas	CC++
Other HFRA	VM/I++
Transmission[119]	TVM/I

Severe Risk Areas

For Severe Risk Area locations, the threat to lives and property is elevated to such an extent that SCE has determined that for public safety reasons it is prudent to not just significantly reduce ignition risk expeditiously but minimize it in the long term to the extent practicable. Therefore, undergrounding is preferred unless covered conductor has already been installed or specific terrain or local issues require alternatives such as covered conductor with supplementary mitigations.

For example, mountainous regions with winding rights-of-way and rocky soil may not be conducive to undergrounding. In those situations, SCE would examine alternatives such as covered conductor paired with REFCL. On the other hand, undergrounding may be more feasible in flat areas with silty clay soil, making that the preferred option. Accordingly, Severe Risk Areas are assigned either the portfolio known as TUG or REFCL/CC++.

Due to the potential impacts that a wildfire would have in these areas, when designing REFCL/CC++, SCE looked to mitigate all risk drivers to the extent reasonably possible. This necessarily means some cost-

[119] SCE's transmission lines also traverse severe risk areas, high consequence areas, and Other HFRAs.

efficient redundancy, which is desirable since no mitigation matches undergrounding on its own. Thus REFCL/CC++ includes covered conductor, fast curve, vegetation management, and fusing to address contact from object; REFCL, asset inspections, and covered conductor to address equipment failure; and covered conductor to address wire to wire contact.

As all options have implementation times of multiple months, up to as much as four years or more, SCE will continue to use initiatives such as Fast Curve (FC) settings, asset inspections on the most frequent basis, and, as a tool of last resort, PSPS to mitigate the risk of ignitions while the selected initiative is designed, permitted, and constructed.

High Consequence Areas

For High Consequence Area locations, SCE's strategy focuses on mitigating the majority of significant ignition risk drivers. SCE has selected CC++ for most of the High Consequence Areas that are still unmitigated, as it addresses all significant ignition risk drivers associated with overhead conductor, reduces more risk per dollar spent, and is faster and easier to deploy.

Other HFRA

For areas classified at Other HFRA, SCE will harden overhead distribution circuits over time, as it replaces retired or damaged bare wires with covered conductor pursuant to its standards in HFRA. SCE will continue wildfire mitigation initiatives such as asset inspections, Fast Curve settings, and vegetation management that have relatively low incremental costs or are dictated by compliance requirements or local conditions. Additionally, the deployment of technology like EFD may provide some monitoring benefit on these unmitigated aging assets (e.g., detect issues on the electric line before failure). Accordingly, Other HFRAs are assigned the VM/I++ portfolio of mitigations.

Although SCE is not currently targeting proactive hardening of these lines (with the exception of where it may be operationally efficient to do so), SCE periodically re-evaluates risks in these locations based on climate change impacts, refined risk methodologies and modeling, and/or more accurate information.

Transmission

Similar to SCE's overhead distribution lines, SCE's overhead transmission lines traverse Severe Risk Areas, High Consequence Areas and Other HFRAs. However, due to taller structures and greater space between phases, SCE's transmission lines generally have a lower risk of ignition than its overhead distribution lines and thus have its own portfolio of mitigations assigned to it, TVM/I. SCE will perform additional review and analysis of possible mitigations for transmission lines in 2023 beyond what is currently included in the TVM/I portfolio. This is further described in Section 8.1.2.12.1.

Table SCE 7-05 below summarizes the components of each portfolio and potential alternatives for each mitigation.

Table SCE 7-05 - Mitigation Portfolios

Mitigation	Portfolio Including Mitigation
Covered Conductor	CC++, REFCL/CC++
Undergrounding Overhead Conductor	TUG
Branch Line Protection Strategy	TUG, CC++, REFCL/CC++, VM/I++
Remote Controlled Automatic Reclosers Settings Update	TUG, CC++, REFCL/CC++, VM/I++
Circuit Breaker Relay Hardware for Fast Curve	TUG, CC++, REFCL/CC++, VM/I++

Mitigation	Portfolio Including Mitigation
Transmission Open Phase Detection	TVM/I
Tree Attachments Remediation	Deployed to address specific known issue
Long Span Initiative (LSI)	Deployed to address specific known issue
Vertical Switches	Deployed to address specific known issue
Vibration Damper Retrofit	Deployed to address specific known issue
Rapid Earth Fault Current Limiters (REFCL) - Ground Fault Neutralizer	REFCL/CC++
REFCL (Grounding Conversion)	REFCL/CC++
Early Fault Detection	CC++, REFCL/CC++, VM/I++
Distribution High Fire Risk-Informed Inspections & Remediations	TUG, CC++, REFCL/CC++, VM/I++
Transmission Risk-Informed Inspections & Remediations	TVM/I
Infrared of Distribution electrical lines & equipment	TUG, CC++, REFCL/CC++, VM/I++
Infrared of Transmission electrical lines & equipment	TVM/I
Generation High Risk Informed Inspections & Remediations	Legacy facilities only
Transmission Conductor & Splice	TVM/I
Hazard Tree Mitigation Program	TUG, CC++, REFCL/CC++, VM/I++
Structure Brushing	TUG, CC++, REFCL/CC++
Expanded Clearances for Legacy Facilities	Legacy facilities only
Dead and Dying Tree Removal	TUG, CC++, REFCL/CC++, VM/I++
Distribution Line Clearances	TUG, CC++, REFCL/CC++, VM/I++
Transmission Line Clearances	TVM/I

Table SCE 7-06 below summarizes the relative effectiveness of each portfolio across risk drivers.

Table SCE 7-06 - Efficacy of Mitigation Portfolios

Attribute	Underground	CC/REFCL++	CC++	VM/I++
Approximate Average lifetime cost/mile[120]	$2.9M-$4.5M+[121]	$1.1M-$2.3M	$1.1M-$1.3M	$0.35-$0.45M[122]
Deployment Speed[123]	25-48+ months	18-36+ months	16-24+months	Annual
Phase-to-phase incandescent particle ignition[124] mitigation	High	High	High	Low

[120] Cost estimates associated with the "++" and VM/I++ portfolio are lifetime O&M costs and excludes Capital costs.
[121] Based on current analysis, SCE estimates that a small population of underground miles may fall below this range.
[122] Estimate of lifetime cost of the VM/I++ portfolio in Other HFRAs
[123] Typical deployment timelines based on historical installations and projected costs. Actual timelines can vary further due to local conditions.
[124] Examples include conductor to conductor contact, balloon coming between two phase wires.

Attribute	Underground	CC/REFCL++	CC++	VM/I++
Phase-to-ground incandescent particle ignition[125] mitigation	High	High	High	Medium
Distribution Wire-down ignition mitigation	High	High	High	Low
Equipment Failure mitigation	High	High	Medium	Medium

Adjustments to Portfolios

As described in Section 6.2.1, the Review and Revise stage consists of the team of SMEs reviewing unhardened segments and local conditions to determine if the segments were appropriately categorized during the Initial Risk Categorization stage. SCE leverages this evaluation process to make individualized adjustments to mitigation portfolios for specific segments if local conditions make an alternative mitigation more appropriate. For example, if a long line of overhead conductor runs through a Severe Risk Area and serves what appears to be relatively small load, the team may recommend a Remote Grid option be evaluated in lieu of undergrounding. Or if the overhead line passes through a region filled with heavy trees and the terrain appears difficult to underground, the team may recommend the evaluation of spacer cable or the combination of covered conductor and REFCL. Further if during a feasibility review, if the mitigation is considered infeasible in a specific location due to local conditions, the Review and Revise team will recommend an alternative mitigation.

7.1.4.3 Mitigation Initiative Scheduling

The electrical corporation must report on its schedule for implementing its portfolio of mitigation initiatives. The electrical corporation must describe its preliminary schedules for each initiative and its iterative processes for modifying mitigation initiatives (Section 7.1.4.1).

Mitigation initiatives may require several years to implement. For example, relocating transmission or distribution capabilities from overhead to underground may require substantial time and resources. Since mitigation initiatives are undertaken in high-risk regions, the electrical corporation may need interim mitigation initiatives to mitigate risk while working to implement long-term strategies. Some examples of interim mitigation initiatives include more frequent inspections, fire detection and monitoring activities, and PSPS usage. If the electrical corporation's mitigation initiative requires substantial time to implement, the electrical corporation must identify and deploy interim mitigation initiatives as described in Section 6.3.1.

In its WMP submission, the electrical corporation must provide a summary description of the procedures it uses in developing and deploying mitigation initiatives. This discussion must include the following:

- *How the electrical corporation schedules mitigation initiatives.*
- *How the electrical corporation evaluates whether an interim mitigation initiative is needed and, if so, how an interim mitigation initiative is selected (see Section 7.2.3)*
- *How the electrical corporation monitors its progress toward its targets within known limitations and constraints. This should include descriptions of mechanisms for detecting when an initiative is off track and for bringing it back on track.*

[125] Examples include tree to conductor contact, animal contact between phase wires and pole.

- *How the electrical corporation measures the effectiveness of mitigation initiatives (e.g., tracking the number of protective equipment and device settings de-energizations that had the potential to ignite a wildfire due to observed damage/contact prior to re-energization). The mitigation sections of these Guidelines (Sections 8) include specific requirements for each mitigation initiative.*

Initiative Implementation Process and Schedule

While SCE's risk models continue to evolve, a guiding principle in scheduling mitigation initiatives is to prioritize work to reduce wildfire risk as expeditiously and efficiently as possible.

The following describes SCE's approach to mitigation scheduling by major mitigation category:

Grid Hardening activities are scheduled and scoped on a multi-year basis due to the long lead times to perform advanced planning tasks such as engineering, sourcing, permitting, municipal coordination, and resource allocation.

Inspections are scheduled on a risk-informed annual basis as described in Sections 8.1.3.1 and 8.1.3.2. At a minimum, SCE performs inspections on a cadence that meets or exceeds CPUC requirements with the riskiest areas getting the most frequent inspections.

Vegetation Management activities are also scheduled on a risk-informed basis as described in Sections 8.2.2.3 and 8.2.3.4. SCE performs vegetation management activities that meet or exceed CPUC requirements.

Activities related to **Situational Awareness**, **Emergency Preparedness**, and **Community Outreach and Engagement** are typically performed on an ongoing basis, with some seasonal variation, and are not scheduled in the same sense as hardening, inspection, and vegetation management activities. Please see Sections 8.3, 8.4, and 8.5 (respectively) for further detail.

Generally, SCE implements its wildfire mitigations through a process that consists of four phases: Initiate, Planning, Scheduling and Execute. The phases are defined below:

- Initiate is the process of developing the scope based on risk data.
- Planning involves engineering and design as well as initiating early permit application requirements
- Scheduling involves performing standard permitting and easement processes, environmental clearance processes, and verifying other permits. Additionally, during this phase materials are acquired, work is scheduled, and circuit maps finalized.
- Execution involves the construction and deployment of the activity.

For the initiate phase, initial selection and scoping is based on areas of highest risk, as defined by the three risk tranches in the IWMS Framework. SCE addresses those circuit-segments and circuits which present the greatest risk. However, SCE will often bundle work related to multiple and/or contiguous circuit-segments together to achieve operational efficiencies. For example, the risk associated with each circuit may not be uniform along its length. In other words, the risk can vary within a circuit, especially if that circuit traverses various parts of HFRA and is exposed to varying topography and vegetation that can influence fire propagation and consequence.

In some cases, it may be operationally efficient and prudent to remediate relatively lower risk segments of a circuit at the same time relatively higher risk segments of the same circuit are addressed, instead of sending

multiple crews out at multiple different times, requiring the development of separate work scope packages. Bundling work can also reduce community and environmental impacts by working in a location once versus sending crews to the same area multiple times.

The planning phase is next, once scope is selected. During this phase, a project manager is assigned to oversee the work and design resources are assigned to initiate the work order, design the project, map the circuit miles, procure the materials, and initiate obtaining permits. On average, this process takes six to nine months for WCCP and nine to fifteen months for TUG, assuming there are no completing resources for planning and no delays in environmental/agency approvals. Relatively higher risk segments might be remediated after other segments if it is more difficult to design or procure permits for them.

Scheduling begins with SCE's regional districts when the work is fully designed, permitted (including obtainment of easements), and cleared of environmental constraints. Scheduling is where materials are acquired, permits are verified, work is scheduled, and circuit maps are revised if found inconsistent with what is shown in the database. Design resources and project management teams also collaborate with customers, local government and state agencies to provide project details to obtain necessary easements prior to the start of construction. Scheduling can take between six to nine months for WCCP and nine to fifteen months for TUG.

In the execution phase, construction will proceed with necessary environmental monitoring if required. There are many factors that may affect the construction timeline including, for example, the size of the project, location of the project, terrain, environmental restrictions, weather (e.g., rain/snow, RFW days, etc.), resource availability and ensuring adherence to city requirements.

Every project will have unique factors that impact project timelines. For example, in many cases Qualified Electrical Workers (QEWs) are required to perform the electrical construction work. SCE uses a combination of SCE and external contractor crews to perform this work. The determination of which to utilize is based on crew availability, work priorities, location, and other factors.

Sample timelines for implementation of SCE's mitigation initiatives, assuming favorable conditions and no significant delay due to permitting or other reasons, are shown below in Table SCE 7-07. For inspection and vegetation management activities, the sample timelines are shown for the remediation portion of the work, as opposed to the inspection.

Table SCE 7-07 - Project Timelines for Wildfire Mitigations

Tracking ID	Mitigation	Initiate	Planning	Schedule	Execute	Total
SH-1	Covered Conductor	2-3 months	6-9 months	6-9 months	2-3 months	16 - 24 months
SH-2	Undergrounding Overhead Conductor	2-3 months	9-15 months	9-15 months	5-15 months	25 - 48 months
SH-4	Branch Line Protection Strategy[126]	1-2 months	3-4 months	10-11 months	10-11 months	14-17 months
SH-5	Remote Controlled Automatic Reclosers Settings Update[127]	1-3 months	1-3 months	1-2 months	1-4 months	4 - 12 months

[126] The schedule phase and execute phase for Branch Line Protection Strategy overlap
[127] Combines installation of Remote Controlled Automatic Reclosers (RAR) and RAR settings update

Tracking ID	Mitigation	Initiate	Planning	Schedule	Execute	Total
SH-6	Circuit Breaker Relay Hardware for Fast Curve	2-3 months	1-2 months	1-2 months	12-24 months	16-31 months
SH-8	Transmission Open Phase Detection	1-2 months	3-6 months	2-4 months	3-6 months	9 - 18 months
SH-10	Tree Attachments Remediation	2-3 months	6-8 months	9-10 months	12-14 months	26 - 35 months
SH-14	Long Span Initiative (LSI)	2-3 months	1-9 months	1-3 months	1-6 months	5 - 21 months
SH-15	Vertical Switches	Completed	1-2 months	1-2 months	1-2 months	3-6 months
SH-16	Vibration Damper Retrofit[128]	1-2 months	3-4 months	10-11 months	10-11 months	14 - 17 months
SH-17	Rapid Earth Fault Current Limiters (REFCL) - Ground Fault Neutralizer	2-3 months	12-72 months	4-9 months	6-12 months	24 - 96 months
SH-18	REFCL (Grounding Conversion)	2-3 months	4-18 months	2-4 months	2-4 months	10 - 29 months
SA-11	Early Fault Detection	1-2 months	3-6 months	2-4 months	3-6 months	9 - 18 months
IN-1.1	Distribution High Fire Risk-Informed Remediations	1day	5 – 11 months	1 month	1day	6 –12 months
IN-1.2	Transmission Risk-Informed Remediations	1day	5 – 11 months	1 month	1day	6 –12 months
IN-3	Distribution Infrared Remediations	1day	5 – 11 months	1 month	1day	6 –12 months
IN-4	Transmission Infrared Remediations	1day	5 – 11 months	1 month	1day	6 –12 months
IN-5	Generation High Risk Informed Inspections & Remediations	4-6 months	2-3 months	1-2 months	12 months	19 - 23 months
IN-9	Transmission Conductor & Splice Remediations	1day	5 – 11 months	1 month	1day	6 –12 months

VM-2	Structure Brushing Remediations	<1 day	<1 day	<1 day	<1 day	1 day
VM-3	Expanded Clearances for Legacy Facilities	1 day	1-2 months	1 month	1 week	2-3 months

[128] The schedule phase and execute phase for Vibration Damper Retrofit overlap

Tracking ID	Mitigation	Initiate	Planning	Schedule	Execute	Total
VM-4	Dead and Dying Tree Removal	1 day	1-2 months	1-2 month	1 day	2-4 months
VM-7	Distribution Line Clearances	1 day	1-2 months	1 month	1 day	2-3 months
VM-8	Transmission Line Clearances	1 day	1-2 months	1 month	1 day	2-3 months

Interim Strategy Development

Please see Section 7.2.3 Interim Mitigation Initiativesfor the explanation of interim strategy development.

Project Management Controls/Target Tracking

On an annual basis, SCE's performance management organization works with the strategy and execution teams to develop internal monthly and/or quarterly project plans for all WMP activities and targets.

The project plans are used in conjunction with other lagging and leading indicators to measure the monthly performance of the WMP activities in achieving their targets, as well as to proactively identify issues throughout the year that may affect an activity's performance. Key performance insights are consolidated into a performance dashboard and presented and discussed on a monthly basis with SCE executives and key leaders. The purpose of the dashboard is to:

- Clearly communicate WMP activities
- Monitor progress toward monthly / annual goals
- Measure delivery of key objectives
- Develop corrective action plans when activities fall behind plan

Performance issues are immediately raised within the respective execution teams, including identification of the key drivers / issues and a plan for resolution and recovery.

Performance highlights are also summarized and provided monthly to OEIS with a monthly report-out on activities that are behind-plan or at-risk of meeting their year-end targets.

On a quarterly basis, SCE further summarizes progress toward meeting its WMP commitments through development and delivery of the following deliverables to Energy Safety:

- Quarterly Notification Letter
- Quarterly Data Report - Geographic Information System (GIS) Data
- Quarterly Data Report – Wildfire Mitigation Data Tables

On an annual basis, SCE submits an Annual Report of Compliance (ARC) that details SCE's performance against its WMP, including a review of the wildfire mitigation initiatives implemented and an accounting of whether SCE met its performance targets, whether spending on any of those initiatives did not reach anticipated levels, and whether SCE followed its QA/QC processes.

SCE closely monitors the financial impacts of its wildfire mitigation portfolio on a regular basis, including through the following mechanisms described below.

Recording and reporting of actual spend: Costs incurred for WMP activities record to specific wildfire-related internal accounting codes. This allows SCE to properly track recorded costs against the WMP forecast.

Sarbanes-Oxley (SOX) controls: On a monthly basis, SCE's Finance organization performs SOX control testing on distribution inspection and remediation work orders to help ensure proper accounting. The Finance organization also performs SOX control testing on selected mitigations such as vegetation management, aerial inspections, wildfire remediations, and covered conductor expenditures to help ensure current monthly goods and services received and work performed are properly accrued and accounted for.

Performance Reviews and Year-End Projections: On a monthly basis, SCE's Finance organization partners with execution organizations to refresh assumptions for year-end financial projections for each activity. Throughout the course of the year, various factors may impact the achievement of year-end financial forecasts, including resource costs, work delays or acceleration, etc. SCE reviews variance analyses for work performed to-date, understands changes to cost-pers, and evaluates impacts to year-end financial projections. Any material updates to activity financial projections are approved through internal governance.

Mitigation Initiative Effectiveness

How the electrical corporation measures the effectiveness of mitigation initiatives (e.g., tracking the number of protective equipment and device settings de-energizations that had the potential to ignite a wildfire due to observed damage/contact prior to re- energization). The mitigation sections of these Guidelines (Sections 8) include specific requirements for each mitigation initiative.

Please see in the Performance Metrics tables in Sections 8.1, 8.2, 8.3, 8, Community Outreach and Engagement and 9 for Performance Metrics that SCE has selected for each WMP category. Additional performance metrics are provided in SCE's Wildfire Mitigation Data Tables. SCE will use these metrics, along with other data such as field observations and ignition investigations, to help inform its annual evaluation and calculation of mitigation initiatives' effectiveness against risk drivers, as discussed in Section 7.1.4.1.

SCE also considers learnings from observed risk events as potentially relevant to evaluating mitigation effectiveness. This discussion can be found in Section 10 (Lessons Learned) and Section 11 (Corrective Action Program). These types of learnings may provide insight that SCE uses to adjust or change its approach.

As SCE has stated in prior regulatory filings,[129] risk outcomes and events will vary from year to year based on factors such as weather, system conditions, and other variables. SCE actively monitors risk events and performance metrics, but also understands that a complete understanding of mitigation effectiveness takes several years of observed field data to account for short-term and annual variations inherent in any real-world deployment.

SCE may also use formal studies and analysis to understand mitigation effectiveness. For example, as

[129] *See, e.g.*, SCE's 2022 WMP – Chapter 6.3; November 28, 2022 SCE Opening Comments on Draft Annual Report on Compliance for Southern California Edison's 2020 Wildfire Mitigation Plan; November 22, 2021 SCE Comments on Draft Resolution M-4860 and Related Attachments.

described in SCE's Covered Conductor Compendium,[130] SCE performed benchmarking with other utilities around the world, reviewed literature for best practices, and worked with research institutions and suppliers to perform testing on the effectiveness of covered conductor.

Additionally, SCE also recently worked with other California IOUs to commission Exponent, an independent third party, to review potential failure modes of overhead lines, both bare and covered, and performed additional testing to understand the effectiveness of covered conductor. This additional independent testing on covered conductor effectiveness evaluated phase-to-phase contact and simulated wire-down testing. "CCs were 100% effective at preventing arcing and ignition in tested scenarios at rated voltages. This is consistent with documented field experience as reported in Exponent's Phase I report."[131]

[130] SCE's Covered Conductor Compendium is available at https://www.sce.com/safety/wild-fire-mitigation

[131] See "Joint IOU Covered Conductor Testing Cumulative Report 12-22-22_Redacted", Exponent, pg. vi this document is also available at https://www.sce.com/safety/wild-fire-mitigation

7.2 Wildfire Mitigation Strategy

Each electrical corporation must provide an overview of its proposed wildfire mitigation strategies based on the evaluation process identified in Section 7.1.

7.2.1 Overview of Mitigation Initiatives and Activities

The electrical corporation must provide a high-level summary of the portfolio of mitigation initiatives across its service territory. In addition, the electrical corporation must describe its reasoning for the proposed portfolio of mitigation initiatives and why it did not select other potential mitigation initiatives.

Additionally, for each mitigation initiative category, the electrical corporation must provide the following:

- *A high-level overview of the selected mitigation initiatives*
- *An implementation plan, including its schedule and how progress will be monitored*
- *How the need for any interim mitigation initiatives was determined and how interim mitigation initiatives were selected (see Section 7.2.3)*

Overview

Please see Section 7.1.4, in particular, Table SCE 7-02, Table SCE 7-03, Table SCE 7-04, Table SCE 7-05, Table SCE 7-06 and Table SCE 7-07, for a high-level summary of SCE's portfolio of mitigation initiatives. SCE employs a combination of complementary activities in the categories of grid hardening, asset inspections, vegetation management, grid operations and situational awareness that are developed and targeted to address local wildfire and PSPS conditions. These activities are further complemented by Emergency Preparedness and Community Outreach and Engagement activities.

For an explanation of SCE's mitigation selection process, including choices when multiple options may be available, please see Section 7.1.4.1. SCE's IWMS, which guides mitigation prioritization and selection (e.g., should a given area receive undergrounding, covered conductor, more frequent inspections, etc.), is described in Section 7.1.4.2. The three risk tranches defined by the IWMS Risk Framework are primarily used to determine prioritization and selecting mitigations for grid hardening, vegetation management, and asset inspection activities.

Implementation Plan

Please see Table SCE 7-08, which provides a category level overview, information on the implementation plan for each category, and interim mitigation strategies. The table below contains information at a summary level; see Sections 8.1 through Community Outreach and Engagement for more detail on the various mitigation initiatives for each category in SCE's wildfire mitigation portfolio.

Section 7.2.3 Interim Mitigation Initiatives provides additional detail on interim mitigation initiatives that accompany this plan to address near-term risks while longer-lead time initiatives are implemented.

Please also see Table 7-2, which SCE has populated based on the template provided in the Final Guidelines. SCE has interpreted this requirement as a table that lists the 3- and 10-year objectives by initiative category.

Table SCE 7-08 - Proposed Wildfire Mitigation Portfolio Category Overview

Initiative Category	Overview	Implementation Plan	Interim Initiative Selection
Grid Design, Operations, and Maintenance (System Hardening) Sections 8.1.2, 8.1.8	Mitigation initiatives in this category are implemented to maintain, strengthen, and upgrade electrical equipment and infrastructure to reduce the risk of fire ignitions in the HFRA. Key initiatives include Covered Conductor (SH-1), Targeted Undergrounding (SH-2), REFCL (SH-17 and SH-18), and Circuit Breaker Relay Hardware for Fast Curve (SH-6).	SCE's grid hardening initiatives follow the Initiate, Plan, Schedule and Execute approach as described in 7.1.4.3. Initiatives have various timelines for them to be installed in the field (e.g., WCCP takes ~16-24 months to implement).	SCE determines the interim mitigation(s) by the proposed long-term mitigation strategy (covered conductor or Targeted Undergrounding) that will be deployed using SCE's IWMS. Areas that will be undergrounded will have interim mitigations deployed such as asset inspections (at the most frequent interval), vegetation management, and fast curve settings, that are complementary to covered conductor while the segment is waiting to be undergrounded. See Section 7.2.3 Interim Mitigation Initiatives for more details.
Grid Design, Operations, and Maintenance (Asset Inspections) Section 8–8.1.7	Mitigation initiatives in this category are aimed at inspecting assets in HFRA and remediating identified issues in a timely manner. Key initiatives include Distribution and Transmission High Fire Risk-Informed (HFRI) Inspections & Remediations (IN-1.1 and IN-1.2)	SCE conducts detailed inspections of each structure within HFRA at least once every three years. All structures in areas identified as 'Severe Risk Area' will be inspected annually at minimum.	Due to their repeated and cyclical nature, inspection initiatives generally don't require interim initiatives. Inspections may be used as interim mitigations for other initiatives.
Grid Design, Operations, and Maintenance (Operations) Section 8.1.8	The settings covered by this category are aimed at reducing the risk of wildfires during periods of elevated fire conditions. Key settings include Fast Curve and blocking automatic reclosers.	Implementation time to activate settings during periods of elevated fire threats is very brief where the equipment is capable of those settings.	Due to the short timeframe to activate settings on equipment, protective settings generally don't require interim initiatives. Protective settings may be used as interim mitigations for other initiatives.

Initiative Category	Overview	Implementation Plan	Interim Initiative Selection
Vegetation Management and Inspection Section 8.2	Mitigation initiatives in this category are aimed at preventing risks to public safety and system reliability by managing vegetation in proximity to SCE's electric facilities. Key initiatives include Hazard Tree Management Program (VM-1), Structure Brushing (VM-2), Dead and Dying Tree Removal (VM-4), Distribution Line Clearances (VM-7) and Transmission Line Clearances (VM-8).	Vegetation HTMP inspections are risk prioritized. Grids in the highest risk category follow an annual inspection cycle, while less risky grids follow a three-year inspection cycle. Routine line clearing is performed annually, or more often as needed.	Due to their repeated and cyclical nature, vegetation management initiatives generally don't require interim initiatives. They may be used as interim mitigations for other initiatives.
Situational Awareness and Forecasting Section 8.3	Mitigation initiatives in this category are aimed at improving SCE's weather and fuels modeling and enhancing SCE's visibility of conditions on the system via enhanced monitoring. Key initiatives include Weather Stations (SA-1), Weather and Fuels Modeling System (SA-3) and HD Cameras (SA-10).	SCE prioritizes weather station installations on HFRA circuits that are most likely to exceed PSPS wind thresholds. All distribution circuits that met or exceeded PSPS wind thresholds in the past five years have at least one weather station installed. SCE partners with UCSD to install HD cameras in locations where its Fire Science Team, Fire Management Team, IMT and/or fire agencies provide insight for rural areas needing views to assist in confirming the start of a fire.	Due to the relatively short implementation time of these initiatives, SCE generally does not have interim initiatives. As they're being installed, SCE relies upon previously installed units. For example, while new HD cameras are being installed, SCE relies upon HD cameras already in place.
Emergency Preparedness Section 8.4	Mitigation initiatives in this category are aimed at preparing SCE's response teams for hazards that potentially impact SCE's service area, including service restoration and supporting customers and	Aerial suppression resources can be deployed after the onset of a fire to help reduce the area burned and number of structures damaged or destroyed.	Due to their relatively short implementation time and cyclical nature, SCE generally does not have interim initiatives for initiatives in this category.

Initiative Category	Overview	Implementation Plan	Interim Initiative Selection
	communities during PSPS events. Key initiatives include Adequate and trained workforce for service restoration SCE Emergency Responder Training (DEP-2) Aerial Suppression (DEP-5), and Critical Care Backup Battery Program (PSPS-2).	During PSPS events, SCE uses Community Resource Centers and Community Crew Vehicles to provide support to customers in areas most likely to experience shutoffs.	
Community Outreach and Engagement Section 8.5	Mitigation initiatives in this category are aimed at engaging customers, the community and other stakeholder groups on information about PSPS, emergency preparedness, and SCE's wildfire mitigation plan efforts. Key initiatives include Community Meetings (DEP-1.2) and Customer Research and Education (DEP-4)	SCE will implement a customer-centric, integrated communications strategy to deliver consistent and cohesive messaging across traditional and digital channels to increase wildfire/PSPS customer education and preparedness.	Due to their relatively short implementation time and cyclical nature, SCE generally does not have interim initiatives for initiatives in this category.

Table 7-3 - List and Description of Electrical Corporation-Specific WMP Mitigation Initiatives for 3-year and 10-year Outlooks

WMP Category	Within 3 Years	Within 10 Years	Location in WMP
Grid design, Operations, and Maintenance	• Continue to perform targeted grid hardening to minimize impact on customers by reducing the scope and frequency of PSPS • Continue to prioritize grid hardening deployment based on the IWMS Risk Framework • Continue to deploy protection system mitigations and also refine circuit protection strategies to further reduce wildfire risk while balancing system reliability • Continue evaluation of emerging technologies to determine if any should be added to the grid hardening wildfire mitigation portfolio • Perform assessments of transmission hardening options and develop potential pilots/programs (contingent upon results of assessments) • Evaluate and update the inspection form regarding distribution and transmission high fire risk-informed (HFRI) inspections to reduce time required for data capture while still capturing critical information and incorporating lessons learned of potential failure modes • Continue to align scope selection of inspection programs with the IWMS Risk Framework • Develop and implement risk-prioritized remediations to reduce backlog of asset notifications	• Complete all proactive wildfire mitigation grid hardening • Obtain and implement more programmatic permitting that allows more streamlined execution of grid hardening work • Scale any new successful emergent technologies to supplement existing foundational grid hardening mitigations • If feasible and applicable, implement programs/pilots resulting from integrated transmission hardening strategy development and analysis • Integrate AI/ML analytical tools into inspection image data analysis to identify assets and defects • Integrate new technological tools into data collection for asset inspections (e.g., LiDAR) to identify defects (e.g., clearance issues) that need remediation • Maintain backlog at minimum levels and with as little fire risk as possible	Section 8.1
Vegetation Management	• Complete Joint-IOU Effectiveness of Enhanced Clearances Study • Deploy centralized inspection strategy and transition to circuits from grids • Develop and implement a risk-informed process to minimize backlog • Make substantial progress on evaluating remote sensing technology for vegetation inspections	• Replace a majority of ground inspection for vegetation line clearing in HFRA with remote sensing technology (e.g., LiDAR, satellite), subject to the evolution and effectiveness of the technology • Create and implement predictive growth model to facilitate "auto prescription" to reduce the frequency of manual or remote inspection in HFRA • Optimize vegetation inspection cycles/prescriptions based on risk factors (e.g., species, wind) for more granular locations • Obtain and implement programmatic permits to facilitate timely vegetation management work execution	Section 8.2
Situational Awareness and Forecasting	• Increased data collection (through additional weather station deployment, explore increased collection intervals, and additional SCE HD camera deployment) to expand situational awareness of real-time conditions and refine weather models • Expand data analysis supporting wildfire mitigation efforts, advance fire potential forecasting further, and improve modeling efforts as it relates to fire science • Increase ability to detect issues (e.g., damage and degradation) on the electric grid prior to risk events occurring • Review emerging technologies to improve weather situational awareness and forecasting capabilities for potential evaluation or adoption • Continue to increase situational awareness and improve the accuracy of weather forecasting to help optimize the scope of PSPS events	• Incorporate climate modeling (e.g., impacts of climate change) into medium- and long-term weather and fire potential forecasts • Continue to incorporate technologies and pilots into grid monitoring	Section 8.3

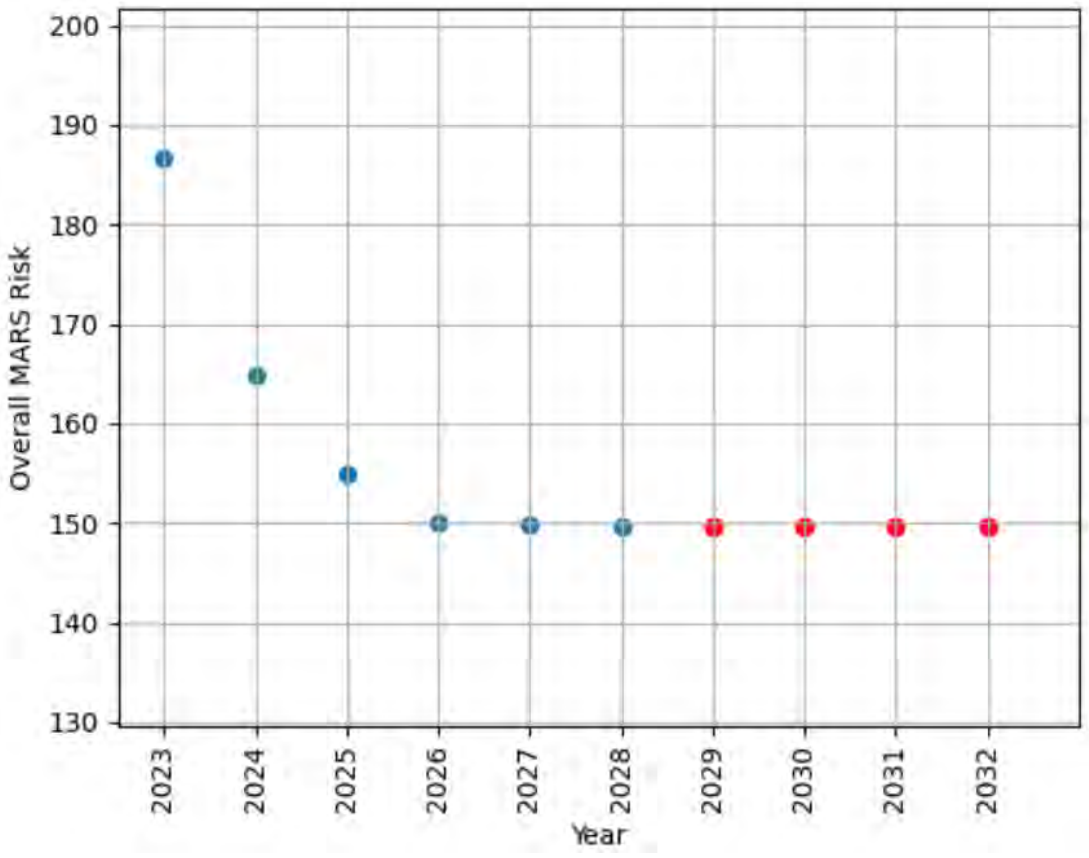
WMP Category	Within 3 Years	Within 10 Years	Location in WMP
Emergency Preparedness	• Maintain a comprehensive all-hazards planning and preparedness program to provide effective emergency response and to safely and expeditiously restore service during and after a major event • Provide effective and accurate communications to the public before, during and immediately following major outages and emergencies	• Refined emergency planning and preparedness practices and programs to support customers before, during, and following emergency events • Ongoing implementation of lessons learned and findings from After Action Reports (AARs) and other external sources to continuously improve emergency response capabilities	Section 8.4
Community Outreach and Engagement	• Actively collaborating with stakeholder networks and partnerships to better understand customer, community and stakeholder specific needs and develop tailored solutions, including AFN • Meet at least quarterly to provide updates on PSPS enhancement efforts and solicit input for improvement areas in how SCE approaches PSPS overall and provides a forum for stakeholders to propose ways to improve all aspects of PSPS	• Refine stakeholder engagement capabilities through tailored approaches for outreach, engagement and information exchange with customers, communities, and stakeholders • Continue to look for ways to expand engagement with agencies outside of CA, including supporting IWRMC's efforts to expand utility membership base and appoint leaders to its Executive Steering Group	Section 8.5
PSPS	• Re-evaluate existing PSPS windspeed thresholds using engineering-based analysis that considers, among other factors, the effectiveness of covered conductor. • Perform additional grid sectionalization and automation, paired with weather stations, to reduce the scope of PSPS events • Evaluate emerging technology for potential incorporation into PSPS protocols • Continue to increase situational awareness and improve precision of weather forecasting to help optimize the scope of PSPS events	• Sufficiently harden HFRA circuits to reduce potential PSPS impacts by up to 90%[132] • Incorporate successful emerging technologies into PSPS protocols to optimize scale, scope and frequency of PSPS	Section 9

[132] This analysis assumes an average PSPS threshold of 31mph sustained winds or 46mph wind gusts for bare, non-hardened circuits, and compares the average exceedance of that control point versus an average threshold of 40mph sustained winds or 58mph wind gusts for circuits with full covered conductor. Based on historical wind speed and FPI, the average circuit across SCE's service territory breaches the approximated hardened threshold about 90% less.

7.2.2 Anticipated Risk Reduction

In this section, the electrical corporation must present an overview of the expected risk reduction of its wildfire mitigation activities.

The electrical corporation must provide:



- *Projected overall risk reduction*
- *Projected risk reduction on highest-risk circuits over the three-year WMP cycle*

7.2.2.1 Projected Overall Risk Reduction

In this section, the electrical corporation must provide a figure showing the overall utility risk in its service territory as a function of time, assuming the electrical corporation meets the planned timeline for implementing the mitigations. The figure is expected to cover at least 10 years. If the electrical corporation proposes risk reduction strategies for a duration longer than ten years, this figure must show that corresponding time frame. Figure 7-1. is an example of a graph showing the long-term projected changes in overall risk.

As part of IWMS, SCE uses MARS to help quantify risk at a particular point of time and then to demonstrate risk reduction. Please see Figure 7-1, where SCE has projected overall risk in HFRA for the years of 2023 through 2028 (represented by the blue dots), which covers the current WMP cycle and the forecast period in SCE's 2025 General Rate Case. SCE has assumed a steady state risk level for the years of 2029 through 2032 (represented by the red dots), as SCE has not currently planned or scoped incremental mitigations after 2028, other than the replacement of retired overheard bare distribution wire with covered conductor pursuant to SCE's design standards in HFRA. SCE updated this figure on April 2, 2024. Please see Chapter 1 of the 2025 WMP Update for details.

Figure 7-1 - Projected Overall HFRA Risk

7.2.2.2 Risk Impact of Mitigation Initiatives

The electrical corporation must calculate the expected "x% risk impact" of each of its mitigation initiative activity targets for each year from 2023–2025. The expected x% risk impact is the expected percentage risk reduction on the last day of each year compared to the first day of that same year. For example: For protective devices and sensitivity settings, the risk on Jan. 1, 2024 = 2.59×10^{-1} After meeting its planned initiative activity targets for protective devices and sensitivity settings, the risk on Jan. 1, 2024 = 1.29×10^{-1} The expected x% risk impact for the protective devices and sensitivity settings initiative in 2024 is:

$$\frac{\text{risk before} - \text{risk after}}{\text{risk before}} \times 100$$

$$\frac{2.59 \times 10^{-1} - 1.29 \times 10^{-1}}{2.59 \times 10^{-1}} \times 100 = 50\%$$

The expected "x% risk impact" numbers must be reported for each planned mitigation initiative activities in the specific mitigation initiative sections of Section 8 (see example tables in Section 8).

7.2.2.3 Projected Risk Reduction on Highest-Risk Circuits Over the Three- Year WMP Cycle

The objective of the service territory risk reduction summary is to provide an integrated view of wildfire risk reduction across the electrical corporation's service territory. The electrical corporation must provide the following information:

- *Tabular summary of number risk reduction for each high-risk circuit, showing rick levels before and after the implementation of mitigation initiatives. This must include the same circuits, segments, or span IDs presented in Section 6.4.2. The table must incluse the following information for ach circuit*
    - ***Circuit, Segment, or Span ID:** Unique identifier for the circuit, segment, or span.*
        - *If there are multiple initiatives per ID, each must be listed separately, using an extender to provide a unique identifier*
        - ***Overall Utility Risk:** Numerical value for the overall utility risk before and after each mitigation initiative.*
        - ***Mitigation initiatives by implementation year:** Mitigation initiatives the electrical corporation plans to apply to the circuit in each year of the WMP cycle.*

Table 7-4 provides an example of a summary of risk reduction for top-risk circuits.

Table 7-4 shows the same circuits presented in Section 6.4.2, using MARS to rank them by overall utility risk in HFRA. To be clear, the existing risk as of January 1, 2023 takes into account covered conductor that was installed prior to 2023. Residual risk may remain high according to MARS for some circuits even after covered conductor is installed due to high potential consequence in those areas. SCE provides a more detailed description of the top-risk circuits below. SCE updated this table on April 2, 2024. Please see Chapter 1 of the 2025 WMP Update for details.

Table 7-4 - Summary of Risk Reduction for Top-Risk Circuits

Circuit Name	*Jan. 1, 2023 Overall utility risk*	*Jan. 1, 2023 - Dec. 31, 2023 Mitigation Initiatives*	*Jan. 1, 2024 Overall utility risk*	*Jan. 1, 2024 - Dec. 31, 2024 Mitigation Initiatives*	*Jan. 1, 2025 Overall utility risk*	*Jan. 1, 2025 - Dec. 31, 2025 Mitigation Initiatives*	*Jan. 1, 2026 Overall utility risk*

7.2.3 Interim Mitigation Initiatives

As indicated in Section 7.1.4.3, for each mitigation that will require greater than one year to implement, the electrical corporation must assess the potential need for interim mitigation initiatives to reduce risk until the primary or permanent mitigation initiative is in place. If the electrical corporation determines that an interim mitigation initiative is necessary, it must also develop and implement that initiative as appropriate.

- *The electrical corporation must provide a description of the following in this section of the WMP:*
- *The electrical corporation's procedures for evaluating the need for interim risk reduction*
- *The electrical corporation's procedures for determining which interim mitigation initiative(s) to implement*
- *The electrical corporation's characterization of each interim risk management/reduction action and evaluation of its specific capabilities to reduce risks, including:*
    - *Potential consequences of risk event(s) addressed by the improvement/mitigation*
    - *Frequency of occurrence of the risk event(s) addressed by the improvement/mitigation*

Each interim mitigation initiative planned by the electrical corporation for implementation on high-risk circuits must be listed as a mitigation initiative in Section 8. In addition, interim mitigation initiatives must be discussed in the relevant mitigation initiative sections of the WMP and included in the related target tables.

SCE's overall approach to interim mitigations is based on two considerations. The first are the known risks on the circuit segment. For example, if there are long spans at heightened risk of wire-to-wire contact or heavy trees within range of SCE's facilities. The second is the current expected timeframe for the permanent mitigations to be deployed on the system. Generally speaking, the primary mitigation initiatives that require interim mitigation strategies due to their lead times are covered conductor and undergrounding, both of which are explained further below.

SCE deploys one interim mitigation (SH-14, described below), as local conditions require, on segments that will be hardened with covered conductor.

Long Span Initiative (SH-14). This initiative installs line spacers on segments that are at heightened risk of wire-to-wire contact. SCE can implement this remediation relatively quickly, making it an effective interim mitigation option to reduce risk on overhead lines that are especially subject to this risk driver.[133] Please see Section 8.1.2.5.2 for more details on LSI.

In addition to the above interim mitigation, SCE will also implement complementary mitigations, as local conditions require, prior to the installation of covered conductor. Mitigations including asset inspections, vegetation management, and fast curve settings will mitigate contact from object, wire-to-wire contact, and equipment failure risk drivers on the circuit segment before covered conductor is installed. In some cases, based on local conditions, SCE may perform additional inspections or vegetation management inspections as part of its Areas of Concern effort, which is described in more detail in Section 8.1. However, unlike LSI, SCE will continue using these mitigations on the circuit segment after covered conductor is installed. As discussed in Section 7.1.4, they complement covered conductor by either

[133] LSI may also be installed as a long-term mitigation on wires that are not scoped for covered conductor.

addressing risk drivers that covered conductor doesn’t or has relatively lower effectiveness and by adding an extra layer of defense on risk drivers that covered conductor does address.

SCE deploys three interim mitigations on segments that will be hardened with undergrounding. These mitigations will cease in their current form after overhead lines are replaced with underground lines:

1) Long-Span Initiative (SH-14): See comments above.

2) The second interim mitigation is SCE's asset inspection portfolio (e.g., 360-degree inspections and Infrared); for more details, please see Section 7.2.3 Interim Mitigation Initiativeswhich reduces ignitions caused by overhead equipment failures.

3) SCE's vegetation management portfolio (e.g., expanded line clearing, Hazard Tree Mitigation Program, etc.); for more details, please see Section 8.2, which reduces ignitions caused by vegetation contacting overhead facilities.

SCE will also utilize, if necessary, PSPS in location that are scoped for undergrounding or covered conductor. Until such time as SCE installs covered conductor or undergrounding, SCE will utilize lower winder speed thresholds for bare-conductor isolatable segments. After installation of covered conductor or undergrounding, SCE will either raise de-energization thresholds or, in the case of where a segment and its feeder are undergrounded, not use PSPS. Further details can be found in Sections 8.1.2 and 9.

8 WILDFIRE MITIGATIONS

8.1 Grid Design, Operations, and Maintenance

8.1.1 Overview

In this section, the electrical corporation must identify objectives for the next 3- and 10-year periods, targets, and performance metrics related to the following grid design, operations, and maintenance programmatic areas:

- *Grid design and system hardening*
- *Asset inspections*
- *Equipment maintenance and repair*
- *Asset management and inspection enterprise system(s)*
- *Quality assurance / quality control*
- *Open work orders*
- *Grid operations and procedures*
- *Workforce planning*

8.1.1.1 Objectives

Each electrical corporation must summarize the objectives for its 3-year and 10-year plans for implementing and improving its grid design, operations, and maintenance.[134] These summaries must include the following:

- *Identification of which initiative(s) in the WMP the electrical corporation is implementing to achieve the stated objective, including Utility Initiative Tracking IDs*
- *Reference(s) to applicable codes, standards, and best practices/guidelines and an indication of whether the electrical corporation exceeds an applicable code, standard, or regulation*
- *Method of verifying achievement of each objective*
- *A target completion date*
- *Reference(s) to the WMP section(s) or appendix, including page numbers, where the details of the objective(s) are documented and substantiated*

This information must be provided in Table 8-1 for the 3-year plan and Table 8-2 for the 10-year plan.

The tables below are based on the examples provided in the Technical Guidelines.

[134] Annual information included in this section must align with Tables 1 and 12 of the QDR.

Table 8-1 - Grid Design, Operations, and Maintenance Objectives (3-year plan)

Objectives for Three Years (2023–2025)	Applicable Initiative(s), Tracking ID(s)	Applicable Regulations, Codes, Standards, and Best Practices (See Note)	Method of Verification (i.e., program)	Completion Date	Reference (section & page #)
Continue to perform targeted grid hardening to minimize impact on customers by reducing the scope and frequency of PSPS.	• WCCP (SH-1) • UG (SH-2)	• GO 95 • SCE Distribution Overhead Construction Standards (DOH) • SCE Distribution Underground Construction Standards (DUG) • GO 128	Completion of planned targeted covered conductor and/or sectionalization devices each year (which can be through work orders, GIS maps, etc.)	December 2025	Section 8.1.2, pp. 250-257
Continue to prioritize grid hardening deployment based on the IWMS Risk Framework	• WCCP (SH-1) • TUG (SH-2) • REFCL (SH-17, SH-18) • Long Span Initiative (SH-14) • Tree Attachment Remediation (SH-10) • Remote Controlled Automatic Reclosers (SH-5) • CB Relays & Fast Curve (SH-6) • Vibration Dampers (SH-16) • Fire Resistant Wrap Retrofit (8.1.2.3.2) • Vertical Switches (SH-15) • Transmission IWMS (8.1.2.12.1)	• GO 95 • GO 165 • SCE DOH • SCE DUG • GO 128 • SCE Distribution Apparatus Construction Standards (DAP) • SCE Electrical Construction Station (ECS) • SCE Electric Design Station Wiring (EDSW) • SCE Distribution Design Standards (DDS)	Measuring how much of grid hardening mitigation deployed (e.g., number of circuit miles, number of units, number of structures, etc.) is aligned with IWMS	December 2025	Sections 8.1.2, pp. 250-277, 8.1.8, pp. 331 - 342 and pp. 8.3.3, 467-492
Continue to deploy protection system mitigations and also refine circuit protection strategies to further reduce wildfire risk while balancing system reliability	• Distribution Open Phase Detection (8.1.8.1.3.3) • Transmission Open Phase Detection (SH-8) • CB Relays & Fast Curve (SH-6) • High Impedance Relay (8.1.8.1.3.1) • Branch line Protection Strategy (SH-4)	• GO 95	Validation of system updates or installations or review of pertinent outage, event, ignition, risk and/or reliability data to evaluate effectiveness.	December 2025	Sections 8.1.2, pp. 250-277, 8.1.8, pp. 331 - 342 and 8.3.3, pp. 467-492
Continue evaluation of emerging technologies to determine if any should be added to the grid hardening wildfire mitigation portfolio	• Remote Grid (8.1.2.9.1) • Spacer Cable	• GO 95	Provide report of remote grid and spacer cable that includes recommendations for plan and	December 2025	Section 8.1.2, pp. 274-275, 251-253

Objectives for Three Years (2023–2025)	Applicable Initiative(s), Tracking ID(s)	Applicable Regulations, Codes, Standards, and Best Practices (See Note)	Method of Verification (i.e., program)	Completion Date	Reference (section & page #)
			strategy going forward		
Perform assessments of transmission hardening options and develop potential pilots/programs (contingent upon results of assessments)	• Transmission IWMS (8.1.2.12.1) • High-risk transition spans	• GO 95 • SCE Transmission Overhead Construction Standards (TOH)	Provide report of transmission grid hardening assessment that includes recommendations for plan and strategy going forward	December 2025	Sections 8.1.2 p. 278, 8.1.3.2, pp. 289-293
Evaluate and update the inspection form regarding distribution and transmission high fire risk-informed (HFRI) inspections to reduce time required for data capture while still capturing critical information and incorporating lessons learned of potential failure modes.	• Inspections and Remediations - Distribution High Fire Risk-Informed (HFRI) Inspections and Remediations (IN-1.1) - Transmission FRI Inspections and Remediations (IN-1.2) • Inspection Work Management Tools - Inspection and Maintenance Tools (IN-8) - Asset Defect Detection using AI/ML (IN-8)	• GO 95 • GO 165 • SCE Distribution Inspection Maintenance Program (DIMP) • SCE Transmission Inspection Maintenance Program (TIMP)	Revised/new version of inspection form	December 2025	Section 8.1.3.1, pp. 282-289 (IN-1.1) Section 8.1.3.2, pp. 289-293 (IN-1.2) Section 8.1.5, pp. 319-325 (IN-8)
Continue to align scope selection of inspection programs with the IWMS Risk Framework	• Inspections and Remediations - Distribution HFRI Inspections and Remediations (IN-1.1) - Transmission HFRI Inspections and Remediations (IN-1.2) - Infrared Inspection of Energized Overhead Distribution Facilities and Equipment (IN-3) - Infrared Inspection, Corona Scanning, and High-Definition Imagery of Energized Overhead Transmission Facilities and Equipment (IN-4) - Generation High Fire Risk-Informed Inspections and Remediations in HFRA (IN-5)	• GO 95 • GO 165	Percent of overall risk inspected annually for each program	December 2025	Section 8.1.3.1, pp. 282-289 (IN-1.1) Section 8.1.3.2, pp. 289-293 (IN-1.2) Section 8.1.3.5, pp. 297-299 (IN-3) Section 8.1.3.6, pp. 300-302 (IN-4) Section 8.1.3.7, pp. 303-304 (IN-5)

Objectives for Three Years (2023–2025)	Applicable Initiative(s), Tracking ID(s)	Applicable Regulations, Codes, Standards, and Best Practices (See Note)	Method of Verification (i.e., program)	Completion Date	Reference (section & page #)
Develop and implement risk-prioritized remediations to reduce backlog of asset notifications	• Inspections and Remediations - Distribution HFRI Inspections and Remediations (IN-1.1) - Transmission HFRI Inspections and Remediations (IN-1.2)	• GO 95 • GO 165	Number of past due notifications and associated risk of those notifications	December 2025	Section 8.1.3.1, pp. 282-289 (IN-1.1) Section 8.1.3.2, pp. 289-293 (IN-1.2)

Note: An asterisk indicates that the electrical corporation exceeds a particular code, regulation, standard, or best practice. The electrical corporation must provide a reference to the appendix section and page providing further documentation and substantiation.

Table 8-02 - Grid Design, Operations, and Maintenance Objectives (10-year plan)

Objectives for Ten Years (2026–2032)	Applicable Initiative(s), Tracking ID(s)	Applicable Regulations, Codes, Standards, and Best Practices (See Note)	Method of Verification (i.e., program)	Completion Date	Reference (section & page #)
Complete all proactive wildfire mitigation grid hardening.	• WCCP (SH-1) • Inspections and Remediations - Distribution HFRI Inspections and Remediations (IN-1.1) - Transmission HFRI Inspections and Remediations (IN-1.2)	• GO 95 • Rule 22.8 • GO 128 • GO 165 • SCE DOH • SCE DUG	All IWMS areas identified have been hardened with the appropriate mitigation based on all factors considered (e.g., feasibility)	December 2032	Section 8.1.3.1, pp. 282-289 (IN-1.1) Section 8.1.3.2, pp. 289-293 (IN-1.2)
Obtain and implement more programmatic permitting that allows more streamlined execution of grid hardening work	• WCCP (SH-1) • TUG (SH-2) • Inspections and Remediations - Distribution HFRI Inspections and Remediations (IN-1.1) - Transmission HFRI Inspections and Remediations (IN-1.2)	• GO 95 • GO 165	Programmatic permit documents that were executed	2026-2028	Section 5.4.5 - Environmental Compliance and Permitting, pp. 83-88
Scale any new successful emergent technologies to supplement existing foundational grid hardening mitigations	• Hi-impedance relays (Hi-Z) (8.1.8.1.3.1) • Distribution Open Phase Detection (DOPD) (8.1.8.1.3.3) • Remote grid (8.1.2.9.1) • Transmission Open Phase Detection (TOPD) (SH-8)	GO 95	Alignment between work being performed and output/ recommendations from technologies and pilots	December 2032	Section 8.1.8.1.3, p. 334, p. 335, p. 337 Section 8.1.2.9.1, p. 274-275
If feasible and applicable, implement programs/pilots resulting from integrated transmission hardening strategy development and analysis	• Transmission IWMS (8.1.2.12.1) • High-risk transition spans	• GO 95 • SCE TOH	Alignment between work being performed and output/recommendations from transmission IWMS assessment	December 2032	Section 8.1.3.2, pp. 289-293 (IN-1.2), Section 8.1.2.12, p. 278
Integrate AI/ML analytical tools into inspection image data	• Inspections and Remediations	• GO 95	Number of AI/ML image	Decemb	Section

Objectives for Ten Years (2026–2032)	Applicable Initiative(s), Tracking ID(s)	Applicable Regulations, Codes, Standards, and Best Practices (See Note)	Method of Verification (i.e., program)	Completion Date	Reference (section & page #)
analysis to identify assets and defects	- Distribution HFRI Inspections and Remediations (IN-1.1) - Transmission HFRI Inspections and Remediations (IN-1.2) - High Risk Transition Spans • Inspection Work Management Tools - Inspection and Maintenance Tools (IN-8) - Asset Defect Detection using AI/ML (IN-8)	• GO 165	models deployed	er 2032	8.1.3.1, pp. 282-289 (IN-1.1) Section 8.1.3.2, pp. 289-293 (IN-1.2) Section 8.1.3.5, pp. 297-299 (IN-3)
Integrate new technological tools into data collection for asset inspections (e.g., LiDAR) to identify defects (e.g., clearance issues) that need remediation	• Inspections and Remediations - Distribution HFRI Inspections and Remediations (IN-1.1) - Transmission HFRI Inspections and Remediations (IN-1.2) - High Risk Transition Spans • Inspection Work Management Tools - Inspection and Maintenance Tools (IN-8) - Asset Defect Detection using AI/ML (IN-8)	• GO 95 • GO 165	Number of assets inspected using new technological tools	Decemb er 2032	Section 8.1.3.1, pp. 282-289 (IN-1.1) Section 8.1.3.2, pp. 289-293 (IN-1.2) Section 8.1.5, pp. 319-325 (IN-8)
Maintain backlog at minimum levels and with as little fire risk as possible	• Inspections and Remediations - Distribution HFRI Inspections and Remediations (IN-1.1) - Transmission HFRI Inspections and Remediations (IN-1.2)	• GO 95 • GO 165	Number of past due notifications and associated risk of those notifications	Decemb er 2032	Section 8.1.3.1, pp. 282-289 (IN-1.1) Section 8.1.3.2, pp. 289-293 (IN-1.2)

Note: An asterisk indicates that the electrical corporation exceeds a particular code, regulation, standard, or best practice. The electrical corporation must provide a reference to the appendix section and page providing further documentation, justification, and substantiation.

8.1.1.2 Targets

Initiative targets are forward-looking quantifiable measurements of activities identified by each electrical corporation in its WMP. Electrical corporations will show progress toward completing targets in subsequent reports, including QDRs and WMP Updates.

The electrical corporation must list all targets it will use to track progress on its grid design, operations, and maintenance for the three years of the Base WMP. Energy Safety's Compliance Assurance Division and third parties must be able to track and audit each target.[135] *For each initiative target, the electrical corporation must provide the following:*

- *Utility Initiative Tracking IDs.*
- *Projected targets for each of the three years of the Base WMP and relevant units.*
- *Quarterly, rolling targets for 2023 and 2024 (inspections only).*
- *The expected "x% risk impact" for each of the three years of the Base WMP. The expected x% risk impact is the expected percentage risk reduction per year, as described in Section 7.2.2.2.*
- *Method of verifying target completion.*

The electrical corporation's targets must provide enough detail to effectively inform efforts to improve the performance of the electrical corporation's grid design, operations, and maintenance initiatives.

The tables below are based on the examples provided in the Technical Guidelines.

In Table 8-3 below, SCE provides the expected risk impact for each initiative at the scoping unit level and at the HFRA-level. As such, a given mitigation might appear to have a relatively smaller impact at the HFRA-level due to a limited scope of deployment, but a much larger impact at the segment or structure level. The risk impact percentages are in MARS and as discussed in Sections 6 and 7, SCE's IWMS Risk Framework takes into account additional factors not considered by MARS. SCE includes additional columns in the table below showing the percentage of an initiative's scope that is in Severe Risk Area (SRA) and High Consequence Areas (HCA).[136]

[135] Annual information included in this section must align with Table 1 of the QDR.

[136] Percentages include adjustments resulting from detailed scope assessments pursuant to IWMS Framework.

Table 8-3 - Grid Design, Operations, and Maintenance Targets by Year

Initiative Activity	Tracking ID	2023 Target & Unit	x% Risk Impact 2023 (Unit /HFRA)	% in SRA/HCA 2023	2024 Target & Unit	x% Risk Impact 2024 (Unit /HFRA)	% in SRA/HCA 2024	2025 Target & Unit	x% Risk Impact 2025 (Unit /HFRA)	% in SRA/HCA 2025	Method of Verification
Covered Conductor	SH-1	Install **1,100** circuit miles of covered conductor in SCE's HFRA SCE will strive to install up to as many as **1,200** circuit miles of covered conductor in SCE's HFRA, subject to resource constraints and other execution risks	51% / 20%	91%	Install **1,050** circuit miles of covered conductor in SCE's HFRA SCE will strive to install up to as many as **1,200** circuit miles of covered conductor in SCE's HFRA, subject to resource constraints and other execution risks	53%/6%	91%	Install **500** circuit miles of covered conductor in SCE's HFRA SCE will strive to install up to as many as **600** circuit miles of covered conductor in SCE's HFRA, subject to resource constraints and other execution risks	49.8%/1.5%	80%	Listing of completed Work Orders
Underground-ing Overhead Conductor	SH-2	Convert **11** circuit miles of overhead to underground in SCE's HFRA	98%/.22%	100%	Convert **16** circuit miles of overhead to underground in SCE's HFRA SCE will strive to convert up to **20** miles of overhead to underground in SCE's HFRA, subject to resource constraints and other execution risks	98%/.64%	100%	Convert **30** circuit miles of overhead to underground in SCE's HFRA SCE will strive to convert up to **60** miles of overhead to underground in SCE's HFRA, subject to resource constraints and other execution risks	98%/.9%	100%	Listing of completed Work Orders

Vibration Damper Retrofit	SH-16	Retrofit vibration dampers on **300** structures where covered conductor is already installed in SCE's HFRA SCE will strive to retrofit vibration dampers on up to **400** structures where covered conductor is already installed in SCE's HFRA, subject to resource constraints and other execution risks	19%/.04%	100%	Retrofit vibration dampers on **500** structures where covered conductor is already installed in SCE's HFRA SCE will strive to retrofit vibration dampers on up to **600** structures where covered conductor is already installed in SCE's HFRA, subject to resource constraints and other execution risks	11%/.01%	99%	Retrofit vibration dampers on **600** structures where covered conductor is already installed in SCE's HFRA SCE will strive to retrofit vibration dampers on up to **800** structures where covered conductor is already installed in SCE's HFRA, subject to resource constraints and other execution risks	20%/.09%	100%	Listing of completed Work Orders
Rapid Earth Fault Current Limiters (REFCL) (Ground Fault Neutralizer (GFN))	SH-17	SCE will complete construction of GFN at **two** substations (Acton and Phelan)	47%/3.6%	94%	SCE will complete construction of GFN at **one** substation (Banducci)	45%/.54%	88%	SCE will complete construction of GFN at **two** substations SCE will strive to complete construction of GFN at **four** substations	49%/1.8%	89%	Listing of completed Work Orders
Rapid Earth Fault Current Limiters (REFCL) - Grounding Conversion	SH-18	SCE will complete grounding conversion at **one** location, subject to land availability.	45%/.06%	91%	SCE will target **four** locations for grounding conversion, subject to land availability SCE will strive to target up to **6** locations for grounding conversion, subject to land availability	N/A scope not determined yet	N/A scope not determined yet	SCE will target **four** locations for grounding conversion, subject to land availability SCE will strive to target up to **6** locations for grounding conversion, subject to land availability	N/A scope not determined yet	N/A scope not determined yet	Listing of completed Work Orders

The risk impact percentages shown in Table 8-4 are based on the cumulative MARS scores of the structures SCE expects to inspect for each initiative annually, divided by the cumulative MARS scores for all structures of that type in HFRA. SCE also provides the percentage of an initiative's inspection scope that is in Severe Risk and High Consequence areas.

Table 8-4 - Asset Inspections Targets by Year

8.1.1.3 Performance Metrics Identified by the Electrical Corporation

Performance metrics indicate the extent to which an electrical corporation's Wildfire Mitigation

Plan is driving performance outcomes. The electrical corporation must:

- *List the performance metrics the electrical corporation uses to evaluate the effectiveness of its grid design, operations, and maintenance in reducing wildfire and PSPS risk*[137]

For each of these performance metrics listed, the electrical corporation must:

- *Report the electrical corporation's performance since 2020 (if previously collected)*
- *Project performance for 2023-2025*
- *List method of verification*

The electrical corporation must ensure that each metric's name and values are the same in its WMP reporting as its QDR reporting (specifically, QDR Table 2 and QDR Table 3). Metrics listed in this section that are the same as performance metrics required by Energy Safety and reported in QDR Table 2 (Performance Metrics)[138] *must match those reported in QDR Table 2. Metrics listed in this section that are not the same as any of the performance metrics identified by Energy Safety and reported in QDR Table 2 must match those reported in QDR Table 3.*

The electrical corporation must:

- *Summarize its self-identified performance metrics in tabular form*
- *Provide a brief narrative that explains trends in the metrics*

Metrics and underlying data are critical components for WMP development, execution, and evaluation, but we continue to emphasize that the near-term focus should be on efficient implementation of our planned activities, while the assessment of whether the activities are having the desired and expected impact on risk reduction should be measured over a longer time horizon. A clear distinction is necessary between targets that monitor compliance with approved WMPs and metrics that evaluate effectiveness of these approved plans and inform future WMP updates.

As in prior WMP submissions, we provide annual initiative targets (such as those provided in Table 8-3) for each WMP initiative which establish goals to evaluate compliance. As stated in previous filings and submittals, tracking initiative targets for approved WMPs is the best means of determining progress and assessing WMP compliance in the near-term.

SCE has identified several performance metrics in Table 3-1 of its Quarterly Wildfire Mitigation Data Tables which may be helpful to inform evaluation of the performance of SCE's wildfire mitigation portfolio. SCE identified metrics because WMP activities are ultimately designed to reduce wildfire ignitions associated with its electrical infrastructure and reduce the impact of PSPS de-energization events to customers.

[137] There may be overlap between the performance metrics the electrical corporation uses and performance metrics required by Energy Safety. The electrical corporation must list these overlapping metrics in this section in addition to any unique performance metrics it uses.

[138] The performance metrics identified by Energy Safety are included in Energy Safety's Data Guidelines.

Importantly, these metrics are within the reasonable control of utilities when appropriately normalized for weather and other exogenous factors. Other metrics such as safety incidents, acres burned or structures destroyed, though important to understand, track, and monitor are impacted by events and circumstances largely outside of the utility's control such as climate change, droughts, fire suppression efforts and fire response.

In Table 8-5, SCE provides a listing of performance metrics that may be helpful to inform the effectiveness of SCE's grid design, operations, and maintenance activities. Because several of the performance metrics identified in QDR Table 3 are impacted by mitigations across several WMP categories, SCE repeats the inclusion of performance metrics in multiple WMP Category tables where applicable. SCE notes that projections provided for its performance metrics are estimates only and subject to change. SCE describes each metric in more detail below.

Table 8-5 - Grid Design, Operations, and Maintenance Performance Metrics Results by Year

Performance Metrics	2020	2021	2022	2023 Projected	2024 Projected	2025 Projected	Method of Verification (e.g., third-party evaluation, QDR)
Number of CPUC reportable ignitions in HFRA	50	48	40	39	38	37	QDR, Tables 2 and 3
Number of wire downs in HFRA	379	468	316	361	360	361	QDR, Tables 2 and 3
Number of outages in HFRA	2,824	2,356	2,404	2,018	1,946	1,892	QDR, Tables 2 and 3
Number of asset management ignition risk-related work orders that are past due (excluding GO95 exceptions)	3,423	3,951	4,607	4,021	4,021	4,021	QDR, Table 3
Frequency of PSPS Events (total)[139]	10	8	3	7	7	7	QDR, Tables 3 and 10
Scope of PSPS Events (total)[140]	424	232	13	210	197	185	QDR, Tables 3 and 10
Duration of PSPS events (total)[141]	4,455,936	3,700,254	112,274	2,508,101	2,282,372	2,076,958	QDR, Tables 3 and 10
Number of customers impacted by PSPS[142]	229,800	179,502	15,784	120,441	102,375	87,019	QDR, Tables 3 and 10

Number of CPUC Reportable Ignitions in HFRA, Wire Downs in HFRA, and Outages in HFRA: SCE is monitoring the number of ignitions and wire-down events at the structure level and by key driver (CFO, EFF, and other). SCE's wildfire mitigations help to reduce wire downs and outages which can lead to ignitions, and also can reduce the likelihood that an ignition occurs as the result of an outage. By observing the key drivers of these events down to the circuit or individual structure level, SCE is building the capability to better evaluate the effectiveness of wildfire activities that were deployed to mitigate those specific drivers, as well as help align future deployment of mitigations to targeting specific drivers identified at those locations. Large variations in weather events, including temperature, rainfall, fuel moisture and wind, can heavily impact performance metrics including outages, wire-down events and ignitions, and can often skew direct comparisons of these metrics year over year. At this time, SCE does not incorporate weather normalization into its WMP ignition forecasts due to the complexity of determining the causal relationship between aberrant weather and ignition probability and fire spread. SCE discusses the trends for each metric below:

- CPUC Reportable Ignitions in HFRA: In 2022, HFRA ignitions decreased by 20% and 17% since 2020 and 2021, respectively. The decrease is primarily due to a decrease in CFO caused ignitions, which aligns with the mitigations central to SCE's IWMS, namely covered conductor. SCE projects a decline in CPUC reportable ignitions in HFRA over the WMP period.
- Wire Downs in HFRA: Overall the number of wired down events year over year, there has not been a trend identified. However, specific sub-drivers such as conductor failure, splice failures and crossarm failures have declined year over year, which aligns with SCE's deployment of covered conductor. Moreover, circuits that are fully covered per mile compared to bare circuits, see a reduction of over 60% in wire downs for drivers that CC is expected to mitigate.
- Outages in HFRA: In 2022 Outages in HFRA decreased from 2020 and are consistent with 2021 values. While some drivers do not have a trend, the following drivers all have decreased year over year: vegetation and animal caused outages. Additionally, vehicle caused outages have increased year over year since 2020. SCE projects a decline in outages in HFRA over the WMP period.

Number of asset management ignition risk-related work orders that are past due (excluding GO95 exceptions): This metric tracks the number of past due notifications (work orders) identified through SCE's transmission and distribution inspection programs that present a potential ignition risk in HFRA. To focus on those past due notifications that are largely within our control, SCE removes notifications that have GO 95 exceptions due to permitting constraints, third party refusal, customer access issues, etc. SCE has seen an increase in the number of asset management work orders as more inspections were completed (i.e., distribution ground inspections) which resulted in more findings and open work orders needing to be completed. As noted in ACI

[139] Frequency of PSPS Events definition: Number of instances where utility operating protocol requires de-energization of a circuit or portion thereof to reduce ignition probability, per year. Only include events in which de-energization ultimately occurred
[140] Scope of PSPS Events definition: Circuit-events, measured in number of events multiplied by number of circuits de-energized per year.
[141] Duration of PSPS events definition: Customer hours per year.
[142] Number of customers impacted by PSPS definition: Number of customers impacted by PSPS (if multiple PSPS events impact the same customer, count each event as a separate customer).

SCE-22-15 Targets Relating to Addressing Inspection Findings within Appendix D: Areas for Continued Improvement of this WMP and Section 8.1.7, SCE is working to mitigate the backlog. The current projection for future years is flat as SCE has seen an increase in repair work from inspections driven by changes to the inspection form and an increase in the number of inspections, which may offset the steps being taken to address the backlog.

Frequency of PSPS (Total), Scope of PSPS (Total), Duration of PSPS (Total), Number of Customers Impacted by PSPS (Total): Please see Section 9 – PSPS – for a full explanation of these metrics and corresponding trends. SCE includes these PSPS performance metrics in this Section due to our efforts to reduce the frequency, scope, and duration of PSPS events through accelerated grid hardening of circuits impacted by PSPS. For example, an isolatable circuit segment with covered conductor installed can have its PSPS de-energization wind speed thresholds raised to higher wind speeds levels.

8.1.2 Grid Design and System Hardening

In this section the electrical corporation must discuss how it is designing its system to reduce ignition risk and what it is doing to strengthen its distribution, transmission, and substation infrastructure to reduce the risk of utility-related ignitions resulting in catastrophic wildfires.

The electrical corporation is required, at a minimum, to discuss grid design and system hardening for each of the following mitigation activities:

1. *Covered conductor installation*
2. *Undergrounding of electric lines and/or equipment*
3. *Distribution pole replacements and reinforcements*
4. *Transmission pole/tower replacements and reinforcements*
5. *Traditional overhead hardening*
6. *Emerging grid hardening technology installations and pilots*
7. *Microgrids*
8. *Installation of system automation equipment*
9. *Line removal (in the HFTD)*
10. *Other grid topology improvements to minimize risk of ignitions*
11. *Other grid topology improvements to mitigate or reduce PSPS events*
12. *Other technologies and systems not listed above*

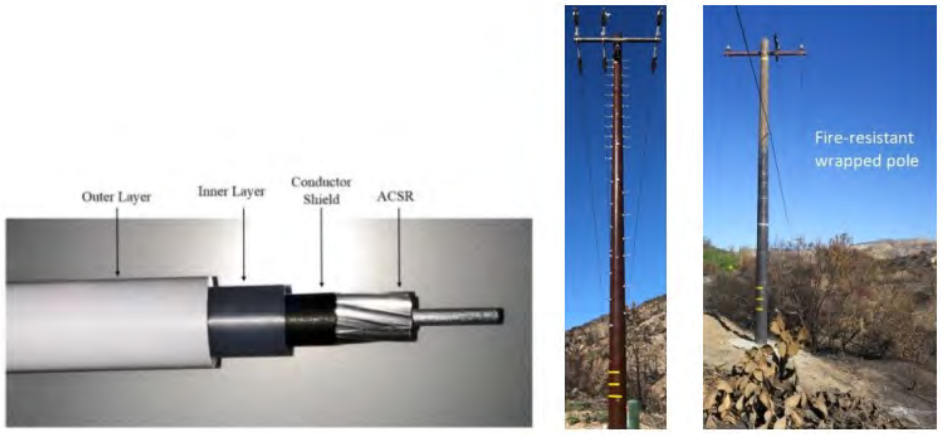
In Sections 8.1.2.1 through 8.1.2.12, the electrical corporation must provide a narrative including the following information for each grid design and system hardening mitigation activity:

- *Utility Initiative Tracking ID.*
- *Overview of the activity: A brief description of the activity including reference to related objectives and targets. Additionally, the overview must identify whether the activity is a program, project, pilot, or study.*
- *Impact of the activity on wildfire risk.*
- *Impact of the activity on PSPS risk.*
- *Updates to the activity: Changes to the initiative since the last WMP submission and a brief explanation as to why those change were made. Discuss any planned improvements or updates to the activity and the timeline for implementation*

8.1.2.1 Covered Conductor Installation

8.1.2.1.1 Covered Conductor

Utility Initiative Tracking ID: SH-1



Overview of activity: The Wildfire Covered Conductor Program (WCCP) is a program in HFRA to replace existing bare wire with covered conductor (CC) along with other associated components such as fire-resistant poles, composite crossarms, FR3 transformers[143], wildlife covers, surge arresters, polymer insulators and vibration dampers, and is scoped based on the risk assessment and mitigation selection processes described in Sections 6 and 7.

Covered conductor refers to a conductor with an internal semiconducting layer and external insulating UV-resistant layers to protect against the arcing, faults, or energy release that can come from incidental contact.

It is SCE's engineering standard to install covered conductor in HFRA any time bare wire needs to be replaced. Examples of this include during post-fire restoration work (outside of the WCCP) and other non-WCCP programmatic work, e.g., through the Overhead Conductor Program (OCP), where bare wires are replaced. SCE tracks and reports the installation of covered conductor under both WCCP and non-WCCP.

SCE installs composite poles or fire-resistant wrapped wood poles (together known as Fire-Resistant Poles or FRPs) during the implementation of WCCP when pole loading requirements require a replacement of a pole. FRPs provide the benefit to withstand a fire and maintain system resiliency and shorten the service restoration time. FRPs that are composite provide the additional benefit of minimizing ignitions from equipment at the top of pole (and thus used for poles with equipment on top or in an area with environmental or wildlife factors such as woodpeckers). Figure SCE 8-01 shows the physical layers of covered conductor, as well as illustrations of a fire-resistant composite pole and a fire-resistant wrapped wood pole.

Figure SCE 8-01 - Cross Section of Covered Conductor (left) Fire-Resistant Composite Pole (middle) and Fire-Resistance Wrapped Wood Pole (Right)

[143] A FR3 transformer contains plant-based oil instead of petroleum-based oil and can withstand higher temperatures before igniting, reducing the chances of the transformer fluid adding fuel to a fire.

SCE has continued to install CC per the previous filing, and is targeting 1,100, 1,050 and 500 miles in years 2023, 2024 and 2025, respectively. SCE will strive to install 1,200 miles in years 2023 and 2024 and 600 miles in 2025.

Impact of activity on wildfire risk: Installation of covered conductor and other associated components such as fire-resistant poles, composite crossarms, FR3 transformers, wildlife covers, and vibration dampers serve as preventative measures against several wildfire risks. It is effective at reducing the ignition drivers associated with contact-from-object (CFO) such as animal or vegetation contact and wire-to-wire faults. It is also effective at reducing ignition drivers associated with equipment or facility failures. In the case of an energized downed wire, covered conductor reduces the area of exposed base wire, thus reducing the likelihood of ignition and serious injury or fatality compared to contact with bare conductor.

SCE has realized significant benefits from covered conductor deployment. On circuits where the overhead primary is all covered conductor, SCE has observed a 71% reduction of faults covered conductor is expected to mitigate compared to bare wire.[144] Zero ignitions have occurred where cover conductor is deployed from drivers covered conductor is expected to mitigate. [145]

Installing FRPs, such as composite poles, helps prevent ignitions at the top of the pole. Also, burned and/or fallen poles can cause other equipment on the pole to fail, making service restoration after a fire more difficult. FRPs can withstand a fire and maintain system resiliency and shorten the service restoration time.

Please see Table SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts wildfire risk.

Impact of activity on PSPS risk: Covered conductor reduces PSPS risks by decreasing the likelihood of de-energization due to higher real-time de-energization windspeed thresholds for fully covered isolatable circuit segments.

SCE has determined that lines with covered conductor have a 90% reduction in PSPS activations.[146] When a circuit (or fully isolatable circuit segment) is all covered conductor, the de-energization threshold is increased to 40/58 mph (sustained wind/gusts).

Please see Table SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts PSPS risk.

Updates to the activity: In 2022, SCE updated its covered conductor standard to include the replacement of open wire secondary or weather-resistant aluminum (OWS or WAL) with multiplex secondary conductors. Weather-resistant aluminum wire on the secondary system is outdated technology and will be updated to the new standard when WCCP is installed.

All OWS and WAL secondary lines that share the same line path or are attached to the same targeted primary structure shall be upgraded to multiplex conductors (see Figure SCE 8-02 below). Multiplex conductors are fully insulated secondary conductors that can help mitigate contact-related faults and

[144] Measurement of CC effectiveness began in 2018.
[145] As of year-end 2022.
[146] Based on PSPS control thresholds for bare and CC circuit using weather data from 2011 to 2021.

associated ignitions.

SCE addressed these issues by updating the inspection forms and covering bare connectors with tape. In 2022, the main driver of secondary ignitions was Equipment/Facility Failure in approximately 70% of cases, followed by CFO in approximately 15% of cases. SCE estimates a small portion of its secondary system (10%) is still bare open wire and weather resistant aluminum which are outdated technology. SCE plans to replace these in the coming years.[147]

Figure SCE 8-02 - Outdated Secondary Conductor (Left) and In-Standard Secondary Conductor (Right)

As described in the ACI SCE-22-17 Address Secondary Conductor Issues in Appendix D: Areas for Continued Improvement, SCE describes results of analysis on secondary ignition events from 2019-2022[148] in SCE's HFRA. SCE observes an increasing trend in the number of secondary ignition events in 2020 and 2021, where the main drivers are CFO and EFF.

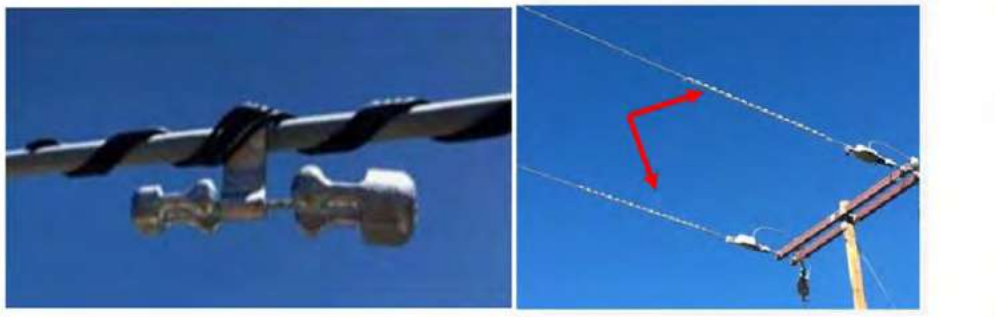
Open wire secondaries and weather-resistant aluminum conductors can pose an ignition risk because they are vulnerable to contact-from-object faults. Upgrading OWS and WAL conductors to multiplex conductors (duplex, triplex, or quadraplex), which are a bundle of conductors twisted around each other (see picture of the multiplex conductor on the right of Figure SCE 8-02 above) will help mitigate ignition events. Since multiplex conductors are covered and bundled together, they can withstand CFO much better than the bare open wire or single conductor can.

This standard update will only affect WCCP installations starting in 2024, and not planned WCCP work for 2022 and 2023, as work for these years is already in the design or construction phase. As described in ACI SCE-22-17 Address Secondary Conductor Issues in Appendix D: Areas for Continued Improvement, SCE has enhanced vegetation management and inspection measures to address the risk of secondaries until they can be remediated. Upgrading secondaries to multiplex conductors and covering bare connectors with tape can mitigate ignition events associated with secondaries.

In 2022 SCE initiated a spacer cable pilot to examine how covered conductor is supported by a high strength messenger through diamond shaped spacers instead of the traditional open crossarm arrangement. The pilot encompassed six spans or about 800 feet of covered conductor. SCE will continue to evaluate the viability of this type of installation as possibly another solution in mitigating

[147] There are approximately 0.3 miles of secondary conductor for every mile of primary conductor in HFRA. SCE estimates that approximately 10% of the secondary conductor requires replacement, with an estimated 7% of secondary spans being weather-resistant aluminum and 3% being bare open wire.

[148] Partial year data was collected for 2019 and 2020 was the first year with a full year of data.



wildfire ignitions.

8.1.2.1.2 Vibration Damper Retrofit

Utility Initiative Tracking ID: SH-16

Overview of activity: SCE's Vibration damper retrofit program aims to stop wind-driven vibration (known as Aeolian vibration) that may lead to conductor abrasion or fatigue over time. This is an issue for both bare and covered conductor. However, covered conductor may be more susceptible to vibration because of the covering's smoothness (perfect cylinder) and the reduction of strand movement due to the covering. If this vibration is not mitigated, the long-term damage may reduce the covered conductor's useful life. While it does not pose an immediate risk, vibration can reduce the covered conductor's useful life from 45 years to an average of 20 years if not addressed, particularly in high and medium vibration susceptibility area.

Figure SCE 8-03 - Types of Vibration Dampers: Stockbridge Damper (left) and Spiral Damper (right)

As discussed in response to the ACI SCE-22-17 in Appendix D: Areas for Continued Improvement, SCE examines potential areas for damper retrofits and prioritizes lines based on defined terrain type categories and persistence of wind. SCE uses the risk informed analysis described to determine CC installations with high, medium and low susceptibility to Aeolian vibrations. Note that this program targets covered conductor installations constructed prior to Q4 2020, when SCE's vibration damper standard was published. For new installations, vibration dampers are required per SCE's covered conductor construction standard.

SCE is targeting installations on 300, 500 and 600 structures in years 2023, 2024 and 2025, respectively. SCE will strive to complete 400, 600 and 800 installations in years 2023, 2024 and 2025, respectively.

Impact of activity on wildfire risk: Installing vibration dampers maintains the expected useful life of the covered conductor, and thus the ability to minimize certain equipment failure ignition drivers, such as damage or failure of the conductor, connector, and/or splice. Please see Table SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts wildfire and PSPS risk.

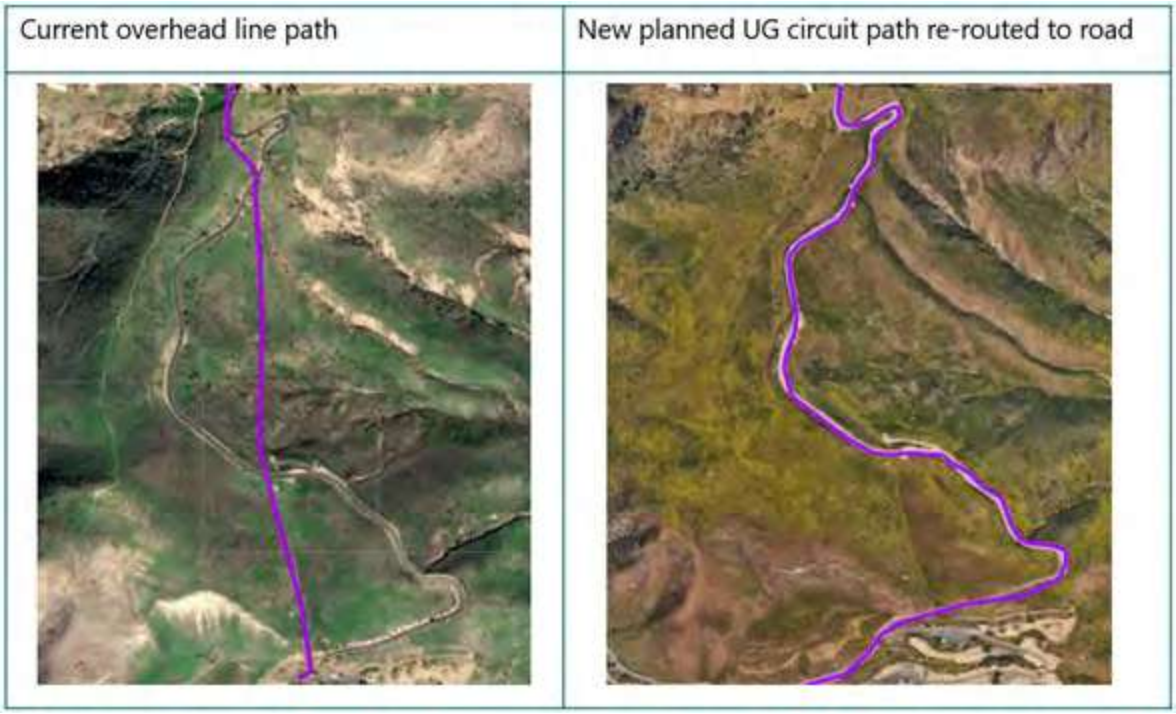
Impact of activity on PSPS risk: As with wildfire risk, vibration dampers support the effectiveness of covered conductor by maintaining its useful life, which allows covered conductor to be utilized to increase de-energization windspeed threshold for a fully covered circuit during an extremely windy conditions and reduce the frequency of PSPS. Please see Table SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts wildfire and PSPS risk.

Updates to the activity: SCE will continue this program as described in SCE's 2022 WMP. SCE will increase the volume of vibration damper retrofits over the next several years, focusing on the riskiest circuit segments identified based on vibration susceptibility studies.

8.1.2.2 Undergrounding of Electric Lines and/or Equipment

8.1.2.2.1 Targeted Undergrounding

Utility Initiative Tracking ID: SH-2



Overview of activity: Targeted Undergrounding (TUG) is a program to underground existing overhead power lines to significantly reduce wildfire and PSPS risk by significantly reducing the possibility for objects to contact energized conductor as well as greatly limiting the ignition-causing potential from equipment failures. In addition to those drivers, fault conditions can weaken and sometimes cause electrical stresses on hardware and insulators, which could lead to energized wire-down events or electrical arcing. Removing overhead lines and replacing them with underground wire significantly reduces this risk. Undergrounding has the added benefit of reducing the need for PSPS during extreme wind events. While the deployment of covered conductor may significantly increase the windspeed threshold for de-energization during a risk event, it does not completely prevent those de-energizations during extreme wind events like undergrounding can. Accordingly, as described in Section 7, undergrounding is the preferred method to nearly eliminate risk in Severe Risk Areas. However, there are some locations that are not feasible to underground due to factors such as rocky terrain, etc. In those cases, SCE would instead consider other mitigation measures including covered conductor combined with other measures.

Generally, when converting existing overhead lines to underground facilities, a line route needs to be determined. Often in urbanized areas, this route can be the same as the existing overhead line assuming pre-existing underground utilities (e.g., natural gas, water, sewer, etc.) do not preclude the addition of a new duct and structure system. Routes may also need to be altered to avoid obstructions. For example, this may involve moving a rear property pole line to curbside to avoid swimming pools, block walls, etc.

In coastal, mountainous, or more rural communities, topography can present additional challenges to those already mentioned above. Lines may need to be moved to the road to avoid steep terrain, heavy vegetation, water crossings, erosion concerns, and to generally avoid environmental considerations associated with heavy equipment access to construct and/or maintain lines. Because of these topographical challenges with some existing overhead lines, vehicle access required for installing underground cable is not available, which makes undergrounding along the same route impractical. Therefore, overhead lines may need to be brought out to the public right-of-way for undergrounding, increasing the length of the undergrounding needed and significantly increasing the cost as well as the construction timeline.

Figure SCE 8-04 shows an example of a necessary re-route. The picture on the left shows the current overhead line path, crossing a steep, hilly terrain. The lines may need to be moved to the road to avoid environmental considerations associated with heavy equipment access to construct and/or maintain lines, as shown in the picture on the right. Re-routing requires an additional length of conductor, labor, and materials.

Figure SCE 8-04 - Re-Route Example in Malibu Area

SCE aims to convert 11, 16 and 48 miles of overhead conductor to underground facilities in years 2023, 2024 and 2025, respectively. SCE will strive to convert 20 and 60 miles in years 2024 and 2025, respectively.

Impact of activity on wildfire risk: Undergrounding substantially reduces the risk of ignitions and outages associated with drivers such as wire contact with objects (e.g., vegetation, metallic balloons, debris, etc.), equipment failure, and wire-to-wire faults. Please see Table SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts wildfire and PSPS risk.

Impact of activity on PSPS risk: Undergrounding substantially reduces the need to call PSPS events on circuits and isolatable segments that are fully undergrounded.[149] Please see Table SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts wildfire and PSPS risk.

Updates to the activity: In 2023, SCE will continue to deploy TUG based on the previous risk prioritization methods prior to the introduction of IWMS. SCE has updated our methodology to release

[149] Note that isolatable segments that are connected to upstream OH circuits can still experience PSPS outages if there is no way to reroute them to get power from another non-PSPS impacted circuit.

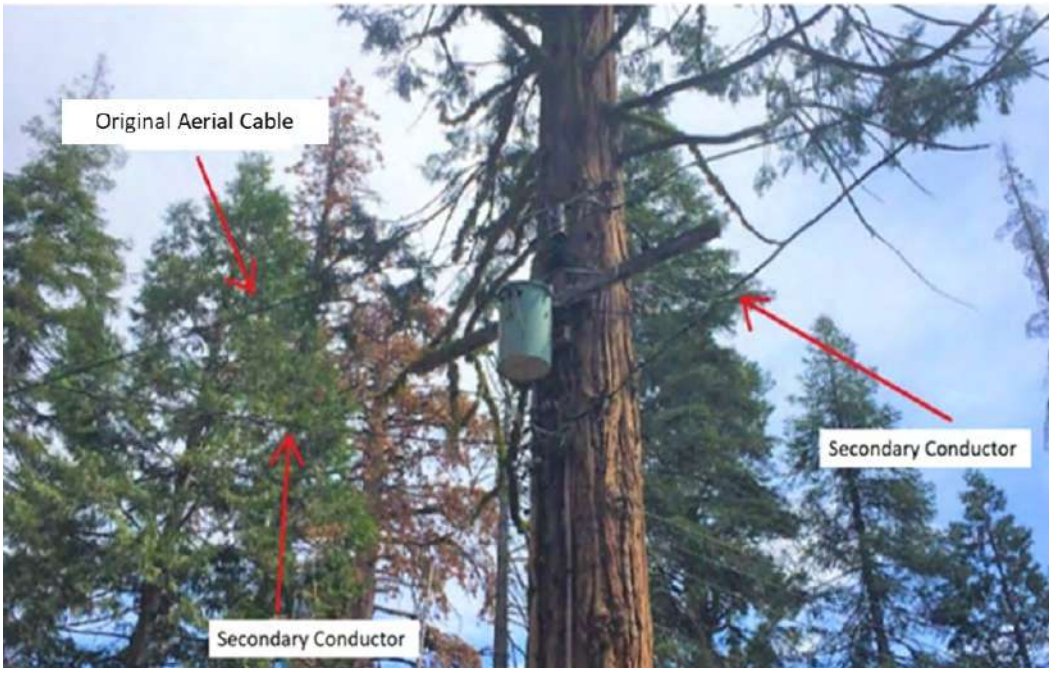
scope using IWMS, which considers factors such as egress, fire travel, and burn history. More details can be found in Section 6.2.1.

8.1.2.3 Distribution Pole Replacements and Reinforcements

SCE has historically had two major pole replacement programs, Deteriorated (Det) Pole Program and Pole Loading Program (PLP),[150] to improve the safety and reliability of the electric grid. As part of the Det Pole Program, SCE intrusively inspects poles through the Intrusive Pole Inspection (IPI) Program. An intrusive inspection involves drilling into the pole interior to identify and measure the extent of internal decay that is typically undetectable with external observation alone. The PLP Program assesses the safety factor of a pole to identify instances that do not meet either GO 95 or SCE's internal requirements that exceed GO 95. Poles that do not meet these requirements are documented and scheduled for either repair or replacement.

Poles are also replaced as part of SCE's HFRI inspections and maintenance programs. In addition, poles may be identified for replacement during various activities if they do not meet pole loading criteria when new equipment is added or if visual damage is identified by field personnel. All these programs span SCE's entire service area, except for HFRI inspections and maintenance which are only in SCE's HFRA. In HFRA, any poles replaced will be replaced with FRPs using the same strategy as described above for WCCP, which is the engineering standard in SCE's HFRA. SCE does not consider pole replacements to be a stand-alone WMP initiative but is incorporated already as part of its system hardening and asset management activities. As described above in regards to SH-1, FRPs are installed in HFRAs as part of WCCP and non-WCCP activities (such as post-fire restoration work).

8.1.2.3.1 Tree Attachment Remediation



Utility Initiative Tracking ID: SH-10

Overview of activity: Tree Attachment Remediation is a Program. Older construction methods used in SCE's forested service area used existing trees to support overhead conductors instead of installing utility poles. These "tree attachments" do not meet SCE's current design standards. The integrity of the trees cannot be verified using inspections and assessment techniques for poles. In addition, tree attachments increase the probability of faults and damages from vegetation contact and "fall-ins."

This initiative entails removing the electrical equipment attached to trees and installing the equipment on new fire-resistant poles to reduce ignition driver risks. Note that most tree attachment work is completed with aerial cable as that is the design standard for areas with dense vegetation. Aerial cable is a fully insulated conductor, equivalent to underground cable, and can withstand permanent phase-to-phase and phase-to-ground contact. If the existing tree attachment has aerial cable in good condition, SCE will relocate the aerial cable to a pole instead of installing covered conductor.

[150] SCE's Pole Loading Program was completed in 2021. Some resulting remediations will take place up to 2024.

Figure SCE 8-05 - An Example of a Tree Attachment Where Electrical Equipment Was Attached to a Live Tree

Impact of activity on wildfire risk: Tree attachment remediations address contact-from-object and equipment failure ignition risks. Removing a tree attachment reduces the probability of vegetation contact and the potential ignition caused by a spark close to vegetation. Leaving overhead conductors attached to trees, especially in HFRA, is inherently risky so SCE is transferring overhead conductor from trees to poles.

SCE aims to complete remediation of 400 and 500 structures in 2023 and 2024 respectively. SCE will strive to complete 500 and 600 structures in 2023 and 2024, respectively. In 2025, SCE will remediate the balance of tree attachments in SCE's HFRA, which is subject to change based on scope completed in previous years.

Please seeTable SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts wildfire and PSPS risk.

Impact of activity on PSPS risk: This initiative does not directly impact PSPS risk.

Updates to the activity: This program will continue through this WMP period without significant changes from our 2022 WMP, with an anticipated conclusion in 2025.

8.1.2.3.2 Fire Resistant Wrap Retrofits

Utility Initiative Tracking ID: 8.1.2.3.2

Overview of activity: Fire Resistant (FR) Wrap Retrofits is a pilot. A dead-end pole is a pole that supports the end of a conductor run spanning multiple poles. A tangent pole supports the conductor in the middle of a conductor run as depicted in Figure SCE 8-06. If a wood dead-end or tangent pole fails in a large fire, it can result in cascading failures such as the collapse of the adjacent poles/wires in a distribution line (if it is a tangent pole, then one on each side of the failed structure; if it is a dead-end pole, then on one side of the failed structure).

Figure SCE 8-06 - Dead-end Structure (left) and Tangent Structure (right)

Although wood poles themselves are generally not the source of ignition, dead-end and tangent structures carry significant amounts of weight and tension from supporting sections of overhead wire. Installing a FR wrap on dead-end and tangent poles can help the poles maintain structural integrity after a fire, which can prevent cascading failures of other poles, and shorten the restoration time. This activity will focus on installing FR wraps on dead end and tangent poles for the top riskiest circuits/circuit segments in HFRA that are located within areas experiencing the highest frequency of burns.[151]

This activity goes back to previously installed covered conductor structures to install FR wraps on unreplaced dead-end poles and adjacent tangent poles (that were not replaced because they passed pole loading requirements when covered conductor was installed) to prevent cascading failures.

Impact of activity on wildfire risk: FR wrap retrofits help mitigate against reliability concerns associated with wildfire consequence by preventing structures from falling and failing during or after wildfire events, which could create cascading failures and longer restoration time for customers post-fire. Please see Table SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation combined with covered conductor impacts wildfire and PSPS risk.

Impact of activity on PSPS risk: FR wrap retrofits do not have an impact on PSPS.

Updates to the activity: The retrofit of poles with FR wrap will be done in 2024. SCE will install 325 FR wraps targeting the riskiest locations. SCE may increase the scope as needed.

8.1.2.4 Transmission Pole/Tower Replacements and Reinforcements

SCE has two major pole replacement programs, the Deteriorated (Det) Pole Program and the Pole Loading Program (PLP).

As part of the Det Pole Program, SCE intrusively inspects poles through the Intrusive Pole Inspection (IPI) Program (please see Section 8.1.3.9 for a detailed description of IPI). An intrusive inspection involves drilling into the pole interior to identify and measure the extent of internal decay that is typically undetectable with external observation alone. Additionally, through the PLP, SCE assesses poles to

[12] Based on fire scar counts.

identify and repair or replace poles that do not meet GO 95 loading, temperature and safety factor requirements or, in areas with known local conditions such as high winds, SCE's loading, temperature and safety factor requirements (please see Sections 8.1.2.3 and 8.1.4 for more information on PLP). These pole programs are driven by CPUC GO 95 and GO 165 requirements.

Poles are also replaced as part of SCE's HFRI inspections and maintenance programs. SCE inspects all Transmission structures in HFRA annually (please see Section 8.1.3.2 for a detailed description of Transmission HFRI). At a minimum, each structure in HFRA is viewed via a routine/annual circuit patrol. Each structure also receives a detailed inspection at minimum every three years—or as frequently as every year—based on the risk-ranking of the structure.

Regardless of the inspection type, any issue requiring remediation is documented and worked according to GO 95 timeframes. These remediations can call for the repair or replacement of the structure or any of the structure's components, depending on its location and severity. Additionally, in HFRA, HFRI inspections are prioritized for faster completion. The timeframe for pole remediations in HFRA Tiers 2 and 3 is typically shorter than in non-HFRA areas (i.e., typically six months to remediate in HFRA Tier 3 and twelve months to remediate in HFRA Tier 2).

Poles may also be identified for replacement during miscellaneous activities if they do not meet pole loading criteria when new equipment is added or if visual damage is identified by field personnel. All these programs span SCE's entire service area, except for HFRI inspections and maintenance, which are only in SCE's HFRA.

SCE also has a Transmission Corrosion Program that assesses and remediates corroded transmission structures identified in SCE's transmission system. This program focuses on all-steel structures across SCE's service area, including out-of-state interties. The structures and lattice towers are mostly comprised of galvanized, painted steel.

Aging steel structures may be at risk of failing due to environmental factors such as soil corrosivity and atmospheric corrosion which can affect the integrity of the structure. The corrosive environments can lead to rusting, pitting, and steel loss, thereby increasing the failing risk of the structures. Once a galvanized tower begins to corrode, the corrosion advances more quickly and can lead to steel loss and structure failures unless mitigated appropriately.

The Transmission Corrosion Program consists of assessment and mitigation of these structures. During the assessment phase, SCE performs above- and below-ground visual inspections and engineering analyses such as pitting depth, remaining steel thickness measurements, and soil sampling. In addition, SCE may perform bore scoping and ultrasonic testing on Light Weight Steel (LWS) poles to determine asset health in the future.

The mitigation phase typically begins two years after the assessment phase to allow completion of the required technical review, procurement, and approval process. Mitigations depends on the assessment recommendations for each structure and may include, but are not limited to installing concrete cap footings, replacing steel members, coating structures, engaging in cathodic protection, and, if necessary, replacing the structure.

SCE discusses various transmission pole/tower replacements and reinforcements in other sections of its WMP. Please refer to Section 8.1.3.2 for a discussion of Transmission remediations, including remediation of transition spans and Transmission Integrated Wildfire Mitigation Strategy (IWMS) Engineering Analysis and Testing in Section 8.1.2.12.1 for a discussion of these efforts.

8.1.2.5 Traditional Overhead Hardening

8.1.2.5.1 Branch Line Protection Strategy

Utility Initiative Tracking ID: SH-4

Overview of activity: SCE's Branch Line Protection activity is a program. Arcing and increased currents associated with electrical faults may produce incandescent particles which can lead to ignitions or stress equipment leading to increased failures. Reducing fault energy can lessen the amount and size of incandescent particles which decreases ignition risks. Current Limiting Fuses (CLF) are safety devices consisting of an internal filament that melts and interrupts an electric circuit if the current exceeds the fuse rating.

Some fuse designs do not meet the Cal Fire "Exempt" classification and can expel molten material when they operate, creating the potential for ignitions. Current Limiting Fuses and other CAL FIRE Exempt fuse designs generally clear faults and reduce fault energy more quickly, reducing arcing and sparks during fault events and the impact of a fault on electrical equipment along the circuit.

The objective of initiative SH-4 involves proactively installing CLFs on branch lines (Branch Line Fuses or BLFs) where no fusing previously existed and replacing conventional fuses with CLFs or other CAL FIRE Exempt fuse designs. This aims to reduce the expulsion of flammable material and the amount of fault energy, thereby reducing the potential for ignitions.

In 2018 and 2019 SCE made substantial efforts for application of branch line fusing (BLF) with current limiting fuse technology where fusing did not previously exist to help reduce ignition risk and improve electric service reliability. From 2020-2023, SCE's focus for the fusing program shifted to branch line fuse replacements, particularly for Cal Fire non-exempt expulsion fuses and other fuses with operational concerns.

Figure SCE 8-07 - Example of Current Limiting Fuse and Fuse Holder

In addition, SCE also bundles fusing replacements, for both BLF or equipment applications with other work. These bundling efforts for equipment fuses largely focuses on replacements for non-exempt fuses for transformer applications. Tracking these fuse replacements was initiated in during inspection efforts in 2019 which cataloged these remaining non-exempt equipment fuses.

SCE is targeting to replace 500 units and will strive to replace 570 units in 2023, concluding the proactive

replacement of branch line fuses. Post 2023, SCE will work to replace any remaining fuses requiring replacement as opportunity work, or will continue to bundle replacement activities with other work.

Impact of activity on wildfire risk: By reducing the amount of fault energy and incandescent particles during a fault compared to a legacy fuse or no fusing, a CLF or other CAL FIRE "Exempt" fuses reduces the potential for faults to cause ignitions.

Impact of activity on PSPS risk: No direct impact on PSPS.

Updates to the activity: SCE does not have significant changes to branch line fuse installation and replacement strategies compared to the 2022 WMP beyond the strategies described above. Legacy fuses for these applications have largely been replaced through prior years' WMP efforts. SCE is targeting to replace 500 units in 2023, concluding the proactive replacement of branch line fuses. Beyond 2023, additional fuses will be replaced as part of ongoing infrastructure maintenance when CLFs are identified needing replacement or repair or as part of other work when regular maintenance can be bundled.

8.1.2.5.2 Long Span Initiative

Utility Initiative Tracking ID: SH-14

Overview of the activity: SCE's Long Span Initiative is a program that addresses increased risk of conductor clash in high wind conditions associated with distribution conductor spans of a certain length, spans with mixed conductor, spans that have a sharp angle, or spans that transition between vertical and horizontal configuration

In 2020, SCE began using LiDAR on its distribution long spans to identify locations with potential conductor clash issues and planned to remediate the highest risk locations upon field validation. In 2022, SCE enhanced its risk methodology and prioritization by incorporating the IWMS and developing a risk analysis that considers LiDAR measurements, conductor POI, and wind-related features to better target conductor clash scenarios.

Long spans that are at high risk for conductor clashing and that fall within locations that are largely consequential in the case of an ignition are prioritized for remediation. The type of remediation selected is determined by the specific details of each span and the corresponding field conditions.

This initiative includes three types of remediations that are carried out with the purpose of reducing conductor clashing risks from long spans:

1. **Line spacers** – Insulated equipment that separates the lines to reduce the possibility of wire-to-wire. It is the preferred remediation type due to the speed of deployment and its effectiveness against clashing. They are utilized during instances where there is bucket truck accessibility.

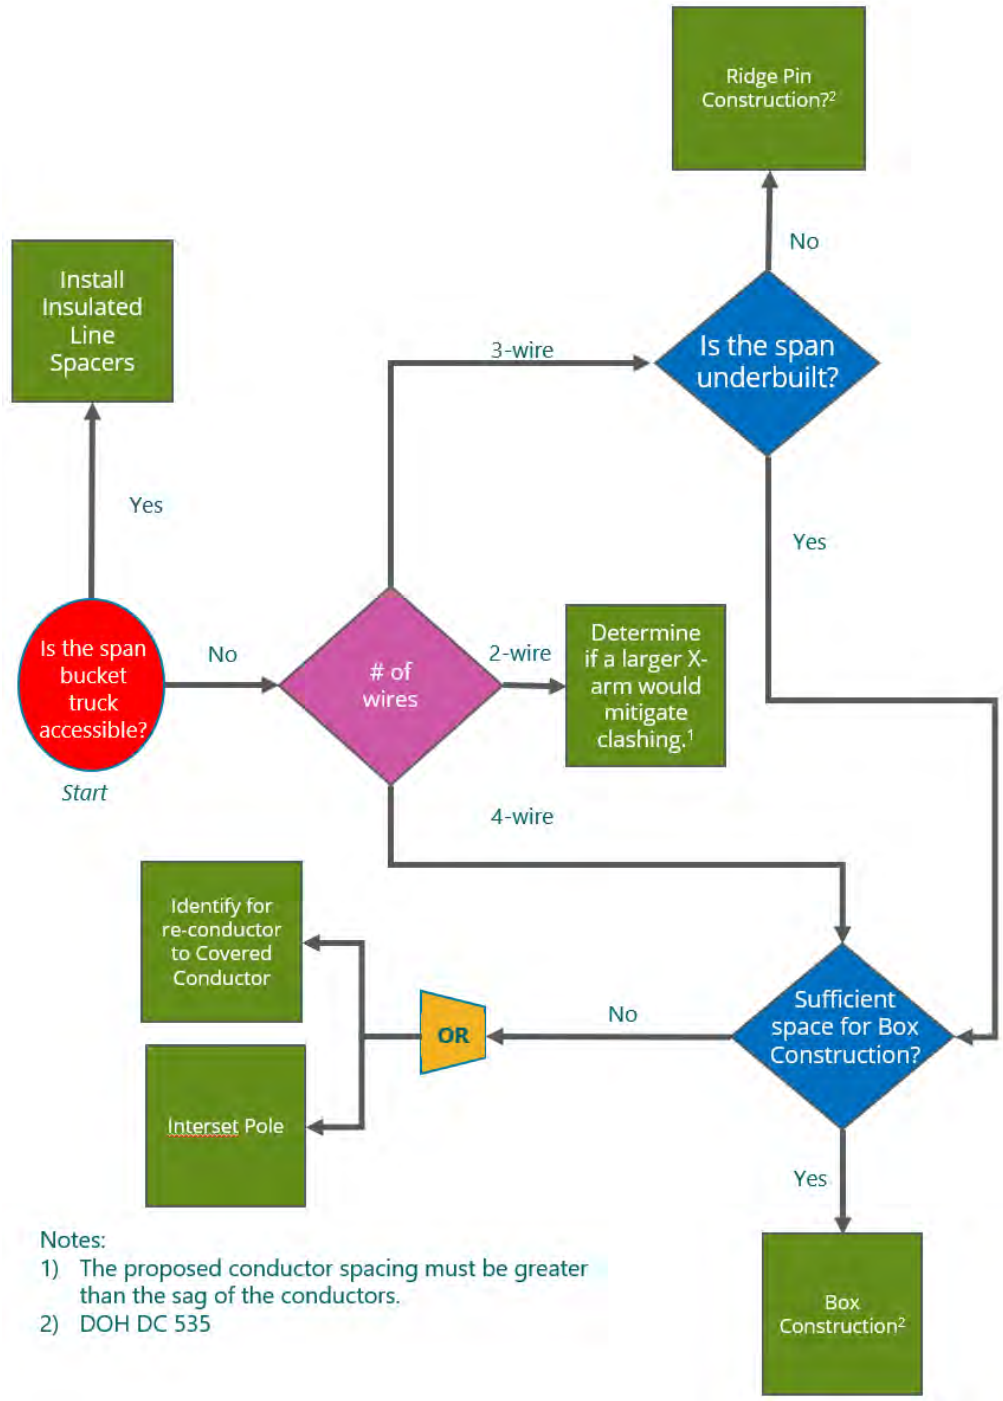


Figure SCE 8-08 - A Line Spacer Installed on a Long Span to Mitigate Wire-to-Wire Contact (Left), Close Up Line Spacer View (Right)

2. **Alternate Construction** – This includes ridge pin, box construction, wider crossarms, and interset poles. These construction configurations increase phase spacing or reduce sag, which minimizes the probability of wire-to-wire contact. This type of remediation is typically utilized when there is no bucket truck accessibility for line spacers.
3. **Covered Conductor** - The wire ensures that the lines are protected if clashing occurs. Covered conductor will be installed in instances where there is no bucket truck access and either a 3-wire span is underbuilt, or a 4-wire span does not have sufficient space for box construction.

The following flow chart demonstrates how SCE makes a determination on the type of remediation appropriate for different scenarios.

Figure SCE 8-09 - Long Span Initiative Remediation Decision Tree

SCE aims to complete 400 spans in 2023 with a strive goal of 500 spans and aims to complete 1,000 spans in 2024 and 2025, striving to complete 1,200 spans in each 2024 and 2025.

Impact of activity on wildfire risk: This initiative is aimed to prevent wire-to-wire contact, which reduces the risk of ignition events. Please see Table SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts wildfire and PSPS risk.

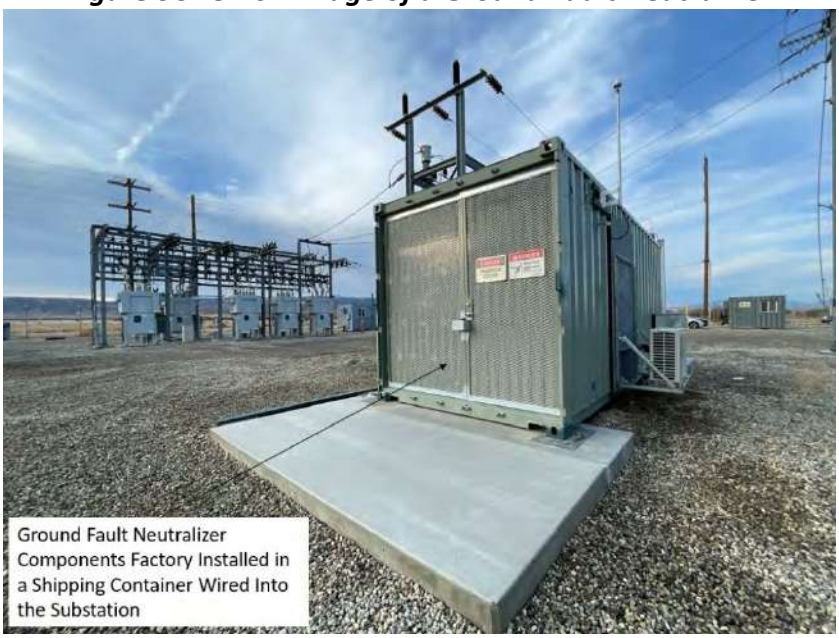
Impact of activity on PSPS risk: No direct impact on PSPS risk.

Updates to the activity: The risk prioritization methodology to determine LSI scope has been updated by using the IWMS risk analysis described above. To determine risk prioritization, SCE's new methodology considers spans in severe risk and high consequence areas and uses the LSI risk model to determine the probability of wire-to-wire contact. For example, a span with high probability of wire-to-wire contact in a Severe Risk Area would be prioritized over a span outside of a Severe Risk Area.

8.1.2.6 Emerging Grid Hardening Technology Installations and Pilots

8.1.2.6.1 Rapid Earth Fault Current Limiter – Grounding Fault Neutralizers

Utility Initiative Tracking ID: SH-17



Overview of activity: The Rapid Earth Fault Current Limiter (REFCL) initiative is a program that deploys technology that detects ground faults as small as a half ampere on one phase of a three-phase powerline. This technology almost instantly reduces the voltage on the faulted conductor while boosting the voltage on the two remaining phases. This allows SCE to maintain service for customers while extinguishing arcs. SCE is utilizing its REFCL program in HFRA to reduce the energy released from ground faults to the point that an ignition is unlikely.

SCE utilizes two approaches to implement REFCL technology: Ground Fault Neutralizer (SH-17) and Grounding Conversions (SH-18).

Ignitions caused by single phase to ground faults can be mitigated with the use of the Ground Fault Neutralizer which reduces fault energy by a factor of a thousand or more compared to typical utility designs. A Ground Fault Neutralizer can detect and act upon ground faults as small as a half ampere, making it substantially more sensitive than traditional protection.

The first GFN on the SCE system was recently installed at SCE's Neenach substation to reduce ground fault energy across the approximately 170 miles of circuitry fed by Neenach, of which approximately 70 miles are in HFRA. The Ground Fault Neutralizer is likely to be the preferred REFCL design for large substations. Large systems produce greater fault currents, which benefit more from the additional equipment used in a Ground Fault Neutralizer project. Figure SCE 8-10 below shows an example of a Ground Fault Neutralizer.

Figure SCE 8-10 - Image of a Ground Fault Neutralizer

SCE provides additional details on its REFCL program in the workpaper titled, "Rapid Earth Fault Current Limiter (REFCL) Projects at Southern California Edison."[152] This report provides an overview of SCE's evaluation of REFCL and experience with the Ground Fault Neutralizer at Neenach substation installed in 2021 as well as experience with three grounding conversion projects:

- An overhead isolation transformer installed in 2020 covering 2.5 miles of the Calstate 12kV circuit.
- A padmount isolation transformer covering 12 miles of the Stetson 12kV circuit in 2021.
- An Arc Suppression Coil (ASC) to resonant ground Arrowhead substation, covering 40 miles of 12 kV circuitry, installed in 2021.

Additional details of REFCL can also be found in Section 8.3.3 discussing Grid Monitoring systems.

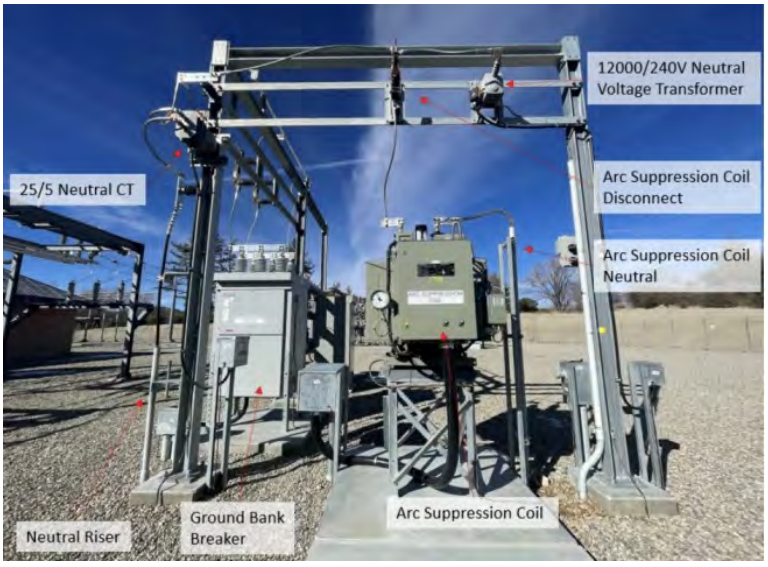
SCE aims to complete GFN at two substations in 2023, one in 2024 and four in 2025. The reduction in number of units in 2024 is because SCE is using that time to onboard a second equipment supplier.

Impact of activity on wildfire risk: A substantial number of public safety hazards from high voltage electrical equipment, including downed wire incidents, energized conductor contacts, events involving underground equipment failures, arc flashes, step and touch voltage incidents, and fire ignitions come from ground faults. REFCL technology has been found to substantially reduce the energy released in ground faults, and therefore has the potential to significantly reduce these risks. Please see Table SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts wildfire and PSPS risk.

[152] See "Rapid Earth Fault Current Limiter (REFCL) Projects at Southern California Edison" workpaper, available at https://www.sce.com/safety/wild-fire-mitigation

Impact of activity on PSPS risk: Currently SCE does not factor the presence of REFCL into PSPS thresholds, however that may change as SCE's REFCL deployment expands and more experience is gained with the technology.

Updates to the activity: SCE has decided to split out Grounding Conversions from SH-17 into its own initiative, SH-18, as each has distinct uses and targets. As described below, GFN differs from grounding conversions and SCE believes it is appropriate to examine and report on these separately.



8.1.2.6.2 Rapid Earth Fault Current Limiter – Grounding Conversions

Utility Initiative Tracking ID: SH-18

Overview of activity: SH-18 is part of the REFCL program, but a newly designated activity. The REFCL grounding conversion applications act to reduce energy and ignition risk associated with single phase to ground faults. SCE created a separate category for grounding conversion projects which are utilized on smaller substations or applied at the distribution circuit level, rather than larger substations which are targeted by the REFCL GFN program. These projects convert the existing electric system to operate either ungrounded or resonant grounded without the use of the GFN. For the purposes of REFCL systems, the distinction between "large" and "small" substations/systems primarily depends on the lengths of overhead and underground circuitry. Typical grounding conversion projects cover 2 to 15 miles of circuitry.

Figure SCE 8-11 below shows the main components used to resonant ground Arrowhead substation. This project demonstrated resonant grounding which was added at an existing substation. This type of grounding conversion is likely to be the preferred REFCL design for smaller substations. Smaller substations produce lower fault current and resonant grounding alone can be used to reduce fault currents to help mitigate ignitions from ground faults.

Figure SCE 8-11 - Image of a Resonant Grounded Substation

Grounding conversions for distribution circuitry outside of the substation is also possible in two variations. First the application of isolation transformers and, second the application of what SCE calls “pole tops.”

Traditionally “poletop” transformers were located on the top of a pole as depicted in Figure SCE 8-12, below, however many newer installs use padmounted equipment.

Figure SCE 8-12 - Pole Top Step Down (33kV to 12kV) Transformer (left) and Isolation (Iso) Bank Transformer (12kV to 12kV) (right)

Figure SCE 8-13 below shows an example of overhead compared to a pad-mounted isolation transformer installation. Overhead isolation transformer installations have a few limitations when compared to the pad-mounted alternative, with the main limitation being smaller size equipment which limits the amount of customer load that can be converted to the REFCL scheme. The pad-mounted isolation transformers can be built much larger and therefore be applied to serve more customer load, and additionally can simplify certain construction and operational practices.

Figure SCE 8-13 - Images of Isolation Transformers used for Grounding Conversion

In 2023, SCE anticipates completing one grounding conversion project, then four projects in each 2024 and 2025 with strive targets of six in 2024 and 2025.

Impact of activity on wildfire risk: A substantial number of public safety hazards from high voltage electrical equipment, including downed wire incidents, energized conductor contacts, events involving underground equipment failures, arc flashes, step and touch voltage incidents, and fire ignitions come from ground faults. REFCL technology has been found to substantially reduce the energy released in ground faults, and therefore has the potential to significantly reduce these risks. Please see Table SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts wildfire and PSPS risk.

Impact of activity on PSPS risk: Currently SCE does not factor the presence of REFCL into PSPS thresholds, however that may change as SCE's REFCL deployment expands and more experience is gained with the technology.

Updates to the activity: This is a new initiative.

8.1.2.7 Microgrids

8.1.2.7.1 Microgrid Assessments

Utility Initiative Tracking ID: 8.1.2.7.1

Overview of activity: Microgrid assessments are studies that SCE has undertaken to understand the feasibility of microgrid deployment. The microgrid program and microgrids are important tools that can help reduce wildfire risks during extreme weather conditions and support customers during PSPS de-energizations. Microgrids that can island from the grid during de-energization events can provide backup power to maintain reliability, thereby increasing community resilience.

This initiative focuses on two activities: 1) produce a study evaluating sites that are subject to frequent PSPS events to determine which sites would benefit from having a microgrid that provides backup power during de-energizations, and 2) engaging the property owners of those sites with a proposal to install a microgrid at the location to support community resilience to PSPS events.

Impact of activity on wildfire risk: This activity indirectly reduces wildfire risk since it allows SCE to maintain power delivery to customers while de-energizing the overhead lines during extreme windy events which may cause ignitions.

Impact of activity on PSPS risk: This initiative enables those served by the microgrid to maintain reliability and circumvent the impacts of a disruption in power due to a PSPS de-energization.

Updates to the activity: In October 2022, SCE identified 1,400 sites with the potential for microgrids, by identifying clusters of customers that are affected by frequent PSPS events and are mostly served through underground wires. The microgrids would operate during PSPS de-energization events, to help customers maintain reliability. However, SCE found through its study that the net cost for installing the microgrid was higher than the value of service it would provide to customers for most sites. Project deployment cost—which includes the added civil work, information technology (IT) costs, project management, and contingency costs—is on average 76% higher than the costs to both purchase microgrid assets and the lifetime operations and maintenance cost of the microgrid (e.g., fuel purchases, asset repairs and replacement, etc.) and is the driving factor behind the high cost of deploying microgrids.

Based on the evaluation, only 13 of the 1,400 sites had substantially high value of service[153] to justify further review. In November 2022, a manual site review was performed on the 13 sites to validate the feasibility of deploying the microgrid based on exposure to high winds, the configured network topology, and cost-effective alternatives. For all 13 sites, SCE determined that microgrids were not cost-effective, especially when considering the costs needed to scale the microgrid to a level that could provide enough coverage for the feeder impacted by the PSPS outage.

In 2023, SCE will re-evaluate its approach, re-run its assessment, and explore potential cooperative opportunities through the Microgrid Incentive Program, the Microgrid OIR (R.19-09-009), and/or other microgrid mechanisms. SCE also plans to pilot remote grid capabilities and is undertaking feasibility studies to determine optimal locations for the pilot. Please see Section 8.1.2.9.1 for more information about the remote grid feasibility studies.

8.1.2.8 Installation of System Automation Equipment

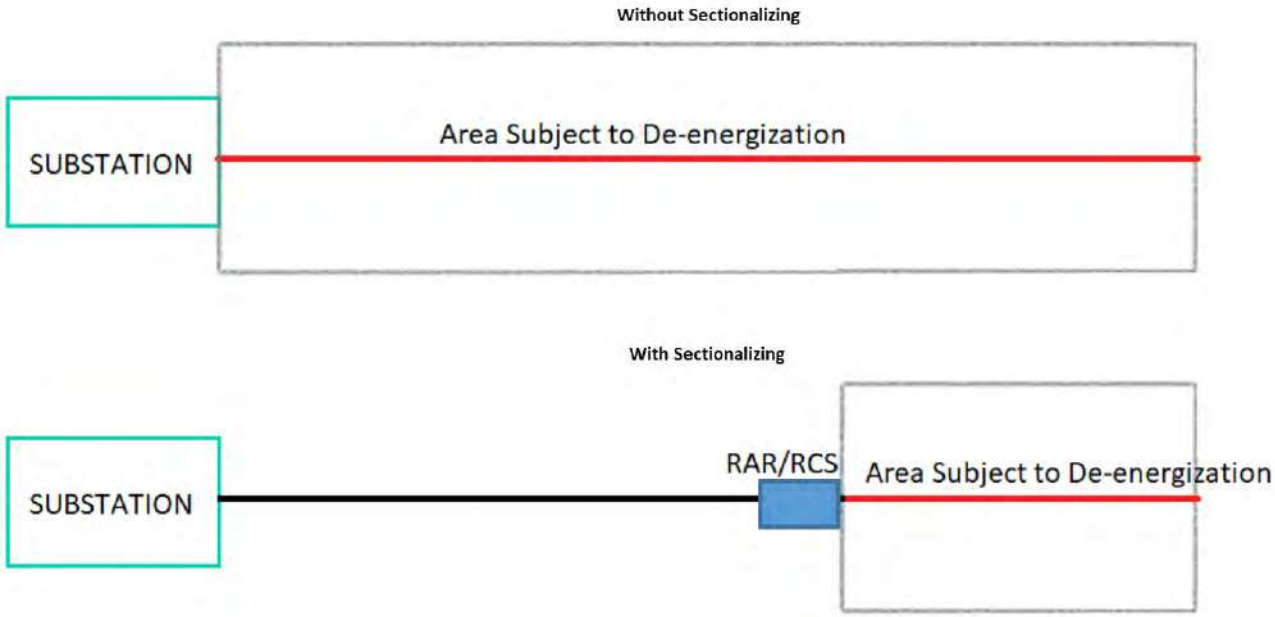
8.1.2.8.1 Remote Controlled Automatic Reclosers

Utility Initiative Tracking ID: SH-5

Overview of activity: SH-5 is a program to install and update Remote Controlled Automatic Reclosers. The updates are to accommodate enhanced protective settings known as Fast Curves (described further in Section 8.1.8.1.1). Distribution circuits span many miles, may traverse areas of varying risk, and are subject to varying weather conditions based on specific asset locations. In the past, during PSPS events, both the portions of circuits that do not pose ignition risks and the portions that present ignition risks have been de-energized, as there were no available means of isolating these segments to only de-energize portions of concern. To address this issue, SCE is installing Remote Control Switches (RCS) and Remote Automatic Reclosure (RARs) devices to help sectionalize circuits and control the flow of electricity remotely.

[153] SCE uses the Value of Service (VOS) as described by the Nexant 2019 Value of Service Study presented in the 2021 General Rate Case (GRC).

Remote Control Switches (RCS)



RCS are a type of load sectionalization device that helps SCE limit PSPS de-energization to fewer and smaller circuit segments. Although SCE has traditionally installed automation equipment to improve reliability and provide operational flexibility, it has since expanded its distribution automation activities as part of wildfire and PSPS mitigation strategy (see Figure SCE 8-13 - Images of Isolation Transformers used for Grounding Conversion).

Having manual switches increases the time and resources needed for de-energization, testing, and re-energization. The remote-control capabilities associated with RCS are necessary to enable SCE to quickly respond to emergent fire danger conditions to reduce ignition driver risks and minimize the effects of PSPS events.

Remote Automatic Reclosures (RARs)

RARs are a type of fault-interrupting automatic switch that shuts off electric power when an electrical fault or short circuit is detected, thus reducing the risk of ignition (see Figure SCE 8-13 - Images of Isolation Transformers used for Grounding Conversion). RARs are reclosers that have been modified to be remotely operated by means of a radio. They operate in a similar fashion to a substation Circuit Breaker but are located on distribution line sections remote from the substation.

Figure SCE 8-14 - Sectionalizing Devices Limit De-energization to Smaller Segments

New RARs and RCSs will be required to further sectionalize circuits and circuit segments and improve ability to reduce PSPS scope, isolate faults and improve restoration time. As described in Section 8.1.8.1.1, SCE increases the fault sensitivity of RARs by way of operational settings during adverse weather conditions.

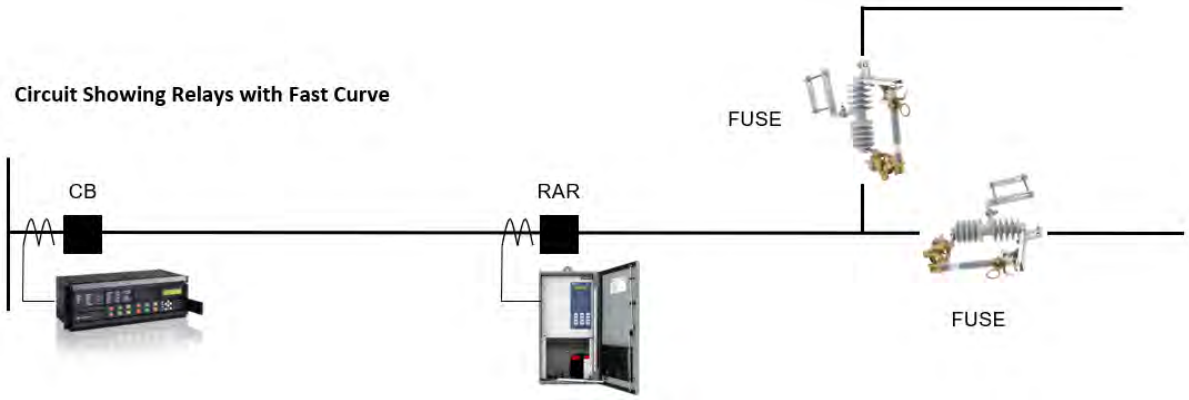
Figure SCE 8-15 - A Remote Control Box (left) and Remote Automatic Recloser (RAR) Switch (right)

SCE aims to complete six RAR/RCS projects in 2023 and five in each 2024 and 2025, subject to PSPS analysis from the prior year, which can inform where projects are most needed. SCE will strive to complete as many as 17 projects each year between 2023 and 2025.

Impact of activity on wildfire risk: Fast Curve settings that are enabled on RARs can reduce response time to protect the line from fault currents when they occur, thereby reducing ignition risk. Please see Section 8.1.8.1.1 for further discussion on Fast Curves. Please see Table 7-2 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts wildfire risk.

Impact of activity on PSPS risk: RARs and RCSs allow SCE to sectionalize circuits into smaller segments during PSPS and thus reduce the scope and size of PSPS. Please see Table SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts PSPS risk.

Updates to the activity: SCE plans to perform detailed engineering reviews to identify locations for new RARs to help further expand to potentially impacted customers the coverage afforded by these devices. In addition, SCE has been making updates to the Fast Curve settings that are enabled on these devices, which is discussed in more detail in Section 8.1.8.1.1



8.1.2.8.2 Circuit Breaker Relay Hardware for Fast Curve

Utility Initiative Tracking ID: SH-6

Overview of activity: Upgrading circuit breakers is a program. At substations, a relay is a device designed to trip a Circuit Breaker (CB) when it detects a fault, which is an electrical disturbance in the power system accompanied by a sudden increase in current. The CB then interrupts the current flow, cutting off the power supply to minimize damage to the circuit. As discussed in Section 8.1.8.1.1 and 8.3.3, SCE has implemented Fast Curve settings at substation CB relays (SH-6) in addition to the RARs

(SH-5), discussed above, to increase the speed of the relay detecting a fault and deenergizes a circuit, thus decreasing the risk of an ignition. SCE upgrades old electromechanical relays with new microprocessor relays that can accommodate Fast Curve settings integration.

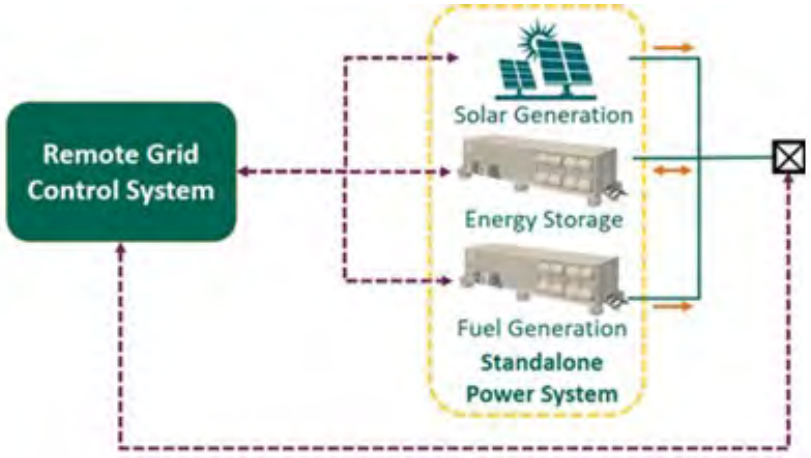
Figure SCE 8-16 - Depiction of Circuit Breaker Relative to Remote Automatic Reclosers & Fuses

SCE aims to replace or upgrade 75 circuit breakers in 2023 but will strive for 88. In 2024 SCE aims to complete an additional 10 units, sunsetting the program after these units are completed.

Impact of activity on wildfire risk: CB Relays with Fast Curve settings allows SCE to more quickly protect circuits when fault currents are detected. The result is reduced ignition risk from any fault event. Please see Section 8.1.8.1.1 for a discussion of Fast Curve settings, and Table SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts wildfire risk.

Impact of activity on PSPS risk: This initiative does not impact PSPS risk as PSPS prevents faults from occurring whereas CBs with Fast Curve settings protect a circuit quicker after a fault occurs. Please see Table SCE 7-02 and Appendix F: Supplemental Information (i.e., "Mitigation Effectiveness Workpapers") for additional information on how this mitigation impacts PSPS risk.

Updates to the activity: SCE is continuing to replace old electromechanical relays with modern microprocessor relays on circuit breakers to allow them to be set with Fast Curves. SCE is also updating its Fast Curve settings as discussed in Section 8.1.8.1.1.



8.1.2.9 Line Removal (in the HFTD)

8.1.2.9.1 Remote Grid Feasibility Study for Wildfire Reduction

Utility Initiative Tracking ID: 8.1.2.9.1

Overview of the Activity: A remote grid is a configuration where a small number of customers in remote locations are served entirely by local Distributed Energy Resources (DERs) that are disconnected from the SCE grid, as shown in Figure SCE 8-17. These are similar to microgrids, without the option to be connected to the larger grid. See Section 8.1.2.7.1 for more information about SCE's Microgrid Assessment.

Figure SCE 8-17 - Remote Grid System Diagram

Remote grid systems are comprised of solar PV, battery energy storage, backup fuel generator and grid system controller to form a permanent islanded power system co-located with the customer loads. Customers in remote areas with relatively small and steady load (typically < 100 kW) can potentially be served by remote grids, allowing for improved resiliency by isolating the customer loads from other portions of the grid where ignitions or faults may occur (i.e., the overhead portion of the grid serving those customers). As SCE's IWMS identifies undergrounding line segments in severe risk areas where there are egress constraints and other high consequential criteria, remote grids may be a viable alternative to reducing ignition risk in select cases where undergrounding of distribution lines are infeasible or very expensive (see Section 8.1.2.2.1 for a discussion of SCE's undergrounding initiatives).

There are also potential additional benefits, such as reduced vegetation management and inspection work, since the long lines that connect the customer load to the rest of the grid will be removed. A related activity is the Microgrid Assessment which is discussed in Section 8.1.2.7.1.

The focus of this activity is to perform a feasibility study to determine whether a remote grid is a viable option at locations that are scoped for undergrounding and exhibit high length to load ratio (i.e., has a long line segment feeding a small load). The outcome of each study will indicate whether a remote grid is feasible and cost-effective and determine its effectiveness as a mitigation strategy in lieu of undergrounding.

The number of studies were determined based on SCE's evaluation of how many locations SCE found where undergrounding is infeasible and the ratio of line length to load appears to be relatively high. This list was further refined using SCE's IWMS risk tranches to prioritize locations in Severe Risk Areas. From this review process, SCE has identified 13 locations that meet the criteria.

Impact of activity on wildfire risk: This activity does not directly impact wildfire risk drivers. However, once the study identifies a location appropriate for a remote grid, the resulting associated work will remove overhead lines and thus substantially reduce the risk of wildfire from those overhead lines.

Impact of activity on PSPS risk: This activity does not directly impact PSPS risk. However, once the study identifies a location appropriate for a remote grid, the resulting associated work will substantially reduce PSPS risk to a particular location as it will no longer be impacted by de-energized facilities.

Updates to the activity: Not applicable as this is a new WMP activity.

8.1.2.10 Other Grid Topology Improvements to Minimize Risk of Ignitions

8.1.2.10.1 Legacy Facilities

Utility Initiative Tracking ID: 8.1.2.10.1, formerly SH-11

Overview of activity: In prior WMPs, SCE implemented initiative SH-11, Legacy Facilities, to harden electrical equipment supporting SCE's hydroelectric generation operations. These generation-related assets in HFRA were examined for potential ignition risks and mitigations applied in the form of installing covered conductor, removing bare conductor, re-routing to existing lines that are already equipped with covered conductor, and updating control circuits with updated protections. SCE previously had three sub-activities in this initiative:

- Low Voltage site hardening, which assesses a variety of low voltage sites in HFRA for opportunities to reduce wildfire risk.
- Updating hydro control circuits, which involves an assessment of distribution lines that feed hydroelectric generation facilities exclusively.
- Assessing and updating grounding grids and lightning arrestors help ensure that in the event of a lightning strike or electrical incident, equipment can handle the voltage and release safely instead of causing additional wildfire risk.

Impact of activity on wildfire risk: Bare copper control circuit wire between the hydroelectric generation facility and operating gatehouse travels along the same path as the open wire distribution lines feeding the legacy facility. Re-routing to an existing covered conductor line and upgrading the bare copper controls to a fiber circuit reduces the risks of ignitions due to contact from object or clashing of bare conductors. Remediation of the grounding grid and lighting arresters help ensure equipment is able to safely discharge voltage in the event of a lightning strike or electrical fault and not cause additional wildfire risk.

Impact of activity on PSPS risk: Sites with grid hardening measures such as covered conductor can benefit from reduced PSPS risk as CC increases wind thresholds allowing lines to remain energized during higher wind speed events.

Updates to the activity: In 2022, SCE completed its targets for low voltage hardening and grounding grid studies, however only completed two out of the three hydro control reconductoring projects. The incomplete reconductor project at Siphon was delayed due to external environmental permitting issues and SCE expects to complete the project in Q3 2023.

On a going forward basis, SCE will continue to assess and update grounding grids and lightning arrestors

as applicable to help ensure that in the event of a lightning strike or electrical incident, equipment can handle the voltage and release safely instead of causing additional wildfire risk. This may involve installing grounding rods, rushed rock, and lightning arrestors in years 2023, 2024 and 2025 at various legacy facility sites.

8.1.2.10.2 Vertical Switches

Utility Initiative Tracking ID: SH-15

Overview of activity: Vertical switch upgrades is a program to upgrade switches, which need replacement. Engineering analysis of legacy vertical distribution switches concluded that older switches may generate incandescent particles if not properly adjusted or constructed. Additionally, a study revealed that wooden crossarms, upon which these switches are mounted, may shrink or warp over time potentially allowing the switch system to move out of alignment. A misaligned or improperly constructed switch may not perform normally and within its ratings. Findings from vertical switch inspections performed in 2019 in HFRA reinforced the need to replace the vertical switch population. The findings identified misadjusted switches and other construction issues that may negatively affect the wood crossarm based vertical switch systems.

Specifically, the mounting hardware for these legacy vertical switches clamp and bolt to the wood crossarms. Over time, warping of the wooden crossarms can cause the mounting hardware to loosen and correspondingly cause the vertical switch contacts to be out of alignment, potentially leading to failures. If a vertical switch fails, arcing may generate sparks with sufficient heat content to reach the ground.

This initiative replaces previously identified wooden crossarm mounted vertical switches requiring replacement with composite crossarm mounted vertical switches in SCE's HFRA.

Impact of activity on wildfire risk: A concern with vertical switch failures is the production of sparks associated with misaligned contacts. If a vertical switch fails, arcing may generate arcs or spark showers with sufficient heat content to reach the ground. The replacement of wooden crossarm mounted vertical switches identified for requiring replacement with composite crossarm mounted vertical switches in SCE's HFRA may reduce these events from faulty or worn devices, and therefore reduce the risk of ignitions from equipment failure that can lead to wildfires.

Impact of activity on PSPS risk: No direct impact on PSPS.

Updates to the activity: SCE has made no changes to the initiative since the last WMP submission. SCE will continue replacement of vertical switches as reported for 2021 and 2022. SCE anticipates completing remaining switch replacements in 2023.

8.1.2.11 Other Grid Topology Improvements to Mitigate or Reduce PSPS Events

As part of its IWMS, SCE evaluates circuits that face potential impacts from PSPS and determines appropriate mitigations such as grid hardening (see SH-1, Section 8.1.2.1 and SH-2, Section 8.1.2.2) and sectionalizing devices (see SH-5, Section 8.1.2.8). These targeted mitigations can help reduce the need for PSPS or reduce the number of customers impacted by PSPS. For example, these efforts could reduce the impact of PSPS on customers located in non-HFRA that are connected to circuits that traverse HFRA, and customers located on certain underground circuit segments within HFRA that are fed from overhead circuitry within HFRA. Targeted covered conductor deployment can help increase windspeed thresholds for PSPS de-energization. Please see Section 9 – PSPS for further discussion on SCE's PSPS program and approaches to minimize impacts to customers.

8.1.2.12 Other Technologies and Systems Not Listed Above

8.1.2.12.1 Transmission Integrated Wildfire Mitigation Strategy (IWMS) Engineering Analysis and Testing

Utility Initiative Tracking ID: 8.1.2.12.1

Overview of activity: Transmission IWMS is a study. While transmission lines have a lower probability of failure compared to distribution lines, there still exists risks associated with ignitions that could propagate from a transmission line. SCE has primarily focused its wildfire mitigation efforts on the riskiest areas of the distribution system and has made significant progress. SCE now looks to address the remaining risk on the Transmission System.

Currently, SCE performs ongoing inspections, maintenance, and vegetation management related wildfire mitigations on the transmission system. This proposed activity will explore additional potential mitigations for the transmission system in 2023, which would include an assessment of feasibility and a cost analysis of potential mitigation options. If the studies find that the mitigations are feasible and cost-effective, then SCE may deploy them in the future.

Impact of activity on wildfire risk: This activity does not directly impact WF risk drivers. However, the mitigations that may come out of this activity are intended to address drivers such as contact-from-object, wire-to-wire contact, and equipment failure.

Impact of activity on PSPS risk: This activity does not directly impact PSPS risk drivers. However, the mitigations that may come out of this activity will be reviewed to see if they can reduce PSPS risk in addition to wildfire risk.

Updates to the activity: Not applicable, this is a new study.

8.1.3 Asset Inspections

In this section, the electrical corporation must provide an overview of its procedures for inspecting its assets.

The electrical corporation must first summarize details regarding its ~~vegetation management~~[154] inspections in Table 8-6. The table must include the following:

- ***Type of inspection**: i.e., distribution, transmission, or substation*
- ***Inspection program name**: Identify various inspection programs within the electrical corporation*
- ***Frequency or trigger**: Identify the frequency or triggers, such as inputs from the risk model. Indicate differences in frequency or trigger by HTFD Tier, if applicable*
- ***Method of inspection**: Identify the methods used to perform the inspection (e.g., patrol, detailed, aerial, climbing, and LiDAR)*
- ***Governing standards and operating procedures**: Identify the regulatory requirements and the electrical corporation's procedures for addressing them*

Table 8-6 - Asset Inspection Frequency, Method, and Criteria

Type	Inspection Program	Frequency or Trigger (Note 1)	Method of Inspection (Note 2)	Governing Standards & Operating Procedures
Distribution	Distribution Detailed Inspections and Remediations	As Identified in Section 8.1.3.1 Frequency	Detailed[155] Ground Inspection Detailed Aerial Inspection (See Section 8.1.3.1 Process)	GO 95 GO 165 Distribution Inspection Maintenance Program (DIMP)
Transmission	Transmission Detailed Inspections and Remediations	As Identified in Section 8.1.3.2 Frequency	Detailed Ground Inspection Detailed Aerial Inspection (See Section 8.1.3.2 Process)	GO 95 GO 165 Transmission Inspection Maintenance Program (TIMP) North American Electric Reliability Corporation (NERC) Western Electricity Coordinating Council (WECC) California Independent System Operator's (CAISO) Transmission

[154] Manual adjustment by SCE to reflect the asset inspections section.

		Effects Analysis (FMEA),[157] these inspections are performed every 2 years.	Monitoring (CBOLM) and Oil Circuit Breaker Analysis (OCBA)) Inspection is done for all substation equipment by means of visual, infrared thermography and ultrasonic inspection (See Section 8.1.3.10 Process)	Criteria, Pages A-1, A-2 and A-3

Note 1: The electrical corporation must provide electrical corporation-specific risk-informed triggers used for asset inspections.

Note 2: The electrical corporation must provide electrical corporation-specific definitions of the different methods of inspection.

The electrical corporation must then provide a narrative overview of each ~~vegetation asset~~[158] inspection program identified in the above table; Sections 8.2.2.1. provides instructions for the overviews. The sections should be numbered 8.1.3.1 to Section 8.1.3. (i.e., each ~~vegetation asset~~[159] inspection program is detailed in its own section).The electrical corporation must include inspection programs it is discontinuing or has discontinued since the last WMP submission; in these cases the electrical corporation must explain why the program is being discontinued or has been discontinued.

[157] The purpose of the study was to develop recommendations for substation equipment inspection and maintenance based on qualitative analysis of probability and consequence of failure and associated ignition.

[158] Manual adjustment by SCE to reflect the asset inspections section.

[159] Manual adjustment by SCE to reflect the asset inspections section.

8.1.3.1 Distribution Detailed Inspections and Remediations (IN-1.1)[160]

Process

In this section, the electrical corporation must provide an overview of the individual asset inspection program, including inspection criteria and the various inspection methods used for each inspection program.

SCE performs visual detailed inspections of distribution facilities as part of its routine practices throughout its service area in compliance with GO 165. Degradation of equipment and structures as part of wear and tear during normal operations and due to external factors, such as weather or third-party caused damage increases the probability of in-service malfunction or failures that can have safety and service reliability impacts. GO 95 provides guidance on overhead electric line construction standards and GO 165 provides guidance on the minimum timing for inspections. SCE performs inspections in our high-fire risk areas that go beyond the GO 95 and GO 165 requirements as described below.

To identify equipment or structure degradation that occurs between compliance cycles that could lead to a potential ignition risk, SCE conducts more frequent and ignition-focused risk inspections in HFRA beyond GO 165 requirements ("High Fire Risk-Informed inspections" or "HFRI inspections"). Prior to 2019, distribution detailed inspections entailed a ground-based visual inspection conducted by inspectors within HFRA and non-HFRA.

In 2019, a crossarm failed on a pole, and resulted in a small fire. An investigation revealed that the crossarm was damaged, and the damage was not visible from the ground. Thus, in 2019 SCE began to also perform aerial detailed visual inspections via helicopter or drone as shown below in Figure SCE 8-18 in HFRA to supplement ground-based inspections to identify deterioration or unfavorable asset conditions, such as a damaged pole top as shown below in Figure SCE 8-19. Ground inspections continue to be necessary because they help detect equipment/structure conditions that are difficult to identify via aerial inspections (e.g., the condition of guy anchors are not able to be assessed appropriately via aerial inspections), such as a damaged wood pole and h-frame (see Figure SCE 8-20 and

Figure SCE 8-21 below). In 2022, SCE piloted a single visit 360 inspection for distribution (for inspections on 33kV assets and below), this consisted of performing the ground and aerial inspections for the structure on the same visit. 360 Inspections will not typically be performed by one individual, but instead by both an inspector and a pilot. In some cases, a single inspector will perform an inclusive inspection (ground and aerial). A quality review of a pre-determined percentage will be performed to ensure consistency and aptitude of inspection.

[160] The "Distribution Detailed Inspections and Remediations" program is referred to as "HFRA 360" within the 2025 GRC.

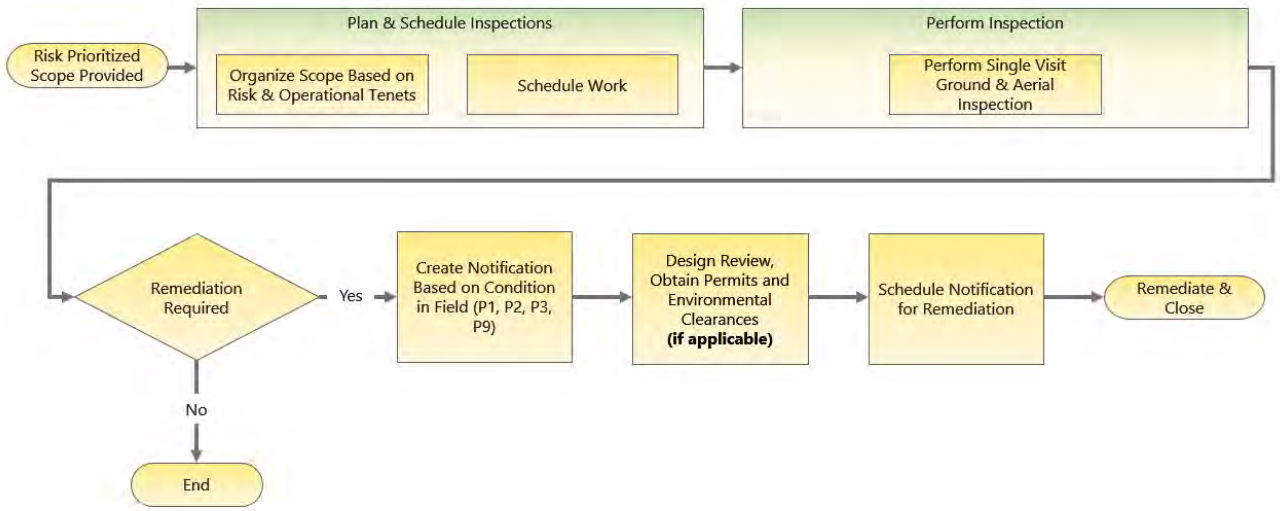
Figure SCE 8-21 - Damaged H-Frame on a 12kV Circuit

Distant	At Close Range
	

The frequency of HFRI inspections varies by the location-specific risk (as defined by IWMS) within SCE's HFRA and emergent conditions. Issues identified by inspectors during the detailed inspections are prioritized for remediation to be completed within GO95 compliance timelines. Remediations can be repairs to or replacements of existing assets depending on asset condition. For example, SCE repairs ground molding with that is found to be broken/damaged with an exposed ground wire at the public level. Also, SCE replaces wood guy guards if found to be missing, damaged or outdated.

SCE has enhanced its HFRI inspections since 2018 based on continuously improving data and ignition risk analysis. One such example is that since 2020, SCE's Fire Science team has identified Areas of Concern (AOCs) in HFRA based on actual current year conditions, which are areas that pose increased fuel-driven (Summer AOCs) and wind-driven (Fall AOCs) fire risk. The AOCs are identified based on several factors, including fire history, current and near-term weather conditions, fuel type, exposure to wind, and egress, among others. To mitigate the potential risk in AOCs, SCE implements an action plan in the AOCs that includes inspections of the assets (e.g., distribution, transmission, and generation) and, acceleration of remediations for the assets with the highest risk.



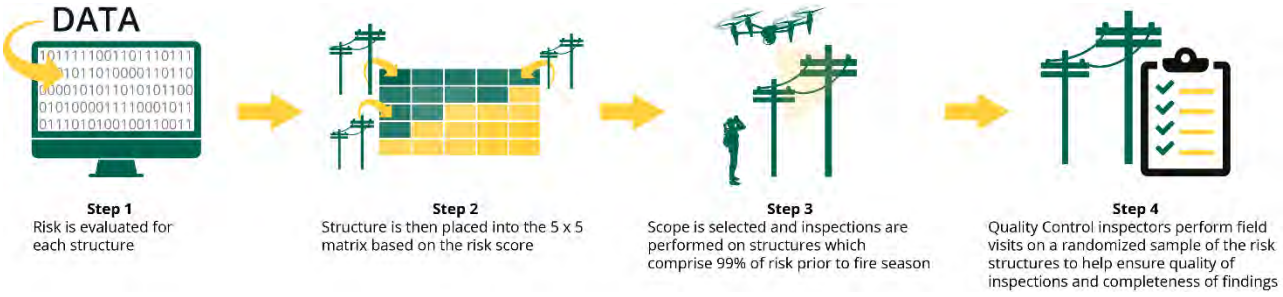
SCE also updates its AOCs effort each year based on lessons learned in order to optimize efficiency in execution of the action plan prior to peak fire season.

From 2023 to 2025, SCE's distribution detailed inspections will include a single visit ground and aerial inspection of the structure also known as the "360 inspection." In addition, SCE plans to continue the Summer and Fall AOCs program as a component of the distribution detailed inspections.

Include relevant visuals and graphics depicting the workflow and decision-making process the electrical corporation uses for the inspection program.

Figure 8-1a below depicts the workflow and decision process regarding distribution detailed inspections.

Figure 8-1a - Distribution Detailed Inspections and Remediations Workflow



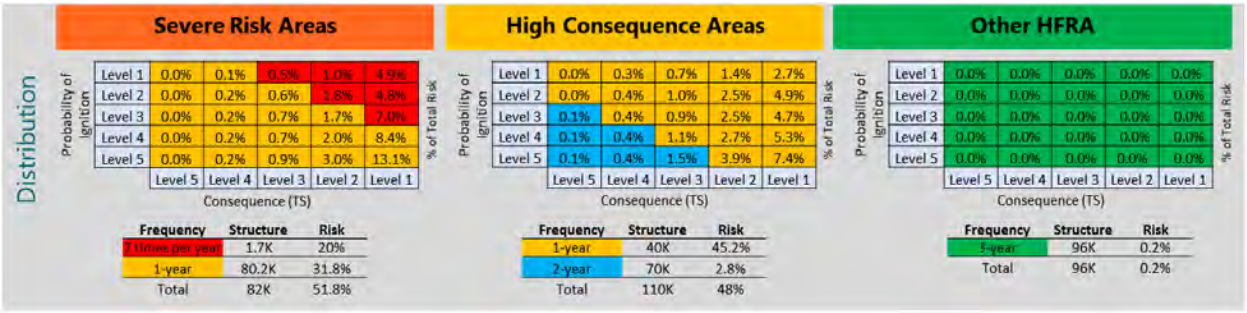
Frequency or Trigger

In this section, the electrical corporation must identify the frequency (including how frequency may differ by HFTD Tier or other risk designation[s]) or triggers used in the inspection program, such as inputs from the risk model.

SCE conducts detailed inspections of each structure within HFRA at least once every three years, which exceeds the GO 165 requirements of once every five years.[161] Standard ground-based distribution detailed inspections continue to be performed in SCE's non-HFRA every five years in accordance with GO 165 requirements.

Because risk levels vary across SCE's HFRA, structures are prioritized for inspection based on POI and consequence. In determining the 2023 Distribution HFRI inspection scope, SCE used the locational risk categorization from its IWMS Risk Framework, incorporated the latest risk modeling, and appropriate reserve capacity needed for resources to perform emergent AOCs. Figure SCE 8-22 below, outlines the process by which SCE incorporates risk through its inspection scoping processes.

Figure SCE 8-22 - Evaluation of Risk for Distribution



In 2022, SCE shifted to a 5x5 matrix with one dimension of the matrix representing five levels of POI risk and the other dimension representing five levels of consequence. The structures that fall into Severe Risk Area and High Consequence Area IWMS tranches and qualify as the highest risk structures in their respective 5x5 matrix are inspected more frequently. This is illustrated in Figure SCE 8-23 below. Each 5x5 matrix in the figure represents the portion of the structure population that qualifies as the specific IWMS tranche (e.g., Severe Risk Areas, High Consequence Areas or Other HFRA). The percentages within each cell represents the percent of total risk associated with the structures within the population. The percent of total risk takes into consideration the number of structures in the cell which may result in a higher percentage in a relatively lower risk cell compared to a relatively higher risk cell (i.e., POI Level 5, TS Level 1 contains a higher risk total percent then POI Level 1, TS Level 1). Figure SCE 8-23 shows that in 2023, SCE will inspect structures that comprise approximately 99% of risk in HFRA associated with distribution structures.[162]

[161] The not to exceed three-year frequency guidance applies to all structures within HFRA distribution scope (e.g., distribution poles, combination poles and streetlight only poles) unless designated as higher frequency based on risk.

[162] Risk as measured by multiplying POI by Technosylva consequence. The same 99% risk coverage applies to SCE's Transmission Detailed Inspections.

SCE will annually inspect at minimum, all structures in areas identified as Severe Risk Areas and those structures identified within an AOCs. Additionally, in 2023 SCE will inspect highest risk structures in Severe Risk Areas IWMS category twice per year. Structures in High Consequence Areas will either be inspected annually, or once every two years depending on the risk profile. All remaining lower risk structures captured within the IWMS Other HFRA category will be inspected once every three years.

Figure SCE 8-23 - Visualization of Risk Analysis for Distribution

Regarding remediations, Priority 1 (P1) conditions are addressed within 72 hours either by fully remediating the condition or by temporarily repairing the equipment or structure and resolving immediate safety concerns prior to more extensive follow-up corrective action. P1 notifications are emergent activities, also referred to as breakdown maintenance, and include the repair of SCE equipment and structures that are severely damaged, compromised or have failed while in service. Examples of P1 conditions include vegetation touching lines, broken crossarms or insulators, burned connectors, or wires laying on crossarms.

Priority 2 (P2) issues are lower risk than P1s and therefore are resolved within six months for Tier 3 or 12 months for Tier 2 within HFRA. Examples of P2 issues include vegetation near lines and deteriorated crossarms or splices.

Priority 3 (P3) issues do not require near-term remediation because they do not pose material safety, reliability, or fire risks, and will either be repaired in conjunction with other scheduled work at the structure or re-evaluated at or before the next detailed inspection. P3 issues generally require remediation within 60 months pursuant to GO 95, Rule 18. Examples of P3 issues include missing items such as reflector strips, ground moldings, guy wire guards, or high voltage signs.

If the inspection program is schedule-based, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.

SCE utilizes a risk-informed strategy as described above to identify inspection scope and then schedules those inspections in HFRA to be performed before the peak of fire season and Non-HFRA inspections to be completed based on their compliance due dates. Additionally, SCE informs its schedule by prioritizing inspections in Summer AOCs areas to be completed prior to summer and Fall AOCs areas to be completed prior to fall.

Accomplishments, Roadblocks, and Updates

In this section, the electrical corporation must discuss:

- *Noteworthy accomplishments for the inspection program since the last WMP submission*

In 2022, SCE completed 162,721 distribution ground inspections and 157,144 distribution aerial inspections which exceeded the targets of 152,000 and 150,000 respectively. As discussed above, in 2022, SCE successfully completed the 360 inspections for distribution pilot, which consisted of performing ground and aerial inspections for structures on the same visit. The previous approach, for HFRA inspections, consisted of a ground and aerial inspection taking place on separate schedules. The benefits of this new approach are fewer anticipated customer impacts, more efficient notification prioritization, safety benefits for field personnel, more consistent asset data capture, as well as reduction in environmental impacts (e.g., reduced driving in the field).

Another noteworthy accomplishment in 2022 is a decrease in QA/QC findings regarding secondary conductors. SCE has deployed improved training for its inspectors and improvements within the inspection survey which has contributed to this decrease. Please reference ACI SCE-22-17 Address Secondary Conductor Issueswithin Appendix D: Areas for Continued Improvement of this WMP for additional details.

- *Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblocks*

In 2022, SCE encountered access and customer issues when performing the distribution detailed inspection program. To address access issues, SCE utilized Air Operations to perform the inspections aerially, where possible. For any customer issues raised, SCE coordinated with each of the customers in an attempt to resolve their concerns and perform the inspections.

- *Changes/updates to the inspection program since the last WMP submission including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)*

As discussed above, in 2022 SCE began implementation of the single-visit 360 inspection for distribution HFRA detailed inspections. From 2023 to 2025, SCE will continue to execute the single-visit 360 inspections for distribution detailed inspections. [163]

For 2023 and beyond, SCE will utilize a purely risk-based inspections and will inspect more frequently than GO 165 5-year requirement for all structures within HFRA. Over the next five years, SCE will transition to a risk-informed remediation framework for all asset notifications.

A new strategy that SCE is evaluating is the ability to utilize LiDAR specifically for asset inspections. Currently, SCE does not directly collect LiDAR data for the purpose of inspecting T&D distribution lines and equipment. Historically, SCE collected LiDAR data for vegetation management, engineering, and electric asset data needs. To directly mitigate wildfire ignition risk, the vegetation management organization utilizes LiDAR datasets to inspect vegetation grow/fall-in encroachment risks to identify priority notifications. The use of LiDAR for inspecting vegetation encroachment and clearance is

[163] While the intent of the program is for most inspections to follow these 360 single visit approaches, there may be instances where the ground and aerial inspections cannot be performed on the same visit and must be performed on different visits.

described in Section 8.2.2.4.1.

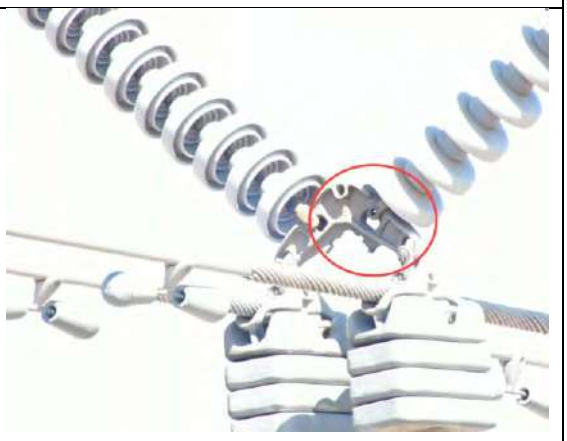
In 2021, the scope, schedule, and cost of procuring LiDAR data for SCE was consolidated in the centralized inspections organization to ensure that the inspections organizations are aware of LiDAR data collected throughout SCE. Then in 2022, SCE performed a detailed evaluation and competitive procurement to select a LiDAR visualization and analytics software platform to enable the visualization of the collected LiDAR data. This platform will help SCE prepare for advanced analytics capabilities supporting overhead structural T&D inspections via AI/ML analytics at a network scale. In addition, SCE also engaged in the procurement of a diverse array of suppliers that provide end-to-end data LiDAR life cycle capabilities including ground control survey, data collection, data processing (e.g., calibration and feature classification), and data analytics. In 2023, SCE will begin operationalizing the LiDAR visualization and software platform as well as explore the development of T&D LiDAR inspection surveys that can be leveraged by the inspection programs to log and track identified inspection risk and issue notification work orders if necessary.

8.1.3.2 Transmission Detailed Inspections and Remediations (IN-1.2)

Process

In this section, the electrical corporation must provide an overview of the individual asset inspection program, including inspection criteria and the various inspection methods used for each inspection program.

SCE performs detailed inspections of SCE's overhead transmission electric system in compliance with regulatory requirements including GO 165, NERC and WECC rules and regulations, and the CAISO Transmission Control Agreement.



Degradation of transmission equipment and structures as part of wear and tear during normal operations and due to external factors, such as weather or third-party caused damage, increases the probability of in-service malfunction or failure which can have safety and service reliability impacts. CPUC, NERC, WECC and CAISO regulatory requirements as well as SCE's wildfire risk models for HFRA drive the type and frequency of inspections to be performed.

To identify asset conditions that may lead to malfunction or failure, SCE's Transmission Inspection and Maintenance Program (TIMP) performs visual detailed inspections of overhead transmission and sub-transmission assets. For compliance purposes, these inspections are conducted by qualified inspectors every three years. GO 95 provides guidance on overhead electric line construction standards and GO 165 provides guidance on the minimum timing for inspections and maintenance for which SCE is required to comply. However, to identify transmission equipment or structure degradation that occurs between compliance cycles due to natural wear and tear or emergent events such as weather or third party caused damages that could lead to a potential ignition risk, SCE has implemented more frequent and ignition-focused risk inspections on transmission equipment and structures in HFRA ("HFRI inspections").

As with distribution inspections, aerial inspections supplement ground-based inspections. Aerial inspections are typically performed at the same locations as ground inspections and in combination provides a 360-degree view of the assets to detect equipment/structure conditions that are difficult to identify via ground inspections, such as missing cotter keys, which could lead to faults and ignitions (see

Figure SCE 8-24 below). From 2023 to 2025, SCE's compliance driven structure inspections within HFRA will follow the same type and scope of inspection that SCE uses to perform its transmission HFRI inspections as discussed below, which includes both a ground and an aerial inspection of the structure.

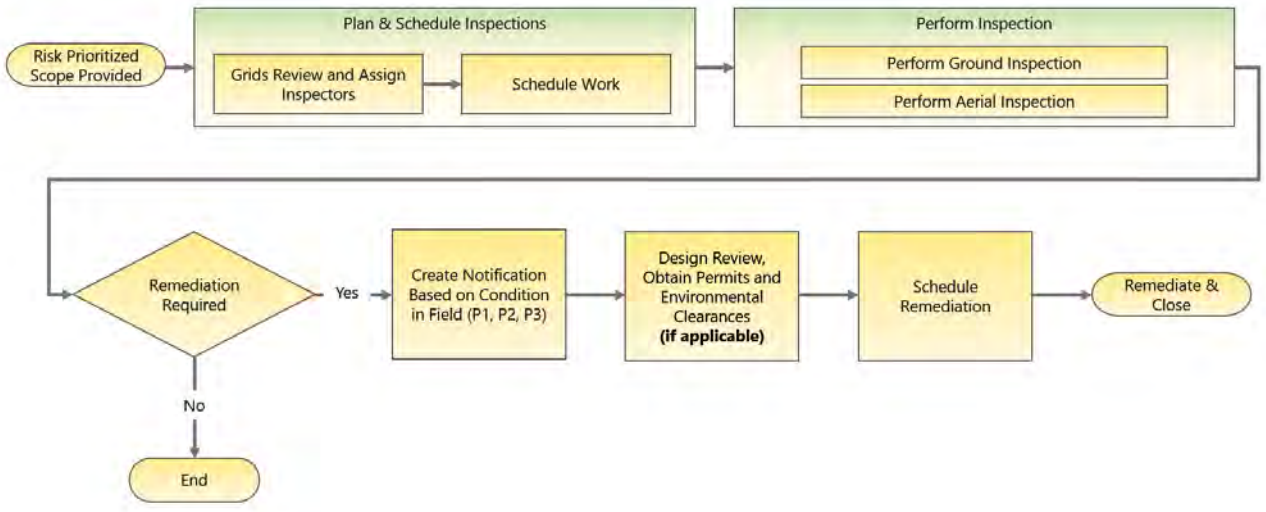


Figure SCE 8-24 - Transmission Missing Cotter Key (Drone Capture)

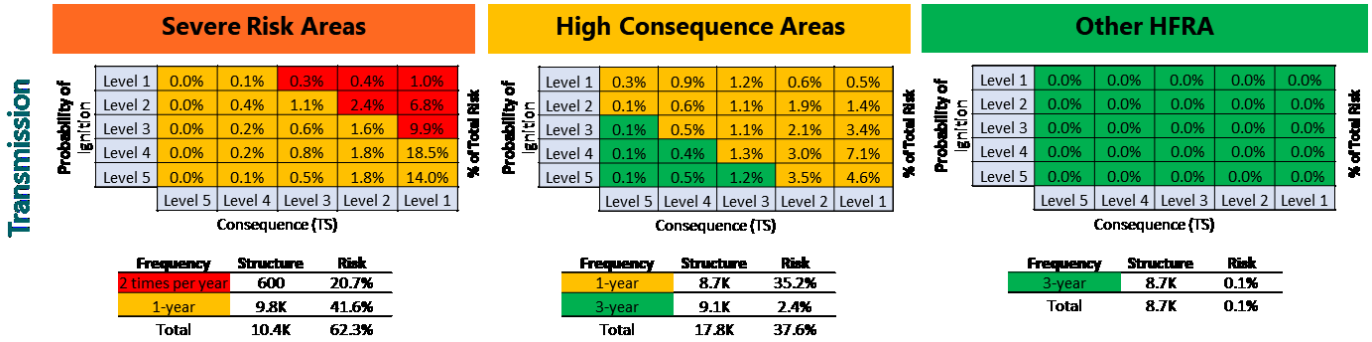
Distant	At Close Range
	

Include relevant visuals and graphics depicting the workflow and decision-making process the electrical corporation uses for the inspection program.

Below in Figure 8-1 b, is a relevant visual that depicts the workflow and decision process regarding transmission detailed inspections.

Figure 8-1 b - Transmission Detailed Inspections Workflow



Frequency or Trigger

In this section, the electrical corporation must identify the frequency (including how frequency may differ by HFTD Tier or other risk designation[s]) or triggers used in the inspection program, such as inputs from the risk model.

SCE performs a detailed transmission inspection of its entire service area over the span of three years. As risk levels vary across SCE's HFRA, a targeted quantitative approach for transmission inspections is being deployed to balance risk reduction, resource availability, and costs. Structures are prioritized for inspection based on POI and consequence. SCE aligned 2023 inspection scope with the IWMS and incorporated the latest risk modeling while taking into account the resource requirements of potential emergent inspections throughout the year. Figure SCE 8-25 summarizes the frequency of Transmission structure inspections based on IWMS risk tranche. Transmission structures in Severe Risk Areas and those structures identified within an AOC will be inspected annually at a minimum and a portion of highest risk structures in the Severe Risk Areas will be inspected twice a year. Additionally, transmission structures in High Consequence Areas will either be inspected annually, or once every three years based on the risk-informed 5x5 Matrix as shown below in Figure SCE 8-25. All remaining lower risk transmission structures in the IWMS Other HFRA category will be inspected once every three years. Where an inspection in HFRA is scheduled to be performed for compliance reasons around the same time as SCE's risk analysis determines that an HFRI inspection should be performed, these inspection requirements are combined into one inspection. The transmission HFRI inspections and remediations frequency methodology is similar to distribution as described within Section 8.1.3.1 above. Please refer to that section for additional detail.

Figure SCE 8-25 - Visualization of Risk Analysis for Transmission

If the inspection program is schedule-based, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.

SCE utilizes a risk-informed strategy as described above to identify inspection scope and then schedules those inspections in HFRA to be performed before the peak of fire season. Additionally, SCE informs its schedule by prioritizing inspections in Summer AOCs areas to be completed for summer readiness and Fall AOCs areas to be completed for fall readiness.

Accomplishments, Roadblocks, and Updates

In this section, the electrical corporation must discuss:

- *Noteworthy accomplishments for the inspection program since the last WMP submission*

In 2022, SCE completed 17,542 transmission ground inspections and 17,133 transmission aerial inspections which exceeded the target of 16,000 (both ground & aerial). In addition, SCE initiated a more formalized process to incorporate field expertise in the development of the next yearly inspection scope. SCE supplemented the inspection scope informed by the risk models with input from Transmission Senior Patrolman who have field knowledge about asset and location conditions that may not be included in current models. Based on this analysis, SCE expanded the 2023 HFRI inspection annual scope. Field input not only helps us improve risk reduction, but also facilitates risk model validation and enhancements. This is a good example of frontline worker feedback of wildfire risk they see in the field.

- *Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblocks*

SCE rolled out a new inspection tool in 2022 (InspectForce) for Transmission ground and for Distribution and Transmission aerial inspections. SCE experienced challenges relating to logistics and access to bug fixes and desired enhancements. SCE's Transmission and Distribution execution teams worked very closely with SCE's IT department to prioritize fixes and enhancements and were able to stabilize the tool so that 2022 inspections could be effectively completed. This tool will bring together all core inspection programs into one inspection tool that will integrate into SCE's systems of record.

- *Changes/updates to the inspection program since the last WMP submission including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)*[164]

In 2022, SCE began the new unified 360 approach for distribution inspections, which consisted of performing ground and aerial inspections for structures on the same visit. SCE is evaluating whether to implement a similar approach for transmission inspections in the future. Additionally, please reference Section 8.1.3.1 for the specialized T&D LiDAR program's accomplishments, current state and future plans for transmission.

Another update to our transmission inspection program is that SCE identified five transition span locations that require remediation to reduce ignition risk as part of wire-to-wire contact. Analysis of outage data indicated that transition span clashing accounts for 30% of outage events that were recorded in the "Other" primary driver category. High-risk transition spans, as shown below in

Figure SCE 8 are conductor spans on the transmission system where the conductor changes orientation from a horizontal configuration to a vertical configuration (or vice versa). In addition, transition spans are more susceptible to wire-to-wire contact under certain situations. These situations may include a high wind event or a vehicle-hit-structure where the wire-to-wire contact may create incandescent particles that could spark an ignition. This mitigation activities include

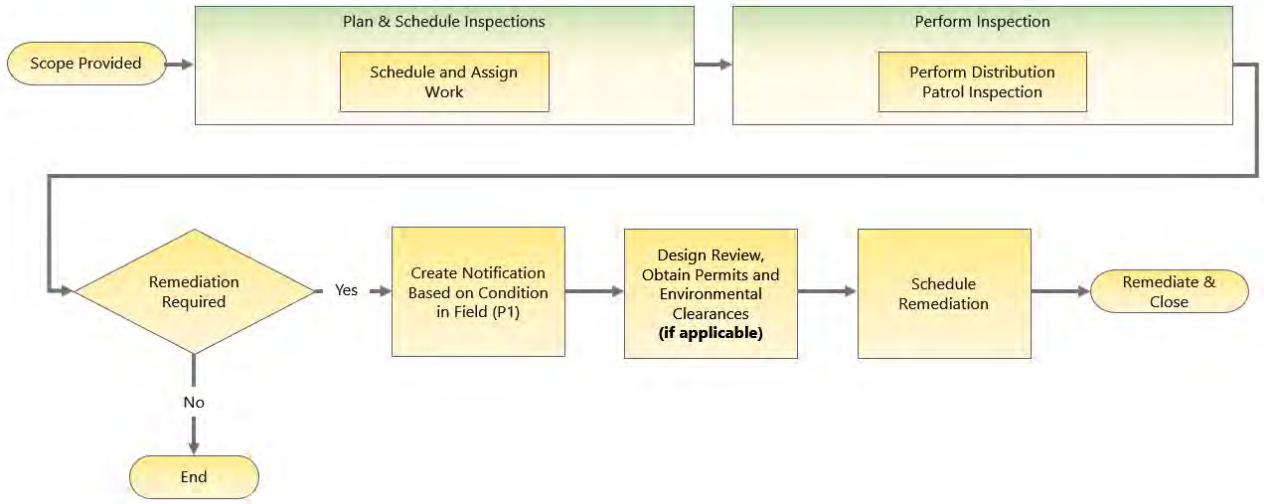
[164] In prior WMPs, SCE included a mitigation initiative (SH-13 – C-Hook Replacements) to proactively identify and remove C-Hooks from SCE's Transmission system and replace with hardware in SCE's current construction standard. SCE completed this proactive replacement program in 2022 and has since sunset the program. SCE maintains a question in its Transmission inspection form regarding the identification of C-Hooks, just to ensure all C-Hooks have been removed from SCE's system. Further, to the extent SCE acquires new transmission lines that contain C-Hooks, SCE intends to remove all C-Hooks prior to energizing those lines.

increasing conductor phase spacing by re-arranging the pole-head configuration, adding inter-set poles to decrease the span length, upgrading pole structures that will accommodate larger phase clearances, and installing line spacers to reduce risks where transition spans are identified. To identify high-risk transition spans, SCE revised the inspection survey form to include a question on the location of transition spans and to then SCE's engineering team will perform additional analysis on those locations.

Figure SCE 8-26 - Example of Transition Span

8.1.3.3 Distribution Patrols Inspections

Process



In this section, the electrical corporation must provide an overview of the individual asset inspection program, including inspection criteria and the various inspection methods used for each inspection program.

SCE performs patrol inspections of SCE's overhead distribution electric system in compliance with GO 165. A patrol inspection is a simple visual inspection that is designed to identify obvious structural problems or hazards. GO 165 requires SCE to perform an annual patrol inspection of all overhead distribution electric assets that are in SCE's HFRA. Annual grid patrols inspections provide SCE an additional opportunity to identify P1 conditions that may have occurred since the last inspection.

Include relevant visuals and graphics depicting the workflow and decision-making process the electrical corporation uses for the inspection program.

Below in Figure 8-1c, is a relevant visual that depicts the workflow and decision process regarding distribution patrol inspections.

Figure 8-1c - Distribution Patrol Inspections Workflow

Frequency or Trigger

In this section, the electrical corporation must identify the frequency (including how frequency may differ by HFTD Tier or other risk designation[s]) or triggers used in the inspection program, such as inputs from the risk model.

Annual Patrols are performed on all above ground structures, overhead conductors and equipment, as well as entryways to subsurface enclosures and vaults throughout SCE's service area. Additionally, in 2021 SCE introduced the concept of a Fall AOCs pre-patrol as a component of the AOCs effort to prepare for peak fire season. The Fall AOCs pre-patrol consists of a vehicle-based (where possible) patrol which looked for P1 conditions, mid-span clearance conditions (e.g., vegetation in lines or potential wire slap) and Communication Infrastructure Provider (CIP)/third party hazardous conditions.

If the inspection program is schedule-based, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.

SCE schedules its annual grid patrols in HFRA to be completed in the first half of the year in order to be performed prior to the summer months. SCE's Fall AOCs pre-patrols are scheduled to be completed prior to peak fire season.

Accomplishments, Roadblocks, and Updates

In this section, the electrical corporation must discuss:

- *Noteworthy accomplishments for the inspection program since the last WMP submission*

SCE completed patrol inspections of all distribution grids (which includes HFRA), and associated structures, in 2022.

- *Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblocks*

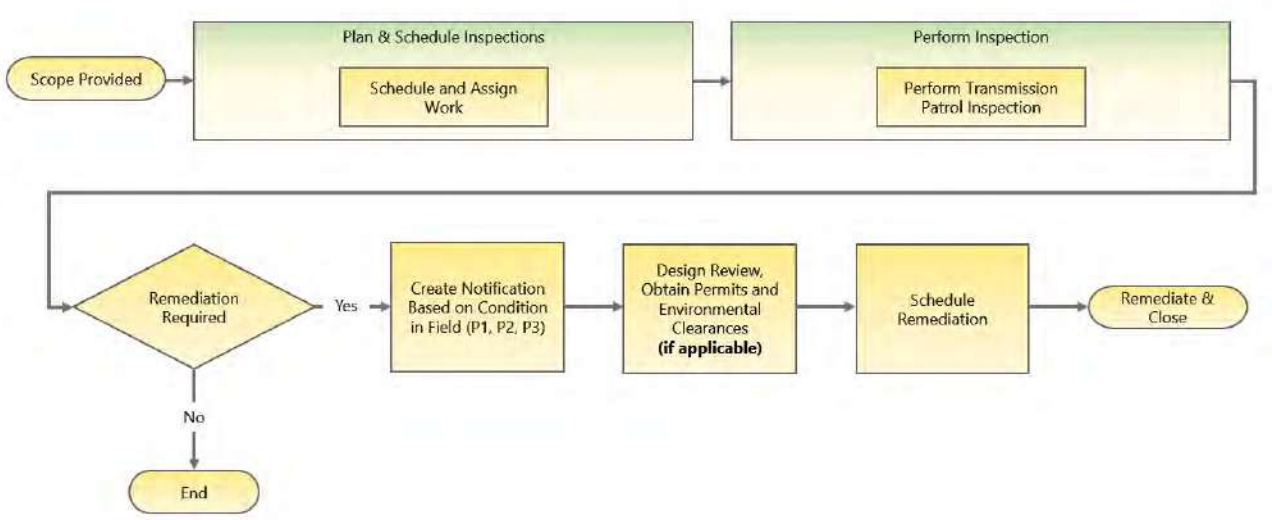
SCE encountered access issues with certain distribution assets performing this inspection program in 2022. To mitigate, SCE utilized helicopters to perform the inspections aerially.

- *Changes/updates to the inspection program since the last WMP submission including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)*

Since 2022, SCE engaged contractors to perform all grid patrol inspections to free up capacity for inspectors to focus on detailed inspections. There are no current plans for additional changes or improvements going forward; however, SCE will continue to evaluate the methods and data collections tools to improve the efficiency and risk mitigation opportunities of patrol inspections.

8.1.3.4 Transmission Patrols Inspections

Process



In this section, the electrical corporation must provide an overview of the individual asset inspection program, including inspection criteria and the various inspection methods used for each inspection program.

This program is part of SCE's portfolio of inspection activities. SCE performs patrol inspections of SCE's overhead transmission electric system in compliance with GO 165, NERC, WECC rules and regulations and CAISO's Transmission Control Agreement. A patrol inspection is a simple visual inspection that is designed to identify obvious structural problems or hazards associated to the structure.

Include relevant visuals and graphics depicting the workflow and decision-making process the electrical corporation uses for the inspection program.

Below in Figure 8-1d is a relevant visual that depicts the workflow and decision process regarding transmission patrol inspections.

Figure 8-1d - Transmission Patrol Inspections Workflow

Frequency or Trigger

In this section, the electrical corporation must identify the frequency (including how frequency may differ by HFTD Tier or other risk designation[s]) or triggers used in the inspection program, such as inputs from the risk model.

SCE performs routine patrol inspections of all circuits in SCE's service area annually and performs detailed patrol inspections every three years. Patrols are visual inspections and are done inside and outside of SCE's HFRA. The more detailed HFRI inspections are often done at the same time as patrols, with structures in that scope getting a more comprehensive inspection than the patrol provides. Additionally, in 2021 SCE introduced the concept of a Fall AOCs pre-patrol to prepare for peak fire season. The Fall AOCs pre-patrol consists of a vehicle-based (where possible) patrol which looked for P1 conditions.

If the inspection program is schedule-based, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.

SCE aligns its patrol schedules based on compliance dates and optimizes scheduling where possible with transmission HFRA detailed inspections when the scope of the two programs overlap. Additionally, the Fall AOCs pre-patrols are scheduled to be completed prior to peak fire season.

Accomplishments, Roadblocks, and Updates

In this section, the electrical corporation must discuss:

- *Noteworthy accomplishments for the inspection program since the last WMP submission*

SCE completed patrol inspections of all transmission and sub-transmission circuits (which includes HFRA), and associated structures, in 2022.

- *Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblocks*

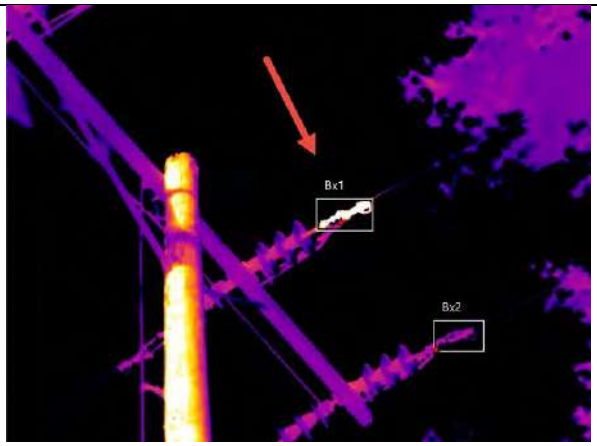
SCE did not experience any roadblocks when implementing this inspection program in 2022.

- *Changes/updates to the inspection program since the last WMP submission including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)*

Changes to the program scope or approach are not planned at this time. SCE plans to perform patrol inspections each year from 2023 to 2025 in alignment with previous years and in accordance with regulatory requirements.

8.1.3.5 Distribution Infrared (IR) Inspections (IN-3)

Process



In this section, the electrical corporation must provide an overview of the individual asset inspection program, including inspection criteria and the various inspection methods used for each inspection program.

SCE evaluated the need for infrared (IR) inspections on its distribution circuits and found that these inspections offer a substantial benefit beyond standard visual inspections. SCE had benchmarked methods to evaluate distribution overhead lines and learned that using IR technology to detect thermal differences and identify hot splices and connectors can be leading indicators of asset failure. SCE piloted IR inspections of energized distribution lines and equipment in 2017 and 2018 to help reduce the risk of conductor failure. Following the pilot, SCE deemed it prudent to inspect all distribution facilities in HFRA over a two-year cycle using IR technology.

The IR scan can detect temperature differences between components and identify heat signatures of components called “hot spots,” that may indicate deterioration in structures and equipment not visible to the naked eye. Most inspections have been performed from ground vehicles; however, a small percentage of the inspections require the inspector to hike to the structure or perform the inspection from a helicopter.

IR inspections can detect conditions that may indicate a wide range of anomalies, including, but not limited to, failing switch and fuse contacts, poor connections, loose bushings, overloaded/failing transformers, and other issues that can result in component failure. These conditions are often not visible to the human eye and can go undetected during detailed visual inspections as shown below in Figure SCE 8-27.

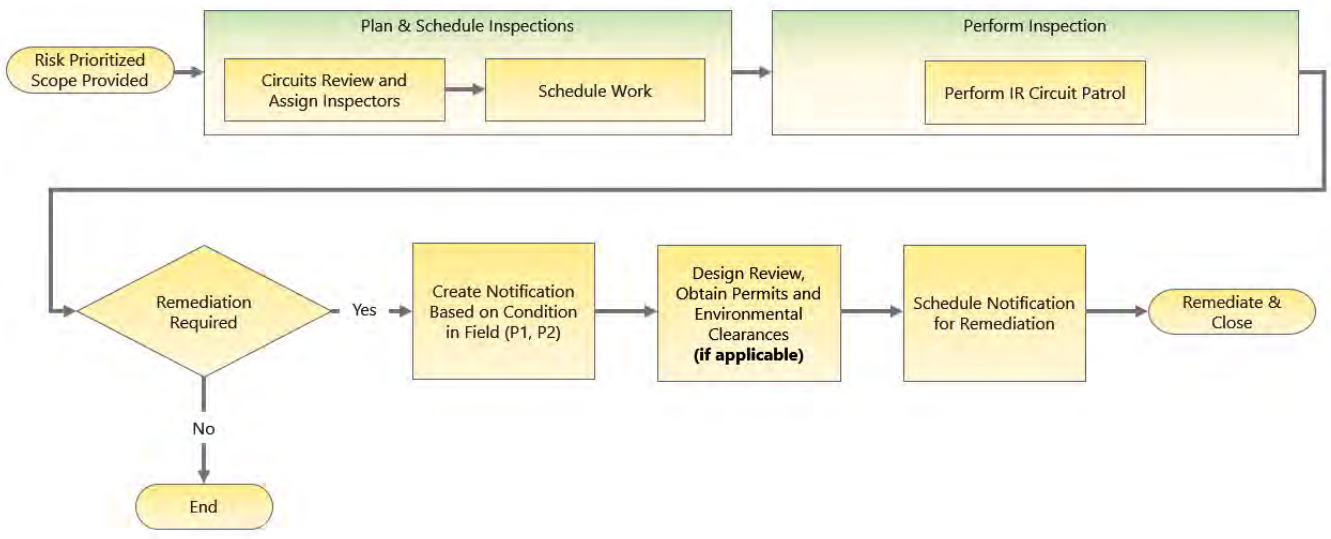


Figure SCE 8-27 - Distribution Infrared (IR) Inspection of a 16kV Circuit

Standard Imagery	Thermal Imagery
	

Include relevant visuals and graphics depicting the workflow and decision-making process the electrical corporation uses for the inspection program.

Below in, is a relevant visual that depicts the workflow and decision process regarding distribution infrared (IR) inspections.

Figure 8-1e - Transmission Patrol Inspections Workflow

Frequency or Trigger

In this section, the electrical corporation must identify the frequency (including how frequency may differ by HFTD Tier or other risk designation[s]) or triggers used in the inspection program, such as inputs from the risk model.

SCE will continue to perform IR scans on overhead distribution equipment throughout SCE's territory within HFRA from 2023 through 2025. Circuits within Tier 3 (extreme fire threat) and Tier 2 (elevated fire threat) are grouped by district and then prioritized by relative risk. Risk for each district is calculated by multiplying the POI by the Technosylva consequence, and then aggregating the risk scores of each structure in the district. District risk scores are ranked highest to lowest and are then scheduled accordingly. Since 2023 is the first year of the two-year cycle, SCE also incorporated IWMS in the prioritization analysis. The districts selected to be inspected annually were not only the highest risk, but also had large portions of their circuits that were within High Consequence Areas and Severe Risk Areas. From 2023 to 2025, following this methodology, SCE plans to inspect a total of approximately 5,300 distribution circuit miles annually within HFRA; the circuits in the highest risk districts will be inspected annually and the remaining circuits every other year.

If the inspection program is schedule-based, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.

SCE inspects the highest risk districts annually with the remaining scope approximately being split evenly and inspected every two years. The inspections are optimized and scheduled around the summer months to best recognize peak loading and temperatures of SCE's equipment.

Accomplishments, Roadblocks, and Updates

In this section, the electrical corporation must discuss:

- *Noteworthy accomplishments for the inspection program since the last WMP submission*

For 2022, the second year of the two-year cycle, SCE inspected the remaining overhead distribution circuit miles in HFRA which included 4,408 miles.

- *Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblocks*

SCE encountered issues relating to truck access (e.g., rural areas, secured areas, etc.) which were circumvented by performing the inspections from a helicopter. In addition, due to seasonal constraints (e.g., inclement weather) some inspections were re-scheduled to a different period of the year.

- *Changes/updates to the inspection program since the last WMP submission including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)*

Since SCE's 2022 WMP Update, changes have included optimizing the program schedule to balance risk coverage across each year while distributing mileage equivalently across both years. Additionally, in 2023, SCE will plan and schedule the distribution infrared inspections, where operationally efficient, to be conducted May through September to take advantage of expected higher loading during those months which could result in better conditions to identify hot spots.

8.1.3.6 Transmission Infrared (IR) and Corona Scan Inspections (IN-4)

Process

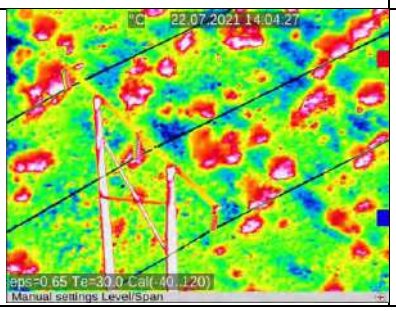
In this section, the electrical corporation must provide an overview of the individual asset inspection program, including inspection criteria and the various inspection methods used for each inspection program.

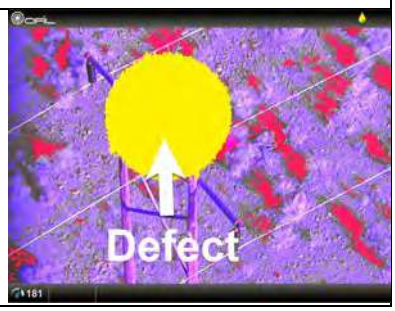
In the first quarter of 2019, SCE launched the Transmission IR & Corona Scanning program. Specialized infrared and ultraviolet (Corona) light cameras are mounted to helicopters, which inspect the line, with special attention paid to splices, conductor connection/attachment points, and insulators. SCE utilizes internal resources to conduct all aspects of the IR and Corona inspections.

Similar to the distribution infrared inspection protocol, the IR scan detects temperature differences and heat signatures of components, which may indicate problems that could result in component/conductor failure. Corona scanning is a technology that is only being used on transmission circuits in HFRA as certain anomalies (e.g., insulator failures) are not as common on distribution circuits.

Corona detection is accomplished by identifying ultraviolet energy, which is generated by electric discharge or "leakage" due to the ionization of air surrounding high voltage electric components. In some cases, the "leakage" is substantial enough that it may result in an arc flash and potential ignition. The Corona image identifies a conductor that has broken strands by showing the ultraviolet energy that is generated by electric discharge. It is very difficult to identify this type of issue with conventional photographs. Figure SCE 8-28 below shows an example of a defect that was captured by a Corona scan that could not be detected during a visual or IR inspection. Helicopters (see Figure SCE 8-29 below) are used for these inspections due to the long distances between structures and because these assets are frequently located on rugged terrain.

Figure SCE 8-28 - Midway-Vincent No 1 & No 2 500kV Lines





Visual	Infrared (IR)	Corona Scan
		

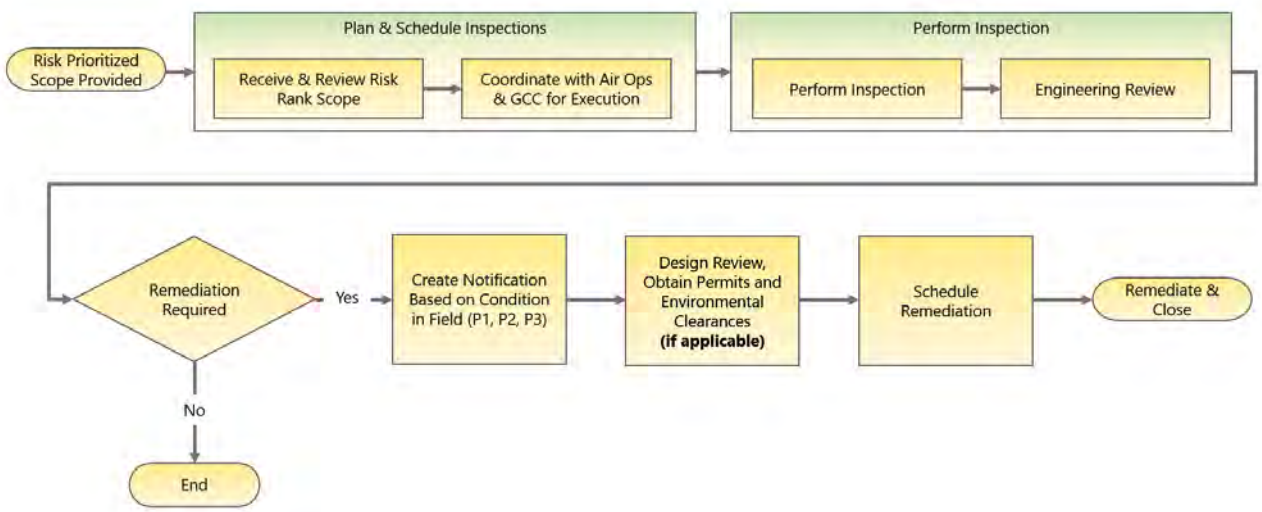


Figure SCE 8-29 - SCE Helicopters

SCE Helicopter	Mounted with IR & Corona Camera
	

Include relevant visuals and graphics depicting the workflow and decision-making process the electrical corporation uses for the inspection program. (see the example in Figure 8-1f).

Below in Figure 8-1f, is a relevant visual that depicts the workflow and decision process regarding transmission infrared (IR) and Corona scan inspections.

Figure 8-1f - Transmission Infrared (IR) and Corona Scan Inspections Workflow

Frequency or Trigger

In this section, the electrical corporation must identify the frequency (including how frequency may differ by HFTD Tier or other risk designation[s]) or triggers used in the inspection program, such as inputs from the risk model.

The Transmission IR & Corona Scanning program uses a risk prioritized method with consideration given to HFRA circuit miles and circuits completed in the previous year. The circuits are risk assessed by their probability of ignition and consequence levels and then prioritized by their calculated risk score. The circuits inspected in the previous year are removed from the priority list unless identified as one of the highest risk circuits utilizing POI and Technosylva.

Finally, the scope is chosen by identifying the remaining circuits that should be inspected to inspect approximately 1,000 HFRA circuit miles annually with this program. 1,000 annual miles allows SCE to inspect all transmission circuit miles roughly every five years while also targeting higher risk circuits more frequently.

If the inspection program is schedule-based, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.

SCE inspects the highest risk circuits annually with the remaining scope on a five-year review cadence which distributes the risk proportionally each year. The work is executed in an operationally efficient manner, taking into account weather conditions, circuit loading, outages and the proximity of other circuits.

Accomplishments, Roadblocks, and Updates

In this section, the electrical corporation must discuss:

- *Noteworthy accomplishments for the inspection program since the last WMP submission*

In 2022, SCE exceeded its WMP target of completing 1,000 circuit miles by completing 1,075 miles.

- *Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblocks*

SCE did not experience any roadblocks in implementing this inspection program in 2022.

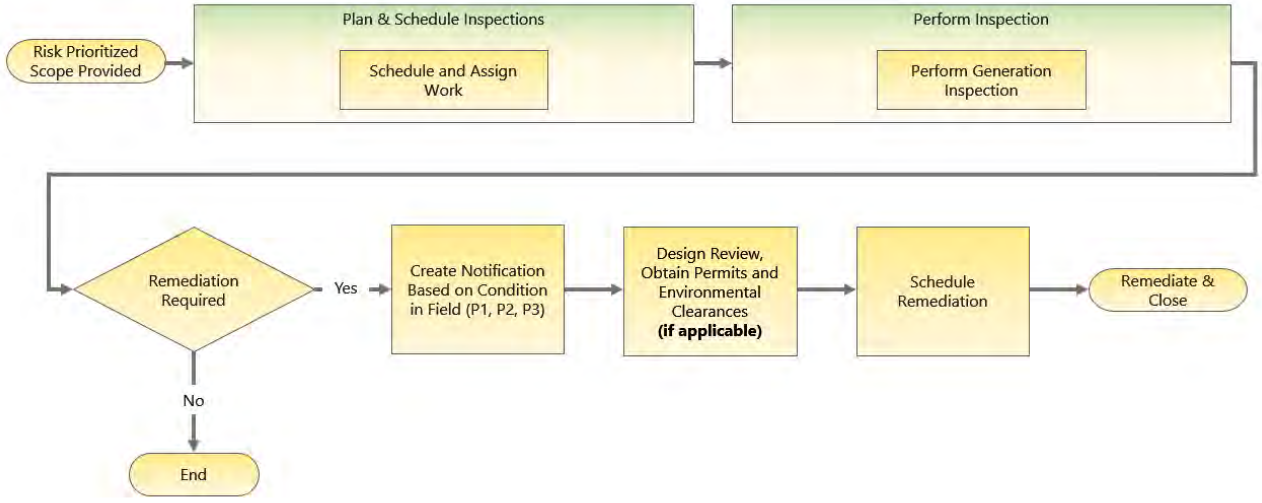
- *Changes/updates to the inspection program since the last WMP submission including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)*

Since SCE's 2022 WMP Update, there have been no changes to this inspection program. SCE will continue to evaluate the results of this program to determine appropriate scope and methods for this activity going forward. Starting in 2023, SCE will investigate the most ideal way to align the Transmission Infrared risk methodology with IWMS.

8.1.3.7 Generation Inspections (IN-5)

Process

In this section, the electrical corporation must provide an overview of the individual asset inspection program, including inspection criteria and the various inspection methods used for each inspection program.



In 2019, SCE began performing wildfire inspections on all electrical lines to align with the EOI/HFRI initiative that began in late 2018 for transmission & distribution, equipment, and overhead wiring associated with generation infrastructure, including secondary and control lines feeding ancillary generation assets in HFRA. These inspections included ignition-focused assessments of low-voltage ancillary assets and their associated overhead lines, supporting structures, and any exposed wiring and/or threats from vegetation that require additional mitigation. In 2020 and 2021, SCE continued to inspect generation-related assets and worked towards integrating wildfire related inspections into existing routine equipment and operations inspections to streamline field efforts.

From 2023 to 2025, SCE is continuing its inspection program of relevant generation-related assets in HFRA, including powerhouses, substations, and low-voltage ancillary assets to identify needed remediations to reduce the risk of wildfire ignition. SCE's generation facilities in HFRA are often located in or near heavily forested areas; ignitions related to these facilities could lead to substantial wildfire risk. Once asset deterioration or other corrective actions are identified during inspections, remediations of these conditions are intended to reduce the probability of faults and potential ignitions.

Include relevant visuals and graphics depicting the workflow and decision-making process the electrical corporation uses for the inspection program. (see the example in Figure 8-1g).

Below in Figure 8-1g is a relevant visual that depicts the workflow and decision process regarding generation inspections.

Figure 8-1g - Generation Inspections Workflow

Frequency or Trigger

In this section, the electrical corporation must identify the frequency (including how frequency may differ by HFTD Tier or other risk designation[s]) or triggers used in the inspection program, such as inputs from the risk model.

The frequency of generation HFRI inspections is based on each asset's calculated risk, based on POI and Technosylva consequence. SCE inspects 75% of the risk associated with these generation facilities on an annual cadence. The remaining 25% is lower risk and is divided equally over a two-year cycle. This allows SCE to inspect approximately 88% of the risk associated with these facilities on a yearly basis. Generation HFRI inspections are performed on a two-year cycle utilizing the same risk methodology each year and which allows SCE to inspect every generation asset during the cycle. In 2022, SCE began the first year of the two-year cycle. In 2023, SCE will continue with the second year of the two-year cycle.

If the inspection program is schedule-based, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.

Generation inspections are scheduled to be executed in an operationally efficient manner, which considers weather conditions and geographical location and are completed before peak fire season.

Accomplishments, Roadblocks, and Updates

In this section, the electrical corporation must discuss:

- *Noteworthy accomplishments for the inspection program since the last WMP submission*

SCE exceeded its 2022 WMP target of inspecting 190 assets by completing 222 asset inspections.

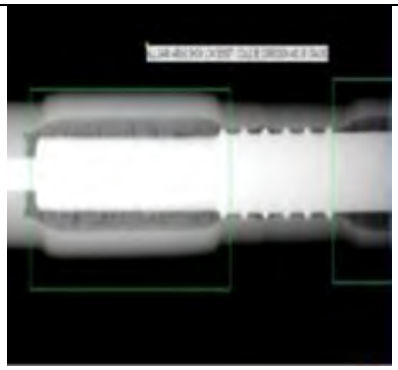
- *Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblocks*

SCE encountered some inclement weather while implementing the inspection program in 2022; however, SCE was able to overcome this roadblock by rescheduling the affected inspections to different periods of the year when weather was more favorable.

- *Changes/updates to the inspection program since the last WMP submission including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)*

Starting in 2024, SCE will investigate the most ideal way to align the generation risk methodology with IWMS. In addition, SCE will continue to monitor the asset inspections performed as well as the notifications found and should any trends or opportunities for improvement be identified, will seek to implement those as quickly as possible.

8.1.3.8 Transmission Conductor and Splice Assessment (IN-9)



Process

In this section, the electrical corporation must provide an overview of the individual asset inspection program, including inspection criteria and the various inspection methods used for each inspection program.

SCE is continuing its transmission conductor and splice assessment methods (LineVue and X-Ray) in HFRA to complement existing inspection processes. SCE identified 87 transmission wire down events that occurred from 2015 to 2022[165] throughout the SCE service territory, with most failures attributed to conductors and splices.[166] Conductors and splices can fail due to age, weather, contact from object, and other factors that can lead to wires down. To reduce transmission conductor wire down events, SCE is using transmission conductor and splice assessment methods to identify anomalies and any underlying issues in order to replace or remediate conductors and/or splices that have a higher probability of failure. In addition, these methods help capture issues that may not be visibly apparent to the human eye or other inspection technologies. To the extent possible, SCE will coordinate LineVue and X-Ray on the same outage.

LineVue and X-Ray, as shown below in Figure SCE 8-30, were chosen for their enhanced inspection methods of finding anomalies which are not apparent or visibly exposed.

Figure SCE 8-30 - Transmission Conductor and Splice Assessment

LineVue	**X-Ray**
	
Utilizes a magnetic flux to detect the degradation of the steel core of the conductor.	Takes an internal image of the splice, which is used to determine degradation due to corrosion/improper installation.

LineVue determines the deterioration of the cross-sectional area of the conductor steel core and detects any localized breaks or corrosion pits on the steel wires and loss of zinc galvanized layer. LineVue inspections are more effective than visual inspections in identifying these issues given the difficulty in seeing internal issues. *Figure SCE 8-31* below shows an example of a LineVue inspection being

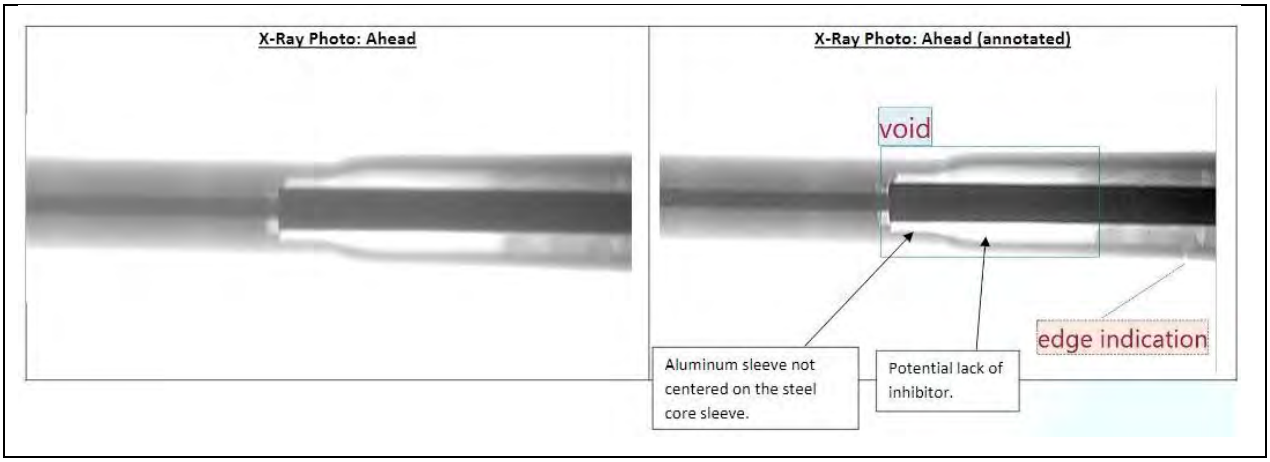
[165] 2022 will be an historical year when SCE files the WMP in 2023.

[166] A wire down event is considered a risk to the public due to being on the ground or within eight feet of the ground.

performed on a transmission line.

Figure SCE 8-31 - LineVue Inspection

Distant	At Close Range
	



X-Ray is used on conductor splices to verify proper installation as well as identify broken strands or deformities. X-Ray inspections are more effective than visual inspections in identifying these issues given the difficulty in seeing internal issues or improper termination installations.

Figure SCE 8-32 below shows an example of an x-ray inspection being performed on a transmission line. In addition, Figure SCE 8-33 below shows an example of an anomaly identified during an x-ray inspection that otherwise could not be captured visually.

Figure SCE 8-32 - X-Ray Inspection

Distant	At Close Range
	

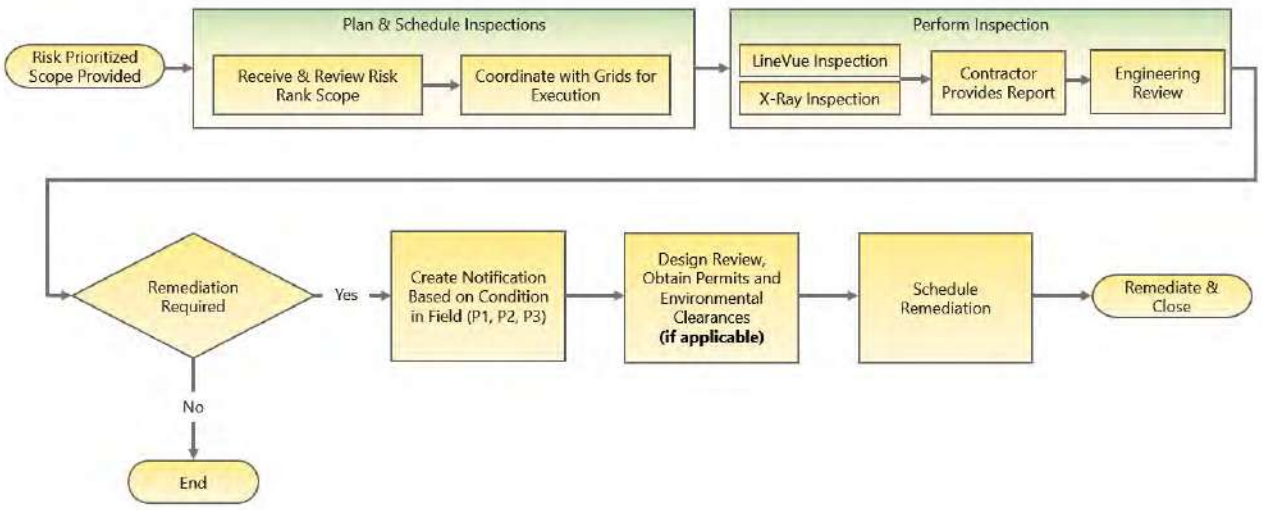


Figure SCE 8-33 - Anomaly Identified During X-Ray Inspection

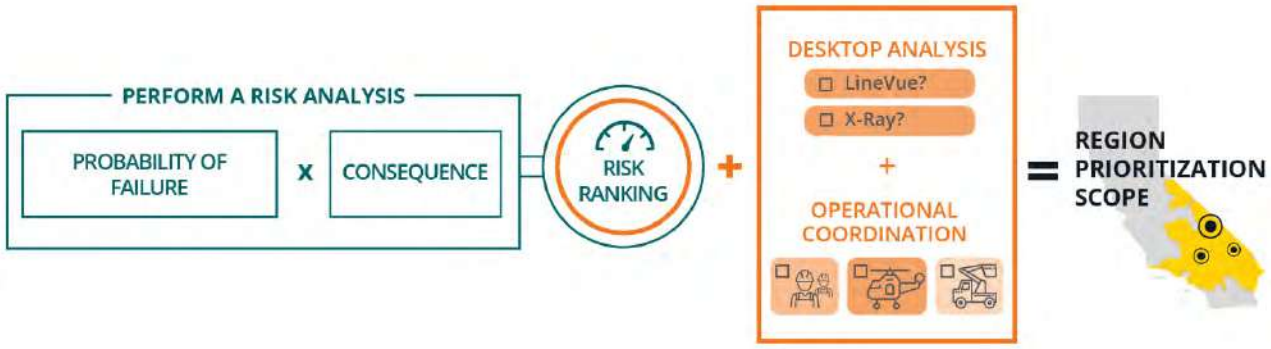
Include relevant visuals and graphics depicting the workflow and decision-making process the electrical corporation uses for the inspection program.

Below in Figure 8-1h is a relevant visual that depicts the workflow and decision process regarding transmission conductor and splice assessment.

Figure 8-1h - Transmission Conductor and Splice Assessment Workflow

Frequency or Trigger



In this section, the electrical corporation must identify the frequency (including how frequency may differ by HFTD Tier or other risk designation[s]) or triggers used in the inspection program, such as inputs from the risk model.

As outlined below in Figure SCE 8-34, SCE developed a risk methodology to evaluate risk across

transmission structures to help prioritize transmission inspections. This methodology utilizes various data elements, including structure age and location, circuit loading, splice count, conductor type, outage data, and repair notifications. SCE then incorporated Technosylva consequence impacts and an environmental multiplier composed of atmospheric corrosivity and historical fire maps to calculate and rank risk across assets.

In 2023, inspections will be prioritized in the order of the risk ranking by structures, followed by a desktop analysis to determine whether LineVue or X-Ray should be utilized. For example, X-Ray is only performed on splices. Coordination is then needed with SCE's Air Operations team to determine availability of helicopters to perform LineVue and/or X-Rays as well as outage availability. Finally, a field inspection is performed with either LineVue or X-Ray to identify if any anomalies or underlying issues are present. While locations for LineVue and X-Ray are selected based on risk analysis, consideration is also given to operational feasibility and locations that offer specific learnings.

Figure SCE 8-34 - Transmission Conductor and Splice Prioritization

If the inspection program is schedule-based, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.

As described above, the transmission conductor and splice assessment program utilize risk prioritization to identify its scope. SCE prioritizes mitigations and to the extent possible leverages work bundling on existing planned outages to minimize the potential reliability and customer impacts.

Accomplishments, Roadblocks, and Updates

In this section, the electrical corporation must discuss:

- *Noteworthy accomplishments for the inspection program since the last WMP submission*

In 2022, SCE inspected 79 spans with LineVue, 63 splices with x-ray and obtained six conductor samples which exceeded the targets of 75 spans, 50 splices and 5 conductor samples respectively.

- *Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblocks*

The LineVue and x-ray inspection methods can technically be performed while the transmission line is either energized or de-energized; however, due to safety and qualification requirements (e.g., helicopter and crew training), SCE chose to schedule most of the inspections while de-energized. To mitigate this challenge, SCE is looking to obtain additional training and equipment to perform these inspections while energized safely.

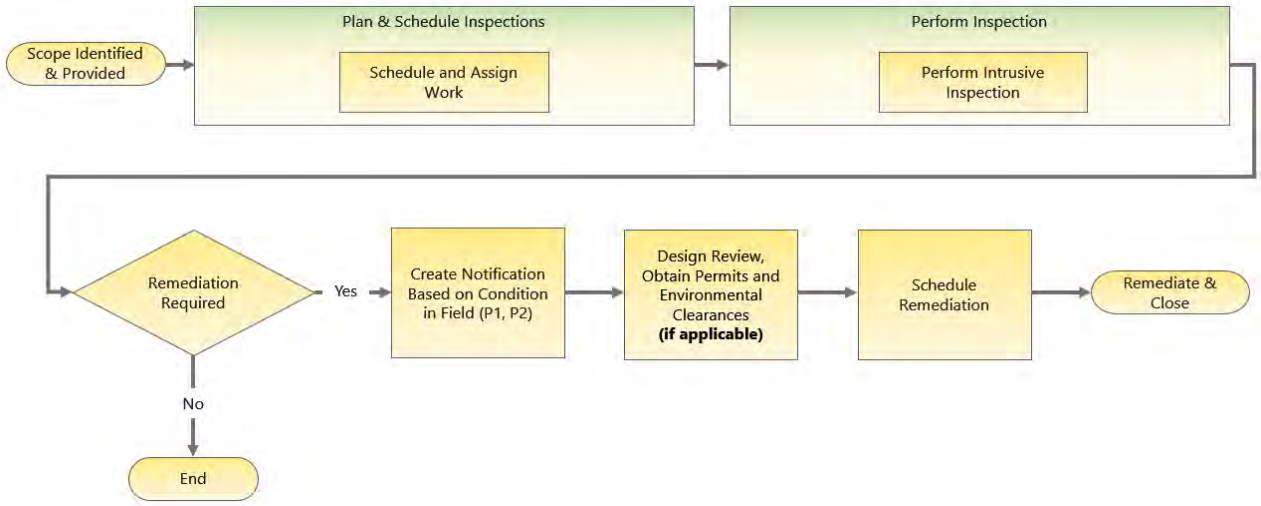
- *Changes/updates to the inspection program since the last WMP submission including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)*

Since the 2022 WMP update, SCE is no longer obtaining conductor samples due not being able to obtain viable samples within the field without potentially adding risk into the system. In addition, as a result of the 63 splices x-rayed four P1s, 20 P2s and 10 P3s were identified. The high find rate of P1s, P2s and P3s compared to the number of x-rays conducted validated the continuation of this inspection program into 2023. SCE will continue to monitor the find rate and should it continue to remain high, more proactive mitigations will be considered in the future. Starting in 2023, SCE will investigate the most ideal way to align the transmission conductor & splice assessment risk methodology with IWMS.

8.1.3.9 Intrusive Pole Inspections

Process

In this section, the electrical corporation must provide an overview of the individual asset inspection program, including inspection criteria and the various inspection methods used for each inspection program.



SCE performs intrusive pole inspections (IPI) in compliance with GO 165. The strength of wood poles can diminish over time due to insect infestation or material deterioration, increasing the probability of structure failure, which is a safety hazard given the electrical equipment supported by the poles and proximity of these poles to the public.

The IPI program is a preventative program designed to identify deteriorated poles within HFRA and non-HFRA that may require remediation to meet with GO 95 requirements, while maintaining the safety of personnel, public, and environment. The IPI program was established in accordance with GO 165 to evaluate SCE's wood poles using visual and internal examination of the poles (by drilling into the pole and testing the extracted wood) to identify damage or decay, analyze the remaining strength of the pole, and determine if remediation is required. As an industry practice approved by the Commission, the program performs remedial treatments during intrusive inspections to prevent poles from deteriorating and to extend the useful lives of the poles.

Include relevant visuals and graphics depicting the workflow and decision-making process the electrical corporation uses for the inspection program.

Below in Figure 8-1i, is a relevant visual that depicts the workflow and decision process regarding intrusive pole inspections.

Figure 8-1i - Intrusive Pole Inspections Workflow

Frequency or Trigger

In this section, the electrical corporation must identify the frequency (including how frequency may differ by HFTD Tier or other risk designation[s]) or triggers used in the inspection program, such as inputs from the risk model.

SCE utilizes a 10-year inspection cycle using a grid-based approach to maintain operational and resource allocation efficiencies and is in line with industry practices and benchmarking. This inspection cadence is more frequent than what is generally required in GO 165. Small portions of annual work are prioritized to address constrained poles that SCE was unable to inspect previously for various reasons (e.g., unable to access and/or obstructions). Additionally, GO 95 Rule 44.2 informs ad hoc inspections that are performed through the IPI program annually.[167]

If the inspection program is schedule-based, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.

SCE utilizes a 10-year grid approach to maintain operational and resource allocation efficiencies and compliance throughout the system. Small portions of annual work are prioritized to address constrained poles unable to be inspected previously for various reasons (e.g., unable to access and/or obstructions). By aligning with a 10-year cycle, SCE is able to help ensure that decay rates do not increase for local

[167] Rule 44.2 of GO 95 mandates that pole loads calculated in anticipation of additional construction incorporate the results of an intrusive inspection completed within the previous 5 years for wood poles older than 15 years.

conditions.

Accomplishments, Roadblocks, and Updates

In this section, the electrical corporation must discuss:

- *Noteworthy accomplishments for the inspection program since the last WMP submission*

SCE's find rate for the IPI program is decreasing due to the preventative maintenance program which identifies deteriorated poles prior to failure and speaks to the health of poles throughout SCE's service territory.

- *Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblocks*

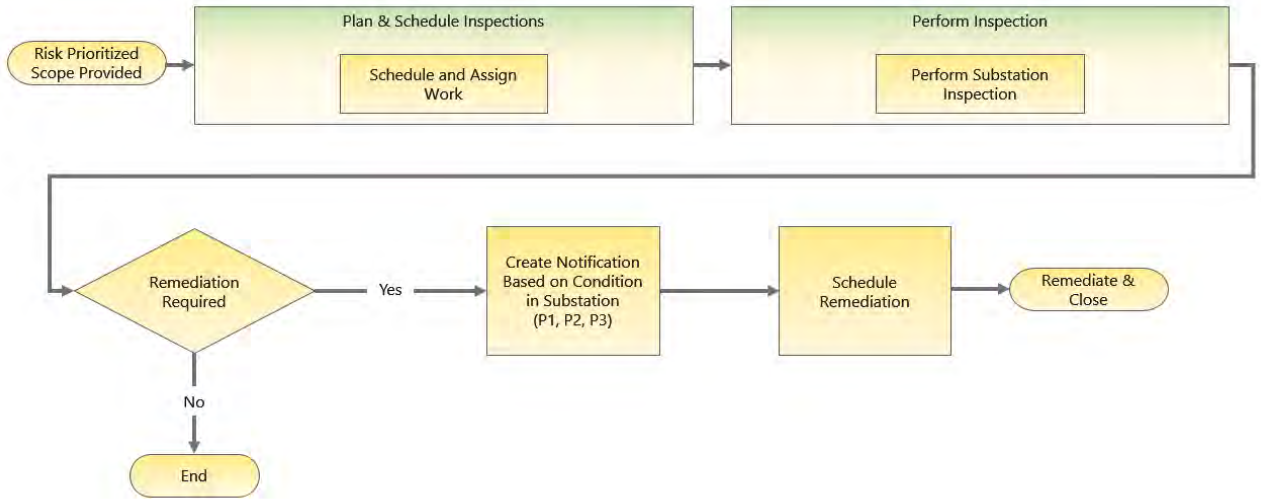
In 2022, SCE experienced roadblocks, such as access issues and obstruction at the base of the pole within HFRA. In order to address this, SCE worked through customer notifications, appointments, and removal of customer-built obstructions and will continue to work through any outstanding obstacles to obtain the inspection results.

- *Changes/updates to the inspection program since the last WMP submission including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)*

In 2023, SCE will continue evaluating performance and scope identifications of the IPI program through ongoing asset performance and risk prioritization analysis. This includes investigating historical data concerning poles that are selected for remediation and identifying reasons for failure. This will help SCE ensure that it is installing the right pole type in the grid, and reducing foreseeable failure (e.g., replacing wood with non-wood poles where damage is caused by woodpecker activity).

8.1.3.10 Substation Inspections

Process



In this section, the electrical corporation must provide an overview of the individual asset inspection program, including inspection criteria and the various inspection methods used for each inspection program.

In 2020, SCE performed a study to help identify potential sources of ignition from major substation assets and develop recommendations for substation equipment inspections and maintenance. This study concluded in 2020 and recommended three actions in the inspection space: continue the installation of Circuit Breaker Online Monitoring (CBOLM), prioritize inspections of oil-filled CBs in HFRA substations through the Oil Circuit Breaker Analysis (OCBA) program, and increase Predictive Maintenance Assessment (PMA) inspections on approximately 40 HFRA substations identified in the Failure Mode & Effects Analysis (FMEA). In 2021, SCE developed plans to perform this work, and began executing that year.

Include relevant visuals and graphics depicting the workflow and decision-making process the electrical corporation uses for the inspection program.

Below in Figure 8-1j, is a relevant visual that depicts the workflow and decision process regarding substation inspections.

Figure 8-1j - Substation Inspections Workflow

Frequency or Trigger

In this section, the electrical corporation must identify the frequency (including how frequency may differ by HFTD Tier or other risk designation[s]) or triggers used in the inspection program, such as inputs from the risk model.

For these programs, substations located within HFRA boundaries are given priority. Within the OCBA program, priority is first given to the HFRA equipment, although equipment condition, diagnostic results and/or known issues will also be taken into consideration when assessing priority order. Regarding PMA, priority is given to the HFRA substations identified within the FMEA. For CBOLM, prioritization is given to HFRA substations, followed by larger/more critical distribution voltage substations, especially those with elevated number of interruption events, and finally by transmission voltage stations.

In 2022, SCE increased the frequency of PMA inspections from three and five years (depending on the substation) to a consistent two-year cycle for approximately 40 HFRA substations identified through the FMEA. SCE will also continue the installation of CBOLM devices as well as prioritizing existing oil equipment inspections through the OCBA program.

If the inspection program is schedule-based, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.

SCE schedules PMA inspections based on which substations were identified within the FMEA. The substations within HFRA are then inspected every two years. For OCBA, prioritization is given to circuit breakers located in HFRA substations. For CBOLM, SCE is installing Circuit Breaker On-Line Monitors (CBOLM) at substations in HFRA to enable collection of real time circuit breaker operational health data during all normal and fault-clearing circuit breaker operations. When this real-time operational health data shows slowing or other operational risk, emergent maintenance is immediately triggered by a back-end server to activate crews to perform corrective maintenance.

Accomplishments, Roadblocks, and Updates

In this section, the electrical corporation must discuss:

- *Noteworthy accomplishments for the inspection program since the last WMP submission*

SCE completed its target of inspecting all substations that were originally identified within the FMEA by June 2022.

- *Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblocks*

SCE did not encounter any roadblocks while implementing the program for substation inspections in 2022.

- *Changes/updates to the inspection program since the last WMP submission including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)*

In 2022, SCE increased the frequency of PMA inspections from three to five years to a two-year inspection cycle for 37 HFRA substations. Substation inspection scope decreased to 37 substations; Topanga substation, which is out of service and Isabella and Tengen substations were omitted from the inspection cycle list due to not meeting the risk criteria. SCE will incorporate any lessons learned in its deployments of this new frequency in the future.

8.1.4 Equipment Maintenance and Repair

In this section, in addition to the information described above regarding distribution, transmission, and substation inspections, the electrical corporation must provide a brief narrative of maintenance programs. As a narrative, the electrical corporation must include its strategy for maintenance, such as whether the electrical corporation replaces or upgrades facilities/equipment proactively (for example, an electrical corporation may monitor dissolved gases in its transformers to detect potential transformer failures to alert engineering and maintenance personnel or component lifecycle management) or if it runs its facilities/equipment to failure.

SCE maintains a robust infrastructure replacement (IR) program across its service area. Infrastructure replacements are typically: (1) unplanned, to address in-service failures; (2) planned, based on inspections; or (3) planned, based on engineering and data analysis. SCE's infrastructure replacement programs discussed in this section are not wildfire driven, but rather driven by maintaining a safe and reliable electric distribution system.

The narrative must include, at minimum, the following types of equipment:

- *Capacitors*

Transmission

Not applicable as SCE currently does not have capacitors on the transmission system.

Distribution

The distribution capacitor bank replacement program replaces or removes failed distribution capacitor banks and their associated capacitor switches. Each capacitor bank is comprised of capacitor units, fuses, a rack, and mounting hardware. For switched capacitor banks, capacitor switches and a capacitor control are also included. Capacitor banks are identified for reactive replacement through either cyclic or ad hoc field inspections. Capacitor data points are collected on a survey while aerial and/or ground inspections are being performed.

Substation

SCE substation capacitor banks are on a condition-based program, which entails periodic thermal and visual inspection and analysis by the Predictive Maintenance Assessment group. Also, SCE performs proactive maintenance, which involves a period inspection on equipment by operators. If an issue is identified, it is documented and reported to Maintenance personnel and further investigation of the issue is performed.

- *Circuit breakers*

Transmission

Not applicable as these are substation equipment.

Distribution

Not applicable as these are substation equipment.

Substation

SCE has multiple programs to mitigate risks related to circuit breaker failures. SCE health scores all circuit breakers from bulk electric system (BES) voltage down to distribution customer circuit voltage. Our maintenance and inspection programs monitor and maintain circuit breaker conditions. The substation infrastructure replacement (IR) program replaces aging circuit breakers preemptively before they reach the end of their usable lives. The Substation Equipment Replacement Program (SERP) replaces overstressed circuit breakers. Both programs regularly interact to review forecast and bundle projects for cost effective implementation. These mitigations are intended to reduce the number of circuit breaker failures, which in turn reduces the associated reliability and safety risks. SCE also proactively tries to mitigate unplanned events by the utilization of the health index tool for circuit breakers. This takes input from SCE's substation Condition Based Maintenance (CBM) programs which are designed for the ongoing identification, prioritization, and quantification of condition assessment performed on a recent asset.

- *Connectors, including hotline clamps*

Transmission

As part of SCE's Transmission Overhead Re-conductor Program (ORCP), hardware, and associated components including connectors will be replaced as a result of reconductoring, Additionally, while performing inspections conditions found to need repair will be documented and remediated.

Distribution

As part of SCE's OCP, hardware and associated components including connectors will be replaced as a result of reconductoring. Additionally, while performing inspections conditions found to need repair will be documented and remediated.

Substation

Not applicable as SCE currently does not have a designated replacement program.

- *Conductor, including covered conductor*

Transmission

The ORCP replaces transmission conductor, to reduce the likelihood of risk events, such as wire downs, by replacing overhead segments with new conductor. Additionally, while performing inspections conditions found to need repair will be documented and remediated.

Distribution

The OCP is the primary vehicle for the proactive replacement of overhead conductor outside of High Fire Risk Areas (HFRA). OCP is a risk-informed program that proactively replaces high-risk conductor segments and includes the installation of protective devices as needed. To further optimize the program, SCE uses a risk analysis that considers factors such as consequences of a wire down event in areas with a high degree of public safety.

This program aims to prevent failures that can lead to wire down events by replacing conductor that is more resilient to fault events and reduces the number of faults. OCP also replaces problematic conductor segments that have been spliced or damaged with larger more resilient conductor to improve system integrity and to reduce the number of potential wire downs.

Substation

The Copper Wire Replacement program replaces aging copper communication cable with fiber optic cable to preserve the reliability of grid protection and grid operations circuits and provides more bandwidth for increasing data needs. The average service life of copper cable ranges from 25 to 35 years, depending on the environment where the cable is installed. Most of SCE's copper cables are over 25 years old, with more than 50% (over 1,000 miles of cable) over 35 years old. As copper cable reaches the end of its useful life, performance degrades because of ground faults, susceptibility to noise, and the effects of high-voltage testing and cable outages. These factors all greatly reduce system reliability.

SCE has other substation programs related to communication assets, such as fiber optic replacement program, which replaces aging and problematic fiber optic cables, and microwave replacement program, which replaces obsolete, failed, beyond useful life, and damaged microwave equipment.

- *Fuses, including expulsion fuses*

Transmission

Not applicable as SCE currently does not have fuses on the transmission system.

Distribution

While performing inspections conditions found to need repair will be documented and remediated. Fuses are installed per our engineering standards for new construction and fuses are replaced when a failure has been identified.

Substation

While performing inspections, conditions found to need repair will be documented and remediated. Fuses are installed per our engineering standards for new construction and fuses are replaced when a failure has been identified. Refer to “other equipment not listed” section for ignition events reviewed through our Wildfire Mitigation Strategy department for proactive measures established through the evaluation of asset trends.

- *Distribution poles*

Programs, such as Pole Loading Program (PLP) and Intrusive Pole Inspection Program (IPI) identify when a pole needs to be replaced based on calculated criteria. SCE also has a Steel Stub Program, which supports the remediation of deteriorated wood poles that are within a specified threshold by restoring the poles to their original load capacity. The steel stub extends the useful service life of the wood pole while ensuring safety factors are maintained for safety and compliance. Pole data points are collected on a survey while aerial and/or ground inspections are being performed. Pole replacements can also be identified through detailed inspections, patrols, new construction (e.g., covered conductor, equipment replacement, new equipment installation, etc.) which requires pole loading that can result in pole replacement.

Per SCE standards, distribution pole replacements in HFRA locations with no equipment and not located in a woodpecker area will be installed with a wood pole with fire resistant (FR) wrap. Distribution pole replacements in HFRA locations with specific equipment (e.g., transformer, capacitor, automatic recloser, RCS, or riser) will be installed with a composite pole with fire shield.

- *Lightning arrestors*

Transmission

Not applicable as these are not installed on transmission lines.

Distribution

SCE performs aerial and/or ground inspections where issues pertaining to lightning arrestors could be identified. Lightning arrestor data points are collected on a survey while aerial and/or ground inspections are being performed. Refer to “other equipment not listed” section for ignition events reviewed through our Wildfire Mitigation Strategy department for proactive measures established through the evaluation of asset trends.

Substation

While performing inspections conditions found to need repair will be documented and remediated. Refer to “other equipment not listed” section for ignition events reviewed through our Wildfire Mitigation Strategy department for proactive measures established through the evaluation of asset trends.

- *Reclosers*

Transmission

Not applicable as SCE currently does not have a designated replacement program.

Distribution

The distribution automatic recloser replacement program replaces automatic reclosers (ARs) identified as being obsolete and/or unreliable. SCE has been replacing ARs in recent years to remove all old oil filled ARs from inventory and replace them with new vacuum ARs. The program will continue to replace older and obsolete vacuum ARs as well as Vacuum Fault Interrupters in the upcoming GRC cycle. Recloser data points are collected on a survey while aerial and/or ground inspections are being performed.

Substation

Automatic recloser replacement program is not applicable to substations.

- *Splices*

Transmission

As part of SCE’s Transmission program (ORCP), hardware and associated components including splices will be replaced as a result of reconductoring. Additionally, while performing inspections conditions found to need repair will be documented and remediated.

Distribution

As part of SCE’s Distribution overhead conductor program (OCP), hardware and associated components including splices will be replaced as a result of reconductoring. Additionally, while performing inspections conditions found to need repair will be documented and remediated. SCE will continue to perform infrared (IR) inspections in HFRA. The IR scan detects temperature differences and heat signatures of components, which may indicate problems that could result in component failure. Additionally, while performing inspections conditions found to need repair will be documented and remediated. Fuses are installed per our engineering standards for new construction and fuses are replaced when a failure has been identified.

Substation

SCE uses infrared technology during substation inspection to identify hot spots on connection and components. While performing inspections conditions found to need repair will be documented and remediated.

- *Transmission poles/towers*

SCE performs both proactive and reactive maintenance and repairs on the transmission system based on inspection findings and system conditions. Proactive maintenance identifies issues during regular inspections, and reactive maintenance occurs due to unplanned events. This activity includes performing repairs on transmission line equipment and structures, such as poles, towers, conductors, and their components, including FAA tower lighting and marker balls.

Programs, such as Pole Loading Program (PLP) and Intrusive Pole Inspection Program (IPI) identify when a pole needs to be replaced based on calculated criteria. SCE also has a Steel Stub Program, which supports the remediation of deteriorated wood poles that are within a specified threshold by restoring the poles back to the original load capacity. The steel stub extends the useful service life of the wood pole, while ensuring safety factors are maintained for safety and compliance. Pole data points are collected on a survey for HFRA locations while aerial and/or ground inspections are being performed. Pole replacements can also be identified through detailed inspections, patrols, new construction (e.g., covered conductor, equipment replacement, new equipment installation, etc.) which requires pole loading that can result in pole replacement. Per SCE standards, new construction or pole replacements are installed with wood pole with fire resistant (FR) wrap.

SCE's Transmission Infrastructure Replacement Program targets assets for replacement, such as overhead conductor, underground cable, switches, cable terminations, and other infrastructure based on risk, engineering and data analysis. The tower corrosion program is an assessment program that SCE implements annually to identify the total scope of remediation work. These assessments will be above and below ground. Without mitigation, especially in more extreme weather areas, SCE's lattice towers will continue to corrode.

Finally, regarding insulator washing, this program requires a visual inspection of a circuit for contamination, often indicated by arcing or buzzing. If no or minimal contamination is present, the circuit will continue to be monitored. If excessive contamination is present, the circuit must be washed. Typically, beach areas with high salt levels and high traffic volume require more frequent washing than a desert area with drier air and less exhaust from traffic.

- *Transformers*

Transmission

Not applicable as SCE does not install transmission transformers. Transformers are installed inside substations when transforming down to lower voltages.

Distribution

SCE's Polychlorinated Biphenyls (PCB) Transformer Removal Program replaces distribution line transformers suspected of being contaminated with PCB oil greater than 50 parts per million. PCBs are chemicals that could have negative effects on the environment and human health.

In addition, SCE will be proposing in the upcoming GRC, a proactive replacement program for distribution service transformers, focused on assets where heat stress is likely to be most impactful. The program aims to improve safety and reliability by reducing catastrophic and routine service transformer failures, and to reduce operational burden during and after heat waves by proactively replacing units that are most likely to fail.

At this time, SCE does not have a transformer replacement program for other types of transformers not mentioned above. SCE's approach is to run this equipment to or near failure. However, when aerial and/or ground inspections are being performed, transformers repairs/replacements are identified, and transformer data points are collected on a survey when performing a detailed inspection. Additionally, while performing inspections conditions found to need repair will be documented and remediated. Fuses are installed per our engineering standards for new construction and fuses are replaced when a failure has been identified.

Substation

The substation transformer replacement program identifies and replaces transformers approaching the end of their service lives, which contain parts known to be problematic or are no longer available. Also, SCE proactively tries to mitigate unplanned events by the utilization of the health index tool for transformers. This takes input from SCE's substation Condition Based Maintenance (CBM) programs, which are designed for the ongoing identification, prioritization, and quantification of condition assessment performed on recent assets. The substation transformer asset replacement program consists of the following transformer classes:

- AA-Bank transformers – located in major substations where they take electricity at the 500kV transmission level and transform it down to 220kV
- A-Bank transformers – located in major substations where electricity at the 220kV transmission level is transformed down to a sub-transmission voltage, either 115kV or 66kV
- B-Bank transformers – located at the sub-transmission level, usually 66kV but sometimes 115kV, transform it down to 33kV, 16kV, 12kV, or 4kV, and distribute it onto distribution circuits to feed pole-mounted, pad-mounted, or subsurface line transformers.
- *Other equipment not listed*

For transmission and distribution equipment, SCE reviews ignition events and asset trends across HFRA and non-HFRA locations. Engineers and technical experts will review and analyze data to identify potential trends and determine if further evaluation is required, which may result in a proactive mitigation program being established to address the identified risk(s). Additionally, while performing inspections conditions found to need repair will be documented and remediated.

In the 2022 WMP, SCE committed to perform a FMEA study for substation assets located in HFRA locations to identify potential failures associated with ignition risks. This study resulted in shortened inspection timeframe for a select number of substations the If a risk was identified, the inspection timeframe was shortened.

8.1.5 Asset Management and Inspection Enterprise System(s)

In this section, the electrical corporation must provide an overview of inputs to, operation of, and support for centralized asset management and inspection enterprise system(s) updated based upon inspection results and activities such as hardening, maintenance, and remedial work. This overview must include discussion of:

The electrical corporation's asset inventory and condition database.

SAP is SCE's enterprise resource planning software that serves as our systems of record for asset inventory and asset conditions. As such, software developed specifically for wildfire mitigation receives master data from SAP, updates data with work order status information, and writes the results of work back to the SAP system.

Describe the electrical corporation's internal documentation of its database(s).

SAP has documentation of both transaction and database elements of the software housed in augmented tools as well as formal documentation that comes with the software. Additionally, any customizations that SCE makes to SAP are documented in functional design specifications and/or technical design specifications.

Integration with systems in other lines of business.

The SAP software is integrated through hundreds of interfaces to hundreds of subscribing enterprise systems that require master data similar to the software that is reliant on SAP for asset master data in this volume. Other lines of business, such as customer service, transmission & distribution, human resources, information technology, grid operations, supply chain management, finance, and a myriad of other operating units utilize systems that are integrated with SAP.

Integration with the auditing system(s) (see QA/QC section below).

SAP has Sarbanes-Oxley (SOX) financial controls and separation of duty controls that are built directly into the software. Additionally, software changes and updates go through rigorous QA/QC testing to help ensure all subscribing systems and interfaces continue to function to support SCE operations once the changes are put into production.

Describe internal procedures for updating the enterprise system including database(s) and any planned updates.

SAP is SCE's core enterprise resource planning (ERP) system. SAP is responsible for updating the respective components (including databases) on a regular basis to ensure compatibility with SCE's operational systems, meaning all the systems that rely on master data from SAP. When these updates are available, SCE loads this new code into our test environment, and validates the functionality end to end with regression and user acceptance testing to ensure everything works as expected in our environment. Any bugs found are communicated back to the vendor to be fixed and retested. Once the new code passes testing, we migrate the new functionality to our production environment. For any custom developed functionality, SCE follows a standard software development lifecycle process, including quality assurance testing, regression testing, and user acceptance testing before new functionality is moved into our production environment.

Any changes to the initiative since the last WMP submission and a brief explanation as to why those changes were made. Include any planned improvements or updates to the initiative and the timeline for implementation.

Since the last WMP submission, SAP continuously undergoes changes based on enterprise needs, however, with respect to wildfire mitigation no changes were made to SAP due to the WMP. SCE's

design approach for SAP is to ensure all subscribing systems can obtain the same master data from SAP databases, which allows programs that connect to SAP for that data to customize as necessary outside of SAP.

Wildfire Mitigation Systems that Leverage SCE's Asset Management and Inspection Enterprise System

There are several systems and tools that SCE has and continues to build to support wildfire mitigation efforts. These systems connect with SAP. SCE summarizes several of these systems below, including:

- Wildfire Safety Data Mart and Portal (WiSDM)
- Ezy Data
- InspectForce
- FMP360

- **Wildfire Safety Data Mart and Portal (WiSDM)**

WiSDM is a scalable, cloud-based, and geospatially enabled centralized wildfire data repository.[168] The main asset inventory master data resides in SAP and condition data is collected from various systems and inspection tools.

In addition to data ingestion from the source systems, Foundry also provides data harmonization and normalization, visually displays the data ontology (model), tracks data lineage and transformations, and can help to automate manual business workflows. Within WiSDM, a common data design is created that allows for simplified access to asset data, asset condition, asset inspections, and wildfire mitigation, and further allows for use of this data in SCE's risk analysis and internal and external reporting.

From a software design and integration standpoint, WiSDM relies on a shared meta-data directory with Ezy to help ensure structured and unstructured data, such as LiDAR data, photos, and video, can be associated with each other accurately. Additionally, QA/QC personnel may use the data in WiSDM to check timestamped photos, videos, and LiDAR to validate that work has been completed. Similarly, data used for various reports will be timestamped and stored for future reference.

In 2023, SCE intends to perform the following:

- Initial consolidation of wildfire data ingestion and management into WiSDM
- Build an Enterprise Data Warehouse (EDW) on Snowflake for storage and analytics of wildfire data (including historical data)
- Building a Wildfire Data Portal using ArcGIS Portal

[168] A data repository (or data mart) is a subject-oriented database that meets the demands of a specific group of users. It is typically a subject area within a data warehouse.

- **Ezy Data**

Ezy Data is a system that collects unstructured data (e.g., pictures, video, LiDAR) from various inspection tools and consolidates inspection data reporting across wildfire activities. In addition, Ezy Data manages the full life cycle of SCE's unstructured data that supports aerial and other asset inspection programs at

SCE. SAP's asset inventory and other GIS datasets are used to schedule and manage image capture assignments related to SCE structures.

The part of Ezy Data that documents the metadata for unstructured data is the Universal Data Descriptor Repository (UDDR), which is being built to catalog unstructured remote sensing data. UDDR stores metadata in a centralized repository that references underlying raw data stored in various cloud platforms (GCP, Azure, AWS). Specifically, structured data is used to tag unstructured data (e.g., asset information on a high-definition video) in order for inspectors and other consumers of the data to be able to quickly locate the unstructured data they require.

The UDDR provides a mechanism to integrate unstructured (e.g., images, documents) data with their relevant asset master (e.g., data associated with an asset such as location or type) and transactional data (e.g., information captured during inspection). The AI/ML algorithms leverage the UDDR data in order to provide insights to optimize the inspection business process.

Ezy Data has data pipelines that process multiple inspection programs data, one of which is QA/QC inspection. This integration contains two use cases:

- Dedicated data pipeline that processes QA/QC photos (from AGOL on AWS) and add both photo thumbnails and metadata to UDDR on GCP
- UDDR exposes all inspection photos (as linkable GRViewer url) to QA/QC PowerBI based dashboard

SCE plans to derive data insights (e.g., structure lat/long location) from structured/unstructured data collected from Ezy Data and use these findings to remediate asset master datasets. One such example is structure location data. From millions of high-definition (HD) images, algorithms and ML models are run to predict correct structure location with high confidence. Once data insights are gathered from the automated latitude/longitude location accuracy report, remediation workflow will update master data in source systems. For 2023, SCE plans to update asset master data for 100,000 structures.

Since the last WMP submission, Ezy Data is adding more unstructured data into its repository, including videos from aerial inspections and other programs, which will enable a more comprehensive database of asset information in support of SCE's wildfire programs. Ezy Data is also extending its integration with other systems, such as Salesforce-based field inspection platforms, AI/ML projects for object/defect detection, image analytics, and others. In addition, SCE is also expanding its design and development of UDDR to support future analytics and solutions capabilities with both structured and unstructured datasets.

The planned improvements or updates to Ezy Data include:

- Centralize storage and processing of LiDAR datasets collected from multiple SCE programs, integrate them with HD images and videos in UDDR, and support various business use cases.
- With the expansion of UDDR data, especially the association of LiDAR, HD photos and videos with a high degree of data accuracy assurance, SCE can better support future analytics and solutions capabilities with both structured and unstructured datasets.
- Continue to enhance advanced AI/ML capabilities using SCE's data science environment on Ezy Data. With more advanced object and defect detection models, SCE can enhance automatic detection of potential fault conditions by leveraging all of the data tools and technologies in the Ezy Data environment. This will increase the enhance the efficiency of our inspectors by identifying potential faults and prioritizing them for review. For example, The AI/ML computer vision models for asset defect detection are being used by Overhead Distribution Inspections and Transmission Inspections. They will automatically analyze images to identify characteristics within the image (e.g., defects) without human intervention. These models are currently running in an advisory mode, where the output is presented to an inspector who then reviews and validates the detected defect's accuracy. The inspector will agree with the defect, which raises a notification for mitigation, or will disagree, which retrains and improves the model's accuracy.

- **InspectForce**

InspectForce is the centralized asset inspection product used for planning and executing inspections, which was developed on the Salesforce platform. It is a common inspection management solution to support many inspection types (aerial and ground for transmission and distribution, post failure and post construction asset inspections, etc.). This establishes a foundation for sharing work and information across inspections and will improve the effectiveness and speed of inspections, data quality and record accuracy, and help ensure that information is available, accessible, and timely to support wildfire mitigation activities.

InspectForce utilizes the asset inventory from the asset system of record, SAP. The survey data collected during the inspections is stored in Salesforce and is available for reporting and analytics. Any condition issues that are identified during an inspection that requires remediation will result in the creation of a notification that is stored in SAP.

The InspectForce application solution design, including the data model, data schema, and all other database design aspects, are documented in the Solution Architecture Document for the application.

The majority of master data that InspectForce consumes comes from interfaces with our SAP and cGIS (consolidate geographic information system) systems. SAP is the system of record for asset master data while cGIS is the system of record for location-based data. All interfaces are documented in the logical architecture.

IT systems are continuously monitored to ensure operational and data integrity is maintained through a variety of tools. Additionally, IT operations has a help desk function for SCE users experiencing any problems with any systems to report those as necessary.

SCE is utilizing Salesforce as well as two Salesforce partner products, Youreka (for mobile complex, dynamic forms) and Lemur (for mobile maps), as the core technology components of InspectForce. As inspections are completed using InspectForce, the inspection information (inspection survey and any notifications raised) are captured in the InspectForce (Salesforce) database.

These vendors are responsible for updating their respective software products (including databases) on a regular basis to ensure compatibility with SCE's operating system (typically 3-4 times a year). When these updates are available, SCE loads this new code into our test environment, and validates the functionality end to end with regression and user acceptance testing to ensure everything works as expected in our environment. Any bugs found are communicated back to the vendor to be fixed and retested. Once the new code passes testing, we then migrate the new functionality to our production environment. For any custom developed functionality for the solution, we use an agile development process with a standard monthly release schedule. This process also includes quality assurance testing, regression testing, and user acceptance testing before new functionality is moved into our production environment.

Since SCE's last WMP submission, SCE is planning in 2023 the following updates:

- Utilizing the feasibility assessment and high-level design completed in 2022, SCE will develop the detailed design to migrate the distribution ground inspection application to the single digital platform. Migration of distribution ground to a single digital inspection platform is tentatively scheduled for 2024.
- Based on the outcome of the analysis completed in 2022 for incorporating the work bundling functionality into the Scope Mapping Tool, a decision was made to defer implementation of the functionality into a future iteration of SMT as this was determined to be a more effective approach.
- Plan to pilot the ability to run the ML models in the field. This will help the inspector in the field identify potential defects at the time of inspection that may have been missed, speeding up the time to raise a notification if required.
- Plan to complete the evaluation and design to integrate the assisted reality InspectCam capability, including the ability to automatically detect if the image captured is at the appropriate image clarity, into the InspectForce solution.

- **FMP360**

The FMP360 mobile application is used for tracking the remediation work resulting from an asset inspection. FMP360 is a field solution specifically deployed to help ensure ignition risk conditions identified by ground and aerial inspections are tracked and validated as those issues are corrected in the field.

FMP360 is primarily integrated with SAP through the consolidated mobile solution (CMS) system and the data subsequently updates the status and evidence of work in our SAP and records management systems. This makes the state of remediations available to users across the organization.

As part of software quality assurance, SCE performs rigorous software testing including user acceptance testing (UAT) to ensure software meets operational needs. In addition, data captured by the FMP360

mobile app in the field on an iPad by crew foreman or QA inspectors is uploaded into the CMS enterprise back-office system with time stamps, work order numbers, and associated metadata. That data is then published to other subscribing systems across the enterprise, such as SAP.

8.1.6 Quality Assurance and Quality Control

In this section, the electrical corporation must provide an overview of its quality assurance and quality control (QA/QC) activities for asset management and inspections. This overview must include:

- *Reference to procedures documenting QA/QC activities.*

SCE field supervisors perform random quality field checks as a first line of defense. SCE also has a Compliance & Quality (C&Q) organization that performs QA/QC assessments of wildfire and non-wildfire activities and drives continuous improvement throughout the organization as a second line of defense. Current QA/QC programs include assessments of distribution planning, distribution and transmission construction activities by SCE and contract crews, as well as various transmission and distribution inspection programs. The group assesses compliance with General Order Nos. 95/128/165 and various SCE maintenance, inspection, and construction standards. Supporting documentation for QA/QC activities is available at https://www.sce.com/safety/wild-fire-mitigation for assessments of construction activities, Distribution Detailed Inspections and Remediations [Section 8.1.3.1], Transmission Detailed Inspections and Remediations [Section 8.1.3.2] and Generation Inspections [Section 8.1.3.7].

- *How the sample sizes are determined and how the electrical corporation ensures the samples are representative.*

SCE's Compliance & Quality (C&Q) group uses a risk-based approach to determine sample size/selection and measure performance targets (i.e., Confidence Level (CL). The CL and Confidence Interval (CI) used to determine the sample size varies by risk from Very High, High, Medium, to Low. In 2023, C&Q shifted to the new IWMS 5x5 matrix with one dimension of the matrix representing five levels of POI risk and the other dimension representing five levels of consequence. These dimensions were translated into the four categories for IWMS risk shown in

Figure SCE 8- 35 below (also see Figure SCE 8-25 for further detail on this translation). Programs also receive a tanking based on factors such as complexity, potential downstream impacts, and component or structure risk. Under this methodology the C&Q organization performs QC reviews on wildfire and non-wildfire activities using the CL/CI levels as shown below in Figure-SCE-8-35.

Figure SCE 8- 35 - Confidence Level (CL)/Confidence Interval (CI) for QC inspection programs

	IWMS Risk							
	Very High		High		Medium		Low/Non	
Program Ranking	CL	CI	CL	CI	CL	CI	CL	CI
Very High	100%	0%	99%	1%	99%	2%	99%	5%
High	99%	1%	97%	1%	97%	3%	97%	5%
Medium	97%	1%	97%	2%	96%	3%	96%	5%
Low	95%	1%	95%	2%	95%	3%	95%	5%

- *Qualifications of the auditors.*

All QC inspectors meet the defined Personnel Qualification Standard (PQS) and perform the field inspections following the Inspection and Maintenance Program manual developed for each respective inspection program (e.g., Distribution Inspection and Maintenance Program (DIMP), Transmission Inspection & Maintenance Program (TIMP), etc.).[169] This involves required office and field training, as well as certification testing and re-qualification for each program being reviewed.

- *Documentation of findings and how lessons learned based on those findings are incorporated into trainings and/or procedures.*

The C&Q group partners with organizations throughout SCE's T&D operating unit to identify potential quality gaps and assess compliance with CPUC General Order's 95/165 and various SCE maintenance, inspection, and construction standards. SCE's inspection QA/QC program helps drive continuous improvement and is deemed effective when it identifies non-conformance with SCE standards, determines causes of non-conformance, or implements necessary corrective actions. SCE follows the progress of the formal action plans to corrective actions, which can include implementing changes or enhancements to inspection processes, training, etc., to continuously improve the inspection programs based on QA/QC findings. Corrective actions and their status are tracked in a corrective action tracker until completion. Increases in conformance rates over time also reflect the effectiveness of the program.

- *Any changes to the initiative since the last WMP submission and a brief explanation as to why those changes were made. Include any planned improvements or updates to the initiative and the timeline for implementation.*

Since SCE's last WMP submission, the Quality Program risk rankings and the risk methodology used to determine sample size/selection are updated annually. The CL and CI used to determine the sample size varies by program risk and structure level risk as determined by SCE's risk model. As described above,

[169] This section pertains to Quality Assurance and Quality Control activities, therefore, the "Qualification of the auditors" is referring to the QC inspectors performing the activities described in this section. SCE also has an independent Audit Services Department that performs audits and that is not what is being described in this section.

C&Q shifted to the new IWMS 5x5 matrix in 2023.

Tabular information that includes:

- *Sample sizes*
- *Type of QA/QC performed (e.g., desktop or field)*
- *Resulting pass rates, starting in 2022*
- *Yearly target pass rate for the 2023-2025 WMP cycle*

Table 8-7 - Grid Design and Maintenance QA/QC Program

Activity Being Audited	Sample Size	Type of Audit	Audit Results 2022	Yearly Target Pass Rate for 2023-2025
Overhead Detailed QC Inspection	4,132 samples in 2022, Randomly selected Risk Based Inspections in Tier 2 and Tier 3 Areas	Field	96%	2023: 95%; 2024-25: To be Developed Annually after previous year results become available
Transmission Detailed Inspections	532 samples in 2022, Randomly selected Risk Based Inspections in Tier 2 and Tier 3 Areas	Field	98%	2023: 97%; 2024-25: To be Developed Annually after previous year results become available
Generation Inspections	150 samples in 2022, Randomly selected Risk Based Inspections in Tier 2 and Tier 3 Areas	Field	95%	2023: 95%; 2024-25: To be Developed Annually after previous year results become available

8.1.7 Open Work Orders

In this section, the electrical corporation must provide an overview of the procedures it uses to manage its open work orders resulting from inspections that prescribe asset management activities. This overview must include a brief narrative that provides:

- *Reference to procedures documenting the work order process. The electrical corporation must provide a summary of these procedures or provide a copy in the supporting documents location on its website.*

Supporting documentation is available at https://www.sce.com/safety/wild-fire-mitigation for both the TIMP and DIMP.

- *A description of how work orders are prioritized based on risk.*

SCE currently prioritizes open work orders[170] based on the severity of the finding and the associated compliance deadline based on HFTD location (i.e., HFRA Tier 2, HFRA Tier 3, or Non-HFRA). An explanation of the various severity notification types is discussed in Section 8.1.3.1.

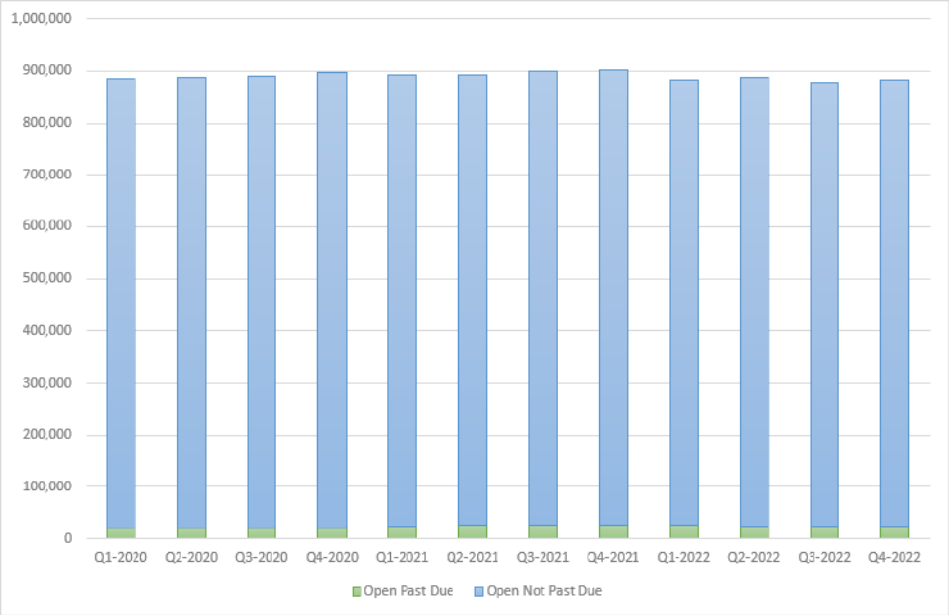
In 2020, SCE introduced a supplemental notification prioritization algorithm to accelerate remediation of the highest risk notifications in AOCs. In Q4 2022, after considering existing risk processes and incorporating lessons learned, SCE expanded on the prioritization methodology to apply to the notification backlog that currently exists, and which is discussed in response to ACI SCE-22-15 Targets Relating to Addressing Inspection Findings. In 2023, SCE will expand the prioritization methodology to apply to all open notifications in order to remediate the highest risk notifications.

- *A description of the plan for eliminating any backlog of work orders (i.e., open work orders that have passed remediation deadlines), if applicable.*

SCE's plan for eliminating its backlog of notifications that have passed their remediation deadline is discussed in detail in ACI SCE-22-15 Targets Relating to Addressing Inspection Findings. Additionally, to prevent the occurrence of new past-due notifications, SCE will analyze how it can prioritize all open-notifications to eliminate the riskiest and oldest notifications instead of the compliance focused "first-in and first-out" method used historically. Considering the growth in volume of work since SCE implemented more rigorous and frequent inspections in HFRA, SCE will modify its prioritization methods to prevent a growing backlog. In 2023, using lessons learned, SCE plans to update its notification backlog prioritization (as described in ACI SCE-22-15 Targets Relating to Addressing Inspection Findings) and aim to apply it to all open notifications. SCE will also investigate the possibility of expanding its open notification prioritization methodology based on lessons learned. While the reduction of the overall backlog count is desired, SCE's goal is to prioritize and close work orders that pose the highest risk to SCE's electrical system. The trade-off in prioritizing riskier work is that low risk work sometimes becomes past-due. The majority of SCE's backlog is comprised of low-risk notifications.

- *A discussion of trends with respect to open work orders.*

SCE's past due open work orders constitute less than 3% of SCE's overall open work orders. While this is a small fraction of the total, SCE is investigating new prioritization approaches for its open work orders to minimize the backlog in the future. Please reference SCE-22-15 Targets Relating to Addressing Inspection Findings.



- *In addition, each electrical corporation must:*
- *Graph open work orders over time as reported in the QDRs (Table 2, metrics 7.a and 7.b)[171].*

[170] SCE utilizes the term notification instead of work order.

[171] Manual adjustment by SCE to reflect open work orders as metric 8.a refers to "Response time to locked open circuit breaker."

Figure SCE 8-36 shows open work orders over time as reported in the QDRs. This data includes all transmission and distribution P2 and P3 open work orders regardless of whether they present an ignition risk or not.

Figure SCE 8-36 - Open Work Orders Over Time as Reported in the QDRs

- *Provide an aging report for work orders past due.*

The three below tables for past due notifications (as of 12/31/2022) are broken down by (Table 8-8a) all past due notifications within HFRA and non-HFRA, (Table 8-8b) ignition risk past due notifications within HFRA and (Table 8-8c) ignition risk past due notifications within HFRA excluding GO 95 exceptions. SCE clarifies that for Table 8-8a, a portion of these notifications are non-ignition risk. For example, P2 notifications regarding right of way, ground clearing, and 3rd party customer attachments below the communication level. As discussed above, any notification that may result in an imminent ignition risk (P1) is made safe within 24 hours and the remediation is started within 72 hours, thus P1s do not contribute to the scope of notifications past their compliance due date.

Table 8-8a - Number of Past Due Asset Work Orders Number of Past Due Asset Work Orders [172] Categorized by Age as of 12/31/2022 – All (HFRA & Non-HFRA)

HTFD Area	0-30 Days	31-90 Days	91-180 Days	181+ Days	TOTAL
Non-HFTD	452	779	613	13,951	**15,795**
HFTD Tier 2	29	82	118	2,646	**2,875**
HFTD Tier 3	419	1,118	937	3,638	**6,112**
TOTAL	**900**	**1,979**	**1,668**	**20,235**	**24,782**

Table 8-8b - Number of Past Due Asset Work Orders Categorized by Age as of 12/31/2022 – Ignition Risk (HFRA)

HTFD Area	0-30 Days	31-90 Days	91-180 Days	181+ Days	TOTAL
HFTD Tier 2	25	70	111	2,319	**2,525**
HFTD Tier 3	412	1,076	876	2,948	**5,312**
TOTAL	**437**	**1,146**	**987**	**5,267**	**7,837**

Table 8-8c - Number of Past Due Ignition Risk Asset Work Orders Categorized by Age as of 12/31/2022 - Excluding GO 95 Exceptions (HFRA)

HTFD Area	0-30 Days	31-90 Days	91-180 Days	181+ Days	TOTAL
HFTD Tier 2	13	32	34	977	**1,056**

TOTAL	**288**	**812**	**739**	**2,768**	**4,607**

[172] SCE refers to “work orders” and “notifications” interchangeably.

8.1.8 Grid Operations and Procedures

8.1.8.1 Equipment Settings to Reduce Wildfire Risk

In this section, the electrical corporation must discuss the ways in which operates its system to reduce wildfire risk. The equipment settings discussion must include the following:

- *Protective equipment and device settings*
- *Automatic recloser settings*
- *Settings of other emerging technologies (e.g., rapid earth fault current limiters)*

For each of the above, the electrical corporation must provide a narrative on the following:

- *Settings to reduce wildfire risk*
- *Analysis of reliability/safety impacts for settings the electrical corporation uses*
- *Criteria for when the electrical corporation enables the settings*
- *Operational procedures for when the settings are enabled*
- *The number of circuit miles capable of these settings*
- *An estimate of the effectiveness of the settings*

8.1.8.1.1 Protective Equipment and Device Settings

Settings to reduce wildfire risk

Fast Curves are protective settings that operate faster than traditional relay protection settings to open the RAR or substation circuit breaker to stop the flow of electricity when an electrical fault unexpectedly occurs on a line. SCE implements Fast Curve settings on devices such as the Remote Automatic Reclosers (RARs) (SH-5) and substation circuit breaker relays (SH-6) as described in Section 8.1.2.8. Devices with Fast Curve settings reduce the amount of energy released at the fault location (due to causes such as a lightning strike or car hit pole incident) and, thus, reduce the likelihood of a fault creating an arc or sparking event that could result in an ignition.

Analysis of reliability/safety impacts for settings the electrical corporation uses

SCE studies and coordinates the settings applied to each protective device installed on every circuit to minimize the number of customers impacted. SCE coordinates Fast Curve settings so that the nearest device upstream of a fault operates before other upstream devices. This helps ensure that only the section of the circuit downstream of the protective device is interrupted from service while the rest of the circuit remains energized. For example, if a fault occurs downstream of a branch line fuse at the end of a circuit, the fuse should operate before the upstream recloser or circuit breaker, which would mean that only the section of the circuit downstream of the branch line fuse is interrupted from service. SCE reviews this type of coordination and deploys its Fast Curve settings accordingly based on the configuration of each circuit.

SCE began installing Fast Curve settings in 2018 to enable faster protection response to faults on higher risk circuits. In 2021, SCE did a MATLAB/Simulink analysis on 15 HFRA circuits and determined that we could refine our Fast Curve settings to improve reliability. SCE also determined in 2022 through a

desktop analysis that we could further increase the sensitivity of our settings without impacting reliability. When SCE conducted an analysis comparing older Fast Curve settings with newer Fast Curve settings installed since June 2021, we found that Fast Curve installations have not had any significant impact on customer reliability. Additionally, we found that outage impacts have been mitigated by other wildfire mitigations such as covered conductor and branch line fuses. SCE benchmarked its Fast Curve setting practices with several other electric utilities' fast trip practices to gain further insights. Based on the benchmarking analysis, SCE's Fast Curve settings operate comparable to other utilities while striking a balance between fast operation and reliable coordination with other protection devices.

SCE will conduct engineering reviews of previous installations of Fast Curve in 2023 to determine which devices should receive updated settings.

Criteria for when the electrical corporation enables the settings

SCE enables Fast Curve settings during elevated fire conditions. The criteria for these conditions include Red Flag Warnings (RFW) declared by the NWS and/or a Fire Weather Threats (FWT), Fire Climate Zones (FCZ), Thunderstorm Threats (TT) or PSPS Proximity Threats declared by SCE's weather forecasting team. This criteria is outlined in SCE's Standard Operating Bulletin 322 (SOB 322) and has evolved based on lessons learned from historical conditions (e.g., addition of FCZ, TT, etc.). SOB 322 helps to ensure consistency in the execution of HFRA protocols by consolidating the protocols into one bulletin that is used to train key stakeholders. SOB 322 contains updated operational protocols and standards for the safe operation of HFRA circuits and guides SCE's response during wildfire events and PSPS operations to help mitigate and reduce wildfire ignitions. The application of Fast Curve settings for the distribution system during a RFW, FCZ, FWT, TT, or PSPS proximity threat helps to ensure that any relay operation during a time of high wildfire risk releases as little electrical energy as possible. Transmission and sub-transmission systems already have high-speed tripping relays, so Fast Curve settings are not needed on these systems.

Operational procedures for when the settings are enabled

Following operation of a relay that has Fast Curve settings enabled, the impacted circuit is patrolled prior to re-energization pursuant to SOB 322. This helps ensure that qualified personnel identify and mitigate any conditions that could potentially lead to a wildfire ignition upon re-energization.

The number of circuit miles capable of these settings

All HFRA miles are capable of Fast Curve settings. Currently, approximately ~900 of ~1075 circuits have Fast Curve enabled on them. SCE is continuing to replace old electromechanical relays with modern microprocessor relays on the remaining ~175 circuits which will allow them to be set with Fast Curves. This relay replacement work should be completed by 2024. Furthermore, SCE anticipates revising all Fast Curves with the new setting strategy to provide better coverage by the end of its next GRC period ending in 2028.

An estimate of the effectiveness of the settings

SCE has seen a reduction of ~54% in the ignition-to-fault ratio on circuits with Fast Curve enabled during FCZ, compared to circuits without Fast Curve enabled, when analyzed over the same time period. The mitigation effectiveness value of Fast Curve settings, which includes the benefits of blocking automatic reclosers, is estimated to be up to 40% depending on the sub-driver.

8.1.8.1.2 Automatic Recloser Settings

Settings to reduce wildfire risk

During normal operations, automatic reclosing devices that are installed on circuits will operate to reenergize the circuit after a fault event to quickly restore electric service to customers. Although this approach has many benefits for addressing faults that are temporary, if the fault persists (e.g., is permanent) and fire risk is present, then subsequent attempts to automatically re-energize the circuits through this process could potentially lead to an ignition. SCE blocks automatic reclosers in areas and times of particular risk of an ignition. Blocking reclosing means that no attempted re-energization takes place automatically. SCE's current remote-control capabilities allow for blocking of reclosing relays for CBs and RARs with group commands of hundreds of devices at once.

Analysis of reliability/safety impacts for settings the electrical corporation uses

SCE has practiced blocking of automatic recloser relays for at least 30 years. Industry research has found that roughly 70% of distribution fault events are temporary in nature.[173] In some instances in the past, when an automatic recloser re-energized the line, the initial condition that created the fault had not cleared and caused another fault. SCE's practice of blocking reclosing is intended to reduce re-energization of permanent fault conditions, preventing repeat ignition risks.

Criteria for when the electrical corporation enables the settings

SCE blocks reclosers in HFRA during a RFW declared by the NWS, and/or a FWT, TT or PSPS Proximity Threat declared by SCE's weather team. This criteria is outlined in SCE's SOB 322.[174]

The number of circuit miles capable of these settings

All HFRA miles are capable of blocking automatic reclosing of reclosers.

Operational procedures for when the settings are enabled

Blocking reclosing is enabled during Red Flag Warnings declared by the National Weather Service, and/or a FWT, FCZ, TT or PSPS Proximity Threats declared by SCE's weather forecasting team. This

[173] Sanap, M., & Shrivastava, P. K. (2018). Single phase fault analysis for temporary and permanent fault. *Asian Journal For Convergence In Technology* (AJCT) ISSN -2350-1146, 4(I). Retrieved from https://asianssr.org/index.php/ajct/article/view/514

[174] See Section 8.1.8.1.1 for a description of SOB 322.

criteria is outlined in SCE's SOB 322. When reclosing is blocked, the circuit or circuit section will remain de-energized until crews can be dispatched to patrol the line and determine if it is safe to re-energize.

An estimate of the effectiveness of the settings

SCE has calculated the mitigation effectiveness of Fast Curve, which includes blocking automatic reclosers. The mitigation effectiveness value of Fast Curve settings with recloser blocking is estimated to be up to 40% depending on the sub-driver.

8.1.8.1.3 Settings of other emerging technologies

This section describes emerging technologies that are currently being piloted in "alarm mode" only to determine if the device/algorithm detects the targeted grid conditions correctly. As such, the settings are in development and there are no grid response procedures that have been developed or implemented yet to respond to such events since the detection ability of these technologies is not yet proven. Much of the pilot evaluation is focused on eliminating the number of false positives generated from the schemes and are not advanced enough to be able to evaluate the impacts of different settings on reliability and safety if/when a detected condition is tripped. The responses below are provided with these constraints in mind.

8.1.8.1.3.1 High Impedance Relays (Hi-Z)

Settings to reduce wildfire risk

Hi-Z settings are designed to sense high impedance events on SCE distribution circuits residing within the field devices. Currently these settings are designed to raise an alarm if a potential condition is detected.

Analysis of reliability/safety impacts for settings the electrical corporation uses

In lab testing, SCE has demonstrated that the Hi-Z relay technology can detect Hi-Z conditions; however, SCE is still validating the technology's efficiency in the field in detecting actual Hi-Z events.

Criteria for when the electrical corporation enables the settings

Hi-Z settings are being piloted and will remain in "alarm mode" only until the technology and SCE's use of it has been validated in the field. If the technology is successful, SCE plans develop a standard for Hi-Z relay operations and expects that the technology would be deployed to continuously monitor the lines for high impedance conditions.

Operational procedures for when the settings are enabled

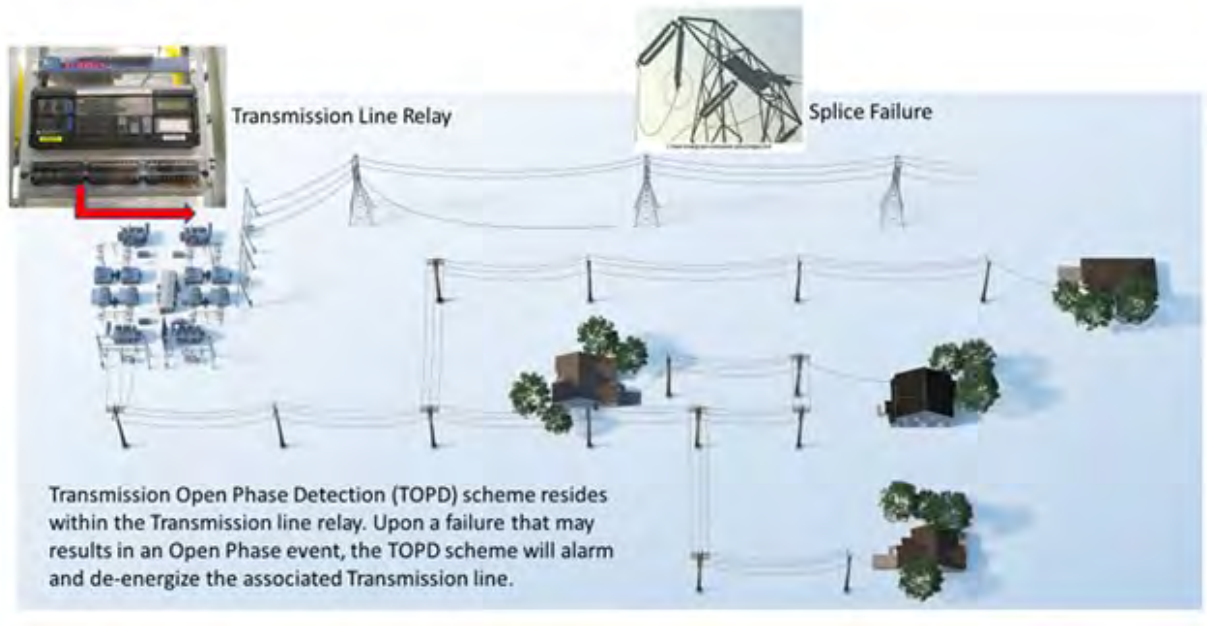
As the deployment is still in the pilot phase, there are no specific actions required for Hi-Z alarms at this time. Since Hi-Z alarms are integrated with the monitoring systems for SCE's grid operations, if the Hi-Z alarms, then the grid operations team will determine next steps, e.g., verifying the alarm and determining the appropriate response. If an actual Hi-Z condition results in a faulted event, SCE has procedures in place for system restoration to respond to the fault.

The number of circuit miles capable of these settings

The Hi-Z algorithm can be installed on any solidly grounded distribution system.[175] Once installed, the Hi-Z settings are only able to detect high impedance conditions downstream of the field devices where the settings are installed.

An estimate of the effectiveness of the settings

Detection of Hi-Z conditions is an industry-wide challenge and SCE's traditional feeder protection elements are based on overcurrent, meaning the protection elements rely on fault magnitude to trigger the relay to operate. In a Hi-Z event, however, the fault magnitude is relatively small to non-existent. Therefore, protection schemes that can detect Hi-Z conditions can reduce the propagation of low magnitude fault conditions and reduce ignition risk. When fully operational, with the ability to alarm and trip, Hi-Z relays are effective at mitigating the impact of downed energized wire conditions. Please see Appendix F: Supplemental Information for additional information on the estimated effectiveness of Hi-Z at addressing each risk driver.



8.1.8.1.3.2 Transmission Open Phase Detection (TOPD)

Settings to reduce wildfire risk

Transmission Open Phase Detection (TOPD) facilitates detection and de-energization of an open phase (broken transmission conductor) before it can contact a grounded object and create a fault event. While most of the pilot installation is operated in alarm-mode only, if deployed with the ability to alarm and trip this technology could reduce ignition risk associated with the high voltage transmission system.

Table SCE 8-37 below shows an illustration of a TOPD scheme.

Figure SCE 8-37 - Illustration of a TOPD Scheme

[175] Solidly grounded systems are those that have a power source in which the neutral wire of the transformer or generator is directly connected to the ground.

Analysis of reliability/safety impacts for settings the electrical corporation uses

Open phase conditions refer to the scenario where one of three phases is physically disconnected on the transmission system. This could occur due to a loose cable, broken conductor, or hardware/splice failure. An undetected open phase condition may cause the energized conductor to drop to the ground. In 2019, SCE evaluated the effectiveness of the open phase detection scheme using Real Time Digital Simulation (RTDS). Test results indicated the technology works as intended, that is, TOPD was able to correctly identify all broken conductor testing events simulated. In collaboration with our relay vendors, TOPD settings will be vetted through RTDS to ensure that TOPD settings deployed will respond correctly.

Criteria for when the electrical corporation enables the settings

TOPD is in the pilot stage and most of the installation will remain in "Alarm mode" only. During "Alarm Mode", the TOPD scheme will not de-energize Transmission lines. In December 2022, SCE enabled trip functionality on TOPD settings for five of the Transmission lines. The TOPD settings for these five lines were set to continuously monitor the lines for any open phase conditions.

Operational procedures for when the settings are enabled

Since TOPD alarms are integrated with the monitoring systems for SCE's grid operations, if the TOPD alarms then the grid operations team will determine next steps, e.g., verifying the type of event, validating the alarm and determining the appropriate response. If an actual open phase condition results in a faulted event, SCE has procedures in place for system restoration to respond to the fault.

The number of circuit miles capable of these settings

TOPD scheme may only be deployed for transmission lines that have single-conductor per phase and connect between two substations. TOPD installations through 2025 will have covered nearly all Transmission circuits in HFRA capable of this technology. TOPD is not deployable on distribution circuits.

An estimate of the effectiveness of the settings

In 2020, SCE evaluated two false positive events related to a fault on a transmission line which resulted in the refinement of the logic scheme by incorporating a 0.7 second delay timer. This made TOPD logic less susceptible to events that normally occur on the system and are not related to open phase events. The deployment of TOPD across different regions is required to identify similar/new challenges with the security of the TOPD logic since each Transmission line will vary in complexity. This complexity is related to factors, such as line loading, number or terminals, CT ratios, and frequency of faults within the region. All these factors play a role in the effectiveness of the TOPD. From the 2021 efforts, SCE learned that TOPD detection depends on seasonal factors. For instance, factors such as current transformer (CT) [176] ratios and seasonal loading profiles may impact the technology's ability to sense an open phase (generally more loading is better for TOPD detections).

The TOPD sensitivity is dependent upon the available Transmission line loading and CT ratios. If the minimum arming requirements are met, the TOPD is expected to successfully detect an Open Phase condition. To date, TOPD logic is mostly accurate except for a few false positive alarms. SCE is continuing to refine its TOPD logic to improve detection accuracy.

[176] The components used to monitor the Transmission lines are CTs. The TOPD scheme is a current-based algorithm and requires a minimum loading of current to be armed based on CT ratios. The higher the CT ratio, the more line loading that is required for the TOPD scheme to operate correctly.

8.1.8.1.3.3 Distribution Open Phase Detection (DOPD)

Settings to reduce wildfire risk

A Distribution Open Phase Detection (DOPD) scheme aims to detect open phase (broken conductor) conditions on the distribution system. The scheme focuses on reducing ignition risk associated with wire-down incidents for both bare and covered conductor systems, by allowing the protection system to isolate a separated conductor before the wire contacts the ground. SCE's detection scheme leverages existing recloser installations at circuit tie-points and pairs these devices with new high-speed radio installations (point-to-point communications) to detect a separated conductor. Once detected, an alarm operation is rapidly deployed to an upstream source recloser. The pilot effort also helps SCE understand the potential for additional circuit outages related to the increased sensitivity of this protection system.

Analysis of reliability/safety impacts for settings the electrical corporation uses

DOPD settings have been vetted through extensive Power System Computer-Aided Design simulations and RTDS to ensure that DOPD settings deployed will respond correctly to normal system transients and reliably detect for open phase conditions.

Criteria for when the electrical corporation enables the settings

DOPD is in the pilot stage and is engineered to provide alarm indication only. If DOPD is successful, then SCE's grid operations will work to identify how such devices should be used (e.g., whether deployed to continuously monitor or in response to certain conditions) and incorporate these protocols into relevant standard operating bulletins.

Operational procedures for when the settings are enabled

As the deployment is still in the pilot phase, there are no specific actions required for DOPD alarms at this time. Since DOPD alarms are integrated with the monitoring systems for SCE's grid operations, if the DOPD alarms then the grid operations team will determine next steps, e.g., verifying the alarm and determining the appropriate response. If an actual open phase condition results in a faulted event, SCE has procedures in place for system restoration to respond to the fault.

The number of circuit miles capable of these settings

DOPD can be deployed on all mainline circuits that are solidly grounded and have a high-speed communication channel.

An estimate of the effectiveness of the settings

The DOPD scheme is intended to successfully detect Open Phase conditions for its zone of protection. If successful at detecting open phase conditions and isolating lines prior to the lines contacting ground, the DOPD system is expected to reduce ignition probability. The success rate for detecting open phase conditions and isolating lines in the required time is still under review. Evaluation includes: (1) Ability to identify and isolate an open phase condition within 1.2 seconds; 177 (2) Reduction in number of energized wire-down events; (3) System reliability impacts from false detections with an operational OPD scheme; and (4) Costs for broad scale deployment of OPD systems.

[177] Using the freefall equation, 1.2 seconds is the estimated time it would take for a Distribution conductor to hit the ground after separating.

8.1.8.2 Grid Response Procedures and Notifications

The electrical corporation must provide a narrative on operational procedures it uses to respond to faults, ignitions, or other issues detected on its grid that may result in a wildfire including, at a minimum, how the electrical corporation:

- *Locates the issues*
- *Prioritizes the issues*
- *Notifies relevant personnel and suppression resources to respond to issues*
- *Minimizes/optimizes response times to issues*

Locates the issues detected

Identification of issues detected on the grid can come from a number of sources, including analysis of meter data, HD cameras, customer calls, circuit patrols (including PSPS pre- and post-event patrols), and grid monitoring equipment.

Prioritize issues detected

Prioritization depends on severity of issue and the circumstances of the event, e.g., a fault in HFRA during a fire weather threat (FWT) period may be prioritized over less potentially severe issues. Public safety issues (such as wires down, 911 emergencies) are typically prioritized first, followed by reliability/significant customer issues, then power quality related (voltage problems, etc.). However, prioritization of such matters would still depend on circumstances, including whether there is an immediate safety issue present, and typically reviewed at our dispatch operations centers.

For protection equipment, such as RARs, SCE follows SOB 322 procedures to prioritize the issues identified.

For fires detected through SCE's HD cameras, SCE will map the location of the fire and conduct a fire threat assessment related to SCE's infrastructure. SCE will prioritize threats based on proximity to bulk power, distribution lines, generation facilities, and public assets at risk, as these will have the greatest downstream impacts to customers.

Notifies relevant personnel and suppression resources to respond to issues detected

In HFRA, SCE typically de-energizes and sends out a troubleman to patrol the entire line to find and address any damage prior to re-energization. In certain circumstances, SCE may send out a troubleman to investigate the line first, prior to making any decisions about de-energization.

For an energized wire down detected by smart meters, such as through Meter Alarm Down Energized Conductor (MADEC), the alerts are sent to a switching center, which will take appropriate steps prior to de-energizing the line. For Primary Issue Alerts,[178] SCE sends a troubleman to investigate the issue.

Furthermore, for fires and other emergencies, SCE's Public Safety Partners are already integrated with the same HD camera networks and email alerts as SCE for fires in their areas. SCE works with responding

[178] Primary Issues Alerts are system-generated alerts that notify SCE's grid operations about possible primary issues based on meter exception data and SCE connectivity information.

fire agencies to coordinate emergency response, damage assessment, and electrical service restoration. SCE also provides year-round standby funding to Orange County, Los Angeles County, and Ventura County to be able to use helitankers to aid with fire suppression in SCE's service area.

For PSPS, SCE will send out pre- and post-event patrols to monitor the lines for any hazards prior to re-energization.

Minimizes/optimizes response times to issues detected

SCE works to ensure that enough troublemen are assigned to cover each area to lower response times. This may include, for example, assigning more troublemen to report to districts with a higher frequency of events and obtaining additional resources when needed (e.g., from adjacent sectors or from other personnel). For wire-downs, SCE typically measures the response time from the time of the call to the time of arrival at the location.

Circuit patrols also carry some limited fire suppression resources in case of sparks or ignitions discovered during a patrol performed pursuant to SOB 322.

For fires, SCE has a 24-7 Watch Office that monitors fires and coordinates with SCE's Grid Control Center to advise of any fire threats to the bulk power system. SCE's Fire Management organization will also reach out to the troublemen at the affected District(s) to provide liaison support, such as coordination for potential de-energizations and to provide detailed information about the fire.

For PSPS events, SCE will assess where to pre-stage staff resources prior to an inclement weather event. SCE also deploys CCVs to areas where an extended outage is anticipated/experienced.

8.1.8.3 Personnel Work Procedures and Training in Conditions of Elevated Fire Risk

The electrical corporation must provide a narrative on the following:

- *The electrical corporation's procedures that designate what type of work the electrical corporation allows (or does not allow) personnel to perform during operating conditions of different levels of wildfire risk, including:*
    - *What the electrical corporation allows (or does not allow) during each level of risk*
    - *How the electrical corporation defines each level of wildfire risk*
    - *How the electrical corporation trains its personnel on those procedures*
    - *How it notifies personnel when conditions change, warranting implementation of those procedures*

Training personnel performing high risk grid operating procedures in elevated fire conditions is necessary to promote sound decision-making and to reduce the chance of utility-associated ignitions. SCE has implemented work procedures that outline the necessary steps to mitigate ignitions associated with crews and equipment in HFRA and empower qualified employees to request temporary de-energization of a line or line segment. These procedures also contain provisions which restrict or delay field work when conditions call for such action. Non-emergency/routine work involving hot work activities shall be cancelled when working on or near circuits under consideration for or de-energized due to a PSPS event. SCE also provides these employees with the training necessary to safely perform

these activities. All personnel responses to issues on the grid are subject to SOB 322 operating restrictions in HFRA and PSPS Outages, which are captured by the Hazard Event Restriction and Management Emergency System (HERMES) application within SCE's Grid Management System (GMS). The HFRA Hot Work Restriction and Mitigation Measures program applies to both SCE employees and contractors and is intended to reduce their risk of causing an ignition during the normal course of work in HRFA when the weather and fuel conditions are more susceptible to fire ignitions.

SCE provides annual training to all field personnel (both employees and contractors) performing wildfire mitigation activities, patrols, and live field observations, which includes all updates to SOBs, which encompass operating protocols, remedial actions, communication and notification protocols, ratings and limits of lines and equipment, and system protection schemes. In addition, the training includes PSPS Operating Protocols, PSPS Decision-Making Tool Enhancements, Patrolling and Live Field Observation for field operations, and Field Operations Tool Training. This training will be refreshed for all field personnel performing the same types of patrols in 2023, which includes both experienced and new resources.

SCE will continue to provide training to field personnel prior to every wildfire season, as additional resources are onboarded every year that will need to be trained. The annual training will include updates to all SOBs and any updates in work restriction procedures. SCE continues to refine its training program based on feedback from field employees and its QC program.

The electrical corporation's procedures regarding deployment of firefighting staff and equipment (e.g., fire suppression engines, hoses, water tenders, etc.) to construction and/or electrical worksites for site-specific fire prevention and ignition mitigation during on-site work

When SCE crews perform construction and maintenance work in the field, especially if it is considered "hot work," there is a small chance of generating sparks, arcs or incandescent particles. "Hot work" is defined as activities that are capable of initiating a fire or generating potential ignition sources. SCE and contract crews performing this work are equipped with basic fire mitigation and suppression tools.

SCE's HFRA Hot Work Restriction and Mitigation Measures program contains provisions to mitigate crew caused ignitions and are in effect whenever performing hot work activities in SCE's HFRAs, with limited exceptions. The program requires SCE and contract crews performing hot work activities to be equipped with basic fire mitigation and suppression tools with the goal of preventing ignitions and rapidly responding to incipient stage ignitions should one occur during the normal course of their work in the field.

SCE performed benchmarking studies regarding dedicated fire suppression resources and services with other utility companies and determined that the number and size of ignitions first encountered by field crews did not support pursuing professional, private firefighting resources at this time. SCE will continue using its existing HFRA Hot Work Restriction and Mitigation program and related protocols that are in place to help prevent crew or equipment caused ignitions, and in the event of an ignition, the crews will use their equipment, such as fire extinguishers, shovels, and/or rakes, to put out incipient stage fires that could occur during the course of their activities in the field. SCE will also continue to monitor the risks posed by ignitions first encountered by its field crews and consider professional firefighting crews as an option in future iterations of its WMP.

8.1.9 Workforce Planning

In this section, the electrical corporation must report on qualifications and training practices regarding wildfire and PSPS mitigation for workers in the following target roles:

- *Asset inspections.*
- *Grid hardening.*
- *Risk event inspection.*

For each of the target roles listed above, the electrical corporation must:

- *List all worker titles relevant to the target role.*
- *For each worker title, list and explain minimum qualifications, with an emphasis on qualifications relevant to wildfire and PSPS mitigation. Note if the job requirements include:*
- *Going beyond a basic knowledge of GO 95 requirements to perform relevant types of inspections or activities.*
- *Being a "Qualified Electrical Worker" (QEW). If so, define what is required by the electrical corporation for it to consider a worker to be a QEW in terms of certifications, qualifications, experience, etc.*
- *Report the percentage of electrical corporation and contractor full-time employees (FTEs) in the target role, with specific job titles.*
- *Report plans to improve qualifications of workers relevant to wildfire and PSPS mitigation work. The electrical corporation must explain how it is developing training programs that teach electrical workers to identify hazards that could ignite wildfires.*

SCE summarizes the applicable information in the tables below for each of the target roles identified. Full time employee (FTE) figures represent counts and percentages as of month-end November 2022 and include SCE and contractor field workers relevant to each target role. It is important to note that worker counts can fluctuate throughout the year depending on work required, resource availability, etc., particularly with contract workers. Below each table, SCE provides a more detailed description of the qualifications for each role, as well as discussion on training and plans to improve worker qualifications.

8.1.9.1 Target Role: Asset Inspections

SCE performs detailed inspections of SCE's overhead distribution and transmission electric system in its HFRA that meet and exceed compliance requirements. For details on SCE wildfire-related inspection programs, please see Section 8.1.3

SCE performs aerial and ground detailed inspections of its transmission and distribution assets to identify hazards that could lead to safety and reliability issues. SCE uses employees and contractors to take high-definition imagery of assets from the air, either via helicopter or unmanned aircraft system (UAS). In some cases, helicopters will also collect LiDAR data.

SCE Aircraft Operations employs a rigorous aviation vendor qualification audit to determine a

prospective aviation vendor's suitability to provide aviation services for SCE. Appropriate Federal Aviation Administration (FAA) certifications[179] are a basic conditional check during aviation audits. Only aviation vendors approved under this process are eligible for SCE contracts involving aviation activities.

SCE uses employee and contract Inspectors to perform ground and aerial inspections. These Inspectors identify structural issues that may require possible remediations based on these inspections and create a notification.

Our worker qualifications and training for Asset Inspections will evolve and adapt in accordance with any future changes to our inspection programs, designs, and operational practices.

Table 8-9 details the worker titles and associated statistics pertaining to Asset Inspections. For purposes of this table and target role, "Special Certification Requirements" includes: Qualified Electrical Worker QEW),[180] FAA Certification and Infrared Thermographer Level III.[181]

[179] FAA certification required for helicopter pilots are 14 CFR 61, 91 and 133; FAA certification required for UAS pilots is 14 CRF 107 or higher. FAA certification is not required for UAS observers.

[180] A Qualified Electrical Worker (QEW) is an individual who has a minimum of two years' training and experience with exposed high voltage circuits and equipment and demonstrated familiarity with the services to be performed and the hazards involved. In addition, for roles where it is applicable, SCE specifies in its contracts with vendors that the contractors at a minimum should meet the qualifications for a QEW as defined by the International Brotherhood of Electrical Workers (IBEW) Local No 47. SCE also specifies that contractors that perform Journeyman Lineman tasks on SCE's Distribution system must be certified "Journeyman Linemen" as determined by criteria set forth by IBEW Local No 47.

[181] A Level III thermographer is primarily a thermography program manager who writes the company's written predictive maintenance/inspection practices, develops the test procedures and severity criteria, determines how often equipment should be inspected, and calculates the return on investment the thermography program is providing. By completing this advanced infrared training, a Level III thermographer can provide guidance to Level I and II certified personnel. The Level III thermographer is the resource to consult when repeat equipment problems necessitate a review of operating and maintenance procedures or involve a redesign of equipment.

Table 8-9 - Workforce Planning, Asset Inspections

Worker Title	**Minimum Qualifications for Target Role**	**Special Certification Requirements**	**Electrical Corporation % FTE Min Quals**[182]	**Electrical Corporation % Special Certifications**[183]	**Contractor % FTE Min Quals**[182][182]	**Contractor % Special Certifications**[183]	**Reference to Electrical Corporation Training/Qualification Programs**
ELECTRICAL SYSTEM INSPECTOR	See Below	N/A	40.6%	N/A	34.7%	N/A	See ESI Training in Table 8-9-1, "New Electrical System Inspector (ESI) Training " and "Existing ESI Inspection Training"

			100%		100%		

[182] "% of FTE Min Quals" column = # of SCE Workers in each Worker Title / Total # of SCE Workers in the Table. The same logic applies for Contractor.
[183] "% Special Certification" column = # of SCE workers in that Worker Title that have the special certification / total number of SCE workers in that Worker Title. The same logic applies for Contractor.

General Minimum Qualifications:

Workers who conduct detailed transmission, distribution overhead (or underground) and aerial electrical inspections must have knowledge of the basic uses and functions of electrical equipment, hand tools, power tools, techniques in performing electrical system inspections andrepairs. Workers must understand the fundamentals of electric circuitry and operation of electrical equipment. Further, workers must understand SCE standards, policies and procedures, and basic GO 95 requirements.

A Qualified Electrical Worker (QEW) is an individual who has a minimum of two years' training and experience with exposed high voltage circuits and equipment and demonstrated familiarity with the services to be performed and the hazards involved. In addition, for roles where it is applicable, SCE specifies in its contracts with vendors that the contractors at a minimum should meet the qualifications for a QEW as defined by the International Brotherhood of Electrical Workers (IBEW) Local No 47. SCE also specifies thatcontractors that perform Journeyman Lineman tasks on SCE's Distribution system must be certified "Journeyman Linemen" as determined by criteria set forth by IBEW Local No 47.

Additional Minimum Qualifications:

ELECTRICAL SYSTEM INSPECTOR: Responsible for performing inspections of distribution poles and equipment and must pass the required Edison Electric Institute (EEI) aptitude test as well as have the ability to obtain and maintain a California driver's license. Inspectors must also have knowledge of: Basic electricity and electrical distribution principles; computer programs and email systems; company work rules, regulations and policies, construction methods, procedures, and standards; SCE's Accident Prevention Manual and safe work practices; and the motor vehicle code.

JOURNEYMAN TRANSMISSION/DISTRIBUTION LINEMAN: Responsible for performing construction and maintenance work on overhead and underground facilities. Journeyman linemen are QEWs and must have working experience as a lineman or groundman and graduated from SCE's apprenticeship program and have working knowledge of SCE's Accident Prevention Manual. Linemen must also have successfully passed a pre-hire physical assessment. Skills and abilities required by this job are of a level normally acquired by completion of job-related high school courses and the apprenticeship program for Lineman.

PATROLMAN: Responsible for patrolling, inspecting, and ensuring assigned transmission lines are properly maintained. Transmission Senior Patrolmen are QEWs and must have knowledge of: equipment, tools, techniques, and methods employed in the construction, installation, maintenance, and repair of overhead line facilities, roads, trails, and rights-of-way (ROWs); stresses, strains, and rigging; safety regulations; capabilities and limitations of insulator washing equipment; transmission overhead and underground circuitry and switching; and SCE's Accident Prevention Manual. The knowledge, skills, and abilities required for this job are of a level comparable with those normally acquired through ahigh school education, supplemented by technical study, extensive training, and experience as a journeyman, patrolman or lineman.

HELICOPTER PILOT: Responsible for conducting routine and complex missions including power line patrols, passenger transports, photo flights, positioning flights, snow surveys, and external load missions, as required. Pilots are FAA certified and must also have knowledge of: all applicable governmental aviation regulations, company policies, procedures, practices, work instructions, and FAA Regulations, 14 CFR Part 91 & 133. The knowledge, skills, and abilities required of this job are of a level comparable with those with a high school education and a minimum of 3,000 hours of helicopter pilot in command and 250 hours pilot in command above 5,000 feet. Pilots must also possess and maintain a Class II FAA Medical Certificate and a valid California driver's license.

SENSOR OPERATOR: Responsible for remote sensing mission planning, sensor configuration, and understanding complex sensing system technology from data collection to product hand off. The knowledge, skills, and abilities required for this job include operating and maintaining complex sensing equipment as part of an aircrew onboard a helicopter; and understanding the evolution of advanced three-dimensional geospatial tools and analysis as this has a direct bearing on the collection of data with remote sensing equipment.

GENERATION: HYDRO ELECTRICIAN & INSTRUMENT CONTROL TECHNICIAN/ICE TECHNICIAN: Responsible for maintaining, repairing and installing computerized control systems. Must have knowledge of: Basic power plant system operations; electrical and pressure instruments and devices and functions as related to power plant systems; tools, methods, materials and techniques used in repair, adjustment and testing, including computerized tooling and interface hardware and software; theory of electricity, mechanics and instruments; materials, methods, practices and tools used in installation and maintenance; principles of physics and advanced mathematics; county and state electrical code; SCE's Accident Prevention Manual and environmental regulations and procedures. The knowledge, skills, and abilities for this job are of a level comparable to those normally acquired through a high school education, additional technical study, and knowledge of complex digital and analog control systems and equipment; plus, experience typically attained in a similar technical field or journeyman electrician.

GENERATION: HYDRO FOREMAN ELECTRICIAN & INSTRUMENT CONTROL TECHNICIAN /FOREMAN, ICE TECHNICIAN: Supervises and oversees repairs and installations of control systems. Must have knowledge of: Basic power plant system operations; electrical and pressure instruments and devices and functions as related to power plant systems; tools, methods, materials and techniques used in repair, adjustment and testing, including computerized tooling and interface hardware and software; theory of electricity, mechanics and instruments; materials, methods, practices and tools used in installation and maintenance; principles of physics and advanced mathematics, county and state electrical code; SCE's Accident Prevention Manual, safety rules and regulations, environmental regulations and procedures. The knowledge, skills, and abilities for this job are of a level comparable to those normally acquired through a high school education, additional technical study, and knowledge of complex digital and analog control systems and equipment; plus, experience typically attained in a similar technical field or journeyman electrician.

GENERATION: CHIEF HYDRO STATION OPERATOR: Supervises and controls the operation of hydroelectric generating stations and related equipment; dams, intakes, forebays, spillways, and water conduits to assure efficient loading and operations of the Hydro Division plants. Must have knowledge of: Fundamentals of electricity, basic Alternate Current-Direct Current (AC-DC) theory, computer theory and language; hydraulics and the principles of physics; dispatching, system operating and water management procedures and operator's duties; general electrical and mechanicalmaintenance; overall plant facilities and operating characteristics; and SCE's Accident Prevention Manual. The knowledge, skills, and abilities required for this job are of a level comparable to those normally acquired through a high school education and extensive progressive training and experience in hydro generating plant operations.

GENERATION: HYDRO OPERATOR MECHANIC/PLANT EQUIPMENT OPERATOR: Operates attended and unattended hydroelectric generation stations; dams, intakes, fore bays, spillways, and water conduits; and related electronic, electrical, mechanical, hydraulic and pneumatic equipment. Must have knowledge of: electrical, hydraulic, pneumatic and mechanical equipment; basic computer theory and language, system construction, capacity, limitation, theories of operation and operating procedures; plant design and equipment locations, valve configurations, and normal range of flows, temperatures, levels, methods to clear equipment; tools, safety rules, equipment and systems malfunctions; reporting procedures and practices, maintenance procedures and practices; and electrical and mechanical prints, rigging standards, generation plant terminology and nomenclature. The knowledge, skills, and abilities required of this job are of a level comparable to those normally acquired through a high school education and considerable experience operating and maintaining a generation facility.

UAS PILOT: Responsible for conducting UAS missions, including preflight inspections, specific aircraft and ground control station checks, maintenance, and operational safety activities. Must possess a current and valid Federal Aviation Remote Pilot Certificate (14 CFR 107 or higher, as appropriate) and be proficient in operating each UAS model appropriate to the current pending mission profile. The knowledge, skills, and abilities required for this job include the capability of mission planning relative to the appropriate level of mission complexity and federal certification.

UAS VISUAL OBSERVER: A visual observer is considered an optional crewmember for most operations under 14 CFR Part 107. There are, however, more complex instances in which at least one visual observer will be required by SCE UAS Operations. The UAS Operator and UAS Observer are responsible for functioning as a crew in a safe, responsible and coordinated manner.

INFRARED THERMOGRAPHER: Responsible for performing thermal inspections of poles and equipment. Must be certified as a level-one thermographer and possess 40-hours minimum of field and office training and pass an associated written exam administered by Osmose or an outside agency. The knowledge, skills, and abilities required for this job include a basic understanding of electrical and communication infrastructure and GO 95. Additionally, level-one thermographers are provided specific training on the cameras used for the patrol and capture of IR images used for SCE's reports.

INFRARED GENERAL MANAGER THERMOGRAPHER: Responsible for training and managing of level-one thermographers and must be certified as a level-three thermographer. Minimum qualifications include the level-one thermographer requirements, plus an additional 32-hour training program and certification exam administered by an outside agency. Level-three thermographers are also responsible for the creation and evaluation of reports containing IR imagery; designing and implementing written procedures; and understanding regulatory requirements with a focus on safety and compliance. Level-three thermographers are trained and certified through the IR Training Center systems company.

AERIAL DESKTOP FOREMAN: Supervise work performed by desktop inspectors to help ensure the work is performed qualitatively. Oversees and approves timesheets related to hours worked. Requires knowledge of SCE Standards relating to construction and Inspections. Skills and abilities required for this job are of a level comparable with those normally acquired through a high school education and extensive training and experience as a Journeyman Lineman.

Training and plans to improve worker qualifications:

To facilitate asset inspection work, SCE implements training for those performing inspections. This technical training prepares workers to perform their jobs safely, comply with regulatory requirements and laws, maintain system reliability, and meet the demands of new technology. SCE will continue to deploy new work methods and technologies in support of wildfire activities. SCE's risk-informed inspection strategy involves using new tools to help perform field inspections, modify inspection checklists to evaluate asset conditions, and establish new processes. These new technologies and work methods require the creation of new training material and deployment of the training to SCE employees. In addition to technical competency, this training must provide education and clarification on new procedures and standards, building upon lessons learned obtained from field activities. SCE also conducts training for workers in the Risk Event Inspection role related to its wildfire mitigation and PSPS work, which is described in Section 8.1.9.3 Table 8-11 below.

Separately, SCE surveys its workers to identify where more focused training may be needed. These surveys provide information at the employee and supervisor level, which allows SCE to identify specific areas where individuals may benefit from additional training.

As technical aspects (e.g., process, technology, or tool changes) of SCE's various inspection programs change, SCE will provide the requisite training to those who will be performing inspections. Further, SCE will update its training program based on lessons learned and provide refresher training as necessary to communicate changes in protocols. For example, SCE continuously adds or updates material as supplements to its training for Electrical System Inspectors (ESIs) who perform inspections through SCE's Overhead Detail Inspection and/or HFRI programs, as shown in Table SCE 8-01.

SCE requires all new ESIs to take the comprehensive training identified below. In addition, all ESIs take regular refresher training every 12 months to incorporate new processes, procedures, and lessons-learned relevant to inspection practices; and engage in a comprehensive quality and consistent program to help ensure accurate and consistent inspections. The program consists of four major components all focused on improving inspection quality and to help ensure inspection results are consistent.

Table SCE 8-01 -SCE Training Courses Specific to Asset Inspections

Course Name	Course Description
